It has been customary since the early 1980s to establish alert and action levels for environmental monitoring. However, in recent years the numerical spread between alert and action levels has become quite small. It is generally accepted that growth and recovery microbiological assays have normal variability in the range of ± 0.5 $\log_{10}$. Studies on active microbiological air samplers indicate that variability of as much as 10-fold is possible among commonly used sampling devices. As a result of this inherent variability and indeterminate error, differences between, for example, an alert level of 1 cfu and an action level of 3 cfu are not analytically significant. Therefore, caution is in order in ascribing differences to microbial sampling results that are within expected variability of measurement. In a practical sense, numerical values that vary by as much as 5- to 10-fold may not be significantly different.

Because of the limited accuracy and precision of microbial growth and recovery assays, in evaluating microbiological risk it is more logical to consider contamination incidence rate than absolute numbers of cfu detected in any single sample. Mean incidence rates should be determined for each clean room environment, and changes in incidence rate at any given site or within a given room may indicate the need for corrective action. Within the Class 5 critical zone, airborne and surface contamination incidence rates of 1% or less should be readily attainable. Incidence rates for isolator systems should be significantly lower and can be expected to be $< 0.1\%$.

Contamination observed at multiple sites within an environment within a single sampling period may be indicative of increased contamination risk to product and should be carefully evaluated. The appearance of contamination at multiple sites may also arise from poor sampling technique. Therefore, careful review of the situation is in order before conclusions are drawn regarding potential loss of control. It is important to consider that resampling of an environment several days after contamination is recovered at multiple locations is of little value because the conditions present on one sampling occasion may not be accurately duplicated on another.

Table 3. EU Recommended Microbiological Monitoring Levels for Aseptic Processing*

Room Grade	Active Air Sample	Settling Plate (9 cm) 4-hr Exposure	Contact Plate	Glove Sample
A (ISO Class 5)	<1	<1	<1	<1
B	10	5	5	5
C (ISO Class 7)	100	50	25	—
D (ISO Class 8)	200	100	50	—

* The values listed for Grade A environments are average values over a significant period of time. Colonies appear only as whole integers.
The values given for Class B, C, and D environments are for general reference only. Users should base their expectations on actual observed results.
Surface samples may also be taken on clean room garments. In this case the average should be <1 for these sample sites as well.

Table 4. Recommended Contamination Incident Rates for Aseptic Processing*

Grade	Active Air Sample	Settle Plate (9 cm) 4-hr exposure	Contact Plate or Swab	Glove or Garment
Isolator (ISO Class 5 or better)	<0.1%	<0.1%	<0.1%	<0.1%
A/ISO Class 5	<1%	<1%	<1%	<1%
B	<3%	<3%	<3%	<3%
C/ISO Class 7	<5%	<5%	<5%	<5%
D/ISO Class 8	<10%	<10%	<10%	<10%

* The incidence rates apply only to aseptic processing environments. Clean rooms that are used for other applications such as control of bioburden in closed processing areas, rooms surrounding isolators or fermentors, isolators used primarly for containment, manufacture of most terminally sterilized products, or solid dosage form manufacturing areas can have more liberal contamination incidence rates. In these applications where asepsis is not claimed and bioburden control is the objective, incidence rates can and should be established on a case-by-case basis supported by risk analysis.

Given the inherent variability associated with microbial sampling methods, incidence rates are a more useful way of trending results than focusing on the number of colonies recovered from a given sample. *Table 4* shows recommended incidence rates for aseptic processing environments. The incident rate is the rate at which environmental samples are found to contain any level of contamination. For example, an incident rate of 1% would mean that only 1% of the samples taken have any contamination regardless of colony number. In other words, 99% of the samples taken are completely free of contamination. Higher incidence rates than those recommended in *Table 4* may be acceptable in rooms of similar classification that are used for lower microbial risk activities. Action should be required when the incidence rate is seen to trend above these recommendations for a significant period of time.

Incidence rates should be based on actual monitoring data and should be retabulated regularly. Action levels should be based on actual empirical process capability. When contamination incidence rates are seen that exceed the recommendations in *Table 4* or are greater than established process capability, corrective actions should be taken. Corrective actions may include, but are not limited to, the following:

1. Revision of sanitization program including selection of antimicrobial agents, application methods, and frequencies.
2. Increased surveillance of personnel practices by supervisory staff. This may include written critiques of aseptic methods and techniques used by personnel.
3. Review of microbiological sampling methods and techniques.
4. When higher than typical glove and garment incidence levels are observed, additional training on gowning practices may be indicated.▲*USP29*

~~**Methodology and Instrumentation for Quantitation of Viable Airborne Microorganisms**~~

▲Methodology and Instrumentation for Sampling of Airborne Microorganisms▲*USP29*

~~It is generally accepted by scientists that airborne microorganisms in controlled environments can influence the microbiological quality of the intermediate or final products manufactured in these areas. Also, it generally is accepted that estimation of the airborne microorganisms can be affected by instruments and procedures used to perform these assays. Therefore, where alternative methods or equipment is used, the general equivalence of the results obtained should be ascertained. Advances in technology in the future are expected to bring innovations that would offer greater precision and sensitivity than the current available methodology and may justify a change in the absolute numbers of organisms that are detected.~~

▲TYPES OF SAMPLERS▲*USP29*

Today, the most commonly used samplers in the U.S. pharmaceutical and medical device industry are the impaction and centrifugal samplers. A number of commercially available samplers are listed for informational purposes. The selection, appropriateness, and adequacy of using any particular sampler is the responsibility of the user.

Slit-to-Agar Air Sampler (STA)—~~This sampler is the instrument upon which the microbial guidelines given in *Table 3* for the various controlled environments are based. The unit is powered by an attached source of controllable vacuum. The air intake is obtained through a standardized slit below which is placed a slowly revolving Petri dish containing a nutrient agar. Particles in the air that have sufficient mass impact on the agar surface and viable organisms are allowed to grow out. A remote air intake is often used to minimize disturbance of the laminar flow field.~~

▲The unit is powered by an attached source of controllable vacuum. The air intake is obtained through a standardized slit below which is placed a slowly revolving Petri dish containing a nutrient agar. Particles in the air that have sufficient mass impact on the agar surface and viable organisms are allowed to grow out. A remote air intake is often used to minimize disturbance of the unidirectional airflow field.▲*USP29*

Sieve ~~Impactor~~

▲Impaction▲*USP29*—The apparatus consists of a container designed to accommodate a Petri dish containing a nutrient agar. The cover of the unit is perforated, with the perforations of a predetermined size. A vacuum pump draws a known volume of air through the cover, and the particles in the air containing microorganisms impact on the agar medium in the Petri dish. Some samplers are available with a cascaded series of containers containing perforations of decreasing size. These units allow for the determination of the distribution of the size ranges of particulates containing viable microorganisms, on the basis of which size perforations admit the particles onto the agar plates.

Centrifugal Sampler—The unit consists of a propeller or turbine that pulls a known volume of air into the unit and then propels the air outward to impact on a tangentially placed nutrient agar strip set on a flexible plastic base.

Sterilizable Microbiological Atrium—The unit is a variant of the single-stage sieve impactor. The unit's cover contains uniformly spaced orifices approximately 0.25 inch in size. The base of the unit accommodates one Petri dish containing a nutrient agar. A vacuum pump controls the movement of air through the unit, and a multiple-unit control center as well as a remote sampling probe are available.

Surface Air System Sampler—This integrated unit consists of an entry section that accommodates an agar contact plate. Immediately behind the contact plate is a motor and turbine that pulls air through the unit's perforated cover over the agar contact plate and beyond the motor, where it is exhausted. Multiple mounted assemblies are also available.

Gelatin Filter Sampler—The unit consists of a vacuum pump with an extension hose terminating in a filter holder that can be located remotely in the critical space. The filter consists of random fibers of gelatin capable of retaining airborne microorganisms. After a specified exposure time, the filter is aseptically removed and dissolved in an appropriate diluent and then plated on an appropriate agar medium to estimate its microbial content.

Settling Plates—~~This method is still widely used as a simple and inexpensive way to~~ **qualitatively** assess the environments over ~~prolonged exposure times. The exposure of open agar-filled Petri dishes, or settling plates, is~~ **not to be used for quantitative** ~~estimations of the microbial contamination levels of critical environments.~~

~~One of the major limitations of mechanical air samplers is the limitation in sample size of air being sampled. Where the microbial level in the air of a controlled environment is expected to contain~~

In-Process Revision

~~not more than three cfu per cubic meter, several cubic meters of air should be tested if results are to be assigned a reasonable level of precision and accuracy. Often this is not practical. To show that microbial counts present in the environment are not increasing over time, it might be necessary to extend the time of sampling to determine if the time of sampling is a limiting factor or not. Typically, slit-to-agar samplers have an 80-liter-per-minute sampling capacity (the capacity of the surface air system is somewhat higher). If one cubic meter of air is tested, then it would require an exposure time of 15 minutes. It may be necessary to use sampling times in excess of 15 minutes to obtain a representative environmental sample. Although there are samplers reported to be capable of very high sampling volume rates, consideration in these situations should be given to the potential for disruption of the airflow patterns in any critical area or to the creation of a turbulence that could increase the probability of contamination.~~

~~For centrifugal air samplers, a number of earlier studies showed that the samples demonstrated a selectivity for larger particles. The use of this type of sampler may have resulted in higher airborne counts than the other types of air samplers because of that inherent selectivity.~~

~~When selecting a centrifugal sampler, the effect of the sampler on the linearity of the airflow in the controlled zone where it is placed for sampling should be taken into consideration. Regardless of the type of sampler used, the use of a remote probe requires determining that the extra tubing does not have an adverse effect on the viable airborne count. This effect should either be eliminated or, if this is not possible, a correction factor should be introduced in the reporting of results.~~

▲This method is a simple and inexpensive way to qualitatively assess the environments over prolonged exposure times. Settling plates may be particularly useful in critical areas, where the use of an active sampling device could be unduly intrusive and therefore a hazard to safe aseptic operation. However, settle plates may be less efficient for the collection of airborne viable contamination than active air sampling devices, even when long exposure times (4–5 hours) are used.

SAMPLE VOLUMES FOR ACTIVE AIR MONITORING

One of the major limitations of mechanical air samplers is the limitation in sample size of air being sampled. Where the microbial level in the air of a controlled environment is expected to contain extremely low levels of contamination per unit volume, at least one cubic meter of air should be tested in order to maximize sensitivity. Typically, slit-to-agar samplers have a sampling capacity of 80 L per minute (the capacity of the surface air system is somewhat higher). If one cubic meter of air is tested, then it would require an exposure time of 15 minutes. It may be necessary to use sampling times in excess of 15 minutes to obtain a representative environmental sample. Although there are samplers reported to be capable of very high sampling volume rates, consideration in these situations should be given to the potential for disruption of the airflow patterns in any critical area or to the creation of a turbulence that could increase the probability of contamination.

Users may wish to use remote sampling systems in order to minimize the potential for risk to the process resulting from the intervention by environmental samplers in critical zones. Regardless of the type of sampler used, it must be determined that the use of a remote probe with its extra tubing does not reduce the method's sensitivity to such an extent that the detection of low levels of contamination becomes unlikely or even impossible.▲*USP29*

Methodology and Equipment for Sampling of Surfaces for Quantitation of Viable Microbial Contaminants in Controlled Environments

Another component of the microbial environmental control program in controlled environments is surface sampling of equipment, facilities, and personnel gear used in these environments. The standardization of surface sampling methods and procedures has not been as widely addressed in the pharmaceutical industry as the standardization of air sampling procedures.[3] To minimize disruptions to critical operations, surface sampling is performed at the conclusion of operations. Surface sampling may be accomplished by the use of *contact plates* or by the *swabbing method*. Surface monitoring is generally performed on areas that come in contact with the product and on areas adjacent to those contact areas. Contact plates filled with nutrient agar are used when sampling regular or flat surfaces and are directly incubated at a time appropriate for a given incubation temperature for quantitation of viable counts. Specialized agar can be used for specific quantitation of fungi, spores, etc.

~~The swabbing method may be used for sampling of irregular surfaces, especially for equipment. Swabbing is used to supplement contact plates for regular surfaces. The swab is then placed in an appropriate diluent and the estimate of microbial count is done by plating of an appropriate aliquot on or in specified nutrient agar. The area to be swabbed is defined using a sterile template of appropriate size. In general, it is in the range of 24 to 30 cm^2. The microbial estimates are reported per contact plate or per swab.~~

▲The swabbing method may be used for sampling of irregular surfaces, especially for equipment. Swabbing can also be used for regular surfaces. The area to be swabbed may be

[3] The Sixteenth Edition of Standard Methods for the Examination of Dairy Products (the American Health Association) provides a section on surface sampling.

In-Process Revision

defined using a sterile template of appropriate size. In general, the size is in the range of 24 to 30 cm^2. After collection of the sample, the swab is placed in an appropriate diluent and plated onto the desired nutrient agar. The microbial estimates are reported per contact plate or per swab. Swabbing and contact sampling are widely used methods and can be expected to yield similar recovery levels in most industrial applications. It is not necessary for each user to validate recovery because these are standard methods in the industry.

Surface monitoring is used as an environmental assessment tool in all types of classified environments. In Class 5 environments in which aseptic processing is done, surface monitoring is generally performed adjacent to those contact areas. The entire area in which the product and the containers and closures are exposed in aseptic processing is typically defined as the critical zone. Component hoppers and feed chutes that contact sterile surfaces on closures and filling needles may be tested for microbial contamination. Typically, these product contact surfaces are steam sterilized and aseptically assembled or decontaminated in situ. The ability of operators to perform these aseptic manipulations are demonstrated during process simulations or media fills. It is important to note that surface monitoring on surfaces that directly contact sterile parts or product, if monitored, should be done only at the conclusion of operations. Sampling during operations would require a dangerous process-line intervention that could, in and of itself, create a hazard to sterility assurance. Surface sampling is not a sterility test and should not be used in and of itself as a criterion for the release or rejection of product. Given the fact that these samples must be taken aseptically by personnel, it can never be established with certainty that any contamination that is recovered would have affected the product.▲*USP29*

Identification of Microbial Isolates from the Environmental Control Program

~~The environmental control program includes an appropriate level of identification of the flora obtained from sampling. A knowledge of the normal flora in controlled environments aids in determining the usual microbial flora anticipated for the facility being monitored; evaluating the effectiveness of the cleaning and sanitization procedures, methods, and agents; and recovery methods. The information gathered by an identification program can also be useful in the investigation of the source of contamination, especially when the *Action levels* are exceeded.~~

In-Process Revision

▲The environmental control program includes an appropriate level of identification of the flora obtained from sampling. A knowledge of the flora in controlled environments aids in the following: determining the usual microbial flora anticipated for the facility being monitored; evaluating the effectiveness of the cleaning and sanitization procedures, methods, and agents; and recovery methods. The information gathered by an identification program can also be useful in the investigation of the source of contamination, especially when recommended contamination incidence rates are exceeded, a situation that implies that corrective action is required.▲*USP29*

Identification of isolates from critical areas and areas immediate to these critical areas should take precedence over identification of microorganisms from noncritical areas. Identification methods should be verified, and ready-to-use kits should be qualified for their intended purpose (see *Critical Factors Involved in the Design and Implementation of a Microbiological Environmental Control Program*).

Add the following:

▲Conclusion

Environmental monitoring is one of several key elements required to ensure that a classified clean room or aseptic processing area is maintained with an adequate level of control. Monitoring is a qualitative exercise and even in the most critical applications such as aseptic processing, conclusions regarding lot acceptability should not be reached on the basis of environmental sampling results alone. Environments that are essentially free of human operators will generally have a very low initial contamination rate and will maintain very low levels of microbial contamination in use. However, human scale clean rooms present a vastly different picture. Studies conclusively show that operators continuously slough microorganisms into the environment, even when carefully and correctly gowned. Therefore, it is unreasonable to assume that recovery levels of zero, even in the critical zone or on critical surfaces, will be observed at all times. Periodic excursions are a fact of life in human scale clean rooms; however the incidence rate of contamination particularly in ISO Class 5 environments used for aseptic processing should be consistently low.

Clean room operators, particularly those engaged in aseptic processing must always strive to maintain a suitable quality of environment and must work towards continuous improvement of personnel operations and environmental control. In general, reductions in personnel involved in aseptic processing and monitoring and reduction in interventions will reduce the risk of microbial contamination.▲*USP29*

~~▲Operational Evaluation of the Microbiological Status of Aseptically Filled Products in Clean Rooms and Other Controlled Environments~~

~~The controlled environment is monitored through an appropriate environmental monitoring program. To assure that minimal bioburden is achieved, additional information on the evaluation of the microbiological status of the controlled environment can be obtained by the use of *media fills*. An acceptable media fill shows that a successful simulated product run can be conducted on the manufacturing line at that point in time. However, other factors are important, such as appropriate construction of facilities, environmental monitoring and training of personnel.~~

~~When an aseptic process is developed and installed, it is generally necessary to qualify the microbiological status of the process by running at least three successful consecutive media fills. A media fill utilizes growth medium in lieu of products to detect the growth of microorganisms. Issues in the development of a media fill program that should be considered are the following: media fill procedures, media selection, fill volume, incubation, time and temperature, inspection of filled units, documentation, interpretation of results, and possible corrective actions required.~~

~~Since a media fill is designed to simulate aseptic processing of a specified product, it is important that conditions during a normal product run are in effect during the media fill. This includes the full complement of personnel and all the processing steps and materials that constitute a normal production run. During the conduct of media fill, various predocumented interventions that are known to occur during actual product runs should be planned (e.g., changing filling needles, fixing component jams).~~

~~Alternatively, in order to add a safety margin, a combination of possible conditions can be used. Examples may include frequent start and stop sequences, unexpected repair of processing system, replacement of filters, etc. The qualification of an aseptic process need not be done for every product, but should be done for each processing line. Since the geometry of the container (size as well as opening of the container) and the speed of the line are factors that are variable in the use of an aseptic processing line, appropriate combination of these factors, preferably at the extremes, should be used in the qualification of the line. A rationale for products used should be documented.~~

~~The 1987 FDA Guideline on Sterile Drug Products Produced by Aseptic Processing indicates that media fill runs be done to cover all production shifts for line/product/container combinations. This guideline should be considered not only for qualification media fill~~

runs, but also for periodic reevaluation or revalidation. Media fill programs should also simulate production practices over extended runs. This can be accomplished by doing media-fill runs at the end of production runs.

In general, an all-purpose, rich medium such as Soybean–Casein Broth that has been checked for growth promotion with a battery of indicator organisms (see *Sterility Tests* ⟨71⟩) at a level of below 100 cfu/unit, can be used. Isolates from the controlled environment where aseptic processing is to be conducted may also be used. Following the aseptic processing of the medium, the filled containers are incubated at 22.5 ± 2.5° or at 32.5 ± 2.5°. All media-filled containers should be incubated for a minimum of 14 days. If two temperatures are used for incubation of media-filled samples, then these filled containers should be incubated for at least 7 days at each temperature. Following incubation, the medium-filled containers should be inspected for growth. Media-filled isolates are identified by genus and, when possible, by species in order to investigate the sources of contamination.

Critical issues in performing media fills are the number of fills to qualify an aseptic process, the number of units filled per media fill, the interpretation of results, and implementation of corrective actions. Historically, three media-fill runs during initial qualification or start-up of a facility are conducted to demonstrate consistency of the aseptic processing line. The minimum number of units to demonstrate a contamination rate of not more than 0.1%, which is the criterion for acceptance of a successful media-fill run, is at least 3,000. It should be emphasized that many firms in the United States and other countries are filling more than 3,000 units in a single media-fill run.[4] Pilot plant facilities used for preparing small clinical lots may use smaller media fills.

A number of international documents (i.e., ISO and EU GMP) have also cited an expectation of zero positives out of 3,000 media filled units at the 95% confidence level. However, it is recognized that repeated media runs are required in order to confirm the statistical validity of the observed contamination rate for the process.

PDA Technical Monograph Number 17,[4] "A Survey of Current Sterile Manufacturing Practices," indicated that many manufacturers believe that their aseptic processes are capable of contamination rates below 0.1%.

Since the most critical source of contamination in the clean room is the personnel, visual documentation that can be helpful in correlating production activities to contamination events during media fills is encouraged. The widespread use of isolator systems for sterility testing has demonstrated that elimination of personnel does reduce contamination in aseptic handling. ▲*USP29*

Delete the following:

▲An Overview of the Emerging Technologies for Advanced Aseptic Processing

Because of the strong correlation between human involvement and intervention and the potential for product contamination in aseptic processing, production systems in which personnel are removed from critical zones have been designed and implemented. Methods developed to reduce the likelihood of contamination include equipment automation, barriers, and isolator systems. Facilities that employ these advanced aseptic processing strategies are already in operation. In facilities where personnel have been completely excluded from the critical zone, the necessity for room classification based on particulate and environmental microbiological monitoring requirements may be significantly reduced.

The following are definitions of some of the systems currently in place to reduce the contamination rate in aseptic processing:

Barriers— In the context of aseptic processing systems, a barrier is a device that restricts contact between operators and the aseptic field enclosed within the barrier. These systems are used in hospital pharmacies, laboratories, and animal care facilities, as well as in aseptic filling. Barriers may not be sterilized and do not always have transfer systems that allow passage of materials into or out of the system without exposure to the surrounding environment. Barriers range from plastic curtains around the critical production zones to rigid enclosures found on modern aseptic filling equipment. Barriers may also incorporate such elements as glove ports, half-suits, and rapid-transfer ports.

Blow/Fill/Seal— This type of system combines the blow-molding of container with the filling of product and a sealing operation in one piece of equipment. From a microbiological point of view, the sequence of forming the container, filling with sterile product, and formation and application of the seal are achieved aseptically in an uninterrupted operation with minimal exposure to the environment. These systems have been in existence for about 30 years and have demonstrated the capability of achieving contamination rates below 0.1%. Contamination rates of 0.001% have been cited for blow/fill/seal systems when combined media-fill data are summarized and analyzed.

Isolator— This technology is used for a dual purpose. One is to protect the product from contamination from the environment, including personnel, during filling and closing, and the other is to protect personnel from deleterious or toxic products that are being manufactured.

Isolator technology is based on the principle of placing previously sterilized components (containers/products/closures) into a sterile environment. These components remain sterile during the whole processing operation, since no personnel or nonsterile components are brought into the isolator. The isolator barrier is an absolute barrier that does not allow for interchanges between the protected and unprotected environments. Isolators either may be physically sealed against the entry of external contamination or may be effectively sealed by the application of continuous overpressure. Manipulations of materials by personnel are done via use of gloves, half-suits, or full-suits. All air entering the isolator passes through either an HEPA or ULPA filter, and exhaust air typically exits through an HEPA-grade filter. Peracetic acid and hydrogen peroxide vapor are commonly used for the surface sterilization of the isolator unit's internal environment. The sterilization of the interior of isolators and all contents are usually validated to a sterility assurance level of 10^{-6}.

Equipment, components, and materials are introduced into the isolator through a number of different procedures: use of a double-door autoclave; continuous introduction of components via a conveyor belt passing through a sterilizing tunnel; use of a transfer container system through a docking system in the isolator enclosure. It is also necessary to monitor closely an isolator unit's integrity, calibration, and maintenance.

The requirements for controlled environments surrounding these newer technologies for aseptic processing depend on the type of technology used.

Blow/Fill/Seal equipment that restricts employee contact with the product may be placed in a controlled environment, especially if some form of employee intervention is possible during production.

Barrier systems will require some form of controlled environment. Because of the numerous barrier system types and applications, the requirements for the environment surrounding the barrier system will vary. The design and operating strategies for the environment around these systems will have to be developed by the manufacturers in a logical and rational fashion. Regardless of these strategies, the capability of the system to produce sterile products must be validated to operate in accordance with pre-established criteria.

In isolators, the air enters the isolator through integral filters of HEPA quality or better, and their interiors are sterilized typically to a sterility assurance level of 10^{-6}; therefore, isolators contain sterile

[4] A Parenteral Drug Association Survey (Technical Monograph 17) showed that out of 27 respondents, 50% were filling more than 3,000 units per run.

~~air, do not exchange air with the surrounding environment, and are free of human operators. However, it has been suggested that when the isolator is in a controlled environment, the potential for contaminated product is reduced in the event of a pinhole leak in the suit or glove.~~

~~The extent and scope of an environmental microbiological monitoring of these advanced systems for aseptic processing depends on the type of system used. Manufacturers should balance the frequency of environmental sampling systems that require human intervention with the benefit accrued by the results of that monitoring. Since barrier systems are designed to reduce human intervention to a minimum, remote sampling systems should be used in lieu of personnel intervention. In general, once the validation establishes the effectiveness of the barrier system, the frequency of sampling to monitor the microbiological status of the aseptic processing area could be reduced, as compared to the frequency of sampling of classical aseptic processing systems.~~

~~Isolator systems require relatively infrequent microbiological monitoring. Continuous total particulate monitoring can provide assurance that the air filtration system within the isolator is working properly. The methods for quantitative microbiological air sampling described in this chapter may not have sufficient sensitivity to test the environment inside an isolator. Experience with isolators indicates that under normal operations pinhole leaks or tears in gloves represent the major potential for microbiological contamination; therefore, frequent testing of the gloves for integrity and surface monitoring of the gloves is essential. Surface monitoring within the isolator may also be beneficial on an infrequent basis.~~ ▲*USP29*

GLOSSARY

~~**Airborne Particulate Count** (also referred to as *Total Particulate Count*) — Particles detected are 0.5 µm and larger. When a number of particles is specified, it is the maximum allowable number of particles per cubic meter of air (or per cubic foot of air).~~

~~**Airborne Viable Particulate Count** (also referred to as *Total Airborne Aerobic Microbial Count*) — When a number of microorganisms is specified, it is the maximum number of colony-forming units (cfu) per cubic meter of air (or per cubic foot of air) that is associated with a Cleanliness Class of controlled environment based on the *Airborne Particulate Count*.~~

~~**Aseptic Processing** — A mode of processing pharmaceutical and medical products that involves the separate sterilization of the product and of the package (containers/closures or packaging material for medical devices) and the transfer of the product into the container and its closure under microbiologic critically controlled conditions.~~

~~**Air Sampler** — Devices or equipment used to sample a measured amount of air in a specified time to quantitate the particulate or microbiological status of air in the controlled environment.~~

~~**Air Changes** — The frequency per unit of time (minutes, hours, etc.) that the air within a controlled environment is replaced. The air can be recirculated partially or totally replaced.~~

~~**Action Levels** — Microbiological levels in the controlled environment, specified in the standard operating procedures, which when exceeded should trigger an investigation and a corrective action based on the investigation.~~

~~**Alert Levels** — Microbial levels, specified in the standard operating procedures, which when exceeded should result in an investigation to ensure that the process is still within control. Alert levels are specific for a given facility and are established on the basis of a baseline developed under an environmental monitoring program. These Alert levels can be modified depending on the trend analysis done in the monitoring program. Alert levels are always lower than Action levels.~~

~~**Bioburden** — Total number of microorganisms detected in or on an article.~~

~~**Clean Room** — A room in which the concentration of airborne particles is controlled to meet a specified airborne particulate Cleanliness Class. In addition, the concentration of microorganisms in the environment is monitored; each Cleanliness Class defined is also assigned a microbial level for air, surface, and personnel gear.~~

~~**Clean Zone** — A defined space in which the concentration of airborne particles and microorganisms are controlled to meet specific Cleanliness Class levels.~~

~~**Controlled Environment** — Any area in an aseptic process system for which airborne particulate and microorganism levels are controlled to specific levels, appropriate to the activities conducted within that environment.~~

~~**Commissioning of a Controlled Environment** — Certification by engineering and quality control that the environment has been built according to the specifications of the desired cleanliness class and that, under conditions likely to be encountered under normal operating conditions (or worst-case conditions), it is capable of delivering an aseptic process. Commissioning includes media-fill runs and results of the environmental monitoring program.~~

~~**Corrective Action** — Actions to be performed that are in standard operating procedures and that are triggered when certain conditions are exceeded.~~

~~**Environmental Isolates** — Microorganisms that have been isolated from the environmental monitoring program.~~

~~**Environmental Monitoring Program** — Documented program, implemented through standard operating procedures, that describes in detail the procedures and methods used for monitoring particulates as well as microorganisms in controlled environments (air, surface, personnel gear). The program includes sampling sites, frequency of sampling, and investigative and corrective actions that should be followed if Alert or Action levels are exceeded. The methodology used for trend analysis is also described.~~

~~**Equipment Layout** — Graphical representation of an aseptic processing system that denotes the relationship between and among equipment and personnel. This layout is used in the *Risk Assessment Analysis* to determine sampling site and frequency of sampling based on potential for microbiological contamination of the product/container/closure system. Changes must be assessed by responsible managers, since unauthorized changes in the layout for equipment or personnel stations could result in increase in the potential for contamination of the product/container/closure system.~~

~~**Federal Standard 209E** — "Airborne Particulate Cleanliness Classes in Clean Rooms and Clean Zones" is a standard approved by the Commissioner, Federal Supply Services, General Service Administration, for the use of "All Federal Agencies." The Standard establishes classes of air cleanliness based on specified concentration of airborne particulates. These classes of air cleanliness have been developed, in general, for the electronic industry "superclean" controlled environments. In the pharmaceutical industry, the Federal Standard 209E is used to specify the construction of controlled environment. Class 100, Class 10,000, and Class 100,000 are generally represented in an aseptic processing system. If the classification system is applied on the basis of particles equal to or greater than 0.5 µm, these classes are now represented in the SI system by Class M3.5, M5.5, and M6.5, respectively.~~

~~**Filter Integrity** — Testing that ensures that a filter functional performance is satisfactory [e.g., dioctyl phthalate (DOP) and bubble point test].~~

~~**Material Flow** — The flow of material and personnel entering controlled environments should follow a specified and documented pathway that has been chosen to reduce or minimize the potential for microbial contamination of the product/closure/container systems. Deviation from the prescribed flow could result in increase in potential for microbial contamination. Material/personnel flow can be changed, but the consequences of the changes from a microbiological point of view should be assessed by responsible managers and must be authorized and documented.~~

~~**Media Growth Promotion**—Procedure that references *Growth Promotion* under *Sterility Tests* ⟨71⟩ to demonstrate that media used in the microbiological environmental monitoring program, or in *media-fill* runs, are capable of supporting growth of indicator microorganisms and of environmental isolates from samples obtained through the monitoring program or their corresponding ATCC strains.~~

~~**Media Fill**—Microbiological simulation of an aseptic process by the use of growth media processed in a manner similar to the processing of the product and with the same container/closure system being used.~~

~~**Out-of-Specification Event**—Temporary or continuous event when one or more of the requirements included in standard operating procedures for controlled environments are not fulfilled.~~

~~**Product Contact Areas**—Areas and surfaces in a controlled environment that are in direct contact with either products, containers, or closures and the microbiological status of which can result in potential microbial contamination of the product/container/closure system. Once identified, these areas should be tested more frequently than non-product contact areas or surfaces.~~

~~**Risk Assessment Analysis**—Analysis of the identification of contamination potentials in controlled environments that establish priorities in terms of severity and frequency and that will develop methods and procedures that will eliminate, reduce, minimize, or mitigate their potential for microbial contamination of the product/container/closure system.~~

~~**Sampling Plan**—A documented plan that describes the procedures and methods for sampling a controlled environment; identifies the sampling sites, the sampling frequency, and number of samples; and describes the method of analysis and how to interpret the results.~~

~~**Sampling Sites**—Documented geographical location, within a controlled environment, where sampling for microbiological evaluation is taken. In general, sampling sites are selected because of their potential for product/container/closure contacts.~~

~~**Standard Operating Procedures**—Written procedures describing operations, testing, sampling, interpretation of results, and corrective actions that relate to the operations that are taking place in a controlled environment and auxiliary environments. Deviations from standard operating procedures should be noted and approved by responsible managers.~~

~~**Sterile Field**—In aseptic processing or in other controlled environments, it is the space at the level of or above open product containers, closures, or product itself, where the potential for microbial contamination is highest.~~

~~**Sterility**—Within the strictest definition of sterility, an article is deemed sterile when there is complete absence of viable microorganisms. Absolute sterility cannot be practically demonstrated without testing every article in a batch. Sterility is defined in probabilistic terms, where the likelihood of a contaminated article is acceptably remote.~~

~~**Swabs**—Devices provided that are used to sample irregular as well as regular surfaces for determination of microbial status. The swab, generally composed of a stick with an absorbent extremity, is moistened before sampling and used to sample a specified unit area of a surface. The swab is then rinsed in sterile saline or other suitable menstruum and the contents plated on nutrient agar plates to obtain an estimate of the viable microbial load on that surface.~~

~~**Trend Analysis**—Data from a routine microbial environmental monitoring program that can be related to time, shift, facility, etc. This information is periodically evaluated to establish the status or pattern of that program to ascertain whether it is under adequate control. A trend analysis is used to facilitate decision making for requalification of a controlled environment or for maintenance and sanitization schedules.~~

▲**AIRBORNE PARTICULATE COUNT** (also referred to as *Total Particulate Count*)—Particles detected are 0.5 µm and larger. When a number of particles is specified, that number refers to the maximum allowable number of particles of a specified size per cubic meter of air.

AIRBORNE VIABLE PARTICULATE COUNT (also referred to as *Total Airborne Aerobic Microbial Count*)—When a number of microorganisms is specified, that number refers to the maximum number of colony forming units (cfu) per cubic meter of air that is associated with a cleanliness class of controlled environment based on the *Airborne Particulate Count*.

ASEPTIC PROCESSING—Aseptic means the absence of pathogenic microorganisms. In the healthcare industry, aseptic processing is a mode of processing that involves the separate sterilization of the product and of the package (containers/closures or packaging material for medical devices) and the transfer of the product into the container and its closure under microbiological, critically controlled conditions.

AIR SAMPLER—This is a device or equipment used to sample a measured amount of air in a specified time to evaluate the particulate or microbiological air quality in an environment.

AIR CHANGES—The frequency per unit of time (minutes, hours, etc.) with which the air within a controlled environment is replaced. The air can be recirculated partially or totally replaced.

ACTION LEVELS—These are incident rates that exceed those that are normally observed in an environment.

ASEPTIC—Technically, this term means the absence of pathogenic organisms; in the field of aseptic processing, however, "aseptic" refers to methods and operations that minimize microbial contamination in environments where filtered sterilized product and sterilized components are filled and/or assembled.

In-Process Revision

BIOBURDEN—Total number of microorganisms and identity of the predominant microorganisms detected in or on an article.

CLEAN ROOM—A room in which the concentration of airborne particles is controlled to meet a specified airborne particulate cleanliness class. In addition, the concentration of microorganisms in the environment is monitored; each cleanliness class defined is also assigned a microbial level for air, surface, and personnel gear.

CLEAN ZONE—A defined space in which the concentration of airborne particles and microorganisms are controlled to meet specific cleanliness class levels.

CONTROLLED ENVIRONMENT—Any area in an aseptic process system for which airborne particulate and microorganism levels are controlled to specific levels that are appropriate to the activities conducted within that environment.

COMMISSIONING OF A CONTROLLED ENVIRONMENT—Certification by engineering and by quality control that the environment has been built according to the specifications of the desired cleanliness class and that, under conditions likely to be encountered under normal operating conditions (or worst-case conditions), that environment is capable of delivering an aseptic process. Commissioning includes media-fill runs and results of the environmental monitoring program.

CORRECTIVE ACTION—Actions to be performed that are in standard operating procedures and that are triggered when certain conditions are exceeded.

CRITICAL ZONE—The entire area in which the product and the containers and closures are exposed in aseptic processing is typically defined as the critical zone.

ENVIRONMENTAL ISOLATES—Microorganisms that have been isolated from the environmental monitoring program.

ENVIRONMENTAL MONITORING PROGRAM—Documented program, implemented through standard operating procedures, that describes in detail the procedures and methods used for monitoring particulates as well as microorganisms in controlled environments (air, surface, personnel gear). The program includes sampling sites, frequency of sampling, and investigative and corrective actions that should be followed if alert or action levels are exceeded. The methodology used for trend analysis is also described.

EQUIPMENT LAYOUT—Graphical representation of an aseptic processing system that denotes the relationship between and among equipment and personnel. This layout is used in the *Risk Assessment Analysis* to determine sampling site and frequency of sampling based on the potential for microbiological contamination of the product/container/closure system. Changes must be assessed by responsible managers because unauthorized changes in the layout for equipment or personnel stations could result in an increase in the potential for contamination of the product/container/closure system.

INCIDENT RATES—The rate or frequency at which contamination is observed in an environment. Typically expressed as a percentage of samples in which contamination is observed per unit time.

ISO 14644—The international standard that has supplanted Federal Standard 209E and which defines cleanliness grades for clean rooms and recommends practices for the classification of these clean rooms in terms of their ability to control total particulate contamination.

MATERIAL FLOW—The flow of material and personnel entering controlled environments should follow a specified and documented pathway that has been chosen to reduce or minimize the potential for microbial contamination of the product/closure/container systems. Deviation from the prescribed flow could result in an increase in the

potential for microbial contamination. Material/personnel flow can be changed, but, from a microbiological point of view, the consequences of the changes should be assessed by responsible managers and must be authorized and documented.

MEDIA GROWTH PROMOTION—A procedure that references *Growth Promotion Test of Aerobes, Anaerobes, and Fungi* under *Sterility Tests* ⟨71⟩ to demonstrate that media used in the microbiological environmental monitoring program, or in media-fill runs, are capable of supporting growth of indicator microorganisms and of environmental isolates from samples obtained through the monitoring program or their corresponding ATCC strains.

MEDIA FILL—A microbiological simulation of an aseptic process by the use of growth media processed in a manner similar to the processing of the product and with the same container/closure system being used.

OUT-OF-TREND EVENT—A temporary or continuous event when one or more of the requirements included in the standard operating procedures for controlled environments are not fulfilled.

PRODUCT CONTACT AREAS—Areas and surfaces in a controlled environment that are in direct contact with either products, containers, or closures and the microbiological status of which can result in potential microbial contamination of the product/container/closure system.

RISK ASSESSMENT ANALYSIS—Analysis of the identification of contamination potentials in controlled environments that establishes priorities in terms of severity and frequency and that develops methods and procedures that will eliminate, reduce, minimize, or mitigate the potential for microbial contamination of the product/container/closure system.

SAMPLING PLAN—A documented plan that (1) describes the procedures and methods for sampling a controlled environment; (2) identifies the sampling sites, the sampling frequency, and number of samples; and (3) describes the method of analysis and how to interpret the results.

SAMPLING SITES—A documented geographical location, within a controlled environment, where sampling for microbiological evaluation is taken. In general, sampling sites are selected because of their potential for product/container/closure contacts.

STANDARD OPERATING PROCEDURES—Written procedures describing operations, testing, sampling, interpretation of results, and corrective actions that relate to the operations that are taking place in a controlled environment and auxiliary environments. Deviations from standard operating procedures should be noted and approved by responsible managers.

STERILE OR ASEPTIC FIELD—The space at the level of or above open product containers used in aseptic processing or in other controlled environments.

STERILITY—Within the strictest definition of sterility, an article is deemed sterile when there is complete absence of viable microorganisms, where viability is defined as organisms having the capacity to reproduce. Absolute sterility cannot be practically demonstrated, as it is technically unfeasible to prove a negative absolute.

SWABS—Devices that are used to sample irregular as well as regular surfaces for determination of microbial status. The swab, generally composed of a stick with an absorbent extremity, is moistened before sampling and used to sample a specified unit area of a surface. The swab is then rinsed in sterile saline or other suitable menstruum and the contents plated on nutrient agar plates to obtain an estimate of the viable microbial load on that surface.

TREND ANALYSIS—Data from a routine microbial environmental monitoring program that can be related to time, shift, facility, etc. This information is periodically evaluated to establish the status or pattern of that program to ascertain whether it is under adequate control. A trend analysis is used to facilitate decision-making for requalification of a controlled environment or for maintenance and sanitization schedules.▲*USP29*

BRIEFING

⟨1225⟩ Validation of Compendial Methods, *USP 28* page 2748 and page 1382 of *PF* 30(4) [July–Aug. 2004]. On the basis of comments received, it is proposed to delete the section on *Ruggedness* because this concept is described under *Precision* as ''intermediate precision.'' The term ''pharmaceutical products'' is replaced with ''pharmaceutical articles'' to indicate that this chapter applies to both drug substances and drug products (see the USP *General Notices*). It is also indicated, in *Robustness,* that robustness may be investigated during method development. In previous revisions, the term ''method(s)'' was replaced with ''procedure(s)'' to align with the terms used by the International Conference on Harmonization (ICH). Even though these terms have different meanings throughout USP, it is expected that USP will continue to make this change, where appropriate, in order to harmonize with ICH terminology.

(PA4: H. Pappa) RTS—41909-1; 42042-2; 42077-1; 42149-1; 42162-1

Change to read:

⟨1225⟩ VALIDATION OF COMPENDIAL ~~METHODS~~

▲PROCEDURES▲*USP29*

Change to read:

Test procedures for assessment of the quality levels of pharmaceutical ~~products~~

▲articles▲*USP29*
are subject to various requirements. According to Section 501 of the Federal Food, Drug, and Cosmetic Act, assays and specifications in monographs of the United States Pharmacopeia and the National Formulary constitute legal standards. The Current Good Manufacturing Practice regulations [21 CFR 211.194(a)] require that test methods, which are used for assessing compliance of pharmaceutical ~~products~~

▲articles▲*USP29*
with established specifications, must meet proper standards of accuracy and reliability. Also, according to these regulations [21 CFR 211.194(a)(2)], users of analytical methods described in *USP–NF* are not required to validate the accuracy and reliability of these methods, but merely verify their suitability under actual conditions of use. Recognizing the legal status of *USP* and *NF* standards, it is essential, therefore, that proposals for adoption of new or revised compendial analytical ~~methods~~

▲procedures▲*USP29*
be supported by sufficient laboratory data to document their validity.

The text of this information chapter harmonizes, to the extent possible, with the Tripartite International Conference on Harmonization (ICH) documents *Validation of Analytical Procedures* and the *Methodology* extension text, which are concerned with analytical procedures included as part of registration applications submitted within the EC, Japan, and the USA. ~~Some aspects (dissolution, drug release), which form part of this chapter, are dealt with only in passing in the ICH documents and are to be discussed in the future. Complete harmonization has not been possible, in part because of different uses of terminology. For example, the ICH use of "procedure" presents difficulty, as this term has a specific and different use throughout the *USP–NF.*~~

▲▲*USP29*

Change to read:

SUBMISSIONS TO THE COMPENDIA

Submissions to the compendia for new or revised analytical ~~methods~~

▲procedures▲*USP29*
should contain sufficient information to enable members of the ~~USP Committee of Revision~~

▲USP Council of Experts and its Expert Committees▲*USP29*
to evaluate the relative merit of proposed procedures. In most cases, evaluations involve assessment of the clarity and completeness of the description of the analytical ~~methods,~~

▲procedures,▲*USP29*
determination of the need for the ~~methods,~~

▲procedures,▲*USP29*
and documentation that they have been appropriately validated. Information may vary depending upon the type of method involved. However, in most cases a submission will consist of the following sections.

Rationale—This section should identify the need for the ~~method~~

▲procedure▲*USP29*
and describe the capability of the specific ~~method~~

▲procedure▲*USP29*
proposed and why it is preferred over other types of determinations. For revised procedures, a comparison should be provided of limitations of the current compendial ~~method~~

▲procedure▲*USP29*

and advantages offered by the proposed ~~method.~~

▲procedure.▲*USP29*

Proposed Analytical Procedure—This section should contain a complete description of the analytical ~~method~~

▲procedure▲*USP29*
sufficiently detailed to enable persons "skilled in the art" to replicate it. The write-up should include all important operational parameters and specific instructions such as preparation of reagents, performance of system suitability tests, description of blanks used, precautions, and explicit formulas for calculation of test results.

Data Elements—This section should provide thorough and complete documentation of the validation of the analytical ~~method.~~

▲procedure.▲*USP29*
It should include summaries of experimental data and calculations substantiating each of the applicable analytical performance characteristics. These characteristics are described in the following section.

Change to read:

VALIDATION

Validation of an analytical ~~method~~

▲procedure▲*USP29*
is the process by which it is established, by laboratory studies, that the performance characteristics of the ~~method~~

▲procedure▲*USP29*
meet the requirements for the intended analytical applications. Typical analytical performance characteristics that should be considered in the validation of the types of ~~methods~~

▲procedures▲*USP29*
described in this document are listed in *Table 1*. Since opinions may differ with respect to terminology and use, each of the performance characteristics is defined in the next section of this chapter, along with a delineation of a typical method or methods by which it may be measured.

Table 1. Typical Analytical Characteristics Used in Method Validation

Accuracy
Precision
Specificity
Detection Limit
Quantitation Limit
Linearity
Range
▲Robustness▲*USP29*
~~Ruggedness~~

In the case of compendial ~~methods,~~

▲procedures,▲*USP29*
revalidation may be necessary in the following cases: a submission to the USP of a revised analytical ~~method;~~

▲procedure;▲*USP29*
or the use of an established general ~~method~~

▲procedure▲*USP29*
with a new product or raw material (see below under *Data Elements Required for Assay Validation*).

The ICH documents give guidance on the necessity for revalidation in the following circumstances: changes in the synthesis of the drug substance; changes in the composition of the drug product; and changes in the analytical procedure.

Analytical Performance Characteristics

ACCURACY

Definition—The accuracy of an analytical ~~method~~

▲procedure▲*USP29*
is the closeness of test results obtained by that ~~method~~

▲procedure▲*USP29*
to the true value. The accuracy of an analytical ~~method~~

▲procedure▲*USP29*
should be established across its range.

Determination—In the case of the assay of a drug substance, accuracy may be determined by application of the analytical ~~method~~

▲procedure▲*USP29*
to an analyte of known purity (e.g., a Reference Standard) or by comparison of the results of the ~~method~~

▲procedure▲*USP29*
with those of a second, well-characterized ~~method;~~

▲procedure,▲*USP29*
the accuracy of which has been stated or defined.

In the case of the assay of a drug in a formulated product, accuracy may be determined by application of the analytical ~~method~~

▲procedure▲*USP29*
to synthetic mixtures of the drug product components to which known amounts of analyte have been added within the range of the ~~method.~~

▲procedure.▲*USP29*
If it is not possible to obtain samples of all drug product components, it may be acceptable either to add known quantities of the analyte to the drug product (i.e., "to spike") or to compare results with those of a second, well-characterized ~~method;~~

▲procedure,▲*USP29*
the accuracy of which has been stated or defined.

In the case of quantitative analysis of impurities, accuracy should be assessed on samples (of drug substance or drug product) spiked with known amounts of impurities. Where it is not possible to obtain samples of certain impurities or degradation products, results should be compared with those obtained by an independent ~~method.~~

▲procedure.▲*USP29*
In the absence of other information, it may be necessary to calculate the amount of an impurity based on comparison of its response to that of the drug substance; the ratio of the responses of equal amounts of the impurity and the drug substance

▲(relative▲*USP29*
response factor) should be used if known.

Accuracy is calculated as the percentage of recovery by the assay of the known added amount of analyte in the sample, or as the difference between the mean and the accepted true value, together with confidence intervals.

In-Process Revision

The ICH documents recommend that accuracy should be assessed using a minimum of nine determinations over a minimum of three concentration levels, covering the specified range (i.e., three concentrations and three replicates of each concentration).

▲Assessment of accuracy can be accomplished in a variety of ways, including evaluating the recovery of the analyte (percent recovery) across the range of the assay, or evaluating the linearity of the relationship between estimated and actual concentrations. The statistically preferred criterion is that the confidence interval for the slope be contained in an interval around 1.0, or alternatively, that the slope be close to 1.0. In either case, the interval or the definition of closeness should be specified in the validation protocol. The acceptance criterion will depend on the assay and its variability and on the product. Setting an acceptance criterion based on the lack of statistical significance of the test of the null hypothesis that the slope is 1.0 is not an acceptable approach.▲*USP29*

PRECISION

Definition—The precision of an analytical ~~method~~

▲procedure▲*USP29*
is the degree of agreement among individual test results when the ~~method~~

▲procedure▲*USP29*
is applied repeatedly to multiple samplings of a homogeneous sample. The precision of an analytical ~~method~~

▲procedure▲*USP29*
is usually expressed as the standard deviation or relative standard deviation (coefficient of variation) of a series of measurements. Precision may be a measure of either the degree of reproducibility or of repeatability of the analytical ~~method~~

▲procedure▲*USP29*
under normal operating conditions. In this context, reproducibility refers to the use of the analytical procedure in different laboratories, as in a collaborative study. Intermediate precision

▲(also known as ruggedness)▲*USP29*
expresses within-laboratory variation, as on different days, or with different analysts or equipment within the same laboratory. Repeatability refers to the use of the analytical procedure within a laboratory over a short period of time using the same analyst with the same equipment. ~~For most purposes, repeatability is the criterion of concern in USP analytical procedures, although reproducibility between laboratories or intermediate precision may well be considered during the standardization of a procedure before it is submitted to the Pharmacopeia.~~

▲▲*USP29*

Determination—The precision of an analytical ~~method~~

▲procedure▲*USP29*
is determined by assaying a sufficient number of aliquots of a homogeneous sample to be able to calculate statistically valid estimates of standard deviation or relative standard deviation (coefficient of variation). Assays in this context are independent analyses of samples that have been carried through the complete analytical procedure from sample preparation to final test result.

The ICH documents recommend that repeatability should be assessed using a minimum of nine determinations covering the specified range for the procedure (i.e., three concentrations and three replicates of each concentration or using a minimum of six determinations at 100% of the test concentration).

SPECIFICITY

Definition—The ICH documents define specificity as the ability to assess unequivocally the analyte in the presence of components that may be expected to be present, such as impurities, degradation products, and matrix components. Lack of specificity of an individual analytical procedure may be compensated by other supporting analytical procedures. [NOTE—Other reputable international authorities (IUPAC, ~~AOAC~~)

▲AOAC-I)▲*USP29*
have preferred the term "selectivity," reserving "specificity" for those procedures that are completely selective.] For the ~~test or assay methods~~

▲tests discussed▲*USP29*
below, the above definition has the following implications:

Identification Tests: ensure the identity of the analyte.

Purity Tests: ensure that all the analytical procedures performed allow an accurate statement of the content of impurities of an analyte (e.g., related substances test, heavy metals limit, organic volatile ~~impurity limit).~~

▲impurities).▲*USP29*

Assays: provide an exact result, which allows an accurate statement on the content or potency of the analyte in a sample.

Determination—In the case of qualitative analyses (identification tests), the ability to select between compounds of closely related structure that are likely to be present should be demonstrated. This should be confirmed by obtaining positive results (perhaps by comparison to a known reference material) from samples containing the analyte, coupled with negative results from samples that do not contain the analyte and by confirming that a positive response is not obtained from materials structurally similar to or closely related to the analyte.

In the case of analytical ~~procedure~~

▲procedures▲*USP29*
for impurities, specificity may be established by spiking the drug substance or product with appropriate levels of impurities and demonstrating that these impurities are determined with appropriate accuracy and precision.

In the case of the assay, demonstration of specificity requires that it can be shown that the procedure is unaffected by the presence of impurities or excipients. In practice, this can be done by spiking the drug substance or product with appropriate levels of impurities or excipients and demonstrating that the assay result is unaffected by the presence of these extraneous materials.

~~■For assay or impurity procedures, this can be done alternatively by demonstrating dilution parallelism between the standard and the sample over the same range used for linearity. The responses from the standard and the analyte are plotted against the respective dilutions (or after appropriate mathematical transformation, if necessary) and the two dilution curves are shown to be parallel within the limits of variation determined by the preset confidence interval for the procedure.■2S *(USP28)*~~

If impurity or degradation product standards are unavailable, specificity may be demonstrated by comparing the test results of samples containing impurities or degradation products to a second well-characterized procedure (e.g., a Pharmacopeial or other validated procedure). These comparisons should include samples stored under relevant stress conditions (e.g., light, heat, humidity, acid/base hydrolysis, oxidation). In the case of the assay, the results should be compared; in the case of chromatographic impurity tests, the impurity profiles should be compared.

The ICH documents state that when chromatographic procedures are used, representative chromatograms should be presented to demonstrate the degree of selectivity, and peaks should be appropriately labeled. Peak purity tests (e.g., using diode array or mass spectrometry) may be useful to show that the analyte chromatographic peak is not attributable to more than one component.

DETECTION LIMIT

Definition—The detection limit is a characteristic of limit tests. It is the lowest amount of analyte in a sample that can be detected, but not necessarily quantitated, under the stated experimental conditions. Thus, limit tests merely substantiate that the amount of analyte is above or below a certain level. The detection limit is usually expressed as the concentration of analyte (e.g., percentage, parts per billion) in the sample.

Determination—For noninstrumental ~~methods,~~

▲procedures,▲*USP29*
the detection limit is generally determined by the analysis of samples with known concentrations of analyte and by establishing the minimum level at which the analyte can be reliably detected.

For instrumental procedures, the same ~~method~~

▲approach▲*USP29*
may be used as for noninstrumental

▲procedures.▲*USP29*
In the case of ~~methods~~

▲procedures▲*USP29*
submitted for consideration as official compendial ~~methods,~~

▲procedures,▲*USP29*
it is almost never necessary to determine the actual detection limit. Rather, the detection limit is shown to be sufficiently low by the analysis of samples with known concentrations of analyte above and below the required detection level. For example, if it is required to detect an impurity at the level of 0.1%, it should be demonstrated that the procedure will reliably detect the impurity at that level.

In the case of instrumental analytical procedures that exhibit background noise, the ICH documents describe a common approach, which is to compare measured signals from samples with known low concentrations of analyte with those of blank samples. The minimum concentration at which the analyte can reliably be detected is established. Typically acceptable signal-to-noise ratios are 2 : 1 or 3 : 1. Other approaches depend on the determination of the slope of the calibration curve and the standard deviation of responses. Whatever method is used, the detection limit should be subsequently validated by the analysis of a suitable number of samples known to be near, or prepared at, the detection limit.

QUANTITATION LIMIT

Definition—The quantitation limit is a characteristic of quantitative assays for low levels of compounds in sample matrices, such as impurities in bulk drug substances and degradation products in finished pharmaceuticals. It is the lowest amount of analyte in a sample that can be determined with acceptable precision and accuracy under the stated experimental conditions. The quantitation limit is expressed as the concentration of analyte (e.g., percentage, parts per billion) in the sample.

Determination—For noninstrumental ~~methods,~~

▲procedures,▲*USP29*
the quantitation limit is generally determined by the analysis of samples with known concentrations of analyte and by establishing the minimum level at which the analyte can be determined with acceptable accuracy and precision.

For instrumental procedures, the same ~~methods~~

▲approach▲*USP29*
may be used as for noninstrumental

▲procedures.▲*USP29*
In the case of ~~methods~~

▲procedures▲*USP29*
submitted for consideration as official compendial ~~methods,~~

▲procedures,▲*USP29*
it is almost never necessary to determine the actual quantitation limit. Rather, the quantitation limit is shown to be sufficiently low by the analysis of samples with known concentrations of analyte above and below the quantitation level. For example, if it is required that an analyte be assayed at the level of 0.1 mg per tablet, it should be demonstrated that the ~~method~~

▲procedure▲*USP29*
will reliably quantitate the analyte at that level.

In the case of instrumental analytical ~~methods~~

▲procedures▲*USP29*
that exhibit background noise, the ICH documents describe a common approach, which is to compare measured signals from samples with known low concentrations of analyte with those of blank samples. The minimum concentration at which the analyte can reliably be quantified is established. A typically acceptable signal-to-noise ratio is 10 : 1. Other approaches depend on the determination of the slope of the calibration curve and the standard deviation of responses. Whatever ~~method~~

▲approach▲*USP29*
is used, the quantitation limit should be subsequently validated by the analysis of a suitable number of samples known to be near, or prepared at, the quantitation limit.

LINEARITY AND RANGE

Definition of Linearity—The linearity of an analytical ~~method~~

▲procedure▲*USP29*

is its ability to elicit test results that are directly, or by a well-defined mathematical transformation, proportional to the concentration of analyte in samples within a given range.

▲Thus, in this section, ''linearity'' refers to the linearity of the relationship of concentration and assay measurement. In some cases, to attain linearity, the concentration and/or the measurement may be transformed. (Note that the weighting factors used in the regression analysis may change when a transformation is applied.) Possible transformations may include log, square root, or reciprocal, although other transformations are acceptable. If linearity is not attainable, a nonlinear model may be used. The goal is to have a model, whether linear or nonlinear, that describes closely the concentration-response relationship.▲*USP29*

Definition of Range—The range of an analytical ~~method~~

▲procedure▲*USP29*
is the interval between the upper and lower levels of analyte (including these levels) that have been demonstrated to be determined with a suitable level of precision, accuracy, and linearity using the ~~method~~

▲procedure▲*USP29*
as written. The range is normally expressed in the same units as test results (e.g., percent, parts per million) obtained by the analytical ~~method.~~

▲procedure.▲*USP29*

Determination of Linearity and Range—Linearity should be established across the range of the analytical procedure. It should be established initially by visual examination of a plot of signals as a function of analyte concentration of content. If there appears to be a linear relationship, test results should be established by appropriate statistical methods (e.g., by calculation of a regression line by the method of least squares). ~~In some cases, to obtain linearity between the response of an analyte and its concentration, the test data may have to be subjected to a mathematical transformation.~~

▲▲*USP29*
Data from the regression line itself may be helpful to provide mathematical estimates of the degree of linearity. The correlation coefficient, y-intercept, slope of the regression line, and residual sum of squares should be submitted.

The range of the ~~method~~

▲procedure▲*USP29*
is validated by verifying that the analytical ~~method~~

▲procedure▲*USP29*
provides acceptable precision, accuracy, and linearity when applied to samples containing analyte at the extremes of the range as well as within the range.

ICH recommends that, for the establishment of linearity, a minimum of five concentrations normally be used. It is also recommended that the following minimum specified ranges should be considered:

Assay of a Drug Substance (or a finished product): from 80% to 120% of the test concentration.

Determination of an Impurity: from 50% to 120% of the ~~specification.~~

▲acceptance criterion.▲*USP29*

For Content Uniformity: a minimum of 70% to 130% of the test concentration, unless a wider or more appropriate range, based on the nature of the dosage form (e.g., metered-dose inhalers) is justified.

For Dissolution Testing: ±20% over the specified range (e.g., if the ~~specifications~~

▲acceptance criteria▲*USP29*
for a controlled-release product cover a region from 20%, after 1 hour, and up to 90%, after 24 hours, the validated range would be 0% to 110% of the label claim).

~~RUGGEDNESS~~

~~**Definition**—The ruggedness of an analytical method is the degree of reproducibility of test results obtained by the analysis of the same samples under a variety of conditions, such as different laboratories, different analysts, different instruments, different lots of reagents, different elapsed assay times, different assay temperatures, different days, etc. Ruggedness is normally expressed as the lack of influence on test results of operational and environmental variables of the analytical method. Ruggedness is a measure of reproducibility of test results under the variation in conditions normally expected from laboratory to laboratory and from analyst to analyst.~~

~~**Determination**—The ruggedness of an analytical method is determined by analysis of aliquots from homogeneous lots, in different laboratories, by different analysts, using operational and environmental conditions that may differ but are still within the specified parameters of the assay. The degree of reproducibility of test results is then determined as a function of the assay variables. This reproducibility may be compared to the precision of the assay under normal conditions to obtain a measure of the ruggedness of the analytical method.~~

▲▲*USP29*

ROBUSTNESS

Definition—The robustness of an analytical ~~method~~

▲procedure▲*USP29*
is a measure of its capacity to remain unaffected by small but deliberate variations in ~~method parameters and provides an indication of its reliability~~

▲procedural parameters listed in the procedure documentation and provides an indication of its suitability▲*USP29*
during normal usage.

▲Robustness ~~should~~ may be determined during development of the analytical procedure.▲*USP29*

SYSTEM SUITABILITY

If measurements are susceptible to variations in analytical conditions, these should be suitably controlled, or a precautionary statement should be included in the ~~method.~~

▲procedure.▲*USP29*
One consequence of the evaluation of robustness and ruggedness should be that a series of system suitability parameters is established to ensure that the validity of the analytical ~~method~~

In-Process Revision

▲procedure▲*USP29*
is maintained whenever used. Typical variations are the stability of analytical solutions, different equipment, and different analysts. In the case of liquid chromatography, typical variations are the pH of the mobile phase, the mobile phase composition, different lots or suppliers of columns, the temperature, and the flow rate. In the case of gas chromatography, typical variations are different lots or suppliers of columns, the temperature, and the flow rate.

System suitability tests are based on the concept that the equipment, electronics, analytical operations, and samples to be analyzed constitute an integral system that can be evaluated as such. System suitability test parameters to be established for a particular ~~method~~

▲procedure▲*USP29*
depend on the type of ~~method~~

▲procedure▲*USP29*
being evaluated. They are especially important in the case of chromatographic ~~methods, and submissions~~

▲procedures. Submissions▲*USP29*
to the USP should make note of the requirements under the *System Suitability* section in the general test chapter *Chromatography* ⟨621⟩.

Data Elements Required for ~~Assay~~

▲▲*USP29*

Validation

Compendial ~~assay procedures~~

▲test requirements▲*USP29*
vary from highly exacting analytical determinations to subjective evaluation of attributes. Considering this ~~variety of assays,~~

▲broad variety,▲*USP29*
it is only logical that different test ~~methods~~

▲procedures▲*USP29*
require different validation schemes. This chapter covers only the most common categories of ~~assays~~

▲tests▲*USP29*
for which validation data should be required. These categories are as follows:

Category I—Analytical ~~methods~~

▲procedures▲*USP29*
for quantitation of major components of bulk drug substances or active ingredients (including preservatives) in finished pharmaceutical products.

Category II—Analytical ~~methods~~

▲procedures▲*USP29*
for determination of impurities in bulk drug substances or degradation compounds in finished pharmaceutical products. These ~~methods~~

▲procedures▲*USP29*
include quantitative assays and limit tests.

Category III—Analytical ~~methods~~

▲procedures▲*USP29*
for determination of performance characteristics (e.g., dissolution, drug release).

Category IV—Identification tests.
For each ~~assay~~

▲▲*USP29*
category, different analytical information is needed. Listed in *Table 2* are data elements that are normally required for each of ~~the categories of assays.~~

* May be required, depending on the nature of the specific test.

Already established general ~~assays and tests (e.g., titrimetric method of water determination, bacterial endotoxins test)~~

▲procedures (e.g., titrimetric determination of water, bacterial endotoxins)▲*USP29*
should be revalidated to verify their accuracy (and absence of possible interference) when used for a new product or raw material.

The validity of an analytical ~~method~~

▲procedure▲*USP29*
can be verified only by laboratory studies. Therefore, documentation of the successful completion of such studies is a basic requirement for determining whether a ~~method~~

▲procedure▲*USP29*
is suitable for its intended application(s).

▲Current compendial procedures are also subject to regulations that require demonstration of suitability under actual conditions of use.▲*USP29*
Appropriate documentation should accompany any proposal for new or revised compendial analytical procedures.

BRIEFING

⟨**1226**⟩ **Verification of Compendial Procedures.** The purpose of this new general information chapter is to provide guidelines for verifying the suitability of a compendial procedure under actual conditions of use, as stated in 21 CFR 211.194(a)(2). Because it is not necessary for users of compendial procedures to perform a complete validation, but rather, to confirm that the procedure works for their drug substance, excipient, or dosage form, verification can be accomplished by assessing a subset of validation characteristics. This new chapter is considered an extension of the general information chapter *Validation of Compendial Methods* ⟨1225⟩, and both chapters use similar terminology. Interested parties are encouraged to submit comments by July 15, 2005.

(PA1: K. Russo) RTS—42133-1

Add the following:

▲⟨1226⟩ VERIFICATION OF COMPENDIAL PROCEDURES

Calibration, validation, and traceability are core metrological components. The validation of analytical procedures is a standard practice in pharmaceutical analytical laboratories because it ensures the accuracy and reliability of generated data. General information chapter *Validation of Compendial Methods* ⟨1225⟩ provides guidance on characteristics that should be evaluated for various test categories and on the documentation that should accompany analytical procedures submitted for inclusion in *USP–NF*. Chapter ⟨1225⟩ does not provide guidance on verifying the suitability of compendial procedures. The intent of general information chapter ⟨1226⟩ is to provide guidance to laboratories on how to verify that a compendial procedure that is being performed for the first time will yield acceptable results utilizing the laboratories' personnel, equipment, and reagents. Verification consists of assessing selected *Analytical Performance Characteristics,* which are described in chapter ⟨1225⟩, to generate appropriate, relevant data rather than repeating the validation process.

Users of compendial analytical procedures are not required to validate these procedures when first used in their laboratories, but suitability should be established under actual conditions of use. In the United States, this requirement is established in 21 CFR 211.194(a)(2), which states that "the suitability of all testing methods used shall be verified under actual conditions of use." In cases where multiple sites or laboratories will perform the monograph test for the first time, one laboratory may verify the suitability of the procedure, and then conduct a procedure transfer to the other locations.

Microbiological procedures are not included in this chapter because they are covered in USP general chapters *Antimicrobial Effectiveness Testing* ⟨51⟩, *Microbial Limit Tests* ⟨61⟩, *Sterility Tests* ⟨71⟩, and *Validation of Microbial Recovery from Pharmacopeial Articles* ⟨1227⟩.

VERIFICATION PROCESS

Laboratory personnel should have the appropriate experience, knowledge, and training to understand and be able to perform the compendial procedure as written. An approved document should be available prior to performing the com-

pendial procedure; this document describes the procedure to be verified, establishes the number and identity of lots or batches of articles that will be used in the verification test, details the analytical performance characteristics (see *Table 1*) to be evaluated, and specifies the range of results that will be considered acceptable. Any deviation from the recommendations in chapter ⟨1226⟩ should be justified in this documentation. Acceptance criteria should be established such that results meeting the requirements will provide confidence that the compendial procedure will perform suitably. Typically, the acceptance criteria would be more stringent than the compendial monograph specifications for the test.

Once the samples described in the verification document are analyzed, the data should be compared to the predetermined and approved acceptance criteria and the results documented. Documentation should include a summary of the analytical data, an assessment of the results and comparison to the acceptance criteria, and a conclusion as to the acceptability of the data as they relate to the ability of the laboratory analysts to successfully perform the compendial procedure in the particular laboratory. Once the results are shown to be acceptable, it can be concluded that the USP procedure will perform in the laboratory as intended.

If any of the acceptance criteria are not met, the source of the problem should be identified and corrective action, where appropriate, should be initiated (e.g., providing additional training for the laboratory analyst, or contacting USP staff for clarification of the procedure). Revisions to the verification document to include the implemented corrective actions should be made before the procedure is repeated. The initial unacceptable results, the most probable cause, and corrective actions implemented should be described in the final document.

If, after several attempts, the verification of the compendial procedure is not successful, and assistance from USP staff has not resolved the problem, it may be concluded that the procedure may not be suitable for use with the article being tested. It may then be necessary to develop and validate an alternate procedure and submit the data to USP with a recommendation to replace the current compendial procedure with the new procedure. In some situations it may be possible to revise the current procedure by adding the new procedure as an alternative to the current procedure.[1] The final internal verification documentation should summarize the inability to verify the compendial procedure and describe the action that was taken.

ANALYTICAL PERFORMANCE CHARACTERISTICS

The analytical performance characteristics that are typically included in the validation of procedures and that should be considered for the verification process are defined in general information chapter ⟨1225⟩.

Table 2 in chapter ⟨1225⟩ lists the analytical performance characteristics to be determined for several categories of assays to ensure that the procedure is validated. However, not all of the characteristics listed in chapter ⟨1225⟩, *Table 2,* need to be repeated for the verification of the compendial procedure in a laboratory. Depending on the type of test to be verified, different analytical performance characteristics should be studied.

Table 1 in this chapter includes examples of analytical performance characteristics that should be studied for various common analytical techniques applied to drug substances and excipients; corresponding information for dosage forms for each of the categories is presented in *Table 2* of this chapter. For several of the categories, the number of analytical performance characteristics to be studied for dosage forms is generally larger than that for excipients or drug sub-

[1] Request for revision includes both new monograph or general chapters and suggested changes to existing monographs and general chapters. See the USP *Guideline for Submitting Requests for Revision to the USP–NF.*

stances because of the greater complexity of a drug product. Where the technique is not suitable for the category, no data elements are displayed in the table.

In addition to the analytical performance characteristics summarized in *Table 1,* the evaluation of other characteristics may be considered in order to provide further assurance that the procedure will continue to perform as intended when unplanned changes occur in analysts, equipment, reagent, or environmental conditions, or when deliberate adjustments are made in procedure parameters. The sensitivity of the procedure to these changes can be measured by a robustness study. An appropriate ruggedness study may be necessary if there is a possibility that the procedure will be used by more than one analyst or if the procedure is to be transferred to multiple company sites or laboratories. The design of the ruggedness study will depend on how the procedure will be used. The definition of ruggedness and robustness can be found in chapter ⟨1225⟩. Verification is not required for general tests such as residue on ignition, unless there is a reason to suspect that the compendial procedure is not appropriate for the article under test.

In-Process Revision

DIETARY SUPPLEMENTS

General Chapters—General Information

BRIEFING

⟨2030⟩ Supplemental Information for Articles of Botanical Origin. Quality control directly impacts the safety and efficacy of botanical products. Until now little attention has been given to the importance of good agricultural practices as the first step in the continuum of processes required in achieving consistent high quality botanical products and in reducing the adverse events associated with raw material of low quality including intentional and unintentional adulterants. This chapter contains information for specific botanicals about quality assurance measures for good agricultural and collection practices and other auxiliary information not covered in the monographs that is deemed to be important for achieving raw material of consistent quality.

(DSB: J. Salguero) RTS—41788-1

Add the following:

▲⟨2030⟩ SUPPLEMENTAL INFORMATION FOR ARTICLES OF BOTANICAL ORIGIN

This general chapter provides information about several aspects of botanical articles not covered in *USP* standards monographs. Although the standards in the monographs address the quality issues associated with botanical plant materials, extracts, and preparations of Pharmacopeial articles, there is a need to develop appropriate information to optimize the preharvesting conditions for appropriate growth and the postharvesting handling to achieve consistent quality with minimum variations in the composition of chemical constituents.

PROTOCOL CONTENTS

GENERAL GUIDANCES

It is recommened that, at a minimum, growers and others involved in the handling and distribution of botanical products should become familiar with and follow the WHO guidelines for good agricultural and collection practices for medicinal plants. Information about this document can be obtained at www.who.int/medicines/library/trm/medicinalplants/agricultural.shtml.

Commercial trade in natural products occurs in a global market. Material of domestic origin must be produced in compliance with all federal laws of the United States. Material of foreign origin, imported into the U.S., must be produced and transported in compliance with the laws of the U.S., the country of origin, and relevant international treaties. These include, but may not be limited to the following:

1. The Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) is an international agreement between governments. Its aim is to ensure that international trade in specimens of wild animals and plants does not threaten their survival. Information about CITES is available at http:/www.cites.org.
2. The Convention on Biological Diversity (CBD) establishes three main goals: the conservation of biological diversity, the sustainable use of its components, and the fair and equitable sharing of the benefits from the use of genetic resources. Each country that has ratified and is a party to the Convention is responsible for implementation by means of national enabling legislation that can differ from country to country.

3. The Endangered Species Act (ESA) was originally adopted in 1973. The ESA is a law that aims to protect species of fish, wildlife, and plants believed to be threatened with extinction. The ESA is administered primarily by the U.S. Fish and Wildlife Service. Full text of the act is available at: http://endangered.fws.gov/esa.html.

Provided below is additional information not covered in the compendial specifications: historical use; sources; collection and cultivation, including common adulterants; drying, storing, and shipping; and global regulatory status. This information is provided to complement the standards for quality control in the monographs for botanical articles.

ADDITIONAL INFORMATION FOR PROTOCOLS

Historical Use—The focus in this section is on historical compendial use that has strong validity, with only brief reference to anecdotal use. This is important information because traditional use is one of the elements taken into consideration to support the safety and the presumptions of benefits of botanical dietary supplements.

Sources—Included here is the point of origin of the botanical and encompasses cultivation (defined as agricultural growing) and wildcrafting (defined as collected in the wild), along with a listing of the primary geographical (native) areas of production.

Collection and Cultivation—This section discusses wildcrafting, the conservation of restricted and rare species, and the trend to cultivation as an ecological alternative; such optimal harvesting and collection practices serve to preserve the integrity of species and botanical products. It is subdivided into four subsections:

1. Collection (conservation and ecology)
2. Cultivation Practices
3. Optimal Times for Harvest
4. Optimal Handling and Processing Practices

Drying, Storage, and Shipping—Important factors regarding storage of herbal products and how they should be maintained include the following.

1. *Light:* Protection from light is particularly important for botanical articles. Light accelerates numerous chemical processes that may lead to degradation or changes in the constituents of the articles.
2. *Temperature:* Storage temperatures in this Pharmacopeia are defined in the *General Notices.* Excessive heat may affect the content of volatile constituents (essential oils) and accelerate degradation processes. However, heat treatments are sometimes useful in the maintenance of the article's quality and can be used in drying, killing microorganisms, and inhibiting certain enzymes. Heat application during these processes must be carefully controlled to achieve the desired balance between degradation and quality conservation.
3. *Humidity:* Moisture in the articles may allow certain enzymes such as glycosidases to become active, hence degrading constituents. High humidity also increases the danger of microbial proliferation. As a rule, it is advisable to store botanical articles below 60% relative humidity. Controlled humidity and temperature warehouses are now required in many good manufacturing practices for natural products.
4. *Degree of Comminution:* The degree of comminution plays a role in determining the stability of the botanical articles during storage. The increased surface area in fine powders allows oxidation and other degradation processes to occur more extensively and rapidly than in the case of a whole article. Plants containing tannins,

bitter substances, and essential oils are particularly sensitive to the degree of comminution, and therefore storage as a whole plant is preferred in these cases.

5. *Containers*—Appropriate containers are defined in this Pharmacopeia in the *General Notices.*

Constituents—Where known, the substances mainly responsible for the activity of the product are listed, along with other compounds contained in the plant.

Global Regulatory Status—The regulatory recognition of botanicals around the world changes constantly, so it is very difficult to provide comprehensive, up-to-date information for this section. Therefore, this section is limited to a list of countries in which a particular botanical is officially recognized.

GOOD AGRICULTURAL PRACTICE PROTOCOLS

Black Cohosh *Actaea racemosa* L. [*Cimicifuga racemosa* (L.) Nutt.] (Fam. Ranunculaceae)

Botanical Identification—*Actaea racemosa* L. Herbaceous perennial from rhizome.

Stem: Erect, solitary, to 2.5 m tall, glabrous.

Leaves: Basal and cauline, alternate, 2-4-ternately compound, petioles 15 to 60 cm long, bases clasping stem; leaflets 20 to 70; terminal leaflet of central division 3-lobed, 6 to 15 cm long, 6 to 16.5 cm wide, with 3 prominent veins arising from base; subterminal leaflets with blades ovate-lanceolate to obovate, 4 to 12 cm long and 3 to 8 cm wide; margins toothed to deeply incised; green above, paler below; glabrous or rarely pubescent along veins of undersurface.

Inflorescence: Terminal panicle of 4 to 9 slender branches, each 7 to 60 cm long, pubescent; 1 bract subtending each pedicel.

Flowers: Perfect, radially symmetric; sepals 4, greenish-white, caducous; petals 0; staminodes (1-) 4 (-8), petaloid, cream-colored, 2 to 3 mm long, clawed, apex bifid; stamens 55 to 110; pistils 1 (-3), glabrous to pubescent, ovary superior, style short, stigma 0.5 mm wide.

Fruit: Many-seeded follicle, 5 to 10 mm long, ovoid, laterally compressed with curved, stout beak (peristent style), pubescent; seeds hemispheric, brown, scales lacking. Chromosome number: n = 8.

There are currently two varieties of *A. racemosa* recognized based on differences in leaf morphology: var. *racemosa* and var. *dissecta*. The former variety has triternate-pinnate leaves with serrate margins, while the latter has quadriternate-pinnate leaves that are deeply incised with serrate lobes. Variety *dissecta* is only known from very few herbarium specimens, all of which were collected well over 100 years ago, making this taxon of uncertain taxonomic significance.

Historical Use—Black Cohosh appeared on the secondary list of substances in the first *United States Pharmacopeia (USP)* of 1820, where it was listed as an anti-inflammatory and antispasmodic. It soon rose to the primary list in 1830, a position it held until the 10th decennial revision of 1920. Black Cohosh appeared in the first edition of the *United States Dispensatory (USD)* in 1833 and remained through 1955 for a total of 122 years. Carrying forward the traditional Native American use of Black Cohosh for women's ailments and Barton's use for throat complaints, current therapeutics finds the plant used in a number of preparations for coughs and for gynecological disorders. In 2001, both the rhizome and the dry rhizome extract of Black Cohosh were proposed once again for inclusion in the *United States Pharmacopeia–National Formulary* (see revised proposal on page 1455 of *PF* 28(5) [Sept.–Oct. 2002].

Constituents—Major constituents of Black Cohosh are triterpene glycosides principally as beta-xylopyranosides and alpha-arabinopyranosides. The aglycones are mostly derived from acteol and cimigenol. The nomenclature of these compounds is quite confusing in the literature with different names often given to the same compounds. A cyclopropane ring is a common feature of these compounds, which are structurally related to cycloartenol. The isoflavone formononetin has been reported in some publications, however recent evidence indicates its absence in the roots and rhizomes of *Actaea racemosa.* Other constituents include tannins, resin, fatty acids, starch, sugars, and aromatic acids including ferulic acid, isoferulic acid, caffeic acid, and salicylic acid.

Sources—Black Cohosh can be found in moist deciduous forests, ravines, moist meadows, creek margins, and mountainous terrain. Black Cohosh flowers June to September and is native to eastern North America from Ontario south to Georgia and west to Missouri. The entire supply of Black Cohosh comes from the United States. The major producers of Black Cohosh are Kentucky and Tennessee, with additional supplies coming from Georgia, Ohio, North Carolina, Michigan, South Carolina, Virginia, West Virginia, and Wisconsin. Although there are reports of Black Cohosh being grown in China and India for export, the true identity of the cultivated material has not been verified and may well be an Asian species of *Actaea* such as *A. cimicifuga (syn. Cimicifuga foetida)*. The vast majority of the commercial Black Cohosh is wild harvested. Concern over the conservation of Black Cohosh due to increasing demand makes this species a good candidate for cultivation.

Collection and Cultivation—

*Collection (Conservation and Ecology)—*Traditionally, Black Cohosh has been harvested after plants become reproductive, which occurs anywhere from 2 to 8 years of age in cultivated plants depending on growing techniques (see *Cultivation*). A portion of the rhizome with a visible bud on it should be left in the ground to resprout the following year. There is no published information on the relationship between the constituent profile of the rhizome and its age, growing conditions, or place of origin, although such studies are underway. The impact of harvest on wild populations of Black Cohosh is currently unknown and sources differ in their opinion about it. While some maintain that current levels of harvest threaten the viability of wild populations, others feel that sustainable harvesting is possible at current levels of demand. A study of sustainable harvest limits is currently underway. The regulatory status regarding the trade of Black Cohosh is under review by the CITES. Refraining from harvesting plants until after they have set seed and leaving a portion of the rhizome in the ground to resprout are key components to sustainable harvesting.

*Cultivation Practices—*Black Cohosh is grown from rhizome cuttings or seeds and requires some shading, depending on altitude and other environmental conditions. If grown from rhizome cuttings, a plant takes 2 to 3 years to become reproductive; grown from seed sown in the greenhouse and then planted, takes 4 to 6 years; direct-seeded may take from 6 to 8 years. Preliminary work indicates that Black Cohosh can be propagated successfully using in vitro techniques.

*Optimal Times for Harvest—*Rhizomes and roots should be harvested in autumn when the plant is dormant. At that time the underground portions of the plant have lower moisture content than in other seasons. Fall harvesting also allows plants to produce mature seeds before being uprooted.

*Optimal Handling and Processing Practices—*Rhizomes with roots may be processed fresh or dried. They should be thoroughly washed directly after harvest and then laid out to dry. Freshly harvested roots should be solid but not woody.

Drying, Storage, and Shipping—

*Drying—*Rhizomes with roots are cut and air-dried at 35° to 45°. They are fully dried when they are brittle and snap easily and when no moisture is evident in cross section, either visibly or to the touch.

Storage—Follow general guidelines for storage by packing in airtight containers protected from light, heat, moisture, and insect infestation.

Adulterants—Other species of *Actaea,* especially yellow cohosh (*A. podocarpa* syn. *Cimicifuga americana*), have commonly but unintentionally been mixed with *A. racemosa* due to the similarity in above-ground appearance between species. The two species can be distinguished by differences in their freshly harvested underground parts: the fresh rhizome of *A. podocarpa* has a distinct yellowish hue, whereas that of *A. racemosa* is black. The rhizomes of both species are far more difficult to tell apart when dry because *A. podocarpa* darkens upon drying. The underground portions of baneberry *(Actaea pachypoda* and *A. rubra)* occur as occasional adulterants of Black Cohosh supplies. Fruiting plants of baneberry may be distinguished from Black Cohosh by their fleshy white or red poisonous berries, which contrast with the dry follicles of Black Cohosh. No information was available on how to distinguish the underground portions of Black Cohosh and baneberry from each other. According to one herb dealer, the roots of baneberry are smaller than those of Black Cohosh, and therefore are not often harvested by wildcrafters. In the Pacific Northwest, *Actaea elata* (syn. *Cimicifuga elata*) is collected for medicinal use.

There is no published information on chemical means of distinguishing the rhizomes of any of the above species. However, work using random amplified polymorphic DNA (RAPDs) to identify plant taxa both at and below the species level make it likely that such DNA testing would be useful in the identification of *Actaea* species. Investigators using RAPDs were able to distinguish Black Cohosh from other medicinal plant species. Various Asian species of *Actaea* are sold as Chinese Cimicifuga, including sheng ma (*A. cimicifuga* syn. *Cimicifuga foetida*), xing an sheng ma (*A. dahurica* syn. *C. dahurica*), and da san ye sheng ma (*A. heracleifolia* syn. *C. heracleifolia*; also known as guan sheng ma). Guang dong sheng ma, a member of the *Serratula* genus, is a common substitute for sheng ma in the Asian market. While these species are generally not found as adulterants of Black Cohosh, they are mentioned here due to similarities in medicinal use and the increasing overlap of the Asian and American herb markets.

Global Regulatory Status—

1. World Health Organization monograph published in 2003.
2. ESCOP monograph "Cimicifugae rhizoma" published in 2003.
3. *Austria:* The fresh or dried rhizome with attached roots is an approved nonprescription drug for oral use. Indications: Premenstrual disorders, dysmenorrhea, or climacteric [menopausal] neurovegetative ailments.
4. *Brazil:* Resolution n° 89/04 (ANVISA—simple register without clinical trials): Used part: roots or rizome; Markers: 27-deoxyactein or isoferulic acid; Use forms: extracts; Indications: climacteric symptoms; Dose: 1.8 mg per day of 27-deoxyacteine; Administration route: oral; Under prescription drug.
5. *Canada:* Black Cohosh will be listed as a Natural Health Product under new regulations if a health claim is made or if it is provided in specific dosage forms. Crude herbs in bulk form will remain regulated as "foods". When identified as a Traditional Herbal Medicine, Black Cohosh preparations are regulated as nonprescription OTC drugs requiring premarket registration and assignment of a drug identification number.
6. *France:* Official requirements for herbal remedies in France: French Agency for the safety of drugs (Agence Francaise de Sécurité Sanitaire des Produits de Santé, AFSSAPS), Notice to applicants for marketing authorization, Cahiers de l'Agence nr 3, 1999. Classement pharmaco-thérapeutique VIDAL: "Sdatif d'origine végétale".

7. *Germany:* The fresh or dried rhizome with attached roots is an approved nonprescription drug for oral use according to the German Commission E Monographs. Indications: Premenstrual disorders, dysmenorrhea, or climacteric [menopausal] neurovegetative ailments. Action: Estrogen-like action; luteinizing hormone suppression; binding to estrogen receptors.
8. *Spain:* No official monograph. Regulated as an OTC drug for symptomatic treatment of complaints caused by menopause, such as hot flushes, sweating, sleep-induction disturbances, tiredness, nervousness, and moodiness.
9. *Sweden:* Classified as a natural remedy intended for self-medication, requiring advanced application for marketing authorization.
10. *Switzerland:* Black Cohosh single-ingredient medicines are classified by the Interkantonale Kontrollstelle für Heilmittel (IKS-List D) as nonprescription drugs with sale limited to pharmacies and drugstores. Indications: Menopausal complaints, hot flashes, sweating, sleep disorders, nervousness, and mood disorders.
11. *United Kingdom:* Occurs in the *British Herbal Pharmacopoeia* (*BHP* 1996). Black Cohosh dried rhizome and root is an herbal medicine indicated for conditions capable of self diagnosis as specified in the General Sale List, Schedule 1 (medicinal products requiring a full product license), Table A (for internal or external use); 200-mg maximum single dose. Exemptions from licensing are contained in section 12 of the 1968 Medicines Act. Indications: Menopausal disorders, premenstrual complaints, dysmenorrhea, uterine spasm (Bradley 1992). Actions: Anti-inflammatory (*BHP* 1996), antirheumatic, endocrine (pituitary, estrogen-mimetic) activity, emmenagogue.
12. *United States:* Regulated as a dietary supplement. Black Cohosh dried rhizome and root, both whole and powdered, and Black Cohosh dry extract have been proposed for inclusion in the *United States Pharmacopeia–National Formulary.*

Ginger *Zingiber officinale* Roscoe (Fam. Zingiberaceae)

Botanical Identification—*Zingiber officinale* Roscoe. Herbaceous perennial from tuberous rhizome, aromatic due to the presence of volatile oils.

Stem: Erect, unbranched pseudostem formed by the tight overlap of sheathing leaf bases; 9 to 15 dm tall.

Leaf: Simple, alternate and two-ranked, sessile or petioles short with bases sheathing the stem and a ligule where the leaf base meets the stem; blade linear to narrowly lanceolate, 15 to 25 cm long, 1.5 to 3 cm wide; margin entire; glabrous to pubescent.

Inflorescence: Terminal spike, 3.5 to 8 cm long, 1.5 to 2 cm wide, with conspicuous spirally arranged primary bracts; usually borne on specialized leafless stems.

Flower: Perfect, bilaterally symmetric; calyx tubular with 3 lobes; corolla tube 2 to 2.5 cm long with lanceolate apical lobes, 1.5 to 2 cm long, 2 to 3.5 mm wide, greenish yellow; stamen 1, anther cream-colored with dark purple, elongated connective grasping upper part of style; staminodes 4, petaloid, 2 fused into an erect, ovate-oblong lip which is dull purple with cream mottling; ovary inferior; style 1, slender, exerted beyond connective.

Fruit: Loculicidal capsule; seeds shiny black with a white aril. Chromosome number: n = 11.

There are several different varieties and forms of *Zingiber*. The varying morphological characteristics of these are displayed in *Table 1*.

Table 1. Morphological Characteristics of Ginger from Different Areas of Production

Source	Form	Aroma	Color (External)	Oil Content
Africa	Flat surfaces, mostly peeled, starchy and fibrous; 9 cm long, 1.5 cm wide	Poor quality is recognized by its camphoraceous aroma	Uncut surface dark grayish-brown; cut surface brownish-black	1.6% (1.5% gingerol)
Australia		Citrus-like	Buff	
Bengal	Flat surfaces, scraped		Gray-brown	2% to 3% (0.6% to 1.8% gingerol)
China	Short stumpy lobes, unscraped, mostly sliced	Strong, floral to citrus	Pale brown	
Cochin	Lateral surfaces lacking cork	Strong, floral to citrus	Cream color with numerous black resin dots	1.35% to 1.5% (0.6% gingerol)
Jamaica (unbleached)	Up to 12 cm long, 1 cm wide; surfaces completely peeled; starchy and fibrous thin cortex	Delicate, citrus-like	All surfaces yellow-brown	
Japan	Up to 7 cm long, 12 mm wide; flat surfaces usually completely peeled; starchy and fibrous thick cortex	Bergamot-like	Externally gray white to light grayish-brown, often with white powder from being coated with lime	1.23%
Malabar (Cochin and Calcutta)	Cork layer completely removed, mostly treated with chalk	Citrus-like	Almost white	
Nigeria	Smaller in size than other varieties, rather less deeply scraped	Delicate	Somewhat darker than other varieties	0.7% to 1%

Historical Use—Ginger was official in the *United States Pharmacopoeia* from the first edition of 1820 through the fourteenth revision of 1950, often appearing in multiple preparations. It also appeared in all editions of the *United States Dispensatory* from 1833 through the final edition of 1973 where it was described as "a stimulant and carminative that has been used for treatment of dispepsia and flatulent colic".

Constituents—The essential oils and the pungent principles make up some of the major components of the rhizome of Ginger: 4.0% to 10.0% of the rhizome consists of an oleoresin composed of nonvolatile, pungent principles (phenols such as gingerols and their related dehydration products, shogaols); nonpungent fats and their waxes. The essential oil (1% to 3%) contains sesquiterpenes and monoterpenes, mainly geranial and nerals. Generally, but not always sesquiterpenes predominate (30% to 70%) such as zingiberene, sesquiphellandrene and beta-bisabolene, which decompose on drying and storage. The nonvolatile pungent principles include the phenylalkanones, gingerols, and the phenylalkanonols, shogaols with varying chain lengths.

Sources—*Zingiber* is cultivated in most tropical and subtropical countries to greater or lesser degrees. The world production is estimated to be 100,000 tons. China and India are reported to be the primary areas of production. Approximately 5000 tons of *Zingiber* are imported into the United States. An estimated 80% of this comes from China. In China, Sichuan and Guizhou provinces reportedly produce the largest quantities and highest quality. It is also produced in Zhejian, Shandong, Hubei, Guangdong, and Shanxi provinces. Most of the dried ginger from China available in the United States has had the cortex scraped or rubbed off before it is dried. This gives it a whitish appearance. The freshly dug root is soaked overnight in water, scraped with a knife to remove the outer cortex and then sun-dried. It has been reported that high arsenic levels in the soil of Changning County of Hunan Province, China has negatively effected *Zingiber* yields.

In India, *Zingiber* is grown on a large scale in the warm, moist regions of Madras and Cochin, and to a lesser extent in Bengal and the Punjab. Varieties grown in Bengal are reportedly the highest quality material in India. Other areas of production include Africa (Nigeria and Sierra Leone), Australia, Fiji, East Indies, Jamaica, and Hawaii. The morphological characteristics of *Zingiber* cultivated in these different areas are outlined in *Table 1*.

In older literature, Jamaican *Zingiber* is reported to be the highest quality and the most aromatic, though supplies are limited.

Collection and Cultivation—

Collection (Conservation and Ecology)—When the stems wither and are white, the rhizomes are ready for collection. Usually Ginger is harvested after 6 months of growth at the earliest, and sometimes not until as late as 20 months, or to obtain larger roots it is harvested in January or February of the second year of growth. In tropical and subtropical areas, roots are harvested as early as 4 months of growth as they tend to become fibrous and tough as they get older. As *Zingiber* matures it becomes more fibrous and stronger in flavor. Ginger harvest can be described in three stages:

1. Ginger that has been harvested early is known as green ginger and is traded as fresh ginger. It is succulent and tender, mellow, and mildly aromatic with a floral or lemony aroma and mild flavor.
2. Ginger harvested a few months later is more fibrous and drier and is collected for drying and may be sold as a full-flavored, pungent dried whole ginger.

3. The last harvest is usually around 9 months and yields the strongest ginger, which is quite dry and also richest in pungent components. This ginger is dried and then ground into powder.

Cultivation Practices—Ginger is a perennial herb that grows well at subtropical temperatures where the rainfall is at least 1.98 meters per year. The plant is sterile and is grown by vegetative means. Selected pieces of rhizome ("seed pieces" or "setts"), each bearing a bud, are planted in holes or trenches. Ideally the soil should be well-drained, rich clay loam. The growing conditions resemble those of potato cultivation. Mulching or manuring is necessary because the plant rapidly exhausts the soil of nutrients.

Ginger is susceptible to water logging and root rot. Preventive methods include using only the cleanest ginger for planting and washing it with fungicide before planting. A study growing *Zingiber* hydroponically yielded up to 125 tons per hectare in 6 to 7 months compared to 35 tons per hectare when grown in soil.

Optimal Times for Harvest: typically in December or January.

Optimal Handling and Processing Practices—After harvesting, the rhizome is cleaned and stripped of its stems and roots. Each area processes its *Zingiber* differently after harvest. This results in the different quality and commercial grades available on the market. Green *Zingiber* consists of the rhizomes sent to market without drying. Unscraped or partially scraped varieties are traded as coated or black ginger. These roots have been scalded with boiling water and dried quickly. When dry, black *Zingiber* breaks with a horny, blackish, somewhat diaphanous fracture, due to the pasty condition of the starch. White *Zingiber* is bleached usually by rubbing with chalk or lime to lighten its color and to prevent insect infestation. Preserved ginger consists of soft, yellowish-brown pieces obtained by steeping the fresh *Zingiber* in hot syrup and carefully bottling. It is soft, brown-yellow and translucent. When baked, *Zingiber* loses its pungency and acquires a bitter taste.

Drying, Storage, and Shipping—

Drying—In general, after harvest, the fresh roots are washed and the whole dark outer skin, consisting of cork and a little underlying parenchyma, is scraped away. Scraping speeds up the drying time of the crude drug. However, excessive scraping can result in lower concentrations of essential oil that is lost with the discarded epidermal tissue. After scraping, the rhizomes are then laid out on clean floors and dried in the sun for 7 to 10 days. During this time they are occasionally turned and are piled up every night. If the fresh rhizomes are too fleshy or moist, drying will take longer and the product will end up looking shriveled. To obtain a whiter product, the ginger is moistened after 5 or 6 days and dried for another 2 days at which time it is ready for export. Dried ginger is more pungent and stronger in taste than fresh ginger.

Storage—Store in a tightly closed container, protected from light and moisture, in a cool area. A study was done on Ginger harvested after 8, 9.5, 11, or 12 months. Samples were stored at 10° to 15° and 45% to 55% relative humidity or 25° to 30° and 75% relative humidity for 0, 4, or 8 weeks. Oil and oleoresin yields increased with the age of the Ginger. Room temperature storage had adverse effects but refrigerated storage for up to 4 weeks had no affect on quality. When stored for extended periods of time, ground Ginger loses its pungency.

Adulterants—Because *Zingiber* is so characteristic, unintentional adulterants are rare. However, in East Asia sometimes the much larger *Zedoary cassumer* and *Zedoary zerumbet* along with *Alpinia allughas* are used and found in

European commerce. They are easy to distinguish due to their characteristic aromas. Occasionally, Chinese sugar-candied *Zingiber* is prepared from *Alpinia galangal*.

In older literature, other herbs have reportedly been used as adulterants. These include various species of *Curcuma, Capsicum,* and Grains of Paradise *(Amomum melegueta)* added to exhausted material in order to enhance the color and pungency.

Zingiber powder is sometimes adulterated with plant starches such as those from wheat middlings, potatoes, corn, barley, rice, legumes, acorns, flaxseed meal, mannihot, oil cakes from linseed, raps, mustard, almond meal, palm kernal or olives, hazelnut shells, and mineral additives. These may be easily identified microscopically. The extent of this type of adulteration in trade is unknown.

Exhausted material should be considered an adulterant.

Global Regulatory Status—

1. *Austria:* Ginger is registered as a nonprescription drug to prevent nausea and vomiting associated with motion sickness. Official in *Austrian Pharmacopoeia.*
2. *Brazil:* Resolution n° 89/04 (simplified registration of phytotherapeuticals): Used part: roots; Used forms: extract; Administration route: oral; Nonprescription drug to prevent nausea associated with motion sickness and postsurgical nausea.
3. *Canada:* When labeled as a Traditional Herbal Medicine (THM) ginger is regulated as a nonprescription drug requiring premarket registration and assignment of a Drug Identification Number (DIN) (Health Canada, 1996).
4. *European Union:* Dried, whole or cut, rhizome of *Zingiber officinale* Roscoe, containing not less than 15 mL per kg of essential oil, calculated with reference to the anhydrous drug official in *European Pharmacopoeia* (*Ph. Eur.,* 2001).
5. *France:* Classified as a food.
6. *Germany:* The fresh or dried rhizome as well as its preparations in effective dosages are approved nonprescription drugs of the German Commission E Monographs for the treatment of dyspepsia and the prevention of motion sickness. Dried rhizome official in *German Pharmacopoeia* (*DAB,* 1999).
7. *Sweden:* Classified as food (no products marketed as natural herbal remedy, MPA, 2004)
8. *Switzerland:* Herbal medicine with positive classification (List D), sale limited to pharmacies and drugstores without prescription. Ginger is indicated to prevent motion sickness and for the treatment of dispeptic complaints. Dried rhizome official in *Swiss Pharmacopoeia*.
9. *United Kingdom:* Included in the General Sale List (GSL) of the Medicines and Healthcare Products Regulatory Agency (MHRA). Dried rhizome official in *British Pharmacopoeia* (*BP,* 1980).
10. *United States:* Generally Recognized as Safe (GRAS) (U.S. FDA, 1998). Dietary supplement (*USC,* 1994). Dried rhizome, powdered dried rhizome and ginger tincture official in the *U.S. Pharmacopeia* (*USP 28;* 2005, 2091–2093).

Valerian *Valeriana officinalis* L. (Fam. Valerianaceae)

Botanical Identification—*Valeriana officinalis* L. Herbacious perennial, rhizomatous.

Stem: Solitary, hollow, 15 to 150 cm.

Leaf: Basal and cauline, opposite, oddly once pinnately lobed, lobes 11 to 21 lanceolate, entire or dentate, basal leaves petiolate, cauline leaves subsessile to clasping.

Inflorescence: Compound cyme, terminal or axillary, many pale pink to white, strongly scented flowers.

Flower: Calyx 5-lobed, lobes inconspicuous in flower, becoming elongate and pappus-like in fruit, corolla funnelform, slightly saccate at the base, 5-lobed, tube 4 mm, lobes 1 mm, stamens 3, filaments attached to corolla tube alternate to corolla lobes, ovary inferior, tri-loculate, uni-ovulate, only 1 locule fertile, stigma tripartite.

Fruit: Achene crowned by persistent calyx, lanceolate-oblong, 4.5 to 5 mm, hairy or glabrous. Populations of *V. officinalis* range in ploidy level from diploid to tetraploid or octaploid. British *V. officinalis* is usually octaploid, and central European supplies are tetraploid.

There are three subspecies of *V. officinalis*: ssp. *officinalis*, ssp. *collina* (Wallr.) Nyman, and ssp. *sambucifolia* (Mikan fil.) Celak. All three of these subspecies, as well as the other European species of valerian, *V. repens* Host, have been considered acceptable source material for medicinal preparations.

Macroscopic Identification—Various chemotypes will have slightly different characteristics. When dried, the whole rhizome is up to 50 mm long and up to 30 mm in diameter, obconical to cylindrical, with an elongated or compressed base. It has a yellowish-brown to dark brown exterior with a circular stem and leaf scars. The rhizome contains numerous thick, light to dark brown rootlets that are located around a thin ligneous cord. The root is longitudinally wrinkled and approximately 100 mm long and 1 to 3 mm in diameter, almost cylindrical and almost the same color as the rhizome. In longitudinal section, the pith exhibits a central cavity transversed by septa. The stolons are 20 to 50 mm long, pale yellowish grey with prominent nodes separated by longitudinally striated internodes. It is commonly sliced in half for ease of cleaning. The rootlets, which contain the majority of the essential oil, are brittle and break in short, horny fractures and are whitish or yellowish internally. Aroma: When dried properly, *V. officinalis* L., s.l. has only a very faint characteristic, valeric acid-like aroma that becomes stronger as it ages. Improperly dried or old material possesses a strong and characteristic odor due to the enzymatic hydrolysis of esters of the valepotriates (isovaleric acid and hydroxyvaleric acid). Taste: Mildly sweet and camphoraceous with a slightly bitter and spicy aftertaste.

Historical Use—Valerian was official in the *United States Pharmacopeia* from the first edition of 1820 through the eleventh revison of 1930, often appearing in multiple preparations. At its peak from 1850 through 1880 it appeared six to seven times in different preparations. Valerian is among the top 30 most listed botanicals in the history of the *USP*. The root of Valerian has been used as a sedative and spasmolytic in Europe since the 16th century.

Constituents—Major constituents of Valerian have been identified as sesquiterpenes of volatile oils and iridoids (epoxy-triesters) known as valepotriates. The total content of volatile oil varies widely within a single species and between different species. European *Valeriana officinalis* L. usually contains 0.1% to 2.8% volatile oil. The oil consists of mixtures of monoterpene and sesquiterpene derivatives. The amount of valepotriates present also varies widely between species and genera and even within a species, generally ranging from 0.5% to 1.2%. Valepotriates are particularly unstable; they decompose easily under the effect of moisture, temperatures above 40° (104°F), or acidity (pH <3).

Valerian also contains small amounts of aliphatic acids, alkaloids, amino acids, phenolic acids, flavonoids, free fatty acids, sugars, and salts. Valerian constituents that have possible sedative effects include acetoxyvalerenic acid, 1-acevaltrate, baldrinal, didrovaltrate, hydroxyvalerenic acid, kessane derivatives, valeranone, valerenal, valerenic acid, and valtrate.

Sources—Valerian is found in damp or dry meadows, scrub, or woods in most of Europe, but rare in the south, and is cultivated and naturalized in North America. Valerian is cultivated in Britain, Belgium, Eastern Europe, France, Germany, Holland, Japan, the Netherlands, North America, and Russia. The majority of standardized extract products and crude cut and sifted material on the domestic market are prepared from European supplies. A large number of liquid extracts are prepared from domestically cultivated material. Many species other than *V. officinalis* are reported to be traded as medicinal valerian. These include *V. edulis* Nutt. ex Torr. & A. Gray, *V. corneana* Briq. k, *V. stubendorfi* Kreyer ex Kom., *V. amurensis* P. Smirn. ex Kom., *V. hardwickii* Wall., *V. exaltata* Mikan, and *V. wallichi* DC. syn. *V. jatamansi* Jones.* The most frequently used North American species include *V. sitchensis* Bong and *V. edulis* Nutt.* = *V. edulis* Nutt. ex Torr. & Gray ssp. *procera.* Other species reported to be used locally include *V. arizonica* Gray, *V. capitata* Pall ex Link., *V. diocia* L., and *V. scouleri* Rydb. Detailed chemical analyses of most American species are lacking. A limited number of assays of material cultivated in the Pacific Northwest show varying levels of essential oil ranging from 0.4% to 1.3%. Valerenic acid and valepotriates have been found to be present in fresh and dry samples of *V. sitchensis* Bong. *V. sitchensis* Bong exhibits a strong pungency when fresh. High quality material is reported to contain from 1.0% to 1.5% essential oil, ≥30% extractable matter, and ≥0.5% valerenic acid.

Collection and Cultivation—

Collection (Conservation and Ecology)—The majority of Valerian in trade comes from cultivated material. Harvest times will vary geographically. The composition of the essential oil varies greatly among different populations of the same subspecies and even between the same population of plants from year to year. Essential oil content also varies with genotypes, harvest times, growing conditions, age of root, drying techniques, and method of analysis. It has been reported that valerian harvested in higher elevations, grown in dryer regions, or cultivated in phosphate-rich soil yields relatively high levels of essential oil.

Older literature reports that valerian should be harvested in the fall, between August and September, preferably in the second year of growth. Analyses of material cultivated in the Netherlands report that the majority of constituents, including the essential oil and valerenic acid, were highest in roots harvested in the first year of growth with essential oil being highest in September and November (1.2% to 2.1%). The next highest level of essential oil was reported for material harvested in March (0.9% to 1.6%). Valerenic acid and its derivatives were found to be highest in February and March (0.7% to 0.9%) followed by material harvested in September (0.5% to 0.7%) and then in January (0.3% to 0.4%). From a commercial standpoint, it is more cost effective to harvest the roots in the same year the plants are sown than in the second year.

Cultivation Practices—Sowing seeds has been reported to be preferred over planting of seedlings. Best results were achieved by flat field planting at row spacings of 50 cm and a seed rate of 3 kg per hectare. Cutting off the flowering tops before the plant has set seed causes the rhizome to develop more fully.

Optimal Times for Harvest—Wagner reports that harvest should take place in the morning during relatively cool weather, a general recommendation for roots rich in essential oils.

Optimal Handling and Processing Practices—The essential oil is located in the hypodermis of the rhizome in large thin-walled cells. Therefore, care must be taken not to damage these cells during handling. Excess washing of the roots

* V. wallichi DC. and V. edulis Nutt. reportedly are lacking in valerenic acid and its derivatives.

In-Process Revision

can result in a significant reduction of extractive matter. Because of the sensitivity of volatile oils to heat, it is necessary to minimize the amount of time generated in the grinding or powdering process by doing small lots at a time, with frequent interruptions in run times, or by utilizing a cryogenic grinder.

Drying, Storage, and Shipping—

Drying—For maximum preservation of the essential oils, Valerian should be dried at 40° with a flow rate of 0.05 kg per sec per m^2. Alternatively, drying at 20° for approximately 10 days, shade drying at approximately 45°, low temperature vacuum-drying, and freeze-drying are also reported to be appropriate drying techniques.

Careless or prolonged drying produces a darker color in the roots and results in the hydrolysis of the isovalerianic esters and the liberation of isovaleric and hydroxyisovaleric acid. This produces the characteristic valerianic aroma. Properly dried Valerian will produce this same aroma over time.

Storage—Store in closed containers protected from light, air, and moisture. Hydroxyvalerenic acid, a decomposition product of acetoxyvalerenic acid, is formed when the herb is stored at too high humidity.

Improper storage conditions can cause significant deterioration of the material. Although the essential oil is relatively stable, it can evaporate with excessive exposure to air. The essential oil can degrade quickly in powdered material. In powdered root, the essential oil content can decrease by 50% within 6 months.

Valepotriates are sensitive to humidity, temperatures above 40°, and acid media (pH <3) and are generally not detected in commercial products after 60 days.

Adulterants—Other species of Valerian: An unidentified *Apiaceae* species may be found in valerian trade. Adulteration of Valerian in the American market is not common. Many species other than *V. officinalis* are reported to be traded as medicinal Valerian. These include *V. edulis* Nutt. ex Torr. & A. Gray, *V. coreana* Briq.k, *V. stubendorfi* Kreyer ex Kom., *V. amurensis* P. Smirn. ex Kom., *V. hardwickii* Wall, *V. exaltata* Mikan, and *V. wallichi* DC. syn. *V. jatamansi* Jones.

Global Regulatory Status—

1. *Austria:* Official in *Austrian Pharmacopoeia.*
2. *Belguim:* Oral use as Traditional Herbal Medicine (THM), accepted for specific indications.
3. *Canada:* Dried root in tablet, capsule, powder, extract, tincture, or tea bags labeled as THM indicated as sleep aid or sedative; requires premarket authorization and assignment of a Drug Identification Number (DIN) and conformance with the Valerian Labeling Standard.
4. *European Union:* "Whole", dried, underground parts containing no less than (NLT) 0.5% volatile oil, and "cut", dried, underground parts (NLT 0.3% volatile oil; NLT 0.17% sesquiterpenic acids), official in *European Pharmacopoeia* (*Ph. Eur.,* 2001).
5. *France:* Oral use as THM accepted for specified indications. Dried root (NLT 0.5% volatile oil), official in *French Pharmacopoeia.*
6. *Germany:* Dried root, for preparation of tea infusion, tincture, or extract is an approved nonprescription drug of the German Commission E Monographs. Tea infusion and hydro-alcoholic tincture forms are approved nonprescription drugs of the German Standard License monographs. Extract or volatile oil for balneotherapy (bath therapy) is approved in the German Commission B8 Monographs. Dry native extract, 3~6 : 1 (w/w), is official in *German Pharmacopoeia* (*DAB,* 1999). The mother tincture (and liquid dilutions) of dried root are official preparations of the *German Homeopathic Pharmacopoeia* (*GHP,* 1993).

7. *Italy:* Dried root (NLT 0.5% volatile oil) official in *Italian Pharmacopoeia* (*Ph. Ital.* 1991).
8. *Russian Federation:* Official in *State Pharmacopoeia of the Union of Soviet Socialist Republics*.
9. *Sweden:* Classified as Natural Remedy for self-medication requiring advance application for marketing authorization. A valerian monograph is published in the Medical Products Agency (MPA) "Authorised Natural Remedies", which lists four registered monopreparations and 10 multiple-herb (with passionflower, lemon balm, or hops) preparations (MPA, 1997 and 2001; Tunón, 1999). Two valerian products (Baldrian-Dispert and Neurol) are regulated as Pharmaceutical Specialties, or conventional OTC drugs.
10. *Switzerland:* Herbal medicine with positive classification (List D) by the Interkantonale Konstrollstelle für Heilmittel (IKS) and corresponding sales category D with sale limited to pharmacies and drugstores, without prescription. There are 62 valerian phytomedicines and 11 homeopathic preparations listed in the Swiss Codex 2000/01. Dried root official in *Swiss Pharmacopoeia* 1997.
11. *United Kingdom:* General Sale List (GSL), Schedule 1, Table A. Dried root (NLT 0.5% volatile oil) and powdered dried root (NLT 0.3% volatile oil) official in *British Pharmacopoeia.*
12. *United States:* Generally Recognized as Safe (GRAS) (U.S. FDA, 1998). Dietary supplement (USC, 1994). Application for OTC approval for use as a nighttime sleep aid is pending. Valerian root (NLT 0.5% volatile oil; NLT 0.05% valerenic acid) and powdered valerian (NLT 0.3% volatile oil; NLT 0.04% valerenic acid) are official in *U.S. Pharmacopeia* (*USP 28;*2005, 2133–2135). Powdered Valerian extract, 4~7 : 1 (w/w) (NLT 0.3% valerenic acid) added to *NF 19, 1st Supplement* (*USP,* 2000). The mother tincture 1 : 10 (w/v), 55% alcohol (v/v), of fresh or dried root, is an OTC Class C drug official in *Homeopathic Pharmacopoeia of the United States* (*HPUS,* 1993).▲*USP29*

REAGENTS, INDICATORS, AND SOLUTIONS

Reagent Specifications

BRIEFING

Acetanilide, *USP 28* page 2795. For safety reasons, it is proposed to eliminate all references to smell and taste in the specifications for this and the following reagents.

Acetyl Chloride
Acetylcholine Chloride
4-Amino-6-chloro-1,3-benzenedisulfonamide
Amyl Acetate
tert-Amyl Alcohol
L-Asparagine
Benzaldehyde
Benzphetamine Hydrochloride
Benzyltrimethylammonium Chloride
Biphenyl
N-Bromosuccinimide
2,3-Butanedione
n-Butyl Chloride
Cadmium Acetate
Calcium Citrate
Calcium Lactate
Casein
Charcoal, Activated
Chlorobenzene
Congo Red
Cyclohexanol
o-Dichlorobenzene
Dicyclohexylamine
Diidofluorescein
1,2-Dimethoxyethane
Ethyl Cyanoacetate
Ethylene Glycol
Ferric Ammonium Citrate
Guaiacol
n-Heptane, Chromatographic
Hexamethyldisilazane
Hexane, Solvent
Inositol
Isopropylamine
Maleic Acid

In-Process Revision

Methyl Acetate
1-Naphthol
2-Naphthol
5-Nitro-1,10-phenanthroline
Nonylphenoxypoly(ethyleneoxy)ethanol
Para-aminobenzoic Acid
Paraformaldehyde
Propionic Anhydride
Pyrrole
Rose Bengal Sodium
Silver Oxide
Sodium Arsenite
Sodium Chromate
Sodium Glycocholate
Tetramethylammonium Hydroxide
Thioglycolic Acid
Thymol
n-Tricosane
Triethylamine

(HDQ: M. Marques) RTS—42098-1

Change to read:

Acetanilide, C_8H_9NO—**135.16**—White, shiny crystals, usually in scales, or a white, crystalline powder. ~~Is odorless and~~

▲▲*USP29*
Is stable in air. Freely soluble in alcohol and in chloroform; soluble in boiling water, in ether, and in glycerin; slightly soluble in water.

Melting range ⟨741⟩: between 114° and 116°.

Reaction—Its saturated solution is neutral to litmus.

Loss on drying ⟨731⟩—Dry it over sulfuric acid for 2 hours: it loses not more than 0.5% of its weight.

Residue on ignition (Reagent test): not more than 0.05%.

BRIEFING

Acetyl Chloride, *USP 28* page 2795—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-2

Change to read:

Acetyl Chloride, CH_3COCl—**78.50**—Clear, colorless liquid. ~~having a strong, pungent odor.~~

▲▲*USP29*
Is decomposed by water and by alcohol. Miscible with benzene and with chloroform. Use ACS reagent grade.

Specific gravity ⟨841⟩: about 1.1.

BRIEFING

Acetylcholine Chloride, *USP 28* page 2795—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-3

Change to read:

Acetylcholine Chloride, $[CH_3COOCH_2CH_2N(CH_3)_3]Cl$—**181.66**—White, crystalline ~~odorless or nearly odorless~~

▲▲*USP29*
powder. Very deliquescent; very soluble in water; freely soluble in alcohol.

Melting range ⟨741⟩—When previously dried at 110° in a capillary tube for 1 hour, it melts between 149° and 152°.

Reaction—Its 1 in 10 solution is neutral to litmus.

Residue on ignition (Reagent test): negligible, from 200 mg.

Solubility in alcohol—A solution of 500 mg in 5 mL of alcohol is complete and colorless.

Percent of acetyl (CH_3CO)—Weigh accurately about 400 mg, previously dried at 105° for 3 hours, and dissolve in 15 mL of water in a glass-stoppered conical flask. Add 40.0 mL of 0.1 N sodium hydroxide VS, and heat on a steam bath for 30 minutes. Insert the stopper, allow to cool, add phenolphthalein TS, and titrate the excess alkali with 0.1 N sulfuric acid VS. Determine the exact normality of the 0.1 N sodium hydroxide by titrating 40.0 mL after it has been treated in the same manner as in the test. Each mL of 0.1 N sodium hydroxide is equivalent to 4.305 mg of CH_3CO. Between 23.2% and 24.2% is found.

Percent of chlorine (Cl)—Weigh accurately about 400 mg, previously dried at 105° for 3 hours, and dissolve in 50 mL of water in a glass-stoppered, 125-mL flask. Add with agitation 30.0 mL of 0.1 N silver nitrate VS, then add 5 mL of nitric acid and 5 mL of nitrobenzene, shake, add 2 mL of ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS: each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of Cl. Between 19.3% and 19.8% of Cl is found.

BRIEFING

4-Amino-6-chloro-1,3-benzenedisulfonamide, *USP 28* page 2797—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-4

Change to read:

4-Amino-6-chloro-1,3-benzenedisulfonamide, $C_6H_8ClN_3O_4S_2$—**285.73**—White ~~odorless~~

▲▲*USP29*
powder. Insoluble in water and in chloroform; soluble in ammonia TS.

Residue on ignition (Reagent test): not more than 2 mg from 2 g (0.1%).

Absorbance—A 1 in 200,000 solution in methanol exhibits absorbance maxima at about 223 nm, 265 nm, and 312 nm. Its absorptivity (see *Spectrophotometry and Light-Scattering* ⟨851⟩) at 265 nm is about 64.0.

BRIEFING

Amyl Acetate, *USP 28* page 2799—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42048-5

Change to read:

Amyl Acetate (*Isoamyl Acetate*), $CH_3CO_2C_5H_{11}$—**130.18**—Clear, colorless liquid. ~~with a characteristic, banana oil–like odor.~~

▲▲*USP29*
Slightly soluble in water. Miscible with alcohol, with amyl alcohol, with benzene, and with ether.

Specific gravity ⟨841⟩: about 0.87.

Boiling range (Reagent test, *Method I*): not less than 90%, between 137° and 142°.

Solubility in diluted alcohol—A 1.0-mL portion dissolves in 20 mL of diluted alcohol to form a clear solution.

Acidity—Add 5.0 mL to 40 mL of neutralized alcohol, and, if the pink color is discharged, titrate with 0.10 N sodium hydroxide: not more than 0.20 mL is required to restore the pink color (about 0.02% as CH_3COOH).

Water—A 5-mL portion gives a clear solution with 5 mL of carbon disulfide.

BRIEFING

***tert*-Amyl Alcohol,** *USP 28* page 2799—See briefing under *Acetanilide*.

(HDQ: M. Marques) RTS—42098-6

Change to read:

***tert*-Amyl Alcohol,** $C_5H_{12}O$—**88.15**—Clear, colorless, flammable, volatile liquid. ~~with a characteristic odor.~~

▲▲*USP29*
Specific gravity ⟨841⟩: about 0.81.

Boiling range (Reagent test): not less than 95%, between 100° and 103°.

Residue on evaporation—Evaporate 50 mL (40 g) on a steam bath, and dry at 105° for 1 hour: the residue weighs not more than 1.6 mg (0.004%).

Acids and *esters*—Dilute 20 mL with 20 mL of alcohol, add 5.0 mL of 0.1 N sodium hydroxide VS, and reflux gently for 10 minutes. Cool, add 2 drops of phenolphthalein TS, and titrate the excess sodium hydroxide with 0.1 N hydrochloric acid VS: not more than 0.75 mL of the 0.10 N sodium hydroxide is consumed, correction being made for the amount consumed in a blank (0.06% as amyl acetate).

Aldehydes—Shake 5 mL with 5 mL of potassium hydroxide solution (30 in 100) in a glass-stoppered cylinder for 5 minutes, and allow to separate: no color develops in either layer.

BRIEFING

L-Asparagine, *USP 28* page 2801—See briefing under *Acetanilide*.

(HDQ: M. Marques) RTS—42098-7

Change to read:

L-Asparagine (L-*2-Aminosuccinamic Acid*), $COOHCH(NH_2)CH_2CONH_2 \cdot H_2O$—**150.13**—Colorless ~~odorless~~

▲▲*USP29*
crystals. One g dissolves in 50 mL of water; soluble in acids and in alkalies; insoluble in alcohol and in ether. Its neutral or alkaline solutions are levorotatory; its acid solutions are dextrorotatory.

Specific rotation ⟨781⟩: between +31° and +33°, determined in a solution in diluted hydrochloric acid containing the equivalent of 5 g (on the anhydrous basis, as determined by drying at 105° for 5 hours) in each 100 mL.

Residue on ignition (Reagent test): not more than 0.1%.

Chloride (Reagent test)—One g shows not more than 0.03 mg of Cl (0.003%).

Sulfate (Reagent test, *Method I*)—One g shows not more than 0.05 mg of SO_4 (0.005%).

Heavy metals (Reagent test): 0.002%.

Nitrogen content, *Method II* ⟨461⟩: between 18.4% and 18.8% of N is found.

BRIEFING

Benzaldehyde, *USP 28* page 2801—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-8

Change to read:

Benzaldehyde, C_7H_6O—**106.12**—Colorless, strongly refractive liquid. ~~having an odor resembling that of bitter almond oil.~~

▲▲*USP29*
Soluble in water; miscible with alcohol, with ether, and with fixed and volatile oils.

In-Process Revision

Assay—Pipet about 1 mL into a tared, glass-stoppered weighing bottle, and weigh accurately. Loosen the stopper, and transfer both the weighing bottle and its contents to a 250-mL conical flask containing 25 mL of a hydro-alcoholic solution of hydroxylamine hydrochloride (prepared by dissolving 34.7 g of hydroxylamine hydrochloride in 160 mL of water, then adding alcohol to make 1000 mL, and neutralizing to bromophenol blue by the addition of sodium hydroxide TS). Using a graduated cylinder to measure the volume, rinse the sides of the flask with an additional 50 mL of this reagent solution. Allow the solution to stand for 10 minutes, add 1 mL of bromophenol blue TS, and titrate the liberated hydrochloric acid with 1 N sodium hydroxide VS. Perform a blank determination with the same quantities of the same reagents, and make any necessary correction. Each mL of 1 N sodium hydroxide consumed is equivalent to 106.1 mg of C_7H_6O. Not less than 98% is found.

Specific gravity ⟨841⟩: between 1.041 and 1.046.

Refractive index ⟨831⟩: between 1.5440 and 1.5465 at 20°.

Hydrocyanic acid—Shake 0.5 mL with 5 mL of water, add 0.5 mL of sodium hydroxide TS and 0.1 mL of ferrous sulfate TS, and warm the mixture gently. Add a slight excess of hydrochloric acid: no greenish-blue color or blue precipitate is observed within 15 minutes.

BRIEFING

Benzphetamine Hydrochloride, *USP 28* page 2802—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-9

Change to read:

Benzphetamine Hydrochloride, $C_{17}H_{21}N \cdot HCl$—**275.82**—White to off-white, ~~odorless,~~

▲▲*USP29*
crystalline powder. Freely soluble in water, in alcohol, and in chloroform; slightly soluble in ether.

Assay—Dissolve about 500 mg, accurately weighed, in a mixture of 50 mL of glacial acetic acid and 10 mL of mercuric acetate TS, add 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 27.58 mg of $C_{17}H_{21}N \cdot HCl$. Between 98.0% and 101.0%, calculated on the dried basis, is found.

Melting range ⟨741⟩: between 152° and 158°.

Specific rotation ⟨781⟩: between +22° and +26°, determined in a solution containing 200 mg in 10 mL, the specimen having been previously dried in vacuum at 60° for 3 hours.

Loss on drying ⟨731⟩—Dry in vacuum at 60° for 3 hours: it loses not more than 1% of its weight.

Residue on ignition ⟨281⟩: not more than 0.2%.

BRIEFING

Benzyltrimethylammonium Chloride, *USP 28* page 2802—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-10

Change to read:

Benzyltrimethylammonium Chloride, $C_6H_5CH_2N(CH_3)_3Cl$—**185.69**—Available as a 60% aqueous solution. Is clear and is colorless or not more than slightly yellow. ~~, and has a slight amine-like odor.~~

▲▲*USP29*
Assay—Pipet 2 mL into a 50-mL volumetric flask, and add water to volume. Pipet 20 mL of the solution into a 125-mL conical flask, add about 30 mL of water, then add 0.25 mL of dichlorofluorescein TS, and titrate with 0.1 N silver nitrate VS. Each mL of 0.1 N silver nitrate is equivalent to 18.57 mg of $C_6H_5CH_2N(CH_3)_3Cl$. Between 59.5% and 60.5% is found.

BRIEFING

Biphenyl, *USP 28* page 2803—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-11

Change to read:

Biphenyl, $C_{12}H_{10}$—**154.21**—Colorless to white crystals or crystalline powder. ~~, having a pleasant odor.~~

▲▲*USP29*
Insoluble in water; soluble in alcohol and in ether. Boils at about 254°.

Melting range ⟨741⟩: between 68° and 72°.

BRIEFING

***N*-Bromosuccinimide,** *USP 28* page 2804—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-12

Change to read:

***N*-Bromosuccinimide,** $C_4H_4BrNO_2$—**177.98**—White to off-white crystals or powder. ~~, having a faint odor.~~

▲▲*USP29*

Freely soluble in water, acetone, and glacial acetic acid. *[Caution—Highly irritating to eyes, skin, and mucous membranes.]*

Assay—Transfer 200 mg, accurately weighed, to a conical flask, add 25 mL of 0.5 N alcoholic potassium hydroxide, cover with a watch glass, heat to boiling, and boil for 5 minutes. Cool, transfer the solution to a beaker, rinsing the flask with water until the total volume of solution plus rinsings is about 100 mL, and add 10 mL of glacial acetic acid. Insert suitable electrodes, and titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically. Each mL of 0.1 N silver nitrate is equivalent to 17.80 mg of $C_4H_4BrNO_2$. Not less than 98% is found.

BRIEFING

2,3-Butanedione, *USP 28* page 2804—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-13

Change to read:

2,3-Butanedione (*Diacetyl*), $CH_3COCOCH_3$—**86.09**—Bright yellow to yellowish-green liquid. ~~having a strong, pungent odor.~~

▲▲*USP29*
Soluble in water. Miscible with alcohol and with ether. Boils at about 88°.

Assay—

HYDROXYLAMINE HYDROCHLORIDE SOLUTION—Dissolve 20 g of hydroxylamine hydrochloride in 40 mL of water, and dilute with alcohol to 400 mL. Add, with stirring, 300 mL of 0.5 N alcoholic potassium hydroxide, and filter. Discard after 2 days.

PROCEDURE—Transfer about 1 g, accurately weighed, to a glass-stoppered, 250-mL flask, add 75.0 mL of *Hydroxylamine hydrochloride solution,* and insert the stopper in the flask. Reflux the mixture for 1 hour, then cool to room temperature. Add bromophenol blue TS, and titrate with 0.5 N hydrochloric acid VS to a greenish-yellow endpoint. [NOTE—Alternatively, the solution may be titrated potentiometrically to a pH of 3.4.] Perform a blank test with the same quantities of reagent used for the test specimen, and make any necessary correction. Each mL of 0.5 N hydrochloric acid is equivalent to 43.05 mg of $CH_3COCOCH_3$. Not less than 97% of $CH_3COCOCH_3$ is found.

Congealing temperature ⟨651⟩: between –2.0° and –5.5°.

Refractive index ⟨831⟩: between 1.3935 and 1.3965, at 20°.

Specific gravity ⟨841⟩: about 0.98.

BRIEFING

***n*-Butyl Chloride,** *USP 28* page 2805—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-16

Change to read:

***n*-Butyl Chloride** (*1-Chlorobutane*), C_4H_9Cl—**92.57**—Clear, colorless, volatile liquid. ~~having a slight, characteristic odor.~~

▲▲*USP29*
Highly flammable. Practically insoluble in water. Miscible with alcohol and with ether.

Assay—When examined by gas–liquid chromatography, it shows a purity of not less than 98%. The following conditions have been found suitable for assaying the article: a 3-mm × 1.8-m stainless steel column packed with phase G16 on support S1. Helium, flowing at a rate of about 40 mL per minute, is the carrier gas, the detector temperature is about 310°, the injection port temperature is about 230°, and the column temperature is programmed to rise at 10° per minute from 35° to 150°. A flame-ionization detector is employed.

Boiling range ⟨721⟩: between 76° and 80°, within a 2° range.

Refractive index ⟨831⟩: between 1.4015 and 1.4035 at 20°.

Acidity—Add phenolphthalein TS to 75 mL, and titrate with 0.1 N potassium hydroxide in methanol to a faint pink color that persists, with shaking, for 1.5 seconds: not more than 0.91 mL is required (about 0.005% as HCl).

Water ⟨921⟩: not more than 0.02%, determined by the *Titrimetric Method*.

Residue after evaporation—Evaporate about 60 mL (50 g), accurately weighed, in a tared platinum dish on a steam bath, and dry at 105° for 1 hour: not more than 0.005% is found.

BRIEFING

Cadmium Acetate, *USP 28* page 2805—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-17

Change to read:

Cadmium Acetate, $C_4H_6CdO_4 \cdot 2H_2O$—**266.53**—Colorless, transparent to translucent crystals. ~~Is odorless or has a slight odor of acetic acid.~~

▲▲*USP29*
Freely soluble in water; soluble in alcohol.

Insoluble matter (Reagent test): not more than 1 mg, from 20 g (0.005%).

Chloride (Reagent test)—One g shows not more than 0.01 mg of Cl (0.001%).

In-Process Revision

Sulfate (Reagent test, *Method II*)—Dissolve 10 g in 100 mL of water, add 1 mL of hydrochloric acid, and filter: the residue weighs not more than 1.2 mg more than the residue obtained in a complete blank test (0.005%).

Substances not precipitated by hydrogen sulfide—Dissolve 2 g in a mixture of 135 mL of water and 15 mL of 1 N sulfuric acid, heat to boiling, and pass a rapid stream of hydrogen sulfide through the solution as it cools. Filter, and to 75 mL of the clear filtrate add 0.25 mL of sulfuric acid, then evaporate to dryness, and ignite gently: the residue weighs not more than 1 mg (0.1%).

BRIEFING

Calcium Citrate, *USP 28* page 2806—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-18

Change to read:

Calcium Citrate, $Ca_3(C_6H_5O_7)_2 \cdot 4H_2O$—**570.49**—A white, ~~odorless,~~

▲▲*USP29*
crystalline powder. Slightly soluble in water; freely soluble in 3 N hydrochloric acid and in 2 N nitric acid; insoluble in alcohol. To 15 mL of hot 2 N sulfuric acid add in small portions and with stirring about 500 mg of calcium citrate. Boil the mixture for 5 minutes, and filter while hot: the cooled filtrate responds to the identification test for *Citrate* ⟨191⟩.

Assay—Accurately weigh about 400 mg of the salt, previously dried at 150° to constant weight, and transfer to a 250-mL beaker. Dissolve the test specimen in 150 mL of water containing 2 mL of 3 N hydrochloric acid, add 15 mL of 1 N sodium hydroxide and 250 mg of hydroxy naphthol blue, and titrate with 0.05 M edetate disodium VS until the solution turns deep blue in color. Each mL of 0.05 M edetate disodium is equivalent to 8.307 mg of $Ca_3(C_6H_5O_7)_2$: between 97.5% and 101% is found.

Calcium oxide and carbonate—Triturate 1 g of calcium citrate with 5 mL of water for 1 minute: the mixture does not turn red litmus blue. Then add 5 mL of warm 3 N hydrochloric acid: only a few isolated bubbles escape.

Hydrochloric acid-insoluble matter—Dissolve 5 g by heating with a mixture of 10 mL of hydrochloric acid and 50 mL of water for 30 minutes: not more than 2.5 mg of insoluble residue remains (0.05%).

Loss on drying ⟨731⟩—Dry it at 150° to constant weight: it loses between 12.2% and 13.3% of its weight.

Arsenic ⟨211⟩—Proceed with 0.50 g as directed for organic compounds (6 ppm of As).

Heavy metals, Method I ⟨231⟩: 0.002%.

BRIEFING

Calcium Lactate, *USP 28* page 2806—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-19

Change to read:

Calcium Lactate, $(CH_3CHOHCOO)_2Ca \cdot 5H_2O$—**308.29**—White~~, almost odorless~~

▲▲*USP29*
granules or powder. Is somewhat efflorescent and at 120° becomes anhydrous. One g dissolves in 20 mL of water; practically insoluble in alcohol. Store it in tight containers.

Assay—Accurately weigh about 500 mg, previously dried at 120° for 4 hours, transfer to a suitable container, and dissolve in 150 mL of water containing 2 mL of diluted hydrochloric acid. Add 15 mL of sodium hydroxide TS and 300 mg of hydroxy naphthol blue indicator, and titrate with 0.05 M edetate disodium VS until the solution is deep blue in color. Each mL of 0.05 M edetate disodium is equivalent to 10.91 mg of $C_6H_{10}CaO_6$. Not less than 98% is found.

Loss on drying ⟨731⟩—Dry it at 120° for 4 hours: it loses between 25.0% and 30.0% of its weight.

Acidity—Add phenolphthalein TS to 20 mL of a 1 in 20 solution, and titrate with 0.10 N sodium hydroxide: not more than 0.50 mL is required to produce a pink color.

Heavy metals (Reagent test)—Dissolve 1 g in 2.5 mL of diluted hydrochloric acid, dilute with water to 40 mL, and add 10 mL of hydrogen sulfide TS: any brown color produced is not darker than that of a control containing 0.02 mg of added Pb (0.002%).

Magnesium and *alkali salts*—Mix 1 g with 40 mL of water, carefully add 5 mL of hydrochloric acid, heat the solution, boil for 1 minute, and add rapidly 40 mL of oxalic acid TS. Add immediately to the warm mixture 2 drops of methyl red TS, then add ammonia TS dropwise, from a buret, until the mixture is just alkaline. Cool to room temperature, transfer to a 100-mL graduated cylinder, dilute with water to 100 mL, mix, and allow to stand for 4 hours or overnight. Filter, and transfer to a platinum dish 50 mL of the clear filtrate, to which has been added 0.5 mL of sulfuric acid. Evaporate the mixture on a steam bath to a small bulk. Carefully heat over a free flame to dryness, and continue heating to complete decomposition and volatilization of ammonium salts. Finally ignite the residue at 800 ± 25° for 15 minutes: the residue weighs not more than 5 mg (1%).

Volatile fatty acid—Stir about 500 mg with 1 mL of sulfuric acid, and warm: the mixture does not emit an odor of volatile fatty acid.

BRIEFING

Casein, *USP 28* page 2807—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-20

Change to read:

Casein—White or slightly yellow, ~~odorless,~~

▲▲*USP29*
granular powder. Insoluble in water and in other neutral solvents; readily dissolved by ammonia TS and by solutions of alkali hydroxides, usually forming a cloudy solution.

Residue on ignition (Reagent test)—Ignite 2 g: the residue weighs not more than 20 mg (1.0%).

Loss on drying ⟨731⟩—Dry at 105° to constant weight: it loses not more than 10.0% of its weight.

Alkalinity—Shake 1 g with 20 mL of water for 10 minutes, and filter: the filtrate is not alkaline to red litmus paper.

Soluble substances—When the filtrate from the *Alkalinity* test is evaporated and dried at 105°, the residue weighs not more than 1 mg (0.1%).

Fats—Dissolve 1 g in a mixture of 10 mL of water and 5 mL of alcoholic ammonia TS, and shake out with two 20-mL portions of solvent hexane. Evaporate the hexane at a low temperature, and dry at 80°: the weight of the residue does not exceed 5 mg (0.5%).

Nitrogen content, Method I ⟨461⟩: between 15.2% and 16.0% of N is found, on the anhydrous basis.

Where vitamin-free casein is required, use casein that has been rendered free from the fat-soluble vitamins by continuous extraction with hot alcohol for 48 hours followed by air-drying to remove the solvent.

BRIEFING

Charcoal, Activated, *USP 28* page 2808—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-21

Change to read:

Charcoal, Activated (*Activated Carbon; Decolorizing Carbon*)—A fine, black~~, odorless~~

▲▲*USP29*
powder, which is the residue from the destructive distillation of various organic materials, treated to increase its high capacity for adsorbing organic coloring substances, as well as nitrogenous bases.

Adsorptive power—Dissolve 100 mg of strychnine sulfate in 50 mL of water, add 1 g of the test specimen, shake during 5 minutes, and filter through a dry filter, rejecting the first 10 mL of the filtrate. To a 10-mL portion of the subsequent filtrate add 1 drop of hydrochloric acid and 5 drops of mercuric iodide TS: no turbidity is produced.

Residue on ignition (Reagent test)—Ignite 500 mg: the residue weighs not more than 20 mg (4.0%).

Reaction—Boil 2 g with 50 mL of water for 5 minutes, allow to cool, restore the original volume by the addition of sufficient water, and filter: the filtrate is colorless and is neutral to litmus paper.

Acid-soluble substances—Boil 1.0 g with 25 mL of dilute hydrochloric acid (1 in 5) for 5 minutes, filter into a tared porcelain crucible, and wash the residue with 10 mL of hot water, adding the washings to the filtrate. To the combined filtrate and washings add 1 mL of sulfuric acid, evaporate to dryness, and ignite to constant weight: the residue weighs not more than 35 mg (3.5%).

Alcohol-soluble substances—Boil 2 g with 40 mL of alcohol for 5 minutes under a reflux condenser, and filter. Evaporate 20 mL of the filtrate on a steam bath, and dry at 105° for 1 hour: the residue weighs not more than 2 mg (0.2%).

Uncarbonized constituents—To 250 mg add 10 mL of sodium hydroxide TS, heat to boiling, and filter: the filtrate is colorless.

Chloride (Reagent test)—A 5-mL portion of the filtrate obtained in the test for *Reaction* shows not more than 0.04 mg of Cl (0.02%).

Sulfate (Reagent test, *Method I*)—A 5-mL portion of the filtrate from the test for *Reaction* shows not more than 0.3 mg of SO_4 (0.15%).

Sulfide—Place 1 g in a small flask with a narrow neck, add 35 mL of water and 5 mL of hydrochloric acid, and boil gently: the escaping vapors do not darken paper moistened with lead acetate TS.

BRIEFING

Chlorobenzene, *USP 28* page 2809—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-23

Change to read:

Chlorobenzene, C_6H_5Cl—**112.56**—Clear, colorless liquid. ~~having a characteristic odor.~~

▲▲*USP29*
Insoluble in water; soluble in alcohol, in benzene, in chloroform, and in ether. Use ACS reagent grade.

BRIEFING

Congo Red, *USP 28* page 2810—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-25

Change to read:

Congo Red, $C_{32}H_{22}N_6Na_2O_6S_2$—**696.67**—A dark red or reddish-brown powder. ~~Is odorless and~~

In-Process Revision

▲▲*USP29*
Decomposes on exposure to acid fumes. Its solutions have a pH of about 8 to 9.5. One g dissolves in about 30 mL of water. Is slightly soluble in alcohol.

Loss on drying ⟨731⟩—Dry it at 105° for 4 hours: it loses not more than 3.0% of its weight.

Residue on ignition—Accurately weigh about 1 g, previously dried at 105° for 4 hours, and place it in a porcelain dish or crucible. Ignite carefully until well charred, cool, add 2 mL of sulfuric acid, and carefully ignite until the residue is white or practically so. Cool, add 0.5 mL of sulfuric acid and 1 mL of nitric acid, evaporate, and again ignite to constant weight: the weight of the sodium sulfate so obtained is between 20.0% and 24.0% of the weight of the dried specimen taken.

Sensitiveness—To 50 mL of carbon dioxide-free water add 0.1 mL of congo red solution (1 in 1000). The red color of the solution is changed to violet by the addition of 0.05 mL of 0.10 N hydrochloric acid and is restored by the subsequent addition of 0.05 mL of 0.10 N sodium hydroxide.

BRIEFING

Cyclohexanol, *USP 28* page 2811—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-26

Change to read:

Cyclohexanol, $C_6H_{12}O$—**100.16**—A clear liquid. ~~having a camphoraceous odor.~~

▲▲*USP29*
Freely soluble in water. Miscible with alcohol, with ethyl acetate, and with aromatic hydrocarbons.

Assay—When examined by gas-liquid chromatography, using suitable gas chromatographic apparatus and conditions, it shows a purity of not less than 98%.

Melting temperature: about 23°.

Specific gravity: about 0.962, at 20°.

BRIEFING

***o*-Dichlorobenzene,** *USP 28* page 2812—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-27

Change to read:

***o*-Dichlorobenzene,** $C_6H_4Cl_2$—**147.00**—Clear liquid, having a light yellowish–brown tint (about APHA 20). ~~and an aromatic odor.~~

▲▲*USP29*
Practically insoluble in water. Miscible with alcohol and with ether. Boils at about 180°.

Assay—When examined by gas–liquid chromatography, with the use of suitable apparatus and conditions, it shows a purity of not less than 98%.

Density: between 1.299 and 1.301.

Refractive index ⟨831⟩: between 1.548 and 1.550 at 25°.

Residue on evaporation—Evaporate 80 mL on a steam bath, and dry at 105° for 1 hour: the residue weighs not more than 50 mg (0.005%).

Acidity—Add phenolphthalein TS to 25 mL of methanol, and titrate with 0.02 N alcoholic potassium hydroxide VS until a faint pink color persists for 15 seconds. Pipet 25 mL of test specimen into the solution, mix, avoiding exposure to the atmosphere, and titrate with 0.02 N alcoholic potassium hydroxide VS: not more than 2.2 mL is required to restore the pink color (about 0.005%).

BRIEFING

Dicyclohexylamine, *USP 28* page 2813—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-28

Change to read:

Dicyclohexylamine, $(C_6H_{11})_2NH$—**181.32**—Clear, strongly alkaline liquid. ~~having a faint, fishy odor.~~

▲▲*USP29*
Sparingly soluble in water. Miscible with common organic solvents. Density: 0.9104. Solidifies at –0.1°; melts at about 20°.

Assay—Accurately weigh about 400 mg in a tared, small weighing bottle equipped with a well-fitting closure. Transfer the stoppered bottle to a 250-mL beaker, add sufficient glacial acetic acid TS to cover the bottle, and open the bottle under the surface of the acid. Add crystal violet TS, and titrate with 0.1 N perchloric acid VS. Each mL of 0.1 N perchloric acid is equivalent to 18.13 mg of $(C_6H_{11})_2NH$. Not less than 98% is found.

Specific gravity ⟨841⟩: between 0.911 and 0.917.

Boiling range (Reagent test): between 255° and 257°.

Water, *Method I* ⟨921⟩: not more than 0.5%.

BRIEFING

Diiodofluorescein, *USP 28* page 2814—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-29

Change to read:

Diiodofluorescein, $C_{20}H_{10}I_2O_5$—**584.10**—Orange-red ~~, odorless~~

▲▲*USP29*
powder. Slightly soluble in water; soluble in alcohol and in solutions of alkali hydroxides.

Residue on ignition—Ignite 200 mg with 5 drops of sulfuric acid: the weight of the residue does not exceed 1.0 mg (0.5%).

Sensitiveness—Accurately weigh about 100 mg of potassium iodide, previously dried at 105° to constant weight, and dissolve it in 50 mL of water. Add 1 mL of diiodofluorescein TS prepared from the test specimen and 1 mL of glacial acetic acid, and titrate with 0.1 N silver nitrate VS until the color of the precipitate changes from brownish red to a bluish red. The volume of 0.1 N silver nitrate consumed is not in excess of 0.10 mL over the calculated volume, based on the KI content of the dried potassium iodide determined as follows. Dissolve about 500 mg of potassium iodide, accurately weighed, in about 10 mL of water, and add 35 mL of hydrochloric acid and 5 mL of chloroform. Titrate with 0.05 M potassium iodate VS until the purple color of iodine disappears from the chloroform. Add the last portions of the iodate solution dropwise, agitating vigorously and continuously. After the chloroform has been decolorized, allow the mixture to stand for 5 minutes. If the chloroform develops a purple color, titrate further with the iodate solution. Each mL of 0.05 M potassium iodate is equivalent to 16.60 mg of KI.

BRIEFING

1,2-Dimethoxyethane, *USP 28* page 2814—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-30

Change to read:

1,2-Dimethoxyethane, $C_4H_{10}O_2$—**90.12**—Clear, colorless liquid. ~~having a sharp, ethereal odor.~~

▲▲*USP29*
Miscible with water and with alcohol. Soluble in hydrocarbon solvents. *May form peroxides on standing*.

Boiling range (Reagent test)—Not less than 95% distils between 83° and 86°.

Refractive index ⟨831⟩: between 1.379 and 1.381, at 20°.

Acidity—To 20 mL add bromophenol blue TS, and titrate with 0.020 N sodium hydroxide: not more than 2.0 mL is consumed (about 0.015% as CH_3COOH).

Water, *Method I* ⟨921⟩: not more than 0.2%.

BRIEFING

Ethyl Cyanoacetate, *USP 28* page 2817—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-31

Change to read:

Ethyl Cyanoacetate, $CNCH_2COOC_2H_5$—**113.11**—Colorless to pale yellow liquid. ~~having a pleasant odor.~~

▲▲*USP29*
Slightly soluble in water. Miscible with alcohol and with ether. At atmospheric pressure it boils between 205° and 209°, with decomposition. At a pressure of 10 mm of mercury it distils at about 90°.

Specific gravity ⟨841⟩: between 1.057 and 1.062.

Acidity—Dissolve 2 mL in 25 mL of neutralized alcohol, add phenolphthalein TS, and titrate with 0.10 N sodium hydroxide: not more than 1.5 mL is required to produce a pink color.

BRIEFING

Ethylene Glycol, *USP 28* page 2818—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42098-32

Change to read:

Ethylene Glycol, $HOCH_2CH_2OH$—**62.07**—Clear, colorless, slightly viscous, hygroscopic ~~practically odorless~~

▲▲*USP29*
liquid. Slightly soluble in ether; practically insoluble in benzene. Miscible with water and with alcohol.

Specific gravity ⟨841⟩: about 1.11.

Boiling range (Reagent test): between 194° and 200°.

Residue on ignition—Evaporate 100 mL (110 g) in a tared evaporating dish over a flame until the vapors continue to burn after the flame is removed. Allow the vapors to burn until the specimen is consumed. Ignite at 800 ± 25° for 1 hour, cool, and weigh: the residue weighs not more than 5.5 mg (0.005%).

Acidity—Add 0.2 mL of phenol red TS to 50 mL of water, and titrate with 0.1 N sodium hydroxide to a red endpoint. Add 50 mL (55 g) of ethylene glycol, and titrate with 0.1 N sodium hydroxide: not more than 1 mL is required to restore the red color (0.01% as CH_3COOH).

Chloride (Reagent test)—A 4.5-mL (5-g) portion shows not more than 0.025 mg of Cl (5 ppm).

Water, *Method I* ⟨921⟩: not more than 0.20%.

BRIEFING

Ferric Ammonium Citrate, *USP 28* page 2818—See briefing under *Acetanilide*.

(HDQ: M. Marques) RTS—42098-33

Change to read:

Ferric Ammonium Citrate—Thin, transparent, garnet-red scales or granules or brownish-yellow powder. ~~odorless or having a slightly ammoniacal odor.~~

▲▲*USP29*
Is deliquescent and is affected by light. Very soluble in water; insoluble in alcohol.

Assay—Accurately weigh about 1 g, dissolve in 25 mL of water in a glass-stoppered flask, add 5 mL of hydrochloric acid and 4 g of potassium iodide, insert the stopper in the flask, and allow to stand in the dark for 15 minutes. Add 100 mL of water, and titrate the liberated iodine with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium thiosulfate is equivalent to 5.585 mg of Fe: between 16.5% and 18.5% is found.

Ferric citrate—To 250 mg dissolved in 25 mL of water add 1 mL of potassium ferrocyanide TS: no blue precipitate is formed.

Tartrate—Dissolve 1 g in 10 mL of water, add 1 mL of potassium hydroxide TS, boil to coagulate the ferric hydroxide, adding more potassium hydroxide TS, if necessary, to precipitate all of the iron, filter, and slightly acidify the filtrate with glacial acetic acid. Add 2 mL of glacial acetic acid, and allow to stand for 24 hours: no crystalline white precipitate is formed.

Lead ⟨251⟩—Dissolve 1.0 g in 30 mL of water, add 5 mL of dilute nitric acid (1 in 21), boil gently for 5 minutes, cool, and dilute with water to 50 mL: 20 mL of the solution shows not more than 0.008 mg of Pb (0.002%).

BRIEFING

Guaiacol, *USP 28* page 2820—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-1

Change to read:

Guaiacol *(o-Methoxyphenol)* $C_7H_8O_2$—**124.14**—Colorless to yellowish, refractive liquid. ~~having a characteristic odor.~~

▲▲*USP29*
Soluble in about 65 parts of water; soluble in sodium hydroxide solution; miscible with alcohol, with chloroform, with ether, and with glacial acetic acid.

Assay—When examined by gas–liquid chromatography, it shows a purity of not less than 98%. The following conditions have been found suitable for assaying it: a 3-mm × 1.8-m stainless steel column containing liquid phase G16 on 60- to 80-mesh support S1A. Helium is the carrier gas, the injection port temperature is maintained at 180°, the column temperature is maintained at 200°, and the flame-ionization detector is maintained at 280°. The retention time is about 8 minutes.

Refractive index ⟨831⟩: between 1.5430 and 1.5450, at 20°.

BRIEFING

***n*-Heptane, Chromatographic,** *USP 28* page 2821—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-2

Change to read:

***n*-Heptane, Chromatographic**—Clear, colorless, volatile, flammable liquid consisting essentially of C_7H_{16}. ~~It has a characteristic odor.~~

▲▲*USP29*
Practically insoluble in water; soluble in absolute alcohol. Miscible with ether, with chloroform, with benzene, and with most fixed and volatile oils. [NOTE—*n*-Heptane may require purification by passage through a column of silica gel, a ratio of about 25 g of the gel for each 100 mL of *n*-heptane being used, and subsequent fractional distillation.]

Boiling range (Reagent test): between 94.5° and 99.0°.

Spectral purity—Measure in a 1-cm cell at 250 nm, with a suitable spectrophotometer, against water as the blank: its absorbance is not more than 0.10.

Residue on evaporation—It meets the requirements of the test for *Residue on evaporation* under *Hexane, Solvent*.

BRIEFING

Hexamethyldisilazane, *USP 28* page 2821—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-3

Change to read:

Hexamethyldisilazane, $C_6H_{19}NSi_2$—**161.39**—Clear, colorless liquid. ~~, having a characteristic odor.~~

▲▲*USP29*
Assay—When examined by gas–liquid chromatography, it shows a purity of not less than 95%. The following conditions have been found suitable for assaying the article: A 2-mm × 1.8-m glass column packed with phase G3 on support S1. Helium, flowing at a rate of about 40 mL per minute, is the carrier gas; the detector temperature is about 310°; the injection port temperature is about 100°; and the column temperature is programmed to start at 35°, hold for 5 minutes, then rise at a rate of 8° per minute to 200°. A flame-ionization detector is employed.

Residue after evaporation—Transfer 200 g to a tared dish, and evaporate on a steam bath to dryness. Dry the residue at 105° for 1 hour, cool, and weigh: not more than 0.0025% of residue is found.

BRIEFING

Hexane, Solvent, *USP 28* page 2821 and page 1045 of *PF* 30(3) [May–June 2004]—See briefing under *Acetanilide*.

(HDQ: M. Marques) RTS—42104-4

Change to read:

Hexane, Solvent ~~*(Petroleum Benzin; Petroleum Ether)*~~

■*(Petroleum Benzin; Petroleum Ether, Ligroin)*■1S (*USP28*)—Clear, volatile liquid. ~~having an ethereal or faint, petroleum-like odor.~~

▲▲*USP29*
Practically insoluble in water; soluble in absolute alcohol. Miscible with ether, with chloroform, with benzene, and with most fixed and volatile oils.

Caution—It is dangerously flammable. Keep it away from flames, and store in tight containers in a cool place.

~~*Appearance and color*—Pour 100 mL, previously well-mixed in its original container, into a 100-mL color-comparison tube, and compare with a standard, in a similar tube, containing 2 mL of platinum-cobalt TS in similar volume: the two liquids are equally clear and free from suspended matter or sediment and when viewed across the columns by transmitted light, the test specimen is not darker in color than the standard.~~

~~*Odor*—Its odor is not disagreeable or suggestive of mercaptans or thiophene.~~

~~*Distilling range* (Reagent test)—Distil 100 mL: none distils below 30° and not less than 100% distils between 30° and 60°.~~

~~*Residue on evaporation*—Evaporate 150 mL (100 g) on a steam bath, and dry at 105° for 30 minutes: the residue weighs not more than 1 mg (0.001%).~~

~~*Acidity*—Shake 10 mL with 5 mL of water for 2 minutes, and allow the layers to separate: the water layer does not turn blue litmus red within 15 seconds.~~

~~*Heavy oils and fats*—Gradually pour 10 mL onto the center of a clean filter paper: there is no disagreeable odor and no greasy stain visible on the paper after it has stood for 30 minutes.~~

■Use ACS reagent grade Petroleum Ether.■1S (*USP28*)

BRIEFING

Inositol, *USP 28* page 2823—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-5

Change to read:

Inositol (*Hexahydroxycyclohexane*), $C_6H_6(OH)_6$—**180.16**—Fine, white crystals or a white, crystalline powder; ~~odorless,~~

▲▲*USP29*
stable in air. Its solutions are neutral to litmus. Optically inactive. One g dissolves in 5.7 mL of water. Slightly soluble in alcohol; insoluble in ether and in chloroform. Store in well-closed containers.

Melting range ⟨741⟩: between 223° and 226°.

Loss on drying ⟨731⟩—Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.

Residue on ignition (Reagent test): not more than 0.1%.

BRIEFING

Isopropylamine, *USP 28* page 2824—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-6

Change to read:

Isopropylamine (*2-Aminopropane*), $C_3H_7NH_2$—**59.11**—Clear, colorless, flammable liquid. ~~having a strong odor of ammonia.~~

▲▲*USP29*
Miscible with water, with alcohol, and with ether.

Assay—Transfer about 0.2 g, accurately weighed, to a suitable container, add 50 mL of water, and mix. Titrate with 0.1 N hydrochloric acid VS, using a mixture of methyl red TS and bromocresol green TS (1 : 5) as indicator. Each mL of 0.1 N hydrochloric acid is equivalent to 59.11 mg of C_3H_9N. Not less than 98% is found.

Boiling range (Reagent test)—Not less than 95% distils between 31° and 33°.

Refractive index ⟨831⟩: between 1.3743 and 1.3753, at 20°.

In-Process Revision

BRIEFING

Maleic Acid, *USP 28* page 2825—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-7

Change to read:

Maleic Acid, $C_4H_4O_4$—**116.07**—White ~~odorless,~~

▲▲*USP29*
crystalline powder. Soluble in 1.5 parts of water, in 2 parts of alcohol, and in 12 parts of ether.

Assay—Dissolve about 2 g, accurately weighed, in 100 mL of water and titrate with 1 N sodium hydroxide VS, using phenolphthalein TS as the indicator. Each mL of 1 N sodium hydroxide is equivalent to 58.04 mg of $C_4H_4O_4$: not less than 99% of $C_4H_4O_4$, calculated on the dried basis, is found.

Loss on drying—Dry it in vacuum over phosphorus pentoxide for 2 hours: it loses not more than 1.5% of its weight.

Residue on ignition ⟨281⟩: not more than 0.1%.

BRIEFING

Methyl Acetate, *USP 28* page 2826—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-8

Change to read:

Methyl Acetate, $C_3H_6O_2$—**74.08**—Colorless liquid. ~~having a characteristic odor.~~

▲▲*USP29*
Soluble in water. Miscible with alcohol and with ether.

Specific gravity ⟨841⟩: about 0.933.

Refractive index ⟨831⟩: between 1.3615 and 1.3625 at 20°.

Boiling range (Reagent test)—Not less than 95% distills between 57° and 58°.

BRIEFING

1-Naphthol, *USP 28* page 2828—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-12

Change to read:

1-Naphthol (*Alphanaphthol*), $C_{10}H_7OH$—**144.17**—Colorless or slightly pinkish crystals or crystalline powder. ~~having a characteristic odor.~~

▲▲*USP29*
Insoluble in water; soluble in alcohol, in benzene, and in ether.

Melting range ⟨741⟩: between 95° and 97°.

Solubility—Separate 1-g portions dissolve in alcohol and in benzene to yield solutions that are clear and colorless or nearly colorless.

Acidity—Shake 1 g with 50 mL of water occasionally during 15 minutes, and filter: the filtrate is neutral to litmus.

Residue on ignition (Reagent test): not more than 0.05%.

BRIEFING

2-Naphthol, *USP 28* page 2828—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-13

Change to read:

2-Naphthol (*Betanaphthol*), $C_{10}H_7OH$—**144.17**—White leaflets or crystalline powder. ~~having a faint, characteristic odor.~~

▲▲*USP29*
Discolors on exposure to light. Very slightly soluble in water; soluble in alcohol, in ether, in chloroform, and in solutions of alkali hydroxides.

Melting range ⟨741⟩: between 121° and 123°.

Solubility in alcohol—A solution of 1 g in 10 mL of alcohol is complete and colorless or practically so.

Residue on ignition (Reagent test): not more than 0.05%.

Acidity—Shake 1 g with 50 mL of water occasionally during 15 minutes, and filter: the filtrate is neutral to litmus.

1-Naphthol—Boil 100 mg with 10 mL of water until dissolved, cool, and filter. Add to the filtrate 0.3 mL of 1 N sodium hydroxide and 0.3 mL of 0.1 N iodine: no violet color is produced.

Insoluble in ammonia (naphthalene, etc.)—Shake 500 mg with 30 mL of ammonia TS: the 2-naphthol dissolves completely and the solution is not darker than pale yellow.

BRIEFING

5-Nitro-1,10-phenanthroline, *USP 28* page 2829—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-14

Change to read:

5-Nitro-1,10-phenanthroline, $C_{12}H_7N_3O_2$—**225.20**—White~~,~~ ~~odorless~~

▲▲*USP29*
powder. Soluble in water.

Melting range ⟨741⟩: between 198° and 200°.

Suitability as redox indicator—Dissolve 25 mg in a minimum volume of diluted sulfuric acid, add 10 mg of ferrous sulfate, and dilute with water to 100 mL: the solution is deep red in color and exhibits an absorption maximum at 510 nm. To 1.0 mL of the solution add 1.0 mL of 0.01 M ceric sulfate: the red color is discharged.

BRIEFING

Nonylphenoxypoly(ethyleneoxy)ethanol, *USP 28* page 2829—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-15

Change to read:

Nonylphenoxypoly(ethyleneoxy)ethanol—Clear, viscous, pale yellow liquid. ~~having an aromatic odor.~~

▲▲*USP29*
May exhibit slight solidification on cooling; warming with agitation will restore to original condition. Density: about 1.06. Soluble in alcohol, in xylene, and in water. Suitable for use in gas–liquid chromatography.

[NOTE—A suitable grade is "Igepal CO 710," available from General Aniline and Film Corp., 140 West 51st St., New York, NY 10020.]

BRIEFING

***Para*-aminobenzoic Acid,** *USP 28* page 2831—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-17

Change to read:

***Para*-aminobenzoic Acid** (*p-Aminobenzoic Acid*), $H_2NC_6H_4COOH$—**137.14**—White or slightly yellow ~~odorless~~

▲▲*USP29*
crystals or crystalline powder, becoming discolored on exposure to air or light. One g dissolves in 170 mL of water, in 9 mL of boiling water, in 8 mL of alcohol, and in 50 mL of ether. Freely soluble in solutions of alkali hydroxides and carbonates; soluble in warm glycerin; sparingly soluble in diluted hydrochloric acid; slightly soluble in chloroform. Store in tight, light-resistant containers.

Assay—Accurately weigh about 300 mg, previously dried at 105° for 2 hours, and transfer to a beaker or casserole. Add 5 mL of hydrochloric acid and 50 mL of water, and stir until dissolved. Cool to about 15°, add about 25 g of crushed ice, and slowly titrate with 0.1 M sodium nitrite VS until a glass rod dipped into the titrated solution produces an immediate blue ring when touched to starch iodide paper. When the titration is complete, the endpoint is reproducible after the mixture has been allowed to stand for 1 minute. Each mL of 0.1 M sodium nitrite is equivalent to 13.71 mg of $C_7H_7NO_2$. Not less than 98.5% is found.

Melting range ⟨741⟩: between 186° and 189°.

Loss on drying ⟨731⟩—Dry it at 105° for 2 hours: it loses not more than 0.2% of its weight.

Residue on ignition (Reagent test): not more than 0.1%.

BRIEFING

Paraformaldehyde, *USP 28* page 2831—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-18

Change to read:

Paraformaldehyde, $(CH_2O)_n$—Fine, white powder. ~~having the characteristic odor of formaldehyde.~~

▲▲*USP29*
Assay—Transfer about 1 g, accurately weighed, to a 250-mL conical flask containing 50.0 mL of 1 N sodium hydroxide VS, and mix by swirling. Immediately, and slowly, add 50 mL of hydrogen peroxide TS, previously neutralized to bromothymol blue, through a small funnel placed in the neck of the flask. After the reaction moderates, rinse the funnel and inner wall of the flask with water, allow the solution to stand for 30 minutes, add bromothymol blue TS, and titrate the excess alkali with 1 N sulfuric acid VS. Each mL of 1 N sodium hydroxide is equivalent to 30.03 mg of HCHO: not less than 95% is found.

Residue on ignition: not more than 0.1%.

In-Process Revision

Solubility in ammonia—Dissolve 5 g in 50 mL of ammonia TS: a practically clear, colorless solution results.

Reaction—Shake 1 g with 20 mL of water for about 1 minute, and filter: the filtrate is neutral to litmus.

BRIEFING

Propionic Anhydride, *USP 28* page 2835—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-19

Change to read:

Propionic Anhydride, $C_6H_{10}O_3$—**130.14**—Colorless liquid. ~~having a pungent odor.~~

▲▲*USP29*
Is decomposed by water. Soluble in methanol, in alcohol, in ether, and in chloroform.

Assay—Accurately weigh about 350 mg into a tared, glass-stoppered flask containing 50 mL of dimethylformamide previously neutralized to the thymol blue endpoint with 0.1 N sodium methoxide in methanol VS. Titrate with 0.1 N sodium methoxide in methanol VS to the thymol blue endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium methoxide is equivalent to 13.014 mg of $C_6H_{10}O_3$. Not less than 97.0% is found.

Refractive index ⟨831⟩: between 1.4035 and 1.4045 at 20°.

BRIEFING

Pyrrole, *USP 28* page 2836—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-21

Change to read:

Pyrrole, C_4H_5N—**67.09**—Clear liquid, colorless when freshly distilled, becoming yellow in a few days. ~~Has a characteristic odor.~~

▲▲*USP29*
Specific gravity: about 0.94. Insoluble in water; soluble in alcohol, in benzene, and in ether.

Boiling range (Reagent test)—Not less than 90% distills between 128° and 132°.

BRIEFING

Rose Bengal Sodium, *USP 28* page 2837—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-22

Change to read:

Rose Bengal Sodium (*Disodium Salt of 4,5,6,7-Tetrachloro-2′,4′,5′,7′-tetraiodofluorescein*), $C_{20}H_2Cl_4I_4Na_2O_5$—**1017.64**—Fine, rose-colored crystals or crystalline powder. ~~Is practically odorless.~~

▲▲*USP29*
Soluble in water.

NOTE—Render commercially available material suitably pure by the following treatment. Dissolve 8 g in 200 mL of water, and adjust to a pH between 10 and 11, using short-range pH indicator paper. Add 200 mL of acetone, while stirring gently, then add dilute hydrochloric acid (1 in 10), while continuing to stir, until the pH of the solution reaches 4.0. Add 400 mL more of water, with stirring, and continue the stirring for 5 minutes. Filter the crystals on a filtering funnel, and return the crystals to the beaker used for crystallization. Recrystallize three more times in the same manner, and dry the crystals at 110° for 12 hours. Store in an amber bottle in a refrigerator at a temperature between 2° and 8°. Prepare this reagent fresh monthly.

Chromatographic purity—Dissolve 100 mg of rose bengal sodium, prepared as described above, in 100 mL of water, and apply 10 µL of the solution on suitable chromatographic paper. Develop the chromatogram by ascending chromatography, using a mixture of 1 part of dilute alcohol (1 in 4) and 1 part of dilute stronger ammonia water (1 in 12). Examine the chromatogram in daylight and under UV light (360 nm): no colored or fluorescent spot is visible other than the rose bengal sodium spot.

[NOTE—A suitable grade is available commercially as "Silica Gel H".]

BRIEFING

Silver Oxide, *USP 28* page 2839—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-23

Change to read:

Silver Oxide, Ag_2O—**231.74**—Brownish-black, heavy ~~odorless~~

▲▲*USP29*
powder. Slowly decomposes on exposure to light. Absorbs carbon dioxide when moist. Practically insoluble in water; freely soluble in dilute nitric acid and in ammonia; insoluble in alcohol. Store in well-closed containers; do not expose to ammonia fumes or easily oxidizable substances.

Assay—Dissolve about 500 mg, previously dried at 120° for 3 hours and accurately weighed, in a mixture of 20 mL of water and 5 mL of nitric acid. Dilute with 100 mL of water, add 2 mL of ferric

ammonium sulfate TS, and titrate with 0.1 N ammonium thiocyanate VS to a permanent reddish-brown color. Each mL of 0.1 N ammonium thiocyanate is equivalent to 11.59 mg of Ag_2O: not less than 99.7% of Ag_2O is found.

Loss on drying—Dry it at 120° for 3 hours: it loses not more than 0.25% of its weight.

Nitrate—To 500 mg add 30 mg of sodium carbonate and 2 mL of phenoldisulfonic acid TS, mix, and heat on a steam bath for 15 minutes. Cool, *cautiously* add 20 mL of water, render alkaline with ammonia TS, and dilute with water to 30 mL: any color produced by the test solution is not darker than that produced in a control containing 0.01 mg of NO_3 (0.002%).

Substances insoluble in nitric acid—Dissolve 5 g in a mixture of 5 mL of nitric acid and 10 mL of water, dilute with water to about 65 mL, and filter any undissolved residue on a tared filtering crucible (retain the filtrate for the test for *Substances not precipitated by hydrochloric acid*). Wash the crucible with water until the last washing shows no opalescence with 1 drop of hydrochloric acid, and dry at 105° to constant weight: the residue weighs not more than 1 mg (0.02%).

Substances not precipitated by hydrochloric acid—Dilute the filtrate obtained in the test for *Substances insoluble in nitric acid* with water to 250 mL, heat to boiling, and add, dropwise, sufficient hydrochloric acid to precipitate all of the silver (about 5 mL), avoiding any great excess. Cool, dilute with water to 300 mL, and allow to stand overnight. Filter, evaporate 200 mL of the filtrate in a suitable tared porcelain dish to dryness, and ignite: the residue weighs not more than 1.7 mg (0.05%).

Alkalinity—Heat 2 g with 40 mL of water on a steam bath for 15 minutes, cool, and dilute with water to 50 mL. Filter, discarding the first 10 mL of the filtrate. To 25 mL of the subsequent filtrate add 2 drops of phenolphthalein TS, and titrate with 0.02 N hydrochloric acid VS to the disappearance of any pink color: not more than 0.20 mL is required (0.016% as NaOH).

BRIEFING

Sodium Arsenite, *USP 28* page 2839—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-24

Change to read:

Sodium Arsenite, $NaAsO_2$—**129.91**—White, crystalline~~, odorless~~

▲▲*USP29*
powder. Soluble in water; slightly soluble in alcohol.

Assay—Transfer about 5.5 g, accurately weighed, to a 500-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Pipet 25 mL of this solution into a suitable container, add 50 mL of water and 5 g of dibasic sodium phosphate, swirl to dissolve, and titrate with 0.1 N iodine VS, adding 3 mL of starch TS as the endpoint is approached. Each mL of 0.1 N iodine is equivalent to 3.746 mg of As. Between 57.0% and 60.5% is found (equivalent to 98.8% to 104.9% of $NaAsO_2$).

Chloride (Reagent test)—One g shows not more than 0.10 mg of Cl (0.01%).

Heavy metals—Dissolve 200 mg in 8 mL of dilute hydrochloric acid (3 in 8), and evaporate on a steam bath to dryness. Dissolve the residue in 5 mL of dilute hydrochloric acid (2 in 5), and again evaporate to dryness. Dissolve the residue in 10 mL of water, and add 2 mL of diluted acetic acid and 10 mL of hydrogen sulfide TS. Any brown color produced is not darker than that of a control containing 0.01 mg of added Pb (0.005%).

Iron—Dissolve 1 g in 20 mL of dilute hydrochloric acid (1 in 5), and add, dropwise, a slight excess of bromine TS. Boil the solution to remove the excess bromine, cool, dilute with water to 40 mL, and add 10 mL of ammonium thiocyanate solution (3 in 10). Any red color produced is not darker than that of a control containing 0.02 mg of added Fe (0.02%).

Sulfide—Dissolve 1 g in 20 mL of water, and add 5 drops of lead acetate TS: no brown color is produced (about 0.0005%).

Sulfate (Reagent test, *Method II*)—Dissolve 5 g in 100 mL of water, add methyl orange TS, neutralize with 1 N hydrochloric acid, add 3 mL of the acid in excess, and filter: the filtrate yields not more than 3 mg of residue (0.02%).

BRIEFING

Sodium Chromate, *USP 28* page 2840—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-26

Change to read:

Sodium Chromate, $Na_2CrO_4 \cdot 4H_2O$—**234.03**—Lemon-yellow ~~odorless~~

▲▲*USP29*
crystals. Soluble in water.

Assay—Accurately weigh about 300 mg, and dissolve in 10 mL of water contained in a 500-mL flask. Add 3 g of potassium iodide and 10 mL of diluted sulfuric acid, and dilute with 350 mL of oxygen-free and carbon dioxide-free water. Titrate the liberated iodine with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Each mL of 0.1 N sodium thiosulfate consumed is equivalent to 7.802 mg of $Na_2CrO_4 \cdot 4H_2O$. Not less than 99% is found.

Insoluble matter (Reagent test): not more than 1 mg, from 20 g dissolved in 150 mL of water (0.005%).

Aluminum—Dissolve 20 g in 140 mL of water, filter, and add 5 mL of glacial acetic acid to the filtrate. Add stronger ammonia water until alkaline, and digest for 2 hours on a steam bath. Filter through hardened filter paper, wash thoroughly, ignite, and weigh: the residue weighs not more than 0.8 mg (0.002%).

Calcium—Determine as directed in the test for calcium for ACS reagent grade Potassium Chromate (0.005%).

Chloride—Determine as directed in the test for chloride for ACS reagent grade Potassium Chromate (about 0.005%).

Sulfate—Determine as directed in the test for sulfate for ACS reagent grade Potassium Dichromate, but add 4.5 mL of hydrochloric acid to the water used to dissolve the test specimen: the residue weighs not more than 2.4 mg (0.01%).

In-Process Revision

BRIEFING

Sodium Glycocholate, *USP 28* page 2841—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-27

Change to read:

Sodium Glycocholate, $C_{26}H_{42}NNaO_6$—**487.60**—White to tan ~~odorless or practically odorless~~

▲▲*USP29*
powder. Is hygroscopic. Freely soluble in water and in alcohol.

Specific rotation ⟨781⟩: between +28° and +31°, calculated on the dried basis (it is rendered anhydrous by drying at 100° for 2 hours), determined at 20° in a solution containing 10 mg per mL.

Nitrogen, *Method I* ⟨461⟩: between 2.6% and 3.2% of N is found, calculated on the dried basis.

BRIEFING

Sodium 1-Hexanesulfonate Monohydrate. This new reagent is used to prepare the *Buffer solution* in the test for *Chromatographic purity* and in the *Assay* under *Methscopolamine Bromide,* which appears elsewhere in this number of *PF.*

(HDQ: M. Marques) RTS—41998-2

Add the following:

▲**Sodium 1-Hexanesulfonate Monohydrate,** $C_6H_{13}NaO_3S \cdot H_2O$—**206.23** [*2832-45-3*]—Use a suitable grade.▲*USP29*

BRIEFING

Tetramethylammonium Hydroxide, *USP 28* page 2846—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-30

Change to read:

Tetramethylammonium Hydroxide, $(CH_3)_4NOH$—**91.15**—Available as an approximately 10% or approximately 25% aqueous solution, or as the crystalline pentahydrate. Is clear and colorless. ~~and has a strong, ammonia-like odor.~~

▲▲*USP29*
Tetramethylammonium hydroxide is a stronger base than ammonia, and rapidly absorbs carbon dioxide from the air. Store in tight containers.

Assay—Accurately weigh a glass-stoppered flask containing about 15 mL of water. Add a quantity of a solution of tetramethylammonium hydroxide, equivalent to about 200 mg of $(CH_3)_4NOH$, and again weigh. Add methyl red TS, and titrate the solution with 0.1 N hydrochloric acid VS: each mL of 0.1 N acid is equivalent to 9.115 mg of $(CH_3)_4NOH$.

Residue on evaporation—Evaporate 5 mL of solution on a steam bath, and dry at 105° for 1 hour: the weight of the residue is equivalent to not more than 0.02% of the weight of the test specimen.

Ammonia and other amines—Accurately weigh a quantity of solution, corresponding to about 300 mg of $(CH_3)_4NOH$, in a low-form weighing bottle tared with 5 mL of water. Add a slight excess of 1 N hydrochloric acid (about 4 mL), evaporate on a steam bath to dryness, and dry at 105° for 2 hours: the weight of the tetramethylammonium chloride so obtained, multiplied by 0.8317, represents the quantity, in mg, of $(CH_3)_4NOH$ in the portion of test specimen taken and corresponds to within 0.2% above or below that found in the *Assay.*

BRIEFING

Thioglycolic Acid, *USP 28* page 2846—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-31

Change to read:

Thioglycolic Acid (*Thioglycolic Acid*), $HSCH_2COOH$—**92.12**—A colorless or nearly colorless liquid. ~~having a strong, unpleasant odor.~~

▲▲*USP29*
Miscible with water. Soluble in alcohol.

Residue on ignition ⟨Reagent test⟩: not more than 0.1%.

Solubility—A solution of 1 mL in 10 mL of water is clear and colorless.

Sensitiveness—Mix 1 mL with 2 mL of stronger ammonia water, and dilute with water to 20 mL. Add 1 mL of this solution to a mixture of 20 mL of water and 0.1 mL of dilute ferric chloride TS (1 in 100), then add 5 mL of ammonia TS: a distinct pink color is produced.

BRIEFING

Thymol, *USP 28* page 2847—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-32

Change to read:

Thymol, $C_6H_3[CH_3][OH][CH(CH_3)_2]1,3,4$—**150.22**—Colorless, often large, crystals, or a white, crystalline powder. ~~having an aromatic, thyme-like odor.~~

▲ ▲*USP29*
Is affected by light. Has greater density than water, but when liquefied by fusion is less dense than water. Its alcohol solutions are neutral to litmus. One g dissolves in about 1000 mL of water, in 1 mL of alcohol, in 1 mL of chloroform, in 1.5 mL of ether, and in about 2 mL of olive oil. Soluble in glacial acetic acid and in fixed or volatile oils. Store in tight, light-resistant containers.

Melting range ⟨741⟩: between 48° and 51°, but when melted it remains liquid at a considerably lower temperature.

Nonvolatile matter—Volatilize 2 g on a steam bath, and dry at 105° to constant weight: the residue weighs not more than 1 mg (0.05%).

BRIEFING

***n*-Tricosane,** *USP 28* page 2848—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-33

Change to read:

***n*-Tricosane,** $C_{23}H_{48}$—**324.63**—Colorless or white, more or less translucent mass, showing a crystalline structure. ~~Odorless, or practically so.~~

▲ ▲*USP29*
Has a slightly greasy feel. Insoluble in water and in alcohol; soluble in chloroform, in ether, in volatile oils, and in most warm fixed oils; slightly soluble in dehydrated alcohol. Boils at about 380°.

Melting range ⟨741⟩: between 47° and 49°.

Suitability—Determine its suitability for use in the test for *Related compounds* under *Propoxyphene Hydrochloride* (USP monograph) as follows. Dissolve a suitable quantity in chloroform to yield a solution containing 20 µg per mL. Following the directions given in the test for *Related compounds* under *Propoxyphene Hydrochloride,* inject a suitable volume of the solution into the chromatograph, and record the chromatogram. Concomitantly record the chromatogram from the *Standard preparation* prepared as directed in the test for *Related compounds:* only one main peak is obtained from the *n*-tricosane solution, and no minor peaks are observed at, or near, the peak positions obtained for propoxyphene, acetoxy, or carbinol in the chromatogram from the *Standard preparation*.

BRIEFING

Triethylamine, *USP 28* page 2848—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-34

Change to read:

Triethylamine, $(C_2H_5)_3N$—**101.19**—Colorless liquid. ~~having a strong, ammoniacal odor.~~

▲ ▲*USP29*
Slightly soluble in water. Miscible with alcohol, with ether, and with cold water. Store in well-closed containers.

Boiling range (Reagent test): between 89° and 90°.

Absorbance—To 1 mL in a 50-mL volumetric flask add 10 mL of methanol and 1 mL of hydrochloric acid, and add chloroform to volume. The absorbance of this solution, determined at the wavelength of maximum absorbance at about 285 nm, with a suitable spectrophotometer, does not exceed 0.01. [NOTE—If the absorbance exceeds 0.01, purify the triethylamine as follows. Reflux 100 mL with 20 mL of water and 2 g of sodium hydrosulfite for not less than 8 hours, wash with water, dry by refluxing, using a Dean-Stark trap, and distill, collecting only the first 75 mL of the filtrate. Store over anhydrous sodium carbonate or anhydrous potassium carbonate.]

BRIEFING

2,4,6-Trimethylpyridine, *USP 28* page 2849—See briefing under *Acetanilide.*

(HDQ: M. Marques) RTS—42104-35

Change to read:

2,4,6-Trimethylpyridine (*5-Collidine*), $C_8H_{11}N$—**121.18**—Clear, colorless liquid. ~~having an aromatic odor.~~

▲ ▲*USP29*
Soluble in cold water and less soluble in hot water; soluble in alcohol, in chloroform, and in methanol. Miscible with ether.

Assay—Inject an appropriate test specimen into a suitable gas chromatograph (see *Chromatography* ⟨621⟩), helium being used as a carrier gas. The following conditions have been found suitable: a 3-mm × 1.85-m stainless steel column containing phase G16 on support S1A; the injection port, column, and detector temperatures are maintained at 180°, 165°, and 270°, respectively, and a flame-ionization detector is used. The area of the $C_8H_{11}N$ peak is not less than 98% of the total peak area.

Refractive index ⟨831⟩: between 1.4970 and 1.4990, at 20°.

In-Process Revision

REFERENCE TABLES

BRIEFING

Container Specifications for Capsules and Tablets, *USP 28* page 2869 and page 120 of *PF* 31(1) [Jan.–Feb. 2005].

(HDQ) RTS—40316-2

The following table is provided as a reminder for the pharmacist engaged in the typical dispensing situation who already is acquainted with the *Packaging and storage* requirements set forth in the individual monographs. It lists the capsules and tablets that are official in the United States Pharmacopeia and indicates the relevant tight (T), well-closed (W), and light-resistant (LR) specifications applicable to containers in which the drug that is repackaged should be dispensed.

This table is not intended to replace, nor should it be interpreted as replacing, the definitive requirements stated in the individual monographs.

Container Specifications for Capsules and Tablets

Monograph Title	*Container Specification*
Add the following:	
■Acetaminophen Tablets, Extended-Release	$T_{■1S}$ (*USP28*)
Add the following:	
■Benazepril Tablets	$W_{■2S}$ (*USP28*)
Add the following:	
■Bismuth Subsalicylate Tablets	$T_{■2S}$ (*USP28*)
Add the following:	
■Cefaclor Tablets	$T_{■2S}$ (*USP28*)
Add the following:	
■Chromium Picolinate Tablets	$W_{■2S}$ (*USP28*)
Add the following:	
■Clarithromycin Tablets, Extended-Release	$W_{■2S}$ (*USP28*)

Container Specifications for Capsules and Tablets *(Continued)*

Aspirin, Caffeine, and Dihydrocodeine Bitartrate Capsules—See PF Vol. 30 No. 1, page 60.
Atenolol—See PF Vol. 29 No. 5, page 1416.
Atenolol Tablets—See PF Vol. 29 No. 1, page 49.
Atracurium Besylate—See PF Vol. 29 No. 6, page 1846.
Atracurium Besylate Injection—See PF Vol. 30 No. 3, page 808.
Atropine Sulfate—See PF Vol. 29 No. 6, page 1847.
Aurothioglucose—See PF Vol. 29 No. 6, page 1847.
Avobenzone—See PF Vol. 30 No. 4, page 1164.
Azaperone—See PF Vol. 29 No. 6, page 1847.
Baclofen Tablets—See PF Vol. 30 No. 1, page 61.
Benazepril Hydrochloride—See PF Vol. 29 No. 5, page 1422.
Benazepril Hydrochloride Tablets—See PF Vol. 29 No. 3, page 606.
Benzocaine—See PF Vol. 30 No. 3, page 809.
Benzoyl Peroxide Gel—See PF Vol. 30 No. 4, page 1165.
Benzoyl Peroxide Lotion—See PF Vol. 30 No. 2, page 456.
Benzoyl Peroxide Topical Emulsion—See PF Vol. 30 No. 2, page 456.
Benztropine Mesylate—See PF Vol. 29 No. 6, page 1848.
Benzyl Benzoate Lotion—See PF Vol. 30 No. 2, page 457.
Benzyl Benzoate Topical Emulsion—See PF Vol. 30 No. 2, page 457.
Betahistine Hydrochloride—See PF Vol. 30 No. 5, page 1584.
Betamethasone Tablets—See PF Vol. 30 No. 1, page 62.
Betamethasone Dipropionate Lotion—See PF Vol. 30 No. 2, page 458.
Betamethasone Dipropionate Topical Emulsion—See PF Vol. 30 No. 2, page 459.
Betamethasone Sodium Phosphate—See PF Vol. 30 No. 4, page 1166.
Betamethasone Valerate Lotion—See PF Vol. 30 No. 2, page 461.
Betamethasone Valerate Topical Emulsion—See PF Vol. 30 No. 2, page 461.
Bethanechol Chloride—See PF Vol. 30 No. 5, page 1586.
Bethanechol Chloride Tablets—See PF Vol. 30 No. 5, page 1587.

In-Process Revision

Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Metal or Plastic Carriers—See PF Vol. 30 No. 1, page 63.
Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions—See PF Vol. 30 No. 1, page 66.
Biperiden—See PF Vol. 29 No. 6, page 1851.
Bismuth Subsalicylate Oral Suspension—See PF Vol. 30 No. 4, page 1166.
Bismuth Subsalicylate Tablets—See PF Vol. 30 No. 4, page 1167.
Bretylium Tosylate—See PF Vol. 29 No. 5, page 1431.
Bretylium Tosylate in Dextrose Injection—See PF Vol. 30 No. 5, page 1589.
Bromodiphenhydramine Hydrochloride and Codeine Phosphate Syrup—See PF Vol. 27 No. 5, page 2980.
Brompheniramine Maleate—See PF Vol. 29 No. 5, page 1431.
Brompheniramine Maleate Tablets—See PF Vol. 30 No. 6, page 1978.
Budesonide—See PF Vol. 30 No. 6, page 1978.
Bumetanide—See PF Vol. 29 No. 5, page 1432.
Bupivacaine Hydrochloride—See PF Vol. 30 No. 5, page 1589.
Bupivacaine Hydrochloride in Dextrose Injection—See PF Vol. 30 No. 5, page 1590.
Bupropion Hydrochloride Extended-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 142.
Butabarbital Sodium Tablets—See PF Vol. 31 No. 1, page 41.
Butalbital, Acetaminophen, and Caffeine Tablets—See PF Vol. 30 No. 1, page 80.
Butorphanol Tartrate—See PF Vol. 29 No. 6, page 1851.
Caffeine—See PF Vol. 30 No. 4, page 1168.
Caffeine Citrate Injection—See PF Vol. 30 No. 5, page 1590.
Caffeine Citrate Oral Solution—See PF Vol. 30 No. 5, page 1593.
Calcitonin Salmon—See PF Vol. 30 No. 4, page 1169.
Calcitonin Salmon Injection—See PF Vol. 30 No. 4, page 1177.
Calcitonin Salmon Nasal Solution—See PF Vol. 30 No. 4, page 1178.
Calcitriol—See PF Vol. 29 No. 5, page 1433.
Calcitriol Injection—See PF Vol. 29 No. 5, page 1434.
Calcium Carbonate and Magnesia Tablets—See PF Vol. 29 No. 6, page 1852.
Calcium Carbonate and Magnesia Chewable Tablets—See PF Vol. 29 No. 6, page 1852.
Calcium Carbonate, Magnesia, and Simethicone Tablets—See PF Vol. 29 No. 6, page 1853.
Calcium Carbonate, Magnesia, and Simethicone Chewable Tablets—See PF Vol. 29 No. 6, page 1854.
Calcium Chloride—See PF Vol. 29 No. 5, page 1436.
Calcium Lactate Tablets—See PF Vol. 30 No. 1, page 81.
Calcium Pantothenate Tablets—See PF Vol. 30 No. 1, page 81.
Carbamazepine Tablets (Harmonization)—See PF Vol. 31 No. 1, page 143.
Carbamazepine Extended-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 143.
Carbidopa—See PF Vol. 30 No. 3, page 811.
Carboprost Tromethamine—See PF Vol. 30 No. 1, page 82.
Carboxymethylcellulose Sodium Suspension—See PF Vol. 30 No. 3, page 812.
Cefaclor Capsules—See PF Vol. 29 No. 1, page 56.
Cefaclor Tablets—See PF Vol. 29 No. 6, page 1858.
Cefaclor Extended-Release Tablets—See PF Vol. 31 No. 1, page 42.
Cefaclor Extended-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 144.
Cefazolin Ophthalmic Solution—See PF Vol. 28 No. 2, page 261.
Chlordiazepoxide Hydrochloride—See PF Vol. 29 No. 6, page 1859.
Chlordiazepoxide Hydrochloride and Clidinium Bromide Capsules—See PF Vol. 30 No. 1, page 83.
Chloroprocaine Hydrochloride—See PF Vol. 29 No. 5, page 1438.
Chloroquine—See PF Vol. 29 No. 6, page 1859.
Chlorothiazide—See PF Vol. 29 No. 5, page 1439.
Chlorpheniramine Maleate—See PF Vol. 29 No. 5, page 1439.
Chlorpheniramine Maleate Extended-Release Capsules (Harmonization)—See PF Vol. 31 No. 1, page 144.
Chlorpheniramine Maleate and Phenylpropanolamine Hydrochloride Extended-Release Capsules (Harmonization)—See PF Vol. 31 No. 1, page 145.
Chlorpheniramine Maleate and Phenylpropanolamine Hydrochloride Extended-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 145.
Chlorpheniramine Maleate and Pseudoephedrine Hydrochloride Extended-Release Capsules (Harmonization)—See PF Vol. 31 No. 1, page 145.
Chlorpromazine Hydrochloride—See PF Vol. 29 No. 6, page 1860.
Chromic Chloride—See PF Vol. 29 No. 5, page 1440.
Ciclopirox—See PF Vol. 29 No. 2, page 393.
Ciclopirox Olamine—See PF Vol. 30 No. 3, page 813.
Ciclopirox Olamine Cream—See PF Vol. 30 No. 5, page 1595.
Ciclopirox Olamine Topical Suspension—See PF Vol. 30 No. 5, page 1596.
Cimetidine—See PF Vol. 29 No. 5, page 1440.
Ciprofloxacin—See PF Vol. 29 No. 6, page 1860.
Ciprofloxacin Hydrochloride—See PF Vol. 29 No. 6, page 1861.
Ciprofloxacin Injection—See PF Vol. 31 No. 1, page 42.
Clarithromycin—See PF Vol. 30 No. 4, page 1179.
Clarithromycin Tablets—See PF Vol. 30 No. 4, page 1182.
Clarithromycin Extended-Release Tablets—See PF Vol. 30 No. 4, page 1183.
Clindamycin Injection—See PF Vol. 30 No. 5, page 1597.
Clonidine—See PF Vol. 29 No. 1, page 58.
Clonidine Transdermal System (Harmonization)—See PF Vol. 31 No. 1, page 146.
Clopidogrel Tablets—See PF Vol. 30 No. 3, page 820.
Clorazepate Dipotassium—See PF Vol. 30 No. 6, page 1982.
Clotrimazole Lotion—See PF Vol. 30 No. 2, page 473.
Clotrimazole Topical Emulsion—See PF Vol. 30 No. 2, page 474.
Clozapine—See PF Vol. 30 No. 6, page 1984.
Colchicine Tablets—See PF Vol. 30 No. 1, page 91.
Cyanocobalamin Co 57 Capsules—See PF Vol. 29 No. 2, page 397.
Codeine Phosphate—See PF Vol. 30 No. 5, page 1597.
Cortisone Acetate—See PF Vol. 29 No. 5, page 1447.
Cupric Chloride—See PF Vol. 29 No. 6, page 1864.
Cupric Sulfate—See PF Vol. 29 No. 5, page 1447.
Cyclandelate—See PF Vol. 30 No. 6, page 1985.
Cyclizine Hydrochloride Tablets—See PF Vol. 30 No. 1, page 91.
Cyclophosphamide Tablets—See PF Vol. 30 No. 4, page 1186.
Cyclosporine Capsules—See PF Vol. 27 No. 4, page 2721.
Cysteine Hydrochloride—See PF Vol. 30 No. 5, page 1598.
Dalteparin Sodium—See PF Vol. 30 No. 5, page 1598.
Desflurane—See PF Vol. 30 No. 4, page 1187.
Deslanoside—See PF Vol. 29 No. 5, page 1448.
Desogestrel—See PF Vol. 28 No. 6, page 1785.
Desogestrel and Ethinyl Estradiol Tablets—See PF Vol. 30 No. 5, page 1604.
Desoxycorticosterone Acetate—See PF Vol. 29 No. 5, page 1456.
Desoxycorticosterone Pivalate—See PF Vol. 29 No. 6, page 1865.
Dexamethasone Acetate—See PF Vol. 29 No. 5, page 1457.
Dextran 1—See PF Vol. 29 No. 6, page 1866.
Dextran 40—See PF Vol. 29 No. 6, page 1866.
Dextran 70—See PF Vol. 29 No. 6, page 1868.
Dextroamphetamine Sulfate—See PF Vol. 30 No. 3, page 831.
Dextroamphetamine Sulfate Capsules—See PF Vol. 30 No. 1, page 94.
Dextroamphetamine Sulfate Elixir—See PF Vol. 30 No. 5, page 1612.
Dextroamphetamine Sulfate Oral Solution—See PF Vol. 30 No. 5, page 1613.
Dextroamphetamine Sulfate Tablets—See PF Vol. 30 No. 1, page 94.
Dextrose—See PF Vol. 29 No. 5, page 1457.
Dextrose Injection—See PF Vol. 30 No. 5, page 1614.

Dextrose and Sodium Chloride Injection—See PF Vol. 30 No. 5, page 1614.
Diatrizoate Meglumine—See PF Vol. 30 No. 3, page 832.
Diatrizoate Sodium—See PF Vol. 29 No. 6, page 1868.
Diatrizoic Acid—See PF Vol. 29 No. 6, page 1869.
Diazepam—See PF Vol. 30 No. 1, page 96.
Diazepam Extended-Release Capsules (Harmonization)—See PF Vol. 31 No. 1, page 147.
Diazoxide—See PF Vol. 29 No. 5, page 1458.
Dibucaine Hydrochloride—See PF Vol. 29 No. 5, page 1458.
Diclofenac Sodium Delayed-Release Tablets—See PF Vol. 30 No. 6, page 1986.
Diclofenac Sodium Delayed-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 148.
Dicyclomine Hydrochloride—See PF Vol. 29 No. 5, page 1458.
Dicyclomine Hydrochloride Capsules—See PF Vol. 30 No. 3, page 832.
Dicyclomine Hydrochloride Tablets—See PF Vol. 30 No. 3, page 834.
Diethylcarbamazine Citrate Tablets—See PF Vol. 30 No. 1, page 97.
Diethylstilbestrol—See PF Vol. 29 No. 5, page 1463.
Diethylstilbestrol Diphosphate Tablets—See PF Vol. 30 No. 4, page 1187.
Dihydroergotamine Mesylate—See PF Vol. 29 No. 6, page 1870.
Dihydroxyaluminum Sodium Carbonate Tablets—See PF Vol. 29 No. 6, page 1873.
Dihydroxyaluminum Sodium Carbonate Chewable Tablets—See PF Vol. 29 No. 6, page 1873.
Diltiazem Hydrochloride Extended-Release Capsules—See PF Vol. 30 No. 2, page 478.
Diltiazem Hydrochloride Extended-Release Capsules (Harmonization)—See PF Vol. 31 No. 1, page 148.
Dimenhydrinate—See PF Vol. 29 No. 5, page 1466.
Dimenhydrinate Oral Solution—See PF Vol. 30 No. 4, page 1190.
Dimenhydrinate Syrup—See PF Vol. 30 No. 4, page 1190.
Dimenhydrinate Tablets—See PF Vol. 30 No. 4, page 1191.
Dimercaprol—See PF Vol. 29 No. 5, page 1466.
Dimercaprol Injection—See PF Vol. 30 No. 6, page 1987.
Diphenhydramine Hydrochloride—See PF Vol. 29 No. 5, page 1466.
Diphenhydramine Hydrochloride Capsules—See PF Vol. 30 No. 1, page 97.
Diphenhydramine and Pseudoephedrine Capsules—See PF Vol. 30 No. 1, page 98.
Diphenoxylate Hydrochloride and Atropine Sulfate Oral Solution—See PF Vol. 30 No. 6, page 1987.
Dipyridamole—See PF Vol. 29 No. 5, page 1467.
Dirithromycin Delayed-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 151.
Disopyramide Phosphate Extended-Release Capsules (Harmonization)—See PF Vol. 31 No. 1, page 152.
Divalproex Sodium Delayed-Release Tablets—See PF Vol. 30 No. 3, page 835.
Divalproex Sodium Delayed-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 153.
Dobutamine Hydrochloride—See PF Vol. 29 No. 5, page 1467.
Dobutamine in Dextrose Injection—See PF Vol. 30 No. 5, page 1615.
Dolasetron Mesylate—See PF Vol. 29 No. 5, page 1468.
Dolasetron Mesylate Injection—See PF Vol. 29 No. 1, page 60.
Dopamine Hydrochloride—See PF Vol. 29 No. 5, page 1469.
Dopamine Hydrochloride and Dextrose Injection—See PF Vol. 30 No. 5, page 1615.
Doxapram Hydrochloride—See PF Vol. 29 No. 6, page 1874.
Doxazosin Mesylate—See PF Vol. 29 No. 5, page 1470.
Doxazosin Tablets—See PF Vol. 29 No. 1, page 64.
Doxepin Hydrochloride Capsules—See PF Vol. 30 No. 6, page 1987.
Doxycycline Hyclate Delayed-Release Capsules (Harmonization)—See PF Vol. 31 No. 1, page 154.
Droperidol—See PF Vol. 29 No. 6, page 1875.
Dyclonine Hydrochloride—See PF Vol. 31 No. 1, page 42.
Dyphylline—See PF Vol. 29 No. 5, page 1473.
Dyphylline and Guaifenesin Tablets—See PF Vol. 30 No. 1, page 100.
Edetate Calcium Disodium—See PF Vol. 29 No. 5, page 1474.
Edetate Disodium—See PF Vol. 29 No. 5, page 1474.
Edrophonium Chloride—See PF Vol. 29 No. 5, page 1475.
Egg Phospholipids—See PF Vol. 29 No. 2, page 401.
Multiple Electrolytes Injection Type 1—See PF Vol. 30 No. 3, page 836.
Multiple Electrolytes Injection Type 2—See PF Vol. 30 No. 3, page 838.
Multiple Electrolytes and Dextrose Injection Type 1—See PF Vol. 30 No. 5, page 1616.
Multiple Electrolytes and Dextrose Injection Type 2—See PF Vol. 30 No. 3, page 838.
Multiple Electrolytes and Dextrose Injection Type 3—See PF Vol. 30 No. 3, page 839.
Emetine Hydrochloride—See PF Vol. 29 No. 6, page 1875.
Enalapril Maleate and Hydrochlorothiazide Tablets—See PF Vol. 30 No. 6, page 1988.
Enoxaparin Sodium—See PF Vol. 29 No. 6, page 1876.
Enoxaparin Sodium Injection—See PF Vol. 29 No. 6, page 1882.
Ensulizole—See PF Vol. 30 No. 4, page 1191.
Ephedrine Sulfate—See PF Vol. 30 No. 3, page 840.
Epinephrine—See PF Vol. 29 No. 5, page 1476.
Epinephrine Injection—See PF Vol. 31 No. 1, page 43.
Epinephrine Nasal Solution—See PF Vol. 30 No. 4, page 1192.
Epinephryl Borate Opthalmic Solution—See PF Vol. 30 No. 4, page 1192.
Ergoloid Mesylates Tablets—See PF Vol. 30 No. 4, page 1193.
Ergonovine Maleate—See PF Vol. 29 No. 5, page 1478.
Ergotamine Mesylates Sublingual Tablets—See PF Vol. 30 No. 4, page 1196.
Ergotamine Tartrate—See PF Vol. 29 No. 6, page 1884.
Ergotamine Tartrate Tablets—See PF Vol. 30 No. 4, page 1198.
Ergotamine Tartrate Sublingual Tablets—See PF Vol. 30 No. 4, page 1199.
Ergotamine Tartrate and Caffeine Suppositories—See PF Vol. 30 No. 6, page 1988.
Ergotamine Tartrate and Caffeine Tablets—See PF Vol. 30 No. 6, page 1988.
Erythromycin Delayed-Release Capsules (Harmonization)—See PF Vol. 31 No. 1, page 154.
Erythromycin Delayed-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 154.
Estradiol—See PF Vol. 29 No. 5, page 1478.
Estradiol Transdermal System—See PF Vol. 30 No. 4, page 1201.
Estradiol and Norethindrone Acetate Tablets—See PF Vol. 30 No. 6, page 1989.
Conjugated Estrogens—See PF Vol. 30 No. 3, page 840.
Conjugated Estrogens Tablets (Harmonization)—See PF Vol. 31 No. 1, page 155.
Estrone—See PF Vol. 29 No. 5, page 1479.
Ethacrynic Acid—See PF Vol. 29 No. 5, page 1479.
Ethacrynic Acid Tablets—See PF Vol. 30 No. 6, page 1993.
Ethosuximide Capsules—See PF Vol. 30 No. 1, page 102.
Ethotoin—See PF Vol. 29 No. 1, page 66.
Etidronate Disodium—See PF Vol. 30 No. 5, page 1616.
Etidronate Disodium Tablets—See PF Vol. 30 No. 5, page 1619.
Etodolac Extended-Release Tablets—See PF Vol. 30 No. 4, page 1203.
Famotidine for Oral Suspension—See PF Vol. 30 No. 6, page 1993.
Famoditine Tablets—See PF Vol. 30 No. 6, page 1995.
Felodipine Extended-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 156.
Fenbendazole—See PF Vol. 30 No. 4, page 1205.
Fenoldapam Mesylate—See PF Vol. 29 No. 5, page 1479.
Fentanyl Citrate—See PF Vol. 29 No. 6, page 1885.

Ferrous Fumarate and Docusate Sodium Extended-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 158.
Ferumoxides Injection—See PF Vol. 28 No. 3, page 758.
Fexofenadine Hydrochloride—See PF Vol. 30 No. 4, page 1208.
Fexofenadine Hydrochloride Capsules—See PF Vol. 30 No. 3, page 845.
Fexofenadine Hydrochloride Tablets—See PF Vol. 30 No. 6, page 1997.
Cryopreserved Human Fibroblast-Derived Dermal Substitute—See PF Vol. 30 No. 4, page 1211.
Human Fibroblast-Derived Temporary Skin Substitute—See PF Vol. 30 No. 4, page 1221.
Finasteride Tablets—See PF Vol. 30 No. 5, page 1620.
Flucytosine—See PF Vol. 30 No. 5, page 1621.
Fludarabine Phosphate—See PF Vol. 30 No. 5, page 1621.
Flumazenil—See PF Vol. 30 No. 4, page 1223.
Flumazenil Injection—See PF Vol. 29 No. 5, page 1484.
Flunixin Meglumine—See PF Vol. 29 No. 6, page 1886.
Fluoxetine Capsules—See PF Vol. 30 No. 3, page 849.
Fluoxetine Delayed-Release Capsules—See PF Vol. 30 No. 3, page 849.
Fluoxetine Tablets—See PF Vol. 30 No. 3, page 852.
Fluphenazine Decanoate—See PF Vol. 29 No. 6, page 1887.
Fluphenazine Enanthate—See PF Vol. 29 No. 6, page 1887.
Fluphenazine Hydrochloride—See PF Vol. 29 No. 6, page 1888.
Flurandrenolide Lotion—See PF Vol. 30 No. 2, page 489.
Flurandrenolide Topical Emulsion—See PF Vol. 30 No. 2, page 489.
Flurazepam Hydrochloride—See PF Vol. 30 No. 4, page 1229.
Fluticasone Propionate—See PF Vol. 30 No. 4, page 1230.
Fluvastatin Sodium—See PF Vol. 31 No. 1, page 43.
Fluvastatin Capsules—See PF Vol. 31 No. 1, page 47.
Fluvoxamine Maleate—See PF Vol. 30 No. 4, page 1240.
Fluvoxamine Maleate Tablets—See PF Vol. 30 No. 5, page 1622.
Folic Acid Tablets—See PF Vol. 29 No. 2, page 409.
Fosinopril Sodium—See PF Vol. 30 No. 6, page 2001.
Fosinopril Sodium Tablets—See PF Vol. 30 No. 6, page 2004.
Fosinopril Sodium and Hydrochlorothiazide Tablets—See PF Vol. 30 No. 6, page 2006.
Fosphenytoin Sodium—See PF Vol. 29 No. 6, page 1888.
Fructose—See PF Vol. 29 No. 5, page 1496.
Furosemide—See PF Vol. 29 No. 5, page 1497.
Gabapentin—See PF Vol. 31 No. 1, page 50.
Gabapentin Capsules—See PF Vol. 28 No. 2, page 298.
Gadodiamide—See PF Vol. 29 No. 6, page 1889.
Gadoteridol—See PF Vol. 29 No. 6, page 1890.
Gallamine Triethiodide—See PF Vol. 29 No. 5, page 1503.
Ganciclovir—See PF Vol. 29 No. 6, page 1890.
Garlic Delayed-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 159.
Gemcitabine for Injection—See PF Vol. 30 No. 4, page 1246.
Gemfibrozil Capsules—See PF Vol. 30 No. 4, page 1246.
Gemfibrozil Tablets—See PF Vol. 30 No. 4, page 1247.
Glimepiride—See PF Vol. 30 No. 4, page 1247.
Glucagon—See PF Vol. 30 No. 5, page 1625.
Glyburide Tablets—See PF Vol. 29 No. 2, page 418.
Glycerin—See PF Vol. 29 No. 6, page 1895.
Glycopyrrolate—See PF Vol. 29 No. 5, page 1503.
Glycopyrrolate Tablets—See PF Vol. 30 No. 1, page 105.
Gold Sodium Thiomalate—See PF Vol. 29 No. 6, page 1895.
Gonadorelin Acetate—See PF Vol. 30 No. 4, page 1250.
Chorionic Gonadotropin—See PF Vol. 29 No. 6, page 1896.
Graftskin—See PF Vol. 30 No. 2, page 490.
Guaifenesin Capsules—See PF Vol. 30 No. 1, page 106.
Guaifenesin Tablets—See PF Vol. 30 No. 1, page 107.
Haloperidol—See PF Vol. 29 No. 6, page 1897.
Helium—See PF Vol. 30 No. 2, page 502.
Histamine Phosphate—See PF Vol. 29 No. 5, page 1504.
Hydralazine Hydrochloride—See PF Vol. 29 No. 5, page 1505.
Hydrocodone Bitartrate—See PF Vol. 30 No. 5, page 1628.
Hydrocodone Bitartrate and Acetaminophen Tablets—See PF Vol. 30 No. 1, page 109.
Hydrocodone Bitartrate and Homatropine Methylbromide Tablets—See PF Vol. 30 No. 3, page 853.
Hydrocortisone—See PF Vol. 29 No. 5, page 1506.
Hydrocortisone Acetate Lotion—See PF Vol. 30 No. 2, page 504.
Hydrocortisone Acetate Ointment—See PF Vol. 30 No. 2, page 504.
Hydrocortisone Acetate Topical Emulsion—See PF Vol. 30 No. 2, page 504.
Hydrocortisone Lotion—See PF Vol. 30 No. 2, page 505.
Hydrocortisone Topical Emulsion—See PF Vol. 30 No. 2, page 506.
Hydrogen Peroxide Concentrate—See PF Vol. 30 No. 5, page 1629.
Hydromorphone Hydrochloride—See PF Vol. 30 No. 4, page 1254.
Hydroxyprogesterone Caproate—See PF Vol. 29 No. 5, page 1506.
Hydroxyzine Hydrochloride—See PF Vol. 29 No. 6, page 1902.
Hydroxyzine Hydrochloride Tablets (Harmonization)—See PF Vol. 31 No. 1, page 159.
Hyoscyamine Sulfate—See PF Vol. 29 No. 5, page 1507.
Hyoscyamine Sulfate Elixir—See PF Vol. 30 No. 3, page 857.
Hyoscyamine Sulfate Injection—See PF Vol. 30 No. 3, page 858.
Hyoscyamine Sulfate Oral Solution—See PF Vol. 30 No. 3, page 860.
Hyoscyamine Sulfate Tablets—See PF Vol. 30 No. 3, page 861.
Hypromellose Ophthalmic Solution—See PF Vol. 30 No. 3, page 862.
Ibuprofen Capsules—See PF Vol. 26 No. 2, page 360.
Imipramine Hydrochloride—See PF Vol. 29 No. 6, page 1904.
Inamrinone—See PF Vol. 29 No. 5, page 1507.
Indigotindisulfonate Sodium—See PF Vol. 29 No. 6, page 1905.
Indinavir Sulfate—See PF Vol. 30 No. 3, page 862.
Indinavir Sulfate Capsules—See PF Vol. 30 No. 2, page 508.
Indocyanine Green—See PF Vol. 29 No. 6, page 1905.
Indomethacin Extended-Release Capsules (Harmonization)—See PF Vol. 31 No. 1, page 159.
Indomethacin Topical Gel—See PF Vol. 30 No. 3, page 866.
Insulin—See PF Vol. 30 No. 5, page 1629.
Insulin Human—See PF Vol. 29 No. 6, page 1906.
Insulin Human Injection—See PF Vol. 30 No. 5, page 1630.
Inulin—See PF Vol. 29 No. 6, page 1906.
Iodipamide—See PF Vol. 29 No. 6, page 1907.
Iodixanol—See PF Vol. 31 No. 1, page 54.
Iodixanol Injection—See PF Vol. 29 No. 1, page 80.
Iohexol—See PF Vol. 29 No. 6, page 1908.
Iopamidol—See PF Vol. 29 No. 6, page 1909.
Iophendylate—See PF Vol. 29 No. 6, page 1910.
Iothalamic Acid—See PF Vol. 29 No. 6, page 1910.
Ioversol—See PF Vol. 29 No. 6, page 1910.
Ioxaglic Acid—See PF Vol. 29 No. 6, page 1911.
Ioxilan—See PF Vol. 29 No. 6, page 1911.
Ipecac—See PF Vol. 30 No. 3, page 866.
Powdered Ipecac—See PF Vol. 30 No. 3, page 867.
Irbesartan Tablets—See PF Vol. 29 No. 4, page 1035.
Irbesartan and Hydrochlorothiazide Tablets—See PF Vol. 29 No. 4, page 1036.
Isoflurane—See PF Vol. 30 No. 4, page 1255.
Isoniazid—See PF Vol. 29 No. 6, page 1912.
Isoproterenol Hydrochloride—See PF Vol. 29 No. 5, page 1509.
Isosorbide Dinitrate Extended-Release Capsules (Harmonization)—See PF Vol. 31 No. 1, page 160.
Isosorbide Dinitrate Extended-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 160.
Isosorbide Dinitrate Sublingual Tablets—See PF Vol. 30 No. 1, page 113.
Diluted Isosorbide Mononitrate—See PF Vol. 30 No. 3, page 868.
Isosorbide Mononitrate Tablets—See PF Vol. 29 No. 5, page 1513.
Isosorbide Mononitrate Extended-Release Tablets—See PF Vol. 30 No. 3, page 871.

Ivermectin—See PF Vol. 30 No. 3, page 875.
Kanamycin Sulfate Capsules—See PF Vol. 30 No. 1, page 120.
Ketamine Hydrochloride—See PF Vol. 29 No. 6, page 1913.
Ketoconazole Tablets—See PF Vol. 30 No. 4, page 1256.
Ketorolac Tromethamine—See PF Vol. 29 No. 6, page 1915.
Labetalol Hydrochloride—See PF Vol. 29 No. 6, page 1916.
Lamivudine—See PF Vol. 30 No. 3, page 881.
Lansoprazole—See PF Vol. 30 No. 6, page 2010.
Lansoprazole Delayed-Release Capsules (Harmonization)—See PF Vol. 31 No. 1, page 161.
Leuprolide Acetate—See PF Vol. 30 No. 3, page 882.
Levodopa—See PF Vol. 30 No. 3, page 888.
Levodopa Tablets—See PF Vol. 30 No. 3, page 890.
Levorphanol Tartrate—See PF Vol. 29 No. 6, page 1916.
Levothyroxine Sodium—See PF Vol. 30 No. 5, page 1630.
Levothyroxine Sodium Tablets—See PF Vol. 31 No. 1, page 55.
Lidocaine Hydrochloride—See PF Vol. 30 No. 4, page 1256.
Lidocaine Hydrochloride and Dextrose Injection—See PF Vol. 30 No. 5, page 1631.
Lidocaine Hydrochloride and Epinephrine Injection—See PF Vol. 30 No. 4, page 1257.
Lindane Lotion—See PF Vol. 30 No. 2, page 512.
Lindane Topical Emulsion—See PF Vol. 30 No. 2, page 512.
Liothyronine Sodium—See PF Vol. 30 No. 5, page 1631.
Liothyronine Sodium Tablets (Harmonization)—See PF Vol. 31 No. 1, page 162.
Liotrix Tablets—See PF Vol. 30 No. 5, page 1632.
Lipid Injectable Emulsion—See PF Vol. 29 No. 2, page 421.
Lisinopril Tablets—See PF Vol. 30 No. 1, page 121.
Lithium Carbonate Extended-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 162.
Loperamide Hydrochloride Tablets—See PF Vol. 30 No. 5, page 1633.
Loratadine—See PF Vol. 30 No. 6, page 2011.
Loratadine Oral Solution—See PF Vol. 31 No. 1, page 56.
Lorazepam—See PF Vol. 29 No. 6, page 1918.
Lypressin Nasal Solution—See PF Vol. 30 No. 3, page 893.
Mafenide Acetate—See PF Vol. 30 No. 4, page 1258.
Mafenide Acetate for Topical Solution—See PF Vol. 30 No. 4, page 1259.
Magaldrate and Simethicone Tablets—See PF Vol. 29 No. 6, page 1918.
Magaldrate and Simethicone Chewable Tablets—See PF Vol. 29 No. 6, page 1919.
Magnesium Carbonate, Citric Acid, and Potassium Citrate for Oral Solution—See PF Vol. 26 No. 4, page 1050.
Magnesium Chloride—See PF Vol. 30 No. 3, page 893.
Magnesium Oxide—See PF Vol. 29 No. 4, page 1047.
Magnesium Sulfate—See PF Vol. 29 No. 6, page 1921.
Malathion Lotion—See PF Vol. 30 No. 2, page 513.
Malathion Topical Emulsion—See PF Vol. 30 No. 2, page 513.
Mangafodipir Trisodium—See PF Vol. 30 No. 6, page 2014.
Manganese Chloride—See PF Vol. 29 No. 5, page 1526.
Manganese Sulfate—See PF Vol. 29 No. 6, page 1922.
Mannitol—See PF Vol. 27 No. 5, page 3017.
Mannitol Injection—See PF Vol. 28 No. 1, page 73.
Mebrofenin—See PF Vol. 29 No. 6, page 1923.
Mecamylamine Hydrochloride—See PF Vol. 28 No. 6, page 1817.
Mecamylamine Hydrochloride Tablets—See PF Vol. 28 No. 2, page 322.
Meclizine Hydrochloride Tablets—See PF Vol. 30 No. 1, page 127.
Medroxyprogesterone Acetate—See PF Vol. 29 No. 5, page 1526.
Mefloquine Hydrochloride—See PF Vol. 30 No. 4, page 1260.
Megestrol Acetate Oral Suspension—See PF Vol. 30 No. 6, page 2015.
Melengestrol Acetate—See PF Vol. 30 No. 3, page 893.
Meloxicam—See PF Vol. 31 No. 1, page 57.
Menadiol Sodium Diphosphate—See PF Vol. 29 No. 5, page 1531.
Menadione—See PF Vol. 29 No. 5, page 1531.
Menotropins—See PF Vol. 29 No. 6, page 1923.
Meperidine Hydrochloride—See PF Vol. 31 No. 1, page 62.
Mephobarbital—See PF Vol. 30 No. 5, page 1634.
Mepivacaine Hydrochloride—See PF Vol. 29 No. 5, page 1533.
Mepivacaine Hydrochloride Injection—See PF Vol. 30 No. 6, page 2017.
Meprobamate Tablets—See PF Vol. 30 No. 1, page 129.
Mercaptopurine Tablets—See PF Vol. 30 No. 4, page 1261.
Mesalamine Delayed-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 163.
Mesalamine Extended-Release Capsules—See PF Vol. 30 No. 3, page 896.
Mesalamine Extended-Release Capsules (Harmonization)—See PF Vol. 31 No. 1, page 163.
Mesoridazine Besylate—See PF Vol. 30 No. 4, page 1262.
Metaraminol Bitartrate—See PF Vol. 29 No. 5, page 1533.
Metformin Hydrochloride—See PF Vol. 31 No. 1, page 62.
Metformin Hydrochloride Tablets—See PF Vol. 30 No. 3, page 897.
Methadone Hydrochloride—See PF Vol. 29 No. 6, page 1929.
Methenamine Tablets—See PF Vol. 30 No. 1, page 130.
Methenamine Hippurate Tablets—See PF Vol. 31 No. 1, page 63.
Methocarbamol—See PF Vol. 29 No. 6, page 1930.
Methocarbamol Tablets—See PF Vol. 30 No. 1, page 130.
Methohexital—See PF Vol. 29 No. 5, page 1534.
Methotrimeprazine—See PF Vol. 29 No. 6, page 1931.
Methscopolamine Bromide—See PF Vol. 30 No. 3, page 899.
Methylbenzethonium Chloride Lotion—See PF Vol. 30 No. 2, page 515.
Methylbenzethonium Chloride Topical Emulsion—See PF Vol. 30 No. 2, page 515.
Methylbenzethonium Chloride Topical Powder—See PF Vol. 30 No. 2, page 516.
Methyldopate Hydrochloride—See PF Vol. 29 No. 5, page 1534.
Methylene Blue—See PF Vol. 29 No. 5, page 1534.
Methylergonovine Maleate—See PF Vol. 29 No. 5, page 1535.
Methylphenidate Hydrochloride Tablets—See PF Vol. 30 No. 1, page 131.
Methylphenidate Hydrochloride Extended-Release Tablets—See PF Vol. 30 No. 4, page 1263.
Methylphenidate Hydrochloride Extended-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 164.
Methylprednisolone Acetate—See PF Vol. 29 No. 5, page 1535.
Metoclopramide Hydrochloride—See PF Vol. 29 No. 5, page 1536.
Metolazone Tablets—See PF Vol. 29 No. 6, page 1932.
Metoprolol Succinate—See PF Vol. 30 No. 4, page 1263.
Metoprolol Succinate Extended-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 165.
Metoprolol Tartrate—See PF Vol. 29 No. 5, page 1536.
Metronidazole—See PF Vol. 29 No. 6, page 1933.
Miconazole—See PF Vol. 29 No. 6, page 1934.
Mirtazapine—See PF Vol. 30 No. 3, page 900.
Mirtazapine Tablets—See PF Vol. 30 No. 3, page 902.
Modafinil—See PF Vol. 30 No. 5, page 1634.
Modafinil Tablets—See PF Vol. 30 No. 5, page 1636.
Morantel Tartrate—See PF Vol. 30 No. 6, page 2017.
Morphine Sulfate—See PF Vol. 30 No. 5, page 1639.
Morphine Sulfate Extended-Release Capsules—See PF Vol. 28 No. 6, page 1822.
Morphine Sulfate Extended-Release Capsules (Harmonization)—See PF Vol. 31 No. 1, page 165.
Nabumetone—See PF Vol. 31 No. 1, page 63.
Nabumetone Tablets—See PF Vol. 30 No. 6, page 2019.
Nadolol and Bendroflumethiazide Tablets—See PF Vol. 30 No. 1, page 132.
Nalidixic Acid—See PF Vol. 30 No. 1, page 132.
Nalorphine Hydrochloride—See PF Vol. 29 No. 6, page 1935.
Naloxone Hydrochloride—See PF Vol. 29 No. 6, page 1936.
Naltrexone Hydrochloride—See PF Vol. 30 No. 6, page 2019.
Nandrolone Decanoate—See PF Vol. 29 No. 5, page 1539.
Naproxen—See PF Vol. 30 No. 3, page 904.

Naproxen Delayed-Release Tablets—See PF Vol. 30 No. 4, page 1264.
Naratriptan Hydrochloride—See PF Vol. 30 No. 4, page 1266.
Naratriptan Tablets—See PF Vol. 30 No. 4, page 1268.
Neomycin Sulfate and Flurandrenolide Lotion—See PF Vol. 30 No. 2, page 516.
Neomycin Sulfate and Flurandrenolide Topical Emulsion—See PF Vol. 30 No. 2, page 516.
Neomycin Sulfate and Hydrocortisone Acetate Cream—See PF Vol. 30 No. 2, page 517.
Neomycin Sulfate and Hydrocortisone Acetate Lotion—See PF Vol. 30 No. 2, page 517.
Neomycin Sulfate and Hydrocortisone Acetate Ointment—See PF Vol. 30 No. 2, page 518.
Neomycin Sulfate and Hydrocortisone Acetate Ophthalmic Ointment—See PF Vol. 30 No. 2, page 518.
Neomycin Sulfate and Hydrocortisone Acetate Topical Emulsion—See PF Vol. 30 No. 2, page 518.
Neomycin and Polymyxin B Sulfates, Bacitracin, and Hydrocortisone Acetate Ointment—See PF Vol. 30 No. 2, page 519.
Neomycin and Polymyxin B Sulfates, Bacitracin, and Hydrocortisone Acetate Ophthalmic Ointment—See PF Vol. 30 No. 2, page 519.
Neomycin and Polymyxin B Sulfates, Bacitracin Zinc, and Hydrocortisone Acetate Ophthalmic Ointment—See PF Vol. 30 No. 2, page 519.
Neomycin and Polymyxin B Sulfates, Gramicidin, and Hydrocortisone Acetate Cream—See PF Vol. 30 No. 2, page 520.
Neomycin and Polymyxin B Sulfates and Hydrocortisone Acetate Cream—See PF Vol. 30 No. 2, page 520.
Neostigmine Bromide Tablets—See PF Vol. 30 No. 1, page 133.
Neostigmine Methylsulfate—See PF Vol. 29 No. 6, page 1936.
Niacinamide Tablets—See PF Vol. 30 No. 1, page 139.
Nicotine Transdermal System (Harmonization)—See PF Vol. 31 No. 1, page 166.
Nifedipine Extended-Release Tablets—See PF Vol. 30 No. 4, page 1269.
Nifedipine Extended-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 168.
Nitrofurantoin Capsules (Harmonization)—See PF Vol. 31 No. 1, page 170.
Diluted Nitroglycerin—See PF Vol. 29 No. 5, page 1547.
Nitroglycerin Tablets—See PF Vol. 30 No. 4, page 1272.
Nitroglycerin Sublingual Tablets—See PF Vol. 30 No. 4, page 1272.
Nitrous Oxide—See PF Vol. 30 No. 2, page 521.
Norepinephrine Bitartrate—See PF Vol. 29 No. 5, page 1547.
Norgestimate and Ethinyl Estradiol Tablets—See PF Vol. 29 No. 1, page 87.
Nystatin—See PF Vol. 30 No. 1, page 141.
Nystatin Lotion—See PF Vol. 30 No. 2, page 522.
Nystatin Topical Emulsion—See PF Vol. 30 No. 2, page 522.
Nystatin, Neomycin Sulfate, Thiostrepton, and Triamcinolone Acetonide Ointment—See PF Vol. 30 No. 6, page 2020.
Octisalate—See PF Vol. 30 No. 3, page 904.
Octocrylene—See PF Vol. 30 No. 3, page 905.
Ofloxacin—See PF Vol. 30 No. 4, page 1274.
Omeprazole Delayed-Release Capsules—See PF Vol. 30 No. 1, page 143.
Omeprazole Delayed-Release Capsules (Harmonization)—See PF Vol. 31 No. 1, page 171.

Propoxyphene Napsylate—See PF Vol. 30 No. 3, page 927.
Propranolol Hydrochloride—See PF Vol. 29 No. 5, page 1568.
Propranolol Hydrochloride Extended-Release Capsules (Harmonization)—See PF Vol. 31 No. 1, page 180.
Propranolol Hydrochloride and Hydrochlorothiazide Extended-Release Capsules (Harmonization)—See PF Vol. 31 No. 1, page 181.
Propyliodone—See PF Vol. 29 No. 6, page 1976.
Pseudoephedrine Hydrochloride Extended-Release Capsules (Harmonization)—See PF Vol. 31 No. 1, page 181.
Pseudoephedrine Hydrochloride Tablets—See PF Vol. 30 No. 1, page 172.
Pseudoephedrine Hydrochloride Extended-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 182.
Pyridostigmine Bromide—See PF Vol. 29 No. 6, page 1977.
Pyridoxine Hydrochloride Tablets—See PF Vol. 30 No. 1, page 177.
Pyrilamine Maleate Tablets—See PF Vol. 30 No. 1, page 177.
Pyrimethamine Tablets—See PF Vol. 30 No. 3, page 929.
Quazepam Tablets—See PF Vol. 30 No. 2, page 531.
Quinapril Tablets—See PF Vol. 29 No. 4, page 1071.
Quinidine Gluconate—See PF Vol. 29 No. 5, page 1568.
Quinidine Gluconate Extended-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 183.
Quinidine Sulfate Extended-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 184.
Ramipril—See PF Vol. 30 No. 6, page 2032.
Ranitidine Hydrochloride—See PF Vol. 30 No. 6, page 2033.
Ranitidine Oral Solution—See PF Vol. 30 No. 6, page 2036.
Oral Rehydration Salts—See PF Vol. 30 No. 5, page 1646.
Reserpine—See PF Vol. 29 No. 5, page 1570.
Riboflavin—See PF Vol. 30 No. 3, page 929.
Rifampin and Isoniazid Capsules—See PF Vol. 30 No. 2, page 533.
Rifampin, Isoniazid, and Pyrazinamide Tablets—See PF Vol. 30 No. 2, page 534.
Ringer's and Dextrose Injection—See PF Vol. 30 No. 5, page 1647.
Ritodrine Hydrochloride—See PF Vol. 29 No. 5, page 1570.
Ropivacaine Hydrochloride—See PF Vol. 30 No. 6, page 2039.
Saquinavir Capsules—See PF Vol. 27 No. 2, page 2197.
Sargramostin—See PF Vol. 30 No. 6, page 2044.
Scopolamine Hydrobromide—See PF Vol. 31 No. 1, page 73.
Selenious Acid—See PF Vol. 29 No. 5, page 1571.
Sevoflurane—See PF Vol. 30 No. 1, page 178.
Sildenafil Citrate—See PF Vol. 24 No. 6, page 7182.
Sildenafil Tablets—See PF Vol. 24 No. 6, page 7184.
Simethicone—See PF Vol. 30 No. 4, page 1293.
Simethicone Emulsion—See PF Vol. 30 No. 4, page 1294.
Simethicone Capsules—See PF Vol. 30 No. 4, page 1294.
Simethicone Oral Suspension—See PF Vol. 30 No. 4, page 1294.
Simvastatin—See PF Vol. 30 No. 5, page 1647.
Simvastatin Tablets—See PF Vol. 30 No. 4, page 1295.
Sodium Acetate—See PF Vol. 29 No. 5, page 1576.
Sodium Bicarbonate—See PF Vol. 29 No. 5, page 1577.
Sodium Chloride and Dextrose Tablets—See PF Vol. 30 No. 5, page 1647.
Sodium Nitrite—See PF Vol. 29 No. 5, page 1577.
Dibasic Sodium Phosphate—See PF Vol. 29 No. 5, page 1578.
Monobasic Sodium Phosphate—See PF Vol. 29 No. 5, page 1579.
Sodium Sulfate—See PF Vol. 29 No. 5, page 1579.
Sodium Thiosulfate—See PF Vol. 29 No. 5, page 1579.
Somatropin—See PF Vol. 30 No. 4, page 1295.
Somatropin for Injection—See PF Vol. 30 No. 4, page 1299.
Sotalol Hydrochloride—See PF Vol. 30 No. 6, page 2044.
Soybean Oil—See PF Vol. 30 No. 5, page 1648.
Spironolactone Oral Suspension—See PF Vol. 30 No. 3, page 929.
Spironolactone Tablets—See PF Vol. 31 No. 1, page 74.
Spironolactone and Hydrochlorothiazide Oral Suspension—See PF Vol. 30 No. 3, page 930.
Stavudine—See PF Vol. 30 No. 3, page 932.
Stavudine Capsules—See PF Vol. 30 No. 3, page 934.
Stavudine for Oral Solution—See PF Vol. 30 No. 3, page 937.
Succinylcholine Chloride—See PF Vol. 31 No. 1, page 74.
Sufentanil Citrate—See PF Vol. 29 No. 6, page 1988.
Sufentanil Citrate Injection—See PF Vol. 30 No. 6, page 2045.
Sulfadiazine Sodium—See PF Vol. 29 No. 6, page 1988.
Sulfamethoxazole—See PF Vol. 29 No. 6, page 1989.
Sulfasalazine Delayed-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 185.
Sulfisoxazole—See PF Vol. 30 No. 4, page 1301.
Sumatriptan Nasal Spray—See PF Vol. 30 No. 6, page 2045.
Terbutaline Sulfate—See PF Vol. 31 No. 1, page 75.
Terbutaline Sulfate Injection—See PF Vol. 26 No. 3, page 756.
Terbutaline Sulfate Tablets—See PF Vol. 31 No. 1, page 76.
Testosterone—See PF Vol. 29 No. 5, page 1585.
Testosterone Enanthate—See PF Vol. 30 No. 5, page 1648.
Tetracaine Hydrochloride in Dextrose Injection—See PF Vol. 30 No. 5, page 1648.
Theophylline—See PF Vol. 29 No. 5, page 1586.
Theophylline Extended-Release Capsules (Harmonization)—See PF Vol. 31 No. 1, page 185.
Theophylline in Dextrose Injection—See PF Vol. 30 No. 5, page 1649.
Theophylline, Ephedrine Hydrochloride, and Phenobarbital Tablets—See PF Vol. 30 No. 1, page 189.
Thiabendazole Tablets—See PF Vol. 29 No. 6, page 1991.
Thiabendazole Chewable Tablets—See PF Vol. 29 No. 6, page 1991.
Thiacetarsamide—See PF Vol. 29 No. 1, page 126.
Thiacetarsamide Sodium Injection—See PF Vol. 29 No. 1, page 127.
Thiamine Hydrochloride Tablets—See PF Vol. 30 No. 1, page 190.
Thioguanine—See PF Vol. 30 No. 6, page 2049.
Thiopental Sodium—See PF Vol. 29 No. 5, page 1586.
Thiothixene Hydrochloride—See PF Vol. 29 No. 6, page 1993.
Tiagabine Hydrochloride—See PF Vol. 30 No. 5, page 1649.
Tiamulin—See PF Vol. 31 No. 1, page 77.
Tiamulin Fumarate—See PF Vol. 30 No. 3, page 938.
Timolol Maleate Tablets—See PF Vol. 30 No. 1, page 191.

Titanium Dioxide—See PF Vol. 30 No. 4, page 1301.
Titanium Dioxide (new)—See PF Vol. 30 No. 4, page 1304.
Tobramycin Inhalation Solution—See PF Vol. 29 No. 2, page 438.
Tolazoline Hydrochloride—See PF Vol. 29 No. 5, page 1588.
Tolcapone—See PF Vol. 30 No. 6, page 2051.
Tolcapone Tablets—See PF Vol. 30 No. 3, page 943.
Topiramate—See PF Vol. 30 No. 4, page 1307.
Triamcinolone Acetonide—See PF Vol. 30 No. 3, page 945.
Triamcinolone Acetonide Lotion—See PF Vol. 30 No. 2, page 538.
Triamcinolone Acetonide Topical Emulsion—See PF Vol. 30 No. 2, page 538.
Trichlorfon—See PF Vol. 26 No. 6, page 1576.
Triclosan—See PF Vol. 30 No. 6, page 2054.
Trifluoperazine Hydrochloride—See PF Vol. 29 No. 6, page 1993.
Triflupromazine Hydrochloride—See PF Vol. 29 No. 6, page 1994.
Trihexyphenidyl Hydrochloride Extended-Release Capsules (Harmonization)—See PF Vol. 31 No. 1, page 187.
Trimethobenzamide Hydrochloride—See PF Vol. 29 No. 5, page 1589.
Trimethoprim—See PF Vol. 29 No. 6, page 1995.
Trimethoprim Sulfate—See PF Vol. 29 No. 6, page 1995.
Tripelennamine Hydrochloride—See PF Vol. 30 No. 4, page 1312.
Triprolidine and Pseudoephedrine Hydrochlorides Tablets—See PF Vol. 30 No. 1, page 192.
Trolamine Salicylate—See PF Vol. 30 No. 4, page 1312.
Tubocurarine Chloride—See PF Vol. 29 No. 6, page 1996.
Urea C for Oral Solution—See PF Vol. 29 No. 2, page 441.
Urofollitropin—See PF Vol. 28 No. 6, page 1875.
Urofollitropin for Injection—See PF Vol. 28 No. 6, page 1881.
Ursodiol—See PF Vol. 30 No. 4, page 1313.
Ursodiol Capsules—See PF Vol. 31 No. 1, page 79.
Valrubicin—See PF Vol. 30 No. 3, page 946.
Valsartan—See PF Vol. 29 No. 6, page 1996.
Valsartan and Hydrochlorothiazide Tablets—See PF Vol. 29 No. 6, page 2000.
Vancomycin Hydrochloride—See PF Vol. 30 No. 6, page 2055.
Vasopressin—See PF Vol. 29 No. 6, page 2004.
Vecuronium Bromide—See PF Vol. 30 No. 6, page 2057.
Verapamil Hydrochloride—See PF Vol. 29 No. 5, page 1598.
Verapamil Hydrochloride Extended-Release Tablets (Harmonization)—See PF Vol. 31 No. 1, page 188.
Verteporfin—See PF Vol. 30 No. 3, page 947.
Vinorelbine Injection—See PF Vol. 30 No. 4, page 1314.
Vitamin E—See PF Vol. 27 No. 5, page 3159.
Water for Injection—See PF Vol. 30 No. 5, page 1650.
Bacteriostatic Water for Injection—See PF Vol. 30 No. 4, page 1315.
Sterile Water for Inhalation—See PF Vol. 30 No. 4, page 1316.
Sterile Water for Injection—See PF Vol. 30 No. 4, page 1316.
Pure Steam—See PF Vol. 30 No. 5, page 1651.
Purified Water—See PF Vol. 30 No. 4, page 1316.
Sterile Purified Water—See PF Vol. 30 No. 4, page 1317.
Water for Hemodialysis—See PF Vol. 30 No. 4, page 1317.
Small Intestinal Submucosa Wound Matrix—See PF Vol. 30 No. 5, page 1652.
Xylazine—See PF Vol. 29 No. 6, page 2004.
Xylazine Hydrochloride—See PF Vol. 29 No. 6, page 2005.
Yohimbine Hydrochloride—See PF Vol. 29 No. 6, page 2005.
Zidovudine—See PF Vol. 29 No. 6, page 2006.
Zileuton—See PF Vol. 30 No. 3, page 948.
Zinc Gluconate—See PF Vol. 29 No. 3, page 683.
Zinc Oxide—See PF Vol. 31 No. 1, page 80.
Zinc Oxide Neutral—See PF Vol. 31 No. 1, page 80.
Zinc Sulfate Tablets—See PF Vol. 31 No. 1, page 82.

DIETARY SUPPLEMENTS

MONOGRAPHS

Choline Bitartrate—See PF Vol. 30 No. 3, page 950.
Choline Chloride—See PF Vol. 31 No. 1, page 84.
Chondroitin Sulfate Sodium—See PF Vol. 30 No. 6, page 2068.
Chondroitin Sulfate Sodium Tablets—See PF Vol. 31 No. 1, page 85.
Chromium Picolinate Tablets—See PF Vol. 30 No. 5, page 1664.
Black Cohosh—See PF Vol. 28 No. 5, page 1455.
Powdered Black Cohosh—See PF Vol. 28 No. 5, page 1460.
Powdered Black Cohosh Extract—See PF Vol. 28 No. 5, page 1461.
Black Cohosh Tablets—See PF Vol. 28 No. 5, page 1462.
Cranberry Liquid Preparation—See PF Vol. 30 No. 3, page 951.
Echinacea angustifolia—See PF Vol. 30 No. 2, page 552.
Eleuthero—See PF Vol. 26 No. 6, page 1596.
Fish Oil Rich in Omega-3 Acids—See PF Vol. 29 No. 4, page 1272.
Fish Oil Rich in Omega-3 Acids Capsules—See PF Vol. 29 No. 4, page 1278.
Ginger Capsules—See PF Vol. 28 No. 3, page 814.
Powdered Ginkgo Extract—See PF Vol. 27 No. 2, page 2233.
Ginkgo Capsules—See PF Vol. 27 No. 2, page 2238.
Ginkgo Tablets—See PF Vol. 27 No. 2, page 2240.
American Ginseng Capsules—See PF Vol. 30 No. 2, page 565.
American Ginseng Tablets—See PF Vol. 30 No. 2, page 567.
Asian Ginseng—See PF Vol. 30 No. 2, page 569.
Asian Ginseng Capsules—See PF Vol. 30 No. 2, page 571.
Glucosamine and Chondroitin Sulfate Sodium Tablets—See PF Vol. 31 No. 1, page 85.
Goldenseal—See PF Vol. 30 No. 3, page 952.
Powdered Goldenseal—See PF Vol. 30 No. 3, page 953.
Powdered Goldenseal Extract—See PF Vol. 30 No. 3, page 954.
Licorice—See PF Vol. 26 No. 5, page 1363.
Powdered Licorice Extract—See PF Vol. 30 No. 2, page 574.
Lutein—See PF Vol. 29 No. 2, page 470.
Lutein Preparation—See PF Vol. 29 No. 2, page 472.
Lycopene—See PF Vol. 30 No. 6, page 2073.
Lycopene Preparation—See PF Vol. 30 No. 6, page 2075.
Lycopene Tomato Extract—See PF Vol. 30 No. 2, page 578.
Lysine Hydrochloride Tablets—See PF Vol. 30 No. 5, page 1665.
Milk Thistle Capsules—See PF Vol. 29 No. 2, page 479.
Minerals Capsules—See PF Vol. 28 No. 5, page 1543.
Minerals Tablets—See PF Vol. 28 No. 5, page 1543.
Psyllium Husk—See PF Vol. 30 No. 6, page 2077.
Pygeum—See PF Vol. 30 No. 3, page 954.
Pygeum Capsules—See PF Vol. 30 No. 3, page 959.
Pygeum Extract—See PF Vol. 30 No. 3, page 956.
Pyridoxine Hydrochloride Injection—See PF Vol. 30 No. 2, page 583.
Ubidecarenone—See PF Vol. 31 No. 1, page 86.
Ubidecarenone Capsules—See PF Vol. 31 No. 1, page 86.
Valerian Capsules—See PF Vol. 27 No. 1, page 1825.

GENERAL CHAPTERS

General Tests and Assays

General Requirements for Tests and Assays

⟨1⟩ Injections—See PF Vol. 29 No. 3, page 707.
⟨1⟩ Injections (Harmonization)—See PF Vol. 31 No. 1, page 192.
⟨11⟩ USP Reference Standards—See PF Vol. 25 No. 4, page 8561; PF Vol. 26 No. 3, page 793; PF Vol. 26 No. 4, page 1101; PF Vol. 26 No. 5, page 1369; PF Vol. 27 No. 1, page 1832; PF Vol. 27 No. 6, page 3348; PF Vol. 28 No. 2, page 433; PF Vol. 28 No. 3, page 839; PF Vol. 28 No. 4, page 1224; PF Vol. 28 No. 5, page 1468; PF Vol. 28 No. 6, page 1913; PF Vol. 29

No. 3, page 710; PF Vol. 29 No. 4, page 1137; PF Vol. 29 No. 5, page 1601; PF Vol. 29 No. 6, page 2022; PF Vol. 30 No. 1, page 211; PF Vol. 30 No. 2, page 613; PF Vol. 30 No. 3, page 998; PF Vol. 30 No. 4, page 1338; PF Vol. 30 No. 5, page 1674; PF Vol. 30 No. 6, page 2092; PF Vol. 31 No. 1, page 99.

Apparatus for Tests and Assays

⟨41⟩ Weights and Balances—See PF Vol. 30 No. 3, page 999.

Microbiological Tests

⟨55⟩ Biological Indicators—Resistance Performance Tests—See PF Vol. 30 No. 1, page 212.

Biological Tests and Assays

⟨81⟩ Antibiotics—Microbial Assays—See PF Vol. 30 No. 3, page 1002.
⟨121⟩ Insulin Assays—See PF Vol. 30 No. 5, page 1675.

Chemical Tests and Assays

LIMIT TESTS

⟨231⟩ Heavy Metals—See PF Vol. 30 No. 3, page 1004.
⟨267⟩ Porosimetry by Mercury Intrusion—See PF Vol. 29 No. 3, page 712.

OTHER TESTS AND ASSAYS

⟨301⟩ Acid-Neutralizing Capacity—See PF Vol. 30 No. 3, page 1006.
⟨341⟩ Antimicrobial Agents—Content—See PF Vol. 30 No. 5, page 1678.
⟨381⟩ Elastomeric Closures for Injections—See PF Vol. 30 No. 1, page 220.
⟨386⟩ Environmentally Sensitive Preparations—See PF Vol. 30 No. 5, page 1680.
⟨518⟩ Solution Calorimetry—See PF Vol. 28 No. 4, page 1299.
⟨571⟩ Vitamin A Assay—See PF Vol. 30 No. 4, page 1340.

Physical Tests and Determinations

⟨601⟩ Aerosols, Metered-Dose Inhalers, and Dry Powder Inhalers—See PF Vol. 30 No. 4, page 1342.
⟨611⟩ Alcohol Determination—See PF Vol. 30 No. 4, page 1379.
⟨621⟩ Chromatography—See PF Vol. 30 No. 6, page 2094.
⟨643⟩ Total Organic Carbon—See PF Vol. 30 No. 5, page 1700.
⟨645⟩ Water Conductivity—See PF Vol. 30 No. 4, page 1380.
⟨661⟩ Containers—See PF Vol. 29 No. 2, page 490.
⟨696⟩ Crystallinity Determination by Solution Calorimetry—See PF Vol. 29 No. 1, page 175.
⟨701⟩ Disintegration (Harmonization)—See PF Vol. 31 No. 1, page 194.
⟨711⟩ Dissolution—See PF Vol. 30 No. 1, page 234.
⟨711⟩ Dissolution (Harmonization)—See PF Vol. 31 No. 1, page 198.
⟨724⟩ Drug Release (Harmonization)—See PF Vol. 31 No. 1, page 213.
⟨730⟩ Inductively Coupled Plasma (ICP)—See PF Vol. 30 No. 3, page 1022.
⟨776⟩ Optical Microscopy—See PF Vol. 30 No. 6, page 2209.
⟨785⟩ Osmolality and Osmolarity—See PF Vol. 30 No. 5, page 1702.
⟨786⟩ Particle Size Distribution Estimation by Analytical Sieving—See PF Vol. 30 No. 6, page 2216.
⟨795⟩ Pharmaceutical Compounding—Nonsterile Preparations—See PF Vol. 29 No. 1, page 179.
⟨811⟩ Powder Fineness (Harmonization)—See PF Vol. 31 No. 1, page 228.
⟨823⟩ Radiopharmaceuticals for Positron Emission Tomography—Compounding—See PF Vol. 29 No. 2, page 494.
⟨851⟩ Spectrophotometry and Light-Scattering—See PF Vol. 30 No. 5, page 1703.

General Information

Introduction—See PF Vol. 29 No. 6, page 2039.
⟨1043⟩ Ancillary Materials for Cell, Gene, and Tissue-Engineered Products—See PF Vol. 30 No. 2, page 629.
⟨1070⟩ Emergency Medical Services Vehicles and Ambulances—Storage of Preparations—See PF Vol. 30 No. 5, page 1706.
⟨1072⟩ Disinfectants and Antiseptics—See PF Vol. 30 No. 6, page 2108.
⟨1075⟩ Good Compounding Practices—See PF Vol. 31 No. 1, page 101.
⟨1078⟩ Good Manufacturing Practices for Bulk Pharmaceutical Excipients—See PF Vol. 28 No. 5, page 1504.
⟨1079⟩ Good Storage and Shipping Practices—See PF Vol. 30 No. 6, page 2118.
⟨1080⟩ Bulk Pharmaceutical Excipients—Certificate of Analysis—See PF Vol. 28 No. 5, page 1650.
⟨1082⟩ Genotoxicity Testing—See PF Vol. 30 No. 1, page 264.
⟨1087⟩ Intrinsic Dissolution—See PF Vol. 30 No. 6, page 2130.
⟨1101⟩ Medicine Dropper—See PF Vol. 30 No. 6, page 2137.
⟨1111⟩ Microbiological Attributes of Nonsterile Pharmaceutical Products—See PF Vol. 25 No. 2, page 7785.
⟨1112⟩ Application of Water Activity Determination to Nonsterile Pharmaceutical Products—See PF Vol. 30 No. 5, page 1709.
⟨1117⟩ Microbiological Best Laboratory Practices—See PF Vol. 30 No. 5, page 1713.
⟨1118⟩ Monitoring Devices—Time, Temperature, and Humidity—See PF Vol. 29 No. 1, page 206.
⟨1119⟩ Near-Infrared Spectrophotometry—See PF Vol. 30 No. 6, page 2137.
⟨1120⟩ Raman Spectrophotometry—See PF Vol. 30 No. 6, page 2139.
⟨1136⟩ Packaging—Unit of Use—See PF Vol. 30 No. 5, page 1722.

In-Process Revision

Dietary Supplements

⟨2023⟩ Microbiological Attributes of Nonsterile Nutritional and Dietary Supplements—See PF Vol. 30 No. 5, page 1818.
⟨2040⟩ Disintegration and Dissolution of Nutritional Supplements—See PF Vol. 29 No. 2, page 513.
⟨2091⟩ Uniformity of Dietary Supplement Intake Units—See PF Vol. 28 No. 5, page 1549.

REAGENTS, INDICATORS, AND SOLUTIONS

Reagent Specifications

Acetal—See PF Vol. 30 No. 2, page 644.
Agarose—See PF Vol. 27 No. 6, page 3363.
Air-Nitrous Oxide Certified Standard—See PF Vol. 28 No. 4, page 1234.
Ammonium Hydroxide, 6 N—See PF Vol. 30 No. 4, page 1389.
Ammonium Pyrrolidinedithiocarbamate—See PF Vol. 30 No. 3, page 1043.
Anion-exchange Resin, Styrene-Divinylbenzene—See PF Vol. 30 No. 3, page 1043.
Bacterial Alkaline Protease Preparation—See PF Vol. 30 No. 2, page 644.
Barbituric Acid—See PF Vol. 29 No. 1, page 265.
Benzil—See PF Vol. 28 No. 4, page 1305.
Rat Tail Collagen—See PF Vol. 30 No. 2, page 644.
Branched Polymeric Sucrose—See PF Vol. 27 No. 6, page 3363.
Bromelain—See PF Vol. 28 No. 2, page 552.
Bromofluoromethane—See PF Vol. 30 No. 4, page 1389.
Calf Thymus DNA—See PF Vol. 30 No. 4, page 1389.
dl-Camphene—See PF Vol. 28 No. 6, page 1951.
Cation-exchange Resin, Styrene-Divinylbenzene—See PF Vol. 30 No. 3, page 1043.
p-Chlorophenol—See PF Vol. 30 No. 3, page 1044.
4-Chlorophenol—See PF Vol. 30 No. 6, page 2168.
Chromotrope 2R—See PF Vol. 30 No. 4, page 1390.
Citric Acid, Anhydrous—See PF Vol. 30 No. 3, page 1044.
Collagen—See PF Vol. 30 No. 4, page 1390.
Collagenase—See PF Vol. 30 No. 4, page 1390.
DEAE-Agarose—See PF Vol. 29 No. 1, page 265.
Deoxyadenosine Triphosphate—See PF Vol. 27 No. 6, page 3364.
Deoxycytidine Triphosphate—See PF Vol. 27 No. 6, page 3364.
Deoxyguanosine Triphosphate—See PF Vol. 27 No. 6, page 3364.
Deoxyribonucleic Acid Polymerase—See PF Vol. 27 No. 6, page 3365.
Deoxythymidine Triphosphate—See PF Vol. 27 No. 6, page 3365.
Deuterated Methanol—See PF Vol. 29 No. 6, page 2054.
2,8-Dichlorodibenzo-*p*-dioxin—See PF Vol. 30 No. 6, page 2168.
2,8-Dichlorodibenzofuran—See PF Vol. 30 No. 6, page 2168.
2,4-Dichlorophenol—See PF Vol. 30 No. 6, page 2168.
Dicyclohexyl Phthalate—See PF Vol. 26 No. 2, page 504.
Diethylpyrocarbonate—See PF Vol. 27 No. 6, page 3365.
Diisobutylene—See PF Vol. 28 No. 4, page 1305.
N,N-Dimethylformamide Diethyl Acetal—See PF Vol. 29 No. 5, page 1681.
N,N-Dimethyldodecylamine-*N*-oxide—See PF Vol. 27 No. 4, page 2837.
Dimethyl Sulfoxide—See PF Vol. 30 No. 3, page 1045.
3-(4,5-Dimethylthiazol-2-yl)-2,5-diphenyl Tetrazolium Bromide—See PF Vol. 27 No. 6, page 3365.
1,2-Dioleoyl-3-linoleoyl-rac-glycerol—See PF Vol. 28 No. 3, page 849.
Direct Red 80—See PF Vol. 30 No. 4, page 1390.
Disodium Arsenate—See PF Vol. 28 No. 4, page 1305.
Ether, Peroxide-Free—See PF Vol. 30 No. 4, page 1390.
Ethidium Bromide—See PF Vol. 27 No. 6, page 3366.
Fast Green FCF—See PF Vol. 30 No. 4, page 1391.
Formamide, Anhydrous—See PF Vol. 27 No. 5, page 3115.
L-Glutamic Acid—See PF Vol. 27 No. 6, page 3366.
L-Glutamine—See PF Vol. 27 No. 6, page 3366.
Guanidine Isothiocyanate—See PF Vol. 27 No. 6, page 3366.
Heptakis-(2,6-di-*O*-methyl)-β-cyclodextrin—See PF Vol. 30 No. 6, page 2169.
Hexadecane—See PF Vol. 28 No. 4, page 1305.
Hexadimethrine Bromide—See PF Vol. 29 No. 1, page 265.
Hexane, Solvent—See PF Vol. 30 No. 3, page 1045.
Hexane, Solvent, Chromatographic—See PF Vol. 30 No. 3, page 1046.
Hexanes—See PF Vol. 30 No. 3, page 1046.
L-Histidine Hydrochloride Monohydrate—See PF Vol. 27 No. 6, page 3366.
Homatropine Hydrobromide—See PF Vol. 28 No. 4, page 1305.
Hydrocodone Diol—See PF Vol. 28 No. 4, page 1306.
2′-(4-Hydroxyphenyl)-5-(4-methyl-1-piperazinyl)-2,5′-bi-1*H*-benzimidazole Trihydrochloride Pentahydrate—See PF Vol. 30 No. 4, page 1391.
Iodine—See PF Vol. 30 No. 4, page 1391.
Isoferulic Acid—See PF Vol. 27 No. 4, page 2837.
Isovaleric Acid—See PF Vol. 30 No. 3, page 1046.
Lanthanum Chloride—See PF Vol. 29 No. 2, page 507.
Lanthanum Oxide—See PF Vol. 28 No. 3, page 851.
Linoleic Acid—See PF Vol. 27 No. 6, page 3367.
α-Lipoic Acid—See PF Vol. 27 No. 6, page 3367.
Methoxyphenylacetic Acid—See PF Vol. 30 No. 3, page 1046.
3-Methyl-2-benzothiazolinone Hydrazone Hydrochloride—See PF Vol. 25 No. 3, page 8280.
Methyl Iodide—See PF Vol. 30 No. 3, page 1046.
4-Methylpentan-2-ol—See PF Vol. 30 No. 2, page 646.
Methyl Red—See PF Vol. 31 No. 1, page 108.
Methyl Sulfoxide—See PF Vol. 30 No. 3, page 1047.
Methylene Blue—See PF Vol. 30 No. 4, page 1391.
Nonionic Wetting Agent—See PF Vol. 30 No. 3, page 1047.
Nonylphenol Polyoxyethylene Ether—See PF Vol. 27 No. 6, page 3368.
Octoxynol—See PF Vol. 30 No. 4, page 1392.
Oligo-deoxythymidine—See PF Vol. 27 No. 6, page 3368.
Oxygen-Helium Certified Standard—See PF Vol. 30 No. 2, page 646.
Phenol Red, Sodium—See PF Vol. 27 No. 6, page 3368.
Piperazine—See PF Vol. 30 No. 5, page 1821.
Polyoxyethylene (20) Sorbitan Monolaurate—See PF Vol. 27 No. 6, page 3368.
Putrescine Dihydrochloride—See PF Vol. 27 No. 6, page 3369.
Reverse Transcriptase—See PF Vol. 27 No. 6, page 3369.
Rhodamine 6G—See PF Vol. 30 No. 4, page 1392.
Ribonuclease Inhibitor—See PF Vol. 27 No. 6, page 3369.
Sodium Arsenite, Twentieth-Molar (0.05 M)—See PF Vol. 29 No. 4, page 1250.
Sodium 1-Heptanesulfonate—See PF Vol. 30 No. 3, page 1047.
Sodium 1-Hexanesulfonate—See PF Vol. 30 No. 3, page 1048.
Sodium Hydrogen Sulfate—See PF Vol. 29 No. 5, page 1682.
Sodium Iodate—See PF Vol. 27 No. 6, page 3369.
Sodium Phosphate, Monobasic—See PF Vol. 30 No. 4, page 1392.
Thrombin Human—See PF Vol. 29 No. 6, page 2055.
Thymidine—See PF Vol. 27 No. 6, page 3369.
1,3,7-Trichlorodibenzo-*p*-dioxin—See PF Vol. 30 No. 6, page 2169.
2,4,8-Trichlorodibenzofuran—See PF Vol. 30 No. 6, page 2169.
Tropic Acid—See PF Vol. 30 No. 3, page 1048.
L-Tyrosine Disodium—See PF Vol. 27 No. 6, page 3370.
Vinyl Acetate—See PF Vol. 30 No. 6, page 2169.
2-Vinylpyridine—See PF Vol. 26 No. 2, page 504.
Vinylpyrrolidinone—See PF Vol. 31 No. 1, page 108.
Zinc Sulfate Heptahydrate—See PF Vol. 26 No. 2, page 504.

Indicator Test Papers

Methyl Green—See PF Vol. 28 No. 4, page 1306.
Methyl Green—Iodomercurate Paper—See PF Vol. 28 No. 4, page 1306.
Nickel Standard Solution TS—See PF Vol. 27 No. 5, page 3117.

Ninhydrin TS—See PF Vol. 28 No. 3, page 852.
Perchloric Acid TS—See PF Vol. 27 No. 1, page 1905.

Test Solutions

Ammonia TS—See PF Vol. 30 No. 4, page 1392.
Folin-Ciocalteu Phenol TS—See PF Vol. 30 No. 1, page 316.
Hydroxylamine Hydrochloride TS—See PF Vol. 30 No. 4, page 1393.
Iodine and Potassium Iodide TS 1—See PF Vol. 30 No. 4, page 1393.
Iodine and Potassium Iodide TS 2—See PF Vol. 30 No. 4, page 1393.
Methyl Yellow TS—See PF Vol. 30 No. 4, page 1393.
Potassium Pyroantimonate TS—See PF Vol. 30 No. 4, page 1393.

Volumetric Solutions

Ammonium Thiocyanate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1393.
Bromine, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1393.
Ceric Ammonium Nitrate, Twentieth-Normal (0.05 N)—See PF Vol. 30 No. 4, page 1394.
Ceric Sulfate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 6, page 2170.
Cupric Nitrate, Tenth Normal (0.1 N)—See PF Vol. 30 No. 4, page 1394.
Standard Dichlorophenol-Indophenol Solution—See PF Vol. 30 No. 4, page 1394.
Edetate Disodium, Twentieth-Molar (0.05 M)—See PF Vol. 30 No. 4, page 1395.
Ferric Ammonium Sulfate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1395.
Ferrous Ammonium Sulfate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1395.
Hydrochloric Acid, Normal (1 N)—See PF Vol. 30 No. 4, page 1395.
Hydrochloric Acid, Half-Normal (0.5 N)—See PF Vol. 30 No. 4, page 1395.
Hydrochloric Acid, Half-Normal (0.5 N) in Methanol—See PF Vol. 30 No. 4, page 1396.
Hydrochloric Acid, Alcoholic, Tenth-Molar (0.1 M)—See PF Vol. 30 No. 4, page 1396.
Iodine, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1396.
Iodine, Hundredth-Normal (0.01 N)—See PF Vol. 30 No. 4, page 1396.
Lead Perchlorate, Tenth-Molar (0.1 M)—See PF Vol. 30 No. 4, page 1396.
Lead Perchlorate, Hundredth-Molar (0.1 M)—See PF Vol. 30 No. 4, page 1397.
Lithium Methoxide, Fiftieth-Normal (0.02 N) in Methanol—See PF Vol. 30 No. 4, page 1397.
Lithium Methoxide, Tenth-Normal (0.1 N) in Chlorobenzene—See PF Vol. 30 No. 4, page 1397.
Lithium Methoxide, Tenth-Normal (0.1 N) in Methanol—See PF Vol. 31 No. 1, page 112.
Lithium Methoxide, Tenth-Normal (0.1 N) in Toluene—See PF Vol. 30 No. 4, page 1397.
Mercuric Nitrate, Tenth-Molar (0.1 M)—See PF Vol. 30 No. 4, page 1398.
Morpholine, Half-Normal (0.5 N) in Methanol—See PF Vol. 30 No. 4, page 1398.
Oxalic Acid, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1398.
Perchloric Acid, Tenth-Normal (0.1 N) (in Glacial Acetic Acid)—See PF Vol. 30 No. 4, page 1398.
Perchloric Acid, Tenth-Normal (0.1 N) in Dioxane—See PF Vol. 30 No. 4, page 1398.
Potassium Bromate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1399.
Potassium Bromide–Bromate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1399.
Potassium Dichromate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1399.
Potassium Ferricyanide, Twentieth-Molar (0.05 M)—See PF Vol. 30 No. 4, page 1399.
Potassium Hydroxide, Normal (1 N)—See PF Vol. 30 No. 4, page 1399.
Potassium Hydroxide, Alcoholic, Half-Normal (0.05 N)—See PF Vol. 30 No. 4, page 1399.
Potassium Hydroxide, Alcoholic, Tenth Molar (0.1 M)—See PF Vol. 30 No. 4, page 1400.
Potassium Hydroxide, Methanolic, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1400.
Potassium Permanganate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1400.
Silver Nitrate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1400.
Sodium Hydroxide, Normal (1 N)—See PF Vol. 30 No. 4, page 1400.
Sodium Hydroxide, Alcoholic, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1401.
Sodium Methoxide, Tenth-Normal (0.1 N) (in Toluene)—See PF Vol. 30 No. 4, page 1401.
Sodium Methoxide, Half-Normal (0.5 N) in Methanol—See PF Vol. 30 No. 4, page 1401.
Sodium Nitrite, Tenth-Molar (0.1 M)—See PF Vol. 30 No. 4, page 1401.
Sodium Tetraphenylboron, Fiftieth-Molar (0.02 M)—See PF Vol. 30 No. 4, page 1402.
Sodium Thiosulfate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1402.
Sulfuric Acid, Half-Normal (0.5 N) in Alcohol—See PF Vol. 30 No. 4, page 1402.
Tetrabutylammonium Hydroxide, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1402.
Tetrabutylammonium Hydroxide in Methanol/Isopropyl Alcohol, 0.1 N—See PF Vol. 30 No. 4, page 1403.
Tetramethylammonium Bromide, Tenth-Molar (0.1 M)—See PF Vol. 30 No. 4, page 1403.
Tetramethylammonium Chloride, Tenth-Molar (0.1 M)—See PF Vol. 30 No. 4, page 1403.
Titanium Trichloride, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1403.
Zinc Sulfate, Twentieth-Molar (0.05 M)—See PF Vol. 30 No. 4, page 1403.

HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps **(*Stages*)**.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

MONOGRAPHS (USP)

BRIEFING

Anhydrous Citric Acid, *USP 28* page 483 and page 1851 in *PF* 30(5) [Sept.–Oct. 2004]. The test for *Organic volatile impurities* is omitted to comply with the Stage 6 Harmonization Draft. It is proposed to implement the revision via the *Fourth Interim Revision Announcement* pertaining to *USP 28–NF 23,* with an official date of Aug. 1, 2005.

(EMC: J. Lane) RTS—42152-1

Add the following:

■**Packaging and storage**—Preserve in tight containers. No storage requirements specified.■2S (*USP28*)

Delete the following:

•~~**Organic volatile impurities,** *Method IV* ⟨467⟩**: meets the requirements.**~~•4

BRIEFING

Citric Acid Monohydrate, *USP 28* page 485 and page 1854 in *PF* 30(5) [Sept.–Oct. 2004]. The preparation of the *Standard solutions,* under the test for *Color of solution*, is added to comply with the Stage 6 Harmonization Draft. It is proposed to implement the revision via the *Fourth Interim Revision Announcement* pertaining to *USP 28–NF 23*, with an official date of Aug. 1, 2005.

(EMC: J. Lane) RTS—42152-2

Add the following:

■**Packaging and storage**—Preserve in tight containers. No specific storage requirements specified.■2S (*USP28*)

Change to read:

Color of solution—

Standard stock solutions—Prepare three solutions, *A, B,* and *C,* containing, respectively, the following parts of ferric chloride CS, cobaltous chloride CS, cupric sulfate CS, and dilute hydrochloric acid (10 g per L):

A—2.4 : 0.6 : 0 : 7.0
B—2.4 : 1.0 : 0.4 : 6.2
C—9.6 : 0.2 : 0.2 : 0

•*Standard solutions*—[NOTE—Prepare the *Standard solutions* immediately before use.] Transfer 2.5 mL of *Standard stock solution A* to a 100-mL volumetric flask, dilute with dilute hydrochloric acid (10 g per L) to volume, and mix to obtain *Standard solution A*. Transfer 2.5 mL of *Standard stock solution B* to a 100-mL volumetric flask, dilute with dilute hydrochloric acid (10 g per L) to volume, and mix to obtain *Standard solution B*. Transfer 0.75 mL of *Standard stock solution C* to a 100-mL volumetric flask, dilute with dilute hydrochloric acid (10 g per L) to volume, and mix to obtain *Standard solution C*.•4

Test solution—Use the *Test solution* prepared in the *Clarity of solution* test.

Procedure—Transfer a sufficient portion of the *Test solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 to 25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Standard solution A, Standard solution B, Standard solution C,* and water to separate matching test tubes. Compare the *Test solution, Standard solution A, Standard solution B, Standard solution C,* and water in diffused daylight, viewing vertically against a white background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). The *Test solution* is not more intensely colored than *Standard solutions A, B, C* or water.

BRIEFING

Saccharin Calcium, *USP 28* page 1744 and page 1423 of *PF* 30(4) [July–Aug. 2004]. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the *Saccharin Calcium* monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States Pharmacopeias. The following monograph, which represents the **ADOPTION STAGE 6** document, is based in part on comments from the Japanese Pharmacopoeia and the European

Pharmacopoeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the United States Pharmacopeia.

Pharmacopeial Discussion Group Sign-Off Document

Attributes	EP	JP	USP
Definition	+	–	+
Packaging and storage	+	–	+
Identification B	+	–	+
Identification C	–	–	+
Water	+	–	+
Readily carbonizable substances	+	–	+
Limit of benzoate and salicylate	–	–	+
Assay	+	–	+

Legend: + will adopt and implement; – will not stipulate.

Nonharmonized attributes: Heavy metals, Labeling, Clarity of solution, Color of solution, Limit of toluenesulfonamides, Identification (IR).

Specific local attributes: USP: Organic volatile impurities.

Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference materials and reagent specifications.

Differences between the **ADOPTION STAGE 6** document and the current *USP* monograph include the following:

(1) In the opening paragraph (the Definition)—The lower limit is changed from not less than 98.0 percent to not less than 99.0 percent.
(2) *Packaging and storage*—Storage conditions at room temperature are added.
(3) *USP Reference standards*—A reference for Saccharin Calcium is added for use in *Identification* test *A*.
(4) *Clarity of solution*—This test is added to comply with EP standards.
(5) *Color of solution*—This test is added to comply with EP standards.
(6) *Identification—Identification* tests *A, B,* and *D* are replaced with a more definitive IR absorption test. *Identification* test *C* is retained, but separated into two tests *(B* and *C).*
(7) *Water*—No change.
(8) *Readily carbonizable substances*—No change.
(9) *Selenium*—This test is deleted because it is unnecessary for this compound.
(10) *Limit of toluenesulfonamides*—The test method and limits are changed to those of the European Pharmacopoeia, which include a more modern test method. The *Test solution* is corrected to that of the EP. Editorial changes are made.
(11) *Heavy metals*—No change.
(12) *Limit of benzoate and salicylate*—No change.
(13) *Organic volatile impurities*—No change.
(14) *Assay*—No change.

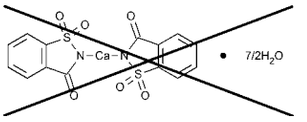
~~Saccharin Calcium~~



~~$C_{14}H_8CaN_2O_6S_2 \cdot 3\frac{1}{2}H_2O$ 467.49~~
~~1,2-Benzisothiazol-3(2*H*)-one, 1,1-dioxide, calcium salt, hydrate (2:7).~~
~~1,2-Benzisothiazolin-3-one 1,1-dioxide calcium salt hydrate (2:7) [*6381-91-5*].~~
~~Anhydrous 404.44 [*6485-34-3*].~~

~~» Saccharin Calcium contains not less than 98.0 percent and not more than 101.0 percent of $C_{14}H_8CaN_2O_6S_2$, calculated on the anhydrous basis.~~

~~**Packaging and storage**—Preserve in well-closed containers.~~

~~**Labeling**—Where the quantity of saccharin calcium is indicated in the labeling of any preparation containing Saccharin Calcium, this shall be expressed in terms of saccharin ($C_7H_5NO_3S$).~~

~~**USP Reference standards** ⟨11⟩—*USP o-Toluenesulfonamide RS. USP p-Toluenesulfonamide RS.*~~

~~**Identification—**~~

~~**A:** Dissolve about 100 mg in 5 mL of sodium hydroxide solution (1 in 20), evaporate to dryness, and gently fuse the residue over a small flame until it no longer evolves ammonia. Allow the residue to cool, dissolve in 20 mL of water, neutralize with 3 N hydrochloric acid, and filter: the addition of a drop of ferric chloride TS to the filtrate produces a violet color.~~

~~**B:** Mix 20 mg with 40 mg of resorcinol, add 10 drops of sulfuric acid, and heat the mixture in a suitable liquid bath at 200° for 3 minutes. Allow it to cool, and add 10 mL of water and an excess of 1 N sodium hydroxide: a fluorescent green liquid results.~~

~~**C:** A solution (1 in 10) meets the requirements of the tests for *Calcium* ⟨191⟩.~~

~~**D:** To 10 mL of a solution (1 in 10) add 1 mL of hydrochloric acid: a crystalline precipitate of saccharin is formed. Wash the precipitate with cold water, and dry at 105° for 2 hours: it melts between 226° and 230°, the procedure for *Class I* being used (see *Melting Range or Temperature* ⟨741⟩).~~

~~**Water,** *Method I* ⟨921⟩: not more than 15.0%.~~

~~**Readily carbonizable substances** ⟨271⟩—Dissolve 200 mg in 5 mL of sulfuric acid TS, and maintain at a temperature of 48° to 50° for 10 minutes: the solution has no more color than *Matching Fluid A.*~~

~~**Selenium** ⟨291⟩: 0.003%.~~

~~**Toluenesulfonamides—**~~

~~*Internal standard solution, Standard stock solution,* and *Standard preparations*—Prepare as directed for *Internal standard solution, Standard stock solution,* and *Standard preparations* in the test for *Toluenesulfonamides* under *Saccharin* (see *NF* monograph).~~

~~*Test preparation*—Prepare as directed under *Column Partition Chromatography* (see *Chromatography* ⟨621⟩), employing a chromatographic tube fitted with a porous glass disk in its base, a plastic stopcock on the delivery tube, and a reservoir on the top. Add a mixture consisting of 10 g of *Solid Support* and a solution of 2.0 g, accurately weighed, of Saccharin Calcium in 8.0 mL of sodium carbonate solution (1 in 20), and proceed as directed for *Test preparation* in the test for *Toluenesulfonamides* under *Saccharin* (see *NF* monograph), beginning with "Pack the contents."~~

~~*Chromatographic system* and *Procedure*—Proceed as directed for *Chromatographic system* and *Procedure* in the test for *Toluenesulfonamides* under *Saccharin* (see *NF* monograph).~~

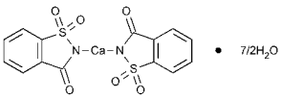
~~**Heavy metals,** *Method I* ⟨231⟩—Dissolve 4 g in 46 mL of water, add 4 mL of dilute hydrochloric acid (1 in 12), mix, and rub the inner wall of the vessel with a glass rod until crystallization begins. Allow the solution to stand for 1 hour, then pass through a dry filter, discarding the first 10 mL of the filtrate, and use 25 mL of the subsequent filtrate for the *Test Preparation:* the limit is 0.001%.~~

~~**Limit of benzoate and salicylate**—To 10 mL of a solution (1 in 20), previously acidified with 5 drops of 6 N acetic acid, add 3 drops of ferric chloride TS: no precipitate or violet color appears.~~

~~**Organic volatile impurities,** *Method I* ⟨467⟩**:**—meets the requirements.~~

~~**Assay**—Accurately weigh about 500 mg of Saccharin Calcium, and transfer completely to a separator with the aid of 10 mL of water. Add 2 mL of 3 N hydrochloric acid, and extract the precipitated saccharin first with 30 mL, then with five 20-mL portions, of a mixture of chloroform and alcohol (9 : 1). Evaporate the combined extracts on a steam bath to dryness, with the aid of a current of air, then dissolve the residue in 40 mL of alcohol, add 40 mL of water, mix, add phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS. Perform a blank determination on a mixture of 40 mL of alcohol and 40 mL of water, and make any necessary correction. Each mL of 0.1 N sodium hydroxide is equivalent to 20.22 mg of $C_{14}H_8CaN_2O_6S_2$.~~

▲Saccharin Calcium



$C_{14}H_8CaN_2O_6S_2 \cdot 3½H_2O$ 467.49

1,2-Benzisothiazol-3(2*H*)-one, 1,1-dioxide, calcium salt, hydrate (2 : 7).

1,2-Benzisothiazolin-3-one 1,1-dioxide calcium salt hydrate (2 : 7) [*6381-91-5*].

Anhydrous 404.44 [*6485-34-3*].

» Saccharin Calcium contains not less than 99.0 percent and not more than 101.0 percent of $C_{14}H_8CaN_2O_6S_2$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers. ~~Store at room temperature.~~ Store at room temperature.

Labeling—Where the quantity of saccharin calcium is indicated in the labeling of any preparation containing Saccharin Calcium, this shall be expressed in terms of saccharin ($C_7H_5NO_3S$).

USP Reference standards ⟨11⟩—*USP Saccharin Calcium RS. USP o-Toluenesulfonamide RS. USP p-Toluenesulfonamide RS.*

Clarity of solution—[NOTE—The *Test solution* is to be compared to the *Reference suspension A* and to water in diffused daylight 5 minutes after preparation of *Reference suspension A.*]

Hydrazine solution—Transfer 1.0 g of hydrazine sulfate to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Allow to stand for 4 to 6 hours.

Methenamine solution—Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension—[NOTE—This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.] Transfer 25.0 mL of *Hydrazine solution* to the *Methenamine solution* in the 100-mL glass-stoppered flask. Mix, and allow to stand for 24 hours.

Opalescence standard—[NOTE—This suspension should not be used beyond 24 hours after preparation.] Transfer 15.0 mL of the *Primary opalescent suspension* to a 1000-mL volumetric flask, dilute with water to volume, and mix.

Reference suspensions—Transfer 5.0 mL of the *Opalescence standard* to a 100-mL volumetric flask, dilute with water to volume, and mix to obtain *Reference suspension A.* Transfer 10.0 mL of the *Opalescence standard* to a second 100-mL volumetric flask, dilute with water to volume, and mix to obtain *Reference suspension B.*

Test solution—Dissolve 5.0 g of test material in about 20 mL of a 200 g per L solution of sodium acetate, dilute with the same solution to 25 mL, and mix.

Procedure—Transfer a sufficient portion of the *Test solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 mm to 25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Reference suspension A, Reference suspension B,* water, and a 200 g per L solution of sodium acetate to separate matching test tubes. Compare the *Test solution, Reference suspension A, Reference suspension B,* water, and a 200 g per L solution of sodium acetate in diffused daylight, viewing vertically against a black background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). [NOTE—The diffusion of light must be such that *Reference suspension A* can readily be distinguished from water, and that *Reference suspension B* can readily be distinguished from *Reference suspension A.*] The *Test solution* shows the same clarity as that of water, or the 200 g per L solution of sodium acetate, or its opalescence is not more pronounced than that of *Reference suspension A.*

Color of solution—

Standard stock solution—Combine 3.0 mL of ferric chloride CS, 3.0 mL of cobaltous chloride CS, 2.4 mL of cupric sulfate CS, and 1.6 mL of dilute hydrochloric acid (10 g per L).

Standard solution—[NOTE—Prepare the *Standard solution* immediately before use.] Transfer 1.0 mL of *Standard stock solution* to a 100-mL volumetric flask, dilute with dilute hydrochloric acid (10 g per L) to volume, and mix.

Test solution—Use the *Test solution* from *Clarity of solution.*

Procedure—Transfer a sufficient portion of the *Test solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 mm to 25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Standard solution,* a 200 g per L solution of sodium acetate, and water to separate matching test tubes. Compare the *Test solution,* the *Standard solution,* a 200 g per L solution of sodium acetate, and water in diffused daylight, viewing vertically against a white background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). The *Test solution* has the appearance of water or the 200 g per L solution of sodium acetate, or is not more intensely colored than the *Standard solution.*

Identification—

A: *Infrared Absorption* ⟨197K⟩—Dry the specimen at 105° for 2 hours before use.

B: To a solution (1 in 10) add 2 drops of methyl red TS, and neutralize with 6 N ammonium hydroxide. Add 3 N hydrochloric acid, dropwise, until the solution is acid to the indicator. Upon the addition of ammonium oxalate TS, a white precipitate is formed. This precipitate is insoluble in 6 N acetic acid but dissolves in hydrochloric acid.

C: Calcium salts moistened with hydrochloric acid impart a transient yellowish red color to a nonluminous flame.

Water, *Method I* ⟨921⟩**:** not more than 15.0%.

Readily carbonizable substances ⟨271⟩—Dissolve 200 mg in 5 mL of sulfuric acid (between 94.5% and 95.5% [w/w] of H_2SO_4), and keep at a temperature of 48° to 50° for 10 minutes: the solution has no more color than *Matching Fluid A,* when viewed against a white background.

Heavy metals, *Method I* ⟨231⟩—Dissolve 4 g in 46 mL of water, add 4 mL of dilute hydrochloric acid (1 in 12), mix, and rub the inner wall of the vessel with a glass rod until crystallization begins. Allow the solution to stand for 1 hour, then pass through a dry filter, discarding the first 10 mL of the filtrate, and use 25 mL of the subsequent filtrate for the *Test Preparation:* the limit is 0.001%.

Limit of toluenesulfonamides—

Internal standard solution—Dissolve 25 mg of caffeine in methylene chloride, and dilute with the same solvent to 100 mL.

Reference solution—Dissolve 20.0 mg of USP *o*-Toluenesulfonamide RS and 20.0 mg of USP *p*-Toluenesulfonamide RS in methylene chloride, and dilute with the same solvent to 100.0 mL. Dilute 5.0 mL of the solution with methylene chloride to 50.0 mL. Evaporate 5.0 mL of the final solution to dryness in a stream of nitrogen. Dissolve the residue in 1.0 mL of the *Internal standard solution.*

Test solution—~~Suspend 10.0 g of the substance to be examined in 20 mL of water, and dissolve using 5 mL to 6 mL of 10 N sodium hydroxide.~~ Dissolve 10.0 g of the substance to be examined in about 45 mL of water. If necessary, adjust the solution with 1 N sodium hydroxide or 1 N hydrochloric acid to a pH of 7 to 8, and dilute with water to 50 mL. Shake the solution with four quantities each of 50 mL of methylene chloride. Combine the lower layers, dry over anhydrous sodium sulfate, and filter. Wash the filter and the sodium sulfate with 10 mL of methylene chloride. Combine the solution and the washings, and evaporate almost to dryness in a water bath at a temperature not exceeding 40°. Using a small quantity of methylene chloride, quantitatively transfer the residue into a suitable 10-mL tube, evaporate to dryness in a stream of nitrogen, and dissolve the residue in 1.0 mL of the *Internal standard solution.*

Blank solution—Evaporate 200 mL of methylene chloride to dryness in a water bath at a temperature not exceeding 40°. Dissolve the residue in 1 mL of methylene chloride.

Chromatographic system (see *Chromatography* ⟨621⟩)—The ~~instrument~~ gas chromatograph is equipped with a flame-ionization detector and contains a 0.53-mm × 10-m fused silica column, coated with G3 phase (film thickness 2 µm). The injection port, column, and detector temperatures are maintained at about 250°, 180°, and 250°, respectively; and nitrogen is used as the carrier gas at a flow rate of about 10 mL per minute. The injector employs a split ratio of 1 : 2.

Procedure—Inject about 1 µL of the *Reference solution.* Adjust the sensitivity of the detector so that the height of the peak due to caffeine is not less than 50% of the full scale of the recorder. The substances are eluted in the following order: *o*-toluenesulfonamide, *p*-toluenesulfonamide, and caffeine. The test is not valid unless the resolution between the peaks due to *o*-toluenesulfonamide and *p*-toluenesulfonamide is at least 1.5. Inject about 1 µL of the *Blank solution.* In the chromatogram obtained, verify that there are no peaks with the same retention times as the internal standard, *o*-toluenesulfonamide, and *p*-toluenesulfonamide. Inject about 1 µL of the *Test solution,* and 1 µL of the *Reference solution.* If any peaks due to *o*-toluenesulfonamide and *p*-toluenesulfonamide appear in the chromatogram obtained with the *Test solution,* the ratio of their areas to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the *Reference solution* (10 ppm of *o*-toluenesulfonamide and 10 ppm of *p*-toluenesulfonamide).

Limit of benzoate and salicylate—To 10 mL of a solution (1 in 20), previously acidified with 5 drops of 6 N acetic acid, add 3 drops of ferric chloride TS: no precipitate or violet color appears.

Organic volatile impurities, *Method I* ⟨467⟩**:** meets the requirements.

Assay—Dissolve, with the aid of slight heating if necessary, about 150 mg of Saccharin Calcium, accurately weighed, in 50 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid, determining the endpoint potentiometrically. Perform a blank titration, if necessary, and make the appropriate correction. Each mL of 0.1 N perchloric acid is equivalent to 20.22 mg of $C_{14}H_8CaN_2O_6S_2$·▲*USP29*

BRIEFING

Saccharin Sodium, *USP 28* page 1745 and page 1427 of *PF* 30(4) [July–Aug. 2004]. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the *Saccharin Sodium* monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States Pharmacopeias. The following monograph, which represents the **ADOPTION STAGE 6** document, is based in part on comments from the Japanese Pharmacopoeia and the European Pharmacopoeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the United States Pharmacopeia.

Pharmacopeial Discussion Group Sign-Off Document

Attributes	EP	JP	USP
Definition	+	+	+
Identification B	+	+	+
Identification C	–	+	+
Acidity or alkalinity	+	+	+
Water	+	+	+
Readily carbonizable substances	+	+	+
Limit of benzoate and salicylate	–	+	+
Assay	+	+	+

Legend: + will adopt and implement; – will not stipulate.

Nonharmonized attributes: Packaging and storage, Heavy metals, Labeling, Clarity of solution, Color of solution, Limit of toluenesulfonamides, Identification A (IR).

Specific local attributes: USP: Organic volatile impurities; JP: Description.

Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference materials and reagent specifications.

Differences between the **ADOPTION STAGE 6** document and the current *USP* monograph include the following:

(1) In the opening paragraph (the Definition)—The lower limit is changed from not less than 98.0 percent to not less than 99.0 percent.
(2) *Packaging and storage*—Storage conditions at room temperature are added.
(3) *Labeling*—No change.
(4) *USP Reference standards*—A reference for Saccharin Sodium is added for use in *Identification* test *A*.
(5) *Clarity of solution*—This test is added to comply with EP standards.
(6) *Color of solution*—This test is added to comply with EP standards.
(7) *Identification—Identification* test *B* is replaced with a more definitive IR absorption test. *Identification* test *A* is retained, but separated into two tests (*B* and *C*).
(8) *Water*—No change.
(9) *Readily carbonizable substances*—No change.
(10) *Selenium*—This test is deleted because it is unnecessary for this compound.
(11) *Limit of toluenesulfonamides*—The test method and limits are changed to those of the European Pharmacopoeia, which include a more modern test method. The *Test solution* is corrected to that of the EP. Editorial changes are made.
(12) *Heavy metals*—No change.
(13) *Limit of benzoate and salicylate*—No change.
(14) *Organic volatile impurities*—No change.
(15) *Assay*—No change.

~~*Internal standard solution, Standard stock solution,* and *Standard preparations*—Prepare as directed for *Internal standard solution, Standard stock solution,* and *Standard preparations* in the test for *Toluenesulfonamides* under *Saccharin* (see *NF* monograph).~~

~~*Test preparation*—Prepare as directed under *Column Partition Chromatography* (see *Chromatography* ⟨621⟩), employing a chromatographic tube fitted with a porous glass disk in its base, a plastic stopcock on the delivery tube, and a reservoir on the top. Add a mixture consisting of 10 g of *Solid Support* and a solution of 2.0 g, accurately weighed, of Saccharin Sodium in 8.0 mL of sodium carbonate solution (1 in 20), and proceed as directed under *Test preparation* in the test for *Toluenesulfonamides* under *Saccharin* (see *NF* monograph), beginning with "Pack the contents."~~

~~*Chromatographic system* and *Procedure*—Proceed as directed for *Chromatographic system* and *Procedure* in the test for *Toluenesulfonamide* under *Saccharin* (see *NF* monograph).~~

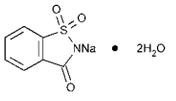
~~**Heavy metals,** *Method I* ⟨231⟩—Dissolve 4 g in 46 mL of water, add 4 mL of 1 N hydrochloric acid, mix, and rub the inner wall of the vessel with a glass rod until crystallization begins. Allow the solution to stand for 1 hour, and then filter through a dry filter, discarding the first 10 mL of the filtrate: the limit, determined on 25 mL of the subsequent filtrate, is 0.001%.~~

~~**Organic volatile impurities,** *Method IV* ⟨467⟩**:** meets the requirements.~~

~~**Other requirements**—It responds to *Identification* tests *A* and *B*, and meets the requirements of the tests for *Water, Benzoate and salicylate, Selenium,* and *Readily carbonizable substances* under *Saccharin Calcium*.~~

~~**Assay**—Proceed with Saccharin Sodium as directed in the *Assay* under *Saccharin Calcium*. Each mL of 0.1 N sodium hydroxide is equivalent to 20.52 mg of $C_7H_4NNaO_3S$.~~

▲Saccharin Sodium



$C_7H_4NNaO_3S \cdot 2H_2O$ 241.20

1,2-Benzisothiazol-3(2*H*)-one, 1,1-dioxide, sodium salt, dihydrate.

1,2-Benzisothiazolin-3-one 1,1-dioxide sodium salt dihydrate [*6155-57-3*].

Anhydrous 205.17 [*128-44-9*].

» Saccharin Sodium contains not less than 99.0 percent and not more than 101.0 percent of $C_7H_4NNaO_3S \cdot 2H_2O$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers. ~~Store at room temperature.~~ Store at room temperature.

Labeling—Where the quantity of saccharin sodium is indicated in the labeling of any preparation containing Saccharin Sodium, this shall be expressed in terms of saccharin ($C_7H_5NO_3S$).

USP Reference standards ⟨11⟩—*USP Saccharin Sodium RS. USP o-Toluenesulfonamide RS. USP p-Toluenesulfonamide RS.*

Clarity of solution—[NOTE—The *Test solution* is to be compared to *Reference suspension A* and to water in diffused daylight 5 minutes after preparation of *Reference suspension A*.]

Hydrazine solution—Transfer 1.0 g of hydrazine sulfate to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Allow to stand for 4 to 6 hours.

Methenamine solution—Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension—[NOTE—This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.]

Transfer 25.0 mL of *Hydrazine solution* to the *Methenamine solution* in the 100-mL glass-stoppered flask. Mix, and allow to stand for 24 hours.

Opalescence standard—[NOTE—This suspension should not be used beyond 24 hours after preparation.] Transfer 15.0 mL of the *Primary opalescent suspension* to a 1000-mL volumetric flask, dilute with water to volume, and mix.

Reference suspensions—Transfer 5.0 mL of the *Opalescence standard* to a 100-mL volumetric flask, dilute with water to volume, and mix to obtain *Reference suspension A.* Transfer 10.0 mL of the *Opalescence standard* to a second 100-mL volumetric flask, dilute with water to volume, and mix to obtain *Reference suspension B.*

Test solution—Dissolve 5.0 g of test material in about 20 mL of a 200 g per L solution of sodium acetate, dilute with ~~water~~ the same solution to 25 mL, and mix.

Procedure—Transfer a sufficient portion of the *Test solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 mm to 25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Reference suspension A, Reference suspension B,* water, and a 200 g per L solution of sodium acetate to separate matching test tubes. Compare the *Test solution, Reference suspension A, Reference suspension B,* water, and a 200 g per L solution of sodium acetate in diffused daylight, viewing vertically against a black background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). [NOTE—The diffusion of light must be such that *Reference suspension A* can readily be distinguished from water, and that *Reference suspension B* can readily be distinguished from *Reference suspension A.*] The *Test solution* shows the same clarity as that of water, or the 200 g per L solution of sodium acetate, or its opalescence is not more pronounced that that of *Reference suspension A.*

Color of solution—

Standard stock solution—Combine 3.0 mL of ferric chloride CS, 3.0 mL of cobaltous chloride CS, 2.4 mL of cupric sulfate CS, and 1.6 mL of dilute hydrochloric acid (10 g per L).

Standard solution—[NOTE—Prepare the *Standard solution* immediately before use.] Transfer 1.0 mL of *Standard stock solution* to a 100-mL volumetric flask, dilute with dilute hydrochloric acid (10 g per L) to volume, and mix.

Test solution—Use the *Test solution* from the test for *Clarity of solution.*

Procedure—Transfer a sufficient portion of the *Test solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 mm to 25 mm to obtain a depth of 40 mm. Similarly transfer portions of the *Standard solution,* a 200 g per L solution of sodium acetate, and water to separate matching test tubes. Compare the *Test solution,* the *Standard solution,* a 200 g per L solution of sodium acetate, and water in diffused daylight, viewing vertically against a white background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). The *Test solution* has the appearance of water or the 200 g per L solution of sodium acetate, or is not more intensely colored than the *Standard solution.*

Identification—

A: *Infrared Absorption* ⟨197K⟩—Dry the specimen at 105° for 2 hours before use.

B: To a solution (1 in 10) add 2 mL of 15% potassium carbonate, and heat to boiling. No precipitate is formed. Add 4 mL of potassium pyroantimonate TS, and heat to boiling. Allow to cool in ice water and, if necessary, rub the inside of the test tube with a glass rod. A dense precipitate is formed.

C: Sodium salts impart an intense yellow color to a nonluminous flame.

Acidity or alkalinity—To a solution of 1.0 g in 10 mL of carbon dioxide-free water add 1 drop of phenolphthalein TS: no pink color is produced. Then add 1 drop of 0.1 N sodium hydroxide: a pink color is produced.

Water, *Method I* ⟨921⟩**:** not more than 15.0%.

Readily carbonizable substances ⟨271⟩**—**Dissolve 200 mg in 5 mL of sulfuric acid (between 94.5% and 95.5% [w/w] of H_2SO_4), and keep at a temperature of 48° to 50° for 10 minutes: the solution has no more color than *Matching Fluid A,* when viewed against a white background.

Heavy metals, *Method I* ⟨231⟩**—**Dissolve 4 g in 46 mL of water, add 4 mL of dilute hydrochloric acid (1 in 12), mix, and rub the inner wall of the vessel with a glass rod until crystallization begins. Allow the solution to stand for 1 hour, then pass through a dry filter, discarding the first 10 mL of the filtrate, and use 25 mL of the subsequent filtrate for the *Test Preparation:* the limit is 0.001%.

Limit of toluenesulfonamides—

Internal standard solution—Dissolve 25 mg of caffeine in methylene chloride, and dilute with the same solvent to 100 mL.

Reference solution—Dissolve 20.0 mg of USP *o*-Toluenesulfonamide RS and 20.0 mg of USP *p*-Toluenesulfonamide RS in methylene chloride, and dilute with the same solvent to 100.0 mL. Dilute 5.0 mL of the solution with methylene chloride to 50.0 mL. Evaporate 5.0 mL of the final solution to dryness in a stream of nitrogen. Dissolve the residue in 1.0 mL of the *Internal standard solution.*

Test solution—~~Suspend 10.0 g of the substance to be examined in 20 mL of water, and dissolve using 5 mL to 6 mL of 1 10 N sodium hydroxide.~~ Dissolve 10.0 g of the substance to be examined in about 45 mL of water. If necessary adjust the solution with 1 N sodium hydroxide or 1 N hydrochloric acid to a pH of 7 to 8, and dilute with water to 50 mL. Shake the solution with four quantities each of 50 mL of methylene chloride. Combine the lower layers, dry over anhydrous sodium sulfate, and filter. Wash the filter and the sodium sulfate with 10 mL of methylene chloride. Combine the solution and the washings, and evaporate almost to dryness in a water bath at a temperature not exceeding 40°. Using a small quantity of methylene chloride, quantitatively transfer the residue into a suitable 10-mL tube, evaporate to dryness in a stream of nitrogen, and dissolve the residue in 1.0 mL of the *Internal standard solution.*

Blank solution—Evaporate 200 mL of methylene chloride to dryness in a water bath at a temperature not exceeding 40°. Dissolve the residue in 1 mL of methylene chloride.

Chromatographic system (see *Chromatography* ⟨621⟩)—The ~~instrument~~ gas chromatograph is equipped with a flame-ionization detector and contains a 0.53-mm × 10-m fused silica column, coated with G3 phase (film thickness 2 µm). The injection port, column, and detector temperatures are maintained at about 250°, 180°, and 250°, respectively; and nitrogen is used as the carrier gas at a flow rate of about 10 mL per minute. The injector employs a split ratio of 1 : 2.

Procedure—Inject about 1 µL of the *Reference solution.* Adjust the sensitivity of the detector so that the height of the peak due to caffeine is not less than 50% of the full scale of

the recorder. The substances are eluted in the following order: *o*-toluenesulfonamide, *p*-toluenesulfonamide, and caffeine. The test is not valid unless the resolution between the peaks due to *o*-toluenesulfonamide and *p*-toluenesulfonamide is at least 1.5. Inject about 1 µL of the *Blank solution.* In the chromatogram obtained, verify that there are no peaks with the same retention times as the internal standard, *o*-toluenesulfonamide, and *p*-toluenesulfonamide. Inject about 1 µL of the *Test solution* and 1 µL of the *Reference solution.* If any peaks due to *o*-toluenesulfonamide and *p*-toluenesulfonamide appear in the chromatogram obtained with the *Test solution,* the ratio of their areas to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the *Reference solution* (10 ppm of *o*-toluenesulfonamide and 10 ppm of *p*-toluenesulfonamide).

Limit of benzoate and salicylate—To 10 mL of a solution (1 in 20), previously acidified with 5 drops of 6 N acetic acid, add 3 drops of ferric chloride TS: no precipitate or violet color appears.

Organic volatile impurities, *Method I* ⟨467⟩**:** meets the requirements.

Assay—Dissolve, with the aid of slight heating if necessary, about 150 mg of Saccharin Sodium, accurately weighed, in 50 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid, determining the endpoint potentiometrically. Perform a blank titration, if necessary, and make the appropriate correction. Each mL of 0.1 N perchloric acid is equivalent to 20.52 mg of $C_7H_4NNaO_3S$.▲*USP29*

MONOGRAPHS (NF)

BRIEFING

Saccharin, *NF 23* page 3070 and page 1450 of *PF* 30(4) [July–Aug. 2004]. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the *Saccharin* monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States Pharmacopeias. The following monograph, which represents the **ADOPTION STAGE 6** document, is based in part on comments from the European and Japanese Pharmacopoeias in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the United States Pharmacopeia.

Pharmacopeial Discussion Group Sign-Off Document

Attributes	EP	JP	USP
Definition	+	+	+
Packaging and storage	+	+	+
Loss on drying	+	+	+
Readily carbonizable substances	+	+	+
Residue on ignition	+	+	+
Limit of benzoate and salicylate	–	+	+
Assay	+	+	+

Legend: + will adopt and implement; – will not stipulate.

Nonharmonized attributes: Heavy metals, Melting range, Clarity of solution, Color of solution, Limit of toluenesulfonamides, Identification (IR).

Specific local attributes: USP: Organic volatile impurities; JP: Description.

Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference materials and reagent specifications.

Differences between the **ADOPTION STAGE 6** document and the current *NF* monograph include the following:

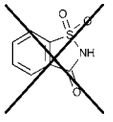
(1) In the opening paragraph (the Definition)—The lower limit is changed from not less than 98.0 percent to not less than 99.0 percent.
(2) *Packaging and storage*—Storage conditions at room temperature are added.
(3) *USP Reference standards*—A reference for Saccharin is added for use in the *Identification* test.
(4) *Clarity of solution*—This test is added to comply with EP standards.

(5) *Color of solution*—This test is added to comply with EP standards.
(6) *Identification—Identification* tests *A* and *B* are replaced with a more definitive IR absorption test.
(7) *Melting range*—No change.
(8) *Loss on drying*—No change.
(9) *Readily carbonizable substances*—No change.
(10) *Residue on ignition*—No change.
(11) *Limit of toluenesulfonamides*—The test method and limits are changed to those of the European Pharmacopoeia, which include a more modern test method. Editorial corrections are made.
(12) *Selenium*—This test is deleted because it is unnecessary for this compound.
(13) *Heavy metals*—No change.
(14) *Limit of benzoate and salicylate*—No change.
(15) *Organic volatile impurities*—No change.
(16) *Assay*—No change.

(EMC: J. Lane) RTS—42147-1

Change to read:

~~Saccharin~~



~~$C_7H_5NO_3S$ 183.19~~
~~1,2-Benzisothiazol-3(2*H*)-one, 1,1-dioxide.~~
~~1,2-Benzisothiazolin-3-one-1,1-dioxide [*81-07-2*].~~

~~» Saccharin contains not less than 98.0 percent and not more than 101.0 percent of $C_7H_5NO_3S$, calculated on the dried basis.~~

~~**Packaging and storage**—Preserve in well-closed containers.~~

~~**USP Reference standards** ⟨11⟩—*USP o-Toluenesulfonamide RS. USP p-Toluenesulfonamide RS.*~~

~~**Identification—**~~

~~**A:**—Dissolve about 100 mg in 5 mL of sodium hydroxide solution (1 in 20), evaporate the solution to dryness, and gently fuse the residue over a small flame until it no longer evolves ammonia. Allow the residue to cool, dissolve it in 20 mL of water, neutralize the solution with 3 N hydrochloric acid, and filter: the addition of a drop of ferric chloride TS to the filtrate produces a violet color.~~

~~**B:**—Mix 20 mg with 40 mg of resorcinol, add 10 drops of sulfuric acid, and heat the mixture in a suitable liquid bath at 200° for 3 minutes. Allow it to cool, and add 10 mL of water and an excess of 1 N sodium hydroxide: a fluorescent green liquid results.~~

~~**Melting range** ⟨741⟩: between 226° and 230°.~~

~~**Loss on drying** ⟨731⟩—Dry it at 105° for 2 hours: it loses not more than 1.0% of its weight.~~

~~**Readily carbonizable substances** ⟨271⟩—Dissolve 200 mg in 5 mL of sulfuric acid TS, and keep at a temperature of 48° to 50° for 10 minutes: the solution has no more color than *Matching Fluid A.*~~

~~**Residue on ignition** ⟨281⟩: not more than 0.2%.~~

~~**Toluenesulfonamides—**~~

~~*Internal standard solution*—Place 10 mg of *n*-tricosane in a 10-mL volumetric flask, dissolve in *n*-heptane, dilute with *n*-heptane to volume, and mix.~~

~~*Standard stock solution*—Transfer 20 mg each, accurately weighed, of USP *o*-Toluenesulfonamide RS and of USP *p*-Toluenesulfonamide RS to a 10-mL volumetric flask, dissolve in methylene chloride, dilute with methylene chloride to volume, and mix.~~

~~*Standard preparations*—Transfer 100, 150, 200, and 250 µL, respectively, of *Standard stock solution* to each of four 10-mL volumetric flasks. Add 250 µL, accurately measured, of *Internal standard solution* to each flask, dilute each with methylene chloride to volume, and mix. These preparations contain, in each mL, 25 µg of *n*-tricosane and, respectively, 20, 30, 40, and 50 µg of each toluenesulfonamide isomer.~~

~~*Test preparation*—Prepare as directed under *Column Partition Chromatography* (see *Chromatography* ⟨621⟩), employing a chromatographic tube fitted with a porous glass disk in its base, a plastic stopcock on the delivery tube, and a reservoir at the top. Add a mixture consisting of 12 g of *Solid Support* and a solution of 2.0 g, accurately weighed, of Saccharin with 12 mL of filtered sodium bicarbonate solution (1 in 11). Add about 200 mg of sodium bicarbonate to effect complete solution of the saccharin. Pack the contents of the tube by tapping the column on a padded surface, and then by tamping firmly from the top. Place 100 mL of methylene chloride in the reservoir, and adjust the stopcock so that 50 mL of eluate is collected in 20 to 30 minutes. To the eluate add 25 µL of *Internal standard solution*, mix, and concentrate the solution, by suitable means, to a volume of 1.0 mL.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—Under typical conditions, the instrument is equipped with a flame ionization detector, and contains a 1.8-m × 3.2-mm glass column packed with 10% liquid phase G3 on 100- to 120-mesh support S1AB, utilizing a glass-lined sample introduction system or on-column injection. The injector port, column, and detector block are maintained at temperatures of about 225°, 210°, and 250°, respectively, and dry helium is used as the carrier gas at a flow rate of about 30 mL per minute.~~

~~*Procedure*—Inject portions (about 2.5 µL) of the *Standard preparations*, successively, into a gas chromatograph, and record each chromatogram so as to obtain at least 50% of maximum recorder response. Measure the areas under the first (*o*-toluenesulfonamide), second (*p*-toluenesulfonamide), and third (*n*-tricosane) peaks, and for each chromatogram record the values as A_o, A_p, and A_n, respectively. Calculate the ratios R_o and R_p taken by the equations:~~

$$R_o = A_o / A_n \text{ and } R_p = A_p / A_n,$$

~~and prepare standard curves by plotting the concentrations, in µg per mL, of USP *o*-Toluenesulfonamide RS and of USP *p*-Toluenesulfonamide RS in the *Standard preparations* versus R_o and R_p, respectively. [NOTE—Relative retention times are, approximately, 0.39 for *o*-toluenesulfonamide, 0.46 for *p*-toluenesulfonamide, and 1.0 for *n*-tricosane.] Similarly inject a portion (about 2.5 µL) of the *Test preparation*, and record the chromatogram. Measure the areas under the first (*o*-toluenesulfonamide), second (*p*-toluenesulfonamide), and third (*n*-tricosane) peaks, and record the values as a_o, a_p, and a_n, respectively. Calculate the ratios r_o and r_p taken by the equations:~~

$$r_o = a_o / a_n \text{ and } r_p = a_p / a_n,$$

~~and, from the standard curve, determine the concentration, in µg per mL, of each toluenesulfonamide isomer in the *Test preparation:* the total amount of toluenesulfonamides in the specimen taken is not more than 0.0025%.~~

~~**Selenium** ⟨291⟩: 0.003%, a 100-mg specimen, mixed with 100 mg of magnesium oxide, being used.~~

~~**Heavy metals,** *Method II* ⟨231⟩: 0.001%.~~

~~**Benzoic and salicylic acids**—To 10 mL of a hot, saturated solution of it add ferric chloride TS, dropwise: no precipitate or violet color appears in the liquid.~~

~~**Organic volatile impurities,** *Method V* ⟨467⟩**:** meets the requirements.~~

~~*Solvent*—Use dimethyl sulfoxide.~~

~~**Assay**—Accurately weigh about 500 mg of Saccharin, dissolve in 40 mL of alcohol, add 40 mL of water, mix, add phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium hydroxide is equivalent to 18.32 mg of $C_7H_5NO_3S$.~~

Compare the *Test solution, Reference suspension A, Reference suspension B,* water, and a 200 g per L solution of sodium acetate in diffused daylight, viewing vertically against a black background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). [NOTE—The diffusion of light must be such that *Reference suspen-*

sion A can readily be distinguished from water and that *Reference suspension B* can readily be distinguished from *Reference suspension A.*] The *Test solution* shows the same clarity as that of water, or the 200 g per L solution of sodium acetate, or its opalescence is not more pronounced than that of *Reference suspension A.*

Color of solution—

Standard stock solution—Combine 3.0 mL of ferric chloride CS, 3.0 mL of cobaltous chloride CS, 2.4 mL of cupric sulfate CS, and 1.6 mL of dilute hydrochloric acid (10 g per L).

Standard solution—[NOTE—Prepare the *Standard solution* immediately before use.] Transfer 1.0 mL of *Standard stock solution* to a 100-mL volumetric flask, dilute with dilute hydrochloric acid (10 g per L) to volume, and mix.

Test solution—Use the *Test solution* from *Clarity of solution.*

Procedure—Transfer a sufficient portion of the *Test solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 mm to 25 mm to obtain a depth of 40 mm. Similarly transfer portions of the *Standard solution*, a 200 g per L solution of sodium acetate, and water to separate matching test tubes. Compare the *Test solution,* the *Standard solution,* a 200 g per L solution of sodium acetate, and water in diffused daylight, viewing vertically against a white background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). The *Test solution* has the appearance of water or the 200 g per L solution of sodium acetate, or is not more intensely colored than the *Standard solution.*

Identification, *Infrared Absorption* ⟨197K⟩.

Melting range ⟨741⟩**:** between 226° and 230°.

Loss on drying ⟨731⟩—Dry it at 105° for 2 hours: it loses not more than 1.0% of its weight.

Readily carbonizable substances ⟨271⟩—Dissolve 200 mg in 5 mL of sulfuric acid (between 94.5% and 95.5% [w/w] of H_2SO_4), and keep at a temperature of 48° to 50° for 10 minutes: the solution has no more color than *Matching Fluid A,* when viewed against a white background.

Residue on ignition ⟨281⟩**:** not more than 0.2%. Ignition temperature: 600 ± 50°.

Heavy metals, *Method II* ⟨231⟩**:** 0.001%.

Limit of toluenesulfonamides—

Internal standard solution—Dissolve 25 mg of caffeine in methylene chloride, and dilute with the same solvent to 100 mL.

Reference solution—Dissolve 20.0 mg of USP *o*-Toluenesulfonamide RS and 20.0 mg of USP *p*-Toluenesulfonamide RS in methylene chloride, and dilute with the same solvent to 100.0 mL. Dilute 5.0 mL of the solution with methylene chloride to 50.0 mL. Evaporate 5.0 mL of the final solution to dryness in a stream of nitrogen. Dissolve the residue in 1.0 mL of the *Internal standard solution.*

Test solution—Suspend 10.0 g of the substance to be examined in 20 mL of water, and dissolve using 5 mL to 6 mL of 10 N sodium hydroxide. If necessary adjust the solution with 1 N sodium hydroxide or 1 N hydrochloric acid to a pH of 7 to 8, and dilute with water to 50 mL. Shake the solution with four quantities each of 50 mL of methylene chloride. Combine the lower layers, dry over anhydrous sodium sulfate, and filter. Wash the filter and the sodium sulfate with 10 mL of methylene chloride. Combine the solution and the washings, and evaporate almost to dryness in a water bath at a temperature not exceeding 40°. Using a small quantity of methylene chloride, quantitatively transfer the residue into a suitable 10 mL tube, evaporate to dryness in a stream of nitrogen, and dissolve the residue in 1.0 mL of the *Internal standard solution.*

Blank solution—Evaporate 200 mL of methylene chloride to dryness in a water bath at a temperature not exceeding 40°. Dissolve the residue in 1 mL of methylene chloride.

Chromatographic system (see *Chromatography* ⟨621⟩)—The ~~instrument~~ gas chromatograph is equipped with a flame-ionization detector and contains a 0.53-mm × 10-m fused silica column, coated with G3 phase (film thickness 2 µm). The injection port, column, and detector temperatures are maintained at about 250°, 180°, and 250°, respectively; and nitrogen is used as the carrier gas at a flow rate of about 10 mL per minute. The injector employs a split ratio of 1 : 2.

Procedure—Inject about 1 µL of the *Reference solution.* Adjust the sensitivity of the detector so that the height of the peak due to caffeine is not less than 50% of the full scale of the recorder. The substances are eluted in the following order: *o*-toluenesulfonamide, *p*-toluenesulfonamide, and caffeine. The test is not valid unless the resolution between the peaks due to *o*-toluenesulfonamide and *p*-toluenesulfonamide is at least 1.5. Inject about 1 µL of the *Blank solution.* In the chromatogram obtained, verify that there are no peaks with the same retention times as the internal standard, *o*-toluenesulfonamide, and *p*-toluenesulfonamide. Inject about 1 µL of the *Test solution* and 1 µL of the *Reference solution.* If any peaks due to *o*-toluenesulfonamide, and *p*-toluenesulfonamide appear in the chromatogram obtained with the *Test solution,* the ratio of their areas to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the *Reference solution* (10 ppm of *o*-toluenesulfonamide and 10 ppm of *p*-toluenesulfonamide).

Limit of benzoate and salicylate—To 10 mL of a hot, saturated solution of it add ferric chloride TS, dropwise: no precipitate or violet color appears in the liquid.

Organic volatile impurities, *Method V* ⟨467⟩**:** meets the requirements.

Solvent—Use dimethyl sulfoxide.

Assay—Accurately weigh about 500 mg of Saccharin, dissolve in 40 mL of alcohol, add 40 mL of water, mix, add phenolphthalein TS, and titrate with 0.1 N sodium hydroxide. Perform a blank titration, if necessary, and make the appropriate correction. Each mL of 0.1 N sodium hydroxide is equivalent to 18.32 mg of $C_7H_5NO_3S$.▲*NF24*

Harmonization

PHARMACOPEIAL PREVIEWS

This section contains potential revisions not yet targeted for official adoption. These may include drafts for new monographs or chapters; drafts for standards that would require new or unusual technology; drafts for which more data are required; or changes that would affect numerous monographs, thus having a broad impact on individual products. Readers should review the drafts in this section and provide comments to the appropriate staff liaison whose name is cited in the Briefing (use the *Staff Directory* to find the contact information).

Briefings Each Preview is preceded by a Briefing in the following format:

BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being used, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How To Use PF*), the name of the scientific staff liaison who handled this item, and the USP tracking correspondence number, as shown in the example below:

(PA5: K. Russo) RTS—55678-1

Symbols No symbols are used in this section, as Previews are not yet targeted for official adoption.

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of authoritative committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* and *Pharmacopeial Previews* sections. Readers interested in submitting comments should see *Instructions to Authors.*

Pharmacopeial Forum
Vol. 31(2) [Mar.–Apr. 2005]

Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP–NF* revision will be considered for publication in the *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention, Inc., (USPC) and may not be published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

References—Consult a current copy of the *Pharmacopeial Forum* and the *ACS Style Guide* for assistance with reference style.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Contact Person—When submitting a manuscript, designate one author of the article as correspondent and include that author's full address, telephone number, fax number, and e-mail address.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Graphics that cannot be submitted electronically must be camera-ready, of easily reproducible quality and size, and clearly labeled. Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

Common Pharmacopeial Calculations in USP Monographs

Behnam Davani, Ph.D., Karen A. Russo, Ph.D., Andrzej Wilk, Ph.D., and Lokesh Bhattacharyya, Ph.D.,* *United States Pharmacopeia*

ABSTRACT This article was prompted by questions USP has received pertaining to the formulas used in official monographs. It attempts to explain most commonly used formulas by citing representative examples and analyzes all factors that have led to the final formula. In many cases, factors such as dilution and/or relative response factors are combined in a single numerical value. It is not always obvious how the numerical factor was derived until a thorough analysis is completed. Examples were chosen from three areas: miscellaneous tests such as *Loss on drying* and *Loss on ignition,* assays comprising various procedures, and related compounds determined by HPLC. Recommendations to simplify the format and express the formulas in a more explanatory manner are included.

INTRODUCTION

Calculations are part of almost every monograph procedure. Monograph procedures use various techniques, experimental designs, and corresponding formulas to calculate results. In order to understand the results of a test, the analyst should have complete comprehension of the interdependence of the formula and the experimental design.

The purpose of this *Stimuli* article is to present detailed explanations of many of the most commonly used pharmacopeial calculations. Three categories of formulas are included: Calculations for tests such as *Loss on drying* and *Loss on ignition* are included under miscellaneous tests; the *Assay* section includes formulas for titrimetric and spectroscopic procedures; and the related compounds and assay categories include formulas used in quantitative chromatographic [high-performance liquid chromatography (HPLC) and gas chromatography (GC)] procedures. As applicable, formulas from USP drug substance and drug product monographs are used to illustrate various examples. Although many examples are presented, this article is not meant to be an exhaustive review of every possible type of compendial formula. For the purposes of this article, calculations for biological tests are not included.

The result of this review of pharmacopeial calculations is a list of recommendations for presenting formulas in monograph procedures. This list is offered to the pharmaceutical industry and to USP as a tool for drafting monograph formulas so that they are scientifically sound and useful to the analyst.

The authors have made a few assumptions in writing this article. First, the analyst must have the required theoretical knowledge and practical laboratory training in order to perform the monograph procedure. Second, a thorough understanding of the *USP General Notices* and applicable General Chapters is critical in order to execute the procedures correctly. Finally, the analyst also should have working knowledge of the appropriate regulatory guidances and International Conference on Harmonization (ICH) guidelines and the USP "Guideline for Submitting Requests for Revision to *USP–NF*" (*1*).

MISCELLANEOUS CALCULATIONS

Following are sample calculations for tests such as *Loss on drying* (LOD) or *Loss on ignition* (LOI) needed for the correction of the assay result when appropriate.

Percent LOD

This procedure determines the amount of volatile matter of any kind that is driven off under the conditions specified (*2*). In this simple technique, the sample is weighed, then heated, and the dried sample is reweighed. The difference in the sample weight is the volatile content. A typical calculation is as follows:

Weight of container = C

Weight of container and test sample before drying = T

Weight of container and test sample after final drying = F

$$\%LOD = [(T - F)/(T - C)] \times 100$$

*Correspondence should be addressed to: Lokesh Bhattacharyya, Ph.D., Director, Department of Standards Development, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852-1790; tel. 301.816.8201; fax 301.816.8373; e-mail lb@usp.org.

Percent LOI

This procedure determines the percentage of test material that is volatilized and driven off under the conditions specified (*3*). The sample is initially weighed and then ignited in a suitable oven. The sample is cooled in a desiccator and accurately reweighed. The percentage loss for the test material is calculated as follows:

Weight of container = C

Weight of container and test sample before ignition = T

Weight of container and test sample after final ignition = F

$$\%LOI = [(T - F)/(T - C)] \times 100$$

ASSAY

Assay procedures determine the content of an active ingredient in a drug substance or a drug product. The acceptance criteria for an assay are indicated in the definition section of the *USP* monograph and generally are expressed as a percent. However, the value calculated in the assay generally is the quantity (e.g., mg or µg). Therefore, further calculations may be needed to convert the assay result to the appropriate unit (usually percent) consistent with the Definition section of the monograph.

Example 1 (Assay "As Is")

Malathion contains not less than 98.0 percent and not more than 102.0 percent of $C_{10}H_{19}O_6PS_2$.
The quantity of Malathion obtained in the assay = Q
The quantity of Malathion taken = T

Assume:
Q = 495 mg
T = 500.0 mg

Calculation: $Q/T \times 100 = 495/500.0 \times 100 = 99.0$ percent.

The percent acceptance criteria in the definition for the article without further qualification generally indicate the assay result "as is." However, the acceptance criteria for the assay frequently indicate limits to be calculated on the anhydrous basis, on the dried basis, or on the ignited basis.

The following section from the *USP General Notices* (p. 7) may help analysts understand the common calculations involving appropriate correction factors:

Where the definition in a monograph states the tolerances as being "calculated on the dried (or anhydrous or ignited) basis," the directions for drying or igniting the sample prior to assaying are generally omitted from the *Assay* procedure. Assay and test procedures may be performed on the undried or unignited substance and the results calculated on the dried, anhydrous, or ignited basis, provided a test for *Loss on drying,* or *Water,* or *Loss on ignition,* respectively, is given in the monograph.

Example 2 (Assay Result Corrected for Loss on Drying)

Miconazole contains not less than 98.0 percent and not more than 102.0 percent of $C_{18}H_{14}C_{l4}N_2O$, calculated on the dried basis.
Quantity of $C_{18}H_{14}C_{l4}N_2O$ obtained in the assay = Q
Quantity of Miconazole taken = T
Percent LOD = A

Assume:
Q = 295.0 mg
T = 300.0 mg
A = 0.34%

Assay result = $[Q/T/(100 - A)/100] \times 100 = [295.0/300.0/(100 - 0.34)/100] \times 100 = 98.7$ percent.

Example 3 (Assay Result Corrected for Water)

Acyclovir contains not less than 98.0 percent and not more than 101.0 percent of $C_8H_{11}N_5O_3$, calculated on the anhydrous basis.
Quantity of $C_8H_{11}N_5O_3$ obtained in the assay = Q
Quantity of Acyclovir taken = T
Percent of water = A

Assume:
Q = 96.0 mg
T = 99.8 mg
A = 3.54 %

Assay result = $[Q/T/(100 - A)/100] \times 100 = [96.0/99.8/(100 - 3.54)/100] \times 100 = 99.7$ percent

Example 4 (Assay Result Corrected for Loss on Ignition)

Ferric Oxide contains not less than 97.0 percent and not more than 100.5 percent of Fe_2O_3, calculated on the ignited basis.
Quantity of Fe_2O_3 obtained in the assay = Q
Quantity of Ferric Oxide taken = T
Percent LOI = A

Assume:
Q = 2.48 mg
T = 2.52 mg
A = 1.24%

Assay result = $[Q/T/(100 - A)/100] \times 100$ = [2.48/2.52/ (100 – 1.24/100)] × 100 = 99.6 percent

The *USP General Notices* also state (p. 7):

> Where the presence of moisture or other volatile material may interfere with the procedure, previous drying of the substance is specified in the individual monograph and is obligatory. Throughout a monograph that includes a test for *Loss on drying* or *Water,* the expression "previously dried" without qualification signifies that the substance is to be dried as directed under *Loss on drying* or *Water* (gravimetric determination).

Example 5 (Assay Result on Previously Dried Sample)

> Ganciclovir contains not less than 98.0 percent and not more than 102.0 percent of $C_9H_{13}N_5O_4$, calculated on the previously dried basis.
> Quantity of $C_9H_{13}N_5O_4$ obtained in the assay = Q
> Quantity of Ganciclovir, previously dried, taken = T
>
> Assume:
> Q = 10.7 mg
> T = 10.5 mg
>
> Assay result = $Q/T \times 100$ = 10.7/10.5 × 100 = 101.9 percent.

Example 6: (Assay Result on Previously Dried Sample)

In some cases, the procedure in the monograph will indicate that the sample should be dried before use.

> Adenosine contains not less than 99.0 percent and not more than 101.0 percent of $C_{10}H_{13}N_5O_4$ calculated on the dried basis.
> *Assay*—Dissolve about 200 mg of Adenosine, previously dried at 105° for 2 hours and accurately weighed, in 50 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 26.72 mg of $C_{10}H_{13}N_5O_4$.

In the two previous cases, the test sample must be dried first and then assayed. There is no actual additional calculation for the dried basis. Rather, the term "calculated on the dried basis" or "calculated on the previously dried basis" implies that the values calculated for the assay have already been corrected for the volatile compounds (water and/or solvents) because the test sample was previously dried.

The acceptance criteria for the assay also can be expressed on the solvent-free basis or other variations and combination terms. In this case, the assay result needs to be corrected for the solvent, if present. A test for specific residual solvent(s) or a general test for volatile organic impurities is usually provided in the monograph.

Example 7 (Assay Result Corrected for Both Water and Solvent)

> Lamivudine contains not less than 98.0 percent and not more than 102.0 percent of $C_8H_{11}N_3O_3S$, calculated on the anhydrous and solvent-free basis.
> Quantity of $C_8H_{11}N_3O_3S$ in the portion of Lamivudine obtained in the assay = Q
> Quantity of Lamivudine taken = T
> Percent of water = A
> Percent of residual solvent = B
>
> Assume:
> Q = 26.0 mg
> T = 25.9 mg
> A = 0.183%
> B = 0.281%
>
> Assay result = $[Q/T/(100 - A - B)/100] \times 100$ =
>
> [26.0/25.9/ (100 – 0.183 – 0.281)/100] × 100 = 100.9 percent.
>
> NOTE—When the assay result in a *USP* monograph is corrected for LOD, LOI, water, residual solvent, or combinations of such factors, not only must the acceptance criteria for the assay be met but all other acceptance criteria for the monograph also have to be achieved. In other words, the assay value of 100.9% obtained above is within the tolerance value of 98.0% to 102.0%. In addition, both water and residual solvent must remain within the acceptance criteria of not more than 0.2% and 0.3%, respectively, for Lamivudine.

COMMON CALCULATIONS FOR DETERMINATION OF THE ASSAY RESULT

In this section, common or typical calculations used for the determination of assay results are discussed. Simple and more complex calculations for both drug substance and dosage forms will be presented. Because most of the assay procedures are based on chromatography, titration, or spectroscopy, examples using such techniques will be explored. However, a detailed discussion of the different types of techniques used is beyond the scope of this *Stimuli* article. It is assumed that the reader has a basic understanding of the concepts and the principles of chromatographic, titration, and spectroscopic procedures. As necessary, the reader

is advised to consult USP General Chapters *Chromatography* ⟨621⟩ (*4*), *Titrimetry* ⟨541⟩ (*5*), *Spectrophotometry and Light-Scattering* ⟨851⟩ (*6*), and books on analytical chemistry and quantitative analysis (e.g., *7* and *8*).

In the following examples, only the relevant portions of the monograph as related to the assay and the corresponding calculations are selected. Please refer to the current *USP–NF* to review the complete monographs and/or procedures.

Chromatography

Example 1 (HPLC)

Isoniazid contains not less than 98.0 percent and not more than 102.0 percent of $C_6H_7N_3O$, calculated on the dried basis.

Assay preparation—Transfer about 16 mg of Isoniazid, accurately weighed, to a 50-mL volumetric flask, dissolve in *Mobile phase,* dilute with *Mobile phase* to volume, and mix. Calculate the quantity, in mg, of $C_6H_7N_3O$ in the portion of Isoniazid taken by the formula:

$$50C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Isoniazid RS in the *Standard preparation;* and r_U and r_S are the peak responses of isoniazid obtained from the *Assay preparation* and the *Standard preparation,* respectively.

The simple calculation given above is very common in *USP* monographs. The quantitation is based on an external Reference Standard. In addition, a factor is also introduced to correct for the volume dilution. To further clarify the equation using the appropriate unit factors:

The quantity, in mg, of $C_6H_7N_3O$ in the portion of Isoniazid taken = 50 (mL) C (mg/mL) [r_U (area of the major peak in assay preparation)/r_S (area of the major peak in the reference standard preparation)].

Example 2 (HPLC)

Benzoyl Peroxide Gel is benzoyl peroxide in a suitable gel base. It contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of benzoyl peroxide ($C_{14}H_{10}O_4$).

Assay preparation—Transfer an accurately weighed quantity of Gel, equivalent to about 40 mg of benzoyl peroxide, to a 50-mL volumetric flask. Add 40 mL of acetonitrile, and shake until the material is thoroughly dispersed. Sonicate the mixture for 5 minutes, dilute with acetonitrile to volume, mix, and filter. Pipet 10 mL of the filtrate and 5 mL of *Internal standard solution* into a 25-mL volumetric flask, dilute with acetonitrile to volume, and mix. Calculate the quantity, in mg, of benzoyl peroxide ($C_{14}H_{10}O_4$) in the portion of Gel taken by the formula:

$$125C(R_U / R_S),$$

in which C is the concentration, in mg per mL, of benzoyl peroxide in the *Standard preparation,* and R_U and R_S are the peak response ratios of benzoyl peroxide to ethyl benzoate obtained from the *Assay preparation* and the *Standard preparation,* respectively.

This formula has the same general concept and can be simplified as:

$$DC(R_U / R_S),$$

D = Dilution factor = 50 (mL) × 25 (mL)/10 (mL) = 125.

Example 3 (HPLC)

Atovaquone Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of atovaquone ($C_{22}H_{19}C_lO_3$).

Assay preparation—Transfer approximately 5.2 g of the well-mixed Oral Suspension, accurately weighed, to a low-actinic 250-mL volumetric flask. Add 50 mL of water, swirl for about 5 minutes, add 150 mL of 0.1 M methanolic sodium hydroxide, and sonicate for about 15 minutes. Allow to cool, dilute with 0.1 M methanolic sodium hydroxide to volume, and mix. Immediately filter a 20-mL portion, discarding the first 5 mL of the filtrate. Transfer 3.0 mL of the clear filtrate to a low-actinic 100-mL volumetric flask, dilute with a mixture of methanol and water (1:1) to volume, and mix. Calculate the quantity, in mg, of atovaquone ($C_{22}H_{19}C_lO_3$) in each mL of the Oral Suspension taken by the formula:

$$(25{,}000/3)(C/V)(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Atovaquone RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken to prepare the *Assay preparation;* and r_U and r_S are the atovaquone peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.

This formula has the same general concept and can be simplified as:

$$DC(r_U / r_S),$$

D = Dilution factor = 250 (mL) × 100 (mL)/3 (mL) = 25,000/3.

NOTE—In the example above, *V* is defined as "the volume, in mL, of Oral Suspension taken to prepare the *Assay preparation.*" However, the weight rather than the volume of Oral Suspension was taken to prepare the *Assay preparation*. In other words, the weight, approximately 5.2 grams in this case, has to be converted to volume using the density of the Oral Suspension, 1.04 g per mL as given in the related compound section of the monograph. The reason for taking the weight rather than the volume is the difficulty of accurately measuring the volume of the Oral Suspension directly.

In several *USP* monographs, the assay calculations are corrected for the molecular weight ratio. This is usually done when the RS used and the content determined are in two different forms (e.g., salt and free base). Therefore, a correction factor (the molecular weight ratio) is included in the equation.

Example 4 (HPLC)

Dobutamine Injection is a sterile solution of Dobutamine Hydrochloride in Water for Injection. It contains an amount of Dobutamine Hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dobutamine ($C_{18}H_{23}NO_3$).
Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 25 mg of dobutamine, to a 50-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix. Calculate the quantity, in mg, of $C_{18}H_{23}NO_3$ in the portion of Injection taken by the formula:

$$(301.39/337.84)(50C)(r_U/r_S),$$

in which 301.39 is the molecular weight of dobutamine (free base), 337.84 is the molecular weight of dobutamine hydrochloride; *C* is the concentration, in mg per mL, of USP Dobutamine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

NOTE—The RS used is dobutamine hydrochloride (salt), but the definition is expressed in terms of percentage of the labeled amount of dobutamine (free base). Therefore, the correction factor (the molecular weight ratio) is included in the equation to calculate the dobutamine content.

Example 5 (GC)

Hyoscyamine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{17}H_{23}NO_3$.
Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 0.86 mg of hyoscyamine, to a separator containing 5 mL of *pH 9.0 buffer,* and add, by pipet, 2.0 mL of *Internal standard solution*. Proceed as directed under *Standard preparation,* beginning with "adjust with 1 N sodium hydroxide to a pH of 9.0."
Standard preparation—Dissolve about 10 mg of USP Hyoscyamine Sulfate RS, accurately weighed, in water contained in a 100-mL volumetric flask, add water to volume, and mix. Prepare fresh daily. Pipet 10.0 mL of this solution into a separator, add 2.0 mL of *Internal standard solution* and 5.0 mL of *pH 9.0 buffer,* and adjust with 1 N sodium hydroxide to a pH of 9.0. Extract with two 10-mL portions of methylene chloride, filter the methylene chloride extracts through 1 g of anhydrous sodium sulfate supported by a small cotton plug in a funnel into a 50-mL beaker, and evaporate under nitrogen to dryness. Dissolve the residue in 2.0 mL of methylene chloride.
Procedure—Inject 1-µL portions of the *Assay preparation* and the *Standard preparation* successively into the gas chromatograph . . . Calculate the ratio, A_U, of the area of the hyoscyamine peak to the area of the internal standard peak in the chromatogram from the *Assay preparation,* and similarly calculate the ratio, A_S, in the chromatogram from the *Standard preparation*. Calculate the quantity, in mg, of $C_{17}H_{23}NO_3$ in the portion of tablets taken by the formula:

$$(289.37/676.83)(W/10)(A_U/A_S),$$

in which 289.37 and 676.83 are the molecular weights of hyoscyamine and anhydrous hyoscyamine sulfate, respectively; and *W* is the weight, in mg, of USP Hyoscyamine Sulfate RS taken for the *Standard preparation*.

NOTE—Only 10.0 mL of 100 mL standard solution was used. Therefore, the correction factor 10 (10/100) is used in the denominator.

Titration

USP monographs do not provide chemical equations of reactions used for assay calculations. However, they provide directions for calculating the assay result. We provide a general guideline for such calculations.

Direct titration is the treatment of a soluble substance, contained in solution in a suitable vessel (the titrate), with an appropriate standardized solution (the titrant), the endpoint being determined instrumentally or visually with the aid of a suitable indicator.

Example 1 (Direct Titration)

Ketoprofen contains not less than 98.5 percent and not more than 101.0 percent of $C_{16}H_{14}O_3$, calculated on the dried basis.
Assay—Dissolve about 200 mg of Ketoprofen, accurately weighed, in 25 mL of alcohol. Add 25 mL of water and several drops of phenol red TS, and titrate with 0.1 N sodium hydroxide having been standardized by a similar titration of primary standard benzoic acid. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium hydroxide is equivalent to 25.43 mg of $C_{16}H_{14}O_3$.

$$\%\text{Assay: } [(V - B) \times N \times F \times 100] / [TN \times W \times (100 - A)/100]$$

V: Sample titrant volume (mL)
B: Blank titrant volume (mL)
N: Titrant normality
F: Equivalence Factor (mg sample/mL of TN)
TN: Theoretical normality
W: Sample weight (mg)
A: Assay correction for LOD

Assume:
$V = 8.5$ mL
$B = 1.4$ mL
$N = 0.11$
$TN = 0.1$
$W = 202$ mg
$A = 0.42\%$

$$\text{Assay result} = [(V - B) \times N \times F \times 100] / [TN \times W \times (100 - A)/100] =$$

$$[(8.5–1.4) \times 0.11 \times 25.43 \times 100]/ [0.1 \times 202 \times (100 – 0.42)/100] = 98.7\%$$

Some pharmacopeial assays require the addition of a measured volume of a volumetric solution in excess of the volume actually needed to react with the substance being assayed. The excess of this solution is then titrated with a second volumetric solution in a direct titration. This constitutes a residual titration and is also known as back titration. The quantity of the substance being titrated is calculated from the difference between the volume of the volumetric solution originally added, corrected by blank, and that consumed by the titrant in the back titration (*5*).

Example 2 (Residual Titration or Back Titration)

Methenamine, dried over phosphorus pentoxide for 4 hours, contains not less than 99.0 percent and not more than 100.5 percent of $C_6H_{12}N_4$.
Assay—Transfer about 1 g of Methenamine, previously dried and accurately weighed, to a beaker. Add 40.0 mL of 1 N sulfuric acid VS, and heat to a gentle boil, adding water from time to time if necessary, until the formaldehyde has been expelled. Test for the absence of formaldehyde by adding a drop of the assay solution to a glass fiber filter disk, on a watch glass, on which has previously been placed 3 or 4 drops of *Chromotropic acid spot test solution*. Formaldehyde produces a violet color with this reagent; repeat the test until no violet color is obtained on the warmed test filter disk upon comparison with a blank filter disk to which no assay specimen is added. Cool, add 20 mL of water, then add methyl red TS, and titrate the excess acid with 1 N sodium hydroxide VS. Perform a blank determination. Each mL of 1 N sulfuric acid is equivalent to 35.05 mg of $C_6H_{12}N_4$.

$$\%\text{Assay: } [(B - V) \times N \times F \times 100] / [TN \times W]$$

B: Titrant volume (mL) for blank titration
V: Titrant volume (mL) for titration of sample
N: Titrant normality
F: Equivalence Factor = (mg sample/mL of TN)
TN: Theoretical normality
W: Sample weight (mg)

Assume:
$B = 43.78$ mL
$V = 15.10$ mL
$F = 35.05$ mg/mL (given)
$N = 0.9993$
$TN = 1$
$W = 1007.8$ mg (previously dried)

$$\text{Assay result} = (43.78 \text{ mL} - 15.10 \text{ mL}) \times 0.9993 \times 35.05 \text{ mg/mL} \times 100/(1 \times 1007.8 \text{ mg}) = 99.7\%$$

Determination of Equivalence Factor in Titration-Based Assays

The titrimetric method is based on a general chemical reaction as below:

$$\alpha A + \beta R \rightarrow \text{Products}$$

where α molecules of an analyte (e.g., titrate), A, reacts with β molecules of reactant (e.g., titrant), R.

Stoichiometric calculations can be made using either moles (molecular weight) or equivalent (equivalent weight).

The equivalent weight (*EW*) and molecular weight (*MW*) are related by the following equation:

$$EW = MW/n,$$

where *n* is the number of electrons transferred in the reaction. Thus the value of *n* depends on the reaction. In any titration reaction, the same number of equivalents of titrate and titrant react at the endpoint.

For example, for simple acid–base reactions:

$H^+ + OH^- \rightarrow H_2O$; $n = 1$
$CO_3^{2-} + 2\ H^+ \rightarrow [H_2CO_3] \rightarrow H_2O + CO_2$, $n = 2$
$CO_3^{2-} + H^+ \rightarrow HCO_3^-$, $n = 1$

And the following are examples of redox reactions:

$MnO_4^- + 8\ H^+ + 5\ e \rightarrow Mn^{2+} + 4\ H_2O$; $n = 5$
$H_2O_2 \rightarrow O_2 + 2\ H^+ + 2\ e$; $n = 2$
$Cr_2O_7^{2-} + 14\ H^+ + 6\ e \rightarrow 2\ Cr3^+ + 7\ H_2O$; $n = 6$

Example 3 (Acid-Base Titration)

Sodium Bicarbonate Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $NaHCO_3$.

Assay—Weigh and finely powder not fewer than 20 Tablets. Weigh accurately a portion of the powder, equivalent to about 2 g of sodium bicarbonate, dissolve in 100 mL of water, add methyl red TS, and titrate with 1 N hydrochloric acid VS. Add the acid slowly, with constant stirring, until the solution becomes faintly pink. Heat the solution to boiling, cool, and continue the titration until the pink color no longer fades after boiling. Each mL of 1 N hydrochloric acid is equivalent to 84.01 mg of $NaHCO_3$.

$$NaHCO_3 + HCl \rightarrow NaCl + CO_2 + H_2O$$

Number of equivalents HCl = Number of equivalents $NaHCO_3$

$V \times N$ = Number of equivalents $NaHCO_3$ (NOTE—*V* is in liters)

1 mL of 1 N HCl = mequivalents $NaHCO_3$ = MW/n = 84.01 mg/1 = 84.01 mg

Example 4 (Redox Titration)

Hydrogen Peroxide Concentrate contains not less than 29.0 percent and not more than 32.0 percent, by weight, of H_2O_2.

Procedure: Weigh accurately about 1 mL of Concentrate in a tared 100-mL volumetric flask, dilute with water to volume, and mix. To 20.0 mL of this solution add 20 mL of 2 N sulfuric acid, and titrate with 0.1 N potassium permanganate VS. Each mL of 0.1 N potassium permanganate is equivalent to 1.701 mg of H_2O_2.

Reactions:

$$MnO_4^- + 8H^+ + 5e \rightarrow Mn^{2+} + 4H_2O \qquad (1)$$

$$H_2O_2 \rightarrow O_2 + 2H^+ + 2e \qquad (2)$$

Multiply equation (1) by 2, equation (2) by 5 and add:

$2\ MnO_4^- + 6\ H^+ + 5\ H_2O_2 \rightarrow$
$2\ Mn^{2+} + 8\ H_2O + 5\ O_2$
or
$2\ KMnO_4 + 3\ H_2SO_4 + 5\ H_2O_2 \rightarrow$
$2\ MnSO_4 + 8\ H_2O + 5\ O_2 + K_2SO_4$

Number of equivalents $KMnO_4$ = Number of equivalents H_2O_2

$V_1 \times N_1$ = Number of equivalents H_2O_2
(*V* is in liters)

NOTE—Equivalent weight (*EW*) = Molecular weight (*MW*)/*n*

n = 2 for H_2O_2 because this is the number of electrons transferred from H_2O_2 in reaction 2 above.

1 mL of 1 N $KMnO_4$ = 34.01/2 mg H_2O_2 = 17.01 mg H_2O_2.

But the titration uses 0.1 N $KMnO_4$. Thus, 1 mL of 0.1 N $KMnO_4$ = 1.701 mg of H_2O_2.

Spectroscopy and Other Methods

USP contains numerous examples of analytical techniques used in the *Assay* section other than chromatography or titrimetry. In the simplest cases, the measurement of a signal is directly proportional to the amount of the material taken, and the formula contains only the dilution and response factors.

Example 1 (Acetazolamide—Assay Using IR)

Acetazolamide contains not less than 98.0 percent and not more than 102.0 percent of $C_4H_6N_4O_3S_2$, calculated on the anhydrous basis.

Assay—Dissolve about 200 mg of Acetazolamide, accurately weighed, in a small volume of pyridine in a 10-mL volumetric flask, add the solvent to volume, and

mix. Similarly, dissolve an accurately weighed quantity of USP Acetazolamide RS in pyridine to obtain a *Standard solution* having a known concentration of about 20 mg per mL. Concomitantly determine the absorbances of both solutions in 0.1-mm cells at the wavelength of maximum absorbance at about 7.38 µm (1350 cm^{-1}), with a suitable IR spectrophotometer, using pyridine as the blank. Calculate the quantity, in mg, of $C_4H_6N_4O_3S_2$ in the portion of Acetazolamide taken by the formula:

$$10C(A_U/A_S),$$

in which C is the concentration, in mg per mL, of USP Acetazolamide RS in the *Standard solution,* and A_U and A_S are the absorbances of the solution of Acetazolamide and the *Standard solution,* respectively.

In this example IR absorbance, A_U, at specified wavelength is compared to that of the reference standard, A_S. Both values are proportional to the concentration. The quantity, in mg, of the $C_4H_6N_4O_3S_2$ in the portion of Acetazolamide taken = 10 (mL) C (mg/mL) (A_U/A_S).

Example 2 (Assay Using UV)

Nalorphine Hydrochloride contains not less than 97.0 percent and not more than 103.0 percent of $C_{19}H_{21}NO_3 \cdot HCl$, calculated on the dried basis.
Assay—Transfer about 25 mg of Nalorphine Hydrochloride, accurately weighed, to a 250-mL volumetric flask, dissolve in water, dilute with water to volume, and mix. Concomitantly determine the absorbances of this solution and of a *Standard solution* of USP Nalorphine Hydrochloride RS in the same medium having a known concentration of about 100 µg per mL in 1-cm cells at the wavelength of maximum absorbance at about 285 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of $C_{19}H_{21}NO_3 \cdot HCl$ in the Nalorphine Hydrochloride taken by the formula:

$$0.25C(A_U/A_S),$$

in which C is the concentration, in µg per mL, of USP Nalorphine Hydrochloride RS in the *Standard solution,* and A_U and A_S are the absorbances of the solution of Nalorphine Hydrochloride and the *Standard solution,* respectively.
NOTE—The factor 0.25 is derived by combination of the dilution factor (250 mL) and unit conversion (µg to mg).
250 (mL) × C (µg/mL) × 1 mg/1000 µg = 0.25

Example 3 (Cefamandole Nafate—Assay Using Polarography)

Cefamandole Nafate has a potency equivalent to not less than 810 µg and not more than 1000 µg of cefamandole ($C_{18}H_{18}N_6O_5S_2$) per mg, calculated on the anhydrous basis.
Standard preparation—Transfer about 12 mg of USP Cefamandole Nafate RS, accurately weighed, to a 50-mL volumetric flask containing 4 mL of water. Immediately before use, add 30.0 mL of *pH 2.3 buffer,* dilute with water to volume, and mix.
Assay preparation—Using Cefamandole Nafate, prepare as directed under *Standard preparation*.
Procedure—Transfer a portion of the *Assay preparation* to a suitable polarographic cell. Deaerate by bubbling scrubbed nitrogen through the solution for 5 minutes, and redirect the nitrogen flow to the surface outlet. Insert the dropping mercury electrode of a suitable polarograph (*9*) capable of measuring a current of 0.5 microampere or appropriate current to maintain on-scale response, using an average capillary, and a drop rate of 1 per second. Record the polarogram in the differential pulse mode from –0.3 volts to –1.05 volts, using a saturated calomel reference electrode and platinum wire counter electrode. Determine the peak height obtained, in microamperes, where the peak height is defined as the perpendicular distance from the extrapolated baseline to the highest point of the peak as compared to the full-scale current range. Similarly, determine the peak current of the *Standard preparation*. Calculate the quantity, in µg, of $C_{18}H_{18}N_6O_5S_2$ in each mg of the Cefamandole Nafate taken by the formula:

$$P(W_S/W_U)(i_U/i_S),$$

in which P is the potency, in µg of cefamandole per mg, of USP Cefamandole Nafate RS, W_S and W_U are the quantities, in mg, of USP Cefamandole Nafate RS and Cefamandole Nafate taken to prepare the *Standard preparation* and the *Assay preparation,* respectively, and i_U and i_S are the peak currents, in microamperes, from the *Assay preparation* and the *Standard preparation,* respectively.

This direct comparison is corrected by the potency factor, in µg per mg, according to the labeled value for the reference standard, and the result is expressed in the same units.

RELATED COMPOUNDS

A primary goal of the USP is to provide public standards that ensure the purity, strength, and quality of official articles. One mechanism for assessing the purity of an article is the detection and quantitation of related compounds. To this end, monographs may include a *Related compounds* or *Chromatographic purity* test. Chromatographic procedures are commonly accepted means by which impurities can be separated and quantitated. For this reason, chromatographic procedures, particularly high-performance liquid chromatography (HPLC), are widely used in the pharmaceutical industry and in USP monographs.

According to ICH guideline Q3A(R), *Impurities in New Drug Substances,* there are three classes of impurities: inorganic impurities, residual solvents, and organic impurities. Inorganic impurities include catalysts, ligands, heavy metals, and metal salts. Though it is important to identify and quantitate these types of impurities, analysis and quantitation typically are not accomplished using chromatographic procedures. Residual solvents, solvents remaining from the synthesis and/or purification processes, or formed during formulation are generally measured via gas chromatography (GC). Detection and quantitation of residual solvents are addressed in *USP* General Chapter *Organic Volatile Impurities* ⟨467⟩ (*10*).

Types of organic impurities include starting materials, process intermediates, degradants, or reagents. This section includes an exploration of formulas used in USP monographs to calculate the levels of organic impurities. *USP* monographs include chromatographic procedures for the quantitation of impurities (specified, unspecified, identified, and unidentified). If an impurity is characterized, it is known as a specified impurity. The chemical identity of a specified impurity may be known or unknown, i.e., identified or unidentified. For monograph purposes, the impurity may be identified by its official USP reference standard name or chemical name, by a relative retention time designation, or by a descriptor such as Impurity 1 or Impurity A.

USP monographs describe procedures for quantitation of organic impurities or degradants as *Chromatographic purity* or *Related compounds* test; this name generally refers to a quantitative separation technique such HPLC or GC. Results for *Chromatographic purity* or *Related compounds* typically are expressed in percent, the most commonly used units for the acceptance criteria. Acceptance criteria should be provided for each specified identified impurity, each specified unidentified impurity, any unspecified impurity with acceptance criteria of not more than the identification threshold, and total impurities in compliance with ICH Q3A(R) guideline (*11*).

These approaches range from simple formulas for calculating the percentage of total peak area to complex formulas that incorporate correction factors. Correction factors are incorporated to adjust for differences in concentrations between test and reference standard solutions, molecular weights of different forms of a compound, and detector response.

Percent of Total Peak Area

An example of the simplest formula follows:

$$100(r_i / r_s),$$

where r_i is the peak response for each impurity observed in the *Test solution* and r_s is the sum of responses for all peaks in the *Test solution*. Multiplying by 100 converts the result to the desired units of percent. The experimental design uses data from a test solution only; there is no concomitant analysis of a reference standard solution. This formula assumes similar detector responses for all peaks in the chromatogram. Examples of this formula are found in the drug substance monographs for Fenoldapam Mesylate and Pheniramine Maleate. Execution of this simple experimental design and formula can also be applied to drug product monographs as shown in the monographs for Fluoxetine Capsules and Gadodiamide Injection.

Using Different Concentrations of the Test Sample

The next level of complexity in terms of experimental design and formula used to quantitate impurities involves the use of test solutions prepared at different concentrations. The goal of this design is to maximize the peak response of impurities by using a concentrated test sample solution. For quantitation purposes, a less concentrated solution of the test sample is needed because the response of the major peak in the concentrated test sample solution typically is off-scale (overrange in an electronic data system); thus the peak response of the major peak is inaccurate. This experimental design is reflected in the formula by accounting for the difference in the two test sample solutions from which data are used.

Following is an example from the Fluoxetine Hydrochloride monograph. This procedure requires the preparation and analysis of two fluoxetine hydrochloride solutions: *Test solution 1* is 5.6 mg per mL and *Test solution 2* is prepared by a 5-fold dilution of *Test solution 1*.

$$100r_i(r_s + 5r_U),$$

in which r_i is the peak response from each impurity obtained from *Test solution 1;* r_s is the sum of all peak responses, excluding that of fluoxetine, obtained from *Test solution 1,* and r_U is the peak response of fluoxetine obtained from *Test solution 2*. *Test solution 1* is 5 times the concentration of *Test solution 2,* so the factor of 5 is needed in the formula to account for this difference. It should be noted that this factor is not explained in the monograph along with the other terms of the equation but rather it is based on knowledge of the experimental design.

Using a Reference Standard

Moving to the next level of complexity in experimental design involves examining procedures in which impurities in the test sample are quantitated against a reference standard solution. In this type of experiment, impurities may

be quantitated against a reference standard of the parent compound or against an appropriate related compound reference standard. The formula for calculating the amount of a related compound must consider whether or not the determination is made against a corresponding reference standard of the impurity.

In *Related compounds Test 2* of the Pyrilamine Maleate monograph, the percentage of each impurity is calculated against the USP Pyrilamine Maleate RS as follows:

$$10{,}000(C/W)(r_i/r_S),$$

in which C is the concentration, in mg per mL, of USP Pyrilamine Maleate RS in the *Standard solution, W* is the weight, in mg, of the Pyrilamine Maleate taken to prepare the *Test solution,* r_i is the peak response for each impurity, and r_S is the response of the *Standard solution*. It should be noted in this example that although the units of the target concentration given in the instructions for the preparation of the *Standard solution* are in µg per mL, the concentration term in the formula is defined as mg per mL. Therefore, it is necessary to convert the concentration of the *Standard solution* to mg per mL by dividing the concentration in µg per mL by 1,000. Another feature of this formula is the term of 10,000 which is not explained in the monograph. Based on the experimental design, the dimensional analysis shows:

$$\% = \frac{\left(\frac{mg}{mL}\right)\left(\frac{area_i}{area_S}\right)(100mL)(100\%)}{mg}$$

Written in this manner, C is the concentration of the *Standard solution* in mg per mL, the response of r_i and r_S are represented as $area_i$ and $area_S$, respectively, and W is the weight, in mg, of the test sample. To complete the calculation, the term 100 mL is added to the numerator because the sample weight, *W,* is diluted to 100 mL according the test solution preparation. The term 100% is needed to convert the result to percent. The terms mg, mL, and area cancel, leaving 100 × 100, or 10,000.

With some exceptions, multipliers appearing in formulas are not explained. Readers familiar with *USP* monographs are accustomed to seeing factors such as 10,000 or 50,000 in formulas without a specific explanation. The reason for this is the understanding that the multiplier reflects a combination of factors reduced to a single term. Although the purpose of the multiplier has been to simplify the formula for the reader, this practice may not be optimal because the derivations of these factors are not always clear. An experienced user of *USP* monographs can usually derive these numbers, but often it is a time-consuming exercise. In the interest of providing useful information, formulas in monographs should include an explanation of all terms and avoid condensing terms. One way to avoid unexplained multipliers is to include the concentration terms because the purpose of the multiplier is to account for the dilution factors. Examples of this approach include the Mefanamic Acid, Methylprednisone Hemisuccinate, Phenytoin, Phenytoin Sodium, Propantheline Bromide Tablets, and Proparacaine Hydrochloride Ophthalmic Solution monographs. Although the terms may vary slightly, the format for the formulas for calculating the percentage of related compounds is:

$$100(C_S/C_U)(r_U/r_S),$$

in which C_S is the concentration, typically in mg per mL, of the *Standard solution;* C_U is the theoretical concentration of the *Test solution* (same units as the *Standard solution*); and r_U and r_S are the peak responses from the *Test solution* and *Standard solution,* respectively.

A variation of this format is used when the concentrations of the *Test solution* and *Standard solution* are expressed in different units, e.g., µg per mL for the *Test solution* and mg per mL for the *Standard solution*. Maintaining the same straightforward approach, the formula for calculating the percentage of related compounds becomes:

$$0.1(C_S/C_U)(r_U/r_S),$$

in which the C_S is the concentration, in µg per mL, of the *Standard solution;* C_U is the concentration, in mg per mL, of the *Test solution; and* r_U and r_S are the peak responses of the *Test solution* and *Standard solution,* respectively. In this case, the multiplier of 0.1 represents the 100% divided by the factor of 1000 necessary for the conversion of µg per mL to mg per mL. Examples of this format are included in the *Related compounds* procedures for the Hydroxyzine Hydrochloride and Methsuximide monographs.

Using Relative Response Factors

When the quantitation of an impurity is performed using a reference standard other than the impurity reference standard, typically the API reference standard, a relative response factor (RRF) may be used. An RRF value, which is specific to a given set of experimental conditions, compares the responses of the impurity and the API reference standard and is incorporated into the formula as a means to correct for differences in detector response.

This technique is used in the following formula for calculating related compounds in the Zileuton drug substance monograph.

$$100F(C_S/C_U)(r_i/r_S),$$

in which F is the relative response factor for each impurity and is 1.2, 1.4, and 1.7 for peaks with relative retention times of 0.8, 2.1, and 2.8, respectively; C_S is the concentration, in mg per mL, of USP Zileuton RS in the *Standard solution;* C_U is the concentration, in mg per mL, of zileuton in the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the peak response for zileuton obtained from the *Standard solution*.

In *USP* monographs, placement of the RRF in the numerator or denominator depends on how RRF was determined. If the RRF was calculated using the ratio of the impurity response relative to that of the API, then the

RRF appears in the denominator. The RRF appears in the numerator if it was calculated as the response of the API to that of the impurity. Currently, there is no USP definition for determining an RRF value; however USP is working to develop a definition and incorporate it consistently in all monographs.

As stated in General Chapter *Validation of Compendial Methods* ⟨1225⟩, in the absence of other information, it may be necessary to calculate the amount of an impurity based on a comparison of its response to that of the drug substance. The ratio of the responses of equal amounts of the impurity and the drug substance (response factor) should be used if known. When using a response factor in a formula, one should understand that the value is applicable only to the experimental conditions defined in the procedure (*12*).

When a reference standard is indicated in a procedure, it may be the same compound as the test sample or it may be different, e.g., the free base of a compound versus the salt form. Adjustments for molecular weight differences between different forms of an impurity or parent drug (free base versus salt form) are incorporated into the formula (see the *Assay* section of this article for examples). Having the molecular weight terms clearly presented and defined is crucial to a *Related compounds* test. The calculation of the percentage of impurities in the Propoxyphene Hydrochloride monograph includes a factor of 1.12, which is the ratio of the molecular weights of α-*d*-2-acetoxy-4-dimethylamino-1,2-diphenyl-3-methylbutane hydrochloride to that of α-*d*-2-acetoxy-4-dimethylamino-1,2-diphenyl-3-methylbutane free base; the individual molecular weights for these two compounds are not provided in the monograph.

RECOMMENDATIONS

Based on a review of formulas used in current *USP* monographs, the following suggestions are offered in order to provide the most information and facilitate use of the monograph:

1. Present formulas so that all terms, including numerical terms, and their units are included and defined for the user.
2. Avoid condensing several terms into a single multiplier. If a condensed multiplier must be used, its origin should be clearly explained in the monograph.
3. For calculation of related compounds, include a concentration term for the sample under test because it incorporates dilution factors, thereby reducing the need for an unexplained multiplier in formulas.
4. Include relative response factors and relative retention times in the monograph if corresponding reference standard materials are not available.
5. Change the format of formulas in current *USP* monographs in accordance with points 1–4 above. Revisions should be made as early as possible.
6. For the *Assay,* formulas should be written so that the final results are expressed in the same units as the assay limits presented in the definition, unless otherwise specified in the monograph.
7. Create a new General Chapter for the pharmaceutical calculations used in the *USP* monographs. The content of this *Stimuli* article, after comments from the industry and other stakeholders, is expected to be the basis for this chapter. This General Chapter should provide an easy reference for further clarification of the calculations used in *USP* monographs.

ABSTRACT This *Stimuli* article represents the conclusions and recommendations of the USP Working Group on HPLC Columns. The working group included the five largest manufacturers of HPLC columns in the United States, along with the National Institute of Standards and Technology (NIST) and USP. This work attempts to facilitate the selection of HPLC columns by the analyst when performing a USP test.

INTRODUCTION

The L nomenclature to designate high-performance liquid chromatography (HPLC) column type was introduced for the first time in the *Fourth Supplement* to *USP XIX* in 1978. The L1 designation is for columns with octadecilsilane as the bonded phase. When *USP XX* was published in 1980, only seven columns were classified and given a brief description. Since then the list has grown without pause to 56 descriptions, some of them very broad or with imprecise wording (*1, 2*). For years, this classification system has generated an increasing number of inquiries to USP regarding which column brand is appropriate for a particular compendial procedure. Today, column packings are developed for specific applications, resulting in columns with distinct characteristics even though they belong to the same original USP classification. For example, more than 220 columns currently available in the worldwide market can be classified as L1, but not all of them have the same applications (*3, 4*). This situation makes the process of selecting a column for a particular application very difficult. The problem is partially controlled by the *System Suitability* test in most of the USP chromatographic procedures, but in many cases these tests are not conclusive to ensure column interchangeability. Evidently the current classification nomenclature does not provide sufficient information to fill the needs of modern liquid chromatography.

THE USP APPROACH

In an attempt to facilitate the selection of possible columns by the analyst, the chair of the USP Expert Committee (EC) on Pharmaceutical Analysis 2, Dr. Timothy Wozniak, and the vice-chair of the same EC, Dr. Linda Ng, created a group to define a proposal about how to subclassify initially only L1 columns, and, perhaps in the future, extend the approach to other USP column designations. The USP Working Group on HPLC Columns was created, and its membership represented the National Institute of Standards and Technology (NIST) and the five largest manufacturers of HPLC columns in the United States. Dr. Ng chaired this group.

At the beginning the group considered several existing approaches. After a series of meetings, they decided to use the NIST Standard Reference Material (SRM) 870 to carry out the evaluation of C18 columns according to the procedure described in the certificate of analysis for this SRM (*5, 6*).

This procedure uses a mixture of five organic compounds (uracil, toluene, ethylbenzene, quinizarin, and amitriptyline) in methanol to characterize column performance. This test mixture is intended primarily for the characterization of C18 columns used in reversed-phase liquid chromatography. Selection of the components in SRM 870 was based on published testing protocols (*7, 8*) and commercial column literature (*9*) to provide a broad characterization of column performance in a single, simple test.

On the basis of the results obtained and the problems faced during the evaluation of the C18 columns using NIST SRM 870, the group identified four parameters to be used in the characterization of the columns: hydrophobicity (capacity factor of ethylbenzene); chelation (tailing factor of quinizarin); activity toward bases (silanol activity, capacity factor, and tailing factor of amitriptyline); and shape selectivity (bonding density). The term *shape selectivity* is commonly used to denote a chromatographic quality exhibited by certain stationary phases for which enhanced separations of geometric isomers may result based on their molecular structure rather than other physical or chemical properties of the solute (*10*). Although SRM 870 does not characterize shape selectivity, the property can be assessed by use of other chromatographic tests, such as SRM 869a, *Column Selectivity Test Mixture for Liquid Chromatography,* or by measuring the bonding density of the stationary phase.

[‡] Correpondence should be addressed to: Horacio Pappa, 12601 Twinbrook Pkwy., Rockville, MD, 20852-1790; e-mail: hp@usp.org.

To compare columns on the same basis, the user should evaluate column performance by separating the mixture isocratically using a mobile phase constituted by 80% methanol and 20% buffer phosphate at pH 7.0.

The certificate of analysis for NIST SRM 870 contains a series of chromatograms representative of possible types of retention behavior. In most instances, peak identification can be made on the basis of elution order (uracil, toluene, ethylbenzene) and detector response (quinizarin, amitriptyline). Relative peak areas depend on the detection wavelength. Quinizarin has significant absorbance at 480 nm, and separations of SRM 870 carried out at this wavelength are selective for this single component. Conversely, quinizarin exhibits reduced absorbance at 210 nm, permitting measurement of amitriptyline in the presence of quinizarin.

The retention behavior of reversed-phase liquid chromatography (LC) columns often differs in a variety of ways. The components in this test mixture were selected as indicators of several types of chromatographic properties. The determination of peak width (efficiency; theoretical plates), peak asymmetry (A_S), absolute retention (k'), and selectivity factor (α, i.e., relative retention, k'_1/k'_2) for these components may provide useful measures of these properties.

Uracil

This component is commonly used as an indicator of the void volume (unretained volume) in an LC column, which is required to calculate the retention factor (k').

Toluene/Ethylbenzene

The retention of these compounds can be considered to result primarily from solvophobic interactions. The selectivity factor $\alpha_{E/T}$ is the k' ratio of ethylbenzene and toluene, and this value has been used to characterize differences among C18 and C8 columns. Absolute retention of a nonpolar component such as ethylbenzene provides a measure of column retentiveness (column strength). Toluene and/or ethylbenzene are also useful markers for calculation of column efficiency (theoretical plates, N).

Quinizarin

Quinizarin (1,4-dihydroxyanthraquinone) is a metal-chelating reagent. The retention behavior of this component is expected to be indicative of the presence or absence of metals in the chromatographic system. Columns demonstrate one of two types of retention behavior. Low activity toward chelating reagents is indicated by symmetric peak shape, and high activity toward chelating reagents is indicated by tailing, asymmetric peak shape. Quinizarin typically elutes after ethylbenzene and before amitriptyline. It is interesting to note that for columns known to contain certain embedded polar functional groups, quinizarin elutes last, with good peak symmetry. Peak asymmetry is not strongly correlated with retention for quinizarin.

Amitriptyline

Amitriptyline is a basic compound (pKa = 9.4) commonly used by column manufacturers for column characterization. Elution of organic bases with severe peak tailing is often associated with high silanol activity; however, the elution of such compounds with symmetrical peak shape is considered indicative of column deactivation. Because peak tailing is the most objectionable property associated with silanol activity, A_S is an appropriate measure of this property. Peak asymmetry is not strongly correlated with retention for amitriptyline.

The influence of chromatographic conditions on test results was examined for several different parameters. Because retention, efficiency, and peak shape are influenced by testing conditions, column evaluation should be carried out under standardized conditions to facilitate column comparisons. The largest changes in retention behavior occur with changes in mobile phase composition. The absolute retention of the polar and nonpolar components increases with the percentage of buffer in the mobile phase (at pH 7.0 and constant ionic strength in the mixed solution). A composition of 80% methanol and 20% buffer was selected to provide appropriate retention for a broad range of column types.

Changes in column temperature influence the absolute retention of the components in SRM 870; however, relatively small effects are observed in the peak shape of quinizarin or amitriptyline. It is recommended that column temperature be controlled to 23 °C ±1 °C.

Forty-one commercial C18 columns were used in the development of SRM 870. Columns were selected to represent a broad sampling of chromatographic retention properties and included alkyl phases prepared with embedded polar functional groups. No two columns exhibit identical retention behavior; however, similarities do exist among several columns. Among columns utilized, values of k' for ethylbenzene ranged from 0.2 to 2.8. In contrast, only slight differences were observed for methylene selectivity ($\alpha_{E/T}$; range, 1.26 to 1.45). The retention of quinizarin ranged from $k' = 1$ to $k' = 23.6$. In two instances, no elution of this compound was detected. Peak asymmetry values ranged from $A_S = 1.1$ to $A_S = 5.7$ (in two instances, peaks were not defined well enough to permit determination of A_S). Finally, the retention of amitriptyline ranged from $k' = 1.4$ to $k' = 72.9$ ($A_S = 1.0$ to $A_S = 11$).

Besides the members of the USP Working Group, several other column manufacturers tested their columns using this protocol. The results from these tests are presented in *Table 1*.

Figure 1 illustrates typical elution patterns for SRM 870. To improve chromatographic performance toward bases, five of the columns utilized are known to contain embedded polar functional groups within the stationary phase. The separation of SRM 870 was similar for these columns. In each case, quinizarin eluted last, and both amitriptyline and quinizarin exhibited symmetrical peak shape (e.g., *Figure 1A*).

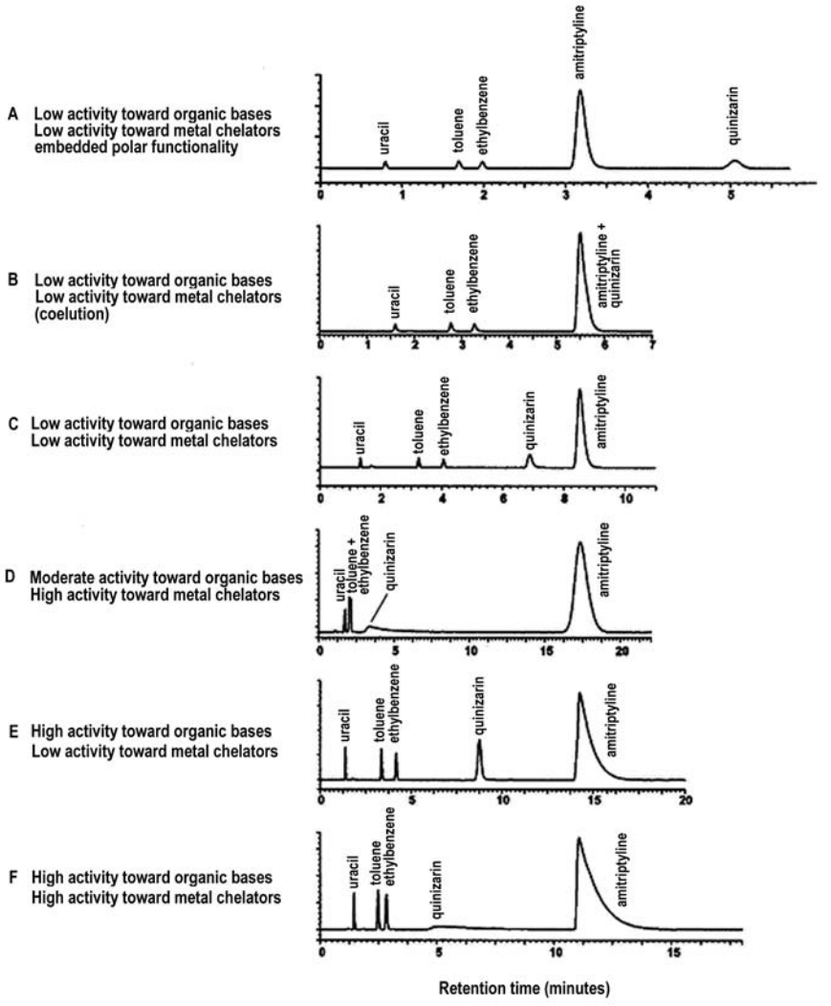

Fig. 1. Examples of separations of SRM 870 on commercial C18 column (reproduced from SRM-870 Certificate of Analysis, NIST)

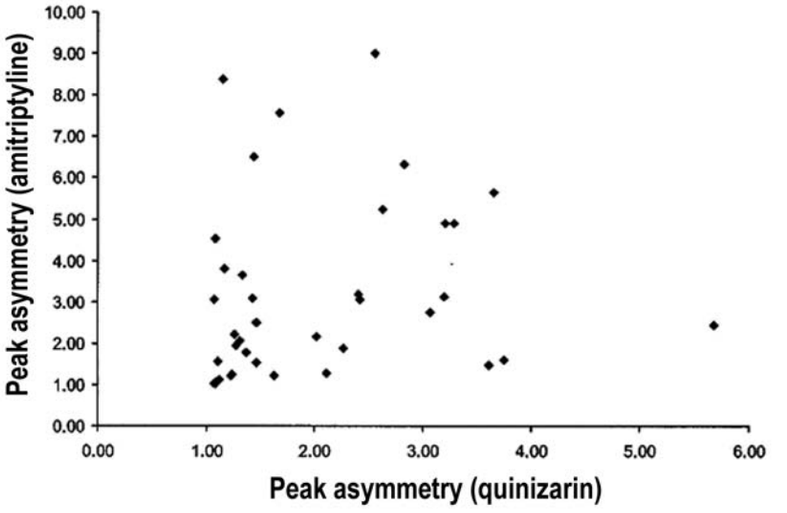

Fig. 2. Plot of peak asymmetry for amitriptyline vs. peak asymmetry for quinazirin for various C18 columns (reproduced from SRM-870 Certificate of Analysis, NIST)

Peak asymmetry data for quinizarin and amitriptyline are plotted in *Figure 2*. The scatter in the data indicates independence of the two terms. Thus, it is possible for a column to exhibit high activity toward chelating agents and low activity toward bases, or other combinations (e.g., *Figures 1C* through *1F*).

THE PQRI INITIATIVE

The Impurities Working Group of the PQRI Drug Substance Technical Committee had an objective to investigate the impact of technology on the characterization of impurities. This project is being carried out in collaboration with Dr. Lloyd Snyder, who has initiated work to create a database and software that will help to define conditions that will lead to equivalent separations for different columns. An application resulting from the project will be a way to obtain an equivalent separation for a monograph method that stipulates an L1 or L7 column.

The Snyder/Dolan column test procedure has been described in a series of publications (*11–18* and a review in *19*). Based on retention data for a series of standard mixtures (see *Table 2*) and the same separation conditions (50% acetonitrile/buffer; pH 2.8 and 7.0; 35 °C), every reversed-phase column can be characterized by six column-selectivity parameters (*15*): relative retention (k_{EB}), hydrophobicity (*H*), steric interaction (*S**), hydrogen-bond acidity (*A*) and basicity (*B*), and relative silanol ionization or cation-exchange capacity (*C*).

Table 2. Test mixtures for Snyder/Dolan procedure

Mixture 1 thiourea amitriptyline 4-butylbenzoic acid	**Mixture 2a** nortriptyline acetophenone mefenamic acid
Mixture 1a *N,N*-diethylacetamide 5-phenyl-1-pentanol ethylbenzene	**Mixture 3** *p*-nitrophenol anisole 4-hexylaniline
Mixture 2 *N,N*-dimethylacetamide 5,5-diphenylhydantoin toluene	**Mixture 3a** *cis/trans* chalcone benzonitrile
	Mixture 4 berberine

Column *hydrophobicity* increases with an increase in total carbon. *H* is somewhat larger for small-pore packings because of the compression of the ends of the alkyl chains. Because end-capping adds only a few tenths of a percent carbon to the column, end-capping has little effect on *H*. As noted before, *H* has only a minor effect on column selectivity.

Column *steric interaction* increases as the bonded phase becomes more crowded. That means an increase in *S** for increased chain length or concentration of the bonded phase. *S** also increases for narrow-pore packings because of the compression of the ends of the alkyl groups. *S** has a significant effect on column selectivity, especially for molecules of different shape.

Column *hydrogen-bond acidity* due to non-ionized silanols increases with column acidity. Therefore, values of *A* are greater for more acidic type-A columns. When the column is end-capped, the number of accessible and unreacted silanols decreases, as do values of *A*. The column parameter *A* has a significant effect on column selectivity for non-ionized basic molecules such as amines and amides, especially aliphatic derivatives.

Column *hydrogen-bond basicity* arises from various functional groups within the bonded phase. For all type-B (high-purity silica) and some type-A (older, less pure silica) columns, it appears that water from the mobile phase partly dissolves in the bonded phase, and this water can preferentially interact with and bind to non-ionized carboxylic acids. So, columns with larger values of *B* preferentially retain acidic compounds.

In the case of columns with embedded polar groups, the basic polar group (urea, amide, carbamate) can strongly bind both phenols and carboxylic acids. Some type-A columns have larger values of *B,* believed to be the result of metal impurities in the silica.

Silanol ionization results in a negative charge on the column, and this charge attracts ionized (positively charged) bases and repels ionized (negatively charged) acids. For samples that contain ionized acids or (especially) bases, the column parameter *C* is a very important contributor to column selectivity. For samples that do not contain acids or bases, *C* is unimportant. Column ionization and values of *C* increase as mobile-phase pH is increased. End-capping results in decreased access to ionized silanols and a large decrease in *C*.

The ability to characterize column selectivity is of potential value for two different situations. First, routine HPLC procedures require the replacement of the column from time to time due to deterioration of the column during use. Also, when an HPLC method is transferred, it is necessary to obtain a suitable column for that procedure. In either situation, there exists the possibility that an equivalent column from the original supplier may no longer be available. For this reason, two or more equivalent columns with different part numbers can be specified as part of method development. ''Equivalent'' columns will have similar (ideally, ''identical'') values of the six column-selectivity parameters discussed above. This phase of the project was done and completed in collaboration with PQRI.

A second use of the six column-selectivity parameters outlined above is for the selection of columns of very different selectivity. Columns of different selectivity are often required during HPLC method development (for a deliberate change in selectivity) or for the development of orthogonal procedures that can be used to ensure that no new sample impurity is present in some samples.

The Snyder/Dolan procedure was originally developed for application to type-B C18 columns (*11–13*). It since has been extended to type-B alkyl–silica columns with C_1–C_{30} ligands (*14*), type-A C8 and C18 columns (*15*), columns with polar groups such as urea, carbamate, or amide that are either embedded into the ligand or used to end-cap the column (*16*), cyano columns (*17*), and phenyl and fluoro columns (*18*).

Columns with identical values of *H, S*, A, B*, and *C* are expected to give essentially identical selectivity (spacing of bands) for a given HPLC procedure (same mobile phase, temperature, and flow rate). Small differences in values of k_{EB} can be corrected by changes in flow rate. Although it is rare to find two reversed-phase columns that have identical values of *H, S*,* etc., small differences in these column parameters are still acceptable for any sample, and larger differences are allowable for some samples. A column comparison function F_S can be defined for two columns 1 and 2 as follows:

$$F_S = \{[12.5\ (H_2 - H_1)]^2 + [100\ (S^*_2 - S^*_1)]^2 + [30\ (A_2 - A_1)]^2 + [143\ (B_2 - B_1)]^2 + [83\ (C_2 - C_1)]^2\}^{1/2} \qquad [1]$$

Here, H_1 and H_2 refer to values of *H* for columns 1 and 2, S^*_1 and S^*_2 are values of *S** for columns 1 and 2, and so on for the remaining column parameters *A, B,* and *C*. If $F_S<3$ for any two columns 1 and 2, the two columns should provide equivalent selectivity and band spacing for any sample or set of conditions. Equivalent separation may still be achieved for $F_S>3$, but this is less certain. However, if it is known that the sample does not contain ionized compounds (e.g., no acids or [especially] bases), the term $C_2 - C_1$ of Equation 1 can be ignored, which usually means a much smaller value of F_S for two columns 1 and 2. Similarly, if carboxylic acids (ionized or not) are absent from the sample, the term $B_2 - B_1$ can also be ignored, again reducing the value of F_S.

In the event that columns of very different selectivity are desired, two columns 1 and 2 with a very large value of F_S would be preferred. *Figure 3* provides an example of the use of values of F_S to select columns of either similar (*a–c*) or different (*d*) selectivity.

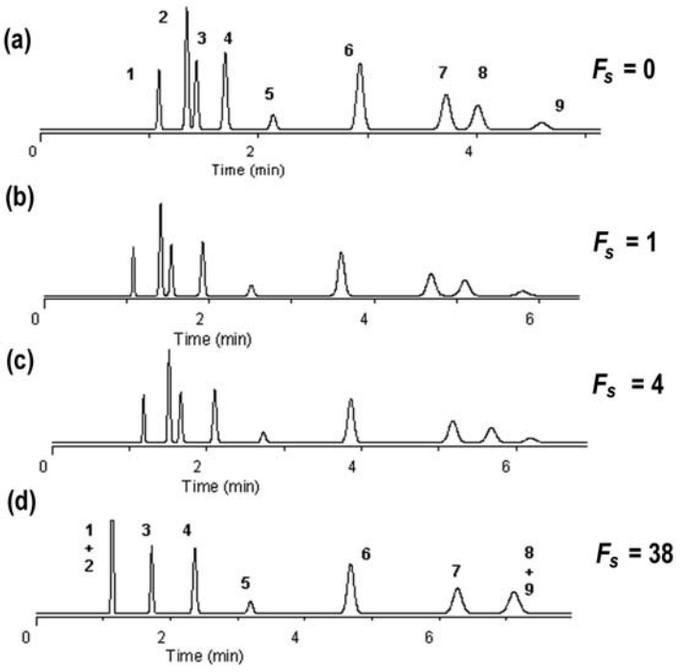

Fig. 3. Example of use of F_S values to select columns of either similar (*a–c*) or different (*d*) selectivity

The measurement of values of *H, S*,* etc. has been studied by four separate laboratories under PQRI sponsorship. On the basis of replicate testing of 42 different C8 and C18 columns, it was established that the measurement of values of *H, S*,* etc. is suitably repeatable (*20*). Further studies by these and other laboratories have since confirmed the reliability of Equation 1 as a basis for comparing column selectivity (*21*). These results have substantiated the ability of values of F_S to select columns of equivalent selectivity. The study of Snyder et al. (*20*) has also shown that the measurement of values of *H, S*,* etc. can be simplified and shortened, requiring only 2–3 hours per column. Five separate laboratories are currently evaluating the utility of the Snyder/Dolan approach for the development of orthogonal separations.

CONCLUSIONS

Both of these approaches have merit, and it is too soon to favor one over the other. The USP approach provides column performance characterization (theoretical plate count, good peak symmetry, etc.) and produces five data points to describe the column. The PQRI approach provides selectivity characterization (relative retention times), and the parameters are included in a searchable database that produces a list of suitable columns ordered by the F_S factor. The USP approach also could be provided in database form to permit ordering of columns based on a single factor derived from the measured parameters (analogous to the Snyder/Dolan approach). A third option might be to provide data from both characterization approaches. Algorithms could be developed to permit column assessment based on the combined data. Ultimately, the approach(es) utilized must balance ease of use with effectiveness.

In the USP approach, performance proprieties include tailing determination due to the presence of trace metals in the column packing and "active" silanols (which may also be the result of metal contamination), but the PQRI (Snyder/Dolan procedure) does not. However, it must be pointed out that poor column performance is associated mainly with older columns that utilize type-A silica.

As a result of the evaluation presented here, the USP Working Group on column classification resolved to publish the data obtained by these two approaches and encourage users to submit their comments in order to improve these tools. In the near future, the results obtained by the NIST SRM 870 and the searchable database will become public via the USP Web page (www.usp.org). This will allow users to evaluate the results obtained with both approaches. Both databases will be updated as new results are obtained. In the interim, USP will continue to update and publish *Chromat-*

ographic Reagents Used in USP–NF and Pharmacopeial Forum that lists the original column brand used during method development for compendial procedures.

Isonicotinyl Hydrazone of Rifampicin and Isoniazid: Should It Be Controlled as a Related Substance (or Impurity) in USP Monographs for Anti-tuberculosis Combination Products?

T.T. Mariappan,[*] Saranjit Singh,[*] Rajesh Pandey,[†] Anshika Sharma[†]

ABSTRACT A significant amount of rifampicin is converted to isonicotinyl hydrazone (HYD) in the presence of isoniazid in the formulation environment and also in situ under stomach acid pH conditions. The present study was carried out to determine whether this interaction product should be included as a related substance (or impurity) in USP monographs for combination products containing these two drugs. For this purpose, the in vivo fate and the chemotherapeutic activity of HYD were determined. The stability of HYD was determined at various gastrointestinal pH conditions, in various tissue homogenates, and in the blood of rats. The samples were analyzed by a validated HPLC method. In vitro activity was determined against *Mycobacterium tuberculosis* H37Rv. In vivo activity was tested against the same microorganism by administering the compound to Laca mice via oral and intravenous routes at three dose levels (4, 12, and 24 mg/kg).

HYD was rapidly hydrolyzed at pH <3 and also in intestinal homogenate and blood. In all these cases, the hydrolysis products were 3-formylrifamycin and isoniazid. Although HYD showed in vitro activity at a concentration of 6 μg/mL, 3-formylrifamycin, the hydrolysis product of HYD, showed activity at 0.6 μg/mL. However, both these compounds were found to be devoid of in vivo activity, except that 3-formylrifamycin showed activity at 24 mg/kg after intravenous administration. The study shows that to whatever extent rifampicin is converted to HYD, the result is a corresponding loss of anti-tuberculosis activity. Thus, it may be reasonable to suggest that HYD should be controlled as a related substance or an impurity in the USP monographs for anti-tuberculosis combination products containing rifampicin and isoniazid.

INTRODUCTION

The fixed-dose combinations (FDCs) of anti-tuberculosis (anti-TB) drugs (rifampicin, isoniazid, pyrazinamide, and/or ethambutol) are being promoted by the World Health Organization in its worldwide programs because of the obvious advantages of patient compliance, prevention of monotherapy, etc. (*1*). However, several reports in the literature have raised concerns about the quality of these products, and more FDCs have been found to be substandard than have single-drug formulations (*2–4*). There are even reports about decreased bioavailability of rifampicin in drug combinations (*5–7*). Several meetings also have been held in the recent past to discuss the quality of FDCs and to find solutions to the problems (*8–10*). The USP Drug Quality Information (USP DQI) program recently held a meeting in Botswana regarding the quality of anti-infectives in use and recommended a three-level testing system for ensuring the quality of FDCs. Among the recommendations, one of the elements was the determination of unusual impurities (*10*).

Research in our laboratory has confirmed that there is indeed an unusual impurity generated in anti-tuberculosis FDC products and that it is formed not as a result of degradation of either drug present in the combinations but rather from the interaction between rifampicin and isoniazid, the two primary anti-TB drugs. The drugs show facile interaction to form isonicotinyl hydrazone (HYD) in situ under stomach acid conditions (*11–12*) and also in the solid-state environment of unpackaged and packaged FDC formulations (*13–14*). This is amply shown from the data in *Table 1*. The mechanisms for the decomposition of rifampicin in the presence of isoniazid under both acidic and nonacidic formulation conditions have been postulated.

Key: R—Rifampicin, H—Isoniazid, Z—Pyrazinamide, E—Ethambutol.

* The area % of HYD was calculated with respect to *R* and *H,* ignoring the contribution due to *Z*. The contribution due to *E* was not measured because it was not analyzed by the HPLC method.

† Data taken from reference 12.

‡ Data taken from reference 14.

It has been proposed that under acidic conditions rifampicin is hydrolyzed to 3-formylrifamycin, which interacts with isoniazid to form HYD by means of a fast second-order reaction. The product, due to its instability in acidic conditions, regenerates isoniazid and 3-formylrifamycin by a pseudo–first-order reaction. Because the second-order forward reaction is faster than the preceding (rifampicin to 3-formylrifamycin) and the following (hydrazone to 3-formylrifamycin and isoniazid) first-order reactions, the overall reaction is favored towards the formation of hydrazone. As a result, the decomposition of rifampicin to 3-formylrifamycin is pushed forward, and an overall enhancement of degradation of rifampicin is observed (*15*). Under non-acidic formulation conditions, the reaction takes place through a transhydrazone formation process via nucleophilic attack on the imine group of rifampicin by the amino group of isoniazid following a tetrahedral mechanism (*16*). Because these reactions result in extensive loss of rifampicin and to a smaller or equal extent even of isoniazid (*Table 1*), this has been held as the reason behind the quality and bioavailability problems with FDC products (*17*).

However, even though this interaction affects the quality of anti-TB FDCs, USP, which is the first international pharmacopoeia to establish standards for anti-tuberculosis combination products (*18*), still does not cover isonicotinyl hydrazone as a related substance or an impurity. Recently, USP carried out a survey regarding studies and literature reports on FDC drugs (*19*), as a result of which hydrazone was recognized as an unstable product formed from rifampicin in the presence of isoniazid, which is a positive development.

However, a formal declaration of hydrazone as a related substance or impurity perhaps requires key information about its fate in vivo, as well as a determination about whether or not it possesses anti-TB activity. The present study was carried out to find answers to these questions.

MATERIALS AND METHODS

Materials

Sprague-Dawley rats used in the studies were in the weight range of 240–260 g. Laca mice were in the weight range of 20–25 g. All studies involving the use of animals were carried out under approved protocols from Institutional Animal Ethics Committees. *Mycobacterium tuberculosis* H37Rv was obtained from the National Collection of Type Cultures (NCTC), London, UK. Rifampicin and isoniazid were gift samples from Panacea Biotec Ltd., Lalru, India. HYD was prepared by an already reported method (*15*). Buffer materials and all other chemicals were of analytical-reagent grade. HPLC-grade acetonitrile and methanol were procured from J.T. Baker (Mexico City, Mexico) and Mallinckrodt Baker Inc. (Paris, KY, USA), respectively. Ultrapure water was obtained from a water purification unit (Elga Ltd., Bucks, England). Culture media and other chemicals for microbiological studies were obtained from Himedia Laboratories Pvt. Ltd., Mumbai, India.

Equipment

Decomposition studies were carried out using a digital shaking water bath (Julabo SW21, Seelbach, Germany). pH recordings were made on a research pH meter (MA 235, Mettler Toledo GmbH, Schwerzenbach, Switzerland). Other equipment used included an analytical balance (AG 135, Mettler Toledo, Switzerland), autopipettes (Tripette, Merck KGaA, Darmstadt, Germany), a homogenizer (PT-MR 3100 POLYTRON, Kinematica AG, Littau, Switzerland), a sonicator (Branson Ultra-sonic Corporation, Danbury, CT, USA), and a centrifuge (Biofuge 15, Hanau, Germany). The HPLC system consisted of an on-line degasser (DGU-14AM), low-pressure gradient flow control valve (FCV-10AL$_{VP}$), solvent delivery module (LC-10AT$_{VP}$), autoinjector (SIL-10AD$_{VP}$), column oven (CTO-10AS$_{VP}$), UV-visible dual-wavelength detector (SPD-10A$_{VP}$), system controller (SCL-10A$_{VP}$) and CLASS-VP software (all from Shimadzu, Kyoto, Japan). The separations were achieved on a Zorbax XDB C-18 (250 × 4.6 mm, 5 µm) column (Agilent Technologies, Wilmington, DE, USA).

Stability at Different pH Level

HYD was added to buffers with pH between 1.0 and 7.0 at a concentration of 0.8 mg/mL. The resulting suspensions/solutions were stored at 37 °C for 1 hour. The samples were analyzed by HPLC after appropriate dilution with methanol. Percentage degradation was calculated from the difference between the peak areas of samples drawn at 0 and 1 hour.

Stability of HYD in Homogenates of Rat Gastrointestinal Tract (GIT) and Liver

Necessary organs (stomach, intestine, and liver) were removed from rats and retained in ice-cold saline until homogenization. The organs were homogenized before the study, and the masses were diluted to 10% with phosphate buffer (pH 7.4) and stored at –20 °C. HYD at a concentration of 50 µg/mL was added to dilute homogenates, and the mixtures were incubated at 37 °C in a shaking water bath set at 50 rpm. At appropriate intervals, 250-µL samples were withdrawn and mixed with 750 µL of methanol to cause protein precipitation. Subsequently, centrifugation was carried out at 5000 rpm, and the supernatant was analyzed by HPLC. All the studies were carried out in triplicate.

Stability of HYD in Rat Blood

Kinetics studies were conducted on HYD in whole rat blood at the same drug concentration and following a similar incubation and testing protocol, as described above for homogenates of GIT and liver.

HPLC Analyses

HYD was analyzed by HPLC employing a gradient method reported earlier (*20*). The mobile phase was composed of acetonitrile and buffer consisting of 0.01 M sodium dihydrogen orthophosphate (pH adjusted to 6.8 with dilute orthophosphoric acid). The method was validated for the parameters such as linearity, precision, and accuracy.

In Vitro Anti-Mycobacterial Activity

Testing for in vitro activity was carried out on HYD and also 3-formylrifamycin. Rifampicin and isoniazid were tested as controls. The established broth microdilution minimum inhibitory concentration (MIC) method (*21*) was employed using *M. tuberculosis* H37Rv. The procedure involved addition of different concentrations of the compounds from the stock solutions to flasks containing 100 mL Youman's medium. Subsequently, 500 µL of *M. tuberculosis* H37Rv culture containing 1.5×10^8 colony-forming units (cfu) per mL was added. The flasks were kept in a shaker for 7 days. On the eighth day, growth was observed visibly in all the flasks and compared to the blank. The lowest concentration of the drug at which the surface growth layer could not be observed was taken as the MIC.

In Vivo Anti-Tubercular Activity

This experiment was carried out using the method reported by Pandey et al. (*22*). Laca mice were infected through the tail vein with 1×10^5 viable bacilli of *M. tuberculosis* H37Rv in 0.1 mL of sterile isotonic saline. To confirm the establishment of infection, three animals were randomly selected and sacrificed after 15 days. Their lungs and spleens were removed aseptically and homogenized in

sterile phosphate buffered saline (PBS). Ziehl Neelsen staining of tissue smears confirmed establishment of the infection. In addition, 50 µL of undiluted homogenates were plated on Middlebrook 7H10 agar base supplemented with oleic acid, dextrose, and citrate (OADC). Colonies were counted three weeks post-inoculation, and basal cfu load was calculated.

For the treatment, mice were organized into thirteen groups, including the control (Group I). Groups II to VII were used for testing 3-formylrifamycin, and Groups VIII to XIII were used for HYD. The compounds were dissolved in a mixture of water and methanol (4:1), and 0.1 mL was administered intravenously and also orally for 14 days at doses of 4, 12, and 24 mg/kg. On the 15th day, the mice were sacrificed, and their livers and spleens were removed and homogenized. The homogenates were plated after appropriate dilution, as described above. Colonies were counted on day 21 post-inoculation.

RESULTS AND DISCUSSION

Figure 1 shows the pH–stability profile of HYD. It clearly shows that HYD is labile in the acidic pH range but is stable beyond pH 5. The profile can be attributed to hydrogen-ion catalysis and noncatalysis of the hydrolysis of the undissociated compound (*23*). A review of the chromatograms generated during stability studies confirmed that HYD was converted to 3-formylrifamycin and isoniazid upon degradation, because peaks relative to these two appeared with the progress of the reaction.

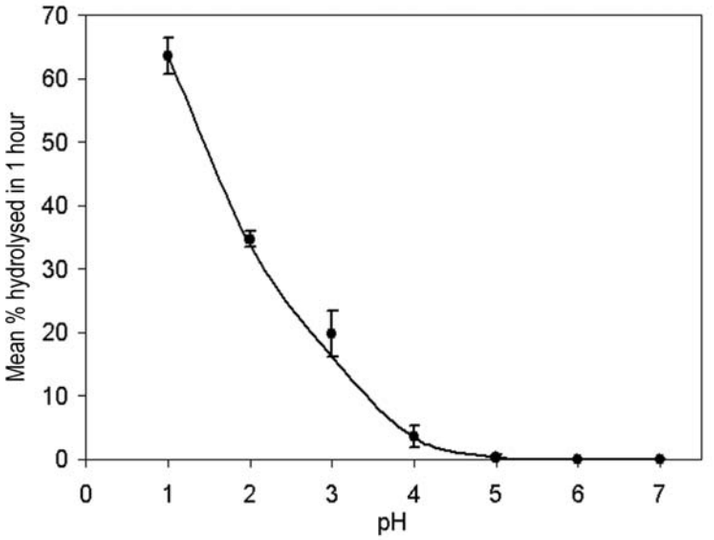

Fig. 1. pH–stability profile of HYD at 37 °C. Results are expressed as the mean ±SD of at least three experiments.

Pseudo–first-order plots for the hydrolysis of HYD in homogenates of rat stomach, intestine, liver, and rat blood are given in *Figure 2.* The corresponding hydrolysis rate constants and half-lives are listed in *Table 2.* HYD hydrolyzed in blood and tissue homogenates in the order of intestine>blood>liver>stomach. Also in these studies, the chromatogram showed conversion of HYD to 3-formylrifamycin and isoniazid. This suggests that HYD has a good potential to rapidly reconvert to 3-formylrifamycin and isoniazid inside the body.

Table 2. Pseudo–first-order hydrolysis rate constants and half-lives of HYD in various GI segments, liver, and blood of rat

Homogenate/ blood	Rate constant, k ($hour^{-1}$)	Half life (hours)
Stomach	0.092 ±0.001	7.56 ±0.08
Intestine	0.471 ±0.009	1.47 ±0.03
Liver	0.129 ±0.001	5.34 ±0.06
Blood	0.229 ±0.004	3.03 ±0.06

Results are expressed as the mean ±SD of at least three experiments.

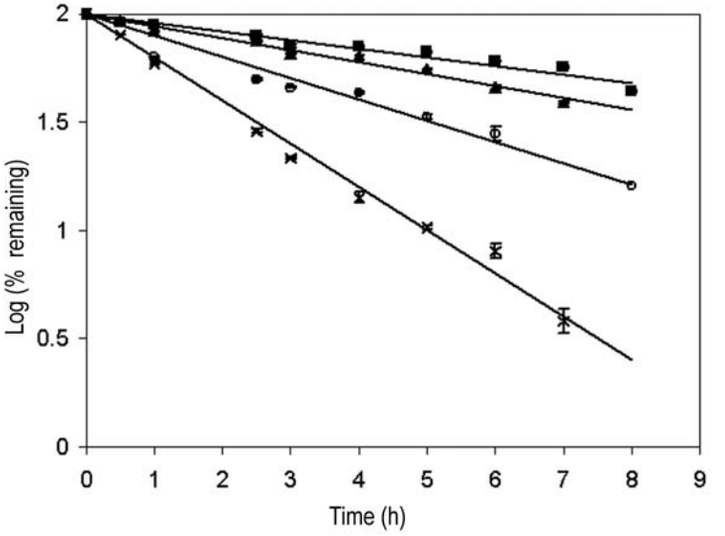

Fig. 2. Pseudo–first-order plots for the hydrolysis of HYD in rat stomach (■), intestine (×), and liver (▲) homogenates, and blood (O). Results are expressed as the mean ±SD of at least three experiments.

Table 3 lists the MIC values of rifampicin, isoniazid, 3-formylrifamycin, and HYD. The values given in the table for rifampicin (0.25 μg/mL) and isoniazid (0.1 μg/mL) are similar to those reported in the literature (*21, 24*), confirming that the method used for in vitro testing was dependable and could give reproducible results. By the same test, the MIC value obtained for 3-formylrifamycin was 0.6 μg/mL, and the corresponding value for HYD was 6.0 μg/mL.

Table 3. In vitro anti-tubercular activities of rifampicin, isoniazid, 3-formylrifamycin, and HYD against *M. tuberculosis* H37Rv

Compound	Concentration ranges tested (μg/mL)	MIC (μg/mL)	Relative potency with respect to rifampicin
Rifampicin	0.05–1.0	0.25 (0.06–0.25)*	—
Isoniazid	0.05–1.0	0.10 (0.025–0.3)	2.5
3-Formylrifamycin	0.05–1.0	0.60	0.416
HYD	0.05–10.0	6.00	0.0416

* Values in the parentheses are literature values (*21, 24*).

Table 4 shows the in vivo chemotherapeutic efficacy of 3-formylrifamycin and HYD when administered by intravenous and oral routes. As evident, 3-formylrifamycin was active only after intravenous administration of the highest tested dose of 24 mg/kg. It was inactive orally at all tested doses. On the other hand, HYD was devoid of in vivo activity when administered by both intravenous and oral routes.

Table 4. In vivo anti-tubercular activities of 3-formylrifamycin and HYD administered via intravenous and oral routes

Groups	Route of administration	Dose (mg/kg)	Log_{10} cfu/lung	Log_{10} cfu/spleen
Basal	—	—	2.552 ±0.042	2.439 ±0.059
Control				
I	—	—	4.864 ±0.031	4.844 ±0.023
3-Formylrifamycin				
II	Intravenous	4	4.765 ±0.016	4.773 ±0.018
III		12	4.703 ±0.016	4.732 ±0.026
IV		24	4.085 ±0.071*	4.008 ±0.067*
V	Oral	4	4.845 ±0.020	4.858 ±0.027
VI		12	4.871 ±0.022	4.852 ±0.024
VII		24	4.834 ±0.022	4.857 ±0.019
Isonicotinyl hydrazone (HYD)				
VIII	Intravenous	4	4.817 ±0.014	4.789 ±0.017

XII		12	4.788 ±0.028	4.820 ±0.025
XIII		24	4.864 ±0.026	4.852 ±0.024

Results are expressed as the mean ±SEM of at least six experiments.
* Significantly different from control ($p<0.001$).

CONCLUSION

This study provides a clear conclusion that any extent of HYD that may be present initially in anti-tuberculosis FDC formulations containing rifampicin and isoniazid or is formed in situ in the stomach upon administration of these products would result in a loss of therapeutic activity of rifampicin, the first-line drug for tuberculosis. This is because HYD lacks in vivo activity, and even its conversion to 3-formylrifamycin does not help because the latter is also inactive in vivo; 3-formylrifamycin has also been mentioned previously in the literature as an inactive metabolite of rifampicin (*25*). Thus it may be necessary to control the presence of HYD in formulations for which compendial authorities, especially USP, should consider categorizing HYD as a related substance. To assess and control the extent of in situ conversion of rifampicin and isoniazid to HYD, it may be prudent to include in the compendia an additional test for dissolution. This dissolution test could involve the determination of the extent of HYD formed from anti-tuberculosis combination formulations in 0.01 M hydrochloric acid (pH ~2) at 37 °C in 1 hour (*17, 26*), the mean stomach residence time. USP at present recommends dissolution testing in 0.1 M hydrochloric acid (pH ~1) for 45 minutes for a two-drug combination, simulated gastric fluid for 30 minutes for a three-drug combination, and pH 6.8 for 45 minutes for four-drug combinations. It is reported that interaction between rifampicin and isoniazid takes place much more strongly at pH 2 than pH 1 (*12*). For analysis of dissolution samples for all these combinations, the use of HPLC methods is suggested, unlike the colorimetric method recommended currently in USP for testing dissolution samples of two- and three-drug combination products containing rifampicin and isoniazid. Our recent separate findings are that HYD interferes in colorimetric (*27*) and microbiological (*28*) methods of analysis of rifampicin.

RSD and Other Variability Measures of the Lognormal Distribution

Charles Y. Tan, Ph.D.*

ABSTRACT This *Stimuli* article reviews relative standard deviation (RSD) in the context of the lognormal distribution. The article discusses the advantage of RSD compared to standard deviation (SD). Other variability measures that offer similar advantage are discussed and compared.

The relative standard deviation (*RSD* or *%RSD*) is defined as the sample standard deviation, *S,* divided by sample mean, $\overline{X}$, and is expressed as a percentage:

$$RSD = \frac{S}{\overline{X}} \times 100\%.$$

It is a widely used measure of variability in biology and chemistry. *RSD* is sometimes referred to as the coefficient of variance *(CV)* in many statistics textbooks and is little studied in statistics. The purpose of this *Stimuli* article is to describe the characteristics of the *RSD,* particularly in the context of the lognormal distribution.

In biology and, to a lesser degree, in chemistry, the variability of a measurement often increases with the magnitude of the measurement. In many cases, the log-transformed measurements are well characterized or approximated by normal distributions. In such cases, the original measurement is said to have the lognormal distribution with the following density function:

$$f(x) = \frac{1}{\sqrt{2\pi}\sigma} * \frac{\exp\left(-(\ln x - \mu)^2 / (2\sigma^2)\right)}{x},$$

$$\text{where } \ln x = \log_e x,$$

where μ is the mean and σ is the standard deviation of the normal distribution, and x is any point on the distribution. The mean and standard deviation of the lognormally distributed variable X are

$$E(X) = \exp\left(\mu + \sigma^2/2\right),$$

and

$$std(X) = \exp(\mu)\sqrt{\exp\left(2\sigma^2\right) - \exp\left(\sigma^2\right)}.$$

The *RSD* of the lognormally distributed X is

$$RSD(X) = std(X)/E(X) * 100\% =$$

$$\sqrt{\exp\left(\sigma^2\right) - 1} * 100\%.$$

It is worth noting that *RSD* of X depends only on one parameter, σ, but both the mean and standard deviation of X depend on both parameters, μ and σ.

A normal distribution is completely specified by its natural location and variability parameters: mean and standard deviation. The two parameters are also ‘‘independent’’ in the sense that by changing one parameter without changing the other, one still has a valid normal distribution. The mean and standard deviation of the lognormal distribution are not ‘‘independent’’ in this sense, because a higher mean demands a higher standard deviation. However, there are ‘‘independent’’ location and variability parameters that completely specify a lognormal distribution.

Many statistical procedures were developed under the assumption that the population from which the sample is taken is normally distributed. Pooling the variability estimates at different response levels is an important part of many statistical procedures, including analysis of variation (ANOVA),

* Correspondence should be addressed to: Charles Y. Tan, Ph.D., Merck & Co., Inc., P.O. Box 4, WP37C-305, West Point, PA 19486; e-mail: charles_tan@merck.com.

regression, and variance component analysis. For lognormal distributions, the standard deviations are not poolable when the means are different; however, alternative parameters do exist to allow pooling of variability across response levels. For example, the *RSD*s can be pooled when the medians are different.

The median of the lognormal distribution, $median(X) = \exp(\mu)$, is a location parameter that is a meaningful alternative to the mean. There are several alternative variability parameters that are independent of the median; the *RSD* is one. Other choices include

$$R_2 = [\exp(\sigma) - 1] * 100\%,$$

and

$$R_3 = \sigma * 100\%.$$

R_2 is particularly useful in constructing intervals with specified probability. The following interval covers the lognormal distribution with the same probability as that for the usual interval $[\mu - k\sigma, \mu + k\sigma]$ covered in the normal case:

$$\left[\frac{\exp(\mu)}{(R_2 + 1)^k}, \exp(\mu) \times (R_2 + 1)^k \right].$$

R_3 is simply the standard deviation on the log-transformed scale.

It is interesting to note that *RSD*, R_2, and R_3 are numerically very close when they are small: The three are within 2% of each other when they are less than 20%. This may explain why they are often treated as if they are the same parameter. *Table 1* compares the three variability parameters numerically.

Table 1. Comparison of *RSD*, R_2, and R_3

RSD	0.00%	5.00%	10.00%	15.00%	20.00%	25.00%
R_2	0.00%	5.12%	10.49%	16.09%	21.90%	27.92%
R_3	0.00%	5.00%	9.98%	14.92%	19.80%	24.62%
RSD	35.00%	40.00%	45.00%	50.00%	60.00%	70.00%
R_2	40.49%	47.00%	53.64%	60.38%	74.11%	88.04%
R_3	33.99%	38.53%	42.94%	47.24%	55.45%	63.15%
RSD	80.00%	90.00%	100.00%	120.00%	140.00%	160.00%
R_2	102.05%	116.04%	129.92%	157.14%	183.41%	208.59%
R_3	70.33%	77.03%	83.26%	94.45%	104.17%	112.68%

When lognormal distributions are appropriate, many classic and commonly used statistical procedures (e.g., ANOVA) can be performed on the log-transformed data. The arithmetic mean of the log-transformed data corresponds to the geometric mean (GM) of the original data, which is an estimator for the median. The difference in the log scale becomes a ratio in the original scale. The variance of the log-transformed data can be easily translated to *RSD* or R_2 on the original scale.

If the information obtained from an assay is considered to be normally distributed, and

$$\sigma^2_{between} \text{ and } \sigma^2_{within}$$

are the between-run and within-run variance components, respectively, then the total variability of a single readout from this assay is

$$\sigma^2_{total} = \sigma^2_{between} + \sigma^2_{within}.$$

Similarly, if the readout from an assay is considered to be lognormally distributed, and $RSD_{between}$ and RSD_{within} are the between-run and within-run *RSD*s, respectively, then the total *RSD* of a single readout from this assay is

$$RSD^2_{total} + 1 = (RSD^2_{between} + 1)(RSD^2_{within} + 1).$$

If the reportable value of the assay in the normal case is the mean of n runs and k replicates per run, the precision variance of the reportable value is

$$\sigma^2_{precision} = \frac{\sigma^2_{between}}{n} + \frac{\sigma^2_{within}}{n*k}.$$

Similarly, if the reportable value of the assay in the lognormal case is the geometric mean of n runs and k replicates per run, the precision *RSD* of the reportable value is

$$RSD^2_{precision} + 1 = \left(RSD^2_{between} + 1\right)^{\frac{1}{n}} * \left(RSD^2_{within} + 1\right)^{\frac{1}{n*k}}.$$

It should be noted that the *RSD,* R_2, and R_3 defined above apply only when the log of base e (natural log) is used in the transformation. If log of base 10 (common log) is used, they should be modified as

$$RSD = \sqrt{\left(10^{\ln 10}\right)^{\sigma^2} - 1} * 100\%,$$

$$R_2 = (10^{\sigma} - 1) * 100\%,$$

and

$$R_3 = \ln 10 * \sigma * 100\%.$$

In conclusion, the standard deviation is the natural variability parameter for normal distribution but not for all distributions. In the context of lognormal distribution, which is common in biological and chemical measurements, *RSD* and R_2 may be more useful.

NOTE 1

If X is lognormally distributed, the inference regarding *RSD* of X can be easily handled by many common statistical procedures applied on the scale of $\ln(X)$. However, if X is normally distributed, inference regarding *RSD* of X is possible, but it is much more complicated.

NOTE 2

Solid dosage pharmaceuticals such as tablets and capsules usually are manufactured only to a few selected strength levels. For assays that measure the active ingredients, the variability does tend to increase with the strength levels (label claims) if the results are reported on the scale of mass/weight. However, if the results are analyzed on the scale of percent label claim, i.e., mass or weight divided by label claim, the variability becomes stable and poolable. In this context, the arithmetic mean, instead of geometric mean, is usually used to average. In other words, normal distributions on the scale of percent label claim usually work well. Sometimes, the standard deviation on the scale of percent label claim is called *RSD*. This is a pseudo-*RSD* because it is not divided by the random variable $\overline{X}$ but by a constant: label claim. However, this pseudo-*RSD* usually is preferred instead of the true *RSD* because it usually provides adequate description of the variability, it is more stable, and there are many readily available statistical procedures to handle the inference.

ACKNOWLEDGEMENT

The author would like to thank Dr. James E. De Muth, Dr. Walter W. Hauck, and members of USP Biostatistics Expert Committee for their useful comments and many discussions.

The USP Revision Process: Recommendations for Enhancements

Rafik H. Bishara, *Eli Lilly and Company* and *Chair of USP Project Team on Compendial Process Improvements (PT 19);* Susan J. Schniepp, *Hospira, Inc.;* Barbara Ferguson,[*] *Schering-Plough;* Neil Schwarzwalder, *Eli Lilly and Company;* Luciano Virgili, *Bristol-Myers Squibb;* Phyllis Walsh, *Schering-Plough;* Mark Wiggins, *Merck & Co.;* Janeen Kincaid, *Pfizer*

ABSTRACT The International Conference on Harmonization (ICH) defines a specification as "a list of tests, references to analytical procedures, and appropriate acceptance criteria which are numerical limits, ranges, or other criteria for the tests described. It establishes the set of criteria to which a drug substance or drug product should conform to be considered acceptable for its intended use. 'Conformance to specifications' means that the drug substance and/or drug product, when tested according to the listed analytical procedures, will meet the listed acceptance criteria" (*1*). The United States Pharmacopeia (USP) is an independent standards-setting organization responsible for publishing the specifications and test methods that govern the strength, quality, and purity of pharmaceutical products of commerce sold in the United States of America. It is recognized as the legal standard by the U.S. Food and Drug Administration (*2–5*) as well as by regulatory authorities in other countries. USP relies on a system of volunteerism to effect changes to these standards, making it distinctive among the compendia. This *Stimuli* article will explore ways to improve the efficiency and timeliness of the *USP* revision process while preserving and strengthening its unique approach to public participation.

INTRODUCTION

The United States Pharmacopeia (USP) has many strengths that set it apart from pharmacopeias of other nations. Because it is the only major nongovernmental pharmacopeia, USP relies on expert volunteers from academia, government, and industry to make decisions about revisions to *USP* text. All changes adopted in *USP* are presented for public review and comment in *Pharmacopeial Forum (PF)*, and significant changes in content are not made without further publication in *PF*, offering additional opportunity for public review. Although the *USP* revision process is efficient, the increasing volume of changes and the expectations of regulatory agencies require enhancement of the basic revision process. In response to its stakeholders' suggestions, USP sponsored a Project Team on Process Improvements, which is made up of representatives from pharmaceutical manufacturers, FDA, and USP staff. This *Stimuli* article discusses the team's observations regarding the current USP process and presents specific recommendations for improvements. The underlying theme of the recommendations is that the comment and implementation periods for a change to a *USP* standard should be a function of the nature of the specific change.

The USP standards-setting process has many facets. It may begin with resolutions proposed at the USP Convention or as information submitted by independent parties, persons, or companies. It may encompass *Stimuli to the Revision Process* articles and participant input from Open Conferences or USP Meetings. Regardless of their origin, proposals for change are published in *PF* before they are officially adopted in the *USP* annual main volume, a semiannual *Supplement,* or a bimonthly (*6*) *Interim Revision Announcement (IRA)*. The processes governing these three publications areas—*PFs, Supplements*/main volumes, and *IRAs*—could benefit from improvements that would positively impact the efficiency of *USP* and the synergy with industry trends and standards.

PHARMACOPEIAL FORUM

The *General Notices and Requirements* section of *USP* describes *PF* as "...the working document of the USP Committee of Revision. It is intended to provide ... public notice of proposed new and revised standards of the *USP* and *NF* and to afford opportunity for comment thereon." This information is echoed in the Standards Development section of *PF* itself: "*USP* publishes *Pharmacopeial Forum (PF)* bimonthly as the working vehicle of the USP Council of Experts. *PF* provides interested parties an opportunity to review and comment as the Council of Experts develops or revises standards for the *United States Pharmacopeia* and the *National Formulary (USP–NF)*."

USP's comment period for *PF* proposals is currently defined to be a minimum of 60 days before the proposal can be officially adopted. The beginning of the comment period starts with the publication of *PF* and includes the transit time for the volume to reach subscribers. Companies can minimize time delays by subscribing to the online version of *PF*. Proposals appearing in *PF* prompt companies and any other users (e.g., academia, health care practitioners, trade associations, health authorities, and governmental agencies such as FDA) to assess the impact these changes could have on products and/or processes before an appropriate, science-based response can be communicated to USP.

Pharmacopeial Forum
Vol. 31(2) [Mar.–Apr. 2005]

This evaluation must consider the effect of the change in relationship to product quality, release, and stability requirements, as well as regulatory commitments. The evaluation should encompass a comprehensive review for changes to specifications, methodology, associated standard operating procedures, and other relevant documentation (e.g., impact on validation). Many *PF* proposals require a laboratory evaluation before a company can prepare a response. When a laboratory evaluation is warranted, appropriate materials (e.g., reagents, chromatographic columns, and reference standards) must be secured before the analysis. A determination regarding the depth of the evaluation also must be considered in the assessment. Once the appropriate actions for response are determined, the evaluating facility must be identified, and testing must be scheduled and prioritized into the laboratory's daily workload.

The data generated from the laboratory analysis must then be reviewed and comments formulated, approved, and communicated to USP. The final step in the process often results in documents to be edited in anticipation of the proposal being officially adopted in the *USP* main volume or a semiannual *Supplement.* The entire evaluation process ranges from 12 to 180 working days, depending on the complexity and impact of the proposal (see *Figure 1*). It should be noted that the number of proposals a company must address varies from *PF* to *PF* and from company to company and can influence the timeline for evaluation and response. In addition, many companies are not able to complete an entire evaluation of one *PF* before the next one is published.

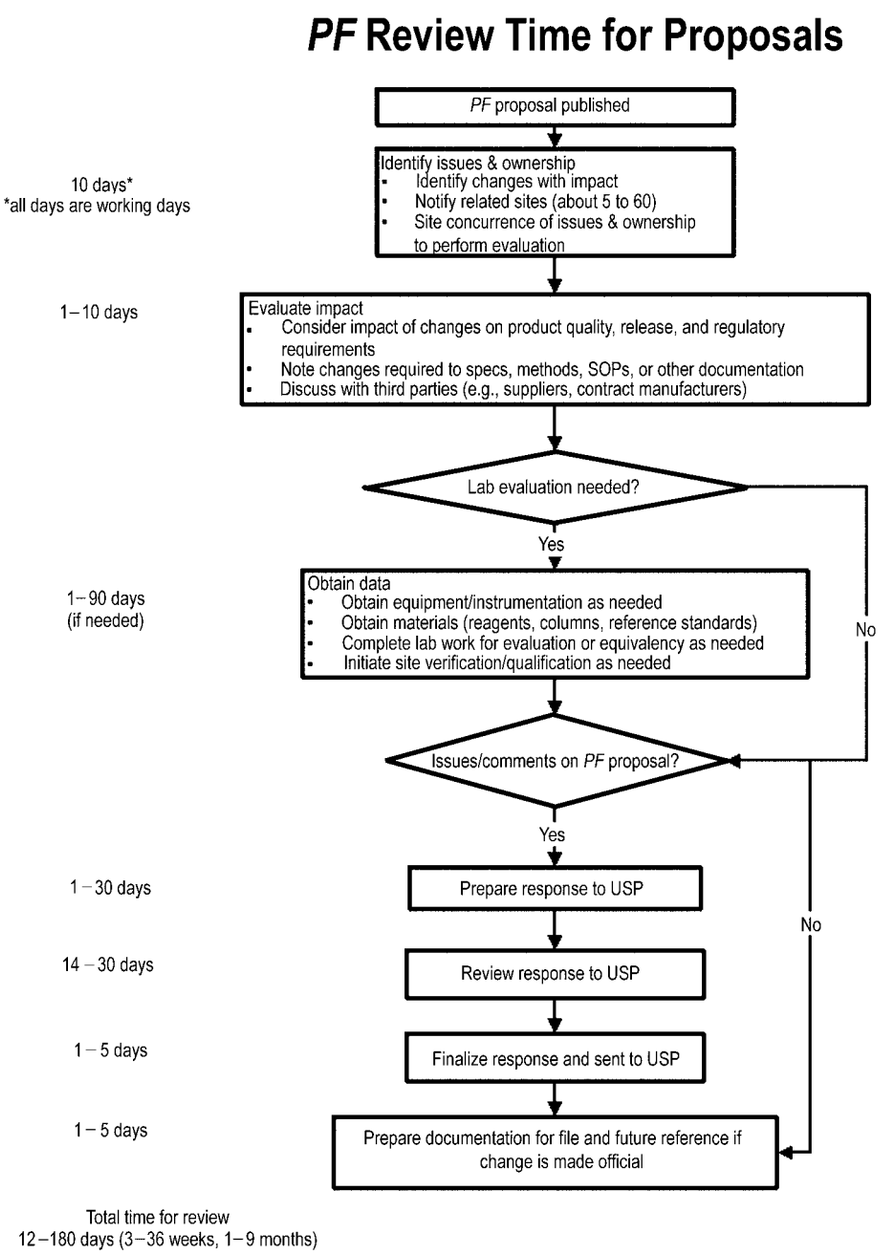

Fig. 1. *PF* review time for proposals

Regulatory authorities also monitor *PF* proposals, and although they face different challenges than does industry, the resulting impact on the resources is similar. Regulators assume the entire contents of *PF* must be reviewed, sorted, and distributed to the appropriate divisions, who in turn must reprioritize their workload to address the impact of the proposal. In an organization as diverse as FDA, finding the appropriate reviewer for a specific issue may take considerable time. In addition, as in industry, FDA staff may have different opinions regarding an issue, and these must be resolved before a comment can be communicated to USP.

Pharmacopeial Forum
Vol. 31(2) [Mar.–Apr. 2005]

Recommendation

In view of the factors discussed above and the criticality of appropriate review of *PF* proposals, the team recommends assigning comment periods based on the complexity of the proposal. Therefore, instead of targeting all proposals in a particular *PF* to a particular *Supplement* or main volume, a targeted *Supplement* or main volume could be chosen based on the impact of the proposal. For example, a change to a test's acceptance criteria in a particular monograph would be targeted for the next available *Supplement,* thereby triggering a shorter comment period. However, a change to a General Chapter—such as *Residue on Ignition* ⟨281⟩ that influences how we test many compendial articles—would be targeted for a subsequent *Supplement,* thereby allowing more time for laboratory evaluation. In addition, the minimum comment period should be extended from 60 days to 90 days. Most *PF*s allow at least 90 days for comments, but the March–April *PF* allows only about 60 days for comments. An adequate comment period for most proposals (i.e., excluding high-impact changes) could be achieved simply by extending the comment deadline for the March–April *PF* to at least 90 days and leaving the deadlines for the other five *PF*s unchanged.

THE MAIN VOLUME AND *SUPPLEMENTS*

The main volume of *USP,* published yearly, is the current, officially recognized collection of standards that pharmaceutical articles must meet before they can be marketed in the United States. *Supplements* to the main volume are published semiannually. *PF* proposals approved by the Council of Experts are elevated to official status with their inclusion in one of these publications.

The time allowance for implementing changes appearing in a *Supplement* or main volume is currently two months or 60 calendar days from the date of release of publication. As with *PF,* the transit time to receive the publications is deducted from the initial time allowance, thus reducing the amount of time to implement to about 45 calendar days. Again, users of *USP* can minimize the delay by subscribing to the *USP–NF* online version. Once an item becomes official, companies must update their internal control documents to maintain compliance status and to be aligned with the compendium. Changes to official company documents must be completed through a rigorous change-control system. Document changes must be prepared, routed for approval, assigned an effective date, distributed to manufacturing plants and suppliers, and potentially include training before compliance to the new standard can be achieved. This process can take anywhere from 24 working days, for the simplest changes, to 158 working days for the more complex, broad-scope changes such as changes to a General Chapter that impacts many materials (see *Figure 2*). Even if documents are edited for change at the *PF* stage, compliance still may not be achieved by the official date because of the sequential steps needed to ensure adherence to the new standard. Additionally, it may not be practical or beneficial to edit documents at the *PF* stage because subsequent revisions may be made before the change becomes official. In some instances, companies are required to file Changes Being Effected Supplements (CBE-30s) with FDA before the manufacturer can make the change effective, which adds an additional 30 days to an already tight compliance timeline.

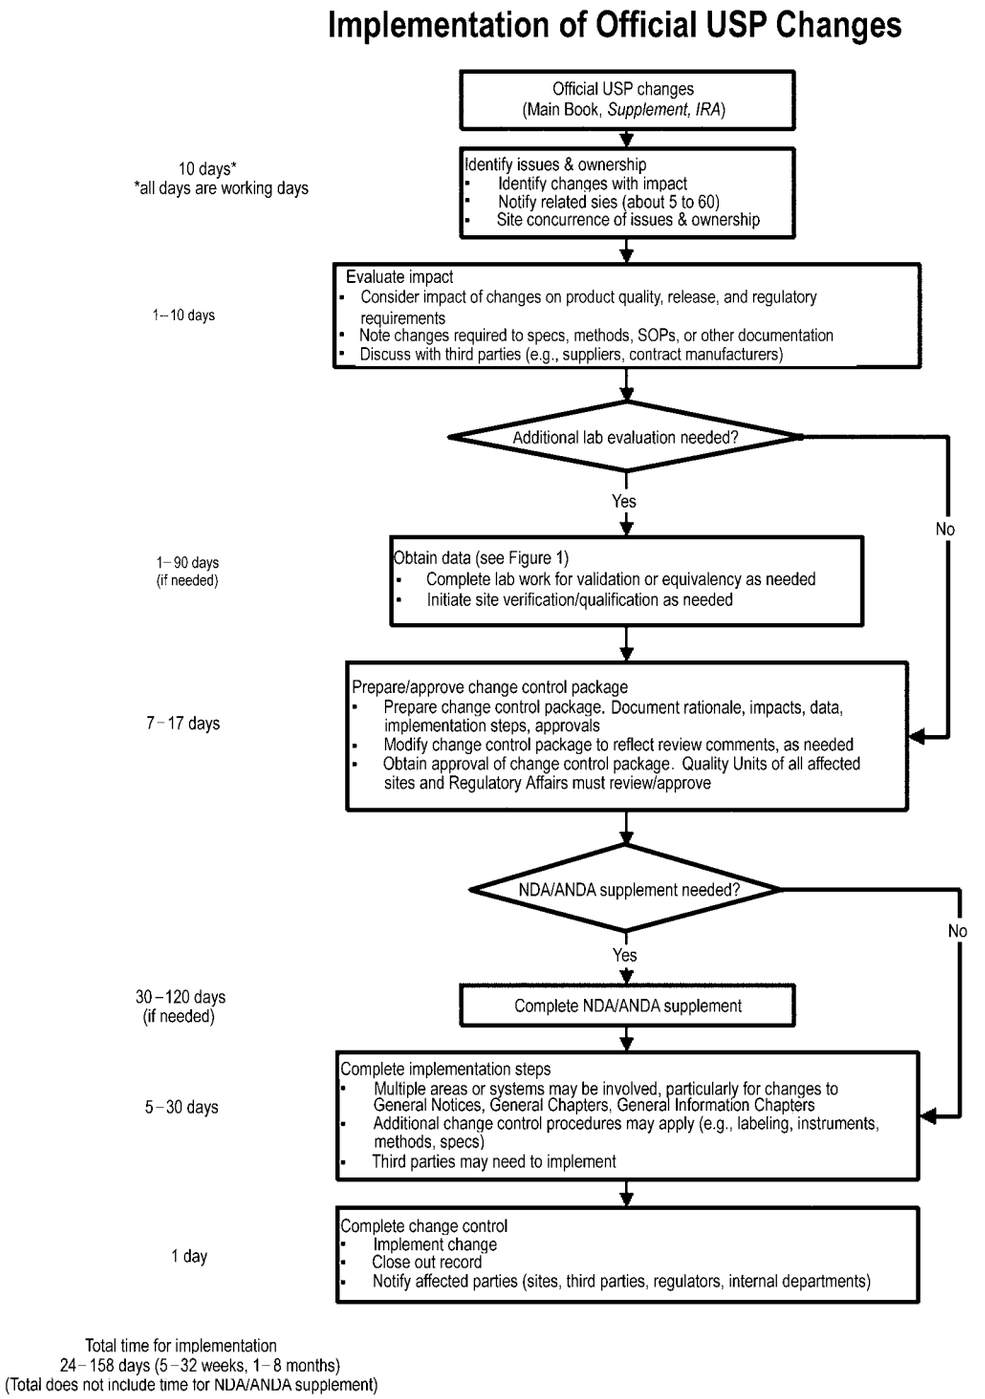

Fig. 2. Implementation of official USP changes

Recommendation

To avoid unnecessary risk to a company's compliance status, the team recommends that USP implement official dates that reflect the scope of the change being adopted. The appropriate time for changes should be chosen on a risk basis. Simple changes (e.g., editorial, editorial clarification) could remain at the current two-month time frame. More complex changes (e.g., specifications or methodology) should have a 6-month time frame for implementation. For broad-scope initiatives (e.g., General Test Chapters, Nomenclature, or Packaging and Storage Requirements) affecting multiple materials or products, a minimum of 12 months should be allowed before the revision becomes effective. Industry must recognize that if these extensions in the implementation timeline for official items are adopted by USP, industry must actively participate and offer recommendations that have been substantiated by data during the *PF* proposal stage. Industry needs to be proactive in reviewing *PF* regardless of the timelines.

INTERIM REVISION ANNOUNCEMENTS

Changes also can be adopted via an *Interim Revision Announcement (IRA)* to allow for rapid implementation of urgent revisions. This type of revision carries the same status as items in *USP–NF* and its *Supplements.* Although *IRA*s may not be published in each edition of *PF,* this typically is the case. Although changes adopted in *IRA*s are considered official, they are always republished in the next *USP–NF* main volume or semiannual *Supplement.*

For industry, *IRA*s carry the same compliance status as the main volume or its *Supplements.* The steps to effect these changes mimic those discussed in the section on main volume and *Supplements,* with the exception that the timeline for implementation is different because they are issued in response to critical need. *IRA*s should encompass very few issues, and industry must be able to implement them quickly. However, even the most responsive change-control system requires adequate time for adopting new standards and conducting training. The current 30-day period is not adequate for industry unless it is willing to enact the new standard on a risk-based decision.

Recommendation

To ensure that all users have equal opportunity to achieve compliance to *IRA* issues, the team recommends that the timeline for an *IRA* to become official should be extended by an additional 15 days, thus bringing the total time for complying with an *IRA* to 45 days. In addition, the team recommends that *IRA*s be used solely to address safety or regulatory compliance issues (i.e., those issues that are truly urgent and require immediate implementation).

ADDITIONAL RECOMMENDATIONS

In addition to the recommendations outlined above, USP should consider additional changes in an effort to bring their process timelines in line with industry's. The *Previews* section of the *PF* should be eliminated, and items that normally would have appeared in this section should be introduced in the *In-Process Revision* section with an extended comment period. The Project Team also recommends that USP publish a work plan for the 2005–2010 revision cycle to allow for more transparency in the process. Moreover, it recommends that a list of standards that have been approved for implementation be published on the USP Web site, along with the targeted *Supplement*/main volume for each item. The list could be further broken down to new and revised text similar to the *Admissions* list in the front of each *Supplement*/main volume.

CONCLUSION

The current USP revision process challenges industry's ability to appropriately respond to ever-changing standards in a timely manner based on the volume and complexity of the issues currently being proposed. The Project Team on Process Improvements recommends that USP modify its current revision timelines by:

1. assigning *PF* comment periods that reflect the complexity of the proposals,
2. assigning official adoption dates that correspond to the complexity of the issues being implemented, and
3. extending the adoption period for an *IRA* issue to 45 days.

We anticipate that USP's adopting the recommendations outlined in this article would positively influence the standards-setting process. USP timelines would be more closely synchronized with industry's ability to react/respond to proposals and adopt USP standards in a timely manner via mandated change control and compliance systems. The recommendations would allow companies to become more proactive and less reactive in setting and maintaining compliance with the public standards governing the pharmaceutical industry.

NOMENCLATURE

This section includes supplements to the latest edition of the *USP Dictionary of USAN and International Drug Names* that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI),* in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences.*

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum* (*PF*), for the development of official pharmaceutical standards.

USP publishes *Pharmacopeial Forum* (*PF*) bimonthly as the working vehicle of the USP Council of Experts. *PF* provides interested parties an opportunity to review and comment as the Council of Experts develops or revises standards for the *United States Pharmacopeia* and the *National Formulary* (*USP–NF*).

PF includes the following:

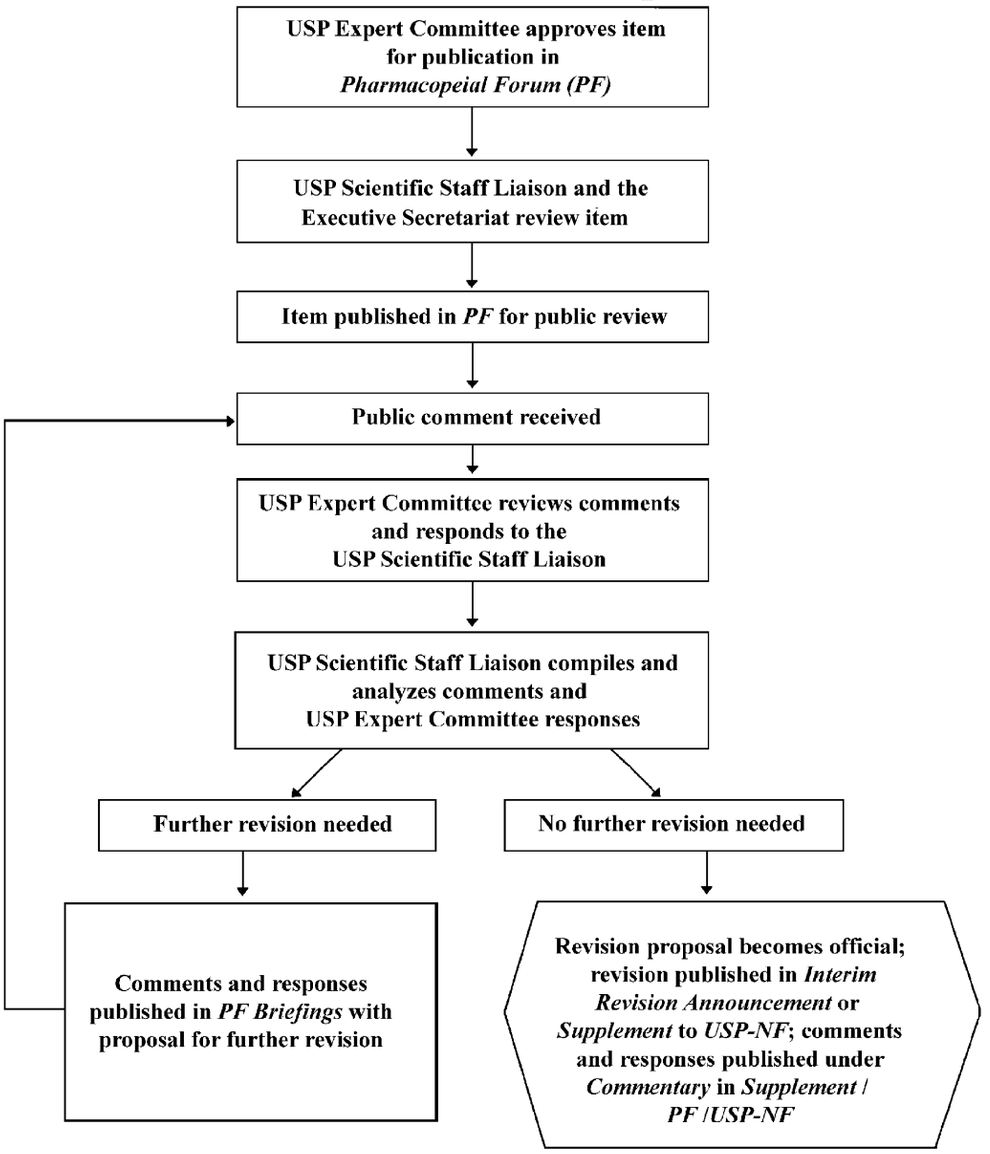
1. Potential revisions—entirely new standards, revision ideas, and drafts not yet targeted for official adoption (*Pharmacopeial Previews*)
2. Proposed revisions—new or revised standards targeted for official adoption (*In-Process Revision*)
3. Adopted revisions—new or revised standards that become official and binding before the publication of the next *USP–NF* or *Supplement* (*Interim Revision Announcement*)

USP welcomes comments and data on potential, proposed, or official standards.* Comments, along with USP's responses, will be published either in *PF Briefings*, the *Commentary* section of *PF*, the *Commentary* section of *Supplements* to *USP–NF*, or the *Commentary* section of *USP–NF*.

* If you are not immediately able to submit comments but you intend to do so, please notify USP by using the Intent to Comment form provided before the section *Chromatographic Reagents Used in USP–NF and PF*.

The chart below shows the public review and comment process and its relationship to standards development.

Public Review and Comment Process for Standards Development



Questions on the process should be addressed to John W. Gasper, M.A., J.D., Director, Office of the Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: jg@usp.org).

HOW TO USE *PF*

This section provides descriptions of the various parts of *PF*. It also includes *Committee Designations* and the *Staff Directory.*

The contents of the different sections of *PF* are briefly described below. Readers will get an idea of how each section is relevant to their job functions. They may contact USP scientific staff liaisons or staff members of the Executive Secretariat (listed in the *Staff Directory*) if they have any questions. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a Request for Revision is available on the USP website (www.usp.org/standards/revisionguideline/).

Proposed and Adopted Revisions

Section	Content	How Readers Can Respond
Pharmacopeial Previews Early ideas for revisions	•BRIEFING: Scientific rationale for potential inclusion or change. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •Potential revisions not yet targeted for official adoption that require a longer public review and comment process because of issues such as: — the controversial nature of an item; — the application of new technologies that require further study; and — articles produced by multiple sources.	Review drafts and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview.*
In-Process Revision Revisions targeted for adoption	•BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see *Standards Development*). New or revised text is marked with symbols (■▪ or •▲ or ▲•) to specify the tentative earliest date on which the revision would be officially adopted.	Review material and send comments promptly to USP staff liaison (see the *Staff Directory*). Guidelines on how to comment are found at the end of the *Policies and Announcements* section.
Harmonization Items the Pharmacopeial Discussion Group (PDG) is trying to harmonize internationally	•BRIEFING: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. The stage determines whether an item appears under *Pharmacopeial Previews* or under *In-Process Revision,* both separate sections of *Harmonization.* •For *In-Process Revision,* new or revised text is marked with symbols (■▪) to specify the tentative, earliest date on which the revision would be officially adopted.	Review material and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview* or *In-Process Revision.*
Interim Revision Announcement Adopted standards	Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols •▪.	Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance.
Pending Proposals	In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *PF* to allow the public an opportunity to review and comment upon it. When an item is adopted it is published in either the *USP–NF*, its supplements, or an *IRA*. Those items that have not yet been adopted are still pending.	Review items to track pending proposals.
Canceled Proposals	Canceled proposals are items that were published in *PF* and were pending, but have since been canceled. Note that canceled proposals may be republished to be considered in the future for adoption into the *USP–NF.*	Review items to track canceled proposals.

Other Sections

Committee Designations
Names of the committees (composed of volunteer scientific experts) that USP staff work with on the development of standards.

Staff Directory
Names of all USP scientific staff liaisons with contact information.

Policies and Announcements
- General scientific and policy issues affecting *USP–NF* standards and processes
- Update on standards-related issues being considered by USP
- Summaries of meetings of the Council of Experts
- Guidelines on how to comment
- Publication and comment schedules

Stimuli to the Revision Process
- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

Nomenclature
- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the *USP Dictionary of USAN and International Drug Names*
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

Index
Cumulative directory for the content of all issues of *PF* beginning with *PF* 31(1).

Reference Standards Catalog
List of official USP Reference Standards specified in *USP–NF*, along with availability and ordering information.

Chromatographic Reagents Used in USP–NF* and *Pharmacopeial Forum
Update of chromatographic reagents based on the proposals published in this issue of *PF*.

EXPERT COMMITTEE DESIGNATIONS*

The names of the Committees and their abbreviations are as follows:

AER	Aerosols
AMB	Analytical Microbiology
BBP	Blood and Blood Products
BNA	Bioavailability and Nutrient Absorption
BNT	Biotechnology and Natural Therapeutics and Diagnostics
BPC	Biopharmaceutics
BST	Biostatistics
CRX	Compounding Pharmacy
DSB	Dietary Supplements—Botanicals
DSI	Dietary Supplements—Information
DSN	Dietary Supplements—Non-Botanicals
EMC	Excipient Monograph Content
ETM	Excipients—Test Methods
GCT	Gene Therapy, Cell Therapy, and Tissue Engineering
GTB	General Toxicity and Biocompatibility
NL	Nomenclature and Labeling
PA1	Pharmaceutical Analysis 1
PA2	Pharmaceutical Analysis 2
PA3	Pharmaceutical Analysis 3
PA4	Pharmaceutical Analysis 4
PA5	Pharmaceutical Analysis 5

POLICIES AND ANNOUNCEMENTS

In this section, readers may find statements about general scientific and policy issues that may have an impact on *USP–NF* standards and processes, announcements about issues being considered by USP, and summaries of Council of Experts meetings. This section also includes publication and comment schedules.

POLICY DECISIONS OF THE COUNCIL OF EXPERTS EXECUTIVE COMMITTEE JANUARY 25–28, 2005. The 2000–2005 Council of Experts Executive Committee met for the final time on January 25–28, 2005. The meeting included a joint session with the USP Board of Trustees, end-of-cycle presentations by the Chairperson of the Council of Experts and each Division Executive Committee (Noncomplex Actives and Excipients, Complex Actives, General Policies and Requirements, and Information), discussion of several scientific topics, and voting on policy topics relating to polymorphism, degree of hydration, particle size, specific surface area, impurities, and relative response factor. The issues related to these policy topics have been brought to USP's attention through input into USP's standards-setting process by pharmaceutical companies requesting the need for flexibility in USP's monographs. Because of this input and its relation to USP's mission to provide public monographs that promote the public health and provide good quality pharmaceuticals everywhere, the following policies were approved by the Council of Experts Executive Committee.

These policies are respectfully submitted to readers of *Pharmacopeial Forum* and other interested parties by Eric B. Sheinin, Ph.D., USP Chief Science Officer (acting), and Scientific Liaison to the Council of Experts Executive Committee. Where appropriate, they will be incorporated into the *General Notices* section of *USP 29–NF 24* and into the *USP Guideline for Submitting Requests for Revision to USP–NF.*

Council of Experts Executive Committee Members Attending and Voting

Roger L. Williams, M.D., Chairperson; Darrell R. Abernethy, M.D., Ph.D.; Judy P. Boehlert, Ph.D.; Edward M. Cohen, Ph.D.; James E. DeMuth, Ph.D.; Thomas S. Foster, Pharm.D.; Alexander M.M. Shepherd, M.D.; Saloman Stavchansky, Ph.D.; Lynn C. Yeoman, Ph.D.; Timothy P. Wozniak, Ph.D.

Council of Experts Executive Committee Members Not in Attendance and Not Voting

Marilynn Frederiksen, M.D.; Paul Schiff, Ph.D.; Sally S. Seaver, Ph.D.

Policies Relating to Polymorphism, Degree of Hydration, Particle Size, Specific Surface Area, and Impurities

1. Differing Degrees of Solvation/Hydration

The *USP–NF* now allows the inclusion of differing degrees of hydration/solvation in a drug substance monograph. These monographs include tests, procedures, and acceptance criteria to differentiate the differently solvated materials.

Hereafter, the *USP–NF* will allow differing polymorphic forms with appropriate tests, procedures, and acceptance criteria in drug substance monographs. However, this policy will apply only when the FDA has approved, or has not given any indication that it will not approve, a new drug application for a drug product with a different polymorphic form of the active ingredient than the form used to manufacture the reference listed drug. This approach may result in multiple procedures and/or multiple acceptance criteria for a given test. It also may lead to labeling requirements differentiating the various forms.

2. Differing Impurity Profiles

The *USP–NF* now includes procedures and acceptance criteria in a drug substance monograph for multiple impurity profiles, using the flexible monograph approach. These procedures and acceptance criteria are for profiles for which safety has been evaluated by the FDA.

Hereafter, USP can publish a proposed revision to the impurities test in *Pharmacopeial Forum* even if the sponsor of the *Request for Revision* does not have FDA approval at the time, but is seeking such approval. This policy will not limit FDA's authority to approve drug products for the U.S. market. The monograph will contain a statement that it will become official upon approval of an application by FDA.

3. Unnecessary Testing

The flexible monograph policy allows for the inclusion of tests and procedures that are not applicable to all manufacturers of that article. The *General Notices* of the *USP–NF*currently allows the elimination of testing where a manufacturer knows that the material will pass if tested. However, the *General Notices*also states that an article must pass all tests to be compliant.

Hereafter, the *General Notices* will be appended to include the statement to the effect that "where an impurity test or procedure that is not applicable to all manufacturers of that article is included in a monograph, the test need not be per-

formed if the supplier of the article has demonstrated that the given impurity is not formed by or utilized in the synthetic route used for the manufacture of that article."

Hereafter, where a test or procedure that relates to the physical character of an article (such as a particle size test or specific surface area test) that is not applicable to all manufacturers of that article is included in a monograph, the monograph will indicate that the test need not be performed.

USP Policies Relating to Relative Response Factor

1. USP will use the symbol *F* consistently to designate a Relative Response Factor in General Chapters and monographs, where appropriate.
2. USP will use uniform terminology "Relative Response Factor" in all General Chapters and monographs.
3. USP will include definitions of Response Factor and Relative Response Factor in the *Glossary of Symbols* section of General Chapter *Chromatography* ⟨621⟩.
   a. The definition of Response Factor is peak response per unit mass of analyte.
   b. The definition of Relative Response Factor is ratio of the peak response of an impurity to that of an equal amount of the drug substance. That is, $F = r_i / r_U$.
4. The use of a Relative Response Factor is acceptable only if it is accurate within the linear range.
5. Relative Response Factor values are expressed to two decimal places if <1.0 and to one decimal place if ≥1.0.
6. Rounding off to 1.0 is permitted only if the Relative Response Factor is 0.8–1.2. This will be implemented prospectively only.

PQRI TO SURVEY CURRENT EXCIPIENT CONTROL PRACTICES. Later this year, probably during the second quarter, a working group of the Product Quality Research Institute (PQRI), the joint government/industry/academia research consortium, plans to separately survey U.S. pharmaceutical manufacturers, excipient producers, and excipient distributors for information regarding companies' current excipient control practices to assure excipient safety, quality, and processability. Each survey will be confidential and respondents will not be asked to identify themselves, only their area of business, e.g., finished drug manufacturer, excipient manufacturer, or distributor.

Information received will be compiled by the PQRI Executive Secretariat, and survey replies will not be reviewed by working group members, regardless of their affiliation.

It is hoped that information gathered will provide a more comprehensive view of the types of testing, compendial and noncompendial, which are currently in use throughout the different industry segments to control the chemical and physical properties of materials used in pharmaceutical manufacturing. It is anticipated that this information might be useful in connection with ongoing global harmonization efforts related to setting excipient specifications and determination of an excipient's processability.

If so, all parties involved in PQRI activities will benefit, e.g., industry groups, the USP, and the FDA.

Thus, subscribers to the *USP* are asked to watch for the forthcoming survey and to respond. As noted above, all responses will be blinded and confidential.

USP ANNUAL SCIENTIFIC MEETING, SEPTEMBER 27–30, 2005: IMPACT THE FUTURE OF PHARMACOPEIAL STANDARDS. The USP Annual Scientific Meeting will be held in the Hotel del Coronado, San Diego, California, September 27–30, 2005.

Spread the word. Tell your colleagues and register at: www.usp.org/conferences, 301-816-8134.

The USP 2005 Annual Scientific Meeting is your opportunity to directly contribute to USP's standards-setting processes. Through interaction with USP's scientific staff and Council of Experts, you will help establish standards-setting priorities for the organization and help shape the quality requirements that you must, by law, follow.

Featuring:

NEW! Analytical Validation and Verification of Compendial Methods

Learn about the new USP information in General Informational Chapter ⟨1226⟩ *Verification of Compendial Procedures.* Also includes presentations and workshops on the requirements for evolving analytical validation procedures, including spectroscopic and other physical test methods.

Biologics and Biotechnology Derived Therapies

Interactive discussion on cross-cutting, standards-setting activities currently being undertaken by USP, including validation of bioassays, development of standards for ancillary materials and international activities in biological standardization.

NEW! Dietary Supplements

Learn about the current and future impact of dietary supplement verification and new FDA regulatory initiatives on the marketplace; expansion of General Informational Chapter ⟨2030⟩, *Supplemental Information for Botanicals;* technologies for botanical classification, and identification and analysis of new/emerging/potential dietary supplement ingredients.

Excipients

Interact with USP scientific experts, FDA, industry, and academic experts to discuss the science and related issues of excipients quality, including additives, excipient functionality and its impact on formulation, and multisource excipient equivalence, as well as recent advances in the development of novel excipients.

Making *USP–NF* Work for You

Be among the first to learn about future directions and updates based on resolutions adopted at the 2005 USP Convention and through other USP initiatives.

NEW! Annual Scientific Meeting 2005 Exhibit Program

Network with your colleagues as they showcase what's new and upcoming in the industry.

WHO SHOULD ATTEND:

- USP-NF and USP Reference Standards Users
- Scientists focusing on chemistry, biologics and biotechnology, analytical validation, excipients, and dietary supplements
- Government
- Academia and association representatives
- Regulatory Affairs personnel
- R&D and QC personnel
- Lab supervisors/managers
- Compendial Affairs personnel
- Statisticians
- Technical consultants
- Healthcare practitioners

New and experienced bench chemists who want to better understand the USP process also may wish to attend the "Making *USP–NF* Work for You" track.

SCHEDULE:

Day 1—	September 27, 2005:	Registration
Day 2—	September 28, 2005:	The Annual Scientific Meeting starts with an opening session in the morning followed by Track Session I in the afternoon
Day 3—	September 29, 2005:	Track Session II (morning) and Track Session III (afternoon)
Day 4—	September 30, 2005:	Track Session IV in the morning followed by a "Town Hall" discussion. Meeting adjourns at 12:30 p.m.

Extension Services in Pharmacy at the University of Wisconsin-Madison School of Pharmacy is accredited by the Accreditation Council on Pharmacy Education (ACPE, formerly the American Council on Pharmaceutical Education) as a provider of continuing pharmaceutical education. This program is approved for 15 hours or 1.5 continuing education units (CEUs).

In order to receive credit, pharmacists will be required to complete an Annual Scientific Meeting evaluation form. In addition, pharmacists must complete a statements of credit form for continuing pharmaceutical education participation which will be mailed (by USP) within one month after the meeting. ACPE number: 073-999-05-065-L01.

ADVANCE NOTICE OF UPCOMING OFFICIAL REVISIONS TO THE *USP–NF.* In order to provide as much time as possible for industry to adopt revisions made to the compendia, upcoming official revisions to the *USP–NF* are now being announced on the USP website as soon as they are voted on to become official by the appropriate Expert Committees of the Council of Experts.

Readers are directed to the "Notices" section found in the top right corner of the USP homepage at www.usp.org. By clicking on "Upcoming Official Revisions to the *USP–NF:* Reference Standards Required But Not Available" you are taken to a page where upcoming revisions to the compendia are listed. The information posted includes the title of the item being revised, the *PF* citation where the revision was proposed, and a description of the proposal. In addition, an

e-mail link to the USP Scientific Liaison for each revision is listed in parentheses after the item. The actual content and official date of each revision will be published in either an annual edition, *Supplement,* or *Interim Revision Announcement* and the items are sorted according to the publication in which they are to appear.

In addition, readers will also find a list of new USP Reference Standards that correspond to new *USP–NF* monographs but unfortunately are not yet available. The official dates of any *USP–NF* Standards, tests, or assays that require the use of these Standards are postponed until further notice pending availability of the Standards.

USP GUIDELINE FOR SUBMITTING REQUESTS FOR REVISION TO THE *USP–NF.* We are pleased to announce the availability of the *USP Guideline for Submitting Requests for Revision to the USP–NF*. This document was developed in conjunction with the USP Council of Experts and its Expert Committees, USP staff, and the Drug Substance, Complex Actives, and Excipients Project Teams of the Prescription/Nonprescription Stakeholders Forum. This document includes information to aid submission of new monographs and revisions to existing monographs for Noncomplex Active Substances and Products, Biological and Biotech Substances and Products, Excipients, and Vaccines. It incorporates many of the concepts and suggestions included in the ICH Q3A, Q3B, Q3C, Q6A, and Q6B guidelines. These include the definition of a specification and incorporate much of the terminology of Q3A for the control of impurities. The guideline clearly defines the information needed for the USP's Council of Experts and its Expert Committees to evaluate a request for revision. The document is approximately 75 pages in length with about 25 pages of addenda and is available in PDF format from the USP website at www.usp.org. Hard copies will be provided upon request.

PHARMACOPEIAL EDUCATION COURSES. USP's Pharmacopeial Education courses offer specialized instruction for chemists, scientists, and professionals in the pharmaceutical and allied industries. USP scientists who play a key role in establishing official USP standards teach these courses and provide expert insights on the practical applications of official test procedures and best practices in using the *USP–NF* and other USP resources. The courses also give participants an opportunity to learn how to get involved in USP's standards-setting processes and the benefits of participating in standards development. Courses offered in 2005 are listed below. For more information and to register, visit www.usp.org. To discuss how USP can bring courses to a location of your choice or design a custom course package for you, call 301-816-8237, or e-mail PharmacopeialEducation@usp.org.

Calendar of Pharmacopeial Education Courses, 2005

Date	Name of Course	Location
May 18	Analytical Method Validation	USP Headquarters, Rockville, MD
July 18 and 19	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
August 12	Fundamentals of Microbiological Testing	USP Headquarters, Rockville, MD
August 17	Analytical Method Validation	USP Headquarters, Rockville, MD
August 18	Standards 100: Fundamentals of the Use of *USP–NF* and the Standards Development Process	USP Headquarters, Rockville, MD
August 19	Standards 101: Advanced Use of *USP–NF,* General Notices, and Monograph Chapters	USP Headquarters, Rockville, MD
October 19 and 20	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
December 7	Standards 100: Fundamentals of the Use of *USP–NF* and the Standards Development Process	USP Headquarters, Rockville, MD
December 8	Standards 101: Advanced Use of *USP–NF,* General Notices, and Monograph Chapters	USP Headquarters, Rockville, MD

VISIT THE USP WEB SITE AT ⟨http://www.usp.org⟩. Various resources related to Pharmacopeial standards are presented, including highlights from *PF.*

***USP–NF* AVAILABLE IN PRINT, ONLINE, AND CD.** *USP–NF,* the authoritative reference for official pharmaceutical standards is available in three convenient formats—print, online, and CD. One main edition and two *Supplements* are published each year. The current edition, *USP 28–NF 23*, is official through 2005. Starting with the *Second Supplement* to *USP 28–NF 23,* which will be available in June 2005, the *USP–NF* Online and CD versions will feature several enhancements. The

enhancements include ''My *USP–NF,*'' an exciting new option that lets subscribers customize their use of *USP–NF* by saving frequent searches, creating a unique table of contents, and using other personalization options. To order *USP–NF,* go to www.usp.org or call 1-800-227-8772 or 301-881-0666.

CHROMATOGRAPHIC REAGENTS. Official and proposed chromatographic procedures in the *USP–NF* and *Pharmacopeial Forum (PF)* refer to column reagents only by 'L', 'S', or 'G' designations. The brand names of these reagents are listed in *Chromatographic Reagents.* This book also provides an index of column manufacturers and lists alternative columns that may be used to carry out official procedures. *Chromatographic Reagents* saves chemists and scientists valuable laboratory time spent searching for the right columns to use in testing. *Chromatographic Reagents* is available in print format. The online format of the *USP–NF* includes the latest *Chromatographic Reagents*. To order *Chromatographic Reagents,* go to www.usp.org or call 1-800-227-8772 or 301-881-0666.

INTERNATIONAL CORRESPONDENCE. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows:

Technical Secretariat of the
European Pharmacopoeia Commission
B.P. 907
F 67029 Strasbourg Cedex 1
France

NAKASHIMA Nobumasa
Evaluation and Licensing Division
Pharmaceutical and Medical Safety Bureau
Ministry of Health, Labour and Welfare, Japan
Tel. +81-3-3595-2431, Fax. +81-3-3597-9535
E-mail: nakashima-nobumasa@mhlw.go.jp

HOW TO SUBMIT COMMENTS. The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. Submissions concerning a particular item that has appeared in a *PF* should be submitted to the appropriate USP scientific staff liaison identified at the end of the *Briefing* accompanying each item. To submit comments and data to a liaison, use the e-mail address and telephone numbers listed in the *Staff Directory* included in every *PF.*

Please note that *USP–NF* is being published in an annual edition with one main book and two *Supplements* a year. In addition, the following schedule will repeat every year so that users will know what to expect and become familiar with the deadlines.

Publication and Comment Schedule for *USP 28–NF 23*

Publication	Comment Deadline	Publication Date	Official Date
Main Book	May 15, 2004	November 2004	January 2005
Supplement One	October 15, 2004	February 2005	April 2005
Supplement Two	February 17, 2005	June 2005	August 2005

Publication and Comment Schedule for *USP 29–NF 24*

Publication	Comment Deadline	Publication Date	Official Date
Main Book	May 15, 2005	November 2005	January 2006
Supplement One	October 15, 2005	February 2006	April 2006
Supplement Two	February 17, 2006	June 2006	August 2006

In the future, USP anticipates including the comment submission deadline in each briefing of every revision proposal when it is published for public review and comment.

For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or FAX number 301-816-8373.

All official revisions are published in *Supplements to USP–NF* (twice yearly). Between *Supplements,* official revisions are published in *PF* in the *Interim Revision Announcement;* these revisions are also incorporated in the upcoming *Supplement.* The electronic version of *USP–NF* is updated as each *Supplement* becomes available and, therefore, contains all official text up to and including the contents of the latest *Supplement*.

PUBLICATION SCHEDULES

Publication	Publication Date	Official Date
1st Supplement	Feb. 2005	Apr. 1, 2005
PF 31(2) [Mar.–Apr. 2005]	Mar. 2005	Not Applicable
2nd IRA [published in *PF* 31(2)]	Mar. 2005	Apr. 1, 2005
PF 31(3) [May–June 2005]	May 2005	Not Applicable
3rd IRA [published in *PF* 31(3)]	May 2005	June 1, 2005
2nd Supplement	June 2005*	Aug. 1, 2005*
PF 31(4) [July–Aug. 2005]	July 2005*	Not Applicable
4th IRA [published in *PF* 31(4)]	July 2005*	Aug. 1, 2005*
PF 31(5) [Sept.–Oct. 2005]	Sept. 2005*	Not Applicable
5th IRA [published in *PF* 31(5)]	Sept. 2005*	Oct. 1, 2005*
PF 31(6) [Nov.–Dec. 2005]	Nov. 2005*	Not Applicable
6th IRA [published in *PF* 31(6)]	Nov. 2005*	Dec. 1, 2005*

* Tentative

INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- New adopted (official) revisions to the *USP–NF* that become effective before the effective date of the next *Supplement* or that were not ready for adoption by the closing date for the upcoming *Supplement*. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.

Symbols—Interim revisions are shown with new text (if any) enclosed in circles, •new text•. Text enclosed in squares, ▪new text▪, has already been adopted in a *Supplement*. Where the symbols appear together with no enclosed text, such as •• or ▪▪, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by a number that indicates the *IRA* or *Supplement* in which the revision first appeared. For example, •2 indicates that the revision was officially adopted in the *Second Interim Revision Announcement*, and ▪2S (*USP27*) indicates that the revision was officially adopted in the *Second Supplement* to *USP 27*.

Errata—At the end of the *Interim Revision Announcement* section is a list of errata and corrections to *USP 28–NF 23*. The page number indicates where the item is found in *USP–NF*. If necessary, this list will be updated with every issue of *PF*. This information will also be cumulative in the next available *Supplement*, and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

THIRD INTERIM REVISION ANNOUNCEMENT to *USP 28* and to *NF 23*

By authority of the United States Pharmacopeial Convention, Inc.
Prepared by the Council of Experts and published by the Board of Trustees

Larry L. Braden, *Chair*
USP Board of Trustees

Roger L. Williams, *Executive Vice President*
and *Chairman, USP Council of Experts*

John W. Gasper, *Director*, *Executive Secretariat*

Official June 1, 2005. **Released May 1, 2005.**

All inquiries and comments regarding *USP 28* text and *NF 23* text should be addressed to the Executive Secretariat, *USP–NF*, 12601 Twinbrook Parkway, Rockville, MD 20852.

New USP Reference Standards

The following USP Reference Standards, which were indicated in past *Supplements to USP–NF* as being not yet available, have since become available. Thus, the official date of each *USP 28* or *NF 23* standard, test, or assay requiring the use of the following Reference Standards is indicated individually in this list. (AS) indicates Authentic Substances, which are materials that have no specified use in monographs or General Chapters and are offered for the convenience of *USF–NF* users.

USP Adipic Acid RS (September 1, 2005)
USP Agnuside RS (November 1, 2005)
USP Alcohol RS (May 1, 2005)
USP Aluminum Sulfate (AS)
USP Amiodarone Hydrochloride RS (July 1, 2005)
USP Amlodipine Besylate RS (May 1, 2005)
USP Ammonium Carbonate (AS)
USP Ammonium Phosphate Dibasic (AS)
USP Ascorbyl Palmitate RS (September 1, 2005)
USP Asparagine Anhydrous RS (November 1, 2005)
USP Asparagine Monohydrate RS (November 1, 2005)
USP Bismuth Subcarbonate RS (September 1, 2005)
USP Bismuth Subgallate RS (September 1, 2005)
USP Bismuth Subnitrate RS (November 1, 2005)
USP Boric Acid (AS)
USP Buproprion Hydrochloride Related Compound B RS (November 1, 2005)
USP Calcium Acetate (AS)
USP Calcium Carbonate (AS)
USP Calcium Chloride (AS)
USP Calcium Hydroxide (AS)
USP Calcium Stearate (AS)
USP Calcium Sulfate (AS)
USP Carboxymethylcellulose Sodium RS (September 1, 2005)
USP Carprofen RS (September 1, 2005)
USP Casticin RS (November 1, 2005)

NOTICE OF POSTPONEMENT

Fexofenadine Hydrochloride and *Fexofenadine Hydrochloride Capsules*

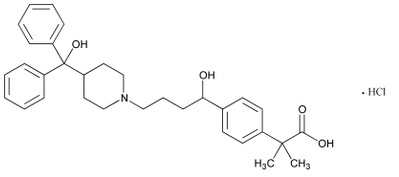
USP has **postponed indefinitely** the official dates of the *Fexofenadine Hydrochloride* and *Fexofenadine Hydrochloride Capsules* monographs, which were published in the *First Supplement* to *USP 28–NF 23* on pages 3227 and 3228 respectively. These monographs were originally slated to become official on April 1, 2005. The postponements are to provide additional time to further evaluate some of the tests, procedures, and acceptance criteria provided in the proposed monographs.

The Pharmaceutical Analysis 1 Expert Committee is presently reviewing comments received concerning these monographs. The USP intends to publish, if necessary, additional proposed revisions in a future issue of *Pharmacopeial Forum* for further public review and comment. USP proposes that these monograph revisions go forward to official text once the public comments have been considered.

Should you have any questions, please contact Karen A. Russo, Ph.D., Associate Director, Noncomplex Actives and Excipients, and liaison to the Pharmaceutical Analysis 1 Expert Committee (301-816-8379 or kar@usp.org).

Change to read:

•Fexofenadine Hydrochloride



$C_{32}H_{39}NO_4 \cdot HCl$ 538.12

Benzeneacetic acid, 4-[1-hydroxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]butyl]-α,α-dimethyl-, hydrochloride, (±)-.

(±)-*p*-[1-Hydroxy-4-[4-(hydroxydiphenylmethyl)piperidino]butyl]-α-methylhydratropic acid, hydrochloride [*138452-21-8*].

» Fexofenadine Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of $C_{32}H_{39}NO_4 \cdot HCl$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed, light-resistant containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Fexofenadine Hydrochloride RS. USP Fexofenadine Related Compound A RS. USP Fexofenadine Related Compound B RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the fexofenadine peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

C: *Differential scanning calorimetry* ⟨891⟩—Accurately weigh 2 to 6 mg of Fexofenadine Hydrochloride into an aluminum pan, and crimp the pan, using a suitable sample press. Analyze the sample from 25° to 225° at 10° per minute. The sample exhibits a single endotherm between 193° and 199°. [NOTE—The pan can be sealed hermetically, provided a pinhole is punched into the lid so that the sample can degas during heating.]

Water, *Method Ic* ⟨921⟩: not more than 0.5%.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩: 0.002%.

Specific surface area, *Method II* ⟨846⟩**—**Outgas a portion of Fexofenadine Hydrochloride, 0.2 to 0.5 g, using helium flow for 1 hour at 100° or vacuum for 1 hour at 100°. Test the sample, using gas sorption: between 2.5 and 5.0 m^2 per g is found.

Limit of fexofenadine related compound B—

Ammonium acetate buffer solution—Add 2.3 mL of glacial acetic acid to 2000 mL of water. Adjust with 6 N ammonium hydroxide to a pH of 4.0 ± 0.1.

Mobile phase—Prepare a filtered and degassed mixture of *Ammonium acetate buffer solution* and acetonitrile (80 : 20). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Add about 1.2 mg of USP Fexofenadine Related Compound B RS, accurately weighed, to a 5-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix. Transfer 2.0 mL of the solution so obtained into a 100-mL volumetric flask; add about 25 mg of USP Fexofenadine Hydrochloride RS, accurately weighed; dilute with *Mobile phase* to volume; and mix.

Standard solution—Dilute the *System suitability solution* quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 2.5 µg of USP Fexofenadine Hydrochloride RS per mL.

Test solution—Dissolve an accurately weighed quantity of Fexofenadine Hydrochloride in *Mobile phase* to obtain a solution having a concentration of about 0.25 mg per mL.

NOTICE OF POSTPONEMENT (*continued*)

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L45. The column is maintained at room temperature. The flow rate is about 0.5 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the retention time for fexofenadine is between 15 and 23 minutes; the relative retention times are about 0.7 for fexofenadine related compound B and 1.0 for fexofenadine; and the resolution, *R,* between fexofenadine and fexofenadine related compound B is not less than 3.0.

Procedure—Separately inject equal volumes (about 20 µL) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of fexofenadine related compound B in the portion of Fexofenadine Hydrochloride taken by the formula:

$$100/0.8(c_S/c_T)(r_U/r_S),$$

in which 0.8 is the relative response factor for fexofenadine related compound B relative to fexofenadine; c_S is the concentration, in mg per mL, of USP Fexofenadine Hydrochloride RS in the *Standard solution;* c_T is the concentration, in mg per mL, of fexofenadine in the *Test solution;* r_U is the peak response for fexofenadine related compound B obtained from the *Test solution;* and r_S is the peak response for fexofenadine obtained from the *Standard solution:* not more than 0.1% is found.

Related compounds—

Phosphate–perchlorate buffer, Diluting solution, Mobile phase, and *Chromatographic system*—Prepare as directed in the *Assay.*

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Reference solution—Use the *Assay preparation,* prepared as directed in the *Assay.*

Test solution—Use the *Assay stock preparation,* prepared as directed in the *Assay.*

Procedure—Separately inject equal volumes (about 20 µL) of the *Test solution,* the *Standard solution,* the *Reference solution,* and *Mobile phase* (used as the blank) into the chromatograph; record the chromatograms; and measure the peak areas, excluding the peaks corresponding to those obtained from the *Mobile phase*. Calculate the percentage of fexofenadine related compound A in the portion of Fexofenadine Hydrochloride taken by the formula:

$$100(C_S/C_T)(r_U/r_S),$$

in which C_S is the concentration, in mg per mL, of USP Fexofenadine Related Compound A RS in the *Standard solution;* C_T is the concentration, in mg per mL, of fexofenadine in the *Test solution;* and r_U and r_S are the peak responses for fexofenadine related compound A obtained from the *Test solution* and the *Standard solution,* respectively. Calculate the percentage of decarboxylated degradant [(+)-4-[1-hydroxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]-butyl]-isopropylbenzene], with a relative retention time of 3.2, in the portion of Fexofenadine Hydrochloride taken by the formula:

$$(100/1.1)(C_S/C_T)(r_U/r_S),$$

in which C_S is the concentration, in mg per mL, of USP Fexofenadine Hydrochloride RS in the *Standard solution;* C_T is the concentration, in mg per mL, of fexofenadine in the *Test solution;* r_U is the peak response of the decarboxylated degradant obtained from the *Test solution;* r_S is the peak response of fexofenadine obtained from the *Standard solution;* and 1.1 is the relative response factor for the decarboxylated degradant relative to fexofenadine. Calculate the percentage of other impurities in the portion of Fexofenadine Hydrochloride taken by the formula:

$$100(C_S/C_T)(r_i/r_S),$$

in which C_S is the concentration, in mg per mL, of fexofenadine in the *Reference solution;* C_T is the concentration, in mg per mL, of fexofenadine in the *Test solution;* r_i is the peak response for any other impurity obtained from the *Test solution;* and r_S is the peak response of fexofenadine obtained from the *Reference solution:* not more than 0.18% of fexofenadine related compound A is found; not more than 0.15% of decarboxylated degradant is found; not more than 0.1% of any other unknown impurity is found; and not more than 0.30% of total impurities is found.

Content of chloride—Dissolve about 300 mg of Fexofenadine Hydrochloride, accurately weighed, in 50 mL of methanol. Titrate with 0.1 N silver nitrate VS, and determine the endpoint potentiometrically (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N silver nitrate VS is equivalent to 3.545 mg of chloride: not less than 6.45% and not more than 6.75% of chloride is found, calculated on an anhydrous basis.

Assay—

Phosphate–perchlorate buffer—Dissolve 6.64 g of monobasic sodium phosphate and 0.84 g of sodium perchlorate in 1000 mL of water. Adjust with phosphoric acid to a pH of 2.0.

Diluting solution—Prepare a mixture of acetonitrile and *Phosphate–perchlorate buffer* (50 : 50).

Mobile phase—Prepare a filtered and degassed mixture of *Phosphate–perchlorate buffer* and acetonitrile (65 : 35). Add 3 mL of triethylamine per L, and mix. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Prepare a solution of USP Fexofenadine Hydrochloride RS and USP Fexofenadine Related Compound A RS in *Mobile phase* having known concentrations of about 0.06 mg per mL and 0.005 mg per mL, respectively.

Assay stock preparation—Transfer about 50 mg of Fexofenadine Hydrochloride, accurately weighed, to a 50-mL volumetric flask, and dissolve in and dilute with *Diluting solution* to volume to obtain a solution having a concentration of about 1.0 mg of fexofenadine hydrochloride per mL.

Assay preparation—Transfer 3.0 mL of the *Assay stock preparation* to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution having a concentration of about 0.06 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L11. The column is maintained at room temperature. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between fexofenadine and fexofenadine related compound A is not less than 10; the tailing factor is not more than 2.0; and the relative standard deviations for replicate injections determined from fexofenadine and fexofenadine related compound A are not more than 2.0% and 3.0%, respectively.

NOTICE OF POSTPONEMENT (*continued*)

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $C_{32}H_{39}NO_4 \cdot HCl$ in the portion of Fexofenadine Hydrochloride taken by the formula:

$$833.3C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Fexofenadine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses for fexofenadine obtained from the *Assay preparation* and the *Standard preparation,* respectively.●3

●(Postponed indefinitely)●3

Change to read:

●Fexofenadine Hydrochloride Capsules

» Fexofenadine Hydrochloride Capsules contain not less than 93.0 percent and not more than 105.0 percent of the labeled amount of fexofenadine hydrochloride ($C_{32}H_{39}NO_4 \cdot HCl$).

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Fexofenadine Hydrochloride RS. USP Fexofenadine Related Compound A RS.*

Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

B: *Infrared Absorption* ⟨197K⟩—

Test specimen—Empty the contents of several Capsules, equivalent to about 60 mg of fexofenadine hydrochloride, into a suitable capped tube. Add 10 mL of a mixture of acetonitrile and methanol (10 : 1), and shake until the sample is dispersed. Allow to settle. Decant, filter, and collect the supernatant in a suitable beaker. Evaporate the solvent to near dryness by using a stream of nitrogen and with gentle heating from an appropriate source (steam, low-temperature hot plate). While still warm, add 5 mL of water and 5 drops of diluted hydrochloric acid, and stir to induce precipitation. Chill in an ice bath for about 30 minutes. Pass through a 10- to 15-µm filtering crucible with fritted disk. Dry the precipitate in an air oven for 1 hour at 105°.

Dissolution ⟨711⟩**—**

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Times: 15 and 45 minutes.

Determine the amount of $C_{32}H_{39}NO_4 \cdot HCl$ dissolved by employing the following method.

Buffer solution—Dissolve 1.0 g of monobasic sodium phosphate, 0.5 g of sodium perchlorate, and 0.3 mL of phosphoric acid in 300 mL of water, and mix.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and *Buffer solution* (700 : 300), and mix. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability stock solution—[NOTE—A small amount of glacial acetic acid, not to exceed 5% of the total volume, is used, if necessary, to dissolve USP Fexofenadine Related Compound A RS.] Dissolve an accurately weighed quantity of USP Fexofenadine Related Compound A RS in water to obtain a solution having a known concentration of 0.44 mg per mL.

System suitability solution—Prepare a solution of USP Fexofenadine Hydrochloride RS in *System suitability stock solution* containing about 0.01 mg of USP Fexofenadine Related Compound A RS and 0.06 mg of USP Fexofenadine Hydrochloride RS per mL.

Standard solution—[NOTE—A small amount of methanol, not to exceed 0.5% of the total volume, is used, if necessary, to dissolve USP Fexofenadine Hydrochloride RS.] Dissolve an accurately weighed quantity of USP Fexofenadine Hydrochloride RS in water to obtain a solution having a known concentration of 0.07 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 10-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between fexofenadine and fexofenadine related compound A is not less than 2.0. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and filtered portions of the solution under test into the chromatograph, record the chromatograms, and measure the responses for the fexofenadine peaks. Calculate the quantity of $C_{32}H_{39}NO_4 \cdot HCl$ dissolved.

Tolerances—Not less than 50% *(Q)* of the labeled amount of $C_{32}H_{39}NO_4 \cdot HCl$ is dissolved in 15 minutes. Not less than 75% *(Q)* of the labeled amount of $C_{32}H_{39}NO_4 \cdot HCl$ is dissolved in 45 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Water, *Method I* ⟨921⟩**:** between 3.5% and 8.0%, the titration being performed at 50° and the titration vessel being kept in a heated water jacket.

Related compounds—

Phosphate–perchlorate buffer, Diluting solution, Mobile phase, and *Chromatographic system*—Proceed as directed in the *Assay* under *Fexofenadine Hydrochloride.*

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay* under *Fexofenadine Hydrochloride.*

Reference solution—Use the *Assay preparation,* prepared as directed in the *Assay.*

Test solution—Use the *Assay stock preparation,* prepared as directed in the *Assay.*

NOTICE OF POSTPONEMENT (*continued*)

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of fexofenadine related compound A in the portion of Capsules taken by the formula:

$$100(C_S / C_T)(r_U / r_S),$$

in which C_S is the concentration, in mg per mL, of USP Fexofenadine Related Compound A RS in the *Standard solution;* C_T is the concentration, in mg per mL, of fexofenadine in the *Test solution;* and r_U and r_S are the peak responses of fexofenadine related compound A obtained from the *Test solution* and the *Standard solution,* respectively. Calculate the percentage of decarboxylated degradant [(+)-4-[1-hydroxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]-butyl]-isopropylbenzene], with a relative retention time of 3.2, in the portion of Fexofenadine Hydrochloride taken by the formula:

$$(100/1.1)(C_S / C_T)(r_U / r_S),$$

in which 1.1 is the relative response factor for the decarboxylated degradant relative to fexofenadine; C_S is the concentration, in mg per mL, of USP Fexofenadine Hydrochloride RS in the *Standard solution;* C_T is the concentration, in mg per mL, of fexofenadine in the *Test solution;* r_U is the peak response of the decarboxylated degradant obtained from the *Test solution;* and r_S is the peak response of fexofenadine obtained from the *Standard solution*. Calculate the percentage of other impurities in the portion of Fexofenadine Hydrochloride taken by the formula:

$$100(C_R / C_T)(r_U / r_R),$$

in which C_R is the concentration, in mg per mL, of fexofenadine in the *Reference solution;* C_T is the concentration, in mg per mL, of fexofenadine in the *Test solution;* r_U is the peak response for any other impurity obtained from the *Test solution;* and r_R is the peak response of fexofenadine obtained from the *Reference solution.* Not more than 0.3% of fexofenadine related compound A, not more than 0.2% of decarboxylated degradant, and less than 0.1% of any other unknown impurity is found; not more than 0.2% total other unknown impurities, and not more than 0.5% of total impurities is found.

Assay—

Phosphate–perchlorate buffer, Diluting solution, Mobile phase, Standard preparation, and *Chromatographic system*—Proceed as directed in the *Assay* under *Fexofenadine Hydrochloride*.

Assay stock preparation—Remove, as completely as possible, the contents of not fewer than 20 Capsules, mix the combined contents, and finely powder by using a mortar and pestle. Transfer a portion of the powder, equivalent to about 50 mg of fexofenadine hydrochloride, accurately weighed, to a 50-mL volumetric flask. Add 40 mL of *Diluting solution,* and shake by mechanical means for 60 minutes. Sonicate for about 2 minutes. Allow to cool to room temperature, dilute with *Diluting solution* to volume, and mix.

Assay preparation—Transfer 3.0 mL of the *Assay stock preparation* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of fexofenadine hydrochloride ($C_{32}H_{39}NO_4 \cdot HCl$) in the portion of Capsules taken by the formula:

$$833.3C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Fexofenadine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.●3

Interim Revision Announcement

NOTICE OF POSTPONEMENT

Helium, Nitrous Oxide, Nitrogen, and *Nitrogen 97 Percent*

USP has **postponed indefinitely** the official dates of the revisions to the *Helium, Nitrous Oxide, Nitrogen,* and *Nitrogen 97 Percent* monographs, which were published in the *First Supplement* to *USP 28–NF 23* on pages 3245, 3264, 3359, and 3359, respectively. These revisions were originally slated to become official on April 1, 2005. The postponements are due to the unavailability of the following USP Reference Standards:

(1) USP Air–Helium RS
(2) USP Nitrogen RS
(3) USP Oxygen–Helium RS
(4) USP Nitrous Oxide RS
(5) USP Nitrogen 97 Percent RS

These postponements are in accordance with the Rules and Procedures of the Council of Experts that state:

> *"Where a new reference standard is required in a new monograph or in a revision of an existing monograph but is not yet available, the official date of any portion of the monograph utilizing such reference standard shall be postponed until such reference standard is available. During the period of such unavailability, the Chairperson of the Council of Experts shall publish the name of such reference standards and indicate that it is not yet available. Subsequently, the availability of the reference standards shall be announced and the effective date of the postponed portion(s) of the monograph shall be announced."*

Should you have any questions, please contact Khakashan Zaidi, Ph.D., Scientist, General Policies and Requirements Division and liaison to the Aerosols Expert Committee (301-816-8379 or kxz@usp.org).

Helium

Change to read:

•**USP Reference standards** ⟨11⟩—*USP Air–Helium RS.*•

•(Postponed indefinitely)•

Change to read:

Assay—Introduce a specimen of Helium into a gas chromatograph by means of a gas sampling valve. Select the operating conditions of the gas chromatograph such that the standard peak signal resulting from the following procedure corresponds to not less than 70% of the full-scale reading. Preferably, use an apparatus corresponding to the general type in which the column is 6 m in length and 4 mm in inside diameter and is packed with porous polymer beads, which permits complete separation of nitrogen and oxygen from Helium, although the nitrogen and oxygen may not be separated from each other. Use industrial grade helium (99.99%) as the carrier gas, with a thermal-conductivity detector, and control the column temperature: the peak response produced by the assay specimen exhibits a retention time corresponding to that produced by •USP Air–Helium RS,• and indicates not more than 1.0% of air when compared to the peak response of the •USP Air–Helium RS,• and not less than 99.0%, by volume, of He.

•(Postponed indefinitely)•

Nitrous Oxide

Change to read:

•**USP Reference standards** ⟨11⟩—*USP Air–Helium RS. USP Nitrous Oxide RS.*•

•(Postponed indefinitely)•

NOTICE OF POSTPONEMENT *(continued)*

Change to read:

Identification—

A: With the container temperatures the same and maintained between 15° and 25°, concomitantly read the pressure of the Nitrous Oxide container and of a container of •USP Nitrous Oxide RS.•$_{3}$ [NOTE—Do not use the •USP Nitrous Oxide RS•$_{3}$ if it has been depleted to less than half of its full capacity.] The pressure of the Nitrous Oxide container is within 50 psi of that of the •USP Nitrous Oxide RS.•$_{3}$

B: Pass 100 ± 5 mL released from the vapor phase of the contents of the Nitrous Oxide container through a carbon dioxide detector tube at the rate specified for the tube: no color change is observed *(distinction from carbon dioxide).*

C: Collect about 100 mL of the gas under test in a 100-mL tube fitted at the top with a stopcock. Open the stopcock, and quickly add a freshly prepared solution of 500 mg of pyrogallol in 2 mL of water and a freshly prepared solution of 12 g of potassium hydroxide in 8 mL of water. Immediately close the stopcock, and mix: the gas is not absorbed, and the solution does not become brown *(distinction from oxygen).*

•D: Prepare a gas chromatograph as directed in the *Assay,* and inject USP Nitrous Oxide RS and a sample of Nitrous Oxide into the gas chromatograph. The retention time of the major peak in the chromatogram of the Nitrous Oxide sample corresponds to that in the chromatogram of the USP Nitrous Oxide RS.•$_{3}$

•(Postponed indefinitely)•$_{3}$

Change to read:

Assay—Introduce a specimen of Nitrous Oxide taken from the liquid phase, as directed in the test for *Nitrogen dioxide,* into a gas chromatograph by means of a gas-sampling valve. Select the operating conditions of the gas chromatograph such that the peak response resulting from the following procedure corresponds to not less than 70% of the full-scale reading. Preferably, use an apparatus corresponding to the general type in which the column is 6 m in length and 4 mm in inside diameter and is packed with porous polymer beads, which permits complete separation of N_2 and O_2 from N_2O, although the N_2 and O_2 may not be separated from each other. Use industrial grade helium (99.99%) as the carrier gas, with a thermal-conductivity detector, and control the column temperature: the peak response produced by the assay specimen exhibits a retention time corresponding to that produced by •USP Air–Helium RS,•$_{3}$ and is equivalent to not more than 1.0% of air when compared to the peak response of the •USP Air–Helium RS,•$_{3}$ indicating not less than 99.0%, by volume, of N_2O.

MONOGRAPHS (USP)

Butabarbital Sodium Tablets

Change to read:

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

•*Acid–methanol mixture*—Prepare a mixture of methanol and 1 N hydrochloric acid (9 : 1).

Standard preparation—Dissolve an accurately weighed quantity of USP Butabarbital RS in *Acid–methanol mixture* to obtain a solution having a known concentration of about 0.45 mg per mL.•

Test preparation—Transfer 1 finely powdered Tablet to a 25-mL volumetric flask, •add *Acid–methanol mixture* to volume, and mix. Filter, discarding the first 5 mL of the filtrate, and dilute the subsequent filtrate quantitatively and stepwise if necessary, with *Acid–methanol mixture* to obtain a solution containing 0.5 to 0.6 mg of butabarbital sodium per mL.•

Procedure—•Transfer 2.0 mL each of the *Standard preparation* and the *Test preparation* to separate 100-mL volumetric flasks, and transfer 2.0 mL of *Acid–methanol mixture* to a third volumetric flask to provide a blank. Dilute each flask with pH 9.6 alkaline borate buffer (see under *Solutions* in the section *Reagents, Indicators, and Solutions*), and mix. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 240 nm, with a suitable spectrophotometer, using the blank to set the instrument.• Calculate the quantity, in mg, of $C_{10}H_{15}N_2NaO_3$ in the Tablet •taken• by the formula:

$$•(234.23/212.25)/(TC/D)(A_U/A_S)•$$

in which 234.23 and 212.25 are the molecular weights of butabarbital sodium and butabarbital, respectively; T is the labeled quantity, in mg, of butabarbital sodium in the Tablet; C is the concentration, in •mg• per mL, of USP Butabarbital RS in the *Standard preparation; D* is the concentration, in •mg• per mL, of butabarbital sodium in the *Test preparation,* based upon the labeled quantity per Tablet and the extent of dilution; and A_U and A_S are the absorbances of the solutions from the *Test preparation* and the *Standard preparation,* respectively.

Chondroitin Sulfate Sodium Tablets

Change to read:

Labeling—Label it to indicate the species of the source from which the chondroitin used to prepare the Tablets was derived. •Label it to state the source(s) of chondroitin sulfate sodium, whether bovine, porcine, avian, or a mixture of any of them. The label states on the front panel the content of chondroitin sulfate sodium on the dried basis.•

Glucosamine and Chondroitin Sulfate Sodium Tablets

Change to read:

Labeling—The label indicates the types of glucosamine salts contained in the article and the species source from which chondroitin was derived. •Label it to state the source(s) of chondroitin sulfate sodium, whether bovine, porcine, avian, or a mixture of any of them. The label states on the front panel the content of chondroitin sulfate sodium on the dried basis.•

Levothyroxine Sodium Tablets

Change to read:

Dissolution ⟨711⟩**—**[NOTE—All containers that are in contact with solutions containing levothyroxine sodium are to be made of glass.▲*USP28*]

TEST 1—

Medium: 0.01 N hydrochloric acid containing 0.2% sodium lauryl sulfate; 500 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Determine the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of methanol and 0.1% phosphoric acid (60 : 40). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Prepare a stock solution of USP Levothyroxine RS in methanol having a known concentration of about 0.1 mg per mL. Dilute this stock solution with *Medium* to obtain a solution having a concentration similar to that expected in the *Test solution*.

Test solution—[NOTE—Prior to use, check the filters for absorptive loss of drug.] Use a filtered portion of the solution under test.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5; and the relative standard deviation is not more than 4.0%.

Procedure—Separately inject equal volumes (about 800 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved.

Tolerances—Not less than 70% *(Q)* of the labeled amount of $C_{15}H_{10}I_4NNaO_4$ is dissolved in 45 minutes.

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

Medium, Apparatus, Mobile phase, Standard solution, Test solution, Chromatographic system, and *Procedure*—Proceed as directed for *Test 1.*

Time: 15 minutes.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{15}H_{10}I_4NNaO_4$ is dissolved in 15 minutes.

•TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium, Apparatus, Time, Standard solution, and *Test solution*—Proceed as directed for *Test 1*. [NOTE—Filter the *Standard solution* in a manner identical to the *Test solution*.]

Interim Revision Announcement

Determine the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (65 : 35) with 0.5 mL of phosphoric acid per L. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L10. The column temperature is maintained at 30°. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5; and the relative standard deviation is not more than 4.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of $C_{15}H_{10}I_4NNaO_4$.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{15}H_{10}I_4NNaO_4$ is dissolved in 45 minutes.●3

TEST 4—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4.*

▲NOTE—Do not use paddle stirrers with synthetic coating.▲*USP28*

Medium: 0.01 N hydrochloric acid; 500 mL for Tablets labeled to contain between 25 µg and 175 µg of levothyroxine sodium; 900 mL for Tablets labeled to contain 200 µg or 300 µg of levothyroxine sodium.

Apparatus 2: 75 rpm.

Time: 45 minutes.

Determine the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and 85% orthophosphoric acid (700 : 500 : 2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Prepare a stock solution by transferring about 100 mg of USP Levothyroxine RS, accurately weighed, to a 100-mL volumetric flask. Add 80 mL of alcohol and 1 mL of 1 N hydrochloric acid, sonicate for about 2 minutes, dilute with alcohol to volume, and mix. Dilute this stock solution with a mixture of alcohol and water (1 : 1) to obtain a solution having a concentration of 0.01 mg of levothyroxine per mL. Dilute this intermediate solution with *Medium* to obtain a solution having a concentration similar to that expected in the *Test solution.*

Test solution—Use a centrifuged portion of the solution under test.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 225-nm detector and a 4.0-mm × 12.5-cm column that contains packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5; and the relative standard deviation is not more than 4.0%.

Procedure—Separately inject equal volumes (about 500 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of $C_{15}H_{10}I_4NNaO_4$.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{15}H_{10}I_4NNaO_4$ is dissolved in 45 minutes.

Interim Revision Announcement

IN-PROCESS REVISION

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) items that previously appeared under *Pharmacopeial Previews* and are now formally proposed as revisions, (2) proposed revisions placed directly under *In-Process Revision,* or (3) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the staff liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

BRIEFING

> **Name of Item**, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How to Use PF*), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
>
> (PA5: K. Russo) RTS—55678-1

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type, as shown in the examples below:

•new text•

if slated for an *Interim Revision Announcement to USP 28–NF 23* (*IRA*);

▲new text▲*USP29*

if slated for *USP 29–NF 24*; and

■new text■

if slated for a *Supplement to USP–NF*. The same symbols *not* set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as •• or ■■ or ▲▲, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •2 indicates that the revision is proposed for the *Second Interim Revision Announcement*, ■2S (*USP 28*) indicates that the proposed revision is slated for the *Second Supplement to USP 28*, and ▲*USP29* and ▲*NF24* indicate that the revisions are proposed for *USP 29* and *NF 24*, respectively.

Official Title Changes Where the specification ***"Monograph title change"*** is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

BRIEFING

General Notices and Requirements, *USP 28* page 1, page 3208 of the *First Supplement,* and page 1571 of *PF* 30(5) [Sept.–Oct. 2004]. In the *Storage Temperature and Humidity* section, it is proposed to add a definition of *Controlled Cold Temperature* that will allow calculation of the mean kinetic temperature (MKT) at the cold temperature range in consideration of the storage, shipping, and distribution of pharmaceutical articles. A sample calculation of MKT is presented in general chapter *Pharmaceutical Calculations in Prescription Compounding* ⟨1160⟩. The definition for *Controlled Cold Temperature* becomes an overarching definition that envelops the cold temperature definition, creating a continuum of temperature that allows excursions of temperature experienced during storage, shipping, and distribution.

(PSD: C. Okeke) RTS—42329-1

Change to read:

TESTS AND ASSAYS

Apparatus—A specification for a definite size or type of container or apparatus in a test or assay is given solely as a recommendation. Where volumetric flasks or other exact measuring, weighing, or sorting devices are specified, this or other equipment of at least equivalent accuracy shall be employed. (See also *Thermometers* ⟨21⟩, *Volumetric Apparatus* ⟨31⟩, and *Weights and Balances* ⟨41⟩.) Where low-actinic or light-resistant containers are specified, clear containers that have been rendered opaque by application of a suitable coating or wrapping may be used.

Where an instrument for physical measurement, such as a spectrophotometer, is specified in a test or assay by its distinctive name, another instrument of equivalent or greater sensitivity and accuracy may be used. In order to obtain solutions having concentrations that are adaptable to the working range of the instrument being used, solutions of proportionately higher or lower concentrations may be prepared according to the solvents and proportions thereof that are specified for the procedure.

Where a particular brand or source of a material, instrument, or piece of equipment, or the name and address of a manufacturer or distributor, is mentioned (ordinarily in a footnote), this identification is furnished solely for informational purposes as a matter of convenience, without implication of approval, endorsement, or certification. Items capable of equal or better performance may be used if these characteristics have been validated.

Where the use of a centrifuge is indicated, unless otherwise specified, the directions are predicated upon the use of apparatus having an effective radius of about 20 cm (8 inches) and driven at a speed sufficient to clarify the supernatant layer within 15 minutes.

Unless otherwise specified, for chromatographic tubes and columns the diameter specified refers to internal diameter (ID); for other types of tubes and tubing the diameter specified refers to outside diameter (OD).

Steam Bath—Where the use of a steam bath is directed, exposure to actively flowing steam or to another form of regulated heat, corresponding in temperature to that of flowing steam, may be used.

Water Bath—Where the use of a water bath is directed without qualification with respect to temperature, a bath of vigorously boiling water is intended.

Foreign Substances and Impurities—Tests for the presence of foreign substances and impurities are provided to limit such substances to amounts that are unobjectionable under conditions in which the article is customarily employed (see also *Impurities in Official Articles* ⟨1086⟩).

Although one of the primary objectives of the Pharmacopeia is to assure the user of official articles of their identity, strength, quality, and purity, it is manifestly impossible to include in each monograph a test for every impurity, contaminant, or adulterant that might be present, including microbial contamination. These may arise from a change in the source of material or from a change in the processing, or may be introduced from extraneous sources. Tests suitable for detecting such occurrences, the presence of which is inconsistent with applicable good manufacturing practice or good pharmaceutical practice, should be employed in addition to the tests provided in the individual monograph.

Other Impurities—Official substances may be obtained from more than one process, and thus may contain impurities not considered during preparation of monograph assays or tests. Wherever a monograph includes a chromatographic assay or purity test based on chromatography, other than a test for ~~organic volatile impurities,~~

■residual solvents,■1S *(USP29)*

and that monograph does not detect such an impurity, solvents excepted, the impurity shall have its amount and identity, where both are known, stated under the heading *Other Impurity*(*ies*) by the labeling (certificate of analysis) of the official substance.

The presence of any unlabeled impurity in an official substance is a variance from the standard if the content is 0.1% or greater. Tests suitable for detection and quantitating unlabeled impurities, when present as the result of process change or other identifiable, consistent occurrence, shall be submitted to the USP for inclusion in the individual monograph. Otherwise, the impurity shall be identified, preferably by name, and the amount listed under the heading *Other Impurity(ies)* in the labeling (certificate of analysis) of the official substance. The sum of all *Other Impurities* combined with the monograph-detected impurities does not exceed 2.0% (see *Ordinary Impurities* ⟨466⟩), unless otherwise stated in the monograph.

Categories of drug substances excluded from *Other Impurities* requirements are fermentation products and semisynthetics derived therefrom, radiopharmaceuticals, biologics, biotechnology-derived products, peptides, herbals, and crude products of animal or plant origin. Any substance known to be toxic must not be listed under *Other Impurities*.

■**Residual Solvents—**The requirements are stated in *Organic Volatile Impurities* ⟨467⟩ together with information in *Impurities in Official Articles* ⟨1086⟩. Thus all drug substances, excipients, and products are subject to relevant control of residual solvents, even when no test is specified in the individual monograph. The requirements have been aligned with the ICH guideline on this topic. If solvents are used during production, they are of suitable quality. In addition, the toxicity and residual level of each solvent are taken into consideration, and the solvents are limited according to the

In-Process Revision

principles defined and the requirements specified in *Organic Volatile Impurities* ⟨467⟩, using the general methods presented therein or other suitable methods. [NOTE—*Residual Solvents* to become official January 1, 2007.]■2S (*USP28*)

Procedures—Assay and test procedures are provided for determining compliance with the Pharmacopeial standards of identity, strength, quality, and purity.

In performing the assay or test procedures in this Pharmacopeia, it is expected that safe laboratory practices will be followed. This includes the use of precautionary measures, protective equipment, and work practices consistent with the chemicals and procedures used. Prior to undertaking any assay or procedure described in this Pharmacopeia, the individual should be aware of the hazards associated with the chemicals and the procedures and means of protecting against them. This Pharmacopeia is not designed to describe such hazards or protective measures.

Every compendial article in commerce shall be so constituted that when examined in accordance with these assay and test procedures, it meets all the requirements in the monograph defining it. However, it is not to be inferred that application of every analytical procedure in the monograph to samples from every production batch is necessarily a prerequisite for ensuring compliance with Pharmacopeial standards before the batch is released for distribution. Data derived from manufacturing *process validation* studies and from *in-process controls* may provide greater assurance that a batch meets a particular monograph requirement than analytical data derived from an examination of finished units drawn from that batch. On the basis of such assurances, the analytical procedures in the monograph may be omitted by the manufacturer in judging compliance of the batch with the Pharmacopeial standards.

Automated procedures employing the same basic chemistry as those assay and test procedures given in the monograph are recognized as being equivalent in their suitability for determining compliance. Conversely, where an automated procedure is given in the monograph, manual procedures employing the same basic chemistry are recognized as being equivalent in their suitability for determining compliance. Compliance may be determined also by the use of alternative methods, chosen for advantages in accuracy, sensitivity, precision, selectivity, or adaptability to automation or computerized data reduction or in other special circumstances. Such alternative or automated procedures or methods shall be validated. However, Pharmacopeial standards and procedures are interrelated; therefore, where a difference appears or in the event of dispute, only the result obtained by the procedure given in this Pharmacopeia is conclusive.

In the performance of assay or test procedures, not fewer than the specified number of dosage units should be taken for analysis. Proportionately larger or smaller quantities than the specified weights and volumes of assay or test substances and Reference Standards may be taken, provided the measurement is made with at least equivalent accuracy and provided that any subsequent steps, such as dilutions, are adjusted accordingly to yield concentrations equivalent to those specified and are made in such manner as to provide at least equivalent accuracy. To minimize environmental impact or contact with hazardous materials, apparatus and chemicals specified in Pharmacopeial procedures also may be proportionally changed.

Where it is directed in an assay or a test that a certain quantity of substance or a counted number of dosage units is to be examined, the specified quantity or number is a minimal figure (the singlet determination) chosen only for convenience of analytical manipulation; it is not intended to restrict the total quantity of substance or number of units that may be subjected to the assay or test or that should be tested in accordance with good manufacturing practices.

Where it is directed in the assay of Tablets to "weigh and finely powder not fewer than" a given number, usually 20, of the Tablets, it is intended that a counted number of Tablets shall be weighed and reduced to a powder. The portion of the powdered Tablets taken for assay is representative of the whole Tablets and is, in turn, weighed accurately. The result of the assay is then related to the amount of active ingredient per Tablet by multiplying this result by the average Tablet weight and dividing by the weight of the portion taken for the assay.

Similarly, where it is directed in the assay of Capsules to remove, as completely as possible, the contents of not fewer than a given number, usually 20, of the Capsules, it is intended that a counted number of Capsules should be carefully opened and the contents quantitatively removed, combined, mixed, and weighed accurately. The portion of mixed Capsules contents taken for the assay is representative of the contents of the Capsules and is, in turn, weighed accurately. The result of the assay is then related to the amount of active ingredient per Capsule by multiplying this result by the average weight of Capsule content and dividing by the weight of the portion taken for the assay.

Where the definition in a monograph states the tolerances as being "calculated on the dried (or anhydrous or ignited) basis," the directions for drying or igniting the sample prior to assaying are generally omitted from the *Assay* procedure. Assay and test procedures may be performed on the undried or unignited substance and the results calculated on the dried, anhydrous, or ignited basis, provided a test for *Loss on drying,* or *Water,* or *Loss on ignition,* respectively, is given in the monograph. ■Results are calculated on an "as-is" basis unless otherwise specified in the monograph.■1S (*USP28*) Where the presence of moisture or other volatile material may interfere with the procedure, previous drying of the substance is specified in the individual monograph and is obligatory.

Throughout a monograph that includes a test for *Loss on drying* or *Water,* the expression "previously dried" without qualification signifies that the substance is to be dried as directed under *Loss on drying* or *Water* (gravimetric determination).

Unless otherwise directed in the test or assay in the individual monograph or in a general chapter, USP Reference Standards are to be dried before use, or used without prior drying, specifically in accordance with the instructions given in the chapter *USP Reference Standards* ⟨11⟩, and on the label of the Reference Standard. Where the label instructions differ in detail from those in the chapter, the label text is determinative.

In stating the appropriate quantities to be taken for assays and tests, the use of the word "about" indicates a quantity within 10% of the specified weight or volume. However, the weight or volume taken is accurately determined, and the calculated result is based upon the exact amount taken. The same tolerance applies to specified dimensions.

Where the use of a pipet is directed for measuring a specimen or an aliquot in conducting a test or an assay, the pipet conforms to the standards set forth under *Volumetric Apparatus* ⟨31⟩, and is to be used in such manner that the error does not exceed the limit stated for a pipet of its size. Where a pipet is specified, a suitable buret, conforming to the standards set forth under *Volumetric Apparatus* ⟨31⟩, may be substituted. Where a "to contain" pipet is specified, a suitable volumetric flask may be substituted.

Expressions such as "25.0 mL" and "25.0 mg," used with respect to volumetric or gravimetric measurements, indicate that the quantity is to be "accurately measured" or "accurately weighed" within the limits stated under *Volumetric Apparatus* ⟨31⟩ or under *Weights and Balances* ⟨41⟩.

The term "transfer" is used generally to specify a quantitative manipulation.

The term "concomitantly," used in such expressions as "concomitantly determine" or "concomitantly measured," in directions for assays and tests, is intended to denote that the determinations or

measurements are to be performed in immediate succession. See also *Use of Reference Standards* under *Spectrophotometry and Light-Scattering* ⟨851⟩.

Blank Determination—Where it is directed that "any necessary correction" be made by a blank determination, the determination is to be conducted using the same quantities of the same reagents treated in the same manner as the solution or mixture containing the portion of the substance under assay or test, but with the substance itself omitted.

Desiccator—The expression "in a desiccator" specifies the use of a tightly closed container of suitable size and design that maintains an atmosphere of low moisture content by means of silica gel or other suitable desiccant.

A "vacuum desiccator" is one that maintains the low-moisture atmosphere at a reduced pressure of not more than 20 mm of mercury or at the pressure designated in the individual monograph.

Dilution—Where it is directed that a solution be diluted "quantitatively and stepwise," an accurately measured portion is to be diluted by adding water or other solvent, in the proportion indicated, in one or more steps. The choice of apparatus to be used should take into account the relatively larger errors generally associated with using small-volume volumetric apparatus (see *Volumetric Apparatus* ⟨31⟩).

Drying to Constant Weight—The specification "dried to constant weight" means that the drying shall be continued until two consecutive weighings do not differ by more than 0.50 mg per g of substance taken, the second weighing following an additional hour of drying.

Filtration—Where it is directed to "filter," without further qualification, the intent is that the liquid be filtered through suitable filter paper or equivalent device until the filtrate is clear.

Identification Tests—The Pharmacopeial tests headed *Identification* are provided as an aid in verifying the identity of articles as they are purported to be, such as those taken from labeled containers. Such tests, however specific, are not necessarily sufficient to establish proof of identity; but failure of an article taken from a labeled container to meet the requirements of a prescribed identification test indicates that the article may be mislabeled. Other tests and specifications in the monograph often contribute to establishing or confirming the identity of the article under examination.

Ignition to Constant Weight—The specification "ignite to constant weight" means that the ignition shall be continued, at $800 \pm 25^{\circ}$ unless otherwise indicated, until two consecutive weighings do not differ by more than 0.50 mg per g of substance taken, the second weighing following an additional 15-minute ignition period.

Indicators—Where the use of a test solution ("TS") as an indicator is specified in a test or an assay, approximately 0.2 mL, or 3 drops, of the solution shall be added, unless otherwise directed.

Logarithms—Logarithms used in the assays are to the base 10.

Microbial Strains—Where a microbial strain is cited and identified by its ATCC catalog number, the specified strain shall be used directly or, if subcultured, shall be used not more than five passages removed from the original strain.

Negligible—This term indicates a quantity not exceeding 0.50 mg.

Odor—Terms such as "odorless," "practically odorless," "a faint characteristic odor," or variations thereof, apply to examination, after exposure to the air for 15 minutes, either of a freshly opened package of the article (for packages containing not more than 25 g) or (for larger packages) of a portion of about 25 g of the article that has been removed from its package to an open evaporating dish of about 100-mL capacity. An odor designation is descriptive only and is not to be regarded as a standard of purity for a particular lot of an article.

Pressure Measurements—The term "mm of mercury" used with respect to measurements of blood pressure, pressure within an apparatus, or atmospheric pressure refers to the use of a suitable manometer or barometer calibrated in terms of the pressure exerted by a column of mercury of the stated height.

Solutions—Unless otherwise specified in the individual monograph, all solutions called for in tests and assays are prepared with *Purified Water.*

An expression such as "(1 in 10)" means that 1 part *by volume* of a liquid is to be diluted with, or 1 part *by weight* of a solid is to be dissolved in, sufficient of the diluent or solvent to make the volume of the finished solution 10 parts *by volume.*

An expression such as "(20 : 5 : 2)" means that the respective numbers of parts, by volume, of the designated liquids are to be mixed, unless otherwise indicated.

The notation "VS" after a specified volumetric solution indicates that such solution is standardized in accordance with directions given in the individual monograph or under *Volumetric Solutions* in the section *Reagents, Indicators, and Solutions,* and is thus differentiated from solutions of approximate normality or molarity.

Where a standardized solution of a specific concentration is called for in a test or an assay, a solution of other normality or molarity may be used, provided allowance is made for the difference in concentration and provided the error of measurement is not increased thereby.

Specific Gravity—Unless otherwise stated, the specific gravity basis is $25^{\circ}/25^{\circ}$, i.e., the ratio of the weight of a substance in air at 25° to the weight of an equal volume of water at the same temperature.

Temperatures—Unless otherwise specified, all temperatures in this Pharmacopeia are expressed in centigrade (Celsius) degrees, and all measurements are made at 25°. Where moderate heat is specified, any temperature not higher than 45° (113° F) is indicated. See *Storage Temperature* under *Preservation, Packaging, Storage, and Labeling* for other definitions.

Time Limit—In the conduct of tests and assays, 5 minutes shall be allowed for the reaction to take place unless otherwise specified.

Vacuum—The term "in vacuum" denotes exposure to a pressure of less than 20 mm of mercury unless otherwise indicated.

Where drying in vacuum over a desiccant is directed in the individual monograph, a vacuum desiccator or a vacuum drying pistol, or other suitable vacuum drying apparatus, is to be used.

Water—Where water is called for in tests and assays, *Purified Water* is to be used unless otherwise specified. For special kinds of water such as "carbon dioxide–free water," see the introduction to the section *Reagents, Indicators, and Solutions*. For *High-Purity Water* see *Containers* ⟨661⟩.

Water and Loss on Drying—Where the water of hydration or adsorbed water of a Pharmacopeial article is determined by the titrimetric method, the test is generally given under the heading *Water.* Monograph limits expressed as a percentage are figured on a weight/weight basis unless otherwise specified. Where the determination is made by drying under specified conditions, the test is generally given under the heading *Loss on drying.* However, *Loss on drying* is most often given as the heading where the loss in weight is known to represent residual volatile constituents, including organic solvents as well as water.

Test Results, Statistics, and Standards—Interpretation of results from official tests and assays requires an understanding of the nature and style of compendial standards, in addition to an understanding of the scientific and mathematical aspects of laboratory analysis and quality assurance for analytical laboratories.

Confusion of compendial standards with release tests and with statistical sampling plans occasionally occurs. Compendial standards define what is an acceptable article and give test procedures that demonstrate that the article is in compliance. These standards apply at any time in the life of the article from production to consumption. The manufacturer's release specifications, and compli-

In-Process Revision

ance with good manufacturing practices generally, are developed and followed to ensure that the article will indeed comply with compendial standards until its expiration date, when stored as directed. Thus, when tested from the viewpoint of commercial or regulatory compliance, any specimen tested as directed in the monograph for that article shall comply.

Tests and assays in this Pharmacopeia prescribe operation on a single specimen, that is, the singlet determination, which is the minimum sample on which the attributes of a compendial article should be measured. Some tests, such as those for *Dissolution* and *Uniformity of dosage units,* require multiple dosage units in conjunction with a decision scheme. These tests, albeit using a number of dosage units, are in fact the singlet determinations of those particular attributes of the specimen. These procedures should not be confused with statistical sampling plans. Repeats, replicates, statistical rejection of outliers, or extrapolations of results to larger populations are neither specified nor proscribed by the compendia; such decisions are dependent on the objectives of the testing. Commercial or regulatory compliance testing, or manufacturer's release testing, may or may not require examination of additional specimens, in accordance with predetermined guidelines or sampling strategies. Treatments of data handling are available from organizations such as ISO, IUPAC, and AOAC.

Where the *Content Uniformity* determinations have been made using the same procedure specified in the *Assay,* the average of all of the individual *Content Uniformity* determinations may be used as the *Assay* value.

Description—Information on the "description" pertaining to an article, which is relatively general in nature, is provided in the reference table *Description and Relative Solubility of USP and NF Articles* in this Pharmacopeia for those who use, prepare, and dispense drugs and/or related articles, solely to indicate properties of an article complying with monograph standards. The properties are not in themselves standards or tests for purity even though they may indirectly assist in the preliminary evaluation of an article.

Solubility—The statements concerning solubilities given in the reference table *Description and Relative Solubility of USP and NF Articles* for Pharmacopeial articles are not standards or tests for purity but are provided primarily as information for those who use, prepare, and dispense drugs and/or related articles. Only where a quantitative solubility test is given, and is designated as such, is it a test for purity.

The approximate solubilities of Pharmacopeial substances are indicated by the descriptive terms in the accompanying table.

Descriptive Term	Parts of Solvent Required for 1 Part of Solute
Very soluble	Less than 1
Freely soluble	From 1 to 10
Soluble	From 10 to 30
Sparingly soluble	From 30 to 100
Slightly soluble	From 100 to 1000
Very slightly soluble	From 1000 to 10,000
Practically insoluble, or Insoluble	Greater than or equal to 10,000

Soluble Pharmacopeial articles, when brought into solution, may show traces of physical impurities, such as minute fragments of filter paper, fibers, and other particulate matter, unless limited or excluded by definite tests or other specifications in the individual monographs.

Interchangeable Methods—Certain general chapters contain a statement that the text in question is harmonized with the corresponding text of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia* and that these texts are interchangeable. Therefore, if a substance or preparation is found to comply with a requirement using an interchangeable method from one of these pharmacopeias, it should comply with the requirements of the *United States Pharmacopeia.* However, where a difference appears, or in the event of dispute, only the result obtained by the procedure given in this Pharmacopeia is conclusive.

Change to read:

PRESERVATION, PACKAGING, STORAGE, AND LABELING

Containers—The *container* is that which holds the article and is or may be in direct contact with the article. The *immediate container* is that which is in direct contact with the article at all times. The *closure* is a part of the container.

Prior to being filled, the container should be clean. Special precautions and cleaning procedures may be necessary to ensure that each container is clean and that extraneous matter is not introduced into or onto the article.

The container does not interact physically or chemically with the article placed in it so as to alter the strength, quality, or purity of the article beyond the official requirements.

The Pharmacopeial requirements for the use of specified containers apply also to articles as packaged by the pharmacist or other dispenser, unless otherwise indicated in the individual monograph.

Tamper-Evident Packaging —The container or individual carton of a sterile article intended for ophthalmic or otic use, except where extemporaneously compounded for immediate dispensing on prescription, shall be so sealed that the contents cannot be used without obvious destruction of the seal.

Articles intended for sale without prescription are also required to comply with the tamper-evident packaging and labeling requirements of the FDA where applicable.

Preferably, the immediate container and/or the outer container or protective packaging used by a manufacturer or distributor for all dosage forms that are not specifically exempt is designed so as to show evidence of any tampering with the contents.

Light-Resistant Container (see *Light Transmission* under *Containers* ⟨661⟩)—A light-resistant container protects the contents from the effects of light by virtue of the specific properties of the material of which it is composed, including any coating applied to it. Alternatively, a clear and colorless or a translucent container may be made light-resistant by means of an opaque covering, in which case the label of the container bears a statement that the opaque covering is needed until the contents are to be used or administered. Where it is directed to "protect from light" in an individual monograph, preservation in a light-resistant container is intended.

Where an article is required to be packaged in a light-resistant container, and if the container is made light-resistant by means of an opaque covering, a single-use, unit-dose container or mnemonic pack for dispensing may not be removed from the outer opaque covering prior to dispensing.

Well-Closed Container—A well-closed container protects the contents from extraneous solids and from loss of the article under the ordinary or customary conditions of handling, shipment, storage, and distribution.

Tight Container—A tight container protects the contents from contamination by extraneous liquids, solids, or vapors; from loss of the article; and from efflorescence, deliquescence, or evaporation under the ordinary or customary conditions of handling, shipment, storage, and distribution; and is capable of tight reclosure. Where a tight container is specified, it may be replaced by a hermetic container for a single dose of an article.

A gas cylinder is a metallic container designed to hold a gas under pressure. As a safety measure, for carbon dioxide, cyclopropane, helium, nitrous oxide, and oxygen, the Pin-Index Safety System of matched fittings is recommended for cylinders of Size E or smaller.

NOTE—Where packaging and storage in a *tight container* or a *well-closed container* is specified in the individual monograph, the container used for an article when dispensed on prescription meets the requirements under *Containers—Permeation* ⟨671⟩.

Hermetic Container—A hermetic container is impervious to air or any other gas under the ordinary or customary conditions of handling, shipment, storage, and distribution.

Single-Unit Container—A single-unit container is one that is designed to hold a quantity of drug product intended for administration as a single dose or a single finished device intended for use promptly after the container is opened. Preferably, the immediate container and/or the outer container or protective packaging shall be so designed as to show evidence of any tampering with the contents. Each single-unit container shall be labeled to indicate the identity, quantity and/or strength, name of the manufacturer, lot number, and expiration date of the article.

Single-Dose Container (see also *Containers for Injections* under *Injections* ⟨1⟩)—A single-dose container is a single-unit container for articles intended for parenteral administration only. A single-dose container is labeled as such. Examples of single-dose containers include prefilled syringes, cartridges, fusion-sealed containers, and closure-sealed containers when so labeled.

Unit-Dose Container—A unit-dose container is a single-unit container for articles intended for administration by other than the parenteral route as a single dose, direct from the container.

Unit-of-Use Container—A unit-of-use container is one that contains a specific quantity of a drug product and that is intended to be dispensed as such without further modification except for the addition of appropriate labeling. A unit-of-use container is labeled as such.

Multiple-Unit Container—A multiple-unit container is a container that permits withdrawal of successive portions of the contents without changing the strength, quality, or purity of the remaining portion.

Multiple-Dose Container (see also *Containers for Injections* under *Injections* ⟨1⟩)—A multiple-dose container is a multiple-unit container for articles intended for parenteral administration only.

■**Poison Prevention Packaging Act—**This act (see the Website, www.cpsc.gov/businfo/pppa.html) requires special packaging of most human oral prescription drugs, oral controlled drugs, certain nonoral prescription drugs, certain dietary supplements, and many over-the-counter (OTC) drug preparations in order to protect the public from personal injury or illness from misuse of these preparations (16 CFR § 1700.14).

The immediate packaging of substances regulated under the PPPA must comply with the special packaging standards (16 CFR § 1700.15 and 16 CFR § 1700.20). The PPPA regulations for special packaging apply to all packaging types including reclosable, nonclosable, and unit-dose types.

Special packaging is not required for drugs dispensed within a hospital setting for inpatient administration. Manufacturers and packagers of bulk-packaged prescription drugs do not have to use special packaging if the drug will be repackaged by the pharmacist. PPPA-regulated prescription drugs may be dispensed in nonchild-resistant packaging upon the request of the purchaser or when directed in a legitimate prescription (15 U.S.C. § 1473).

Manufacturers or packagers of PPPA-regulated OTC preparations are allowed to package one size in nonchild-resistant packaging as long as popular-size, special packages are also supplied. The nonchild-resistant package requires special labeling (18 CFR § 1700.5).

Various types of child-resistant packages are covered in ASTM International Standard D-3475, Standard Classification of Child-Resistant Packaging. Examples are included as an aid in the understanding and comprehension of each type of classification.■2S (*USP28*)

Storage Temperature and Humidity—Specific directions are stated in some monographs with respect to the temperatures and humidity at which Pharmacopeial articles shall be stored and distributed (including the shipment of articles to the consumer) when stability data indicate that storage and distribution at a lower or a higher temperature and a higher humidity produce undesirable results. Such directions apply except where the label on an article states a different storage temperature on the basis of stability studies of that particular formulation. Where no specific storage directions or limitations are provided in the individual monograph, but the label of an article states a storage temperature that is based on stability studies of that particular formulation, such labeled storage directions apply (see also *Pharmaceutical Stability* ⟨1150⟩). The conditions are defined by the following terms.

Freezer—A place in which the temperature is maintained thermostatically between –25° and –10° (–13° and 14 °F).

Cold—Any temperature not exceeding 8° (46 °F). A *refrigerator* is a cold place in which the temperature is maintained thermostatically between 2° and 8° (36° and 46 °F).

Cool—Any temperature between 8° and 15° (46° and 59 °F). An article for which storage in a *cool place* is directed may, alternatively, be stored and distributed in a *refrigerator,* unless otherwise specified by the individual monograph.

■*Controlled Cold Temperature*—This temperature is defined as the temperature maintained thermostatically between 2° and 8° (36° and 46 °F), that allows for excursions in temperature between 0° and 15° (32° and 59 °F) that may be experienced during storage, shipping, and distribution such that the allowable calculated MKT is not more than 8° (46 °F). Transient spikes up to 25° (77 °F)

In-Process Revision

may be permitted if the manufacturer so instructs and provided that such spikes do not exceed 24 hours for cold storage.■1S (*USP29*)

Room Temperature—The temperature prevailing in a working area.

Controlled Room Temperature—A temperature maintained thermostatically that encompasses the usual and customary working environment of 20° to 25° (68° to 77 °F); that results in a mean kinetic temperature calculated to be not more than 25°; and that allows for excursions between 15° and 30° (59° and 86 °F) that are experienced in pharmacies, hospitals, and warehouses. Provided the mean kinetic temperature remains in the allowed range, transient spikes up to 40° are permitted as long as they do not exceed 24 hours. Spikes above 40° may be permitted if the manufacturer so instructs. Articles may be labeled for storage at "controlled room temperature" or at "up to 25°", or other wording based on the same mean kinetic temperature. The mean kinetic temperature is a calculated value that may be used as an isothermal storage temperature that simulates the nonisothermal effects of storage temperature variations. (See also *Pharmaceutical Stability* ⟨1150⟩.)

An article for which storage at *Controlled room temperature* is directed may, alternatively, be stored and distributed in a *cool place,* unless otherwise specified in the individual monograph or on the label.

Warm—Any temperature between 30° and 40° (86° and 104 °F).

Excessive Heat—Any temperature above 40° (104 °F).

Protection from Freezing—Where, in addition to the risk of breakage of the container, freezing subjects an article to loss of strength or potency, or to destructive alteration of its characteristics, the container label bears an appropriate instruction to protect the article from freezing.

Dry Place—The term "dry place" denotes a place that does not exceed 40% average relative humidity at *Controlled Room Temperature* or the equivalent water vapor pressure at other temperatures. The determination may be made by direct measurement at the place or may be based on reported climatic conditions. Determination is based on not less than 12 equally spaced measurements that encompass either a season, a year, or, where recorded data demonstrate, the storage period of the article. There may be values of up to 45% relative humidity provided that the average value is 40% relative humidity.

Storage in a container validated to protect the article from moisture vapor, including storage in bulk, is considered a dry place.

Storage under Nonspecific Conditions—Where no specific directions or limitations are provided in the *Packaging and storage* section of individual monographs or in the article's labeling, the conditions of storage shall include storage at controlled room temperature, protection from moisture, and, where necessary, protection from light. Articles shall be protected from moisture, freezing, and excessive heat, and, where necessary, from light during shipping and distribution. Active pharmaceutical ingredients are exempt from this requirement.

■**Repackaging Instructions—**Except where a drug product is packaged in a container intended to be dispensed directly to the patient, such as a unit-of-use or unit-dose container, the labeling shall contain directions specifying the types of containers suitable for repackaging the drug product so as to maintain its identity, strength, quality, and purity. Such directions shall be sufficient to allow a repackager or dispenser to select an adequate container and shall include a description of the composition of the container(s), e.g., glass, polyethylene, polyvinyl chloride, and any moisture vapor transmission rate characteristics required. The labeling shall also indicate whether or not the container is to afford light protection, and shall include any storage or shipping temperature restrictions to which the drug as repackaged shall be limited (see 21 CFR § 201.100).■1S (*USP29*)

Labeling—The term "labeling" designates all labels and other written, printed, or graphic matter upon an immediate container of an article or upon, or in, any package or wrapper in which it is enclosed, except any outer shipping container. The term "label" designates that part of the labeling upon the immediate container.

A shipping container containing a single article, unless such container is also essentially the immediate container or the outside of the consumer package, is labeled with a minimum of product identification (except for controlled articles), lot number, expiration date, and conditions for storage and distribution.

Articles in this Pharmacopeia are subject to compliance with such labeling requirements as may be promulgated by governmental bodies in addition to the Pharmacopeial requirements set forth for the articles.

Amount of Ingredient per Dosage Unit—The strength of a drug product is expressed on the container label in terms of micrograms or milligrams or grams or percentage of the therapeutically active moiety or drug substance, whichever form is used in the title, unless otherwise indicated in an individual monograph. Both the active moiety and drug substance names and their equivalent amounts are then provided in the labeling.

Pharmacopeial articles in capsule, tablet, or other unit dosage form shall be labeled to express the quantity of each active ingredient or recognized nutrient contained in each such unit; except that, in the case of unit-dose oral solutions or suspensions, whether supplied as liquid preparations or as liquid preparations that are constituted from solids upon addition of a designated volume of a specific diluent, the label shall express the quantity of each active ingredient or recognized nutrient delivered under the conditions prescribed in *Deliverable Volume* ⟨698⟩. Pharmacopeial drug products not in unit dosage form shall be labeled to express the quantity of each active ingredient in each milliliter or in each gram, or to express the percentage of each such ingredient (see *Percentage Measurements*), except that oral liquids or solids intended to be constituted to yield oral liquids may, alternatively, be labeled in terms of each 5-mL portion of the liquid or resulting liquid. Unless otherwise indicated in a monograph or chapter, such declarations of strength or quantity shall be stated only in metric units (see also *Units of Potency* in these *General Notices*).

Use of Leading and Terminal Zeros—In order to help minimize the possibility of errors in the dispensing and administration of drugs, the quantity of active ingredient when expressed in whole numbers shall be shown without a decimal point that is followed by a terminal zero (e.g., express as 4 mg [not 4.0 mg]). The quantity of active ingredient when expressed as a decimal number smaller than 1 shall be shown with a zero preceding the decimal point (e.g., express as 0.2 mg [not .2 mg]).

Labeling of Salts of Drugs—It is an established principle that Pharmacopeial articles shall have only one official name. For purposes of saving space on labels, and because chemical symbols for the most common inorganic salts of drugs are well known to practitioners as synonymous with the written forms, the following alternatives are permitted in labeling official articles that are salts: HCl for hydrochloride; HBr for hydrobromide; Na for sodium; and K for potassium. The symbols Na and K are intended for

use in abbreviating names of the salts of organic acids; but these symbols are not used where the word Sodium or Potassium appears at the beginning of an official title (e.g., Phenobarbital Na is acceptable, but Na Salicylate is not to be written).

Labeling Vitamin-Containing Products—The vitamin content of an official drug product shall be stated on the label in metric units per dosage unit. The amounts of vitamins A, D, and E may be stated also in USP Units. Quantities of vitamin A declared in metric units refer to the equivalent amounts of retinol (vitamin A alcohol). The label of a nutritional supplement shall bear an identifying lot number, control number, or batch number.

▲*Labeling Botanical-Containing Products*—The label of an herb or other botanical intended for use as a dietary supplement bears the statement, "If you are pregnant or nursing a baby, seek the advice of a health professional before using this product."▲*USP28*

Labeling Parenteral and Topical Preparations—The label of a preparation intended for parenteral or topical use states the names of all added substances (see *Added Substances* in these *General Notices and Requirements*, and see *Labeling* under *Injections* ⟨1⟩), and, in the case of parenteral preparations, also their amounts or proportions, except that for substances added for adjustment of pH or to achieve isotonicity, the label may indicate only their presence and the reason for their addition.

Labeling Electrolytes—The concentration and dosage of electrolytes for replacement therapy (e.g., sodium chloride or potassium chloride) shall be stated on the label in milliequivalents (mEq). The label of the product shall indicate also the quantity of ingredient(s) in terms of weight or percentage concentration.

Labeling Alcohol—The content of alcohol in a liquid preparation shall be stated on the label as a percentage (v/v) of C_2H_5OH.

Special Capsules and Tablets—The label of any form of Capsule or Tablet intended for administration other than by swallowing intact bears a prominent indication of the manner in which it is to be used.

Expiration Date and Beyond-Use Date—The label of an official drug product or nutritional or dietary supplement product shall bear an expiration date. All articles shall display the expiration date so that it can be read by an ordinary individual under customary conditions of purchase and use. The expiration date shall be prominently displayed in high contrast to the background or sharply embossed, and easily understood (e.g., "EXP 6/89," "Exp. June 89," or "Expires 6/89"). [NOTE—For additional information and guidance, refer to the Nonprescription Drug Manufacturers Association's *Voluntary Codes and Guidelines of the OTC Medicines Industry.*]

The monographs for some preparations state how the expiration date that shall appear on the label is to be determined. In the absence of a specific requirement in the individual monograph for a drug product or nutritional supplement, the label shall bear an expiration date assigned for the particular formulation and package of the article, with the following exception: the label need not show an expiration date in the case of a drug product or nutritional supplement packaged in a container that is intended for sale without prescription and the labeling of which states no dosage limitations, and which is stable for not less than 3 years when stored under the prescribed conditions.

Where an official article is required to bear an expiration date, such article shall be dispensed solely in, or from, a container labeled with an expiration date, and the date on which the article is dispensed shall be within the labeled expiry period. The expiration date identifies the time during which the article may be expected to meet the requirements of the Pharmacopeial monograph, provided it is kept under the prescribed storage conditions. The expiration date limits the time during which the article may be dispensed or used. Where an expiration date is stated only in terms of the month and the year, it is a representation that the intended expiration date is the last day of the stated month. The beyond-use date is the date after which an article must not be used. The dispenser shall place on the label of the prescription container a suitable beyond-use date to limit the patient's use of the article based on any information supplied by the manufacturer and the *General Notices and Requirements* of this Pharmacopeia. The beyond-use date placed on the label shall not be later than the expiration date on the manufacturer's container.

For articles requiring constitution prior to use, a suitable beyond-use date for the constituted product shall be identified in the labeling.

For all other dosage forms, in determining an appropriate period of time during which a prescription drug may be retained by a patient after its dispensing, the dispenser shall take into account, in addition to any other relevant factors, the nature of the drug; the container in which it was packaged by the manufacturer and the expiration date thereon; the characteristics of the patient's container, if the article is repackaged for dispensing; the expected storage conditions to which the article may be exposed; any unusual storage conditions to which the article may be exposed; and the expected length of time of the course of therapy. The dispenser shall, on taking into account the foregoing, place on the label of a multiple-unit container a suitable beyond-use date to limit the patient's use of the article. Unless otherwise specified in the individual monograph, or in the absence of stability data to the contrary, such beyond-use date shall be not later than (a) the expiration date on the manufacturer's container, or (b) 1 year from the date the drug is dispensed, whichever is earlier. For nonsterile solid and liquid dosage forms that are packaged in single-unit and unit-dose containers, the beyond-use date shall be 1 year from the date the drug is packaged into the single-unit or unit-dose container or the expiration date on the manufacturer's container, whichever is earlier, unless stability data or the manufacturer's labeling indicates otherwise.

The dispenser must maintain the facility where the dosage forms are packaged and stored, at a temperature such that the mean kinetic temperature is not greater than 25°. The plastic material used in packaging the dosage forms must afford better protection than polyvinyl chloride, which does not provide adequate protection against moisture permeation. Records must be kept of the temperature of the facility where the dosage forms are stored, and of the plastic materials used in packaging.

Pharmaceutical Compounding—The label on the container or package of an official compounded preparation shall bear a beyond-use date. The beyond-use date is the date after which a compounded preparation is not to be used. Because compounded preparations are intended for administration immediately or following short-term storage, their beyond-use dates may be assigned based on criteria different from those applied to assigning expiration dates to manufactured drug products.

The monograph for an official compounded preparation typically includes a beyond-use requirement that states the time period following the date of compounding during which the preparation, properly stored, is to be used. In the absence of stability information that is applicable to a specific drug and preparation, recommendations for maximum beyond-use dates have been devised for nonsterile compounded drug preparations that are packaged in tight, light-resistant containers and stored at controlled room temperature unless otherwise indicated (see *Stability Criteria and Beyond-Use Dating* under *Stability of Compounded Preparations* in the general test chapter *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).

■**Guidelines for Packaging and Storage Statements in *USP–NF* Monographs—**In order to provide users of the *USP–NF* with proper guidance on how to package and store compendial articles, every monograph in the *USP–NF* is required to have a packaging and storage specification.

In-Process Revision

For those instances where, for some reason, storage information is not yet found in the *Packaging and storage* specification of a monograph, the section *Storage Under Non-Specific Conditions* is included in the *General Notices* as interim guidance. The *Storage Under Nonspecific Conditions* statement is not meant to substitute for the inclusion of proper, specific storage information in the *Packaging and storage* statement of any monograph.

For the packaging portion of the statement, the choice of containers is given in the *General Notices* and includes *Light-Resistant Container, Well-Closed Container, Tight Container, Hermetic Container, Single-Unit Container, Single-Dose Container, Unit-Dose Container,* and *Unit-of-Use Container.* For most preparations, the choice is determined by the container in which it is to be dispensed (e.g., tight, well-closed, hermetic, unit-of-use, etc). For active pharmaceutical ingredients (APIs), the choice would appear to be tight, well-closed, or, where needed, a light-resistant container. For excipients, given their typical nature as large-volume commodity items, with containers ranging from drums to tank cars, a well-closed container is an appropriate default. Therefore, in the absence of data indicating a need for a more protective class of container, the phrase "Preserve in well-closed containers" should be used as a default for excipients.

For the storage portion of the statement, the choice of storage temperatures presented in the *General Notices* includes *Freezer, Cold, Cool,* ■*Controlled Cold Temperature,* ■1S (*USP29*) *Room Temperature, Controlled Room Temperature, Warm, Excessive Heat,* and *Protection from Freezing.* The definition of a dry place is provided if protection from humidity is important.

For most preparations, the choice is determined by the experimentally determined stability of the preparation and may include any of the previously stated storage conditions as determined by the manufacturer. For APIs that are expected to be retested before incorporation into a preparation, a more general and nonrestrictive condition may be desired. In this case, the specification "room temperature" (the temperature prevailing in a working area) should suffice. The use of the permissive room temperature condition reflects the stability of an article over a wide temperature range. For excipients, the phrase "No storage requirements specified" in the *Packaging and storage* statement of the monograph would be appropriate.

Because most APIs in the *USP–NF* have associated Reference Standards, special efforts should be considered to ensure that the Reference Standards' storage conditions correspond to the conditions indicated in the *USP–NF* monographs.

The Packaging, Storage, and Distribution Expert Committee may review questionable *Packaging and storage* statements on a case-by-case basis. In cases where the *Packaging and storage* statements are incomplete, the monographs would move forward to publication while the *Packaging and storage* statements are temporarily deferred.■2S (*USP28*)

MONOGRAPHS (USP)

BRIEFING

Acetylcysteine, *USP 28* page 46. It is proposed to introduce a new USP Reference Standard, USP L-Phenylalanine RS, to replace DL-phenylalanine used in the *Internal standard solution* of the *Assay.*

(PA2: C. Anthony) RTS—42459-1

Change to read:

USP Reference standards ⟨11⟩—*USP Acetylcysteine RS.*

■*USP L-Phenylalanine RS.*■1S *(USP29)*

Change to read:

Assay—

Mobile phase—Dissolve 6.8 g of monobasic potassium phosphate in 1000 mL of water, pass through a membrane filter having a 0.45-µm porosity, and degas. Adjust with phosphoric acid to a pH of 3.0.

Internal standard solution—Dissolve about 1 g of ~~DL-phenylalanine~~

■USP L-Phenylalanine RS■1S *(USP29)*
in 200 mL of freshly prepared sodium metabisulfite solution (1 in 2000).

Standard preparation—Dissolve an accurately weighed quantity of USP Acetylcysteine RS in sodium metabisulfite solution (1 in 2000) to obtain a solution having a known concentration of about 10 mg per mL. Pipet 10.0 mL of this solution and 10.0 mL of *Internal standard solution* into a 200-mL volumetric flask, dilute with sodium metabisulfite solution (1 in 2000) to volume, and mix to obtain a *Standard preparation* having a known concentration of about 0.5 mg per mL of USP Acetylcysteine RS.

Assay preparation—Transfer about 1000 mg of Acetylcysteine, accurately weighed, to a 100-mL volumetric flask. Dissolve in and dilute with sodium metabisulfite solution (1 in 2000) to volume, and mix. Pipet 10.0 mL of this solution and 10.0 mL of *Internal standard solution* into a 200-mL volumetric flask, dilute with sodium metabisulfite solution (1 in 2000) to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 214-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%; and the resolution, *R,* between acetylcysteine and DL-phenylalanine is not less than 6.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.5 for acetylcysteine and 1.0 for ~~DL-phenylalanine.~~

■L-phenylalanine.■1S *(USP29)*
Calculate the quantity, in mg, of $C_5H_9NO_3S$ in the portion of Acetylcysteine taken by the formula:

$$2000C(R_U / R_S),$$

in which C is the concentration, in mg per mL, of USP Acetylcysteine RS in the *Standard preparation;* and R_U and R_S are the ratios of the peak response of acetylcysteine to that of ~~DL-phenylalanine~~

■L-phenylalanine■1S *(USP29)*
obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Albuterol Tablets, *USP 28* page 58 and page 40 of *PF* 31(1) [Jan.–Feb. 2005]. It is proposed to revise the *Procedure* in the *Assay* by correcting the formula to indicate that one molecule of albuterol sulfate liberates two molecules of albuterol.

Change to read:

Dissolution ~~*Procedure for a Pooled Sample*~~

▲▲*USP29*
⟨711⟩—

Medium: water; 500 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Determine the amount of $C_{13}H_{21}NO_3$ dissolved using the following method.

Mobile phase, Standard preparation, and *Chromatographic system*—Prepare as directed in the *Assay.*

Procedure—

▲Proceed as directed for *Procedure for Capsules, Uncoated Tablets,* and *Plain Coated Tablets* under *Dissolution* ⟨711⟩. Combine equal volumes of the filtered solutions of the 6 or 12 individual specimens withdrawn, and use the pooled sample as the test solution.▲*USP29*
Inject a suitable volume (about 100 µL) of ~~a portion of the solution under test,~~

▲the pooled sample,▲*USP29*

In-Process Revision

previously filtered through a 0.45-µm nylon filter, into the chromatograph, record the chromatogram, and measure the response for the major peak. Calculate the quantity of $C_{13}H_{21}NO_3$ dissolved by comparing this peak response with the major peak response similarly obtained on chromatographing the *Standard preparation* previously diluted, if necessary, with a mixture of water and methanol (6 : 4) to obtain a Standard solution having a known concentration of USP Albuterol Sulfate RS approximately corresponding to the concentration of the solution under test.

Tolerances—Not less than 80% (*Q*) of the labeled amount of $C_{13}H_{21}NO_3$ is dissolved in 30 minutes:

▲the requirements are met if the quantities of active ingredient dissolved from the pooled sample conform to the accompanying *Acceptance Table for a Pooled Sample*. Continue testing through the three stages unless the results conform at either S_1 or S_2. The quantity, *Q,* is the amount of dissolved active ingredient specified, expressed as a percentage of the labeled content.

Acceptance Table for a Pooled Sample

Stage	Number Tested	Acceptance Criteria
S_1	6	Average amount dissolved is not less than Q + 10%.
S_2	6	Average amount dissolved (S_1 + S_2) is equal to or greater than Q + 5%.
S_3	12	Average amount dissolved (S_1 + S_2 + S_3) is equal to or greater than Q.

▲*USP29*

Change to read:

Assay—

1% Acetic acid—Transfer a 20-mL portion of glacial acetic acid to a suitable volumetric flask, and dilute with water to 2000 mL.

Mobile phase—Dissolve 1.13 g of sodium 1-hexanesulfonate in 1200 mL of water, add 12 mL of glacial acetic acid, and mix. Prepare a filtered and degassed mixture of this solution and methanol (6 : 4). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer about 12 mg of USP Albuterol Sulfate RS, accurately weighed, to a 100-mL volumetric flask. Add 60 mL of *1% Acetic acid,* sonicate for 5 minutes, dilute with methanol to volume, and mix. Pipet 25 mL of this solution into a 100-mL volumetric flask, dilute with a mixture of water and methanol (6 : 4) to volume, and mix.

Assay preparation—Transfer a number of whole Tablets, equivalent to about 50 mg of albuterol, to a 2000-mL volumetric flask. Add 1200 mL of *1% Acetic acid,* shake by mechanical means for 45 minutes, sonicate for 10 minutes, allow to cool to room temperature, dilute with methanol to volume, and mix. Pass through a suitable filter having a 0.45-µm or finer porosity.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 276-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency determined from the analyte peak is not less than 800 theoretical plates; the tailing factor for the analyte peak is not more than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of albuterol ($C_{13}H_{21}NO_3$) in the number of Tablets taken by the formula:

~~$2(239.32/576.71)200C(r_U/r_S)$,~~

~~in which 239.32 and 576.71 are the molecular weights of albuterol and albuterol sulfate, respectively; *C* is the concentration, in mg per mL, of USP Albuterol Sulfate RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.~~

■$2000C(r_U/r_S)(2)(239.31/576.70)$,

in which 2000 is the volume, in mL, of the *Assay preparation; C* is the concentration, in mg per mL, of USP Albuterol Sulfate RS in the *Standard preparation;* r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively; 2 is the number of molecules of albuterol released from each molecule of albuterol sulfate; and 239.31 and 576.70 are the molecular weights of albuterol and albuterol sulfate, respectively.■1S (*USP29*)

BRIEFING

Anticoagulant Citrate Dextrose Solution, *USP 28* page 165 and page 1583 of *PF* 30(5) [Sep.–Oct. 2004]—See briefing under *Anticoagulant Sodium Citrate Solution*.

~~*1,2,4-Aminonaphtholsulfonic acid solution*—Dissolve 0.5 g of 1,2,4-aminonaphtholsulfonic acid in about 150 mL of sodium metasulfite solution (3 in 20) in a 200-mL volumetric flask, warming if necessary. Add 5 mL of sodium sulfite solution (1 in 5), mix, and dilute with sodium metasulfite solution (3 in 20) to volume.~~

~~*Standard preparation*—Dissolve about 0.44 g of monobasic potassium phosphate, accurately weighed, in water to make 1000 mL, and mix. Pipet 25 mL of this solution into a 100-mL volumetric flask, and dilute with water to volume so as to obtain a solution having a known concentration of about 0.11 mg per mL of monobasic potassium phosphate.~~

~~*Assay preparation*—Dilute 5.0 mL of Solution with water to 100 mL.~~

~~*Procedure*—Pipet 5 mL of *Standard preparation,* 5 mL of *Assay preparation,* and 5 mL of water, to provide a control, into separate 25-mL volumetric flasks. Treat the contents of each flask as follows. Add 10.0 mL of 1 N sulfuric acid, and mix. Add 2.0 mL of ammonium molybdate solution (1 in 40), and mix. Add 1.0 mL of *1,2,4-Aminonaphtholsulfonic acid solution,* dilute with water to volume, again mix, and allow to stand for 10 minutes at 20° to 25°. Determine the absorbances of the solutions from the *Standard preparation* and the *Assay preparation* against the reference solution in 1-cm cells at 660 nm, with a suitable spectrophotometer, taking care to measure the absorbance of each solution at the same elapsed time from mixing. Calculate the quantity, in mg, of monobasic sodium phosphate ($NaH_2PO_4 \cdot H_2O$) in each mL of the Solution taken by the formula:~~

~~$20.28C(A_U/A_S),$~~

~~in which *C* is the concentration, in mg per mL, of KH_2PO_4 in the *Standard preparation;* and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation,* respectively.~~ ■1S (*USP29*)

(Official April 1, 2009)

Add the following:

■**Assay for total citrate and total phosphate**—

Mobile Phase, Standard Preparation 2, and *Chromatographic System*—Proceed as directed under *Assay for Citric Acid/Citrate and Phosphate* ⟨345⟩.

Assay preparation for total citrate assay—Pipet 10 mL of Solution into a suitable volumetric flask, and proceed as directed for *Assay Preparation for Citric Acid/Citrate Assay* under general chapter ⟨345⟩.

Assay preparation for total phosphate assay—Pipet 5 mL of Solution into a suitable volumetric flask, and proceed as directed for *Assay Preparation for Phosphate Assay* under general chapter ⟨345⟩.

Procedure—Proceed as directed for *Procedure* under general chapter ⟨345⟩, and calculate the quantity, in mg, of anhydrous citric acid ($C_6H_8O_7$) in the volume of Solution taken by the formula:

$$0.001(192.12/189.10)C_S D(r_U / r_S),$$

in which 192.12 is the molecular weight of anhydrous citric acid; 189.10 is the molecular weight of citrate ($C_6H_5O_7$); C_S is the concentration, in µg per mL, of citrate in *Standard Preparation 2; D* is the dilution factor; and r_U and r_S are the citrate peak areas obtained from the *Assay preparation for total citrate assay* and *Standard Preparation 2,* respectively.

Calculate the quantity, in mg, of phosphate, expressed as monobasic sodium phosphate monohydrate ($NaH_2PO_4 \cdot H_2O$), in the volume of Solution taken by the formula:

$$0.001(137.99/94.97)C_S D(r_U / r_S),$$

in which 137.99 is the molecular weight of monobasic sodium phosphate monohydrate; 94.97 is the molecular weight of phosphate (PO_4); C_S is the concentration, in µg per mL, of phosphate in *Standard Preparation 2; D* is the dilution factor; and r_U and r_S are the phosphate peak areas obtained from the *Assay preparation for total phosphate assay* and *Standard Preparation 2,* respectively.■1S (*USP29*)

BRIEFING

Aprotinin; Aprotinin Injection. Because there is no existing *USP* monograph for this article, a new monograph is being proposed. The liquid chromatographic procedures in the test for *Limit of N-pyroglutamyl-aprotinin and related compounds* are based on analyses performed with the TSK Gel SP-5 PW brand of L52 column. The liquid chromatographic procedures in the test for *Limit of high molecular weight proteins* are based on analyses performed with the Waters Protein-Pak 125 brand of L33 column.

(BNT: L. Callahan) RTS—41730-1; 42056-1; 42090-1

Add the following:

■Aprotinin

$C_{284}H_{432}N_{84}O_{79}S_7$ 6511.44

Aprotinin [*9087-70-1*].

» Aprotinin is a polypeptide consisting of a chain of 58 amino acid residues, which inhibits stoichiometrically the activity of several proteolytic enzymes such as chymotrypsin, kallikrein, plasmin, and trypsin. Aprotinin is obtained from bovine tissues and purified by a suitable process, and is stored as a bulk solution or lyophilized powder. Its potency calculated on a dried basis is not less than 3 USP Aprotinin Units per mg. In addition, the method of manufacture is validated to result in not more than 0.2 µg of histamine per 3 USP units of aprotinin by validated methods. The origin and sourcing of bovine material must be in compliance with FDA regulations and must fulfill the regulatory requirements for the health of animals for human consumptiion. The manufacturing process is validated to demonstrate the clearance of potential infectious agents (i.e., viruses, TSE agents). One USP Aprotinin Unit is equivalent to 1800 Kallikrein Inhibition Units (K.I.U.).

In-Process Revision

Packaging and storage—For lyophillized powder, preserve in tight containers, and store in a cold place. Protect from light. For bulk solution, preserve in tight containers at a temperature not exceeding 25°. Avoid freezing.

Labeling—The labeling states the source of material and the number of Kallikrein Inhibition Units per mg or the number of Kallikrein Inhibition Units per mL.

USP Reference standards ⟨11⟩**—***USP Aprotinin RS. USP Aprotinin System Suitability RS. USP Endotoxin RS. USP Trypsin Crystallized RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Prepare a solution of Aprotinin in water having a concentration of about 15 USP Aprotinin units per mL.

Developing solvent system: a mixture of glacial acetic acid and water (100 : 80) containing 100 g per L of sodium acetate.

Cupric chloride solution—Dissolve 1 g of cupric chloride in 100 mL of water.

Spray reagent—Dissolve 0.1 g of ninhydrin in a mixture containing 6 mL of *Cupric chloride solution,* 21 mL glacial acetic acid, and 70 mL of alcohol.

Procedure—Proceed as directed in the chapter, except to spray the plate with the *Spray reagent,* and heat at 60° to visualize the spots.

B: The retention time of the major peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *Standard solution,* as obtained in the test for *Limit of N-pyroglutamyl-aprotinin and related compounds*.

Absorbance ⟨851⟩**—**Prepare a solution containing 3.0 USP Aprotinin Units per mL. The solution shows an absorption maximum at 277 nm. The absorbance at the maximum is not greater than 0.80.

Safety—Prepare a solution of aprotinin that contains 4 USP units per mL using a sufficient quantity of water for injection. It meets the requirements when tested as directed in the section *Safety Tests—Biologicals* under *Biological Reactivity Tests, In Vivo* ⟨88⟩.

Bacterial endotoxins ⟨85⟩**—**It contains not more than 0.14 USP Endotoxin Unit per USP Aprotinin Unit. Use solution that contains 6 USP Aprotinin Units per mL.

Loss on drying ⟨731⟩—[NOTE—This test should only be performed on the lyophilized powder.] Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 6.0% of its weight.

Specific activity of the dry residue—[NOTE—This test should only be performed when product is a concentrated solution.] Evaporate 25.0 mL of Aprotinin concentrated solution to dryness in a water bath, dry the residue at 110° for 15 hours, and weigh. From the weight of the residue and the activity determined in the *Assay,* calculate the number of USP Aprotinin Units per mg of dry residue. Not less than 3.0 USP Aprotinin units per mg dried residue is found.

Limit of des-Ala-aprotinin and des-Ala-des-Gly-aprotinin—

Test solution—Dilute a concentrated solution of Aprotinin with water or weigh out Aprotinin, and dissolve in water to obtain a solution containing about 4 to 7 USP Aprotinin Units per ml.

Standard solution—Dilute USP Aprotinin RS with water to obtain a solution having a concentration similar to that of the *Test solution*.

Capillary zone electrophoresis buffer—Dissolve 8.21g of potassium phosphate, monobasic in 400 mL water, adjust with phosphoric acid to a pH of 3.0, and dilute with water to 500 mL.

Capillary zone electrophoresis system (see *Capillary Electrophoresis in Biotechnology-Derived Articles* ⟨1047⟩)—The capillary electropherograph is equipped with a 214-nm detector and a 45 to 60 cm uncoated fused silica capillary with an internal diameter of 75 µm with the temperature controlled at 25°. Apply a field strength of 0.2 kV/cm for 30 minutes, using *Capillary zone electrophoresis buffer* as the electrolyte in both buffer reservoirs. Electropherograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative migration times are about 0.98 for des-Ala-des-Gly-aprotinin, 0.99 for des-Ala-aprotinin, and 1 for aprotinin. The resolution, R_S, between the des-Ala-des-Gly-aprotinin and des-Ala-aprotinin peaks is not less than 0.8, and the resolution between the des-Ala-aprotinin and aprotinin peaks is not less than 0.5. The migration time for the aprotinin peak is between 19 and 25 minutes. The tailing factor, *T,* of the aprotinin peak is not more than 3 (see *Chromatography* ⟨621⟩ for calculation). The baseline is stable and shows little drift. Rinse the capillary for at least 1 minute with at least 10 total capillary volumes of 0.1 N sodium hydroxide, followed by at least 10 total capillary volumes of water, and by at least 20 capillary volumes of *Capillary zone electrophoresis buffer* between injections.

Procedure—Transfer a volume of the *Test solution,* approximately 15 nL, into the anodic end of the capillary (apply differential pressure of 3.5 kPa for 3 seconds either by vacuum or pressure), record an electropherogram, and measure the peak areas. Calculate the percentage contents of des-Ala-des-Gly-aprotinin and des-Ala-aprotinin by the formula:

$$100(r_i / r_S)$$

in which r_i is the peak response corresponding to des-Ala-des-Gly-aprotinin or des-Ala-aprotinin; and r_S is the sum of the responses of des-Ala-des-Gly-aprotinin, des-Ala-aprotinin and aprotinin peaks: not more than 8.0% des-Ala-des-Gly-aprotinin and not more than 7.5% des-Ala-aprotinin is found.

Limit of N-pyroglutamyl-aprotinin and related compounds—

Solution A—Prepare a filtered and degassed solution containing 3.52 g of potassium phosphate, monobasic and 7.26 g of sodium phosphate, dibasic dissolved in 1000 mL of water.

Solution B—Prepare a filtered and degassed solution containing 3.52 g of potassium phosphate, monobasic, 7.26 g of sodium phosphate, dibasic, and 66.07 g of ammonium sulfate dissolved in 1000 mL of water.

Resolution solution—Prepare a solution of USP Aprotinin System Suitability RS containing about 5 USP Aprotinin Units per mL in *Solution A.*

Test solution—Prepare a solution of aprotinin having a concentration of about 5 USP Aprotinin Units per mL. Dilute with *Solution A.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 7.5-mm × 7.5-cm column that contains packing L52 and is maintained at a constant temperature of 40°. The flow rate is 1 mL per minute. The chromatograph is programmed as follows.

In-Process Revision

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–21	92→64	8→36	linear gradient
21–30	64→0	36→100	linear gradient
30–31	0→92	100→8	linear gradient
31–40	92	8	re-equilibration

Chromatograph the *Resolution solution* as directed for *Procedure:* the retention time for aprotinin is between 17 and 20 minutes; the relative retention times are about 0.9 for N-pyroglutamyl-aprotinin, and 1.0 for aprotinin; the resolution, *R,* between N-pyroglutamyl-aprotinin and aprotinin is not less than 1.0; and the tailing factor for the aprotinin peak is not greater than 2.0.

Procedure—Inject 40 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak areas. Calculate the percentage of each impurity peak in the chromatogram by the formula:

$$100(r_i / r_S)$$

in which r_i is the response of each impurity peak; and r_S is the sum of the responses of all peaks in the chromatogram of the *Test solution:* not more than 1.0% *N*-pyroglutamyl-aprotinin is found; not more than 0.5% of any other impurity is found; and the sum of all unknown impurities is not more than 1.0%.

Limit of high molecular weight proteins—

Mobile phase—Prepare a filtered and degassed mixture of water, glacial acetic acid, and acetonitrile (6 : 2 : 2).

Resolution solution—Prepare an aprotinin solution that contains about 5 USP Aprotinin units per mL with about 2% aprotinin oligomers. [NOTE—This solution can be obtained by heating lyophilized aprotinin at 112° for about 2 hours and dissolving the solid at the specified concentration in water.]

Test solution—Prepare a solution of aprotinin in water that contains about 5 USP units per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a series of three 7.8-mm × 30-cm columns containing packing L33. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution* as directed for *Procedure:* The retention time for aprotinin is between 24.5 and 25.5 minutes; the relative retention times are about 0.9 for the dimer and 1.0 for aprotinin; the resolution, *R,* between the dimer peak and the aprotinin peak is not less than 1.3; and the tailing factor for the aprotinin peak is not greater than 2.5.

Procedure—Inject about 100 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak areas. Calculate the percentage of each oligomer peak in the chromatogram by the formula:

$$100 r_i / r_S$$

in which r_i is the response of each peak having a retention time less than that of aprotinin monomer; and r_S is the sum of the responses of all peaks: the sum of all oligomers is not more than 1.0%.

Assay—

0.0015 M Borate buffer—Transfer about 0.93 g of boric acid into a 1000-mL volumetric flask, dissolve in 900 mL of water, adjust with 5 N sodium hydroxide to a pH of 8.0, adjust with water to volume, and mix. Transfer 100 mL of this solution into a 1000 mL volumetric flask, adjust with water to volume, and mix.

Assay preparation—Prepare a solution of aprotinin with *0.0015 M Borate buffer* to obtain a solution having about 1.67 USP units per mL (about 0.6 mg per mL).

Trypsin solution—Prepare a solution of USP Crystallized Trypsin RS containing about 4300 USP units per mL, using 0.001 N hydrochloric acid as the solvent. Use a freshly prepared solution, and keep in iced water.

Trypsin and aprotinin solution—To 4.0 mL of the *Trypsin solution,* add 1.0 mL of the *Assay preparation.* Dilute immediately with *0.0015 M Borate buffer* to 40.0 mL. Allow to stand at room temperature for 10 minutes, and then keep in iced water. Use within 6 hours of preparation.

Dilute trypsin solution—Dilute 0.5 mL of the *Trypsin solution* with *0.0015 M Borate buffer* to 10.0 mL. Allow to stand at room temperature for 10 minutes, and then keep in iced water.

Substrate solution—Dissolve 69 mg of N-benzoyl-L-arginine ethyl ester hydrochloride in 10 mL of water. [NOTE—Use within 2 hours.]

Procedure—Mix 9.0 mL of *0.0015 M Borate buffer* and 1.0 mL of *Substrate solution* in a jacketed glass vessel with a capacity of about 30 mL and that contains a stirring device. The lid of the reaction vessel should contain five holes to accommodate the electrodes, the tip of a buret, a tube for the admission of nitrogen, and the introduction of reactants. An automated or manual titration apparatus may be used. Adjust to a pH of 8.0 by the addition of 0.1 N sodium hydroxide VS. Maintain an atmosphere of nitrogen within the vessel, and stir continuously. When the temperature has reached equilibrium at 25 ± 0.1°, add 1.0 mL of *Trypsin and aprotinin solution,* and start a timer. Maintain at a pH of 8.0 by the addition of 0.1 N sodium hydroxide VS, and note the volume added every 30 seconds. Continue the reaction for 6 minutes. Determine the volume of 0.1 N sodium hydroxide added per second, in mL (n_1). Carry out a similar titration using 1.0 mL of the *Dilute trypsin solution*. Determine the volume of 0.1 N sodium hydroxide added per second, in mL (n_2). For the lyophilized powder, calculate the aprotinin activity in USP Aprotinin units per mg using the formula:

$$4000(2n_2 - n_1)/m$$

in which m is the mg of aprotinin used to prepare 1 mL of the *Assay preparation*. For the concentrated solution, calculate the USP Aprotinin Units per mL using the following formula:

$$4000(2n_2 - n_1)D$$

in which D is the dilution factor of the concentrated solution used to prepare the *Assay preparation.* ■1S (*USP29*)

BRIEFING

Aprotinin Injection—See briefing under *Aprotinin.*

(BNT: L. Callahan) RTS—41752-1

In-Process Revision

Add the following:

■Aprotinin Injection

» Aprotinin Injection is a sterile solution of Aprotinin in Water for Injection that also contains sodium chloride. One USP Aprotinin Unit is equivalent to 1800 Kallikrein Inhibition Units

(K.I.U.). It contains not less than 90.0 percent and not more than 110.0 percent of the potency stated on the label, expressed in Kallikrein Inhibition Units per mL.

Packaging and storage—Preserve in single-dose containers, store up to 25°, and avoid freezing.

USP Reference standards ⟨11⟩—*USP Aprotinin RS. USP Aprotinin System Suitability RS. USP Endotoxin RS. USP Trypsin Crystallized RS.*

Identification—

A: The retention time of the major peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *Standard solution,* as obtained in the test for *Limit of N-pyroglutamyl-aprotinin and related compounds* under *Aprotinin*.

B: The determination of activity by the *Assay* is based on the specific inhibition of trypsin.

Bacterial endotoxins ⟨85⟩—It contains not more than 0.14 USP Endotoxin Units per USP Aprotinin Unit.

Sterility ⟨71⟩—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

pH ⟨791⟩**:** between 4.5 and 6.5.

Particulate matter ⟨788⟩**:** meets the requirements.

Sodium chloride content—Pipet 5.0 mL of Aprotinin injection into 50 mL of water in a beaker. Add 10 mL of 25% nitric acid. Titrate with 0.1 N silver nitrate VS to a potentiometric endpoint, using a silver combination electrode. Perform a blank determination (see *Titrimetry* ⟨541⟩), and make any necessary correction. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of sodium chloride: between 42.5 mg and 47.5 mg of sodium chloride is found.

Other requirements—It meets the requirements under *Injections* ⟨1⟩ and for *Limit of N-pyroglutamyl-aprotinin and related compounds* under *Aprotinin*.

Limit of high molecular weight proteins—Proceed as directed in the test for *Limit of high molecular weight proteins* under *Aprotinin*. The sum of all oligomers is not more than 1.5%.

Assay—Proceed as directed in the *Assay* under *Aprotinin.* ■1S (*USP29*)

BRIEFING

Aztreonam for Injection, *USP 28* page 211. It is proposed to make changes in the *Procedure* of the *Assay* section for clarification.

(PA7a: B. Gilbert) RTS—42376-1

Change to read:

Assay—

Mobile phase—Dissolve 1.15 g of monobasic ammonium phosphate in about 800 mL of water. Adjust with phosphoric acid to a pH of 2.0 ± 0.1, dilute with water to 1000 mL, and mix. Prepare a suitable mixture of acetonitrile and this solution (750 : 250). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve accurately weighed quantities of USP Aztreonam RS and USP L-Arginine RS quantitatively in *Mobile phase* to obtain a solution containing known concentrations of about 0.2 mg of each per mL.

Resolution solution—Prepare a solution in *Mobile phase* containing in each mL about 0.2 mg each of USP Aztreonam RS and USP Open Ring Aztreonam RS.

Assay preparation 1—Weigh accurately 1 container of Aztreonam for Injection. Transfer the contents of the container to a 100-mL volumetric flask. Weigh the empty container, and calculate the weight, in mg, of Aztreonam for Injection removed. Dissolve the powder in the volumetric flask in *Mobile phase*, dilute with *Mobile phase* to volume, and mix. Dilute an accurately measured volume of this solution quantitatively with *Mobile phase* to obtain a solution having a concentration of about 0.2 mg of aztreonam per mL.

Assay preparation 2—Constitute 1 container of Aztreonam for Injection with a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling, except where the capacity of the container is 100 mL or greater to constitute with 10 mL of water. Withdraw the total withdrawable contents of the container, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution containing about 0.2 mg of aztreonam per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 206-nm detector, a 4.6-mm × 50-cm saturator precolumn containing packing L27, and a 4-mm × 25-cm analytical column containing packing L20.

The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution,* and record the responses as directed for *Procedure:* the relative retention times are about 0.8 for aztreonam and 1.0 for open ring aztreonam; the resolution, *R,* between aztreonam and open ring aztreonam is not less than 2.0; the column efficiency as determined from the aztreonam peak is not less than 1000 theoretical plates; the tailing factor for the aztreonam peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation,* ~~and the *Assay preparation,*~~

■*Assay preparation 1,* and *Assay preparation 2*■1S (*USP29*) into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.3 for aztreonam and 1.0 for arginine. Calculate the percentage of aztreonam ($C_{13}H_{17}N_5O_8S_2$) in the Aztreonam for Injection taken by the formula:

$$0.1(C_S P_S / C_U)(r_U / r_S),$$

in which C_S is the concentration, in mg per mL, of USP Aztreonam RS in the *Standard preparation;* P_S is the assigned purity, in µg per mg, of the USP Aztreonam RS; C_U is the concentration, in mg per mL, of Aztreonam for Injection in *Assay preparation 1,* based on the weight, in mg, of Aztreonam for Injection removed from the container and the extent of dilution; and r_U and r_S are the aztreonam peak responses obtained from *Assay preparation 1* and the *Standard preparation,* respectively. Calculate the quantity, in mg, of aztreonam ($C_{13}H_{17}N_5O_8S_2$) in the container of Aztreonam for Injection used to prepare *Assay preparation 2* taken by the formula:

$$(C_S P_S L / 1000 C_U)(r_U / r_S),$$

in which C_S is the concentration, in mg per mL, of USP Aztreonam RS in the *Standard preparation;* P_S is the assigned purity, in µg per mg, of USP Aztreonam RS; L is the labeled quantity, in mg, of aztreonam in the container of Aztreonam for Injection; C_U is the concentration, in mg per mL, of aztreonam in *Assay preparation 2,* on the basis of the labeled quantity, in mg, of aztreonam in the container and the extent of dilution; and r_U and r_S are the aztreonam peak responses obtained from ~~*Assay preparation 1*~~

■*Assay preparation 2*■1S (*USP29*) and the *Standard preparation*, respectively.

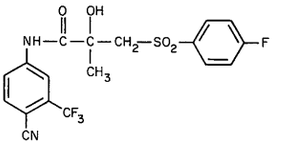
BRIEFING

Bicalutamide. Because there is no existing *USP* monograph for this drug substance, a new monograph based on validated methods is being proposed. The reverse phase HPLC procedures in the test for *Chromatographic purity* are based on analyses performed with a Hypersil ODS brand of L1 column. The typical retention time for bicalutamide is about 17 minutes. The reverse phase HPLC procedures in the *Assay* are based on analyses performed with a Hypersil ODS brand of L1 column. The typical retention time for bicalutamide is about 3 minutes.

(PA6: L. Evans; PSD: C. Okeke; NL: L. Paul) RTS—42222-1; 42222-2; 42222-3

Add the following:

■Bicalutamide



$C_{18}H_{14}F_4N_2O_4S$ 430.37

Propanamide, *N*-[4-cyano-3-(trifluoromethyl)phenyl]-3-[(4-fluorophenyl)sulfonyl]-2-hydroxy-2-methyl-, (±)-.

(±)-4′-Cyano-α,α,α-trifluoro-3-[(*p*-fluorophenyl)sulfonyl]-2-methyl-*m*-lactotoluidide [*90357-06-5*].

» Bicalutamide contains not less than 98.0 percent and not more than 102.0 percent of $C_{18}H_{14}F_4N_2O_4S$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight containers, and store at room temperature.

USP Reference standards ⟨11⟩—*USP Bicalutamide RS. USP Bicalutamide Related Compound A RS.*

Identification—

A: *Infrared Absorption* ⟨197M⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

In-Process Revision

Water, *Method I* ⟨921⟩**:** not more than 0.5%.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩: 0.002%.

Limit of alcohol—

Standard solution—Prepare a solution of alcohol in dimethyl sulfoxide having a known concentration of about 0.1 mg of alcohol per mL.

Test solution—Dissolve an accurately weighed portion of Bicalutamide in dimethyl sulfoxide to obtain a solution having a concentration of about 100 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a headspace injector, a flame-ionization detector, and a 0.53-mm × 30-m capillary column, the internal wall of which is coated with a 1.0-µm film of liquid phase G43. The carrier gas is helium, flowing at a rate of about 4.4 mL per minute with a split ratio of 1 : 5. The chromatograph is programmed as follows. Initially the temperature of the column is maintained at 70° for 2 minutes, then increased at a rate of 20° per minute to 170°, and maintained at 170° for 1 minute. The injector port temperature is maintained at 140°; the headspace sampler temperature is maintained at 80°; and the detector temperature is maintained at 250°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the retention time for alcohol is about 1.6 minutes; the column effiiciency is not less than 10,000 theoretical plates; and the relative standard deviation for three injections of the *Standard solution* is not more than 5.0%.

Procedure—Transfer 1.0 mL each of the *Test solution* and the *Standard solution* to separate 20-mL headspace vials. Record the chromatograms, and measure the peak area for the alcohol peak. Calculate the amount of alcohol in ppm in the portion of Bicalutamide taken by the formula:

$$10^6(C_S / C_U)(r_U / r_S),$$

in which C_S is the concentration, in mg per mL, of alcohol in the *Standard solution;* C_U is the concentration, in mg per mL, of Bicalutamide in the *Test solution;* and r_U and r_S are the alcohol peak areas in the chromatograms obtained from the *Test solution* and the *Standard solution,* respectively: not more than 500 ppm of alcohol (C_2H_5OH) is found.

Chromatographic purity—

Solution A, Solution B, and *Diluent*—Prepare as directed in the *Assay.*

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve accurately weighed quantities of USP Bicalutamide Related Compound A RS and USP Bicalutamide RS in *Diluent* to obtain a solution having known concentrations of about 0.005 mg per mL and 0.05 mg per mL, respectively.

Standard solution—Dissolve an accurately weighed quantity of USP Bicalutamide RS in *Diluent* to obtain a solution having a known concentration of about 1 µg per mL.

Test solution—Transfer about 25 mg of Bicalutamide, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with 270-nm detector and a 4.0-mm × 10-cm column that contains 3-µm packing

L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–16.5	67	33	isocratic
16.5–26.5	67→40	33→60	linear gradient
26.5–32.5	40→5	60→95	linear gradient
32.5–32.6	5→67	95→33	linear gradient
32.6–35.0	67	33	isocratic

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.62 for bicalutamide related compound A isomer A, 0.65 for bicalutamide related compound A isomer B, and 1.0 for bicalutamide; and the resolution, *R,* between bicalutamide related compound A isomer A and bicalutamide related compound A isomer B is not less than 0.8, and the resolution, *R,* between bicalutamide related compound A isomer B and bicalutamide is not less than 8.5.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Bicalutamide taken by the formula:

$$2.5(CW)(r_i / r_S),$$

in which C is the concentration, in µg per mL, of USP Bicalutamide RS in the *Standard solution; W* is the weight, in mg, of Bicalutamide in the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the bicalutamide peak response obtained from the *Standard solution*. Disregard any peak less than 0.02%: not more than 0.10% of any individual impurity is found; and not more than 0.50% of total impurities is found.

Assay—

Solution A—Prepare a filtered and degassed 0.01% (v/v) solution of trifluoroacetic acid in water.

Solution B—Prepare a filtered and degassed 0.01% (v/v) solution of trifluoroacetic acid in acetontrile.

Diluent—Prepare a mixture of *Solution A* and *Solution B* (1 : 2).

Mobile phase—Prepare a filtered and degassed mixture of *Solution A* and *Solution B* (52 : 48). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Prepare a solution of USP Bicalutamide RS and USP Bicalutamide Related Compound A RS in *Diluent* to obtain a solution having known concentrations of about 0.05 mg per mL and 0.005 mg per mL, respectively.

Standard preparation—Dissolve an accurately weighed quantity of USP Bicalutamide RS in *Diluent* to obtain a solution having a known concentration of about 50 µg per mL.

Assay preparation—Transfer about 25 mg of Bicalutamide, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix. Pipet 1.0 mL of this solution into a 20-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 270-nm detector and a 4.0-mm × 10-cm column that contains 3-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution* and the *Standard preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between bicalutamide related compound A isomer B and bicalutamide is not less than 2.0; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

In-Process Revision

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{18}H_{14}F_4N_2O_4S$ in the portion of Bicalutamide taken by the formula:

$$500C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Bicalutamide RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■1S (*USP29*)

BRIEFING

Bismuth Subsalicylate Tablets, page 1167 of *PF* 30(4) [July–Aug. 2004]. It is proposed to add a test for *Disintegration* to this proposed new monograph.

(BPC: M. Marques) RTS—42316-1

Add the following:

■Bismuth Subsalicylate Tablets

» Bismuth Subsalicylate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of bismuth subsalicylate ($C_7H_5BiO_4$).

Packaging and storage—Preserve in tight containers. Store between 15° and 30°.

Labeling—Label chewable Tablets to indicate that they are to be chewed before swallowing.

Identification—

A: It meets the requirements of the tests for *Bismuth* ⟨191⟩.

B: After acidifying with nitric acid, it meets the requirements of the test for *Salicylate* ⟨191⟩ with ferric chloride TS.

Disintegration ⟨701⟩**:** 10 minutes. [NOTE—This test does not apply for Tablets labeled as chewable.]

Assay—

Standard preparation—Transfer about 500 mg of bismuth, accurately weighed, to a 200-mL volumetric flask, dissolve in 12 mL of nitric acid, and dilute with 0.01 N nitric acid to volume. Transfer 10.0 mL of the solution so obtained into a 500-mL volumetric flask, and dilute with 1 N nitric acid to volume to obtain a concentration of 50 µg of bismuth per mL.

Assay preparation—Transfer an accurately weighed portion of finely powdered Tablets, equivalent to about 90 mg of bismuth subsalicylate, to a 200-mL volumetric flask, add about 150 mL of 1 N nitric acid, and sonicate for 2 minutes. Dilute with 1 N nitric acid to volume. Transfer 20.0 mL of the solution so obtained to a 100-mL volumetric flask, and dilute with 1 N nitric acid to volume. Centrifuge a portion at 4500 rpm for at least 10 minutes.

Procedure—Transfer 10.0 mL, accurately measured, of the *Assay preparation* and the *Standard preparation* to separate 50.0-mL volumetric flasks. Add 10.0 mL of 10% ascorbic acid solution and 25.0 mL of 20% potassium iodide solution into each volumetric flask, and dilute with 1 N nitric acid to volume. Concomitantly determine the absorbance of the solutions at the wavelength of maximum absorbance at about 463 nm with a suitable spectrophotom-

eter using the combined reagent solutions as the blank. Calculate the quantity, in mg, of $C_7H_5BiO_4$ in the portion of Tablets taken by the formula:

$$(362.11/208.98)(C)(A_U/A_S),$$

in which 362.11 and 208.98 are the molecular weights of bismuth subsalicylate and bismuth, respectively; C is the concentration, in ~~µg~~ mg per mL, of bismuth in the *Standard preparation;* and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP29*)

BRIEFING

Buspirone Hydrochloride, *USP 28* page 299. It is proposed to revise the test for *Content of chloride* to clarify that the content is measured using residual titration (also known as back titration).

(PA3: R. Ravichandran) RTS—42392-1

Change to read:

Content of chloride—Dissolve about 400 mg, accurately weighed, in 20 mL of water. Add 3 mL of nitric acid and 20.0 mL of 0.1 N silver nitrate VS. Gently boil the mixture for about 5 minutes. Filter, rinse the flask with about 80 mL of water divided into small portions, and filter each portion. Add 2 mL of 8% ferric ammonium sulfate. ~~and stir rapidly while titrating from a buret with 0.1 N ammonium thiocyanate VS to a faint red-brown endpoint.~~

■While stirring rapidly, titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS from a buret to a faint red-brown endpoint. Perform a blank determination (see *Residual Titrations* under *Titrimetry* ⟨541⟩.■1S (*USP29*)
Each mL of 0.1 N silver nitrate

■consumed■1S (*USP29*)
is equivalent to 3.545 mg of chloride: between 8.0% and 8.8% is found.

BRIEFING

Camphor, *USP 28* page 334. It is proposed to change the name of the test from *Water* to *Appearance of solution* to accurately reflect this procedure.

(PA7b: B. Davani) RTS—42258-1

Change to read:

~~**Water—**~~

■**Appearance of solution**—■1S (*USP29*)
A 1 in 10 solution in solvent hexane is clear.

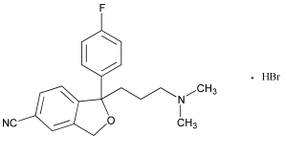
BRIEFING

Citalopram Hydrobromide. Because there is no existing *USP* monograph for this drug substance, a new monograph is proposed. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with the YMC Basic column. Typical retention times are about 28 minutes for citalopram and 25 minutes for citalopram related compound D.

(PA3: R. Ravichandran; NL: L. Paul; PSD: C. Okeke) RTS—41833-1; 41833-3; 41833-4

Add the following:

■Citalopram Hydrobromide



$C_{20}H_{21}FN_2O \cdot HBr$ 405.30

5-Isobenzofurancarbonitrile, 1-[3-(dimethylamino)propyl]-1-(4-fluorophenyl)-1,3-dihydro-, monohydrobromide.

In-Process Revision

1-[3-(Dimethylamino)propyl]-1-(*p*-fluorophenyl)-5-phthalancarbonitrile monohydrobromide [*59729-32-7*].

» Citalopram Hydrobromide contains not less than 98.0 percent and not more than 102.0 percent of $C_{20}H_{21}FN_2O \cdot HBr$, calculated on an anhydrous basis.

Packaging and storage—Preserve in well-closed containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Citalopram Hydrobromide RS. USP Citalopram Hydrobromide Related Compound D RS.*

Completeness of solution—The absorbance at 410 nm of a 2.5% w/v solution, in 96% alcohol, against a sample solvent in a 1-cm quartz cell is not more than 0.040.

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

C: A solution of 10 mg per mL meets the requirements of the test for *Bromide* ⟨191⟩.

Specific rotation ⟨781S⟩**:** between –0.2° and +0.2° at 20°.

Test solution: 25 mg per mL, in methanol.

pH ⟨791⟩**:** between 5.5 and 6.5, in a solution (0.5 in 100).

Water, *Method I* ⟨921⟩**:** not more than 0.5% using about 250 mg of sample.

Residue on ignition ⟨281⟩**:** not more than 0.1%. The sample is moistened with 2 mL of nitric acid and 5 drops of sulfuric acid.

Heavy metals, *Method II* ⟨231⟩**:** 0.002%.

Related compounds—

Buffer, Mobile phase, Diluent, and *Chromatographic system*—Prepare as directed in the *Assay.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Use the *Standard preparation,* as prepared in the *Assay.*

Working standard solution—Prepare a solution having a concentration of 0.625 µg per mL of citalopram hydrobromide through stepwise dilution of the *Standard solution* with *Mobile phase.*

System suitability solution—Dissolve an accurately weighed quantity of USP Citalopram Hydrobromide RS and USP Citalopram Related Compound D RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.001 mg per mL.

Sensitivity solution—Dilute 5.0 mL of the *Working standard solution* with *Diluent* to 50 mL to obtain a solution having 0.0625 µg of citalopram hydrobromide per mL.

Test solution—Use the *Assay preparation*.

Chromatographic system (see *Chromatography* ⟨621⟩)—Inject the *Diluent* as directed for *Procedure* to verify that there are no interfering peaks. Inject the *Sensitivity solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio is at least 3. Inject the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are 0.90 for citalopram related compound D and 1.0 for citalopram hydrobromide; the resolution, *R,* between citalopram related compound D and citalopram is not less than 1.8; the column efficiency is not less than 7000 theoretical plates for citalopram; the tailing factor for the citalopram hydrobromide peak is not less

than 0.8 and not more than 1.5; and the relative standard deviation for replicate injections is not more than 5% based on the citalopram peak.

Procedure—Separately inject equal volumes (about 20 µL) of the *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms for about 40 minutes, and measure the responses for the major peaks. Calculate the percentage of related compounds in the portion of Citalopram Hydrobromide taken by the formula:

$$100(C_S / C_T)(r_i / r_S)(324.39/405.30)(1/F),$$

in which C_S and C_T are the concentrations, in mg per mL, of Citalopram Hydrobromide in the *Working standard solution* and the *Test solution,* respectively; r_i is the peak response for each impurity obtained from the *Test solution;* r_S is the peak response for the citalopram peak, obtained from the *Working standard solution;* 324.39 and 405.30 are the molecular weights for citalopram and citalopram hydrobromide; and F is the relative response factor for each impurity relative to citalopram (free base) as presented in *Table 1.*

Table 1

Related Compound	Relative Retention Time	Relative Response Factor (*F*)	Limit (%)
1-(3-Dimethylaminopropyl)-1-(4′-fluorophenyl)-5-(4-dimethylaminobutyryl)-1,3-dihydrobenzofuran	0.13	0.34	NMT* 0.1
Citalopram related compound A	0.18	0.77	NMT 0.1
4-[4-Dimethylamino-1-(4′-fluorophenyl)-1-hydroxy-1-butyl]-3-hydroxymethyl benzonitrile	0.26	0.99	NMT 0.1
Citalopram related compound B	0.40	0.98	NMT 0.1
Citalopram related compound C	0.67	0.69	NMT 0.1
Citalopram related compound D	0.90	1.04	NMT 0.1
Citalopram hydrobromide	1.0	1.0	—
Citalopram related compound E	1.29	0.91	NMT 0.1
Unkown	—	1.0	NMT 0.1 each
Total known and unknown	—	—	NMT 0.2

* NMT = not more than.

In-Process Revision

Organic volatile impurities, *Method IV* ⟨467⟩**:** meets the requirements.

Assay—

Buffer—In a 1-L volumetric flask, dissolve about 1 g of sodium acetate in 800 mL of water, and add 6 mL of triethylamine. Adjust with acetic acid to a pH of 4.6, and dilute with water to volume.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer* and acetonitrile (80 : 20). The apparent pH is 5.0 ± 0.1. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of methanol and water (1 : 1).

Standard preparation—Dissolve an accurately weighed quantity of USP Citalopram Hydrobromide RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.625 mg per mL.

Assay preparation—Transfer about 62.5 mg of Citalopram Hydrobromide, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix to obtain a solution containing 0.625 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 239-nm detector and a 150-mm × 4.6-cm column that contains 5-µm packing L7. The flow rate is about 1 mL per minute. The column temperature is maintained at 50°. Inject the *Diluent* to verify that there are no interfering peaks. Inject the *Standard preparation,* and record the peak responses as directed for *Procedure*: the column efficiency is not less than 3000 theoretical plates; the tailing factor is not more than 3.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms for about 30 minutes, and measure the responses for the major peaks. Calculate the quantity, in percent of $C_{20}H_{21}FN_2O \cdot HBr$ in the portion of Citalopram Hydrobromide taken by the formula:

$$100(C_S / C_U)(r_U / r_S),$$

in which C_S and C_U are the concentrations, in mg per mL, of the *Standard preparation* and the *Assay preparation,* respectively; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP29*)

BRIEFING

Citalopram Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph is proposed. The proposed liquid chromatographic procedures in the *Assay* are performed with the Spherisorb ODS 1 column; the test for *Related compounds* uses an Inertsil-2 ODS column. The typical retention time for citalopram is about 6 minutes.

(PA3: R. Ravichandran; NL: L. Paul; PSD: Claudia Okeke) RTS—41833-2; 41833-5; 41833-6

Add the following:

■Citalopram Tablets

» Citalopram Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of citalopram free base ($C_{20}H_{21}FN_2O$).

In-Process Revision

Packaging and storage—Preserve in well-closed containers. Store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Citalopram Hydrobromide RS. USP Citalopram Related Compound A RS. USP Citalopram Related Compound B RS. USP Citalopram Related Compound C RS. USP Citalopram Related Compound E RS. USP Citalopram Related Compound F RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩—

Test specimen—Extract finely ground Tablet powder containing about 200 mg of citalopram with 30 mL of water, and filter. Add 1 mL of 1 N sodium hydroxide, and extract with 50 mL of cyclohexane by shaking for 10 minutes. Pass the cyclohexane layer through a silicone treated filter paper into a beaker. Reduce the filtrate down to 3 mL using gentle heat as necessary. Transfer the hot solution to a small centrifuge tube. Induce crystallization while cooling by scratching the side of the test tube with a spatula. Centrifuge the mixture, and decant off the cyclohexane. Dry the residue under vacuum in a desiccator. Mix approximately 2 mg of the residue with approximately 300 mg of potassium bromide, and record the IR spectrum.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

C: A solution of 2 mg per mL equivalent of citalopram in water meets the requirements of the test for *Bromide* ⟨191⟩.

Dissolution ⟨711⟩—[To come.]

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

Buffer, Diluent, Internal standard solution, Mobile phase, and *Chromatographic system*—Proceed as directed in the *Assay.*

Test solution—Transfer 1 Tablet to a 100-mL volumetric flask, add 10 mL of *Buffer,* and shake by mechanical means until disintegrated. Add 40 mL of methanol, and sonicate for about 5 minutes. Allow to cool to room temperature. Add sufficient volume of *Internal standard solution,* and dilute, stepwise if necessary, with *Diluent* to volume to obtain a *Test solution* having a concentration of about 0.1 mg per mL of citalopram and 0.025 mg per mL of internal standard. Pass a portion of this solution through a membrane filter (PVDF) having a 0.45-µm or finer porosity, and use the filtrate.

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Procedure—Proceed as directed in the *Assay.* Calculate the quantity, in mg, of $C_{20}H_{21}FN_2O$ in the portion of sample taken by the formula:

$$100(CV)(R_U / R_S)(324.39/405.30),$$

in which C is the concentration, in mg per mL, of USP Citalopram Hydrobromide RS in the *Standard solution; V* is the final volume, in mL, required to obtain the *Test solution;* R_U and R_S are the ratio of peak responses of citalopram to the internal standard in the *Test solution* and *Standard solution,* respectively; and 324.39 and 405.30 are the molecular weights of citalopram and citalopram hydrobromide, respectively.

Related compounds—

Phosphate buffer—Dissolve 3.15 g of potassium dihydrogen phosphate and 3.60 g of disodium hydrogen phosphate ($Na_2HPO_412H_2O$) in 1 L of water.

In-Process Revision

Mobile phase—Prepare a filtered and degassed mixture of *Phosphate buffer,* methanol, and acetonitrile (55 : 38 : 7). Adjust with phosphoric acid to a pH of 6.5. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Dissolve an accurately weighed quantity of USP Citalopram Hydrobromide RS in *Mobile phase* to obtain a solution having a known concentration of about 0.5 mg per mL.

Standard solution—Prepare a solution having a concentration of 0.625 µg per mL of citalopram hydrobromide through stepwise dilution of the *Standard stock solution* with *Mobile phase*.

Sensitivity solution—Prepare a solution having a concentration of 0.05 µg per mL of citalopram hydrobromide through stepwise dilution of the *Standard solution* with *Mobile phase*.

Related compounds stock solutions—Separately dissolve accurately weighed quantities of USP Citalopram Related Compound A RS, USP Citalopram Related Compound B RS, USP Citalopram Related Compound C RS, and USP Citalopram Related Compound E RS in *Mobile phase* to obtain stock solutions having known concentrations of about 0.1 mg per mL of each compound.

Peak identification solution—Prepare a mixture containing about 0.001 mg per mL of each of USP Citalopram Related Compound A RS, USP Citalopram Related Compound B RS, USP Citalopram Related Compound C RS, and USP Citalopram Related Compound E RS using the *Standard stock solution* as the diluent.

Resolution solution—Dilute 0.5 mL of *Citalopram related compound C stock solution* and 25.0 mL of the *Standard stock solution* with *Mobile phase* to 50 mL to obtain a solution containing 0.01 mg per mL of citalopram related compound C and 0.25 mg per mL of citalopram hydrobromide.

Test solution—Transfer 10 Tablets into a 200-mL volumetric flask, add 25 mL of *Phosphate buffer,* and shake by mechanical means until disintegrated. Add about 100 mL of a mixture of methanol and water (50 : 50), mix and sonicate for about 5 minutes. Allow to cool, dilute with a mixture of methanol and water (50 : 50) to volume, and mix thoroughly. Allow the excipients to settle. Dilute as necessary to obtain a final concentration of 0.5 mg per mL of citalopram. Pass a portion of this solution through a polytetrafluoroethylene (PTFE) membrane filter having a 0.45-µm or finer porosity, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with 239-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The column temperature is maintained at 45°. The flow rate is about 0.8 mL per minute. Inject the *Standard solution,* and record the peak responses as directed for *Procedure*: the citalopram peak shows no shoulders or excessive tailing; the column efficiency is not less than 5000 theoretical plates; the tailing factor is not more than 1.5; the capacity factor, k', is not less than 3.5; the relative standard deviation of both the retention time and the response for replicate injections is not more than 5%. Inject the *Sensitivity solution* into the chromatographic system and verify that the signal-to-noise ratio is at least 3. Inject the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, R, between citalopram related compound C and citalopram is not less than 3. Inject the *Peak identification solution,* and record the responses as directed for *Procedure:* the four related compound peaks are baseline resolved from each other and the citalopram peak.

Procedure—Inject a volume (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in each Tablet by the formula:

$$100(r_i / r_S)(324.39/405.30)(C_S / C_T)(1/F),$$

in which r_i is the individual peak response for each citalopram related compound obtained from the *Test solution;* r_S is the response of the corresponding peak in the *Standard solution;* 324.39 and 405.30 are the molecular weights of citalopram and citalopram hydrobromide, respectively; F is the relative response factor of each impurity relative to citalopram (free base); and C_S and C_T are the concentrations, in mg per mL, of citalopram hydrobromide in the *Standard solution* and the *Test solution,* respectively. The limits for the related compounds are listed in *Table 1.*

Table 1

Related Compound	Relative Retention Time	Relative Response Factor *(F)*	Limit (%)
Citalopram related compound A	0.43	0.77	NMT* 0.1
Citalopram related compound B	0.60	0.98	NMT 0.25
Citalopram related compound C	0.83	0.69	NMT 0.25
Citalopram related compound E	1.32	0.91	NMT 0.1
Unknown	—	1.0	NMT 0.1 each
Total known and unknown	—	—	NMT 0.7

* NMT = not more than.

Assay—

Buffer—Transfer about 0.71 g of anhydrous dibasic sodium phosphate to a 500-mL volumetric flask, add about 250 mL of water. Shake to dissolve, then dilute with water to volume.

Diluent—Prepare a solution of methanol and *Buffer* (80 : 20).

Internal standard solution—Dissolve an accurately weighed amount of USP Citalopram Related Compound F RS in *Diluent* and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.25 mg per mL.

Mobile phase—Prepare a filtered and degassed solution of *Diluent* containing about 770 mg of dodecyltrimethylammonium bromide per L. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Dissolve an accurately weighed quantity of USP Citalopram Hydrobromide RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 1.25 mg of citalopram hydrobromide per mL.

Standard preparation—Pipet 5.0 mL of the *Standard stock preparation* and 5.0 mL of the *Internal standard solution* into a 50-mL volumetric flask. Dilute with *Diluent* to volume, and mix.

Assay preparation—Transfer 10 Tablets to a 200-mL volumetric flask, add 25 mL of *Buffer,* and shake by mechanical means until disintegrated. Add 100 mL of methanol, and sonicate for about 5 minutes. Allow to cool to room temperature, then dilute with *Diluent* to volume. Allow to stand until the residue settles before taking an aliquot for dilution. Transfer an accurately measured volume of the upper clear solution to a 50-mL volumetric flask to obtain a final concentration equivalent to between 0.090 and 0.10 mg per mL

In-Process Revision

of citalopram. Add 5.0 mL of *Internal standard solution,* dilute with *Diluent* to volume, and mix. Pass a portion through a filter (PTFE) having a 0.45-µm or finer porosity.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. The column temperature is maintained at 45°. Inject the *Standard preparation,* and record the peak responses as directed for *Procedure*: the relative retention times are about 1.36 for citalopram related compound F and 1.0 for citalopram; the resolution, *R,* between citalopram and citalopram related compound F is not less than 1.5; the column efficiency is not less than 2000 theoretical plates, calculated from the citalopram peak; and the relative standard deviation for replicate injections is not more than 1.5% for the citalopram peak.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the citalopram peaks. Calculate the quantity, in percent of label claim, of citalopram per Tablet taken by the formula:

$$100(C_S / C_U)(324.39/405.30)(R_U / R_S),$$

in which C_S and C_U are the concentrations, in mg per mL, of USP Citalopram Hydrobromide RS in the *Standard preparation* and Citalopram Hydrobromide the *Assay preparation,* respectively; 324.39 and 405.30 are the molecular weights of citalopram and citalopram hydrobromide, respectively; R_U and R_S are the ratio of peak responses of citalopram to the internal standard obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP29*)

BRIEFING

Anhydrous Citric Acid, *USP 28* page 483 and page 607 of *PF* 31(2) [Mar.–Apr. 2005]. It is proposed to change the reagent used in the test for *Sulfates* from dibasic potassium sulfate to potassium sulfate.

(EMC: J. Lane) RTS—42402-2

Add the following:

■**Packaging and storage—**Preserve in tight containers. No storage requirements specified.■2S (*USP28*)

Drug release, *Method B* ⟨724⟩—
ACID STAGE—
Medium: 0.1 N hydrochloric acid; 900 mL.
Apparatus 2 (paddles constructed of, or coated with, polytef being used): 50 rpm.
Procedure—At the end of 2 hours, remove each Tablet, or the major portion thereof if the Tablet is not intact, from the individual vessels, and subject them to the test in the *Buffer stage*. To the 0.1 N hydrochloric acid remaining in each vessel, add 20.0 mL of 5 N sodium hydroxide, and stir for 5 minutes. Determine the amount of $C_{14}H_{10}Cl_2NNaO_2$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 276 nm on filtered portions of the solution under test in comparison with a Standard solution prepared as follows. Transfer about 68 mg of USP Diclofenac Sodium RS, accurately weighed, to a 100-mL volumetric flask, add 10.0 mL of 0.1 N sodium hydroxide, dilute with water to volume, and mix. Transfer ~~2.0 mL~~

■3.0 mL■2S (*USP28*) of this solution to a second 100-mL volumetric flask, dilute with a mixture of 0.1 N hydrochloric acid and 5 N sodium hydroxide (900 : 20) to volume, and mix. This Standard solution contains about 13.6 µg of USP Diclofenac Sodium RS per mL.
BUFFER STAGE—
pH 6.8 Phosphate buffer—Dissolve 76 g of tribasic sodium phosphate in water to obtain 1000 mL of solution. Mix 250 mL of this solution with 750 mL of 0.1 N hydrochloric acid, and, if necessary, adjust with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of 6.8 ± 0.05.
Medium: pH 6.8 Phosphate buffer; 900 mL.
Apparatus 2: 50 rpm.
Procedure—At the end of 45 minutes, determine the amount of $C_{14}H_{10}Cl_2NNaO_2$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 276 nm on filtered portions of the solutions under test, suitably diluted with *Medium,* in comparison with a Standard solution prepared as follows. Transfer about 68 mg of USP Diclofenac Sodium RS, accurately weighed, to a 100-mL volumetric flask, add 10.0 mL of 0.1 N sodium hydroxide, dilute with water to volume, and mix. Transfer 3.0 mL of this solution to a second 100-mL volumetric flask, dilute with *Medium,* as obtained in the *Buffer stage,* to volume, and mix. This Standard solution contains about 0.02 mg of USP Diclofenac Sodium RS per mL.
Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{14}H_{10}Cl_2NNaO_2$ is dissolved.

BRIEFING

Docusate Calcium, *USP 28* page 683—See briefing under *Docusate Sodium.*

(PA4: E. Gonikberg) RTS—42224-4

In-Process Revision

Change to read:

Limit of bis(2-ethylhexyl)maleate—

~~*Electrolyte solution*—In a 250-mL borosilicate glass beaker dissolve 21.2 g of lithium perchlorate in 175 mL of water, and adjust by the dropwise addition of glacial acetic acid to a pH of 3.0. Transfer to a 200-mL volumetric flask, dilute with water to volume, and mix.~~

~~*Sample stock solution*—Transfer the equivalent of 12.5 g of anhydrous Docusate Calcium, accurately weighed, to a 150-mL beaker, add about 85 mL of isopropyl alcohol, stir to dissolve, and transfer to a 250-mL volumetric flask. Rinse the beaker with another 85-mL portion of isopropyl alcohol, stirring, if necessary, to dissolve any residual Docusate Calcium, combine the rinsing with the solution in the volumetric flask, dilute with isopropyl alcohol to volume, and mix.~~

~~*Standard solution*—Transfer 25 mg of USP Bis(2-ethylhexyl) maleate RS, accurately weighed, to a 25-mL volumetric flask, dissolve in isopropyl alcohol, dilute with isopropyl alcohol to volume, and mix. In a second 100-mL volumetric flask combine 10.0 mL of this solution, 50.0 mL of *Sample stock solution*, and 20.0 mL of *Electrolyte solution*, mix, and allow to stand for 2 minutes. Dilute with isopropyl alcohol to volume, and mix.~~

~~*Test solution*—In a 100-mL volumetric flask combine 50.0 mL of *Sample stock solution* with 20.0 mL of *Electrolyte solution*, mix, and allow to stand for 2 minutes. Dilute with isopropyl alcohol to volume, and mix.~~

~~*Procedure*—Transfer a portion of the *Test solution* to a polarographic cell, and deaerate by bubbling through the solution, for 15 minutes, nitrogen that has previously been passed through isopropyl alcohol. Continue to flush the surface of the solution with the nitrogen, insert the dropping mercury electrode of a suitable polarograph (see *Polarography* ⟨801⟩), and record the polarogram from −0.9 to −1.5 volts, using a saturated calomel electrode as the reference electrode. Determine the height of the polarogram at the half-wave potential, at about −1.2 volts, measuring from the baseline. From this height subtract the height, at the same potential, of the polarogram obtained from a blank solution prepared by diluting 20.0 mL of *Electrolyte solution* with isopropyl alcohol to 100 mL in a volumetric flask and mixing. Designate this corrected height as H_u. Concomitantly and similarly determine the height of the polarogram of the *Standard solution,* and subtract the blank value from it. Designate the result as H_s. The value, H_u, is not greater than one-half H_s, corresponding to not more than 0.4% of bis(2-ethylhexyl) maleate.~~

■*Mobile phase, Standard solution,* and *Chromatographic system*—Proceed as directed under *Docusate Sodium*.

Test solution—Transfer about 1.0 g of Docusate Calcium, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with ethanol to volume, and mix. If necessary, warm the mixture using the steam bath to achieve a complete dissolution.

Procedure—Separately inject equal volumes (about 3 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the bis(2-ethylhexyl)maleate peaks. Calculate the percentage of bis(2-ethylhexyl)maleate in the portion of Docusate Calcium taken by the formula:

$$5C/W(r_U / r_S),$$

in which C is the concentration, in µg per mL, of USP Bis(2-ethylhexyl)maleate RS in the *Standard solution; W* is the weight, in mg, of Docusate Calcium taken to prepare the *Test solution;* and r_U and r_S are the peak responses of bis(2-ethylhexyl)maleate obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.4% is found.■1S *(USP29)*

BRIEFING

Docusate Potassium, *USP 28* page 684—See briefing under *Docusate Sodium*.

(PA4: E. Gonikberg) RTS—42224-3

Change to read:

Limit of bis(2-ethylhexyl) maleate—~~Place 12.5 g of Docusate Potassium, previously dried and accurately weighed, in a 100-mL volumetric flask. Pipet 20 mL of pH 10 alkaline borate buffer (see under *Solutions* in the section *Reagents, Indicators, and Solutions*) into the flask, and add about 70 mL of alcohol. Swirl the flask and contents, with gentle warming if necessary, until the solid dissolves. Adjust the reaction dropwise, if necessary, with 1 N sodium hydroxide to a pH of 10. Add alcohol to volume, and proceed as directed in the test for *Bis(2-ethylhexyl)maleate* under *Docusate Sodium,* beginning with "Transfer a portion of this solution to a polarographic cell." The diffusion current for the test solution of Docusate Potassium is not greater than one-half the diffusion current of the solution containing the added bis(2-ethylhexyl)maleate [not more than 0.4% of bis(2-ethylhexyl)maleate].~~

■*Mobile phase, Standard solution,* and *Chromatographic system*—Proceed as directed under *Docusate Sodium.*

Test solution—Transfer about 1.0 g of Docusate Potassium, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with ethanol to volume, and mix. If necessary, warm the mixture using the steam bath to achieve a complete dissolution.

Procedure—Separately inject equal volumes (about 3 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the bis(2-ethylhexyl)maleate peaks. in which C is the concentration, in µg per mL, of USP Bis(2-ethylhexyl)maleate RS in the *Standard solution; W* is the weight, in mg, of Docusate Potassium taken to prepare the *Test solution;* and r_U and r_S are the peak responses of bis(2-ethylhexyl)maleate obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.4% is found.■1S (*USP29*)

BRIEFING

Docusate Sodium, *USP 28* page 685; **Docusate Calcium,** *USP 28* page 683; **Docusate Potassium,** *USP 28* page 684. It is proposed to replace the current test for *Limit of bis(2-ethylhexyl)maleate* with a simple HPLC procedure that eliminates the use of a polarograph, an instrument which is no longer widely employed because of environmental concerns associated with mercury handling and disposal. The liquid chromatographic procedure is based on analyses performed with a Zorbax XDB-C18 Rapid Resolution brand of L1 column. The typical retention time for bis(2-ethylhexyl)maleate is about 1.5 minutes; docusate elutes at the void volume at about 0.4 minutes.

(PA4: E. Gonikberg) RTS—42224-1; 42224-2

Change to read:

Limit of bis(2-ethylhexyl)maleate—~~Place 12.5 g of Docusate Sodium, previously dried at 105° for 2 hours and accurately weighed, in a 100-mL volumetric flask. Pipet 20 mL of pH 10 alkaline borate buffer (see under *Solutions* in the section *Reagents, Indicators, and Solutions*) into the flask, and add about 70 mL of alcohol. Swirl the flask and contents, with gentle warming, until the solid dissolves. Cool, and add alcohol to volume. Transfer a portion of this test solution to a polarographic cell that is immersed in a water bath regulated at 25 ± 0.5°, and deaerate by bubbling through the solution, for 10 minutes, purified nitrogen that previously has been passed through a solution prepared by mixing 4 volumes of alcohol and 1 volume of water. Insert the dropping mercury electrode of a suitable polarograph, and record the polarogram from −0.5 volt to −1.6 volts, using a saturated calomel electrode as the reference electrode (see *Polarography* ⟨801⟩). Determine the height of the diffusion current at the current plateau at about −1.45 volts. To a separate 50-mL portion of the solution add 25 mg of USP Bis(2-ethylhexyl)maleate RS, accurately weighed, and when solution is complete, deaerate a portion of the resulting solution, and record the polarogram, as directed in the foregoing. The diffusion current for the test solution of Docusate Sodium is not greater than one-half the diffusion current of the solution containing the added USP Bis(2-ethylhexyl)maleate RS [not more than 0.4% of bis(2-ethylhexyl) maleate].~~

■*Mobile phase*—Prepare a filtered and degassed mixture of ethanol and water (78 : 22). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

In-Process Revision

Standard solution—Dissolve an accurately weighed quantity of USP Bis(2-ethylhexyl)maleate RS in ethanol, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 80 µg per mL.

Test solution—Transfer about 1.0 g of Docusate Sodium, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with ethanol to volume, and mix. If necessary, warm the mixture using the steam bath to achieve a complete dissolution.

Chromatographic system (see *Chromatography* ⟨621⟩—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 3-cm column that contains 3.5-µm packing L1. The column temperature is maintained at 30°. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 3 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the bis(2-ethylhexyl)maleate peaks. Calculate the percentage of bis(2-ethylhexyl)maleate in the portion of Docusate Sodium taken by the formula:

$$5C/W(r_U/r_S),$$

in which C is the concentration, in µg per mL, of USP Bis(2-ethylhexyl)maleate RS in the *Standard solution; W* is the weight, in mg, of Docusate Sodium taken to prepare the *Test solution;* and r_U and r_S are the peak responses of bis(2-ethylhexyl)maleate obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.4% is found. ■1S (*USP29*)

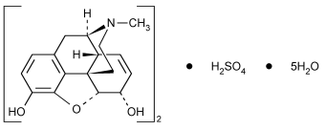
BRIEFING

Drospirenone. Because there is no existing *USP* monograph for this drug substance, a new monograph is being proposed. The liquid chromatographic procedures in the test for *Chromatographic purity* are based on analyses performed with the Symmetry brand of L1 column.

(PA1: C. Anthony) RTS—41672-1

Add the following:

■Drospirenone



$C_{24}H_{30}O_3 \cdot 5H_2O$ 366.49

(6*R*,7*R*,8*R*,9*S*,10*R*,13*S*,14*S*,15*S*,16*S*,17*S*)-1,3′,4′,6,6a,7,8,9,10,11,12,13,14,15,15a,16-Hexadecahydro-10,13-dimethylspiro-[17*H*-dicyclopropa[6,7:15,16]cyclopenta[*a*]phenanthrene-17,2′(5′*H*)-furan]-3,5′(2*H*)-dione. 17-Hydroxy-6*β*,7*β*:15*β*,16*β*-dimethylene-3-oxo-17α-pregn-4-ene-21-carboxylic acid, γ-lactone [*67392-87-4*].

» Drospirenone contains not less than 98.0 percent and not more than 102.0 percent of $C_{24}H_{30}O_3$, calculated on the anhydrous, solvent-free basis.

Packaging and storage—Preserve in tight containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Drospirenone RS.*

In-Process Revision

Identification—

A: *Infrared Absorption* ⟨197M⟩.

B: The retention time of the major peaks in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Melting range, *Class 1* ⟨741⟩: between 198° and 203°. [NOTE—Dry over silica gel for not less than 24 hours prior to testing.]

Specific rotation ⟨781S⟩**:** between –186° and –196°.

Water, *Method I* ⟨921⟩**:** not more than 0.2%.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩**:** not more than 0.002%.

Organic volatile impurities, *Method IV* ⟨467⟩**:** meets the requirements.

Solvent—Use dimethylformamide.

Limit of 1,2-dimethoxyethane and diisopropyl ether—

Standard solution—Prepare a solution of 1,2-dimethoxyethane and diisopropyl ether in dimethylformamide to obtain a solution having known concentrations of about 0.1 mg and 0.05 mg per mL, respectively.

Test solution—Dissolve an accurately weighed portion of Drospirenone in dimethylformamide to obtain a solution having a known concentration of about 50 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a headspace injector, a flame-ionization detector, and a 0.25-mm × 30-m capillary column coated with a 1.4-µm film of liquid phase G43. The column temperature is programmed according to the following steps: it is held at 40° for 10 minutes, then increased at a rate of 5° per minute to 70°; it is then increased at a rate of 30° per minute to 220°. The injection port temperature is maintained at 160°, and the detector temperature is maintained at 250°. The carrier gas is helium, flowing at a rate of about 32 ± 8 cm per second. [NOTE—For pressure-controlled systems, a column pressure of approximately 130 kPa will be necessary.] Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.6 for diisopropyl ether and 1.0 for 1,2-dimethoxyethane; and the relative standard deviation for six injections of the *Standard solution* is not more than 4.0%.

Procedure—Transfer 2.0 mL each of the *Test solution* and the *Standard solution* to separate headspace vials, and seal. The vials are maintained at 80° for 60 minutes prior to headspace injection. Record the chromatograms, and measure the peak areas for the 1,2-dimethoxyethane and diisopropyl ether peaks. Separately calculate the percentage of 1,2-dimethoxyethane and diisopropyl ether in the portion of Drospirenone taken by the formula:

$$100(C_S/C_U)(r_U/r_S),$$

in which C_S is the concentration, in mg per mL, of 1,2-dimethoxyethane or diisopropyl ether in the *Standard solution;* C_U is the concentration, in mg per mL, of drospirenone in the *Test solution;* and r_U and r_S are the 1,2-dimethoxyethane or diisopropyl ether peak areas in the chromatograms obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.2% of 1,2-dimethoxyethane and 0.1% of diisopropyl ether are found.

Chromatographic purity—

Solvent A, Solvent B, Mobile phase, Diluent, Standard preparation, Assay preparation, and *Chromatographic system*—Proceed as described in the *Assay.*

Procedure—Separately inject equal volumes (about 10 L) of the *Standard preparation,* the *Assay preparation,* and the

In-Process Revision

Diluting solution into the chromatograph, and record the chromatograms. Calculate the percentage of each impurity in the portion of Drospirenone taken by the formula:

$$100F(r_i / r_s),$$

in which F is the relative response factor equal to 1.3 for 15β,16β-methylene-3-oxo-4,6-pregnadiene-21,17-carbolactone with a relative retention time of 0.78, 0.5 for 15β,16β-methylene-3-oxo-17α-pregn-4-ene-21,17-carbolactone with a relative retention time of 0.73, and 1.0 for all other impurities; r_i is the peak area for each impurity; and r_s is the sum of the responses of all the peaks. Disregard peaks that are less than 0.05% of the drospirenone peak. Not more than 0.1% of any individual impurity is found; and not more than 0.4% of total impurities is found.

Assay—

Solvent A—Use water.

Solvent B— Use acetonitrile.

Mobile phase—Use variable mixtures of *Solvent A* and *Solvent B,* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a degassed mixture of water and acetonitrile (1 : 1).

Standard preparation—Dissolve accurately weighed quantities of USP Drospirenone RS in *Diluent* to obtain a solution having known concentrations of about 2 mg per mL.

Assay preparation—Transfer about 20 mg of drospirenone, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 245-nm detector and a 4.0-mm × 25-cm column containing 5-µm packing L1 that is maintained at a constant temperature of about 30°. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solvent A* (%)	*Solvent B* (%)	Elution
0–28.5	64	36	isocratic
28.5–45	64→10	36→90	linear gradient
45–45.5	10→0	90→100	linear gradient
45.5–52	0	100	isocratic
52–53	0→64	100→36	linear gradient
53–80	64	36	equilibration

Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 7000 theoretical plates; the tailing factor is not more than 2.5; and the relative standard deviation for replicate injections is not more than 1.0%. No peaks with a signal-to-noise ratio >10 should be present in the chromatogram of the *Diluting solution* between 5 and 45 minutes.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the response for the drospirenone peak. Calculate the quantity, in mg, of $C_{24}H_{30}O_3$ in the portion of Drospirenone taken by the formula:

$$10C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Drospirenone RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP29*)

In-Process Revision

BRIEFING

Egg Phospholipids, page 401 of *PF* 29(2) [Mar.–Apr. 2003]. On the basis of comments received, it is proposed to change the Definition to reflect the various compositions of egg phospholipids in available products. It is also proposed to revise the limits in the tests for *Acid value* and *Peroxide value.*

(PPI: J. Kelly) RTS—41300-1

Add the following:

■Egg Phospholipids

» ~~Egg Phospholipids is a mixture of occurring phospholipids obtained from the yolk of hens' eggs and is suitable for use as an emulsifying agent in injectable emulsions. It contains not less than 60 percent (w/w) of phosphatidylcholine and not less than 5.0 percent (w/w) of phosphatidylethanolamine. The mixture may also contain not more than 3 percent (w/w) of sphingomyelin. It may also contain other related phospholipids. It may contain not more than 0.2 percent (w/w) DL-α-tocopherol when added as a preservative.~~ Egg Phospholipids is a mixture of naturally occurring phospholipids obtained from the yolk of hens' eggs, which is suitable for use as an emulsifying agent in injectable emulsions. The contents of phosphatidylcholine, phosphatidylethanolamine, and other related phospholipids are indicated in the labeling. It may also contain a suitable stabilizer.

Packaging and storage—Preserve under nitrogen in a sealed container, and store at a temperature of –10° or below.

USP Reference standards ⟨11⟩—*USP Endotoxin RS. USP Phosphatidylcholine RS. USP Phosphatidylethanolamine RS.* ~~*USP Sphingomyelin RS.*~~

Acid value ⟨401⟩**:** not more than ~~4.5.~~ 3.0.

Peroxide value ⟨401⟩**:** not more than ~~10.~~ 20.

Microbial limits ⟨61⟩—It meets the requirements of the test for absence of *Salmonella* species and *Escherichia coli.* The total ~~aerobic~~ microbial count does not exceed 100 cfu per g.

Bacterial endotoxins ⟨85⟩—It contains not more than 20 USP Endotoxin Units per g.

Water, *Method I* ⟨921⟩—Dissolve about 2 g, accurately weighed, in 50 mL of anhydrous methyl alcohol. Protect from atmospheric moisture during transfer. Determine the water content titrimetrically, using an accurately measured portion of this solution: not more that 6.0% is found.

Limit of nonphosphatidyl lipids—

Solvent: a mixture of chloroform and methyl alcohol (9 : 1).

Chromatographic column—Transfer 125 g of silica gel having an average pore size of 6 nm into a 600-mL beaker. [NOTE—Silica gel containing between 3% and 5% of moisture volatiles when heated at 200° has been found to be suitable.] Prepare a slurry with 400 mL of *Solvent,* and transfer to a 4.5-cm chromatographic column (see *Column Chromatography* under *Chromatography* ⟨621⟩). Drain the *Solvent* through the column to a level of about 1 cm above the silica gel bed. Place a plug of glass wool on top of the bed. Rinse the beaker and the column walls with 400 mL of *Solvent,* and drain to about 0.5 cm above the silica gel. Discard the eluted rinses, and place a suitable flask beneath the column.

Test solution—Transfer about 10 g of Egg Phospholipids, accurately weighed, to a 150-mL beaker, add 50 mL of *Solvent,* and mix to dissolve.

Procedure—Transfer the *Test solution* to the *Chromatographic column,* and drain to about 0.5 cm above the silica gel at a rate of about 8 to 10 mL per minute. Rinse the column containing the *Test solution* with three 20-mL portions of *Solvent,* allowing each rinse to pass through the column before adding the next. Add additional *Solvent* onto the column until 800 mL of eluate has been collected. Evaporate the eluate in a tared round-bottom, 250-mL flask to dryness, using a suitable rotary evaporator and a water bath maintained between 50° and 60°. If silica gel is visible after evaporation, redissolve the residue in *Solvent,* filter through a sintered-glass, medium-porosity funnel, wash the funnel with 25 mL of *Solvent,* transfer back to the round-bottom flask, and evaporate to dryness. Place the flask in a vacuum oven at about 55° for 1 hour. Transfer to a desiccator for not less than 1 hour, then weigh again. Repeat until the weight is constant within 1 mg. Calculate the gain in weight: not more than 5% of the weight of the Egg Phospholipids taken is found.

Content of phospholipids—

Solution A—Use filtered and degassed isopropyl alcohol.

Solution B—Use filtered and degassed hexane.

Solution C—Use filtered and degassed water.

Mobile phase—Use variable mixtures of *Solution A, Solution B,* and *Solution C* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Solvent—Prepare a mixture of isopropyl alcohol, hexane, and water (1 : 1 : 1).

Standard solutions—Transfer accurately weighed quantities of USP Phosphatidylcholine RS and USP Phosphatidylethanolamine RS~~, and USP Sphingomyelin RS~~ to separate flasks, dissolve each in *Solvent,* and dilute quantitatively and stepwise, if necessary, with *Solvent* to obtain *Standard solutions* having known concentrations of about 6 mg per mL, 1 mg per mL, and 0.5 mg per mL, respectively.

Test solution—Transfer about 1 g of Egg Phospholipids, accurately weighed, to a 100-mL volumetric flask, add 50 mL of *Solvent,* and mix. Dilute with *Solvent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with an evaporative light-scattering detector and a 4.6-mm × 10-cm column that contains 3-µm packing L1. The flow rate is about 1.2 mL per minute. The column temperature is maintained at a constant temperature of about 25°. [NOTE—The parameters of detector operation may be adjusted to achieve an appropriate signal-to-noise ratio.] The chromatograph is programmed as follows:

Time (minutes)	*Solution A* (%)	*Solution B* (%)	*Solution C* (%)	Elution
0	58	40	2	equilibration
0–7	58→52	40	2→8	linear gradient
7–15	52	40	8	isocratic

Chromatograph the *Standard solutions,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.6 for phosphatidylethanolamine and 1.0 for phosphatidylcholine~~, and 1.2 for sphingomyelin~~; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of each of the *Standard solutions* and the *Test solution* into the chromatograph, record the chromatograms, and identify the peaks of the relevant analytes in the chromatogram of the *Test solution* by comparison with the chromatograms obtained from the *Standard solutions.* Measure the

In-Process Revision

areas of the analyte peaks. Plot the logarithms of the relevant responses versus the logarithms of the concentrations, in mg per mL, of each analyte obtained from the *Standard solutions,* and determine the regression line using a least-squares analysis. The correlation coefficient for the regression line is not less than 0.995. From the graphs so obtained, determine the concentration, *C,* in mg per mL, of the relevant analyte in the *Test solution.* Separately calculate the percentages of phosphatidylethanolamine and phosphatidylcholine~~, and sphingomyelin~~ in the portion of Egg Phospholipids taken by the formula:

$$10(C/W)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of the USP Reference Standard in the relevant *Standard solution; W* is the weight, in g, of Egg Phospholipids taken to prepare the *Test solution;* and r_U and r_S are the peak areas of the relevant analytes in the chromatograms obtained from the *Test solution* and the *Standard solution,* respectively. ■1S (*USP29*)

BRIEFING

Multiple Electrolytes Injection Type 2, *USP 28* page 717 and page 3220 of the *First Supplement*—See briefing under *Anticoagulant Sodium Citrate Solution*.

Assay for citrate *(if present)*—

~~*Mobile phase*—Prepare a filtered and degassed solution of 0.05 N sulfuric acid. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~

~~*Standard preparations*—Dissolve an accurately weighed quantity of anhydrous sodium citrate, previously dried at 180° for 18 hours, in water to obtain a stock solution having a known concentration of about 10 mg per mL. Dilute accurately measured volumes of this stock solution quantitatively with water to obtain three *Standard preparations* having known concentrations of about 0.5, 1.0, and 2.0 mg, respectively, of anhydrous sodium citrate per mL.~~

~~*Assay preparation*—Where the labeled quantity is greater than 10 mEq of citrate per liter, dilute an accurately measured volume of Injection quantitatively with water to obtain a solution containing about 0.01 mEq of citrate per mL. Where the labeled quantity is 10 mEq of citrate or less per liter, use the undiluted Injection as the *Assay preparation.*~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector, a 7.8-mm × 4-cm guard column containing packing L17, and a 7.8-mm × 30-cm analytical column containing packing L17, and is maintained at about 60°. The flow rate is about 0.8 mL per minute. Chromatograph the *Standard preparation* containing 1 mg of anhydrous sodium citrate per mL, and record the responses as directed for *Procedure*: the tailing factor for the analyte peak is not more than 1.5, and the relative standard deviation for replicate injections is not more than 2.0%.~~

~~*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard preparations* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Plot the responses of the *Standard preparations* versus concentration, in mg of anhydrous sodium citrate per mL, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, *C,* in mg of anhydrous sodium citrate equivalent per mL, in the *Assay preparation.* Calculate the quantity, in mEq per liter, of citrate ($C_6H_8O_7$) in the Injection taken by the formula:~~

~~$$(C/258.07)(L/D),$$~~

~~in which 258.07 is the molecular weight of anhydrous sodium citrate, *L* is the labeled quantity, in mEq per liter, of citrate in the Injection, and *D* is the quantity, in mEq per mL, of citrate in the *Assay preparation,* based on the labeled quantity and the extent of dilution.~~

■*Mobile Phase* and *Chromatographic System*—Proceed as directed under *Assay for Citric Acid/Citrate and Phosphate* ⟨345⟩.

Standard preparation—Dissolve an accurately weighed quantity of USP Citric Acid RS in freshly prepared 1 mM sodium hydroxide to obtain a solution having a known concentration of about 0.3 mEq of citrate ($C_6H_5O_7$) per L.

Assay preparation—Dilute an accurately measured volume of Injection quantitatively with freshly prepared sodium hydroxide to obtain a solution having a concentration of about 0.3 mEq of citrate per L in 1 mM sodium hydroxide.

In-Process Revision

Procedure—Proceed as directed for *Procedure* under general chapter ⟨345⟩, calculate the quantity, in mEq per L, of citrate ($C_6H_5O_7$) in the Injection taken by the formula:

$$C_S D(r_U / r_S),$$

in which C_S is the concentration, in mEq per L, of citrate in the *Standard preparation; D* is the dilution factor; and r_U and r_S are the citrate peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S *(USP29)*

(Official April 1, 2009)

In-Process Revision

BRIEFING

Enoxaparin Sodium Injection, page 1882 of *PF* 29(6) [Nov.–Dec. 2003]. It is proposed to correct the designation of the column used in the *Free sulfate content* test in this new monograph.

(HDQ: M. Marques) RTS—42324

Add the following:

■Enoxaparin Sodium Injection

» Enoxaparin Sodium Injection is a sterile solution of Enoxaparin Sodium in Water for Injection. Its potency value is not less than 90.0 percent and not more than 110.0 percent of the potency stated on the label in terms of USP Anti-factor X_a Units. It may contain, in multiple-dose containers, a suitable antimicrobial preservative, such as benzyl alcohol.

Packaging and storage—Preserve in single-dose or multiple-dose containers in Type I glass. Store between 20° and 25°, excursions permitted between 15° and 30°.

Labeling—Label it to indicate the amount (milligrams) of Enoxaparin Sodium in the total volume of contents. The label states also that the Enoxaparin Sodium starting material is porcine derived.

USP Reference standards ⟨11⟩**—***USP Benzyl Alcohol RS. USP Endotoxin RS. USP Enoxaparin Sodium RS. USP Enoxaparin Sodium Solution for Bioassays RS.*

Identification—

A: Add 2 mL of water to the total content of a single-dose container or to 0.4 mL from a multiple-dose container and 1 mL of 2% w/v protamine sulfate solution in a glass test tube, and mix. A creamy white precipitate is formed.

B: *Ultraviolet Absorption* ⟨197U⟩—

Standard solution: 500 µg per mL.

Medium: 0.01 N hydrochloric acid. The spectra exhibit maxima at 231 ± 2 nm.

Test solution—Transfer the total content of a single-dose container or 0.4 mL from a multiple-dose container to a 100-mL volumetric flask. Dilute with *Medium* to volume.

C: It meets the requirements of the test for *Sodium* ⟨191⟩.

Clarity (see *Clarity and Degree of Opalescence of Liquids* ⟨625⟩)—The clarity of the solution does not exceed that of suspension I.

Color (see *Degree of Color of Liquids, Method I* ⟨627⟩)—The color of the solution is not more than degree 4 of the range of reference solution of the most appropriate color for a solution containing 100 mg of enoxaparin sodium per mL.

pH ⟨791⟩**:** between 5.5 and 7.5.

Benzyl alcohol content *(if present)*—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (1 : 1).

Standard solution—Transfer about 200 mg, accurately weighed, of USP Benzyl Alcohol RS to a 200-mL volumetric flask, and dilute with *Mobile phase* to volume.

Test solutions—Transfer 5.0 mL of the Injection to a 50-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 258-nm detector and a 4.0-mm × 25-cm stainless steel column that contains packing L1[1]. The flow rate is about 1.0 mL per minute maintained constant to ±10%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution,* record the chromatograms, and measure the peak responses. Calculate the percentage of benzyl alcohol in the portion of enoxaparin sodium solution taken by the formula:

$$(A_T \times M)/(A_S \times 20),$$

in which, A_T and A_S are areas of the benzyl alcohol peaks in the chromatograms of the *Test solution* and the *Standard solution,* respectively; and M is the mass of the benzyl alcohol dissolved to prepare the *Standard solution*. The percentage (w/v) of benzyl alcohol in the Injection is not less than 1.35% and not more than 1.65%.

Bacterial endotoxins ⟨85⟩**—**It contains less than 0.01 USP Endotoxin Units per unit of anti-factor X_a activity in USP Anti-factor X_a Units.

Free sulfate content—

Mobile phase—Prepare a 3.0 mM sodium carbonate solution. Make adjustments if necessary.

Standard sulfate stock solution—Prepare a solution of sodium sulfate in the *Mobile phase* in a suitable sulfate-free container such that the concentration of sulfate is accurately known at about 1 g per L. Transfer about 5 g, accurately weighed, of the solution to a similar container, and add *Mobile phase* to obtain about 25 g of solution.

Standard solutions—Prepare standard solutions at concentrations of 0.1, 0.5, 1, 2, 4, and 5 µg per g by appropriate dilution of the *Standard sulfate stock solution* in the *Mobile phase*.

System suitability solution—Prepare a solution containing 3 µg per mL of sulfate anion and 5 µg per mL of oxalate anion.

Test solutions—Transfer about 200 mg of a 100 mg per mL Enoxaparin Sodium Injection, accurately weighed, to a suitable previously tared sulfate-free vial. Add *Mobile phase* to obtain a total mass, M_S, of about 20 g.

Chromatographic system (see *Chromatography* ⟨621⟩)—The ion chromatograph is equipped with a conductivity detector and a 4-mm × 5-cm anion-exchange guard column, a 4-mm × 25-cm anion-exchange analytical column, ~~pre-packed with L## and L## packings~~ both containing L61 packing (see *Chromatography* ⟨621⟩), and a micromembrane anion autosuppressor[2] or a suitable chemical suppression system. The flow rate is about 2.0 mL per minute.

Procedure—Chromatograph about 25 µL of the *System suitability solution*. The resolution between the sulfate and oxalate peaks is greater than 1. Separately inject 25 µL of the *Standard solutions* and the *Test solution* into the chromatograph and plot the standard curve of sulfate peak height as a function of sulfate concentration (in µg per g) in the *Standard solutions*. From the sulfate peak height in the chromatogram determine the concentration of sulfate, *T,* in µg per g, in the *Test solution* using the standard curve. Calculate the percentage of free sulfate content (w/v) in the Injection taken using the formula:

$$T \times M_S / 10m,$$

[1] Available as Lichrospher 100 RP 18, Pore size 100 Å, Particle size 5 µm.

[2] Available as Anion Self-Regenerating Suppressor (ASRS) from Dionex Inc.

in which *m* is the mass, in mg, of Enoxaparin Sodium Injection aliquoted to prepare the *Test solution*. The percentage of free sulfate is not more than 0.12%.

Anti-factor II_a activity—Proceed as directed for *Anti-factor II_a activity* under *Enoxaparin Sodium*.

Anti-factor X_a to anti-factor II_a ratio—The ratio of the numerical value of the anti-factor X_a activity in USP Anti-Factor X_a Units per mg to the numerical value of the anti-factor II_a activity in USP Anti-Factor II_a Units per mg, as determined by the *Assay (anti-factor X_a activity)* and the *Anti-factor II_a activity,* respectively, is not less than 3.3 and not more than 5.3.

Other requirements—It meets the requirements under *Injections* ⟨1⟩, *Particulate Matter in Injections* ⟨788⟩, and *Sterility Tests* ⟨71⟩.

Assay (anti-factor X_a activity)—Proceed as directed for *Assay (anti-factor X_a activity)* under *Enoxaparin Sodium*.■1S (*USP29*)

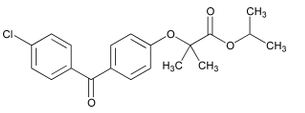
BRIEFING

Fenofibrate. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on validated methods of analysis, is being proposed. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with the Lichrospher RP 18e brand of L1 column. The typical retention time for fenofibrate is about 13 minutes.

(PA4: E. Gonikberg; NL: L. Paul; PSD: C. Okeke) RTS—42290-1

Add the following:

■Fenofibrate



$C_{20}H_{21}ClO_4$ 360.83

Isopropyl 2-[4-(4-chlorobenzoyl)phenoxy]-2-methylpropanoate [*49562-28-9*].

» Fenofibrate contains not less than 98.5 percent and not more than 101.0 percent of $C_{20}H_{21}ClO_4$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed, light-resistant containers. Store at room temperature.

USP Reference standards ⟨11⟩**—***USP Fenofibrate RS. USP Fenofibrate Related Compound A RS. USP Fenofibrate Related Compound B RS. USP Fenofibrate Related Compound C RS.*

Color of solution ⟨631⟩**—**

Reference solution—Mix 5 mL of *Matching Fluid G* and 95 mL of dilute hydrochloric acid (1 in 40).

Test solution—Transfer 500 mg of Fenofibrate to a 10-mL volumetric flask, dissolve in and dilute with acetone to volume, and mix.

Procedure—Proceed as directed under *Color and Achromicity* ⟨631⟩: the *Test solution* is clear and not more intensely colored than the *Reference solution*.

Identification—*Infrared Absorption* ⟨197K⟩.

Melting range, *Class 1a* ⟨741⟩**:** between 79° and 82°.

In-Process Revision

Acidity—Dissolve 1.0 g in 50 mL of alcohol previously neutralized to phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS: not more than 0.2 mL of 0.1 N sodium hydroxide VS is required to change the color of the indicator to pink.

Loss on drying ⟨731⟩**—**Dry it in vacuum over phosphorus pentoxide at 60° to constant weight: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.1%, determined on 1.0 g.

Chloride ⟨221⟩**—**

Test solution—Add 25 mL of water to 5.0 g of Fenofibrate, and heat at 50° for 10 minutes. Cool, dilute with water to 50.0 mL, filter, and use the filtrate. [NOTE—Retain the remaining portion of the *Test solution* for the test for *Sulfate*.]

Procedure—Use 10 mL of the *Test solution*: it shows no more chloride than corresponds to 0.15 mL of 0.020 N hydrochloric acid (0.01%).

Sulfate ⟨221⟩**—**Use 10 mL of the *Test solution* retained from the test for *Chloride*: it shows no more sulfate than corresponds to 0.15 mL of 0.020 N sulfuric acid (0.01%).

Heavy metals, *Method II* ⟨231⟩**:** 0.002%.

Related compounds—

Mobile phase—Proceed as directed in the *Assay.*

Impurity standard solution—Dissolve accurately weighed quantities of USP Fenofibrate RS, USP Fenofibrate Related Compound A RS, USP Fenofibrate Related Compound B RS, and USP Fenofibrate Related Compound C RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having known concentrations of about 1 µg per mL each of fenofibrate, fenofibrate related compound A, and fenofibrate related compound B, and about 2 µg per mL of fenofibrate related compound C.

Test solution—Prepare as directed for the *Assay preparation*.

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay*. In addition, chromatograph the *Impurity standard solution*, and record the peak responses as directed for *Procedure*: the resolution, *R,* between fenofibrate related compound A and fenofibrate related compound B is not less than 1.5.

Procedure—Separately inject equal volumes (about 20 µL) of the *Impurity standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and identify the fenofibrate peak and the peaks due to the impurities and degradation products listed in *Table 1*. Measure the responses for the major peaks, and calculate the percentage of each of fenofibrate related compound A, fenofibrate related compound B, and fenofibrate related compound C in the portion of Fenofibrate taken by the formula:

$$10C/W(r_U/r_S),$$

in which C is the concentration, in µg per mL, of the appropriate fenofibrate related compound in the *Impurity standard solution; W* is the weight, in mg, of fenofibrate taken to prepare the *Test solution;* and r_U and r_S are the peak responses of the appropriate fenofibrate related compound obtained from the *Test solution* and the *Impurity standard solution,* respectively.

In-Process Revision

Table 1

Name	Relative Retention Time	Limit (%)
(4-Chlorophenyl)(4-hydroxyphenyl)methanone[1]	0.34	0.1
2-[4-(4-Chlorobenzoyl)phenoxy]-2-methylpropanoic acid (fenofibric acid)[2]	0.36	0.1
(3*RS*)-3-[4-(4-Chlorobenzoyl)phenoxy]butan-2-one	0.50	0.1
Methyl 2-[4-(4-chlorobenzoyl)phenoxy]-2-methyl-propanoate	0.65	0.1
Ethyl 2-[4-(4-chlorobenzoyl)phenoxy]-2-methyl-propanoate	0.80	0.1
(4-Chlorophenyl)[4-(1-methylethoxy)phenyl]methanone	0.85	0.1
1-Methylethyl 2-[[2-[4-(4-chlorobenzoyl)phenoxy]-2-methylpropanoyl]oxy]-2-methylpropanoate[3]	1.35	0.2
Any other impurity	—	0.1

[1] Fenofibrate related compound A
[2] Fenofibrate related compound B
[3] Fenofibrate related compound C

Calculate the percentage of any other impurity in the portion of Fenofibrate taken by the formula:

$$10C/W(r_U/r_S),$$

in which C is the concentration, in µg per mL, of fenofibrate in the *Impurity standard solution; W* is as defined above; r_U is the peak response for each impurity obtained from the *Test solution;* and r_S is the peak response of fenofibrate obtained from the *Impurity standard solution.* In addition to not exceeding the limits for each impurity in *Table 1*, not more than 0.5% of total impurities is found.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water acidified with phosphoric acid to a pH of 2.5 (70: 30). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Fenofibrate RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1.0 mg per mL.

Assay preparation—Transfer about 100 mg of Fenofibrate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 286-nm detector and a 4.0-mm × 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromato-

graph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for six replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{20}H_{21}ClO_4$ in the portion of Fenofibrate taken by the formula:

$$100C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Fenofibrate RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP29*)

BRIEFING

Flurazepam Hydrochloride, *USP 28* page 864 and page 3232 of the *First Supplement.* In stating the limits in *Identification* test *B,* it is proposed to calculate the absorptivities on the anhydrous rather than on the dried basis.

(PA3: R. Ravichandran) RTS—42304-1

Change to read:

Identification—

A: *Infrared Absorption* ⟨197K⟩—[NOTE—Do not grind excessively, as decomposition may occur.]

B: *Ultraviolet Absorption* ⟨197U⟩—

Solution: 10 µg per mL.

Medium: sulfuric acid in methanol (1 in 36).

Absorptivities at 239 nm, calculated on the ~~dried~~ ■anhydrous■1S (*USP29*) basis, do not differ by more than 3.0%.

C: Prepare a solution of it in methanol containing 3 mg per mL. Apply 10 µL of this solution and 10 µL of a methanol solution of USP Flurazepam Hydrochloride RS containing 3 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of ethyl acetate and ammonium hydroxide (200 : 1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by viewing under short-wavelength UV light: the R_F value of the principal spot in the chromatogram of the test solution corresponds to that obtained from the solution of the Reference Standard.

D: To 2 mL of a solution (1 in 20), add 1 mL of 2 N nitric acid: the solution responds to the tests for *Chloride* ⟨191⟩, 5 drops of silver nitrate TS being used.

BRIEFING

Glutaral Concentrate, *USP 28* page 909. It is proposed to slightly modify the lower limit of the test for *Specific gravity* to accommodate variation in the manufacturing process for this product.

(PA7: B. Davani) RTS—41889-1

Change to read:

Specific gravity ⟨841⟩**:** between ~~1.128~~ ■1.126■1S (*USP29*) and 1.135 at ~~20°/20°.~~ ■20°.■1S (*USP29*)

BRIEFING

Glyburide and Metformin Hydrochloride Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph, based on validated methods of analysis, is being proposed. The liquid chromatographic procedures in the tests for *Related compounds—glyburide* and *Dissolution* and in the *Assay for glyburide* are based on analyses performed with the Zorbax-Rx C8 brand of L7 column. The typical retention time for the glyburide peak is about 14 minutes. The liquid chromatographic procedures in the test for *Chromatographic purity—metformin hydrochloride*

In-Process Revision

and in the *Assay for metformin hydrochloride* are based on analyses performed with the µBondapak C18 brand of L1 column. The typical retention time for the metformin peak is about 7.5 minutes.

(PA4: E. Gonikberg; BPC: M. Marques; NL: W. Paul; PSD: C. Okeke) RTS—41684-1

Add the following:

■Glyburide and Metformin Hydrochloride Tablets

» Glyburide and Metformin Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of glyburide ($C_{23}H_{28}ClN_3O_5S$) and metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$).

Packaging and storage—Preserve in tight, light-resistant containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Glyburide RS. USP Glyburide Related Compound A RS. USP Metformin Hydrochloride RS. USP Metformin Related Compound B RS. USP Metformin Related Compound C RS.*

Identification—

A: GLYBURIDE—

Infrared Absorption⟨197K⟩—Prepare the test specimen as follows. Grind 5 tablets to a fine powder. Add 25 mL of water, and shake for 5 minutes. Add 25 mL of chloroform, and shake for an additional 5 minutes. Centrifuge at 2500 rpm for 5 minutes. Transfer the lower chloroform layer to another container, evaporate the solvent under a stream of nitrogen, and dry the extract at 60° for 3 hours: the IR absorption spectrum of a potassium bromide dispersion prepared from the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Glyburide RS.

B: METFORMIN HYDROCHLORIDE—

The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay for metformin hydrochloride.*

Dissolution ⟨711⟩**—**

GLYBURIDE—

Medium: 0.05 M boric acid and 0.05 M potassium chloride solution, prepared by dissolving 3.09 g of boric acid and 3.73 g of potassium chloride in approximately 250 mL of water, adjusting with 1 N sodium hydroxide to a pH of 9.5, and diluting with water to 1 L; 500 mL.

Apparatus 2: 75 rpm.

Time: 30 minutes.

Determine the amount of glyburide ($C_{23}H_{28}ClN_3O_5S$) dissolved by employing the following method.

Phosphate buffer—Dissolve 28.7 g of monobasic ammonium phosphate in water, and dilute with water to 1 L.

Mobile phase—Prepare a filtered and degassed mixture of *Phosphate buffer* and acetonitrile (1 : 1), and adjust with 1 N sodium hydroxide to a pH of 5.3. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Transfer about 10 mg of USP Glyburide RS, accurately weighed, to a 100-mL volumetric flask, dissolve in 20 mL of acetonitrile, and dilute with *Medium* to volume. Dilute further with *Medium* to obtain a solution having a glyburide concentration, in mg per mL, of *L*/500, where *L* is the label claim, in mg, of glyburide.

Test solution—Pass a portion of the solution under test through a 0.45-µm polypropylene filter or a 1-µm glass fiber filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L7. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 30°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 5000 theoretical plates; the tailing factor is between 0.8 and 2.0; and the relative standard deviation for replicate injections is not more than 2%.

Procedure—Separately inject equal volumes (about 200 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the glyburide peaks. Calculate the quantity of glyburide dissolved, expressed as a percentage of the glyburide label claim, by the formula:

$$\frac{r_U \times C_S \times 500 \times 100}{r_S \times L},$$

in which r_U and r_S are the peak responses for the *Test solution* and *Standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Standard solution;* 500 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and L is the Tablet label claim, in mg, of glyburide.

Tolerances—Not less than 85% (Q) of the labeled amount of glyburide is dissolved in 30 minutes.

METFORMIN HYDROCHLORIDE—

Medium: 0.05 M phosphate buffer, pH 6.8, prepared by dissolving 6.8 g of monobasic potassium phosphate in 1000 mL of water, and adjusting with 0.2 N sodium hydroxide to a pH of 6.8 ± 0.1; 1000 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Determine the amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved by employing the following method.

Standard solution—Dissolve an accurately weighed quantity of USP Metformin Hydrochloride RS in *Medium*. Dilute with *Medium*, if necessary, to obtain a solution having a concentration, in mg per mL, of metformin hydrochloride of about L/1000, where L is the label claim, in mg, of metformin hydrochloride.

Test solution—Pass a portion of the solution under test through a 0.45-µm polypropylene filter or a 1-µm glass fiber filter.

Procedure—Determine the amount of metformin hydrochloride dissolved by employing UV absorption at the wavelength of maximum absorbance at about 232 nm on portions of the *Test solution* in comparison with the *Standard solution*. Calculate the percentage of metformin hydrochloride dissolved, expressed as a percentage of the metformin hydrochloride label claim, by the formula:

$$\frac{A_U \times C_S \times 1000 \times 100}{A_S \times L},$$

in which A_U and A_S are the absorbances obtained from the *Test solution* and *Standard solution,* respectively; C_S is the concentration, in mg per mL, of USP Metformin Hydrochloride RS in the *Standard solution;* 1000 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and L is the Tablet label claim in mg.

Tolerances—Not less than 85% (Q) of the labeled amount of metformin hydrochloride is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements for *Weight variation* for metformin hydrochloride and for *Content uniformity* for glyburide.

In-Process Revision

Related compounds—

GLYBURIDE—

Diluent, Mobile phase, and *Chromatographic system*—Prepare as directed in the *Assay for glyburide*.

Standard stock solution—Prepare as directed for the *Standard preparation* in the *Assay.*

Standard solution—Transfer 1.0 mL of the *Standard stock solution* to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay for glyburide*.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all the peak responses. Calculate the percentage of glyburide related compound A in the portion of Tablets taken by the formula:

$$100CFVD(r_i / r_S)/NL,$$

in which C is the concentration, in mg per mL, of glyburide in the *Standard solution; F* is the relative response factor of glyburide related compound A and is equal to 0.8; V is the volume in which the sample is dissolved to prepare the *Test solution; D* is any further dilution of the sample; r_i is the peak response for glyburide related compound A in the *Test solution;* r_S is the peak response for glyburide in the *Standard solution; N* is the number of Tablets taken to prepare the *Test solution;* and L is the glyburide label claim in mg per Tablet: not more than 1.0% is found.

Calculate the percentage of any other impurity in the portion of Tablets taken by the formula:

$$100CVD(r_i / r_S)/NL,$$

in which r_i is the peak response for each impurity obtained from the *Test solution,* and the other terms are as defined above: not more than 0.2% of any other impurity is found; and the sum of all impurities, excluding glyburide related compound A, is not more than 0.50%. Disregard any peak less than 0.05% and also disregard any peak observed in the blank.

Chromatographic purity—

METFORMIN HYDROCHLORIDE—

Mobile phase and *Chromatographic system*—Prepare as directed in the *Assay for metformin hydrochloride*.

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay for metformin hydrochloride.*

Procedure—Inject a volume (about 5 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure all the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(r_i / r_s),$$

in which r_i is the peak response for each impurity, and r_s is the sum of the responses of all the peaks: not more than 0.1% of any individual impurity is found; and not more than 0.5% of total impurities is found. Disregard any peak less than 0.05%, and disregard any peak observed in the blank.

Assay for glyburide—

Ammonium phosphate buffer solution—Dissolve 28.8 g of monobasic ammonium phosphate in water, and dilute with water to 1000 mL.

Mobile phase—Prepare a filtered and degassed mixture of *Ammonium phosphate buffer solution* and acetonitrile (60 : 40), and adjust with 1 N sodium hydroxide solution to a pH of 5.3. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Use a mixture of acetonitrile and water (50 : 50).

Standard preparation—Transfer an accurately weighed quantity of USP Glyburide RS to a suitable volumetric flask. Dissolve first in acetonitrile, using 50% of the final volume, then dilute with water to volume, and mix, to obtain a solution having a known concentration of about 0.25 mg of glyburide per mL. Dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.025 mg per mL.

System suitability intermediate preparation—Prepare a solution of USP Glyburide Related Compound A RS in *Diluent* having a concentration of 0.025 mg per mL. Transfer 50 µL of this solution to a 50-mL volumetric flask, and dilute with *Standard preparation* to volume.

System suitability preparation—Transfer an accurately weighed quantity of USP Metformin Hydrochloride RS, and dilute quantitatively with the *System suitability intermediate preparation* to obtain a solution having a known concentration of about 5.0 mg per mL.

Assay preparation—Dissolve not fewer than 5 Tablets in *Diluent* by stirring with a magnetic stirring bar for at least 1 hour. Dilute accurately, and stepwise, if necessary, to obtain a solution having a glyburide concentration of approximately 0.025 mg per mL, based on the label claim. Centrifuge a portion of this solution at 3000 rpm for 10 minutes, and use the clear supernatant. [NOTE—Retain a portion of the solution for the *Assay for metformin hydrochloride.*]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L7. The flow rate is about 1.2 mL per minute. The column temperature is maintained at 40°. Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure*: for the peak due to glyburide, the capacity factor, k', is not less than 7; the column efficiency is not less than 3000 theoretical plates; and the relative standard deviation for replicate injections is not more than 1.5%. For the peak due to glyburide related compound A, the relative retention time is approximately 0.30 with respect to glyburide; and the relative standard deviation for replicate injections is not more than 10%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms for about 1.25 times the retention time of the glyburide peak, and measure the responses for the major peaks. Calculate the quantity, in mg per Tablet, of glyburide ($C_{23}H_{28}ClN_3O_5S$) by the formula:

$$CVD(r_U / r_S)/N,$$

in which C is the concentration, in mg per mL, of USP Glyburide RS in the *Standard preparation; V* is the volume, in mL, used to prepare the *Assay preparation; D* is the dilution factor of the *Assay preparation;* r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively; and N is the number of Tablets used to prepare the *Assay preparation.*

Assay for metformin hydrochloride—

Buffer solution—Transfer 1.0 g each of sodium heptanesulfonate and sodium chloride to a 2000-mL volumetric flask, add 1800 mL of water, and mix. Adjust with 0.06 M phosphoric acid to a pH of 3.85, and dilute with water to volume.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (90 : 10). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Use a 2.5% solution of acetonitrile in water.

Standard preparation—Dissolve an accurately weighed quantity of USP Metformin Hydrochloride RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with

In-Process Revision

Diluent to obtain a solution having a known concentration of about 0.25 mg per mL. Use sonication if necessary to achieve a complete dissolution.

System suitability preparation—Dissolve suitable quantities of USP Metformin Related Compound B RS and USP Metformin Related Compound C RS in *Diluent* to obtain a solution containing about 25 µg of each per mL. Pipet 0.5 mL of this solution into a 50-mL volumetric flask, and dilute with the *Standard preparation* to volume.

Assay preparation—Quantitatively dilute a portion of the *Assay preparation,* obtained as directed for *Assay for glyburide,* with water to obtain a solution having an expected concentration of about 0.25 mg of metformin hydrochloride per mL, based on the label claim.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 218-nm detector and a 3.9-mm × 30-cm column that contains 10-µm packing L1. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 30°. Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.86 for metformin related compound B, 1.0 for metformin, and about 2.1 to 2.3 for metformin related compound C [NOTE—This impurity can have a variable retention time]; the resolution, *R,* between metformin related compound B and metformin is not less than 1.5; the tailing factor for the metformin peak is not less than 0.8 and not more than 2.0; and the relative standard deviation for replicate injections is not more than 1.5% for the metformin peak and not more than 10% for each of the peaks due to metformin related compound B and metformin related compound C.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms until after the elution locus of metformin related compound C; and measure the responses for the major peaks. Calculate the quantity, in mg per Tablet, of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) by the formula:

$$CVD(r_U / r_S)/N,$$

in which C is the concentration, in mg per mL, of USP Metformin Hydrochloride RS in the *Standard preparation; V* is the volume, in mL, used to prepare the *Assay preparation; D* is the dilution factor of the *Assay preparation;* r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively; and N is the number of Tablets used to prepare the *Assay preparation.* ■1S (*USP29*)

BRIEFING

Hypromellose Ophthalmic Solution, *USP 28* page 990 and page 3246 of the *First Supplement.* It is proposed to remove references to the *Hypromellose* monograph, in preparation for revising the *Hypromellose* monograph with changes resulting from the harmonization process.

(EMC: J. Lane) RTS—42401-1

Change to read:

Identification—

A: ~~It meets the requirements of *Identification* test *C* under *Hypromellose.*~~

■Pour a few mL of Ophthalmic Solution onto a glass plate, and allow the water to evaporate: a thin, self-sustaining film results. ■1S (*USP29*)

B: Heat 5 mL of Ophthalmic Solution in a test tube over a low flame: the warm solution turns cloudy but clears upon chilling.

In-Process Revision

BRIEFING

Ketoprofen, *USP 28* page 1099. To provide the needed accuracy for potency determination, it is proposed to change the procedure in the *Assay* by increasing the sample weight from 200 to 450 mg.

(PA2: C. Anthony) RTS—42292-1

Change to read:

Assay—Dissolve about ~~200 mg~~

■450 mg■1S (*USP29*)
of Ketoprofen, accurately weighed, in 25 mL of alcohol. Add 25 mL of water and several drops of phenol red TS, and titrate with 0.1 N sodium hydroxide having been standardized by a similar titration of primary standard benzoic acid. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium hydroxide is equivalent to 25.43 mg of $C_{16}H_{14}O_3$.

BRIEFING

Metformin Hydrochloride Extended-Release Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph, based on validated methods of analysis, is being proposed. The liquid chromatographic procedures in the test for *Chromatographic purity* and in the *Assay* are based on analyses performed with the µBondapak C18 brand of L1 column. The typical retention time for metformin is about 7.5 minutes.

(PA4: E. Gonikberg; BPC: M. Marques; NL: L. Paul; PSD: C. Okeke) RTS—41431-1; 41431-2; 41008-2; 42250-1; 42232-1; 42207-2; 42374-1

In-Process Revision

Add the following:

■Metformin Hydrochloride Extended-Release Tablets

» Metformin Hydrochloride Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$).

Packaging and storage—Preserve in well-closed, light-resistant containers, and store at controlled room temperature.

Labeling—When more than one *Dissolution Test* is given, the labeling states the *Dissolution Test* used only if *Test 1* is not used.

USP Reference standards ⟨11⟩—*USP Metformin Hydrochloride RS. USP Metformin Related Compound B RS. USP Metformin Related Compound C RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—

TEST 1—

Medium: pH 6.8 phosphate buffer prepared by dissolving 6.8 g of monobasic potassium phosphate in 1000 mL of water and adjusting with 0.2 N sodium hydroxide to a pH of 6.8 ± 0.1; 1000 mL.

Apparatus 2: 100 rpm, for Tablets labeled to contain 500 mg.

Apparatus 1: 100 rpm, for Tablets labeled to contain 750 mg.

Times: 1, 3, and 10 hours.

Procedure—Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by UV absorption at the wavelength of maximum absorbance at about 232 nm on portions of the solution under test passed through a 0.45-µm hydrophilic polyethylene filter, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium*.

Calculate the amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), in percentage, released at each time point by the formula:

$$\frac{[C \times (A_U / A_S) \times (V - V_S) + (C_{60} \times V_S) + (C_{180} \times V_S)] \times 100}{L}$$

in which C is the concentration, in mg per mL, of the Standard solution; A_U and A_S are the absorbances of the solution under test and the Standard solution, respectively; V is the initial volume, in mL, of *Medium* in the vessel; V_S is the volume, in mL, withdrawn from the vessel for previous samplings; C_{60} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 1 hour; C_{180} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 3 hours; 100 is the conversion factor to percentage; and L is the Tablet label claim in mg.

Tolerances—The percentages of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	500-mg Tablet, amount dissolved	750-mg Tablet, amount dissolved
1	between 20% and 40%	between 22% and 42%
3	between 45% and 65%	between 49% and 69%
10	not less than 85%	not less than 85%

TEST 2—If the product complies with this test, the labeling indicates that the product meets *USP Dissolution Test 2*.

Medium: Prepare as directed for *Medium* in *Test 1;* 1000 mL.

Apparatus 2: 100 rpm.

Times: 1, 2, 6, and 10 hours.

Procedure—Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by UV absorption at the wavelength of maximum absorbance at about 232 nm on portions of the solution under test passed through a 0.45-µm polyethylene filter, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium*. Calculate the content of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), C_t, in mg per mL, in the *Medium* at each time point, *t,* by the formula:

$$\frac{A_U \times C_s \times D_U}{A_s}$$

in which A_U and A_S are the absorbances of the solution under test and the Standard solution, respectively; C_S is the concentration of metformin hydrochloride, in mg per mL, in the Standard solution; and D_U is the dilution factor of the solution under test. Calculate the percentage of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved at each time point by the following formulas:

Percentage dissolved at the first time point (1 hour):

$$\frac{C_1 \times 1000 \times 100}{L}$$

in which C_1 is the content of metformin hydrochloride, in mg per mL, in the *Medium* at the first time interval; 1000 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and L is the Tablet label claim in mg.

Percentage dissolved at the second time point (2 hours):

$$\frac{C_2 \times (1000 - SV_1) + C_1 \times SV_1 \times 100}{L}$$

in which C_2 is the content of metformin hydrochloride, in mg per mL, in the *Medium* at the second time interval; 1000 is the volume, in mL, of *Medium; SV_1* is the volume, in mL, of the sample withdrawn at 1 hour; C_1 is the content of metformin hydrochloride, in mg per mL, in the *Medium* at 1 hour; 100 is the conversion factor to percentage; and L is the Tablet label claim in mg.

Percentage dissolved at the *n*th time point:

$$\frac{C_n \times [1000 - (n-1)SV] + (C_1 + C_2 + ... + C_{n-1}) \times SV \times 100}{L}$$

in which C_n is the content of metformin hydrochloride, in mg per mL, in the *Medium* at the *n*th time interval; n is the time interval of interest; SV is the volume, in mL, of sample withdrawn at each time interval; C_1, C_2, C_3, ... C_{n-1} is the content of metformin hydrochloride, in mg per mL, in the *Medium* at each time interval; 100 is the conversion factor to percentage; and L is the Tablet label claim in mg.

Tolerances—The percentages of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 20% and 40%
2	between 35% and 55%
6	between 65% and 85%
10	not less than 85%

TEST 3—If the product complies with this test, the labeling indicates that the product meets *USP Dissolution Test 3*.

Medium, Apparatus, and *Procedure*—Proceed as directed for *Test 1*.

Times: 1, 2, 5, and 12 hours for Tablets labeled to contain 500 mg; and 1, 3, and 10 hours for Tablets labeled to contain 750 mg.

Procedure—Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by UV absorption at the wavelength of maximum absorbance at about 232 nm on portions of the solution under test passed through a 0.45-µm hydrophilic polyethylene filter, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium*. Calculate the amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), in percentage, released at each time point by the formula:

$$\frac{[C \times (A_U / A_S) \times (V - V_S) + (C_{60} \times V_S) + (C_{120} \times V_S) + (C_{300} \times V_S)] \times 100}{L}$$

in which C is the concentration, in mg per mL, of the Standard solution, A_U and A_S are the absorbances of the solution under test and the Standard solution, respectively; V is the initial volume, in mL, of *Medium* in the vessel; V_S is the volume, in mL, withdrawn from the vessel for previous samplings; C_{60} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 1 hour; C_{120} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 3 hours; C_{300} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 5 hours; 100 is the conversion factor to percentage; and L is the Tablet label claim in mg.

In-Process Revision

Tolerances—The percentages of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

FOR TABLETS LABELED TO CONTAIN 500 MG

Time (hours)	Amount dissolved
1	between 20% and 40%
2	between 35% and 55%
5	between 60% and 80%
12	not less than 85%

FOR TABLETS LABELED TO CONTAIN 750 MG

Time (hours)	Amount dissolved
1	between 22% and 42%
3	between 49% and 69%
10	not less than 85%

TEST 4—If the product complies with this test, the labeling indicates that the product meets *USP Dissolution Test 4*.

Medium: Prepare as directed for *Medium* in *Test 1;* 1000 mL.

Apparatus 2: 100 rpm.

Times: 1, 3, 6, and 10 hours.

Procedure—Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by UV absorption at the wavelength of maximum absorbance at about 250 nm (shoulder) on portions of the solution under test passed through a 0.45-µm polyethylene filter, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium*. Calculate the content of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), C_t, in mg per mL, in the *Medium* at each time point, *t,* by the formulas specified in *Test 2.*

Tolerances—The percentages of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
1	between 20% and 40%
3	between 45% and 65%
6	between 65% and 85%
10	not less than 85%

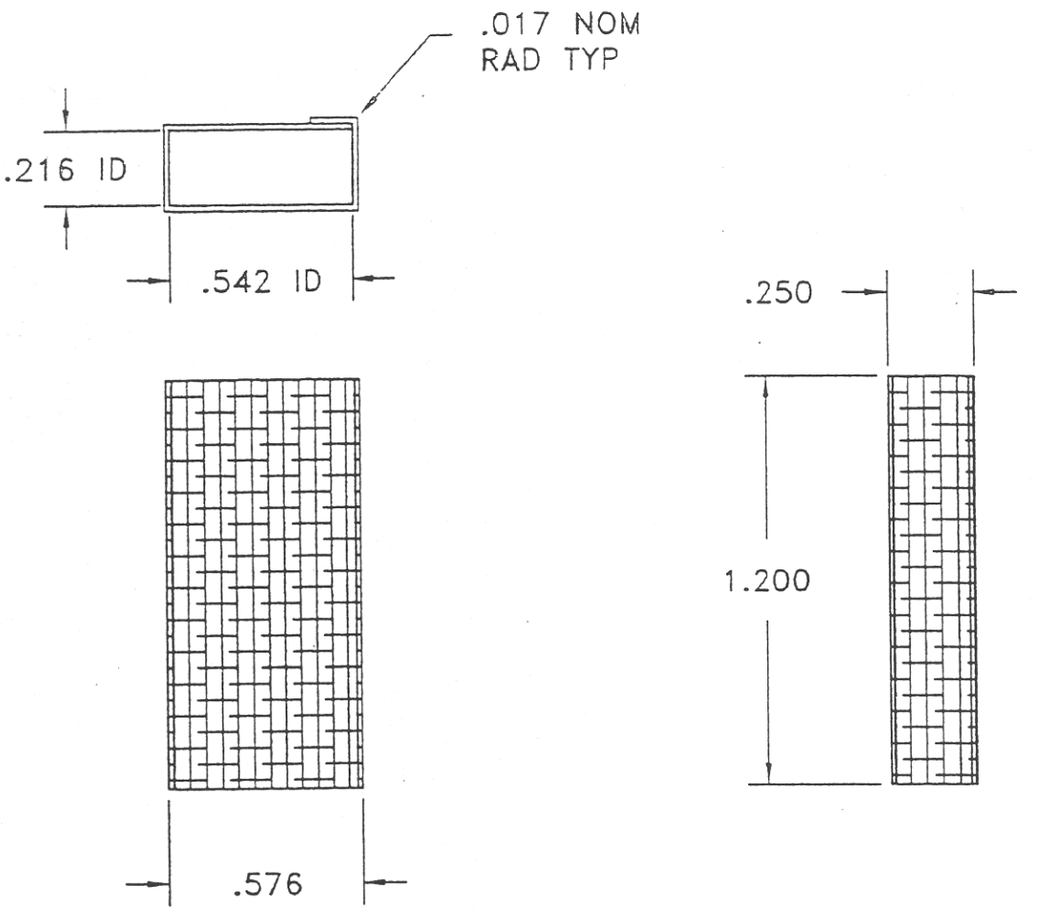
TEST 5—If the product complies with this test, the labeling indicates that the product meets *USP Dissolution Test 5.*

Medium: pH 6.8 phosphate buffer prepared by dissolving 6.8 g of monobasic potassium phosphate in 1000 mL of water and adjusting with 0.2 N sodium hydroxide to a pH of 6.8 ± 0.1; 900 mL, deaerated.

Apparatus 1: 100 rpm, with the vertical holder described below.

Times: 2, 8, and 16 hours.

Procedure—Place a vertical sample holder into each basket (see *Figures 1* and *2*). Place one Tablet inside the sample holder, making sure that the Tablets are vertical at the bottom of the baskets. Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by UV absorption at the wavelength of maximum absorbance at about 250 nm on portions of the solution under test passed through a 0.45-µm polyethylene filter, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium*. Calculate the content of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), C_t, in mg per mL, in the *Medium* at each time point, *t,* by the formulas specified in *Test 2.*



NOTES:

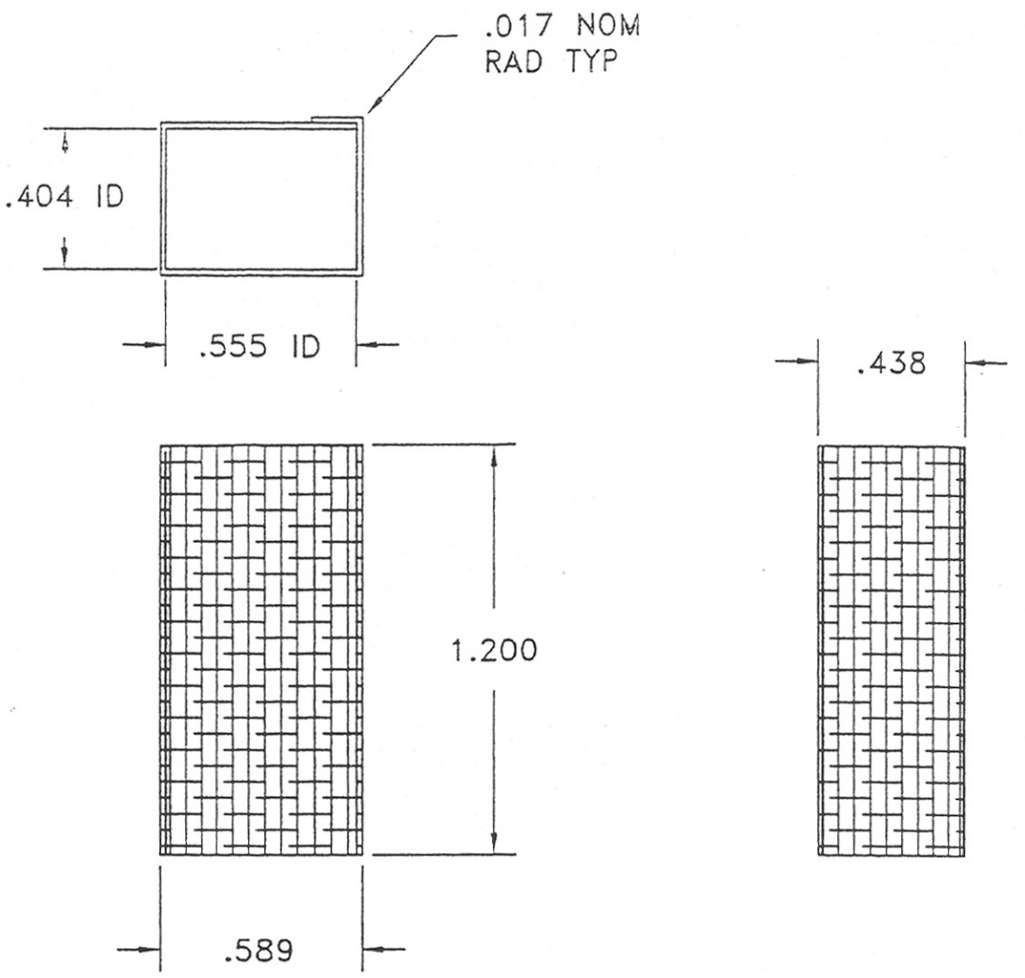
2. TOLERANCES TO BE +/-.010

Figure 1



NOTES:

1. MATERIAL: 316SS OR EQUIVALENT .017 WIRE VERTICAL MEAS SQUARE WEAVE WITH .039 SQUARE OPENINGS.
2. TOLERANCES TO BE +/-.010

Figure 2

Tolerances—The percentages of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	500-mg Tablet, amount dissolved	1000-mg Tablet, amount dissolved
2	not more than 30%	not more than 30%
8	between 60% and 85%	between 65% and 90%
16	not less than 90%	not less than 90%

TEST 6—If the product complies with this test, the labeling indicates that the product meets *USP Dissolution Test 6.*

Medium: pH 6.8 phosphate buffer prepared by dissolving 6.8 g of monobasic potassium phosphate in 1000 mL of water and adjusting with 0.2 N sodium hydroxide to a pH of 6.8 ± 0.05; 1000 mL, deaerated.

Apparatus 2: 100 rpm, with USP sinker.

Procedure—Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by UV absorption at the wavelength of maximum absorbance at about 233 nm on portions of the solution under test passed through a 0.45-µm hydrophilic polyethylene filter, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium*. Calculate the amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), in percentage, released at each time point by the formula:

$$\frac{[C \times (A_U / A_S) \times (V - V_S) + (C_{60} \times V_S) + (C_{180} \times V_S) + (C_{600} \times V_S)] \times 100}{L}$$

in which C is the concentration, in mg per mL, of the Standard solution; A_U and A_S are the absorbances of the solution under test and Standard solution, respectively; V is the initial volume, in mL, of *Medium* in the vessel; V_S is the volume, in mL, withdrawn from the vessel for previous samplings; C_{60} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 1 hour; C_{180} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 3 hours; C_{600} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 10 hours; 100 is the conversion factor to percentage; and L is the Tablet label claim in mg.

Tolerances—The percentages of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	500-mg Tablet, amount dissolved	750-mg Tablet, amount dissolved
1	between 20% and 40%	between 20% and 40%
3	between 45% and 65%	between 45% and 65%
10	not less than 85%	not less than 85%

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Chromatographic purity—

Mobile phase and *Chromatographic system*—Prepare as directed in the *Assay.*

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay.*

Procedure—Inject a volume (about 10 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(r_i / r_s)$$

In-Process Revision

in which r_i is the peak response for each impurity, and r_s is the sum of the responses of all the peaks: not more than 0.1% of any individual impurity is found, and not more than 0.5% of total impurities is found. Disregard any peak less than 0.05%, and disregard any peak observed in the blank.

Assay—

Buffer solution—Transfer 1.0 g each of sodium heptanesulfonate and sodium chloride to a 2000-mL volumetric flask, add 1800 mL of water, and mix. Adjust with 0.06 M phosphoric acid to a pH of 3.85, and dilute with water to volume.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (90 : 10). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Use a 1.25% solution of acetonitrile in water.

Standard preparation—Dissolve an accurately weighed quantity of USP Metformin Hydrochloride RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about (*L*/4000) mg per mL, where *L* is the labeled quantity, in mg, of metformin hydrochloride in each Tablet.

System suitability preparation—Dissolve suitable quantities of USP Metformin Related Compound B RS and USP Metformin Related Compound C RS in *Diluent* to obtain a solution containing about 12.5 µg of each per mL. Pipet 0.5 mL of this solution into a 50-mL volumetric flask, and dilute with the *Standard preparation* to volume.

Assay stock preparation—Weigh and finely powder not fewer than 10 Tablets. Transfer an accurately weighed portion of the powder, equivalent to the average Tablet weight, to a homogenization vessel, and accurately add 500 mL of 10% acetonitrile solution. Alternately, homogenize and allow to soak until the sample is fully homogenized.

Assay preparation—Pass a portion of the *Assay stock preparation* through a filter having a 0.45-µm porosity, discarding the first 3 mL of filtrate. Transfer 25 mL of the filtrate to a 200-mL volumetric flask, and dilute with water to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 218-nm detector and a 3.9-mm × 30-cm column that contains 10-µm packing L1. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 30°. Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.86 for metformin related compound B, 1.0 for metformin, and about 2.1 to 2.3 for metformin related compound C [NOTE—This impurity can have a variable retention time]; the resolution, *R,* between peaks due to metformin related compound B and to metformin is not less than 1.5; the tailing factor for the metformin peak is not less than 0.8 and not more than 2.0; and the relative standard deviation for replicate injections is not more than 1.5% for the metformin peak and not more than 10% for each of the peaks due to metformin related compound B and metformin related compound C.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, carrying out the run until after the elution locus of metformin related compound C; record the chromatograms; and measure the responses for the major peaks. Calculate the quantity, in mg per Tablet, of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) by the formula:

$$C(V/W)TD(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Metformin Hydrochloride RS in the *Standard preparation; V* is the volume, in mL, of the *Assay stock preparation; W* is the

In-Process Revision

weight, in mg, of sample used to prepare the *Assay stock preparation; T* is the average Tablet weight, in mg; *D* is the dilution factor of the *Assay preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP29*)

BRIEFING

Methylcellulose Ophthalmic Solution, *USP 28* page 1258; **Methylcellulose Oral Solution,** *USP 28* page 1258; **Methylcellulose Tablets,** *USP 28* page 1258. It is proposed to remove references to the *Methylcellulose* monograph, in preparation for revising the *Methylcellulose* monograph with changes resulting from the harmonization process.

(EMC: J. Lane) RTS—42400-3

Change to read:

Identification—~~It responds to *Identification* tests *B* and *C* under *Methylcellulose*.~~

■**A:** Heat a few mL of Ophthalmic Solution: the solution becomes cloudy and a flaky precipitate, which redissolves as the solution cools, appears.

B: Pour a few mL of Ophthalmic Solution onto a glass plate, and allow the water to evaporate: a thin, self-sustaining film results.■1S (*USP29*)

BRIEFING

Methylcellulose Oral Solution, *USP 28* page 1258—See briefing under *Methylcellulose Ophthalmic Solution.*

BRIEFING

Oxandrolone Tablets, *USP 28* page 1427 and page 344 of *PF* 31(2) [Mar.–Apr. 2005]. It is proposed to add a *Dissolution Test 2* for the recently approved generic version of this product. The chromatographic procedure in this test was validated using a Inertsil ODS(3) brand of L1 packing. Using this column, the retention time for oxandrolone is about 6.5 minutes. In the absence of any adverse comments, it is proposed to implement this revision via the *Fifth Interim Revision Announcement*, pertaining to *USP 28–NF 23*, with an official date of October 1, 2005.

(BPC: M. Marques) RTS—42295-1

Add the following:

•**Labeling**—When more than one *Dissolution Test* is given, the labeling states the *Dissolution Test* test used only if *Test 1* is not used.•5

In-Process Revision

Change to read:

•**Dissolution** ⟨711⟩—

•TEST 1—•5

Medium: a solution of water and isopropanol (7 : 3); 500 mL.
Apparatus 2: 100 rpm.
Time: 60 minutes.

Determine the amount of $C_{19}H_{30}O_3$ dissolved by employing the following method.

Internal standard solution—Dissolve accurately weighed quantities of 17α-methyl testosterone, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a concentration of about 0.2 mg per mL (for tablets with 2.5-mg label claim) and about 0.8 mg per mL (for tablets with 10-mg label claim).

Standard solution—Dissolve an accurately weighed quantity of USP Oxandrolone RS, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a concentration of about 1 mg per mL.

Working standard solution—Combine 100 µL of the *Standard solution,* 400 µL of the *Internal standard solution,* and 1500 µL of acetonitrile.

Test solution—Withdraw 25 mL of the solution under test from the vessel. Pass through a 0.45-µm polytef filter. Transfer 20 mL of the filtrate to a separatory funnel, add 400 µL of the *Internal standard solution,* 40 mL of 10% potassium chloride solution, and 8 mL of chloroform. In separate separatory funnels, prepare an extraction blank and an internal standard blank in a similar manner using 20 mL of filtered *Medium* in place of the solution under test and excluding the *Internal standard solution* from the extraction blank. Shake each funnel, and allow the layers to separate. Collect the lower chloroform layer. Repeat the extraction procedure one more time. Evaporate the solvents under a stream of nitrogen at 45° until just dry. Reconstitute the dried residue with 2 mL of acetonitrile (for tablets with 2.5-mg label claim) or with 8 mL of acetonitrile (for tablets with 10-mg label claim), and sonicate for 10 minutes.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 30-m column coated with a 0.5-µm phase G27. The carrier gas is helium, flowing at a rate of about 16.8 mL per minute. The injection port and detector temperatures are maintained at 190° and 320°, respectively. The chromatograph is programmed as follows. Upon injection, the column temperature is increased at a rate of 25° per minute to 280°, and maintained at 280° for 3 minutes. Then the column temperature is increased at a rate of 10° per minute to 320°, and maintained at 320° for 3 minutes. Chromatograph the acetonitrile, the extraction blank, and the internal standard blank, and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5. Make two injections of the *Working standard solution,* and record the peak responses. The average oxandrolone/*Internal standard solution* peak area percent comparison is between 98.0% and 102.0%. The resolution, *R,* between the oxandrolone peak and the nearest eluting peak is equal to or greater than 1.5.

Procedure—Separately inject equal volumes (0.5 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{19}H_{30}O_3$ released by the formula:

$$\frac{C_S \times \text{sample ratio} \times V_{UF} \times 500 \times 100}{\text{Standard ratio} \times V_{UI} \times LC},$$

in which C_S is the concentration, in mg per mL, of oxandrolone in the *Standard solution;* sample ratio is the area ratio of oxandrolone to 17α-methyltestosterone in the sample injection for each *Test solution;* V_{UF} is the final volume, in mL, of the sample after reconstitution of the dry residue; 500 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; standard ratio is the mean area ratio of oxandrolone to 17α-methyltestosterone in all injections of the *Standard solution;* V_{UI} is the initial sample volume, in mL, used in the extraction; and *LC* is the tablet label claim, in mg.

Tolerances—Not less than 75% *(Q)* of the labeled amount of oxandrolone ($C_{19}H_{30}O_3$) is dissolved in 60 minutes.•2

•TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

Medium: 1% polysorbate 80 in water; 500 mL, deaerated.

Apparatus 2: 100 rpm.

Time: 120 minutes.

Determine the amount of $C_{19}H_{30}O_3$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (55 : 45). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Transfer about 20 mg of USP Oxandrolone RS, accurately weighed, to a 200-mL volumetric flask. Add about 20 mL of acetonitrile, and sonicate to dissolve. Dilute with *Medium* to volume, and mix.

Working standard solution—Quantitatively dilute the *Standard stock solution* with *Medium* to obtain a solution having a final concentration of about 5 µg per mL for Tablets with a label claim of 2.5 mg, or a final concentration of about 20 µg per mL for Tablets with a label claim of 10 mg.

Test solution—Withdraw about 10 mL of the solution under test from the vessel. Centrifuge in a glass tube at 2000 rpm for 10 minutes.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a reflective index detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Working standard solution,* and record the peak responses as directed for *Procedure:* the tailing fac-

In-Process Revision

tor is not more than 2.0; the column efficiency is not less than 4000 theoretical plates; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{19}H_{30}O_3$ released by the formula:

$$\frac{r_U \times C_S \times D \times 500 \times 100}{r_S \times LC},$$

in which r_U and r_S are the peak responses for the *Test solution* and *Working standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Working standard solution; D* is the dilution factor of the *Test solution;* 500 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the tablet label claim in mg.

Tolerances—Not less than 65% *(Q)* of the labeled amount of $C_{19}H_{30}O_3$ is dissolved in 120 minutes.●5

B: To a solution (1 in 100) add an equal volume of alcohol: a translucent, gelatinous precipitate is formed (*distinction from most gums*).

C: ~~To 10 mL of a solution (1 in 100) add 1 mL of thorium nitrate TS, stir, and allow to stand for 2 minutes: a stable precipitate or gel forms (*distinction from gums*).~~

~~**D:**~~

■■1S *(USP29)*
To 5 mL of a solution (1 in 100) add 1 mL of 2 N sodium hydroxide, and allow to stand at room temperature for 15 minutes: a gel or semigel forms (*distinction from tragacanth*).

~~**E:**~~

■**D:**■1S *(USP29)*
Acidify the gel from the preceding test with 3 N hydrochloric acid, and shake: a voluminous, colorless, gelatinous precipitate forms, which upon boiling becomes white and flocculent (*pectic acid*).

BRIEFING

Phenylephrine Bitartrate, page 2028 of *PF* 30(6) [Nov.–Dec. 2004]. On the basis of comments received, it is proposed to revise the limit of individual unknown impurity in the table under *Procedure* in the test for *Chromatographic purity.* The chemical name of the drug substance has also been revised to include the stereochemistry of tartaric acid.

(PA2: D. Bempong) RTS—42389-1

BRIEFING

Pectin, *USP 28* page 1477. On the basis of comments received, it is proposed to delete *Identification* test *C* because of its use of a radioactive material, thorium nitrate.

(EMC: C. Sheehan) RTS—42430-1

Change to read:

Identification—

A: Heat 1 g with 9 mL of water on a steam bath until a solution is formed, replacing water lost by evaporation: it forms a stiff gel on cooling.

Add the following:

■Phenylephrine Bitartrate

Change to read:

$C_9H_{13}NO_2 \cdot C_4H_6O_6$ 317.3

R-2-(Methylamino)-1-(3-hydroxyphenyl)ethanol-, ~~hydrogen tartrate.~~■(2*R*,3*R*)-2,3-dihydroxybutanedioate (1 : 1) (salt).■1S *(USP29)*

(–)-1-(3-Hydroxyphenyl)-2-methylaminoethanol, hydrogen tartrate.

In-Process Revision

(–)-3 Hydroxy-α-[(methylamino)methyl] benzenemethanol, hydrogen tartrate.

1-*m*-Hydroxy-α-[(methylamino)methyl]benzyl alcohol, hydrogen tartrate [~~*17162-39-0*~~ ■*17162-39-9*■IS *(USP29)*].

» Phenylephrine Bitartrate contains not less than 99.0 percent and not more than 100.5 percent of $C_9H_{13}NO_2 \cdot C_4H_6O_6$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Norphenylephrine Hydrochloride RS. USP Phenylephrine Hydrochloride RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The alkaline ~~of tartrate~~ filtrate from the test for *Specific rotation* responds positively to the test for *Tartrate* ⟨191⟩.

Specific rotation ⟨781S⟩**:** between –53° and –57° for the prepared sample.

Test solution—Prepare a sample solution of about ~~24~~ 240 mg per mL in water. Make the solution slightly alkaline by adding concentrated ammonium hydroxide dropwise. Rub the wall of the vessel with a glass rod so that the base precipitates out. Filter the base under suction, wash with a little water and acetone, and dry at 105° for 2 hours. Prepare and measure a 50 mg per mL solution of base precipitate in 1 M hydrochloric acid.

pH ⟨791⟩**:** between 3.0 and 4.0 in 10% w/v aqueous solution.

Loss on drying ⟨731⟩—Dry at 105° to a constant weight: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Change to read:

Chromatographic purity—

Buffer solution—Dissolve 3.25 g of 1-octanesulfonic acid sodium salt monohydrate in 1 L of water. Adjust slowly with 3 M phosphoric acid to a pH of 2.8.

Solution A—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (9 : 1).

Solution B—Prepare a filtered and degassed mixture of acetonitrile and *Buffer solution* (9 : 1).

Diluent—Prepare a mixture of *Solution A* and *Solution B* (8 : 2).

System suitability solution—Dissolve accurately weighed quantities of USP Phenylephrine Hydrochloride RS~~, norphenylephrine hydrochloride, 1-benzylphenylepherine base, and benzylphenylepherine hydrochloride~~ and USP Norphenylephrine Hydrochloride RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having known concentrations of about ~~0.06 mg per mL, 0.09 mg per mL, 0.07 mg per mL, and 0.05 mg per mL~~ 1.0 mg per mL and 0.9 µg per mL, respectively.

Blank solution—Prepare a solution containing 0.8 mg per mL L(+)-tartaric acid in *Diluent*.

Test solution—Transfer 78 mg of Phenylephrine Bitartrate, accurately weighed, to a 50-mL volumetric flask. Dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 4-mm × 5.5-cm column that contains packing L1. The column temperature and injector temperature are maintained at 45 ± 2°. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

In-Process Revision

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	93	7	equilibration
0–10	93→~~30~~ 70	7→~~70~~ 30	linear gradient
10–~~18~~ 10.1	~~30~~ 70→93	~~70~~-30→7	~~isocratic~~ linear gradient
10.1–18	93	7	equilibration

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* ~~the relative retention times are about 0.9 for norphenylephrine, about 1.0 for (–)-phenylephrine, about 1.2 for phenylephrone, about 2.9 for 1-benzylphenylepherine, and about 3.1 for benzylphenylepherine HCl.~~ the resolution, *R,* between norphenylephrine and (–)-phenylephrine is not less than 1.5; the tailing factor of (–)-phenylephrine is less than 1.8; and the relative standard deviation for replicate injections is not more than ~~6%~~ 5%.

Procedure—~~Inject about 10 µL of~~ Separately inject equal volumes (about 4 µL) of the *Blank solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Phenylephrine Bitartrate taken by the formula:

$$100(r_i / r_s),$$

in which r_i is the peak response for each impurity, and r_s is the sum of the responses of all the peaks: ~~not more than 0.2% of any individual impurity is found, and not more than 0.5% of total impurities is found.~~ [NOTE—Examine the chromatogram of the *Blank solution* for peaks and disregard any corresponding peaks observed in the chromatogram of the *Test solution*.] The limits of impurities are specified in the accompanying table.

Compound	Approximate Relative Retention Time	Limit (%)
Phenylephrine	1.0	—
Norphenylephrine	0.9	0.2
Phenylephrone	1.2	0.1
Benzylphenylephrine	2.9	0.2
Benzylphenyl-ephrone	3.1	0.1
Individual unknown impurity	—	~~0.2~~ ■0.1■1S (*USP29*)
Total impurity	—	0.5

Assay—Transfer about 280 mg of Phenylephrine Bitartrate, accurately weighed, to a 100-mL beaker, and dissolve by stirring in 60 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid, determining the endpoint potentiometrically. Perform a blank determination (see *Titrimetry* ⟨541⟩), and make the necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 31.73 mg of $C_9H_{13}NO_2 \cdot C_4H_6O_6$.■2S (*USP28*)

In-Process Revision

BRIEFING

Potassium Bitartrate, *USP 28* page 1583; **Potassium Sodium Tartrate,** *USP 28* page 1599; **Sodium Bicarbonate,** *USP 28* page 1775. It is proposed to replace the odor perception method in the test for *Limit of ammonia* with a colorimetric test based on the iodophenol blue color reaction. A simple limit test is proposed for *Sodium Bicarbonate;* for *Potassium Bitartrate* and *Potassium Sodium Tartrate,* the proposed procedure includes a comparison to a color of the *Standard solution,* because an observable blue color may develop at a very low concentration of ammonia.

Because the limit of ammonia in the current test is not clear, the proposed limits reflect the quality of the materials available on the market. Interested parties are encouraged to submit comments to the Expert Committee.

(PA4: E. Gonikberg) RTS—42377-1

Change to read:

Limit of ammonia~~— Heat 500 mg of it with 5 mL of 1 N sodium hydroxide: no ammonia odor is detected.~~

■*Sodium hypochlorite solution*—Use a commercially available solution that contains between 4.0% and 6.0% of NaOCl.

Oxidizing solution—[NOTE—Prepare on the day of use.] Prepare a mixture of alkaline sodium citrate TS and *Sodium hypochlorite solution* (4 : 1).

Diluted sodium nitroferricyanide solution—Prepare a mixture of water and sodium nitroferricyanide TS (10 : 1).

Standard solution—Transfer 300 mg of ammonium chloride, previously dried over silica gel for 4 hours, to a 1-L volumetric flask, and dilute with water to volume. This solution contains 100 µg of ammonia per mL. Dilute this solution quantitatively and stepwise, if necessary, with water to obtain a solution having a concentration of 0.25 µg of ammonia per mL.

Test solution—Transfer 250 mg of Potassium Bitartrate to a 100-mL volumetric flask, dissolve in and dilute with water to volume. Heat gently to facilitate the dissolution.

Procedure—[NOTE—Carefully follow this order of addition.] Separately transfer 6.0 mL of each of the *Standard solution* and the *Test solution* to two color comparison tubes. To each tube, add 0.4 mL of phenol TS, 0.4 mL of *Diluted sodium nitroferricyanide solution,* 1.0 mL of *Oxidizing solution,* dilute with water to 10 mL, mix, and let stand for 1 hour: the color of the *Test solution* is not darker than the color of the *Standard solution* (0.01%).■1S (*USP29*)

BRIEFING

Potassium Iodide Oral Solution, *USP 28* page 1595. It is proposed to revise the *Note* in the Definition to indicate that those products that have been demonstrated to be stable for longer periods of time without the addition of thiosulfate are exempt from the thiosulfate requirement.

(PA7b: B. Davani) RTS—42302-1

Change to read:

» Potassium Iodide Oral Solution contains not less than 94.0 percent and not more than 106.0 percent of the labeled amount of KI.

NOTE—If Potassium Iodide Oral Solution is not to be used within a short time, add 0.5 mg of sodium thiosulfate for each g of KI.

■Products that have data to demonstrate acceptable stability without the addition of thiosulfate are exempt from this requirement.■1S (*USP29*)

Crystals of potassium iodide may form in Potassium Iodide Oral Solution under normal conditions of storage, especially if refrigerated.

In-Process Revision

BRIEFING

Potassium Sodium Tartrate, *USP 28* page 1599—See briefing under *Potassium Bitartrate.*

(PA4: E. Gonikberg) RTS—42377-2

Change to read:

Limit of ammonia— ~~Heat a 5-mL portion of a solution (1 in 10) with 5 mL of 1 N sodium hydroxide: the odor of ammonia is not noticeable.~~

■*Sodium hypochlorite solution*—Use a commercially available solution that contains between 4.0% and 6.0% of NaOCl.

Oxidizing solution—[NOTE—Prepare on the day of use.] Prepare a mixture of alkaline sodium citrate TS and *Sodium hypochlorite solution* (4 : 1).

Diluted sodium nitroferricyanide solution—Prepare a mixture of water and sodium nitroferricyanide TS (10 : 1).

Standard solution—Transfer 300 mg of ammonium chloride, previously dried over silica gel for 4 hours, to a 1-L volumetric flask, and dilute with water to volume. This solution contains 100 µg of ammonia per mL. Dilute this solution quantitatively and stepwise, if necessary, with water to obtain a solution having a concentration of 1.0 µg of ammonia per mL.

Test solution—Transfer 5.0 g of Potassium Sodium Tartrate to a 100-mL volumetric flask, dissolve in and dilute with water to volume.

Procedure—[NOTE—Carefully follow this order of addition.] Separately transfer 4.0 mL of each of the *Standard solution* and the *Test solution* to two color comparison tubes. To each tube, add 0.4 mL of phenol TS, 0.4 mL of *Diluted sodium nitroferricyanide solution,* 1.0 mL of *Oxidizing solution,* dilute to 10 mL with water, mix, and let stand for 1 hour: the color of the *Test solution* is not darker than the color of the *Standard solution* (0.002%).■1S *(USP29)*

BRIEFING

Ramipril, *USP 28* page 1701 and page 2032 of *PF* 30(6) [Nov.–Dec. 2004]. It is proposed to correct the concentration of the ion-pairing agent and the injection volume in the *Assay.*

(PA5: A.Wilk) RTS—40611-2

Change to read:

» Ramipril contains not less than 98.0 percent and not more than ~~101.0~~

■102.0■1S *(USP29)* percent of $C_{23}H_{32}N_2O_5$, calculated on the dried basis.

Change to read:

Assay— ~~Dissolve about 300 mg of Ramipril, accurately weighed, in 25 mL of methanol, add 25 mL of water, and titrate with 0.1 N sodium hydroxide VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N sodium hydroxide is equivalent to 41.65 mg of $C_{23}H_{32}N_2O_5$.~~

■*Sodium dodecyl sulfate solution*—Prepare a ~~1%~~ 0.1% solution of sodium dodecyl sulfate. Adjust with phosphoric acid to a pH of 2.4 ± 0.1, filter, and degas.

Mobile phase—Prepare a mixture of *Sodium dodecyl sulfate solution* and acetonitrile (55 : 45). Adjust with phosphoric acid to a pH of 2.75 ± 0.1, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability preparation—Dissolve accurately weighed quantities of USP Ramipril RS and USP Ramipril Related Compound A RS in *Mobile phase* to obtain a solution having known concentrations of about 0.2 mg per mL and 0.01 mg per mL, respectively.

Standard preparation—Dissolve an accurately weighed quantity of USP Ramipril RS in *Mobile phase* to obtain a solution having a known concentration of about 0.2 mg per mL.

Assay preparation—Transfer about 100 mg of Ramipril, accurately weighed, to a 100-mL volumetric flask, dissolve in about 10 mL of acetonitrile, dilute with *Mobile phase* to volume, and mix. Pipet about 10 mL of this stock solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.8 mL per minute. Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between ramipril and ramipril related compound A is not less than 2.0; the column efficiency determined from the ramipril peak is not less than 4000 theoretical plates; and the relative standard deviation for replicate injections determined from the ramipril peak is not more than 1.0%.

Procedure—Separately inject equal volumes (about ~~10 µL~~ 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the quantity, in mg, of $C_{23}H_{32}N_2O_5$ in the portion of Ramipril taken by the formula:

$$500C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Ramipril RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■1S (*USP29*)

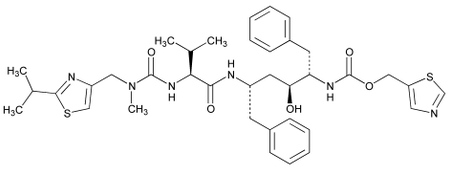
BRIEFING

Ritonavir. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on validated methods of analysis, is being proposed. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with the YMC Butyl C4 brand of L26 column (see *Chromatography* ⟨621⟩). The retention time for ritonavir is between 30 and 35 minutes.

(PA7b: B. Davani) RTS—41225-1

Add the following:

■Ritonavir



$C_{37}H_{48}N_6O_5S_2$ 720.94

2.4.7.12-Tetraazatridecan-13-oic acid, 10-hydroxy-2-methyl-5-(1-methylethyl)-1-[2-(1-methylethyl)-4-thiazolyl]-3,6-dioxo-8,11-bis(phenylmethyl)-5-thiazolylmethyl ester [5*S*-(5*R**,8*R**,10*R**,11*R**)].

5-Thiazolylmethyl [(α*S*)-α-[1*S*,3*S*)-1-hydroxy-3-[(2*S*)-2-[3-[(2-isopropyl-4-thiazolyl)methyl]-3-methylureido]-3-methylbutyramido]-4-phenylbutyl]phenethyl]carbamate [*155213-67-5*].

In-Process Revision

» Ritonavir contains not less than 97.0 percent and not more than 102.0 percent of $C_{37}H_{48}N_6O_5S_2$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight, light-resistant containers. Store between 5° and 30°.

USP Reference standards ⟨11⟩**—***USP Ritonavir RS. USP Ritonavir Related Compounds Mixture RS.*

Identification—

A: *Infrared Absorption* ⟨197S⟩—

Test specimen—Dissolve 50 mg of Ritonavir in 1.0 mL of chloroform. Add 1 drop of this solution to the surface of a potassium bromide or a sodium chloride disc, and evaporate to dryness.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* is within 2% of the retention time of the major peak in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

C: *X-Ray diffraction* ⟨941⟩—The X-ray diffraction pattern conforms to that of USP Ritonavir RS.

Heavy metals, *Method II* ⟨231⟩**:** not more than 0.002%, using 1.0 g of Ritonavir and 2 mL of *Standard Lead Solution* (10 ppm Pb) in the *Standard Preparation.*

Water, *Method I* ⟨921⟩**:** not more than 0.5%, determined on 0.500 g.

Residue on ignition ⟨281⟩**:** not more than 0.2%, determined on 1.0 g.

Organic volatile impurities ⟨467⟩**:** meets the requirements.

Related compounds—[NOTE—Ritonavir is alkaline sensitive. All glassware should be prerinsed with distilled water prior to use to remove residual detergent contamination.]

Monobasic potassium phosphate solution (0.03M)—Dissolve about 8.2 g of monobasic potassium phosphate in 2.0 L of water. Mix well, and filter through a 0.45-µm nylon membrane.

Diluent—Prepare a mixture of *Monobasic potassium phosphate solution (0.03M)* and acetonitrile (1 : 1). Mix well, and filter through a 0.45-µm nylon membrane.

Solution A—Prepare a mixture of the filtered *Monobasic potassium phosphate solution (0.03M)*, acetonitrile, tetrahydrofuran (inhibitor-free), and *n*-butanol (69 : 18 : 8 : 5).

Solution B—Prepare a mixture of the filtered *Monobasic potassium phosphate solution (0.03M)*, acetonitrile, tetrahydrofuran (inhibitor-free), and *n*-butanol (40 : 47 : 8 : 5).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩). [NOTE—Because of the high dependence of retention time and selectivity on the *Mobile phase* composition, the volumes should be accurately measured. Excessive or continued helium sparging must be avoided. Store the *Mobile phase* in a tightly sealed container when not in use.]

Ritonavir identity standard solution—Transfer about 50 mg of USP Ritonavir Related Compounds Mixture RS, accurately weighed, to a 50-mL volumetric flask. Dissolve in and dilute with *Diluent* to volume, and mix.

Standard stock solution—Transfer about 100 mg of USP Ritonavir RS, accurately weighed, to a 50-mL volumetric flask. Dissolve in and dilute with *Diluent* to volume, and mix. [NOTE—This solution may be kept for 5 days if refrigerated.]

Intermediate standard solution—Transfer 5.0 mL of the *Standard stock solution* to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Standard solution—Transfer 5.0 mL of the *Intermediate standard solution* to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. [NOTE—This solution may be used for 48 hours if stored at room temperature.]

Test solution—Transfer about 50 mg of Ritonavir, accurately weighed, to a 50-mL volumetric flask. Dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm × 15-cm column that contains 3-µm L26 packing and is maintained at a constant temperature of about 60°. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibrium
0–60	100	0	isocratic
60–120	100→0	0→100	gradient
120.1	0→100	100→0	step gradient
120.1–155	100	0	isocratic

The run time for the *Standard solution* is 40 minutes and the run time for the *Test solution* is 155 minutes. Chromatograph the *Ritonavir identity standard solution,* and the *Standard solution,* and record the responses as directed for *Procedure:* the retention time of ritonavir is between 30 and 35 minutes; the resolution, *R,* between impurity E and impurity F in the *Ritonavir identity standard solution* is not less than 1.0; the ratio of peak (H_p) to valley (H_v) of impurity N (regioisomer) is not less than 1; the capacity factor, *k′,* using the main component peak of the first *Standard solution* injection, is not less than 13; the column efficiency, using the main component peak of the first *Standard solution* injection, is not less than 5000 theoretical plates; the tailing factor, using the main component peak of the first *Standard solution* injection, is between 0.8 and 1.2; and the relative standard deviation of the peak area response of the main component peak, for replicate injections of the *Standard solution,* is not more than 3.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Diluent, Ritonavir identity standard solution, Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak area responses. Calculate the percentage of each impurity in the portion of Ritonavir taken by the formula:

$$0.0025(W_S / W_T)\ (R_T / R_S)(1/F)P,$$

in which W_S is the the weight, in mg, of the USP Ritonavir RS taken to prepare the *Standard solution;* W_T is the weight, in mg, of Ritonavir taken to prepare the *Test solution;* R_T is the area of the impurity peak obtained from the *Test solution;* R_S is the average peak area of ritonavir obtained from the the six injections of *Standard solution; F* is the response factor for the impurity (see values in *Table 1);* and *P* is the purity, in percent, of the USP Ritonavir RS taken to prepare the *Standard solution.* Not more than 0.3% of impurity E and O is found; not more than 0.2% of impurity T is found; not more than 0.1% of any other impurity is found; and not more than 1.0% of total impurities is found.

Table 1. Approximate Relative Retention Time (RRT) for Known Related Impurities

Impurity Identity	Common Name	Response Factor	RRT
A + B	Mixture of 2,4-Wing acid and monoacyl valine	—	0.07
C	Monoacylacetamide	—	0.15
D	5-Wing diacyl	1.37	0.24
E	Oxidation impurity	—	0.36
F	Acid hydrolysis product	0.73	0.39
G	Ritonavir hydroperoxide	—	0.45

I	Ethyl analog	—	0.64
J + K	Mixture of Boc-monoacyl and monoacyl isobutyl carbamate	0.74	0.81
L	Base cyclization product	0.53	0.87
M	2,4-Wing isobutyl ester	—	0.94
N	Regioisomer	—	1.05
O	Isomer #2	—	1.11
P	Di-monoacyl urea	—	1.14
Q	Isomer #4	—	1.23
R	Isomer #1	—	1.32
S	Di-monoacyl valine urea	—	1.62
T	2,4-Wing diacyl	0.73	2.87
U	Triacyl impurity	—	3.20

Assay—

Solution A, Solution B, Mobile phase, Diluent, and *Intermediate standard solution*—Proceed as directed in the test for *Related compounds.*

Standard preparation—Transfer 25.0 mL of the *Intermediate standard solution* to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Assay preparation—Transfer 5.0 mL of the *Test solution,* prepared as directed in the test for *Related compounds,* to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix. Dilute 25.0 mL of this solution with *Diluent* to 100-mL, and mix.

Chromatographic system—Proceed as directed in the test for *Related compounds.*The run time for the *Standard preparation* and *Assay preparation* is 40 minutes. Chromatograph the *Standard preparation,*and record the responses as directed for *Procedure:* the capacity factor, k', using the main component peak of the first *Standard preparation* injection, is not less than 13; the column efficiency, using the main component peak of the first *Standard preparation* injection, is not less than 5000 theoretical plates; the tailing factor, using the main component peak of the first *Standard preparation* injection, is between 0.8 and 1.2; and the relative standard deviation of the peak area response of the main component peak, for replicate injections of the *Standard preparation,* is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak area responses. Calculate the percentage, on the as-is basis, of $C_{37}H_{48}N_6O_2S_2$ in the portion of Ritonavir taken by the formula:

$$0.5(W_S / W_T)(R_T / R_S)P,$$

in which W_S is the weight, in mg, of USP Ritonavir RS taken to prepare the *Standard preparation;* W_T is the weight, in mg, of Ritonavir taken to prepare the *Assay preparation;* R_T is the peak area of the impurity obtained from the chromatogram of the *Assay preparation;* R_S is the average peak area of ritonavir obtained from the chromatograms of the five injections of *Standard preparation;* and P is the purity, in percent, of the USP Ritonavir RS taken to prepare the *Standard preparation.*

Calculate the percentage, on the anhydrous basis, of $C_{37}H_{48}N_6O_2S_2$ in the portion of Ritonavir taken by the formula:

$$100A/(100 - B),$$

in which A is the percent of $C_{37}H_{48}N_6O_2S_2$ on the as-is basis, as calculated above, and B is the percent of water content.■1S (*USP29*)

BRIEFING

Simvastatin, *USP 28* page 1770 and page 1647 of *PF* 30(5) [Sept.–Oct. 2004]. It is proposed to replace the current methods for *Chromatographic purity, Limit of lovastatin,* and *Assay* with a single stability-indicating HPLC method. The separate test for *Limit of lovastatin* is being deleted; this test is now performed as a part of the test for *Chromatographic purity.* It is also proposed to replace the UV *Identification* test with the HPLC retention time agreement of the major peak in the chromatograms of the *Assay preparation* and the *Standard preparation.* The proposed methods are based on the analyses performed with the Perkin-Elmer Pecosphere C18 CR brand of L1 column; typical retention time of the simvastatin peak is about 2.5 minutes.

(PA4: E. Gonikberg) RTS—40244-1

B: ~~*Ultraviolet Absorption* ⟨197U⟩~~
~~*Solution:* 10 µg per mL.~~
~~*Medium:* acetonitrile.~~

■The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the major peak in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*■1S *(USP29)*

Change to read:

Chromatographic purity—

~~*Diluting solution*—Prepare a solution of butylated hydroxytoluene in acetonitrile containing 0.5 mg per mL.~~

~~*Standard solutions*—Dissolve an accurately weighed quantity of USP Simvastatin RS in *Diluting solution* to obtain *Standard solution A* having a known concentration of about 0.2 mg per mL. Transfer 4.0, 2.0, and 1.0 mL of *Standard solution A* to separate 10-mL volumetric flasks, and dilute with *Diluting solution* to volume to obtain *Standard solutions B*, *C*, and *D*, respectively.~~

~~*Test solution*—Dissolve an accurately weighed quantity of simvastatin in *Diluting solution* to obtain a solution having a concentration of about 20 mg per mL.~~

~~*Procedure*—Separately apply 4 µL portions of each of the *Standard solutions* and the *Test solution* to a thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of silica gel mixture, previously washed with methanol and air-dried. Dry the spots with the aid of a stream of nitrogen. Position the plate in a chromatographic chamber previously equilibrated with a solvent system consisting of a mixture of cyclohexane, chloroform, and isopropyl alcohol (5 : 2 : 1) containing 0.5 mg of butylated hydroxytoluene per mL, and develop the chromatogram until the solvent front has moved about three-quarters of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate under a stream of nitrogen. Spray the plate with a mixture of methanol and sulfuric acid (8 : 2), heat at 110° for 30 minutes, and immediately examine the plate: no secondary spot in the chromatogram of the *Test solution* is greater in size or intensity than the principal spot from *Standard solution B* (0.4%), and the sum of all such secondary spots obtained from the *Test solution* is not greater than 1.0%.~~

■*Mobile phase, Diluent,* and *Chromatographic system*—Proceed as directed in the *Assay.*

Test solution—Use the *Assay preparation*.

Procedure—Inject about 5 µL of the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Calculate the percentage of each impurity in the portion of Simvastatin taken by the formula:

$$100(r_i / r_s),$$

in which r_i is the peak area for each impurity; and r_s is the sum of the areas of all the peaks. Not more than 1.0% of the sum of lovastatin and epilovastatin is found. [NOTE—If present, lovastatin and epilovastatin may not be completely resolved by the method. These peaks, appearing at a relative retention time of 0.6, should be integrated together to determine conformance.] Not more than 0.4% of any individual impurity other than lovastatin and epilovastatin is found; and not more than 1.0% of total impurities other than lovastatin and epilovastatin is found.■1S *(USP29)*

Delete the following:

■~~**Limit of lovastatin**—From the chromatograms of the *Assay preparation* and the *Standard preparation,* obtained as directed in the *Assay,* calculate the percentage of lovastatin in the portion of Simvastatin taken by the formula:~~

~~$$10{,}000(C / W)(r_u / r_s),$$~~

~~in which *C* is the concentration, in mg per mL, of USP Lovastatin RS in the *Standard preparation; W* is the weight, in mg, of Simvastatin taken for the *Assay preparation;* and r_u and r_s are the lovastatin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively: not more than 1% is found.~~■1S *(USP29)*

Change to read:

Assay—

~~*Mobile phase*—Prepare a filtered and degassed mixture of acetonitrile and dilute phosphoric acid (1 in 1000) (50 : 50). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~

~~*Diluting solution*—Prepare a mixture of acetonitrile and 0.01 M monobasic potassium phosphate (60 : 40), filter, and adjust with phosphoric acid to a pH of 4.0.~~

~~*Standard preparation*—Dissolve accurately weighed quantities of USP Simvastatin RS and USP Lovastatin RS in *Diluting solution*, and dilute quantitatively, and stepwise if necessary, to obtain a solution having known concentrations of about 0.3 mg per mL of USP Simvastatin RS and 0.003 mg per mL of USP Lovastatin RS.~~

~~*Assay preparation*—Transfer about 30 mg of Simvastatin, accurately weighed, to a 100-mL volumetric flask, and dissolve in and dilute with *Diluting solution* to volume.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 238-nm detector and a 4.6- × 33-mm column that contains packing L1. The flow rate is about 3.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.65 for lovastatin and 1.0 for simvastatin, the resolution, *R*, between simvastatin and lovastatin is not less than 3.0, the column efficiency is not less than 2000~~

In-Process Revision

~~theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 1.0%.~~

~~*Procedure*—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas of the responses for the major peaks. Calculate the quantity, in mg, of $C_{25}H_{38}O_5$ in the portion of Simvastatin taken by the formula:~~

~~$$100C(r_U/r_S),$$~~

~~in which *C* is the concentration, in mg per mL, of USP Simvastatin RS in the *Standard preparation*, and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.~~

■*Solution A*—Prepare a mixture of acetonitrile and 0.1% phosphoric acid in water (1 : 1).

Solution B—Prepare a 0.1% solution of phosphoric acid in acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B,* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Buffer solution—Prepare a solution containing 1.4 g of monobasic potassium phosphate per L, and adjust with phosphoric acid to a pH of 4.0.

Diluent—Prepare a mixture of acetonitrile and *Buffer solution* (3 : 2).

System suitability preparation—Dissolve accurately weighed quantities of USP Simvastatin RS and USP Lovastatin RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having known concentrations of about 1.5 mg per mL of USP Simvastatin RS and 0.015 mg per mL of USP Lovastatin RS.

Standard preparation—Dissolve an accurately weighed quantity of USP Simvastatin RS in *Diluent* to obtain a solution having a known concentration of about 1.5 mg per mL.

Assay preparation—Transfer about 75 mg of Simvastatin, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩—The liquid chromatograph is equipped with a 238-nm detector and a 4.6- × 33-mm column that contains packing L1. The flow rate is about 3.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–4.5	100	0	isocratic
4.5–4.6	100→95	0→5	linear gradient
4.6–8.0	95→25	5→75	linear gradient
8.0–11.5	25	75	isocratic
11.5–11.6	25→100	75→0	linear gradient
11.6–13	100	0	re-equilibration

Chromatograph the *Standard preparation* and the *System suitability preparation,* and record the peak responses as directed for *Procedure*. For the *System suitability preparation,* the relative retention times are about 0.60 for lovastatin and 1.0 for simvastatin; and the resolution, *R,* between simvastatin and lovastatin is greater than 3. For the *Standard preparation,* the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure

In-Process Revision

the areas of the major peaks. Calculate the quantity, in mg, of $C_{25}H_{38}O_5$ in the portion of Simvastatin taken by the formula:

$$VC(r_U / r_S),$$

in which V is the volume, in mL, of the *Assay preparation;* C is the concentration, in mg per mL, of USP Simvastatin RS in the *Standard preparation;* and r_U and r_S are the responses of the simvastatin peak obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP29*)

Oxidizing solution—[NOTE—Prepare on the day of use.] Prepare a mixture of alkaline sodium citrate TS and *Sodium hypochlorite solution* (4 : 1).

Diluted sodium nitroferricyanide solution—Prepare a mixture of water and sodium nitroferricyanide TS (10 : 1).

Test solution—Transfer 2.5 g of Sodium Bicarbonate to a 100-mL volumetric flask, dissolve in and dilute with water to volume.

Procedure—[NOTE—Carefully follow this order of addition.] To 4.0 mL of the *Test solution,* add 0.4 mL of phenol TS, 0.4 mL of *Diluted sodium nitroferricyanide solution,* 1.0 mL of *Oxidizing solution,* dilute with water to 10 mL, mix, and let stand for 1 hour: no blue color develops (0.002%).■1S (*USP29*)

BRIEFING

Sodium Bicarbonate, *USP 28* page 1775. The following changes are proposed:

1. *Limit of ammonia*—See briefing under *Potassium Bitartrate*.
2. *Normal carbonate*—Comments were received that a solubility problem was encountered when performing this test at a temperature not exceeding 5°. It is proposed to perform this test at a temperature not exceeding 15°, as was previously official in *USP VIII* through *USP XX*.

BRIEFING

Sodium Chloride, *USP 28* page 1779. It is proposed to revise the *Identification* test, the test for *Loss on drying,* and the test for *Limit of potassium* to align the monograph with the harmonization text presented by the Pharmacopeial Discussion Group. In the *Identification* test references to USP General Chapters are omitted and replaced with tests *A, B, C,* and *D*. A tolerance of ± 10% is added to the sample weight under the test for *Loss on drying*. In addition, it is proposed to clarify the *Procedure* in the test for *Limit of potassium* to indicate that atomic emission spectrophotometry is used.

(PA1: J. Lane) RTS—42477-1

Change to read:

Identification~~— It responds to the tests for *Sodium* ⟨191⟩ and for *Chloride*.~~

■**A:** Dissolve in 2 mL of water a quantity of the substance to be examined equivalent to about 2 mg of chloride (Cl^-). Acidify with diluted nitric acid, and add 0.4 mL of a silver nitrate solution containing about 42.5 g per L. Shake,

In-Process Revision

and allow to stand. A curdled, white precipitate is formed. Centrifuge, and wash the precipitate with three quantities, each 1 mL, of water. Carry out this operation rapidly in subdued light, disregarding the fact that the supernatant may not become perfectly clear. Suspend the precipitate in 2 mL of water, and add 1.5 mL of ammonium hydroxide. The precipitate dissolves easily with the possible exception of a few large particles which dissolve slowly.

B: Introduce into a test tube a quantity of the substance to be examined equivalent to about 15 mg of chloride (Cl^-). Add 0.2 g of potassium dichromate and 1 mL of sulfuric acid. Place a filter-paper strip impregnated with 0.1 mL of *Diphenylcarbazide solution* over the opening of the test tube. The paper turns violet-red. The impregnated paper must not come into contact with the potassium dichromate.

Diphenylcarbazide solution—Dissolve 0.2 g of diphenylcarbazide in 10 mL of glacial acetic acid, and dilute with alcohol to 100 mL. Prepare immediately before use.

C: Dissolve 0.1 g of the substance to be examined in 2 mL of water. Add 2 mL of a 150 g per L solution of potassium carbonate, and heat to boiling. No precipitate is formed. Add 4 mL of *Potassium pyroantimonate solution,* and heat to boiling. Allow to cool in iced water, and if necessary rub the inside of the test tube with a glass rod. A dense white precipitate is formed.

Potassium pyroantimonate solution—Dissolve 2 g of potassium pyroantimonate in 95 mL of hot water. Cool quickly and add a solution containing 2.5 g of potassium hydroxide in 50 mL of water and 1 mL of sodium hydroxide solution containing 8.5 g of sodium hydroxide in 100 mL of water. Allow to stand for 24 hours, filter, and dilute with water to 150 mL.

D: Dissolve a quantity of the substance to be examined equivalent to about 2 mg of sodium (Na^+) in 0.5 mL of water. Add 1.5 mL of *Methoxyphenylacetic reagent,* and cool in ice water for 30 minutes. A voluminous, white, crystalline precipitate is formed. Place in water at 20°, and stir for 5 minutes. The precipitate does not disappear. Add 1 mL of ammonia TS. The precipitate dissolves completely. Add 1 mL of ammonium carbonate solution (158 g per L). No precipitate is formed.

Methoxyphenylacetic reagent—Dissolve 2.7 g of methoxyphenylacetic acid in 6 mL of 10% tetramethylammonium hydroxide solution in methanol, and add 20 mL of alcohol. Store in a polyethylene container.■1S (*USP29*)

Assay—

Mobile phase—Prepare a mixture of water, methanol, and glacial acetic acid (68 : 30 : 2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Extractant—Prepare a mixture of 0.15 N hydrochloric acid and methanol (3 : 1).

Standard preparation—Prepare a solution of USP Sulfamethazine RS in *Extractant* having a known concentration of about 0.01 mg per mL.

Assay preparation—Transfer about 5 g of Sulfamethazine Granulated, accurately weighed, to a suitable container, add 250.0 mL of *Extractant*, and shake by mechanical means for 2 hours. Allow the mixture to settle, storing the mixture in a refrigerator if settling is allowed to continue overnight. Filter a portion of the supernatant, and transfer 10.0 mL of the clear filtrate to a 100-mL volumetric flask. Dilute with *Extractant* to volume, and mix. Transfer 5.0 mL of this solution to a 200-mL volumetric flask, dilute with *Extractant* to volume, and mix. Pass a portion of this solution through a filter having a 0.5-µm or finer porosity, and use the filtrate as the *Assay preparation*. This solution contains about 0.01 mg of sulfamethazine per mL.

Derivatizing reagent—Dissolve 6.0 g of dimethylaminobenzaldehyde in 200 mL of glacial acetic acid, add 120 mL of methanol and 80 mL of water, mix, and degas. Prepare this reagent daily.

Chromatographic system—The liquid chromatograph is equipped with a guard column that contains packing L1, a 4.6-mm × 25-cm analytical column that contains

■10-µm■1S *(USP29)*
packing L1, a separate pump to deliver the *Derivatizing reagent* via a T-junction installed immediately postcolumn, a postcolumn derivatization coil consisting of 3-m × 0.5-mm inside-diameter polytef tubing, a flow cell, and a 450-nm detector. The *Mobile phase* flow rate is about 2 mL per minute, and the *Derivatizing reagent* flow rate is about 1 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the capacity factor, k', for the sulfamethazine peak is not less than 2.0; and the relative standard deviation for replicate injections is not more than 3.5%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the sulfamethazine peaks. Calculate the quantity, in mg, of sulfamethazine ($C_{12}H_{14}N_4O_2S$) in each g of the Sulfamethazine Granulated taken by the formula:

$$100{,}000(C/W)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Sulfamethazine RS in the *Standard preparation, W* is the quantity, in g, of Sulfamethazine Granulated taken to prepare the *Assay preparation,* and r_U and r_S are the sulfamethazine peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

■1.0■1S *(USP29)*
for the tilmicosin *cis*-isomer, and ~~1.0~~

■1.1■1S *(USP29)*
for the tilmicosin *cis*-8-epimer.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the percentage of each related compound in the portion of Tilmicosin taken by the formula:

$$5(CP / W)(r_c / r_s),$$

in which C is the concentration, in mg per mL, of USP Tilmicosin RS in the *Standard solution; P* is the designated potency, in µg per mg, ~~of tilmicosin *trans*-isomers, tilmicosin *cis*-isomer, and tilmicosin *cis*-8-epimer, respectively. In the USP Tilmicosin RS~~

■of tilmicosin in the USP Tilmicosin RS;■1S *(USP29)*
W is the weight, in mg, of Tilmicosin taken to prepare the *Test solution;* r_c is the area response of the individual related compound peak, other than those obtained for tilmicosin *trans*-isomers, tilmicosin *cis*-isomer, and tilmicosin *cis*-8-epimer; and r_s is the sum of the peak area responses for the tilmicosin *trans*-isomers, the tilmicosin *cis*-isomer, and the tilmicosin *cis*-8-epimer obtained from the *Standard solution*. Not more than 3% of any individual related compound, calculated on the anhydrous basis, is found, and the sum of all the related compounds is not more than 10%, calculated on the anhydrous basis.

Assay—

Dibutylammonium phosphate buffer—Add, with stirring, 70 mL of dilute phosphoric acid (1 in 10) to 16.8 mL of dibutylamine (90 : 10). Allow to cool, and adjust with phosphoric acid to a pH of 2.5 ± 0.1. Dilute with water to 100 mL, and mix.

Mobile phase—To 700 mL of water, add 115 mL of acetonitrile, 55 mL of tetrahydrofuran, and 25 mL of *Dibutylammonium phosphate buffer.* Dilute with water to 1000 mL, and mix. Each component may be degassed before use, or the *Mobile phase* may be sparged with helium for 2 minutes before use. Store the *Mobile phase* in a sealed container when not in use. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩). [NOTE—Decreasing the proportion of acetonitrile or tetrahydrofuran increases resolution.]

Diluent—To 900 mL of water, add 5.71 g of phosphoric acid, adjust with 12.5 N sodium hydroxide to a pH of 2.5 ± 0.1, dilute with water to 1000 mL, and mix.

Standard preparation—Transfer about 25 mg of USP Tilmicosin RS, accurately weighed, to a 50-mL volumetric flask, add 10 mL of acetonitrile, and sonicate to dissolve. Dilute with *Diluent* to volume, and mix. [NOTE—Use this solution on the day prepared.]

Assay preparation—Transfer about 25 mg of Tilmicosin, accurately weighed, to a 50-mL volumetric flask, add 10 mL of acetonitrile, and sonicate to dissolve. Dilute with *Diluent* to volume, and mix. [NOTE—Use this solution on the day prepared.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation,* and record the responses as directed for *Procedure:* the relative retention times are about 0.8 for the tilmicosin *trans*-isomers and 1.0 for the tilmicosin *cis*-isomers

■[NOTE—Tilmicosin *cis*-isomer and tilmicosin *cis*-8-epimer co-elute in this chromatographic system];■1S *(USP29)*
the resolution, R, between the tilmicosin *trans*-isomers peak and the tilmicosin *cis*-isomers peak is not less than 1.25; the tailing factors for the peaks are not less than 0.7 and not more than 2; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in µg, of tilmicosin *trans*- and *cis*-isomers in the portion of Tilmicosin taken by the formula:

$$50(CP / W)(r_i / r_S),$$

in which C is the concentration, in mg per mL, of USP Tilmicosin RS in the *Standard preparation; P* is the designated potency, in µg per mg, of the relevant (*trans* or *cis*) tilmicosin isomers in the USP Tilmicosin RS; W is the weight, in mg, of Tilmicosin taken to prepare the *Assay preparation;* r_i is the peak area response for the relevant (*trans* or *cis*) tilmicosin isomers obtained from the *Assay preparation;* and r_S is the peak area response for the relevant (*trans* or *cis*) tilmicosin isomers obtained from the *Standard preparation*. Calculate the percentage of tilmicosin ($C_{46}H_{80}N_2O_{13}$) in the portion of Tilmicosin taken by the formula:

$$0.1(trans + cis),$$

in which *trans* and *cis* are the quantities, in µg per mg, of tilmicosin *trans*-isomers and tilmicosin *cis*-isomers in the Tilmicosin, as de-

termined above. Calculate the percentages of tilmicosin *trans*-isomers and tilmicosin *cis*-isomers taken by the formula:

$$100\ isomer / (trans + cis),$$

in which *isomer* is the quantity, in µg per mg, of either the tilmicosin *trans*-isomers or the tilmicosin *cis*-isomers in the Tilmicosin, as determined above.

BRIEFING

Triamcinolone Acetonide, *USP 28* page 1959 and page 3279 of the *First Supplement.* It is proposed to include the use of a USP Reference Standard, USP Fluoxymesterone RS, to replace fluoxymesterone in the *Internal standard solution* of the *Assay.*

(PA1: C. Anthony) RTS—42460-01

Change to read:

USP Reference standards ⟨11⟩—

■*USP Fluoxymesterone RS.*■1S *(USP29)*
USP Triamcinolone Acetonide RS.

Change to read:

Assay—

Mobile phase—Prepare a solution of acetonitrile in water containing approximately 30% (v/v) of acetonitrile.

Internal standard solution—Dissolve ~~fluoxymesterone~~

■USP Fluoxymesterone RS■1S *(USP29)* in methanol to obtain a solution having a concentration of about 50 µg per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Triamcinolone Acetonide RS in *Internal standard solution* to obtain a solution having a known concentration of about 75 µg per mL. Mix an accurately measured volume of the resulting solution with an equal volume of *Mobile phase* to obtain a *Standard preparation* containing about 37.5 µg of USP Triamcinolone Acetonide RS per mL.

Assay preparation—Using about 37 mg of Triamcinolone Acetonide, accurately weighed, proceed as directed for *Standard preparation.*

Procedure—Introduce equal volumes (between 15 µL and 25 µL) of the *Assay preparation* and the *Standard preparation* into a high-pressure liquid chromatograph (see *Chromatography* ⟨621⟩) operated at room temperature, by means of a suitable microsyringe or sampling valve. Adjust the operating parameters with *Mobile phase* on the column so that the separation of triamcinolone acetonide and internal standard is optimized, with a retention time of about 14.5 minutes for triamcinolone acetonide. Typically, the apparatus is fitted with a 4-mm × 30-cm column containing packing L1 and is equipped with a UV detector capable of monitoring absorbance at 254 nm, and a suitable recorder. In a suitable chromatogram, the coefficient of variation for five replicate injections of a single specimen is not more than 3.0%; and the resolution factor, *R* (see *Chromatography* ⟨621⟩), between the peaks for triamcinolone acetonide and fluoxymesterone is not less than 2.0. Measure the heights of the internal standard and triamcinolone acetonide peaks at the same retention times obtained from the *Assay preparation* and the *Standard preparation.* Calculate the quantity, in mg, of $C_{24}H_{31}FO_6$ in the portion of Triamcinolone Acetonide taken by the formula:

$$1000C(R_U / R_S),$$

in which *C* is the concentration, in mg per mL, of USP Triamcinolone Acetonide RS in the *Standard preparation;* and R_U and R_S are the ratios of the peak heights of triamcinolone acetonide to the internal standard obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Ursodiol Capsules, *USP 28* page 2006 and page 79 of *PF* 31(1) [Jan.–Feb. 2005]. It is proposed to correct the molar concentration of the *Medium* in the test for *Dissolution*.

(BPC: M. Marques) RTS—42318-1

Dissolution ⟨711⟩—

Medium: ~~0.2 M~~
★~~0.5 M~~★*USP29*

■0.05 M■1S *(USP29)* pH 8.4 phosphate buffer, prepared by mixing 250 mL of 0.2 M monobasic potassium phosphate, 280 mL of 0.2 M potassium hydroxide, and 5 mL of 2% sodium lauryl sulfate solution. Adjust with 0.2 M potassium hydroxide to a pH of 8.4, and dilute with water to 1000 mL; 1000 mL.

Apparatus 2: 75 rpm.

Time: 30 minutes.

Determine the amount of ursodiol ($C_{24}H_{40}O_4$) dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and 0.075 M monobasic potassium phosphate (50 : 50). Adjust with 85% phosphoric acid to a pH of 3.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Ursodiol RS, and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration equivalent to that expected in the solution under test.

Test solution—Use a filtered portion of the solution under test.

Chromatographic system—The liquid chromatograph is equipped with a refractive index detector, a guard column that contains packing L1, and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute, and the column and detector temperatures are maintained at 40°. Chromatograph the *Standard solution,* and record the peak responses as

In-Process Revision

directed for *Procedure:* the tailing factor of the ursodiol peak is not more than 1.7; and the relative standard deviation for replicate injections is not more than 2%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{24}H_{40}O_4$ dissolved by the formula:

$$100{,}000(r_U / r_S)(C/W),$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; C is the concentration, in mg per mL, of USP Ursodiol RS in the *Standard solution;* and W is the labeled amount, in mg, of ursodiol in each Capsule.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{24}H_{40}O_4$ is dissolved in 30 minutes.

BRIEFING

Valproic Acid Injection. The proposed new monograph for *Valproic Acid Injection*, previously published on page 940 of PF 26(4) [July–Aug. 2000], is hereby cancelled and replaced with the following new proposal. The *Assay* employs a gas chromatographic method using a 2-mm × 1.8-m glass column packed with 10% phase G34 on 80- to 100-mesh support S1A with biphenyl as the internal standard. Typical retention time for valproic acid is about 3 minutes, and that for biphenyl is about 7 minutes.

(PA3: R. Ravichandran; NL: L. Paul; AMB: R. Tirumalai; PSD: C. Okeke) RTS—22708-1; 22708-2; 22708-3; 22708-4

Add the following:

■Valproic Acid Injection

» Valproic Acid Injection is a sterile aqueous solution of sodium valproate, formed from the interaction of Valproic Acid and Sodium Hydroxide, in Water for Injection, and one or more suitable buffering or sequestering agents. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of valproic acid ($C_8H_{16}O_2$). Valproic Acid Injection contains no antimicrobial agents.

Packaging and storage—Preserve in single-dose *Containers for Injection* as described under *Injections* ⟨1⟩, preferably Type I glass. Store at controlled room temperature, 20° to 25°, excursions allowed between 15° and 30°.

Labeling—Label it to state the name and quantity of any buffering or sequestering agent used.

USP Reference standards ⟨11⟩**—***USP Endotoxin RS. USP Valproic Acid RS.*

Identification—

A: The relative retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

B: It meets the requirements of the tests for *Sodium* ⟨191⟩.

Bacterial endotoxins ⟨85⟩**—**It contains not more than 23 USP Endotoxin Units per mL of Injection.

Sterility ⟨71⟩**—**It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product To Be Examined.*

pH ⟨791⟩**:** between 7.0 and 9.0.

Particulate matter ⟨788⟩**—**It meets the requirements for small-volume injections.

Other requirements—It meets the requirements under *Injections* ⟨1⟩.

Assay—

Internal standard solution—Dissolve a quantity of biphenyl in methylene chloride to obtain a solution containing 5 mg per mL.

Standard stock preparation—Prepare a solution of USP Valproic Acid RS in *Internal standard solution* having a concentration of about 8 mg per mL.

Standard preparation—Transfer 5.0 mL of *Standard stock preparation* into a 50-mL volumetric flask, and dilute with methylene chloride to volume.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to 400 mg of sodium valproate, into a suitable container; add about 20 mL of 5% (v/v) hydrochloric acid; shake by mechanical means for 2 minutes; add 50.0 mL of *Internal standard solution;* and shake by mechanical means for 1 hour. Allow the phase to separate (approximately 1 hour). The bottom organic layer remains cloudy, and at times a slight emulsion may persist. The emulsion is easily broken up with the aid of a glass rod. Pipet 5 mL of the extract from the bottom organic layer into a 50-mL volumetric flask, and dilute with methylene chloride.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm × 1.8-m glass column packed with 10% phase G34 on 80- to 100-mesh support S1A. The column temperature is maintained at about 155°, the injection port temperature is maintained at about 275°, and the detector block temperature is maintained at about 300°. Dry helium is used as the carrier gas at a flow rate of about 20 mL per minute. Chromatograph the *Standard preparation* as directed for *Procedure:* the resolution, *R,* between the valproic acid and biphenyl peaks is not less than 3.0; and the relative standard deviation of the peak area ratios for replicate injections is not more than 2.0%.

Procedure—Separately inject equal amounts (about 2 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak areas for the valproic acid and biphenyl peaks. Calculate the quantity, in mg, of valproic acid in the portion of Injection taken by the formula:

$$C(R_U / R_S)\, D,$$

in which C is the concentration, in mg per mL, of USP Valproic Acid RS in the *Standard preparation;* R_U and R_S are the peak area ratios obtained from the *Assay preparation* and the *Standard preparation,* respectively; and D is the appropriate dilution factor used to prepare the *Assay preparation.* ■1S (*USP29*)

BRIEFING

Sterile Purified Water, *USP 28* page 2035 and page 3282 of the *First Supplement;* **Sterile Water for Irrigation,** *USP 28* page 2035. The Pharmaceutical Waters Expert Committee has previously proposed revisions of the packaged water monographs, but without success. Total organic carbon (TOC) testing primarily identifies the extractables from the container, and it is difficult to arrive at an acceptable limit. Conductivity testing, however, can be applied and in so doing several outmoded subjective "wet chemistry" tests can be deleted from the monographs. Therefore, the Committee proposes a conductivity test with limits that harmonize with the *European Pharmacopoeia.* Also, it is proposed to delete the *pH* standard because a sample cannot pass the test for *Conductivity* and fail the test for *pH;* i.e., the two tests are interrelated. The Committee retains the test for *Oxidizable substances* with a reduction in the potassium permanganate solution concentration, again to harmonize with the procedure described in the *European Pharmacopoeia.* However, the Committee continues to seek a replacement for the test for *Oxidizable substances* since it has been shown to produce questionable results. A new general chapter *Conductivity*

⟨644⟩, developed to provide the testing protocol, is found in this issue of *PF*. Comments should be addressed to Frank Barletta, Liaison to the Pharmaceutical Waters Expert Committee.

Oxidizable substances—To 100 mL, add 10 mL of 2 N sulfuric acid, and heat to boiling. For Sterile Purified Water in containers having a fill volume of less than 50 mL, add 0.4 mL of ~~0.1 N~~

■0.02 N■1S (*USP29*)
potassium permanganate, and boil for 5 minutes; where the fill volume is 50 mL or more, add 0.2 mL of ~~0.1 N~~

■0.02 N■1S (*USP29*)
potassium permanganate, and boil for 5 minutes. If a precipitate forms, cool in an ice bath to room temperature, and pass through a sintered-glass filter: the pink color does not completely disappear.

BRIEFING

Excipients, USP and NF Excipients, Listed by Category, *NF 23* page 2941, page 3349 of the *First Supplement,* and page 2062 of *PF* 30(6) [Nov.–Dec. 2005]. It is proposed to add *Gamma Cyclodextrin* to the *Sequestering Agent* category. The proposed revision complements the proposed new monograph, *Gamma Cyclodextrin,* which appears elsewhere in this number of *PF.*

(EMC) RTS—41451-1

Add the following:

■In the following reference table, the grouping of excipients by functional category is intended to summarize the most typically identified purpose that these excipients serve in drug product formulations. The list of substances included in each category is not comprehensive. The statement of category is intended neither to limit in any way the choice or use of the substance nor to indicate that it has no other utility.■2S (*NF23*)

MONOGRAPHS (NF)

BRIEFING

Acesulfame Potassium, *NF 23* page 2947 and page 87 of *PF* 31(1) [Jan.–Feb. 2005]. It is proposed to revise the test for *Limit of fluoride* so that it corresponds to the procedure under *Acesulfame Potassium* in the *European Pharmacopoeia 5th Edition.*

(EMC: K. Russo) RTS—42330-1

Add the following:

▲**Packaging and storage—**Preserve in a well-closed container, and protect from light. Store at room temperature.▲*NF24*

Change to read:

Limit of fluoride—[NOTE—Use plasticware throughout this test.]

Buffer solution—Dissolve 210 g of citric acid monohydrate in 400 mL of water. Adjust with concentrated ammonia to a pH of 7.0, dilute with water to 1000 mL, and mix *(Solution A).* Dissolve 132 g of ~~monobasic~~

■dibasic■1S *(NF24)*
ammonium phosphate in water, dilute with water to 1000 mL, and mix *(Solution B).* To a suspension of 292 g of ~~edetate disodium~~

■edetic acid■1S *(NF24)*
in about 500 mL of water, add about 200 mL of ammonium hydroxide, and mix to dissolve *(Solution C).* Adjust with ammonium hydroxide to a pH between 6 and 7, dilute with water to make 1000 mL, and mix. Mix equal volumes of *Solution A, Solution B,* and *Solution C,* and adjust with ammonium hydroxide to a pH of 7.5.

Standard stock solution—Weigh accurately about 0.442 g of sodium fluoride, previously dried at 300° for 12 hours, into a 1-L volumetric flask, dilute with water to volume, and mix. Store the solution in a closed plastic container. Immediately before use, pipet 5 mL of this solution into a 100-mL volumetric flask, dilute with water to volume, and mix. Each mL of this solution contains 10 µg of fluoride ion.

Standard solutions—Into separate 50-mL volumetric flasks, pipet 0.5, ~~1.5, 5, and 15 mL~~

■1.0, 1.5, and 3.0 mL■1S *(NF24)*
of the *Standard stock solution,* add 15.0 mL of *Buffer solution* to each volumetric flask, dilute with water to volume, and mix.

Test solution—Place about ~~1 g~~

■3 g■1S *(NF24)*
of Acesulfame Potassium, accurately weighed, in a 50-mL volumetric flask, dissolve in water, add 15.0 mL of *Buffer solution,* dilute with water to volume, and mix.

Procedure—Concomitantly measure the potential (see *Titrimetry* ⟨541⟩), in mV, of the *Standard solutions* and the *Test solution,* with a suitable pH meter equipped with a fluoride-specific ion electrode and a silver-silver chloride reference electrode. When taking the measurements, transfer the solution to a 25-mL beaker, and immerse the electrodes. Insert a polytef-coated stirring bar into the beaker, place the beaker on a magnetic stirrer having an insulated top, and allow to stir until equilibrium is attained (about 1 to 2 minutes). Rinse, and dry the electrodes between measurements, taking care not to scratch the crystal in the flouride-specific ion electrode. Measure the potential of each *Standard solution,* and plot the fluoride concentration, in µg per mL, versus the potential, in mV, on semilogarithmic paper. Measure the potential of the *Test solution,* and determine the fluoride concentration from the standard curve, in µg per mL. Calculate the percentage of fluoride in the portion of Acesulfame Potassium taken by the formula:

$$5(C/W),$$

in which C is the fluoride concentration, in µg per mL, from the standard curve; and W is the weight, in mg, of Acesulfame Potassium taken to prepare the *Test solution:* not more than 0.0003% of fluoride is found.

BRIEFING

Ethylcellulose Aqueous Dispersion, *NF 23* page 3004. It is proposed to remove the reference to the *Ethylcellulose* monograph, because the reference is invalid due to changes resulting from the harmonization process.

(ETM: J. Lane) RTS—42403-1

Change to read:

Identification—

A: Transfer a small quantity to a silver chloride plate, and allow the water to evaporate: the IR absorption spectrum of the residue in the 3600 to 2600 cm^{-1} and 1500 to 800 cm^{-1} regions exhibits maxima only at the same wave numbers as that of a film of USP Ethylcellulose RS prepared ~~as directed in the test for *Identification* under *Ethylcellulose.*~~

■by dissolving about 250 mg of USP Ethylcellulose RS in 5 mL of a mixture of 80 parts of toluene and 20 parts of alcohol and evaporating a few mL on a silver chloride plate.■1S *(NF24)*

B: Transfer about 2 mL to a 100-mm diameter petri dish so that the bottom of the dish is covered uniformly. Place the dish in an oven or on a hot plate to evaporate the water: a transparent film results.

In-Process Revision

C: Dissolve the film formed in *Identification* test *B* in 20 mL of chloroform. Inject 2 µL of this solution into a gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a 2-mm × 1.8-m column that contains 10% liquid phase G1 on support S1A maintained at a temperature of 220° and a flame-ionization detector. The temperatures of the injection port and the detector are maintained at about 250° and 275°, respectively. The retention time of the major peak following the solvent peak in the resulting chromatogram corresponds to that obtained from a similar solution of USP Cetyl Alcohol RS.

D: *Methylene blue solution*—To a 150-mL graduated beaker containing 0.7 mL of sulfuric acid and 5 g of anhydrous sodium sulfate slowly add water to the 90-mL mark. Add methylene blue solution (3 in 1000) to the 100-mL mark, and mix.

Procedure—To 1 mL of Aqueous Dispersion in a 100-mL graduated mixing cylinder add 9 mL of water followed by 25 mL of *Methylene blue solution*, and mix. Add 15 mL of chloroform, and shake vigorously. Allow the two phases to separate: the lower phase is blue, indicating the presence of sodium lauryl sulfate.

BRIEFING

Ethylparaben, *NF 23* page 3006 and page 3356 of the *First Supplement.* It is proposed to revise the *Melting range* in *Identification* test *B* to align the monograph with the harmonization text presented by the Pharmacopeial Discussion Group.

(EMC: J. Lane) RTS—42478-1

Change to read:

Identification—

A: *Infrared Absorption* ⟨197M⟩.

B: *Melting range* ⟨741⟩: ~~between 96° and 99°.~~

■between 115° and 118°.■IS (*NF24*)

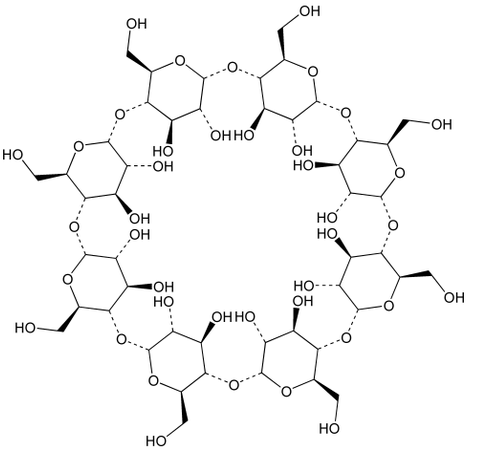
BRIEFING

Gamma Cyclodextrin. Because there is no existing *NF* monograph for this excipient, a new monograph, based on the manufacturer's tests and acceptance criteria, is being proposed. The liquid chromatographic procedures in the *Assay* were validated using a Nucleosil 100-5 NH_2, 4-mm × 25-cm brand of L8 column. The typical retention time for gamma cyclodextrin in the *Assay* is approximately 7.8 minutes. The liquid chromatographic procedures in the test for *Related compounds* were validated using a 4.6-mm × 25-cm Nucleosil 120-5 C18 brand of L1 column containing 5-µm packing and a 4.6-mm × 25-cm Supelcosil LC-18 brand of L1 column containing 5-µm packing. Typical retention times for gamma cyclodextrin, beta cyclodextrin, and alpha cyclodextrin in the test for *Related compounds* are approximately 3.2, 9.9, and 4.5 minutes, respectively.

(EMC: J. Lane; PSD: C. Okeke; NL: L. Paul; AMB: R. Tirumalai) RTS—41451-1

Add the following:

■Gamma Cyclodextrin



$C_{48}H_{80}O_{40}$ 1297.12 [*17465-86-0*].

» Gamma Cyclodextrin is composed of 8 gamma-(1–4) linked D-glycopyranosyl units. It contains not less than 98.0 percent and not more than 102.0 percent of $C_{48}H_{80}O_{40}$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers, and store at room temperature.

USP Reference standards ⟨11⟩—*USP Alpha Cyclodextrin RS. USP Beta Cyclodextrin RS. USP Gamma Cyclodextrin RS.*

In-Process Revision

Color and clarity of solution—

Test solution—Transfer about 2.5 g of Gamma Cyclodextrin, accurately weighed, into a 25-mL volumetric flask, dissolve in and dilute with water that has been previously boiled and cooled to room temperature to volume, and mix.

Procedure—Determine the absorbance of the *Test solution* in a 1-cm cell with a suitable spectrophotometer, after correcting for the blank: at 420 nm, the absorbance is not greater than 0.20; and the solution is clear.

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

C: It meets the requirements of the test for *Specific rotation.*

Specific rotation ⟨781S⟩**:** between +174° and +180°.

Test solution: 10 mg per mL, in water.

Microbial limits ⟨61⟩**—**It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*. The total aerobic microbial count does not exceed 1000 cfu per g, and the total combined molds and yeasts count does not exceed 100 cfu per g.

Loss on drying ⟨731⟩**—**Dry it at 105° for 2 hours: it loses not more than 11.0% of its weight.

Residue on ignition ⟨281⟩: not more than 0.1%, determined on a 1.0-g specimen.

Heavy metals, *Method II* ⟨231⟩**:** 5 ppm.

Related compounds—

Mobile phase—Prepare a filtered and degassed mixture of water and methanol (90 : 10).

System suitability solution—Dissolve an accurately weighed quantity of USP Alpha Cyclodextrin RS, USP Beta Cyclodextrin RS, and USP Gamma Cyclodextrin RS in water to obtain a solution having a known concentration of about 0.5 mg of each per mL.

Standard solution—Transfer 25 mg of USP Gamma Cyclodextrin RS, accurately weighted, to a 25-mL volumetric flask, and dissolve in and dilute with water to volume.

Test solution—Dissolve about 250 mg of Gamma Cyclodextrin, previously dried, in water with the aid of heat. Cool, and dilute with water to 25.0 mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector and a 4.6-mm × 25-cm column that contains 10-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure*: the retention time of gamma cyclodextrin is about 3.2 minutes; the relative retention times are about 1.4 for alpha cyclodextrin and about 3.1 for beta cyclodextrin; the resolution, *R,* between the alpha cyclodextrin and beta cyclodextrin peaks is not less that 1.5 and the resolution, *R,* between the beta cyclodextrin and gamma cyclodextrin peaks is not less than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. For the *Test solution,* the areas of any peaks corresponding to beta cyclodextrin or alpha cyclodextrin are not greater than the area of the corresponding peaks in the chromatogram of the *Standard solution* (0.5%), and the sum of the areas of all the peaks, excluding the principal peak and the peaks corresponging to beta cy-

clodextrin or to alpha cyclodextrin, is not greater than half of the area of the peak corresponding to gamma cyclodextrin in the chromatogram of the *Standard solution* (0.5%).

Reducing substances—

Copper citrate solution—Dissolve, with the aid of heat, about 173 g of sodium citrate dihydrate and 117 g of sodium carbonate monohydrate in about 700 mL of water, and filter. In a second flask, dissolve about 27.06 g of cupric sulfate in about 100 mL of water. Slowly combine the two solutions while stirring, and dilute with water to 1000 mL.

Dextrose standard solution—Transfer 1.1 g of dextrose monohydrate, accurately weighed, to a 100-mL volumetric flask, and dissolve in and dilute with water to volume.

Procedure—Transfer about 1.0 g of Gamma Cyclodextrin, accurately weighed, to a 500-mL conical flask, dissolve in 10 mL of water, and add 25 mL of *Copper citrate solution*. Cover the flask with aluminum foil, and boil the solution for 5 minutes. Cool in an ice bath to room temperature. Add 25 mL of 0.6 N acetic acid, 10 mL of 3 N hydrochloric acid, and 10 mL of 0.1 N iodine solution. [NOTE—The addition of these solutions must be in the order given.] Titrate the solution with 0.1 N sodium thiosulfate VS, and determine the endpoint potentiometrically. Perform a blank determination (see *Residual Titrations* under *Titrimetry* ⟨541⟩). Create a calibration curve by similarly titrating 0.25, 0.5, 0.75, and 1.0 mL of *Dextrose standard solution*. Calculate the amount of reducing substances in the sample by comparing the thiosulfate consumption in the sample titration with that in the titration of the standard solutions of the calibration curve, and by dividing that amount by 10 to obtain the percentage: not more than 0.5% is found.

Organic volatile impurities *Method IV* ⟨467⟩**:** meets the requirements.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (67 : 33).

Standard preparation—Dissolve an accurately weighed quantity of USP Gamma Cyclodextrin RS in water to obtain a solution having a known concentration of about 10 mg per mL.

Assay preparation—Transfer about 100 mg of Gamma Cyclodextrin, previously dried, to a 10-mL volumetric flask, and dissolve in about 8 mL of water. Dilute with water to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector and a 4-mm × 25-cm column that contains 10-µm packing L8. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{48}H_{80}O_{40}$ in the portion of Gamma Cyclodextrin taken by the formula:

$$100C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Gamma Cyclodextrin RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■1S (*NF24*)

In-Process Revision

BRIEFING

Maleic Acid, *NF 23* page 3031. It is proposed to make a correction in the *Identification* test *A*.

(EMC: E. Gonikberg) RTS—42378-1

Change to read:

Identification—

A: Dissolve about 500 mg of Maleic Acid in 10 mL of water: the pH of the solution is ~~not~~

■■1S (*NF24*)
less than 2.

B: The principal spot in the chromatogram obtained from *Test solution 2* corresponds in color, size, and R_F value to that in the chromatogram obtained from the *Maleic acid standard solution,* as obtained in the test for *Limit of fumaric acid.*

C: Dissolve about 35 mg of resorcinol in 10 mL of sulfuric acid *(Resorcinol solution).* Dissolve about 100 mg of Maleic Acid in 10 mL of water *(Test solution).* To 0.3 mL of the *Test solution* add 3 mL of the *Resorcinol solution,* and heat in a water bath for 15 minutes: no color develops. To 3 mL of the *Test solution* add 1 mL of bromine TS, heat in a water bath for 15 minutes to remove the bromine, then heat to boiling, and cool. To 0.2 mL of this solution, add 3 mL of the *Resorcinol solution,* and heat in a water bath for 15 minutes: a violet-pink color develops.

BRIEFING

Maltose, *NF 23* page 3034 and page 3358 of the *First Supplement.* On the basis of comments received, it is proposed to revise the lower limit in the test for *Water* from 5.0% to 4.5%.

(EMC: C. Sheehan) RTS— 42452-1

Change to read:

Water, *Method I* ⟨921⟩—The anhydrous form contains not more than 1.5%. The monohydrate form contains not less than ~~5.0%~~

■4.5%■1S (*NF24*)
and not more than 6.5%.

BRIEFING

Olive Oil, *NF* 23 page 3043. Based on comments received, it is proposed to revise the test for *Teaseed oil* regarding the interpretation of a color reaction in the test. It is proposed to include a *Note* concerning a pink coloration based on the text adopted in the seventh session report of the Joint FAO/WHO Codex Alimentarius Commission. It is also proposed to revise the Definition and add a *Labeling* section to include the use of suitable antioxidants.

(EMC: C. Sheehan; NL: L. Paul) RTS—42427-1

Change to read:

» Olive Oil is the fixed oil obtained from the ripe fruit of *Olea europaea* Linné (Fam. Oleaceae).

■It may contain suitable antioxidants.■1S (*NF24*)

Add the following:

■**Labeling**—Label it to indicate the name and quantity of any suitable antioxidants.■1S (*NF24*)

Change to read:

Teaseed oil—In a dry, 18- × 150-mm test tube place 0.8 mL of acetic anhydride, 1.5 mL of chloroform, and 0.2 mL of sulfuric acid, mix, and cool in a water bath to 25°. Add about 200 mg of Olive Oil (about 7 drops), mix, and cool to 25°. If the solution is cloudy, add acetic anhydride, dropwise, shaking after each addition, until the solution suddenly clears. Allow the mixture to remain in the water bath for 5 minutes: it shows a green color by both reflected and transmitted light. Add 10 mL of absolute ether, and mix by inverting the tube: the initial green color fades to a brownish gray. (Before the dilution with ether, the presence of *teaseed oil* will cause a brown color to appear by transmitted light, and after the dilution, a transient red color.)

■[NOTE—A pink color is regarded as negative, because some olive oils yield this color.]■1S (*NF24*)

BRIEFING

Phenoxyethanol, *NF 23* page 3048. It is proposed to correct the calculations in the *Assay* and add a clarification under *Chromatographic purity* test. The proposals to add the test for *Bacterial endotoxins,* and the *Labeling* and *Reference standards* proposals related to this addition, published on page 94 of *PF* 31(1) [Jan.–Feb. 2005], are now being canceled.

(EMC: E. Gonikberg) RTS—42458-1

Change to read:

Chromatographic purity—

Phenol solution—Prepare a solution of phenol in isopropyl alcohol having a known concentration of about 0.25 mg of phenol per mL.

Standard solution—Dissolve an accurately weighed quantity of USP Phenoxyethanol RS in *Phenol solution* to obtain a solution having a known concentration of about 5 mg of phenoxyethanol per mL. Accurately transfer 500 µL of this solution to a vial, add 1000 µL of isopropyl alcohol, crimp the vial, and mix on a vortex mixer for about 15 seconds.

■Calculate the concentrations of phenoxyethanol and phenol in this solution.■1S (*NF24*)

Test solution—Accurately transfer 500 µL of Phenoxyethanol to a tared vial, and determine the weight of Phenoxyethanol taken. Add 1000 µL of isopropyl alcohol, crimp the vial, and mix on a vortex mixer for about 15 seconds.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.32-mm × 10-m capillary column coated with a 5-µm film of stationary phase G27. The carrier gas is helium with a split flow rate of 44 mL per minute. The injector port temperature and the detector temperature are both maintained at 300°. The column temperature is programmed as follows: the starting column temperature is 80°; after injection, it is increased to 260° at a rate of 8° per minute, then held for 10 minutes. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between phenol and phenoxyethanol peaks is not less than 10; and the relative standard deviation for replicate injections for the phenoxyethanol peak is not more than 2.0%.

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak area responses. Calculate the percentage of total impurities in the portion of Phenoxyethanol taken by the formula:

$$150(C/W)(r_U / r_S),$$

in which C is the concentration, in mg per mL, of phenoxyethanol in the *Standard solution; W* is the weight of Phenoxyethanol, in mg, taken to prepare the *Test solution;* r_U is the sum of all additional peak areas in the chromatogram obtained from the *Test solution,* excluding the main peak, the solvent peak, and the phenol peak; and r_S is the peak area of the phenoxyethanol peak in the chromatogram obtained from the *Standard solution:* not more than 1.0% of total impurities is found.

Change to read:

Assay—

Phenol solution and *Chromatographic system*—Prepare as directed under *Chromatographic purity.*

Standard preparation—Use the *Standard solution,* prepared as directed under *Chromatographic purity.*

Assay preparation—Transfer about 500 mg of Phenoxyethanol, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with isopropyl alcohol to volume, and mix. Accurately transfer 500 µL of this solution to a vial, add 1000 µL of isopropyl alcohol, crimp the vial, and mix on a vortex mixer for about 15 seconds.

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak area responses. Calculate the quantity, in mg, of $C_8H_{10}O_2$ in the portion of Phenoxyethanol taken by the formula:

~~$150C(r_u / r_s),$~~

$$■300C(r_U / r_S),■1S\ (NF24)$$

in which C is the concentration, in mg per mL, of USP Phenoxyethanol RS in the *Standard preparation;* and r_U and r_S are the responses of the phenoxyethanol peak obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Polyoxyl 10 Oleyl Ether, *NF 23* page 3058 and **Polyoxyl 20 Cetostearyl Ether,** *NF 23* page 3059. It is proposed to revise the *Standard preparation* in the test for *Free ethylene oxide* to remove the requirement to use USP Reference Standard material as the diluent for the ethylene oxide. It is sufficient to use the sample under test to prepare the *Standard preparation*.

Change to read:

Free ethylene oxide—

Internal standard solution—Prepare a solution containing 100 mg of *n*-butyl chloride in each mL of chlorobenzene. Store in a tightly closed container. Prepare fresh weekly.

Standard solution—[Caution—Ethylene oxide is toxic and flammable. Prepare this solution in a well-ventilated hood, using great care.] Place 250 mL of chlorobenzene in a glass-stoppered, 500-mL conical flask. Bubble ethylene oxide through the chlorobenzene at a moderate rate for about 30 minutes, insert the stopper,

In-Process Revision

and store with protection from heat. Pipet 25 mL of a 0.5 N alcoholic hydrochloric acid solution, prepared by mixing 45 mL of hydrochloric acid with 1 L of alcohol, into a 500-mL conical flask containing 40 g of magnesium chloride hexahydrate. Shake the mixture to effect saturation. Pipet 10 mL of the ethylene oxide solution into the flask, and add 20 drops of bromocresol green TS. If the solution is not yellow (acid) at this point, add an additional volume, accurately measured, of 0.5 N alcoholic hydrochloric acid to give an excess of about 10 mL. Record the total volume of 0.5 N alcoholic hydrochloric acid added. Insert the stopper in the flask, and allow to stand for 30 minutes. Titrate the excess acid with 0.5 N alcoholic potassium hydroxide VS. Perform a blank titration, using 10.0 mL of chlorobenzene instead of ethylene oxide solution, adding the same total volume of 0.5 N alcoholic hydrochloric acid, and note the difference in volumes required. Each mL of the difference in volumes of 0.5 N alcoholic potassium hydroxide consumed is equivalent to 22.02 mg of ethylene oxide. Calculate the concentration, in mg per mL, of ethylene oxide in the *Standard solution*. Standardize daily.

Standard preparation—Transfer about 5 g of ~~USP Polyoxyl 10 Oleyl Ether RS~~

■Polyoxyl 10 Oleyl Ether■1S (*NF24*)
to a suitable glass bottle of about 60-mL capacity, and add 10 mL of chlorobenzene, exactly 50 µL of *Internal standard solution,* and an accurately measured volume of *Standard solution* containing about 0.5 mg of ethylene oxide. Insert a magnetic stirring bar, cap the bottle tightly, and stir until homogeneity is attained.

Test preparation—Transfer about 5 g of Polyoxyl 10 Oleyl Ether, accurately weighed, to a suitable glass bottle of about 60-mL capacity, and add 10 mL of chlorobenzene and 50 µL, accurately measured, of *Internal standard solution*.

■Add a volume of chlorobenzene equal to the volume of the *Standard solution* added to prepare the *Standard preparation.*■1S (*NF24*)
Insert a magnetic stirring bar, cap the bottle tightly, and stir until homogeneity is attained.

Chromatographic system—Under typical conditions, the instrument is equipped with a flame-ionization detector, and contains a 3-mm (OD) × 1.8-m stainless steel column packed with S3. The injector port and detector block temperatures are maintained at about 210° and 230°, respectively, and the column temperature at about 160°. Helium is used as the carrier gas at a flow rate of 66 mL per minute.

Interference check—Inject a suitable volume of chlorobenzene into the gas chromatograph, and allow the chromatogram to run until the solvent has eluted. Similarly inject and chromatograph the *Internal standard solution*, the *Standard solution,* and a solution prepared according to the directions for the *Test preparation,* but omitting the internal standard. No interfering peaks are observed.

Procedure—Inject about 2 µL of the *Standard preparation* into a suitable gas chromatograph, and record the chromatogram. Similarly, inject about 2 µL of the *Test preparation,* and record the chromatogram. ~~Calculate the quantity, in mg, of ethylene oxide in the portion of Polyoxyl 10 Oleyl Ether taken by the formula:~~

~~$W_E(R_U / R_S)$,~~

~~in which W_E is the weight, in mg, of ethylene oxide in the portion of *Standard solution* taken, and R_U and R_S are the area ratios of ethylene oxide to internal standard in the chromatograms for the *Test preparation* and the *Standard preparation*, respectively. The limit is 0.01%.~~

■Calculate the weight, in g, of ethylene oxide in the *Test preparation* (W_T) by the formula:

$$(W_E W_U R_U)/1000(W_U R_S - W_S R_U),$$

in which W_E is the weight, in mg, of ethylene oxide added to the *Standard preparation;* W_U and W_S are the weights, in g, of Polyoxyl 10 Oleyl Ether used to prepare the *Test preparation* and the *Standard preparation,* respectively; and R_U and R_S are the area ratios of ethylene oxide to internal standard in the chromatograms for the *Test preparation* and the *Standard preparation,* respectively. Calculate the percentage of ethylene oxide in the portion of Polyoxyl 10 Oleyl Ether taken by the formula:

$$100W_T / W_U,$$

in which W_T and W_U are as defined previously. The limit is 0.01%.■1S (*NF24*)

BRIEFING

BRIEFING

Sodium Benzoate, *NF 23* page 3075. It is proposed to add a spectrophotometric identification test to this monograph employing *Infrared Absorption* ⟨197M⟩ and to include a new Reference Standard, USP Sodium Benzoate RS, to be used to perform this test.

(EMC: C. Sheehan) RTS—42426-1

Add the following:

■**USP Reference standards** ⟨11⟩—*USP Sodium Benzoate RS*. ■1S (*NF24*)

In-Process Revision

Change to read:

Identification—

■**A:** *Infrared Absorption* ⟨197M⟩, on the undried specimen.

B: ■1S (*NF24*)
It responds to the tests for *Sodium* ⟨191⟩ and for *Benzoate* ⟨191⟩.

BRIEFING

Tagatose, page 1672 of *PF* 30(5) [Sept.–Oct. 2004]. On the basis of comments received, it is proposed to widen the proposed range for *Specific rotation,* to accommodate the high-purity material currently available on the market. It is also proposed to clarify the description of the atomic absorption spectrophotometer used in the test for *Lead*. The liquid chromatographic procedure in the *Assay* was validated using a Biorad Aminex HPX-87C brand of L19 column; tagatose peak elutes at approximately 16 minutes.

(EMC: E. Gonikberg) RTS—42394-1; 42394-2

BRIEFING

Sugar Spheres, *NF 23* page 3096. It is proposed to revise the *Identification* test because there is an incorrect cross reference to the deleted *Starch* monograph.

(EMC: R. Ravichandran) RTS—42391-1

Change to read:

Identification—~~Transfer about 20 g, accurately weighed, to a 200-mL volumetric flask, add 160 mL of water, shake to dissolve the sucrose, add water to volume, and mix. Separate the solubilized sucrose from the insoluble starch component by vacuum filtration through fine filter paper until the filtrate is clear. A water slurry of the insoluble portion responds to *Identification*test *B* under *Starch.* [NOTE—Use the freshly prepared, clear filtrate for the *Specific rotation* test.].~~

■A 1 : 10 suspension gives a violet to deep blue color with iodine TS.■1S (*NF24*)

Change to read:

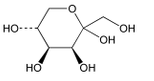
Specific rotation ⟨781⟩: not less than +41° and not more than +61°, ~~determined on a portion of the filtrate obtained in the *Identification* test,~~

■■1S (*NF24*)
corresponding to not less than 62.5% and not more than 91.5% of sucrose ($C_{12}H_{22}O_{11}$), calculated on the dried basis.

■*Test solution*—Transfer about 20 g accurately weighed, to a 200-mL volumetric flask, add 160 mL of water, shake to dissolve the sucrose, add water to volume, and mix. Pass the solubilized sucrose solution by vacuum filtration through fine filter paper.■1S (*NF24*)

Add the following:

■Tagatose



$C_6H_{12}O_6$ 180.16 [*87-81-0*].

D-Tagatose.

D-*lyxo*-Hexulose.

» Tagatose is a ketohexose, an epimer of D-fructose inverted at C-4. It is obtained from D-galactose by isomerization under alkaline conditions in the presence of calcium. It contains not less than 98.0 percent of $C_6H_{12}O_6$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers, and store at room temperature.

USP Reference standards ⟨11⟩**—***USP Tagatose RS.*

In-Process Revision

Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

B: It meets the requirements of the test for *Specific rotation* ⟨781S⟩.

C: Add 3 mL of a solution (1 in 5) to 5 mL of hot alkaline cupric tartrate TS: a copious red precipitate of cuprous oxide is formed.

Melting range, *Class 1* ⟨741⟩**:** between 133° and 144°.

Specific rotation ⟨781S⟩**:** ~~between 4° and 5.6°.~~ between –4° and –7°.

Test solution: 10 mg per mL, in water.

Microbial limits ⟨61⟩—It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli.* The total aerobic microbial count does not exceed 1000 cfu per g, and the total combined molds and yeasts count does not exceed 100 cfu per g.

Loss on drying ⟨731⟩—Dry it at 102° for 2 hours: it loses not more than 0.5% of its weight.

Total ash ⟨561⟩**:** not more than 0.1%, determined on a 1.0-g specimen.

Limit of lead—

Test solution—Accurately weigh about 2.5 g of Tagatose, and dissolve in a mixture of 4 mL of sulfuric acid and 5 mL of hydrochloric acid. Transfer the solution to a 50-mL volumetric flask, dilute with water to volume, and mix.

Standard lead solution—Dissolve 1.60 g of lead nitrate in diluted nitric acid (10 mL of nitric acid diluted with 20 mL water, boiled to remove nitrous fumes, and cooled), and dilute with water to 1000 mL. Dilute 10.0 mL of this solution with water to 500 mL. This solution contains the equivalent of 20 µg of lead per mL.

Calibration solutions—To a series of 100-mL volumetric flasks, pipet 0, 1, 2, 3, 4 and 5 mL of the *Standard lead solution,* and dilute to about 50 mL. Add 8 mL of sulfuric acid and 10 mL of hydrochloric acid to each flask, shake to dissolve, and dilute with water to volume. These solutions contain 0, 0.2, 0.4, 0.6, 0.8 and 1.0 µg of lead per mL.

Procedure—Concomitantly determine the absorbances of the *Calibration solutions* and the *Test solution* at the wavelength of maximum absorbance at 283.3 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩). ~~using an air–acetylene flame~~ Plot the absorbances of the *Calibration solutions* versus the concentration of lead. Using this graph, determine the concentration of lead in the *Test solution.* Not more than 1 µg per g is found.

Assay—

Mobile phase—Prepare a solution in water containing 50 mg of calcium acetate per L.

Standard preparation—Dissolve an accurately weighed quantity of USP Tagatose RS in water to obtain a solution having a known concentration of about 5 mg per mL. Pass through a 0.2-µm filter.

Assay preparation—Transfer about 50 mg of Tagatose, previously dried, to a 10-mL volumetric flask, and dissolve in about 8 mL of water. Dilute with water to volume, and pass through a 0.2-µm filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector and a 7.8-mm × 30-cm column that contains 9-µm packing L19. The column temperature is maintained at 85°. The flow rate is about 0.6 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

In-Process Revision

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_6H_{12}O_6$ in the portion of Tagatose taken by the formula:

$$10C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Tagatose RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*NF24*)

Change to read:

Identification—

A: ~~Triturate it with about an equal weight of camphor or menthol: the mixture liquefies.~~

■*Infrared Absorption* ⟨197K⟩.■1S (*NF24*)

B: ~~Dissolve a very small crystal of it in 1 mL of glacial acetic acid, and add 6 drops of sulfuric acid and 1 drop of nitric acid: the liquid shows a deep bluish green color when viewed by reflected light.~~

■It meets the requirements under *Melting range.*■1S (*NF24*)

~~**C:** Place about 1 g in a test tube, add 5 mL of sodium hydroxide solution (1 in 10), and heat in a water bath: a clear, colorless or pale red, solution is produced, and it becomes darker on standing, without the separation of oily drops. Add to this solution a few drops of chloroform, and agitate the mixture: a violet color is produced.~~

■■1S (*NF24*)

BRIEFING

Thymol, *NF* 23 page 3098. It is proposed to delete the current *Identification* tests *A, B,* and *C* and replace them with two new identification tests: a spectrophotometric identification test employing *Infrared Absorption* ⟨197K⟩ and a test that meets the monograph requirements under *Melting Range* ⟨741⟩; a new Reference Standard, USP Thymol RS, is also proposed to be used in *Identification* test *A*.

(EMC: C. Sheehan) RTS—42428-1

Add the following:

■**USP Reference standards** ⟨11⟩—*USP Thymol RS.*■1S (*NF24*)

BRIEFING

Xanthan Gum, *NF 23* page 3108. It is proposed to revise the *Assay* to specify the procedure under the general test chapter *Alginates Assay* ⟨311⟩, including *System Suitability.*

(EMC: R. Ravichandran) RTS—42399-1

Change to read:

Assay—Proceed as directed ~~with Xanthan Gum for *Procedure*~~

■■1S (*NF24*)
under *Alginates Assay* ⟨311⟩ using about 1.2 g of Xanthan Gum, accurately weighed.

Physical Tests and Determinations

BRIEFING

⟨**611**⟩ **Alcohol Determination,** *USP 28* page 2378 and page 1379 of *PF* 30(4) [July–Aug. 2004]. It is proposed to revise *Method II* to add a new capillary gas chromatographic method, *Method IIb,* developed and validated by USP laboratories. The new method was validated using a DB-624 column, a brand name of G43 column, manufactured by J&W Scientific. The official *Method II* is now designated as *Method IIa.* Manufacturers interested in incorporating *Method IIb* in compendial monographs are encouraged to submit appropriate requests for revision with supporting documentation.

CHROMATOGRAPHIC METHOD

~~Method II is to be used where~~

■Use *Method IIa* when *Method II* is■1S (*USP29*) specified in the individual monograph. For a discussion of the principles upon which it is based, see *Gas Chromatography* under *Chromatography* ⟨621⟩.

In-Process Revision

▲**USP Reference Standards**—*USP Alcohol Determination—Acetonitrile RS. USP Alcohol Determination—Alcohol RS.* ▲*USP28*

■Method IIa■1S (*USP29*)

Apparatus—Under typical conditions, use a gas chromatograph equipped with a flame-ionization detector and a 4-mm × 1.8-m glass column packed with 100- to 120-mesh chromatographic column packing No. S3, using nitrogen or helium as the carrier. Prior to use, condition the column overnight at 235° with a slow flow of carrier gas. The column is maintained at 120°, and the injection port and detector are maintained at 210°. Adjust the carrier flow and temperature so that acetonitrile, the internal standard, elutes in 5 to 10 minutes.

Solutions—

▲*USP28*

Test Stock Preparation—Dilute the specimen under examination stepwise with water to obtain a solution containing approximately 2% (v/v) of alcohol.

Test Preparation—Pipet ▲5 mL each of the *Test Stock Preparation* and the USP Alcohol Determination—Acetonitrile RS [NOTE—Alternatively, a 2% aqueous solution of acetonitrile of suitable quality may be used as the internal standard solution] into a 50-mL▲*USP28* volumetric flask, and dilute with water to volume.

Standard Preparation—Pipet ▲5 mL each of the USP Alcohol Determination—Alcohol RS and the USP Alcohol Determination—Acetonitrile RS [NOTE—Alternatively, a 2% aqueous solution of acetonitrile of suitable quality may be used as the internal standard solution] into a 50-mL▲*USP28* volumetric flask, dilute with water to volume, and mix.

Procedure—Inject about 5 µL each of *Test Preparation* and *Standard Preparation,* in duplicate, into the gas chromatograph, record the chromatograms, and determine the peak response ratios. Calculate the percentage of alcohol (v/v) in the specimen under test according to the formula:

$$\blacktriangle CD(R_U / R_S),\ \blacktriangle USP28$$

in which ▲C is the labeled concentration of USP Alcohol Determination—Alcohol RS;▲*USP28* D is the dilution factor (the ratio of the volume of the *Test Stock Preparation* to the volume of the specimen taken); and R_U and R_S are the peak response ratios obtained for the *Test Preparation* and the *Standard Preparation,* respectively.

System Suitability Test—In a suitable chromatogram, the resolution factor, *R,* is not less than 2; the tailing factor of the alcohol peak is not greater than ~~1.5;~~

■2.0;■2S (*USP28*)

and six replicate injections of the *Standard Preparation* show a relative standard deviation of not more than 2.0% in the ratio of the peak of alcohol to the peak of the internal standard.

■Method IIb

Apparatus—The gas chromatograph is equipped with a split injection port with a split ratio of 5 : 1, a flame-ionization detector, and a 0.53-mm × 30-m capillary column coated with a 3.0-µm film of phase G43. Helium is used as the carrier gas at a linear velocity of 34.0 cm per second. The chromatograph is programmed to maintain the column temperature at 50° for 5 minutes, then to increase the temperature at a rate of 10° per minute to 200°, and held at this temperature for 4 minutes. The injection port is maintained at 210° and the detector temperature at 280°.

Solutions—

Test Stock Preparation—Dilute the specimen under examination stepwise with water to obtain a solution containing approximately 2% (v/v) of alcohol.

Test Preparation—Pipet 5 mL each of the *Test Stock Preparation* and the USP Alcohol Determination—Acetonitrile RS [NOTE—Alternatively, a 2% aqueous solution of acetonitrile of suitable quality may be used as the internal standard solution.] into a 25-mL volumetric flask, and dilute with water to volume.

Standard Preparation—Pipet 5 mL each of the USP Alcohol Determination—Alcohol RS and USP Alcohol Determination—Acetonitrile RS [NOTE—Alternatively, a 2% aqueous solution of acetonitrile of suitable quality may be used as the internal standard solution.] into a 25-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Inject about 0.2 µL each of the *Test Preparation* and the *Standard Preparation*, in duplicate, into the gas chromatograph, record the chromatograms, and determine the peak response ratios. Calculate the percentage of alcohol (v/v) in the specimen under test according to the formula:

$$CD(R_U / R_S),$$

in which C is the labeled concentration of USP Alcohol Determination—Alcohol RS; D is the dilution factor (the ratio of the volume of the *Test Stock Preparation* to the volume of

In-Process Revision

the specimen taken); and R_U and R_S are the peak response ratios obtained for the *Test Preparation* and the *Standard Preparation,* respectively.

System Suitability Test—In a suitable chromatogram, the resolution factor, *R*, between alcohol and the internal standard is not less than 4; six replicate injections of the *Standard Preparation* show a relative standard deviation of not more than 4.0% in the ratio of the peak of alcohol to the peak of the internal standard; and the tailing factor of the alcohol peak is not greater than 2.0.■1S (*USP29*)

BRIEFING

⟨**621**⟩ **Chromatography,** *USP 28* page 2380, page 3317 of the *First Supplement,* and page 2094 of *PF* 30(6) [Nov.–Dec. 2004]. It is proposed to revise the *System Suitability* section to clarify the requirements for verification of system suitability following adjustments in operating conditions. In this regard, a reference to the proposed new general information chapter *Verification of Compendial Procedures* ⟨1226⟩ (see page 555 of *PF* 31(2) [Mar.–Apr. 2005]) has been added. It is also proposed to clarify that relative retention times in monographs are given for informational purposes only and that there are no acceptance criteria associated with these values. Also, in the *Chromatographic Reagents* section, it is proposed to eliminate the footnotes and to replace them with *Notes* inserted in the text after the corresponding column designations.

INTRODUCTION

This chapter defines the terms and procedures used in chromatography and provides general information. Specific requirements for chromatographic ~~tests and assays of~~

■procedures for■2S (*USP28*)
drug substances and dosage forms, including adsorbent and developing solvents, are given in the individual monographs.

Chromatography is defined as a procedure by which solutes are separated by a dynamic differential migration process in a system consisting of two or more phases, one of which moves continuously in a given direction and in which the individual substances exhibit different mobilities by reason of differences in adsorption, partition, solubility, vapor pressure, molecular size, or ionic charge density. The individual substances thus ~~obtained~~

■separated■2S (*USP28*)
can be identified or determined by analytical ~~methods.~~

■procedures.■2S (*USP28*)
The general chromatographic technique requires that a solute undergo distribution between two phases, one of them fixed (stationary phase), the other moving (mobile phase). It is the mobile phase that transfers the solute through the medium until it eventually emerges separated from other solutes that are eluted earlier or later. Generally, the solute is transported through the separation medium by means of a flowing stream of a liquid or a gaseous solvent known as the "eluant." The stationary phase may act through adsorption, as in the case of adsorbents such as activated alumina ~~, silica gel, and ion-exchange resins,~~

■and silica gel,■2S (*USP28*)
or it may act by dissolving the solute, thus partitioning the latter between the stationary and mobile phases. ~~In the latter process, a liquid coating held on an inert support serves as the stationary phase.~~

■In the latter process, a liquid coated onto an inert support, or chemically bonded onto silica gel, or directly onto the wall of a fused silica capillary, serves as the stationary phase.■2S (*USP28*)
Partitioning is the predominant mechanism of separation in gas–liquid chromatography, paper chromatography, and forms of column chromatography

■and thin-layer chromatography■2S (*USP28*)
designated as liquid-liquid ~~chromatography.~~

■separation.■2S (*USP28*)
In practice, separations frequently result from a combination of adsorption and partitioning effects.

■Other separation principles include ion exchange, ion-pair formation, size exclusion, hydrophobic interaction, and chiral recognition.■2S (*USP28*)
The types of chromatography useful in qualitative and quantitative analysis that are employed in the *USP* ~~tests and assays~~

■procedures■2S (*USP28*)
are column, gas, paper, thin-layer,

■(including high-performance thin-layer chromatography),■2S (*USP28*)
and pressurized liquid chromatography (commonly called high-pressure or high-performance liquid chromatography). Paper and thin-layer chromatography are ordinarily more useful for purposes of identification, because of their convenience and simplicity. Column chromatography offers a wider choice of stationary phases and is useful for the separation of individual compounds, in quantity, from mixtures. ~~Both gas chromatography and pressurized liquid chromatography require more elaborate apparatus and usually provide high resolution methods that will identify and quantitate very small amounts of material.~~

In-Process Revision

■Modern high-performance thin-layer chromatography, gas chromatography, and pressurized liquid chromatography require more elaborate apparatus but usually provide high resolution and identify and quantitate very small amounts of material.■2S (*USP28*)

Use of Reference Substances in Identity Tests—In paper and thin-layer chromatography, the ratio of the distance (this distance being measured to the point of maximum intensity of the spot

■or zone)■2S (*USP28*)
traveled on the medium by a given compound to the distance traveled by the front of the mobile phase, from the point of application of the test substance, is designated as the R_F value of the compound. The ratio between the distances traveled by a given compound and a reference substance is the R_R value. R_F values vary with the experimental conditions, and thus identification is best accomplished where an authentic specimen of the compound in question is used as a reference substance on the same chromatogram.

For this purpose, chromatograms are prepared by applying on the thin-layer adsorbent or on the paper in a straight line, parallel to the edge of the chromatographic plate or paper, solutions of the substance to be identified, the authentic specimen, and a mixture of nearly equal amounts of the substance to be identified and the authentic specimen. Each sample application contains approximately the same quantity by weight of material to be chromatographed. If the substance to be identified and the authentic specimen are identical, all chromatograms agree in color and R_F value and the mixed chromatogram yields a single spot; i.e., R_R is 1.0.

Location of Components—The spots produced by paper or thin-layer chromatography may be located by: (1) direct inspection if the compounds are visible under white or either short-wavelength (254 nm) or long-wavelength (360 nm) UV light, (2) inspection in white or UV light after treatment with reagents that will make the spots visible (reagents are most conveniently applied with an atomizer), (3) use of a Geiger-Müller counter or autoradiographic techniques in the case of the presence of radioactive substances, or (4) evidence resulting from stimulation or inhibition of bacterial growth by the placing of removed portions of the adsorbent and substance on inoculated media.

In open-column chromatography, in pressurized liquid chromatography performed under conditions of constant flow rate, and in gas chromatography, the retention time, *t,* defined as the time elapsed between sample injection and appearance of the peak concentration of the eluted sample zone, may be used as a parameter of identification. Solutions of the substance to be identified or derivatives thereof, of the reference compound, and of a mixture of equal amounts of these two are chromatographed successively on the same column under the same chromatographic conditions. Only one peak should be observed for the mixture. The ratio of the retention times of the test substance, the reference compound, and a mixture of these, to the retention time of an internal standard is called the relative retention time R_R and is also used frequently as a parameter of identification.

The deviations of R_R, R_F, or t values measured for the test substance from the values obtained for the reference compound and mixture should not exceed the reliability estimates determined statistically from replicate assays of the reference compound.

Chromatographic identification by these methods under given conditions strongly indicates identity but does not constitute definitive identification. Coincidence of identity parameters under 3 to 6 different sets of chromatographic conditions (temperatures, column packings, adsorbents, eluants, developing solvents, various chemical derivatives, etc.) increases the probability that the test and reference substances are identical. However, many isomeric compounds cannot be separated. Specific and pertinent chemical, spectroscopic, or physicochemical identification of the eluted component combined with chromatographic identity is the most valid criterion of identification. For this purpose, the individual components separated by chromatography may be collected for further identification.

Change to read:

THIN-LAYER CHROMATOGRAPHY

In thin-layer chromatography, the adsorbent is a relatively thin, uniform layer of dry, finely powdered material applied to a glass, plastic, or metal sheet or plate, glass plates being most commonly employed. The coated plate can be considered an ''open chromatographic column'' and the separations achieved may be based upon adsorption, partition, or a combination of both effects, depending on the particular type of ~~support,~~

■stationary phase,■2S (*USP28*)
its preparation, and its use with different solvents. Thin-layer chromatography on ion-exchange ~~films~~

■layers■2S (*USP28*)
can be used for the fractionation of polar compounds. Presumptive identification can be effected by observation of spots

■or zones■2S (*USP28*)
of identical R_F value and about equal magnitude obtained, respectively, with an unknown and a reference sample chromatographed on the same plate. A visual comparison of the size ~~of the spots~~

■or intensity of the spots or zones■2S (*USP28*)
may serve for semiquantitative estimation. Quantitative measurements are possible by means of densitometry ~~, fluorescence, and fluorescence quenching;~~

■(absorbance or fluorescence measurements),■2S (*USP28*)
or the spots may be carefully removed from the plate, followed by elution with a suitable solvent and spectrophotometric measurement. For two-dimensional thin-layer chromatography, the chromatographed plate is turned at a right angle and again chromatographed, usually in another chamber equilibrated with a different solvent system.

Apparatus—Acceptable apparatus and materials for thin-layer chromatography consist of the following.

~~Flat *glass plates* of convenient size, typically 20 cm × 20 cm.[*]~~

~~An *aligning tray* or a flat surface upon which to align and rest the plates during the application of the adsorbent.~~

~~A *storage rack* to hold the prepared plates during drying and transportation. The rack holding the plates should be kept in a desiccator or be capable of being sealed in order to protect the plates from the environment after removal from the drying oven.~~

~~The *adsorbent* consists of finely divided adsorbent materials, normally 5 to 40 µm in diameter, suitable for chromatography. It can be applied directly to the glass plate or can be bonded to the plate by means of plaster of paris (hydrated calcium sulfate) [at a ratio of 5% to 15%] or with starch paste or other binders. The former will not yield as hard a surface as will the starch, but it is not affected by strongly oxidizing spray reagents. The adsorbent may contain fluorescing material to aid in the visualization of spots that absorb ultraviolet light.~~

~~A *spreader,* which, when moved over the glass plate, will apply a uniform layer of adsorbent of desired thickness over the entire surface of the plate.~~

~~[*] Commercially prepared plates may be substituted for plates prepared as directed herein.~~

In-Process Revision

~~A *developing chamber* that can accommodate one or more plates and can be properly closed and sealed as described under *Ascending Chromatography.* The chamber is fitted with a *plate-support rack* that supports the plates, back to back, with the lid of the chamber in place.~~

~~A *template* (generally made of plastic) to aid in placing the test spots at definite intervals, to mark distances as needed, and to aid in labeling the plates.~~

~~A graduated *micropipet* capable of delivering 10 µL volumes. Total volumes of test and standard solutions are specified in the individual monograph.~~

~~A *reagent sprayer* that will emit a fine spray and will not itself be attacked by the reagent.~~

~~An *ultraviolet light source* suitable for observations with short (254 nm) and long (360 nm) UV wavelengths.~~

■A *TLC or HPTLC plate.* The chromatography is generally carried out using *precoated plates* or *sheets* (on glass, aluminum, or polyester support) of suitable size. It may be necessary to clean the plates prior to separation. This can be done by migration of, or immersion in, an appropriate solvent. The plates may also be impregnated by procedures such as development, immersion, or spraying. At the time of use, the plates may be activated, if necessary, by heating in an oven at 120° for 20 minutes. The *stationary phase* of TLC plates has an average particle size of 10–15 µm, and that of HPTLC plates an average particle size of 5 µm. Commercial plates with a preadsorbant zone can be used if they are specified in a monograph. Sample applied to the preabsorbant region develops into sharp, narrow bands at the preabsorbant-sorbent interface. Alternatively, flat *glass plates* of convenient size, typically 20 cm × 20 cm can be coated as described under *Preparation of Chromatographic Plates.*

A suitable *manual, semiautomatic, or automatic application device* can be used to ensure proper positioning of the plate and proper transfer of the sample, with respect to volume and position, onto the plate. Alternatively, a *template* can be used to guide in manually placing the test spots at definite intervals, to mark distances as needed, and to aid in labeling the plates. For the proper application of the solutions, *micropipets, microsyringes,* or *calibrated disposable capillaries* are recommended.

For ascending development, a *chromatographic chamber* made of inert, transparent material and having the following specifications is used: a flat bottom or twin trough, a tightly fitted lid, and a size suitable for the plates. For horizontal development, the chamber is provided with a reservoir for the mobile phase, and it also contains a device for directing the mobile phase to the stationary phase.

Devices for transfer of reagents onto the plate by spraying, immersion, or exposure to vapor and devices to facilitate any necessary heating for visualization of the separated spots or zones.

A *UV light source* suitable for observations under short (254 nm) and long (365 nm) wavelength UV light.

A suitable *device for documentation* of the visualized chromatographic result.

Procedure—Apply the prescribed volume of the test solution and the standard solution in sufficiently small portions to obtain circular spots of 2 to 5 mm in diameter (1 to 2 mm on HPTLC plates) or bands of 10 to 20 mm by 1 to 2 mm (5 to 10 mm by 0.5 to 1 mm on HPTLC plates) at an appropriate distance from the lower edge—during chromatography the application position must be 3 mm (HPTLC) to 5 mm (TLC) above the level of the developing solvent—and from the sides of the plate. Apply the solutions on a line parallel to the lower edge of the plate with an interval of at least 10 mm (5 mm on HPTLC plates) between the centers of spots or 4 mm (2 mm on HPTLC plates) between the edges of bands, and allow to dry.

Ascending Development—Line at least one wall of the chromatographic chamber with filter paper. Pour into the chromatographic chamber a quantity of the mobile phase sufficient for the size of the chamber to give, after impregnation of the filter paper, a level of depth appropriate to the dimension of the plate used. For saturation of the chromato-

graphic chamber, close the lid, and allow the system to equilibrate. Unless otherwise indicated, the chromatographic separation is performed in a saturated chamber.

Place the plate in the chamber, ensuring that the plate is as vertical as possible and that the spots or bands are above the surface of the mobile phase, and close the chamber. The stationary phase faces the inside of the chamber. Remove the plate when the mobile phase has moved over the prescribed distance. Dry the plate, and visualize the chromatograms as prescribed. For two-dimensional chromatography, dry the plates after the first development, and carry out a second development in a direction perpendicular to that of the first development.

Horizontal Development—Introduce a sufficient quantity of the developing solvent into the reservoir of the chamber using a syringe or pipet. Place the plate horizontally in the chamber, connect the mobile phase direction device according to the manufacturer's instructions, and close the chamber. If prescribed, develop the plate starting simultaneously at both ends. Remove the plate when the mobile phase has moved over the distance prescribed in the monograph. Dry the plate, and visualize the chromatograms as prescribed.

For two-dimensional chromatography, dry the plates after the first development, and carry out a second development in a direction perpendicular to that of the first development.

Detection—Observe the dry plate first under short-wavelength UV light (254 nm) and then under long-wavelength UV light (365 nm) or as stated in the monograph. If further directed, spray, immerse, or expose the plate to vapors of the specified reagent, heat the plate when required, observe, and compare the test chromatogram with the standard chromatogram. Document the plate after each observation. Measure and record the distance of each spot or zone from the point of origin, and indicate for each spot or zone the wavelength under which it was observed. Determine the R_F values for the principal spots or zones (see *Glossary of Symbols*).

Quantitative Measurement—Using appropriate instrumentation, substances separated by TLC and responding to ultraviolet-visible (UV-Vis) irradiation prior to or after derivatization can be determined directly on the plate. While moving the plate or the measuring device, the plate is examined by measuring the reflectance of the incident light. Similarly, fluorescence may be measured using an appropriate optical system. Substances containing radionuclides can be quantified in three ways: (1) directly by moving the plate alongside a suitable counter or vice versa; (2) by cutting the plates into strips and measuring the radioactivity on each individual strip using a suitable counter; or (3) by scraping off the stationary phase, dissolving it in a suitable scintillation cocktail, and measuring the radioactivity using a liquid scintillation counter (see *Radioactivity* ⟨821⟩).

The apparatus for direct quantitative measurement on the plate is a densitometer that is composed of a mechanical device to move the plate or the measuring device along the x-axis and the y-axis, a recorder, a suitable integrator or a computer; and, for substances responding to UV-Vis irradiation, a photometer with a source of light, an optical device capable of generating monochromatic light, and a photo cell of adequate sensitivity, all of which are used for the measurement of reflectance. In the case where fluorescence is measured, a suitable filter is also required to prevent the light used for excitation from reaching the photo cell while permitting the emitted light or specific portions thereof to pass. The linearity range of the counting device must be verified.

For quantitative tests, it is necessary to apply to the plate not fewer than three standard solutions of the substance to be examined, the concentrations of which span the expected

value in the test solution (e.g., 80%, 100%, and 120%). Derivatize with the prescribed reagent, if necessary, and record the reflectance or fluorescence in the chromatograms obtained. Use the measured results for the calculation of the amount of substance in the test solution.

Preparation of Chromatographic Plates—

Apparatus—

Flat *glass plates* of convenient size, typically 20 cm × 20 cm.

An *aligning tray* or a flat surface upon which to align and rest the plates during the application of the adsorbent.

A *storage rack* to hold the prepared plates during drying and transportation. The rack holding the plates should be kept in a desiccator or be capable of being sealed in order to protect the plates from the environment after removal from the drying oven.

The *adsorbent* consists of finely divided adsorbent materials, normally 5 to 40 µm in diameter, suitable for chromatography. It can be applied directly to the glass plate or can be bonded to the plate by means of plaster of Paris (calcium sulfate hemihydrate [at a ratio of 5% to 15%]) or with starch paste or other binders. The plaster of Paris will not yield as hard a surface as will the starch, but it is not affected by strongly oxidizing spray reagents. The adsorbent may contain fluorescing material to aid in the visualization of spots that absorb UV light.

A *spreader,* which, when moved over the glass plate, will apply a uniform layer of adsorbent of desired thickness over the entire surface of the plate.■2S (*USP28*)

Procedure—[NOTE—In this procedure, use purified water that is obtained by distillation.] Clean the

■glass■2S (*USP28*)
plates scrupulously, ~~as by immersion in chromic acid cleansing mixture,~~

■using an appropriate cleaning solution (see *Cleaning Glass Apparatus* ⟨1051⟩),■2S (*USP28*)

rinsing them with copious quantities of water until the water runs off the plates without leaving any visible water or oily spots, then dry. It is important that the plates be completely free from lint and dust when the adsorbent is applied.

Arrange the plate or plates on the aligning tray, place a 5- × 20-cm plate adjacent to the front edge of the first square plate and another 5- × 20-cm plate adjacent to the rear edge of the last square, and secure all of the plates so that they will not slip during the application of the adsorbent. Position the spreader on the end plate opposite the raised end of the aligning tray. Mix 1 part of adsorbent with 2 parts of water (or in the ratio suggested by the supplier) by shaking vigorously for 30 seconds in a glass-stoppered conical flask, and transfer the slurry to the spreader. Usually 30 g of adsorbent and 60 mL of water are sufficient for five 20- × 20-cm plates. Complete the application of adsorbents using plaster of Paris binder within 2 minutes of the addition of the water, because thereafter the mixture begins to harden. Draw the spreader smoothly over the plates toward the raised end of the aligning tray, and remove the spreader when it is on the end plate next to the raised end of the aligning tray. (Wash away all traces of adsorbent from the spreader immediately after use.) Allow the plates to remain undisturbed for 5 minutes, then transfer the square plates, layer side up, to the storage rack, and dry at 105° for 30 minutes. Preferably place the rack at an angle in the drying oven to prevent the condensation of moisture on the back sides of plates in the rack. When the plates are dry, allow them to cool to room temperature, and inspect the uniformity of the distribution and the texture of the adsorbent layer; transmitted light will show uniformity of distribution, and reflected light will show uniformity of texture. Store the satisfactory plates over silica gel in a suitable chamber.

~~Place two filter paper wicks, 18 cm in height and as wide as the length of the developing chamber, into the chamber, add about 100 mL of the solvent (sufficient to have a depth of 5 to 10 mm at the bottom of the chamber), seal the cover to the top of the chamber, and allow the system to equilibrate; it is essential that the wicks become completely wet. Alternatively, the chamber may be completely lined with filter paper. In either case, assure that the filter paper dips into the solvent at the bottom of the chamber. Where vapor saturation of the chamber by these methods is undesirable, it is so indicated in the individual monograph.~~

~~Apply the test solution and the standard solution, as directed in the individual monograph, at points about 1.5 cm apart and about 2 cm from the lower edge of the plate (the lower edge is the first part over which the spreader moved in the application of the adsorbent layer), and allow to dry. Avoid physical disturbance of the adsorbent during the spotting procedure (by the pipet or other applicator) or when handling the plates. The template will aid in determining the spot points and the 10- to 15-cm distance through which the solvent front should pass.~~

~~Place a mark 10 to 15 cm above the spot point. Arrange the plate on the supporting rack (test spots toward the bottom), and introduce the rack into the developing chamber. Allow the solvent in the chamber to reach the lower edge of the adsorbent, but do not allow the spot points to be immersed. Put the cover in place, and maintain the system until the solvent ascends to a point 10 to 15 cm above the initial spots, this usually requires about 15 minutes to 1 hour. Remove the plate from the developing chamber, mark the solvent front, air-dry the plates, and observe first under short-wavelength UV light (254 nm) and then under long-wavelength UV light (360 nm). Measure and record the distance of each spot from the point of origin, and indicate for each spot the wavelength under which it was observed. Determine the R_F values for the principal spots (see *Glossary of Symbols*). If further directed, spray the spots with the reagent specified, observe, and compare the test chromatogram with the standard chromatogram.~~

In-Process Revision

~~Continuous Development Thin-Layer Chromatography~~

~~In contrast to conventional thin-layer chromatography, which is carried out in a closed tank, the continuous development or continuous flow technique allows the upper end of the plate to project through a slot in the cover of the developing chamber. When the developing solvent reaches the slot, continuous evaporation occurs, producing a steady flow of solvent over the plate. In conventional thin layer chromatography, spot migration ceases when the solvent reaches the top of the plate, after which the spots simply enlarge by diffusion. In the continuous flow process, spot migration continues as long as the plate remains in the tank and the developing solvent is not exhausted.~~

~~Development may be continued for several hours after the solvent reaches the top of the plate, to provide adequate migration of the spots. Usually spots of a standard solution, a test solution, and a mixture of equal amounts of test and standard solutions, are initially applied at a standard distance from the base of the plate. Identity of the standard and test substances is confirmed by their migrating equal distances from the origin and by the observation that the two substances applied as a mixture show no tendency to separate.~~

~~A major advantage of continuous development thin layer chromatography stems from the greater solvent selectivity for solvents of low solvent strength. Solvent strength refers to the property of a developing solvent that causes solutes to migrate, and it is strongly influenced by the polarity of the solvent. Increasing the solvent strength by adding a more polar solvent causes the R_F value to increase. Solvent selectivity refers to the ability of a solvent system to produce different R_F values for closely related substances. In conventional thin layer chromatography, a solvent system giving an R_F value in the range of 0.3 to 0.7, but with adequate selectivity to permit separation of the substances being examined is usually selected. It is much easier to find solvent systems producing adequate migration than to find those affording adequate selectivity.~~

~~Solvent systems of lower strength generally exhibit higher selectivity, but are difficult to employ in conventional thin layer chromatography because they result in very little migration before the solvent reaches the top of the plate. Migration may be increased, however, by repeated drying and redevelopment of the plate or, more conveniently, by providing means for evaporation of solvent at the top of the plate, which results in continuous development. Two techniques are used: continuous development and short bed continuous development thin layer chromatography.~~

~~An R_F value cannot be measured in continuous development thin layer chromatography. Substances may be compared either by their migration distance over a fixed period of time or by comparison with the migration of a standard substance applied to the plate.~~

~~CONTINUOUS DEVELOPMENT~~

~~**Apparatus**—Acceptable apparatus and materials for continuous development thin layer chromatography are the same as those described under conventional *Thin-Layer Chromatography,* except as follows.~~

~~A *developing chamber* is used that consists of a rectangular tank, approximately 23 cm × 23 cm × 9 cm, equipped with a glass solvent trough and a platform about 3.75 cm high to elevate the solvent trough above the base of the tank. The chamber is fitted with a cover having a 21 × 6 cm slot in the front edge.~~

~~**Procedure**—Apply the standard solution, the test solution, and a mixture of equal amounts of the standard solution and the test solution to a line about 2 cm from the base of the plate. Place the plate in the elevated empty solvent trough with the adsorbent on the underside of the leaning plate. The adsorbent rests against a piece of heavy (about 1 mm thick)[2] filter paper measuring 20 cm × 3 cm, folded lengthwise and placed over the front edge of the tank. Place the developing solvent in the trough; set the cover in place, and seal all openings except where the adsorbent contacts the paper wick. The plate extends about 1 cm beyond the top of the tank. After the solvent reaches the top of the plate, allow development to continue for an appropriate time. Then remove and dry the plate, and detect the spots by suitable means.~~

~~SHORT-BED CONTINUOUS DEVELOPMENT~~

~~A major advantage of the short bed technique derives from the fact that solvent velocity is inversely related to bed length. Since spot migration depends upon the total amount of solvent passing over the plate, the short bed permits useful migration to be obtained in a reasonable time with solvent having very low solvent strength. Lower diffusion in solvents of low solvent strength produces smaller and more dense spots, which enhances both detectability and discernment of small differences in migration distance.~~

~~**Apparatus**—Acceptable apparatus and materials for short bed continuous development thin layer chromatography are the same as those described under conventional *Thin-Layer Chromatography*, except as follows.~~

~~A shallow *developing chamber*[3] approximately 22 cm × 9 cm × 3 cm, equipped with a cover plate and tight fitting polytef wings that enable the chamber to be sealed against the plate, is used. The inside bottom of the chamber contains ridges that support the plate and allow it to be inserted at different angles, thereby varying the length of the plate contained within the tank.~~

~~**Procedure**—Apply the standard solution, the test solution, and a mixture of equal parts of the standard solution and the test solution to a line about 2 cm from the base of the plate. Place the plate in the developing chamber (adsorbent side up), and add the developing solvent to the chamber. No paper wick is employed. After the solvent reaches the top of the plate, allow development to continue for an appropriate time. Then remove and dry the plate, and detect the spots by suitable means.~~

■■2S (*USP28*)

INTERPRETATION OF CHROMATOGRAMS

Figure 1 represents a typical chromatographic separation of two substances, 1 and 2, where t_1 and t_2 are the respective retention times; and h, $h/2$, and $W_{h/2}$ are the height, the half-height, and the width at half-height, respectively, for peak 1. W_1 and W_2 are the respective widths of peaks 1 and 2 at the baseline. Air peaks are a feature of gas chromatograms and correspond to the solvent front in liquid chromatography.

[2] ~~Whatman No. 3MM filter paper or equivalent.~~

[3] ~~Suitable equipment is available from Regis Chemical Company, Morton Grove, IL.~~

In-Process Revision

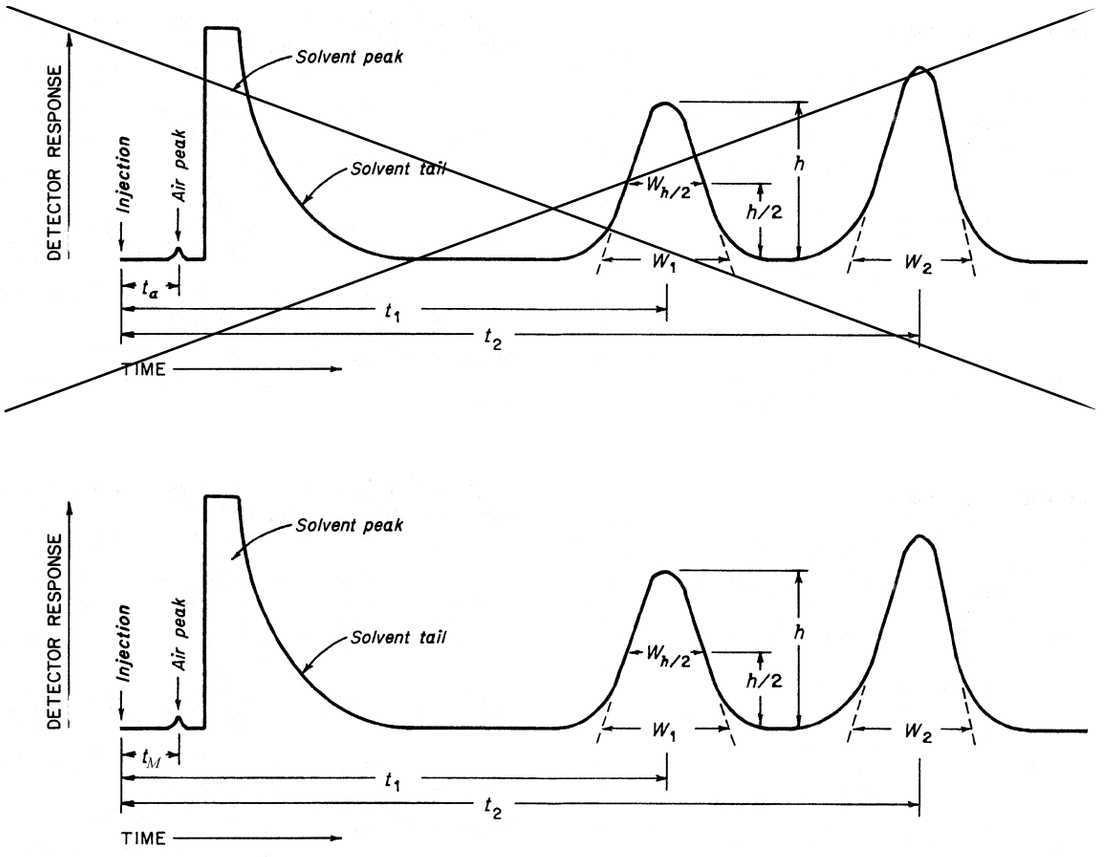

Fig. 1. Chromatographic separation of two substances

Chromatographic retention times are characteristic of the compounds they represent but are not unique. Coincidence of retention times of a test and a reference substance can be used as a feature in construction of an identity profile but is insufficient on its own to establish identity. Absolute retention times of a given compound vary from one chromatogram to the next. ~~Comparisons are normally made in terms of relative retention, α, r, which is calculated by the equation:~~

~~$$\alpha = \frac{t_2 - t_a}{t_1 - t_a},$$~~

~~$$r = \frac{t_2 - t_a}{t_1 - t_a}$$~~

~~where t_a and t_a are the retention times, measured from the point of injection, of the test and reference substances, respectively, determined under identical experimental conditions on the same column, and t_a is the retention time of a nonretained substance, such as methane in the case of gas chromatography.~~

~~In this and the following expressions, the corresponding retention volumes or linear separations on the chromatogram, both of which are directly proportional to retention time, may be substituted in the equations. Where the value of t_a is small, R_a or R_a may be estimated from the retention times measured from the point of injection (t_2/t_1).~~

~~R_a~~

▲Due to the fact that most procedures do not need to identify an unretained peak, comparisons are normally made in terms of relative retention times R_r:

$$R_r = \frac{t_2}{t_1},$$

where t_2 and t_1 are the retention times, measured from the point of injection, of the test and the reference substances, respectively, determined under indentical experimental conditions on the same column.

In-Process Revision

Other procedures may identify the peak position using the relative retention *r*:

$$r = \frac{t_2 - t_M}{t_1 - t_M},$$

where t_M is the retention time of a non-retained marker, which needs to be defined in the procedure.▲*USP29*

The number of theoretical plates, *N,* is a measure of column efficiency. For Gaussian peaks, it is calculated by the equation:

~~$N = 16\left(\frac{t}{W}\right)^2$ or $N = 5.54\left(\frac{t}{W_{h/2}}\right)^2$,~~

▲$N = 16\left(\frac{t}{W}\right)^2$, ▲*USP29*

where *t* is the retention time of the substance and *W* is the width of the peak at its base, obtained by extrapolating the relatively straight sides of the peak to the baseline. ~~$W_{h/2}$ is the peak width at half-height, obtained directly by electronic integrators.~~

▲▲*USP29*

The value of *N* depends upon the substance being chromatographed as well as the operating conditions such as mobile phase or carrier gas flow rates and temperature, the quality of the packing, the uniformity of the packing within the column and, for capillary columns, the thickness of the stationary phase film, and the internal diameter and length of the column.

The separation of two components in a mixture, the resolution, *R,* is determined by the equation:

$$R = \frac{2(t_2 - t_1)}{W_2 + W_1},$$

in which t_2 and t_1 are the retention times of the two components, and W_2 and W_1 are the corresponding widths at the bases of the peaks obtained by extrapolating the relatively straight sides of the peaks to the baseline.

Where electronic integrators are used, it may be convenient to determine the resolution, *R,* by the equation:

$$R = \frac{2(t_2 - t_1)}{1.70(W_{1,h/2} + W_{2,h/2})},$$

and to determine the number of theoretical plates, *N,* by the equation:

$$N = 5.54(t/W_{h/2})^2,$$

▲where $W_{h/2}$ is the peak width at half-height, obtained directly by electronic integrators.▲*USP29*

However, in the event of dispute, only equations based on peak width at baseline are to be used.

Peak areas and peak heights are usually proportional to the quantity of compound eluting. These are commonly measured by electronic integrators but may be determined by more classical approaches. Peak areas are generally used but may be less accurate if peak interference occurs. For manual measurements, the chart should be run faster than usual, or a comparator should be used to measure the width at half-height and the width at the base of the peak, to minimize error in these measurements. For accurate quantitative work, the components to be measured should be separated from any interfering components. Peak tailing and fronting and the measurement of peaks on solvent tails are to be avoided.

Chromatographic purity tests for drug raw materials are sometimes based on the determination of peaks due to impurities, expressed as a percentage of the area due to the drug peak. It is preferable, however, to compare impurity peaks with those in the chromatogram of a standard at a similar concentration. The standard may be the drug itself at a level corresponding to, for example, 0.5% impurity, or in the case of toxic or signal impurities, a standard of the impurity itself.

SYSTEM SUITABILITY

System suitability tests are an integral part of gas and liquid chromatographic methods. They are used to verify that the

■detection sensitivity,■1S *(USP29)*

resolution, and reproducibility of the chromatographic system are adequate for the analysis to be done. The tests are based on the concept that the equipment, electronics, analytical operations, and samples to be analyzed constitute an integral system that can be evaluated as such.

■The detection sensitivity is a measure used to ensure the suitability of a given chromatographic procedure for the complete detection of the impurities in the *Chromatographic purity* or *Related compounds* tests by injecting a volume of a quantitation limit solution equal to that of the *Test so-*

In-Process Revision

lution. Unless otherwise specified in the individual monograph, the quantitation limit solution may be prepared by dissolving the drug substance Reference Standard in the same solvent as that used for the *Test solution* at a 0.05% concentration level relative to the amount of drug substance in the *Test solution* in the case of drug substances, and at a 0.1% level relative to the amount of drug substance in the *Test solution* for drug products. The signal-to-noise ratio for the drug substance peak obtained with the quantitation limit solution should be not less than 10.■1S (*USP29*)

The resolution, *R,* [NOTE—All terms and symbols are defined in the *Glossary of Symbols*] is a function of the column efficiency, *N,* and is specified to ensure that closely eluting compounds are resolved from each other, to establish the general resolving power of the system, and to ensure that internal standards are resolved from the drug. Column efficiency may be specified also as a system suitability requirement, especially if there is only one peak of interest in the chromatogram; however, it is a less reliable means to ensure resolution than direct measurement. Column efficiency is a measure of peak sharpness, which is important for the detection of trace components.

Replicate injections of a Standard preparation used in the assay or other standard solution are compared to ascertain whether requirements for precision are met. Unless otherwise specified in the individual monograph, data from five replicate injections of the analyte are used to calculate the relative standard deviation, S_R, if the requirement is 2.0% or less; data from six replicate injections are used if the relative standard deviation requirement is more than 2.0%.

The tailing factor, *T,* a measure of peak symmetry, is unity for perfectly symmetrical peaks and its value increases as tailing becomes more pronounced (see *Figure 2*). In some cases, values less than unity may be observed. As peak asymmetry increases, integration, and hence precision, becomes less reliable.

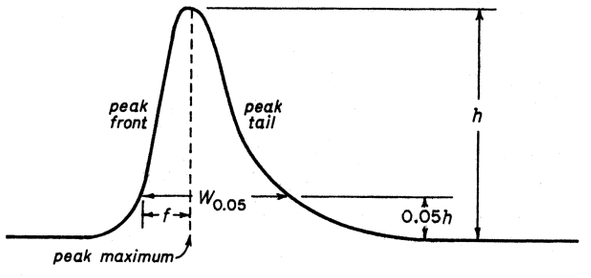

Fig. 2. Asymmetrical chromatographic peak

These tests are performed by collecting data from replicate injections of standard or other solutions as specified in the individual monograph. The specification of definitive parameters in a monograph does not preclude the use of other suitable operating conditions (see *Procedures* under *Tests and Assays* in the *General Notices*). ~~Adjustments of operating conditions to meet system suitability requirements may be necessary.~~

■If adjustments of operating conditions to meet system suitability requirements are necessary, each of the following is the maximum ~~specification~~ variation that can be considered, unless otherwise directed in the monograph. Adjustments are permitted only when ~~Reference Standards~~ suitable standards (including Reference Standards) are available for all ~~analytes~~ compounds used in the suitability test and only when those standards are used to show that the adjustments have improved the quality of the chromatography in meeting system suitability requirements. Adjustments to chromatographic systems performed in order to comply with system suitability requirements are not to be made to compensate for column failure or to circumvent replacing a deteriorated column. ~~The changes described below may require additional validation data unless the user can verify the suitability of the method under the new conditions. This verification consists of assessing the analytical performance characteristics that can be affected by the change (e.g., specificity, linearity, precision, accuracy) to ensure the adequacy of the method. Multiple adjustments that may have a cumulative effect in the performance of the system are to be avoided.~~ The changes described below may require additional validation data. The user should verify the suitability of the method under the new conditions by assessing the relevant analytical performance characteristics potentially affected by the change. *Tables 1* and *2* in the general information chapter *Verification of Compendial Procedures* ⟨1226⟩ provide lists of analytical performance validation characteristics that may require assessment. Multiple adjustments can have a cumulative effect in the performance of the system and should be considered carefully before implementation.

pH of Mobile Phase (HPLC)—The pH of the aqueous buffer used in the preparation of the mobile phase can be adjusted to within ~~0.2~~ ±0.2 units of the value or range specified.

Concentration of Salts in Buffer (HPLC)—The concentration of the salts used in the preparation of the aqueous buffer used in the mobile phase can be adjusted to within ±10%, provided the permitted pH variation (see above) is met.

Ratio of Components in Mobile Phase (HPLC)— ~~The amount of the minor~~ The following adjustment limits apply to minor components of the mobile phase (specified at 50% or less). The amount(s) of these component(s) can be adjusted by ±30% relative. ~~or ±2% absolute (i.e., in relation to the total mobile phase), whichever is larger.~~ However, the change in any component cannot exceed ±10% absolute (i.e., in relation to the total mobile phase), nor can the final concentration of any component be reduced to zero. Adjustment can be made to one minor component in a ternary mixture. Examples of adjustments for binary and ternary mixtures are given below.

Binary Mixtures—

SPECIFIED RATIO OF 50 : 50—Thirty percent of 50 is 15% absolute, but this exceeds the maximum permitted change of ±10% absolute in either component. Therefore, the mobile phase ratio may be adjusted only within the range of 40 : 60 to 60 : 40.

~~SPECIFIED RATIO OF 95 : 5 Thirty percent of 5 is 1.5% absolute. However, because adjustments up to ±2% absolute are allowed, the ratio may be adjusted within the range of 93 : 7 to 97 : 3.~~

SPECIFIED RATIO OF 2 : 98—Thirty percent of 2 is 0.6% absolute. ~~In this case an absolute adjustment of ±2% is not allowed because it would reduce the amount of the first component to zero.~~ Therefore the maximum allowed adjustment is within the range of 1.4 : 98.6 to 2.6 : 97.4.

Ternary Mixtures—

SPECIFIED RATIO OF 60 : 35 : 5—For the second component, 30% of 35 is 10.5% absolute, which exceeds the maximum permitted change of ±10% absolute in any component. Therefore the second component may be adjusted only within the range of 25% to 45% absolute. For the third component, 30% of 5 is 1.5% absolute. ~~Since ±2% absolute is permitted and provides more flexibility, the third component may be adjusted within the range of 3% to 7% absolute.~~ In all cases, a sufficient quantity of the first component is used to give a total of 100%. Therefore, mixture ranges of 50 : 45 : 5 to 70 : 25 : 5 or ~~58 : 35 : 7 to 62 : 35 : 3~~ 58.5 : 35 : 6.5 to 61.5 : 35 : 3.5 would meet the requirement.

~~Detector~~ Wavelength of UV-Visible Detector (HPLC)—Deviations from the wavelengths specified in the method are not permitted. The procedure specified by the detector manufacturer, or another validated procedure, is to be used to verify that error in the detector wavelength is, at most, ±3 nm.

Column Length (GC, HPLC): can be adjusted by as much as ~~70%.~~ ±70%.

Column Inner Diameter (GC, HPLC): can be adjusted by as much as ~~±25% 50%.~~ ±25% for HPLC and ±50% for GC.

Film Thickness (Capillary GC): can be adjusted by as much as –50% to 100%.

Particle Size (HPLC): can be reduced by as much as 50%.

In-Process Revision

Particle Size (GC): going from a larger to a smaller or a smaller to a larger (if it is the same "Range Ratio", which is the diameter of the largest particle divided by the diameter of the smallest particle) particle size GC mesh support is acceptable, provided the chromatography meets the requirements of the system suitability.

Flow Rate (GC, HPLC): can be adjusted by as much as ±50%.

Injection Volume (GC, HPLC): can be reduced as far as is consistent with accepted precision and detection limits. ~~It may be increased to as much as twice the volume specified, provided there are no adverse effects on factors such as baseline, peak shapes, resolution, linearity, and retention times.~~

Column Temperature (HPLC): can be adjusted by as much as ~~±20°.~~ ±10°. Column thermostating is recommended to improve control and reproducibility of retention time.

~~**Column** **Oven Temperature (GC):** can be adjusted by as much as ±2%, in terms of absolute temperature.~~ ±10%.

Oven Temperature Program (GC)—Adjustment of temperatures is permitted as stated above. For the times specified for the temperature to be maintained or for the temperature to be changed from one value to another, an adjustment of up to ±20% is permitted.

~~**Gradient Elution (HPLC)** The configuration of the equipment employed may significantly alter the resolution, retention time, and relative retentions described in the method. Should this occur, it may be due to excess dwell time, which is the volume between the point at which the two eluants meet and the top of the column.~~ ■1S (*USP29*)

Unless otherwise directed in the monograph, system suitability parameters are determined from the analyte peak.

■Relative retention times may be provided in monographs for informational purposes only, to aid in peak identification. There are no acceptance criteria applied to relative retention times.■1S (*USP29*)

To ascertain the effectiveness of the final operating system, it should be subjected to suitability testing. Replicate injections of the standard preparation required to demonstrate adequate system precision may be made before the injection of samples or may be interspersed among sample injections. System suitability must be demonstrated throughout the run by injection of an appropriate control preparation at appropriate intervals.

The control preparation can be a standard preparation or a solution containing a known amount of analyte and any additional materials useful in the control of the analytical system, such as excipients or impurities. Whenever there is a significant change in equipment or in a critical reagent, suitability testing should be performed before the injection of samples. No sample analysis is acceptable unless the requirements of system suitability have been met. Sample analyses obtained while the system fails

■system suitability■1S (*USP29*) requirements are unacceptable.

CHROMATOGRAPHIC REAGENTS

The following list of packings (L), phases (G), and supports (S) is intended to be a convenient reference for the chromatographer. [NOTE—Particle sizes given in this listing are those generally provided. Where other, usually finer, sizes are required, the individual monograph specifies the desired particle size. Within any category of packings or phases listed below, there may be a wide range of columns available. Where it is necessary to define more specifically the chromatographic conditions, the individual monograph so indicates.]

Packings

L1—Octadecyl silane chemically bonded to porous silica or ceramic micro-particles, 3 to 10 µm in diameter,

■or a monolithic silica rod.■1S (*USP29*)

L2—Octadecyl silane chemically bonded to silica gel of a controlled surface porosity that has been bonded to a solid spherical core, 30 to 50 µm in diameter.

L3—Porous silica particles, 5 to 10 µm in diameter.

L4—Silica gel of controlled surface porosity bonded to a solid spherical core, 30 to 50 µm in diameter.

L5—Alumina of controlled surface porosity bonded to a solid spherical core, 30 to 50 µm in diameter.

L6—Strong cation-exchange packing–sulfonated fluorocarbon polymer coated on a solid spherical core, 30 to 50 µm in diameter.

L7—Octylsilane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

L8—An essentially monomolecular layer of aminopropylsilane chemically bonded to totally porous silica gel support, ■3 to■1S (*USP28*) 10 µm in diameter.

L9—~~10 µm~~

■■1S (*USP29*)

In-Process Revision

Irregular or spherical, totally porous silica gel having a chemically bonded, strongly acidic cation-exchange coating,

■3 to 10 µm in diameter.■1S (*USP29*)

L10—Nitrile groups chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L11—Phenyl groups chemically bonded to porous silica particles, 5 to 10 µm in diameter.

L12—A strong anion-exchange packing made by chemically bonding a quaternary amine to a solid silica spherical core, 30 to 50 µm in diameter.

L13—Trimethylsilane chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L14—Silica gel ■■1S (*USP28*) having a chemically bonded, strongly basic quaternary ammonium anion-exchange coating, ■5 to 10 µm in diameter.■1S (*USP28*)

L15—Hexylsilane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

L16—Dimethylsilane chemically bonded to porous silica particles, 5 to 10 µm in diameter.

L17—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form, 7 to 11 µm in diameter.

L18—Amino and cyano groups chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L19—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the calcium form, about 9 µm in diameter.

L20—Dihydroxypropane groups chemically bonded to porous silica particles, 5 to 10 µm in diameter.

L21—A rigid, spherical styrene-divinylbenzene copolymer, 5 to 10 µm in diameter.

L22—A cation-exchange resin made of porous polystyrene gel with sulfonic acid groups, about 10 µm in size.

L23—An anion-exchange resin made of porous polymethacrylate or polyacrylate gel with quaternary ammonium groups, about 10 µm in size.

L24—A semi-rigid hydrophilic gel consisting of vinyl polymers with numerous hydroxyl groups on the matrix surface, 32 to 63 µm in diameter.[5]

■[NOTE—Available as YMC-Pack PVA-SIL manufactured by YMC Co., Ltd. and distributed by Waters Corp. (www.waters.com).]■1S (*USP29*)

L25—Packing having the capacity to separate compounds with a molecular weight range from 100–5000 (as determined by polyethylene oxide), applied to neutral, anionic, and cationic water-soluble polymers. A polymethacrylate resin base, cross-linked with polyhydroxylated ether (surface contained some residual carboxyl functional groups) was found suitable.

L26—Butyl silane chemically bonded to totally porous silica particles, ~~5~~

■3■1S (*USP29*)
to 10 µm in diameter.

L27—Porous silica particles, 30 to 50 µm in diameter.

L28—A multifunctional support, which consists of a high purity, 100 Å, spherical silica substrate that has been bonded with anionic exchanger, amine functionality in addition to a conventional reversed phase C8 functionality.

L29—Gamma alumina, reverse-phase, low carbon percentage by weight, alumina-based polybutadiene spherical particles, 5 µm in diameter with a pore volume of 80 Å.

L30—Ethyl silane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

L31—A ■hydroxide-selective,■1S (*USP29*) strong anion-exchange resin-quaternary amine bonded on latex particles attached to a core of 8.5-µm macroporous particles having a pore size of 2000 Å and consisting of ethylvinylbenzene cross-linked with 55% divinylbenzene.

L32—A chiral ligand-exchange packing–L-proline copper complex covalently bonded to irregularly shaped silica particles, 5 to 10 µm in diameter.

L33—Packing having the capacity to separate dextrans by molecular size over a range of 4000 to 500,000 Da. It is spherical, silica-based, and processed to provide pH stability.[6]

■[NOTE—Available as TSKgel G4000 SWXL from Tosoh Biosep (www.tosohbiosep.com).]■1S (*USP29*)

L34—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the lead form, about 9 µm in diameter.

L35—A zirconium-stabilized spherical silica packing with a hydrophilic (diol-type) molecular monolayer bonded phase having a pore size of 150 Å.

L36—A 3,5-dinitrobenzoyl derivative of L-phenylglycine covalently bonded to 5-µm aminopropyl silica.

L37—Packing having the capacity to separate proteins by molecular size over a range of 2,000 to 40,000 Da. It is a polymethacrylate gel.

L38—A methacrylate-based size-exclusion packing for water-soluble samples.

L39—A hydrophilic polyhydroxymethacrylate gel of totally porous spherical resin.

L40—Cellulose tris-3,5-dimethylphenylcarbamate coated porous silica particles, 5 to 20 µm in diameter.

L41—Immobilized α_1-acid glycoprotein on spherical silica particles, 5 µm in diameter.

L42—Octylsilane and octadecylsilane groups chemically bonded to porous silica particles, 5 µm in diameter.

L43—Pentafluorophenyl groups chemically bonded to silica particles by a propyl spacer, 5 to 10 µm in diameter.

L44—A multifunctional support, which consists of a high purity, 60 Å, spherical silica substrate that has been bonded with a cationic exchanger, sulfonic acid functionality in addition to a conventional reversed phase C8 functionality.

L45—Beta cyclodextrin bonded to porous silica particles, 5 to 10 µm in diameter.

L46—Polystyrene/divinylbenzene substrate agglomerated with quaternary amine functionalized latex beads,■about■1S (*USP28*) 10 µm in diameter.

L47—High-capacity anion-exchange microporous substrate, fully functionalized with trimethlyamine groups, 8 µm in diameter.[7]

■[NOTE—Available as CarboPac MA1 and distributed by Dionex Corp. (www.dionex.com).]■1S (*USP29*)

L48—Sulfonated, cross-linked polystyrene with an outer layer of submicron, porous, anion-exchange microbeads, 15 µm in diameter.

L49—A reversed-phase packing made by coating a thin layer of polybutadiene onto spherical porous zirconia particles, 3 to 10 µm in diameter.[8]

[5] ~~Available as YMC-Pack PVA-SIL manufactured by YMC Co., Ltd.■ and distributed by Waters Corp. (www.waters.com).■1S (*USP29*)~~

Phases

G1—Dimethylpolysiloxane oil.
G2—Dimethylpolysiloxane gum.
G3—50% Phenyl-50% methylpolysiloxane.
G4—Diethylene glycol succinate polyester.
G5—3-Cyanopropylpolysiloxane.
G6—Trifluoropropylmethylpolysiloxane.
G7—50% 3-Cyanopropyl-50% phenylmethylsilicone.
G8—80% Bis(3-cyanopropyl)-20% 3-cyanopropylphenylpolysiloxane (percentages refer to molar substitution).
G9—Methylvinylpolysiloxane.
G10—Polyamide formed by reacting a C_{36} dicarboxylic acid with 1,3-di-4-piperidylpropane and piperidine in the respective mole ratios of 1.00 : 0.90 : 0.20.
G11—Bis(2-ethylhexyl) sebacate polyester.
G12—Phenyldiethanolamine succinate polyester.
G13—Sorbitol.
G14—Polyethylene glycol (av. mol. wt. of 950 to 1050).
G15—Polyethylene glycol (av. mol. wt. of 3000 to 3700).
G16—Polyethylene glycol compound (av. mol. wt. about 15,000). A high molecular weight compound of polyethylene glycol with a diepoxide linker. Available commercially as Polyethylene Glycol Compound 20M, or as Carbowax 20M, from suppliers of chromatographic reagents.
G17—75% Phenyl-25% methylpolysiloxane.
G18—Polyalkylene glycol.
G19—25% Phenyl-25% cyanopropyl-50% methylsilicone.
G20—Polyethylene glycol (av. mol. wt. of 380 to 420).
G21—Neopentyl glycol succinate.
G22—Bis(2-ethylhexyl) phthalate.
G23—Polyethylene glycol adipate.
G24—Diisodecyl phthalate.
G25—Polyethylene glycol compound TPA. A high molecular weight compound of a polyethylene glycol and a diepoxide that is esterified with terephthalic acid. ~~Available commercially as Carbowax 20M-TPA from suppliers of chromatographic reagents.~~

■[NOTE—Available commercially as Carbowax 20M-TPA from suppliers of chromatographic reagents.]■1S (*USP29*)

G26—25% 2-Cyanoethyl-75% methylpolysiloxane.
G27—5% Phenyl-95% methylpolysiloxane.
G28—25% Phenyl-75% methylpolysiloxane.
G29—3,3′-Thiodipropionitrile.
G30—Tetraethylene glycol dimethyl ether.
G31—Nonylphenoxypoly(ethyleneoxy)ethanol (av. ethyleneoxy chain length is 30); Nonoxynol 30.
G32—20% Phenylmethyl-80% dimethylpolysiloxane.
G33—20% Carborane-80% methylsilicone.
G34—Diethylene glycol succinate polyester stabilized with phosphoric acid.
G35—A high molecular weight compound of a polyethylene glycol and a diepoxide that is esterified with nitroterephthalic acid.
G36—1% Vinyl-5% phenylmethylpolysiloxane.
G37—Polyimide.
G38—Phase G1 containing a small percentage of a tailing inhibitor.[19]

■[NOTE—A suitable grade is available commercially as ''SP2100/0.1% Carbowax 1500'' from Supelco, Inc. (www.sigma-aldrich.com/supelco).]■1S (*USP29*)

G39—Polyethylene glycol (av. mol. wt. about 1500).
G40—Ethylene glycol adipate.
G41—Phenylmethyldimethylsilicone (10% phenyl-substituted).
G42—35% phenyl-65% dimethylpolysiloxane (percentages refer to molar substitution).
G43—6% cyanopropylphenyl-94% dimethylpolysiloxane (percentages refer to molar substitution).
G44—2% low molecular weight petrolatum hydrocarbon grease and 1% solution of potassium hydroxide.
G45—Divinylbenzene-ethylene glycol-dimethylacrylate.
G46—14% Cyanopropylphenyl-86% methylpolysiloxane.
G47—Polyethylene glycol (av. mol. wt. of about 8000).
G48—Highly polar, partially cross-linked cyanopolysiloxane.
~~G49—Proprietary derivatized phenyl groups on a polysiloxane backbone.[20]~~

■■1S (*USP29*)

Supports

NOTE—Unless otherwise specified, mesh sizes of 80 to 100 or, alternatively, 100 to 120 are intended.

S1A—Siliceous earth for gas chromatography has been flux-calcined by mixing diatomite with Na_2CO_3 flux and calcining above 900°. The siliceous earth is acid-washed, then water-washed until neutral, but not base-washed. The siliceous earth may be silanized by treating with an agent such as dimethyldichlorosilane[21]

■[NOTE—Unless otherwise specified in the individual monograph, silanized support is intended.]■1S (*USP29*)
to mask surface silanol groups.

S1AB—The siliceous earth as described above is both acid- and base-washed.[21]

~~[19] A suitable grade is available commercially as ''SP2100/0.1% Carbowax 1500'' from Supelco, Inc., ■(www.sigma-aldrich.com/supelco).■1S (*USP28*)~~

~~[20] A suitable grade is available commercially as ''Optima Delta-3'' from Machery-Nagel, Inc., 215 River Vale Road, River Vale, NJ 07675.~~

~~[21] Unless otherwise specified in the individual monograph, silanized support is intended.~~

In-Process Revision

■[NOTE—Unless otherwise specified in the individual monograph, silanized support is intended.]■1S (*USP29*)

S1C—A support prepared from crushed firebrick and calcined or burned with a clay binder above 900° with subsequent acid-wash. It may be silanized.

S1NS—The siliceous earth is untreated.

S2—Styrene-divinylbenzene copolymer having a nominal surface area of less than 50 m^2 per g and an average pore diameter of 0.3 to 0.4 µm.

S3—Copolymer of ethylvinylbenzene and divinylbenzene having a nominal surface area of 500 to 600 m^2 per g and an average pore diameter of 0.0075 µm.

S4—Styrene-divinylbenzene copolymer with aromatic –O and –N groups, having a nominal surface area of 400 to 600 m^2 per g and an average pore diameter of 0.0076 µm.

S5—40- to 60-mesh, high-molecular weight tetrafluorethylene polymer.

S6—Styrene-divinylbenzene copolymer having a nominal surface area of 250 to 350 m^2 per g and an average pore diameter of 0.0091 µm.

S7—Graphitized carbon having a nominal surface area of 12 m^2 per g.

S8—Copolymer of 4-vinyl-pyridine and styrene-divinylbenzene.

S9—A porous polymer based on 2,6-diphenyl-*p*-phenylene oxide.

S10—A highly polar cross-linked copolymer of acrylonitrite and divinylbenzene.

S11—Graphitized carbon having a nominal surface area of 100 m^2 per g modified with small amounts of petrolatum and polyethylene glycol compound.[22]

■[NOTE—Commercially available as SP1500 on Carbopack B from Supelco (www.sigma-aldrich.com/supelco).]■1S (*USP29*)

S12—Graphitized carbon having a nominal surface area of 100 m^2 per g.

BRIEFING

⟨**644**⟩ **Conductivity.** It is proposed to add this new general chapter to address a need based upon proposed revisions of the packaged water monographs, which appear elsewhere in this issue of *PF*. The conductivity limits in these monographs are harmonized with the *European Pharmacopoeia,* and the conductivity test procedure is provided by reference to EP section 2.2.38. It therefore became necessary for the Committee to develop a new general chapter in which the content is a very loose adaptation of that EP section. This chapter provides information that can be used for testing conductivity when appropriate for any article, whereas the general chapter *Water Conductivity* ⟨645⟩ is restricted to water testing. Comments should be addressed to Frank Barletta, liaison to the Pharmaceutical Waters Expert Committee.

(PW: F. Barletta) RTS—42230-1

[22] ~~Commercially available as SP1500 on Carbopack B from Supelco (www.sigma-aldrich.com/supelco).~~

Add the following:

■⟨644⟩ CONDUCTIVITY

INTRODUCTION

Conductivity is the measurement of the ability of a fluid to conduct electricity via the ions in that fluid. The measurement is non-ion-specific, and all ions respond with different equivalent conductances, λ. Despite the lack of specificity, conductivity is a valuable overall tool for measurement and control of total ionic content because it is directly proportional to the concentration of each ionic species, C_i, as described in the equation below.[1] Conductivity, κ, defined in the equation below, is measured using an alternating current in order to prevent (1) polarization (or collection of ions) at the electrodes or (2) any electrolytic reaction.

$$\kappa = 1000 \sum_{i}^{\substack{all \\ ions}} C_i \lambda_i$$

The technique is valid for use with all concentrations of ionic species ranging from acids and bases (high conductivity) to pure water (low conductivity) and even to organic, nonionic species such as glycols. The measurement can be sensitive to ion concentrations as low as 0.05 ppb.

[1] At low ion concentrations, the conductivity–concentration relationship is valid. As ion concentrations increase ($> 10^{-3}$ mol/L), small negative deviations from linearity arise as a result of decreases in λ for each ion. Those deviations vary from ion to ion. For some acids and bases, the extent of dissociation into ions also may decrease as a result of molecular interactions, thereby lowering the solution conductivity. At some concentrations of strong acids, usually >10% to 15%, the negative deviations persist, and in some cases, the conductivity may decrease with increasing concentration.

In-Process Revision

The conductivity of fluids in pharmaceutical systems varies greatly. The quantity of ions present in *Purified Water* or *Water for Injection* is very low, resulting in a conductivity of <5 µS/cm and often in a conductivity approaching <0.055 µS/cm. In drinking waters, the conductivity may vary from 30 to 1000 µS/cm. In chromatographic separations, the conductivity of the eluent may vary from 100 to 100,000 µS/cm. For hot concentrated acids, the conductivity may be as much as 1,000,000 µS/cm.

The conductivity of a solution (κ, in siemens/cm) is related to the conductance, K(siemens), between two electrodes according to the following equation:

$$\kappa = K \times \left[\frac{d}{A}\right] = K \times \theta,$$

in which A is the area of the conducting electrodes (cm^2) and d is the distance between the electrodes (cm). Although S/m is the appropriate SI unit for conductivity, historically units of S/cm have been selected as the accepted unit for conductivity. The reciprocal of conductivity is resistivity, ρ, (ohm-cm), and is given by the following equation:

$$\rho = \frac{1}{\kappa} = \frac{1}{K \times \theta} = \frac{R}{\theta},$$

in which R is the resistance of the fluid between the electrodes [ohm (Ω) = 1/siemens (S)]. The geometrical ratio, d/A (or θ), is known as the cell constant (cm^{-1}) of the sensor. Because the conductance of a fluid is proportional to the area of the electrodes and inversely proportional to the distance between the electrodes, the conductance is normalized for the geometrical construction of the two electrodes, resulting in the conductivity. It is the conductivity that is proportional to the ionic content of the fluid. Similarly, it is the resistivity that is inversely proportional to the ionic content of the fluid.

There is no difference in the physical measurement of conductivity and resistivity. They are reciprocals of each other (see units above). Therefore, if one measurement is known, then the other value is readily calculated by taking the reciprocal of the numerical value and the units. There is no difference in the instrumentation or the sensors. The only difference is in how the measured value is reported or displayed for the convenience of the analyst. For example, 1 MΩ-cm = 1 µS/cm and 5 kΩ-cm = 0.2 mS/cm.

Cell Constant Determination—The distinction between resistivity (or conductivity) and the more common electrical term resistance (or conductance) can be confusing. When two electrodes are placed in a conducting fluid and a voltage is applied to them, there is a resistance between the electrodes. If the electrodes are placed farther apart, the resistance increases (or conductance decreases). If the area of the electrodes increases, then the resistance decreases (or conductance increases). In both cases, the ionic concentration does not change, but the geometrical factor affects the

resistance. The purpose of the cell constant is to normalize the resistance measurement for the geometrical construction of the two electrodes, resulting in the resistivity (or conductivity). The cell constant (θ) is defined as the distance (d) between the electrodes divided by the area (A) of the electrodes according to the following equation:

$$\theta(\mathrm{cm}^{-1}) = \frac{d(\mathrm{cm})}{A(\mathrm{cm}^2)}.$$

For sensors of modern construction, the exact measurement of the cell constant obtained by directly measuring d and A is impractical because of the various geometrical configurations and the nonuniformity of the electric field between the electrodes. The cell constant is usually determined by immersing the conductivity sensor in a solution of known conductivity. Typically, the conductivity analyzer computes the cell constant by measuring the conductance of a solution of known conductivity, and entering the known conductivity into the meter. The analyzer then solves for θ.

Solutions of known conductivity, traceable to authoritative agencies, are not as common as other solutions such as pH buffers or other reference solutions. Examples of some competent authorities include, but are not limited to, ASTM and NIST. ASTM D1125, *Standard Test Method for Electrical Conductivity and Resistivity of Water,* is an established method that provides the procedure for preparing solutions of known conductivity ranging from ~150 to 100,000 µS/cm. NIST and other national agencies offer various reference conductivity solutions over a similar range. Water with no impurities or exposure to air (also known as ultrapure water) is a reliable reference conductivity material below 10 µS/cm because the fundamental conductivity of pure water is known precisely as a function of temperature.

Temperature Compensation—Temperature compensation is usually a requirement for most conductivity measurements, though there are exceptions such as those discussed in *Water Conductivity* ⟨645⟩. The conductivity of a fluid is related to the temperature. As the temperature increases, ions are more mobile and the conductivity increases. The effect of temperature depends on the type and concentration of the ion, but for most solutions with conductivities >10 µS/cm, the impact of temperature is in the range of 1.9% to 2.2% of the reading per degree. For strong acids, this may be as low as 1.5% per degree. For high-purity water, the temperature coefficient could vary anywhere from 2.0% to 7.5% per degree, depending on the temperature and purity of the water. For each case described here, some knowledge of the type of impurity is needed in order to ensure adequate temperature compensation. If the temperature coefficient is constant and linear, the equation that relates the compensated conductivity to the non-temperature compensated conductivity is the following:

$$\kappa_{25} = \frac{\kappa_t}{[1+\alpha(t-25)]},$$

in which t is the measured temperature, κ_{25} is the conductivity compensated to 25°, κ_t is the conductivity at t, and α is 0.02 for a temperature coefficient of 2% per degree.

Most conductivity analyzers directly measure the uncompensated conductivity and the temperature, and the temperature-compensated conductivity is determined via mathematical algorithms in the microprocessor of the analyzer. Depending on the application and knowledge of the content of the fluid, different compensation algorithms may be available. For many process control applications, temperature compensation is usually advisable. When the uncompensated conductivity changes, it is impractical to

distinguish whether this change is due to a change in temperature or a change in ionic content. Temperature compensation allows the analyst to distinguish between changes in temperature or ionic content. Compensation to a reference temperature of 25° is standard practice.

CALIBRATION

Although specific details will vary, the conductivity measurement system is calibrated in three stages: first, the analyzer electronic circuitry; second, the temperature sensor; and third, the cell constant of the conductivity sensor. Depending on the type of sensor and analyzer, calibration cycles will vary widely from weekly to annually depending on manufacturer's recommendations and application requirements.

Instrument Calibration—Calibrate the analyzer electronic circuitry by disconnecting the sensor and connecting precision resistors (resistors of known value) to the analyzer. The resistors shall be traceable to a competent national authority. The resistance values shall be selected such that (1) they are in the range of measurement capability of the analyzer, and (2) they are in the range of the conductivity to be measured. Because the analyzer may have multiple circuits internally, verification of the appropriate circuit and measurement range is necessary. Comparison of the measured resistance with the actual resistance will verify whether the analyzer is properly calibrated. The resulting difference shall be within 2% of the actual resistance. Adjustment of the resistance measurement circuit is necessary if this limit is exceeded.

If a temperature measurement circuit is integrated into the analyzer and utilized as part of the measurement system, then verification of this circuit is required. Depending on the type of temperature device located at the sensor (this could be an RTD, thermistor, or thermocouple), an appropriate signal source (resistor, voltage, etc.) should be input to the analyzer. Comparison of the measured temperature with the simulated temperature will verify whether the temperature measurement circuit is properly calibrated. The resulting difference shall be within 0.5° of the simulated temperature. Adjustment of the temperature measurement circuit is necessary if this limit is exceeded.

Temperature Sensor Calibration—If a temperature sensor is integrated into the conductivity sensor, the temperature sensor shall have an accuracy of ±2° compared to a reference system. The reference system can be another traceable temperature measurement device, or it can be a system of known temperature such as boiling water (corrected for elevation, if necessary) or an ice-water bath. Adjustment of the temperature sensor calibration is recommended if the 1° accuracy is exceeded.

Cell Constant Calibration—The cell constant of the sensor is calibrated by placing the sensor in a solution of known conductivity traceable to the competent authority, as described above. Adjustment of the cell constant calibration is recommended if the difference between the actual and measured conductivity exceeds 2% of the actual conductivity. Specific reference solutions are not listed here because various options exist as described above.

Because the cell constant is a geometrical property of the sensor, and it is a constant, the determination of the cell constant does not need to be in the range of operation of the pharmaceutical process. However, the cell constant calibration should be done with a solution that is in the operational range of the analyzer. In addition, cell constant calibration should be performed in the recommended temperature range of the reference solution. Cell constant calibration can be performed with or without temperature compensation depending on the reference solution. For reference solutions

exceeding 10 µS/cm, if temperature compensation is needed, a temperature coefficient (α) of 2% per degree is sufficient over the range of $25 \pm 10^{\circ}$ unless otherwise specified.

METHOD

Determination of the Conductivity of the Solution To Be Examined—If the conductivity measurement is not a continuous process measurement, but is based on a grab sample, the sensor should be carefully handled and cleaned. The sensor should be rinsed with a suitable quality of water, and then rinsed at least 1 to 2 times with the solution to be measured. The procedure may vary depending on the solution to be tested. For very low conductivity samples such as pharmaceutical grade water, more rinsing may be needed to remove any remaining residue from the sensor. Similarly, the sample should be transferred to a container that has been cleaned using a method similar to that used for the sensor. Transfer an appropriate volume of fluid to the container, and immerse the sensor. If a temperature-compensated measurement is advised, then select the appropriate temperature compensation algorithm, and adjust the sample temperature to the recommended range, if necessary. Otherwise, disable the temperature compensation. Verify that the temperature is sufficiently stable ($< 0.25^{\circ}$), and record the conductivity reading and the temperature, if necessary.

If the conductivity sensor is immersed in a closed process, such as a piping system or tank, the sensor does not need to be removed and cleaned prior to measurement, except as required as part of the cleaning process for the entire system. If a temperature-compensated measurement is advised, then select the appropriate temperature compensation algorithm. Otherwise, disable the temperature compensation. Although temperature stability is desirable, it may not be possible depending on the process that is being measured. Record the conductivity reading and the temperature, if necessary.

This method can be implemented as an in-process online measurement as well as a laboratory measurement.■1S (*USP29*)

BRIEFING

⟨**785**⟩ **Osmolality and Osmolarity,** *USP 28* page 2444 and page 1702 of *PF* 30(5) [Sept.–Oct. 2004]. It is proposed to correct the molecular weight of vancomycin in the section on *Osmolarity.* Also, in the *Test Solution* under *Measurement of Osmolality,* because instructions to use a dilution factor in calculations may exist in specific cases, it is proposed to add a phrase to indicate that a dilution factor may be noted in a particular monograph. To address those instruments that are not designed to accept two calibration points in addition to water, changes in the *Procedure* are introduced along with acceptance criteria for calibration. An alternative procedure for calculations is also proposed.

(PA4: H. Pappa) RTS—41922-1; 41821-1

Change to read:

OSMOLARITY

Osmolarity of a solution is a theoretical quantity expressed in osmoles per L (Osmol per L) of a solution and is widely used in clinical practice because it expresses osmoles as a function of volume. Osmolarity cannot be measured but is calculated theoretically from the experimentally measured value of osmolality.

Sometimes, osmolarity (ξ_c) is calculated theoretically from the molar concentrations:

$$\xi_c = \Sigma \nu_i c_i,$$

where ν_i is as defined above, and c_i is the molar concentration of the i^{th} solute in solution. For example, the osmolarity of a solution prepared by dissolving 1 g of vancomycin in 100 mL of 0.9% sodium chloride solution can be calculated as follows:

~~[3 × 10 g/L/1468 (mol. wt. of vancomycin) + 2 × 9 g/L/58.5 (mol. wt. of sodium chloride)] × 1000 = 328 mOsmol/L.~~

■[3 × 10 g/L/1485.71 (mol. wt. of vancomycin) + 2 × 9 g/L/58.5 (mol. wt. of sodium chloride)] × 1000 = 328 mOsmol/L.■1S (*USP29*)

The results suggest that the solution is slightly hyperosmotic since the osmolality of blood ranges between 285 and 310 mOsmol per kg. However, the solution is found to be hypo-osmotic and has an experimentally determined osmolality of 255 mOsmol per kg.[1] The example illustrates that osmolarity values calculated theoret-

[1] Kastango, E.S. and Hadaway, L. *International Journal of Pharmaceutical Compounding 5,* (2001) 465-469.

In-Process Revision

ically from the concentration of a solution should be interpreted cautiously and may not represent the osmotic properties of infusion solutions.

The discrepancy between theoretical (osmolarity) and experimental (osmolality) results is, in part, due to the fact that osmotic pressure is related to osmolality and not osmolarity. More significantly, the discrepancy between experimental results and the theoretical calculation is due to the fact that the osmotic pressure of a real solution is less than that of an ideal solution because of interactions between solute molecules or between solute and solvent molecules in a solution. Such interactions reduce the pressure exerted by solute molecules on a semipermeable membrane, reducing experimental values of osmolality compared to theoretical values. This difference is related to the molal osmotic coefficient ($\Phi_{m,i}$). The example also illustrates the importance of determining the osmolality of a solution experimentally, rather than calculating the value theoretically.

Change to read:

MEASUREMENT OF OSMOLALITY

The osmolality of a solution is commonly determined by the measurement of the freezing point depression of the solution.

Apparatus—The apparatus, an osmometer for freezing point depression measurement, consists of the following: a means of cooling the container used for the measurement; a resistor sensitive to temperature (thermistor), with an appropriate current- or potential-difference measurement device that may be graduated in temperature change or in osmolality; and a means of mixing the sample.

■Osmometers that measure the vapor pressures of solutions are less frequently employed. They require a smaller volume of specimen (generally about 5 μL), but the accuracy and precision of the resulting osmolality determination are comparable to those obtained by the use of osmometers that depend upon the observed freezing points of solutions.■2S (*USP28*)

Standard Solutions—Prepare *Standard Solutions* as specified in *Table 1,* as necessary.

Test Solution—For a solid for injection, constitute with the appropriate diluent as specified in the instructions on the labeling. For solutions, use the sample as is. [NOTE—A solution can be diluted to bring it within the range of measurement of the osmometer, if necessary, but the results must be expressed as that of the diluted solution and must not be multiplied by a dilution factor to calculate the osmolality of the original solution,

■unless otherwise indicated in the monograph.■1S (*USP29*) The molal osmotic coefficient is a function of concentration. Therefore, it changes with dilution.]

Procedure—Set the zero of the apparatus using water. To calibrate the apparatus, choose at least two solutions from *Table 1* such that the osmolalities of the *Standard Solutions* span the expected range of osmolality of the *Test Solution.*

■[NOTE—If the instrument does not calibrate with multiple standards, calibrate the instrument by the manufacturer's instructions and confirm the instrument calibration with at least two solutions from *Table 1* such that the osmolalities of the *Standard Solutions* span the expected range of osmolality of the *Test Solution*. The instrument reading should be within ±2 mOsmol/kg from the *Standard Solution* (over the standard range of 100 to 700 mOsmol/kg).]■1S (*USP29*)

Table 1. Standard Solutions for Osmometer Calibration[2]

Standard Solutions (Weight in g of sodium chloride per kg of water)	Osmolality (mOsmol/kg) (ξ_m)	Molal Osmotic Coefficient ($\Phi_{m,\,NaCl}$)	Freezing Point Depression (°) ΔT_f
3.087	100	0.9463	0.186
6.260	200	0.9337	0.372
9.463	300	0.9264	0.558
12.684	400	0.9215	0.744
15.916	500	0.9180	0.930
19.147	600	0.9157	1.116
22.380	700	0.9140	1.302

[2] Adapted from the *European Pharmacopoeia,* 4th Edition, 2002, p. 50.

Introduce an appropriate volume of each *Standard Solution* into the measurement cell as per the manufacturer's instructions, and start the cooling system. Usually, the mixing device is programmed to operate at a temperature below the lowest temperature expected from the freezing point depression. The apparatus indicates when the equilibrium is attained. Calibrate the osmometer using an appropriate adjustment device such that the reading corresponds to either the osmolality or freezing point depression value of the *Standard Solution* shown in *Table 1*. [NOTE—Some instruments indicate osmolality and some others show freezing point depression.] Before each measurement, rinse the measurement cell at least twice with the solution to be tested. Repeat the procedure with each *Test Solution*. Read the osmolality of the *Test Solution* directly, or calculate it from the measured freezing point depression.

Assuming that the value of the osmotic coefficient is essentially the same whether the concentration is expressed in molality or molarity, the experimentally determined osmolality of a solution can be converted to osmolarity in the same manner in which the concentration of a solution is converted from molality to molarity. Unless a solution is very concentrated, the osmolarity of a solution (ξ_c) can be calculated from its experimentally determined osmolality (ξ_m):

$$\xi_c = 1000\xi_m / (1000 / \rho + \Sigma w_i \nu_i),$$

where w_i is the weight in g; and ν_i is the partial specific volume, in mL per g, of the i^{th} solute. The partial specific volume of a solute is the change in volume of a solution when an additional 1 g of solute is dissolved in the solution. This volume can be determined by the measurement of densities of the solution before and after the addition of the solute. The partial specific volumes of salts are generally very small, around 0.1 mL per g. However, those of other solutes are generally higher. For example, the partial specific volumes of amino acids are in the range of 0.6–0.9 mL per g.

■It can be shown from the above equation correlating osmolarity with osmolality that,

$$\xi_c = \xi_m (\rho - c),$$

where ρ is the density of the solution, and c is the total solute concentration, both expressed in g per mL. Thus, alternatively, the osmolarity can also be calculated from experimentally determined osmolality from the measurement of density of the solution by a suitable method and the total weight of the solute, after correction for water content, dissolved per mL of the solution.■1S *(USP29)*

GENERAL CHAPTERS

General Information

BRIEFING

⟨1160⟩ Pharmaceutical Calculations in Prescription Compounding, *USP 28* page 2712. In the section *Application of Mean Kinetic Temperature,* it is proposed to add a sample calculation of the mean kinetic temperature (MKT) for the controlled cold temperature range in consideration of conditions during the storage, shipping, and distribution of pharmaceutical articles. (See *General Notices* for the definition of *Controlled Cold Temperature.*) In addition, editorial changes have been made to improve the readability of this chapter.

Change to read:

BASIC PHARMACEUTICAL CALCULATIONS

The remainder of this chapter will focus on basic pharmaceutical calculations. It is important to recognize the rules involved when adding, subtracting, dividing, and multiplying values. The interrelationships between various units within the different weighing and measuring systems are also important and have to be understood.

Calculations in Compounding

The pharmacist must be able to calculate the amount or concentration of drug substances in each unit or dosage portion of a compounded preparation at the time it is dispensed. Pharmacists must perform calculations and measurements to obtain, theoretically, 100% of the amount of each ingredient in compounded formulations. Calculations must account for the active ingredient, or active moiety, and water content of drug substances, which includes that in the chemical formulas of hydrates. Official drug substances and added substances must meet the requirements under *Loss on Drying* ⟨731⟩, which must be included in the calculations of amounts and concentrations of ingredients. The pharmacist should consider the effect of ambient humidity on the gain or loss of water from drugs and added substances in containers subjected to intermittent opening over prolonged storage. Each container should be opened for the shortest duration necessary and then closed tightly immediately after use.

The nature of the drug substance that is to be weighed and used in compounding a prescription must be known exactly. If the substance is a hydrate, its anhydrous equivalent weight may need to be calculated. On the other hand, if there is adsorbed moisture present that is either specified on a certificate of analysis or that is determined in the pharmacy immediately before the drug substance is

used by the procedure under *Loss on Drying* ⟨731⟩, this information must be used when calculating the amount of drug substance that is to be weighed in order to determine the exact amount of anhydrous drug substance required.

There are cases in which the required amount of a dose is specified in terms of a cation [e.g., Li^+, netilmicin (n+)], an anion [e.g., F^-], or a molecule (e.g., theophylline in aminophylline). In these instances, the drug substance weighed is a salt or complex, a portion of which represents the pharmacologically active moiety. Thus, the exact amount of such substances weighed must be calculated on the basis of the required quantity of the pharmacological moiety.

The following formula may be used to calculate the exact theoretical weight of an ingredient in a compounded preparation:

$$W = ab/de,$$

in which W is the actual weighed amount; a is the prescribed or pharmacist-determined weight of the active or functional moiety of drug or added substance; b is the chemical formula weight of the ingredient, including waters of hydration for hydrous ingredients; d is the fraction of dry weight when the percent by weight of adsorbed moisture content is known from the loss on drying procedure (see *Loss on Drying* ⟨731⟩); and e is the formula weight of the active or functional moiety of a drug or added substance that is provided in the formula weight of the weighed ingredient.

EXAMPLE 1: Triturate Morphine Sulfate USP and Lactose NF to obtain 10 g in which there are 30 mg of Morphine Sulfate USP for each 200 mg of the morphine-lactose mixture. [NOTE—Clinical dosages of morphine mean Morphine Sulfate USP, which is the pentahydrate.]

Equation Factor	Numerical Value
W	weight, in g, of Morphine Sulfate USP
a	1.5 g of morphine sulfate pentahydrate in the prescription
b	759 g/mole
d	1.0
e	759 g/mole

$$W = \frac{1.5\,\text{g}\,(759\,\text{g/mole})}{1.0\,(759\,\text{g/mole})} = 1.5\,\text{g}.$$

EXAMPLE 2: Accurately weigh an amount of Aminophylline USP to obtain 250 mg of anhydrous theophylline. [NOTE—The powdered aminophylline dihydrate weighed contains 0.4% w/w adsorbed moisture as stated in the Certificate of Analysis.]

Equation Factor	Numerical Value
W	weight, in mg, of Aminophylline USP (dihydrate)
a	250 mg of theophylline
b	456 g/mole
d	0.996
e	360 g/mole

$$W = \frac{250\,\text{mg}\,(456\,\text{g/mole})}{0.996\,(360\,\text{g/mole})} = 318\,\text{mg}$$

EXAMPLE 3: Accurately weigh an amount of Lithium Citrate USP (containing 2.5% moisture as stated in the Certificate of Analysis) to obtain 200 mEq of lithium (Li^+). [NOTE—One mEq of Li^+ is equivalent to 0.00694 g of Li^+.]

Equation Factor	Numerical Value
W	weight, in g, of Lithium Citrate USP (tetrahydrate)
a	200 mEq of Li^+ or 1.39 g of Li^+
b	282 g/mole
d	0.975
e	3 × 6.94 g/mole or 20.8 g/mole

$$W = \frac{1.39\,\text{g}\,(282\,\text{g/mole})}{0.975\,(20.8\,\text{g/mole})} = 19.3\,\text{g}.$$

EXAMPLE 4: Accurately weigh an amount of Netilmicin Sulfate USP, equivalent to 2.5 g of netilmicin. [NOTE—Using the procedure under *Loss on Drying* ⟨731⟩, the Netilmicin Sulfate USP that was weighed lost 12% of its weight.]

Equation Factor	Numerical Value
W	weight, in g, of Netilmicin Sulfate USP
a	2.5 g
b	1442 g/mole
d	0.88
e	951 g/mole

$$W = \frac{2.5\,\text{g}\,(1442\,\text{g/mole})}{0.88\,(951\,\text{g/mole})} = 4.31\,\text{g}.$$

Buffer Solutions

Definition—A buffer solution is an aqueous solution that resists a change in pH when small quantities of acid or base are added, when diluted with the solvent, or when the temperature changes. Most buffer solutions are mixtures of a weak acid and one of its salts or mixtures of a weak base and one of its salts. Water and solutions of a neutral salt such as sodium chloride have very little ability to resist the change of pH and are not capable of effective buffer action.

Preparation, Use, and Storage of Buffer Solutions—Buffer solutions for pharmacopeial tests should be prepared using freshly boiled and cooled water (see *Standard Buffer Solutions* under *Buffer Solutions in Reagents, Indicators, and Solutions*). They should be stored in containers such as Type I glass bottles and used within 3 months of preparation.

In-Process Revision

Buffers used in physiological systems are carefully chosen so as not to interfere with the pharmacological activity of the medicament or the normal function of the organism. Commonly used buffers in parenteral products, for example, are acetic, citric, glutamic, and phosphoric acids and their salts. Buffer solutions should be freshly prepared.

The Henderson-Hasselbalch equation, noted above, allows the pH of a buffer solution of a weak acid and its salt to be calculated. Appropriately modified, this equation may be applied to buffer solutions composed of a weak base and its salt.

Buffer Capacity—The buffer capacity of a solution is the measurement of the ability of that solution to resist a change in pH upon addition of small quantities of a strong acid or base. An aqueous solution has a buffer capacity of 1 when 1 L of the buffer solution requires 1 gram equivalent of strong acid or base to change the pH by 1 unit. Therefore, the smaller the pH change upon the addition of a specified amount of acid or base, the greater the buffer capacity of the buffer solution. Usually, in analysis, much smaller volumes of buffer are used in order to determine the buffer capacity. An approximate formula for calculating the buffer capacity is gram equivalents of strong acid or base added per L of buffer solution per unit of pH change, i.e., (Eq /L)/(pH change).

EXAMPLE—
The addition of 0.01 g equivalents of sodium hydroxide to 0.25 L of a buffer solution produced a pH change of 0.50. The buffer capacity of the buffer solution is calculated as follows:

$$(0.01/0.25)/0.50 = 0.08(\text{Eq/L})/(\text{pH change})$$

Dosage Calculations

Special Dosage Regimens—Geriatric and pediatric patients require special consideration when designing dosage regimens. In geriatric patients, the organs are often not functioning efficiently as a result of age-related pharmacokinetic changes or disease. For these patients, modifications in dosing regimens are available in references such as *USP Drug Information*.

For pediatric patients, where organs are often not fully developed and functioning, careful consideration must be applied during dosing. Modifications in dosing regimens for pediatric patients are also available in references such as *USP Drug Information*. General rules for calculating doses for infants and children are available in pharmacy calculation textbooks. These rules are not drug-specific and should be used only in the absence of more complete information.

The usual method for calculating a dose for children is to use the information provided for children for the specific drug. The dose is frequently expressed as mg of drug per kg of body weight for a 24-hour period, and is then usually given in divided portions.

The calculation may be made using the following equation:

(mg of drug per kg of body weight) × (kg of body weight) = dose for an individual for a 24-hour period

A less frequently used method of calculating the dose is based on the surface area of the individual's body. The dose is expressed as amount of drug per body surface area in m^2, as shown in the equation below:

(amount of drug per m^2 of body surface area) × (body surface area in m^2) = dose for an individual for a 24-hour period.

The body surface area (BSA) may be determined from nomograms relating height and weight in dosage handbooks. The BSA for adult and pediatric patients may also be determined using the following equations:

$$\text{BSA } (m^2) = \text{square root of } \{[\text{Height (in)} \times \text{Weight (lb)}] / 3131\}$$

or

$$\text{BSA } (m^2) = \text{square root of } \{[\text{Height (cm)} \times \text{Weight (kg)}]/ 3600\}.$$

EXAMPLE—
Rx for Spironolactone Suspension 25 mg/tsp. Sig: 9 mg BID for an 18 month-old child who weighs 22 lbs.

The *USP DI 2002,* 22nd ed., states that the normal pediatric dosing regimen for Spironolactone is 1 to 3 mg per kg per day. In this case, the weight of the child is 22 lbs, which equals 22 lbs/(2.2 lbs/kg) = 10 kg. Therefore the normal dose for this child is 10 to 30 mg per day and the dose ordered is 18 mg per day as a single dose or divided into 2 to 4 doses. The dose is acceptable based on published dosing guidelines.

Percentage Concentrations

Percentage concentrations of solutions are usually expressed in one of three common forms:

$$\text{Volume percent (v/v)} = \frac{\text{Volume of solute}}{\text{Volume of solution}} \times 100\%$$

$$\text{Weight percent (w/w)} = \frac{\text{Weight of solute} \times 100\%}{\text{Weight of solution}}$$

$$\text{Weight in volume percent (w/v)} = \frac{\text{Weight of solute (in g)}}{\text{Volume of solution (in mL)}} \times 100\%$$

See also *Percentage Measurements* under *Concentrations* in the *General Notices*. The above three equations may be used to calculate any one of the three values (i.e., weights, volumes, or percentages) in a given equation if the other two values are known.

Note that weights are always additive, i.e., 50 g plus 25 g = 75 g. Volumes of two different solvents or volumes of solvent plus a solid solute are not strictly additive. Thus 50 mL of water + 50 mL of pure alcohol do not produce a volume of 100 mL. Nevertheless, it is assumed that in some pharmaceutical calculations, volumes are additive, as discussed below under *Reconstitution of Drugs Using Volumes Other than Those on the Label.*

EXAMPLES—

1. Calculate the percentage concentrations (w/w) of the constituents of the solution prepared by dissolving 2.50 g of phenol in 10.00 g of glycerin. Using the weight percent equation above, the calculation is as follows.

   Total weight of the solution = 10.00 g + 2.50 g = 12.50 g.

   Weight percent of phenol = (2.50 g × 100%)/12.50 g = 20.0% of phenol.

   Weight percent of glycerin = (10 g × 100%)/12.50 g = 80.0% of glycerin.

2. A prescription order reads as follows:
   Eucalyptus Oil 3% (v/v) in Mineral Oil.
   Dispense 30.0 mL.
   What quantities should be used for this prescription? Using the volume percent equation above, the calculation is as follows.
   Amount of Eucalyptus Oil:

   $$3\% = (\text{Volume of oil in mL}/30.0\text{ mL}) \times 100\%$$

   Solving the equation, the volume of oil = 0.90 mL
   Amount of Mineral Oil:
   To 0.90 mL of Eucalyptus Oil add sufficient Mineral Oil to prepare 30.0 mL.
3. A prescription order reads as follows:

Zinc oxide	7.5 g
Calamine	7.5 g
Starch	15 g
White petrolatum	30 g

   Calculate the percentage concentration for each of the four components. Using the weight percent equation above, the calculation is as follows.
   Total weight = 7.5 g + 7.5 g + 15 g + 30 g = 60.0 g.
   Weight percent of zinc oxide = (7.5 g zinc oxide/60 g ointment) × 100% = 12.5%.
   Weight percent of calamine = (7.5 g calamine/60 g ointment) × 100% = 12.5%.
   Weight percent of starch = (15 g starch/60 g ointment) × 100% = 25%.
   Weight percent of white petrolatum = (30 g white petrolatum/60 g ointment) × 100% = 50%.

Specific Gravity

The definition of Specific Gravity is usually based on the ratio of weight of a substance in air at 25° to that of the weight of an equal volume of water at the same temperature. The weight of 1 mL of water at 25° is approximately 1 g. The following equation may be used for calculations.

Specific Gravity = (Weight of the substance)/(Weight of an equal volume of water)

EXAMPLES—

1. A liquid weighs 125 g and has a volume of 110 mL. What is the specific gravity?
   The weight of an equal volume of water is 110 g.
   Using the above equation, specific gravity = 125 g/110 g = 1.14.
2. Hydrochloric Acid NF is approximately a 37% (w/w) solution of hydrochloric acid (HCl) in water. How many grams of HCl are contained in 75.0 mL of HCl NF? (Specific gravity of Hydrochloric Acid NF is 1.18.)
   Calculate the weight of HCl NF using the above equation.
   The weight of an equal volume of water is 75 g.
   Specific Gravity 1.18 = weight of the HCl NF g /75.0 g.
   Solving the equation, the weight of HCl NF is 88.5 g.
   Now calculate the weight of HCl using the weight percent equation.
   37.0 % (w/w) = (weight of solute g/88.5 g) × 100.
   Solving the equation, the weight of the HCl is 32.7 g.

Dilution and Concentration

A concentrated solution can be diluted. Powders and other solid mixtures can be triturated or diluted to yield less concentrated forms. Because the amount of solute in the diluted solution or mixture is the same as the amount in the concentrated solution or mixture, the following relationship applies to dilution problems.

The quantity of *Solution 1* (Q_1) × concentration of *Solution 1* (C_1) = the quantity of *Solution 2* (Q_2) × concentration of *Solution 2* (C_2), or

$$(Q_1)(C_1) = (Q_2)(C_2).$$

Almost any quantity and concentration terms may be used. However, the units of the terms must be the same on both sides of the equation.

EXAMPLES—

1. Calculate the ~~amount~~ ■quantity■ 1S *(USP29)* (Q_2), in g, of diluent that must be added to 60 g of a 10% (w/w) ointment to make a 5% (w/w) ointment.
   Let (Q_1) = 60 g, (C_1) = 10%, and (C_2) = 5%.
   Using the above equation,

   $$60\text{ g} \times 10\% = (Q_2) \times 5\%\text{ (w/w)}$$

   Solving the above equation, the ~~amount~~ ■quantity■ 1S *(USP29)* of product needed, Q_2, is 120 g. The initial ~~amount~~ ■quantity■ 1S *(USP29)* of product added was 60 g, and therefore an additional 60 g of diluent must be added to the initial ~~amount~~ ■quantity■ 1S *(USP29)* to give a total of 120 g.
2. How much diluent should be added to 10 g of a trituration (1 in 100) to make a mixture that contains 1 mg of drug in each 10 g of final mixture?
   Determine the final concentration by first converting mg to g. One mg of drug in 10 g of mixture is the same as 0.001g in 10 g.
   Let (Q_1) = 10 g, (C_1) = (1 in 100), and (C_2) = (0.001 in 10).
   Using the equation for dilution, 10 g × (1/100) = (Q_2) g × (0.001/10).
   Solving the above equation, (Q_2) = 1000 g.
   Because 10 g of the final mixture contains all of the drug and some diluent, (1000 g – 10 g) or 990 g of diluent is required to prepare the mixture at a concentration of 0.001 g of drug in 10 g of final mixture.
3. Calculate the percentage strength of a solution obtained by diluting 400 mL of a 5.0% solution to 800 mL.
   Let (Q_1) = 400 mL, (C_1) = 5%, and (Q_2) = 800 mL.
   Using the equation for dilution, 400 mL × 5% = 800 mL × (C_2)%.
   Solving the above equation, (C_2) = 2.5% (w/v).

In-Process Revision

Use of Potency Units

See *Units of Potency* in the *General Notices*.

Because some substances may not be able to be defined by chemical and physical means, it may be necessary to express quantities of activity in biological units of potency.

EXAMPLES—

1. One mg of Pancreatin contains not less than 25 USP Units of amylase activity, 2.0 USP Units of lipase activity, and 25 USP Units of protease activity. If the patient takes 0.1 g (100 mg) per day, what is the daily amylase activity ingested?

   1 mg of Pancreatin corresponds to 25 USP Units of amylase activity.

   100 mg of Pancreatin corresponds to 100 × (25 USP Units of amylase activity) = 2500 Units.
2. A dose of penicillin G benzathine for streptococcal infection is 1.2 million units intramuscularly. If a specific product contains 1180 units per mg, how many milligrams would be in the dose?

   1180 units of penicillin G benzathine are contained in 1 mg.

   1 unit is contained in 1/1180 mg.

   1,200,000 units are contained in (1,200,000 × 1)/1180 units = 1017 mg.

Base v. Salt or Ester Forms of Drugs

Frequently the base form of a drug is administered in an altered form such as an ester or salt for stability or other reasons such as taste or solubility. This altered form of the drug usually has a different molecular weight (MW), and at times it may be useful to determine the amount of the base form of the drug in the altered form.

EXAMPLES—

1. Four hundred milligrams of erythromycin ethylsuccinate (molecular weight, 862.1) is administered. Determine the amount of erythromycin (molecular weight, 733.9) in this dose.

   862.1 g of erythromycin ethylsuccinate corresponds to 733.9 g of erythromycin.

   1 g of erythromycin ethylsuccinate corresponds to (733.9/862.1) g of erythromycin.

   0.400 g of erythromycin ethylsuccinate corresponds to (733.9/862.1) × 0.400 g or 0.3405 g of erythromycin.
2. The molecular weight of testosterone cypionate is 412.6 and that of testosterone is 288.4. What is the dose of testosterone cypionate that would be equivalent to 60.0 mg of testosterone?

   288.4 g of testosterone corresponds to 412.6 g of testosterone cypionate.

   1 g of testosterone corresponds to 412.6/288.4 g of testosterone cypionate.

   60.0 mg or 0.0600 g of testosterone corresponds to (412.6/288.4) × 0.0600 = 0.0858 g or 85.8 mg of testosterone cypionate.

Reconstitution of Drugs Using Volumes Other Than Those On The Label

Occasionally it may be necessary to reconstitute a powder in order to provide a suitable drug concentration in the final product. This may be accomplished by estimating the volume of the powder and liquid medium required.

EXAMPLES—

1. If the volume of 250 mg of ceftriaxone sodium is 0.1 mL, how much diluent should be added to 500 mg of ceftriaxone sodium powder to make a suspension having a concentration of 250 mg per mL?

$$500\ \text{mg} \times \frac{1\ \text{mL}}{250\ \text{mg}} = 2\ \text{mL}.$$

~~2.~~

■1S (*USP29*)
Volume of 500 mg of ceftriaxone sodium =

$$500\ \text{mg} \times \frac{0.1\ \text{mL}}{250\ \text{mg}} = 0.2\ \text{mL}$$

~~3.~~

■1S (*USP29*)
Volume of the diluent required = (2 mL of suspension) – (0.2 mL of Ceftriaxone Sodium) = 1.8 mL.

~~4.~~

■2. ■1S (*USP29*)
What is the volume of dry powder cefonicid, if 2.50 mL of diluent is added to 1 g of powder to make a solution having a concentration of 325 mg per mL?

Volume of solution containing 1 g of the powder =

$$1\ \text{g of cefonicid} \times \frac{1000\ \text{mg}}{1\ \text{g}} \times \frac{1\ \text{mL of solution}}{325\ \text{mg of cefonicid}} = 3.08\ \text{mL}$$

Volume of dry powder cefonicid = 3.08 mL of solution – 2.50 mL of diluent = 0.58 mL.

Alligation Alternate and Algebra

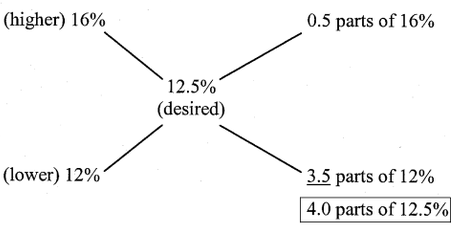
Alligation—Alligation is a rapid method of determining the proportions in which substances of different strengths are mixed to yield a desired strength or concentration. Once the proportion is found, the calculation may be performed to find the exact amounts of substances required. Set up the problem as follows.

1. Place the desired percentage or concentration in the center.
2. Place the percentage of the substance with the lower strength on the lower left-hand side.
3. Place the percentage of the substance with the higher strength on the upper left-hand side.
4. Subtract the desired percentage from the lower percentage, and place the obtained difference on the upper right-hand side.
5. Subtract the higher percentage from the desired percentage, and place the obtained difference on the lower right-hand side.

The results obtained will determine how many parts of the two different percentage strengths should be mixed to produce the desired percentage strength of a drug mixture.

EXAMPLES—

1. How much ointment having a 12% drug concentration and how much ointment having a 16% drug concentration must be used to make 1 kg of a preparation containing a 12.5% drug concentration?



In a total of 4.0 parts of 12.5% product, 3.5 parts of 12% ointment and 0.5 parts of 16% ointment are needed.

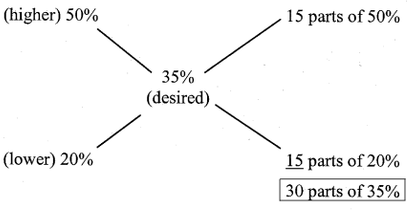
4 parts correspond to 1 kg or 1000 g.

1 part corresponds to 250 g.

3.5 parts correspond to 3.5 × 250 g or 875 g.

0.5 parts correspond to 0.5 × 250 g or 125 g.

2. How many mL of 20% dextrose in water and 50% dextrose in water are needed to make 750 mL of 35% dextrose in water?



In a total of 30 parts of 35% dextrose in water, 15 parts of 50% dextrose in water and 15 parts of 20% dextrose in water are required.

30 parts correspond to 750 mL.

15 parts correspond to 375 mL.

Thus use 375 mL of the 20% solution and 375 mL of the 50% solution to prepare the product.

Algebra—Instead of using alligation to solve the above problems, algebra may be used, following the scheme outlined below.

In order to represent the total ~~amount~~

■quantity■1S *(USP29)*
(weights, parts, or volumes) of the final mixture or solution, 1 or a specified ~~amount~~

■quantity■1S *(USP29)*
is used.

Let x be the ~~amount~~

■quantity■1S *(USP29)*
of one portion and [1 (or the specified amount) – x] be the remaining portion. Set up the equation according to the statement below, and solve.

The amount

■of drug■1S *(USP29)*
in one part plus the amount

■of drug■1S *(USP29)*
in the other part equals the total amount in the final mixture or solution.

EXAMPLES—

1. How much ointment having a 12% drug concentration and how much ointment having a 16% drug concentration must be used to make 1 kg of a preparation containing a 12.5% drug concentration?

   Let 1 kg be the total ~~amount~~

   ■quantity■1S *(USP29)*
   of ointment to be prepared, let x be the quantity, in kg, of the 12% ointment, and let $(1 - x)$ be the quantity in kg of the 16% ointment. The equation is as follows:

   $$(12/100)\,x + (16/100)(1 - x) = (12.5/100)(1).$$

   Solving the equation, x equals 0.875 kg of the 12% ointment and $(1 - x)$ equals $(1 - 0.875)$ or 0.125 kg of the 16% ointment.

2. How many mL of 20% dextrose in water and 50% dextrose in water are needed to make 750 mL of 35% dextrose in water?

   Let x be the volume, in mL, of the 20% solution, and let $(750 - x)$ be the volume in mL of the 50% solution. The equation is as follows:

   $$(20/100)x + (50/100)(750 - x) = (35/100)(750).$$

   Solving the equation, x equals 375 mL of the 20% solution and $(750 - x)$ equals $(750 - 375)$ or 375 mL of the 50% solution.

Molar, Molal, and Normal Concentrations

See *Concentrations* in the *General Notices*.

Molarity—The molar concentration, M, of the solution is the number of moles of the solute contained in one L of solution.

Molality—The molal concentration, m, is the number of moles of the solute contained in one kilogram of solvent.

Normality—The normal concentration, N, of a solution expresses the number of milliequivalents (mEq) of solute contained in 1 mL of solution or the number of equivalents (Eq, gram-equivalent weight) of solute contained in 1 L of solution. When using normality, the pharmacist must apply quantitative chemical analysis principles using molecular weight (MW). Normality depends on the reaction capacity of a chemical compound and therefore the reaction capacity must be known. For acids and bases, reaction capacity is the number of accessible protons available from, or the number of proton binding sites available on, each molecular aggregate. For electron transfer reactions, reaction capacity is the number of electrons gained or lost per molecular aggregate.

EXAMPLES—

1. How much sodium bicarbonate powder is needed to prepare 50.0 mL of a 0.07 N solution of sodium bicarbonate ($NaHCO_3$)? (MW of $NaHCO_3$ is 84.0 g per mol.)

   In an acid or base reaction, because $NaHCO_3$ may act as an acid by giving up one proton, or as a base by accepting one proton, one Eq of $NaHCO_3$ is contained in each mole of

In-Process Revision

$NaHCO_3$. Thus the equivalent weight of $NaHCO_3$ is 84 g. [NOTE—The volume, in L, × normality of a solution equals the number of equivalents in the solution.]

The number of equivalents of $NaHCO_3$ required = (0.07 Eq/L) (50.0 mL/1000 mL /L) = 0.0035 equivalents.

1 equivalent weight is 84.0 g.

0.0035 equivalents equals 84.0 g/Eq × 0.0035 Eq = 0.294 g.

2. A prescription calls for 250 mL of a 0.1 N hydrochloric acid (HCl) solution. How many mL of concentrated hydrochloric acid are needed to make this solution? [NOTE—The specific gravity of concentrated hydrochloric acid is 1.18, the molecular weight is 36.46 and the concentration is 37.5% (w/w). Because hydrochloric acid functions as an acid and reacts by giving up one proton in a chemical reaction, 1 Eq is contained in each mole of the compound. Thus the equivalent weight is 36.46 g.]

   The number of equivalents of HCl required is 0.250 L × 0.1 N = 0.025 equivalents.

   1 equivalent is 36.46 g.

   0.025 equivalents correspond to 0.025 Eq × 36.46 g/Eq = 0.9115 g.

   37.5 g of pure HCl are contained in 100 g of concentrated HCl.

   Thus 1 g of pure HCl is contained in (100/37.5) g = 2.666 g of concentrated acid, and 0.9115 g is contained in (0.9115 × 2.666) g or 2.43 g of concentrated acid.

   In order to determine the volume of the supplied acid required, use the definition for specific gravity as shown below.

   Specific gravity = (weight of the substance)/(weight of an equal volume of water).

   1.18 = 2.43 g/(weight of an equal volume of water).

   The weight of an equal volume of water is 2.056 g or 2.06 g, which measures 2.06 mL. Thus, 2.06 mL of concentrated acid is required.

Milliequivalents and Millimoles

NOTE—This section addresses milliequivalents (mEq) and millimoles (mmol) as they apply to electrolytes for dosage calculations.

The quantities of electrolytes administered to patients are usually expressed in terms of mEq. This term must not be confused with a similar term used in quantitative chemical analysis as discussed above. Weight units such as mg or g are not often used for electrolytes because the electrical properties of ions are best expressed as mEq. An equivalent is the weight of a substance (equivalent weight) that supplies one unit of charge. An equivalent weight is the weight, in g, of an atom or radical divided by the valence of the atom or radical. A milliequivalent is one-thousandth of an equivalent (Eq). Because the ionization of phosphate depends on several factors, the concentration is usually expressed in millimoles, moles, or milliosmoles which are described below. [NOTE—Equivalent weight (Eq.wt) = wt. of an atom or radical (ion) in g/valence (or charge) of the atom or radical. Milliequivalent weight (mEq.wt) = Eq.wt. (g)/1000.]

EXAMPLES—

1. Potassium (K^+) has a gram-atomic weight of 39.10. The valence of K^+ is 1^+. Calculate its milliequivalent weight (mEq wt).

   Eq wt = 39.10 g/1 = 39.10 g

   mEq wt = 39.10 g/1000 = 0.03910 g = 39.10 mg

2. Calcium (Ca^{2+}) has a gram-atomic weight of 40.08. Calculate its milliequivalent weight (mEq wt).

   Eq wt = 40.08 g/2 = 20.04 g

   mEq wt. = 20.04 g/1000 = 0.02004 g = 20.04 mg

NOTE—The equivalent weight of a compound may be determined by dividing the molecular weight in g by the product of the valence of either relevant ion and the number of times this ion occurs in one molecule of the compound.

3. How many milliequivalents of potassium ion (K^+) are there in a 250-mg Penicillin V Potassium Tablet? [NOTE—Molecular weight of penicillin V potassium is 388.48 g per mol; there is one potassium atom in the molecule; and the valence of K^+ is 1.]

   Eq wt = 388.48 g/[1(valence) × 1(number of charges)] = 388.48 g.

   mEq wt = 388.48 g/1000 = 0.38848 g = 388.48 mg.

   (250 mg per Tablet)/(388.48 mg per mEq) = 0.644 mEq of K^+ per Tablet.

4. How many equivalents of magnesium ion and sulfate ion are contained in 2 mL of a 50% Magnesium Sulfate Injection? (Molecular weight of $MgSO_4 \cdot 7H_2O$ is 246.48 g per mol.)

   Amount of magnesium sulfate in 2 mL of 50% Magnesium Sulfate Injection

$$2\,\text{mL of Injection} \times \frac{50\,\text{g of magnesium sulfate}}{100\,\text{mL of Injection}} = 1\,\text{g}.$$

   Eq wt of $MgSO_4.7H_2O$ = MW (g)/(valence of specified ion × number of specified ions in one mole of salt).

   For the magnesium ion:

   The number of equivalents is calculated as follows:

   246.48/[2(valence) × 1 (number of ions in the compound)] = 123.24 g/Eq of magnesium ion.

   The number of equivalents in 1 g is 1g/ 123.24 g/Eq = 0.008114 Eq.

   The number of mEq may be calculated as follows.

   The mEq wt = Eq wt (g)/1000 = (123.24 g/Eq)/1000 = 0.12324 g.

   The number of milliequivalents of magnesium ion in 1 g is 1g/ 0.12324 g/mEq = 8.114 mEq.

   For the sulfate ion:

   The number of equivalents is calculated as follows:

   246.48/[2(valence) × 1 (number of ions in the compound)] = 123.24 g/Eq of sulfate ion.

   The number of equivalents in 1 g is 1g/123.24 g/Eq = 0.008114 Eq.

   The number of mEq may be calculated as follows.

   The mEq wt = Eq wt (g)/1000 = (123.24 g/Eq)/1000 = 0.12324 g.

   The number of milliequivalents of sulfate ion in 1 g is 1g/ 0.12324 g/mEq = 8.114 mEq.

5. A vial of Sodium Chloride Injection contains 3 mEq of sodium chloride per mL. What is the percentage strength of this solution? (Molecular weight of sodium chloride is 58.44 g per mol.)

   1 mEq = 1 Eq/1000 = 58.44 g/1000 = 0.05844 g = 58.44 mg.

Amount of sodium chloride in 3 mEq per mL = 58.44 mg per mEq × 3 mEq per mL = 175.32 mg per mL.

$$\frac{175.32\text{ mg}}{1\text{ mL}} = \frac{17532\text{ mg}}{100\text{ mL}} = \frac{17.532\text{ g}}{100\text{ mL}} = 17.5\%$$

Using mols and *mmols*—

A number of countries have adopted the International System of Units and no longer calculate doses using mEq as described above, but instead use the terms moles (mol) and millimoles (mmol). In *USP 28–NF 23,* the International System of Units is used except for the labeling of electrolytes.

Definitions—

A mole equals one gram atomic weight or gram molecular weight of a substance.

A millimole equals 1/1000 of a mole.

EXAMPLES—

1. Potassium (K) has a gram-atomic weight of 39.10. Calculate its weight in millimoles (mmol).

   The weight of one mole is 39.10 g and the weight in millimoles is 39.10 g/1000 =0.0391 g or 39.1 mg.
2. How many millimoles of Penicillin V are in a tablet that contains 250 mg of Penicillin V Potassium? (Molecular weight of penicillin V potassium is 388.48 g per mol.)

   The weight of one mole is 388.48 and the weight in millimoles is 388.48/1000 = 0.3848 g or 388.48 mg. Thus there are 250 mg/388.48 mg/mmol = 0.644 mmol of Penicillin V ion per tablet.

Isoosmotic Solutions

The following discussion and calculations have therapeutic implications in preparations of dosage forms intended for ophthalmic, subcutaneous, intravenous, intrathecal, and neonatal use.

Cells of the body, such as erythrocytes, will neither swell nor shrink when placed in a solution that is isotonic with the body fluids. However, the measurement of tonicity, a physiological property, is somewhat difficult. It is found that a 0.9% (w/v) solution of sodium chloride, which has a freezing point of – 0.52°, is isotonic with body fluids and is said to be isoosmotic with body fluids. In contrast to isotonicity, the freezing point depression is a physical property. Thus many solutions which are isoosmotic with body fluids are not necessarily isotonic with body fluids, e.g., a solution of urea. Nevertheless many pharmaceutical products are prepared using freezing point data or related sodium chloride data to prepare solutions that are isoosmotic with the body fluids. A closely related topic is osmolarity (see *Osmolality and Osmolarity* ⟨785⟩).

Freezing point data or sodium chloride equivalents of pharmaceuticals and excipients (see *Table 1* below) may be used to prepare isoosmotic solutions, as shown in the examples below.

Table 1. Sodium Chloride Equivalents (E) and Freezing Point (FP) Depressions for a 1% Solution of the Drug or Excipient

Drug or Excipient	E	FP Depression
Atropine sulfate	0.13	0.075
Sodium chloride	1.00	0.576

EXAMPLE—

Determine the amount of sodium chloride required to prepare 60 mL of an isoosmotic solution of atropine sulfate 0.5% using the sodium chloride equivalent values and also the freezing point depression values.

Using the sodium chloride equivalent values—

The total amount of substances equivalent to sodium chloride (for a 0.9% solution) = (0.9 g/100 mL) × 60 mL = 0.54 g.

The amount of atropine sulfate required = (0.5 g/100 mL) × 60 mL = 0.3 g.

1 g of atropine sulfate is equivalent to 0.13 g of sodium chloride.

0.3 g atropine sulfate is equivalent to 0.3 × 0.13 g = 0.039 g of sodium chloride.

Thus the required amount of sodium chloride is 0.54 – 0.039 = 0.501 g or 0.50 g.

Using freezing point depression values—

The freezing point depression required is 0.52°.

A 1% solution of atropine sulfate causes a freezing point depression of 0.075°.

A 0.5% solution of atropine sulfate causes a freezing point depression of 0.075° × 0.5 = 0.0375°.

The additional freezing point depression required is 0.52° – 0.0375° = 0.482°.

A 1% solution of sodium chloride causes a freezing point depression of 0.576°.

A (1%/ 0.576) solution of sodium chloride causes a freezing point depression of 1°.

A (1%/ 0.576) × 0.482 = 0.836% solution of sodium chloride causes a freezing point depression of 0.482°.

The required amount of sodium chloride is (0.836 g/100 mL) × 60 mL = 0.502 g or 0.50 g.

Flow Rates in Intravenous Sets

Some calculations concerning flow rates in intravenous sets are provided below. [NOTE—Examples below are *not* to be used for treatment purposes.]

EXAMPLES—

1. Sodium Heparin 8,000 units in 250 mL Sodium Chloride Injection 0.9% solution are to be infused over 4 hours. The administration set delivers 20 drops per mL.

   What is the flow rate in mL per hour?

   In 4 hours, 250 mL are to be delivered.

   In 1 hour, 250 mL/4 = 62.5 mL are delivered.

   What is the flow rate in drops per minute?

   In 60 minutes, 62.5 mL are delivered.

   In 1 minute, 62.5 mL/60 = 1.04 mL are delivered.

   1 mL = 20 drops.

   1.04 mL = 1.04 × 20 drops = 20.8 drops.

   Thus in 1 minute, 20.8 or 21 drops are administered.
2. A 14.5 kg patient is to receive 50 mg of Sodium Nitroprusside in 250 mL of dextrose 5% in water (D5W) at the rate of 1.3 µg per kg per minute. The set delivers 50 drops per mL.

   Calculate the flow rate in mL per hour.

   The dose for 1 kg is 1.3 µg per minute.

   The 14.5 kg patient should receive 14.5 × 1.3 µg = 18.85 µg per minute.

   50 mg or 50000 µg of drug are contained in 250 mL of D5W.

   18.85 µg are contained in 250 mL × 18.85/50000 = 0.09425 mL D5W, which is administered every minute.

   In 1 minute, 0.09425 mL are administered.

In 1 hour or 60 minutes, 60 × 0.09425 mL = 5.655 or 5.7 mL are administered.

Calculate the flow rate in drops per minute.

1 mL corresponds to 50 drops per minute.

0.09425 mL corresponds to 0.09425 × 50 = 4.712 or 4.7 drops per minute.

Temperature

The relationship between Celsius degrees (°C) and Fahrenheit degrees (°F) is expressed by the following equation:

$$9\ (^{\circ}C) = 5\ (^{\circ}F) - 160,$$

in which $^{\circ}C$ and $^{\circ}F$ are the numbers of Celsius degrees and Fahrenheit degrees, respectively.

EXAMPLES—

1. Convert 77 °F to Celsius degrees.
   $9(^{\circ}C) = 5(^{\circ}F) - 160$
   $^{\circ}C = [5(^{\circ}F) - 160]/9 = [(5 \times 77) - 160]/9 = 25\ ^{\circ}C$
2. Convert 30 °C to Fahrenheit degrees.
   $9(^{\circ}C) = 5(^{\circ}F) - 160$
   $^{\circ}F = [9(^{\circ}C) + 160]/5 = [(9 \times 30) + 160]/5 = 86\ ^{\circ}F$

The relationship between the Kelvin and the Celsius scales is expressed by the equation:

$$K = {}^{\circ}C + 273.1,$$

in which K and $^{\circ}C$ are the numbers of Kelvin degrees and Celsius degrees, respectively.

Application of Mean Kinetic Temperature

See *Pharmaceutical Stability* ⟨1150⟩ for the definition of mean kinetic temperature (MKT). MKT is usually higher than the arithmetic mean temperature and is derived from the Arrhenius equation. MKT addresses temperature fluctuations during the storage period of the product. The mean kinetic temperature, T_K, is calculated by the following equation:

$$T_K = \frac{\frac{-\Delta H}{R}}{ln(\frac{e^{-\Delta H/RT_1} + e^{-\Delta H/RT_2} + ... + e^{-\Delta H/RT_n}}{n})},$$

in which ΔH is the heat of activation, which equals 83.144 kJ per mol (unless more accurate information is available from experimental studies); R is the universal gas constant, which equals 8.3144×10^{-3} kJ per degree per mol; T_1 is the average temperature, in degrees Kelvin, during the first time period, e.g., the first week; T_2 is the average temperature, in degrees Kelvin, during the second time period, e.g., second week; and T_n is the average temperature, in degrees Kelvin during the nth time period, e.g., nth week, n being the total number of temperatures recorded. The mean kinetic temperature is calculated from average storage temperatures recorded over a one-year period, with a minimum of twelve equally spaced average storage temperature observations being recorded (see *Pharmaceutical Stability* ⟨1150⟩). This calculation can be performed manually with a pocket calculator or electronically with computer software.

EXAMPLES—

1. The means of the highest and lowest temperatures for 52 weeks are 25 °C each. Calculate the MKT.
   $n = 52$
   $\Delta H/R = 10{,}000$ K
   $T_1, T_2, ..., T_n = 25\ ^{\circ}C = 273.1 + 25 = 298.1$ K
   $R = 0.0083144$ kJ $K^{-1}mol^{-1}$
   $\Delta H = 83.144$ kJ per mol

$$T_K = \frac{\frac{-\Delta H}{R}}{ln(\frac{e^{-\Delta H/RT_1} + e^{-\Delta H/RT_2} + ... + e^{-\Delta H/RT_n}}{n})}$$

$$= \frac{-10{,}000\text{K}}{ln(\frac{52 \times e^{-\Delta H/R \times 298.1}}{52})}$$

$$= \frac{-10{,}000\text{K}}{ln(\frac{52 \times e^{-33.5158}}{52})}$$

$$= \frac{-10{,}000\text{K}}{-33.5458} = 298.1\text{K} = 25.0^{\circ}\text{C}$$

The calculated MKT is 25.0 °C. Therefore the controlled room temperature requirement is met by this pharmacy. [NOTE—If the averages of the highest and lowest weekly temperatures differed from each other and were in the allowed range of 15 °C to 30 °C (see *Controlled Room Temperature* under *Preservation*, *Packaging*, *Storage*, *and Labeling* in the *General Notices*), then each average would be substituted individually into the equation. The remaining two examples illustrate such calculations, except that the monthly averages are used]

2. A pharmacy recorded a yearly MKT on a monthly basis, starting in January and ending in December. Each month, the pharmacy recorded the monthly highest temperature and the monthly lowest temperature, and the average of the two was calculated and recorded for the MKT calculation at the end of the year (see *Table 2*). From these data the MKT may be estimated or it may be calculated. If more than half of the observed temperatures are lower than 25 °C and a mean lower than 23 °C is obtained, the MKT may be estimated without performing the actual calculation.

a. To estimate the MKT, the recorded temperatures are evaluated and the average is calculated. In this case, the calculated arithmetic mean is 22.9 °C. Therefore, the above requirements are met and it can be concluded that the mean kinetic temperature is lower than 25 °C. Therefore, the controlled room temperature requirement is met.

Table 2. Data for Calculation of MKT

n	Month	Lowest Temperature (in °C)	Highest Temperature (in °C)	Average Temperature (in °C)	Average Temperature (in K)	$\Delta H/RT$	$e^{-\Delta H/RT}$
1	Jan.	15	27	21	294.1	34.002	1.710×10^{-15}
2	Feb.	20	25	22.5	295.6	33.830	2.033×10^{-15}
3	Mar.	17	25	21	294.1	34.002	1.710×10^{-15}
4	Apr.	20	25	22.5	295.6	33.830	2.033×10^{-15}
5	May	22	27	24.5	297.6	33.602	2.551×10^{-15}
6	June	15	25	20	293.1	34.118	1.523×10^{-15}
7	July	20	26	23	296.1	33.772	2.152×10^{-15}
8	Aug.	22	26	24	297.1	33.659	2.411×10^{-15}
9	Sept.	23	27	25	298.1	33.546	2.699×10^{-15}
10	Oct.	20	28	24	297.1	33.659	2.411×10^{-15}
11	Nov.	20	24	22	295.1	33.887	1.919×10^{-15}
12	Dec.	22	28	25	298.1	33.546	2.699×10^{-15}

b. The second approach is to perform the actual calculation.

$$n = 12$$

$$T_K = \frac{\frac{-\Delta H}{R}}{ln(\frac{e^{-\Delta H/RT_1} + e^{-\Delta H/RT_2} + ... + e^{-\Delta H/RT_n}}{n})}$$

$$= \frac{-10{,}000\text{K}}{ln(\frac{1.710\times10^{-15} + 2.033\times10^{-15} + 1.710\times10^{-15} + ... + 2.699\times10^{-15}}{12})}$$

$$= \frac{-10{,}000\text{K}}{ln(\frac{2.585 \times 10^{-14}}{12})}$$

$$= \frac{-10{,}000\text{K}}{-33.771} = 296.11\text{K} = 23.0\ ^\circ\text{C}$$

The calculated MKT is 23.0 °C, so the controlled room temperature requirement is met. [NOTE—These data and calculations are used only as an example.]

3. An article was stored for one year in a pharmacy where the observed monthly average of the highest and lowest temperatures was 25 °C (298.1 K), except for one month with an average of 28 °C (301.1 K). Calculate the MKT of the pharmacy.

$$n = 12$$

$$T_K = \frac{\frac{-\Delta H}{R}}{ln(\frac{e^{-\Delta H/RT_1} + e^{-\Delta H/RT_2} + ... + e^{-\Delta H/RT_n}}{n})},$$

$$= \frac{\frac{-\Delta H}{R}}{ln(\frac{11 \times e^{-\Delta H/(R \times 298.1)} + 1 \times e^{-\Delta H/(R \times 301.1)}}{12})}$$

$$= \frac{-10{,}000\text{K}}{ln(\frac{11 \times e^{-33.546} + 1 \times e^{-33.212}}{12})}$$

$$= \frac{-10{,}000\text{K}}{ln(\frac{2.9692 \times 10^{-14} + 3.7705 \times 10^{-15}}{12})}$$

$$= \frac{-10{,}000\text{K}}{ln(\frac{3.3463 \times 10^{-14}}{12})}$$

$$= \frac{-10{,}000\text{K}}{ln(2.7886 \times 10^{-15})}$$

$$= \frac{-10{,}000\text{K}}{-33.513} = 298.39\text{K} = 25.29°\text{ C}$$

The controlled room temperature requirement is not met because the calculated MKT exceeds 25 °C. (See *Note* in Example 2 above.)

■4. Using the same calculation technique for controlled room temperature, the MKT for controlled cold temperatures can also be calculated.

a. For example, if the mean of the highest and lowest temperatures for each week over a period of 52 weeks was 8 °C (i.e., the same mean for each week), then the MKT can be calculated as follows:

$$T_K = \frac{-10{,}000}{ln\left[52e^{-\Delta H/R(281.1)}\right]/52}$$

$$T_K = \frac{-10{,}000}{ln\left[e^{-\Delta H/R(281.1)}\right]}$$

$$T_K = \frac{-10{,}000}{ln\left[e^{-35.575}\right]}$$

$$= \frac{-10{,}000}{ln\left[3.548 \times 10^{-16}\right]}$$

$$= \frac{-10{,}000}{-35.575}$$

$T_K = 281.1\text{K}$
$C = 281.1 - 273.1$
$C = 8°$

b. In another example, where a variety of average temperatures are used, as would be the case in reality, if the average of the highest and lowest temperatures ranges from 0° to 15 °C, then these averages would be individually substituted into the equation. For simplification of the mathematical process, 10 intervals are shown in *Table 3* below. This illustration is intended for calculation of MKT at storage or in transit; i.e., during shipping or distribution of the critical drug product. These calculations can be performed manually or with a computer.

Table 3. Sample Data for MKT Calculations

Intervals	Low	High	Average	Average Temperature (°C)	ΔH/RT	$e^{-\Delta H/RT} \times 10^{16}$
1	0	5	2.5	275.6	36.284	1.746

■1S (*USP29*)

REAGENTS, INDICATORS, AND SOLUTIONS

Reagent Specifications

BRIEFING

Anion-Exchange Resin, Strong, Lightly Cross-Linked, in the Chloride Form, *USP 28* page 2799. It is proposed to correct the procurement information about this reagent.

(HDQ: M. Marques) RTS—42323-1

Change to read:

Anion-Exchange Resin, Strong, Lightly Cross-Linked, in the Chloride Form—Use a suitable grade.

[NOTE—A suitable resin is ~~"AG 50W-X12,"~~ ■"AG 1-X4, catalog number 140-1331,"■1S (*USP29*) produced by BioRad Laboratories, www.bio-rad.com.]

BRIEFING

Dicyclohexyl, *USP 28* page 2813. To facilitate the procurement of this reagent, it is proposed to add its synonym and CAS number.

(HDQ: M. Marques) RTS—42482-1

Change to read:

▲**Dicyclohexyl,** ~~$C_{12}H_{22}$—166.31~~

■*(Bicyclohexyl)* $C_{12}H_{22}$—**166.31** [*92-51-3*]■1S (*USP29*) —Use a suitable grade.▲*USP28*

BRIEFING

Dodecyltrimethylammonium Bromide. This new reagent is used to prepare the *Mobile phase* in the *Assay* in the new monograph *Citalopram Hydrobromide Tablets,* proposed elsewhere in this number of *PF.*

(HDQ: M. Marques) RTS—41833-2

Add the following:

■**Dodecyltrimethylammonium Bromide** *(Lauryltrimethylammonium bromide).* $CH_3(CH_2)_{11}N(CH_3)_3Br$—**308.3** [*1119-94-4*]—Use a suitable grade.

[NOTE—A suitable grade is available as catalog number D 5047 from www.sigma-aldrich.com.]■1S (*USP29*)

BRIEFING

Ethylene Oxide in Methylene Chloride (50 mg/mL)—It is proposed to add this new reagent that is used to prepare the *Ethylene oxide standard solution* in the test for *Limit of ethylene oxide and dioxane* under *Polyethylene Glycol,* which appears elsewhere in this number of *PF.*

(HDQ: M. Marques) RTS—42266-1

Add the following:

■**Ethylene Oxide in Methylene Chloride (50 mg/mL)**—Use a suitable grade.

[NOTE—A suitable grade is available from Sigma Aldrich Corporation, www.sigmaaldrich.com.]■1S (*NF24*)

Test Solutions

BRIEFING

Test Solutions, *USP 28* page 2855 and page 3338 of the *First Supplement.* Two new *Test Solutions* are proposed: Phenol TS and Alkaline Sodium Citrate TS, both specified in the test for *Limit of ammonia* in the *Potassium Bitartrate, Potassium Sodium Tartrate,* and *Sodium Bicarbonate* monographs published elsewhere in this number of *PF.*

(HDQ: M. Marques) RTS—42377-4; 42377-5

Add the following:

■**Phenol TS**—Dissolve 1.2 g of phenol in alcohol to make 10 mL. Prepare weekly.■1S (*USP29*)

Add the following:

■**Sodium Citrate TS, Alkaline**—Dissolve 50 g of sodium citrate dihydrate and 2.5 g of sodium hydroxide in water to make 250 mL.■1S (*USP29*)

REFERENCE TABLES

BRIEFING

Container Specifications for Capsules and Tablets, *USP 28* page 2869, page 3346 of the *First Supplement,* and page 589 of *PF* 31(2) [Mar.–Apr. 2005].

(HDQ) RTS—41008-2; 41078-2; 41431-1; 41431-2; 41684-1; 41833-1; 41833-5; 41833-6

The following table is provided as a reminder for the pharmacist engaged in the typical dispensing situation who already is acquainted with the *Packaging and storage* requirements set forth in the individual monographs. It lists the capsules and tablets that are official in the *United States Pharmacopeia* and indicates the relevant tight (T), well-closed (W), and light-resistant (LR) specifications applicable to containers in which the drug that is repackaged should be dispensed.

This table is not intended to replace, nor should it be interpreted as replacing, the definitive requirements stated in the individual monographs.

Container Specifications for Capsules and Tablets

Monograph Title	*Container Specification*
Add the following:	
■Benazepril Tablets	W ■2S (*USP28*)
Add the following:	
■Bismuth Subsalicylate Tablets	T ■2S (*USP28*)
Add the following:	
■Cefaclor Tablets	T ■2S (*USP28*)
Add the following:	
■Chromium Picolinate Tablets	W ■2S (*USP28*)
Add the following:	
■Citalopram Hydrobromide Tablets	W ■1S (*USP29*)
Add the following:	
■Clarithromycin Tablets, Extended-Release	W ■2S (*USP28*)
Add the following:	
■Black Cohosh Tablets	T, LR ■2S (*USP28*)
Add the following:	
■Desogestrel and Ethinyl Estradiol Tablets	W ■2S (*USP28*)
Add the following:	
■Estradiol and Norethindrone Acetate Tablets	W ■2S (*USP28*)

BRIEFING

Description and Relative Solubility of USP and NF Articles, *USP 28* page 2875, page 3347 of the *First Supplement,* page 8589 of *PF* 25(4) [July–Aug. 1999], page 9254 of *PF* 25(6) [Nov.–Dec. 1999], page 1135 of *PF* 26(4) [July–Aug. 2000], page 1908 of *PF* 27(1) [Jan.–Feb. 2001], page 554 of *PF* 28(2) [Mar.–Apr. 2002], page 1236 of *PF* 28(4) [Sept.–Oct. 2002], page 1542 of *PF* 28(5) [Sept.–Oct. 2002], page 1953 of *PF* 28(6) [Nov.–Dec. 2002], page 267 of *PF* 29(1) [Jan.–Feb. 2003], page 1262 of *PF* 29(4) [July–Aug. 2003], page 1684 of *PF* 29(5) [Sept.–Oct. 2003], page 2057 of *PF* 29(6) [Nov.–Dec. 2003], page 1262 of *PF* 29(4) [July–Aug. 2003], page 1050 of *PF* 30(3) [May–June 2004], page 1822 of *PF* 30(5) [Sept.–Oct. 2004], page 2183 of *PF* 30(6) [Nov.–Dec. 2004], page 122 of *PF* 31(1) [Jan.–Feb. 2005], and page 591 of *PF* 31(2) [Mar.–Apr. 2005].

(HDQ) RTS—41225-1; 42425-1; 42290-1; 41672-2; 42386-1; 42222-1; 42222-2; 42222-3; 41833-1; 41833-3; 41833-4; 41451-1

Change to read:

Benzyl Alcohol: Clear, colorless, oily liquid. Boils at about 206°, without decomposition. Is neutral to litmus. Sparingly soluble in water; freely soluble in 50% alcohol. Miscible with alcohol, with ether, and with chloroform.

■The specific gravity is between 1.042 and 1.047.■1S (*NF24*)
NF category: Antimicrobial preservative.

Add the following:

■**Bicalutamide**: White, crystalline powder. Soluble in acetone and in tetrahydrofuran; sparingly soluble in methanol; slightly soluble in chloroform and in absolute alcohol; practically insoluble in hot water.■1S (*USP29*)

In-Process Revision

Add the following:

■**Citalopram Hydrobromide:** White to almost white, crystalline powder. Freely soluble in water, in alcohol, and in chloroform.■1S (*USP29*)

Add the following:

■**Gamma Cyclodextrin:** White or almost white, amorphous or crystalline powder. Freely soluble in water and in propylene glycol. *NF category:* Sequestering agent.■1S (*NF24*)

Add the following:

■**Drospirenone:** White to off-white powder. Freely soluble in methylene chloride; soluble in acetone and in methanol; sparingly soluble in ethyl acetate and in alcohol; practically insoluble in hexane and in water.■1S (*USP29*)

Add the following:

■**Fenofibrate:** A white or almost white, crystralline powder. Very soluble in methylene chloride; slightly soluble in alcohol; practically insoluble in water.■1S (*USP29*)

Change to read:

Glimepiride: White to almost white powder. Soluble in dimethylformamide; slightly soluble in methanol; sparingly soluble in methylene chloride; practically insoluble in water. ~~It also dissolves in dilute alkali hydroxides and in dilute acids.~~

■■1S (*USP29*)

Add the following:

■**Ritonavir:** Freely soluble in methanol and in methylene chloride; very soluble in acetonitrile; practically insoluble in water.■1S (*USP29*)

In-Process Revision

Pending Proposals

(Items from earlier numbers of PF that have not yet been adopted and become official)

In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *Pharmacopeial Forum (PF)* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in the *USP–NF*, its *Supplements*, or an *IRA*. Those items that have not yet been adopted are marked as *Pending Proposals.*

The *Pending Proposals* list contains these items separated into the following categories: General Notices and Requirements; *USP* monographs; Dietary Supplements Monographs; General Chapters; Reference Tables; Excipients; and *NF* Monographs. Each entry in the *Pending Proposals* list contains the monograph title and the citation of the most recent publication of the monograph. When the appropriate USP Expert Committee is considering advancing to official status a pending proposal that is more than 2 years old, it is republished in *PF* for additional opportunity for public review and comment. Reprints of *PF* proposals may be purchased from USP by sending a written request for information to custsvc@usp.org.

To check the status of a *Pending Proposal,* please contact USP as directed below.

- The briefing accompanying the monograph or general chapter lists the names of the Scientific Liaisons responsible for the proposed revisions. The contact information (phone number and email) for the Scientific Liaison is available in the *Staff Directory* section of *How to Use PF*. For *USP–NF Online* subscribers, the name and contact information for the assigned Scientific Liaison is available in the *Auxiliary Information* portion of each monograph.
- Call USP at 301-816-8344 and ask to speak with the Scientific Liaison assigned to the monograph or general chapter of interest.
- Submit questions by email to stdsmonographs@usp.org. Please indicate the name of the monograph or general chapter in the subject line of the email.

Following these lists the reader will find the *Cancelled Proposals* list. There are items that were published in *PF* and were pending, but have since been canceled. This list contains cumulative entries for the six issues per volume of *PF* [i.e., 30(1) through 30(6)]. Note that canceled proposals may be republished in *PF* to be considered for future adoption into the *USP–NF*.

Title and Proposal	***Vol.***	***No.***	***Page(s)***
Carboxymethylcellulose Sodium Suspension (new)	30	3	812
Cefaclor Tablets (new)	29	6	1858
Cefaclor Extended-Release Tablets—*Labeling* (delete)	31	1	42
Chlordiazepoxide Hydrochloride and Clidinium Bromide Capsules—*Dissolution*	30	1	83
Ciclopirox Olamine Cream—*USP Reference standards [USP Benzyl Alcohol RS], Content of benzyl alcohol*	30	5	1595
Ciclopirox Olamine Topical Suspension—*USP Reference standards [USP Benzyl Alcohol RS]*	30	5	1596
Ciprofloxacin—*USP Reference standards, Other requirements*	31	2	393
Ciprofloxacin Injection—*Definition, USP Reference standards, Pyrogen* (delete), *Bacterial endotoxins* (add), *Limit of ciprofloxacin ethylenediamine analog, Dextrose content*	31	2	393
Citric Acid, Magnesium Oxide, and Sodium Carbonate Irrigation—*USP Reference standards, Assay for citric acid*	31	2	394
Anhydrous Citric Acid [Harmonization]—*Packaging and storage, Organic volatile impurities* (delete)	31	2	607
Citric Acid Monohydrate [Harmonization]—*Packaging and storage, Color of solution*	30	5	1854
Cladribine (new)	31	2	395
Clarithromycin—*Definition, USP Reference standards, Identification, Specific rotation, pH, Residue on ignition, Heavy metals, Related substances* (add), *Assay*	30	4	1179
Clarithromycin Tablets—*Assay*	30	4	1182
Clarithromycin Extended-Release Tablets (new)	30	4	1183
Clindamycin Injection—*USP Reference standards [USP Benzyl Alcohol RS], Assay*	30	5	1597
Clorazepate Dipotassium—*USP Reference standards, Related compounds*	30	6	1982
Clotrimazole Lozenges—*Disintegration* (delete), *Dissolution* (add)	31	2	398
Clozapine—*Chromatographic purity*	30	6	1984
Codeine Phosphate—*Packaging and storage*	30	5	1597
Colchicine Tablets—*Dissolution*	30	1	91
Cyclandelate (new)	30	6	1985
Cyclizine Hydrochloride Tablets—*Dissolution*	30	1	91
Cyclosporine Capsules—*Labeling* (add), *USP Reference standards, Identification A, B, Dissolution, Droplet size* (add), *Content of alcohol* (add), *Assay*	27	4	2721
Cysteine Hydrochloride—*Assay*	30	5	1598
Dalteparin Sodium (new)	30	5	1598
Cryopreserved Human Fibroblast-Derived Dermal Substitute (new)	30	4	1211
Desogestrel (new)	28	6	1785
Desogestrel and Ethinyl Estradiol Tablets (new)	30	5	1604
Dextroamphetamine Sulfate Capsules—*Dissolution*	30	1	94

Pending Proposals (*continued*)
(Items from earlier numbers of PF that have not yet been adopted and become official)

	PF Volume, Issue, and Page Numbers of Pending Proposals		
Title and Proposal	***Vol.***	***No.***	***Page(s)***
Dextroamphetamine Sulfate Elixir (delete monograph)	30	5	1612
Dextroamphetamine Sulfate Oral Solution (delete monograph)	30	5	1643
Dextroamphetamine Sulfate Tablets—*Dissolution*	30	1	94
Dextrose Injection—*Assay*	30	5	1614
Dextrose and Sodium Chloride Injection—*Assay for dextrose*	30	5	1614
Dibucaine—*Identification B*	31	2	399
Dibucaine Cream—*Identification, Assay*	31	2	399
Dibucaine Ointment—*Identification*	31	2	400
Dibucaine Hydrochloride—*Labeling* (add), *USP Reference standards, Identification B, Other requirements* (add)	31	2	400
Dibucaine Hydrochloride Injection—*Identification A*	31	2	401
Diclofenac Sodium Delayed-Release Tablets—*Drug release*	30	6	1986
Diclofenac Sodium Extended-Release Tablets (new)	30	2	476
Diethylcarbamazine Citrate Tablets—*Dissolution*	30	1	97
Dihydroergotamine Mesylate—*Identification C, Related alkaloids* (delete), *Chromatographic purity* (add), *Assay*	29	6	1870
Dihydroxyaluminum Sodium Carbonate Tablets—*Title* (name change)	29	6	1873
Dihydroxyaluminum Sodium Carbonate Chewable Tablets (new)	29	6	1873
Diltiazem Hydrochloride Extended-Release Capsules—*Drug release, Test 14*	30	2	478
Dimercaprol Injection—*USP Reference standards* (add), *Bacterial endotoxins* (add)	30	6	1987
Diphenhydramine Hydrochloride Capsules—*Dissolution*	30	1	97
Diphenhydramine and Pseudoephedrine Capsules—*Dissolution*	30	1	98
Diphenoxylate Hydrochloride and Atropine Sulfate Oral Solution—*Uniformity of dosage units*	30	6	1987
Dobutamine in Dextrose Injection—*Assay for dextrose*	30	5	1615
Dopamine Hydrochloride and Dextrose Injection—*Assay for dextrose*	30	5	1615
Dorzolamide Hydrochloride—*Limit of dorzolamide hydrochloride related compound A, Assay*	31	2	401
Doxazosin Mesylate (new)	29	5	1470
Doxazosin Tablets (new)	29	1	64
Doxepin Hydrochloride Capsules—*Identification*	30	6	1987
Dyclonine Hydrochloride—*Identification B*	31	1	42
Dyphylline and Guaifenesin Tablets—*Dissolution*	30	1	100
Egg Phospholipids (new)	29	2	401
Multiple Electrolytes and Dextrose Injection Type 1—*Assay for dextrose*	30	5	1616
Enalapril Maleate and Hydrochlorothiazide Tablets—*Dissolution*	30	6	1988
Enoxaparin Sodium (new)	29	6	1876
Enoxaparin Sodium Injection (new)	29	6	1882
Epinephrine Injection—*Identification A, B*	31	1	43

Pending Proposals (*continued*)
(Items from earlier numbers of PF that have not yet been adopted and become official)

	PF Volume, Issue, and Page Numbers of Pending Proposals		
Title and Proposal	***Vol.***	***No.***	***Page(s)***
Ergotamine Tartrate and Caffeine Suppositories—*Identification B*	30	6	1988
Ergotamine Tartrate and Caffeine Tablets—*Identification B*	30	6	1988
Estradiol and Norethindrone Acetate Tablets (new)	30	6	1989
Estradiol Transdermal System (new)	30	4	1201
Conjugated Estrogens—*Definition*	30	3	840
Ethacrynic Acid Tablets—*Dissolution*	30	6	1993
Ethinyl Estradiol Tablets—*Disintegration* (delete), *Dissolution* (add), *Related compounds*	31	2	402
Ethosuximide Capsules—*Dissolution*	30	1	102
Etidronate Disodium—*USP Reference standards [USP Etidronate Disodium Related Compound A RS], Limit of phosphite, Assay*	30	5	1616
Etidronate Disodium Tablets—*Dissolution, Assay*	30	5	1619
Famotidine for Oral Suspension (new)	30	6	1993
Famotidine Tablets—*Related compounds, Assay*	30	6	1995
Fexofenadine Hydrochloride Tablets (new)	30	6	1997
Fexofenadine Hydrochloride and Pseudoephedrine Hydrochloride Extended-Release Tablets (new)	31	2	403
Finasteride Tablets—*Dissolution*	30	5	1620
Fluconazole—*Definition, Labeling* (add), *USP Reference standards, Related compounds*	31	2	408
Flucytosine—*Fluorouracil*	30	5	1621
Fludarabine Phosphate—*Chloride, Assay*	30	5	1621
Fluoxetine Delayed-Release Capsules (new)	30	3	849
Fluvastatin Capsules (new)	31	1	47
Fluvastatin Sodium (new)	31	1	43
Fluvoxamine Maleate Tablets (new)	30	5	1622
Fosinopril Sodium (new)	30	6	2001
Fosinopril Sodium Tablets (new)	30	6	2004
Fosinopril Sodium and Hydrochlorothiazide Tablets (new)	30	6	2006
Gabapentin (new)	31	1	50
Gabapentin Capsules (new)	28	7	298
Glyburide Tablets—*Dissolution*	29	2	418
Glycopyrrolate Tablets—*Dissolution*	30	1	105
Gonadorelin Acetate (new)	30	4	1250
Goserelin Acetate (new)	31	2	410
Guaifenesin Capsules—*Dissolution*	30	1	106
Guaifenesin Tablets—*Dissolution*	30	1	107
Helium—*Identification, Assay*	28	4	1121
Hydrocodone Bitartrate—*USP Reference standards [USP Hydrocodone Bitartrate Related Compound A RS], Ordinary impurities* (delete), *Related compounds* (add)	30	5	1628

Pending Proposals (*continued*)
(Items from earlier numbers of PF that have not yet been adopted and become official)

	PF Volume, Issue, and Page Numbers of Pending Proposals		
Title and Proposal	***Vol.***	***No.***	***Page(s)***
Hydrocodone Bitartrate and Acetaminophen Tablets—*Dissolution*	30	1	109
Hydrocodone Bitartrate and Homatropine Methylbromide Tablets (new)	30	3	853
Hydrogen Peroxide Concentrate—*Acidity*	30	5	1629
Indinavir Sulfate Capsules (new)	30	2	508
Indocyanine Green—*Definition, Assay*	29	6	1905
Insulin Human Injection—*Limit of high molecular weight proteins* (add), *Other requirements*	30	5	1630
Iodixanol—*Labeling* (add), *USP Reference standards, Limit of calcium, Other requirements* (add)	31	1	54
Irbesartan Tablets (new)	29	4	1035
Irbesartan and Hydrochlorothiazide Tablets (new)	29	4	1036
Isosorbide Dinitrate Sublingual Tablets—*Dissolution*	30	1	113
Diluted Isosorbide Mononitrate (new)	30	3	868
Isosorbide Mononitrate Tablets (new)	29	5	1513
Isosorbide Mononitrate Extended-Release Tablets (new)	30	3	871
Kanamycin Sulfate Capsules—*Dissolution*	30	1	120
Lamivudine—*Limit of lamivudine enantiomer, Resolution solution, Limit of residual solvents*	30	3	881
Lansoprazole—*Packaging and storage, Chromatographic purity*	30	6	2010
Leuprolide Acetate (new)	30	3	882
Levothyroxine Sodium—*Assay*	30	5	1630
Levothyroxine Sodium Tablets—*Dissolution, Limit of liothyronine sodium*	31	2	413
Lidocaine Hydrochloride—*Assay*	31	2	415
Lidocaine Hydrochloride and Dextrose Injection—*Assay for dextrose*	30	5	1631
Lidocaine Hydrochloride and Epinephrine Injection—*Assay for lidocaine hydrochloride, Assay for epinephrine*	31	2	415
Liothyronine Sodium—*Assay*	30	5	1631
Lipid Injectable Emulsion (new)	31	2	416
Liotrix Tablets—*Assay*	30	5	1632
Lisinopril Tablets—*Dissolution*	30	1	121
Loperamide Hydrochloride Tablets—*Dissolution, Assay*	30	5	1633
Loratadine—*Labeling* (add), *USP Reference standards, Related compounds*	30	6	2011
Loratadine Oral Solution—*Antimicrobial effectiveness test* (delete), *Related compounds*	31	1	56
Magaldrate and Simethicone Tablets—*Title* (name change)	29	6	1918
Magaldrate and Simethicone Chewable Tablets (new)	29	6	1919
Magnesium Carbonate and Citric Acid for Oral Solution—*USP Reference standards* (add), *Content of anhydrous citric acid, Other requirements*	31	2	419

Pending Proposals (*continued*)
(Items from earlier numbers of PF that have not yet been adopted and become official)

	PF Volume, Issue, and Page Numbers of Pending Proposals		
Title and Proposal	***Vol.***	***No.***	***Page(s)***
Magnesium Carbonate, Citric Acid, and Potassium Citrate for Oral Solution (new)	26	4	1050
Magnesium Chloride—*Identification, Insoluble matter*	31	2	420
Magnesium Citrate Oral Solution—*USP Reference standards* (add), *Assay for anhydrous citric acid*	31	2	420
Magnesium Citrate for Oral Solution—*USP Reference standards* (add), *Content of anhydrous citric acid, Other requirements*	31	2	421
Magnesium Oxide—*Bulk density* (add)	29	4	1047
Mangafodipir Trisodium—*Packaging and storage*	30	6	2014
Mannitol Injection—*Labeling*	28	1	73
Meclizine Hydrochloride Tablets—*Dissolution*	30	1	127
Mefloquine Hydrochloride (new)	31	2	422
Meloxicam (new)	31	1	57
Meperidine Hydrochloride—*Packaging and storage, Labeling* (add), *USP Reference standards, Other requirements* (add)	31	1	62
Mephobarbital—*Assay*	30	5	1634
Mepivacaine Hydrochloride Injection—*Assay*	30	6	2017
Meprobamate Tablets—*Dissolution*	30	1	129
Mesalamine—*Related compounds*	31	2	424
Metformin Hydrochloride—*Packaging and storage*	31	1	62
Methenamine Tablets—*Dissolution*	30	1	130
Methenamine Hippurate Tablets—*Labeling* (add), *Dissolution*	31	1	63
Methocarbamol Tablets—*Dissolution*	30	1	130
Methscopolamine Bromide (new)	31	2	425
Methscopolamine Bromide Tablets (new)	31	2	427
Methylphenidate Hydrochloride Tablets—*Dissolution*	30	1	131
Metolazone Tablets—*Assay*	29	6	1932
Modafinil (new)	30	5	1634
Modafinil Tablets (new)	30	5	1636
Morantel Tartrate (new)	30	6	2017
Morphine Sulfate—*Packaging and storage*	30	5	1639
Morphine Sulfate Extended-Release Capsules—*Packaging and storage*	28	6	1822
Mupirocin Calcium (new)	31	2	430
Mupirocin Cream (new)	31	2	432
Nabumetone—*Related compounds*	31	1	63
Nabumetone Tablets—*Dissolution*	30	6	2019
Nadolol and Bendroflumethiazide Tablets—*Dissolution*	30	1	132
Nalidixic Acid—*Assay*	30	1	132
Naltrexone Hydrochloride—*Limit of total solvents*	30	6	2019
Naproxen Delayed-Release Tablets—*Packaging and storage*	30	4	1264

Pending Proposals (*continued*)

Neostigmine Bromide Tablets—*Dissolution*	30	1	133
Niacinamide Tablets—*Dissolution*	30	1	139
Nitrous Oxide—*Identification, Assay*	28	4	1169
Norgestimate and Ethinyl Estradiol Tablets (new)	29	1	87
Nystatin—*Composition* (add)	30	1	141
Nystatin, Neomycin Sulfate, Thiostrepton, and Triamcinolone Acetonide Ointment—*Assay for nystatin*	30	6	2020
Ofloxacin—*Chromatographic purity* (delete), *Related compounds* (add)	30	4	1274
Omeprazole Delayed-Release Capsules—*Packaging and storage*	30	1	143
Ondansetron (new)	30	6	2021
Ondansetron Oral Solution—*Packaging and storage*	30	3	905
Ondansetron Orally Disintegrating Tablets (new)	30	6	2024
Oxandrolone—*Definition, USP Reference standards, Identification B, Ordinary impurities* (delete), *Related compounds* (add), *Assay*	31	1	64
Oxaprozin—*Packaging and storage*	29	4	1059
Oxaprozin Tablets—*Packaging and storage*	29	4	1061
Oxybutynin Chloride Extended-Release Tablets (new)	30	4	1276
Oxycodone Hydrochloride—*Limit of alcohol*	30	6	2027
Oxycodone and Acetaminophen Capsules—*Dissolution*	30	1	151
Oxycodone and Acetaminophen Tablets—*Dissolution*	30	1	151
Oxycodone and Aspirin Tablets—*Dissolution*	30	1	152
Oxygen—*Identification, Assay*	28	4	1171
Oxygen 93 Percent—*Identification A, B* (delete), *Identification* (add), *Assay*	28	4	1171
Paroxetine Tablets—*Identification A, C*	31	2	435
Paroxetine Hydrochloride—*USP Reference standards, Limit of 1-methyl-4-(p-fluorophenyl)-1,2,3,6-tetrahydropyridine, Chromatographic purity*	31	1	69
Penicillamine Capsules—*Dissolution*	31	2	436
Pentazocine and Acetaminophen Tablets (new)	28	6	1838
Pentobarbital—*Definition, Labeling* (add), *USP Reference standards, Other requirements* (add)	31	1	72
Pentobarbital Sodium—*Definition, Labeling* (add), *USP Reference standards, Other requirements* (add)	31	1	73
Perflutren Protein-Type A Microspheres for Injection—*Assay for protein [Footnote 9]*	30	5	1639
Perflutren Protein-Type A Microspheres Injectable Suspension—*Assay for protein [Footnote 9]*	30	5	1640
Petrolatum (new) [Harmonization]	28	2	569
White Petrolatum (new) [Harmonization]	28	2	570
Phentermine Hydrochloride Capsules—*Dissolution*	30	1	159
Phentermine Hydrochloride Tablets—*Dissolution*	30	1	160

Pending Proposals (*continued*)

Title and Proposal	***Vol.***	***No.***	***Page(s)***
Phenylephrine Bitartrate (new)	30	6	2028
Phenylethyl Alcohol—*USP Reference standards*	30	4	1290
Phenylpropanolamine Hydrochloride Capsules—*Dissolution*	30	1	161
Phenylpropanolamine Hydrochloride Tablets—*Dissolution*	30	1	162
Phenytoin Tablets—*Title* (name change)	29	6	1965
Phenytoin Chewable Tablets (new)	29	6	1965
Phenytoin Sodium—*Related compounds, Assay*	30	6	2030
Physostigmine Salicylate Injection—*USP Reference standards, Assay*	30	6	2031
Pimozide Tablets—*Dissolution*	30	1	164
Pindolol Tablets—*Dissolution*	30	1	165
Piperacillin and Tazobactam Injection (new)	31	2	437
Piperacillin and Tazobactam for Injection (new)	31	2	439
Piperazine Citrate Tablets—*Dissolution*	30	1	165
Potassium and Sodium Bicarbonates and Citric Acid Effervescent Tablets for Oral Solution—*USP Reference standards* (add), *Assay for anhydrous citric acid*	31	2	440
Potassium Bromide (new)	31	2	441
Potassium Chloride in Dextrose Injection—*Definition, Assay for dextrose*	30	5	1640
Potassium Chloride in Dextrose and Sodium Chloride Injection—*Assay for dextrose*	30	5	1641
Potassium Citrate Extended-Release Tablets—*USP Reference standards* (add), *Assay*	31	2	443
Potassium Citrate and Citric Acid Oral Solution—*USP Reference standards* (add), *Assay for citrate* (delayed implementation)	31	2	444
Prednisolone—*Chromatographic purity* (add), *Ordinary impurities* (delete)	30	5	1641
Prednisolone Acetate—*Identification C*	30	5	1642
Prilocaine (new)	30	5	1643
Procyclidine Hydrochloride Tablets—*Dissolution*	30	1	169
Propantheline Bromide Tablets—*Dissolution*	30	1	170
Propofol—*Packaging and storage, Labeling, USP Reference standards, Related compounds, Assay*	30	5	1645
Propoxycaine Hydrochloride—*Identification C*	30	6	2032
Propoxyphene Hydrochloride and Acetaminophen Tablets—*Dissolution*	30	1	170
Pseudoephedrine Hydrochloride Tablets—*Dissolution*	30	1	172
Pyridoxine Hydrochloride Tablets—*Dissolution*	30	1	177
Pyrilamine Maleate Tablets—*Dissolution*	30	1	177
Quinapril Tablets—*Packaging and storage*	29	4	1071
Ramipril—*Definition, Assay*	30	6	2032
Ranitidine Hydrochloride—*USP Reference standards [USP Ranitidine Resolution Mixture RS], Chromatographic purity, Assay*	30	6	2033

Pending Proposals (*continued*)
(Items from earlier numbers of PF that have not yet been adopted and become official)

HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps **(*Stages*)**.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

MONOGRAPHS (NF)

BRIEFING

Polyethylene Glycol, *NF 23* page 3053 and page 1313 of *PF* 29(4) [July–Aug. 2003]. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the *Polyethylene Glycol* monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the Revised **OFFICIAL INQUIRY STAGE 4** document, is based in part on comments from the European and Japanese Pharmacopoeias in response to the Harmonization Stage 4 draft prepared by the United States Pharmacopeia.

Differences between the Revised **OFFICIAL INQUIRY STAGE 4** document and the current *NF* monograph include the following:

(1) Opening paragraph (Definition)—The limits for the average molecular weight have been omitted from the monograph. Those limits were considered redundant, because viscosity is tested and limited.
(2) *Packaging and storage*—"Well-closed containers" has been changed to "tight containers" because of the potential volatility of some lower molecular weight polyethylene glycols that are in liquid form.
(3) *Labeling*—No change.
(4) *USP Reference standards*—New Reference Standards are added to comply with the proposed *Infrared Absorption* test in *Identification.*
(5) *Completeness and color of solution*—The test is modified to use color comparison standards.
(6) *Identification*—A new, definitive *Identification* test, test *A,* based on IR spectroscopy performed by comparison with a Reference Standard, is added. The test for *Viscosity* is referenced in the *Identification* section, because that test can be used to distinguish between the various grades of material.
(7) *Viscosity*—The EP method for the *Viscosity* test is adopted, because it is easier to perform than the *USP* test and complies with the molecular weight range of 200 to 35,000.
(8) *Average molecular weight*—This test is omitted on the basis of the viscosity–molecular weight relationship among the polyethylene glycols. Polytheylene glycols are typically employed on the basis of their viscosity.
(9) *pH*—The limit is changed from between 4.5 and 7.5 to between 4.0 and 7.5.
(10) *Water*—A new test for *Water* is added, with a limit corresponding to that in the JP monograph.
(11) *Residue on ignition*—The sample weight has been lowered to 2.00 g, and the use of a platinum dish is omitted because it is not necessary.
(12) *Heavy metals*—This test is omitted, because Polyethylene Glycol is totally organic and not derived from any materials that usually contain heavy metals.
(13) *Limit of ethylene oxide and dioxane*—The test is modified to use a readily available ethylene oxide standard. The limit for ethylene oxide is lowered from not more than 10 µg per g to not more than 1 µg per g.
(14) *Limit of ethylene glycol and diethylene glycol*—A proposed capillary gas chromatographic method for the *Limit of ethylene glycol and diethylene glycol* test and a reduced limit based on the current limit in the *U.S. Code of Federal Regulations* are added. The limit is changed to not more than 620 ppm for ethylene glycol to comply with currrent *International Conference on Harmonization* (ICH) guidelines.
(15) *Limit of formaldehyde*—This test is added to limit cross-linking when Polythylene Glycol is used with gelatin capsules.
(16) *Organic volatile impurities*—This test is omitted, because it is unnecessary for this compound.

(EMC: J. Lane) RTS—42266-1

Add the following:

Polyethylene Glycol

Poly(oxy-1,2-ethanediyl), α-hydro-ω-hydroxy-.

Polyethylene glycol [*25322-68-3*].

» Polyethylene Glycol is an addition polymer of ethylene oxide and water, represented by the formula:

$$H(OCH_2CH_2)_nOH,$$

in which *n* represents the average number of oxyethylene groups. The nominal average molecular weight is from 200 to 35,000. It may contain a suitable antioxidant.

Packaging and storage—Preserve in tight containers, protected from direct sunlight.

Labeling—Label it to state, as part of the official title, the average nominal molecular weight of the Polyethylene Glycol. Label it to indicate the name and quantity of any added antioxidant.

USP Reference standards ⟨11⟩—*USP Polyethylene Glycol 200 RS. USP Polyethylene Glycol 300 RS. USP Polyethylene Glycol 400 RS. USP Polyethylene Glycol 600 RS. USP Polyethylene Glycol 1000 RS. USP Polyethylene Glycol 1500 RS. USP Polyethylene Glycol 3000 RS. USP Polyethylene Glycol 3350 RS. USP Polyethylene Glycol 4000 RS. USP Polyethylene Glycol 6000 RS. USP Polyethylene Glycol 8000 RS. USP Polyethylene Glycol 10000 RS. USP Polyethylene Glycol 12000 RS. USP Polyethylene Glycol 20000 RS. USP Polyethylene Glycol 35000 RS.*

Completeness and color of solution—

Standard stock solution—Combine 2.4 mL of ferric chloride CS, 1.0 mL of cobaltous chloride CS, 0.4 mL of cupric sulfate CS, and 6.2 mL of dilute hydrochloric acid (10 g per L).

Standard solution—[NOTE—Prepare the *Standard solution* immediately before use.] Transfer 5.0 mL of *Standard stock solution* to a 100-mL volumetric flask, dilute with dilute hydrochloric acid (10 g per L) to volume, and mix.

Test solution A—Dissolve 12.5 g of Polyethylene Glycol in water, and dilute with water to 50 mL.

Test solution B—Dissolve 5.0 g of Polyethylene Glycol in water, and dilute with water to 50 mL.

Procedure—Separately transfer a sufficient portion of *Test solution A* and *Test solution B* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 to 25 mm to obtain a depth of 40 mm. Similarly transfer a portion of the *Standard solution* to a separate matching test tube. Compare the test material and the *Standard solution* in diffused daylight, viewing vertically against a white background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). *Test solution A* is not more intensely colored than the *Standard solution*. *Test solution B* has the same clarity as that of water, when viewed against a black background, at 25 ± 5°, for nominal average molecular weights less than or equal to 1000, and is not more than slightly hazy for nominal average molecular weights greater than 1000.

Identification—

A: *Infrared Absorption* ⟨197K⟩—Use a thin film of test specimen, melted if necessary, in the range from 4000 cm^{-1} to 600 cm^{-1}.

B: It meets the requirements of the test for *Viscosity.*

Viscosity ⟨911⟩—Determine its kinematic viscosity, using a capillary viscosimeter giving a flow time of not less than 200 seconds, and a liquid bath maintained at 20 ± 0.1°. For polyethylene glycols having a nominal average molecular weight greater than 400, determine the viscosity of a 50% (w/w) solution of the substance to be examined. The viscosity is within the limits specified in the accompanying table. For a polyethylene glycol not listed in the table, calculate the limits by interpolation.

Nominal Average Molecular Weight	Kinematic Viscosity Range, Centistokes ($mm^2 \cdot s^{-1}$)
200	53–62
300	71–94
400	94-–116
600	13.9–18.5
1000	20.4–27.7
1500	31–46
3000	69–93
3350	76–110
4000	102–158
6000	185–250
8000	240–472
10,000	500–675

Nominal Average Molecular Weight	Kinematic Viscosity Range, Centistokes ($mm^2 \cdot s^{-1}$)
12,000	1000–1300
20,000	2500–3200
35,000	10,000–13,000

pH ⟨791⟩**—**Dissolve 5.0 g of Polyethylene Glycol in 100 mL of water with an unadjusted pH of 5.0 or greater, stirring in a sealed bottle, if necessary. To this solution, add 0.30 mL of a saturated solution of potassium chloride. The test solution should be maintained at 25 ± 2° during the measurement. The measured pH is between 4.0 and 7.5.

Water ⟨921⟩**:** not more than 1.0%, determined on 2.00 g.

Residue on ignition ⟨281⟩**:** not more than 0.1%, a 2-g specimen and the residue being moistened with 2 mL of sulfuric acid.

Limit of ethylene oxide and dioxane—

Ethylene oxide standard solution—Dilute 0.5 mL of ethylene oxide in methylene chloride (50 mg per mL) with water to 50.0 mL. [NOTE—The solution is stable for 3 months if stored in vials with teflon-coated silicon membrane crimped caps at –20°.] Allow to reach room temperature. Dilute 1.0 mL of this solution with water to 250.0 mL to obtain a solution having a concentration of 2 µg per mL.

Dioxane standard solution—Dilute 1.0 mL of dioxane with water to 200.0 mL. Dilute 1.0 mL of this solution with water to 100.0 mL to obtain a solution having a concentration of 50 µg per mL.

Acetaldehyde standard solution—Accurately weigh about 100 mg of acetaldehyde into a 100-mL volumetric flask, and dilute with water to volume. Transfer 1.0 mL of this solution into a 100-mL volumetric flask, and dilute with water to volume to obtain a solution having a concentration of 10 µg per mL.

Resolution solution—Add 2.0 mL of *Acetaldehyde standard solution* and 2.0 mL of *Ethylene oxide standard solution* to a 10-mL headspace vial, and seal the vial immediately with a teflon-coated silicon membrane and an aluminum cap. Mix carefully.

Standard solution A—Dilute 6.0 mL of *Ethylene oxide standard solution* and 2.5 mL of *Dioxane standard solution* with water to 25.0 mL.

Standard solution B—Accurately weigh 1.00 g of the substance to be examined into a 10-mL headspace vial. Add 2.0 mL of *Standard solution A,* and seal the vial immediately with a teflon-coated silicon membrane and an aluminum cap. Mix carefully.

Test solution—Accurately weigh 1.00 g of the substance to be examined into a 10-mL headspace vial. Add 2.0 mL of water, and seal the vial immediately with a teflon-coated silicon membrane and an aluminum cap. Mix carefully.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a balanced-pressure automatic headspace sampler, a flame-ionization detector, a split injection system, and a 0.32-mm × 50-m fused-silica analytical column coated with a 5-µm film of phase G27. The carrier gas is helium, with a column pressure of about 70 kPa, and a total flow of about 20 mL per minute. The column temperature is increased from 70° to 250° at a rate of 10° per minute, then maintained at 250° for at least 5 minutes. The injection port and detector temperatures are maintained at 85° and 250°, respectively. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure*: the relative retention times are about 0.9 for acetaldehyde and 1.0 for ethylene oxide; and the resolution, *R,* between acetaldehyde and ethylene oxide is not less than 2.0.

Procedure—Place the vials containing *Standard solution B* and the *Test solution* into the automated sampler, and heat the vials at a temperature of 80° for 30 minutes. Using a 2-mL gas syringe preheated in an oven at 90°, separately inject 1.0 mL of the headspace from each vial into the chromatograph, record the chromatogram, and measure the areas for the major peaks. [NOTE—A headspace apparatus that automatically transfers the measured amount of headspace may be used to perform the injection.] The relative retention times for ethylene oxide and dioxane are about 1.0 and 1.8, respectively. Calculate the amount, in µg per g, of ethylene oxide in the portion of Polyethylene Glycol taken by the formula:

$$2Cr_U/(r_S - r_U),$$

in which C is the concentration, in µg per mL, of ethylene oxide in *Standard solution B;* and r_U and r_S are the peak areas of ethylene oxide obtained from the *Test solution* and *Standard solution B*, respectively: not more than 1 µg per g of ethylene oxide is found. Calculate the amount, in µg per g, of dioxane in the portion of Polyethylene Glycol taken by the formula:

$$[2(1.03)Cr_U]/(r_S - r_U),$$

in which C is the concentration, in µL per mL, of dioxane in *Standard solution B;* 1.03 is the density of dioxane, in g per mL; and r_U and r_S are the peak areas of dioxane obtained from the *Test solution* and *Standard solution B*, respectively: not more than 10 µg per g of dioxane is found.

Limit of ethylene glycol and diethylene glycol—

NOTE—Testing is not required for nominal average molecular weights greater than 1000.

Internal standard solution—Dissolve 30.0 mg of 1,2-pentanediol, accurately weighed, in acetone, and dilute with the same solvent to 30.0 mL. Dilute 1.0 mL of this solution with acetone to 20.0 mL to obtain a solution having a concentration of 50 µg per mL.

Standard solution A—Dissolve 30.0 mg of ethylene glycol, accurately weighed, in acetone, and dilute with the same solvent to 100.0 mL. Dilute 1.0 mL of this solution with the *Internal standard solution* to 10.0 mL to obtain a solution having a concentration of 30 µg per mL of ethylene glycol and 45 µg per mL of 1-2-pentanediol.

Standard solution B—Dissolve 200.0 mg of diethylene glycol, accurately weighed, in acetone, and dilute with the same solvent to 100.0 mL. Dilute 1.0 mL of this solution with the *Internal standard solution* to 10.0 mL to obtain a solution having a concentration of 200 µg per mL of ethylene glycol and 45 µg per mL of 1,2-pentanediol.

Test solution—Transfer about 500 mg of Polyethylene Glycol, accurately weighed, to a 10-mL volumetric flask, and dissolve in and dilute with *Internal standard solution* to volume to obtain a solution having a concentration of 50 µg per mL of 1,2-pentanediol.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a split injection system, and a 0.53-mm × 30-m fused-silica analytical column coated with 1-µm film of phase G16. The carrier gas is helium, flowing at a rate of about 30 mL per minute, and the split ratio is about 1 : 3. The column temperature is programmed to increase from 80° to 200° from the time of injection to 40 minutes, and from 200° to 230° from 40 minutes to 45 minutes; then it is maintained at 230° for at least 20 minutes. The injection port and detector temperatures are maintained at 250°. Chromatograph *Standard solution A,* and record the peak responses as directed for *Procedure*: the relative retention times are

about 0.7 for ethylene glycol, about 1.0 for 1,2-pentanediol, and about 1.3 for diethylene glycol; the resolution, *R,* between ethylene glycol and 1,2-pentanediol is not less than 2.0; and the resolution, *R,* between the 1,2-pentanediol and diethylene glycol is not less than 2.0.

Procedure—Inject 2 µL of *Standard solution A* and 2 µL of *Standard solution B* into the chromatograph, record the chromatogram, and measure the areas of the peaks for ethylene glycol, the internal standard, and diethylene glycol, recorded as r_{SE}, r_{SI}, and r_{SD}, respectively. Inject 2 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak areas as directed for *Standard solution A* and *Standard solution B*. Use the retention times observed in the chromatogram of *Standard solutions A* and *B* to identify the peaks in the chromatogram of the *Test solution* corresponding to ethylene glycol, the internal standard, and diethylene glycol. Record the areas of the peaks for ethylene glycol, the internal standard, and diethylene glycol as r_E, r_I, and r_D, respectively. Calculate the response factors, F_N, of ethylene glycol and diethylene glycol by the formula:

$$(C_N\, r_{SI}) / (C_{SI}\, r_{SN}),$$

in which C_N is the concentration, in µg per mL, of the analyte of interest in the *Standard solution;* r_{SI} is the peak area for the internal standard obtained from the *Standard solution;* C_{SI} is the concentration, in µg per mL, of the internal standard in the *Standard solution;* and r_{SN} is the peak area for the analyte of interest obtained from the *Standard solution.* Calculate the percentages, by weight, of ethylene glycol and diethylene glycol in the portion of Polyethylene Glycol taken by the formula:

$$(F_N C_I\, r_N) / (r_I W),$$

in which F_N is as obtained above; C_I is the concentration, in µg per mL, of the internal standard in the *Internal standard solution;* r_N and r_I are the peak areas of the analyte of interest and the *Internal standard,* respectively, obtained from the *Test solution;* and W is the weight, in mg, of Polyethylene Glycol taken to prepare the *Test solution:* not more than 620 ppm of ethylene glycol and not more than 0.2% of ethylene glycol and diethylene glycol combined are found.

Limit of formaldehyde—

Chromotropic acid sodium solution—Dissolve 0.60 g of chromotropic acid disodium salt in about 80 mL of water, and dilute with water to 100 mL. [NOTE—Use this solution within 24 hours.]

Test solution—Transfer 1.0 g of Polyethylene Glycol to a 10-mL volumetric flask, add about 3 mL of water, add 0.25 mL of *Chromotropic acid sodium solution,* and cool in iced water. Add 5.0 mL of sulfuric acid, allow to stand for 15 minutes, and dilute slowly with water to volume.

Reference solution—Dilute 0.860 g of formaldehyde solution with water to100 mL. Dilute 1.0 mL of this solution with water to 100 mL. In a 10-mL volumetric flask, mix 1.00 mL of this solution with 0.25 mL of *Chromotropic acid sodium solution.* Add 3.0 mL of water, cool in iced water, add 5.0 mL of sulfuric acid, allow to stand for 15 minutes, and dilute slowly with water to volume.

Blank solution—In a 10-mL volumetric flask mix 1.00 mL of water with 0.25 mL of *Chromotropic acid sodium solution,* and cool in iced water. Dilute slowly with water to volume.

Procedure—Determine against the *Blank solution* that the absorbance at 567 nm of the *Test solution* is not higher than that of the *Reference solution* (0.003%).

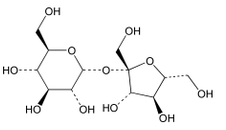
BRIEFING

Sucrose, *NF 23* page 3094. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the *Sucrose* monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the revised **OFFICIAL INQUIRY STAGE 4** document, is based in part on comments from the United States Pharmacopeia and Japanese Pharmacopoeia in response to the Harmonization Stage 4 draft prepared by the European Pharmacopoeia. The draft has been revised to introduce methods that are standards in the sugar industry and are approved by the International Commission for Uniform Methods in Sugar Analysis (ICUMSA). The current *USP* monograph contains tests for chloride, sulfate, calcium, and heavy metals, but these are considered unnecessary because the added test for *Conductivity* will effectively limit these ionic impurities. In addition to these changes, a *Bacterial endotoxins* test and a related *Labeling* requirement have been added.

(EMC: J. Lane) RTS—42289-1

Add the following:

Sucrose



$C_{12}H_{22}O_{11}$ 342.30

α-D-Glucopyranoside, β-D-fructofuranosyl-.

Sucrose [*57-50-1*].

» Sucrose is β-D-fructofuranosyl α-D-glycopyranoside. It contains no added substances.

Packaging and storage—Preserve in well-closed containers.

Labeling—Label it to state, where applicable, that the substance is suitable for use in the manufacture of large-volume parenteral dosage forms.

Appearance of solution—Dissolve 50.0 g in water and dilute with the same solvent to 100.0 mL: the resulting solution is clear.

Color value—

Test solution—Dissolve 50.0 g in 50.0 mL of water. Mix, filter (diameter of pores 0.45 µm), and degas.

Procedure—Measure the absorbance at 420 nm, using a cell of at least 4 cm (a cell length of 10 cm or more is preferred). Calculate the color value using the expression:

$$(A \cdot 1000) / (b \cdot c),$$

in which A is the absorbance measured at 420 nm; b is the cell path length in centimeters; and c is the concentration of the solution, in g per mL, calculated from the refractive index of the solution. Use *Table 1,* and interpolate the values if necessary. The absolute difference between two results is not more than 3. The color value is not more than 45.

Table 1

n^{20}_D	c (g/mL)
1.4138	0.570

Identification, *Infrared Absorption* ⟨197K⟩.

Specific rotation ⟨781S⟩: +66.3° to +67.0°.

Test solution—Dissolve 26 g in water, and dilute with the same solvent to 100.0 mL.

Bacterial endotoxins ⟨85⟩**:** less than 0.25 IU per mg, if intended for use in the preparation of large-volume infusions.

Conductivity—

Test solution—Dissolve 31.3 g of Sucrose in freshly boiled and cooled water, and dilute with the same solvent to 100 mL.

Apparatus—Use a conductivity meter or resistivity meter that measures the resistance of the column of liquid between the electrodes of the immersed measuring device. The apparatus is supplied with alternating current to avoid the effects of electrode polarization. It is equipped with a temperature compensation device or a precision thermometer.

Calibration—Choose a conductivity cell that is appropriate for the conductivity of the solution to be examined. The higher the expected conductivity, the higher the cell constant that must be chosen so that the value measured, *R,* is as large as possible for the apparatus used. Commonly used conductivity cells have cell constants in the order of 0.1 cm^{-1}, 1 cm^{-1}, and 10 cm^{-1}. Use a standard solution of potassium chloride that is appropriate for the measurement. Rinse the cell several times with water that has been previously boiled and cooled to room temperature and at least twice with the potassium chloride solution used for the determination of the cell constant of the conductivity cell. Measure the resistance of the conductivity cell using the potassium chloride solution at $20 \pm 0.1^{\circ}$. The constant C (in cm^{-1}) of the conductivity cell is given by the expression:

$$C = R_{KCl} \times K_{KCl},$$

in which R_{KCl} is the measured resistance, expressed in megohms, and K_{KCl} is the conductivity of the standard solution of potassium chloride used, expressed in $\mu S \cdot cm^{-1}$. The measured constant, *C,* of the conductivity cell must be within 5% of the given value.

Procedure—Measure the conductivity of the *Test solution* (C_1), while gently stirring with a magnetic stirrer, and that of the water used for preparing the *Test solution* (C_2). The readings must be stable within 1% over a period of 30 seconds. Calculate the conductivity of the *Test solution* from the expression:

$$C_1 - 0.35C_2.$$

Not more than 35 $\mu S \cdot cm^{-1}$.

Loss on drying ⟨731⟩**:** not more than 0.1%, determined on 2.000 g by heating in an oven at 105° for 3 hours.

Dextrins—[NOTE—If intended for use in the preparation of large-volume infusions, it complies with the test for *Dextrins*.]

Test solution—Dissolve 50.0 g of Sucrose in water, and dilute with the same solvent to 100.0 mL.

Procedure—To 2 mL of the *Test solution* add 8 mL of water, 0.05 mL of dilute hydrochloric acid (73 g per L), and 0.05 mL of 0.05 M iodine. The solution remains yellow.

Sulfite—

Test solution—Dissolve 4.0 g of Sucrose in freshly prepared distilled water, and dilute with the same solvent to 10.0 mL.

Sulfite standard solution—Dissolve 3.150 g of anhydrous sodium sulfite in freshly prepared distilled water, and dilute with the same solvent to 100.0 mL. Dilute 0.5 mL of this solution with freshly prepared distilled water to 100.0 mL.

Reference solution—Dissolve 4.0 g of Sucrose in freshly prepared distilled water, add 0.5 mL of *Sulfite standard solution,* and dilute with freshly prepared distilled water to 10.0 mL. Use freshly prepared distilled water as the blank.

Procedure—Determine the sulfite content by a suitable enzymatic method based on the following reactions. Sulfite is oxidized by sulfite oxidase to sulphate and hydrogen peroxide, which in turn is reduced by nicotinamide–adenine di-

nucleotide–peroxidase in the presence of reduced nicotinamide–adenine dinucleotide (NADH). The amount of NADH oxidized is proportional to the amount of sulfite.

Separately introduce 2.0 mL each of the *Test solution,* the *Reference solution,* and the blank into 10-mm cuvettes, and add the reagents as described in the kit instructions. Measure the absorbance at the maximum at about 340 nm before and at the end of the reaction time and subtract the value obtained with the blank. The absorbance difference of the *Test solution* is not greater than half the absorbance difference of the *Reference solution:* not more than 10 ppm calculated as SO_2.

Lead—

Lead-free nitric acid: not more than 1 µg per kg of lead.

Dilute lead-free nitric acid—Dilute 5 g of *Lead-free nitric acid* with carbon dioxide-free water to 100 mL.

Test solution—Dissolve 1.5 g of Sucrose in 1.5 mL of carbon dioxide-free water in a digestion tube. Add 0.75 mL of *Lead-free nitric acid,* slowly warm to between 90° and 95°, and avoiding spattering. Heat for about 60 minutes, and again add 0.75 mL of *Lead-free nitric acid*. Heat until all brown vapors have dissipated and any reddish tint is gone (about 60 minutes). Cool. Add 0.5 mL of 30 percent hydrogen peroxide dropwise and heat at between 90° and 95° for 15 minutes. Cool. Again add 0.5 mL of 30 percent hydrogen peroxide dropwise, heat at between 90° and 95° for 60 minutes, and cool. Repeat these steps until a clear, light yellow solution is obtained. Dilute with carbon dioxide-free water to 10.0 mL. Store in capped plastic vials.

Lead standard solution (0.5 ppm Pb)—Dissolve in *Dilute lead-free nitric acid* a quantity of lead nitrate equivalent to 0.400 g of $Pb(NO_3)_2$, and dilute with the same solvent to 250 mL. Dilute with *Dilute lead-free nitric acid* to 100 times its volume. Dilute this solution with *Dilute lead-free nitric acid* to 20 times its volume. [NOTE—Use within 1 week.]

Reference solutions—Prepare three reference solutions in the same manner as the *Test solution* but adding 0.5 mL, 1.0 mL, and 1.5 mL, respectively, of *Lead standard solution (0.5 ppm Pb)* in addition to 1.5 g of Sucrose.

Blank solution—Prepare a blank in the same manner as for the *Test solution* but without Sucrose.

Zero-setting solution—Use carbon dioxide-free water.

Magnesium nitrate solution—Dissolve 20 g of magnesium nitrate ($Mg(NO_3)_2 \cdot 6H_2O$) with carbon dioxide-free water, and dilute with the same solvent to 100 mL. Immediately before use, dilute with carbon dioxide-free water 10 mL to 100 mL. A volume of 5 µL will provide 0.06 mg of $Mg(NO_3)_2$.

Apparatus—Use a suitable graphite furnace atomic absorption spectrometer equipped with a background compensation system, an autosampler, pyrolytically coated tubes or with pyrolytic graphite platforms, and a hollow-cathode lamp or electrodeless discharge lamp. Argon is used as the purge gas, and air is used as the alternate gas during the charring step. The flow rate is typically between 200 mL per minute and 300 mL per minute, but may be adapted according to the apparatus. Employ a wavelength of 283.3 nm.

Procedure—Separately inject 20 µL of the *Zero-setting solution,* the *Blank solution,* the *Test solution,* the *Reference solutions,* and add immediately 5 µL of *Magnesium nitrate solution,* which is used as matrix modifier, to each of the solutions. Inject each solution in triplicate. The ashing and atomization temperatures and times vary according to the apparatus, the background compensation system, the graphite tube, etc. The following parameters are given for guidance and need to be adjusted.

Heat the furnace progressively to 200° and maintain the drying temperature at 200° for 30 seconds, the ashing temperature at 750° for 40 seconds after a 40-second tempera-

ture rise, and the atomization temperature at 1800° for 10 seconds (0 seconds temperature rise). Clean out at 2600° for 7 seconds after a 1-second temperature rise.

Use the *Zero-setting solution* to set the instrument to zero. Calculate the mean readings of the *Test solution* and of the *Reference solutions* subtracting the mean blank. If necessary, dilute with the *Zero-setting solution* to obtain a reading within the linear range: the relative standard deviation of the three readings obtained for the triplicate injections of the *Test solution* and the *Reference solutions* to which the mean blank has been subtracted is not more than 15%; not more than 0.5 ppm of lead is found.

Reducing sugars—

Test solution—Dissolve 50.0 g of Sucrose in water, and dilute with the same solvent to 100.0 mL.

Procedure—Combine 5 mL of the *Test solution,* 5 mL of water, 1.0 mL of 1 M sodium hydroxide, and 1.0 mL of a 1 g per L solution of methylene blue in a test tube approximately 150 mm long and 16 mm in diameter. Mix, and place in a water bath. After exactly 2 minutes, take the tube out of the bath, and immediately examine the solution: the blue color does not disappear completely; ignore any blue color at the air/solution interface.

Organic volatile impurities, *Method IV* ⟨467⟩: meets the requirements.

LIMIT TESTS

BRIEFING

⟨**267**⟩ **Porosimetry by Mercury Intrusion,** page 893 of *PF* 28(3) [May–June 2002]. The European Pharmacopoeia, a member of the Pharmacopoeial Discussion Group, is the coordinating pharmacopoeia in the efforts toward the international harmonization of compendial standards for this general test chapter. The presented text represents the **OFFICIAL INQUIRY STAGE 4** draft in the harmonization process, based in part on comments received in response to the **Stage 3** draft. The proposed draft differs from the **Stage 3** draft by the reconsideration of the draft as a whole to take into consideration ISO Standards. A safety statement is added. Also, several editorial changes are made.

(ETM: J. Lane) RTS—42336-1

Add the following:

⟨267⟩ POROSIMETRY BY MERCURY INTRUSION

In general, different types of pores may be pictured as apertures, channels, or cavities within a solid body or as space (i.e., interstices or voids) between solid particles in a bed, compact, or aggregate. Porosity is a term that is often used to indicate the porous nature of solid material and is more precisely defined as the ratio of the volume of accessible pores and voids to the total volume occupied by a given amount of the solid. In addition to the accessible pores, a solid may contain closed pores, which are isolated from the external surface and into which fluids are not able to

penetrate. The characterization of closed pores, i.e., cavities with no access to an external surface, is not covered in this general chapter.

Porous materials may take the form of fine or coarse powders, compacts, extrudates, sheets, or monoliths. Their characterization usually involves the determination of the total pore volume or porosity as well as the pore size distribution.

It is well established that the performance of a porous solid (e.g., its strength, reactivity, permeability, or adsorbent power) is dependent on its pore structure. Many different methods have been developed for the characterization of pore structure. In view of the complexity of most porous solids, it is not surprising to find that the results obtained are not always in agreement and that no single technique can be relied upon to provide a complete picture of the pore structure. The choice of the most appropriate method depends on the application of the porous solid, its chemical and physical nature, and the range of pore size.

This chapter provides guidance for measurement of porosity and pore size distribution by mercury porosimetry. It is a comparative test, usually destructive in which the volume of mercury penetrating a pore or void is determined as a function of an applied hydrostatic pressure, which can be related to a pore diameter. Other information such as pore shape and interconnectivity, the internal and external surface area, powder granulometry, and bulk and tapped density can also be inferred from volume–pressure curves; however, these aspects of the technique do not fall under the scope of this chapter.

Practical considerations presently limit the maximum applied absolute pressure reached by some equipment to about 400 MPa, corresponding to a minimum equivalent pore diameter of approximately 0.003 µm. The maximum diameter will be limited for samples having a significant depth because of the difference in the hydrostatic head of mercury from the top to the bottom of the sample. For most purposes this limit may be regarded as 400 µm.

Inter-particle and intra-particle porosity can be determined, but the method does not distinguish between these porosities where they co-exist.

The method is suitable for the study of most porous materials. Samples that amalgamate with mercury, such as certain metals, may be unsuitable for this technique or may require a preliminary passivation. Other materials may deform or compact under the applied pressure. In some cases, it may be possible to apply sample compressibility corrections, and useful comparative data may still be obtained.

The mercury porosimetry technique should be considered to be comparative, because for most porous media, a theory is not available to allow an absolute calculation of results of pore size distribution. Therefore this technique is mainly recommended for development studies.

Mercury is toxic. Appropriate precautions must be observed to safeguard the health of the operator and others working in the area. Waste material must also be disposed of in a suitable manner, according to local regulations.

PRINCIPLE

The technique is based on the measurement of the mercury volume intruded into a porous solid as a function of the applied pressure. The measurement includes only those pores into which mercury can penetrate at the pressure applied.

A nonwetting liquid penetrates into a porous system only under pressure. The pressure applied is in inverse proportion to the inner width of the pore aperture. In the case of cylindrical pores, the correlation between pore diameter and pressure is given by the Washburn equation:

$$d_p = -\frac{4 \cdot \sigma}{p} \cos\theta \qquad (1)$$

p = applied pressure, in pascals,

d_p = pore diameter, in meters,

σ = surface tension of mercury, in newtons per meter,

θ = contact angle of mercury on the sample, in degrees.

APPARATUS

The sample holder, referred to as penetrometer or dilatometer, has a calibrated capillary tube, through which the sample can be evacuated and through which mercury can enter. The capillary tube is attached to a wider tube in which the test sample is placed. The change in the volume of mercury intruded is usually measured by the change in capacitance between the mercury column in the capillary tube and a metal sleeve around the outside of the capillary tube. If precise measurements are required, the internal volume of the capillary tube should be between 20% and 90% of the expected pore and void volume of the sample. Because different materials exhibit a wide range of open porosities, a number of penetrometers with different diameter capillary tubes and sample volumes may be required. A typical set-up for a mercury porosimeter instrument is given in *Figure 1*. The porosimeter may have separate ports for high- and low-pressure operation, or the low-pressure measurement may be carried out on a separate unit.

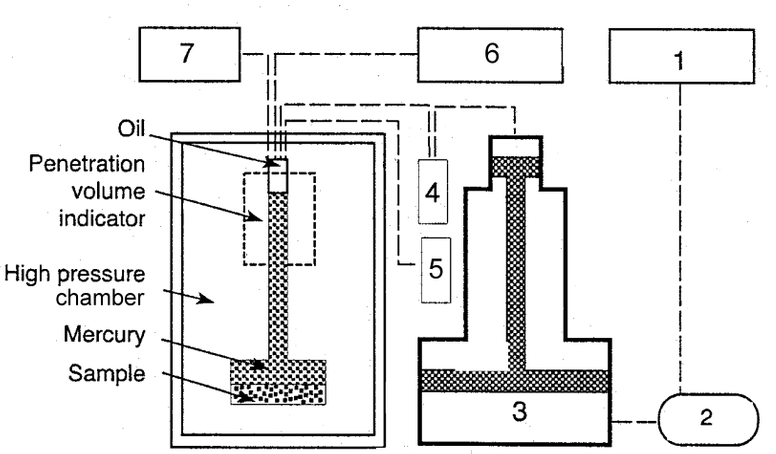

Fig. 1. Example of the set-up of a mercury porosimeter instrument.

METHOD

Sample Preparation—The sample is pretreated to remove adsorbed material that can obscure its accessible porosity by either heating and/or evacuation or by flowing inert gas. It may be possible to passivate the surface of wettable or amalgam-forming solids by producing a thin layer of oxide, or by coating with stearate. The sample of the pretreated solid is weighed and transferred to the penetrometer. The pore system of the sample is then degassed in a vacuum to a maximum residual pressure of 7 Pa.

Filling the Penetrometer with Mercury—Use mercury of analytical quality. The sample is overlaid with mercury under vacuum. The vacuum is required to ensure the transfer of mercury from the reservoir to the penetrometer. In a filled penetrometer, the filling pressure is comprised of the applied pressure plus the pressure contribution created by the head of mercury contacting the sample. A typical filling pressure would be about 5 kPa. The hydrostatic pressure of the mercury over the sample can be minimized by filling the penetrometer in the horizontal positions.

Low-Pressure Measurement—Admit air or nitrogen in a controlled manner to increase the pressure either in stages corresponding to the particular pore sizes of interest, or continuously at a slow rate. The concomitant change in the length of the mercury column in the capillary tube is recorded. When the maximum required pressure has been reached, reduce the pressure to ambient.

High-Pressure Measurement—After measurement at low-pressure conditions, the penetrometer filled with mercury is transferred to the high-pressure port or unit of the instrument and overlaid with hydraulic fluid. Mercury is intruded into the pore system via the hydraulic fluid. Increase the pressure in the system to the maximum pressure reached in the low-pressure measurement and record the intrusion volume at this pressure, because subsequent intrusion volumes are calculated from this initial volume. Increase the pressure either in stages corresponding to the particular pore sizes of interest, or continuously at a slow rate. The fall in the mercury column is measured up to the maximum required pressure. If required, the pressure may be decreased either in stages or continuously at a slow rate to determine the mercury extrusion curve. Make corrections to take account of changes in the volume of the mercury, the penetrometer, and other components of the volume detector system under elevated pressure. The extent of the corrections may be determined by means of blank measurements under the same conditions. An experimentally determined volume–pressure curve is shown in *Figure 2*.

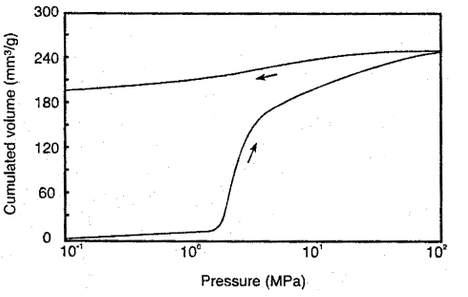

Fig. 2. Volume–pressure curve as semilogarithmic plot.

REPORTING OF RESULTS

The pressure readings are converted to pore diameter by means of the Washburn equation.

The surface tension of mercury σ depends not only on the temperature and the material, but also—in the case of markedly curved surfaces areas—on the radius of curvature. In general, values between $0.41\ N \cdot m^{-1}$ and $0.52\ N \cdot m^{-1}$ are measured at room temperature. If the value is not known, $\sigma = 0.48\ N \cdot m^{-1}$ can be used.

The contact angle of mercury θ in most cases is more than 90°. It may be determined using a contact angle instrument. If the θ value is not known, 140° can be used. Report the values of contact angle and surface tension used in the calculation. Visualization of the data can be done with several types of graphs. Frequently, in a graphical representation, the pore diameter is plotted on the abscissa and the dependent intruded specific volume on the ordinate to give the pore size distribution. It is appropriate here to choose a logarithmic scale for the abscissa (see *Figure 3*). The spaces between the particles of the solid sample are included as pores in the calculation. If the pores differ in size from the voids, the latter can be separated by choosing the relevant pore size range.

Extrusion curves may not be used for calculating the pore size distribution (for hysteresis, see *Figure 2*), because an intruded part of the mercury always remains in the pore system. The retention ratio may be useful for the qualitative characterization of pores that are only accessible via narrow openings (''ink-bottle pores'').

The most common characteristic values, such as the total intruded specific volume, the mean, and the median pore diameter are calculated from the pore size distribution. Moreover, sufficient information should be documented about the sample, the sample preparation, the evacuation conditions and the instrument used.

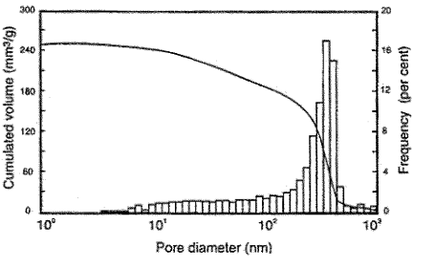

Fig. 3. Pore volume distribution as semilogarithmic plot.

CONTROL OF THE INSTRUMENT'S PERFORMANCE

As the mercury porosimetry technique is considered as a comparative test, no details are given in this chapter. However, it is recommended that a stable comparison material should be tested on a regular basis to monitor instrument calibration and performance.

Physical Tests and Determinations

BRIEFING

⟨**616**⟩ **Bulk Density and Tapped Density,** *USP 28* page 2379 and page 901 of *PF* 28(3) [May–June 2002]. The European Pharmacopoeia, a member of the Pharmacopoeial Discussion Group, is the coordinating pharmacopoeia in the efforts toward the international harmonization of compendial standards for this general test chapter. The presented text represents the **OFFICIAL INQUIRY STAGE 4** draft in the harmonization process, based in part on comments received in response to the **Stage 3** draft. The proposed draft differs from the USP chapter by the omission of *Methods 2* and *3* for both Bulk and Tapped Density. The Scott Volumeter was specific to USP and the vessel apparatus was specific to JP. Through harmonization efforts, the cylinder method is retained, because it is available in all regions. Also, several editorial changes are made.

(ETM: J. Lane) RTS—42336-2

Add the following:

⟨616⟩ BULK DENSITY AND TAPPED DENSITY

The bulk density of a powder is the ratio of the mass of a powder sample and its volume, including the contribution of the interparticulate void volume. Hence, the bulk density depends on both the density of powder particles and the spatial arrangement of particles in the powder bed. The bulk density is expressed in grams per milliliter (g/mL) although the international unit is kilograms per cubic meter (1 g/mL = 1000 kg/m^3) because the measurements are made using cylinders.

The bulking properties of a powder are dependent upon the preparation, treatment, and storage of the sample, i.e., how it was handled. The particles can be packed to have a range of bulk densities and, moreover, the slightest disturbance of the powder bed may result in a changed bulk density. Thus, the bulk density of a powder is often very difficult to measure with good reproducibility and, in reporting the results, it is essential to specify how the determination was made.

The tapped density is an increased bulk density attained after mechanically tapping a graduated cylinder containing the powder sample. Because the interparticulate interactions influencing the bulking properties of a powder are also the interactions that interfere with powder flow, a comparison of the bulk and tapped densities can give a measure of the relative importance of these interactions in a given powder. Such a comparison is often used as an index of the ability of the powder to flow, which may be called "volume reduction index", as defined below.

BULK DENSITY

The bulk density of a powder is determined by measuring the volume of a known mass of powder sample, that may have been passed through a screen, into a graduated cylinder.

Procedure

Pass a quantity of powder sufficient to complete the test through a sieve with an aperture greater than or equal to 1.4 mm, if necessary, to break up agglomerates that may have formed during storage; this must be done gently to avoid changing the nature of the material. Into a dry graduated cylinder of 250 mL (readable to 2 mL), gently introduce, without compacting, approximately 100 g of the test sample (m) weighed with 0.1% accuracy. Carefully level the powder without compacting, if necessary, and read the unsettled apparent volume (V_0) to the nearest graduated unit. Calculate the bulk density, in g per mL, by the formula m/V_0. Generally, replicate determinations are desirable for the determination of this property.

If the powder density is too low or too high, such that the test sample has an untapped apparent volume of either more than 250 mL or less than 150 mL, it is not possible to use 100 g of powder sample. Therefore, a different amount of powder has to be selected as the test sample, such that its untapped apparent volume is 150 mL to 250 mL (apparent volume greater than or equal to 60% of the total volume of the cylinder); the mass of the test sample is specified in the expression of results.

TAPPED DENSITY

The tapped density is obtained by mechanically tapping a graduated measuring cylinder containing the powder sample. After observing the initial powder volume, the measuring cylinder is mechanically tapped, and volume readings are taken until little further volume change is observed. The mechanical tapping is achieved by raising the cylinder and allowing it to drop, under its own mass, a specified distance. Devices that rotate the cylinder during tapping may be preferred to minimize any possible separation of the mass during tapping down.

Apparatus

The apparatus (*Figure 1)* consists of the following:

— A 250-mL graduated cylinder (readable to 2 mL) with a mass of 220 ± 44 g; and

— A settling apparatus capable of producing, in 1 minute, either nominally 250 ± 15 taps from a height of 3 ± 0.2 mm, or nominally 300 ± 15 taps from a height of 14 ± 2 mm. The support for the graduated cylinder, with its holder, has a mass of 450 ± 10 g.

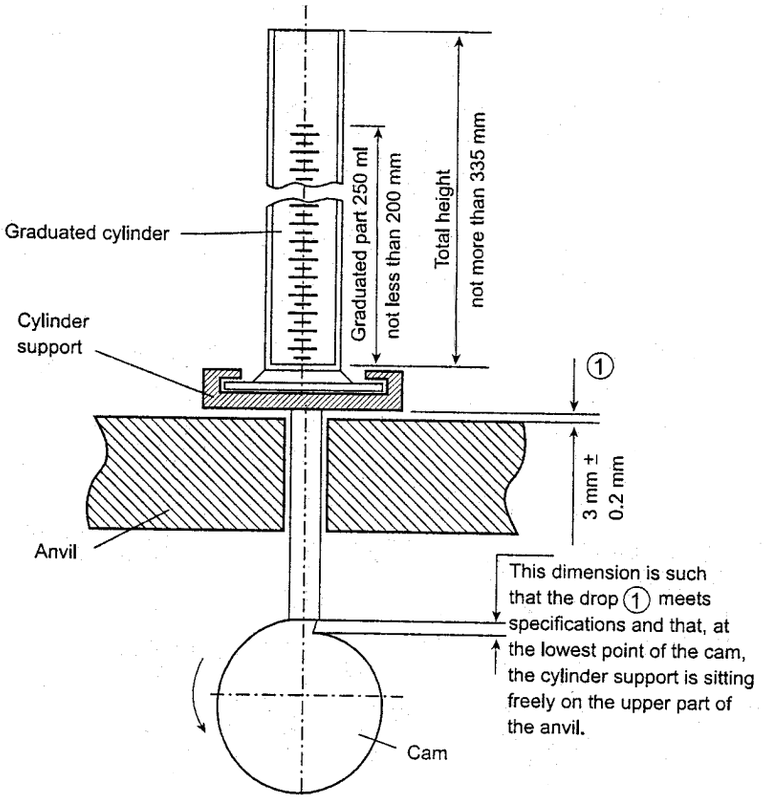

Fig. 1.

Procedure

Proceed as described above for the determination of the bulk volume (V_0). Secure the cylinder in the holder. Carry out 10, 500, and 1250 taps on the same powder sample and read the corresponding volumes V_{10}, V_{500}, and V_{1250} to the nearest graduated unit. If the difference between V_{500} and V_{1250} is less than 2 mL, V_{1250} is the tapped volume. If the difference between V_{500} and V_{1250} exceeds 2 mL, repeat in increments such as 1250 taps, until the difference between succeeding measurements is less than 2 mL. Note that fewer taps may be appropriate for some powders, when validated. Calculate the tapped density (g/mL) using the formula m/V_f, in which V_f is the final tapped volume. Generally, replicate determinations are desirable for the determination of this property.

MEASURES OF VOLUME REDUCTION INDEX

The volume reduction index and the Hausner Ratio are measures of the propensity of a powder to reduce its volume under mechanical tapping as described above. As such, they are measures of the powder ability to settle and they permit an assessment of the relative importance of interparticulate interactions. In a free-flowing powder, such interactions are less significant, and the bulk and tapped densities will be closer in value. For poorer flowing materials, there are frequently greater interparticulate interactions, and a greater difference between the bulk and tapped densities will be observed. These differences are reflected in the volume reduction index and the Hausner Ratio.

Volume Reduction Index—Calculate by the formula:

$$\frac{100(V_0 - V_f)}{V_0}.$$

Hausner Ratio—Calculate by the formula:

$$\frac{V_0}{V_f}.$$

BRIEFING

⟨**699**⟩ **Density of Solids,** *USP 28* page 2410 and page 603 of *PF* 28(2) [Mar.–Apr. 2002]. The European Pharmacopoeia, a member of the Pharmacopoeial Discussion Group, is the coordinating pharmacopoeia in the efforts toward the international harmonization of compendial standards for this general test chapter. The presented text represents the **OFFICIAL INQUIRY STAGE 4** draft in the harmonization process, based in part on comments received in response to the **Stage 3** draft. The proposed draft differs from the USP chapter by the omission of the introductory section, which is informational. Also, several editorial changes are made.

(ETM: J. Lane) RTS—42307-1

Harmonization

Add the following:

⟨699⟩ DENSITY OF SOLIDS

GAS PYCNOMETRY FOR THE MEASUREMENT OF DENSITY

The test for gas pycnometric density of solids is intended to determine the volume occupied by a known mass of powder by measuring the volume of gas displaced under defined conditions. Hence, its pycnometric density is calculated.

Apparatus

The apparatus (see *Figure 1*) consists of the following:

— A sealed test cell, with an empty cell volume (V_c), connected through a valve to a reference cell, with a reference volume (V_r);

— A system capable of pressurizing the test cell with the measurement gas until a defined pressure (P), indicated by a manometer; and

— The system is connected to a source of measurement gas, which is preferably helium, unless another gas is specified.[1]

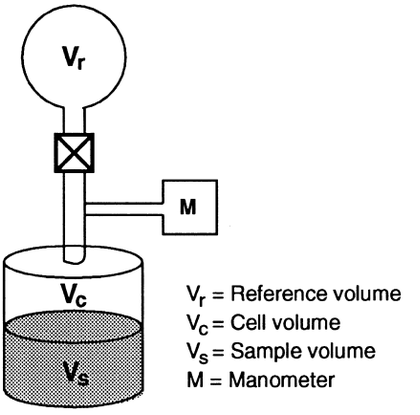

Fig. 1. Schematic of Gas Pycnometer.

The temperature of the gas pycnometer is between 15° and 30° and must not vary by more than 2° during the course of measurement.

The apparatus is calibrated, which means that the volumes (V_c) and (V_r) are determined, using a suitable reference standard, whose volume is known to the nearest 0.001 cm^3. The procedure described below is followed in two runs. First, with an empty test cell and second, with the reference standard placed in the test cell. The volumes (V_c) and (V_r) are calculated using the equation for the sample volume taking into account that the volume is zero in the first run.

Method

Weigh the test cell of the pycnometer and record the mass. Fill the test cell with a given mass of powder of the substance to be examined. Seal the test cell in the pycnometer. Record the system reference pressure (P_r) as indicated by the manometer while the valve that connects the reference cell with the test cell is open. Close the valve to separate the reference cell from the test cell. Pressurize the test cell with the gas to an initial pressure (P_i) and record the value obtained. Open the valve to connect the reference cell with

[1] If gases other than helium are used, it would not be surprising to obtain values different from those obtained with helium, since the penetration of the gas is dependent on the size of the pore as well as the cross-sectional area of the penetrating molecule. For example, the pycnometric volume will be overestimated by using nitrogen by comparison with helium, resulting in an underestimation of density.

the test cell. Record the final pressure (P_f). Repeat the measurement sequence for the same powder sample until consecutive measurements of the sample volume (V_s) agree to within 0.5%. The sample volume is expressed in cubic centimeters. Unload the test cell and measure the final powder mass (m) expressed in grams. If the pycnometer differs in operation or construction from the one shown in *Figure 1,* follow the instructions of the manufacturer of the pycnometer.

Expression of the Results

The sample volume (V_s) is given by the expression:

$$V_s = V_c - \frac{V_r}{\frac{P_i - P_r}{P_f - P_r} - 1}$$

The density (ρ) is given by the equation:

$$\rho = \frac{m}{V_s}$$

The sample conditioning is indicated with the results. For example, indicate whether the sample was tested as is or dried under specific conditions such as those described for *Loss on drying.*

It should be noted that the measured density is a volume weighted average of the densities of individual powder particles. The density will therefore be incorrect if the test gas sorbs onto the powder or if volatile contaminants are evolved from the powder during the measurement. Sorption is prevented by an appropriate choice of test gas. Helium is the common choice. Volatile contaminates in the powder are removed by degassing the powder under a constant purge of helium prior to the measurement. Occasionally, powders may have to be degassed under vacuum. Two consecutive readings must yield sample volumes that are equal within 0.2% if volatile contaminants are not interfering with the measurements. Because volatiles may be evolved during the measurement, weighing of the sample is done after the pycnometric measurement of volume.

PHARMACOPEIAL PREVIEWS

This section contains potential revisions not yet targeted for official adoption. These may include drafts for new monographs or chapters; drafts for standards that would require new or unusual technology; drafts for which more data are required; or changes that would affect numerous monographs, thus having a broad impact on individual products. Readers should review the drafts in this section and provide comments to the appropriate staff liaison whose name is cited in the Briefing (use the *Staff Directory* to find the contact information).

Briefings Each Preview is preceded by a Briefing in the following format:

BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being used, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How To Use PF*), the name of the scientific staff liaison who handled this item, and the USP tracking correspondence number, as shown in the example below:

(PA5: K. Russo) RTS—55678-1

Symbols No symbols are used in this section, as Previews are not yet targeted for official adoption.

MONOGRAPHS (USP)

BRIEFING

Acetazolamide Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 25-cm column that contains 5-µm packing L1. The typical retention time for acetazolamide is about 3.0 minutes.

(CRX: C. Okeke) RTS—42327-1

Add the following:

Acetazolamide Oral Suspension

» Acetazolamide Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of acetazolamide ($C_4H_6N_4O_3S_2$). Prepare Acetazolamide Oral Suspension 25 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Acetazolamide	2.5 g
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free) and Vehicle for Oral Suspension, *NF,* (1 : 1), or Cherry Syrup, *NF* a sufficient quantity to make	100 mL

NOTE—If Cherry Syrup, *NF* is used, it becomes a solution.

If using Tablets place the Tablets in a mortar and comminute the Tablets to a fine powder, or add Acetazolamide powder. Add about 20 mL of the Vehicle, and mix to a uniform paste. Add the Vehicle in geometric portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough liquid Vehicle to bring to final volume.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature or in a cold place.

Labeling—Label it to state that it is to be well shaken before use, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Acetazolamide RS.*

pH ⟨791⟩**:** between 4.0 and 5.0 (Vehicle for Oral Solution and Vehicle for Oral Suspension) and between 3.1 and 3.9 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Mobile phase—Dissolve 4.1 g of anhydrous sodium acetate in 950 mL of water, add 20 mL of methanol, and 30 mL of acetonitrile, and mix. Adjust with glacial acetic acid to a pH of 4.0. Filter and degas the solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Transfer about 25 mg of USP Acetazolamide RS, accurately weighed, to a 50-mL volumetric flask, add 5.0 mL of 0.5 N sodium hydroxide, and mix to dissolve. Dilute with water to volume, and mix.

Standard preparation—Transfer 25.0-mL of the *Standard stock preparation* to a 50-mL volumetric flask, and dilute with water to obtain a solution having a known concentration of 250 µg per mL.

Assay preparation—Containers of Oral Suspension are agitated for 30 minutes on a rotating mixer before a 5-mL sample is removed. These samples are stored in clear glass vials at –70° until analyzed. At time of analysis remove the sample from the freezer and allow it to reach room temperature, mix with a vortex mixer for 30 seconds, and pipet 1.0 mL to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 3 minutes, and the relative standard deviation for replicate injections is not more than 1.1%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of acetazolamide ($C_4H_6N_4O_3S_2$) in the volume of Oral Suspension taken by the formula:

$$100(C/V)(r_U/r_S),$$

in which C is the concentration, in µg per mL, of USP Acetazolamide RS in the *Standard preparation; V* is the volume, in mL, of suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Alprazolam Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 25-cm column that contains 5-µm packing L1. The typical retention time for alprazolam is about 10.0 minutes.

(CRX: C. Okeke) RTS—42327-2

Add the following:

Alprazolam Oral Suspension

» Alprazolam Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of alprazolam ($C_{17}H_{13}ClN_4$). Prepare Alprazolam Oral Suspension 1 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Alprazolam	100 mg
(Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free) and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

NOTE—If Cherry Syrup, *NF* is used, it becomes a solution.

If using Tablets, place the Tablets in a suitable mortar, and comminute or triturate to a fine powder, or add Alprazolam powder. Add about 20 mL of the Vehicle, and mix until a uniform paste is formed. Add the Vehicle in geometric portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add sufficient Vehicle to bring to final volume.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature or under refrigeration.

Labeling—Label it to state that it is to be well shaken before use, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Alprazolam RS.*

pH ⟨791⟩**:** between 4.2 and 4.7 (Vehicle for Oral Solution and Vehicle for Oral Suspension) and between 3.4 and 4.2 (Cherry Syrup).

Beyond-use date: 45 days after the day on which it was compounded.

Assay—

Buffer solution—0.04 M sodium acetate solution adjusted with glacial acetic acid to a pH of 2.4.

Mobile phase—Prepare a filtered and degassed solution of *Buffer solution,* methanol, and acetonitrile (47 : 45 : 8). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Alprazolam RS in *Mobile phase,* and quantitatively dilute with *Mobile phase* to obtain a solution having a known concentration of about 20 µg per mL.

Assay preparation—Containers of Alprazolam Oral Suspension are agitated for 30 minutes on a rotating mixer before a 5-mL sample is removed. These samples are stored in clear glass vials at –70° until analyzed. At the time of analysis, remove the sample from the freezer and allow it to reach room temperature, mix with a vortex mixer for 30 seconds, and pipet 1.0 mL into a 50-mL volumetric flask. Dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 0.6 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 10 minutes, and the relative standard deviation for replicate injections is not more than 1.4%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the

quantity, in mg, of alprazolam. ($C_{17}H_{13}ClN_4$) in each mL of Oral Suspension taken by the formula:

$$50(C/V)(r_U/r_S),$$

In which C is the concentration, in µg per mL, of USP Alprazolam RS in the *Standard preparation;* V is the volume, in mL, of suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Azathioprine Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 25-cm column that contains 5-µm packing L1. The typical retention time for azathioprine is about 4 minutes.

(CRX: C. Okeke) RTS—42327-3

Add the following:

Azathioprine Oral Suspension

» Azathioprine Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of azathioprine ($C_9H_7N_7O_2S$). Prepare Azathioprine Oral Suspension 50 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Azathioprine	5 g
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free) and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,*	
a sufficient quantity to make	100 mL

NOTE—If Cherry Syrup, *NF* is used, it becomes a solution.

If using Tablets, comminute them to a fine powder in a suitable mortar, or add Azathioprine powder to the mortar. Add about 10 mL of the Vehicle, and mix to a uniform paste. Add the Vehicle in geometric portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add sufficient Vehicle to bring to final volume.

Packaging and storage—Preserve in tight, light-resistant containers. Store at room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken before use, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Azathioprine RS.*

pH ⟨791⟩**:** between 3.9 and 4.7 (Vehicle for Oral Solution and Vehicle for Oral Suspension) and between 3.1 and 4.9 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Mobile phase—Dissolve 1.1 g of sodium 1-heptanesulfonate in 700 mL of water, add 300 mL of methanol, and mix. Adjust with 1 N hydrochloric acid to a pH of 3.5. Filter, and degas the solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve about 25 mg of USP Azathioprine RS, accurately weighed, in a 50-mL volumetric flask. Add about 15 mL of methanol and 0.5 mL of ammonium hydroxide to the flask, swirl and sonicate for 2 minutes. Dilute with methanol to volume, and mix. Transfer 10 mL of this solution to a 50-mL volumetric flask, dilute with water to volume, and mix.

Assay preparation—Containers of Oral Suspension are agitated for 30 minutes on a rotating mixer before a 5-mL sample is removed. These samples are stored in clear glass vials at –70° until analyzed. At the time of analysis, remove the sample from the freezer, and allow it to reach room temperature. Mix with a vortex mixer for 30 seconds, and pipet 1.0 mL into a 100-mL volumetric flask. Dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 4 minutes, and the relative standard deviation for replicate injections is not more than 1.3%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of azathioprine ($C_9H_7N_7O_2S$) in the volume of Oral Suspension taken by the formula:

$$100(C / V)(r_U / r_S),$$

in which C is the concentration, in µg per mL, of USP Azathioprine RS in the *Standard preparation; V* is the volume, in mL, of suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Baclofen Oral Solution. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 25-cm column that contains 5-µm packing L1. The typical retention time for baclofen is about 5.5 minutes.

(CRX: C. Okeke) RTS—42327-4

Add the following:

Baclofen Oral Solution

» Baclofen Oral Solution contains not less than 90 percent and not more than 110 percent of the labeled amount of baclofen ($C_{10}H_{12}ClNO_2$). Prepare Baclofen Oral Solution 5 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Baclofen	500 mg
Glycerin	5 mL
Syrup, *NF,* a sufficient quantity to make	100 mL

If using Tablets, comminute the Baclofen Tablets to a fine powder in a suitable mortar, or add Baclofen powder to the mortar. Add about 5 mL of the Glycerin to wet the powder, and triturate the powder to form a fine paste. Add about 5 mL of the Syrup to the paste, triturate well, and transfer, stepwise and quantitatively, the contents to a calibrated bottle. Rinse the mortar with additional portions of the Syrup, and transfer the contents to the container; repeat as necessary with sufficient Syrup to final volume.

Packaging and storage—Preserve in tight, light resistant containers. Store in a cold place.

Labeling—Label it to state that it is to be well shaken, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Baclofen RS.*

pH ⟨791⟩**:** between 5.0 and 6.0.

Beyond-use date: 35 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a solution of 0.05 M monobasic sodium phosphate and acetonitrile (80 : 20) and adjust with phosphoric acid to a pH of 3.5. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Dissolve an accurately weighed quantity of USP Baclofen RS in water to obtain a concentration of about 1.0 mg per mL.

Standard preparation—Dilute the *Standard stock preparation* with water to obtain a solution having a known concentration of 5 µg per mL.

Assay preparation—Shake thoroughly by hand each bottle of Oral Solution. Pipet 0.5 mL of Oral Solution from each bottle to a 500-mL volumetric flask, dilute with water to volume to obtain a concentration of 5 µg per mL, and pass through a 0.22-µm polyvinylidenefluoride (PVDF) filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 5.5 for baclofen; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 15 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of baclofen ($C_{10}H_{12}ClNO_2$) in the volume of Oral Solution taken by the formula:

$$1000(C/V)(r_U/r_S),$$

in which C is the concentration, in µg per mL, of USP Baclofen RS in the *Standard preparation; V* is the volume, in mL, of solution taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Bethanechol Chloride Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 25-cm column that contains 5-µm packing L##. The typical retention time for bethanechol chloride is about 3 minutes.

(CRX: C. Okeke) RTS—42327-5

Add the following:

Bethanechol Chloride Oral Suspension

» Bethanechol Chloride Oral Suspension contains not less than 90 percent and not more than 110 percent of the labeled amount of bethanechol chloride ($C_7H_{17}ClN_2O_2$). Prepare Bethanechol Chloride 5 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Bethanechol Chloride.	500 g
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free) and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

NOTE—If Cherry Syrup, *NF* is used, it becomes a solution.

If using Bethanechol Chloride Tablets, add to a suitable mortar and comminute to a fine powder, or add the Bethanechol Chloride powder to the mortar. Add about 20 mL of the Vehicle and mix to a uniform paste. Add the Vehicle in geometric portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add sufficient Vehicle to final volume.

Packaging and storage—Preserve in tight, light resistant containers. Store at room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Bethanechol Chloride RS.*

pH ⟨791⟩**:** between 4.0 and 4.8 (Vehicle for Oral Solution and Vehicle for Oral Suspension), and between 2.6 and 3.4 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Mobile phase—Acetonitrile and water (33 : 67). Filter and degas the solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Bethanechol Chloride RS in *Mobile phase,* and dilute quantitatively with *Mobile phase* to obtain a solution having a known concentration of about 500 µg per mL.

Assay preparation—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 10-mL sample, and store in a clear glass vial at –70° until analyzed.

At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 5.0 mL of the sample into a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 200-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L##. The flow rate is about 0.7 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 3 minutes, and the relative standard deviation for replicate injections is not more than 3.1%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of bethanechol chloride ($C_7H_{17}ClN_2O_2$) in the volume of Oral Suspension taken by the formula:

$$10(C/V)(r_U/r_S),$$

in which C is the concentration, in µg per mL, of USP Bethanechol Chloride RS in the *Standard preparation; V* is the volume, in mL, of suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Captopril Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 25-cm column that contains 5-µm packing L1. The typical retention time for captopril is about 5.0 minutes.

(CRX: C. Okeke) RTS—42327-6

Add the following:

Captopril Oral Suspension

» Captopril Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of captopril ($C_9H_{15}NO_3S$). Prepare Captopril Oral Suspension 0.75 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Captopril	100 mg
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free), and Vehicle for Oral Suspension (1 : 1), *NF*, a sufficient quantity to make	134 mL

If using Tablets place the required number of Captopril Tablets in a suitable mortar and comminute to a fine powder, or add Captopril powder to the mortar. Add about 10 mL of the Vehicle and mix to a uniform paste. Add the remainder of the Vehicle in geometric portions, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a graduate. Add sufficient quantity of vehicle to final volume and transfer 100 mL to a calibrated bottle.

Packaging and storage—Preserve in tight, light-resistant containers. Store in a cold place.

Labeling—Label it to state that it is to be well shaken, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Captopril RS.*

pH ⟨791⟩**:** between 4.0 and 4.2 (Vehicle for Oral Solution and Vehicle for Oral Suspension).

Beyond-use date: 7 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of methanol and water (11 : 9) containing 0.5 mL of phosphoric acid. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve USP Captopril RS in water to obtain a solution having a known concentration of 7.5 µg per mL.

Assay preparation—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 5.0 minutes, and the relative standard deviation for replicate injections is not more than 0.9%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of captopril ($C_9H_{15}NO_3S$) in the volume of Oral Suspension taken by the formula:

$$100(C/V)(r_U/r_S),$$

in which C is the concentration, in µg per mL, of USP Captopril RS in the *Standard preparation; V* is the volume, in mL, of suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Ciprofloxacin Oral Solution. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 25-cm column that contains 5-µm packing L1. The typical retention time for ciprofloxacin is about 5 minutes.

(CRX: C. Okeke) RTS—42327-7

Add the following:

Ciprofloxacin Oral Solution

» Ciprofloxacin Hydrochloride Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of Ciprofloxacin Hydrochloride ($C_{17}H_{18}FN_3O_3 \cdot HCl \cdot H_2O$).

Prepare Ciprofloxacin Hydrochloride Oral Solution 50 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Ciprofloxacin Hydrochloride	5 g
Vehicle for Oral Suspension, *NF*. . .	50 mL
Syrup, *NF,* a sufficient quantity to make	100 mL

If using Tablets, comminute the Tablets in a suitable mortar to a fine powder, or add Ciprofloxacin Hydrochloride powder to the mortar. Gradually add the Vehicle to the powder, and triturate well to a uniform paste. Add Syrup in geometric portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add sufficient Syrup to bring to final volume.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken before use, and state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Ciprofloxacin RS.*

pH ⟨791⟩**:** between 4.0 and 5.0.

Beyond-use date: 50 days after the day on which it was compounded.

Assay—

Buffer solution—Prepare a solution of 5.5 mM monobasic potassium phosphate and 1.8 mM dibasic sodium phosphate adjusted to a pH of 7.4 by adding sodium hydroxide, and containing 5.5 mM hexadecyltrimethylammonium bromide.

Mobile phase—Prepare a solution of methanol and *Buffer solution* (65 : 35). Filter, and degas the *Mobile phase.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Dissolve an accurately weighed quantity of USP Ciprofloxacin Hydrochloride RS in water to obtain a concentration of about 1.0 mg per mL.

Standard preparation—Dilute the *Standard stock preparation* with water to obtain a solution having a known concentration of 5.0 µg per mL. The concentration of the working standard preparation is 5.0 µg per mL.

Assay preparation—Transfer by pipet about 1 mL of Oral Solution from each bottle to a suitable container, and dilute with water to obtain a concentration of 5 µg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 275-nm detector, a column heater maintained at 30°, and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the 5.0 µg per mL *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.5%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of ciprofloxacin ($C_{17}H_{18}FN_3O_3$) in the volume of Oral Solution taken by the formula:

$$10000\,(C/V)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Ciprofloxacin Hydrochloride RS in the *Standard preparation;* V is the volume, in mL, of solution taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Clonazepam Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 10-cm column that contains 5-µm packing L1 (see *Chromatography* ⟨621⟩). The typical retention time for clonazepam is about 7 minutes.

(CRX: C. Okeke) RTS—1384-8

Add the following:

Clonazepam Oral Suspension

» Clonazepam Oral Suspension contains not less than 90 percent and not more than 110 percent of the labeled amount of clonazepam ($C_{15}H_{10}ClN_3O_3$). Prepare Clonazepam Oral Suspension 0.1 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Clonazepam	10 mg
Vehicle: a mixture of Vehicle for Oral Solution, *NF,* (regular or sugar-free) and Vehicle for Oral Suspension, *NF,* or Cherry Syrup, *NF,* (1 : 1), a sufficient quantity to make	100 mL

NOTE—If Cherry Syrup, *NF* is used, it becomes a solution.

If using Tablets, comminute the Tablets into a fine powder in a suitable mortar, or add Clonazepam powder to the mortar. Add approximately 10 mL of the vehicle, and mix to a uniform paste. Add the vehicle in geometric portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough vehicle to bring to final volume.

Packaging and storage—Preserve in tight, light resistant containers. Store at controlled room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken before use, and state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Clonazepam RS.*

pH ⟨791⟩**:** between 4.0 and 4.4 (Vehicle for Oral Solution and Vehicle for Oral Suspension), and between 2.5 and 3.3 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a solution of water, methanol, and acetonitrile (4 : 3 : 3). Filter and degas the *Mobile phase.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Dissolve an accurately weighed quantity of USP Clonazepam RS in acetonitrile to obtain a concentration of about 0.5 mg per mL.

Standard preparation—Dilute the *Standard stock preparation* with acetonitrile to obtain a solution having a known concentration of 25 µg per mL.

Assay preparation—Containers of Oral Suspension are agitated for 30 minutes on a rotating mixer before a 5-mL sample is removed. These samples are stored in clear glass vials at –70° until analyzed. At the time of analysis, remove the sample from the freezer and allow it to reach room temperature, mix with a vortex mixer for 30 seconds, and pipet 2.5 mL to a 10-mL volumetric flask. Dilute with acetonitrile to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 10-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time of clonazepam is about 7 minutes; and the relative standard deviation for replicate injections is not more than 1.8%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of clonazepam ($C_{15}H_{10}ClN_3O_3$) in the volume of Oral Suspension taken by the formula:

$$4(C/V)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Clonazepam RS in the *Standard preparation; V* is the volume, in mL, of suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Diltiazem Hydrochloride Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 25-cm column that contains 5-µm packing L1. The typical retention time for diltiazem is about 9.6 minutes.

(CRX: C. Okeke) RTS—42327-9

Add the following:

Diltiazem Hydrochloride Oral Suspension

» Diltiazem Hydrochloride Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of diltiazem hydrochloride ($C_{22}H_{26}N_2O_4S \cdot HCl$). Prepare Diltiazem Hydrochloride Oral Suspension, 12 mg per mL, as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Diltiazem Hydrochloride	1.2 g
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free) and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,*	
a sufficient quantity to make	100 mL

NOTE—If Cherry Syrup, *NF* is used, it becomes a solution.

If using Tablets, comminute the Tablets to a fine powder in a suitable mortar or add Diltiazem Hydrochloride powder to the mortar. Add approximately 10 mL of the Vehicle, and mix to a uniform paste. Add the Vehicle to the mortar in geometric portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough Vehicle to bring to final volume.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken, and state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Diltiazem Hydrochloride RS.*

pH ⟨791⟩**:** between 3.8 and 4.6 (Vehicle for Oral Solution and Vehicle for Oral Suspension), and between 3.1 and 3.9 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Buffer solution—Dissolve 1.16 g of *d*-10-camphorsulfonic acid in 1000 mL of 0.1 M sodium acetate, adjust this solution by the addition of 0.1 N sodium hydroxide to a pH of 6.2, and mix.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, methanol, and *Buffer solution* (2 : 1 : 1). Make adjustments if necessary (see *System suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve USP Diltiazem Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of 120 µg per mL.

Assay preparation—Containers of Oral Suspension are agitated for 30 minutes on a rotating mixer before a 5-mL sample is removed. These samples are stored in clear glass vials at –70° until analyzed. At time of analysis remove the sample from the freezer, allow it to reach room temperature, mix with a vortex mixer for 30 seconds, and pipet 1.0 mL to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the 100 µg per mL *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 9.6 minutes, and the relative standard deviation for replicate injections is not more than 1.3%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of diltiazem hydrochloride ($C_{22}H_{26}N_2O_4S \cdot HCl$) in the volume of Oral Suspension taken by the formula:

$$100(C/V)(r_U/r_S),$$

in which C is the concentration, in µg per mL, of USP Diltiazem Hydrochloride RS in the *Standard preparation; V* is the volume, in mL, of suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Dipyridamole Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 25-cm column that contains 5-µm packing L1. The typical retention time for dipyridamole is about 7.3 minutes.

(CRX: C. Okeke) RTS—42327-10

Add the following:

Dipyridamole Oral Suspension

» Dipyridamole Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dipyridamole ($C_{24}H_{40}N_8O_4$). Prepare Dipyridamole Oral Suspension 10 mg per mL as follows. See *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Dipyridamole	1 g
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free) and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,*	
a sufficient quantity to make	100 mL

NOTE—If Cherry Syrup, *NF* is used, it becomes a solution.

If using Tablets, place the Dipyridamole Tablets in a suitable mortar, and comminute to a fine powder, or add Dipyridamole powder to the mortar. Add about 20 mL of Vehicle, and mix to a uniform paste. Add the Vehicle in geometric portions, and mix well after each addition. Transfer, stepwise and quantitatively, to a graduated or a calibrated bottle. Add the Vehicle in portions to rinse the mortar, and add sufficient Vehicle to bring to final volume.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Dipyridamole RS.*

pH ⟨791⟩**:** between 3.9 and 4.7 (Vehicle for Oral Solution and Vehicle for Oral Suspension), and between 3.0 and 3.8 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Mobile phase—Dissolve 250 mg of dibasic sodium phosphate in 250 mL of water, and adjust with dilute phosphoric acid (1 in 3) to a pH of 4.6. Add 750 mL of methanol, mix, and pass through a 0.5-µm membrane filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve USP Dipyridamole RS in *Mobile phase* to obtain a suspension having a known concentration of 100 µg per mL.

Assay preparation—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 288-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.3 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 7.3 minutes, and the relative standard deviation for replicate injections is not more than 2.3%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of dipyridamole ($C_{24}H_{40}N_8O_4$) in the volume of Oral Suspension taken by the formula:

$$100(C/V)(r_U/r_S),$$

in which C is the concentration, in µg per mL, of USP Dipyridamole RS in the *Standard preparation; V* is the volume, in mL, of suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Dolasetron Mesylate Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 15-cm column that contains 5-µm packing L10. The typical retention time for dolasetron mesylate is about 6.9 minutes.

(CRX: C. Okeke) RTS—42327-11

Add the following:

Dolasetron Mesylate Oral Suspension

» Dolasetron Mesylate Oral Suspension contains not less than 90 percent and not more than 110 percent of the labeled amount of dolasetron mesylate ($C_{19}H_{20}N_2O_3 \cdot CH_4O_3S \cdot H_2O$). Prepare Dolasetron Mesylate Oral Suspension, 10 mg per mL, as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Dolasestron Mesylate	1 g
Vehicle: a mixture of Vehicle for Oral Suspension, *NF* and Vehicle for Oral Solution, Sugar-Free, *NF* (1 : 1); or Strawberry Syrup and Vehicle for Oral Suspension, a sufficient quantity to make	100 mL

NOTE—If Strawberry Syrup, *NF* is used, it becomes a solution.

If using Tablets, comminute into a fine powder in a suitable mortar or add Dolasetron Mesylate powder. Mix separately Vehicle for Oral Suspen-

sion and Vehicle for Oral Solution, Sugar-Free, and stir vigorously; or mix with Strawberry Syrup. Add about 15 mL of the mixture to the powder and triturate well to a uniform paste. Transfer mortar contents, stepwise and quantitatively, to a calibrated bottle, rinse the mortar with about 15 mL of the Vehicle, and repeat the previous step as necessary to bring to final volume.

Packaging and storage—Preserve in tight, light-resistant containers. Store at room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken before use, and state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Dolasetron Mesylate RS.*

pH ⟨791⟩**:** between 3.6 and 4.6.

Beyond-use date: 90 days after the day on which it was compounded.

Assay—

Buffer—Prepare a solution of 0.05 M ammonium acetate adjusted with diluted ammonium hydroxide to a pH of 7.5.

Mobile phase—Prepare a filtered and degassed solution of *Buffer* and acetonitrile (76 : 24). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Sample diluent—Prepare a solution of water and acetonitrile (76 : 24).

Standard stock preparation—Dissolve USP Dolasetron Mesylate RS in *Sample diluent* to obtain a solution having a known concentration of about 500 µg per mL.

Standard preparation—Transfer 2 mL of *Standard stock preparation* to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume. Transfer 10 mL of this prepared solution to another 100-mL volumetric flask, and dilute with *Mobile phase* to obtain a solution having a known concentration of about 10 µg per mL.

Assay preparation—Transfer 1.0 mL of Oral Suspension by pipet to a 100-mL volumetric flask, and dilute with *Sample diluent* to obtain a 10 µg per mL concentration. Shake each sample thoroughly by hand for about 15 seconds, centrifuge at 1000 rpm for about 2 minutes, and assay the supernatant.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 15-cm analytical column that contains 5-µm packing L10, and is maintained at a temperature of 30°. The flow rate is about 0.8 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 6.9 minutes, and the relative standard deviation for replicate injections is not more than 1.4%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of dolasetron mesylate ($C_{19}H_{20}N_2O_3 \cdot CH_4O_3S \cdot H_2O$) in the volume of Oral Suspension taken by the formula:

$$1000(C/V)(r_U/r_S),$$

in which C is the concentration, in µg per mL, of USP Dolasetron Mesylate RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Flucytosine Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6- × 200-mm column that contains 5-µm packing L3. The typical retention time for flucytosine is about 3 minutes.

(CRX: C. Okeke) RTS—42327-12

Add the following:

Flucytosine Oral Suspension

» Flucytosine Oral Suspension contains not less than 90 percent and not more than 110 percent of the labeled amount of flucytosine ($C_4H_4FN_3O$). Prepare Flucytosine Oral Suspension 10 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Flucytosine	2.5 g
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free) and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

NOTE—If Cherry Syrup, *NF* is used, it becomes a solution.

If using Flucytosine Capsules, empty the appropriate amount into a suitable mortar, or add Flucytosine powder to the mortar. Add about 10 mL of the Vehicle, and mix to a uniform paste. Add the Vehicle in geometric portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough Vehicle to bring to final volume.

Packaging and storage—Preserve in tight, light resistant containers. Store in a cold place.

Labeling—Label it to state that it is to be well shaken, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Flucytosine RS.*

pH ⟨791⟩**:** between 4.0 and 4.8 (Vehicle for Oral Solution and Vehicle for Oral Suspension) and between 3.2 and 4.0 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Buffer—Dissolve 1g of ammonium acetate and 1 mL of diisopropylamine in one L of water, and adjust with glacial acetic acid to a pH of 7.5.

Mobile phase—Prepare a filtered and degassed solution of methanol and *Buffer* (1 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Flucytosine RS in *Mobile phase,* and dilute quantitatively with *Mobile phase* to obtain a solution having a known concentration of about 50 µg per mL.

Assay preparation—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer,

allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 0.5 mL of the sample into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6- × 200-mm analytical column that contains 5-µm packing L3. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 3 minutes, and the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of flucytosine ($C_4H_4FN_3O$) in the volume of Oral Suspension taken by the formula:

$$200(C/V)(r_U/r_S),$$

in which C is the concentration, in µg per mL, of USP Flucytosine RS in the *Standard preparation; V* is the volume, in mL, of suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Ganciclovir Oral Solution. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 10-cm column that contains 5-µm packing L1. The typical retention time for ganciclovir is about 3 minutes.

(CRX: C. Okeke) RTS—42327-13

Add the following:

Ganciclovir Oral Solution

» Ganciclovir Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ganciclovir ($C_9H_{13}N_5O_4$). Prepare Ganciclovir Oral Solution, 100 mg per mL, as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Ganciclovir	10 g
Vehicle for Oral Solution, *NF* (regular or sugar-free), a sufficient quantity to make . . .	100 mL

If using Capsules, empty the contents of the Capsules into a suitable mortar, or add Ganciclovir powder to the mortar. Add sufficient Vehicle to wet the powder, and work to a smooth paste. Add additional Vehicle to about half the final volume, and transfer the contents of the mortar to a calibrated bottle. Using additional Vehicle, rinse out the mortar and transfer the contents, stepwise and quantitatively, to bring to final volume.

[Caution—Avoid skin contact or inhalation of ganciclovir by using protective gloves and a fume hood or surgical mask.]

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature.

Labeling—Label it to state that it is to be well shaken before use, and state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Ganciclovir RS.*

pH ⟨791⟩**:** between 4.0 and 5.0.

Beyond-use date: 90 days after the day on which it was compounded.

Assay—

25 mM Monobasic sodium phosphate buffer—Prepare this buffer and adjust with phosphoric acid to a pH of 2.5.

Mobile phase—Prepare a solution of *25 mM Monobasic sodium phosphate buffer* and acetonitrile (97.5 : 2.5). Filter, and degas the *Mobile phase.* Make adjustments if necessary (see *System suitability* under *Chromatography* ⟨621⟩).

Sample diluent—Prepare a solution of water, acetonitrile, and methanol (80 : 15 : 5).

Internal standard solution—Prepare a 4 mg per mL aqueous solution of hypoxanthine.

Standard stock preparation—Dissolve an accurately weighed quantity of USP Ganciclovir RS in water to obtain a concentration of about 1.0 mg per mL.

Standard preparation—Transfer an appropriate volume of *Standard stock preparation* to a suitable container, and add an appropriate volume of *Internal standard solution* to obtain a solution having known concentrations of 6 µg per mL and 4 µg per mL, respectively.

Assay preparation—Transfer about 1 mL of Oral Solution from each bottle to a plastic weighing cup, and weigh to determine density. [NOTE—The exact volume of Oral Solution taken from each bottle is calculated by the suspension density.] Transfer the suspension to a 100-mL volumetric flask, and add about 50 mL of water. Place the volumetric flask on a mechanical shaker for 30 minutes, and then dilute with water to volume. Transfer 0.6 mL from this solution and 1 mL of the *Internal standard solution* to a 100-mL volumetric flask, and dilute with water to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 10-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative retention time for ganciclovir is 1.0, and 0.75 for hypoxanthine; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of ganciclovir ($C_9H_{13}N_5O_4$) in the volume of Oral Solution taken by the formula:

$$100(C/V)(R_U/R_S),$$

in which C is the concentration, in mg per mL, of USP Ganciclovir RS in the *Standard preparation; V* is the volume, in mL, of solution taken; and R_U and R_S are the peak response ratios of the analyte peak to the internal standard peak obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Isradipine Oral Solution. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 25-cm column that contains 5-µm packing L1. The typical retention time for isradipine is about 6.0 minutes.

(CRX: C. Okeke) RTS—42327-14

Add the following:

Isradipine Oral Solution

» Isradipine Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of isradipine ($C_{19}H_{21}N_3O_5$). Prepare Isradipine Oral Solution 1 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Isradipine	100 mg
Glycerin	5 mL
Syrup, *NF*, a sufficient quantity to make	100 mL

If using Capsules, empty the contents of the Isradipine Capsules into a suitable mortar, or add Isradipine powder to the mortar. Add about 5 mL of Glycerin to wet the powder, and triturate to a fine paste. Add about 15 mL of Syrup to the paste, triturate well, and then transfer the contents to a calibrated bottle. Rinse the mortar with additional portions of Syrup, and transfer the contents, stepwise and quantitatively, and bring to final volume.

Packaging and storage—Preserve in tight, light-resistant containers. Store in a cold place.

Labeling—Label it to state that it is to be well shaken, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Isradipine RS.*

pH ⟨791⟩**:** between 5.0 and 7.0.

Beyond-use date: 35 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a solution of methanol, water, and tetrahydrofuran (42 : 38 : 20). Filter and degas the *Mobile phase.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent: methanol and alcohol (1 : 1).

Standard stock solution—Dissolve an accurately weighed quantity of USP Isradipine RS in *Diluent* to obtain a concentration of about 1.0 mg per mL.

Standard preparation—Dilute the *Standard stock preparation* with *Diluent* to obtain a solution having a known concentration of 100 µg per mL

Assay preparation—Pipet 1.0 mL of Oral Solution from each bottle to a 10-mL volumetric flask, and dilute with *Diluent* to volume to obtain a concentration of 100 µg per mL. Pass through a 0.22-µm polyvinylidenefluoride (PVDF) filter prior to injection.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 6.0 minutes for isradipine; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of isradipine ($C_{19}H_{21}N_3O_5$) in the volume of Oral Solution taken by the formula:

$$10(C / V)(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Isradipine RS in the *Standard preparation;* V is the volume, in mL, of solution taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Labetalol Hydrochloride Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 25-cm column that contains 5-µm packing L1 (see *Chromatography* ⟨621⟩). The typical retention time for labetalol is about 7.5 minutes.

(CRX: C. Okeke) RTS—42327-15

Add the following:

Labetalol Hydrochloride Oral Suspension

» Labetalol Hydrochloride Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of labetalol hydrochloride ($C_{19}H_{24}N_2O_3 \cdot HCl$). Prepare Labetalol Hydrochloride Oral Suspension 40 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Labetalol Hydrochloride	4 g
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free) and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

NOTE—If Cherry Syrup, *NF* is used, it becomes a solution.

If using Tablets, place the Labetalol Hydrochloride Tablets in a suitable mortar. Comminute the Tablets to a fine powder or add Labetalol Hydrochloride powder. Add about 20 mL of the Vehicle and mix to a uniform paste. Add the Vehicle in geometric portions almost to volume. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add the Vehicle in portions to rinse the mortar, and combine with the final preparation to final volume and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Labetalol Hydrochloride RS.*

pH ⟨791⟩**:** between 4.0 and 5.0 (Vehicle for Oral Solution and Vehicle for Oral Suspension), and between 3.0 and 4.0 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a suitable filtered and degassed mixture of 0.1 M monobasic sodium phosphate and methanol (65 : 35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve USP Labetolol Hydrochloride RS in water to obtain a solution having a known concentration of 400 µg per mL.

Assay preparation—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.3 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 7.5 minutes, and the relative standard deviation for replicate injections is not more than 1.6%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of labetalol hydrochloride ($C_{19}H_{24}N_2O_3 \cdot HCl$) in the volume of Oral Suspension taken by the formula:

$$100(C / V)(r_U / r_S),$$

in which C is the concentration, in µg per mL, of USP Labetalol RS in the *Standard preparation; V* is the volume, in mL, of suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Levothyroxine Sodium Oral Solution. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 25-cm column that contains 5-µm packing L10. The typical retention time for levothyroxine sodium is about 7.6 minutes.

(CRX: C. Okeke) RTS—42327-16

Add the following:

Levothyroxine Sodium Oral Solution

» Levothyroxine Sodium Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of levothyroxine sodium ($C_{15}H_{10}I_4NNaO_4$). Prepare Levothyroxine Sodium Oral Solution 25 µg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Levothyroxine Sodium	2.5 mg
Glycerin, *NF*	40 mL
Purified Water, a sufficient quantity to make	100 mL

If using Tablets place the Tablets in a suitable mortar. Using a pestle, break the Tablets and pulverize them to a fine powder, or add Levothyroxine Sodium powder. Add the Glycerin, triturate the powder into a pourable suspension, and transfer, stepwise and quantitatively, to a graduated container. Rinse the mortar with portions of Purified Water. Add Purified Water to the preparation to final volume, and mix well. Package and label.

Packaging and storage—Preserve in tight, light-resistant, high-density polyethylene containers. Store in a cold place.

Labeling—Label it to state that it is to be well shaken before use.

USP Reference standards ⟨11⟩**—***USP Levothyroxine RS. USP Liothyronine RS.*

pH ⟨791⟩**:** between 6.5 and 7.0.

Beyond-use date: 8 days after the day on which it was compounded.

Limit of liothyronine sodium—*Mobile phase, Standard liothyronine preparation,* and *Chromatographic system—* Proceed as directed in the *Assay.*

Test preparation—Prepare as directed for the *Assay preparation.*

Procedure—Proceed as directed in the *Assay.* Calculate the quantity, in µg, of liothyronine sodium ($C_{15}H_{11}I_3NNaO_4$) in the Oral Solution taken by the formula:

$$(672.96/650.98)C(r_U/r_S),$$

in which 672.96 and 650.98 are the molecular weights of liothyronine sodium and liothyronine, respectively; C is the concentration, in µg per mL, of USP Liothyronine RS in the *Standard liothyronine preparation;* and r_U and r_S are the liothyronine peak responses obtained from the *Test preparation* and the *Standard liothyronine preparation,* respectively: not more than 2.0% of liothyronine is found.

Assay—

Mobile phase—Prepare a solution of water, acetonitrile, and phosphoric acid (65 : 35 : 1). Filter and degas the *Mobile phase.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Levothyroxine stock preparation—Dissolve an accurately weighed quantity of USP Levothyroxine RS in water to obtain a concentration of about 100 µg per mL.

Levothyroxine standard preparation—Dilute the *Levothyroxine stock preparation* with water to obtain a solution having a known concentration of 25 µg per mL

Liothyronine stock preparation—Dissolve an accurately weighed quantity of USP Liothyronine RS in water to obtain a solution having a known concentration of 100 µg per mL.

Liothyronine standard preparation—Dilute the *Liothyronine stock preparation* with water to obtain a solution having a known concentration of 25 µg per mL

Assay preparation—Remove a 1-mL sample of the Oral Solution from each bottle after inverting the bottle by hand 30 times, place the sample into 2-mL freezing vials, and freeze at –80° until analyzed. Thaw samples at room temperature, mix thoroughly with a vortex mixer, and centrifuge at 2500 rpm for 5 minutes. The supernatant is used for the sample injection into the chromatographic system.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L10. The flow rate is about 1.0 mL per minute. Chromatograph the *Levothyroxine standard preparation* and the *Liothyronine standard preparation,* and record the peak responses as directed for *Procedure:* the retention times for levothyroxine and liothyronine are about 7.6 and 6.2 minutes, respectively; and the relative standard deviation for replicate injections is not more than 5.2%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Levothyroxine standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg, of ($C_{15}H_{10}I_4NNaO_4$) in the volume of Oral Solution taken by the formula:

$$(798.85 / 776.87)\,(C / V)(r_U / r_S),$$

in which 798.85 and 776.87 are the molecular weights of levothyroxine sodium and levothyroxine, respectively; C is the concentration, in mg per mL, of USP Levothyroxine RS in the *Levothyroxine standard preparation; V* is the volume, in mL, of solution taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Levothyroxine standard preparation,* respectively.

BRIEFING

Metolazone Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 20-cm column that contains 5-µm packing L3. The typical retention time for metolazone is about 6.0 minutes.

(CRX: C. Okeke) RTS—42327-17

Add the following:

Metolazone Oral Suspension

» Metolazone Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of Metolazone. ($C_6H_9N_3O_3$). Prepare Metolazone Oral Suspension 1mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Metolazone	100 mg
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free) and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF*, a sufficient quantity to make	100 mL

NOTE—If Cherry Syrup, *NF* is used, it becomes a solution.

If using Tablets, place the Metolazone Tablets in a suitable mortar, and comminute to a fine powder, or add Metolazone powder to the mortar. Add about 20 mL of the Vehicle, and mix to a uniform paste. Add the Vehicle in geometric portions, and transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add suffi-

cient Vehicle in portions to rinse the mortar. Add to the preparation to final volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Metolazone RS.*

pH ⟨791⟩**:** between 3.6 and 4.6 (Vehicle for Oral Solution and Vehicle for Oral Suspension) and between 2.5 and 3.3 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a suitable filtered and degassed mixture of 700 mL methanol, 300 mL of 1.5 g ammonium acetate, and 1 mL of diisopropylamine. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve USP Metolazone RS in water to obtain a solution having a known concentration of 1.0 µg per mL.

Assay preparation—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample into a 1000-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 20-cm analytical column that contains 5-µm packing L3. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time for metolazone is about 6.0 minutes, and the relative standard deviation for replicate injections is not more than 2.2%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of metolazone ($C_6H_9N_3O_3$) in the volume of Oral Suspension taken by the formula:

$$1000(C/V)(r_U/r_S),$$

in which C is the concentration, in µg per mL, of USP Metolazone RS in the *Standard preparation; V* is the volume, in mL, of suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Metoprolol Tartrate Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 25-cm column that contains 5-µm packing L1. The typical retention time for metoprolol tartrate is about 7.3 minutes.

(CRX: C. Okeke) RTS—42327-18

Add the following:

Metoprolol Tartrate Oral Suspension

» Metoprolol Tartrate Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of Metoprolol Tartrate. $((C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6)$. Prepare Metoprolol Tartrate Oral Suspension 10 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Metoprolol Tartrate	1 g
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free) and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF* a sufficient quantity to make	100 mL

NOTE—If Cherry Syrup, *NF* is used, it becomes a solution.

If using Tablets, place the Metoprolol Tartrate Tablets in a suitable mortar, and comminute the tablets, or add Metoprolol Tartrate powder. Add the Vehicle in geometric portions, and mix well. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add the Vehicle in portions to rinse the mortar. Add to the preparation to final volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature, or under refrigeration.

Labeling—Label it to state that it is to be well shaken, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Metoprolol Tartrate RS.*

pH ⟨791⟩**:** between 3.6 and 4.6 (Vehicle for Oral Solution and Vehicle for Oral Suspension) and between 3.0 and 3.8 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a suitable filtered and degassed solution by dissolving 961 mg of 1-pentanesulfonic acid sodium salt, monohydrate, and 82 mg of anhydrous sodium acetate in a mixture of 550 mL of methanol, 470 mL of water, and 0.57 mL of glacial acetic acid. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve USP Metoprolol Tartrate RS in water to obtain a solution having a known concentration of 100 µg per mL.

Assay preparation—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time

for metoprolol tartrate is about 7.3 minutes; and the relative standard deviation for replicate injections is not more than 1.3%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of metoprolol tartrate $((C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6)$ in the volume of Oral Suspension taken by the formula:

$$100(C/V)(r_U/r_S),$$

in which C is the concentration, in µg per mL, of USP Metoprolol Tartrate RS in the *Standard preparation; V* is the volume, in mL, of suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Norfloxacin Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 150-mm column that contains 5-µm packing L11. The typical retention time for norfloxacin is about 3.5 minutes.

(CRX: C. Okeke) RTS—42327-19

Add the following:

Norfloxacin Oral Suspension

» Norfloxacin Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of Norfloxacin. ($C_{16}H_{18}FN_3O_3$). Prepare Norfloxacin Oral Suspension 20 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Norfloxacin	2 g
Vehicle for Oral Suspension, *NF*. . .	50 ml
Strawberry Syrup: a mixture of	
3200 mL Syrup, *NF* and	
600 mL Strawberry Syrup, *NF,*	
a sufficient quantity to make	100 mL

If using Tablets, place the Norfloxacin Tablets in a suitable mortar and comminute well, or add Norfloxacin powder. Levigate with the Vehicle, using geometric proportions. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add the Strawberry Syrup in portions to rinse the mortar, and add to the preparation to final volume, and mix well.

Packaging and storage—Preserve in tight light-resistant containers. Store at controlled room temperature.

Labeling—Label it to state that it is to be well shaken, and to state the beyond-use date.

USP Reference standards ⟨11⟩—*USP Norfloxacin RS.*

pH ⟨791⟩**:** between 5.3 and 6.3.

Beyond-use date: 30 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a solution of 94 mM monobasic potassium phosphate, acetonitrile, methanol, and trifluoroacetic acid (80 : 15 : 5 : 0.3). Filter, and degas the *Mobile phase.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Sample diluent: water, acetonitrile, and methanol (80 : 15 : 5).

Standard stock preparation—Dissolve an accurately weighed quantity of USP Norfloxacin RS in 0.1 N hydrochloric acid to obtain a concentration of about 500 µg per mL.

Standard preparation—Dilute the *Standard stock preparation* with *Sample diluent* to obtain a solution having a known concentration of 5 µg per mL

Assay preparation—Pipet 250 µL of Oral Suspension from each bottle to a 10-mL volumetric flask, and dilute with 0.1 N hydrochloric acid to volume. Agitate the sample on a vortex mixer to ensure dissolution of Norfloxacin. Pipet 100 µL of this solution into a 10-mL volumetric flask, and dilute with *Sample diluent* to volume to obtain a concentration of 5 µg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 278-nm detector and a 4.6-mm × 150-mm analytical column that contains 5-µm packing L11. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 3.3 for norfloxacin; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of norfloxacin ($C_{16}H_{18}FN_3O_3$) in the volume of Oral Suspension taken by the formula:

$$4000(C/V)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Norfloxacin RS in the *Standard preparation; V* is the volume, in mL, of suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Ondansetron Hydrochloride Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 3.9-mm × 20-mm guard column that contains 4-µm packing L10, and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L10. The typical retention time for Ondansetron Hydrochloride is about 30 minutes.

(CRX: C. Okeke) RTS—42327-20

Add the following:

Ondansetron Hydrochloride Oral Suspension

» Ondansetron Hydrochloride Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of on-

dansetron hydrochloride. ($C_{18}H_{19}N_3O \cdot HCl \cdot 2H_2O$). Prepare Ondansetron Hydrochloride Oral Suspension 0.8 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Ondansetron Hydrochloride	80 mg
Vehicle for Oral Suspension, *NF* Vehicle for Oral Solution, *NF* (regular or sugar-free) (1 : 1), or Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

NOTE—If Cherry Syrup, *NF* is used, it becomes a solution.

If using Tablets, place the Tablets in a suitable glass mortar, and comminute well, or add Ondansetron Hydrochloride powder. In 5 mL portions, add the mixed Vehicle for Oral Suspension, and mix well. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add the mixed Vehicle for Oral Suspension in geometric portions to rinse the mortar, and add to the preparation to final volume, and mix well. If using Cherry Syrup, repeat as above, replacing mixed Vehicle for Oral Suspension with Cherry Syrup.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature or in a cold place.

Labeling—Label it to state that it is to be well shaken before use, and state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Ondansetron Hydrochloride RS.*

pH ⟨791⟩**:** between 3.6 and 4.6 (Vehicle for Oral Solution and Vehicle for Oral Suspension) and between 3.0 and 4.0 (Cherry Syrup).

Beyond-use date: 42 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a solution of 43 mM monobasic potassium phosphate buffer adjusted with a mixture of 1 N sodium hydroxide and acetonitrile (85 : 15) to a pH of 5.4. Filter and degas the solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Ondansetron Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 4 µg per mL.

Assay preparation—After each amber plastic vial containing Oral Suspension that is stored at 4° is brought to room temperature, pipet 500 µL of Oral Suspension from each bottle into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume. Pass through a 0.45-µm filter and keep frozen at –70° until assayed.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 216-nm detector, a 3.9-mm × 20-mm guard column that contains 4-µm packing L10, and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L10. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 30 minutes for ondansetron hydrochloride; and the relative standard deviation for replicate injections is not more than 1.6%.

Procedure—Separately inject equal volumes (about 80 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and

measure the responses for the major peaks. Calculate the quantity, in mg, of ondansetron hydrochloride ($C_{18}H_{19}N_3O$) in the volume of Oral Suspension taken by the formula:

$$200(C/V)(r_U/r_S),$$

in which C is the concentration, in µg per mL, of USP Ondansetron Hydrochloride RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Quinidine Sulfate Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 10-cm column that contains 5-µm packing L1. The typical retention time for quinidine sulfate is about 8.5 minutes.

(CRX: C. Okeke) RTS—42327-21.

Add the following:

Quinidine Sulfate Oral Suspension

» Quinidine Sulfate Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of quinidine sulfate ($(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O$). Prepare Quinidine Sulfate Oral Suspension 10 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Quinidine Sulfate	1 g
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free) and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

NOTE—If Cherry Syrup, *NF* is used, it becomes a solution.

If using Quinidine Sulfate Tablets, place in a suitable mortar, and comminute into a fine powder, or add Quinidine Sulfate powder to the mortar. Add about 15 mL of the Vehicle, and mix to a uniform paste. Add the Vehicle in geometric portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to the calibrated bottle. Add sufficient Vehicle to volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store at room temperature or in a cold place.

Labeling—Label it to state that it is to be well shaken before use, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Quinindine Sulfate RS.*

pH ⟨791⟩**:** between 3.4 and 4.4 (Vehicle for Oral Solution and Vehicle for Oral Suspension), and between 3.2 and 4.0 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Methanesulfonic acid solution—Add 35.0 mL of methanesulfonic acid to 20.0 mL of glacial acetic acid, dilute with water to 500 mL, and mix.

Diethylamine solution—Dissolve 10.0 mL of diethylamine in water to obtain 100 mL of solution.

Mobile phase—Prepare a suitable filtered and degassed solution of water, acetonitrile, *Methanesulfonic acid solution*, and *Diethylamine solution* (80 : 20 : 2 : 2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve USP Quinidine Sulfate RS in *Mobile phase* to obtain a solution having a known concentration of about 100 µg per mL.

Assay preparation—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix on a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 235-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the 100 µg per mL *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time for quinidine sulfate is about 8.5 minutes, and the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of quinidine sulfate $(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O$ in the volume of Oral Suspension taken by the formula:

$$100(C/V)(r_U/r_S),$$

in which C is the concentration, in µg per mL, of USP Quinidine Sulfate RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Sumatriptan Succinate Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 10-cm column that contains 5-µm packing L1. The typical retention time for sumatriptan succinate is about 11 minutes.

(CRX: C. Okeke) RTS—42327-22

Add the following:

Sumatriptan Succinate Oral Suspension

» Sumatriptan Succinate Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of sumatriptan succinate ($C_{14}H_{21}N_3O_2S \cdot C_4H_6O_4$). Prepare Sumatriptan Succinate Oral Suspension 5 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Sumatriptan Succinate	500 mg
Vehicle for Oral Suspension, *NF* . . .	25 mL
Vehicle for Oral Solution, *NF* (regular or sugar-free), a sufficient quantity to make	100 mL

If using Tablets, comminute into a fine powder using a suitable mortar, or add Sumatriptan Succinate powder to the mortar. Add about 25 mL of the Vehicle for Oral Suspension in 5-mL portions, mixing thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add sufficient Vehicle for Oral Solution to bring to final volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store at a controlled room temperature or in a cold place.

Labeling—Label it to state that it is to be well shaken before use, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Sumatriptan Succinate RS.*

pH ⟨791⟩**:** between 3.6 and 4.6.

Beyond-use date: 14 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a solution of 0.01 M dibutylamine in 0.025 M aqueous monobasic sodium phosphate dihydrate and acetonitrile (75 : 25). Adjust with 1 N sodium hydroxide to a pH of 8.0, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Internal standard solution—Dissolve an accurately weighed quantity of *N*-hydroxymethylsumatriptan in *Mobile phase* to obtain a known concentration of about 3.0 mg per mL.

Standard stock preparation—Dissolve an accurately weighed quantity of USP Sumatriptan Succinate RS in *Mobile phase* to obtain a known concentration of about 4.0 mg per mL.

Standard preparation—Dilute the *Standard stock preparation* with *Mobile phase* to obtain a solution having a known concentration of about 120 µg per mL. Each solution contains 30 µg per mL of *Internal standard solution.*

Assay preparation—Transfer about 1 mL of Oral Suspension from each bottle to a suitable container, and dilute with 0.1 M hydrochloric acid to obtain a concentration of about 0.15 mg per mL. Pass the solution through a 0.22-µm filter into a 0.3-mL polypropylene sample vial for assay.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 282-nm detector and a 4.6-mm × 10-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention times for sumatriptan and *N*-hydroxymethylsumatriptan are 11 and 14 minutes respectively; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of sumatriptan succinate ($C_{14}H_{21}N_3O_2S \cdot C_4H_6O_4$) in the volume of Oral Suspension taken by the formula:

$$100(C / V)(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Sumatriptan Succinate RS in the *Standard preparation; V* is the volume, in mL, of suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Verapamil Hydrochloride Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being previewed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 25-cm column that contains 5-µm packing L1. The typical retention time for verapamil hydrochloride is about 4.8 minutes.

(CRX: C. Okeke) RTS—42327-25

Add the following:

Verapamil Hydrochloride Oral Suspension

» Verapamil Hydrochloride Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of verapamil hydrochloride ($C_{27}H_{38}N_2O_4 \cdot HCl$). Prepare Verapamil Hydrochloride Oral Suspension 50 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Verapamil Hydrochloride	5 g
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free) and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

NOTE—If Cherry Syrup, *NF* is used, it becomes a solution.

If using Verapamil Hydrochloride Tablets, comminute to a fine powder using a suitable mortar, or add Verapamil Hydrochloride powder. Add about 40 mL of the Vehicle in geometric portions, and mix to obtain a uniform paste. Transfer the mortar contents, stepwise and quantitatively, to a calibrated bottle. Add the Vehicle in portions to rinse the mortar, add sufficient Vehicle to final volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature or in a cold place.

Labeling—Label it to state that it is to be well shaken before use, and to state the beyond-use date.

USP Reference standards ⟨11⟩—*USP Verapamil Hydrochloride RS.*

pH ⟨791⟩**:** between 3.8 and 4.8 (Vehicle for Oral Solution and Vehicle for Oral Suspension) and between 3.0 and 3.8 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a suitable filtered and degassed mixture of .01 M sodium acetate with a mixture of acetic acid having a concentration of 33 mL per L, acetonitrile, and 2-aminoheptane (50 : 50 : 0.5). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve USP Verapamil Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of 500 µg per mL.

Assay preparation—Agitate containers of Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, store in a clear glass vial at –70° until analyzed. At time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix on a vortex mixer for 30 seconds. Pipet 1.0 mL into a 10-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 278-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 0.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time for verapamil hydrochloride is about 4.8 minutes, and the relative standard deviation for replicate injections is not more than 0.7%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of verapamil hydrochloride ($C_{27}H_{38}N_2O_4 \cdot HCl$) in the volume of Oral Suspension taken by the formula:

$$100(C/V)(r_U/r_S),$$

in which C is the concentration, in µg per mL, of USP Verapamil Hydrochloride RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of authoritative committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* and *Pharmacopeial Previews* sections. Readers interested in submitting comments should see *Instructions to Authors.*

Pharmacopeial Forum
Vol. 31(3) [May–June 2005]

Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP–NF* revision will be considered for publication in the *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention, Inc., (USPC) and may not be published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

References—Consult a current copy of the *Pharmacopeial Forum* and the *ACS Style Guide* for assistance with reference style.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Contact Person—When submitting a manuscript, designate one author of the article as correspondent and include that author's full address, telephone number, fax number, and e-mail address.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Graphics that cannot be submitted electronically must be camera-ready, of easily reproducible quality and size, and clearly labeled. Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

Process Characterization and Validation for Protein Products

Janice T. Brown, Gregory C. Davis, John Geigert, Wesley E. Workman, and Lynn C. Yeoman, *USP Biotechnology and Natural Therapeutics and Diagnostics Expert Committee;* John Dougherty, *Eli Lilly;* and Kurt Brorson, *FDA/CDER*[*]

ABSTRACT Process characterization and validation are essential to the production of quality proteins from both recombinant and natural sources. This *Stimuli* article describes approaches for studies to validate and optimize manufacturing processes at various stages of a protein product's life cycle. A proposed new *USP* General Chapter will provide general guidance on the extent of process characterization necessary at each stage of the protein product's life cycle. A life-cycle approach to process validation not only spares precious research resources but also allows the experimentation necessary to develop robust processes that produce quality protein products. Readers are invited to submit comments, suggested additions, changes, and revisions.

INTRODUCTION

Quality cannot be inspected or tested into a product, but instead it must be achieved by design and control of the manufacturing process, which consists of: (1) detailed instructions for carrying out the defined manufacturing process, (2) comprehensive in-process monitoring and quality controls, (3) final product testing, and (4) process validation.

Process validation is establishing documented evidence that provides a high degree of assurance that a specific process operated within established parameters performs effectively and reproducibly to produce a product meeting its predetermined specifications and quality attributes. Process validation is not simply a three-batch study but is instead a life-cycle concept that starts with preliminary process controls for products used in Phase 1 clinical studies, continual process characterization during clinical development, formal process validation studies for market approval, and continuing revalidation throughout the lifetime of the manufacturing process.

There are three approaches to process validation: (1) prospective (process validation conducted prior to product distribution), (2) concurrent (process validation conducted during routine production), and (3) retrospective, (process validation conducted for a product already in distribution). Prospective process validation is the preferred approach, but in some exceptional cases concurrent process validation can be justified (e.g., limited or infrequent manufacturing runs). Only rarely is retrospective process validation justifiable (e.g., for well-established processes). Regardless of the validation approach used, the following validation elements are required: preapproved written validation protocol with predefined acceptance criteria, followed by a reviewed and approved written validation report.

The complex nature of macromolecular pharmaceuticals of biological and biotechnological origin requires rigorous design and control of the manufacturing process. The purpose for this proposed *USP* General Chapter is to provide general guidelines for carrying out process validation on biological/biotech specific manufacturing processes.

PHASE 1

Phase 1 clinical studies are designed to assess product safety and occasionally to determine the maximum tolerated dose (MTD) for a given substance. Process development is an on-going activity, and no expectations should exist that the final process, specifications, or product assays will be set on material used in Phase 1 trials. In some instances, early Phase 1 work is performed at academic centers where the product is manufactured in a laboratory rather than a GMP facility. In these cases, the facility and/or processes used during Phase 1 are unlikely to be used in subsequent clinical studies.

At early stages of the product life cycle, a balance must be met between process development, setting of specifications, and initiating assay development and validation. These activities should be pursued early enough to accelerate development of products that turn out to be clinically and economically viable, while at the same time not so early that full-scale process and assay validation activities are conducted for unproven products. This balance will likely vary between individual products and corporate development strategies, but at a minimum they should include consistent production of the active pharmaceutical ingredient (API) with similar or improving quality attributes, setting reasonable and achievable interim specifications, and qualification of critical assays needed to define safety and potency. Critical assays should be sufficiently robust and reproducible to allow comparisons between early-phase product and

[*] The views presented in this article do not necessarily reflect those of FDA. No official support or endorsement by the Food and Drug Administration is intended or should be inferred.

product made for later clinical trials if development proves successful. Careful documentation of the development program and archiving of data, process, and final product samples are also important in maintaining continuity if development progresses beyond Phase 1.

Regulatory requirements for product and process characterization in Phase 1 focus on product safety rather than in-depth characterization of the physico-chemical and biological attributes of the product. Detailed molecular characterization of the API, although important, generally is not needed for material used in Phase 1 studies (*1*). Examples of safety requirements prior to the initiation of the Phase 1 study include validation of the removal of murine retroviruses and other viruses by the purification process. This is required because rodent cell lines, such as Chinese hamster ovary (CHO) cells and murine hybridomas spontaneously produce endogenous type C retrovirus particles because their genomes contain dozens of copies of retroviral sequences. Harvests from mammalian cell cultures can be expected to contain some level of type C particles, and the purification process should be demonstrated to be able to remove sufficient particles to ensure that fewer than one dose in every one million will potentially contain one viral particle.

Other microbiological considerations in Phase 1 include testing harvests and cell banks for potential bacterial, fungal, or viral contaminants. The scope of testing required for marketed products is described in the International Conference on Harmonization (ICH) Q5A document (*2*). At a minimum in Phase 1 the cell banks should be screened for sterility, and freedom from mycoplasma and adventitious viruses using in vitro co-cultivation assays. Cell culture harvests should be screened routinely for mycoplasma and adventitious viruses using in vitro co-cultivation assays. To prevent introduction of Transmissible Spongiform Encephalopathies (TSEs) into the product, animal-derived raw materials should not be sourced from countries under USDA import ban. Products made with primate-derived cell lines should be stringently screened for relevant human pathogens (*1, 2*). Finally, bioburden in intermediates during downstream processing should be minimized in order to prevent significant introduction of endotoxin or other bacterial contaminants into intermediates or the final product. For drugs intended for parenteral use, it is expected that product in its final dosage form will be sterile filtered into sterile container/closure systems in class 100 conditions. During Phase 1, it is acceptable to perform this process manually in class 100 laminar-flow tissue culture hoods if no other facility is available (e.g., at an academic institution).

Other product safety considerations in Phase 1 are likely to be product specific. For example, oncology products such as anti-tumor monoclonal antibody–toxin complexes may have presumed effective doses close to the MTD. In these cases, having a highly precise and reproducible potency assay is particularly critical to avoid overdosing. Product mix-ups at multi-product or contract facilities producing several products such as multiple monoclonal antibodies could easily confound clinical studies and raise safety issues. A highly specific identity test in this case would be the front line against potential product mix-ups and would be expected by regulatory authorities.

Stability studies should be initiated immediately before Phase 1 studies. These stability studies should focus on continued product stability during the clinical trials. However, it is not too early to start to define stability-indicating assays, determine optimal storage conditions, and start developing formulations that maximize stability of the API.

PHASE 2

Many products fail in early clinical studies; therefore, due to economic reasons extensive process validation studies beyond safety considerations do not start until there is a reasonable certainty that the drug candidate will progress to market. Typically these activities are not initiated until late in Phase 2 trials or early in the pivotal trials. Starting process validation too early in the development process may lead to repeating many of the studies; waiting to start process validation may delay a regulatory submission and final drug approval. Preliminary characterization of the process should be initiated sometime during Phase 2 trials. The challenge during Phase 2 is to optimize the time and cost of process development. Data collected during the process characterization stage provide a basis for developing the commercial process and will serve as the foundation for later process validation studies.

Manufacturing of the product used in Phase 2 trials typically occurs at pilot scale and only rarely at laboratory or commercial scale. Equipment used in manufacturing the drug substance and drug product should be qualified to ensure that data collected from the process can satisfactorily be evaluated and transferred when the process is scaled up and validated. For example, culture conditions collected during fermentation—including pH, temperature, dissolved oxygen, and feed rates—can be evaluated only if adequate calibration of the monitoring equipment has been performed. Monitoring the quality of intermediates, final product, and equipment operating parameters during the manufacture of developmental and clinical trail batches facilitates later identification of critical parameters that influence the quality of the drug and affect the reproducibility of the process. Critical operating parameters usually are determined by analyzing data that affect the physico-chemical and biological characteristics, impurity profile, or yield of the product.

Development activities for the product used in early Phase 2 studies should emphasize developing and qualifying analytical methods and reference standard to adequately identify the quality of drug substance intermediates, drug substance, and the drug product. For example, if a process change increases the yield at a specific step, the level of product- and/or process-related impurities also may increase. Without adequate methods to evaluate the quality of intermediates and final product, changes to the process may lead to a product with levels of impurities and related substances that are outside qualified levels. As changes are made to the manufacturing process, levels of impurities

should not exceed drug product levels used in the pharmacology/toxicology and clinical studies. The driving force for collecting manufacturing data in early product development is to collect of body of knowledge about the process, develop an understanding of each unit operation, determine the level of clearance of impurities at each step, justify process adjustments during scale-up, identify critical control points and operating ranges that will be monitored later in the commercial process, and determine how and if impurities and related substances will be monitored in later validation studies.

During product development there may be optimization of the manufacturing process ranging from minor adjustments to a specific step to extensive process modifications. When developing a manufacturing process, operators must understand how each step in the process affects the impurity profile of the drug. Process optimization can be evaluated only if the purity and impurity profile of the drug are known. To determine the type and level of impurities, adequate method development and reference standard qualification should be completed by the end of the Phase 2 program. Full characterization is not always performed, but the purity of the desired product and relative levels of each impurity should be identified and provisional drug substance acceptance criteria should be established. Although in-process controls are still in development, based on the manufacturing history there should be some identified control points in each unit operation to ensure the product will meet the tentative limits in the specifications. Typical control points include input and output parameters that affect whether the intermediate can be processed in subsequent steps.

As a general rule to successfully validate a manufacturing process, the following steps should be performed by the end of the Phase 2 studies: (1) Appropriately scale up the manufacturing process, and minimize any significant process changes that could produce a drug product with characteristics outside of the clinically desired experience; (2) establish operating ranges (input variables) and product quality attributes (output variables) for each manufacturing step; (3) identify critical control parameters and establish in-process controls; and (4) conduct prevalidation runs or qualification trials. Each of these categories is described in detail below.

Manufacturing Scale-Up and Laboratory Runs

By the end of the Phase 2 studies, the commercial manufacturing process should be completely developed. Significant process changes should be minimized unless the change provides an improvement to the quality of the product, significantly reduces the cost of production, improves the robustness and/or reduces the variability of the process, or facilitates transfer to the commercial plant. Small-scale studies typically are performed prior to or concurrently with the production scale up. Small-scale studies are crucial in determining process performance characteristics because evaluating parameters for each unit operation at full scale is extremely costly and time consuming. Characterization of the process using a scaled-down version of the commercial process involves varying process parameters for each manufacturing step and assessing the impact on product quality and process performance. The results of these studies typically are used to support the in-process controls for each manufacturing step, identify and/or verify critical operating parameters, and determine the capability of the overall process. Product comparability studies should bridge the pre- and post-change products.

Establish Operating Ranges and Product Quality Attributes

Operating parameters with defined ranges and intermediate quality attributes for each manufacturing step should be defined. This can be determined by establishing a Proven Acceptable Range (PAR). The PAR includes the upper and lower tolerances for each control step based on a review of previous laboratory and developmental batch data. Determining the PAR for each process parameter can be performed using a process characterization document. This document summarizes the previous manufacturing history, including process conditions, equipment operating ranges, quality of intermediates, quality of raw materials, equipment list and qualification studies, intermediate holds, stability data, and equipment cleaning validation. An added benefit for a comprehensive process characterization document is that it can be used to justify the quality of an intermediate when a manufacturing deviation occurs during commercial manufacturing if a specific process parameter falls outside an acceptable range.

Critical Control Parameters

Once the process characterization document is assembled, the critical control parameters should be identified, and in-process controls should be established. For all control parameters once the upper and lower limits have been defined, the set point typically is operated in the middle of the range. In an early Phase 2 program, in-process control testing of intermediates does not need acceptance criteria for all tests; however, assessing the quality of intermediates helps to identify operating parameters that may affect product quality attributes. If levels of impurities decline or product-related substances are consistently removed and testing is performed to establish levels at specific steps, removal of certain in-process testing and/or exclusion in the drug substance and/or drug product specifications may be justified.

For well-established manufacturing steps such as sterile filtration and lyophilization, standard industry practice can be used to identify critical process parameters. In other cases, the determination of parameters deemed critical or noncritical may not be easily identifiable. Manufacturing steps that have a large number of variables are especially problematic; the same is true when a product quality attribute is a function of two or more variables. Stress studies (e.g., effect of pH, time/temperature, H_2O_2) on product and/or intermediates can suggest parameters that may or

Pharmacopeial Forum
Vol. 31(3) [May–June 2005]

may not be critical in a given manufacturing step. In laboratory-scale studies, a design of experiment (DOE) approach can be very useful in optimizing processes and identifying critical parameters or critical combinations of parameters in a given manufacturing step or process. Critical and noncritical parameters are identified/verified by a qualified laboratory-scale version of the commercial process. Determining the ranges to evaluate in a scaled-down study depends on the parameter. For example, in a chromatography step if the maximum column load is 10 mg of product per mL of resin and acceptable results are obtained, testing at ranges below 10 mg/mL is not necessary. Other parameter testing usually is performed over a range centered on but at least three times larger than the normal operating range. For example, if a normal operating temperature range for a manufacturing step is ±3 °C with a target temperature of 30 °C (27–33 °C) studies over a range of 21–39 °C could be used to determine if temperature is critical in a given manufacturing step.

The definition of a critical process parameter (CPP) is a parameter for which the PAR is ≤2 times the Normal Operating Range (NOR). Temperature in the example above would be a CPP if the process failed to produce an acceptable product when operated between 34 and 36 °C. Evaluation of several variables operating at the extreme of the operating ranges can help identify optimum operating conditions and determine when failures are likely to occur. It is important to have adequate statistical analysis when two or more variables are evaluated. Scaled-down studies also can be used to support process changes during development and can identify parameters that lead to process variability. The suitability of manufacturing steps, parameters, and processes also can be analyzed using a six-sigma approach to determine Cpk (process capability index), principal component analysis (PCA), or partial least squares (PLS) analysis. A Cpk value of less than 1.33 usually means a process is not capable of reproducibly yielding a quality product.

Trials

Manufacturing trial batches should be produced at the commercial scale prior to execution of the process validation study to ensure that any process parameter changes resulting from scale up are appropriate. The production of these trial batches also serves an important role in ensuring that process analytical technologies utilized to monitor and/or control the process are functioning in accordance with predetermined design criteria and are suitable for their intended use. Phase 2 is the time to make any corrections or changes in the process in the event that the data collected in the small-scale study do not directly transfer to the full-scale process. Manufacturing trials generally are approached by assessing the process in stages: upstream—fermentation, midstream—isolation/purification of protein, and downstream—modification/derivatization of protein. Operating ranges generally are tighter than the acceptable ranges to build ruggedness into the process.

PHASE 3

Prerequisites to Process Validation

The purpose of the process validation study is to confirm, by rational experimental design, that the manufacturing process will reliably produce acceptable product. Characterization of the process and the application of process analytical technologies (PAT) to the intended commercial process provide a high level of process understanding and control capability, thereby providing additional assurance that the process will reliably produce acceptable product. A number of activities must be completed prior to the start of the prospective validation study for the commercial-scale drug substance and drug product manufacturing process. Completion of these activities is fundamental to managing the risks associated with undertaking the process-validation study. The following prerequisites should be completed prior to initiating the process qualification batches:

1. Quality Control Unit

Quality systems must be established and operational as prescribed by applicable current Good Manufacturing Practices (cGMP) e.g., ICH Q7A (*3*) and 21 *CFR* Parts 210 and 211.

2. Equipment and Facility Qualification

Qualification activities must be completed for all equipment, utilities, and the manufacturing facility used in the production and testing of the drug substance and drug product. Appropriate references should be consulted for guidance pertaining to these activities.

3. Method Validation

Analytical procedures associated with testing raw materials, product intermediates, drug substance, and drug product must be fully validated in accordance with the requirements set forth in ICH Q2A (*4*), Q2B (*5*), and applicable compendia. Analytical systems associated with at-line, on-line, or in-line process analysis should be validated to ensure that they are suitable for their intended use.

4. Raw Materials

Quality attributes for raw materials used in the drug substance and drug product manufacturing process must be identified to support qualification activities. An appropriate quality system and/or testing of raw materials to predetermined acceptance criteria are necessary to demonstrate that raw materials are suitable for their intended use.

5. Validation Master Plan (VMP)

A VMP is a document that provides an overview of all activities associated with the process validation study. The VMP serves as the conceptual framework that ensures an integrated systems approach is incorporated into the validation study. This plan should contain or provide reference to the documents associated with the qualification activities discussed above. The VMP serves as the repository for

the preapproved process validation protocol(s), detailed validation report(s) containing the data, and conclusions obtained from the study. The VMP also makes references to studies in the process characterization document.

6. Process Validation Protocol

The Process Validation Protocol contains a summary of the intended commercial-scale manufacturing processes for drug substance and drug product. The purpose of individual processing steps should be stated and supported by data provided in the Process Characterization Document. Specifications for process intermediates, drug substance, and drug product are established in accordance with the requirements set forth in ICH Q6B (*6*). The body of knowledge obtained during process development and characterization activities is used to establish predetermined acceptance criteria for critical process parameters, criteria for forward processing of intermediates (in-process controls), and to justify noncritical parameters for each unit operation. Additional product characterization tests and associated acceptance criteria should be considered in order to provide additional assurance that the process reliably produces acceptable product. The Process Validation Protocol also should address whether monitoring of process- and product-related impurities will be performed as part of quality control testing (in-process control or drug substance specifications) or whether validated removal will be used to support elimination of testing in the drug substance or drug product specification. Product- and process-related impurities include, but are not limited to, host cell DNA, cell culture components (antibiotics, chemical inducing agents), endotoxins, leachates from chromatographic matrices, and other materials introduced during processing. The use of process validation to meet specification requirements for an impurity is based on the levels in the product used in the clinical studies and the clinical consequences.

Stability protocols containing predetermined acceptance criteria for stability-indicating product quality attributes are developed and included in the Process Validation Protocol. These protocols are intended to support the establishment of drug substance process intermediate hold times and drug substance and drug product expiration dates. Protocols are developed in accordance with the requirements set forth in applicable ICH Q1 stability guidelines.

Critical process parameters, in-process controls, in-process specifications, release specifications, and additional testing requirements serve as the basis for the Process Validation Protocol for batches produced at commercial scale. Performance of these runs qualifies the manufacturing process. The criteria for these runs also serve as the basis for parameters that will be trended and reviewed on a periodic basis over the life of the product. All these components together define Process Validation of the drug substance and drug product. Using the defined process, technicians prepare a series of production batches under routine conditions. The identified batches are tested in accordance with the predetermined analytical procedures described in the Process Validation Protocol. The results from these tests are compared to the predetermined acceptance criteria provided in the protocol. It is generally considered acceptable that three consecutive batches produced within the predetermined acceptance criteria constitute a validation of the process. It is important to note that batches intended for commercial sale must be produced at the intended manufacturing scale.

A departure from the acceptance criteria contained in the validation protocol explicitly concludes that the process has not been validated. Departures must be investigated in accordance with established procedures. Causal factors should be identified and remedial actions implemented prior to the initiation of additional validation studies.

MAINTENANCE OF THE VALIDATED STATE

Once the manufacturing process has been successfully transferred and validated for commercial production, the process must be maintained in a validated state. This requires active stewardship and involves not only manufacturing site management but also technical services and quality. On an annual basis, process data from the last year should be reviewed to determine whether the process as validated is still performing to expectations. This annual review should consider such data as deviation history (number, type, by manufacturing step, corrective actions taken, etc.), rejected lots and the basis for rejection, product complaints, recalls, and adverse event data. The latter data may not provide any clear signal; however, for some product types (e.g., parenterals) certain adverse events can signal possible manufacturing issues (e.g., injection site abscess). All change controls should be assessed to determine if the number and extent of changes warrant possible revalidation. Trend analysis should be conducted for all in-process and final lot data. Stability data should be compared against the registration commitments to determine if the degradation rates and impurities profiles are consistent. When technically feasible, the application of PAT for continuous process control is encouraged. Evaluation of PAT data over time can provide powerful insights regarding the maintenance of the validated state.

If upon completion of an annual review, there appears to be a change in the performance of the process, the manufacturer should consider additional technical evaluations to get to the root cause of performance change. Ultimately, if performance data are sufficiently different from the process as originally validated, then revalidation may be needed. The manufacturer may consider a planned revalidation every 3–5 years as a matter of good stewardship to demonstrate that the process is still in control, capable, and compliant with regulatory commitments.

The Use of Relative Response Factors to Determine Impurities

Lokesh Bhattacharyya,* Horacio Pappa, Karen A. Russo, Eric Sheinin, and Roger L. Williams, *U.S. Pharmacopeia*

ABSTRACT Relative Response Factor is a critical analytical parameter widely used in chromatographic procedures to control impurities in drug substances and dosage forms. Lacking a standardized approach, manufacturers develop case-by-case solutions, which reduces the likelihood "of ensuring that measurements made at different times, by different analysts, or with different methods can be confidently compared"—a goal of sound metrology *(1).* Inconsistencies also exist in the *USP–NF* monographs and, in a few cases, even within the same monograph. The use of the parameter is left open to the interpretation of the monograph user, which may lead to the possibility of misinterpretation. This *Stimuli* article reviews approaches to Relative Response Factors, elucidates their nomenclature and applications, and proposes ways in which they can be standardized throughout *USP–NF* and *PF.*

INTRODUCTION

Impurities have drawn significant attention recently as critical quality attributes for drug substances and dosage forms. This has been reflected in the International Conference on Harmonization (ICH) Q3 guidelines, Food and Drug Administration (FDA) guidance documents, and the USP *Guideline for Submission of Requests for Revision to USP–NF.*

Optimally, official USP Reference Standards for impurities should be relied on in the execution of a monograph's *Impurity* test. In this regard, USP offers more than 300 reference standards for impurities and is working to offer many more. However, official USP Reference Standards for impurities may not be available for a number of reasons, including lack of donation, difficulty in isolation, and difficulty in synthesis. Where an appropriate reference standard(s) is not available, a USP monograph, relying on instrumental techniques (e.g., gas or liquid chromatography), may help control the impurities in a compendial article through reliance on the Relative Response Factor (RRF) approach, usually in conjunction with an official USP Reference Standard for the corresponding drug substance. The approach allows expressing the mass of an impurity in terms of the mass of its corresponding drug substance, e.g., a specified impurity is present in the article at a mass of 0.1% of the mass of the drug substance. This correlation between the response factor (RF) of the impurity or impurities and the drug substance must be documented in the validation data submitted by a Sponsor in a Request for Revision.

An RRF value, which is specific to a given set of experimental conditions, compares the instrumental responses of the impurity and the drug substance reference standard and is incorporated into a formula as a means to correct for differences in detector response. An additional valuable parameter in the *Impurity* test procedure is the Relative Retention Time (RRT). *USP–NF* monographs often use RRTs and RRFs to identify and control impurities.

Approximately 120 of the monographs published in *USP 28–NF 23* and in *Pharmacopeial Forum (PF)* to Vol. 30, No. 6 (see *Table 1* following References) use an RRF for the determination of impurities. The remainder either do not test for impurities or use a peak area approach. At present, *USP–NF* does not have an official definition or standard for the use of RRF, nor do FDA guidances and ICH guidelines. USP monographs also present at times differing approaches and nomenclature. A review of *USP–NF* monographs shows that the same parameter is termed differently in different monographs (*Table 1*). Some of the monographs use the term *Response Factor,* some use the term *Relative Response Factor,* and others use *Correction Factor.* Furthermore, in some formulas for calculation of percent impurity, the term is used in the numerator and in others it is used in the denominator. In addition, the number of decimal places used to express the RRF differs among monographs from one to four decimal places. A few examples will illustrate these issues.

Example 1

The Metrifonate monograph states:

> Calculate the percentage of each impurity taken by the formula:
>
> $$100F(r_i / r_S),$$
>
> in which F is a response factor, being 0.38 for the desmethylmetrifonate peak, if present at a retention time of 0.5 relative to that of Metrifonate, 0.03 for the dichlorvos peak, if present, at a retention time of 1.9 relative to that of Metrifonate, and 1.0 for any other impurity . . .

* Correspondence should be addressed to: Lokesh Bhattacharyya, Ph.D., Director, Department of Standards Development, USP, 12601 Twinbrook Parkway, Rockville, MD 20852-1790; tel. 301.816.8201; e-mail lb@usp.org.

In this example, the term *F* is denoted as "response factor" and is used to mean the same parameter as RRF in other monographs. The term is used in the numerator in the formula to calculate the percentage of each impurity in the drug substance. The RF values are expressed to two decimal places when they are less than 1.0 and to one decimal place when it is equal to 1.0. However, the value of the RF for the dichlorvos peak is extremely low, 0.03, which could result in underestimation of the impurity (discussed in greater detail later in this article).

Example 2

The Oxandrolone monograph proposed in *PF* 31(1) (pp. 64–67) states:

> Calculate the percentage of each impurity in the portion of Oxandrolone taken by the formula:
>
> $$500(1/F)(C/W)(r_i / r_S),$$
>
> in which *C* is the concentration . . . *F* is the relative response factor and is equal to . . .

In this monograph the term *F* is denoted as the RRF and is used in the same sense as RF in Example 1. In contrast to Example 1, here the term appears in the denominator in the formula. As in Example 1, the values of the RRF in this monograph are given to two decimal places if they are below 1.0 and to one decimal place when they are $\geq$1.0 (not shown).

Example 3

The Clarithromycin monograph indicates:

> Calculate the percentage of each impurity in the Clarithromycin taken by the formula:
>
> $$50(C_C/W)(r_i F/ r_C)P,$$
>
> in which C_C is the concentration . . . *F* is 1.0, or correction factor of 0.27, and 0.15 applied to the responses for peaks at relative retention times in relation to that of clarithromycin . . .

In this monograph, the term *F* is called "correction factor" but is used in the same sense as "response factor" in Example 1 and "relative response factor" in Example 2. Note that it appears in the numerator in the formula. As in the two examples above, the values of *F* are expressed to two decimal places when the values are less than 1.0 and to one decimal place when the value is equal to 1.0 in this monograph.

Example 4

The Sevoflurane monograph indicates:

> [For] other known impurities . . . their amounts present are determined using their respective relative response factors (*Table 2*) by the formula:
>
> $$FC_{SME–std}\ (r_i / r_{SME–std})$$
>
> Use the relative response factor of SME [USP Sevomethyl Ether RS] to calculate the unknown impurities. *F* is the relative response factor of the known impurity not present in the *Standard solution* . . .

Table 2

Impurity	Relative Retention Time	Relative Response Factor
Sevomethyl ether	1	1
2-Chloropropane	0.48	0.4092
Dichloromethane	0.76	1.5141
Chlorosevo ether	2.23	1.0884
Hexafluoroisopropyl formate	1.47	1.3068
Unknown impurities	—	1

In this example, the term *F* is called the "relative response factor." It appears in the numerator in the formula. Also, the values of *F* are expressed to four decimal places, except for Sevomethyl ether and "Unknown impurities," for which the values are given as 1 (without any decimal place). Also, the values of the RRT of four of the impurities are given to two decimal places, but that of Sevomethyl ether is expressed without any decimal place.

Example 5

The Fluvastatin Sodium monograph indicates:

> Calculate the percentage of each impurity, except for 3-hydroxy-5-keto fluvastatin . . .
>
> $$100F(C_S / C_T)(r_{i(305)} / r_{S(305)})$$
>
> in which *F* is the relative response factor as listed in *Table 3*. [NOTE—Use *F* equal to 1.0 for unknown impurities]. . .

Table 3

Impurity	Relative Retention Time	Relative Response Factor (*F*)	Limit (%)
Fluvastatin *N*-ethyl analog	0.7	0.9	0.1
Fluvastatin anti-isomer	1.2	1.0	0.8
3-Hydroxy-5-keto fluvastatin	1.5	0.037	0.1
3-Keto-5-hydroxy fluvastatin	1.6	1.6	0.1
Fluvastatin hydroxy-diene	2.0	1.1	0.1
Fluvastatin short-chain aldehyde	3.0	0.7	0.1
Fluvastatin *t*-butyl ester	3.4	1.1	0.2

In this example, the term *F* is called "relative response factor" and is used in the numerator in the formula. The values are given to one decimal place except for the impurity 3, for which it is given to three decimal places. Also, the value of impurity 3 is extremely small. In addition, the values of the RRT are given to one decimal place, but in Example 4 the values of the RRT of four of the impurities are given to two decimal places.

DISCUSSION

The inconsistencies in different *USP–NF* monographs regarding terms used for RRF, how it is used in the formulas, and the number of decimal places to which the values are expressed can be traced primarily to the different approaches adopted by different Sponsors of Requests for Revision. The RRF is placed in the numerator or in the denominator in the formula for calculating percent impurity depending on how it is defined. *Appendix A* shows that the term should be in the numerator if it is defined as the RF of the drug substance divided by that of the impurity. Conversely, it should be in the denominator if it is defined as the ratio of the RF of an impurity to that of the drug substance. That is why the formulas contain RRF in the denominator in many monographs and in the numerator in many others, depending upon how the company that submitted the monograph defined it.

One can argue that whether the term is in the numerator or in the denominator may not be an issue if a monograph indicates how it is defined or calculated. However, current monographs provide values only for the RRF—but, generally, give no details about its calculation. Thus, it is left open to judgment and interpretation by the user of the monograph (other than the submitter) with the consequent possibility of misinterpretation. Furthermore, the fact that RRF is used differently in formulas in different monographs is contrary to the practices of standardization to which USP is committed. As an example, consider that a monograph indicates that the RRF of an impurity is 0.65. Because the monograph does not say how it is defined or calculated, this could be the peak response of the impurity divided by the peak response of an equal amount of the drug substance—or it could be the peak response of the drug substance divided by the peak response of an equal amount of the impurity. The monograph Sponsor knows how it was calculated, but other users are not informed, raising the possibility of differing application and an incorrect result.

USP also does not have any requirement regarding the range over which an RRF can be used. The *British Pharmacopoeia* requires that an RRF be used only if it is in the range 0.2–5.0 *(2).* It is difficult to accept such a "one size fits all" approach without appropriate scientific justification. The acceptable value of the RRF should depend upon the analytical parameters of the *Impurity* test procedure, including the linear range, accuracy, and the robustness. If an RRF value is calculated based on the data obtained outside the linear ranges of the impurity and the drug substance (either below the Limits of Quantitation or above the linear range determined during validation), the impurity percentage is likely to be underestimated. Such an approach is inconsistent with the requirements of the ICH Q3A(R) guideline *(3),* which states,

> *"The drug substance can be used as a standard to estimate the levels of impurities. In cases where the response factors of the drug substance and the relevant impurity are not close, this practice can still be appropriate, provided a correction factor is applied or the impurities are, in fact, being overestimated"* (emphasis added).

In addition, USP does not indicate when the RRF can be rounded off to 1.0. Data submitted to USP show the current practice varies widely. Some Sponsors round off the RRF values to 1.0 when they are in the range 0.80–1.2, some do so when they are in the range 0.90–1.1, and others do so when they are in the range 0.95–1.05. The *European Pharmacopoeia* requires that, if the value of the RRF is different from 0.8–1.2, it should be included in the monographs *(4).*

PROPOSAL

In order to address the issues discussed above and in the interest of developing a uniform and consistent standard that can apply to all *USP–NF* monographs, this *Stimuli* article provides a proposal for a consistent compendial approach regarding the use of RRF to control impurities in an article. The approach would be part of revision of appropriate General Chapters and Monographs.

1. Use the symbol *F* to designate the RRF consistently.
2. Define the RRF of an impurity as the ratio of the peak response of the impurity to that of an equal mass of the drug substance. That is,

$$F = r_i / r_U,$$

   in which r_i and r_U are the peak responses of equal masses of the impurity, *i,* and the drug substance, *U,* respectively.
3. Define the term RF of an analyte as the peak response per unit mass of the analyte.
4. Include the definitions of RRF and RF in the Glossary section of General Chapter ⟨621⟩ *Chromatography* and revise General Chapter ⟨1225⟩ *Validation of Compendial Methods,* as appropriate.
5. Eliminate terms such as Correction Factor and Response Factor from *USP–NF* monographs, and replace them with RRF where appropriate, that is, where evaluations of the data submitted together with the monograph submission show that the terms Correction Factor or Response Factor were used to mean the same thing as the RRF. However, where such terms are used to mean different parameters—for example, the term RF is used to mean the peak response per unit mass of the analyte—they will be retained.

6. Use the RRF for impurity measurement only if the value is accurately determined over the linear range of the procedure for the impurity and the drug substance. This requirement will be included in General Chapter ⟨621⟩.
7. State the RRF values in monographs to one decimal place if it is equal to or greater than 1.0 and to two decimal places if it is less than 1.0. That is, the RRF value will be expressed to two significant digits. The ICH Q3A(R) guideline (*2*) indicates that the impurity results should be reported to one decimal place if they are at or above 1.0 and to two decimal places if they are below 1.0. Thus, this proposal will make the *USP–NF* requirement consistent with the ICH Q3A(R) guideline. This requirement will be included in General Chapter ⟨621⟩.
8. The RRF values can be rounded off to 1.0 in *USP–NF* monographs if they are in the range 0.8–1.2, calculated per the definition above. This requirement will be included in General Chapter ⟨621⟩.
9. Revise the USP Guideline to include recommendations to Sponsors of Requests for Revision when the RF and RRF approaches are used in compendial articles.

Implementation Plan

1. General Chapter ⟨621⟩ *Chromatography* will be revised to include the changes described above, and the proposed revision will be published in *PF* for public review and comment and adopted by the usual USP procedures.
2. *Table 1* shows a list of monographs affected by this proposal. Each monograph in *Table 1* will be evaluated using the data that were submitted to USP as part of the sponsor's Request for Revision to determine if the RRF values, the formula(s), and other information in the monograph are consistent with the proposals outlined above. If necessary, monographs will be revised to make them consistent with the current proposals and then will be published in *PF* for public review and comment. This may include recalculating the RRF values based on the data submitted to USP, changing the number of decimal places of the RRF values, rewriting the formula(s), and/or changing the terminology and symbol, on an as-needed basis. The revisions will be adopted through the appropriate USP procedures.
3. Proposal 8 above will be implemented prospectively (only for new monographs).
4. When adequate data are not available, USP Scientific Liaisons will contact Sponsors for the data, and revisions will be made based on subsequent review of the data. If the requested data cannot be obtained, necessary data may be generated by the USP Research and Development Laboratory.
5. The implementation of the revisions to current monographs may be delayed to allow sufficient time for manufacturers to make necessary changes in their internal documents and to report amendments to FDA.

CONCLUSIONS

RRF is a common parameter frequently used in many chromatographic procedures. The parameter is particularly critical for quantitative or limit tests for impurities because in many cases the corresponding reference standards are not available. To date *USP–NF* does not have standards, including a definition, for this parameter. Consequently, the terminology, number of decimal places of the values, and the formulas for calculating percent impurities are different in different monographs. The emphasis on impurity testing and control is an outcome of the ICH Q3 guidelines. Approximately 120 of the monographs published in *USP 28–NF 23* and up to *PF* Vol. 30 No. 6 (*Table 1*) use RRF for impurity determination, although inconsistent terminology appears among them (e.g., Relative Response Factor vs. Response Factor vs. Correction Factor). Many of them are consistent with the proposals advocated above. Thus, if the proposals are implemented now, a relatively small number of monographs will need revision, and the standards can be applied to all incoming monographs. The number of monographs that involve RRF is expected to grow rapidly due to the current emphasis on impurity control.

* (*PF*) means that the monographs currently are published in *PF* as proposals.
† In the Collodion monograph the term RRF is used to mean the ratio of the concentration of C_2H_5OH to the area ratio of alcohol to acetone in the respective standard preparations. The use of the term in this sense is unique and is different from the meaning of the term RRF elsewhere in *USP–NF*.
‡ The definition of RF is given in the monograph and is consistent with the definition proposed in the current article.
§ The calculations of RRF/RF are included in the monographs.
# The Topiramate monograph uses the term RRF in the *Related compounds* test and uses the term in the denominator in the formula. However, in the *Limit of sulfamate and sulfate* test it uses the term CF and includes it in the numerator in the formula.

APPENDIX A

F is the RRF of an impurity, *i,* with respect to the drug substance, *U,* and is defined as the ratio of the peak response of the impurity to that of an equal mass of the drug substance.

So, $F = r_i / r_U$, where r_i is the peak response of unit mass of the impurity peak, and r_U is the peak response of an equal mass of the drug substance peak.

If the sample contains x_i mass of impurity and C_U mass of drug substance (expressed in the same unit), then,

$x_i r_i = R_i$, where R_i is the peak response of the impurity peak in the sample and

$C_U r_U = R_U$, where R_U is the peak response of the drug substance peak in the sample.

Hence, $(x_i r_i)/C_U r_U = R_i / R_U$.

That is, $(x_i F)/C_U = R_i / R_U$.

Therefore, $x_i / C_U = (1/F)(R_i / R_U) = (1/F)(R_i / R_S)(C_S / C_U)$, because $C_U / C_S = R_U / R_S$ or $R_U = (C_U / C_S)R_S$.

Thus, Percent Impurity $= 100x_i / C_U = (100/F)(R_i / R_S)(C_S / C_U)$.

On the other hand, if *F* is the RRF of an impurity, *i,* peak with respect to the drug substance, *U,* peak and is defined as the ratio of the peak response of the drug substance to that of an equal amount of the impurity, then,

$$\text{Percent Impurity} = 100x_i / C_U = 100F(R_i / R_S)(C_S / C_U).$$

NOMENCLATURE

This section includes supplements to the latest edition of the *USP Dictionary of USAN and International Drug Names* that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

USP Dictionary of USAN and International Drug Names
2005 USP DICTIONARY SUPPLEMENT 1

IMPORTANT—Save this Supplement. This and all supplements appearing in *PF* are needed to keep the 2005 edition of the USP Dictionary (USPD) up-to-date. The cumulative contents of the supplements to the current (2005) edition will be included in the next complete edition of the Dictionary.

Revisions of United States Adopted Names (USAN)

The following is a revision of an existing United States Adopted Name (USAN).

Canfosfamide Hydrochloride

(Telik)

Proposed and Recommended International Nonproprietary Names

International Nonproprietary Names (INN) are devised by the World Health Organization (WHO).

Under its charter, the WHO is empowered simply to *recommend* specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as *proposals* (''Proposed International Nonproprietary Names''). A period of four months from the date of publication in *WHO Drug Information* is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested parties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event that no objection is received, the WHO proceeds with listing and publishing the names so devised as *recommendations* (''Recommended International Nonproprietary Names''), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

Proposed International Nonproprietary Names

The following 57 names have been selected by the World Health Organization (WHO) as Proposed International Nonproprietary Names. This list, with chemical names or descriptions and the molecular formulae, appears in *WHO Drug Information*, Vol. 18, No. 4, 2004.

Any comments or formal objections to the proposed names should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

Proposed INN	Therapeutic Indication
Ancriviroc	*Antiviral*
Artemifone	*Antimalarial*
Atilmotin	*Digestive agent*
Avanafil	*Vasodilator*
Balicatib	*Cathepsin K inhibitor*
Becatecarin	*Antineoplastic*
Becocalcidiol	*Vitamin D analogue*
Bemotrizinol	*Sunscreen*
Besilesomab	*Radioimmunodiagnostic agent*
Bisoctrizole	*Sunscreen*
Canfosfamide	*Antineoplastic*
Ceftobiprole	*Antibiotic*
Ceftobiprole medocaril	*Antibiotic*
Centredekin besudotox	*Antineoplastic*
Davasaicin	*Topical analgesic*
Deferitrin	*Iron chelator*
Delmitide	*Immunomodulator*
Deutolperisone	*Muscle relaxant*
Efipladib	*Cytosolic phospholipase A2 inhibitor*
Elomotecan	*Antineoplastic*
Embeconazole	*Antifungal*
Epoetin zeta	*Antianaemic*
Eritoran	*Bacterial lipopolysaccharide receptors antagonist*
Etalocib	*Antineoplastic*
Farampator	*Antipsychotic*
Forodesine	*Antineoplastic*
Galsulfase	*Enzyme*
Glucarpidase	*Enzyme*
Iboctadekin	*Antineoplastic*
Icomucret	*Mucin secretion stimulator*
Inotuzumab ozogamicin	*Antineoplastic*
Isalmadol	*Analgesic*
Ispinesib	*Antineoplastic*
Levotofisopam	*Anxiolytic*
Linaprazan	*Acid pump inhibitor*
Morphine glucuronide	*Analgesic*
Naveglitazar	*Antidiabetic*
Omocianine	*Fluorescent diagnostic contrast agent*
Peliglitazar	*Antidiabetic*
Pemaglitazar	*Antidiabetic*
Perflisobutane	*Ultrasound contrast agent*
Piclozotan	*Serotonin receptor antagonist*
Pralatrexate	*Antineoplastic*
Radotermin	*Growth factor*
Raxibacumab	*Antitoxin*
Rimeporide	*NA+/H+ antiport inhibitor*
Salclobuzic acid	*Pharmaceutical aid*
Saxagliptin	*Antidiabetic*
Seliciclib	*Antineoplastic*
Sugammadex	*Pharmaceutical aid*
Talabostat	*Antineoplastic*
Talactoferrin alfa	*Recombinant human lactoferrin*
Talaglumetad	*Anxiolytic*
Tanogitran	*Antithrombotic*
Tefibazumab	*Antitoxin*
Temsirolimus	*Immunosuppressant*
Thrombomodulin alfa	*Prevention and treatment of thrombosis*

Recommended International Nonproprietary Names

The following 49 nonproprietary names have been selected by the World Health Organization (WHO) as Recommended International Nonproprietary Names. This list, with chemical names or descriptions and the molecular formulae, appears in *WHO Drug Information*, Vol. 18. No. 3, 2004.

Recommended INN	Recommended INN	Recommended INN	Recommended INN
Adecatumumab	Doranidazole	Muraglitazar	Sabarubicin
Arformoterol	Ecopladib	Nebentanum	Solabegron
Banoxantrone	Eglumetad	Netupitant	Tadekinig alfa
Batabulin	Enzastaurin	Omigapilum	Tanaproget
Becampanel	Esoxybutynin	Paclitaxel poliglumex	Taneptacogin alfa
Beminafil	Parathyroid hormone	Pasireotide	Taprizosin
Binodenoson	Idursulfase	Pelitrexol	Teduglutide
Certolizumab pegol	Imidafenacin	Pruvanserin	Tocilizumab
Ciluprevir	Lacosamide	Ramelteon	Urtoxazumab
Clazosentan	Lumiliximab	Ranibizumab	Valtorcitabine
Clofarabine	Maropitant	Razaxaban	Vildagliptin
Daglutril	Mubritinib	Rivaroxaban	Zanolimumab
Dextofisopam			

Suggested United States Adopted Names

The United States Adopted Names (USAN) program is the specifically organized effort in the United States directed to producing simple and useful nonproprietary names for drugs while the drugs are still in the investigational stages. The American Medical Association (AMA), the American Pharmaceutical Association (APhA), and the United States Pharmacopeial Convention (USPC) jointly sponsor the USAN program with representation from the FDA.

Each U.S. Adopted Name is chosen with the expectation that it will be suitable for prescribing and dispensing purposes and for designation as the title of the monograph, should the article be recognized in the official *United States Pharmacopeia* or *National Formulary.* A measure of the prestige and recognition of the value of the USAN program can be found in the following regulations published by the Commissioner of Food and Drugs and the Secretary of Health and Human Services in the *Federal Register* of February 1988.

> All who are concerned with the prescription, dispensing, use, sale or manufacture of drugs may, in the absence of the designation of an official name by the FDA, rely on the current compendial name or the U.S. Adopted Name (USAN) listed in this volume as being the established name in accordance with the Federal Food, Drug, and Cosmetic Act.

A formal procedure[1] is followed by the USAN Council in selecting an established name for a drug. The USAN Council Secretary is also an ex officio member of the International Nonproprietary Names (INN) Committee. USAN Guiding Principles are concordant with World Health Organization (WHO) principles, and all USANs for substances also named by the INN Committee are systematically processed through the INN Committee. This ensures that, with very rare exceptions, USANs are identical to INNs and available for world-wide use.

A suggestion for a USAN originates usually from a firm or an individual who has developed a substance of potential therapeutic utility to the point where there is a distinct possibility of its being marketed in the United States of America. Occasionally, the initiative is taken by the USAN Council in the form of a request to parties interested in a substance for which a nonproprietary name appears to be lacking.

Submissions to the USAN Council are expected to conform to the established Guiding Principles[2] and to be reasonably free from conflict with other names, including both trademarks and nonproprietary names. An effort is made to discourage the occasional, undesirable practice of incorporating in trademarks the syllables used in an established nonproprietary name, or syllables recommended for USAN. Such trademarks may act as a bar to the subsequent adoption of appropriate nonproprietary names for closely related drugs.

The suggested nonproprietary names for the drugs described in the following list are under consideration by the USAN Council. The name(s) being considered for each drug substance, and the applicable *category*, are separated by double spacing from the name(s) and *category* for the next listed drug substance. Where two or more names are being considered for the same drug substance, the names are single-spaced, and the applicable category term is written only once to the right of the single-spaced group of names.

Any comments or protests should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

Suggested USAN	Category
Abrextrin Apiclermin Aplicermin Aprexermin Aprextrin Daprexermin Dapiclermin	*Treatment of obesity*
Adarolimus Etosirolimus Tetrazolimus Tetrolimus Tetrosirolimus Tezolimus Tezorolimus Zolimus Zoterolimus	*Antifungal macrolide (drug component of an investigational phosphoryl choline polymer coated eluting stent, currently under evaluation for the prevention of coronary restenosis following stent replacement*
Adfilcon H Alifilcon H Paflufocon D-hemiberfilcon A	*Rigid gas permeable contact lens material with a poly-HEMA soft skirt; Hybrid contact lens material*
Adopanib Hydrochloride Balitanib Hydrochloride Pazopanib Hydrochloride	*Antineoplastic*
Aerofilcon Comfilcon Comfilcon A Elvifilcon A Gomlifilcon A Miplofilcon A Omsifilcon A Oxsilfilcon Pomifilcon A Silfilcon Tepsifilcon A	*Hydrophilic contact lens material*
Altamisate Altarmirsate Ambetisate Amyglybril Amytargam Betamilod Cosamisate Prevamilod Preveglybril Prevetargam Tarlamibril Disodium Zeprotargam Zontargam	*Treatment of mild-to-moderate Alzheimzer's disease, treatment of cerebral amyloid angiopathy (antiamyloidotic)*

[1] *USP Dictionary of USAN and International Drug Names,* Preface.

[2] Ibid., Appendix VII.

Suggested USAN	Category
Amyglybril Amytargam Fibramilod Fibritargam Prevamibril Disodium Prevamilod Preveglybril Prosdisate Disodium Zontargam	*Treatment of secondary (AA) amyloidosis*
Apaxabam Apixaban Aprixaban Belaxaban Cinaxaban	*Anticoagulant; antithrombotic*
Avaquizotin Mesylate Avasizotine Mesylate Avazositine Mesylate Tazositine Mesylate Trasizotine Mesylate Trazositine Mesylate Trequizotin Mesylate	*Antidepressant*
Belizumab Crelizumab Lolizumab Ocrelizumab Relizumab Ubelizumab	*Treatment of rheumatoid arthritis*
Betafilcon A Omegafilcon	*Hydrophilic contact lens material*
Bolamevatide Bolatide Disomevatide Lamevatide	*Melanoma peptide vaccine*
Bosatinib Fanditinib Tolatinib	*For use in oncologic treatment*
Brifospofol Disodium Brifosprofol Fospropofol Disodium Prefospofol Disodium Profospofol Disodium Proposfol Phosphate Disodium	*Intravenous sedative-hypnotic solution in conscious sedation for brief surgical and diagnostic procedures*
Brilipladib Corbilipladib Ordilipladib	*Treatment of atherosclerosis*
Cardoxinyl Hydrochloride Hexodinyl Hydrochloride Mefenexane Hydrochloride Nefenakant Nexonokoc	*Treatment of patients with atrial fibrillation and atrial flutter*
Cemlimarev (CEA, MUC-1, vaccinia vaccine) Cemllimarev (multigene vaccinia virus) Cemtulimarev-Alfa Cemtulirev-Alfa	*Treatment of pancreatic cancer; treatment of CEA-bearing cancers*
Cemtulimarev-Beta Cemtulirev-Beta Molimarev (CEA, MUC-1, vaccinia vaccine) Molimarev (multigene vaccinia virus)	*Treatment of pancreatic cancer; treatment of CEA-bearing cancers*
Cetforlimumab Cetirilimumab Cetlalimumab Cetolimumab Citilimumab	*Treatment of cancer*
Darlipladib	*Treatment of atherosclerosis*
Diaplaginin Diaplasginin Diaplastinin Diaplaxtinin	*Treatment of fibrinolytic impairment disease*
Elzydavose Hydrochloride Fabenimose Hydrochloride	*Treatment of Fabry disease*
Emavatide Omatide Omevatide	*Melanoma peptide vaccine*
Esmirtazapine Maleate	*Treatment of moderate to severe vasomotor symptoms associated with menopause*
Goxalipadib Oxalipadib Voxalipadib	*Treatment of atherosclerosis*
Indisulam	*Antineoplastic*
Lusaridone Hydrochloride	*Treatment of schizophrenia*
Melanotide Pamelacron Pamelactron Pamelcortide Pamelcotide Panocortide	*Treatment of sexual dysfunction*
Ologlisec Serglisec Tranoglisec	*Treatment of Type II diabetes mellitus as monotherapy and in combination with other glucose lowering agents*
Pelacriviroc Hydrochloride Pelaviroc Hydrochloride Sirocrivoc Hydrochloride Siroviroc Hydrochloride	*Treatment of HIV infection*
Pradefovir Mesylate Ranofovir Mesylate Remofovir Mesylate	*Antiviral*
Prataxomer Acetate Pratiramer Acetate Tagliramer Acetate	*Treatment of multiple sclerosis and glaucoma*
Reparixin	*Treatment of delayed graft function*

Suggested USAN	Category
Scovavirine Choline Sedovorine Choline	*Treatment of HIV infection*
Ticalizumab Tilolizumab Tradulizumab	*Treatment of B-cell malignancies*
Valategrast	*Treatment of asthma*
Valpreotide Acetate	*Treatment of acute variceal bleeding related to portal hypertension*

Suggested International Nonproprietary Names

International Nonproprietary Names (INN) are devised by the World Health Organization (WHO). INNs for substances originating within the United States are applied for through the USAN Council. INN and USAN Guiding Principles are concordant, which assures that, with very few exceptions, INNs and USANs are identical.

Under its charter, the WHO is empowered simply to *recommend* specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as *proposals* (''Proposed International Nonproprietary Names''). A period of four months from the date of publication in *WHO Drug Information* is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested parties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event that no objection is received, the WHO proceeds with listing and publishing the names so devised as *recommendations* (''Recommended International Nonproprietary Names''), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

The names for the drugs that are categorized in the following list are under consideration for the selection of new Proposed International Nonproprietary Names. The name(s) being considered for each drug substance, and the applicable *category*, are separated by double spacing from the name(s) and *category* for the next listed drug substance. Where two or more names are being considered for the same drug substance, the names are single-spaced, and the applicable category term is written only once to the right of the single-spaced group of names.

Any comments or protests should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

Nomenclature

Suggested INN	Category
Abrafibrate Espafibrate Relafibrate	*Treatment of dyslipidemia*
Adarolimus Tezorolimus Zoterolimus	*Antifungal macrolide (drug component of an investigational phosphoryl choline polymer coated eluting stent, currently under evaluation for the prevention of coronary restenosis following stent replacement*
Aliskiren Fumarate	*Treatment of hypertension*
Apaxaban Apixaban Aprixaban	*Anticoagulant; antithrombotic*
Brexanavir Pixanavir Prexanavir	*Treatment of HIV infection*
Casipitant Mesylate Cenapitant Mesylate Crinapitant Mesylate	*Treatment of depression, anxiety, sleep disorders, nausea and vomiting, functional dyspepsia, irritable bowel syndrome, gastroesophageal reflux disease, and overactive bladder disease*
Cilansetrone Hydrochloride	*Treatment of diarrhea-predominant Irritable Bowel Syndrome*
Crelizumab Ocrelizumab	*Treatment of rheumatoid arthritis*
Dapiclermin Daprexermin	*Treatment of obesity*
Denogliptin Tosylate Nalagliptin Tosylate Raligliptin Tosylate	*Treatment of Type II diabetes mellitus*
Diaplaginin Diaplasginin Diaplastinin Diaplaxtinin	*Treatment of fibrinolytic impairment disease*
Elzigalastat Hydrochloride Elzivadose Hydrochloride	*Treatment of Fabry disease*
Entrigapex Rotigapex Rotigapide Rotiregap	*Treatment of ventricular tachycardia or ventricular fibrillation*
Esmirtazapine Maleate	*Treatment of moderate to severe vasomotor symptoms associated with menopause*
Fesoterodine Fumarate	*Treatment of overactive bladder*
Indisulam Indisumide	*Antineoplastic*
Netupitant	*NK1 receptor antagonist*
Pradefovir Mesylate Remofovir	*Synthetic nucleotide antiviral agent*
Sodium Cholate Soy Fatty Acids Sodium Cholate Soy Phasphatidylcholine Soy Posepibex Soyafotaline	*Treatment of patients with Gram-negative sepsis*

INDEX

PHARMACOPEIAL FORUM VOL. 31 NO. 4 JULY–AUG. 2005

* The *USP–NF* (*USP29–NF24*), the *Supplement* (*Supp*), or the *Interim Revision Announcement* (*IRA*) for which the revision proposal is targeted is shown in parentheses next to each proposed item.

THE JOURNAL OF STANDARDS DEVELOPMENT AND OFFICIAL COMPENDIA REVISION

Please address comments on *PF* content to Executive Secretariat
USP–NF, 12601 Twinbrook Pkwy.
Rockville, MD 20852

Telephone: 1-301-816-8345
Fax: 1-301-816-8373
http://www.usp.org

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI),*in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences.*

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum* (*PF*), for the development of official pharmaceutical standards.

USP publishes *Pharmacopeial Forum* (*PF*) bimonthly as the working vehicle of the USP Council of Experts. *PF* provides interested parties an opportunity to review and comment as the Council of Experts develops or revises standards for the *United States Pharmacopeia* and the *National Formulary* (*USP–NF*).

PF includes the following:

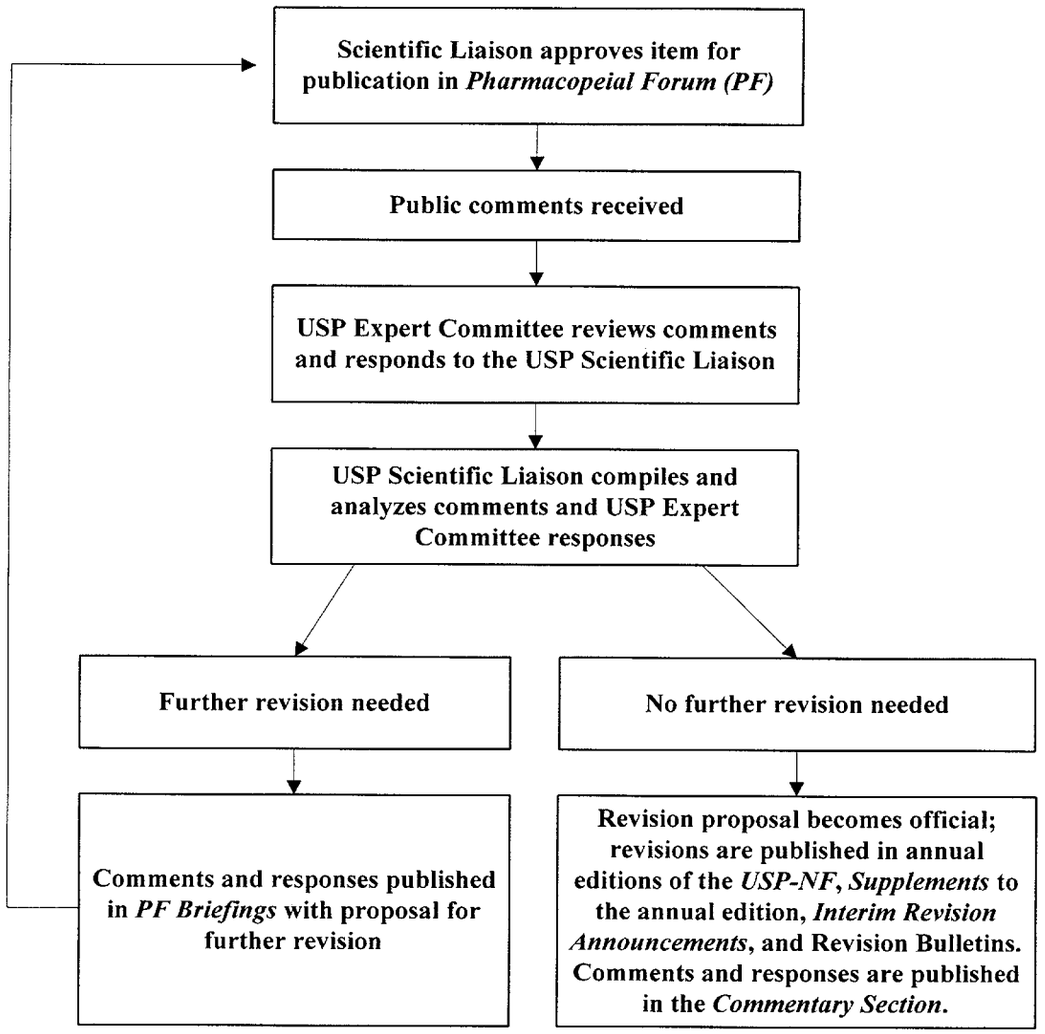
1. Potential revisions—entirely new standards, revision ideas, and drafts not yet targeted for official adoption (*Pharmacopeial Previews*)
2. Proposed revisions—new or revised standards targeted for official adoption (*In-Process Revision*)
3. Adopted revisions—new or revised standards that become official and binding before the publication of the next *USP–NF* or *Supplement* (*Interim Revision Announcement*)

USP welcomes comments and data on potential, proposed, or official standards.* Comments, along with USP's responses, will be published either in *PF Briefings*, the *Commentary* section of *PF*, the *Commentary* section of *Supplements* to *USP–NF*, or the *Commentary* section of *USP–NF*.

* If you are not immediately able to submit comments but you intend to do so, please notify USP by using the Intent to Comment form provided before the section *Chromatographic Reagents Used in USP–NF and PF*.

The chart below shows the public review and comment process and its relationship to standards development.

Public Review and Comment Process for *USP-NF* Standards Development



Questions on the process should be addressed to Director, Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: execsec@usp.org).

HOW TO USE *PF*

This section provides descriptions of the various parts of *PF*. It also includes *Committee Designations* and the *Staff Directory.*

The content of the different sections of *PF* are briefly described below. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a *Request for Revision* is available in the *Guideline for Submitting Requests for Revision to the USP-NF* on the USP website (http://www.usp.org/USPNF/submitMonograph/subGuide.html).

Proposed and Adopted Revisions to the *USP-NF*

Section	Content	How Readers Can Respond
Pharmacopeial Previews Early ideas for revisions	•BRIEFING: Scientific rationale for potential inclusion or change. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •Potential revisions not yet targeted for official adoption that require a longer public review and comment process because of issues such as: — the controversial nature of an item; — the application of new technologies that require further study; and — articles produced by multiple sources.	Review drafts and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview.*
In-Process Revision Revisions targeted for adoption	•BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see *Standards Development*). New or revised text is marked with symbols (■ or ● or ▲) to specify the tentative earliest date on which the revision would be officially adopted.	Review material and send comments promptly to USP staff liaison (see the *Staff Directory*). Guidelines on how to comment are found at the end of the *Policies and Announcements* section.
Harmonization Items the Pharmacopeial Discussion Group (PDG) is working to harmonize internationally	•BRIEFING: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. The stage determines whether an item appears under *Pharmacopeial Previews* or under *In-Process Revision,* both separate sections of *Harmonization.* •For *In-Process Revision,* new or revised text is marked with symbols (■) to specify the tentative, earliest date on which the revision would be officially adopted.	Review material and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview* or *In-Process Revision.*
Interim Revision Announcement Adopted standards	Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols ●.	Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance.
Pending Proposals	In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *PF* to allow the public an opportunity to review and comment upon it. When an item is adopted it is published in either the *USP–NF*, its supplements, or an *IRA*. Those items that have not yet been adopted are still pending.	Review items to track pending proposals.
Canceled Proposals	Canceled proposals are items that were published in *PF* and were pending, but have since been canceled. Note that canceled proposals may be republished to be considered in the future for adoption into the *USP–NF.*	Review items to track canceled proposals.

Other Sections

Committee Designations
Names of the committees (composed of volunteer scientific experts) that USP staff work with on the development of standards.

Staff Directory
Names of all USP scientific staff liaisons with contact information.

Policies and Announcements
- General scientific and policy issues affecting *USP–NF* standards and processes
- Update on standards-related issues being considered by USP
- Where to find summaries of meetings of the Council of Experts
- Guidelines on how to comment
- Publication and comment schedules

Stimuli to the Revision Process
- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

Nomenclature
- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the *USP Dictionary of USAN and International Drug Names*
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

Index
Cumulative directory for the content of all issues of *PF* beginning with *PF* 31(1).

Reference Standards Catalog
List of official USP Reference Standards specified in *USP–NF*, along with availability and ordering information.

Chromatographic Reagents* Used in *USP–NF* and *Pharmacopeial Forum
Update of chromatographic reagents based on the proposals published in this issue of *PF*.

EXPERT COMMITTEE DESIGNATIONS*

The names of the Committees and their abbreviations are as follows:

2000—2005

AER	Aerosols
AMB	Analytical Microbiology
BBP	Blood and Blood Products
BNA	Bioavailability and Nutrient Absorption
BNT	Biotechnology and Natural Therapeutics and Diagnostics
BPC	Biopharmaceutics
BST	Biostatistics
CRX	Compounding Pharmacy
DSB	Dietary Supplements—Botanicals
DSI	Dietary Supplements—Information
DSN	Dietary Supplements—Non-Botanicals
EMC	Excipient Monograph Content
ETM	Excipients—Test Methods
GCT	Gene Therapy, Cell Therapy, and Tissue Engineering
GTB	General Toxicity and Biocompatibility
NL	Nomenclature and Labeling
PA1	Pharmaceutical Analysis 1
PA2	Pharmaceutical Analysis 2
PA3	Pharmaceutical Analysis 3
PA4	Pharmaceutical Analysis 4
PA5	Pharmaceutical Analysis 5
PA6	Pharmaceutical Analysis 6
PA7	Pharmaceutical Analysis 7a—Antibiotics; 7b—Antimicrobials and Antivirals
PDF	Pharmaceutical Dosage Forms
PPC	Parenteral Products—Compounding and Preparation
PPI	Parenteral Products—Industrial
PSD	Packaging, Storage, and Distribution
PW	Pharmaceutical Waters
RMI	Radiopharmaceuticals and Medical Imaging
SMU	Safe Medication Use
VET	Veterinary Drugs
VVI	Vaccines, Virology, and Immunology

2005—2010

AER	Aerosols
BB BBP	B&B Blood and Blood Products
BB CGT	B&B Cell and Gene Therapy
BB PP	B&B Proteins and Polysaccharides
BB VV	B&B Vaccines and Virology
BPC	Biopharmaceutics
CRX	Compounding Pharmacy
DS-BA	Dietary Supplements—Bioavailability
DSB	Dietary Supplements—Botanicals

POLICIES AND ANNOUNCEMENTS

In this section, readers may find statements about general scientific and policy issues that may have an impact on *USP–NF* standards and processes, announcements about issues being considered by USP, and summaries of Council of Experts meetings. This section also includes publication and comment schedules.

CALL FOR HIGH PRIORITY MONOGRAPHS FOR DRUG SUBSTANCES AND PRODUCTS, AND EXCIPIENTS. USP is seeking monographs for the following drug substances and drug products that are or soon will be off patent and thus are of the highest priority. USP also is seeking monographs for the excipients listed below. Monograph sponsors should consult USP's *Guideline for Submitting Requests for Revision to the USP–NF* at http://www.usp.org/standards/revisionguideline/index.html. **For further information, contact Lokesh Bhattacharyya, Ph.D., lb@usp.org.**

MONOGRAPH NAME
Noncomplex Actives (Drug Substances and Products)

Abacavir Sulfate, Lamivudine, and Zidovudine Tablets	Acetaminophen, Butalbital, Caffeine, and Codeine Phosphate Capsules	Acetaminophen, Clemastine Fumarate and Pseudoephedrine Hydrochloride Tablets
Acetazolamide Extended-Release Capsules	Alatrofloxacin Mesylate	Albuterol Extended-Release Tablets
Albuterol for Inhalation	Albuterol Inhalation Aerosol	Alendronate Sodium Oral Solution
Alfuzosin	Alfuzosin Tablets	Allopurinol for Injection
Allopurinol Sodium	Alprazolam Extended-Release Tablets	Alprostadil Urethral Suppository
Aminopromazine Fumarate	Aminopromazine Fumarate and Neomycin Sulfate Tablets	
Aminopromazine Fumarate Tablets	Aminopterin Sodium	Aminopromazine Fumarate Injection
Amlodipine	Amlodipine and Benazepril Hydrochloride Capsules	Aminopterin Sodium Tablets
Amphotericin B Injection	Anagrelide Hydrochloride ***(Received)***	Anagrelide Hydrochloride Capsules
Arsenic Trioxide	Arsenic Trioxide Injection	Atovaquone and Proguanil Hydrochloride Tablets
Atovaquone Tablets	Auranofin Capsules	Azatadine Maleate and Pseudoephedrine Sulfate Extended-Release Tablets
Azelaic Acid	Azelaic Acid Cream	Azithromycin for Injection
Azithromycin Tablets	Baclofen Injection	Balsalazide Disodium
Balsalazide Disodium Capsules	Beclomethasone Dipropionate Inhalation Aerosol	Beclomethasone Dipropionate Metered-Dose Nasal Suspension
Bentoquatam	Bentoquatam Topical Suspension	Benzocaine and Cetylpyridinium Chloride Lozenges
Benzocaine and Menthol Lotion	Benzphetamine Hydrochloride Tablets	Bepridil Hydrochloride
Bepridil Tablets	Bivalirudin	Bicalutamide
Bicalutamide Tablets	Brompheniramine Maleate, Dextromethorphan Hydrobromide and Pseudoephedrine Hydrochloride Oral Solution	Bivalirudin Injection
Budesonide ***(Received)***	Budesonide Metered-Dose Inhalation Aerosol	Budesonide Inhalation Aerosol
Bupivacaine and Lidocaine Hydrochloride Injection	Buprenorphine Hydrochloride Injection	Butalbital and Acetaminophen Capsules
Butalbital and Acetaminophen Tablets	Butorphanol Tartrate Nasal Solution ***(Received)***	Cabergoline
Cabergoline Tablets	Calcipotriene	Calcipotriene Cream
Calcipotriene Ointment	Calcipotriene Topical Solution	Calcitriol Capsules
Calcitriol Oral Solution	Calcium Acetate Capsules	Calcium Trisodium Pentetate
Calcium Trisodium Pentetate Injection	Calfactant	Calfactant Intratracheal Suspension
Candesartan Cilexetil	Carbidopa and Levodopa Extended-Release Tablets	Carbidopa and Levodopa Tablets for Oral Suspension
Carbidopa, Levidopa, and Entacapone Tablets	Carmustine ***(Received)***	Carmustine Implant
Carmustine for Injection	Cefdinir	Carvedilol
Carvedilol Tablets	Cefditoren Pivoxil Tablets	Cefdinir Tablets
Cefditoren Pivoxil	Ceftibuten for Oral Suspension	Ceftibuten
Ceftibuten Capsules	Cetirizine Hydrochloride Oral Solution	Ceftiofur Hydrochloride Oral Suspension
Cetirizine Hydrochloride	Cetrorelix Injection	Cetirizine Hydrochloride Tablets

MONOGRAPH NAME
Noncomplex Actives (Drug Substances and Products) *(Continued)*

Cetrorelix	Chloroxine	Cevimeline
Cevimeline Hydrochloride Capsules	Choline and Magnesium Salicylates Oral Solution	Chloroxine Cream
Chlorpromazine Hydrochloride Extended-Release Capsules	Ciclopirox Shampoo	Choline and Magnesium Salicylates Tablets
Choline Salicylate Oral Solution	Cilostazol ***(Received)***	Ciclopirox Topical Gel
Ciclopirox Topical Solution	Ciprofloxacin Hydrochloride and Hydrocortisone Otic Suspension	Cilostazol Tablets
Cimetidine Oral Solution	Citalopram Hydrobromide Oral Solution	Ciprofloxacin Otic Solution
Citalopram Hydrobromide ***(Received)***	Citalopram Hydrobromide Tablets ***(Received)***	Cladribine Injection
Citric Acid, Gluconolactone, and Magnesium Carbonate Irrigation	Clonazepam Orally-Disintegrating Tablets	Clemastine Fumarate Syrup
Clobetasol Propionate Gel	Clotrimazole and Betamethasone Dipropionate Lotion	Clorazepate Dipotassium Capsules
Clorazepate Dipotassium Extended-Release Tablets	Colfosceril and Tyloxapol Suspension	Colestipol Hydrochloride Tablets
Colfosceril	Conjugated Estrogens and Medroxyprogesterone Acetate Tablets	Compound Undecylenic Acid Cream
Compound Undecylenic Acid Topical Powder	Cyclosporine Modified Oral Solution	Cromolyn Sodium Metered-Dose Nasal Solution
Cyclosporine Modified Capsules	Cysteamine Bitartrate Capsules	Cyclosporine Ointment
Cyclosporine Topical Solution	Dalfopristin	Cytarabine Liposome
Cytarabine Liposome Injection	Dantrolene Sodium Capsules	Dalfopristin and Quinupristin Injection
Dantrolene Sodium	Dapiprazole for Ophthalmic Solution	Dantrolene Sodium for Injection
Dantrolene Sodium Oral Suspension	Desirudin for Injection	Dapirazole Hydrochloride
Desirudin	Dexrazoxane	Desonide ***(Received)***
Desonide Cream	Didanosine ***(Received)***	Didanosine for Oral Solution ***(Received)***
Didanosine Chewable Tablets ***(Received)***	Dextromethorphan Polistirex Extended-Release Oral Suspension	Dexrazoxane for Injection
Dextroamphetamine Sulfate Extended-Release Capsules	Diazepam Injectable Emulsion	Diethylpropion Hydrochloride Extended-Release Tablets
Diclofenac Sodium Ophthalmic Solution	Difloxacin Hydrochloride	Difloxacin Hydrochloride Tablets
Difenoxin and Atropine Tablets	Dinoprostone Vaginal Suppositories	Diphenhydramine Hydrochloride and Acetaminophen Tablets
Diltiazem Malate Extended-Release Tablets	Divalproex Sodium Delayed-Release Capsules	Docosanol
Divalproex Sodium ***(Received)***	Dorzolamide Ophthalmic Solution	Doxacurium Chloride Injection
Dorzolamide and Timolol Ophthalmic Solution	Doxycycline Oral Gel	Econazole Nitrate Cream
Doxepin Hydrochloride Cream	Enalapril Maleate and Diltiazem Maleate Extended-Release Tablets	Enalapril Maleate and Felodipine Extended-Release Tablets
Edrophonium Chloride and Atropine Sulfate Injection	Entacapone	Entacapone Tablets
Enalaprilat Injection	Epoprostenol	Epoprostenol For Injection
Ephedrine Sulfate and Guaifenesin Tablets	Erythromycin Phosphate	Erythromycin Thiocyanate
Epoprostenol Injection	Esmolol Hydrochloride Injection	Esomeprazole Magnesium
Esmolol	Estazolam	Estazolam Tablets
Esomeprazole Magnesium Capsules	Estramustine Phosphate Sodium	Estramustine Phosphate Sodium Capsules
Estradiol Benzoate	Ethanolamine Oleate Injection	Etomidate
Etomidate Injection	Etidronate Disodium Injection Concentrate	Ethanolamine Oleate

MONOGRAPH NAME
Noncomplex Actives (Drug Substances and Products) *(Continued)*

Etoposide Phosphate	Exemestane	Exemestane Tablets
Fentanyl ***(Received)***	Famotidine Injection	Famotidine Orally Disintegrating Tablets
Ferrous Fumarate and Docusate Sodium Extended-Release Capsules	Fentanyl Lozenges	Fentanyl Transdermal System
Fluconazole Injection	Flavoxate Hydrochloride	Flavoxate Hydrochloride Tablets
Flunisolide Nasal Spray	Fluconazole Tablets	Flunisolide Inhalation Aerosol
Fluoromethane F 18	Fluocinolone Acetonide Shampoo	Fluorescein Sodium Ophthalmic Solution
Fluticasone Propionate Inhalation Powder	Fluorometholone Ointment	Fluticasone Propionate Cream ***(Received)***
Fluticasone Propionate Ointment ***(Received)***	Fluticasone Propionate Pressurized Inhaler	Foscarnet Sodium
Fosfomycin Tromethamine	Foscarnet Sodium Injection	Fosfomycin For Oral Solution
Gadobenate Dimeglumine	Gabapentin Oral Solution	Gabapentin Tablets
Galantamine	Gadobenate Dimeglumine Injection	Gadopentetic Acid
Gallium Nitrate Injection	Galantamine Hydrobromide Tablets	Gallium Nitrate
Ganirelix Acetate Injection	Ganciclovir Capsules	Ganirelix
Gentamicin Sulfate Oral Solution	Gatifloxacin Injection	Gatifloxacin Tablets
Glipizide Extended-Release Tablets	Gentamicin Sulfate Soluble Powder	Glimepiride Tablets
Guaifenesin and Pseudoephedrine Hydrochloride Extended-Release Tablets	Glyceryl Aminobenzoate	Granisetron
Guaifenesin and Salts of Dextromethorphan and Pseudoephedrine Oral Solution	Granisetron Tablets	Granisetron Injection
Halobetasol Propionate Ointment	Guanidine Hydrochloride Tablets	Halobetasol Propionate
Haloperidol Lactate Injection	Guanidine Hydrochloride	Halobetasol Propionate Cream
Hydrochlorothiazide Oral Solution Concentrate	Haloperidol Decanoate	Haloperidol Decanoate Injection
Hydrocodone Bitartrate and Acetaminophen Oral Solution	Haloperidol Lactate Oral Concentrate	Hydralazine Hydrochloride and Hydrochlorothiazide Capsules
Hydrocodone Bitartrate and Homatropine Methylbromide Syrup	Hydrochlorothiazide Capsules	Hydrocodone Bitartrate and Guaifenesin Oral Solution
Hydrocortisone ***(Received)***	Hydrocodone Bitartrate and Aspirin Tablets	Hydrocodone Polistirex
Hydrocortisone Butyrate Lotion	Hydrocodone Bitartrate and Homatropine Methylbromide Tablets	Hydrocortisone Acetate Rectal Foam Aerosol
Hydroquinone Lotion	Hydrocortisone Acetate Dental Paste	Hydromorphone Hydrochloride Oral Solution
Ibuprofen Capsules	Hydroflumethiazide and Reserpine Tablets	Ibandronate Sodium Tablets
Imipramine Pamoate Capsules	Ibandronate Sodium	Imipramine Pamoate
Irinotecan	Idarubicin Hydrochloride Injection	Ipratropium Bromide Inhalation Solution
Isosulfan Blue Injection	Ipratropium Bromide Inhalation Aerosol	Isosulfan Blue
Itraconazole Injection	Irinotecan Hydrochloride Injection	Itraconazole
Ketoconazole Shampoo	Isradipine Extended-Release Tablets	Ketoconazole Cream
Ketoprofen Tablets	Itraconazole Oral Solution	Ketoprofen Extended-Release Capsules
Lactic Acid Lotion	Ketoprofen Capsules	Ketotifen Fumarate Ophthalmic Solution
Lamotrigine	Ketotifen Fumarate	Lamotrigine
Lawsone	Lamivudine Tablets	Latanoprost Ophthalmic Solution
Levetriacepam	Latanoprost	Leucovorin Calcium for Injection
Levobetaxolol Ophthalmic Suspension	Lawsone With Dihydroxyacetone	Levobetaxolol
Levofloxacin	Levetriacepam Tablets	Levocabastine Ophthalmic Suspension
Levomethadyl Acetate Hydrochloride Oral Concentrate	Levocabastine Hydrochloride	Levomethadyl Acetate
Liothyronine Injection	Levofloxacin Solution	Lincomycin Hydrochloride and Spectinomycin Sulfate Soluble Powder

MONOGRAPH NAME
Noncomplex Actives (Drug Substances and Products) *(Continued)*

Lomustine Capsules	Lidocaine and Prilocaine Cream ***(Received)***	Lomustine
Lopinavir and Ritonavir Solution	Lisinopril and Hydrochlorothiazide Tablets	Loratadine and Pseudoephedrine Sulfate Extended-Release Tablets ***(Received)***
Loratadine Orally Disintegrating Tablets	Lopinavir	Lopinavir Solution
Losartan Potassium Tablets	Mesalamine Suppositories	Methacholine Chloride for Inhalation Solution
Mesoridazine Besylate Concentrate	Mefloquine Hydrochloride Tablets	Methoxsalen Softgels
Methadone Hydrochloride Oral Concentrate	Melphalan for Injection	Metipranolol Hydrochloride
Methyclothiazide and Deserpidine Tablets	Metaraminol Bitartrate Injection	Metronidazole Cream
Metipranolol Ophthalmic Solution	Methocarbamol and Aspirin Tablets	Metronidazole Lotion
Metronidazole Extended-Release Tablets	Methylphenidate Hydochloride Chewable Tablets	Midazolam Hydrochloride
Midazolam Hydrochloride Injection	Metronidazole Capsules	Mifepristone
Molindone Hydrochloride Oral Solution	Moexipril	Metronidazole Hydrochloride for Injection
Miconazole Nitrate Topical Aerosol	Misoprostol ***(Received)***	Misoprostol Dispersion ***(Received)***
Misoprostol Tablets ***(Received)***	Milrinone Injection	Mifepristone Tablets
Morphine Sulfate for Injection Concentrate	Mivacurium	Mivacurium in Dextrose Injection
Morphine Sulfate Tablets	Moexipril Hydrochloride and Hydrochlorothiazide Tablets	Morphine Sulfate Oral Solution Concentrate
Mycophenolate Mofetil Tablets	Mivacurium Injection	Mycophenolate Mofetil Oral Solution
Nalmefene Hydrochloride	Moexipril Hydrochloride Tablets	Nalbuphine Hydrochloride Injection
Naproxen Extended-Release Tablets	Morphine Sulfate Oral Solution	Naphazoline Hydrochloride and Phenirамine Maleate Ophthalmic Solution
Neomycin Sulfate Oral Powder	Mycophenolate Mofetil Capsules	Nedocromil Sodium Inhalation Aerosol
Nicardipine Hydrochloride	Nalbuphine Hydrochloride	Nevirapine Tablets
Nilutamide Tablets	Nalmefene Hydrochloride Injection	Nilutamide
Nisoldipine Extended-Release Tablets	Nedocromil	Nisoldipine
Ofloxacin In Dextrose Injection	Nevirapine Oral Suspension	Nizatidine Tablets
Olopatadine	Nicardipine Hydrochloride Capsules	Ofloxacin Tablets
Olsalazine Sodium Capsules	Nimodipine Capsules	Olsalazine Sodium
Orphenadrine Citrate Extended-Release Tablets	Nitroglycerin Solution in Acrylic Adhesive	Ondansetron Tablets
Oxcarbazepine Suspension	Ofloxacin Injection	Orbifloxacin Tablets
Pantoprazole Sodium	Olopatadine Ophthalmic Solution	Oxcarbazepine ***(Received)***
Paroxetine Hydrochloride Extended-Release Tablets	Ondansetron Oral Solution	Oxiconazole Cream
Pemoline	Orbifloxacin	Pancuronium Bromide Injection ***(Received)***
Pentaerythritol Tetranitrate Extended-Release Capsules	Orphenadrine Citrate, Aspirin, and Caffeine Tablets	Pantoprazole Sodium Tablets
Pentamidine Isethionate for Inhalation	Oxcarbazepine Tablets	Pemirolast Potassium Ophthalmic Solution
Permethrin Cream	Pancuronium Bromide ***(Received)***	Penicillin G Potassium Tablets for Oral Solution
Phentermine Resin Complex	Pantoprazole Sodium for Injection	Pentamidine Isethionate
Phenylephrine Hydrochloride and Chlorpheniramine Maleate Extended-Release Tablets	Paroxetine Oral Suspension	Pentazocine Hydrochloride and Acetaminophen Tablets
Phendimetrazine Tartrate Extended-Release Capsules	Pemoline Tablets	Phenobarbital Capsules

MONOGRAPH NAME
Noncomplex Actives (Drug Substances and Products) *(Continued)*

Pilocarpine Hydrochloride Ophthalmic Ointment	Pentaerythritol Tetranitrate Extended-Release Tablets	Phenylephrine Hydrochloride and Chlorpheniramine Maleate Extended-Release Capsules
Piperonyl Butoxide and Pyrethrins Aerosol Foam	Pentamidine Isethionate for Injection	Phenylephrine Hydrochloride, Chlorpheniramine Maleate, and Acetaminophen Extended-Release Tabs
Poractant Alpha	Phentermine Resin Complex Capsules	Pilocarpine Hydrochloride Ophthalmic Gel
Povacrylate Solution	Pilocarpine Hydrochloride Tablets	Piperonyl Butoxide
Povidone-Iodine Swabsticks	Pirbuterol Acetate	Pirbuterol Acetate Inhalation Aerosol
Pramipexole Dihydrochloride Tablets	Poractant Alpha Supension	Porfimer Sodium for Injection
Prednicarbate Cream	Povacrylate-Iodine Topical Solution	Povidone-Iodine Gauze
Prochlorperazine Maleate Extended-Release Capsules	Povidone-Iodine Topical Aerosol Foam	Povidone-Iodine Vaginal Suppositories
Promethazine and Phenylephrine Hydrochlorides and Codeine Phosphate Syrup	Prazosin Hydrochloride and Polythiazide Capsules	Prednicarbate ***(Received)***
Promethazine Hydrochloride and Dextromethorphan Hydrobromide Syrup	Prednicarbate Ointment	Prednisolone Sodium Phosphate Oral Solution
Pseudoephedrine Hydrochloride And Naproxen Sodium Extended-Release Tablets	Progesterone Capsules	Proguanil
Pseudoephedrine Sulfate And Dexbrompheniramine Maleate Extended-Release Tablets	Promethazine and Phenylephrine Hydrochlorides Syrup	Promethazine Hydrochloride and Codeine Phosphate Oral Solution
Pyrilamine Maleate Injection	Propafenone Hydrochloride Tablets	Pseudoephedrine Hydrochloride and Brompheniramine Maleate Extended-Release Tablets
Ranitidine Capsules	Pseudoephedrine Hydrochloride, Chlorpheniramine Maleate, and Codeine Phosphate Oral Solution	Pseudoephedrine Hydrochloride, Guaifenesin, and Codeine Phosphate Oral Solution
Reserpine and Polythiazide Tablets	Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Oral Solution	Pseudoephedrine Sulfate, Dexbrompheniramine Maleate, and Acetaminophen Extended-Release Table
Risperidone Orally Disintegrating Tablets	Quinidine Sulfate Injection	Quetiapine Fumarate
Rivastigmine Tartrate Capsules	Rauwolfia Serpentina and Endroflumethiazide Tablets	Ramipril Capsules
Rimantadine Hydrochloride Oral Solution	Risperidone ***(Received)***	Risperidone Tablets
Rosiglitazone Maleate Tablets	Rose Bengal	Risperidone Oral Solution
Salicylic Acid and Sulfur Lotion	Rivastigmine Tartrate Oral Solution	Rocuronium Bromide Injection
Salmeterol Xinafoate	Rose Bengal Ophthalmic Solution	Ropinirole Hydrochloride Tablets
Scopolamine Transdermal System	Salicylic Acid Cream	Salicylic Acid and Sulfur Cleansing Lotion
Serpacwa Topical Cream	Salicylic Acid and Sulfur Shampoo	Salicylic Acid Ointment
Sodium Bicarbonate, Sodium Citrate, and Sodium Tartrate for Oral Suspension	Salmeterol Inhalation Aerosol	Salmeterol Xinafoate Inhalation Powder
Sodium Chlorophyllin Copper Complex Tablets	Selegiline Hydrochloride Capsules	Sibutramine Hydrochloride Capsules
Sodium Phenylbutyrate Oral Powder	Sertraline Hydrochloride Oral Solution	Simethicone ***(Received)***
Sodium Phosphates Tablets	Sodium Bicarbonate and Sodium Citrate for Oral Solution	Sodium Phenylbutyrate
Sterile Talc Aerosol	Sodium Iodide Injection	Sodium Phosphates for Oral Suspension
Sucralfate Oral Suspension	Sodium Phenylbutyrate Tablets	Sterile Methotrexate Sodium
Sulfacetamide Sodium and Prednisolone Sodium Phosphate Ophthalmic Solution	Sodium Salicylate and Sulfur Shampoo	Streptozocin for Injection
Sulisobenzone Lotion	Streptozocin	Sulfacetamide Sodium and Fluorometholone Ophthalmic Suspension
Tacrolimus	Sulconazole Nitrate Cream	Sulfacytine Tablets

MONOGRAPH NAME
Noncomplex Actives (Drug Substances and Products) *(Continued)*

Tacrolimus Ointment	Sulfacytine	Sulfasalazine Oral Suspension
Tenofovir Disoproxil Fumarate Tablets	Sulfanilamide Vaginal Cream	Sumatriptan Tablets
Terbinafine Tablets	Sumatriptan Injection	Tacrolimus Injection
Terconazole Vaginal Cream	Tacrolimus Capsules	Technetium Tc 99m Teboroxime Injection
Tetracycline Hydrochloride Periodontal Fiber	Tamsulosin Hydrochloride Capsules	Terbinafine Hydrochloride Cream
Tioconazole Vaginal Ointment	Terbinafine Hydrochloride	Terconazole
Tolnaftate Topical Aerosol Solution	Terbinafine Topical Solution	Testosterone Transdermal System
Torsemide Injection	Terconazole Vaginal Suppositories	Tiludronate Disodium
Trandolapril Tablets	Theophylline Extended-Release Tablets	Tiopronin Tablets
Tranylcypromine Sulfate	Tiopronin	Topiramate Tablets
Tretinoin Microsphere Gel	Topiramate Capsules	Trandolapril and Verapamil Hydrochloride Extended-Release Tablets
Trimetrexate for Injection	Torsemide Tablets	Tranexamic Acid Injection
Triprolidine and Pseudoephedrine Hydrochlorides and Codeine Phosphate Syrup	Tranexamic Acid	Tretinoin Capsules
Trolamine Salicylate Topical Emulsion	Tranylcypromine Sulfate Tablets	Trifluridine Ophthalmic Solution
Trovafloxacin Mesylate for Injection	Triamcinolone Acetonide Metered-Dose Nasal Suspension	Trimipramine Maleate Capsules
Urea Cream	Trimipramine Maleate	Trolamine Salicylate Gel
Valproic Acid Injection ***(Received)***	Trolamine Salicylate Cream	Trovafloxacin Mesylate
Venlafaxine Tablets	Trovafloxacin Injection	Unoprostone Isopropyl Ophthalmic Solution
Verapamil Hydrochloride Capsules	Verapamil Hydrochloride Extended-Release Capsules	Undecylenic Acid Topical Foam Aerosol
Venlafaxine Extended-Release Capsules	Vecuronium Bromide for Injection	Yttrium Y-90 Glass Microspheres
Yttrium Y-90 Chloride Solution	Yttrium Y-90 Microspheres Injection	Zidovudine and Lamivudine Tablets
Zinc Tridosium Pentetate	Zinc Tridosium Pentetate Injection	Zinc Acetate Capsules
Ziprasidone Hydrochloride Capsules	Zoledronic Acid for Injection	
Excipients		
Aluminum Stearate	Butylene Glycol	Calcium Alginate
Calcium Glycerophosphate	Calcium Propionate	Calcium Sorbate
Canola Oil	Coconut Oil	Cystine
Dehydroacetic Acid	Desoxycholic Acid	Diethyl Sebacate
Diisopropanolamine ***(Received)***	Erythritol ***(Received)***	Erythorbic Acid
Ethyl Hexanediol	Ethyl Maltol	Gamma-Cyclodextrin
Glycerol Ester Of Gum Rosin (Ester Gum)	Hexanetriol(-1,2,6-)	Lanolin (Wool Fat), Hydrogenated
Lanolin Hydrous	Lauramine Oxide	Linoleic Acid
Macrogol Sorbitan Tristearate	Maltitol ***(Received)***	Microcrystalline Cellulose, Silicified
N-Methylpyrrolidone ***(Received)***	Oleyl Oleate	Palm Kernel Oil
Polyacrylate Dispersion 30 Percent ***(Received)***	Polydextrose	Polyvinyl Acetate
Potassium Alginate ***(Received)***	Potassium Glycerophospate	Propylene Glycol Monolaurate ***(Received)***
Purified Polyoxyl 35 Castor Oil ***(Received)***	Rapeseed Oil	Rapeseed Oil, Hydrogenated
Rapeseed Oil, Superglycerinated	Rosin	Sodium Acid Pyrophosphate
Sodium Aluminosilicate	Sodium Aluminum Phosphate Acidic	Sodium Aluminum Phosphate Basic
Sodium Bisulfite	Sodium Citrate, Monobasic	Sodium Diacetate
Sodium Erythorbate	Sodium Polyphosphates Glassy	Sodium Pyrophosphate
Sodium Sesquicarbonate	Sodium Thiomalate	Sodium Trimetaphosphate
Sodium Tripolyphosphate	Soy Polysaccharides	Stannous Chloride
Stearyl Citrate	Succinylated Monoglycerides	Sucrose Stearate
Sulfobutyl Ether Beta Cyclodextran	Tallow Glycerides	Wheat Gluten

USP ANNUAL SCIENTIFIC MEETING, SEPTEMBER 27–30, 2005: IMPACT THE FUTURE OF PHARMACOPEIAL STANDARDS. The USP Annual Scientific Meeting will be held in the Hotel del Coronado, Coronado, California, September 27–30, 2005.

Spread the word. Tell your colleagues and register at: www.usp.org/conferences, 301-816-8134.

The USP 2005 Annual Scientific Meeting is your opportunity to directly contribute to USP's standards-setting processes. Through interaction with USP's scientific staff and Council of Experts, you will help establish standards-setting priorities for the organization and help shape the quality requirements that you must, by law, follow.

Featuring:

Analytical Validation and Verification of Compendial Methods

Learn about the new USP information in General Informational Chapter ⟨1226⟩ *Verification of Compendial Procedures.* Also includes presentations and workshops on the requirements for evolving analytical validation procedures, including spectroscopic and other physical test methods.

Biologics and Biotechnology Derived Therapies

Interactive discussion on cross-cutting, standards-setting activities currently being undertaken by USP, including validation of bioassays, development of standards for ancillary materials and international activities in biological standardization.

Dietary Supplements

Learn about the current and future impact of dietary supplement verification and new FDA regulatory initiatives on the marketplace; expansion of General Information Chapter ⟨2030⟩ *Supplemental Information for Botanicals;* technologies for botanical classification, and identification and analysis of new/emerging/potential dietary supplement ingredients.

Excipients

Interact with USP scientific experts, FDA, industry, and academic experts to discuss the science and related issues of excipients quality, including additives, excipient functionality and its impact on formulation, and multisource excipient equivalence, as well as recent advances in the development of novel excipients.

Making *USP–NF* Work for You

Be among the first to learn about future directions and updates based on resolutions adopted at the 2005 USP Convention and through other USP initiatives.

Annual Scientific Meeting 2005 Exhibit Program

Network with your colleagues as they showcase what's new and upcoming in the industry.

WHO SHOULD ATTEND:

- *USP-NF* and USP Reference Standards Users
- Scientists focusing on chemistry, biologics and biotechnology, analytical validation, excipients, and dietary supplements
- Government representatives
- Academia and association representatives
- Regulatory Affairs personnel
- R&D and QC personnel
- Lab supervisors/managers
- Compendial Affairs personnel
- Statisticians
- Technical consultants
- Healthcare practitioners

New and experienced bench chemists who want to better understand the USP process also may wish to attend the "Making *USP–NF* Work for You" track.

SCHEDULE:

Day 1—	September 27, 2005:	Registration
Day 2—	September 28, 2005:	The Annual Scientific Meeting starts with an opening session in the morning followed by Track Session I in the afternoon
Day 3—	September 29, 2005:	Track Session II (morning) and Track Session III (afternoon)
Day 4—	September 30, 2005:	Track Session IV in the morning followed by a "Town Hall" discussion. Meeting adjourns at 12:30 p.m.

Extension Services in Pharmacy at the University of Wisconsin-Madison School of Pharmacy is accredited by the Accreditation Council on Pharmacy Education (ACPE, formerly the American Council on Pharmaceutical Education) as a provider of continuing pharmaceutical education. This program is approved for 14.5 hours or 1.45 continuing education units (CEUs).

In order to receive credit, pharmacists will be required to complete an Annual Scientific Meeting evaluation form. In addition, pharmacists must complete a statements of credit form for continuing pharmaceutical education participation which will be mailed (by USP) within one month after the meeting. ACPE number: 073-999-05-076-L04 through 073-999-05-081-L04.

ADVANCE NOTICE OF UPCOMING OFFICIAL REVISIONS TO THE *USP–NF.* In order to provide as much time as possible for industry to adopt revisions made to the compendia, upcoming official revisions to the *USP–NF* are now being announced on the USP website as soon as they are voted on to become official by the appropriate Expert Committees of the Council of Experts.

Readers are directed to the ''Notices'' section found in the top right corner of the USP homepage at www.usp.org. By clicking on ''Upcoming Official Revisions to the *USP–NF:* Reference Standards Required But Not Available,'' you are taken to a page where upcoming revisions to the compendia are listed. The information posted includes the title of the item being revised, the *PF* citation where the revision was proposed, and a description of the proposal. In addition, an e-mail link to the USP Scientific Liaison for each revision is listed in parentheses after the item. The actual content and official date of each revision will be published in either an annual edition, *Supplement,* or *Interim Revision Announcement* and the items are sorted according to the publication in which they are to appear.

In addition, readers will also find a list of new USP Reference Standards that correspond to new *USP–NF* monographs but unfortunately are not yet available. The official dates of any *USP–NF* Standards, tests, or assays that require the use of these Standards are postponed until further notice pending availability of the Standards.

USP GUIDELINE FOR SUBMITTING REQUESTS FOR REVISION TO THE *USP–NF.* The *USP Guideline for Submitting Requests for Revision to the USP–NF* is available on USP's website at www.usp.org. This document was developed in conjunction with the USP Council of Experts and its Expert Committees, USP staff, and the Drug Substance, Complex Actives, and Excipients Project Teams of the Prescription/Nonprescription Stakeholders Forum. This document includes information to aid submission of new monographs and revisions to existing monographs for Noncomplex Active Substances and Products, Biological and Biotech Substances and Products, Excipients, and Vaccines. It incorporates many of the concepts and suggestions included in the ICH Q3A, Q3B, Q3C, Q6A, and Q6B guidelines. These include the definition of a specification and incorporate much of the terminology of Q3A for the control of impurities. The guideline clearly defines the information needed for the USP's Council of Experts and its Expert Committees to evaluate a request for revision. The document is approximately 75 pages in length with about 25 pages of addenda and is available in PDF format from the USP website at www.usp.org. Hard copies will be provided upon request.

PHARMACOPEIAL EDUCATION COURSES. USP's Pharmacopeial Education courses offer specialized instruction for chemists, scientists, and professionals in the pharmaceutical and allied industries. USP scientists who play a key role in establishing official USP standards teach these courses and provide expert insights on the practical applications of official test procedures and best practices in using the *USP–NF* and other USP resources. The courses also give participants an opportunity to learn how to get involved in USP's standards-setting processes and the benefits of participating in standards development. Courses offered in 2005 are listed below. For more information and to register, visit www.usp.org. To discuss how USP can bring courses to a location of your choice or design a custom course package for you, call 301-816-8237, or e-mail PharmacopeialEducation@usp.org.

2005 Calendar of Pharmacopeial Education Courses

Date	Name of Course	Location
July 18 and 19	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
August 12	Fundamentals of Microbiological Testing	USP Headquarters, Rockville, MD
August 17	Analytical Method Validation	USP Headquarters, Rockville, MD
August 18	Standards 100: Fundamentals of the Use of *USP–NF* and the Standards Development Process	USP Headquarters, Rockville, MD
August 19	Standards 101: Advanced Use of *USP–NF,* General Notices, and Monograph Chapters	USP Headquarters, Rockville, MD
October 19 and 20	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
December 7	Standards 100: Fundamentals of the Use of *USP–NF* and the Standards Development Process	USP Headquarters, Rockville, MD
December 8	Standards 101: Advanced Use of *USP–NF,* General Notices, and Monograph Chapters	USP Headquarters, Rockville, MD

VISIT THE USP WEB SITE AT ⟨http://www.usp.org⟩. Various resources related to Pharmacopeial standards are presented, including highlights from *PF.*

***USP–NF* AVAILABLE IN PRINT, ONLINE, AND CD.** *USP–NF,* the authoritative reference for official pharmaceutical standards is available in three convenient formats—print, online, and CD. One main edition and two *Supplements* are published each year. The current edition, *USP 28–NF 23*, is official through 2005. Starting with the *Second Supplement* to *USP 28–NF 23,* which will be available in June 2005, the *USP–NF* Online and CD versions will feature several enhancements. The enhancements include ''My *USP–NF,*'' an exciting new option that lets subscribers customize their use of *USP–NF* by saving frequent searches, creating a unique table of contents, and using other personalization options. To order *USP–NF,* go to www.usp.org or call 1-800-227-8772 or 301-881-0666.

CHROMATOGRAPHIC REAGENTS. Official and proposed chromatographic procedures in the *USP–NF* and *Pharmacopeial Forum (PF)* refer to column reagents only by 'L,' 'S,' or 'G' designations. The brand names of these reagents are listed in *Chromatographic Reagents.* This book also provides an index of column manufacturers and lists alternative columns that may be used to carry out official procedures. *Chromatographic Reagents* saves chemists and scientists valuable laboratory time spent searching for the right columns to use in testing. *Chromatographic Reagents* is available in print format. The online format of the *USP–NF* includes the latest *Chromatographic Reagents*. To order *Chromatographic Reagents,* go to www.usp.org or call 1-800-227-8772 or 301-881-0666.

INTERNATIONAL CORRESPONDENCE. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows:

Technical Secretariat of the
European Pharmacopoeia Commission
B.P. 907
F 67029 Strasbourg Cedex 1
France

NAKASHIMA Nobumasa
Evaluation and Licensing Division
Pharmaceutical and Medical Safety Bureau
Ministry of Health, Labour and Welfare, Japan
Tel. +81-3-3595-2431, Fax. +81-3-3597-9535
E-mail: nakashima-nobumasa@mhlw.go.jp

HOW TO SUBMIT COMMENTS. The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. Submissions concerning a particular item that has appeared in a *PF* should be submitted to the appropriate USP scientific staff liaison identified at the end of the *Briefing* accompanying each item. To submit comments and data to a liaison, use the e-mail address and telephone numbers listed in the *Staff Directory* included in every *PF.*

Please note that *USP–NF* is being published in an annual edition with one main book and two *Supplements* a year. In addition, the following schedule will repeat every year so that users will know what to expect and become familiar with the deadlines.

In the future, USP anticipates including the comment submission deadline in each briefing of every revision proposal when it is published for public review and comment.

For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or FAX number 301-816-8373.

Publication and Comment Schedule for *USP 29–NF 24*

Publication	Comment Deadline	Publication Date	Official Date
Main Book	May 15, 2005	November 2005	January 2006
Supplement One	August 15, 2005	February 2006	April 2006
Supplement Two	December 16, 2005	June 2006	August 2006

All official revisions are published in *Supplements to USP–NF* (twice yearly). Between *Supplements,* official revisions are published in *PF* in the *Interim Revision Announcement;* these revisions are also incorporated in the upcoming *Supplement.* The electronic version of *USP–NF* is updated as each *Supplement* becomes available and, therefore, contains all official text up to and including the contents of the latest *Supplement*.

PUBLICATION SCHEDULES

Publication	Publication Date	Official Date
1st Supplement	Feb. 2005	Apr. 1, 2005
PF 31(2) [Mar.–Apr. 2005]	Mar. 2005	Not Applicable
2nd IRA [published in *PF* 31(2)]	Mar. 2005	Apr. 1, 2005
PF 31(3) [May–June 2005]	May 2005	Not Applicable
3rd IRA [published in *PF* 31(3)]	May 2005	June 1, 2005
2nd Supplement	June 2005	Aug. 1, 2005
PF 31(4) [July–Aug. 2005]	July 2005	Not Applicable
4th IRA [published in *PF* 31(4)]	July 2005	Aug. 1, 2005
PF 31(5) [Sept.–Oct. 2005]	Sept. 2005*	Not Applicable
5th IRA [published in *PF* 31(5)]	Sept. 2005*	Oct. 1, 2005*
PF 31(6) [Nov.–Dec. 2005]	Nov. 2005*	Not Applicable
6th IRA [published in *PF* 31(6)]	Nov. 2005*	Dec. 1, 2005*
PF 32(1) [Jan.–Feb. 2006]	Jan. 2006*	Not Applicable
1st IRA [published in *PF* 32(1)]	Jan. 2006*	Feb. 1, 2006*
1st Supplement	Feb. 2006*	Apr. 1, 2006*
PF 32(2) [Mar.–Apr. 2006]	Mar. 2006*	Not Applicable
2nd IRA [published in *PF* 32(2)]	Mar. 2006*	Apr. 1, 2006*
PF 32(3) [May–June 2006]	May 2006*	Not Applicable
3rd IRA [published in *PF* 32(3)]	May 2006*	June 1, 2006*
2nd Supplement	June 2006*	Aug. 1, 2006*
PF 32(4) [July–Aug. 2006]	July 2006*	Not Applicable
4th IRA [published in *PF* 32(4)]	July 2006*	Aug. 1, 2006*
PF 32(5) [Sept.–Oct. 2006]	Sept. 2006*	Not Applicable
5th IRA [published in *PF* 32(5)]	Sept. 2006*	Oct. 1, 2006*
PF 32(6) [Nov.–Dec. 2006]	Nov. 2006*	Not Applicable
6th IRA [published in *PF* 32(6)]	Nov. 2006*	Dec. 1, 2006*

* Tentative

INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- New adopted (official) revisions to the *USP–NF* that become effective before the effective date of the next *Supplement* or that were not ready for adoption by the closing date for the upcoming *Supplement*. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.

Symbols—Interim revisions are shown with new text (if any) enclosed in circles, •new text•. Text enclosed in squares, ▪new text▪, has already been adopted in a *Supplement*. Where the symbols appear together with no enclosed text, such as •• or ▪▪, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by a number that indicates the *IRA* or *Supplement* in which the revision first appeared. For example, •2 indicates that the revision was officially adopted in the *Second Interim Revision Announcement*, and ▪2S (*USP27*) indicates that the revision was officially adopted in the *Second Supplement* to *USP 27*.

Errata—At the end of the *Interim Revision Announcement* section is a list of errata and corrections to *USP 28–NF 23*. The page number indicates where the item is found in *USP–NF*. If necessary, this list will be updated with every issue of *PF*. This information will also be cumulative in the next available *Supplement*, and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

FOURTH INTERIM REVISION ANNOUNCEMENT to *USP 28* and to *NF 23*

By authority of the United States Pharmacopeial Convention, Inc.
Prepared by the Council of Experts and published by the Board of Trustees

John W. Mauger, *Chair*
USP Board of Trustees

Roger L. Williams, *Executive Vice President*
and *Chairman, USP Council of Experts*

Eric B. Sheinin, Ph.D., *Chief Science Officer*

Official August 1, 2005 **Released July 1, 2005**

All inquiries and comments regarding *USP 28* text and *NF 23* text should be addressed to the Executive Secretariat, *USP–NF*, 12601 Twinbrook Parkway, Rockville, MD 20852.

New USP Reference Standards

The following USP Reference Standards, which were indicated in past *Supplements to USP–NF* as being not yet available, have since become available. Thus, the official date of each *USP 28* or *NF 23* standard, test, or assay requiring the use of the following Reference Standards is indicated individually in this list. (AS) indicates Authentic Substances, which are materials that have no specified use in monographs or General Chapters and are offered for the convenience of *USF–NF* users.

USP Ademetione Disulfate Tosylate RS (January 1, 2006)
USP Adipic Acid RS (September 1, 2005)
USP Agnuside RS (November 1, 2005)
USP Aluminum Sulfate (AS)
USP Amiodarone Hydrochloride RS (July 1, 2005)
USP Ammonium Phosphate Dibasic (AS)
USP Ascorbyl Palmitate RS (September 1, 2005)
USP Asparagine Anhydrous RS (November 1, 2005)
USP Asparagine Monohydrate RS (November 1, 2005)
USP Bismuth Subcarbonate RS (September 1, 2005)
USP Bismuth Subgallate RS (September 1, 2005)
USP Bismuth Subnitrate RS (November 1, 2005)
USP Bupropion Hydrochloride Related Compound A RS (January 1, 2006)
USP Bupropion Hydrochloride Related Compound B RS (November 1, 2005)
USP Bupropion Hydrochloride Related Compound C RS (January 1, 2006)
USP Bupropion Hydrochloride Related Compound F RS (January 1, 2006)
USP Calcium Stearate (AS)
USP Carboxymethylcellulose Calcium (AS)
USP Carboxymethylcellulose Sodium RS (September 1, 2005)
USP Carprofen RS (September 1, 2005)
USP Casticin RS (November 1, 2005)
USP Microcrystalline Cellulose (AS)
USP Powdered Cellulose (AS)
USP Ciclopirox RS (January 1, 2006)
USP Ciclopirox Related Compound A RS (January 1, 2006)
USP Ciclopirox Related Compound B RS (January 1, 2006)
USP Cromolyn Sodium Related Compound A (AS)
USP 2-Deoxy-D-glucose RS (November 1, 2005)
USP Desoaminylazithromycin RS (January 1, 2006)
USP Dextran 1 RS (July 1, 2005)
USP Dextran T-10 RS (July 1, 2005)
USP Dibutyl Sebacate (AS)
USP Dichlorvos (AS)
USP Diethanolamine RS (November 1, 2005)
USP Eleutheroside B RS (January 1, 2006)
USP Eleutheroside E RS (January 1, 2006)
USP Enrofloxacin RS (January 1, 2006)
USP Eugenol RS (November 1, 2005)
USP Fexofenadine Hydrochloride RS (July 1, 2005)
USP Fexofenadine Related Compound A RS (July 1, 2005)
USP Fexofenadine Related Compound B RS (July 1, 2005)
USP Fluconazole RS (July 1, 2005)
USP Fluconazole Related Compound A RS (July 1, 2005)
USP Fluconazole Related Compound B RS (July 1, 2005)
USP Fluconazole Related Compound C RS (July 1, 2005)
USP Fludeoxyglucose Related Compound A RS (September 1, 2005)
USP Fluvoxamine Maleate RS (November 1, 2005)
USP L-Fucose RS (November 1, 2005)
USP Galactitol RS (January 1, 2006)
USP Hypromellose Acetate Succinate RS (July 1, 2005)
USP Indapamide Related Compound A (AS)
USP Indinavir RS (September 1, 2005)
USP Indinavir System Suitability RS (September 1, 2005)
USP Isopropyl Alcohol RS (September 1, 2005)
USP Lactic Acid (AS)
USP Lauroyl Polyoxylglycerides (AS)
USP Losartan Potassium RS (July 1, 2005)
USP Lutein RS (September 1, 2005)
USP Magnesium Carbonate (AS)
USP Magnesium Stearate (AS)
USP Maltose Monohydrate RS (January 1, 2006)
USP Mangafodipir Related Compound A RS (July 1, 2005)
USP Mangafodipir Related Compound B RS (July 1, 2005)
USP Mangafodipir Trisodium RS (July 1, 2005)
USP Manganese Chloride (AS)
USP Manganese Sulfate (AS)
USP Meglumine RS (September 1, 2005)
USP Melengestrol Acetate RS (September 1, 2005)
USP Melengestrol Acetate Related Compound A RS (September 1, 2005)
USP Melengestrol Acetate Related Compound B RS (September 1, 2005)
USP Metacholine Chloride (AS)
USP Methyl Salicylate RS (September 1, 2005)
USP Monobasic Potassium Phosphate (AS)
USP Monoethanolamine RS (November 1, 2005)
USP Monosodium Glutamate RS (September 1, 2005)
USP Morantel Tartrate RS (September 1, 2005)
USP Oleic Acid RS (November 1, 2005)
USP Olive Oil (AS)
USP Omeprazole Related Compound A RS (September 1, 2005)
USP Pancuronium Bromide RS (September 1, 2005)
USP Peanut Oil (AS)
USP Phenoxyethanol RS (July 1, 2005)
USP Phenylethyl Alcohol RS (November 1, 2005)
USP Phosphoric Acid (AS)
USP Potassium Acetate (AS)
USP Potassium Bitartrate (AS)
USP Potassium Citrate RS (September 1, 2005)
USP Potassium Nitrate (AS)
USP Dibasic Potassium Phosphate (AS)
USP Potassium Sodium Tartrate RS (September 1, 2005)
USP Potassium Sorbate (AS)
USP Prilocaine RS (January 1, 2006)
USP Prilocaine Related Compound A RS (January 1, 2006)
USP Propofol RS (January 1, 2006)
USP Propofol Related Compound A RS (January 1, 2006)
USP Propofol Related Compound B RS (January 1, 2006)
USP Propofol Related Compound C RS (January 1, 2006)
USP Propofol Resolution Mixture C RS (January 1, 2006)
USP Ramipril Related Compound D RS (November 1, 2005)
USP Residual Solvent Class 2—Hexane RS (November 1, 2005)
USP Residual Solvents Class 2—Mixture B RS (January 1, 2006)
USP Sevoflurane Related Compound B RS (July 1, 2005)
USP Sevoflurane Related Compound C RS (July 1, 2005)
USP β-Sitosterol RS (September 1, 2005)
USP Sodium Bicarbonate (AS)
USP Sodium Benzoate RS (January 1, 2006)
USP Sodium Chloride (AS)
USP Sorbic Acid (AS)
USP Stavudine RS (January 1, 2006)
USP Stavudine System Suitability Mixture RS (January 1, 2006)
USP Sulfaquinoxaline Related Compound A RS (January 1, 2006)
USP Sumatriptan Succinate Related Impurities RS (November 1, 2005)
USP Tagatose RS (January 1, 2006)
USP Tannic Acid RS (September 1, 2005)
USP Tartaric Acid RS (September 1, 2005)
USP Terbutaline Related Compound A RS (September 1, 2005)
USP Thymol RS (November 1, 2005)
USP Tilmicosin RS (November 1, 2005)

USP Tolcapone RS (July 1, 2005)
USP Tolcapone Related Compound B RS (September 1, 2005)
USP Trenbolone CIII RS (November 1, 2005)
USP Trenbolone Acetate CIII RS (November 1, 2005)
USP Tribasic Calcium Phosphate (AS)
USP Trolamine RS (November 1, 2005)
USP Tylosin Tartrate RS (September 1, 2005)
USP Urea RS (September 1, 2005)

The official dates of any *USP 28* or *NF 23* standards, tests, or assays requiring the use of the following new USP Reference Standards are postponed until further notice pending availability of the respective Reference Standards.

USP Albumin Human RS
USP Alteplase RS
USP Amifostine RS
USP Amifostine Thiol RS
USP Antithrombin III Human RS
USP Berberine Chloride RS
USP Budesonide RS
USP Bupropion Hydrochloride Related Compound D RS

NOTICE OF POSTPONEMENT

Helium, Nitrous Oxide, Nitrogen, and *Nitrogen 97 Percent*

USP has **postponed indefinitely** the official dates of the revisions to the *Helium, Nitrous Oxide, Nitrogen,* and *Nitrogen 97 Percent* monographs, which were published in the *First Supplement* to *USP 28–NF 23* on pages 3245, 3264, 3359, and 3359, respectively. These revisions were originally slated to become official on April 1, 2005. The postponements are intended to provide additional time to further evaluate some of the tests, procedures, and acceptance criteria provided in the proposed revisions.

The Aerosols Expert Committee is presently reviewing comments received concerning these revisions. The USP intends to publish, if necessary, additional proposed revisions in a future issue of *Pharmacopeial Forum* for further public review and comment. USP proposes that these monograph revisions go forward to official text once the public comments have been considered.

Should you have any questions, please contact Kahkashan Zaidi, Ph.D., Scientist, General Policies and Requirements Division and liaison to the Aerosols Expert Committee (301-816-8269 or kxz@usp.org).

Helium

Change to read:

•**USP Reference standards** ⟨11⟩—*USP Air–Helium RS.*•

•(Postponed indefinitely)•

Change to read:

Assay—Introduce a specimen of Helium into a gas chromatograph by means of a gas sampling valve. Select the operating conditions of the gas chromatograph such that the standard peak signal resulting from the following procedure corresponds to not less than 70% of the full-scale reading. Preferably, use an apparatus corresponding to the general type in which the column is 6 m in length and 4 mm in inside diameter and is packed with porous polymer beads, which permits complete separation of nitrogen and oxygen from Helium, although the nitrogen and oxygen may not be separated from each other. Use industrial grade helium (99.99%) as the carrier gas, with a thermal-conductivity detector, and control the column temperature: the peak response produced by the assay specimen exhibits a retention time corresponding to that produced by •USP Air–Helium RS,• and indicates not more than 1.0% of air when compared to the peak response of the •USP Air–Helium RS,• and not less than 99.0%, by volume, of He.

•(Postponed indefinitely)•

Nitrous Oxide

Change to read:

•**USP Reference standards** ⟨11⟩—*USP Air–Helium RS. USP Nitrous Oxide RS.*•

•(Postponed indefinitely)•

Change to read:

Identification—

A: With the container temperatures the same and maintained between 15° and 25°, concomitantly read the pressure of the Nitrous Oxide container and of a container of •USP Nitrous Oxide RS.• [NOTE—Do not use the •USP Nitrous Oxide RS• if it has been depleted to less than half of its full capacity.] The pressure of the Nitrous Oxide container is within 50 psi of that of the •USP Nitrous Oxide RS.•

B: Pass 100 ± 5 mL released from the vapor phase of the contents of the Nitrous Oxide container through a carbon dioxide detector tube at the rate specified for the tube: no color change is observed *(distinction from carbon dioxide).*

C: Collect about 100 mL of the gas under test in a 100-mL tube fitted at the top with a stopcock. Open the stopcock, and quickly add a freshly prepared solution of 500 mg of pyrogallol in 2 mL of water and a freshly prepared solution of 12 g of potassium hydroxide in 8 mL of water. Immediately close the stopcock, and mix: the gas is not absorbed, and the solution does not become brown *(distinction from oxygen).*

Interim Revision Announcement

NOTICE OF POSTPONEMENT (*continued*)

•**D:** Prepare a gas chromatograph as directed in the *Assay,* and inject USP Nitrous Oxide RS and a sample of Nitrous Oxide into the gas chromatograph. The retention time of the major peak in the chromatogram of the Nitrous Oxide sample corresponds to that in the chromatogram of the USP Nitrous Oxide RS.•4

•(Postponed indefinitely)•4

Change to read:

Assay—Introduce a specimen of Nitrous Oxide taken from the liquid phase, as directed in the test for *Nitrogen dioxide,* into a gas chromatograph by means of a gas-sampling valve. Select the operating conditions of the gas chromatograph such that the peak response resulting from the following procedure corresponds to not less than 70% of the full-scale reading. Preferably, use an apparatus corresponding to the general type in which the column is 6 m in length and 4 mm in inside diameter and is packed with porous polymer beads, which permits complete separation of N_2 and O_2 from N_2O, although the N_2 and O_2 may not be separated from each other. Use industrial grade helium (99.99%) as the carrier gas, with a thermal-conductivity detector, and control the column temperature: the peak response produced by the assay specimen exhibits a retention time corresponding to that produced by •USP Air–Helium RS,•4 and is equivalent to not more than 1.0% of air when compared to the peak response of the •USP Air–Helium RS,•4 indicating not less than 99.0%, by volume, of N_2O.

•(Postponed indefinitely)•4

Nitrogen

Change to read:

•**USP Reference standards** ⟨11⟩*—USP Nitrogen RS. USP Oxygen–Helium RS.*•4

•(Postponed indefinitely)•4

Change to read:

Identification—•Prepare a gas chromatograph as directed in the *Assay,* and inject USP Nitrogen RS and the nitrogen sample into the gas chromatograph. The retention time of the major peak in the chromatogram of the nitrogen sample corresponds to that in the chromatogram of the USP Nitrogen RS.•4

•(Postponed indefinitely)•4

Change to read:

Assay—Introduce a specimen of Nitrogen into a gas chromatograph by means of a gas sampling valve. Select the operating conditions of the gas chromatograph such that the standard peak signal resulting from the following procedure corresponds to not less than 70% of the full-scale reading. Preferably, use an apparatus corresponding to the general type in which the column is 3 m in length and 4 mm in inside diameter and is packed with a molecular sieve prepared from a synthetic alkali-metal aluminosilicate capable of absorbing molecules having diameters of up to 0.5 nm, which permit complete separation of oxygen from nitrogen. Use industrial grade helium (99.99%) as the carrier gas, with a thermal-conductivity detector, and control the column temperature: the peak response produced by the assay specimen exhibits a retention time corresponding to that produced by •the USP Oxygen–Helium RS,•4 and is equivalent to not more than 1.0% of oxygen when compared to the peak response of the •USP Oxygen–Helium RS,•4 indicating not less than 99.0%, by volume, of N_2.

•(Postponed indefinitely)•4

Nitrogen 97 Percent

Change to read:

•**USP Reference standards** ⟨11⟩*—USP Nitrogen 97 Percent RS. USP Oxygen–Helium RS.*•4

•(Postponed indefinitely)•4

Change to read:

Identification—•Prepare a gas chromatograph as directed in the *Assay,* and inject USP Nitrogen 97 Percent RS and a sample of Nitrogen 97 Percent into the gas chromatograph. The retention time of the major peak in the chromatogram of the test sample corresponds to that in the chromatogram of the USP Nitrogen 97 Percent RS.•4

•(Postponed indefinitely)•4

Change to read:

Assay—Proceed as directed in the *Assay* under *Nitrogen.* The peak response produced by the assay specimen exhibits a retention time corresponding to that produced by •the USP Oxygen–Helium RS•4 and is equivalent to not more than 3.0% of oxygen when compared to the peak response of the •USP Oxygen–Helium RS,•4 indicating not less than 97.0%, by volume, of N_2.

•(Postponed indefinitely)•4

MONOGRAPHS (USP)

Anhydrous Citric Acid

Delete the following:

•**Organic volatile impurities,** *Method IV* ⟨467⟩: meets the requirements.•4

Citric Acid Monohydrate

Change to read:

Color of solution—

Standard stock solutions—Prepare three solutions, *A, B,* and *C,* containing, respectively, the following parts of ferric chloride CS, cobaltous chloride CS, cupric sulfate CS, and dilute hydrochloric acid (10 g per L):

A—2.4 : 0.6 : 0 : 7.0
B—2.4 : 1.0 : 0.4 : 6.2
C—9.6 : 0.2 : 0.2 : 0

•*Standard solutions*—[NOTE—Prepare the *Standard solutions* immediately before use.] Transfer 2.5 mL of *Standard stock solution A* to a 100-mL volumetric flask, dilute with dilute hydrochloric acid (10 g per L) to volume, and mix to obtain *Standard solution A*. Transfer 2.5 mL of *Standard stock solution B* to a 100-mL volumetric flask, dilute with dilute hydrochloric acid (10 g per L) to volume, and mix to obtain *Standard solution B*. Transfer 0.75 mL of *Standard stock solution C* to a 100-mL volumetric flask, dilute with dilute hydrochloric acid (10 g per L) to volume, and mix to obtain *Standard solution C*.•4

Test solution—Use the *Test solution* prepared in the *Clarity of solution* test.

Procedure—Transfer a sufficient portion of the *Test solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 to 25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Standard solution A, Standard solution B, Standard solution C,* and water to separate matching test tubes. Compare the *Test solution, Standard solution A, Standard solution B, Standard solution C,* and water in diffused daylight, viewing vertically against a white background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). The *Test solution* is not more intensely colored than *Standard solutions A, B, C,* or water.

Clarithromycin Extended-Release Tablets

Add the following:

•**Labeling**—When more than one *Dissolution Test* is given, the labeling states the *Dissolution Test* used only if *Test 1* is not used.•4

Change to read:

•**Dissolution** ⟨711⟩—

TEST 1—•4

Medium: 0.3 M phosphate buffer, pH 6.0 (prepared by dissolving 816.5 g of monobasic potassium phosphate and 48 g of sodium hydroxide in about 4 L of water, mixing, and diluting with water to 20 L. Adjust with either concentrated phosphoric acid or 1 N sodium hydroxide to a pH of 6.0 ± 0.05); 900 mL.

Apparatus 2: 75 rpm.

Times: 30, 45, 60, and 120 minutes.

Procedure—Determine the percentages of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved using the following method.

Standard solutions—Prepare five solutions of USP Clarithromycin RS dissolved in acetonitrile and diluted in *Medium,* with known concentrations over the range of about 60 to 600 µg per mL.

Test solution—Use portions of the solution under test passed through a 35-µm polyethylene filter.

Chromatographic system—Proceed as directed in the *Assay.*

Procedure—Separately inject equal volumes (about 50 µL) of the five *Standard solutions* and the *Test solution* into the chromatograph, and measure the responses for the major peaks. Perform a linear regression analysis to generate a standard curve using the peak area of each *Standard solution* versus its concentration. Determine the amount of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved at each specified time interval, using the peak area of each *Test solution* and the linear regression statistics for the *Standard solutions.*

Tolerances—The percentages of the labeled amounts of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved at the times specified conform to the following *Acceptance Table.*

Acceptance Table

Level	Time (minutes)	Amount dissolved (individual limits)	Amount dissolved (average limits)
L_1	30	not more than 65%	—
	45	between 55 and 85%	—
	60	not less than 75%	—
	120	not less than 85%	—
L_2	30	not more than 75%	not more than 65%
	45	between 45% and 95%	between 55% and 85%
	60	not less than 65%	not less than 75%
	120	not less than 75%	not less than 85%
L_3	30	not more than 2 tablets release more than 75%, and no individual tablet releases more than 85%	not more than 65%
	45	not more than 2 tablets are outside the range of 45% to 95%, and no individual tablet is outside the range of 35% to 105%	between 55% and 85%

Acceptance Table *(Continued)*

Level	Time (minutes)	Amount dissolved (individual limits)	Amount dissolved (average limits)
	60	not more than 2 tablets release less than 65%, and no individual tablet releases less than 55%	not less than 75%
	120	not more than 2 tablets release less than 75%, and no individual tablet releases less than 65%	not less than 85%

•TEST 2—

Medium: 0.05 M phosphate buffer, pH 6.8 containing 0.5% of sodium lauryl sulfate; 900 mL, degassed by sonication and vacuum.

Apparatus 1: 100 rpm.

Times: 2, 12, and 24 hours.

Procedure—Determine the percentages of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved using the following method.

0.067 M Phosphate buffer, pH 2.5—Dissolve 9.2 g of monobasic sodium phosphate monohydrate in about 800 mL of water. Adjust with phosphoric acid to a pH of 2.5. Dilute with water to 1000 mL.

Mobile phase—Prepare a filtered and degassed mixture of methanol and *0.067 M Phosphate buffer, pH 2.5* (65 : 35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Transfer about 56 mg of USP Clarithromycin RS, accurately weighed, to a 100-mL volumetric flask. Add 10 mL of methanol and sonicate to dissolve. Dilute with *Medium* to volume.

Test solution—Centrifuge the solution under test at 2500 rpm for 10 minutes.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; the column efficiency is not less than 2000; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Determine the amount, in percentage, of clarithromycin dissolved by the formula:

$$C_U = \frac{r_U \times C_S}{r_S}$$

in which C_U is the concentration, in mg per mL, of clarithromycin in the sample at each time point; r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; and C_S is the concentration, in mg per mL, of clarithromycin in the *Standard solution.*

Calculate the amount, in percentage, of clarithromycin dissolved with volume correction:

$$\frac{\{C_n \times [900 - V_U (n-1)]\} + [\sum_{i=1}^{n-1} C_i \times V_U] \times 100}{LC}$$

in which C_n is the concentration, in mg per mL, of clarithromycin in the *Test solution* at each time point; 900 is the volume, in mL, of *Medium;* V_U is the volume, in mL, of sample withdrawn at each timepoint; n is the number of time points [NOTE—The summation of the amount of clarithromycin removed at previous sampling time points is applicable only where $n > 1$)]; 100 is the conversion factor to percentage; and *LC* is the Tablet label claim.

Tolerances—The percentages of the labeled amounts of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
2	not more than 20%
12	between 45% and 70%
24	not less than 80%

Interim Revision Announcement

ERRATA

Following is a list of errata and corrections to *USP 28–NF 23*. The page number indicates where the item is found in *USP 28–NF 23*. If necessary, this list will be updated with every issue of *PF*. This information will also be available as a cumulative table in the next available *Supplement* and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement. USP staff are available to respond to questions regarding the accuracy of a particular requirement by calling 1-800-822-USPC.

Page	Title	Section	Description
1174	*Magnesium Salicylate Tablets*	*Dissolution*	Line 11 under *Dissolution:* Change "(298.54/276.24)(900*C*)(A_S/A_S)" to: (298.54/276.24)(900*C*)(A_U/A_S)
1867	*Terazosin Hydrochloride*	*Limit of tetrahydro-2-furancarboxylic acid*	Line 6 under *Procedure:* Change "100(*C*/*W*)(R_U/R_S)," to: (*C*/*W*)(R_U/R_S),
3080	*Sodium Starch Glycolate*	*Identification*	Line 2: Change "iodine and potassium iodide TS" to: iodine and potassium iodide TS1
Supplement 1			
3290	⟨11⟩ *USP Reference Standards*	*USP Fluticasone Propionate System Suitability Mixture RS*	Lines 2 and 3: Change "It is a mixture of USP Fluticasone Propionate RS and fluticasone propionate related compounds A, B, C, D, and E." to: It is a mixture of USP Fluticasone Propionate RS and fluticasone propionate related compounds B, C, and D.

Interim Revision Announcement

IN-PROCESS REVISION

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) items that previously appeared under *Pharmacopeial Previews* and are now formally proposed as revisions, (2) proposed revisions placed directly under *In-Process Revision,* or (3) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the staff liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

BRIEFING

> **Name of Item**, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How to Use PF*), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
>
> (PA5: K. Russo) RTS—55678-1

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type, as shown in the examples below:

•new text•

if slated for an *Interim Revision Announcement to USP 28–NF 23* (*IRA*);

▲new text▲*USP29*

if slated for *USP 29–NF 24*; and

■new text■

if slated for a *Supplement to USP–NF*. The same symbols *not* set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as •• or ■■ or ▲▲, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •2 indicates that the revision is proposed for the *Second Interim Revision Announcement*, ■2S (*USP 28*) indicates that the proposed revision is slated for the *Second Supplement to USP 28*, and ▲*USP29* and ▲*NF24* indicate that the revisions are proposed for *USP 29* and *NF 24*, respectively.

Official Title Changes Where the specification ***"Monograph title change"*** is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

MONOGRAPHS (USP)

BRIEFING

Acetaminophen, *USP 28* page 16. On the basis of comments received, it is proposed to modify the storage conditions in the *Packaging and storage* section.

(PA2: C. Anthony) RTS—41271-1

BRIEFING

Medical Air, *USP 28* page 54; **Carbon Dioxide,** *USP 28* page 349; **Cyclopropane,** *USP 28* page 559; **Helium,** *USP 28* page 939, page 3245 of the *First Supplement,* and the *Third Interim Revision Announcement (Notice of Postponement)* on page 707 of *PF* 31(3) [May–June 2005]; **Nitrous Oxide,** *USP 28* page 1388, page 3264 of the *First Supplement,* and the *Third Interim Revision Announcement (Notice of Postponement)* on page 707 of *PF* 31(3) [May–June 2005]; **Oxygen,** *USP 28* page 1442; **Oxygen 93 Percent,** *USP 28* page 1443; **Nitrogen,** *NF 23* page 3041, page 3359 of the *First Supplement,* and the *Third Interim Revision Announcement (Notice of Postponement)* on page 708 of *PF* 31(3) [May–June 2005]; **Nitrogen 97 Percent,** *NF 23* page 3041, page 3359 of the *First Supplement,* and the *Third Interim Revision Announcement (Notice of Postponement)* on page 708 of *PF* 31(3) [May–June 2005]. The *Packaging and storage* section in the monograph is revised to address the issues concerning medical gas mixups. The Definition of the monograph is also revised for clarity.

(AER: K. Zaidi) RTS—42651-1

Change to read:

» Medical Air is a natural or synthetic mixture of gases consisting largely of nitrogen and oxygen. It contains not less than 19.5 percent and not more than 23.5 percent, ~~by volume~~

■volume/volume,■2S (*USP29*)
of O_2.

Change to read:

Packaging and storage~~— Preserve in cylinders or in a low-pressure collecting tank.~~

■Preserve in yellow cylinders or in a yellow low-pressure collecting tank. Containers and connections are to be specific to the application and must be controlled in such a fashion that there are sufficient change controls to prevent the connection of the incorrect gas to the system (such as those suggested in CGA Standard CGA V-1-2003).■2S (*USP29*)
Containers used for Medical Air are not to be treated with any toxic, sleep-inducing, or narcosis-producing compounds, and are not to be treated with any compound that would be irritating to the respiratory tract when the Medical Air is used.

NOTE—Reduce the container pressure by means of a regulator. Measure the gases with a gas volume meter downstream from the detector tube in order to minimize contamination or change of the specimens.The various detector tubes called for in the respective tests are listed under *Reagent Specifications* in the section *Reagents, Indicators, and Solutions.*

In-Process Revision

BRIEFING

Amiloride Hydrochloride and Hydrochlorothiazide Tablets, *USP 28* page 118. It is proposed to include the formulas for the calculation of the amounts released in the test for *Dissolution.*

(BPC: M. Marques) RTS—42507-2

Change to read:

Dissolution ⟨711⟩—

Medium: 0.1 N hydrochloric acid; 900 mL.
Apparatus 2: 50 rpm.
Time: 30 minutes.

■*Amiloride standard solution*—Transfer about 60 mg of USP Amiloride Hydrochloride RS (equivalent to about 52 mg of anhydrous amiloride hydrochloride), accurately weighed, to a 200-mL volumetric flask. Dissolve in and dilute with methanol to volume. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, and dilute with *Medium* to volume.

Hydrochlorothiazide standard solution—Transfer about 100 mg of USP Hydrochlorothiazide RS, accurately weighed, to a 100-mL volumetric flask. Dissolve in and dilute with methanol to volume. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, and dilute with *Medium* to volume. Transfer 10.0 mL of the resulting solution to a 50-mL volumetric flask, and dilute with *Medium* to volume.

Test solution 1—Pass a portion of the solution under test through a 0.45-µm glass fiber filter.

Test solution 2—Transfer 5.0 mL of *Test solution 1* to a 25-mL volumetric flask, and dilute with *Medium* to volume.■2S *(USP29)*

Procedure—Determine the amounts of amiloride hydrochloride ($C_6H_8ClN_7O \cdot HCl$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) dissolved by employing UV absorption at the wavelengths of maximum absorbance at about 363 nm for amiloride hydrochloride and 270 nm for hydrochlorothiazide

■using *Medium* as the blank.■2S *(USP29)* ~~(corrected for interference from amiloride hydrochloride on the basis of the absorbances of amiloride hydrochloride at 270 nm and 363 nm) on filtered portions of the solution under test, suitably diluted with 0.1 N hydrochloric acid, in comparison with Standard solutions having known concentrations of USP Amiloride Hydrochloride RS and USP Hydrochlorothiazide RS in the same *Medium.* An amount of methanol not to exceed 2% of the total volume of the Standard solution may be used to dissolve the amiloride hydrochloride.~~

■Calculate the amount of amiloride hydrochloride ($C_6H_8ClN_7O \cdot HCl$) dissolved, in percentage, by the formula:

$$\frac{A_U \times C_S \times 900 \times 100}{A_S \times LC}$$

in which A_U and A_S are the absorbances obtained from *Test solution 1* and the *Amiloride standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Amiloride standard solution;* 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the Tablet label claim, in mg, of amiloride.

Correction for the interference of amiloride is made using the following equation:

$$A_{UC} = A_{U270} - \left[\frac{F \times A_{U363}}{5}\right]$$

in which A_{UC} is the corrected absorbance of *Test solution 1* at 270 nm; A_{U270} is the absorbance of *Test solution 2* at 270 nm; A_{U363} is the absorbance of *Test solution 1* at 363 nm; and *F* is as defined below.

$$F = \frac{A_{SAmiloride}\ at\ 270\,nm}{A_{SAmiloride}\ at\ 363\,nm}$$

in which $A_{SAmiloride}$ is the absorbance of the *Amiloride standard solution.*

In-Process Revision

Calculate the amount of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) dissolved, in percentage, by the formula:

$$\frac{A_{UC} \times C_S \times 900 \times \left(\frac{25}{5}\right) \times 100}{A_S \times LC}$$

in which A_{UC} is the corrected absorbance of *Test solution 1* at 270 nm; A_S is the absorbance of the *Hydrochlorothiazide standard solution;* C_S is the concentration, in mg per mL, of the *Hydrochlorothiazide standard solution;* 900 is the volume, in mL, of *Medium;* (25/5) is the dilution factor of *Test solution 2;* 100 is the conversion factor to percentage; and *LC* is the Tablet label claim, in mg, of hydrochlorothiazide. ■2S (*USP29*)

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_6H_8ClN_7O \cdot HCl$ and 75% *(Q)* of the labeled amount of $C_7H_8ClN_3O_4S_2$ are dissolved in 30 minutes.

BRIEFING

Amoxicillin and Clavulanate Potassium for Oral Suspension, *USP 28* page 147. It is proposed to delete the test for *Water* to be in accordance with the approved NDA of this drug product.

(PA7a: B. Gilbert) RTS—42078-1

Delete the following:

~~■**Water,** *Method I* ⟨921⟩: not more than 7.5% where the label indicates that after constitution as directed the suspension contains an amount of amoxicillin that is less than 40 mg per mL; not more than 8.5% where the label indicates that after constitution as directed the suspension contains an amount of amoxicillin that is equal to or more than 40 mg per mL and is less than or equal to 50 mg per mL; not more than 11.0% where the label indicates that after constitution as directed the suspension contains an amount of amoxicillin that is more than 50 mg per mL and is less than or equal to 80 mg per mL; and not more than 12.0% where the label indicates that after constitution as directed the suspension contains an amount of amoxicillin that is more than 80 mg per mL.~~ ■2S (*USP29*)

BRIEFING

Aspirin Boluses, *USP 28* page 180. It is proposed to make some modifications in the *Dissolution* test. Aspirin Boluses are very large tablets weighing approximately 20 g. Therefore, it is proposed to replace *Apparatus 1* with *Apparatus 2* to accommodate these large tablets. The rotation speed is being set at 75 rpm to improve the dispersion of the particles. The *Medium* is being changed to 900 mL of 0.5 M phosphate buffer, pH 7.4, to provide and maintain sink conditions.

(BPC: M. Marques) RTS—41253-1; 42511-1

Change to read:

Dissolution ⟨711⟩—

Medium: ~~0.05 M acetate buffer, prepared by mixing 8.97 g of sodium acetate trihydrate with 2700 mL of water, adjusting with glacial acetic acid to a pH of 4.50 ± 0.05, and diluting with water to 3000 mL, and mixing; 500 mL.~~

■0.5 M phosphate buffer, pH 7.4; 900 mL. ■2S (*USP29*)

~~*Apparatus 1* [NOTE—Use basket and shaft dimensions that accommodate the size of the individual bolus.]: 100 rpm.~~

■*Apparatus 2:* 75 rpm. ■2S (*USP29*)

Time: 45 minutes.

Diluting solution—Prepare a mixture of acetonitrile and formic acid (99 : 1).

Procedure—Determine the amount of aspirin ($C_9H_8O_4$) dissolved from UV absorbances at the wavelength of the isosbestic point of aspirin and salicylic acid at 265 ± 2 nm of filtered portions of the solution under test, suitably diluted with *Diluting solution*, if necessary, in comparison with a Standard solution having a known concentration of USP Aspirin RS in the same medium. [NOTE—Prepare the Standard solution at the time of use.]

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_9H_8O_4$ is dissolved in 45 minutes.

In-Process Revision

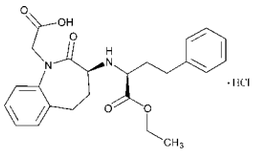
BRIEFING

Benazepril Hydrochloride, page 1422 of *PF* 29(5) [Sept.–Oct. 2003]. On the basis of comments received, it is proposed to make changes in the *Absorbance of solution* section to use a standard 1-cm spectrophotometric cell. The *Loss on drying* limit is also being revised to 1.5%.

(PA5: A. Wilk) RTS—41987-1

Add the following:

■Benazepril Hydrochloride



$C_{24}H_{28}N_2O_5 \cdot HCl$ ~~460.96~~ 460.95

1 *H*-1-Benzazepine-1-acetic acid, 3-[[1-(ethoxycarbonyl)-3-phenylpropyl]amino]-2,3,4,5-tetrahydro-2-oxo-, monohydrochloride, [*S*-(*R**,*R**)]-.

(3*S*)-3-[[(1*S*)-1-Carboxy-3-phenylpropyl]amino]-2,3,4,5-tetrahydro-2-oxo-1*H*-1-benzazepine-1-acetic acid, 3-ethyl ester, monohydrochloride [*86541-74-4*].

» Benazepril Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of $C_{24}H_{28}N_2O_5 \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers, and store at a temperature below 30°, preferably between 15° and 30°.

USP Reference standards ⟨11⟩—*USP Benazepril Hydrochloride RS. USP Benazepril Related Compound A RS. USP Benazepril Related Compound B RS. USP Benazepril Related Compound C RS. USP Benazepril Related Compound D RS. USP Benazepril Related Compound E RS. USP Benazepril Related Compound F RS. USP Benazepril Related Compound G RS.*

Identification—

A: *Infrared Absorption* ⟨197M⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

C: It responds to the test for *Chloride* ⟨191⟩.

Absorbance of solution—The absorbance of a 1 in 100 solution of it in methanol, determined in a ~~2-cm~~ 1-cm cell at 420 nm, is not more than ~~0.03,~~ 0.015, methanol being used as the blank.

Absorptivity—

Test preparation: 25 mg in 1000 mL of methanol.

Procedure—Proceed as directed under *Spectrophotometry and Light-Scattering* ⟨851⟩, and measure the absorbance at 238 nm: the absorptivity is between 21.0 and 23.2.

~~**Specific rotation** ⟨781S⟩**:** between −136° and −141°, determined at 20°.~~

~~*Test solution:* 10 mg per mL, in dehydrated alcohol.~~

Loss on drying ⟨731⟩—Dry it at 105° for 3 hours: it loses not more than ~~1.5% 0.5%~~ 1.5% of its weight.

In-Process Revision

Residue on ignition ⟨281⟩—Ignite at 600°. Not more than 0.1% residue is found.

Heavy metals, *Method II* ⟨231⟩**:** 0.001%.

~~**Limit of ethyl acetate**~~

~~*Standard solution*~~ — Pipet 0.5 mL of ethyl acetate into a 100-mL volumetric flask, and determine the weight added by difference. Dissolve in and dilute with dimethylformamide to volume, and mix. Pipet 3.0 mL of this solution into a 25-mL volumetric flask, dilute with dimethylformamide to volume, and mix. Pipet 1.0 mL of this solution into a 10-mL volumetric flask, dilute with dimethylformamide to volume, and mix.

~~*Test solution*~~ — Transfer 100 mg of Benazepril Hydrochloride, accurately weighed, to a 1-mL volumetric flask. Dissolve in and dilute with dimethylformamide to volume, and mix.

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)~~ — The gas chromatograph is equipped with a flame-ionization detector and a 2-mm × 1.8-m glass column packed with support S1. S2. The carrier gas is helium, flowing at a rate of 30 mL per minute. The chromatograph is programmed as follows. Initially the temperature of the column is equilibrated at 160° for 8 minutes, then the temperature is increased at a rate of 20° per minute to 200°, and maintained at 200° for 20 minutes. The injection port temperature is maintained at 120°, and the detector is maintained at 270°.

~~*Procedure*~~ — Separately inject equal volumes (about 2 µL) of the ~~*Standard solution,*~~ and the ~~*Test solution*~~ into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage, by weight, of ethyl acetate in the portion of Benazepril Hydrochloride taken by the formula:

$$0.012(W_S/W_U)(r_U/r_S)$$

in which W_S is the weight, in mg, of ethyl acetate taken to prepare the *Standard solution;* W_U is the weight, in mg, of Benazepril Hydrochloride taken to prepare the *Test solution;* and r_U and r_S are the peak responses of ethyl acetate obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.1% of ethyl acetate is found.

~~**Limit of chloroform and alcohol**~~

~~*Standard solution*~~ — Pipet 0.5 mL each of chloroform and alcohol into separate 100-mL volumetric flasks, and determine the weight of each by difference. Dissolve in and dilute the contents of each flask with dimethylformamide to volume, and mix. Pipet 2.0 mL of each of these solutions into a 100-mL volumetric flask, dilute with dimethylformamide to volume, and mix.

~~*Test solution*~~ — Prepare as directed for ~~*Test solution*~~ under ~~*Limit of ethyl acetate.*~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)~~ — Proceed as directed for ~~*Limit of ethyl acetate*~~, except to increase the column temperature from 160° to 300° 200°, and maintain at 300° 200° for 30 minutes.

~~*Procedure*~~ — Separately inject equal volumes (about 2 µL) of the ~~*Standard solution*~~ and the ~~*Test solution*~~ into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Separately calculate the percentages, by weight, of chloroform and alcohol in the portion of Benazepril Hydrochloride taken by the formula:

$$0.02(W_S/W_U)(r_U/r_S)$$

in which W_S is the weight, in mg, of either chloroform or alcohol taken to prepare the *Standard solution;* W_U is the weight, in mg, of Benazepril Hydrochloride taken to prepare the *Test solution;* and r_U and r_S are the peak responses of either chloroform or alcohol obtained from the *Test solution*

In-Process Revision

~~and the *Standard solution,* respectively: not more than 0.5% 0.1% of chloroform is found; and not more than 0.1% 0.5% of alcohol is found.~~

Related compounds—

TEST 1 *(for benazepril related compound A)—*

~~*Zinc sulfate solution*—Dissolve 0.719 g of zinc sulfate heptahydrate in sufficient water to make 1000 mL. Dilute 100 mL of this solution with water to 1000 mL, and mix.~~

pH 6.0 Phosphate buffer—Dissolve 9.66 g of monobasic potassium phosphate and 2.68 g of dibasic sodium phosphate, heptahydrate in about 900 mL of water, and dilute with water to 1000 mL.

Mobile phase—Prepare a filtered and degassed mixture of ~~*Zinc sulfate solution* and dehydrated alcohol (975 : 25).~~ *pH 6.0 Phosphate buffer* and methanol (80 : 20). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

~~*Benazepril stock solution*—Dissolve an accurately weighed quantity of USP Benazepril RS in *Zinc sulfate solution* to obtain a solution having a known concentration of about 0.5 mg per mL.~~

Resolution solution—~~Pipet 25.0 mL of *Benazepril stock solution* and 25.0 mL of *Standard solution* into a suitable flask, and mix. Prepare a mixture of *Benazepril stock solution* and *Standard solution* (1 : 1).~~ Dissolve an accurately weighed quantity of USP Benazepril Hydrochloride RS and USP Benazepril Related Compound A RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1.0 mg per mL and 0.005 mg per mL, respectively.

Standard stock solution—Dissolve an accurately weighed quantity of USP Benazepril Related Compound A RS in ~~*Zinc sulfate solution*~~ *Mobile phase* to obtain a solution having a known concentration of about ~~0.5 mg~~ 0.05 mg per mL.

Standard solution—Dilute a suitable portion of *Standard stock solution,* accurately measured, with *Mobile phase* to obtain a solution having a known concentration of about 5 µg per mL.

Dilute standard solution—~~Pipet 1.0 mL of the *Standard solution* into a 100-mL volumetric flask, and dilute with *Benazepril stock solution* to volume.~~ Dilute a suitable portion of *Standard stock solution,* accurately measured, with *Mobile phase* to obtain a solution having a known concentration of about 1 µg per mL.

Test solution—Transfer about 50 mg of Benazepril Hydrochloride, accurately weighed, to a ~~100-mL~~ 50-mL volumetric flask, dissolve in and dilute with ~~*Zinc sulfate solution*~~ *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 240-nm detector and a ~~4.6-mm × 25-cm~~ 4.0-mm × 10-cm column that contains packing ~~L32.~~ L41. The flow rate is about ~~1 mL~~ 0.9 mL per minute. The column temperature is maintained at ~~50°.~~ 30°. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about ~~1.8~~ 2.3 for benazepril related compound A and 1.0 for benazepril hydrochloride; and the resolution, *R,* between benazepril hydrochloride and benazepril related compound A is not less than ~~5.0.~~ 2.0. Chromatograph the *Dilute standard solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio is ~~greater~~ not less than 10 : 1. Chromatograph the *Standard solution:* the relative standard deviation for

In-Process Revision

replicate injections determined from the benazepril ~~hydrochloride~~ related compound A peak is not more than ~~3.5%.~~ 10%.

Procedure—Separately inject equal volumes (about 50 µL) of the ~~*Dilute standard*~~ *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the ~~areas for all the peaks.~~ area for the benazepril related compound A peak. Calculate the percentage of benazepril related compound A in the portion of Benazepril Hydrochloride taken by the formula:

$$100(C_S / C_T)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Benazepril Related Compound A RS in the ~~*Dilute standard*~~ *Standard solution;* C_T is the concentration, in mg per mL, of Benazepril Hydrochloride in the *Test solution;* r_U is the peak response for benazepril related compound A obtained from the *Test solution;* and r_S is the peak response for benazepril related compound A obtained from the ~~*Dilute standard*~~ *Standard solution:* not more than ~~0.5%~~ 0.1% of benazepril related compound A is found.

TEST 2 *(for benazepril related compounds B, ~~and other impurities)~~ C, D, E, F, and G)—*

Tetrabutylammonium bromide solution, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—~~Pipet 5.0 mL of *System suitability solution* into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.~~ Dissolve accurately weighed quantities of USP Benazepril Related Compound B RS, USP Benazepril Related Compound C RS, USP Benazepril Related Compound D RS, USP Benazepril Related Compound E RS, USP Benazepril Related Compound F RS, and USP Benazepril Related Compound G RS in *Mobile phase* to obtain a solution having known concentrations of about 10 µg per mL of each related compound.

Test solution—Transfer about ~~100~~ 50 mg of Benazepril Hydrochloride, accurately weighed, to a ~~100-mL~~ 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas for ~~benazepril related compound B.~~ all the peaks. Calculate the percentage of benazepril related compounds ~~B~~ in the portion of Benazepril Hydrochloride taken by the formula:

$$100(C_S / C_T)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of ~~USP Benazepril Related Compound B RS~~ the relevant USP Reference Standard in the *Standard solution;* C_T is the concentration, in mg per mL, of benazepril hydrochloride in the *Test solution;* r_U is the peak response for the relevant benazepril related compound ~~B~~ obtained from the *Test solution;* and r_S is the peak response for the relevant benazepril related compound ~~B~~ obtained from the *Standard solution* (See *Table 1* for values). ~~not more than 1.0% of benazepril related compound B is found. Calculate the percentage of each impurity (other than benazepril related compound B) in the portion of Benazepril Hydrochloride taken by the formula:~~

~~$100(F r_i / r_s)$~~

~~in which *F*, the relative response factor, is equal to 0.53, 0.66, and 0.86 for peaks with relative retention times of 0.43, 0.51, and 0.60, respectively, and 1.0 for all other peaks; 0.4 [(3-amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-~~

In-Process Revision

~~benazepine)-1-acetic acid], 0.5 [*t*-butyl (3-amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benazepine)-1-acetate], and 0.6 [(3-(1-carboxy-3-phenyl-1*S*-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benazepine)-1-acetic acid], respectively, and 1.0 for all other peaks including peaks at relative retention times of 1.8 [(3-(1-ethoxycarbonyl-3-cyclohexyl-1*S*-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benazepine)-1-acetic acid] and 2.1 [ethyl (3-(1-ethoxycarbonyl-3-phenyl-1*S*-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benazepine)-1-acetic acid]; *r*~~ is the peak response for each impurity obtained from the *Test solution;* and *r*~~ is the sum of the responses of all the peaks: not more than 0.5% of any impurity is found; and not more than 2.0% of total impurities is found, the results of *Test 1* and *Test 2* being added.~~

Table 1

Benazepril Related Compound	Relative Retention Time	Limit (%)
E[1]	0.4	0.2
F[2]	0.5	0.2
C[3]	0.6	0.3
B[4]	1.5	0.5
D[5]	1.7	0.2
G[6]	2.0	0.2

[1] 3-Amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine-1-acetic acid
[2] *t*-Butyl-3-amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine-1-acetic acid
[3] 3-(1-Carboxy-3-phenyl-(1*S*)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine)-1-acetic acid
[4] Mixture of diastereoisomers (3-(1-ethoxycarbonyl-3-phenyl-(1*R*)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine)-1-acetic acid and (3-(1-ethoxycarbonyl-3-phenyl-(1*S*)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*R*)-benzazepine)-1-acetic acid
[5] 3-(1-Ethoxycarbonyl-3-cyclohexyl-(1*S*)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine)-1-acetic acid
[6] 3-(1-Ethoxycarbonyl-3-phenyl-(1*S*)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine)-1-acetic acid ethyl ester

In addition to not exceeding the limits for benazepril related compounds in *Table 1,* not more than 0.1% of any other single impurity is found; and not more than 2.0% of total impurities (excluding benazepril related compound A from *Test 1*) is found.

Organic volatile impurities, *Method IV* ⟨467⟩**:** meets the requirements.

Solvent: dimethylformamide.

Assay—

Tetrabutylammonium bromide solution—Dissolve 0.81 g of tetrabutylammonium bromide in 360 mL of water containing 0.2 mL of glacial acetic acid.

Mobile phase—Prepare a filtered and degassed mixture of methanol and *Tetrabutylammonium bromide solution* ~~(2 : 1).~~ (64 : 36). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve accurately weighed quantities of USP Benazepril Hydrochloride RS and USP Benazepril Related Compound B RS in *Mobile phase* to obtain a solution having known concentrations of about ~~0.2 mg~~ 0.4 mg of each per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Benazepril Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 0.2 mg per mL.

Assay preparation—Transfer about ~~50 mg~~ 10 mg of Benazepril Hydrochloride, accurately weighed, to a ~~250-mL~~ 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm × 0.3-cm guard column that contains ~~7-µm~~ packing L1 connected to a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* ~~the relative retention times are about 1.5 for benazepril related compound B and 1.0 for benazepril hydrochloride;~~ the resolution, *R,* between benazepril hydrochloride and benazepril related compound B is not less than ~~4.0;~~ 1.7; and the relative standard deviation for replicate injections determined from benazepril hydrochloride and benazepril related compound B is not more than ~~1.0%~~ 2.0% for each.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the quantity, in mg, of $C_{24}H_{28}N_2O_5 \cdot HCl$ in the portion of Benazepril Hydrochloride taken by the formula:

$$250C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Benazepril Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S *(USP29)*

BRIEFING

Betamethasone Oral Solution, *USP 28* page 242. In the *Thin-layer chromatographic identification test*, it is proposed to reduce the volume of *Assay preparation* taken to prepare the *Test solution* from 25 mL to 1 mL.

(PA1: C. Anthony) RTS—42595-2

Betamethasone Oral Solution

Former title: Betamethasone Syrup

Change to read:

Thin-layer chromatographic identification test ⟨201⟩—
Test solution—Evaporate ~~25 mL~~

■1 mL■2S *(USP29)* of the *Assay preparation,* prepared as directed in the *Assay,* on a steam bath just to dryness, and dissolve the residue in 0.5 mL of alcohol.

Developing solvent system: a mixture of chloroform and diethylamine (2 : 1).

Procedure—Proceed as directed in the chapter. Locate the spots by lightly spraying with dilute sulfuric acid (1 in 2) and heating on a hot plate or under a lamp until spots appear.

BRIEFING

Biphasic Isophane Insulin Human Suspension. Because there is no existing *USP* monograph for this article, a new monograph is being proposed.

(BNT: L. Callahan) RTS—41466-1; 41896-1; 42154-1; 42264-2

In-Process Revision

Add the following:

■Biphasic Isophane Insulin Human Suspension

» Biphasic Isophane Insulin Human Suspension is a sterile buffered suspension of Insulin Human, complexed with Protamine Sulfate, in a solution of Insulin Human. Its potency, based on the sum of its insulin and desamido insulin components, as determined in the *Assay*, is not less than 95.0 percent and not more than 105.0 percent of the potency stated on the label, expressed in USP Insulin Human Units in each mL.

Packaging and storage—Preserve in the unopened, multiple-dose container provided by the manufacturer. Store in a refrigerator, protect from sunlight, and avoid freezing.

Labeling—The Suspension container label states that the Suspension is to be properly resuspended before use. Label it to indicate that it has been prepared with Insulin Human of semisynthetic origin (i.e., derived by enzyme modification of pork pancreas insulin) or with Insulin Human of recombinant DNA origin (i.e., obtained from microbial synthesis), whichever is applicable. Label it to state that it is to be stored in a refrigerator and that freezing is to be avoided. The label states the potency in USP Insulin Human Units per mL and the percent ratio of isophane insulin human suspension to soluble insulin human injection.

USP Reference standards ⟨11⟩—*USP Endotoxin RS. USP Insulin Human RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Bacterial endotoxins ⟨85⟩—It contains not more than 80 USP Endotoxin Units per 100 USP Insulin Human Units.

Sterility ⟨71⟩—It meets the requirements of the test for *Sterility* under *Isophane Insulin Suspension.*

pH ⟨791⟩**:** between 7.0 and 7.8, determined potentiometrically.

Zinc content ⟨591⟩**:** between 0.02 mg and 0.04 mg for each 100 USP Insulin Human Units.

Limit of high molecular weight proteins—Proceed as directed in the test for *Limit of high molecular weight proteins* under *Insulin Injection*: not more than 3.0% is found.

Soluble insulin human content—[NOTE—Use one of the two methods listed below.]

METHOD 1—

Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay* under *Insulin.*

Soluble insulin test solution—Maintain the temperature at 25 ± 1° throughout the procedure. Transfer 5.0 mL of the Suspension to a centrifuge tube. Add 20 µL of 1 N sodium hydroxide, and adjust with 0.05 N hydrochloric acid or 0.05 N sodium hydroxide to a pH of 8.20 ± 0.02 if the total zinc concentration is approximately 20 µg per mL or adjust to a pH of 8.35 ± 0.02 if the total zinc concentration is approximately 30 µg per mL. Record the volume, in µL, of acid or base needed to adjust the pH. Mix, and allow to stand for 1 hour. Centrifuge, transfer the supernatant to another centrifuge tube, and repeat the centrifugation. Transfer 2 mL of the supernatant to another tube, add 5 µL of 9.6 N hydrochloric acid, and mix.

Total insulin test solution—Transfer 2 mL of Suspension to a suitable vessel, add 5 µL of 9.6 N hydrochloric acid, and allow the suspension to clarify. Dilute the resulting solution with 0.01 N hydrochloric acid to the same theoretical con-

centration of insulin as the *Soluble insulin test solution* (e.g., if the Suspension is labeled to contain 20% soluble insulin, the dilution factor is 100/20 = 5).

Procedure—Separately inject equal volumes (about 20 µL) of the *Soluble insulin test solution* and *Total insulin test solution* into the chromatograph, record the chromatograms, and measure the human insulin peak responses. Calculate the amount of soluble insulin human as a percent of the total insulin content of the Suspension by the formula:

$$(100/D)[(5020 + V_A)/5000](r_S / r_T)$$

in which D is the dilution factor for the *Total insulin test solution;* V_A is the number of µL added to adjust the pH of the *Soluble insulin test solution;* and r_S and r_T are the responses of the *Soluble insulin test solution* and the *Total insulin test solution*, respectively. The percent of soluble insulin human is in the range $L \pm 5$, where L is the percent of soluble insulin human stated on the product label.

METHOD 2—

Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay* under *Insulin.*

0.1 M Tris buffer solution—Dissolve 3.54 ± 0.01 g of Tris(hydroxymethyl)aminomethane hydrochloride and 3.34 ± 0.01 g of Tris(hydroxymethyl)aminomethane in 500 mL of water. The pH of the *0.1 M Tris buffer solution* must be between 8.0 and 8.4. If the pH is outside of this range, discard the solution and prepare fresh; do not adjust the pH. [NOTE—This solution is stable for two weeks and should be stored out of direct sunlight.]

Soluble insulin test solution—Thoroughly mix 2.0 mL of Suspension with 2.0 mL of *0.1 M Tris buffer solution*. Immerse the container in a water bath at 25 ± 2° for 30 ± 2 minutes. Immediately pass this solution through a 0.2-µm filter using a disposable syringe. Transfer 2 mL of the filtrate to a suitable vessel, and add 1 mL of 0.2 N hydrochloric acid and 2 mL of 0.01 N hydrochloric acid.

Total insulin test solution—For each mL of Suspension, add 3.0 µL of 9.6 N hydrochloric acid, mix, and allow the suspension to clarify. Dilute the resulting solution with 0.01 N hydrochloric acid to the same theoretical concentration of insulin as the *Soluble insulin test solution* (e.g., if the product is labeled to contain 20% soluble insulin, the dilution factor is 2/1 × 5/2 × 100/20 = 25).

Procedure—Separately inject equal volumes (about 20 µL) of the *Soluble insulin test solution* and the *Total insulin test solution,* record the chromatograms, and measure the human insulin peak responses. Calculate the amount of soluble insulin human as a percent of the total human insulin content of the Suspension by the formula:

$$(500/D)(r_S / r_T)$$

in which D is the dilution factor for the *Total insulin test solution;* and r_S and r_T are the human insulin peak responses obtained from the *Soluble insulin test solution* and the *Total insulin test solution*, respectively. The percent of soluble insulin human is in the range $L \pm 5$, where L is the percent of soluble insulin human stated on the product label.

Assay—Proceed as directed in the *Assay* under *Insulin Human Injection.*■2S (*USP29*)

In-Process Revision

BRIEFING

Bismuth Subsalicylate Oral Suspension, page 1166 of *PF* 30(4) [July–Aug. 2004]. On the basis of comments received, it is proposed to eliminate the requirement for absence of *Salmonella* species in the test for *Microbial limits.*

(PA2: C. Anthony) RTS—42669-1

Add the following:

■Bismuth Subsalicylate Oral Suspension

» Bismuth Subsalicylate Oral Suspension is a suspension that contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_7H_5BiO_4$. It may contain one or more suitable buffers, coloring agents, flavors, preservatives, stabilizers, sweeteners, and suspending agents.

Packaging and storage—Preserve in tight containers, and avoid freezing. Store between 15° and 30°.

Identification—

A: It meets the requirements of the tests for *Bismuth* ⟨191⟩.

B: It meets the requirements of the tests for *Salicylate* ⟨191⟩, after acidifying with nitric acid.

pH ⟨791⟩**:** between 3.0 and 5.0.

Microbial limits ⟨61⟩—The total aerobic microbial count does not exceed 100 cfu per g, the combined yeast and mold count does not exceed 50 cfu per g, and it meets the requirements of the tests for absence of *Escherichia coli.* ~~and of *Salmonella* species.~~

Assay—

Standard preparation—Transfer about 500 mg of bismuth metal, accurately weighed, into a 200-mL volumetric flask, dissolve in 12 mL of nitric acid, and dilute with 0.01 N nitric acid to volume. Transfer 10.0 mL of this solution into a 500-mL volumetric flask, and dilute with 1 N nitric acid to volume to obtain a solution having a concentration of 50 µg of bismuth per mL.

Assay preparation—Transfer an accurately measured quantity of about 10 g of Oral Suspension, previously well-shaken in its original container to ensure homogeneity, to a 200-mL volumetric flask. Add about 100 mL of 1 N nitric acid, mix, and dilute with 1 N nitric acid to volume. Mix well without shaking, and transfer 10.0 mL of this mixture into a 100-mL volumetric flask, and dilute with 1 N nitric acid to volume. Centrifuge about 20 mL at 4500 rpm for at least 10 minutes.

Procedure—Transfer an accurately measured volume of the *Assay preparation* that contains about 0.9 mg of bismuth subsalicylate and 10 mL of the *Standard preparation* to separate 50-mL volumetric flasks. Add 10.0 mL of 10% ascorbic acid solution and 25.0 mL of 20% potassium iodide solution into each volumetric flask, dilute with water to volume, and mix well. Concomitantly determine the absorbances of both solutions in 1.0-cm cells at a wavelength of 463 nm with a suitable spectrophotometer using the reagent blank to set the spectrophotometer. Calculate the quantity, in mg, of $C_7H_5BiO_4$ in the portion of Oral Suspension taken by the formula:

$$(362.11/208.98)20(C/V)(A_U/A_S)$$

in which 362.11 and 208.98 are the molecular weights of bismuth subsalicylate and bismuth, respectively; C is the concentration, in µg per mL, of bismuth in the *Standard preparation;* V is the volume, in mL, of the *Assay prepara-*

tion taken; and A_U and A_S are the absorbances of the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP29*)

BRIEFING

Calcitonin Salmon, page 385 of *PF* 31(2) [Mar.–Apr. 2005]. On the basis of comments received, it is proposed to delete several tests that are process-specific and not product-specific. It is proposed to delete (1) *Identification* test *B* (UV absorption) because it is thought that the retention times from the *Assay* and the *Amino acid profile* are sufficient for identification and (2) the correction factors for threonine and serine in the test for *Amino acid profile* because it is believed that the acceptance criteria are wide enough to account for any degradation that occurs during hydrolysis. It is also proposed to add a test for *Organic volatile impurities.* In addition, minor editorial changes have been made.

(BNT: L. Callahan) RTS—42620-1; 42662-1

Add the following:

■Calcitonin Salmon

$C_{145}H_{240}N_{44}O_{48}S_2$ 3432 daltons [*47931-85-1*].

» Calcitonin Salmon is a synthetic polypeptide that has the same sequence as that of the hormone that regulates calcium metabolism and is secreted by the ultimobranchial gland of salmon. It lowers the calcium concentration in the plasma of mammals by diminishing the rate of bone resorption. It contains not less than 90.0 percent and not more than 105.0 percent of calcitonin salmon, calculated on an acetic acid–free and dried basis.

NOTE—One mg of acetic acid–free, anhydrous Calcitonin Salmon is equivalent to 6000 USP Calcitonin Salmon Units.

Packaging and storage—Preserve in tight containers. Store in a refrigerator, protected from light.

Labeling—The labeling states that the material is synthetic.

USP Reference standards ⟨11⟩—*USP Calcitonin Salmon RS. USP Calcitonin Salmon Related Compound A RS* (*N*-acetyl-cys[1]-calcitonin). ~~*USP Endotoxin RS.*~~

Identification—

~~**A:**~~ The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation,* obtained as directed in the *Assay.*

~~**B: The UV absorption spectrum of a 0.1% solution (based on free peptide) in 0.01 N hydrochloric acid exhibits a minima and a maxima at the same wavelengths as those of a similar solution of USP Calcitonin Salmon RS, concomitantly measured. The absorbance at approximately 275 nm (maxima) is about 0.40 to 0.55, and the ratio of the absorbance at 275 nm (maxima) and 254 nm (minima) is between 1.6 and 2.5.~~**

Amino acid profile (see *Amino Acid Analysis* ~~*Method 1,*~~ under *Biotechnology-Derived Articles—Tests* ⟨1047⟩)—[NOTE—The concentration of amino acids in the *Internal standard solution,* the *Standard amino acid solution,* and the *Standard solution* and the amount of material used to prepare the *Test solution* can be adjusted depending on the method used for amino acid analysis. The concentrations given are based on analysis using *Method 1.*]

Internal standard solution—Prepare a 1-mM solution of γ-aminobutyric acid.

In-Process Revision

Standard amino acid solution—Prepare a mixture containing equimolar amounts of ammonia and the L form of lysine, histidine, arginine, aspartic acid, threonine, serine, proline, valine, glutamic acid, glycine, leucine, and tyrosine, together with half the equimolar amount of L-cystine, in 0.1 M hydrochloric acid. The final concentration is about 2.5 mM for each amino acid.

Standard solution—Transfer 5 mL of the *Internal standard solution* and 2 mL of the *Standard amino acid solution* into a 50-mL volumetric flask, and dilute with 0.1 M hydrochloric acid to volume.

Test solution—Place about 1.5 mg of an accurately weighed quantity of Calcitonin Salmon into a heavy-wall ignition tube, add 1.0 mL of 6 N hydrochloric acid, allow to cool, immerse the lower half of the tube in a freezing mixture until the contents are frozen, evacuate to approximately 10 μM, purge with nitrogen (repeat the evacuation and nitrogen purge three times), and seal the tube while it is under a 10-μM vacuum. Heat for 16 hours at 110° to 115° in an air oven. Cool, open the tube, dry in a vacuum desiccator, remove the contents, and allow to cool to room temperature. Dissolve in 0.1 M hydrochloric acid, transfer to a 10-mL volumetric flask, add 1 mL of *Internal standard solution,* and dilute with 0.1 M hydrochloric acid to volume.

Procedure—Standardize the amino acid analyzer, using the *Standard solution.* Inject the *Test solution* into the amino acid analyzer, and determine the relative proportion of amino acids.

Calculation of amino acid profile—Express the content of each amino acid in moles, using an internal standard calibration technique. Calculate the relative proportions of the amino acids by taking as equivalent to 1 the sum of the number of moles of aspartic acid, glutamic acid, proline, glycine, valine, leucine, histidine, arginine, and lysine divided by 20. ~~For threonine and serine, perform the same calculation, and correct the concentrations for degradation by adding 5% and 10%, respectively, to their indicated results.~~ The requirements are met if the values fall within the following limits: aspartic acid, 1.8 to 2.2; glutamic acid, 2.7 to 3.3; proline, 1.7 to 2.3; glycine, 2.7 to 3.3; valine, 0.9 to 1.1; leucine, 4.5 to 5.3; histidine, 0.9 to 1.1; arginine, 0.9 to 1.1; lysine, 1.8 to 2.2; serine, 3.2 to 4.2; threonine, 4.2 to 5.2; tyrosine, 0.7 to 1.1; half cystine, 1.4 to 2.1.

~~**Bacterial endotoxins** ⟨85⟩—It contains not more than 1000 USP Endotoxin Units per mg of calcitonin salmon.~~

Microbial limits ⟨61⟩—The test is performed on a portion of about 0.2 g, accurately weighed. The total aerobic microbial count does not exceed 100 cfu per g. ~~It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa.*~~

~~**pH** ⟨791⟩**:** between 4.0 and 6.0 in a 1% solution in carbon dioxide–free water.~~

Water, *Method Ic* ⟨921⟩**:** not more than 10%.

Heavy metals, *Method II* ⟨231⟩**:** 0.005%.

~~**Limit of trifluoroacetic acid**—[NOTE—Use deionized, degassed water where water is indicated.]~~

~~*Solution A:* water.~~

~~*Solution B:* 0.005 N sodium hydroxide.~~

~~*Solution C:* 0.1 N sodium hydroxide.~~

~~*Mobile phase*—Use variable mixtures of *Solution A, Solution B,* and *Solution C* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~

In-Process Revision

Chloride stock standard solution— Dissolve an accurately weighed quantity of sodium chloride in water to obtain a solution having a concentration of the chloride ion of about 0.1 mg per mL.

Trifluoroacetic acid stock standard solution— Dissolve an accurately weighed quantity of trifluoroacetic acid in water to obtain a solution having a concentration of trifluoroacetic acid of about 0.1 mg per mL.

Resolution solution— Pipet 0.2 mL of *Chloride stock standard solution* and 0.5 mL of *Trifluoroacetic acid stock standard solution* into a 100-mL volumetric flask, dilute with water to volume, and mix to obtain a solution that contains 0.2 µg of chloride and 0.5 µg of trifluoroacetate per mL, respectively.

Standard solutions— Pipet 0.2 mL, 0.5 mL, 1.0 mL, and 2.0 mL of *Trifluoroacetic acid stock standard solution* into ordered 100-mL volumetric flasks. Dilute with water to volume and mix to obtain solutions that contain concentrations of about 0.2 µg, 0.5 µg, 1.0 µg, and 2.0 µg of trifluoroacetate per mL, respectively.

Test solution— Transfer about 10 mg of Calcitonin Salmon, accurately weighed, to a 5-mL volumetric flask. Dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)— The ion chromatograph is equipped with a conductivity detector, a 4-mm × 5-cm anion exchange guard column containing packing L31, a 4-mm × 25-cm anion exchange analytical column containing packing L31, a high capacity anion trap column in hydroxide form in the eluant line in front of the injection valve, and a micromembrane anion self regenerating suppressor. The flow rate is about 2.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	*Solution C* (%)	Elution
0–2	90	10	0	isocratic
2–5	90 →0	10 →100	0	linear gradient
5–15	0	100 →65	0 →35	linear gradient
15–20	0 →90	65 →10	35 →0	linear gradient

Chromatograph the *Resolution solution,* and record the peak responses as directed for the *Procedure*: the resolution, *R,* between the chloride peak and the trifluoroacetic acid peak is not less than 3; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure— Separately inject equal volumes (about 100 µL) of each of the *Standard solutions* and the *Test solution* into the chromatograph, record the chromatograms, and measure the area of peak responses. Plot the response of the trifluoroacetic acid peak in the *Standard solutions* versus the concentration of trifluoroacetic acid, and draw the straight line best fitting the plotted points. From the graphs so obtained, determine a concentration value, *C,* in µg per mL for trifluoroacetic acid. Calculate the quantity, in ppm, for trifluoroacetic acid in Calcitonin Salmon by the formula:

$$5000(C/W),$$

in which *W* is the weight in mg of Calcitonin Salmon taken to prepare the *Test solution:* not more than 200 ppm of trifluoroacetic acid is found.

Limit of residual solvents—

Standard stock solution— Prepare a solution containing about 300 µg of methanol, 40 µg of acetonitrile, 60 µg of methylene chloride, 500 µg of *tert* butyl methyl ether, and 90 µg of dimethylformamide per mL of methyl sulfoxide.

In-Process Revision

~~*Standard solution*—Transfer 5 mL of the *Standard stock solution* to a 25-mL volumetric flask, and dilute with dimethyl sulfoxide to volume. Transfer 1 mL of the *Standard solution* to a 20-mL headspace vial fitted with a septum and a crimp cap, and seal the vial.~~

~~*Test solution 1*—Transfer about 100 mg of Calcitonin Salmon, accurately weighed, to a 20-mL headspace vial fitted with a septum and a crimp cap, add 1 mL of dimethyl sulfoxide, seal the vial, and mix.~~

~~*Test solution 2*—Transfer about 100 mg of Calcitonin Salmon, accurately weighed, to a 20-mL headspace vial fitted with a septum and a crimp cap, add 1 mL of *Standard solution,* seal the vial, and mix.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a headspace injector and a flame ionization detector and contains a 0.32-mm × 60-m fused silica column coated with a 1.0-µm film of stationary phase G38. Nitrogen is used as the carrier gas, flowing at a rate of about 25 mL per minute. The column temperature is maintained at 45° for 2 minutes, then increased at a rate of 10° per minute to 75°, then increased at a rate of 5° per minute to 170° and maintained at 170° for 3 minutes. The split injector temperature is maintained at about 200°, and the detector temperature is maintained at about 170°. The transfer loop and transfer line temperature is 170°, and the pressurize time is 0.5 minute. The *Standard solution* vial and the *Test solutions 1* and *2* vials are maintained at about 90°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.55 for methanol, 0.76 for acetonitrile, 1.0 for methylene chloride, 1.2 for *tert* butyl methyl ether, and 2.3 for dimethylformamide; and the relative standard deviation, determined from peak areas for each peak, for six replicate injections is not more than 10%.~~

~~*Procedure*—Separately inject equal volumes (about 1 mL) of headspace from vials of *Test solution 1* and *Test solution 2* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of methanol, acetonitrile, methylene chloride, *tert* butyl methyl ether, and dimethylformamide in the Calcitonin Salmon taken by the formula:~~

$$~~100(r_{U1})(C)/(r_{S1})(W_{U1}) - (r_{U1})(W_{U2})~~,$$

~~in which C is the concentration, in mg per mL, of the relevant analyte in the *Standard solution;* W_{U1} and W_{U2} are the weights, in mg, of Calcitonin Salmon taken to prepare *Test solution 1* and *Test solution 2,* respectively; and r_{U1} and r_{U2} are the peak areas of the corresponding analyte obtained from *Test solution 1* and *Test solution 2,* respectively: not more than 3000 µg of methanol, 400 µg of acetonitrile, 600 µg of methylene chloride, 5000 µg of *tert* butyl methyl ether, and 900 µg of dimethylformamide per g of Calcitonin Salmon are found.~~

Organic volatile impurities ⟨467⟩: meets the requirements.

Acetic acid content—

Internal standard stock solution—Mix 1 mL of dioxane with water to obtain 100 mL of solution.

Standard solution—Transfer approximately 100 mg of glacial acetic acid, accurately weighed, and 10 mL of *Internal standard stock solution* to a 100-mL volumetric flask, dilute with water to volume, and mix.

Test solution—Transfer about 100 mg of Calcitonin Salmon, accurately weighed, to a 10-mL volumetric flask, add 1 mL of *Internal standard stock solution,* dissolve in and dilute with water to volume, and mix.

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm × 3-m glass column packed with 10% liquid phase G35, 1% phosphoric acid, on support S1A. Nitrogen is the carrier gas, flowing at a rate of about 30 mL per minute. The column temperature is maintained at 70° for 4 minutes, then increased at a rate of 8° per minute to 120°, then maintained at 120° for 4 minutes. The injection port and detector temperatures are maintained isothermally at about 200°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between dioxane and acetic acid is not less than 8; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 4 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The retention times are about 3 minutes for acetic acid and 1 minute for dioxane. Calculate the percentage of acetic acid in the portion of Calcitonin Salmon taken by the formula:

$$1000(C/W)(R_U / R_S)$$

in which C is the concentration, in mg per mL, of acetic acid in the *Standard solution; W* is the weight, in mg, of Calcitonin Salmon used to prepare the *Test solution,* and R_U and R_S are the peak response ratios of acetic acid to dioxane obtained from the *Test solution* and the *Standard solution,* respectively: not less than 4.0% and not more than 15.0% is found.

Bioidentity—

RPMI 1640 with L-glutamine—Prepare a mixture of the ingredients in the quantities shown in sufficient water to obtain 1 L of medium, and sterilize by filtration.

Calcium Nitrate	100.00 mg
Potassium Chloride	400.00 mg
Magnesium Sulfate, Anhydrous	48.84 mg
Potassium Chloride	400 mg
Sodium Chloride	6000 mg
Sodium Phosphate, Dibasic, Anhydrous	800 mg
Sodium Bicarbonate	2000 mg
Glycine	10 mg
L-Arginine	200 mg
L-Asparagine	50 mg
L-Aspartic Acid	20 mg
L-Cystine Dihydrochloride	65 mg
L-Glutamic Acid	20 mg
L-Glutamine	300 mg
L-Histidine	15 mg
L-Hydroxyproline	20 mg
L-Isoleucine	50 mg
L-Leucine	50 mg
L-Lysine Hydrochloride	40 mg
L-Methionine	15 mg
L-Phenylalanine	15 mg
L-Proline	20 mg
L-Serine	30 mg
L-Threonine	20 mg
L-Tryptophan	5 mg
L-Tyrosine Disodium Salt Dihydrate	29 mg
L-Valine	20 mg
Biotin	0.2 mg
Choline Chloride	3 mg
D-Calcium Pantothenate	0.25 mg
Folic Acid	1 mg
i-Inositol	35 mg
Niacinamide	1 mg
Para-Aminobenzoic Acid	1 mg
Pyridoxine Hydrochloride	1 mg

Riboflavin	0.2 mg
Thiamine Hydrochloride	1 mg
Vitamin B_{12}	0.005 mg

Medium A (growth medium)—Using aseptic technique, prepare the following tissue culture medium.

RPMI 1640 with L-glutamine	500 mL
Fetal bovine serum	50 mL
1 M HEPES	5 mL
Penicillin/streptomycin solution (10,000 IU per mL /10 mg per mL)	5 mL
Human insulin	10 IU
Hydrocortisone	0.5 mg

Medium B (stimulation medium)—Dissolve 5 g of albumin bovine serum (BSA) in 500 mL of 2 mM *RPMI 1640 with L -glutamine.*

2% BSA solution—Dissolve 50 mg of albumin bovine serum in 25 mL of water. [NOTE—Use within 1 day.]

Formic acid/BSA solution—Add 25 mL of 0.1 M formic acid and 5 mL of *2% BSA solution* to a 50-mL volumetric flask, and dilute with water to volume. [NOTE—Use within 2 days.]

Trypsin–tetrasodium ethylenediaminetetraacetate (EDTA) solution—Prepare a sterile filtered solution containing 0.25% trypsin and 0.53 mM EDTA.

Dulbecco's phosphate buffered saline—Dissolve 8 g of sodium chloride, 1.15 g of dibasic sodium phosphate, 0.2 g of monobasic potassium phosphate, 0.2 g of potassium chloride, 0.1 g of calcium chloride, and 0.1 g of magnesium chloride in 1 L of water.

Standard stock solution—Dissolve an accurately weighed quantity of USP Calcitonin Salmon RS in *Formic acid/BSA solution* to obtain a solution having a known concentration of about 20 µg per mL.

Positive control solution—Quantitatively dilute the *Standard stock solution* with *Medium B* to obtain a solution of USP Calcitonin Salmon RS having a known concentration of 1 ng per mL.

Negative control solution: Medium B.

Standard solution A—Quantitatively dilute the *Standard stock solution* with *Medium B* to obtain a solution of USP Calcitonin Salmon RS having a known concentration of 0.1 ng per mL.

Standard solution B—Dilute *Standard solution A* quantitatively with *Medium B* to obtain a solution of USP Calcitonin Salmon RS having a known concentration of 0.033 ng per mL.

Standard solution C—Dilute *Standard solution B* quantitatively (1 : 2) with *Medium B* to obtain a solution of USP Calcitonin Salmon RS having a known concentration of 0.011 ng per mL.

Standard solution D—Dilute *Standard solution C* quantitatively (1 : 2) with *Medium B* to obtain a solution of USP Calcitonin Salmon RS having a known concentration of 0.0037 ng per mL.

Test stock solution—Dissolve an accurately weighed quantity of Calcitonin Salmon in *Formic acid/BSA solution* to obtain a solution having a concentration of about 20 µg per mL.

Test solution A—Quantitatively dilute the *Test stock solution* with *Medium B* to obtain a solution of Calcitonin Salmon having a concentration of 0.1 ng per mL.

Test solution B—Quantitatively dilute *Test solution A* with *Medium B* (1 : 2) to obtain a solution of Calcitonin Salmon having a concentration of 0.033 ng per mL.

Test solution C—Quantitatively dilute *Test solution B* with *Medium B* (1 : 2) to obtain a solution of Calcitonin Salmon having a concentration of 0.011 ng per mL.

Test solution D—Quantitatively dilute *Test solution C* with *Medium B* (1 : 2) to obtain a solution of Calcitonin Salmon having a concentration of 0.0037 ng per mL.

Cell culture preparation—Prepare cell culture of the human mammary tumor cell line T-47D. Cells are propagated using *Medium A* at 37° and 5% carbon dioxide. The medium is changed every 2 days, and cells are passaged every 5 to 9 days, using *Trypsin–EDTA solution* with a 1 : 4 subculture.

Cell suspension—For the test, use a cell culture that is 5 to 9 days old. Remove the cell culture medium from the flask by aspiration, add 10 mL of *Dulbecco's phosphate buffered saline,* and rock the culture flask to rinse the entire monolayer. Remove the liquid by aspiration, add 2 mL of *Trypsin–EDTA solution,* spread over the entire monolayer, allow to stand for 3 to 5 minutes, and add 10 mL of *Medium A.* Homogenize the cell suspension using a pipet, transfer to a 15-mL polypropylene tube, centrifuge at about 220 × *g* for 5 minutes, pour off the supernatant, and resuspend the cell pellet in 10 mL of *Medium A.* Count the cells, and adjust the cell density through dilution, using *Medium A,* to 2.5×10^4 cells per mL.

Procedure—Place 200 µL of the *Cell suspension* into each well of a 96-well culture plate (the *tissue culture plate*), and incubate for 18 to 24 hours at 37° and 5% carbon dioxide. Fill each well of an empty round-bottomed 96-well culture plate (the *prepared plate*) with 150 µL of one of the following solutions: *Positive control solution, Negative control solution, Standard solutions A–D,* and *Test solutions A–D,* so that each solution fills at least five wells on the prepared plate. After incubation, remove the culture medium from the tissue culture plate. Using an 8-channel or 12-channel pipet, rapidly transfer 100 µL of solution from each well of the prepared plate to each well of the tissue culture plate. Incubate for 15 minutes at ambient temperature, remove the solution from each well, stop stimulation by immediately adding an appropriate cell-lysis buffer, and quantitate cAMP produced within the cells, using a validated kit. Perform the test three times, using three different 96-well culture plates. [NOTE—Some kits include a cell-lysis reagent and a sequestering agent for the cell-lysis reagent. The range of the test kit is between 0.05 ng and 10 ng per mL of cAMP. The number of cells used in the assay may vary depending on the validated kit used to quantitate cAMP.] Potency is determined by a 3-dose, 6-point parallel-line assay, using standard statistical methods. The calculation is carried out using both the lower three concentrations and the upper three concentrations. For the assay to be valid, the requirements for regression and parallelism must be met. If the requirements for validity are met to the same extent in both assessments (the lower and the higher assessments), the final result is determined from the concentration range that shows the higher value when the common slope is divided by the mean square error. The potency levels determined from all three performances of the test are homogeneous, and the confidence limits for all three determinations are between 64% and 156% of the calculated potency.

Related peptides and other related substances—

Test solution—Prepare as directed for the *Assay preparation* in the *Assay.*

Solution A, Solution B, Mobile phase, Resolution solution, and *Chromatographic system*—Prepare as directed in the *Assay.*

Procedure—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the area percentage of each peak observed in the chromatogram. Disregard any peaks due to the solvent and any peaks whose area is less than 0.1% of the principal peak. No peak other than the principal peak constitutes more than 3.0% of the total

area of all peaks. The sum of the areas of all the peaks apart from the principal peak is not greater than 5.0% of the sum of the areas of all the peaks including the principal peak.

Other requirements—Where the label states that Calcitonin Salmon is sterile, it meets the requirements for *Sterility* under *Calcitonin Salmon Injection.*

Assay—

Solution A—Dissolve ~~3.62~~ 3.26 g of tetramethylammonium hydroxide pentahydrate in 900 mL of water, add 100 mL of acetonitrile, and mix. Adjust with phosphoric acid to a pH of 2.5, pass through a filter having a 0.5-µm or finer porosity, and degas.

Solution B—Dissolve 1.45 g of tetramethylammonium hydroxide pentahydrate in 400 mL of water, add 600 mL of acetonitrile, and mix. Adjust with phosphoric acid to a pH of 2.5, pass through a filter having a 0.5-µm or finer porosity, and degas.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer about 10.0 mg of USP Calcitonin Salmon RS, accurately weighed, into a 10-mL volumetric flask, dissolve in and dilute with *Solution A* to volume, and mix.

Resolution solution—Dissolve the contents of a vial of USP Calcitonin Salmon Related Compound A RS in 0.4 mL of *Solution A,* add 0.1 mL of the *Standard preparation,* and mix.

Assay preparation—Transfer about 10.0 mg of Calcitonin Salmon, accurately weighed, into a 10-mL volumetric flask, dissolve in and dilute with *Solution A,* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The column temperature is maintained at about 65°. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–30	72→48	28→52	linear gradient
30–32	48→72	52→28	linear gradient
32–55	72	28	isocratic

Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.15 for calcitonin salmon related compound A and 1.0 for calcitonin salmon; the resolution, *R,* between calcitonin salmon related compound A and calcitonin salmon is not less than 3; the tailing factor is not more than 2.5; and the relative standard deviation for replicate injections is not more than 3%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses of the major peaks. Calculate the percentage of calcitonin salmon in the portion of Calcitonin Salmon taken by the formula:

$$P(W_S / W_U)(r_U / r_S)$$

in which P is the percentage of calcitonin salmon in USP Calcitonin Salmon RS; W_S is the weight, in mg, of USP Calcitonin Salmon RS taken to prepare the *Standard preparation;* W_U is the weight, in mg, of Calcitonin Salmon used to prepare the *Assay preparation;* and r_U and r_S are the main peak areas from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP29*)

In-Process Revision

BRIEFING

Carbamazepine Tablets, *USP 28* page 342 and the *Second Interim Revision Announcement* on page 320 of *PF* 31(2) [Mar.–Apr. 2005]. It is proposed to delete *Dissolution Test 4* from this monograph because the test was assigned to a chewable tablet product that now complies with *Dissolution Test 1*.

(BPC: M. Marques) RTS—42521-1

Change to read:

Dissolution ⟨711⟩—

FOR PRODUCTS LABELED AS 100-MG CHEWABLE TABLETS:

TEST 1—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.

Medium: water containing 1% sodium lauryl sulfate; 900 mL.

Apparatus 2: 75 rpm.

Time: 60 minutes.

Procedure—Determine the amount of $C_{15}H_{12}N_2O$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 288 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Carbamazepine RS in the same *Medium*.[NOTE—A volume of methanol not exceeding 1% of the final total volume of the Standard solution may be used to dissolve the carbamazepine.]

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 60 minutes. Use *Acceptance Table 1* under *Dissolution* ⟨711⟩, with the following exceptions: at S_2, no unit is less than Q – 5%; at S_3, no unit is less than Q – 10%; and not more than 2 of the 24 units are less than Q – 5%.

~~TEST 4—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.~~

~~*Medium:* 0.1 N hydrochloric acid containing 1% sodium lauryl sulfate; 225 mL. Add 2 drops of simethicone to each.~~

~~*Apparatus 3* (see *Drug release* ⟨724⟩): 35 dips per minute; use 20-mesh screen on the top of the reciprocating cylinder and a 100-mesh screen on the bottom of the reciprocating cylinder.~~

~~*Time:* 60 minutes.~~

~~*Procedure*—Determine the amount of $C_{15}H_{12}N_2O$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 284 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Carbamazepine RS in the same *Medium*.~~

~~*Tolerances*—Not less than 70% *(Q)* of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 60 minutes, the acceptance criteria specified for *Test 1* being used.~~

■■2S (*USP29*)

FOR PRODUCTS LABELED AS 200-MG TABLETS:

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium, *Apparatus*, and *Procedure*—Proceed as directed for *Test 1*.

Times and *Tolerances*—Between 45% and 75% of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 15 minutes; not less than 75% *(Q)* of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 60 minutes. Use *Acceptance Table 1* under *Drug Release* ⟨724⟩, with the following exceptions: at 15 minutes—at L_2, no unit is more than 5% outside the stated range; at L_3, no unit is more than 10% outside the stated range; and not more than 2 of the 24 units are more than 5% outside the stated range. At 60 minutes—at L_2, no unit is less than Q – 5%; at L_3, no unit is less than Q – 10%; and not more than 2 of the 24 units are less than Q – 5%.

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium, *Apparatus*, and *Procedure*—Proceed as directed for *Test 1*.

Times and *Tolerances*—Between 60% and 85% of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 15 minutes; not less than 75% *(Q)* of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 60 minutes. Use *Acceptance Table 1* under *Drug Release* ⟨724⟩, with the following exceptions: at 15 minutes—at L_2, no unit is more than 5% outside the stated range; at L_3, no unit is more than 10% outside the stated range; and not more than 2 of the 24 units are more than 5% outside the stated range. At 60 minutes—at L_2, no unit is less than Q – 5%; at L_3, no unit is less than Q – 10%; and not more than 2 of the 24 units are less than Q – 5%.

Dissolution ⟨711⟩—

FOR PRODUCTS LABELED AS 100-MG CHEWABLE TABLETS—

TEST 1—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.

Medium: water containing 1% sodium lauryl sulfate; 900 mL.

Apparatus 2: 75 rpm.

Time: 60 minutes.

Procedure—Determine the amount of $C_{15}H_{12}N_2O$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 288 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Carbamazepine RS in the same *Medium*. [NOTE—A volume of methanol not exceeding 1% of the final total volume of the Standard solution may be used to dissolve the carbamazepine.]

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 60 minutes. Use •*Acceptance Table 1*,•$_2$ with the following exceptions: at S_2, no unit is less than Q – 5%; at S_3, no unit is less than Q – 10%; and not more than 2 of the 24 units are less than Q – 5%.

~~TEST 4—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.~~

~~*Medium:* 0.1 N hydrochloric acid containing 1% sodium lauryl sulfate; 225 mL. Add 2 drops of simethicone to each.~~

~~*Apparatus 3:* •$_2$ 35 dips per minute; use 20-mesh screen on the top of the reciprocating cylinder and a 100-mesh screen on the bottom of the reciprocating cylinder.~~

~~*Time:* 60 minutes.~~

~~*Procedure*—Determine the amount of $C_{15}H_{12}N_2O$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 284 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Carbamazepine RS in the same *Medium*.~~

~~*Tolerances*—Not less than 70% *(Q)* of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 60 minutes, the acceptance criteria specified for *Test 1* being used.~~

■■2S (*USP29*)

FOR PRODUCTS LABELED AS 200-MG TABLETS—

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium, *Apparatus*, and *Procedure*—Proceed as directed for *Test 1*.

Times and *Tolerances:* between 45% and 75% of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 15 minutes; not less than 75% *(Q)* of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 60 minutes. Use •*Acceptance Table 2*,•$_2$ with the following exceptions: at 15 minutes—at L_2, no unit is more than 5% outside the stated range; at L_3, no unit is more than 10% outside the stated

In-Process Revision

range; and not more than 2 of the 24 units are more than 5% outside the stated range. At 60 minutes—at L_2, no unit is less than Q – 5%; at L_3, no unit is less than Q – 10%; and not more than 2 of the 24 units are less than Q – 5%.

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium, *Apparatus*, and *Procedure*—Proceed as directed for *Test 1*.

Times and *Tolerances:* between 60% and 85% of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 15 minutes; not less than 75% *(Q)* of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 60 minutes. Use •*Acceptance Table 2,*•2 with the following exceptions: at 15 minutes—at L_2, no unit is more than 5% outside the stated range; at L_3, no unit is more than 10% outside the stated range; and not more than 2 of the 24 units are more than 5% outside the stated range. At 60 minutes—at L_2, no unit is less than Q – 5%; at L_3, no unit is less than Q – 10%; and not more than 2 of the 24 units are less than Q – 5%.

BRIEFING

Carbon Dioxide, *USP 28* page 349—See briefing under *Medical Air*.

(AER: K. Zaidi) RTS—42651-2

Change to read:

» Carbon Dioxide contains not less than 99.0 percent, ~~by volume~~

■volume/volume,■2S (*USP29*)
of CO_2.

Change to read:

Packaging and storage—~~Preserve in cylinders.~~

■Preserve in gray cylinders. Containers and connections are to be specific to the application and must be controlled in such a fashion that there are sufficient change controls to prevent the connection of the incorrect gas to the system (such as those suggested in CGA Standard CGA V-1-2003).■2S (*USP29*)

NOTES—The following tests are designed to reflect the quality of Carbon Dioxide in both its vapor and liquid phases, which are present in previously unopened cylinders. Reduce the container pressure by means of a regulator. Withdraw the specimens for the tests with the least possible release of Carbon Dioxide consistent with proper purging of the sampling apparatus. Measure the gases with a gas volume meter downstream from the detector tubes in order to minimize contamination or change of the specimens. Perform tests in the sequence in which they are listed.

The various detector tubes called for in the respective tests are listed under *Reagent Specifications* in the section *Reagents, Indicators, and Solutions.*

BRIEFING

Cefadroxil for Oral Suspension, *USP 28* page 372. It is proposed to provide an additional *Water* specification for dry preparations that on constitution indicate a content of cefadroxil that is higher than the strengths for which the current 2.0% *Water* limit was established. The original strengths were 25 mg and 50 mg of cefadroxil per mL of suspension (125 mg and 250 mg per 5 mL). The source of much of the water found in these dry preparations is the cefadroxil monohydrate component, which may contain up to 6.0% water. This proposal provides for a *Water* limit of not more than 3.0% where the product is labeled as containing 100 mg of cefadroxil per mL (500 mg per 5 mL) after constitution.

(PA7a: B. Gilbert) RTS— 41870-1

Change to read:

BRIEFING

Citalopram Tablets, page 745 of *PF* 31(3) [May–June 2005]. It is proposed to add a *Dissolution* test to this new monograph.

(BPC: M. Marques) RTS—41833-7

Add the following:

■Citalopram Tablets

» Citalopram Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of citalopram free base ($C_{20}H_{21}FN_2O$).

Packaging and storage—Preserve in well-closed containers. Store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Citalopram Hydrobromide RS. USP Citalopram Related Compound A RS. USP Citalopram Related Compound B RS. USP Citalopram Related Compound C RS. USP Citalopram Related Compound E RS. USP Citalopram Related Compound F RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩—

Test specimen—Extract finely ground Tablet powder containing about 200 mg of citalopram with 30 mL of water, and filter. Add 1 mL of 1 N sodium hydroxide, and extract with 50 mL of cyclohexane by shaking for 10 minutes. Pass the cyclohexane layer through a silicone-treated filter paper into a beaker. Reduce the filtrate down to 3 mL, using gentle heat as necessary. Transfer the hot solution to a small centrifuge tube. Induce crystallization while cooling by scratching the side of the test tube with a spatula. Centrifuge the mixture, and decant off the cyclohexane. Dry the residue under vacuum in a desiccator. Mix approximately 2 mg of the residue with approximately 300 mg of potassium bromide, and record the IR spectrum.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

C: A solution of 2 mg per mL equivalent of citalopram in water meets the requirements of the test for *Bromide* ⟨191⟩.

Add the following:

■**Dissolution** ⟨711⟩—

Medium: pH 1.5 buffer (prepared by transferring 118 mL of 1 N hydrochloric acid and 82 mL of 1 N sodium hydroxide to a 1000-mL volumetric flask, diluting with water to volume, and adjusting with 1 N sodium hydroxide to a pH of 1.5); 800 mL, deaerated.

Apparatus 1: 100 rpm.

Time: 30 minutes.

Procedure—Determine the amount of citalopram hydrobromide dissolved by employing UV absorption at the wavelength of maximum absorbance at about 239 nm on portions of the solution under test passed through a 0.45-µm PVDF filter, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration (about 12 µg per mL) of USP Citalopram Hydrobromide RS in the same *Medium.* Calculate the amount of citalopram hydrobromide dissolved, in percentage, by the formula:

$$\frac{A_U \times C_S \times 324.44 \times D \times 800 \times 100}{A_S \times 405.30 \times L}$$

In-Process Revision

in which A_U and A_S are the absorbances obtained from the solution under test and the Standard solution, respectively; C_S is the concentration, in mg per mL, of the Standard solution; D is the dilution factor of the solution under test; 800 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; 324.44 and 405.30 are the molecular weights of citalopram and citalopram hydrobromide, respectively; and L is the tablet label claim, in mg, of citalopram.

Tolerances—Not less than 80% (Q) of the labeled amount of citalopram hydrobromide is dissolved in 30 minutes. ■2S (*USP29*)

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

Buffer, Diluent, Internal standard solution, Mobile phase, and *Chromatographic system*—Proceed as directed in the *Assay.*

Test solution—Transfer 1 Tablet to a 100-mL volumetric flask, add 10 mL of *Buffer,* and shake by mechanical means until disintegrated. Add 40 mL of methanol, and sonicate for about 5 minutes. Allow to cool to room temperature. Add a sufficient volume of *Internal standard solution,* and dilute, stepwise if necessary, with *Diluent* to volume to obtain a *Test solution* having a concentration of about 0.1 mg per mL of citalopram and 0.025 mg per mL of internal standard. Pass a portion of this solution through a membrane filter (PVDF) having a 0.45-µm or finer porosity, and use the filtrate.

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Procedure—Proceed as directed in the *Assay.* Calculate the quantity, in mg, of $C_{20}H_{21}FN_2O$ in the portion of sample taken by the formula:

$$100(CV)(R_U / R_S)(324.39/405.30)$$

in which C is the concentration, in mg per mL, of USP Citalopram Hydrobromide RS in the *Standard solution; V* is the final volume, in mL, required to obtain the *Test solution;* R_U and R_S are the ratio of peak responses of citalopram to the internal standard in the *Test solution* and the *Standard solution,* respectively; and 324.39 and 405.30 are the molecular weights of citalopram and citalopram hydrobromide, respectively.

Related compounds—

Phosphate buffer—Dissolve 3.15 g of potassium dihydrogen phosphate and 3.60 g of disodium hydrogen phosphate ($Na_2HPO_4 \cdot 12H_2O$) in 1 L of water.

Mobile phase—Prepare a filtered and degassed mixture of *Phosphate buffer,* methanol, and acetonitrile (55 : 38 : 7). Adjust with phosphoric acid to a pH of 6.5. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Dissolve an accurately weighed quantity of USP Citalopram Hydrobromide RS in *Mobile phase* to obtain a solution having a known concentration of about 0.5 mg per mL.

Standard solution—Prepare a solution having a concentration of 0.625 µg per mL of citalopram hydrobromide through stepwise dilution of the *Standard stock solution* with *Mobile phase.*

Sensitivity solution—Prepare a solution having a concentration of 0.05 µg per mL of citalopram hydrobromide through stepwise dilution of the *Standard solution* with *Mobile phase.*

Related compounds stock solutions—Separately dissolve accurately weighed quantities of USP Citalopram Related Compound A RS, USP Citalopram Related Compound B RS, USP Citalopram Related Compound C RS, and USP Ci-

talopram Related Compound E RS in *Mobile phase* to obtain stock solutions having known concentrations of about 0.1 mg per mL of each compound.

Peak identification solution—Prepare a mixture containing about 0.001 mg per mL each of USP Citalopram Related Compound A RS, USP Citalopram Related Compound B RS, USP Citalopram Related Compound C RS, and USP Citalopram Related Compound E RS, using the *Standard stock solution* as the diluent.

Resolution solution—Dilute 0.5 mL of *Citalopram related compound C stock solution* and 25.0 mL of the *Standard stock solution* with *Mobile phase* to 50 mL to obtain a solution containing 0.01 mg per mL of citalopram related compound C and 0.25 mg per mL of citalopram hydrobromide.

Test solution—Transfer 10 Tablets into a 200-mL volumetric flask, add 25 mL of *Phosphate buffer,* and shake by mechanical means until disintegrated. Add about 100 mL of a mixture of methanol and water (50 : 50), mix, and sonicate for about 5 minutes. Allow to cool, dilute with a mixture of methanol and water (50 : 50) to volume, and mix thoroughly. Allow the excipients to settle. Dilute as necessary to obtain a final concentration of 0.5 mg per mL of citalopram. Pass a portion of this solution through a polytetrafluoroethylene (PTFE) membrane filter having a 0.45-µm or finer porosity, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 239-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The column temperature is maintained at 45°. The flow rate is about 0.8 mL per minute. Inject the *Standard solution,* and record the peak responses as directed for *Procedure*: the citalopram peak shows no shoulders or excessive tailing; the column efficiency is not less than 5000 theoretical plates; the tailing factor is not more than 1.5; the capacity factor, k', is not less than 3.5; and the relative standard deviation of both the retention time and the response for replicate injections is not more than 5%. Inject the *Sensitivity solution* into the chromatograph, and verify that the signal-to-noise ratio is at least 3. Inject the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, R, between citalopram related compound C and citalopram is not less than 3. Inject the *Peak identification solution,* and record the responses as directed for *Procedure:* the four related compound peaks are baseline resolved from each other and the citalopram peak.

Procedure—Inject a volume (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in each Tablet by the formula:

$$100(r_i / r_S)(324.39/405.30)(C_S / C_T)(1/F)$$

in which r_i is the individual peak response for each citalopram related compound obtained from the *Test solution;* r_S is the response of the corresponding peak in the *Standard solution;* 324.39 and 405.30 are the molecular weights of citalopram and citalopram hydrobromide, respectively; F is the relative response factor of each impurity relative to citalopram (free base); and C_S and C_T are the concentrations, in mg per mL, of citalopram hydrobromide in the *Standard solution* and the *Test solution,* respectively. The limits for the related compounds are listed in *Table 1.*

In-Process Revision

Table 1

Related Compound	Relative Retention Time	Relative Response Factor *(F)*	Limit (%)
Citalopram related compound A	0.43	0.77	NMT* 0.1
Citalopram related compound B	0.60	0.98	NMT 0.25
Citalopram related compound C	0.83	0.69	NMT 0.25
Citalopram related compound E	1.32	0.91	NMT 0.1
Unknown	—	1.0	NMT 0.1 each
Total known and unknown	—	—	NMT 0.7

* NMT = not more than.

Assay—

Buffer—Transfer about 0.71 g of anhydrous dibasic sodium phosphate to a 500-mL volumetric flask, and add about 250 mL of water. Shake to dissolve, then dilute with water to volume.

Diluent—Prepare a solution of methanol and *Buffer* (80 : 20).

Internal standard solution—Dissolve an accurately weighed amount of USP Citalopram Related Compound F RS in *Diluent* and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.25 mg per mL.

Mobile phase—Prepare a filtered and degassed solution of *Diluent* containing about 770 mg of dodecyltrimethylammonium bromide per L. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Dissolve an accurately weighed quantity of USP Citalopram Hydrobromide RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 1.25 mg of citalopram hydrobromide per mL.

Standard preparation—Pipet 5.0 mL of the *Standard stock preparation* and 5.0 mL of the *Internal standard solution* into a 50-mL volumetric flask. Dilute with *Diluent* to volume, and mix.

Assay preparation—Transfer 10 Tablets to a 200-mL volumetric flask, add 25 mL of *Buffer,* and shake by mechanical means until disintegrated. Add 100 mL of methanol, and sonicate for about 5 minutes. Allow to cool to room temperature, then dilute with *Diluent* to volume. Allow to stand until the residue settles before taking an aliquot for dilution. Transfer an accurately measured volume of the clear supernatant to a 50-mL volumetric flask to obtain a final concentration between 0.090 and 0.10 mg per mL of citalopram. Add 5.0 mL of *Internal standard solution,* dilute with *Diluent* to volume, and mix. Pass a portion through a filter (PTFE) having a 0.45-µm or finer porosity.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. The column temperature is maintained at 45°. Inject the *Stan-*

dard preparation, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.36 for citalopram related compound F and 1.0 for citalopram; the resolution, *R,* between citalopram and citalopram related compound F is not less than 1.5; the column efficiency is not less than 2000 theoretical plates, calculated from the citalopram peak; and the relative standard deviation for replicate injections is not more than 1.5% for the citalopram peak.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the citalopram peaks. Calculate the quantity, in percent of label claim, of citalopram per Tablet taken by the formula:

$$100(C_S / C_U)(324.39/405.30)(R_U / R_S)$$

in which C_S and C_U are the concentrations, in mg per mL, of USP Citalopram Hydrobromide RS in the *Standard preparation* and Citalopram Hydrobromide in the *Assay preparation,* respectively; 324.39 and 405.30 are the molecular weights of citalopram and citalopram hydrobromide, respectively; and R_U and R_S are the ratio of peak responses of citalopram to the internal standard obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP29*)

BRIEFING

Cloxacillin Benzathine, *USP 28* pages 524; **Cloxacillin Benzathine Intramammary Infusion,** *USP 28* page 525. It is proposed to replace the microbial-based *Assay* with an HPLC method. The procedure utilizes a 4.6-mm × 25-cm column that contains 10-µm packing L1. USP has received validation data indicating that LiChrosphere RP18 brand column is suitable for use in this *Assay.* Interested parties are encouraged to submit comments.

(VET: I. DeVeau) RTS—42440-1

Change to read:

Assay—~~Proceed as directed for cloxacillin under *Antibiotics—Microbial Assays* ⟨81⟩, using an accurately weighed quantity of Cloxacillin Benzathine dissolved quantitatively in methanol to yield a stock solution having a convenient concentration. Promptly dilute an accurately measured volume of this stock solution quantitatively and stepwise with *Buffer No. 1* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.~~

■*0.1 M Phosphate buffer*—Dissolve 55.2 g of monobasic sodium phosphate in water, and dilute with water to 4 L.

Mobile phase—Combine 1000 mL of acetonitrile and 3000 mL of *0.1 M Phosphate buffer.* Adjust with phosphoric acid or 1 N sodium hydroxide to a pH of 4.6 ± 0.2. Pass through a 0.45-µm nylon filter, and degas. [NOTE—The retention time of cloxacillin is very sensitive to the acetonitrile content of the *Mobile phase*.]

Diluent—Transfer 13.8 g of monobasic sodium phosphate to a 2-L volumetric flask, mix, and dilute with water to volume. Combine 1800 mL of the resulting solution with 1200 mL of acetonitrile. Adjust with phosphoric acid or 1 N sodium hydroxide to a pH of 6.4.

Standard preparations—In duplicate, dissolve an accurately weighed quantity of USP Cloxacillin Sodium RS in *Diluent* to obtain solutions having known concentrations of about 112 µg per mL.

In-Process Revision

Assay preparations—In duplicate, dissolve an accurately weighed quantity of Cloxacillin Benzathine in *Diluent* to obtain solutions having concentrations of about 128 µg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains 10-µm packing L1. The flow rate is about 1.5 mL per minute and the column temperature is 40°. Chromatograph the *Standard preparations,* and record the peak areas as directed for *Procedure:* the tailing factor is less than 2.0; the peak areas of the two *Standard preparations* agree within 98% to 102%; and the relative standard deviation for replicate injections is not more than 2%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparations* and the *Assay preparations* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in µg, of $C_{19}H_{18}ClN_3O_5S$ in each mg of Cloxacillin Benzathine taken by the formula:

$$P(C_S / C_U)(r_U / r_S)$$

in which P is the assigned potency in µg of cloxacillin per mg of USP Cloxacillin Sodium RS; C_S and C_U are the concentrations, in µg per mL, of cloxacillin sodium and cloxacillin benzathine in the *Standard preparations* and *Assay preparations,* respectively; and r_U and r_S are the average peak areas of the cloxacillin peaks obtained from the *Assay preparations* and the *Standard preparations,* respectively. ■2S (*USP29*)

BRIEFING

Cloxacillin Benzathine Intramammary Infusion, *USP 28* page 525—See briefing under *Cloxacillin Benzathine.*

(VET: I. DeVeau) RTS— 42440-2

Change to read:

Assay— ~~Proceed as directed for cloxacillin under *Antibiotics—Microbial Assays* ⟨81⟩, expelling the contents of 1 syringe of Intramammary Infusion into a high speed glass blender jar containing sufficient methanol to yield a volume of 500 mL, and blend for 3 to 5 minutes. Promptly dilute an accurately measured volume of this solution quantitatively and stepwise with *Buffer No. 1* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.~~

■*0.1M Phosphate buffer, Mobile phase, Diluent, Standard preparations,* and *Chromatographic system*—Proceed as directed in the *Assay* under *Cloxacillin Benzathine*.

Assay preparations—In duplicate, quantitatively express the entire contents of a syringe of Cloxacillin Benzathine Intramammary Infusion into a 500-mL volumetric flask. Add about 300 mL of methanol, and stir for 45 minutes ± 1 minute. Dilute with methanol to volume, and stir for an additional 10 minutes ± 1 minute. Immediately transfer 45 mL of the resulting solution to a 50 mL polypropylene centrifuge tube, and centrifuge for 10 minutes. From the supernatant remove an aliquot, and dilute with a sufficient volume of *Diluent* to prepare a solution containing about 100 µg cloxacillin per mL.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparations* and the *Assay preparations* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in µg, of $C_{19}H_{18}ClN_3O_5S$ in each syringe of Cloxacillin Benzathine Intramammary Infusion taken by the formula:

$$P(CD/1000)(r_U / r_S)$$

In-Process Revision

in which *P* is the assigned potency, in µg of cloxacillin per mg, of USP Cloxacillin Sodium RS; *C* is the concentration, in µg per mL, of cloxacillin sodium in the *Standard preparations; D* is the dilution factor used in preparing the *Assay preparations;* and r_U and r_S are the average peak areas of the cloxacillin peaks obtained from the *Assay preparations* and the *Standard preparations,* respectively. ■2S (*USP29*)

BRIEFING

Desmopressin Acetate; Desmopressin Injection; Desmopressin Nasal Spray Solution. Because there are no existing *USP* monographs for these articles, new monographs are being proposed. The test for *Amino acid content* involves acid hydrolysis and precolumn derivatization followed by HPLC using a 2.1-mm × 20-cm column that contains 5-µm packing L1. USP has received validation data indicating that an Agilent Hypersil AA-ODS model of column is suitable. The test for *Limit of acetic acid* uses a gas chromatographic method with flame-ionization detection and a 0.32-mm × 30-m fused silica capillary column coated with a 0.25-µm film of phase G35. Validation data indicate that a Phenomenex ZB-FFAP model of column is suitable. The HPLC procedures in the test for *Related compounds* and in the *Assay* utilize a 4.6-mm × 25-cm column that contains 5-µm packing L1. Validation data indicate that a LichroSphere C-18 model of column is suitable. Interested parties are encouraged to submit comments.

(BNT: I. DeVeau) RTS—38378-1; 40319-1; 42218-1

Solution: 1 mg in 5 mL.

Medium: 0.1 N sodium hydroxide.

B: *Mass spectral analysis—*

Diluent: a mixture of water and methanol (1 : 1).

Standard solution—Dissolve an accurately weighed quantity of USP Desmopressin Acetate RS in *Diluent* to obtain a solution having a known concentration of about 5 µg per mL.

Test solution—Dissolve an accurately weighed quantity of Desmopressin Acetate in *Diluent* to obtain a solution having a known concentration of about 5 µg per mL. [NOTE—The final concentration of *Standard solution* and *Test solution* can be adjusted depending on the sensitivity of the mass spectrometer used in the testing.]

Mass spectrometric system (see *Mass Spectrometry* ⟨736⟩)—The LC/MS Spectrometer is equipped with an electrospray interface, positive ion mode, infusion system, and MS/MS capability.

Procedure—Separately infuse the *Standard solution* and the *Test solution* at about 5 µL per minute into the mass spectrometer. Obtain optimized MS and MS/MS spectra of the peak with mass-to-charge ratio 1069. For MS spectra, the major peak with mass-to-charge ratio of 1069 should be observed. For MS/MS spectra, product ions at mass-to-charge ratios of about 641, 742, and 995 are present.

C: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatgram of the *Standard preparation,* as obtained in the *Assay.*

Specific rotation ⟨781S⟩**:** between –72° and –82°, calculated on the anhydrous, acetic acid-free basis.

Test solution: 5 mg per mL, in diluted acetic acid.

Microbial limits ⟨61⟩**—**The total aerobic microbial count does not exceed 100 cfu per g.

Water, *Method I* ⟨921⟩**:** not more than 6.0%.

Amino acid content (see *Biotechnology-Derived Articles—Tests* ⟨1047⟩)**—**

Solution A—Prepare a solution having final concentrations of 20 mM sodium acetate, 0.2% (v/v) triethylamine, and 0.3% (v/v) tetrahydrofuran.

Solution B—Prepare a solution containing 20% (v/v) 100 mM sodium acetate, 40% (v/v) methanol, and 40% (v/v) acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Borate buffer—Transfer 12.4 g of boric acid to a 500-mL volumetric flask, and suspend it in 300 mL of water. Add 100 mL of 1 N potassium hydroxide, and mix. Adjust with 1 N potassium hydroxide to a pH of 10.4, dilute with water to volume, and mix. Store in a closed plastic container.

Norvaline solution—Prepare a 4 mM solution of norvaline.

2% DTDPA solution—Transfer 2 g of dithiodipropionic acid to a 100-mL volumetric flask. Dissolve in and dilute with water to volume.

Sarcosine solution—Prepare a 4 mM solution of sarcosine.

0.1% Phenol—Prepare a solution containing 0.1% (w/v) phenol in 6 N hydrochloric acid.

OPA reagent—Prepare a solution containing 10 mg per mL each of *o*-phthalaldehyde and 3-mercaptopropionic acid in *Borate buffer.*

FMOC reagent—Prepare a solution containing 2.5 mg per mL of 9-fluorenylmethylchloroformate in acetonitrile.

Calibration solution—Prepare a mixture in which the final concentrations of amino acids are as follows: about 2.50 mM glycine; about 2.50 mM for the L-form of the amino acids lysine, histidine, arginine, aspartic acid, threonine, serine, glutamic acid, proline, alanine, valine, methionine, isoleucine, leucine, tyrosine, and phenylalanine; and about 1.25 mM L-cystine. Transfer a 1-mL aliquot of this solution to a suitable vial, and add 5 µL each of *Norvaline solution* and *2% DTDPA solution.* Evaporate the aliquot to dryness, and add 300 µL of *0.1% Phenol.* Mix, and alternate between purging the head space of the vial with nitrogen gas and reducing the pressure to 2 mm of mercury for a total of two purge-vacuum cycles. Purge the sample with nitrogen gas one additional time, and reduce the pressure to 1.5 mm of mercury. Seal, and heat the sample at 110° for 24 hours. Open the vial, and evaporate to dryness. Dissolve the residue in 115 µL of *Borate buffer,* and add 5 µL of *Sarcosine solution.* Centrifuge for 2 minutes, and transfer the supernatant to a clean vial. Remove a 6-µL aliquot, and add 1 µL of *OPA reagent.* Mix, and add 1 µL of *FMOC reagent.* Mix, add 28 µL of water, and mix again.

Test solution—Dissolve an accurately weighed quantity of Desmopressin Acetate in water to obtain a solution having a known concentration of about 1.00 mg per mL. Add 5 µL each of *Norvaline solution* and *2% DTDPA solution* to a 1-mL aliquot, and prepare as directed in *Calibration solution,* beginning with "Bring the aliquot to dryness and add 300 µL of *0.1% Phenol.*"

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a thermoregulated autosampler, set at 4°, that is capable of adding and mixing derivatizing agents; a multi-wavelength detector set at 262 nm and 338 nm; and a 2.1-mm × 20-cm column that contains 5-µm packing L1. The flow rate is about 0.45 mL per minute. The column temperature is maintained at 40°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibration
0–17	100→40	0→60	linear gradient
17–18.10	40→0	60→100	linear gradient
18.10–24	0	100	isocratic
24–25	0→100	100→0	linear gradient
25–35	100	0	re-equilibration

Process and inject the *Calibration solution* and *Test solution,* and record the peak responses for individual amino acid derivatives as directed for *Procedure*: the order of elution of the amino acid derivatives is aspartic acid, glutamic acid, serine, histidine, glycine, threonine, cysteine (reduced cystine), alanine, arginine, tyrosine, valine, methionine, norvaline, phenylalanine, isoleucine, leucine, lysine, and proline; the resolution, *R,* between the amino acid pairs histidine and glycine, alanine and arginine, and valine and methionine in the *Calibration solution* is not less than 1; and the relative standard deviation for triplicate injection of the *Calibration solution* is not greater than 15% for cysteine, lysine and proline, and not greater than 10% for all other amino acids. The peak area of the norvaline peak in the *Test solution* should be not less than 80% and not greater than 120% of that found in the *Calibration solution.*

Procedure—Using the autosampler, separately remove equal volumes (about 6 µL) of the *Calibration solution* and the *Test solution,* and to each add 1 µL of *OPA reagent.* Mix, and to each add 1 µL of *FMOC reagent.* Mix, add 28 µL of water to each, mix again, and inject the entire volume into the chromatograph. Record the area responses for the main peaks, and identify the amino acids. Using the *Calibration solution* as a standard, express the content of each amino acid in moles. With the content for arginine set to 1, calculate the relative proportions of the amino acids: aspartic acid, glutamic acid, proline, glycine, and phenylalanine are between 0.95 and 1.05; tyrosine is between 0.7 and 1.05; cysteine is between 0.30 and 1.05; lysine, isoleucine, and leucine are absent; and not more than traces of other amino acids are found.

Limit of acetic acid—

Internal standard solution—Transfer about 16 mL of hydrochloric acid into a 1000-mL volumetric flask containing about 500 mL of water, and mix. Add about 0.5 mL of propionic acid, accurately measured, dilute with acetonitrile to volume, and mix.

Standard solution—Transfer about 1.049 g of acetic acid, accurately measured, to a 100-mL volumetric flask. Dilute with *Internal standard solution* to volume, and mix. Transfer 2.5 mL of the resulting solution to a 50-mL volumetric flask. Dilute with *Internal standard solution* to volume, and mix.

Test solution—Dissolve about 5 mg of Desmopressin Acetate, accurately weighed, in 0.5 mL of *Internal standard solution,* and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.32-mm × 30-m fused silica capillary column coated with a 0.25-µm film of phase G35. The carrier gas is helium, flowing at a rate of about 3 mL per minute, and the split flow ratio is 20 : 3. The column temperature is maintained at 120°, and the injector port and detector temperatures are maintained at 250°. Chromatograph six replicate injections of the *Standard solution,* and record the peak areas as directed for *Procedure:* the order of elution is acetic acid followed by propionic acid; the resolution, *R,* between acetic acid and propionic acid is not less than 5.0; the tailing factor for acetic acid is not more than 3.0; and the relative standard deviation of the peak area ratio of acetic acid to propionic acid is not more than 15%.

Procedure—Separately inject equal volumes (about 1.0 µL) of the *Standard solution* and the *Test solution* into the chromatograph, and measure the peak responses. Calculate the percentage of acetic acid in the portion of Desmopressin Acetate taken by the formula:

$$100(C_S / C_U)(R_U / R_S)$$

in which C_S is the concentration, in mg per mL, of acetic acid in the *Standard solution;* C_U is the concentration, in mg per mL, of desmopressin acetate in the *Test solution;* and R_U and R_S are the peak area ratios of acetic acid to the internal standard obtained from the *Test solution* and the *Standard solution,* respectively: not more than 8.0% is found.

Chromatographic purity—

Mobile phase and *System suitability solution*—Proceed as directed in the *Assay.*

Standard solution—Dissolve an accurately weighed quantity of USP Desmopressin Acetate RS in *Mobile phase* to obtain a solution having a known concentration of about 1 µg per mL.

Test solution—Dissolve an accurately weighed quantity of Desmopressin Acetate in *Mobile phase* to prepare a solution having a known concentration of about 200 µg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute, and the column is maintained at 30°. Chromatograph the *Standard solution* and *System suitability solution,* and record the peak areas as directed for *Procedure:* the desmopressin peak elutes before the oxytocin peak; the resolution, *R,* between desmopressin and oxytocin is not less than 1.5; the tailing factor is not greater than 2.0; and the relative standard deviation of the desmopressin peak area for replicate injections of the *Standard solution* is not greater than 5.0%.

Procedure—Separately inject equal volumes (about 200 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the response for each peak, except for the main desmopressin peak in the chromatogram of the *Test solution.* Calculate the percentage of each impurity in the portion of Desmopressin Acetate taken by the formula:

$$100(C_S / C_U)(r_i / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Desmopressin Acetate RS, calculated on the anhydrous, acetic acid-free basis, in the *Standard solution;* C_U is the concentration, in mg per mL, of Desmopressin Acetate, calculated on the anhydrous, acetic acid-free basis, in the *Test solution;* r_i is the peak response of an individual impurity in the chromatogram obtained from the *Test solution;* and r_S is the desmopressin peak response obtained from the *Standard solution:* not more than 0.5% of any individual impurity is found, and the sum of all impurities is less than 1.5%.

Assay—

Buffer solution—Dissolve 3.4 g of monobasic potassium phosphate and 2.0 g of sodium 1-heptanesulfonic acid in 1000 mL of water. Adjust the pH to 4.50 ± 0.05 with phosphoric acid or sodium hydroxide, as needed. Pass through a 0.45-µm filter.

Mobile phase—Mix 780 mL of *Buffer solution* with 220 mL of acetonitrile, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩). [NOTE—The retention time of desmopressin is very sensitive to the composition of the *Mobile phase.*]

Standard preparation—Dissolve an accurately weighed quantity of USP Desmopressin Acetate RS in *Mobile phase* to obtain a solution having a known concentration of about 20 µg per mL.

Assay preparation—Dissolve an accurately weighed quantity of Desmopressin Acetate in *Mobile phase* to prepare a solution having a known concentration of about 20 µg per mL.

System suitability solution—Dissolve about 1 mg of oxytocin, accurately weighed, in a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of the resulting solution and 5.0 mL of *Assay preparation* to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The column temperature is maintained at 30°. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation* and *System suitability solution,* and record the peak areas as directed for *Procedure:* the desmopressin peak elutes before the oxytocin peak; the resolution, *R,* between desmopressin and oxytocin is not less than

In-Process Revision

1.5; the tailing factor is not greater than 2.0; and the relative standard deviation of the desmopressin peak area for replicate injections is not greater than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation,* both freshly prepared, into the chromatograph, record the chromatograms, and measure the desmopressin peak areas. Calculate the percentage of $C_{46}H_{64}N_{14}O_{12}S_2$ in the portion of Desmopressin Acetate taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Desmopressin Acetate RS, calculated on the anhydrous, acetic acid-free basis, in the *Standard preparation;* C_U is the concentration, in mg per mL, of Desmopressin Acetate, calculated on anhydrous, acetic acid-free basis, in the *Assay preparation;* and r_U and r_S are the peak responses for desmopressin obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S *(USP29)*

BRIEFING

Desmopressin Injection—See briefing under *Desmopressin Acetate.*

(BNT: I. DeVeau) RTS—38378-2

Add the following:

■Desmopressin Injection

» Desmopressin Injection is a sterile solution of Desmopressin Acetate in a suitable diluent. It may contain suitable preservatives. It possesses, in each mL, an activity of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of desmopressin ($C_{46}H_{64}N_{14}O_{12}S_2$), calculated on the anhydrous, acetic acid-free basis.

Packaging and storage—Preserve in tight containers, protected from light. Store at a temperature between 2° and 8°.

Labeling—Label it to state the potency, in mg, of desmopressin.

USP Reference standards ⟨11⟩**—***USP Desmopressin Acetate RS. USP Endotoxin RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

Bacterial endotoxins ⟨85⟩**—**It contains not more than 10 USP Endotoxin Units per µg of desmopressin.

Sterility ⟨71⟩**—**It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined.*

In-Process Revision

pH ⟨791⟩**:** between 3.5 and 6.0.

Particulate matter ⟨788⟩**:** meets the requirements for small-volume injections.

Other requirements—It meets the requirements for *Volume in Container* under *Injections* ⟨1⟩.

Assay—

Buffer solution—Dissolve 4.9 g of phosphoric acid, accurately weighed, in water. Dilute with water to 1000 mL. Adjust with triethylamine to a pH of 3.5.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (83.5 : 16.5). Make adjustments, if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Solution A—Transfer 9 g of sodium chloride, accurately weighed, to a 1000-mL flask, and dissolve in and dilute with water to volume. Adjust with hydrochloric acid to a pH between 3.5 and 5.0.

Solution B—Transfer 9 g of sodium chloride, accurately weighed, to a 1000-mL flask, dissolve in water, and add 5 g of chlorobutanol. Dilute with water to volume, and adjust with hydrochloric acid to a pH between 3.5 and 5.0.

Standard preparation—Dissolve an accurately weighed quantity of USP Desmopressin Acetate RS in water to obtain a solution having a known concentration of about 1 mg per mL. Dilute this solution with *Solution A* or *Solution B*, as directed for the *Assay preparation*, to obtain a solution with a concentration of desmopressin equivalent to that in the *Assay preparation*.

Assay preparation—For injections at concentrations of desmopressin between 4 µg per mL and 0.1 mg per mL, use undiluted Desmopressin Injection. For injections at concentrations exceeding 0.1 mg per mL and without preservatives, dilute 1000 µL of Desmopressin Injection, accurately measured, with 10 mL of *Solution A*. For injections at concentrations exceeding 0.1 mg per mL and containing preservatives, dilute 1000 µL of Desmopressin Injection, accurately measured, with 10 mL of *Solution B*.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph about 50 µL of the *Standard preparation,* and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.4; and the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation*, both freshly prepared, into the chromatograph, and record the chromatograms for a total time of not less than 2.5 times the retention time of the desmopressin peak. Calculate the quantity of $C_{46}H_{64}N_{14}O_{12}S_2$, in mg, in the volume of *Injection* taken by the formula:

$$CD(r_U / r_S)$$

in which C is the concentration of desmopressin, in mg per mL, in the *Standard preparation; D* is the dilution factor used to prepare the *Assay preparation;* and r_U and r_S are the peak responses for desmopressin obtained from the *Assay preparation* and the *Standard preparation*, respectively.■2S (*USP29*)

In-Process Revision

BRIEFING

Desmopressin Nasal Spray Solution—See briefing under *Desmopressin Acetate*.

(BNT: I. DeVeau) RTS—38378-3

Add the following:

■Desmopressin Nasal Spray Solution

» Desmopressin Nasal Spray Solution is a solution of Desmopressin Acetate in a suitable diluent. It is supplied in a form suitable for nasal administration and contains suitable preservatives. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of desmopressin ($C_{46}H_{64}N_{14}O_{12}S_2$), calculated on the anhydrous, acetic acid-free basis.

Packaging and storage—Preserve in containers suitable for administering the contents by spraying into the nasal cavities in a controlled, individualized dosage. Protect from light, and store at a temperature between 2° and 8°.

Labeling—Label it to indicate that it is for intranasal administration only and to state the total number of discharges. Label it also to state that the dosage regulation is described in the package insert.

USP Reference standards ⟨11⟩**—***USP Desmopressin Acetate RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

Microbial limits ⟨61⟩**—**The total aerobic microbial count does not exceed 100 cfu per mL, the total combined molds and yeasts count does not exceed 10 cfu per mL, and it meets the requirements of the test for the absence of *Staphylococcus aureus and Pseudomonas aeruginosa.*

pH ⟨791⟩**:** between 3.5 and 6.0.

Uniformity of unit spray weight and total number of discharges per container—Select three Nasal Spray Solution units, and prime each spray pump as directed on the label, but not more than five times. Accurately weigh, by difference, 10 individual deliveries from each unit, weighing the first three discharges immediately after priming, and weighing four discharges from the middle of each unit, and three close to the end of each unit. Continue to fire until the unit is empty. For each unit, determine the total number of discharges, including the number of priming deliveries, and calculate the mean weight delivered per discharge: it contains not less than the number of discharges stated on the label; the mean weight delivered per discharge is within 10% of the labeled weight per discharge; and not fewer than nine tested discharges for each unit are between 85% and 125% of the labeled weight per discharge.

Assay—

Buffer solution, Mobile phase, Solution A, Solution B, and *Chromatographic system*—Prepare as directed in the *Assay* under *Desmopressin Injection*.

Assay preparation, Standard preparation, and *Procedure*—Proceed as directed for products containing preservatives in the *Assay* under *Desmopressin Injection.* ■2S (*USP29*)

In-Process Revision

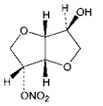
BRIEFING

Diluted Isosorbide Mononitrate, page 868 of *PF* 30(3) [May–June 2004]. On the basis of comments received, it is proposed to revise the lower limit of the *pH* range to 4.0.

(PA5: A. Wilk) RTS—41640-1

Add the following:

■Diluted Isosorbide Mononitrate



$C_6H_9NO_6$ 191.14

D-Glucitol, 1,4 : 3,6-dianhydro-, 5-nitrate.

1,4 : 3,6-Dianhydro-D-glucitol 5-nitrate [*16051-77-7*].

» Diluted Isosorbide Mononitrate is a dry mixture of isosorbide mononitrate ($C_6H_9NO_6$) with lactose or other suitable excipients to permit safe handling. It contains not less than ~~87.5 percent and not more than 92.5 percent (w/w)~~ 95.0 percent and not more than 105.0 percent of the labeled amount of isosorbide mononitrate ($C_6H_9NO_6$).

Caution—Exercise proper precautions in handling undiluted isosorbide mononitrate, which is a powerful explosive and can be exploded by percussion or excessive heat. Only exceedingly small amounts should be isolated.

Packaging and storage—Preserve in tight containers. Store between 20° and 30°.

USP Reference standards ⟨11⟩**—***USP Isosorbide RS. USP Diluted Isosorbide Dinitrate RS. USP Isosorbide Mononitrate RS. USP Isosorbide Mononitrate Related Compound A RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Change to read:

pH ⟨791⟩**:** between ~~4.8~~ ■4.0■2S (*USP29*) and 6.5. To prepare the test solution, dissolve 5.6 g of Diluted Isosorbide Mononitrate in 50 mL of boiling water, sonicate for 5 minutes, and allow to cool to room temperature.

Water, *Method Ic* ⟨921⟩**:** between 0.4% and 0.8%. Proceed as directed for hygroscopic materials. To 1.0 g of sample, accurately weighed, add 5 mL of methanol, shake for 30 minutes, and centrifuge at about 2500 rpm for 5 minutes. Use 1.0 mL of the resulting supernatant.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Caution—Material is explosive upon heating; digest the sample thoroughly before ignition.

Heavy metals, *Method I* ⟨231⟩**:** not more than 10 µg per g.

Organic volatile impurities, *Method IV* ⟨467⟩**:** meets the requirements.

Related compounds—

TEST 1—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

In-Process Revision

Standard solution 1—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with absolute alcohol to obtain a solution having a known concentration of about 0.0125 mg of isosorbide per mL.

Standard solution 2—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with absolute alcohol to obtain a solution having a known concentration of about 0.025 mg of isosorbide per mL.

Standard solution 3—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with absolute alcohol to obtain a solution having a known concentration of about 0.05 mg of isosorbide per mL.

Test solution—Transfer a portion of Diluted Isosorbide Mononitrate, equivalent to about 200 mg of isosorbide mononitrate, accurately weighed, to a suitable container, add 20.0 mL of absolute alcohol, sonicate for 10 minutes, and then centrifuge. Use the supernatant.

Application volume: 20 µL.

Developing solvent system: a mixture of absolute alcohol and toluene (8 : 2).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. After developing, dry the plate with warm air for about 10 minutes, dip the plate in a solution prepared by dissolving 1.25 g of potassium permanganate and 10.0 g of sodium hydroxide in 500 mL of water (prepared fresh for each plate), and heat at 105° for 5 minutes. Any spot in the chromatogram obtained from the *Test solution* and corresponding to the R_F value of the spots obtained from the *Standard solutions* is not more intense than the spot in the chromatogram obtained from *Standard solution 3:* not more than 0.5% of any individual impurity is found. If the spot in the chromatogram obtained from the *Test solution* is nearly as intense as the spot obtained from *Standard solution 3,* further dilute the *Test solution* (1 : 1) with absolute alcohol, repeat the test, and compare the intensity of the isosorbide spot in the diluted *Test solution* with the intensity of the spots obtained from the *Standard solutions,* correcting the percent level for the additional dilution of the *Test solution.*

TEST 2—

Mobile phase, Resolution solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Isosorbide mononitrate related compound A standard solution—Prepare as directed for *Isosorbide mononitrate related compound A standard preparation* in the *Assay.*

Isosorbide dinitrate standard stock solution—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Dinitrate RS in methanol, sonicate and warm if necessary, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.125 mg of isosorbide dinitrate per mL.

Standard solution—Transfer a quantity of USP Isosorbide Mononitrate RS, accurately weighed, to a suitable volumetric flask. Dissolve in water, quantitatively add a volume of *Isosorbide mononitrate related compound A standard solution* and a volume of *Isosorbide dinitrate standard stock solution,* and dilute with water to volume to obtain a solution having a known concentration of about 2.0 mg of USP Isosorbide Mononitrate RS per mL, 0.005 mg of isosorbide mononitrate related compound A per mL, and 0.005 mg of isosorbide dinitrate per mL. Filter a portion of the solution, discarding the first few mL of the filtrate.

Test solution—Use the *Assay preparation.*

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of isosorbide mononitrate related compound A and isosorbide dinitrate relative to the amount of isosorbide mononitrate in the portion of Diluted Isosorbide Mononitrate taken by the formula:

$$5556(C/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of the appropriate Reference Standard, USP Isosorbide Mononitrate Related Compound A RS or USP Diluted Isosorbide Dinitrate RS, in the *Standard solution; W* is the weight, in mg, of Diluted Isosorbide Mononitrate used to prepare the *Test solution;* and r_U and r_S are the peak areas of the corresponding components obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.25% of isosorbide mononitrate related compound A is found; and not more than 0.25% of isosorbide dinitrate is found. Calculate the percentage of each other impurity (other than isosorbide mononitrate related compound A or isosorbide dinitrate) in the portion of Diluted Isosorbide Mononitrate taken by the formula:

$$100(r_i/r_s)$$

in which r_i is the peak area for each other impurity obtained from the *Test solution;* and r_s is the sum of the areas of all the peaks: not more than 0.5% of total impurities is found, including isosorbide mononitrate related compound A and isosorbide dinitrate; and not more than 0.5% of total impurities is found, the results for *Test 1* and *Test 2* being considered.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water and methanol (95 : 5). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer an accurately weighed quantity of USP Isosorbide Mononitrate RS to a suitable volumetric flask, dissolve in water, add a volume of methanol equivalent to 4% of the flask volume, and dilute with water to volume to obtain a solution having a known concentration of about 2.0 mg per mL.

Isosorbide mononitrate related compound A standard preparation—Dissolve an accurately weighed quantity of USP Isosorbide Mononitrate Related Compound A RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 1.0 mg per mL. Quantitatively dilute a portion of this solution with water to obtain a solution having a known concentration of about 0.05 mg per mL.

Resolution solution—Transfer 10.0 mL of *Isosorbide mononitrate related compound A standard preparation,* 1.0 mL of *Standard preparation,* and 4.0 mL of methanol to a 100-mL volumetric flask, and dilute with water to volume. Filter a portion of the solution, discarding the first few mL of the filtrate.

Assay preparation—Transfer about 110 mg of Diluted Isosorbide Mononitrate, accurately weighed, to a 50-mL volumetric flask, dissolve in about 25 mL of water, add 2 mL of methanol, dilute with water to volume, and mix. Filter a portion of the solution, discarding the first few mL of the filtrate.

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4-mm × 12.5-cm column that contains packing L1. The flow rate is about 1.5 mL per minute, increasing to 3.0 mL per minute at about 8.5 minutes to ensure that the isosorbide mononitrate peak has completely eluted. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.8 for isosorbide mononitrate related compound A, 1.0 for isosorbide mononitrate, and 4.1 for isosorbide dinitrate; and the resolution, *R,* between isosorbide mononitrate related compound A and isosorbide mononitrate is not less than 2.0. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the isosorbide mononitrate peaks. Calculate the quantity, in mg, of isosorbide mononitrate ($C_6H_9NO_6$) in the portion of Diluted Isosorbide Mononitrate taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of isosorbide mononitrate in the *Standard preparation;* and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP28*)

BRIEFING

Estradiol Transdermal System, page 1201 of *PF* 30(4) [July–Aug. 2004]. It is proposed to add a *Drug Release Test 2* for one generic product approved by FDA. The chromatographic procedure in this test was validated using a Nova-Pak C18 brand of L1 column.

(BPC: M. Marques) RTS—41485-1; 42016-2

Add the following:

■Estradiol Transdermal System

» Estradiol Transdermal System contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of estradiol ($C_{18}H_{24}O_2$).

Packaging and storage—Preserve in hermetic, light-resistant, unit-dose pouches.

Labeling—When more than one *Drug Release Test* is given, the labeling states the *Drug Release Test* used only if *Test 1* is not used.

USP Reference standards ⟨11⟩—*USP Estradiol RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Drug release ⟨724⟩**—**

TEST 1—

FOR PRODUCTS LABELED FOR DOSING EVERY 84 HOURS—

Medium: water; 900 mL, deaerated.

Apparatus 5: 50 rpm.

In-Process Revision

Times: 24, 48, and 96 hours.

Determine the amount of $C_{18}H_{24}O_2$ released by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (3 : 2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solutions—Dissolve an accurately weighed quantity of USP Estradiol RS in dehydrated alcohol, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 9 µg per mL. Dilute this solution with water to obtain additional solutions having known concentrations of about 0.9, 0.45, and 0.045 µg per mL.

Test solution—At each sampling time interval, withdraw a 10-mL aliquot of the solution under test.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a fluorometric detector, set at an excitation wavelength of 220 nm and an emission wavelength of 270 nm, and a 4.6-mm × 3-cm column that contains packing L1. The column temperature is maintained at 40°. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solutions,* and record the peak responses as directed for *Procedure:* the tailing factor is between 0.9 and 2.5; and the relative standard deviation for replicate injections of the 0.45 µg per mL *Standard solution* is not more than 3.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solutions* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Plot the peak responses of the *Standard solutions* versus concentration, in µg per mL, of estradiol. From the graph so obtained, determine the amount, in µg per mL, of $C_{18}H_{24}O_2$ released, using the formulas that follow:

µg of estradiol released in the interval 0 to 24 hours:

$$\frac{900(A_1 - b)}{480m}$$

µg of estradiol released in the interval 24 to 48 hours:

$$\frac{900(A_1 - b) - 890(A_{n-1} - b)}{480m}$$

cumulative µg of estradiol released:

$$\left[\frac{900(A_n - b)}{20m}\right] + \frac{10}{20}\left[\sum_{x=1}^{n=1}\frac{(A_x - b)}{m}\right]$$

in which A_1 is the peak area of estradiol in the sample solution at the first release interval; A_n is the peak area of estradiol in the sample solution at the release interval *n; m* is the slope of the calibration curve; and *b* is the *y*-intercept of the calibration curve.

Tolerances—The amounts of $C_{18}H_{24}O_2$ released, as percentages of the labeled amount of the dose ~~absorbed in vivo~~ released to the skin at the times specified, conform to ~~*Acceptance Table 4.*~~ *Acceptance Table 1.*

In-Process Revision

Time (hours)	Amount dissolved
24	between 2.4% and 26.4%
48	between 4.8% and 52.0%
96	between 10.0% and 85.0%

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 2.*

Medium: 0.005 M phosphate buffer, pH 5.5, containing 0.3% sodium lauryl sulfate; 500 mL.

Apparatus 5: 100 rpm. Use a 76-mm stainless steel disk assembly. Adhere the patch to the disk assembly using double-faced adhesive tape.

Times: 1, 4, 8, and 24 hours.

Determine the amount of estradiol ($C_{18}H_{24}O_2$) released by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (1 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Dissolve an accurately weighed amount of USP Estradiol RS in acetone, and dilute quantitatively, and stepwise if necessary, with acetone to obtain a solution having a known concentration of about 800 µm per mL.

Standard working solution—Dilute the *Standard stock solution* with *Medium* to obtain a solution having a known concentration close to that expected in the solution under test, assuming 100% drug release.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 205-nm detector and a 4.0-mm × 30-cm column that contains 4-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard working solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard working solution* and the solution under test into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of estradiol released at each time point by the following formulas:

$$M_i = \frac{R_U \times C_S \times V_i}{R_S}$$

$$m_1 = M_1$$

$$m_2 = M_2 + M_1 \frac{V_a}{V_1}$$

$$m_3 = M_3 + M_2 \frac{V_a}{V_2} + M_1 \frac{V_a}{V_1}$$

$$m_4 = M_4 + M_3 \frac{V_a}{V_3} + M_2 \frac{V_a}{V_2} + M_1 \frac{V_a}{V_1}$$

In-Process Revision

in which M_i is the amount, in mg, of estradiol released into the *Medium* at a given time interval; R_U is the peak response of estradiol in the sample solution, R_S is the peak response of estradiol in the *Working standard solution;* C_S is the concentration, in mg per mL, of estradiol in the *Standard working solution;* V_i is the corrected volume, in mL, of the *Medium* at a given time interval; m_i is the total amount, in mg, of estradiol released at a given time interval; m_1, m_2, m_3, and m_4 are the total amounts of estradiol, in mg, released from the patch at given time intervals; M_1, M_2, M_3, and M_4 are the amounts of estradiol, in mg, released into the *Medium* at given time intervals; V_a is the volume, in mL, of the aliquot taken from the dissolution vessel at each time point; and V_1, V_2, and V_3 are the volumes of the *Medium* at given time intervals.

Tolerances—The amounts of estradiol ($C_{18}H_{24}O_2$) released, as percentages of the labeled amount of the dose released to the skin, at the times specified conform to *Acceptance Table 1.*

Time (hours)	Amount released
1	between 15% and 40%
4	between 45% and 70%
8	between 70% and 90%
24	not less than 80%

Uniformity of dosage units ⟨905⟩**:** meets the requirements.

Alcohol content—

Diluent—Prepare a mixture of acetonitrile and water (1 : 1).

Internal standard solution—Pipet 4.0 mL of dehydrated methanol into a 100-mL volumetric flask. Dilute with water to volume, and mix.

Standard solution—Accurately weigh, by difference, about 1.6 mL of dehydrated alcohol into a tared 50-mL volumetric flask containing about 15 mL of water. Dilute with *Diluent* to volume, and mix. Pipet 10.0 mL of this solution into a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix. Pipet 25.0 mL of this solution into a 50-mL volumetric flask, add 5.0 mL of *Internal standard solution,* dilute with water to volume, and mix.

Test solutions—Prepare as directed for *Assay preparations,* with the following changes. Pipet 25.0 mL of each solution into individual 50-mL volumetric flasks. Add 5.0 mL of *Internal standard solution,* dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm × 2-m glass column that contains support S2. The carrier gas is helium, flowing at a rate of 30 mL per minute. The column temperature is 100°. The injection port temperature and the detector temperature are maintained at 200°. Chromatograph the *Standard solution,* and record the peak areas as directed for *Procedure:* the relative retention times are about 0.4 for the internal standard and about 1.0 for alcohol; and the relative standard deviation for replicate injections, determined from the ratios of alcohol peak areas to those of the internal standard, is not more than 1.5%.

Procedure—Separately inject equal volumes (about 2 µL) of the *Standard solution* and each of the *Test solutions* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the amount of alcohol, in mg, in each Transdermal System taken by the formula:

$$160C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of dehydrated alcohol in the *Standard solution;* and R_U and R_S are the ratios of the peak responses of alcohol to the internal standard obtained from the *Test solutions* and the *Standard so-*

In-Process Revision

lution, respectively. Calculate the average amount of alcohol in the *Test solution* taken: between 80% and 120% of the labeled amount of C_2H_5OH is found.

Assay—

Diluent—Prepare a mixture of acetonitrile and water (1 : 1).

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (55 : 45). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Estradiol RS in *Diluent.* Dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.1 mg per mL.

Assay preparations—Cut 10 Transdermal Systems into pieces, keeping the pieces from each system separate. Remove the protective liners, if any, from the strips, and discard. Transfer the pieces of each system into separate stoppered flasks of suitable size, and add an accurately measured volume of *Diluent* to each flask to obtain solutions having a concentration of about 0.1 mg of estradiol per mL. Shake by mechanical means for about 3 hours, and sonicate for 15 minutes.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The column temperature is maintained at 35°. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor is between 0.9 and 1.6; and the relative standard deviation for replicate injections is not more than 2.5%.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparations* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of estradiol ($C_{18}H_{24}O_2$) in each Transdermal System taken by the formula:

$$VC(r_U / r_S)$$

in which V is the volume, in mL, of *Diluent* used to prepare the *Assay preparation; C* is the concentration, in mg per mL, of USP Estradiol RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. Calculate the average quantity, in mg, of estradiol in each Transdermal System. Use the individual assays to determine the *Uniformity of dosage units.* ■2S *(USP29)*

BRIEFING

Ethinyl Estradiol Tablets, *USP 28* page 789 and page 402 of *PF* 31(2) [Mar.–Apr. 2005] . It is proposed to increase the limit of any unknown impurity to the approved value of 0.5% in the test for *Related compounds.*

Related compounds—

Solution A: acetonitrile and 20 mM potassium phosphate buffer, pH 6.0 (50 : 50).

Solution B: acetonitrile and 20 mM potassium phosphate buffer, pH 6.0 (80 : 20).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

In-Process Revision

Diluent—Prepare a mixture of acetonitrile and water (50 : 50).

Standard stock solution—Dissolve an accurately weighed quantity of USP Ethinyl Estradiol RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.3 mg per mL.

Standard solution—Quantitatively dilute portions of *Standard stock solution* with *Diluent* to obtain a solution containing about 0.12 µg per mL of USP Ethinyl Estradiol RS.

Test solution 1—Transfer 20 Tablets into a 200-mL volumetric flask. Add about 120 mL of *Diluent*, and shake for about 30 minutes. Dilute with *Diluent* to volume, and mix. Centrifuge a portion of the dissolution sample, and use the clear supernatant.

Test solution 2—Dilute a portion of *Test solution 1* with *Diluent* to obtain a solution containing about 0.6 µg per mL of ethinyl estradiol.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm UV detector and a spectrofluorometric detector with an excitation wavelength of 285 nm and an emission wavelength of 310 nm, a 4.6-mm × 15-cm column that contains packing L11, and a 4.6-mm × 12.5-mm guard column that contains packing L11. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution	Flow rate (mL per min.)
0–20	100	0	equilibration/ isocratic	2
20–25	100→0	0→100	linear gradient	2.5
25–30	0	100	isocratic	3
30–32	0→100	100→0	linear gradient	2
32–35	100	0	re-equilibration	2

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0 for ethinyl estradiol; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Inject a volume (about 200 µL) of *Test solution 2* into the chromatograph, record the chromatograms, and measure the peak heights for the major peaks obtained within 20 minutes. Calculate the percentage of 17β-ethinyl estradiol in the portion of Tablets taken by the formula:

$$100(r_U / r_S)$$

in which r_U is the height of any peak at the relative retention time of 1.16; and r_S is the peak height of ethinyl estradiol obtained with the spectrofluorometric detector. Inject a volume (about 200 µL) of *Test solution 1* into the chromatograph, record the chromatograms, and measure the peak heights for the major peaks obtained within 20 minutes. Calculate the percentage of estrone in the portion of Tablets taken by the formula:

$$100(r_U / r_S) - E$$

in which r_U is the height of any peak at the relative retention time of 1.2; r_S is the peak height of ethinyl estradiol obtained with the UV detector at 210 nm; and E is the percentage of 17β-ethinyl estradiol obtained in the Tablets. Calculate the percentage of any other impurity taken by the formula:

$$100(r_U / r_S)$$

in which r_U is the height of any peak other than those mentioned above; and r_S is the peak height of ethinyl estradiol obtained with the UV detector. Not more than 0.5% of 17β-ethinyl estradiol is found; not more than 0.5% of estrone is found; not more than ~~0.1%~~ ★~~0.3%~~▲*USP29* ■0.5%■2S *(USP29)* of any unknown impurity is found; and not more than 2.0% of total impurities is found.

BRIEFING

Etodolac Extended-Release Tablets, page 3225 of the *First Supplement* to *USP 28.* It is proposed to add a *Labeling* section, to change the *Drug release* section title to *Dissolution,* and to add *Dissolution Test 2* and *Test 3* to the monograph. In the absence of any significant adverse comments, it is proposed to implement this revision via the *Fifth Interim Revision Announcement* pertaining to *USP 28–NF 23,* with an official date of October 1, 2005.

(BPC: M. Marques) RTS—42027-1; 42515-1

Assay preparation—Dissolve an accurately weighed quantity of Fluticasone Propionate in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.04 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 239-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 40°. Chromatograph the *Resolution solution,* and record the peak areas as directed for *Procedure:* the relative retention times are about 1.10 for fluticasone propionate related compound D and 1.0 for fluticasone propionate; and the resolution, *R,* between fluticasone propionate and fluticasone propionate related compound D is not less than 1.5. Chromatograph the *Standard solution,* and record the peak areas as directed for *Procedure:* the relative standard deviation for replicate injections

■of the *Standard solution*■2S (*USP29*)
is not more than 2%.

In-Process Revision

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $C_{25}H_{31}F_3O_5S$ in the portion of Fluticasone Propionate taken by the formula:

$$CV(r_U / r_S),$$

in which C is the concentration of USP Fluticasone Propionate RS, in mg per mL, in the *Standard preparation;* V is the volume, in mL, of the *Assay preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Fluticasone Propionate Nasal Spray. Because there is no existing *USP* monograph for this dosage form, a new monograph is being proposed. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with the Spherisorb ODS1 brand of L1 column. The typical retention time for fluticasone propionate is about 13 minutes.

(AER: K. Zaidi) RTS—41571-1

Add the following:

■Fluticasone Propionate Nasal Spray

» Fluticasone Propionate Nasal Spray is a white opaque suspension of fluticasone propionate in water. It is supplied in a form suitable for nasal administration. It contains not less than 95 percent and not more than 115 percent of the labeled amount of fluticasone propionate ($C_{25}H_{31}F_3O_5S$).

Packaging and storage—Preserve in tight, light-resistant containers, and store between 4° and 30°.

USP Reference standards ⟨11⟩**—***USP Fluticasone Propionate RS. USP Fluticasone Propionate Related Compound D RS. USP Fluticasone Propionate Related Compound F RS. USP Phenylethyl Alcohol RS.*

Identification—

A: *Infrared Absorption* ⟨197M⟩—

Test specimen—Transfer about 30 g of Nasal Spray equally into two 50-mL centrifuge tubes. Add 10 mL of water to each tube, insert the stopper, and shake the tubes vigorously for 2 minutes. Centrifuge at 3500 rpm for 10 minutes, and discard the supernatant. Add 10 mL of water to each tube, insert the stopper, and shake the tubes vigorously for 2 minutes. Centrifuge at 3500 rpm for 10 minutes, and discard the supernatant. Add 10 mL of water to each tube, insert the stopper, and shake the tubes vigorously for 2 minutes. Centrifuge at 3500 rpm for 10 minutes, and discard the supernatant. To one tube add 10 mL of methanol. Shake to disperse the residue, and transfer to the other tube. Shake this for 1 minute. Centrifuge at 3500 rpm for 10 minutes. Decant the supernatant into an agate mortar. Evaporate the methanol either by carefully blowing dry with compressed air or nitrogen, or by allowing the methanol to evaporate naturally. If using an air or nitrogen line, use a suitable in-line filter to avoid contamination. Allow the residue to dry overnight in a desiccator over silica gel.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Microbial limits ⟨61⟩—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa.* The total aerobic microbial count does not exceed 100 cfu per g, and the total combined molds and yeasts count does not exceed 50 cfu per g.

pH ⟨791⟩**:** between 5.0 and 7.0.

Particle size—Remove the pump system after shaking the test bottle to ensure product uniformity. Transfer 1 drop of the Nasal Spray onto a clean microscope slide. Examine 10 random fields of view on the slide using 400 × magnification. Record the number of individual particles that are less than 5 µm in diameter: not less than 98% by number. Record the number of the individual particles that are greater than 5 µm in diameter but less than 15 µm in diameter: not more than 1.8% by number. Record the number of the individual particles that are greater than 15 µm in diameter: not more than 0.2% by number.

Foreign particulates—Shake the required number of bottles to ensure uniformity. Remove the pump system carefully to minimize contamination of the sample. Collect about 100 g of Nasal Spray, and pass it through a wetted 250-µm screen. Rinse each bottle with a portion of water equal to twice the volume of each bottle. Pass the rinse through the 250-µm screen. Visually observe the screen and filtrate for any foreign particulates. Also examine the screen under a microscope using transmitted light: free from any visible foreign particulates greater than 250 µm.

Delivered dose uniformity (within container)—

Diluent, 0.01 M Monobasic ammonium phosphate buffer, pH 3.5, Mobile phase, and *Chromatographic system*—Prepare as directed in the *Assay.*

Resolution solution—Dissolve an accurately weighed quantity of USP Fluticasone Propionate RS and USP Fluticasone Propionate Related Compound D RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 4 µg per mL of each.

Standard solution—Dissolve an accurately weighed quantity of USP Fluticasone Propionate RS in *Diluent* to obtain a solution having a known concentration of about 4 µg per mL.

Test solution—Wipe clean the pump, and record the weight of the bottle prior to actuation. Shake the bottle for 30 seconds, and mechanically prime the bottle. Hold a 25-mL volumetric flask in an inverted position, and discharge the first two actuations (1 dose) into the flask. Turn the flask to the upright position immediately after each actuation. Insert the stopper into the flask after the collection of two actuations. Weigh the bottle after sample collection. Discharge actuations 3 to 48 (50-spray pack) or 3 to 118 (120-spray pack) to waste. Wipe clean the bottle, and record the weight of the bottle. Collect the last two actuations (49 and 50 or 119 and 120) into a second 25-mL volumetric flask. Turn the flask to the upright position immediately after each actuation. Insert the stopper into the flask, and record the weight of the bottle. Add 20 mL of the *Diluent* to each flask, and shake well for 10 minutes to disperse the suspension. Dilute with *Diluent* to volume, and mix thoroughly. Allow the flask to stand until the excipients have settled. Transfer a portion of the clear supernatant to an HPLC vial and inject. Repeat this procedure with 4 additional bottles.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in µg, of $C_{25}H_{31}F_3O_5S$ per dose taken by the formula:

$$CV(r_U / r_S)$$

in which C is the concentration of USP Fluticasone Propionate RS, in µg per mL, in the *Standard solution; V* is the total volume of *Test solution,* in mL; and r_U and r_S are the peak responses obtained from the *Test solution* and the *Stan-*

In-Process Revision

dard solution, respectively. The mean dose delivered from 10 doses is within 85% to 115% of label claim. Not more than 1 dose is outside 80% to 120% of label claim. No doses are outside 75% to 125% of label claim. Test an additional 10 bottles if 2 or 3 doses are outside ±20% of label claim. The mean dose delivered from 30 doses should be within 85% to 115% of the label claim. Not more than 3 doses are outside 80% to 120% of label claim. No doses are outside 75% to 125% of label claim.

Delivered dose uniformity (within batch)—

Diluent, 0.01 M Monobasic ammonium phosphate buffer, pH 3.5, Mobile phase, and *Chromatographic system*—Prepare as directed in the *Assay.*

Resolution solution—Prepare as directed in the test for *Delivered dose uniformity* (within container).

Standard solution—Prepare as directed in the test for *Delivered dose uniformity* (within container).

Test solution—Wipe clean the pump, and record the weight of the bottle prior to actuation. Shake the bottle for 30 seconds, and mechanically prime the bottle. Hold a 25-mL volumetric flask in an inverted position, and discharge the first two actuations into the flask. Turn the flask to the upright position immediately after each actuation. Insert the stopper into the flask after the collection of two actuations (1 dose). Repeat this procedure with 9 additional bottles.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in µg, of $C_{25}H_{31}F_3O_5S$ per dose taken by the formula:

$$CV(r_U / r_S)$$

in which C is the concentration of USP Fluticasone Propionate RS, in µg per mL, in the *Standard solution; V* is the total volume of *Test solution,* in mL; and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively. The mean dose delivered from 10 doses is within 85% to 115% of label claim. Not more than 1 dose is outside 80% to 120% of label claim. No doses are outside 75% to 125% of label claim. Test an additional 20 bottles if 2 or 3 doses are outside ±20% of label claim. The mean dose delivered from the two actuations at the beginning of the 30 bottles (30 doses) is within 85% to 115% of the label claim. Not more than 3 doses are outside 80% to 120% of label claim. No doses are outside 75% to 125% of label claim.

Related compounds—

Solution A—Prepare a mixture of methanol and acetonitrile (77 : 23).

0.01 M Monobasic ammonium phosphate buffer—Dissolve 1.15 g of monobasic ammonium phosphate in 1000 mL of water, adjust with phosphoric acid to a pH of 3.4 ±0.1, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *Solution A* and *0.01 M Monobasic ammonium phosphate buffer* (60 : 40). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of acetonitrile and 0.001 M hydrochloric acid (60 : 40).

Control solution—Prepare a solution in a mixture of water and *Diluent* (1 : 4) containing about 0.5 mg per mL of USP Phenylethyl Alcohol RS and 0.08 mg per mL of benzalkonium chloride.

System suitability solution—Dissolve an accurately weighed quantity of USP Fluticasone Propionate RS, USP Fluticasone Related Compound D RS, USP Fluticasone Propionate Related Compound F RS, and USP Phenylethyl Alcohol RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a

known concentration of about 100 µg per mL, 1.0 µg per mL, 1.0 µg per mL, and 500 µg per mL of each Reference Standard, respectively.

Test solution—Transfer accurately about 1.0 g of the Nasal Spray to a 5-mL volumetric flask, dissolve in and dilute with *Diluent* to volume. Shake the flask vigorously to dissolve. Pass through a 0.5-µm porosity filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 239-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. The column is maintained at a temperature of 40°. Chromatograph the *System suitability solution,* and measure the peak responses as directed for *Procedure:* the resolution, *R,* between fluticasone propionate related compound F and phenylethyl alcohol is not less than 1.5; the resolution, *R,* between fluticasone propionate related compound D and fluticasone propionate is not less than 2; and the relative retention times and limits are as provided in *Table 1.*

Procedure—Separately inject a volume (about 50 µL) of the *System suitability solution* and the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Nasal Spray taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each impurity, and r_s is the sum of the responses of all the peaks, excluding the peaks obtained from the *Control solution.*

Table 1

Compound	Approximate Relative Retention Time	Limit (%)

In-Process Revision

Content of phenylethyl alcohol—

Diluent, Mobile phase, Resolution solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Dissolve an accurately weighed quantity of USP Phenylethyl Alcohol RS in *Diluent* to obtain a solution having a known concentration of about 50 µg per mL.

Test solution—Use the *Assay preparation.*

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg per g, of phenylethyl alcohol in the portion of Nasal Spray taken by the formula:

$$50(C/W_U)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of the USP Phenylethyl Alcohol RS in the *Standard solution;* W_U is the weight, in g, of the Nasal Spray taken to prepare the *Test solution;* and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively. For 50 sprays: not less than 1.75 mg per g and not more than 2.63 mg per g. For 120 sprays: not less than 1.88 mg per g and not more than 2.63 mg per g.

Content of benzalkonium chloride—

Citric acid buffer solution—Dissolve 50 g of citric acid in 200 mL of water. Adjust the solution with 2 N sodium hydroxide to a pH of 3.5 ± 0.05.

Docusate sodium titrant—Dissolve 0.22 g of docusate sodium in 100 mL of warm water, and dilute with water to make 1000 mL.

Eosin Y indicator—Dissolve about 25 mg of eosin Y in 50 mL of acetone. Add 450 mL of chloroform and 5.0 ± 0.5 g of citric acid. Shake thoroughly until no discoloration occurs. Filter the mixture to remove any undissolved citric acid. Store in an amber bottle.

Benzalkonium chloride standard stock solution—Use 50% (w/v) solution of benzalkonium chloride.[1]

Benzalkonium chloride standard solution—Transfer accurately about 0.4 g of *Benzalkonium chloride standard stock solution* to a 1000-mL volumetric flask. Dilute with water to volume, and mix. Sonicate for 5 minutes to dissolve.

Procedure—Pipet 10 mL of *Benzalkonium chloride standard solution* into a 250-mL glass stoppered flask containing 40 mL of water, 5 mL of *Eosin Y indicator,* and 2 mL of *Citric acid buffer solution.* Insert the stopper into the flask, and shake the mixture, releasing any build-up of pressure. Titrate with *Docusate sodium titrant* with vigorous shaking to a point when pink coloration is discharged from the chloroform layer. Perform a blank determination, substituting 10 mL of water for the *Benzalkonium chloride standard solution*, and make any necessary correction (see *Titrimetry* ⟨541⟩). Calculate the titer value of the *Docusate sodium titrant,* in µg of benzalkonium chloride per mL of *Docusate sodium titrant,* by the formula:

$$W_B/V_D$$

in which W_B is the weight, in µg, of benzalkonium chloride titrated; and V_D is the volume, in mL, of *Docusate sodium titrant.* Transfer accurately about 10 g of Nasal Spray into a 250-mL glass stoppered flask containing 40 mL of water, 5 mL of *Eosin Y indicator,* and 2 mL of *Citric acid buffer solution.* Repeat the procedure as given above for *Benzalkoni-*

[1] A suitable grade is available from Merck, Germany (www.merck.com).

um chloride standard solution. To clarify the endpoint, place the flask in an ultrasonic bath for 1 to 2 minutes to separate the chloroform layer from the aqueous phase. Perform a blank determination. Calculate the concentration of benzalkonium chloride, in µg per g, in the portion of Nasal Spray taken by the formula:

$$TV/W$$

in which T is the titer value of *Docusate sodium titrant; V* is the volume, in mL, of the *Docusate sodium titrant* used in the titration of the Nasal Spray; and W is the weight, in g, of the portion of Nasal Spray taken: not less than 160 µg per g and not more than 210 µg per g.

Assay—

Diluent—Prepare a mixture of acetonitrile and 0.001 M hydrochloric acid (60 : 40).

0.01 M Monobasic ammonium phosphate buffer, pH 3.5—Dissolve 1.15 g of monobasic ammonium phosphate in 1000 mL of water, adjust with phosphoric acid to a pH of 3.5 ± 0.05, and mix.

Mobile phase—Prepare a filtered and degassed mixture of methanol, *0.01 M Monobasic ammonium phosphate buffer, pH 3.5,* and acetonitrile (50 : 35 : 15). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—Dissolve accurately weighed quantities of USP Phenylethyl Alcohol RS, USP Fluticasone Propionate RS, and USP Fluticasone Propionate Related Compound D RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having known concentrations of about 50 µg per mL, 10 µg per mL, and 1 µg per mL, respectively.

Standard preparation—Dissolve an accurately weighed quantity of the USP Fluticasone Propionate RS in *Diluent* to obtain a solution having a known concentration of about 10 µg per mL.

Assay preparation—Transfer accurately about 1.0 g of the Nasal Spray to a 50-mL volumetric flask, add about 40 mL of *Diluent,* and sonicate the flask for 10 minutes. Dilute with *Diluent* to volume, and shake. Allow to stand for about 10 minutes until the supernatant is a clear solution. Inject the clear supernatant into the chromatograph.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 4.6-mm × 25-cm column that contains 5-µm packing L1, and a programmable variable wavelength detector capable of monitoring at 210 nm and 239 nm. The flow rate is about 1.5 mL per minute. The column is maintained at a temperature of 40°. Chromatograph the *Resolution solution* and the *Standard preparation,* record the peak areas at 210 nm for 5 minutes, and then change the wavelength to 239 nm and record the peak areas: the relative retention times are about 0.42 for phenylethyl alcohol, 1.0 for fluticasone propionate, and 1.10 for fluticasone propionate related compound D; the resolution, R, between fluticasone propionate and fluticasone propionate related compound D is not less than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of fluticasone propionate ($C_{25}H_{31}F_3O_5S$) in the portion of Nasal Spray taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration of USP Fluticasone Propionate RS, in mg per mL, in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S *(USP29)*

BRIEFING

Glycopyrrolate Tablets, *USP 28* page 914 and page 105 of *PF* 30(1) [Jan.–Feb. 2004]. It is proposed to add a clarification to the *Identification* test.

(PA4: E. Gonikberg) RTS—42524-1

Change to read:

Identification—Blend a portion of finely powdered Tablets, equivalent to about 25 mg of glycopyrrolate, with 50 mL of water in a high-speed blender, and filter through very retentive filter paper

■or other suitable filter, to obtain a clear filtrate:■2S *(USP29)* the UV absorption spectrum of the filtrate exhibits maxima and minima at the same wavelengths as that of a solution of USP Glycopyrrolate RS (1 in 2000).

Dissolution ~~*Procedure for a Pooled Sample*~~

▲▲*USP29*
⟨711⟩—
Medium: water; 500 mL.
Apparatus 1: 100 rpm.
Time: 45 minutes.
Procedure—

▲Proceed as directed for *Procedure for Capsules, Uncoated Tablets, and Plain Coated Tablets* under *Dissolution* ⟨711⟩. Combine equal volumes of the filtered solutions of the 6 or 12 individual specimens withdrawn, and use the pooled sample as the test solution.▲*USP29*
Determine the amount of $C_{19}H_{28}BrNO_3$ dissolved, employing the procedure set forth in the *Assay,* making any necessary modifications.

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{19}H_{28}BrNO_3$ is dissolved in 45 minutes:

▲the requirements are met if the quantities of active ingredient dissolved from the pooled sample conform to the accompanying *Acceptance Table for a Pooled Sample.* Continue testing through the three stages unless the results conform at either S_1 or S_2. The quantity, Q, is the amount of dissolved active ingredient, expressed as a percentage of the labeled content.

Acceptance Table for a Pooled Sample

Stage	Number Tested	Acceptance Criteria
S_1	6	Average amount dissolved is not less than Q + 10%.
S_2	6	Average amount dissolved (S_1 + S_2) is equal to or greater than Q + 5%.
S_3	12	Average amount dissolved (S_1 + S_2 + S_3) is equal to or greater than Q.

Packaging and storage~~— Preserve in cylinders.~~

■Preserve in brown cylinders. Containers and connections are to be specific to the application and must be controlled in such a fashion that there are sufficient change controls to prevent the connection of the incorrect gas to the system (such as those suggested in CGA Standard CGA V-1-2003).■2S (*USP29*)

NOTE—Reduce the container pressure by means of a regulator. Measure the gases with a gas volume meter downstream from the detector tube in order to minimize contamination or change of the specimens.

BRIEFING

Hyoscyamine Sulfate, *USP 28* page 986. It is proposed to make the following changes:

1. Replace the current tests for *Melting temperature, Other alkaloids,* and *Readily carbonizable substances* with a more specific test for *Chromatographic purity*. The *Melting temperature* information is being placed under *Description and Solubility.*
2. Replace the current *Identification* test *B* with the HPLC retention time agreement of the major peak in the chromatograms of the *Test solution* and the *Standard solution*.
3. Replace the nonselective test for *Loss on drying* with the selective *Water* determination by Karl Fischer titration.
4. Change the limits in the test for *Residue on ignition* from 0.2% to 0.1%, to reflect the quality of currently marketed material.
5. Change the weight of the sample under the *Assay* from 1.0 g to 0.5 g.

The stability-indicating liquid chromatographic procedure in the test for *Chromatographic purity* is based on analyses performed with the Aquasil C18 brand of L1 column. The typical retention time for hyoscyamine is about 9.8 minutes.

In-Process Revision

Add the following:

■**Chromatographic purity**—

Buffer solution—Dissolve 7.0 g of monobasic potassium phosphate in 1000 mL of water, adjust with 0.05 M phosphoric acid to a pH of 3.3, and mix.

Solution A—Dissolve 3.5 g of sodium dodecyl sulfate in 606 mL of *Buffer solution,* add 320 mL of acetonitrile, and mix.

Solution B—Use acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Dissolve an accurately weighed quantity of USP Hyoscyamine Sulfate RS in *Solution A* to obtain a solution having a known concentration of about 1.2 mg of hyoscyamine sulfate per mL.

Standard solution—Dilute a portion of the *Standard stock solution* with *Solution A* to obtain a solution having a known concentration of about 0.24 mg of hyoscyamine sulfate per mL.

Diluted standard solution—Dilute the *Standard solution* with *Solution A* to obtain a solution having a known concentration of about 0.24 µg of hyoscyamine sulfate per mL.

System suitability solution—Prepare a solution of USP Hyoscyamine Related Compound A RS in *Solution A* having a concentration of about 2.4 µg per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, add 10 mL of the *Standard stock solution,* and dilute with *Solution A* to volume.

Test solution—Transfer about 60 mg of Hyoscyamine Sulfate, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Solution A* to volume, and mix. Transfer 10 mL of this solution to a 50-mL volumetric flask, and dilute with *Solution A* to volume. This solution contains about 0.24 mg of hyoscyamine sulfate per mL.

Chromatographic system (see *Chromatography* ⟨621⟩—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 10-cm column that contains 3-µm packing L1. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows:

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–2	95	5	isocratic
2–20	95→70	5→30	linear gradient
20–20.1	70→95	30→5	linear gradient
20.1–25	95	5	re-equilibration

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 1.0%. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure*: the resolution between hyoscyamine related compound A and hyoscyamine peaks is greater than 2.0.

Procedure—Separately inject equal volumes (about 10 µL) of the *Diluted standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses of the major peaks. Calculate the percentage of each impurity in the portion of Hyoscyamine sulfate taken by the formula:

$$0.1(C_S / C_T)\ (r_i / r_S)$$

in which C_S is the concentration, in µg per mL, of hyoscyamine sulfate in the *Diluted standard solution;* C_T is the con-

centration, in mg per mL, of hyoscyamine sulfate in the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the hyoscyamine peak response obtained from the *Diluted standard solution*. In addition to not exceeding the limits for each impurity in *Table 1,* not more than 0.1% of any other individual impurity is found; and not more than 0.5% of total impurities is found.

Table 1

Name	Relative Retention Time	Limit (%)
DL-Tropic acid	0.2	0.2
7-Hydroxyhyoscyamine	0.67	0.2
6-Hydroxyhyoscyamine	0.72	0.2
Scopolamine	0.8	0.2
Norhyoscyamine (Hyoscyamine related compound A)	0.9	0.3
Apoatropine	1.1	0.2
Littorine	1.8	0.2

■2S (*USP29*)

Change to read:

Assay—Dissolve about ~~1 g~~ ■0.5 g■2S (*USP29*) of Hyoscyamine Sulfate, accurately weighed, in 50 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 67.68 mg of $(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4$.

BRIEFING

Irbesartan Tablets, page 1035 of *PF* 29(4) [July–Aug. 2003]. It is proposed to make modifications in the *Dissolution* test so that the test will be in accordance with the dissolution conditions approved by FDA.

(BPC: M. Marques) RTS—40548-10; 41088-1

Add the following:

■Irbesartan Tablets

» Irbesartan Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of irbesartan ($C_{25}H_{28}N_6O$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards ⟨11⟩—*USP Irbesartan RS.*

Identification—The relative retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: ~~0.01 N hydrochloric acid~~ 0.1 N hydrochloric acid; ~~900 mL~~ 1000 mL.

Apparatus 2: 50 rpm.

Time: ~~45 minutes~~ 20 minutes.

Procedure—Determine the amount of $C_{25}H_{28}N_6O$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about ~~254 nm~~ 244 nm on ~~filtered portions of the solution under test,~~ portions of the solution

In-Process Revision

under test passed through a 0.45-µm filter of acrylic copolymer on a nylon support,[1] suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Irbesartan RS in the same *Medium*. Calculate the amount of $C_{25}H_{28}N_6O$ dissolved, in percentage, by the formula:

$$\frac{A_U \times C_S \times 1000 \times 100}{A_S \times L}$$

in which A_U and A_S are the absorbances obtained from the solution under test and the Standard solution, respectively; C_S is the concentration, in mg per mL, of the concentration of the Standard solution; 1000 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and L is the label claim, in mg, of irbesartan.

Tolerances—Not less than ~~75%~~ 80% *(Q)* of the labeled amount of $C_{25}H_{28}N_6O$ is dissolved in ~~45 minutes~~ 20 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Chromatographic purity—

Diluent, Triethylamine solution, Mobile phase, Standard preparation, and *Chromatographic system*—Proceed as directed in the *Assay.* ~~under *Irbesartan.*~~

Test solution—Use the *Assay preparation.*

Procedure—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each impurity; and r_s is the sum of the responses of all the peaks: not more than 1.0% of any individual impurity is found, and not more than 2.0% of total impurities is found.

umn efficiency is not less than 1000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, and record the responses for the major peaks. Calculate the quantity, in mg, of irbesartan ($C_{25}H_{28}N_6O$) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Irbesartan RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP29*)

BRIEFING

Isosorbide Mononitrate Extended-Release Tablets, page 871 of *PF* 30(3) [May–June 2004]. It is proposed to add a *Dissolution* test to this new monograph. The liquid chromatographic procedures in the *Dissolution* test were validated using a Zorbax ODS brand of L1 packing. The retention time of isosorbide is about 5.5 minutes.

(BPC: M. Marques) RTS—42534-1

Add the following:

■Isosorbide Mononitrate Extended-Release Tablets

» Isosorbide Mononitrate Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of isosorbide mononitrate ($C_6H_9NO_6$).

Packaging and storage—Preserve in tight containers. Store at a temperature between 20° and 30°.

Labeling—[To come.]

USP Reference standards ⟨11⟩**—***USP Diluted Isosorbide Dinitrate RS. USP Isosorbide RS. USP Isosorbide Mononitrate RS. USP Isosorbide Mononitrate Related Compound A RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—Proceed as directed for *Identification* test *A* under *Isosorbide Mononitrate Tablets.*

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

~~**Drug release** ⟨724⟩ —[To come.]~~

Dissolution ⟨711⟩—

Medium: water; 900 mL.

Apparatus 2: 50 rpm. The Tablets are placed in a metal helix, prepared by winding 10 inches of a 0.8-mm stainless steel wire around a 9/32-inch shaft and pulling the coils to form a helix 1 inch long.

Times: 1, 2, 4, 8, and 12 hours.

In-Process Revision

Determine the amount of isosorbide mononitrate dissolved by employing the following method.

Standard solution—Dissolve an accurately weighed quantity of USP Isosorbide Mononitrate RS in *Medium*, and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration of about 0.06 mg per mL.

Test solution—Use portions of the solution under test passed through a 0.45-µm nylon filter, discarding the first 4 to 6 mL of the filtrate.

Mobile phase—Prepare a filtered and degassed mixture of water and methanol (7 : 3). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution,* and record the chromatogram as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Determine the amount, in mg, of isosorbide mononitrate dissolved *(AD)* at each interval by the formula:

$$\frac{r_U \times C_S \times V}{r_S}$$

in which r_U and r_S are the peak responses for the *Test solution* and *Standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Standard solution;* and V is the volume, in mL, of *Medium* in the vessel at each time point.

Calculate the amount, in mg, of isosorbide mononitrate removed *(AR)* by sampling at the previous time points by the formula:

$$\sum AD \times \frac{V_S}{V}$$

in which AD is the amount, in mg, of isosorbide mononitrate dissolved at each time point; V_S is the volume, in mL, of the sample taken; and V is the volume, in mL, of *Medium* in the vessel at each time point.

Calculate the percentage of isosorbide mononitrate dissolved at each time point by the formula:

$$\frac{(AD + AR) \times 100}{LC}$$

in which AD is the amount, in mg, of isosorbide mononitrate dissolved at a given time point; AR is the amount, in mg, of isosorbide mononitrate removed at the previous time point; 100 is the conversion factor to percentage; and LC is the Tablet label claim in mg.

Tolerances—The percentages of the labeled amount of isosorbide mononitrate dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 12% and 32%
2	between 23% and 43%
4	between 39% and 59%
8	between 65% and 85%
12	not less than 80%

Uniformity of dosage units ⟨905⟩**:** meet the requirements for *Content Uniformity.* Proceed as directed in the *Assay,* except to use 1 Tablet in place of the portion of powdered Tablets used in the *Assay preparation.*

~~**Water,** *Method I* ⟨921⟩**:** not more than 5.0%.~~

~~*Test solution*—Weigh and finely powder 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to one Tablet, accurately weighed, to a suitable container. Add 5.0 mL of methanol, shake for 45 minutes, and then centrifuge at about 4000 rpm for 10 minutes. Use 0.25 mL of the resulting supernatant, correcting for the blank.~~

Related compounds—

TEST 1—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Standard solution 1—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 0.0125 mg of isosorbide per mL.

Standard solution 2—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 0.025 mg of isosorbide per mL.

Standard solution 3—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 0.05 mg of isosorbide per mL.

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of isosorbide mononitrate, to a suitable flask containing 20.0 mL of acetonitrile. Sonicate for 10 minutes, and then centrifuge. Use the supernatant.

Application volume: 20 µL.

Developing solvent system: a mixture of toluene, ethyl acetate, and isopropyl alcohol (53 : 32 : 15).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. After developing, dry the plate with warm air for about 10 minutes, dip the plate in a solution prepared by dissolving 1.25 g of potassium permanganate and 10.0 g of sodium hydroxide in 500 mL of water (prepared fresh for each plate), and heat at 105° for 5 minutes. Any spot in the chromatogram obtained from the *Test solution* and corresponding to the R_F value of the spots obtained from the *Standard solutions* is not more intense than the spot in the chromatogram obtained from *Standard solution 3:* not more than 1% of any individual impurity is found. [NOTE—The R_F values of isosorbide and isosorbide mononitrate are about 0.2 and 0.6, respectively.] If the spot in the chromatogram obtained from the *Test solution* is nearly as intense as the spot obtained from *Standard solution 3,* further dilute the *Test solution* (1 : 1) with acetonitrile, repeat the test, and compare the intensity of the isosorbide spot in the diluted *Test solution* with the intensity of the spots obtained from the *Standard solutions,* correcting the percent level for the additional dilution of the *Test solution.*

TEST 2—

Mobile phase—Prepare a filtered and degassed mixture of water and methanol (75 : 25). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Isosorbide mononitrate related compound A standard stock solution—Dissolve an accurately weighed quantity of USP Isosorbide Mononitrate Related Compound A RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.3 mg per mL.

In-Process Revision

Isosorbide dinitrate standard stock solution—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Dinitrate RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.15 mg of isosorbide dinitrate per mL.

Standard stock solution—Transfer 2.0 mL of *Isosorbide mononitrate related compound A standard stock solution* and 4.0 mL of *Isosorbide dinitrate standard stock solution* to a 100-mL volumetric flask. Dilute with water to volume, and mix.

~~*Standard*~~ *Resolution solution*—Transfer about 24 mg of USP Isosorbide Mononitrate RS, accurately weighed, to a 100-mL volumetric flask, add 10.0 mL of *Standard stock solution,* add 20 mL of methanol, and dilute with water to volume.

~~*Resolution*~~ *Standard solution*—Transfer 10.0 mL of *Standard stock solution* and 20 mL of methanol to a 100-mL volumetric flask. Dilute with water to volume, and mix.

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 60 mg of isosorbide mononitrate, to a 50-mL volumetric flask, add 40 mL of methanol, and sonicate for about 30 minutes with cooling. Warm to ambient temperature, dilute with methanol to volume, and mix. Centrifuge at about 3000 rpm for 10 minutes. Quantitatively dilute the supernatant (10 in 50) with water. Pass a portion of this solution through a filter having a 0.45-µm or finer porosity, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the isosorbide mononitrate related compound A and the isosorbide mononitrate is not less than 1.0. [NOTE—The relative retention times are about 0.9 for isosorbide mononitrate related compound A, 1.0 for isosorbide mononitrate, and 5.6 for isosorbide dinitrate.] Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 10% for the isosorbide mononitrate related compound A and isosorbide dinitrate peaks.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of isosorbide mononitrate related compound A and isosorbide dinitrate in the portion of Tablets taken by the formula:

$$25(C/W)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of the appropriate Standard, USP Isosorbide Mononitrate Related Compound A RS or USP Diluted Isosorbide Dinitrate RS, in the *Standard solution; W* is the weight, in mg, of isosorbide mononitrate in the sample used to prepare the *Test solution;* and r_U and r_S are the peak areas of the corresponding component obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.25% of isosorbide mononitrate related compound A is found; and not more than 0.25% of isosorbide dinitrate is found. Calculate the percentage of each other impurity (other than isosorbide

In-Process Revision

mononitrate related compound A or isosorbide dinitrate) in the portion of Tablets taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak area for each other impurity obtained from the *Test solution;* and r_s is the sum of the areas of all the peaks: not more than 0.25% of total other impurities is found and not more than 0.5% of total impurities is found, including isosorbide mononitrate related compound A and isosorbide dinitrate.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water and methanol (8 : 2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Isosorbide mononitrate related compound A standard preparation—Dissolve an accurately weighed quantity of USP Isosorbide Mononitrate Related Compound A RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.15 mg per mL.

Resolution solution—Transfer a quantity of USP Isosorbide Mononitrate RS, accurately weighed, equivalent to about 30 mg of isosorbide mononitrate, to a 250-mL volumetric flask. Dissolve in water, add 10.0 mL of *Isosorbide mononitrate related compound A standard preparation,* add 50 mL of methanol, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a concentration of about 0.12 mg of isosorbide mononitrate per mL and about 0.006 mg of isosorbide mononitrate related compound A per mL.

Standard preparation—Transfer a quantity of USP Isosorbide Mononitrate RS, accurately weighed, to a suitable volumetric flask. Dissolve in water, add a portion of methanol equivalent to about 20% of the flask volume, and dilute with water to volume to obtain a solution having a known concentration of about 0.12 mg of isosorbide mononitrate per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 60 mg of isosorbide mononitrate, to a 100-mL volumetric flask, add 50 mL of methanol, and sonicate for about 30 minutes with cooling. Warm to ambient temperature, dilute with methanol to volume, and mix. Centrifuge at about 3000 rpm for 10 minutes. Quantitatively dilute the supernatant (10 in 50) with water. Pass a portion of this solution through a filter having a 0.45-µm or finer porosity, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4-mm × 12.5-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between isosorbide mononitrate related compound A and isosorbide mononitrate is not less than 1.5. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about ~~50 µL)~~ 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of isosorbide mononitrate ($C_6H_9NO_6$) in the portion of Tablets taken by the formula:

$$500C(r_U / r_S)$$

In-Process Revision

in which C is the concentration, in mg per mL, of isosorbide mononitrate in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP29*)

BRIEFING

Lidocaine and Prilocaine Cream. Because there is no existing *USP* monograph for this dosage form, a new monograph is proposed. The proposed liquid chromatographic procedures for *Related compounds* and the *Assay* are based on a Luna C18 brand of L1 column. The retention times for prilocaine and lidocaine are approximately 10 minutes and 20 minutes, respectively.

(PA1: K. Russo; AMB: R. Tirumalai; NL: L. Paul; PSD: C. Okeke) RTS—42219-1; 42219-2

Add the following:

■Lidocaine and Prilocaine Cream

» Lidocaine and Prilocaine Cream contains not less than 95.0 percent and not more than 105.0 percent of the labeled amounts of lidocaine ($C_{14}H_{22}N_2O$) and prilocaine ($C_{13}H_{20}N_2O$).

Packaging and storage—Preserve in collapsible tubes or in tight containers. Store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Lidocaine RS. USP Prilocaine Hydrochloride RS. USP Prilocaine Related Compound B RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Microbial limits ⟨61⟩**—**It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa.* The total aerobic microbial count does not exceed 100 cfu per g, and the total combined molds and yeasts count does not exceed 50 cfu per g.

Minimum fill ⟨755⟩**:** meets the requirements.

pH ⟨791⟩**:** between 9.3 and 9.9, in a solution (1 in 10).

Related compounds—

Solution A, Solution B, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Dissolve accurately weighed quantities of USP Lidocaine RS and USP Prilocaine Hydrochloride RS in *Solution A,* and dilute quantitatively, and stepwise if necessary, with *Solution A* to obtain a solution having a known concentration of about 0.002 mg per mL of each compound. Immediately store this solution at or below 10°.

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay.*

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay.* Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are listed in *Table 1;* and the resolution, *R,* between prilocaine and prilocaine related compound B is not less than 1.4. Chromatograph the *Standard solution* a minimum of six times, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the

peak responses. Calculate the percentage of each related compound in the portion of the Cream taken by the formula:

$$100C(r_U / r_S)(V / W)(100/L)(1/F)(220.31/256.77)$$

in which C is the individual concentration, in mg per mL, of either USP Lidocaine RS or USP Prilocaine Hydrochloride RS in the *Standard solution;* r_U and r_S are the individual peak responses for either lidocaine or prilocaine obtained from the *Test solution* and the *Standard solution,* respectively; V is the volume, in mL, of the *Test solution;* W is the weight, in mg, of the Cream taken to prepare the *Test solution;* L is the individual label claim, in percent, for lidocaine and prilocaine; F is the relative response factor for each related compound as listed in *Table 1;* and 220.31 and 256.77 are the molecular weights of prilocaine and prilocaine hydrochloride, respectively (these are used only for calculation involving prilocaine related compounds). The percentages of lidocaine related compounds and prilocaine related compounds are calculated using the concentration and peak response from USP Lidocaine RS and USP Prilocaine Hydrochloride RS, respectively. The designation of whether an impurity is a lidocaine related compound or prilocaine related compound is specified in *Table 1*. The percent of any individual unknown related compound is determined using the concentration and peak response from USP Prilocaine Hydrochloride RS in the *Standard solution*.

Table 1

Related Compound	Relative Retention Time[1]	Relative Response Factor (*F*)	Limit
o-Toluidine	0.38	0.44 (P)[2]	not more than 0.1%

Total related compounds	—	—	not more than 1.0%

[1] relative to the prilocaine peak
[2] P designates a prilocaine related compound
[3] L designates a lidocaine related compound

Assay—

Solution A—Dissolve about 2.73 g of monobasic potassium phosphate in 630 mL of water, and adjust with 5 N sodium hydroxide to a pH of 7.20 ± 0.02. Dilute with acetonitrile to 1 L.

Solution B—Dissolve about 2.73 g of monobasic potassium phosphate in 900 mL of water, and adjust with 5 N sodium hydroxide to a pH of 7.20 ± 0.02. Dilute with acetonitrile to 1 L.

Mobile phase—Use variable mixtures of filtered and degassed *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve accurately weighed quantities of USP Lidocaine RS and USP Prilocaine Hydrochloride RS in *Solution A*, and dilute quantitatively, and stepwise if necessary, with *Solution A* to obtain a solution having a known concentration of about 0.2 mg per mL of each compound. Immediately store this solution at or below 10°.

System suitability solution—Dissolve an accurately weighed quantity of USP Prilocaine Related Compound B RS in the *Standard preparation,* and dilute quantitatively, and stepwise if necessary, with the *Standard preparation,* to obtain a solution having a known concentration of about 0.08 mg per mL of prilocaine related compound B.

Assay preparation—Transfer a portion of the Cream, equivalent to about 20 mg each of lidocaine and prilocaine, accurately weighed, to a 100-mL volumetric flask. Add 5 mL of 5 N sodium hydroxide to disperse the Cream, and mix. Add 5 mL of 5 N hydrochloric acid, and dilute with *Solution A* to volume, and mix. Pass a portion through a nylon filter having a 0.2-µm porosity or finer, discarding the first 1 mL, and use the filtrate. Immediately store this solution at or below 10°.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 232-nm detector and a 4.6-mm × 10-cm column that contains 3-µm packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 40°. The samples are maintained at or below 10°. The chromatograph is programmed as follows:

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	67	33	equilibration
0–11.0	67	33	isocratic
11.0–22.0	67→100	33→0	linear gradient
22.0–32.0	100	0	isocratic

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are listed in the table; and the resolution, *R,* between prilocaine and prilocaine related compound B is not less than 1.4. Chromatograph the *Standard preparation* a minimum of five times, and record the peak responses as directed for *Procedure:* the column efficiency is not less than 5000 theoretical plates, based on the prilocaine peak; the tailing factor is not more than 1.5, based on the prilocaine peak; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the lidocaine and prilocaine

peaks. Calculate the percent of label claim of lidocaine ($C_{14}H_{22}N_2O$) and prilocaine ($C_{13}H_{20}N_2O$) in the portion of Cream taken by the formula:

$$100C(r_U / r_S)(V/W)(100/L)(220.31/256.77)$$

in which C is the individual concentration, in mg per mL, of either USP Lidocaine RS or USP Prilocaine Hydrochloride RS in the *Standard preparation;* r_U and r_S are either the individual peak responses of lidocaine or prilocaine obtained from the *Assay preparation* and the *Standard preparation,* respectively; V is the volume, in mL, of the *Assay preparation;* W is the weight, in mg, of the Cream taken to prepare the *Assay preparation;* L is the individual label claim, in percent, for either lidocaine or prilocaine; and 220.31 and 256.77 are the molecular weights of prilocaine and prilocaine hydrochloride, respectivley (these are used only for calculating the percent of prilocaine in the Cream).■2S (*USP29*)

BRIEFING

Lisinopril Tablets, *USP 28* page 1140 and page 121 of *PF* 30(1) [Jan.–Feb. 2004]. It is proposed to add the option of carrying out the *Dissolution* test in unit samples.

(BPC: M. Marques) RTS—41893-2

Dissolution ~~*Procedure for a Pooled Sample*~~

■■2S (*USP29*)
⟨711⟩—
Medium: 0.1 N hydrochloric acid; 900 mL.
Apparatus 2: 50 rpm.
Time: 30 minutes.
Determine the amount of lisinopril dissolved using the following method.
Mobile phase and *Chromatographic system*—Prepare as directed in the *Assay.*
~~*Procedure*~~

■PROCEDURE FOR POOLED SAMPLE—■2S (*USP29*)

■Proceed as directed for *Procedure* in *Apparatus 1 and Apparatus 2, Immediate-Release Dosage Forms* under *Dissolution* ⟨711⟩. Combine equal volumes of the filtered solutions of the 6 or 12 individual specimens withdrawn, and use the pooled sample as the test solution.■2S (*USP29*) Inject a volume of ~~a filtered portion of the solution under test~~ ■the pooled sample■2S (*USP29*) into the chromatograph, record the chromatogram, and measure the response for the major peak. Calculate the quantity of $C_{21}H_{31}N_3O_5$ dissolved in comparison with a Standard solution having a known concentration of USP Lisinopril RS in the same medium and similarly chromatographed.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{21}H_{31}N_3O_5$ in the Tablets is dissolved in 30 minutes:

■the requirements are met if the quantities of active ingredient dissolved from the pooled sample conform to the accompanying *Acceptance Table for a Pooled Sample*. Continue testing through the three stages unless the results conform at either S_1 or S_2. The quantity, Q, is the amount of dissolved active ingredient specified, expressed as a percentage of the labeled content.

Acceptance Table for a Pooled Sample

Stage	Number Tested	Acceptance Criteria
S_1	6	Average amount dissolved is not less than Q + 10%.
S_2	6	Average amount dissolved (S_1 + S_2) is equal to or greater than Q + 5%.
S_3	12	Average amount dissolved (S_1 + S_2 + S_3) is equal to or greater than Q.

PROCEDURE FOR UNIT SAMPLE—Proceed as directed for *Procedure* in *Apparatus 1 and Apparatus 2, Immediate-Release Dosage Forms* under *Dissolution* ⟨711⟩. Inject a volume of a filtered portion of the solution under test into the chromatograph, record the chromatogram, and measure the

response for the major peak. Calculate the amount of $C_{21}H_{31}N_3O_5$ dissolved in comparison with a Standard solution having a known concentration of USP Lisinopril RS in the *Medium* and similarly chromatographed.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{21}H_{31}N_3O_5$ is dissolved in 30 minutes.■2S (*USP29*)

BRIEFING

Magnesium Oxide, *USP 28* page 1172 and page 1047 of *PF* 29(4) [July–Aug. 2003]. Comments were received that the proposed density specifications, as well as the differentiation between Light and Heavy Magnesium Oxide, are of historic importance only and do not represent the pharmaceutical grade material available on the market. It is proposed to delete the density specifications from the test for *Bulk density.* The *Labeling* section is revised to delete the references to the Light and Heavy Magnesium Oxide and to indicate the bulk density of the material.

(PA4: E. Gonikberg) RTS—41017-1

Change to read:

Labeling—~~Label it to indicate whether it is Light Magnesium Oxide or Heavy Magnesium Oxide.~~

■Label it to indicate its bulk density. The indicated density may be in the form of a range.■2S (*USP29*)

Add the following:

■**Bulk density,** *Method I* ⟨616⟩—Using the procedure specified in the chapter, determine ~~the volume occupied by 25.0 g of Magnesium Oxide: the volume is approximately 200 to 250 mL for Light Magnesium Oxide, and is approximately 50 to 100 mL for Heavy Magnesium Oxide~~ the bulk density of Magnesium Oxide.■2S (*USP29*)

BRIEFING

Mefloquine Hydrochloride, page 3253 of the *First Supplement* and page 422 of *PF* 31(2) [Mar.–Apr. 2005]. An editorial change is proposed in the test for *Related compounds* to clarify the preparation of the *Mobile phase.*

(PA7b: B. Davani) RTS—42631-1

Change to read:

Related compounds—

Mobile phase—Dissolve 1 g of tetraheptylammonium bromide in a

■1-L■2S (*USP29*)
mixture of a 1.5 g per L solution of sodium hydrogen sulfate, acetonitrile, and methanol (2 : 2 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Transfer about 4 mg of USP Mefloquine Hydrochloride RS and 4 mg of USP Mefloquine Related Compound A RS to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. [NOTE—Mefloquine related compound A is *threo*-mefloquine.] Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Test solution—Transfer about 0.10 g of Mefloquine Hydrochloride, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Diluted test solution—Transfer 1.0 mL of the *Test solution* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 1.0 mL of this solution to a 20-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector, a 4-mm × 2.5-cm precolumn, and a 4.0-mm × 25-cm column, both containing 5-µm packing L1. The flow rate is about 0.8 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about ~~0.5~~

▲0.7▲*USP29*
for ~~quinidine~~

▲mefloquine related compound A▲*USP29*
and 1.0 for mefloquine; the resolution, *R,* between mefloquine related compound A and mefloquine is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Equilibrate the column with *Mobile phase* at a flow rate of about 0.8 mL per minute for about 30 minutes. Inject 20 µL of *Diluted test solution.* Adjust the sensitivity of the system so that the height of the major peak is at least 50% of the full scale of the recorder. Separately inject equal volumes (about 20 µL) of the *Test solution* and *Diluted test solution* into the chromatograph, record the chromatogram for a time that is 10 times the retention time of the main peak, and measure the responses of all peaks, excluding the main peak and any other peak producing a response of less than 0.2 times (0.02%) of the main peak in the chromatogram of the *Diluted test solution.* The response of the mefloquine related compound A peak in the *Test solution* with a relative retention time of about 0.7, with reference to the main peak, is not more than twice the area of the main peak in the chromatogram of the *Diluted test solution* (0.2%). The response of any other individual peak, other

than the main peak in the chromatogram of the *Test solution,* is not greater than that of the main peak in the chromatogram of the *Diluted test solution* (0.1%); and the sum of the responses of any such peaks in the chromatogram of the *Test solution* is not greater than five times the response of the main peak in the chromatogram of the *Diluted test solution* (0.5%).

BRIEFING

Metformin Hydrochloride, *USP 28* page 1231 and page 62 of *PF* 31(1) [Jan.–Feb. 2005]; **Metformin Hydrochloride Tablets,** page 3255 of the *First Supplement.* In the *Procedure* section of the test for *Related compounds,* it is proposed to add formulas for calculation of the percentage of impurities. It is also proposed to revise the preparation of the *Resolution solution.*

(PA4: E. Gonikberg) RTS—42526-1

Add the following:

▲**Packaging and storage**—Preserve in well-closed containers. ~~Store at 25°, excursions permitted between 15° and 30°.~~ Store at room temperature.▲*USP29*

Change to read:

Related compounds—

Mobile phase—Prepare a solution in water, containing 17 g of monobasic ammonium phosphate per L, adjust with phosphoric acid to a pH of 3.0, and mix.

Standard solution—Prepare a solution of USP Metformin Related Compound A RS in water having a known concentration of about 0.2 mg per mL. Transfer 1.0 mL of this solution to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. [NOTE—Metformin related compound A is 1-cyanoguanidine.]

Test solution—Transfer about 500 mg of Metformin Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Diluted test solution—Transfer 1.0 mL of the *Test solution* to a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Resolution solution—~~Transfer about 10 mg of melamine to a 100-mL volumetric flask, and dissolve in about 90 mL of water. Add 5.0 mL of the *Test solution,* dilute with water to volume, and mix.~~

■Prepare a solution in water containing about 0.25 mg of metformin hydrochloride and about 0.1 mg of melamine per mL.■2S *(USP29)*
Transfer 1.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 218-nm detector and a 4.6-mm × 25-cm column containing packing L9. The flow rate is about 1.0 to 1.7 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between melamine and metformin is not less than 10.

Procedure—Separately inject equal volumes (about 20 µL) of the *Test solution,* the *Standard solution,* and the *Diluted test solution* into the chromatograph, record the chromatograms for not less than twice the retention time of metformin, and measure the peak areas. ~~The area of a peak corresponding to metformin related compound A in the chromatogram of the *Test solution* is not greater than the area of the corresponding peak in the chromatogram of the *Standard solution:*~~

■Calculate the percentage of metformin related compound A in the portion of Metformin Hydrochloride taken by the formula:

$$10C/W(r_U/r_S)$$

in which C is the concentration, in µg per mL, of the USP Metformin Related Compound A RS in the *Standard solution; W* is the weight, in mg, of Metformin Hydrochloride taken to prepare the *Test solution;* and r_U and r_S are the metformin related compound A peak responses obtained from the *Test solution* and the *Standard solution,* respectively:■2S *(USP29)*
not more than 0.02% of metformin related compound A is found.

~~The area of any other secondary peak in the chromatogram of the *Test solution* is not greater than the area of the major peak in the chromatogram of the *Diluted test solution;* and the sum of the areas of all secondary peaks in the chromatogram of the *Test solution* is not greater than five times the area of the major peak in the chromatogram of the *Diluted test solution:*~~

■Calculate the percentage of any other impurity in the portion of Metformin Hydrochloride taken by the formula:

$$0.1(r_i/r_S)$$

in which r_i is the peak response for an individual impurity obtained from the *Test solution;* and r_S is the metformin peak response obtained from the *Diluted test solution:*■2S *(USP29)*
not more than 0.1% of any other impurity is found; and not more than 0.5% of total impurities is found.

In-Process Revision

BRIEFING

Metformin Hydrochloride Tablets, page 3255 of the *First Supplement*—See briefing under *Metformin Hydrochloride.* On the basis of comments received, in *Identification* test *A* it is also proposed to increase the drying time of the residue from 1 hour to 2 hours to ensure the removal of the dehydrated alcohol used to prepare the *Test specimen*.

(PA4: E. Gonikberg) RTS—42525-1; 42526-2

Change to read:

Identification—

A: *Infrared Absorption* ⟨197K⟩.

Test specimen—Transfer a quantity of powdered Tablets, equivalent to about 20 mg of metformin hydrochloride, to a suitable flask, add 20 mL of dehydrated alcohol, and shake. Filter, evaporate the filtrate on a water bath to dryness, and dry the residue at 105° for ~~1 hour.~~

■2 hours.■2S (*USP29*)

B: Triturate a quantity of the powdered Tablets, equivalent to about 50 mg of metformin hydrochloride, with 10 mL of water, and filter. To 5 mL of the filtrate add 1.5 mL of 5 N sodium hydroxide solution and 1 mL of a 1-naphthol solution, prepared by dissolving 1 g of 1-naphthol in a solution containing 6 g of sodium hydroxide and 16 g of anhydrous sodium carbonate in 100 mL of water. Add 0.5 mL of sodium hypochlorite TS, dropwise, and with shaking: an orange-red color is produced that darkens on standing.

C: Triturate a quantity of the powdered Tablets, equivalent to about 50 mg of metformin hydrochloride, with 10 mL of water, and filter. The filtrate meets the requirements of the tests for *Chloride* ⟨191⟩.

Change to read:

Related compounds—

Mobile phase, Resolution solution, and *Chromatographic system*—Proceed as directed in the test for *Related compounds* under *Metformin Hydrochloride*.

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer a portion of the powder, equivalent to about 500 mg of metformin hydrochloride, to a 100-mL volumetric flask, dissolve in *Mobile phase,* with shaking, dilute with *Mobile phase* to volume, and mix. Filter, and use the filtrate.

Diluted test solution—Proceed as directed for *Metformin Hydrochloride,* except to use the *Test solution* prepared as described herein.

Procedure—Separately inject equal volumes (about 20 µL) of the *Test solution* and the *Diluted test solution* into the chromatograph, record the chromatograms for not less than twice the retention time of metformin, and measure the peak areas.

~~The area of any secondary peak in the chromatogram of the *Test solution* is not greater than the area of the major peak in the chromatogram of the *Diluted test solution;* and the sum of the areas of all secondary peaks in the chromatogram of the *Test solution* is not greater than six times the area of the major peak in the chromatogram of the *Diluted test solution.*~~

■Calculate the percentage of each impurity in the portion of Metformin Hydrochloride Tablets taken by the formula:

$$0.1(r_i / r_S)$$

in which r_i is the peak response for an individual impurity obtained from the *Test solution;* and r_S is the metformin peak response obtained from the *Diluted test solution:*■2S (*USP29*) not more than 0.1% of any impurity is found; and not more than 0.6% of total impurities is found.

BRIEFING

Naphazoline Hydrochloride, *USP 28* page 1333. It is proposed to replace the current titration *Assay* procedure with an HPLC method. In addition, the upper *Assay* specification is being revised to reflect the change in the analytical technique. The liquid chromatographic procedure in the *Assay* is based on analyses performed with the LiChroCART 125-4 brand of L1 column. The typical retention time for naphazoline hydrochloride is about 1.8 minutes.

(PA6: L. Evans) RTS—42447-1

Change to read:

» Naphazoline Hydrochloride contains not less than 98.0 percent and not more than ~~100.5~~

■102.0■2S (*USP29*) percent of $C_{14}H_{14}N_2 \cdot HCl$, calculated on the dried basis.

Change to read:

Assay— ~~Dissolve about 300 mg of Naphazoline Hydrochloride, accurately weighed, in 50 mL of glacial acetic acid, and add 10 mL of mercuric acetate TS and 1 drop of crystal violet TS. Titrate (see *Titrimetry* ⟨541⟩) with 0.1 N perchloric acid VS to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 24.67 mg of $C_{14}H_{14}N_2 \cdot HCl$.~~

In-Process Revision

■*Buffer*—In a 1000-mL volume flask, dissolve 3.0 g of monobasic potassium phosphate, accurately weighed, in 800 mL of water. Add 3.0 mL of triethylamine, adjust with phosphoric acid to a pH of 3.0, dilute with water to volume, and mix.

Mobile phase—Prepare a filterd and degassed solution of *Buffer* and acetonitrile (80 : 20). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Naphazoline Hydrochloride RS in water, and dilute quantitatively, and stepwise if necessary, to obtain a concentration of 0.05 mg per mL.

Assay preparation—Transfer about 200 mg of Naphazoline Hydrochloride, accurately weighed, to a 200-mL volumetric flask, dissolve in and dilute with water to volume. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.0-mm × 25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure*: the capacity factor, *k′,* is not less than 2.0; the column efficiency is not less than 1500 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{14}H_{14}N_2 \cdot HCl$ in the portion of Naphazoline Hydrochloride taken by the formula:

$$4000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Naphazoline Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP29*)

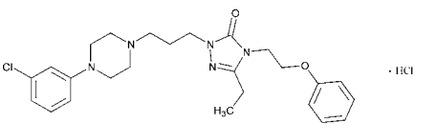
BRIEFING

Nefazodone Hydrochloride. Because there is no existing *USP* monograph for this active drug substance, a new monograph is proposed. The proposed liquid chromatographic tests in the *Assay* and in the test for *Related compounds* are based on analyses performed with the Waters Symmetry C18 brand of L1 column. Typical retention time for nefazodone hydrochloride is about 12 minutes.

(PA3: R. Ravichandran; NL: L. Paul; PSD: C. Okeke) RTS—41818-1; 41818-3; 41818-4

Add the following:

■Nefazodone Hydrochloride



$C_{25}H_{32}ClN_5O_2 \cdot HCl$ 506.47

3*H*-1,2,4-Triazol-3-one, 2-[3-[4-(3-chlorophenyl)-1-piperazinyl)]propyl]-5-ethyl-2,4-dihydro-4-(2-phenoxyethyl)-, monohydrochloride.

1-[3-[4-(*m*-Chlorophenyl)-1-piperazinyl]propyl]-3-ethyl-4-(2-phenoxyethyl)-Δ^2-1,2,4-triazolin-5-one monohydrochloride [*82752-99-6*].

In-Process Revision

» Nefazodone Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of $C_{25}H_{32}ClN_5O_2 \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers. Store at a temperature between 15° and 30°.

USP Reference standards ⟨11⟩**—***USP Nefazodone Hydrochloride RS. USP Nefazodone Related Compound A RS. USP Nefazodone Related Compound B RS.*

Completeness of solution ⟨641⟩**—**A 25 mg per mL solution in methanol meets the requirements.

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: A solution of 10 mg per mL meets the requirements of the test for *Chloride* ⟨191⟩.

Loss on drying ⟨731⟩**—**Dry it in vacuum at 105° for 3 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩**:** 0.001%.

Related compounds—

Diluent—Prepare a solution of water and acetonitrile (50 : 50).

Solution A—Dissolve 0.77 g of ammonium acetate in about 950 mL of water. Adjust with triethylamine to a pH of 7.10 ± 0.05. Dilute with water to 1 L. Filter and degas.

Solution B—Use filtered and degassed acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Dissolve an accurately weighed amount of USP Nefazodone Hydrochloride RS in *Diluent* to obtain a solution containing 0.1 mg per mL of nefazodone hydrochloride.

Nefazodone related compound A stock solution and *Nefazodone related compound B stock solution*—Transfer about 20 mg of each USP Nefazodone Related Compound A RS and USP Nefazodone Related Compound B RS, accurately weighed, into separate 200-mL volumetric flasks. Dissolve in and dilute with *Diluent* to volume.

Resolution solution— Pipet 5.0 mL of *Nefazodone related compound A stock solution* and 5.0 mL of *Nefazodone related compound B stock solution* into a 100-mL volumetric flask. Dilute with *Standard stock solution* to volume, and mix. This solution contains about 90 µg per mL of nefazodone hydrochloride, and about 5 µg per mL each of nefazodone related compound A and B.

Standard solution—Pipet 2.0 mL each of the *Standard stock solution, Nefazodone related compound A stock solution,* and *Nefazodone related compound B stock solution* into a 200-mL volumetric flask. Dilute with *Diluent* to volume, and mix well to obtain a final concentration of 1 µg per mL each of nefazodone hydrochloride, nefazodone related compound A, and nefazodone related compound B.

Test solution—Transfer about 100 mg of Nefazodone Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 250-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.7 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	50	50	equilbration
0–10	50→45	50→55	linear gradient
10–16	45→35	55→65	linear gradient
16–25	35	65	isocratic

In-Process Revision

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
25–26	35→50	65→50	linear gradient
26–35	50	50	re-equilbration

Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.94 for nefazodone related compound A, 1.0 for nefazodone hydrochloride, and 1.2 for nefazodone related compound B; the resolution, *R*, between nefazodone related compound A and nefazodone hydrochloride is not less than 1.5 and is not less than 4.0 between nefazodone hydrochloride and nefazodone related compound B. Chromatograph the *Standard solution* into the chromatograph, and measure the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 5.0% for nefazodone related compound A and nefazodone related compound B.

Procedure—Inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each nefazodone related compound in the portion of Nefazodone Hydrochloride taken by the formula

$$100(C_S/C_T)(r_U/r_S)$$

in which C_S is the concentration, in mg per mL, of the relevant USP Reference Standard in the *Standard solution;* C_T is the concentration of Nefazodone Hydrochloride, in mg per mL, in the *Test solution;* and r_U and r_S are the peak areas of the corresponding nefazodone related compound obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.2% of nefazodone related compound A is found; not more than 0.2% of nefazodone related compound B is found; not more than 0.1% of any unknown impurity is found; and not more than 0.5% of total impurities is found. [NOTE—Use the peak area for nefazodone hydrochloride in the *Standard solution* as r_S to calculate any unknown impurity.]

Organic volatile impurities, *Method I* ⟨467⟩**:** meets the requirements.

Assay—Dissolve about 800 mg of Nefazodone Hydrochloride, accurately weighed, in 50 mL of glacial acetic acid, and add 15 mL of 3% (v/v) mercuric acetate in glacial acetic acid. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N perchloric acid VS is equivalent to 50.65 mg of $C_{25}H_{32}ClN_5O_2 \cdot HCl$. ■2S *(USP29)*

BRIEFING

Nefazodone Hydrochloride Tablets. Because there is no existing *USP* monograph for Nefazodone Hydrochloride Tablets, a new monograph is proposed based on the validation data received. The test for *Related compounds* and the *Assay* test were developed using Waters Symmetry brand of L1 column. Nefazodone related compound A has a retention time of about 12 minutes, nefazodone hydrochloride has a retention time of about 13 minutes, and nefazodone related compound B has a retention time of about 18 minutes.

(PA3: R. Ravichandran; NL: L. Paul; PSD: C. Okeke; BPC: M. Marques) RTS—41818-2; 41818-5; 41818-6; 41818-7

In-Process Revision

Add the following:

■Nefazodone Hydrochloride Tablets

» Nefazodone Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of nefazodone hydrochloride ($C_{25}H_{32}ClN_5O_2 \cdot HCl$).

Packaging and storage—Preserve in tight containers. Store between 15° and 30°.

USP Reference standards ⟨11⟩**—***USP Nefazodone Hydrochloride RS. USP Nefazodone Related Compound A RS. USP Nefazodone Related Compound B RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩**—**

Medium: 0.1 N hydrochloric acid; 900 mL, deaerated.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Standard stock solution—Transfer about 70 mg of USP Nefazodone Hydrochloride RS, accurately weighed, to a 50-mL volumetric flask. Add 2.5 mL of methanol, dilute with *Medium* to volume, and mix.

Standard solution—Dilute the *Standard stock solution* with *Medium* in such a way that the final concentration is similar to the one expected in the *Test solution.*

Test solution—Use portions of the solution under test passed through a 0.45-µm PVDF filter, discarding the first 5 mL.

Procedure—Determine the percentage of the labeled amount of nefazodone hydrochloride dissolved by employing UV absorption, using a suitable spectrophotometer, at the wavelength of maximum absorbance at about 246 nm, on the *Test solution* in comparison with the *Standard solution*, using the *Medium* as blank. Calculate the percentage of nefazodone hydrochloride dissolved by the formula:

$$\frac{A_U \times C_S \times 900 \times 100}{A_S \times LC}$$

in which A_U and A_S are the absorbances obtained from the *Test solution* and *Standard solution,* respectively; C_S is the concentration, in mg per mL, of the USP Nefazodone Hydrochloride RS in the *Standard solution;* 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the tablet label claim, in mg.

Tolerances—Not less than 75% *(Q)* of the labeled amount of nefazodone hydrochloride is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Related compounds—

Diluted acetic acid, Buffer solution, Mobile phase, Nefazodone related compound A stock solution, Nefazodone related compound B stock solution, System suitability preparation, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Test solution—Use the *Assay stock preparation,* prepared as directed in the *Assay.*

In-Process Revision

Procedure—Inject a volume (about 10 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of individual nefazodone related compounds in the portion of Tablets taken by the formula:

$$100(r_U / r_S)(C_S / C_T)(1/F)$$

in which r_U is the individual peak response for each nefazodone related compound obtained from the *Test solution;* r_S is the response of the corresponding peak in the *Standard solution,* respectively; C_S and C_T are the concentrations, in mg per mL, of nefazodone hydrochloride in the *Standard solution* and *Test solution,* respectively; and F is the relative response factor obtained from *Table 1.* The related compound requirements are listed in *Table 1.*

Table 1

Related Compound	Relative Retention Time	Relative Response Factor *(F)*	Limit (%)
Nefazodone related compound A	0.9	1.0	0.2
Nefazodone related compound B	1.4	1.2	0.2
1,3-Bis[4-(3-chlorophenyl)piperzin-1-yl]propane	2.2	1.6	0.2
Unknown	—	1.0	0.1 each
Total known and unknown	—	—	0.5

Assay—

Diluted acetic acid—Prepare a mixture of acetic acid and water (1 : 1).

Buffer solution—Dissolve 0.77 g of ammonium acetate in 1 L of water. Add 1.0 mL of triethylamine, and mix well. Adjust with *Diluted acetic acid* to a pH of 7.10 ± 0.05, and mix.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and *Buffer solution* (58 : 42). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Nefazodone related compound A stock solution—Prepare a solution of USP Nefazodone Related Compound A RS in *Mobile phase* having a known concentration of about 80 µg per mL.

Nefazodone related compound B stock solution—Prepare a solution of USP Nefazodone Related Compound B RS in *Mobile phase* having a known concentration of about 80 µg per mL.

System suitability preparation—Transfer about 10 mg of USP Nefazodone Hydrochloride RS into a 10-mL volumetric flask. Add 2.0 mL of *Nefazodone related compound A stock solution* and 2.0 mL of *Nefazodone related compound B stock solution,* and mix to dissolve the nefazodone hydrochloride. Dilute with *Mobile phase* to volume, and mix.

Standard preparation—Prepare a solution of USP Nefazodone Hydrochloride RS in *Mobile phase* having a known concentration of about 0.1 mg per mL.

Assay stock preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 250 mg of nefazodone hydrochloride, to a 250-mL volumetric flask, add

about 125 mL of *Mobile phase*, and sonicate for about 10 minutes with occasional shaking. Dilute with *Mobile phase* to volume, and mix to obtain a solution having a concentration of about 1 mg per mL of nefazodone hydrochloride. Pass a portion of this solution through a filter having a 0.45-µm or finer porosity, and use the filtrate, which has a concentration of about 1 mg per mL of nefazodone hydrochloride.

Assay preparation—Transfer 5.0 mL of *Assay stock preparation* into a 50-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix to obtain a solution having a concentration of 0.1 mg per mL of nefazodone hydrochloride.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 250-nm detector and a 4.6-mm × 25-cm column containing 5-µm L1 packing. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 30°. Inject the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.9 for nefazodone related compound A, 1.0 for nefazodone hydrochloride, and 1.4 for nefazodone related compound B; the resolution, *R,* between nefazodone related compound A and nefazodone hydrochloride is not less than 1.5, and the resolution, *R,* between nefazodone related compound B and nefazodone hydrochloride is not less than 2.0. Inject the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 2000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in percent of label claim, of nefazodone hydrochloride ($C_{25}H_{32}ClN_5O_2 \cdot HCl$) in the portion of Tablets taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which C_S and C_U are the concentrations, in mg per mL, of nefazodone hydrochloride in the *Standard preparation* and *Assay preparation,* respectively; and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP29*)

BRIEFING

Nitrous Oxide, *USP 28* page 1388, page 3264 of the *First Supplement,* and the *Third Interim Revision Announcement (Notice of Postponement)* on page 707 of *PF* 31(3) [May–June 2005]—See briefing under *Medical Air.*

(AER: K. Zaidi) RTS—42651-5

Change to read:

» Nitrous Oxide contains not less than 99.0 percent, ~~by volume~~

■volume/volume,■2S (*USP29*) of N_2O.

Change to read:

Packaging and storage—~~Preserve in cylinders.~~

■Preserve in blue cylinders. Containers and connections are to be specific to the application and must be controlled in such a fashion that there are sufficient change controls to prevent the connection of the incorrect gas to the system (such as those suggested in CGA Standard CGA V-1-2003).■2S (*USP29*)

In-Process Revision

NOTE—The following tests are designed to reflect the quality of Nitrous Oxide in both the vapor and liquid phases that are present in previously unopened cylinders. Reduce the container pressure by means of a regulator. Withdraw the samples for the tests with the least possible release of Nitrous Oxide consistent with proper purging of the sampling apparatus. Measure the gases with a gas volume meter downstream from the detector tubes in order to minimize contamination or change of the specimens. Perform tests in the sequence in which they are listed.

The various detector tubes called for in the respective tests are listed under *Reagents* in the section *Reagents, Indicators, and Solutions*.

Change to read:

Assay—Introduce a specimen of Nitrous Oxide taken from the liquid phase, as directed in the test for *Nitrogen dioxide,* into a gas chromatograph by means of a gas-sampling valve. Select the operating conditions of the gas chromatograph such that the peak response resulting from the following procedure corresponds to not less than 70% of the full-scale reading. Preferably, use an apparatus corresponding to the general type in which the column is 6 m in length and 4 mm in inside diameter and is packed with porous polymer beads, which permits complete separation of N_2 and O_2 from N_2O, although the N_2 and O_2 may not be separated from each other. Use industrial grade helium (99.99%) as the carrier gas, with a thermal-conductivity detector, and control the column temperature: the peak response produced by the assay specimen exhibits a retention time corresponding to that produced by •~~USP Air–Helium RS~~•.

■USP Nitrous Oxide RS,■2S (*USP29*)
and is equivalent to not more than 1.0% of air when compared to the peak response of the •USP Air–Helium RS,•3 indicating not less than 99.0%, by volume, of N_2O.

■•(Postponed indefinitely)•3 ■2S (*USP29*)

BRIEFING

Omeprazole, *USP 28* page 1416. It is proposed to add a note clarifying the preparation of ammonia-saturated dichloromethane for *Method 1* in the test for *Chromatographic purity.*

(PA4: E. Gonikberg) RTS—42575-1

Change to read:

Chromatographic purity—

METHOD 1—

Solvent—Prepare a mixture of dichloromethane and methanol (1 : 1).

Standard solutions—Dissolve an accurately weighed quantity of USP Omeprazole RS in *Solvent,* and mix to obtain *Standard solution A* having a known concentration of about 0.5 mg per mL. Dilute this solution quantitatively with *Solvent* to obtain *Standard solution B* and *Standard solution C* having known concentrations of about 0.15 mg per mL and 0.05 mg per mL, respectively.

Test solution—Prepare a solution of Omeprazole in *Solvent* containing 50 mg per mL.

Identification solution—Dilute a volume of the *Test solution* quantitatively with *Solvent* to obtain a solution containing 0.25 mg per mL.

Procedure—Separately apply 10 µL of the *Test solution,* the *Identification solution,* and each of the *Standard solutions* to a thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of ammonia-saturated dichloromethane, dichloromethane, and isopropyl alcohol (2 : 2 : 1) until the solvent front has moved about three-fourths of the length of the plate.

■[NOTE—Prepare ammonia-saturated dichloromethane as follows: shake 100 mL of dichloromethane with 30 mL of ammonium hydroxide in a separatory funnel, allow the layers to separate, and use the lower layer.]■2S (*USP29*)
Remove the plate from the developing chamber, mark the solvent front, allow the solvent to evaporate, and examine the plate under short-wavelength UV light: the chromatograms show principal spots at about the same R_F value. Estimate the intensities of any secondary spots observed in the chromatogram of the *Test solution* by comparison with the spots in the chromatograms of the *Standard solutions:* no secondary spot from the chromatogram of the *Test solution* is larger or more intense than the principal spot obtained from *Standard solution B* (0.3%), and the sum of the intensities of all secondary spots obtained from the *Test solution* is no more intense than the principal spot obtained from *Standard solution A* (1.0%).

METHOD 2—

Diluent—Use *Mobile phase.*

Phosphate buffer, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Test solution—Dissolve an accurately weighed quantity of Omeprazole in *Diluent* to obtain a solution containing about 0.16 mg per mL. [NOTE—Prepare this solution fresh.]

Procedure—Inject equal volumes (about 40 µL) of the *Test solution* and *Diluent* into the chromatograph, and allow the *Test solution* to elute for not less than two times the retention time of omeprazole. Record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Omeprazole taken by the formula:

$$100(r_i/r_s)$$

in which r_i is the peak response for each impurity, and r_s is the sum of the responses of all of the peaks: not more than 0.3% of any individual impurity is found, and the sum of all impurities is not more than 1.0%.

In-Process Revision

BRIEFING

Ondansetron Orally Disintegrating Tablets, page 2024 of *PF* 30(6) [Nov.—Dec. 2004]. It is proposed to add a *Disintegration* test and a *Dissolution* test to this new monograph.

(BPC: M. Marques) RTS—42415-1

Add the following:

■Ondansetron Orally Disintegrating Tablets

» Ondansetron Orally Disintegrating Tablets contain the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ondansetron ($C_{18}H_{19}N_3O$).

Packaging and storage—Preserve in light-resistant containers. Store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Ondansetron RS. USP Ondansetron Related Compound A RS. USP Ondansetron Related Compound D RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Disintegration: not more than 10 seconds.

Dissolution ⟨711⟩**—**

Medium: 0.1 N hydrochloric acid; 500 mL, deaerated.

Apparatus 2: 50 rpm.

Time: 10 minutes.

Standard solution—Accurately weigh an amount of USP Ondansetron RS, and dilute with *Medium* to obtain a solution having a final concentration of 0.01 mg per mL for Tablets labeled to contain 4 mg, and a final concentration of 0.02 mg per mL for Tablets labeled to contain 8 mg.

Test solution—Pass a portion of the solution under test through a filter.

Procedure—Determine the amount of $C_{18}H_{19}N_3O$ dissolved by UV absorption at the wavelength of maximum absorbance at about 310 nm on portions of the *Test solution* in comparison with the *Standard solution*, using a 1-cm cell. Calculate the amount, in percentage, of ondansetron released by the formula:

$$\frac{A_U \times W_S \times 500 \times MW_1 \times P \times 100}{A_S \times D \times L \times MW_2}$$

in which A_U and A_S are the absorbances obtained from the *Test solution* and the *Standard solution*, respectively; W_S is the weight, in mg, of USP Ondansetron RS taken; 500 is the volume, in mL, of *Medium; MW_1* is the molecular weight of ondansetron (293.4); *P* is the purity, expressed in decimal, of USP Ondansetron RS; 100 is the conversion factor to percentage; *D* is the dilution factor of the *Standard solution; L* is the Tablet label claim, in mg; and MW_2 is the molecular weight of ondansetron hydrochloride dihydrate (365.9).

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{18}H_{19}N_3O$ is dissolved in 10 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Water ⟨921⟩**:** not more than 4.0%.

In-Process Revision

Related compounds—

Phosphate buffer—Prepare as directed in the *Assay.*

Mobile phase—Prepare a filtered and degassed mixture of *Phosphate buffer* and acetonitrile (8 : 2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Ondansetron related compound D solution—Dissolve an amount of USP Ondansetron Related Compound D RS in acetonitrile, and dilute stepwise with *Mobile phase* to obtain a solution having a known concentration of about 0.04 mg per mL.

2-Methylimidazole solution—Dissolve an amount of 2-methylimidazole in acetonitrile, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.04 mg per mL.

Standard stock solution—Dissolve an accurately weighed quantity of USP Ondansetron RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.04 mg per mL.

System suitability solution—Transfer 5.0 mL each of *Standard stock solution, 2-Methylimidazole solution,* and *Ondansetron related compound D solution,* to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

Standard solution—Pipet 5.0 mL of the *Standard stock solution* into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

System sensitivity solution—Pipet 10.0 mL of the *Standard solution* into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Test solution—Transfer 10 Tablets to an appropriate volumetric flask so that the final concentration of ondansetron is about 400 µg per mL. Add *Mobile phase* to fill about 60% of the flask capacity. Shake by mechanical means for about 5 minutes, and dilute with *Mobile phase* to volume. Centrifuge a portion of this solution at 3000 rpm for 10 minutes. Use the supernatant.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 216-nm detector and a 4.6-mm × 25-cm column that contains packing L10. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are given in *Table 1;* the resolution, *R,* between ondansetron and any adjacent peak is not less than 1.5; the column efficiency is not less than 8000 theoretical plates for ondansetron; and the tailing factor for the ondansetron peak is not more than 2.0. Chromatograph the *System sensitivity solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio for the ondansetron peak is not less than 15. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Inject a volume (about 20 µL) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(C/F)(V/D)(r_i / r_S)$$

in which C is the concentration, in mg per mL, of USP Ondansetron RS in the *Standard solution; F* is the relative response factor for each impurity as described in *Table 1; V* is the volume, in mL, of the volumetric flask used to prepare the *Test solution; D* is the amount, in mg, of ondansetron in the sample based on the labeled amount and number of Tab-

In-Process Revision

lets taken; r_i is the peak area of any impurity in the *Test solution;* and r_S is the peak area of ondansetron in the *Standard solution:* it meets the requirements specified in *Table 1.*

Table 1

Compound Name	Relative Retention time	Relative Response Factor	Limit (%)
2-Methylimidazole	0.16	0.5	0.15
Ondansetron related compound D	0.45	1.2	0.12
Ondansetron	1.0	—	—
Individual unknown impurity	—	1.0	0.1
Total impurities	—	—	0.5

[NOTE—The run time is about 60 minutes.]

Assay—

Diluent: 0.01 N hydrochloric acid.

Phosphate buffer—Dissolve about 2.72 g of monobasic potassium phosphate in 1000 mL of water. Adjust with 1 N sodium hydroxide or 0.5 N sodium hydroxide to a pH of 5.4.

Mobile phase—Prepare a filtered and degassed mixture of phosphate buffer and acetonitrile (52 : 48). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Ondansetron related compound A solution—Dissolve an amount of USP Ondansetron Related Compound A RS in *Diluent*, and dilute stepwise with *Diluent* to obtain a solution having a known concentration of about 0.14 mg per mL.

Assay preparation concentrated—Transfer 10 Tablets to an appropriate volumetric flask so that the final concentration is about 400 µg of ondansetron per mL. Add *Diluent* to fill about 60% of the flask capacity. Shake by mechanical means for about 5 minutes, and dilute with *Diluent* to volume. Filter a portion of this solution through a 0.45-µm polypropylene membrane, discarding the first 5 mL.

System suitability solution—Transfer 8.0 mL of *ondansetron related compound A solution* and 8.0 mL of the *Assay preparation concentrated* to a 50-mL volumetric flask. Dilute with *Diluent* to volume, and mix.

Standard preparation—Dissolve an accurately weighed quantity of USP Ondansetron RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 40 µg per mL.

Assay preparation—Transfer 5.0 mL of the *Assay preparation concentrated* to a 50-mL volumetric flask. Dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 216-nm detector and a 4.6-mm × 25-cm column that contains packing L10. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.1 for ondansetron related compound A, and 1.0 for ondansetron; the resolution, *R,* between ondansetron related compound A and ondansetron is not less than 1.5; and the tailing factor is not more than 2.0 for the ondansetron peak. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and

measure the responses for the ondansetron peaks. Calculate the quantity, in mg, of ondansetron ($C_{18}H_{19}N_3O$) in the portion of Tablets taken by the formula:

$$(10V)C(r_U / r_S)$$

in which V is the volume used to prepare the *Assay preparation concentrated;* C is the concentration, in mg per mL, of USP Ondansetron RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP29*)

BRIEFING

Oxycodone Hydrochloride Extended-Release Tablets. Because there is no existing *USP* monograph for this article, the following new monograph, which is based on submitted data, is being proposed. The liquid chromatographic procedures in the *Related compounds* test and the *Assay* are based on analyses performed with the Symmetry brand of L1 column. The typical retention times for oxycodone are about 8 minutes for the *Related compounds* test and about 4 minutes for the *Assay.*

(PA2: D. Bempong) RTS—41546-2; 41809-1

In-Process Revision

Add the following:

■Oxycodone Hydrochloride Extended-Release Tablets

» Oxycodone Hydrochloride Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$).

Packaging and storage—Preserve in tight, light-resistant containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Oxycodone RS. USP Oxycodone Related Compound A RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Transfer a portion of powdered Tablets, equivalent to about 5 mg of oxycodone hydrochloride, to a suitable screw-capped tube, add 5 mL of chloroform, sonicate for about 30 seconds, shake for several minutes, and centrifuge. Use the clear supernatant.

Standard solution: 0.9 mg of USP Oxycodone RS per mL of chloroform.

Application volume: 20 µL.

Developing solvent solution: a mixture of acetone, toluene, ether, and ammonium hydroxide (6: 4: 1: 0.3).

Procedure—Proceed as directed in the chapter. Spray with iodoplatinate TS: the R_F value, color, and size of the principal spot obtained from the *Test solution* correspond to those obtained from the *Standard solution;* and no other spot is observed.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Drug release ⟨724⟩**—**[To come.]

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Related compounds—

Buffer solution—Dissolve 1.5 g of sodium heptanesulfonate in 810 mL of water. Mix with 10 mL of glacial acetic acid, adjust with 5 N sodium hydroxide solution to a pH of 3.50 ± 0.05, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (82 : 18). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve accurately weighed quantities of USP Oxycodone RS and USP Oxycodone Related Compound A RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a concentration of about 1.8 µg per mL of USP Oxycodone RS and about 1.8 µg per mL of USP Oxycodone Related Compound A RS.

Standard solution—Dissolve an accurately weighed quantity of USP Oxycodone RS in *Mobile phase,* and dilute quantitatively and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1.8 µg per mL.

Sensitivity test solution—Transfer 5 mL of the *Standard solution* into a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to 40 mg of oxycodone hydrochloride, to a 100-mL volumetric flask, add about 20 mL of a solvent consisting of methanol and acetonitrile (50 : 50), sonicate for about 10 minutes, and stir for 20 minutes. Dilute with *Buffer solution* to volume, and mix. Pass a portion of this solution through a suitable filter, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The column is maintained at a temperature of 50° and the flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure*: the resolution, *R*, between oxycodone related compound A and oxycodone is not less than 2.0. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 1000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%. Chromatograph the *Sensitivity test solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio is not less than 10.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$10(C/W)(1/F)(r_i / r_S)$$

in which C is the concentration, in µg per mL, of USP Oxycodone RS in the *Standard solution; W* is the weight, in mg, of oxycodone hydrochloride in the powdered Tablets taken to prepare the *Test solution; F* is the relative response factor (see *Table 1* for values); r_i is the peak response obtained for each individual impurity in the *Test solution;* and r_S is the peak response for oxycodone in the *Standard solution*.

Table 1

Name	Relative Retention Time	Relative Response Factor	Limit (w/w, %)
Oxycodone	1.00	—	—
7, 8 Dihydro-14-hydroxycodeine (DHC)	about 0.6	0.64	0.5
14-Hydroxycodeine (HC) (Oxycodone related compound A)	about 1.2	0.78	0.5
Individual unknown impurity	—	—	0.5
Total impurities	—	—	2.0

Assay—

Buffer solution—Dissolve 1.5 g of sodium heptanesulfonate in 740 mL of water. Mix with 10 mL of glacial acetic acid, adjust with 5 N sodium hydroxide solution to a pH of 3.50 ± 0.05, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (75 : 25). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Oxycodone RS in *Mobile phase,* and dilute quantitatively and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.036 mg per mL.

Assay stock preparation—Transfer 10 Tablets into an appropriate volumetric flask, add a volume of a mixture of methanol and acetonitrile (50 : 50) equivalent to 50% of the volumetric flask volume, sonicate for about 10 minutes, and stir for about 20 minutes. Dilute with *Buffer solution* to volume, and mix.

Assay preparation—Transfer a volume of the *Assay stock preparation,* equivalent to 4 mg of oxycodone hydrochloride into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass a portion of the solution through a suitable filter, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the efficiency is not less than 4000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the oxycodone peak. Calculate

In-Process Revision

the quantity, in mg, of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$) in the portion of Tablets taken by the formula:

$$(351.82/315.37)CD(r_U/r_S)$$

in which 351.82 and 315.37 are the molecular weights of oxycodone hydrochloride and oxycodone base, respectively; *C* is the concentration, in mg per mL, of USP Oxycodone RS in the *Standard preparation; D* is the dilution factor, in mL, for the *Assay preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP29*)

BRIEFING

Oxygen, *USP 28* page 1442—See briefing under *Medical Air.*

(AER: K. Zaidi) RTS—42651-6

Change to read:

» Oxygen contains not less than 99.0 percent, ~~by volume,~~

■volume/volume,■2S (*USP29*)
of O_2. [NOTE—Oxygen that is produced by the air-liquefaction process is exempt from the requirements of the tests for *Carbon dioxide* and *Carbon monoxide*.]

Change to read:

Packaging and storage—~~Preserve in cylinders or in a pressurized storage tank.~~

■Preserve in green cylinders or in a green pressurized storage tank. Containers and connections are to be specific to the application and must be controlled in such a fashion that there are sufficient change controls to prevent the connection of the incorrect gas to the system (such as those suggested in CGA Standard CGA V-1-2003).■2S (*USP29*)
Containers used for Oxygen must not be treated with any toxic, sleep-inducing, or narcosis-producing compounds, and must not be treated with any compound that will be irritating to the respiratory tract when the Oxygen is used.

NOTE—Reduce the container pressure by means of a regulator. Measure the gases with a gas volume meter downstream from the detector tube in order to minimize contamination or change of the specimens.

BRIEFING

Oxygen 93 Percent, *USP 28* page 1443—See briefing under *Medical Air.*

(AER: K. Zaidi) RTS—42651-7

■volume/volume,■2S (*USP29*)
of O_2, the remainder consisting mostly of argon and nitrogen.

Change to read:

Packaging and storage—~~Preserve in cylinders or in a low-pressure collecting tank.~~

■Preserve in green cylinders or in a green low-pressure collecting tank. Containers and connections are to be specific to the application and must be controlled in such a fashion that there are sufficient change controls to prevent the connection of the incorrect gas to the system (such as those suggested in CGA Standard CGA V-1-2003).■2S (*USP29*)
Containers used for Oxygen 93 Percent must not be treated with any toxic, sleep-inducing, or narcosis-producing compounds, and must not be treated with any compound that will be irritating to the respiratory tract when the Oxygen 93 Percent is used.

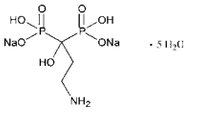
BRIEFING

Pamidronate Disodium, Pamidronate Disodium for Injection. Because there is no existing *USP* monograph for this drug substance and drug product, new monographs, based on validated methods of analysis, are being proposed. The liquid chromatographic procedures in *Test 2* for *Related compounds* and in the *Assay* are based on analyses performed with the Metrohm IC Anion Super-Sep brand of L23 column. The typical retention time for the pamidronate peak is about 8 minutes; the retention times for the phosphate and phosphite peaks are about 10 and 15 minutes, respectively. Please note that these retention times could be affected strongly by the small variations in the amounts of formic acid in the *Mobile phase*.

(PA4: E. Gonikberg; PSD: C. Okeke; NL: L. Paul; AMB: R. Tirumalai) RTS—33667-1

Add the following:

■Pamidronate Disodium



$C_3H_9NNa_2O_7P_2 \cdot 5H_2O$ 369.11

Phosphonic acid, (3-amino-1-hydroxypropylidene)bis-, disodium salt, pentahydrate.

Disodium dihydrogen (3-amino-1-hydroxypropylidene)diphosphonate, pentahydrate [*109552-15-0*].

Anhydrous [*57248-88-1*].

» Pamidronate Disodium contains not less than 98.0 percent and not more than 102.0 percent of $C_3H_9NNa_2O_7P_2$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight containers. Store at a temperature not exceeding 30°.

USP Reference standards ⟨11⟩**—***USP Beta Alanine RS. USP Pamidronate Disodium RS.*

Clarity and color of solution—

Test preparation 1—Dissolve 1.0 g of it in 50 mL of water with gentle warming. Cool to room temperature.

Test preparation 2—Dissolve 1.0 g of it in 25 mL of 2 N sodium hydroxide solution with gentle warming. Cool to room temperature.

Procedure—Examine *Test preparation 1* and *Test preparation 2:* the solutions are clear. Separately measure the absorbance of each of these solutions at 420 nm in 4-cm cells, using water as the blank for *Test preparation 1* and using 2 N sodium hydroxide solution as a blank for *Test preparation 2*: the absorbance of each solution is not more than 0.10.

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

C: It meets the requirements of the pyroantimonate precipitate test for *Sodium* ⟨191⟩.

Microbial limits ⟨61⟩—The total aerobic microbial count does not exceed 1000 cfu per g, and the total combined yeasts and molds count does not exceed 100 cfu per g.

pH ⟨791⟩**:** between 7.8 and 8.8, in a solution (1 in 100).

Water, *Method I* ⟨921⟩**:** between 23.0% and 25.5%.

Heavy metals, *Method II* ⟨231⟩**:** 20 µg per g.

In-Process Revision

Related compounds—

TEST 1—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Test solution—Transfer 30 mg of Pamidronate Disodium to a 10-mL volumetric flask, and dissolve in and dilute with water to volume.

Standard solution—Dissolve an accurately weighed quantity of USP Beta Alanine RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution containing 0.006 mg of beta alanine per mL.

Application volume: 10 µL.

Developing solvent system: a mixture of methanol, diisopropyl ether, and 25% ammonia (9 : 8 : 4).

Spray reagent—Dissolve 0.2 g of ninhydrin in 100 mL of a mixture of butyl alcohol and 2 N acetic acid (95 : 5).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. Dry the plate between 100° and 105° until the ammonia disappears completely. Spray with *Spray reagent,* and heat between 100° and 105° for about 15 minutes. Examine the plate under white light. The spot having an R_F value of about 0.5 obtained from the *Test solution* is not greater in size or intensity than the corresponding spot obtained from the *Standard solution:* not more than 0.2% of beta alanine is found. Evaluate any other additional spot in the chromatogram of the *Test solution,* and determine the percentage of total other impurities (excluding beta alanine).

TEST 2—

Mobile phase—Proceed as directed in the *Assay.*

Impurity stock solution 1—Transfer about 300 mg of ortho-phosphoric acid, accurately weighed, to a 1000-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Impurity stock solution 2—Transfer about 250 mg of phosphorous acid, accurately weighed, to 1000-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Impurity standard solution—Transfer 2.0 mL each of *Impurity stock solution 1* and *Impurity stock solution 2* to a 50-mL volumetric flask, dilute with water to volume, and mix.

Test solution—Prepare as directed for *Assay preparation*.

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay.* Chromatograph the *Impurity standard solution,* and record the peak responses as directed for *Procedure:* the elution order is a phosphate peak followed by the phosphite peak; the resolution, *R,* between the two peaks is not less than 2.5; the relative standard deviation for replicate injections, determined from the phosphate peak, is not more than 10%; and the relative standard deviation for replicate injections, determined from the phosphite peak, is not more than 20%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Impurity standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of phosphates as ortho-phosphoric acid in the portion of Pamidronate Disodium taken by the formula:

$$0.2\ (W_1 / W)\ (r_U / r_S)$$

in which W_1 is the weight, in mg, of ortho-phosphoric acid taken to prepare the *Impurity stock solution 1; W* is the weight, in mg, of Pamidronate Disodium taken to prepare the *Test solution;* and r_U and r_S are the responses of phosphate peaks obtained from the *Test solution* and the *Impurity standard solution*, respectively: not more than 0.5% of phosphate, determined as ortho-phosphoric acid, is found.

Calculate the percentages of phosphites as phosphorous acid in the portion of Pamidronate Disodium taken by the formula:

$$0.2\ (W_2/W)\ (r_U/r_S)$$

in which W_2 is the weight, in mg, of phosphorous acid taken to prepare the *Impurity stock solution 1; W* is defined above; and r_U and r_S are the responses of phosphite peaks obtained from the *Test solution* and the *Impurity standard solution,* respectively: not more than 0.5% of phosphite, determined as phosphorous acid, is found, and not more than 0.5% of total phosphate and phosphite combined is found.

Calculate the percentage of any other impurity in the portion of Pamidronate Disodium taken by the formula:

$$0.2\ (W_1/W)\ (r_i/r_S)$$

in which W_1 and W are defined above; r_i is the peak response of any other impurity in the *Test solution; and* r_S is the response of the phosphate peak obtained from the *Impurity standard solution:* not more than 0.5% of total other impurities (excluding beta alanine, phosphate as ortho-phosphoric acid, and phosphite as phosphorous acid) is found, the results for *Test 1* and *Test 2* being added.

Alcohol content, *Method II* ⟨611⟩: not more than 0.3% is found.

Assay—

Mobile phase—To 2500 mL of water, add 0.47 mL of anhydrous formic acid, adjust with 2 N sodium hydroxide solution to a pH of 3.5, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩). [NOTE—The small amounts of formic acid have a strong influence on the retention times.]

Standard preparation—Dissolve an accurately weighed quantity of USP Pamidronate Disodium RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 2 mg per mL.

Assay preparation—Transfer about 100 mg of Pamidronate Disodium, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector and a 4.6-mm × 10-cm column that contains packing L23. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 35°. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor is not less than 0.3 and not more than 1.2; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_3H_9NNa_2O_7P_2$ in the portion of Pamidronate Disodium taken by the formula:

$$50C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Pamidronate Disodium RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■2S (*USP29*)

In-Process Revision

BRIEFING

Pamidronate Disodium for Injection—See briefing under *Pamidronate Disodium.*

(PA4: E. Gonikberg; PSD: C. Okeke; NL: L. Paul; AMB: R. Tirumalai) RTS—33667-2

Add the following:

■Pamidronate Disodium for Injection

» Pamidronate Disodium for Injection is a sterile, freeze-dried mixture of Pamidronate Disodium and suitable excipients. It contains not less than 98.0 percent and not more than 108.0 percent of the labeled amount of pamidronate disodium ($C_3H_9NNa_2O_7P_2$).

Packaging and storage—Preserve in *Containers for Sterile Solids,* as described under *Injections* ⟨1⟩, preferably of Type III glass. Store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Beta Alanine RS. USP Endotoxin RS. USP Pamidronate Disodium RS.*

Constituted solution—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* ⟨1⟩.

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Bacterial endotoxins ⟨85⟩**—**It contains not more than 2 USP Endotoxin Units per mg of anhydrous pamidronate disodium.

Uniformity of dosage units ⟨905⟩**:** meets the requirements for *Weight Variation.*

pH ⟨791⟩**:** between 6.0 and 7.0, determined in a solution constituted as directed in the labeling.

Particulate matter ⟨788⟩**:** meets the requirements for small-volume injections.

Other requirements—It meets the requirements under *Sterility Tests* ⟨71⟩ and *Labeling* under *Injections* ⟨1⟩.

Water, *Method Ia* ⟨921⟩**:** not more than 5%.

Limit of beta alanine—

Adsorbent, Application volume, Developing solvent system, and *Spray reagent*—Proceed as directed under the *Related compounds, Test 1* for *Pamidronate Disodium.*

Standard solution—Dissolve an accurately weighed quantity of USP Beta Alanine RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution containing 0.0075 mg of beta alanine per mL.

Test solution—Reconstitute the vial with the appropriate amount of water to achieve a solution having a concentration of 3 mg of anhydrous pamidronate disodium per mL, based on the label claim.

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. Dry the plate between 100° and 105° until the ammonia disappears completely. Spray with *Spray reagent,* and heat between 100° and 105° for about 15 minutes. Examine the plate under white light. The spot having an R_F value of about 0.5 obtained from the *Test solution* is not greater in size or intensity than the corresponding spot obtained from the *Standard solution:* not more than 0.25% of beta alanine is found.

Assay—

Mobile phase and *Chromatographic system*—Proceed as directed in the *Assay* under *Pamidronate Disodium.*

Standard preparation—Dissolve an accurately weighed quantity of USP Pamidronate Disodium RS in water, and dilute quantitatively, and stepwise if necessary, with water

to obtain a solution having a known concentration of about 2.5 mg per mL. Calculate the concentration, *C,* of anhydrous pamidronate disodium; the molecular weights of anhydrous and pentahydrate pamidronate disodium being 279.06 and 369.11, respectively.

Assay preparation—Constitute a suitable number of vials of Pamidronate Disodium for Injection with the appropriate amount of water to obtain a solution having a known concentration of about 2 mg of anhydrous pamidronate disodium per mL, based on the label claim.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_3H_9NNa_2O_7P_2$ in the portion of Pamidronate Disodium for Injection taken by the formula:

$$50C(r_U / r_S)$$

in which C is as defined under the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP29*)

In-Process Revision

BRIEFING

Paroxetine Hydrochloride, *USP 28* page 1474 and page 69 of *PF* 31(1) [Jan.–Feb. 2005]. It is proposed to rename the Reference Standards used in this monograph. USP Paroxetine Hydrochloride System Suitability RS is being renamed as USP Paroxetine System Suitability Mixture A RS. USP Paroxetine Related Compound E RS is being renamed as USP Paroxetine Related Compound E Mixture RS. The *USP Reference standards* section is being revised to reflect this change.

(PA3: R. Ravichandran) RTS—42643-1

Change to read:

Limit of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine—

~~*Solution A*—Prepare a filtered and degassed mixture of acetonitrile and trifluoroacetic acid (1000 : 1).~~

~~*Solution B*—Prepare a filtered and degassed mixture of water and trifluoroacetic acid (1000 : 1).~~

~~*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~

~~*Standard solution*—Dissolve an accurately weighed quantity of USP Paroxetine Related Compound E RS in a mixture of *Solution B* and *Solution A* (7 : 3), and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine of about 100 ng per mL.~~ ■~~20 ng per mL.~~■1S (*USP29*)

~~*Test solution*—Transfer about 20 mg of Paroxetine Hydrochloride, accurately weighed, to a suitable flask, add 1.0 mL of a mixture of *Solution B* and *Solution A* (7 : 3), and shake to dissolve.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a tandem mass spectrophotometric detector, monitoring the mass-to-charge ratio of 44 arising from the fragmentation of mass-to-charge ratio of 192, and a 2.0-mm × 25-cm column that contains base-deactivated packing L1. The flow rate is about 0.15 mL per minute. The collision-induced disassociation sector is filled with sufficient argon gas to produce 20-eV collisions. Adjust the argon gas pressure as necessary. The chromatograph is programmed as follows.~~

~~Time (minutes)~~	~~*Solution A* (%)~~	~~*Solution B* (%)~~	~~Elution~~
~~0~~	~~30~~	~~70~~	~~equilibration~~
~~0–10~~	~~30~~	~~70~~	~~isocratic~~
~~10–10.5~~	~~30→90~~	~~70→10~~	~~linear gradient~~
~~10.5–20~~	~~90~~	~~10~~	~~isocratic~~
~~20–20.5~~	~~90→30~~	~~10→70~~	~~linear gradient~~
~~20.5–30~~	~~30~~	~~70~~	~~isocratic~~

~~Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio for the analyte response at a mass-to-charge ratio of 44 is not less than 5; and the relative standard deviation for replicate injections is not more than 5.0%. [NOTE—A large peak due to paroxetine is observed at about 10 minutes in this system. Divert the flow of eluate from the mass spectrometer at about 10 minutes after injection.]~~

~~*Procedure*—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the ma-~~

~~jor peaks. Calculate the amount, in ng, of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine in the portion of Paroxetine Hydrochloride taken by the formula:~~

~~$CI(r_u / r_s)$~~

~~in which *C* is the concentration, in mg per mL, of USP Paroxetine Related Compound E RS in the *Standard solution; I* is the amount, in ng, of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine in each mg of USP Paroxetine Related Compound E RS in the *Standard solution;* and r_u and r_s are the peak responses for 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine obtained from the *Test solution* and the *Standard solution,* respectively: not more than 20 ng is found (0.0001%).~~

■*Solution A*—Dissolve about 30 g of sodium perchlorate in about 900 mL of water. Add 3.5 mL of phosphoric acid and 2.4 mL of triethylamine. Dilute with water to volume, and mix. Adjust with phosphoric acid or triethylamine to a pH of 2.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Solution B: acetonitrile, filtered and degassed.

Diluent: a mixture of water and acetonitrile (4 : 1).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments to either solution as necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of ~~USP Paroxetine Hydrochloride Related Compound E RS,~~ USP Paroxetine Related Compound E Mixture RS, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 42 ng per mL of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine.

Test solution—Transfer about 420 mg of Paroxetine Hydrochloride, accurately weighed, to a 10-mL volumetric flask, dissolve in about 7 mL of *Diluent* with sonication. Dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 242-nm detector and a 4.0-mm × 25-cm column that contains packing L1. The column temperature is maintained at 30°. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	85	15	equilibration
0–20	85→80	15→20	linear gradient
20–27	80→55	20→45	linear gradient
27–36	55	45	isocratic
36–38	55→80	45→15	linear gradient
38–45	85	15	re-equilibration

Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are 0.6 for 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine and 1.0 for paroxetine; and the relative standard deviation for replicate injections is not more than 15.0% for the 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine peak.

Procedure—Separately inject equal volumes (about 75 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine in the portion of Paroxetine Hydrochloride taken by the formula:

$$1000(CI/W)\ (r_i / r_s)$$

in which *C* is the concentration, in mg per mL, of ~~USP Paroxetine Hydrochloride Related Compound E RS~~ USP Paroxetine Related Compound E Mixture RS in the *Standard solution; I* is the fraction, by weight, of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine in ~~USP Paroxetine Hydrochloride Related Compound E RS;~~ USP Paroxetine

In-Process Revision

Hydrochloride Related Compound E Mixture RS; *W* is the weight, in mg, of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the *Test solution;* and r_i and r_S are the peak areas for 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine obtained from the *Test solution* and the *Standard solution,* respectively: not more than of 0.0001% of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine is found.■2S (*USP29*)

Change to read:

Chromatographic purity—[NOTE—Perform all related impurities methods unless the manufacturer has assurance, based on knowledge of the manufacturing process, that one of the tests is not relevant to their material.]

TEST 1—

Solution A—Prepare a filtered and degassed mixture of water, tetrahydrofuran, and trifluoroacetic acid (180 : 20 : 1).

Solution B—Prepare a filtered and degassed mixture of acetonitrile, tetrahydrofuran, and trifluoroacetic acid (180 : 20 : 1).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent: a mixture of water and tetrahydrofuran (9 : 1).

Standard solution—Dissolve an accurately weighed quantity of USP Paroxetine Hydrochloride RS, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 1 µg per mL.

System suitability solution—~~Dissolve, by sonication if necessary, suitable quantities of USP Paroxetine Related Compound A RS and USP Paroxetine Related Compound B RS in *Diluent* to obtain a solution having known concentrations of about 0.01 mg of each USP Reference Standard per mL.~~

■Dissolve, by sonication if necessary, a suitable quantity of ~~USP Paroxetine Hydrochloride for System Suitability RS~~ USP Paroxetine System Suitability Mixture A RS in *Diluent* to obtain a solution having a known concentration of about 1 mg per mL.■2S (*USP29*)

Test solution—Transfer about 25 mg of Paroxetine Hydrochloride, accurately weighed, to a 25-mL volumetric flask, dissolve in 20 mL of *Diluent,* sonicate, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 285-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 1 mL per minute. The column temperature is maintained at 40°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	80	20	equilibration
0–30	80	20	isocratic
30–50	80→20	20→80	linear gradient
50–60	20	80	isocratic
60–70	20→80	80→20	linear gradient

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about ~~1.1 for paroxetine related compound B, and 1.0 for paroxetine related compound A~~

■0.66 for paroxetine related compound A, 0.73 for paroxetine related compound B, and 1.0 for paroxetine;■2S (*USP29*) the resolution, *R,* between paroxetine related compound A and paroxetine related compound B is not less than 2.0; the tailing factor of the paroxetine related compound A peak is between 0.8 and 2.0; and the relative standard deviation for replicate injections is not more than 2.0% for paroxetine related compound A.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution,* the *Test solution,* and the *Diluent* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of each impurity in the portion of Paroxetine Hydrochloride taken by the formula:

$$2500(C/W)(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Paroxetine Hydrochloride RS in the *Standard solution; W* is the weight, in mg, of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the *Test solution;* r_U is the peak area of each impurity in the *Test solution,* excluding the peaks obtained from the chromatogram of the *Diluent;* and r_S is the peak area of paroxetine obtained from the *Standard solution:* not more than of 0.3% of any peak at a retention time of paroxetine related compound B is found; not more that 0.1% of any other individual impurity is found; and not more than 1.0% of total impurities is found.

TEST 2—

Phosphate buffer—Dissolve 3.4 g of monobasic potassium phosphate and 3.4 g of tetrabutylammonium hydrogen sulfate in 1.0 L of water.

Solution A—Prepare a filtered and degassed mixture of *Phosphate buffer* and acetonitrile (98 : 2).

Solution B—Prepare a filtered and degassed mixture of *Phosphate buffer* and acetonitrile (6 : 4).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent: a mixture of *Phosphate buffer* and acetonitrile (9 : 1).

Standard solution—Dissolve an accurately weighed quantity of USP Paroxetine Hydrochloride RS, USP Paroxetine Related Compound B RS, USP Paroxetine Related Compound F RS, and USP Paroxetine Related Compound G RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having known concentrations of about 4 µg per mL, 10 µg per mL, 10 µg per mL, and 4 µg per mL, respectively.

Identification solution—Dissolve an accurately weighed quantity of USP Paroxetine Hydrochloride RS, USP Paroxetine Related Compound B RS, USP Paroxetine Related Compound F RS, and USP Paroxetine Related Compound G RS in *Diluent* to obtain a solution having known concentrations of about 2 mg per mL, 10 µg per mL, 10 µg per mL, and 4 µg per mL, respectively.

In-Process Revision

Test solution—Transfer about 25 mg of Paroxetine Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 3.9-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibration
0–5	100	0	isocratic
5–70	100→40	0→60	linear gradient
70–90	40→0	60→100	linear gradient
90–95	0	100	isocratic
95–95.1	0→100	100→0	linear gradient
95.1–110	100	0	re-equilibration

Chromatograph the *Identification solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.91 for paroxetine related compound B, about 0.96 for paroxetine related compound F, 1.0 for paroxetine, and about 1.34 for paroxetine related compound G. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 10.0% for the paroxetine related compound B, paroxetine related compound F, paroxetine hydrochloride, and paroxetine related compound G peaks.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of paroxetine related compound B, paroxetine related compound F, and paroxetine related compound G in the portion of Paroxetine Hydrochloride taken by the formula:

$$5000(C/W)(r_i / r_S)$$

in which C is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard solution; W* is the weight, in mg, of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the *Test solution;* and r_i and r_S are the peak areas for the corresponding impurity in the *Test solution* and the *Standard solution,* respectively: not more than of 0.5% of paroxetine related compound B is found; not more than 0.2% of paroxetine related compound F is found; and not more than 0.2% of paroxetine related compound G is found. Calculate the percentage of any unknown impurity in the portion of Paroxetine Hydrochloride taken by the formula:

$$5000(C/W)(r_i / r_S)$$

in which C is the concentration, in mg per mL, of USP Paroxetine Hydrochloride RS in the *Standard solution; W* is the weight, in mg, of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the *Test solution;* r_i is the peak area for any unknown impurity in the *Test solution;* and r_S is the peak area of paroxetine in the *Standard solution:* not more than of 0.1 % of any single unknown impurity is found, and not more than 1.0% of total impurities is found.

BRIEFING

Sodium Polystyrene Sulfonate Suspension, *USP 28* page 1793. It is proposed to remove the reference to *Sorbitol* as a component of this dosage form. This revision was prompted by safety concerns. In the absence of any significant adverse comment, it is proposed to implement this revision via the *Fifth Interim Revision Announcement* pertaining to *USP 28–NF 23,* with an official date of October 1, 2005.

(RMI: A. Wilk) RTS—42353-1

Change to read:

» Sodium Polystyrene Sulfonate Suspension is a suspension of Sodium Polystyrene Sulfonate in an aqueous vehicle ~~containing a suitable quantity of sorbitol. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of sorbitol ($C_6H_{14}O_6$), and~~

•that may contain suitable suspending or stabilizing agents. It•5
exchanges not less than 110 mg and not more than 135 mg of potassium for each g of the labeled amount of sodium polystyrene sulfonate.

Delete the following:

•~~**Labeling**—Label it to state the quantity of sorbitol in a given volume of Suspension.~~•5

Delete the following:

•~~**USP Reference standards** ⟨11⟩—*USP Sorbitol RS*~~•5

Delete the following:

•~~**Assay for sorbitol**—~~

~~*Mobile phase, Resolution solution, Standard preparation,* and *Chromatographic system*—Proceed as directed in the *Assay* under *Sorbitol* (see *NF* monograph).~~

~~*Assay preparation*—Dilute an accurately measured volume of Suspension, freshly mixed and free from air bubbles, quantitatively with water to obtain a solution containing about 4.8 mg of sorbitol per mL. Filter, and use the filtrate as the *Assay preparation.*~~

~~*Procedure*—Separately inject equal volumes (about 20 µL) of the *Assay preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Proceed as directed for *Procedure* in the *Assay* under *Sorbitol* (see *NF* monograph). Calculate the quantity, in g, of $C_6H_{14}O_6$, in each mL of the Suspension taken by the formula:~~

~~$$(L / D)(C)(r_U / r_S),$$~~

~~in which L is the labeled quantity, in g, of sorbitol in each mL of Suspension; D is the quantity, in mg, of sorbitol in each mL of the~~

In-Process Revision

~~*Assay preparation* based on the labeled quantity and the extent of dilution; *C* is the concentration, in mg per mL, of *USP Sorbitol RS* in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.~~ •5

BRIEFING

Sodium Salicylate Tablets, *USP 28* page 1794. It is proposed to revise the monograph to include USP Sodium Salicylate RS, to be used in the preparation of the Standard solution specified in the *Dissolution* test.

(PA2: D. Bempong) RTS—42612-1

Add the following:

■**USP Reference standards** ⟨11⟩—*USP Sodium Salicylate RS.* ■2S (*USP29*)

BRIEFING

Tazobactam. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on validated methods of analysis, is being proposed. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with the Partisil ODS-3 brand of L1 column. It is noted that if an autosampler is used, the plastic tubing connected to the injection needle should be replaced with a stainless steel assembly to eliminate absorption of tazobactam on the plastic tubing. In the test for *Related compounds,* the typical retention times for tazobactam related compound A and tazobactam are about 2.8 and 10 minutes, respectively. In the *Assay,* the typical retention times for L-phenylalanine (resolution compound) and tazobactam are about 7 and 10 minutes, respectively.

(PA7a: B. Gilbert) RTS—40762-1

In-Process Revision

Add the following:

■Tazobactam

$C_{10}H_{12}N_4O_5S$ 300.29

4-Thia-1-azobicyclo[3.2.0]heptane-2-carboxylic acid, 3-methyl-7-oxo-3-(1*H*-1,2,3-triazol-1-ylmethyl)-, 4,4-dioxide, [2*S*-(2α,3β,5α)]-.

(2*S*,3*S*,5*R*)-3-Methyl-7-oxo-3-(1*H*-1,2,3-triazol-1-ylmethyl)-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 4,4-dioxide [*89786-04-9*].

» Tazobactam contains not less than 98.0 percent and not more than 102.0 percent of $C_{10}H_{12}N_4O_5S$ calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers. Store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Endotoxin RS. USP Tazobactam RS. USP Tazobactam Related Compound A RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩, on an undried specimen.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Bacterial endotoxins ⟨85⟩**—**[To come.]

Specific rotation ⟨781S⟩**:** between +60° and +167° (*t* = 20°).

Test solution: 10 mg per mL, in dimethylformamide.

Microbial limits ⟨61⟩—The total aerobic microbial count does not exceed 1000 cfu per g, and the total combined molds and yeasts count does not exceed 100 cfu per g.

pH ⟨791⟩**:** between 1.8 and 2.8, in a solution containing 2.5 mg per mL.

Water, *Method I* ⟨921⟩**:** not more than 0.6%.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩**:** 0.002%.

Related compounds—

Mobile phase, L-Phenylalanine solution, System suitability solution, and *Chromatographic system*—Prepare as directed in the *Assay.*

Blank—Use water.

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Test solution—Use the *Assay preparation.*

Procedure—Cool and maintain the *Standard solution*, the *System suitability solution,* the *Blank,* and the *Test solution* at 3° until injection. [NOTE—If an autosampler is used, replace the plastic tubing connected to the injection needle with a stainless steel assembly, and maintain at 3°.] Separately inject equal volumes (about 20 µL) of the *Standard solution*, the *System suitability solution,* the *Blank,* and the *Test solution* into the chromatograph; record the chromatograms; and measure the area responses for the peaks. Calculate the percentage of each related substance in the portion of Tazobactam taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the response for each related compound in the chromatogram obtained from the *Test solution,* and r_s is the sum of the peak responses of all the peaks in the chromatogram obtained from the *Test solution:* not more than 1.0% of tazobactam related compound A is found; and the sum of all impurities found, other than tazobactam related compound A, is not greater than 0.3%. [NOTE—Ignore any peaks in the chromatogram of the *Test solution* that correspond to any peaks seen in the chromatogram of the *Blank.*]

Organic volatile impurities, *Method IV* ⟨467⟩**:** meets the requirements.

Assay—

Mobile phase—Dissolve 1.32 g of dibasic ammonium phosphate in 750 mL of water. Adjust with 5% v/v phosphoric acid to a pH of 2.5, dilute with water to 1000 mL, and mix. Add 30 mL of acetonitrile, mix, and pass through a filter having 0.2-µm porosity. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve accurately weighed quantities of USP Tazobactam RS and USP Tazobactam Related Compound A RS in water to obtain a solution having known concentrations of about 0.5 mg per mL and 0.08 mg per mL, respectively.

L-Phenylalanine solution—Prepare an aqueous solution of L-phenylalanine containing 0.8 mg per mL.

System suitability solution—Pipet 1.0 mL of *L-Phenylalanine solution* and 5.0 mL of the *Standard preparation* into a 50-mL volumetric flask. Dilute with water to volume, and mix. [NOTE—Maintain this solution at 3° until injection. Prepare fresh daily.]

Assay preparation—Transfer about 25 mg of Tazobactam, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 25-cm column that contains 5-µm

packing L1. The flow rate is about 1.5 mL per minute. Chromatograph 20 µL of the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between tazobactam and L-phenylalanine is not less than 6.0; the tailing factor is not more than 1.8; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Cool and maintain the *Standard preparation*, the *System suitability solution*, and the *Assay preparation* at 3° until injection. [NOTE—If an autosampler is used, replace the plastic tubing connected to the injection needle with a stainless steel assembly, and maintain at 3°.] Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{10}H_{12}N_4O_5S$ in the portion of Tazobactam taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Tazobactam RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP29*)

BRIEFING

Tolazamide, *USP 28* page 1945. It is proposed to revise the test for *Chromatographic purity* to correct the relative retention time for the specified impurity (*p*-toluenesulfonic acid) and to modify the calculation procedure.

(PA4: E. Gonikberg) RTS—42605-1

Change to read:

Chromatographic purity—

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and glacial acetic acid (100 : 100 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve an accurately weighed quantity of USP Tolazamide RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.014 mg per mL.

Test solution—[NOTE—Make solution fresh before each injection.] Transfer about 140 mg of Tolazamide, accurately weighed, to a 100-mL volumetric flask, dissolve in *Mobile phase*, sonicating if necessary, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 4000 theoretical plates; the tailing factor is not more than 3.0; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Inject a volume (about 50 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Tolazamide taken by the formula:

~~$100r_i/(\Sigma r_i + r_s)$,~~

■$100(1/F)(r_i / r_s)$■2S (*USP29*)

in which F is the relative response factor, which is equal to ~~2 for any peak having~~

■0.52 for the *p*-toluenesulfonic acid peak eluting at■2S (*USP29*) a relative retention time of ~~0.03~~

■0.23■2S (*USP29*) and equal to 1.0 for all other peaks; r_i is the peak response for each impurity; and ~~r_s is the tolazamide peak response:~~

■r_s is the sum of the responses of all peaks:■2S (*USP29*) not more than 0.5% of any individual impurity is found; and not more than 1.5% of total impurities is found.

In-Process Revision

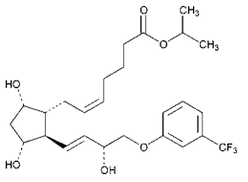
BRIEFING

Travoprost. Because there is no existing *USP* monograph for this drug substance, a new monograph is being proposed based on manufacturer's tests and acceptance criteria. The reverse phase HPLC procedures for the *Related compounds* and *Assay* tests were validated using a Hypersil C18 brand of L1 column; travoprost elutes at approximately 36.5 minutes.

(PA6: L. Evans; PSD: C. Okeke; NL: L. Paul) RTS—41201-1; 42060-1

Add the following:

■Travoprost



$C_{26}H_{35}F_3O_6$ 500.55

[1*R*-[1α(*Z*),2*β*(1*E*,3*R**),3α,5α]]-7-[3,5-Dihydroxy-2-[3-hydroxy-4-[3-(trifluoromethyl)phenoxy]-1-butenyl]cyclopentyl]-5-heptenoic acid, 1-methylethyl ester.

(*Z*)-7-[(1*R*,2*R*,3*R*,5*S*)-3,5-Dihydroxy-2-[(1*E*,3*R*)-3-hydroxy-4-[(α,α,α-trifluoro-*m*-isopropyl-tolyl)oxy]-1-butenyl]cyclopentyl]-5-heptenoate [*157283-68-6*].

» Travoprost contains not less than 96.0 percent and not more than 102.0 percent of $C_{26}H_{35}F_3O_6$, calculated on the anhydrous basis.

Caution—Great care should be taken to avoid inhalation and contact with the body.

Packaging and storage—Preserve at –25° to –15° in tight, light-resistant containers under a nitrogen atmosphere.

USP Reference standards ⟨11⟩—*USP Travoprost RS.*

Identification—

A: *Infrared Absorption* ⟨197F⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Water, *Method Ia* ⟨921⟩**:** not more than 1.0%, determined on a 0.2-g specimen. Use a solvent mixture of acetontrile and methanol (1 : 1) and a titrant for which 1 mL is equivalent to 2 mg of water.

Specific rotation ⟨781S⟩**:** from +52.0° to +58.0°, at 365 nm.

Test solution: 20 mg per mL, in ethyl alcohol, absolute.

Related compounds—

Buffer, Mobile phase, Standard preparation, and *Chromatographic system*—Proceed as directed in the *Assay.*

Test solution—Use the *Assay preparation*.

Procedure—Inject a volume (about 100 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Travoprost taken by the formula:

$$100(1/F)(r_i / r_s)$$

in which F is the relative response factor for each impurity, r_i is the individual peak response of each individual impurity, and r_s is the sum of the responses of all the peaks. In addi-

tion to not exceeding the limits for each impurity in *Table 1,* not more than 0.1% of any other individual impurity is found and not more than 4 .0 % of total impurities is found.

Table 1

Name	Relative Retention Time	Relative Response Factor (*F*)	Limit (%)
acid derivative[1]	about 0.11	1.0	0.2
epoxide derivative[2]	about 0.55	1.0	0.4
15-*epi* diastereomer[3]	about 0.90	1.0	0.1
5,6-*trans* isomer[4]	about 1.16	1.0	3.5
15-keto derivative[5]	about 1.45	1.6	0.3

[1] acid derivative — (5*Z*,13*E*)-(9*S*,11*R*,15*R*)-9,11,15-Trihydroxy-16-(*m*-trifluoromethylphenoxy)-17,18,19,20-tetranor-5,13-prostadienoic acid
[2] epoxide derivative — (5*Z*,13*E*)-(9*S*,11*R*,15*R*)-9,11,15-Trihydroxy-12, 13-dihydroepoxy-16-(*m*-trifluoromethylphenoxy)-17,18,19,20-tetranor-5,13-prostadienoic acid, isopropyl ester;
[3] 15-epi diastereomer — (5*Z*,13*E*)-(9*S*,11*R*,15*S*)-9,11,15-Trihydroxy-16-(*m*-trifluoromethylphenoxy)-17,18,19,20-tetranor-5,13-prostadienoic acid, isopropyl ester
[4] 5,6-trans isomer — (5*E*,13*E*)-(9*S*,11*R*,15*R*)-9,11,15-Trihydroxy-16-(*m*-trifluoromethylphenoxy)-17,18,19,20-tetranor-5,13-prostadienoic acid, isopropyl ester
[5] 15-keto derivative — (5*Z*,13*E*)-(9*S*,11*R*,15*R*)-9,11,-Dihydroxy-15-oxo-16-(*m*-trifluoromethylphenoxy)-17,18,19,20-tetranor-5,13-prostadienoic acid, isopropyl ester

Limit of ethyl acetate—

Standard solution—Dilute an accurately measured quantity of ethyl acetate in *N,N*-dimethylacetamide to obtain a solution having a known concentration of about 50 µg per mL.

Test solution—Dissolve an accurately weighed quantity of Travoprost in *N,N*-dimethylacetamide to obtain a solution having a concentration of about 20 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and contains a 0.53-m × 30-m column coated with a 1-µm film of liquid phase G16. The carrier gas is helium, flowing at a rate of 4 mL per minute. The chromatograph is programmed as follows. Initially the temperature of the column is maintained at 55° for 6 minutes, then the temperature is increased at a rate of 25° per minute to 240°, and held at 240° for 20 minutes. The injection port temperature is maintained at 140°, and the detector temperature is maintained at 240°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the retention time is about 3.5 minutes for ethyl acetate; the resolution, *R,* between ethyl acetate and any adjacent peak is not less than 1.5; and the relative standard deviation for replicate injections is not more than 15.0%.

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the concentration, in ppm, of ethyl acetate in the portion of Travoprost taken by the formula:

$$C_S / C_U (r_U / r_S)$$

in which C_S is the concentration, in µg per mL, of ethyl acetate in the *Standard solution;* C_U is the concentration, in g per mL, of Travoprost in the *Test solution;* and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; not more than 5000 ppm of ethyl acetate is found.

Assay—

Buffer—Add 2.0 mL of phosphoric acid to 1 L of water. Adjust with sodium hydroxide to a pH of 3.0.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer* and acetonitrile (7 : 3). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Use USP Travopost RS without dilution (0.5 mg per mL).

In-Process Revision

Assay preparation—Transfer about 25 mg of Travoprost, accurately weighed, to a 50-mL volumetric flask, and dissolve in 15 mL of acetonitrile. Add 25 mL of water, mix, and wait until the solution reaches room temperature. Dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 5-cm column that contains packing L1. The flow rate is about 3.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the resolution, *R,* between travoprost and any adjacent peak is not less than 1.5; the column efficiency is not less than 1500 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{26}H_{35}F_3O_6$ in the portion of Travoprost taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Travoprost RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP29*)

BRIEFING

Travoprost Ophthalmic Solution. Because there is no existing *USP* monograph for this dosage form, a new monograph is being proposed based on manufacturer's tests and acceptance criteria. The reverse phase HPLC procedures for the *Limit of degradation products* and *Assay* tests were validated using a Discovery C18 brand of L1 column; travoprost elutes at aprroximately 38.9 minutes. The reverse phase HPLC procedure for the *Limit of travoprost related compound A* test was validated using a Hypersil C18 brand of L1 column; travoprost related compound A elutes at approximately 15.2 minutes.

(PA6: L. Evans; PSD: C. Okeke; NL: L. Paul; AMB: R. Tirumalai) RTS—41201-2; 42060-2

Add the following:

■Travoprost Ophthalmic Solution

» Travoprost Ophthalmic Solution is a sterile buffered aqueous solution of Travoprost. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of travoprost ($C_{26}H_{35}F_3O_6$). It may contain suitable stabilizers, buffers, and antimicrobial agents.

Caution—Great care should be taken to avoid inhalation of Travoprost and exposure to the body.

Packaging and storage—Preserve in tight, light-resistant containers. Store between 2° to 25°.

USP Reference standards ⟨11⟩**—***USP Travoprost RS. USP Travoprost Related Compound A RS.*

In-Process Revision

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Sterility—It meets the requirements under *Sterility Tests* ⟨71⟩ when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined.*

pH ⟨791⟩**:** between 5.5 and 6.5.

Limit of travoprost related compound A—

Buffer—Add 2.0 mL of phosphoric acid to 2.0 L of water Adjust with sodium hydroxide to a pH of 3.0.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer* and acetonitrile (19 : 6). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dilute USP Travoprost Related Compound A RS with water and acetonitrile (80 : 20), and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.3 µg of travoprost related compound A per mL.

Test solution—Use the Ophthalmic Solution without dilution.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 5-cm column that contains packing L1. The flow rate is about 3.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 2000 theoretical plates; and the relative standard deviation for replicate injections is not more than 10.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg of USP Travoprost Related Compound A RS in each mL of the Ophthalmic Solution taken by the formula:

$$C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Travoprost Related Compound A RS in the *Standard solution;* and r_U and r_S are the peak responses of travoprost related compound A obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.3% is found.

Limit of degradation products—

Buffer, Mobile phase, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Prepare as directed for *Standard preparation* in the *Assay.*

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay.*

Procedure—Measure the responses for the 5,6-*trans* isomer and 15-keto derivative. Calculate the quantity, in mg, of each degradation product in each mL, of the Ophthalmic Solution taken by the formula:

$$(C/F)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of travoprost in the *Standard solution; F* is the relative response factor for each known degradation product; r_U is the peak response for each degradation product obtained from the *Test solution;* and r_S is the travoprost peak response obtained from the *Standard solution:* not more than 5.0% of 5,6-*trans* isomer (relative retention time of about 1.1 and relative response factor, F = 1.0) and not more than 0.3% of the 15-keto derivative (relative retention time of about 1.4 and relative response factor, F = 1.7) is found; and the sum of all

In-Process Revision

degradation products, including the amount of travoprost related compound A obtained in the test for the *Limit of travoprost related compound A* is not more than 5.5%.

Assay—

Buffer—Dissolve 4.35 g of octanesulfonic acid, sodium salt in 2.0 L of water. Adjust with phosphoric acid to a pH of 3.5.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer* and acetonitrile (33 : 17). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dilute USP Travoprost RS with water and acetonitrile (7 : 3), and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.04 mg of travoprost per mL.

Assay preparation—Use the Ophthalmic Solution without dilution.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between travoprost and any adjacent peak is not less than 1.5; the column efficiency is not less than 2000 theoretical plates; and the relative standard deviation for replicate injections for the travoprost peak is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of travoprost ($C_{26}H_{35}F_3O_6$) in each mL of the Ophthalmic Solution taken by the formula:

$$C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Travoprost RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■2S (*USP29*)

BRIEFING

Valsartan and Hydrochlorothiazide Tablets, page 2000 of *PF* 29(6) [Nov.–Dec. 2003]. This monograph is presented again with additional changes. It is proposed to revise the formulas for the calculation of the amounts of drug released in the test for *Dissolution.*

(BPC: M. Marques) RTS—42317-1

Add the following:

■Valsartan and Hydrochlorothiazide Tablets

» Valsartan and Hydrochlorothiazide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of valsartan ($C_{24}H_{29}N_5O_3$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$).

Packaging and storage—Preserve in ~~well-closed containers.~~ tight containers, and store at 25°; excursions are permitted between 15° and 30°. Protect from moisture and heat.

USP Reference standards ⟨11⟩—~~*USP 4-Amino-6-chloro-1,3-benzenedisulfonamide RS.*~~ *USP Benzothiadiazine Related Compound A RS. USP Hydrochlorothiazide RS. USP Valsartan RS. USP Valsartan Related Compound B RS.*

In-Process Revision

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—To a centrifuge tube transfer an amount of ground Tablets, equivalent in weight to a single Tablet, add 2.0 mL of acetone, sonicate for 15 minutes, and centrifuge.

Application volume: 2 µL.

Developing solvent system: a mixture of ethyl acetate, dehydrated alcohol, and a solution (25 in 100) of ammonium hydroxide (8 : 2 : 1).

Procedure—Proceed as directed in the chapter, except to develop the plate in a paper-lined chromatographic chamber equilibrated with *Developing solvent system* for about 15 minutes prior to use. Allow the chromatogram to develop until the solvent front has moved at least 7 cm. After removing the plate and marking the solvent front, dry the plate under a current of warm air until it is completely dry. The R_F values of the principal spots obtained from the *Test solution* correspond to those obtained from the Standard solution.

B: The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: pH 6.8 phosphate buffer; 1000 mL.

Apparatus 2: 50 rpm.

Time: ~~45~~ 30 minutes.

Procedure—Determine the amounts of valsartan ($C_{24}H_{29}N_5O_3$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) dissolved by employing UV absorption at the wavelengths of maximum absorbance at about 250 nm for valsartan ~~(corrected for interference from hydrochlorothiazide on the basis of the absorbances of hydrochlorothiazide at 250 and 272 nm)~~ and at about 272 nm for hydrochlorothiazide on portions of the solution under test passed through a 1-µm glass fiber filter, ~~suitably diluted with *Dissolution Medium,* in comparison with a Standard solution having known concentrations of USP Valsartan RS and USP Hydrochlorothiazide RS in the same *Medium*~~ diluted with *Medium* if necessary, using a 0.2-cm quartz cell. Calculate the amount of valsartan ($C_{24}H_{29}N_5O_3$) dissolved, in percentage, by the formula:

$$1000D\left(\frac{A_{\text{obs}250}a_{\text{H}272}-A_{\text{obs}272}a_{\text{H}250}}{a_{\text{V}250}a_{\text{H}272}-a_{\text{V}272}a_{\text{H}250}}\right)$$

~~in which D is the sample dilution factor if used; A_{obs250} is the observed absorbance of the sample solution at 250 nm; A_{obs272} is the observed absorbance of the sample solution at 272 nm; a_{V250} is the absorptivity of valsartan at 250 nm; a_{V272} is the absorptivity of valsartan at 272 nm; a_{H250} is the absorptivity of hydrochlorothiazide at 250 nm; and a_{H272} is the absorptivity of hydrochlorothiazide at 272 nm. The absorptivities, a, are determined from separate Standard solutions of USP Valsartan RS and USP Hydrochlorothiazide RS in the *Medium* having known concentration and expressed in units as defined by *Spectrophotometry and Light Scattering* ⟨851⟩. Calculate the quantity of $C_7H_8ClN_3O_4S_2$ dissolved, in mg, by the formula:~~

$$1000D\left(\frac{A_{\text{obs}272}a_{\text{V}250}-A_{\text{obs}250}a_{\text{V}272}}{a_{\text{V}250}a_{\text{H}272}-a_{\text{V}272}a_{\text{H}250}}\right)$$

~~in which the terms are as defined above.~~

$$\frac{(AT2\times A1\%H_{272nm})-(AT1\times A1\%H_{250nm})}{(A1\%V_{250nm}\times A1\%H_{272nm})-(A1\%V_{272nm}\times A1\%H_{250nm})}\times 12{,}500$$

In-Process Revision

Calculate the amount of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) dissolved, in percentage, by the formula:

$$\frac{(AT1 \times A1\%V_{250nm}) - (AT2 \times A1\%V_{272nm})}{(A1\%H_{272nm} \times A1\%V_{250nm}) - (A1\%H_{250nm} \times A1\%V_{272nm})} \times 80{,}000$$

in which $AT1$ is the absorbance of the solution under test at 272 nm; $AT2$ is the absorbance of the solution under test at 250 nm; $A1\%V_{272nm}$ is the absorptivity (1%, 0.2 cm, 272 nm) of valsartan in *Medium;* $A1\%V_{250nm}$ is the absorptivity (1%, 0.2 cm, 250 nm) of valsartan in *Medium;* $A1\%H_{272\ nm}$ is the absorptivity (1%, 0.2 cm, 272 nm) of hydrochlorthiazide in *Medium;* $A1\%H_{250nm}$ is the absorptivity (1%, 0.2 cm, 250 nm) of hydrochlorothiazide in *Medium.*

Tolerances—Not less than ~~75%~~ 80% *(Q)* of the labeled amounts of $C_{24}H_{29}N_5O_3$ and $C_7H_8ClN_3O_4S_2$ is dissolved in ~~45~~ 30 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

Diluent, Solution A, Solution B, Mobile phase, and *Chromatographic system*—Prepare as directed in the *Assay.*

Standard solution—Use the *Standard preparation,* as prepared in the *Assay.*

Test solution—Place 1 Tablet in a 200-mL volumetric flask, add 5 mL of water, and allow to stand for 5 minutes. Add about 100 mL of *Diluent,* and sonicate for 15 minutes. Dilute with *Diluent* to volume, mix, and centrifuge a portion of this solution at about 3000 rpm. Quantitatively dilute a volume of the clear supernatant with *Diluent* to obtain a solution having a concentration of about 0.2 mg of valsartan per mL.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Separately calculate the quantities, in mg, of valsartan ($C_{24}H_{29}N_5O_3$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the Tablet taken by the formula:

$$(LC_S / C_U)(r_U / r_S)$$

in which L is the labeled quantity, in mg, of the relevant analyte in the Tablet; C_S is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard solution;* C_U is the concentration, in mg per mL, of the corresponding analyte in the *Test solution,* based on the labeled quantity per Tablet and the extent of dilution; and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively.

Related compounds—

Diluent, Solution A, Solution B, and *Mobile phase*—Prepare as directed in the *Assay.*

Standard stock solution—Dissolve accurately weighed quantities of ~~USP 4-Amino-6-chloro-1,3-benzenedisulfonamide RS,~~ USP Benzothiadiazine Related Compound A RS, USP Hydrochlorothiazide RS, USP Valsartan RS, and USP Valsartan Related Compound B RS in *Diluent* to obtain a solution having known concentrations of about 0.03 mg per mL, 0.06 mg per mL, 0.08 mg per mL, and 0.2 mg per mL, respectively.

Resolution solution—Dilute 5.0 mL of *Standard stock solution* with *Diluent* to 100.0 mL, and mix.

Standard solution—Dilute 10.0 mL of the *Resolution solution* with *Diluent* to 100.0 mL, and mix.

Test solution—Use the *Assay preparation* as specified.

Chromatographic system—Prepare as directed in the *Assay.* Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between valsartan related compound B and valsartan, and between ~~4-amino-6-chloro-1,3-benzenedisulfonamide~~ benzothiadiazine related compound A and hydrochlorothiazide

In-Process Revision

is not less than 1.4. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation, determined from the valsartan and hydrochlorothiazide peaks, for replicate injections is not more than 10.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks, disregarding the peak, if any, with a retention time of about 22 minutes. Calculate the quantity, in mg, of each impurity in the portion of Tablets taken by the formula:

$$2000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of ~~USP Valsartan Related Compound B RS or USP 4-Amino-6-chloro-1,3-benzenedisulfonamide RS,~~ USP Benzothiadiazine Related Compound A RS, or the relevant USP Reference Standard (when determining the quantity of other impurities) in the *Standard solution;* and r_U and r_S are the corresponding peak responses obtained from the *Test solution* and the *Standard solution,* respectively: not more than ~~0.5%~~ 1.0% ~~each of valsartan related compound B and~~ of ~~4-amino-6-chloro-1,3-benzenedisulfonamide~~ benzothiadiazine related compound A is found; not more than 0.2% of any other impurity, excluding valsartan related compound A ~~and valsartan related compound B~~, is found; and not more than ~~0.8%~~ 1.3% of total impurities, excluding valsartan related compound A, ~~and valsartan related compound B~~ is found. [NOTE—Valsartan related compound A is the enantiomer of valsartan and coelutes with valsartan in this test.]

Assay—

Diluent—Prepare a mixture of acetonitrile and water (1 : 1).

Solution A—Prepare a filtered and degassed mixture of water, acetonitrile, and trifluoroacetic acid (90 : 10 : 0.1).

Solution B—Prepare a filtered and degassed mixture of acetonitrile, water, and trifluoroacetic acid (90 : 10 : 0.1).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer about 12.5 mg of USP Hydrochlorothiazide RS, accurately weighed, to a 200-mL volumetric flask. Add about 12.5J mg of USP Valsartan RS, accurately weighed, J being the ratio of the labeled amount, in mg, of valsartan to the labeled amount, in mg, of hydrochlorothiazide per Tablet. Add about 100 mL of *Diluent,* sonicate for 15 minutes, dilute with *Diluent* to volume, and mix. Transfer 25.0 mL of this solution to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix. Quantitatively dilute a volume of this solution with *Diluent* to obtain a solution having a known concentration of about 0.2 mg of USP Valsartan RS per mL.

Assay preparation—Transfer a number of Tablets, equivalent to about 62.5 mg of hydrochlorothiazide, to a 250-mL volumetric flask. Add 5 mL of water, and allow to stand for 5 minutes. Then add about 100 mL of *Diluent,* sonicate for 15 minutes, and shake for 30 minutes. Dilute with *Diluent* to volume, mix, and centrifuge a portion of this solution at 3000 rpm. Dilute 25.0 mL of the clear supernatant with *Diluent* to 200.0 mL, and mix *(Solution 1).* [NOTE—Retain a portion of *Solution 1* to use as the *Test solution* in the test for *Related compounds*.] Dilute an accurately measured volume of *Solution 1* with *Diluent* to obtain a solution containing about 0.2 mg of valsartan per mL.

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 265-nm detector and a 3.0-mm × 12.5-cm column that contains 5-µm packing L1. The flow rate is about 0.4 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–25	90→10	10→90	linear gradient
25–27	10→90	90→10	linear gradient
27–40	90	10	isocratic

Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Separately calculate the quantities, in mg, of valsartan ($C_{24}H_{29}N_5O_3$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the portion of Tablets taken by the formula:

$$(LC_S / C_U)(r_U / r_S)$$

in which L is the labeled quantity, in mg, of the relevant analyte in each Tablet; C_S is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation;* C_U is the concentration, in mg per mL, of the corresponding analyte in the *Assay preparation,* based on the labeled quantity per Tablet and the extent of dilution; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP29*)

BRIEFING

Vasopressin, *USP 28* page 2016. It is proposed to revise *Identification* test *B* by replacing the test for *Bioidentity* with a test for *Mass spectral analysis*.

(BNT: L. Callahan) RTS—42671-1

Change to read:

Identification—

A: The retention time of the vasopressin peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

~~**B:** *Bioidentity*—About 18 hours prior to the test, select a male rat weighing between 275 g and 325 g. Inject, subcutaneously, 1 mL per kg of body weight of a solution prepared by dissolving 50 mg of phenoxybenzamine hydrochloride in 0.1 mL of alcohol, acidifying with 1 drop of hydrochloric acid, and diluting with saline TS to 5 mL. On the day of the test, anesthetize the rat, using an anesthetic substance that favors the maintenance of a uniform blood pressure. Secure the animal, and cannulate the trachea for artificial respiration. Arrange to obtain a continuous record of the blood pressure from the carotid artery. Arrange for intravenous injections by means of a suitable cannula approximately 1 mm in external diameter inserted into a femoral or jugular vein. Keep the animal warm during its preparation and during the test. Determine by trial the dose of the *Standard preparation* which, when injected intravenously at regular intervals of 12 to 15 minutes, will produce consistent blood pressure elevations of between 20 and 70 mm of mercury. Select the 2 doses that would be in a ratio of approximately 2 to 3, and prepare 2 doses of the *Test preparation* that correspond to the doses of the selected *Standard preparations*. Inject the rat with each dose in replicate of the *Standard preparation* and the *Test preparation* in a random fashion at regular intervals of 12 to 15 minutes, and record the blood pressures. The requirements of the test are met if the increase in blood pressure between the low dose and the high dose of the *Standard preparation* is comparable to that of the *Test preparation*.~~

■**B:** *Mass spectral analysis*—

Infusion solution—Prepare a mixture of acetonitrile, water, and trifluoroacetic acid (80 : 20 : 0.08).

Standard solution—Dissolve an accurately weighed quantity of USP Vasopressin RS in water to obtain a solution having a known concentration of about 1 mg per mL.

Test solution—Dissolve an accurately weighed quantity of USP Vasopressin RS in water to obtain a solution having a known concentration of about 1 mg per mL. [NOTE—The final concentrations of the *Standard solution* and the *Test solution* can be adjusted depending on the sensitivity of the mass spectrometer used in the testing.]

In-Process Revision

Mass spectrometric system (see *Mass Spectrometry* ⟨736⟩)—The LC/MS spectrometer is equipped with an infusion system connected to an electrospray interface. The mass spectrometer is operated in the positive ion mode. [NOTE—The infusion system flow rate can be adjusted, as needed. To assist in nebulization, the infusion system can contain a sheathing gas fluid.]

Procedure—Separately inject equal volumes of the *Standard solution* and the *Test solution* (about 10 µL) into the infusion system. The flow rate for the infusion system is approximately 0.3 mL per minute. Obtain optimized mass spectra, following injection. The mass spectra of both the *Standard solution* and the *Test solution* should contain peaks with mass-to-charge ratios of 1084 and 543.■2S (*USP29*)

BRIEFING

Excipients, USP and NF Excipients, Listed by Category, *NF 23* page 2941, page 3349 of the *First Supplement,* and page 805 of *PF* 31(3) [May–June 2005]. It is proposed to add *Maltitol* to the *Humectant, Sweetening Agent,* and *Tablet and/or Capsule Diluent* categories to complement the proposed new monograph *Maltitol*. It is also proposed to add *Amino Methacrylate Copolymer* and *Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion* to the *Coating Agent, Polymer Membrane,* and *Tablet Binder* categories to complement the proposed new monographs *Amino Methacrylate Copolymer* and *Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion,* respectively, which appear elsewhere in this issue of *PF.*

(EMC) RTS—39405-1; 40243-1; 41750-1; 41979-1; 41979-2

Add the following:

■In the following reference table, the grouping of excipients by functional category is intended to summarize the most typically identified purpose that these excipients serve in drug product formulations. The list of substances included in each category is not comprehensive. The statement of category is intended neither to limit in any way the choice or use of the substance nor to indicate that it has no other utility.■2S (*NF23*)

DIETARY SUPPLEMENTS—MONOGRAPHS

BRIEFING

Lutein, *USP 28* page 2112; **Lutein Preparation,** *USP 28* page 2112. It is proposed to revise the content of lutein and zeaxanthin specifications in the Definition. Revisions to the *Packaging and storage* section are also being proposed. *Identification* test *A* is being revised to account for the absorbance exhibited by the small amount of zeaxanthin present. A new normal phase HPLC procedure used in the tests for *Zeaxanthin and other related compounds* and *Content of lutein* is being proposed; it was validated using a Spherisorb CN brand of L10 column. The retention times for lutein and zeaxanthin are about 20.0 minutes and 22.6 minutes, respectively. Finally, additional revisions are being proposed in the test for *Content of total carotenoids.*

(DSN: L. Evans; PSD: C. Okeke) RTS—42699-1

Change to read:

» Lutein is the purified fraction obtained from saponification of the oleoresin of *Tagetes erecta* L. It contains not less than 80.0 percent of total carotenoids calculated as lutein ($C_{40}H_{56}O_2$). ~~It contains not less than 75.0 percent of lutein and not more than 8.0 percent of zeaxanthin, both calculated as lutein ($C_{40}H_{56}O_2$) on the anhydrous basis.~~

■It contains not less than 74.0 percent of lutein and not more than 8.5 percent of zeaxanthin, both calculated as ($C_{40}H_{56}O_2$) on the anhydrous basis.■2S (*USP29*)

MONOGRAPHS (NF)

BRIEFING

Amino Methacrylate Copolymer. Because there is no existing *NF* monograph for this excipient, a new monograph, based on submitted data, is being proposed. The procedure in *Test 1* under *Limit of monomers* is based on analysis performed with the Nucleosil C18 brand of L1 columns, and *Test 2* is based on analysis performed with the Nucleosil NH2 brand of L8 columns. The typical retention times in *Test 1* for methyl methacrylate and butyl methacrylate are about 1.8 minutes and 8.4 minutes, respectively. The typical retention time in *Test 2* is about 2.0 minutes for (2-dimethylaminoethyl) methacrylate.

(EMC: C. Sheehan; NL: W. Paul; PSD: C. Okeke) RTS—39405-1; 40243-1

Add the following:

■Amino Methacrylate Copolymer

» Amino Methacrylate Copolymer is a fully polymerized copolymer of (2-dimethylaminoethyl) methacrylate, butyl methacrylate, and methyl methacrylate. It contains not less than 20.8 percent and not more than 25.5 percent dimethylaminoethyl groups ($C_4H_{10}N$), calculated on the dried basis.

Packaging and storage—Preserve in tight containers, and store at a temperature not exceeding 25°.

USP Reference standards ⟨11⟩—*USP Amino Methacrylate Copolymer RS.*

Color of solution—The absorbance of the *Test solution* prepared in the test under *Viscosity,* determined in a 1-cm cell at 420 nm in a suitable spectrophotometer, is not greater than 0.300. Use water as the blank.

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: Pour 1 mL of the *Test solution* prepared in the test under *Viscosity* onto a glass plate and allow the solvent to evaporate: a clear, colorless film results.

Viscosity ⟨911⟩—

Test solution—Dissolve 12.5 g in a mixture of 35.0 g of acetone and 52.5 g of isopropyl alcohol. [NOTE—Reserve a portion of this solution for the *Color of solution* test.]

Procedure—Equip a suitable rotational viscosimeter with an adapter system consisting of a measuring cylinder and a spindle. The measuring cylinder has an internal diameter of 2.762 cm and a depth of 13.50 cm; the spindle is 2.515 cm in diameter, 9.074 cm in height, and has a shaft 0.40 cm in diameter. Transfer 16 mL of the *Test solution* into the measuring cylinder, and adjust the temperature of the solution and the adapter to 20 ± 0.1°. With the spindle rotating at 30 rpm, immediately observe and record the scale reading. Convert the scale reading to centipoises by multiplying the reading by the constant for the viscosimeter, the adapter system, and the speed employed. The viscosity is between 3 and 6 centipoises.

Loss on drying ⟨731⟩—Dry it at 110° for 3 hours: it loses not more than 2.0% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Limit of monomers—

TEST 1, LIMIT OF BUTYL METHACRYLATE AND METHYL METHACRYLATE—

pH 2.0 Phosphate buffer (0.0625 M)—Prepare an aqueous solution containing 8.9 g of anhydrous dibasic sodium phosphate and 8.5 g of monobasic potassium phosphate per L. Adjust with phosphoric acid to a pH of 2.0.

Mobile phase—Prepare a mixture of methanol and *pH 2.0 Phosphate buffer (0.0625 M)* (55 : 45).

Standard solution—Prepare a solution in acetonitrile having a concentration of about 1000 µg per mL each of butyl methacrylate and methyl methacrylate. Dilute 1.0 mL of the solution to 250.0 mL with water, and mix.

Test solution—Dissolve about 1.0 g of Amino Methacrylate Copolymer, accurately weighed, in *pH 2.0 Phosphate buffer (0.0625 M),* and dilute with *pH 2.0 Phosphate buffer (0.0625 M)* to 50.0 mL, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 205-nm detector and a 4.6-mm × 12-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between butyl methacrylate and methyl methacrylate is not less than 10; and the relative standard deviation for replicate injections is not more than 3.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg, of each monomer in the portion of Amino Methacrylate Copolymer taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in µg per mL, of each monomer in the *Standard solution;* and r_U and r_S are the peak responses of each monomer obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.1% of each monomer is found.

TEST 2, LIMIT OF 2-DIMETHYLAMINOETHYL METHACRYLATE—

Potassium monobasic phosphate solution (0.025M)—Prepare an aqueous solution containing 3.4 g of monobasic potassium phosphate per L.

Mobile phase—Prepare a mixture of *Potassium monobasic phosphate solution (0.025M)* and tetrahydrofuran (75 : 25).

Standard solution—Prepare a solution in tetrahydrofuran having a concentration of about 200 µg per mL of (2-dimethylaminoethyl) methacrylate. Dilute 2.0 mL of the solution to 50.0 mL with tetrahydrofuran, and mix.

Test solution—Dissolve about 1.0 g of Amino Methacrylate Copolymer, accurately weighed, in tetrahydrofuran, dilute with tetrahydrofuran to 50.0 mL, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 12-cm column that contains packing L8. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the

In-Process Revision

response for the major peak. Calculate the quantity, in µg, of (2-dimethylaminoethyl) methacrylate in the portion of Amino Methacrylate Copolymer taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in µg per mL, of the monomer in the *Standard solution;* and r_U and r_S are the peak responses of (2-dimethylaminoethyl) methacrylate obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.1% is found.

Assay—Dissolve 0.20 g in a mixture of 4 mL of water and 96 mL of glacial acetic acid, and mix. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically (see *Titrimetry* ⟨541⟩). One mL of 0.1 N perchloric acid is equivalent to 7.21 mg of dimethylaminoethyl groups ($C_4H_{10}N$).■2S (*NF24*)

■The indicated viscosity may be in the form of a range encompassing 80.0% to 120.0% of the nominal viscosity, where the solution concentration is 1% (w/w); and 75.0% to 140.0% of the nominal viscosity, where the solution concentration is 2% (w/w).■2S (*NF24*)

Change to read:

Viscosity ⟨911⟩—Determine the viscosity in a water solution at the concentration stated on the label. Using undried Carboxymethylcellulose Sodium 12, weigh accurately the amount which, on the dried basis, will provide 200 g of solution of the stated concentration. Add the substance in small amounts to about 180 mL of stirred water contained in a tared, wide-mouth bottle, continue stirring rapidly until the powder is well wetted, add sufficient water to make the mixture weigh 200 g, and allow to stand, with occasional stirring, until solution is complete. Adjust the temperature to 25 ± 0.2°, and determine the viscosity, using a rotational type of viscosimeter, making certain that the system reaches equilibrium before taking the final reading. The viscosity of solutions of 2% concentration is not less than 80.0% and not more than 120.0% of that stated on the label; the viscosity of solutions of 1% concentration is not less than 75.0% and not more than 140.0% of that stated on the label

■or it is between the maximum and minimum values, where stated as a range of viscosities.■2S (*NF24*)

BRIEFING

Carboxymethylcellulose Sodium 12, *NF 23* page 2978. It is proposed to revise the *Labeling* and *Viscosity* sections to allow viscosity to be stated as a range of viscosities. The proposed range corresponds to the requirements under *Viscosity,* when it is stated as a single value.

(EMC: J. Lane) RTS—42626-1

Change to read:

Labeling—Label it to indicate the

BRIEFING

Diisopropanolamine. It is proposed to reinstate this excipient monograph, which was omitted in *NF XVIII.*

(EMC: K. Russo; PSD: C. Okeke) RTS—42519-1; 42519-2

Add the following:

■Diisopropanolamine

$C_6H_{15}NO_2$ 133.19

2-Propanol, 1,1′-iminobis-.

1,1′-Iminodi-2-propanol [*110-97-4*].

» Diisopropanolamine is a mixture of isopropanolamines, consisting largely of diisopropanolamine. It contains not less than 98.0 percent and not more than 102.0 percent of isopropanolamines, calculated on the anhydrous basis as $NH(C_3H_6OH)_2$.

In-Process Revision

Packaging and storage—Preserve in tight, light-resistant containers. No specific storage conditions required.

Identification—The infrared absorption spectrum of a thin film exhibits regions of absorption between 2.8 µm and 4.0 µm, between 6.7 µm and 7.1 µm, and between 8.5 µm and 9.4 µm; and several characteristic peaks, the most pronounced being at about 7.3 µm, 7.5 µm, 8.3 µm, 9.6 µm, 10.4 µm, and 10.7 µm.

Water, *Method I* ⟨921⟩**:** not more than 0.50%, a mixture of 5.0 mL of glacial acetic acid and 25 mL of methanol being used as the solvent.

Triisopropanolamine—

Mixed indicator—Dissolve about 150 mg of methyl orange and about 80 mg of xylene cyanole FF in water, and dilute with water to 100 mL.

Procedure—Add 100 mL of methanol and 6 to 8 drops of *Mixed indicator* in a glass-stoppered, 500-mL conical flask, and neutralize with 0.1 N alcoholic sulfuric acid or 0.1 N alcoholic potassium hydroxide. The neutral solution is amber when viewed by transmitted light and is red-brown when viewed by reflected light. Add about 20 g of Diisopropanolamine, accurately weighed. Cautiously add 75 mL of acetic anhydride, and swirl to dissolve. Allow to stand at room temperature for 30 minutes. Cool to room temperature, if necessary. Titrate with 0.5 N alcoholic sulfuric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.5 N alcoholic sulfuric acid is equivalent to 95.7 mg of triisopropanolamine: the limit is 1.0% by weight.

Assay—Transfer about 2 g mg of Diisopropanolamine, accurately weighed, to a 250-mL conical flask, add 50 mL of water and bromocresol green TS, and titrate with 0.5 N hydrochloric acid VS. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.5 N hydrochloric acid is equivalent to 66.60 mg of isopropanolamines, expressed as $NH(C_3H_6OH)_{2\cdot}$■2S *(NF24)*

BRIEFING

Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion. Because there is no existing *NF* monograph for this article, a new monograph, based on submitted data, is being proposed. The liquid chromatographic procedure in the test for *Limit of monomers* is based on analyses performed with a Nucleosil C18 brand of L1 column. Typical retention times for ethyl acrylate and methyl methacrylate are about 6.0 and 6.8 minutes, respectively.

(EMC: C. Sheehan; NL: W. Paul; AMB: R. Tirumalai; PSD: C. Okeke) RTS—41750-1

Add the following:

■Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion

[*9010-88-2*].

» Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion is an aqueous dispersion of a copolymer of ethyl acrylate and methyl methacrylate having an average molecular weight of about 800,000. It may contain suitable emulsifying agents.

Packaging and storage—Preserve in well-closed containers. Store between 5° and 25°, with excursions permitted up to 30°. Do not freeze.

Labeling—Label it to indicate the name and quantity of any added emulsifiers.

USP Reference standards ⟨11⟩**—***USP Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion RS.*

In-Process Revision

Identification, *Infrared Absorption* ⟨197K⟩.

Viscosity ⟨911⟩—Equip a suitable rotational viscosimeter with an adapter system consisting of a measuring cylinder and a spindle. The measuring cylinder has an internal diameter of 2.762 cm and a depth of 13.50 cm; the spindle is 2.515 cm in diameter and 9.074 cm in height, and has a shaft that is 0.40 cm in diameter. Mix the Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion, pipet 16 mL into the measuring cylinder, and adjust the temperature of the Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion and the adapter to $20 \pm 0.1^{\circ}$. With the spindle rotating at 30 rpm, immediately observe and record the scale reading. Convert the scale reading to centipoises by multiplying the reading by the constant for the viscosimeter, the adapter system, and the speed employed. The viscosity is not more than 50 centipoises.

Microbial limits ⟨61⟩—The total aerobic microbial count does not exceed 1000 cfu per g and total yeast and mold count does not exceed 100 cfu per g.

pH ⟨791⟩**:** between 5.5 and 8.6.

Loss on drying ⟨731⟩—Dry it at 110° for 3 hours: it loses between 68.5% and 71.5% of its weight.

Residue on ignition ⟨281⟩—Using mild heating conditions (e.g., steam bath, sand bath) to avoid loss of material, evaporate the Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion to dryness prior to ignition: not more than 0.4% residue is obtained, calculated on the undried basis.

Limit of monomers—

Sodium perchlorate solution—Dissolve 3.5 g of sodium perchlorate in 100 mL of water.

pH 2.0 Phosphoric acid—Dilute phosphoric acid with water to obtain a solution having a pH of 2.0.

Mobile phase—Prepare a mixture of *pH 2.0 Phosphoric acid* and methanol (80 : 20), filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Prepare a solution in tetrahydrofuran having a concentration of about 2 µg per mL each of ethyl acrylate and methyl methacrylate. To 10.0 mL of this solution add 5.0 mL of a *Sodium perchlorate solution,* and mix. Dilute 5.0 mL of the mixture to 10.0 mL with water, and mix.

Test stock solution—Dissolve 1.0 g of Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion with tetrahydrofuran, and dilute with the same solvent to 50 mL.

Test solution—To 5.0 mL of *Sodium perchlorate solution* add 10.0 mL of the *Test stock solution*, dropwise, while stirring continuously. Centrifuge and filter the clear supernatant. Dilute 5.0 mL of the clear supernatant with water to 10.0 mL, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 200-nm detector and a 4.6- × 120-mm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between ethyl acrylate and methyl methacrylate peaks is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0% for each analyte.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg, of each monomer in the portion of Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion taken by the formula:

$$10C(r_U / r_S)$$

In-Process Revision

in which C is the concentration, in µg per mL, of the monomer in the *Standard solution;* and r_U and r_S are the peak responses for the monomer obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.01% of total monomers is found.

Coagulum content—Accurately weigh a stainless steel sieve having 125-µm openings, and filter 100 g of Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion through it. Wash the sieve with distilled water until a clear filtrate is obtained, and dry the sieve to constant weight at 105°: the weight of the residue does not exceed 1000 mg (1%).■2S *(NF24)*

BRIEFING

Lactitol, *NF 23* page 3023. It is proposed to correct the calculations in the test for *Related compounds*.

(PA4: E. Gonikberg) RTS—42599-1

Change to read:

Related compounds—

Standard solution—Dissolve an accurately weighed quantity of USP Lactitol RS in water to obtain a solution having a known concentration of about 0.3 mg per mL.

Chromatographic system—Proceed as directed in the *Assay*, except to chromatograph the *Standard solution* instead of the *Standard preparation.*

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay.*

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. The relative retention times are about 0.53 for lactose, 0.58 for glucose, 0.67 for galactose, 0.72 for lactulitol, 1.0 for lactitol, 1.55 for galactitol, and 1.68 for sorbitol. Calculate the percentages of galactitol, sorbitol, lactulitol, lactose, glucose, and galactose in the portion of Lactitol taken by the formula:

~~$1000(C/W)(r_U/r_S)$,~~

■$100(CV/W)(r_U/r_S)$■2S *(NF24)*

in which C is the concentration, in mg per mL, of USP Lactitol RS in the *Standard solution*;

■V is the volume, in mL, of the *Test solution;*■2S *(NF24)*
W is the weight, in mg, of Lactitol in the *Test solution;* r_U is the peak response of the relevant related compound, if observed, obtained from the *Test solution;* and r_S is the lactitol peak response obtained from the *Standard solution*. The total of the percentages of all related compounds is not more than 1.5%.

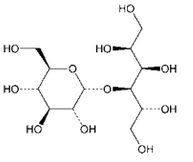
BRIEFING

Maltitol. Because there is no existing *NF* monograph for this article, the following new monograph is proposed based on a manufacturer's tests and acceptance criteria. The liquid chromatographic procedure in the *Assay* is based on analysis performed using a Biorad Aminex Fast Carbohydrate brand of L34 column; maltitol peak elutes at approximately 8.7 minutes.

(EMC: C. Sheehan; NL: W. Paul; PSD: C. Okeke; AMB: R. Tirumalai) RTS— 41979-1

Add the following:

■Maltitol



$C_{12}H_{24}O_{11}$ 344.31

D-Glucopyranosyl-D-glucitol [*585-88-6*].

» Maltitol contains not less than 92.0 percent and not more than 100.5 percent of D-maltitol, calculated on the anhydrous basis. The amounts of total sugars, other polyhydric alcohols, and any polyol

In-Process Revision

anhydrides, if detected, are not included in the requirements or in the calculated amount under *Other Impurities* in *General Notices and Requirements.*

Packaging and storage—Preserve in well-closed containers. No storage requirements specified.

USP Reference standards ⟨11⟩—*USP Maltitol RS.*

Identification—

A: Dissolve 1 g of Maltitol in 75 mL of water. Transfer 3 mL of this solution to a 15-cm test tube, add 3 mL of freshly prepared catechol solution (1 in 10), and mix. Add 6 mL of sulfuric acid, mix again, then gently heat the tube in a flame for about 30 seconds: a deep pink or wine-red color appears.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Microbial limits ⟨61⟩—The total aerobic microbial count using the *Plate Method* is not more than 1000 cfu per g and the total combined molds and yeasts count is not more than 100 cfu per g.

Conductivity—Dissolve 20.0 g of Maltitol in water, and dilute with the same solvent to 100.0 mL. Using an appropriate conductivity meter, choose a conductivity cell that is appropriate for the properties and conductivity of the solution to be examined. Use a certified reference material[1], for example a solution of potassium chloride, that is appropriate for the measurement. The conductivity value of the certified reference material should be near the expected conductivity value of the solution to be examined. After calibrating the apparatus with a certified reference material solution, rinse the conductivity cell several times with water and at least twice with the aqueous solution to be examined. Measure the conductivity of the solution at a temperature of 20°, while gently stirring with a magnetic stirrer: the conductivity is not more than 20 μS per cm.

Water, *Method I* ⟨921⟩**:** not more than 1.0%.

Reducing sugars—Dissolve 3.3 g of Maltitol in 3 mL of water with the aid of gentle heat. Cool, and add 20.0 mL of cupric citrate TS and a few glass beads. Heat so that boiling begins after 4 minutes, and maintain boiling for 3 minutes. Cool rapidly, and add 40 mL of diluted acetic acid, 60 mL of water, and 20.0 mL of 0.05 N iodine VS. With continuous shaking, add 25 mL of a mixture of 6 mL of hydrochloric acid and 94 mL of water. When the precipitate has dissolved, titrate the excess of iodine with 0.05 N sodium thiosulfate VS using 2 mL of starch TS, added towards the end of the titration, as an indicator. Not less than 12.8 mL of 0.05 N sodium thiosulfate VS is required, corresponding to not more than 0.3% of reducing sugars, as glucose. The amount determined in this test is not included in the calculated amount under *Other Impurities*.

Limit of nickel—not more than 1 μg per g calculated on the anhydrous basis is found. Proceed as directed in the test for *Limit of nickel* under *Sorbitol.*

Assay—

Mobile phase—Use degassed water.

Standard preparation—Dissolve accurately weighed quantities of USP Maltitol RS and sorbitol in water, to obtain a solution having known concentrations of about 10 mg per g and 1.6 mg per g, respectively.

[1] Commercially available conductivity calibration solutions for conductivity meter standardization, standardized by methods traceable to the National Institute of Standards and Technology (NIST), may be used. Solutions prepared according to instructions given in ASTM Standard D1125 may be used provided the conductivity of the resultant solution is the same as that of the solution prepared from the NIST-certified material.

In-Process Revision

Resolution solution—Dissolve accurately weighed quantities of USP Maltitol RS and sorbitol in water to obtain a solution having known concentrations of about 4.8 mg of each per g.

Assay preparation—Dissolve about 0.20 g of Maltitol, accurately weighed, in water, and dilute with water to about 20 g. Accurately record the final solution weight, and mix thoroughly.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatographic system is equipped with a refractive index detector maintained at a constant temperature of about 35°, and a 7.8-mm × 10-cm column that contains packing L34 (see *Chromatography* ⟨621⟩). The column temperature is maintained at about 60°, controlled to within ±2°, and the flow rate is about 0.5 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.48 for maltitol, and 1.0 for sorbitol; the resolution, *R*, between maltitol and sorbitol is not less than 2.0. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Assay preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage, on the anhydrous basis, of $C_{12}H_{24}O_{11}$, in the portion of Maltitol taken by the formula:

$$[10{,}000(C_S / C_U)(r_U / r_S)]/(100 - W)$$

in which C_S is the concentration, in mg per g, of USP Maltitol RS in the *Standard preparation;* C_U is the concentration, in mg per g, of Maltitol in the *Assay preparation;* r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively; and *W* is the percentage obtained in the test for *Water.* ■2S (*NF24*)

BRIEFING

Nitrogen, *NF 23* page 3041, page 3359 of the *First Supplement,* and the *Third Interim Revision Announcement (Notice of Postponement)* on page 708 of *PF* 31(3) [May–June 2005]—See briefing under *Medical Air.*

■[NOTE—This test does not require a developing solvent.]■2S *(NF24)*

Adsorbent: 0.25-mm layer of chromatographic silica gel.

Spray reagent—Dissolve about 1.23 g of *p*-anisidine and 1.66 g of phthalic acid in 100 mL of methanol. Store the solution in the dark and refrigerate to prevent discoloration. Discard if the solution becomes discolored. *[Caution—p-Anisidine is toxic if inhaled or if absorbed through the skin.]*

Standard solution 1—Transfer about 10.0 g of mannitol to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

In-Process Revision

Standard solution 2—Transfer about 40.0 mg of fructose and 10.0 g of mannitol to a 100-mL volumetric flask, dissolve in 25 mL of water, dilute with water to volume, and mix.

Test solution—Transfer about 2.5 g of Sucralose, accurately weighed, to a 10-mL volumetric flask, dissolve in about 5 mL of methanol, dilute with methanol to volume, and mix.

Application volume: 5-µL portions separately applied in 1-µL increments, allowing the plate to dry between applications.

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. Spray the plate with *Spray reagent,* and heat the plate at 100 ± 2° for 15 minutes. If the spot from *Standard solution 1* has darkened, repeat the test, heating for a shorter period of time. Immediately after heating, view the plate against a dark background: the color of the spot obtained from the *Test solution* is not more intense than that obtained from *Standard solution 2* (0.1%).

BRIEFING

Compressible Sugar, *NF 23* page 3095. On the basis of comments received, it is proposed to revise the test for *Loss on drying* to remove the lower limit of the acceptance criteria.

(EMC: D. Bempong) RTS—42559-1

Change to read:

Loss on drying ⟨731⟩—Dry it at 105° for 4 hours: ~~it loses between 0.25% and 1.0% of its weight.~~

■it loses not more than 1.0% of its weight.■2S (*NF24*)

BRIEFING

Confectioner's Sugar, *NF* 23 page 3095. It is proposed to revise the *Identification* test to remove a reference to the now deleted *Starch* monograph.

(EMC: D. Bempong) RTS—42616-1

Change to read:

Identification, Specific rotation, Chloride, Calcium, Sulfate, and Heavy metals—Transfer about 20 g, accurately weighed, to a 100-mL volumetric flask, add 80 mL of water, shake to dissolve the sucrose, then add water to volume, and mix. Separate the solubilized sucrose from the insoluble starch component by filtration until the filtrate is sparkling clear. Use the insoluble portion for the *Identification* test, and use the freshly prepared, clear filtrate for the other tests that follow.

Identification—A water slurry of the insoluble portion ~~responds to *Identification* test *B* under *Starch*~~

■is colored reddish-violet to deep blue by iodine TS.■2S (*NF24*)

Specific rotation ⟨781⟩: not less than +62.6°, determined on a portion of the filtrate, corresponding to not less than 95.0% of $C_{12}H_{22}O_{11}$, calculated on the dried basis.

Chloride ⟨221⟩—A 10-mL portion of the filtrate shows no more chloride than corresponds to 0.40 mL of 0.020 N hydrochloric acid (0.014%).

Calcium ⟨191⟩—To 5 mL of the filtrate add 5 mL of water and 1 mL of ammonium oxalate TS: the solution remains clear for not less than 1 minute.

Sulfate ⟨221⟩—A 25-mL portion of the filtrate shows no more sulfate than corresponds to 0.30 mL of 0.020 N sulfuric acid (0.006%).

Heavy metals ⟨231⟩—To 20 mL of the filtrate add 4 mL of water and 1 mL of 0.1 N hydrochloric acid: the limit is 5 ppm.

BRIEFING

Xylitol, *NF 23* page 3109. The proposed revison to the *Assay* specifies the use of USP Reference Standard materials in the *Internal standard solution* and in the *Standard preparation.* This proposal also affects the test for *Limit of other polyols.* Additional proposals in this test and in the *Assay* are intended to clarify the calculations.

(EMC: R. Ravichandran) RTS—42635-1

Change to read:

USP Reference standards ⟨11⟩—

■*USP L-Arabinitol RS. USP Erythritol RS. USP Galactitol RS. USP Mannitol RS. USP Sorbitol RS.*■2S (*NF24*)
USP Xylitol RS.

In-Process Revision

Change to read:

Limit of other polyols—Using the chromatograms obtained in the *Assay,* separately calculate the percentage of each polyol in the portion of Xylitol taken by the formula:

~~$2500C/W\,(R_u/R_s),$~~

~~in which C is the concentration, in mg per mL, of the individual polyol in the *Standard preparation; W* is the weight, in mg, of Xylitol taken to prepare the *Assay preparation;* and R_u and R_s are the peak response ratios of the individual derivatized polyol to that of derivatized erythritol in the chromatograms of the solutions obtained from the *Assay preparation* and the *Standard preparation*, respectively.~~

■$100(C_S/C_U)(R_U/R_S)$

in which C_S and C_U are the concentrations, in mg per mL, of the individual polyol in the *Standard preparation* and *Assay preparation,* respectively; and R_U and R_S are the peak response ratios of the individual derivatized polyol to that of derivatized erythritol in the chromatograms of the solutions obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S *(NF24)*

The sum of the polyols found, calculated on the anhydrous basis, is not more than 2.0%.

Change to read:

Assay—

Internal standard solution—~~Transfer about 88 mg oferythritol to a 25-mL volumetric flask, dissolve in anddilute with water to volume, and mix.~~

■Dissolve an accurately weighed quantity of USP Erythritol RS in water to obtain a solution having a known concentration of about 3.5 mg per mL of erythritol.■2S *(NF24)*

Standard preparation—~~Transfer accurately weighed quantities of about 25 mg each of arabinitol, galactitol, mannitol, and sorbitolto a 100-mL volumetric flask. Dissolve in and dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 25-mL volumetric flask, add about 250 mg of USP Xylitol RS, accurately weighed, dilute with water to volume, and mix.~~

■Dissolve accurately weighed quantities of USP L-Arabinitol RS, USP Galactitol RS, USP Mannitol RS, USP Sorbitol RS, and USP Xylitol RS in water to obtain a solution having a known concentration of 0.05 mg per mL each of L-arabinitol, galactitol, sorbitol, and mannitol; and 10 mg per mL of xylitol.■2S *(NF24)*

Assay preparation—~~Transfer about 250 mg of Xylitol, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with water to volume, and mix.~~

■Dissolve an accurately weighed quantity of Xylitol in water to obtain a solution having a concentration of about 10 mg per mL.■2S *(NF24)*

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.25-mm × 30-m capillary column bonded with a 0.25-µm layer of phase G46. The carrier gas is helium flowing at a rate of about 1 mL per minute. The chromatograph is programmed to maintain the column temperature at 170° for 5 minutes, then to increase the temperature at a rate of 6° per minute to 215°, holding at that temperature for 8 minutes, then to increase the temperature at a rate of 10° per minute to 270°, which is held for 14 minutes. The temperature of the injection port is about 270°, and the detector temperature is about 280°. Chromatograph the solution obtained from the *Standard preparation* as directed for *Procedure*, and record the peak responses: the relative retention times corresponding to the derivatives of erythritol, L-arabinitol, xylitol, mannitol, galactitol, and sorbitol are about 0.47, 0.75, 0.81, 0.98, 0.99, and 1.0, respectively; and the relative standard deviation for the peak area ratios of xylitol to erythritol for replicate injections is not more than 1.5%.

Procedure—Transfer 1.0 mL each of the *Standard preparation* and the *Assay preparation* to separate round-bottom, 10-mL boiling flasks. To each flask, add 1.0 mL of *Internal standard solution*, and evaporate each of the mixtures under reduced pressure to dryness on a water bath at 60°, with the aid of a rotary evaporator. Add 1 mL of dehydrated alcohol, shake gently, and evaporate to dryness under the same conditions. Dissolve each residue in 1 mL of pyridine. Add 1 mL of acetic anhydride to each flask, cap each flask, and mix on a vortex mixer for 30 seconds. Store the closed flasks in an oven at 70° for 30 minutes. Separately inject equal volumes (about 1 µL) of the solutions obtained from the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of $C_5H_{12}O_5$ in the portion of Xylitol taken by the formula:

~~$2500(C/W)(R_u/R_s),$~~

~~in which C is the concentration, in mg per mL, of USP Xylitol RS in the *Standard preparation; W* is the weight, in mg, of Xylitol taken to prepare the *Assay preparation;* and R_u and R_s are the peak area ratios of derivatized xylitol to derivatized erythritol in the chromatograms of the solutions obtained from the *Assay preparation* and the *Standard preparation*, respectively.~~

■$100(C_S/C_U)(R_U/R_S)$

in which C_S and C_U are the concentrations, in mg per mL, of xylitol in the *Standard preparation* and the *Assay preparation,* respectively; and R_U and R_S are the peak area ratios of derivatized xylitol to derivatized erythritol in the chromatograms of the solutions obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S *(NF24)*

GENERAL CHAPTERS

General Tests and Assays

General Requirements for Tests and Assays

BRIEFING

〈**1**〉 **Injections,** *USP 28* page 2201 and page 504 of *PF* 31(2) [Mar.–Apr. 2005]. Based on a Stimuli article, "Report and Recommendations of the USP–FDA Advisory Panel on Simplification and Improvement of Injection Labeling" in *PF* 20(4) [July–Aug. 1994] and reports of medication errors from the USP/ISMP Medication Errors Reporting Program and the USP MEDMARX Program, the Parenteral Products—Industrial, Nomenclature and Labeling, and Safe Medication Use Expert Committees have agreed that the total strength and total volume should appear on a prominent area of the label for multiple-dose and single-dose injectable drug products. The implementation date for this proposal, *Strength and Total Volume for Single- and Multiple-Dose Injectable Drug Products,* will be thirty months from the date of publication in *Pharmacopeial Forum.*

(PPI: J. Kelly) RTS—42550-1; 42554-1

Change to read:

LABELS AND LABELING

Labeling

NOTE—See definitions of "label" and "labeling" under *Labeling* in the section *Preservation, Packaging, Storage, and Labeling* of the *General Notices and Requirements.*

The label states the name of the preparation; in the case of a liquid preparation, the percentage content of drug or amount of drug in a specified volume; in the case of a dry preparation, the amount of *active* ingredient; the route of administration; a statement of storage conditions and an expiration date; the name and place of business of the manufacturer, packer, or distributor; and an identifying lot number. The lot number is capable of yielding the complete manufacturing history of the specific package, including all manufacturing, filling, sterilizing, and labeling operations.

Where the individual monograph permits varying concentrations of active ingredients in the large-volume parenteral, the concentration of each ingredient named in the official title is stated as if part of the official title, e.g., Dextrose Injection 5%, or Dextrose (5%) and Sodium Chloride (0.2%) Injection.

The labeling includes the following information if the complete formula is not specified in the individual monograph: (1) In the case of a liquid preparation, the percentage content of each ingredient or the amount of each ingredient in a specified volume, except that ingredients added to adjust to a given pH or to make the solution isotonic may be declared by name and a statement of their effect; and (2) in the case of a dry preparation or other preparation to which a diluent is intended to be added before use, the amount of each ingredient, the composition of recommended diluent(s) [the name(s) alone, if the formula is specified in the individual monograph], the amount to be used to attain a specific concentration of active ingredient and the final volume of solution so obtained, a brief description of the physical appearance of the constituted solution, directions for proper storage of the constituted solution, and an expiration date limiting the period during which the constituted solution may be expected to have the required or labeled potency if it has been stored as directed.

Containers for Injections that are intended for use as dialysis, hemofiltration, or irrigation solutions and that contain a volume of more than 1 L are labeled to indicate that the contents are not intended for use by intravenous infusion.

Injections intended for veterinary use are labeled to that effect.

The container is so labeled that a sufficient area of the container remains uncovered for its full length or circumference to permit inspection of the contents.

■STRENGTH AND TOTAL VOLUME FOR SINGLE- AND MULTIPLE-DOSE INJECTABLE DRUG PRODUCTS

For single-dose and multiple-dose injectable drug products, the strength per total volume should be the primary and prominent expression on the principal display panel of the label followed in close proximity by strength per mL enclosed by parentheses. For containers less than 1 mL, the strength per fraction of a mL should be the only expression of strength. Strength per single mL should be expressed as mg/mL not mg/1 mL.

The following format would be acceptable for contents greater than 1 mL:

Total Strength/Total Volume: 500 mg/10 mL

Strength/mL: (50 mg/mL) or

Total Strength/Total Volume: 25,000 Units/5 mL

Strength/mL: (5,000 Units/mL)

The following format would be acceptable for contents less than 1 mL: 12.5 mg/0.625 mL

There are, however, some exceptions to expressing strength per total volume. In certain cases, the primary and prominent expression of the total drug content per container would not be practical in preventing medication errors (e.g., insulin). An example is the use of lidocaine or other similar drugs used as a local anesthetic where the product is ordered and administered by percent (e.g., 1%, 2%) or a local anesthetic in combination with epinephrine which is expressed as a ratio (e.g., 1 : 100,000). In such cases, the total strength should be expressed (e.g., 1% (100 mg/10 mL). Dry solids, which need to be reconstituted, should follow the same format, with the exception that only the total strength of the drug is listed (not the strength/total volume or strength/mL).■2S (*USP29*)

(Official January 1, 2008)

~~Aluminum in Large and Small Volume Parenterals Used in Total Parenteral Nutrition~~

~~(a) The aluminum content of large volume parenteral (LVP) drug products used in total parenteral nutrition (TPN) therapy must not exceed 25 micrograms per liter (µg/L).~~

~~(b) The package insert of LVPs used in TPN therapy must state that the drug product contains no more than 25 µg of aluminum per liter. This information must be contained in the "Precautions" section of the labeling of all large volume parenterals used in TPN therapy.~~

~~(c) The maximum level of aluminum present at expiry must be stated on the immediate container label of all small volume parenteral (SVP) drug products and pharmacy bulk packages (PBPs) used in the preparation of TPN solutions. The aluminum content must be stated as follows: "Contains no more than ___ µg of aluminum per liter." The immediate container label of all SVPs and PBPs that are lyophilized powders used in the preparation of TPN solutions must contain the following statement: "When reconstituted in accordance with the package insert instructions, the concentration of aluminum will be no more than ____ µg per liter." This maximum level of aluminum must be stated as the highest of the following:~~

~~(1) The highest level for the batches produced during the last 3 years;~~

~~(2) The highest level for the latest five batches, or~~

~~(3) The maximum historical level, but only until completion of production of the first five batches after January 26, 2001.~~

~~(d) The package insert for all LVPs, all SVPs, and PBPs used in TPN must contain a warning statement. This warning must be contained in the "Warnings" section of the labeling. The warning must state the following:~~

~~WARNING: This product contains aluminum that may be toxic. Aluminum may reach toxic levels with prolonged parenteral administration if kidney function is impaired. Premature neonates are particularly at risk because their kidneys are immature, and they require large amounts of calcium and phosphate solutions that contain aluminum.~~

In-Process Revision

~~Research indicates that patients with impaired kidney function, including premature neonates, who receive parenteral levels of aluminum at greater than 4 to 5 µg per kg per day accumulate aluminum at levels associated with central nervous system and bone toxicity. Tissue loading may occur at even lower rates of administration.~~

▲Aluminum in Large-Volume Injections (LVIs), Small-Volume Injections (SVIs), and Pharmacy Bulk Packages (PBPs) Used in Total Parenteral Nutrition (TPN) Therapy

(a) The aluminum content of LVIs used in TPN therapy must not exceed 25 µg per L.

(b) The package insert of LVIs used in TPN therapy must state that the drug product contains no more than 25 µg of aluminum per L. This information must be contained in the "Precautions" section of the labeling of all LVIs used in TPN therapy.

(c) If the maximum amount of aluminum in SVIs and PBPs is 25 µg per L or less, instead of stating the exact amount of aluminum that each may contain, as in paragraph (d), the immediate container label for SVIs and PBPs used in the preparation or in the administration of TPN injections (with exceptions as noted below) and injectable emulsions may state: "Contains no more than 25 µg/L of aluminum." If the SVI or PBP is a lyophilized powder, the immediate container label may state the following; if the SVI or PBP is a lyophilized powder used in the preparation of TPN injections and injectable emulsions, the immediate container label must state the following: "When reconstituted in accordance with the package insert instructions, the concentration of aluminum will be no more than 25 µg/L."

(d) The maximum level of aluminum at expiry must be stated on the immediate container label of all SVIs and PBPs used in the preparation or the administration of TPN injections and injectable emulsions. The aluminum content must be stated as follows: "Contains no more than __ µg/L of aluminum." This maximum amount of aluminum may be stated as the highest one of the following three levels:

1. The highest level for the batches produced during the last three years,
2. The highest level for the latest five batches, or
3. The maximum level in terms of historical levels, but only until completion of production of the first five batches after the effective date of July 26, 2004.

The package insert for all LVIs, SVIs, and PBPs used in the preparation or administration of TPN products must contain a warning statement. This warning must be contained in the "Warnings" section of the labeling and must state the following: "WARNING: This product contains aluminum that may be toxic. Aluminum may reach toxic levels with prolonged parenteral administration if kidney function is impaired. Premature neonates are particularly at risk because their kidneys are immature, and they require large amounts of calcium and phosphate solutions which contain

aluminum. Research indicates that patients with impaired kidney function, including premature neonates, who receive parenteral levels of aluminum at greater than 4 to 5 µg per kg per day accumulate aluminum at levels associated with central nervous system and bone toxicity. Tissue loading may occur at even lower rates of administration of TPN products and of the lock-flush solutions used in their administration." ▲*USP29*

PACKAGING

Containers for Injections

Containers, including the closures, for preparations for injections do not interact physically or chemically with the preparations in any manner to alter the strength, quality, or purity beyond the official requirements under the ordinary or customary conditions of handling, shipment, storage, sale, and use. The container is made of material that permits inspection of the contents. The type of glass preferable for each parenteral preparation is usually stated in the individual monograph. Unless otherwise specified in the individual monograph, plastic containers may be used for packaging injections (see *Containers* ⟨661⟩).

For definitions of single-dose and multiple-dose containers, see *Containers* in the *General Notices and Requirements.* Containers meet the requirements under *Containers* ⟨661⟩.

Containers are closed or sealed in such a manner as to prevent contamination or loss of contents. Validation of container integrity must demonstrate no penetration of microbial contamination or chemical or physical impurities. In addition, the solutes and the vehicle must maintain their specified total and relative quantities or concentrations when exposed to anticipated extreme conditions of manufacturing and processing, and storage, shipment, and distribution. Closures for multiple-dose containers permit the withdrawal of the contents without removal or destruction of the closure. The closure permits penetration by a needle and, upon withdrawal of the needle, closes at once, protecting the container against contamination. Validation of the multiple-dose container integrity must include verification that such a package prevents microbial contamination or loss of product contents under anticipated conditions of multiple entry and use.

Piggyback containers are usually intravenous infusion containers used to administer a second infusion through a connector of some type or an injection port on the administration set of the first fluid, thereby avoiding the need for another injection site on the patient's body. Piggyback containers are also known as secondary infusion containers.

Potassium Chloride for Injection Concentrate

The use of a black closure system on a vial (e.g., a black flip-off button and a black ferrule to hold the elastomeric closure) or the use of a black band or series of bands above the constriction on an ampul is prohibited, except for *Potassium Chloride for Injection Concentrate.*

Neuromuscular Blocking and Paralyzing Agents

All injectable preparations of neuromuscular blocking agents and paralyzing agents must be packaged in vials with a cautionary statement printed on the ferrules or cap overseals. Both the container cap ferrule and the cap overseal must bear in black or white print (whichever provides the greatest color contrast with the ferrule or cap color) the words: "Warning: Paralyzing Agent" or "Paralyzing Agent" (depending on the size of the closure system). Alternatively, the overseal may be transparent and without words, allowing for visualization of the warning labeling on the closure ferrule.

(Official October 1, 2005)

Containers for Sterile Solids

Containers, including the closures, for dry solids intended for parenteral use do not interact physically or chemically with the preparation in any manner to alter the strength, quality, or purity beyond the official requirements under the ordinary or customary conditions of handling, shipment, storage, sale, and use.

A container for a sterile solid permits the addition of a suitable solvent and withdrawal of portions of the resulting solution or suspension in such manner that the sterility of the product is maintained.

Where the *Assay* in a monograph provides a procedure for the *Assay preparation,* in which the total withdrawable contents are to be withdrawn from a single-dose container with a hypodermic needle and syringe, the contents are to be withdrawn as completely as possible into a dry hypodermic syringe of a rated capacity not exceeding three times the volume to be withdrawn and fitted with a 21-gauge needle not less than 2.5 cm (1 inch) in length, with care being taken to expel any air bubbles, and discharged into a container for dilution and assay.

Volume in Container

Each container of an injection is filled with sufficient excess of the labeled "size" or that volume which is to be withdrawn. See *Injections* under *Pharmaceutical Dosage Forms* ⟨1151⟩.

DETERMINATION OF VOLUME OF INJECTION IN CONTAINERS

Select one or more containers if the volume of the container is 10 mL or more, three or more if the volume is more than 3 mL and less than 10 mL, or five or more if the volume is 3 mL or less. Individually take up the contents of each container selected into a dry hypodermic syringe of a rated capacity not exceeding three times the volume to be measured and fitted with a 21-gauge needle not less than 2.5 cm (1 inch) in length. Expel any air bubbles from the syringe and needle, and then discharge the contents of the syringe, without emptying the needle, into a standardized, dry cylinder (graduated to contain rather than to deliver the designated volumes) of such size that the volume to be measured occupies at least 40% of the cylinder's rated volume. Alternatively, the contents of the syringe may be discharged into a dry, tared beaker, the volume, in mL, being calculated as the weight, in g, of Injection taken divided by its density. The contents of up to five 1- or 2-mL containers may be pooled for the measurement, provided that a

In-Process Revision

separate dry syringe assembly is used for each container. The content of containers holding 10 mL or more may be determined by means of opening them and emptying the contents directly into the graduated cylinder or tared beaker.

The volume is not less than the labeled volume in the case of containers examined individually or, in the case of 1- and 2-mL containers, is not less than the sum of the labeled volumes of the containers taken collectively.

For Injections in multiple-dose containers labeled to yield a specific number of doses of a stated volume, proceed as directed in the foregoing, using the same number of separate syringes as the number of doses specified. The volume is such that each syringe delivers not less than the stated dose.

For Injections containing oil, warm the containers, if necessary, and thoroughly shake them immediately before removing the contents. Cool to 25° before measuring the volume.

For Injections in cartridges or prefilled syringes, assemble the container with any required accessories such as a needle or plunger. Following the same procedure as above, and without emptying the needle, transfer the entire contents of each container to a dry, tared beaker by slowly and constantly depressing the plunger. Weigh, and calculate the volume as described above. The volume of each container is not less than the labeled volume.

For large-volume intravenous solutions, select 1 container, and transfer the contents into a dry measuring cylinder of such size that the volume to be measured occupies at least 40% of its rated volume. The volume is not less than the labeled volume.

Printing on Ferrules and Cap Overseals

Only cautionary statements are to be printed on the ferrules and cap overseals of vials containing an injectable drug product. A cautionary statement is one intended to prevent an imminent life-threatening situation if the injectable drug is used inappropriately. Examples of such statements are the following: ''Warning'', ''Dilute Before Using'', ''Paralyzing Agent'', ''I.M. Use Only'', ''Chemotherapy'', etc.

The printing must be in contrasting color and conspicuous under ordinary conditions of use. The cautionary statement may be printed solely on the ferrule, provided the cap overseal is constructed so as to allow the cautionary statement below to be readily legible.

(Official October 1, 2005)

Packaging and Storage

The volume of injection in single-dose containers provides the amount specified for parenteral administration at one time and in no case is more than sufficient to permit the withdrawal and administration of 1 L.

Preparations intended for intraspinal, intracisternal, or peridural administration are packaged only in single-dose containers.

Unless otherwise specified in the individual monograph, a multiple-dose container contains a volume of Injection sufficient to permit the withdrawal of not more than 30 mL.

Injections packaged for use as irrigation solutions, for hemofiltration or dialysis, or for parenteral nutrition are exempt from the 1-L restriction of the foregoing requirements relating to packaging.

Containers for Injections packaged for use as hemofiltration or irrigation solutions may be designed to empty rapidly and may contain a volume of more than 1 L.

Injections labeled for veterinary use are exempt from packaging and storage requirements concerning the limitation to single-dose containers and the limitation on the volume of multiple-dose containers.

Change to read:

~~FOREIGN MATTER AND PARTICLES~~

▲FOREIGN AND PARTICULATE MATTER▲*USP29*

~~Foreign Matter~~

~~Every care should be exercised in the preparation of all products intended for injection to prevent contamination with microorganisms and foreign material. Good pharmaceutical practice requires also that each final container of Injection be subjected individually to a physical inspection, whenever the nature of the container permits, and that every container whose contents shows evidence of contamination with visible foreign material be rejected.~~

~~Particulate Matter~~

~~All large-volume Injections for single-dose infusion, and those small-volume Injections for which the monographs specify such requirements, are subject to the particulate matter limits set forth under *Particulate Matter in Injections* ⟨788⟩. An article packaged as both a large-volume and a small-volume Injection meets the requirements set forth for small-volume Injections where the container is labeled as containing 100 mL or less if the individual monograph includes a test for *Particulate Matter;* it meets the requirements set forth for large-volume Injections for single-dose infusion where the container is labeled as containing more than 100 mL. Injections packaged and labeled for use as irrigating solutions are exempt from requirements for *Particulate Matter.*~~

▲All articles intended for parenteral administration shall be prepared in a manner designed to exclude particulate matter as defined in *Particulate Matter in Injections* ⟨788⟩ and other foreign matter. Each final container of all parenteral preparations shall be inspected to the extent possible for the presence of observable foreign and particulate matter (hereafter termed ''visible particulates'') in its contents. The inspection process shall be designed and qualified to ensure that every lot of all parenteral preparations is essentially free from visible particulates. Qualification of the inspection

process shall be performed with reference to particulates in the visible range of a type that might emanate from the manufacturing or filling process. Every container whose contents shows evidence of visible particulates shall be rejected. The inspection for visible particulates may take place when inspecting for other critical defects, such as cracked or defective containers or seals, or when characterizing the appearance of a lyophilized product.

Where the nature of the contents or the container–closure system permits only limited capability for the inspection of the total contents, the 100% inspection of a lot shall be supplemented with the inspection of constituted (e.g., dried) or withdrawn (e.g., dark amber container) contents of a sample of containers from the lot.

All large-volume injections for single-dose infusion and small-volume injections are subject to the light obscuration or microscopic procedures and limits for subvisible particulate matter set forth in *Particulate Matter in Injections* ⟨788⟩, unless otherwise specified in the individual monograph. An article packaged as both a large-volume and a small-volume injection meets the requirements set forth for small-volume injections where the container is labeled as containing 100 mL or less, if the individual monograph states a test for *Particulate Matter in Injections* ⟨788⟩; it meets the requirements set forth for large-volume injections for single-dose infusion where the container is labeled as containing more than 100 mL. Injections administered exclusively by the intramuscular or subcutaneous route or packaged and labeled for use as irrigating solutions are exempt from requirements for *Particulate Matter in Injections* ⟨788⟩.▲*USP29*

BRIEFING

Add the following:

■**USP Beta Alanine RS [**3-aminopropionic acid**]**—[To come.]■2S (*USP29*)

Add the following:

■**USP Amino Methacrylate Copolymer RS**—Dry at 110° for 3 hours. Keep container tightly closed. Store at or below room temperature.■2S (*USP29*)

In-Process Revision

Add the following:

■**USP L-Arabinitol RS** [L-arabitol, 1,2,3,4,5-pentanepentol] ($C_5H_{12}O_5$ ✧ 152.15)—[To come.]■2S (*USP29*)

Add the following:

■**USP Benazepril Related Compound A RS** ~~[3-(1-ethoxycarbonyl-3-phenyl-(1*R*)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*R*)-benazepine)-1-acetic acid]~~ [(3*R*) 3-[[(1*R*) 1-(ethoxycarbonyl)-3-phenylpropyl]amino]-2,3,4,5-tetrahydro-2-oxo-1*H*-1-benzazepine-1-acetic acid, monohydrochloride] ($C_{24}H_{28}N_2O_5 \cdot HCl$ ✧ ~~460.96~~ 460.95)—Do not dry. Store in a refrigerator. Protect from light.■2S (*USP29*)

Add the following:

■**USP Benazepril Related Compound B RS** ~~[3-(1-ethoxycarbonyl-3-phenyl-(1*R*)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benazepine)-1-acetic acid]~~ [(3*S*) 3-[[(1*R*) 1-(ethoxycarbonyl)-3-phenylpropyl] amino]-2,3,4,5-tetrahydro-2-oxo-1*H*-1-benzazepine-1-acetic acid, monohydrochloride] ($C_{24}H_{28}N_2O_5 \cdot HCl$ ✧ ~~460.96~~ 460.95)—Do not dry. Store in a refrigerator. Protect from light.■2S (*USP29*)

Add the following:

■**USP Benazepril Related Compound C RS** [3-(1-carboxy-3-phenyl-1(*S*)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine-1-acetic acid] ($C_{22}H_{24}N_2O_5$ ✧ 396.44—Dry portion in vacuum at 105° for 4 hours before using.■2S (*USP29*)

Add the following:

■**USP Benazepril Related Compound D RS** [(3-(1-ethoxycarbonyl-3-cyclohexyl-(1*S*)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine)-1-acetic acid]—[To come.]■2S (*USP29*)

Add the following:

■**USP Benazepril Related Compound E RS** [3-amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine-1-acetic acid]—[To come.]■2S (*USP29*)

Add the following:

■**USP Benazepril Related Compound F RS** [*tert*-butyl-3-amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine-1-acetic acid]—[To come.]■2S (*USP29*)

Add the following:

■**USP Benazepril Related Compound G RS** [(3-(1-ethoxycarbonyl-3-phenyl-(1*S*)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine)-1-acetic acid ethyl ester]—[To come.]■2S (*USP29*)

Add the following:

■**USP Desmopressin Acetate RS**—[To come.]■2S (*USP29*)

Add the following:

■**USP Erythritol RS** [*meso*-erythritol, 1,2,3,4-butanetetrol] ($C_4H_{10}O_4$ ✧ 122.12)—[To come.]■2S (*USP29*)

Add the following:

■**USP Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion RS**—Dry at 105° for 1.5 hours before use.■2S (*USP29*)

Add the following:

■**USP Fluticasone Propionate Related Compound F RS** [6α,9α-difluoro-11β,17α-dihydroxy-16α-methyl-3-oxoandrosta-1,4-diene-17β-carboxylic acid]—[To come.]■2S (*USP29*)

Add the following:

■**USP Galactitol RS** [dulcitol] ($C_6H_{14}O_6$ ✧ 182.17)—[To come.]■2S (*USP29*)

In-Process Revision

Add the following:

■**USP Hyoscamine Related Compound A RS** [norhyoscyamine sulfate or (1*R*,3*R*,5*S*)-8-azabicyclo[3.2.1]oct-3-yl(2*S*)-3-hydroxy-2-phenylpropanoate]—[To come.]■2S (*USP29*)

Add the following:

■**USP Nefazodone Hydrochloride RS**—[To come.]■2S (*USP29*)

Add the following:

■**USP Nefazodone Related Compound A RS** [1-(3-chloropropyl)-4-(chlorophenyl)piperazine] ($C_{13}H_{18}Cl_2N_2$ ✧ 273.20)—[To come.]■2S (*USP29*)

Add the following:

■**USP Nefazodone Related Compound B RS** [2-(3-(4-(chlorophenyl)-1-piperazinyl)propyl)-5-ethyl-2,4-dihydro-4-(2-phenoxyethyl)-3*H*-1,2,4-triazol-3-one] ($C_{25}H_{32}ClN_5O_2$ ✧ 470.01)—[To come.]■2S (*USP29*)

Add the following:

■**USP Pamidronate Disodium RS**—[To come.]■2S (*USP29*)

Delete the following:

~~■**USP Paroxetine Related Compound A RS** [*trans*-4-(*p*-methoxyphenyl)-3-[(3,4-methylenedioxy)phenoxy]methylpiperidine hydrochloride]—Do not dry before use. Keep container tightly closed. Protect from light.~~■2S (*USP29*)

Add the following:

~~▲**USP Paroxetine Hydrochloride for System Suitability RS**~~ ■**USP Paroxetine System Suitability Mixture A RS**■2S (*USP29*)—Mixture of 1% paroxetine related compound A [piperidine, 3-[(1,3-benzodioxol-5-yloxy)methyl]-4-(4-methoxyphenyl)-, hydrochloride (3 *S-trans*); and 1% of paroxetine related compound B [piperidine, 3-[(1,3-benzodioxol-5-yloxy)methyl]-4-phenyl)-, hydrochloride (3 *S-trans*)] in a matrix of paroxetine hydrochloride.▲*USP29*

Add the following:

■**USP Phenylethyl Alcohol RS** ■($C_8H_{10}O$ ✧ 122.17)—[To come.]■2S (*USP29*) ■2S (*USP28*)

Add the following:

■**USP Sodium Salicylate RS**—[To come.]■2S (*USP29*)

Add the following:

■**USP Tazobactam RS**—[To come.]■2S (*USP29*)

Add the following:

■**USP Tazobactam Related Compound A RS**—[To come.]■2S (*USP29*)

Add the following:

■**USP Travoprost RS**—[To come.]■2S (*USP29*)

Add the following:

■**USP Travoprost Related Compound A RS** [(5*Z*,13*E*)-(9*S*,11*R*,15*R*)-9,11,15-trihydroxy-16-(*m*-trifluoromethylphenoxy)-17,18,19,20-tetranor-5,13-prostadienoic acid] ($C_{23}H_{29}F_3O_6$ ✧ 458.52)—[To come.]■2S (*USP29*)

In-Process Revision

Chemical Tests and Assays

OTHER TESTS AND ASSAYS

BRIEFING

⟨**401**⟩ **Fats and Fixed Oils,** *USP 28* page 2310. It is proposed to revise the test for *Acid Value (Free Fatty Acids)* to include the formula.

(EMC: C. Sheehan) RTS—42638-1

Change to read:

ACID VALUE (FREE FATTY ACIDS)

The acidity of fats and fixed oils in this Pharmacopeia may be expressed as the number of mL of 0.1 N alkali required to neutralize the free acids in 10.0 g of substance. Acidity is frequently expressed as the Acid Value, which is the number of mg of potassium hydroxide required to neutralize the free acids in 1.0 g of the substance.

Procedure—Unless otherwise directed, dissolve about 10.0 g of the substance, accurately weighed, in 50 mL of a mixture of equal volumes of alcohol and ether (which has been neutralized to phenolphthalein with 0.1 N sodium hydroxide) contained in a flask. If the test specimen does not dissolve in the cold solvent, connect the flask with a suitable condenser and warm slowly, with frequent shaking, until the specimen dissolves. Add 1 mL of phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS until the solution remains faintly pink after shaking for 30 seconds. Calculate either the Acid Value or the volume of 0.1 N alkali required to neutralize 10.0 g of specimen (free fatty acids), whichever is appropriate.

■Calculate the Acid Value by the formula:

$$56.1V \times N/W$$

in which V is the volume, in mL, and N is the normality, respectively, of the sodium hydroxide solution; and W is the weight, in g, of the sample taken.■2S (*USP29*)

If the volume of 0.1 N sodium hydroxide VS required for the titration is less than 2 mL, a more dilute titrant may be used, or the sample size may be adjusted accordingly. The results may be expressed in terms of the volume of titrant used or in terms of the equivalent volume of 0.1 N sodium hydroxide.

If the oil has been saturated with carbon dioxide for the purpose of preservation, gently reflux the alcohol-ether solution for 10 minutes before titration. The oil may be freed from carbon dioxide also by exposing it in a shallow dish in a vacuum desiccator for 24 hours before weighing the test specimens.

GENERAL CHAPTERS

General Information

BRIEFING

⟨**1058**⟩ **Analytical Instrument Qualification,** page 233 of *PF* 31(1) [Jan.–Feb. 2005]. This new general information chapter, which previously appeared in *Pharmacopeial Previews,* is now forwarded with minor editorial changes to *In-Process Revision.* The Expert Committee recognizes that the current chapter does not address corrective and preventive actions when a periodic PQ fails. Readers are encouraged to submit comments to USP regarding these or any other relevant issues.

(PA4: H. Pappa) RTS—41837-1

Add the following:

■⟨1058⟩ ANALYTICAL INSTRUMENT QUALIFICATION

INTRODUCTION

A large variety of instruments and tools, ranging from simple nitrogen evaporators to complex multiple-function technologies, are used in the pharmaceutical industry to acquire data to help ensure that products are suitable for their intended use and that they do not pose high safety risks. The analyst's objective is to consistently obtain reliable and val-

In-Process Revision

id data suitable for the intended purpose. Depending on the applications, users validate their procedures and perform system suitability tests and in-process quality control checks to help ensure that the acquired data are reliable. These activities help enhance the quality of data, and there are specific guidances and procedures for performing the activities. With the increasing sophistication and automation of analytical instruments, an increasing demand has been placed on users to qualify their instruments.

Unlike method validation and system suitability activities, analytical instrument qualification (AIQ) currently has no specific guidance or procedures. Competing opinions abound regarding instrument qualification and validation procedures and the roles and responsibilities of those who perform them. Consequently, various approaches have been used for instrument qualification, approaches that require varying amounts of resources and generate widely differing amounts of documentation. This chapter provides a scientific approach to AIQ and considers AIQ as one of the major components required for generating reliable and consistent data.

Validation versus Qualification

Because there is ambiguity in the use of the terms ''validation'' and ''qualification'', in this chapter the term ''validation'' will be used for processes and software, and the term ''qualification'' will be used for instruments. Thus, the phrase ''analytical instrument qualification'' (AIQ) is used for the process of ensuring that an instrument is suitable for its intended application. The term ''validation'' is reserved for processes including analytical procedures and software procedures.

COMPONENTS OF DATA QUALITY

There are four critical components involved in the generation of reliable and consistent data (quality data). *Figure 1* shows these components as layered activities within a quality triangle. Each layer adds to the overall quality. Analytical instrument qualification forms the base for generating quality data. The other components essential for generating quality data are analytical method validation, system suitability tests, and quality control checks. These quality components are described below.

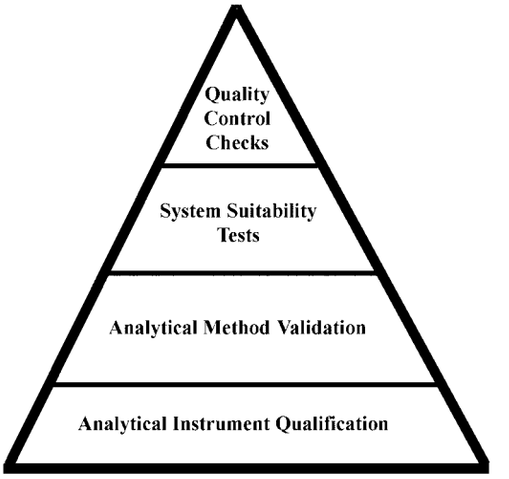

Figure 1. Components of data quality.

Analytical Instrument Qualification

AIQ is the collection of documented evidence that an instrument performs suitably for its intended purpose and that it is properly maintained and calibrated. Use of a qualified instrument in analyses contributes to confidence in the veracity of generated data.

Analytical Method Validation

Analytical method validation is the collection of documented evidence that an analytical procedure does what it purports to do and addresses the required attributes of the procedure. Use of a validated procedure provides confidence that the procedure will generate test data of acceptable quality. Users of compendial procedures perform validation using the criteria provided in general information chapter *Validation of Compendial Methods* ⟨1225⟩.

System Suitability Tests

System suitability tests verify that the system will perform according to the analyst's expectations and according to the criteria set forth in the procedure. These tests are performed along with the sample analyses to ensure that the system's performance is acceptable at the time of the test. USP general chapter *Chromatography* ⟨621⟩ presents a more detailed discussion of system suitability tests.

Quality Control Checks

Most analyses are performed on instruments calibrated or standardized using reference materials or calibration standards. The calibration or standardization process uses a single- or multiple-point calibration, depending on the instrument and the intended application. The calibration or standardization of an instrument during analysis ensures that the instrument response correlates with the known quantity or quality of the calibration standard or reference material. In addition to calibration or standardization, some analyses also require the inclusion of quality control check samples to provide an in-process or ongoing assurance of the test's suitable performance.

The extent of system suitability tests or quality control checks varies for different analyses, depending on their intended use. Chemical analyses, which are largely subject to Good Manufacturing Practices (GMP) regulations and require tighter precision and accuracy, may require more system suitability tests than bioanalytical work, which is largely subject to Good Laboratory Practice (GLP) regulations. Bioanalytical work requires sensitive, specific, broad-range analysis and therefore is generally performed with more quality control checks during sample analysis. Control check samples are also appropriate when high-variability tests or instruments (i.e., those with a relative standard deviation [RSD] higher than 5%) are considered. Other use-specific considerations may also determine the extent of system suitability tests or quality-control-check sample analysis. Whatever the case, the sum total of such controls provides an important step in delivering quality data for the intended purpose.

In summary, analytical instrument qualification and analytical method validation ensure the quality of analysis *before* conducting the tests. System suitability tests and quality control checks ensure the quality of analytical results *immediately before* or *during* sample analysis.

ANALYTICAL INSTRUMENT QUALIFICATION PROCESS

The following sections address in detail the AIQ process. The other three components of building quality into analytical data—analytical method validation, system suitability tests, and quality control checks—are not within the scope of this chapter.

Qualification Phases

Instrument qualification is not a single continuous process, but instead results from several discrete activities. For convenience, these activities can be grouped into four phases: design qualification (DQ), installation qualification (IQ), operational qualification (OQ), and performance qualification (PQ).

Some of these qualification terms have their roots in manufacturing-process validation. Note, however, that adoption of process validation terms does not imply that all process validation activities are necessary for AIQ. Also, some AIQ activities cover more than one qualification phase and could arguably be performed within any of the phases. It is important that the required AIQ activities be performed; however, within which qualification phase an activity is performed or reported is not as important. *Table 1* accommodates these overlapping activities by letting users perform them under one or another phase as necessary. The user should describe where the activity is performed and reported.

Table 1. Timing, Applicability, and Activities for Each Phase of Analytical Instrument Qualification*

DQ	IQ		OQ		PQ
Timing and applicability					
Prior to purchase of a new type of instrument	At installation of each instrument (new, old, or existing unqualified)		After installation or major repair of each instrument		Periodically at specified intervals for each instrument
Activities					
Assurance of vendor's DQ	System description	⇆	Fixed parameters		Preventive maintenance and repairs
Assurance of adequate support availability from manufacturer	Instrument delivery				SOPs for operation, calibration, and maintenance
Instrument's fitness for use in laboratory	Utilities/facility/ environment				
	Network and data storage	⇆	Secure data storage, backup, and archive		
	Assembly and installation				
	Installation verification	⇆	Instrument function tests	⇆	Performance checks

* Activities under each phase are usually performed as given in the table. However, in some cases, it may be more appropriate to perform or combine a given activity with another phase. Such activities spanning more than one qualification phase are shown as connected by double arrows. If an activity listed under a given phase is performed under another phase, it is not necessary to repeat the activity under the phase where the activity is listed. Performing the activity is far more important than the phase under which the activity is performed.

DESIGN QUALIFICATION

Design qualification (DQ) is most suitably performed by the instrument developer or manufacturer. Because the instrument design is already in place for commercial off-the-shelf (COTS) systems, users do not need to repeat all aspects of DQ. However, users should ensure that COTS instruments are suitable for their intended applications and that the manufacturer has adopted a quality system for developing, manufacturing, and testing. Users should also establish that manufacturers and vendors adequately support installation, service, and training. Methods for ascertaining the manufacturer's design qualification and an instrument's suitability for its intended use depend on the nature of the instrument, the complexity of the proposed application, and the extent of the user's previous interaction with the manufacturer. Vendor audits or required vendor-supplied documentation satisfy part of the DQ requirements. The required scope and comprehensiveness of the audits and documentation vary with users' familiarity with the instrument and their previous interactions with the vendor.

Informal processes also form an important part of DQ. Informal personal communications and networking with peers at technical or user-group meetings significantly inform users about the suitability of instrument design for various applications and the quality of vendor support services. Informal site visits to other users' and vendors' facilities to obtain data on representative samples that used the specified instrument are another good source of information about suitability for intended use. In many instances an assessment of the quality of vendor support, gleaned from informal discussions with peer users, significantly influences instrument selection.

INSTALLATION QUALIFICATION

Installation qualification (IQ) is the documented collection of activities necessary for installing an instrument in the user's environment. IQ applies to an instrument that is new or was pre-owned, or to any instrument that exists on site but has not been previously qualified. Relevant parts of IQ would also apply to a qualified instrument that has been packed and transported to another location. The activities and documentation associated with IQ are as follows.

System Description—Provide a description of the instrument, including its manufacturer, model, serial number, software version, etc. Use drawings and flow charts where appropriate.

Instrument Delivery—Ensure that the instrument, software, manuals, supplies, and any other accessories arrive with the instrument as the purchase order specifies and that they are undamaged. For a pre-owned or existing instrument, manuals and documentation should be obtained.

Utilities/Facility/Environment—Verify that the installation site satisfactorily meets vendor-specified environmental requirements. A commonsense judgment for the environment suffices: one need not measure the exact voltage for a standard-voltage instrument or the exact humidity reading for an instrument that will operate at ambient conditions.

Network and Data Storage—Some analytical systems require users to provide network connections and data storage capabilities at the installation site. When required, connect the instrument to the network, and check its functionality.

Assembly and Installation—Assemble and install the instrument, and perform any preliminary diagnostics and testing. Assembly and installation of a complex instrument are best done by the vendor or specialized engineers, whereas users can assemble and install simple ones. For complex

instruments, vendor-established installation tests and guides provide a valuable baseline reference for determining instrument acceptance. Any abnormal event observed during assembly and installation merits documenting. If the preowned, unqualified existing instrument or transported instrument requires assembly and installation, perform the tasks as specified above, then perform the installation verification procedure, described below.

Installation Verification—Perform the initial diagnostics and testing of the instrument after installation. On obtaining acceptable results, the user and, when present, the installing engineer should confirm that the installation was successful before proceeding with the next qualification phase.

OPERATIONAL QUALIFICATION

After a successful IQ, the instrument is ready for OQ testing. The OQ phase may consist of these test parameters.

Fixed Parameters—These tests measure the instrument's nonchanging parameters such as length, height, weight, voltage inputs, acceptable pressures, and loads. If the vendor-supplied specifications for these parameters satisfy the user, the test requirements may be waived. However, if the user wants to confirm the parameters, testing can be performed at the user's site. Fixed parameters do not change over the life of the instrument, and therefore never need redetermination. [NOTE—These tests could also be performed during the IQ phase (see *Table 1*); if so, fixed parameters need not be redetermined as part of OQ testing.]

Secure Data Storage, Backup, and Archiving—When required, test secure data handling such as storage, backup, and archiving at the user's site according to written procedures.

Instrument Function Tests—Important instrument functions should be tested to verify that the instrument operates as intended by the manufacturer and required by the user. The user should select important instrument parameters for testing according to the instrument's intended use. Vendor-supplied information is useful in identifying specifications for these parameters. Tests should be designed to evaluate the identified parameters. Users, or their qualified designees, should perform these tests to verify that the instrument meets vendor and user specifications.

The extent of OQ testing that an instrument undergoes depends on its intended applications. Therefore, no specific OQ tests for any instrument or application are offered in this chapter. Nevertheless, as a guide to the types of tests possible during OQ, consider the following, which apply to an HPLC unit:

- pump flow rate
- gradient linearity
- detector wavelength accuracy
- detector linearity
- column oven temperature
- injector precision and accuracy
- peak retention time precision

Routine analytical tests do not constitute OQ testing. OQ tests are specifically designed to verify the instrument's operation according to specifications in the user's environment, and repeating the testing at regular intervals may not be required. However, when the instrument undergoes major repairs or modifications, relevant OQ tests should be repeated to verify whether the instrument continues to operate satisfactorily. Relevant OQ tests should also be repeated for an instrument that has been transported to another location, although a move within the laboratory, or from one room to another, that does not disturb instrument operation may not require requalification.

OQ tests can be modular or holistic. Modular testing of individual components of a system may facilitate interchanging of such components without requalification and

should be performed whenever possible. Holistic tests, which involve the entire system, are acceptable in lieu of modular testing. Having successfully completed OQ testing, the instrument is qualified for use in regulated samples analysis.

PERFORMANCE QUALIFICATION

After IQ and OQ have been performed, the instrument's continued suitability for its intended use is demonstrated through performance qualification (PQ). The PQ phase includes the following parameters.

Performance Checks—Set up a test or series of tests to verify the acceptable performance of the instrument for its intended use. PQ tests are usually based on the instrument's typical on-site applications. Some tests may resemble those performed during OQ, but the specifications for their results can be set differently if required. PQ tests should be performed routinely on a working instrument, not only on a new instrument at installation. Therefore, PQ specifications can be slightly less rigorous than OQ specifications. Nevertheless, user specifications for PQ tests should evince trouble-free instrument operation for the intended applications. PQ tests should be performed independently of the routine analytical testing performed on the instrument. As is the case with OQ testing, PQ tests can be modular or holistic. However, because many modules within a system interact, holistic tests generally prove to be more effective because they evaluate the entire system, not simply the system's individual modules.

Testing frequency depends on the ruggedness of the instrument and the criticality of the tests performed. Testing may be unscheduled—for example, each time the instrument is used. It may also be scheduled for regular intervals, such as weekly or monthly. Experience with the instrument can influence this decision. Generally, the same PQ tests are repeated each time so that a history of the instrument's performance can be compiled. Some system suitability tests or quality control checks that are performed concurrently with the test samples also imply that the instrument is performing suitably. However, although system suitability tests can supplement periodic PQ tests, they cannot replace them.

Preventive Maintenance and Repairs—When an instrument fails to meet PQ test specifications, it requires maintenance or repair. A periodic preventive maintenance may also be recommended for many instruments. The relevant PQ test(s) should be repeated after the needed maintenance or repair to ensure that the instrument remains qualified.

Standard Operating Procedure[s] for Operation, Calibration, and Maintenance—Establish standard operating procedures to maintain and calibrate the instrument. Use a logbook, binder, or electronic record to document each maintenance and calibration activity.

Roles and Responsibilities

USERS

Users are ultimately responsible for instrument operations and data quality. The user's group encompasses analysts, their supervisors, and organization management. Users should be adequately trained in the instrument's use, and their training records should be maintained as required by the regulations.

Users should also be responsible for qualifying their instruments, because their training and expertise in the use of instruments make them the best-qualified group to design the instrument test(s) and specification(s) necessary for successful AIQ. Consultants, validation specialists, and quality assurance (QA) personnel can advise and assist as needed,

but the final responsibility for qualifying instruments lies with the users. The users must also maintain the instrument in a qualified state by routinely performing PQ.

QUALITY ASSURANCE

The QA role in AIQ remains the same as for any other regulated study. QA personnel should understand the instrument qualification process, and they should learn about the instrument's application by working with the users. Finally, they should review the AIQ process to determine whether it meets regulatory requirements, and they should make certain that the users attest to the scientific validity of the process.

MANUFACTURERS

Manufacturers and developers are responsible for DQ when designing the instrument. They are also responsible for validation of relevant processes used in manufacturing and assembly of the hardware and for software associated with the instrument. Manufacturers and developers are also responsible for writing stand-alone software for analytical work in a documented quality manner and for the validation of this software. Manufacturers should test the assembled instruments before shipping them to users.

Manufacturers and vendors should make available to users a summary of their validation efforts and the results of final instrument and software tests, and they should provide the critical functional test scripts that can be used to qualify the instrument and software at the user site. For instance, manufacturers and vendors can provide a large database and scripts for functional testing of the network's bandwidth for laboratory information management system (LIMS) software.

Finally, manufacturers and vendors should notify all known users about hardware or software defects discovered after a product's release; offer user training, service, repair, and installation support; and invite user audits as necessary.

SOFTWARE VALIDATION

Software used for analytical work can be classified into three categories: firmware; instrument control, data acquisition, and processing software; and stand-alone software.

Firmware—Computerized analytical instruments contain integrated chips with low-level software (firmware). Such instruments will not function without properly operating firmware, and users generally cannot alter firmware design or function. Firmware is thus considered a component of the instrument itself. Indeed, the qualification of hardware is not possible without operating it via its firmware. So when the hardware (that is, the analytical instrument) is qualified at the user's site, the integrated firmware is also essentially qualified. No separate on-site qualification of the firmware is needed. Any changes made to firmware versions should be tracked through change control of the instrument (see *Change Control,* below).

Instrument Control, Data Acquisition, and Processing Software—Software for instrument control, data acquisition, and processing for many of today's computerized instruments is loaded on a computer connected to the instrument. Operation of the instrument is then controlled via the software, leaving fewer operating controls on the instrument. Also, the software is needed for data acquisition and postacquisition calculations. Thus both hardware and software, their functions inextricably intertwined, are critical to providing analytical results.

The manufacturer should perform DQ, validate this software, and provide users with a summary of validation. At the user site, holistic qualification, which involves the entire

instrument and software system, is more efficient than modular validation of the software alone. Thus the user qualifies the instrument control, data acquisition, and processing software by qualifying the instrument according to the AIQ process.

Stand-Alone Software—An authoritative guide for validating stand-alone software, such as LIMS, is available.[1] The validation process is administered by the software developer, who also specifies the development model appropriate for the software. Validation takes place in a series of activities planned and executed through various stages of the development cycle.

The software validation guide cited in the previous paragraphs indicates that user-site testing is an essential part of the software development cycle. Note, however, that user-site testing, though essential, is only part of the validation process for stand-alone software and does not constitute complete validation. Refer to the software validation guide for activities that must be performed at the user site for testing stand-alone software used in analytical work.

Change Control

Changes to the instrument and software become inevitable as manufacturers add new features and correct known defects. However, implementing all such changes may not always benefit users. Users should therefore adopt changes they deem useful or necessary and should also assess the effects of changes to determine what, if any, requalification is required. The change control process enables them to do this.

Change control follows the DQ/IQ/OQ/PQ classification process. For DQ, evaluate the changed parameters, and determine whether need for the change warrants implementing it. If implementation of the change is needed, install the changes to the system during IQ. Evaluate which of the existing OQ and PQ tests need revision, deletion, or addition as a result of the installed change. Where the change calls for additions, deletions, or revisions to the OQ or PQ tests, follow the procedure outlined below:

Operational Qualification—Revise OQ tests as necessitated by the change. Perform the revised OQ testing. If the OQ did not need revision, repeat only the relevant tests affected by the change. This ensures the instrument's effective operation after the change is installed.

Performance Qualification—Revise PQ tests as necessitated by the change. Perform the PQ testing after installation of the change if similar testing is not already performed during OQ. In the future, perform the revised PQ testing.

For changes to firmware and to software for instrument control, data acquisition, and processing, change control is performed through DQ/IQ/OQ/PQ of the affected instrument. Change control for stand-alone software requires user-site testing of changed functionality.

AIQ Documentation

Two types of documents result from AIQ: static and dynamic.

STATIC DOCUMENTS

Static documents are obtained during the DQ, IQ, and OQ phases and should be kept in a ''Qualification'' binder. Where multiple instruments of one kind exist, documents common to all instruments should go into one binder or section, and documents specific to an instrument should go into

[1] *General Principles of Software Validation: Final Guidance for Industry and FDA Staff,* U.S. Department of Health and Human Services, Food and Drug Administration, Rockville, MD, January 11, 2002. http://www.fda.gov/cdrh/comp/guidance/938.html (accessed September 2004).

that instrument's binder or section. During change control, additional documents can be placed with the static ones, but previous documents should not be removed. When necessary, such documents may be archived.

DYNAMIC DOCUMENTS

Dynamic documents are generated during the OQ and PQ phases when the instrument is maintained or tested for performance. Arranged in a binder or logbook, they provide a running record for the instruments and should be kept with them. These documents may also be archived as necessary.

Instrument Categories

Modern laboratories typically include a suite of tools varying from simple nitrogen evaporators to complex automated instruments. Therefore, applying a single set of principles to qualifying such dissimilar instruments would be scientifically inappropriate. Users are most capable of establishing the level of qualification needed for an instrument. On the basis of the level needed, it is convenient to categorize instruments into three groups: A, B, and C, as defined below. Examples of instruments in each group are provided. Note that the list of instruments provided here is for illustration only and is not meant to be exhaustive. It does not provide the exact category for an instrument at a user site. That category should be determined by users for their specific instruments or applications.

GROUP A

Conformance of Group A instruments to user requirements is determined by visual observation. No independent qualification process is required. Examples of instruments in this group are nitrogen evaporators, magnetic stirrers, vortex mixers, mortar and pestle sets, and glass pipets.

GROUP B

Conformance of Group B instruments to user requirements is determined according to an instrument's standard operating procedures. Conformity assessments are generally unambiguous. Installation of Group B instruments is relatively simple, and causes of their failure are readily discernible by simple observation. Examples of instruments in this group are balances, incubators, IR spectrometers, melting point apparatus, muffle furnaces, light microscopes, pH meters, variable pipets, refractometers, refrigerator-freezers, thermocouples, thermometers, titrators, ovens, and viscosimeters.

GROUP C

Conformance of Group C instruments to user requirements is complex and highly method-specific; conformity bounds are determined by the application. Installing these instruments can be a complicated undertaking and may require the assistance of specialists. A full qualification process, as outlined in this document, should apply to these instruments. Examples of instruments in this group include the following:

- atomic absorption spectrometers
- differential scanning calorimeters
- electron microscopes
- flame absorption spectrometers
- high-pressure liquid chromatographs
- mass spectrometers
- microplate readers
- thermal gravimetric analyzers
- X-ray fluorescence spectrometers
- densitometers
- diode-array detectors
- elemental analyzers

- gas chromatographs
- near IR spectrometers
- Raman spectrometers
- UV/Vis spectrometers
- inductively coupled argon–plasma emission spectrometers

Again, it must be emphasized that the placement of these instruments in the given three groups is for illustrative purposes only. The exact grouping of an instrument must be determined by users for their specific requirements. Depending on individual user requirements, the same instrument may appropriately fall into one group for one user and another group for another user. Therefore, a careful selection of groups by users is highly encouraged.

CONCLUSION

The purpose of the use of analytical instruments is to generate reliable data. Analytical instrument qualification helps fulfill this purpose. No authoritative guide existed that considered the risk of instrument nonperformance and combined that risk with users' scientific knowledge and ability to use the instrument to deliver reliable and consistent data. In the absence of such a guide, the qualification of analytical instruments became a subjective and often fruitless document-generating exercise.

This chapter is based on the outcome of a user workshop-conference on the subject and provides an efficient science- and risk-based process for AIQ. This approach emphasizes AIQ's place in the overall process of obtaining reliable data from analytical instruments. The process provided in this chapter focuses on scientific value rather than on producing documents. Implementing such a process should increase efficiency and remove ambiguous or varying interpretations by different groups.■2S (*USP29*)

BRIEFING

⟨1080⟩ Bulk Pharmaceutical Excipients—Certificate of Analysis. This new general information chapter, which previously appeared in *Pharmacopeial Previews* on page 1650 of *PF* 28(5) [Sept.–Oct. 2002], is now forwarded to *In-Process Revision.* The chapter is based on the *Certificate of Analysis Guide for Bulk Pharmaceutical Excipients*, prepared by The International Pharmaceutical Excipients Council of the Americas (IPEC-Americas). The chapter defines the required elements of a Certificate of Analysis, provides a template for organizing required and optional data in a logical manner, and assists in establishing a uniform understanding of the roles and responsibilities of excipient manufacturers, distributors, and users.

This proposed chapter, published with the permission of IPEC-Americas, is informational and contains no standards, tests, assays, or other mandatory specifications with respect to any Pharmacopeial article.

On the basis of comments received, allowances are made to include materials that do not meet certain compendial requirements as compendial materials, with labeling requirements to state the deficiencies; and clarification is made to the *Compendial Designation* section by the deletion of a reference to *Good Manufacturing Practices for Bulk Pharmaceutical Excipients* ⟨1078⟩, because these are not the only recognized principles of good manufacturing practices. Because this chapter is presented as a general information chapter, editorial changes have been made to exclude terms such as "required" and "must"; also other minor editorial changes have been made.

(ETM: J. Lane) RTS—39715-1

Add the following:

■⟨1080⟩ BULK PHARMACEUTICAL EXCIPIENTS—CERTIFICATE OF ANALYSIS

BACKGROUND

This general information chapter is derived from the *Certificate of Analysis Guide for Bulk Pharmaceutical Excipients,* prepared by The International Pharmaceutical Excipients Council of the Americas (IPEC-Americas), an international guidance document on the preparation and appropriate use of a Certificate of Analysis (COA) for these excipients, referenced throughout the chapter as "excipient(s)". The chapter defines the ~~required~~ suggested elements of a Certificate of Analysis, provides a template for organizing required and optional data in a logical manner, and as-

In-Process Revision

sists in establishing a uniform understanding of the roles and responsibilities of excipient manufacturers, distributors, and users.

The principles and information in this chapter can be applied to the manufacture of all bulk pharmaceutical excipients intended for use in human drugs, veterinary drugs, and biologics. As an international guidance document, it cannot specify all national legal requirements nor cover in detail the particular characteristics of every excipient. When considering how to use this chapter, each manufacturer, distributor, or user ~~must~~ should consider how it may apply to that specific manufacturer's product and processes. The diversity of excipients means that some principles of the chapter may not be applicable to certain products and processes.

The chapter is divided into several parts. The first part provides background discussion necessary for the design and ~~required~~ suggested elements of a COA. A template is provided to show the format and placement of information in the COA. This is followed by a detailed discussion to ensure that the purpose and meaning of the specific information contained in the COA is understood. For a list of terms used in this information chapter and their definitions, see *Appendix 1*.

GENERAL GUIDANCE

International regulations governing drugs require that components of the drugs be manufactured, processed, packed, and held in accordance with good manufacturing practices (GMPs). For a thorough discussion of GMPs that apply to excipient manufacture, see *Good Manufacturing Practices for Bulk Pharmaceutical Excipients* ⟨1078⟩. The excipient is often a natural substance, mixture, or polymer whose chemical and physical properties are difficult to quantify and that is often used with a broad range of active pharmaceutical ingredients and in a diverse range of finished dosage forms. Until now, there were no guidance documents that specifically focused on the content or format of COAs for excipients and that addressed the diversity of both the excipients and their usage.

Preparation and Appropriate Use of a Certificate of Analysis—The Certificate of Analysis for excipients should be prepared and issued by the supplier of the material, following the general guidelines discussed below. Primary responsibility for the preparation of the COA belongs to the excipient manufacturer. It is most important that a complete and accurate COA be provided to the excipient user for specific lots or batches intended for use in the pharmaceutical industry. Additional considerations ~~must~~ should be made for the preparation and issuance of a COA by a distributor of excipients.
