Table of Contents*

PHARMACOPEIAL FORUM VOL. 31 NO. 1 JAN.–FEB. 2005

* The *USP–NF* (*USP29–NF24*), the *Supplement* (*Supp*), or the *Interim Revision Announcement* (*IRA*) for which the revision proposal is targeted is shown in parentheses next to each proposed item.

THE JOURNAL OF STANDARDS DEVELOPMENT AND OFFICIAL COMPENDIA REVISION

Please address comments on *PF* content to Executive Secretariat
USP–NF, 12601 Twinbrook Pkwy.
Rockville, MD 20852

Telephone: 1-301-816-8345
Fax: 1-301-816-8373
http://www.usp.org

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI),* in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences.*

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

ISSN: 0363-4655

Printed in Canada by Webcom Limited, Toronto, Ontario

STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum* (*PF*), for the development of official pharmaceutical standards.

USP publishes *Pharmacopeial Forum* (*PF*) bimonthly as the working vehicle of the USP Council of Experts. *PF* provides interested parties an opportunity to review and comment as the Council of Experts develops or revises standards for the *United States Pharmacopeia* and the *National Formulary* (*USP–NF*).

PF includes the following:

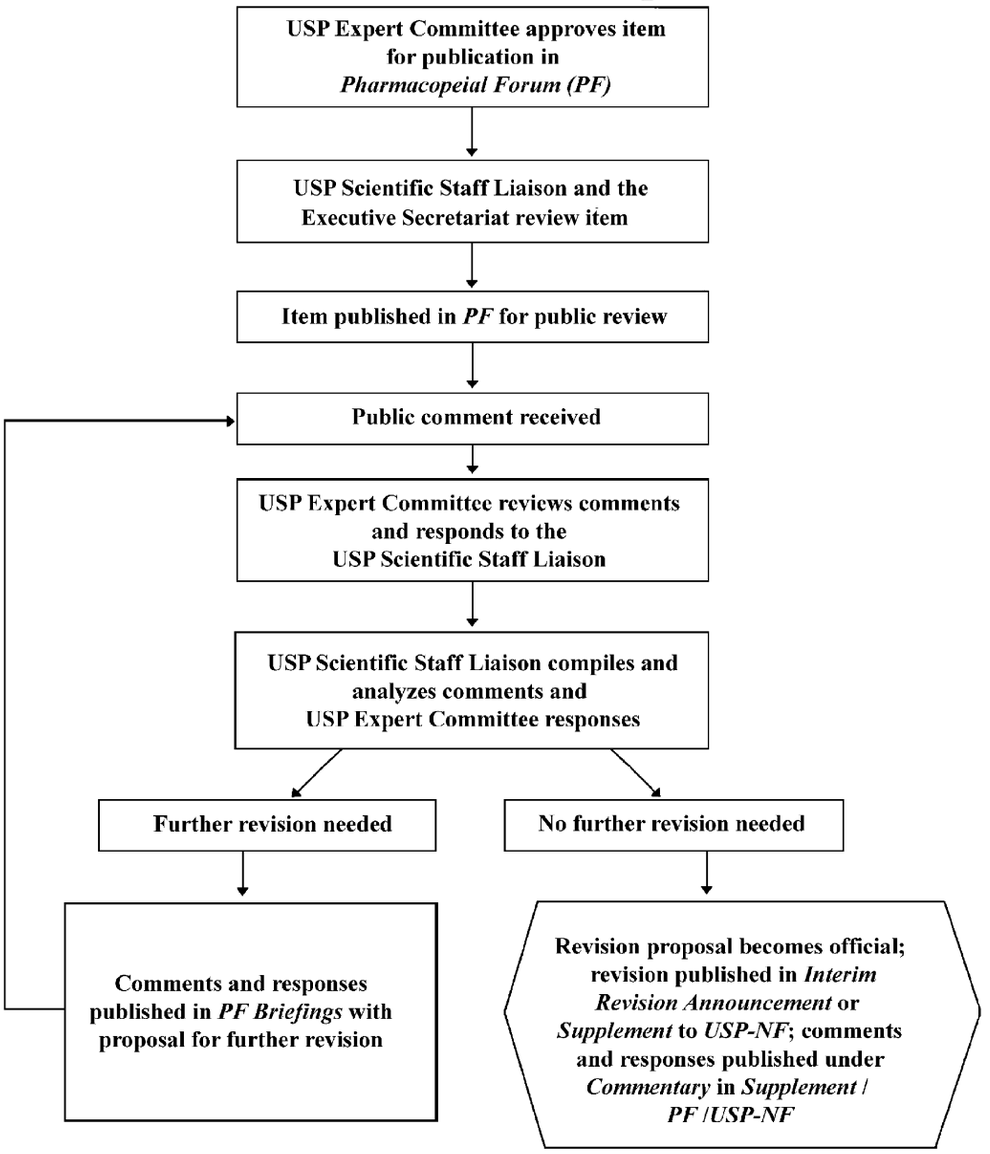
1. Potential revisions—entirely new standards, revision ideas, and drafts not yet targeted for official adoption (*Pharmacopeial Previews*)
2. Proposed revisions—new or revised standards targeted for official adoption (*In-Process Revision*)
3. Adopted revisions—new or revised standards that become official and binding before the publication of the next *USP–NF* or *Supplement* (*Interim Revision Announcement*)

USP welcomes comments and data on potential, proposed, or official standards.* Comments, along with USP's responses, will be published either in *PF Briefings*, the *Commentary* section of *PF*, the *Commentary* section of *Supplements* to *USP–NF*, or the *Commentary* section of *USP–NF*.

* If you are not immediately able to submit comments but you intend to do so, please notify USP by using the Intent to Comment form provided before the section *Chromatographic Reagents Used in USP–NF and PF*.

The chart below shows the public review and comment process and its relationship to standards development.

Public Review and Comment Process for Standards Development



Questions on the process should be addressed to John W. Gasper, M.A., J.D., Director, Office of the Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: jg@usp.org).

HOW TO USE *PF*

This section provides descriptions of the various parts of *PF*. It also includes *Committee Designations* and the *Staff Directory.*

The contents of the different sections of *PF* are briefly described below. Readers will get an idea of how each section is relevant to their job functions. They may contact USP scientific staff liaisons or staff members of the Executive Secretariat (listed in the *Staff Directory*) if they have any questions. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a Request for Revision is available on the USP website (www.usp.org/standards/revisionguideline/).

Proposed and Adopted Revisions

Section	Content	How Readers Can Respond
Pharmacopeial Previews Early ideas for revisions	•BRIEFING: Scientific rationale for potential inclusion or change. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •Potential revisions not yet targeted for official adoption that require a longer public review and comment process because of issues such as: — the controversial nature of an item; — the application of new technologies that require further study; and — articles produced by multiple sources.	Review drafts and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview.*
In-Process Revision Revisions targeted for adoption	•BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see *Standards Development*). New or revised text is marked with symbols (■▪ or •▲ or ▲•) to specify the tentative earliest date on which the revision would be officially adopted.	Review material and send comments promptly to USP staff liaison (see the *Staff Directory*). Guidelines on how to comment are found at the end of the *Policies and Announcements* section.
Harmonization Items the Pharmacopeial Discussion Group (PDG) is trying to harmonize internationally	•BRIEFING: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. The stage determines whether an item appears under *Pharmacopeial Previews* or under *In-Process Revision*, both separate sections of *Harmonization.* •For *In-Process Revision*, new or revised text is marked with symbols (■▪) to specify the tentative, earliest date on which the revision would be officially adopted.	Review material and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview* or *In-Process Revision.*
Interim Revision Announcement Adopted standards	Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols •▪.	Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance.

Other Sections

Committee Designations
Names of the committees (composed of volunteer scientific experts) that USP staff work with on the development of standards.

Staff Directory
Names of all USP scientific staff liaisons with contact information.

Policies and Announcements
- General scientific and policy issues affecting *USP–NF* standards and processes
- Update on standards-related issues being considered by USP
- Summaries of meetings of the Council of Experts
- Guidelines on how to comment
- Publication and comment schedules

Stimuli to the Revision Process
- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

Nomenclature
- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the *USP Dictionary of USAN and International Drug Names*
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

Index
Cumulative directory for the content of all issues of *PF* beginning with *PF* 31(1).

Reference Standards Catalog
List of official USP Reference Standards specified in *USP–NF*, along with availability and ordering information.

Chromatographic Reagents* Used in *USP–NF* and *Pharmacopeial Forum
Update of chromatographic reagents based on the proposals published in this issue of *PF*.

EXPERT COMMITTEE DESIGNATIONS*

The names of the Committees and their abbreviations are as follows:

AER	Aerosols
AMB	Analytical Microbiology
BBP	Blood and Blood Products
BNA	Bioavailability and Nutrient Absorption
BNT	Biotechnology and Natural Therapeutics and Diagnostics
BPC	Biopharmaceutics
BST	Biostatistics
CRX	Compounding Pharmacy
DSB	Dietary Supplements—Botanicals
DSI	Dietary Supplements—Information
DSN	Dietary Supplements—Non-Botanicals
EMC	Excipient Monograph Content
ETM	Excipients—Test Methods
GCT	Gene Therapy, Cell Therapy, and Tissue Engineering
GTB	General Toxicity and Biocompatibility
NL	Nomenclature and Labeling
PA1	Pharmaceutical Analysis 1
PA2	Pharmaceutical Analysis 2
PA3	Pharmaceutical Analysis 3
PA4	Pharmaceutical Analysis 4
PA5	Pharmaceutical Analysis 5
PA6	Pharmaceutical Analysis 6
PA7	Pharmaceutical Analysis 7—Antibiotics
PDF	Pharmaceutical Dosage Forms
PPC	Parenteral Products—Compounding and Preparation
PPI	Parenteral Products—Industrial
PSD	Packaging, Storage, and Distribution
PW	Pharmaceutical Waters
RMI	Radiopharmaceuticals and Medical Imaging
SMU	Safe Medication Use
VET	Veterinary Drugs
VVI	Vaccines, Virology, and Immunology

* **HDQ** Indicates USP Headquarters items.

STAFF DIRECTORY

This is an updated directory that reflects assignment changes based on the reorganization of USP. The general USP telephone number, (301) 881-0666, may still be used for general inquiries or when a particular Committee is not identified. The Fax number is (301) 816-8373.

STAFF	E-MAIL	PHONE	ASSIGNMENT
Clydewyn M. Anthony, Scientist	cma@usp.org	(301) 816-8139	Pharmaceutical Analysis 1 (PA1)

POLICIES AND ANNOUNCEMENTS

In this section, readers may find statements about general scientific and policy issues that may have an impact on *USP–NF* standards and processes, announcements about issues being considered by USP, and summaries of Council of Experts meetings. This section also includes publication and comment schedules.

NEW DIRECTOR NAMED FOR SCIENTIFIC ADMINISTRATION. USP is pleased to announce that Todd L. Cecil, Ph.D., has been named as the Director, DSD Scientific Administration. As part of his duties, he will be responsible for the day-to-day operations of the DSD scientific staff. He is also responsible for ensuring that scientific information included in the compendia is complete and relevant and is responsible for providing support to *USP–NF* users. In addition, Dr. Cecil has a significant role in the development of the updated infrastructure USP requires to track the monograph development process.

Most recently, Dr. Cecil served as the DSD Director of General Policies and Requirements at USP where he was responsible for the development of general chapters.

Dr. Cecil may be reached by telephone at 301-816-8234, and via email at tlc@usp.org.

NEW DIRECTOR NAMED FOR VOLUNTEER AND ORGANIZATIONAL AFFAIRS. USP is pleased to announce that Angela G. Long has been named DSD Director, Volunteer and Organizational Affairs. As part of her duties, she will be responsible for the following: support and services for the USP Council of Experts and specifically the members of the Standards Expert Committees; Executive Secretariat support to the USP Council of Experts; organizational affairs and outreach with scientific professional, trade, and standards-setting organizations and manufacturers; management of USP Stakeholder Forums and Project Teams; serving as liaison to USP's International Quality Communication Groups; and management of USP's meetings.

Most recently, Ms. Long served as Program Director, Professional Affairs where she was involved in outreach to and communication with professional and trade organizations and USP meetings.

Ms. Long joined USP in 1990. She left briefly to operate her own communications business that focused on pharmaceutical organizations and returned to USP in 2002. Prior to joining USP in 1990, Ms. Long worked for USA TODAY.

Ms. Long may be reached by telephone at 301-816-8382, and via email at agl@usp.org.

NEW DIRECTOR NAMED FOR GENERAL POLICIES AND REQUIREMENTS. USP is pleased to announce that David A. Porter, Ph.D., has been named as the new DSD Director for General Policies and Requirements. As part of his duties, he will be responsible for the development of general chapters and monographs.

Most recently, Dr. Porter served as the DSD Associate Director of Complex Actives at USP where he was involved in activities with the Analytical Microbiology Expert Committee. Prior to joining USP, he acquired significant industrial experience in pharmaceutical and cosmetic research, development, and clinical affairs.

Dr. Porter may be reached by telephone at 301-816-8225, and via email at dap@usp.org.

ADVANCE NOTICE OF UPCOMING OFFICIAL REVISIONS TO THE *USP–NF*. In order to provide as much time as possible for industry to adopt revisions made to the compendia, upcoming official revisions to the *USP–NF* are now being announced on the USP website as soon as they are voted on to become official by the appropriate Expert Committees of the Council of Experts.

Readers are directed to the "Notices" section found in the top right corner of the USP homepage at www.usp.org. By clicking on "Upcoming Official Revisions to the *USP–NF:* Reference Standards Required But Not Available" you are taken to a page where upcoming revisions to the compendia are listed. The information posted includes the title of the item being revised, the *PF* citation where the revision was proposed, and a description of the proposal. In addition, an e-mail link to the USP Scientific Liaison for each revision is listed in parentheses after the item. The actual content and official date of each revision will be published in either an annual edition, *Supplement,* or *Interim Revision Announcement* and the items are sorted according to the publication in which they are to appear.

In addition, readers will also find a list of new USP Reference Standards that correspond to new *USP–NF* monographs but unfortunately are not yet available. The official dates of any *USP–NF* Standards, tests, or assays that require the use of these Standards are postponed until further notice pending availability of the Standards.

USP GUIDELINE FOR SUBMITTING REQUESTS FOR REVISION TO THE *USP–NF*. We are pleased to announce the availability of the *USP Guideline for Submitting Requests for Revision to the USP–NF*. This document was developed in conjunction with the USP Council of Experts and its Expert Committees, USP staff, and the Drug Substance, Complex Actives, and Excipients Project Teams of the Prescription/Nonprescription Stakeholders Forum. This document includes information to aid submission of new monographs and revisions to existing monographs for Non-Complex Active Substances and Products, Biological and Biotech Substances and Products, Excipients, and Vaccines. It incorporates many of the concepts and suggestions included in the ICH Q3A, Q3B, Q3C, Q6A, and Q6B guidelines. These include the definition of a specification and incorporate much of the terminology of Q3A for the control of impurities. The guideline clearly defines the information needed for the USP's Council of Experts and its Expert Committees to evaluate a request for revision. The document is approximately 75 pages in length with about 25 pages of addenda and is available in PDF format from the USP website at www.usp.org. Hard copies will be provided upon request.

PHARMACOPEIAL EDUCATION COURSES. USP's Pharmacopeial Education series has been developed to enhance the knowledge, skills, and expertise of pharmaceutical industry personnel.

The following list indicates tentatively scheduled course dates. For further information, contact Laura A. McCurry, Manager, Pharmacopeial Education, lam@usp.org, 301-816-8285; Diana Lenahan, Program Associate, dpl@usp.org, 301-816-8530; or visit the website at www.usp.org/education to register. Call 301-816-8530 to get information on customized courses offered at USP or at your site.

Calendar of Pharmacopeial Education Courses, 2005

Date	Name of course	Location
January 11	Fundamentals of Titrations (Lecture Only)	USP Headquarters, Rockville, MD
February 3	Fundamentals of Microbiological Testing	USP Headquarters, Rockville, MD
February 8	Analytical Method Validation	USP Headquarters, Rockville, MD
March 15	Standards 100: Fundamentals of the Use of *USP–NF* and the Standards Development Process	USP Headquarters, Rockville, MD
March 16	Standards 101: Advanced use of *USP–NF,* General Notices, & Monograph Chapters	USP Headquarters, Rockville, MD
March 22 and 23	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
April 11	Basic Statistics and their Practical Applications to the USP	USP Headquarters, Rockville, MD
May 18	Analytical Method Validation	USP Headquarters, Rockville, MD
July 18 and 19	Fundamentals of Dissolution	USP Headquarters, Rockville, MD

Calendar of Pharmacopeial Education Courses, 2005 *(Continued)*

Date	Name of course	Location
August 12	Fundamentals of Microbiological Testing	USP Headquarters, Rockville, MD
August 17	Analytical Method Validation	USP Headquarters, Rockville, MD
August 18	Standards 100: Fundamentals of the Use of *USP–NF* and the Standards Development Process	USP Headquarters, Rockville, MD
August 19	Standards 101: Advanced use of *USP–NF,* General Notices, and Monograph Chapters	USP Headquarters, Rockville, MD
October 19 and 20	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
December 7	Standards 100: Fundamentals of the Use of *USP–NF* and the Standards Development Process	USP Headquarters, Rockville, MD
December 8	Standards 101: Advanced use of *USP–NF,* General Notices, & Monograph Chapters	USP Headquarters, Rockville, MD

VISIT THE USP WEB SITE AT ⟨http://www.usp.org⟩. Various resources related to Pharmacopeial standards are presented, including highlights from *PF.*

***USP–NF* AVAILABLE IN THREE ELECTRONIC FORMATS.** The trusted reference for official pharmaceutical standards is available in three convenient electronic formats—CD, intranet, and online. The CD is ideal for single users who prefer to have *USP–NF* on their hard drives. The intranet format allows Web browser-based access to multiple users within a company, through their own intranet server. The online format can be accessed by individual registered users through the World Wide Web. All three electronic formats provide fast and easy access to official *USP–NF* content. More information can be obtained by visiting www.usp.org/products or by calling USP's Customer Service Department at 1-800-227-8772 or 301-881-0666.

***CHROMATOGRAPHIC REAGENTS* NOW AVAILABLE.** *Chromatographic Reagents* lists the brand names of the column reagents cited in every proposal for new or revised gas- or liquid-chromatographic test methods that has been published in *Pharmacopeial Forum* (*PF*) since 1980. *Chromatographic Reagents* also helps to track which column reagents were used to validate methods that have become official and are included in *USP–NF*. The branded column reagents list is updated bimonthly through *Pharmacopeial Forum. Chromatographic Reagents* can be ordered by calling USP's Customer Service Department at 1-800-227-8772 or 301-881-0666.

INTERNATIONAL CORRESPONDENCE. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows:

Technical Secretariat of the
European Pharmacopoeia Commission
B.P. 907
F 67029 Strasbourg Cedex 1
France

NAKASHIMA Nobumasa
Evaluation and Licensing Division
Pharmaceutical and Medical Safety Bureau
Ministry of Health, Labour and Welfare, Japan
Tel. +81-3-3595-2431, Fax. +81-3-3597-9535
E-mail: nakashima-nobumasa@mhlw.go.jp

HOW TO SUBMIT COMMENTS. The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. Submissions concerning a particular item that has appeared in a *PF* should be submitted to the appropriate USP scientific staff liaison identified at the end of the *Briefing* accompanying each item. To submit comments and data to a liaison, use the e-mail address and telephone numbers listed in the *Staff Directory* included in every *PF.*

Please note that *USP–NF* is being published in an annual edition with one main book and two *Supplements* a year. In addition, the following schedule will repeat every year so that users will know what to expect and become familiar with the deadlines.

Publication and Comment Schedule for *USP 28–NF 23*

Publication	**Comment Deadline**	**Publication Date**	**Official Date**
Main Book	May 15, 2004	November 2004	January 2005
Supplement One	October 15, 2004	February 2005	April 2005
Supplement Two	February 17, 2005	June 2005	August 2005

In the future, USP anticipates including the comment submission deadline in each briefing of every revision proposal when it is published for public review and comment.

For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or FAX number 301-816-8373.

All official revisions are published in *Supplements to USP–NF* (twice yearly). Between *Supplements,* official revisions are published in *PF* in the *Interim Revision Announcement;* these revisions are also incorporated in the upcoming *Supplement.* The electronic version of *USP–NF* is updated as each *Supplement* becomes available and, therefore, contains all official text up to and including the contents of the latest *Supplement*.

PUBLICATION SCHEDULES

Publication	Publication Date	Official Date
1st Supplement	Feb. 2005*	Apr. 1, 2005*
PF 31(2) [Mar.–Apr. 2005]	Mar. 2005*	Not Applicable
2nd IRA [published in *PF* 31(2)]	Mar. 2005*	Apr. 1, 2005*
PF 31(3) [May–June 2005]	May 2005*	Not Applicable
3rd IRA [published in *PF* 31(3)]	May 2005*	June 1, 2005*
2nd Supplement	June 2005*	Aug. 1, 2005*
PF 31(4) [July–Aug. 2005]	July 2005*	Not Applicable
4th IRA [published in *PF* 31(4)]	July 2005*	Aug. 1, 2005*
PF 31(5) [Sept.–Oct. 2005]	Sept. 2005*	Not Applicable
5th IRA [published in *PF* 31(5)]	Sept. 2005*	Oct. 1, 2005*
PF 31(6) [Nov.–Dec. 2005]	Nov. 2005*	Not Applicable
6th IRA [published in *PF* 31(6)]	Nov. 2005*	Dec. 1, 2005*

* Tentative

INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- New adopted (official) revisions to the *USP–NF* that become effective before the effective date of the next *Supplement* or that were not ready for adoption by the closing date for the upcoming *Supplement*. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.

Symbols—Interim revisions are shown with new text (if any) enclosed in circles, •new text•. Text enclosed in squares, ▪new text▪, has already been adopted in a *Supplement*. Where the symbols appear together with no enclosed text, such as •• or ▪▪, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by a number that indicates the *IRA* or *Supplement* in which the revision first appeared. For example, •2 indicates that the revision was officially adopted in the *Second Interim Revision Announcement*, and ▪2S (*USP27*) indicates that the revision was officially adopted in the *Second Supplement* to *USP 27*.

Errata—At the end of the *Interim Revision Announcement* section is a list of errata and corrections to *USP 28–NF 23*. The page number indicates where the item is found in *USP–NF*. If necessary, this list will be updated with every issue of *PF*. This information will also be cumulative in the next available *Supplement*, and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

FIRST INTERIM REVISION ANNOUNCEMENT to *USP 28* and to *NF 23*

By authority of the United States Pharmacopeial Convention, Inc.
Prepared by the Council of Experts and published by the Board of Trustees

Larry L. Braden, *Chair*
USP Board of Trustees

Roger L. Williams, *Executive Vice President*
and *Chairman, USP Council of Experts*

John W. Gasper, *Director*, *Executive Secretariat*

Official February 1, 2005. **Released January 1, 2005.**

All inquiries and comments regarding *USP 28* text and *NF 23* text should be addressed to the Executive Secretariat, *USP–NF*, 12601 Twinbrook Parkway, Rockville, MD 20852.

New USP Reference Standards

The following USP Reference Standards, which were indicated in past *Supplements to USP–NF* as being not yet available, have since become available. Thus, the official date of each *USP 28* or *NF 23* standard, test, or assay requiring the use of the following Reference Standards is indicated individually in this list. (AS) indicates Authentic Substances, which are materials that have no specified use in monographs or General Chapters and are offered for the convenience of *USF–NF* users.

USP Alcohol RS (May 1, 2005)
USP Alcohol Determination–Acetonitrile RS (March 1, 2005)
USP Alcohol Determination–Alcohol RS (March 1, 2005)
USP Amiodarone Hydrochloride RS (July 1, 2005)
USP Amlodipine Besylate RS (May 1, 2005)
USP Ammonium Carbonate (AS)
USP Ammonium Phosphate Dibasic (AS)
USP Benazepril Related Compound C RS (January 1, 2005)
USP Boric Acid (AS)
USP Butylated Hydroxytoluene RS (March 1, 2005)
USP Calcium Acetate (AS)
USP Calcium Carbonate (AS)
USP Calcium Chloride (AS)
USP Calcium Hydroxide (AS)
USP Calcium Stearate (AS)
USP Calcium Sulfate (AS)
USP Candelilla Wax RS (March 1, 2005)
USP Caprylocaproyl Polyoxylglycerides RS (March 1, 2005)
USP Cefpodoxime Proxetil RS (January 1, 2005)
USP Cellaburate (cellulose acetate butyrate) RS (May 1, 2005)
USP Powdered Black Cohosh Extract RS (March 1, 2005)
USP Corn Oil (AS)
USP Cottonseed Oil (AS)
USP Dehydrated Alcohol RS (May 1, 2005)
USP Dextran 1 RS (July 1, 2005)
USP Dextran T-10 RS (July 1, 2005)
USP Dibutyl Phthalate RS (March 1, 2005)
USP Dibutyl Sebacate (AS)
USP Fenbendazole Related Compound A RS (January 1, 2005)
USP Fenbendazole Related Compound B RS (January 1, 2005)
USP Ferrous Sulfate (AS)
USP Fexofenadine Hydrochloride RS (July 1, 2005)
USP Fexofenadine Related Compound A RS (July 1, 2005)
USP Fexofenadine Related Compound B RS (July 1, 2005)
USP Fluconazole RS (July 1, 2005)
USP Fluconazole Related Compound A RS (July 1, 2005)
USP Fluconazole Related Compound B RS (July 1, 2005)
USP Fluconazole Related Compound C RS (July 1, 2005)
USP Gemcitabine Hydrochloride RS (March 1, 2005)
USP Glacial Acetic Acid (AS)
USP Homopolymer Polypropylene RS (January 1, 2005)
USP Hypromellose Acetate Succinate RS (July 1, 2005)
USP Lactase RS (May 1, 2005)
USP Lactic Acid (AS)
USP Lauroyl Polyoxylglycerides (AS)
USP Leuprolide Acetate RS (January 1, 2005)
USP Linoleoyl Polyoxylglycerides RS (January 1, 2005)
USP Loratadine Related Compound A RS (May 1, 2005)
USP Loratadine Related Compound B RS (May 1, 2005)
USP Losartan Potassium RS (July 1, 2005)
USP Magnesium Carbonate (AS)
USP Magnesium Chloride (AS)
USP Magnesium Hydroxide (AS)
USP Magnesium Stearate (AS)
USP Magnesium Sulfate (AS)
USP Mangafodipir Related Compound A RS (July 1, 2005)
USP Mangafodipir Related Compound B RS (July 1, 2005)
USP Mangafodipir Trisodium RS (July 1, 2005)
USP Manganese Chloride (AS)
USP Manganese Sulfate (AS)
USP Mirtazapine RS (March 1, 2005)
USP Nabumetone Related Compound A RS (May 1, 2005)
USP Nevirapine Anhydrous RS (March 1, 2005)
USP Nevirapine Hemihydrate RS (January 1, 2005)
USP Nevirapine Related Compound A RS (January 1, 2005)
USP Nevirapine Related Compound B RS (January 1, 2005)
USP Ondansetron Resolution Mixture RS (May 1, 2005)
USP Oxybutynin Related Compound B RS (January 1, 2005)
USP Oxybutynin Related Compound C RS (January 1, 2005)
USP Oleoyl Polyoxylglycerides RS (January 1, 2005)
USP Olive Oil (AS)
USP Palm Oil (AS)
USP Paroxetine Related Compound F RS (May 1, 2005)
USP Paroxetine Related Compound G RS (May 1, 2005)
USP Peanut Oil (AS)
USP Phenothiazine (AS)
USP Phenoxyethanol RS (July 1, 2005)
USP Phosphoric Acid (AS)
USP Polysorbate 20 (AS)
USP Polysorbate 40 (AS)
USP Polysorbate 60 (AS)
USP Polysorbate 80 (AS)
USP Potassium Benzoate (AS)
USP Potassium Bicarbonate RS (January 1, 2005)
USP Potassium Carbonate (AS)
USP Potassium Chloride (AS)
USP Potassium Iodide (AS)
USP Potassium Sorbate (AS)
USP Propionic Acid (AS)
USP Residual Solvent Class 2—Chlorobenzene RS (January 1, 2005)
USP Residual Solvent Class 2—Chloroform RS (May 1, 2005)
USP Residual Solvent Class 2—Cyclohexane RS (May 1, 2005)
USP Residual Solvent Class 2—1,2-Dichloroethene RS (March 1, 2005)
USP Residual Solvent Class 2—1,2-Dimethoxyethane RS (May 1, 2005)
USP Residual Solvent Class 2—*N,N*-Dimethylacetamide RS (May 1, 2005)
USP Residual Solvent Class 2—*N,N*-Dimethylformamide RS (May 1, 2005)
USP Residual Solvent Class 2—1,4-Dioxane RS (January 1, 2005)
USP Residual Solvent Class 2—2-Ethoxyethanol RS (May 1, 2005)
USP Residual Solvent Class 2—Formamide RS (May 1, 2005)
USP Residual Solvent Class 2—Methanol RS (January 1, 2005)
USP Residual Solvent Class 2—Methylbutylketone RS (May 1, 2005)
USP Residual Solvent Class 2—Methylcyclohexane RS (March 1, 2005)
USP Residual Solvent Class 2—Methylene Chloride RS (January 1, 2005)
USP Residual Solvent Class 2—*N*-Methylpyrrolidone RS (May 1, 2005)
USP Residual Solvent Class 2—2-Methoxyethanol RS (May 1, 2005)
USP Residual Solvent Class 2—Mixture A RS (May 1, 2005)
USP Residual Solvent Class 2—Mixture C RS (May 1, 2005)
USP Residual Solvent Class 2—Nitromethane RS (May 1, 2005)
USP Residual Solvent Class 2—Pyridine RS (May 1, 2005)
USP Residual Solvent Class 2—Sulfolane RS (May 1, 2005)
USP Residual Solvent Class 2—Tetrahydrofuran RS (January 1, 2005)
USP Residual Solvent Class 2—Tetralin RS (May 1, 2005)
USP Residual Solvent Class 2—Toluene RS (January 1, 2005)

USP Residual Solvent Class 2—Trichloroethylene RS (May 1, 2005)
USP Residual Solvent Class 2—Xylenes RS (January 1, 2005)
USP Sevoflurane Related Compound B RS (July 1, 2005)
USP Sevoflurane Related Compound C RS (July 1, 2005)
USP Sodium Acetate (AS)
USP Sodium Bicarbonate (AS)
USP Sodium Carbonate Anhydrous (AS)
USP Sodium Chloride (AS)
USP Sodium Citrate (AS)
USP Sodium Metabisulfite (AS)
USP Sodium Nitrite (AS)
USP Sodium Sulfate Anhydrous (AS)
USP Sodium Thiosulfate (AS)
USP Titanium Dioxide (AS)
USP Tolcapone RS (July 1, 2005)
USP Zinc Oxide (AS)
USP Zinc Sulfate (AS)

The official dates of any *USP 28* or *NF 23* standards, tests, or assays requiring the use of the following new USP Reference Standards are postponed until further notice pending availability of the respective Reference Standards.

USP Alteplase RS
USP Amiloxate RS
USP Bupropion Hydrochloride Related Compound A RS
USP Bupropion Hydrochloride Related Compound B RS
USP Bupropion Hydrochloride Related Compound C RS
USP Bupropion Hydrochloride Related Compound D RS
USP Bupropion Hydrochloride Related Compound E RS
USP Bupropion Hydrochloride Related Compound F RS
USP Cinoxate RS
USP Decoquinate RS
USP Diethylstilbestrol Diphosphate RS
USP Enalapril Related Compound B RS
USP Enzacamene RS
USP Fludeoxyglucose RS
USP Ginseng Extract RS
USP Gonadorelin Hydrochloride RS
USP Hypericin RS
USP Lactase RS
USP Maltose Monohydrate RS
USP Menotropins RS
USP Methyldopa–Glucose Reaction Product RS
USP Mibolerone RS
USP Narasin RS
USP Ondansetron Related Compound B RS
USP Potassium Perchlorate RS
USP Propofol RS
USP Propofol Related Compound A RS
USP Propofol Related Compound B RS
USP Propofol Resolution RS
USP Propofol for System Suitability RS
USP Pyrethrum Extract RS
USP Sargramostim RS
USP Sulisobenzone RS
USP Terbutaline Related Compound A RS
USP Δ^8-tetrahydrocannabinol RS
USP Δ^9-tetrahydrocannabinol RS
USP Thiacetarsamide RS
USP Tilmicosin RS
USP Tinidazole Related Compound B RS
USP Trenbolone RS
USP Trenbolone Acetate RS
USP Powdered Valerian RS
USP Vasopressin RS

MONOGRAPHS (USP)

Bisoprolol Fumarate Tablets

Delete the following:

•**Water,** *Method I* ⟨921⟩: not more than 3.0%.•

Change to read:

Assay—

Diluent—Prepare a mixture of water and acetonitrile (65:35).

Mobile phase—•To a 1-L portion of *Diluent* add• 5 mL of heptafluorobutyric acid, 5 mL of diethylamine, and 2.5 mL of formic acid. Mix, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Prepare a solution in *Diluent* having a concentration of 0.5 mg of propranolol hydrochloride per mL and 1.0 mg of bisoprolol fumarate per mL.

Standard preparation—Quantitatively dissolve an accurately weighed quantity of USP Bisoprolol Fumarate RS in *Diluent* to obtain a solution having a known concentration of about 1 mg per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 25 mg of bisoprolol fumarate, to a 25-mL volumetric flask. Add 10 mL of *Diluent,* and sonicate for 10 minutes. Cool, dilute with *Diluent* to volume, and mix. Centrifuge for 20 minutes, and use the clear supernatant.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 273-nm detector and a 4.6-mm × 12.5-cm column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution,* and record the peak areas as directed for *Procedure:* the resolution, *R,* between bisoprolol and propranolol is not less than 7.0. Chromatograph the *Standard preparation,* and record the peak areas as directed for *Procedure:* the tailing factor for the analyte peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of bisoprolol fumarate [$(C_{18}H_{31}NO_4)_2 \cdot C_4H_4O_4$] in the portion of Tablets taken by the formula:

$$25C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Bisoprolol Fumarate RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Glucagon

Change to read:

Assay—[NOTE—All buffers have a final pH of 7.4, unless otherwise indicated.]

HEPATOCYTE PREPARATION—

Calcium-free perfusion buffer with dextrose—Prepare a solution containing, in each L, 7.92 g of sodium chloride, 0.35 g of potassium chloride, 1.80 g of dextrose, 0.19 g of edetic acid, and 2.38 g of *N*-2-hydroxyethylpiperazine-*N*′-2-ethanesulfonic acid. Oxygenate prior to circulation.

Collagenase buffer—Prepare a solution containing, in each L, 3.62 g of sodium chloride, 23.83 g of *N*-2-hydroxyethylpiperazine-*N*′-2-ethanesulfonic acid, 0.35 g of potassium chloride, 0.52 g of calcium chloride, and 1.8 g of dextrose. Adjust to a pH of 7.6, and oxygenate. Immediately before perfusion, dissolve a quantity of collagenase in this solution to obtain a concentration of 0.02% to 0.05%.

Wash buffer—Prepare a solution containing, in each L, 7.92 g of sodium chloride, 0.35 g of potassium chloride, 0.19 g of edetic acid, 2.38 g of *N*-2-hydroxyethylpiperazine-*N*′-2-ethanesulfonic acid, 0.22 g of calcium chloride, and 0.12 g of magnesium sulfate.

Incubation buffer—Prepare a solution containing, in each L, 6.19 g of sodium chloride, 0.35 g of potassium chloride, 0.22 g of calcium chloride, 0.12 g of magnesium sulfate, 0.16 g of monobasic potassium phosphate, 11.915 g of *N*-2-hydroxyethylpiperazine-*N*′-2-ethanesulfonic acid, and 1% bovine serum albumin. Adjust to a pH of 7.5.

Test animals—Male Sprague-Dawley rats are maintained on a standard rat chow diet and freely given water. On the morning of the test, select a healthy rat weighing approximately 300 g, and administer 100 Units of Heparin Sodium subcutaneously.

Procedure—[NOTE—Conduct this procedure in the morning to ensure that the rat has optimal glycogen in its liver.] Anesthetize the rat with an appropriate anesthetic. Open the abdominal cavity, and isolate the portal vein. Insert an angiocatheter connected to a perfusion pump, and tie into the portal vein at the general location of the lienal branch. Start the perfusion (25 mL per minute) in situ with *Calcium-free perfusion buffer with dextrose,* equilibrated with oxygen, at a temperature of 37°. As the liver enlarges, cut the inferior vena cava to allow pressure equilibrium. [NOTE—About 300 mL of the perfusate is needed to clear the liver of red blood cells at a flow rate of 30 to 60 mL per minute.] Then circulate *Collagenase buffer* at a flow rate of 30 to 60 mL per minute for about 10 minutes. The exact concentration of collagenase (within the range of 0.02% to 0.05%) is determined empirically for each lot of enzyme. The concentration of collagenase is that necessary to consistently cause a breakdown of the liver about 10 minutes after initial entry of the *Collagenase buffer* into the liver. When the liver significantly increases in size, changes color and consistency, and starts to leak perfusate out of the lobes, change the system to the oxygenated prewarmed *Wash buffer.* About 100 mL of *Wash buffer* is needed to wash the liver of collagenase at a flow rate of 25 mL per minute. Surgically remove the liver from the animal and place in a prewarmed tray containing oxygenated *Wash buffer* (37°). Gently comb the liver with a stainless steel, fine-toothed comb to free the hepatocytes. Wash the hepatocytes with *Wash buffer,* and filter through cheesecloth (or a 150-µm mesh polyethylene net) into a plastic beaker. Centrifuge the cell suspension for about 2 minutes at about 25 × *g* to form a loosely packed pellet. Discard the supernatant, and resuspend the pellet in *Wash buffer.* Repeat the washing procedure twice for a total of three washes. Resuspend the final pellet in 100 to 200 mL of *Incubation buffer,* depending on cell yield. [NOTE—If the *Assay* procedure is interrupted, cool the cells by collecting the cells in a beaker placed in ice. The cells are washed with ice-cold *Wash buffer,* and stored on ice until ready for use. At that point the cells are pelleted once more, and resuspended in ice-cold *Incubation buffer.*]

Suitability—The concentrations of cells may vary due to the collagenase activity and the viability of the hepatocytes. To check cell viability and to determine viable cell concentration, dilute duplicate 100-µL aliquots of cell suspension with 400 µL of *Wash buffer* and 500 µL of isotonic 0.4% trypan blue. The aliquots are counted in a hemocytometer. The cells are suspended in *Incubation buffer*

to obtain a viable cell concentration of not less than 3×10^6 per mL. Count several distinct fields. [NOTE—Viable cells are those cells that exclude the trypan blue.]

NEGATIVE CONTROL SOLUTION—Prepare a solution containing 0.5% bis(trimethylsilyl)acetamide (BSA) in sterile water.

INCUBATION FLASKS—Use 25-mL conical flasks, the bottoms of which have been heated and pushed inward to form a conically raised center.

STANDARD PREPARATIONS—In duplicate, dissolve a suitable quantity of USP Glucagon RS, accurately measured, in 0.01 N hydrochloric acid or other suitable diluent to obtain a solution containing 1.0 USP Glucagon Unit per mL. All dilutions thereafter are made using 0.5% BSA (w/v) in water. Accurately dilute measured volumes of each solution with *Negative control solution* to obtain five concentrations—200, 100, 50, 25, and 12.5 micro-Units per mL—of each solution *(Standard preparations).* Pipet 0.2 mL of each *Standard preparation* into separate *Incubation flasks.* Pipet 0.2 mL of *Negative control solution* into each of two flasks *(Negative control solutions 1* and *2).* Then add the hepatocytes into each of the 12 flasks.

ASSAY PREPARATIONS—Using accurately weighed quantities of Glucagon, proceed as directed for *Standard preparations.*

D-GLUCOSE DETERMINATION—

Standard stock solution—Transfer 2.0 g of USP Dextrose RS, accurately weighed, to a 200-mL volumetric flask; and dissolve in and dilute with saturated benzoic acid solution to volume.

Standard solutions—Transfer suitable quantities of *Standard stock solution* to three flasks, and dilute with saturated benzoic acid solution to obtain solutions having known concentrations of 0.5, 1.0, and 1.5 times the typical sample glucose concentration.

Potassium ferrocyanide solution—Dissolve 1.25 g of trihydrate potassium ferrocyanide in 125 mL of *Sterile Water for Injection.*

System suitability—Analyze the *Potassium ferrocyanide solution,* the *Standard solutions,* and five replicates of the middle *Standard solution.* Prepare a standard curve using the *Standard solutions* as directed for *Procedure:* the relative standard deviation of the standard curve is not more than 2.0%; the response of the *Potassium ferrocyanide solution* is not more than 30 mg per L; and the relative standard deviation is not more than 2.0% for the replicate analyses of the middle *Standard solution.*

PROCEDURE—Dispense 5 mL of *Hepatocyte preparation* into the special incubation flasks in sequence from high glucagon concentration to low glucagon concentration, alternating the *Standard preparations* with the *Assay preparations.* The flasks are swirled in an orbiting water bath at 125 rpm at 30° for approximately 30 to 60 minutes. NOTE—The exact incubation time must be determined to optimize the signal-to-noise ratio. Following incubation, place 0.5- to 1.0-mL aliquots, in duplicate, from each incubation flask into labeled tubes, and centrifuge at $12{,}500 \times g$. Determine the percentage of glucose concentration in each flask's supernatant.

To conform to the linear range of the instrument being used, it may be necessary to adjust by dilution each of the preparations. Use a glucose analyzer that has demonstrated appropriate specificity, accuracy, precision, and linear response over the range of concentrations being determined. [NOTE—A suitable analyzer may use an immobilized, oxidase-enzyme membrane or jacket-generating hydrogen peroxide, which is then detected at the electrode.] Perform the glucose analysis in the following sequence: *Negative control solution 1, Standard preparations, Assay preparations,* and *Negative control solution 2.* Determine the percentage of glucose against the *Negative control solution* for each preparation.

CALCULATIONS—

Linearity test—Use an analysis of variance (ANOVA) with one sample assayed against a standard, and using two replicates each, construct a table (see *Table 1*). Compare the value of the ratio $MSNL/MSRES_1$ to a critical value obtained from a table for an F distribution with $m-2$ and $3m-3$ degrees of freedom, where m is the number of dose levels for each preparation. If the ratio $MSNL/MSRES_1$ does not indicate the presence of significant nonlinearity (ratio value is lower than the critical value), then proceed to the test for parallelism. If the ratio exceeds the critical value (significance level of 0.05), the nonlinearity is statistically significant and the test is repeated, discarding the results from either the highest or lowest dose of both the *Standard preparations* and the *Assay preparations* (four dose levels). If the ratio $MSNL/MSRES_1$ does not indicate the presence of significant nonlinearity, then proceed to the test for parallelism.

Parallelism test—Compare the ratio $MSNP/MSRES_2$ to a critical value obtained from an F distribution having 1 and $4m-5$ degrees of freedom. If the ratio $MSNP/MSRES_2$ does not indicate the presence of significant nonparallelism, then the assay is considered valid. Use the appropriate dose levels for the estimation of the relative potency.

Relative potency—Calculate the relative potency, R, of the *Assay preparations* as compared with the *Standard preparations* as follows.

(1) X_j is defined as the $\log_{10}$ of the j^{th} dose of the *Standard preparations* or the *Assay preparations.* The glucagon dose varies from 12.5 to 200×10^{-6} USP Glucagon Units per mL. For ease in the subsequent calculations, these doses are respectively represented by 1 through 5, as shown in the table below.

j	1	2	3	4	5
Dose	12.5	25	50	100	200
X_j	1.10	1.40	1.70	2.00	2.30

(2) To differentiate between the *Standard preparations* and the *Assay preparations* in the calculations, the subscript i will be used, with $i = 1$ to designate the *Standard preparations* and $i = 2$ to designate the *Assay preparations.* Y_{ijk} will denote the glucose concentration associated with the k^{th} replicate of the j^{th} dose of the i^{th} preparation. For example, Y_{1jk} is the glucose concentration associated with the k^{th} replicate of the j^{th} dose of the appropriate *Standard preparation;* Y_{11k} is the glucose concentration associated with the k^{th} replicate of dose 1 of the *Standard preparation;* and Y_{21k} is the glucose concentration associated with the k^{th} replicate of dose 1 of the *Assay preparation.* Dose 1 represents a glucose dose of 12.5×10^{-6} USP Glucagon Units per mL. Finally, Y_{132} represents the glucose concentration associated with the 2nd replicate of dose 3 for the *Standard preparation.*

(3) Y_S and Y_t denote the average glucose concentrations for the *Standard preparations* and the *Assay preparations,* respectively.

(4) Calculate the least-squares slope estimate, b, for a linear regression relating the Y_{ijk}'s to the X_j's as follows: $b = S_{xy}/S_{xx}$, with S_{xy} and S_{xx} calculated using the equations in *Table 2.*

(5) The log potency, M, is calculated using $M = -1[(Y_S - Y_t)/b]$.

(6) R = antilog *(M).*

(7) Calculate the confidence limits (upper and lower) for the relative potency, R, using the value $s^2 = MSRES_3$ (see *Table 1* and *Table 2*) as follows. Obtain t from a table for a t distribution having $4m-4$ degrees of freedom. For the 95% limits, the t values can be obtained from *Table 9* under *Design and Analysis of Biological Assays* ⟨111⟩.

Interim Revision Announcement

NOTE—For confidence limits having other probability levels (i.e., 100(1 – *a*) %), the right tail *t* critical value having *a*/2 area to its right is used.

$$\text{Calculate } g = t^2S^2 / b^2S_{xx}$$

$$\text{and } F = (ts / b)\sqrt{(1/m)(1-g) + (M^2 / S_{xx})},$$

and calculate

$$M_L = (M - F)/(1 - g),$$

and

$$M_U = (M + F)/(1 - g),$$

where M is the log potency and M_L and M_U are the log potency lower and upper confidence limits. The lower and upper confidence limits for the relative potency, R, are given by

$$RL = \text{antilog } (M_L)$$

$$RU = \text{antilog } (M_U)$$

It meets the requirements if the potency is between 0.8 and 1.25 USP Glucagon Units per mg, and the confidence interval width at $P = 0.95$ does not exceed 45% of the computed potency. •Repeat the assay if the confidence interval width exceeds 45% of the computed potency.•1

Table 1. ANOVA for the Rat Hepatocyte Assay for Glucagon

Source	Degrees of Freedom	SS (Sum of Squares)	MS (Mean Square)
Preparations	1	SSPREP	MSPREP
Replicates	1	SSREP	MSREP
Linear Slope	1	SSLIN	MSLIN
Residual_3	$4m - 4$	SSRES_3	MSRES_3
Nonparallelism	1	SSNP	MSNP
Residual_2	$4m - 5$	SSRES_2	MSRES_2
Nonlinearity	$m - 2$	SSNL	MSNL
Residual_1	$3m - 3$	SSRES_1	MSRES_1
TOTAL	$4m - 1$	SST	

NOTES—This analysis pertains to one sample assayed against a standard, using two replicates each.

The number of dose levels for each preparation is denoted by *m*. *Table 2* gives the equations for calculating the SS terms.

In each row of the ANOVA table, the MS is obtained by dividing the SS term by the degrees of freedom.

Table 2. Equations for Calculating the Sums of Squares in the Analysis of Variance*

$$Y_{i..} = \sum_{jk}\sum y_{ijk}$$

$$Y_{.j.} = \sum_{ik}\sum y_{ijk}$$

$$Y_{..k} = \sum_{ij}\sum y_{ijk}$$

$$CF = \frac{\left(\sum_{ijk}\sum\sum y_{ijk}\right)^2}{4m}$$

$$S^S_{xy} = \sum_{jk}\sum x_j y_{1jk} - \frac{\left(\sum_j x_j\right)(Y_{1..})}{m}$$

$$S^T_{xy} = \sum_{jk}\sum x_j y_{2jk} - \frac{\left(\sum_j x_j\right)(Y_{2..})}{m}$$

$$S_{xy} = S^S_{xy} + S^T_{xy}$$

$$S^S_{xx} = 2\sum_j x_j^2 - \frac{2\left(\sum_j x_j\right)^2}{m}$$

$$S^T_{xx} = S^S_{xx}$$

$$S_{xx} = S^S_{xx} + S^T_{xx}$$

$$SSPREP = \frac{\sum_i Y^2_{i..}}{2m} - CF$$

$$SSREP = \frac{\sum_k Y^2_{..k}}{2m} - CF$$

$$SSLIN = \frac{\left(S_{xy}\right)^2}{S_{xx}}$$

$$SST = \sum_{i\,j\,k}\sum\sum y^2_{ijk} - CF$$

$$SSRES_3 = SST - SSPREP - SSREP - SSLIN$$

$$SSNP = \frac{\left(S^S_{xy}\right)^2}{S^S_{xx}} + \frac{\left(S^T_{xy}\right)^2}{S^T_{xx}} - SSLIN$$

$$SSRES_2 = SSRES_3 - SSNP$$

$$SSNL = \frac{\sum_j Y^2_{.j.}}{4} - SSLIN - CF$$

$$SSRES_1 = SSRES_2 - SSNL$$

* Refer to the *Calculations* for section on *Relative Potency* for the definitions of x_j and y_{ijk}.

GENERAL CHAPTERS

General Tests and Assays

General Requirements for Tests and Assays

⟨11⟩ USP REFERENCE STANDARDS

Change to read:

USP Betamethasone Sodium Phosphate RS—•Do not dry.•(1) Determine the water content titrimetrically at time of use. Keep container tightly closed. Store in a dry place. This material is hygroscopic.

Change to read:

USP Caffeine RS—•Do not dry. Keep container tightly closed. Protect from light.•(1)

Change to read:

USP Ceftriaxone Sodium RS—Do not dry before using. •For quantitative applications, determine the water content titrimetrically at the time of use. Store in a refrigerator. Keep container tightly closed.•(1)

Change to read:

USP Dexchlorpheniramine Maleate RS—•Do not dry.•(1) Keep container tightly closed. Protect from light. •Store in a refrigerator.•(1)

Change to read:

USP Dextran 1 RS—•Dry portion at 105° for 5 hours before use. Keep container tightly closed. Store in a desiccator.•(1)

Change to read:

▲**USP Fluconazole RS**—•Do not dry. Keep container tightly closed and avoid exposure to > 70% relative humidity. Protect from light.•(1)▲*USP28*

Change to read:

USP Fluconazole Related Compound B RS [2-(4-fluorophenyl)-1,3-bis(1*H*-1,2,4-triazol-1-yl)-propan-2-ol]—•Do not dry. Keep container tightly closed. Protect from light.•(1)

Change to read:

USP Gentamicin Sulfate RS—Dry portion in vacuum at a pressure not exceeding 5 mm of mercury at 110° for 3 hours before using. •Handle the dry material quickly and in a dry atmosphere.•(1) Keep container tightly closed. Protect from light. Store in a cold place.

ERRATA

Following is a list of errata and corrections to *USP 28–NF 23*. The page number indicates where the item is found in *USP 28–NF 23*. If necessary, this list will be updated with every issue of *PF*. This information will also be available as a cumulative table in the next available *Supplement* and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement. USP staff are available to respond to questions regarding the accuracy of a particular requirement by calling 1-800-822-USPC.

Page	Title	Section	Description
464	*Cholecalciferol Solution*	*Assay*	Line 18 under *Precholecalciferol response factor*: Change the formula "$C'_{pre}r_p$," to: C'_{pre}/r_p,
1217	*Meropenem*	*Chromatographic purity*	Line 18 under *Procedure*: Change "Not more than 0.3% of any two major impurities is found, calculated on the dried basis; not more than 0.1% of any other impurity is found, calculated on the dried basis;" to: Not more than 0.3% of any two major impurities is found, calculated on the anhydrous basis; not more than 0.1% of any other impurity is found, calculated on the anhydrous basis;

Interim Revision Announcement

IN-PROCESS REVISION

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) items that previously appeared under *Pharmacopeial Previews* and are now formally proposed as revisions, (2) proposed revisions placed directly under *In-Process Revision,* or (3) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the staff liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

BRIEFING

> **Name of Item**, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How to Use PF*), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
>
> (PA5: K. Russo) RTS—55678-1

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type, as shown in the examples below:

•new text•

if slated for an *Interim Revision Announcement to USP 28–NF 23* (*IRA*);

▲new text▲*USP29*

if slated for *USP 29–NF 24*; and

■new text■

if slated for a *Supplement to USP–NF*. The same symbols *not* set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as •• or ■■ or ▲▲, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •2 indicates that the revision is proposed for the *Second Interim Revision Announcement*, ■2S (*USP 28*) indicates that the proposed revision is slated for the *Second Supplement to USP 28*, and ▲*USP29* and ▲*NF24* indicate that the revisions are proposed for *USP 29* and *NF 24*, respectively.

Official Title Changes Where the specification ***"Monograph title change"*** is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

MONOGRAPHS (USP)

BRIEFING

Albuterol Tablets, *USP 28* page 58 and page 50 of *PF* 30(1) [Jan.–Feb. 2004]. It is proposed to revise the *Procedure* in the *Assay* by correcting the formula so that it reflects the final volume of the *Assay preparation*.

(PA1: K. Russo) RTS—41888-1

Change to read:

Dissolution ~~*Procedure for a Pooled Sample*~~

▲ ▲*USP29*
⟨711⟩—

Medium: water; 500 mL.
Apparatus 2: 50 rpm.
Time: 30 minutes.

Determine the amount of $C_{13}H_{21}NO_3$ dissolved using the following method.

Mobile phase, Standard preparation, and *Chromatographic system*—Prepare as directed in the *Assay.*

Procedure—

▲Proceed as directed for *Procedure for Capsules, Uncoated Tablets,* and *Plain Coated Tablets* under *Dissolution* ⟨711⟩. Combine equal volumes of the filtered solutions of the 6 or 12 individual specimens withdrawn, and use the pooled sample as the test solution.▲*USP29*
Inject a suitable volume (about 100 µL) of ~~a portion of the solution under test,~~

▲the pooled sample,▲*USP29*
previously filtered through a 0.45-µm nylon filter, into the chromatograph, record the chromatogram, and measure the response for the major peak. Calculate the quantity of $C_{13}H_{21}NO_3$ dissolved by comparing this peak response with the major peak response similarly obtained on chromatographing the *Standard preparation* previously diluted, if necessary, with a mixture of water and methanol (6 : 4) to obtain a Standard solution having a known concentration of USP Albuterol Sulfate RS approximately corresponding to the concentration of the solution under test.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{13}H_{21}NO_3$ is dissolved in 30 minutes:

▲the requirements are met if the quantities of active ingredient dissolved from the pooled sample conform to the accompanying *Acceptance Table for a Pooled Sample*. Continue testing through the three stages unless the results conform at either S_1 or S_2. The quantity, *Q,* is the amount of dissolved active ingredient specified, expressed as a percentage of the labeled content.

Acceptance Table for a Pooled Sample

Stage	Number Tested	Acceptance Criteria
S_1	6	Average amount dissolved is not less than Q + 10%.
S_2	6	Average amount dissolved (S_1 + S_2) is equal to or greater than Q + 5%.
S_3	12	Average amount dissolved (S_1 + S_2 + S_3) is equal to or greater than Q.

▲*USP29*

Change to read:

Assay—

1% Acetic acid—Transfer a 20-mL portion of glacial acetic acid to a suitable volumetric flask, and dilute with water to 2000 mL.

Mobile phase—Dissolve 1.13 g of sodium 1-hexanesulfonate in 1200 mL of water, add 12 mL of glacial acetic acid, and mix. Prepare a filtered and degassed mixture of this solution and methanol (6 : 4). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer about 12 mg of USP Albuterol Sulfate RS, accurately weighed, to a 100-mL volumetric flask. Add 60 mL of *1% Acetic acid,* sonicate for 5 minutes, dilute with methanol to volume, and mix. Pipet 25 mL of this solution into a 100-mL volumetric flask, dilute with a mixture of water and methanol (6 : 4) to volume, and mix.

Assay preparation—Transfer a number of whole Tablets, equivalent to about 50 mg of albuterol, to a 2000-mL volumetric flask. Add 1200 mL of *1% Acetic acid*, shake by mechanical means for 45 minutes, sonicate for 10 minutes, allow to cool to room temperature, dilute with methanol to volume, and mix. Pass through a suitable filter having a 0.45-µm or finer porosity.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 276-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency determined from the analyte peak is not less than 800 theoretical plates; the tailing factor for the analyte peak is not more than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%.

In-Process Revision

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of albuterol ($C_{13}H_{21}NO_3$) in the number of Tablets taken by the formula:

~~$2(239.32/576.71)200C(r_u/r_s),$~~

~~in which 239.32 and 576.71 are the molecular weights of albuterol and albuterol sulfate, respectively; *C* is the concentration, in mg per mL, of USP Albuterol Sulfate RS in the *Standard preparation;* and r_u and r_s are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.~~

▲$2000(239.31/576.70)C(r_U/r_S),$

in which 2000 is the volume, in mL, of the *Assay preparation;* 239.31 and 576.70 are the molecular weights of albuterol and albuterol sulfate, respectively; *C* is the concentration, in mg per mL, of USP Albuterol Sulfate RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP29*

BRIEFING

Butabarbital Sodium Tablets, *USP 28* page 302. It is proposed to revise the test for *Uniformity of dosage units* to correct an invalid cross-reference to the *Butabarbital Sodium Capsules* monograph, which has been omitted from *USP.* It is proposed to implement this revision via the *Third Interim Revision Announcement* pertaining to *USP 28–NF 23,* with an official date of June 1, 2005.

(PA3: R. Ravichandran) RTS—41943-1

Change to read:

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

~~*Acid–methanol mixture* and *Standard preparation*—Prepare as directed in the test for *Content uniformity* under *Butabarbital Sodium Capsules.*~~

•*Acid–methanol mixture*—Prepare a mixture of methanol and 1 N hydrochloric acid (9 : 1).

Standard preparation—Dissolve an accurately weighed quantity of USP Butabarbital RS in *Acid–methanol mixture* to obtain a solution having a known concentration of about 0.45 mg per mL.•3

Test preparation—Transfer 1 finely powdered Tablet to a 25-mL volumetric flask, ~~and proceed as directed for *Test preparation* in the test for *Content uniformity* under *Butabarbital Sodium Capsules,* beginning with "add *Acid–methanol mixture* to volume."~~

•add *Acid–methanol mixture* to volume, and mix. Filter, discarding the first 5 mL of the filtrate, and dilute the subsequent filtrate quantitatively and stepwise if necessary, with *Acid–methanol mixture* to obtain a solution containing 0.5 to 0.6 mg of butabarbital sodium per mL.•3

Procedure—~~Proceed as directed for *Procedure* in the test for *Content uniformity* under *Butabarbital Sodium Capsules.*~~

•Transfer 2.0 mL each of the *Standard preparation* and the *Test preparation* to separate 100-mL volumetric flasks, and transfer 2.0 mL of *Acid–methanol mixture* to a third volumetric flask to provide a blank. Dilute each flask with pH 9.6 alkaline borate buffer (see under *Solutions* in the section *Reagents, Indicators, and Solutions*), and mix. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 240 nm, with a suitable spectrophotometer, using the blank to set the instrument.•3

Calculate the quantity, in mg, of $C_{10}H_{15}N_2NaO_3$ in the Tablet

•taken•3

by the formula: ~~given therein,~~

•$(234.23/212.25)/(TC/D)(A_U/A_S),$•3

in which 234.23 and 212.25 are the molecular weights of butabarbital sodium and butabarbital, respectively; *T* is the labeled quantity, in mg, of butabarbital sodium in the Tablet; *C* is the concentration, in ~~µg~~

•mg•3

per mL, of USP Butabarbital RS in the *Standard preparation; D* is the concentration, in ~~µg~~

•mg•3

per mL, of butabarbital sodium in the *Test preparation,* based upon the labeled quantity per Tablet and the extent of dilution; and A_U and A_S are the absorbances of the solutions from the *Test preparation* and the *Standard preparation,* respectively.

In-Process Revision

BRIEFING

Cefaclor Extended-Release Tablets, *USP 28* page 371—See briefing under *Aspirin Delayed-Release Capsules.*

(BPC: W. Brown) RTS—42035-48

Delete the following:

▲~~**Labeling**—The labeling indicates the *Drug Release Test* with which the product complies.~~▲*USP29*

BRIEFING

Ciprofloxacin Injection, *USP 28* page 478 and page 1596 of *PF* 30(5) [Nov.–Dec. 2004]. It is proposed to revise the Definition to use Water for Injection rather than Sterile Water for Injection.

(PA7b: B. Davani) RTS—41929-1

Change to read:

» Ciprofloxacin Injection is a sterile solution of Ciprofloxacin ▲or Ciprofloxacin Hydrochloride▲*USP28* in ~~Sterile Water for Injection~~

▲Water for Injection,▲*USP29*
in 5 percent Dextrose Injection, or in 0.9 percent Sodium Chloride Injection prepared with the aid of Lactic Acid. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ciprofloxacin ($C_{17}H_{18}FN_3O_3$).

Change to read:

Limit of ciprofloxacin ethylenediamine analog—Proceed as directed in the *Assay* under *Ciprofloxacin*. Calculate the percentage of ciprofloxacin ethylenediamine analog from the chromatogram obtained from the *Assay preparation* by the formula:

$$100[0.7r_A/(0.7r_A + r_C)],$$

in which 0.7 is the ~~response~~

■correction■1S *(USP28)*
factor for ciprofloxacin ethylenediamine analog; ~~relative to that of ciprofloxacin~~

■■1S *(USP28)*

and r_A and r_C are the responses of the ciprofloxacin ethylenediamine analog peak and the ciprofloxacin peak, respectively. It contains not more than 0.5% of ciprofloxacin ethylenediamine analog.

Change to read:

Dextrose content *(if present)*—Using the undiluted Injection, determine the angular rotation in a suitable polarimeter tube ~~at 25° (see *Optical Rotation* ⟨781⟩). The observed rotation, in degrees, multiplied by 1.0425*A*, in which *A* is the ratio 200 divided by the length, in mm, of the polarimeter tube employed, represents the weight, in g, of $C_6H_{12}O_6 \cdot H_2O$ in each 100 mL of Injection taken: between 4.75 and 5.25 g of $C_6H_{12}O_6 \cdot H_2O$ is found.~~

■(see *Optical Rotation* ⟨781⟩). Calculate the percentage (g per 100 mL) of $C_6H_{12}O_6 \cdot H_2O$ in the portion of Injection taken by the formula:

$$(100/52.9)(198.17/180.16)AR,$$

in which 100 is the percentage; 52.9 is the midpoint of the specific rotation range for anhydrous dextrose, in degrees; 198.17 and 180.16 are the molecular weights for dextrose monohydrate and anhydrous dextrose, respectively; *A* is 100 mm divided by the length of the polarimeter tube, in mm; and *R* is the observed rotation, in degrees: between 4.75 and 5.25 g of $C_6H_{12}O_6 \cdot H_2O$ is found.■2S *(USP28)*

BRIEFING

Dyclonine Hydrochloride, *USP 28* page 706. It is proposed to revise the tests for *Identification* by replacing the UV absorption spectra comparison (test *B*) with an HPLC retention time agreement of the major peak in the chromatograms of the *Assay preparation* and the *Standard preparation,* in accordance with current policies.

(PA1: K. Russo) RTS—41743-5

Change to read:

Identification—
A: *Infrared Absorption* ⟨197M⟩.
B: ~~*Ultraviolet Absorption* ⟨197U⟩—~~
~~*Solution:* 25 µg per mL.~~

In-Process Revision

▲The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the chromatogram of the *Standard preparation,* as obtained in the *Assay.*▲*USP29*

C: Add 2 mL of silver nitrate TS to 10 mL of Dyclonine Hydrochloride solution (1 in 100): a white precipitate is formed. Add 2 mL of nitric acid, centrifuge, and discard the supernatant. Wash the precipitate twice by adding 10 mL of 2 N nitric acid, centrifuging, and discarding the supernatant: the precipitate so obtained is soluble in 6 N ammonium hydroxide.

BRIEFING

Epinephrine Injection, *USP 28* page 740. It is proposed to revise the test for *Identification* with the addition of an HPLC retention time agreement of the major peak in the chromatograms of the *Assay preparation* and the *Standard preparation,* in accordance with current policies.

Assay—

Solution A—Add 20 mL of 25% aqueous tetramethylammonium hydroxide solution to 880 mL of water. Adjust with about 2.3 mL of phosphoric acid to a pH of 7.2 ± 0.2. Add 100 mL of a mixture of methanol and acetonitrile (3 : 2), mix, and filter.

Solution B—Add 20 mL of 25% aqueous tetramethylammonium hydroxide solution and 80 mL of water to 900 mL of a mixture of methanol and acetonitrile (3 : 2). Adjust with about 2.3 mL of phosphoric acid to a pH of 7.2 ± 0.2, mix, and filter. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.*

System suitability preparation—Transfer an accurately weighed quantity of USP Fluvastatin for System Suitability RS to a suitable volumetric flask, dissolve first in *Solution B,* using 40% of the final volume, then dilute with *Solution A* to volume, and mix to obtain a solution having a known concentration of about 0.5 mg of fluvastatin sodium per mL.

Standard preparation—Transfer an accurately weighed quantity of USP Fluvastatin Sodium RS to a suitable volumetric flask, dissolve first in *Solution B,* using 40% of the final volume, then dilute with *Solution A* to volume, and mix to obtain a solution having a known concentration of about 0.5 mg of fluvastatin sodium per mL.

Assay preparation—Transfer about 25 mg of Fluvastatin Sodium, accurately weighed, to a 50-mL volumetric flask. Dissolve in 20 mL of *Solution B,* dilute with *Solution A* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 305-nm detector and a 4.6-mm × 5-cm column that contains 5-µm packing L1. The flow rate is about 3.0 mL per minute, and the column temperature is maintained at 35°. The chromatograph is programmed as follows. [NOTE—Adjust the start time of the gradient step and the equilibration time for each instrument.]

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–6	60	40	isocratic
6–20	60→18	40→82	linear gradient
20–20.1	18→60	82→40	linear gradient
20.1–25.1	60	40	equilibration

Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.0 for fluvastatin and 1.2 for fluvastatin anti-isomer; the resolution, *R,* between the fluvastatin anti-isomer peak and the fluvastatin peak is not less than 1.6; the column efficiency is not less than 700 theoretical plates for the fluvastatin peak; and the tailing factor is not more than 3.0. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the fluvastatin peaks. Calculate the quantity, in mg, of $C_{24}H_{25}FNNaO_4$ in the portion of Fluvastatin Sodium taken by the formula:

$$50C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Fluvastatin Sodium RS in the *Standard preparation;* and r_U and r_S are the fluvastatin peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■1S (*USP28*)

In-Process Revision

BRIEFING

Fluvastatin Capsules, page 1237 of *PF* 30(4)—See briefing under *Fluvastatin Sodium*.

(PA4: E. Gonikberg) RTS—42030-2

Add the following:

■Fluvastatin Capsules

» Fluvastatin Capsules contain an amount of Fluvastatin Sodium equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluvastatin ~~($C_{24}H_{25}FNO_4$)~~ $C_{24}H_{26}FNO_4$.

Packaging and storage—Preserve in tight, light-resistant containers, protected from moisture and light. Store in a cool place or at controlled room temperature.

Change to read:

USP Reference standards ⟨11⟩*—USP Fluvastatin Sodium RS.* ~~*USP Fluvastatin Sodium Anti-Isomer RS. USP Fluvastatin-Related Compound A RS.*~~ ▲*USP29* *USP Fluvastatin for System Suitability RS.*

Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

B: A solution (0.2 in 1) meets the requirements of the flame test for *Sodium* ⟨191⟩.

Dissolution ⟨711⟩**—**

Medium: water; 500 mL.

Apparatus 2: 50 rpm, sinkers not used.

Time: 30 minutes.

Determine the amount of ~~$C_{24}H_{25}FNO_4$~~ $C_{24}H_{26}FNO_4$ dissolved by employing the following method.

Buffer solution—Dissolve about 1.534 g of monobasic ammonium phosphate in about 800 mL of water, and adjust with phosphoric acid or ammonium hydroxide to a pH of 3.5.

Mobile phase—Prepare a filtered and degassed mixture of methanol and *Buffer solution* (7 : 3).

Standard solution—[NOTE—A volume of methanol, not exceeding 2% of the final volume of solution, may be used to aid in dissolving the USP Reference Standard.] Dissolve an accurately weighed quantity of USP Fluvastatin Sodium RS in *Medium* to obtain a solution having a known concentration of fluvastatin corresponding to that obtained when 1 Capsule is dissolved in 500 mL of solvent.

Test solution—Withdraw 20-mL portions of liquid under test from each vessel, and pass through a suitable filter, discarding the first 2 mL of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 235-nm detector, a suitable 7-µm guard column that contains packing L1, and a 4.6-mm × 10-cm column that contains 5-µm packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than ~~2.0%~~ 1.5%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the

areas for the fluvastatin peaks. From the measured peak areas, calculate the quantity of ~~$C_{24}H_{25}FNO_4$~~ $C_{24}H_{26}FNO_4$ dissolved.

Tolerances—Not less than 80% *(Q)* of the labeled amount of ~~$C_{24}H_{25}FNO_4$~~ $C_{24}H_{26}FNO_4$ is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements, the *Chromatographic system* being prepared as directed for the *Dissolution* test.

Change to read:

Chromatographic purity—[NOTE—Protect all solutions from light, and use amber autosampler vials and low-actinic glassware.]

Solution A, Solution B, Mobile phase, and *Diluent*—Proceed as directed in the *Assay.*

~~*System suitability stock solution*—Prepare a solution in methanol containing about 0.1 mg of USP Fluvastatin Related Compound A RS per mL.~~ ▲▲*USP29*

System suitability solution—~~Transfer about 50 mg of USP Fluvastatin for System Suitability RS, accurately weighed, to a 100-mL volumetric flask, and dissolve in 35 mL of methanol. Add 5.0 mL of *System suitability stock solution* into the flask, dilute with *Diluent* to volume, and mix. [NOTE—The *System suitability stock solution* and the *System suitability solution* are stable for up to 6 months if stored in a refrigerator.]~~ ▲Transfer an accurately weighed quantity of USP Fluvastatin for System Suitability RS to a suitable volumetric flask, dissolve first in *Solution B,* using 40% of the final volume, then dilute with *Solution A* to volume, and mix to obtain a solution having a known concentration of about 0.5 mg of fluvastatin sodium per mL. [NOTE—USP Fluvastatin for System Suitability RS contains fluvastatin sodium and three related impurities: fluvastatin anti-isomer, fluvastatin hydroxydiene, and fluvastatin *t*-butyl ester. The *System suitability stock solution* and the *System suitability solution* are stable for up to 6 months if stored in a refrigerator.]▲*USP29*

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Test solution—Use the *Assay preparation.*

Chromatographic system—Proceed as directed in the *Assay,* except use the liquid chromatograph equipped with either a programmable variable wavelength detector or two separate detectors capable of monitoring at 305 nm and at 365 nm. Chromatograph the *System suitability solution,* and record the peak responses at 305 nm as directed for *Procedure.* Identify the peaks corresponding to fluvastatin, fluvastatin anti-isomer, and fluvastatin hydroxydiene. Chromatograph the *System suitability solution,* and record the peak responses at 305 nm as directed for *Procedure:* the resolution, *R,* between the fluvastatin anti-isomer peak and the fluvastatin peak is not less than 1.4; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms at 305 nm and 365 nm, identify the impurities listed in *Table 1,* and measure the peak responses. [NOTE—3-Hydroxy-5-keto fluvastatin is monitored using a wavelength of 365 nm, and all other compounds are monitored at 305 nm.] Calculate the percentage of each impurity, except for 3-hydroxy-5-keto fluvastatin, in the portion of Capsules taken by the formula:

$$100F(411.48/433.46)(C_S / C_T)(r_{i(305)} / r_{S(305)}),$$

in which F is the relative response factor as listed in *Table 1* [NOTE—Use F equal to 1.0 for unknown impurities.]; 411.48 and 433.46 are the molecular weights of fluvastatin and fluvastatin sodium, respectively; C_S is the concentration, in mg

In-Process Revision

per mL, of USP Fluvastatin Sodium RS in the *Standard solution;* C_T is the concentration, in mg per mL, of fluvastatin in the *Test solution,* based on the label claim; $r_{i\,(305)}$ is the peak response at 305 nm for each impurity obtained from the *Test solution;* and $r_{S\,(305)}$ is the peak response at 305 nm for the fluvastatin peak, obtained from the *Standard solution*.

Calculate the percentage of 3-hydroxy-5-keto fluvastatin in the portion of Capsules taken by the formula:

$$100F(411.48/433.46)(C_S/C_T)(r_{i\,(365)}/r_{S(365)}),$$

in which F, C_S, and C_T are as defined above; $r_{i\,(365)}$ is the peak response at 365 nm for 3-hydroxy-5-keto fluvastatin, obtained from the *Test solution;* and $r_{S\,(365)}$ is the peak response at 365 nm for the fluvastatin peak, obtained from the *Standard solution.* In addition to not exceeding the limits for each impurity in *Table 1,* not more than 0.5% of any unknown impurity is found; not more than 1.5% of total unknown impurities is found; and not more than 4.0% of total impurities is found.

Table 1

Name	Relative Retention Time	Relative Response Factor *(F)*	Limit (%)
Fluvastatin anti-isomer	1.2	1.0	1.5
3-Hydroxy-5-keto fluvastatin	1.6	0.037[1]	1.0
Fluvastatin hydroxy-diene[2] ▲*USP29*	2.2	1.1	1.0
Fluvastatin short-chain aldehyde	3.2	0.7	0.5

[1] At 365 nm
[2] ~~Fluvastatin related compound A~~ ▲*USP29*

Assay—

pH 7.2 Buffer—Prepare a solution containing 40 mL of 25% aqueous tetramethylammonium hydroxide in 1 L of water, and adjust with approximately 4.5 mL of phosphoric acid to a pH of 7.2 ± 0.2.

Methanol–acetonitrile mixture—Prepare a mixture of methanol and acetonitrile (3 : 2).

Solution A—Prepare a filtered and degassed mixture of *pH 7.2 Buffer* and *Methanol–acetonitrile mixture* (87.5 : 12.5).

Solution B—Prepare a filtered and degassed mixture of *Methanol–acetonitrile mixture* and *pH 7.2 Buffer* (87.5 : 12.5).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.*

Diluent—Prepare a mixture of *pH 7.2 Buffer* and *Methanol–acetonitrile mixture* (54 : 46).

System suitability preparation—Dissolve an accurately weighed quantity of USP Fluvastatin for System Suitability RS in *Diluent* to obtain a solution having a known concentration of about 0.42 mg of fluvastatin sodium per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Fluvastatin Sodium RS in *Diluent* to obtain a solution having a known concentration of about 0.42 mg of fluvastatin sodium per mL.

Assay stock preparation—Transfer the contents and the empty shells of 10 Capsules to a 200-mL glass-stoppered flask. Add 100.0 mL of methanol, and stir with a magnetic or a mechanical stirrer for 45 minutes. Centrifuge a portion of this solution at 4000 rpm for 20 minutes.

Assay preparation—Quantitatively transfer an amount of the *Assay stock preparation,* containing 20.0 mg of fluvastatin based on the label claim, to a 50-mL volumetric flask, and dilute with *Diluent* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 305-nm detector and a 4.6-mm × 5-cm column that contains 5-µm packing Ll. The flow rate is about 2.0 mL per minute. The chromatograph is programmed as follows. [NOTE—Adjust the start time of the gradient step and the equilibration time for each instrument.]

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–6	54	46	isocratic
6–17	54→17	46→83	linear gradient
17–20	17	83	isocratic
20–20.1	17→54	83→46	linear gradient
20.1–26.1	54	46	equilibration

Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the retention time of the fluvastatin peak is about 5.4 minutes; the relative retention times are about 1.0 for fluvastatin and 1.2 for fluvastatin anti-isomer; the resolution, *R,* between the fluvastatin anti-isomer peak and the fluvastatin peak is not less than 1.4; and the relative standard deviation for replicate injections is not more than 1.5%. [NOTE–If the retention time of the fluvastatin peak exceeds 5.7 minutes, adjust the isocratic step accordingly so that both the fluvastatin peak and the anti-isomer peak elute within the isocratic region.]

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the fluvastatin peaks. Calculate the quantity, in mg, of fluvastatin ($C_{24}H_{26}FNO_4$) in the portion of Capsules taken by the formula:

$$5000(411.48/433.46)(C/V)(r_U/r_S),$$

in which 411.48 and 433.46 are the molecular weights of fluvastatin and fluvastatin sodium, respectively; C is the concentration, in mg per mL, of USP Fluvastatin Sodium RS in the *Standard preparation;* V is the volume, in mL, of the *Assay stock preparation* taken to prepare the *Assay preparation;* and r_U and r_S are the fluvastatin peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP28*)

BRIEFING

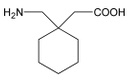
Gabapentin. The proposed new monograph for Gabapentin previously published on page 72 of *PF* 29(1) [Jan.–Feb, 2003] is hereby canceled and replaced with the following new proposal. It is proposed to revise the methods in the test for *Related compounds* and in the *Assay* to include impurities and acceptance criteria for approved products. The validation of the analytical procedures in *Method 1* of *Test 1* in the test for *Related compounds* and in the *Assay* was performed using a Luna C18 brand of L1 packing. The retention time for gabapentin is about 6 minutes. In *Method 2* of *Test 1* in the test for *Related compounds* the validation of the analytical procedures was performed using a Luna C18 brand of L1 packing. The retention time for gabapentin related compound D is about 17 minutes. *Test 2* in *Related compounds* was previously published on page 3004 of *PF* 27(5) [Sept.–Oct. 2001]; tests for this method used a Symmetry C8 brand of L7 column. The retention time for gabapentin is about 7.5 minutes.

(PA3: S. Salado) RTS—39923-1; 41257-1; 41450-1

In-Process Revision

Add the following:

▲Gabapentin



$C_9H_{17}NO_2$ 171.24

Cyclohexaneacetic acid, 1-(aminomethyl)-.

1-(Aminomethyl)cyclohexaneacetic acid [*60142-96-3*].

» Gabapentin contains not less than 98.0 percent and not more than 102.0 percent of $C_9H_{17}NO_2$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers. Store at room temperature.

Labeling—Label it to indicate with which impurity tests the article complies.

USP Reference standards ⟨11⟩**—***USP Gabapentin RS. USP Gabapentin Related Compound A RS. USP Gabapentin Related Compound B RS. USP Gabapentin Related Compound D RS. USP Gabapentin Related Compound E RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

pH ⟨791⟩**:** between 6.5 and 8.0, in a solution (1 in 50).

Water, *Method I* ⟨921⟩**:** not more than 0.5%.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩**:** 0.002%.

Limit of chloride—Transfer about 1500 mg of Gabapentin, accurately weighed, to a 100-mL beaker, and dissolve in 50 mL of a mixture of water, methanol, and acetic acid (60 : 39 : 1). Titrate with 0.01 N silver nitrate VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary corrections (see *Titrimetry* ⟨541⟩). Each mL of 0.01 N silver nitrate is equivalent to 0.3545 mg of chloride: not more than 0.01% is found.

Related compounds—[NOTE—Perform all related impurity tests unless the manufacturer has assurance, based on knowledge of the manufacturing process, that one of the tests is not relevant to the manufacturer's material.]

TEST 1, METHOD 1—

Diluent, Buffer solution, Mobile phase, Impurities solution, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Test solution—Use the *Assay preparation*.

Standard solution—Use the *Standard preparation* prepared as directed in the *Assay.*

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of any impurity in the portion of Gabapentin taken by the formula:

$$2500F(C/W)\ (r_i / r_S),$$

in which F is the relative response factor of the impurity according the table below; C is the concentration, in mg per mL, of USP Gabapentin Related Compound E RS in the *Standard solution; W* is the weight, in mg, of Gabapentin, on an anhydrous basis, used to prepare the *Test solution;* r_i is the peak area for any impurity in the *Test solution;*

and r_S is the peak area for gabapentin related compound E in the *Standard solution*: the impurities meet the requirements given in the table below.

Compound Name	Relative Response Factor	Limit (%)
Gabapentin related compound A	1.0	0.10
Gabapentin related compound B	1.0	0.06
Gabapentin related compound E	1.0	0.10
Individual unknown impurity	0.025	0.10

TEST 1, METHOD 2—

Diluent—Dissolve 2.32 g of ammonium phosphate monobasic in 1000 mL of water. Adjust with phosphoric acid to a pH of 2.0.

Buffer solution—Proceed as directed in the *Assay.*

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution,* methanol, and acetonitrile (35 : 30 : 30). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Gabapentin Related Compound D RS in methanol, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.0028 mg per mL.

Test solution—Use the *Assay preparation.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. The column temperature is maintained at 40°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 13,600 theoretical plates for the gabapentin related compound D peak; and the relative standard deviation for replicate injections is not more than 7.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of any impurity in the portion of Gabapentin taken by the formula:

$$2500(C/W)\,(r_i/r_S),$$

in which C is the concentration, in mg per mL, of USP Gabapentin Related Compound D RS in the *Standard solution; W* is the weight, in mg, of Gabapentin, on the anhydrous basis, used to prepare the *Test solution;* r_i is the peak area for any impurity in the *Test solution;* and r_S is the peak area for gabapentin related compound D in the *Standard solution:* not more than 0.02% of gabapentin related compound D is found; not more than 0.10% of any other impurity is found; and not more than 0.35% of total impurities is found (including the impurities quantified in *Test 1* and *Test 2*). [NOTE—Disregard all the peaks having relative retention times of 0.35 or less.]

TEST 2—

Diluent—Dissolve 1.2 g of monobasic potassium phosphate in 1000 mL of water, and adjust with 5 N potassium hydroxide to a pH of 6.9.

Blank solution—Use the *Diluent*.

Solution A—Dissolve 1.2 g of monobasic potassium phosphate in 940 mL of water, and adjust with 5 N potassium hydroxide to a pH of 6.9, add 60 mL of acetonitrile, mix, filter, and degas.

In-Process Revision

Solution B—Dissolve 1.2 g of monobasic potassium phosphate in 700 mL of water, adjust with 5 N potassium hydroxide to a pH of 6.9, add 300 mL of acetonitrile, mix, filter, and degas.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve accurately weighed quantities of USP Gabapentin RS and USP Gabapentin Related Compound A RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.04 mg per mL.

Test solution—Transfer about 500 mg of Gabapentin, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The flow rate is about 1.3 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibration
0–7	100	0	isocratic
7–45	100→0	0→100	linear gradient
45–45.1	0→100	100→0	linear gradient
45.1–48	100	0	re-equilibration

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 4.8 for gabapentin related compound A and 1.0 for gabapentin; and the relative standard deviation for replicate injections in both peaks is not more than 10.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. [NOTE—Disregard any peaks obtained from the *Blank solution.*] Calculate the percentage of gabapentin related compound A in the portion of Gabapentin taken by the formula:

$$2500(C/W)(r_i / r_S),$$

in which C is the concentration, in mg per mL, of USP Gabapentin Related Compound A RS in the *Standard solution; W* is the amount, in mg, of Gabapentin taken to prepare the *Test solution*; r_i is the peak area of gabapentin related compound A in the *Test solution;* and r_S is the peak area of USP Gabapentin Related Compound A RS in the *Standard solution:* not more than 0.10% of gabapentin related compound A is found. Calculate the percentage of each impurity in the portion of Gabapentin taken by the formula:

$$2500(C/W)(r_i / r_S),$$

in which C is the concentration, in mg per mL, of USP Gabapentin RS in the *Standard solution; W* is the amount, in mg, of Gabapentin taken to prepare the *Test solution; r_i* is the peak area of any impurity different from gabapentin related compound A in the *Test solution;* and r_S is the peak area of USP Gabapentin RS in the *Standard solution:* not more than 0.10% of any individual impurity is found, and the sum of all impurities is not more than 0.50%.

Organic volatile impurities ⟨467⟩**:** meets the requirements.

Assay—

Diluent—Dissolve 2.32 g of ammonium phosphate monobasic in 1000 mL of water. Adjust with phosphoric acid to a pH of 2.0.

Buffer solution—Dissolve 0.58 g of ammonium phosphate monobasic and 1.83 g of sodium perchlorate in 1000 mL of water. Adjust with perchloric acid to a pH of 1.8.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (76 : 24). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Impurities solution—Dissolve suitable quantities of USP Gabapentin Related Compound A RS and USP Gabapentin Related Compound B RS in methanol to obtain a solution containing about 1.4 mg per mL and 0.84 mg per mL, respectively.

System suitability solution—Dissolve suitable quantities of USP Gabapentin RS in *Diluent,* and add an appropriate volume of *Impurities solution* to obtain a solution containing about 14.0 mg per mL, 0.014 mg per mL, and 0.0084 mg per mL of USP Gabapentin RS, USP Gabapentin Related Compound A RS, and USP Gabapentin Related Compound B RS, respectively.

Standard preparation—Dissolve accurately weighed quantities of USP Gabapentin RS and USP Gabapentin Related Compound E RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 14.0 mg per mL and 0.0084 mg per mL, respectively.

Assay preparation—Transfer about 350 mg of Gabapentin, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. The column temperature is maintained at 40°. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 2.75 for gabapentin related compound A, about 3.3 for gabapentin related compound B, and 1.0 for gabapentin; and the resolution, *R,* between gabapentin related compound A and gabapentin related compound B is not less than 2.3. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 2.7 for gabapentin related compound E and 1.0 for gabapentin; and the relative standard deviation for replicate injections is not more than 2.0% for the gabapentin peak.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_9H_{17}NO_2$ in the portion of Gabapentin taken by the formula:

$$25C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Gabapentin RS in the *Standard preparation;* and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.▲*USP29*

BRIEFING

Iodixanol, *USP 28* page 1039 and page 1908 of *PF* 29(6) [Nov.–Dec. 2003]. It is proposed to make a correction in the *Internal standard solution* in the test for *Limit of calcium*.

(PA5: A.Wilk) RTS—41999-1

In-Process Revision

Add the following:

■**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.■1S (*USP28*)

Change to read:

USP Reference standards ⟨11⟩—

Change to read:

Limit of calcium—

Internal standard solution—Accurately weigh about 3.067 g of scandium oxide, and dissolve in 1 L of water (each mL contains ~~1.000 g~~

▲2.0 mg▲*USP29*
of scandium). Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

Blank solution—Transfer 5.0 mL of *Internal standard solution* to a 50-mL volumetric flask, dilute with water to volume, and mix.

Standard solutions—Prepare a solution having a concentration of 10 µg of calcium per mL. Add 0.5, 2.5, 5.0, and 10.0 mL of this solution to separate 50-mL volumetric flasks. To each flask, add 5.0 mL of *Internal standard solution,* dilute with water to volume, and mix.

Test solution—Transfer about 2 g of Iodixanol, accurately weighed, to a 20-mL volumetric flask, add about 10 mL of water, and mix. Add 2.0 mL of *Internal standard solution,* dilute with water to volume, and mix.

Procedure—Concomitantly determine the absorbances of each *Standard solution* and the *Test solution* at 393.366 nm, the calcium emission line, and at 361.38 nm, the scandium emission line, with an atomic absorption spectrophotometer, using the *Blank solution* as the blank. Plot a standard curve of the ratio of the calcium absorption to the scandium absorption versus the respective calcium concentrations. From the graph so obtained, determine the calcium concentration, *C,* in µg per mL, in the *Test solution.* Calculate the content of calcium, in µg per g, in the portion of Iodixanol taken by the formula:

$$20(C/W),$$

in which C is as obtained above; and W is the weight, in g, of Iodixanol taken to prepare the *Test solution:* not more than 5 µg per g is found.

Add the following:

■**Other requirements**—Where the label states that Iodixanol is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Iodixanol Injection*. Where the label states that Iodixanol must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Iodixanol Injection.*■1S (*USP28*)

BRIEFING

Levothyroxine Sodium Tablets, *USP 28* page 1128. It is proposed to add *Dissolution Test 3* to this monograph. The chromatographic procedure in this test was validated using a Discovery Cyano brand of column that contains L10 packing; a suitable alternative is the 4.6-mm × 7.5-cm Zorbax SB-CN brand of column that contains 3.5-µm packing. In the absence of any adverse comments, it is proposed to implement this revision via the *Third Interim Revision Announcement* pertaining to *USP 28–NF 23,* with an official date of June 1, 2005.

(BPC: M. Marques) RTS—41612-1

Dissolution ⟨711⟩—[NOTE—All containers that are in contact with solutions containing levothyroxine sodium are to be made of glass.]

▲▲*USP28*
TEST 1—

Medium: 0.01 N hydrochloric acid containing 0.2% sodium lauryl sulfate; 500 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Determine the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of methanol and 0.1% phosphoric acid (60 : 40). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Prepare a stock solution of USP Levothyroxine RS in methanol having a known concentration of about 0.1 mg per mL. Dilute this stock solution with *Medium* to obtain a solution having a concentration similar to that expected in the *Test solution*.

Test solution—[NOTE—Prior to use, check the filters for absorptive loss of drug.] Use a filtered portion of the solution under test.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5; and the relative standard deviation is not more than 4.0%.

Procedure—Separately inject equal volumes (about 800 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved.

Tolerances—Not less than 70% *(Q)* of the labeled amount of $C_{15}H_{10}I_4NNaO_4$ is dissolved in 45 minutes.

In-Process Revision

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

Medium, Apparatus, Mobile phase, Standard solution, Test solution, Chromatographic system, and *Procedure*—Proceed as directed for *Test 1.*

Time: 15 minutes.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{15}H_{10}I_4NNaO_4$ is dissolved in 15 minutes.

•TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium, Apparatus, Time, Standard solution, and *Test solution*—Proceed as directed for *Test 1*. [NOTE—Filter the *Standard solution* in a manner identical to the *Test solution*.]

Determine the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (65 : 35) with 0.5 mL of phosphoric acid per L. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L10. The column temperature is maintained at 30°. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5; and the relative standard deviation is not more than 4.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of $C_{15}H_{10}I_4NNaO_4$.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{15}H_{10}I_4NNaO_4$ is dissolved in 45 minutes.•[3]

TEST 4—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4.*

▲NOTE—Do not use paddle stirrers with synthetic coating.▲*USP28*

Medium: 0.01 N hydrochloric acid; 500 mL for tablets labeled to contain between 25 µg and 175 µg of levothyroxine sodium; 900 mL for tablets labeled to contain 200 µg or 300 µg of levothyroxine sodium.

Apparatus 2: 75 rpm.

Time: 45 minutes.

Determine the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and 85% orthophosphoric acid (700 : 500 : 2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Prepare a stock solution by transferring about 100 mg of USP Levothyroxine RS, accurately weighed, to a 100-mL volumetric flask. Add 80 mL of alcohol and 1 mL of 1 N hydrochloric acid, sonicate for about 2 minutes, dilute with alcohol to volume, and mix. Dilute this stock solution with a mixture of alcohol and water (1 : 1) to obtain a solution having a concentration of 0.01 mg of levothyroxine per mL. Dilute this intermediate solution with *Medium* to obtain a solution having a concentration similar to that expected in the *Test solution.*

Test solution—Use a centrifuged portion of the solution under test.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 225-nm detector and a 4.0-mm × 12.5-cm column that contains packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5; and the relative standard deviation is not more than 4.0%.

Procedure—Separately inject equal volumes (about 500 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of $C_{15}H_{10}I_4NNaO_4$.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{15}H_{10}I_4NNaO_4$ is dissolved in 45 minutes.

BRIEFING

Loratadine Oral Solution, *USP 28* page 1150, the *Sixth Interim Revision Announcement* on page 1969 of *PF* 30(6) [Nov.–Dec. 2004], and page 2014 of *PF* 30(6) [Nov.–Dec. 2004]. It is proposed to delete the *Antimicrobial effectiveness test.* This test is a formulation development and stability test, not a release test. Deletion of the *Antimicrobial effectiveness test* is consistent with other *USP* monographs for oral solutions.

(PA1: K. Russo; AMB: D. Porter) RTS—41936-1

Delete the following:

▲~~**Antimicrobial effectiveness test** ⟨51⟩**:** meets the requirements.~~▲*USP29*

Change to read:

Related compounds—

Mobile phase—Prepare a mixture of 15 mmol of sodium dodecyl sulfate in a mixture of water and acetonitrile (1 : 1). Adjust with phosphoric acid to a pH of 2.6 ± 0.1, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

In-Process Revision

Diluent—Prepare a mixture of *Mobile phase* and water (2 : 1).

System suitability solution 1—Dissolve an accurately weighed quantity of USP Loratadine RS, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.002 mg per mL.

System suitability solution 2—Quantitatively transfer 5.0 mL of *System suitability solution 1* into a suitable container, dilute with *Diluent* to 50 mL, and mix.

Resolution solution—Transfer an amount of Oral Solution, equivalent to 20 mg of loratadine, into a screw-cap glass container. Add 1 mL of 3% aqueous hydrogen peroxide, and mix. Cap, and heat at 65° for 18 to 24 hours.

■Allow to cool to room temperature, then dilute 5 mL with *Diluent* to 25 mL.■2S (*USP28*)

Test solution—Transfer an accurately measured volume of Oral Solution, equivalent to about 5 mg of loratadine, to a 25-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The flow rate is about 2 mL per minute. The column temperature is maintained between 30° and 40°. Chromatograph the *Resolution solution,* and record the peak areas as directed for *Procedure:* the relative retention times are about 0.70 for ethyl 4-[8-chloro-5,6-dihydro-4-(hydroxymethyl)-11*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-ylidene]-1-piperidinecarboxylate, 0.84 for ethyl 4-[8-chloro-5,6-dihydro-2-(hydroxymethyl)-11*H*-benzo[5,6]cyclohepta[1,2-*b*]-pyridin-11-ylidene]-1-piperidinecarboxylate, and 1.0 for loratadine; and the resolution, *R,* between loratadine and ethyl 4-[8-chloro-5,6-dihydro-2-(hydroxymethyl)-11*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-ylidene]-1-piperidinecarboxylate is not less than 3.0. Chromatograph *System suitability solution 1,* and record the peak area response of the loratadine peak as directed for *Procedure:* the tailing factor is not less than 0.7 and not greater than 1.1. Chromatograph *System suitability solution 2,* and record the peak area response of the loratadine peak as directed for *Procedure:* the relative standard deviation for replicate injections of *System suitability solution 2* is not more than 10%.

Procedure—Inject about 50 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure all the peak area responses. Calculate the percentage of each individual related compound in the portion of Oral Solution taken by the formula:

$$100(r_i / r_s),$$

in which r_i is the individual peak response of each related compound in the *Test solution;* and r_s is sum of the responses of all the peaks, excluding excipient peaks: not more than 0.3% of ethyl 4-[8-chloro-5,6-dihydro-4-(hydroxymethyl)-11*H*-benzo[5,6]cyclohepta[1,2-*b*]-pyridin-11-ylidene]-1-piperidinecarboxylate is found; not more than 0.3% of ethyl 4-[8-chloro-5,6-dihydro-2-(hydroxymethyl)-11*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-ylidene]-1-piperidinecarboxylate is found; not more than 0.2% of any other individual impurity is found; and the sum of all impurities is not more than 0.5%.

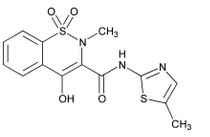
BRIEFING

Meloxicam. Because there is no existing *USP* monograph for this article, a new monograph is being proposed. The liquid chromatographic procedures in the *Related compounds Test 1* and in the *Assay* are based on analyses performed with the Inertsil ODS-2 brand of L1 column. The typical retention times for meloxicam are about 7 and 6 minutes for *Related compounds Test 1* and the *Assay,* respectively. The liquid chromatographic procedures in the *Related compounds Test 2* are based on analyses performed with the Purosphere RP-18e brand of L1 column. The typical retention time for meloxicam is about 5 minutes.

(PA2: D. Bempong; PSD: C. Okeke; NL: C. Barnstein) RTS—41206-1; 41637-1; 41689-1

Add the following:

▲Meloxicam



$C_{14}H_{13}N_3O_4S_2$ 351.40

4-Hydroxy-2-methyl-*N*-(5-methyl-2-thiazolyl)-2*H*-1,2-benzothiazine-3-carboxamide 1,1-dioxide [*71125-38-7*].

» Meloxicam contains not less than 99.0 percent and not more than 100.5 percent of $C_{14}H_{13}N_3O_4S_2$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers. Store at room temperature.

Labeling—The labeling states with which *Related compounds* test the article complies if a test other than *Test 1* is used.

In-Process Revision

USP Reference standards ⟨11⟩—*USP Meloxicam RS. USP Meloxicam Related Compound A RS. USP Meloxicam Related Compound B RS. USP Meloxicam Related Compound C RS. USP Meloxicam Related Compound D RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: *Ultraviolet Absorption* ⟨197U⟩.

Spectral range: 240 to 450 nm.

Solution: 10 µg per mL.

Medium: methanol.

Loss on drying ⟨731⟩—Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩**:** not more than 0.001%.

Related compounds—[NOTE—Perform either *Test 1* or *Test 2* depending on the manufacturing process used.]

TEST 1—

Solution A: a 0.1% w/v solution of monobasic potassium phosphate adjusted with 1 N sodium hydroxide to a pH of 6.0.

Solution B: methanol.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Transfer about 4 mg of USP Meloxicam RS and about 4 mg each of USP Meloxicam Related Compound A RS and USP Meloxicam Related Compound B RS into a 50-mL volumetric flask, dissolve in 5 mL of methanol and 0.3 mL of 1 N sodium hydroxide, dilute with methanol to volume, and mix.

Standard solution—Transfer about 12 mg of USP Meloxicam RS, accurately weighed, to a 20-mL volumetric flask, dissolve in 5 mL of methanol and 0.3 mL of 1 N sodium hydroxide, dilute with methanol to volume, and mix. Transfer 2 mL of this solution to a 100-mL volumetric flask, dilute with methanol to volume, and mix.

Test solution—Transfer about 80 mg of Meloxicam, accurately weighed, to a 20-mL volumetric flask, dissolve in 5 mL of methanol and 0.3 mL of 1 N sodium hydroxide, dilute with methanol to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a variable wavelength or multi-wavelength UV detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The column temperature is maintained at 45°. The flow rate is about 1 mL per minute, and the detection wavelengths are 260 nm and 350 nm. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–2	60	40	isocratic
2–10	60→30	40→70	linear gradient
10–15	30	70	isocratic
15–15.1	30→60	70→40	linear gradient
15.1–18	60	40	equilibration

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times based on the meloxicam peak at about 7 minutes are listed in *Table 1.* At 350 nm, the resolution, *R,* between meloxicam related compound A and meloxicam is not less than 3.0; at 260 nm, the resolution, *R,* between meloxicam related compound B and meloxicam is not less than 3.0. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 10%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms at detection wavelengths

of 260 nm and 350 nm, and measure the peak responses. Calculate the percentage of each impurity in the portion of Meloxicam taken by the formula:

$$100(C_S / C_T)(1 / F)(r_U / r_S),$$

in which C_S is the concentration, in mg per mL, of USP Meloxicam RS in the *Standard solution;* C_T is the concentration, in mg per mL, of Meloxicam in the *Test solution; F* is the relative response factor (see *Table 1*); r_U is the peak response of each impurity obtained from the *Test solution;* and r_S is the peak response of meloxicam at 350 nm obtained from the *Standard solution*. [NOTE—For the specified impurities, calculate the percentage content of each impurity, using the *Test solution* peak responses recorded at the detection wavelength given in *Table 1*. For an unknown impurity, calculate the percentage content, using peak responses recorded at the wavelength that gives the greater response.]

Table 1

Compound	Approximate Relative Retention Time	Wavelength (nm)	Relative Response Factor (*F*)	Limit (w/w, %)
4-Hydroxy-2-methyl-2*H*-1,2-benzothiazine-3-carboxylic acid ethylester 1,1-dioxide (meloxicam related compound A)	1.4	350	0.5	0.1
2-Amino-5-methyl-thiazole (meloxicam related compound B)	0.4	260	1.0	0.1
4-Hydroxy-2-methyl-*N*-(*N*′-methyl-5-methyl-2-thiazolyl)-2*H*-1,2-benzothiazine-3-carboxamide-1, 1-dioxide	1.9	350	1.0	0.05
4-Hydroxy-2-methyl-*N*-(*N*′-ethyl-5-methyl-2-thiazolyl)-2*H*-1,2-benzothiazine-3-carboxamide-1, 1-dioxide	1.7	350	1.0	0.05
Individual unknown impurity	—	260/350	1.0	0.1
Total impurity	—	—	—	0.3

TEST 2—If an article complies with this test, the labeling indicates that it meets the requirements of *Related compounds Test 2*.

Solution A and *Solution B*—Prepare as directed in *Test 1*.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent A: a mixture of *Diluent B* and 0.4 N sodium hydroxide (50 : 3).

Diluent B: a mixture of water and methanol (60 : 40).

Standard stock solution 1—Prepare a solution having a known concentration of about 50 µg per mL of USP Meloxicam RS in *Diluent A*. Transfer 2 mL of the solution to a 10-mL volumetric flask, dilute with *Diluent B* to volume, and mix.

Standard stock solution 2—Transfer about 5 mg each of USP Meloxicam Related Compound B RS, USP Meloxicam Related Compound C RS, and USP Meloxicam Related Compound D RS into a 100-mL volumetric flask, add 6 mL of 0.4 N sodium hydroxide, and sonicate for about 2 minutes. Add 40 mL of methanol to the resulting solution, sonicate for about 2 minutes, dilute with water to volume, and mix.

Standard solution—Transfer 1 mL each of *Standard stock solution 1* and *Standard stock solution 2* into a 10-mL volumetric flask, dilute with *Diluent B* to volume, and mix.

System suitability stock solution—Prepare a solution containing about 2 mg per mL of USP Meloxicam RS in *Diluent A*.

System suitability solution—Transfer 5 mL of *System suitability stock solution* and 1 mL of *Standard stock solution 2* into a 10-mL volumetric flask, dilute with *Diluent B* to volume, and mix.

Test solution—Transfer about 20 mg of Meloxicam, accurately weighed, to a 20-mL volumetric flask, dissolve in 10 mL of *Diluent A,* dilute with *Diluent B* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a variable wavelength or multi-wavelength UV detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The column temperature is maintained at 45°. The flow rate is about 1 mL per minute and the detection wavelengths are 260 nm and 350 nm. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–25	45	55	isocratic
25–30	45→30	55→70	linear gradient
30–40	30	70	isocratic
40–45	30→45	70→55	linear gradient
45–50	45	55	equilibration

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times based on the meloxicam peak at about 5 minutes are listed in *Table 2;* and the resolution, *R,* between meloxicam related compound D and meloxicam at 350 nm is not less than 5.0. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 5.0% for meloxicam related compound C and for meloxicam related compound D at 350 nm; and not more than 5.0% for meloxicam related compound B at 260 nm.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms at detection wavelengths of 260 nm and 350 nm, and measure the peak responses. Calculate the percentage of each impurity in the portion of Meloxicam taken by the formula:

$$100(C_S / C_T)(r_U / r_S),$$

in which C_S is the concentration, in mg per mL, of the corresponding USP Related Compound RS in the *Standard solution* [NOTE—Use the concentration of the USP Meloxicam RS for unknown impurities.]; C_T is the concentration, in mg per mL, of Meloxicam in the *Test solution;* r_U is the peak response of each impurity obtained from the *Test solution;* and r_S is the peak response of the corresponding related

In-Process Revision

compound obtained from the *Standard solution.* [NOTES—Use the peak response of the USP Meloxicam RS for unknown impurities; for the specified impurities, calculate the percentage content of each impurity using the *Test solution* peak responses recorded at the detection wavelength given in *Table 2.* For an unknown impurity, calculate the percentage content using peak responses recorded at the wavelength that gives the greater response.]

Table 2

Compound	Approximate Relative Retention Time	Wavelength (nm)	Limit (w/w, %)
2-Amino-5-methyl-thiazole (meloxicam related compound B)	0.8	260	0.1
Isopropyl-4-hydroxy-2-methyl-2*H*-1,2-benzothiazine-3-carboxylate-1,1-dioxide (meloxicam related compound C)	3.2	350	0.1
4-Methoxy-2-methyl-*N*-(5-methyl-1,3-thiazol-2yl)-2*H*-1,2-benzothiazine-3-carboxamide-1,1-dioxide (meloxicam related compound D)	2.4	350	0.1
Individual unknown impurity	—	260/350	0.1
Total impurity	—	—	0.3

Assay—

Buffer solution: a mixture of 0.1% w/v solution of ammonium acetate adjusted with 10% ammonia solution to a pH of 9.1.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and methanol (58 : 42). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Transfer about 4 mg of USP Meloxicam RS and about 4 mg of USP Meloxicam Related Compound A RS into a 50-mL volumetric flask, dissolve with 25 mL methanol and 0.1 mL of 1 N sodium hydroxide, dilute with water to volume, and mix.

Standard preparation—Transfer about 20 mg of USP Meloxicam RS, accurately weighed, into a 100-mL volumetric flask, dissolve in 50 mL of methanol and 0.2 mL of 1 N sodium hydroxide, dilute with water to volume, and mix.

Assay preparation—Transfer about 20 mg of Meloxicam, accurately weighed, into a 100-mL volumetric flask, dissolve in 50 mL of methanol and 0.2 mL of 1 N sodium hydroxide, dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 360-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The column temperature is maintained at 45°. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.7 for related compound A and 1.0 for meloxicam; the resolu-

tion, *R,* between the two peaks is not less 3.0; the tailing factor for the meloxicam peak is not more than 2.0; and the relative standard deviation for replicate injections, calculated for the meloxicam peak, is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the meloxicam peak. Calculate the quantity, in mg, of $C_{14}H_{13}N_3O_4S_2$ in the portion of Meloxicam taken by the formula:

$$100C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Meloxicam RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP29*

BRIEFING

Methenamine Hippurate Tablets, *USP 28* page 1242. It is proposed to add a *Dissolution Test 2* in this monograph for the generic versions of this product.

(BPC: M. Marques) RTS—40621-3

Add the following:

▲**Labeling—**When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.▲*USP29*

Change to read:

Dissolution ⟨711⟩**—**

▲TEST 1—▲*USP29*

Medium: water; 900 mL.
Apparatus 2: 100 rpm.
Time: 30 minutes.
Standard solution—Dissolve an accurately weighed quantity of USP Methenamine Hippurate RS in water to obtain a solution having a known concentration of about 22 µg per mL.
Procedure—Determine the amount of $C_6H_{12}N_4 \cdot C_9H_9NO_3$ dissolved by employing UV absorption, using a suitable spectrophotometer, at the wavelength of maximum absorbance at about 227 nm on filtered portions of the solution under test, suitably diluted with water, if necessary, in comparison with the *Standard solution*.
Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_6H_{12}N_4 \cdot C_9H_9NO_3$ is dissolved in 30 minutes.

▲TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 60 minutes.

Standard solution and *Procedure*—Proceed as directed under *Test 1*.

Tolerances —Not less than 80% *(Q)* of the labeled amount of $C_6H_{12}N_4 \cdot C_9H_9NO_3$ is dissolved in 60 minutes.▲*USP29*

BRIEFING

Nabumetone, *USP 28* page 1320. On the basis of comments received, it is proposed to revise the *Related compounds* test to provide the names of the related compounds.

(PA2: D. Bempong) RTS—41890-1

Change to read:

Related compounds—
Solution A, Solution B, and *Mobile phase*—Proceed as directed in the *Assay.*
System suitability solution—Dissolve accurately weighed quantities of USP Nabumetone RS and USP Nabumetone Related Compound A RS in acetonitrile to obtain a solution having known concentrations of about 1 mg per mL and 1 µg per mL, respectively.
Test solution—Use the *Assay preparation*.
Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay,* except to chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.9 for nabumetone related compound A and 1.0 for nabumetone; the resolution, *R,* between nabumetone related compound A and nabumetone is not less than 1.5; the column efficiency is not less than 3600 theoretical plates; the tailing factor determined from the nabumetone peak is between 0.8 and 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.
Procedure—Inject 10 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak areas. Calculate the percentage of each impurity in the portion of Nabumetone taken by the formula:

$$100Fr_i/(r_N + \Sigma Fr_i)$$

in which F is the relative response factor ~~and is equal to 0.12 for any peak with a relative retention time of 0.73, 0.10 for any peak with a relative retention time of 2.7, 0.25 for any peak with a relative retention time of 0.93, 0.42 for any peak with a relative retention time of 1.2, 0.94 for any peak with a relative retention time of 0.85, 1.02 for any peak with a relative retention time of 1.9, and 0.91 for any peak with a relative retention time of 2.6~~

▲for each impurity (see the accompanying table for values);▲*USP29*
r_i is the peak response for each impurity; and r_N is the nabumetone peak response. ~~not more than 0.3% of any impurity with a relative retention time of 2.7 is found; not more than 0.1% of any other individual impurity is found; and not more than 0.8% of total impurities is found~~

▲The limits of impurities are specified in the accompanying table.

In-Process Revision

BRIEFING

Oxandrolone, *USP 28* page 1426 and page 148 of *PF* 30(1) [Jan.–Feb. 2004]. It is proposed to replace the liquid chromatographic procedure in the test for *Related compounds* with a linear gradient elution method that provides greater sensitivity to the impurities and makes the method stability indicating. The previously proposed revision to the test for *Related compounds,* which appeared in *PF* 30(1), is being canceled. It is also proposed to further revise the *Assay* to make additional modifications to the *Mobile phase, Standard preparation, Chromatographic system,* and *Procedure*.

Add the following:

▲**Related compounds**—

Solution A: acetonitrile.

Solution B: water.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution 1—Weigh accurately 5 mg of USP Oxandrolone Related Compound A RS and 5 mg of USP Oxandrolone Related Compound C RS into a 50-mL volumetric flask, dissolve in 25 mL of acetonitrile using an ultrasonic bath, dilute with acetonitrile to volume, and mix.

Standard solution 2—Weigh accurately 5 mg of USP Oxandrolone RS and 3 mg of USP Oxandrolone Related Compound B RS into a 25-mL volumetric flask, dissolve in 1 mL of acetonitrile, add 1.00 mL of *Standard solution 1,* dilute with acetonitrile to volume, and mix.

Standard solution 3—Dilute 1.0 mL of *Standard solution 2* with 4.0 mL of acetonitrile and 5.0 mL of water and mix.

Test solution—Weigh accurately 40 mg of Oxandrolone into a 10-mL volumetric flask, dissolve in 5.0 mL of acetonitrile using an ultrasonic bath, dilute with water to volume, and mix. [NOTE—*Test* and blank solutions are made up fresh and injected immediately.]

Chromatographic system—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1.The column temperature is maintained at 40°. The flow rate is about 0.7 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	50	50	equilibration
0–30	50→100	50→0	linear gradient
30–32	100→50	0→50	linear gradient
32–40	50	50	re-equilibration

Chromatograph *Standard solution 3,* and record the peak responses as directed for *Procedure*. The resolution, *R,* between oxandrolone related compound A and oxandrolone related compound B is not less than 1.5, and the resolution, *R,* between oxandrolone related compound B and oxandrolone is not less than 2.0; the tailing factor is not more than 1.1; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 50 µL) of *Standard solution 3* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of oxandrolone

related compound A and oxandrolone related compound C in the portion of Oxandrolone taken by the formula:

$$1000(C/W)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of oxandrolone related compound A or oxandrolone related compound C in *Standard solution 3; W* is the weight of Oxandrolone taken to prepare the *Test solution;* r_U is the peak area of oxandrolone related compound A or oxandrolone related compound C in the chromatogram of the *Test solution;* and r_S is the peak area obtained for oxandrolone related compound A or oxandrolone related compound C in the chromatogram of *Standard solution 3*.

Calculate the percentage of each impurity, other than oxandrolone related compound A and oxandrolone related compound C, by the formula:

$$100F(C/W)(r_U/r_S),$$

in which F is the relative response factor for each impurity; C is the concentration, in mg per mL, of USP Oxandrolone RS in *Standard solution 3; W* is the weight of Oxandrolone taken to prepare the *Test solution;* r_U is the peak area of each impurity in the chromatogram of the *Test solution;* and r_S is the peak area obtained for oxandrolone in *Standard solution 3.* The impurities meet the requirements specified in the table below.

Compound	Relative Retention Time	Relative Response Factor	Limit (%)
4-Oxa-isomer (17β-hydroxy-17α-methyl-4-oxa-5α-androstan-3-one) Oxandrolone related compound B	0.94	0.73	0.3

Change to read:

Assay—~~Transfer about 500 mg of Oxandrolone, accurately weighed, to a 250-mL conical flask, and add 25.0 mL of 0.1 N alcoholic potassium hydroxide VS. Insert into the neck of the flask, by means of a perforated stopper, an air condenser consisting of a glass tube 70 to 80 cm in length and 5 to 8 mm in diameter, and heat the flask on a steam bath for 30 minutes, frequently rotating the contents. Cool, add 1 mL of phenolphthalein TS, and titrate the excess alkali with 0.1 N hydrochloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N alcoholic potassium hydroxide is equivalent to 30.64 mg of $C_{19}H_{30}O_3$.~~

▲*Mobile phase*—Prepare a filtered and degassed mixture of ~~0.01% (v/v) glacial acetic acid in~~ water and acetonitrile ~~(64 : 36)~~ (50 : 50). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Weigh accurately 30 mg of USP Oxandrolone RS into a 10-mL volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix.

Standard preparation—Dissolve an accurately weighed quantity of USP Oxandrolone RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about ~~5~~ 3 mg per mL. [NOTE—Sonicate if necessary to dissolve.]

Assay preparation—Transfer to a suitable volumetric flask an accurately weighed quantity of Oxandrolone, and dissolve in and dilute with acetonitrile to volume to obtain a solution having a concentration of about ~~5~~ 3 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a ~~198-nm~~ 210-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about ~~1.0~~ 0.8 mL per minute. Chromatograph the *Standard preparation* and the *System suitability solution,* and record the peak responses as directed for *Procedure.* The column efficiency is not less than 2000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about ~~25 µL~~ 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{19}H_{30}O_3$ taken by the formula:

$$VC(r_U / r_S),$$

in which V is the final volume, in ~~mg per~~ mL, of the *Assay preparation;* C is the concentration, in mg per mL, of USP Oxandrolone RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP29*

BRIEFING

Oxandrolone Tablets, *USP 28* page 1427. It is proposed to replace the *Disintegration* test with a *Dissolution* test. The chromatographic procedure in the *Dissolution* test was validated using the RTX-5 brand of column containing packing G27. In the absence of any adverse comment, it is proposed to implement this revision via the *Second Interim Revision Announcement* pertaining to *USP 28–NF 23*, with an official date of April 1, 2005.

Add the following:

•**Dissolution** ⟨711⟩—

Medium: a solution of water and isopropanol (7 : 3); 500 mL.

Apparatus 2: 100 rpm.

Time: 60 minutes.

In-Process Revision

Determine the amount of $C_{19}H_{30}O_3$ dissolved by employing the following method.

Internal standard solution—Dissolve accurately weighed quantities of 17α-methyl testosterone, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a concentration of about 0.2 mg per mL (for tablets with 2.5-mg label claim) and about 0.8 mg per mL (for tablets with 10-mg label claim).

Standard solution—Dissolve an accurately weighed quantity of USP Oxandrolone RS, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a concentration of about 1 mg per mL.

Working standard solution—Combine 100 µL of the *Standard solution,* 400 µL of the *Internal standard solution,* and 1500 µL of acetonitrile.

Test solution—Withdraw 25 mL of the solution under test from the vessel. Pass through a 0.45-µm polytef filter. Transfer 20 mL of the filtrate to a separatory funnel, add 400 µL of the *Internal standard solution,* 40 mL of 10% potassium chloride solution, and 8 mL of chloroform. In separate separatory funnels, prepare an extraction blank and an internal standard blank in a similar manner using 20 mL of filtered *Medium* in place of the solution under test and excluding the *Internal standard solution* from the extraction blank. Shake each funnel, and allow the layers to separate. Collect the lower chloroform layer. Repeat the extraction procedure one more time. Evaporate the solvents under a stream of nitrogen at 45° until just dry. Reconstitute the dried residue with 2 mL of acetonitrile (for tablets with 2.5-mg label claim) or with 8 mL of acetonitrile (for tablets with 10-mg label claim), and sonicate for 10 minutes.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 30-m column coated with a 0.5-µm phase G27. The carrier gas is helium, flowing at a rate of about 16.8 mL per minute. The injection port and detector temperatures are maintained at 190° and 320°, respectively. The chromatograph is programmed as follows. Upon injection, the column temperature is increased at a rate of 25° per minute to 280°, and maintained at 280° for 3 minutes. Then the column temperature is increased at a rate of 10° per minute to 320°, and maintained at 320° for 3 minutes. Chromatograph the acetonitrile, the extraction blank, and the internal standard blank, and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5. Make two injections of the *Working standard solution,* and record the peak responses. The average oxandrolone/*Internal standard solution* peak area percent comparison is between 98.0% and 102.0%. The resolution between the oxandrolone peak and the nearest eluting peak is equal to or greater than 1.5.

Procedure—Separately inject equal volumes (0.5 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{19}H_{30}O_3$ released by the formula:

$$\frac{C_s \times \text{sample ratio} \times V_{UF} \times 500 \times 100}{\text{Standard ratio} \times V_{UI} \times LC},$$

in which C_S is the concentration, in mg per mL, of oxandrolone in the *Standard solution;* sample ratio is the area ratio of oxandrolone to 17α-methyltestosterone in the sample injection for each *Test solution;* V_{UF} is the final volume, in mL, of the sample after reconstitution of the dry residue; 500 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; standard ratio is the mean area ratio of oxandrolone to 17α-methyltestosterone in all injections of the

In-Process Revision

Standard solution; V_{UI} is the initial sample volume, in mL, used in the extraction; and *LC* is the tablet label claim, in mg.

Tolerances—Not less than 75% *(Q)* of the labeled amount of oxandrolone ($C_{19}H_{30}O_3$) is dissolved in 60 minutes.●2

BRIEFING

Paroxetine Hydrochloride *USP 28* page 1474 and page 1282 of *PF* 30(4) [Jul.–Aug. 2004]. It is proposed to replace the method in the test for *Limit of 1-methyl-4-(p-fluorophenyl)-1,2,3,6-tetrahydropyridine* with a validated test that does not use a tandem mass spectrophotometric detector. The proposed method was validated using a Purospher RP-18e brand of L1 column. The retention time of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine is about 20 minutes. In addition, in the test for *Chromatographic purity* it is proposed to replace USP Paroxetine Related Compound A RS and USP Paroxetine Related Compound B RS with USP Paroxetine Hydrochloride for System Suitability RS in the *System suitability solution* section under *Test 1.*

~~*Standard solution*—Dissolve an accurately weighed quantity of USP Paroxetine Related Compound E RS in a mixture of *Solution B* and *Solution A* (7 : 3), and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of 1-methyl-4 (*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine of about 100 ng per mL.~~

~~■20 ng per mL.■ IS (USP23).~~

~~*Test solution*—Transfer about 20 mg of Paroxetine Hydrochloride, accurately weighed, to a suitable flask, add 1.0 mL of a mixture of *Solution B* and *Solution A* (7 : 3), and shake to dissolve.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a tandem mass spectrophotometric detector, monitoring the mass-to-charge ratio of 44 arising from the fragmentation of mass-to-charge ratio of 192, and a 2.0-mm × 25-cm column that contains base-deactivated packing L1. The flow rate is about 0.15 mL per minute. The collision-induced dissociation sector is filled with sufficient argon gas to produce 20 eV collisions. Adjust the argon gas pressure as necessary. The chromatograph is programmed as follows.~~

~~Time (minutes)~~	~~*Solution A* (%)~~	~~*Solution B* (%)~~	~~Elution~~
~~0~~	~~30~~	~~70~~	~~equilibration~~
~~0–10~~	~~30~~	~~70~~	~~isocratic~~
~~10–10.5~~	~~30→90~~	~~70→10~~	~~linear gradient~~
~~10.5–20~~	~~90~~	~~10~~	~~isocratic~~
~~20–20.5~~	~~90→30~~	~~10→70~~	~~linear gradient~~
~~20.5–30~~	~~30~~	~~70~~	~~isocratic~~

~~Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the signal-to-noise ratio for the analyte response at a mass-to-charge ratio of 44 is not less than 5; and the relative standard deviation for replicate injections is not more than 5.0%. [NOTE—A large peak due to paroxetine is observed at about 10 minutes in this system. Divert the flow of eluate from the mass spectrometer at about 10 minutes after injection.]~~

~~*Procedure*—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in ng, of 1-methyl-4 (*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine in the portion of Paroxetine Hydrochloride taken by the formula:~~

$$~~CI(r_U/r_S),~~$$

~~in which *C* is the concentration, in mg per mL, of USP Paroxetine Related Compound E RS in the *Standard solution*; *I* is the amount, in ng, of 1-methyl-4 (*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine in each mg of USP Paroxetine Related Compound E RS in the *Standard solution*; and r_U and r_S are the peak responses for 1-methyl-4 (*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine obtained from the *Test solution* and the *Standard solution*, respectively: not more than 20 ng is found (0.0001%).~~

▲*Solution A*—Dissolve about 30 g of sodium perchlorate in about 900 mL of water. Add 3.5 mL of phosphoric acid and 2.4 mL of triethylamine. Dilute with water to volume, and mix. Adjust with phosphoric acid or triethylamine to a pH of 2.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Solution B: acetonitrile, filtered and degassed.

Diluent: a mixture of water and acetonitrile (4 : 1).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments to either solution as necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Paroxetine Hydrochloride Related Compound E RS, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 42 ng per mL of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine.

Test solution—Transfer about 420 mg of Paroxetine Hydrochloride, accurately weighed, to a 10-mL volumetric flask, dissolve in about 7 mL of *Diluent* with sonication. Dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 242-nm detector and a 4.0-mm × 25-cm column that contains packing L1. The column temperature is maintained at 30°. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	85	15	equilibration
0–20	85→80	15→20	linear gradient
20–27	80→55	20→45	linear gradient
27–36	55	45	isocratic
36–38	55→80	45→15	linear gradient
38–45	85	15	re-equilibration

Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are 0.6 for 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine and 1.0 for paroxetine; and the relative standard deviation for replicate injections is not more than 15.0% for the 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine peak.

In-Process Revision

Procedure—Separately inject equal volumes (about 75 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine in the portion of Paroxetine Hydrochloride taken by the formula:

$$1000(CI/W)\ (r_i / r_S),$$

in which C is the concentration, in mg per mL, of USP Paroxetine Hydrochloride Related Compound E RS in the *Standard solution; I* is the fraction, by weight, of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine in USP Paroxetine Hydrochloride Related Compound E RS; W is the weight, in mg, of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the *Test solution;* and r_i and r_S are the peak areas for 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine obtained from the *Test solution* and the *Standard solution,* respectively: not more than of 0.0001% of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine is found.▲*USP29*

Change to read:

Chromatographic purity—[NOTE—Perform all related impurities methods unless the manufacturer has assurance, based on knowledge of the manufacturing process, that one of the tests is not relevant to their material.]

TEST 1—

Solution A—Prepare a filtered and degassed mixture of water, tetrahydrofuran, and trifluoroacetic acid (180 : 20 : 1).

Solution B—Prepare a filtered and degassed mixture of acetonitrile, tetrahydrofuran, and trifluoroacetic acid (180 : 20 : 1).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent: a mixture of water and tetrahydrofuran (9 : 1).

Standard solution—Dissolve an accurately weighed quantity of USP Paroxetine Hydrochloride RS, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 1 µg per mL.

System suitability solution—~~Dissolve, by sonication if necessary, suitable quantities of USP Paroxetine Related Compound A RS and USP Paroxetine Related Compound B RS in *Diluent* to obtain a solution having known concentrations of about 0.01 mg of each USP Reference Standard per mL.~~

▲Dissolve, by sonication if necessary, a suitable quantity of USP Paroxetine Hydrochloride for System Suitability RS in *Diluent* to obtain a solution having a known concentration of about 1 mg per mL.▲*USP29*

Test solution—Transfer about 25 mg of Paroxetine Hydrochloride, accurately weighed, to a 25-mL volumetric flask, dissolve in 20 mL of *Diluent,* sonicate, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 285-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 1 mL per minute. The column temperature is maintained at 40°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	80	20	equilibration
0–30	80	20	isocratic
30–50	80→20	20→80	linear gradient
50–60	20	80	isocratic
60–70	20→80	80→20	linear gradient

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about ~~1.1 for paroxetine related compound B, and 1.0 for paroxetine related compound A~~

▲0.66 for paroxetine related compound A, 0.73 for paroxetine related compound B, and 1.0 for paroxetine;▲*USP29* the resolution, *R,* between paroxetine related compound A and paroxetine related compound B is not less than 2.0; the tailing factor of the paroxetine related compound A peak is between 0.8 and 2.0; and the relative standard deviation for replicate injections is not more than 2.0% for paroxetine related compound A.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution,* the *Test solution,* and the *Diluent* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of each impurity in the portion of Paroxetine Hydrochloride taken by the formula:

$$2500(C/W)(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Paroxetine Hydrochloride RS in the *Standard solution; W* is the weight, in mg, of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the *Test solution;* r_U is the peak area of each impurity in the *Test solution,* excluding the peaks obtained from the chromatogram of the *Diluent;* and r_S is the peak area of paroxetine obtained from the *Standard solution:* not more than of 0.3% of any peak at a retention time of paroxetine related compound B is found; not more that 0.1% of any other individual impurity is found; and not more than 1.0% of total impurities is found.

TEST 2—

Phosphate buffer—Dissolve 3.4 g of monobasic potassium phosphate and 3.4 g of tetrabutylammonium hydrogen sulfate in 1.0 L of water.

Solution A—Prepare a filtered and degassed mixture of *Phosphate buffer* and acetonitrile (98 : 2).

Solution B—Prepare a filtered and degassed mixture of *Phosphate buffer* and acetonitrile (6 : 4).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent: a mixture of *Phosphate buffer* and acetonitrile (9 : 1).

Standard solution—Dissolve an accurately weighed quantity of USP Paroxetine Hydrochloride RS, USP Paroxetine Related Compound B RS, USP Paroxetine Related Compound F RS, and USP

Paroxetine Related Compound G RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having known concentrations of about 4 µg per mL, 10 µg per mL, 10 µg per mL, and 4 µg per mL, respectively.

Identification solution—Dissolve an accurately weighed quantity of Paroxetine Hydrochloride, USP Paroxetine Related Compound B RS, USP Paroxetine Related Compound F RS, and USP Paroxetine Related Compound G RS in *Diluent* to obtain a solution having known concentrations of about 2 mg per mL, 10 µg per mL, 10 µg per mL, and 4 µg per mL, respectively.

Test solution—Transfer about 25 mg of Paroxetine Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 3.9-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibration
0–5	100	0	isocratic
5–70	100→40	0→60	linear gradient
70–90	40→0	60→100	linear gradient
90–95	0	100	isocratic
95–95.1	0→100	100→0	linear gradient
95.1–110	100	0	re-equilibration

Chromatograph the *Identification solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.91 for paroxetine related compound B, about 0.96 for paroxetine related compound F, 1.0 for paroxetine, and about 1.34 for paroxetine related compound G. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 10.0% for the paroxetine related compound B, paroxetine related compound F, paroxetine hydrochloride, and paroxetine related compound G peaks.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of paroxetine related compound B, paroxetine related compound F, and paroxetine related compound G in the portion of Paroxetine Hydrochloride taken by the formula:

$$5000(C/W)(r_i/r_S),$$

in which C is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard solution; W* is the weight, in mg, of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the *Test solution;* and r_i and r_S are the peak areas for the corresponding impurity in the *Test solution* and the *Standard solution,* respectively: not more than of 0.5% of paroxetine related compound B is found; not more than 0.2% of paroxetine related compound F is found; and not more than 0.2% of paroxetine related compound G is found. Calculate the percentage of any unknown impurity in the portion of Paroxetine Hydrochloride taken by the formula:

$$5000(C/W)(r_i/r_S),$$

in which C is the concentration, in mg per mL, of USP Paroxetine Hydrochloride RS in the *Standard solution; W* is the weight, in mg, of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the *Test solution;* r_i is the peak area for any unknown impurity in the *Test solution;* and r_S is the peak area of paroxetine in the *Standard solution:* not more than of 0.1 % of any single unknown impurity is found, and not more than 1.0% of total impurities is found.

BRIEFING

Pentobarbital, *USP 28* page 1507 and page 154 of *PF* 30(1) [Jan.–Feb. 2004]; **Pentobarbital Sodium,** *USP 28* page 1509 and page 157 of *PF* 30(1) [Jan.–Feb. 2004]. According to the data received, when the material is intended for veterinary use, the approved limit of the known impurity, 5-ethyl-5-(1-ethylpropyl) barbituric acid, commonly known as the 3-isomer is 3%. Hence, it is proposed to change the assay limits from 98.0%–102.0% to 97.0%–102.0% .

BRIEFING

Succinylcholine Chloride, *USP 28* page 1807. It is proposed to revise the procedure for *Chromatographic purity, Test 2 (Limit of choline)* to correct the concentration of sodium chloride in the *System suitability solution*. Because this test was developed and validated specifically for the quantitation of choline, it is also proposed that the *Procedure* be revised to remove the formula for calculating the percentage of any other unknown impurities.

(PA1: K. Russo) RTS—41717-1

Change to read:

Chromatographic purity—

TEST 1—

Buffer solution—Prepare a solution in water containing 3.85 g per L of 1-pentanesulfonic acid, 2.9 g per L of sodium chloride, and 1% (v/v) of 1 N sulfuric acid.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and *Buffer solution* (5 : 95).

System suitability solution—Dissolve accurately weighed quantities of citric acid and succinic acid in *Mobile phase* to obtain a solution containing about 0.5 mg of each per mL.

Standard solution—Dissolve an accurately weighed quantity of USP Succinylmonocholine Chloride RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.05 mg per mL.

Test solution—Transfer about 100 mg of Succinylcholine Chloride, accurately weighed, to a 10-mL volumetric flask, and dissolve in and dilute with *Mobile phase* to volume.

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—The chromatograph is equipped with a 214-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Samples are maintained at a temperature of about 4° during the analysis. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.22 for succinic acid, 0.32 for the doublet of peaks quantitated as a single component, 0.49 for succinylmonocholine chloride, and 1.0 for succinylcholine chloride; the resolution, *R,* between citric acid and succinic acid is not less than 2.9; and the relative standard deviation for replicate injections is not more than 3.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Begin integration after the edetate disodium peak, if present (retention time is about 3.5 minutes). Calculate the percentage of each impurity in the portion of Succinylcholine Chloride taken by the formula:

$$10C(r_i / r_S)F,$$

in which C is the concentration, in mg per mL, of USP Succinylmonocholine Chloride RS in the *Standard solution;* r_i is the peak area for each impurity obtained from the *Test solution;* r_S is the succinylmonocholine chloride peak area obtained from the *Standard solution;* and F is the response factor (0.63 for succinic acid): not more than 0.1% of succinic acid is found; not more than 0.4% of the doublet of peaks quantitated as a single component is found; not more than 0.4% of succinylmonocholine chloride is found; and not more than 0.2% of any other individual impurity is found.

TEST 2 (LIMIT OF CHOLINE)—

Solution A—Prepare a solution in water containing 5% (v/v) of acetonitrile and 5% (w/v) of 0.1 M 1-hexanesulfonic acid.

Solution B—Prepare a solution of acetonitrile and water (1 : 1).

Mobile phase—Use variable amounts of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve an accurately weighed quantity of USP Choline Chloride RS and sodium chloride in water; and dilute quantitatively, and stepwise if necessary, with water to obtain a solution containing 0.05 mg per mL and ~~0.5~~

▲0.01▲*USP29*
mg per mL, respectively.

Standard stock solution—Dissolve an accurately weighed quantity of USP Choline Chloride RS in water; and dilute quantitatively, and stepwise if necessary, with water to obtain a solution containing 0.5 mg per mL.

Standard solution—Dilute 1 mL of the *Standard stock solution* with water to 50 mL.

Test solution—Transfer an accurately weighed quantity of Succinylcholine Chloride, about 50 mg, to a 25-mL flask. Dissolve in and dilute with water to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The ion chromatograph is equipped with a suitable device for chemical suppression, a conductivity detector at 30 µS and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The eluant flow is about 1 mL per minute, and uses a suitable regenerant flow rate at 50 mA output. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–15	100	0	isocratic
15–16	100→0	0→100	linear gradient
16–25	0	100	isocratic
25–27	0→100	100→0	linear gradient
27–40	100	0	isocratic

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the sodium and choline peaks is not less than 2.0; and the relative standard deviation for replicate injections is not more than 3.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of choline in the portion of Succinylcholine Chloride taken by the formula:

$$37.5C(r_C / r_S),$$

in which C is the concentration, in mg per mL, of USP Choline Chloride RS in the *Standard solution;* and r_C and r_S are the choline peak areas obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.3% of choline is found, ~~Calculate the percentage of any other impurity present by the formula:~~

~~$50C(r_i / r_S)$,~~

~~in which *C* is the concentration, in mg per mL, of USP Choline Chloride RS in the *Standard solution;* r_i is the peak area of each impurity obtained from the *Test solution;* and r_S is the choline peak area obtained from the *Standard solution:*~~

▲and▲*USP29*
not more than 1.5% of total impurities is found, the results for *Test 1* and *Test 2* being added.

BRIEFING

Terbutaline Sulfate, *USP 28* page 1869 and page 1585 of *PF* 29(5) [Sept.–Oct. 2003]; **Terbutaline Sulfate Tablets,** *USP 28* page 1871 and page 188 of *PF* 30(1) [Jan.–Feb. 2004]. It is proposed to change the name of USP Terbutaline Sulfate Related Compound A RS to USP Terbutaline Related Compound A RS, in accordance with the current naming conventions.

Dissolution ~~*Procedure for a Pooled Sample*~~

■■2S (*USP28*)
⟨711⟩—
Medium: water; 900 mL.
Apparatus 1: 100 rpm.
Time: 45 minutes.
Procedure—

■Proceed as directed for *Procedure for Capsules, Uncoated Tablets, and Plain Coated Tablets* under *Dissolution* ⟨711⟩. Combine equal volumes of the filtered solutions of the 6 or 12 individual specimens withdrawn, and use the pooled sample as the test solution.■2S (*USP28*)

Determine the amount of $(C_{12}H_{19}NO_3)_2 \cdot H_2SO_4$ dissolved, employing the procedure set forth in the *Assay,* making any necessary modifications.

Tolerances—Not less than 75% *(Q)* of the labeled amount of $(C_{12}H_{19}NO_3)_2 \cdot H_2SO_4$ is dissolved in 45 minutes:

■the requirements are met if the quantities of active ingredient dissolved from the pooled sample conform to the accompanying *Acceptance Table for a Pooled Sample*. Continue testing through the three stages unless the results conform at either S_1 or S_2. The quantity, *Q,* is the amount of dissolved active ingredient, expressed as a percentage of the labeled content.

Acceptance Table for a Pooled Sample

Stage	Number Tested	Acceptance Criteria
S_1	6	Average amount dissolved is not less than Q + 10%.
S_2	6	Average amount dissolved (S_1 + S_2) is equal to or greater than Q + 5%.
S_3	12	Average amount dissolved (S_1 + S_2 + S_3) is equal to or greater than Q.

■2S (*USP28*)

In-Process Revision

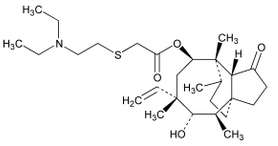
BRIEFING

Tiamulin. Because there is no existing *USP* monograph for this article, a new monograph is being proposed. The gas chromatographic procedure in the test for *Limit of alcohol and toluene* is based upon analyses performed with the HP-INNOWax brand of 530-µm × 30-m column coated with a 1.0-µm film of phase G16. In the test for *Related compounds* and the *Assay,* the Supelcosil LC-18-DB and Polaris C18-A brands of 4.6-mm × 15-cm column containing 5-µm L1 packing are suitable. Interested parties are encouraged to submit comments to the USP Veterinary Drugs Expert Committee.

(VET: I. DeVeau) RTS— 41731-1; 41731-2

Add the following:

▲Tiamulin



$C_{28}H_{47}NO_4S$ 493.74

Acetic acid, [[2-(diethylamino)ethyl]thio]-, 6-ethenyldecahydro-5-hydroxy-4,6,9,10-tetramethyl-1-oxo-3a,9-propano-3a*H*-cyclopentacycloocten-8-yl ester [3a*S*-(3aα,4*β*,5α,6α,8*β*,9α,9a*β*,10*S**)].

[[2-(Diethylamino)ethyl]thio]acetic acid 8-ester with (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-octahydro-5,8-dihydroxy-4,6,9,10)-tetramethyl-6-vinyl-3a,9-propano-3a*H*-cyclopentacycloocten-1(4*H*)-one [*55297-95-5*].

» Tiamulin contains not less than 96.5 percent and not more than 102.0 percent of $C_{28}H_{47}NO_4S$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed, light-resistant containers, and store at room temperature.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards ⟨11⟩**—***USP Endotoxin RS. USP Tiamulin RS. USP Tiamulin Fumarate RS.*

Clarity and color of solution—Dissolve 2.5 g in methanol, and dilute with methanol to 50.0 mL. Solution is clear and its absorbance at 420 nm is not more than 0.050 (see *Spectrophotometry and Light-Scattering* ⟨851⟩).

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the tiamulin peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Bacterial endotoxins ⟨85⟩**—**It contains not more than 0.4 USP Endotoxin Units per mg.

Loss on drying ⟨731⟩**—**Dry it at about 80° to constant weight: it loses not more than 1.0% of its weight.

Limit of alcohol and toluene—

Internal standard solution—To a 100-mL volumetric flask add about 90 mL of dimethylformamide and 150 µL of dioxane, dilute with dimethylformamide to volume, and mix.

Standard solution—To a 50-mL volumetric flask add about 40 mL of *Internal standard solution,* 100 µL of dehydrated alcohol, and 10 µL of toluene. Dilute with *Internal standard solution* to volume, and mix. Transfer 2 mL of this solution to a 20-mL headspace vial.

Test solution—Transfer about 200 mg of Tiamulin, accurately weighed, to a 20-mL headspace vial. Add 2 mL of *Internal standard solution,* close the vial, and sonicate to dissolve.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a headspace injector, a flame-ionization detector, and a 0.530-mm × 30-m capillary column coated with a 1.0-µm film of phase G16 and operated in 1/10 split mode. The carrier gas is helium flowing at a rate of about 30 mL per minute. The vial is heated to 100°, the injector syringe is heated to 130°, the injector port temperature is maintained at 200°, and the detector temperature is maintained at 250°. The column temperature is programmed to be isothermal at 50° for 8 minutes followed by a linear increase of 40° per minute until the temperature has reached 150°. Chromatograph the *Standard solution,* and record the peak areas as directed for *Procedure:* the relative retention times are about 0.5, 0.9, and 1.0 for alcohol, toluene, and dioxane, respectively; the resolution, *R,* between toluene and dioxane is not less than 2.0; the tailing factor of toluene and alcohol is not more than 2.0; and the relative standard deviation for triplicate injections, calculated from the ratio between the toluene or alcohol peak relative to the internal standard peak, is not more than 5.0%.

Procedure—Separately inject equal volumes (about 1.0 mL) of the headspace of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses for alcohol, toluene, and dioxane. Calculate the percentages (w/w) of alcohol and toluene in the portion of Tiamulin taken by the formula:

$$0.04P(DV/W_U)(R_U/R_S),$$

in which P is the percent purity of the solvent of interest in the *Standard solution; D* is the density, in mg per mL, of the solvent of interest used to prepare the *Standard solution; V* is the volume, in mL, of the solvent of interest used to prepare the *Standard solution;* W_U is the weight, in mg, of Tiamulin taken to prepare the *Test solution;* and R_U and R_S are the peak response ratios of the solvents of interest obtained from the *Test solution* and the *Standard solution,* respectively: not more than 1.0% of alcohol is found, not more than 0.08 % of toluene is found, and not more than 1.0% of alcohol plus toluene is found.

Related compounds—

Ammonium carbonate buffer, Mobile phase, and *Diluent*—Proceed as directed in the *Assay.*

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Toluene solution—Transfer 0.1 mL of toluene to a 100-mL volumetric flask, dilute with acetonitrile to volume, and mix. Transfer 0.1 mL of this solution to another 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Test solution 1—Use the *Assay preparation.*

Test solution 2—Add 1.0 mL of *Test solution 1* to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Chromatographic system—Proceed as directed in the *Assay.* Chromatograph the *Standard solution,* and record the peak areas as directed for *Procedure:* the retention times of possible tiamulin-related impurities relative to tiamulin are about 0.22 for mutilin, 0.50 for 2-(benzylsulfanyl)-*N*,*N*-diethylethanamine, 0.66 for 2,2′-(disulfane-1,2-diyl)-bis(*N*,*N*-diethylethanamine), 1.1 for hydroxy-11-oxotiamulin, 1.6 for 1-hydroxy-11-oxotiamulin, and 2.4 for 11-oxotiamulin. [NOTE—Impurities are not limited to those listed above.]

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution, Toluene solution, Test solution 1,* and *Test solution 2* into the chromatograph, record the chromatograms, identify the peaks, and measure the areas for the major peaks. Disregarding the toluene peak and any peak in the chromatogram of *Test solution 1* less than 0.1 times the area of the principal peak in the chromatogram

In-Process Revision

obtained with *Test solution 2,* calculate the area percentage of each impurity, relative to tiamulin, in the portion of Tiamulin taken by the formula:

$$(r_i / r_S),$$

in which r_i is the peak area of each individual impurity obtained from *Test solution 1;* and r_S is the peak area of Tiamulin obtained from *Test solution 2:* not more than 1.0% of any identified impurity is found; not more than 0.2% of any unidentified impurity is found; and not more than 3.0% of total impurities is found.

Assay—

Ammonium carbonate buffer—Dissolve 10.0 g of ammonium carbonate in water, add 22 mL of perchloric acid TS, and dilute with water to 1000 mL. Adjust with ammonium hydroxide to a pH of 10.0.

Mobile phase—Mix 490 mL of methanol, 300 mL of *Ammonium carbonate buffer,* and 210 mL of acetonitrile.

Diluent—Mix 500 mL of *Ammonium carbonate buffer* and 500 mL of acetonitrile.

Standard preparation—Dissolve an accurately weighed quantity of USP Tiamulin Fumarate RS in *Diluent* to obtain a solution having a known concentration of about 5.0 mg per mL.

Assay preparation—Dissolve an accurately weighed quantity of Tiamulin in *Diluent* to obtain a solution having a known concentration of about 4.0 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 212-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak areas as directed for *Procedure:* the resolution, *R,* between tiamulin and its subsequent peak is not less than 2.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{28}H_{47}NO_4S$ in the portion of Tiamulin taken by the formula:

$$P(C_S / C_U)(r_U / r_S),$$

in which P is the labeled percentage of tiamulin of USP Tiamulin Fumarate RS; C_S and C_U are the concentrations, in mg per mL, of the *Standard preparation* and *Assay preparation,* respectively; and r_U and r_S are the peak areas of tiamulin obtained from the *Assay preparation* and *Standard preparation,* respectively.▲*USP29*

BRIEFING

Ursodiol Capsules, *USP 28* page 2006. It is proposed to correct the molar concentration of the dissolution *Medium*.

(BPC: M. Marques) RTS—41828-1

Change to read:

Dissolution ⟨711⟩—
Medium: ~~0.2 M~~

▲0.5 M▲*USP29*
pH 8.4 phosphate buffer, prepared by mixing 250 mL of 0.2 M monobasic potassium phosphate, 280 mL of 0.2 M potassium hydroxide, and 5 mL of 2% sodium lauryl sulfate solution. Adjust with 0.2 M potassium hydroxide to a pH of 8.4, and dilute with water to 1000 mL; 1000 mL.
Apparatus 2: 75 rpm.
Time: 30 minutes.
Determine the amount of ursodiol ($C_{24}H_{40}O_4$) dissolved by employing the following method.
Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and 0.075 M monobasic potassium phosphate (50 : 50). Adjust with 85% phosphoric acid to a pH of 3.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

In-Process Revision

Standard solution—Dissolve an accurately weighed quantity of USP Ursodiol RS, and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration equivalent to that expected in the solution under test.

Test solution—Use a filtered portion of the solution under test.

Chromatographic system—The liquid chromatograph is equipped with a refractive index detector, a guard column that contains packing L1, and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute, and the column and detector temperatures are maintained at 40°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor of the ursodiol peak is not more than 1.7; and the relative standard deviation for replicate injections is not more than 2%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{24}H_{40}O_4$ dissolved by the formula:

$$100{,}000(r_U / r_S)(C/W),$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; C is the concentration, in mg per mL, of USP Ursodiol RS in the *Standard solution;* and W is the labeled amount, in mg, of ursodiol in each Capsule.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{24}H_{40}O_4$ is dissolved in 30 minutes.

BRIEFING

Zinc Oxide, *USP 28* page 2054. It is proposed to revise the test for *Iron and other heavy metals* to provide more clarity to the procedure.

(PA6: L. Evans) RTS—41908-1

Change to read:

Iron and other heavy metals~~— Cooled 5-mL portions of the solution obtained in the test for *Carbonate and color of solution* yield white precipitates with potassium ferrocyanide TS and with sodium sulfide TS.~~

▲Cool two separate 5-mL portions of the solution obtained in the test for *Carbonate and color of solution.* White precipitates are formed when potassium ferrocyanide TS is added to the first portion and when sodium sulfide TS is added to the second portion.▲*USP29*

BRIEFING

Zinc Oxide Neutral. Because there is no existing *USP* monograph for this article, a new monograph is being proposed.

(DSN: L. Evans; PSD: C. Okeke; NL: C. Barnstein) RTS—34758-1; 39969-1; 39969-2; 40131-1; 41305-1; 41568-1

Add the following:

▲Zinc Oxide Neutral

ZnO 81.39

» Zinc Oxide Neutral, freshly ignited, contains not less than 95.0 percent and not more than 98.0 percent of ZnO.

Packaging and storage—Preserve in well-closed containers, and store at controlled room temperature.

Labeling—Label it to indicate that it is for use in sunscreen preparations only.

Identification—

A: When strongly heated, it assumes a yellow color that disappears on cooling.

B: A solution of it in a slight excess of 3 N hydrochloric acid responds to the tests for *Zinc* ⟨191⟩.

Alkalinity—Mix 1.0 g with 10 mL of hot water. The addition of two drops of phenolphthalein TS produces no color change.

Loss on ignition ⟨733⟩**—**Weigh accurately about 1 g, and ignite at 750° for 15 minutes: it loses not more than 5.0% of its weight.

In-Process Revision

Carbonate and color of solution—Mix 2.0 g with 10 mL of water, add 30 mL of 2 N sulfuric acid, and heat on a steam bath with constant stirring: no effervescence occurs, and the resulting solution is clear and colorless. [NOTE—Use this solution in the test for *Iron and other heavy metals.*]

Sulfate ⟨221⟩**—**A 0.1 g portion shows no more sulfate than corresponds to 2.3 mL of 0.020 N sulfuric acid (2.2%).

Arsenic, *Method I* ⟨211⟩**:** 2 ppm.

Lead—Add 2 g to 20 mL of water, stir well, add 5 mL of glacial acetic acid, and warm on a steam bath until solution is effected: the addition of five drops of potassium chromate TS produces no turbidity or precipitate.

Mercury—

Mercury Detection Instrument and *Aeration Apparatus—*Proceed as directed for the section *Method IIa and Method IIb* under *Mercury* ⟨261⟩.

Nitric acid solution 1—Carefully add 50 mL of nitric acid to 450 mL of water, and mix.

Nitric acid solution 2—Carefully add 10 mL of nitric acid to 490 mL of water, and mix.

Hydrochloric acid–nitric acid solution—Carefully add three volumes of concentrated hydrochloric acid to one volume of concentrated nitric acid. [NOTE—Prepare immediately before use.]

Stannous sulfate solution—Add 25 g of stannous sulfate to 250 mL of 0.5 N sulfuric acid. [NOTE—The mixture is a suspension and should be stirred continuously during use.]

Sodium chloride–hydroxylamine sulfate solution—Dissolve 12 g of sodium chloride and 12 g of hydroxylamine sulfate in water, dilute with water to 100 mL, and mix.

Potassium permanganate solution—Dissolve 5 g of potassium permanganate in 100 mL of water, and mix.

Standard stock mercury solution—Dissolve 0.1354 g of mercuric chloride in *Nitric acid solution 1* to obtain a solution having a concentration of about 1.0 mg of mercury per mL. [NOTE—Use of a commercially prepared mercury standard is recommended.]

Standard working mercury solution—Quantitatively dilute an accurately measured volume of the *Standard stock mercury solution* with *Nitric acid solution 2* to obtain a solution having a known concentration of about 0.5 µg of mercury per mL.

Standard solutions—Transfer 1-, 2-, 3-, and 4-mL aliquots of *Standard stock mercury solution* to four separate 300-mL biological oxygen-demand (BOD) bottles. To each bottle, add 5 mL of water and 5 mL of *Hydrochloric acid–nitric acid solution*. Heat the sample for 2 minutes in a water bath at 95°. Cool, and add 50 mL of water and 15 mL of *Potassium permanganate solution*. Mix thoroughly, and place in a water bath for 30 minutes at 95°. Cool, add 5 mL of *Sodium chloride–hydroxylamine sulfate solution,* dilute with water to 200 mL, and mix. These solutions contain the equivalents of 2.5, 5, 7.5, and 10 ng of mercury per mL, respectively.

Blank solution—To a 300-mL BOD bottle, add 5 mL of water and 5 mL of *Hydrochloric acid–nitric acid solution*. Heat the solution for 2 minutes in a water bath at 95°. Cool, and add 50 mL of water and 15 mL of *Potassium permanganate solution*. Mix thoroughly, and place in a water bath for 30 minutes at 95°. Cool, add 5 mL of *Sodium chloride–hydroxylamine sulfate solution,* dilute with water to 200 mL, and mix.

Test solution—Transfer about 2.0 g of Zinc Oxide Neutral, accurately weighed, to a 300-mL BOD bottle. To the bottle, add 5 mL of water and 5 mL of *Hydrochloric acid–nitric acid solution*. Heat the sample in a water bath for 2 minutes at 95°. Cool, and add 50 mL of water and 15 mL of *Potas-*

sium permanganate solution. Mix thoroughly, and place in a water bath for 30 minutes at 95°. Cool, add 5 mL of *Sodium chloride–hydroxylamine sulfate solution,* dilute with water to 200 mL, and mix.

Procedure—Add 5 mL of *Stannous sulfate solution* to a *Standard solution,* and immediately insert the bottle into the *Aeration Apparatus*. Obtain the absorbance of the *Standard solution*. Repeat with the remaining *Standard solutions, Test solution,* and *Blank solution.* Perform a blank determination, and make any necessary corrections. Plot the absorbances of the *Standard solutions* versus concentrations, in µg per mL, and draw the straight line best fitting the plotted points. From the graph so obtained, determine the concentration, in µg per g of mercury, in the *Test solution*: not more than 1 µg per g is found.

Iron and other heavy metals—Cool two separate 5-mL portions of the solution obtained in the test for *Carbonate and color of solution*. White precipitates are formed when potassium ferrocyanide TS is added to the first portion and when sodium sulfide TS is added to the second portion.

Content of magnesium oxide—

Nitric acid solution—Carefully add 10 mL of concentrated nitric acid to 490 mL of water, and mix.

Standard solution—Prepare a solution in *Nitric acid solution* having a concentration of about 25 µg of magnesium per mL. [NOTE—Use of a commercially prepared magnesium–inductively coupled plasma standard solution is recommended.]

Test solution—Transfer 200 mg of Zinc Oxide Neutral, accurately weighed, to a 50-mL volumetric flask. Dissolve in and dilute with *Nitric acid solution* to volume.

Procedure—Set up an inductively coupled plasma–atomic emission spectrometer with a wavelength of 279.1 nm, RF power of about 1.2 KW, argon torch flow of about 17 L per minute, argon nebulizer flow of about 1.0 L per minute, and argon auxiliary flow of about 1.4 L per minute. Analyze the *Standard solution* and *Test solution,* using *Nitric acid solution* as the blank. Calculate the percentage of magnesium oxide in the portion of Zinc Oxide Neutral taken by the formula:

$$5F(C/W),$$

in which F is the conversion factor for conversion of magnesium to magnesium oxide (1.658); C is the concentration, in µg per mL, of magnesium found in the *Test solution,* determined from the instrument; and W is the weight, in mg, of the portion of Zinc Oxide Neutral taken to prepare the *Test solution*: not more than 0.7% is found.

Assay—Dissolve about 1.5 g of freshly ignited Zinc Oxide Neutral, accurately weighed, and 2.5 g of ammonium chloride in 50.0 mL of 1 N sulfuric acid VS, with the aid of gentle heat, if necessary. When dissolution is complete, add methyl orange TS, and titrate the excess sulfuric acid with 1 N sodium hydroxide VS. Each mL of 1 N sulfuric acid is equivalent to 40.69 mg of ZnO.▲*USP29*

BRIEFING

Zinc Sulfate Tablets. Because there is no existing *USP* monograph for this drug product, the following new monograph is being proposed. The development of this monograph has been requested by the United Nations International Children's Emergency Fund (UNICEF), the United States Agency for International Development (USAID), and the World Health Organization (WHO) as a treatment for diarrhea. Although the product is not approved by the FDA, USP is giving this monograph special consideration to support efforts by the aforementioned organizations to ensure the availability of quality public standards for the product marketed outside the United States.

(DSN: L. Evans; PSD: C. Okeke; NL: C. Barnstein; BPC: M. Marques) RTS—41759-1; 41759-2

In-Process Revision

Add the following:

▲Zinc Sulfate Tablets

» Zinc Sulfate Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $ZnSO_4 \cdot H_2O$. It may contain one or more suitable flavors and sweeteners.

Packaging and storage—Preserve in well-closed containers, and store at controlled room temperature.

Labeling—Label the Tablets in terms of zinc sulfate ($ZnSO_4 \cdot H_2O$) and in terms of elemental zinc.

Identification—

*Test solution—*Dissolve the equivalent of 1 g of finely powdered Tablets in 50 mL of water. Use in the following two tests.

A: To 5 mL of the *Test solution* add 0.2 mL of concentrated sodium hydroxide. A white precipitate is formed. Dissolve the precipitate in 2 mL of concentrated sodium hydroxide. The solution remains clear after the addition of 10 mL of ammonium chloride solution and forms a white precipitate after the addition of 0.1 mL of sodium sulfide solution.

B: To 5 mL of the *Test solution* add 1 mL of dilute hydrochloric acid and 1 mL of barium chloride TS. A white precipitate is formed.

Dissolution—

Medium: purified water with resistivity below 1 µS/cm; 750 mL.

Apparatus: basket-rack assembly (see *Disintegration* ⟨701⟩).

Time: 20 seconds.

*Procedure—*Place 1 Tablet in each of the six tubes of the basket, lower the basket-rack assembly into the beaker containing the *Medium,* and introduce the electrode of the resistivity meter into the beaker without hindering the motion of the basket. Measure the resistivity every 2 seconds.

*Tolerances—*The disintegration of the Tablets is complete in 20 seconds, and the resistivity stabilizes at about 255 to 260 µS in 20 seconds.

Uniformity of dosage units ⟨905⟩**—**meet the requirements.

Assay—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 90 mg of zinc, to a 200-mL volumetric flask. Dissolve in 15 mL of dilute acetic acid, and sonicate for 15 minutes. Dilute with water to volume, and mix. Add 50 mg of xylenol orange triturate to the solution, and mix. Neutralize the solution with about 2 g of methenamine until the solution is a violet-pink color. Titrate with 0.1 M edetate disodium VS until the solution is yellow. Each mL of 0.1 M edetate disodium VS is equivalent to 17.946 mg of $ZnSO_4 \cdot H_2O$.▲*USP29*

In-Process Revision

DIETARY SUPPLEMENTS—MONOGRAPHS

BRIEFING

Choline Chloride, *USP 28* page 2067 and page 951 of *PF* 30(3) [May–June 2004]. It is proposed to revise the *Procedure* in the test for *Limit of total amines* to correct the equation used to calculate the correction factor (*F*).

(DSN: L. Evans) RTS—41895-1

Change to read:

Limit of total amines—

Standard solution—Dissolve an accurately weighed quantity of trimethylamine hydrochloride in water, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of 500 µg per mL.

Test solution—Transfer 10.0 g of Choline Chloride to a beaker containing a plastic-coated stirring bar, add 170 mL of water and 30.0 mL of sodium hydroxide TS, and stir until dissolved.

System suitability solution—Dissolve an accurately weighed quantity of trimethylamine hydrochloride in water, and dilute quantitatively, and stepwise if necessary, to obtain a solution containing 10 µg of trimethylamine hydrochloride per mL. Transfer 10.0 mL of this solution to a beaker containing a plastic-coated stirring bar, add 170 mL of water and 30.0 mL of sodium hydroxide TS, and stir until dissolved.

Electrode system—Use a gas-sensing, ammonia-specific indicating electrode with internal reference connected to a pH meter capable of measuring potentials with a minimum reproducibility of ± 0.1 mV (see *pH* ⟨791⟩).

Standard response line—Transfer 30.0 mL of sodium hydroxide TS to a suitable beaker, and add enough water to give a total volume of 200 mL. Add a plastic-coated stirring bar, insert the electrode into the solution, and record the potential, in mV. Continue stirring, and at 5-minute intervals add 0.200, 0.600, 1.00, and 2.00 mL of *Standard solution*, and record the potential after each addition. Plot the logarithms of the cumulative trimethylamine concentrations (0.50, 1.50, 2.50, and 5.00 µg per mL) versus potential, in mV, and determine the slope *(S)* of the *Standard response line* for the electrode.

System suitability—Proceed with the *System suitability solution* as directed for *Test solution* for *Procedure* and measure the potentials: the trimethylamine equivalent is between 8.5 and 11.5 mg per liter.

Procedure—Rinse the electrode, insert it into the *Test solution,* stir, and record the potential, in mV. Add 0.100 mL of the *Standard solution,* and record the potential. Add another 0.100 mL of the *Standard solution,* and record the potential. [NOTE—If the total change after the second addition of the *Standard solution* is less than 10 mV, add a third aliquot of 0.200 mL.] Calculate the quantity, in µg per g, of total amines in the portion of Choline Chloride taken by the formula:

$$500V_A/(F-1)W,$$

in which V_A is the total volume of the *Standard solution* added to the *Test solution; W* is the weight, in g, of Choline Chloride taken to prepare the *Test solution;* and the correction factor, *F,* is calculated by the formula:

~~antilog $(mV_0 - mV_F)/S$,~~

~~in which *mVo* is the initial reading, in mV, of the *Test solution; mV~F~* is the final reading, in mV, after the additions of the *Standard solution;*~~

Chromatographic purity—

Buffer solution—Dissolve 7.1 g of anhydrous dibasic sodium phosphate in 1 L of water. Adjust with phosphoric acid to a pH of 2.5.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile ~~(50 : 50).~~

■(70 : 30).■1S *(USP28)*

Standard solution—Transfer an accurately weighed amount, not more than 100 mg, of USP Choline Chloride RS to a 24-mL screw-capped vial, and add 400 mg of 3,5-dinitrobenzoyl chloride and 10 mL of acetonitrile. Cap the vial, heat to 55°, and continue heating for ~~1 hour.~~

■2 hours.■1S *(USP28)*
Cool to room temperature, and add 5 mL of water. Allow to stand for ~~2 minutes.~~

■5 minutes.■1S *(USP28)*
Quantitatively transfer the solution to a 25-mL volumetric flask, dilute with acetonitrile to volume, and mix. Dilute a volume of this solution with *Mobile phase* to obtain a solution having a known concentration of 2.0 µg of USP Choline Chloride RS per mL.

Test solution—Transfer about 110 mg of Choline Chloride, accurately weighed, to a 24-mL screw-capped vial. Dry at 120° for 2 hours. Add 400 mg of 3,5-dinitrobenzoyl chloride and 10 mL of acetonitrile. Cap the vial, heat to 55°, and continue heating for ~~1 hour.~~

■2 hours.■1S *(USP28)*
Cool to room temperature, and add 5 mL of water. Allow to stand for ~~2 minutes.~~

■5 minutes.■1S *(USP28)*
Quantitatively transfer the solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

In-Process Revision

■Pipet 2.0 mL of the solution into a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.■1S *(USP28)*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 208-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The column temperature is maintained at 30°. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the capacity factor, k', is not less than 2; and the relative standard deviation determined from the choline chloride derivative peak is not more than 5%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all the peak responses. Calculate the percentage of each impurity in the portion of Choline Chloride taken by the formula:

~~$5000(C/W)(r_i/r_s),$~~

■$62{,}500(C/W)(r_i/r_S),$■1S *(USP28)*

in which C is the concentration, in mg per mL, of USP Choline Chloride RS in the *Standard solution;* W is the weight, in mg, of Choline Chloride taken to prepare the *Test solution;* r_i is the peak response for each impurity, other than that for the choline chloride derivative and 3,5-dinitrobenzoic acid obtained from the *Test solution;* and r_S is the peak response for the choline chloride derivative obtained from the *Standard solution:* not more than 0.3% of any individual impurity is found; and not more than 2.0% of total impurities is found.

BRIEFING

Chondroitin Sulfate Sodium Tablets, *USP 28* page 2069 and page 2071 of *PF* 30(6) [Nov.–Dec. 2004]; **Glucosamine and Chondroitin Sulfate Sodium Tablets,** *USP 28* page 2102 and page 2072 of *PF* 30(6) [Nov.–Dec. 2004]. The current label requires declaration of the species used to prepare the chondroitin sulfate sodium. The monograph allows preparation from bovine, avian, and porcine cartilages. A request to remove the species declaration, based on the lack of validated tests to determine the origin, was received at USP. After consideration of the request, the committee decided to retain the declaration of the sources in the labeling section of the monograph with minor clarifying language. The current official monograph for Chondroitin Sulfate Sodium Tablets directs that the label state the content of chondroitin sulfate sodium on the dried basis, but also allows the label to state the content on the hydrous basis. Because prominence could be given to either the dried weight or the hydrous weight, leading to consumer confusion, it is proposed to modify the labeling statement by requiring declaration of the dried content on the front panel of the labels. In the absence of any adverse comment, it is proposed to implement this revision via the *Third Interim Revision Announcement* pertaining to *USP 28–NF 23,* with an official date of June 1, 2005.

(DSB: G. Giancaspro) RTS—41084-1

Change to read:

Labeling—Label it to indicate the species of the source from which the chondroitin used to prepare the Tablets was derived. ~~The label states the content of chondroitin sulfate sodium on the dried basis; the corresponding content of chondroitin sulfate sodium on the hydrous basis may also be stated.~~

•Label it to state the source(s) of chondroitin sulfate sodium, whether bovine, porcine, avian, or a mixture of any of them. The label states on the front panel the content of chondroitin sulfate sodium on the dried basis.•3

USP Ubidecarenone for System Suitability RS.

Change to read:

Assay—

Mobile phase—Prepare a filtered and degassed mixture of methanol and dehydrated alcohol (13 : 7). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability preparation—Dissolve accurately weighed quantities of USP Ubidecarenone RS and ~~coenzyme Q_9~~ ▲USP Ubidecarenone Related Compound A RS▲*USP29* in dehydrated alcohol, heating at about 50° for 2 minutes if necessary, to obtain a solution having known concentrations of about 0.5 mg of each per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Ubidecarenone RS in dehydrated alcohol, heating at about 50° for 2 minutes if necessary, to obtain a solution having a known concentration of about 1.0 mg per mL.

Assay preparation—Transfer about 50 mg of Ubidecarenone, accurately weighed, to a 50-mL volumetric flask, dissolve in dehydrated alcohol, heating at about 50° for 2 minutes if necessary, cool, dilute with dehydrated alcohol to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 275-nm detector and a 5-mm × 15-cm column that contains packing L1, and is maintained at a temperature of 35°. The flow rate is adjusted to obtain a retention time of about 11 minutes. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.75 for ~~coenzyme Q_9~~ ▲ubidecarenone related compound A▲*USP29* and 1.0 for ubidecarenone; the resolution, *R,* between ~~coenzyme Q_9~~ ▲ubidecarenone related compound A▲*USP29* and ubidecarenone is not less than 4; and the relative standard deviation for replicate injections is not more than 0.8%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{59}H_{90}O_4$ in the portion of Ubidecarenone taken by the formula:

$$50C(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Ubidecarenone RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Ubidecarenone Capsules, *USP 28* page 2132. It is proposed to introduce a new USP Reference Standard, USP Ubidecarenone Related Compound A, for coenzyme Q_9.

Assay—[NOTE—Conduct this test promptly with minimum exposure to actinic light.]

Solvent—Prepare a mixture of *n*-hexane and dehydrated alcohol (5 : 2).

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, tetrahydrofuran, and water (55 : 40 : 5). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Ubidecarenone RS in *Solvent* to obtain a solution having a known concentration of 1.0 mg per mL. Dilute a portion of this solution with dehydrated alcohol to obtain a solution having a known concentration of about 40 µg per mL.

Resolution solution—Dissolve an accurately weighed quantity of ~~coenzyme Q_9~~ ▲USP Ubidecarenone Related Compound A RS▲*USP29* in *Solvent* to obtain a solution having a concentration of 1.0 mg per mL. Dilute a portion of this solution with dehydrated alcohol to obtain a solution having a concentration of about 40 µg per mL. Mix equal volumes of this solution and the *Standard preparation.*

Assay preparation 1 (for soft gelatin Capsules)—Using a suitable cutting instrument, open an accurately counted number of Capsules, equivalent to about 200 mg of ubidecarenone. Quantitatively transfer the shells and contents to a suitable container, add 100 mL of *Solvent,* and shake by mechanical means for 30 minutes. Using small portions of *Solvent,* quantitatively transfer this mixture to a 200-mL volumetric flask, dilute with *Solvent* to volume, and mix. Centrifuge a portion of this solution, transfer 1.0 mL of the supernatant to a 25-mL volumetric flask, add 2.5 mL of a 0.1% solution of anhydrous ferric chloride in alcohol, ▲dilute with alcohol to volume,▲*USP28* and mix.

Assay preparation 2 (for hard gelatin Capsules)—Empty and thoroughly mix the contents of not fewer than 20 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of ubidecarenone, to a 100-mL volumetric flask, add 60 mL of *Solvent,* and shake by mechanical means for 30 minutes. Dilute with *Solvent* to volume, and mix. Centrifuge a portion of this solution, transfer 1.0 mL of the supernatant to a 25-mL volumetric flask, add 2.5 mL of a 0.1% solution of anhydrous ferric chloride in alcohol, dilute with alcohol to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and an 8-mm × 10-cm column that contains packing L1. The flow rate is about 2.5 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between ubidecarenone and ~~coenzyme Q_9~~

In-Process Revision

▲ubidecarenone related compound A▲*USP29*
is not less than 2.5. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 15 µL) of the *Standard preparation* and *Assay preparation 1* or *Assay preparation 2* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of ubidecarenone ($C_{59}H_{90}O_4$) in each soft gelatin Capsule taken by the formula:

$$5000(C/N)(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Ubidecarenone RS in the *Standard preparation; N* is the number of Capsules taken to prepare *Assay preparation 1;* and r_U and r_S are the peak responses obtained from *Assay preparation 1* and the *Standard preparation,* respectively. Calculate the quantity, in mg, of ubidecarenone ($C_{59}H_{90}O_4$) in the portion of hard gelatin Capsules taken by the formula:

$$2500C(r_U / r_S),$$

in which r_U is the peak response obtained from *Assay preparation 2;* and the other terms are as defined herein.

▲**Packaging and storage**—Preserve in a tight container. No storage requirements specified.▲*NF24*

BRIEFING

Isomalt. Because there is no existing *NF* monograph for this article, the following new monograph, based on submitted data, is being proposed. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with the BioRad HPX-87 C brand of L19 column. The typical retention time for 1-*O*-α-D-Glucopyranosyl-D-mannitol (1,1-GPM) in the *Related compounds* test is about 12.3 minutes.

(EMC: D. Bempong; PSD: C. Okeke; NL: C. Barnstein) RTS—40631-1

In-Process Revision

Add the following:

▲Isomalt

$C_{12}H_{24}O_{11}$ 344.32

6-*O*-α–Glucopyranosyl-D-sorbitol.

6-*O*-α-D-Glucopyranosyl-D-glucitol.

$C_{12}H_{24}O_{11} \cdot 2H_2O$ 380.32

1-*O*-α-D-Glucopyranosyl-D-mannitol dihydrate [*64519-82-0*].

» Isomalt contains not less than 98.0 percent and not more than 102.0 percent of a mixture of 6-*O*-α-D-glucopyranosyl-D-sorbitol (1,6-GPS) and 1-*O*-α-D-glucopyranosyl-D-mannitol (1,1-GPM), and neither of the two components is less than 3.0 percent of the mixture, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers. No storage requirements specified.

Labeling—Label it to indicate the percentage content of 1,6-GPS and 1,1-GPM.

USP Reference standards ⟨11⟩—*USP Isomalt RS. USP Mannitol RS. USP Sorbitol RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture containing a fluorescent indicator having optimal intensity at 254 nm.

Test solution: 5000 µg per mL in water.

Application volume: 1 µL.

Developing solvent system: a mixture of ethyl acetate, pyridine, water, acetic acid, and propionic acid (50 : 50 : 10 : 5 : 5).

Procedure—Separately apply 1 µL each of the Standard solution and the *Test solution* to the thin-layer chromatographic plate, and thoroughly dry the starting points in warm air. Develop over 10 cm using the *Developing solvent system*, dry the plate in a current of hot air, and dip for 3 seconds in a 1 g per L solution of sodium periodate. Dip the plate for 3 seconds in a mixture of dehydrated alcohol, sulfuric acid, acetic acid, and anisaldehyde (90 : 5 : 1 : 1). Dry the plate in a current of hot air until colored spots become visible. The background color may be brightened by exposure to warm steam. Examine in daylight. The chromatogram obtained from the Standard solution shows two blue-grey spots with R_F values of about 0.13 (1,6-GPS) and 0.16 (1,1-GPM). The chromatogram obtained from the *Test solution* shows principal spots similar in position and color to the chromatogram obtained from the Standard solution.

B: The retention times of the two principal peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Conductivity—Dissolve 20 g in carbon dioxide-free water prepared from distilled water, and dilute with the same solvent to 100 mL. Using an appropriate conductivity meter that has been standardized with a potassium chloride conductivity calibration standard, measure the conductivity of the solution while gently stirring with a magnetic stirrer. The conductivity of the test solution is not more than 20 µS per cm.

Water, *Method I* ⟨921⟩**:** not more than 7% determined on 0.3 g. Use a mixture of anhydrous methanol and formamide (1 : 1) as solvent at 50 ± 5°.

Heavy metals, *Method I* ⟨231⟩**:** 10 µg per g.

Reducing sugars—Dissolve 3.3 g in 10 mL of Purified Water with the aid of gentle heat. Cool, and add 20 mL of cupric citrate TS and a few glass beads. Heat so that boiling begins after 4 minutes, and maintain boiling for 3 minutes. Cool rapidly, and add 40 mL of dilute acetic acid, 60 mL of water, and 20 mL of 0.025 M iodine VS. With continuous shaking, add 25 mL of a mixture of 6 mL of hydrochloric acid and 94 mL of water. When the precipitate has dissolved, titrate the excess iodine with 0.05 N sodium thiosulfate VS using 1 mL of starch TS, added towards the end of the titration as an indicator. Not less than 12.8 mL of 0.05 N sodium thiosulfate VS is required, corresponding to not more than 0.3% of reducing sugars, determined on the anhydrous basis, as glucose.

Limit of nickel—[NOTE—The purity of the reagents and the water used must be suitable for trace analysis, and the reagents and water must be free of nickel.]

Nickel standard solution—Transfer 1 mL of nickel standard solution TS into a 100-mL volumetric flask, add 1 mL of nitric acid, dilute with water to volume, and mix. This solution contains the equivalent of 0.1 µg of nickel per mL.

Test solution—Accurately weigh about 8 g of Isomalt into a 50-mL volumetric flask, add 8 mL of water and 3 mL of 65% nitric acid solution, and incubate at 95° for 1 hour. Allow the solution to cool to room temperature, add another 3 mL of 65% nitric acid solution, and incubate at 95° until all brown vapors have dissipated (about 1–1.5 hours). Allow the solution to cool to room temperature, carefully add 3 mL of 30 percent hydrogen peroxide, and keep the solution at 95° until the evolution of gas has ceased (about 1–2 hours). Allow the solution to cool to room temperature. Repeat the procedure two more times, i.e., adding 30 percent hydrogen peroxide, heating to 95°, and cooling to room temperature. Dilute the resulting solution with water to 50 mL.

Blank—Prepare as directed for the *Test solution,* except to omit the addition of Isomalt.

Standard solutions—Into seven identical 10-mL volumetric flasks, introduce respectively 0, 0.5, 1.0, 1.5, 2.0, 2.5, and 3.0 mL of *Nickel standard solution* equivalent to 0, 0.05, 0.1, 0.15, 0.2, 0.25, and 0.3 µg of nickel. To each flask, add a 2.0-mL portion of the *Test solution,* and dilute with water to volume.

Blank solutions—Prepare as directed for *Standard solutions* except to replace 2 mL of the *Test solution* with 2 mL of the *Blank*.

Procedure—Concomitantly determine the absorbances of the *Standard solutions* and the *Blank solutions* at the wavelength of maximum absorbance at 232.0 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with a graphite furnace and a nickel hollow-cathode lamp. Record the average of the steady readings for each of the *Standard solutions* and the *Blank solutions*. Plot the absorbances of the *Standard solutions* versus the quantity of nickel, in µg, in the portion of *Nickel standard solution* added to each *Standard solution* flask. Extrapolate the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the axes represents the amount of nickel (A_T), in µg, present in the portion of *Test solution* that was added to each of the *Standard solution* flasks. Similarly, plot the absorbance of the *Blank solutions* versus the quantity of nickel, in µg, in the portion of *Nickel standard solution* added to each of the *Blank solution* flasks, to determine the quantity of nickel (A_B) in the portion of

In-Process Revision

Blank added to each of the *Blank solution* flasks. Calculate the quantity, in µg, of nickel in the portion of Isomalt taken by the formula:

$$25(A_T - A_B).$$

Not more than 1 µg per g, calculated on the anhydrous basis, is found.

Related compounds—

Mobile phase—Prepare as directed in the *Assay.*

Resolution solution—Dissolve accurately weighed quantities of USP Isomalt RS, USP Mannitol RS, and USP Sorbitol RS, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having known concentrations of about 20 mg per mL, 0.1 mg per mL, and 0.1 mg per mL, respectively.

Standard solution—Dissolve an accurately weighed quantity of USP Sorbitol RS and USP Mannitol RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.1 mg of each per mL.

Test solution—Use the *Assay preparation.*

Chromatographic system—Prepare as directed in the *Assay.* Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the typical retention time of 1,1-GPM is about 12.3 minutes; the relative retention times are about 1.2 for 1,6-GPS, about 1.6 for mannitol, about 2.0 for sorbitol, and 1.0 for 1,1-GPM; and the resolution, *R,* between 1,1-GPM and 1,6-GPS is not less than 2.0.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of mannitol or sorbitol in the portion of Isomalt taken by the formula:

$$5000C/W(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Mannitol RS or USP Sorbitol RS in the *Standard solution;* and r_U and r_S are the individual peak responses of mannitol or sorbitol obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.5% of mannitol and not more than 0.5% of sorbitol is found. Calculate the percentage of any other impurity in the portion of Isomalt taken by the formula:

$$100(r_i/r_s),$$

in which r_i is the peak response for each impurity, and r_s is the sum of the responses of all the peaks obtained from the *Test solution:* not more than 0.5% of any individual impurity is found; and not more than 2.0% of total impurities, including mannitol and sorbitol, is found. Disregard any impurity peak that is less than 0.1%.

Assay—

Mobile phase—Use degassed water.

Standard preparation—Dissolve an accurately weighed quantity of USP Isomalt RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 20 mg per mL.

Assay preparation—Transfer about 1000 mg of Isomalt, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector maintained at a constant temperature, a 7.8-mm × 30-cm column that contains packing L19, and a 4.6-mm × 3-cm guard column that contains packing L19. The flow rate is about 0.5 mL per minute. The column temperature is maintained at 80 ± 1°. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.2 for 1,6-GPS and 1.0 for 1,1-GPM; the resolution, *R,* between 1,1-GPM and 1,6-GPS is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%, determined from the 1,6-GPS and 1,1-GPM peak responses.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the 1,6-GPS and 1,1-GPM peaks. Calculate the quantity, in mg, of 1,6-GPS in the portion of Isomalt taken by the formula:

$$50C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of 1,6-GPS in the *Standard preparation,* with calculation based on the declared 1,6-GPS content of USP Isomalt RS; and r_U and r_S are the 1,6-GPS peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. Similarly, calculate the quantity, in mg, of 1,1-GPM in the portion of Isomalt taken.▲*NF24*

BRIEFING

Lauroyl Macrogolglycerides, page 1212 of *PF* 28(4) [July–Aug. 2002]. It is proposed to adopt Lauroyl Polyoxylglycerides as the title of this proposed new monograph. A monograph for this excipient first appeared in *Pharmacopeial Previews* in *PF* 24(5) [Sept.–Oct. 1998] and under *In-Process Revision* in *PF* 28(4) [July–Aug. 2002] with the name Lauroyl Macrogolglycerides. The name Lauroyl Polyoxylglycerides is proposed by the Expert Committee on Nomenclature and Labeling to be the title of the monograph for this excipient, which is proposed for inclusion in *NF 24,* but with an official date of January 1, 2011, which is 60 months later than January 1, 2006, the official date of *NF 24.* The 60-month extension will provide the time deemed necessary for labeling changes to be made for the article and the numerous preparations in which it is an ingredient, and for practitioners, consumers, and regulatory agencies to become familiar with the terminology.

Use of the prefix "polyoxyl-" instead of "macrogol-" is consistent with the terminology used in the United States, particularly in the titles of other monographs on excipients. The "polyethylene glycol" and "polyoxyl-" designation for esters and ethers formed with polyethylene glycol and organic acid and alcohols or polyols replaces the "macrogol" designation that is used for polyethylene glycol in some locations outside the United States.

(EMC: C. Sheehan; NL: C. Barnstein) RTS—41993-1

Add the following:

▲Lauroyl ~~Macrogolglycerides~~ Polyoxylglycerides

(Title for this new monograph—to become official January 1, 2011)

(Prior to January 1, 2011, it is expected that the current practice of labeling the article of commerce with the name Lauroyl Macrogolglycerides will be continued.)

» Lauroyl ~~Macrogolglycerides~~ Polyoxylglycerides are mixtures of monoesters, diesters, and triesters of glycerol and monoesters and diesters of ~~macrogols~~ polyethylene glycols with a mean relative molecular weight between 300 and 1500. They are produced by partial alcoholysis of saturated oils, mainly containing triglycerides of lauric acid with ~~macrogol~~ polyethylene glycols, by esterification of glycerol and ~~macrogol~~ polyethylene glycols with fatty acids, or as a mixture

In-Process Revision

of glycerol esters and ethylene oxide condensate with the fatty acids of the hydrogenated oils. The average molecular weight is not less than 90.0 percent and not more than 110.0 percent of the labeled nominal value.

Packaging and storage—Preserve in tight containers, protected from light and moisture. Store at controlled room temperature.

Labeling—Label it to indicate the average nominal molecular weight of esters as part of the official title. The label also indicates the nominal saponification value.

USP Reference standards ⟨11⟩—*USP Lauroyl ~~Macrogolglycerides~~ Polyoxylglycerides RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: It meets the requirements for *Identification* test *B* under *Caprylocaproyl ~~Macrogolglycerides~~ Polyoxylglycerides*.

Acid value ⟨401⟩**:** not more than 2.0, determined on a 2.0-g specimen.

Hydroxyl value ⟨401⟩**:** between 36 and 85, determined on a 1.0-g specimen, accurately weighed.

Iodine value ⟨401⟩**:** not more than 2.0.

Peroxide value ⟨401⟩**:** not more than 6.0, determined on a 2.0-g specimen.

Saponification value ⟨401⟩**:** between 79 and 204, determined on a 2.0-g specimen.

Fatty acid composition ⟨401⟩**:** not more than 15.0% of caprylic acid is found; not more than 12.0% of capric acid is found; between 30% and 50% of lauric acid is found; between 5% and 25% of myristic acid is found; between 4% and 25% of palmitic acid is found; and between 5% and 35% of stearic acid is found.

Water, *Method I* ⟨921⟩**:** not more than 1.0%, determined on a 1.0-g specimen.

Total ash ⟨561⟩**:** not more than 0.1%, determined on a 1.0-g specimen.

Heavy metals, *Method II* ⟨231⟩**:** 0.001%.

Limit of free ethylene oxide and dioxane—Proceed as directed in the test for *Limit of free ethylene oxide and dioxane* under *Caprylocaproyl ~~Macrogolglycerides~~ Polyoxylglycerides:* not more than 1 µg of ethylene oxide per g is found; and not more than 10 µg of dioxane per g is found.

Limit of free glycerol—Proceed as directed in the test for *Limit of free glycerol* under *Caprylocaproyl ~~Macrogolglycerides~~ Polyoxylglycerides:* not more than 5.0% is found.▲*NF24*

BRIEFING

Methacrylic Acid Copolymer, *NF 23* page 3035. On the basis of comments received, it is proposed to revise the *Phosphate buffer* in the test for *Limit of monomers* to change the term ''fortieth-molar'' to ''0.025 M'' and to indicate the use of the anhydrous form of dibasic sodium phosphate to be consistent with the *Reagent Specifications* section of *USP 28–NF 23.*

(EMC: C. Sheehan) RTS—42046-1

Change to read:

Limit of monomers—
~~*pH 2.0 Phosphate buffer, fortieth molar*~~

▲*pH 2.0 Phosphate buffer, 0.025 M*▲*NF24*
—Prepare an aqueous solution containing 3.550 g of

▲anhydrous▲*NF24*
dibasic sodium phosphate (Na_2HPO_4) and 3.400 g of monobasic potassium phosphate (KH_2PO_4) per L. Adjust with phosphoric acid to a pH of 2.0.

Mobile phase—Prepare a solution in methanol to contain 700 mL of ~~*pH 2.0 Phosphate buffer, fortieth molar*~~

▲*pH 2.0 Phosphate buffer, 0.025 M*▲*NF24*
per L.

In-Process Revision

Standard solution—Prepare a solution in methanol to contain an accurately known concentration of about 2.4 µg per mL each of methacrylic acid and either methyl methacrylate (for Type A and Type B) or ethyl acrylate (for Type C). To 50.0 mL of this solution, add 25.0 mL of water, and mix.

Test solution—Dissolve about 40 mg of Methacrylic Acid Copolymer, accurately weighed, in 50.0 mL of methanol, add 25.0 mL of water, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 202-nm detector and a 4-mm × 12.5-cm column that contains 5-µm packing L1. The flow rate is about 2.5 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the resolution, *R,* of each pair of analytes is not less than 2.0; the capacity factors, k', for methacrylic acid, ethyl acrylate, and methyl methacrylate are 1.7, 4.3, and 4.8, respectively; and the relative standard deviation for replicate injections determined from each analyte is not more than 2%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg, of each monomer in the portion of Methacrylic Acid Copolymer taken by the formula:

$$75C(r_U / r_S),$$

in which C is the concentration, in µg per mL, of the monomer in the *Standard solution;* and r_U and r_S are the peak responses for the monomer obtained from the *Test solution* and the *Standard solution*, respectively. Not more than 0.05% of total monomers is found.

BRIEFING

Phenolsulfonphthalein, *USP* 28 page 3048 and page 988 of *PF* 30(3) [May–June 2004]. Comments were received that specific limits for the test for *Bacterial endotoxins* should not be included in the excipient monograph because the excipient could be used in multiple finished products with differing limits for bacterial endotoxins. On the basis of these comments, it is proposed to revise the requirements in the test for *Bacterial endotoxins*.

(EMC: E. Gonikberg; AMB: R. Tirumalai) RTS—42043-1

Add the following:

■**Packaging and storage**—Preserve in well-closed containers. ~~Store at 25°, excursions permitted between 15° and 30°.~~ No storage requirements specified.■1S *(NF23)*

Add the following:

▲**Labeling**—Where it is intended for use in articles administered parenterally, it is so labeled.▲*NF24*

Add the following:

▲**USP Reference standards** ⟨11⟩—*USP Endotoxin RS.*▲*NF24*

Add the following:

▲**Bacterial endotoxins** ⟨85⟩—Where it is intended for use in articles administered parenterally, the level of bacterial endotoxins is such that the requirement under the relevant dosage form monograph(s) in which Phenolsulfonphthalein is used can be met.▲*NF24*

BRIEFING

Phenoxyethanol, *NF* 23 page 3048 and page 208 of *PF* 30(1) [Jan.–Feb. 2004]. Because *Phenoxyethanol* could be used in articles administered parenterally, it is proposed to add the test for *Bacterial endotoxins* and an appropriate *Labeling* requirement. See also briefing under *Phenolsulfonphthalein*.

(EMC: E. Gonikberg; AMB: R. Tirumalai) RTS—42043-2

(EMC: K. Russo; PSD: C. Okeke) RTS—41917-5

Add the following:

▲**Packaging and storage**—Preserve in a well-closed container. No storage requirements specified.▲*NF24*

BRIEFING

Sunflower Oil, page 2803 of *PF* 27(4) [July–Aug. 2001]. Following the comments received for the preview published on page 1422 of *PF* 26(5) [Sept.–Oct. 2000], this revision is proposed. The gas chromatographic procedure that appeared in the preview article has been modified to improve the chromatography. The procedure modification is along the lines of general test chapter *Fats and Fixed Oils* ⟨401⟩. Interested parties are encouraged to try the procedure and submit comments to USP Headquarters for consideration. In addition, minor editorial style changes have been made.

(EMC: R. Ravichandran; PSD: C. Okeke) RTS—41367-1

Add the following:

▲Sunflower Oil

» Sunflower Oil is a refined fixed oil obtained from the seeds of the sunflower plant *Helianthus annuus* Linné (Fam. Asteraceae alt. Compositae).

Packaging and storage—Preserve in tight, light-resistant containers. ~~, and avoid exposure to excessive heat.~~ No storage requirement specified.

Labeling—The label states the Latin binomial and, following the official name, the part of the plant source from which the article was derived. The label also indicates the name and concentration of any additive.

Specific gravity ⟨841⟩**:** between 0.914 and 0.924 at 20°.

Free fatty acids ⟨401⟩**:** not more than 2.5 mL of 0.020 N sodium hydroxide is required for neutralization.

Iodine value, *Method II* ⟨401⟩**:** between 128 and 148 for generic Oil, between 98 and 118 for mid-oleic Oil, and between 78 and 98 for high-oleic Oil.

Saponification value ⟨401⟩**:** between 180 and 200.

Unsaponifiable matter ⟨401⟩**:** not more than 1.0%.

Fatty acid composition—

~~*0.1 N Methanolic potassium hydroxide solution*—Dissolve 34 g of potassium hydroxide in a sufficient volume of methanol to obtain a final volume of 500 mL, allow to stand for 24 hours in a tightly stoppered bottle, and decant the clear supernatant.~~

Standard solution—Prepare an ester mixture containing methyl palmitate, methyl stearate, methyl oleate, methyl linoleate, and methyl linolenate (7 : 5 : 35 : 50 : 3). [NOTE—Ester mixtures are available commercially from Nu-Chek-Prep, Inc., P.O. Box 295, Elysian, MN 56028. Typical Nu-Chek-Prep ester mixtures useful in this test include Nu-Chek 15A.This mixture may contain other components.]

Test solution—~~Place about 1 g of Oil in a small conical flask fitted with a reflux condenser. Add 10 mL of methanol and 0.5 mL of *0.1 N Methanolic potassium hydroxide solution*. Reflux the mixture for 10 minutes, cool, transfer to a separator with the aid of 15 mL of *n* heptane, add 10 mL of saturated sodium chloride solution, shake, and allow to separate. Transfer the lower layer to another separator, add 10 mL of *n* heptane, and shake. Wash the combined organic layers with 10 mL of water, dry over anhydrous sodium sulfate, and filter.~~ Transfer about 100 mg of the test specimen to a 50-mL conical flask fitted with a suitable water-cooled reflux condenser and a magnetic stir bar. Add 4 mL of 0.5 N methanolic sodium hydroxide solution, and reflux until fat globules disappear (usually 5 to 10 minutes). Add 5 mL of a solution prepared by dissolving 14 g of boron trifluoride in methanol to make 100 mL, swirl to mix, and reflux for 2 minutes. Add 4 mL of chromatographic *n*-heptane through the condenser, and reflux for 1 minute. Cool, remove the condenser, add about 15 mL of saturated sodium chloride solution, shake, and allow the layers to separate. Pass the *n*-heptane layer through 0.1 g of anhydrous sodium sulfate (previously washed with chromatographic *n*-heptane) into a suitable flask. Transfer 1.0 mL of this solution to a 10-mL volumetric flask, dilute with chromatographic *n*-heptane to volume, and mix.

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—~~The gas chromatograph is equipped with a flame-ionization detector and a 0.25-mm × 30-m capillary column bonded with a 0.25-µm layer of phase G5. The carrier gas is hydrogen, flowing at a rate of 1 mL per minute. The injection port and detector temperatures are maintained at 250°, and the column temperature is maintained at 175°.~~ The gas chromatograph is equipped with a flame-ionization detector maintained at a temperature of about 250°, a splitless injection system, and a 0.25-mm × 30-m fused-silica capillary column bonded with a 0.25-µm layer of phase G5. The column temperature is maintained at 120° for about 2 minutes after injection, and the temperature is then increased at the rate of 4° per minute to 240° and maintained at 240° for 5 minutes. The injection port temperature is maintained at about 220°. The carrier gas is hydrogen, with a flow rate of about 1 mL per minute. Chromatograph 1 µL of the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.87 for methyl palmitate, 0.99 for methyl stearate, and 1.0 for methyl oleate; the resolution, *R,* between methyl stearate and methyl oleate is not less than 1.5; and the relative standard deviation of the peak area responses for the palmitate and stearate peaks for replicate injections is not more than 6.0%. The relative standard deviation of the peak area response ratio of the palmitate to stearate peaks from these replicate injections is not more than 1.0%.

Procedure—Inject a volume (about 1 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the areas of the five major peaks for the methyl esters of the fatty acids, which elute in the following order: palmitate, stearate, oleate, linoleate, and linolenate. Calculate the relative ~~areas for these peaks~~ amounts of palmitate, stearate, oleate, linoleate, and linolenate, expressed as percentages of the total area of the five major peaks: for generic Oil, between 3% and 10% of methyl palmitate is found, between 2% and 8% of methyl stearate is found, between 14% and 24% of methyl oleate is found, between 63% and 73% of methyl linoleate is found, and between 0% and 3% of methyl linolenate is found; for mid-oleic Oil, between 2% and 9% of methyl palmitate is found, between 2% and 8% of methyl stearate is found, between 40% and 70% of methyl oleate is found, between 15% and 40% of methyl linoleate is found, and between 0% and 3% of methyl linolenate is found; and for high-oleic Oil, between 2% and 9% of methyl palmitate is found, between 2% and 8% of methyl stearate is found, between 70% and 90% of methyl oleate is found, between 5% and 15% of methyl linoleate is found, and between 0% and 3% of methyl linolenate is found.

Refractive index ⟨831⟩**:** between 1.472 and 1.474 at 20°.

Heavy metals, *Method II* ⟨231⟩**:** 0.001%.

In-Process Revision

Limit of peroxide—[NOTE—This test must be performed promptly after sampling to avoid oxidation of the test specimen.]

Solvent—Mix 60 mL of glacial acetic acid and 40 mL of chloroform.

Potassium iodide solution—Prepare a saturated solution of potassium iodide in freshly boiled and cooled water, and store it protected from light. [NOTE—Discard the solution if it becomes colored upon addition of *Solvent* and iodine-free starch TS.]

Procedure—Transfer about 10 g of Oil, accurately weighed, to a conical flask, add 30 mL of *Solvent*, and swirl to dissolve. Add 0.5 mL of *Potassium iodide solution*, swirl for 1.0 minute, add 30 mL of water, and titrate with 0.01 N sodium thiosulfate VS, with vigorous agitation, to a light yellow color. Add 2.0 mL of iodine-free starch TS, and continue the titration until the blue color has disappeared. Perform a blank determination, and make any necessary correction. Calculate the amount of peroxide, in mEq per kg, in the portion of Oil taken by the formula:

$$1000VN/W,$$

in which V is the volume, in mL, of sodium thiosulfate used in the titration; N is the actual normality of sodium thiosulfate VS; and W is the weight, in g, of Oil taken: not more than 10.0 mEq per kg is found.▲*NF24*

BRIEFING

Medium-Chain Triglycerides, *USP 28* page 3101. The proposed change in the Definition clarifies the source of the saturated fatty acids.

(EMC: E. Gonikberg) RTS—39838-1

Change to read:

» Medium-Chain Triglycerides ~~are obtained from the oil extracted from the hard, dried fraction of the endosperm of *Cocos nucifera* L. or from the dried endosperm of *Elaeis guineensis* Jacq. They consist of a mixture of triglycerides of saturated fatty acids, mainly of caprylic acid ($C_8H_{16}O_2$) and of capric acid ($C_{10}H_{20}O_2$).~~

▲consist of a mixture of triglycerides of saturated fatty acids, mainly of caprylic acid ($C_8H_{16}O_2$) and capric acid ($C_{10}H_{20}O_2$). The fatty acids are derived from the oil extracted from the hard, dried fraction of the endosperm of *Cocos nucifera* L. or from the dried endosperm of *Elaeis guineensis* Jacq.▲*NF24* They contain not less than 95 percent of saturated fatty acids with 8 and 10 carbon atoms.

In-Process Revision

GENERAL CHAPTERS

General Information

BRIEFING

⟨**1075**⟩ **Good Compounding Practices,** *USP 28* page 2620. It is proposed to revise this general chapter to improve its readability and to provide definitions for terms used in several sections. The word "levels" has been replaced with "categories," and the previous levels 1–3 have been combined to form category 1. There are now 7 categories, as follows.

1. Nonsterile—Simple
2. Nonsterile—Complex
3. Sterile—Risk Level 1 and Ophthalmics, Nasal, Oral Inhalation, etc.
4. Sterile—Risk Level 2
5. Sterile—Risk Level 3
6. Radiopharmaceuticals
7. Veterinary

On the basis of comments received, the Committee has voted to delete the section *Compounding Pharmacy Generated Products* and to redefine a compounder as "a professional authorized by the state to perform compounding."

In addition, other revisions were proposed to clarify the intent of the chapter.

(CRX: C. Okeke) RTS—37469-19

⟨1075⟩ GOOD COMPOUNDING PRACTICES

Change to read:

The purpose of this chapter is to provide compounders with guidance on applying good compounding practices for the preparation of compounded formulations for dispensing and/or administration to humans or animals.

▲This chapter is intended to provide information as a supplement to other relevant chapters. The following discussion is applicable to those engaged in compounding preparations in all pharmacies.▲*USP29*

It is expected that pharmacists or compounders engaged in the compounding of drugs will compound in conformance with applicable state and federal compounding laws, regulations, or guidelines.

Change to read:

APPLICABLE DEFINITIONS

Compounding (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩)—Compounding involves the preparation, mixing, assembling, packaging, and labeling of a drug or device in accordance with a licensed practitioner's prescription

▲of medication order▲*USP29*
under an initiative based on the practitioner/patient/pharmacist/compounder relationship in the course of professional practice. Compounding includes the following:

a. Preparation of drugs or devices in anticipation of prescription drug orders based on routine, regularly observed prescribing patterns.
b. Reconstitution

▲or manipulation▲*USP29*
of commercial products that may require the addition of ~~two~~

▲one▲*USP29*
or more ingredients as a result of a licensed practitioner's prescription drug order.

~~c. Manipulation of commercial products that may require the addition of one or more ingredients as a result of a licensed practitioner's prescription drug order.~~
~~d. Preparation of drugs or devices for the purposes of, or as an incident to, research, teaching, or chemical analysis.~~

▲e. Preparation of drugs or devices for the purposes of, or as an incident to, research, teaching, or chemical analysis.▲*USP29*

~~**Levels of Compounding**~~

~~Level 1~~	~~Nonsterile (topical)~~ ~~Mixing of one or two creams~~ ~~Mixing of creams with alcohol, water, etc. (as per manufacturer's labeling instruction)~~
~~Level 2~~	~~Nonsterile (topical)~~ ~~Preparation of nonsterile topical ointment, cream Preparations with no dosage limitation~~
~~Level 3~~	~~Nonsterile (reconstituting or flavoring)~~ ~~Reconstitution according to manufacturer's labeling instruction Addition of flavoring~~
~~Level 4~~	~~Sterile (simple injections, e.g., reconstituted for immediate administration) Preparation of injections for immediate administration~~
~~Level 5~~	~~Nonsterile (dosage forms)~~ ~~Preparation of solid oral dosage forms (tablets, capsules)~~ ~~Preparation of liquid oral dosage forms (emulsion, solutions, suspensions, etc.)~~ ~~Preparation of suppositories, lozenges~~
~~Level 6~~	~~Sterile (ophthalmics/otics) Preparation of ophthalmic and otic suspensions, solutions~~

In-Process Revision

~~Level 7~~	~~Sterile (complex injections) Preparation of injections for many patients Preparation of injection not for immediate administration Preparation of total parenteral nutritions (TPNs) Preparation of multicomponent injection~~
~~Level 8~~	~~Other sterile injections and patches Preparation of chemotherapeutic injections or implants Preparation of transdermal medications~~
~~Level 9~~	~~Sterile (radiopharmaceuticals) Preparation of radiopharmaceuticals~~

▲**Categories of Compounding—**The categories of compounding are intended to provide an understanding among compounders when different forms of preparations are compounded. It is to be understood that there are levels of training associated with each category. In the categories of compounding described below, certain criteria were used to determine the overall classification.

Category 1	Nonsterile—Simple Generally, the mixing of two or more commercial products
Category 2	Nonsterile—Complex Generally, compounding with the bulk drug substances or when calculations are required.
Category 3	Sterile—Risk Level 1 (See *Low-Risk Level* in USP general chapter ⟨797⟩)
Category 4	Sterile—Risk Level II (See *Medium-Risk Level* in USP general chapter ⟨797⟩)
Category 5	Sterile—Risk Level III (See *High-Risk Level* in USP general chapter ⟨797⟩)
Category 6	Radiopharmaceuticals Preparation of radiopharmaceuticals
Category 7	Veterinary Preparation of veterinary pharmaceuticals▲*USP29*

Manufacturing—Manufacturing involves the production, propagation, conversion, or processing of a drug or device, either directly or indirectly, by extraction of the drug from substances of natural origin or by means of chemical or biological synthesis. Manufacturing also includes (1) any packaging or repackaging of the substance(s) or labeling or relabeling of containers for the promotion and marketing of such drugs or devices; (2) any preparation of a drug or device that is given or sold for resale by pharmacies, practitioners, or other persons; (3) the distribution of inordinate amounts of compounded preparations or the copying of commercially available drug products; and (4) the preparation of any quantity of a drug product without a licensed prescriber/patient/licensed pharmacist/compounder relationship.

Component—A component is any ingredient used in the compounding of a drug product, including any that are used in its preparation, but may not appear on the labeling of such a product. (See *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩ for additional definitions.)

~~**Pharmacy Generated Product (PGP)—**A pharmacy generated product (PGP) is a product that is prepared, packaged, and labeled in a pharmacy and can be sold by the pharmacy without a prescription. PGPs are clearly different from drugs defined in section 201 (g) of the Federal Food, Drug, and Cosmetic Act.~~

▲▲*USP29*

Compounder—A compounder is a ~~pharmacist or a physician who is engaged in the act of compounding~~

▲professional authorized by the state to perform compounding▲*USP29*
pursuant to a precription order by a licensed prescriber.

Change to read:

RESPONSIBILITIES OF THE COMPOUNDER

a. Compounders who are engaged in drug compounding or nutriceutical compounding shall be proficient in compounding and should continually expand their compounding knowledge by participating in seminars and/or studying appropriate literature.

b. A compounder ~~shall~~

▲must▲*USP29*
be familiar with all of the details of *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩, *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩,

▲*Pharmaceutical Calculations in Prescription Compounding* ⟨1160⟩,▲*USP29*

In-Process Revision

and other applicable state or federal compounding guidelines or laws. In addition, the compounder ~~shall~~

▲must▲*USP29*
be responsible for the following:

- certifying all prescription orders;
- approving or rejecting all components, drug product containers, closures, in-process materials, and labeling;
- preparing and reviewing all compounding records to assure that errors have not occurred in the compounding process;
- assuring the proper maintenance, cleanliness, and use of all equipment used in a prescription compounding practice;
- assuring that only ~~personnel authorized by the compounding supervisor shall~~

  ▲authorized personnel shall ▲*USP29*
  be in the immediate vicinity of the drug compounding operations;
- assuring that the drug product and components of drug products are not on the list of federally recognized drug products that have been withdrawn or removed from the market for public health reasons.

c. The compounder ~~shall~~

▲must▲*USP29*
ensure that personnel engaged in compounding wear clean clothing appropriate to the type of compounding performed, e.g., coats, gowns, gloves, masks, shoes, aprons, or other items as needed for protection of personnel from chemical exposures and for prevention of drug contamination.

d. The compounder ~~shall~~

▲must▲*USP29*
implement procedures to prevent cross-contamination when compounding with drugs (e.g., penicillins) that require special precaution to prevent cross-contamination.

Change to read:

TRAINING

All personnel involved in the compounding, evaluation, packaging, and dispensing of compounded preparations shall be properly trained for the type of compounding conducted. All training activities will be covered by appropriate standard operating procedures (SOPs) and documentation.

All compounders and all personnel involved in compounding must be well trained and must participate in current, relevant training programs. It is the responsibility of the ~~pharmacist~~

▲compounder▲*USP29*
to ensure that a training program has been implemented and that it is ongoing. Standards of ~~pharmacy~~

▲▲*USP29*
practice require that all employees be adequately trained in their job functions and that all of the training is properly documented. Steps in the training procedure will include the following:

a. All employees involved in pharmaceutical compounding shall read and become familiar with *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩, *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩, and *Pharmaceutical Calculations in Prescription Compounding* ⟨1160⟩.
b. All employees shall read and become familiar with each of the procedures related to compounding, including those involving the facility, equipment, personnel, actual compounding, evaluation, packaging, storage, and dispensing.
c. The compounder shall meet with employees to review their work and answer any questions the employees may have concerning SOPs.
d. The compounder shall demonstrate the procedures for the employee, and will observe and guide the employee throughout the ~~procedure.~~

   ▲training process.▲*USP29*
   The employee will then repeat the procedure without any assistance from, but under the

   ▲direct▲*USP29*
   supervision of, the ~~pharmacist~~

   ▲compounder.▲*USP29*
e. When the employee has demonstrated to the compounder a verbal and functional knowledge of the procedure, then and only then, will the employee be permitted to perform the procedure without

   ▲direct▲*USP29*
   supervision.

   ▲However, the compounder should be physically present and should check off the final preparation.▲*USP29*
f. When the compounder is satisfied with the employee's knowledge and proficiency, the compounder will sign off on the documentation records to show that ~~both the employee and the compounder agree.~~

   ▲the employee was appropriately trained.▲*USP29*
g. The compounder shall continually monitor the work of the employee and

   ▲assure that the employee's calculations and work are accurate and adequately performed. The compounder is completely responsible for the finished preparation.

   The compounder will▲*USP29*
   answer any questions the employee may have concerning the SOPs.

Change to read:

PROCEDURES AND DOCUMENTATION

All significant procedures performed in the compounding area will be covered by SOPs and will be documented.

Procedures should be developed for the facility, equipment, personnel, preparation, packaging, and storage of compounded preparations to ensure accountability, accuracy, quality, safety (including access to Material Safety Data Sheets) and uniformity in ~~a compounding practice. More importantly,~~

▲compounding.▲*USP29*

Implementing SOPs establishes procedural consistency and also provides a reference for orientation and training of personnel.

Documentation enables a ~~pharmacy~~

▲compounder,▲*USP29*
whenever necessary, to systematically trace, evaluate, and replicate the steps included throughout the preparation process of a compounded ~~product.~~

▲preparation.▲*USP29*

Change to read:

DRUG COMPOUNDING FACILITIES

a. Compounding facilities shall have an adequate space that is specifically designated for compounding of prescriptions. This area may include a space for the storage of equipment and materials.
b. Sterile compounded preparations shall be compounded in accordance with the provisions in *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩, and aseptic processes shall be conducted in an area separate and distinct from the area used for the compounding of nonsterile products.
c. The areas used for compounding shall be maintained in clean, orderly, and sanitary conditions.
d. The areas for drug compounding shall be maintained in a good state of repair. The plumbing system shall be free of defects that could contribute to contamination of any compounded product. Adequate washing facilities shall be easily accessible to the compounding areas. Such facilities shall include, but not be limited to, hot and cold water, soap or detergent, and an air-drier or single-use towels.
e. Potable water shall be supplied under continuous positive pressure.
f. The area for compounding shall have adequate lighting and ventilation.
g. The area for compounding shall be free of infestation by insects, rodents, and other vermin. Trash shall be held and disposed of in a sanitary and timely manner.
h. Sewage and other refuse in the area of compounding shall be disposed of in a safe and sanitary manner.
i. Bulk drugs and other chemicals or materials used in the compounding of drugs must be stored as directed by the manufacturer, or according to USP monograph requirements, in a clean, dry area, ~~(defined temperature condition), or in a refrigerator or freezer as specified.~~

▲under appropriate temperature conditions (controlled room temperature, refrigerator, or freezer).▲*USP29*
The bulk chemicals shall be stored in a manner such that they are protected from contamination. All containers shall be properly labeled.
j. If parenteral products are compounded, the compounder shall refer to *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩, and *Injections* ⟨1⟩ for compounding technique applications.

Change to read:

DRUG COMPOUNDING EQUIPMENT

(See also *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩.)

a. The equipment or utensils used for compounding of a drug ~~product~~

▲preparation▲*USP29*
shall be of appropriate design and capacity. The equipment ~~shall~~

▲should▲*USP29*
be stored in such a manner as to protect it from contamination, and shall be located in such a place as to facilitate operations for its use, maintenance, and cleaning.
b. ~~The equipment shall be cleaned and sanitized prior to use to prevent contamination that may affect the safety or quality of compounded preparations.~~

▲
▲*USP29*
c. The equipment ~~shall~~

▲should▲*USP29*
be of suitable composition such that the surfaces that contact components are neither reactive, additive, nor absorptive and therefore will not affect or alter the purity of the compounded preparations.
d. Automated, mechanical, electronic, and other types of equipment used in compounding ~~shall~~

▲or testing of compounded preparations should▲*USP29*
be routinely inspected, calibrated as necessary, and checked to ensure proper performance.
e. Immediately prior to initiation of compounding operations, the equipment shall be inspected by the compounder to determine its suitability for use.
f. ~~The equipment shall be cleaned appropriately using special instructions when cross-contaminating products or products requiring special precaution.~~

▲After use, the equipment should be appropriately cleaned. Extra care should be used when cleaning equipment used in compounding preparations requiring special precaution.▲*USP29*
e.g., antibiotics, cytotoxins, cancer drugs, and other hazardous materials. ~~, are used with the equipment~~

▲
▲*USP29*
If possible, special equipment may be dedicated for such use or if the same equipment is being used for all drug products, appropriate procedures must be in place to allow meticulous cleaning of equipment prior to use with other drugs.

In-Process Revision

Change to read:

COMPONENT SELECTION REQUIREMENTS

a. The compounder ~~shall~~

▲must▲*USP29*
first attempt to use *USP–NF* drug substances manufactured in an FDA-registered facility.

b. The compounder shall also first attempt to use inactive components manufactured in an FDA-registered facility.
c. If components are not obtainable from an FDA-registered facility or if the FDA and/or the providing company cannot document FDA registration, compounders shall use their professional judgment in first receiving, storing, or using the components that meet official compendial requirements or are provided by another high quality source.
d. If components of compendial quality are not obtainable, components of high quality such as those that are chemically pure, analytical reagent grade, American Chemical Society-certified, or Food Chemical Codex grade may be used.
e. When a component is not obtained from an official compendial source or is not obtainable from the sources mentioned above, the component may be obtained from a source deemed acceptable and reliable in the professional judgment of the compounder.
f. When a component is derived from ruminant animals (e.g., bovine, caprine, ovine) the supplier shall provide written assurance that these animals were born, raised, ~~or~~

▲and▲*USP29*
slaughtered in countries where bovine spongiform encephalopathy (BSE) and scrapie are known not to exist.

g. The compounder shall not use components that are listed by FDA to be withdrawn from the market for public health reasons.
h. Components shall be stored off the floor, handled and stored to prevent contamination, and rotated so that the oldest stock is used first.

Change to read:

PACKAGING AND DRUG ~~PRODUCT~~

▲PREPARATION▲*USP29* CONTAINERS

a. The compounder shall ensure that the containers and container closures used in packaging the compounded preparations meet the requirements under *Containers* ⟨661⟩ and *Containers—Permeation* ⟨671⟩. The compounder shall obtain written records from the supplier to show that the containers meet USP requirements.
b. Containers and container closures intended for compounding of sterile preparations and nonsterile preparations must be handled, sterilized (if appropriate), and stored as described in *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩ and *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩. The use of commercially available presterilized containers ~~may be considered.~~

▲is encouraged for sterile preparations.▲*USP29*

c. The containers and closures shall be stored off the floor, handled and stored to prevent contamination, and rotated so that the oldest ~~approved~~

▲▲*USP29*
stock is used first.

d. The containers and container closures shall be stored in such a way as to permit inspection and cleaning of the work area.
e. The containers and container closures shall be made of clean materials that are neither reactive, additive, nor absorptive.
f. The containers and closures shall be of suitable material so as not to alter the quality, strength, or purity of the compounded drug.
g. The compounder shall ensure that the containers and container closures selected to dispense the finished compounded prescription, whether sterile or nonsterile or radiopharmaceutical, meet the criteria in sections (a)–(f) above.

Change to read:

COMPOUNDING CONTROLS

a. The compounder ~~shall~~

▲should▲*USP29*
ensure that there are written procedures for the compounding of drug products to assure that the finished products have the identity, strength, quality, and purity that they purport to have.

▲These procedures should be available in either written form or electronically stored with printable documentation.▲*USP29*

b. The compounder shall establish procedures ~~for listing components, their amounts (weight or volume), the order of component mixing, and a description of the compounding process~~

▲that include a description of (1) components, their amounts, the order of component additives, and the compounding process; (2) the required equipment and utensils; and (3) the drug product container and closure system.▲*USP29*

~~c. The compounder shall list all equipment, utensils, and container closure systems relevant to the sterility, stability, and intended use of a drug.~~

▲▲*USP29*

d. The written procedures described above shall be followed in execution of the compounding process.
e. The compounder shall accurately weigh, measure, and subdivide as appropriate.
f. The compounder shall check and recheck each procedure at each stage of the process to ensure that each weight or measure is correct as stated in the written compounding procedures.
g. If a component is transferred from the original container to another container (e.g., a powder is taken from the original container, weighed, placed in a container, and stored in that other container), the new container shall be identified with

In-Process Revision

the component name, weight or measure, the lot or control number, the expiration or beyond-use date, and the transfer date.

~~h. The compounder shall have drug compounding procedures available in either written form or electronically stored with printable documentation.~~

~~i. The procedures shall include a description of (1) the components, their amounts, the order of component additives, and the compounding process; (2) the required equipment and utensils; and (3) the drug product container and closure system.~~

▲▲*USP29*

j. The compounder ~~shall~~

▲should▲*USP29*
have established written procedures that will describe the tests or examinations to be conducted on the ~~product~~

▲preparation▲*USP29*
compounded (e.g., the degree of weight variation among capsules) to assure uniformity and integrity of compounded drug ~~products.~~

▲preparations.▲*USP29*

k. Appropriate control procedures ~~shall~~

▲should▲*USP29*
be established to monitor the output and to validate the performance of those compounding processes that may be responsible for causing variability in the final compounded preparations. Factors that may cause variability include (1) capsule weight variation; (2) adequacy of mixing to assure uniformity and homogeneity; and (3) clarity, completeness, or pH of solutions.

l. Appropriate written procedures ~~shall~~

▲should▲*USP29*
be designed to prevent microbiological contamination of compounded drug ~~products~~

▲preparations▲*USP29*
purporting to be sterile, and these procedures shall be followed. Such procedures shall include validation of sterilization processes (see *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩).

m. The compounder ~~shall~~

▲should▲*USP29*
establish appropriate beyond-use dates determined either from available *USP–NF* monographs, appropriate testing, or from peer-reviewed literature.

n. The compounder ~~shall~~

▲should▲*USP29*
adopt appropriate storage requirements as provided in *Preservation*, *Packaging*, *Storage*, *and Labeling* under *General Notices and Requirements*.

Change to read:

LABELING

1. The compounder's ~~prescription label shall contain the following:~~

▲preparation label should contain information required by state and federal law and accepted standards of practice.▲*USP29*

~~a Patient's name~~
~~b Prescriber's name~~
~~c Name and address of compounder~~
~~d Prescription number~~
~~e Established name or distinct common name (cannot use trademarked name of a manufactured product)~~
~~f Strength~~
~~g Statement of quantity~~
~~h Directions for use~~
~~i Date filled~~
~~j Beyond-use date/storage, etc.~~
~~k An appropriate designation that this is a compounded prescription~~
~~l. Any other federal or state requirements [NOTE—The compounder shall not use an NDC number assigned to another product.]~~

▲[NOTES—(a) The compounder shall use the established name or distinct common name (cannot use the trademarked name of a manufactured product). (b) The compounder cannot indicate that the compounded product is therapeutically equivalent to a manufactured product. (c) The label should state that this is a compounded preparation. (d) The compounder shall not use an NDC number assigned to another product.]▲*USP29*

2. The compounder shall label any excess compounded products so as to reference them to the formula used, the assigned control number, and beyond-use date based on the compounder's appropriate testing, published data, or *USP–NF* standards.

3. ~~Products prepared~~

▲Preparations compounded▲*USP29*
in anticipation of a prescription prior to receiving a valid prescription should not be prepared in an inordinate amount. A regularly used amount should be prepared on the basis of a history of prescriptions filled by the pharmacy. These ~~products shall~~

▲preparations should▲*USP29*
be labeled or documentation referenced with the following:

a. A complete list of ingredients or preparation name and reference or established name or distinct common name
b. Dosage form
c. Strength
d. Preparation date

In-Process Revision

e. Name and address of compounder
f. Inactive ingredients
g. Batch or lot number
h. Assigned beyond-use date, based on published data, or appropriate testing, or *USP–NF* standards.

Storage conditions for these ~~products shall~~

▲preparations should▲*USP29*
be dictated by their composition and sterility, e.g., stored in a clean, dry place ~~(defined temperature condition), in a refrigerator, or at controlled room temperature.~~

▲under appropriate temperature conditions (controlled room temperature, refrigerator, or freezer.)▲*USP29*

4. The compounder ~~shall~~

▲should▲*USP29*
examine the ~~product~~

▲preparation▲*USP29*
for correct labeling after completion of the compounding process.

Change to read:

RECORDS AND REPORTS

a. The compounder shall maintain records, including but not limited to, the hard copy of the prescription to indicate that the prescription is compounded,

▲and to provide formulation records and compounding records.▲*USP29*
b. The compounder shall keep adequate records of controlled drug substances (scheduled drugs) used in compounding.
c. All records of all compounded ~~products~~

▲preparations▲*USP29*
shall be kept for a period of time as set forth in the

▲federal and▲*USP29*
state laws or regulations. Such records shall be readily available for authorized inspection.

▲d. The compounding records shall include the manufacturer and lot number of all ingredients.▲*USP29*

Change to read:

COMPOUNDING FOR A PRESCRIBER'S OFFICE USE

a. Compounders may prepare compounded drug ~~products~~

▲preparations▲*USP29*
for a prescriber's office use ~~pursuant to federal and state requirements.~~

▲only where permitted by federal and state requirements.▲*USP29*
b. An order by the prescriber indicating the formula and quantity ordered may be filled in the compounder's facility.
c. ~~The~~

▲Where compounding for office use is permitted, the▲*USP29*
compounder shall compound the ~~product for the~~

▲preparation for the sole▲*USP29*
purpose of administration by or for the prescriber.
d. A record of the compounding process shall be maintained.
e. A label ~~may~~

▲must▲*USP29*
be generated and a number may be assigned.

Change to read:

COMPOUNDING VETERINARIAN PRODUCTS

a. Compounders shall compound prescriptions for animals on the basis of prescription orders.
b. These prescriptions shall be handled and filled ~~as are human prescriptions.~~

▲according to the guideline available for compounding of veterinarian products.▲*USP29*

Delete the following:

▲~~COMPOUNDING PHARMACY GENERATED PRODUCTS~~

~~a Compounders may prepare compounded drug products that can be sold without a prescription.~~
~~b Pharmacy-generated products (PGP) shall be compounded using the same procedures as those for prescription drug products detailed in this chapter.~~
~~c Additional labeling sufficient for patient use will be required to meet the individual State Board of Pharmacy and federal requirements. [NOTE—PGPs are clearly different from drugs defined in section 201 (g) of the Federal Food, Drug, and Cosmetic Act.]~~▲*USP29*

REAGENTS, INDICATORS, AND SOLUTIONS

Reagent Specifications

BRIEFING

Methyl Red. It is proposed to add this new reagent.

(HDQ: M. Marques) RTS—41930-1

Add the following:

▲**Methyl Red** *(2-[4-dimethylaminophenylazo]benzoic acid, C. I. Acid Red 2)* $C_{15}H_{15}N_3O_2$—**269.30**—Use ACS reagent grade.▲*USP29*

BRIEFING

1-Vinyl-2-pyrrolidone, *USP 28* page 2850. It is proposed to modify the name of this reagent to be in accordance with the name in the appropriate monograph. Also, synonyms and the CAS number are being added to facilitate the procurement of this reagent.

(HDQ: M. Marques) RTS—41930-2

Change to read:

~~**1-Vinyl-2-pyrrolidone**~~

▲**Vinylpyrrolidinone** (*1-Vinyl-2-pyrrolidinone, 1-vinyl-2-pyrrolidone, N-vinylpyrrolidinone, N-vinylpyrrolidone*),▲*USP29*
C_6H_9NO—**111.14**

▲[*88-12-0*]▲*USP29*
—Colorless liquid.

Assay—Inject an appropriate volume into a gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a flame-ionization detector, helium being used as the carrier gas. The following conditions have been found suitable: a 0.25-mm × 30-m capillary column coated with a 1-µm layer of G2; the injection port temperature is maintained at 250°; the detector temperature is maintained at 300°; and the column temperature is maintained at 100° and programmed to rise 10° per minute to 250°. The area of the C_6H_9NO peak is not less than 99.0% of the total peak area.

Water, Method I ⟨921⟩: not more than 0.1%, determined on 2.5 g, using a mixture of 50 mL of methanol and 10 mL of butyrolactone as the solvent.

▲[NOTE—A suitable grade is available from http://www.sigma-aldrich.com, catalog number V340-9.]▲*USP29*

Volumetric Solutions

BRIEFING

Volumetric Solutions, *USP 28* page 2862 and page 2170 of *PF* 30(6) [Nov.–Dec. 2004]. It is proposed to add a new volumetric solution, 0.1 N Lithium Methoxide in Methanol.

(HDQ: M. Marques) RTS—41932-1

Change to read:

Ammonium Thiocyanate, Tenth-Normal (0.1 N)
NH_4SCN, **76.12**
7.612 g in 1000 mL

Dissolve about 8 g of ammonium thiocyanate in 1000 mL of water, and standardize the solution as follows.

Accurately measure about 30 mL of 0.1 N silver nitrate VS into a glass-stoppered flask. Dilute with 50 mL of water, then add 2 mL of nitric acid and 2 mL of ferric ammonium sulfate TS, and titrate with the ammonium thiocyanate solution to the first appearance of a red-brown color. ~~Calculate the normality.~~

$$\blacksquare N = \frac{\text{mL } AgNO_3 \times N\,AgNO_3}{\text{mL } NH_4SCN \text{ Solution}}\ \blacksquare 1S\ (USP28)$$

If desirable, 0.1 N ammonium thiocyanate may be replaced by 0.1 N potassium thiocyanate where the former is directed in various tests and assays.

Perchloric Acid, Tenth-Normal (0.1 N) (in Glacial Acetic Acid)
$HClO_4$, **100.46**
10.05 g in 1000 mL

NOTE—Where called for in the tests and assays, this volumetric solution is specified as "0.1 N perchloric acid." Thus, where 0.1 N or other strength of this volumetric solution is specified, the solution in glacial acetic acid is to be used, unless the words "in dioxane" are stated. [See also *Perchloric Acid, Tenth-Normal (0.1 N) in Dioxane*.]

Mix 8.5 mL of perchloric acid with 500 mL of glacial acetic acid and 21 mL of acetic anhydride, cool, and add glacial acetic acid to make 1000 mL. Alternatively, the solution may be prepared as follows. Mix 11 mL of 60 percent perchloric acid with 500 mL of glacial acetic acid and 30 mL of acetic anhydride, cool, and add glacial acetic acid to make 1000 mL.

Allow the prepared solution to stand for 1 day for the excess acetic anhydride to be combined, and determine the water content by *Method I* (see *Water Determination* ⟨921⟩), except to use a test specimen of about 5 g of the 0.1 N perchloric acid that is expected to contain approximately 1 mg of water and the *Reagent* (see *Reagent* under *Method Ia* in *Water Determination* ⟨921⟩) diluted such that 1 mL is equivalent to about 1 to 2 mg of water. If the water content exceeds 0.5%, add more acetic anhydride. If the solution contains no titratable water, add sufficient water to obtain a content of between 0.02% and 0.5% of water. Allow the solution to stand for 1 day, and again titrate the water content. The solution so obtained contains between 0.02% and 0.5% of water, indicating freedom from acetic anhydride.

Standardize the solution as follows.

Accurately weigh about 700 mg of potassium biphthalate, previously crushed lightly and dried at 120° for 2 hours, and dissolve it in 50 mL of glacial acetic acid in a 250-mL flask. Add 2 drops of crystal violet TS, and titrate with the perchloric acid solution until the violet color changes to blue-green. Deduct the volume of the perchloric acid consumed by 50 mL of the glacial acetic acid. ~~and calculate the normality.~~

■■1S (*USP28*)

In-Process Revision

Each 20.42 mg of potassium biphthalate is equivalent to 1 mL of 0.1 N perchloric acid.

$$\blacksquare N = \frac{\text{g } KHC_8H_4O_4}{0.20423 \times \text{mL } HClO_4 \text{ solution (corrected for the blank)}} \blacksquare 1S\ (USP28)$$

Potassium Hydroxide, Normal (1 N)
KOH, **56.11**
56.11 g in 1000 mL

Dissolve 68 g of potassium hydroxide in about 950 mL of water. Add a freshly prepared saturated solution of barium hydroxide until no more precipitate forms. Shake the mixture thoroughly, and allow it to stand overnight in a stoppered bottle. Decant the clear liquid, or filter the solution in a tight, polyolefin bottle, and standardize by the procedure set forth for *Sodium Hydroxide*, *Normal* (*1 N*).

$$\blacksquare N = \frac{\text{g } KHC_8H_4O_4}{0.20423 \times \text{mL NaOH}} \blacksquare 1S\ (USP28)$$

Change to read:

Potassium Hydroxide, Alcoholic, Half-Normal (0.5 N)
28.06 g in 1000 mL

Dissolve about 34 g of potassium hydroxide in 20 mL of water, and add aldehyde-free alcohol to make 1000 mL. Allow the solution to stand in a tightly stoppered bottle for 24 hours. Then quickly decant the clear supernatant into a suitable, tight container, and standardize the solution as follows.

Accurately measure about 25 mL of 0.5 N hydrochloric acid VS. Dilute with 50 mL of water, add 2 drops of phenolphthalein TS, and titrate with the alcoholic potassium hydroxide solution until a permanent, pale pink color is produced. ~~Calculate the normality.~~

■■1S (*USP28*)

NOTE—Store in tightly stoppered bottles, protected from light.

$$\blacksquare N = \frac{\text{mL HCl} \times \text{N HCl}}{\text{mL KOH}} \blacksquare 1S\ (USP28)$$

Add the following:

■Potassium Hydroxide, Alcoholic, Tenth-Molar (0.1 M)

KOH, **56.11**

Dilute 20 mL of 0.5 M alcoholic potassium hydroxide with aldehyde-free alcohol to 100.0 mL.■1S (*USP28*)

Change to read:

Potassium Hydroxide, Methanolic, Tenth-Normal (0.1 N)
5.612 g in 1000 mL

Dissolve about 6.8 g of potassium hydroxide in 4 mL of water, and add methanol to make 1000 mL. Allow the solution to stand in a tightly stoppered bottle for 24 hours. Then quickly decant the clear supernatant into a suitable, tight container, and standardize the solution as follows.

Measure accurately about 25 mL of 0.1 N hydrochloric acid VS. Dilute with 50 mL of water, add 2 drops of phenolphthalein TS, and titrate with the methanolic potassium hydroxide solution until a permanent, pale pink color is produced. ~~Calculate the normality.~~

■■1S (*USP28*)
NOTE—Store in tightly stoppered bottles, protected from light.

$$\blacksquare N = \frac{\text{mL HCl} \times \text{N HCl}}{\text{mL KOH}} \blacksquare 1S\ (USP28)$$

Change to read:

Potassium Permanganate, Tenth-Normal (0.1 N)
$KMnO_4$, **158.03**
3.161 g in 1000 mL

Dissolve about 3.3 g of potassium permanganate in 1000 mL of water in a flask, and boil the solution for about 15 minutes. Insert the stopper in the flask, allow it to stand for at least 2 days, and filter through a fine-porosity, sintered-glass crucible. If necessary, the bottom of the sintered-glass crucible may be lined with a pledget of glass wool. Standardize the solution as follows.

Accurately weigh about 200 mg of sodium oxalate, previously dried at 110° to constant weight, and dissolve it in 250 mL of water. Add 7 mL of sulfuric acid, heat to about 70°, and then slowly add the permanganate solution from a buret, with constant stirring, until a pale pink color, which persists for 15 seconds, is produced. The temperature at the conclusion of the titration should be not less than 60°. Calculate the normality. Each ~~67.00 mg~~

■6.700 mg■1S (*USP28*)
of sodium oxalate is equivalent to 1 mL of 0.1 N potassium permanganate.

In-Process Revision

Because potassium permanganate is reduced on contact with organic substances such as rubber, the solution must be handled in apparatus entirely of glass or other suitably inert material. It should be frequently restandardized. Store in glass-stoppered, amber-colored bottles.

$$\blacksquare N = \frac{\text{g } Na_2C_2O_4}{\text{mL } KMnO_4 \text{ solution} \times 0.06700} \blacksquare 1S\ (USP28)$$

Change to read:

Silver Nitrate, Tenth-Normal,(0.1 N)
$AgNO_3$, **169.87**
16.99 g in 1000 mL

Dissolve about 17.5 g of silver nitrate in 1000 mL of water, and standardize the solution as follows.

Transfer about 100 mg, accurately weighed, of reagent-grade sodium chloride, previously dried at 110° for 2 hours, to a 150-mL beaker, dissolve in 5 mL of water, and add 5 mL of acetic acid, 50 mL of methanol, and about 0.5 mL of eosin Y TS. Stir, preferably with a magnetic stirrer, and titrate with the silver nitrate solution. ~~Calculate the normality.~~

$$\blacksquare N = \frac{\text{mg NaCl}}{\text{mL } AgNO_3 \times 58.44} \blacksquare 1S\ (USP28)$$

Change to read:

Sodium Hydroxide, Normal (1 N)
NaOH, **40.00**
40.00 g in 1000 mL

Dissolve 162 g of sodium hydroxide in 150 mL of carbon dioxide-free water, cool the solution to room temperature, and filter through hardened filter paper. Transfer 54.5 mL of the clear filtrate to a tight, polyolefin container, and dilute with carbon dioxide-free water to 1000 mL.

Accurately weigh about 5 g of potassium biphthalate, previously crushed lightly and dried at 120° for 2 hours, and dissolve in 75 mL of carbon dioxide-free water. Add 2 drops of phenolphthalein TS, and titrate with the sodium hydroxide solution to the production of a permanent pink color. Each 204.2 mg of potassium biphthalate is equivalent to 1 mL of 1 N sodium hydroxide.

$$\blacksquare N = \frac{\text{g } KHC_8H_4O_4}{0.20423 \times \text{mL NaOH solution}} \blacksquare 1S\ (USP28)$$

NOTES—(1) Solutions of alkali hydroxides absorb carbon dioxide when exposed to air. They should be preserved in bottles having well-fitted, suitable stoppers, provided with a tube filled with a mixture of sodium hydroxide and lime (soda-lime tubes) so that air entering the container must pass through this tube, which will absorb the carbon dioxide. (2) Prepare solutions of lower concentration (e.g., 0.1 N, 0.01 N) by quantitatively diluting accurately measured volumes of the 1 N solution with sufficient carbon dioxide-free water to yield the desired concentration.

Restandardize the solution frequently.

Change to read:

Sodium Hydroxide, Alcoholic, Tenth-Normal (0.1 N)
NaOH, **40.00**

To 250 mL of alcohol add 2 mL of a 50% (w/w) solution of sodium hydroxide.

Dissolve about 200 mg of benzoic acid, accurately weighed, in 10 mL of alcohol and 2 mL of water. Add 2 drops of phenolphthalein TS, and titrate with the alcoholic sodium hydroxide solution until a permanent pale pink color is produced. ~~Calculate the normality as follows:~~

~~$W/122.12V$,~~

~~in which W is the weight, in mg, of benzoic acid taken, V is the volume, in mL, of alcoholic sodium hydroxide consumed, and 122.12 is the molecular weight of benzoic acid.~~

$$\blacksquare N = \frac{\text{mg benzoic acid}}{122.1 \times \text{mL sodium hydroxide}} \blacksquare 1S\ (USP28)$$

In-Process Revision

Change to read:

Sodium Methoxide, Tenth-Normal (0.1 N) (in Toluene)
CH_3ONa, **54.02**
5.402 g in 1000 mL

Cool in ice-water 150 mL of methanol contained in a 1000-mL volumetric flask, and add, in small portions, about 2.5 g of freshly cut sodium metal. When the metal has dissolved, add toluene to make 1000 mL, and mix. Store preferably in the reservoir of an automatic delivery buret suitably protected from carbon dioxide and moisture. Standardize the solution as follows.

Accurately weigh about 400 mg of primary standard benzoic acid, and dissolve in 80 mL of dimethylformamide in a flask. Add 3 drops of a 1 in 100 solution of thymol blue in dimethylformamide, and titrate with the sodium methoxide to a blue endpoint. Correct for the volume of the sodium methoxide solution consumed by 80 mL of the dimethylformamide. ~~and calculate the normality.~~

■■1S (*USP28*)
Each 12.21 mg of benzoic acid is equivalent to 1 mL of 0.1 N sodium methoxide.

$$\blacksquare N = \frac{\text{mg benzoic acid}}{122.1 \times \text{mL sodium methoxide (corrected for the blank)}} \blacksquare 1S\ (USP28)$$

NOTES—(1) To eliminate any turbidity that may form following dilution with toluene, add methanol (25 to 30 mL usually suffices) until the solution is clear. (2) Restandardize the solution frequently.

Change to read:

Sodium Methoxide, Half-Normal (0.5 N) in Methanol
CH_3ONa, **54.02**
27.01 g in 1000 mL

Weigh 11.5 g of freshly cut sodium metal, and cut into small cubes. Place about 0.5 mL of anhydrous methanol in a round-bottom, 250-mL flask equipped with a ground-glass joint, add 1 cube of the sodium metal, and, when the reaction has ceased, add the remaining sodium metal to the flask. Connect a water-jacketed condenser to the flask, and slowly add 250 mL of anhydrous methanol, in small portions, through the top of the condenser. Regulate the addition of the methanol so that the vapors are condensed and do not escape through the top of the condenser. After addition of the methanol is complete, connect a drying tube to the top of the condenser, and allow the solution to cool. Transfer the solution to a 1-L volumetric flask, dilute with anhydrous methanol to volume, and mix. Standardize the solution as follows.

Accurately measure about 20 mL of freshly standardized 1 N hydrochloric acid VS into a 250-mL conical flask, add 0.25 mL of phenolphthalein TS, and titrate with the sodium methoxide solution to the first appearance of a permanent pink color. ~~Calculate the normality.~~

$$\blacksquare N = \frac{\text{mL HCl} \times \text{N HCl}}{\text{mL sodium methoxide}} \blacksquare 1S\ (USP28)$$

Change to read:

Sodium Nitrite, Tenth-Molar (0.1 M)
$NaNO_2$, **69.00**
6.900 g in 1000 mL

Dissolve 7.5 g of sodium nitrite in water to make 1000 mL, and standardize the solution as follows.

Accurately weigh about 500 mg of USP Sulfanilamide RS, previously dried at 105° for 3 hours, and transfer to a suitable beaker. Add 20 mL of hydrochloric acid and 50 mL of water, stir until dissolved, and cool to 15°. Maintaining the temperature at about 15°, titrate slowly with the sodium nitrite solution, placing the buret tip below the surface of the solution to preclude air oxidation of the sodium nitrite, and stir the solution gently with a magnetic stirrer, but avoid pulling a vortex of air beneath the surface. Use the indicator specified in the individual monograph, or, if a potentiometric procedure is specified, determine the endpoint electrometrically, using platinum-calomel or platinum-platinum electrodes. When the titration is within 1 mL of the endpoint, add the titrant in 0.1-mL portions, and allow 1 minute between additions. ~~Calculate the molarity.~~

■■1S (*USP28*)
Each 17.22 mg of sulfanilamide is equivalent to 1 mL of ~~1000 M~~

■0.1000 M■1S (*USP28*)
sodium nitrite.

$$\blacksquare M = \frac{\text{mg of sulfanilamide}}{172.22 \times \text{mL } NaNO_2} \blacksquare 1S\ (USP28)$$

Sodium Tetraphenylboron, Fiftieth-Molar (0.02 M)
$NaB(C_6H_5)_4$, **342.22**
6.845 g in 1000 mL

Dissolve an amount of sodium tetraphenylboron, equivalent to 6.845 g of $NaB(C_6H_5)_4$, in water to make 1000 mL, and standardize the solution as follows.

Pipet two 75-mL portions of the solution into separate beakers, and to each add 1 mL of acetic acid and 25 mL of water. To each beaker add, slowly and with constant stirring, 25 mL of potassium biphthalate solution (1 in 20), and allow to stand for 2 hours. Filter one of the mixtures through a filtering crucible, and wash the precipitate with cold water. Transfer the precipitate to a container, add 50 mL of water, shake intermittently for 30 minutes, filter, and use the filtrate as the saturated potassium tetraphenylborate solution in the following standardization procedure. Filter the second mixture through a tared filtering crucible, and wash the precipitate with three 5-mL portions of saturated potassium tetraphenylborate solution. Dry the precipitate at 105° for 1 hour. Each g of potassium tetraphenylborate is equivalent to 955.1 mg of sodium tetraphenylboron. ~~From the weight of sodium tetraphenylboron obtained, calculate the molarity of the sodium tetraphenylboron solution.~~

Sodium Thiosulfate, Tenth-Normal (0.1 N)
$Na_2S_2O_3 \cdot 5H_2O$, **248.19**
24.82 g in 1000 mL

Dissolve about 26 g of sodium thiosulfate and 200 mg of sodium carbonate in 1000 mL of recently boiled and cooled water. Standardize the solution as follows.

Accurately weigh about 210 mg of primary standard potassium dichromate, previously pulverized and dried at 120° for 4 hours, and dissolve in 100 mL of water in a glass-stoppered, 500-mL flask. Swirl to dissolve the solid, remove the stopper, and quickly add 3 g of potassium iodide, 2 g of sodium bicarbonate, and 5 mL of hydrochloric acid. Insert the stopper gently in the flask, swirl to mix, and allow to stand in the dark for exactly 10 minutes. Rinse the stopper and the inner walls of the flask with water, and titrate the liberated iodine with the sodium thiosulfate solution until the solution is yellowish-green in color. Add 3 mL of starch TS, and continue the titration until the blue color is discharged. Perform a blank determination. ~~Calculate the normality.~~

■■1S (*USP28*)
Restandardize the solution as frequently as supported by laboratory stability data. In the absence of such data, restandardize the solution weekly.

Sulfuric Acid, Half-Normal (0.5 N) in Alcohol
H_2SO_4, **98.08**
24.52 g in 1000 mL

Add slowly, with stirring, 13.9 mL of sulfuric acid to a sufficient quantity of dehydrated alcohol to make 1000 mL. Cool, and standardize against tromethamine as described under *Hydrochloric Acid*, *Half-Normal* (*0.5 N*) *in Methanol.*

$$■N = \frac{\text{mg tromethamine}}{121.14 \times \text{mL } H_2SO_4}$$ ■1S (*USP28*)

Change to read:

Tetrabutylammonium Hydroxide, Tenth-Normal (0.1 N)
$(C_4H_9)_4NOH$, **259.47**
25.95 g in 1000 mL

Dissolve 40 g of tetra-*n*-butylammonium iodide in 90 mL of anhydrous methanol in a glass-stoppered flask. Place in an ice bath, add 20 g of powdered silver oxide, insert the stopper in the flask, and agitate vigorously for 60 minutes. Centrifuge a few mL, and test the supernatant for iodide (see *Iodide* ⟨191⟩). If the test is positive, add an additional 2 g of silver oxide, and continue to allow to stand for 30 minutes with intermittent agitation. When all of the iodide has reacted, pass through a fine-porosity, sintered-glass funnel. Rinse the flask and the funnel with three 50-mL portions of anhydrous toluene, adding the rinsings to the filtrate. Dilute with a mixture of three volumes of anhydrous toluene and 1 volume of anhydrous methanol to 1000 mL, and flush the solution for 10 minutes with dry, carbon dioxide-free nitrogen. [NOTE—If necessary to obtain a clear solution, further small quantities of anhydrous methanol may be added.] Store in a reservoir protected from carbon dioxide and moisture, and discard after 60 days. Alternatively, the solution may be prepared by diluting a suitable volume of commercially available tetrabutylammonium hydroxide solution in methanol with a mixture of 4 volumes of anhydrous toluene and 1 volume of anhydrous methanol. [NOTE—If necessary to obtain a clear solution, further small quantities of methanol may be added.]

Standardize the solution on the day of use as follows. Dissolve about 400 mg of primary standard benzoic acid, accurately weighed, in 80 mL of dimethylformamide, add 3 drops of a 1 in 100 solution of thymol blue in dimethylformamide, and titrate to a blue endpoint with the tetrabutylammonium hydroxide solution, delivering the titrant from a buret equipped with a carbon dioxide absorption trap. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N tetrabutylammonium hydroxide is equivalent to 12.21 mg of benzoic acid.

$$■N = \frac{\text{mg benzoic acid}}{122.1 \times \text{mL } (C_4H_9)_4NOH}$$ ■1S (*USP28*)

Change to read:

▲Tetrabutylammonium Hydroxide in Methanol/Isopropyl Alcohol, 0.1 N

Prepare as described for *Tetrabutylammonium Hydroxide, Tenth-Normal (0.1 N),* using isopropyl alcohol instead of toluene, and standardize as described. Alternatively, the solution may be prepared by diluting a suitable volume of commercially available tetrabutylammonium hydroxide solution in methanol with 4 volumes of anhydrous isopropyl alcohol.

$$■N = \frac{\text{mg benzoic acid}}{122.1 \times \text{mL } (C_4H_9)_4NOH}$$ ■1S (*USP28*) ▲*USP28*

Change to read:

Tetramethylammonium Bromide, Tenth-Molar (0.1 M)
$(CH_3)_4NBr$, **154.05**
15.41 g in 1000 mL

Dissolve 15.41 g of tetramethylammonium bromide in water to make 1000 mL, and standardize the solution as follows.

Transfer an accurately measured volume of about 40 mL of the solution to a beaker, add 10 mL of diluted nitric acid and 50.0 mL of 0.1 N silver nitrate VS, and mix. Add 2 mL of ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS. ~~Calculate the molarity.~~

$$\blacksquare M = \frac{\text{mL } AgNO_3 \times \text{N } AgNO_3}{\text{mL } (CH_3)_4NBr} \quad \blacksquare 1S\ (USP28)$$

Change to read:

Tetramethylammonium Chloride, Tenth-Molar (0.1 M)
$(CH_3)_4NCl$, **109.60**
10.96 g in 1000 mL

Dissolve 10.96 g of tetramethylammonium chloride in water to make 1000 mL, and standardize the solution as follows.

Transfer an accurately measured volume of about 40 mL of the solution to a flask, add 10 mL of diluted nitric acid and 50.0 mL of 0.1 N silver nitrate VS, and mix. Add 5 mL of nitrobenzene and 2 mL of ferric ammonium sulfate TS, shake, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS. ~~Calculate the molarity.~~

$$\blacksquare M = \frac{\text{mL } AgNO_3 \times \text{N } AgNO_3}{\text{mL } (CH_3)_4NCl} \quad \blacksquare 1S\ (USP28)$$

Change to read:

Titanium Trichloride, Tenth-Normal (0.1 N)
$TiCl_3$, **154.23**
15.42 g in 1000 mL

Add 75 mL of titanium trichloride solution (1 in 5) to 75 mL of hydrochloric acid, dilute to 1000 mL, and mix. Standardize the solution as follows, using the special titration apparatus described.

Apparatus—Store the titanium trichloride solution in the reservoir of a closed-system titration apparatus in an atmosphere of hydrogen.

Use a wide-mouth, 500-mL conical flask as the titration vessel, and connect it by means of a tight-fitting rubber stopper to the titration buret, an inlet tube for carbon dioxide, and an exit tube. Arrange for mechanical stirring. All joints must be airtight. Arrange to have both the hydrogen and the carbon dioxide pass through wash bottles containing titanium trichloride solution (approximately 1 in 50) to remove any oxygen.

If the solution to be titrated is to be heated before or during titration, connect the titration flask with an upright reflux condenser through the rubber stopper.

Standardization—Place an accurately measured volume of about 40 mL of 0.1 N ferric ammonium sulfate VS in the titration flask, and pass in a rapid stream of carbon dioxide until all the air has been removed. Add the titanium trichloride solution from the buret until near the calculated endpoint (about 35 mL), then add through the outlet tube 5 mL of ammonium thiocyanate TS, and continue the titration until the solution is colorless. ~~Calculate the normality.~~

$$\blacksquare N = \frac{\text{mL } FeNH_4(SO_4)_2 \times \text{N } FeNH_4(SO_4)_2}{\text{mL } TiCl_3} \quad \blacksquare 1S\ (USP28)$$

Change to read:

Zinc Sulfate, Twentieth-Molar (0.05 M)
$ZnSO_4 \cdot 7H_2O$, **287.56**
14.4 g in 1000 mL

Dissolve 14.4 g of zinc sulfate in water to make 1 L. Standardize the solution as follows.

Accurately measure about 10 mL of 0.05 M edetate disodium VS into a 125-mL conical flask, and add, in the order given, 10 mL of acetic acid-ammonium acetate buffer TS, 50 mL of alcohol, and 2 mL of dithizone TS. Titrate with the zinc sulfate solution to a clear, rose-pink color. ~~Calculate the molarity.~~

~~NOTE—For many of the reagents mentioned in the foregoing section, the corresponding standards of the 6th edition (1980) of *Reagent Chemicals*, published by the American Chemical Society, should be consulted. For a limited number of other reagents, the standards are adapted from those appearing in *Reagent Chemicals and Standards*, 5th edition, by Joseph Rosin and copyrighted by the publisher, D. Van Nostrand Co., Inc.~~

$$\blacksquare M = \frac{\text{mL edetate disodium} \times \text{M edetate disodium}}{\text{mL } ZnSO_4} \quad \blacksquare 1S\ (USP28)$$

BRIEFING

Container Specifications for Capsules and Tablets, *USP 28* page 2869 and page 2181 of *PF* 30(6) [Nov.–Dec. 2004].

(HDQ) RTS—41759-1; 41759-2

The following table is provided as a reminder for the pharmacist engaged in the typical dispensing situation who already is acquainted with the *Packaging and storage* requirements set forth in the individual monographs. It lists the capsules and tablets that are official in the United States Pharmacopeia and indicates the relevant tight (T), well-closed (W), and light-resistant (LR) specifications applicable to containers in which the drug that is repackaged should be dispensed.

This table is not intended to replace, nor should it be interpreted as replacing, the definitive requirements stated in the individual monographs.

▲Zinc Sulfate Tablets	W▲(*USP29*)

BRIEFING

Description and Relative Solubility of USP and NF Articles, *USP 28* page 2875, page 8589 of *PF* 25(4) [July–Aug. 1999], page 9254 of *PF* 25(6) [Nov.–Dec. 1999], page 1135 of *PF* 26(4) [July–Aug. 2000], page 1908 of *PF* 27(1) [Jan.–Feb. 2001], page 554 of *PF* 28(2) [Mar.–Apr. 2002], page 1236 of *PF* 28(4) [July–Aug. 2002], page 1542 of *PF* 28(5) [Sept.–Oct. 2002], page 1953 of *PF* 28(6) [Nov.–Dec. 2002], page 266 of *PF* 29(1) [Jan.–Feb. 2003], page 812 of *PF* 29(3) [May–June 2003], page 1262 of *PF* 29(4) [July–Aug. 2003], page 1684 of *PF* 29(5) [Sept.–Oct. 2003], page 2057 of *PF* 29(6) [Nov.–Dec. 2003], page 1050 of *PF* 30(3) [May–June 2004], page 1405 of *PF* 30(4) [July–Aug. 2004], page 1822 of *PF* 30(5) [Sept.–Oct. 2004], and page 2183 of *PF* 30(6) [Nov.–Dec. 2004].

(HDQ) RTS—41206-1; 41637-1; 41689-1; 41731-1; 41731-2; 41731-3

Add the following:

▲**Meloxicam:** Pale yellow powder. Soluble in dimethylformamide; slightly soluble in acetone; very slightly soluble in methanol and in alcohol; practically insoluble in water.▲*USP29*

Add the following:

▲**Tiamulin:** A sticky, translucent yellowish mass, slightly hygroscopic. Very soluble in dichloromethane; freely soluble in dehydrated alcohol; practically insoluble in water.▲*USP29*

In-Process Revision

Items from Earlier Numbers of PF that Have Not Yet Appeared in a Supplement, and are Therefore Candidates for Subsequent Supplements.

GENERAL NOTICES AND REQUIREMENTS

Tests and Assays—See PF Vol. 30 No. 3, page 795.
Preservation, Packaging, Storage, and Labeling—See PF Vol. 30 No. 5, page 1574.

USP MONOGRAPHS

Acepromazine Maleate—See PF Vol. 29 No. 6, page 1832.
Acepromazine Maleate Injection—See PF Vol. 30 No. 4, page 1161.
Acetaminophen Extended-Release Tablets—See PF Vol. 30 No. 4, page 1161.
Acetaminophen Oral Suspension—See PF Vol. 30 No. 5, page 1579.
Acetaminophen and Aspirin Tablets—See PF Vol. 30 No. 1, page 41.
Capsules Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine—See PF Vol. 30 No. 1, page 43.
Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Phenylpropanolamine—See PF Vol. 30 No. 1, page 42.
Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine—See PF Vol. 30 No. 1, page 44.
Acetaminophen and Codeine Phosphate Capsules—See PF Vol. 30 No. 1, page 45.
Acetaminophen and Diphenhydramine Citrate Tablets—See PF Vol. 30 No. 1, page 47.
Acetaminophen, Diphenhydramine Hydrochloride, and Pseudoephedrine Hydrochloride Tablets—See PF Vol. 30 No. 1, page 47.
Acetaminophen and Pseudoephedrine Hydrochloride Tablets—See PF Vol. 30 No. 1, page 48.
Acetohydroxamic Acid—See PF Vol. 30 No. 5, page 1579.
Acetohydroxamic Acid Tablets—See PF Vol. 30 No. 1, page 49.
Acyclovir—See PF Vol. 30 No. 5, page 1580.
Adenosine—See PF Vol. 29 No. 6, page 1834.
Medical Air—See PF Vol. 28 No. 4, page 1065.
Albendazole Oral Suspension—See PF Vol. 30 No. 4, page 1163.
Albumin Human—See PF Vol. 29 No. 4, page 992.
Albuterol Tablets—See PF Vol. 30 No. 1, page 50.
Alcohol in Dextrose Injection—See PF Vol. 30 No. 5, page 1581.
Alendronate Sodium Tablets—See PF Vol. 28 No. 3, page 740.
Alfentanil Hydrochloride—See PF Vol. 29 No. 6, page 1834.
Allopurinol—See PF Vol. 28 No. 5, page 1386.
Alprazolam Tablets—See PF Vol. 30 No. 5, page 1582.
Alprostadil—See PF Vol. 29 No. 5, page 1412.
Alteplase—See PF Vol. 29 No. 6, page 1835.
Altretamine—See PF Vol. 27 No. 3, page 2514.
Alumina, Magnesia, and Calcium Carbonate Tablets—See PF Vol. 29 No. 6, page 1835.
Alumina, Magnesia, and Calcium Carbonate Chewable Tablets—See PF Vol. 29 No. 6, page 1836.
Alumina, Magnesia, Calcium Carbonate, and Simethicone Tablets—See PF Vol. 29 No. 6, page 1837.
Alumina, Magnesia, Calcium Carbonate, and Simethicone Chewable Tablets—See PF Vol. 29 No. 6, page 1837.
Alumina, Magnesia, and Simethicone Tablets—See PF Vol. 29 No. 6, page 1841.
Alumina, Magnesia, and Simethicone Chewable Tablets—See PF Vol. 29 No. 6, page 1842.
Amantadine Hydrochloride Capsules—See PF Vol. 30 No. 1, page 51.
Amifostine—See PF Vol. 30 No. 6, page 1974.
Amifostine for Injection—See PF Vol. 30 No. 6, page 1976.
Aminocaproic Acid—See PF Vol. 29 No. 5, page 1414.
Aminopentamide Sulfate—See PF Vol. 30 No. 4, page 1163.
Aminophylline—See PF Vol. 29 No. 5, page 1414.
Aminosalicylate Sodium Tablets—See PF Vol. 30 No. 1, page 53.
Amitriptyline Hydrochloride—See PF Vol. 29 No. 6, page 1844.
Ammonium Chloride—See PF Vol. 29 No. 5, page 1415.
Ammonium Molybdate—See PF Vol. 29 No. 5, page 1416.
Amoxicillin Capsules—See PF Vol. 30 No. 5, page 1583.
Amoxicillin Tablets—See PF Vol. 30 No. 6, page 1977.
Amphetamine Sulfate—See PF Vol. 30 No. 3, page 807.
Amphetamine Sulfate Tablets—See PF Vol. 30 No. 1, page 54.
Amphotericin B Lotion—See PF Vol. 30 No. 2, page 444.
Amphotericin B Topical Emulsion—See PF Vol. 30 No. 2, page 445.
Ampicillin—See PF Vol. 28 No. 6, page 1766.
Ampicillin Capsules—See PF Vol. 30 No. 1, page 55.
Ampicillin Tablets—See PF Vol. 30 No. 1, page 56.
Anecortave Acetate—See PF Vol. 30 No. 2, page 445.
Anecortave Acetate Injectable Suspension—See PF Vol. 30 No. 2, page 447.
Anileridine—See PF Vol. 29 No. 6, page 1846.
Anticoagulant Citrate Dextrose Solution—See PF Vol. 30 No. 5, page 1583.
Ascorbic Acid Tablets—See PF Vol. 30 No. 1, page 60.
L-Asparagine—See PF Vol. 29 No. 3, page 687.
Aspartic Acid—See PF Vol. 30 No. 4, page 1163.
Aspirin—See PF Vol. 30 No. 4, page 1164.
Aspirin, Caffeine, and Dihydrocodeine Bitartrate Capsules—See PF Vol. 30 No. 1, page 60.
Atenolol—See PF Vol. 29 No. 5, page 1416.
Atenolol Tablets—See PF Vol. 29 No. 1, page 49.
Atracurium Besylate—See PF Vol. 29 No. 6, page 1846.
Atracurium Besylate Injection—See PF Vol. 30 No. 3, page 808.
Atropine Sulfate—See PF Vol. 29 No. 6, page 1847.
Aurothioglucose—See PF Vol. 29 No. 6, page 1847.
Avobenzone—See PF Vol. 30 No. 4, page 1164.
Azaperone—See PF Vol. 29 No. 6, page 1847.
Baclofen Tablets—See PF Vol. 30 No. 1, page 61.
Benazepril Hydrochloride—See PF Vol. 29 No. 5, page 1422.
Benazepril Hydrochloride Tablets—See PF Vol. 29 No. 3, page 606.
Benzocaine—See PF Vol. 30 No. 3, page 809.
Benzoyl Peroxide Gel—See PF Vol. 30 No. 4, page 1165.
Benzoyl Peroxide Lotion—See PF Vol. 30 No. 2, page 456.
Benzoyl Peroxide Topical Emulsion—See PF Vol. 30 No. 2, page 456.
Benztropine Mesylate—See PF Vol. 29 No. 6, page 1848.
Benzyl Benzoate Lotion—See PF Vol. 30 No. 2, page 457.
Benzyl Benzoate Topical Emulsion—See PF Vol. 30 No. 2, page 457.
Betahistine Hydrochloride—See PF Vol. 30 No. 5, page 1584.
Betamethasone Tablets—See PF Vol. 30 No. 1, page 62.
Betamethasone Dipropionate Lotion—See PF Vol. 30 No. 2, page 458.
Betamethasone Dipropionate Topical Emulsion—See PF Vol. 30 No. 2, page 459.
Betamethasone Sodium Phosphate—See PF Vol. 30 No. 4, page 1166.
Betamethasone Valerate Lotion—See PF Vol. 30 No. 2, page 461.
Betamethasone Valerate Topical Emulsion—See PF Vol. 30 No. 2, page 461.
Bethanechol Chloride—See PF Vol. 30 No. 5, page 1586.
Bethanechol Chloride Tablets—See PF Vol. 30 No. 5, page 1587.
Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Metal or Plastic Carriers—See PF Vol. 30 No. 1, page 63.
Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions—See PF Vol. 30 No. 1, page 66.
Biperiden—See PF Vol. 29 No. 6, page 1851.

Bismuth Subsalicylate Oral Suspension—See PF Vol. 30 No. 4, page 1166.
Bismuth Subsalicylate Tablets—See PF Vol. 30 No. 4, page 1167.
Bisoprolol Fumarate Tablets—See PF Vol. 30 No. 5, page 1588.
Bretylium Tosylate—See PF Vol. 29 No. 5, page 1431.
Bretylium Tosylate in Dextrose Injection—See PF Vol. 30 No. 5, page 1589.
Bromodiphenhydramine Hydrochloride and Codeine Phosphate Syrup—See PF Vol. 27 No. 5, page 2980.
Brompheniramine Maleate—See PF Vol. 29 No. 5, page 1431.
Brompheniramine Maleate Tablets—See PF Vol. 30 No. 6, page 1978.
Budesonide—See PF Vol. 30 No. 6, page 1978.
Bumetanide—See PF Vol. 29 No. 5, page 1432.
Bupivacaine Hydrochloride—See PF Vol. 30 No. 5, page 1589.
Bupivacaine Hydrochloride in Dextrose Injection—See PF Vol. 30 No. 5, page 1590.
Butalbital, Acetaminophen, and Caffeine Tablets—See PF Vol. 30 No. 1, page 80.
Butorphanol Tartrate—See PF Vol. 29 No. 6, page 1851.
Caffeine—See PF Vol. 30 No. 4, page 1168.
Caffeine Citrate Injection—See PF Vol. 30 No. 5, page 1590.
Caffeine Citrate Oral Solution—See PF Vol. 30 No. 5, page 1593.
Calcitonin Salmon—See PF Vol. 30 No. 4, page 1169.
Calcitonin Salmon Injection—See PF Vol. 30 No. 4, page 1177.
Calcitonin Salmon Nasal Solution—See PF Vol. 30 No. 4, page 1178.
Calcitriol—See PF Vol. 29 No. 5, page 1433.
Calcitriol Injection—See PF Vol. 29 No. 5, page 1434.
Calcium Carbonate and Magnesia Tablets—See PF Vol. 29 No. 6, page 1852.
Calcium Carbonate and Magnesia Chewable Tablets—See PF Vol. 29 No. 6, page 1852.
Calcium Carbonate, Magnesia, and Simethicone Tablets—See PF Vol. 29 No. 6, page 1853.
Calcium Carbonate, Magnesia, and Simethicone Chewable Tablets—See PF Vol. 29 No. 6, page 1854.
Calcium Chloride—See PF Vol. 29 No. 5, page 1436.
Calcium Lactate Tablets—See PF Vol. 30 No. 1, page 81.
Calcium Pantothenate Tablets—See PF Vol. 30 No. 1, page 81.
Carbidopa—See PF Vol. 30 No. 3, page 811.
Carboprost Tromethamine—See PF Vol. 30 No. 1, page 82.
Carboxymethylcellulose Sodium Suspension—See PF Vol. 30 No. 3, page 812.
Cefaclor Capsules—See PF Vol. 29 No. 1, page 56.
Cefaclor Tablets—See PF Vol. 29 No. 6, page 1858.
Cefazolin Ophthalmic Solution—See PF Vol. 28 No. 2, page 261.
Chlordiazepoxide Hydrochloride—See PF Vol. 29 No. 6, page 1859.
Chlordiazepoxide Hydrochloride and Clidinium Bromide Capsules—See PF Vol. 30 No. 1, page 83.
Chloroprocaine Hydrochloride—See PF Vol. 29 No. 5, page 1438.
Chloroquine—See PF Vol. 29 No. 6, page 1859.
Chlorothiazide—See PF Vol. 29 No. 5, page 1439.
Chlorpheniramine Maleate—See PF Vol. 29 No. 5, page 1439.
Chlorpromazine Hydrochloride—See PF Vol. 29 No. 6, page 1860.
Chromic Chloride—See PF Vol. 29 No. 5, page 1440.
Ciclopirox—See PF Vol. 29 No. 2, page 393.
Ciclopirox Olamine—See PF Vol. 30 No. 3, page 813.
Ciclopirox Olamine Cream—See PF Vol. 30 No. 5, page 1595.
Ciclopirox Olamine Topical Suspension—See PF Vol. 30 No. 5, page 1596.
Cimetidine—See PF Vol. 29 No. 5, page 1440.
Ciprofloxacin—See PF Vol. 29 No. 6, page 1860.
Ciprofloxacin Hydrochloride—See PF Vol. 29 No. 6, page 1861.
Ciprofloxacin Injection—See PF Vol. 30 No. 5, page 1596.
Clarithromycin—See PF Vol. 30 No. 4, page 1179.
Clarithromycin Tablets—See PF Vol. 30 No. 4, page 1182.
Clarithromycin Extended-Release Tablets—See PF Vol. 30 No. 4, page 1183.
Clindamycin Injection—See PF Vol. 30 No. 5, page 1597.
Clonidine—See PF Vol. 29 No. 1, page 58.
Clonidine Transdermal System—See PF Vol. 30 No. 3, page 814.
Clopidogrel Tablets—See PF Vol. 30 No. 3, page 820.
Clorazepate Dipotassium—See PF Vol. 30 No. 6, page 1982.
Clotrimazole Lotion—See PF Vol. 30 No. 2, page 473.
Clotrimazole Topical Emulsion—See PF Vol. 30 No. 2, page 474.
Clozapine—See PF Vol. 30 No. 6, page 1984.
Colchicine Tablets—See PF Vol. 30 No. 1, page 91.
Cyanocobalamin Co 57 Capsules—See PF Vol. 29 No. 2, page 397.
Codeine Phosphate—See PF Vol. 30 No. 5, page 1597.
Cortisone Acetate—See PF Vol. 29 No. 5, page 1447.
Cupric Chloride—See PF Vol. 29 No. 6, page 1864.
Cupric Sulfate—See PF Vol. 29 No. 5, page 1447.
Cyclandelate—See PF Vol. 30 No. 6, page 1985.
Cyclizine Hydrochloride Tablets—See PF Vol. 30 No. 1, page 91.
Cyclophosphamide Tablets—See PF Vol. 30 No. 4, page 1186.
Cyclosporine Capsules—See PF Vol. 27 No. 4, page 2721.
Cysteine Hydrochloride—See PF Vol. 30 No. 5, page 1598.
Dalteparin Sodium—See PF Vol. 30 No. 5, page 1598.
Desflurane—See PF Vol. 30 No. 4, page 1187.
Deslanoside—See PF Vol. 29 No. 5, page 1448.
Desogestrel—See PF Vol. 28 No. 6, page 1785.
Desogestrel and Ethinyl Estradiol Tablets—See PF Vol. 30 No. 5, page 1604.
Desoxycorticosterone Acetate—See PF Vol. 29 No. 5, page 1456.
Desoxycorticosterone Pivalate—See PF Vol. 29 No. 6, page 1865.
Dexamethasone Acetate—See PF Vol. 29 No. 5, page 1457.
Dextran 1—See PF Vol. 29 No. 6, page 1866.
Dextran 40—See PF Vol. 29 No. 6, page 1866.
Dextran 70—See PF Vol. 29 No. 6, page 1868.
Dextroamphetamine Sulfate—See PF Vol. 30 No. 3, page 831.
Dextroamphetamine Sulfate Capsules—See PF Vol. 30 No. 1, page 94.
Dextroamphetamine Sulfate Elixir—See PF Vol. 30 No. 5, page 1612.
Dextroamphetamine Sulfate Oral Solution—See PF Vol. 30 No. 5, page 1613.
Dextroamphetamine Sulfate Tablets—See PF Vol. 30 No. 1, page 94.
Dextrose—See PF Vol. 29 No. 5, page 1457.
Dextrose Injection—See PF Vol. 30 No. 5, page 1614.
Dextrose and Sodium Chloride Injection—See PF Vol. 30 No. 5, page 1614.
Diatrizoate Meglumine—See PF Vol. 30 No. 3, page 832.
Diatrizoate Sodium—See PF Vol. 29 No. 6, page 1868.
Diatrizoic Acid—See PF Vol. 29 No. 6, page 1869.
Diazepam—See PF Vol. 30 No. 1, page 96.
Diazoxide—See PF Vol. 29 No. 5, page 1458.
Dibucaine Hydrochloride—See PF Vol. 29 No. 5, page 1458.
Diclofenac Sodium Delayed-Release Tablets—See PF Vol. 30 No. 6, page 1986.
Diclofenac Sodium Extended-Release Tablets—See PF Vol. 30 No. 2, page 476.
Dicyclomine Hydrochloride—See PF Vol. 29 No. 5, page 1458.
Dicyclomine Hydrochloride Capsules—See PF Vol. 30 No. 3, page 832.
Dicyclomine Hydrochloride Tablets—See PF Vol. 30 No. 3, page 834.
Diethylcarbamazine Citrate Tablets—See PF Vol. 30 No. 1, page 97.
Diethylstilbestrol—See PF Vol. 29 No. 5, page 1463.
Diethylstilbestrol Diphosphate Tablets—See PF Vol. 30 No. 4, page 1187.
Dihydroergotamine Mesylate—See PF Vol. 29 No. 6, page 1870.
Dihydroxyaluminum Sodium Carbonate Tablets—See PF Vol. 29 No. 6, page 1873.
Dihydroxyaluminum Sodium Carbonate Chewable Tablets—See PF Vol. 29 No. 6, page 1873.
Diltiazem Hydrochloride Extended-Release Capsules—See PF Vol. 30 No. 2, page 478.

Desmopressin Nasal Spray Solution—See PF Vol. 24 No. 2, page 5779.
Desogestrel—See PF Vol. 28 No. 6, page 1785.
Desogestrel and Ethinyl Estradiol Tablets—See PF Vol. 30 No. 3, page 823.
Desoxycorticosterone Acetate—See PF Vol. 29 No. 5, page 1456.
Desoxycorticosterone Pivalate—See PF Vol. 29 No. 6, page 1865.
Dexamethasone Acetate—See PF Vol. 29 No. 5, page 1457.
Dexamethasone Oral Solution—See PF Vol. 30 No. 1, page 93.
Dexbrompheniramine Maleate and Pseudoephedrine Sulfate Oral Solution—See PF Vol. 30 No. 1, page 93.
Dextran 1—See PF Vol. 29 No. 6, page 1866.
Dextran 40—See PF Vol. 29 No. 6, page 1866.
Dextran 70—See PF Vol. 29 No. 6, page 1868.
Dextroamphetamine Sulfate—See PF Vol. 30 No. 3, page 831.
Dextroamphetamine Sulfate Capsules—See PF Vol. 30 No. 1, page 94.
Dextroamphetamine Sulfate Tablets—See PF Vol. 30 No. 1, page 94.
Dextromethorphan Hydrobromide Oral Solution—See PF Vol. 30 No. 1, page 95.
Dextromethorphan Hydrobromide Syrup—See PF Vol. 30 No. 1, page 95.
Dextrose—See PF Vol. 29 No. 5, page 1457.
Diatrizoate Meglumine—See PF Vol. 30 No. 3, page 832.
Diatrizoate Sodium—See PF Vol. 29 No. 6, page 1868.
Diatrizoic Acid—See PF Vol. 29 No. 6, page 1869.
Diazepam—See PF Vol. 30 No. 1, page 96.
Diazoxide—See PF Vol. 29 No. 5, page 1458.
Dibucaine Hydrochloride—See PF Vol. 29 No. 5, page 1458.
Diclofenac Sodium Extended-Release Tablets—See PF Vol. 30 No. 2, page 476.
Dicyclomine Hydrochloride—See PF Vol. 29 No. 5, page 1458.
Dicyclomine Hydrochloride Capsules—See PF Vol. 30 No. 3, page 832.
Dicyclomine Hydrochloride Tablets—See PF Vol. 30 No. 3, page 834.
Diethylcarbamazine Citrate Tablets—See PF Vol. 30 No. 1, page 97.
Diethylstilbestrol—See PF Vol. 29 No. 5, page 1463.
Diethylstilbestrol Diphosphate Tablets—See PF Vol. 30 No. 4, page 1187.
Dihydroergotamine Mesylate—See PF Vol. 29 No. 6, page 1870.
Dihydroxyaluminum Sodium Carbonate Tablets—See PF Vol. 29 No. 6, page 1873.
Dihydroxyaluminum Sodium Carbonate Chewable Tablets—See PF Vol. 29 No. 6, page 1873.
Diltiazem Hydrochloride Extended-Release Capsules—See PF Vol. 30 No. 2, page 478.
Dimenhydrinate—See PF Vol. 29 No. 5, page 1466.
Dimenhydrinate Oral Solution—See PF Vol. 30 No. 4, page 1190.
Dimenhydrinate Syrup—See PF Vol. 30 No. 4, page 1190.
Dimenhydrinate Tablets—See PF Vol. 30 No. 4, page 1191.
Dimercaprol—See PF Vol. 29 No. 5, page 1466.
Diphenhydramine Hydrochloride—See PF Vol. 29 No. 5, page 1466.
Diphenhydramine Hydrochloride Capsules—See PF Vol. 30 No. 1, page 97.
Diphenhydramine and Pseudoephedrine Capsules—See PF Vol. 30 No. 1, page 98.
Dipyridamole—See PF Vol. 29 No. 5, page 1467.
Divalproex Sodium Delayed-Release Tablets—See PF Vol. 30 No. 3, page 835.
Dobutamine Hydrochloride—See PF Vol. 29 No. 5, page 1467.
Dolasetron Mesylate—See PF Vol. 29 No. 5, page 1468.
Dolasetron Mesylate Injection—See PF Vol. 29 No. 1, page 60.
Dopamine Hydrochloride—See PF Vol. 29 No. 5, page 1469.
Dorzolamide Hydrochloride—See PF Vol. 30 No. 2, page 481.
Doxapram Hydrochloride—See PF Vol. 29 No. 6, page 1874.
Doxazosin Mesylate—See PF Vol. 29 No. 5, page 1470.
Doxazosin Tablets—See PF Vol. 29 No. 1, page 64.
Doxycycline Hyclate—See PF Vol. 30 No. 3, page 836.
Droperidol—See PF Vol. 29 No. 6, page 1875.
Dyphylline—See PF Vol. 29 No. 5, page 1473.
Dyphylline and Guaifenesin Tablets—See PF Vol. 30 No. 1, page 100.
Edetate Calcium Disodium—See PF Vol. 29 No. 5, page 1474.
Edetate Disodium—See PF Vol. 29 No. 5, page 1474.
Edrophonium Chloride—See PF Vol. 29 No. 5, page 1475.
Egg Phospholipids—See PF Vol. 29 No. 2, page 401.
Multiple Electrolytes Injection Type 1—See PF Vol. 30 No. 3, page 836.
Multiple Electrolytes Injection Type 2—See PF Vol. 30 No. 3, page 838.
Multiple Electrolytes and Dextrose Injection Type 1—See PF Vol. 30 No. 3, page 838.
Multiple Electrolytes and Dextrose Injection Type 2—See PF Vol. 30 No. 3, page 838.
Multiple Electrolytes and Dextrose Injection Type 3—See PF Vol. 30 No. 3, page 839.
Emetine Hydrochloride—See PF Vol. 29 No. 6, page 1875.
Enoxaparin Sodium—See PF Vol. 29 No. 6, page 1876.
Enoxaparin Sodium Injection—See PF Vol. 29 No. 6, page 1882.
Ensulizole—See PF Vol. 30 No. 4, page 1191.
Ephedrine—See PF Vol. 30 No. 3, page 839.
Ephedrine Hydrochloride—See PF Vol. 30 No. 3, page 839.
Ephedrine Sulfate—See PF Vol. 30 No. 3, page 840.
Ephedrine Sulfate Oral Solution—See PF Vol. 30 No. 2, page 482.
Ephedrine Sulfate Syrup—See PF Vol. 30 No. 1, page 101.
Epinephrine—See PF Vol. 29 No. 5, page 1476.
Epinephrine Nasal Solution—See PF Vol. 30 No. 4, page 1192.
Epinephryl Borate Opthalmic Solution—See PF Vol. 30 No. 4, page 1192.
Ergoloid Mesylates Tablets—See PF Vol. 30 No. 4, page 1193.
Ergonovine Maleate—See PF Vol. 29 No. 5, page 1478.
Ergotamine Mesylates Sublingual Tablets—See PF Vol. 30 No. 4, page 1196.
Ergotamine Tartrate—See PF Vol. 29 No. 6, page 1884.
Ergotamine Tartrate Tablets—See PF Vol. 30 No. 4, page 1198.
Ergotamine Tartrate Sublingual Tablets—See PF Vol. 30 No. 4, page 1199.
Estradiol—See PF Vol. 29 No. 5, page 1478.
Estradiol Transdermal System—See PF Vol. 30 No. 4, page 1201.
Conjugated Estrogens—See PF Vol. 30 No. 3, page 840.
Conjugated Estrogens Tablets—See PF Vol. 30 No. 1, page 101.
Estrone—See PF Vol. 29 No. 5, page 1479.
Ethacrynic Acid—See PF Vol. 29 No. 5, page 1479.
Ethosuximide Capsules—See PF Vol. 30 No. 1, page 102.
Ethotoin—See PF Vol. 29 No. 1, page 66.
Etodolac Extended-Release Tablets—See PF Vol. 30 No. 4, page 1203.
Etoposide—See PF Vol. 30 No. 1, page 103.
Felodipine Extended-Release Tablets—See PF Vol. 30 No. 2, page 482.
Fenbendazole—See PF Vol. 30 No. 4, page 1205.
Fenoldapam Mesylate—See PF Vol. 29 No. 5, page 1479.
Fentanyl Citrate—See PF Vol. 29 No. 6, page 1885.
Ferumoxides Injection—See PF Vol. 28 No. 3, page 758.
Fexofenadine Hydrochloride—See PF Vol. 30 No. 4, page 1208.
Fexofenadine Hydrochloride Capsules—See PF Vol. 30 No. 3, page 845.
Cryopreserved Human Fibroblast-Derived Dermal Substitute—See PF Vol. 30 No. 4, page 1211.
Human Fibroblast-Derived Temporary Skin Substitute—See PF Vol. 30 No. 4, page 1221.
Finasteride Tablets—See PF Vol. 29 No. 2, page 403.
Floxuridine—See PF Vol. 29 No. 6, page 1886.
Fluconazole—See PF Vol. 30 No. 1, page 103.
Flumazenil—See PF Vol. 30 No. 4, page 1223.
Flumazenil Injection—See PF Vol. 29 No. 5, page 1484.
Flunixin Meglumine—See PF Vol. 29 No. 6, page 1886.
Fluorodopa F 18 Injection—See PF Vol. 30 No. 2, page 486.

Fluoxetine Hydrochloride—See PF Vol. 30 No. 3, page 848.
Fluoxetine Capsules—See PF Vol. 30 No. 3, page 849.
Fluoxetine Delayed-Release Capsules—See PF Vol. 30 No. 3, page 849.
Fluoxetine Tablets—See PF Vol. 30 No. 3, page 852.
Fluoxymesterone Tablets—See PF Vol. 30 No. 1, page 105.
Fluphenazine Decanoate—See PF Vol. 29 No. 6, page 1887.
Fluphenazine Enanthate—See PF Vol. 29 No. 6, page 1887.
Fluphenazine Hydrochloride—See PF Vol. 29 No. 6, page 1888.
Flurandrenolide Lotion—See PF Vol. 30 No. 2, page 489.
Flurandrenolide Topical Emulsion—See PF Vol. 30 No. 2, page 489.
Flurazepam Hydrochloride—See PF Vol. 30 No. 4, page 1229.
Fluticasone Propionate—See PF Vol. 30 No. 4, page 1230.
Fluvastatin Sodium—See PF Vol. 30 No. 4, page 1234.
Fluvastatin Capsules—See PF Vol. 30 No. 4, page 1237.
Fluvoxamine Maleate—See PF Vol. 30 No. 4, page 1240.
Fluvoxamine Maleate Tablets—See PF Vol. 30 No. 4, page 1243.
Folic Acid Tablets—See PF Vol. 29 No. 2, page 409.
Fosphenytoin Sodium—See PF Vol. 29 No. 6, page 1888.
Fructose—See PF Vol. 29 No. 5, page 1496.
Furosemide—See PF Vol. 29 No. 5, page 1497.
Gabapentin—See PF Vol. 29 No. 1, page 72.
Gabapentin Capsules—See PF Vol. 28 No. 2, page 298.
Gadodiamide—See PF Vol. 29 No. 6, page 1889.
Gadoteridol—See PF Vol. 29 No. 6, page 1890.
Gallamine Triethiodide—See PF Vol. 29 No. 5, page 1503.
Ganciclovir—See PF Vol. 29 No. 6, page 1890.
Gemcitabine for Injection—See PF Vol. 30 No. 4, page 1246.
Gemfibrozil Capsules—See PF Vol. 30 No. 4, page 1246.
Gemfibrozil Tablets—See PF Vol. 30 No. 4, page 1247.
Glimepiride—See PF Vol. 30 No. 4, page 1247.
Glucagon—See PF Vol. 29 No. 6, page 1894.
Glyburide Tablets—See PF Vol. 29 No. 2, page 418.
Glycerin—See PF Vol. 29 No. 6, page 1895.
Glycerin Injection—See PF Vol. 27 No. 5, page 3143.
Glycopyrrolate—See PF Vol. 29 No. 5, page 1503.
Glycopyrrolate Tablets—See PF Vol. 30 No. 1, page 105.
Gold Sodium Thiomalate—See PF Vol. 29 No. 6, page 1895.
Gonadorelin Acetate—See PF Vol. 30 No. 4, page 1250.
Chorionic Gonadotropin—See PF Vol. 29 No. 6, page 1896.
Graftskin—See PF Vol. 30 No. 2, page 490.
Guaifenesin Capsules—See PF Vol. 30 No. 1, page 106.
Guaifenesin Oral Solution—See PF Vol. 30 No. 1, page 107.
Guaifenesin Syrup—See PF Vol. 30 No. 1, page 107.
Guaifenesin Tablets—See PF Vol. 30 No. 1, page 107.
Guaifenesin and Codeine Phosphate Oral Solution—See PF Vol. 30 No. 1, page 108.
Guaifenesin and Codeine Phosphate Syrup—See PF Vol. 30 No. 1, page 108.
Haloperidol—See PF Vol. 29 No. 6, page 1897.
Helium—See PF Vol. 30 No. 2, page 502.
Heparin Calcium—See PF Vol. 29 No. 6, page 1898.
Heparin Sodium—See PF Vol. 29 No. 6, page 1898.
Histamine Phosphate—See PF Vol. 29 No. 5, page 1504.
Homosalate—See PF Vol. 30 No. 1, page 108.
Homotropine Hydrobromide—See PF Vol. 30 No. 2, page 502.
Hydralazine Hydrochloride—See PF Vol. 29 No. 5, page 1505.
0.1 Normal Hydrochloric Acid Intravenous Injection—See PF Vol. 27 No. 5, page 3144.
Hydrocodone Bitartrate and Acetaminophen Tablets—See PF Vol. 30 No. 1, page 109.
Hydrocodone Bitartate and Homatropine Methylbromide Tablets—See PF Vol. 30 No. 3, page 853.
Hydrocortisone—See PF Vol. 29 No. 5, page 1506.
Hydrocortisone Acetate Lotion—See PF Vol. 30 No. 2, page 504.
Hydrocortisone Acetate Ointment—See PF Vol. 30 No. 2, page 504.
Hydrocortisone Acetate Topical Emulsion—See PF Vol. 30 No. 2, page 504.
Hydrocortisone Lotion—See PF Vol. 30 No. 2, page 505.
Hydrocortisone Topical Emulsion—See PF Vol. 30 No. 2, page 506.
Hydromorphone Hydrochloride—See PF Vol. 30 No. 4, page 1254.
Hydroxyprogesterone Caproate—See PF Vol. 29 No. 5, page 1506.
Hydroxyzine Hydrochloride—See PF Vol. 29 No. 6, page 1902.
Hydroxyzine Hydrochloride Tablets—See PF Vol. 30 No. 2, page 507.
Hyoscyamine Sulfate—See PF Vol. 29 No. 5, page 1507.
Hyoscyamine Sulfate Elixir—See PF Vol. 30 No. 3, page 857.
Hyoscyamine Sulfate Injection—See PF Vol. 30 No. 3, page 858.
Hyoscyamine Sulfate Oral Solution—See PF Vol. 30 No. 3, page 860.
Hyoscyamine Sulfate Tablets—See PF Vol. 30 No. 3, page 861.
Hypromellose Ophthalmic Solution—See PF Vol. 30 No. 3, page 862.
Ibuprofen Capsules—See PF Vol. 26 No. 2, page 360.
Ibuprofen Oral Suspension—See PF Vol. 30 No. 1, page 110.
Imipramine Hydrochloride—See PF Vol. 29 No. 6, page 1904.
Inamrinone—See PF Vol. 29 No. 5, page 1507.
Indigotindisulfonate Sodium—See PF Vol. 29 No. 6, page 1905.
Indinavir Sulfate—See PF Vol. 30 No. 3, page 862.
Indinavir Sulfate Capsules—See PF Vol. 30 No. 2, page 508.
Indocyanine Green—See PF Vol. 29 No. 6, page 1905.
Indomethacin Oral Suspension—See PF Vol. 30 No. 1, page 110.
Indomethacin Topical Gel—See PF Vol. 30 No. 3, page 866.
Insulin—See PF Vol. 29 No. 6, page 1906.
Insulin Human—See PF Vol. 29 No. 6, page 1906.
Inulin—See PF Vol. 29 No. 6, page 1906.
Iodipamide—See PF Vol. 29 No. 6, page 1907.
Iodixanol—See PF Vol. 29 No. 6, page 1908.
Iodixanol Injection—See PF Vol. 29 No. 1, page 80.
Iohexol—See PF Vol. 29 No. 6, page 1908.
Iopamidol—See PF Vol. 29 No. 6, page 1909.
Iophendylate—See PF Vol. 29 No. 6, page 1910.
Iothalamic Acid—See PF Vol. 29 No. 6, page 1910.
Ioversol—See PF Vol. 29 No. 6, page 1910.
Ioxaglic Acid—See PF Vol. 29 No. 6, page 1911.
Ioxilan—See PF Vol. 29 No. 6, page 1911.
Ipecac—See PF Vol. 30 No. 3, page 866.
Powdered Ipecac—See PF Vol. 30 No. 3, page 867.
Irbesartan—See PF Vol. 30 No. 1, page 110.
Irbesartan Tablets—See PF Vol. 29 No. 4, page 1035.
Irbesartan and Hydrochlorothiazide Tablets—See PF Vol. 29 No. 4, page 1036.
Isoflurane—See PF Vol. 30 No. 4, page 1255.
Isoniazid—See PF Vol. 29 No. 6, page 1912.
Isoproterenol Hydrochloride—See PF Vol. 29 No. 5, page 1509.
Isoproterenol Hydrochloride Injection—See PF Vol. 30 No. 2, page 510.
Isosorbide Dinitrate Sublingual Tablets—See PF Vol. 30 No. 1, page 113.
Diluted Isosorbide Mononitrate—See PF Vol. 30 No. 3, page 868.
Isosorbide Mononitrate Tablets—See PF Vol. 29 No. 5, page 1513.
Isosorbide Mononitrate Extended-Release Tablets—See PF Vol. 30 No. 3, page 871.
Isradipine Capsules—See PF Vol. 30 No. 2, page 510.
Ivermectin—See PF Vol. 30 No. 3, page 875.
Kanamycin Sulfate Capsules—See PF Vol. 30 No. 1, page 120.
Ketamine Hydrochloride—See PF Vol. 29 No. 6, page 1913.
Ketoconazole Tablets—See PF Vol. 30 No. 4, page 1256.
Ketorolac Tromethamine—See PF Vol. 29 No. 6, page 1915.
Labetalol Hydrochloride—See PF Vol. 29 No. 6, page 1916.
Lamivudine—See PF Vol. 30 No. 3, page 881.
Leuprolide Acetate—See PF Vol. 30 No. 3, page 882.
Leuprolide Acetate Injection—See PF Vol. 25 No. 5, page 8722.
Levocarnitine—See PF Vol. 28 No. 1, page 71.
Levodopa—See PF Vol. 30 No. 3, page 888.
Levodopa Tablets—See PF Vol. 30 No. 3, page 890.
Levorphanol Tartrate—See PF Vol. 29 No. 6, page 1916.
Levothyroxine Sodium Tablets—See PF Vol. 30 No. 1, page 120.

In-Process Revision

Lidocaine Hydrochloride—See PF Vol. 30 No. 4, page 1256.
Lidocaine Hydrochloride and Epinephrine Injection—See PF Vol. 30 No. 4, page 1257.
Lindane Lotion—See PF Vol. 30 No. 2, page 512.
Lindane Topical Emulsion—See PF Vol. 30 No. 2, page 512.
Lipid Injectable Emulsion—See PF Vol. 29 No. 2, page 421.
Lisinopril Tablets—See PF Vol. 30 No. 1, page 121.
Loperamide Hydrochloride Tablets—See PF Vol. 30 No. 1, page 122.
Loratadine—See PF Vol. 30 No. 3, page 891.
Loratadine Oral Solution—See PF Vol. 30 No. 4, page 1258.
Lorazepam—See PF Vol. 29 No. 6, page 1918.
Losartan Potassium—See PF Vol. 30 No. 1, page 125.
Lypressin Nasal Solution—See PF Vol. 30 No. 3, page 893.
Mafenide Acetate—See PF Vol. 30 No. 4, page 1258.
Mafenide Acetate for Topical Solution—See PF Vol. 30 No. 4, page 1259.
Magaldrate and Simethicone Tablets—See PF Vol. 29 No. 6, page 1918.
Magaldrate and Simethicone Chewable Tablets—See PF Vol. 29 No. 6, page 1919.
Magnesium Carbonate, Citric Acid, and Potassium Citrate for Oral Solution—See PF Vol. 26 No. 4, page 1050.
Magnesium Chloride—See PF Vol. 30 No. 3, page 893.
Magnesium Oxide—See PF Vol. 29 No. 4, page 1047.
Magnesium Sulfate—See PF Vol. 29 No. 6, page 1921.
Malathion Lotion—See PF Vol. 30 No. 2, page 513.
Malathion Topical Emulsion—See PF Vol. 30 No. 2, page 513.
Mangafodipir Trisodium—See PF Vol. 29 No. 6, page 1921.
Manganese Chloride—See PF Vol. 29 No. 5, page 1526.
Manganese Sulfate—See PF Vol. 29 No. 6, page 1922.
Mannitol—See PF Vol. 27 No. 5, page 3017.
Mannitol Injection—See PF Vol. 28 No. 1, page 73.
Mebrofenin—See PF Vol. 29 No. 6, page 1923.
Mecamylamine Hydrochloride—See PF Vol. 28 No. 6, page 1817.
Mecamylamine Hydrochloride Tablets—See PF Vol. 28 No. 2, page 322.
Meclizine Hydrochloride Tablets—See PF Vol. 30 No. 1, page 127.
Medroxyprogesterone Acetate—See PF Vol. 29 No. 5, page 1526.
Mefloquine Hydrochloride—See PF Vol. 30 No. 4, page 1260.
Megestrol Acetate Oral Suspension—See PF Vol. 29 No. 1, page 80.
Melengestrol Acetate—See PF Vol. 30 No. 3, page 893.
Menadiol Sodium Diphosphate—See PF Vol. 29 No. 5, page 1531.
Menadione—See PF Vol. 29 No. 5, page 1531.
Menotropins—See PF Vol. 29 No. 6, page 1923.
Meperidine Hydrochloride—See PF Vol. 29 No. 6, page 1924.
Meperidine Hydrochloride Oral Solution—See PF Vol. 30 No. 1, page 128.
Meperidine Hydrochloride Syrup—See PF Vol. 30 No. 1, page 129.
Mephobarbital Tablets—See PF Vol. 30 No. 2, page 514.
Mepivacaine Hydrochloride—See PF Vol. 29 No. 5, page 1533.
Meprobamate Tablets—See PF Vol. 30 No. 1, page 129.
Mercaptopurine Tablets—See PF Vol. 30 No. 4, page 1261.
Mesalamine Extended-Release Capsules—See PF Vol. 30 No. 3, page 896.
Mesoridazine Besylate—See PF Vol. 30 No. 4, page 1262.
Metaramenol Bitartrate—See PF Vol. 29 No. 5, page 1533.
Metformin Hydrochloride—See PF Vol. 29 No. 6, page 1925.
Metformin Hydrochloride Tablets—See PF Vol. 30 No. 3, page 897.
Methadone Hydrochloride—See PF Vol. 29 No. 6, page 1929.
Methadone Hydrochloride Oral Solution—See PF Vol. 30 No. 1, page 130.
Methenamine Tablets—See PF Vol. 30 No. 1, page 130.
Methocarbamol—See PF Vol. 29 No. 6, page 1930.
Methocarbamol Tablets—See PF Vol. 30 No. 1, page 130.
Methohexital—See PF Vol. 29 No. 5, page 1534.
Methotrimeprazine—See PF Vol. 29 No. 6, page 1931.
Methscopolamine Bromide—See PF Vol. 30 No. 3, page 899.
Methylbenzethonium Chloride Lotion—See PF Vol. 30 No. 2, page 515.
Methylbenzethonium Chloride Topical Emulsion—See PF Vol. 30 No. 2, page 515.
Methylbenzethonium Chloride Topical Powder—See PF Vol. 30 No. 2, page 516.
Methyldopate Hydrochloride—See PF Vol. 29 No. 5, page 1534.
Methylene Blue—See PF Vol. 29 No. 5, page 1534.
Methylergonovine Maleate—See PF Vol. 29 No. 5, page 1535.
Methylphenidate Hydrochloride Tablets—See PF Vol. 30 No. 1, page 131.
Methylphenidate Hydrochloride Extended-Release Tablets—See PF Vol. 30 No. 4, page 1263.
Methylprednisolone Acetate—See PF Vol. 29 No. 5, page 1535.
Metoclopramide Hydrochloride—See PF Vol. 29 No. 5, page 1536.
Metolazone Tablets—See PF Vol. 29 No. 6, page 1932.
Metoprolol Succinate—See PF Vol. 30 No. 4, page 1263.
Metoprolol Tartrate—See PF Vol. 29 No. 5, page 1536.
Metronidazole—See PF Vol. 29 No. 6, page 1933.
Miconazole—See PF Vol. 29 No. 6, page 1934.
Mirtazapine—See PF Vol. 30 No. 3, page 900.
Mirtazapine Tablets—See PF Vol. 30 No. 3, page 902.
Misoprostol—See PF Vol. 26 No. 5, page 1304.
Misoprostol Dispersion—See PF Vol. 28 No. 3, page 772.
Misoprostol Tablets—See PF Vol. 26 No. 5, page 1310.
Morphine Sulfate—See PF Vol. 29 No. 6, page 1934.
Morphine Sulfate Extended-Release Capsules—See PF Vol. 28 No. 6, page 1822.
Nabumetone Tablets—See PF Vol. 29 No. 1, page 82.
Nadolol and Bendroflumethiazide Tablets—See PF Vol. 30 No. 1, page 132.
Nalidixic Acid—See PF Vol. 30 No. 1, page 132.
Nalorphine Hydrochloride—See PF Vol. 29 No. 6, page 1935.
Naloxone Hydrochloride—See PF Vol. 29 No. 6, page 1936.
Nandrolone Decanoate—See PF Vol. 29 No. 5, page 1539.
Naproxen—See PF Vol. 30 No. 3, page 904.
Naproxen Delayed-Release Tablets—See PF Vol. 30 No. 4, page 1264.
Naproxen Oral Suspension—See PF Vol. 30 No. 1, page 133.
Naratriptan Hydrochloride—See PF Vol. 30 No. 4, page 1266.
Naratriptan Tablets—See PF Vol. 30 No. 4, page 1268.
Neomycin Sulfate Oral Solution—See PF Vol. 30 No. 1, page 133.
Neomycin Sulfate and Flurandrenolide Lotion—See PF Vol. 30 No. 2, page 516.
Neomycin Sulfate and Flurandrenolide Topical Emulsion—See PF Vol. 30 No. 2, page 516.
Neomycin Sulfate and Hydrocortisone Acetate Cream—See PF Vol. 30 No. 2, page 517.
Neomycin Sulfate and Hydrocortisone Acetate Lotion—See PF Vol. 30 No. 2, page 517.
Neomycin Sulfate and Hydrocortisone Acetate Ointment—See PF Vol. 30 No. 2, page 518.
Neomycin Sulfate and Hydrocortisone Acetate Ophthalmic Ointment—See PF Vol. 30 No. 2, page 518.
Neomycin Sulfate and Hydrocortisone Acetate Topical Emulsion—See PF Vol. 30 No. 2, page 518.
Neomycin and Polymyxin B Sulfates, Bacitracin, and Hydrocortisone Acetate Ointment—See PF Vol. 30 No. 2, page 519.
Neomycin and Polymyxin B Sulfates, Bacitracin, and Hydrocortisone Acetate Ophthalmic Ointment—See PF Vol. 30 No. 2, page 519.
Neomycin and Polymyxin B Sulfates, Bacitracin Zinc, and Hydrocortisone Acetate Ophthalmic Ointment—See PF Vol. 30 No. 2, page 519.
Neomycin and Polymyxin B Sulfates, Gramicidin, and Hydrocortisone Acetate Cream—See PF Vol. 30 No. 2, page 520.
Neomycin and Polymyxin B Sulfates and Hydrocortisone Acetate Cream—See PF Vol. 30 No. 2, page 520.
Neostigmine Bromide Tablets—See PF Vol. 30 No. 1, page 133.

Neostigmine Methylsulfate—See PF Vol. 29 No. 6, page 1936.
Netilmicin Sulfate—See PF Vol. 30 No. 1, page 134.
Netilmicin Sulfate Injection—See PF Vol. 30 No. 1, page 136.
Nevirapine—See PF Vol. 30 No. 1, page 136.
Niacinamide Tablets—See PF Vol. 30 No. 1, page 139.

Nitrofurantoin Capsules—See PF Vol. 30 No. 1, page 139.
Nitrofurantoin Oral Suspension—See PF Vol. 30 No. 2, page 520.
Diluted Nitroglycerin—See PF Vol. 29 No. 5, page 1547.
Nitroglycerin Tablets—See PF Vol. 30 No. 4, page 1272.
Nitroglycerin Sublingual Tablets—See PF Vol. 30 No. 4, page 1272.
Nitrous Oxide—See PF Vol. 30 No. 2, page 521.
Norepinephrine Bitartrate—See PF Vol. 29 No. 5, page 1547.
Norgestimate and Ethinyl Estradiol Tablets—See PF Vol. 29 No. 1, page 87.
Norgestrel and Ethinyl Estradiol Tablets—See PF Vol. 29 No. 5, page 1547.
Nystatin—See PF Vol. 30 No. 1, page 141.
Nystatin Cream—See PF Vol. 28 No. 1, page 134.
Nystatin Lotion—See PF Vol. 30 No. 2, page 522.
Nystatin Lozenges—See PF Vol. 28 No. 1, page 135.
Nystatin Ointment—See PF Vol. 28 No. 1, page 136.
Nystatin Topical Emulsion—See PF Vol. 30 No. 2, page 522.
Nystatin Topical Powder—See PF Vol. 28 No. 1, page 136.
Nystatin Oral Suspension—See PF Vol. 28 No. 1, page 136.
Nystatin for Oral Suspension—See PF Vol. 30 No. 1, page 143.
Nystatin Tablets—See PF Vol. 28 No. 1, page 137.
Nystatin and Triamcinolone Acetonide Cream—See PF Vol. 28 No. 1, page 137.
Nystatin and Triamcinolone Acetonide Ointment—See PF Vol. 28 No. 1, page 138.
Octisalate—See PF Vol. 30 No. 3, page 904.
Octocrylene—See PF Vol. 30 No. 3, page 905.
Ofloxacin—See PF Vol. 30 No. 4, page 1274.
Omeprazole—See PF Vol. 30 No. 2, page 522.
Omeprazole Delayed-Release Capsules—See PF Vol. 30 No. 1, page 143.
Ondansetron Oral Solution—See PF Vol. 30 No. 3, page 905.
Ondansetron Hydrochloride—See PF Vol. 29 No. 6, page 1941.
Opium—See PF Vol. 30 No. 3, page 907.
Orphenadrine Citrate—See PF Vol. 30 No. 2, page 523.
Orphenadrine Citrate Injection—See PF Vol. 30 No. 2, page 524.
Oxandrolone—See PF Vol. 30 No. 1, page 148.
Oxaprozin—See PF Vol. 29 No. 4, page 1059.
Oxaprozin Tablets—See PF Vol. 29 No. 4, page 1061.
Oxybutynin Chloride—See PF Vol. 30 No. 3, page 908.
Oxybutynin Chloride Extended-Release Tablets—See PF Vol. 30 No. 4, page 1276.
Oxycodone and Acetaminophen Capsules—See PF Vol. 30 No. 1, page 151.
Oxycodone and Acetaminophen Tablets—See PF Vol. 30 No. 1, page 151.
Oxycodone and Aspirin Tablets—See PF Vol. 30 No. 1, page 152.
Oxycodone Hydrochloride Oral Solution—See PF Vol. 30 No. 1, page 150.
Oxymorphone Hydrochloride—See PF Vol. 29 No. 6, page 1946.
Oxytocin—See PF Vol. 29 No. 6, page 1946.
Oxytocin Injection—See PF Vol. 30 No. 1, page 153.
Water O 15 Injection—See PF Vol. 27 No. 2, page 2182.
Paclitaxel—See PF Vol. 30 No. 4, page 1279.
Padimate O Lotion—See PF Vol. 30 No. 2, page 527.
Padimate O Topical Emulsion—See PF Vol. 30 No. 2, page 527.
Papaverine Hydrochloride—See PF Vol. 29 No. 5, page 1551.
Paroxetine Hydrochloride—See PF Vol. 30 No. 4, page 1282.
Paroxetine Tablets—See PF Vol. 30 No. 3, page 919.
Penicillamine Capsules—See PF Vol. 30 No. 1, page 153.
Penicillin G Potassium for Injection—See PF Vol. 30 No. 1, page 154.
Penicillin G Procaine, Neomycin and Polymyxin B Sulfates, and Hydrocortisone Acetate Topical Suspension—See PF Vol. 30 No. 2, page 528.
Penicillin G Sodium for Injection—See PF Vol. 30 No. 1, page 154.
Pentazocine and Acetaminophen Tablets—See PF Vol. 28 No. 6, page 1838.
Pentobarbital—See PF Vol. 30 No. 1, page 154.
Pentobarbital Sodium—See PF Vol. 30 No. 1, page 157.
Perphenazine—See PF Vol. 29 No. 6, page 1963.
Petrolatum—See PF Vol. 28 No. 2, page 569.
White Petrolatum—See PF Vol. 28 No. 2, page 570.
Phenindamine Tartrate—See PF Vol. 25 No. 3, page 8063.
Phenobarbital—See PF Vol. 29 No. 6, page 1964.
Camphorated Phenol Topical Solution—See PF Vol. 30 No. 3, page 922.
Phentermine Hydrochloride Capsules—See PF Vol. 30 No. 1, page 159.
Phentermine Hydrochloride Tablets—See PF Vol. 30 No. 1, page 160.
Phentolamine Mesylate—See PF Vol. 29 No. 5, page 1562.
Phenylbutazone Injection—See PF Vol. 29 No. 6, page 1964.
Phenylephrine Bitartrate—See PF Vol. 30 No. 3, page 923.
Phenylephrine Hydrochloride—See PF Vol. 29 No. 6, page 1964.
Phenylethyl Alcohol—See PF Vol. 30 No. 4, page 1290.
Phenylpropanolamine Hydrochloride Capsules—See PF Vol. 30 No. 1, page 161.
Phenylpropanolamine Hydrochloride Oral Solution—See PF Vol. 30 No. 1, page 161.
Phenylpropanolamine Hydrochloride Tablets—See PF Vol. 30 No. 1, page 162.
Phenyltoloxamine Citrate—See PF Vol. 30 No. 4, page 1291.
Phenytoin Oral Suspension—See PF Vol. 30 No. 2, page 528.
Phenytoin Tablets—See PF Vol. 29 No. 6, page 1965.
Phenytoin Chewable Tablets—See PF Vol. 29 No. 6, page 1965.
Phenytoin Sodium—See PF Vol. 29 No. 6, page 1967.
Physostigmine Salicylate—See PF Vol. 29 No. 6, page 1967.
Pimozide Tablets—See PF Vol. 30 No. 1, page 164.
Pindolol Tablets—See PF Vol. 30 No. 1, page 165.
Piperazine Citrate Tablets—See PF Vol. 30 No. 1, page 165.
Platelets—See PF Vol. 30 No. 1, page 166.
Poloxalene—See PF Vol. 29 No. 2, page 429.
Potassium Chloride—See PF Vol. 29 No. 5, page 1562.
Dibasic Potassium Phosphate—See PF Vol. 29 No. 5, page 1563.
Povidone—See PF Vol. 30 No. 4, page 1298.
Prednisolone—See PF Vol. 28 No. 5, page 1440.
Prednisolone Acetate—See PF Vol. 29 No. 5, page 1564.
Prednisone Oral Solution—See PF Vol. 30 No. 1, page 169.
Prilocaine Hydrochloride—See PF Vol. 29 No. 5, page 1564.
Procainamide Hydrochloride—See PF Vol. 29 No. 5, page 1565.
Procainamide Hydrochloride Extended-Release Tablets—See PF Vol. 29 No. 1, page 109.
Prochlorperazine Edisylate—See PF Vol. 29 No. 5, page 1565.
Procyclidine Hydrochloride Tablets—See PF Vol. 30 No. 1, page 169.
Progesterone—See PF Vol. 29 No. 5, page 1566.
Promazine Hydrochloride—See PF Vol. 29 No. 5, page 1566.
Promethazine Hydrochloride—See PF Vol. 29 No. 5, page 1567.
Propantheline Bromide—See PF Vol. 29 No. 2, page 430.
Propantheline Bromide Tablets—See PF Vol. 30 No. 1, page 170.
Propoxycaine Hydrochloride—See PF Vol. 29 No. 5, page 1567.
Propoxyphene Hydrochloride—See PF Vol. 30 No. 3, page 925.
Propoxyphene Hydrochloride and Acetaminophen Tablets—See PF Vol. 30 No. 1, page 170.
Propoxyphene Napsylate—See PF Vol. 30 No. 3, page 927.
Propoxyphene Napsylate Oral Suspension—See PF Vol. 30 No. 1, page 171.
Propranolol Hydrochloride—See PF Vol. 29 No. 5, page 1568.
Propyliodone—See PF Vol. 29 No. 6, page 1976.
Pseudoephedrine Hydrochloride Oral Solution—See PF Vol. 30 No. 1, page 171.

In-Process Revision

Pseudoephedrine Hydrochloride Syrup—See PF Vol. 30 No. 1, page 172.
Pseudoephedrine Hydrochloride Tablets—See PF Vol. 30 No. 1, page 172.
Pseudoephedrine Hydrochloride, Carbinoxamine Maleate, and Dextromethorphan Hydrobromide Oral Solution—See PF Vol. 30 No. 1, page 173.
Psyllium Hemicellulose—See PF Vol. 30 No. 1, page 173.
Pyridostigmine Bromide—See PF Vol. 29 No. 6, page 1977.
Pyridoxine Hydrochloride Injection—See PF Vol. 30 No. 2, page 583.
Pyridoxine Hydrochloride Tablets—See PF Vol. 30 No. 1, page 177.
Pyrilamine Maleate Tablets—See PF Vol. 30 No. 1, page 177.
Pyrimethamine Tablets—See PF Vol. 30 No. 3, page 929.
Quazepam Tablets—See PF Vol. 30 No. 2, page 531.
Quinapril Tablets—See PF Vol. 29 No. 4, page 1071.
Quinidine Gluconate—See PF Vol. 29 No. 5, page 1568.
Ranitidine Oral Solution—See PF Vol. 28 No. 2, page 360.
Ranitidine Hydrochloride—See PF Vol. 29 No. 5, page 1569.
Reserpine—See PF Vol. 29 No. 5, page 1570.
Resorcinol and Sulfur Lotion—See PF Vol. 30 No. 2, page 531.
Resorcinol and Sulfur Topical Suspension—See PF Vol. 30 No. 2, page 531.
Riboflavin—See PF Vol. 30 No. 3, page 929.
Rifampin and Isoniazid Capsules—See PF Vol. 30 No. 2, page 533.
Rifampin, Isoniazid, and Pyrazinamide Tablets—See PF Vol. 30 No. 2, page 534.
Rifampin, Isoniazid, Pyrazinamide, and Ethambutol Hydrochloride Tablets—See PF Vol. 30 No. 2, page 535.
Ringer's and Dextrose Injection—See PF Vol. 30 No. 4, page 1293.
Ritodrine Hydrochloride—See PF Vol. 29 No. 5, page 1570.
Saccharin Sodium Tablets—See PF Vol. 30 No. 2, page 536.
Saquinavir Capsules—See PF Vol. 27 No. 2, page 2197.
Selenious Acid—See PF Vol. 29 No. 5, page 1571.
Selenium Sulfide Lotion—See PF Vol. 30 No. 2, page 537.
Selenium Sulfide Topical Suspension—See PF Vol. 30 No. 2, page 537.
Sevoflurane—See PF Vol. 30 No. 1, page 178.
Shark Liver Oil—See PF Vol. 26 No. 6, page 1643.
Sildenafil Citrate—See PF Vol. 24 No. 6, page 7182.
Sildenafil Tablets—See PF Vol. 24 No. 6, page 7184.
Simethicone—See PF Vol. 30 No. 4, page 1293.
Simethicone Emulsion—See PF Vol. 30 No. 4, page 1294.
Simethicone Capsules—See PF Vol. 30 No. 4, page 1294.
Simethicone Oral Suspension—See PF Vol. 30 No. 4, page 1294.
Simvastatin Tablets—See PF Vol. 30 No. 4, page 1295.
Sodium Acetate—See PF Vol. 29 No. 5, page 1576.
Sodium Bicarbonate—See PF Vol. 29 No. 5, page 1577.
Sodium Chloride—See PF Vol. 28 No. 4, page 1249.
Sodium Nitrite—See PF Vol. 29 No. 5, page 1577.
Dibasic Sodium Phosphate—See PF Vol. 29 No. 5, page 1578.
Monobasic Sodium Phosphate—See PF Vol. 29 No. 5, page 1579.
Sodium Sulfate—See PF Vol. 29 No. 5, page 1579.
Sodium Thiosulfate—See PF Vol. 29 No. 5, page 1579.
Somatropin—See PF Vol. 30 No. 4, page 1295.
Somatropin for Injection—See PF Vol. 30 No. 4, page 1299.
Sorbitol Solution—See PF Vol. 30 No. 3, page 929.
Spironolactone Oral Suspension—See PF Vol. 30 No. 3, page 929.
Spironolactone and Hydrochlorothiazide Oral Suspension—See PF Vol. 30 No. 3, page 930.
Stavudine—See PF Vol. 30 No. 3, page 932.
Stavudine Capsules—See PF Vol. 30 No. 3, page 934.
Stavudine for Oral Solution—See PF Vol. 30 No. 3, page 937.
Sufentanil Citrate—See PF Vol. 29 No. 6, page 1988.
Sulfadiazine Sodium—See PF Vol. 29 No. 6, page 1988.
Sulfamethoxazole—See PF Vol. 29 No. 6, page 1989.
Sulfisoxazole—See PF Vol. 30 No. 4, page 1301.
Sumatriptan—See PF Vol. 30 No. 1, page 184.
Sumatriptan Nasal Spray—See PF Vol. 29 No. 1, page 119.
Sumatriptan Succinate—See PF Vol. 27 No. 5, page 3157.
Terbutaline Sulfate—See PF Vol. 29 No. 5, page 1585.
Terbutaline Sulfate Inhalation Aerosol—See PF Vol. 26 No. 3, page 753.
Terbutaline Sulfate Injection—See PF Vol. 26 No. 3, page 756.
Terbutaline Sulfate Tablets—See PF Vol. 30 No. 1, page 188.
Testosterone—See PF Vol. 29 No. 5, page 1585.
Theophylline—See PF Vol. 29 No. 5, page 1586.
Theophylline Syrup—See PF Vol. 27 No. 1, page 1819.
Theophylline, Ephedrine Hydrochloride, and Phenobarbital Tablets—See PF Vol. 30 No. 1, page 189.
Thiabendazole Tablets—See PF Vol. 29 No. 6, page 1991.
Thiabendazole Chewable Tablets—See PF Vol. 29 No. 6, page 1991.
Thiacetarsamide—See PF Vol. 29 No. 1, page 126.
Thiacetarsamide Sodium Injection—See PF Vol. 29 No. 1, page 127.
Thiamine Hydrochloride Tablets—See PF Vol. 30 No. 1, page 190.
Thiopental Sodium—See PF Vol. 29 No. 5, page 1586.
Thiothixene Hydrochloride—See PF Vol. 29 No. 6, page 1993.
Tiamulin Fumarate—See PF Vol. 30 No. 3, page 938.
Timolol Maleate Tablets—See PF Vol. 30 No. 1, page 191.
Titanium Dioxide—See PF Vol. 30 No. 4, page 1301.
Titanium Dioxide (new)—See PF Vol. 30 No. 4, page 1304.
Tobramycin Inhalation Solution—See PF Vol. 29 No. 2, page 438.
Tolazoline Hydrochloride—See PF Vol. 29 No. 5, page 1588.
Tolcapone—See PF Vol. 30 No. 3, page 939.
Tolcapone Tablets—See PF Vol. 30 No. 3, page 943.
Topiramate—See PF Vol. 30 No. 4, page 1307.
Triamcinolone Acetonide—See PF Vol. 30 No. 3, page 945.
Triamcinolone Acetonide Lotion—See PF Vol. 30 No. 2, page 538.
Triamcinolone Acetonide Topical Emulsion—See PF Vol. 30 No. 2, page 538.
Trichlorfon—See PF Vol. 26 No. 6, page 1576.
Trifluoperazine Hydrochloride—See PF Vol. 29 No. 6, page 1993.
Triflupromazine Hydrochloride—See PF Vol. 29 No. 6, page 1994.
Trimethobenzamide Hydrochloride—See PF Vol. 29 No. 5, page 1589.
Trimethoprim—See PF Vol. 29 No. 6, page 1995.
Trimethoprim Sulfate—See PF Vol. 29 No. 6, page 1995.
Tripelennamine Hydrochloride—See PF Vol. 30 No. 4, page 1312.
Triprolidine and Pseudoephedrine Hydrochlorides Tablets—See PF Vol. 30 No. 1, page 192.
Trolamine Salicylate—See PF Vol. 30 No. 4, page 1312.
Tubocurarine Chloride—See PF Vol. 29 No. 6, page 1996.
Urea C for Oral Solution—See PF Vol. 29 No. 2, page 441.
Urofollitropin—See PF Vol. 28 No. 6, page 1875.
Urofollitropin for Injection—See PF Vol. 28 No. 6, page 1881.
Ursodiol—See PF Vol. 30 No. 4, page 1313.
Valproic Acid Injection—See PF Vol. 26 No. 4, page 939.
Valrubicin—See PF Vol. 30 No. 3, page 946.
Valsartan—See PF Vol. 29 No. 6, page 1996.
Valsartan Capsules—See PF Vol. 28 No. 2, page 399.
Valsartan and Hydrochlorothiazide Tablets—See PF Vol. 29 No. 6, page 2000.
Vancomycin Hydrochloride for Oral Solution—See PF Vol. 30 No. 1, page 193.
Vasopressin—See PF Vol. 29 No. 6, page 2004.
Vecuronium Bromide—See PF Vol. 30 No. 1, page 193.
Vecuronium Bromide for Injection—See PF Vol. 25 No. 4, page 8449.
Verapamil Hydrochloride—See PF Vol. 29 No. 5, page 1598.
Verteporfin—See PF Vol. 30 No. 3, page 947.
Vinorelbine Injection—See PF Vol. 30 No. 4, page 1314.
Vitamin E—See PF Vol. 27 No. 5, page 3159.
Bacteriostatic Water for Injection—See PF Vol. 30 No. 4, page 1315.
Sterile Water for Inhalation—See PF Vol. 30 No. 4, page 1316.
Sterile Water for Injection—See PF Vol. 30 No. 4, page 1316.
Purified Water—See PF Vol. 30 No. 4, page 1316.

Sterile Purified Water—See PF Vol. 30 No. 4, page 1317.
Water for Hemodialysis—See PF Vol. 30 No. 4, page 1317.
White Lotion—See PF Vol. 30 No. 2, page 538.
Small Intestinal Submucosa Wound Matrix—See PF Vol. 30 No. 2, page 538.
Xylazine—See PF Vol. 29 No. 6, page 2004.
Xylazine Hydrochloride—See PF Vol. 29 No. 6, page 2005.
Yohimbine Hydrochloride—See PF Vol. 29 No. 6, page 2005.
Zidovudine—See PF Vol. 29 No. 6, page 2006.
Zileuton—See PF Vol. 30 No. 3, page 948.
Zinc Gluconate—See PF Vol. 29 No. 3, page 683.
Zinc Sulfide Topical Suspension—See PF Vol. 30 No. 2, page 546.

DIETARY SUPPLEMENTS

MONOGRAPHS

Chaste Tree—See PF Vol. 30 No. 2, page 546.
Powdered Chaste Tree Extract—See PF Vol. 29 No. 4, page 1269.
Horse Chestnut—See PF Vol. 30 No. 2, page 550.
Powdered Horse Chestnut Extract—See PF Vol. 30 No. 2, page 550.
Choline Bitartrate—See PF Vol. 30 No. 3, page 950.
Choline Chloride—See PF Vol. 30 No. 3, page 951.
Chondroitin Sulfate Sodium—See PF Vol. 30 No. 1, page 197.
Chondroitin Sulfate Sodium Tablets—See PF Vol. 30 No. 1, page 200.
Red Clover—See PF Vol. 30 No. 2, page 550.
Powdered Red Clover Extract—See PF Vol. 30 No. 2, page 552.
Black Cohosh—See PF Vol. 28 No. 5, page 1455.
Powdered Black Cohosh—See PF Vol. 28 No. 5, page 1460.
Powdered Black Cohosh Extract—See PF Vol. 28 No. 5, page 1461.
Black Cohosh Tablets—See PF Vol. 28 No. 5, page 1462.
Cranberry Liquid Preparation—See PF Vol. 30 No. 3, page 951.
Docosahexaenoic Acid—See PF Vol. 26 No. 6, page 1648.
Docosahexaenoic Acid Capsules—See PF Vol. 26 No. 6, page 1651.
Docosahexaenoic Acid Oil—See PF Vol. 26 No. 6, page 1652.
Echinacea angustifolia—See PF Vol. 30 No. 2, page 552.
Powdered *Echinacea angustifolia* Extract—See PF Vol. 30 No. 2, page 554.
Echinacea pallida—See PF Vol. 30 No. 2, page 555.
Powdered *Echinacea pallida* Extract—See PF Vol. 30 No. 2, page 556.
Echinacea purpurea Aerial Parts—See PF Vol. 30 No. 2, page 557.
Echinacea purpurea Root—See PF Vol. 30 No. 2, page 561.
Powdered *Echinacea purpurea* Extract—See PF Vol. 30 No. 2, page 561.
Eleuthero—See PF Vol. 26 No. 6, page 1596.
Fish Oil Rich in Omega-3 Acids—See PF Vol. 29 No. 4, page 1272.
Fish Oil Rich in Omega-3 Acids Capsules—See PF Vol. 29 No. 4, page 1278.
Ginger Capsules—See PF Vol. 28 No. 3, page 814.
Powdered Ginkgo Extract—See PF Vol. 27 No. 2, page 2233.
Ginkgo Capsules—See PF Vol. 27 No. 2, page 2238.
Ginkgo Tablets—See PF Vol. 27 No. 2, page 2240.
American Ginseng—See PF Vol. 30 No. 2, page 563.
American Ginseng Capsules—See PF Vol. 30 No. 2, page 565.
American Ginseng Tablets—See PF Vol. 30 No. 2, page 567.
Powdered American Ginseng—See PF Vol. 30 No. 2, page 564.
Powdered American Ginseng Extract—See PF Vol. 30 No. 2, page 564.
Asian Ginseng—See PF Vol. 30 No. 2, page 569.
Asian Ginseng Capsules—See PF Vol. 30 No. 2, page 571.
Asian Ginseng Tablets—See PF Vol. 30 No. 2, page 573.
Powdered Asian Ginseng—See PF Vol. 30 No. 2, page 570.
Powdered Asian Ginseng Extract—See PF Vol. 30 No. 2, page 570.
Glucosamine and Chondroitin Sulfate Sodium Tablets—See PF Vol. 30 No. 1, page 201.
Goldenseal—See PF Vol. 30 No. 3, page 952.
Powdered Goldenseal—See PF Vol. 30 No. 3, page 953.
Powdered Goldenseal Extract—See PF Vol. 30 No. 3, page 954.
Licorice—See PF Vol. 26 No. 5, page 1363.
Powdered Licorice Extract—See PF Vol. 30 No. 2, page 574.
Lutein—See PF Vol. 29 No. 2, page 470.
Lutein Preparation—See PF Vol. 29 No. 2, page 472.
Lycopene—See PF Vol. 30 No. 2, page 574.
Lycopene Preparation—See PF Vol. 30 No. 2, page 576.
Lycopene Tomato Extract—See PF Vol. 30 No. 2, page 578.
Milk Thistle Capsules—See PF Vol. 29 No. 2, page 479.
Minerals Capsules—See PF Vol. 28 No. 5, page 1543.
Minerals Tablets—See PF Vol. 28 No. 5, page 1543.
Pygeum—See PF Vol. 30 No. 3, page 954.
Pygeum Capsules—See PF Vol. 30 No. 3, page 959.
Pygeum Extract—See PF Vol. 30 No. 3, page 956.
Pyridoxine Hydrochloride Injection—See PF Vol. 30 No. 2, page 583.
Powdered St. John's Wort Extract—See PF Vol. 30 No. 2, page 584.
Ubidecarenone Capsules—See PF Vol. 30 No. 1, page 202.
Valerian Capsules—See PF Vol. 27 No. 1, page 1825.
Oil- and Water-Soluble Vitamins Tablets—See PF Vol. 30 No. 2, page 585.
Oil- and Water-Soluble Vitamins with Minerals Capsules—See PF Vol. 28 No. 5, page 1544.
Oil- and Water-Soluble Vitamins with Minerals Oral Solution—See PF Vol. 30 No. 2, page 585.
Oil- and Water-Soluble Vitamins with Minerals Tablets—See PF Vol. 30 No. 2, page 585.
Oil-Soluble Vitamins Tablets—See PF Vol. 28 No. 5, page 1547.
Water-Soluble Vitamins Tablets—See PF Vol. 30 No. 2, page 587.
Water-Soluble Vitamins with Minerals Capsules—See PF Vol. 28 No. 5, page 1547.
Water-Soluble Vitamins with Minerals Tablets—See PF Vol. 30 No. 2, page 587.

Dietary Supplements

⟨2040⟩ Disintegration and Dissolution of Nutritional Supplements—See PF Vol. 29 No. 2, page 513.
⟨2091⟩ Uniformity of Dietary Supplement Intake Units—See PF Vol. 28 No. 5, page 1549.

REAGENTS, INDICATORS, AND SOLUTIONS

Reagent Specifications

Acetal—See PF Vol. 30 No. 2, page 644.
Agarose—See PF Vol. 27 No. 6, page 3363.
Air-Nitrous Oxide Certified Standard—See PF Vol. 28 No. 4, page 1234.
Ammonium Hydroxide, 6 N—See PF Vol. 30 No. 4, page 1389.
Ammonium Pyrrolidinedithiocarbamate—See PF Vol. 30 No. 3, page 1043.
Anion-exchange Resin, Styrene-Divinylbenzene—See PF Vol. 30 No. 3, page 1043.
Anti-A Blood Grouping Reagent, Anti-B Blood Grouping Reagent, and Anti-A,B Blood Grouping Reagent—See PF Vol. 29 No. 2, page 505.
Anti-D (Rh_o) Reagent—See PF Vol. 29 No. 2, page 505.
Anti-D Reagent—See PF Vol. 29 No. 2, page 506.
Antihuman Globulin Reagent—See PF Vol. 29 No. 2, page 506.
Antithrombin III for Amidolytic Test—See PF Vol. 29 No. 1, page 264.
Bacterial Alkaline Protease Preparation—See PF Vol. 30 No. 2, page 644.
Barbituric Acid—See PF Vol. 29 No. 1, page 265.
Benzamidine Hydrochloride Hydrate—See PF Vol. 30 No. 2, page 644.
Benzil—See PF Vol. 28 No. 4, page 1305.
Blood Group A_1 and Blood Group B Red Blood Cells—See PF Vol. 29 No. 2, page 506.
Bovine Collagen—See PF Vol. 30 No. 2, page 644.
Rat Tail Collagen—See PF Vol. 30 No. 2, page 644.
Branched Polymeric Sucrose—See PF Vol. 27 No. 6, page 3363.
Bromelain—See PF Vol. 28 No. 2, page 552.
Bromofluoromethane—See PF Vol. 30 No. 4, page 1389.
1,4-Butanediol—See PF Vol 25 No. 5, page 8747.
Calf Thymus DNA—See PF Vol. 30 No. 4, page 1389.
dl-Camphene—See PF Vol. 28 No. 6, page 1951.

Cation-exchange Resin, Styrene-Divinylbenzene—See PF Vol. 30 No. 3, page 1043.
p-Chlorophenol—See PF Vol. 30 No. 3, page 1044.
4-Chlorophenol—See PF Vol. 30 No. 3, page 1045.
Chromotrope 2R—See PF Vol. 30 No. 4, page 1390.
Citric Acid, Anhydrous—See PF Vol. 30 No. 3, page 1044.
Collagen—See PF Vol. 30 No. 4, page 1390.
Collagenase—See PF Vol. 30 No. 4, page 1390.
Cyclohexylmethanol—See PF Vol. 30 No. 2, page 644.
DEAE-Agarose—See PF Vol. 29 No. 1, page 265.
Deoxyadenosine Triphosphate—See PF Vol. 27 No. 6, page 3364.
Deoxycytidine Triphosphate—See PF Vol. 27 No. 6, page 3364.
Deoxyguanosine Triphosphate—See PF Vol. 27 No. 6, page 3364.
Deoxyribonucleic Acid Polymerase—See PF Vol. 27 No. 6, page 3365.
Deoxythymidine Triphosphate—See PF Vol. 27 No. 6, page 3365.
Deuterated Methanol—See PF Vol. 29 No. 6, page 2054.
Dicyclohexyl—See PF Vol. 30 No. 2, page 645.
Dicyclohexyl Phthalate—See PF Vol. 26 No. 2, page 504.
Diethylpyrocarbonate—See PF Vol. 27 No. 6, page 3365.
Diisobutylene—See PF Vol. 28 No. 4, page 1305.
1,5-Dimethyl-1,5-diazundecamethylene Polymethobromide—See PF Vol. 30 No. 1, page 315.
N,N-Dimethylformamide Diethyl Acetal—See PF Vol. 29 No. 5, page 1681.
N,N-Dimethyldodecylamine-*N*-oxide—See PF Vol. 27 No. 4, page 2837.
1,9-Dimethyl-Methylene Blue—See PF Vol. 30 No. 2, page 645.
Dimethyl Sulfoxide—See PF Vol. 30 No. 3, page 1045.
3-(4,5-Dimethylthiazol-2-yl)-2,5-diphenyl Tetrazolium Bromide—See PF Vol. 27 No. 6, page 3365.
Dioleoylglycerol—See PF Vol. 26 No. 6, page 1622.
1,2-Dioleoyl-3-linoleoyl-rac-glycerol—See PF Vol. 28 No. 3, page 849.
Direct Red 80—See PF Vol. 30 No. 4, page 1390.
Disodium Arsenate—See PF Vol. 28 No. 4, page 1305.
3-(Dodecyldimethylammonio)propanesulfonate—See PF Vol. 30 No. 2, page 645.
Drabkin's Reagent—See PF Vol. 29 No. 2, page 507.
Escin—See PF Vol. 27 No. 4, page 2837.
Ether, Peroxide-Free—See PF Vol. 30 No. 4, page 1390.
Ethidium Bromide—See PF Vol. 27 No. 6, page 3366.
Ethylbenzene—See PF Vol. 30 No. 2, page 645.
Fast Green FCF—See PF Vol. 30 No. 4, page 1391.
Fibroblast Growth Factor-2—See PF Vol. 30 No. 2, page 645.
9-Fluorenylmethyl Chloroformate—See PF Vol. 25 No. 5, page 8916.
Formamide, Anhydrous—See PF Vol. 27 No. 5, page 3115.
Glucose—See PF Vol. 28 No. 3, page 850.
L-Glutamic Acid—See PF Vol. 27 No. 6, page 3366.
L-Glutamine—See PF Vol. 27 No. 6, page 3366.
Guanidine Isothiocyanate—See PF Vol. 27 No. 6, page 3366.
Hexadecane—See PF Vol. 28 No. 4, page 1305.
Hexadimethrine Bromide—See PF Vol. 29 No. 1, page 265.
Hexane, Solvent—See PF Vol. 30 No. 3, page 1045.
Hexane, Solvent, Chromatographic—See PF Vol. 30 No. 3, page 1046.
Hexanes—See PF Vol. 30 No. 3, page 1046.
L-Histidine Hydrochloride Monohydrate—See PF Vol. 27 No. 6, page 3366.
Homatropine Hydrobromide—See PF Vol. 28 No. 4, page 1305.
Hydrocodone Diol—See PF Vol. 28 No. 4, page 1306.
2′-(4-Hydroxyphenyl)-5-(4-methyl-1-piperazinyl)-2,5′-bi-1*H*-benzimidazole Trihydrochloride Pentahydrate—See PF Vol. 30 No. 4, page 1391.
IgG-Coated Red Cells—See PF Vol. 29 No. 2, page 507.
Iodine—See PF Vol. 30 No. 4, page 1391.
Iodoethane—See PF Vol. 24 No. 6, page 7327.
Isoferulic Acid—See PF Vol. 27 No. 4, page 2837.
Isovaleric Acid—See PF Vol. 30 No. 3, page 1046.
Lanthanum Chloride—See PF Vol. 29 No. 2, page 507.
Lanthanum Oxide—See PF Vol. 28 No. 3, page 851.
Lauryl Dimethyl Amine Oxide—See PF Vol. 30 No. 2, page 645.
Linoleic Acid—See PF Vol. 27 No. 6, page 3367.
α-Lipoic Acid—See PF Vol. 27 No. 6, page 3367.
Melamine—See PF Vol. 29 No. 6, page 2055.
Methanol, Aldehyde-Free—See PF Vol. 30 No. 2, page 646.
Methoxyphenylacetic Acid—See PF Vol. 30 No. 3, page 1046.
Methylbenzothiazolone Hydrazone Hydrochloride—See PF Vol. 30 No. 2, page 646.
3-Methyl-2-benzothiazolinone Hydrazone Hydrochloride—See PF Vol. 25 No. 3, page 8280.
Methyl Iodide—See PF Vol. 30 No. 3, page 1046.
4-Methylpentan-2-ol—See PF Vol. 30 No. 2, page 646.
Methyl Sulfoxide—See PF Vol. 30 No. 3, page 1047.
Methylene Blue—See PF Vol. 30 No. 4, page 1391.
Monooleoylglycerol—See PF Vol. 26 No. 6, page 1622.
Nonionic Wetting Agent—See PF Vol. 30 No. 3, page 1047.
Nonylphenol Polyoxyethylene Ether—See PF Vol. 27 No. 6, page 3368.
Octoxynol—See PF Vol. 30 No. 4, page 1392.
Oligo-deoxythymidine—See PF Vol. 27 No. 6, page 3368.
Oxygen-Helium Certified Standard—See PF Vol. 30 No. 2, page 646.
Pentadecanoic Acid Methyl Ester—See PF Vol. 26 No. 6, page 1622.
Phenol Red, Sodium—See PF Vol. 27 No. 6, page 3368.
Phenylmethylsulfonyl Fluoride—See PF Vol. 30 No. 2, page 647.
Polyoxyethylene (23) Lauryl Ether—See PF Vol. 29 No. 2, page 507.
Polyoxyethylene (20) Sorbitan Monolaurate—See PF Vol. 27 No. 6, page 3368.
Propionaldehyde—See PF Vol. 30 No. 2, page 647.
Putrescine Dihydrochloride—See PF Vol. 27 No. 6, page 3369.
Red-Cell Lysing Agent—See PF Vol. 29 No. 2, page 507.
Reverse Transcriptase—See PF Vol. 27 No. 6, page 3369.
Rhodamine 6G—See PF Vol. 30 No. 4, page 1392.
Ribonuclease Inhibitor—See PF Vol. 27 No. 6, page 3369.
Sodium Arsenite, Twentieth-Molar (0.05 M)—See PF Vol. 29 No. 4, page 1250.
Sodium 1-Heptanesulfonate—See PF Vol. 30 No. 3, page 1047.
Sodium 1-Heptanesulfonate Monohydrate—See PF Vol. 30 No. 2, page 647.
Sodium 1-Hexanesulfonate—See PF Vol. 30 No. 3, page 1048.
Sodium Hydrogen Sulfate—See PF Vol. 29 No. 5, page 1682.
Sodium Iodate—See PF Vol. 27 No. 6, page 3369.
Sodium Phosphate, Monobasic—See PF Vol. 30 No. 4, page 1392.
1,1,4,4-Tetraphenyl-1,3-butadiene—See PF Vol. 26 No. 6, page 1623.
Thrombin Human—See PF Vol. 29 No. 6, page 2055.
Thymidine—See PF Vol. 27 No. 6, page 3369.
Thyroglobulin—See PF Vol. 30 No. 1, page 316.
1,3,7-Trichlorodibenzo-*p*-dioxin—See PF Vol. 30 No. 4, page 1392.
Trioleoylglycerol—See PF Vol. 26 No. 6, page 1623.
Tritirachium Album Proteinase K—See PF Vol. 30 No. 2, page 647.
Tropic Acid—See PF Vol. 30 No. 3, page 1048.
Tropine—See PF Vol. 30 No. 2, page 647.
L-Tyrosine Disodium—See PF Vol. 27 No. 6, page 3370.
Tuberculin, Purified Protein Derivative (Tuberculin PPD)—See PF Vol. 29 No. 5, page 1682.
2-Vinylpyridine—See PF Vol. 26 No. 2, page 504.
Wright's Stain—See PF Vol. 30 No. 1, page 316.
Zinc Sulfate Heptahydrate—See PF Vol. 26 No. 2, page 504.

Indicator Test Papers

Methyl Green—See PF Vol. 28 No. 4, page 1306.
Methyl Green—Iodomercurate Paper—See PF Vol. 28 No. 4, page 1306.
Nickel Standard Solution TS—See PF Vol. 27 No. 5, page 3117.

In-Process Revision

Ninhydrin TS—See PF Vol. 28 No. 3, page 852.
Perchloric Acid TS—See PF Vol. 27 No. 1, page 1905.

Test Solutions

Ammonia TS—See PF Vol. 30 No. 4, page 1392.
Folin-Ciocalteu Phenol TS—See PF Vol. 30 No. 1, page 316.
Hydroxylamine Hydrochloride TS—See PF Vol. 30 No. 4, page 1393.
Iodine and Potassium Iodide TS 1—See PF Vol. 30 No. 4, page 1393.
Iodine and Potassium Iodide TS 2—See PF Vol. 30 No. 4, page 1393.
Methyl Yellow TS—See PF Vol. 30 No. 4, page 1393.
Potassium Pyroantimonate TS—See PF Vol. 30 No. 4, page 1393.

Volumetric Solutions

Ammonium Thiocyanate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1393.
Bromine, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1393.
Ceric Ammonium Nitrate, Twentieth-Normal (0.05 N)—See PF Vol. 30 No. 4, page 1394.
Ceric Sulfate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1394.
Cupric Nitrate, Tenth Normal (0.1 N)—See PF Vol. 30 No. 4, page 1394.
Standard Dichlorophenol-Indophenol Solution—See PF Vol. 30 No. 4, page 1394.
Edetate Disodium, Twentieth-Molar (0.05 M)—See PF Vol. 30 No. 4, page 1395.
Ferric Ammonium Sulfate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1395.
Ferrous Ammonium Sulfate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1395.
Hydrochloric Acid, Normal (1 N)—See PF Vol. 30 No. 4, page 1395.
Hydrochloric Acid, Half-Normal (0.5 N)—See PF Vol. 30 No. 4, page 1395.
Hydrochloric Acid, Half-Normal (0.5 N) in Methanol—See PF Vol. 30 No. 4, page 1396.
Hydrochloric Acid, Alcoholic, Tenth-Molar (0.1 M)—See PF Vol. 30 No. 4, page 1396.
Iodine, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1396.
Iodine, Hundredth-Normal (0.01 N)—See PF Vol. 30 No. 4, page 1396.
Lead Perchlorate, Tenth-Molar (0.1 M)—See PF Vol. 30 No. 4, page 1396.
Lead Perchlorate, Hundredth-Molar (0.1 M)—See PF Vol. 30 No. 4, page 1397.
Lithium Methoxide, Fiftieth-Normal (0.02 N) in Methanol—See PF Vol. 30 No. 4, page 1397.
Lithium Methoxide, Tenth-Normal (0.1 N) in Toluene—See PF Vol. 30 No. 4, page 1397.
Lithium Methoxide, Tenth-Normal (0.1 N) in Chlorobenzene—See PF Vol. 30 No. 4, page 1397.
Mercuric Nitrate, Tenth-Molar (0.1 M)—See PF Vol. 30 No. 4, page 1398.
Morpholine, Half-Normal (0.5 N) in Methanol—See PF Vol. 30 No. 4, page 1398.
Oxalic Acid, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1398.
Perchloric Acid, Tenth-Normal (0.1 N) (in Glacial Acetic Acid)—See PF Vol. 30 No. 4, page 1398.
Perchloric Acid, Tenth-Normal (0.1 N) in Dioxane—See PF Vol. 30 No. 4, page 1398.
Potassium Bromate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1399.
Potassium Bromide–Bromate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1399.
Potassium Dichromate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1399.
Potassium Ferricyanide, Twentieth-Molar (0.05 M)—See PF Vol. 30 No. 4, page 1399.
Potassium Hydroxide, Normal (1 N)—See PF Vol. 30 No. 4, page 1399.
Potassium Hydroxide, Alcoholic, Half-Normal (0.05 N)—See PF Vol. 30 No. 4, page 1399.
Potassium Hydroxide, Alcoholic, Tenth Molar (0.1 M)—See PF Vol. 30 No. 4, page 1400.
Potassium Hydroxide, Methanolic, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1400.
Potassium Permanganate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1400.
Silver Nitrate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1400.
Sodium Hydroxide, Normal (1 N)—See PF Vol. 30 No. 4, page 1400.
Sodium Hydroxide, Alcoholic, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1401.
Sodium Methoxide, Tenth-Normal (0.1 N) (in Toluene)—See PF Vol. 30 No. 4, page 1401.
Sodium Methoxide, Half-Normal (0.5 N) in Methanol—See PF Vol. 30 No. 4, page 1401.
Sodium Nitrite, Tenth-Molar (0.1 M)—See PF Vol. 30 No. 4, page 1401.
Sodium Tetraphenylboron, Fiftieth-Molar (0.02 M)—See PF Vol. 30 No. 4, page 1402.
Sodium Thiosulfate, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1402.
Sulfuric Acid, Half-Normal (0.5 N) in Alcohol—See PF Vol. 30 No. 4, page 1402.
Tetrabutylammonium Hydroxide, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1402.
Tetrabutylammonium Hydroxide in Methanol/Isopropyl Alcohol, 0.1 N—See PF Vol. 30 No. 4, page 1403.
Tetramethylammonium Bromide, Tenth-Molar (0.1 M)—See PF Vol. 30 No. 4, page 1403.
Tetramethylammonium Chloride, Tenth-Molar (0.1 M)—See PF Vol. 30 No. 4, page 1403.
Titanium Trichloride, Tenth-Normal (0.1 N)—See PF Vol. 30 No. 4, page 1403.

In-Process Revision

HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps **(*Stages*)**.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

MONOGRAPHS (USP)

BRIEFING

Aspirin Delayed-Release Capsules, *USP 28* page 182. It is proposed to revise references to the General Chapter *Drug Release* ⟨724⟩, which will affect monographs where the procedure or acceptance criteria are now to refer to the harmonized text of *Dissolution* ⟨711⟩. These proposed changes are being published in this issue of *PF* for information only, not for public comment, and are scheduled for publication in the *Second Interim Revision Announcement to USP 28–NF 23* with a scheduled delayed implementation date of **April 1, 2006**. Earlier implementation by individual companies may be done at their discretion.

Other monographs affected by this decision are the following:

Aspirin Delayed-Release Tablets
Aspirin Extended-Release Tablets
Bupropion Hydrochloride Extended-Release Tablets
Carbamazepine Extended-Release Tablets
Carbamazepine Tablets
Cefaclor Extended-Release Tablets
Chlorpheniramine Maleate Extended-Release Capsules
Chlorpheniramine Maleate and Phenylpropanolamine Hydrochloride Extended-Release Capsules
Chlorpheniramine Maleate and Phenylpropanolamine Hydrochloride Extended-Release Tablets
Chlorpheniramine Maleate and Pseudoephedrine Hydrochloride Extended-Release Capsules
Clonidine Transdermal System
Conjugated Estrogens Tablets
Diazepam Extended-Release Capsules
Diclofenac Sodium Delayed-Release Tablets
Diltiazem Hydrochloride Extended-Release Capsules
Dirithromycin Delayed-Release Tablets
Disopyramide Phosphate Extended-Release Capsules
Divalproex Sodium Delayed-Release Tablets
Doxycycline Hyclate Delayed-Release Capsules
Erythromycin Delayed-Release Capsules
Erythromycin Delayed-Release Tablets
Felodipine Extended-Release Tablets
Ferrous Fumarate and Docusate Sodium Extended-Release Tablets
Garlic Delayed-Release Tablets
Hydroxyzine Hydrochloride Tablets
Indomethacin Extended-Release Capsules
Isosorbide Dinitrate Extended-Release Capsules
Isosorbide Dinitrate Extended-Release Tablets
Lansoprazole Delayed-Release Capsules
Liothyronine Sodium Tablets
Lithium Carbonate Extended-Release Tablets
Mesalamine Delayed-Release Tablets
Mesalamine Extended-Release Capsules
Methylphenidate Hydrochloride Extended-Release Tablets
Metoprolol Succinate Extended-Release Tablets
Morphine Sulfate Extended-Release Capsules
Nicotine Transdermal System
Nifedipine Extended-Release Tablets
Nitrofurantoin Capsules
Omeprazole Delayed-Release Capsules
Oxprenolol Hydrochloride Extended-Release Tablets
Oxtriphylline Extended-Release Tablets
Pentoxifylline Extended-Release Tablets
Phenylpropanolamine Hydrochloride Extended-Release Capsules
Phenylpropanolamine Hydrochloride Extended-Release Tablets
Pilocarpine Ocular System
Procainamide Hydrochloride Extended-Release Tablets
Progesterone Intrauterine Contraceptive System
Propranolol Hydrochloride Extended-Release Capsules
Propranolol Hydrochloride and Hydrochlorothiazide Extended-Release Capsules
Pseudoephedrine Hydrochloride Extended-Release Capsules
Pseudoephedrine Hydrochloride Extended-Release Tablets
Quinidine Gluconate Extended-Release Tablets
Quinidine Sulfate Extended-Release Tablets
Sulfasalazine Delayed-Release Tablets
Theophylline Extended-Release Capsules
Trihexyphenidyl Hydrochloride Extended-Release Capsules
Verapamil Hydrochloride Extended-Release Tablets

•TEST 1—•5
Medium: water; 900 mL.
Apparatus 2: 50 rpm.
Times: 1, 4, and 8 hours.
Procedure—Determine the amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 298 nm, using a 1.0-cm cell, on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Bupropion Hydrochloride RS in the same *Medium.*
Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to ~~*Acceptance Table 1* ⟨724⟩~~

•*Acceptance Table 2.*•2

Time (hours)	Amount dissolved
1	between 25% and 45%
4	between 60% and 85%
8	not less than 80%

•TEST 2—If the product complies with this test, the labeling indicates that it meets ~~USP *Drug release Test 2.*~~

•USP *Dissolution Test 2.*•2
Medium: 0.1 N hydrochloric acid, pH 1.5; 900 mL.
Apparatus 1: 50 rpm.
Times: 1, 2, 4, and 6 hours.
Determine the percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved by employing the following method.

Buffer solution—Dissolve 3.45 g of sodium phosphate monobasic monohydrate in 996 mL of water, add 4.0 mL of triethylamine, and mix. Adjust with phosphoric acid to a pH of 2.80 ± 0.05.
Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and methanol (65 : 35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).
Standard solution—Dissolve an accurately weighed quantity of USP Bupropion Hydrochloride RS in *Medium,* and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration similar to the one expected in the *Test solution.*
Test solution—Use portions of the solution under test, and pass through a 0.45-µm nylon filter.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 298-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 2000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.
Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of bupropion hydrochloride dissolved at each time point.
Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to ~~*Acceptance Table 1* ⟨724⟩~~

•*Acceptance Table 2.*•2

Time (hours)	Amount dissolved
1	between 25% and 50%
2	between 40% and 65%

BRIEFING

Carbamazepine Tablets, *USP 28* page 342—See briefing under *Aspirin Delayed-Release Capsules.*

(BPC: W. Brown) RTS—42035-46

Change to read:

Dissolution ⟨711⟩—

FOR PRODUCTS LABELED AS 100-MG CHEWABLE TABLETS:

TEST 1— If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.

Medium: water containing 1% sodium lauryl sulfate; 900 mL.

Apparatus 2: 75 rpm.

Time: 60 minutes.

Procedure—Determine the amount of $C_{15}H_{12}N_2O$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 288 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Carbamazepine RS in the same *Medium.* [NOTE—A volume of methanol not exceeding 1% of the final total volume of the Standard solution may be used to dissolve the carbamazepine.]

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 60 minutes. Use ~~the *Acceptance Table* under *Dissolution* ⟨711⟩;~~

•*Acceptance Table 1,*•2
with the following exceptions: at S_2, no unit is less than Q – 5%; at S_3, no unit is less than Q – 10%; and not more than 2 of the 24 units are less than Q – 5%.

TEST 4— If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

Medium: 0.1 N hydrochloric acid containing 1% sodium lauryl sulfate; 225 mL. Add 2 drops of simethicone to each.

Apparatus 3: ~~(see *Drug release* ⟨724⟩.)~~

••2
35 dips per minute; use 20-mesh screen on the top of the reciprocating cylinder and a 100-mesh screen on the bottom of the reciprocating cylinder.

Time: 60 minutes.

Procedure—Determine the amount of $C_{15}H_{12}N_2O$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 284 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Carbamazepine RS in the same *Medium*.

Tolerances—Not less than 70% *(Q)* of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 60 minutes, the acceptance criteria specified for *Test 1* being used.

FOR PRODUCTS LABELED AS 200-MG TABLETS:

TEST 2— If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium, *Apparatus*, and *Procedure*—Proceed as directed for *Test 1*.

Times and *Tolerances*—Between 45% and 75% of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 15 minutes; not less than 75% *(Q)* of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 60 minutes. Use ~~*Acceptance Table 1* under *Drug Release* ⟨724⟩;~~

•*Acceptance Table 2,*•2
with the following exceptions: at 15 minutes—at L_2, no unit is more than 5% outside the stated range; at L_3, no unit is more than 10% outside the stated range; and not more than 2 of the 24 units are more than 5% outside the stated range. At 60 minutes—at L_2, no unit is less than Q – 5%; at L_3, no unit is less than Q – 10%; and not more than 2 of the 24 units are less than Q – 5%.

TEST 3— If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium, *Apparatus*, and *Procedure*—Proceed as directed for *Test 1*.

Times and *Tolerances*—Between 60% and 85% of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 15 minutes; not less than 75% *(Q)* of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 60 minutes. Use ~~*Acceptance Table 1* under *Drug Release* ⟨724⟩;~~

•*Acceptance Table 2,*•2
with the following exceptions: at 15 minutes—at L_2, no unit is more than 5% outside the stated range; at L_3, no unit is more than 10% outside the stated range; and not more than 2 of the 24 units are more than 5% outside the stated range. At 60 minutes—at L_2, no unit is less than Q – 5%; at L_3, no unit is less than Q – 10%; and not more than 2 of the 24 units are less than Q – 5%.

BRIEFING

Clonidine Transdermal System, *USP 28* page 515—See briefing under *Aspirin Delayed-Release Capsules.*

(BPC: W. Brown) RTS—42035-53

Change to read:

Drug release ⟨724⟩—

Medium: 0.001 M phosphoric acid; 80 mL for systems containing 5 mg or less of clonidine; 200 mL for systems containing more than 5 mg of clonidine.

Times: 8, 24, 96, and 168 hours.

Apparatus 7—Proceed as directed in the chapter, using the transdermal system holder-angled disk (see *Figure 7a*). The appropriate size of the holder, 1.42 or 1.98 inches, should be chosen based on the size of the system to prevent overhang. Use 100-mL beakers for *Medium* volumes of 80-mL and 300-mL beakers for *Medium* volumes of 200 mL. Gently press the transdermal system to a dry, smooth, square piece of cellulose membrane*, or equivalent, with the adhesive side against the membrane. Attach the membrane/system to a suitable inert sample holder with a Viton O-ring, or equivalent, such that the backing of the system is adjacent to, and centered on, the bottom of the sample holder. Trim the excess of cellulose membrane with scissors. Suspend each sample holder from the arm of a reciprocating shaker such that each system is continuously immersed in a beaker containing the specified volume of *Medium.* The filled beakers are weighed and pre-equilibrated to 32.0 ± 0.3° prior to immersing the test sample. Agitate the sample in an up-down motion at a frequency of 30 cycles per minute with an amplitude of 2.0 ± 0.1 cm. The *Medium* must be added daily to the beakers during each interval to maintain sample immersion. At the end of each time interval, transfer the test sample to a fresh beaker containing the appropriate volume of *Medium,* weighed and pre-equilibrated to 32.0 ± 0.3°.

Determine the amount of $C_9H_9Cl_2N_3$ released by employing the following method.

Mobile phase—Use a filtered and degassed 0.1% solution of triethylamine in a mixture of water and methanol (70 : 30), adjust with phosphoric acid to a pH of 6.0 ± 0.2. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Prepare a solution of USP Clonidine RS in 0.001 M phosphoric acid having a known concentration of about 10 µg per mL.

Standard solutions—Prepare a minimum of four standard solutions of USP Clonidine RS in 0.001 M phosphoric acid having known concentrations of clonidine similar to those of the *Test solutions.*

Test solutions—At the end of each release interval, allow the beakers to cool to room temperature and make up for evaporative *Medium* losses by adding *Medium* to obtain the original weight. Mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; the capacity factor is not less

* A suitable cellulose membrane is available as Cuprophan 80M, from Membrana GmbH, Oehder Strasse 28, D-42289, Wuppertal, Germany, fax number +49 02 02 60 57 15.

than 0.5; the column efficiency is not less than 2000 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 25 µL) of filtered portions of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Construct a standard curve of concentration (µg per mL) of clonidine in the *Standard solutions* versus peak area by linear regression analysis. The correlation coefficient is not less than 0.995. Calculate the release rate of clonidine by the formula:

$$CV/TA,$$

in which C is the concentration, in µg per mL, of clonidine in the sample obtained from the standard curve; V is the volume, in mL, of the *Medium;* T is the time, in hours; and A is the area, in cm^2, of the transdermal system.

Tolerances—The release rate of $C_9H_9Cl_2N_3$ from the Transdermal System, expressed as µg per hour per cm^2 at the times specified, conforms to ~~*Acceptance Table 4.*~~

•*Acceptance Table 1* under *Drug Release* ⟨724⟩.•₂

Time (hours)	Time for sampling (hours)	Release rate (µg/h/cm^2)
0–8	8	between 7.5 and 16.0
8–24	24	between 1.5 and 4.6
24–96	96	between 1.5 and 4.6
96–168	168	between 1.5 and 3.3

•(Official April 1, 2006)•₂

BRIEFING

Diazepam Extended-Release Capsules, *USP 28* page 619—See briefing under *Aspirin Delayed-Release Capsules*.

(BPC: W. Brown) RTS—42035-54

Change to read:

~~**Drug release** ⟨724⟩~~

•**Dissolution** ⟨711⟩—•₂

Medium: simulated gastric fluid TS, prepared without enzymes; 900 mL.

Apparatus 1: 100 rpm.

Times: 1 hour; 4 hours; 8 hours; 12 hours.

Mobile phase—Prepare a suitable degassed and filtered mixture of methanol and water (65 : 35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Buffer solution—Dissolve 77.1 g of ammonium acetate in water to make 1000 mL of solution, and adjust with ammonium hydroxide to a pH of 8.7.

Standard solution—Dissolve an accurately weighed quantity of USP Diazepam RS in *Medium*, dilute quantitatively with *Medium* to obtain a solution having a known concentration of about 0.15 mg per mL, and mix. Transfer 2.0-, 5.0-, 8.0-, and 10.0-mL aliquots of this solution to separate 100-mL volumetric flasks, add *Medium* to volume, and mix. Pipet 1.0 mL of each solution and 1.0 mL of *Buffer solution* into individual small vials, mix, and allow to stand at room temperature for about 10 minutes.

Test solution—Wrap each Capsule in a coil made from a 10-cm piece of 18-gauge copper wire weighing approximately 750 mg, so that the wire encircles the Capsule 4 times. The Capsule enclosed in the coil remains at the bottom of the basket (it should not float). Filter a portion of the solution under test, obtained at each time interval, through a suitable 0.6-µm porosity filter. Pipet 1.0 mL of each solution and 1.0 mL of *Buffer solution* into individual small vials, mix, and allow to stand at room temperature for about 10 minutes.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and an 8-mm × 10-cm column that contains packing L1. The flow rate is about 5.0 mL per minute. Chromatograph the appropriate *Standard solution*, and record the peak responses as directed for *Procedure:* the tailing factor is not greater than 1.7; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Determine the amount of $C_{16}H_{13}ClN_2O$ dissolved from peak responses of diazepam obtained from the *Test solution* and the *Standard solution*.

Tolerances—The percentage of the labeled amount of $C_{16}H_{13}ClN_2O$ dissolved is within the range stated at each of the following times.

Time (hours)	Amount dissolved
1	between 15% and 27%
4	between 49% and 66%
8	between 76% and 96%
12	between 85% and 115%

BRIEFING

Diclofenac Sodium Delayed-Release Tablets, *USP 28* page 626 and page 1986 of *PF* 30(6) [Nov.–Dec. 2004]—See briefing under *Aspirin Delayed-Release Capsules.*

(BPC: W. Brown) RTS—42035-55

Change to read:

~~**Drug release,** *Method B* ⟨724⟩~~

•**Dissolution** ⟨711⟩—Proceed as directed for *Procedure* for *Method B* under *Apparatus 1 and Apparatus 2, Delayed-Release Dosage Forms.*•2

ACID STAGE—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 2 (paddles constructed of, or coated with, polytef being used): 50 rpm.

Procedure—At the end of 2 hours, remove each Tablet, or the major portion thereof if the Tablet is not intact, from the individual vessels, and subject them to the test in the *Buffer stage*. To the 0.1 N hydrochloric acid remaining in each vessel, add 20.0 mL of 5 N sodium hydroxide, and stir for 5 minutes. Determine the amount of $C_{14}H_{10}Cl_2NNaO_2$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 276 nm on filtered portions of the solution under test in comparison with a Standard solution prepared as follows. Transfer about 68 mg of USP Diclofenac Sodium RS, accurately weighed, to a 100-mL volumetric flask, add 10.0 mL of 0.1 N sodium hydroxide, dilute with water to volume, and mix. Transfer ~~2.0 mL~~

■3.0 mL■2S (*USP28*)

of this solution to a second 100-mL volumetric flask, dilute with a mixture of 0.1 N hydrochloric acid and 5 N sodium hydroxide (900 : 20) to volume, and mix. This Standard solution contains about 13.6 µg of USP Diclofenac Sodium RS per mL.

BUFFER STAGE—

pH 6.8 Phosphate buffer—Dissolve 76 g of tribasic sodium phosphate in water to obtain 1000 mL of solution. Mix 250 mL of this solution with 750 mL of 0.1 N hydrochloric acid, and, if necessary, adjust with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of 6.8 ± 0.05.

Medium: pH 6.8 Phosphate buffer; 900 mL.

Apparatus 2: 50 rpm.

Procedure—At the end of 45 minutes, determine the amount of $C_{14}H_{10}Cl_2NNaO_2$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 276 nm on filtered portions of the solutions under test, suitably diluted with *Medium*, in comparison with a Standard solution prepared as follows. Transfer about 68 mg of USP Diclofenac Sodium RS, accurately weighed, to a 100-mL volumetric flask, add 10.0 mL of 0.1 N sodium hydroxide, dilute with water to volume, and mix. Transfer 3.0 mL of this solution to a second 100-mL volumetric flask, dilute with *Medium*, as obtained in the *Buffer stage,* to volume, and mix. This Standard solution contains about 0.02 mg of USP Diclofenac Sodium RS per mL.

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{14}H_{10}Cl_2NNaO_2$ is dissolved.

BRIEFING

Diltiazem Hydrochloride Extended-Release Capsules, *USP 28* page 655 and page 478 of *PF* 30(2) [Mar.–Apr. 2004]—See briefing under *Aspirin Delayed-Release Capsules.*

(BPC: W. Brown) RTS—42035-56

Change to read:

Labeling—The labeling indicates the ~~*Drug Release Test*~~

•*Dissolution Test*•2 with which the product complies.

•(Official April 1, 2006)•2

Change to read:

~~**Drug release** ⟨724⟩—~~

•**Dissolution** ⟨711⟩—•2

FOR PRODUCTS LABELED FOR DOSING EVERY 12 HOURS—

TEST 1—If the product complies with this test, the labeling indicates that it meets ~~USP *Drug Release Test 1.*~~

•USP *Dissolution Test 1.*•2 Proceed as directed for ~~*Extended Release Articles—General Drug Release Standard* ⟨724⟩.~~

•*Extended-Release Dosage Forms.*•2

Medium: water; 900 mL.

Apparatus 2: 100 rpm.

Times: 3, 9, and 12 hours.

Procedure—Determine the amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 237 nm on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Diltiazem Hydrochloride RS in the same *Medium.*

Harmonization

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to the *Acceptance Table* given.

Acceptance Table

Level	Number Tested	Criteria
L_1	6	No individual value lies outside each of the stated ranges, and no individual value is less than the stated amount at the final test time.
L_2	6	The average value of the 12 units ($L_1 + L_2$) lies within each of the stated ranges and is not less than the stated amount at the final test time. At 3 hours none of the units is outside the range of 10% to 35% of labeled content; at 9 hours none of the units is outside the range of 45% to 95% of labeled content; and at 12 hours none of the units is less than 65% of labeled content at the final test time.
L_3	12	The average value of the 24 units ($L_1 + L_2 + L_3$) lies within each of the stated ranges and is not less than the stated amount at the final test time. At 3 hours not more than 2 of the 24 units are outside the range of 10% to 35% of labeled content, and these two units must be within the range of 5% to 45% of labeled content; at 9 hours not more than 2 of 24 of the units are outside the range of 45% to 95% of labeled content, and these two units must be within the range of 35% to 100% of labeled content; at 12 hours not more than 2 of the 24 units are less than 65% of labeled content at the final test time, and these two units cannot be less than 60% of labeled content at the final test time.

TEST 4—If the product complies with this test, the labeling indicates that it meets ~~USP *Drug Release Test 4.*~~

•USP *Dissolution Test 4.*•$_2$
Medium, Apparatus, and *Procedure*—Proceed as directed under *Test 1.*
Times: 4, 8, 12, and 24 hours.
Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to ~~*Acceptance Table 1* under *Drug Release* ⟨724⟩.~~

•*Acceptance Table 2.*•$_2$

Time (hours)	Amount dissolved
4	between 10% and 25%
8	between 35% and 60%
12	between 55% and 80%
24	not less than 80%

TEST 5—If the product complies with this test, the labeling indicates that it meets ~~USP *Drug Release Test 5.*~~

•USP *Dissolution Test 5.*•$_2$
Medium: 0.05 M phosphate buffer, pH 7.2; 900 mL.
Apparatus 2: 50 rpm.
Procedure—Proceed as directed under *Test 1.*
Times: 1, 3, and 8 hours.
Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to ~~*Acceptance Table 1* under *Drug Release* ⟨724⟩.~~

•*Acceptance Table 2.*•$_2$

Time (hours)	Amount dissolved
1	not more than 15%
3	between 45% and 70%
8	not less than 80%

TEST 10—If the product complies with this test, the labeling indicates that it meets ~~USP *Drug Release Test 10.*~~

•USP *Dissolution Test 10.*•$_2$
Medium: 0.05 M phosphate buffer, pH 6.5; 900 mL. Prepare the buffer employing the following method. Dissolve 7.1 g of anhydrous dibasic sodium phosphate in 1000 mL of water, and adjust with phosphoric acid to a pH of 6.5.
Apparatus 1: 100 rpm.
Procedure—Proceed as directed under *Test 1.*
Times: 1, 6, 9, and 24 hours.
Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to ~~*Acceptance Table 1* under *Drug Release* ⟨724⟩.~~

•*Acceptance Table 2.*•$_2$

Time (hours)	Amount dissolved
1	not more than 10%
6	between 10% and 30%
9	between 34% and 60%
24	not less than 80%

12	not less than 70%
16	not less than 80%

TEST 7—If the product complies with this test, the labeling indicates that it meets ~~USP *Drug Release Test 7.*~~

•USP *Dissolution Test 7.*•$_2$

Medium: pH 4.2 acetate buffer; 900 mL. Prepare the buffer by employing the following method. Transfer 115 mL of acetic acid to a 10-L volumetric flask, dilute with water to volume, and mix (Solution A). Transfer 165.4 g of anhydrous sodium acetate to a 10-L volumetric flask, dilute with water to volume, and mix (Solution B). Mix 4410 mL of Solution A with 1590 mL of Solution B. Adjust, if necessary, with the addition of Solution A or Solution B to a pH of 4.2 ± 0.05.

Apparatus 2: 100 rpm.

Times: 1, 4, 10, and 15 hours.

Procedure—Determine the amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 237 nm on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration ofUSP Diltiazem Hydrochloride RS in the same *Medium.*

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to ~~*Acceptance Table 1* under *Drug Release* ⟨724⟩.~~

•*Acceptance Table 2.*•$_2$

Time (hours)	Amount dissolved
1	not more than 10%
4	between 15% and 35%
10	between 65% and 85%
15	not less than 80%

TEST 8—If the product complies with this test, the labeling indicates that it meets ~~USP *Drug Release Test 8.*~~

•USP *Dissolution Test 8.*•$_2$

Medium, Apparatus, and *Procedure*—Proceed as directed under *Test 1.*

Times: 1, 4, 10, and 15 hours.

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to ~~*Acceptance Table 1* under *Drug Release* ⟨724⟩.~~

BRIEFING

Dirithromycin Delayed-Release Tablets, *USP 28* page 676—See briefing under *Aspirin Delayed-Release Capsules.*

(BPC: W. Brown) RTS—42035-57

Change to read:

~~**Drug release,** *Method B* ⟨724⟩—~~

•**Dissolution** ⟨711⟩—Proceed as directed for *Procedure* for *Method B* under *Apparatus 1 and Apparatus 2, Delayed-Release Dosage Forms.*•2
ACID STAGE—
Medium: 0.1 N hydrochloric acid; 900 mL.
Apparatus 1: 10-mesh basket; 100 rpm.

Xanthydrol TS—[NOTE Prepare this solution daily.] To about 150 mg of xanthydrol in a 100-mL volumetric flask, add 10 mL of glacial acetic acid, and swirl to dissolve. Dilute with hydrochloric acid to volume, and mix.

Standard solution—Quantitatively dissolve an accurately weighed quantity of USP Dirithromycin RS in 0.1 N hydrochloric acid to obtain a solution having a known concentration of about 0.28 mg per mL.

Procedure—After 2 hours of operation, remove each Tablet, or the major portion thereof if the Tablet is not intact, from the individual vessel, and subject each Tablet to the test in the *Buffer stage*. Separately add 0.50 mL of acetic anhydride to 0.50 mL of the filtered solution under test and to 0.50 mL of the *Standard solution*, and mix. Add 5.0 mL of glacial acetic acid, allow to stand for 5 minutes, then add 0.50 mL of *Xanthydrol TS*, and allow 30 minutes for color development. Determine the amount of $C_{42}H_{78}N_2O_{14}$, including the 16*R*- and 16*S*-epimers, dissolved by employing UV absorption at the wavelength of maximum absorbance at about 540 nm.

BUFFER STAGE—

Medium: pH 6.8 phosphate buffer; 900 mL.

Procedure—Proceed as directed for *Acid stage* beginning with "Separately add 0.50 mL of acetic anhydride".

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{42}H_{78}N_2O_{14}$, including the 16*R*- and 16*S*-epimers, is dissolved in 45 minutes.

•(Official April 1, 2006)•2

•*Dissolution Test 1*•2

pH 2.5, 0.1 M Phosphate buffer—Dissolve 272 g of monobasic potassium phosphate in 20 L of water, and adjust with hydrochloric acid to a pH of 2.50 ± 0.04. [NOTE—Do not adjust back to pH 2.50 with base if too much acid is added. It is imperative that the ionic strength of the buffer be controlled.]

Medium: pH 2.5, 0.1 M Phosphate buffer; 1000 mL.

Apparatus 1: 100 rpm.

Times: 1 hour; 2 hours; 5 hours; 12 hours.

Procedure—Filter 10 mL of the solution under test at the required test points. Determine the amount of disopyramide ($C_{21}H_{29}N_3O$) dissolved from UV absorbances at the wavelength of maximum absorbance at about 261 nm of this solution, suitably diluted with *Medium*, if necessary, using *Medium* as the blank, in comparison with a Standard solution having a known concentration of USP Disopyramide Phosphate RS dissolved in *Medium*.

Tolerances—The percentage of the labeled amount of disopyramide ($C_{21}H_{29}N_3O$) dissolved is within the range stated at each of the following times.

Time (hours)	Amount dissolved
1	between 5% and 25%
2	between 17% and 43%
5	between 50% and 80%
12	not less than 85%

•**Dissolution** ⟨711⟩—•2

~~*pH 1.2, 0.08 N Hydrochloric acid*—Add 40 mL of Hydrochloric acid to 5000 mL of water. Adjust with 2 N hydrochloric acid to a pH of 1.2, dilute with water to 6.0 liters, and mix.~~

~~*pH 7.5 Phosphate buffer*—Dissolve 40.83 g of monobasic potassium phosphate and 9.84 g of sodium hydroxide in 5000 mL of water. just with *pH 1.2, 0.08 N Hydrochloric acid* to a pH of 7.5, dilute with water to 6.0 liters, and mix.~~

~~*Medium*—Proceed as directed for *Method B,* observing the following exceptions. Perform *Acid Stage* testing, using 900 mL of *pH 1.2, 0.08 N Hydrochloric acid,* for 1 hour; and perform *Buffer Stage* testing, using 900 mL of *pH 7.5 Phosphate buffer,* for not less than 1 hour.~~

~~*Apparatus 2:* 50 rpm.~~

~~*Times:* 1 and 2 hours.~~

■ACID STAGE—

Medium: 0.08 N hydrochloric acid (prepared by adding 40 mL of hydrochloric acid to 5000 mL of water, adjusting with 2 N hydrochloric acid to a pH of 1.2, and diluting with water to 6000 mL); 900 mL.

Apparatus 2: 50 rpm.

Time: 1 hour.

Procedure—At the end of 1 hour, carefully transfer the Tablet to a dissolution vessel containing the *Medium* of the *Buffer stage*. [NOTE—Do not perform an analysis of the *Medium* in the *Acid stage*.]

BUFFER STAGE—

Medium: pH 7.5 phosphate buffer (prepared by dissolving 40.83 g of monobasic potassium phosphate and 9.84 g of sodium hydroxide in 5000 mL of water, adjusting with 0.08 N hydrochloric acid to a pH of 7.5, and diluting with water to 6000 mL); 900 mL.

Apparatus 2: 50 rpm.

Time: 1 hour.■1S *(USP28)*

Determine the amount of $C_8H_{16}O_2$ dissolved ■in the *Buffer stage*■1S *(USP28)* by employing the following method.

Citrate buffer—Dissolve 0.5 g of citric acid monohydrate and 0.4 g of dibasic sodium phosphate in 1.0 L of water.

Potassium phosphate buffer—Dissolve 6.8 g of monobasic potassium phosphate and 1.7 g of sodium hydroxide in 1.0 L of water. Adjust with phosphoric acid to a pH of 7.4 ± 0.1.

Mobile phase—Prepare a mixture of *Citrate buffer, Potassium phosphate buffer,* and acetonitrile (35 : 35 : 30). Adjust with phosphoric acid to a pH of 3.0 ± 0.1, and mix. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Prepare a solution of USP Valproic Acid RS in the ~~*pH 7.5 Phosphate buffer*~~

■*Medium*■1S *(USP28)* used in the *Buffer stage,* having a known concentration of about 0.12 mg per mL. [NOTE—A volume of acetonitrile not exceeding 10.0% of the total volume may be used to dissolve the USP Valproic Acid RS.]

Test solution—If necessary, dilute a portion of each filtered solution under test with the ~~*pH 7.5 Phosphate buffer*~~

■*Medium*■1S *(USP28)* used in the *Buffer stage* to obtain a solution having a concentration of about 0.12 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 3.9-mm × 15-cm column that contains 4-µm packing L11. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 1000 theoretical plates; the tailing factor is not more that 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of valproic acid ($C_8H_{16}O_2$) dissolved by the formula:

$$900CD(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Valproic Acid RS in the *Standard solution; D* is the dilution factor used to prepare the *Test solution;* and r_U and r_S are the peak areas of valproic acid obtained from the *Test solution* and the *Standard solution,* respectively.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_8H_{16}O_2$ is dissolved in ~~2 hours.~~

ACID STAGE—[NOTE—Conduct the test by transferring the contents of each Capsule to the individual basket units of the apparatus.]

Medium: 0.06 N hydrochloric acid; 900 mL.

Apparatus 1: 50 rpm.

Time: 20 minutes.

Diluting solvent: 0.1 N hydrochloric acid.

Procedure—Determine the amount of $C_{22}H_{24}N_2O_8$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 345 nm on filtered portions of the solution under test, suitably diluted with *Diluting solvent*, in comparison with a Standard solution having a known concentration of about 0.01 mg of USP Doxycycline Hyclate RS per mL in *Diluting solvent*.

Tolerances—Level 1 (6 Capsules tested): No individual value exceeds 50% dissolved. *Level 2* (6 Capsules tested): Not more than 2 individual values of 12 tested are greater than 50% dissolved.

BUFFER STAGE—[NOTE—Conduct this stage of testing on separate specimens, selecting Capsules that were not previously subjected to *Acid-stage* testing and transferring the contents of each Capsule to the individual basket units of the apparatus.]

Medium: pH 5.5 neutralized phthalate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 1000 mL.

Apparatus 1: 50 rpm.

Time: 30 minutes.

Diluting solvent: 0.1 N hydrochloric acid.

Procedure—Determine the amount of $C_{22}H_{24}N_2O_8$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 345 nm on filtered portions of the solution under test, suitably diluted with *Diluting solvent*, in comparison with a Standard solution having a known concentration of about 0.01 mg of USP Doxycycline Hyclate RS per mL in *Diluting solvent*.

Tolerances—Not less than 85% *(Q)* of the labeled amount of $C_{22}H_{24}N_2O_8$ is dissolved in 30 minutes.

•**Dissolution** ⟨711⟩—Proceed as directed for *Procedure* for *Method B* under *Apparatus 1 and Apparatus 2, Delayed-Release Dosage Forms.*•2

Apparatus 1: 50 rpm.

Times: 60 minutes for *Acid Stage;* 60 minutes for *Buffer Stage*.

Procedure—Transfer the contents of 1 Capsule to the apparatus. Proceed as directed for *Acid Stage*, 900 mL of 0.06 N hydrochloric acid being placed in the vessel instead of 1000 mL of 0.1 N hydrochloric acid, and the apparatus being operated for 60 minutes instead of 2 hours. Do not perform an analysis at the end of the *Acid stage*. Continue as directed for *Buffer Stage*, 900 mL of the pH 6.8 phosphate buffer being used instead of 1000 mL. Determine the amount of $C_{37}H_{67}NO_{13}$ dissolved after 120 minutes by assaying a filtered portion of the solution under test as directed under *Antibiotics—Microbial Assays* ⟨81⟩.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{37}H_{67}NO_{13}$ is dissolved in 120 minutes.

•(Official April 1, 2006)•2

TEST 1— If the product complies with this test, the labeling indicates that it meets USP ~~*Drug Release Test 1.*~~

•USP *Dissolution Test 1.*•2
Apparatus 1: 100 rpm.
Times: 60 minutes, Stage 1; 60 minutes, Stage 2.
Acid stage—Using 900 mL of simulated gastric fluid TS (prepared without pepsin) in place of 0.1 N hydrochloric acid, conduct this stage of the test for 1 hour, and do not perform an analysis of the medium.
Buffer stage—Using 900 mL of 0.05 M pH 6.8 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*), conduct this stage of the test for 60 minutes.
Test solution—If necessary, dilute a filtered portion of the solution under test with *Dissolution Medium* to obtain a solution having a concentration of about 0.28 mg of erythromycin per mL, and mix.
Procedure—Transfer a 2.0-mL portion of the *Test solution* to a suitable separator. Add 6 mL of pH 1.2 buffer (see *Solutions* in the section *Reagents*, *Indicators*, *and Solutions*), and 8 mL of a solution of bromocresol purple, prepared by dissolving 1 g of bromocresol purple in 1 L of pH 4.5 phosphate buffer, and mix. Extract with 40.0 mL of chloroform. Determine the amount of $C_{37}H_{67}NO_{13}$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 410 nm using the chloroform extracts. Similarly prepare a Standard solution, having a known concentration of USP Erythromycin RS, and treat similarly.
TEST 2— If the product complies with this test, the labeling indicates that it meets ~~USP *Drug Release Test 2.*~~

TEST 1 (for products labeled as 0.3-, ▲0.45-,▲*USP28* and 0.625-mg tablets)—If the product complies with this test, the labeling indicates that it meets ~~USP *Drug Release Test 1.*~~

•USP *Dissolution Test 1.*•2
Medium: water; 900 mL.
Apparatus 2: 50 rpm.
Mobile phase—Prepare a filtered and degassed mixture of 0.025 M monobasic potassium phosphate and acetonitrile (3 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).
Standard solution—Transfer 10 Tablets to a 1000-mL volumetric flask, dilute with water to volume, and stir vigorously by mechanical means for at least 3 hours. Pipet a filtered 100-mL aliquot of the solution into a 900-mL volumetric flask, and dilute with water to volume.
Test solution—Filter a portion of the solution under test. [NOTE—It is recommended that the filters selected be tested for binding affinity.]
Chromatographic system—The liquid chromatograph is equipped with a 205-nm detector and a 4.6-mm × 3.0-cm column that contains 3-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph replicate injections of the *Standard solution,* and record the responses as directed for *Procedure:* the relative retention times are about 0.9 for equilin sulfate and 1.0 for estrone sulfate, the estrone sulfate peak being the last major peak in the chromatogram; the resolution, *R,* between equilin sulfate and estrone sulfate is not less than 1.5; and the relative standard deviation for the estrone sulfate peak is not more than 1.5%. [NOTE—If estrone is present it may be retained on the column for a period longer than 50 minutes and interfere in later chromatographic runs.]
Procedure—Separately inject equal volumes (between 20 and 200 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the estrone sulfate peaks. Calculate the percentage of estrone sodium sulfate released by the formula:

$$100(r_U/r_S),$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively.

•**Dissolution** ⟨711⟩—•2

▲*Medium:* pH 6.5 phosphate buffer with 1% of sodium lauryl sulfate (Transfer 206 mL of 1 M monobasic sodium phosphate monohydrate, 196 mL of 0.5 M dibasic sodium phosphate anhydrous, and 50.0 g of sodium lauryl sulfate to a 5000-mL volumetric flask. Add approximately 4000 mL of water, and mix well. If necessary, adjust with 1 N sodium hydroxide to a pH of 6.5. Dilute with water to volume, and mix well); 500 mL.

Apparatus 2: 50 rpm.

Times: 2, 6, and 10 hours.

Buffer solution—Prepare as directed in the *Assay.*

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution,* acetonitrile, and methanol (2 : 2.5 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Dissolve an accurately weighed quantity of USP Felodipine RS in alcohol to obtain a solution having a known concentration of 0.25 mg per mL.

Standard solution—Dilute an accurately measured volume of the *Standard stock solution* quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration of USP Felodipine RS equivalent to the concentration that would result from about 60% dissolution of a single Tablet in 500 mL of *Medium.*

Test solution—Place each Tablet in a specially made quadrangular basket of stainless steel wire gauze, soldered in one of its upper, narrow sides to the end of a steel rod (see *Figure 1*). Place the tablet cover in the horizontal diagonal of the basket. Put the rod assembly up through the cover of the dissolution vessel, and fix it by means of two teflon nuts, 3.2 cm from the center of the vessel, or by any other appropriate means. Adjust the lower edge of the bottom of the basket to approximately 1 cm above the top of the paddle blade (see *Figure 2*). Orient the large side of the basket tangentially to the flow stream with the Tablet standing on its edge. Pass a 10-mL portion of the solution under test, obtained at each time interval, through a suitable filter.

Chromatographic system—Proceed as directed in the *Assay.*

Procedure—Separately inject equal volumes (100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of felodipine ($C_{18}H_{19}Cl_2NO_4$) dissolved in the *Medium* by the formula:

$$CD(r_U / r_S),$$

Harmonization

in which C is the concentration, in mg per mL, of USP Felodipine RS in the *Standard solution; D* is the dilution factor used in preparing the *Test solution;* and r_U and r_S are the felodipine peak areas obtained from the *Test solution* and the *Standard solution,* respectively.▲*USP28*

Tolerances—The percentages of the labeled amount of $C_{18}H_{19}ClNO_4$ dissolved at the times specified conform to ~~*Acceptance Table 1*~~ ♣ ~~under *Drug Release* ⟨724⟩~~.▲*USP28*

ACID STAGE—

Acid stage medium: 0.1 N hydrochloric acid; 500 mL.
Apparatus 2: 75 rpm.
Time: 60 minutes.

Procedure—Withdraw a 25-mL aliquot and then proceed immediately as directed for *Test solution* in the *Buffer stage,* leaving the remaining 475 mL in the vessel for use in the *Buffer stage*. Using a filtered portion of the aliquot, determine the amount of $C_{16}H_{14}F_3N_3O_2S$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 306 nm, using *Acid stage medium* as the blank. Concomitantly determine the absorbance of the *Acid stage* test solution in comparison with a solution of USP Lansoprazole RS, having a known concentration equivalent to about 8% of the labeled amount of lansoprazole dissolved per 500 mL of *Acid stage medium.* [NOTE—A volume of methanol not to exceed 0.5% of the total volume of the Standard solution may be used to dissolve USP Lansoprazole RS prior to dilution with *Acid stage medium.*]

Tolerances—Not more than 10% of the labeled amount of $C_{16}H_{14}F_3N_3O_2S$ is dissolved in 60 minutes.

BUFFER STAGE—

Buffer concentrate—Transfer 65.4 g of monobasic sodium phosphate, 28.2 g of sodium hydroxide, and 12 g of sodium dodecyl sulfate to a suitable container, and add enough water to dissolve. Dilute with water to 4 L, and mix well.

Blank solution—Prepare a mixture of *Acid stage medium* and *Buffer concentrate* (19 : 17). Adjust, if necessary, with either phosphoric acid or sodium hydroxide to a pH of 6.8.

Test solution—Add 425 mL of *Buffer concentrate* to the remaining 475 mL of solution in each vessel from the *Acid stage.* Adjust, if necessary, with either phosphoric acid or sodium hydroxide to a pH of 6.8.

Apparatus 2: 75 rpm.

Time: 60 minutes.

Procedure—Determine the amount of $C_{16}H_{14}F_3N_3O_2S$ dissolved in filtered portions of the *Test solution*, using the difference between the absorbances at the wavelengths of about 286 nm and 650 nm, with *Blank solution* as the blank. Concomitantly determine the absorbances of the *Test solution* in comparison with the solution of USP Lansoprazole RS having a known concentration equivalent to about 70% of the labeled amount of lansoprazole dissolved in 900 mL of *Blank solution.* [NOTE—An amount of methanol not to exceed 2% of the total volume of the Standard solution may be used to dissolve USP Lansoprazole RS prior to dilution with *Blank solution.*]

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{16}H_{14}F_3N_3O_2S$ is dissolved in 60 minutes.

•(Official April 1, 2006)•2

obtain a solution having a known concentration of about 10 µg of USP Liothyronine RS per mL. Dilute a portion of this solution quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.5 µg of USP Liothyronine RS per mL.

Test solution—Transfer 20 mL of the solution under test to a centrifuge tube, and centrifuge until a clear supernatant is obtained.

Resolution solution—Prepare a solution of USP Liothyronine RS and USP Levothyroxine RS in *Ammoniated solution* having known concentrations of about 10 µg of each USP Reference Standard per mL. Dilute with water to obtain a concentration of about 0.5 µg of each USP Reference Standard per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 25-cm column that contains packing L10. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure:* the resolution, *R,* between liothyronine and levothyroxine is not less than 3.0. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 4.0%.

Procedure—Separately inject equal volumes (about 200 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of $C_{15}H_{12}I_3NO_4$ dissolved.

Tolerances—Not less than 70% *(Q)* of the labeled amount of $C_{15}H_{12}I_3NO_4$ is dissolved in 45 minutes.

•(Official April 1, 2006)•2

Change to read:

~~**Drug release** ⟨724⟩—~~

•**Dissolution** ⟨711⟩—•$_2$

pH 6.0 Phosphate buffer—Transfer about 43.35 g of monobasic potassium phosphate and 1.65 g of sodium hydroxide to a 2-L volumetric flask. Dissolve in and dilute with water to volume, and mix. Adjust with 1 N sodium hydroxide or phosphoric acid to a pH of 6.0, and mix.

Sodium hydroxide solution—Transfer 133.6 g of sodium hydroxide to a 2-L volumetric flask, dissolve in and dilute with water to volume, and mix.

Media: 0.1 N hydrochloric acid, 500 mL for *Acid stage; pH 6.0 Phosphate buffer*, 900 mL for *Buffer stages*.

Apparatus 2: 100 rpm for *Acid stage* and for *Buffer stage 1;* 50 rpm for *Buffer stage 2*.

Times: 2 hours for *Acid stage;* 1 hour for *Buffer stage 1;* 90 minutes for *Buffer stage 2*.

ACID STAGE—After 2 hours of operation, withdraw an aliquot of the fluid, discard the remaining solution, and retain the Tablets in proper order, so that each will be returned to its respective vessel later on. Blot the Tablets with a paper towel to dry, and proceed immediately as directed for *Buffer stage 1*.

Procedure—Determine the amount of $C_7H_7NO_3$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 302 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Mesalamine RS, equivalent to about 1% of the labeled amount of $C_7H_7NO_3$, in the same *Medium*.

Tolerances—The percentage of the labeled amount of $C_7H_7NO_3$ dissolved from the units tested conforms to the *Acceptance Table* shown below. Continue testing through all levels unless the results conform at an earlier level.

BUFFER STAGE 1—[NOTE—Use buffer that has been equilibrated to a temperature of 37 ± 0.5°.] Transfer *pH 6.0 Phosphate buffer* to each of the dissolution vessels, and place each Tablet from the *Acid stage* into its respective vessel. After 1 hour remove a 50-mL aliquot, and proceed immediately as directed for *Buffer stage 2*.

Procedure—Determine the amount of $C_7H_7NO_3$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 330 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Mesalamine RS, equivalent to about 1% of the labeled amount of $C_7H_7NO_3$, in the same *Medium*.

Tolerances—The percentage of the labeled amount of $C_7H_7NO_3$ dissolved from the units tested conforms to the *Acceptance Table* shown below. Continue testing through all levels unless the results conform at an earlier level.

Acceptance Table

Level	Number Tested	Criteria
L_1	6	No individual value exceeds 1% dissolved.
L_2	6	Average of the 12 units ($L_1 + L_2$) is not more than 1% dissolved, and no individual unit is greater than 10% dissolved.
L_3	12	Average of the 24 units ($L_1 + L_2 + L_3$) is not more than 1% dissolved, and not more than one individual unit is greater than 10% dissolved.

BUFFER STAGE 2—Add 50 mL of *Sodium hydroxide solution* to each dissolution vessel to adjust to a pH of 7.2, and continue the run.

Procedure—Determine the amount of $C_7H_7NO_3$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 332 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Mesalamine RS in the same *Medium*.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_7H_7NO_3$ is dissolved. The requirements are met if the quantities dissolved from the product conform to ~~*Acceptance Table 3* under *Drug Release*⟨724⟩.~~

BRIEFING

Nicotine Transdermal System, *USP 28* page 1371—See briefing under *Aspirin Delayed-Release Capsules.*

(BPC: W. Brown) RTS—42035-11

Change to read:

Drug release ⟨724⟩—

TEST 1—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 1.*

Medium: Phosphoric acid solution (1 in 1000); 250 mL, in a tall-form beaker.

Apparatus 7—Proceed as directed in the chapter, using the transdermal system holder—cylinder ~~(see *Figure 7b*).~~

•(see *Figure 4b*).•$_2$
Center the Transdermal System onto a dry, unused 10-cm × 10-cm piece of Cuprophan dialysis membrane with the adhesive side against the membrane, taking care to eliminate air bubbles between the membrane and the release surface. Attach the membrane to the cylinder using two Parker O-rings, such that one of the borders of the transdermal system is aligned to the groove and it is wrapped around the cylinder. The filled beakers are weighed and pre-equilibrated to 32.0 ± 0.3°, prior to immersing the test sample. Reciprocate at a frequency of about 30 cycles per minute with an amplitude of 2.0 ± 0.1 cm. At the end of each time interval, transfer the test sample to a fresh beaker containing the appropriate volume of *Medium*, weighed and pre-equilibrated to 32.0 ± 0.3°. At the end of each release interval, allow the beakers to cool to room temperature, make up for evaporative losses by adding water to obtain the original weight, and mix. This solution is the final *Test solution*.

Times: 2, 12, and 24 hours.

Determine the amount of $C_{10}H_{14}N_2$ released by employing the following method.

Mobile phase—Transfer 0.2 mL of *N,N*-dimethyloctylamine to a 1-L volumetric flask, add 220 mL of acetonitrile, and mix. Add 300 mL of water, 0.2 mL of glacial acetic acid, 0.20 g of anhydrous sodium acetate, and 0.55 g of sodium 1-dodecanesulfonate, and dilute with water to volume. Mix for 1 hour until clear. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩). [NOTE—Equilibration of the column may take as long as 3 hours.]

Standard solution—Dissolve an accurately weighed quantity of USP Nicotine Bitartrate Dihydrate RS in *Dissolution Medium*, and dilute quantitatively, and stepwise if necessary, with *Dissolution Medium* to obtain a solution having a known concentration of about 0.142 mg of nicotine bitartrate per mL (or 0.046 mg nicotine as free base per mL). [NOTE—About 80 mL of this solution is required to prepare the *System suitability solution.*]

System suitability solution—Transfer 8 mg (free base) of nicotine to a 100-mL volumetric flask, and dissolve in 10 mL of acetonitrile. Add 5 mL of 30 percent hydrogen peroxide, and allow 15 minutes to react. Dilute with *Dissolution Medium* to volume, and mix. Transfer 20 mL of this solution to a 100-mL volumetric flask, dilute with *Standard solution* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the resolution, *R*, between nicotine and any degradation peaks is not less than 1.1; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 50 µL) of filtered portions of the *Standard solution* and the solution under test into the chromatograph, record the chromatograms, and measure the responses for the major peaks.

Tolerances—The amount of $C_{10}H_{14}N_2$ released, as a percentage of the labeled amount of the dose absorbed in vivo, at the times specified below, conforms to ~~*Acceptance Table 4.*~~

•*Acceptance Table 1.*•$_2$

Time (hours)	Amount dissolved
0–2	between 31% and 87%
2–12	between 62% and 191%
12–24	between 85% and 261%

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 2.*

Phosphate buffer—Dissolve 40.0 g of sodium chloride, 1.0 g of potassium chloride, 8.66 g of dibasic sodium phosphate, and 1.0 g of monobasic potassium phosphate in 5 L of water.

Medium: Phosphate buffer; 500 mL.

Apparatus 6: 50 rpm, double-sided tape being used to attach the Transdermal System to the cylinder.

Times: 6 and 24 hours.

Determine the amount of $C_{10}H_{14}N_2$ released by employing the following method.

Mobile phase—Proceed as directed in the *Assay.*

System suitability solution—Transfer 1.0 mL of the *System suitability solution*, prepared as directed in the *Assay*, to a 100-mL volumetric flask, dilute with *Dissolution Medium* to volume, and mix.

Standard solution—Pipet 6.0 mL of the *Standard preparation*, prepared as directed in the *Assay*, into a 50-mL volumetric flask, dilute with *Dissolution Medium* to volume, and mix. Dilute quantitatively and stepwise with *Dissolution Medium* to obtain an appropriate final concentration.

Test solution—At each of the test times, withdraw a 2-mL aliquot of the solution under test. [NOTE—Replace the aliquots withdrawn for analysis with fresh portions of *Medium.*]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 260-nm detector and a 4.6-mm × 12.5-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution* used for the 6-hour interval, and record the peak responses as directed for *Procedure:* the resolution, *R*, between 4,4′-dipyridyl dihydrochloride and nicotine is not less than 5.0; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the filtered portion of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks.

Tolerances—The amount of $C_{10}H_{14}N_2$ released, as a percentage of the labeled amount of the dose absorbed in vivo, at the times specified, conforms to ~~*Acceptance Table 4*~~

•*Acceptance Table 1.*•$_2$

Time (hours)	Amount dissolved
6	between 71% and 157%
24	between 156% and 224%

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 3*.

Medium: water; 900 mL.

Apparatus 5: 50 rpm, the stainless steel disk assembly being replaced with a 5-cm watch glass for an 11-mg Transdermal System and an 8-cm watch glass for a 22-mg Transdermal System.

Times: 1, 2, and 4 hours.

Standard solution—Prepare a solution of USP Nicotine Bitartrate RS in water having a known concentration of nicotine similar to that of the solution under test.

Procedure—Determine the amount of $C_{10}H_{14}N_2$ released by employing UV absorption at the wavelength of maximum absorbance at about 259 nm, in comparison with the *Standard solution*, using water as the blank.

Tolerances—The amount of $C_{10}H_{14}N_2$ released, as a percentage of the labeled amount of the dose absorbed in vivo, at the times specified, conforms to the following *Acceptance Table*.

Acceptance Table

Level	Tested	Criteria
L_1	6	No individual value lies outside each of the stated ranges and no individual value is less than the stated amount at the final test time.
L_2	6	The average value of the 12 units ($L_1 + L_2$) lies within each of the stated ranges and is not less than the stated amount at the final test time; none is more than 5% of the labeled content outside each of the stated ranges; and none is more than 5% of the labeled content below the stated amount at the final test time.
L_3	12	The average value of the 24 units ($L_1 + L_2 + L_3$) lies within each of the stated ranges and is not less than the stated amount at the final test time; not more than 2 of the 24 units are more than 5% of labeled content outside each of the stated ranges; not more than 2 of the 24 units are more than 5% of the labeled content below the stated amount at the final test time; and none of the units is more than 10% of the labeled content outside each of the stated ranges or more than 10% of the labeled content below the stated amount at the final test time.

TEST 4—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 4*.

Medium: 0.025 N hydrochloric acid; 600 mL.

Apparatus 5: 50 rpm, a convex screen being used to hold the Transdermal System in position during testing.

Times: 4 and 16 hours.

Standard solution and *Procedure*—Proceed as directed for *Procedure* in *Test 3*.

Tolerances—The amount of $C_{10}H_{14}N_2$ released, as a percentage of the labeled amount of the dose absorbed in vivo, at the times specified, conforms to ~~*Acceptance Table 4*~~

•*Acceptance Table 1.*•$_2$

Time (hours)	Amount dissolved
4	between 36% and 66%

~~**Drug release** ⟨724⟩—~~

•**Dissolution** ⟨711⟩—•2
TEST 1—If the product complies with this test, the labeling indicates that it meets ~~USP *Drug Release Test 1.*~~

•USP *Dissolution Test 1.*•2
Medium: water; 500 mL.
Apparatus 7

•(see *Drug Release* ⟨724⟩):•2

■15 to 30 cycles per minute.■1S (*USP28*)
Do not use the reciprocating disk, but use a 25-cm plexiglas rod, the perimeter of the Tablets being affixed to the rod with a water-insoluble glue. The solution containers are 25-mm test tubes, 150 to 200 mm in length, and the water bath is maintained at 37 ± 0.5°.

■At the end of each specified test interval, the systems are transferred to the next row of new test tubes containing 50 mL of fresh *Medium*.■1S (*USP28*)
Times: 4, ~~12, and 24 hours.~~

■8, 12, 16, 20, and 24 hours.■1S (*USP28*)
~~*Diluting solution 1:* a mixture of methanol and acetonitrile (1 : 1).~~
~~*Diluting solution 2:* a mixture of *Diluting solution 1* and water (1 : 1).~~

■*Diluting solution:* a mixture of methanol and water (1 : 1).■1S (*USP28*)
Standard solutions—Transfer about 50 mg of USP Nifedipine RS, accurately weighed, to a 100-mL volumetric flask, dissolve in 50 mL of ~~*Diluting solution 1,*~~

■methanol,■1S (*USP28*)
dilute with water to volume, and mix to obtain a Standard stock solution. Quantitatively dilute this Standard stock solution with ~~*Diluting solution 2* to obtain solutions having known concentrations of 0.01 mg per mL, 0.05 mg per mL, and 0.20 mg per mL that are used at 4 hours, 12 hours, and 24 hours, respectively.~~

■*Diluting solution* to obtain solutions having suitable known concentrations.

Test solution—Use portions of the solution under test, passed through a 0.4-µm filter, suitably diluted with methanol, and stepwise, if necessary, with *Diluting solution* to obtain a final mixture consisting of equal parts of methanol and water.■1S (*USP28*)
Procedure—~~[NOTE—For the 4-hour time period, filter, determine the absorbance at 456 nm, and use this determination to correct for excipient interference at the other time periods.] Determine the amount of $C_{17}H_{18}N_2O_6$ released at each 4-hour interval by employing UV absorption at the wavelength of maximum absorbance at about 338 nm, in 0.5-cm cells. Use test solutions that are suitably diluted, if necessary, with *Diluting solution 1* and water to obtain a final mixture of water, methanol, and acetonitrile (2 : 1 : 1) in comparison with the appropriate *Standard solution,* using *Diluting solution 2* as the blank.~~

■Determine the amount of $C_{17}H_{18}N_2O_6$ released in the *Test solution* at each 4-hour interval by employing UV absorption at the wavelength of maximum absorbance at about 338 nm, in 0.5-cm cells. [NOTE—For the 4-hour time period, determine the absorbance at 456 nm, and use this determination to correct for excipient interference.]■1S (*USP28*)
Tolerances—The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$), released in vivo and dissolved at the times specified, conform to ~~*Acceptance Table 1.*~~

•*Acceptance Table 2.*●2

~~Time (hours)~~	~~Amount dissolved~~
~~4~~	~~between 5% and 17%~~
~~12~~	~~between 43% and 80%~~
~~24~~	~~not less than 80%~~

■

Time (hours)	Amount dissolved*
4	between 5% and 17%
8	—
12	between 43% and 80%
16	—
20	—
24	not less than 80%

* The amount dissolved is expressed in terms of the labeled tablet strength rather than in terms of the labeled total contents.■1S (*USP28*)

TEST 2—If the product complies with this test, the labeling indicates that it meets ~~USP *Drug Release Test 2.*~~

•USP *Dissolution Test 2.*●2

Buffer concentrate—Transfer 330.9 g of dibasic sodium phosphate and 38 g of citric acid to a 1-L volumetric flask, add water to dissolve, add 10 mL of phosphoric acid, dilute with water to volume, and mix.

Medium—Mix 125.0 mL of *Buffer concentrate* and 1 L of 10% sodium lauryl sulfate solution, and dilute to 10 L. Adjust if necessary to a pH of 6.8; 900 mL.

Apparatus 2: 50 rpm, with sinkers (see *Figure 1*).

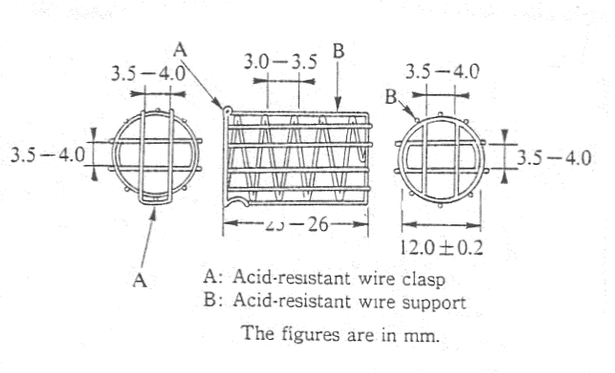

Fig. 1 (printed with permission of the Japanese Pharmacopoeia)

Times: 3, 6, and 12 hours.

Determine the amount of nifedipine ($C_{17}H_{18}N_2O_6$) dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (70 : 30). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Nifedipine RS in methanol to obtain a solution having a known concentration of about 1.11 mg per mL. Dilute quantitatively and stepwise with *Medium* to obtain a solution having a known concentration of 0.1 mg per mL.

Chromatographic system—The liquid chromatograph is equipped with a 350-nm detector and a 4.0-mm × 125-mm column that contains 3-µm packing L1. The flow rate is about 1.5 mL per minute. The column is maintained at about 40°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 2000 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of filtered portions of the *Standard solution* and the solution under test into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Determine the amount of nifedipine ($C_{17}H_{18}N_2O_6$) dissolved.

Tolerances—The percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$) released in vivo and dissolved at the times specified conform to ~~*Acceptance Table 1.*~~

•*Acceptance Table 2.*●2

Time (hours)	Amount dissolved
3	between 10% and 30%
6	between 40% and 65%
12	not less than 80%

TEST 3—If the product complies with this test, the labeling indicates that it meets ~~USP *Drug Release Test 3.*~~

•USP *Dissolution Test 3.*●2

FOR TABLETS LABELED TO CONTAIN 30 MG OF NIFEDIPINE—

Phase 1:

Medium: 0.05 M phosphate buffer, pH 7.5;

■900 mL.■1S (*USP28*)

Apparatus 2: 100 rpm.

Time: 1 hour.

Standard solution—Prepare a solution in *Medium* having an accurately known concentration of about 0.034 mg of USP Nifedipine RS per mL. [NOTE—If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.]

Procedure—[NOTE—After the run, take the Tablet out of the dissolution vessel, adapt a sinker to it, and transfer the Tablet with the sinker to the dissolution vessel containing the *Medium* for *Phase 2*.] Determine the amount of $C_{17}H_{18}N_2O_6$ released in *Phase 1* from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the *Standard solution*, using the *Medium* as the blank.

Phase 2:

Medium: 0.5% sodium lauryl sulfate in simulated gastric fluid without enzyme, pH 1.2; 900 mL.

Apparatus 2: 100 rpm.

Times: 1, 4, 8, and 12 hours.

Standard solution—Prepare a solution in *Medium* having an accurately known concentration of about 0.034 mg of USP Nifedipine RS per mL. [NOTE—If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.]

Procedure—Determine the amount of $C_{17}H_{18}N_2O_6$ released in *Phase 2* from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the *Standard solution*, using *Medium* as the blank.

Tolerances—The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$), released in vivo and dissolved at the times specified, conform to ~~*Acceptance Table 1.*~~

•*Acceptance Table 2.*•2

Time (hours)	Amount dissolved*
1	not more than 30%
4	between 30% and 55%
8	not less than 60%
12	not less than 80%

* For each dosage unit, add the amount dissolved in phosphate buffer, pH 7.5 from *Phase 1* to the amount dissolved at each time point in *Phase 2*.

FOR TABLETS LABELED TO CONTAIN 60 MG OF NIFEDIPINE—

Phase 1:

Medium: 0.05 M phosphate buffer, pH 7.5;

■900 mL.■1S (*USP28*)

Procedure—[NOTE—After the run, take the Tablet out of the dissolution vessel, adapt a sinker to it, and transfer the Tablet with the sinker to the dissolution vessel containing the *Medium* for *Phase 2.*] Determine the amount of $C_{17}H_{18}N_2O_6$ released in *Phase 1* from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the *Standard solution*, using the *Medium* as the blank.

Apparatus 2: 100 rpm.

Time: 25 minutes.

Standard solution—Prepare a solution in *Medium* having an accurately known concentration of about 0.067 mg of USP Nifedipine RS per mL. If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.

Phase 2:

Medium: 0.5% sodium lauryl sulfate in simulated gastric fluid without enzyme, pH 1.2; 900 mL.

Apparatus 2: 100 rpm.

Times: 1, 4, 8, and 12 hours.

Standard solution—Prepare a solution in *Medium* having an accurately known concentration of about 0.067 mg of USP Nifedipine RS per mL. [NOTE—If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.]

Procedure—Determine the amount of $C_{17}H_{18}N_2O_6$ released in *Phase 2* from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the *Standard solution*, using *Medium* as the blank.

Tolerances—The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$), released in vivo and dissolved at the times specified, conform to ~~*Acceptance Table 1.*~~

•*Acceptance Table 2.*•2

Time (hours)	Amount dissolved*
1	not more than 30%
4	between 40% and 70%
8	not less than 70%
12	not less than 80%

* For each dosage unit, add the amount dissolved in phosphate buffer, pH 7.5 from *Phase 1* to the amount dissolved at each time point in *Phase 2*.

TEST 4—If the product complies with this test, the labeling indicates that the product meets ~~USP *Drug Release Test 4.*~~

•USP *Dissolution Test 4.*•2

Medium: 0.5% sodium lauryl sulfate in simulated gastric fluid without enzyme, pH 1.2; 900 mL.

Apparatus 2: 100 rpm.

Times: 1, 4, and 12 hours.

Standard solution—Prepare a solution in *Medium* having an accurately known concentration of about 0.067 mg of USP Nifedipine RS per mL for Tablets labeled to contain 60 mg, and of about 0.034 mg of USP Nifedipine RS per mL for Tablets labeled to contain 30 mg. [NOTE—If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.]

Procedure—Determine the amount of $C_{17}H_{18}N_2O_6$ released from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the *Standard solution*, using the *Medium* as the blank.

BRIEFING

Nitrofurantoin Capsules, *USP 28* page 1381—See briefing under *Aspirin Delayed-Release Capsules.*

(BPC: W. Brown) RTS—42035-2

Change to read:

Dissolution ⟨711⟩—

TEST 1 (where it is labeled as containing Nitrofurantoin macrocrystals)—

Medium: pH 7.2 (±0.05) phosphate buffer; 900 mL.

Harmonization

Apparatus 1: 100 rpm.
Times: 1, 3, and 8 hours.
Procedure—Determine the amount of $C_8H_6N_4O_5$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 375 nm on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Nitrofurantoin RS in the same *Medium.*
Tolerances—The percentage of the labeled amount of $C_8H_6N_4O_5$ dissolved at the 1-hour point conforms to ~~*Acceptance Table 1* under *Drug Release* ⟨724⟩;~~

•*Acceptance Table 2,*•
and the percentages dissolved at the 3- and 8-hour points conform to the criteria for the final test time in ~~*Acceptance Table 1* under *Drug Release* ⟨724⟩.~~

•*Acceptance Table 2.*•

Time (hours)	Amount dissolved
1	between 20% and 60%
3	not less than 45%
8	not less than 60%

TEST 2 (where it is labeled as containing both Nitrofurantoin macrocrystalline and monohydrate forms). If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*
Acid medium: 0.01 N hydrochloric acid for 1 hour; 900 mL.
pH 7.5 Buffer medium—Prepare a pH 7.5 buffer concentrate by dissolving 62.2 g of potassium hydroxide and 129.3 g of monobasic potassium phosphate in water, dilute with water to 1 L, and mix. After 1 hour change the *Acid medium* to *pH 7.5 Buffer medium* by adding 50 mL of pH 7.5 buffer concentrate, for an additional 6 hours.
Apparatus 2: 100 rpm, with sinkers made of teflon-coated steel wire prepared by forming a coil approximately 22 mm long from a 13-cm length of 20-gauge wire (see *Figure 1*).

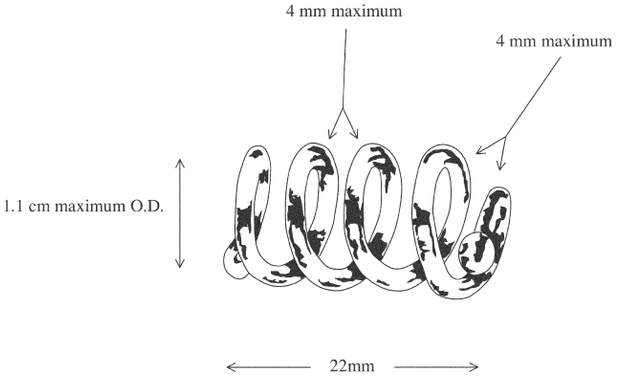

Fig. 1. Sinker.

Times: 1, 3, and 7 hours.
Acid-stage standard solution—Prepare a solution of USP Nitrofurantoin RS in *Acid medium* to obtain a solution having a known concentration of about 0.025 mg per mL.
Buffer-stage standard solution—Prepare a solution of USP Nitrofurantoin RS in *pH 7.5 Buffer medium* to obtain a solution having a known concentration of about 0.075 mg per mL.
Procedure—Determine the amount of $C_8H_6N_4O_5$ dissolved from UV absorbances at the isosbestic wavelength at about 375 nm on filtered portions of each solution under test, suitably diluted, if necessary, with *Acid medium* or *pH 7.5 Buffer medium* when appropriate in comparison with the appropriate *Standard solution.*
Tolerances—The percentages of the labeled amount of $C_8H_6N_4O_5$ dissolved at the specified times conform to the accompanying *Acceptance Table.*

Time (hours)	Amount dissolved (individual)	Amount dissolved (mean)
1	between 2% and 16%	between 5% and 13%
3	between 27% and 69%	between 39% and 56%
7	not less than 68%	not less than 81%

Acceptance Table

Level	Number Tested	Criteria
L_1	12	The mean percentage of dissolved label claim lies within the range for the means at each interval and is not less than the stated amount at the final test time. All individual values lie within the ranges for the individuals at each interval and are not less than the stated amount at the final test time.
L_2	12	The mean percentage of dissolved label claim lies within the range for the means at each interval and is not less than the stated amount at the final test time. Not more than 2 of the 24 individual values lie outside the stated ranged for individuals at each interval, and not more than 2 of 24 are less than the stated amount at the final test time.

•(Official April 1, 2006)•

BRIEFING

Omeprazole Delayed-Release Capsules, *USP 28* page 1417 and page 143 of *PF* 30(1) [Jan.–Feb. 2004]—See briefing under *Aspirin Delayed-Release Capsules.*

Labeling—When more than one ~~*Drug Release* test~~

•*Dissolution Test*•2
is given, the labeling states the ~~*Drug Release* test~~

•*Dissolution Test*•2
used only if *Test 1* is not used.

•(Official April 1, 2006)•2

Change to read:

~~**Drug release**~~

•**Dissolution** ⟨711⟩—•2
TEST 1~~, METHOD A ⟨724⟩~~—

••2
ACID RESISTANCE STAGE—
Medium: 0.1 N hydrochloric acid; 500 mL.
Apparatus 2: 100 rpm.
Time: 2 hours.
pH 7.6 Phosphate buffer, Mobile phase, and *Chromatographic system*—Proceed as directed for *Buffer stage.*
Standard solution—Transfer about 50 mg of USP Omeprazole RS, accurately weighed, to a 250-mL volumetric flask, dissolve in 50 mL of alcohol, dilute with 0.01 M sodium borate solution to volume, and mix. Transfer 10.0 mL of this solution into a 100-mL volumetric flask, add 20 mL of alcohol, dilute with 0.01 M sodium borate solution to volume, and mix.
Test solution—After 2 hours, filter the *Dissolution Medium* containing the pellets through a sieve with an aperture of not more than 0.2 mm. Collect the pellets on the sieve, and rinse them with water. Using approximately 60 mL of 0.01 M sodium borate solution, carefully transfer the pellets quantitatively to a 100-mL volumetric flask. Sonicate for about 20 minutes until the pellets are broken up. Add 20 mL of alcohol to the flask, dilute with 0.01 M sodium borate solution to volume, and mix. Dilute an appropriate amount of this solution with 0.01 M sodium borate solution to obtain a solution having a concentration of about 0.02 mg per mL.

•At level L_1, test 6 units. Test 6 additional units at level L_2, and at level L_3, an additional 12 units are tested. Continue testing through the three levels unless the results conform at either L_1 or L_2.•2
Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of omeprazole ($C_{17}H_{19}N_3O_3S$) dissolved in the *Medium* by the formula:

$$T - CD(r_U / r_S),$$

in which T is the labeled quantity, in mg, of omeprazole in the capsule; C is the concentration, in mg per mL, of USP Omeprazole RS in the *Standard solution; D* is the dilution factor used in preparing the *Test solution;* and r_U and r_S are the omeprazole peak responses obtained from the *Test solution* and the *Standard solution,* respectively.
Tolerances—Level L_1: no individual value exceeds 15% of omeprazole dissolved. Level L_2: the average of 12 units is not more than 20% of omeprazole dissolved, and no individual unit is greater than 35% of omeprazole dissolved. Level L_3: the average of 24 units is not more than 20% of omeprazole dissolved, not more than 2 units are greater than 35% of omeprazole dissolved, and no individual unit is greater than 45% of omeprazole dissolved.
BUFFER STAGE—
Medium: pH 6.8 phosphate buffer, 900 mL.
Proceed as directed for *Acid resistance stage* with a new set of capsules from the same batch. After 2 hours, add 400 mL of 0.235 M dibasic sodium phosphate to the 500 mL of 0.1 N hydrochloric acid medium in the vessel. Adjust, if necessary, with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of 6.8 ± 0.05.
Apparatus 2: 100 rpm.
At the end of 30 minutes, determine the amount of $C_{17}H_{19}N_3O_3S$ dissolved in pH 6.8 phosphate buffer by employing the following method.
pH 10.4, 0.235 M Dibasic sodium phosphate—Dissolve 33.36 g of anhydrous dibasic sodium phosphate in 1000 mL of water, and adjust with 2 N sodium hydroxide to a pH of 10.4 ± 0.1.
pH 6.8 Phosphate buffer—Add 400 mL of 0.1 N hydrochloric acid to 320 mL of *pH 10.4, 0.235 M Dibasic sodium phosphate,* and adjust with 2 N hydrochloric acid or 2 N sodium hydroxide, if necessary, to a pH of 6.8 ± 0.05.
pH 7.6 Phosphate buffer—Dissolve 0.718 g of monobasic sodium phosphate and 4.49 g of dibasic sodium phosphate in 1000 mL of water. Adjust with 2 N hydrochloric acid or 2 N sodium hydroxide, if necessary, to a pH of 7.6 ± 0.1. Dilute 250 mL of this solution with water to 1000 mL.
Mobile phase—Transfer 340 mL of acetonitrile to a 1000-mL volumetric flask, dilute with *pH 7.6 Phosphate buffer* to volume, and pass through a membrane filter having a 0.5-µm or finer porosity. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).
Standard solution 1 (for Capsules labeled 10 mg)—Dissolve an accurately weighed quantity of USP Omeprazole RS in alcohol to obtain a solution having a known concentration of about 2 mg per mL. Dilute with *pH 6.8 Phosphate buffer* quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.01 mg per mL. Immediately add 2 mL of 0.25 M sodium hydroxide to 10 mL of this solution, and mix. [NOTE—Do not allow the solution to stand before adding the sodium hydroxide solution.]
Standard solution 2 (for Capsules labeled 20 mg and 40 mg)—Proceed as directed for *Standard solution 1,* except to obtain a solution having a known concentration of about 0.02 mg per mL before mixing with 2 mL of 0.25 M sodium hydroxide.
Test solution 1 (for Capsules containing 10 mg and 20 mg)—Immediately transfer 5.0 mL of the solution under test to a test tube containing 1.0 mL of 0.25 M sodium hydroxide. Mix well, and pass through a membrane filter having a 1.2-µm or finer porosity. Protect from light.
Test solution 2 (for Capsules labeled 40 mg)—Immediately transfer 5.0 mL of the solution under test to a test tube containing 2.0 mL of 0.25 M sodium hydroxide and 5 mL of *pH 6.8 Phosphate buffer.* Mix well, and pass through a membrane filter having a 1.2-µm or finer porosity. Protect from light.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.0-mm × 12.5-cm analytical column that contains 5-µm packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the appropriate *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 2000 theoretical plates, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the appropriate *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of omeprazole ($C_{17}H_{19}N_3O_3S$) dissolved by the formula:

$$VCD(r_U/r_S),$$

in which V is the volume of *Medium* in each vessel; C is the concentration, in mg per mL, of USP Omeprazole RS in the appropriate *Standard solution; D* is the dilution factor used in preparing the appropriate *Test solution;* and r_U and r_S are the omeprazole peak responses obtained from the appropriate *Test solution* and the *Standard solution,* respectively.

Tolerances—For Capsules labeled 10 and 20 mg, not less than 75% *(Q)* of the labeled amount of $C_{17}H_{19}N_3O_3S$ is dissolved in 30 minutes. For Capsules labeled 40 mg, not less than 70% (*Q*) of the labeled amount of $C_{17}H_{19}N_3O_3S$ is dissolved in 30 minutes.

•The requirements are met if the quantities dissolved from the product conform to *Acceptance Table 1.*•2

TEST 2 —⟨~~711~~⟩

••2

If the product complies with this test, the labeling indicates that it meets ~~USP *Drug Release Test 2.*~~

•USP *Dissolution Test 2.*•2

ACID RESISTANCE STAGE—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 1: 100 rpm.

Time: 2 hours.

Procedure—After 2 hours, remove each sample from the basket, and quantitatively transfer into separate volumetric flasks to obtain a solution having a final concentration of about 0.2 mg per mL. Proceed as directed for the *Assay preparation* in the *Assay,* starting with "Add about 50 mL of *Diluent*". Calculate the quantity, in mg, of omeprazole ($C_{17}H_{19}N_3O_3S$) dissolved in the *Medium* by the formula:

$$T - CD(r_U/r_S)$$

in which T is the assayed quantity, in mg, of omeprazole in the capsule; C is the concentration, in mg per mL, of USP Omeprazole RS in the *Standard solution; D* is the dilution factor used in preparing the *Test solution;* and r_U and r_S are the omeprazole peak responses obtained from *Test solution* and *Standard solution,* respectively.

Tolerances—It complies with the following *Acceptance Table:*

Acceptance Table

Level	Criterion
L_1	the average of the 6 units is not more than 10% of omeprazole dissolved
L_2	the average of the 12 units is not more than 10% of omeprazole dissolved
L_3	the average of the 24 units is not more than 10% of omeprazole dissolved

BUFFER STAGE—

Medium: 0.05 M pH 6.8 phosphate buffer; 900 mL (see *Reagents, Indicators, and Solutions*).

Apparatus 1: 100 rpm.

Time: 45 minutes.

Procedure—Proceed as directed for *Acid resistance stage* with a new set of capsules from the same batch. After 2 hours, replace the acid medium with the buffer medium and continue the test for 45 more minutes. Determine the amount of $C_{17}H_{19}N_3O_3S$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 305 nm on portions of the solutions under test passed through a 0.2-µm nylon filter, in comparison with a Standard solution having a known concentration of USP Omeprazole RS in the same *Medium.*

Tolerances—It complies with ~~the *Acceptance Table*~~

•*Acceptance Table 1*•2

under *Dissolution* ⟨711⟩. Not less than 75% *(Q)* of the labeled amount of $C_{17}H_{19}N_3O_3S$ is dissolved in 45 minutes.

BRIEFING

Oxprenolol Hydrochloride Extended-Release Tablets, *USP 28* page 1431—See briefing under *Aspirin Delayed-Release Capsules.*

(BPC: W. Brown) RTS—42035-4

Change to read:

~~**Drug release** ⟨724⟩~~—

•**Dissolution** ⟨711⟩—•2

Acid medium: 0.1 N hydrochloric acid; 900 mL.

Dissolution medium: simulated intestinal fluid TS (without enzyme); 900 mL.

Apparatus 1: 100 rpm.

Times: 1 hour in *Acid medium;* 1, 3, and 7 hours in *Dissolution medium*.

Procedure—Determine the amount of $C_{15}H_{23}NO_3 \cdot HCl$ dissolved from UV absorbances at the wavelength of maximum absorption at about 272 nm of the first solution under test, suitably diluted with *Acid medium*, in comparison with a Standard solution having a known concentration of USP Oxprenolol Hydrochloride RS in the same medium. Promptly transfer the basket containing the Tablet to *Dissolution medium*. After 1, 3, and 7 hours, respectively, remove 9.0 mL of the test solution and determine the amount of $C_{15}H_{23}NO_3 \cdot HCl$ dissolved from UV absorbances at the wavelength of maximum absorption at about 272 nm of the solution under test, suitably diluted with *Dissolution medium*, in comparison with a Standard solution having a known concentration of USP Oxprenolol Hydrochloride RS in the same medium. [NOTE—Replace the aliquots withdrawn for analysis with fresh portions of *Dissolution medium*.]

Tolerances—The percentages of the labeled amount of $C_{15}H_{23}NO_3 \cdot HCl$ dissolved at the times specified conform to ~~*Acceptance Table 1.*~~

•*Acceptance Table 2.*•2

Time (hours)	Amount dissolved
1, in *Acid medium*	between 15% and 45%
1, in *Dissolution medium*	between 30% and 60%
3, in *Dissolution medium*	between 50% and 80%
7, in *Dissolution medium*	not less than 75%

TEST 1— If the product complies with this test, the labeling indicates that it meets ~~USP *Drug Release Test 1.*~~

•USP *Dissolution Test 1.*•$_2$
Medium: water; 1000 mL.
Apparatus 1: 100 rpm.
Times: 3, 6, and 12 hours.
Determine the amount of $C_9H_{13}NO \cdot HCl$ dissolved by employing the following method.
Solvent A—Dissolve 1.9 g of sodium 1-hexanesulfonate in 700 mL of water, add 50 mL of 1 M monobasic sodium phosphate and 20 mL of 0.25 N triethylammonium phosphate (prepared by mixing 500 mL of a solution containing 25.3 g of triethylamine and 500 mL of a solution containing 9.6 g of phosphoric acid), and mix. Dilute with water to 1 L, and mix.
Mobile phase—Prepare a filtered and degassed mixture of *Solvent A* and methanol (100 : 82). Make adjustments if necessary (see *System Suitablity* under *Chromatography* ⟨621⟩).
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate

is about 1.5 mL per minute. Chromatograph replicate injections of a Standard solution, and record the peak responses as directed for *Procedure:* the tailing factor for the analyte peak is not more than 1.5, and the relative standard deviation for replicate injections is not more than 2%.

Procedure—Inject an accurately measured volume (about 50 µL) of a filtered portion of the solution under test into the chromatograph, record the chromatogram, and measure the response for the major peak. Calculate the quantity of $C_9H_{13}NO \cdot HCl$ dissolved by comparison with a Standard solution having a known concentration of USP Phenylpropanolamine Hydrochloride RS in the same medium and similarly chromatographed.

Tolerances—The percentages of the labeled amount of $C_9H_{13}NO \cdot HCl$ dissolved at the times specified conform to ~~*Acceptance Table 1.*~~

BRIEFING

Pilocarpine Ocular System, *USP 28* page 1560—See briefing under *Aspirin Delayed-Release Capsules*.

(BPC: W. Brown) RTS—42035-7

Change to read:

Drug release pattern—Place each of the Ocular Systems in suitable porous holders made of an inert material, and suspend each from a nickel wire. To the upper end of the wire attach a tag identifying the specimen. Put each assembly into a test tube containing 27.0 mL of saline TS so that the system lies at the bottom of the tube and the identifying tag extends from the open top of the tube. Put the tubes into a horizontally reciprocating shaker in which the temperature is maintained at $37 \pm 0.5^\circ$. Agitate the tubes with a horizontal amplitude of about 4 cm and a frequency of about 35 cycles per minute. At 7, 24, 48, 72, 96, and 168 hours, remove the assemblies from their tubes, and each time replace them in similar tubes containing 27.0 mL of fresh saline TS. Determine the amount of pilocarpine in solution in each tube, after adjusting the volume to 27.0 mL to make up for any evaporative losses, by measuring the UV absorbance in 1-cm cells at the wavelength of maximum absorbance at about 215 nm, with a suitable spectrophotometer, against saline TS as the blank. Concomitantly measure the absorbance of a Standard solution of USP Pilocarpine Hydrochloride RS having a known concentration of about 20 µg in each mL of saline TS. Calculate the quantity, in µg, of $C_{11}H_{16}N_2O_2$ in each solution taken by the formula:

$$(208.26 / 244.72)(A_U / A_S)27C,$$

in which 208.26 and 244.72 are the molecular weights of pilocarpine and pilocarpine hydrochloride, respectively; A_U and A_S are the absorbances of the test solution and the Standard solution, respectively; and C is the concentration, in µg per mL, of USP Pilocarpine Hydrochloride RS in the Standard solution. Calculate the amount of pilocarpine released in 168 hours by adding the pilocarpine content of each set of tubes collected over 168 hours.

Tolerances—The amount of $C_{11}H_{16}N_2O_2$ from each Ocular System released during the total 0 to 168 hours tested conforms to ~~*Acceptance Table 4*~~

•*Acceptance Table 1*•$_2$

under *Drug Release* ⟨724⟩. The drug release range for this time period is not less than 80.0% and not more than 120.0% of the labeled release pattern.

•(Official April 1, 2006)•2

Progesterone Intrauterine Contraceptive System, *USP 28* page 1636—See briefing under *Aspirin Delayed-Release Capsules.*

(BPC: W. Brown) RTS—42035-25

Change to read:

Drug release pattern—Remove the attached sutures from 10 Systems, and secure each system to a corrosion-resistant wire of sufficient length such that the systems are completely immersed during the shaking operation but do not touch the bottoms of the flasks. Suspend each system by the attached wire from the arm of a mechanical shaker designed to travel 2.5 cm in each direction in a

vertically reciprocating cycle, at a speed of 2.5 cycles per second, so that each system is immersed in a separate 250-mL volumetric flask containing 230 mL of water, pre-equilibrated to 60 ± 0.1°. Immerse the volumetric flasks in an insulated constant-temperature water bath, maintained at 60 ± 0.1° and having a suitable means of maintaining the water level, so that the water level of the bath is above the water level in the flasks. Employ a rack or other suitable means of support for the flasks in the water bath.

Operate the shaker under the conditions described above for 23.5 hours, then remove the flasks and the systems from the bath. Remove the systems from the flasks, and immerse each system in a different flask containing 230 mL of water, pre-equilibrated to 60 ± 0.1°, and immerse these flasks in the water bath. Repeat this shaking operation daily for 12 days, using different flasks each day.

Determine the quantity of progesterone in the solutions from each of the 12 days of testing as follows. Immediately add 15 mL of methanol to each solution, allow to cool to room temperature, dilute with water to volume, and mix. Concomitantly determine the UV absorbances of each test solution and of a solution of USP Progesterone RS in the same medium, having a known concentration of about 7 µg per mL, in 2-cm cells at the wavelength of maximum absorbance at about 248 nm, with a suitable spectrophotometer, against a blank of water and methanol (47 : 3). Calculate the progesterone release rate, in mg per day, in the solutions taken by the formula:

$$(A_U / A_S)(24 / 23.5)0.25C,$$

in which A_U and A_S are the absorbances of the test solution and the Standard solution, respectively; and C is the concentration, in µg per mL, of USP Progesterone RS in the Standard solution. For the time points specified, the drug-release pattern conforms to ~~*Acceptance Table 4*~~

•*Acceptance Table 1*•2
under *Drug Release* ⟨724⟩.

Day	Release Rate (mg per day)
6	1.05–1.45
9	0.95–1.35
12	0.90–1.30

pH 1.5 Buffer solution, pH 6.8 Buffer solution, Media, and *Apparatus*—Proceed as directed in the test for ~~*Drug release*~~

•*Dissolution*•
under *Propranolol Hydrochloride Extended-Release Capsules*.

Analytical method—Determine the amounts of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) and propranolol hydrochloride ($C_{16}H_{21}NO_2 \cdot HCl$) dissolved, using the following method.

Stock standard solution A—Prepare a solution of USP Propranolol Hydrochloride RS in dilute hydrochloric acid (1 in 100) having a known concentration of about 0.4 mg per mL.

Stock standard solution B—Dissolve an accurately weighed quantity of USP Hydrochlorothiazide RS in 0.25 N sodium hydroxide to obtain a solution having a concentration of about 25 mg per mL. Quantitatively dilute this solution with water to obtain a solution having a known concentration of about 0.5 mg per mL.

Standard solution—Prepare, by combining aliquots of *Stock standard solutions*, *A* and *B*, and diluting with dilute hydrochloric acid (1 in 100), solutions bracketing the expected concentration of the samples at the various time points.

Times: 30 minutes; 1.5 hours; 4 hours; 8 hours; 14 hours; 24 hours.

Procedure—Use an automatic analyzer consisting of a liquid sampler, a proportioning pump, two UV spectrophotometers, and a manifold consisting of the components illustrated in the diagram under *Automated Methods of Analysis* ⟨16⟩. Start the sampler and conduct determinations at a rate of 30 per hour, using a ratio of about 1 : 1 for the sample to wash time. Calculate the amounts of $C_7H_8ClN_3O_4S_2$ and $C_{16}H_{21}NO_2 \cdot HCl$ dissolved by comparison with the *Standard solution.*

Tolerances (*Hydrochlorothiazide*)—Use ~~*the Acceptance Table under Dissolution* ⟨711⟩~~.

•*Acceptance Table 1.*•
Not less than 80% *(Q)* of the labeled amount of $C_7H_8ClN_3O_4S_2$ is dissolved in 30 minutes.

Tolerances (*Propranolol Hydrochloride*)—The percentages of the labeled amount of $C_{16}H_{21}NO_2 \cdot HCl$ dissolved at the times specified conform to ~~*Acceptance Table 1* under *Drug Release* ⟨724⟩~~.

•*Acceptance Table 2.*•

FOR PRODUCTS LABELED FOR DOSING EVERY 12 HOURS—
TEST 1—
Medium: water; 900 mL.
Apparatus 2: 50 rpm.
Times: 1, 3, and 6 hours.
Standard solution—Dissolve an accurately weighed quantity of USP Pseudoephedrine Hydrochloride RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.13 mg per mL.
Procedure—Determine the amount of $C_{10}H_{15}NO \cdot HCl$ dissolved by employing the procedure set forth in the *Assay.* Separately inject equal volumes (about 50 µL) of the *Standard solution* and the filtered solution under test. Calculate the amount of $C_{10}H_{15}NO \cdot HCl$ dissolved per Tablet.
Times and *Tolerances*—

•The percentage of the labeled amount of $C_{10}H_{15}NO \cdot HCl$ dissolved at the times given conforms to *Acceptance Table 2.*•[2]

Time (hours)	Amount dissolved
1	between 25% and 45%
3	between 50% and 75%
6	not less than 75%

TEST 3—If the product complies with this test, the labeling indicates that it meets ~~USP *Drug Release Test 3.*~~

•USP *Dissolution Test 3.*•[2]
Medium, Apparatus, and *Times*—Proceed as directed for *Test 1.*
Procedure—Determine the amount of $C_{10}H_{15}NO \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 214 nm on portions of the solution under test, filtered through a 0.45-µm filter and suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Pseudoephedrine Hydrochloride RS in the same *Medium.*
Times and *Tolerances*—

•The percentage of the labeled amount of $C_{10}H_{15}NO \cdot HCl$ dissolved at the times given conforms to *Acceptance Table 2.*•[2]

Time (hours)	Amount dissolved

3	between 60% and 80%
6	not less than 80%

FOR PRODUCTS LABELED FOR DOSING EVERY 24 HOURS—
TEST 2—If the product complies with this test, the labeling indicates that it meets ~~USP *Drug Release Test 2.*~~

•USP *Dissolution Test 2.*•[2]
Medium: 0.9% sodium chloride in water; 50 mL.
Apparatus 7

•(see *Drug Release* ⟨724⟩):•[2]

30 cycles per minute; 2–3 cm amplitude. To prepare the sample, see *Figure 1* below that illustrates the following steps:

1. Place one Tablet on a 5- × 5-cm nylon netting.
2. Fold netting over the Tablet. Continue folding until the Tablet is enclosed in netting.
3. Fold netting so that the two open ends meet. The Tablet should be enveloped in the center of the netting.
4. Insert rod ~~(see *Figure 7c* under *Drug Release* ⟨724⟩.)~~

•(see *Figure 4c* under *Drug Release* ⟨724⟩)•2 through netting to secure the Tablet.

5. Secure netting with HPLC plastic ferrules or other appropriate device. Trim the excess netting. Attach each sample holder to the vertically reciprocating sample holder.

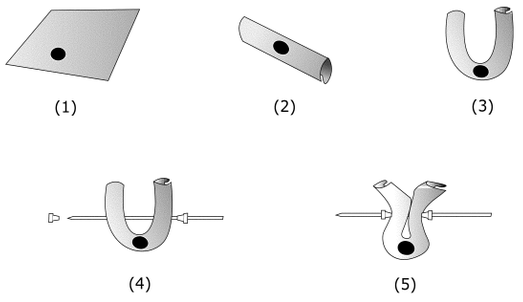

Fig. 1

Times: 2, 8, 14, and 24 hours.

Determine the amount of $C_{10}H_{15}NO \cdot HCl$ dissolved by employing the following method.

0.05 M Phosphate buffer, pH 6.8—Transfer 200 mL of water to a 1000-mL volumetric flask. Add 3.4 mL of phosphoric acid and 5 mL of triethylamine. Add water to almost 900 mL. Adjust with 1 N sodium hydroxide to a pH of about 6.8, dilute with water to volume, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *0.05 M Phosphate buffer, pH 6.8* and methanol (9 : 1).

System suitability solution—Dissolve an accurately weighed quantity of USP Pseudoephedrine RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.4 mg per mL.

Standard solutions—Prepare solutions in water having accurately known concentrations of USP Pseudoephedrine Hydrochloride RS in a range around the expected concentration of the solution under test at each time interval.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 5-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the tailing factor for the analyte peak is not more than 2; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solutions* and the solution under test into the chromatograph, record the chromatograms, and measure the responses for the major peak. Construct a calibration curve by plotting the peak response versus concentration of the *Standard solutions*. Determine the amount of $C_{10}H_{15}NO \cdot HCl$ dissolved at each time interval from a linear regression analysis of the calibration curve.

Sulfasalazine Delayed-Release Tablets, *USP 28* page 1834—See briefing under *Aspirin Delayed-Release Capsules.*

(BPC: W. Brown) RTS—42035-36

Change to read:

~~**Drug release,** *Method B* ⟨724⟩~~—

•**Dissolution** ⟨711⟩—Proceed as directed for *Procedure* for *Method B* under *Apparatus 1 and Apparatus 2, Delayed-Release Dosage Forms.*•2

ACID STAGE—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 1: 100 rpm.

Time: 120 minutes.

At the end of 120 minutes, determine the amount of $C_{18}H_{14}N_4O_5S$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water, isopropanol, acetonitrile, and glacial acetic acid (22 : 11 : 7 : 0.4). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Sulfasalazine RS in 0.1 N sodium hydroxide, and dilute quantitatively, and stepwise if necessary, with 0.1 N sodium hydroxide to obtain a solution having a known concentration of about 55.6 µg per mL.

Test solution—Pass about 7 mL of the solution under test through a membrane filter having a 0.45-µm porosity.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the retention time for sulfasalazine is about 7.7 minutes; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Inject a volume (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, and measure the peak responses. Calculate the percentage of $C_{18}H_{14}N_4O_5S$ dissolved by the formula:

$$(900C_S/LC)(r_U/r_S),$$

in which C_S is the concentration, in mg per mL, of USP Sulfasalazine RS in the *Standard solution; LC* is the label claim, in mg; and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively.

Tolerances—Not more than 10% of the labeled amount of $C_{18}H_{14}N_4O_5S$ is dissolved in 120 minutes.

BUFFER STAGE—

Medium: pH 7.5 phosphate buffer; 900 mL.

Apparatus 1: 100 rpm.

Time: 60 minutes.

At the end of 60 minutes, determine the amount of $C_{18}H_{14}N_4O_5S$ dissolved by employing the chromatographic method as described under *Acid stage.*

Tolerances—Not less than 85% *(Q)* of the labeled amount of $C_{18}H_{14}N_4O_5S$ is dissolved in 60 minutes.

•(Official April 1, 2006)•2

Proceed as directed for *Method B* under ~~*Delayed-Release Articles—General Drug Release Standard*~~,except to use ~~*Acceptance Table 1*~~ under ~~*Extended-Release Articles—General Drug Release Standard*~~

•*Apparatus 1 and 2, Delayed-Release Dosage Forms,* except to use *Acceptance Table 2.*•2

Medium: pH 1.2 simulated gastric fluid (without pepsin) for 1 hour; pH 7.5 simulated intestinal fluid (without enzyme); 900 mL.

Apparatus 2: 50 rpm.

Procedure—Proceed as directed under *Test 1.*

Times and *Tolerances*—

•The percentage of the labeled amount of $C_7H_8N_4O_2$ dissolved at the times given conforms to *Acceptance Table 2.*•2

Time (hours)	Amount dissolved
1	between 1% and 17%
2	between 30% and 60%
3	between 50% and 90%
4	not less than 65%
7	not less than 85%

TEST 4—If the product complies with this test, the labeling indicates that it meets ~~USP *Drug Release Test 4*~~

•USP *Dissolution Test 4.*•2

Proceed as directed for *Method A* under ~~*Delayed-Release Articles—General Drug Release Standard*~~, except to use ~~*Acceptance Table 1*~~ under ~~*Extended-Release Articles—General Drug Release Standard*~~

•*Apparatus 1 and 2, Delayed-Release Dosage Forms*, except to use *Acceptance Table 2.*•2

Medium: pH 3.0 phosphate buffer, 0.05 M potassium phosphate buffer adjusted with phosphoric acid to a pH of 3.0 ± 0.05, for the first 3½ hours, followed by the addition of 5.3 M sodium hydroxide to adjust to a pH of 7.4 ± 0.05; 900 mL.

Apparatus 2: 50 rpm.

Procedure—Proceed as directed under *Test 1.*

Times and *Tolerances*—

•The percentage of the labeled amount of $C_7H_8N_4O_2$ dissolved at the times given conforms to *Acceptance Table 2.*•2

Time (hours)	Amount dissolved
1	between 13% and 38%
2	between 25% and 50%
3.5	between 37% and 65%
5	between 85% and 115%

TEST 5—If the product complies with this test, the labeling indicates that it meets ~~USP *Drug Release Test 5.*~~

•USP *Dissolution Test 5.*•2

Medium, *Apparatus*, and *Procedure*—Proceed as directed under *Test 4*.

Times and *Tolerances*—

•The percentage of the labeled amount of $C_7H_8N_4O_2$ dissolved at the times given conforms to *Acceptance Table 2.*•2

Time (hours)	Amount dissolved
1	between 10% and 30%
3.5	between 30% and 60%
5	between 50% and 80%
7	not less than 65%
10	not less than 80%

TEST 7—If the product complies with this test, the labeling indicates that it meets ~~USP *Drug Release Test 7*~~

•USP *Dissolution Test 7.*•2

Phosphate buffer—Dissolve 40.8 g of monobasic potassium phosphate in 6 L of water, add 667 mg of octoxynol 9, mix, and adjust with dilute hydrochloric acid or sodium hydroxide to a pH of 4.5.

Medium: Phosphate buffer; 900 mL.

Apparatus 2: 50 rpm.
Procedure—Proceed as directed under *Test 1*.
Times and *Tolerances*—The percentages of the labeled amount of $C_7H_8N_4O_2$ dissolved at the times specified conform to ~~*Acceptance Table 1*~~

•*Acceptance Table 2.*•$_2$

Time (hours)	Amount dissolved
1	between 10% and 40%
2	between 35% and 70%
4	between 60% and 90%
8	not less than 85%

TEST 8—If the product complies with this test, the labeling indicates that it meets ~~USP *Drug Release Test 8*~~

•USP *Dissolution Test 8.*•$_2$
Medium: pH 7.5 simulated intestinal fluid (without enzyme); 900 mL.
Apparatus 1: 100 rpm.
Procedure—Proceed as directed under *Test 1*.
Times and *Tolerances*—The percentages of labeled amount of $C_7H_8N_4O_2$ dissolved at the times specified conform to ~~*Acceptance Table 1*~~

•*Acceptance Table 2.*•$_2$

~~**Drug release** ⟨724⟩~~—

•**Dissolution** ⟨711⟩—•$_2$
Medium: water; 500 mL.
Apparatus 1: 100 rpm.
Times: 3, 6, and 12 hours.
Determine the amount of $C_{20}H_{31}NO \cdot HCl$ dissolved, using the following method.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, water, and triethylamine (920 : 80 : 0.2), and adjust with phosphoric acid to a pH of 4.0.

Standard preparation—Dissolve an accurately weighed quantity of USP Trihexyphenidyl Hydrochloride RS in water, and dilute quantitatively and stepwise with water to obtain a solution having a known concentration of about 5 µg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 8.3-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the tailing factor for the trihexyphenidyl peak is not more than 2.8, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Dilute the *Standard preparation* and the solution under test with acetonitrile (1 : 1). Separately inject equal volumes (about 20 µL) of these solutions into the chromatograph, record the chromatograms, and measure the responses for trihexyphenidyl. Calculate the percentage of the labeled amount of $C_{20}H_{31}NO \cdot HCl$ HCl dissolved.

Tolerances—The percentages of the labeled amount of $C_{20}H_{31}NO \cdot HCl$ dissolved at the times specified conform to ~~*Acceptance Table 1.*~~

•*Acceptance Table 2.*•

Time (hours)	Amount dissolved
3	between 20% and 50%
6	between 40% and 70%
12	not less than 70%

•(Official April 1, 2006)•

BRIEFING

Verapamil Hydrochloride Extended-Release Tablets, *USP 28* page 2019—See briefing under *Aspirin Delayed-Release Capsules.*

(BPC: W. Brown) RTS—42035-23

Labeling—The labeling indicates the ~~*Drug Release Test*~~

•*Dissolution Test*•
with which the product complies.

•(Official April 1, 2006)•

Change to read:

~~**Drug release** ⟨724⟩—~~

•**Dissolution** ⟨711⟩—•

TEST 1—If the product complies with this test, the labeling indicates that it meets ~~USP *Drug Release Test 1.* Proceed as directed for *Method B* under *Delayed-Release (Enteric-Coated) Articles—General Drug Release Standard*~~

•USP *Dissolution Test 1*. Proceed as directed for *Procedure* for *Method B* under *Apparatus 1 and Apparatus 2, Delayed-Release Dosage Forms.*•

Acid stage—Using 900 mL of simulated gastric fluid TS (without enzyme), conduct this stage of the test for 1 hour.

Buffer stage—Using 900 mL of simulated intestinal fluid TS (without enzyme), conduct this stage of the test for 7 hours.

Apparatus 2: 50 rpm.

Times: Acid stage—1 hour; *Buffer stage*—2, 3.5, 5, and 8 hours.

Procedure—Wrap each Tablet in a wire helix to prevent the Tablets from floating. After 1 hour in the *Acid stage*, withdraw a specimen for analysis, and carefully transfer the dosage form, including the wire helix, to a vessel containing the *Buffer stage* medium, which has been previously warmed to 37 ± 0.5°. Filter a portion of the solution under test at each time interval, using a suitable glass microfiber filter paper. [NOTE—Use only filters that have been shown not to absorb verapamil.] Dilute, if necessary, the filtered portions of the solutions under test with water at the 1-hour interval and with 0.1 N hydrochloric acid at the 2-, 3.5-, 5-, and 8-hour intervals. Determine the amounts of $C_{27}H_{38}N_2O_4 \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 278 nm, using 0.01 N hydrochloric acid as the blank, by comparison with a Standard solution having a known concentration of USP Verapamil Hydrochloride RS in 0.01 N hydrochloric acid.

Tolerances—The percentage of the labeled amount of $C_{27}H_{38}N_2O_4 \cdot HCl$ dissolved at the times specified conforms to ~~*Acceptance Table 1*~~

MONOGRAPHS (NF)

BRIEFING

Butylparaben, *NF 23* page 2969 and page 1431 of *PF* 30(4) [July–Aug. 2004]. The European Pharmacopoeia, a member of the Pharmacopeial Discussion Group, is the coordinating pharmacopeia in the efforts toward the international harmonization of compendial standards for this monograph. The presented text represents the **ADOPTION STAGE 6** draft in the harmonization process.

Pharmacopeial Discussion Group Sign-Off Document

Attributes	EP	JP	USP
Definition	+	+	+
Identification A	+	+	+
Appearance of solution	+	+	+
Acidity	+	+	+
Related substances*	+	+	+
Sulphated ash	+	+	+
Assay	+	+	+

* JP will not include the system suitability requirement and consequently will not include reference solution (b).

Legend: + will adopt and implement; – will not stipulate.

Nonharmonized attributes: Characters, Identification by infrared spectrophotometry, Storage.

Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference materials and reagent specifications.

Local requirements: JP: Heavy metals (20 ppm); USP: Organic volatile impurities.

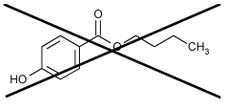
Differences between the **ADOPTION STAGE 6** document and the current *NF* monograph include the following:

(1) In the opening paragraph (the Definition)—Calculations using the dried substance are deleted, as the *Loss on drying* test is deleted. The acceptance range has been widened.
(2) *Packaging and storage*—No change.
(3) *USP Reference standards*—The reference standard for Propylparaben has been added for the *Related substances* test.
(4) *Identification*—The test for *Melting range* has been moved under *Identification*.
(5) *Color of solution*—This test is added to comply with EP standards.
(6) *Melting range*—Moved under *Identification*.
(7) *Acidity*—The EP test method has replaced the current USP method.
(8) *Loss on drying*—Deleted.
(9) *Residue on ignition*—The limits are increased to not more than 0.1% to comply with EP standards.
(10) *Organic volatile impurities*—No change.
(11) *Related substances*—This test is added to comply with EP standards. Corrections are made to the preparation of *Standard solution B* to use USP Propylparaben RS.
(12) *Assay*—The sample amount and the amount of 1 N sodium hydroxide has changed, and the heating process has changed to a specific temperature and does not include refluxing.

(EMC: J. Lane) RTS—41918-1

Change to read:

~~Butylparaben~~



~~$C_{11}H_{14}O_3$~~ ~~194.23~~
~~Benzoic acid, 4-hydroxy-, butyl ester.~~
~~Butyl *p*-hydroxybenzoate [*94-26-8*].~~

~~» Butylparaben contains not less than 99.0 percent and not more than 100.5 percent of $C_{11}H_{14}O_3$, calculated on the dried basis.~~

~~**Packaging and storage**—Preserve in well-closed containers.~~

~~**USP Reference standards** ⟨11⟩—*USP Butylparaben RS.*~~

~~**Identification,** *Infrared Absorption* ⟨197M⟩.~~

~~**Melting range** ⟨741⟩: between 68° and 72°.~~

~~**Acidity**—Heat 0.75 g in 15 mL of water at 80° for 1 minute, cool, and filter: the filtrate is neutral or acid to litmus. To 10 mL of the filtrate add 0.20 mL of 0.10 N sodium hydroxide and 2 drops of methyl red TS: the solution is yellow.~~

~~**Loss on drying** ⟨731⟩—Dry it over silica gel for 5 hours: it loses not more than 0.5% of its weight.~~

~~**Residue on ignition** ⟨281⟩: not more than 0.05%.~~

~~**Organic volatile impurities,** *Method IV* ⟨467⟩: meets the requirements.~~

~~**Assay**—Transfer about 2 g of Butylparaben, accurately weighed, to a flask fitted with a ground-glass stopper and equipped for refluxing under a water-cooled condenser. Add 40.0 mL of 1 N sodium hydroxide VS, and reflux for 1 hour. Cool to room temperature, and rinse the condenser with water. Titrate the excess sodium hydroxide with 1 N sulfuric acid VS, continuing the titration until the second point of inflection and determining the endpoint potentiometrically (see *Titrimetry* ⟨541⟩). Perform a blank determination (see *Residual Titrations* under *Titrimetry* ⟨541⟩). Each mL of 1 N sodium hydroxide is equivalent to 194.2 mg of $C_{11}H_{14}O_3$.~~

Harmonization

▲Butylparaben

$C_{11}H_{14}O_3$ 194.23

Benzoic acid, 4-hydroxy-, butyl ester.

Butyl *p*-hydroxybenzoate [*94-26-8*].

» Butylparaben contains not less than 98.0 percent and not more than 102.0 percent of $C_{11}H_{14}O_3$.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards ⟨11⟩**—***USP Butylparaben RS*. *USP Propylparaben RS*.

Identification—

A: *Infrared Absorption* ⟨197M⟩.

B: *Melting range* ⟨741⟩: between 68° and 71°.

Color of solution—Dissolve 1 g in alcohol, dilute with alcohol to 10 mL, and mix *(Butylparaben solution)*. This solution is clear and not more intensely colored than alcohol or a solution prepared immediately before use by mixing 2.4 mL of ferric chloride CS, 1.0 mL of cobaltous chloride CS, and 0.4 mL of cupric sulfate CS with 0.3 N hydrochloric acid to make 10 mL, and diluting 5 mL of this solution with 0.3 N hydrochloric acid to make 100 mL. Make the comparison by viewing the solutions downward in matched color-comparison tubes against a white surface (see *Color and Achromicity* ⟨631⟩).

Acidity—To 2 mL of *Butylparaben solution* prepared in the *Color of solution* test, add 3 mL of alcohol, 5 mL of carbon dioxide-free water, and 0.1 mL of bromocresol green TS, and titrate with 0.10 N sodium hydroxide: not more than 0.1 mL is required to produce a blue color.

Residue on ignition ⟨281⟩**:** not more than 0.1%, determined on 1.0 g.

Related substances—

Test solution—Prepare a solution of Butylparaben in acetone containing 10 mg per mL.

Standard solutions—Transfer 0.5 mL of the *Test solution* to a 100-mL volumetric flask, dilute with acetone to volume, and mix *(Standard solution A)*. Dissolve 10 mg, accurately weighed, of USP ~~Butylparaben~~ Propylparaben RS in 1 mL of the *Test solution,* and dilute with acetone to 10 mL *(Standard solution B)*.

Procedure—Separately apply 2 µL of the *Test solution* and 2 µL of each *Standard solution* to a thin-layer chromatographic plate (see *Chromatography* ⟨621⟩), coated with a 0.25-mm layer of chromatographic octadecylsilanized silica gel mixture. Develop the chromatogram in a solvent system consisting of a mixture of methanol, water, and glacial acetic acid (70 : 30 : 1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Examine the plate under short-wavelength UV light, and compare the intensities of any secondary spots observed in the chromatogram of the *Test solution* with that of the principal spot in the chromatogram of *Standard solution A:* the intensity of any individual secondary spot in the chromatogram of the *Test solution* is not greater than that of the principal spot obtained in the chromatogram of *Standard solution A* (0.5%). The test is not valid unless the chromatogram obtained with *Standard solution B* shows two clearly separated principal spots.

Organic volatile impurities, *Method IV* ⟨467⟩**:** meets the requirements.

Assay—To about 1.000 g of Butylparaben, accurately weighed, add 20.0 mL of 1 N sodium hydroxide VS, and heat at about 70° for 1 hour. Cool rapidly in an ice bath. Carry out the titration on the solutions at room temperature. Titrate the excess sodium hydroxide with 1 N sulfuric acid VS,

continuing the titration until the second point of inflection and determining the endpoint potentiometrically (see *Titrimetry* ⟨541⟩). Perform a blank determination (see *Residual Titrations* under *Titrimetry* ⟨541⟩). Each mL of 1 N sodium hydroxide is equivalent to 194.2 mg of $C_{11}H_{14}O_3$. ▲*NF24*

GENERAL CHAPTERS

General Tests and Assays

General Requirements for Tests and Assays

BRIEFING

⟨**1**⟩ **Injections,** *USP 28* page 2201. The United States Pharmacopeia is the coordinating pharmacopeia in the efforts toward international harmonization of the specifications provided in this general test chapter. The Parenteral Products—Industrial Expert Committee in conjunction with the Pharmaceutical Discussion Group (PDG) have agreed to harmonize the text for *Determination of Volume of Injection in Containers* within the section *Volume in Container.* The text, which is being published in this issue of *PF* for information only, not for public comment, is scheduled for publication in *USP 29–NF 24* with a scheduled implementation date of **April 1, 2006.**

(PPI: J. Kelly) RTS—41973-2

Change to read:

PACKAGING

Containers for Injections

Containers, including the closures, for preparations for injections do not interact physically or chemically with the preparations in any manner to alter the strength, quality, or purity beyond the official requirements under the ordinary or customary conditions of handling, shipment, storage, sale, and use. The container is made of material that permits inspection of the contents. The type of glass preferable for each parenteral preparation is usually stated in the individual monograph. Unless otherwise specified in the individual monograph, plastic containers may be used for packaging injections (see *Containers* ⟨661⟩).

For definitions of single-dose and multiple-dose containers, see *Containers* in the *General Notices and Requirements.* Containers meet the requirements under *Containers* ⟨661⟩.

Containers are closed or sealed in such a manner as to prevent contamination or loss of contents. Validation of container integrity must demonstrate no penetration of microbial contamination or chemical or physical impurities. In addition, the solutes and the vehicle must maintain their specified total and relative quantities or concentrations when exposed to anticipated extreme conditions of manufacturing and processing, and storage, shipment, and distribution. Closures for multiple-dose containers permit the withdrawal of the contents without removal or destruction of the closure. The closure permits penetration by a needle and, upon withdrawal of the needle, closes at once, protecting the container against contamination. Validation of the multiple-dose container integrity must include verification that such a package prevents microbial contamination or loss of product contents under anticipated conditions of multiple entry and use.

Piggyback containers are usually intravenous infusion containers used to administer a second infusion through a connector of some type or an injection port on the administration set of the first fluid, thereby avoiding the need for another injection site on the patient's body. Piggyback containers are also known as secondary infusion containers.

Potassium Chloride for Injection Concentrate

The use of a black closure system on a vial (e.g., a black flip-off button and a black ferrule to hold the elastomeric closure) or the use of a black band or series of bands above the constriction on an ampul is prohibited, except for *Potassium Chloride for Injection Concentrate.*

Neuromuscular Blocking and Paralyzing Agents

All injectable preparations of neuromuscular blocking agents and paralyzing agents must be packaged in vials with a cautionary statement printed on the ferrules or cap overseals. Both the container cap ferrule and the cap overseal must bear in black or white print (whichever provides the greatest color contrast with the ferrule or cap color) the words: "Warning: Paralyzing Agent" or "Paralyzing Agent" (depending on the size of the closure system). Alternatively, the overseal may be transparent and without words, allowing for visualization of the warning labeling on the closure ferrule.

(Official October 1, 2005)

Containers for Sterile Solids

Containers, including the closures, for dry solids intended for parenteral use do not interact physically or chemically with the preparation in any manner to alter the strength, quality, or purity beyond the official requirements under the ordinary or customary conditions of handling, shipment, storage, sale, and use.

A container for a sterile solid permits the addition of a suitable solvent and withdrawal of portions of the resulting solution or suspension in such manner that the sterility of the product is maintained.

Where the *Assay* in a monograph provides a procedure for the *Assay preparation,* in which the total withdrawable contents are to be withdrawn from a single-dose container with a hypodermic needle and syringe, the contents are to be withdrawn as completely as possible into a dry hypodermic syringe of a rated capacity not exceeding three times the volume to be withdrawn and fitted with a 21-gauge needle not less than 2.5 cm (1 inch) in length, with care being taken to expel any air bubbles, and discharged into a container for dilution and assay.

Volume in Container

Each container of an injection is filled with sufficient excess of the labeled "size" or that volume which is to be withdrawn. See *Injections* under *Pharmaceutical Dosage Forms* ⟨1151⟩.

DETERMINATION OF VOLUME OF INJECTION IN CONTAINERS

Select one or more containers if the volume of the container is 10 mL or more, three or more if the volume is more than 3 mL and less than 10 mL, or five or more if the volume is 3 mL or less. Individually take up the contents of each container selected into a dry hypodermic syringe of a rated capacity not exceeding three times the volume to be measured and fitted with a 21-gauge needle not less than 2.5 cm (1 inch) in length. Expel any air bubbles from the syringe and needle, and then discharge the contents of the syringe, without emptying the needle, into a standardized, dry cylinder (graduated to contain rather than to deliver the designated volumes) of such size that the volume to be measured occupies at least 40% of the cylinder's rated volume. Alternatively, the contents of the syringe may be discharged into a dry, tared beaker, the volume, in mL, being calculated as the weight, in g, of Injection taken divided by its density. ~~The contents of up to five 1- or 2-mL containers may be pooled for the measurement,~~

▲The contents of a sufficient number of containers with a nominal volume of less than or equal to 2 mL may be pooled to obtain a minimum total of 5 mL,▲*USP29* provided that a separate dry syringe assembly is used for each container. The content of containers holding 10 mL or more may be determined by means of opening them and emptying the contents directly into the graduated cylinder or tared beaker.

The volume is not less than the labeled volume in the case of containers examined individually or, in the case of 1- and 2-mL containers, is not less than the sum of the labeled volumes of the containers taken collectively.

For Injections in multiple-dose containers labeled to yield a specific number of doses of a stated volume, proceed as directed in the foregoing, using the same number of separate syringes as the number of doses specified. The volume is such that each syringe delivers not less than the stated dose.

For Injections containing oil, warm the containers, if necessary, and thoroughly shake them immediately before removing the contents. Cool to 25° before measuring the volume.

For Injections in cartridges or prefilled syringes, assemble the container with any required accessories such as a needle or plunger. Following the same procedure as above, and without emptying the needle, transfer the entire contents of each container to a dry, tared beaker by slowly and constantly depressing the plunger. Weigh, and calculate the volume as described above. The volume of each container is not less than the labeled volume.

For large-volume intravenous solutions, select 1 container, and transfer the contents into a dry measuring cylinder of such size that the volume to be measured occupies at least 40% of its rated volume. The volume is not less than the labeled volume.

Printing on Ferrules and Cap Overseals

Only cautionary statements are to be printed on the ferrules and cap overseals of vials containing an injectable drug product. A cautionary statement is one intended to prevent an imminent life-threatening situation if the injectable drug is used inappropriately. Examples of such statements are the following: "Warning", "Dilute Before Using", "Paralyzing Agent", "I.M. Use Only", "Chemotherapy", etc.

The printing must be in contrasting color and conspicuous under ordinary conditions of use. The cautionary statement may be printed solely on the ferrule, provided the cap overseal is constructed so as to allow the cautionary statement below to be readily legible.

(Official October 1, 2005)

Packaging and Storage

The volume of injection in single-dose containers provides the amount specified for parenteral administration at one time and in no case is more than sufficient to permit the withdrawal and administration of 1 L.

Preparations intended for intraspinal, intracisternal, or peridural administration are packaged only in single-dose containers.

Unless otherwise specified in the individual monograph, a multiple-dose container contains a volume of Injection sufficient to permit the withdrawal of not more than 30 mL.

Injections packaged for use as irrigation solutions, for hemofiltration or dialysis, or for parenteral nutrition are exempt from the 1-L restriction of the foregoing requirements relating to packaging.

Containers for Injections packaged for use as hemofiltration or irrigation solutions may be designed to empty rapidly and may contain a volume of more than 1 L.

Injections labeled for veterinary use are exempt from packaging and storage requirements concerning the limitation to single-dose containers and the limitation on the volume of multiple-dose containers.

Change to read:

⟨~~701~~⟩ ~~DISINTEGRATION~~

~~This test is provided to determine compliance with the limits on *Disintegration* stated in the individual monographs except where the label states that the tablets or capsules are intended for use as troches, or are to be chewed, or are designed as modified-release dosage forms (see *Drug Release* ⟨724⟩). Determine the type of units under test from the labeling and from observation, and apply the appropriate procedure to 6 or more dosage units.~~

~~For the purposes of this test, disintegration does not imply complete solution of the unit or even of its active constituent. Complete disintegration is defined as that state in which any residue of the unit, except fragments of insoluble coating or capsule shell, remaining on the screen of the test apparatus is a soft mass having no palpably firm core.~~

~~APPARATUS~~

~~The apparatus consists of a basket-rack assembly, a 1000-mL, low-form beaker, 138 to 155 mm in height and having an inside diameter of 97 to 110 mm for the immersion fluid, a thermostatic arrangement for heating the fluid between 35° and 39°, and a device for raising and lowering the basket in the immersion fluid at a constant frequency rate between 29 and 32 cycles per minute through a distance of not less than 5.3 cm and not more than 5.7 cm. The volume of the fluid in the vessel is such that at the highest point of the upward stroke the wire mesh remains at least 2.5 cm below the surface of the fluid and descends to not less than 2.5 cm from the bottom of the vessel on the downward stroke. The time required for the upward stroke is equal to the time required for the downward stroke, and the change in stroke direction is a smooth transition, rather than an abrupt reversal of motion. The basket-rack assembly moves vertically along its axis. There is no appreciable horizontal motion or movement of the axis from the vertical.~~

~~**Basket-rack Assembly**— The basket-rack assembly consists of six open-ended transparent tubes, each 7.75 ± 0.25 cm long and having an inside diameter of 20.7 to 23 mm and a wall 1.0 to 2.8 mm thick; the tubes are held in a vertical position by two plastic plates, each 8.8 to 9.2 cm in diameter and 5 to 7 mm in thickness, with six holes, each 22 to 26 mm in diameter, equidistant from the center of the plate and equally spaced from one another. Attached to the under surface of the lower plate is a woven stainless steel wire cloth, which has a plain square weave with 1.8- to 2.2-mm mesh apertures and with a wire diameter of 0.63 ± 0.03 mm. The parts of the apparatus are assembled and rigidly held by means of three bolts passing through the two plastic plates. A suitable means is provided to suspend the basket-rack assembly from the raising-and-lowering device using a point on its axis.~~

~~The design of the basket-rack assembly may be varied somewhat provided the specifications for the glass tubes and the screen mesh size are maintained.~~

~~**Disks**— The use of disks is permitted only where specified in the monograph. If specified in the individual monograph, each tube is provided with a cylindrical disk 9.5 ± 0.15 mm thick and 20.7 ± 0.15 mm in diameter. The disk is made of a suitable, transparent plastic material having a specific gravity of between 1.18 and 1.20. Five parallel 2-mm holes extend between the ends of the cylinder. One of the holes is centered on the cylindrical axis. The other holes are centered 6 mm from the axis on imaginary lines perpendicular to the axis and parallel to each other. Four identical trapezoidal-shaped planes are cut into the wall of the cylinder, nearly perpendicular to the ends of the cylinder. The trapezoidal shape is symmetrical; its parallel sides coincide with the ends of the cylinder and are parallel to an imaginary line connecting the centers of two adjacent holes 6 mm from the cylindrical axis. The parallel side of the trapezoid on the bottom of the cylinder has a length of 1.6 mm, and its center lies at a depth of 1.8 mm from the cylinder's circumference. The parallel side of the trapezoid on the top of the cylinder has a length of 9.4 ± 0.2 mm, and its center lies at a depth of 2.6 ± 0.1 mm from the cylinder's circumference. All surfaces of the disk are smooth. If the use of disks is specified in the individual monograph, add a disk to each tube, and operate the apparatus as directed under *Procedure*.~~

~~PROCEDURE~~

~~**Uncoated Tablets**— Place 1 tablet in each of the six tubes of the basket and operate the apparatus, using water maintained at 37 ± 2° as the immersion fluid unless otherwise specified in the individual monograph. At the end of the time limit specified in the monograph, lift the basket from the fluid, and observe the tablets: all of the tablets have disintegrated completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not less than 16 of the total of 18 tablets tested disintegrate completely.~~

~~**Plain-Coated Tablets**— Apply the test for *Uncoated Tablets*, operating the apparatus for the time specified in the individual monograph.~~

~~**Delayed-Release (Enteric-Coated) Tablets**— Place 1 tablet in each of the six tubes of the basket and, if the tablet has a soluble external coating, immerse the basket in water at room temperature for 5 minutes. Then operate the apparatus using simulated gastric fluid TS maintained at 37 ± 2° as the immersion fluid. After 1 hour~~

~~of operation in simulated gastric fluid TS, lift the basket from the fluid, and observe the tablets: the tablets show no evidence of disintegration, cracking, or softening. Operate the apparatus, using simulated intestinal fluid TS maintained at 37 ± 2° as the immersion fluid, for the time specified in the monograph. Lift the basket from the fluid, and observe the tablets: all of the tablets disintegrate completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not less than 16 of the total of 18 tablets tested disintegrate completely.~~

~~**Buccal Tablets**—Apply the test for *Uncoated Tablets.* After 4 hours, lift the basket from the fluid, and observe the tablets: all of the tablets have disintegrated. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not less than 16 of the total of 18 tablets tested disintegrate completely.~~

~~**Sublingual Tablets**—Apply the test for *Uncoated Tablets.* Observe the tablets within the time limit specified in the individual monograph: all of the tablets have disintegrated. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not less than 16 of the total of 18 tablets tested disintegrate completely.~~

~~**Hard Gelatin Capsules**—Apply the test for *Uncoated Tablets.* Attach a removable wire cloth, which has a plain square weave with 1.8- to 2.2-mm mesh apertures and with a wire diameter of 0.60 to 0.655 mm, as described under *Basket-Rack Assembly*, to the surface of the upper plate of the basket-rack assembly. Observe the capsules within the time limit specified in the individual monograph: all of the capsules have disintegrated except for fragments from the capsule shell. If 1 or 2 capsules fail to disintegrate completely, repeat the test on 12 additional capsules: not less than 16 of the total of 18 capsules tested disintegrate completely.~~

~~**Soft Gelatin Capsules**—Proceed as directed under *Hard Gelatin Capsules*.~~

•⟨701⟩ DISINTEGRATION

This general chapter is harmonized with the corresponding texts of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia.* The texts of these pharmacopeias are therefore interchangeable, and the methods of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia* may be used for demonstration of compliance instead of the present general chapter. These pharmacopeias have undertaken not to make any unilateral change to this harmonized chapter.

Portions of the present general chapter text that are national *USP* text, and therefore not part of the harmonized text, are marked with symbols (◆◆) to specify this fact.

This test is provided to determine whether tablets or capsules disintegrate within the prescribed time when placed in a liquid medium at the experimental conditions presented below. ◆Compliance with the limits on *Disintegration* stated in the individual monographs is required except where the label states that the tablets or capsules are intended for use as troches, or are to be chewed, or are designed as extended-release dosage forms or delayed-release dosage forms. Determine the type of units under test from the labeling and from observation, and apply the appropriate procedure to 6 or more dosage units.◆

For the purposes of this test, disintegration does not imply complete solution of the unit or even of its active constituent. Complete disintegration is defined as that state in which any residue of the unit, except fragments of insoluble coating or capsule shell, remaining on the screen of the test apparatus or adhering to the lower surface of the disk, if used, is a soft mass having no palpably firm core.

APPARATUS

The apparatus consists of a basket-rack assembly, a 1000-mL, low-form beaker, 138 to 160 mm in height and having an inside diameter of 97 to 115 mm for the immersion fluid, a thermostatic arrangement for heating the fluid between 35° and 39°, and a device for raising and lowering the basket in the immersion fluid at a constant frequency rate between 29 and 32 cycles per minute through a distance of not less than 53 mm and not more than 57 mm. The volume of the fluid in the vessel is such that at the highest point of the upward stroke the wire mesh remains at least 15 mm below the surface of the fluid and descends to not less than 25 mm from the bottom of the vessel on the downward stroke. At no time should the top of the basket-rack assembly become submerged. The time required for the upward stroke is equal to the time required for the downward stroke, and the change in stroke direction is a smooth transition, rather than

an abrupt reversal of motion. The basket-rack assembly moves vertically along its axis. There is no appreciable horizontal motion or movement of the axis from the vertical.

Basket-Rack Assembly—The basket-rack assembly consists of six open-ended transparent tubes, each 77.5 ± 2.5 mm long and having an inside diameter of 20.7 to 23 mm and a wall 1.0 to 2.8 mm thick; the tubes are held in a vertical position by two plates, each 88 to 92 mm in diameter and 5 to 8.5 mm in thickness, with six holes, each 22 to 26 mm in diameter, equidistant from the center of the plate and equally spaced from one another. Attached to the under surface of the lower plate is a woven stainless steel wire cloth, which has a plain square weave with 1.8- to 2.2-mm apertures and with a wire diameter of 0.57 to 0.66 mm. The parts of the apparatus are assembled and rigidly held by means of three bolts passing through the two plates. A suitable means is provided to suspend the basket-rack assembly from the raising and lowering device using a point on its axis.

The design of the basket-rack assembly may be varied somewhat, provided the specifications for the glass tubes and the screen mesh size are maintained. The basket-rack assembly conforms to the dimensions found in *Figure 1*.

Disks—The use of disks is permitted only where specified or allowed ◆in the monograph. If specified in the individual monograph,◆ each tube is provided with a cylindrical disk 9.5 ± 0.15 mm thick and 20.7 ± 0.15 mm in diameter. The disk is made of a suitable transparent plastic material having a specific gravity of between 1.18 and 1.20. Five parallel 2 ± 0.1-mm holes extend between the ends of the cylinder. One of the holes is centered on the cylindrical axis. The other holes are centered 6 ± 0.2 mm from the axis on imaginary lines perpendicular to the axis and parallel to each other. Four identical trapezoidal-shaped planes are cut into the wall of the cylinder, nearly perpendicular to the ends of the cylinder. The trapezoidal shape is symmetrical; its parallel sides coincide with the ends of the cylinder and are parallel to an imaginary line connecting the centers of two adjacent holes 6 mm from the cylindrical axis. The parallel side of the trapezoid on the bottom of the cylinder has a length of 1.6 ± 0.1 mm, and its bottom edges lie at a depth of 1.6 ± 0.1 mm from the cylinder's circumference. The parallel side of the trapezoid on the top of the cylinder has a length of 9.4 ± 0.2 mm, and its center lies at a depth of 2.6 ± 0.1 mm from the cylinder's circumference. All surfaces of the disk are smooth. If the use of disks is specified ◆in the individual monograph◆, add a disk to each tube, and operate the apparatus as directed under *Procedure*. The disks conform to dimensions found in *Figure 1*.[1]

[1] The use of automatic detection employing modified disks is permitted where the use of disks is specified or allowed. Such disks must comply with the requirements for density and dimension given in this chapter.

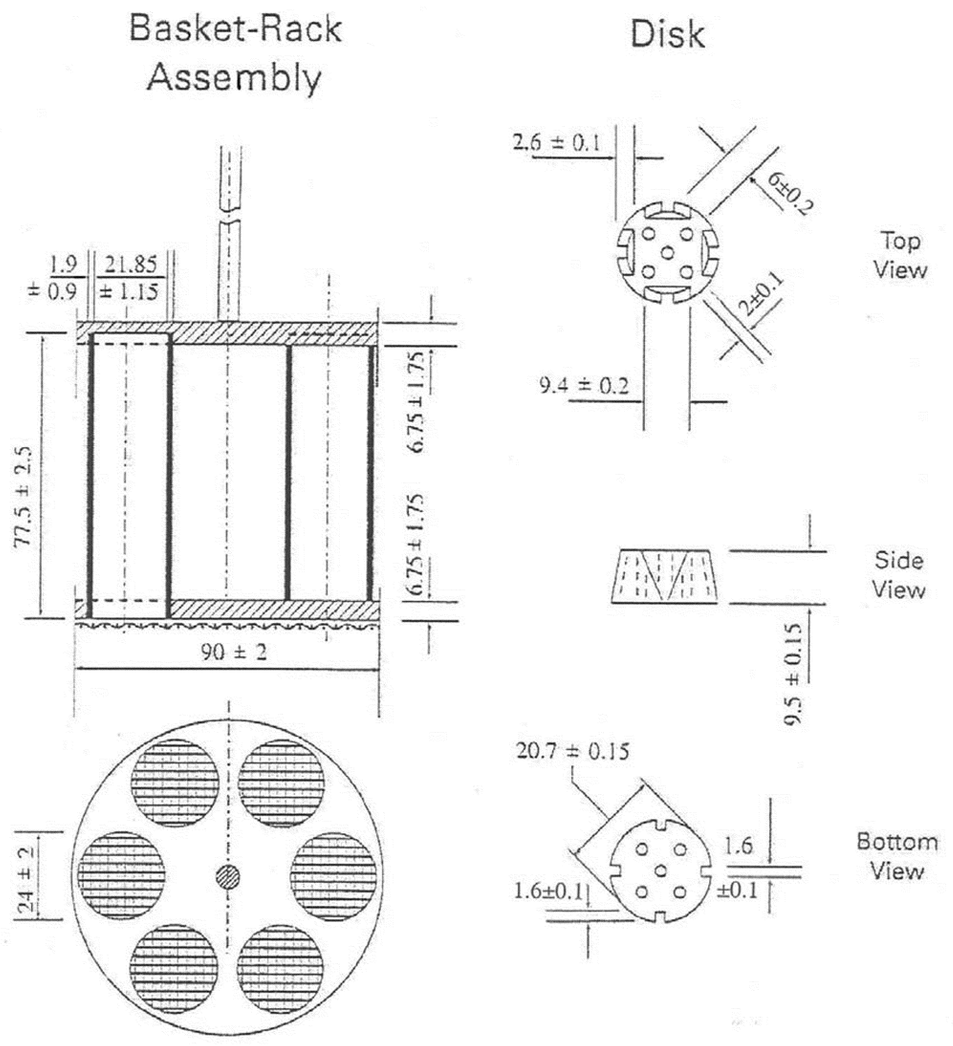

Fig. 1. Disintegration apparatus. (All dimensions are expressed in mm.)

PROCEDURE

◆**Uncoated Tablets**—◆Place 1 dosage unit in each of the six tubes of the basket and, if prescribed, add a disk. Operate the apparatus, using ◆water or◆ the specified medium as the immersion fluid, maintained at 37 ± 2°. At the end of the time limit specified ◆in the monograph,◆ lift the basket from the fluid, and observe the tablets: all of the tablets have disintegrated completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets. The requirement is met if not fewer than 16 of the total of 18 tablets tested are disintegrated.

◆**Plain-Coated Tablets**—Apply the test for *Uncoated Tablets,* operating the apparatus for the time specified in the individual monograph.

Delayed-Release (Enteric-Coated) Tablets—Place 1 tablet in each of the six tubes of the basket and, if the tablet has a soluble external sugar coating, immerse the basket in water at room temperature for 5 minutes. Then operate the apparatus using simulated gastric fluid TS maintained at $37 \pm 2^\circ$ as the immersion fluid. After 1 hour of operation in simulated gastric fluid TS, lift the basket from the fluid, and observe the tablets: the tablets show no evidence of disintegration, cracking, or softening. Operate the apparatus, using simulated intestinal fluid TS maintained at $37 \pm 2^\circ$ as the immersion fluid, for the time specified in the monograph. Lift the basket from the fluid, and observe the tablets: all of the tablets disintegrate completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.

Buccal Tablets—Apply the test for *Uncoated Tablets*. After 4 hours, lift the basket from the fluid, and observe the tablets: all of the tablets have disintegrated. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.

Sublingual Tablets—Apply the test for *Uncoated Tablets.* At the end of the time limit specified in the individual monograph: all of the tablets have disintegrated. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.

Hard Gelatin Capsules—Apply the test for *Uncoated Tablets*. Attach a removable wire cloth, which has a plain square weave with 1.8- to 2.2-mm mesh apertures and with a wire diameter of 0.60 to 0.655 mm, as described under *Basket-Rack Assembly,* to the surface of the upper plate of the basket-rack assembly. Observe the capsules within the time limit specified in the individual monograph: all of the capsules have disintegrated except for fragments from the capsule shell. If 1 or 2 capsules fail to disintegrate completely, repeat the test on 12 additional capsules: not fewer than 16 of the total of 18 capsules tested disintegrate completely.

Soft Gelatin Capsules—Proceed as directed under *Hard Gelatin Capsules*.◆ ●2

(Official April 1, 2006)

BRIEFING

⟨**711**⟩ **Dissolution,** *USP 28* page 2412 and page 234 of *PF* 30(1) [Jan.–Feb. 2004]. The United States Pharmacopeia is the coordinating pharmacopeia in the efforts toward interntional harmonization of the specifications provided in this general test chapter. The Stage 5B text for this chapter has been signed off by the Pharmacopeial Discussion Group members. The text presented herein represents a merger of the Stage B text and the national USP text. This combined text, which is being published in this issue of *PF* for information only, not for public comment, is scheduled for publication in the *Second Interim Revision Announcement* with a scheduled implementation date of **April 1, 2006.** Earlier implementation by individual companies may be done at their discretion.

(BPC: W. Brown) RTS—42036-1

Change to read:

⟨~~711~~⟩ ~~DISSOLUTION~~

~~This test is provided to determine compliance with the dissolution requirements where stated in the individual monograph for a tablet or capsule dosage form. Of the types of apparatus described herein, use the one specified in the individual monograph. Where the label states that an article is enteric-coated, and a dissolution or disintegration test that does not specifically state that it is to be applied to enteric-coated articles is included in the individual monograph, the test for *Delayed-Release Articles* under *Drug Release* ⟨724⟩ is applied unless otherwise specified in the individual monograph. For hard or soft gelatin capsules and gelatin-coated tablets that do not conform to the *Dissolution* specification, repeat the test as follows. Where water or a medium with a pH of less than 6.8 is specified as the *Medium* in the individual monograph, the same *Medium* specified may be used with the addition of purified pepsin that results in an activity of 750,000 Units or less per 1000 mL. For media with a pH of 6.8 or greater, pancreatin can be added to produce not more than 1750 USP Units of protease activity per 1000 mL.~~

~~**USP Reference Standards** ⟨11⟩ *USP Prednisone Tablets RS* (*Dissolution Calibrator, Disintegrating*). *USP Salicylic Acid Tablets RS* (*Dissolution Calibrator, Nondisintegrating*).~~

Apparatus 1— The assembly consists of the following: a covered vessel made of glass or other inert, transparent material[1]; a motor; a metallic drive shaft; and a cylindrical basket. The vessel is partially immersed in a suitable water bath of any convenient size or placed in a heating jacket. The water bath or heating jacket permits holding the temperature inside the vessel at 37 ± 0.5° during the test and keeping the bath fluid in constant, smooth motion. No part of the assembly, including the environment in which the assembly is placed, contributes significant motion, agitation, or vibration beyond that due to the smoothly rotating stirring element. Apparatus that permits observation of the specimen and stirring element during the test is preferable. The vessel is cylindrical, with a hemispherical bottom and with one of the following dimensions and capacities: for a nominal capacity of 1 L, the height is 160 mm to 210 mm and its inside diameter is 98 mm to 106 mm; for a nominal capacity of 2 L, the height is 280 mm to 300 mm and its inside diameter is 98 mm to 106 mm; and for a nominal capacity of 4 L, the height is 280 mm to 300 mm and its inside diameter is 145 mm to 155 mm. Its sides are flanged at the top. A fitted cover may be used to retard evaporation[2]. The shaft is positioned so that its axis is not more than 2 mm at any point from the vertical axis of the vessel and rotates smoothly and without significant wobble. A speed-regulating device is used that allows the shaft rotation speed to be selected and maintained at the rate specified in the individual monograph, within ± 4%.

Shaft and basket components of the stirring element are fabricated of stainless steel, type 316 or equivalent, to the specifications shown in *Figure 1*. Unless otherwise specified in the individual monograph, use 40-mesh cloth. A basket having a gold coating 0.0001 inch (2.5 µm) thick may be used. The dosage unit is placed in a dry basket at the beginning of each test. The distance between the inside bottom of the vessel and the basket is maintained at 25 ± 2 mm during the test.

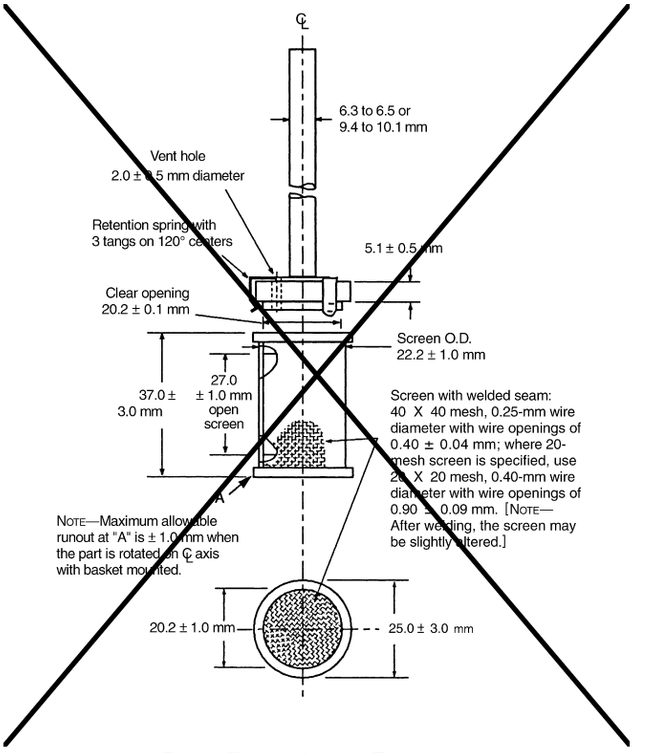

Fig. 1. Basket Stirring Element

Apparatus 2— Use the assembly from *Apparatus 1*, except that a paddle formed from a blade and a shaft is used as the stirring element. The shaft is positioned so that its axis is not more than 2 mm at any point from the vertical axis of the vessel and rotates smoothly without significant wobble. The vertical center line of the blade passes through the axis of the shaft so that the bottom of the blade is flush with the bottom of the shaft. The paddle conforms to the specifications shown in *Figure 2*. The distance of 25 ± 2 mm between the blade and the inside bottom of the vessel is maintained during the test. The metallic or suitably inert, rigid blade and shaft comprise a single entity. A suitable two-part detachable design may be used provided the assembly remains firmly engaged during the test. The paddle blade and shaft may be coated with a suitable inert coating. The dosage unit is allowed to sink to the bottom of the vessel before rotation of the blade is started. A small, loose piece of nonreactive material such as not more than a few turns of wire helix may be attached to dosage units that would otherwise float. Other validated sinker devices may be used.

[1] The materials should not sorb, react, or interfere with the specimen being tested.

[2] If a cover is used, it provides sufficient openings to allow ready insertion of the thermometer and withdrawal of specimens.

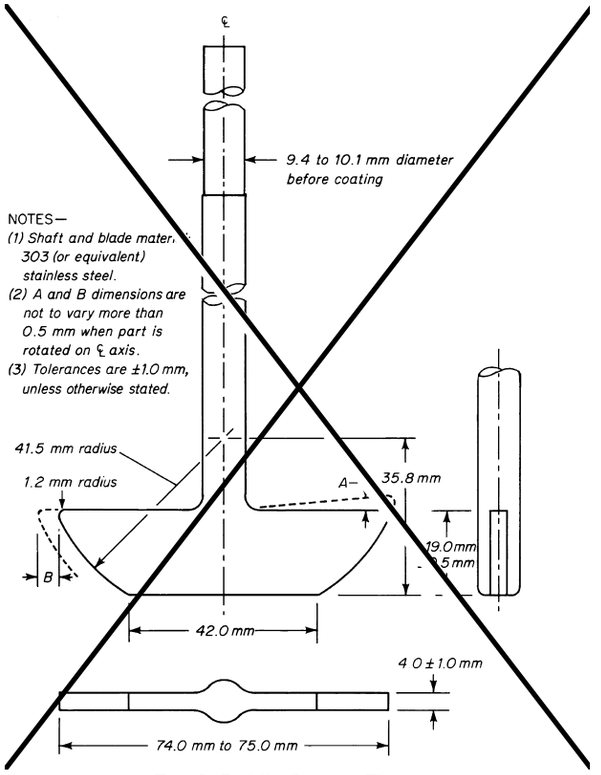

Fig. 2. Paddle Stirring Element

Apparatus Suitability Test—Individually test 1 tablet of the *USP Dissolution Calibrator, Disintegrating Type* and 1 tablet of *USP Dissolution Calibrator, Nondisintegrating Type,* according to the operating conditions specified. The apparatus is suitable if the results obtained are within the acceptable range stated in the certificate for that calibrator in the apparatus tested.

Dissolution Medium—Use the solvent specified in the individual monograph. If the *Dissolution Medium* is a buffered solution, adjust the solution so that its pH is within 0.05 unit of the pH specified in the individual monograph. [NOTE—Dissolved gases can cause bubbles to form, which may change the results of the test. In such cases, dissolved gases should be removed prior to testing.[3]]

Time—Where a single time specification is given, the test may be concluded in a shorter period if the requirement for minimum amount dissolved is met. If two or more times are specified, specimens are to be withdrawn only at the stated times, within a tolerance of ± 2%.

Procedure for Capsules, Uncoated Tablets, and Plain Coated Tablets—Place the stated volume of the *Dissolution Medium* (± 1%) in the vessel of the apparatus specified in the individual monograph, assemble the apparatus, equilibrate the *Dissolution Medium* to 37 ± 0.5°, and remove the thermometer. Place 1 tablet or 1 capsule in the apparatus, taking care to exclude air bubbles from the surface of the dosage form unit, and immediately operate the apparatus at the rate specified in the individual monograph. Within the time interval specified, or at each of the times stated, withdraw a specimen from a zone midway between the surface of the *Dissolution Medium* and the top of the rotating basket or blade, not less than 1 cm from the vessel wall. [NOTE—Replace the aliquots withdrawn for analysis with equal volumes of fresh *Dissolution Medium* at 37°, or, where it can be shown that replacement of the medium is not necessary, correct for the volume change in the calculation. Keep the vessel covered for the duration of the test, and verify the temperature of the mixture under test at suitable times.] Perform the analysis as directed in the individual monograph[4]. Repeat the test with additional dosage form units.

If automated equipment is used for sampling and the apparatus is modified, validation of the modified apparatus is needed to show that there is no change in the agitation characteristics of the test.

Where capsule shells interfere with the analysis, remove the contents of not fewer than 6 capsules as completely as possible, and dissolve the empty capsule shells in the specified volume of *Dissolution Medium*. Perform the analysis as directed in the individual monograph. Make any necessary correction. Correction factors greater than 25% of the labeled content are unacceptable.

Procedure for a Pooled Sample for Capsules, Uncoated Tablets, and Plain Coated Tablets—Use this procedure where *Procedure for a Pooled Sample* is specified in the individual monograph. Proceed as directed under *Procedure for Capsules, Uncoated Tablets, and Plain Coated Tablets*. Combine equal volumes of the filtered solutions of the six or twelve individual specimens withdrawn, and use the pooled sample as the test solution. Determine the average amount of the active ingredient dissolved in the pooled sample.

Interpretation—

Unit Sample—Unless otherwise specified in the individual monograph, the requirements are met if the quantities of active ingredient dissolved from the units tested conform to the accompanying *Acceptance Table*. Continue testing through the three stages unless the results conform at either S_1 or S_2. The quantity, Q, is the amount of dissolved active ingredient specified in the individual monograph, expressed as a percentage of the labeled content; the 5%, 15%, and 25% values in the *Acceptance Table* are percentages of the labeled content so that these values and Q are in the same terms.

Acceptance Table

Stage	Number Tested	Acceptance Criteria
S_1	6	Each unit is not less than Q + 5%.
S_2	6	Average of 12 units (S_1 + S_2) is equal to or greater than Q, and no unit is less than Q − 15%.
S_3	12	Average of 24 units (S_1 + S_2 + S_3) is equal to or greater than Q, not more than 2 units are less than Q − 15%, and no unit is less than Q − 25%.

[3] One method of deaeration is as follows: Heat the medium, while stirring gently, to about 41°, immediately filter under vacuum using a filter having a porosity of 0.45 µm or less, with vigorous stirring, and continue stirring under vacuum for about 5 minutes. Other validated deaeration techniques for removal of dissolved gases may be used.

[4] If test specimens are filtered, use an inert filter that does not cause adsorption of the active ingredient or contain extractable substances that would interfere with the analysis.

Harmonization

~~*Pooled Sample*~~ ~~Unless otherwise specified in the individual monograph, the requirements are met if the quantities of active ingredient dissolved from the pooled sample conform to the accompanying *Acceptance Table for a Pooled Sample*. Continue testing through the three stages unless the results conform at either S_1 or S_2. The quantity, Q, is the amount of dissolved active ingredient specified in the individual monograph, expressed as a percentage of the labeled content.~~

~~**Acceptance Table for a Pooled Sample**~~

~~Stage~~	~~Number Tested~~	~~Acceptance Criteria~~
~~S_1~~	~~6~~	~~Average amount dissolved is not less than Q + 10%.~~
~~S_2~~	~~6~~	~~Average amount dissolved (S_1 + S_2) is equal to or greater than Q + 5%.~~
~~S_3~~	~~12~~	~~Average amount dissolved (S_1 + S_2 + S_3) is equal to or greater than Q.~~

•⟨711⟩ DISSOLUTION

This general chapter is harmonized with the corresponding texts of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia.* The texts of these pharmacopeias are therefore interchangeable, and the methods of the European Pharmacopoeia or the Japanese Pharmacopoeia may be used for demonstration of compliance instead of the present general chapter. These pharmacopeias have undertaken not to make any unilateral change to this harmonized chapter.

Portions of the present general chapter text that are national USP text, and therefore not part of the harmonized text, are marked with symbols (◆◆) to specify this fact.

This test is provided to determine compliance with the dissolution requirements ◆where stated in the individual monograph◆ for dosage forms administered orally. In this general chapter, a dosage unit is defined as 1 tablet or 1 capsule or the amount specified. ◆Of the types of apparatus described herein, use the one specified in the individual monograph. Where the label states that an article is enteric-coated, and where a dissolution or disintegration test that does not specifically state that it is to be applied to delayed-release articles is included in the individual monograph, the procedure and interpretation given for *Delayed-Release Dosage Forms* is applied unless otherwise specified in the individual monograph. For hard or soft gelatin capsules and gelatin-coated tablets that do not conform to the *Dissolution* specification, repeat the test as follows. Where water or a medium with a pH of less than 6.8 is specified as the *Medium* in the individual monograph, the same *Medium* specified may be used with the addition of purified pepsin that results in an activity of 750,000 Units or less per 1000 mL. For media with a pH of 6.8 or greater, pancreatin can be added to produce not more than 1750 USP Units of protease activity per 1000 mL.

USP Reference Standards ⟨11⟩—*USP Chlorpheniramine Maleate Extended-Release Tablets RS (Drug Release Calibrator, Single Unit). USP Prednisone Tablets RS (Dissolution Calibrator, Disintegrating). USP Salicylic Acid Tablets RS. (Dissolution Calibrator, Nondisintegrating).*◆

APPARATUS

Apparatus 1 (Basket Apparatus)

The assembly consists of the following: a vessel, which may be covered, made of glass or other inert, transparent material[1]; a motor; a metallic drive shaft; and a cylindrical basket. The vessel is partially immersed in a suitable water bath of any convenient size or heated by a suitable device such as a heating jacket. The water bath or heating device permits holding the temperature inside the vessel at $37 \pm 0.5^\circ$ during the test and keeping the bath fluid in constant, smooth motion. No part of the assembly, including the environment in which the assembly is placed, contributes significant motion, agitation, or vibration beyond that due

[1] The materials should not sorb, react, or interfere with the specimen being tested.

to the smoothly rotating stirring element. An apparatus that permits observation of the specimen and stirring element during the test is preferable. The vessel is cylindrical, with a hemispherical bottom and ◆with one of the following dimensions and capacities: for a nominal◆ capacity of 1 L, the height is 160 mm to 210 mm and its inside diameter is 98 mm to 106 mm; ◆for a nominal capacity of 2 L, the height is 280 mm to 300 mm and its inside diameter is 98 mm to 106 mm; and for a nominal capacity of 4 L, the height is 280 mm to 300 mm and its inside diameter is 145 mm to 155 mm◆. Its sides are flanged at the top. A fitted cover may be used to retard evaporation.[2] The shaft is positioned so that its axis is not more than 2 mm at any point from the vertical axis of the vessel and rotates smoothly and without significant wobble that could affect the results. A speed-regulating device is used that allows the shaft rotation speed to be selected and maintained at the specified rate ◆given in the individual monograph,◆ within ±4%.

Shaft and basket components of the stirring element are fabricated of stainless steel, type 316, or other inert material, to the specifications shown in *Figure 1.* A basket having a gold coating of about 0.0001 inch (2.5 μm) thick may be used. A dosage unit is placed in a dry basket at the beginning of each test. The distance between the inside bottom of the vessel and the bottom of the basket is maintained at 25 ± 2 mm during the test.

[2] If a cover is used, it provides sufficient openings to allow ready insertion of the thermometer and withdrawal of specimens.

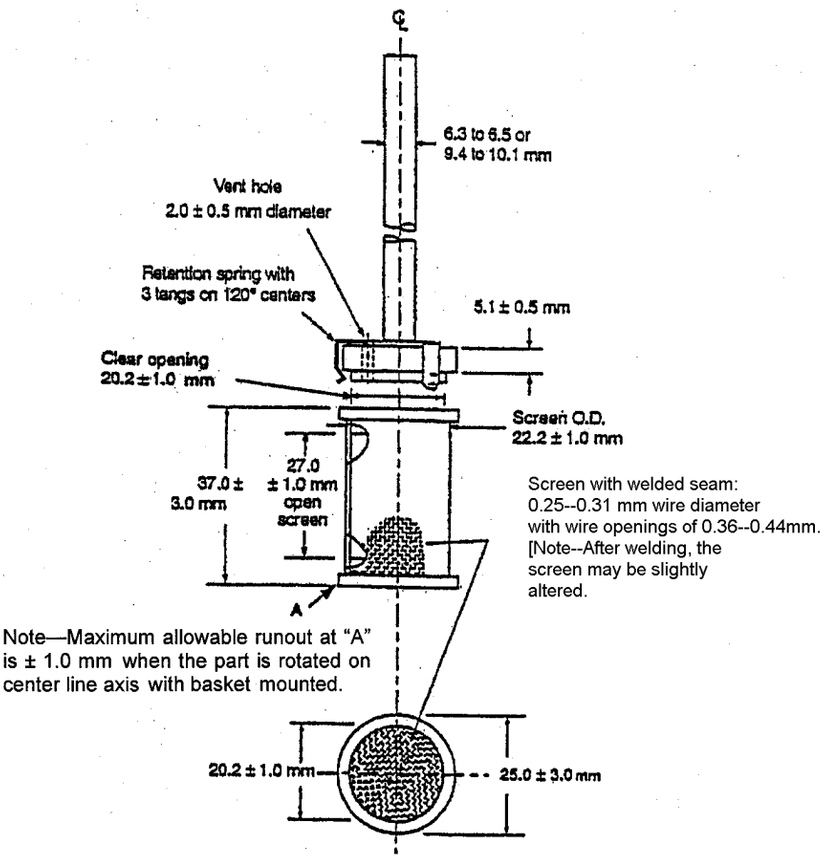

Fig. 1. Basket Stirring Element

Apparatus 2 (Paddle Apparatus)

Use the assembly from *Apparatus 1*, except that a paddle formed from a blade and a shaft is used as the stirring element. The shaft is positioned so that its axis is not more than 2 mm from the vertical axis of the vessel at any point and rotates smoothly without significant wobble that could affect the results. The vertical center line of the blade passes through the axis of the shaft so that the bottom of the blade is flush with the bottom of the shaft. The paddle conforms to the specifications shown in *Figure 2*. The distance of 25 ± 2 mm between the bottom of the blade and the inside bottom of the vessel is maintained during the test. The metallic or suitably inert, rigid blade and shaft comprise a single entity. A suitable two-part detachable design may be used provided the assembly remains firmly engaged during the test. The paddle blade and shaft may be coated with a suitable coating so as to make them inert. The dosage unit is allowed to sink to the bottom of the vessel before rotation of the blade is started. A small, loose piece of nonreactive material, such as not more than a few turns of wire helix, may be attached to dosage units that would otherwise float. An alternative sinker device is shown in *Figure 2a*. Other validated sinker devices may be used.

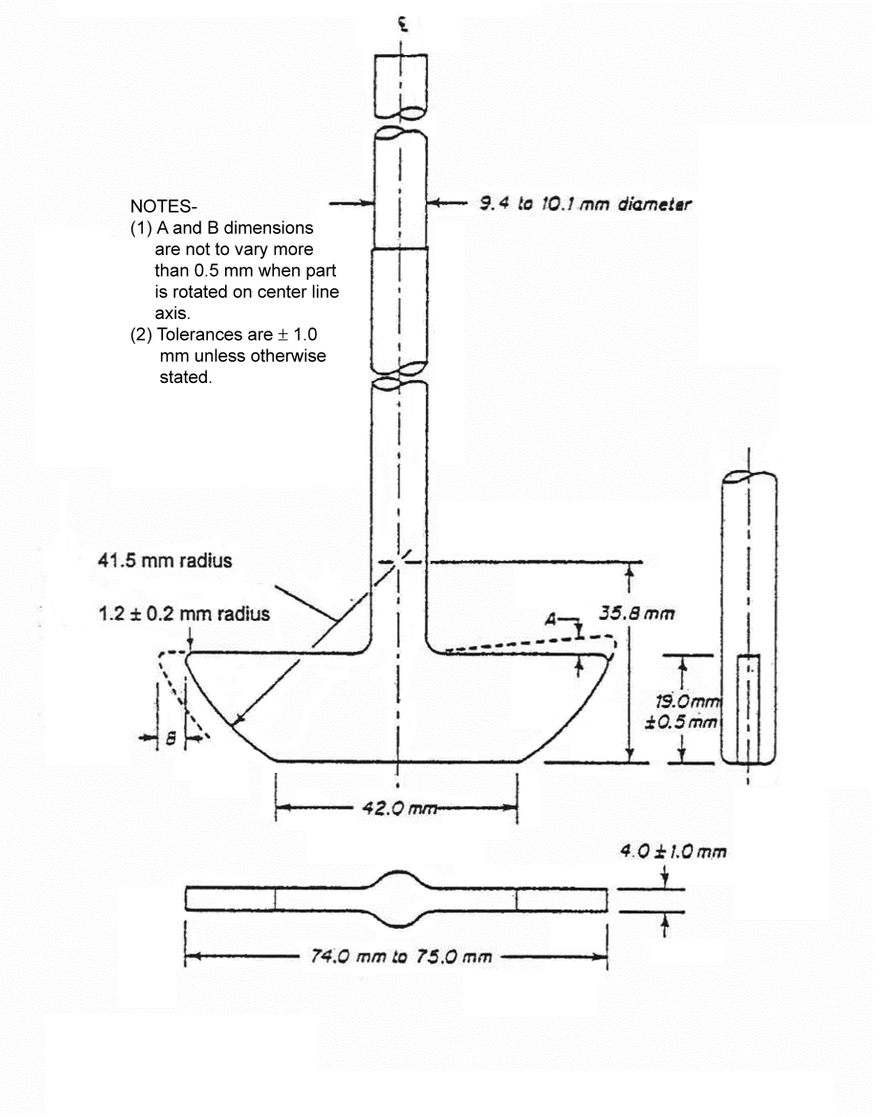

Fig. 2. Paddle Stirring Element

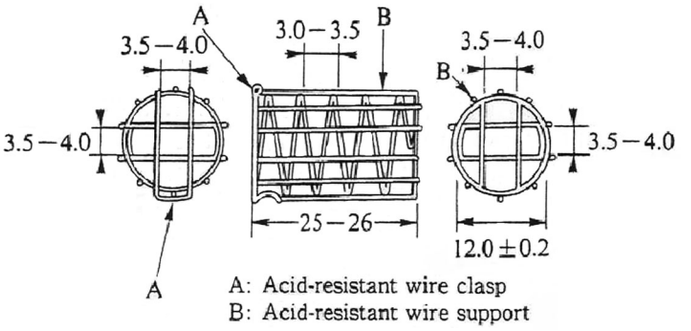

Fig. 2a. Alternative sinker. All dimensions expressed in mm.

Apparatus 3 (Reciprocating Cylinder)

NOT ACCEPTED BY THE JAPANESE PHARMACOPOEIA

The assembly consists of a set of cylindrical, flat-bottomed glass vessels; a set of glass reciprocating cylinders; inert fittings (stainless steel type 316 or other suitable material), and screens that are made of suitable nonsorbing and nonreactive material and that are designed to fit the tops and bottoms of the reciprocating cylinders; and a motor and drive assembly to reciprocate the cylinders vertically inside the vessels and, if desired, index the reciprocating cylinders horizontally to a different row of vessels. The vessels are partially immersed in a suitable water bath of any convenient size that permits holding the temperature at $37 \pm 0.5^{\circ}$ during the test. No part of the assembly, including the environment in which the assembly is placed, contributes significant motion, agitation, or vibration beyond that due to the smooth, vertically reciprocating cylinder. A device is used that allows the reciprocation rate to be selected and maintained at the specified dip rate ◆given in the individual monograph◆ within $\pm 5\%$. An apparatus that permits observation of the specimens and reciprocating cylinders is preferable. The vessels are provided with an evaporation cap that remains in place for the duration of the test. The components conform to the dimensions shown in *Figure 3* unless otherwise specified ◆in the individual monograph◆.

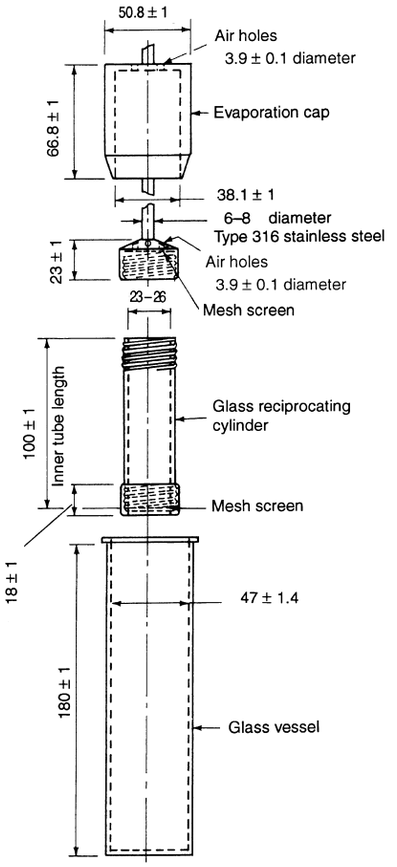

Fig. 3. Apparatus 3 (reciprocating cylinder)

Apparatus 4 (Flow-Through Cell)

The assembly consists of a reservoir and a pump for the *Dissolution Medium;* a flow-through cell; a water bath that maintains the *Dissolution Medium* at 37 ± 0.5°. Use the specified cell size ◆as given in the individual monograph◆.

The pump forces the *Dissolution Medium* upwards through the flow-through cell. The pump has a delivery range between 240 and 960 mL per hour, with standard flow rates of 4, 8, and 16 mL per minute. It must deliver a constant flow (±5% of the nominal flow rate); the flow profile is sinusoidal with a pulsation of 120 ± 10 pulses per minute.

The flow-through cell (see *Figures 4* and *5*), of transparent and inert material, is mounted vertically with a filter system (specified in the individual monograph) that prevents escape of undissolved particles from the top of the cell; standard cell diameters are 12 and 22.6 mm; the bottom cone is usually filled with small glass beads of about 1-mm diameter with one bead of about 5 mm positioned at the apex to protect the fluid entry tube; a tablet holder (see *Figures 4* and *5*) is available for positioning of special dosage forms, for example, inlay tablets. The cell is immersed in a water bath, and the temperature is maintained at 37 ± 0.5°.

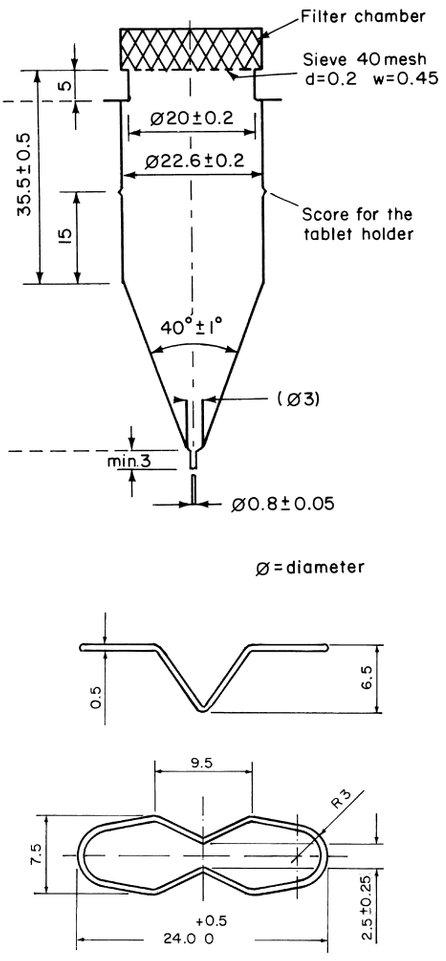

Fig. 4. Large cell for tablets and capsules (top) Tablet holder for the large cell (bottom) (All measurements are expressed in mm unless noted otherwise.)

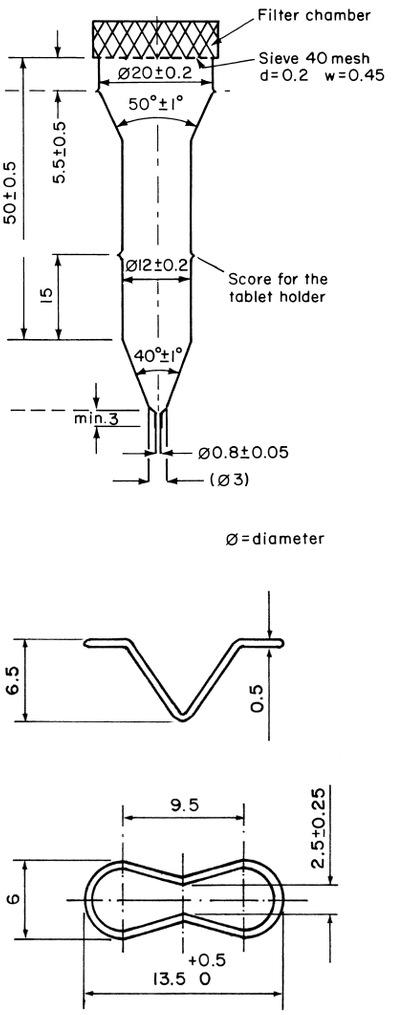

Fig. 5. Small cell for tablets and capsules (top) Tablet holder for the small cell (bottom) (All mesurements are expressed in mm unless noted otherwise.)

The apparatus uses a clamp mechanism and two O-rings to assemble the cell. The pump is separated from the dissolution unit in order to shield the latter against any vibrations originating from the pump. The position of the pump should not be on a level higher than the reservoir flasks. Tube connections are as short as possible. Use suitably inert tubing, such as polytef, with about 1.6-mm inner diameter and chemically inert flanged-end connections.

APPARATUS SUITABILITY

The determination of suitability of a test assembly to perform dissolution testing must include conformance to the dimensions and tolerances of the apparatus as given above. In addition, critical test parameters that have to be monitored periodically during use include volume and temperature of the *Dissolution Medium,* rotation speed (*Apparatus 1* and *Apparatus 2*), dip rate (*Apparatus 3*), and flow rate of medium (*Apparatus 4*).

Determine the acceptable performance of the dissolution test assembly periodically. ◆The suitability for the individual apparatus is demonstrated by the *Apparatus Suitability Test*.

Apparatus Suitability Test, Apparatus 1 and 2—Individually test 1 tablet of the USP Dissolution Calibrator, Disintegrating Type and 1 tablet of USP Dissolution Calibrator, Nondisintegrating Type, according to the operating conditions specified. The apparatus is suitable if the results obtained are within the acceptable range stated in the certificate for that calibrator in the apparatus tested.

Apparatus Suitability Test, Apparatus 3—Individually test 1 tablet of the USP Drug Release Tablets (Single Unit) according to the operating conditions specified. The apparatus is suitable if the results obtained are within the acceptable range stated in the certificate.

Apparatus Suitability Test, Apparatus 4—[To come.]◆

PROCEDURE

Apparatus 1 and Apparatus 2

IMMEDIATE-RELEASE DOSAGE FORMS

Place the stated volume of the *Dissolution Medium* (±1%) in the vessel of the specified apparatus ◆given in the individual monograph,◆ assemble the apparatus, equilibrate the *Dissolution Medium* to 37 ± 0.5°, and remove the thermometer. Place 1 dosage unit in the apparatus, taking care to exclude air bubbles from the surface of the dosage unit, and immediately operate the apparatus at the specified rate ◆given in the individual monograph◆. Within the time interval specified, or at each of the times stated, withdraw a specimen from a zone midway between the surface of the *Dissolution Medium* and the top of the rotating basket or blade, not less than 1 cm from the vessel wall. [NOTE—Where multiple sampling times are specified, replace the aliquots withdrawn for analysis with equal volumes of fresh *Dissolution Medium* at 37° or, where it can be shown that replacement of the medium is not necessary, correct for the volume change in the calculation. Keep the vessel covered for the duration of the test, and verify the temperature of the mixture under test at suitable times.] Perform the analysis ◆as directed in the individual monograph◆ using a suitable assay method. [3] Repeat the test with additional dosage form units.

If automated equipment is used for sampling or the apparatus is otherwise modified, verification that the modified apparatus will produce results equivalent to those obtained with the standard apparatus described in this general chapter is necessary.

[3] Test specimens are filtered immediately upon sampling unless filtration is demonstrated to be unnecessary. Use an inert filter that does not cause adsorption of the active ingredient or contain extractable substances that would interfere with the analysis.

Dissolution Medium—A suitable dissolution medium is used. Use the solvent specified ◆in the individual monograph.◆ The volume specified refers to measurements made between 20° and 25°. If the *Dissolution Medium* is a buffered solution, adjust the solution so that its pH is within 0.05 unit of the specified pH ◆given in the individual monograph.◆ [NOTE—Dissolved gases can cause bubbles to form, which may change the results of the test. If dissolved gases influence the dissolution results, dissolved gases should be removed prior to testing.[4]]

Time—Where a single time specification is given, the test may be concluded in a shorter period if the requirement for minimum amount dissolved is met. Specimens are to be withdrawn only at the stated times within a tolerance of ±2%.

EXTENDED-RELEASE DOSAGE FORMS

Proceed as directed for *Immediate-Release Dosage Forms.*

Dissolution Medium—Proceed as directed for *Immediate-Release Dosage Forms.*

Time—The test-time points, generally three, are expressed in hours.

DELAYED-RELEASE DOSAGE FORMS

NOT ACCEPTED BY THE JAPANESE PHARMACOPOEIA

Use *Method A* or *Method B* and the apparatus specified ◆in the individual monograph.◆ All test times stated are to be observed within a tolerance of ±2%, unless otherwise specified.

[4] One method of deaeration is as follows: Heat the medium, while stirring gently, to about 41°, immediately filter under vacuum using a filter having a porosity of 0.45 µm or less, with vigorous stirring, and continue stirring under vacuum for about 5 minutes. Other validated deaeration techniques for removal of dissolved gases may be used.

Method A—

Procedure ◆(unless otherwise directed in the individual monograph)◆—

ACID STAGE—Place 750 mL of 0.1 N hydrochloric acid in the vessel, and assemble the apparatus. Allow the medium to equilibrate to a temperature of 37 ± 0.5°. Place 1 dosage unit in the apparatus, cover the vessel, and operate the apparatus at the specified rate ◆given in the monograph◆.

After 2 hours of operation in 0.1 N hydrochloric acid, withdraw an aliquot of the fluid, and proceed immediately as directed under *Buffer Stage*.

Perform an analysis of the aliquot using a suitable assay method. ◆The procedure is specified in the individual monograph.◆

BUFFER STAGE—[NOTE—Complete the operations of adding the buffer, and adjusting the pH within 5 minutes.]

With the apparatus operating at the rate specified ◆in the monograph,◆ add to the fluid in the vessel 250 mL of 0.20 M tribasic sodium phosphate that has been equilibrated to 37 ± 0.5°. Adjust, if necessary, with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of 6.8 ± 0.05. Continue to operate the apparatus for 45 minutes, or for the specified time ◆given in the individual monograph◆. At the end of the time period, withdraw an aliquot of the fluid, and perform the analysis using a suitable assay method. ◆The procedure is specified in the individual monograph. The test may be concluded in a shorter time period than that specified for the *Buffer Stage* if the requirement for the minimum amount dissolved is met at an earlier time.◆

Method B—

Procedure ◆(unless otherwise directed in the individual monograph◆)—

ACID STAGE—Place 1000 mL of 0.1 N hydrochloric acid in the vessel, and assemble the apparatus. Allow the medium to equilibrate to a temperature of 37 ± 0.5°. Place 1 dosage

unit in the apparatus, cover the vessel, and operate the apparatus at the rate specified ◆in the monograph◆. After 2 hours of operation in 0.1 N hydrochloric acid, withdraw an aliquot of the fluid, and proceed immediately as directed under *Buffer Stage*.

Perform an analysis of the aliquot using a suitable assay method. ◆The procedure is specified in the individual monograph◆.

BUFFER STAGE—[NOTE—For this stage of the procedure, use buffer that previously has been equilibrated to a temperature of 37 ± 0.5°.] Drain the acid from the vessel, and add to the vessel 1000 mL of pH 6.8 phosphate buffer, prepared by mixing 0.1 N hydrochloric acid with 0.20 M tribasic sodium phosphate (3 : 1) and adjusting, if necessary, with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of 6.8 ± 0.05. [NOTE—This may also be accomplished by removing from the apparatus the vessel containing the acid and replacing it with another vessel containing the buffer and transferring the dosage unit to the vessel containing the buffer.]

Continue to operate the apparatus for 45 minutes, or for the specified time ◆given in the individual monograph◆. At the end of the time period, withdraw an aliquot of the fluid, and perform the analysis using a suitable assay method. ◆The procedure is specified in the individual monograph. The test may be concluded in a shorter time period than that specified for the *Buffer Stage* if the requirement for minimum amount dissolved is met at an earlier time.◆

Apparatus 3 (Reciprocating Cylinder)

NOT ACCEPTED BY THE JAPANESE PHARMACOPOEIA

IMMEDIATE-RELEASE DOSAGE FORMS

Place the stated volume of the *Dissolution Medium* in each vessel of the apparatus, assemble the apparatus, equilibrate the *Dissolution Medium* to 37 ± 0.5°, and remove the thermometer. Place 1 dosage-form unit in each of the six reciprocating cylinders, taking care to exclude air bubbles from the surface of each dosage unit, and immediately operate the apparatus as specified ◆in the individual monograph◆. During the upward and downward stroke, the reciprocating cylinder moves through a total distance of 9.9 to 10.1 cm. Within the time interval specified, or at each of the times stated, raise the reciprocating cylinders and withdraw a portion of the solution under test from a zone midway between the surface of the *Dissolution Medium* and the bottom of each vessel. Perform the analysis as directed ◆in the individual monograph◆. If necessary, repeat the test with additional dosage-form units.

Dissolution Medium—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

Time—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

EXTENDED-RELEASE DOSAGE FORMS

Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 3*.

Dissolution Medium—Proceed as directed for *Extended-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

Time—Proceed as directed for *Extended-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

DELAYED-RELEASE DOSAGE FORMS

Proceed as described for *Delayed-Release Dosage Forms, Method B* under *Apparatus 1 and Apparatus 2* using one row of vessels for the acid stage media and the following row of vessels for the buffer stage media and using the volume of medium specified (usually 300 mL).

Time—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

Apparatus 4 (Flow-Through Cell)

IMMEDIATE-RELEASE DOSAGE FORMS

Place the glass beads into the cell specified ◆in the monograph◆. Place 1 dosage unit on top of the beads or, if specified ◆in the monograph,◆ on a wire carrier. Assemble the filter head, and fix the parts together by means of a suitable clamping device. Introduce by the pump the *Dissolution Medium* warmed to 37 ± 0.5° through the bottom of the cell to obtain the flow rate specified ◆in the individual monograph◆ and measured with an accuracy of 5%. Collect the eluate by fractions at each of the times stated. Perform the analysis as directed ◆in the individual monograph◆. Repeat the test with additional dosage-form units.

Dissolution Medium—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

Time—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

EXTENDED-RELEASE DOSAGE FORMS

Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 4.*

Dissolution Medium—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 4*.

Time—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 4.*

DELAYED-RELEASE DOSAGE FORMS

Proceed as directed for *Delayed-Release Dosage Forms* under *Apparatus 1 and Apparatus 2,* using the specified media.

Time—Proceed as directed for *Delayed-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

INTERPRETATION

Immediate-Release Dosage Forms

Unless otherwise specified ◆in the individual monograph◆, the requirements are met if the quantities of active ingredient dissolved from the dosage units tested conform to *Acceptance Table 1*. Continue testing through the three stages unless the results conform at either S_1 or S_2. The quantity, Q, is the amount of dissolved active ingredient ◆specified in the individual monograph,◆ expressed as a percentage of the labeled content of the dosage unit; the 5%, 15%, and 25% values in *Acceptance Table 1* are percentages of the labeled content so that these values and Q are in the same terms.

Acceptance Table 1

Stage	Number Tested	Acceptance Criteria
S_1	6	Each unit is not less than Q + 5%.
S_2	6	Average of 12 units (S_1 + S_2) is equal to or greater than Q, and no unit is less than Q – 15%.
S_3	12	Average of 24 units (S_1 + S_2 + S_3) is equal to or greater than Q, not more than 2 units are less than Q – 15%, and no unit is less than Q – 25%.

Acceptance Table 2

Level	Number Tested	Criteria
L_1	6	No individual value lies outside each of the stated ranges and no individual value is less than the stated amount at the final test time.
L_2	6	The average value of the 12 units (L_1 + L_2) lies within each of the stated ranges and is not less than the stated amount at the final test time; none is more than 10% of labeled content outside each of the stated ranges; and none is more than 10% of labeled content below the stated amount at the final test time.
L_3	12	The average value of the 24 units (L_1 + L_2 + L_3) lies within each of the stated ranges, and is not less than the stated amount at the final test time; not more than 2 of the 24 units are more than 10% of labeled content outside each of the stated ranges; not more than 2 of the 24 units are more than 10% of labeled content below the stated amount at the final test time; and none of the units is more than 20% of labeled content outside each of the stated ranges or more than 20% of labeled content below the stated amount at the final test time.

Extended-Release Dosage Forms

Unless otherwise specified ◆in the individual monograph◆, the requirements are met if the quantities of active ingredient dissolved from the dosage units tested conform to *Acceptance Table 2*. Continue testing through the three levels unless the results conform at either L_1 or L_2. Limits on the amounts of active ingredient dissolved are expressed in terms of the percentage of labeled content. The limits embrace each value of Q_i, the amount dissolved at each specified fractional dosing interval. Where more than one range is specified ◆in the individual monograph◆, the acceptance criteria apply individually to each range.

Delayed-Release Dosage Forms

NOT ACCEPTED BY THE JAPANESE PHARMACOPOEIA.

Acid Stage—Unless otherwise specified ◆in the individual monograph◆, the requirements of this portion of the test are met if the quantities, based on the percentage of the labeled content, of active ingredient dissolved from the units tested conform to *Acceptance Table 3*. Continue testing through all levels unless the results of both acid and buffer stages conform at an earlier level.

Acceptance Table 3

Level	Number Tested	Criteria
A_1	6	No individual value exceeds 10% dissolved.
A_2	6	Average of the 12 units ($A_1 + A_2$) is not more than 10% dissolved, and no individual unit is greater than 25% dissolved.
A_3	12	Average of the 24 units ($A_1 + A_2 + A_3$) is not more than 10% dissolved, and no individual unit is greater than 25% dissolved.

Buffer Stage—Unless otherwise specified ◆in the individual monograph◆, the requirements are met if the quantities of active ingredient dissolved from the units tested conform to *Acceptance Table 4*. Continue testing through the three levels unless the results of both stages conform at an earlier level. The value of Q in *Acceptance Table 4* is 75% dissolved unless otherwise specified ◆in the individual monograph◆. The quantity, Q,◆specified in the individual monograph◆ is the total amount of active ingredient dissolved in both the *Acid* and *Buffer Stages*, expressed as a percentage of the labeled content. The 5%, 15%, and 25% values in *Acceptance Table 4* are percentages of the labeled content so that these values and Q are in the same terms.

Acceptance Table 4

Level	Number Tested	Criteria
B_1	6	Each unit is not less than Q + 5%.
B_2	6	Average of 12 units ($B_1 + B_2$) is equal to or greater than Q, and no unit is less than Q – 15%.
B_3	12	Average of 24 units ($B_1 + B_2 + B_3$) is equal to or greater than Q, not more than 2 units are less than Q – 15%, and no unit is less than Q – 25%.

(Official April 1, 2006)

BRIEFING

⟨**724**⟩ **Drug Release,** *USP 28* page 2415. It is proposed to revise this general test chapter where current text will become part of the harmonized text of *Dissolution* ⟨711⟩. The proposed change, which is being published in this *PF* for information only and is not for public comment, is scheduled for implementation in the *Second Interim Revision Announcement to USP 28–NF 23,* but with an delayed implementation date of **April 1, 2006**. Earlier implementation by individual companies may be done at their discretion.

(BPC: W. Brown) RTS—42047-1

Change to read:

⟨~~724~~⟩ ~~DRUG RELEASE~~

~~This test is provided to determine compliance with drug release requirements where specified in individual monographs. Use the apparatus specified in the individual monograph. Replace the aliquots withdrawn for analysis with equal volumes of fresh *Dissolution Medium* at 37° or, where it can be shown that replacement of the medium is not necessary, correct for the volume change in the calculation. [NOTE—Medium replacement is not necessary for *Ap-*~~

paratus 4, which is a continuous-flow system.] Keep the vessel covered for the duration of the test, and verify the temperature of the mixture under test at suitable times.

EXTENDED-RELEASE ARTICLES — GENERAL DRUG RELEASE STANDARD

Apparatus 1 and Apparatus 2

Apparatus Proceed as directed under *Dissolution* ⟨711⟩.

Apparatus Suitability Test, Dissolution Medium, and Procedure Proceed as directed under *Dissolution* ⟨711⟩.

Time The test time points, generally three, are expressed in hours. Specimens are to be withdrawn within a tolerance of ±2% of the stated time.

Interpretation Unless otherwise specified in the individual monograph, the requirements are met if the quantities of active ingredient dissolved from the units tested conform to *Acceptance Table 1.* Continue testing through the three levels unless the results conform at either L_1 or L_2. Limits on the amounts of active ingredient dissolved are expressed in terms of the percentage of labeled content. The limits embrace each value of Q, the amount dissolved at each specified fractional dosing interval. Where more than one range is specified in the individual monograph, the acceptance criteria apply individually to each range.

Acceptance Table 1

Level	Number Tested	Criteria
L_1	6	No individual value lies outside each of the stated ranges and no individual value is less than the stated amount at the final test time.
L_2	6	The average value of the 12 units ($L_1 + L_2$) lies within each of the stated ranges and is not less than the stated amount at the final test time; none is more than 10% of labeled content outside each of the stated ranges; and none is more than 10% of labeled content below the stated amount at the final test time.
L_3	12	The average value of the 24 units ($L_1 + L_2 + L_3$) lies within each of the stated ranges, and is not less than the stated amount at the final test time; not more than 2 of the 24 units are more than 10% of labeled content outside each of the stated ranges; not more than 2 of the 24 units are more than 10% of labeled content below the stated amount at the final test time; and none of the units is more than 20% of labeled content outside each of the stated ranges or more than 20% of labeled content below the stated amount at the final test time.

Apparatus 3 (Reciprocating Cylinder)

Apparatus The assembly consists of a set of cylindrical, flat-bottomed glass vessels; a set of glass reciprocating cylinders; stainless steel fittings (type 316 or equivalent) and screens that are made of suitable nonsorbing and nonreactive material and that are designed to fit the tops and bottoms of the reciprocating cylinders; and a motor and drive assembly to reciprocate the cylinders vertically inside the vessels and, if desired, index the reciprocating cylinders horizontally to a different row of vessels. The vessels are partially immersed in a suitable water bath of any convenient size that permits holding the temperature at 37 ± 0.5° during the test. No part of the assembly, including the environment in which the assembly is placed, contributes significant motion, agitation, or vibration beyond that due to the smooth, vertically reciprocating cylinder. A device is used that allows the reciprocation rate to be selected and maintained at the dip rate specified in the individual monograph, within ± 5%. An apparatus that permits observation of the specimens and reciprocating cylinders is preferable. The components conform to the dimensions shown in *Figure 1* unless otherwise specified in the individual monograph.

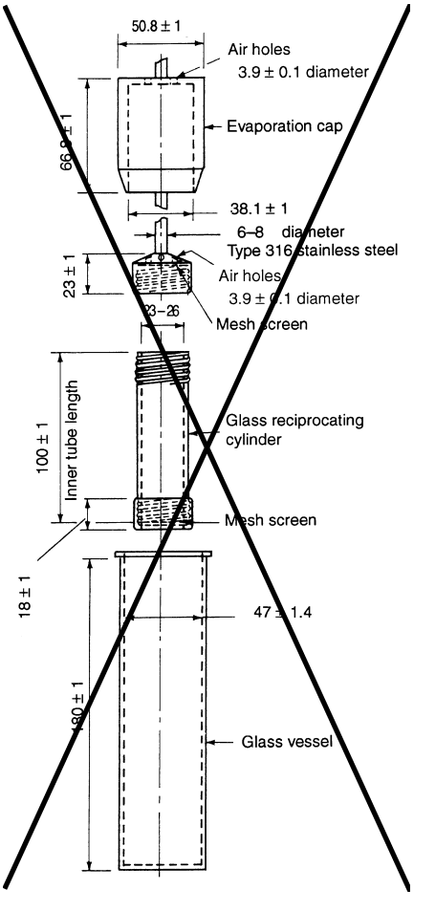

Fig. 1. Apparatus 3.
(All measurements are expressed in mm unless noted otherwise.)

USP Reference Standards ⟨11⟩ USP Chlorpheniramine Extended-Release Tablets RS *(Drug-Release Calibrator, Single Unit).*

Harmonization

Apparatus Suitability Test— Individually test 1 tablet of the USP Drug Release Calibrator Tablets (Single Unit) according to the operation conditions specified. The apparatus is suitable if the results obtained are within the acceptable range stated in the certificate for that calibrator in the apparatus tested.

Dissolution Medium— Proceed as directed under *Dissolution* ⟨711⟩.

Procedure— Place the stated volume of the *Dissolution Medium* in each vessel of the apparatus, assemble the apparatus, equilibrate the *Dissolution Medium* to 37 ± 0.5°, and remove the thermometer. Place 1 dosage form unit in each of the six reciprocating cylinders, taking care to exclude air bubbles from the surface of each dosage form unit, and immediately operate the apparatus as specified in the individual monograph. During the upward and downward stroke, the reciprocating cylinder moves through a total distance of 9.9 to 10.1 cm. Within the time interval specified, or at each of the times stated, raise the reciprocating cylinders and withdraw a portion of the solution under test from a zone midway between the surface of the *Dissolution Medium* and the bottom of each vessel. Perform the analysis as directed in the individual monograph. If necessary, repeat the test with additional dosage form units.

Where capsule shells interfere with the analysis, remove the contents of not fewer than 6 capsules as completely as possible, and dissolve the empty capsule shells in the specified volume of *Dissolution Medium*. Perform the analysis as directed in the individual monograph. Make any necessary correction. Correction factors greater than 25% of the labeled content are unacceptable.

Time and Interpretation— Proceed as directed under *Apparatus 1 and Apparatus 2*.

Apparatus 4 (Flow-Through Cell)

Apparatus— The assembly consists of a reservoir and a pump for the *Dissolution Medium;* a flow-through cell; a water bath that maintains the *Dissolution Medium* at 37 ± 0.5° (see Figures *2* and *3*). The cell size is specified in the individual monograph.

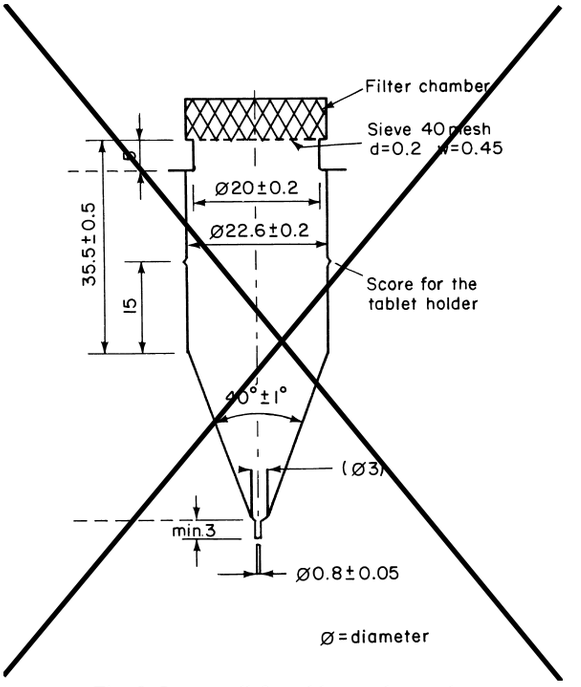

Fig. 2. Large cell for tablets and capsules.
(All measurements are expressed in mm unless noted otherwise.)

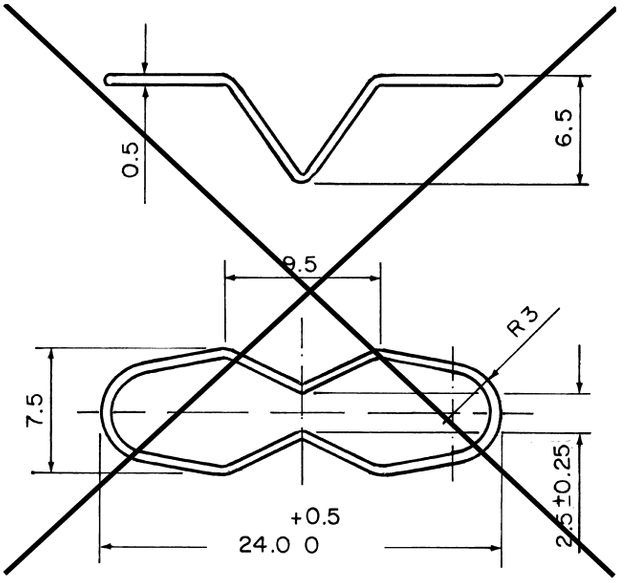

Fig. 2a. Tablet holder for the large cell.
(All measurements are expressed in mm unless noted otherwise.)

The pump forces the *Dissolution Medium* upwards through the flow-through cell. The pump has a delivery range between 240 and 960 mL per hour, with standard flow rates of 4, 8, and 16 mL per minute. It must be volumetric to deliver constant flow independent of flow resistance in the filter device; the flow profile is sinusoidal with a pulsation of 120 ± 10 pulses per minute.

The flow-through cell (see Figures *2* and *3*), of transparent and inert material, is mounted vertically with a filter system (specified in the individual monograph) that prevents escape of undissolved

particles from the top of the cell; standard cell diameters are 12 and 22.6 mm; the bottom cone is usually filled with small glass beads of about 1-mm diameter with one bead of about 5-mm positioned at the apex to protect the fluid entry tube; a tablet holder (see Figures *2a* and *3a*) is available for positioning of special dosage forms, for example, inlay tablets. The cell is immersed in a water bath, and the temperature is maintained at 37 ± 0.5°.

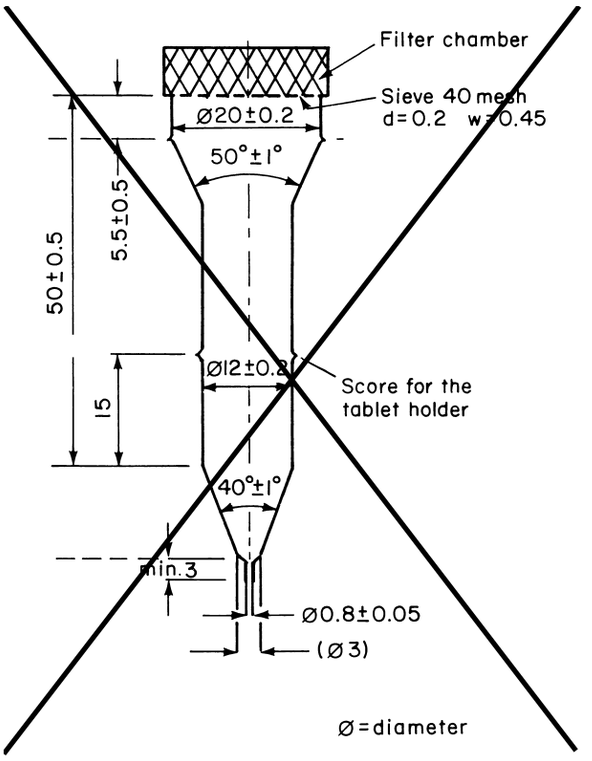

Fig. 3. Small cell for tablets and capsules.
(All measurements are expressed in mm unless noted otherwise.)

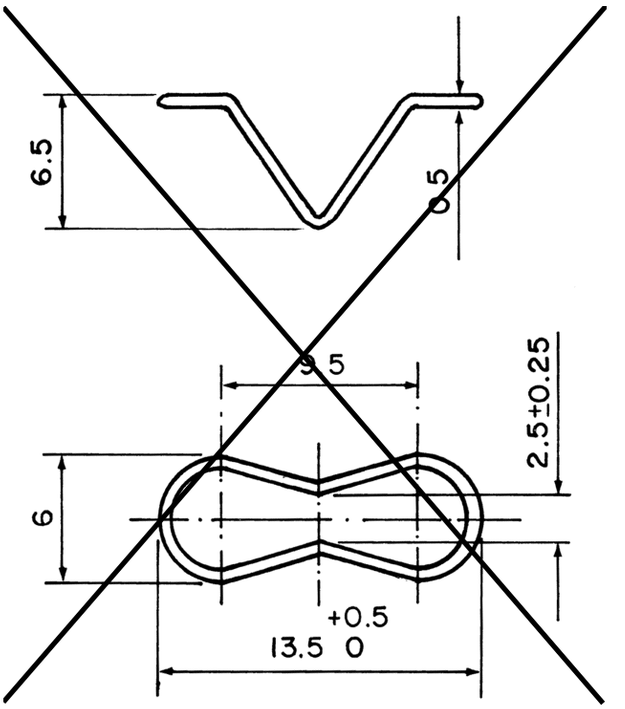

Fig. 3a. Tablet holder for the small cell.
(All measurements are expressed in mm unless noted otherwise.)

The apparatus uses a clamp mechanism and two O-rings for the fixation of the cell assembly. The pump is separated from the dissolution unit in order to shield the latter against any vibrations originating from the pump. The position of the pump should not be on a level higher than the reservoir flasks. Tube connections are as short as possible. Use polytef tubing with a 1.6-mm inner diameter and chemically inert flanged end connections.

Apparatus Suitability Test and Dissolution Medium— Proceed as directed under *Dissolution* ⟨711⟩.

Procedure— Place the glass beads into the cell specified in the monograph. Place 1 dosage form unit on top of the beads or, if specified in the monograph, on a wire carrier. Assemble the filter head and fix the parts together by means of a suitable clamping device. Introduce by the pump the *Dissolution Medium* warmed to 37 ± 0.5° through the bottom of the cell to obtain the flow rate specified in the individual monograph and measured with an accuracy of 5%. Collect the eluate by fractions at each of the times stated. Perform the analysis as directed in the individual monograph. Repeat the test with additional dosage form units.

Where capsule shells interfere with the analysis, remove the contents of not less than 6 capsules as completely as possible, and dissolve the empty capsule shells in the specified volume of *Dissolution Medium*. Perform the analysis as directed in the individual monograph. Make any necessary correction. Correction factors greater than 25% of the labeled content are unacceptable.

Time and Interpretation— Proceed as directed under *Apparatus 1 and Apparatus 2*.

DELAYED-RELEASE (ENTERIC-COATED) ARTICLES—GENERAL DRUG RELEASE STANDARD

Use *Method A* or *Method B* and the apparatus specified in the individual monograph. Conduct the *Apparatus Suitability Test* as directed under *Dissolution* ⟨711⟩. All test times stated are to be observed within a tolerance of ± 2%, unless otherwise specified.

Method A

Procedure (unless otherwise directed in the individual monograph)—

Acid Stage—Place 750 mL of 0.1 N hydrochloric acid in the vessel, and assemble the apparatus. Allow the medium to equilibrate to a temperature of 37 ± 0.5°. Place 1 tablet or 1 capsule in the apparatus, cover the vessel, and operate the apparatus for 2 hours at the rate specified in the monograph.

After 2 hours of operation in 0.1 N hydrochloric acid, withdraw an aliquot of the fluid, and proceed immediately as directed for *Buffer Stage*.

Perform an analysis of the aliquot using the *Procedure* specified in the test for *Drug release* in the individual monograph.

Unless otherwise specified in the individual monograph, the requirements of this portion of the test are met if the quantities, based on the percentage of the labeled content, of active ingredient dissolved from the units tested conform to *Acceptance Table 2*. Continue testing through all levels unless the results of both acid and buffer stages conform at an earlier level.

Acceptance Table 2

Level	Number Tested	Criteria
A_1	6	No individual value exceeds 10% dissolved.
A_2	6	Average of the 12 units ($A_1 + A_2$) is not more than 10% dissolved, and no individual unit is greater than 25% dissolved.
A_3	12	Average of the 24 units ($A_1 + A_2 + A_3$) is not more than 10% dissolved, and no individual unit is greater than 25% dissolved.

Buffer Stage—[NOTE—Complete the operations of adding the buffer, and adjusting the pH within 5 minutes.] With the apparatus operating at the rate specified in the monograph, add to the fluid in the vessel 250 mL of 0.20 M tribasic sodium phosphate that has been equilibrated to 37 ± 0.5°. Adjust, if necessary, with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of 6.8 ± 0.05. Continue to operate the apparatus for 45 minutes, or for the time specified in the individual monograph. At the end of the time period, withdraw an aliquot of the fluid, and perform the analysis using the *Procedure* specified in the test for *Drug release* in the individual monograph. The test may be concluded in a shorter time period than that specified for the *Buffer Stage* if the requirement for minimum amount dissolved is met at an earlier time.

Interpretation—Unless otherwise specified in the individual monograph, the requirements are met if the quantities of active ingredient dissolved from the units tested conform to *Acceptance Table 3*. Continue testing through the three levels unless the results of both stages conform at an earlier level. The value of *Q* in *Acceptance Table 3* is 75% dissolved unless otherwise specified in the individual monograph. The quantity, *Q*, specified in the individual monograph, is the total amount of active ingredient dissolved in both the acid and buffer stages, expressed as a percentage of the labeled content. The 5% and 15% values in *Acceptance Table 3* are percentages of the labeled content so that these values and *Q* are in the same terms.

Acceptance Table 3

Level	Number Tested	Criteria
B_1	6	Each unit is not less than Q + 5%.
B_2	6	Average of 12 units ($B_1 + B_2$) is equal to or greater than Q, and no unit is less than Q − 15%.
B_3	12	Average of 24 units ($B_1 + B_2 + B_3$) is equal to or greater than Q, not more than 2 units are less than Q − 15%, and no unit is less than Q − 25%.

Method B

Procedure (unless otherwise directed in the individual monograph)—

Acid Stage—Place 1000 mL of 0.1 N hydrochloric acid in the vessel, and assemble the apparatus. Allow the medium to equilibrate to a temperature of 37 ± 0.5°. Place 1 tablet or 1 capsule in the apparatus, cover the vessel, and operate the apparatus for 2 hours at the rate specified in the monograph. After 2 hours of operation in 0.1 N hydrochloric acid, withdraw an aliquot of the fluid, and proceed immediately as directed under *Buffer Stage*.

Perform an analysis of the aliquot using the *Procedure* specified in the test for *Drug release* in the individual monograph.

Unless otherwise specified in the individual monograph, the requirements of this portion of the test are met if the quantities, based on the percentage of the labeled content, of active ingredient dissolved from the units tested conform to *Acceptance Table 2* under *Method A*. Continue testing through all levels unless the results of both acid and buffer stages conform at an earlier level.

Buffer Stage—[NOTE—For this stage of the procedure, use buffer that previously has been equilibrated to a temperature of 37 ± 0.5°.] Drain the acid from the vessel, and add to the vessel 1000 mL of pH 6.8 phosphate buffer, prepared by mixing 0.1 N hydrochloric acid with 0.20 M tribasic sodium phosphate (3 : 1) and adjusting, if necessary, with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of 6.8 ± 0.05. [NOTE—This may be accomplished also by removing from the apparatus the vessel containing the acid and replacing it with another vessel containing the buffer and transferring the dosage unit to the vessel containing the buffer.] Continue to operate the apparatus for 45 minutes, or for the time specified in the individual monograph. At the end of the time period, withdraw an aliquot of the fluid, and perform the analysis using the *Procedure* specified in the test for *Drug release* in the individual monograph. The test may be concluded in a shorter time period than that specified for the *Buffer Stage* if the requirement for minimum amount dissolved is met at an earlier time.

Interpretation—Proceed as directed for *Interpretation* under *Method A*.

TRANSDERMAL DELIVERY SYSTEMS—GENERAL DRUG RELEASE STANDARDS

Apparatus 5 (Paddle-over-Disk)

Apparatus—Use the paddle and vessel assembly from *Apparatus 2* as described under *Dissolution* ⟨711⟩, with the addition of a stainless steel disk assembly[1] designed for holding the transdermal

[1] Disk assembly (stainless support disk) may be obtained from Millipore Corp., Ashley Rd., Bedford, MA 01730.

system at the bottom of the vessel. Other appropriate devices may be used, provided they do not sorb, react with, or interfere with the specimen being tested [3]. The temperature is maintained at 32 ± 0.5°. A distance of 25 ± 2 mm between the paddle blade and the surface of the disk assembly is maintained during the test. The vessel may be covered during the test to minimize evaporation. The disk assembly for holding the transdermal system is designed to minimize any "dead" volume between the disk assembly and the bottom of the vessel. The disk assembly holds the system flat and is positioned such that the release surface is parallel with the bottom of the paddle blade (see *Figure 4*).

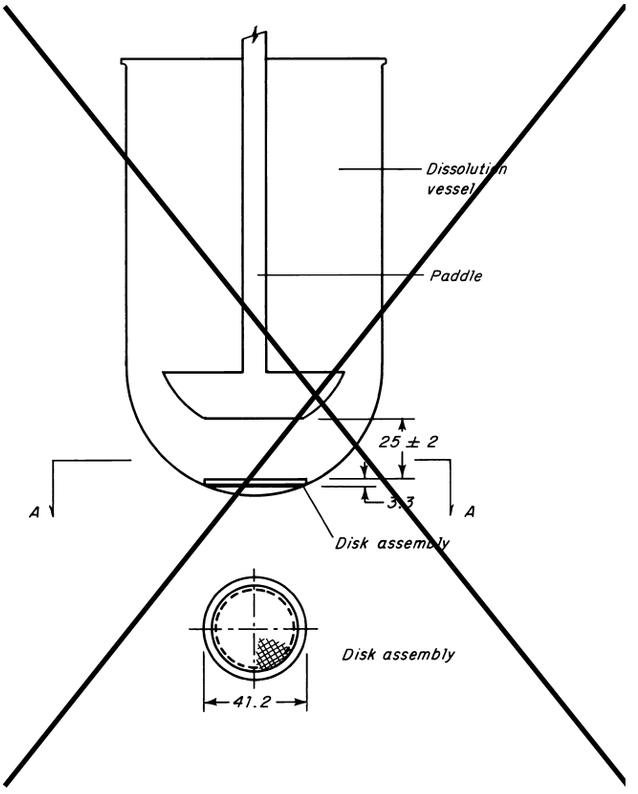

Fig. 4. Paddle Over Disk.
(All measurements are expressed in mm unless noted otherwise.)

Apparatus Suitability Test and Dissolution Medium — Proceed as directed for *Apparatus 2* under *Dissolution* ⟨711⟩.

Procedure — Place the stated volume of the *Dissolution Medium* in the vessel, assemble the apparatus without the disk assembly, and equilibrate the medium to 32 ± 0.5°. Apply the transdermal system to the disk assembly, assuring that the release surface of the system is as flat as possible. The system may be attached to the disk by applying a suitable adhesive [3] to the disk assembly. Dry for 1 minute. Press the system, release surface side up, onto the adhesive coated side of the disk assembly. If a membrane [4] is used to support the system, it is applied so that no air bubbles occur between the membrane and the release surface. Place the disk assembly flat at the bottom of the vessel with the release surface facing up and parallel to the edge of the paddle blade and surface of the *Dissolution Medium*. The bottom edge of the paddle is 25 ± 2 mm from the surface of the disk assembly. Immediately operate the apparatus at the rate specified in the monograph. At each sampling time interval, withdraw a specimen from a zone midway between the surface of the *Dissolution Medium* and the top of the blade, not less than 1 cm from the vessel wall. Perform the analysis on each sampled aliquot as directed in the individual monograph, correcting for any volume losses, as necessary. Repeat the test with additional transdermal systems.

Time — The test time points, generally three, are expressed in hours. Specimens are to be withdrawn within a tolerance of ± 15 minutes or ± 2% of the stated time, the tolerance that results in the narrowest time interval being selected.

Interpretation — Unless otherwise specified in the individual monograph, the requirements are met if the quantities of active ingredient released from the system conform to *Acceptance Table 4* for transdermal drug delivery systems. Continue testing through the three levels unless the results conform at either L_1 or L_2.

Acceptance Table 4

Level	Number Tested	Criteria
L_1	6	No individual value lies outside the stated range.
L_2	6	The average value of the 12 units (L_1 + L_2) lies within the stated range. No individual value is outside the stated range by more than 10% of the average of the stated range.
L_3	12	The average value of the 24 units (L_1 + L_2 + L_3) lies within the stated range. Not more than 2 of the 24 units are outside the stated range by more than 10% of the average of the stated range; and none of the units is outside the stated range by more than 20% of the average of the stated range.

Apparatus 6 (Cylinder)

Apparatus — Use the vessel assembly from *Apparatus 1* as described under *Dissolution* ⟨711⟩, except to replace the basket and shaft with a stainless steel cylinder stirring element and to maintain the temperature at 32 ± 0.5° during the test. The shaft and cylinder components of the stirring element are fabricated of stainless steel to the specifications shown in *Figure 5*. The dosage unit is placed on the cylinder at the beginning of each test. The distance between the inside bottom of the vessel and the cylinder is maintained at 25 ± 2 mm during the test.

[3] A suitable device is the watchglass patch polytef mesh sandwich assembly available as the Transdermal SandwichTM from Hanson Research Corp., 9810 Variel Ave., Chatsworth, CA 91311.

[3] Use Dow Corning, MD7-4502 Silicone Adhesive 65% in ethyl acetate, or the equivalent.

[4] Use Cuprophan, Type 150 pm, 11 ± 0.5 µm thick, an inert, porous cellulosic material, which is available from Medicell International Ltd., 239 Liverpool Road, London NI ILX, England.

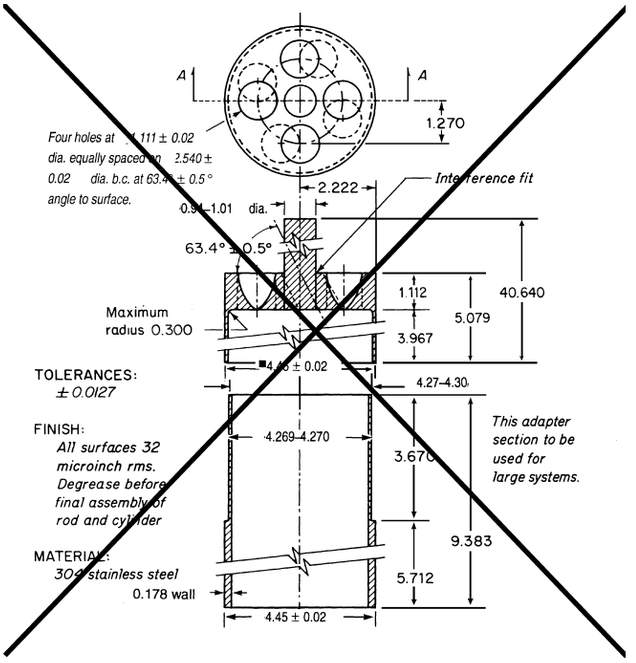

Fig. 5. Cylinder Stirring Element.[5]
(All measurements are expressed in cm unless noted otherwise.)

Dissolution Medium— Use the medium specified in the individual monograph (see *Dissolution* ⟨711⟩).

Procedure— Place the stated volume of the *Dissolution Medium* in the vessel of the apparatus specified in the individual monograph, assemble the apparatus, and equilibrate the *Dissolution Medium* to 32 ± 0.5°. Unless otherwise directed in the individual monograph, prepare the test system prior to test as follows. Remove the protective liner from the system, and place the adhesive side on a piece of Cuprophan[4] that is not less than 1 cm larger on all sides than the system. Place the system, Cuprophan covered side down, on a clean surface, and apply a suitable adhesive[3] to the exposed Cuprophan borders. If necessary, apply additional adhesive to the back of the system. Dry for 1 minute. Carefully apply the adhesive coated side of the system to the exterior of the cylinder such that the long axis of the system fits around the circumference of the cylinder. Press the Cuprophan covering to remove trapped air bubbles. Place the cylinder in the apparatus, and immediately rotate at the rate specified in the individual monograph. Within the time interval specified, or at each of the times stated, withdraw a quantity of *Dissolution Medium* for analysis from a zone midway between the surface of the *Dissolution Medium* and the top of the rotating cylinder, not less than 1 cm from the vessel wall. Perform the analysis as directed in the individual monograph, correcting for any volume losses as necessary. Repeat the test with additional transdermal drug delivery systems.

Time— Proceed as directed under *Apparatus 5*.

Interpretation— Unless otherwise specified in the individual monograph, the requirements are met if the quantities of active ingredient released from the system conform to *Acceptance Table 4* for transdermal drug delivery systems. Continue testing through the three levels unless the results conform at either L_1 or L_2.

Apparatus 7 (Reciprocating Holder)

NOTE— This apparatus may also be specified for use with a variety of dosage forms.

Apparatus— The assembly consists of a set of volumetrically calibrated or tared solution containers made of glass or other suitable inert material[6], a motor and drive assembly to reciprocate the system vertically and to index the system horizontally to a different row of vessels automatically if desired, and a set of suitable sample holders (see *Figure 6*[7] and *Figures 7a–7d*). The solution containers are partially immersed in a suitable water bath of any convenient size that permits maintaining the temperature, *T*, inside the containers at 32 ± 0.5° or within the allowable range, as specified in the individual monograph, during the test. No part of the assembly, including the environment in which the assembly is placed, contributes significant motion, agitation, or vibration beyond that due to the smooth, vertically reciprocating sample holder. Apparatus that permits observation of the system and holder during the test is preferable. Use the size container and sample holder as specified in the individual monograph.

[5] The cylinder stirring element is available from Accurate Tool, Inc., 25 Diaz St., Stamford, CT 06907, or from VanKel Technology Group, 13000 Weston Parkway, Cary, NC 27513.

[6] The materials should not sorb, react with, or interfere with the specimen being tested.

[7] The reciprocating disk sample holder may be purchased from ALZA Corp., 1900 Charleston Road, P.O. Box 7210, Mt. View, CA 94039-7210 or VanKel Technology Group.

Stainless Steel Spring Dimensions

A	B
1.45	.58 O
1.40	.31 O
.96	.33 O
.60	.25 O

Fig. 7d. Oral extended-release tablet holder—spring holder.

Dissolution Medium—Use the *Dissolution Medium* specified in the individual monograph (see *Dissolution* ⟨711⟩).

Sample Preparation A (Coated tablet drug delivery system)—Attach each system to be tested to a suitable sample holder (e.g., by gluing system edge with 2-cyano-acrylate glue onto the end of a plastic rod or by placing the system into a small nylon net bag at the end of a plastic rod or within a metal coil attached to a metal rod).

Sample Preparation B (Transdermal drug delivery system)—Press the system onto a dry, unused piece of Cuprophan[4], nylon netting, or equivalent with the adhesive side against the selected substrate, taking care to eliminate air bubbles between the substrate and the release surface. Attach the system to a suitable-sized sample holder with a suitable O-ring such that the back of the system is adjacent to and centered on the bottom of the disk-shaped sample holder or centered around the circumference of the cylindrical-shaped sample holder. Trim the excess substrate with a sharp blade.

Sample Preparation C (Other drug delivery systems)—Attach each system to be tested to a suitable holder as described in the individual monograph.

Procedure—Suspend each sample holder from a vertically reciprocating shaker such that each system is continuously immersed in an accurately measured volume of *Dissolution Medium* within a calibrated container pre-equilibrated to temperature, *T*. Reciprocate at a frequency of about 30 cycles per minute with an amplitude of about 2 cm, or as specified in the individual monograph, for the specified time in the medium specified for each time point. Remove the solution containers from the bath, cool to room temperature, and add sufficient solution (i.e., water in most cases) to correct for evaporative losses. Perform the analysis as directed in the individual monograph. Repeat the test with additional drug delivery systems as required in the individual monograph.

~~**Interpretation**—Unless otherwise specified in the individual monograph, the requirements are met if the quantities of the active ingredients released from the system conform to *Acceptance Table 1* for coated tablet drug delivery systems, to *Acceptance Table 4* for transdermal drug delivery systems, or as specified in the individual monograph. Continue testing through the three levels unless the results conform at either L_1 or L_2.~~

•⟨724⟩ DRUG RELEASE

This test is provided to determine compliance with drug-release requirements where specified in individual monographs. Use the apparatus specified in the individual monograph. Replace the aliquots withdrawn for analysis with equal volumes of fresh *Dissolution Medium* at the temperature specified in the monograph or, where it can be shown that replacement of the medium is not necessary, correct for the volume change in the calculation. Keep the vessel covered for the duration of the test, and verify the temperature of the mixture under test at suitable times.

TRANSDERMAL DELIVERY SYSTEMS—GENERAL DRUG RELEASE STANDARDS

Apparatus 5 (Paddle over Disk)

Apparatus—Use the paddle and vessel assembly from *Apparatus 2* as described under *Dissolution* ⟨711⟩, with the addition of a stainless steel disk assembly[1] designed for holding the transdermal system at the bottom of the vessel. Other appropriate devices may be used, provided they do not sorb, react with, or interfere with the specimen being tested[2]. The temperature is maintained at 32 ± 0.5°. A distance of 25 ± 2 mm between the paddle blade and the surface of the disk assembly is maintained during the test. The vessel may be covered during the test to minimize evaporation. The disk assembly for holding the transdermal system is designed to minimize any "dead" volume between the disk assembly and the bottom of the vessel. The disk assembly holds the system flat and is positioned such that the release surface is parallel with the bottom of the paddle blade (see *Figure 1*).

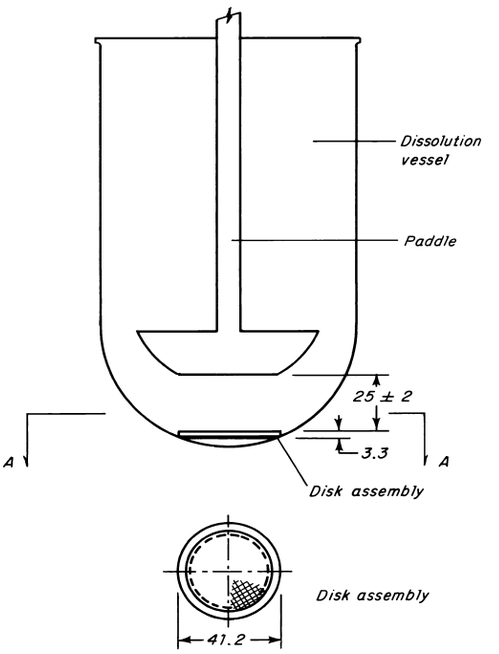

Fig. 1. Paddle Over Disk.
(All measurements are expressed in mm unless noted otherwise.)

[1] Disk assembly (stainless support disk) may be obtained from Millipore Corp., Ashley Rd., Bedford, MA 01730.

[2] A suitable device is the watchglass-patch-polytef mesh sandwich assembly available as the Transdermal SandwichTM from Hanson Research Corp., 9810 Variel Ave., Chatsworth, CA 91311.

Apparatus Suitability Test and Dissolution Medium— Proceed as directed for *Apparatus 2* under *Dissolution* ⟨711⟩.

Procedure—Place the stated volume of the *Dissolution Medium* in the vessel, assemble the apparatus without the disk assembly, and equilibrate the medium to 32 ± 0.5°. Apply the transdermal system to the disk assembly, assuring that the release surface of the system is as flat as possible. The system may be attached to the disk by applying a suitable adhesive[3] to the disk assembly. Dry for 1 minute. Press the system, release surface side up, onto the adhesive-coated side of the disk assembly. If a membrane[4] is used to support the system, it is applied so that no air bubbles occur between the membrane and the release surface. Place the disk assembly flat at the bottom of the vessel with the release surface facing up and parallel to the edge of the paddle blade and surface of the *Dissolution Medium.* The bottom edge of the paddle is 25 ± 2 mm from the surface of the disk assembly. Immediately operate the apparatus at the rate specified in the monograph. At each sampling time interval, withdraw a specimen from a zone midway between the surface of the *Dissolution Medium* and the top of the blade, not less than 1 cm from the vessel wall. Perform the analysis on each sampled aliquot as directed in the individual monograph, correcting for any volume losses, as necessary. Repeat the test with additional transdermal systems.

Time—The test time points, generally three, are expressed in hours. Specimens are to be withdrawn within a tolerance of ±15 minutes or ±2% of the stated time, the tolerance that results in the narrowest time interval being selected.

[3] Use Dow Corning, MD7-4502 Silicone Adhesive 65% in ethyl acetate, or the equivalent.
[4] Use Cuprophan, Type 150 pm, 11 ± 0.5-µm thick, an inert, porous cellulosic material, which is available from Medicell International Ltd., 239 Liverpool Road, London NI ILX, England.

Interpretation—Unless otherwise specified in the individual monograph, the requirements are met if the quantities of active ingredient released from the system conform to *Acceptance Table 1* for transdermal drug delivery systems. Continue testing through the three levels unless the results conform at either L_1 or L_2.

Acceptance Table 1

Level	Number Tested	Criteria
L_1	6	No individual value lies outside the stated range.
L_2	6	The average value of the 12 units ($L_1 + L_2$) lies within the stated range. No individual value is outside the stated range by more than 10% of the average of the stated range.
L_3	12	The average value of the 24 units ($L_1 + L_2 + L_3$) lies within the stated range. Not more than 2 of the 24 units are outside the stated range by more than 10% of the average of the stated range; and none of the units is outside the stated range by more than 20% of the average of the stated range.

Apparatus 6 (Cylinder)

Apparatus—Use the vessel assembly from *Apparatus 1* as described under *Dissolution* ⟨711⟩, except to replace the basket and shaft with a stainless steel cylinder stirring element and to maintain the temperature at 32 ± 0.5° during the test. The shaft and cylinder components of the stirring

element are fabricated of stainless steel to the specifications shown in *Figure 2*. The dosage unit is placed on the cylinder at the beginning of each test. The distance between the inside bottom of the vessel and the cylinder is maintained at 25 ± 2 mm during the test.

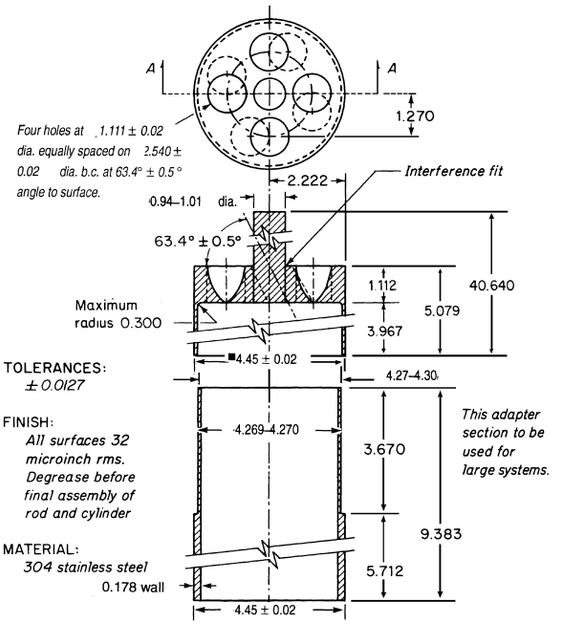

Fig. 2. Cylinder Stirring Element.[5]

(All measurements are expressed in cm unless noted otherwise.)

Dissolution Medium—Use the medium specified in the individual monograph (see *Dissolution* ⟨711⟩).

Procedure—Place the stated volume of the *Dissolution Medium* in the vessel of the apparatus specified in the individual monograph, assemble the apparatus, and equilibrate the *Dissolution Medium* to 32 ± 0.5°. Unless otherwise directed in the individual monograph, prepare the test system prior to test as follows. Remove the protective liner from the system, and place the adhesive side on a piece of Cuprophan[4] that is not less than 1 cm larger on all sides than the system. Place the system, Cuprophan covered side down, on a clean surface, and apply a suitable adhesive[3] to the exposed Cuprophan borders. If necessary, apply additional adhesive to the back of the system. Dry for 1 minute. Carefully apply the adhesive-coated side of the system to the exterior of the cylinder such that the long axis of the system fits around the circumference of the cylinder. Press the Cuprophan covering to remove trapped air bubbles. Place the cylinder in the apparatus, and immediately rotate at the rate specified in the individual monograph. Within the time interval specified, or at each of the times stated, withdraw a quantity of *Dissolution Medium* for analysis from a zone midway between the surface of the *Dissolution Medium* and the top of the rotating cylinder, not less than 1 cm from the vessel wall. Perform the analysis as directed in the individual monograph, correcting for any volume losses as necessary. Repeat the test with additional transdermal drug delivery systems.

Time—Proceed as directed under *Apparatus 5*.

Interpretation—Unless otherwise specified in the individual monograph, the requirements are met if the quantities of active ingredient released from the system conform to *Acceptance Table 1* for transdermal drug delivery systems. Continue testing through the three levels unless the results conform at either L_1 or L_2.

Apparatus 7 (Reciprocating Holder)

NOTE—This apparatus may also be specified for use with a variety of dosage forms.

[5] The cylinder stirring element is available from Accurate Tool, Inc., 25 Diaz St., Stamford, CT 06907, or from VanKel Technology Group, 13000 Weston Parkway, Cary, NC 27513.

Apparatus—The assembly consists of a set of volumetrically calibrated or tared solution containers made of glass or other suitable inert material[6], a motor and drive assembly to reciprocate the system vertically and to index the system horizontally to a different row of vessels automatically if desired, and a set of suitable sample holders (see *Figure 3*[7] and Figures *4a–4d*). The solution containers are partially immersed in a suitable water bath of any convenient size that permits maintaining the temperature, *T,* inside the containers at 32 ± 0.5° or within the allowable range, as specified in the individual monograph, during the test. No part of the assembly, including the environment in which the assembly is placed, contributes significant motion, agitation, or vibration beyond that due to the smooth, vertically reciprocating sample holder. Apparatus that permits observation of the system and holder during the test is preferable. Use the size container and sample holder as specified in the individual monograph.

O = diameter

Fig. 4d. Oral extended-release tablet holder—spring holder.

Dissolution Medium—Use the *Dissolution Medium* specified in the individual monograph (see *Dissolution* ⟨711⟩).

Sample Preparation A (Coated tablet drug delivery system)—Attach each system to be tested to a suitable sample holder (e.g., by gluing system edge with 2-cyano acrylate glue onto the end of a plastic rod or by placing the system into a small nylon net bag at the end of a plastic rod or within a metal coil attached to a metal rod).

Sample Preparation B (Transdermal drug delivery system)—Press the system onto a dry, unused piece of Cuprophan[4], nylon netting, or equivalent with the adhesive side against the selected substrate, taking care to eliminate air bubbles between the substrate and the release surface. Attach the system to a suitable sized sample holder with a suitable O-ring such that the back of the system is adjacent to and centered on the bottom of the disk-shaped sample holder or centered around the circumference of the cylindrical-shaped sample holder. Trim the excess substrate with a sharp blade.

Sample Preparation C (Other drug delivery systems)—Attach each system to be tested to a suitable holder as described in the individual monograph.

Procedure—Suspend each sample holder from a vertically reciprocating shaker such that each system is continuously immersed in an accurately measured volume of *Dissolution Medium* within a calibrated container pre-equilibrated to temperature, *T*. Reciprocate at a frequency of about 30 cycles per minute with an amplitude of about 2 cm, or as specified in the individual monograph, for the specified time in the medium specified for each time point. Remove the solution containers from the bath, cool to room temperature, and add sufficient solution (i.e., water in most cases) to correct for evaporative losses. Perform the analysis as directed in the individual monograph. Repeat the test with additional drug delivery systems as required in the individual monograph.

Interpretation—Unless otherwise specified in the individual monograph, the requirements are met if the quantities of the active ingredients released from the system conform to *Acceptance Table 2* under *Dissolution* ⟨711⟩ for coated tablet drug delivery systems, to *Acceptance Table 1* for transdermal drug delivery systems, or as specified in the individual monograph. Continue testing through the three levels unless the results conform at either L_1 or L_2.●2

(Official April 1, 2006)

BRIEFING

⟨**811**⟩ **Powder Fineness,** *USP 28* page 2480. The United States Pharmacopeia, a member of the Pharmacopoeial Discussion Group, is the coordinating pharmacopeia in the efforts toward the international harmonization of compendial standards for this general test chapter. The presented text represents the **OFFICIAL INQUIRY STAGE 4** draft in the harmonization process, based in part on comments received in response to the **CONSENSUS STAGE 5B** draft. Because of significant changes, the draft has reverted to the **OFFICIAL INQUIRY STAGE 4**.

Proposed changes from the current USP General Chapter ⟨811⟩ *Powder Fineness* include the following:

(1) *In the opening paragraph (the introduction)*—References to USP General Chapters have been removed to further harmonization. Allowance for light diffraction methods is introduced.
(2) *Sieves for Pharmacopeial Testing*—This section that references USP General Chapters is omitted to further harmonization.
(3) *Powdered Vegetable and Animal Drugs*—This section is omitted based on comments that it is irrelevant for harmonization.
(4) *Air Permeation Method for Determining Fineness of Subsieve Size Particles*—This section is omitted based on comments that it would be better to describe this method separately. This paragraph is no longer referenced in a USP monograph.
(5) *Classification of Powder Fineness*—This section is completely revised to use ISO Standards. The term ''very coarse'' has been omitted from the draft based on comments that it is not used in *EP* or *JP*.

(ETM: J. Lane) RTS—41926-1

Add the following:

⟨811⟩ POWDER FINENESS

The particle size distribution should be estimated by analytical sieving or by application of other methods where practical. A simple descriptive classification of powder fineness is provided in this chapter. For practical reasons, sieves are commonly used to measure powder fineness. Sieving is most suitable where a majority of the particles are larger than about 75 μm, although it can be used for some powders having smaller particle sizes where the method can be validated. Light diffraction is also a widely used technique for measuring the size of a wide range of particles from very fine to coarse (0.1 μm to 8 mm).

Classification of Powder Fineness—Where the cumulative distribution has been determined by analytical sieving or by application of other methods, powder fineness may be classified in the following manner:

x_{90} = particle dimension corresponding to 90% of the cumulative undersize distribution;

x_{50} = median particle dimension (i.e., 50% of the particles are smaller and 50% of the particles are larger);

x_{10} = particle dimension corresponding to 10% of the cumulative undersize distribution.

It is recognized that the symbol d is also widely used to designate these values. Therefore, the symbols d_{90}, d_{50}, and d_{10} may be used.

The following parameters may be defined based on the cumulative distribution.

$Q_R(x)$ = cumulative distribution of particles with a dimension less than or equal to x where the subscript R reflects the type of quantity of the density distribution.

R	Distribution Type
0	Number
1	Length
2	Area
3	Volume

Harmonization

Therefore, by definition:

$Q_R(x) = 0.90$ when $x = x_{90}$

$Q_R(x) = 0.50$ when $x = x_{50}$

$Q_R(x) = 0.10$ when $x = x_{10}$

An alternative but less informative method of classifying powder fineness is by use of the terms in the following table.

Classification of Powders by Fineness

Descriptive Term	x_{50}	Cumulative Distribution by Volume Basis, $Q_3(x)$
Coarse	$x_{50} > 355$	$Q_3(355)$ 0.50
Moderately Fine	180 $x_{50} \leq 355$	$Q_3(180)$ 0.50 and $Q_3(355) \geq 0.50$
Fine	125 $x_{50} \leq 180$	$Q_3(125)$ 0.50 and $Q_3(180) \geq 0.50$
Very Fine	$x_{50} \leq 125$	$Q_3(125) \geq 0.50$

Harmonization

PHARMACOPEIAL PREVIEWS

This section contains potential revisions not yet targeted for official adoption. These may include drafts for new monographs or chapters; drafts for standards that would require new or unusual technology; drafts for which more data are required; or changes that would affect numerous monographs, thus having a broad impact on individual products. Readers should review the drafts in this section and provide comments to the appropriate staff liaison whose name is cited in the Briefing (use the *Staff Directory* to find the contact information).

Briefings Each Preview is preceded by a Briefing in the following format:

BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being used, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How To Use PF*), the name of the scientific staff liaison who handled this item, and the USP tracking correspondence number, as shown in the example below:

(PA5: K. Russo) RTS—55678-1

Symbols No symbols are used in this section, as Previews are not yet targeted for official adoption.

GENERAL CHAPTERS

General Information

BRIEFING

⟨1058⟩ Analytical Instrument Qualification. This new general information chapter, which is being presented in *Pharmacopeial Previews,* reflects the conclusions of a 2003 workshop held in Arlington, Virginia, by the American Association of Pharmaceutical Scientists. Good Manufacturing Practices (GMP) regulations require companies to establish procedures ensuring the fitness for use of instruments that generate data supporting regulated product testing. However, GMP regulations do not provide definitive guidance for the qualification of analytical instruments. This chapter covers the initial part of the data quality acquisition process (qualification, validation, and verification), defines the roles and responsibilities of those associated with an instrument's qualification, and establishes the essential parameters for performing instrument qualification and a common terminology. It is recognized by the Expert Committee that the current chapter does not address corrective and preventive actions when a periodic performance qualification (PQ) check fails. Readers are encouraged to submit comments to USP regarding these or any other relevant issues.

(PA4: H. Pappa) RTS—41837-1

Add the following:

⟨1058⟩ ANALYTICAL INSTRUMENT QUALIFICATION

INTRODUCTION

A large variety of instruments and tools, ranging from simple nitrogen evaporators to complex multiple-function technologies, are used in the pharmaceutical industry to acquire data to help ensure that products are suitable for their intended use and that they do not pose high safety risks. Analysts' objective is to consistently obtain reliable and valid data suitable for the intended purpose. Depending on the applications, users validate their procedures and perform system suitability tests and in-process quality control checks to help ensure that the acquired data are reliable. These activities help enhance the quality of data, and there are specific guidance and procedures for performing the activities. With the increasing sophistication and automation of analytical instruments, an increasing demand has been placed on users to qualify their instruments.

Unlike method validation and system suitability activities, analytical instrument qualification (AIQ) currently has no specific guidance or procedures. Competing opinions abound regarding instrument qualification and validation procedures and the roles and responsibilities of the people who perform them. Consequently, various approaches have been used for instrument qualification, which require varying amounts of resources and generate widely differing amounts of documentation. This chapter provides a scientific approach to AIQ and considers AIQ as one of the major components required for generating reliable and consistent data.

Validation versus Qualification

Ambiguity exists in the use of the terms "validation" and "qualification". In this chapter the term "validation" is used for processes and software, and the term "qualification" is used for instruments. Therefore, the phrase "analytical instrument qualification" (AIQ) is used for the process of ensuring that an instrument is suitable for its intended application. The term "validation" is reserved for processes including analytical procedures and software procedures.

COMPONENTS OF DATA QUALITY

There are four critical components involved in the generation of reliable and consistent data (quality data). *Figure 1* shows these components as layered activities within a quality triangle. Each layer adds to the overall quality. Analytical instrument qualification forms the base for generating quality data. The other components essential for generating quality data are analytical method validation, system suitability tests, and quality control checks. These quality components are described below.

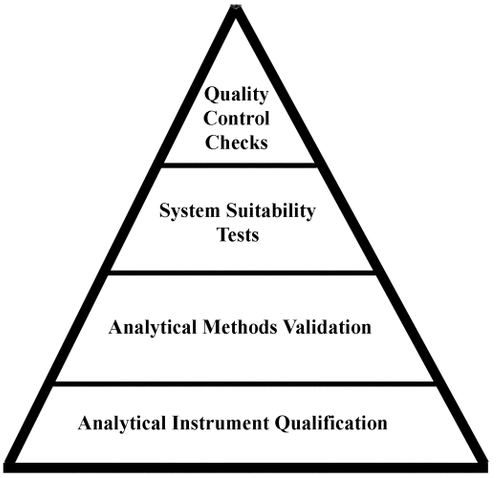

Fig. 1. Components of data quality.

Analytical Instrument Qualification

AIQ is the collection of documented evidence that an instrument performs suitably for its intended purpose and that it is properly maintained and calibrated. Use of a qualified instrument in analyses contributes to confidence in the veracity of generated data.

Analytical Method Validation

Analytical method validation is the collection of documented evidence that an analytical procedure does what it purports to do and addresses the required attributes of the procedure. Use of a validated procedure provides confidence that the procedure will generate test data of acceptable quality. Users of compendial procedures perform validation using the criteria provided in General Chapter *Validation of Compendial Methods* ⟨1225⟩.

System Suitability Tests

System suitability tests verify that the system will perform according to the analyst's expectations and the criteria set forth in the procedure. These tests are performed along with the sample analyses to ensure the system's acceptable performance at the time of the test. USP General Chapter *Chromatography* ⟨621⟩ presents a more detailed discussion of system suitability tests.

Quality Control Checks

Most analyses are performed on instruments calibrated or standardized using reference materials or calibration standards. The calibration or standardization process uses a single- or multiple-point calibration, depending on the instrument and the intended application. The calibration or standardization of an instrument during analysis ensures that the instrument response correlates with the known quantity or quality of the calibration standard or reference material. In addition to calibration or standardization, some analyses also require the inclusion of quality control check samples to provide an in-process or ongoing assurance of the test's suitable performance.

The extent of system suitability tests or quality control checks varies for different analyses, depending on their intended use. Chemical analyses, which are largely subject to Good Manufacturing Practices (GMP) regulations and require tighter precision and accuracy, may require more system suitability tests than bioanalytical work. This work—largely subject to Good Laboratory Practice (GLP) regulations and requiring sensitive, specific, broad-range analysis—is generally performed with more quality control checks during sample analysis. Control check samples are also appropriate when high-variability tests or instruments (i.e., those with a relative standard deviation [RSD] higher than 5%) are considered. Other use-specific considerations may also determine the extent of system suitability tests or quality-control-check sample analysis. Nevertheless, the sum total of such controls provides an important step in delivering quality data for the intended purpose.

In summary, analytical instrument qualification and analytical method validation ensure the quality of analysis *before* conducting the tests. System suitability tests and quality control checks ensure the quality of analytical results *immediately before* or *during* sample analysis.

ANALYTICAL INSTRUMENT QUALIFICATION PROCESS

The following sections address in detail the AIQ process. The other three components of building quality into analytical data—analytical method validation, system suitability tests, and quality control checks—are not within the scope of this chapter.

Qualification Phases

Instrument qualification is not a single continuous process but instead results from several discrete activities. For convenience, these activities can be grouped into four phases: design qualification (DQ), installation qualification (IQ), operational qualification (OQ), and performance qualification (PQ).

Some of these qualification terms have their roots in manufacturing-process validation. Note, however, that adoption of process validation terms does not imply that all process validation activities are necessary for AIQ. Also, some AIQ activities cover more than one qualification phase and could arguably be performed within any of the phases. It is important that the required AIQ activities be performed; it is not as important within which qualification phase an activity is performed or reported. *Table 1* accommodates these overlapping activities by letting users perform them under one or another phase as necessary. The user should describe where the activity is performed and reported.

Table 1: Timing, Applicability, and Activities for Each Phase of Analytical Instrument Qualification*

DQ	IQ	OQ	PQ
	Timing and applicability		
Prior to purchase of a new type of instrument	At installation of each instrument (new, old, or existing unqualified)	After installation or major repair of each instrument	Periodically at specified intervals for each instrument
	Activities		
Assurance of vendor's DQ	System description ⇆	Fixed parameters	Preventive maintenance and repairs
Assurance of adequate support availability from manufacturer	Instrument delivery		SOPs for operation, calibration, and maintenance
Instrument's fitness for use in laboratory	Utilities/facility/ environment		
	Network and data storage ⇆	Secure data storage, backup, and archive	
	Assembly and installation		
	Installation verification ⇆	Instrument functions tests ⇆	Performance checks

* Activities under each phase are usually performed as given in the table. However, in some cases, it may be more appropriate to perform or combine a given activity with another phase. Such activities spanning more than one qualification phase are shown as connected by double arrows. If an activity listed under a given phase is performed under another phase, it is not necessary to repeat the activity under the phase where the activity is listed. Performing the activity is far more important than the phase under which the activity is performed.

DESIGN QUALIFICATION

Design qualification (DQ) is most suitably performed by the instrument developer or manufacturer. Since the instrument design is already in place for commercial off-the-shelf (COTS) systems, users do not need to repeat all aspects of DQ. However, users should ensure that COTS instruments are suitable for their intended applications and that the manufacturer has adopted a quality system for developing, manufacturing, and testing. Users should also establish that manufacturers and vendors adequately support installation, service, and training. Methods for ascertaining the manufacturer's design qualification and an instrument's suitability for its intended use depend on the nature of the instrument, the complexity of the proposed application, and the extent of users' previous interaction with the manufacturer. Vendor audits or required vendor-supplied documentation satisfy

part of the DQ requirements. The required scope and comprehensiveness of the audits and documentation vary with users' familiarity with the instrument and their previous interactions with the vendor.

Informal processes also form an important part of DQ. Informal personal communications and networking with peers at technical or user-group meetings significantly inform users about the suitability of instrument design for various applications and the quality of vendor support services. Another good source of information about suitability for intended use is informal site visits to other users' and vendors' facilities to obtain data on representative samples that used the specified instrument. In many instances an assessment of the quality of vendor support, gleaned from informal discussions with peer users, significantly influences instrument selection.

INSTALLATION QUALIFICATION

Installation qualification (IQ) is the documented collection of activities necessary for installing an instrument in the user's environment. IQ applies to an instrument that is new or was preowned, or to any instrument that exists on site but has not been previously qualified. Relevant parts of IQ would also apply to a qualified instrument that has been packed and transported to another location. The activities and documentation associated with IQ are as follows.

System Description—Provide a description of the instrument, including its manufacturer, model, serial number, software version, etc. Use drawings and flow charts where appropriate.

Instrument Delivery—Ensure that the instrument, software, manuals, supplies, and any other accessories arrive with the instrument as the purchase order specifies and that they are undamaged. For a pre-owned or existing instrument, manuals and documentation should be obtained.

Utilities/Facility/Environment—Verify that the installation site satisfactorily meets vendor specified environmental requirements. A commonsense judgment for the environment suffices: one need not measure the exact voltage for a standard-voltage instrument or the exact humidity reading for an instrument that will operate at ambient conditions.

Network and Data Storage—Some analytical systems require users to provide network connections and data storage capabilities at the installation site. When required, connect the instrument to the network, and check its functionality.

Assembly and Installation—Assemble and install the instrument, and perform any preliminary diagnostics and testing. Assembly and installation of a complex instrument are best done by the vendor or specialized engineers, whereas users can assemble and install simple ones. For complex instruments, vendor-established installation tests and guides provide a valuable baseline reference for determining instrument acceptance. Any abnormal event observed during assembly and installation merits documenting. If the preowned, unqualified existing instrument or transported instrument requires assembly and installation, perform the tasks as specified above, then perform the installation verification procedure, described below.

Installation Verification—Perform the initial diagnostics and testing of the instrument after installation. On obtaining acceptable results, the user and, when present, the installing engineer should confirm that the installation was successful before proceeding with the next qualification phase.

OPERATIONAL QUALIFICATION

After a successful IQ, the instrument is ready for OQ testing. The OQ phase may consist of these test parameters.

Fixed Parameters—These tests measure the instrument's nonchanging parameters. like length, height, weight, voltage inputs, acceptable pressures, and loads. If the vendor-supplied specifications for these parameters satisfy the user, the test requirements may be waived. However, if the user wants to confirm the parameters, testing can be performed at the user's site. Fixed parameters do not change over the life of the instrument, and therefore never need redetermination. [NOTE—These tests could also be performed during the IQ phase (see *Table 1*); if so, fixed parameters need not be redetermined as part of OQ testing.]

Secure Data Storage, Backup, and Archiving—When required, test secure data handling, such as storage, backup, and archiving, at the user's site according to written procedures.

Instrument Function Tests—Important instrument functions should be tested to verify that the instrument operates as intended by the manufacturer and required by the user. The user should select important instrument parameters for testing according to the instrument's intended use. Vendor-supplied information is useful in identifying specifications for these parameters. Tests should be designed to evaluate the identified parameters. Users, or their qualified designees, should perform these tests to verify that the instrument meets vendor and user specifications.

The extent of OQ testing an instrument undergoes depends on its intended applications. Therefore, no specific OQ tests for any instrument or application are offered in this chapter. Nevertheless, as a guide to the type of tests possible during OQ, consider these, which apply to an HPLC unit:

- pump flow rate,
- gradient linearity,
- detector wavelength accuracy,
- detector linearity,
- column oven temperature,
- injector precision and accuracy, and
- peak retention time precision.

Routine analytical tests do not constitute OQ testing. OQ tests are specifically designed to verify the instrument's operation according to specifications in the user's environment and may not be required to be repeated at regular intervals. Rather, when the instrument undergoes major repairs or modifications, relevant OQ tests should be repeated to verify whether the instrument continues to operate satisfactorily. Relevant OQ tests should also be repeated for an instrument that has been transported to another location, although a move within the laboratory, or from one room to another, that does not disturb instrument operation may not require requalification.

OQ tests can be modular or holistic. Modular testing of individual components of a system may facilitate interchanging of such components without requalification and should be performed whenever possible. Holistic tests, which involve the entire system, are acceptable in lieu of modular testing. Having successfully completed OQ testing, the instrument is qualified for use in regulated samples analysis.

PERFORMANCE QUALIFICATION

After IQ and OQ have been performed, the instrument's continued suitability for its intended use is demonstrated through performance qualification (PQ). The PQ phase includes the following parameters.

Performance Checks—Set up a test or series of tests to verify the acceptable performance of the instrument for its intended use. PQ tests are usually based on the instrument's typical on-site applications. Some tests may resemble those performed during OQ, but the specifications for their results can be set differently if required. PQ tests should be performed routinely on a working instrument, not only on a

new instrument at installation. Therefore, PQ specifications can be slightly less rigorous than OQ specifications. Nevertheless, user specifications for PQ tests should evince trouble-free instrument operation for the intended applications. PQ tests should be performed independently of the routine analytical testing performed on the instrument. Like OQ testing, the tests can be modular or holistic. Because many modules within a system interact, holistic tests generally prove more effective because they evaluate the entire system, not simply the system's individual modules.

Testing frequency depends on the ruggedness of the instrument and the criticality of the tests performed. Testing may be unscheduled—for example, each time the instrument is used. Or it may be scheduled for regular intervals, such as weekly or monthly. Experience with the instrument can influence this decision. Generally, the same PQ tests are repeated each time so that a history of the instrument's performance can be compiled. Some system suitability tests or quality control checks that are performed concurrently with the test samples also imply that the instrument is performing suitably. However, although system suitability tests can supplement periodic PQ tests, they cannot replace them.

Preventive Maintenance and Repairs—When an instrument fails to meet PQ test specifications, it requires maintenance or repair. For many instruments a periodic preventive maintenance may also be recommended. The relevant PQ test(s) should be repeated after the needed maintenance or repair to ensure that the instrument remains qualified.

Standard Operating Procedure[s] for Operation, Calibration, and Maintenance—Establish standard operating procedures to maintain and calibrate the instrument. Use a logbook, binder, or electronic record to document each maintenance and calibration activity.

Roles and Responsibilities

USERS

Users are ultimately responsible for instrument operations and data quality. The users' group encompasses analysts, their supervisors, and organization management. Users should be adequately trained in the instrument's use, and their training records should be maintained as required by the regulations.

Users should also be responsible for qualifying their instruments, because their training and expertise in the use of instruments make them the best-qualified group to design the instrument test(s) and specification(s) necessary for successful AIQ. Consultants, validation specialists, and quality assurance (QA) personnel can advise and assist as needed, but the final responsibility for qualifying instruments lies with the users. The users must also maintain the instrument in a qualified state by routinely performing PQ.

QUALITY ASSURANCE

The QA role in AIQ remains the same as for any other regulated study. QA personnel should understand the instrument qualification process, and they should learn the instrument's application by working with the users. Finally, they should review the AIQ process to determine whether it meets regulatory requirements and that the users attest to its scientific validity.

MANUFACTURERS

Manufacturers and developers are responsible for DQ when designing the instrument. They are also responsible for validation of relevant processes used in manufacturing and assembly of the hardware and for software associated with the instrument. Manufacturers and developers are also

responsible for writing stand-alone software for analytical work in a documented quality manner and for the validation of this software. Manufacturers should test the assembled instruments before shipping them to users.

Manufacturers and vendors should make available to users a summary of their validation efforts and the results of final instrument and software tests and should provide the critical functional test scripts that can be used to qualify the instrument and software at the user site. For instance, manufacturers and vendors can provide a large database and scripts for functional testing of the network's bandwidth for laboratory information management system (LIMS) software.

Finally, manufacturers and vendors should notify all known users about hardware or software defects discovered after a product's release; offer user training, service, repair, and installation support; and invite user audits as necessary.

SOFTWARE VALIDATION

Software used for analytical work can be classified into three categories: firmware; instrument control, data acquisition, and processing software; and stand-alone software.

Firmware—Computerized analytical instruments contain integrated chips with low-level software (firmware). Such instruments will not function without properly operating firmware, and users generally cannot alter firmware design or function. Firmware is thus considered a component of the instrument itself. Indeed, the qualification of hardware is not possible without operating it via its firmware. So when the hardware (that is, the analytical instrument) is qualified at the user's site, the integrated firmware is also essentially qualified. No separate on-site qualification of the firmware is needed. Any changes made to firmware versions should be tracked through change control of the instrument (see *Change Control,* below).

Instrument Control, Data Acquisition, and Processing Software—Software for instrument control, data acquisition, and processing for many of today's computerized instruments is loaded on a computer connected to the instrument. Operation of the instrument is then controlled via the software, leaving fewer operating controls on the instrument. Also, the software is needed for data acquisition and postacquisition calculations. Thus both hardware and software, their functions inextricably intertwined, are critical to providing analytical results.

The manufacturer should perform DQ, validate this software, and provide users with a summary of validation. At the user site, holistic qualification, which involves the entire instrument and software system, is more efficient than modular validation of the software alone. Thus the user qualifies the instrument control, data acquisition, and processing software by qualifying the instrument according to the AIQ process.

Stand-Alone Software—An authoritative guide for validating stand-alone software, such as LIMS, is available.[1] The validation process is administered by the software developer, who also specifies the development model appropriate for the software. Validation takes place in a series of activities planned and executed through various stages of the development cycle.[1]

The software validation guide cited in the previous paragraphs indicates that user-site testing is an essential part of the software development cycle. Note, however, that user-site testing, though essential, is only part of the validation process for stand-alone software and does not constitute

[1] *General Principles of Software Validation: Final Guidance for Industry and FDA Staff,* U.S. Department of Health and Human Services, Food and Drug Administration, Rockville, MD, January 11, 2002. http://www.fda.gov/cdrh/comp/guidance/938.html (accessed September 2004).

complete validation. Refer to the software validation guide for activities that must be performed at the user site for testing stand-alone software used in analytical work.

Change Control

Changes to the instrument and software become inevitable as manufacturers add new features and correct known defects. However, implementing all such changes may not always benefit users. Users should therefore adopt changes they deem useful or necessary and should also assess the effects of changes to determine what, if any, requalification is required. The change control process enables them to do this.

Change control follows the DQ/IQ/OQ/PQ classification process. For DQ, evaluate the changed parameters, and determine whether need for the change warrants implementing it. If implementation of the change is needed, install the changes to the system during IQ. Evaluate which of the existing OQ and PQ tests need revision, deletion, or addition as a result of the installed change. Where the change calls for additions, deletions, or revisions to the OQ or PQ tests, follow the procedure outlined below:

Operational Qualification—Revise OQ tests as necessitated by the change. Perform the revised OQ testing. If the OQ did not need revision, repeat only the relevant tests affected by the change. This ensures the instrument's effective operation after the change is installed.

Performance Qualification—Revise PQ tests as necessitated by the change. Perform the PQ testing after installation of the change if similar testing is not already performed during OQ. In future, perform the revised PQ testing.

For changes to firmware and to software for instrument control, data acquisition, and processing, change control is performed through DQ/IQ/OQ/PQ of the affected instrument. Change control for stand-alone software requires user-site testing of changed functionality.

AIQ Documentation

Two types of documents result from AIQ: static and dynamic.

STATIC DOCUMENTS

Static documents are obtained during the DQ, IQ, and OQ phases and should be kept in a ''Qualification'' binder. Where multiple instruments of one kind exist, documents common to all instruments should go into one binder or section, and documents specific to an instrument should go into that instrument's binder or section. During change control, additional documents can be placed with the static ones, but previous documents should not be removed. When necessary, such documents may be archived.

DYNAMIC DOCUMENTS

Dynamic documents are generated during the OQ and PQ phase when the instrument is maintained or tested for performance. Arranged in a binder or logbook, they provide a running record for the instruments and should be kept with them. These documents may also be archived as necessary.

Instrument Categories

Modern laboratories typically include a suite of tools varying from simple nitrogen evaporators to complex automated instruments. Therefore, applying a single set of prin-

ciples to qualifying such dissimilar instruments would be scientifically inappropriate. Users are most capable of establishing the level of qualification needed for an instrument. On the basis of the level needed, it is convenient to categorize instruments into three groups: A, B, and C, as defined below. Each group is illustrated by some example instruments. Note that the list of instruments provided here is for illustration only and is not meant to be exhaustive. It does not provide the exact category for an instrument at a user site, which should be determined by users for their specific instruments or applications.

GROUP A

Conformance of Group A instruments to user requirements is determined by visual observation. No independent qualification process is required. Example instruments in this group are nitrogen evaporators, magnetic stirrers, vortex mixers, mortar and pestle sets, and glass pipets.

GROUP B

Conformance of Group B instruments to user requirements is performed according to the instruments' standard operating procedures. Their conformity assessments are generally unambiguous. Installation of Group B instruments is relatively simple, and causes of their failure are readily discernible by simple observations. Example instruments in this group are balances, incubators, infrared spectrometers, melting point apparatus, muffle furnaces, light microscopes, pH meters, variable pipets, refractometers, refrigerator-freezers, thermocouples, thermometers, titrators, ovens, and viscosimeters.

GROUP C

Conformance of Group C instruments to user requirements is complex and highly method specific, and conformity bounds are determined by the application. Installing these instruments can be a complicated undertaking and may require the assistance of specialists. A full qualification process, as outlined in this document, should apply to these instruments. Example instruments in this group include the following:

- atomic absorption spectrometers,
- differential scanning calorimeters,
- electron microscope,
- flame absorption spectrometers,
- high-pressure liquid chromatographs,
- mass spectrometers,
- microplate readers,
- thermal gravimetric analyzers,
- X-ray fluorescence spectrometers,
- densitometers,
- diode-array detectors,
- elemental analyzers,
- gas chromatographs,
- near IR spectrometers,
- Raman spectrometers,
- UV/Vis spectrometers, and
- inductively coupled argon–plasma emission spectrometers.

Again, it must be emphasized that the placement of these instruments in the given three groups are for illustrative purposes only. The exact grouping of an instrument must be determined by users for their specific requirements. Depending on individual user requirements, the same instrument may appropriately fall into one group for one user and another group for another user. Therefore, a careful selection of groups by users is highly encouraged.

CONCLUSION

The purpose of the use of analytical instruments is to generate reliable data. Analytical instrument qualification helps fulfill this purpose. No authoritative guide existed that considered the risk of instrument nonperformance and combined that risk with users' scientific knowledge and ability to use the instrument to deliver reliable and consistent data. In the absence of such a guide, the qualification of analytical instruments became a subjective and often fruitless document-generating exercise.

This chapter is based on the outcome of a user workshop-conference on the subject and provides an efficient science- and risk-based process for AIQ. This approach emphasizes AIQ's place in the overall process of obtaining reliable data from analytical instruments. The process provided in this chapter focuses on scientific value rather than on producing documents. Implementing such a process should increase efficiency and remove ambiguous or varying interpretations by various groups.

BRIEFING

⟨1090⟩ In Vivo Bioequivalence Guidances. A new version of this USP general information chapter, entitled *Drug Product Interchangeability,* is being previewed in this issue of *PF.* The new version of this chapter presents the different approaches used by regulatory authorities to assess drug product interchangeability in order to establish national markets for reference products and generic equivalents. The text discusses the relationships among WHO, ICH, FDA, and USP approaches from the following perspectives: specifications; bioavailability (BA), bioequivalence (BE), and dissolution; WHO and FDA interchangeability approaches; and methodology for BE studies and waivers for in vivo studies. Interested parties are encouraged to submit comments.

(BPC: H. Pappa) RTS—41913-1

Change to read:

⟨1090⟩ ~~IN VIVO BIOEQUIVALENCE GUIDANCES~~ DRUG PRODUCT INTERCHANGEABILITY

In many countries, drug products (medicines) enter the marketplace only after evaluation of safety, efficacy, and quality information by a national drug regulatory authority. Many of the requirements and recommendations for the kind of data to be submitted to these authorities by an applicant are specified in national laws, regulations, and guidances. Through the World Health Organization (WHO) and the International Conference on Harmonization (ICH), the type of information needed to support a regulatory filing has been clarified and, where feasible, harmonized. Adoption of a WHO document by a regulatory authority is optional. For countries participating in ICH, adoption is required after agreement is reached on the harmonized document. The ICH documents then become allied with additional national or regional requirements and recommendations as a means of informing applicants about optimal ways to develop information in a regulatory filing. WHO, but not ICH, has developed guidances that consider bioavailability (BA), bioequivalence (BE), and dissolution studies and their role in assuring product performance in an initial regulatory filing and following approval. Well-evolved national systems that promote a system of interchangeable multisource drug products have arisen in the U.S. and elsewhere. In these settings, a national drug regulatory authority determines whether a dosage form is pharmaceutically equivalent and bioequivalent to a defined reference product. If this determination is positive, the dosage form is declared to be therapeutically equivalent and hence interchangeable with

the reference product. These systems rely on various types of studies to document pharmaceutical equivalence and bioequivalence. For bioequivalence, both in vivo clinical studies (e.g., pharmacokinetic, pharmacodynamic, and clinical) are used as well as in vitro dissolution studies. In addition, dissolution techniques are also used for nonsolution orally administered and other drug products to control quality. Given that they apply to both the reference product and interchangeable multisource drug products, public drug substance and drug product monographs in the *USP–NF* help assure interchangeability of drug substances and drug products.

The relationships among WHO, ICH, FDA, and USP approaches are similar and at times identical. The purpose of this general information chapter is to discuss these relationships from the following perspectives: (1) specifications; (2) BA, BE, and dissolution; (3) WHO and FDA interchangeability approaches; and (4) methodology for BE studies.

SPECIFICATIONS

Information in a regulatory filing about the safety, efficacy, and quality of a drug product is closely related. Safety and efficacy are established in clinical and nonclinical trials using active and inactive ingredients and products that are subjected to extensive physicochemical and other characterization tests. As part of the regulatory approval process, a subset of these tests is used in a private set of specifications, at times allied with public standards in *USP–NF* that control the quality of the drug product to its expiry date. In the ICH document *Specifications: Test Procedures and Acceptance Criteria for New Drug Substances and New Drug Products: Chemical Substances* (Q6A), a specification is defined as a series of tests, procedures, and acceptance criteria for an ingredient, a product, its packaging material, or other components used in the manufacturing process. Many of these private specifications subsequently become public via Pharmacopeial processes and are presented, together with other requirements, in ingredient and product monographs in *USP–NF* and other pharmacopeias. Specifications are adequate to control quality only when important manufacturing factors (method of manufacture, components, and composition) are invariant relative to the manufacturing factors that created the clinical trial material on which safety and efficacy data were generated. With changes in method of manufacture of the drug product and/or its ingredients, additional recharacterization information may be needed to assure the continuing quality and performance of the drug product. This information can be submitted in postapproval regulatory filings that undergo scrutiny in a manner similar to that for an original application. Maintenance of key quality attributes reflected in these approaches work to assure practitioners and patients that the requisite safety and efficacy outcomes will be achieved with administration of the drug product.

Standards in a Pharmacopeial monograph include introductory statements (definition, description, packaging and storage statements), followed by the public specification for the ingredient or product (article). When an article is shown by testing and other scrutiny to conform to the stipulations of its monograph, the identity of the article is established. The specifications in *USP–NF* ingredient and product monographs allow the public at large to understand better how the quality of a drug product is controlled. Furthermore, monograph standards help assure interchangeability across ingredients and products with the same name, which should be tested using the same procedures and acceptance criteria when appropriate. Private specifications help control the quality of a specific set of ingredients that are combined in a specific product. Public specifications help control the quality of all ingredients and

products bearing the same name. Thus while a public and private specifi-cation may be closely related, differences exist to account for different routes of synthesis and manufacturing processes. Increasingly, these differences will be accounted for in *USP–NF* monographs. Taken together, the work of a regulatory authority and USP are closely allied, with each performing different yet complementary functions. For example, the regulatory authority generally establishes acceptance criteria for impurities, given that these are closely related to safety and efficacy information. *USP–NF* provides generally useful validated analytical procedures with acceptance criteria that are applicable to many ingredients and products.

BIOAVAILABILITY, BIOEQUIVALENCE, AND DISSOLUTION

Except for solution dosage forms, where bioavailability is usually considered self-evident, bioavailability (BA) and bioequivalence (BE) information is considered important in a regulatory filing. Although BA information may be part of a data set that broadly addresses the absorption, distribution, metabolism, and excretion (ADME) of the active ingredient, product quality BA and BE studies focus on the performance of the drug product. For an innovator product, BA requires no comparator product in that it establishes the performance of the to-be-marketed drug product or precursor clinical trial material, even though this performance may be evaluated relative to a solution, suspension, parenteral, or other type of dosage form as reference. BE data are necessarily comparative in that a BE study assesses the performance of two drug products—the test (T) and reference (R) product. Although not specifically mentioned, BA and BE studies conform to the general approaches delineated in the ICH Q6A document, i.e., they are characterization studies that establish, for purposes of a regulatory filing, the performance of a specific drug product. In this context, disintegration or dissolution tests with acceptance criteria, which are specifically mentioned in ICH Q6A, may become one of a series of tests in the drug product specification. The BE characterization test is more determinative than the in vitro dissolution or disintegration batch release test, i.e., bioequivalent drug products may still rely on different dissolution or disintegration procedures and acceptance criteria to assess performance. Over time, the private dissolution or disintegration test may become the public performance test in *USP–NF*. Both the private and public approaches frequently rely on suitably validated and calibrated disintegration, dissolution, and other procedures provided in *USP–NF* general chapters. Determinations about BA and BE are regulatory in character. The USP performance test is related to BA and BE only when closely allied with a sound regulatory determination. Without this link, the USP performance test should be regarded solely as a quality control test for batch release.

INTERCHANGEABILITY

The challenge of moving towards a fully evolved system of innovator (R) and interchangeable (generic) drug products (T) exists in many countries and regions of the world. In the U.S., reference products, termed the reference listed drug, are so noted in FDA's *Approved Drug Products with Therapeutic Equivalence Ratings* (Orange Book), which is

updated monthly (http://www.fda.gov/cder/ob). Although the pioneer product is usually the reference product (R), this is not always the case. To assist countries and regions where the reference product may not always be readily identifiable, the WHO has prepared a document entitled *Guidance on the Selection of Comparator Pharmaceutical Products for Equivalence Assessment of Interchangeable Multisource (Generic) Products.* With a clearly defined set of reference products, the task for a country or region becomes one of requiring that a manufacturer demonstrate, to the satisfaction of its regulatory authority, that its multisource product is pharmaceutically equivalent and bioequivalent to the corresponding reference product.

Many documents are available throughout the world to help applicants understand BA and BE requirements and recommendations. These approaches have become increasingly important as countries and regions move to legal systems that support the availability of innovator and interchangeable multi-source products. These systems necessarily rely on some definition of pharmaceutical equivalence and a further requirement that two drug products (T and R) must be both pharmaceutically equivalent and bioequivalent in order to be therapeutically equivalent and thus interchangeable under all conditions of use. WHO and FDA documents provide extensive recommendations on the topic. There is substantial correspondence between the WHO and FDA approaches, which reflects the harmonization that has already occurred. Sometimes differences in terminology and other approaches exists. A comparison between WHO and FDA approaches is provided in *Table 1.*

Table 1—FDA and WHO Definitions

	FDA	WHO
Pharmaceutical Equivalents	Drug products are considered pharmaceutical equivalents if they contain the same active ingredient(s), are of the same dosage form, use the same route of administration, and are identical in strength or concentration. Pharmaceutically equivalent drug products are formulated to meet the same or compendial or other applicable standards, but they may differ in characteristics such as shape, scoring configuration, release mechanisms, packaging, excipients, expiration time, and, within certain limits, labeling.	Products are pharmaceutical equivalents if they contain the same amount of the same active substance(s) in the same dosage form; if they meet the same or comparable standards; and if they are intended to be administered by the same route. However pharmaceutical equivalence does not necessarily imply therapeutic equivalence, as differences in the excipients and/or the manufacturing process can lead to differences in product performance.
Pharmaceutical Alternatives	Drug products are considered pharmaceutical alternatives if they contain the same therapeutic moiety, but are different salts, esters, or complexes of that moiety, or are different dosage forms or strengths.	

Table 1—FDA and WHO Definitions *(Continued)*

	FDA	WHO
Therapeutic Equivalents	Drug products are considered to be therapeutic equivalents only if they are pharmaceutical equivalents and if they can be expected to have the same clinical effect and safety profile when administered to patients under the conditions specified in the labeling.[1]	Two pharmaceutical products are therapeutically equivalent if they are pharmaceutically equivalent and after administration in the same molar dose their effects, with respect to both efficacy and safety, will be essentially the same, all determined from appropriate studies (bioequivalence, pharmacodynamic, clinical or in vitro studies).
Bioavailability	The rate and extent to which the active ingredient or active moiety is absorbed from a drug product and becomes available at the site of action.	The rate and extent of availability of an active drug ingredient from a dosage form as determined by its concentration-time curve in the systemic circulation or by its excretion in urine.
Bioequivalent Drug Products	This term describes pharmaceutical equivalent or alternative products that display comparable bioavailability when studied under similar experimental conditions.[2]	Two pharmaceutical products are bioequivalent if they are pharmaceutically equivalent and their bioavailabilities (rate and extent of availability), after administration in the same molar dose, are similar to such a degree that their effects can be expected to be essentially the same.
Reference Products	A reference listed drug (21 CFR 314.94[a][3]) means the listed drug identified by FDA as the drug product upon which an applicant relies in seeking approval of its ANDA.	A reference product is a pharmaceutical product with which the new product is intended to be interchangeable in clinical practice. The reference product will normally be the innovator product for which efficacy, safety and quality have been established. Where the innovator product is not available, the product that is the market leader may be used as a reference product, provided that it has been authorized for marketing and its efficacy, safety, and quality have been established and documented.

Table 1—FDA and WHO Definitions *(Continued)*

	FDA	WHO
Generic Products		A generic product is a pharmaceutical product, usually intended to be interchangeable with the innovator product. It is usually manufactured without a license from the innovator company and marketed after the expiry of patent or other exclusivity rights.
Multisource Pharmaceutical Products		Multisource pharmaceutical products are pharmaceutically equivalent products that may or may not be therapeutically equivalent. Multisource pharmaceutical products that are therapeutically equivalent are interchangeable.
Interchangeable Pharmaceutical Products		An interchangeable pharmaceutical product is one that is therapeutically equivalent to a reference product.

[1] FDA classifies as therapeutically equivalent those products that meet the following general criteria: (1) they are approved as safe and effective; (2) they are pharmaceutical equivalents in that they (a) contain identical amounts of the same active drug ingredient in the same dosage form and route of administration, and (b) meet compendial or other applicable standards of strength, quality, purity, and identity; (3) they are bioequivalent in that (a) they do not present a known or potential bioequivalence problem, and they meet an acceptable in vitro standard, or (b) if they do present such a known or potential problem, they are shown to meet an appropriate bioequivalence standard; (4) they are adequately labeled; and (5) they are manufactured in compliance with current Good Manufacturing Practices regulations.

[2] Section 505(j)(7)(B) of the Act describes one set of conditions under which a test and reference listed drug shall be considered bioequivalent: the rate and extent of absorption of the test drug do not show a significant difference from the rate and extent of absorption of the reference drug when administered at the same molar dose of the therapeutic ingredient under similar experimental conditions in either a single dose or multiple doses; or the extent of absorption of the test drug does not show a significant difference from the extent of absorption of the reference drug when administered at the same molar dose of the therapeutic ingredient under similar experimental conditions in either a single dose or multiple doses and the difference from the reference drug in the rate of absorption of the drug is intentional, is reflected in its proposed labeling, is not essential to the attainment of effective body drug concentrations on chronic use, and is considered medically insignificant for the drug. Where these above methods are not applicable (e.g., for drug products that are not intended to be absorbed into the bloodstream), other in vivo or in vitro test methods to demonstrate bioequivalence may be appropriate. Bioequivalence may sometimes be demonstrated using an in vitro bioequivalence standard, especially when such an in vitro test has been correlated with human in vivo bioavailability data. In other situations, bioequivalence may sometimes be demonstrated through comparative clinical trials or pharmacodynamic studies.

World Health Organization

In 1995, WHO developed a guidance entitled *Multisource (Generic) Pharmaceutical Products: Guidelines on Registration Requirements to Establish Interchangeability (WHO Guideline).* This document provides recommendations to manufacturers and drug regulatory authorities on the information required to support a regulatory decision regarding the interchangeability between a multisource product (T) and a corresponding innovator (R) product. The WHO Guideline is part of a series of normative documents available to countries throughout the world on approaches to assure the quality of medicines. The guideline is abstracted in this section and is available at www.who.int.

Introduction—The *Introduction* acknowledges that conformity to current Good Manufacturing Practices (cGMPs) and pharmacopeial standards may be sufficient to assure interchangeability for many solution dosage forms. The *Introduction* also speaks to the scope of the guideline, which excludes complex active ingredients, and notes that it is provided without prejudice to intellectual property considerations.

Glossary—The *Glossary* to the WHO Guideline defines several important terms (bioavailability, bioequivalence, dosage form, therapeutic equivalence, generic product, innovator pharmaceutical product, interchangeable pharmaceutical product, multisource pharmaceutical product, pharmaceutical equivalence, reference product). These definitions provide the regulatory and science/technical basis for determining interchangeability. Definitions of the terms *pharmaceutical equivalence* and *bioequivalence* are particularly important. Pharmaceutical equivalence is established if two drug products contain the same amount of the same active substance(s), if they meet the same or comparable standards, and if they are intended to be administered by the same route. Although pharmaceutical equivalence has elements that are satisfied by definition (same route of administration and same dosage form), a determination that the active ingredient in a T product is the same as that in an R product might require extensive characterization studies depending on the complexity of the molecule. The allowance for dosage forms with different names is an important aspect of pharmaceutical equivalence and requires both regulatory and compendial judgment. In the U.S., for example, capsules and tablets are not considered pharmaceutically equivalent, although they might be considered pharmaceutically equivalent in other market zones. The WHO Guideline notes the importance of considering BA and BE not only in terms of rate and extent of absorption but also in terms of systemic exposure patterns. Noting various interpretations of the term *generic product*, the document expresses a preference for the term *interchangeable pharmaceutical product.* The WHO Guideline corresponds to U.S. approaches delineated at 21 Code of Federal Regulations (CFR) 320.

Part One: Regulatory Assessment of Interchangeable Multisource Pharmaceutical Products—The WHO Guideline emphasizes the importance of authorization by a regulatory authority as a means of allowing market access. Alternatively, where regulatory resources are limited, reliance on the WHO certification scheme may be useful. The latter approach, however, may not satisfy a national interest in assuring interchangeability. A WHO certificate does not usually indicate a determination of interchangeability. Secondly, even if such a determination were made, it would apply to the innovator product in the exporting country, a product that might not have the same quality and performance characteristics as that of the innovator product in the importing country.

The WHO Guideline notes that differences between multisource and innovator products may be obvious and unimportant (e.g., differences in appearance), while others may be less obvious but more important (e.g., excipients, stability, instructions for use, packaging). The section emphasizes the importance not only of a conclusion of therapeutic equivalence but also the need for manufacture according to GMPs, labeling, and other considerations. For orally administered dosage forms, excipients in a multisource product and in a corresponding innovator product do not have to be the same, although practitioners and patients should be aware that patients may respond differently to some excipients. The remainder of the section focuses on (1) technical data for regulatory assessment; (2) product information and promotion; (3) collaboration between drug regulatory authorities; and (4) exchange of evaluation reports as a means of conserving regulatory resources. A compendial monograph for the ingredients in a drug product and for the drug product itself can satisfy several elements in the list of required technical data.

Part Two: Equivalence Studies Needed for Marketing Authorization—The WHO Guideline lists the studies needed to document equivalence, allowing comparative bioequivalence studies, comparative pharmacodynamic studies, clinical studies, and in vitro dissolution. For most nonsolution dosage forms, bioequivalence may be satisfied either with bioequivalence studies or with in vitro dissolution studies. The WHO Guideline uses the term bioequivalence to indicate a pharmacokinetic study. In the U.S., the term bioequivalence is used to indicate any study—pharmacokinetic, pharmacodynamic, clinical, or in vitro dissolution study—used to document comparable product performance.

The WHO Guidance recommends in vivo studies for the following dosage forms:

- bioproblem drugs
- transdermal patches, suppositories
- modified-release products
- fixed combinations of two or more active ingredients
- locally acting, nonsolution pharmaceutical products

In vitro studies may be adequate for all other dosage forms and for lower strengths of some of the dosage forms for which in vivo studies are recommended. The general approaches in this section of the WHO Guidance correspond to U.S. approaches for products approved prior to 1962. After that date, FDA generally required an in vivo bioequivalence study, although more recently FDA has allowed increased reliance on in vitro dissolution studies within the recommendations of the biopharmaceutics classification system (BCS).

Part Three: Tests for Bioequivalence—The WHO Guideline provides detailed recommendations regarding the conduct of pharmacokinetic studies in humans and brief descriptions of pharmacodynamic and clinical studies. The WHO Guidance notes that where in vitro dissolution is used to document equivalence, an in vivo-in vitro correlation (IVIVC) may be required or, alternatively, a multi-source and an innovator product may be considered equivalent if both are rapidly dissolving (80% in 15 minutes). The latter approach is partial implementation of the Biopharmaceutical Classification System (BCS) (see below), while the former may be unnecessary, given that the requirements to document an IVIVC may be more burdensome than just showing BE via a single in vivo study. For all comparisons, the WHO Guidance recommends the use of an average criterion to assure interchangeability.

Concluding Parts—The closing sections of the WHO Guideline provide additional information on the following: in vitro dissolution tests in product development and quality control (Part 4); clinically important variations in bioavailability leading to nonapproval of the product (Part 5); studies needed to support new post-marketing manufacturing conditions (Part 6); and choice of reference product (Part 7). Part 7 was considered in more detail in the previously mentioned WHO *Comparator Pharmaceutical Product Guidance.*

Food and Drug Administration

In the past, FDA provided drug-specific guidances to sponsors who wished to perform bioequivalence studies. With minor modifications, these were published in *In Vivo Bioequivalence Guidances* ⟨1090⟩. More recently, FDA has issued or plans to issue general guidances on the topic, with the goal of reducing drug-specific guidances (http://www.fda.gov/cder/guidance/index.htm). A list of these guidances, together with their status, appears below:

- *Bioavailability and Bioequivalence Studies for Orally Administered Drug Products—General Considerations (General Guidance)*
- *Statistical Approaches to Establishing Bioequivalence*
- *Bioanalytical Method Validation*
- *Waiver of In Vivo Bioavailability and Bioequivalence Studies for Immediate Release Solid Oral Dosage Forms Based on a Biopharmaceutics Classification System*
- *Food-Effect Bioavailability and Fed Bioequivalence Studies*
- *Bioavailability and Bioequivalence Studies for Nasal Aerosols and Nasal Sprays for Local Action (draft);*
- *Dissolution Testing of Immediate Release Solid Oral Dosage Forms*
- *Extended Release Oral Dosage Forms: Development, Evaluation, and Application of In Vitro/In Vivo Correlations*

Given that BA/BE studies are especially relevant for orally administered solid and nonsolution liquid oral dosage forms, the central guidance in this set of guidances is the *General Guidance.* This guidance is composed of six primary sections that are abstracted in the following paragraphs.

Section I—The *Introduction* states that the General Guidance addresses how to meet the BA and BE requirements set forth in 21 CFR part 320 as they apply to orally administered drug product and to other drug products where reliance on systemic exposure measures is suitable to document BA and BE (e.g., transdermal delivery systems and certain rectal and nasal drug products). The Guidance supports (1) BA and BE studies conducted during the Investigational New Drug (IND) period for a New Drug Application (NDA), (2) BE studies intended for submission in an Abbreviated New Drug Application (ANDA), and (3) BE studies conducted in the postapproval period for certain changes in both NDAs and ANDAs. These statements emphasize the need to document links between the clinical trial material used to document safety and efficacy, where BA is established, and, via BE studies, between subsequent iterations of both pioneer and generic dosage forms.

Section II—*Background* provides the legal basis for the requirement of BA and BE studies, which is expressed in terms of the rate and extent of absorption. While rate of absorption is difficult to measure, the legal requirement is satisfied by systemic exposure measures, e.g., concentration-time curves of either parent drug or a relevant metabolite. The *Background* notes that BA may be part of a more

comprehensive set incorporating ADME data. Establishing product quality BA is a benchmarking effort for an innovator product. In contrast, documenting BE is usually a more formal comparative test that uses specified criteria for comparisons and predetermined BE acceptance criteria.

Section III—*Methods to Document BA and BE* indicates that (1) pharmacokinetic, (2) pharmacodynamic, (3) clinical, and (4) in vitro dissolution studies may be used to document BA and establish BE. The section notes the value of replicate study designs and provides a representative pharmacokinetic study design. The section also endorses the value, in BA and BE studies, of including in the study population individuals representative of the general population. After consideration of pharmacodynamic and clinical studies, the section concludes with the discussion of dissolution both as a means of measuring BA and BE and as a quality control test, i.e., one test in a series of tests forming the drug product specification.

Section IV—*Comparison of BA Measures in BE Studies* recommends an equivalence approach. This approach relies on (1) a criterion to allow the comparison, (2) a confidence interval for the criterion, and (3) a BE limit (acceptance criteria or ''goalpost''). Log-transformation of exposure measures prior to statistical analysis should be performed. Although the General Guidance recommends an average criterion, it allows the possibility of other criteria that better assess a determination of interchangeability (see the FDA Guidance *Statistical Approaches to Establishing Bioequivalence*). The FDA Guidance recommends goalposts of 80%–125% for all products irrespective of whether the active ingredient in a T and R product is or is not defined as having a narrow therapeutic range (see also *Section VI*).

Section V—*Documentation of BA and BE* recommends an in vivo BE study for all solid oral dosage forms approved after 1962 and for bioproblem drug products approved prior to 1962. The section also establishes when a waiver of in vivo studies for different strengths of a drug product may be granted. The section then comments on specific recommendations for BA and BE studies depending on type of dosage form (solutions, suspensions, immediate-release products [capsules and tablets], modified-release products [delayed-release products and extended-release], and miscellaneous dosage forms).

Section VI—*Special Topics* provides comments and recommendations on (1) food-effect studies, (2) moieties to be measured, (3) long half-life drugs, (3) first point C_{max}, (4) orally administered drugs intended for local action, and (5) narrow therapeutic range drugs.

FDA has provided two guidances that address the use of dissolution both for regulatory and quality control purposes. The first of these is entitled *Dissolution Testing of Immediate Release Solid Oral Dosage Forms* and the second is entitled *Extended Release Oral Dosage Forms: Development, Evaluation and Application of In Vitro/In Vivo Correlations*. USP general information chapter ⟨1088⟩ also provides useful information on the development of an IVIVC correlation.

METHODOLOGY FOR BIOEQUIVALENCE STUDIES

BE can be evaluated by comparing the in vivo rate and extent of drug absorption of a test and reference formulation in healthy subjects. In a standard in vivo bioequivalence study design, study participants receive test and reference products on separate occasions, in either single or multiple doses, with random assignment to the two possible sequences of product administration. Samples of an accessible biologic fluid such as blood or urine are analyzed for drug and metabolite concentrations, and pharmacokinetic parameters (AUC, C_{max} and T_{max}) are obtained from the resulting con-

centration-time curves. These pharmacokinetic parameters are then analyzed statistically to determine if the test and reference products yield comparable values.

Single-Dose Fasting Two-Way Crossover Design

Objective—The objective is to compare the rate and extent of absorption of a generic product with that of the reference-listed product when administered in equal labeled doses.

Design—The study design is a single-dose, two-treatment, two-period, two-sequence crossover with an adequate washout period (usually equal to at least 10 elimination half-lives of the drug) between the two phases of the study. An equal number of subjects should be randomly assigned to the two possible dosing sequences. Before the study begins, the proposed protocol should be approved by an institutional review board.

Facilities—Clinical facilities and analytical laboratory used for the study should be identified along with the names, titles, and curriculum vitae of the medical and scientific or analytical directors.

Selection of Subjects—The sponsor should enroll a number of subjects sufficient to ensure statistical validity of the study. It is recommended that a minimum of 24 subjects be used in this study. More subjects may be required for a drug that exhibits high intra-subject variability in metrics of rate and extent of absorption. Subjects should be healthy, preferably nonsmoking, volunteers 18 to 50 years of age, and within 10% of ideal body weight for height and build, although within 15% of ideal body weight is acceptable (Metropolitan Life Insurance Company Statistical Bulletin, 1983). Subjects should be accepted on the basis of acceptable medical history, physical examination, and clinical laboratory tests. Female subjects must be given a pregnancy test prior to beginning the study. Subjects with any current or past medical condition that might significantly affect their pharmacokinetic or pharmacodynamic response to the administered drug should be excluded from the study. If smokers are included, they should be identified as such. Written, informed consent must be obtained from all subjects before they are accepted into the study.

Procedure—Following an overnight fast of at least 10 hours, subjects should be administered a single dose of the test or reference product with 240 mL of water. They should continue fasting for 4 hours after administration of the test or reference treatment.

Restrictions—Study volunteers should observe the following restrictions:

a. No alcohol- or xanthine-containing foods or beverages should be consumed for 48 hours prior to dosing and until after the last blood sample is collected.
b. Subjects should take no Rx medications, including oral contraceptives, beginning two weeks prior to and no OTC medications beginning one week prior to initiation of the study and until after the study is completed.
c. Water may be taken except for 1 hour before and after administration, when no liquid is allowed other than that needed for drug dosing.
d. All meals during the study should be standardized, and the same meals should be served during both phases of the study.

Blood Sampling—In addition to the predose (0 hour) sample, venous blood samples should be collected postdose so that there are at least four sampling time points on the ascending part and six or more on the descending part of the concentration-time curve. The biological matrix (plasma, serum, or whole blood) should be immediately frozen after collection and, as appropriate, centrifuged, and kept frozen until assayed.

Subject Monitoring—Blood pressure and pulse rate should be monitored hourly during the first 4 hours of the study. Subjects with a heart rate <45 or >110 beats per minute should have an electrocardiogram (lead II) performed and have their pulse monitored hourly. Subjects should report any unusual symptoms observed during the study. Subjects should be periodically questioned during each phase of the study for any unusual symptoms experienced after drug administration.

Analysis of Blood Samples—The active ingredient should be assayed using a suitable analytical method validated with regard to specificity, accuracy, precision (both within and between days), limit of quantitation, linearity, and recovery. Stability of the samples under frozen conditions, at room temperature, and during freeze-thaw cycles, if appropriate, should be determined. If the analytical method is a chromatographic method, chromatograms of unknown samples, including all associated standard curve and quality control chromatograms, should be available for regulatory authorities.

Pharmacokinetic Analysis of Data—Calculation of area under the plasma concentration-time curve to the last quantifiable concentration (AUC_{0-T}) and to infinity ($AUC_{0-\infty}$), C_{max}, T_{max}, and $T_{1/2}$ should be performed according to standard techniques.

Statistical Analysis of Pharmacokinetic Data—The log transformed AUC and C_{max} data should be analyzed statistically using ANOVA. These two parameters for the test product should be shown to be within 80% to 125% of the reference product using the 90% confidence interval criterion.

Clinical Report, Side Effects, and Adverse Reactions—Subject medical histories, physical examination and laboratory reports, and all incidents of possible adverse reactions to the study formulations should be reported.

Multiple-Dose Steady State, Two-Way Crossover Design under Fasting Conditions

Objective—The objective is to compare the steady-state rate and extent of absorption of a generic formulation with that of the reference formulation when given as equal labeled doses.

Design—The study design is a multiple-dose, steady-state two-treatment, two-period, two-sequence crossover with an adequate washout period between the two phases of the study. An equal number of subjects should be randomly assigned to the two possible dosing sequences. Before beginning the study, the study protocol should be approved by an institutional review board.

Facilities and Selection of Subjects—See the appropriate section under *Single-Dose Fasting Two-Way Crossover Design*.

Procedure—Extended-release products that are administered once a day should be dosed following an overnight fast of at least 10 hours; subjects should continue fasting for 4 hours postdose. For extended-release products that are dosed every 12 hours (b.i.d.), the morning dose should be given following an overnight fast of about 10 hours, and subjects should continue fasting for 4 hours postdose; the evening dose should be administered 12 hours after the morning dose and after a fast of at least 2 hours and subjects should continue fasting for 2 hours postdose. Each dose should be administered with 240 mL of water.

Restrictions—Study volunteers should observe the following restrictions:

a. No alcohol- or xanthine-containing foods or beverages should be consumed for 48 hours prior to dosing and until after the last blood sample is collected.

b. Subjects should take no Rx medications, including oral contraceptives, beginning two weeks prior to and no OTC medications beginning one week prior to initiation of the study and until after the study is completed.
c. Water may be taken except for 1 hour before and after administration, when no liquid is allowed other than that needed for drug dosing.

Blood Sampling—At least three trough concentrations (C_{min}) on three consecutive days should be determined to ascertain that the subjects are at steady state prior to measurement of rate and extent of absorption after a single-dose administration in a dosing interval at steady state. The three consecutive trough samples should be collected at the same time of the day and should be comparable. For extended-release drug products administered more often than every 24 hours, assessment of trough levels just prior to 2 consecutive doses is not recommended because a difference in the consecutive trough values may occur due to circadian rhythm irrespective of whether or not steady state has been attained. Adequate blood samples should be collected at appropriate times during a dosing interval at steady state to permit estimation of the total area under the concentration-time curve, peak concentration (C_{max}), and time to peak concentration (T_{max}).

Subject Monitoring and Analysis of Blood Samples—See under *Single-Dose Fasting Two-Way Crossover Design*.

Pharmacokinetic Analysis of Data—The following pharmacokinetic data are to be reported for the evaluation of bioequivalence of the generic extended-release product with the reference listed product:

a. Individual and mean blood drug concentration levels
b. Individual and mean trough levels (C_{min})
c. Individual and mean peak levels (C_{max})
d. Calculation of individual and mean steady state $AUC_{interdose}$ are recommended ($AUC_{interdose}$ is AUC during a dosing interval at steady state)
e. Individual and mean percent fluctuation [$= 100 \times (C_{max} - C_{min}) / C_{min}$]
f. Individual and mean time to peak concentration (T_{max})

Statistical Analysis of Pharmacokinetic Data—The log-transformed AUC and C_{max} data should be analyzed statistically using ANOVA. These two parameters for the test product should be shown to be within 80% to 125% of the reference product using the 90% confidence interval. Fluctuation for the test product should be evaluated for comparability with that for the reference product.

Clinical Report, Side Effects, and Adverse Reactions—See under *Single-Dose Fasting Two-Way Crossover Design.*

Single-Dose, Two-Way Crossover Design under Nonfasting Conditions

Objective—The objective is to compare the rate and extent of absorption of a generic formulation with that of the reference-listed formulation under nonfasting conditions when given as equal labeled doses.

Design—The study design is a randomized, balanced, single-dose, two-treatment (fed vs. fasting), two-period, two-sequence crossover design for studying the effects of food on the BA of either an immediate-release or a modified-release drug product. The formulation to be tested should be administered on an empty stomach (fasting condition) in one period and following a test meal (fed condition) in the other period. A similar, two-treatment, two-period, two-sequence crossover design is recommended for a fed BE study except that the treatments should consist of both test and reference formulations administered follow-

ing a test meal (fed condition). An adequate washout period should separate the two treatments in food-effect BA and fed BE studies.

Selection of Subjects—Both food-effect BA and fed BE studies can be carried out in healthy volunteers drawn from the general population. Studies in the patient population are also appropriate if safety concerns preclude the enrollment of healthy subjects. A sufficient number of subjects should complete the study to achieve adequate power for a statistical assessment of food effects on BA to claim an absence of food effects, or to claim BE in a fed BE. A minimum of 12 subjects should complete the food-effect BA and fed BE studies.

Procedure—Each subject should receive the following two treatments:

Treatment 1: Generic extended-release product administered after a high-fat-content breakfast.

Treatment 2: Innovator extended-release product (reference listed drug) administered after a high-fat-content breakfast.

Following an overnight fast of at least 10 hours, subjects receiving treatments under nonfasting conditions should be served a high-fat breakfast then immediately dosed with Treatment 1 or Treatment 2 with 240 mL of water. No food should be allowed for at least 4 hours postdose, with water allowed after the first hour. Subjects should be served scheduled standardized meals throughout the study, and the same meals should be served during all phases of the study.

Restrictions, Blood Sampling, Subject Monitoring, and Analysis of Blood Samples—For both fasted and fed treatment periods, timed samples in biological fluid, usually plasma, should be collected from the subjects to permit characterization of the complete shape of the plasma concentration-time profile for the parent drug. Consideration should be given to the possibility that co-administration of a dosage form with food can alter the time course of plasma drug concentrations so that fasted and fed treatments can have different sample collection times.

Statistical Analysis of Pharmacokinetic Data—The following exposure measures and pharmacokinetic parameters should be obtained from the resulting concentration-time curves for the test and reference products in food-effect BA and fed BE studies:

- Total exposure, or area under the concentration-time curve ($AUC_{0-\infty}$, AUC_{0-T})
- Peak exposure (C_{max})
- Time to peak exposure (T_{max})
- Lag-time (T_{lag}) for modified-release products, if present
- Terminal elimination half-life
- Other relevant pharmacokinetic parameters

For further information on statistical analysis, see *FDA Guidance for Industry—Food Effect Bioavailability and Fed Bioequivalence Studies;* December 2002.

WAIVER OF IN VIVO BIOEQUIVALENCE STUDY REQUIREMENTS

To conserve resources and avoid unnecessary clinical trials, the requirement to demonstrate bioequivalence based on in vivo clinical studies can be waived, based on documentation of BE using in vitro performance tests.

Waiver Based on the Pharmaceutical Dosage Form

A drug product's in vivo comparative bioavailability or bioequivalence may be waived if the products to be compared contain the same active substance(s) in the same concentration, the same excipients in comparable concentrations, and meet one of the following criteria:

(a) aqueous solutions to be administered parenterally;

(b) solutions for oral use that do not contain an excipient that is known or suspected of affecting gastro-intestinal transit or absorption of the active substance;

(c) gases;

(d) powders for reconstitution as a solution;

(e) otic or ophthalmic products prepared as aqueous solutions;

(f) topical products prepared as aqueous solutions; or

(g) inhalation products or nasal sprays, tested to be administered with or without essentially the same device. Special in vitro performance testing should be required to document comparable device performance.

Waiver Based on the Dose

When a single-dose fasting BE study is conducted on the designated (usually highest) strength of the drug product, the requirement to conduct additional in vivo BE studies on the lower strengths of the same product can be waived provided that the lower strength (a) is in the same dosage form, (b) is proportionally similar in its active and inactive ingredients, (c) has the same drug release mechanism as the highest strength, and (d) meets an appropriate in vitro dissolution test. The drug products should exhibit similar dissolution profiles between the strengths, based on an F_2 statistical test value >50.

Waiver Based on the Biopharmaceutical Classification System (BCS)

For all countries, the need to conduct in vivo BE studies for both "similars" (see *Appendix* for U.S. history) and new multisource products can be a significant resource burden. Depending on risk tolerance, a country might rely solely on dissolution (as the U.S. did for nonbioproblem drug products approved prior to 1962) or solely on in vivo studies (as the U.S. did generally for drug products approved after 1962). The BCS is a valid option for replacing in vivo with in vitro studies. It can be used to justify biowaivers for highly soluble and highly permeable drug substances (i.e., Class 1) formulated in immediate-release solid oral dosage forms that exhibit rapid in vitro dissolution (e.g., 85% dissolved in 30 minutes). The drug products should exhibit similar dissolution profiles, based on an F_2 statistical test value >50. In countries and regions with especially constrained resources, BCS may be extended to the following drug classes: (1) Class 1 drugs if the dosage form exhibits dissolution $\geq$85% in 45 minutes; (2) Class 2 drugs that are soluble at pH 6.8 if the dosage form exhibits dissolution $\geq$85% in 30 minutes; (3) Class 2 drugs that are soluble in surfactant at pH 6.8 if the dosage form exhibits $\geq$85% in 30 minutes; (4) Class 3 drugs if the dosage form exhibits $\geq$85% dissolution at 15 minutes.

"Similars" in the U.S.

Many nations and regions, including the U.S., have been or are challenged to develop "generic" laws that assure therapeutic equivalence between pioneer products and corresponding multisource products. A brief history of the U.S. in this regard appears below:

- The 1902 federal law required that biologic products such as vaccines be evaluated for "safety, purity, and potency."
- The 1906 Food and Drugs Act added regulation of drugs other than biologics.
- The 1938 Federal Food, Drug and Cosmetic Act created the FDA and required that the new Agency conduct a safety evaluation on drugs prior to marketing on the basis of data submitted in a New Drug Application (NDA).
- The Drug Amendments of 1962 amended the 1938 Act to include an effectiveness requirement for approval of an NDA.
- FDA created the Drug Efficacy Study Implementation (DESI) project to assess the efficacy of new drugs approved between 1938 and 1962.
- Pending conclusion of a DESI finding, FDA permitted marketing of "old, me-too" drug products (as opposed to pre-1938 grandfathered) that were identical, similar, or related to drug products that were undergoing DESI review and that had entered the market between 1938 and 1962.
- Via a 1970 Federal Register Notice published April 24, 1970 (35 F.R. 6574), FDA terminated marketing of "me-too" drug products unless (a) the DESI review had confirmed the safety and efficacy of a corresponding reference product, and (b) the manufacturer of the "me-too" product submitted an Abbreviated New Drug Application (ANDA) that provided information about its formulation and manufacture.
- The Supreme Court in the *United States v. Generix Drug Corporation* concluded that each "me-too" drug product marketed between 1938 and 1962 required an ANDA.
- FDA finalized the 1977 Bioavailability/Bioequivalence (BA/BE) regulations (21 CFR 320) that supported a requirement for BA in NDAs, including DESI-effective new drugs approved between 1938 and 1962, and BE data in ANDAs as part of the safety and efficacy information in an application.
- FDA created the paper NDA policy in 1981 (46 FR 27396, May 19, 1981) to permit approval of generic equivalents of post-1962 new drug products on the basis of literature and product-specific data.
- The U.S. Congress passed the 1984 Waxman-Hatch amendments to the Federal Food, Drug, and Cosmetic Act that created a generic new drug approval system (505(j)) for all new drugs and that terminated the need for a paper NDA policy.

The U.S. law allowing a generic system thus became available in 1984. For any country, including the U.S., the task becomes, with finalization of this type of law, two-fold. First, "similars" already in the marketplace, which may or may not be either pharmaceutically equivalent or bioequivalent, require consideration. Second, new multisource products entering a market after a generic law is passed require documentation of pharmaceutical equivalence and bioequivalence in a regulatory filing.

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of authoritative committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* and *Pharmacopeial Previews* sections. Readers interested in submitting comments should see *Instructions to Authors.*

Pharmacopeial Forum
Vol. 31(1) [Jan.–Feb. 2005]

Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP–NF* revision will be considered for publication in the *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention, Inc., (USPC) and may not be published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

References—Consult a current copy of the *Pharmacopeial Forum* and the *ACS Style Guide* for assistance with reference style.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Contact Person—When submitting a manuscript, designate one author of the article as correspondent and include that author's full address, telephone number, fax number, and e-mail address.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Graphics that cannot be submitted electronically must be camera-ready, of easily reproducible quality and size, and clearly labeled. Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

Basis for Using Moisture Vapor Transmission Rate per Unit Product in the Evaluation of Moisture-Barrier Equivalence of Primary Packages for Solid Oral Dosage Forms

PQRI Container–Closure Working Group

ABSTRACT For pharmaceutical solid oral dosage forms, it is well recognized that the most common cause for a packaged product failing to meet its specification is its instability as a result of moisture uptake (*1–3*). The failure is usually related to out-of-specification or out-of-range values in any or combination of the following quality attributes: assay, product degradants, dissolution rate, and other physical properties.

Pharmaceutical solid oral dosage forms are typically packaged in plastic bottles, thermoformed plastic blisters, or cold-formed aluminum blisters. These container–closure systems are sealed either by compression fit between a hard surface and a soft surface or by application of heat to an adhesive layer of polymers. These container–closure systems are considered semipermeable packages, and therefore the moisture-barrier properties need to be characterized. For the purposes of this discussion, it is assumed that manufacturers have procedures in place to demonstrate that container–closure systems are free from pinholes and channels. Therefore, packages with pinholes or channels that allow convective mass transfer are excluded.

Change from the use of one container–closure system to another requires demonstrating that the container–closure system affords equivalent or better protection. This can be achieved in one of two ways: either by generating formal stability data or by providing performance-based data for the container–closure system being compared. We will show that the relationship of a container–closure system's moisture vapor transmission rate (MVTR) and the number of units contained in the system can be used to demonstrate moisture-barrier equivalence. Specifically, it will be shown that MVTR/Unit Product is the critical parameter for demonstrating this equivalence.

INGRESS OF MOISTURE TO CONTAINER–CLOSURE SYSTEMS

Moisture ingress into well-sealed primary packages occurs via two major routes: permeation through the container wall and the seal layer, or diffusion through narrow imperfection channels in the seal or the container wall. Note that other than imperfections introduced in the forming and sealing operations, the container wall is either a nonporous dense polymer or a multilayer polymer/aluminum foil composite.

Gas permeation through polymers has long been recognized to follow a solution-diffusion mechanism[a] and can be quantitatively described by Fick's law. When the moisture partial pressures on both sides of the barrier are held constant, steady-state permeation will be reached in due time.[b] At steady state, the following relationship holds for a flat film:

Steady-state Moisture Permeation Rate, MPR = (permeability coefficient, P_p) × (surface area for permeation, A_p) × (moisture partial pressure difference across the polymer per unit film thickness, $\Delta p / l$),

or, expressed mathematically,

$$MPR = P_p \times A_p \times \frac{\Delta p}{\ell} \quad [1]$$

The moisture permeability coefficient, P_p, of a moisture-barrier or seal polymer (such as HDPE,[c] PVC, PVDC, PCTFE, LDPE, PP, polycycloolefins, PET, and various copolymers) is a characteristic property of the individual barrier material. It is practically a constant for a given material at a given temperature, essentially independent of the driving force, Δp.

* Correspondence should be addressed to: Claudia Okeke, Ph.D., Associate Director, Department of Standards Development, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852-1790, telephone 301.816.8243; e-mail cco@usp.org.

[a] The gas molecules are first "absorbed" into one face of the polymer barrier, then move through the bulk of the polymer by molecular diffusion, and finally are "desorbed" from the other face of the polymer barrier. Polymers with low affinity for water molecules, and/or with low free volume and/or strong chain–chain attraction, are therefore high water barriers.

[b] The time to reach steady state depends primarily on the diffusion coefficient and the thickness of the barrier. (See, for example, J. Crank and G.S. Park, *Diffusion in Polymers,* Academic Press, New York 1968.)

[c] See Glossary of Acronyms.

For a specified commercial container, Equation (1) has to be integrated over the whole effective permeation area, where the thickness may be variable, in order to determine the overall steady-state moisture permeation rate, *MPR,* into the container:

$$MPR = (P_p \times \oint \frac{dA_p}{\ell}) \times \Delta p \quad [2]$$

Note that the term in the parenthesis in Equation (2),

$$(P_p \times \oint \frac{dA_p}{\ell}),$$

is a property of the specific container of interest.

Diffusion of gases through microchannels is nonconvective and is also well described by Fick's law, and it can be described by an expression similar to Equation (1). For a given sealed container, the following equation applies:

Steady-State Moisture Diffusion Rate, *MDR* = (effective permeability coefficient, P_d) × (effective surface area for diffusion, A_d) × (moisture partial pressure difference across the container, Δp) / (effective diffusion length, l_d) or, expressed mathematically,

$$MDR = (P_d \times \frac{A_d}{\ell_d}) \times \Delta p \quad [3]$$

Note that the term

$$(P_d \times \frac{A_d}{\ell_d})$$

is also a property of the specific sealed container of interest. In the absence of gross defects, overall (steady-state) moisture vapor transmission rate, *MVTR,* into a given sealed container is thus the combined contribution of the two moisture ingress routes:

$$MVTR = MPR + MDR$$

$$= (P_p \times \oint \frac{dA_p}{\ell}) \times \Delta p + (P_d \times \frac{d}{\ell_d}) \times \Delta p \quad [4]$$

$$= K \times \Delta p$$

where K is a characteristic property of the specific container–closure system of interest. The unit for MVTR is typically expressed as mg/day/container; the water partial pressure is often expressed in mmHg.

Equation (4) embodies the theoretical basis for quantifying the moisture-barrier property of a given container at a given temperature. It also provides the foundation for experimental determination of this intrinsic property of a given container–closure system.

Experimentally, a sufficient amount of high-capacity desiccant is placed in the empty container. The container is sealed with the selected closure, placed in an environmental chamber at fixed temperature and relative humidity, and the weight gain is monitored with time. If the amount and type of desiccant are chosen correctly, the internal water partial pressure will remain low (e.g., <5 mmHg at 40 °C) throughout the measurement run; as a result, the Δp in Equation (4) remains essentially constant during the course of the MVTR measurement.

MVTR is, therefore, interchangeable with *K,* the characteristic moisture barrier of a given container–closure system via the rearranged Equation (4):

$$K = \frac{MVTR}{(\Delta p)_{test}} \quad [4a]$$

where $(\Delta p)_{test}$ is a constant depending only on the test condition.

In the following discussion, mass-balance considerations together with Equation (4a) will be used to establish the equation that governs the moisture–time profile inside any container–closure system for solid oral dosage forms. The governing equation (see below) unequivocally describes the time profile of the moisture content or relative humidity inside the container for a given set of external test conditions (e.g., ICH 40 °C/75% RH or 30 °C/65% RH or 25 °C/60%

RH). Using the governing equation, we will proceed to demonstrate that

equivalent value of (MVTR/unit product) corresponds to equivalent moisture protection.

GOVERNING EQUATION

Consider the mass balance for water within a sealed container. Assuming negligible chemical consumption of water, we can write the following mass-balance equation with the help of Equation (4) for a sealed package[d]:

$$\frac{dn}{dt} = MVTR = K \times (p_{ex} - p) \quad [5]$$

where n is the total mass of water inside the container, in the headspace and solid (mg)
t is time (day)
p is the (internal) headspace partial pressure of water vapor (mmHg)
p_{ex} is the external partial pressure of water vapor (mmHg).

The total mass of water inside the container, n, comprises the moisture in the headspace and in the solids. The solid could be the product, the desiccant, or fillers such as cotton.

Let the total headspace volume inside the container be V (mL); then the rate of change of water mass in the headspace, according to the ideal gas law, will be

$$\frac{dn_{(headspace)}}{dt} = 18\frac{V}{RT}\frac{dp}{dt} \quad [5a]^{e}$$

If there are N solid components that absorb water vapor reversibly inside the container, the rate of change of water mass in the solids will be

$$\frac{dn_{(solids)}}{dt} = \sum_{1}^{N} m_i \frac{dC_i}{dt} \quad [5b]$$

where m_i is the dry mass of component i inside the container (g)
C_i is the equilibrium concentration of water in component i (mg/g dry basis) when the water partial pressure inside the container is p (mmHg)
R is the gas constant (62.36 mmHg-mL/mmole-°K)
T is the temperature (°K)
t is time (days).

Equation (5) can now be rewritten as

$$18\frac{V}{RT}\frac{dp}{dt} + \sum_{1}^{N} m_i \frac{dC_i}{dt} = K \times (p_{ext} - p) \quad [6]$$

Integration of Equation (6) gives[f]:

$$\left[\frac{18V}{RT}\int_{p_0}^{p_f}\frac{dp}{p_{ext} - p} + \sum_{1}^{N} m_i \int_{C_i^0}^{C_i^f}\frac{dC_i}{p_{ext} - p}\right] \times \frac{1}{K} = t \quad [7]$$

where p_0 is the initial water partial pressure inside the container
p_f is the water partial pressure at time t
C^0_i is the initial equilibrium water content of component i
C^f_i is the equilibrium water content of component i at time t.

The first term in Equation (7),

$$\frac{18V}{RT}\int_{p_0}^{p_f}\frac{dp}{p_{ext} - p},$$

corresponds to the total change in water content of the headspace, and the second term,

[d] For the vast majority of oral solid dosage forms, the amount of water consumed by chemical reaction is negligibly small or nonexistent. The impact of the small induction period on this mass-balance equation is negligible because of the long time scale of shelf-life stability studies (2 years for most oral solid products).

[e] The number 18, the molecular mass of water, was included to ensure dimensional consistency.

[f] Implicit in this mathematical operation is the assumption that the headspace and the various solid contents in the container are at thermodynamic equilibrium at any given instant. This turns out to be a very good approximation as demonstrated by the data shown in *Appendix A*. In those examples, three different products were preequilibrated at preselected conditions and were sealed with desiccant in glass vials separately. The headspace relative humidity was then monitored over time to determine how fast the system reached equilibrium. The data clearly demonstrated that it took no more than one day, which is negligible compared with the typical expectation of 2-yr shelf life. The equilibrium approximation is thus well justified.

$$\sum_{1}^{N} m_i \int_{C_i^0}^{C_i^f} \frac{dC_i}{p_{ext} - p},$$

corresponds to total change in water content of the various solids in the container.

For the vast majority of packages for solid dosage forms, the first term is negligibly small relative to the second term. This can be demonstrated by simply considering the amount of water that can be held in the (gaseous) container headspace and in the solids.

For example, consider the change in the amount of water in one mL of headspace gas (air) at 40 °C[g] when the RH increases from 15% to 75%, an extreme change for a primary package. This corresponds to a change of 0.031 mg water per mL of headspace. For a 100-mg tablet packaged in a unit-dose blister, the typical headspace is no more than 1.0 mL. Thus, even if the headspace has increased from 15% to 75%, the amount of water in the headspace will increase by 0.03 mg, which corresponds to a mere 0.03% of the mass of the 100-mg tablet.

For a multiple-unit container such as a 75-mL bottle containing 30 × 100 mg tablets, the extreme change of headspace humidity of 60% shown above corresponds to 2.32 mg water. This amounts to only 0.08% of the total mass of the tablet, which is near or below the accuracy of the current methods used for water content determination.

Equation (7) can therefore be simplified to the following expression with negligible loss in accuracy[h]:

$$\sum_{1}^{N} m_i \int_{C_i^0}^{C_i^f} \frac{dC_i}{p_{ext} - p} = K \times t = \frac{MVTR}{(\Delta p)_{test}} \times t \quad [8]$$

This expression is the governing equation that describes the water content of component *i* as a function of time under any of the ICH stability testing conditions. The relationship between C_i and p is an intrinsic material property, typically expressed in terms of "moisture sorption isotherm" that can be determined experimentally and independently for each solid.

The definitions for the symbols in Equation (8) are presented below again for clarity:

t	is the duration of the test time
m_i	is the dry mass of component *i* in the container
p	is the water partial pressure inside the container
p_{ext}	is the constant external water partial pressure (e.g., 55.3 mmHg × 75% at 40 °C, corresponding to the 40 °C/75% RH test condition)
C^0_i	is the initial equilibrium water content of component *i*
C^f_i	is the equilibrium water content of component *i* at time *t*
$(\Delta p)_{test}$	is a constant depending only on the test condition used in determining *MVTR* at the temperature of interest
MVTR	is the steady-state moisture transmission rate into the container/closure at the temperature of interest and the relative humidity in the testing chamber

IMPLICATION OF THE GOVERNING EQUATION

The utility of Equation (8) in establishing moisture-barrier equivalence can be illustrated by considering a simple case in which no other moisture-absorbing solid is present other than the drug product itself. This simplified case corresponds to, for example, single-unit blister packages or multiple-unit bottle packages without desiccant; the equation simplifies to:

$$\int_{C_1^0}^{C_1^f} \frac{dC_1}{p_{ext} - p} = \frac{MVTR}{m_i} \times \frac{1}{(\Delta p)_{test}} \times t \quad [9]$$

where m_1 is the mass of the drug product itself.

Note that the only unknown in Equation (9) is (C^f_1), the final moisture content of the drug product at time *t* for a packaged product under stability testing.

Thus, for a given drug product of the same initial moisture content, as long as the value ($MVTR/m_1$) is kept constant, the moisture content of the drug product will be the same at any specified time point during the stability test, regardless of the primary container.

In other words, two container–closure systems that exhibit the same (MVTR/unit product) are equivalent as far as moisture protection is concerned.

An example is given in *Appendix C* to illustrate and support this conclusion.

Another example is given in *Appendix D* to illustrate the effectiveness of the approach for differentiating the degree of moisture protection offered by different container–closure systems.

[g] The water vapor pressure at 40 °C is 55.3 mmHg.

[h] The conclusion drawn from this simplification is not changed even if the headspace contribution is not negligible. This simplification is made here mainly to make the mathematical presentation as simple as possible. See *Appendix B* for details.

CONCLUSION AND RECOMMENDATIONS

In this article, we have presented a step-by-step derivation of the equation that governs the time profile of the moisture content inside any container–closure system for solid oral dosage forms. The physical phenomena involved are straightforward and can be reduced to rigorous mathematical treatment with a high degree of accuracy. As clearly illustrated in the discussion associated with Equation (9), (MVTR/unit product) is indeed the critical container–closure parameter that allows one to establish the moisture-barrier equivalence.

On the practical side, the MVTR determination is subject to experimental errors as well as small variations in the properties of the container–closure, such as wall thickness and closure sealing. In practice, an equivalent (MVTR/unit product) range must be demonstrated via stability studies or other scientific means for a given drug product during pharmaceutical development. Once this range is established, postapproval changes made to the container–closure system will be assured of moisture-barrier equivalence as long as the (MVTR/unit product) of the modified or new system falls within the qualified range.

Current methods for determination of MVTR may not be sensitive enough for high-barrier materials required for the packaging of moisture-sensitive products. In order to apply the MVTR/unit product concept to high-barrier materials, a method with increased sensitivity is required. An improved test method will thus be investigated as part of the proposed project.

APPENDIX A.

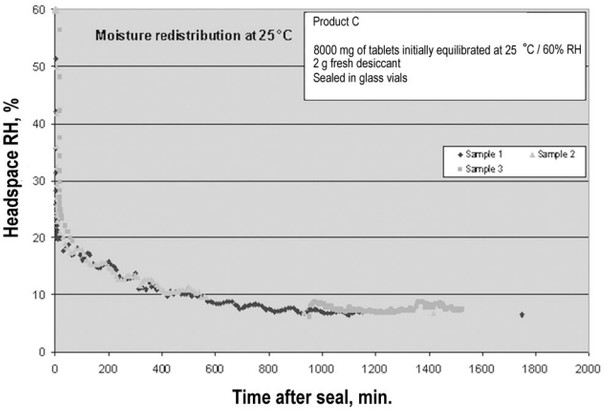

Fig. 1. Rate of moisture exchange

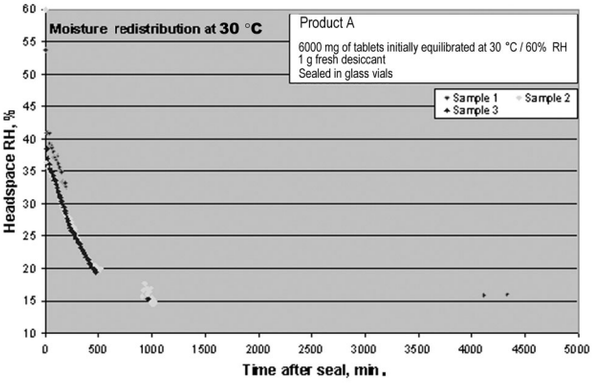

Fig. 2. Rate of moisture exchange

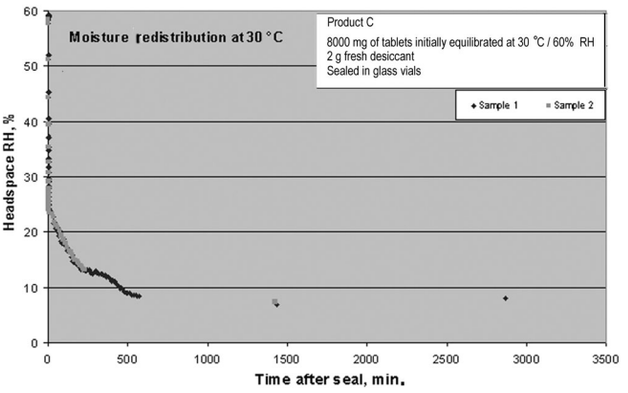

Fig. 3. Rate of moisture exchange

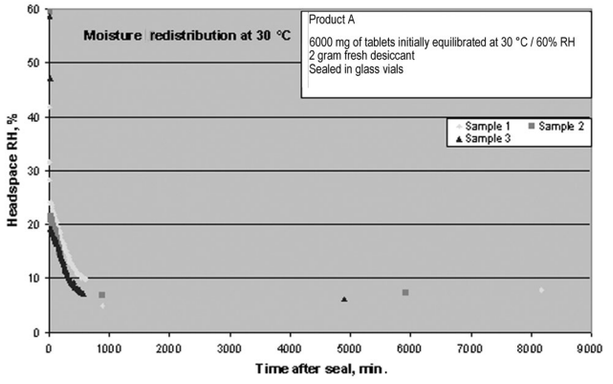

Fig. 4. Rate of moisture exchange

APPENDIX B.

Moisture-barrier equivalence when headspace contribution is not negligible

In instances when one packages a small quantity of product in an oversized container, for example one tablet in an 80-mL bottle, Equation (7) is simplified to:

$$\frac{18}{RT}\times\frac{V}{m_i}\int_{p_0}^{p_f}\frac{dp}{p_{est}-p}+\int_{C_1^0}^{C_1^f}\frac{dC_1}{p_{est}-p}=\frac{MVTR}{m_1}\times\frac{1}{(\Delta p)_{test}}\times t \quad [10]$$

Equation (10) is the governing equation for a container–closure system without desiccant when the water content in the headspace is of the same order of magnitude as that in the product. (See the examples preceding Equation (8) for this estimation.)

In this case, two container–closure systems are equivalent as long as ($MVTR/m_1$) and (V/m_1) are the same. In other words, when the headspace contribution is not negligible, the ‘‘headspace volume per product mass’’ together with ‘‘MVTR per product mass’’ can be used to establish moisture-barrier equivalence between container systems. The validity of ‘‘MVTR/Unit Product’’ thus holds.

APPENDIX C.

Examples of moisture-barrier equivalency for container–closure systems that exhibit the same (MVTR/unit product)

In this example, Product B was packaged in two different blister types and two different bottle configurations. The packages were chosen so that the ($MVTR/m_1$) values for Bottle (7 tablets) and Blister 1 are similar. The same situation holds for Bottle (30 tablets) and Blister 2. The packages were stored in an ICH 40 °C/75% RH chamber for 180 days. At different times in the test period, individual packages were taken from the chamber and water activity in the product was determined.[i]

The data clearly demonstrate that the water activity profile (vs. time) of the product indeed is the same when the ($MVTR/m_1$) value of the container–closure system is adjusted to the same level.[j] In other words, Bottle (7 tablets) and Blister 1 and Bottle (30 tablets) and Blister 2, respectively, are equivalent as far as moisture barrier is concerned.

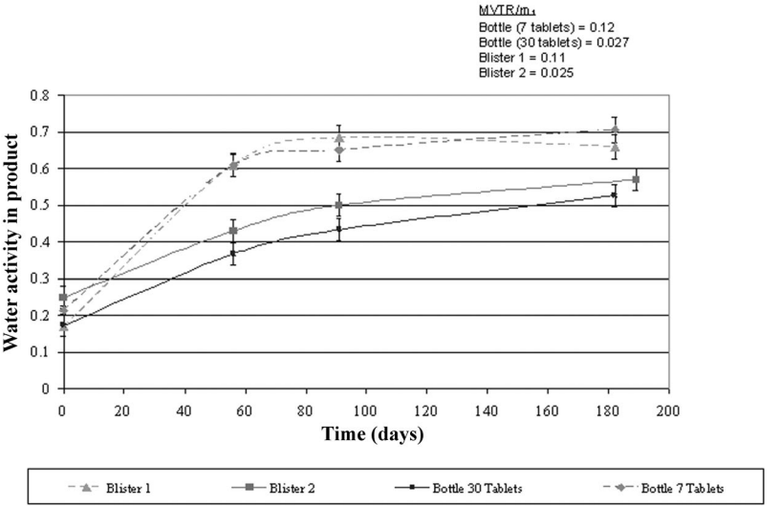

Fig. 5. Product B in different packages

APPENDIX D.

Evaluation of the moisture-protection efficiency of packaging using (MVTR/unit product) for solid oral dosage forms

This example illustrates the use of (MVTR/unit product) to evaluate the protection efficiency of containers. The data are from an isolated study conducted by a participating company. A lower (MVTR/unit product) resulted in lower product moisture content and hence better protection of the product from moisture. Product X was sealed in HDPE bottles A and B and stored in at 25 °C/60% RH. MVTR for the bottles was measured under the same conditions using steady-state data. The MVTR values were 0.282 and 0.342 mg/day/bottle for Bottles A and B, respectively. The packaging configurations and the *MVTR/m* values (where *m* is the number of dose units in the bottles) were:

(1) 10 tablets of X in bottle A, MVTR/mL = 0.0282 mg/day/tablet
(2) 20 tablets of X in bottle B, MVTR/mL = 0.0171 mg/day/tablet.

The increase in the rate of moisture uptake by tablets in bottle A using B as a reference was calculated to be: $R = 0.0282/0.0171 = 1.65$, and it was thus expected that bottle B would provide a better moisture protection for product X than bottle A.

At different times, samples were removed from the stability chamber, and the product water content was determined by an LOD method.

[i] Because the packages were not prepared under exactly the same environment and at exactly the same time, the initial water activity did vary somewhat; nevertheless, they are in the same range at approximately 0.23. A variety of instruments commonly used in areas such as the food industry and based on principles of dew-point or capacitance could be used for the water-activity measurement.

[j] The slight difference between Blister 2 and Bottle (30 Tablets) is due to the small difference in the "initial" water activity.

The observed rates of product water content increased in bottle A relative to bottle B were 1.60, 1.68, and 1.50 at 3, 5, and 9 months, respectively. These results agree very well with the theoretical value of 1.65 for the two bottles and thus show that (MVTR/unit product) is an effective criterion for evaluating the moisture protection efficiency of primary packages and that equivalent protection can be achieved by proper design of the *MVTR/m* value using different containers for solid dosage forms.

MPR	overall steady-state moisture permeation rate, Equation (2)
MVTR	overall moisture vapor transmission rate, Equation (4)
PET	poly(ethylene terephthalate)
PP	polypropylene
PVC	poly(vinyl chloride)
PVDC	poly(vinylidene chloride)
PCTFE	poly(chlorotrifluoro ethylene)

NOMENCLATURE

This section includes supplements to the latest edition of the *USP Dictionary of USAN and International Drug Names* that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

USP Dictionary of USAN and International Drug Names
2004 USP DICTIONARY SUPPLEMENT 5

IMPORTANT—Save this Supplement. This and all supplements appearing in *PF* are needed to keep the 2004 edition of the USP Dictionary (USPD) up-to-date. The cumulative contents of the supplements to the current (2004) edition will be included in the next complete edition of the Dictionary.

New United States Adopted Names (USAN)

The following are newly established United States Adopted Names (USAN). These names will not be listed cumulatively; see preceding and succeeding numbers of *PF* for other new USAN to supplement the Dictionary main volume.

Amustaline Dihydrochloride [*2004*] (aye mus′ ta leen). $C_{22}H_{25}Cl_2N_3O_2.H_2O$. 507.28. (1) β-Alanine, *N*-9-acridinyl-, 2-[bis(2-chloroethyl)amino]ethyl ester, dihydrochloride; (2) 2-[Bis(2-chloroethyl)amino]ethyl 3-(acridin-9-ylamino)propanoate dihydrochloride. *CAS-210584-54-6. Ex-vivo blood bank process for inactivation of viruses, bacteria, parasites, and leukocytes in red blood cells* (*nucleic acid alkylator*). (Cerus) ✧*S-303ôñ2HCl*

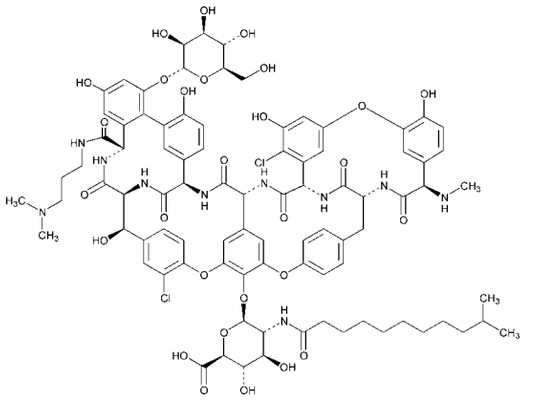
Armodafinil [*2004*] (ar moe daf′ in il). $C_{15}H_{15}NO_2S$. 273.40. (1) Acetamide, 2-[(diphenylmethyl)sulfinyl]-, (–)-; (2) (–)-2-[(*R*)-(Diphenylmethyl)sulfinyl]acetamide. *CAS-112111-43-0*. INN. *Wakefulness promoting agent.* (Cephalon) ✧*CEP-10953*

Carvedilol Phosphate [*2004*] (kar′ ve dil ole). $C_{24}H_{26}N_2O_4.H_3O_4P.½H_2O$. 513.50. (1) 2-Propanol, 1-(9*H*-carbazol-4-yloxy)-3-[[2-(2-methoxyphenoxy)ethyl]amino]-, phosphate (salt), hydrate (2:2:1); (2) (2*RS*)-1-(9*H*-Carbazol-4-yloxy)-3-[[2-(2-methoxyphenoxy)ethyl]amino]propan-2-ol phosphate salt (1:1) hemihydrate. *CAS-610309-89-2. Treatment of congestive heart failure, left ventricular dysfunction following myocardial infarction, and management of hypertension.* (GlaxoSmithKline) ✧*SK&F-105517-D*

Cinacalcet [*2004*] (sin a kal′ set). $C_{22}H_{22}F_3N$. 357.42. (1) 1-Naphthalenemethanamine, α-methyl-*N*-[3-[3-(trifluoromethyl)phenyl]propyl]-, (α*R*)-; (2) *N*-[(1*R*)-1-(Naphthalen-1-yl)ethyl]-3-[3-(trifluoromethyl)phenyl]propan-1-amine.*CAS-226256-56-0. Treatment of hyperparathyroidism and related disorders, such as hypercalcemia* (*reduction of PTH secretion through modulation of calcium ion receptors on parathyroid cells*). Sensipar (Amgen) ✧*AMG073*

Corticorelin Acetate [*2004*] (kor″ ti koe rel′ in). $C_{208}H_{344}N_{60}O_{63}S_2$. 4757.00. (1) Corticotropin-releasing factor (human); (2) Human corticotropin-releasing factor. *CAS-86784-80-7. Treatment of symptoms associated with peritumoral edema in brain tumor patients.* Xerecept (Hollister-Stier) *[Note—The source of the product* (*human, porcine, etc.*) *must be indicated in the labeling.]* ✧*NEU 3002*

Dalbavancin [*2004*] (dal ba van′ sin). $C_{88}H_{100}Cl_2N_{10}O_{28}$. 1816.69. (1) Ristomycin A aglycone, 5,31-dichloro-38-de(methoxycarbonyl)-7-demethyl-19-deoxy-56-*O*-[2-deoxy-2-[(10-methyl-1-oxoundecyl)amino]-β-D-glucopyranuronosyl]-38-[[[3-(dimethylamino)propyl]amino]carbonyl]-42-*O*-α-D-mannopyranosyl-N^{15}-methyl-; (2) 2-Deoxy-1-*O*-[(3*S*,15*R*,18*R*,34*R*,35*S*,38*S*,48*R*,50a*R*)-5,31-dichloro-38-[[3-(dimethylamino)propyl]carbamoyl]-6,11,34,40,44-pentahydroxy-42-(α-D-mannopyranosyloxy)-15-(methylamino)-2,16,36,50,51,59-hexaoxo-2,3,16,17,18,19,35,36,37,38,48,49,50,50a-tetradecahydro-20,23:30,33-dietheno-3,18:35,48-bis(iminomethano)-1*H*,15*H*-4,8:10,14:25,28:43,47-tetrametheno-34*H*-[1,14,6,22]dioxadiazacyclooctacosino[4,5-*m*][10,2,16]benzoxadiazacyclotetracosin-56-yl]-2-[(10-methylundecanoyl)amino]-β-D-glucopyranuronic acid (main component). *CAS-171500-79-1*. INN. *Antibiotic.* (Aventis) ✧*BI397; MDL 64,397; A-A-1; VER001*



Darifenacin Hydrobromide [*2004*] (dar ee fen′ a sin). $C_{28}H_{30}N_2O_2$.HBr. 507.50. [Darifenacin is INN and BAN.] (1) 3-Pyrrolidineacetamide, 1-[2-(2,3-dihydro-5-benzofuranyl)ethyl]-α,α-diphenyl-, monohydrobromide, (3*S*)-; (2) (*S*)-2-{1-[2-(2,3-Dihydrobenzofuran-5-yl)ethyl]-3-pyrrolidnyl}-2,2-diphenylacetamide hydrobromide. *CAS-133099-07-7; CAS-133099-04-4* [darifenacin]. *Treatment for an overactive bladder.* Enablex (Novartis) ✧*UK-88525-04* (*hydrobromide*)

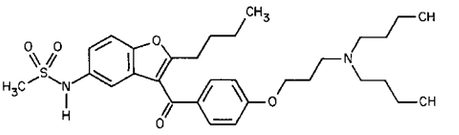
Dasantafil [*2004*] (da san′ ta fil). $C_{22}H_{28}BrN_5O_5$. 522.40. (1) 1*H*-Purine-2,6-dione, 7-[(3-bromo-4-methoxyphenyl)methyl]-1-ethyl-3,7-dihydro-8-[[(1*R*,2*R*)-2-hydroxycyclopentyl]amino]-3-(2-hydroxyethyl); (2) 7-(3-Bromo-4-methoxybenzyl)-1-ethyl-8-[[(1*R*,2*R*)-2-hydroxycyclopentyl]amino]-3-(2-hydroxyethyl)-3,7-dihydro-1*H*-purine-2,6-dione. *CAS-569351-91-3*. INN. *Treatment of erectile dysfunction* (*phosphodiesterase* (*PDE*) *5 isoenzyme inhibitor*). (Schering-Plough) ✧*SCH 446132*

Denufosol Tetrasodium [*2004*] (den ue foe′ sol). $C_{18}H_{23}N_5Na_4O_{21}P_4$. 861.30. [Denufosol is INN.] (1) Uridine 5′-(pentahydrogen tetraphosphate), P′′′→5′-ester with 2′-deoxycytidine, tetrasodium salt; (2) 2′-Deoxycytidine(5′)tetraphospho(5′)uridine tetrasodium salt. *CAS-318250-11-2; CAS-211448-85-0* [denufosol]. *Treatment of rhinitis, URI and lung disease, cystic fibrosis, retinal detachment and edema.* (Yamasa) ✧*INS37217*

Depelestat [*2004*] (dep el′ e stat). $C_{282}H_{412}N_{74}O_{75}S_6$. 6231.00. (1) Proteinase inhibitor M/NEI (synthetic human); (2) Human recombinant neutrophil elastase inhibitor, homologue of the second Kunitz domain of Inter-alpha-trypsin inhibitor light chain: [Glu285,Ile297,Phe300,Pro301,Arg302]AMBP protein precursor-(285-340)-peptide (human). *CAS-506433-25-6*. INN. *Treatment of bronchopulmonary inflammatory damage, specifically Cystic Fibrosis.* (Avecia) ✧*DX-890*

Dirlotapide [*2004*] (dir loe ta ′ pide). $C_{40}H_{33}F_3N_4O_3$. 674.70. (1) 1*H*-Indole-2-carboxamide, 1-methyl-*N*-[(1*S*)-2-[methyl(phenylmethyl)amino]-2-oxo-1-phenylethyl]-5-[[[4′-(trifluoromethyl)[1,1′-biphenyl]-2-yl]carbonyl]amino]-; (2) *N*-[(1*S*)-2-(Benzylmethylamino)-2-oxo-1-phenylethyl]-1-methyl-5-[[[4′-(trifluoromethyl)biphenyl-2-yl]carbonyl]amino]-1*H*-indole-2-carboxamide. *CAS-481658-94-0*. INN. *Treatment of obesity in companion animals* (*dogs*)(*gut microsomal triglyceride transport protein* (*gMTP*) *inhibitor*). (Pfizer) ✧*CP-742,033*

Dronedarone Hydrochloride [*2004*] (droe ne′ da rone). $C_{31}H_{44}N_2O_5S$.HCl. 593.20. [Dronedarone is INN.] (1) Methanesulfonamide, *N*-[2-butyl-3-[4-[3-(dibutylamino)propoxy]benzoyl]-5-benzofuranyl]-, monohydrochloride; (2) *N*-[2-Butyl-3-[*p*-[3-(dibutylamino)proproxy]benzoyl]-5-benzofuranyl] methanesulfonamide-, monohydrochloride. *CAS-141625-93-6; CAS-141626-36-0* [dronedarone]. *Antiarrhythmic.* (Sanofi-Synthelabo) ✧*SR33598B*



Edratide [*2004*] (er′ ra tide). $C_{111}H_{149}N_{27}O_{28}$. L-Glycyl-L-tyrosyl-L-tyrosyl- L-tryptophyl-L-seryl-L-tryptophyl-L-isoleucyl-L-arginyl-L-glutaminyl-L-prolyl-L-prolyl-L-glycyl-L-lysyl-L-glycyl-L-glutamyl-L-glutamyl-L-tryptophyl-L-isoleucyl-L-glycine. *CAS-433922-67-9*. INN. *Treatment of systemic lupus erythematosus.* (Teva, Israel) ✧*TV-4710*

Eglumetad [*2004*] (ee gloo′ me tad). $C_8H_{11}NO_4$. 185.20. (1) Bicyclo[3.1.0]hexane-2,6-dicarboxylic acid, 2-amino-, (1*S*,2*S*,5*R*,6*S*)-; (2) (+)-(1*S*,2*S*,5*R*,6*S*)-2-Aminobicyclo[3.1.0]hexane-2,6-dicarboxylic acid. *CAS-209216-09-1; CAS-176199-48-7* [anhydrous]. INN. *Treatment of general anxiety disorders and smoking cessation* (*metabotropic glutamate agonist*). (Lilly) *[Name previously used: Eglumegad.]* ✧*LY354740*

Fidexaban [*2004*] (fye dex′ a ban). $C_{25}H_{24}F_2N_6O_5$. 526.49. (1) Glycine, *N*-[2-[5-(aminoiminomethyl)-2-hydroxyphenoxy]-6-[3-(4,5-dihydro-1-methyl-1*H*-imidazol-2-yl)phenoxy]-3,5-difluoro-4-pyridinyl]-*N*-methyl-; (2) [[2-(5-Carbamimidoyl-2-hydroxyphenoxy)-3,5-difluoro-6-[3-(1-methyl-4,5-dihydro-1*H*-imidazol-2-yl)phenoxy]pyridin-4-yl]methylamino]acetic acid. *CAS-183305-24-0*. INN. *Anticoagulant* (*Factor Xa inhibitor*). (Schering A.G., Germany) ✧*ZK 807834*

Forodesine Hydrochloride [*2004*] (fore oh′ de seen). $C_{11}H_{14}N_4O_4$.HCl. 302.70. (1) 4*H*-Pyrrolo[3,2-*d*]pyrimidin-4-one, 7-[(2*S*,3*S*,4*R*,5*R*)-3,4-dihydroxy-5-(hydroxymethyl)-2-pyrrolidinyl]-1,5-dihydro-, monohydrochloride; (2) (–)-7-[(2*S*,3*S*,4*R*,5*R*)-3,4-Dihydroxy-5-(hydroxymethyl)pyrrolidin-2-yl]-1,5-dihydro-4*H*-pyrrolo[3,2-*d*]pyrimidin-4-one monohydrochloride. *CAS-284490-13-7*. *Treatment of T-Cell malignancies such as acute lymphoblastic leukemia* (*ALL*) *and cutaneous T-cell lymphoma* (*CTCL*). (BioCryst) ✧*BCX-1777*

Gadoxetate Disodium [*2004*] (gad ox′ e tate). $C_{23}H_{28}GdN_3Na_2O_{11}$. 725.72. (1) Gadolinate(2-), [*N*-[2-[bis[(carboxy-κ*O*)methyl]amino-κ*N*]-3-(4-ethoxyphenyl)propyl]-*N*-[2-[bis[(carboxy-κ*O*)methyl]amino-κ*N*]ethyl]glycinato(5-)-κ*N*,κ*O*]-, disodium, [SA-8-11252634-(*S*)]-; (2) Disodium [*N*-[(2*S*)-2-[bis(carboxymethyl)amino]-3-(*p*-ethoxyphenyl)propyl]-*N*-[2-[bis(carboxymethyl)amino]ethyl]glycinato(5-)]gadolinate(2-).*CAS-135326-22-6*. *Paramagnetic*

Nomenclature

contrast agent for enhancement in magnetic resonance imaging (*MRI*). (Schering Aktiengesellschaft, Germany) ✧*ZK 139834*

Gantacurium Chloride [*2004*] (gan ta kure′ ee um). $C_{53}H_{69}Cl_3N_2O_{14}$. 1-64.50. (1) Isoquinolinium, 2-[3-[[(2*Z*)-2-chloro-1,4-dioxo-4-[3-[(1*S*,2*R*)-1,2,3,4-tetrahydro-6,7-dimethoxy-2-methyl-1-(3,4,5-trimethoxyphenyl)isoquinolinio]propoxy]-2-butenyl]oxy]propyl]-1,2,3,4-tetrahydro-6,7-dimethoxy-2-methyl-1-[(3,4,5-trimethoxyphenyl)methyl]-, dichloride, (1*R*,2*S*)-; (2) (1*R*,2*S*)-2-[3-[[(2*Z*)-2-Chloro-4-[3-[(1*S*,2*R*)-6,7-dimethoxy-2-methyl-1-(3,4,5-trimethoxyphenyl)-1,2,3,4-tetrahydroisoquinolinio]propoxy]-4-oxobut-2-enoyl]oxy]propyl]-6,7-dimethoxy-2-methyl-1-(3,4,5-trimethoxybenzyl)-1,2,3,4-tetrahydroisoquinolinium dichloride. *CAS-213998-46-0*. INN. *Induces muscle paralysis as a surgical adjunct* (*neuromuscular blocker*). (Cedarburg) ✧*GW-280430A*

Golimumab [*2004*] (goe li mue′ mab). $C_{6530}H_{10068}N_{1752}O_{2026}S_{44}$. Immunoglobulin G1, anti-(human tumor necrosis factor α) (human monoclonal CNTO 148 γ1-chain), disulfide with human monoclonal CNTO 148 κ-chain, dimer. Molecular weight is approximately 147,000 daltons. *CAS-476181-74-5*. INN. *Treatment of inflammatory disorders; rheumatoid arthritis, uveitis, asthma and Crohn's disease.* (Centocor) ✧*CNTO 148*

Hyaluronidase [*2004*] (hye al ur on′ i dase). **USP** [Injection]. $C_{2600}H_{4040}N_{696}O_{774}S_{23}$ (peptide). 58,170 daltons. (1) Hyaluronidase (sheep testis isoenzyme); (2) Hyaluronidase (glycoprotein, sheep testis isoenzyme). *CAS-488712-31-8; CAS-9001-54-1*. INN; BAN; JAN. *Clearance of vitreous hemorrhage.* Diffusin (Ortho Pharmaceutical†); Enzodase (Bristol-Myers Squibb†); Hyazyme (Abbott†); Vitrase (Biozyme Laboratories Ltd., UK); Wydase (Wyeth-Ayerst) *[Note—The source of the product* (*ovine, porcine, etc.*) *must be indicated in the labeling.]* ✧*HYO6A*
USP DI Category: Spreading agent.

Idronoxil [*2004*] (id roe nox′ il). $C_{15}H_{12}O_3$. 240.25. (1) 2*H*-1-Benzopyran-7-ol, 3-(4-hydroxyphenyl)-; (2) 3-(4-Hydroxyphenyl)-2*H*-chromen-7-ol. *CAS-81267-65-4*. INN. *Antineoplastic which acts as an antiproliferative, topoisomerase II inhibitor; 5α reductase inhibitor.* (Novogen) *[Note—The trivial name, phenoxodiol, has appeared in the literature.]* ✧*NV-06*

Ismomultin Alfa [*2004*] (iz″ moe mul′ tin). $C_{1827}H_{2785}N_{493}O_{530}S_{11}$. 40,489. (1) Glycoprotein gp 39 (human cartilage isoform Org 39141); (2) 47-261-Glycoprotein gp 39 (human clone CDM8-gp39 reduced). *CAS-457913-93-8*. INN. *Treatment of rheumatoid arthritis.* (Diosynth B.V.) ✧*Org 39141*

Ladostigil Tartrate [*2004*] (lad″ oh stij′ il). $2(C_{16}H_{20}N_2O_2)$. $C_4H_6O_6$. 694.80. [Ladostigil is INN.] (1) Carbamic acid, ethylmethyl-, (3*R*)-2,3-dihydro-3-(2-propynylamino)-1*H*-inden-5-yl ester, (2*R*,3*R*)-2,3-dihydroxybutanedioate (2:1); (2) (3*R*)-3-(Prop-2-ynylamino)-2,3-dihydro-1*H*-inden-5-yl ethylmethylcarbamate (2*R*,3*R*)-tartarate (2:1). *CAS-209394-46-7; CAS-209394-27-4* [ladostigil]. *Treatment of Alzheimer's disease* (*an inhibitor of monoamine oxidase* (*MAO-A and B*)*, an acetylcholinesterase inhibitor, and a neuroprotectant*). (Teva, Israel) ✧*TV-3326*

† Brand name formerly used, and/or firm no longer concerned with this product.

Lanimostim [*2004*] (lan″ i moe′ stim). $C_{2146}H_{3346}N_{572}O_{686}S_{28}$. 49,033 daltons. (1) 4-221-Colony-stimulating factor 1 (human clone p3ACSF-69 reduced); (2) 4-221-Colony-stimulating factor 1 (human clone p3ACSF-69) (dimer). *CAS-117276-75-2*. INN. *Antineoplastic; anti-infective growth factor that acts on both progenitor and mature cells of the macrophage line.* (Eximias)

Lestaurtinib [*2004*] (le stor′ tin ib). $_{26}H_{21}N_3O_4$. 439.46. (1) 9,12-Epoxy-1*H*-diindolo[1,2,3-*fg*:3′,2′,1′-*kl*]pyrrolo[3,4-*i*][1,6]benzodiazocin-1-one, 2,3,9,10,11,12-hexahydro-10-hydroxy-10-(hydroxymethyl)-9-methyl-, [9*S*-(9α,10β,12α)]-; (2) (9*S*,10*S*,12*R*)-10-Hydroxy-10-(hydroxymethyl)-9-methyl-2,3,9,10,11,12-hexahydro-9,12-epoxy-1*H*-diindolo[1,2,3-*fg*:3′,2′,1′-*kl*]pyrrolo[3,4-*i*][1,6]benzodiazocin-1-one. *CAS-111358-88-4*. INN. *Treatment of tumors such as prostate and pancreatic carcinomas* (*selective inhibitor of tyrosine kinase*). (Cephalon) ✧*CEP-701; A-154475.0; SP924; KT5555*

Levotofisopam [*2004*] (lev″ oh toe fis′ oh pam). $C_{22}H_{26}N_2O_4$. 382.45. (1) 5*H*-2,3-Benzodiazepine, 1-(3,4-dimethoxyphenyl)-5-ethyl-7,8-dimethoxy-4-methyl-, (5*S*)-; (2) (–)-(5*S*)-1-(3,4-Dimethoxyphenyl)-5-ethyl-7,8-dimethoxy-4-methyl-5*H*-2,3-benzodiazepine. *CAS-82059-51-6*. *Anxiolytic, autonomic instability.* (Cerilliant) ✧(*S*)-*tofisopam*

Lontucirev (Replicating Adenovirus) [*2004*] (lon too′ si rev). (1) DNA (human adenovirus ONYX-015); (2) E1B-55kDa gene-deleted adenovirus. *CAS-437981-77-6*. *Treatment of multiple cancers* (*E1-B deleted adenovirus; replication competent virus*). (Onyx) ✧*ONYX-015; CI-1042*

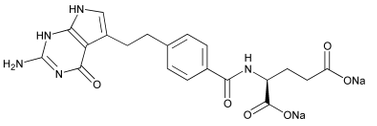
Mecasermin Rinfabate [*2004*] (mek a ser′ min). $C_{1231}H_{1967}N_{371}O_{384}S_{20}$. 36,304. (1) Insulin-like growth factor I (human), complex with insulin-like growth factor-binding protein IGFBP-3 (human); (2) Complex of recombinant human insulin-like growth factor I (somatomedin C) with recombinant human insulin-like growth factor-binding protein 3. *CAS-478166-15-3*. INN. *Antidiabetic.* Somatokine (Avecia, UK) ✧*rhIGF-I/rhIGFBP-3*

Paclitaxel Poliglumex [*2004*] (pak li tax′ el pol ee gloo′ mex). $(C_{52}H_{56}N_2O_{16})_n.(C_5H_7NO_3)_x$. (1) L-Glutamic acid, homopolymer, (1*R*,2*S*)-2-(benzoylamino)-1-[[[(2a*R*,4-*S*,4a*S*,6*R*,9*S*,11*S*,12*S*,12a*R*,12b*S*)-6,12b-bis(acetyloxy)-12-(benzoyloxy)-2a,3,4,4a,5,6,9,10,11,12,12a,12b-dodecahydro-4,11-dihydroxy-4a,8,13,13-tetramethyl-5-oxo-7,11-methano-1*H*-cyclodeca[3,4]benz[1,2-*b*]oxet-9-yl]oxy]carbonyl]-2-phenylethyl ester; (2) Poly(L-glutamic acid) partially γ-esterified with (1*R*,2*S*)-2-(benzoylamino)-1-[[[(2a*R*,4-*S*,4a*S*,6*R*,9*S*,11*S*,12*S*,12a*R*,12b*S*)-6,12b-bis(acetyloxy)-12-(benzoyloxy)-4,11-dihydroxy-4a,8,13,13-tetramethyl-5-oxo-2a,3,4,4a,5,6,9,10,11,12,12a,12b-dodecahydro-7,11-methano-1*H*-cyclodeca[3,4]benzo[1,2-*b*]oxet-9-yl]oxy]carbonyl]-2-phenylethyl. Molecular weight is approximately 45,000 daltons. *CAS-263351-82-2*. INN. *Anti-cancer therapy as a single agent or in combination with other anti-cancer therapies.* (Hauser CRO) ✧*CT-2103*

Panitumumab [*2004*] (pan i tue′ moo mab). $C_{6306}H_{9732}N_{1672}O_{1994}S_{46}$. 142,347. Immunoglobulin, anti-(human epidermal growth factor receptor) (human monoclonal ABX-EGF heavy chain), disulfide with human monoclonal ABX-EGF light chain, dimer. *CAS-339177-26-3*. INN. *Antineoplastic; treatment of EGF expressing tumors.* (Abgenix) ✧*ABX-EGF*

Pelitinib [*2004*] (pel i tye′ nib). $C_{24}H_{23}ClFN_5O_2$. 467.92. (1) 2-Butenamide, *N*-[4-[(3-chloro-4-fluorophenyl)amino]-3-cyano-7-ethoxy-6-quinolinyl]-4-(dimethylamino)-, (2*E*)-; (2) (2*E*)-*N*-[4-[(3-Chloro-4-fluorophenyl)amino]-3-cyano-7-ethoxyquinolin-6-yl]-4-(dimethylamino)but-2-enamide.*CAS-257933-82-7*. INN. *Treatment of cancer.* (Wyeth) ✧*EKB-569*

Pemetrexed Disodium [*2004*] (pem e trex′ ed). $C_{20}H_{19}N_5Na_2O_6$. 471.37. [Pemetrexed is INN and BAN.] (1) L-Glutamic acid, *N*-[4-[2-(2-amino-4,7-dihydro-4-oxo-1*H*-pyrrolo[2,3-*d*]pyrimidin-5-yl)ethyl]benzoyl]-, disodium salt; (2) Disodium *N*-[*p*-[2-(2-amino-4,7-dihydro-4-oxo-1*H*-pyrrolo[2,3-*d*]pyrimidin-5-yl)ethyl]benzoyl]-L-glutamate. *CAS-150399-23-8; CAS-137281-23-3* [pemetrexed]. *Antineoplastic* (*thymidylate synthase*). Alimta (Lilly) ✧*LY231514*



USP DI Category: Antineoplastic (specific thymidylate synthase inhibitor).

Perzinfotel [*2004*] (per zin foe′ tel). $C_9H_{13}N_2O_5P$. 260.20. (1) Phosphonic acid, [2-(8,9-dioxo-2,6-diazabicyclo[5.2.0]non-1(7)-en-2-yl)ethyl]-; (2) [2-(8,9-Dioxo-2,6-diazabicyclo[5.2.0]non-1(7)-en-2-yl)ethyl]phosphonic acid. *CAS-144912-63-0*. INN. *Treatment of neuropathic pain* (*NMDA receptor antagonist*). (Wyeth) ✧*EAA-090*

Prasugrel Hydrochloride [*2004*] (pra soo'pr grel). $C_{20}H_{20}FNO_3S.HCl$. 409.90. [Prasugrel is INN.] (1) Ethanone, 2-[2-(acetyloxy)-6,7-dihydrothieno[3,2-*c*]pyridin-5(4*H*)-yl]-1-cyclopropyl-2-(2-fluorophenyl)-, hydrochloride; (2) 5-[(1*RS*)-2-Cyclopropyl-1-(2-fluorophenyl)-2-oxoethyl]-4,5,6,7-tetrahydrothieno[3,2-*c*]pyridin-2-yl acetate hydrochloride. *CAS-389574-19-0; CAS-150322-43-3* [prasugrel]. *Inhibits platelet aggregation* (*platelet ADPP 2Y12 antagonist*). (Lilly) ✧*LY640315*

Regadenoson [*2004*] (re ga den′ oh son). $C_{15}H_{18}N_8O_5$. 390.35. (1) Adenosine, 2-[4-[(methylamino)carbonyl]-1*H*-pyrazol-1-yl]-; (2) 1-(6-Amino-9-β-D-ribofuranosyl-9*H*-purin-2-yl)-*N*-methyl-1*H*-pyrazole-4-carboxamide. *CAS-313348-27-5*. INN. *Coronary vasodilator for intravenous use as an adjunct, or pharmacologic stress agent, in radionuclide myocardial perfusion imaging in patients unable to exercise adequately* (A_{2A} *adenosine receptor agonist*). (Tetrionics) ✧*CVT-3146*

Retapamulin [*2004*] (re tap′′ a mue′ lin). $C_{30}H_{47}NO_4S$. 517.80. (1) Acetic acid, [[(3-*exo*)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl]thio]-, (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyldecahydro-5-hydroxy-4,6,9,10-tetramethyl-1-oxo-3a,9-propano-3a*H*-cyclopentacycloocten-8-yl ester; (2) (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-5-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopenta[8]annulen-8-yl [[(1*R*,3*s*,5*S*)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl]sulfanyl]acetate. *CAS-224452-66-8*. INN. *Topical antibiotic for secondarily infected traumatic lesions* (*SITL*) *and secondarily infected dermatoses* (*SID*) *or impetigo.* (GlaxoSmithKline) ✧*SB-275833*

Secretin [*2004*] (see′ kret in). $C_{130}H_{220}N_{44}O_{40}$ (human) . 3039.40 (human); $C_{130}H_{220}N_{44}O_{41}$ (porcine). 3055.50 (porcine). CHEMICAL NAMES (human): (1) Secretin (porcine), 15-L-glutamic acid-16-glycine-; (2) L-Histidyl-L-seryl-L-α-aspartylglycyl-L-threonyl-L-phenylalanyl-L-threonyl-L-seryl-L-α-glutamyl-L-leucyl-L-seryl-L-arginyl-L-leucyl-L-arginyl-L-α-glutamylglycyl-L-alanyl-L-arginyl-L-leucyl-L-glutaminyl-L-arginyl-L-leucyl-L-leucyl-L-glutaminylglycyl-L-leucyl-L-valinamide. CHEMICAL NAMES (porcine): (1) Secretin (porcine): (2) L-Histidyl-L-seryl-L-α-aspartylglycyl-L-threonyl-L-phenylalanyl-L-threonyl-L-seryl-L-α-glutamyl-L-leucyl-L-seryl-L-arginyl-L-leucyl-L-arginyl-L-α-aspartyl-L-seryl-L-alanyl-L-arginyl-L-leucyl-L-glutaminyl-L-arginyl-L-leucyl-L-leucyl-L-glutaminylglycyl-L-leucyl-L-valinamide. *CAS-108153-74-8* [human]; *CAS-17034-35-4* [porcine]; *CAS-1393-25-5*. INN; BAN; JAN; DCF; MI. *Stimulates pancreatic and gastric secretions to aid in the diagnosis of pancreatic exocrine dysfunction and the diagnosis of gastrinoma.* (Chesapeake); (PolyPeptide); Secretin-Kabi (KabiVitrum, Sweden) *[NOTE—The source of the product* (*human, porcine, etc.*) *must be indicated in the labeling.]*

Selodenoson [*2004*] (sel oh den′ oh son). $C_{17}H_{24}N_6O_4$. 376.41. (1) β-D-Ribofuranuronamide, 1-[6-(cyclopentylamino)-9*H*-purin-9-yl]-1-deoxy-*N*-ethyl-; (2) 1-[6-(Cyclopentylamino)-9*H*-purin-9-yl]-1-deoxy-*N*-ethyl-β-D-ribofuranuronamide. *CAS-110299-05-3*. INN. *Management of atrial fibrillation and atrial flutter.* (Torcan) ✧*DTI-0009*

Sugammadex Sodium [*2004*] (soo gam′ ma dex). $C_{72}H_{104}Na_8O_{48}S_8$. 2178. (1) γ-Cyclodextrin, 6A,6B,6C,6D,6E,7F,6G,6H-octakis-*S*-(2-carboxyethyl)-6A,6B,6C,6D,6E,7F,6G,6H-octathio-, octasodium salt; (2) Octasodium 6,6′,6′′,6′′′,6′′′′,6′′′′′,6′′′′′′,6′′′′′′′-octakis-*S*-(2-carboxylatoethyl)-6,6′,6′′,6′′′,6′′′′,6′′′′′,6′′′′′′,6′′′′′′′-octathiocyclo-α-(1→4)-D-octaglucopyranoside. *CAS-343306-79-6*. *Reversal agent for neuromuscular blocking agents.* (N.V. Organon, Netherlands) ✧*Org 25969*

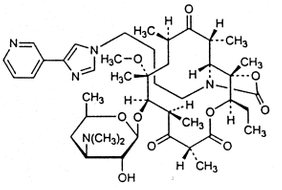
Taltobulin [*2004*] (tal toe bue′ lin). $C_{27}H_{43}N_3O_4$. 473.65. (1) L-Valinamide, *N*,β,β-trimethyl-L-phenylalanine-*N*-[(1*S*,2*E*)-3-carboxy-1-(1-methylethyl)-2-butenyl]-*N*,3-dimethyl-; (2) (4*S*)-4-[[(2*S*)-3,3-Dimethyl-2-[[(2*S*)-3-methyl-2-(methylamino)-3-phenylbutanoyl]amino]butanoyl]methylamino]-2,5-dimethylhex-2-enoic acid. *CAS-228266-40-8*. INN. *Treatment of solid tumors.* (Wyeth) ✧*HTI-286*

Tandutinib [*2004*] (tan doo tye′ nib). $C_{31}H_{42}N_6O_4$. 562.70. (1) 1-Piperazinecarboxamide, 4-[6-methoxy-7-[3-(1-piperidinyl)-propoxy]-4-quinazolinyl]-*N*-[4-(1-methylethoxy)phenyl]-; (2) 4-[6-Methoxy-7-[3-(piperidin-1-yl)propoxy]quinazolin-4-yl]-*N*-[4-(1-methylethoxy)phenyl]piperazine-1-carboxamide. *CAS-387867-13-2*. INN. *Treatment of cardiovascular diseases, fibrotic diseases and acute myelogenous leukemia* (*tyrosine kinase inhibitor*). (Regis) ✧*CT 53518*

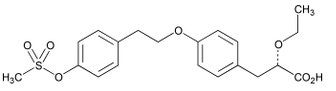
Telavancin Hydrochloride [*2004*] (tel a vam′ sin). $C_{80}H_{106}Cl_2N_{11}O_{27}P.HCl$. 1792.10. [Telavancin is INN.] (1) Vancomycin, $N^{3''}$-[2-(decylamino)ethyl]-29-[[(phosphonomethyl)amino]methyl]-, monohydrochloride; (2) (3*S*,6*R*,7*R*,22*R*,23*S*,26*S*,36*R*,38a*R*)-3-(2-Amino-2-oxoethyl)-10,19-dichloro-44-[[2-*O*-[3-[[2-(decylamino)ethyl]amino]-3-*C*-methyl-2,3,6-trideoxy-α-L-*lyxo*-hexopyranosyl]-β-D-glucopyranosyl]oxy]-7,22,28,30,32-pentahydroxy-6-[[(2*R*)-4-methyl-2-(methylamino)pentanoyl]amino]-2,5,24,38,39-pentaoxo-29-[[(phosphonomethyl)amino]methyl]-

2,3,4,5,6,7,23,24,25,26,36,37,38,38a-tetradecahydro-8,11:18,21-dietheno-23,36-(iminomethano)-22*H*-13,16:31,35-dimetheno-1*H*,13*H*-[1,6,9]oxadiazacyclohexadecino[4,5-*m*][10,2,16]benzoxadiazacyclotetracosine-26-carboxylic acid monohydrochloride. *CAS-560130-42-9; CAS-372151-71-8* [telavancin]. *Antibacterial agent active against gram-positive pathogens.* (Theravance) ✧*Td-6424*

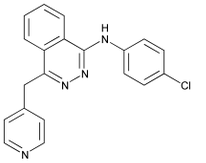
Telithromycin [*2004*] (tel ith″ roe mye′ sin). $C_{43}H_{65}N_5O_{10}$. 812.00. (1) Erythromycin, 3-de[(2,6-dideoxy-3-*C*-methyl-3-*O*-methyl-α-L-*ribo*-hexopyranosyl)oxy]-11,12-dideoxy-6-*O*-methyl-3-oxo-12,11-[oxycarbonyl[[4-[4-(3-pyridinyl)-1*H*-imidazol-1-yl]butyl]imino]-; (2) (3a*S*,4*R*,7*R*,9*R*,10*R*,11*R*,13*R*,15*R*,15a*R*)-4-Ethyl-11-methoxy-3a,7,9,11,13,15-hexamethyl-1-[4-[4-(pyridin-3-yl)-1*H*-imidazol-1-yl]butyl]-10-[[3,4,6-trideoxy-3-(dimethylamino)-β-D-*xylo*-hexopyranosyl]oxy]octahydro-2*H*-oxacyclotetradecino[4,3-*d*]oxazole-2,6,8,14(1*H*,7*H*,9*H*)-tetrone. *CAS-191114-48-4; CAS-173838-31-8*. INN; BAN. *Antimicrobial* (*via inhibition of bacterial protein synthesis*). Ketek (Aventis) ✧*HMR 3647*



Tesaglitazar [*2004*] (tes″ a gli′ ta zar). $C_{20}H_{24}O_7S$. 408.47. (1) Benzenepropanoic acid, α-ethoxy-4-[2-[4-[(methylsulfonyl)oxy]phenyl]ethoxy]-, (α*S*)-; (2) (2*S*)-2-Ethoxy-3-[4-[2-[4-[(methylsulfonyl)oxy]phenyl]ethoxy]phenyl]propanoic acid. *CAS-251565-85-2*. INN. *Treatment of type 2 diabetes and insulin resistance syndrome.* Galida (AstraZeneca) ✧*AR-H039242XX*



Vatalanib [*2004*] (va tal′ an ib). $C_{20}H_{15}ClN_4$. 346.81. (1) 1-Phtalazinamine, *N*-(4-chlorophenyl)-4-(4-pyridinylmethyl)-; (2) *N*-(4-chlorophenyl)-4-(pyridin-4-ylmethyl)phtalazin-1-amine.*CAS-212141-54-3*. INN. *Treatment of tumors.* (Novartis Pharma) ✧*PTK787*



Proposed and Recommended International Nonproprietary Names

International Nonproprietary Names (INN) are devised by the World Helath Organization (WHO).

Under its charter, the WHO is empowered simply to *recommend* specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as *proposals* (''Proposed International Nonproprietary Names''). A period of four months from the date of publication in *WHO Drug Information* is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested parties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event that no objection is received, the WHO proceeds with listing and publishing the names so devised as *recommendations* (''Recommended International Nonproprietary Names''), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

Proposed International Nonproprietary Names

The following 68 names have been selected by the World Health Organization (WHO) as Proposed International Nonproprietary Names. This list, with chemical names or descriptions and the molecular formulae, appears in *WHO Drug Information*, Vol 18, No. 2, 2004.

Any comments or formal objections to the proposed names should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

Proposed INN	Therapeutic Indication
Abatacept	*Immunomodulator*
Acotiamide	*Antiemetic (parasympathomimetic)*
Alagebrium Chloride	*Agent influencing protein glycosylation*
Alglucosidase Alfa	*Enzyme*
Armodafinil	*Psychostimulant*
Bamirastine	*Histamine H_1 receptor antagonist*
Befetupitant	*Neurokinin NK_1 receptor antagonist*
Belotecan	*Antineoplastic agent*
Carmoterol	*Bronchodilator*
Cetilistat	*Gastro-intestinal lipase inhibitor*
Dasantafil	*Vasodilator*
Daxalipram	*Phosphodiesterase IV inhibitor*
Denufosol	*P2Y2 receptor agonist*
Depelestat	*Neutrophil elastase inhibitor*
Dirlotapide	*Antihyperlipidemic (veterinary drug)*
Edaglitazone	*Antidiabetic agent*
Exbivirumab	*Antiviral*
Fampronil	*Antiparasitic agent (veterinary drug)*
Fidexaban	*Blood coagulation factor Xa inhibitor*
Fingolimod	*Immunomodulator*
Gadodenterate	*MNR contrast agent*
Gantacurium Chloride	*Neuromuscular blocking agent*
Golimumab	*Immunomodulator*
Idronoxil	*Antineoplastic agent*
Imiglitazar	*Antidiabetic agent*
Indacaterol	*Bronchodilator*
Indibulin	*Antineoplastic agent*
Ismomultin Alfa	*Antirheumatic*
Lanimostim	*Immunomodulator*
Lemuteporfin	*Photosensitizing agent*
Lenalidomide	*Antineoplastic agent*
Lestaurtinib	*Antineoplastic agent*
Libivirumab	*Antiviral*
Maraviroc	*Antiviral*
Mecasermin Rinfabate	*Antidiabetic agent*
Milataxel	*Antineoplastic agent*
Mirococept	*Anti-inflammatory*
Paclitaxel Ceribate	*Antineoplastic agent*
Palosuran	*Urotensin receptor antagonist*
Panitumumab	*Antineoplastic agent*
Pegamotecan	*Antineoplastic agent*
Pelitinib	*Antineoplastic agent*
Perflubutane	*Ultrasound contrast agent*
Perzinfotel	*NMDA receptor antagonist*
Prasugrel	*Platelet aggregation inhibitor*
Radafaxine	*Antidepressant*
Ranirestat	*Aldose reductase inhibitor*
Regadenoson	*Adenosine receptor A agonist*
Reparixin	*Anti-inflammatory action through the inhibition of cytokine (IL-8)*
Retapamulin	*Antibiotic*
Revaprazan	*Acid pump inhibitor*
Rilpivirine	*Antiviral*
Ritobegron	*Beta$_3$-adrenoreceptor agonist*
Robenacoxib	*Selective cyclo-oxygenase inhibitor (veterinary drug)*
Rostafuroxin	*Hypotensive agent*
Selodenoson	*Selective adenosine A_1 receptor agonist*
Taltobulin	*Antineoplastic agent*
Tandutinib	*Antineoplastic agent*
Teglicar	*Palmitoylcarnitine transferase I inhibitor*
Telavancin	*Antibiotic*
Tetomilast	*Phosphodiesterase IV inhibitor*
Tifuvirtide	*Antiviral*
Topilutamide	*Antiandrogen*
Torapsel	*Antithrombotic agent*
Trodusquemine	*Appetite suppressant*
Vandetanib	*Angiogenesis inhibitor*
Vestipitant	*Neurokinin NK_1 receptor antagonist*
Yttrium (^{90}Y) Tacatuzumab	*Antineoplastic agent*

Recommended International Nonproprietary Names

The following 58 nonproprietary names have been selected by the World Health Organization (WHO) as Recommended International Nonproprietary Names. This list, with chemical names or descriptions and the molecular formulae, appears in *WHO Drug Information*, Vol 18, No. 1, 2004.

Recommended INN	Recommended INN	Recommended INN	Recommended INN
Adargileukin Alfa	Edotecarin	Icofungipen	Pritumumab
Alamifovir	Edratide	Icrocaptide	Ralfimamide
Aprinocarsen	Elsilimomab	Iferanserin	Rebimastat
Belimumab	Elvucitabine	Istradefylline	Segestrone
Cantuzumab Mertansine	Epitumomab Cituxetan	Ixabepilone	Semapimod
Cimicoxib	Eptotermin Alfa	Ladostigil	Sufugolix
Dabuzalgron	Exatecan Alideximer	Lapatinib	Tacapenem
Dacinostat	Exenatide	Lomeguatrib	Tafluprost
Dalbavancin	Firocoxib	Odiparcil	Talizumab
Deligoparin Sodium	Fispemifene	Omiganan	Technetium (99mTc) Nitridocade
Desvenlafaxine	Fluorescein Lisicol	Pactimibe	Tesofensine
Dibotermin Alfa	Freselestat	Patupilone	Tifenazoxide
Diquafosol	Galiximab	Pertuzumab	Tisocalcitate
Disermolide	Hemoglobin Raffimer	Pixantrone	Ulifloxacin
Edifoligide			Varenicline

Suggested United States Adopted Names

The United States Adopted Names (USAN) program is the specifically organized effort in the United States directed to producing simple and useful nonproprietary names for drugs while the drugs are still in the investigational stages. The American Medical Association (AMA), the American Pharmaceutical Association (APhA), and the United States Pharmacopeial Convention (USPC) jointly sponsor the USAN program with representation from the FDA.

Each U.S. Adopted Name is chosen with the expectation that it will be suitable for prescribing and dispensing purposes and for designation as the title of the monograph, should the article be recognized in the official *United States Pharmacopeia* or *National Formulary.* A measure of the prestige and recognition of the value of the USAN program can be found in the following regulations published by the Commissioner of Food and Drugs and the Secretary of Health and Human Services in the *Federal Register* of February 1988.

> All who are concerned with the prescription, dispensing, use, sale or manufacture of drugs may, in the absence of the designation of an official name by the FDA, rely on the current compendial name or the U.S. Adopted Name (USAN) listed in this volume as being the established name in accordance with the Federal Food, Drug, and Cosmetic Act.

A formal procedure[1] is followed by the USAN Council in selecting an established name for a drug. The USAN Council Secretary is also an ex officio member of the International Nonproprietary Names (INN) Committee. USAN Guiding Principles are concordant with World Health Organization (WHO) principles, and all USANs for substances also named by the INN Committee are systematically processed through the INN Committee. This ensures that, with very rare exceptions, USANs are identical to INNs and available for world-wide use.

A suggestion for a USAN originates usually from a firm or an individual who has developed a substance of potential therapeutic utility to the point where there is a distinct possibility of its being marketed in the United States of America. Occasionally, the initiative is taken by the USAN Council in the form of a request to parties interested in a substance for which a nonproprietary name appears to be lacking.

Submissions to the USAN Council are expected to conform to the established Guiding Principles[2] and to be reasonably free from conflict with other names, including both trademarks and nonproprietary names. An effort is made to discourage the occasional, undesirable practice of incorporating in trademarks the syllables used in an established nonproprietary name, or syllables recommended for USAN. Such trademarks may act as a bar to the subsequent adoption of appropriate nonproprietary names for closely related drugs.

The suggested nonproprietary names for the drugs described in the following list are under consideration by the USAN Council. The name(s) being considered for each drug substance, and the applicable *category*, are separated by double spacing from the name(s) and *category* for the next listed drug substance. Where two or more names are being considered for the same drug substance, the names are single-spaced, and the applicable category term is written only once to the right of the single-spaced group of names.

Any comments or protests should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

Suggested USAN	Category
Acallantide Ecallantide Epicallantide Epicallide Epicallintide Epikallintide Pacallantide	*Treatment of hereditary angioedema cardiopulmonary bypass (plasma kallikrein inhibitor)*
Adarolimus Etosirolimus Tetrazolimus Tetrolimus Tetrosirolimus Tezolimus Tezorolimus Zolimus	*Antifungal macrolide (drug component of an investigational phosphoryl choline polymer-coated eluting stent, currently under evaluation for the prevention of coronary restenosis following stent replacement*
Afatacib Afenatacib Afenatastat Apratastat Fanatacib Fapenatacib Fapenetacib Pratacib Rafatacib Rafenatacib Rafutastat Tratacib	*Treatment of rheumatoid arthritis*
Afboximab Afociximab Afotuximab Boxatuximab Valiximab Volociximab Volotuximab	*Anti-angiogenic agent to treat solid tumors and age-related macular degeneration*
Agipartrant Sulfate Torapiparant Sulfate Vogrelapar Sulfate Voparagrel Sulfate Voparonant Sulfate Voraparpiant Sulfate	*Treatment of thrombosis (orally active protease-activated receptor (PAR)1 antagonist)*
Agotinib Aneoganib Axisanib Axitinib Trexisanib Trexitinib	*Treatment of cancer*

Darunavir	*Treatment of HIV infection*
Delamostat Golamostat Relamostat Zelamostat	*Treatment of osteoporosis*
Desancycline Incemocline Incyclinor Incymastat Incyplemib Intepacib Inteplemib Maztecinor	*Treatment of rosacea; treatment of acute respiratory distress syndrome (ARDs) (chemically modified tetracycline [CMT] which is claimed to inhibit multiple proteases and cytokines)*
Diaplastinin Diaplaxtinin	*Treatment of fibrinolytic impairment disease*
Doripenem	*Antibiotic*
Edotecarin	*Antineoplastic (topoisomerase I inhibitor)*
Emulsebinex Prosepibex Sepebinex	*Treatment of patients with suspected or confirmed gram-negative severe sepsis with the intent of reducing 28-day all-cause mortality*
Etravirine	*Treatment of HIV infection*
Evandiracetam Seletracetam Vantiracetam	*Treatment of epilepsy, neuropathic pain, and essential tremor*
Fesoterodine Hydrogen Fumarate	*Treatment of overactive bladder with symptoms of urinary urgency, frequency and/or urge incontinence*
Forodesine	*Treament of T-cell malignancies such as acute lymphoblastic leukemia (ALL) and cutaneous T-cell lymphoma (CTCL)*
Fulvotaxel Misotaxel Naltotaxel	*Treatment of breast cancer*
Glutatrexed Ammonium Gretopterin Ammonium Loropterin Ammonium Oropterin Ammonium Orotrexed Ammonium Talopterin Ammonium	*Antineoplastic*
Hulaplexumid Immunoplexumid Lexlimogene (HLA-B7 Plasmid) Plasmid-huHLA B7 Ulaplastumogene Ulaplasumogene (HLA B7)	*Treatment of melanoma (HLA B7) antigen expression via DNA transfection*
Intadotin Hydrochloride Sintadotin Hydrochloride Synthadotin Hydrochloride Tasidotin Hydrochloride	*Treatment of patients with advanced refractory neoplasms*
Iodine Acrylex Iodine Polacryterlex Iodine Poteracrylex Iodine Povacrylex	*Topical antiseptic*
Ipronicline Ispronicline Promenicline Sarenicline Tivonicline	*Treatment of cognitive and memory disorders (nicotine receptor partial agonist)*
Manalopan Bromide Menaltrexium Bromide Menaltrexone Bromide Methylnaltrexone Bromide Metilnaltrexium Bromide Metilnaltrexone Bromide Metrexopan Bromide Nalpromium Bromide Nalquatrone Bromide Oprinone Bromide	*Treatment of peripheral side effects of opoid therapy (peripheral opoid receptor antagonist)*
Mitratapide	*Management of obesity in dogs*
Nolovizumab Numavizumab Ralivizumab Reslivizumab Resyvizumab Umavizumab	*Prevention of serious lower respiratory tract disease caused by respiratory syncytial virus (RSV) in pediatric patients at high risk*
Olanzapine Pamoate	*Treatment of schizophrenia (selective monoaminergic antagonist)*
Pagibaximab Pediabacximab Pilabaximab Podobaximab	*Prevention of staphylococcal sepsis in premature infants*
Perflubutane Perflutan Perflutane	*A third-generation ultrasound contrast agent intended for assessing myocardial perfusion (blood flow within the heart muscle) in patients with coronary artery disease*
Resatumumab Restumumab Rosutumumab Tiratumumab Tritumumab	*Treatment of oncologic diseases; treatment of relapsed or refractory CD30 positive lymphoma including Hodgkin's disease*
Rimonabant	*Smoking cessation and anti-obesity*

Nomenclature

Suggested USAN	Category
Selanzymin	*Anti-inflammatory and antimicrobial*
Selezymin	
Selmimase	
Selmimetase	
Somimase	
Somimetase	
Sopasemim Manganese	
Sumimetase	
Suprozymin	
Zormimase	
Tisocalcitate	*Topical treatment of plaque-type psoriasis*
Valepcitabine Dihydrochloride	*Treatment of chronic hepatitis C (HCV RNA polymerase inhibitor)*
Valeprucitabine Dihydrochloride	
Valopcitabine Dihydrochloride	
Valopicitabine Dihydrochloride	
Valpercitabine Dihydrochloride	
Zanolimumab	*Treatment of rheumatoid arthritis (RA), psoriasis (PSO), and cutaneous T-cell lymphoma (CTCL)*

Suggested International Nonproprietary Names

International Nonproprietary Names (INN) are devised by the World Health Organization (WHO). INNs for substances originating within the United States are applied for through the USAN Council. INN and USAN Guiding Principles are concordant, which assures that, with very few exceptions, INNs and USANs are identical.

Under its charter, the WHO is empowered simply to *recommend* specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as *proposals* (''Proposed International Nonproprietary Names''). A period of four months from the date of publication in *WHO Drug Information* is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested parties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event that no objection is received, the WHO proceeds with listing and publishing the names so devised as *recommendations* (''Recommended International Nonproprietary Names''), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

The names for the drugs that are categorized in the following list are under consideration for the selection of new Proposed International Nonproprietary Names. The name(s) being considered for each drug substance, and the applicable *category*, are separated by double spacing from the name(s) and *category* for the next listed drug substance. Where two or more names are being considered for the same drug substance, the names are single-spaced, and the applicable category term is written only once to the right of the single-spaced group of names.

Any comments or protests should be addressed to Sandra Van Laan, Assistant Secretary, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

Suggested INN	Category
Acallantide Ecallantide Epicallantide Pacallantide	*Treatment of hereditary angioedema; cardiopulmonary bypass (plasma kallikrein inhibitor)*
Actavirine Etravirine Tetraviridine Vidavirine Vitravirine	*Treatment of HIV infection*
Actinovir Arunavir Darunavir Difanavir	*Treatment of HIV infection*
Adarolimus Tezorolimus	*Antifungal macrolide (drug component of an investigational phosphoryl choline polymer-coated eluting stent, currently under evaluation for the prevention of coronary restenosis following stent replacement)*
Aliskiren	*Antihypertensive*
Apaxaban Aprixaban	*Anticoagulant; antithrombotic*
Apilimumab Ipilimumab Oblimimumab	*Treatment of oncological diseases and HIV infection*
Apratastat Pratacib	*Treatment of rheumatoid arthritis*
Arbuprodene Aviprodene Keniprodene Palprodene	*Neurotrophic and neuroprotective compound expected to be used in the prevention of neurodegenerative diseases (e.g., Alzheimer's and Parkinson's diseases)*
Avanabant Loranabant Surinabant	*Treament of obesity/metabolic disorders and smoking cessation*
Avaracetam Bravaracetam Brivaracetam	*Treatment of epilepsy, neuropathic pain and essential tremor*
Bapineuzumab	*Treatment of Alzheimer's disease*
Belatacept	*Prevention of allograft rejection in recipients of solid organ transplants; prevention of graft-versus-host disease following bone marrow transplantation; treatment of autoimmune diseases and conditions (selective co-stimulation modulator which binds to the B7 family of molecules expressed in antigen-presenting cells)*
Belotecan Pamitecan Travitecan	*Antineoplastic, used in the treatment of advanced solid tumor malignancies refractory to standard therapies*
Calcimetriol Isocalcitol Isocalcitriol Procalcitol Tisocalcitate	*Topical treatment of plaque-type psoriasis*
Celiarone Isoparone Monarone	*Antiarrhythmic related to amiodarone*
Cilansetron	*Treatment of diarrhea-predominant Irritable Bowel Syndrome*
Crelizumab	*Treatment of rheumatoid arthritis*

Suggested INN	Category
Cyclorelin Follirelin Ovorelin	*Endogenous substance regulating secondary hormonal processes in the body via the central nervous system*
Danlimumab Dralimumab Genlimumab Zanolimumab	*Treatment of rheumatoid arthritis (RA), psoriasis (PSO), and Cutaneous T-cell Lymphoma (CTCL)*
Darifenacin Dasifenacin	*Treatment of overactive bladder*
Dianaicline Efinicline Livanicline Solinicline	*Aid to smoking cessation and maintenance of abstinence from smoking*
Diaplastinin Diaplaxtinin	*Treatment of fibrinolytic impairment disease*
Dipromine Fesoterodine Isofurine Mesofidine	*Treatment of incontinence*
Dirlotapide Mifratapide	*Management of obesity in dogs*
Doripenem Toripenem	*Antibiotic*
Edocarban Edocarbax Edotecarin Incarbax	*Antineoplastic (topoisomerase I inhibitor)*
Forodesine	*Treatment of T-cell malignancies such as acute lymphoblastic leukemia (ALL) and cutaneous T-cell lymphoma (CTCL)*
Impronakib Kordkanact Motokanarin	*Treament of spinal cord injury (K^+ channel blocker plus voltage dependent Na^+ channel blocker)*
Ipronicline Ispronicline Tivonicline	*Treatment of cognitive and memory disorders (nicotine receptor agonist)*
Lecozotan	*Treatment of Alzheimer's disease (5-HT1a agonist)*
Legametasone Renametasone Runometasone	*Intranasal and inhaled steroid to reduce swelling and inflammation to relieve common nasal symptoms (when used as an intranasal steroid) or to suppress inflammation within airways (when used as an inhaled steroid to asthma)*
Lexlimogene (HLA-B7 Plasmid)	*Treatment of melanoma (HLA B7) antigen expression via DNA transfection*
Mapatumumab	*Treatment of cancer*
Olanzapine Pamoate	*Treatment of schizophrenia (selective monoaminergic antagonist)*
Pagibaximab	*Prevention of staphylococcal sepis in premature infants*
Perflisoban Perflisotan Perfluban Perflubutane Perfluroban Perflutan	*A third-generation ultrasound contrast agent intended for assessing myocardial perfusion (blood flow within the heart muscle) in patients with coronary artery disease*
Plericixafor Plerixafor	*Stem cell mobilization (CXCR4 antagonist)*
Prevamibril Disodium	*Treament of secondary (AA) amiloidosis*
Rimonabant	*Smoking cessation and anti-obesity*
Rivanicline Galactarate Rovanicline Galactarate	*Treatment of ulcerative colitis*
Seletracetam	*Treatment of epilepsy, neuropathic pain, and essential tremor*
Senitinib Sunitinib	*Treatment of cancer*
Sopasemim Manganese	*Treatment of pain and inflammation (superoxide dismutase mimetic)*
Talamibril Disodium	*Treatment of mild to moderate Alzheimer's disease; treatment of cerebral amyloid angiopathy (antiamyloidotic)*
Talopterin Ammonium	*Antineoplastic*
Tasidotin	*Treatment of advanced, refractory neoplasms*
Valopicitabine	*Treatment of chronic hepatitis C (HCV RNA polymerase inhibitor)*
Volociximab	*Anti-angiogenic agent to treat solid tumors and age-related macular degeneration*

INDEX

This is a cumulative directory for the content of all issues of *PF* beginning with *PF* 31(1).

USP CATALOG

New Items at a Glance

See what's new in USP Reference Standards. For your convenient and quick reference, here's a list of Reference Standards released by USP over the past year.

This list is continuously updated with the newest Reference Standards released within the past 12 months.

Cat. No.	Description	Curr. Lot	Price
1005706	Glacial Acetic Acid (1.5 mL/ampule; 3 ampules) (AS)	F0D002	$162
1012768	Alcohol (1.2 mL/ampule; 5 ampules)	F0D030	$162
1012772	Dehydrated Alcohol (1.2 mL/ampule; 5 ampules)	F0D031	$162
1012699	Alcohol Determination–Acetonitrile (5 mL/ampule; 5 ampules)	F0C419	$162
1012688	Alcohol Determination–Alcohol (5 mL/ampule; 5 ampules)	F0C399	$162
1027302	Amiodarone Hydrochloride (200 mg)	F0D257	$162
1029501	Amlodipine Besylate (200 mg)	F0D167	$162
1029942	Ammonium Carbonate (2 g) (AS)	F0D102	$162
1029986	Ammonium Phosphate Dibasic (1 g) (AS)	F0D104	$162
1048641	Benazepril Related Compound C (50 mg)	F0C425	$506
1071439	Positive Bioreaction (3 strips; 10 cm x 1 cm)	F0D014	$338
1076206	Powdered Black Cohosh Extract (1.5 g)	F0D086	$541
1076341	Boric Acid (1 g) (AS)	F0D036	$208
1082708	Butylated Hydroxytoluene (500 mg) (AS)	F0D122	$162
1086334	Calcium Acetate (1 g) (AS)	F0D156	$162
1086403	Calcium Carbonate (1 g) (AS)	F0D099	$162
1086436	Calcium Chloride (1 g) (AS)	F0D153	$162
1086855	Calcium Hydroxide (1 g) (AS)	F0D168	$162
1087359	Calcium Stearate (2 g) (AS)	F0D255	$162
1087406	Calcium Sulfate (1 g) (AS)	F0D236	$162
1087701	Candelilla Wax (250 mg)	F0D123	$162
1091505	Caprylocaproyl Polyoxylglycerides (200 mg)	F0C312	$182
1098027	Cefpodoxime Proxetil (350 mg)	F0C192	$162
1098322	Cellaburate (350 mg) (Cellulose Acetate Butyrate)	F0D220	$162
1105009	Powdered Chaste Tree Extract (1.5 g)	F0C406	$541
1111307	Chlorhexidine Related Compounds (50 mg)	F0D017	$506
1115545	Chlorogenic Acid (50 mg)	F0C420	$162
1140429	Clonidine Related Compound B (25 mg)	F0C403	$506
1148806	Corn Oil (1 g) (AS)	F0D181	$162
1150207	Cottonseed Oil (1 g) (AS)	F0D173	$162
1179650	Dextran T-10 (200 mg)	F0D238	$162
1187080	Dibutyl Phthalate (200 mg)	F0D125	$162
1187091	Dibutyl Sebacate (1 mL) (AS)	F0D128	$162
1231728	Powdered Echinacea Purpurea Extract (1 g)	F0D018	$541
1231706	Powdered Echinacea Angustifolia Extract (1 g)	F0D019	$541
1269414	Fenbendazole Related Compound A (30 mg)	F0D009	$506
1269425	Fenbendazole Related Compound B (30 mg)	F0D008	$506
1270355	Ferrous Sulfate (1.5 g) (AS)	F0D196	$162
1270377	Fexofenadine Hydrochloride (200 mg)	F0D244	$162
1270388	Fexofenadine Related Compound A (25 mg)	F0D245	$506
1270399	Fexofenadine Related Compound B (25 mg)	F0D246	$506
1271700	Fluconazole (200 mg)	F0D262	$162
1271711	Fluconazole Related Compound A (10 mg)	F0D080	$506
1271722	Fluconazole Related Compound B (10 mg)	F0D081	$506
1288463	Gemcitabine Hydrochloride (200 mg)	F0D037	$162
1305507	2E, 4E-Hexadienoic Acid Isobutylamide (25 mg)	F0C353	$562
1311306	Homopolymer Polypropylene (3 Strips)	F0C096	$162
1335279	Hypromellose Acetate Succinate (100 mg)	F0D275	$162
1356698	Lactase (200 mg)	F0D032	$162
1356734	Lactic Acid (1.5 mL/ampule; 3 ampules) (AS)	F0D027	$162
1356847	Lamivudine Resolution Mixture A (10 mg)	F0D024	$506
1356950	Lauroyl Polyoxylglycerides (500 mg) (AS)	F0D020	$162
1358503	Leuprolide Acetate (200 mg)	F0C430	$1,586
1367708	Linoleoyl Polyoxylglycerides (100 mg)	F0C283	$162
1370280	Loratadine Related Compound A (15 mg)	F0D229	$506
1370291	Loratadine Related Compound B (15 mg)	F0D230	$506
1370462	Losartan Potassium (250 mg)	F0D287	$162
1374226	Magnesium Carbonate (2 g) (AS)	F0D256	$162
1374248	Magnesium Chloride (1 g) (AS)	F0D157	$162
1374260	Magnesium Hydroxide (1 g) (AS)	F0D158	$162
1374340	Magnesium Stearate (5 g) (AS)	F0D214	$162
1374361	Magnesium Sulfate (1 g) (AS)	F0D160	$162
1375069	Mangafodipir Trisodium (200 mg)	F0D272	$162
1375070	Mangafodipir Related Compound A (15 mg)	F0D266	$506
1375080	Mangafodipir Related Compound B (15 mg)	F0D267	$506
1375127	Manganese Chloride (1 g) (AS)	F0D150	$162
1375149	Manganese Sulfate (1 g) (AS)	F0D151	$162
1378012	Medroxyprogesterone Acetate Related Compound A (25 mg)	F0C427	$520
1434011	Methylphenidate Hydrochloride Erythro Isomer Solution **CII** (0.5 mL)	F0C368	$582
1441298	Metoprolol Succinate (200 mg)	F0C415	$162
1444279	Mirtazapine (350 mg)	F0D155	$832
1445211	Mitoxantrone System Suitability Mixture (0.3 mg)	F0D010	$520

New Items at a Glance (*Continued*)

Cat. No.	Description	Curr. Lot	Price
1449530	Nabumetone Related Compound A (15 mg)	F0D165	$506
1457469	Naratriptan Hydrochloride (125 mg)	F0C360	$216
1460703	Nevirapine Anhydrous (100 mg)	F0D159	$162
1460714	Nevirapine Hemihydrate (100 mg)	F0D034	$162
1460725	Nevirapine Related Compound A (15 mg)	F0D035	$506
1460736	Nevirapine Related Compound B (15 mg)	F0D033	$506
1478152	Oleoyl Polyoxylglycerides (100 mg)	F0C313	$162
1478254	Olive Oil (1 g) (AS)	F0D175	$162
1478630	Ondansetron Resolution Mixture (50 mg)	F0D242	$506
1485125	Oxybutynin Related Compound B (20 mg)	F0D061	$506
1485136	Oxybutynin Related Compound C (20 mg)	F0D062	$506
1492040	Palm Oil (1 g) (AS)	F0D179	$162
1500262	Paroxetine Related Compound E Mixture (25 mg)	F0D225	$506
1500273	Paroxetine Related Compound F (10 mg)	F0D237	$506
1500284	Paroxetine Related Compound G (10 mg)	F0D110	$506
1500557	Peanut Oil (1 g) (AS)	F0D171	$162
1525707	Phenothiazine (500 mg) (AS)	F0D231	$162
1526200	Phenoxyethanol (500 mg)	F0D069	$162
1547925	Polysorbate 20 (2 g) (AS)	F0D130	$162
1547936	Polysorbate 40 (2 g) (AS)	F0D204	$162
1547947	Polysorbate 60 (2 g) (AS)	F0D131	$162
1547969	Polysorbate 80 (2 g) (AS)	F0D132	$162
1548101	Potassium Benzoate (1 g) (AS)	F0D161	$162
1548134	Potassium Bicarbonate (1 g) (AS)	F0D074	$162
1548167	Potassium Carbonate (1 g) (AS)	F0D075	$162
1548190	Potassium Chloride (1 g) (AS)	F0D127	$162
1548280	Potassium Iodide (1 g) (AS)	F0D078	$162
1548407	Potassium Sorbate (1 g) (AS)	F0D264	$162
1572208	Propionic Acid (1.5 mL/ampule; 3 ampules) (AS)	F0D029	$162
1601102	Residual Solvents Mixture - Class 1 (1.2 mL/ampule; 3 ampules)	F0C407	$162
1601146	Residual Solvent Class 1 - Benzene (1.2 mL/ampule; 3 ampules)	F0C408	$162
1601168	Residual Solvent Class 1 - Carbon Tetrachloride (1.2 mL/ampule; 3 ampules)	F0C409	$162
1601180	Residual Solvent Class 1 - 1,2-Dichloroethane (1.2 mL/ampule; 3 ampules)	F0C412	$162
1601204	Residual Solvent Class 1 - 1,1-Dichloroethene (1.2 mL/ampule; 3 ampules)	F0C411	$162
1601226	Residual Solvent Class 1 - 1,1,1-Trichloroethane (1.2 mL/ampule; 3 ampules)	F0C410	$162
1601281	Residual Solvents Class 2 - Mixture A (1.2 mL/ampule; 3 ampules)	F0D051	$162
1601306	Residual Solvent Class 2 - Mixture C (1.2 mL/ampule; 3 ampules)	F0D182	$162
1601340	Residual Solvent Class 2 - Acetonitrile (1.2 mL/ampule; 3 ampules)	F0D049	$162
1601361	Residual Solvent Class 2 - Chlorobenzene (1.2 mL/ampule; 3 ampules)	F0D048	$162
1601383	Residual Solvent Class 2 - Chloroform (1.2 mL/ampule; 3 ampules)	F0D186	$162
1601408	Residual Solvent Class 2 - Cyclohexane (1.2 mL/ampule; 3 ampules)	F0D047	$162
1601420	Residual Solvent Class 2 - 1,2-Dichloroethene (1.2 mL/ampule; 3 ampules)	F0D040	$162
1601463	Residual Solvent Class 2 - 1,2-Dimethoxyethane (1.2 mL/ampule; 3 ampules)	F0D185	$162
1601485	Residual Solvent Class 2 - N,N-Dimethylacetamide (1.2 mL/ampule; 3 ampules)	F0D169	$162
1601500	Residual Solvent Class 2 - N,N-Dimethylformamide (1.2 mL/ampule; 3 ampules)	F0D189	$162
1601521	Residual Solvent Class 2 - 1,4-Dioxane (1.2 mL/ampule; 3 ampules)	F0D050	$162
1601543	Residual Solvent Class 2 - 2-Ethoxyethanol (1.2 mL/ampule; 3 ampules)	F0D195	$162
1601565	Residual Solvent Class 2 - Ethylene Glycol (1.2 mL/ampule; 3 ampules)	F0D191	$162
1601587	Residual Solvent Class 2 - Formamide (1.2 mL/ampule; 3 ampules)	F0D188	$162
1601623	Residual Solvent Class 2 - Methanol (1.2 mL/ampule; 3 ampules)	F0D045	$162
1601645	Residual Solvent Class 2 - 2-Methoxyethanol (1.2 mL/ampule; 3 ampules)	F0D194	$162
1601667	Residual Solvent Class 2 - Methylbutylketone (1.2 mL/ampule; 3 ampules)	F0D202	$162
1601689	Residual Solvent Class 2 - Methylcyclohexane (1.2 mL/ampule; 3 ampules)	F0D044	$162
1601441	Residual Solvent Class 2 - Methylene Chloride (1.2 mL/ampule; 3 ampules)	F0D046	$162
1601703	Residual Solvent Class 2 - N-Methylpyrrolidone (1.2 mL/ampule; 3 ampules)	F0D183	$162
1601725	Residual Solvent Class 2 - Nitromethane (1.2 mL/ampule; 3 ampules)	F0D210	$162
1601747	Residual Solvent Class 2 - Pyridine (1.2 mL/ampule; 3 ampules)	F0D215	$162
1601769	Residual Solvent Class 2 - Sulfolane (1.2 mL/ampule; 3 ampules)	F0D187	$162
1601770	Residual Solvent Class 2 - Tetrahydrofuran (1.2 mL/ampule; 3 ampules)	F0D043	$162
1601780	Residual Solvent Class 2 - Tetralin (1.2 mL/ampule; 3 ampules)	F0D228	$162
1601805	Residual Solvent Class 2 - Toluene (1.2 mL/ampule; 3 ampules)	F0D042	$162

New Items at a Glance (*Continued*)

Cat. No.	Description	Curr. Lot	Price
1601827	Residual Solvent Class 2 - Trichloroethylene (1.2 mL/ampule; 3 ampules)	F0D221	$162
1601849	Residual Solvent Class 2 - Xylenes (1.2 mL/ampule; 3 ampules)	F0D041	$162
1612594	Sevoflurane Related Compound C (0.2 mL)	F0D142	$506
1613407	Sodium Acetate (1 g) (AS)	F0D083	$162
1613655	Sodium Bicarbonate (3 g) (AS)	F0D235	$162
1613757	Sodium Carbonate Anhydrous (1 g) (AS)	F0D100	$162
1613804	Sodium Chloride (1 g) (AS)	F0D269	$162
1613859	Sodium Citrate (1 g) (AS)	F0D172	$162
1614396	Sodium Metabisulfite (1 g) (AS)	F0D111	$162
1614454	Sodium Nitrite (1 g) (AS)	F0D117	$162
1614807	Sodium Sulfate Anhydrous (1 g) (AS)	F0D112	$162
1615107	Sodium Thiosulfate (1 g) (AS)	F0D178	$162
1667585	Titanium Dioxide (1 g) (AS)	F0D079	$162
1670207	Tolcapone (200 mg)	F0D280	$162
1670218	Tolcapone Related Compound A (25 mg)	F0D282	$506
1708762	Valsartan (350 mg)	F0C147	$162
1724747	Zinc Oxide (2 g) (AS)	F0D170	$162
1724769	Zinc Sulfate (1 g) (AS)	F0D133	$162

USING USP REFERENCE STANDARDS

Official Reference Standards

USP Reference Standards are required for use in pharmacopeial assays and tests in the official standards publication, the *United States Pharmacopeia–National Formulary* (*USP–NF*). USP Reference Standards help to ensure compliance with the official, FDA-enforceable quality requirements in the *USP–NF*. The Reference Standards also lend themselves to many other applications, including measurements required to attain accurate and reproducible results in modern chromatographic and spectrophotometric methods.

Rigorous Testing and Quality Control

USP Reference Standards are selected for their high purity, critical characteristics, and suitability for the intended purpose. Unless a USP Reference Standard label states a specific potency or content, the USP Reference Standard is taken as being 100% pure for the USP purposes for which it is provided. As a service to our customers, labeled purity values for Reference Standards and Authentic substances released after January 1, 2004 are listed in this catalog. See p. 7 for explanation of how values are calculated.

Heterogeneous substances, of natural origin, are also designated ''Reference Standards'' where needed. Usually these are the counterparts of international standards.

USP Reference Standards are established through a process of rigorous testing, evaluation, and quality control. They are independently tested in three or more laboratories—USP, FDA, and academic and industrial laboratories throughout the United States. The Reference Standards are released under the authority of USP's Board of Trustees, on the recommendation of the USP Reference Standards Expert Committee, which approves selection and suitability of each lot.

Reference Standards Categories

USP offers more than 1,660 Reference Standards for pharmaceuticals, excipients, and dietary supplements. On pages 8–57 of this catalog, you'll find a full list of available USP and NF Reference Standards, with information updated through October 2004. The list includes:

- Reference Standards required by the current official edition of *USP–NF*.
- Reference Standards not required in the current *USP–NF*, but for which sufficient demand remains.
- Reference Standards specified in the current edition of the Food Chemicals Codex (FCC).
- Authentic Substances (AS)—highly purified samples of chemicals, including substances of abuse, required by analytical, clinical, pharmaceutical, and research laboratories.

The distribution of controlled substances is subject to the regulations and licensing provisions of the Drug Enforcement Administration (DEA) of the U.S. Department of Justice.

USP also collaborates with the World Health Organization in its program to provide international biological standards and chemical reference materials for antibiotics, biologicals, and chemotherapeutic agents. Some USP Reference Standards are standardized in terms of the corresponding international standards.

Proper Use of USP Reference Standards

USP Reference Standards are provided primarily for quality control use in conducting the pharmacopeial assays and tests described in the *USP–NF*. Neither Reference Standards nor Authentic Substances are intended for use as drugs, dietary supplements, or medical devices.

To serve its intended purpose, each USP Reference Standard must be properly stored, handled, and used. Users of USP Reference Standards should refer to General Chapter ⟨11⟩ in the *USP–NF*:

Listing and directions in USP–NF

- Refer to the list of revisions, additions, and deletions of individual USP Reference Standards in *USP 28–NF 23*. Individual *USP* or *NF* monographs specify the USP Reference Standard(s) required for assay and test procedures. The *USP 28–NF 23* General Test Chapter ⟨11⟩ USP Reference Standards provides additional information and instructions for proper use and storage. Note that if specific instructions for use appearing on the label of a USP Reference Standard differ from the instructions in Chapter ⟨11⟩, the instructions on the label take precedence.
- Consult the cumulative updates to Reference Standards information provided in *USP–NF Supplements* and also in *USP–NF* Interim Revision Announcements, which are published in USP's bimonthly journal, *Pharmacopeial Forum*.

Suitability for use

- The user must ascertain that the Reference Standards they are using are an official lot.

USING USP REFERENCE STANDARDS

- The user must determine the suitability of Reference Standards for applications and uses not in the *USP–NF*.

Storing

- Ensure that the USP Reference Standards are stored in their original stoppered containers, according to any special label directions, away from heat and humidity, and protected from light.

Weighing

- Ensure that Reference Standard substances are accurately weighed—taking due account of relatively large errors potentially associated with weighing small masses—where it is directed that a standard solution or a standard preparation be prepared for a quantitative determination. See *USP 28–NF 23* General Chapters ⟨41⟩ *Weights and Balances* and ⟨31⟩ *Volumetric Apparatus*, and *USP–NF* General Notices, for information regarding appropriate use of USP Reference Standards.

Drying

- Use a clean and dry vessel, and not the original container, as the drying vessel where a USP Reference Standard is required to be dried before use.
- Make sure not to dry a specimen repeatedly at temperatures above 25 degrees.
- Follow any special drying requirements specified on the Reference Standards label or in specific sections of *USP* or *NF* monographs (note that any specific instructions on the label or in the monograph supersede the usual instructions in Procedures under Tests and Assays in *USP–NF* General Notices).
- Follow Method I under *USP–NF* General Chapter ⟨921⟩ *Water Determination* where the titrimetric determination of water is required at the time a Reference Standard is to be used. Instrumental or microanalytical methods are acceptable for this purpose. When using typical amounts, users must titrate about 50 mg of the Reference Standard with a fourfold dilution of the reagent.

USING USP REFERENCE STANDARDS

Official Reference Standards

USP Reference Standards are required for use in pharmacopeial assays and tests in the official standards publication, the *United States Pharmacopeia–National Formulary* (*USP–NF*). USP Reference Standards help to ensure compliance with the official, FDA-enforceable quality requirements in the *USP–NF*. HOW TO READ PRODUCT LISTINGS

Column 1 (Catalog Number): Catalog number currently assigned to each Reference Standard and Authentic Substance. ***Please include this number in your orders.***

Column 2 (Description): Product description as designated in *USP–NF*, the product label, and / or the Drug Enforcement Administration Control Schedule, as applicable. The quantity of material per container follows the name in parentheses (all materials are in single containers unless otherwise specified).

Column 3 (Current Lot): Current lot designation of each ***official*** item being distributed as of the date of this catalog. If the current lot is blank, the item is not in distribution.

Column 4 (Purity Values) Assigned purity value as it appears on the RS or AS label. Code interpretations for the basis of purity assignments are as follows:

Basis Code	Interpretation
(ai)	as is
(dr)	dried
(an)	anhydrous
(fb)	free base
(ig)	ignited

Column 5 (Change Code): Codes that identify any change in USP Reference Standards status or information since the **Nov.–Dec. 2004,** official Catalog. Code interpretations are as follows:

Change Code	Interpretation
1	New Reference Standard
2	New lot
3	Change in package size or description
4	Correction of typographical error
5	New catalog number—use for all orders
6	Previous lot no longer official; only current lot to be used
7	Valid use date of previous lot extended
8	Change in catalog number and / or name, see cross-reference section
9	Discontinued

Column 6 (Previous Lot/Valid Use Date): Lot designations for recent lots no longer being distributed. The indicated month and year in parenthesis indicates the date (last day of the month) through which that lot was valid as an official USP Reference Standard. (e.g. "F-1 (06/00)" means lot F-1 is no longer being distributed, but was considered official through June 30, 2000.)

Column 7 (CAS Number)*: Chemical Abstracts Service number, when available, for USP Reference Standards and Authentic Substances. In case of mixtures, typically, the CAS number of the analyte of interest is listed.

Column 8 (Price) List price of the reference standard.

* CAS numbers are provided for informational purposes only and their listing in the USP Reference Standards Catalog does not indicate official designation of any CAS number to a salt, isomer, hydration state, or other chemical form of any specific Reference Standard or Authentic Substance.

New Lots in Distribution

Cat. No.	Description	Curr. Lot.	Purity Value/Conc.	Change Code*	Previous Lot/Valid Use Date	CAS No.	Price
1027302	Amiodarone Hydrochloride (200 mg)	F0D257	0.995 mg/mg (ai)	1		[19774-82-4]	$162
1029986	Ammonium Phosphate Dibasic (1 g) (AS)	F0D104	100.0 % (ai)	1		[7783-28-0]	$162
1087359	Calcium Stearate (2 g) (AS)	F0D255	9.8% CaO (ai)	1		[1592-23-0]	$162
1179650	Dextran T-10 (200 mg)	F0D238	1.000 mg/mg (dr)	1		[9004-54-0]	$162
1187091	Dibutyl Sebacate (1 mL)	F0D128	99.2% (ai)	1		[109-43-3]	$162
1270377	Fexofenadine Hydrochloride (200 mg)	F0D244	0.996 mg/mg (ai)	1		[138452-21-8]	$162
1270388	Fexofenadine Related Compound A (25 mg) (4-[1-oxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]-butyl]-alpha,alpha-dimethyl benzeneacetic acid)	F0D245	0.99 mg/mg (ai)	1		n/f	$506
1270399	Fexofenadine Related Compound B (25 mg) (3-[1-hydroxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]butyl]-alpha,alpha-dimethyl benzeneacetic acid hydrochloride)	F0D246		1		n/f	$506
1271700	Fluconazole (200 mg)	F0D262	1.00 mg/mg (ai)	1		[86386-73-4]	$162
1271711	Fluconazole Related Compound A (10 mg) (2-[2-fluoro-4-(1H-1,2,4-triazol-1-yl)phenyl]-1,3-bis(1H-1,2,4-triazol-1-yl)-propan-2-ol)	F0D080	0.95 mg/mg (ai)	1		n/f	$506
1271722	Fluconazole Related Compound B (10 mg) (2-(4-fluorophenyl)-1,3-bis(1H-1,2,4-triazol-1-yl)-propan-2-ol)	F0D081	0.92 mg/mg (ai)	1		[81886-51-3]	$506
1335279	Hypromellose Acetate Succinate (100 mg)	F0D275		1		[71138-97-1]	$162
1356734	Lactic Acid (1.5 mL/ampule; 3 ampules) (AS)	F0D027	88.5% (ai)	1		[50-21-5]	$162
1370462	Losartan Potassium (250 mg)	F0D287	0.998 mg/mg (ai)	1		[124750-99-8]	$162
1374226	Magnesium Carbonate (2 g) (AS)	F0D256	41.8% MgO (ai)	1		[546-93-0]	$162
1374340	Magnesium Stearate (5 g) (AS)	F0D214	65% Stearate 29% Palmitate 4.8% Mg (ai)	1		[577-04-0]	$162
1375069	Mangafodipir Trisodium (200 mg)	F0D272	0.996 mg/mg (an)	1		[140678-14-4]	$162
1375070	Mangafodipir Related Compound A (15 mg) (manganese (II) dipyridoxyl monophosphate sodium salt)	F0D266		1		n/f	$506
1375080	Mangafodipir Related Compound B (15 mg) (manganese (II) dipyridoxyl diphosphate mono-overalkylated sodium salt)	F0D267		1		n/f	$506
1478254	Olive Oil (1 g) (AS)	F0D175		1		[8001-25-0]	$162
1500557	Peanut Oil (1 g) (AS)	F0D171		1		[8002-03-7]	$162
1526200	Phenoxyethanol (500 mg)	F0D069	0.998 mg/mg (ai)	1		[122-99-6]	$162
1548407	Potassium Sorbate (1 g) (AS)	F0D264	99.6% (dr)	1		[24634-61-5]	$162
1612594	Sevoflurane Related Compound C (0.2 mL) (1,1,1,3,3,3-hexafluoro-2-propanol)	F0D142	1.00 mg/mg (ai)	1		[920-66-1]	$506
1613655	Sodium Bicarbonate (3 g) (AS)	F0D235	99.7% (dr)	1		[144-55-8]	$162
1613804	Sodium Chloride (1 g) (AS)	F0D269	100.0% (ai)	1		[7647-14-5]	$162
1670207	Tolcapone (200 mg)	F0D280	0.999 mg/mg (ai)	1		[134308-13-7]	$162
1670218	Tolcapone Related Compound A (25 mg) (4'-methyl-3,4-dihydroxybenzophenone)	F0D282		1		n/f	$506
1021000	Aminocaproic Acid (200 mg)	G0D101	0.997 mg/mg (dr)	2	F-4 (09/05)	[60-32-2]	$162
1059003	Benzphetamine Hydrochloride **CIII** (200 mg) (AS)	F2C272		2	F-1 (10/05)	[5411-22-3]	$215
1068004	Betamethasone Sodium Phosphate (500 mg)	K0C358	0.993 mg/mg (an)	2	J0B043 (06/05) I-1 (02/03) I (01/01)	[151-73-5]	$162

NOTICE TO THE EXECUTIVE SECRETARIAT OF INTENT TO COMMENT

Date _____

Mail to: Executive Secretariat, USP–NF
12601 Twinbrook Parkway
Rockville, MD 20852

Title(s)	With Reference to the Proposal(s) in *Pharmacopeial Forum:* Vol.	No.	Page(s)	Estimated Date of Sending Comments*

I am unable to comment at present, but please be informed of my intent to comment later, as indicated above.

Name _____
(Please type or print)

Company _____

Address _____

_____

_____

Telephone No. ( ) _____
(area code)

*NOTE—Specifying date(s) when you expect to submit comments to the Executive Secretariat will not necessarily result in a deferment of the implementation of the proposal(s) referred to.

[*Please fold before mailing.*]

CHROMATOGRAPHIC REAGENTS USED IN *USP–NF* AND *PHARMACOPEIAL FORUM*

This is an update based on the proposals published in this issue of *PF*.

Chromatographic Reagents Used in *USP–NF* and *Pharmacopeial Forum*

January–February 2005

GABAPENTIN

DSD Mgh #34587

PF	LGS#	Reagent Brand	Type of Test	Comments
31(1)	L1	Luna C18	Assay and Related Compounds	Test 1, Method 1 and Method 2: 25 cm x 4.6 mm, 5 µm, manufacturer Phenomenex.
31(1)	L7	Symmetry C8	Related compounds	Test 2: 25 cm x 4.6 mm, 5 µm, manufacturer Waters Corp.

ISOMALT

DSD Mgh #781

PF	LGS#	Reagent Brand	Type of Test	Comments
31(1)	L19	Aminex Carbohydrate HPX-87	Assay and Related Compounds	Analytical column 7.8 mm x 30 cm, guard column 4.6 mm x 3 cm, manufacturer BioRad.

OXANDROLONE TABLETS

DSD Mgh #59140

PF	LGS#	Reagent Brand	Type of Test	Comments
31(1)	G27	Rtx-5 Amine	Dissolution	0.53 mm x 30 m, 0.5 µm, manufacturer Restek.

TIAMULIN

DSD Mgh #1136

PF	LGS#	Reagent Brand	Type of Test	Comments
31(1)	G16	HP-INNOWax	Limit of	Limit of alcohol and toluene. 0.53 mm x 30 m, 1.0 µm film, manufacturer Agilent.
31(1)	L1	Supelcosil LC-18-DB	Assay and Related Compounds	4.6 mm x 15 cm, 5 µm, manufacturer Supelco. Alternative column Polaris C18-A, same dimensions, manufacturer Metachem Technologies.

Fax: 1-301-816-8373
http://www.usp.org

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI),* in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences.*

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

ISSN: 0363-4655

Printed in Canada by Webcom Limited, Toronto, Ontario

STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum* (*PF*), for the development of official pharmaceutical standards.

USP publishes *Pharmacopeial Forum* (*PF*) bimonthly as the working vehicle of the USP Council of Experts. *PF* provides interested parties an opportunity to review and comment as the Council of Experts develops or revises standards for the *United States Pharmacopeia* and the *National Formulary* (*USP–NF*).

PF includes the following:

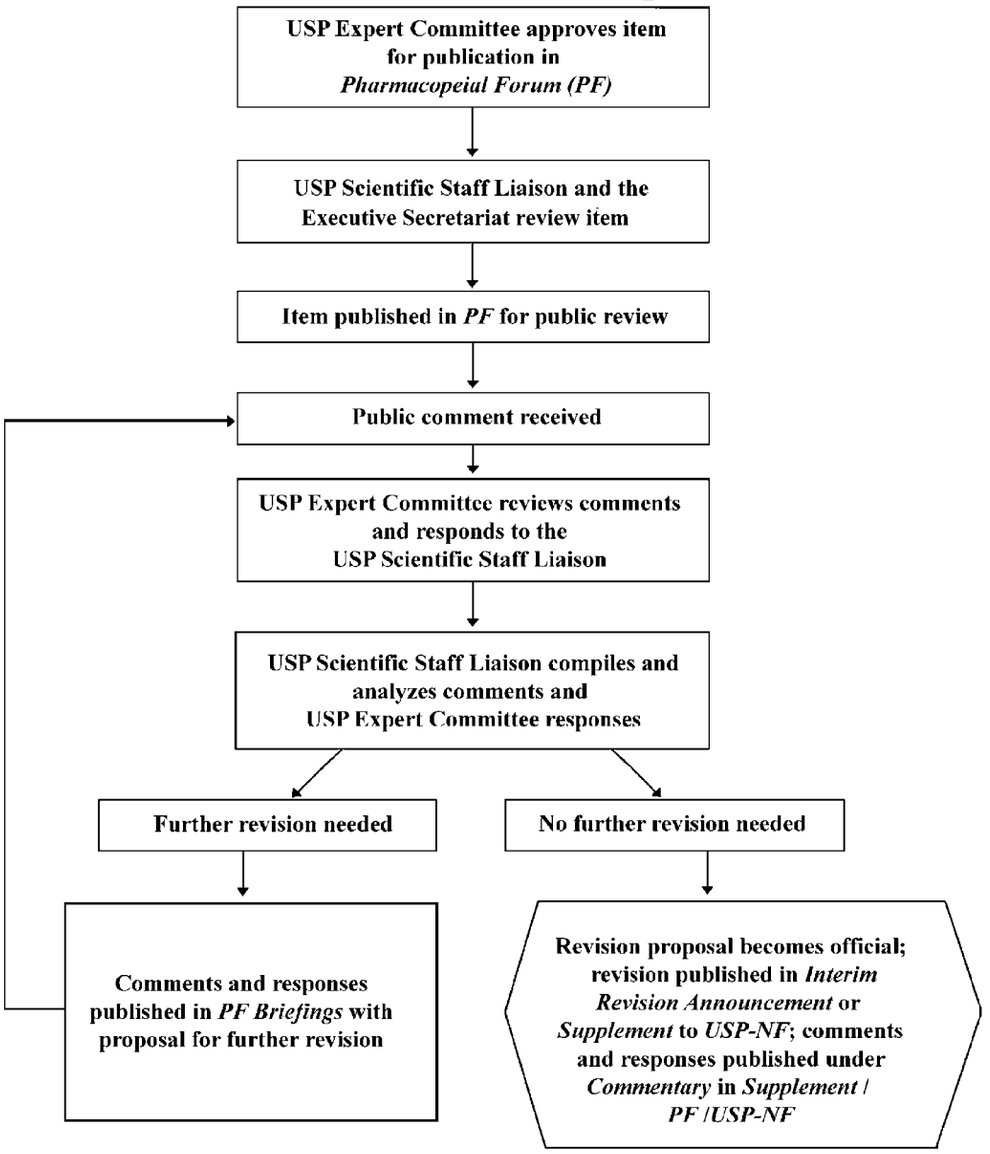
1. Potential revisions—entirely new standards, revision ideas, and drafts not yet targeted for official adoption (*Pharmacopeial Previews*)
2. Proposed revisions—new or revised standards targeted for official adoption (*In-Process Revision*)
3. Adopted revisions—new or revised standards that become official and binding before the publication of the next *USP–NF* or *Supplement* (*Interim Revision Announcement*)

USP welcomes comments and data on potential, proposed, or official standards.* Comments, along with USP's responses, will be published either in *PF Briefings*, the *Commentary* section of *PF*, the *Commentary* section of *Supplements* to *USP–NF*, or the *Commentary* section of *USP–NF*.

* If you are not immediately able to submit comments but you intend to do so, please notify USP by using the Intent to Comment form provided before the section *Chromatographic Reagents Used in USP–NF and PF*.

The chart below shows the public review and comment process and its relationship to standards development.

Public Review and Comment Process for Standards Development



Questions on the process should be addressed to John W. Gasper, M.A., J.D., Director, Office of the Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: jg@usp.org).

HOW TO USE *PF*

This section provides descriptions of the various parts of *PF*. It also includes *Committee Designations* and the *Staff Directory.*

The contents of the different sections of *PF* are briefly described below. Readers will get an idea of how each section is relevant to their job functions. They may contact USP scientific staff liaisons or staff members of the Executive Secretariat (listed in the *Staff Directory*) if they have any questions. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a Request for Revision is available on the USP website (www.usp.org/standards/revisionguideline/).

Proposed and Adopted Revisions

Section	Content	How Readers Can Respond
Pharmacopeial Previews Early ideas for revisions	•BRIEFING: Scientific rationale for potential inclusion or change. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •Potential revisions not yet targeted for official adoption that require a longer public review and comment process because of issues such as: — the controversial nature of an item; — the application of new technologies that require further study; and — articles produced by multiple sources.	Review drafts and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview.*
In-Process Revision Revisions targeted for adoption	•BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see *Standards Development*). New or revised text is marked with symbols (■▪ or •▲ or ▲•) to specify the tentative earliest date on which the revision would be officially adopted.	Review material and send comments promptly to USP staff liaison (see the *Staff Directory*). Guidelines on how to comment are found at the end of the *Policies and Announcements* section.
Harmonization Items the Pharmacopeial Discussion Group (PDG) is trying to harmonize internationally	•BRIEFING: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. The stage determines whether an item appears under *Pharmacopeial Previews* or under *In-Process Revision*, both separate sections of *Harmonization.* •For *In-Process Revision*, new or revised text is marked with symbols (■▪) to specify the tentative, earliest date on which the revision would be officially adopted.	Review material and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview* or *In-Process Revision.*
Interim Revision Announcement Adopted standards	Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols •▪.	Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance.

Other Sections

Committee Designations
Names of the committees (composed of volunteer scientific experts) that USP staff work with on the development of standards.

Staff Directory
Names of all USP scientific staff liaisons with contact information.

Policies and Announcements
- General scientific and policy issues affecting *USP–NF* standards and processes
- Update on standards-related issues being considered by USP
- Summaries of meetings of the Council of Experts
- Guidelines on how to comment
- Publication and comment schedules

Stimuli to the Revision Process
- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

Nomenclature
- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the *USP Dictionary of USAN and International Drug Names*
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

Index
Cumulative directory for the content of all issues of *PF* beginning with *PF* 31(1).

Reference Standards Catalog
List of official USP Reference Standards specified in *USP–NF*, along with availability and ordering information.

Chromatographic Reagents Used in USP–NF* and *Pharmacopeial Forum
Update of chromatographic reagents based on the proposals published in this issue of *PF*.

EXPERT COMMITTEE DESIGNATIONS*

The names of the Committees and their abbreviations are as follows:

AER	Aerosols
AMB	Analytical Microbiology
BBP	Blood and Blood Products
BNA	Bioavailability and Nutrient Absorption
BNT	Biotechnology and Natural Therapeutics and Diagnostics
BPC	Biopharmaceutics
BST	Biostatistics
CRX	Compounding Pharmacy
DSB	Dietary Supplements—Botanicals
DSI	Dietary Supplements—Information
DSN	Dietary Supplements—Non-Botanicals
EMC	Excipient Monograph Content
ETM	Excipients—Test Methods
GCT	Gene Therapy, Cell Therapy, and Tissue Engineering
GTB	General Toxicity and Biocompatibility
NL	Nomenclature and Labeling
PA1	Pharmaceutical Analysis 1
PA2	Pharmaceutical Analysis 2
PA3	Pharmaceutical Analysis 3
PA4	Pharmaceutical Analysis 4
PA5	Pharmaceutical Analysis 5
PA6	Pharmaceutical Analysis 6
PA7	Pharmaceutical Analysis 7a—Antibiotics; 7b—Antimicrobials and Antivirals
PDF	Pharmaceutical Dosage Forms
PPC	Parenteral Products—Compounding and Preparation
PPI	Parenteral Products—Industrial
PSD	Packaging, Storage, and Distribution
PW	Pharmaceutical Waters
RMI	Radiopharmaceuticals and Medical Imaging
SMU	Safe Medication Use
VET	Veterinary Drugs
VVI	Vaccines, Virology, and Immunology

* **HDQ** Indicates USP Headquarters items.

STAFF DIRECTORY

This is an updated directory that reflects assignment changes based on the reorganization of USP. The general USP telephone number, (301) 881-0666, may still be used for general inquiries or when a particular Committee is not identified. The Fax number is (301) 816-8373.

STAFF	E-MAIL	PHONE	ASSIGNMENT
Clydewyn M. Anthony, Scientist	cma@usp.org	(301) 816-8139	Pharmaceutical Analysis 1 (PA1)

POLICIES AND ANNOUNCEMENTS

In this section, readers may find statements about general scientific and policy issues that may have an impact on *USP–NF* standards and processes, announcements about issues being considered by USP, and summaries of Council of Experts meetings. This section also includes publication and comment schedules.

In Memoriam

Charles H. Barnstein, Ph.D.

With great sadness USP notes the death of Charles H. Barnstein, Ph.D. Charlie served more than 35 years as a USP staff member. His name is synonymous with the highest standards of USP because for years he was involved directly in the publication of the *United States Pharmacopeia* and the *National Formulary* (*USP–NF*), *Pharmacopeial Forum,* and the *USP Dictionary of Drug Names* and was involved with the United States Adopted Names (USAN) Council for many years. Dr. Barnstein served as a respected mentor to several generations of USP staff, imparting his scientific and technical knowledge and his rigorous editorial expertise to the development and production of USP publications. He was a member of the *National Formulary* (*NF*) staff at the American Pharmaceutical Association (now American Pharmacists Association). When the *NF* was purchased by USP in 1975, he joined USP staff. Dr. Barnstein officially retired from USP in 2000, but USP retained his invaluable expertise as a consultant in the area of nomenclature and labeling, and he continued to serve as a USP observer on the USAN Council. His dedication to *USP–NF,* to the Committee of Revision/Council of Experts, and to the Expert Committees was exemplary and serves as a model for anyone involved with USP. His passing leaves a void that will be very difficult to fill.

ADVANCE NOTICE OF UPCOMING OFFICIAL REVISIONS TO THE *USP–NF.* In order to provide as much time as possible for industry to adopt revisions made to the compendia, upcoming official revisions to the *USP–NF* are now being announced on the USP website as soon as they are voted on to become official by the appropriate Expert Committees of the Council of Experts. Readers are directed to the "Notices" section found in the top right corner of the USP homepage at www.usp.org. By clicking on "Upcoming Official Revisions to the *USP–NF:* Reference Standards Required But Not Available" you are taken to a page where upcoming revisions to the compendia are listed. The information posted includes the title of the item being revised, the *PF* citation where the revision was proposed, and a description of the proposal. In addition, an e-mail link to the USP Scientific Liaison for each revision is listed in parentheses after the item. The actual content and official date of each revision will be published in either an annual edition, *Supplement,* or *Interim Revision Announcement* and the items are sorted according to the publication in which they are to appear.

In addition, readers will also find a list of new USP Reference Standards that correspond to new *USP–NF* monographs but unfortunately are not yet available. The official dates of any *USP–NF* Standards, tests, or assays that require the use of these Standards are postponed until further notice pending availability of the Standards.

USP GUIDELINE FOR SUBMITTING REQUESTS FOR REVISION TO THE *USP–NF.* We are pleased to announce the availability of the *USP Guideline for Submitting Requests for Revision to the USP–NF.* This document was developed in conjunction with the USP Council of Experts and its Expert Committees, USP staff, and the Drug Substance, Complex Actives, and Excipients Project Teams of the Prescription/Nonprescription Stakeholders Forum. This document includes information to aid submission of new monographs and revisions to existing monographs for Non-Complex Active Substances and Products, Biological and Biotech Substances and Products, Excipients, and Vaccines. It incorporates many of the concepts and suggestions included in the ICH Q3A, Q3B, Q3C, Q6A, and Q6B guidelines. These include the definition of a specification and incorporate much of the terminology of Q3A for the control of impurities. The guideline clearly defines the information needed for the USP's Council of Experts and its Expert Committees to evaluate a request for revision. The document is approximately 75 pages in length with about 25 pages of addenda and is available in PDF format from the USP website at www.usp.org. Hard copies will be provided upon request.

PHARMACOPEIAL EDUCATION COURSES. USP's Pharmacopeial Education series has been developed to enhance the knowledge, skills, and expertise of pharmaceutical industry personnel.

The following list indicates tentatively scheduled course dates. For further information, contact Laura A. McCurry, Manager, Pharmacopeial Education, lam@usp.org, 301-816-8285; Diana Lenahan, Program Associate, dpl@usp.org, 301-816-8530; or visit the website at www.usp.org/education to register. Call 301-816-8530 to get information on customized courses offered at USP or at your site.

Calendar of Pharmacopeial Education Courses, 2005

Date	Name of Course	Location
March 15	Standards 100: Fundamentals of the Use of *USP–NF* and the Standards Development Process	USP Headquarters, Rockville, MD
March 16	Standards 101: Advanced Use of *USP–NF,* General Notices, and Monograph Chapters	USP Headquarters, Rockville, MD
March 22 and 23	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
April 11	Basic Statistics and Their Practical Applications to the USP	USP Headquarters, Rockville, MD
May 18	Analytical Method Validation	USP Headquarters, Rockville, MD
July 18 and 19	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
August 12	Fundamentals of Microbiological Testing	USP Headquarters, Rockville, MD
August 17	Analytical Method Validation	USP Headquarters, Rockville, MD
August 18	Standards 100: Fundamentals of the Use of *USP–NF* and the Standards Development Process	USP Headquarters, Rockville, MD
August 19	Standards 101: Advanced Use of *USP–NF,* General Notices, and Monograph Chapters	USP Headquarters, Rockville, MD
October 19 and 20	Fundamentals of Dissolution	USP Headquarters, Rockville, MD
December 7	Standards 100: Fundamentals of the Use of *USP–NF* and the Standards Development Process	USP Headquarters, Rockville, MD
December 8	Standards 101: Advanced Use of *USP–NF,* General Notices, and Monograph Chapters	USP Headquarters, Rockville, MD

VISIT THE USP WEB SITE AT ⟨http://www.usp.org⟩. Various resources related to Pharmacopeial standards are presented, including highlights from *PF.*

***USP–NF* AVAILABLE IN THREE ELECTRONIC FORMATS.** The trusted reference for official pharmaceutical standards is available in three convenient electronic formats—CD, intranet, and online. The CD is ideal for single users who prefer to have *USP–NF* on their hard drives. The intranet format allows Web browser-based access to multiple users within a company, through their own intranet server. The online format can be accessed by individual registered users through the World Wide Web. All three electronic formats provide fast and easy access to official *USP–NF* content. More information can be obtained by visiting www.usp.org/products or by calling USP's Customer Service Department at 1-800-227-8772 or 301-881-0666.

***CHROMATOGRAPHIC REAGENTS* NOW AVAILABLE.** *Chromatographic Reagents* lists the brand names of the column reagents cited in every proposal for new or revised gas- or liquid-chromatographic test methods that has been published in *Pharmacopeial Forum* (*PF*) since 1980. *Chromatographic Reagents* also helps to track which column reagents were used to validate methods that have become official and are included in *USP–NF.* The branded column reagents list is updated bimonthly through *Pharmacopeial Forum. Chromatographic Reagents* can be ordered by calling USP's Customer Service Department at 1-800-227-8772 or 301-881-0666.

INTERNATIONAL CORRESPONDENCE. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the

coordinating pharmacopeia for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows:

Technical Secretariat of the
European Pharmacopoeia Commission
B.P. 907
F 67029 Strasbourg Cedex 1
France

NAKASHIMA Nobumasa
Evaluation and Licensing Division
Pharmaceutical and Medical Safety Bureau
Ministry of Health, Labour and Welfare, Japan
Tel. +81-3-3595-2431, Fax. +81-3-3597-9535
E-mail: nakashima-nobumasa@mhlw.go.jp

HOW TO SUBMIT COMMENTS. The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. Submissions concerning a particular item that has appeared in a *PF* should be submitted to the appropriate USP scientific staff liaison identified at the end of the *Briefing* accompanying each item. To submit comments and data to a liaison, use the e-mail address and telephone numbers listed in the *Staff Directory* included in every *PF*.

Please note that *USP–NF* is being published in an annual edition with one main book and two *Supplements* a year. In addition, the following schedule will repeat every year so that users will know what to expect and become familiar with the deadlines.

Publication and Comment Schedule for *USP 28–NF 23*

Publication	Comment Deadline	Publication Date	Official Date
Main Book	May 15, 2004	November 2004	January 2005
Supplement One	October 15, 2004	February 2005	April 2005
Supplement Two	February 17, 2005	June 2005	August 2005

Publication and Comment Schedule for *USP 29–NF 24*

Publication	Comment Deadline	Publication Date	Official Date
Main Book	May 15, 2005	November 2005	January 2006
Supplement One	October 15, 2005	February 2006	April 2006
Supplement Two	February 17, 2006	June 2006	August 2006

In the future, USP anticipates including the comment submission deadline in each briefing of every revision proposal when it is published for public review and comment.

For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or FAX number 301-816-8373.

All official revisions are published in *Supplements to USP–NF* (twice yearly). Between *Supplements,* official revisions are published in *PF* in the *Interim Revision Announcement;* these revisions are also incorporated in the upcoming *Supplement.* The electronic version of *USP–NF* is updated as each *Supplement* becomes available and, therefore, contains all official text up to and including the contents of the latest *Supplement*.

PUBLICATION SCHEDULES

Publication	Publication Date	Official Date
1st Supplement	Feb. 2005	Apr. 1, 2005
PF 31(2) [Mar.–Apr. 2005]	Mar. 2005	Not Applicable
2nd IRA [published in *PF* 31(2)]	Mar. 2005	Apr. 1, 2005
PF 31(3) [May–June 2005]	May 2005*	Not Applicable
3rd IRA [published in *PF* 31(3)]	May 2005*	June 1, 2005*
2nd Supplement	June 2005*	Aug. 1, 2005*
PF 31(4) [July–Aug. 2005]	July 2005*	Not Applicable
4th IRA [published in *PF* 31(4)]	July 2005*	Aug. 1, 2005*
PF 31(5) [Sept.–Oct. 2005]	Sept. 2005*	Not Applicable
5th IRA [published in *PF* 31(5)]	Sept. 2005*	Oct. 1, 2005*
PF 31(6) [Nov.–Dec. 2005]	Nov. 2005*	Not Applicable
6th IRA [published in *PF* 31(6)]	Nov. 2005*	Dec. 1, 2005*

INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- New adopted (official) revisions to the *USP–NF* that become effective before the effective date of the next *Supplement* or that were not ready for adoption by the closing date for the upcoming *Supplement*. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.

Symbols—Interim revisions are shown with new text (if any) enclosed in circles, •new text•. Text enclosed in squares, ▪new text▪, has already been adopted in a *Supplement*. Where the symbols appear together with no enclosed text, such as •• or ▪▪, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by a number that indicates the *IRA* or *Supplement* in which the revision first appeared. For example, •2 indicates that the revision was officially adopted in the *Second Interim Revision Announcement*, and ▪2S (*USP27*) indicates that the revision was officially adopted in the *Second Supplement* to *USP 27*.

Errata—At the end of the *Interim Revision Announcement* section is a list of errata and corrections to *USP 28–NF 23*. The page number indicates where the item is found in *USP–NF*. If necessary, this list will be updated with every issue of *PF*. This information will also be cumulative in the next available *Supplement*, and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

Pharmacopeial Forum
Vol. 31(2) [Mar.–Apr. 2005]

SECOND INTERIM REVISION ANNOUNCEMENT to *USP 28* and to *NF 23*

By authority of the United States Pharmacopeial Convention, Inc.
Prepared by the Council of Experts and published by the Board of Trustees

Larry L. Braden, *Chair*
USP Board of Trustees

Roger L. Williams, *Executive Vice President*
and *Chairman, USP Council of Experts*

John W. Gasper, *Director*, *Executive Secretariat*

Official April 1, 2005. **Released March 1, 2005.**

All inquiries and comments regarding *USP 28* text and *NF 23* text should be addressed to the Executive Secretariat, *USP–NF*, 12601 Twinbrook Parkway, Rockville, MD 20852.

New USP Reference Standards

The following USP Reference Standards, which were indicated in past *Supplements to USP–NF* as being not yet available, have since become available. Thus, the official date of each *USP 28* or *NF 23* standard, test, or assay requiring the use of the following Reference Standards is indicated individually in this list. (AS) indicates Authentic Substances, which are materials that have no specified use in monographs or General Chapters and are offered for the convenience of *USF–NF* users.

USP Adipic Acid RS (September 1, 2005)
USP Alcohol RS (May 1, 2005)
USP Alcohol Determination–Acetonitrile RS (March 1, 2005)
USP Alcohol Determination–Alcohol RS (March 1, 2005)
USP Aluminum Sulfate (AS)
USP Amiodarone Hydrochloride RS (July 1, 2005)
USP Amlodipine Besylate RS (May 1, 2005)
USP Ammonium Carbonate (AS)
USP Ammonium Phosphate Dibasic (AS)
USP Ascorbyl Palmitate RS (September 1, 2005)
USP Bismuth Subcarbonate RS (September 1, 2005)
USP Bismuth Subgallate RS (September 1, 2005)
USP Boric Acid (AS)
USP Butylated Hydroxytoluene RS (March 1, 2005)
USP Calcium Acetate (AS)
USP Calcium Carbonate (AS)
USP Calcium Chloride (AS)
USP Calcium Hydroxide (AS)
USP Calcium Stearate (AS)
USP Calcium Sulfate (AS)
USP Candelilla Wax RS (March 1, 2005)
USP Caprylocaproyl Polyoxylglycerides RS (March 1, 2005)
USP Carboxymethylcellulose Sodium RS (September 1, 2005)
USP Carprofen RS (September 1, 2005)
USP Cellaburate (cellulose acetate butyrate) RS (May 1, 2005)
USP Powdered Black Cohosh Extract RS (March 1, 2005)
USP Corn Oil (AS)
USP Cottonseed Oil (AS)
USP Dehydrated Alcohol RS (May 1, 2005)
USP Dextran 1 RS (July 1, 2005)
USP Dextran T-10 RS (July 1, 2005)
USP Dibutyl Phthalate RS (March 1, 2005)
USP Dibutyl Sebacate (AS)
USP Dichlorvos (AS)
USP Ferrous Sulfate (AS)
USP Fexofenadine Hydrochloride RS (July 1, 2005)
USP Fexofenadine Related Compound A RS (July 1, 2005)
USP Fexofenadine Related Compound B RS (July 1, 2005)
USP Fluconazole RS (July 1, 2005)
USP Fluconazole Related Compound A RS (July 1, 2005)
USP Fluconazole Related Compound B RS (July 1, 2005)
USP Fluconazole Related Compound C RS (July 1, 2005)
USP Fludeoxyglucose Related Compound A RS (September 1, 2005)
USP Gemcitabine Hydrochloride RS (March 1, 2005)
USP Glacial Acetic Acid (AS)
USP Hypromellose Acetate Succinate RS (July 1, 2005)
USP Indinavir RS (September 1, 2005)
USP Indinavir System Suitability RS (September 1, 2005)
USP Isopropyl Alcohol RS (September 1, 2005)
USP Lactase RS (May 1, 2005)
USP Lactic Acid (AS)
USP Lauroyl Polyoxylglycerides (AS)
USP Loratadine Related Compound A RS (May 1, 2005)
USP Loratadine Related Compound B RS (May 1, 2005)
USP Losartan Potassium RS (July 1, 2005)
USP Lutein RS (September 1, 2005)
USP Magnesium Carbonate (AS)
USP Magnesium Chloride (AS)
USP Magnesium Hydroxide (AS)
USP Magnesium Stearate (AS)
USP Magnesium Sulfate (AS)
USP Mangafodipir Related Compound A RS (July 1, 2005)
USP Mangafodipir Related Compound B RS (July 1, 2005)
USP Mangafodipir Trisodium RS (July 1, 2005)
USP Manganese Chloride (AS)
USP Manganese Sulfate (AS)
USP Meglumine RS (September 1, 2005)
USP Melengestrol Acetate RS (September 1, 2005)
USP Melengestrol Acetate Related Compound A RS (September 1, 2005)
USP Melengestrol Acetate Related Compound B RS (September 1, 2005)
USP Methyl Salicylate RS (September 1, 2005)
USP Mirtazapine RS (March 1, 2005)
USP Monobasic Potassium Phosphate (AS)
USP Monosodium Glutamate RS (September 1, 2005)
USP Morantel Tartrate RS (September 1, 2005)
USP Nabumetone Related Compound A RS (May 1, 2005)
USP Nevirapine Anhydrous RS (March 1, 2005)
USP Olive Oil (AS)
USP Omeprazole Related Compound A RS (September 1, 2005)
USP Ondansetron Resolution Mixture RS (May 1, 2005)
USP Palm Oil (AS)
USP Pancuronium Bromide RS (September 1, 2005)
USP Paroxetine Related Compound F RS (May 1, 2005)
USP Paroxetine Related Compound G RS (May 1, 2005)
USP Peanut Oil (AS)
USP Phenothiazine (AS)
USP Phenoxyethanol RS (July 1, 2005)
USP Phosphoric Acid (AS)
USP Polysorbate 20 (AS)
USP Polysorbate 40 (AS)
USP Polysorbate 60 (AS)
USP Polysorbate 80 (AS)
USP Potassium Benzoate (AS)
USP Potassium Bitartrate (AS)
USP Potassium Carbonate (AS)
USP Potassium Chloride (AS)
USP Potassium Citrate RS (September 1, 2005)
USP Potassium Iodide (AS)
USP Potassium Nitrate (AS)
USP Potassium Sodium Tartrate RS (September 1, 2005)
USP Potassium Sorbate (AS)
USP Propionic Acid (AS)
USP Residual Solvent Class 2—Chloroform RS (May 1, 2005)
USP Residual Solvent Class 2—Cyclohexane RS (May 1, 2005)
USP Residual Solvent Class 2—1,2-Dichloroethene RS (March 1, 2005)
USP Residual Solvent Class 2—1,2-Dimethoxyethane RS (May 1, 2005)
USP Residual Solvent Class 2—*N,N*-Dimethylacetamide RS (May 1, 2005)
USP Residual Solvent Class 2—*N,N*-Dimethylformamide RS (May 1, 2005)
USP Residual Solvent Class 2—2-Ethoxyethanol RS (May 1, 2005)
USP Residual Solvent Class 2—Formamide RS (May 1, 2005)
USP Residual Solvent Class 2—2-Methoxyethanol RS (May 1, 2005)
USP Residual Solvent Class 2—Methylbutylketone RS (May 1, 2005)
USP Residual Solvent Class 2—Methylcyclohexane RS (March 1, 2005)
USP Residual Solvent Class 2—*N*-Methylpyrrolidone RS (May 1, 2005)

USP Residual Solvent Class 2—Mixture A RS (May 1, 2005)
USP Residual Solvent Class 2—Mixture C RS (May 1, 2005)
USP Residual Solvent Class 2—Nitromethane RS (May 1, 2005)
USP Residual Solvent Class 2—Pyridine RS (May 1, 2005)
USP Residual Solvent Class 2—Sulfolane RS (May 1, 2005)
USP Residual Solvent Class 2—Tetralin RS (May 1, 2005)
USP Residual Solvent Class 2—Trichloroethylene RS (May 1, 2005)
USP Sevoflurane Related Compound B RS (July 1, 2005)
USP Sevoflurane Related Compound C RS (July 1, 2005)
USP β-Sitosterol RS (September 1, 2005)
USP Sodium Acetate (AS)
USP Sodium Bicarbonate (AS)
USP Sodium Carbonate Anhydrous (AS)
USP Sodium Chloride (AS)
USP Sodium Citrate (AS)
USP Sodium Metabisulfite (AS)
USP Sodium Nitrite (AS)
USP Sodium Sulfate Anhydrous (AS)
USP Sodium Thiosulfate (AS)
USP Sorbic Acid (AS)
USP Tannic Acid RS (September 1, 2005)
USP Tartaric Acid RS (September 1, 2005)
USP Terbutaline Related Compound A RS (September 1, 2005)
USP Titanium Dioxide (AS)
USP Tolcapone RS (July 1, 2005)
USP Tolcapone Related Compound B RS (September 1, 2005)
USP Tylosin Tartrate RS (September 1, 2005)
USP Urea RS (September 1, 2005)
USP Zinc Oxide (AS)
USP Zinc Sulfate (AS)

The official dates of any *USP 28* or *NF 23* standards, tests, or assays requiring the use of the following new USP Reference Standards are postponed until further notice pending availability of the respective Reference Standards.

USP Alteplase RS
USP Bupropion Hydrochloride Related Compound A RS
USP Bupropion Hydrochloride Related Compound B RS
USP Bupropion Hydrochloride Related Compound C RS
USP Bupropion Hydrochloride Related Compound D RS
USP Bupropion Hydrochloride Related Compound E RS
USP Bupropion Hydrochloride Related Compound F RS
USP Cinoxate RS

MONOGRAPHS (USP)

Aspirin Delayed-Release Capsules

Change to read:

•**Dissolution** ⟨711⟩—Proceed as directed for *Procedure* for *Method A* under *Apparatus 1 and Apparatus 2, Delayed-Release Dosage Forms.*•2

Apparatus 1: 100 rpm.
Time: 90 minutes, for *Buffer stage*.
Diluent—Prepare a mixture of 0.1 N hydrochloric acid and 0.20 M tribasic sodium phosphate (3 : 1), and adjust, if necessary, with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of 6.8 ± 0.05.
Procedure—Determine the amount of $C_9H_8O_4$ dissolved by determining UV absorbances at the wavelength of the isosbestic point of aspirin and salicylic acid (about 280 nm in the *Acid stage*, and about 265 nm in the *Buffer stage*), using a filtered portion of the solution under test, diluted, if necessary, with 0.1 N hydrochloric acid (analyzing the *Acid stage*) and with *Diluent* (analyzing the *Buffer stage*), in comparison with a Standard solution having a known concentration of USP Aspirin RS in the same *Medium*.

•(Official April 1, 2006)•2

Aspirin Delayed-Release Tablets

Change to read:

•**Dissolution** ⟨711⟩—Proceed as directed for *Procedure* for *Method B* under *Apparatus 1 and Apparatus 2, Delayed-Release Dosage Forms.*•2

Apparatus 1: 100 rpm.
Time: 90 minutes, for *Buffer stage*.
Diluent—Prepare a mixture of 0.1 N hydrochloric acid and 0.20 M tribasic sodium phosphate (3 : 1), and adjust, if necessary, with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of 6.8 ± 0.05.
Procedure—Determine the amount of $C_9H_8O_4$ dissolved by determining UV absorbances at the wavelength of the isosbestic point of aspirin and salicylic acid (about 280 nm in the *Acid stage*, and about 265 nm in the *Buffer stage*), using a filtered portion of the solution under test, diluted, if necessary, with 0.1 N hydrochloric acid (analyzing the *Acid stage*) and with *Diluent* (analyzing the *Buffer stage*), in comparison with a Standard solution having a known concentration of USP Aspirin RS in the same *Medium*.

Aspirin Extended-Release Tablets

Change to read:

Labeling—The labeling indicates the •*Dissolution Test*•2 with which the product complies.

•(Official April 1, 2006)•2

Change to read:

•**Dissolution** ⟨711⟩—•2

TEST 1—If the product complies with this test, the labeling indicates that it meets •USP *Dissolution Test 1.*•2
Medium: 0.1 N hydrochloric acid; 900 mL.
Apparatus 2: 60 rpm.
Times: 1 hour and 4 hours.
Procedure—Determine the amount of $C_9H_8O_4$ dissolved from UV absorbances at the isosbestic point at about 280 nm, using filtered portions of the solution under test, suitably diluted with 0.1 N hydrochloric acid, if necessary, in comparison with a Standard solution having a known concentration of USP Aspirin RS in the same *Medium*.
Tolerances—The percentages of the labeled amount of $C_9H_8O_4$ dissolved at the times specified conform to •*Acceptance Table 2.*•2

Time (hours)	Amount dissolved
1	between 20% and 55%
4	not less than 80%

TEST 2—If the product complies with this test, the labeling indicates that it meets •USP *Dissolution Test 2.*•2
Medium: water; 1000 mL.
Apparatus 2: 30 rpm.
Times: 1, 2, 4, and 8 hours.
Procedure—Determine the amount of $C_9H_8O_4$ dissolved from UV absorbances at the isosbestic point at about 265 nm, using filtered portions of the solution under test, suitably diluted with water, if necessary, in comparison with a Standard solution having a known concentration of USP Aspirin RS in the same *Medium*. [NOTE—Prepare the Standard solution at the time of use. An amount of alcohol not to exceed 5% of the total volume of the Standard solution may be used to bring the USP Reference Standard into solution prior to dilution with *Medium*.]
Tolerances—The percentages of the labeled amount of $C_9H_8O_4$ dissolved at the times specified conform to •*Acceptance Table 2.*•2

Time (hours)	Amount dissolved
1	between 15% and 40%
2	between 25% and 60%
4	between 35% and 75%
8	not less than 70%

•(Official April 1, 2006)•2

■**Labeling**—When more than one •*Dissolution Test*•2 is given, the labeling states the •*Dissolution Test*•2 used only if *Test 1* is not used.■1S (*USP28*)

•(Official April 1, 2006)•2

Change to read:

•**Dissolution** ⟨711⟩—•2

■TEST 1—■1S (*USP28*)
Medium: water; 900 mL.

Interim Revision Announcement

Apparatus 2: 50 rpm.
Times: 1, 4, and 8 hours.
Procedure—Determine the amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 298 nm, using a 1.0-cm cell, on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Bupropion Hydrochloride RS in the same *Medium.*
Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to •*Acceptance Table 2*.•$_2$

Time (hours)	Amount dissolved
1	between 25% and 45%
4	between 60% and 85%
8	not less than 80%

■TEST 2—If the product complies with this test, the labeling indicates that it meets •USP *Dissolution Test 2*.•$_2$
Medium: 0.1 N hydrochloric acid, pH 1.5; 900 mL.
Apparatus 1: 50 rpm.
Times: 1, 2, 4, and 6 hours.
Determine the percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved by employing the following method.
Buffer solution—Dissolve 3.45 g of sodium phosphate monobasic monohydrate in 996 mL of water, add 4.0 mL of triethylamine, and mix. Adjust with phosphoric acid to a pH of 2.80 ± 0.05.
Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and methanol (65 : 35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).
Standard solution—Dissolve an accurately weighed quantity of USP Bupropion Hydrochloride RS in *Medium,* and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration similar to the one expected in the *Test solution.*
Test solution—Use portions of the solution under test, and pass through a 0.45-µm nylon filter.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 298-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 2000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.
Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of bupropion hydrochloride dissolved at each time point.
Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to •*Acceptance Table 2*.•$_2$

Time (hours)	Amount dissolved
1	between 25% and 50%
2	between 40% and 65%
4	between 65% and 90%
6	not less than 80%

TEST 3—If the product complies with this test, the labeling indicates that it meets •USP *Dissolution Test 3*.•$_2$
Medium, Apparatus, and *Procedure*—Proceed as directed for *Test 1,* except using the wavelength of about 250 nm.
Times: 1, 2, 4, and 6 hours.
Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to •*Acceptance Table 2*.•$_2$

Time (hours)	Amount dissolved
1	between 30% and 55%
2	between 50% and 75%
4	between 70% and 90%
6	not less than 80%

■1S (*USP28*)

•(Official April 1, 2006)•$_2$

Carbamazepine Tablets

Change to read:

Dissolution ⟨711⟩—
FOR PRODUCTS LABELED AS 100-MG CHEWABLE TABLETS—
TEST 1—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.
Medium: water containing 1% sodium lauryl sulfate; 900 mL.
Apparatus 2: 75 rpm.
Time: 60 minutes.
Procedure—Determine the amount of $C_{15}H_{12}N_2O$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 288 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Carbamazepine RS in the same *Medium.* [NOTE—A volume of methanol not exceeding 1% of the final total volume of the Standard solution may be used to dissolve the carbamazepine.]
Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 60 minutes. Use •*Acceptance Table 1*,•$_2$ with the following exceptions: at S_2, no unit is less than Q – 5%; at S_3, no unit is less than Q – 10%; and not more than 2 of the 24 units are less than Q – 5%.
TEST 4—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.
Medium: 0.1 N hydrochloric acid containing 1% sodium lauryl sulfate; 225 mL. Add 2 drops of simethicone to each.
Apparatus 3: ••$_2$ 35 dips per minute; use 20-mesh screen on the top of the reciprocating cylinder and a 100-mesh screen on the bottom of the reciprocating cylinder.
Time: 60 minutes.
Procedure—Determine the amount of $C_{15}H_{12}N_2O$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 284 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Carbamazepine RS in the same *Medium*.
Tolerances—Not less than 70% *(Q)* of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 60 minutes, the acceptance criteria specified for *Test 1* being used.
FOR PRODUCTS LABELED AS 200-MG TABLETS—
TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.
Medium, *Apparatus*, and *Procedure*—Proceed as directed for *Test 1*.
Times and *Tolerances:* between 45% and 75% of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 15 minutes; not less than 75% *(Q)* of the labeled amount of $C_{15}H_{12}N_2O$ is dissolved in 60 minutes. Carbamazepine Extended-Release Tablets

Change to read:

•**Dissolution** ⟨711⟩—•$_{\bullet 2}$

Medium: water; 900 mL, 1800 mL for 400-mg Tablets.

Apparatus 1: 100 rpm.

Times: 3, 6, 12, and 24 hours.

Procedure—Determine the amount of $C_{15}H_{12}N_2O$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 284 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Carbamazepine RS in the same *Medium*.

Tolerances—The percentages *(Q)* of the labeled amount of $C_{15}H_{12}N_2O$ dissolved at the times specified conform to •*Acceptance Table 2.*•$_{\bullet 2}$

Time (hours)	Amount dissolved
3	between 10% and 35%
6	between 35% and 65%
12	between 65% and 90%
24	not less than 75%

•(Official April 1, 2006)•$_2$

Clonidine Transdermal System

Change to read:

Drug release ⟨724⟩—

Medium: 0.001 M phosphoric acid; 80 mL for systems containing 5 mg or less of clonidine; 200 mL for systems containing more than 5 mg of clonidine.

Times: 8, 24, 96, and 168 hours.

Apparatus 7—Proceed as directed in the chapter, using the transdermal system holder-angled disk •(see *Figure 4a*).•$_2$ The appropriate size of the holder, 1.42 or 1.98 inches, should be chosen based on the size of the system to prevent overhang. Use 100-mL beakers for *Medium* volumes of 80-mL and 300-mL beakers for *Medium* volumes of 200 mL. Gently press the transdermal system to a dry, smooth, square piece of cellulose membrane*, or equivalent, with the adhesive side against the membrane. Attach the membrane/system to a suitable inert sample holder with a Viton O-ring, or equivalent, such that the backing of the system is adjacent to, and centered on, the bottom of the sample holder. Trim the excess of cellulose membrane with scissors. Suspend each sample holder from the arm of a reciprocating shaker such that each system is continuously immersed in a beaker containing the specified volume of *Medium.* The filled beakers are weighed and pre-equilibrated to 32.0 ± 0.3° prior to immersing the test sample. Agitate the sample in an up-down motion at a frequency of 30 cycles per minute with an amplitude of 2.0 ± 0.1 cm. The *Medium* must be added daily to the beakers during each interval to maintain sample immersion. At the end of each time interval, transfer the test sample to a fresh beaker containing the appropriate volume of *Medium,* weighed and pre-equilibrated to 32.0 ± 0.3°.

Determine the amount of $C_9H_9Cl_2N_3$ released by employing the following method.

Mobile phase—Use a filtered and degassed 0.1% solution of triethylamine in a mixture of water and methanol (70 : 30), adjust with phosphoric acid to a pH of 6.0 ± 0.2. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Prepare a solution of USP Clonidine RS in 0.001 M phosphoric acid having a known concentration of about 10 µg per mL.

Standard solutions—Prepare a minimum of four standard solutions of USP Clonidine RS in 0.001 M phosphoric acid having known concentrations of clonidine similar to those of the *Test solutions.*

Test solutions—At the end of each release interval, allow the beakers to cool to room temperature and make up for evaporative *Medium* losses by adding *Medium* to obtain the original weight. Mix.

* A suitable cellulose membrane is available as Cuprophan 80M, from Membrana GmbH, Oehder Strasse 28, D-42289, Wuppertal, Germany, fax number +49 02 02 60 57 15.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; the capacity factor is not less than 0.5; the column efficiency is not less than 2000 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 25 µL) of filtered portions of each *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Construct a standard curve of concentration (µg per mL) of clonidine in the *Standard solutions* versus peak area by linear regression analysis. The correlation coefficient is not less than 0.995. Calculate the release rate of clonidine by the formula:

$$CV/TA,$$

in which C is the concentration, in µg per mL, of clonidine in the sample obtained from the standard curve; V is the volume, in mL, of the *Medium;* T is the time, in hours; and A is the area, in cm^2, of the transdermal system.

Tolerances—The release rate of $C_9H_9Cl_2N_3$ from the Transdermal System, expressed as µg per hour per cm^2 at the times specified, conforms to •*Acceptance Table 1* under *Drug Release* ⟨724⟩.•$_2$

Time (hours)	Time for sampling (hours)	Release rate (µg/h/cm^2)
0–8	8	between 7.5 and 16.0
8–24	24	between 1.5 and 4.6
24–96	96	between 1.5 and 4.6
96–168	168	between 1.5 and 3.3

•(Official April 1, 2006)•$_2$

Diazepam Extended-Release Capsules

Change to read:

•**Dissolution** ⟨711⟩—•$_2$

Medium: simulated gastric fluid TS, prepared without enzymes; 900 mL.

Apparatus 1: 100 rpm.

Times: 1 hour; 4 hours; 8 hours; 12 hours.

Mobile phase—Prepare a suitable degassed and filtered mixture of methanol and water (65 : 35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Buffer solution—Dissolve 77.1 g of ammonium acetate in water to make 1000 mL of solution, and adjust with ammonium hydroxide to a pH of 8.7.

Standard solution—Dissolve an accurately weighed quantity of USP Diazepam RS in *Medium*, dilute quantitatively with *Medium* to obtain a solution having a known concentration of about 0.15 mg per mL, and mix. Transfer 2.0-, 5.0-, 8.0-, and 10.0-mL aliquots of this solution to separate 100-mL volumetric flasks, add *Medium* to volume, and mix. Pipet 1.0 mL of each solution and 1.0 mL of *Buffer solution* into individual small vials, mix, and allow to stand at room temperature for about 10 minutes.

Test solution—Wrap each Capsule in a coil made from a 10-cm piece of 18-gauge copper wire weighing approximately 750 mg, so that the wire encircles the Capsule 4 times. The Capsule enclosed in the coil remains at the bottom of the basket (it should not float).

Interim Revision Announcement

Filter a portion of the solution under test, obtained at each time interval, through a suitable 0.6-µm porosity filter. Pipet 1.0 mL of each solution and 1.0 mL of *Buffer solution* into individual small vials, mix, and allow to stand at room temperature for about 10 minutes.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and an 8-mm × 10-cm column that contains packing L1. The flow rate is about 5.0 mL per minute. Chromatograph the appropriate *Standard solution*, and record the peak responses as directed for *Procedure:* the tailing factor is not greater than 1.7; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Determine the amount of $C_{16}H_{13}ClN_2O$ dissolved from peak responses of diazepam obtained from the *Test solution* and the *Standard solution*.

Tolerances—The percentage of the labeled amount of $C_{16}H_{13}ClN_2O$ dissolved is within the range stated at each of the following times.

Time (hours)	Amount dissolved
1	between 15% and 27%
4	between 49% and 66%
8	between 76% and 96%
12	between 85% and 115%

•(Official April 1, 2006)•2

Diclofenac Sodium Delayed-Release Tablets

Change to read:

•**Dissolution** ⟨711⟩—Proceed as directed for *Procedure* for *Method B* under *Apparatus 1 and Apparatus 2, Delayed-Release Dosage Forms.*•2

ACID STAGE—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 2 (paddles constructed of, or coated with, polytef being used): 50 rpm.

Procedure—At the end of 2 hours, remove each Tablet, or the major portion thereof if the Tablet is not intact, from the individual vessels, and subject them to the test in the *Buffer stage*. To the 0.1 N hydrochloric acid remaining in each vessel, add 20.0 mL of 5 N sodium hydroxide, and stir for 5 minutes. Determine the amount of $C_{14}H_{10}Cl_2NNaO_2$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 276 nm on filtered portions of the solution under test in comparison with a Standard solution prepared as follows. Transfer about 68 mg of USP Diclofenac Sodium RS, accurately weighed, to a 100-mL volumetric flask, add 10.0 mL of 0.1 N sodium hydroxide, dilute with water to volume, and mix. Transfer 2.0 mL of this solution to a second 100-mL volumetric flask, dilute with a mixture of 0.1 N hydrochloric acid and 5 N sodium hydroxide (900 : 20) to volume, and mix. This Standard solution contains about 13.6 µg of USP Diclofenac Sodium RS per mL.

BUFFER STAGE—

pH 6.8 Phosphate buffer—Dissolve 76 g of tribasic sodium phosphate in water to obtain 1000 mL of solution. Mix 250 mL of this solution with 750 mL of 0.1 N hydrochloric acid, and, if necessary, adjust with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of 6.8 ± 0.05.

Medium: pH 6.8 Phosphate buffer; 900 mL.

Apparatus 2: 50 rpm.

Procedure—At the end of 45 minutes, determine the amount of $C_{14}H_{10}Cl_2NNaO_2$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 276 nm on filtered portions of the solutions under test, suitably diluted with *Medium*, in comparison with a Standard solution prepared as follows. Transfer about 68 mg of USP Diclofenac Sodium RS, accurately weighed, to a 100-mL volumetric flask, add 10.0 mL of 0.1 N sodium hydroxide, dilute with water to volume, and mix. Transfer 3.0 mL of this solution to a second 100-mL volumetric flask, dilute with *Medium*, as obtained in the *Buffer stage,* to volume, and mix. This Standard solution contains about 0.02 mg of USP Diclofenac Sodium RS per mL.

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{14}H_{10}Cl_2NNaO_2$ is dissolved.

Medium and *Procedure*—Proceed as directed under *Test 1.*

Apparatus 1: 100 rpm.

Times: 2, 4, 8, 12, and 16 hours.

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to •*Acceptance Table 2.*•2

Time (hours)	Amount dissolved
2	not more than 25%
4	between 25% and 50%
8	between 60% and 85%
12	not less than 70%
16	not less than 80%

TEST 7—If the product complies with this test, the labeling indicates that it meets •USP *Dissolution Test 7.*•2

Medium: pH 4.2 acetate buffer; 900 mL. Prepare the buffer by employing the following method. Transfer 115 mL of acetic acid to a 10-L volumetric flask, dilute with water to volume, and mix (Solution A). Transfer 165.4 g of anhydrous sodium acetate to a 10-L volumetric flask, dilute with water to volume, and mix (Solution B). Mix 4410 mL of Solution A with 1590 mL of Solution B. Adjust, if necessary, with the addition of Solution A or Solution B to a pH of 4.2 ± 0.05.

Apparatus 2: 100 rpm.

Times: 1, 4, 10, and 15 hours.

Procedure—Determine the amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 237 nm on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration ofUSP Diltiazem Hydrochloride RS in the same *Medium.*

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to •*Acceptance Table 2.*•2

Time (hours)	Amount dissolved
1	not more than 10%
4	between 15% and 35%
10	between 65% and 85%
15	not less than 80%

TEST 8—If the product complies with this test, the labeling indicates that it meets •USP *Dissolution Test 8.*•2

Medium, Apparatus, and *Procedure*—Proceed as directed under *Test 1.*

Times: 1, 4, 10, and 15 hours.

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to •*Acceptance Table 2.*•2

Time (hours)	Amount dissolved
1	between 5% and 20%
4	between 30% and 50%
10	between 60% and 90%
15	not less than 80%

TEST 9—If the product complies with this test, the labeling indicates that it meets •USP *Dissolution Test 9.*•2

NOTE—Perform the test separately in each of the two media.

Medium 1: 0.1 N hydrochloric acid; 900 mL.

Medium 2: simulated intestinal fluid TS, prepared without enzyme and adjusted to a pH of 7.5 ± 0.1; 900 mL.

Apparatus 2: 75 rpm.

Time for Medium 1: 2 hours.

Times for Medium 2: 2, 12, 18, and 24 hours.

Procedure—Determine the amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 237 nm on filtered portions of the solution under test, suitably diluted with the appropriate *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Diltiazem Hydrochloride RS in the same *Medium.*

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to •*Acceptance Table 2.*•2

Time (hours)	Amount dissolved (*Medium 1*)	Amount dissolved (*Medium 2*)
2	between 0% and 5%	between 20% and 45%
12		between 35% and 55%
18		not less than 60%
24		not less than 80%

TEST 11—If the product complies with this test, the labeling indicates that it meets •USP *Dissolution Test 11.*•2

Medium, Apparatus, and *Procedure*—Proceed as directed under *Test 3.*

Times: 1, 6, 12, and 18 hours.

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to •*Acceptance Table 2.*•2

Time (hours)	Amount dissolved
1	not more than 10%
6	between 30% and 40%
12	between 36% and 58%
18	not less than 85%

TEST 12—If the product complies with this test, the labeling indicates that it meets •USP *Dissolution Test 12.*•2 Proceed as directed for •*Extended-Release Dosage Forms.*•2

Medium and *Procedure*—Proceed as directed under *Test 1.*

Apparatus 1: 100 rpm.

Times: 2, 8, 14, and 24 hours.

Dirithromycin Delayed-Release Tablets

Change to read:

•**Dissolution** ⟨711⟩—Proceed as directed for *Procedure* for *Method B* under *Apparatus 1 and Apparatus 2, Delayed-Release Dosage Forms.*•2

ACID STAGE—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 1: 10-mesh basket; 100 rpm.

Xanthydrol TS—[NOTE Prepare this solution daily.] To about 150 mg of xanthydrol in a 100-mL volumetric flask, add 10 mL of glacial acetic acid, and swirl to dissolve. Dilute with hydrochloric acid to volume, and mix.

Standard solution—Quantitatively dissolve an accurately weighed quantity of USP Dirithromycin RS in 0.1 N hydrochloric acid to obtain a solution having a known concentration of about 0.28 mg per mL.

Procedure—After 2 hours of operation, remove each Tablet, or the major portion thereof if the Tablet is not intact, from the individual vessel, and subject each Tablet to the test in the *Buffer stage*. Separately add 0.50 mL of acetic anhydride to 0.50 mL of the filtered solution under test and to 0.50 mL of the *Standard solution*, and mix. Add 5.0 mL of glacial acetic acid, allow to stand for 5 minutes, then add 0.50 mL of *Xanthydrol TS*, and allow 30 minutes for color development. Determine the amount of $C_{42}H_{78}N_2O_{14}$, including the 16*R*- and 16*S*-epimers, dissolved by employing UV absorption at the wavelength of maximum absorbance at about 540 nm.

BUFFER STAGE—

Medium: pH 6.8 phosphate buffer; 900 mL.

Procedure—Proceed as directed for *Acid stage* beginning with "Separately add 0.50 mL of acetic anhydride".

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{42}H_{78}N_2O_{14}$, including the 16*R*- and 16*S*-epimers, is dissolved in 45 minutes.

Interim Revision Announcement

Divalproex Sodium Delayed-Release Tablets

Change to read:

•**Dissolution** ⟨711⟩—•2

■ACID STAGE—

Medium: 0.08 N hydrochloric acid (prepared by adding 40 mL of hydrochloric acid to 5000 mL of water, adjusting with 2 N hydrochloric acid to a pH of 1.2, and diluting with water to 6000 mL); 900 mL.

Apparatus 2: 50 rpm.

Time: 1 hour.

Procedure—At the end of 1 hour, carefully transfer the Tablet to a dissolution vessel containing the *Medium* of the *Buffer stage*. [NOTE—Do not perform an analysis of the *Medium* in the *Acid stage*.]

BUFFER STAGE—

Medium: pH 7.5 phosphate buffer (prepared by dissolving 40.83 g of monobasic potassium phosphate and 9.84 g of sodium hydroxide in 5000 mL of water, adjusting with 0.08 N hydrochloric acid to a pH of 7.5, and diluting with water to 6000 mL); 900 mL.

Apparatus 2: 50 rpm.

Time: 1 hour.■1S *(USP28)*

Determine the amount of $C_8H_{16}O_2$ dissolved ■in the *Buffer stage*■1S *(USP28)* by employing the following method.

Citrate buffer—Dissolve 0.5 g of citric acid monohydrate and 0.4 g of dibasic sodium phosphate in 1.0 L of water.

Potassium phosphate buffer—Dissolve 6.8 g of monobasic potassium phosphate and 1.7 g of sodium hydroxide in 1.0 L of water. Adjust with phosphoric acid to a pH of 7.4 ± 0.1.

Mobile phase—Prepare a mixture of *Citrate buffer, Potassium phosphate buffer,* and acetonitrile (35 : 35 : 30). Adjust with phosphoric acid to a pH of 3.0 ± 0.1, and mix. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Prepare a solution of USP Valproic Acid RS in the ■*Medium*■1S *(USP28)* used in the *Buffer stage,* having a known concentration of about 0.12 mg per mL. [NOTE—A volume of acetonitrile not exceeding 10.0% of the total volume may be used to dissolve the USP Valproic Acid RS.]

Test solution—If necessary, dilute a portion of each filtered solution under test with the ■*Medium*■1S *(USP28)* used in the *Buffer stage* to obtain a solution having a concentration of about 0.12 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 3.9-mm × 15-cm column that contains 4-µm packing L11. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 1000 theoretical plates; the tailing factor is not more that 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of valproic acid ($C_8H_{16}O_2$) dissolved by the formula:

$$900CD(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Valproic Acid RS in the *Standard solution; D* is the dilution factor used to prepare the *Test solution;* and r_U and r_S are the peak areas of valproic acid obtained from the *Test solution* and the *Standard solution,* respectively.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_8H_{16}O_2$ is dissolved in ■1 hour in the *Buffer stage.*■1S *(USP28)*

•(Official April 1, 2006)•2

Doxycycline Hyclate Delayed-Release Capsules

Change to read:

•**Dissolution** ⟨711⟩—Proceed as directed for *Procedure* for *Method B* under *Apparatus 1 and Apparatus 2, Delayed-Release Dosage Forms.*•2

ACID STAGE—[NOTE—Conduct the test by transferring the contents of each Capsule to the individual basket units of the apparatus.]

Medium: 0.06 N hydrochloric acid; 900 mL.

Apparatus 1: 50 rpm.

Time: 20 minutes.

Diluting solvent: 0.1 N hydrochloric acid.

Procedure—Determine the amount of $C_{22}H_{24}N_2O_8$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 345 nm on filtered portions of the solution under test, suitably diluted with *Diluting solvent*, in comparison with a Standard solution having a known concentration of about 0.01 mg of USP Doxycycline Hyclate RS per mL in *Diluting solvent*.

Tolerances—Level 1 (6 Capsules tested): No individual value exceeds 50% dissolved. *Level 2* (6 Capsules tested): Not more than 2 individual values of 12 tested are greater than 50% dissolved.

BUFFER STAGE—[NOTE—Conduct this stage of testing on separate specimens, selecting Capsules that were not previously subjected to *Acid-stage* testing and transferring the contents of each Capsule to the individual basket units of the apparatus.]

Medium: pH 5.5 neutralized phthalate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 1000 mL.

Apparatus 1: 50 rpm.

Time: 30 minutes.

Diluting solvent: 0.1 N hydrochloric acid.

Procedure—Determine the amount of $C_{22}H_{24}N_2O_8$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 345 nm on filtered portions of the solution under test, suitably diluted with *Diluting solvent*, in comparison with a Standard solution having a known concentration of about 0.01 mg of USP Doxycycline Hyclate RS per mL in *Diluting solvent*.

Tolerances—Not less than 85% *(Q)* of the labeled amount of $C_{22}H_{24}N_2O_8$ is dissolved in 30 minutes.

TEST 1 (for products labeled as 0.3-, ▲0.45-,▲*USP28* and 0.625-mg tablets)—If the product complies with this test, the labeling indicates that it meets •USP *Dissolution Test 1.*•2

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Mobile phase—Prepare a filtered and degassed mixture of 0.025 M monobasic potassium phosphate and acetonitrile (3 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Transfer 10 Tablets to a 1000-mL volumetric flask, dilute with water to volume, and stir vigorously by mechanical means for at least 3 hours. Pipet a filtered 100-mL aliquot of the solution into a 900-mL volumetric flask, and dilute with water to volume.

Test solution—Filter a portion of the solution under test. [NOTE—It is recommended that the filters selected be tested for binding affinity.]

Chromatographic system—The liquid chromatograph is equipped with a 205-nm detector and a 4.6-mm × 3.0-cm column that contains 3-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph replicate injections of the *Standard solution,* and record the responses as directed for *Procedure:* the relative retention times are about 0.9 for equilin sulfate and 1.0 for estrone sulfate, the estrone sulfate peak being the last major peak in the chromatogram; the resolution, *R,* between equilin sulfate and estrone sulfate is not less than 1.5; and the relative standard deviation for the estrone sulfate peak is not more than 1.5%. [NOTE—If estrone is present it may be retained on the column for a period longer than 50 minutes and interfere in later chromatographic runs.]

Procedure—Separately inject equal volumes (between 20 and 200 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the estrone sulfate peaks. Calculate the percentage of estrone sodium sulfate released by the formula:

$$100(r_U/r_S),$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively.

Times and *Tolerances*—The percentages of estrone sodium sulfate dissolved at the times specified conform to •*Acceptance Table 2.*•2

Felodipine Extended-Release Tablets

Change to read:

•**Dissolution** ⟨711⟩—•2

▲*Medium:* pH 6.5 phosphate buffer with 1% sodium lauryl sulfate; 500 mL. (*Medium* is prepared as follows. Transfer 206 mL of 1 M monobasic sodium phosphate monohydrate, 196 mL of 0.5 M dibasic sodium phosphate anhydrous, and 50.0 g of sodium lauryl sulfate to a 5000-mL volumetric flask. Add approximately 4000 mL of water, and mix well. If necessary, adjust with 1 N sodium hydroxide to a pH of 6.5. Dilute with water to volume, and mix well.)

Apparatus 2: 50 rpm.

Times: 2, 6, and 10 hours.

Buffer solution—Prepare as directed in the *Assay.*

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, *Buffer solution,* and methanol (2.5 : 2 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Dissolve an accurately weighed quantity of USP Felodipine RS in alcohol to obtain a solution having a known concentration of 0.25 mg per mL.

Standard solution—Dilute an accurately measured volume of the *Standard stock solution* quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration of USP Felodipine RS equivalent to the concentration that would result from about 60% dissolution of a single Tablet in 500 mL of *Medium.*

Test solution—Place each Tablet in a specially made quadrangular basket of stainless steel wire gauze, soldered in one of its upper, narrow sides to the end of a steel rod (see *Figure 1*). Place the tablet cover in the horizontal diagonal of the basket. Put the rod assembly up through the cover of the dissolution vessel, and fix it by means of two teflon nuts, 3.2 cm from the center of the vessel, or by any other appropriate means. Adjust the lower edge of the bottom of the basket to approximately 1 cm above the top of the paddle blade (see *Figure 2*). Orient the large side of the basket tangentially to the flow stream with the Tablet standing on its edge. Pass a 10-mL portion of the solution under test, obtained at each time interval, through a suitable filter.

Chromatographic system—Proceed as directed in the *Assay.*

Procedure—Separately inject equal volumes (100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of felodipine ($C_{18}H_{19}Cl_2NO_4$) dissolved in the *Medium* by the formula:

$$CD(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Felodipine RS in the *Standard solution; D* is the dilution factor used in preparing the *Test solution;* and r_U and r_S are the felodipine peak areas obtained from the *Test solution* and the *Standard solution,* respectively.▲*USP28*

Tolerances—The percentages of the labeled amount of $C_{18}H_{19}ClNO_4$ dissolved at the times specified conform to •*Acceptance Table 2.*•2

Mobile phase, *Crude alliinase solution*, *Blank solution,* and *Chromatographic system*—Proceed as directed in the test for *Content of potential allicin.*

Standard solution—Dissolve an accurately weighed quantity of USP Alliin RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 50 µg per mL. Transfer 1.0 mL of this solution to a 5-mL volumetric flask containing 100 µL of *Crude alliinase solution*, mix, and allow to stand for 5 minutes at room temperature. Dilute with water to volume, and pass through a membrane filter having a 0.45-µm or finer porosity.

Test solution—Transfer 1.0 mL of the solution under test to a test tube containing 50 µL of 0.21 M carboxymethoxylamine hemihydrochloride. [NOTE—The solution must be transferred immediately upon removal from the dissolution vessel in order to inhibit the alliinase enzyme.]

Procedure—[NOTE—Do not perform the allicin determination in the *Acid stage.*] Determine the amount of allicin released by injecting equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the allicin peaks. Calculate the amount, in µg, of allicin released in the *Buffer stage* by the formula:

$$1050C(162.26/354.42)(r_U/r_S),$$

in which C is the concentration, in µg per mL, of USP Alliin RS in the *Standard solution;* 162.26 is the molecular weight of allicin; 354.42 is twice the molecular weight of alliin; and r_U and r_S are the peak responses for allicin obtained from the *Test solution* and the *Standard solution,* respectively. [NOTE—Q is the percentage of the labeled amount of potential allicin released only in the *Buffer stage.*]

Lansoprazole Delayed-Release Capsules

Change to read:

•**Dissolution** ⟨711⟩—Proceed as directed for *Procedure* for *Method A* under *Apparatus 1 and Apparatus 2, Delayed-Release Dosage Forms.*•2

ACID STAGE—

Acid stage medium: 0.1 N hydrochloric acid; 500 mL.

Apparatus 2: 75 rpm.

Time: 60 minutes.

Procedure—Withdraw a 25-mL aliquot and then proceed immediately as directed for *Test solution* in the *Buffer stage,* leaving the remaining 475 mL in the vessel for use in the *Buffer stage*. Using a filtered portion of the aliquot, determine the amount of $C_{16}H_{14}F_3N_3O_2S$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 306 nm, using *Acid stage medium* as the blank. Concomitantly determine the absorbance of the *Acid stage* test solution in comparison with a solution of USP Lansoprazole RS, having a known concentration equivalent to about 8% of the labeled amount of lansoprazole dissolved per 500 mL of *Acid stage medium.* [NOTE—A volume of methanol not to exceed 0.5% of the total volume of the Standard solution may be used to dissolve USP Lansoprazole RS prior to dilution with *Acid stage medium.*]

Tolerances—Not more than 10% of the labeled amount of $C_{16}H_{14}F_3N_3O_2S$ is dissolved in 60 minutes.

BUFFER STAGE—

Buffer concentrate—Transfer 65.4 g of monobasic sodium phosphate, 28.2 g of sodium hydroxide, and 12 g of sodium dodecyl sulfate to a suitable container, and add enough water to dissolve. Dilute with water to 4 L, and mix well.

Blank solution—Prepare a mixture of *Acid stage medium* and *Buffer concentrate* (19 : 17). Adjust, if necessary, with either phosphoric acid or sodium hydroxide to a pH of 6.8.

Test solution—Add 425 mL of *Buffer concentrate* to the remaining 475 mL of solution in each vessel from the *Acid stage.* Adjust, if necessary, with either phosphoric acid or sodium hydroxide to a pH of 6.8.

Apparatus 2: 75 rpm.

Time: 60 minutes.

Procedure—Determine the amount of $C_{16}H_{14}F_3N_3O_2S$ dissolved in filtered portions of the *Test solution*, using the difference between the absorbances at the wavelengths of about 286 nm and 650 nm, with *Blank solution* as the blank. Concomitantly determine the absorbances of the *Test solution* in comparison with the solution of USP Lansoprazole RS having a known concentration equivalent to about 70% of the labeled amount of lansoprazole dissolved in 900 mL of *Blank solution.* [NOTE—An amount of methanol not to exceed 2% of the total volume of the Standard solution may be used to dissolve USP Lansoprazole RS prior to dilution with *Blank solution.*]

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{16}H_{14}F_3N_3O_2S$ is dissolved in 60 minutes.

•(Official April 1, 2006)•2

Liothyronine Sodium Tablets

Change to read:

Dissolution ⟨711⟩—[NOTE—All containers that are in contact with solutions containing liothyronine sodium are to be made of glass.]

Medium: pH 10.0 ± 0.05 alkaline borate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 250 mL.

Apparatus 3: ••2 30 dips per minute, using 20-mesh screen on the top and 40-mesh screen on the bottom of the glass reciprocating cylinder.

Time: 45 minutes.

Determine the amount of liothyronine sodium ($C_{15}H_{12}I_3NO_4$) dissolved by employing the following method.

Ammoniated solution—Add 0.05 mL of ammonium hydroxide to 200 mL of water.

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (55 : 45) that contains 1 mL of phosphoric acid in each 1000 mL of solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Liothyronine RS in *Ammoniated solution*, and dilute quantitatively, and stepwise if necessary, with *Ammoniated solution* to obtain a solution having a known concentration of about 10 µg of USP Liothyronine RS per mL. Dilute a portion of this solution quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.5 µg of USP Liothyronine RS per mL.

Test solution—Transfer 20 mL of the solution under test to a centrifuge tube, and centrifuge until a clear supernatant is obtained.

Resolution solution—Prepare a solution of USP Liothyronine RS and USP Levothyroxine RS in *Ammoniated solution* having known concentrations of about 10 µg of each USP Reference Standard per mL. Dilute with water to obtain a concentration of about 0.5 µg of each USP Reference Standard per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 25-cm column that contains packing L10. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure:* the resolution, *R,* between liothyronine and levothyroxine is not less than 3.0. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 4.0%.

Procedure—Separately inject equal volumes (about 200 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of $C_{15}H_{12}I_3NO_4$ dissolved.

Interim Revision Announcement

Tolerances—Not less than 70% *(Q)* of the labeled amount of $C_{15}H_{12}I_3NO_4$ is dissolved in 45 minutes.

Megestrol Acetate Oral Suspension

Add the following:

•**Labeling**—When more than one test for *Dissolution* is given, the labeling states the test used only if *Test 1* is not used.•2

Change to read:

Dissolution ⟨711⟩—

•TEST 1—

Medium: 0.5% sodium lauryl sulfate in water; 900 mL.

Apparatus 2: 25 rpm.

Time: 30 minutes.

Standard solution—Transfer about 45 mg, accurately weighed, of USP Megestrol Acetate RS to a 250-mL volumetric flask, add about 12 mL of methanol, and put the flask in a warm water bath until the solid is dissolved. Dilute with *Medium* to volume. The final concentration is about 18 µg of megestrol acetate per mL.

Procedure—Transfer to the surface of the *Medium* in the dissolution vessel an accurately measured volume of Oral Suspension, freshly mixed and free from air bubbles, equivalent to about 160 mg of megestrol acetate. Determine the amount of $C_{24}H_{32}O_4$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 292 nm on filtered portions of the solution under test, in comparison with the *Standard solution.* Calculate the percentage of megestrol acetate ($C_{24}H_{32}O_4$) released by the formula:

$$\frac{A_U \times C_S \times 900 \times 100}{A_S \times V \times LC},$$

in which A_U and A_S are the absorbances obtained from the solution under test and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Standard solution; V* is the sample volume, in mL, of Oral Suspension taken; 900 is the volume, in

Interim Revision Announcement

mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the label claim, in mg per mL.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{24}H_{32}O_4$ is dissolved in 30 minutes.

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: 0.5% sodium lauryl sulfate in water; 900 mL.

Apparatus 2: 25 rpm.

Time: 30 minutes.

Standard solution—Transfer about 45 mg, accurately weighed, of USP Megestrol Acetate RS to a 250-mL volumetric flask. Add about 5 mL of methanol, and mix. Dilute with *Medium* to volume. Transfer 10 mL of this solution to a 100-mL volumetric flask, and dilute with *Medium* to volume. The final concentration is about 18 µg per mL.

Test solution—[NOTE—Use a separate syringe for each vessel.] Withdraw more than 10 mL of the Oral Suspension, using a 10-mL syringe with a long cannula. Remove air bubbles from the syringe. Adjust the volume to the 10-mL mark on the syringe, and remove the needle. Wipe the tip of the syringe, and accurately weigh (gross weight). Operate the apparatus, and rapidly dispense the Oral Suspension to the side of the vessel at about halfway from the bottom. Similarly dispense the Oral Suspension into other vessels. Accurately weigh each syringe after dispensing the sample (tare weight). Record sample weights. After completion of the dissolution, pass an aliquot through a nylon filter having a 0.45-µm porosity, and dilute 2.0 mL of the filtrate with *Medium* to 50.0 mL to obtain a solution having a theoretical concentration of about 18 µg per mL.

Procedure—Determine the amount of $C_{24}H_{32}O_4$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 292 nm, using 0.5-cm pathlength cuvettes, on the *Test solution* in comparison with the *Standard solution*. Calculate the percentage of megestrol acetate ($C_{24}H_{32}O_4$) released by the formula:

$$\frac{A_U \times C_S \times 900 \times d \times 100}{A_S \times W_U \times LC},$$

in which A_U and A_S are the absorbances obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Standard solution; d* is the density, in mg per mL, of the Oral Suspension obtained by dividing the weight of Oral Suspension taken by 10 mL; W_U is the weight, in mg, of Oral Suspension taken; 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the label claim, in mg per mL.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{24}H_{32}O_4$ is dissolved in 30 minutes.

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium: 0.5% sodium lauryl sulfate in degassed water; 900 mL. Use ultrapure sodium lauryl sulfate with an assay content of not less than 99.0%.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Determine the amount of $C_{24}H_{32}O_4$ dissolved employing the following method.

Mobile phase—Proceed as directed in the *Assay.*

Standard solution—Transfer about 11.5 mg, accurately weighed, of USP Megestrol Acetate RS to a 25-mL volumetric flask, and dilute with *Mobile phase* to volume.

Test solution—Proceed as directed for *Test 2,* introducing the sample into the vessel over a 10- to 15-second period (about 1 mL per second).

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay.*

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of megestrol acetate ($C_{24}H_{32}O_4$) released by the formula:

$$\frac{r_U \times C_S \times 900 \times d \times 100}{r_S \times W_U \times LC},$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Standard solution; d* is the density, in mg per mL, of the Oral Suspension obtained by dividing the weight of Oral Suspension taken by 10 mL; W_U is the weight, in mg, of Oral Suspension taken; 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the label claim, in mg per mL.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{24}H_{32}O_4$ is dissolved in 30 minutes.●2

Mesalamine Extended-Release Capsules

Interim Revision Announcement

Mesalamine Delayed-Release Tablets

Change to read:

•**Dissolution** ⟨711⟩—•2

pH 6.0 Phosphate buffer—Transfer about 43.35 g of monobasic potassium phosphate and 1.65 g of sodium hydroxide to a 2-L volumetric flask. Dissolve in and dilute with water to volume, and mix. Adjust with 1 N sodium hydroxide or phosphoric acid to a pH of 6.0, and mix.

Sodium hydroxide solution—Transfer 133.6 g of sodium hydroxide to a 2-L volumetric flask, dissolve in and dilute with water to volume, and mix.

Media: 0.1 N hydrochloric acid, 500 mL for *Acid stage; pH 6.0 Phosphate buffer*, 900 mL for *Buffer stages*.

Apparatus 2: 100 rpm for *Acid stage* and for *Buffer stage 1;* 50 rpm for *Buffer stage 2*.

Times: 2 hours for *Acid stage;* 1 hour for *Buffer stage 1;* 90 minutes for *Buffer stage 2*.

ACID STAGE—After 2 hours of operation, withdraw an aliquot of the fluid, discard the remaining solution, and retain the Tablets in proper order, so that each will be returned to its respective vessel later on. Blot the Tablets with a paper towel to dry, and proceed immediately as directed for *Buffer stage 1*.

Procedure—Determine the amount of $C_7H_7NO_3$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 302 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Mesalamine RS, equivalent to about 1% of the labeled amount of $C_7H_7NO_3$, in the same *Medium*.

Tolerances—The percentage of the labeled amount of $C_7H_7NO_3$ dissolved from the units tested conforms to the *Acceptance Table* shown below. Continue testing through all levels unless the results conform at an earlier level.

BUFFER STAGE 1—[NOTE—Use buffer that has been equilibrated to a temperature of 37 ± 0.5°.] Transfer *pH 6.0 Phosphate buffer* to each of the dissolution vessels, and place each Tablet from the *Acid stage* into its respective vessel. After 1 hour remove a 50-mL aliquot, and proceed immediately as directed for *Buffer stage 2*.

Procedure—Determine the amount of $C_7H_7NO_3$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 330 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Mesalamine RS, equivalent to about 1% of the labeled amount of $C_7H_7NO_3$, in the same *Medium*.

Tolerances—The percentage of the labeled amount of $C_7H_7NO_3$ dissolved from the units tested conforms to the *Acceptance Table* shown below. Continue testing through all levels unless the results conform at an earlier level.

Acceptance Table

Level	Number Tested	Criteria
L_1	6	No individual value exceeds 1% dissolved.
L_2	6	Average of the 12 units ($L_1 + L_2$) is not more than 1% dissolved, and no individual unit is greater than 10% dissolved.
L_3	12	Average of the 24 units ($L_1 + L_2 + L_3$) is not more than 1% dissolved, and not more than one individual unit is greater than 10% dissolved.

BUFFER STAGE 2—Add 50 mL of *Sodium hydroxide solution* to each dissolution vessel to adjust to a pH of 7.2, and continue the run.

Procedure—Determine the amount of $C_7H_7NO_3$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 332 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Mesalamine RS in the same *Medium*.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_7H_7NO_3$ is dissolved. The requirements are met if the quantities dissolved from the product conform to •*Acceptance Table 4.*•2 Continue testing through all levels unless the results conform at an earlier level.

Morphine Sulfate Extended-Release Capsules

Change to read:

•**Dissolution** ⟨711⟩—•2

pH 7.5 Phosphate buffer—Dissolve 6.8 g of monobasic potassium phosphate and 1.6 g of sodium hydroxide in 1 L of water. Adjust with phosphoric acid or 2 N sodium hydroxide to a pH of 7.5.

Medium—Proceed as directed for •*Procedure* for *Method B* under *Apparatus 1 and Apparatus 2, Delayed-Release Dosage Forms,*•2 observing the following exceptions. Perform *Acid stage* testing, using 500 mL of 0.1 N hydrochloric acid for 1 hour; and perform *Buffer stage* testing, using 500 mL of *pH 7.5 Phosphate buffer* for not less than 8 hours.

Apparatus 1: 100 rpm.

Times: 1, 4, 6, and 9 hours.

Determine the amount of $(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water, methanol, and glacial acetic acid (72 : 28 : 1), containing 0.73 g of sodium 1-heptanesulfonate. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve suitable quantities of phenol and USP Morphine Sulfate RS in *Mobile phase* to obtain a solution containing about 0.1 mg of each per mL.

Standard solution—Dissolve an accurately weighed quantity of USP Morphine Sulfate RS in *pH 7.5 Phosphate buffer,* and dilute quantitatively, and stepwise if necessary, with *pH 7.5 Phosphate buffer* to obtain a solution having a known concentration corresponding to that of the solution under test.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 284-nm detector and a 3.9-mm × 30.0-cm column that contains 10-µm packing L1. The flow rate is about 2 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.8 for phenol and 1.0 for morphine sulfate; the resolution, *R,* between the phenol and morphine sulfate peaks is not less than 2.0; the tailing factor for the morphine sulfate peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the filtered portion of the solution under test into the chromatograph, record the chromatograms, and measure the peak responses. Determine the amount of $(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O$ dissolved from the measured peak responses.

Tolerances—The percentage of the labeled amount of $(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O$ dissolved in 1 hour conforms to •*Acceptance Table 3.*•2 The percentages of the labeled amount of $(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O$ dissolved at the other times specified conform to •*Acceptance Table 2.*•2

Nicotine Transdermal System

Change to read:

Drug release ⟨724⟩—

TEST 1—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 1.*

Medium: Phosphoric acid solution (1 in 1000); 250 mL, in a tall-form beaker.

Apparatus 7—Proceed as directed in the chapter, using the transdermal system holder—cylinder •(see *Figure 4b*).•2 Center the Transdermal System onto a dry, unused 10-cm × 10-cm piece of Cuprophan dialysis membrane with the adhesive side against the membrane, taking care to eliminate air bubbles between the membrane and the release surface. Attach the membrane to the cylinder using two Parker O-rings, such that one of the borders of the transdermal system is aligned to the groove and it is wrapped around the cylinder. The filled beakers are weighed and pre-equilibrated to 32.0 ± 0.3°, prior to immersing the test sample. Reciprocate at a frequency of about 30 cycles per minute with an amplitude of 2.0 ± 0.1 cm. At the end of each time interval, transfer the test sample to a fresh beaker containing the appropriate volume of *Medium*, weighed and pre-equilibrated to 32.0 ± 0.3°. At the end of each release interval, allow the beakers to cool to room temperature, make up for evaporative losses by adding water to obtain the original weight, and mix. This solution is the final *Test solution*.

Times: 2, 12, and 24 hours.

Determine the amount of $C_{10}H_{14}N_2$ released by employing the following method.

Mobile phase—Transfer 0.2 mL of *N,N*-dimethyloctylamine to a 1-L volumetric flask, add 220 mL of acetonitrile, and mix. Add 300 mL of water, 0.2 mL of glacial acetic acid, 0.20 g of anhydrous sodium acetate, and 0.55 g of sodium 1-dodecanesulfonate, and dilute with water to volume. Mix for 1 hour until clear. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩). [NOTE—Equilibration of the column may take as long as 3 hours.]

Standard solution—Dissolve an accurately weighed quantity of USP Nicotine Bitartrate Dihydrate RS in *Dissolution Medium*, and dilute quantitatively, and stepwise if necessary, with *Dissolution Medium* to obtain a solution having a known concentration of about 0.142 mg of nicotine bitartrate per mL (or 0.046 mg nicotine as free base per mL). [NOTE—About 80 mL of this solution is required in order to prepare the *System suitability solution.*]

System suitability solution—Transfer 8 mg (free base) of nicotine to a 100-mL volumetric flask, and dissolve in 10 mL of acetonitrile. Add 5 mL of 30 percent hydrogen peroxide, and allow 15 minutes to react. Dilute with *Dissolution Medium* to volume, and mix. Transfer 20 mL of this solution to a 100-mL volumetric flask, dilute with *Standard solution* to volume, and mix.

Interim Revision Announcement

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the resolution, *R*, between nicotine and any degradation peaks is not less than 1.1; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 50 µL) of filtered portions of the *Standard solution* and the solution under test into the chromatograph, record the chromatograms, and measure the responses for the major peaks.

Tolerances—The amount of $C_{10}H_{14}N_2$ released, as a percentage of the labeled amount of the dose absorbed in vivo, at the times specified below, conforms to •*Acceptance Table 1*.•$_2$

Time (hours)	Amount dissolved
0–2	between 31% and 87%
2–12	between 62% and 191%
12–24	between 85% and 261%

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 2*.

Phosphate buffer—Dissolve 40.0 g of sodium chloride, 1.0 g of potassium chloride, 8.66 g of dibasic sodium phosphate, and 1.0 g of monobasic potassium phosphate in 5 L of water.

Medium: Phosphate buffer; 500 mL.

Apparatus 6: 50 rpm, double-sided tape being used to attach the Transdermal System to the cylinder.

Times: 6 and 24 hours.

Determine the amount of $C_{10}H_{14}N_2$ released by employing the following method.

Mobile phase—Proceed as directed in the *Assay*.

System suitability solution—Transfer 1.0 mL of the *System suitability solution*, prepared as directed in the *Assay*, to a 100-mL volumetric flask, dilute with *Dissolution Medium* to volume, and mix.

Standard solution—Pipet 6.0 mL of the *Standard preparation*, prepared as directed in the *Assay*, into a 50-mL volumetric flask, dilute with *Dissolution Medium* to volume, and mix. Dilute quantitatively and stepwise with *Dissolution Medium* to obtain an appropriate final concentration.

Test solution—At each of the test times, withdraw a 2-mL aliquot of the solution under test. [NOTE—Replace the aliquots withdrawn for analysis with fresh portions of *Medium*.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 260-nm detector and a 4.6-mm × 12.5-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution* used for the 6-hour interval, and record the peak responses as directed for *Procedure:* the resolution, *R,* between 4,4′-dipyridyl dihydrochloride and nicotine is not less than 5.0; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the filtered portion of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks.

Tolerances—The amount of $C_{10}H_{14}N_2$ released, as a percentage of the labeled amount of the dose absorbed in vivo, at the times specified, conforms to •*Acceptance Table 1*.•$_2$

Time (hours)	Amount dissolved
6	between 71% and 157%
24	between 156% and 224%

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 3*.

Medium: water; 900 mL.

Apparatus 5: 50 rpm, the stainless steel disk assembly being replaced with a 5-cm watch glass for an 11-mg Transdermal System and an 8-cm watch glass for a 22-mg Transdermal System.

Times: 1, 2, and 4 hours.

Standard solution—Prepare a solution of USP Nicotine Bitartrate RS in water having a known concentration of nicotine similar to that of the solution under test.

Procedure—Determine the amount of $C_{10}H_{14}N_2$ released by employing UV absorption at the wavelength of maximum absorbance at about 259 nm, in comparison with the *Standard solution*, using water as the blank.

Tolerances—The amount of $C_{10}H_{14}N_2$ released, as a percentage of the labeled amount of the dose absorbed in vivo, at the times specified, conforms to the following *Acceptance Table*.

Time (hours)	Amount dissolved
1	between 35% and 75%
2	between 55% and 95%
4	not less than 73%

Acceptance Table

Level	Tested	Criteria
L_1	6	No individual value lies outside each of the stated ranges and no individual value is less than the stated amount at the final test time.
L_2	6	The average value of the 12 units ($L_1 + L_2$) lies within each of the stated ranges and is not less than the stated amount at the final test time; none is more than 5% of the labeled content outside each of the stated ranges; and none is more than 5% of the labeled content below the stated amount at the final test time.
L_3	12	The average value of the 24 units ($L_1 + L_2 + L_3$) lies within each of the stated ranges and is not less than the stated amount at the final test time; not more than 2 of the 24 units are more than 5% of labeled content outside each of the stated ranges; not more than 2 of the 24 units are more than 5% of the labeled content below the stated amount at the final test time; and none of the units is more than 10% of the labeled content outside each of the stated ranges or more than 10% of the labeled content below the stated amount at the final test time.

TEST 4—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 4*.

Medium: 0.025 N hydrochloric acid; 600 mL.

Apparatus 5: 50 rpm, a convex screen being used to hold the Transdermal System in position during testing.

Times: 4 and 16 hours.

Standard solution and *Procedure*—Proceed as directed under *Test 3*.

Tolerances—The amount of $C_{10}H_{14}N_2$ released, as a percentage of the labeled amount of the dose absorbed in vivo, at the times specified, conforms to •*Acceptance Table 1*.•$_2$

Time (hours)	Amount dissolved
4	between 36% and 66%
16	between 72% and 112%

TEST 5—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 5*.

Phosphate buffer, Medium, and *Apparatus*—Proceed as directed under *Test 2*.

Times: 3, 6, and 24 hours.

Mobile phase—Proceed as directed in the *Assay*.

System suitability solution, *Standard solution*, *Test solution*, and *Chromatographic system*—Proceed as directed under *Test 2*.

Procedure—Proceed as directed under *Test 2* except to inject about 30 µL.

Tolerances—The amount of $C_{10}H_{14}N_2$ released, as a percentage of the labeled amount of the dose absorbed in vivo, at the times specified, conforms to •*Acceptance Table 1*.•$_2$

Time (hours)	Amount dissolved
3	between 79% and 112%
6	between 108% and 141%
24	between 156% and 202%

Nitrofurantoin Capsules

Change to read:

Dissolution ⟨711⟩—

TEST 1 (where it is labeled as containing nitrofurantoin macrocrystals)—

Medium: pH 7.2 (±0.05) phosphate buffer; 900 mL.

Apparatus 1: 100 rpm.

Times: 1, 3, and 8 hours.

Procedure—Determine the amount of $C_8H_6N_4O_5$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 375 nm on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Nitrofurantoin RS in the same *Medium.*

Tolerances—The percentage of the labeled amount of $C_8H_6N_4O_5$ dissolved at the 1-hour point conforms to •*Acceptance Table 2,*•2 and the percentages dissolved at the 3- and 8-hour points conform to the criteria for the final test time in •*Acceptance Table 2.*•2

Time (hours)	Amount dissolved
1	between 20% and 60%
3	not less than 45%
8	not less than 60%

TEST 2 (where it is labeled as containing both nitrofurantoin macrocrystalline and monohydrate forms)—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

Acid medium: 0.01 N hydrochloric acid for 1 hour; 900 mL.

pH 7.5 Buffer medium—Prepare a pH 7.5 buffer concentrate by dissolving 62.2 g of potassium hydroxide and 129.3 g of monobasic potassium phosphate in water, dilute with water to 1 L, and mix. After 1 hour change the *Acid medium* to *pH 7.5 Buffer medium* by adding 50 mL of pH 7.5 buffer concentrate, for an additional 6 hours.

Apparatus 2: 100 rpm, with sinkers made of teflon-coated steel wire prepared by forming a coil approximately 22 mm long from a 13-cm length of 20-gauge wire (see *Figure 1*).

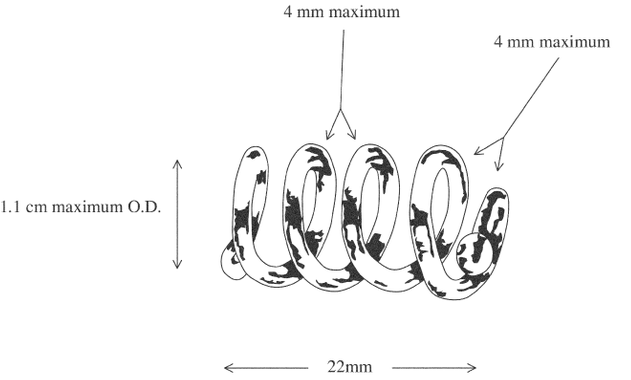

Fig. 1. Sinker.

Times: 1, 3, and 7 hours.

Acid-stage standard solution—Prepare a solution of USP Nitrofurantoin RS in *Acid medium* to obtain a solution having a known concentration of about 0.025 mg per mL.

Buffer-stage standard solution—Prepare a solution of USP Nitrofurantoin RS in *pH 7.5 Buffer medium* to obtain a solution having a known concentration of about 0.075 mg per mL.

Procedure—Determine the amount of $C_8H_6N_4O_5$ dissolved from UV absorbances at the isosbestic wavelength at about 375 nm on filtered portions of each solution under test, suitably diluted, if necessary, with *Acid medium* or *pH 7.5 Buffer medium* when appropriate in comparison with the appropriate *Standard solution.*

Tolerances—The percentages of the labeled amount of $C_8H_6N_4O_5$ dissolved at the specified times conform to the accompanying *Acceptance Table.*

Time (hours)	Amount dissolved (individual)	Amount dissolved (mean)
1	between 2% and 16%	between 5% and 13%
3	between 27% and 69%	between 39% and 56%
7	not less than 68%	not less than 81%

Acceptance Table

Level	Number Tested	Criteria
L_1	12	The mean percentage of dissolved label claim lies within the range for the means at each interval and is not less than the stated amount at the final test time. All individual values lie within the ranges for the individuals at each interval and are not less than the stated amount at the final test time.
L_2	12	The mean percentage of dissolved label claim lies within the range for the means at each interval and is not less than the stated amount at the final test time. Not more than 2 of the 24 individual values lie outside the stated ranged for individuals at each interval, and not more than 2 of 24 are less than the stated amount at the final test time.

•(Official April 1, 2006)•2

Interim Revision Announcement

Omeprazole Delayed-Release Capsules

Change to read:

Labeling—When more than one •*Dissolution Test*•$_2$ is given, the labeling states the •*Dissolution Test*•$_2$ used only if *Test 1* is not used.

•(Official April 1, 2006)•$_2$

Change to read:

•**Dissolution** ⟨711⟩—•$_2$

TEST 1—••$_2$

ACID RESISTANCE STAGE—

Medium: 0.1 N hydrochloric acid; 500 mL.

Apparatus 2: 100 rpm.

Time: 2 hours.

pH 7.6 Phosphate buffer, Mobile phase, and *Chromatographic system*—Proceed as directed for *Buffer stage.*

Standard solution—Transfer about 50 mg of USP Omeprazole RS, accurately weighed, to a 250-mL volumetric flask, dissolve in 50 mL of alcohol, dilute with 0.01 M sodium borate solution to volume, and mix. Transfer 10.0 mL of this solution into a 100-mL volumetric flask, add 20 mL of alcohol, dilute with 0.01 M sodium borate solution to volume, and mix.

Test solution—After 2 hours, filter the *Dissolution Medium* containing the pellets through a sieve with an aperture of not more than 0.2 mm. Collect the pellets on the sieve, and rinse them with water. Using approximately 60 mL of 0.01 M sodium borate solution, carefully transfer the pellets quantitatively to a 100-mL volumetric flask. Sonicate for about 20 minutes until the pellets are broken up. Add 20 mL of alcohol to the flask, dilute with 0.01 M sodium borate solution to volume, and mix. Dilute an appropriate amount of this solution with 0.01 M sodium borate solution to obtain a solution having a concentration of about 0.02 mg per mL. •At level L_1, test 6 units. Test 6 additional units at level L_2, and at level L_3, an additional 12 units are tested. Continue testing through the three levels unless the results conform at either L_1 or L_2.•$_2$

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of omeprazole ($C_{17}H_{19}N_3O_3S$) dissolved in the *Medium* by the formula:

$$T - CD(r_U / r_S),$$

in which T is the labeled quantity, in mg, of omeprazole in the capsule; C is the concentration, in mg per mL, of USP Omeprazole RS in the *Standard solution; D* is the dilution factor used in preparing the *Test solution;* and r_U and r_S are the omeprazole peak responses obtained from the *Test solution* and the *Standard solution,* respectively.

Tolerances—Level L_1*:* no individual value exceeds 15% of omeprazole dissolved. Level L_2*:* the average of 12 units is not more than 20% of omeprazole dissolved, and no individual unit is greater than 35% of omeprazole dissolved. Level L_3*:* the average of 24 units is not more than 20% of omeprazole dissolved, not more than 2 units are greater than 35% of omeprazole dissolved, and no individual unit is greater than 45% of omeprazole dissolved.

BUFFER STAGE—

Medium: pH 6.8 phosphate buffer, 900 mL.

Proceed as directed for *Acid resistance stage* with a new set of capsules from the same batch. After 2 hours, add 400 mL of 0.235 M dibasic sodium phosphate to the 500 mL of 0.1 N hydrochloric acid medium in the vessel. Adjust, if necessary, with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of 6.8 ± 0.05.

Apparatus 2: 100 rpm.

At the end of 30 minutes, determine the amount of $C_{17}H_{19}N_3O_3S$ dissolved in pH 6.8 phosphate buffer by employing the following method.

pH 10.4, 0.235 M Dibasic sodium phosphate—Dissolve 33.36 g of anhydrous dibasic sodium phosphate in 1000 mL of water, and adjust with 2 N sodium hydroxide to a pH of 10.4 ± 0.1.

pH 6.8 Phosphate buffer—Add 400 mL of 0.1 N hydrochloric acid to 320 mL of *pH 10.4, 0.235 M Dibasic sodium phosphate,* and adjust with 2 N hydrochloric acid or 2 N sodium hydroxide, if necessary, to a pH of 6.8 ± 0.05.

pH 7.6 Phosphate buffer—Dissolve 0.718 g of monobasic sodium phosphate and 4.49 g of dibasic sodium phosphate in 1000 mL of water. Adjust with 2 N hydrochloric acid or 2 N sodium hydroxide, if necessary, to a pH of 7.6 ± 0.1. Dilute 250 mL of this solution with water to 1000 mL.

Mobile phase—Transfer 340 mL of acetonitrile to a 1000-mL volumetric flask, dilute with *pH 7.6 Phosphate buffer* to volume, and pass through a membrane filter having a 0.5-µm or finer porosity. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution 1 (for Capsules labeled 10 mg)—Dissolve an accurately weighed quantity of USP Omeprazole RS in alcohol to obtain a solution having a known concentration of about 2 mg per mL. Dilute with *pH 6.8 Phosphate buffer* quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.01 mg per mL. Immediately add 2 mL of 0.25 M sodium hydroxide to 10 mL of this solution, and mix. [NOTE—Do not allow the solution to stand before adding the sodium hydroxide solution.]

Standard solution 2 (for Capsules labeled 20 mg and 40 mg)—Proceed as directed for *Standard solution 1,* except to obtain a solution having a known concentration of about 0.02 mg per mL before mixing with 2 mL of 0.25 M sodium hydroxide.

Test solution 1 (for Capsules containing 10 mg and 20 mg)—Immediately transfer 5.0 mL of the solution under test to a test tube containing 1.0 mL of 0.25 M sodium hydroxide. Mix well, and pass through a membrane filter having a 1.2-µm or finer porosity. Protect from light.

Test solution 2 (for Capsules labeled 40 mg)—Immediately transfer 5.0 mL of the solution under test to a test tube containing 2.0 mL of 0.25 M sodium hydroxide and 5 mL of *pH 6.8 Phosphate buffer.* Mix well, and pass through a membrane filter having a 1.2-µm or finer porosity. Protect from light.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.0-mm × 12.5-cm analytical column that contains 5-µm packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the appropriate *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 2000 theoretical plates, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the appropriate *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of omeprazole ($C_{17}H_{19}N_3O_3S$) dissolved by the formula:

$$VCD(r_U / r_S),$$

in which V is the volume of *Medium* in each vessel; C is the concentration, in mg per mL, of USP Omeprazole RS in the appropriate *Standard solution; D* is the dilution factor used in preparing the appropriate *Test solution;* and r_U and r_S are the omeprazole peak responses obtained from the appropriate *Test solution* and the *Standard solution,* respectively.

Tolerances—For Capsules labeled 10 and 20 mg, not less than 75% *(Q)* of the labeled amount of $C_{17}H_{19}N_3O_3S$ is dissolved in 30 minutes. For Capsules labeled 40 mg, not less than 70% (*Q*) of the labeled amount of $C_{17}H_{19}N_3O_3S$ is dissolved in 30 minutes. •The requirements are met if the quantities dissolved from the product conform to *Acceptance Table 1.*•$_2$

TEST 2 —•$_{\bullet 2}$ If the product complies with this test, the labeling indicates that it meets •USP *Dissolution Test 2.*$_{\bullet 2}$

ACID RESISTANCE STAGE—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 1: 100 rpm.

Time: 2 hours.

Procedure—After 2 hours, remove each sample from the basket, and quantitatively transfer into separate volumetric flasks to obtain a solution having a final concentration of about 0.2 mg per mL. Proceed as directed for the *Assay preparation* in the *Assay,* starting with "Add about 50 mL of *Diluent*". Calculate the quantity, in mg, of omeprazole ($C_{17}H_{19}N_3O_3S$) dissolved in the *Medium* by the formula:

$$T - CD(r_U / r_S),$$

in which T is the assayed quantity, in mg, of omeprazole in the capsule; C is the concentration, in mg per mL, of USP Omeprazole RS in the *Standard solution; D* is the dilution factor used in preparing the *Test solution;* and r_U and r_S are the omeprazole peak responses obtained from *Test solution* and *Standard solution,* respectively.

Tolerances—It complies with the following *Acceptance Table:*

Acceptance Table

Level	Criterion
L_1	the average of the 6 units is not more than 10% of omeprazole dissolved
L_2	the average of the 12 units is not more than 10% of omeprazole dissolved
L_3	the average of the 24 units is not more than 10% of omeprazole dissolved

BUFFER STAGE—

Medium: 0.05 M pH 6.8 phosphate buffer; 900 mL (see *Reagents, Indicators, and Solutions*).

Apparatus 1: 100 rpm.

Time: 45 minutes.

Procedure—Proceed as directed for *Acid resistance stage* with a new set of capsules from the same batch. After 2 hours, replace the acid medium with the buffer medium and continue the test for 45 more minutes. Determine the amount of $C_{17}H_{19}N_3O_3S$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 305 nm on portions of the solutions under test passed through a 0.2-µm nylon filter, in comparison with a Standard solution having a known concentration of USP Omeprazole RS in the same *Medium.*

Tolerances—It complies with •*Acceptance Table 1*$_{\bullet 2}$ under *Dissolution* ⟨711⟩. Not less than 75% *(Q)* of the labeled amount of $C_{17}H_{19}N_3O_3S$ is dissolved in 45 minutes.

•(Official April 1, 2006)$_{\bullet 2}$

Oxandrolone Tablets

Delete the following:

•**Disintegration** ⟨701⟩: 15 minutes.$_{\bullet 2}$

Add the following:

•**Dissolution** ⟨711⟩—

Medium: a solution of water and isopropanol (7 : 3); 500 mL.

Apparatus 2: 100 rpm.

Time: 60 minutes.

Determine the amount of $C_{19}H_{30}O_3$ dissolved by employing the following method.

Internal standard solution—Dissolve accurately weighed quantities of 17α-methyl testosterone, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a concentration of about 0.2 mg per mL (for tablets with 2.5-mg label claim) and about 0.8 mg per mL (for tablets with 10-mg label claim).

Standard solution—Dissolve an accurately weighed quantity of USP Oxandrolone RS, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a concentration of about 1 mg per mL.

Working standard solution—Combine 100 µL of the *Standard solution,* 400 µL of the *Internal standard solution,* and 1500 µL of acetonitrile.

Test solution—Withdraw 25 mL of the solution under test from the vessel. Pass through a 0.45-µm polytef filter. Transfer 20 mL of the filtrate to a separatory funnel, add 400 µL of the *Internal standard solution,* 40 mL of 10% potassium chloride solution, and 8 mL of chloroform. In separate separatory funnels, prepare an extraction blank and an internal standard blank in a similar manner using 20 mL of filtered *Medium* in place of the solution under test and excluding the *Internal standard solution* from the extraction blank. Shake each funnel, and allow the layers to separate. Collect the lower chloroform layer. Repeat the extraction procedure one more time. Evaporate the solvents under a stream of nitrogen at 45° until just dry. Reconstitute the dried residue with 2 mL of acetonitrile (for tablets with 2.5-mg label claim) or with 8 mL of acetonitrile (for tablets with 10-mg label claim), and sonicate for 10 minutes.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 30-m column coated with a 0.5-µm phase G27. The carrier gas is helium, flowing at a rate of about 16.8 mL per minute. The injection port and detector temperatures are maintained at 190° and 320°, respectively. The chromatograph is programmed as follows. Upon injection, the column temperature is increased at a rate of 25° per minute to 280°, and maintained at 280° for 3 minutes. Then the column temperature is increased at a rate of 10° per minute to 320°, and maintained at 320° for 3 minutes. Chromatograph the acetonitrile, the extraction blank, and the internal standard blank, and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5. Make two injections of the *Working standard solution,* and record the peak responses. The average oxandrolone/*Internal standard solution* peak area percent comparison is between 98.0% and 102.0%. The resolution, *R,* between the oxandrolone peak and the nearest eluting peak is equal to or greater than 1.5.

Procedure—Separately inject equal volumes (0.5 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{19}H_{30}O_3$ released by the formula:

$$\frac{C_S \times \text{sample ratio} \times V_{UF} \times 500 \times 100}{\text{Standard ratio} \times V_{UI} \times LC},$$

in which C_S is the concentration, in mg per mL, of oxandrolone in the *Standard solution;* sample ratio is the area ratio of oxandrolone to 17α-methyltestosterone in the sample injection for each *Test solution;* V_{UF} is the final volume, in mL, of the sample after reconstitution of the dry residue; 500 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; standard ratio is the mean area ratio of oxandrolone to 17α-methyltestosterone in all injec-

Interim Revision Announcement

tions of the *Standard solution;* V_{UI} is the initial sample volume, in mL, used in the extraction; and *LC* is the tablet label claim, in mg.

Tolerances—Not less than 75% *(Q)* of the labeled amount of oxandrolone ($C_{19}H_{30}O_3$) is dissolved in 60 minutes.●2

Oxprenolol Hydrochloride Extended-Release Tablets

Change to read:

Phenylpropanolamine Hydrochloride Extended-Release Capsules

Change to read:

Labeling—The labeling indicates the •USP *Dissolution Test*•2 with which the product complies.

•(Official April 1, 2006)•2

Change to read:

•**Dissolution** ⟨711⟩—•2

TEST 1—If the product complies with this test, the labeling indicates that it meets •USP *Dissolution Test 1.*•2

Medium: water; 1000 mL.

Apparatus 1: 100 rpm.

Times: 3, 6, and 12 hours.

Determine the amount of $C_9H_{13}NO \cdot HCl$ dissolved by employing the following method.

Solvent A—Dissolve 1.9 g of sodium 1-hexanesulfonate in 700 mL of water, add 50 mL of 1 M monobasic sodium phosphate and 20 mL of 0.25 N triethylammonium phosphate (prepared by mixing 500 mL of a solution containing 25.3 g of triethylamine and 500 mL of a solution containing 9.6 g of phosphoric acid), and mix. Dilute with water to 1 L, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *Solvent A* and methanol (100 : 82). Make adjustments if necessary (see *System Suitablity* under *Chromatography* ⟨621⟩).

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph replicate injections of a Standard solution, and record the peak responses as directed for *Procedure:* the tailing factor for the analyte peak is not more than 1.5, and the relative standard deviation for replicate injections is not more than 2%.

Procedure—Inject an accurately measured volume (about 50 µL) of a filtered portion of the solution under test into the chromatograph, record the chromatogram, and measure the response for the major peak. Calculate the quantity of $C_9H_{13}NO \cdot HCl$ dissolved by comparison with a Standard solution having a known concentration of USP Phenylpropanolamine Hydrochloride RS in the same *Medium* and similarly chromatographed.

Tolerances—The percentages of the labeled amount of $C_9H_{13}NO \cdot HCl$ dissolved at the times specified conform to •*Acceptance Table 2*•2

Time (hours)	Amount dissolved
3	between 15% and 45%
6	between 40% and 70%
12	not less than 70%

Interim Revision Announcement

Pilocarpine Ocular System

Change to read:

Drug release pattern—Place each of the Ocular Systems in suitable porous holders made of an inert material, and suspend each from a nickel wire. To the upper end of the wire attach a tag identifying the specimen. Put each assembly into a test tube containing 27.0 mL of saline TS so that the system lies at the bottom of the tube and the identifying tag extends from the open top of the tube. Put the tubes into a horizontally reciprocating shaker in which the temperature is maintained at 37 ± 0.5°. Agitate the tubes with a horizontal amplitude of about 4 cm and a frequency of about 35 cycles per minute. At 7, 24, 48, 72, 96, and 168 hours, remove the assemblies from their tubes, and each time replace them in similar tubes containing 27.0 mL of fresh saline TS. Determine the amount of pilocarpine in solution in each tube, after adjusting the volume to 27.0 mL to make up for any evaporative losses, by measuring the UV absorbance in 1-cm cells at the wavelength of maximum absorbance at about 215 nm, with a suitable spectrophotometer, against saline TS as the blank. Concomitantly measure the absorbance of a Standard solution of USP Pilocarpine Hydrochloride RS having a known concentration of about 20 µg in each mL of saline TS. Calculate the quantity, in µg, of $C_{11}H_{16}N_2O_2$ in each solution taken by the formula:

$$(208.26 / 244.72)(A_U / A_S)27C,$$

in which 208.26 and 244.72 are the molecular weights of pilocarpine and pilocarpine hydrochloride, respectively; A_U and A_S are the absorbances of the test solution and the Standard solution, respectively; and C is the concentration, in µg per mL, of USP Pilocarpine Hydrochloride RS in the Standard solution. Calculate the amount of pilocarpine released in 168 hours by adding the pilocarpine content of each set of tubes collected over 168 hours.

Tolerances—The amount of $C_{11}H_{16}N_2O_2$ from each Ocular System released during the total 0 to 168 hours tested conforms to •*Acceptance Table 1*•2 under *Drug Release* ⟨724⟩. The drug release range for this time period is not less than 80.0% and not more than 120.0% of the labeled release pattern.

Progesterone Intrauterine Contraceptive System

Change to read:

Drug release pattern—Remove the attached sutures from 10 Systems, and secure each system to a corrosion-resistant wire of sufficient length such that the systems are completely immersed during the shaking operation but do not touch the bottoms of the flasks. Suspend each system by the attached wire from the arm of a mechanical shaker designed to travel 2.5 cm in each direction in a vertically reciprocating cycle, at a speed of 2.5 cycles per second, so that each system is immersed in a separate 250-mL volumetric flask containing 230 mL of water, pre-equilibrated to 60 ± 0.1°. Immerse the volumetric flasks in an insulated constant-temperature water bath, maintained at 60 ± 0.1° and having a suitable means of maintaining the water level, so that the water level of the bath is above the water level in the flasks. Employ a rack or other suitable means of support for the flasks in the water bath.

Operate the shaker under the conditions described above for 23.5 hours, then remove the flasks and the systems from the bath. Remove the systems from the flasks, and immerse each system in a different flask containing 230 mL of water, pre-equilibrated to 60 ± 0.1°, and immerse these flasks in the water bath. Repeat this shaking operation daily for 12 days, using different flasks each day.

Determine the quantity of progesterone in the solutions from each of the 12 days of testing as follows. Immediately add 15 mL of methanol to each solution, allow to cool to room temperature, dilute with water to volume, and mix. Concomitantly determine the UV absorbances of each test solution and of a solution of USP Progesterone RS in the same medium, having a known concentration of about 7 µg per mL, in 2-cm cells at the wavelength of maximum absorbance at about 248 nm, with a suitable spectrophotometer, against a blank of water and methanol (47 : 3). Calculate the progesterone release rate, in mg per day, in the solutions taken by the formula:

$$(A_U / A_S)(24 / 23.5)0.25C,$$

in which A_U and A_S are the absorbances of the test solution and the Standard solution, respectively; and C is the concentration, in µg per mL, of USP Progesterone RS in the Standard solution. For the time points specified, the drug-release pattern conforms to •*Acceptance Table 1*•2 under *Drug Release* ⟨724⟩.

Day	Release Rate (mg per day)
6	1.05–1.45
9	0.95–1.35
12	0.90–1.30

Propranolol Hydrochloride and Hydrochlorothiazide Extended-Release Capsules

Change to read:

•**Dissolution** ⟨711⟩—•2

pH 1.5 Buffer solution, pH 6.8 Buffer solution, Media, and *Apparatus*—Proceed as directed in the test for •*Dissolution*•2 under *Propranolol Hydrochloride Extended-Release Capsules*.

Analytical method—Determine the amounts of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) and propranolol hydrochloride ($C_{16}H_{21}NO_2 \cdot HCl$) dissolved, using the following method.

Stock standard solution A—Prepare a solution of USP Propranolol Hydrochloride RS in dilute hydrochloric acid (1 in 100) having a known concentration of about 0.4 mg per mL.

Stock standard solution B—Dissolve an accurately weighed quantity of USP Hydrochlorothiazide RS in 0.25 N sodium hydroxide to obtain a solution having a concentration of about 25 mg per mL. Quantitatively dilute this solution with water to obtain a solution having a known concentration of about 0.5 mg per mL.

Standard solution—Prepare, by combining aliquots of *Stock standard solutions*, *A* and *B*, and diluting with dilute hydrochloric acid (1 in 100), solutions bracketing the expected concentration of the samples at the various time points.

Times: 30 minutes; 1.5, 4, 8, 14, and 24 hours.

Procedure—Use an automatic analyzer consisting of a liquid sampler, a proportioning pump, two UV spectrophotometers, and a manifold consisting of the components illustrated in the diagram under *Automated Methods of Analysis* ⟨16⟩. Start the sampler and conduct determinations at a rate of 30 per hour, using a ratio of about 1 : 1 for the sample to wash time. Calculate the amounts of $C_7H_8ClN_3O_4S_2$ and $C_{16}H_{21}NO_2 \cdot HCl$ dissolved by comparison with the *Standard solution.*

Tolerances (*Hydrochlorothiazide*)—Use •*Acceptance Table 1.*•2 Not less than 80% *(Q)* of the labeled amount of $C_7H_8ClN_3O_4S_2$ is dissolved in 30 minutes.

FOR PRODUCTS LABELED FOR DOSING EVERY 12 HOURS—
TEST 1—

Medium: water; 900 mL.
Apparatus 2: 50 rpm.
Times: 1, 3, and 6 hours.

Standard solution—Dissolve an accurately weighed quantity of USP Pseudoephedrine Hydrochloride RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.13 mg per mL.

Procedure—Determine the amount of $C_{10}H_{15}NO \cdot HCl$ dissolved by employing the procedure set forth in the *Assay.* Separately inject equal volumes (about 50 µL) of the *Standard solution* and the filtered solution under test. Calculate the amount of $C_{10}H_{15}NO \cdot HCl$ dissolved per Tablet.

Times and *Tolerances*—•The percentage of the labeled amount of $C_{10}H_{15}NO \cdot HCl$ dissolved at the times given conforms to *Acceptance Table 2.*•$_2$

Time (hours)	Amount dissolved
1	between 25% and 45%
3	between 50% and 75%
6	not less than 75%

TEST 3—If the product complies with this test, the labeling indicates that it meets •USP *Dissolution Test 3.*•$_2$

Medium, Apparatus, and *Times*—Proceed as directed for *Test 1.*

Procedure—Determine the amount of $C_{10}H_{15}NO \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 214 nm on portions of the solution under test, filtered through a 0.45-µm filter and suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Pseudoephedrine Hydrochloride RS in the same *Medium.*

Times and *Tolerances*—•The percentage of the labeled amount of $C_{10}H_{15}NO \cdot HCl$ dissolved at the times given conforms to *Acceptance Table 2.*•$_2$

Time (hours)	Amount dissolved
1	between 25% and 45%
3	between 60% and 80%
6	not less than 80%

FOR PRODUCTS LABELED FOR DOSING EVERY 24 HOURS—
TEST 2—If the product complies with this test, the labeling indicates that it meets •USP *Dissolution Test 2.*•$_2$

Medium: 0.9% sodium chloride in water; 50 mL.

Apparatus 7 •(see *Drug Release* ⟨724⟩):•$_2$ 30 cycles per minute; 2–3 cm amplitude. To prepare the sample, see *Figure 1* below that illustrates the following steps:

1. Place one Tablet on a 5- × 5-cm nylon netting.
2. Fold netting over the Tablet. Continue folding until the Tablet is enclosed in netting.
3. Fold netting so that the two open ends meet. The Tablet should be enveloped in the center of the netting.

Interim Revision Announcement

4. Insert rod •(see *Figure 4c* under *Drug Release* ⟨724⟩)•$_{2}$ through netting to secure the Tablet.
5. Secure netting with HPLC plastic ferrules or other appropriate device. Trim the excess netting. Attach each sample holder to the vertically reciprocating sample holder.

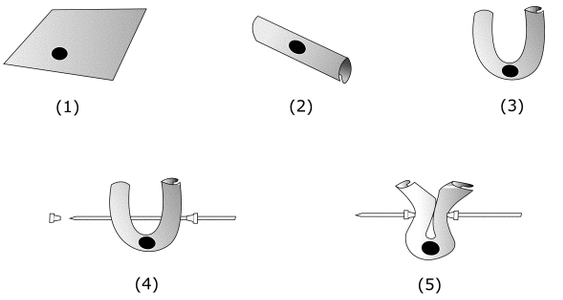

Fig. 1

Times: 2, 8, 14, and 24 hours.

Determine the amount of $C_{10}H_{15}NO \cdot HCl$ dissolved by employing the following method.

0.05 M Phosphate buffer, pH 6.8—Transfer 200 mL of water to a 1000-mL volumetric flask. Add 3.4 mL of phosphoric acid and 5 mL of triethylamine. Add water to almost 900 mL. Adjust with 1 N sodium hydroxide to a pH of about 6.8, dilute with water to volume, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *0.05 M Phosphate buffer, pH 6.8* and methanol (9 : 1).

System suitability solution—Dissolve an accurately weighed quantity of USP Pseudoephedrine RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.4 mg per mL.

Standard solutions—Prepare solutions in water having accurately known concentrations of USP Pseudoephedrine Hydrochloride RS in a range around the expected concentration of the solution under test at each time interval.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 5-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the tailing factor for the analyte peak is not more than 2; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solutions* and the solution under test into the chromatograph, record the chromatograms, and measure the responses for the major peak. Construct a calibration curve by plotting the peak response versus concentration of the *Standard solutions*. Determine the amount of $C_{10}H_{15}NO \cdot HCl$ dissolved at each time interval from a linear regression analysis of the calibration curve.

Times and *Tolerances*—•The percentage of the labeled amount of $C_{10}H_{15}NO \cdot HCl$ dissolved at the times given conforms to *Acceptance Table 2*.•$_{2}$

Quinidine Gluconate Extended-Release Tablets

Change to read:

Labeling—The labeling indicates the •*Dissolution Test*•$_{2}$ with which the product complies.

•(Official April 1, 2006)•$_{2}$

Change to read:

•**Dissolution** ⟨711⟩—•$_{2}$

TEST 1—If the product complies with this test, the labeling indicates that it meets •USP *Dissolution Test 1*.•$_{2}$

Medium: pH 5.4, 0.1 M acetate buffer prepared as follows. Add 6.9 g of anhydrous sodium acetate and 0.525 mL of glacial acetic acid to 1 L of water, and mix. Adjust with 0.1 N hydrochloric acid or 0.1 N sodium hydroxide to a pH of 5.4; 900 mL.

Apparatus 2: 75 rpm.

Times: 1, 2, 4, and 8 hours.

Procedure—Determine the amount of $C_{20}H_{24}N_2O_2 \cdot C_6H_{12}O_7$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 235 nm, using filtered aliquots of the solution under test, diluted with *Medium* if necessary, in comparison with a Standard solution having a known concentration of USP Quinidine Gluconate RS in the same *Medium.*

Tolerances—The percentages of the labeled amount of quinidine gluconate dissolved at the times specified conform to •*Acceptance Table 2*.•$_{2}$

Time (hours)	Amount dissolved
1	between 30% and 50%
2	between 45% and 65%
4	between 60% and 85%
8	not less than 85%

TEST 4—If the product complies with this test, the labeling indicates that it meets •USP *Dissolution Test 4*.•$_{2}$

Medium: 0.1 N hydrochloric acid; 600 mL.

Apparatus 2: 75 rpm.

Times and *Procedure*—Proceed as directed for *Test 1.*

Tolerances—The percentages of the labeled amount of quinidine gluconate dissolved at the times specified conform to •*Acceptance Table 2*.•$_{2}$

Time (hours)	Amount dissolved
1	between 30% and 45%
2	between 45% and 60%
4	between 60% and 80%
8	not less than 85%

TEST 5—If the product complies with this test, the labeling indicates that it meets •USP *Dissolution Test 5*.•$_{2}$

Medium, Apparatus, and *Procedure*—Proceed as directed for *Test 1,* using 8-mesh sinker baskets.*

Times: 1, 2, and 4 hours.

* A suitable sinker is available from VanKel, www.varianinc.com, catalog number 12-3062.

Tolerances—The percentages of the labeled amount of quinidine gluconate dissolved at the times specified conform to •*Acceptance Table 2.*•$_{2}$

Time (hours)	Amount dissolved
1	between 20% and 50%
2	between 40% and 70%
4	not less than 75%

Sulfasalazine Delayed-Release Tablets

Change to read:

•**Dissolution** ⟨711⟩—Proceed as directed for *Procedure* for *Method B* under *Apparatus 1 and Apparatus 2, Delayed-Release Dosage Forms.*•$_{2}$

ACID STAGE—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 1: 100 rpm.

Time: 120 minutes.

At the end of 120 minutes, determine the amount of $C_{18}H_{14}N_4O_5S$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water, isopropanol, acetonitrile, and glacial acetic acid (22 : 11 : 7 : 0.4). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Sulfasalazine RS in 0.1 N sodium hydroxide, and dilute quantitatively, and stepwise if necessary, with 0.1 N sodium hydroxide to obtain a solution having a known concentration of about 55.6 µg per mL.

Test solution—Pass about 7 mL of the solution under test through a membrane filter having a 0.45-µm porosity.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the retention time for sulfasalazine is about 7.7 minutes; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Inject a volume (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, and measure the peak responses. Calculate the percentage of $C_{18}H_{14}N_4O_5S$ dissolved by the formula:

$$(900C_S / LC)(r_U / r_S),$$

in which C_S is the concentration, in mg per mL, of USP Sulfasalazine RS in the *Standard solution; LC* is the label claim, in mg; and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively.

Tolerances—Not more than 10% of the labeled amount of $C_{18}H_{14}N_4O_5S$ is dissolved in 120 minutes.

BUFFER STAGE—

Medium: pH 7.5 phosphate buffer; 900 mL.

Apparatus 1: 100 rpm.

Time: 60 minutes.

Interim Revision Announcement

At the end of 60 minutes, determine the amount of $C_{18}H_{14}N_4O_5S$ dissolved by employing the chromatographic method as described under *Acid stage*.

Tolerances—Not less than 85% *(Q)* of the labeled amount of $C_{18}H_{14}N_4O_5S$ is dissolved in 60 minutes.

•(Official April 1, 2006)•2

Theophylline Extended-Release Capsules

Change to read:

Labeling—The labeling indicates whether the product is intended for dosing every 12 or 24 hours, and states with which in vitro •*Dissolution Test*•2 the product complies.

•(Official April 1, 2006)•2

Change to read:

•**Dissolution** ⟨711⟩—•2[NOTE—The following tests, which were assigned numbers chronologically, are placed in groups corresponding to product dosing intervals. Thus, individual tests do not necessarily appear in numerical order.]

FOR PRODUCTS LABELED FOR DOSING EVERY 12 HOURS—

TEST 1—If the product complies with this test, the labeling indicates that it meets •USP *Dissolution Test 1.* Proceed as directed for *Method B* under *Apparatus 1 and 2, Delayed-Release Dosage Forms,* except to use *Acceptance Table 2.*•2

Medium: pH 1.2 simulated gastric fluid (without pepsin) for the first hour; pH 6.0 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

Apparatus 2: 50 rpm.

Procedure—Determine the amount of $C_7H_8N_4O_2$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 271 nm on filtered portions of the solution under test, diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Theophylline RS in the same *Medium.*

Times and *Tolerances*—•The percentage of the labeled amount of $C_7H_8N_4O_2$ dissolved at the times given conforms to *Acceptance Table 2.*•2

Time (hours)	Amount dissolved

Trihexyphenidyl Hydrochloride Extended-Release Capsules

Change to read:

•**Dissolution** ⟨711⟩—•$_{2}$

Medium: water; 500 mL.

Apparatus 1: 100 rpm.

Times: 3, 6, and 12 hours.

Determine the amount of $C_{20}H_{31}NO \cdot HCl$ dissolved, using the following method.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, water, and triethylamine (920 : 80 : 0.2), and adjust with phosphoric acid to a pH of 4.0.

Standard solution—Dissolve an accurately weighed quantity of USP Trihexyphenidyl Hydrochloride RS in water, and dilute quantitatively and stepwise with water to obtain a solution having a known concentration of about 5 µg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 8.3-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor for the trihexyphenidyl peak is not more than 2.8, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Dilute the *Standard solution* and the solution under test with acetonitrile (1 : 1). Separately inject equal volumes (about 20 µL) of these solutions into the chromatograph, record the chromatograms, and measure the responses for trihexyphenidyl. Calculate the percentage of the labeled amount of $C_{20}H_{31}NO \cdot HCl$ dissolved.

Tolerances—The percentages of the labeled amount of $C_{20}H_{31}NO \cdot HCl$ dissolved at the times specified conform to •*Acceptance Table 2*.•2

Time (hours)	Amount dissolved
3	between 20% and 50%
6	between 40% and 70%
12	not less than 70%

Verapamil Hydrochloride Extended-Release Tablets

Change to read:

Labeling—The labeling indicates the •*Dissolution Test*•2 with which the product complies.

•(Official April 1, 2006)•2

Change to read:

•**Dissolution** ⟨711⟩—•2

TEST 1—If the product complies with this test, the labeling indicates that it meets •USP *Dissolution Test 1*. Proceed as directed for *Procedure* for *Method B* under *Apparatus 1 and Apparatus 2, Delayed-Release Dosage Forms*.•2

Acid stage—Using 900 mL of simulated gastric fluid TS (without enzyme), conduct this stage of the test for 1 hour.

Buffer stage—Using 900 mL of simulated intestinal fluid TS (without enzyme), conduct this stage of the test for 7 hours.

Apparatus 2: 50 rpm.

Times: Acid stage—1 hour; *Buffer stage*—2, 3.5, 5, and 8 hours.

Procedure—Wrap each Tablet in a wire helix to prevent the Tablets from floating. After 1 hour in the *Acid stage*, withdraw a specimen for analysis, and carefully transfer the dosage form, including the wire helix, to a vessel containing the *Buffer stage* medium, which has been previously warmed to 37 ± 0.5°. Filter a portion of the solution under test at each time interval, using a suitable glass microfiber filter paper. [NOTE—Use only filters that have been shown not to absorb verapamil.] Dilute, if necessary, the filtered portions of the solutions under test with water at the 1-hour interval and with 0.1 N hydrochloric acid at the 2-, 3.5-, 5-, and 8-hour intervals. Determine the amounts of $C_{27}H_{38}N_2O_4 \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 278 nm, using 0.01 N hydrochloric acid as the blank, by comparison with a Standard solution having a known concentration of USP Verapamil Hydrochloride RS in 0.01 N hydrochloric acid.

Tolerances—The percentage of the labeled amount of $C_{27}H_{38}N_2O_4 \cdot HCl$ dissolved at the times specified conforms to •*Acceptance Table 2*.•2

FOR PRODUCTS LABELED TO CONTAIN 180 MG OR 240 MG:

Time (hours)	Amount dissolved
1	between 7% and 15%

8	not less than 80%

Interim Revision Announcement

TEST 4—If the product complies with this test, the labeling indicates that it meets •USP *Dissolution Test 4.*•2

Phosphate buffer solution—Dissolve 6.8 g of monobasic potassium phosphate in 250 mL of water. Add 190 mL of 0.2 N sodium hydroxide in 400 mL of water, adjust with 0.2 N sodium hydroxide to a pH of 7.5 ± 0.1, dilute with water to 1000 mL, and mix.

Medium: *Phosphate buffer solution;* 50 mL.

Apparatus 7 •(see *Drug Release* ⟨724⟩):•2 20 cycles per minute.

Procedure—Scrape about 2 mm × 2 mm of the coating from the side edge of the tablet under test. Glue the system to a plastic rod sample holder at the area where the color has been removed. Attach each plastic sample holder to an arm of the apparatus, which reciprocates at an amplitude of about 2 cm and 15 to 30 cycles per minute. The tablet is continuously immersed in tubes containing 50 mL of *Medium* at 37°. At the end of each specified test interval, the systems are transferred to the next row of new test tubes containing 50 mL of fresh *Medium.* Remove the tubes after the last test interval, and allow them to cool to room temperature. Add 2.0 mL of 1.0 M phosphoric acid to each tube, and dilute with water to 50 mL. Stir and mix each tube thoroughly. Determine the amount of $C_{27}H_{38}N_2O_4 \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 278 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Verapamil Hydrochloride RS in the same *Medium.*

Times and *Tolerances*—The percentages of the labeled amount of $C_{27}H_{38}N_2O_4 \cdot HCl$ dissolved at the times specified conform to •*Acceptance Table 2.*•2

Time (hours)	Amount dissolved
3	not more than 10%
6	between 20% and 50%

•⟨701⟩ DISINTEGRATION

This general chapter is harmonized with the corresponding texts of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia.* The texts of these pharmacopeias are therefore interchangeable, and the methods of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia* may be used for demonstration of compliance instead of the present general chapter. These pharmacopeias have undertaken not to make any unilateral change to this harmonized chapter.

Portions of the present general chapter text that are national *USP* text, and therefore not part of the harmonized text, are marked with symbols (••) to specify this fact.

This test is provided to determine whether tablets or capsules disintegrate within the prescribed time when placed in a liquid medium at the experimental conditions presented below. •Compliance with the limits on *Disintegration* stated in the individual monographs is required except where the label states that the tablets or capsules are intended for use as troches, or are to be chewed, or are designed as extended-release dosage forms or delayed-release dosage forms. Determine the type of units under test from the labeling and from observation, and apply the appropriate procedure to 6 or more dosage units.•

For the purposes of this test, disintegration does not imply complete solution of the unit or even of its active constituent. Complete disintegration is defined as that state in which any residue of the unit, except fragments of insoluble coating or capsule shell, remaining on the screen of the test apparatus or adhering to the lower surface of the disk, if used, is a soft mass having no palpably firm core.

APPARATUS

The apparatus consists of a basket-rack assembly, a 1000-mL, low-form beaker, 138 to 160 mm in height and having an inside diameter of 97 to 115 mm for the immersion fluid, a thermostatic arrangement for heating the fluid between 35° and 39°, and a device for raising and lowering the basket in the immersion fluid at a constant frequency rate between 29 and 32 cycles per minute through a distance of not less than 53 mm and not more than 57 mm. The volume of the fluid in the vessel is such that at the highest point of the upward stroke the wire mesh remains at least 15 mm below the surface of the fluid and descends to not less than 25 mm from the bottom of the vessel on the downward stroke. At no time should the top of the basket-rack assembly become submerged. The time required for the upward stroke is equal to the time required for the downward stroke, and the change in stroke direction is a smooth transition, rather than an abrupt reversal of motion. The basket-rack assembly moves vertically along its axis. There is no appreciable horizontal motion or movement of the axis from the vertical.

Basket-Rack Assembly—The basket-rack assembly consists of six open-ended transparent tubes, each 77.5 ± 2.5 mm long and having an inside diameter of 20.7 to 23 mm and a wall 1.0 to 2.8 mm thick; the tubes are held in a vertical position by two plates, each 88 to 92 mm in diameter and 5 to 8.5 mm in thickness, with six holes, each 22 to 26 mm in diameter, equidistant from the center of the plate and equally spaced from one another. Attached to the under surface of the lower plate is a woven stainless steel wire cloth, which has a plain square weave with 1.8- to 2.2-mm apertures and with a wire diameter of 0.57 to 0.66 mm. The parts of the apparatus are assembled and rigidly held by means of three bolts passing through the two plates. A suitable means is provided to suspend the basket-rack assembly from the raising and lowering device using a point on its axis.

The design of the basket-rack assembly may be varied somewhat, provided the specifications for the glass tubes and the screen mesh size are maintained. The basket-rack assembly conforms to the dimensions found in *Figure 1*.

Disks—The use of disks is permitted only where specified or allowed •in the monograph. If specified in the individual monograph,• each tube is provided with a cylindrical disk 9.5 ± 0.15 mm thick and 20.7 ± 0.15 mm in diameter. The disk is made of a suitable transparent plastic material having a specific gravity of between 1.18 and 1.20. Five parallel 2 ± 0.1-mm holes extend between the ends of the cylinder. One of the holes is centered on the cylindrical axis. The other holes are centered 6 ± 0.2 mm from the axis on imaginary lines perpendicular to the axis and parallel to each other. Four identical trapezoidal-shaped planes are cut into the wall of the cylinder, nearly perpendicular to the ends of the cylinder. The trapezoidal shape is symmetrical; its parallel sides coincide with the ends of the cylinder and are parallel to an imaginary line connecting the centers of two adjacent holes 6 mm from the cylindrical axis. The parallel side of the trapezoid on the bottom of the cylinder has a length of 1.6 ± 0.1 mm, and its bottom edges lie at a depth of 1.6 ± 0.1 mm from the cylinder's circumference. The parallel side of the trapezoid on the top of the cylinder has a length of 9.4 ± 0.2 mm, and its center lies at a depth of 2.6 ± 0.1 mm from the cylinder's circumference. All surfaces of the disk are smooth. If the use of disks is specified •in the individual monograph,• add a disk to each tube, and operate the apparatus as directed under *Procedure*. The disks conform to dimensions found in *Figure 1*[1]

[1] The use of automatic detection employing modified disks is permitted where the use of disks is specified or allowed. Such disks must comply with the requirements for density and dimension given in this chapter.

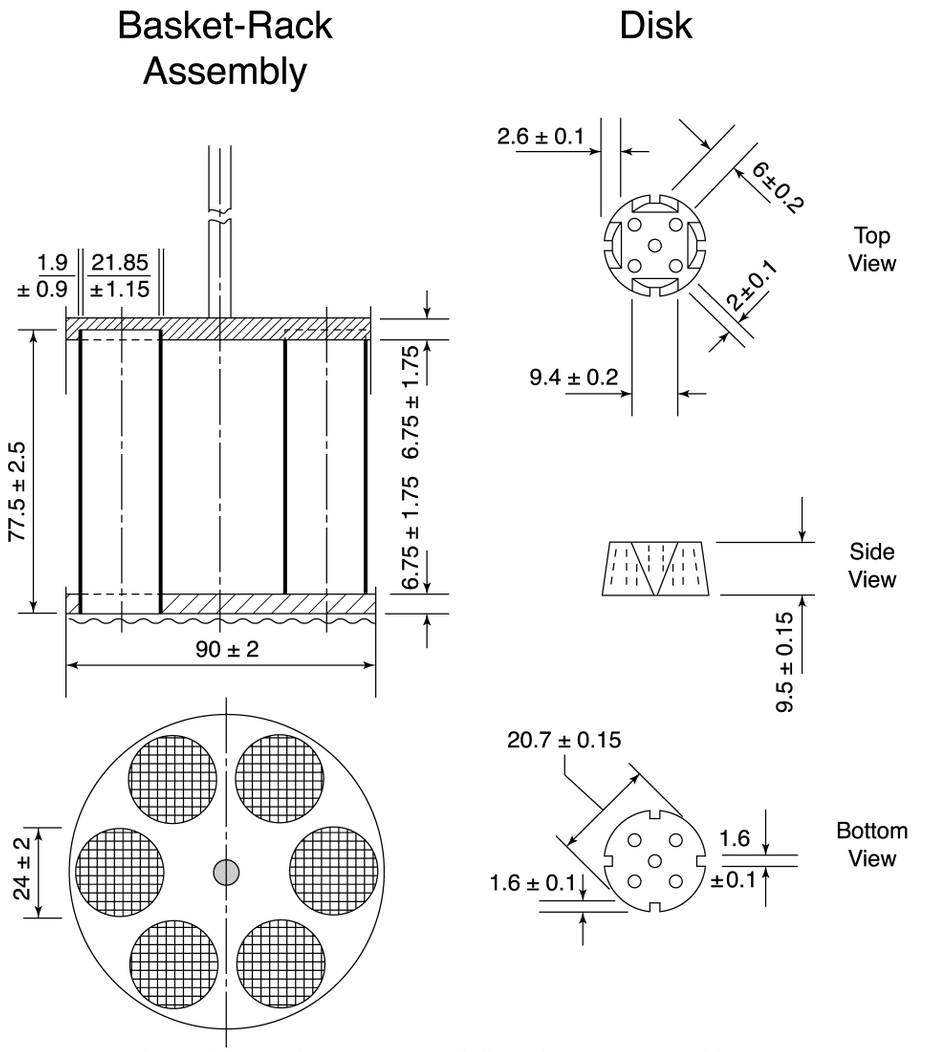

Fig. 1. Disintegration apparatus. (All dimensions are expressed in mm.)

PROCEDURE

◆**Uncoated Tablets**—◆Place 1 dosage unit in each of the six tubes of the basket and, if prescribed, add a disk. Operate the apparatus, using ◆water or◆ the specified medium as the immersion fluid, maintained at 37 ± 2°. At the end of the time limit specified ◆in the monograph,◆ lift the basket from the fluid, and observe the tablets: all of the tablets have disintegrated completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets. The requirement is met if not fewer than 16 of the total of 18 tablets tested are disintegrated.

◆**Plain-Coated Tablets**—Apply the test for *Uncoated Tablets,* operating the apparatus for the time specified in the individual monograph.

Delayed-Release (Enteric-Coated) Tablets—Place 1 tablet in each of the six tubes of the basket and, if the tablet has a soluble external sugar coating, immerse the basket in water at room temperature for 5 minutes. Then operate the apparatus using simulated gastric fluid TS maintained at 37 ± 2° as the immersion fluid. After 1 hour of operation in simulated gastric fluid TS, lift the basket from the fluid, and observe the tablets: the tablets show no evidence of disintegration, cracking, or softening. Operate the apparatus, using simulated intestinal fluid TS maintained at 37 ± 2° as the immersion fluid, for the time specified in the monograph. Lift the basket from the fluid, and observe the tablets: all of the tablets disintegrate completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.

Buccal Tablets—Apply the test for *Uncoated Tablets*. After 4 hours, lift the basket from the fluid, and observe the tablets: all of the tablets have disintegrated. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.

Sublingual Tablets—Apply the test for *Uncoated Tablets.* At the end of the time limit specified in the individual monograph: all of the tablets have disintegrated. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.

Hard Gelatin Capsules—Apply the test for *Uncoated Tablets*. Attach a removable wire cloth, which has a plain square weave with 1.8- to 2.2-mm mesh apertures and with a wire diameter of 0.60 to 0.655 mm, as described under *Basket-Rack Assembly,* to the surface of the upper plate of the basket-rack assembly. Observe the capsules within the time limit specified in the individual monograph: all of the capsules have disintegrated except for fragments from the capsule shell. If 1 or 2 capsules fail to disintegrate completely, repeat the test on 12 additional capsules: not fewer than 16 of the total of 18 capsules tested disintegrate completely.

Soft Gelatin Capsules—Proceed as directed under *Hard Gelatin Capsules*.◆ ●[2]

(Official April 1, 2006)

●⟨711⟩ DISSOLUTION

This general chapter is harmonized with the corresponding texts of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia.* The texts of these pharmacopeias are therefore interchangeable, and the methods of the European Pharmacopoeia or the Japanese Pharmacopoeia may be used for demonstration of compliance instead of the present general chapter. These pharmacopeias have undertaken not to make any unilateral change to this harmonized chapter.

Portions of the present general chapter text that are national USP text, and therefore not part of the harmonized text, are marked with symbols (◆ ◆) to specify this fact.

This test is provided to determine compliance with the dissolution requirements ◆where stated in the individual monograph,◆ for dosage forms administered orally. In this general chapter, a dosage unit is defined as 1 tablet or 1 capsule or the amount specified. ◆Of the types of apparatus described herein, use the one specified in the individual monograph. Where the label states that an article is enteric-coated, and where a dissolution or disintegration test that does not specifically state that it is to be applied to delayed-release articles is included in the individual monograph, the procedure and interpretation given for *Delayed-Release Dosage Forms* is applied unless otherwise specified in the individual monograph. For hard or soft gelatin capsules and gelatin-coated tablets that do not conform to the *Dissolution* specification, repeat the test as follows. Where water or a medium with a pH of less than 6.8 is specified as the *Medium* in the individual monograph, the same *Medium* specified may be used with the addition of purified pepsin that results in an activity of 750,000 Units or less per 1000 mL. For media with a pH of 6.8 or greater, pancreatin can be added to produce not more than 1750 USP Units of protease activity per 1000 mL.

USP Reference Standards ⟨11⟩—*USP Chlorpheniramine Maleate Extended-Release Tablets RS (Drug Release Calibrator, Single Unit). USP Prednisone Tablets RS (Dissolution Calibrator, Disintegrating). USP Salicylic Acid Tablets RS. (Dissolution Calibrator, Nondisintegrating).*◆

APPARATUS

Apparatus 1 (Basket Apparatus)

The assembly consists of the following: a vessel, which may be covered, made of glass or other inert, transparent material[1]; a motor; a metallic drive shaft; and a cylindrical basket. The vessel is partially immersed in a suitable water bath of any convenient size or heated by a suitable device such as a heating jacket. The water bath or heating device permits holding the temperature inside the vessel at 37 ± 0.5° during the test and keeping the bath fluid in constant, smooth motion. No part of the assembly, including the environment in which the assembly is placed, contributes significant motion, agitation, or vibration beyond that due to the smoothly rotating stirring element. An apparatus that permits observation of the specimen and stirring element during the test is preferable. The vessel is cylindrical, with a hemispherical bottom and ◆with one of the following dimensions and capacities: for a nominal◆ capacity of 1 L, the height is 160 mm to 210 mm and its inside diameter is 98 mm to 106 mm; ◆for a nominal capacity of 2 L, the height is 280 mm to 300 mm and its inside diameter is 98 mm to 106 mm; and for a nominal capacity of 4 L, the height is 280 mm to 300 mm and its inside diameter is 145 mm to 155 mm◆. Its sides are flanged at the top. A fitted cover may be used to retard evaporation.[2] The shaft is positioned so that its axis is not more than 2 mm at any point from the vertical axis of the vessel and rotates smoothly and without significant wobble that could affect the results. A speed-regulating device is used that allows the shaft rotation speed to be selected and maintained at the specified rate ◆given in the individual monograph,◆ within ±4%.

Shaft and basket components of the stirring element are fabricated of stainless steel, type 316, or other inert material, to the specifications shown in *Figure 1.* A basket having a gold coating of about 0.0001 inch (2.5 μm) thick may be used. A dosage unit is placed in a dry basket at the beginning of each test. The distance between the inside bottom of the vessel and the bottom of the basket is maintained at 25 ± 2 mm during the test.

[1] The materials should not sorb, react, or interfere with the specimen being tested.

[2] If a cover is used, it provides sufficient openings to allow ready insertion of the thermometer and withdrawal of specimens.

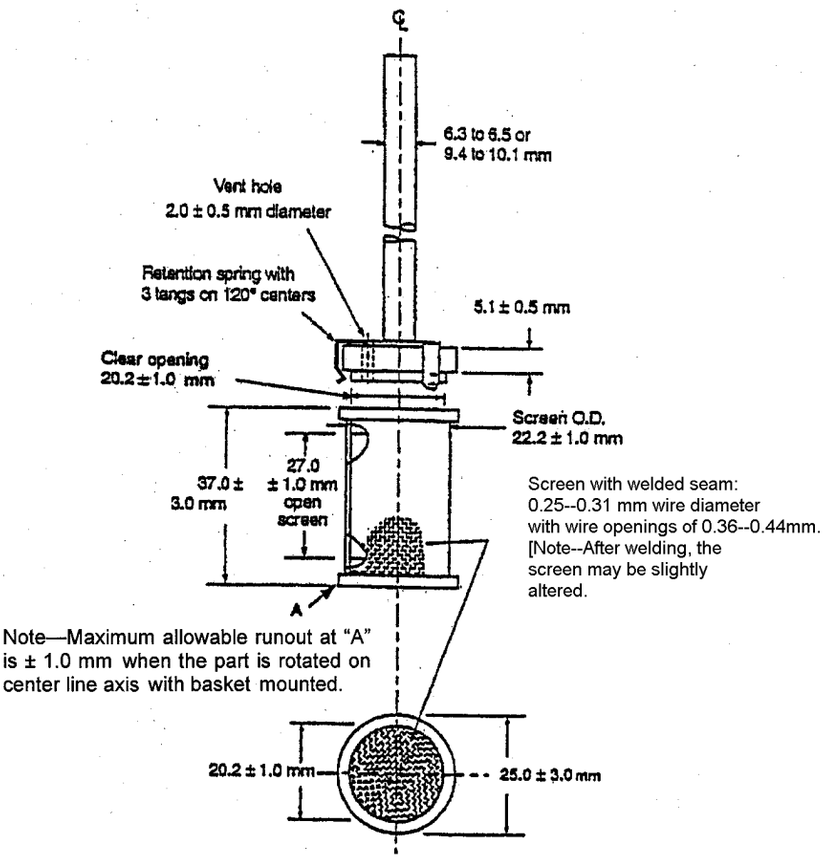

Fig. 1. Basket Stirring Element

Apparatus 2 (Paddle Apparatus)

Use the assembly from *Apparatus 1*, except that a paddle formed from a blade and a shaft is used as the stirring element. The shaft is positioned so that its axis is not more than 2 mm from the vertical axis of the vessel at any point and rotates smoothly without significant wobble that could affect the results. The vertical center line of the blade passes through the axis of the shaft so that the bottom of the blade is flush with the bottom of the shaft. The paddle conforms to the specifications shown in *Figure 2.* The distance of 25 ± 2 mm between the bottom of the blade and the inside bottom of the vessel is maintained during the test. The metallic or suitably inert, rigid blade and shaft comprise a single entity. A suitable two-part detachable design may be used provided the assembly remains firmly engaged during the test. The paddle blade and shaft may be coated with a suitable coating so as to make them inert. The dosage unit is allowed to sink to the bottom of the vessel before rotation of the blade is started. A small, loose piece of nonreactive material, such as not more than a few turns of wire helix, may be attached to dosage units that would otherwise float. An alternative sinker device is shown in *Figure 2a*. Other validated sinker devices may be used.

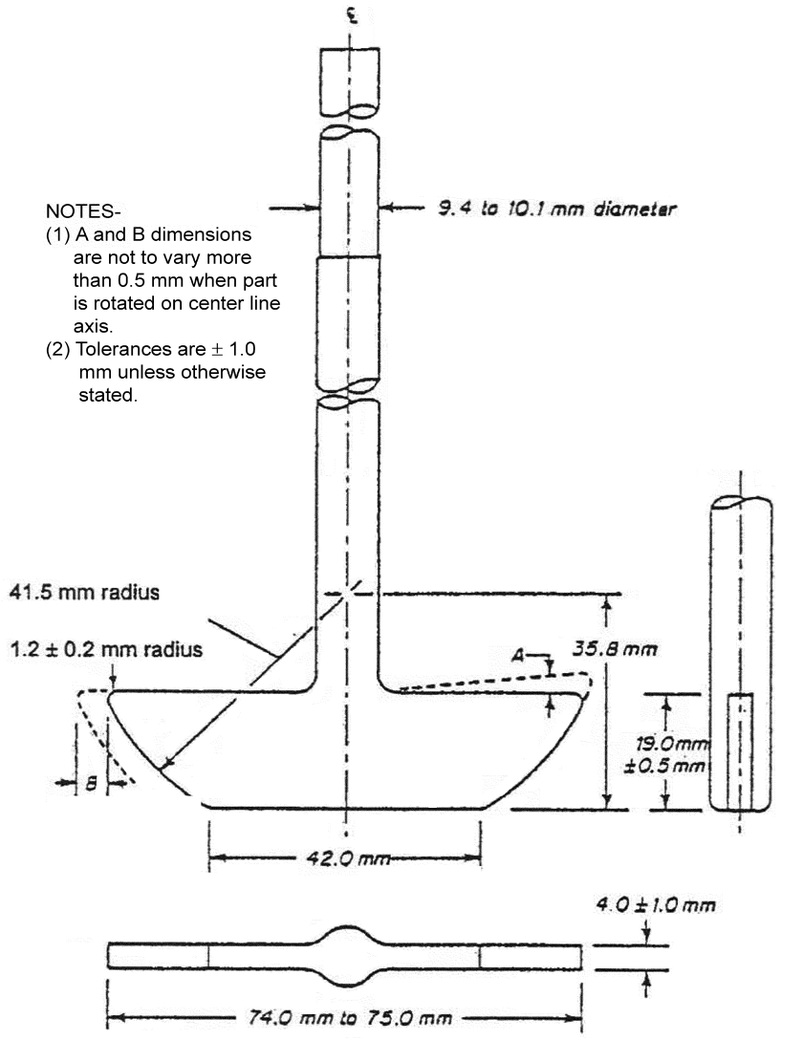

Fig. 2. Paddle Stirring Element

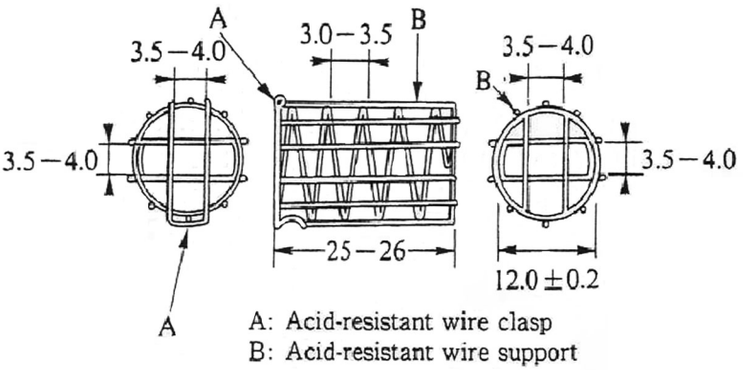

Fig. 2a. Alternative sinker. All dimensions expressed in mm.

Apparatus 3 (Reciprocating Cylinder)

NOT ACCEPTED BY THE JAPANESE PHARMACOPOEIA

The assembly consists of a set of cylindrical, flat-bottomed glass vessels; a set of glass reciprocating cylinders; inert fittings (stainless steel type 316 or other suitable material), and screens that are made of suitable nonsorbing and nonreactive material and that are designed to fit the tops and bottoms of the reciprocating cylinders; and a motor and drive assembly to reciprocate the cylinders vertically inside the vessels and, if desired, index the reciprocating cylinders horizontally to a different row of vessels. The vessels are partially immersed in a suitable water bath of any convenient size that permits holding the temperature at 37 ± 0.5° during the test. No part of the assembly, including the environment in which the assembly is placed, contributes significant motion, agitation, or vibration beyond that due to the smooth, vertically reciprocating cylinder. A device is used that allows the reciprocation rate to be selected and maintained at the specified dip rate ◆given in the individual monograph◆ within ±5%. An apparatus that permits observation of the specimens and reciprocating cylinders is preferable. The vessels are provided with an evaporation cap that remains in place for the duration of the test. The components conform to the dimensions shown in *Figure 3* unless otherwise specified ◆in the individual monograph◆.

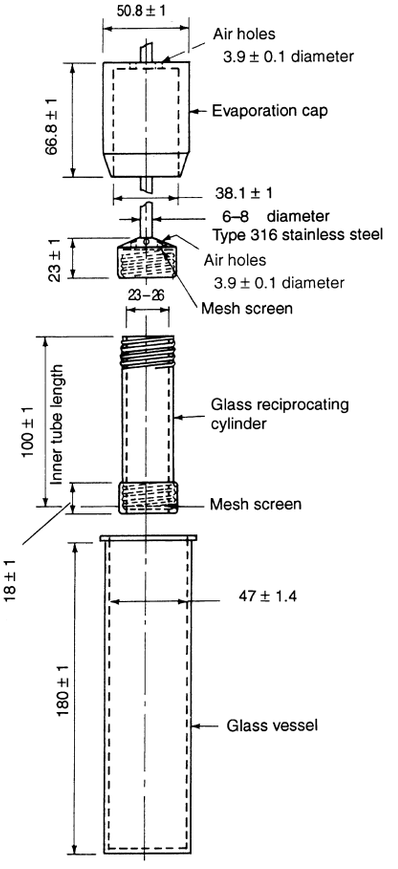

Fig. 3. Apparatus 3 (reciprocating cylinder)

Apparatus 4 (Flow-Through Cell)

The assembly consists of a reservoir and a pump for the *Dissolution Medium;* a flow-through cell; a water bath that maintains the *Dissolution Medium* at 37 ± 0.5°. Use the specified cell size ◆as given in the individual monograph◆.

The pump forces the *Dissolution Medium* upwards through the flow-through cell. The pump has a delivery range between 240 and 960 mL per hour, with standard flow rates of 4, 8, and 16 mL per minute. It must deliver a constant flow ($\pm$5% of the nominal flow rate); the flow profile is sinusoidal with a pulsation of 120 $\pm$ 10 pulses per minute.

The flow-through cell (see *Figures 4* and *5*), of transparent and inert material, is mounted vertically with a filter system (specified in the individual monograph) that prevents escape of undissolved particles from the top of the cell; standard cell diameters are 12 and 22.6 mm; the bottom cone is usually filled with small glass beads of about 1-mm diameter with one bead of about 5 mm positioned at the apex to protect the fluid entry tube; a tablet holder (see *Figures 4* and *5*) is available for positioning of special dosage forms, for example, inlay tablets. The cell is immersed in a water bath, and the temperature is maintained at 37 $\pm$ 0.5°.

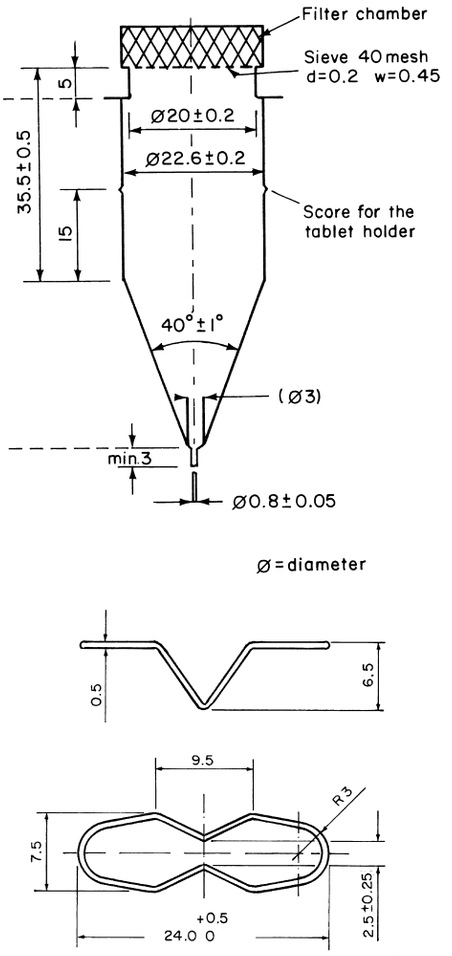

Fig. 4. Large cell for tablets and capsules (top) Tablet holder for the large cell (bottom) (All measurements are expressed in mm unless noted otherwise.)

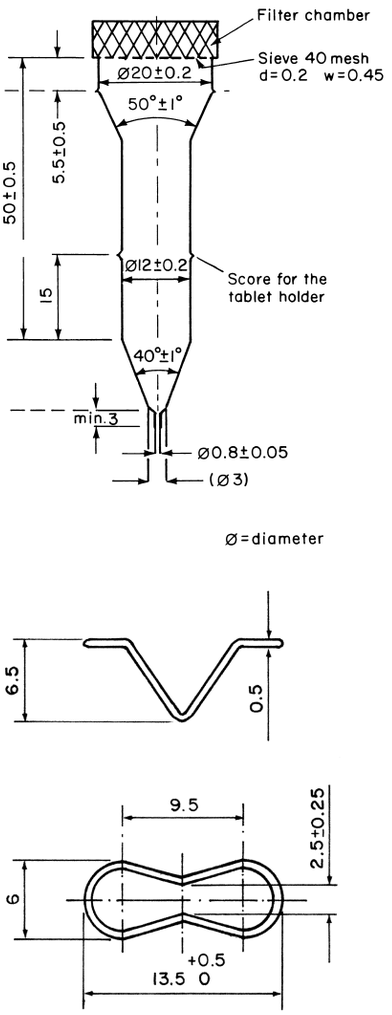

Fig. 5. Small cell for tablets and capsules (top) Tablet holder for the small cell (bottom) (All mesurements are expressed in mm unless noted otherwise.)

The apparatus uses a clamp mechanism and two O-rings to assemble the cell. The pump is separated from the dissolution unit in order to shield the latter against any vibrations originating from the pump. The position of the pump should not be on a level higher than the reservoir flasks. Tube connections are as short as possible. Use suitably inert tubing, such as polytef, with about 1.6-mm inner diameter and chemically inert flanged-end connections.

APPARATUS SUITABILITY

The determination of suitability of a test assembly to perform dissolution testing must include conformance to the dimensions and tolerances of the apparatus as given above. In addition, critical test parameters that have to be monitored periodically during use include volume and temperature of the *Dissolution Medium,* rotation speed (*Apparatus 1* and *Apparatus 2*), dip rate (*Apparatus 3*), and flow rate of medium (*Apparatus 4*).

Determine the acceptable performance of the dissolution test assembly periodically. ◆The suitability for the individual apparatus is demonstrated by the *Apparatus Suitability Test*.

Apparatus Suitability Test, Apparatus 1 and 2—Individually test 1 tablet of the USP Dissolution Calibrator, Disintegrating Type and 1 tablet of USP Dissolution Calibrator, Nondisintegrating Type, according to the operating conditions specified. The apparatus is suitable if the results obtained are within the acceptable range stated in the certificate for that calibrator in the apparatus tested.

Apparatus Suitability Test, Apparatus 3—Individually test 1 tablet of the USP Drug Release Tablets (Single Unit) according to the operating conditions specified. The apparatus is suitable if the results obtained are within the acceptable range stated in the certificate.

Apparatus Suitability Test, Apparatus 4—[To come.]◆

PROCEDURE

Apparatus 1 and Apparatus 2

IMMEDIATE-RELEASE DOSAGE FORMS

Place the stated volume of the *Dissolution Medium* (±1%) in the vessel of the specified apparatus ◆given in the individual monograph,◆ assemble the apparatus, equilibrate the *Dissolution Medium* to 37 ± 0.5°, and remove the thermometer. Place 1 dosage unit in the apparatus, taking care to exclude air bubbles from the surface of the dosage unit, and immediately operate the apparatus at the specified rate ◆given in the individual monograph◆. Within the time interval specified, or at each of the times stated, withdraw a specimen from a zone midway between the surface of the *Dissolution Medium* and the top of the rotating basket or blade, not less than 1 cm from the vessel wall. [NOTE—Where multiple sampling times are specified, replace the aliquots withdrawn for analysis with equal volumes of fresh *Dissolution Medium* at 37° or, where it can be shown that replacement of the medium is not necessary, correct for the volume change in the calculation. Keep the vessel covered for the duration of the test, and verify the temperature of the mixture under test at suitable times.] Perform the analysis ◆as directed in the individual monograph◆ using a suitable assay method.[3] Repeat the test with additional dosage form units.

If automated equipment is used for sampling or the apparatus is otherwise modified, verification that the modified apparatus will produce results equivalent to those obtained with the standard apparatus described in this general chapter is necessary.

Dissolution Medium—A suitable dissolution medium is used. Use the solvent specified ◆in the individual monograph.◆The volume specified refers to measurements made between 20° and 25°. If the *Dissolution Medium* is a buffered solution, adjust the solution so that its pH is within 0.05 unit of the specified pH ◆given in the individual monograph.◆ [NOTE—Dissolved gases can cause bubbles to form, which may change the results of the test. If dissolved gases influence the dissolution results, dissolved gases should be removed prior to testing.[4]]

Time—Where a single time specification is given, the test may be concluded in a shorter period if the requirement for minimum amount dissolved is met. Specimens are to be withdrawn only at the stated times within a tolerance of ±2%.

EXTENDED-RELEASE DOSAGE FORMS

Proceed as directed for *Immediate-Release Dosage Forms*.

Dissolution Medium—Proceed as directed for *Immediate-Release Dosage Forms*.

Time—The test-time points, generally three, are expressed in hours.

DELAYED-RELEASE DOSAGE FORMS

NOT ACCEPTED BY THE JAPANESE PHARMACOPOEIA

Use *Method A* or *Method B* and the apparatus specified ◆in the individual monograph.◆ All test times stated are to be observed within a tolerance of ±2%, unless otherwise specified.

Method A—

Procedure ◆(unless otherwise directed in the individual monograph)◆—

ACID STAGE—Place 750 mL of 0.1 N hydrochloric acid in the vessel, and assemble the apparatus. Allow the medium to equilibrate to a temperature of 37 ± 0.5°. Place 1 dosage unit in the apparatus, cover the vessel, and operate the apparatus at the specified rate ◆given in the monograph◆.

After 2 hours of operation in 0.1 N hydrochloric acid, withdraw an aliquot of the fluid, and proceed immediately as directed under *Buffer Stage*.

Perform an analysis of the aliquot using a suitable assay method. ◆The procedure is specified in the individual monograph.◆

BUFFER STAGE—[NOTE—Complete the operations of adding the buffer, and adjusting the pH within 5 minutes.]

With the apparatus operating at the rate specified ◆in the monograph,◆ add to the fluid in the vessel 250 mL of 0.20 M tribasic sodium phosphate that has been equilibrated to 37 ± 0.5°. Adjust, if necessary, with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of 6.8 ± 0.05. Continue to operate the apparatus for 45 minutes, or for the specified time ◆given in the individual monograph◆. At the end of the time period, withdraw an aliquot of the fluid, and perform the analysis using a suitable assay method. ◆The procedure is specified in the individual monograph. The test may be concluded in a shorter time period than that specified for the *Buffer Stage* if the requirement for the minimum amount dissolved is met at an earlier time.◆

Method B—

Procedure ◆(unless otherwise directed in the individual monograph)◆—

ACID STAGE—Place 1000 mL of 0.1 N hydrochloric acid in the vessel, and assemble the apparatus. Allow the medium to equilibrate to a temperature of 37 ± 0.5°. Place 1 dosage unit in the apparatus, cover the vessel, and operate the apparatus at the rate specified ◆in the monograph◆. After 2 hours of operation in 0.1 N hydrochloric acid, withdraw an aliquot of the fluid, and proceed immediately as directed under *Buffer Stage*.

Perform an analysis of the aliquot using a suitable assay method. ◆The procedure is specified in the individual monograph◆.

BUFFER STAGE—[NOTE—For this stage of the procedure, use buffer that previously has been equilibrated to a temperature of 37 ± 0.5°.] Drain the acid from the vessel, and add to the vessel 1000 mL of pH 6.8 phosphate buffer, prepared by mixing 0.1 N hydrochloric acid with 0.20 M tribasic sodium phosphate (3 : 1) and adjusting, if necessary, with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of 6.8 ± 0.05. [NOTE—This may also be accomplished by removing from the apparatus the vessel containing the acid and replacing it with another vessel containing the buffer and transferring the dosage unit to the vessel containing the buffer.]

[3] Test specimens are filtered immediately upon sampling unless filtration is demonstrated to be unnecessary. Use an inert filter that does not cause adsorption of the active ingredient or contain extractable substances that would interfere with the analysis.

[4] One method of deaeration is as follows: Heat the medium, while stirring gently, to about 41°, immediately filter under vacuum using a filter having a porosity of 0.45 µm or less, with vigorous stirring, and continue stirring under vacuum for about 5 minutes. Other validated deaeration techniques for removal of dissolved gases may be used.

Continue to operate the apparatus for 45 minutes, or for the specified time ◆given in the individual monograph◆. At the end of the time period, withdraw an aliquot of the fluid, and perform the analysis using a suitable assay method. ◆The procedure is specified in the individual monograph. The test may be concluded in a shorter time period than that specified for the *Buffer Stage* if the requirement for minimum amount dissolved is met at an earlier time.◆

Apparatus 3 (Reciprocating Cylinder)

NOT ACCEPTED BY THE JAPANESE PHARMACOPOEIA

IMMEDIATE-RELEASE DOSAGE FORMS

Place the stated volume of the *Dissolution Medium* in each vessel of the apparatus, assemble the apparatus, equilibrate the *Dissolution Medium* to 37 ± 0.5°, and remove the thermometer. Place 1 dosage-form unit in each of the six reciprocating cylinders, taking care to exclude air bubbles from the surface of each dosage unit, and immediately operate the apparatus as specified ◆in the individual monograph◆. During the upward and downward stroke, the reciprocating cylinder moves through a total distance of 9.9 to 10.1 cm. Within the time interval specified, or at each of the times stated, raise the reciprocating cylinders and withdraw a portion of the solution under test from a zone midway between the surface of the *Dissolution Medium* and the bottom of each vessel. Perform the analysis as directed ◆in the individual monograph◆. If necessary, repeat the test with additional dosage-form units.

Dissolution Medium—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

Time—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

EXTENDED-RELEASE DOSAGE FORMS

Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 3*.

Dissolution Medium—Proceed as directed for *Extended-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

Time—Proceed as directed for *Extended-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

DELAYED-RELEASE DOSAGE FORMS

Proceed as described for *Delayed-Release Dosage Forms, Method B* under *Apparatus 1 and Apparatus 2* using one row of vessels for the acid stage media and the following row of vessels for the buffer stage media and using the volume of medium specified (usually 300 mL).

Time—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

Apparatus 4 (Flow-Through Cell)

IMMEDIATE-RELEASE DOSAGE FORMS

Place the glass beads into the cell specified ◆in the monograph◆. Place 1 dosage unit on top of the beads or, if specified ◆in the monograph,◆ on a wire carrier. Assemble the filter head, and fix the parts together by means of a suitable clamping device. Introduce by the pump the *Dissolution Medium* warmed to 37 ± 0.5° through the bottom of the cell to obtain the flow rate specified ◆in the individual monograph◆ and measured with an accuracy of 5%. Collect the eluate by fractions at each of the times stated. Perform the analysis as directed ◆in the individual monograph◆. Repeat the test with additional dosage-form units.

Dissolution Medium—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

Time—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

EXTENDED-RELEASE DOSAGE FORMS

Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 4.*

Dissolution Medium—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 4*.

Time—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 4.*

DELAYED-RELEASE DOSAGE FORMS

Proceed as directed for *Delayed-Release Dosage Forms* under *Apparatus 1 and Apparatus 2,* using the specified media.

Time—Proceed as directed for *Delayed-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

INTERPRETATION

Immediate-Release Dosage Forms

Unless otherwise specified ◆in the individual monograph◆, the requirements are met if the quantities of active ingredient dissolved from the dosage units tested conform to *Acceptance Table 1*. Continue testing through the three stages unless the results conform at either S_1 or S_2. The quantity, Q, is the amount of dissolved active ingredient ◆specified in the individual monograph,◆expressed as a percentage of the labeled content of the dosage unit; the 5%, 15%, and 25% values in *Acceptance Table 1* are percentages of the labeled content so that these values and Q are in the same terms.

Acceptance Table 1

Stage	Number Tested	Acceptance Criteria
S_1	6	Each unit is not less than Q + 5%.
S_2	6	Average of 12 units (S_1 + S_2) is equal to or greater than Q, and no unit is less than Q – 15%.
S_3	12	Average of 24 units (S_1 + S_2 + S_3) is equal to or greater than Q, not more than 2 units are less than Q – 15%, and no unit is less than Q – 25%.

Extended-Release Dosage Forms

Unless otherwise specified ◆in the individual monograph◆, the requirements are met if the quantities of active ingredient dissolved from the dosage units tested conform to *Acceptance Table 2*. Continue testing through the three levels unless the results conform at either L_1 or L_2. Limits on the amounts of active ingredient dissolved are expressed in terms of the percentage of labeled content. The limits embrace each value of Q_i, the amount dissolved at each spec-

Interim Revision Announcement

ified fractional dosing interval. Where more than one range is specified ◆in the individual monograph◆, the acceptance criteria apply individually to each range.

Acceptance Table 2

Level	Number Tested	Criteria
L_1	6	No individual value lies outside each of the stated ranges and no individual value is less than the stated amount at the final test time.
L_2	6	The average value of the 12 units ($L_1 + L_2$) lies within each of the stated ranges and is not less than the stated amount at the final test time; none is more than 10% of labeled content outside each of the stated ranges; and none is more than 10% of labeled content below the stated amount at the final test time.
L_3	12	The average value of the 24 units ($L_1 + L_2 + L_3$) lies within each of the stated ranges, and is not less than the stated amount at the final test time; not more than 2 of the 24 units are more than 10% of labeled content outside each of the stated ranges; not more than 2 of the 24 units are more than 10% of labeled content below the stated amount at the final test time; and none of the units is more than 20% of labeled content outside each of the stated ranges or more than 20% of labeled content below the stated amount at the final test time.

Delayed-Release Dosage Forms

NOT ACCEPTED BY THE JAPANESE PHARMACOPOEIA.

Acid Stage—Unless otherwise specified ◆in the individual monograph◆, the requirements of this portion of the test are met if the quantities, based on the percentage of the labeled content, of active ingredient dissolved from the units tested conform to *Acceptance Table 3*. Continue testing through all levels unless the results of both acid and buffer stages conform at an earlier level.

Acceptance Table 3

Level	Number Tested	Criteria
A_1	6	No individual value exceeds 10% dissolved.
A_2	6	Average of the 12 units ($A_1 + A_2$) is not more than 10% dissolved, and no individual unit is greater than 25% dissolved.
A_3	12	Average of the 24 units ($A_1 + A_2 + A_3$) is not more than 10% dissolved, and no individual unit is greater than 25% dissolved.

Buffer Stage—Unless otherwise specified ◆in the individual monograph◆, the requirements are met if the quantities of active ingredient dissolved from the units tested conform to *Acceptance Table 4*. Continue testing through the three levels unless the results of both stages conform at an earlier level. The value of Q in *Acceptance Table 4* is 75% dissolved unless otherwise specified ◆in the individual monograph◆. The quantity, Q,◆specified in the individual monograph◆ is the total amount of active ingredient dissolved in both the *Acid* and *Buffer Stages*, expressed as a percentage of the labeled content. The 5%, 15%, and 25% values in *Acceptance Table 4* are percentages of the labeled content so that these values and Q are in the same terms.

Acceptance Table 4

Level	Number Tested	Criteria
B_1	6	Each unit is not less than Q + 5%.
B_2	6	Average of 12 units ($B_1 + B_2$) is equal to or greater than Q, and no unit is less than Q – 15%.
B_3	12	Average of 24 units ($B_1 + B_2 + B_3$) is equal to or greater than Q, not more than 2 units are less than Q – 15%, and no unit is less than Q – 25%.

●⟨724⟩ DRUG RELEASE

This test is provided to determine compliance with drug-release requirements where specified in individual monographs. Use the apparatus specified in the individual monograph. Replace the aliquots withdrawn for analysis with equal volumes of fresh *Dissolution Medium* at the temperature specified in the monograph or, where it can be shown that replacement of the medium is not necessary, correct for the volume change in the calculation. Keep the vessel covered for the duration of the test, and verify the temperature of the mixture under test at suitable times.

TRANSDERMAL DELIVERY SYSTEMS—GENERAL DRUG RELEASE STANDARDS

Apparatus 5 (Paddle over Disk)

Apparatus—Use the paddle and vessel assembly from *Apparatus 2* as described under *Dissolution* ⟨711⟩, with the addition of a stainless steel disk assembly[1] designed for holding the transdermal system at the bottom of the vessel. Other appropriate devices may be used, provided they do not sorb, react with, or interfere with the specimen being tested[2]. The temperature is maintained at 32 ± 0.5°. A distance of 25 ± 2 mm between the paddle blade and the surface of the disk assembly is maintained during the test. The vessel may be covered during the test to minimize evaporation. The disk assembly for holding the transdermal system is designed to minimize any "dead" volume between the disk assembly and the bottom of the vessel. The disk assembly holds the system flat and is positioned such that the release surface is parallel with the bottom of the paddle blade (see *Figure 1*).

[1] Disk assembly (stainless support disk) may be obtained from Millipore Corp., Ashley Rd., Bedford, MA 01730.

[2] A suitable device is the watchglass-patch-polytef mesh sandwich assembly available as the Transdermal SandwichTM from Hanson Research Corp., 9810 Variel Ave., Chatsworth, CA 91311.

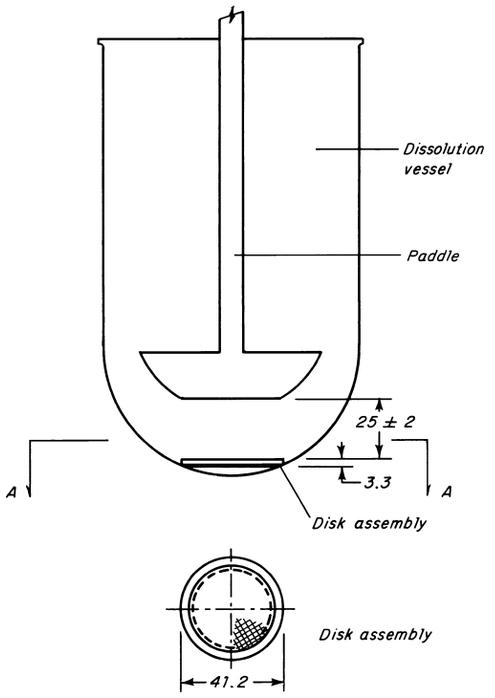

Fig. 1. Paddle Over Disk.
(All measurements are expressed in mm unless noted otherwise.)

Apparatus Suitability Test and Dissolution Medium—Proceed as directed for *Apparatus 2* under *Dissolution* ⟨711⟩.

Procedure—Place the stated volume of the *Dissolution Medium* in the vessel, assemble the apparatus without the disk assembly, and equilibrate the medium to 32 ± 0.5°. Apply the transdermal system to the disk assembly, assuring that the release surface of the system is as flat as possible. The system may be attached to the disk by applying a suitable adhesive[3] to the disk assembly. Dry for 1 minute. Press the system, release surface side up, onto the adhesive-coated side of the disk assembly. If a membrane[4] is used to support the system, it is applied so that no air bubbles occur between the membrane and the release surface. Place the disk assembly flat at the bottom of the vessel with the release surface facing up and parallel to the edge of the paddle blade and surface of the *Dissolution Medium.* The bottom edge of the paddle is 25 ± 2 mm from the surface of the disk assembly. Immediately operate the apparatus at the rate specified in the monograph. At each sampling time interval, withdraw a specimen from a zone midway between the surface of the *Dissolution Medium* and the top of the blade, not less than 1 cm from the vessel wall. Perform the analysis on each sampled aliquot as directed in the individual monograph, correcting for any volume losses, as necessary. Repeat the test with additional transdermal systems.

Time—The test time points, generally three, are expressed in hours. Specimens are to be withdrawn within a tolerance of ±15 minutes or ±2% of the stated time, the tolerance that results in the narrowest time interval being selected.

Interpretation—Unless otherwise specified in the individual monograph, the requirements are met if the quantities of active ingredient released from the system conform to *Acceptance Table 1* for transdermal drug delivery systems. Continue testing through the three levels unless the results conform at either L_1 or L_2.

Acceptance Table 1

Level	Number Tested	Criteria
L_1	6	No individual value lies outside the stated range.
L_2	6	The average value of the 12 units (L_1 + L_2) lies within the stated range. No individual value is outside the stated range by more than 10% of the average of the stated range.
L_3	12	The average value of the 24 units (L_1 + L_2 + L_3) lies within the stated range. Not more than 2 of the 24 units are outside the stated range by more than 10% of the average of the stated range; and none of the units is outside the stated range by more than 20% of the average of the stated range.

Apparatus 6 (Cylinder)

Apparatus—Use the vessel assembly from *Apparatus 1* as described under *Dissolution* ⟨711⟩, except to replace the basket and shaft with a stainless steel cylinder stirring element and to maintain the temperature at 32 ± 0.5° during the test. The shaft and cylinder components of the stirring element are fabricated of stainless steel to the specifications shown in *Figure 2*. The dosage unit is placed on the cylinder at the beginning of each test. The distance between the inside bottom of the vessel and the cylinder is maintained at 25 ± 2 mm during the test.

[3] Use Dow Corning, MD7-4502 Silicone Adhesive 65% in ethyl acetate, or the equivalent.

[4] Use Cuprophan, Type 150 pm, 11 ± 0.5-µm thick, an inert, porous cellulosic material, which is available from Medicell International Ltd., 239 Liverpool Road, London NI ILX, England.

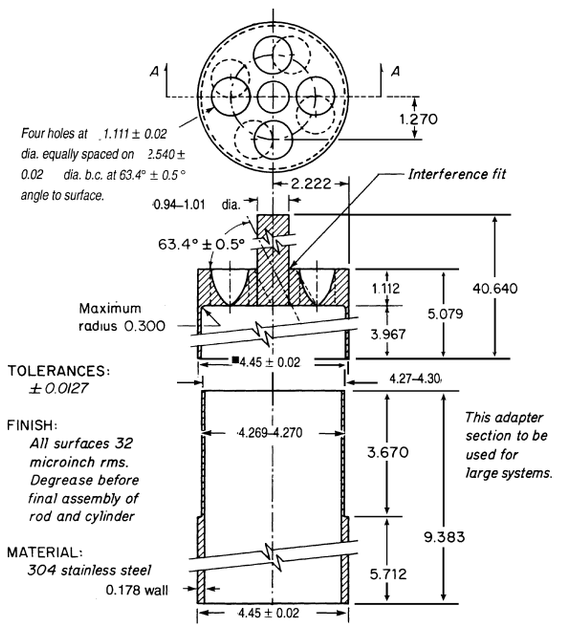

Fig. 2. Cylinder Stirring Element.[5]
(All measurements are expressed in cm unless noted otherwise.)

Dissolution Medium—Use the medium specified in the individual monograph (see *Dissolution* ⟨711⟩).

Procedure—Place the stated volume of the *Dissolution Medium* in the vessel of the apparatus specified in the individual monograph, assemble the apparatus, and equilibrate the *Dissolution Medium* to 32 ± 0.5°. Unless otherwise directed in the individual monograph, prepare the test system prior to test as follows. Remove the protective liner from the system, and place the adhesive side on a piece of Cuprophan[4] that is not less than 1 cm larger on all sides than the system. Place the system, Cuprophan covered side down, on a clean surface, and apply a suitable adhesive [3] to the exposed Cuprophan borders. If necessary, apply additional adhesive to the back of the system. Dry for 1 minute. Carefully apply the adhesive-coated side of the system to the exterior of the cylinder such that the long axis of the system fits around the circumference of the cylinder. Press the Cuprophan covering to remove trapped air bubbles. Place the cylinder in the apparatus, and immediately rotate at the rate specified in the individual monograph. Within the time interval specified, or at each of the times stated, withdraw a quantity of *Dissolution Medium* for analysis from a zone midway between the surface of the *Dissolution Medium* and the top of the rotating cylinder, not less than 1 cm from the vessel wall. Perform the analysis as directed in the individual monograph, correcting for any volume losses as necessary. Repeat the test with additional transdermal drug delivery systems.

Time—Proceed as directed under *Apparatus 5*.

Interpretation—Unless otherwise specified in the individual monograph, the requirements are met if the quantities of active ingredient released from the system conform to *Acceptance Table 1* for transdermal drug delivery systems. Continue testing through the three levels unless the results conform at either L_1 or L_2.

Apparatus 7 (Reciprocating Holder)

NOTE—This apparatus may also be specified for use with a variety of dosage forms.

Apparatus—The assembly consists of a set of volumetrically calibrated or tared solution containers made of glass or other suitable inert material[6], a motor and drive assembly to reciprocate the system vertically and to index the system horizontally to a different row of vessels automatically if desired, and a set of suitable sample holders (see *Figure 3*[7] and *Figures 4a–4d*). The solution containers are partially immersed in a suitable water bath of any convenient size that permits maintaining the temperature, *T,* inside the containers at 32 ± 0.5° or within the allowable range, as specified in the individual monograph, during the test. No part of the assembly, including the environment in which the assembly is placed, contributes significant motion, agitation, or vibration beyond that due to the smooth, vertically reciprocating sample holder. Apparatus that permits observation of the system and holder during the test is preferable. Use the size container and sample holder as specified in the individual monograph.

[5] The cylinder stirring element is available from Accurate Tool, Inc., 25 Diaz St., Stamford, CT 06907, or from VanKel Technology Group, 13000 Weston Parkway, Cary, NC 27513.

[6] The materials should not sorb, react with, or interfere with the specimen being tested.

[7] The reciprocating disk sample holder may be purchased from ALZA Corp., 1900 Charleston Road, P.O. Box 7210, Mt. View, CA 94039–7210 or VanKel Technology Group.

Stainless Steel Spring Dimensions

A	B
1.45	.58 O
1.40	.31 O
.96	.33 O
.60	.25 O

O= diameter

Fig. 4d. Oral Extended-Release Tablet Holder—Spring Holder.

Dissolution Medium—Use the *Dissolution Medium* specified in the individual monograph (see *Dissolution* ⟨711⟩).

Sample Preparation A (Coated tablet drug delivery system)—Attach each system to be tested to a suitable sample holder (e.g., by gluing system edge with 2-cyano acrylate glue onto the end of a plastic rod or by placing the system into a small nylon net bag at the end of a plastic rod or within a metal coil attached to a metal rod).

Sample Preparation B (Transdermal drug delivery system)—Press the system onto a dry, unused piece of Cuprophan[4], nylon netting, or equivalent with the adhesive side against the selected substrate, taking care to eliminate air bubbles between the substrate and the release surface. Attach the system to a suitable sized sample holder with a suitable O-ring such that the back of the system is adjacent to and centered on the bottom of the disk-shaped sample holder or centered around the circumference of the cylindrical-shaped sample holder. Trim the excess substrate with a sharp blade.

Sample Preparation C (Other drug delivery systems)—Attach each system to be tested to a suitable holder as described in the individual monograph.

Procedure—Suspend each sample holder from a vertically reciprocating shaker such that each system is continuously immersed in an accurately measured volume of *Dissolution Medium* within a calibrated container pre-equilibrated to temperature, *T.* Reciprocate at a frequency of about 30 cycles per minute with an amplitude of about 2 cm, or as specified in the individual monograph, for the specified time in the medium specified for each time point. Remove the solution containers from the bath, cool to room temperature, and add sufficient solution (i.e., water in most cases) to correct for evaporative losses. Perform the analysis as directed in the individual monograph. Repeat the test with additional drug delivery systems as required in the individual monograph.

Interpretation—Unless otherwise specified in the individual monograph, the requirements are met if the quantities of the active ingredients released from the system conform to *Acceptance Table 2* under *Dissolution* ⟨711⟩ for coated tablet drug delivery systems, to *Acceptance Table 1* for transdermal drug delivery systems, or as specified in the individual monograph. Continue testing through the three levels unless the results conform at either L_1 or L_2.●2

ERRATA

Following is a list of errata and corrections to *USP 28–NF 23*. The page number indicates where the item is found in *USP 28–NF 23*. If necessary, this list will be updated with every issue of *PF*. This information will also be available as a cumulative table in the next available *Supplement* and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement. USP staff are available to respond to questions regarding the accuracy of a particular requirement by calling 1-800-822-USPC.

Interim Revision Announcement

IN-PROCESS REVISION

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) items that previously appeared under *Pharmacopeial Previews* and are now formally proposed as revisions, (2) proposed revisions placed directly under *In-Process Revision,* or (3) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the staff liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

BRIEFING

> **Name of Item**, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How to Use PF*), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
>
> (PA5: K. Russo) RTS—55678-1

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type, as shown in the examples below:

•new text•

if slated for an *Interim Revision Announcement to USP 28–NF 23* (*IRA*);

▲new text▲*USP29*

if slated for *USP 29–NF 24*; and

■new text■

if slated for a *Supplement to USP–NF*. The same symbols *not* set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as •• or ■■ or ▲▲, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •2 indicates that the revision is proposed for the *Second Interim Revision Announcement*, ■2S (*USP 28*) indicates that the proposed revision is slated for the *Second Supplement to USP 28*, and ▲*USP29* and ▲*NF24* indicate that the revisions are proposed for *USP 29* and *NF 24*, respectively.

Official Title Changes Where the specification ***"Monograph title change"*** is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

MONOGRAPHS (USP)

BRIEFING

Amphetamine Sulfate, *USP 28* page 148 and page 807 of *PF* 30(3) [May–June 2004]. It is proposed to replace the current *Assay* method by the same procedure used in the *Assay* under *Dextroamphetamine Sulfate.*

(PA3: R. Ravichandran) RTS—41946-1

Change to read:

Identification—

A: Dissolve about 100 mg in 5 mL of water, add 5 mL of 1 N sodium hydroxide, cool to about 10°, add 1 mL of a mixture of 1 volume of benzoyl chloride and 2 volumes of absolute ether, insert the stopper, and shake for 3 minutes. Filter the precipitate, wash with about 10 mL of cold water, and recrystallize from diluted alcohol: the crystals of the benzoyl derivative of amphetamine so obtained, after drying at 80° for ~~2 hours,~~

■3 hours,■1S *(USP28)*
melt between 131° and 135°, the procedure for *Class I* being used (see *Melting Range or Temperature* ⟨741⟩).

B: A solution (1 in 10) responds to the tests for *Sulfate* ⟨191⟩.

Change to read:

Assay—

~~*Standard preparation*—Prepare as directed under *Amphetamine Assay* ⟨331⟩.~~

~~*Assay preparation*—Dissolve about 125 mg of Amphetamine Sulfate, previously dried and accurately weighed, in 25 mL of hydrochloric acid solution (1 in 100) in a 50-mL volumetric flask, dilute with the solvent to volume, and mix. Pipet 2.0 mL of the solution into a 100-mL beaker containing 3 g of purified siliceous earth, and mix until a fluffy mixture is obtained.~~

~~*Procedure*—Proceed as directed under *Amphetamine Assay* ⟨331⟩. Calculate the quantity, in mg, of $(C_9H_{13}N)_2 \cdot H_2SO_4$ in the portion of Amphetamine Sulfate taken by the formula:~~

$$0.25C[(A_{test} - A_{blank})/(A_{std} - A_{blank})],$$

~~in which *C* is the concentration, in µg per mL, of USP Dextroamphetamine Sulfate RS in the *Standard preparation*, and the other terms are as defined therein.~~

▲Dissolve about 500 mg of Amphetamine Sulfate, accurately weighed, in 50 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N perchloric acid is equivalent to 36.85 mg of $(C_9H_{13}N)_2 \cdot H_2SO_4$.▲*USP29*

BRIEFING

Betamethasone Acetate, *USP 28* page 245. It is proposed to change the visualization reagent in *Identification* test *B* to 10% sulfuric acid in alcohol to reduce the hazard to the analyst.

(PA1: C. Anthony) RTS—42253-1

Change to read:

Identification—

A: *Infrared Absorption* ⟨197M⟩.

B: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—
Test solution: 0.5 mg per mL in dehydrated alcohol.
Developing solvent system: a mixture of chloroform and diethylamine (2 : 1).
Procedure—Proceed as directed in the chapter. Locate the spots on the plate by lightly spraying with ~~dilute sulfuric acid (1 in 2)~~

▲10% sulfuric acid in alcohol▲*USP29*
and heating on a hot plate or under a lamp until spots appear.

BRIEFING

Bupropion Hydrochloride, *USP 28* page 296; **Bupropion Hydrochloride Extended-Release Tablets,** *USP 28* page 297, page 1562 of the *Fifth Interim Revision Announcement to USP 27–NF 22,* and in the *IRA* of this issue of *PF*. It is proposed to change the name of the test for *Chromatographic purity* to the test for *Related compounds* and to include the name of the impurities quantified in the *Procedure* under *Related compounds, Test 2* to facilitate the analysis of this compound. In addition, the formula to quantify the related compounds is modified according to the proposed method originally submitted. It is also proposed to change the TLC monitoring wavelength from 254 nm to 235 nm in *Related Com-*

~~**Chromatographic purity**~~

▲Related compounds—▲*USP29*

TEST 1—

Adsorbent: a 0.25-mm layer of high-performance silica gel, previously washed with methanol.

Test solution—Prepare a solution of Bupropion Hydrochloride in methanol having a concentration of about 100.0 mg per mL.

Standard solutions—Prepare a solution of *m*-chlorobenzoic acid in methanol containing about 0.5 mg per mL. Dilute this solution quantitatively, and stepwise if necessary, with methanol to obtain solutions having known concentrations of about 0.3, 0.2, and 0.1 mg per mL.

Application volume: ~~2 µL.~~

▲4 µL.▲*USP29*

Developing solvent system: a mixture of toluene, cyclohexane, and glacial acetic acid (47 : 47 : 6).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. Locate and quantitate the spots obtained by scanning the entire plate with a suitable densitometer at ~~254 nm.~~

▲235 nm.▲*USP29*

Plot a standard curve of area versus concentrations of the *Standard solutions.* From the standard curve, determine the percentages of *m*-chlorobenzoic acid and any other impurity present: not more than 0.2% of *m*-chlorobenzoic acid is found; and not more than 0.1% of any other individual impurity is found.

TEST 2—

▲*Diluent, 0.025 M Phosphate buffer, Mobile phase, System suitability solution,* and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Test solution—Use the *Assay preparation.*▲*USP29*

Procedure—Using the chromatograms obtained in the *Assay,* calculate the percentage of each impurity in the portion of Bupropion Hydrochloride taken by the formula:

~~$100F(r_i/r_s)$,~~

▲$5000(C/W)F(r_i/r_S)$,▲*USP29*

in which

▲C is the concentration, in mg per mL, of USP Bupropion Hydrochloride RS in the *Standard solution; W* is the weight, in mg, of sample take to prepare the *Test solution;*▲*USP29*

F is the relative response factor for each impurity (see the accompanying table for values); r_i is the peak response for each impurity obtained from the ~~*Assay preparation;*~~

▲*Test solution;*▲*USP29*

and r_S is the peak response for bupropion hydrochloride obtained from the ~~*Standard preparation.*~~

▲*Standard solution.*▲*USP29*

The limits of impurities are specified in the accompanying table: not more than 0.3% of total unidentified impurities is found; and not more than 1.0% of total impurities is found, the results of *Test 1* and *Test 2* being added.

~~Relative retention time~~	~~Relative response factor (F)~~	~~Limit (%)~~
~~0.38~~	~~0.68~~	~~0.5~~
~~0.58~~	~~0.96~~	~~0.2~~

—Proceed as directed in the *Assay.*

Standard solution—~~Dissolve accurately weighed quantities of USP Bupropion Hydrochloride RS and USP Bupropion Hydrochloride Related Compound E RS in a mixture of 0.001 N hydrochloric acid and methanol (80 : 20) to obtain a solution having known concentrations of about 0.6 mg per mL and 0.0024 mg per mL, respectively.~~

▲Use the *Standard preparation,* prepared as directed in the *Assay.*▲*USP29*

Test solution—Use the *Assay preparation.*

~~*Chromatographic system*—Proceed as directed in the *Assay,* except to use the *Standard solution* instead of the *Standard preparation.*~~

▲▲*USP29*
Procedure—Separately inject equal volumes (about 5 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. ~~Calculate the percentage of bupropion hydrochloride related compound E in the portion of Tablets taken by the formula:~~

~~$100(C/D)(r_u/r_s),$~~

~~in which *C* is the concentration, in mg per mL, of USP Bupropion Hydrochloride Related Compound E RS in the *Standard solution; D* is the concentration, in mg per mL, of bupropion hydrochloride in the *Test solution,* based on the number of Tablets taken, the labeled quantity per Tablet, and the extent of dilution; and r_u and r_s are the peak responses for bupropion hydrochloride related compound E obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.4% of bupropion hydrochloride related compound E is found. Calculate the percentage of each additional impurity in the portion of Tablets taken by the formula:~~

~~$100F(r_i/r_s),$~~

~~in which *F* is the relative response factor for each impurity (see the accompanying table for values); r_i is the peak response for each impurity obtained from the *Test solution;* and r_s is the peak response for bupropion hydrochloride obtained from the *Standard solution.* See the accompanying table for limits of individual impurities based upon Tablet strength.~~

BRIEFING

Calcitonin Salmon, page 1169 of *PF* 30(4) [July–Aug. 2004]. On the basis of comments received, it is proposed to allow other methods besides *Method 1* under *Biotechnology-Derived Articles—Tests* ⟨1047⟩ to be used to perform the test for *Amino acid profile.* It is also proposed to lower the amount of material used to perform the test for *Microbial limits.*

(BNT: L. Callahan) RTS—42086-1

Add the following:

▲Calcitonin Salmon

$C_{145}H_{240}N_{44}O_{48}S_2$ 3432 daltons [*47931-85-1*].

» Calcitonin Salmon is a synthetic polypeptide that has the same sequence as that of the hormone-regulating calcium metabolism secreted by the ultimobranchial gland of salmon. It lowers the calcium concentration in plasma of mammals by diminishing the rate of bone resorption. It contains not less than 90.0 percent and not more than 105.0 percent of calcitonin salmon, calculated on an acetic acid–free and dried basis.

NOTE—1 mg of acetic acid–free, anhydrous Calcitonin Salmon is equivalent to 6000 USP Calcitonin Salmon Units.

Packaging and storage—Preserve in tight containers. Store protected from light in a refrigerator.

Labeling—The labeling states that the material is synthetic.

In-Process Revision

USP Reference standards ⟨**11**⟩—*USP Calcitonin Salmon RS. USP Calcitonin Salmon Related Compound A RS* (*N*-acetyl-cys[1]-calcitonin). *USP Endotoxin RS.*

Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation,* obtained as directed in the *Assay.*

B: The UV absorption spectrum of a 0.1% solution (based on free peptide) in 0.01 N hydrochloric acid exhibits a minima and a maxima at the same wavelengths as those of a similar solution of USP Calcitonin Salmon RS, concomitantly measured. The absorbance at approximately 275 nm (maxima) is about 0.40 to 0.55, and the ratio of the absorbance at 275 nm (maxima) and 254 nm (minima) is between 1.6 and 2.5.

Amino acid profile (see *Amino Acid Analysis ~~Method 1,~~* under *Biotechnology-Derived Articles—Tests* ⟨1047⟩)—[NOTE—The concentration of amino acids in the *Internal standard solution,* the *Standard amino acid solution,* and the *Standard solution* and the amount of material used to prepare the *Test solution* can be adjusted depending on the method used for amino acid analysis. The concentrations given are based on analysis using *Method 1.*]

Internal standard solution—Prepare a 1 mM solution of γ-aminobutyric acid.

Standard amino acid solution—Prepare a mixture containing equimolar amounts of ammonia and the L form of lysine, histidine, arginine, aspartic acid, threonine, serine, proline, valine, glutamic acid, glycine, leucine, and tyrosine, together with half the equimolar amount of L-cystine, in 0.1 M hydrochloric acid. The final concentration is about 2.5 mM for each amino acid.

Standard solution—Transfer 5 mL of the *Internal standard solution* and 2 mL of the *Standard amino acid solution* into a 50-mL volumetric flask, and dilute with 0.1 M hydrochloric acid to volume.

Test solution—Place about 1.5 mg of an accurately weighed quantity of Calcitonin Salmon into a heavy-wall ignition tube, add 1.0 mL of 6 N hydrochloric acid, allow to cool, immerse the lower half of the tube in a freezing mixture until the contents are frozen, evacuate to approximately 10 μM, purge with nitrogen (repeat the evacuation and nitrogen purge three times), and seal the tube while it is under a 10-μM vacuum. Heat for 16 hours at 110° to 115° in an air oven. Cool, open the tube, dry in a vacuum desiccator, remove the contents, and allow to cool to room temperature. Dissolve in 0.1 M hydrochloric acid, transfer to a 10-mL volumetric flask, add 1 mL of *Internal standard solution,* and dilute with 0.1 M hydrochloric acid to volume.

Procedure—Standardize the amino acid analyzer, using the *Standard solution.* Inject the *Test solution* into the amino acid analyzer, and determine the relative proportion of amino acids.

Calculation of amino acid profile—Express the content of each amino acid in moles, using an internal standard calibration technique. Calculate the relative proportions of the amino acids by taking as equivalent to 1 the sum divided by 20 of the number of moles of aspartic acid, glutamic acid, proline, glycine, valine, leucine, histidine, arginine, and lysine. For threonine and serine, perform the same calculation, and correct the concentrations for degradation by adding 5% and 10%, respectively, to their indicated results. The requirements are met if the values fall within the following limits: aspartic acid, 1.8 to 2.2; glutamic acid, 2.7 to 3.3; proline, 1.7 to 2.3; glycine, 2.7 to 3.3; valine, 0.9 to 1.1; leucine, 4.5

In-Process Revision

to 5.3; histidine, 0.9 to 1.1; arginine, 0.9 to 1.1; lysine, 1.8 to 2.2; serine, 3.2 to 4.2; threonine, 4.2 to 5.2; tyrosine, 0.7 to 1.1; half cystine, 1.4 to 2.1.

Bacterial endotoxins ⟨85⟩**—**It contains not more than 1000 USP Endotoxin Units per mg of calcitonin salmon.

Microbial limits ⟨61⟩**—**The test is performed on a portion of about 0.2 g, accurately weighed. The total aerobic microbial count does not exceed 100 cfu per g. It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa.*

pH ⟨791⟩**:** between 4.0 and 6.0 in a 1% solution in carbon dioxide–free water.

Water, *Method Ic* ⟨921⟩**:** not more than 10%.

Heavy metals, *Method II* ⟨231⟩**:** 0.005%.

Limit of trifluoroacetic acid—[NOTE—Use deionized, degassed water where water is indicated.]

Solution A: water.

Solution B: 0.005 N sodium hydroxide.

Solution C: 0.1 N sodium hydroxide.

Mobile phase—Use variable mixtures of *Solution A, Solution B,* and *Solution C* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Chloride stock standard solution—Dissolve an accurately weighed quantity of sodium chloride in water to obtain a solution having a concentration of the chloride ion of about 0.1 mg per mL.

Trifluoroacetic acid stock standard solution—Dissolve an accurately weighed quantity of trifluoroacetic acid in water to obtain a solution having a concentration of trifluoroacetic acid of about 0.1 mg per mL.

Resolution solution—Pipet 0.2 mL of *Chloride stock standard solution* and 0.5 mL of *Trifluoroacetic acid stock standard solution* into a 100-mL volumetric flask, dilute with water to volume, and mix to obtain a solution that contains 0.2 µg of chloride and 0.5 µg of trifluoroacetate per mL, respectively.

Standard solutions—Pipet 0.2 mL, 0.5 mL, 1.0 mL, and 2.0 mL of *Trifluoroacetic acid stock standard solution* into ordered 100-mL volumetric flasks. Dilute with water to volume and mix to obtain solutions that contain concentrations of about 0.2 µg, 0.5 µg, 1.0 µg, and 2.0 µg of trifluoroacetate per mL, respectively.

Test solution—Transfer about 10 mg of Calcitonin Salmon, accurately weighed, to a 5-mL volumetric flask. Dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The ion chromatograph is equipped with a conductivity detector, a 4-mm × 5-cm anion-exchange guard column containing packing L31, a 4-mm × 25-cm anion-exchange analytical column containing packing L31, a high-capacity anion trap column in hydroxide form in the eluant line in front of the injection valve, and a micromembrane anion self-regenerating suppressor. The flow rate is about 2.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	*Solution C* (%)	Elution
0–2	90	10	0	isocratic
2–5	90→0	10→100	0	linear gradient
5–15	0	100→65	0→35	linear gradient
15–20	0→90	65→10	35→0	linear gradient

Chromatograph the *Resolution solution,* and record the peak responses as directed for the *Procedure:* the resolution, *R,* between the chloride peak and the trifluoroacetic acid peak is not less than 3; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 100 µL) of each of the *Standard solutions* and the *Test solution* into the chromatograph, record the chromatograms, and measure the area of peak responses. Plot the response of the trifluoroacetic acid peak in the *Standard solutions* versus the concentration of trifluoroacetic acid, and draw the straight line best fitting the plotted points. From the graphs so obtained, determine a concentration value, *C,* in µg per mL for trifluoroacetic acid. Calculate the quantity, in ppm, for trifluoroacetic acid in Calcitonin Salmon by the formula:

$$5000(C/W),$$

in which *W* is the weight in mg of Calcitonin Salmon taken to prepare the *Test solution:* not more than 200 ppm of trifluoroacetic acid is found.

Limit of residual solvents—

Standard stock solution—Prepare a solution containing about 300 µg of methanol, 40 µg of acetonitrile, 60 µg of methylene chloride, 500 µg of *tert*-butyl methyl ether, and 90 µg of dimethylformamide per mL of methyl sulfoxide.

Standard solution—Transfer 5 mL of the *Standard stock solution* to a 25-mL volumetric flask, and dilute with dimethyl sulfoxide to volume. Transfer 1 mL of the *Standard solution* to a 20-mL headspace vial fitted with a septum and a crimp cap, and seal the vial.

Test solution 1—Transfer about 100 mg of Calcitonin Salmon, accurately weighed, to a 20-mL headspace vial fitted with a septum and a crimp cap, add 1 mL of dimethyl sulfoxide, seal the vial, and mix.

Test solution 2—Transfer about 100 mg of Calcitonin Salmon, accurately weighed, to a 20-mL headspace vial fitted with a septum and a crimp cap, add 1 mL of *Standard solution,* seal the vial, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a headspace injector and a flame-ionization detector and contains a 0.32-mm × 60-m fused silica column coated with a 1.0-µm film of stationary phase G38. Nitrogen is used as the carrier gas, flowing at a rate of about 25 mL per minute. The column temperature is maintained at 45° for 2 minutes, then increased at a rate of 10° per minute to 75°, then increased at a rate of 5° per minute to 170° and maintained at 170° for 3 minutes. The split injector temperature is maintained at about 200°, and the detector temperature is maintained at about 170°. The transfer loop and transfer line temperature is 170°, and the pressurize time is 0.5 minute. The *Standard solution* vial and the *Test solutions 1* and *2* vials are maintained at about 90°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.55 for methanol, 0.76 for acetonitrile, 1.0 for methylene chloride, 1.2 for *tert*-butyl methyl ether, and 2.3 for dimethylformamide; and the relative standard deviation, determined from peak areas for each peak, for six replicate injections is not more than 10%.

Procedure—Separately inject equal volumes (about 1 mL) of headspace from vials of *Test solution 1* and *Test solution 2* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of methanol, acetonitrile, methylene chloride, *tert*-butyl methyl ether, and dimethylformamide in the Calcitonin Salmon taken by the formula:

$$100(r_{T1})(C)/(r_{T2})(W_{T1}) - (r_{T1})(W_{T2}),$$

in which *C* is the concentration, in mg per mL, of the relevant analyte in the *Standard solution;* W_{T1} and W_{T2} are the weights, in mg, of Calcitonin Salmon taken to prepare *Test solution 1* and *Test solution 2,* respectively; and r_{T1} and r_{T2} are the peak areas of the corresponding analyte obtained

from *Test solution 1* and *Test solution 2,* respectively: not more than 3000 µg of methanol, 400 µg of acetonitrile, 600 µg of methylene chloride, 5000 µg of *tert*-butyl methyl ether, and 900 µg of dimethylformamide per g of Calcitonin Salmon are found.

Acetic acid content—

Internal standard stock solution—Mix 1 mL of dioxane with water to obtain 100 mL of solution.

Standard solution—Transfer approximately 100 mg of glacial acetic acid, accurately weighed, and 10 mL of *Internal standard stock solution* to a 100-mL volumetric flask, dilute with water to volume, and mix.

Test solution—Transfer about 100 mg of Calcitonin Salmon, accurately weighed, to a 10-mL volumetric flask, add 1 mL of *Internal standard stock solution,* dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm × 3-m glass column packed with 10% liquid phase G35, 1% phosphoric acid, on support S1A. Nitrogen is the carrier gas, flowing at a rate of about 30 mL per minute. The column is maintained at 70° for 4 minutes, then increased at a rate of 8° per minute to 120°, then maintained at 120° for 4 minutes. The injection port and detector are maintained isothermally at temperatures of about 200°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between dioxane and acetic acid is not less than 8; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 4 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses of the major peaks. The retention times are about 3 minutes for acetic acid and 1 minute for dioxane. Calculate the percentage of acetic acid in the portion of Calcitonin Salmon taken by the formula:

$$1000(C/W)(R_U/R_S),$$

in which C is the concentration, in mg per mL, of acetic acid in the *Standard solution;* and R_U and R_S are the peak response ratios of acetic acid to dioxane obtained from the *Test solution* and the *Standard solution,* respectively: not less than 4.0% and not more than 15.0% is found.

Bioidentity—

RPMI 1640 with L-glutamine—Prepare a mixture of the ingredients in the quantities shown in sufficient water to obtain 1 L of medium, and sterilize by filtration.

Calcium Nitrate	100.00 mg
Potassium Chloride	400.00 mg
Magnesium Sulfate, Anhydrous	48.84 mg
Potassium Chloride	400 mg
Sodium Chloride	6000 mg
Sodium Phosphate, Dibasic, Anhydrous	800 mg
Sodium Bicarbonate	2000 mg
Glycine	10 mg
L-Arginine	200 mg
L-Asparagine	50 mg
L-Aspartic Acid	20 mg
L-Cystine Dihydrochloride	65 mg
L-Glutamic Acid	20 mg
L-Glutamine	300 mg
L-Histidine	15 mg
L-Hydroxyproline	20 mg
L-Isoleucine	50 mg
L-Leucine	50 mg
L-Lysine Hydrochloride	40 mg

L-Methionine	15 mg
L-Phenylalanine	15 mg
L-Proline	20 mg
L-Serine	30 mg
L-Threonine	20 mg
L-Tryptophan	5 mg
L-Tyrosine Disodium Salt Dihydrate	29 mg
L-Valine	20 mg
Biotin	0.2 mg
Choline Chloride	3 mg
D-Calcium Pantothenate	0.25 mg
Folic Acid	1 mg
i-Inositol	35 mg
Niacinamide	1 mg
Para-Aminobenzoic Acid	1 mg
Pyridoxine Hydrochloride	1 mg
Riboflavin	0.2 mg
Thiamine Hydrochloride	1 mg
Vitamin B_{12}	0.005 mg

Medium A (growth medium)—Using aseptic technique, prepare the following tissue culture medium.

RPMI 1640 with L-glutamine	500 mL
Fetal bovine serum	50 mL
1 M HEPES	5 mL
Penicillin/streptomycin solution (10,000 IU per mL /10 mg per mL)	5 mL
Human insulin	10 IU
Hydrocortisone	0.5 mg

Medium B (stimulation medium)—Dissolve 5 g of albumin bovine serum (BSA), in 500 mL of 2 mM *RPMI 1640 with L -glutamine.*

2% BSA solution—Dissolve 50 mg of albumin bovine serum in 25 mL of water. [NOTE—Use within 1 day.]

Formic acid/BSA solution—Add 25 mL of 0.1 M formic acid and 5 mL of *2% BSA solution* to a 50-mL volumetric flask, and dilute with water to volume. [NOTE—Use within 2 days.]

Trypsin–tetrasodium ethylenediaminetetraacetate (EDTA) solution—Prepare a sterile filtered solution containing 0.25% trypsin and 0.53 mM EDTA.

Dulbecco's phosphate buffered saline—Dissolve 8 g of sodium chloride, 1.15 g of dibasic sodium phosphate, 0.2 g of monobasic potassium phosphate, 0.2 g of potassium chloride, 0.1 g of calcium chloride, and 0.1 g of magnesium chloride in 1 L of water.

Standard stock solution—Dissolve an accurately weighed quantity of USP Calcitonin Salmon RS in *Formic acid/BSA solution* to obtain a solution having a known concentration of about 20 µg per mL.

Positive control solution—Quantitatively dilute the *Standard stock solution* with *Medium B* to obtain a solution of USP Calcitonin Salmon RS having a known concentration of 1 ng per mL.

Negative control solution: Medium B.

Standard solution A—Quantitatively dilute the *Standard stock solution* with *Medium B* to obtain a solution of USP Calcitonin Salmon RS having a known concentration of 0.1 ng per mL.

Standard solution B—Dilute *Standard solution A* quantitatively with *Medium B* to obtain a solution of USP Calcitonin Salmon RS having a known concentration of 0.033 ng per mL.

Standard solution C—Dilute *Standard solution B* quantitatively (1 : 2) with *Medium B* to obtain a solution of USP Calcitonin Salmon RS having a known concentration of 0.011 ng per mL.

In-Process Revision

Standard solution D—Dilute *Standard solution C* quantitatively (1 : 2) with *Medium B* to obtain a solution of USP Calcitonin Salmon RS having a known concentration of 0.0037 ng per mL.

Test stock solution—Dissolve an accurately weighed quantity of Calcitonin Salmon in *Formic acid/BSA solution* to obtain a solution having a concentration of about 20 µg per mL.

Test solution A—Quantitatively dilute the *Test stock solution* with *Medium B* to obtain a solution of Calcitonin Salmon having a concentration of 0.1 ng per mL.

Test solution B—Quantitatively dilute *Test solution A* with *Medium B* (1 : 2) to obtain a solution of Calcitonin Salmon having a concentration of 0.033 ng per mL.

Test solution C—Quantitatively dilute *Test solution B* with *Medium B* (1 : 2) to obtain a solution of Calcitonin Salmon having a concentration of 0.011 ng per mL.

Test solution D—Quantitatively dilute *Test solution C* with *Medium B* (1 : 2) to obtain a solution of Calcitonin Salmon having a concentration of 0.0037 ng per mL.

Cell culture preparation—Prepare cell culture of the human mammary tumor cell line T-47D. Cells are propagated using *Medium A* at 37° and 5% carbon dioxide. The medium is changed every 2 days, and cells are passaged every 5 to 9 days, using *Trypsin–EDTA solution* with a 1 : 4 subculture.

Cell suspension—For the test, use a cell culture that is 5 to 9 days old. Remove the cell culture medium from the flask by aspiration, add 10 mL of *Dulbecco's phosphate buffered saline,* and rock the culture flask to rinse the entire monolayer. Remove the liquid by aspiration, add 2 mL of *Trypsin–EDTA solution,* spread over the entire monolayer, allow to stand for 3 to 5 minutes, and add 10 mL of *Medium A.* Homogenize the cell suspension using a pipet, transfer to a 15-mL polypropylene tube, centrifuge at about 220 × *g* for 5 minutes, pour off the supernatant, and resuspend the cell pellet in 10 mL of *Medium A.* Count the cells, and adjust the cell density through dilution, using *Medium A* to 2.5×10^4 cells per mL.

Procedure—Place 200 µL of the *Cell suspension* into each well of a 96-well culture plate (the *tissue culture plate*), and incubate for 18 to 24 hours at 37° and 5% carbon dioxide. Fill each well of an empty round-bottomed 96-well culture plate (the *prepared plate*) with 150 µL of one of the following solutions: *Positive control solution, Negative control solution, Standard solutions A–D,* and *Test solutions A–D,* so that each solution fills at least five wells on the prepared plate. After incubation, remove the culture medium from the tissue culture plate. Using an 8-channel or 12-channel pipet, rapidly transfer 100 µL of solution from each well of the prepared plate to each well of the tissue culture plate. Incubate for 15 minutes at ambient temperature, remove solution from each well, stop stimulation by immediately adding an appropriate cell-lysis buffer, and quantitate cAMP, produced within the cells, using a validated kit. Perform the test three times, using three different 96-well culture plates. [NOTE—Some kits include a cell-lysis reagent and a sequestering agent for the cell-lysis reagent. The range of the test kit is between 0.05 ng and 10 ng per mL of cAMP.] Potency is determined by a 3-dose, 6-point parallel-line assay, using standard statistical methods. The calculation is carried out using both the lower three concentrations and the upper three concentrations. For the assay to be valid, the requirements for regression and parallelism must be met. If the requirements for validity are met to the same extent in both assessments (the lower and the higher assessments), the final result is determined from the concentration range that shows the higher value when the common slope is divided by the mean square error. The potency levels determined from all three performances of the

test are homogeneous, and the confidence limits for all three determinations are between 64% and 156% of the calculated potency.

Related peptides and other related substances—

Test solution—Prepare as directed for the *Assay preparation.*

Solution A, Solution B, Mobile phase, Resolution solution, and *Chromatographic system*—Prepare as directed in the *Assay.*

Procedure—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the area percentage of each peak observed in the chromatogram. Disregard any peaks due to the solvent and any peaks whose area is less than 0.1% of the principal peak. No peak other than the principal peak constitutes more than 3.0% of the total area of all peaks. The sum of the area of all peaks apart from the principal peak is not greater than 5.0% of the area of all peaks.

Other requirements—Where the label states that Calcitonin Salmon is sterile, it meets the requirements for *Sterility* under *Calcitonin Salmon Injection.*

Assay—

Solution A—Dissolve 3.62 g of tetramethylammonium hydroxide pentahydrate in 900 mL of water, add 100 mL of acetonitrile, and mix. Adjust with phosphoric acid to a pH of 2.5, pass through a filter having a 0.5-µm or finer porosity, and degas.

Solution B—Dissolve 1.45 g of tetramethylammonium hydroxide pentahydrate in 400 mL of water, add 600 mL of acetonitrile, and mix. Adjust with phosphoric acid to a pH of 2.5, pass through a filter having a 0.5-µm or finer porosity, and degas.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer about 10.0 mg of USP Calcitonin Salmon RS, accurately weighed, into a 10-mL volumetric flask, dissolve in and dilute with *Solution A* to volume, and mix.

Resolution solution—Dissolve the contents of a vial of USP Calcitonin Salmon Related Compound A RS in 0.4 mL of *Solution A,* add 0.1 mL of the *Standard preparation,* and mix.

Assay preparation—Transfer about 10.0 mg of Calcitonin Salmon, accurately weighed, into a 10-mL volumetric flask, dissolve in and dilute with *Solution A,* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The column temperature is maintained at about 65°. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–30	72→48	28→52	linear gradient
30–32	48→72	52→28	linear gradient
32–55	72	28	isocratic

Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.15 for calcitonin salmon related compound A and 1.0 for calcitonin salmon; the resolution, *R,* between calcitonin salmon related compound A and calcitonin salmon is not less than 3; the tailing factor is not more than 2.5; and the relative standard deviation for replicate injections is not more than 3%.

In-Process Revision

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses of the major peaks. Calculate the percentage of calcitonin salmon in the portion of Calcitonin Salmon taken by the formula:

$$P(W_S / W_U)(r_U / r_S),$$

in which P is the percentage of calcitonin salmon in USP Calcitonin Salmon RS; W_S is the weight, in mg, of USP Calcitonin Salmon RS used to prepare the *Standard preparation;* W_U is the weight, in mg, of Calcitonin Salmon used to prepare the *Assay preparation;* and r_U and r_S are the main peak areas from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP29*

Calculate the quantity, in mg, of $C_6H_8O_7 \cdot H_2O$ in each mL of the Irrigation taken by the formula:~~

~~$$(210.14/192.12)(100C/V)(r_u/r_s),$$~~

~~in which 210.14 and 192.12 are the molecular weights of citric acid monohydrate and anhydrous citric acid, respectively; *C* is the concentration, in mg per mL, of anhydrous citric acid in the *Standard preparation; V* is the volume, in mL, of Irrigation taken; and r_u and r_s are the peak responses for citric acid obtained from the *Assay preparation* and the *Standard preparation,* respectively.~~

▲*Mobile Phase, Standard Preparation 1,* and *Chromatographic System*—Proceed as directed under *Assay for Citric Acid/Citrate and Phosphate* ⟨345⟩.

Assay preparation—Transfer an accurately measured volume of Irrigation, equivalent to about 130 mg of monohydrate citric acid into a suitable volumetric flask, and proceed as directed under *Assay Preparation for Citric Acid/Citrate Assay* in ⟨345⟩.

Procedure—Proceed as directed for *Procedure* in ⟨345⟩, and calculate the quantity, in mg per mL, of monohydrate citric acid ($C_6H_8O_7 \cdot H_2O$) in the Irrigation taken by the formula:

$$0.001(210.14/189.10)C_S(D/V)(r_U/r_S),$$

in which 210.14 is the molecular weight of monohydrate citric acid; 189.10 is the molecular weight of citrate ($C_6H_5O_7^{-3}$); C_S is the concentration, in µg per mL, of citrate in *Standard Preparation 1; D* is the dilution factor; *V* is the volume, in mL, of Irrigation used in the preparation of the *Assay preparation;* and r_U and r_S are the citrate peak areas obtained from the *Assay preparation* and *Standard Preparation 1*, respectively.▲*USP29*

(Official January 1, 2009)

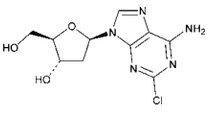
BRIEFING

Cladribine. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on manufacturer's tests and acceptance criteria, is being proposed. The reverse phase HPLC procedures in the test for *Related compounds* and in the *Assay* were validated using a Shimadzu Premier brand of L1 column; cladribine elutes at approximately 8.1 minutes.

(PA6: L. Evans; PSD: C. Okeke; NL: C. Barnstein) RTS—41567-1; 41567-2; 41911-1

Add the following:

▲Cladribine



$C_{10}H_{12}ClN_5O_3$ 285.69

Adenosine, 2-chloro-2′-deoxy-.

2-Chloro-2′-deoxyadenosine [*4291-63-8*].

» Cladribine contains not less than 98.0 percent and not more than 102.0 percent of $C_{10}H_{12}ClN_5O_3$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers, and protect from light. Store between 2° and 8°.

USP Reference standards ⟨11⟩—*USP Cladribine RS. USP Cladribine Related Compound A RS.*

In-Process Revision

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Specific rotation ⟨781S⟩**:** between –17° and –21°.

Test solution: 10 mg per mL, in dimethylformamide.

Water, *Method I* ⟨921⟩**:** not more than 2.0%.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩**:** 0.002%.

Related compounds—

Buffer, Diluent, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Test solution—Use the *Assay preparation*.

Chromatographic system (see *Chromatography* ⟨621⟩)—Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between cladribine and cladribine related compound A is not less than 1.5; and the tailing factor is not more than 2.0.

Procedure—Inject a volume (about 10 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Cladribine taken by the formula:

$$100(r_i / r_s),$$

in which r_i is the individual peak response of each individual impurity, and r_s is the sum of the responses of all the peaks. Refer to *Table 1* for the impurity limits.

Table 1

Name	Relative Retention Time	Limit (%)
2,6-Diaminopurine-2′-deoxyriboside	about 0.41	0.2
2′-Deoxyadenosine	about 0.47	0.2
2-Chloroadenine	about 0.60	0.2
2-Methoxy-2′-deoxyadenosine (cladribine related compound A)	about 0.91	0.2
Any other individual impurity	—	0.1
Total impurities	—	1.0

Limit of residual solvents—

Standard solution—Transfer 15 µL of methanol and 24 µL of alcohol to a 100-mL volumetric flask containing 80 mL of water, dilute with water to volume, and mix. Transfer 3 mL of the solution to a 20-mL headspace vial. The concentrations of methanol and alcohol in the *Standard solution* are 119 µg per mL and 198 µg per mL, respectively.

Test solution—In a 20-mL headspace vial, dissolve 200 mg of Cladribine, accurately weighed, in 5 mL of water.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a headspace injector and a flame-ionization detector and contains a 0.53-mm × 30-m column coated with a 5-µm film of liquid phase G16. The carrier gas is nitrogen, flowing at a rate of 4 mL

per minute. The split ratio is 5 : 1. Vials containing the *Standard solution* and the *Test solution* are equilibrated for 10 minutes at 80° in the headspace sampler. The chromatograph is programmed as follows. Initially the temperature of the column is maintained at 80° for 6 minutes, then increased at a rate of 25° per minute to 240° and held at 240° for 20 minutes. The injection port temperature is maintained at 250°, and the detector temperature is maintained at 250°. Chromatograph the *Standard soluation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between alcohol and methanol is not less than 1.5; and the relative standard deviation for replicate injections is not more than 10.0% for each of the two solvents.

Procedure—Separately inject equal volumes (about 1 mL) of the gaseous headspace of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the concentration, in ppm, of each residual solvent in the portion of Cladribine by the formula:

$$5000(C/W)(r_U / r_S),$$

in which C is the concentration, in µg per mL, of the respective individual solvent in the *Standard solution; W* is the quantity, in mg, of Cladribine taken to prepare the *Test solution;* and r_U and r_S are the peak responses of the relevant solvent obtained from the *Test solution* and the *Standard solution,* respectively: not more than 5000 ppm of alcohol is found, and not more than 450 ppm of methanol is found.

Assay—

Buffer—Dissolve 9.96 g of triethylamine phosphate, accurately weighed, in 500 mL of water, and add another 500 mL of water. Adjust with potassium hydroxide to a pH of 6.1.

Diluent—Prepare a mixture of water and methanol (90 : 10).

Mobile phase—Prepare a filtered and degassed mixture of *Buffer* and methanol (78 : 22). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Prepare a solution of USP Cladribine RS and USP Cladribine Related Compound A RS in *Diluent* to obtain known concentrations of about 2.0 mg per mL each.

Standard preparation—Dissolve an accurately weighed quantity of USP Cladribine RS in *Diluent* to obtain a concentration of 0.5 mg per mL.

Assay preparation—Transfer about 25 mg of Cladribine, accurately weighed, to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 265-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution* and the *Standard preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between cladribine and cladribine related compound A is not less than 1.5; the tailing factor for the cladribine peak in the *System suitability solution* is not more than 2.0; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the

quantity, in mg, of $C_{10}H_{12}ClN_5O_3$ in the portion of Cladribine taken by the formula:

$$50C(r_U / r_S),$$

in which *C* is the concentration, in mg per mL, of USP Cladribine RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP29*

BRIEFING

Clotrimazole Lozenges, *USP 28* page 521. It is proposed to replace the *Disintegration* test with a *Dissolution* test. The liquid chromatographic procedure was developed using a NovaPak C18 brand of column that contains L1 packing. The retention time of clotrimazole is about 6 minutes.

(BPC: M. Marques) RTS—41769-1

Delete the following:

▲~~**Disintegration** ⟨701⟩: 30 minutes, but complete disintegration does not occur before 5 minutes.~~▲*USP29*

Add the following:

▲**Dissolution** ⟨711⟩—

Medium: 0.1 N hydrochloric acid; 500 mL, deaerated.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Determine the amount of $C_{22}H_{17}ClN_2$ dissolved by employing the following method.

25 mM Phosphate buffer—Dissolve 4.4 g of dibasic potassium phosphate in 1000 mL of water.

100 mM Phosphate buffer—Dissolve 17.4 g of dibasic potassium phosphate in 1000 mL of water.

Diluent—Prepare a filtered and degassed mixture of methanol and *100 mM Phosphate buffer* (60 : 40).

Mobile phase—Prepare a filtered and degassed mixture of methanol and *25 mM Phosphate buffer* (4 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Clotrimazole RS, and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a concentration of about 0.02 mg per mL.

Working standard solution—Transfer 5.0 mL of the *Standard solution* to a 25-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Test solution—Withdraw 25 mL of the solution under test from the vessel. Pass through a 0.45-µm polyvinylidene difluoride filter, discarding the first 10 mL of the filtrate. Transfer 5.0 mL of the filtrate to a 25-mL volumetric flask. Dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 3.9-mm × 7.5-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Working standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Working standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in percentage, of $C_{22}H_{17}ClN_2$ released by the formula:

$$\frac{r_U \times C_S \times 500 \times D \times 100}{r_s \times LC},$$

In-Process Revision

in which r_U and r_S are the peak responses for the *Test solution* and the *Working standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Working standard solution; D* is the dilution factor of the *Working standard solution;* 500 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the label claim, in mg.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{22}H_{17}ClN_2$ is dissolved in 45 minutes.▲*USP29*

BRIEFING

Dibucaine, *USP 28* page 622; **Dibucaine Cream,** *USP 28* page 623; **Dibucaine Ointment,** *USP 28* page 623; **Dibucaine Hydrochloride,** *USP 28* page 623 and page 1458 of *PF* 29(5) [Sept.–Oct. 2003]; and **Dibucaine Hydrochloride Injection,** *USP 28* page 624. It is proposed to revise the *Identification* test by replacing the UV absorption spectra comparison with HPLC retention time agreement of the major peak in the *Assay preparation* and the *Standard preparation*. The proposed revision is consistent with current pharmaceutical industry practice.

B: Place a volume of Injection, equivalent to about 30 mg of dibucaine hydrochloride, in a suitable evaporating dish, and concentrate on a steam bath to a volume of about 10 mL. Transfer the solution to a separator, render distinctly alkaline with 1 N sodium hydroxide, and extract with four 20-mL portions of ether. Wash the combined ether extracts with 5 mL of water, discarding the washing. Evaporate the ether extracts with the aid of a current of air to dryness, and dry the residue over phosphorus pentoxide for 3 hours: the dibucaine so obtained melts between 62° and 65°.

BRIEFING

Dorzolamide Hydrochloride, *USP 28* page 691. It is proposed to revise the test for *Limit of dorzolamide hydrochloride related compound A* to delete the relative standard deviation (RSD) requirement and to revise the *Assay* to modify the acetonitrile content in the *Mobile phase*.

(PA6: L. Evans) RTS—41323-1; 41335-1; 41335-2; 41335-3

Change to read:

Limit of dorzolamide hydrochloride related compound A—

Mobile phase—Prepare a filtered and degassed mixture of *tert*-butyl methyl ether, chromatographic *n*-heptane, acetonitrile, and water (63 : 35 : 2 : 0.2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Transfer about 18 mg of USP Dorzolamide Hydrochloride RS and 2 mg of USP Dorzolamide Hydrochloride Related Compound A RS, each accurately weighed, to a 15-mL centrifuge tube, dissolve in 4 mL of 0.5 N ammonium hydroxide, add 4 mL of ethyl acetate, and mix. Separate the ethyl acetate layer, and transfer to a 15-mL centrifuge tube. Add 4 mL of ethyl acetate to the aqueous layer, mix, separate the ethyl acetate layer, and combine it with the first extract. Evaporate the combined organic layers to dryness on a water bath maintained at 50° under a stream of nitrogen. Dissolve the residue in 3 mL of acetonitrile, add 3 drops of *(S)*-(–)-α-methylbenzyl isocyanate ▲[NOTE—Discard the reagent if it is colored.],▲*USP28* and allow to react for 5 minutes on a water bath maintained at 50°. ▲▲*USP28* Evaporate the mixture to dryness on a water bath maintained at 50° under a stream of nitrogen. Dissolve the residue in 10 mL of a mixture of *tert*-butyl methyl ether, glacial acetic acid, and acetonitrile (87 : 10 : 3).

Test solution—Transfer about 20 mg of Dorzolamide Hydrochloride, accurately weighed, to a 15-mL centrifuge tube, and proceed as directed for *System suitability solution* beginning with "dissolve in 4 mL".

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L3. The flow rate is about 2 mL per minute. Chromatograph the *System suitability solution,* and record the peak ▲areas▲*USP28* as directed for *Procedure:* the relative retention times are about 1.0 for dorzolamide and 1.5 for dorzolamide hydrochloride related compound A; the resolution, *R,* between dorzolamide and dorzolamide hydrochloride related compound A is not less than 4.0; the column efficiency ▲for the dorzolamide hydrochloride peak▲*USP28* is not less than ▲4000▲*USP28* theoretical plates; and the tailing factor is not more than 1.4. ~~; and the relative standard deviation for replicate injections determined from the dorzolamide peak is not more than 1.0%.~~

▲▲*USP29*

Procedure—Separately inject equal volumes (about 10 µL) of the *System suitability solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the ▲areas for▲*USP28* the major peaks. Calculate the percentage of dorzolamide hydrochloride related compound A in the portion of Dorzolamide Hydrochloride taken by the formula:

$$▲100r_1 / (r_1 + r_S),$$

in which r_1 is the peak area of dorzolamide hydrochloride related compound A obtained from the *Test solution;* and r_S is the peak area of dorzolamide hydrochloride obtained from the *Test solution:* not more than 0.5% is found.▲*USP28*

Change to read:

Assay—

▲*Phosphate buffer*▲*USP28*—Dissolve 3.7 g of

▲monobasic▲*USP29*
potassium phosphate in ▲1000 mL▲*USP28* of water.

▲*Solution A*—Prepare a filtered and degassed mixture of ~~monobasic *Phosphate buffer* and acetonitrile (94 : 6).~~

▲*Phosphate buffer* and acetonitrile (94 : 6.5).▲*USP29* ▲*USP28*

Solution B—Use acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve suitable quantities of USP Dorzolamide Hydrochloride RS in *Solution A* to obtain a solution having a known concentration of about 0.6 mg per mL.

Assay preparation—Transfer about 60 mg of Dorzolamide Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Solution A* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 35°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–15	100	0	isocratic
15–30	100→50	0→50	linear gradient
30–37	50→100	50→0	linear gradient
37–44	100	0	isocratic

Chromatograph the *Standard preparation,* and record the peak ▲areas▲*USP28* as directed for *Procedure:* the column efficiency is not less than 6500 theoretical plates; the tailing factor is not less than 0.6 and not more than 1.2; and the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the ▲areas▲*USP28* for the major peaks. Calculate the quantity, in mg, of $C_{10}H_{16}N_2O_4S_3 \cdot HCl$ in the portion of Dorzolamide Hydrochloride taken by the formula:

$$100C(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Dorzolamide Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Ethinyl Estradiol Tablets, *USP 28* page 789 and page 1112 of *PF* 28(4) [July–Aug. 2002]. It is proposed to increase the limit of any unknown impurity to the approved value of 0.3% in the test for *Related compounds.* In addition, minor editorial changes have been made.

Related compounds—

Solution A: acetonitrile and 20 mM potassium phosphate buffer, pH 6.0 (50 : 50).

Solution B: acetonitrile and 20 mM potassium phosphate buffer, pH 6.0 (80 : 20).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of acetonitrile and water (50 : 50).

Standard stock solution—Dissolve an accurately weighed quantity of USP Ethinyl Estradiol RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.3 mg per mL.

Standard solution—Quantitatively dilute portions of *Standard stock solution* with *Diluent* to obtain a solution containing about 0.12 µg per mL of USP Ethinyl Estradiol RS.

Test solution 1—Transfer 20 Tablets into a 200-mL volumetric flask. Add about 120 mL of *Diluent*, and shake for about 30 minutes. Dilute with *Diluent* to volume, and mix. Centrifuge a portion of the dissolution sample, and use the clear supernatant.

Test solution 2—Dilute a portion of *Test solution 1* with *Diluent* to obtain a solution containing about 0.6 µg per mL of ethinyl estradiol.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm UV detector and a spectrofluorometric detector with an excitation wavelength of 285 nm and an emission wavelength of 310 nm, a 4.6-mm × 15-cm column that contains packing L11, and a 4.6-mm × 12.5-mm guard column that contains packing L11. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution	Flow rate (mL per min.)
0–20	100	0	equilibration/ isocratic	2
20–25	100→0	0→100	linear gradient	2.5
25–30	0	100	isocratic	3
30–32	0→100	100→0	linear gradient	2
32–35	100	0	re-equilibration	2

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0 for ethinyl estradiol; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Inject a volume (about 200 µL) of *Test solution 2* into the chromatograph, record the chromatograms, and measure the peak heights for the major peaks obtained within 20 minutes. Calculate the percentage of 17β-ethinyl estradiol in the portion of Tablets taken by the formula:

$$100(r_U/r_S),$$

in which r_U is the height of any peak at the relative retention time of 1.16; and r_S is the peak height of ethinyl estradiol obtained with the spectrofluorometric detector. Inject a volume (about 200 µL) of *Test solution 1* into the chromatograph, record the chromatograms, and measure the peak heights for the major peaks obtained within 20 minutes. Calculate the percentage of estrone in the portion of Tablets taken by the formula:

$$100(r_U/r_S) - E,$$

in which r_U is the height of any peak at the relative retention time of 1.2; r_S is the peak height of ethinyl estradiol obtained with the UV detector at 210 nm; and E is the percentage of 17β-ethinyl estradiol obtained in the Tablets. Calculate the percentage of any other impurity taken by the formula:

$$100(r_U/r_S),$$

in which r_U is the height of any peak other than those mentioned above; and r_S is the peak height of ethinyl estradiol obtained with the UV detector. Not more than 0.5% of 17β-ethinyl estradiol is found; not more than 0.5% of estrone is found; not more than ~~0.1%~~

▲0.3%▲*USP29*
of any unknown impurity is found; and not more than 2.0% of total impurities is found.

BRIEFING

Fexofenadine Hydrochloride and Pseudoephedrine Hydrochloride Extended-Release Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph is proposed. The liquid chromatographic system used in the *Related compounds* and *Assay* procedures was validated using an Alltech Adsorbosphere XL SCX brand of L6 column connected in series to a Zorbax SB-phenyl brand of L11 column. Typical retention times are about 4.2 minutes for pseudoephedrine, 5.0 minutes for ephedrone, 7.5 minutes for fexofenadine, 9.2 minutes for fexofenadine related compound A, and 23.6 minutes for fexofenadine related compound B. The *Dissolution* test was validated using a Partisil 10 SCX brand of L6 column. Typical retention times are about 4.3 minutes for fexofenadine and about 6.4 minutes for pseudoephedrine.

(PA1: K. Russo; BPC: M. Marques; PSD: C. Okeke; NL: L. Paul) RTS—40154-1; 40154-2; 40154-3; 40512-3; 41192-2

Add the following:

▲Fexofenadine Hydrochloride and Pseudoephedrine Hydrochloride Extended-Release Tablets

» Fexofenadine Hydrochloride and Pseudoephedrine Hydrochloride Extended-Release Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amounts of fexofenadine hydrochloride ($C_{32}H_{39}NO_4 \cdot HCl$) and pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$).

Packaging and storage—Preserve in well-closed containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Fexofenadine Hydrochloride RS. USP Fexofenadine Related Compound A RS. USP Fexofenadine Related Compound B RS. USP Pseudoephedrine Hydrochloride RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩—

FEXOFENADINE HYDROCHLORIDE—

Test specimen—Grind the fexofenadine hydrochloride layer of 1 Tablet, and transfer it into a 30-mL capped centrifuge tube. Add 20 mL of 1 N sodium hydroxide, mix in a vortex mixer for 1 to 2 minutes, then centrifuge for 3 to 5 minutes at approximately 2500 rpm or greater. Decant the solution, and pass through a 25-mm glass syringe filter. Add 10 mL of 10% hydrochloric acid, and heat this solution, with stirring, to near boiling. Cool, and centrifuge for 3 to 5 minutes. Decant and discard the liquid, wash the precipitate with 10 mL of water, and centrifuge for 1 to 2 minutes. Decant and discard the water, and dry the precipitate in an oven for 1 hour at 105°.

Standard specimen—Transfer a quantity, in mg, of USP Fexofenadine Hydrochloride RS, equivalent to the labeled amount of fexofenadine hydrochloride, to a 30-mL capped centrifuge tube, and proceed as directed beginning with "Add 20 mL of 1 N sodium hydroxide".

PSEUDOEPHEDRINE HYDROCHLORIDE—

Test specimen—Grind the pseudoephedrine hydrochloride layer of 1 Tablet, and transfer it into a capped 30-mL centrifuge tube. Add 20 mL of 0.1 N hydrochloric acid, mix on a vortex mixer for 1 to 2 minutes, and centrifuge for 3 to 5 minutes at approximately 2500 rpm or greater. Decant the solution, and pass through a 0.45-µm nylon filter; discard the residue. Add 10 mL of 1 N sodium hydroxide, and pour it into a separatory funnel containing 15 mL of methylene chloride. Carefully rotate and shake the funnel using care not to form an emulsion. Allow the layers to separate for

about 10 minutes. Decant the methylene chloride (lower) layer into a 50-mL beaker, and filter through a glass funnel loaded with a glass wool plug and 1 to 2 g of sodium sulfate. Evaporate to dryness. [NOTE—Do not exceed 75° if a hot plate is used to aid evaporation.]

Standard specimen—Transfer a quantity, in mg, of USP Pseudoephedrine Hydrochloride RS equivalent to the labeled amount of pseudoephedrine hydrochloride to a 30-mL capped centrifuge tube, and proceed as directed beginning with "Add 20 mL of 0.1 N hydrochloric acid".

B: The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: 0.001 N hydrochloric acid; 900 mL.

Apparatus 2: 50 rpm.

Times: fexofenadine hydrochloride: 15 and 45 minutes; pseudoephedrine hydrochloride: 45 minutes; 3, 5, and 12 hours.

Procedure—Determine the percentages of the labeled amounts of fexofenadine hydrochloride ($C_{32}H_{39}NO_4 \cdot HCl$) and of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) dissolved by using the following method.

Buffer solution—Dissolve 14.0 g of monobasic sodium phosphate monohydrate in 2 L of water. Adjust with 85% phosphoric acid to a pH of 2.00 ± 0.05.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (55 : 45). Make adjustments if necessary (see *System suitability* under *Chromatography* ⟨621⟩).

Standard solution—[NOTE—A small amount of methanol, not to exceed 0.5% of the total volume, can be used to dissolve the fexofenadine hydrochloride.] Dissolve an accurately weighed quantities of USP Fexofenadine Hydrochloride RS and USP Pseudoephedrine Hydrochloride RS in *Medium,* and dilute quantitatively, and stepwise if necessary, to obtain a solution containing known concentrations similar to that expected in the solution under test.

Test solution—Use portions of the solution under test passed through a 0.45-µm nylon filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 25-cm column containing packing L6. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution, *R*, between fexofenadine and pseudoephedrine is not less than 3.0; the tailing factor is not more than 1.5 for fexofenadine and for pseudoephedrine; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, and record the peak responses for fexofenadine and pseudoephedrine. Calculate the amounts of fexofenadine hydrochloride ($C_{32}H_{39}NO_4 \cdot HCl$) and pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) dissolved.

Tolerances—For fexofenadine hydrochloride ($C_{32}H_{39}NO_4 \cdot HCl$), not less than 65% (*Q*) of the labeled amount is dissolved in 15 minutes and not less than 80% (*Q*) of the labeled amount is dissolved in 45 minutes; the percentages of the labeled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) dissolved at the times speci-

3 hours	between 45% and 69%
5 hours	between 61% and 80%
12 hours	not less than 80%

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Water, *Method I* ⟨921⟩**—**Weigh and finely powder not fewer than 5 Tablets, and transfer an accurately weighed quantity of the powder, about 250 mg, to a jacketed titration vessel containing titration medium heated to 50°: between 1.0% and 4.0%.

Related compounds—

Buffer solution, Mobile phase, System suitability preparation, and *Chromatographic system*—Proceed as directed under *Assay.*

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Reference solution—Use the *Assay preparation.*

Test solution—Use the *Stock assay preparation,* prepared as directed in the *Assay.*

Chromatographic system (see *Chromatography* ⟨621⟩)—Chromatograph the *System suitability preparation* as directed for *Procedure:* the relative retention times are about 1.2 for ephedrone and 1.0 for pseudoephedrine; the resolution, *R*, between pseudoephedrine and ephedrone is not less than 1.7; and the relative standard deviation for replicate injections is not more than 1.0% based on the pseudoephedrine peak. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.2 for fexofenadine related compound A, 3.1 for fexofenadine related compound B, and 1.0 for fexofenadine; the resolution, *R*, between fexofenadine and fexofenadine related compound A is not less than 2.0; and the relative standard deviation for replicate injections is not more than 1.0% based on the fexofenadine peak and not more than 3.0% based on the individual peaks for fexofenadine related compound A and fexofenadine related compound B.

Procedure—Inject volumes (about 20 µL) of the *Test solution* and of the *Reference solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of fexofenadine related compound A and fexofenadine related compound B in the portion of Tablets taken by the formula:

$$(100/L)(C_S/C_T)(r_i/r_S),$$

in which L is the label claim for fexofenadine hydrochloride; C_S is the concentration, in mg per mL, of either USP Fexofenadine Related Compound A RS or USP Fexofenadine Related Compound B RS in the *Standard solution;* C_T is the nominal concentration, in mg per mL, of fexofenadine in the *Test solution;* r_i is the individual peak area of either fexofenadine related compound A or fexofenadine related compound B obtained from the *Test solution;* and r_S is the peak area of fexofenadine related compound A obtained from the *Standard solution*. Calculate the percentage of ephedrone in the portion of Tablets taken by the formula:

$$(100/LF)(C_S C_T)\ (r_i/r_S),$$

in which L is the label claim for pseudoephedrine hydrochloride; F is the relative response factor for ephedrone (F is 0.394); C_S is the concentration, in mg per mL, of USP Pseudoephedrine Hydrochloride RS in the *Standard*

solution; C_T is the nominal concentration, in mg per mL, of pseudoephedrine in the *Test solution;* r_i is the peak height for ephedrone obtained from the *Test solution;* and r_S is the peak height for pseudoephedrine obtained from the *Standard solution*. Calculate the percentage of any other impurities in the portion of Tablets taken by the formula:

$$100r_i / (25r_S + r_T),$$

in which r_i is the individual peak area response for an individual unknown impurity in the *Test solution;* 25 is the difference in concentration between the *Test solution* and the *Reference solution;* r_S is the peak area response for fexofenadine in the *Reference solution;* and r_T is the sum of the peak area responses of all unknown impurities in the *Test solution*. Disregard any peak below 0.05%.

Compound	Relative Retention Time	Acceptance Criteria
Pseudoephedrine	1.0	—
Ephedrone	1.2[a]	not more than 0.2%
Fexofenadine	1.0	—
Fexofenadine related compound A	1.2[b]	not more than 0.3%
Fexofenadine related compound B	3.1[b]	not more than 0.2%
Any individual other impurity	—	not more than 0.1%
Total other impurities	—	not more than 0.2%
Total impurities	—	not more than 0.5%

[a] Relative to pseudoephedrine
[b] Relative to fexofenadine

Assay—

Buffer solution—Dissolve 6.8 g of sodium acetate and 16.22 g of sodium 1-octanesulfonate in water, and dilute with water to 1 L. Adjust with glacial acetic acid to a pH of 4.6.

Mobile phase—Prepare a filtered and degassed mixture of methanol and *Buffer solution* (65 : 35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability preparation—Transfer an accurately weighed quantity, about 40 mg, of USP Pseudoephedrine Hydrochloride RS to a 50-mL volumetric flask. Add 5 mL of *tert*-butylhydroperoxide solution, and sonicate. Cover the flask opening with aluminum foil, and place the flask in an oven at about 90° for 60 minutes. Remove from the oven, and allow to cool. Add 35 mL of *Mobile phase,* and cool to room temperature. Dilute with *Mobile phase* to volume, and mix. The degradation of pseudoephedrine hydrochloride by this process produces the related compound ephedrone.

Related compounds preparation—Dissolve accurately weighed quantities of USP Fexofenadine Related Compound A RS and USP Fexofenadine Related Compound B RS in a volume of methanol, and dilute qualitatively, and stepwise if necessary, with *Buffer solution* to maintain a ratio of methanol and *Buffer solution* (60 : 40). Dilute quantitatively, and stepwise if necessary, with methanol and *Buffer solution* (60 : 40) to obtain a solution having known concentrations of 0.2 mg per mL for each component. Dilute 10.0 mL of this solution with *Mobile phase* to 100 mL to obtain the final solution, having known concentrations of 0.02 mg per mL for each component.

Standard stock preparation—Dissolve accurately weighed quantities of USP Fexofenadine Hydrochloride RS and USP Pseudoephedrine Hydrochloride RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary,

with *Mobile phase* to obtain a solution having known concentrations of about 0.4 mg per mL and 0.8 mg per mL of fexofenadine and pseudoephedrine, respectively.

Standard preparation—Dilute 6.0 mL of the *Standard stock preparation* and 15.0 mL of the *Related compounds preparation* with *Mobile phase* to 50 mL to obtain a solution having known concentrations of about 0.048 mg of fexofenadine hydrochloride per mL, 0.096 mg of pseudoephedrine hydrochloride per mL, 0.006 mg of fexofenadine related compound A per mL, and 0.006 mg of fexofenadine hydrochloride related compound B per mL.

Assay stock preparation—Transfer not fewer than 10 whole Tablets to a 500-mL volumetric flask. Add 300 mL of methanol, and shake by mechanical means at high speed for 60 minutes. Sonicate the flask for 60 minutes at 40°. Add 150 mL of *Buffer solution,* and sonicate for 60 minutes at 40°. Vent the flask, and vigorously shake the flask by hand at 15-minute intervals during the mechanical shaking and sonication steps. Cool to room temperature, and dilute with *Buffer solution* to volume to obtain a solution containing approximately 1.2 mg of fexofenadine per mL and 2.4 mg of pseudoephedrine per mL. Pass a portion of this solution through a filter having a 0.45-µm or finer porosity, and use the filtrate.

Assay preparation—Dilute 4.0 mL of the *Assay stock preparation* filtrate with *Mobile phase* to 100 mL. The final concentrations of fexofenadine and pseudoephedrine are 0.048 and 0.096 mg per mL, respectively.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and 4.6-mm × 5-cm column that contains 5-µm packing L6 connected in series to a 4.6-mm × 25-cm column that contains 5-µm packing L11. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 35°. Chromatograph the *System suitability preparation* as directed for *Procedure:* the relative retention times are about 1.2 for ephedrone and 1.0 for pseudoephedrine; the resolution, *R*, between pseudoephedrine and ephedrone is not less than 1.7; and the relative standard deviation for replicate injections is not more than 1.0% based on the pseudoephedrine peak. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.2 for fexofenadine related compound A, 3.1 for fexofenadine related compound B, and 1.0 for fexofenadine; the resolution, *R*, between fexofenadine and fexofenadine related compound A is not less than 2.0; and the relative standard deviation for replicate injections is not more than 1.0% based on the fexofenadine peak.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the fexofenadine and pseudoephedrine peaks. Calculate the percentage of the label claim of fexofenadine hydrochloride ($C_{32}H_{39}NO_4 \cdot HCl$) and pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) in the portion of Tablets taken by the formula:

$$(100/L)(C_S/C_T)(r_U/r_S),$$

in which L is the label claim of either fexofenadine hydrochloride or pseudoephedrine hydrochloride; C_S is the concentration, in mg per mL, of either USP Fexofenadine Hydrochloride RS or USP Pseudoephedrine Hydrochloride RS in the *Standard preparation;* C_T is the nominal concentration, in mg per mL, of either fexofenadine or pseudoephedrine in the *Assay preparation;* and r_U and r_S are the peak responses obtained for either fexofenadine or pseudoephedrine from the *Assay preparation* and the *Standard preparation*, respectively.▲*USP29*

In-Process Revision

BRIEFING

Fluconazole, *USP 28* page 828. It is proposed to add a *Labeling* section to indicate that it is necessary to state with which test for *Related compounds* the article complies only if a test other than *Test 1* is used. Additionally, it is proposed to revise the acceptance criteria for the impurity levels as well as for the Definition to reflect different manufacturing processes for the drug substance.

System suitability solution—Use the *Standard solution*.

Standard solution—Transfer accurately weighed quantities of USP Fluconazole RS, USP Fluconazole Related Compound A RS, USP Fluconazole Related Compound B RS, and USP Fluconazole Related Compound C RS to a suitable volumetric flask, dissolve in acetonitrile, dilute quantitatively, and stepwise if necessary, with *Mobile phase* to volume, and mix to obtain a solution having known concentrations of 10 µg of each per mL.

Test solution—Transfer about 30 mg of Fluconazole, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 260-nm detector and a 4.6-mm × 15-cm column that contains 3.5-µm packing L1. The flow rate is about 0.5 mL per minute. The column temperature is maintained at 40°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* typical retention times are about 4.9 minutes for fluconazole related compound A, 8.0 minutes for fluconazole related compound B, 8.5 minutes for fluconazole related compound C, and 9.9 minutes for fluconazole; the resolution, *R,* between fluconazole related compound B and fluconazole related compound C is not less than 1.5; and the relative standard deviation of each peak for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of fluconazole related compound A, fuconazole related compound B, fluconazole related compound C, and any other impurities in the portion of Fluconazole taken by the formula:

$$1000(C/W)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Fluconazole Related Compound A RS, USP Fluconazole Related Compound B RS, USP Fluconazole Related Compound C RS, or USP Fluconazole RS, respectively, in the *Standard solution; W* is the weight, in mg, of Fluconazole taken to prepare the *Test solution;* r_U is the peak response obtained from the *Test solution;* and r_S is the average peak response of fluconazole related compound A, fluconazole related compound B, fluconazole related compound C, or fluconazole obtained from replicate injections of the *Standard solution:* ~~not more than 0.1% of any individual impurity is found; and not more than 0.3% of total impurities is found.~~

▲not more than 1.0% of any impurity with a relative retention time (RRT) of about 0.6 is found; not more than 0.2% of any impurity with an RRT of 0.5 or an RRT of about 0.9 is found; not more than 0.1% of any other individual impurity is found; not more than 0.2% of total other impurities is found; and not more than 1.2% of total impurities is found.

TEST 2—

Acetate buffer—Prepare a 0.04 M anhydrous sodium acetate solution, adjust with 1 N acetic acid to a pH of 5.0, and mix.

Solution A: filtered and degassed *Acetate buffer.*

Solution B: acetonitrile.

Solution C: methanol.

Mobile phase—Use variable mixtures of *Solution A, Solution B,* and *Solution C* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

In-Process Revision

Diluent—Prepare a mixture of *Acetate buffer* and methanol (84 : 16).

Standard solution—Dissolve an accurately weighed quantity of USP Fluconazole RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.01 mg per mL.

System suitability solution—Dissolve suitable quantities of USP Fluconazole RS and USP Desacetyl Diltiazem Hydrochloride RS in *Diluent.* Dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution containing about 0.02 mg per mL and 0.006 mg per mL, respectively.

Test solution—Transfer about 200 mg of Fluconazole, accurately weighed, to a 100-mL volumetric flask, and dissolve in and dilute with *Diluent* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 261-nm detector and a 4.0-mm × 10-cm column that contains packing L1. The flow rate is 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	*Solution C* (%)	Elution
0–10	80	5	15	isocratic
10–20	80→30	5→55	15	linear gradient (*A* and *B*)
20–23	30	55	15	isocratic
23–25	30→80	55→5	15	reset composition
25–30	80	5	15	re-equilibration

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are 1.0 for fluconazole and about 1.2 for desacetyl hydrochloride; the resolution, *R,* between fluconazole and desacetyl diltiazem hydrochloride is not less than 10.0; the column efficiency for fluconazole is not less than 30,000 theoretical plates; and the tailing factor, *T,* is not more than 1.4. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is less than 5.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Fluconazole taken by the formula:

$$10{,}000(r_i / r_S)(C/W)(1/F),$$

in which r_i is the peak response of each impurity obtained from the *Test solution;* r_S is the peak response of fluconazole obtained from the *Standard solution; C* is the concentration, in mg per mL, of USP Fluconazole RS in the *Standard solution; W* is the weight, in mg, of Fluconazole taken to prepare the *Test solution;* and *F* is the relative response factor as determined from the following table.

Relative Response Factor *(F)*	Relative Retention Time (RRT)
0.72	0.17–0.37
0.85	1.20–1.32
1.21	0.48–0.60
0.96	1.14–1.18
0.97	0.67–0.79
1.0	all other peaks

Not more than 0.1% of any individual impurity is found; and not more than 0.5% of total impurities is found.

TEST 3—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Test solution—Dissolve an accurately weighed quantity of Fluconazole in methanol to obtain a solution containing approximately 50 mg per mL.

Standard solutions—Dissolve an accurately weighed quantity of USP Fluconazole RS in methanol to obtain *Standard solution A* having a known concentration of about 1 mg per mL (2.0%). Quantitatively dilute portions of this solution with methanol to obtain *Standard solution B* and *Standard solution C* having known concentrations of about 0.1 mg per mL (0.2%) and 0.05 mg per mL (0.1%), respectively.

Developing solvent system—Prepare a mixture of chloroform, methanol, and ammonium hydroxide (80 : 20 : 1).

Application volume: 10 µL.

Spray reagent A—Dissolve about 170 mg of silver nitrate in 100 mL of water.

Spray reagent B (Potassium iodoplatinate solution)—Dissolve about 375 mg of chloroplatinic acid in 5 mL of 1 N hydrochloric acid. Dissolve about 5 g of potassium iodide in 50 mL of water, and store in a light-resistant container. Prepare a mixture of water, the potassium iodide solution, and the chloroplatinic acid solution (20 : 9 : 1).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. Spray the dry plate with *Spray reagent A,* and expose the plate to 365-nm UV light for 10 to 20 minutes. Dry the plate for 20 minutes between 80° and 90°, then spray the plate with *Spray reagent B*. Allow the plate to dry. Examine the plate and compare the intensities of any secondary spots observed in the chromatogram of the *Test solution* with those of the principal spots in the chromatograms of the *Standard solutions:* no spot from the chromatogram of the *Test solution* with an R_F value of between 0.10 to 0.25 and 0.27 to 0.41 is larger or more intense than that obtained from *Standard solution B* (0.2%).▲*USP29*

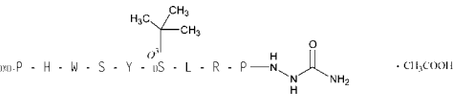
BRIEFING

Goserelin Acetate. Because there is no existing *USP* monograph for this drug substance, a new monograph is being proposed. The liquid chromatographic procedures in the test for *Limit of acetic acid* are based on analyses performed with the Aminex HPX-87H brand of L17 column. The typical retention time for acetic acid is about 11.5 minutes. The liquid chromatographic procedures in the test for *Related substances* and in the *Assay* are based on analyses performed with the X-Terra MS C18 brand of L1 column. The goserelin peak elutes at approximately 45 minutes.

(BNT: L. Callahan) RTS—41757-1

Add the following:

▲Goserelin Acetate



$C_{59}H_{84}N_{18}O_{14} \cdot xC_2H_4O_2$

Luteinizing hormone-releasing factor (pig), 6-[*O*-(1,1-dimethylethyl)-D-serine]-10-deglycinamide-, 2-(aminocarbonyl)hydrazide, acetate (salt) [*145781-92-6*].

1-(5-Oxo-L-prolyl-L-histidyl-L-tryptophyl-L-seryl-L-tyrosyl-*O*-*tert*-butyl-D-seryl-L-leucyl-L-arginyl-L-prolyl)-semicarbazide (Goserelin) 1269.41 [*65807-02-5*].

» Goserelin Acetate is a synthetic nonapeptide analog of the hypothalmic decapeptide, gonadorelin. It is obtained by chemical synthesis and is available as an acetate salt. It contains not less than 94.5 percent and not more than 103.0 percent of goserelin ($C_{59}H_{84}N_{18}O_{14}$), calculated on the anhydrous and acetic acid-free basis.

In-Process Revision

Packaging and storage—Preserve in a tight, light-resistant container, and store in a refrigerator.

USP Reference standards ⟨11⟩**—***USP Endotoxin RS. USP Goserelin Acetate RS. USP Goserelin Related Compound A RS. USP Goserelin Validation Mixture RS.*

Identification—

A: *Nuclear Magnetic Resonance* ⟨761⟩—

Standard solution—Prepare a 10% w/v solution of USP Goserelin Acetate RS in deuterium oxide, and adjust with deuterated acetic acid-d4 to a pH of 4.

Test solution—Prepare a 10% w/v solution of Goserelin Acetate in deuterium oxide, and adjust with deuterated acetic acid-d4 to a pH of 4.

Procedure—Obtain a ^{13}C, proton-decoupled NMR spectrum of both the *Standard solution* and the *Test solution*. The spectra from both solutions should be qualitatively similar, and all the resonances from the spectrum of the *Standard solution* should be present in the spectrum of the *Test solution* and have the same chemical shift values; any other resonances in the spectrum of the *Test solution* should be identified.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Specific rotation ⟨781S⟩**:** between –52° and –56°.

Test solution: 2 mg per mL, in water, calculated on the anhydrous and acetic acid-free basis.

Bacterial endotoxins ⟨85⟩**—**It contains not more than 16 USP Endotoxin Units per mg of goserelin, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

Water, *Method I* ⟨921⟩**:** not more than 10.0%.

Limit of acetic acid—

Mobile phase—Transfer 49.04 g of sulfuric acid to a 1000-mL volumetric flask, dilute with water to volume, and mix. Accurately transfer 20 mL of this solution to a 2000-mL volumetric flask, dilute with water to volume, mix, filter, and degas.

Test solution—Dissolve about 20 mg of Goserelin Acetate, accurately weighed, in 2 to 3 mL of *Mobile phase*. Connect a 1-mL cartridge containing L44 packing to a 1-mL cartridge containing L2 packing, which is then attached to a suitable vacuum apparatus. With the vacuum applied, wash the cartridge combination with 2 mL of methanol followed by 15 mL of *Mobile phase,* and discard the washings. Quantitatively apply the solution containing Goserelin Acetate to the cartridge combination, and wash through the cartridge system with several small volumes of *Mobile phase*. Collect the solution and washings in a 10-mL volumetric flask, and dilute with *Mobile phase* to volume.

Standard solution—Transfer 2.0 mL of glacial acetic acid to a 500-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a standard stock solution. Transfer 5.0 mL of the standard stock solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—[NOTE—Condition the column for about 24 hours until a stable baseline is obtained.] The liquid chromatograph is equipped with a 206-nm detector and a 7.8-mm × 30-cm column that contains packing L17. The column temperature is maintained at 65°, and the flow rate is about 0.8 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the retention time is about 11 minutes for acetic acid; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 3.1%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of acetic acid in the portion of Goserelin taken by the formula:

$$(1.049/5)(r_U / r_S)(1/W),$$

in which 1.049 is the weight per mL, in g, of glacial acetic acid; W is the sample weight of Goserelin Acetate, in g, taken to prepare the *Test solution* and corrected (for purposes of the calculation) to eliminate the water content, which is determined immediately prior to the test; and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively. The content of acetic acid is between 4.5% and 15.0%.

Related compounds—

Mobile phase, Standard preparation, Diluted standard preparation, Resolution solution, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Test solution—Use the *Assay preparation*.

Diluted test solution—Transfer 1 mL of the *Test solution* into a 100-mL volumetric flask, and dilute with water to volume.

Procedure—Separately inject equal volumes (about 10 µL) of the *Test solution, Diluted test solution, Resolution solution,* and *System suitability solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of goserelin-related impurities in the portion of Goserelin Acetate taken by the formula:

$$r_i / r_S,$$

in which r_i is the peak area response for any individual impurity in the *Test solution;* and r_S is the peak area response of the main goserelin peak in the *Diluted test solution:* not more than 1.0% of decarbamoylgoserelin is found, not more than 0.5% of any other impurity is found, and not more than 2.5% of total impurities is found.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and trifluoroacetic acid (1600 : 400 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Goserelin Acetate RS in water to obtain a solution having a known concentration of about 1 mg per mL.

Diluted standard preparation—Transfer 1 mL of the *Standard preparation* to a 10–mL volumetric flask, and dilute with water to volume.

Assay preparation—Transfer about 25 mg of Goserelin Acetate, accurately weighed, to a 25-mL volumetric flask. Dissolve in and dilute with water to volume, and mix.

Resolution solution—Dissolve the contents of a vial of USP Goserelin Related Compound A RS in water to obtain a concentration of 0.1 mg per mL, and mix with an equal volume of *Diluted standard preparation.*

System suitability solution—Dissolve the contents of a vial of USP Goserelin Validation Mixture RS with 1 mL of water.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6–mm × 15–cm column that contains 3.5-µm packing L1. The column temperature is maintained between 50° and 55°, and the flow rate is about 1 mL per minute. Chromatograph the *Resolution solution,* and record the peak

In-Process Revision

responses as directed for *Procedure:* the retention time for goserelin is between 40 and 50 minutes, the relative retention times are about 0.67 for 4-D-ser-goserelin, 0.89 for decarbamoylgoserelin, 0.92 for 5-D-tyr-goserelin, 0.94 for 2-D-his-goserelin, and 1.0 for goserelin; and the resolution, *R,* between 4-D-ser-goserelin and goserelin is not less than 7.0. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* two peaks, corresponding to decarbamoylgoserelin and 2-D-his-goserelin and eluting prior to the principal peak, are visible; three peaks eluting after the principal peak are visible; the column efficiency for the principal peak is not less than 2000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of goserelin ($C_{59}H_{84}N_{18}O_{14}$) in the portion of Goserelin Acetate taken (where sample weight has been corrected for water and acetic acid content, both determined immediately prior to the assay) by the formula:

$$25C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Goserelin Acetate RS in the *Standard preparation;* and r_U and r_S are the goserelin peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP29*

BRIEFING

Levothyroxine Sodium Tablets, *USP 28* page 1128 and page 55 of *PF* 31(1) [Jan.–Feb. 2005]. It is proposed to clarify the calculations under the test for *Limit of liothyronine sodium*.

(PA4: E. Gonikberg) RTS—41612-1

Dissolution ⟨711⟩—[NOTE—All containers that are in contact with solutions containing levothyroxine sodium are to be made of glass. ▲▲*USP28*]

TEST 1—

Medium: 0.01 N hydrochloric acid containing 0.2% sodium lauryl sulfate; 500 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Determine the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of methanol and 0.1% phosphoric acid (60 : 40). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Prepare a stock solution of USP Levothyroxine RS in methanol having a known concentration of about 0.1 mg per mL. Dilute this stock solution with *Medium* to obtain a solution having a concentration similar to that expected in the *Test solution*.

Test solution—[NOTE—Prior to use, check the filters for absorptive loss of drug.] Use a filtered portion of the solution under test.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5; and the relative standard deviation is not more than 4.0%.

Procedure—Separately inject equal volumes (about 800 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved.

Tolerances—Not less than 70% *(Q)* of the labeled amount of $C_{15}H_{10}I_4NNaO_4$ is dissolved in 45 minutes.

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

Medium, Apparatus, Mobile phase, Standard solution, Test solution, Chromatographic system, and *Procedure*—Proceed as directed for *Test 1.*

Time: 15 minutes.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{15}H_{10}I_4NNaO_4$ is dissolved in 15 minutes.

•TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium, Apparatus, Time, Standard solution, and *Test solution*—Proceed as directed for *Test 1*. [NOTE—Filter the *Standard solution* in a manner identical to the *Test solution*.]

In-Process Revision

Determine the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (65 : 35) with 0.5 mL of phosphoric acid per L. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L10. The column temperature is maintained at 30°. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5; and the relative standard deviation is not more than 4.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of $C_{15}H_{10}I_4NNaO_4$.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{15}H_{10}I_4NNaO_4$ is dissolved in 45 minutes.●3

TEST 4—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4.*

▲NOTE—Do not use paddle stirrers with synthetic coating.▲*USP28*

Medium: 0.01 N hydrochloric acid; 500 mL for tablets labeled to contain between 25 µg and 175 µg of levothyroxine sodium; 900 mL for tablets labeled to contain 200 µg or 300 µg of levothyroxine sodium.

Apparatus 2: 75 rpm.

Time: 45 minutes.

Determine the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and 85% orthophosphoric acid (700 : 500 : 2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Prepare a stock solution by transferring about 100 mg of USP Levothyroxine RS, accurately weighed, to a 100-mL volumetric flask. Add 80 mL of alcohol and 1 mL of 1 N hydrochloric acid, sonicate for about 2 minutes, dilute with alcohol to volume, and mix. Dilute this stock solution with a mixture of alcohol and water (1 : 1) to obtain a solution having a concentration of 0.01 mg of levothyroxine per mL. Dilute this intermediate solution with *Medium* to obtain a solution having a concentration similar to that expected in the *Test solution.*

Test solution—Use a centrifuged portion of the solution under test.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 225-nm detector and a 4.0-mm × 12.5-cm column that contains packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5; and the relative standard deviation is not more than 4.0%.

Procedure—Separately inject equal volumes (about 500 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of $C_{15}H_{10}I_4NNaO_4$.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{15}H_{10}I_4NNaO_4$ is dissolved in 45 minutes.

and r_U and r_S are the liothyronine peak responses obtained from the *Test solution* and the *Standard solution,* respectively: not more than 2.0% of liothyronine is found.

In-Process Revision

BRIEFING

Lidocaine Hydrochloride, *USP 28* page 1130 and page 1256 of *PF* 30(4) [July-Aug. 2004]. On the basis of comments and data received, it is proposed to remove the temperature control in the *Chromatographic system* for the *Assay.*

(PA1: K. Russo) RTS—41872-1

Change to read:

Assay—

Mobile phase—Mix 50 mL of glacial acetic acid and 930 mL of water, and adjust with 1 N sodium hydroxide to a pH of 3.40. Mix about 4 volumes of this solution with 1 volume of acetonitrile, so that the retention time of lidocaine is about 4 to 6 minutes. Pass through a membrane filter having a 1-µm or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve about 85 mg of USP Lidocaine RS, accurately weighed, with warming if necessary, in 0.5 mL of 1 N hydrochloric acid in a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a *Standard preparation* having a known concentration of about 1.7 mg of lidocaine per mL.

Assay preparation—Transfer about 100 mg of Lidocaine Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Resolution preparation—Prepare a solution of methylparaben in *Mobile phase* containing about 220 µg per mL. Mix 2 mL of this solution and 20 mL of the *Standard preparation.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1. ~~and is operated at a temperature between 20° and 25°, maintained at ± 1.0° of the selected temperature.~~

▲▲*USP29*
The flow rate is about 1.5 mL per minute. Chromatograph about 20 µL of the *Resolution preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the lidocaine and methylparaben peaks is not less than 3.0. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Assay preparation* and the *Standard preparation* into the chromatograph. Record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{14}H_{22}N_2O \cdot HCl$ in the portion of Lidocaine Hydrochloride taken by the formula:

$$(270.80/234.34)(50C)(r_U/r_S),$$

in which 270.80 and 234.34 are the molecular weights of lidocaine hydrochloride and lidocaine, respectively; C is the concentration, in mg per mL, of USP Lidocaine RS in the *Standard preparation;* and r_U and r_S are the lidocaine peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Lidocaine Hydrochloride and Epinephrine Injection, *USP 28* page 1132 and page 1257 of *PF* 30(4) [July–Aug. 2004]. On the basis of comments and data received, it is proposed to remove the temperature control in the *Chromatographic system* for the *Assay for lidocaine hydrochloride* and the *Assay for epinephrine.*

(PA1: K. Russo) RTS—41872-2

Assay for lidocaine hydrochloride—

Mobile phase—Mix 50 mL of glacial acetic acid and 930 mL of water, and adjust with 1 N sodium hydroxide to a pH of 3.40. Mix about 4 volumes of this solution with 1 volume of acetonitrile, so that the retention time of lidocaine is about 4 to 6 minutes. Pass through a membrane filter having a 1-µm or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve about 85 mg of USP Lidocaine RS, accurately weighed, with warming if necessary, in 0.5 mL of 1 N hydrochloric acid in a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a *Standard preparation* having a known concentration of about 1.7 mg of lidocaine per mL.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 100 mg of lidocaine hydrochloride, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Resolution preparation—Prepare a solution of methylparaben in *Mobile phase* containing about 220 µg per mL. Mix 2 mL of this solution and 20 mL of the *Standard preparation*.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1. ~~and is operated at a temperature between 20° and 25° maintained at ± 1.0° of the selected temperature.~~

▲▲*USP29*
The flow rate is about 1.5 mL per minute. Chromatograph about 20 µL of the *Resolution preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between lidocaine and methylparaben is not less than 3.0. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Assay preparation* and the *Standard preparation* into the chromatograph. Record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of lidocaine hydrochloride ($C_{14}H_{22}N_2O \cdot HCl$) in each mL of the Injection taken by the formula:

$$(270.80/234.34)(50)(C/V)(r_U/r_S),$$

in which 270.80 and 234.34 are the molecular weights of lidocaine hydrochloride and lidocaine, respectively; C is the concentration, in mg per mL, of USP Lidocaine RS in the *Standard preparation;* V is the volume, in mL, of Injection taken; and r_U and r_S are the lidocaine peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Assay for epinephrine—

Mobile phase—Mix 50 mL of glacial acetic acid and 930 mL of water, and adjust with 1 N sodium hydroxide to a pH of 3.40. Dissolve 1.1 g of sodium 1-heptanesulfonate in this solution, add 1.0 mL of 0.1 M edetate disodium, and mix. Mix about 9 volumes of this solution with 1 volume of methanol, so that the retention time of epinephrine is about 4 to 6 minutes. Pass through a membrane filter having a 1-µm or finer porosity, and degas.

Standard preparation—Dissolve an accurately weighed quantity of USP Epinephrine Bitartrate RS in *Mobile phase* to obtain a solution having a known concentration of about 9 µg of epinephrine bitartrate per mL. Pipet 10 mL of this solution into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a *Standard preparation* having a known concentration of about 1.8 µg of epinephrine bitartrate per mL.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 50 µg of epinephrine, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is fitted with a 3.9-mm × 30-cm stainless steel column packed with packing L1 and is equipped with an electrochemical detector held at a potential of +650 mV, a controller capable of regulating the background current, and a suitable recorder. ~~and it is operated at a temperature between 20° and 25° maintained at ± 1.0° of the selected temperature.~~

▲▲*USP29*

The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation* as directed for *Procedure:* the relative standard deviation of the peak responses of successive injections of the *Standard preparation* is not more than 1.5%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Assay preparation* and the *Standard preparation* into the chromatograph by means of a suitable microsyringe or sampling valve, adjusting the specimen size and other operating parameters such that satisfactory chromatography and peak responses are obtained. Record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg, of epinephrine ($C_9H_{13}NO_3$) in each mL of the Injection taken by the formula:

$$(183.21/333.30)(50)(C/V)(r_U/r_S),$$

in which 183.21 and 333.30 are the molecular weights of epinephrine and epinephrine bitartrate, respectively; C is the concentration, in µg per mL, of USP Epinephrine Bitartrate RS in the *Standard preparation; V* is the volume, in mL, of Injection taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Lipid Injectable Emulsion, page 421 of *PF* 29(2) [Mar.–Apr. 2003]. It is proposed to revise the Definition and the *Packaging and storage* sections. In addition, it is proposed to add a new section, *Globule size limits,* that consists of *Method I* and *Method II* as described in *Method I—Light-Scattering Method* and *Method II—Light Obscuration or Extinction Method* under *Globule Size Distribution in Lipid Injectable Emulsions* ⟨729⟩, in *PF* 30(6), page 2235. *Method I* uses a light-scattering technique to determine the mean droplet diameter, and *Method II* uses a light-obscuration method to determine the size distribution of globules in the large-diameter tail of the dispersion.

(PPI: J. Kelly) RTS—41318-1

Add the following:

▲Lipid Injectable Emulsion

» ~~Lipid Injectable Emulsion is a sterile 10 percent, 20 percent, or 30 percent w/v oil-in-water emulsion in a vehicle containing glycerol in Water for Injection. The oils are Soybean Oil, Safflower Oil, Olive Oil, Medium-Chain Triglycerides, or other suitable nutritional oils, or a mixture of these oils. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of the oil. It contains no antimicrobial agents. It contains Egg Phospholipids as an emulsifying agent.~~ Lipid Injectable Emulsion used in total parenteral nutrition is a sterile 10 percent (0.10 g per mL), 20 percent (0.20 g per mL), or 30 percent (0.3 g per mL) w/v emulsion in a vehicle. The vehicle con-

In-Process Revision

tains 2.25 percent to 2.5 percent w/v Glycerin and 0.6 percent to 1.8 percent w/v parenteral Egg Phospholipids in Water for Injection. The principal oil used is Soybean Oil, which provides an ample supply of the essential fatty acids: linoleic acid and linolenic acid. Other oils such as Safflower Oil, Medium-Chain Triglycerides, Olive Oil, Fish Oil Containing Omega-3 Acids, or other suitable oils, can be mixed with Soybean Oil. Hence, Soybean Oil can be the only oil or be part of a mixture containing other oils. It contains not less than 90 percent and not more than 110 percent of the labeled amount of each of the defined oils. It contains no antimicrobial agents. The final products are terminally sterilized.

Packaging and storage~~— Preserve in a single-dose, glass container or glass *Pharmacy Bulk Package* (see *Injections* ⟨1⟩). Use elastomeric closures that are compatible with both the oil and water phases of the Emulsion. Store at controlled room temperature, and protect from freezing.~~ Preserve in single-dose Type I or Type II glass container or glass *Pharmacy Bulk Package* (see *Injections* ⟨1⟩). Use elastomeric closures that are compatible with both the oil and water phases of the Emulsion. Store at a temperature not below 4° (protect from freezing) or above 30° (protect from excessive heat).

Labeling—The label states the identity and the quantities of the oils in the Emulsion. The label states the total ~~osmolal~~ osmolar concentration (or osmolarity) in ~~mOsmol~~ mOsm per ~~kg.~~ L. The labeling provides the following information: do not use if there is evidence of excessive creaming or aggregation, if free oil droplets are visible, or if there ~~are other forms of phase separation indicating that the stability of the product has been compromised.~~ are other indications of compromised integrity such as microbial growth present in the product.

USP Reference standards ⟨11⟩—*USP Endotoxin RS. USP Particle Count RS.*

Fatty acid composition—Transfer a volume of the Emulsion, equivalent to about 200 mg of lipids, to a stoppered extraction vessel, add 10 mL of ether, and mix. Add 5 g of anhydrous sodium sulfate, mix, and allow the mixture to stand until separation of the layers is complete. Wet the packing of a chromatographic silica cartridge with a few mL of ether, transfer about 5 mL of the ether layer from the extraction vessel to the column reservoir, and elute at a rate of between 5 and 10 drops per minute into a suitable vessel. Evaporate the ether from the eluant, and dissolve the residue in 5.0 mL of toluene. Transfer 1.0 mL of the toluene solution to a reaction vial, and add 0.4 mL of (*m*-trifluoromethylphenyl) trimethylammonium hydroxide in methanol. Cover, mix, and allow to stand for 30 minutes. Inject about 1 µL of this solution into a ~~gas ionization detector and~~ gas chromatograph with a 0.53-mm × 50-m wide-bore, fused-silica capillary column coated with a 2.0-µm thickness of liquid phase G16 and maintained at a temperature of 200°. Helium is used as the carrier gas at a flow rate of about 10 mL per minute. Measure the five main peak areas of the methyl esters of the fatty acids. The order of elution is palmitate, stearate, oleate, linoleate, and linolenate: their relative peak areas expressed as a percentage of the five main peaks are in the known ranges for the oils or mixtures of oils specified on the label.

Bacterial endotoxins ⟨85⟩—It contains not more than 0.5 USP Endotoxin Unit per mL.

pH ⟨791⟩**:** between 6.0 and 9.0

Globule size limits—Lipid Injectable Emulsion meets the requirements of the limits specified in both *Method I* and *Method II* as directed under *Globule Size Distribution in Lipid Injectable Emulsions* ⟨729⟩.

Limit of oil droplet mean diameters (See *Method I—Light Scattering Method* under *Globule Size Distribution in Lipid Injectable Emulsions* ⟨729⟩)—Using the method of light scattering, determine the mean droplet diameter (MDD): the sample meets the requirements.

Limit of large globule volume-diameter (See *Method II—Light Obscuration or Extinction Method* under *Globule Size Distribution in Lipid Injectable Emulsions* ⟨729⟩)—Using the method of light obscuration, determine the size distribution of globules in the large-diameter tail of the dispersion (detection threshold ≥2.0 μm). Calculate the volume-weighted mass of lipid in the form of globules with diameters in excess of 5.0 μm per 100 mL of Emulsion. This mass does not exceed 0.05% of the dispersed phase that is > 5.0 μm from the nominal lipid concentration stated on the label.

~~**Particulate matter** ⟨788⟩**:** meets the requirements for *Large-Volume Injections* for single-dose infusion.~~

Limit of free fatty acid—

Solvent—Prepare a mixture of heptane, isopropanol, and water (400 : 400 : 200) in a separatory funnel. Allow the phases to separate, and discard the lower phase. Filter the upper phase (heptane solution) through 40 g of anhydrous sodium sulfate. Store in a tightly-capped glass container, and use within 1 week.

Chromatographic column—Prepare a slurry of heptane and chromatographic silica gel having an average pore size of 6 nm, and activate at 110° for not less than 1 hour prior to use. Transfer the slurry to a 2.3-cm chromatographic tube (see *Column Chromatography* under *Chromatography* ⟨621⟩), and pack to a bed height of between 5 and 6 cm. Wash the column with about 40 mL of heptane, and drain the heptane through the column to a level of about 0.5 cm above the silica gel bed.

Procedure—Transfer 20.0 mL of the Emulsion to a flask, freeze, and lyophilize. Dissolve the residue in 3 mL of *Solvent,* and transfer the solution to the column. Rinse the flask with three 30-mL portions of *Solvent,* and transfer the washings to the column, allowing each rinsing to drain to the top of the column bed before applying the next rinse. Collect a total of 120 mL of effluent. Add 10 drops of phenolphthalein TS to the effluent, bubble nitrogen through the solution, and titrate with 0.02 N alcoholic potassium hydroxide VS until the solution remains pale pink after mixing for 10 seconds. Titrate a blank using 120 mL of *Solvent.* Calculate the quantity of free fatty acids, in mEq, in the portion of Emulsion taken by the formula:

$$(V_U - V_B)N/20C,$$

in which V_U is the volume, in mL, of the 0.02 N alcoholic potassium hydroxide consumed by the eluant; V_B is the volume, in mL, of 0.02 N alcoholic potassium hydroxide consumed by the blank; N is the normality of the 0.02 N alcoholic potassium hydroxide; and C is the labeled concentration of the sum of the individual oils in the Emulsion: not more than 0.07 mEq of free fatty acids per mL of Emulsion is found.

Other requirements—It meets the requirements under *Injections* ⟨1⟩.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of isopropanol, ethyl acetate, and glacial acetic acid (179 : 20 : 1).

In-Process Revision

Standard preparation—Dissolve an accurately weighed portion of Soybean Oil (or other relevant oils used in the Emulsion) in *Mobile phase* to obtain a solution having a known concentration of about 8 mg per mL.

Assay preparation—Transfer an accurately measured portion of Emulsion, equivalent to about 800 mg of oil, to a suitable container, and freeze-dry. Dissolve the residue in *Mobile phase,* and quantitatively transfer to a 100-mL volumetric flask with the aid of additional portions of *Mobile phase.* Dilute with *Mobile phase* to volume, and mix to obtain a solution containing about 8 mg of oil per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector and a 4.6-mm × 25-cm column that contains packing L21. The flow rate is about 1 mL per minute, adjusted so that the peak due to oil elutes at about 6.5 minutes. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the capacity factor, k', is not less than 1.0; the tailing factor for the oil peak is not more than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of oil in the portion of Emulsion taken by the formula:

$$100C(r_U / r_S),$$

~~in which C is the concentration, in mg per mL, of Soybean Oil in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.~~ in which C is the concentration, in mg per mL, of Soybean Oil or other relevant oils used in the Emulsion in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP29*

BRIEFING

Magnesium Carbonate and Citric Acid for Oral Solution, *USP 28* page 1167—See briefings under *Citric Acid, Magnesium Oxide, and Sodium Carbonate Irrigation* and *Assay for Citric Acid/Citrate and Phosphate* ⟨345⟩. Other changes are editorial.

(PA4: E. Gonikberg ; D. Bempong) RTS—42196-8

(Official January 1, 2009)

Change to read:

Content of anhydrous citric acid—

~~*Cation-exchange column*—Mix 10 g of styrene divinylbenzene cation-exchange resin with 50 mL of water in a beaker. Allow the resin to settle, and decant and discard the supernatant until a slurry of resin remains. Pour the slurry into a 15-mm × 30-cm glass chromatographic tube having a pledget of glass wool in the bottom and a stopcock, and allow to settle as a homogeneous bed. Place a pledget of glass wool on the top of the bed. Wash the resin bed with about 100 mL of water, closing the stopcock when the water level has just entered the glass wool pledget on the surface above the resin bed.~~

~~*Test solution*—Transfer an accurately measured volume of the constituted Oral Solution, equivalent to about 9 g of anhydrous citric acid, to a 100-mL volumetric flask, dilute with water to volume, and mix.~~

~~*Procedure*—Transfer 5.0 mL of the *Test solution* carefully onto the top of the resin bed in the cation-exchange column. Place a 250-mL volumetric flask below the column, open the stopcock, and allow to flow until the solution has entered the resin bed. Elute the column with 70 mL of water at a rate of about 5 mL per minute, collecting the eluate in a beaker. Boil the eluate for 1 minute, cool, and add 5 drops of phenolphthalein TS. Titrate with 0.1 N sodium hydroxide VS to a pink endpoint. Each mL of 0.1 N sodium hydroxide is equivalent to 6.404 mg of anhydrous citric acid ($C_6H_8O_7$). The content of anhydrous citric acid is between 76.6% and 107.8% of the labeled amount of magnesium citrate.~~

~~NOTE—Perform the following tests on the Oral Solution obtained after constitution as directed in the labeling. Accurately measure the volume of the constituted Oral Solution.~~

(Official January 1, 2009)

Change to read:

Assay for anhydrous citric acid— ~~Measure accurately 10 mL of Oral Solution, which previously has been freed from excessive carbon dioxide by repeated pouring, into a 250-mL beaker, and add 30 mL of water. Then add phenolphthalein TS and just enough 1 N sodium hydroxide to give the liquid a persistent pink color, and acidify with 4 drops of 1 N hydrochloric acid. Add 20 mL of calcium chloride TS, and concentrate, by boiling, to about 30 mL, stirring constantly with a rubber-tipped glass rod during the boiling. Completely transfer the precipitate from the hot mixture to a filter of from 9 cm to 11 cm in diameter with the aid of small quantities of boiling water, then wash the precipitate five times with boiling water. Collect the filtrate and washings in a 150-mL beaker, and concentrate the solution, by boiling, to about 20 mL. Add sufficient 6 N ammonium hydroxide, dropwise, to give the liquid a distinct red color, and then concentrate to about 10 mL. Transfer the precipitate completely from the hot mixture to a filter of from 7 cm to 9 cm in diameter with the aid of small quantities of boiling water, and wash the precipitate six times with 5-mL portions of boiling water.~~

~~Dry the two filters with the precipitates, and incinerate them together in a loosely covered platinum crucible, heating first at a low temperature until the precipitates are well charred, and then removing the cover and raising the temperature until the residue is nearly white. If a gas flame is used, prevent its contact with the mass in the crucible. Cool, place the crucible with its contents in a suitable beaker, and add about 30 mL of water and then 50.0 mL of 0.5 N hydrochloric acid VS. When the residue has dissolved, remove the crucible, rinsing it well with water into the beaker. Add 100 mL of water, cover the beaker with a watch glass, and boil gently for 10 minutes. Cool, and titrate the excess acid with 0.5 N sodium hydroxide VS, using phenolphthalein TS as the indicator. Each mL of 0.5000 N hydrochloric acid is equivalent to 32.02 mg of $C_6H_8O_7$.~~

Related compounds—

Mobile phase—Dissolve 1 g of tetraheptylammonium bromide in a mixture of a 1.5 g per L solution of sodium hydrogen sulfate, acetonitrile, and methanol (2 : 2 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Transfer about ~~8 mg~~ 4 mg of USP Mefloquine Hydrochloride RS and ~~8 mg~~ 4 mg of ~~quinidine sulfate~~ USP Mefloquine Related Compound A RS to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. [NOTE—Mefloquine related compound A is *threo*-mefloquine.] Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Test solution—Transfer about 0.10 g of Mefloquine Hydrochloride, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Diluted test solution—Transfer 1.0 mL of the *Test solution* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 1.0 mL of this solution to a 20-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector, a 4-mm × 2.5-cm precolumn, and a 4.0-mm × 25-cm column, both containing 5-µm packing L1. The flow rate is about 0.8 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about ~~0.5~~ ▲0.7$_{▲USP29}$ for ~~quinidine~~ ▲mefloquine related compound A$_{▲USP29}$ and 1.0 for mefloquine; the resolution, *R,* between ~~quinidine~~ mefloquine related compound A and mefloquine is not less than ~~8.5~~ 2.0; and the relative standard deviation for replicate injections is not more than ~~3%~~ 2.0%.

Procedure—Equilibrate the column with *Mobile phase* at a flow rate of about ~~2 mL~~ 0.8 mL per minute for about 30 minutes. Inject 20 µL of *Diluted test solution.* Adjust the sensitivity of the system so that the height of the major peak is at least 50% of the full scale of the recorder. Separately inject equal volumes (about 20 µL) of the *Test solution* and *Diluted test solution* into the chromatograph, record the chromatogram for a time that is 10 times the retention time of the main peak, and measure the responses of all peaks, excluding the main peak and any other peak producing a response of less than 0.2 times (0.02%) the main peak in the chromatogram of the *Diluted test solution.* The response of ~~any~~ the mefloquine related compound A peak in the *Test solution* with a relative retention time of about 0.7, with reference to the main peak, is not more than twice the area of the main peak in the chromatogram of the *Diluted test solution* (0.2%). The response of any other individual peak, other than the main peak in the chromatogram of the *Test solution,* is not greater than that of the main peak in the chromatogram of the *Diluted test solution* (0.1%); and the sum of the responses of any such peaks in the chro-

matogram of the *Test solution* is not greater than five times the response of the main peak in the chromatogram of the *Diluted test solution* (0.5%).

Assay—Dissolve about 0.35 g, accurately weighed, in 15 mL of anhydrous formic acid, and add 40 mL of acetic anhydride. Titrate with 0.1 N perchloric acid VS, and determine the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 41.48 mg of $C_{17}H_{16}F_6N_2O \cdot HCl$.■1S *(USP28)*

BRIEFING

Mesalamine, *USP 28* page 1220. It is proposed to correct the flow rate of the carrier gas in the *Related compounds, Test 2* to 15 mL per minute for the compounds of interest to elute within the temperature program time specified in the monograph.

(PA2: D. Bempong) RTS—42053-1

Change to read:

Related compounds—

TEST 1 *(for 3-aminosalicylic acid and other related impurities)*—[NOTE—Use *Test 1* to measure 3-aminosalicylic acid and other related impurities not measured in *Test 2*.]

Mobile phase—Dissolve 1.36 g of monobasic potassium phosphate and 2.2 g of sodium 1-octanesulfonate in 890 mL of water, and adjust with phosphoric acid to a pH of 2.2. Pass through a filter having 0.5-µm or finer porosity. To the filtrate add 80 mL of methanol and 30 mL of acetonitrile. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve accurately weighed quantities of USP Mesalamine RS and 3-aminosalicylic acid quantitatively in *Mobile phase* to obtain a solution having known concentrations of about 1 µg of each per mL.

Test solution—Transfer about 50 mg of Mesalamine, accurately weighed, to a 100-mL volumetric flask, add about 75 mL of *Mobile phase,* and sonicate briefly to dissolve. Dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L7. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.0 for mesalamine and 1.3 for 3-aminosalicylic acid; and the resolution, *R,* between mesalamine and 3-aminosalicylic acid is not less than 2.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for a period of time that is three times the retention time of mesalamine, and measure the peak area responses. Calculate the percentage of 3-aminosalicylic acid by the formula:

$$0.2C_3(r_3 / r_{S3}),$$

in which C_3 is the concentration, in µg per mL, of 3-aminosalicylic acid in the *Standard solution;* r_3 is the response of the 3-aminosalicylic acid peak in the chromatogram obtained from the *Test solution;* and r_{S3} is the response of the 3-aminosalicylic acid peak in the chromatogram obtained from the *Standard solution.* Calculate the percentage of each other impurity by the formula:

$$0.2C_m(r_i / r_{Sm}),$$

in which C_m is the concentration, in µg per mL, of USP Mesalamine RS in the *Standard solution;* r_i is the response of the individual impurity peak in the chromatogram obtained from the *Test solution;* and r_{Sm} is the response of the mesalamine peak in the chromatogram obtained from the *Standard solution:* not more than 0.2% of 3-aminosalicylic acid is found; not more than 0.2% of any other impurity, expressed in terms of mesalamine equivalent, is found; and the total of all impurities found is not more than 1.0%.

TEST 2 *(for aniline, 2-aminophenol, and 4-aminophenol)*—

Standard solution—Prepare a solution of aniline, 2-aminophenol, and 4-aminophenol in methanol having concentrations of 0.05, 2, and 2 mg per mL, respectively, and dilute quantitatively and stepwise, if necessary, with methylene chloride to obtain a solution having known concentrations of 0.5, 20, and 20 µg per mL, respectively.

Test solution—Mix 1.0 g of Mesalamine with 10.0 mL of methylene chloride. Allow to settle, and use the clear methylene chloride solution as the *Test solution*.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 10-m fused-silica capillary column coated with a 2.65-µm film of stationary phase G27. The carrier gas is helium flowing at a rate of ~~1.5 mL~~

▲15 mL▲*USP29*

per minute. The injection port and the detector temperatures are maintained at about 280° and 300°, respectively. The column temperature is programmed according to the following steps: the starting column temperature is 70°; after injection it is held at 70° for 2 minutes, then increased to 150° at a rate of 30° per minute, then held for 1 minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.5 for aniline, 0.9 for 2-aminophenol, and 1.0 for 4-aminophenol; and the peaks are baseline separated.

Procedure—Separately inject equal volumes (about 2 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak area responses. Identify by retention time any peaks present in the chromatogram of the *Test solution* that correspond to those in the chromatogram obtained from the *Standard solution.* Calculate the quantities, in µg per g, of aniline, 2-aminophenol, and 4-aminophenol in the portion of Mesalamine taken by the formula:

$$10C(r_a / r_{Sa}),$$

in which C is the concentration, in µg per mL, of the relevant analyte in the *Standard solution;* r_a is the response of the relevant analyte in the chromatogram obtained from the *Test solution;* and r_{Sa} is the response of the relevant analyte in the chromatogram obtained from the *Standard solution:* not more than 5 µg of aniline, 200 µg of 2-aminophenol, and 200 µg of 4-aminophenol per g are found.

In-Process Revision

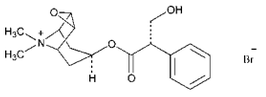
BRIEFING

Methscopolamine Bromide, page 899 of *PF* 30(3) [May–June 2004]. On the basis of comments received, it is proposed to add a test for *Chromatographic purity.* In the *Assay,* it is also proposed to replace the HPLC method with the same new stability-indicating liquid chromatographic procedure proposed for the *Chromatographic purity* test. This method is based on analyses performed with the Chromolith Performance RP-18e brand of L1 column. The typical retention time for methscopolamine bromide is about 2.4 minutes. In addition, the molecular weight of methscopolamine bromide is revised to reflect the current atomic weight values published in *USP 28.*

(PA4: E. Gonikberg) RTS—41998-1

Add the following:

▲Methscopolamine Bromide



$C_{18}H_{24}BrNO_4$ ~~398.30~~ 398.29

3-Oxa-9-azoniatricyclo[3.3.1.$0^{2,4}$]nonane, 7-(3-hydroxy-1-oxo-2-phenylpropoxy)-9,9-dimethyl-, bromide, [7(*S*)-(1α,2*β*,4*β*,5α,7*β*]-.

6*β*,7*β*-Epoxy-3α-hydroxy-8-methyl-1α*H*,5α*H*-tropanium bromide (–)-tropate [*155-41-9*].

» Methscopolamine Bromide contains not less than 97.0 percent and not more than 103.0 percent of $C_{18}H_{24}BrNO_4$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers, and store at room temperature.

USP Reference standards ⟨11⟩**—***USP Methscopolamine Bromide RS. USP Scopolamine Hydrobromide RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: A solution (1 in 20) meets the requirements of the tests for *Bromide* ⟨191⟩.

Specific rotation ⟨781⟩**:** between –21° and –25°, ~~calculated on the dried basis,~~ determined in a solution containing 500 mg in each 10 mL.

Loss on drying ⟨731⟩**—**Dry it at 105° for 2 hours: it loses not more than 2.0% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Chromatographic purity—

Buffer solution, Solution A, and *Solution B*—Proceed as directed in the *Assay.*

Standard solution—Prepare as directed for the *Standard preparation* in the *Assay.*

Diluted standard solution—Dilute 5 µL of the *Standard solution* with *Solution A* to 10.0 mL.

Test solution—Prepare as directed for the *Assay preparation.*

Scopolamine hydrobromide solution—Dissolve an accurately weighed quantity of USP Scopolamine Hydrobromide RS in *Solution A* to obtain a solution having a known concentration of about 0.05 mg per mL.

System suitability solution—Dissolve about 50 mg of USP Methscopolamine Bromide RS in *Solution A,* add 1.0 mL of *Scopolamine hydrobromide solution,* and dilute with *Solution A* to 50.0 mL. This solution contains about 0.1% of scopolamine hydrobromide.

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay.* In addition, chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between methscopolamine and scopolamine is not less than 1.5; and the tailing factor for the methscopolamine peak is not more than 2.0.

In-Process Revision

Procedure—Separately inject equal volumes (about 5 µL) of the *Diluted standard solution* and the *Test solution* into the chromatograph, record the chromatogram for four times the retention time of methscopolamine, and measure the responses for the major peaks. Disregard any peak with an area less than that of the methscopolamine peak in the chromatogram obtained from the *Diluted standard solution,* and disregard any peak that is due to *Solution A*. Calculate the percentage of each impurity in the portion of Methscopolamine Bromide taken by the formula:

$$100F(r_i / r_S),$$

in which F is the relative response factor for the methscopolamine bromide impurities (see *Table 1*); r_i is the peak area of any impurity obtained from the *Test solution;* and r_S is the peak area of methscopolamine obtained from the chromatogram of the *Test solution*: not more than 0.1% of any individual impurity is found; and not more than 0.5% of total impurities is found.

Table 1.

Name	Relative Retention Time	Relative Response Factor (*F*)
Tropic acid	0.4	0.4
Scopolamine hydrobromide	0.9	1.0
Methylatropine bromide	1.2	1.0
Apomethscopolamine bromide	3.5	0.6
Any other impurity	—	1.0

Assay—

~~*Mobile phase*—Prepare a solution containing 2.6 g of decyl sodium sulfate, in 450 mL of water. Add 550 mL of methanol, adjust with 1 N sulfuric acid to a pH of 3.5, mix, filter, and degas.~~

~~*Standard preparation*—Transfer about 25 mg of USP Methscopolamine Bromide RS, accurately weighed, to a 100 mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.~~

~~*Assay preparation*—Prepare as directed under the *Standard preparation,* using about 25 mg of Methscopolamine Bromide, accurately weighed.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for the peak responses is not greater than 2.0%.~~

~~*Procedure*—Separately inject a volume (about 50 µL) of the *Standard preparation* and the *Assay preparation* into a chromatograph, record the chromatogram, and measure the peak responses. Calculate the quantity, in mg, of $C_{18}H_{24}BrNO_4$ in the portion of Methscopolamine Bromide taken by the formula:~~

~~$$100C(r_U / r_S),$$~~

~~in which C is the concentration, in mg per mL, of USP Methscopolamine Bromide RS in the *Standard preparation;* and r_U and r_S are the peak responses of the methscopolamine bromide obtained from the *Assay preparation* and the *Standard preparation,* respectively.~~

In-Process Revision

Buffer solution—Prepare a solution containing 5.16 g of sodium 1-hexanesulfonate monohydrate and 3.40 g of monobasic potassium phosphate in 1000 mL of water, adjust with 1 M phosphoric acid to a pH of 2.8, and mix.

Solution A—Mix 850 mL of *Buffer solution* and 150 mL of acetonitrile, filter, and degas.

Solution B—Mix 500 mL of *Buffer solution* and 500 mL of acetonitrile, filter, and degas.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Methscopolamine Bromide RS in *Solution A* to obtain a solution having a known concentration of about 1.0 mg per mL.

Assay preparation—Transfer about 50 mg of Methscopolamine Bromide, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Solution A* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 10-cm column that contains packing L1. The flow rate is about 3 mL per minute. The column temperature is maintained at 50°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–3	100	0	isocratic
3–10	100→85	0→15	linear gradient
10–10.1	85→100	15→0	linear gradient
10.1–13	100	0	re-equilibration

Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for six replicate injections is not greater than 1%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak area responses. Calculate the quantity, in mg, of $C_{18}H_{24}BrNO_4$ in the portion of Methscopolamine Bromide taken by the formula:

$$50C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Methscopolamine Bromide RS in the *Standard preparation;* and r_U and r_S are the peak area responses of methscopolamine obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP29*

BRIEFING

Methscopolamine Bromide Tablets. On the basis of a recent request, it is proposed to reinstate this monograph, which was omitted from *USP 23–NF 18* in 1995. The liquid chromatographic procedure in the *Assay* is based on analyses performed with the Phenomenex Bondclone brand of L1 column. The typical retention time for the methscopolamine peak is about 23 minutes. The liquid chromatographic procedure in the *Dissolution* test is based on analyses performed with the Phenomenex Synergi Hydro-RP 80A brand of L1 column. The typical retention time for the methscopolamine peak is about 4.8 minutes.

(PA4: E. Gonikberg; BPC: M. Marques) RTS—41016-1; 41016-2; 41016-3; 41016-4

Add the following:

▲Methscopolamine Bromide Tablets

» Methscopolamine Bromide Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of methscopolamine bromide ($C_{18}H_{24}BrNO_4$).

Packaging and storage—Preserve in tight containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Methscopolamine Bromide RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

pH 7.3 Dye-buffer solution—Prepare a solution containing, in each 500 mL, 200 mg of bromothymol blue, 3.2 mL of 0.1 N sodium hydroxide, 577.5 mg of citric acid monohydrate, and 6.3 mg of anhydrous dibasic sodium phosphate.

Test solution—Finely powder 1 Tablet, and transfer an amount, equivalent to about 0.5 mg of methscopolamine bromide, to a suitable container. Add 20 mL of water, heat for 5 minutes on a steam bath with frequent agitation, and centrifuge to obtain a clear supernatant. Transfer 10 mL of the supernatant to a vessel containing 10 mL of chloroform and 10 mL of *pH 7.3 Dye-buffer solution*. Shake vigorously for 3 minutes, centrifuge, and transfer 8 mL of the chloroform layer to a suitable container. Evaporate to dryness, and dissolve the residue in 1 mL of chloroform.

Standard solution—Prepare a solution in water containing about 0.025 mg of USP Methscopolamine Bromide RS per mL, and treat as directed above, beginning with "Transfer 10 mL of the supernatant."

Application volume: 50 µL.

Developing solvent system—In a suitable container, mix water, butyl alcohol, and glacial acetic acid (5: 4 : 1), then transfer a measured volume of the upper organic layer to a suitable container, and mix with a volume of alcohol equivalent to 20% of the volume of the organic layer.

Procedure—Allow the solvent front to move about three-fourths of the length of the plate, remove the plate from the developing chamber, mark the solvent front, and dry the plate under a current of air for 30 minutes. Spray the plate evenly with potassium–bismuth iodide TS: the chromatogram of the *Test solution* shows a bright orange spot on a yellow background corresponding in R_F value (about 0.25) to that in the chromatogram obtained from the *Standard solution*. [NOTE—Bromothymol blue produces a dark yellow spot at an R_F value of about 0.8.]

B: Powder a number of Tablets, equivalent to about 5 mg of methscopolamine bromide, digest with 5 mL of water for 10 minutes, and filter: a portion of the clear solution so obtained responds to the test for *Bromide* ⟨191⟩.

Dissolution ⟨711⟩**—**

Medium: 0.1 N hydrochloric acid; 500 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Determine the percentage of the labeled amount of methscopolamine bromide dissolved using the following method.

pH 3.0 Phosphate buffer—Dissolve 5.44 g of monobasic potassium phosphate in 1 L of water. Adjust with 1 N phosphoric acid to a pH of 3.0.

Mobile phase—Prepare a filtered and degassed mixture of *pH 3.0 Phosphate buffer* and methanol (3 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

In-Process Revision

Standard solution—Dissolve an accurately weighed quantity of USP Methscopolamine Bromide RS in *Medium*, and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration similar to the one expected in the *Test solution*.

Test solution—Use portions of the solution under test that have been passed through a 0.45-µm PTFE filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 204-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 30°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0.; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of methscopolamine bromide dissolved by the formula:

$$\frac{r_U \times C_S \times 500 \times 100}{r_S \times LC},$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of USP Methscopolamine Bromide RS in the *Standard solution;* 500 is the volume, in mL, of *Medium;* 100 is the factor for conversion to percentage; and *LC* is the tablet label claim, in mg.

Tolerances—Not less than 80% (*Q*) of the labeled amount of $C_{18}H_{24}BrNO_4$ is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Assay—

Mobile phase—Prepare a solution containing 2.6 g of decyl sodium sulfate, in 450 mL of water. Add 550 mL of methanol, adjust with 1 N sulfuric acid to a pH of 3.5, mix, filter, and degas.

Standard preparation—Transfer about 25 mg of USP Methscopolamine Bromide RS, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Assay preparation—

FOR THE TABLETS THAT CONTAIN 2.5 MG OF METHSCOPOLAMINE BROMIDE—Place 10 Tablets in a 100-mL volumetric flask, add about 50 mL of *Mobile phase*, and sonicate for 30 minutes. Shake by mechanical means for 30 minutes, dilute with *Mobile phase* to volume, and mix. Pass a portion through a 0.45-µm PTFE filter, discarding the first 2 to 3 mL of the filtrate.

FOR THE TABLETS THAT CONTAIN 5 MG OF METHSCOPOLAMINE BROMIDE—Place 10 Tablets in a 200-mL volumetric flask, add about 100 mL of *Mobile phase,* and sonicate for 30 minutes. Shake by mechanical means for 30 minutes, dilute with *Mobile phase* to volume, and mix. Pass a portion through a 0.45-µm PTFE filter, discarding the first 2 to 3 mL of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not greater than 2.0%.

Procedure—Separately inject a volume (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatogram, and measure the

peak responses. Calculate the quantity, in mg, of methscopolamine bromide ($C_{18}H_{24}BrNO_4$) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Methscopolamine Bromide RS in the *Standard preparation;* and r_U and r_S are the peak responses of the methscopolamine bromide obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP29*

BRIEFING

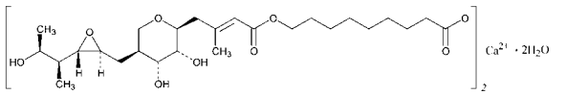
Mupirocin Calcium; Mupirocin Cream. Because there are no existing *USP* monographs for this active antibiotic drug substance and dosage form, new monographs are being proposed. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with the Zorbax C8 brand of L7 column. In the test for *Related compounds,* typical retention times for pseudomonic acid D and mupirocin are about 9 minutes and 12 minutes, respectively. In the *Assay,* typical retention times for pseudomonic acid D and mupirocin are 7 minutes and 9 minutes, respectively.

(PA7: L. Callahan) RTS—37476-1; 41278-1

In-Process Revision

Add the following:

▲Mupirocin Calcium



$C_{52}H_{86}CaO_{18} \cdot 2H_2O$ 1075.34

Nonanoic acid, 9-[[3-Methyl-1-oxo-4-[tetrahydro-3,4-dihydroxy-5-[[3-(2-hydroxy-1-methylpropyl)oxiranyl]-methyl]-2*H*-pyran-2-yl]-2-butenyl]oxy-, calcium salt (2 : 1), dihydrate, [2*S*-[2α(*E*),3β,4β,5α[2*R**,3*R**-(1*R**,2*R**)]]].

(α*E*,2*S*,3*R*,4*R*,5*S*)-5-[(2*S*,3*S*,4*S*,5*S*)-2,3-Epoxy-5-hydroxy-4-methylhexyl]tetrahydro-3,4-dihydroxy-β-methyl-2*H*-pyran-2-crotonic acid, ester with 9-hydroxynonanoic acid, calcium salt (2 : 1), dihydrate [*115074-43-6*].

» Mupirocin Calcium contains the equivalent of not less than 865 µg and not more than 936 µg of mupirocin ($C_{26}H_{44}O_9$) per mg.

Packaging and storage—Preserve in tight containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards ⟨11⟩—*USP Mupirocin Calcium RS. USP Mupirocin Lithium RS.*

Identification—

A: *Infrared Absorption* ⟨197M⟩—[NOTE—Do not dry or grind extensively.]

B: *Ultraviolet Absorption* ⟨197U⟩—

Solution: 20 µg per mL.

Medium: methanol.

C: When moistened with hydrochloric acid, it meets the requirements of the flame test for *Calcium* ⟨191⟩.

Crystallinity ⟨695⟩**:** meets the requirement.

Specific rotation ⟨781S⟩**:** between –16° and –20°.

Test solution: 50 mg per mL, in methanol.

Water, *Method I* ⟨921⟩**:** not less than 3.0% and not more than 4.5%.

Chloride ⟨221⟩—Dissolve 50 mg in a mixture of 1 mL of 2 N nitric acid and 15 mL of methanol. Add 1 mL of silver nitrate TS: the turbidity does not exceed that produced by 0.70 mL of 0.020 N hydrochloric acid (0.5%).

Related compounds—

0.1 M Ammonium acetate—Prepare as directed in the *Assay*.

Mobile phase—Prepare a filtered and degassed mixture of *0.1 M Ammonium acetate* and tetrahydrofuran (70 : 30). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

pH 4 Acetate buffer—Transfer about 13.6 g of sodium acetate to a 1000-mL volumetric flask, and dissolve in about 900 mL of water. Adjust with glacial acetic acid to a pH of 4.0, and dilute with water to volume.

Diluent—Prepare a mixture of *pH 4 Acetate buffer* and methanol (1 : 1).

Standard solution—Transfer about 25 mg of USP Mupirocin Lithium RS, accurately weighed, to a 200-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Test solution—Transfer about 50 mg of Mupirocin Calcium, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Resolution solution—Adjust 10 mL of the *Standard solution* with 6 N hydrochloric acid to a pH of 2.0, allow to stand for 20 hours, and adjust with 5 N sodium hydroxide to a pH of 4.0.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm × 25-cm column that contains 7-µm packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the second of two peaks corresponding to hydrolysis products and the peak corresponding to mupirocin is not less than 7.0. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.75 (6 minutes) for pseudomonic acid D and 1.0 (14 minutes) for mupirocin; the column efficiency for the mupirocin peak is not less than 3000 theoretical plates; the tailing factor for the mupirocin peak is not more than 2; and the relative standard deviation of the mupirocin peak for replicate injections is not more than 5%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, and measure the peak area responses for all of the peaks. Calculate the percentage of each related compound in the portion of Mupirocin Calcium taken by the formula:

$$(E/200)(W_S/W_U)(r_i/r_S),$$

in which E is the mupirocin equivalent, in µg per mg, of USP Mupirocin Lithium RS; W_S is the weight, in mg, of USP Mupirocin Lithium RS taken to prepare the *Standard solution;* W_U is the weight, in mg, of Mupirocin Calcium taken to prepare the *Test solution;* r_i is the peak area for any impurity obtained from the *Test solution;* and r_S is the peak area for mupirocin obtained from the *Standard solution:* the area of any peak corresponding to pseudomonic acid D is not greater than 2.5%; the area of any peak, excluding the mupirocin peak and any peak corresponding to pseudomonic acid D, is not greater than 1%; and the sum of the areas of all the peaks, excluding the principal peak, is not greater than 4.5%. Disregard any peak with an area less than 0.05 times the area of the mupirocin peak in the chromatogram obtained from the *Standard solution*.

Assay—

0.1 M Ammonium acetate—Transfer about 7.7 g of ammonium acetate to a 1000-mL volumetric flask, dissolve in about 900 mL of water, adjust with glacial acetic acid to a pH of 5.7, and dilute with water to volume.

Mobile phase—Prepare a filtered and degassed mixture of *0.1 M Ammonium acetate* and tetrahydrofuran (68 : 32). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer about 25 mg of USP Mupirocin Lithium RS, accurately weighed, to a 200-mL volumetric flask, dissolve in 5 mL of methanol, dilute with *0.1 M Ammonium acetate* to volume, and mix.

Assay preparation—Transfer about 25 mg of Mupirocin Calcium, accurately weighed, to a 200-mL volumetric flask, dissolve in 5 mL of methanol, dilute with *0.1 M Ammonium acetate* to volume, and mix.

Resolution solution—Adjust 10 mL of the *Standard preparation* with 6 N hydrochloric acid to a pH of 2.0, and allow to stand for 20 hours.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains 7-µm packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* of the second of the two peaks corresponding to hydrolysis products and the peak corresponding to mupirocin is not less than 7.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, and measure the peak area responses for the major peaks. Calculate the quantity, in µg, of mupirocin ($C_{26}H_{44}O_9$) in each mg of Mupirocin Calcium taken by the formula:

$$E(M_S / M_U)(r_U / r_S),$$

in which E is the designated mupirocin equivalent, in µg, of mupirocin in each mg of the USP Mupirocin Lithium RS; M_S is the weight, in mg, of USP Mupirocin Lithium RS taken to prepare the *Standard preparation;* M_U is the weight, in mg, of Mupirocin Calcium taken to prepare the *Assay preparation;* and r_U and r_S are the mupirocin peak area responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP29*

BRIEFING

Mupirocin Cream—See briefing under *Mupirocin Calcium.* In the test for *Related compounds,* typical retention times are about 7.6 minutes for pseudomonic acid F; 12.8 and 13.6 minutes for degradation products; 15.8 and 19.4 minutes for pseudomonic acid D and pseudomonic acid B, respectively; 21.5 minutes for mupirocin; 24.7 and 26.5 minutes for other impurities; and 43.6 and 50.1 minutes for pseudomonic acid C and pseudomonic acid E, respectively. It should be noted that the limits for the test for *Related compounds* apply during the entire shelf-life of the Cream.

(PA7: L. Callahan) RTS—37476-2; 41278-2

In-Process Revision

Add the following:

▲Mupirocin Cream

» Mupirocin Cream contains a quantity of Mupirocin Calcium equivalent to not less than 90.0 percent and not more than 120.0 percent of the

labeled amount of mupirocin ($C_{26}H_{44}O_9$). It may contain one or more suitable buffers, dispersants, and preservatives.

Packaging and storage—Preserve in collapsible tubes or well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

Labeling—Label it to indicate that it contains Mupirocin Calcium and its equivalent content of mupirocin.

USP Reference standards ⟨11⟩**—***USP Mupirocin Lithium RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Minimum fill ⟨755⟩**:** meets the requirements.

pH ⟨791⟩**:** between 6.0 and 8.0.

Microbial limits ⟨61⟩—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa.* The total aerobic microbial count does not exceed 100 cfu per g.

Related compounds—

0.1 M Ammonium acetate, Solution A, Solution B, Mobile phase, pH 6.3 Phosphate buffer, and *Chromatographic system*—Proceed as directed in the *Assay.*

Sodium acetate solution—Add 5.8 mL of glacial acetic acid to 900 mL of water, adjust with sodium hydroxide TS to a pH of 4.0, dilute with water to 1000 mL, and mix.

Tetrahydrofuran solution—Mix 750 mL of tetrahydrofuran and 250 mL of water.

Sodium acetate and tetrahydrofuran solution—Prepare a mixture of *Sodium acetate solution* and *Tetrahydrofuran solution* (50 : 50).

Standard solution—Dissolve an accurately weighed portion of USP Mupirocin Lithium RS in *pH 6.3 Phosphate buffer.* Dilute an accurately measured volume of this solution quantitatively to obtain a solution containing 0.1 mg of mupirocin per mL.

Test stock solution—Transfer an accurately weighed quantity of Cream, equivalent to about 50 mg of mupirocin, to a screw-capped centrifuge tube. Add 5.0 mL of *Tetrahydrofuran solution,* cap, and disperse the Cream by mixing on a vortex mixer and shaking. Add 5.0 mL of *Sodium acetate solution,* cap, and mix. Centrifuge for about 15 minutes. Withdraw the lower layer from the tube, pass it through a filter having a 0.5-µm or finer porosity, and use the filtrate.

Test solution—Transfer 1.0 mL of the *Test stock solution* to a 50-mL volumetric flask, dilute with *Sodium acetate and tetrahydrofuran solution* to volume, mix, and pass through a filter having a 0.5-µm or finer porosity.

pH 4 Acetate buffer—Transfer about 13.6 g of sodium acetate to a 1000-mL volumetric flask, and dissolve in about 900 mL of water. Adjust with glacial acetic acid to a pH of 4.0, and dilute with water to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* typical retention times are about 16 minutes for pseudomonic acid D and 21 minutes for mupirocin; the relative retention times are 0.36 for pseudomonic acid F, 0.6 for mupirocin degradation product A, 0.63 for mupirocin degradation product B, 0.74 for pseudomonic acid D, 0.9 for pseudomonic acid B, 1.0 for mupirocin, 1.15 for mupirocin related compound A, 1.23 for mupirocin related compound B, 2.03 for pseudomonic acid C, and 2.15–2.33 for pseudomonic acid E; the resolution, *R,* between pseudomonic acid D and mupirocin is not less than 3; the column efficiency for the mupirocin peak is not less

than 7000 theoretical plates; the tailing factor for the mupirocin peak is not more than 1.75; and the relative standard deviation of the mupirocin peak for replicate injections is not more than 2%.

Procedure—[NOTE—Ensure that buffers, dispersants, or preservatives in the formulation do not interfere with quantification of either impurities or degradation products.] Separately inject equal volumes (about 20 µL) of the *Test stock solution* and the *Test solution* into the chromatograph, and measure the peak responses for all of the peaks that do not correspond to buffers, dispersants, or preservatives. Calculate the percentage of each related compound and degradation product relative to mupirocin in the portion of Cream taken by the formula:

$$2(r_i / r_M),$$

in which r_i is the peak response for each related compound or degradation product obtained from the *Test stock solution;* and r_M is the peak response of the mupirocin peak obtained from the *Test solution:* not more than 3.0% of pseudomonic acid D is found; not more than 8.5% of mupirocin degradation product A is found; not more than 16% of mupirocin degradation product B is found; not more than 1.2% of any other individual impurity or degradation product is found; and not more that 30% of total impurities and degradation products is found.

Assay—

0.1 M Ammonium acetate—Prepare as directed in the *Assay* under *Mupirocin Calcium*.

Solution A—Prepare a filtered and degassed mixture of *0.1 M Ammonium acetate* and tetrahydrofuran (75 : 25).

Solution B—Prepare a filtered and degassed mixture of *0.1 M Ammonium acetate* and tetrahydrofuran (70 : 30).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

pH 6.3 Phosphate buffer—Dissolve 69 g of monobasic sodium phosphate in 800 mL of water, adust with sodium hydroxide TS to pH 6.3, dilute with water to 1000 mL, and mix.

Standard preparation—Transfer about 21 mg of USP Mupirocin Lithium RS, accurately weighed, to a 200-mL volumetric flask, and dissolve in and dilute with *pH 6.3 Phosphate buffer* to volume.

Assay preparation—Transfer an accurately weighed quantity of Cream, equivalent to about 10 mg of mupirocin, to a 100-mL volumetric flask. Add 50 mL of *pH 6.3 Phosphate buffer* and 25 mL of tetrahydrofuran. Insert the stopper into the flask, mix on a vortex mixer, and shake for 1 to 3 minutes. Dilute with *pH 6.3 Phosphate buffer* to volume. Allow to stand until the oil layer separates out, then dilute the aqueous layer with *pH 6.3 Phosphate buffer* to volume. Repeat 2 to 3 times until as much of the oil layer has separated out as possible. After the final dilution, pass the final solution (bottom layer) through a filter having a 0.5-µm or finer porosity.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm × 25-cm column that contains 7-µm packing L7. The flow rate is about 1 mL per minute. Maintain the column at a constant temperature up to 35°. The chromatograph is programmed as follows.

In-Process Revision

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibration
0–6	100	0	isocratic
6–35	100→0	0→100	linear gradient
35–55	0	100	isocratic
55–55.01	0→100	100→0	immediate
55.01–65	100	0	isocratic

Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* typical retention times are about 16 minutes for pseudomonic acid D and 21 minutes for mupirocin; the resolution, *R,* between pseudomonic acid D and mupirocin is not less than 3; the column efficiency for the mupirocin peak is not less than 7000 theoretical plates; the tailing factor for the mupirocin peak is not more than 1.75; and the relative standard deviation of the mupirocin peak for replicate injections is not more than 2%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak area responses for the major peaks. Calculate the weight percent of mupirocin in the portion of Cream taken by the formula:

$$0.05E(M_S/M_U)(r_U/r_S),$$

in which M_S is the weight, in mg, of USP Mupirocin Lithium RS taken to prepare the *Standard preparation; E* is the designated mupirocin equivalent, in µg, of mupirocin in each mg of the USP Mupirocin Lithium RS; M_U is the weight, in mg, of Cream taken to prepare the *Assay preparation;* and r_U and r_S are the mupirocin peak area responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP29*

BRIEFING

Paroxetine Tablets, *USP 28* page 1476. It is proposed to revise *Identification* test *A* to specify the amount of hydrochloric acid used in the preparation of the *Test specimen*. The current procedure uses an inadequate amount of hydrochloric acid in the precipitation step. Also, it is proposed to revise *Identification* test *C* to change angular rotation to specific rotation.

(PA3: R. Ravichandran) RTS—42084-1

Paroxetine Tablets

▲(Title for this new monograph—to become official February 1, 2006)▲*USP28*

Change to read:

Identification—

A: *Infrared Absorption* ⟨197K⟩—

Test specimen—Transfer a quantity of finely powdered Tablets, equivalent to about 90 mg of paroxetine, to a suitable flask, add 100 mL of 0.1 N hydrochloric acid, and stir for 1 hour. Transfer the mixture to a separatory funnel, and add ~~ammonium hydroxide until the solution is alkaline to litmus paper~~

▲1.5 mL of ammonium hydroxide to make the solution alkaline.▲*USP29*

Add 100 mL of ethyl ether to the funnel, and shake for 2 minutes. Transfer the organic layer into the necessary number of centrifuge tubes, and centrifuge for 10 minutes. Recombine the clarified extracts, add 1 drop of water and 0.5 mL of ~~0.1 N~~

▲▲*USP29*

hydrochloric acid, stir, and evaporate to dryness under a stream of nitrogen. Dry the residue in an oven at 90° for 1 hour.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

C: Place a quantity of finely powdered Tablets, equivalent to about 450 mg of paroxetine, in a stoppered flask. Add 100 mL of alcohol, and shake for 1 hour. Centrifuge about 20 mL of the mixture, and measure the ~~angular~~

▲specific▲*USP29*
rotation of the supernatant at 20° (see *Optical Rotation* ⟨781⟩): the ~~angular~~

▲specific▲*USP29*
rotation is between –75° and –115°.

BRIEFING

Penicillamine Capsules, *USP 28* page 1481 and page 153 of *PF* 30(1) [Jan.–Feb. 2004]. It is proposed to revise the *Dissolution* test to add an option for carrying out the test in unit samples. The chromatographic procedure for this option was validated using an Atlantis C18 brand of column that contains packing L1. In addition, minor editorial style changes have been made.

(BPC: M. Marques) RTS—42062-1

Change to read:

Dissolution ~~*Procedure for a Pooled Sample*~~

▲▲*USP29*
⟨711⟩—
Medium: 0.1 N hydrochloric acid; 900 mL.
Apparatus 1: 100 rpm.
Time: 30 minutes.

▲PROCEDURE FOR A POOLED SAMPLE—▲*USP29*
Dilute hydrochloric acid—Dilute 37 mL of hydrochloric acid with water to 1 L.
Ammonium sulfamate reagent—Dissolve 250 mg of ammonium sulfamate in 100 mL of *Dilute hydrochloric acid.*
N-(1-Naphthyl)ethylenediamine dihydrochloride reagent—Dissolve 100 mg of *N*-(1-naphthyl)ethylenediamine dihydrochloride in 100 mL of *Dilute hydrochloric acid.*
Sulfanilamide–mercuric chloride reagent—Dissolve 100 mg of sulfanilamide and 100 mg of mercuric chloride in 100 mL of *Dilute hydrochloric acid.*
Sodium nitrite reagent—Dissolve 200 mg of sodium nitrite in 100 mL of dilute sulfuric acid (1 in 50). Prepare fresh.
Standard solution—Dissolve an accurately weighed quantity of USP Penicillamine RS in 0.1 N hydrochloric acid to obtain a solution having a known concentration of about 250 µg per mL.
Procedure—

▲Proceed as directed for *Procedure for Capsules, Uncoated Tablets, and Plain Coated Tablets* under *Dissolution* ⟨711⟩. Combine equal volumes of the filtered solutions of the 6 or 12 individual specimens withdrawn, and use the pooled sample as the *Test solution.*▲*USP29*
Pipet an aliquot of the ~~filtered test solution,~~ ▲pooled sample▲*USP29* estimated to contain about 278 µg of penicillamine, into a 100-mL volumetric flask. Into a similar flask pipet an equivalent volume of 0.1 N hydrochloric acid to provide a reagent blank, and into a third 100-mL volumetric flask pipet 1 mL of *Standard solution.* Treat each flask as follows. Add by pipet 3 mL of *Sodium nitrite reagent,* and mix by swirling occasionally. After 5 minutes, add 10 mL of *Ammonium sulfamate reagent,* swirl, and allow to stand for an additional 5 minutes. Add 5 mL of *Sulfanilamide–mercuric chloride reagent,* swirl, and immediately add 10 mL of *N-(1-Naphthyl)ethylenediamine dihydrochloride reagent.* Dilute with water to volume, and mix. Determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 540 nm, with a suitable spectrophotometer, against the reagent blank. Calculate the percentage dissolution of the Capsule taken by the formula:

$$90(C/WV)(A_U/A_S),$$

in which C is the concentration, in µg per mL, of USP Penicillamine RS in the *Standard solution; W* is the labeled quantity, in mg, of penicillamine in the Capsule; V is the volume, in mL, of the aliquot of test solution used; and A_U and A_S are the absorbances of the solutions from the test solution and the *Standard solution,* respectively.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_5H_{11}NO_2S$ is dissolved in 30 minutes:

▲the requirements are met if the quantities of active ingredient dissolved from the pooled sample conform to the accompanying *Acceptance Table for a Pooled Sample*. Continue testing through the three stages unless the results conform at either S_1 or S_2. The quantity, *Q,* is the amount of dissolved active ingredient specified, expressed as a percentage of the labeled content.

Acceptance Table for a Pooled Sample

Stage	Number Tested	Acceptance Criteria
S_1	6	Average amount dissolved is not less than Q + 10%.
S_2	6	Average amount dissolved (S_1 + S_2) is equal to or greater than Q + 5%.
S_3	12	Average amount dissolved (S_1 + S_2 + S_3) is equal to or greater than Q.

PROCEDURE FOR A UNIT SAMPLE —

Buffer solution—Prepare a 50 mM solution of monobasic potassium phosphate buffer, pH 3.0.

In-Process Revision

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and methanol (97 : 3). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Prepare a solution of USP Penicillamine RS in 0.1 N hydrochloric acid having a known concentration corresponding to the content of 1 Capsule dissolved in 900 mL of *Medium*.

Resolution solution—Prepare a solution of USP Penicillamine Disulfide RS in 0.1 N hydrochloric acid having a known concentration of about 0.002 mg per mL.

Test solution—Proceed as directed for *Procedure for Capsules, Uncoated Tablets, and Plain Coated Tablets* under *Dissolution* ⟨711⟩. After 30 minutes, withdraw about 10 mL of solution from each vessel, and immediately pass each aliquot through a 0.45-µm polyvinylidene difluoride filter paper. Discard the first 2 mL of filtered solution, and chromatograph the remaining filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equippped with a 210-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%. Chromatograph the *Resolution solution* and record the peak responses as directed for *Procedure:* the resolution, *R,* between penicillamine and penicillamine disulfide is not less than 2.0.

Procedure—Separately inject equal volumes (about 30 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in percentage, of $C_5H_{11}NO_2S$ released by the formula:

$$\frac{r_U \times C_S \times 900 \times 100}{r_S \times LC},$$

in which r_U and r_S are the peak areas obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Standard solution;* 900 is the volume, in mL of *Medium;* 100 is the conversion factor to percentage; and *LC* is the label claim, in mg, for each Capsule.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_5H_{11}NO_2S$ is dissolved in 30 minutes. ▲*USP29*

BRIEFING

Piperacillin and Tazobactam Injection, page 2000 of *PF* 28(6) [Nov.–Dec. 2001]; **Piperacillin and Tazobactam for Injection,** page 2001 of *PF* 28(6) [Nov.–Dec. 2001]. These proposed new monographs, which previously appeared in *Pharmacopeial Previews,* are now being forwarded to *In-Process Revision*. Editorial style changes have been made.

(PA7a: B. Gilbert) RTS—42216-1

Add the following:

▲Piperacillin and Tazobactam Injection

» Piperacillin and Tazobactam Injection is a sterile solution of Piperacillin Sodium and Tazobactam Sodium that contains the equivalent of not less

than 90.0 percent and not more than 110.0 percent of the labeled amounts of piperacillin ($C_{23}H_{27}N_5O_7S$) and tazobactam ($C_{10}H_{12}N_4O_5S$), the labeled amounts representing proportions of piperacillin to tazobactam of 8 : 1.

Packaging and storage—Preserve in *Containers for Injections* as described in the *Packaging* section under *Injections* ⟨1⟩. Maintain in the frozen state.

Labeling—Label it to indicate its sodium content. It meets the requirements for *Labeling* under *Injections* ⟨1⟩. The label states that it is to be thawed just prior to use, describes conditions for proper storage of the resultant solution, and directs that the solution is not to be refrozen.

USP Reference standards ⟨11⟩*—USP Endotoxin RS. USP Piperacillin RS. USP Tazobactam RS.*

Identification—The retention times of the main peaks for piperacillin and tazobactam in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Bacterial endotoxins ⟨85⟩—It contains not more than 0.08 USP Endotoxin Unit in a portion equivalent to 1 mg of a mixture of piperacillin and tazobactam (0.89 and 0.11 mg, respectively).

pH ⟨791⟩: between 5.0 and 7.0.

Particulate matter ⟨788⟩: meets the requirements for small-volume injections.

Other requirements—It meets the requirements under *Injections* ⟨1⟩.

Assay—

Mobile phase, Standard preparation, and *Chromatographic system—*Proceed as directed in the *Assay* under *Piperacillin and Tazobactam for Injection*.

*Assay preparation—*Allow 1 container of Injection to thaw, and mix. Transfer an accurately measured volume of the Injection, equivalent to about 250 mg of piperacillin and 25 mg of tazobactam, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 10.0 mL of this solution to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Procedure—*Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantities, in mg, of piperacillin ($C_{23}H_{27}N_5O_7S$) and tazobactam ($C_{10}H_{12}N_4O_5S$), respectively, in each mL of Injection taken by the formula:

$$0.25C_S P(r_U / r_S),$$

in which C_S is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation; P* is the designated potency, in µg, of piperacillin ($C_{23}H_{27}N_5O_7S$) or tazobactam ($C_{10}H_{12}N_4O_5S$) in each mg of the USP Piperacillin RS or the USP Tazobactam RS, as appropriate; and r_U and r_S are the responses of the appropriate analyte peaks obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP29*

In-Process Revision

BRIEFING

Piperacillin and Tazobactam for Injection, page 2001 of *PF* 28(6) [Nov.–Dec. 2001]—See briefing under *Piperacillin and Tazobactam Injection*. Also, in this monograph, it is proposed to revise the *Assay* to include the component ratios of the *Mobile phase*.

(PA7a: B. Gilbert) RTS—42156-1

Add the following:

▲Piperacillin and Tazobactam for Injection

» Piperacillin and Tazobactam for Injection contains amounts of Piperacillin Sodium and Tazobactam Sodium equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of piperacillin ($C_{23}H_{27}N_5O_7S$) and tazobactam ($C_{10}H_{12}N_4O_5S$), the labeled amounts representing proportions of piperacillin to tazobactam of 8 : 1.

Packaging and storage—Preserve in *Containers for Sterile Solids* as described in the *Packaging* section under *Injections* ⟨1⟩. Store at controlled room temperature.

Labeling—Label it to indicate its sodium content.

USP Reference standards ⟨11⟩**—***USP Endotoxin RS. USP Piperacillin RS. USP Tazobactam RS.*

Identification—The retention times of the main peaks for piperacillin and tazobactam in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Bacterial endotoxins ⟨85⟩**—**It contains not more than 0.08 USP Endotoxin Unit in a portion equivalent to 1 mg of a mixture of piperacillin and tazobactam (0.89 and 0.11 mg, respectively).

Sterility ⟨71⟩**—**It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

pH ⟨791⟩: between 5.0 and 7.0, in a solution containing the equivalent of 40 mg of piperacillin per mL.

Water, *Method I* ⟨921⟩: not more than 2.5%.

Particulate matter ⟨788⟩: meets the requirements for small-volume injections.

Other requirements—It meets the requirements under *Injections* ⟨1⟩.

Assay—

Mobile phase—Prepare a mixture of methanol, water, 0.2 M monobasic sodium phosphate, and 0.4 M tetrabutylammonium hydroxide (510 : 432 : 50 : 8). Adjust with phosphoric acid to a pH of 5.5 ± 0.02. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Prepare a solution of USP Piperacillin RS and USP Tazobactam RS quantitatively in *Mobile phase* to obtain a solution having known concentrations of about 1 mg of USP Piperacillin RS and 0.1 mg of USP Tazobactam RS per mL.

Assay preparation 1 (where it is represented as being in a single-dose container)—Constitute a container of Piperacillin and Tazobactam for Injection with a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw the total withdrawable contents from the container, using a suitable hypodermic needle and syringe, and dilute quantitatively,

In-Process Revision

and stepwise if necessary, with *Mobile phase* to obtain a solution containing the equivalent of about 1 mg of piperacillin and 0.1 mg of tazobactam per mL.

Assay preparation 2 (where the label states the quantities of piperacillin and tazobactam in a given volume of constituted solution)—Constitute a container of Piperacillin and Tazobactam for Injection with a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Dilute an accurately measured volume of the constituted solution quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution containing the equivalent of about 1 mg of piperacillin and 0.1 mg of tazobactam per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1 . The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak area responses for the major peaks. Calculate the quantities, in mg, of piperacillin ($C_{23}H_{27}N_5O_7S$) and tazobactam ($C_{10}H_{12}N_4O_5S$), respectively, withdrawn from the container, or in the volume of constituted solution, taken by the formula:

$$(L/D)(C_S P)(r_U / r_S),$$

in which L is the labeled quantity, in mg, of piperacillin or tazobactam, as appropriate, in the container or in the volume of constituted solution taken; D is the concentration, in mg per mL, of piperacillin or tazobactam in *Assay preparation 1* or *Assay preparation 2,* on the basis of the labeled quantity, in mg, of piperacillin or tazobactam, as appropriate, in the container and the extent of dilution; C_S is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation; P* is the designated potency, in µg, of piperacillin ($C_{23}H_{27}N_5O_7S$) or tazobactam ($C_{10}H_{12}N_4O_5S$) in each mg of the USP Piperacillin RS or the USP Tazobactam RS; and r_U and r_S are the responses of the appropriate analyte peaks obtained from *Assay preparation 1* or *Assay preparation 2* and the *Standard preparation,* respectively.▲*USP29*

BRIEFING

Potassium and Sodium Bicarbonates and Citric Acid Effervescent Tablets for Oral Solution, *USP 28* page 1582—See briefings under *Citric Acid, Magnesium Oxide, and Sodium Carbonate Irrigation* and *Assay for Citric Acid/Citrate and Phosphate* ⟨345⟩.

Assay for anhydrous citric acid—

~~*Cation-exchange column*—Mix 10 g of styrenedivinylbenzene cation-exchange resin with 50 mL of water in a suitable beaker. Allow the resin to settle, and decant the supernatant until a slurry of resin remains. Pour the slurry into a 14-mm × 30-cm glass chromatographic tube (having a sealed-in, coarse-porosity porous glass disk and fitted with a stopcock), and allow to settle as a homogeneous bed. Wash the resin bed with about 100 mL of water, closing the stopcock when the water level is about 2 mm above the resin bed.~~

In-Process Revision

~~*Procedure*—Transfer an accurately measured volume of the stock solution used to prepare *Assay preparation 1* in the *Assay for potassium bicarbonate and sodium bicarbonate,* equivalent to about 40 mg of anhydrous citric acid, carefully onto the top of the resin bed in the *Cation exchange column*. Place a 250-mL conical flask below the column, open the stopcock, and allow to flow until the solution has entered the resin bed. Elute the column with 60 mL of water at a flow rate of about 5 mL per minute, collecting about 65 mL of the eluate in a suitable flask. Boil the eluate for 1 minute, cool, add 5 drops of phenolphthalein TS, swirl the flask, and titrate with 0.02 N sodium hydroxide VS to a pink endpoint. Each mL of 0.02 N sodium hydroxide is equivalent to 1.281 mg of $C_6H_8O_7$.~~

▲*Mobile phase, Standard Preparation 1,* and *Chromatographic System*—Proceed as directed under *Assay for Citric Acid/Citrate and Phosphate* ⟨345⟩.

Assay preparation—Transfer an accurately measured volume of the stock solution used to prepare *Assay preparation 1* in the *Assay for potassium bicarbonate and sodium bicarbonate,* equivalent to about 40 mg of anhydrous citric acid into a suitable volumetric flask, and proceed as directed under *Assay Preparation for Citric Acid/Citrate Assay* in *Assay for Citric Acid/Citrate and Phosphate* ⟨345⟩.

Procedure—Proceed as directed for *Procedure* in ⟨345⟩, and calculate the quantity, in mg, of anhydrous citric acid ($C_6H_8O_7$) in the portion of Tablets taken by the formula:

$$0.001(192.12/189.10)C_S D(r_U / r_S),$$

in which 192.12 is the molecular weight of anhydrous citric acid; 189.10 is the molecular weight of citrate ($C_6H_5O_7^{-3}$); C_S is the concentration, in µg per mL, of citrate in *Standard Preparation 1; D* is the dilution factor; and r_U and r_S are the citrate peak areas obtained from the *Assay preparation* and *Standard Preparation 1,* respectively.▲*USP29*

(Official January 1, 2009)

BRIEFING

Potassium Bromide; Sodium Bromide. Because there are no existing *USP* monographs for these articles, new monographs are being proposed. Potassium Bromide and Sodium Bromide are used in veterinary medicine as components of compounded preparations to treat refractory epilepsy in dogs and cats. These drug substance monographs are being proposed as a prelude to the publication of monographs for the compounded formulations.

(VET: I. DeVeau) RTS—41869-1

Add the following:

▲Potassium Bromide

Potassium bromide 119.0 [*7758-02-3*].

» Potassium Bromide contains not less than 98.0 percent and not more than 100.5 percent of KBr, calculated on the dried basis. It contains no added substances.

Packaging and storage—Preserve in well-closed containers, and store at room temperature.

Appearance of solution: clear and colorless.

Test solution—Dissolve 10.0 g in carbon dioxide-free water, and dilute with the same solvent to 100 mL.

Identification—

A: A solution containing 4.5 mg of potassium bromide responds to the test for *Bromide* ⟨191⟩.

B: Responds to the test for *Potassium* ⟨191⟩.

Acidity or alkalinity—To 10 mL of the solution prepared for the test for *Appearance of solution,* add 0.1 mL of bromothymol blue TS: not more than 0.5 mL of 0.01 N hydrochloric acid or 0.01 N sodium hydroxide is required to change the color of this solution.

In-Process Revision

Loss on drying ⟨731⟩—Dry it at 100° to 105° for 3 hours: it loses not more than 1.0% of its weight.

Bromates—

Starch–mercuric iodide solution—Triturate 1.0 g of soluble starch with 5 mL of water and pour the mixture into 100 mL of boiling water, containing 10 mg of mercuric iodide.

Procedure—To 10 mL of the solution prepared for the test for *Appearance of solution* add 1 mL of *Starch–mercuric iodide solution,* 0.1 mL of a 100 g per L solution of potassium iodide, and 0.25 mL of 0.5 M sulfuric acid. Allow to stand protected from light for 5 minutes. No blue or violet color develops.

Limit of chlorine: not more than 0.6 percent.

Nitric acid solution and *Ferric ammonium sulfate solution*—Proceed as directed in the *Assay.*

Procedure—Dissolve 1.000 g of Potassium Bromide in 20 mL of *Nitric acid solution* in a conical flask, add and mix 5 mL of 30 percent hydrogen peroxide, and heat in a water bath until the solution is colorless. Rinse the sides of the flask with a small quantity of water, and heat in a water bath for 15 minutes. Allow to cool, dilute with water to 50 mL, and add 5.0 mL of silver nitrate VS and 1 mL of dibutyl phthalate. Mix, and back titrate the excess silver nitrate with ammonium thiocyanate VS (see *Titrimetry* ⟨541⟩), using 5 mL of *Ferric ammonium sulfate solution* as the indicator. Perform a blank titration. Not more than 1.7 mL of silver nitrate VS is used.

Iodides—To 5 mL of the solution prepared for the test for *Appearance of solution* add 0.15 mL of a 10.5 g per 100 mL ferric chloride solution, and 2 mL of dichloromethane. Shake, and allow to separate. The lower layer is colorless.

Sulfates ⟨221⟩—A 2.0-g portion shows no more sulfate than corresponds to 0.2 mL of 0.020 N sulfuric acid (0.01%).

Limit of iron: not more than 20 ppm.

Citric acid solution—Prepare a 200 g citric acid per mL solution.

Iron standard solution—Transfer 0.863 g of ferric ammonium sulfate to a 500-mL volumetric flask, and dissolve in 25 mL of dilute sulfuric acid. Dilute with water to volume. Transfer 1.0 mL of the resulting solution to a 10-mL volumetric flask, and dilute with water to volume. Transfer 2.5 mL of this resulting solution to a 50-mL volumetric flask, and dilute with water to volume. [NOTE—Prepare immediately before use.]

Test solution—Transfer 5 mL of the solution prepared for the test for *Appearance of solution* to a 10-mL volumetric flask, and dilute with water to volume.

Procedure—To 10 mL each of the *Iron standard solution* and the *Test solution* add 2.0 mL of the *Citric acid solution* and 0.1 mL of thioglycolic acid. Make alkaline to litmus with ammonia water, and dilute with water to 20 mL. After 5 minutes, any pink color in the *Test solution* is not more intense than that in the *Iron standard solution*.

Magnesium and alkaline-earth metals—To 200 mL of water add 0.1 g of hydroxylamine hydrochloride, 10 mL of pH 10.0 ammonia–ammonium chloride buffer (prepared by dissolving 5.4 g of ammonium chloride in 20 mL of water, adding 20 mL of ammonium hydroxide and diluting to 100 mL), 1 mL of 0.1 M zinc sulfate, and about 0.2 g of eriochrome black T trituration. Heat to about 40°. Titrate this solution (see *Titrimetry* ⟨541⟩) with 0.01 M edetate disodium VS until the violet color changes to deep blue. To this solution add 10.0 g of Potassium Bromide dissolved in 100 mL of water. If the color changes to violet, titrate the solution with 0.01 M edetate disodium VS to a deep blue endpoint. The volume of 0.01 M edetate disodium consumed in the second titration does not exceed 5.0 mL (0.02%, calculated as Ca).

Heavy metals, *Method I* ⟨231⟩**:** not more than 10 ppm.

In-Process Revision

Assay—

Nitric acid solution—Dilute 14 mL of nitric acid with water to 100 mL.

Ferric ammonium sulfate solution—Transfer 10 g of ferric ammonium sulfate to a 100-mL volumetric flask. Dissolve in and dilute with water to volume.

Procedure—Dissolve 2.000 g of Potassium Bromide in water, and dilute with water to 100.0 mL. To 10.0 mL of the solution add 50 mL of water, 5 mL of *Nitric acid solution,* 25.0 mL of silver nitrate VS, and 2 mL of dibutyl phthalate. Mix, and back titrate the excess silver nitrate with ammonium thiocyanate VS (see *Titrimetry* ⟨541⟩), using 2 mL of *Ferric ammonium sulfate solution* as the indicator, shaking vigorously towards the endpoint. Each mL of 0.1 M silver nitrate is equivalent to 11.90 mg of KBr. Calculate the percent content of Potassium Bromide, corrected for the chloride content, by the formula:

$$a - 3.357b,$$

in which a is the percent content of KBr and KCl obtained, calculated as KBr; and b is the percent content of chlorides.▲*USP29*

BRIEFING

Potassium Citrate Extended-Release Tablets, *USP 28* page 1590—See briefings under *Citric Acid, Magnesium Oxide, and Sodium Carbonate Irrigation* and *Assay for Citric Acid/Citrate and Phosphate* ⟨345⟩.

(DSN: L. Evans; D. Bempong) RTS—42196-15

Add the following:

▲**USP Reference standards** ⟨11⟩—*USP Citric Acid RS.*▲*USP29*

(Official January 1, 2009)

Change to read:

Assay—

~~*Standard preparation*—Dissolve a suitable quantity of citric acid, previously dried at 90° for 3 hours and accurately weighed, in water to obtain a solution having a known concentration of about 1.0 mg of anhydrous citric acid per mL.~~

▲*Mobile phase, Standard Preparation 1,* and *Chromatographic System*—Proceed as directed under *Assay for Citric Acid/Citrate and Phosphate* ⟨345⟩.▲*USP29*

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 200 mg of potassium citrate, to a 1000-mL volumetric flask, add about 300 mL of hot water, and shake by mechanical means for 15 minutes. Allow to cool, dilute with water to volume, and mix. Filter, discarding the first 30 mL of the filtrate. ~~Transfer 20.0 mL of the clear filtrate to a 25-mL volumetric flask, dilute with water to volume, and mix.~~

▲Transfer an aliquot of the clear filtrate into a suitable volumetric flask, and dilute with water and freshly prepared sodium hydroxide solution to obtain a solution containing about 20 µg per mL citrate in 1 mM sodium hydroxide.▲*USP29*

[NOTE—Reserve the remaining filtrate for the test for *Potassium content.*]

~~*Standard curve*—Pipet aliquots of 8, 9, 10, 11, and 12 mL, respectively, of the *Standard preparation* into separate 100-mL volumetric flasks, dilute with water to volume, and mix. These solutions contain about 0.08, 0.09, 0.10, 0.11, and 0.12 mg of anhydrous citric acid per mL, respectively. Continue as directed for *Procedure*. Plot the resultant absorbances versus the respective concentrations, in mg per mL, of the standard solutions.~~

~~*Procedure*—Pipet 1 mL of the *Assay preparation* into a suitable test tube. To a second test tube add 1.0 mL of water to serve as a reference blank. To each tube add 1.3 mL of pyridine, and mix by swirling. To one tube at a time add 5.7 mL of acetic anhydride, and mix, using a rotary vortex stirrer. Immediately place in a water bath maintained at 31 ± 1.0°, and allow the color to develop for 33 ± 1 minutes. Determine the absorbance against the reference blank in 2.5-cm cells at 425 nm, taking care to measure the absorbance of each solution at the same elapsed time from mixing. Calculate the quantity, in mg, of $C_6H_8K_2O_7$ in the portion of Tablets taken by the formula:~~

~~$$(306.40/192.13)(1250C),$$~~

~~in which 306.40 and 192.13 are the molecular weights of anhydrous potassium citrate and anhydrous citric acid, respectively, and C is the concentration, in mg per mL, of anhydrous citric acid read from the *Standard curve*.~~

In-Process Revision

▲*Procedure*—Proceed as directed for *Procedure* in ⟨345⟩, and calculate the quantity, in mg, of potassium citrate ($C_6H_5K_3O_7$) in the portion of Tablets taken by the formula:

$$0.001(306.39/189.10)C_S D(r_U / r_S),$$

in which 306.39 is the molecular weight of potassium citrate; 189.10 is the molecular weight of citrate ($C_6H_5O_7^{-3}$); C_S is the concentration, in µg per mL, of citrate in *Standard Preparation 1; D* is the dilution factor; and r_U and r_S are the citrate peak areas obtained from the *Assay preparation* and *Standard Preparation 1,* respectively.▲*USP29*

BRIEFING

Sodium Bromide—See briefing under *Potassium Bromide.*

(VET: I. DeVeau) RTS—41869-2

In-Process Revision

Add the following:

▲Sodium Bromide

Sodium bromide 102.89 [*7647-15-6*].

» Sodium Bromide contains not less than 98.0 percent and not more than 100.5 percent of NaBr, calculated on the dried basis. It contains no added substances.

Packaging and storage—Preserve in well-closed containers, and store at room temperature.

Appearance of solution: clear and colorless.

Test solution—Dissolve 10.0 g in carbon dioxide-free water, and dilute with the same solvent to 100 mL.

Identification—

A: A solution containing 4.0 mg of sodium bromide responds to the test for *Bromide* ⟨191⟩.

B: Responds to the test for *Sodium* ⟨191⟩.

Acidity or alkalinity—To 10 mL of the solution prepared for the test for *Appearance of solution,* add 0.1 mL of bromothymol blue TS: not more than 0.5 mL of 0.01 N hydrochloric acid or 0.01 N sodium hydroxide is required to change the color of this solution.

Loss on drying ⟨731⟩**—**Dry it at 100° to 105° for 3 hours: it loses not more than 3.0% of its weight.

Bromates—

Starch–mercuric iodide solution—Triturate 1.0 g of soluble starch with 5 mL of water, and pour the mixture into 100 mL of boiling water containing 10 mg of mercuric iodide.

Procedure—To 10 mL of the solution prepared for the test for *Appearance of solution* add 1 mL of *Starch–mercuric iodide solution,* 0.1 mL of a 100 g per L solution of potassium iodide, and 0.25 mL of 0.5 M sulfuric acid. Allow to stand protected from light for 5 minutes. No blue or violet color develops.

Limit of chlorine: not more than 0.6%.

Nitric acid solution and *Ferric ammonium sulfate solution*—Proceed as directed in the *Assay.*

Procedure—Dissolve 1.000 g Sodium Bromide in 20 mL of *Nitric acid solution* in a conical flask, add and mix 5 mL of 30 percent hydrogen peroxide, and heat in a water bath until the solution is colorless. Rinse the sides of the flask with a small quantity of water, and heat in a water bath for 15 minutes. Allow to cool, dilute with water to 50 mL, and add 5.0 mL of silver nitrate VS and 1 mL of dibutyl phthalate. Mix, and back titrate the excess silver nitrate with ammonium thiocyanate VS (see *Titrimetry* ⟨541⟩), using 5 mL of *Ferric ammonium sulfate solution* as the indicator. Perform a blank titration. Not more than 1.7 mL of silver nitrate VS is used.

Iodides—To 5 mL of the solution prepared for the test for *Appearance of solution* add 0.15 mL of a 10.5 g per 100 mL ferric chloride solution, and 2 mL of dichloromethane. Shake, and allow to separate. The lower layer is colorless.

Sulfates ⟨221⟩**—**A 2.0-g portion shows no more sulfate than corresponds to 0.2 mL of 0.020 N sulfuric acid (0.01%).

Limit of iron: not more than 20 ppm.

Citric acid solution—Prepare a 200 g citric acid per mL solution.

Iron standard solution—Transfer 0.863 g of ferric ammonium sulfate to a 500-mL volumetric flask, and dissolve in 25 mL of dilute sulfuric acid. Dilute with water to volume. Transfer 1.0 mL of the resulting solution to a 10-mL volumetric flask, and dilute with water to volume. Transfer 2.5 mL of this resulting solution a 50-mL volumetric flask, and dilute with water to volume. [NOTE—Prepare immediately before use.]

Test solution—Transfer 5 mL of the solution prepared for the test for *Appearance of solution* to a 10-mL volumetric flask, and dilute with water to volume.

Procedure—To 10 mL each of the *Iron standard solution* and the *Test solution* add 2.0 mL of the *Citric acid solution* and 0.1 ml of thioglycolic acid. Make alkaline to litmus with ammonia water, and dilute with water to 20 mL. After 5 minutes, any pink color in the *Test solution* is not more intense than that in the *Iron standard solution*.

Magnesium and alkaline-earth metals—To 200 mL of water add 0.1 g of hydroxylamine hydrochloride, 10 mL of pH 10.0 ammonia–ammonium chloride buffer (prepared by dissolving 5.4 g of ammonium chloride in 20 mL of water, adding 20 mL of ammonium hydroxide, and diluting to 100 mL), 1 mL of 0.1 M zinc sulfate, and about 0.2 g of eriochrome black T trituration. Heat to about 40°. Titrate this solution (see *Titrimetry* ⟨541⟩) with 0.01 M edetate disodium VS until the violet color changes to deep blue. To this solution add 10.0 g of Sodium Bromide dissolved in 100 mL of water. If the color changes to violet, titrate the solution with 0.01 M edetate disodium VS to a deep blue endpoint. The volume of 0.01 M edetate disodium consumed in the second titration does not exceed 5.0 mL (0.02%, calculated as Ca).

Heavy metals, *Method I* ⟨231⟩**:** not more than 10 ppm.

Assay—

Nitric acid solution—Dilute 14 mL of nitric acid with water to 100 mL.

Ferric ammonium sulfate solution—Transfer 10 g of ferric ammonium sulfate to a 100-mL volumetric flask. Dissolve in and dilute with water to volume.

Procedure—Dissolve 2.000 g of Sodium Bromide in water and dilute to 100.0 mL. To 10.0 mL of the solution add 50 mL of water, 5 mL of *Nitric acid solution,* 25.0 mL of silver nitrate VS, and 2 mL of dibutyl phthalate. Mix, and back titrate the excess silver nitrate with ammonium thiocyanate VS (see *Titrimetry* ⟨541⟩), using 2 mL of *Ferric ammonium sulfate solution* as the indicator, shaking vigorously

towards the endpoint. Each mL of 0.1 M silver nitrate is equivalent to 10.29 mg of KBr. Calculate the percent content of Sodium Bromide, corrected for the chloride content, by the formula:

$$a - 2.902b,$$

in which a is the percent content of NaBr and NaCl obtained, calculated as NaBr; and b is the percent content of chlorides. ▲*USP29*

BRIEFING

Technetium ^{99m}Tc Fanolesomab Injection. Because there is no existing *USP* monograph for this article, a new monograph is being proposed.

(PA5: A.Wilk) RTS—42148-1

Add the following:

▲Technetium ^{99m}Tc Fanolesomab Injection

» Technetium ^{99m}Tc Fanolesomab Injection is a sterile, nonpyrogenic preparation of anti-CD15 antibody, a partially reduced murine IgM monoclonal antibody that is labeled with ^{99m}Tc and is suitable for intravenous administration. It may contain reducing agents, buffers, and stabilizers. It contains no antimicrobial agents. Other chemical forms of radioactivity do not exceed 10 percent of the total radioactivity. *[Caution—Components of the commercial kit that are used to prepare the Injection are not to be administered directly to the patient.]*

Packaging and storage—Preserve in single-dose containers.

Labeling—Label it to include the following, in addition to the information specified for *Labeling* under *Injections* ⟨1⟩: the time and date of calibration; the amount of ^{99m}Tc as labeled fanolesomab expressed in MBq (or mCi) per mL at the time of calibration; the expiration date and time; the storage temperature; and the statement "Caution—Radioactive Material". The labeling indicates that the radioactive half-life of ^{99m}Tc is 6.0 hours and that, in making dosage calculations, correction is to be made for radioactive decay. The labeling also states that the Injection is to be used within 6 hours following constitution.

USP Reference standards ⟨11⟩**—***USP Endotoxin RS*.

Bacterial endotoxins ⟨85⟩**:** not more than 0.1 Endotoxin Unit per µg of fanolesomeb in the prepared Injection.

pH ⟨791⟩**:** between 5.8 and 6.6.

Particulate matter ⟨788⟩—It meets the requirements for particulate matter specified for small-volume injections.

Radiochemical purity—

SYSTEM 1: *(free pertechnetate ^{99m}Tc)*

Adsorbent: instant thin-layer chromatography (ITLC) strips[1], heat-treated at 110° for 30 minutes.

Test solution—Use the Injection.

Application volume—Apply 3 µL of the *Test solution* to the origin.

[1] ITLC strips for free pertechnetate 99mTc may be obtained from Sunset Scientific Strips LLC (product number 10503), P.O. Box: 3895, Albuquerque, NM 87190-3895.

In-Process Revision

Developing solvent system: methyl ethyl ketone (MEK).

Procedure—Apply the *Test solution* about 2 cm from the bottom of the *Adsorbent* strip. Immediately develop by ascending chromatography (see *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩) until the solvent front has moved about 7.5 cm from the origin. The radiochemical impurity, free pertechnetate ^{99m}Tc, migrates to the top section, while colloidal ^{99m}Tc and technetium ^{99m}Tc fanolesomab remains near the origin on the bottom section. Allow the chromatogram to air-dry. Determine the distribution of radioactivity on the chromatogram by cutting the developed strip at 4 cm from the bottom and then separately measuring and recording the net radioactivity in the top and bottom sections using a suitable radiation detector. Calculate the percentage of free pertechnetate ^{99m}Tc in the Injection by the formula:

$$100\,A_T / (A_T + A_B),$$

in which A_T is the radioactivity measured on the top section; and A_B is the radioactivity measured on the bottom section.

SYSTEM 2: *(colloidal ^{99m}Tc)*

Adsorbent—Use affinity thin-layer chromatography (ATLC) strips[2] that have been soaked in a solution of 50% newborn calf serum (NBCS)[3] in water and allowed to air-dry overnight.

Test solution—Use the Injection.

Developing solvent system: 4% alcohol in 0.3 M sodium chloride.

Application volume—Prespot the point of origin with 3 µL of *Developing solvent system* followed immediately by 3 µL of the *Test solution*.

Procedure—Apply the *Test solution* about 2 cm from the bottom of the *Adsorbent* strip. Immediately develop the strip by ascending chromatography (see *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩) until the solvent front has moved about 7.5 cm above the origin. The radiochemical impurity, colloidal ^{99m}Tc, will remain at the origin, while free pertechnetate ^{99m}Tc and technetium ^{99m}Tc fanolesomab migrate close to the solvent front. Remove the strip, and allow to air-dry. Cut the strip 4 cm from the bottom, and separately measure and record the background-corrected radioactivity found in the top and bottom sections, using a suitable radiation detector. Calculate the percentage of colloidal ^{99m}Tc by the formula:

$$100\,A_B / (A_B + A_T),$$

in which A_B is the radioactivity measured in the bottom section; and A_T is the radioactivity measured in the top section. The sum of the result for free pertechnetate ^{99m}Tc in *System 1* and for colloidal ^{99m}Tc measured in *System 2* is not more than 10%.

Immunoreactivity—

Adsorbent—Use affinity thin-layer chromatography (ATLC) strips[2] that have been soaked in a solution of 50% newborn calf serum (NBCS)[3] in water and allowed to air-dry overnight.

Diluent—Prepare a mixture of NBCS and pH 7.4 phosphate-buffered saline (PBS) (1 : 1).

Test solution—Use the Injection diluted with *Diluent* (1 in 4).

[2] ATLC strips for colloidal 99mTc may be obtained from Sunset Scientific Strips LLC (product number 10506), P.O. Box: 3895, Albuquerque, NM 87190-3895.

[3] NBCS (heat inactivated) may be obtained from GIBCO/Invitrogen Corp. (catalog number 26010-074), 1600 Faraday Avenue, P.O. Box 6482, Carlsbad, CA 92008

REFERENCE MATERIALS—

Positive control: CD15 positive HL-60 (ATCC No. CCL240) formalin fixed-cell suspension (12×10^6 cells per mL).

Negative control: CD15 negative Raji (ATCC No. CCL86) formalin fixed-cell suspension (12×10^6 cells per mL).

Application volume—Thaw, and mix the HL-60 and Raji cell stock suspensions. Dispense 90-µL aliquots into individual incubation tubes. Add 3 µL of the *Test solution* to each incubation tube, and mix on a vortex mixer for 5 seconds. Incubate for 30 minutes with gentle rocking at $37 \pm 2°$.

Developing solvent system—Prepare a solution containing 0.05% sodium azide and 4% alcohol in 10 mM phosphate-buffered saline, pH 7.4 (PBS). Pass through a filter having a porosity of 0.22 µm.

Procedure—Mix each incubation tube on a vortex mixer. Immediately remove, and apply 10 µL of sample to the origin of the *Adsorbent* ATLC strip (2 cm from bottom). Allow the sample to adsorb onto the strip, and immediately develop the strip by ascending chromatography (see *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩) until the solvent front has moved about 7.5 cm from the origin. Remove the strips, and allow to air-dry. Cut both strips 4 cm above the origin. Separately measure and record the background-corrected radioactivity found on the top and bottom sections of each strip, using a suitable radiation detector. Immunoreactive technetium ^{99m}Tc fanolesomab, bound to the HL-60 cells, remains at the origin, while nonbound forms of ^{99m}Tc migrate away from the origin. Nonspecific binding is measured using the Raji negative control cells. Calculate the specific immunoreactive binding by the formula:

$$[100A_{B(HL\text{-}60)}/(A_{B(HL\text{-}60)} + A_{T(HL\text{-}60)})] - [100A_{B(Raji)}/(A_{B(Raji)} + A_{T(Raji)})],$$

in which $A_{B(HL\text{-}60)}$ and $A_{B(Raji)}$ are the radioactivity of the HL-60 positive control cells and Raji negative control cells, respectively, measured on the bottom section of each strip; and $A_{T(HL\text{-}60)}$ and $A_{T(Raji)}$ are the radioactivity of the HL-60 positive control cells and Raji negative control cells measured on the top section of each strip. A minimum specific immunoreactive binding of 40% is required for the CD15-positive HL-60 cells.

Other requirements—It meets the requirements for *Radionuclide identification* and *Radionuclidic purity* under *Sodium Pertechnetate Tc 99m Injection*. It also meets the requirements under *Injections* ⟨1⟩, except that it may be distributed or dispensed prior to completion of the test for *Sterility,* the latter test being started on the date of manufacture.

Assay for radioactivity ⟨821⟩**—**Using a suitable counting assembly (see *Selection of a Counting Assembly*), determine the radioactivity, in MBq (or mCi) per mL, of Injection by use of a calibrated system.▲*USP29*

BRIEFING

Terbutaline Sulfate Inhalation Aerosol, *USP 28* page 1869. It is proposed to revise the *USP Reference standards* section and the *Assay* to reflect the availability of USP Terbutaline Related Compound A RS (3,5-dihydroxy-ω-*tert*-butylaminoacetophenone sulfate). In addition, minor editorial style changes have been made. Please note that the revisions proposed for this monograph in *PF* 26(3) [May–June 2000] have been canceled.

(AER: K. Zaidi) RTS—42069-1

In-Process Revision

Change to read:

USP Reference standards ⟨11⟩—*USP Terbutaline Sulfate RS.*

▲*USP Terbutaline Related Compound A RS.*▲*USP29*

Change to read:

Assay—

Mobile phase—Prepare a solution containing 750 mL of water, 140 mL of methanol, 110 mL of tetrahydrofuran, and 1.08 g of sodium 1-octanesulfonate. Filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—Dissolve suitable quantities of USP Terbutaline Sulfate RS and ~~3,5-dihydroxy-ω-*tert*-butylaminoacetophenone sulfate~~

▲USP Terbutaline Related Compound A RS▲*USP29*
in water to obtain a solution containing about 50 µg per mL and 20 µg per mL, respectively.

Standard preparation—Dissolve an accurately weighed quantity of USP Terbutaline Sulfate RS in water to obtain a solution having a known concentration of about 0.3 mg per mL.

Assay preparation—Accurately weigh not fewer than three containers, and separately perform the following procedure for each of the units. Chill in a dry ice–acetone mixture to about –75° for 15 to 20 minutes. Quickly and carefully remove the top of the container with a tube cutter. Allow the propellants to evaporate at room temperature for 10 to 15 minutes. [NOTE—Avoid complete evaporation of the propellants.] Quantitatively transfer the suspension to a 500-mL separatory funnel with the aid of chloroform. Wash all parts of the container alternately with several small portions of chloroform followed by small portions of 0.01 N sulfuric acid. Transfer the washings to the separatory funnel, and adjust the phase volumes to about 100 mL each with chloroform and 0.01 N sulfuric acid, respectively. Dry the container and all of its parts at 105° for 1 hour. Cool to room temperature, and weigh. Shake the separatory funnel for 1 minute, allow the phases to separate, and discard the chloroform layer. Pass the acidic aqueous phase through filter paper into a 250-mL volumetric flask. Wash the separatory funnel with two 10-mL portions of water, and transfer the washings to the volumetric flask. Dilute with water to volume, mix, and filter, discarding the first 2 mL of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector, a 0.5-µm precolumn, and a 6.2-mm × 8-cm column that contains 3-µm packing L7. The column temperature is maintained at 40°. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about ~~0.83 and 1.0~~

▲1.0 and 0.83▲*USP29*
for terbutaline and ~~3,5-dihydroxy-ω-*tert*-butylaminoacetophenone~~

▲terbutaline related compound A,▲*USP29*
respectively; and the resolution, *R,* between terbutaline sulfate and ~~3,5-dihydroxy-ω-*tert*-butylaminoacetophenone~~

▲terbutaline related compound A▲*USP29*
is not less than 1.6. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of terbutaline sulfate $[(C_{12}H_{19}NO_3)_2 \cdot H_2SO_4]$ in each container taken by the formula:

$$250C(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Terbutaline Sulfate RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and *Standard preparation,* respectively.

BRIEFING

Tetracaine Hydrochloride, *USP 28* page 1881. It is proposed to revise *Identification* test *A* to clarify the preparation of the *Buffer No. 6, 10 percent, pH 6.0.* This buffer is prepared according to the instructions in *Phosphate Buffers and Other Solutions* under *Antibiotics—Microbial Assays* ⟨81⟩. For the purposes of this *Identification* test, it is not necessary to sterilize the buffer.

(PA1: K. Russo) RTS—42212-1

A: *Ultraviolet Absorption* ⟨197U⟩—

Solution—~~Prepare the test solution as follows. Dissolve about 50 mg, accurately weighed, in water to make 250.0 mL. Pipet 5 mL of this solution into a 100-mL volumetric flask, add 2 mL of *Buffer No. 6,* 10 percent, pH 6.0 (see *Phosphate Buffers* ⟨81⟩), then dilute with water to volume, and mix.~~

▲Prepare the test solution as follows. Dissolve about 50 mg, accurately weighed, in water to make 250.0 mL. Pipet 5 mL of this solution into a 100-mL volumetric flask, add 2 mL of *Buffer No. 6, 10 percent, pH 6.0* (see *Antibiotics—Microbial Assays* ⟨81⟩), then dilute with water to volume, and mix. For the purposes of this test, *Buffer No. 6, 10 percent, pH 6.0* does not have to be sterilized.▲*USP29*

Absorptivities at 310 nm, calculated on the anhydrous basis, do not differ by more than 2.0%.

B: Dissolve 100 mg in 10 mL of water, and add 1 mL of potassium thiocyanate solution (1 in 4): a crystalline precipitate is formed. Recrystallize the precipitate from water, and dry at 80° for 2 hours: it melts between 130° and 132°.

C: A solution of 100 mg in 5 mL of water meets the requirements of the tests for *Chloride* ⟨191⟩.

In-Process Revision

BRIEFING

Thalidomide, *USP 28* page 1893. On the basis of comments received, it is proposed to revise the calculation in the test for *Chromatographic purity* to include a factor to convert the value obtained to percent.

(PA6: L. Evans) RTS—42247-1

Change to read:

Chromatographic purity—

Solution A—Prepare a filtered and degassed mixture of water, acetonitrile, and phosphoric acid (95 : 5 : 0.1).

Solution B—Prepare a filtered and degassed mixture of water, acetonitrile, and phosphoric acid (85 : 15 : 0.1).

Diluent—Prepare a mixture of water, acetonitrile, and phosphoric acid (50 : 50 : 0.1).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Phthalic acid stock solution—Transfer about 100 mg of phthalic acid to a 100-mL volumetric flask, dissolve in a mixture of acetonitrile and water (80 : 5), and dilute with acetonitrile to volume. Mix, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a concentration of about 0.1 mg per mL.

Standard stock solution—Dissolve, with the aid of sonication, an accurately weighed quantity of USP Thalidomide RS in acetonitrile to obtain a solution having a known concentration of about 1 mg per mL.

Standard solution—Pipet 2.0 mL of the *Standard stock solution* and 2.0 mL of the *Phthalic acid stock solution* into a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. Pipet 10.0 mL of this solution into a 100-mL volumetric flask, add 10.0 mL of phosphoric acid solution (1 in 100), dilute with water to volume, and mix to obtain a solution having a known concentration of about 0.0002 mg of phthalic acid per mL.

Test solution—Transfer about 100 mg of Thalidomide, accurately weighed, to a 50-mL volumetric flask, and dissolve, with the aid of sonication, in 40 mL of a mixture of water, acetonitrile, and phosphoric acid (50 : 50 : 0.1). Dilute with *Diluent* to volume, and mix. Pipet 10.0 mL of this solution into a 100-mL volumetric flask, add 10.0 mL of phosphoric acid solution (1 in 100), dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 218-nm detector and a 3.9-mm × 15-cm column that contains 4-µm packing L1. The flow rate is about 2 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibration
0–15	100→50	0→50	linear gradient
15–20	50→100	50→0	linear gradient
20–30	100	0	isocratic

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.35 for phthalic acid and about 1.0 for thalidomide; the tailing factor for the phthalic acid and thalidomide peaks is not more than 2.0; and the relative standard deviation determined from the phthalic acid peak for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 200 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Calculate the percentage of each impurity in the portion of Thalidomide taken by the formula:

~~$500(C_P / W)(r_i / r_P)$,~~

$$\blacktriangle 50{,}000(C_P / W)(r_i / r_P), \blacktriangle_{USP29}$$

in which C_P is the concentration, in mg per mL, of phthalic acid in the *Standard solution; W* is the amount, in mg, of Thalidomide taken to prepare the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_P is the phthalic acid peak response obtained from the *Standard solution:* not more than 0.1% of any individual impurity is found; and not more than 0.3% of total impurities is found.

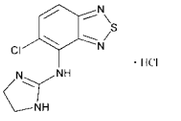
BRIEFING

Tizanidine Hydrochloride; Tizanidine Tablets. Because there are no existing *USP* monographs for this drug substance and dosage form, new monographs are being proposed. The liquid chromatographic procedures in the *Assay* are based on analyses performed with a Luna C8 brand of L7 column. The retention time for tizanidine is about 6.7 minutes. The liquid chromatographic procedures in the test for *Related compounds* are based on analyses performed with a Symmetry C18 brand of L1 column. The retention time for tizanidine is about 5.5 minutes.

(PA3: R. Ravichandran) RTS—40316-3; 41493-1

Add the following:

▲Tizanidine Hydrochloride



$C_9H_8ClN_5S \cdot HCl$ 290.17

2,1,3-Benzothiadiazol-4-amine, 5-chloro-*N*-(4,5-dihydro-1*H*-imidazol-2-yl)-, monohydrochloride.

In-Process Revision

5-Chloro-4-(2-imidazolin-2-ylamino)-2,1,3-benzothiadiazole monohydrochloride [*64461-82-1*].

» Tizanidine Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of $C_9H_8ClN_5S \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers, and store at room temperature.

USP Reference standards ⟨11⟩**—***USP Tizanidine Hydrochloride RS. USP Tizanidine Related Compound A RS. USP Tizanidine Related Compound B RS. USP Tizanidine Related Compound C RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

pH ⟨791⟩**:** between 4.3 and 5.3, in a 1% (w/v) solution.

Loss on drying ⟨731⟩**—**Dry about 0.5 g of sample at 105° for 3 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Heavy metals ⟨231⟩**:** 0.002%.

Related compounds—

Phosphoric acid solution—Transfer 6.0 mL of phosphoric acid to a 50-mL volumetric flask, and dilute with water to volume.

Buffer solution—Dissolve about 3.5 g of sodium 1-pentanesulfonate in 1000 mL of water, and adjust with *Phosphoric acid solution* or 1 N sodium hydroxide to a pH of 3.0 ± 0.05.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (80 : 20). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Tizanidine related compound A solution—Dissolve an accurately weighed quantity of USP Tizanidine Related Compound A RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.1 mg per mL.

Tizanidine related compound B solution—Dissolve an accurately weighed quantity of USP Tizanidine Related Compound B RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.1 mg per mL.

Tizanidine related compound C solution—Dissolve an accurately weighed quantity of USP Tizanidine Related Compound C RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.1 mg per mL.

Resolution solution—Transfer about 23 mg of USP Tizanidine Hydrochloride RS to a 100-mL volumetric flask, add 20 mL of *Mobile phase* and 10 mL each of *Tizanidine related compound A solution, Tizanidine related compound B solution,* and *Tizanidine related compound C solution.* Sonicate to dissolve the USP Tizanidine Hydrochloride RS, and dilute with *Mobile phase* to volume.

Standard solution—Dissolve an accurately weighed quantity of USP Tizanidine Hydrochloride RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.046 mg per mL.

Test solution—Transfer about 57 mg of Tizanidine Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 50°. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the relative retention times are given in *Table 1;* the resolution, *R,* between tizanidine and tizanidine related compound C is not less than 4.0, and the resolution, *R,* between tizanidine and tizanidine related compound B is not less than 4.0. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 5000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major analyte peaks, disregarding the peaks due to the solvent. Calculate the percentage of each impurity in the portion of Tizanidine Hydrochloride taken by the formula:

$$(253.71/290.17)5000(C/W)F(r_i/r_S),$$

in which 253.71 and 290.17 are the molecular weights of tizanidine and tizanidine hydrochloride, respectively; *C* is the concentration, in mg per mL, of USP Tizanidine Hydrochloride RS in the *Standard solution; W* is the weight, in mg, of sample taken to prepare the *Test solution; F* is the relative response factor and is given in *Table 1;* r_i is the peak area for each impurity obtained from the *Test solution;* and r_S is the peak area of tizanidine obtained from the *Standard solution.* The limits for the impurities are specified in *Table 1.*

Table 1.

Compound Name	Relative Retention Time	Relative Response Factor	Limit (%)
Tizanidine related compound C	about 0.8	1.0	0.1
Tizanidine	1.0	—	—
Tizanidine related compound B	about 1.4	0.9	0.1
Tizanidine related compound A	about 10.2	0.9	0.1
Individual unknown	—	1.0	0.1
Total	—	—	0.3

In-Process Revision

Organic volatile impurities ⟨467⟩**:** meets the requirements.

Content of chloride—Dissolve about 500 mg, accurately weighed, in 50 mL of water. Titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of chloride. Not less than 11.9% and not more than 12.5%, calculated on the dried basis, is found.

Assay—

Buffer solution—Dissolve 6.8 g of monobasic potassium phosphate in 1000 mL of water, and adjust with 5.3 N potassium hydroxide to a pH of 7.5 ± 0.05.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (1 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability preparation—Dissolve suitable quantities of USP Tizanidine Hydrochloride RS and USP Tizanidine Related Compound C RS in *Mobile phase*, and dilute quantitatively and stepwise if necessary, with *Mobile phase* to obtain a solution containing about 0.00012 mg per mL and 0.046 mg per mL, respectively.

Standard preparation—Dissolve an accurately weighed quantity of USP Tizanidine Hydrochloride RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.046 mg per mL.

Assay preparation—Transfer about 23 mg of Tizanidine Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 15-cm column that contains packing L7. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 35°. Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.5 for tizanidine related compound C and 1.0 for tizanidine; the resolution, *R,* between tizanidine and tizanidine related compound C is not less than 13.0; and the tailing factor for the tizanidine peak is not more than 1.6. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_9H_8ClN_5S \cdot HCl$ in the portion of Tizanidine Hydrochloride taken by the formula:

$$500C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Tizanidine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP29*

In-Process Revision

BRIEFING

Tizanidine Tablets—See briefing under *Tizanidine Hydrochloride*. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with a Symmetry C18 brand of L1 column. The retention time for tizanidine is about 5.5 minutes.

(PA3: R. Ravichandran) RTS—40316-2

Add the following:

▲Tizanidine Tablets

» Tizanidine Tablets contain Tizanidine Hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of tizanidine ($C_9H_8ClN_5S$).

Packaging and storage—Preserve in tight containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Tizanidine Hydrochloride RS. USP Tizanidine Related Compound A RS. USP Tizanidine Related Compound B RS. USP Tizanidine Related Compound C RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩**—**[To come.]

Related compounds—

Phosphoric acid solution, Buffer solution, Mobile phase, Tizanidine related compound A solution, Tizanidine related compound B solution, Tizanidine related compound C solution, Resolution solution, and *Chromatographic system—*Proceed as directed in the *Assay.*

*Standard solution—*Prepare as directed for the *Standard preparation* in the *Assay.*

*Test solution—*Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg of tizanidine, to a 100-mL volumetric flask, add about 50 mL of *Buffer solution,* sonicate for about 15 minutes with occasional shaking, and shake on a shaker for 15 minutes. Add 20 mL of acetonitrile, and mix. Allow to cool, dilute with *Buffer solution* to volume, and mix. Centrifuge a portion of this solution at 2000 rpm or higher for 10 minutes. Pass a portion of this solution through a filter having a 45-µm or finer porosity, and use the filtrate.

*Procedure—*Inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major analyte peaks, disregarding the peaks due to the solvent. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$(253.71/290.17)10{,}000(C/W)(A/D)F(r_i/r_s),$$

in which 253.71 and 290.17 are the molecular weights of tizanidine and tizanidine hydrochloride, respectively; C is the concentration, in mg per mL, of USP Tizanidine Hydrochloride RS in the *Standard solution; A* is the average weight, in mg, of each Tablet; D is the labeled dose, in mg, of tizanidine per Tablet; W is the weight, in mg, of sample taken to prepare the *Test solution; F* is the relative response factor and is given in *Table 1;* r_i is the peak area for each impurity obtained from the *Test solution;* and r_s is the peak area of tizanidine in the *Standard solution*. The limits for the impurities are specified in *Table 1.*

In-Process Revision

Table 1.

Compound Name	Relative Retention Time	Relative Response Factor	Limit (%)
Tizanidine related compound C	about 0.8	1.0	0.2
Tizanidine	1.0	—	—
Tizanidine related compound B	about 1.4	0.9	0.2
Tizanidine Related compound A	about 10.2	0.9	0.2
Individual unknown	—	1.0	0.2
Total	—	—	0.5

Assay—

Phosphoric acid solution—Dilute 6 mL of phosphoric acid with water to make 50 mL of solution.

Buffer solution—Dissolve about 3.5 g of sodium 1-pentanesulfonate in 1000 mL of water. Adjust with *Phosphoric acid solution* or 1 N sodium hydroxide to a pH of 3.0 ± 0.05.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (80 : 20). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Tizanidine related compound A solution—Dissolve an accurately weighed quantity of USP Tizanidine Related Compound A RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.1 mg per mL.

Tizanidine related compound B solution—Dissolve an accurately weighed quantity of USP Tizanidine Related Compound B RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.1 mg per mL.

Tizanidine related compound C solution—Dissolve an accurately weighed quantity of USP Tizanidine Related Compound C RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.1 mg per mL.

Resolution solution—Transfer about 23 mg of USP Tizanidine Hydrochloride RS to a 100-mL volumetric flask, add 20 mL of *Mobile phase* and 10 mL each of *Tizanidine related compound A solution, Tizanidine related compound B solution,* and *Tizanidine related compound C solution.* Sonicate to dissolve the USP Tizanidine Hydrochloride RS, and dilute with *Mobile phase* to volume.

Standard preparation—Dissolve an accurately weighed quantity of USP Tizanidine Hydrochloride RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.046 mg per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg of tizanidine, to a 500-mL volumetric flask, add about 250 mL of *Buffer solution,* sonicate for about 15 minutes with occasional shaking,

and shake on a shaker for 15 minutes. Add 100 mL of acetonitrile, and mix. Allow to cool, dilute with *Buffer solution* to volume, and mix. Centrifuge a portion of this solution at 2000 rpm or higher for 10 minutes. Pass a portion of this solution through a filter having a 45-µm or finer porosity, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 50°. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the relative retention times are given in *Table 1*; the resolution, *R,* between tizanidine and tizanidine related compound C is not less than 4.0, and the resolution, *R,* between tizanidine and tizanidine related compound B is not less than 4.0. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 5000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of tizanidine ($C_9H_8ClN_5S$) in the portion of Tablets taken by the formula:

$$(253.71/290.17)500C(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Tizanidine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP29*

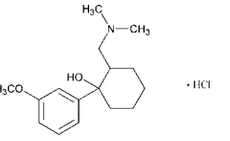
BRIEFING

Tramadol Hydrochloride. Because there is no existing *USP* monograph for this article, the following new monograph, which is based on submitted data, is being proposed. The liquid chromatographic procedure in the test for *Related compounds* is based on analyses performed with a LiChrospher 60 RP-select B brand of L1 column. The typical retention time for tramadol is about 16 minutes. The gas chromatographic procedure in the test for *Limit of isopropyl alcohol* is based on analyses performed with an Rtx-1301 brand of G43 column. The typical retention time for isopropyl alcohol is about 11 minutes.

(PA2: D. Bempong; NL: W. Paul; PSD: C. Okeke) RTS—37475-1; 37658-1

Add the following:

▲Tramadol Hydrochloride



$C_{16}H_{25}NO_2 \cdot HCl$ 299.84

(±)-*cis*-2-[(Dimethylamino)methyl]-1-(3-methoxyphenyl) cyclohexanol hydrochloride.

(±)-*cis*-2-[(Dimethylamino)methyl]-1-(*m*-methoxyphenyl) cyclohexanol hydrochloride [*36282-47-0*].

» Tramadol Hydrochloride contains not less than 99.0 percent and not more than 101.0 percent of $C_{16}H_{25}NO_2 \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Tramadol Hydrochloride RS. USP Tramadol Related Compound A RS. USP 2-(dimethylaminomethyl)-1-cyclohexanone hydrochloride RS.*

In-Process Revision

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: An aqueous solution (1 in 100) meets the requirements of the test for *Chloride* ⟨191⟩.

Acidity—Dissolve 1 g in 20 mL of water. To each of two 5-mL portions of this solution, add 5 mL of water and 0.1 mL of methyl red TS. When 0.25 mL of 0.01 N sodium hydroxide is added to one portion, a yellow color is produced; and when 0.25 mL of 0.01 N hydrochloric acid is added to the other portion, a red color is produced.

pH ⟨791⟩**:** between 5.0 and 6.5, in a solution (1 in 100).

Loss on drying ⟨731⟩**—**Dry it at 105° to constant weight: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Heavy metals, *Method I* ⟨231⟩**:** 0.001%.

Limit of isopropyl alcohol—

Internal standard stock solution—Accurately weigh about 200 mg of *n*-propyl alcohol into a 20-mL volumetric flask containing about 15 mL of water, dilute with water to volume, and mix.

Internal standard solution—Transfer 2 mL of *Internal standard stock* solution to a 200-mL volumetric flask containing about 150 mL of water, dilute with water to volume, and mix.

Standard stock solution—Dissolve an accurately weighed quantity of isopropyl alcohol in *Internal standard solution*, and dilute quantitatively, and stepwise if necessary, with *Internal standard solution* to obtain a solution having a concentration of about 1.0 mg per mL.

Standard solution—Transfer 4 mL of the *Standard stock solution* to a 20-mL volumetric flask, and dilute with *Internal standard solution* to volume. Transfer 1 mL of the solution to a headspace vial, seal immediately, and mix gently.

Test solution—Transfer about 100 mg of Tramadol Hydrochloride, accurately weighed, to a headspace vial, add 1 mL of *Internal standard solution,* seal immediately, and mix gently.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a headspace sampler, and a 0.53-mm × 60-m fused silica column that contains 3-µm packing G43. The injection port is maintained at a temperature of about 140°; the column temperature is maintained at about 35° for 10 minutes, then increased by 10° per minute to 220° and maintained at 220° for 6 minutes; and the detector temperature is maintained at about 260°. The carrier gas is helium with a split flow (1 : 1) and a flow rate of 4.0 mL per minute. The headspace conditions are as follows. Incubation temperature is about 80°, incubation time is 30 minutes, syringe heater temperature is about 85°, sample volume is about 1 mL, fill speed is about 100 µL per second, and injection speed is about 2 mL per second. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.0 for isopropyl alcohol and 1.3 for *n*-propyl alcohol; the resolution, *R,* between isopropyl alcohol and *n*-propyl alcohol is not less than 10.0; and the relative standard deviation, determined from the peak area ratio of isopropyl alcohol to *n*-propyl alcohol for three injections of the *Standard solution,* is not more than 2.0%.

Procedure—Inject the *Standard solution* and the *Test solution* into the gas chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of isopropyl alcohol in the portion of Tramadol Hydrochloride taken by the formula:

$$100(C/W)(R_U/R_S),$$

in which C is the concentration, in mg per mL, of isopropyl alcohol in the *Standard solution; W* is the weight, in mg, of Tramadol Hydrochloride taken to prepare the *Test solution;*

In-Process Revision

and R_U and R_S are the ratios of the peak responses of the corresponding isopropyl alcohol and internal standard peaks obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.2% of isopropyl alcohol is found.

Limit of 2-(dimethylaminomethyl)-1-cyclohexanone hydrochloride—

Adsorbent—0.25-mm layer of chromatographic silica gel mixture.

Test solution—Transfer about 500 mg of Tramadol Hydrochloride, accurately weighed, into a 10-mL volumetric flask, and dilute with methanol to volume.

Standard solution—Dissolve an accurately weighed quantity of USP 2-(dimethylaminomethyl)-1-cyclohexanone hydrochloride RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a concentration of about 0.05 mg per mL.

Developing solvent system—Prepare a mixture of toluene, isopropyl alcohol, and 25% ammonia water (80 : 19 : 1).

Sodium nitrite solution—Dissolve about 2.5 g of sodium nitrite, accurately weighed, in 50 mL of water.

Procedure—Apply separately about 10 µL of the *Test solution* and the *Standard solution* to the plate, and develop the plate until the solvent front is 10 cm above the line of application. Remove the plate, spray with Dragendorff's TS, and air-dry for 5 minutes. Spray the dried plate with *Sodium nitrite solution* until the spot from 2-(dimethylaminomethyl)-1-cyclohexanone hydrochloride in the *Standard solution* is visible. Any secondary spot in the chromatogram obtained from the *Test solution* corresponding to 2-(dimethylaminomethyl)-1-cyclohexanone hydrochloride is not more intense than a corresponding spot in the chromatogram obtained from the *Standard solution* (0.1%).

Related compounds—

Solution A—Dissolve 5 mL of perchloric acid in 950 mL of water in a 1-L volumetric flask, add 4 mL of 25% ammonia water, dilute with water to volume, and mix. Adjust with 25% ammonia water to a pH of 2.2 ± 0.2 . Filter and degas.

Solution B—Prepare a filtered and degassed solution of acetonitrile and water (9 : 1).

Diluent—Prepare a mixture of *Solution A* and acetonitrile (77 : 23).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—Prepare a solution in *Diluent* containing 4 µg of USP Tramadol Hydrochloride RS and 4 µg of USP Tramadol Hydrochloride Related Compound A RS per mL.

Standard solution—Dissolve an accurately weighed quantity of USP Tramadol Hydrochloride RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 4 µg per mL.

System sensitivity solution—Transfer 2 mL of *Standard solution* into a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Test solution—Transfer about 200 mg of Tramadol Hydrochloride, accurately weighed, to a 50-mL volumetric flask; dissolve in and dilute with *Diluent* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 273-nm detector and a 4.0-mm × 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	77	23	equilibration
0–10	77	23	isocratic
10–30	77→33	23→67	linear gradient
30–35	33	67	isocratic
35–37	33→77	67→23	linear gradient
37–50	77	23	isocratic

Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between tramadol and tramadol related compound A is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0% for each compound. Chromatograph the *System sensitivity solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 10%.

Procedure—Inject a volume (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Tramadol Hydrochloride taken by the formula:

$$5(C/W)(1/F)(r_i / r_S),$$

in which C is the concentration, in µg per mL, of USP Tramadol Hydrochloride RS in the *Standard solution; W* is the weight, in mg, of Tramadol Hydrochloride taken to prepare the *Test solution; F* is the relative response factor (see the accompanying table for values); r_i is the peak response obtained for each individual impurity in the *Test solution*; and r_S is the peak response for tramadol in the *Standard solution*. The limits of impurities are specified in the accompanying table.

Compound	Relative Retention Time	Relative Response Factor (*F*)	Limit (w/w, %)
RS,SR-1-(3-Methoxyphenyl)-2-(dimethylaminomethyl) cyclohexanol hydrochloride (Tramadol related compound A)	about 0.89	1.00	0.1
Tramadol hydrochloride	1.00	—	—
1-(3-Methoxyphenyl)-2-(dimethylaminomethyl) cyclohex-1-ene hydrochloride	about 1.50	1.00	0.1
1-(3-Methoxyphenyl)-2-(dimethylaminomethyl) cyclohex-6-ene hydrochloride	about 1.46	1.14	0.1
3-Bromoanisole	about 1.80	1.42	0.1
3,3′-Dimethoxybiphenyl	about 2.00	3.72	0.1
Anisole	about 1.40	1.90	0.1
3-Methoxyphenol	about 0.72	2.28	0.1
Individual unknown impurity	—	1.00	0.1
Total impurities	—	—	0.5

Assay—Transfer about 400 mg of Tramadol Hydrochloride, accurately weighed, to a suitable beaker, dissolve by stirring in 40 mL of mercuric acetate TS, and add 20 mL of glacial acetic acid. Titrate with 0.1 M perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1 M perchloric acid is equivalent to 29.984 mg of $C_{16}H_{25}NO_2 \cdot HCl$.▲*USP29*

BRIEFING

Tramadol Hydrochloride Tablets. Because there is no existing *USP* monograph for this article, the following new monograph, which is based on submitted data, is being proposed. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with the Symmetry brand of L7 column. The typical retention times for tramadol are about 8 minutes for the test for *Related compounds* and about 4 minutes for the *Assay.*

(PA2: D. Bempong; BPC: M. Marques; NL: W. Paul; PSD: C. Okeke) RTS—37475-2

Add the following:

▲Tramadol Hydrochloride Tablets

» Tramadol Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$).

Packaging and storage—Preserve in tight containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Tramadol Hydrochloride RS. USP Tramadol Related Compound A RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩—Accurately weigh powdered Tablets, equivalent to about 200 mg of tramadol hydrochloride, into a 50-mL volumetric flask, add 20 mL of dichloromethane, and sonicate. Filter, and transfer the clear supernatant to a separating funnel. Extract the dichloromethane layer with two 10-mL portions of 2 N sodium hydroxide, and discard the aqueous layer. Dry the dichloromethane layer over anhydrous sodium sulfate, and filter. Evaporate this solution to dryness under a stream of nitrogen.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩**—**

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 1: 100 rpm.

Time: 30 minutes.

Determine the amount of $C_{16}H_{25}NO_2 \cdot HCl$ dissolved by employing the following method.

Solution A and *Mobile phase*—Proceed as directed in the *Assay.*

Standard solution—Dissolve an accurately weighed quantity of USP Tramadol Hydrochloride RS in 0.1 N hydrochloric acid, and dilute quantitatively, and stepwise if necessary, with 0.1 N hydrochloric acid to obtain a solution having a known concentration of about 0.055 mg per mL.

Test solution—Withdraw 9 mL from the dissolution vessel, and pass through a 0.80-µm glass fiber filter. Discard the first 3 mL of the filtrate.

Chromatographic system—Proceed as directed in the *Assay.* Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

In-Process Revision

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the tramadol peak responses. Calculate the quantity, in mg, of $C_{16}H_{25}NO_2 \cdot HCl$ dissolved by the formula:

$$\frac{r_U \times C_S \times 900 \times 100}{r_S \times LC},$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of USP Tramadol Hydrochloride RS in the *Standard solution;* 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the tablet label claim in mg.

Tolerances—Not less than 80% (*Q*) of the labeled amount of $C_{16}H_{25}NO_2 \cdot HCl$ is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

Solution A, Mobile phase, and *Standard preparation*—Proceed as directed in the *Assay.*

Test preparation—Transfer one whole Tablet to a 100-mL volumetric flask, add 70 mL of 0.1 N hydrochloric acid, sonicate until the Tablet is completely disintegrated, and shake for 10 minutes. Dilute with 0.1 N hydrochloric acid to volume, and mix. Pass a portion of this solution through a suitable filter, discarding the first 20 mL of the filtrate. Transfer 10 mL of the clear filtrate into a 50-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix.

Chromatographic system—Proceed as directed in the *Assay.* Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the tramadol peak responses. Calculate the quantity, in mg, of $C_{16}H_{25}NO_2 \cdot HCl$ in the Tablet by the formula:

$$500C(r_U / r_S),$$

in which *C* is the concentration, in mg per mL, of USP Tramadol Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses of tramadol obtained from the *Test preparation* and the *Standard preparation,* respectively.

Related compounds—

Solution A and *Mobile phase*—Proceed as directed in the *Assay.*

Resolution solution—Dissolve accurately weighed quantities of USP Tramadol Hydrochloride RS and USP Tramadol Related Compound A RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.2 mg per mL USP Tramadol Hydrochloride RS and about 0.2 mg per mL USP Tramadol Related Compound A RS.

Standard solution—Dissolve an accurately weighed quantity of USP Tramadol Hydrochloride RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 6 µg per mL.

System sensitivity solution—Transfer 5 mL of the *Standard solution* into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to 200 mg of tramadol hydrochloride, into a 50-mL volumetric flask, add about 35 mL of *Mobile phase,* sonicate for about 5 minutes, and shake for 10 minutes. Dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a suitable filter, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 273-nm detector and a 3.9-mm × 15-cm column that contains packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution* and the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between tramadol related compound A and tramadol is not less than 2.0; and the relative standard deviation for replicate injections of the *Standard solution* is not more than 2.0%. Chromatograph the *System sensitivity solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 10%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$0.1(C_S/C_U)(1/F)(r_i/r_S),$$

in which C_S is the concentration, in µg per mL, of USP Tramadol Hydrochloride RS in the *Standard solution*; C_U is the concentration, in mg per mL, of tramadol hydrochloride in the *Test solution* based on the labeled quantity per tablet; F is the relative response factor (see the accompanying table for values); r_i is the peak response obtained for each individual impurity in the *Test solution;* and r_S is the peak response for tramadol in the *Standard solution*. [NOTE—Disregard any peak that is shown to be due to solvents or excipients.] The limits of impurities are specified in the accompanying table.

Compound Name	Relative Retention Time	Relative Response Factor (*F*)	Limit (w/w, %)
RS,SR-1-(3-Methoxyphenyl)-2-(dimethylaminomethyl) cyclohexanol hydrochloride (tramadol related compound A)	about 0.85	1.00	0.2
Tramadol hydrochloride	1.00	—	—
1-(3-Methoxyphenyl)-2-(dimethylaminomethyl) cyclohex-1-ene hydrochloride	about 5.27	1.00	0.2
1-(3-Methoxyphenyl)-2-(dimethylaminomethyl) cyclohex-6-ene hydrochloride	about 4.27	1.27	0.2
Individual unknown impurity	—	1.00	0.15
Total impurities	—	—	0.7

Assay—

Solution A—Dissolve 5 mL of perchloric acid in 950 mL of water in a 1-L volumetric flask, add 4 mL of 25% ammonia water, dilute with water to volume, and mix. Adjust with 25% ammonia water to a pH of 2.2 ± 0.2.

Mobile phase—Prepare a filtered and degassed mixture of *Solution A* and acetonitrile (77 : 23). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Tramadol Hydrochloride RS in 0.1 N hydrochloric acid, and dilute quantitatively, and stepwise if necessary, with 0.1 N hydrochloric acid to obtain a solution having a known concentration of about 0.1 mg per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to 50 mg of tramadol hydrochloride, into a 100-mL volumetric flask, add about 70 mL of 0.1 N hydrochloric acid, sonicate for about 5 minutes, and shake for 10 minutes. Dilute with 0.1 N hydrochloric acid to volume, and mix. Pass a portion of this solution through a suitable filter, discarding the first 20 mL of the filtrate. Transfer 10 mL of the clear filtrate into a 50-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 273-nm detector and a 3.9-mm × 15-cm column that contains packing L7. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the tramadol peaks. Calculate the quantity, in mg, of tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$) in the portion of Tablets taken by the formula:

$$500C(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Tramadol Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP29*

BRIEFING

Tricitrates Oral Solution, *USP 28* page 1971—See briefings under *Citric Acid, Magnesium Oxide, and Sodium Carbonate Irrigation* and *Assay for Citric Acid/Citrate and Phosphate* ⟨345⟩.

Assay for citrate—

~~*Cation exchange column*—Mix 10 g of styrene divinylbenzene cation exchange resin with 50 mL of water in a suitable beaker. Allow the resin to settle, and decant the supernatant until a slurry of resin remains. Pour the slurry into a 15-mm × 30-cm glass chromatographic tube (having a sealed-in, coarse-porosity fritted disk and fitted with a stopcock), and allow to settle as a homoge-~~

In-Process Revision

~~neous bed. Wash the resin bed with about 100 mL of water, closing the stopcock when the water level is about 2 mm above the resin bed.~~

~~*Procedure*—Pipet 15 mL of Oral Solution into a 250-mL volumetric flask, dilute with water to volume, and mix. Pipet 5 mL of this solution carefully onto the top of the resin bed in the *Cation-exchange column*. Place a 250-mL conical flask below the column, open the stopcock, and allow to flow until the solution has entered the resin bed. Elute the column with 60 mL of water at a flow rate of about 5 mL per minute, collecting about 65 mL of eluate. Add 5 drops of phenolphthalein TS to the eluate, swirl the flask, and titrate with 0.02 N sodium hydroxide VS. Record the buret reading, and calculate the volume *(B)* of 0.02 N sodium hydroxide consumed. Each mL of the difference between the volume *(B)* and the volume *(A)* of 0.02 N sodium hydroxide consumed in the *Assay for citric acid* is equivalent to 1.261 mg of $C_6H_8O_7$.~~

▲*Mobile phase, Standard Preparation 1,* and *Chromatographic System*—Proceed as directed under *Assay for Citric Acid/Citrate and Phosphate* ⟨345⟩.

Assay preparation—Pipet 15 mL of Oral Solution into a suitable volumetric flask, and proceed as directed under *Assay Preparation for Citric Acid/Citrate Assay* in *Assay for Citric Acid/Citrate and Phosphate* ⟨345⟩.

Procedure—Proceed as directed for *Procedure* in ⟨345⟩, and calculate the concentration, in mg per mL, of citrate ($C_6H_5O_7^{-3}$) in the Oral Solution taken by the formula:

$$0.001C_S(D/V)(r_U/r_S)-A(189.10/210.14),$$

in which C_S is the concentration, in µg per mL, of citrate in *Standard Preparation 1; D* is the dilution factor; *V* is the volume of Oral Solution used in the preparation of the *Assay preparation;* r_U and r_S are the citrate peak areas obtained from the *Assay preparation* and *Standard Preparation 1,* respectively; 189.10 is the molecular weight of citrate ($C_6H_5O_7^{-3}$); 210.14 is the molecular weight of citric acid monohydrate ($C_6H_8O_7 \cdot H_2O$); and *A* is the concentration of citric acid monohydrate, in mg per mL, determined in the *Assay for citric acid.*▲*USP29*

(Official January 1, 2009)

BRIEFING

Water for Injection, *USP 28* page 2033 and page 1650 of *PF* 30(5) [Sept.–Oct. 2004]; **Purified Water,** *USP 28* page 2035 and page 1316 of *PF* 30(4) [July–Aug. 2004]. At its meeting on December 8, 2004, the Pharmaceutical Waters Expert Committee decided to clarify the Definition in accordance with comments received.

(PW: F. Barletta) RTS—42233-1

Change to read:

» Water for Injection is water purified by distillation or a purification process that is equivalent or superior to distillation in the removal of chemicals and microorganisms. It is prepared from water complying with the U.S. Environmental Protection Agency National Primary Drinking Water Regulations or ~~comparable~~

▲with the drinking water▲*USP29*
regulations of the European Union, Japan,

▲or with the World Health Organization's Guidelines for Drinking Water Quality.▲*USP29*
It contains no added substance.

NOTE—Water for Injection is intended for use in the preparation of parenteral solutions. Where used for the preparation of parenteral solutions subject to final sterilization, use suitable means to minimize microbial growth, or first render the Water for Injection sterile and thereafter protect it from microbial contamination. For parenteral solutions that are prepared under aseptic conditions and are not sterilized by appropriate filtration or in the final container, first render the Water for Injection sterile and, thereafter, protect it from microbial contamination. The tests for *Total organic carbon* and *Water conductivity* apply to Water for Injection produced on site for use in manufacturing. Water for Injection packaged in bulk for commercial use elsewhere meets the requirement of the test for *Bacterial endotoxins* as indicated below and the requirements of all the tests under *Sterile Purified Water,* except *Labeling*.

In-Process Revision

Bacterial endotoxins ⟨85⟩—It contains ~~not more~~

■less■2S (*USP28*)
than 0.25 USP Endotoxin Unit per mL.

BRIEFING

Purified Water, *USP 28* page 2035 and page 1316 of *PF* 30(4) [July–Aug. 2004]—See briefing under *Water for Injection.*

(PW: F. Barletta) RTS—42233-2

Change to read:

» Purified Water is water obtained by a suitable process. It is prepared from water complying with the U.S. Environmental Protection Agency National Primary Drinking Water Regulations or ~~comparable~~

▲with the drinking water▲*USP29*
regulations of the European Union, Japan,

▲or with the World Health Organization's Guidelines for Drinking Water Quality.▲*USP29*
It contains no added substance.

NOTE—Purified Water is intended for use as an ingredient of official preparations and in tests and assays unless otherwise specified (see *Water* in *Ingredients and Processes* and in *Tests and Assays* under *General Notices and Requirements*). Where used for sterile dosage forms, other than for parenteral administration, process the article to meet the requirements under *Sterility Tests* ⟨71⟩, or first render the Purified Water sterile and thereafter protect it from microbial contamination. Do not use Purified Water in preparations intended for parenteral administration. For such purposes use Water for Injection, Bacteriostatic Water for Injection, or Sterile Water for Injection. The tests for *Total organic carbon* and *Conductivity* apply to Purified Water produced on site for use as an ingredient of official preparations and in tests and assays. Purified Water packaged in bulk for commercial use elsewhere meets the requirements of all of the tests under *Sterile Purified Water,* except *Labeling* and *Sterility* ⟨71⟩.

BRIEFING

Pure Steam, page 1651 of *PF* 30(5) [Sept.–Oct. 2004]. The Pharmaceutical Waters Expert Committee met on December 8, 2004, and addressed all of the comments received. This amended proposal clarifies the intent of the monograph relative to the application of Pure Steam so as to differentiate it from other types of steam used in the pharmaceutical industry.

(PW: F. Barletta) RTS—41332-1

Add the following:

▲Pure Steam

NOTE—For microbiological guidance, see general information chapter *Water for Pharmaceutical Purposes* ⟨1231⟩.

» Pure Steam is water that has been heated above 100° and vaporized in a manner that prevents source water entrainment. It is prepared from water complying with the U.S. Environmental Protection Agency National Primary Drinking Water Regulations, or with drinking water regulations of the European Union or Japan, or with WHO drinking water guidelines. It contains no added substance. The level of steam saturation or dryness, and the amount of noncondensable gases are to be determined by the Pure Steam application.

NOTE—Pure Steam is intended for use where the steam or its condensate comes in contact with the article or the preparation. Pure Steam quality is difficult to assess in its vapor state; therefore the attributes of its condensate are used to ~~indirectly~~

test its quality. The process used to create and collect the condensate for analysis must not adversely impact these quality attributes.

USP Reference standards ⟨11⟩—*USP 1,4 Benzoquinone RS. USP Endotoxin RS. USP Sucrose RS.*

Bacterial endotoxins ⟨85⟩—The condensate contains less than 0.25 USP Endotoxin Unit per mL (when used in the production of parenterals).

Total organic carbon ⟨643⟩**:** the condensate meets the requirement.

Water conductivity ⟨645⟩**:** the condensate meets the requirement.▲*USP29*

BRIEFING

Water for Hemodialysis, *USP 28* page 2036 and page 1317 of *PF* 30(4) [July–Aug. 2004]. At its December 8, 2004 meeting, the Pharmaceutical Waters Expert Committee decided that the test for *Oxidizable substances* should be performed in the same manner in all USP monographs in which it is required. This change is proposed in accordance with this decision.

(PW: F. Barletta) RTS—42235-1

Change to read:

▲0.02 N▲*USP29*

potassium permanganate, and boil for 5 minutes. The pink color does not completely disappear; or alternatively follow the test method for *Total Organic Carbon* ⟨643⟩.

BRIEFING

Zinc Sulfate Oral Solution. Because there is no existing *USP* monograph for this drug product, the following new monograph is being proposed. The development of this monograph has been requested by the United Nations International Children's Emergency Fund (UNICEF), the United States Agency for International Development (USAID), and the World Health Organization (WHO) as a treatment for diarrhea. Although the product is not approved by the FDA, USP is giving this monograph special consideration to support efforts by the aforementioned organizations to ensure the availability of quality public standards for the product marketed outside the USA.

(DSN: L. Evans; PSD: C. Okeke; NL: C. Barnstein) RTS—41920-1; 41994-1

Add the following:

▲Zinc Sulfate Oral Solution

» Zinc Sulfate Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of zinc sulfate ($ZnSO_4 \cdot H_2O$). It may contain one or more suitable flavors and sweeteners.

Packaging and storage—Preserve in well-closed containers protected from light, and store in a cool, dry place.

Labeling—Label the Oral Solution in terms of zinc sulfate ($ZnSO_4 \cdot H_2O$) and in terms of elemental zinc.

Identification—The Oral Solution responds to the tests for *Zinc* ⟨191⟩ and for *Sulfate* ⟨191⟩.

In-Process Revision

pH ⟨791⟩**:** between 2.5 and 4.5.

Specific gravity ⟨841⟩**:** between 1.18 and 1.24.

Assay—Transfer to a 250-mL flask an accurately measured volume of Oral Solution, equivalent to about 99 mg of $ZnSO_4 \cdot H_2O$. Add 50 mL of water and 10 mL of ammonia–ammonium chloride buffer TS and 0.3 mL of eriochrome black TS, and titrate with 0.05 M edetate disodium VS to a green endpoint. Each mL of 0.05 M edetate disodium is equivalent to 8.973 mg of zinc sulfate ($ZnSO_4 \cdot H_2O$). ▲*USP29*

DIETARY SUPPLEMENTS—MONOGRAPHS

BRIEFING

Ademetionine Disulfate Tosylate, page 2075 of *PF* 29(6) [Nov.–Dec. 2003]. On the basis of comments received, this new monograph, which previously appeared in *Pharmacopeial Previews,* is now forwarded to *In-Process Revision* with a revised title and additional modifications. The use of a surrogate reference standard is being proposed to deal with the instability and potency challenges attributed to the chiral sulfonium on the ademetionine molecule. Increased instability at ambient temperatures and in the presence of humidity initiates degradation. Ademetionine containing the double salts sulfate and tosylate improves stability but does not resolve the problem. In addition, the tosylate counterion is nonstoichiometric, with significant variation between the moles of tosylate per mole of ademetionine. These problems are alleviated using as a surrogate reference standard USP *S*-Adenosyl-L-Homocysteine RS, which lacks the methyl group on the sulfur, the cause of instability in the molecule. The HPLC method being proposed in the *Assay* uses the surrogate reference standard in a reverse-phase HPLC method based on analyses performed with the Luna C18 brand of L1 column. In the test for *Isomeric ratio*, it is proposed to revise the previously published specification. A specification of not less than 60% and the labeled amount of the *S,S*-isomer is being proposed. Although it has been extensively reported that only the *S,S*-isomer is enzymatically active for transmethylation, studies indicate that racemization of the *S,S*-isomer to the *R,S*-isomer readily occurs, causing the formation of the *R,S*-isomer, present at levels as low as 20% and increasing with time to 40%. Stability data could help to resolve this issue by establishing a requirement for an expiry date on the label to ensure the quality of the material; however, USP has not received such data and is requesting this information from manufacturers. Additional data is also being requested to identify and establish limits for impurities not given in the proposed *Related compounds* test.

(DSN: L. Evans) RTS—41179-1; 41234-1; 41639-1; 41664-1; 41667-1; 41667-2; 41667-3; 41667-4; 41668-1; 42214-1; 42227-1

Add the following:

▲~~*S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate~~ Ademetionine Disulfate Tosylate

» ~~*S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate contains not less than 49.5 percent and not more than 53.0 percent of *S*-adenosyl-L-methionine ($C_{15}H_{23}N_6O_5S^+$), not less than 21.0 percent and not more than 24.0 percent of *p*-toluene sulfonate as *p*-toluene sulfonic acid ($C_7H_7N_6O_3S$) and not less than 23.5 percent and not more than 26.5 percent of sulfate and the sum of *S*-adenosyl-L-methionine, *p*-toluene sulfonate, and sulfate is not less than 95.0 percent on~~

In-Process Revision

~~the dried basis.~~ Ademetionine Disulfate Tosylate is the disulfate–tosylate mixed salt of a mixture of diastereoisomers of the ademetionine ions. It contains not less than 95.0 percent and not more than 105.0 percent of ademetionine ($C_{15}H_{23}N_6O_5S^+$), calculated on the anhydrous basis.

Packaging and storage—Preserve in tight, light-resistant containers, and store in a refrigerator.

USP Reference standards ⟨11⟩ ~~*USP S-Adenosyl-L-Methionine Disulfate p-Toluene Sulfonate RS.*~~ *USP Ademetionine Disulfate Tosylate RS. USP S-Adenosyl-L-Homocysteine RS.*

Labeling—Label it to indicate the minimum content, in percentage, of *S,S*-isomer.

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

pH ⟨791⟩**:** between 1.0 and 2.0 , in an aqueous solution (1 in 20).

Water, *Method Ia* ⟨921⟩: not more than ~~2.0%.~~ 3.0%.

Heavy metals, *Method I* ⟨231⟩**:** not more than 0.002%.

Organic volatile impurities ~~*Method V*~~ ⟨~~467~~⟩**:** ~~not more than 0.001%~~ meets the requirements.

Isomeric ratio—

Buffer A—Transfer 4.2 g of citric acid monohydrate and 2.03 g of sodium dihydrogen phosphate dihydrate to a 1-L volumetric flask, dissolve in and dilute with water to volume, and mix.

Mobile phase—Transfer 4.0 g of sodium dodecyl sulfate and 440 mL of acetonitrile to a 1-L volumetric flask, dilute with *Buffer A* to volume, and mix.

Standard ~~*solution*~~ *preparation* and *Test* ~~*solution*~~ *preparation*—Use the ~~*Standard preparation*~~ and the ~~*Assay preparation*~~ *Standard solution* and the *Test solution,* prepared as directed in ~~*Assay*~~ *Related compounds.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard* ~~*solution*~~ *preparation,* and record the peak response as directed for *Procedure:* the resolution, *R,* between *S,S*-isomer and *R,S*-isomer is not less than 1.0; and the relative retention times are about 0.94 and 1.0 for ~~*S,S* isomer and *R,S* isomer,~~ the *R,S*- and *S,S*-isomers, respectively.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard* ~~*solution*~~ *preparation* and the *Test* ~~*solution*~~ *preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Identify the peaks of *S,S*- and *R,S*-isomers in the chromatogram of the *Test solution* by comparison with the chromatogram of the *Standard solution,* and calculate the percentage of *S,S*-isomer by the formula:

$$100[r_{SS}/(r_{SS} + r_{RS})],$$

in which r_{SS} and r_{RS} are the areas of the peaks corresponding to the *S,S*-isomer and the *R,S*-isomer, respectively, in the *Test solution*. Not less than ~~75%~~ 60% and not less than the labeled amount of the *S,S*-isomer is found.

In-Process Revision

Related compounds—

Mobile phase— ~~Prepare as directed in the *Assay.*~~ Prepare a filtered and degassed solution of 0.5 M ammonium formate in water, and adjust with formic acid to a pH of 4.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Ademetionine Disulfate Tosylate RS in water to obtain a solution having a known concentration of 1.0 mg per mL.

Test solution— ~~Use the *Assay preparation.*~~ Transfer about 100 mg of Ademetionine Disulfate Tosylate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)— ~~Prepare as directed in the *Assay.* Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure.*~~ The liquid chromatograph is equipped with a 260-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L9. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard solution,* and record the peak response as directed for *Procedure:* the column efficiency is not less than 3950 theoretical plates; the tailing factor is not more than 1.7; and the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of adenosine, *S*-adenosyl-L-homocysteine, methylthioadenosine, and any other impurity in the portion of ~~*S*-Adenosyl L-Methionine Disulfate *p*-Toluenesulfonate~~ Ademetionine Disulfate Tosylate taken by the formula:

$$100(r_i / r_s),$$

in which r_i is the peak area for each individual impurity; and r_s is the sum of the peak areas of all the peaks.

Name	Relative Retention Time	Limit (%)
Adenosine	about 0.86	1.0
S-Adenosyl-L-homocysteine	about 0.90	1.0
Methylthioadenosine	about 2.06	~~1.5~~ 3.0
Other individual impurities	—	0.1
Total impurities	—	3.5

Content of sulfate—

Mobile phase—Prepare a solution of 8.0 mM sodium carbonate and 1.0 mM sodium bicarbonate in water.

Standard solution—Dissolve an accurately weighed quantity of potassium sulfate in water, to obtain a solution having a known sulfate concentration of about 0.18 mg per mL.

Test solution—Transfer about 50 mg of ~~*S*-Adenosyl L-Methionine Disulfate *p*-Toluene Sulfonate~~ Ademetionine Disulfate Tosylate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)— The liquid chromatograph is equipped with an ion detector with suppressed conductivity and a 4.0-mm × 25-cm column that contains 7-µm packing L46. The column temperature is maintained at 30°. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 8200 theoretical plates; the tailing factor is not more than ~~1.1~~ 1.5; and the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the area of the sulfate peak. Calculate the percentage of sulfate in the portion of ~~*S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate~~ Ademetionine Disulfate Tosylate taken by the formula:

$$10{,}000(C/W)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of the *Standard solution; W* is the weight, in mg, of ~~*S*-adenosyl-L-methionine disulfate *p*-toluene sulfonate~~ Ademetionine Disulfate Tosylate taken to prepare the *Test solution;* and r_U and r_S are the peak responses obtained for sulfate in the chromatograms of the *Test solution* and the *Standard solution,* respectively. The content of sulfate is not less than 23.5% and not more than 26.5%.

Content of ~~*p*-toluene sulfonic acid~~ tosylate—

Mobile phase and *Chromatographic system*—~~Proceed as directed in the *Assay.*~~ Proceed as directed in *Related compounds.*

Standard solution—Dissolve an accurately weighed quantity of *p*-toluene sulfonic acid monohydrate in ~~water, to obtain a solution having a known concentration of about 0.5 mg per mL.~~ *Mobile phase.*

Test solution—Transfer about 100 mg of ~~*S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate~~ Ademetionine Disulfate Tosylate, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system—Prepare as directed in ~~*Assay*~~ *Related compounds.* Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the area of the ~~*p*-toluene sulfonic acid~~ tosylate peak. Calculate the percentage of ~~*p*-toluene sulfonic acid~~ tosylate in the portion of ~~*S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate~~ Ademetionine Disulfate Tosylate taken by the formula:

$$\sout{10{,}000}\ 5000(C/W)(r_U/r_S),$$

in which C is the concentration, in mg per mL, of tosylate ion in the *Standard solution; W* is the weight, in mg, of ~~*S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate~~ Ademetionine Disulfate Tosylate taken to prepare the *Test solution;* and r_U and r_S are the peak responses obtained for ~~*p*-toluene sulfonic acid~~ tosylate in the chromatograms of the *Test solution* and the *Standard solution,* respectively. The content of tosylate is not less than 21% and not more than 24%.

Assay—

~~*Mobile phase*—Prepare a filtered and degassed solution of 0.5 M ammonium formate in water, and adjust with formic acid to a pH of 4.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~

~~*Standard preparation*—Dissolve an accurately weighed quantity of USP *S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate in water, to obtain a solution having a known concentration of about 1.0 mg per mL.~~

~~*Assay preparation*—Transfer about 100 mg of *S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 260-nm detector and a 4.6-mm × 25-cm column that contains 5-µm~~

In-Process Revision

~~packing L9. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard preparation,* and record the peak response as directed for *Procedure:* the column efficiency is not less than 3950 theoretical plates; the tailing factor is not more than 1.7; and the relative standard deviation for replicate injections is not more than 1.0%.~~

~~*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area of the major peak. Calculate the quantity, in mg, of $C_{14}H_{22}N_6O_5S$ in the portion of the *S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate taken by the formula:~~

~~$$(399.28/766.56)100C(r_u/r_s),$$~~

~~in which 399.28 and 766.8 are the molecular weights of *S*-adenosyl-L-methionine and *S*-adenosyl-L-methionine disulfate p-toluene sulfonate, respectively; *C* is the concentration, in mg per mL, of USP *S*-Adenosyl-L-Methionine Disulfate *p*-Toluene Sulfonate RS in the *Standard preparation;* and r_u and r_s are the peak responses obtained for *S*-adenosyl-L-methionine in the chromatograms of the *Assay preparation* and the *Standard preparation,* respectively.~~

Buffer—Transfer 10 mL of glacial acetic acid to a 1-L volumetric flask, add 500 mL of water, and mix. To the flask add 2.06 g of sodium 1-hexanesulfonate, dilute with water to volume, and mix.

Mobile phase—Prepare a filtered and degassed solution of *Buffer* and acetronitrile (85 : 15).

System suitability solution—Dissolve accurately weighed quantities of USP Ademetionine Disulfate Tosylate RS and USP *S*-Adenosyl-L-Homocysteine RS in water to obtain a solution having concentrations of about 400 µg of each per mL.

Standard preparations—Dissolve an accurately weighed quantity of USP *S*-Adenosyl-L-Homocysteine RS in water to obtain *Standard preparation A,* having a known concentration of about 400 µg per mL. Dilute portions of *Standard preparation A* to obtain *Standard preparation B* and *Standard preparation C,* having known concentrations of about 200 µg and 80 µg per mL, respectively.

Assay preparation—Transfer about 20 mg of Ademetionine Disulfate Tosylate, accurately weighed, to a 50-mL volumetric flask, add 40 mL of water, and stir for 30 minutes; then dilute with water to volume, and mix. Transfer 1.0 mL of the solution to a 1.5-mL microcentrifuge tube, and centrifuge for 1 minute. Use a portion of the supernatant as the *Assay preparation*.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 260-nm detector and a 4.6-mm × 15-cm column that contains 3-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution* and *Standard preparation B,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.68 for *S*-adenosyl-L-homocysteine and 1.0 for ademetionine disulfate tosylate; the resolution, *R*, between *S*-adenosyl-L-homocysteine and ademetionine disulfate tosylate is not less than 1.5; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0% for *S*-adenosyl-L-homocysteine in *Standard preparation B*.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparations* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area of the *S*-adenosyl-L-homocysteine peak in all three solutions and the ademetionine disulfate tosylate peak in the *Assay preparation.* Plot a calibration curve of the peak area of the *Standard preparations* versus the corre-

sponding *S*-adenosyl-L-homocysteine concentration, in mg per mL, and draw the straight line best fitting the three points. From the calibration curve, and using the peak area of ademetionine from the chromatogram obtained with the *Assay preparation,* determine the concentration, *C,* of ademetionine as *S*-adenosyl-L-homocysteine in the *Assay preparation.* Calculate the quantity, in mg, of ademetionine ($C_{15}H_{23}N_6O_5S^+$) in the portion of Ademetionine Disulfate Tosylate taken by the formula:

$$50C(399.44/384.41),$$

in which 399.44 and 384.41 are the molecular weights of ademetionine and *S*-adenosyl-L-homocysteine, respectively. ▲*USP29*

BRIEFING

Fish Oil Rich in Omega-3 Acids, page 1272 of *PF* 29(4) [July–Aug. 2003]. On the basis of comments received, this proposed new monograph is being presented again with a revised title and additional modifications.

(DSN: L. Evans) RTS—42065-1

In-Process Revision

Add the following:

▲Fish Oil ~~Rich in~~ Containing Omega-3 Acids

» Fish Oil ~~Rich in~~ Containing Omega-3 Acids is the purified, winterized, and deodorized fatty oil obtained from fish of the families *Engraulidae, Carangidae, Clupeidae, Osmeridae, Scrombroidae,* and *Ammodytidae.* The omega-3 acids are defined as the following: alpha-linolenic acid (C18 : 3 n-3), moroctic acid (C18 : 4 n-3), eicosatetraenoic acid (C20 : 4 n-3), eicosapentaenoic acid (EPA) (C20 : 5 n-3), heneicosapentaenoic acid (C21 : 5 n-3), docosapentaenoic acid (C22 : 5 n-3), and docosahexaenoic acid (DHA) (C22 : 6 n-3). It contains not less than 28.0 percent (w/w) of total omega-3 acids, expressed as ~~triglycerides,~~ free acids, consisting of not less than 13.0 percent of EPA and not less than 9.0 percent of DHA. Suitable antioxidants in appropriate concentrations may be added.

Packaging and storage—Preserve in tight, light-resistant containers, and store at controlled room temperature. It may be bottled or otherwise packaged in containers from which air has been expelled by production of a vacuum or by an inert gas.

Labeling—The label states the average content of DHA and EPA in mg per g. It also states the name and concentration of any added antioxidant.

USP Reference standards ⟨11⟩—~~*USP Cod Liver Oil RS.*~~ *USP Fish Oil RS. USP Methyl Tricosanoate RS. USP Omega-3 Ethyl Esters RS.*

Identification—The retention times of the peaks for eicosapentaenoic acid methyl ester and docosahexaenoic acid methyl ester obtained in the chromatogram of the ~~*Test solutions*~~ *Test solution* in the test for *Content of EPA and DHA* correspond to those for the respective compounds in the chromatogram of the *Standard solutions.* The sum of the area for EPA and DHA methyl esters is not less than ~~28~~ 22% of the total detected area for the methyl esters, and no other

peak in the chromatogram has an area higher than 20% of the total detected area for the methyl esters. The chromatogram of ~~*Test solution 1*~~ the *Test solution* exhibits at least 15 additional peaks at the retention times of the methyl esters of unsaturated fatty acids exhibited in the chromatogram of *Standard solution 2.*

Acid value ⟨401⟩**:** not more than 3.

Anisidine value ⟨401⟩**:** not more than 20.0.

Peroxide value ⟨401⟩**:** not more than 5.0.

Total oxidation value (TOTOX) ⟨401⟩**:** Not more than 26, calculated by the formula:

$$(2 \times PV) + AV,$$

in which *PV* is the *Peroxide value,* and *AV* is the *Anisidine value.*

Unsaponifiable matter ⟨401⟩**:** not more than 1.5%.

Stearin: 100 mL remains clear after cooling at 0° for 3 hours.

Absorbance—Dilute 0.300 g to 50.0 mL with isooctane. Quantitively transfer 2.0 mL of this solution to a 50-mL volumetric flask, and dilute with isooctane to volume. The absorbance is not more than 0.70, determined at 233 nm.

Limit of arsenic—[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytef, and plastic vessels before use, employ water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of arsenic as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytef, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 minutes and by rinsing with deionized water.]

1% Palladium stock solution—Transfer 1 g of ultrapure palladium metal, accurately weighed, into a Teflon beaker. Add 20 mL of water and 10 mL of nitric acid, and warm on a hot plate to dissolve. Allow the solution to cool to room temperature, transfer it into a 100-mL volumetric flask, and dilute with deionized water to volume.

1% Magnesium nitrate stock solution—Transfer 1 g of ultrapure magnesium nitrate, accurately weighed, into a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it into a 100-mL volumetric flask, and dilute with deionized water to volume.

Modifier working solution—Transfer 3 mL of *1% Palladium stock solution* and 2 mL of *1% Magnesium nitrate stock solution* into a 10-mL volumetric flask, and dilute with 2% nitric acid to volume. A volume of 5 µL provides 0.015 mg of palladium and 0.01 mg of magnesium nitrate.

Blank—Transfer 5 mL of nitric acid to a 100-mL volumetric flask, dilute with water to volume, and mix.

Standard stock solution—Transfer 10.0 mL of *Standard Arsenic Solution,* prepared as directed in the test for *Arsenic* ⟨211⟩, to a 100-mL volumetric flask, add 40 mL of water and 5 mL of nitric acid, dilute with water to volume, and mix. This solution contains 0.10 µg of arsenic per mL.

Standard solutions—Dilute the *Standard stock solution* with the *Blank* to obtain solutions containing, respectively, 0.002, 0.005, 0.010, 0.025, and 0.050 µg per mL of arsenic.

Test solution—For preparation of the *Test solution,* use a microwave oven with a magnetron frequency of about 2455 MHz and a selectable output power of 0 to 950 watts in 1% increments, equipped with advanced composite vessels with 100-mL polytef liners. Use rupture membranes to vent vessels should the pressure exceed 125 psi. The vessels fit into a turntable, and each vessel can be vented into an overflow container. Equip the microwave oven with an exhaust tube to ventilate fumes. *[Caution—Wear proper eye*

In-Process Revision

protection and protective clothing and gloves.] Transfer approximately 500 mg of Fish Oil Containing Omega-3 Acids, accurately weighed to the nearest 0.1 mg, into a Teflon digestion vessel liner. Prepare samples in duplicate. Add 15 mL of nitric acid, and swirl gently. Cover the vessels with lids, leaving the vent fitting off. Predigest overnight under a hood. Place the rupture membrane in the vent fitting, and tighten the lid. Place all vessels on the microwave oven turntable. Connect the vent tubes to the vent trap, and connect the pressure-sensing line to the appropriate vessel. Initiate a two-stage digestion procedure by heating the microwave at 15% power for 15 minutes, followed by 25% power for 45 minutes. Remove the turntable of vessels from the oven, and allow the vessels to cool to room temperature. [NOTE—A cool water bath may be used to speed the cooling process.] Vent the vessels when they reach room temperature. Remove the lids, and slowly add 2 mL of 30 percent hydrogen peroxide to each. Allow the reactions to subside, and seal the vessels. Return the vessels on the turntable to the microwave oven, and heat for an additional 15 minutes at 30% power. Remove the vessels from the oven, and allow them to cool to room temperature. Transfer the cooled digests into 25-mL volumetric flasks, and dilute with water to volume.

Procedure—Program the graphite furnace as follows. Dry at 115°, using a 1-second ramp, a 65-second hold, and an argon flow of 300 mL per minute; char the sample at 1000°, using a 1-second ramp, a 20-second hold, and an air flow of 300 mL per minute; cool down, and purge the air from the furnace for 10 seconds, using a 20° set temperature and an argon flow of 300 mL per minute; atomize at 2400°, using a 0-second ramp and a 5-second hold with the argon flow stopped; and clean out at 2600° with a 1-second ramp and a 5-second hold. Separately inject equal volumes (about 20 µL) of the *Standard solutions,* the *Test solution,* and the *Blank,* followed by an injection of 5 µL of the *Modifier working solution* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrophotometer equipped with a hollow-cathode lamp for arsenic. Determine the peak area at the arsenic emission line at 193.7 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of arsenic, in µg per mL, and calculate the regression line best fitting the points. Determine the concentration, *C,* in µg per mL, of arsenic in each mL of the *Test solution* by interpolation from the regression line. Calculate the content of arsenic in the portion of Fish Oil Containing Omega-3 Acids taken by the formula:

$$25C/W,$$

in which W is the weight, in g, of Fish Oil Containing Omega-3 Acids taken to prepare the *Test solution:* not more than 0.1 µg per g is found.

Limit of lead—[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytef, and plastic vessels before use, employ water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytef, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 minutes and by rinsing with deionized water.]

10% Ammonium dihydrogen phosphate stock solution—Transfer 10 g of ultrapure ammonium dihydrogen phosphate, accurately weighed, to a 100-mL volumetric flask. Add 40 mL of water and 1 mL of nitric acid to dissolve the phosphate. Dilute with deionized water to 100 mL.

1% Magnesium nitrate stock solution—Transfer 1 g of ultrapure magnesium nitrate, accurately weighed, to a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and

In-Process Revision

warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Modifier working solution—Transfer 4 mL of *10% Ammonium dihydrogen phosphate stock solution* and 2 mL of *1% Magnesium nitrate stock solution* to a 10-mL volumetric flask, and dilute with 2% nitric acid to volume. A volume of 5 µL provides 0.2 mg of phosphate plus 0.01 mg of magnesium nitrate.

Blank—Transfer 5 mL of nitric acid to a 100-mL volumetric flask, dilute with water to volume, and mix.

Standard stock solution—Transfer 10.0 mL of *Lead Nitrate Stock Solution,* prepared as directed in the test for *Heavy Metals* ⟨231⟩, to a 100-mL volumetric flask, add 40 mL of water and 5 mL of nitric acid, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to a second 100-mL volumetric flask, add 50 mL of water and 1 mL of nitric acid, dilute with water to volume, and mix. This solution contains 0.10 µg of lead per mL.

Standard solutions—Dilute the *Standard stock solution* with the *Blank* to obtain solutions containing, respectively, 0.002, 0.005, 0.010, 0.025, and 0.050 µg per mL of lead.

Test solution—Prepare as directed for *Test solution* in the test for *Limit of arsenic.*

Procedure—Program the graphite furnace as follows. Dry at 120°, using a 1-second ramp, a 55-second hold, and an argon flow of 300 mL per minute; char the sample at 850°, using a 1-second ramp, a 30-second hold, and an air flow of 300 mL per minute; cool down, and purge the air from the furnace for 10 seconds, using a 20° set temperature and an argon flow of 300 mL per minute; atomize at 2100°, using a 0-second ramp and a 5-second hold with the argon flow stopped; and clean out at 2600° with a 1-second ramp and a 5-second hold. Separately inject equal volumes (about 20 µL) of the *Standard solutions,* the *Test solution,* and the *Blank,* followed by an injection of 5 µL of the *Modifier working solution* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrophotometer equipped with a hollow-cathode lamp for lead. Determine the peak area at the lead emission line at 283.3 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of lead, in µg per mL, and calculate the regression line best fitting the points. Determine the concentration, *C,* in µg per mL, of lead in each mL of the *Test solution* by interpolation from the regression line. Calculate the content of lead in the portion of Fish Oil Containing Omega-3 Acids taken by the formula:

$$25C/W,$$

in which W is the weight, in g, of Fish Oil Containing Omega-3 Acids taken to prepare the *Test solution:* not more than 0.1 µg per g is found.

Limit of cadmium—[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytef, and plastic vessels before use, employ water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of cadmium as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytef, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 minutes and by rinsing with deionized water.]

10% Ammonium dihydrogen phosphate stock solution—Transfer 10 g of ultrapure ammonium dihydrogen phosphate, accurately weighed, to a 100-mL volumetric flask. Add 40 mL of water and 1 mL of nitric acid to dissolve the phosphate. Dilute with deionized water to 100 mL.

1% Magnesium nitrate stock solution—Transfer 1 g of ultrapure magnesium nitrate, accurately weighed, to a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Modifier working solution—Transfer 4 mL of *10% Ammonium dihydrogen phosphate stock solution* and 2 mL of *1% Magnesium nitrate stock solution* to a 10-mL volumetric flask, and dilute with 2% nitric acid to volume. A volume of 5 µL provides 0.2 mg of phosphate and 0.01 mg of magnesium nitrate.

Blank—Transfer 5 mL of nitric acid to a 100-mL volumetric flask, dilute with water to volume, and mix.

Standard stock solution—Transfer 137.2 mg of cadmium nitrate to a 1000-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Transfer 2.0 mL of this solution to a second 100-mL volumetric flask, add 50 mL of water and 1 mL of nitric acid, dilute with water to volume, and mix. This solution contains 0.10 µg of cadmium per mL.

Standard solutions—Dilute the *Standard stock solution* with the *Blank* to obtain solutions containing, respectively, 0.002, 0.005, 0.010, 0.025, and 0.050 µg per mL of cadmium.

Test solution—Prepare as directed for *Test solution* in the test for *Limit of arsenic.*

Procedure—Program the graphite furnace as follows. Dry at 120°, using a 1-second ramp, a 55-second hold, and an argon flow of 300 mL per minute; char the sample at 850°, using a 1-second ramp, a 30-second hold, and an air flow of 300 mL per minute; cool down, and purge the air from the furnace for 10 seconds, using a 20° set temperature and an argon flow of 300 mL per minute; atomize at 2400°, using a 0-second ramp and a 5-second hold with the argon flow stopped; and clean out at 2600° with a 1-second ramp and a 5-second hold. Separately inject equal volumes (about 20 µL) of the *Standard solutions,* the *Test solution,* and the *Blank,* followed by an injection of 5 µL of the *Modifier working solution* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrophotometer equipped with a hollow-cathode lamp for cadmium. Determine the peak area at the cadmium emission line at 228.8 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of cadmium, in µg per mL, and calculate the regression line best fitting the points. Determine the concentration, *C,* in µg per mL, of cadmium in each mL of the *Test solution* by interpolation from the regression line. Calculate the content of cadmium in the Fish Oil Containing Omega-3 Acids taken by the formula:

$$25C/W,$$

in which W is the weight, in g, of Fish Oil Containing Omega-3 Acids taken to prepare the *Test solution:* not more than 0.1 µg per g is found.

Limit of mercury—Proceed as directed for *Method IIb* under *Mercury* ⟨261⟩, except to use a *Standard Mercury Solution* having the equivalent of 0.025 µg per mL of mercury.

Test solution—Prepare as directed for the *Test solution* in the test for *Limit of arsenic.* The limit is 0.1 µg per g.

Limit of ~~pesticides~~ dioxins, furans, and polychlorinated biphenyls (PCBs)—Determine the content of polychlorinated dibenzo-*para*-dioxins (PCDDs) and polychlorinated dibenzofurans (PCDFs)~~, and polychlorinated biphenyls (PCBs) using the Environmental Protection Agency's Method No. 1613, Revision B.~~ by method No. 1613 revision B of the Environmental Protection Agency. Determine the content of polychlorinated biphenyls (PCBs) by method No. 1668 revision A of the Environmental Protection Agency. The sum of polychlorinated dibenzo-*para*-dioxins (PCDDs)

In-Process Revision

and polychlorinated dibenzofurans (PCDFs) is not more than 2 pg of WHO toxic ~~equivalent factors per g. The content of total polychlorinated biphenyls (PCBs) is not more than 0.09 µg per g~~ equivalents per g. The amount of dioxin-like PCBs (polychlorinated biphenyls, non-ortho IUPAC congeners PCB-77, PCB-81, PCB-126, and PCB-169, and mono-ortho IUPAC congeners PCB-105, PCB-114, PCB-118, PCB-123, PCB-156, PCB-157, PCB-167, and PCB-189) is not more than 3 pg of WHO toxic equivalents per g.

Content of EPA and DHA—

Antioxidant solution—Dissolve an accurately weighed amount of butylated hydroxytoluene in hexanes to obtain a solution having a concentration of 0.05 mg per mL.

Internal standard solution—Transfer an accurately weighed quantity ~~of about 70.0 mg~~ of USP Methyl Tricosanoate RS to a ~~10 mL~~ volumetric flask. Dissolve in ~~isooctane~~ *Antioxidant solution*, and dilute with the same solvent to ~~volume~~ obtain a solution having a concentration of about 3.5 mg per mL. [NOTE—Guard the solution against evaporation during usage.]

~~*Standard stock solution*—Transfer 0.450 g of USP Cod Liver Oil RS accurately weighed, into a 10-mL volumetric flask, dissolve in *Antioxidant solution,* and dilute with the same solvent to volume.~~

Standard stock solution 1—Transfer 0.100 g of USP Omega-3 Ethyl Esters RS, accurately weighed, to a 10-mL volumetric flask, and dissolve in and dilute with *Internal standard solution* to volume.

Standard stock solution 2—Proceed as directed for *Standard stock solution 1,* but use 0.300 g of USP Fish Oil RS instead of USP Omega-3 Ethyl Esters RS.

~~*Standard solution*~~ *Standard solution 1*—Transfer 2.0 mL of ~~the *Standard stock solution*~~ *Standard stock solution 1* to a quartz tube, and evaporate the solvent with a gentle stream of nitrogen. Add 1.5 mL of a 2% solution of sodium hydroxide in methanol, cap tightly with a polytetrafluoroethylene-lined cap, mix, and heat in a boiling water bath for 7 minutes. Cool, add 2 mL of boron trichloride–methanol solution, cover with nitrogen, cap tightly, mix, and heat in a boiling water bath for 30 minutes. Cool to 40° to 50°, add 1 mL of isooctane, cap, and mix on a vortex mixer or shake vigorously for at least 30 seconds. Immediately add 5 mL of saturated sodium chloride solution, cover with nitrogen, cap, and mix on a vortex mixer or shake thoroughly for at least 15 seconds. Allow the upper layer to become clear, and transfer to a separate tube. Shake the methanol layer once more with 1 mL of isooctane, and combine the isooctane extracts. Wash the combined extracts with two quantities, each of 1 mL of water, and dry over anhydrous sodium sulfate.

Standard solution 2—Proceed as directed for *Standard solution 1,* but use *Standard stock solution 2* instead of *Standard stock solution 1.*

System suitability mixture—Prepare a mixture having equal amounts, accurately weighed, of methyl palmitate, methyl stearate, methyl arachidate, and methyl behenate. [NOTE—A suitable mixture is available from Supelco, Bellefonte, Pa., as GLC-40, cat. number 1895-1AMP.]

Test stock solution—Transfer 0.300 g of Fish Oil ~~Rich in~~ Containing Omega-3 Acids, accurately weighed, to a 10-mL volumetric flask, and dissolve in and dilute with *Internal standard solution* to volume.

In-Process Revision

~~*Test solution 1*—Proceed as directed for the *Standard solution,* using the *Stock test solution–Standard solution 1,* except to use the *Test stock solution* and to omit the addition of the *Internal standard solution.*~~

Test solution—~~*2*—Transfer 1.0 mL of the *Internal standard solution* into a quartz tube. Then proceed as directed for *Test solution 1.*~~ Proceed as directed for *Standard solution 1,* except to use the *Test stock solution.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.25-mm × 30-m fused silica capillary column coated with a 0.25-µm film of G16. The temperature of the detector is maintained at 280° and that of the injection port at 250°. The column temperature is initially set at 170° for 2 minutes, then increased at a rate of ~~1°~~ 3° per minute to ~~225°, and is maintained at 225°~~ 240°, and is maintained at this temperature for 20 minutes. The carrier gas is helium with a split flow ratio of 1 : 200. [NOTE—If splitless injection mode is used, solutions should be further diluted 1 in 200.] Chromatograph ~~the *Standard solution,*~~ *Standard solution 2,* the *System suitability mixture,* ~~*Test solution 1,* and *Test solution 2,*~~ and the *Test solution,* and record the peak responses as directed for *Procedure:* the resolution between the peaks in ~~the Standard solution~~ *Standard solution 2* due to methyl oleate and methyl *cis*-vaccinate is not less than 1.3. ~~and that between methyl gadoleate and methyl gondoate is sufficient for purposes of identification and area measurement.~~ The theoretical area percentages ~~for~~ in the chromatogram of the *System suitability mixture* for methyl palmitate, methyl stearate, methyl arachidate, and methyl behenate are 24.4, 24.8, 25.2, and 25.6, respectively. In a suitable instrument, the area percentages from the *System suitability mixture* are within 1% of the theoretical values. The number of fatty acid methyl ester peaks exceeding 0.05% of the total area in the chromatogram of ~~the *Standard solution*~~ *Standard solution 2* is at least 24, and the 24 largest peaks of the methyl esters account for more than 90% of the total area. (These correspond, in common elution order, to: 14 : 0, 15 : 0, 16 : 0, 16 : 1 n-7, 16 : 4 n-1, 18 : 0, 18 : 1 n-9, 18 : 1 n-7, 18 : 2 n-6, 18 : 3 n-3, 18 : 4 n-3, 20 : 1 n-11, 20 : 1 n-9, 20 : 1 n-7, 20 : 2 n-6, 20 : 4 n-6, 20 : 3 n-3, 20 : 4 n-3, 20 : 5 n-3, 22 : 1 n-11, 22 : 1 n-9, 21 : 5 n-3, 22 : 5 n-3, 22 : 6 n-3.)

Procedure—Separately inject duplicate equal volumes (about 1 µL) of ~~the *Standard solution, Test solution 1,* and *Test solution 2*~~ the *Internal standard solution, Standard solution 1, Standard solution 2,* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Identify the retention times of the relevant fatty acid methyl esters by comparison of the chromatogram of ~~the *Standard solution,*~~ *Standard solution 2* with the reference chromatogram supplied with the ~~USP Cod Liver Oil RS.~~ USP Fish Oil RS. Identify the retention time for the *Internal standard solution* ~~by comparison of the chromatograms of *Test solution 1* and *Test solution 2*~~ by comparing the chromatograms for the *Internal standard solution* and *Standard solution 1*. Calculate the area percentage for each fatty acid methyl ester taken by the formula:

$$100(r_A / r_B),$$

in which r_A is the average peak area of each individual fatty acid; and r_B is the total peak area from all peaks in the chromatogram of the *Test solution,* excepting the solvent front and butylated hydroxytoluene. Calculate the percentage of

In-Process Revision

EPA or DHA in the Fish Oil ~~Rich in~~ Containing Omega-3 Acids taken by the formula:

~~$500FC(r_i/r_s)/1.04W,$~~

$$1000C/W(R_U/R_S),$$

in which 1000 is the factor to express the content of DHA and EPA as free fatty acids in percentage; ~~considering a 1 to 5 sample dilution; 1.04 is the factor to convert the methyl tricosanoate into tricosanoic acid;~~ C is the concentration, in mg per mL, of ~~the *Internal standard solution; W*~~ either DHA or EPA in *Standard solution 1; W* is the weight, in mg, of the Fish Oil ~~Rich in~~ Containing Omega-3 Acids taken to prepare the *Test stock solution;* ~~*F* is the theoretical response factor of EPA or DHA, respectively, relative to the internal standard (0.99 for EPA and 0.97 for DHA); r_i is the peak response of either EPA or DHA in the chromatogram of *Test solution 2;*~~ R_U is the ratio of peak responses of either EPA or DHA relative to the internal standard in the chromatogram of ~~*Test solution 2*~~ the *Test solution;* ~~and r_s is the corrected peak response of the internal standard in *Test solution 2* calculated as follows:~~

~~$[(r_{s2}/r_{EPA2}) - (r_{s1}/r_{EPA1})]r_{EPA1},$~~

~~in which r_{s2} is the peak response of any peak at the locus of the internal standard in the chromatogram of *Test solution 2;* r_{s1} is the peak response of any peak at the locus of the internal standard in the chromatogram of *Test solution 1;* r_{EPA1} is the peak response of EPA in the chromatogram of *Test solution 1;* and r_{EPA2} is the peak response of EPA in the chromatogram of *Test solution 2.*~~ and R_S is the ratio of peak responses of either EPA or DHA relative to the internal standard in *Standard solution 1.* ▲*USP29*

BRIEFING

Fish Oil Rich in Omega-3 Acids Capsules, page 1278 of *PF* 29(4) [July–Aug. 2003]. On the basis of comments received, this proposed new monograph is being presented again with a revised title and additional modifications.

(DSN: L. Evans) RTS—42065-2

Add the following:

▲Fish Oil ~~Rich in~~ Containing Omega-3 Acids Capsules

» Fish Oil ~~Rich in~~ Containing Omega-3 Acids Capsules contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of Fish Oil ~~Rich in~~ Containing Omega-3 Acids. The oil contained in Fish Oil ~~Rich in~~ Containing Omega-3 Acids Capsules conforms to the definition for *Fish Oil ~~Rich in~~ Containing Omega-3 Acids.*

Packaging and storage—Preserve in tight containers, and store at room temperature. Protect from light.

Labeling—The label states the amount of docosahexaenoic acid (DHA) and eicosapentaenoic acid (EPA) in mg per Capsule.

USP Reference standards ⟨11⟩ ~~*USP Cod Liver Oil RS.*~~ *USP Fish Oil RS. USP Methyl Tricosanoate RS. USP Omega-3 Ethyl Esters RS.*

In-Process Revision

Identification—Proceed as directed for *Identification* under *Fish Oil ~~Rich in~~ Containing Omega-3 Acids*. The oil contained in the Capsules meets the requirements.

Weight variation ⟨2091⟩**:** meets the requirements.

Dissolution ⟨711 ⟩—

Medium: water; 500 mL.

Apparatus 2: 50 rpm.

Time: 15 minutes; 30 minutes.

Procedure—Place 1 Capsule in each vessel, and allow the Capsule to sink to the bottom of the vessel before starting rotation of the blade. Observe the Capsules, and record the time taken for each capsule shell to rupture.

Tolerances—The requirements are met if all the Capsules tested rupture in not more than 15 minutes. If 1 or 2 of the Capsules rupture in more than 15 minutes but not more than 30 minutes, repeat the test on 12 additional Capsules. Not more than 2 of the total of 18 Capsules tested rupture in more than 15 minutes but not more than 30 minutes.

Other requirements—The contents of the Capsules meet the requirements of the tests for *Acid value, Anisidine value, ~~Heavy metals,~~ Peroxide value, Total oxidation value, Unsaponifiable matter, Stearin, Absorbance, Limit of arsenic, Limit of lead, Limit of cadmium, Limit of mercury, ~~and Pesticides~~* and *Limit of dioxins, furans, and polychlorinated biphenyls* under *Fish Oil ~~Rich in~~ Containing Omega-3 Acids*.

Content of fish oil—Accurately weigh not fewer than 10 Capsules in a tared weighing bottle. With a sharp blade, or by other appropriate means, carefully open the Capsules, without loss of shell material, and transfer the combined Capsule contents to a 100-mL beaker. Remove any adhering substance from the emptied Capsules by washing with several small portions of isooctane. Discard the washings, and allow the empty Capsules to dry in a current of dry air until the isooctane is completely evaporated. Weigh the empty Capsules in the original tared weighing bottle, and calculate the average net weight per capsule.

Content of EPA and DHA—Proceed as directed for *Content of EPA and DHA* under *Fish Oil ~~Rich in~~ Containing Omega-3 Acids*.▲*USP29*

BRIEFING

Selenomethionine, *USP 28* page 2130. It is proposed to add USP L-Methionine RS to the *USP Reference standards* section and to correct the name of the Reference Standard to L-Methionine in the *System suitability preparation* in the *Assay.*

USP Selenomethionine RS.

Change to read:

Assay—

Mobile phase—Prepare a filtered and degassed solution of 6.8 g of monobasic potassium phosphate in 1 L of water. Adjust with phosphoric acid to a pH of 2.75 ± 0.25. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability preparation—Dissolve suitable quantities of ~~USP Methionine RS~~

▲USP L-Methionine RS▲*USP29*
and USP Selenomethionine RS in *Mobile phase* to obtain a solution containing about 0.8 mg per mL and 0.16 mg per mL, respectively.

Standard preparation—Dissolve an accurately weighed quantity of USP Selenomethionine RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.16 mg per mL.

Assay preparation—Transfer about 40 mg of Selenomethionine, accurately weighed, to a 250-mL volumetric flask, dissolve in *Mobile phase* with sonication, dilute with *Mobile phase* to volume, and mix. Filter through a 0.45-µm membrane.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and 4.6-mm × 25-cm column that contains packing L1 with polar end-capping. The flow rate is about 1.0 mL per minute. Chromat-

In-Process Revision

ograph the *System suitability preparation*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.8 for methionine and 1.0 for selenomethionine; the resolution, *R,* between methionine and selenomethionine is not less than 3.0; the tailing factor is not more than 2; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_5H_{11}NO_2Se$ in the portion of Selenomethionine taken by the formula:

$$25C/W(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Selenomethionine RS in the *Standard preparation; W* is the weight, in g, of the portion of Selenomethionine taken to prepare the *Assay preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Purified Bentonite, *NF 23* page 2962. The proposed revision to the *Assay for aluminium and magnesium content* is based on comments received that the current *Magnesium standard preparations* concentrations of 50 ppm to 200 ppm are too high, considering that a magnesium concentration of less than 1 ppm is obtained if the magnesium content of the *Test preparation* is about 3%. Therefore, a further dilution of the 1 mg per mL *Magnesium standard stock preparation* is necessary before preparing the four working standard solutions. In addition, minor editorial style changes have been made.

(EMC: C. Sheehan) RTS—42194-1

Change to read:

Assay for aluminum and magnesium content—[NOTE—The *Standard preparations* and *Assay preparations* may be diluted quantitatively with water, if necessary, to obtain solutions of suitable concentrations, adaptable to the linear or working range of the instrument.]

Lanthanum solution—Stir 88.30 g of lanthanum chloride ($LaCl_3$) with 500 mL of 6 N hydrochloric acid until solution is complete, transfer with the aid of water to a 1000-mL volumetric flask, and dilute with water to volume.

Test preparation—Transfer 0.200 g of Purified Bentonite to a 25-mL platinum crucible containing 1.0 g of lithium metaborate, and mix. Using a muffle furnace or a suitable burner, heat slowly at first, and ignite at 1000° to 1200° for 15 minutes. Cool, place the crucible in a 100-mL beaker containing 25 mL of dilute nitric acid (1 in 20), and add an additional 50 mL of the dilute acid, filling and submerging the upright crucible. Place a polyfluorocarbon-coated magnetic stirring bar into the crucible, and stir gently with a magnetic stirrer until solution is complete. Pour the contents into a 250-mL beaker, and remove the crucible. Warm the solution, and transfer through a rapid-flow filter paper with the aid of water into a 200-mL volumetric flask, dilute with water to volume, and mix.

Aluminum standard stock preparation—Dissolve 1.000 g of aluminum in a mixture of 10 mL of hydrochloric acid and 10 mL of water by gentle heating. Transfer the solution to a 1000-mL volumetric flask, dilute with water to volume, and mix. This solution contains the equivalent of 1 mg of aluminum per mL.

Aluminum standard preparations—Transfer 2-, 5-, and 10-mL aliquots of the *Aluminum standard stock preparation* to separate 100-mL volumetric flasks containing 200 mg of sodium chloride, dilute each with water to volume, and mix.

Aluminum assay preparation—Pipet 20 mL of *Test preparation* into a 100-mL volumetric flask. Add 20 mL of a solution of sodium chloride (1 in 100), dilute with water to volume, and mix.

Procedure for aluminum—In a suitable atomic absorption spectrophotometer equipped with an aluminum hollow-cathode lamp and a single-slot burner, using an oxidizing air–acetylene–nitrous oxide flame, determine the absorbances of the *Aluminum assay preparation* and each of the *Aluminum standard preparations* at 309 nm. From a linear regression equation calculated from the absorbances and concentrations of the *Aluminum standard preparations*, determine the aluminum content of the Purified Bentonite.

Magnesium standard stock preparation—Place 1.000 g of magnesium in a 250-mL beaker containing 20 mL of water, and carefully add 20 mL of hydrochloric acid, warming, if necessary, to complete the reaction. Transfer the solution to a 1000-mL volumetric flask, dilute with water to volume, and mix. This solution contains the equivalent of 1 mg of magnesium per mL.

▲Transfer 10.0 mL of this solution to a 1000-mL volumetric flask, dilute with water to volume, and mix.▲*NF24*

Magnesium standard preparations—Transfer 5-, 10-, 15-, and 20-mL aliquots of the *Magnesium standard stock preparation* to separate 100-mL volumetric flasks. To each flask add 20.0 mL of *Lanthanum solution,* dilute with water to volume, and mix.

Magnesium assay preparation—Transfer a 25-mL aliquot of *Test preparation* to a 50-mL volumetric flask, dilute with water to volume, and mix. Transfer a 5.0-mL aliquot of this dilution to a 100-mL volumetric flask, add 20.0 mL of *Lanthanum solution,* dilute with water to volume, and mix.

Procedure for magnesium—In a suitable atomic absorption spectrophotometer equipped with a magnesium hollow-cathode lamp and a single-slot burner, using a reducing acetylene–air flame, determine the absorbances of the *Magnesium assay preparation* and each of the *Magnesium standard preparations* at 285 nm. From a linear regression equation calculated from the absorbances and concentrations of the *Magnesium standard preparations,* determine the magnesium content of the Purified Bentonite: the ratio of the aluminum content to the magnesium content is between 3.5 and 5.5.

BRIEFING

Carbomer 934P, *NF 23* page 2973. On the basis of comments received, it is proposed to revise the test for *Limit of benzene* to change the maximum column temperature and ramp rate in the *Chromatographic system* to coincide with the requirements in *Method V* under *Organic Volatile Impurities* ⟨467⟩. It is also proposed to reduce the injection volume in the *Procedure* from 4 µL to 1 µL. See also the briefing under *Carbomer Copolymer.*

(EMC: C. Sheehan, E. Gonikberg; NL: W.L. Paul) RTS—38241-1; 41274-5

Add the following:

▲**Labeling**—A carbomer homopolymer manufactured using benzene and complying with the unique requirements of this monograph will be officially titled Carbomer 934P and will not be referred to as *Carbomer Homopolymer.*▲*NF24*

Change to read:

Limit of benzene—

Standard solution—Dissolve an accurately weighed quantity of benzene quantitatively in methanol to obtain a solution having a known concentration of about 0.2 mg per mL. Dilute this solution quantitatively with organic-free water (see *Organic Volatile Impurities* ⟨467⟩) to obtain a solution having a known concentration of about 1.0 µg per mL.

Test solution—Transfer about 1 g of Carbomer 934P, accurately weighed, to a 100-mL volumetric flask. Add about 75 mL of sodium chloride solution (2 in 100), and mix by mechanical means until homogenous (usually about 30 minutes). Dilute with sodium chloride solution (2 in 100) to volume, and mix until homogenous (usually less than 1 minute). [NOTE—This preparation must be analyzed within 3 hours of preparation.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.53-mm × 30-m fused silica analytical column coated with a 3.0-µm G43 stationary phase, a 0.53-mm × 5-m silica guard column deactivated with phenylmethyl siloxane, and a splitless injection system. The carrier gas is helium flowing at a linear velocity of about 35 cm per second. The injection port and detector temperatures are maintained at 140° and 260°, respectively. The column temperature is programmed according to the following steps: it is held at 40° for 20 minutes, then increased ~~at 50° per minute to 260°, and held at 260° for 20 minutes.~~

▲rapidly to 240°, and maintained at 240° for 20 minutes.▲*NF24*

BRIEFING

Carbomer Copolymer, *NF 23* page 2974; **Carbomer Homopolymer,** page 2013 of *PF* 29(6) [Nov.–Dec. 2003]; **Carbomer Interpolymer,** *NF 23* page 2976; **Carbomer 934,** *NF 23* page 2972; **Carbomer 934P,** *NF 23* page 2973; **Carbomer 940,** *NF 23* page 2973 and page 1328 of *PF* 30(4) [July–Aug. 2004]; **Carbomer 941,** *NF 23* page 2974; **Carbomer 1342,** *NF 23* page 2974. On the basis of comments received, it is proposed to make the following changes:

1. Revise the Definition and *Labeling* under *Carbomer Homopolymer* and *Carbomer Copolymer* to clearly define that these monographs cover only carbomers manufactured without using benzene as a solvent. Add a statement under *Labeling* for *Carbomer 934, Carbomer 934P, Carbomer 940,* and *Carbomer 941* to clarify that these monographs cover carbomers manufactured with the use of benzene, which will not be referred to as *Carbomer Homopolymer.* Similarly, add a statement under *Labeling* for *Carbomer 1342* to clarify that this monograph covers a carbomer manufactured with the use of benzene, which will not be referred to as *Carbomer Copolymer.*
2. Clarify the Definition for *Carbomer Copolymer* and *Carbomer Homopolymer* by replacing the term ''polyalkenyl ethers'' with ''allyl ethers''.
3. Add a test for *Limit of benzene* and establish a strict limit of benzene (not more than 2 ppm) for *Carbomer Copolymer, Carbomer Homopolymer,* and *Carbomer Interpolymer.*
4. Add a test for *Organic volatile impurities* (*Method IV*) to *Carbomer Copolymer, Carbomer Homopolymer,* and *Carbomer Interpolymer.*
5. In the test for *Content of carboxylic acid* under *Carbomer Copolymer,* delete the reference to the pH value at the titration endpoint to make the method consistent with the currently official method under *Carbomer 934P.* This change also affects *Carbomer Homopolymer* and *Carbomer Interpolymer.*

In addition, there are also some editorial changes.

(EMC: E. Gonikberg, C. Sheehan; NL: W. L. Paul) RTS—41274-2

Change to read:

» Carbomer Copolymer is a high molecular weight copolymer of acrylic acid and a long chain alkyl methacrylate cross-linked with ~~polyalkenyl~~

▲allyl▲*NF24*
ethers of polyalcohols.

NOTE—

▲The heading of this monograph does not constitute the official title for a *Carbomer Copolymer* manufactured with the use of benzene. When benzene is used in the manufacturing process, the name will be *Carbomer 1342,* provided it complies with the existing requirements in the *Carbomer 1342* monograph.▲*NF24*

Different types of Carbomer Copolymers may not have identical properties with respect to their use for specific pharmaceutical purposes, e.g., as controlled-release agents, bioadhesives, topical gels, thickening agents, and emulsifying agents. Therefore, different types of Carbomer Copolymers should not be interchanged unless performance equivalency has been ascertained.

Change to read:

Labeling— ~~Label it to indicate the nominal viscosity range and~~

▲If benzene has been used in the manufacturing process, the name of the article will be *Carbomer 1342,* provided it complies with and is labeled in accordance with the requirements set forth in that monograph. If benzene is not used in the manufacturing process, label it to indicate whether it is Type A, B, or C; and also to state▲*NF24*
the measured viscosity, the solvent or solvents used in the polymerization process, and the nominal and residual solvent levels for each solvent.

Add the following:

▲**Limit of benzene**—[NOTE—This test does not apply to articles labeled *Carbomer 1342.* Those articles meet a different set of requirements for *Limit of benzene* found in the monograph for *Carbomer 1342*.]

Solvent solution—Dissolve an accurately weighed quantity of benzene quantitatively in dimethyl sulfoxide to obtain a solution having a concentration of about 1.0 mg per mL. Dilute this solution quantitatively, and stepwise if necessary, with organic-free water (see *Organic Volatile Impurities* ⟨467⟩) to obtain a solution having a concentration of about 0.1 µg per mL.

Test solution—Transfer about 50 mg of Carbomer Copolymer, accurately weighed, to a 10-mL volumetric flask. Add about 7.5 mL of sodium chloride solution (2 in 100), and mix by mechanical means until homogeneous (usually about 30 minutes). Dilute with sodium chloride solution

In-Process Revision

(2 in 100) to volume, and mix until homogeneous (usually less than 1 minute). [NOTE—This preparation must be analyzed within 3 hours of preparation.]

Reference solution—Transfer about 50 mg of Carbomer Copolymer, accurately weighed, to a 10-mL volumetric flask. Add about 7.5 mL of sodium chloride solution (2 in 100), and mix by mechanical means until homogeneous (usually about 30 minutes). Add 1.0 mL of the *Solvent solution,* dilute with sodium chloride solution (2 in 100) to volume, and mix until homogeneous (usually less than 1 minute). This solution contains about 0.01 µg of benzene per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a headspace injector, flame-ionization detector, and a 0.53-mm × 30-m fused silica analytical column coated with a 3.0-µm G43 stationary phase. The carrier gas is helium flowing at a linear velocity of about 35 cm per second, and the split ratio is 1 : 5. The injection port and detector temperatures are maintained at 140° and 250°, respectively. The column temperature is programmed according to the following steps: it is held at 40° for 20 minutes after injection, then increased at 10° per minute to 240°, and held at 240° for 20 minutes. [NOTE—The following headspace conditions may be used: a pressurization time of 30 seconds and a transfer line temperature of 90°.] The vials are maintained at a temperature of 80° for 60 minutes prior to headspace injection. Chromatograph the *Reference solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for three replicate injections is not more than 15%.

Procedure—[NOTE—Use peak areas where peak responses are indicated.] Transfer 10.0 mL each of the *Reference solution* and the *Test solution* to separate headspace vials. Close the vials with a tight rubber membrane stopper coated with polytetrafluoroethylene, and secure with an aluminum crimped cap. Shake to obtain a homogeneous dispersion. Separately inject equal volumes (about 1 mL) of the gaseous phase of the *Reference solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the benzene peaks. Calculate the percentage of benzene in the portion of Carbomer Copolymer taken by the formula:

$$(C/W)(r_U / r_S),$$

in which C is the concentration, in µg per mL, of benzene in the *Reference solution; W* is the weight, in mg, of Carbomer Copolymer taken to prepare the *Test solution;* and r_U and r_S are the benzene peak responses obtained from the *Test solution* and the *Reference solution,* respectively: not more than 0.0002% is found.▲*NF24*

Add the following:

▲**Organic volatile impurities,** *Method IV* ⟨467⟩: meets the requirements for chloroform, 1,4-dioxane, methylene chloride, and trichloroethylene.▲*NF24*

Change to read:

Content of carboxylic acid—Slowly add about 400 mg of Carbomer Copolymer, previously dried in vacuum at 80° for 1 hour and accurately weighed, to 400 mL of water in a 1000-mL beaker, while stirring continually at about 1000 rpm. The stirrer shaft is set at an angle of about 60° and to one side of the beaker, and the propeller is positioned near the bottom of the beaker. Continue stirring for 15 minutes. Reduce the stirring speed, and using a calomel-glass electrode system, titrate potentiometrically with 0.25 N sodium hydroxide VS ~~to a pH of 10.0~~

▲▲*NF24*
(see *Titrimetry* ⟨541⟩). After each addition of 0.25 N sodium hydroxide VS, allow 1 minute for mixing before recording the pH. Calculate the percentage of carboxylic acid in the portion of Carbomer Copolymer taken by the formula:

$$100(45.02VN/W),$$

in which 45.02 is the molecular weight of the carboxylic acid (–COOH) group; V is the volume, in mL, of sodium hydroxide consumed; N is the normality of the sodium hydroxide solution; and W is the weight, in mg, of Carbomer Copolymer taken. The carboxylic acid content is not less than 52.0% and not more than 62.0%.

BRIEFING

Carbomer Homopolymer, page 2013 of *PF* 29(6) [Nov.–Dec. 2003]. See briefing under *Carbomer Copolymer.* In addition, it is proposed to revise the test for *Loss on drying* to lower the limit to 2.0%.

(EMC: E. Gonikberg, C. Sheehan; NL: W.L.Paul) RTS—41274-1

Add the following:

▲Carbomer Homopolymer

» Carbomer Homopolymer is a high molecular weight polymer of acrylic acid cross-linked with ~~polyalkenyl~~ allyl ethers of polyalcohols. Carbomer Homopolymer, previously dried, contains not less than 56.0 percent and not more than 68.0 percent of carboxylic acid (–COOH) groups.

NOTE— ~~Carbomer Homopolymer is manufactured without the use of benzene. Specifically, ethyl acetate or a mixture of ethyl acetate and cyclohexane is used.~~ The heading of this monograph does not constitute the official title for a Carbomer Homopolymer manufactured with the use of benzene. When benzene is used in the manufacturing process, the name of the article will be Carbomer 934, Carbomer 934P, Carbomer 940, or Carbomer 941, whichever is appropriate. Carbomer Homopolymer obtained from different manufacturers or produced in different solvents with different manufacturing processes may not have identical properties with respect to its use for specific pharmaceutical purposes, e.g., as tablet controlled-release agents, bioadhesives, topical gellants, etc. Therefore, types of Carbomer Homopolymer should not be interchanged unless performance equivalency has been ascertained.

Packaging and storage—Preserve in tight containers, at a temperature not exceeding 45°.

~~**USP Reference standards** ⟨11⟩ *USP Carbomer Homopolymer RS.*~~

Labeling— ~~The label states the nominal viscosity range of a defined neutralized dispersion; the solvent used in the polymerization process and residual level; and, where applicable, that the Carbomer Homopolymer has been slightly preneutralized.~~ If benzene has been used in the manufacturing process, the name of the article will be Carbomer 934, Carbomer 934P, Carbomer 940, or Carbomer 941, whichever is appropriate. In addition, when benzene is used, the labeling requirements for the referenced individual Carbomer are applicable. If benzene is not used in the manufacturing process, label it to indicate whether it is Type A, B, or C; and also to state the measured viscosity, the solvent or solvents used in the polymerization process, and the nominal and residual solvent levels for each solvent.

Identification—

A: *Infrared Absorption* ⟨197K⟩—The IR spectrum exhibits main bands at or near (±5) wave numbers (cm^{-1}) 1710, 1454, 1414, 1245, 1172, 1115, and 801, with the strongest band at 1710.

~~**B:** The viscosity test result complies with the viscosity range indicated on the label.~~

~~**C:**~~ **B:** Adjust a 1 in 100 dispersion of it with 1 N sodium hydroxide to a pH of about 7.5: a viscous gel is produced.

In-Process Revision

~~**D.**~~ **C:** Add 2 mL of a 1 in 10 aqueous solution of calcium chloride, while stirring, to 10 mL of the gel obtained from *Identification* test ~~*C*~~ *B:* a white precipitate is immediately produced.

~~**E.**~~ **D:** Prepare a 1 in 100 dispersion of it. Add 0.5 mL of thymol blue TS to 10 mL of the dispersion: an orange color is produced. To another 10 mL of the dispersion add 0.5 mL of cresol red TS: a yellow color is produced.

Viscosity ⟨911⟩—Carefully add 2.50 g of the resin, which has been previously dried, to 500 mL of water in a 800-mL beaker, while stirring continuously at 1000 ± 50 rpm. The stirrer shaft is set at an angle of 60° and positioned at one side of the beaker, and the propeller is positioned near the bottom of the beaker. The stirrer used should be a three-blade, 2-inch marine impeller. Add Carbomer Homopolymer at a uniform rate over a period of 45 to 60 seconds, being sure that loose aggregates of powder are broken up, and continue stirring at 1000 ± 50 rpm for 15 minutes. [NOTE—Proper dispersion of the Carbomer Homopolymer resin is imperative for accurate viscosity readings.] Remove the stirrer, and let the beaker containing the dispersion stand at controlled room temperature for 30 minutes. Insert a paddle stirrer to a depth necessary to ensure that the air is not drawn into the dispersion, and while stirring at 300 ± 25 rpm, titrate potentiometrically (see *Titrimetry* ⟨541⟩) with sodium hydroxide solution (18 in 100) to the pH indicated on the label. (For example, if the pH is 7.3, then the total volume of sodium hydroxide would be about 5.4 mL.) After adding the sodium hydroxide solution, stir with a paddle mixer at 300 ± 25 rpm for 2 to 3 minutes. [NOTE—After neutralization, care must be taken to avoid excessively high shearing, as aggressive mixing will break the polymer chains and reduce the viscosity reading.] Take the final pH reading with a pH meter. If the final pH exceeds that indicated on the label, discard the mucilage, and prepare another using a smaller amount of sodium hydroxide for titration. Place the neutralized mucilage into a water bath maintained at 25 ± 2° for 1 hour, then perform the viscosity determination without delay.

Equip a suitable rotational viscometer (i.e., a Brookfield RVT or RVF viscometer) with a suitable spindle, as defined in the chart below. For spindle dimensions, consult the table under *Carbomer Copolymer.*

Expected Viscosity (cP)	Spindle Number	Multiplier
100–400	1	5
400–1600	2	20
1000–4000	3	50
2000–8000	4	100
4000–16,000	5	200
10,000–40,000	6	500
40,000–160,000	7	2000

With the spindle rotating at 20 rpm, observe and record the scale reading. Calculate the viscosity, in centipoise, by multiplying the scale reading by the multiplier defined in the table above for the spindle used at 20 rpm. ~~Viscosity results for the type of Carbomer Homopolymer falls within the range specified in the label when measured at 25 ± 2° and 20 rpm.~~ The viscosity values, determined by the conditions specified herein, are within the limits specified in the accompanying table.

Carbomer Homopolymer	Viscosity Specified (cP)
A	4,000–11,000
B	25,000–45,000
C	40,000–60,000

Loss on drying ⟨731⟩—Dry it in vacuum at 80° for 1 hour: it loses not more than ~~3.0%~~ 2.0% of its weight.

Residue on ignition ⟨231⟩**:** not more than 4.0%, determined on 1.0 g.

Heavy metals, *Method II* ⟨231⟩**:** not more than 0.002%.

Limit of ethyl acetate and cyclohexane—[NOTE—This test is required only for those Carbomer Homopolymers whose labeling indicates that ethyl acetate or a mixture of ethyl acetate and cyclohexane was used in the polymerization process.]

Standard stock solution—Transfer 5.0 mL of methanol to a 10-mL serum vial, insert a rubber septum, and seal with a metal cap. Add an accurately weighed quantity of about 25.0 µL of ethyl acetate and 20.0 µL of cyclohexane through the septum into the vial, and mix.

Standard solution—Transfer 20.0 mL of methanol to a 30-mL serum vial, insert a rubber septum, and seal with a metal cap. Through the rubber septum, add 10 µL of methyl ethyl ketone (internal standard) and 50.0 µL of the *Standard stock solution,* and mix.

Test solution—Transfer about 50 mg of Carbomer Homopolymer, accurately weighed, to a 30-mL serum vial, add 20 mL of methanol, insert a rubber septum, and seal with a metal cap. Through the rubber septum, add 10 µL of methyl ethyl ketone, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed under *Carbomer Copolymer.*

Procedure—Proceed as directed under *Carbomer Copolymer,* except to calculate the percentages of ethyl acetate and cyclohexane in the portion of Carbomer Homopolymer taken by the formula:

$$100(W_S / W_T)(R_U / R_S),$$

in which W_S is the weight, in mg, of ethyl acetate or cyclohexane, as appropriate, in the *Standard solution;* W_T is the weight, in mg, of Carbomer Homopolymer taken to prepare the *Test solution;* and R_U and R_S are the peak area ratios of the relevant analyte peak to the methyl ethyl ketone peak obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.5% of ethyl acetate and not more than 0.3% of cyclohexane is found.

Limit of benzene—[NOTE—This test is required only for those Carbomer Homopolymers whose labeling indicates that benzene was used in the polymerization process.]

Standard solution—Quantitatively dissolve an accurately weighed quantity of benzene in methanol to obtain a solution having a known concentration of about 0.2 mg per mL. Dilute this solution quantitatively with organic-free water (see *Organic Volatile Impurities* ⟨467⟩) to obtain a solution having a known concentration of about 1.0 µg per mL.

Test solution—Transfer an accurately weighed quantity of about 100 mg of Carbomer Homopolymer to a 100-mL volumetric flask. Add about 75 mL of sodium chloride solution (2 in 100), and mix by mechanical means until homogeneous (about 30 minutes). Dilute with sodium chloride solution (2 in 100) to volume, and mix until homogeneous (1 minute or less). [NOTE—This preparation must be analyzed within 3 hours of preparation.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.53-mm × 30-m fused-silica analytical column coated with a 3.0-µm G43 stationary phase, a 0.53-mm × 5-m silica guard column deactivated with phenylmethyl siloxane, and a splitless injection system. The carrier gas is helium flowing at a linear velocity of about 35 cm per second. The injection port and detector are maintained at 140° and 260°, respectively. The column temperature is programmed according to the following steps: it is held at 40° for 20 minutes after injection, then increased at 50° per minute to 260°, and held at 260° for 20 minutes. Chro-

In-Process Revision

~~matograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 15%.~~

~~*Procedure*— Separately inject equal volumes (about 4 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the benzene peaks. Calculate the percentage of benzene in the portion of Carbomer Homopolymer taken by the formula:~~

~~$10(C/W)(r_u / r_s)$,~~

~~in which *C* is the concentration, in µg per mL, of benzene in the *Standard solution; W* is the weight, in mg, of Carbomer Homopolymer taken to prepare the *Test solution;* and r_u and r_s are the benzene peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.1% is found.~~ [NOTE—This test does not apply to those articles titled *Carbomer 934*, *Carbomer 934P*, *Carbomer 940* or *Carbomer 941*. Those articles meet the requirements for *Limit of benzene* in their respective individual monographs.]

Solvent solution—Dissolve an accurately weighed quantity of benzene quantitatively in dimethyl sulfoxide to obtain a solution having a concentration of about 1.0 mg per ml. Dilute this solution quantitatively, and stepwise if necessary, with organic-free water (see *Organic Volatile Impurities* ⟨467⟩) to obtain a solution having a concentration of about 0.1 µg per mL.

Test solution—Transfer about 50 mg of Carbomer Homopolymer, accurately weighed, to a 10-mL volumetric flask. Add about 7.5 ml of sodium chloride solution (2 in 100), and mix by mechanical means until homogeneous (usually about 30 minutes). Dilute with sodium chloride solution (2 in 100) to volume, and mix until homogeneous (usually less than 1 minute). [NOTE—This preparation must be analyzed within 3 hours of preparation.]

Reference solution—Transfer about 50 mg of Carbomer Homopolymer, accurately weighed, to a 10-mL volumetric flask. Add about 7.5 mL of sodium chloride solution (2 in 100), and mix by mechanical means until homogeneous (usually about 30 minutes). Add 1.0 mL of the *Solvent solution*, dilute with sodium chloride solution (2 in 100) to volume, and mix until homogeneous (usually less than 1 minute). This solution contains about 0.01 µg of benzene per mL.

Chromatographic system—Proceed as directed in the test for *Limit of benzene* under *Carbomer Copolymer.*

Procedure—Proceed as directed in the test for *Limit of benzene* under *Carbomer Copolymer*. Calculate the percentage of benzene in the portion of Carbomer Homopolymer taken by the formula:

$$(C/W)(r_U / r_S),$$

in which *C* is the concentration, in µg per mL, of benzene in the *Reference solution; W* is the weight, in mg, of Carbomer Homopolymer taken to prepare the *Test solution;* and r_U and r_S are the benzene peak responses obtained from the *Test solution* and the *Reference solution,* respectively: not more than 0.0002% is found.

Organic volatile impurities, *Method IV* ⟨467⟩**:** meets the requirements for chloroform, 1,4-dioxane, methylene chloride, and trichloroethylene.

Limit of acrylic acid—

0.01 M Phosphate buffer—Dissolve 1.361 g of monobasic potassium phosphate in 100 mL of water, and mix.

Solution A—Use *0.01 M Phosphate buffer.*

Solution B—Prepare a filtered and degassed mixture of *0.01 M Phosphate buffer* and acetonitrile (1 : 1, v/v).

In-Process Revision

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Solvent—Dissolve 25 g of potassium alum in 1000 mL of water, and mix.

Standard solution—Dissolve an accurately weighed quantity of acrylic acid in the *Solvent*, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a concentration of about 12.5 µg per mL.

Test solution—Mix about 100 mg of Carbomer Homopolymer, accurately weighed, with *Solvent,* and add *Solvent* to obtain 20.0 mL of suspension. Heat the suspension at 50° for 20 minutes with occasional shaking. Then shake the suspension continuously at room temperature for 60 minutes. Centrifuge and use the clear supernatant.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 205-nm detector and a 4.6-mm × 12-cm column that contains packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibration
0–8	100	0	isocratic
8–9	100→0	0→100	linear gradient
9–20	0	100	isocratic
20–21	0→100	100→0	linear gradient
21–30	100	0	isocratic

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 5%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the response for the acrylic acid peaks. Calculate the percentage of free acrylic acid in the portion of Carbomer Homopolymer taken by the formula:

$$(C/W)(r_U / r_S),$$

in which C is the concentration, in µg per mL, of acrylic acid in the *Standard solution; W* is the weight, in mg, of Carbomer Homopolymer taken to prepare the *Test solution;* and r_U and r_S are the acrylic acid responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.25% is found.

Content of carboxylic acid—~~Slowly add about 400 mg of Carbomer Homopolymer, previously dried in vacuum at 80° for 1 hour and accurately weighed, to 400 mL of water in a 800-mL beaker, while stirring continuously at about 1000 rpm. The stirrer shaft is set at an angle of 60° and positioned at one side of the beaker, and the propeller is positioned near the bottom of the beaker. Continue stirring for 15 minutes. Reduce the stirring speed, and, using a calomel glass electrode, titrate potentiometrically with 0.25 N sodium hydroxide VS to a pH of 10.0 (see *Titrimetry* ⟨541⟩). Allow 1 minute for mixing, after each addition of 0.25 N sodium hydroxide VS, before recording the pH. Calculate the percentage of carboxylic acid in the portion of Carbomer Homopolymer taken by the formula:~~

~~$100(45.02VN/W),$~~

~~in which V is the volume, in mL, of sodium hydroxide solution consumed; N is the normality of the sodium hydroxide solution; W is the weight, in mg, of Carbomer Homopolymer taken; and 45.02 is the molecular weight of~~

In-Process Revision

~~the carboxylic acid (–COOH) group.~~ Proceed as directed in the test for *Content of carboxylic acid* under *Carbomer Copolymer,* except to calculate the percentage of carboxylic acid in the portion of Carbomer Homopolymer taken by the formula:

$$100(45.02VN/W),$$

in which W is the weight, in mg, of the portion of Carbomer Homopolymer taken; and the other terms are as defined therein.▲*NF24*

BRIEFING

BRIEFING

Cetostearyl Alcohol, *NF 23* page 2985. On the basis of comments received regarding the difficulty in meeting the current system suitability requirements in the *Assay,* it is proposed to revert to the requirements for relative standard deviation that were specified in the original version of the monograph.

(EMC: D. Bempong) RTS—42187-1

Change to read:

Assay—

System suitability solution—Dissolve accurately weighed quantities of USP Cetyl Alcohol RS and USP Stearyl Alcohol RS in alcohol to obtain a solution having a known concentration of about 5 mg of each per mL.

Assay preparation—Dissolve 100 mg of Cetostearyl Alcohol in 10.0 mL of dehydrated alcohol, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 3-mm × 2-m column packed with 10% liquid phase G2 on support S1A. The carrier gas is helium. The column temperature is maintained at about 205°, the injection port temperature at about 275°, and the detector temperature at about 250°. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between cetyl alcohol and stearyl alcohol is not less than 4.0; and the relative standard deviation for replicate injections is not more than 1.5%

▲for the percentages of $C_{16}H_{34}O$ and $C_{18}H_{38}O$.▲*NF24*

Procedure—Inject about 2 µL of the *Assay preparation* into the chromatograph, record the chromatogram, and measure the areas for the major peaks. Separately calculate the percentages of cetyl alcohol ($C_{16}H_{34}O$) and stearyl alcohol ($C_{18}H_{38}O$) in the portion of Cetostearyl Alcohol taken by the formula:

$$100(r_U / r_s),$$

in which r_U is the peak area obtained from cetyl alcohol or stearyl alcohol; and r_s is the sum of the areas of all the peaks, except the solvent peak.

BRIEFING

Cetyl Alcohol, *NF 23* page 2986 and page 970 of *PF* 30(3) [May–June 2004]. As a result of comments received regarding difficulty in meeting the revised system suitability requirements for the *Assay,* it is proposed to change the relative standard deviation to the original requirement.

(EMC: D. Bempong) RTS—42195-1

Change to read:

Assay—

System suitability solution—Dissolve accurately weighed quantities of USP Cetyl Alcohol RS and USP Stearyl Alcohol RS in ■dehydrated■1S *(NF23)* alcohol to obtain a solution having known concentrations of about 9 mg per mL and 1 mg per mL, respectively.

Assay preparation—Dissolve 100 mg of Cetyl Alcohol in 10.0 mL of dehydrated alcohol, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 3-mm × 2-m column packed with 10% liquid phase G2 on support S1A. The carrier gas is helium. The column temperature is maintained at about 205°, the injection port temperature is maintained at about 275°, and the detector temperature is maintained at about 250°. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between cetyl alcohol and stearyl alcohol is not less than 4.0; and the relative standard deviation for replicate injections,

▲calculated with the area ratio of cetyl alcohol to stearyl alcohol,▲*NF24* is not more than 1.5%.

Procedure—Inject about 2 µL of the *Assay preparation* into the chromatograph, record the chromatogram, and measure the areas for the major peaks. Calculate the percentage of $C_{16}H_{34}O$ in the portion of Cetyl Alcohol taken by the formula:

$$100(r_U / r_s),$$

in which r_U is the peak area for cetyl alcohol obtained from the *Assay preparation;* and r_s is the sum of the areas of all the peaks except the solvent peak.

In-Process Revision

BRIEFING

Glyceryl Monostearate, *NF 23* page 3015 and page 975 of *PF* 30(3) [May–June 2004]. On the basis of comments received, it is proposed to revise the *Assay for monoglycerides* to update the monograph with a size-exclusion liquid chromatographic method that is comparable to assay procedures for similar monographs. It is also proposed to delete the *USP Reference standards* section because no reference standard is used.

(EMC: J. Lane) RTS—42249-1

Delete the following:

▲~~**USP Reference standards** ⟨11⟩ — *USP Monoglycerides RS.*~~ ▲*NF24*

Change to read:

Hydroxyl value ⟨401⟩**:** between ~~300~~

■290■1S (*NF23*)
and 330.

Change to read:

Saponification value ⟨401⟩**:** between ~~155~~

■150■1S (*NF23*)
and 165.

Change to read:

Assay for monoglycerides—

~~*Propionating reagent*—Mix 10 mL of pyridine and 20 mL of propionic anhydride.~~

~~*Internal standard solution*—Transfer about 400 mg of hexadecyl hexadecanoate, accurately weighed, to a 100-mL volumetric flask, dissolve in chloroform, dilute with chloroform to volume, and mix.~~

~~*Standard preparation*—Transfer about 50 mg of USP Monoglycerides RS, accurately weighed, to a 25-mL conical flask, add by pipet 5 mL of *Internal standard solution,* and mix. When solution is complete, immerse the flask in a water bath maintained at a temperature between 45° and 50°, and volatilize the chloroform with the aid of a stream of nitrogen. Add 3.0 mL of *Propionating reagent,* and heat on a hot plate at 75° for 30 minutes. Evaporate the reagents with the aid of a stream of nitrogen and gentle steam heat. Add 15 mL of chloroform, and swirl to dissolve the residue.~~

~~*Assay preparation*—Transfer about 50 mg of Glyceryl Monostearate, accurately weighed, to a 25-mL conical flask, and proceed as directed for *Standard preparation,* beginning with "add by pipet 5 mL of *Internal standard solution*."~~

~~*Chromatographic system*—Under typical conditions the instrument is equipped with a flame-ionization detector, and contains a 4-mm × 2.4-m borosilicate glass column packed with 2% liquid phase G27 on 80- to 100-mesh support S1A. The column is maintained isothermally at a temperature between 270° and 280°, the injection port and detector block temperature are maintained at about 310°, and helium is used as the carrier gas at a flow rate of about 70 mL per minute.~~

~~*System suitability*—Chromatograph six to ten injections of the *Standard preparation* as directed for *Procedure:* the resolution factor, *R,* between the peaks for the derivatized glyceryl hexadecanoate and glyceryl octadecanoate is not less than 2.0, and the relative standard deviation of the ratio of the peak area of the derivatized glyceryl octadecanoate to that of the hexadecyl hexadecanoate is not more than 2.0%.~~

~~*Procedure*—Inject a suitable portion of the *Standard preparation* into a suitable gas chromatograph, and record the chromatogram. Measure the areas under the peaks, and record the values of the sum of the areas under the derivatized monoglyceride peaks and of the area under the hexadecyl hexadecanoate peak as A_s and A_u, respectively. Calculate the response factor, F, by the formula:~~

$$(A_s/A_u)(W_u/W_s),$$

~~in which W_u and W_s are the weights, in mg, of hexadecyl hexadecanoate and USP Monoglycerides RS, respectively, in the *Standard preparation.* Similarly inject a suitable portion of the *Assay preparation,* and record the chromatogram. Measure the areas under the peaks, and record the values of the sum of the areas under the derivatized monoglyceride peaks and of the area under the hexadecyl hexadecanoate peak as a_s and a_u, respectively. Calculate the quantity, in mg, of monoglycerides in the amount of Glyceryl Monostearate taken by the formula:~~

$$(W_u/F)(a_s/a_u),$$

~~in which the terms are as defined therein.~~

▲*Mobile phase*—Use tetrahydrofuran.

Assay preparation—Transfer about 40 mg of Glyceryl Monostearate, accurately weighed, to a 5-mL volumetric flask, dissolve in and dilute with tetrahydrofuran to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector and a 7.5-mm × 60-cm column containing 5-µm 100-Å packing L21. The column and the detector temperatures are maintained at 40°. [NOTE—Two or three 7.5-mm × 30-cm L21 columns may be used in place of the one 60-cm column, provided that system suitability requirements are met; and the column temperature may be lowered to ambient temperature, although working at 40° provides stable separation conditions and ensures better sample solubility.] The flow rate is about 1 mL per minute. Chromatograph the *Assay preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.0 for glycerin, 0.86 for monoglycerides, 0.81 for di-

In-Process Revision

glycerides, and 0.77 for triglycerides; and the relative standard deviation for replicate injections determined from the monoglycerides peak is not more than 2.0%.

Procedure—Inject a volume (about 40 µL) of the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of monoglycerides in the portion of Glyceryl Monostearate taken by the formula:

$$100(r_i / r_s),$$

in which r_i is the peak response for the monoglycerides; and r_s is the sum of the responses for all the glyceride peaks. ▲*NF24*

BRIEFING

Purified Honey. Because there is no existing *NF* monograph for this excipient, a new monograph based on submitted data is being proposed.

(EMC: D. Bempong; AMB: R. Tirumalai) RTS—33071-1; 31287-1

In-Process Revision

Add the following:

▲Purified Honey

» Purified Honey is obtained by purification of honey from the comb of the bee, *Apis mellifera L.* and all subspecies of *Apis mellifera*. The honey is extracted by centrifugation, pressure, or other suitable procedures.

Packaging and storage—Preserve in tight containers. No storage requirements specified.

Labeling—Label it to indicate that it is not intended for use in preparations for infants under one year of age, unless it meets the requirement for *Clostridium* species.

USP Reference standards ⟨11⟩—*USP L-Proline RS.*

Identification—To a 0.5-mL aliquot of a solution (1 in 20) in a reaction vial add 0.25 mL of formic acid and 1.0 mL of freshly prepared 3% solution of ninhydrin in peroxide-free ethylene glycol monomethyl ether. Cap the reaction vial tightly, shake well, and place in boiling water for 15 minutes. Cool for 5 minutes in a 22° water bath, remove the cap, and add 5.0 mL of 5% aqueous isopropanol solution. The solution shows a purple color similar to, or more intense than, that of a similarly treated 7.5-µg-per-mL solution of USP L-Proline RS. If necessary, scan the solutions being compared using a suitable spectrophotometer against a water blank. The two solutions each exhibit a maximum at the same wavelength, at about 520 nm. The absorbance of the sample solution should be at least as high as that of the similarly treated 7.5-µg-per-mL solution of USP L-Proline RS.

Specific gravity ⟨841⟩**:** between 1.400 and 1.435 at 20°.

Refractive index ⟨831⟩**:** between 1.4900 and 1.4992 at 20°.

Microbial limits ⟨61⟩—The total bacterial count does not exceed 1000 cfu per g, the total combined molds and yeasts count does not exceed 100 cfu per g.

Clostridium species—Where it is intended for use in preparations for infants under one year of age, it meets the requirements for absence of *Clostridium* species in *Microbiological Procedures for Absence of Specified Microorganisms—Nutritional and Dietary Supplements* ⟨2022⟩.

Water, *Method I* ⟨921⟩**:** between 15.0% and 18.6%.

Chloride ⟨221⟩—A 1-g portion shows no more chloride than corresponds to 0.5 mL of 0.020 N hydrochloric acid (0.035%).

Sulfate ⟨221⟩—A 2-g portion shows no more sulfate than corresponds to 0.5 mL of 0.020 N sulfuric acid (0.024%).

Total ash ⟨561⟩: not more than 0.3%.▲*NF24*

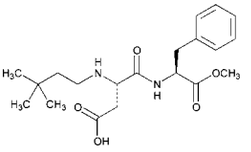
BRIEFING

Neotame. Because there is no existing *NF* monograph for this article, the following new monograph, which is based on submitted data, is being proposed. The liquid chromatographic procedures in the *Assay* and in the test for *Related compounds* are based on analysis performed with the Whatman Partisil 5 ODS 3, RAC II brand of L1. The typical retention time for neotame is about 12 minutes.

(EMC: D. Bempong; PSD: C. Okeke; NL: C. Barnstein)
RTS—41442-1

Add the following:

▲Neotame



$C_{20}H_{30}N_2O_5$ 378.47

L-Phenylalanine, *N*-[*N*-(3,3-dimethylbutyl)-L-α-aspartyl]-1-methyl ester.

N-[*N*-(3,3-Dimethylbutyl)-L-α-aspartyl]-L-phenylalanine 1-methyl ester [*165450-17-9*].

» Neotame contains not less than 97.0 percent and not more than 102.0 percent of $C_{20}H_{30}N_2O_5$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers, store in a dry place, and avoid exposure to excessive heat.

USP Reference standards ⟨11⟩—*USP Neotame RS. USP Neotame Related Compound A RS.*

Identification, *Infrared Absorption* ⟨197K⟩.

Specific rotation ⟨781S⟩**:** between –40.0° and –43.4°, determined at 20°.

Test solution: 5 mg per mL, in water.

Water, *Method Ic* ⟨921⟩**:** not more than 5.0%.

Residue on ignition ⟨281⟩**:** not more than 0.2%.

Lead—[NOTE—Use acid-cleaned (mixture of 5% nitric acid and 5% hydrochloric acid followed by rinsing with water) autosampler cups and volumetric glassware to avoid contamination. For the preparation of all aqueous solutions and for the rinsing of glassware before use, employ water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin. Select all reagents to have as low a content of lead as practicable. Store standards and samples in acid-cleaned polyethylene containers.]

Diluent—Transfer 2 mL of lead-free nitric acid into a 1000-mL volumetric flask, dilute with water to volume, and mix.

Standard stock solution—Dissolve 79.9 mg of lead nitrate in 100 mL of *Diluent* in a 500-mL volumetric flask, and dilute with *Diluent* to volume. Transfer 10.0 mL of the resulting solution into a 100-mL volumetric flask, and dilute with *Diluent* to volume. Each mL of the *Standard stock solution* contains the equivalent of 10 µg of lead.

Standard solutions—Dilute aliquots of the *Standard stock solution* quantitatively and stepwise, if necessary, with *Diluent* to obtain solutions having concentrations of 0.03 and 0.015 µg per mL.

Test solution—Transfer 160 mg of Neotame, accurately weighed, to a 10-mL volumetric flask. Dissolve in and dilute with *Diluent* to volume.

Blank—Use the *Diluent* as the blank.

Procedure—Separately inject equal volumes (about 15 µL) of the *Standard solutions*, the *Blank*, and the *Test solution* into a suitable graphite furnace atomic absorption spectrophotometer set at 283.3 nm and equipped with an autosampler, pyrolytically coated graphite tubes, solid pyrolytic graphite platform, and an adequate means of background correction. Use a hollow-cathode lamp as the source, use argon as the purge gas, and breathing-quality air as the alternate gas. Optimize the instrument program as recommended by the manufacturer for lead, using a char temperature of 500° and an atomization temperature of 2000°. Correct the area responses of all *Test solutions* and *Standard solutions* for the *Blank* area response. Generate the appropriate lead calibration algorithm, and determine the lead concentration in the *Test solution,* in µg per mL. Calculate the percentage of lead in the portion of Neotame taken by the formula:

$$1000(C/W),$$

in which C is the blank corrected lead concentration in the *Test solution,* in µg per mL; and W is the weight, in µg, of Neotame taken for the *Test solution:* not more than 0.0002% is found.

Related compounds—

Mobile phase—Proceed as directed in the *Assay.*

Related compound A standard solution—Dissolve an accurately weighed quantity of USP Neotame Related Compound A RS in *Mobile phase* to obtain a solution having a known concentration of about 0.03 mg per mL.

Detector sensitivity solution—Transfer 2 mL of the *Related compound A standard solution* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Standard solution—Prepare as directed for *Standard preparation* in the *Assay.*

Test solution—Transfer about 100 mg of Neotame, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. [NOTE—This solution is stable for up to 32 hours when stored at a temperature of 0° to 10°.]

Chromatographic system (see *Chromatography* ⟨621⟩)—Use the same system as directed in the *Assay* except to chromatograph the *Related compound A standard solution* and the *Detector sensitivity solution*, and record the peak responses as directed for *Procedure:* the signal-to-noise ratio for the *Detector sensitivity solution* is not less than 10; and the relative standard deviation for replicate injections of the *Related compound A standard solution* is not more than 5.0%.

Procedure—Separately inject equal volumes (about 25 µL) of the *Related compound A standard solution*, thr *Standard solution*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of related compound A in the portion of Neotame taken by the formula:

$$100(C_S/C_U)(r_U/r_S),$$

in which C_S is the concentration, in mg per mL, of USP Neotame Related Compound A RS in the *Related compound A standard solution;* C_U is the concentration, in mg per mL, of Neotame in the *Test solution;* and r_U and r_S are related com-

In-Process Revision

pound A peak responses obtained from the the *Test solution* and *Related compound A standard solution,* respectively: not more than 1.5% is found. Calculate the percentage of other impurites in the portion of Neotame taken by the formula:

$$100(C_S/C_U)(A_i/A_S),$$

in which C_S is the concentration, in mg per mL, of USP Neotame RS in the *Standard solution;* and C_U is the concentration, in mg per mL, of Neotame in the *Test solution*; A_S is the response of the neotame peak in the *Standard solution*; and A_i is the sum of the responses of all impurity peaks (except that of related compound A and the solvent peak, if observed) in the *Test solution*: not more than 2.0% is found.

Assay—

Mobile phase—Dissolve 3.0 g of sodium 1-heptanesulfonate in 740 mL of water in a suitable 1000-mL vessel, add 3.8 mL of triethylamine, and mix. Adjust the resulting solution with phosphoric acid to a pH of 3.5, and dilute with water to 750 mL. Add 250 mL of acetonitrile, adjust with phosphoric acid to an apparent pH of 3.7, mix, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Neotame RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1.0 mg per mL.

Assay preparation—Transfer about 50 mg of Neotame, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Pipet 5 mL of the resulting solution into a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. [NOTE—This solution is stable for up to 32 hours when stored at a temperature of 0° to 10°].

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 10-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 45°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{20}H_{30}N_2O_5$ in the portion of Neotame taken by the formula:

$$50C(r_U/r_S),$$

in which C is the concentration, in mg per mL, of USP Neotame RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.▲*NF24*

In-Process Revision

BRIEFING

Propylene Glycol Dilaurate. Because there is no existing *NF* monograph for this product, a new monograph, based on the Propylene Glycol Dilaurate monograph in the *European Pharmacopoeia, Fourth Edition,* page 4551, is being proposed.

(EMC: D. Bempong; NL: W. Paul; PSD: C. Okeke) RTS—42051-1

Add the following:

▲Propylene Glycol Dilaurate

Dodecanoic acid, monoester with 1,2-propanediol.

Lauric acid, monoester with propane-1,2-diol.

Propylene dilaurate.

» Propylene Glycol Dilaurate is a mixture of the propylene glycol mono- and di-esters of lauric acid. It contains not less than 70.0 percent of diesters and not more than 30.0 percent of monoesters.

Packaging and storage—Preserve in well-closed containers, and protect from moisture. No storage requirements specified.

USP Reference standards ⟨11⟩—*USP Propylene Glycol RS. USP Propylene Glycol Dilaurate RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution: 50 mg per mL, in methylene chloride.

Developing solvent solution: a mixture of hexane and ether (30 : 70)

Spray reagent—Prepare a 0.1 mg per mL solution of rhodamine 6G in alcohol.

Procedure—Develop the chromatogram over a path of 15 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent,* and locate the spots on the plate by examination under UV light at a wavelength of 365 nm: the R_F values of the principal spots obtained from the *Test solution* correspond to those obtained from the Standard solution.

B: It complies with the requirements of the test for *Fatty acid composition.*

Acid value ⟨401⟩**:** not more than 4.

Iodine value ⟨401⟩**:** not more than 1.

Saponification value ⟨401⟩**:** between 230 to 250.

Fatty acid composition ⟨401⟩—Propylene Glycol Dilaurate exhibits the following composition profile of fatty acids, determined as directed in the chapter.

Fatty Acids	Carbon-Chain Length	Percentage (%)
Caprylic acid	C8	not more than 0.5
Capric acid	C10	not more than 2.0
Lauric acid	C12	not less than 95.0
Myristic acid	C14	not more than 3.0
Palmitic acid	C16	not more than 1.0

Water, *Method Ia* ⟨921⟩**:** not more than 1.0%, using a mixture of methanol and methylene chloride (1 : 1) in place of methanol in the titration vessel.

Total ash ⟨561⟩**:** not more than 0.1%.

Limit of propylene glycol—

Mobile phase—Proceed as directed in the *Assay.*

Propylene glycol standard stock solution—Prepare a solution containing a known concentration of about 4 mg per mL of USP Propylene Glycol RS in tetrahydrofuran.

Propylene glycol standard solutions—Into four 15-mL flasks, introduce respectively 0.25 mL, 0.5 mL, 1.0 mL, and 2.5 mL of *Propylene glycol standard stock solution,*

In-Process Revision

and dilute with tetrahydrofuran to 5.0 mL. In a fifth 15-mL flask, introduce 5.0 mL of *Propylene glycol standard stock solution*.

Test solution—Use the *Assay preparation*.

Chromatographic system—Proceed as directed in the *Assay.*

Procedure—Separately inject equal volumes (about 40 µL) of the *Propylene glycol standard solutions* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Prepare a standard curve of peak area versus concentration, in mg per mL, of propylene glycol in the *Propylene glycol standard solutions*. Obtain the concentration, *C,* in mg per mL, of propylene glycol in the *Test solution* from the standard curve. Calculate the percentage of free propylene glycol in the portion of Propylene Glycol Dilaurate taken by the formula:

$$100CV/W,$$

in which V is the final volume of the *Test solution;* and W is the weight, in mg, of Propylene Glycol Dilaurate used to prepare the *Test solution:* not more than 2.0% is found.

Assay—

Mobile phase: tetrahydrofuran.

Assay preparation—Accurately weigh about 200 mg of Propylene Glycol Dilaurate into a 15-mL flask, add 5 mL of tetrahydrofuran, and shake to dissolve.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector and a 7-mm × 60-cm column that contains 5-µm packing L21 (100Å). The flow rate is about 1 mL per minute. The column and detector temperatures are maintained at 40°. [NOTE—Two 7-mm × 30-cm L21 columns may be used in place of one 60-cm column, provided system suitability requirements are met.] Chromatograph the *Assay preparation,* and record the peak responses as directed for *Procedure*. The order of elution is diesters, monoesters, and propylene glycol. The relative standard deviation for replicate injections determined from the monoester peak is not more than 1.0%.

Procedure—Inject a volume (about 40 µL) of the *Assay preparation* into the chromatograph, record the chromatogram, and measure the responses for the major peaks. Calculate the percentage of monoesters or diesters in the portion of Propylene Glycol Monolaurate taken by the formula:

$$(100 - D)(r_U / r_s),$$

in which D is the sum of the percentage content of propylene glycol and percentage content of free fatty acids; r_U is the peak response for monoesters or diesters; and r_s is the sum of the responses of the monoesters and diesters peaks. Calculate the percentage content of free fatty acids using the formula:

$$200(A / 561.1),$$

in which A is the acid value.▲*NF24*

BRIEFING

Propylene Glycol Monolaurate. Because there is no existing *NF* monograph for this product, a new monograph, based on the Propylene Glycol Monolaurate monograph in the *European Pharmacopoeia, Fourth Edition,* page 4552, is being proposed.

(EMC: D. Bempong; NL: W. Paul; PSD: C. Okeke)
RTS—41441-1

In-Process Revision

Add the following:

▲Propylene Glycol Monolaurate

Dodecanoic acid, monoester with 1,2-propanediol.
Lauric acid, monoester with propane-1,2-diol.

» Propylene Glycol Monolaurate is a mixture of the propylene glycol mono- and di-esters of lauric acid. The requirements for monoester and diester content differ for the two types of Propylene Glycol Monolaurate, as set forth in the accompanying table.

	Content of monoesters (%)		Content of diesters (%)	
	Min.	Max.	Min.	Max.
Type I	45.0	70.0	30.0	55.0
Type II	90.0	—	—	10.0

Packaging and storage—Preserve in well-closed containers, and protect from moisture. No storage requirements specified.

Labeling—Label it to indicate the type (Type I or Type II).

USP Reference standards ⟨11⟩—*USP Propylene Glycol RS. USP Propylene Glycol Monolaurate RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution: 50 mg per mL, in methylene chloride.

Developing solvent solution: a mixture of hexane and ether (30 : 70)

Spray reagent—Prepare a 0.1 mg per mL solution of rhodamine 6G in alcohol.

Procedure—Develop the chromatogram over a path of 15 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent,* and locate the spots on the plate by examination under UV light at a wavelength of 365 nm: the R_F values of the principal spots obtained from the *Test solution* correspond to those obtained from the Standard solution.

B: It complies with the requirements of the test for *Fatty acid composition.*

Acid value ⟨401⟩**:** not more than 4.

Iodine value ⟨401⟩**:** not more than 1.

Saponification value ⟨401⟩**:** between 210 to 245 for propylene glycol monolaurate (Type I) and between 200 to 230 for propylene glycol monolaurate (Type II).

Fatty acid composition ⟨401⟩—Propylene Glycol Monolaurate exhibits the following composition profile of fatty acids, determined as directed in the chapter.

Fatty Acids	Carbon-chain Length	Percentage (%)
Caprylic acid	C8	not more than 0.5
Capric acid	C10	not more than 2.0
Lauric acid	C12	not less than 95.0
Myristic acid	C14	not more than 3.0

$$200(A / 561.1),$$

in which A is the acid value.▲*NF24*

In-Process Revision

GENERAL CHAPTERS

General Tests and Assays

General Requirements for Tests and Assays

BRIEFING

⟨**1**⟩ **Injections,** *USP 28* page 2201 and page 707 of *PF* 29(3) [May–June 2003]. The Food and Drug Administration (FDA) is amending its regulations to change the labeling requirements for aluminum in large- and small-volume parenterals and pharmacy bulk packages used in total parenteral nutrition (TPN). The Parenteral Products Industrial Expert Committee has decided to adopt these labeling requirements with the addition that the small-volume injections (SVIs) such as lock flush solutions that are used in the administration of TPN products also meet these requirements. The Committee believes that the quantity of parenterally administered aluminum contributed by lock flush solutions used during TPN therapy is as serious a concern as the aluminum from the SVIs used in the preparation of TPN products for the same reasons expressed in the Background information of the originally published Final Rule notice [*Federal Register,* 65 (17): 4103–4111 (Jan. 26) 2000].

The sections *Foreign Matter* and *Particulate Matter* have been combined and rewritten so that the "essentially free" terminology, which is currently in *Particulate Matter in Injections* ⟨788⟩ and only in *Constituted Solutions* in this chapter, will apply to all injectables. In this manner all articles that are intended for parenteral administration shall be inspected to the extent possible for presence of observable foreign and particulate matter in its contents.

(PPI: J. Kelly) RTS—41973-2

In-Process Revision

Change to read:

LABELS AND LABELING

Labeling—[NOTE—See definitions of "label" and "labeling" under *Labeling* in the section *Preservation, Packaging, Storage, and Labeling* of the *General Notices and Requirements.*]

The label states the name of the preparation; in the case of a liquid preparation, the percentage content of drug or amount of drug in a specified volume; in the case of a dry preparation, the amount of *active* ingredient; the route of administration; a statement of storage conditions and an expiration date; the name and place of business of the manufacturer, packer, or distributor; and an identifying lot number. The lot number is capable of yielding the complete manufacturing history of the specific package, including all manufacturing, filling, sterilizing, and labeling operations.

Where the individual monograph permits varying concentrations of active ingredients in the large-volume parenteral, the concentration of each ingredient named in the official title is stated as if part of the official title, e.g., Dextrose Injection 5%, or Dextrose (5%) and Sodium Chloride (0.2%) Injection.

The labeling includes the following information if the complete formula is not specified in the individual monograph: (1) In the case of a liquid preparation, the percentage content of each ingredient or the amount of each ingredient in a specified volume, except that ingredients added to adjust to a given pH or to make the solution isotonic may be declared by name and a statement of their effect; and (2) in the case of a dry preparation or other preparation to which a diluent is intended to be added before use, the amount of each ingredient, the composition of recommended diluent(s) [the name(s) alone, if the formula is specified in the individual monograph], the amount to be used to attain a specific concentration of active ingredient and the final volume of solution so obtained, a brief description of the physical appearance of the constituted solution, directions for proper storage of the constituted solution, and an expiration date limiting the period during which the constituted solution may be expected to have the required or labeled potency if it has been stored as directed.

Containers for Injections that are intended for use as dialysis, hemofiltration, or irrigation solutions and that contain a volume of more than 1 L are labeled to indicate that the contents are not intended for use by intravenous infusion.

Injections intended for veterinary use are labeled to that effect.

The container is so labeled that a sufficient area of the container remains uncovered for its full length or circumference to permit inspection of the contents.

~~Aluminum in Large and Small Volume Parenterals Used in Total Parenteral Nutrition~~

~~(a) The aluminum content of large volume parenteral (LVP) drug products used in total parenteral nutrition (TPN) therapy must not exceed 25 micrograms per liter (µg/L).~~

~~(b) The package insert of LVPs used in TPN therapy must state that the drug product contains no more than 25 µg of aluminum per liter. This information must be contained in the "Precautions" section of the labeling of all large volume parenterals used in TPN therapy.~~

~~(c) The maximum level of aluminum present at expiry must be stated on the immediate container label of all small volume parenteral (SVP) drug products and pharmacy bulk packages (PBPs) used in the preparation of TPN solutions. The aluminum content must be stated as follows: "Contains no more than ___ µg of aluminum per liter." The immediate container label of all~~

~~SVPs and PBPs that are lyophilized powders used in the preparation of TPN solutions must contain the following statement: "When reconstituted in accordance with the package insert instructions, the concentration of aluminum will be no more than _____ µg per liter." This maximum level of aluminum must be stated as the highest of the following:~~

~~(1) The highest level for the batches produced during the last 3 years;~~

~~(2) The highest level for the latest five batches, or~~

~~(3) The maximum historical level, but only until completion of production of the first five batches after January 26, 2001.~~

~~(d) The package insert for all LVPs, all SVPs, and PBPs used in TPN must contain a warning statement. This warning must be contained in the "Warnings" section of the labeling. The warning must state the following:~~

~~WARNING: This product contains aluminum that may be toxic. Aluminum may reach toxic levels with prolonged parenteral administration if kidney function is impaired. Premature neonates are particularly at risk because their kidneys are immature, and they require large amounts of calcium and phosphate solutions that contain aluminum.~~

~~Research indicates that patients with impaired kidney function, including premature neonates, who receive parenteral levels of aluminum at greater than 4 to 5 µg per kg per day accumulate aluminum at levels associated with central nervous system and bone toxicity. Tissue loading may occur at even lower rates of administration.~~ ■ ~~as (USP28)~~

▲Aluminum in Large-Volume Injections (LVIs), Small-Volume Injections (SVIs), and Pharmacy Bulk Packages (PBPs) Used in Total Parenteral Nutrition (TPN) Therapy

(a) The aluminum content of LVIs used in TPN therapy must not exceed 25 µg per L.

(b) The package insert of LVIs used in TPN therapy must state that the drug product contains no more than 25 µg of aluminum per L. This information must be contained in the "Precautions" section of the labeling of all LVIs used in TPN therapy.

(c) If the maximum amount of aluminum in SVIs and PBPs is 25 µg per L or less, instead of stating the exact amount of aluminum that each may contain, as in paragraph (d), the immediate container label for SVIs and PBPs used in the preparation or in the administration of TPN injections (with exceptions as noted below) and injectable emulsions may state: "Contains no more than 25 µg/L of aluminum". If the SVI or PBP is a lyophilized powder, the immediate container label may state the following; if the SVI or PBP is a lyophilized powder used in the preparation of TPN injections and injectable emulsions, the immediate container label must state the following: "When reconstituted in accordance with the package insert instructions, the concentration of aluminum will be no more than 25 µg/L".

(d) The maximum level of aluminum at expiry must be stated on the immediate container label of all SVIs and PBPs used in the preparation or the administration of TPN injections and injectable emulsions. The alumi-

num content must be stated as follows: "Contains no more than __ µg/L of aluminum''. This maximum amount of aluminum may be stated as the highest one of the following three levels:

1. The highest level for the batches produced during the last three years
2. The highest level for the latest five batches
3. The maximum level in terms of historical levels, but only until completion of production of the first five batches after the effective date of July 26, 2004

The package insert for all LVIs, SVIs, and PBPs used in the preparation or administration of TPN products must contain a warning statement. This warning must be contained in the "Warnings" section of the labeling and must state the following: "WARNING: This product contains aluminum that may be toxic. Aluminum may reach toxic levels with prolonged parenteral administration if kidney function is impaired. Premature neonates are particularly at risk because their kidneys are immature, and they require large amounts of calcium and phosphate solutions which contain aluminum. Research indicates that patients with impaired kidney function, including premature neonates, who receive parenteral levels of aluminum at greater than 4 to 5 µg per kg per day accumulate aluminum at levels associated with central nervous system and bone toxicity. Tissue loading may occur at even lower rates of administration of TPN products and of the lock-flush solutions used in their administration."▲*USP29*

Change to read:

~~**FOREIGN MATTER AND PARTICLES**~~

▲FOREIGN AND PARTICULATE MATTER▲*USP29*

~~**Foreign Matter**~~

~~Every care should be exercised in the preparation of all products intended for injection to prevent contamination with microorganisms and foreign material. Good pharmaceutical practice requires also that each final container of Injection be subjected individually to a physical inspection, whenever the nature of the container permits, and that every container whose contents shows evidence of contamination with visible foreign material be rejected.~~

~~**Particulate Matter**~~

~~All large-volume Injections for single-dose infusion, and those small-volume Injections for which the monographs specify such requirements, are subject to the particulate matter limits set forth under *Particulate Matter in Injections* ⟨788⟩. An article packaged as both a large-volume and a small-volume Injection meets the requirements set forth for small-volume Injections where the container is labeled as containing 100 ml or less if the individual monograph includes a test for *Particulate Matter;* it meets the requirements set forth for large-volume Injections for single-dose infusion where the container is labeled as containing more than 100 mL. Injections packaged and labeled for use as irrigating solutions are exempt from requirements for *Particulate Matter*.~~

▲All articles intended for parenteral administration shall be prepared in a manner designed to exclude particulate matter as defined in *Particulate Matter in Injections* ⟨788⟩ and other foreign matter. Each final container of all parenteral preparations shall be inspected to the extent possible for the presence of observable foreign and particulate matter (hereafter termed "visible particulates") in its contents. The inspection process shall be designed and qualified to ensure that every lot of all parenteral preparations is essentially free from visible particulates. Qualification of the inspection process shall be performed with reference to particulates in the visible range of a type that might emanate from the manufacturing or filling process. Every container whose contents shows evidence of visible particulates shall be rejected. The inspection for visible particulates may take place when inspecting for other critical defects, such as cracked or defective containers or seals, or when characterizing the appearance of a lyophilized product.

Where the nature of the contents or the container-closure system permits only limited capability for the inspection of the total contents, the 100% inspection of a lot shall be supplemented with the inspection of constituted (e.g., dried) or withdrawn (e.g., dark amber container) contents of a sample of containers from the lot.

All large-volume Injections for single-dose infusion and small-volume Injections are subject to the light obscuration or microscopic procedures and limits for subvisible particulate matter set forth in *Particulate Matter In Injections* ⟨788⟩, unless otherwise specified in the individual monograph. An article packaged as both a large-volume and a small-volume Injection meets the requirements set forth for small-volume Injections where the container is labeled as containing 100 mL or less, if the individual monograph states a test for *Particulate Matter* ⟨788⟩; it meets the requirements set forth for large-volume Injections for single-dose infusion where the container is labeled as containing more than 100 mL. Injections administered exclusively by the intramuscular or subcutaneous route or packaged and labeled for use as irrigating solutions are exempt from requirements for *Particulate Matter* ⟨788⟩.▲*USP29*

BRIEFING

Apparatus for Tests and Assays

BRIEFING

⟨**41**⟩ **Weights and Balances,** *USP 28* page 2242 and page 999 of *PF* 30(3) [May–June 2004]. On the basis of comments received, it is proposed to include reference to OIML R111. OIML R111 is the international standard for the design, manufacture, and testing of mass artifacts, while ASTM E617-97 is the U.S. national standard for weights. ASTM E617-97 acknowledges OIML R111 as Appendix X4 with the intent that upon completion of the revision of R111 the revised document would become an Appendix of E617. This change would provide harmonization for international users of the *USP*.

It is also proposed to add sections to the chapter to address the need to verify linearity and span accuracy. It is also recommended that two significant digits, 0.10%, be used in the definition of the expanded relative uncertainty. The multiplier '3' is based on a desired number of standard deviations providing a specified confidence in the result. Adding the explanatory text defining the confidence interval clarifies the reason for using the specified multiplier. To be truly meaningful, the measurement uncertainty of a weighing process must be determined at the time and under the conditions of routine mass measurements. Standard deviation values based on data obtained over a short time period, as described by the "suitability test", reflect only the performance of the weighing system under the conditions present at that time and when used by that individual. A standard deviation calculated from data obtained over a relatively long time period by multiple users of the weighing system, under normal but varying conditions, will reflect the true performance of the weighing system. The resulting measurement uncertainty is based on real measurement data that accounts for all typically encountered measurement error sources that may affect the reported measurement result.

Use of *Equation 10* to calculate the minimum permissible load, m_{min}, for a balance will provide a reasonable estimate of the minimum load for which the actual balance performance will have an error less than the permitted 0.10 % of load. *Equation 5* provides an initial value useful for placing a weighing system in service, based on short term and limited information. The result of *Equation 10* is based on long-term measured weighing system performance and provides the user with significantly increased confidence in the measurement result due to the increased numbers of measurements on which it is based.

(PA4: H. Pappa) RTS—41768-1; 41811-1; 41940-1; 42013-1

Change to read:

~~The intent of this section is to bring the requirements for weights into conformity with American National Standard ANSI/ASTM E617, "Laboratory Weights and Precision Mass Standards." This standard is incorporated by reference and should be consulted for full descriptions and information on the tolerances and construction of weights.[1]~~

~~Pharmacopeial tests and assays require balances that vary in capacity, sensitivity, and reproducibility. Unless otherwise specified, when substances are to be "accurately weighed" for *Assay* the weighing is to be performed with a weighing device whose measurement uncertainty (random plus systematic error) does not exceed 0.1% of the reading. Measurement uncertainty is satisfactory if three times the standard deviation of not less than ten replicate weighings divided by the amount weighed, does not exceed 0.001. Unless otherwise specified, for titrimetric limits tests, the weighing shall be performed to provide the number of significant figures in the weight of the analyte that corresponds to the number of significant figures in the concentration of the titrant.~~

~~The class designations below are in order of increasing tolerances.~~

~~Class 1.1 weights are used for calibration of low capacity, high-sensitivity balances. They are available in various denominations from 1 to 500 mg. The tolerance for any denomination in this class is 5 µg. They are recommended for calibration of balances using optical or electrical methods for accurately weighing quantities below 20 mg.~~

~~Class 1 weights are designated as high precision standards for calibration. They may be used for weighing accurately quantities below 20 mg. (For weights of 10 g or less, the requirements of class 1 are met by *USP XXI* class M.)~~

~~Class 2 weights are used as working standards for calibration, built-in weights for analytical balances, and laboratory weights for routine analytical work. (The requirements of class 2 are met by *USP XXI* class S.)[2]~~

~~Class 3 and class 4 weights are used with moderate precision laboratory balances. (Class 3 requirements are met by *USP XXI* class S 1; class 4 requirements are met by *USP XXI* class P.)[2]~~

~~A weight class is chosen so that the tolerance of the weights used does not exceed 0.1% of the amount weighed. Generally, class 2 may be used for quantities greater than 20 mg, class 3 for quantities of greater than 50 mg, and class 4 for quantities of greater than 100 mg. Weights should be calibrated periodically, preferably against an absolute standard weight.~~

~~[1] Copies of ASTM Standard E 617-81 (Reapproved 1985) may be obtained from the American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103.~~

~~[2] Note that the designations S and P no longer designate weight classes but rather weight grades, that is, design limitations such as range of density of materials, surface area, surface finish, corrosion resistance, and hardness.~~

▲INTRODUCTION

Measurement processes are generally subject to a wide variety of influences. Weighing is no exception and may get distorted by many factors that introduce bias and uncertainty into the results. The distortions may be caused by properties of the weighing object, the balance, the environment, and the procedure used to weigh the object.

Influences originating from the balance, itself, are manifold. They include effects introduced by the following properties of the balance: quantized digital display, limited capability to repeat, nonlinear characteristic, sensitivity to eccentric loading, deviation of sensitivity from the correct value, and temperature dependence. Among the factors that affect the weighing object, the most prominent is buoyancy, which is caused by the fact that weighings are usually being carried out in air instead of empty space (i.e., a vacuum). Determination of the weight of objects with large surface areas is also affected by air drafts (even in the presence of draft shields), by electrostatic charge buildup (e.g., glass, plastic, or other electrically insulating materials), and by magnetic forces (e.g., stirring magnets or magnetically permeable objects). Additionally, materials that absorb moisture from, or dissipate moisture to, the surrounding environment may result in significant measurement errors.

Ambient conditions such as air temperature, humidity, pressure, and air velocity will also have an effect on the weighing object and the balance. In addition, effects caused by vibration, inclination, or other conditions may also be present.

In the following sections the requirements for weights and balances are described.

WEIGHTS

ASTM standard E617, "Standard Specification for Laboratory Weights and Precision Mass Standards", ~~is~~ OIML recommendation R111, "Weights of Classes E1, E2, F1, F2, M1, M1-2, M2, M2-3, and M3" and NIST Handbook 105-1, "Specifications and Tolerances for Field Standard Weights (NIST Class F)", are incorporated by reference and ~~is~~ are to be consulted for full descriptions and information on the tolerances and construction of weights.[1]

Weights are periodically calibrated against standard masses. The mass of each weight thus determined is referred to as its calibration mass value, and the difference between the nominal mass value and the calibration mass value is referred to as its calibration error.

When weights are used with beam balances to weigh materials, the weight class is chosen so that the tolerances of the weights do not exceed ~~0.1%~~ 0.10% of the net amount weighed. If the weights meet the tolerances of the corresponding ~~ASTM class (currently 8 classes, numbered 0–7)~~ ASTM or OIML class, corrections for calibration errors are not required. If, however, weights are used to calibrate beam or electronic balances, different criteria apply.

The class designations below are listed in order of increasing tolerances.

- ~~*Class 0* and *Class 1* weights are designated as high-precision standards for calibration. Use of *Class 0* and *Class 1* weights requires careful control of relative humidity and temperature and accurate monitoring of barometric pressure, as specified by the weight manufacturer.~~
- ~~*Class 1* and *Class 2* weights may be used as laboratory weights for routine analytical work. Weights in *Class 0* through *Class 3* are available in denominations from 1 mg to 50 kg, and their tolerances vary with class and nominal values.~~
- ~~*Class 4*, *Class 5*, and *Class 6* weights may be used with moderate-precision balances, trip balances, dial scales, and platform scales; they are available in denominations from 1 mg to 5000 kg, and their tolerances vary with nominal values.~~
- ~~*Class 7* weights are used in rough weighing operations.~~

- Weights complying with the requirements of ASTM Classes 0 and 1, and OIML Classes E1 and E2 are designated as high-precision standards for calibration. Use of Class 0, 1, E1, and E2 weights requires careful control of relative humidity and temperature and accurate monitoring of barometric pressure as well as special handling to prevent contamination.
- Weights complying with the requirements of ASTM Classes 1, 2, and 3, and OIML Classes E2 and F1 may be used as laboratory weights for routine analytical work. Weights in Classes 1 through 3, and E2 and F1 are available in denominations from 1 mg to 50 kg, and their tolerances vary with class and nominal values. Special handling is required to prevent contamination.
- Weights complying with the requirements of ASTM Classes 4, 5, and 6 and OIML Classes F1, F2, and M1 may be used with moderate-precision balances, trip balances, dial scales, and platform scales; they are available in denominations from 1 mg to 5000 kg, and their tolerances vary with nominal values.

Copies of OIML R111 may be obtained from OIML, 11 Rue Turgot–75009 Paris, France, www.oiml.org. Copies of NIST Handbook 105-1 may be obtained from NIST Weights and Measures Division, 100 Bureau Drive, Mail Stop 2600, Gaithersburg, MD 20899, www.nist.gov/labmetrology, or E-mail: owm@nist.gov.

In-Process Revision

- Weights complying with NIST Handbook 105-1 may be required for calibration of weighing devices complying with NIST Handbook 44, *Specifications, Tolerances, and Other Technical Requirements for Weighing and Measuring Devices,* such as Classes III or IIIL that are used for commercial purposes. NIST Class F weights are available in denominations from 1 mg to 500 kg and 0.001 lb to 10,000 lb, and their tolerances vary with nominal values.
- Weights complying with the requirements of ASTM Class 7 and OIML Classes M2 and M3 are used in rough weighing operations.

BALANCES

Pharmacopeial procedures require balances that vary in capacity, readability, and repeatability.

As stated in the *Introduction,* there are a number of factors that influence the use of balances. These factors must be controlled in order to obtain accurate measurements. To ensure that balances will provide the performances expected of USP weight measurements, balances must be calibrated. There are three characteristics that are to be verified: 1) span accuracy, 2) linearity, and 3) repeatability. Span accuracy and linearity tests are to be performed during routine calibrations of the balance and are typically performed by a calibration organization. The repeatability test is used to determine the suitability of a weighing device initially and at established intervals thereafter. The repeatability test may be performed by the user or by a calibration organization.

There are two methods for evaluating the accuracy (departure from nominal value) and linearity of the balance. In the first method, the accuracy and linearity are evaluated together (*Span Accuracy and Linearity Test, Combined*). In the second method, they are evaluated independently (*Span Accuracy and Linearity Test, Independent*).

Span Accuracy and Linearity Test, Combined—Tests of accuracy and linearity may be performed together because linearity is often considered to be a component of the overall accuracy. Other accuracy components are offset (zero uncertainty) and span (sensitivity) uncertainty. Because accuracy represents the proximity to true value, nonlinearity is a point-by-point measure of accuracy if the zero point and the full-scale calibration point have been set true. Test points may be selected in an arithmetic (e.g., 0, 20, 40, 60, 80, 100) or near geometric series (e.g., 1, 2, 5, 10, 20, 50, 100). At least five different test points (including zero) are chosen, and all test weights used are calibrated.

Span Accuracy and Linearity Test, Independent—To evaluate span errors and nonlinearity independently, the following method may be used. Nonlinearity can be determined when the same test weight is weighed on top of different amounts of tare. A test weight of about 20% to 25% of the span of the balance is first weighed without a tare, then together with tare weights of approximately the same, double, and triple the test weight (and quadruple if the test weight is about 20% of the span), respectively, setting the balance to zero each time before adding the test weight to the tare. Neither the test weights nor the tare weights need to be calibrated. *Span Accuracy,* i.e., calibration error or span error, is tested by weighing a calibrated standard mass at one point in the upper 30% of the balance range. The advantages of the independent approach are that only one calibrated weight is required, and it is at a mass where weight tolerances are favorable.

Uncertainty, Repeatability, and Minimum Weight—When substances are to be "accurately weighed", weighings have to be performed with an expanded relative uncertainty, U_{rel}, equal to or smaller than ~~0.1%~~ 0.10%, observing a

In-Process Revision

coverage factor, *k,* of 3 for a confidence interval of approximately 99.73%. The expanded relative uncertainty, U_{rel}, is thus given by the following expression:

$$U_{rel} = ku_{rel} = 3u_{rel}, \qquad (1)$$

in which the relative standard uncertainty, u_{rel}, is given by the formula:

$$u_{rel} = u/m, \qquad (2)$$

in which u is the (absolute) standard uncertainty of the weighing; and m is the weighed sample (or net) mass to which this uncertainty applies. From *Equation 1* and *Equation 2,* we get the following:

$$U_{rel} = ku/m. \qquad (3)$$

The smallest possible amount of mass that meets the aforementioned requirement is known as the ''minimum weight'', which can be obtained from the following formula:

~~$m_{min} \geq (k/U_{rel})u = (3/0.1\%)u = 3000u$ (4)~~

$$m_{min} \geq (k/U_{rel})u = (3/0.10\%)u = 3000u. \qquad (4)$$

For cases in which a small mass (compared to the maximum capacity of the balance) is considered, it is generally sufficient to represent the standard uncertainty, *u,* of the weighing by its repeatability, defined here as the standard deviation, S_{RP}, of not fewer than ten replicate weighings. Other contributors to uncertainty (from sources such as linearity deviation, eccentric load deviation, or sensitivity offset) are much smaller and thus may be neglected. This leads to a simple expression for m_{min}, whereby the minimal sample mass depends only on one property of the weighing, namely its repeatability:

$$m_{min} \geq (k/U_{rel})S_{RP}, \qquad (5)$$

in which S_{RP} represents the standard deviation of not fewer than ten replicate weighings obtained from the individual net readings, R_i, as follows:

$$S_{RP} = \sqrt{\frac{1}{n-1}\sum_{i=1}^{n}(R_i - \overline{R})^2}, \qquad (6)$$

in which

$$\overline{R} = \frac{1}{n}\sum_{i=1}^{n} R_i. \qquad (7)$$

The test weighings must be performed with a weighing setup under conditions as similar as possible to those expected for later use, including the following: configuration of the balance, type of weighing object (sample and/or container), weighing procedure, environmental conditions, and the site of use. ~~If weights are used to simulate the sample mass, they need not be calibrated.~~ Weights used for this short-term repeatability test need not be calibrated.

As the standard deviation, S_{RP}, is reduced to a value equal ~~or even~~ to or less than the readability, *d,* of a digital balance, ~~then~~ the influence of the necessary rounding between two indication steps on the weighing value becomes predominant. Similarly, the standard deviation estimated from repeated weighings is influenced by the average weighing value ~~and it may accidentally~~ and, as a result of balance

In-Process Revision

resolution and the small number of readings, may vanish altogether, i.e., have a value of zero. ~~To prevent this, a replacement~~ When this situation occurs, a minimum value for the standard uncertainty of no less than $0.4d$ must be observed, as shown below:

$$S_{RP} \geq 0.4d. \qquad (8)$$

~~Thus~~ Therefore the minimal weight, m_{min}, ~~is~~ will be greater than $3000S_{RP}$ or greater than $1200d$, whichever is larger.

This suitability test differs from routine calibrations of the balance. It is used to determine the suitability of a weighing device initially and at established intervals thereafter ~~Measurement uncertainty may be determined as part of the balance maintenance and calibration, and need not be repeated with every weighing.~~ and forms the baseline for continued evaluation of balance performance. The frequency of testing, as well as the measurement conditions, are established by the balance user and form a part of the laboratory standard operating procedures. Routine measurement uncertainty is determined as described in the following paragraphs.

The uncertainty of routine measurements is based on data accumulated over time through the use of stable check standard artifacts as part of routine mass measurement processes, using a minimum of 32 values, subject to the same measurement influences as the routine measurements. Check standards are selected to approximate the typical test loads measured during routine mass measurements and will be used at intervals established using generally accepted measurement assurance techniques[2] and documented in the user's standard operating procedures. Each measured value of the check standard is immediately entered in a measurement assurance control chart and evaluated for appropriateness. An appropriate measurement result is one that is within three standard deviations, $3u$, of either a reference value for the artifact or the median of the recorded values when no reference value is available. The uncertainty of routine mass measurement results, U, is calculated by the following equation:

$$U = 3\sqrt{u^2 + (0.58t_b)^2}, \qquad (9)$$

where t_b is the calibration tolerance of the balance at the test load measured; 0.58 is a multiplier converting the balance tolerance, t_b, to a value equivalent to one standard deviation; u is the standard deviation of the check standard values from the control chart; and $k = 3$ provides a confidence interval of 99.73% for the measurement result. The value of U may be used as an alternative method for calculating m_{min}, by using the formula:

$$m_{\min} > \frac{U}{0.001}. \qquad (10)$$

The result of this equation is typically larger than the value calculated in *Equation 5*; however, this result is based on actual long-term measurement results and is most representative of the true weighing system performance.▲*USP29*

Chemical Tests and Assays

OTHER TESTS AND ASSAYS

BRIEFING

⟨**345**⟩ **Assay for Citric Acid/Citrate and Phosphate.** This new general chapter provides an ion chromatographic procedure for the assay of citric acid/citrate and phosphate. The procedure is based on analyses performed using a liquid chromatograph equipped with an anion trap column (ATC), an AG11 brand of L61 guard column, an IonPac AS11 brand of L61 analytical column, and an electrochemical detector equipped with ASRS-ULTRA II for suppressed conductivity detection. Typical retention times are about 4 minutes for phosphate and 6 minutes for citrate.

(PA2: D. Bempong) RTS—42134-1

Add the following:

▲⟨345⟩ ASSAY FOR CITRIC ACID/ CITRATE AND PHOSPHATE

The following ion chromatographic general procedure is provided for the determination of citric acid/citrate and phosphate in compendial articles, when specified in the individual monographs. Identification tests for citrate and phosphate are provided separately under USP general chapter *Identification Tests—General* ⟨191⟩. The procedure for preparation of the *Standard Preparations* used for the assay depends on whether or not citrate and phosphate are being assayed concomitantly, as indicated below.

USP Reference Standards ⟨11⟩—*USP Citric Acid RS.*

Mobile Phase—Transfer an appropriate volume of water (resistivity not less than 18 megohm-cm) to a suitable container, and degas with helium for not less than 20 minutes. Add an appropriate volume of 50% (w/w) carbonate-free sodium hydroxide or potassium hydroxide to obtain a 20 mM sodium hydroxide or potassium hydroxide solution. Alternatively, a 20 mM sodium hydroxide or potassium hydroxide eluant can be generated electrolytically using an automatic eluant generator. [NOTE—Protect the *Mobile Phase* from atmospheric carbon dioxide.]

Standard Preparations—Use *Standard Preparation 1* for an assay for citric acid/citrate only. Use *Standard Preparation 2* when a concomitant assay for citrate and phosphate is intended.

Standard Preparation 1—Dissolve USP Citric Acid RS in freshly prepared 1 mM sodium hydroxide to obtain a solution having a known concentration of about 20 µg per mL of citrate $(C_6H_5O_7)^{-3}$.

Standard Preparation 2—Dissolve USP Citric Acid RS and monobasic sodium phosphate in freshly prepared 1 mM sodium hydroxide to obtain a solution having known concentrations of about 20 µg per mL and 12 µg per mL of citrate and phosphate $(PO_4)^{-3}$, respectively.

Assay Preparation for Citric Acid/Citrate Assay—Unless stated otherwise in the monograph, dissolve an appropriate quantity of a solid dosage form in freshly prepared 1 mM sodium hydroxide to obtain a solution containing about 20 µg per mL of citrate. If the dosage form is a liquid formulation, dilute with water, and add a freshly prepared sodium hydroxide solution to obtain a solution containing about 20 µg per mL of citrate in 1 mM sodium hydroxide.

Assay Preparation for Phosphate Assay—Unless stated otherwise in the monograph, dissolve an appropriate quantity of a solid dosage form in freshly prepared 1 mM sodium hydroxide to obtain a solution containing about 12 µg per mL of phosphate. If the dosage form is a liquid formulation, dilute with water, and add a freshly prepared sodium hydroxide solution to obtain a solution containing about 12 µg per mL of phosphate in 1 mM sodium hydroxide.

In-Process Revision

Chromatographic System (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a suitable anion trap column; a 4-mm × 50-mm guard column and a 4-mm × 250-mm analytical column, both packed with L61 packing; and an electrochemical detector with suppressed conductivity detection using either a micromembrane anion autosuppressor or a suitable chemical suppression system. All columns are maintained at 30° and eluted at a flow rate of 2 mL per minute. [NOTE—An anion trap column designed to remove trace anion contaminants in the *Mobile Phase* should be added to the column assembly before the injector.] Chromatograph *Standard Preparation 1* or *Standard Preparation 2,* as appropriate, and record the peak area responses as directed for *Procedure:* the tailing factor is not more than 2.0; and the relative standard deviation of the peak areas for citrate (and phosphate where appropriate), for six replicate injections of *Standard Preparation 1* or *Standard Preparation 2,* is not more than 1.5%.

Procedure—Separately inject 10 µL each of the appropriate *Standard Preparation* and *Assay Preparation* into the chromatograph, record the chromatograms, and measure the peak areas for citrate and phosphate, as appropriate. Determine the concentrations of citrate or phosphate in the portion of *Assay Preparation* taken by the formula:

$$C_S(r_U / r_S),$$

in which C_S is the concentration of citrate or phosphate, in µg per mL, in the appropriate *Standard Preparation;* and r_U and r_S are the peak areas of citrate or phosphate obtained from the *Assay Preparation* and the *Standard Preparation,* respectively.▲*USP29*

Physical Tests and Determinations

BRIEFING

⟨**841**⟩ **Specific Gravity,** *USP 28* page 2492. It is proposed to add a new method for determination of specific gravity. This method is based on the use of the oscillating transducer density meter and is designated as *Method II.* The official method using pycnometers is designated as *Method I,* which is to be used unless otherwise directed in the individual monograph. Editorial style changes have also been made.

Manufacturers interested in incorporating *Method II* in compendial monographs are encouraged to submit appropriate requests for revision with supporting documentation.

(PA4: E. Gonikberg) RTS—40825-1

Change to read:

Unless otherwise stated in the individual monograph, the specific gravity determination is applicable only to liquids, and, unless otherwise stated, is based on the ratio of the weight of a ~~substance~~

▲liquid▲*USP29*
in air at 25° to that of an equal volume of water at the same temperature. Where a temperature is specified in the individual monograph, the specific gravity is the ratio of the weight of the ~~substance~~

▲liquid▲*USP29*
in air at the specified temperature to that of an equal volume of water at the same temperature. When the substance is a solid at 25°, determine the specific gravity

▲of the melted material▲*USP29*
at the temperature directed in the individual monograph, and refer to water at 25°.

▲Unless otherwise stated in the individual monograph, the density is defined as the mass of a unit volume of the substance at 25°, expressed in kilograms per cubic meter or grams per cubic centimeter ($1\ kg/m^{-3} = 10^{-3}\ g/cm^{-3}$).

Add the following:

▲METHOD II

The procedure includes the use of the *Oscillating transducer density meter.* The apparatus consists of the following:

— a U-shaped tube, usually of borosilicate glass, which contains the liquid to be examined;
— a magneto-electrical or piezo-electrical excitation system that causes the tube to oscillate as a cantilever oscillator at a characteristic frequency depending on the density of the liquid to be examined;
— a means of measuring the oscillation period *(T),* which may be converted by the apparatus to give a direct reading of density or used to calculate density by using the constants *A* and *B* described below; and
— a means to measure and/or control the temperature of the oscillating transducer containing the liquid to be tested.

The oscillation period is a function of the spring constant *(c)* and the mass of the system:

$$T^2 = \left(\frac{M}{c} + \frac{\rho \times V}{c} \right) \times 4\pi^2$$

where ρ is the density of the liquid to be tested, M is the mass of the tube, and V is the volume of the filled tube.

Introduction of two constants $A = c/(4\pi^2 \times V)$ and $B = M/V$, leads to the classical equation for the oscillating transducer:

$$\rho = A \times T^2 - B.$$

The specific gravity of the liquid is given by the formula:

$$\rho_{(L)} / \rho_{(W)},$$

where $\rho_{(L)}$ and $\rho_{(W)}$ are the densities of the liquid and water, respectively, both determined at 25°, unless otherwise directed in the individual monograph.

Calibration—The constants A and B are determined by operating the instrument with the U-tube filled with two different samples of known density (e.g., degassed water and air). Perform the control measurements daily using degassed water: the results displayed for the control measurement using degassed water do not deviate from the reference value ($\rho_{25} = 0.997043$ g/cm^{-3}) by more than its specified error. Precision is a function of the repeatability and stability of the oscillator frequency. Density meters are able to achieve

In-Process Revision

measurements with an error on the order of 1×10^{-3}g/cm^{-3} to 1×10^{-5}g/cm^{-3} and a repeatability of 1×10^{-4}g/cm^{-3} to 1×10^{-6}g/cm^{-3}. For example, an instrument specified to $\pm 1 \times 10^{-4}$g/cm^{-3} must display 0.9970 $\pm$ 0.0001 g/cm^{-3} in order to be suitable for further measurement, otherwise a re-adjustment is necessary. Calibration with certified reference materials should be carried out regularly.

Procedure—Using the manufacturer's instructions, perform the measurements using the same procedure as for *Calibration.* If necessary, equilibrate the liquid to be examined at 25° before introduction into the tube to avoid the formation of bubbles and to reduce the time required for measurement. Factors affecting accuracy include the following:

— temperature uniformity throughout the tube,
— nonlinearity over a range of density,
— parasitic resonant effects, and
— viscosity, if the oscillating transducer density meters used do not provide automatic compensation of sample viscosity influence.▲*USP29*

BRIEFING

⟨**921**⟩ **Water Determination,** *USP 28* page 2510. On the basis of comments received, it is proposed to revise the *Test Preparation* and *Standardization of the Reagent* sections under *Method Ia*. For a sample with a trace amount of water, the sensitivity of the method can be improved by using a small buret and a reagent with a low water equivalency factor. A formula to estimate the sample size is also included. Additional recommendations are added for standardization of the *Reagent* used for determination of the trace amount of water.

(PA4: H. Pappa) RTS—41925-1

Change to read:

METHOD I (TITRIMETRIC)

Determine the water by *Method Ia,* unless otherwise specified in the individual monograph.

Method Ia (Direct Titration)

Principle—The titrimetric determination of water is based upon the quantitative reaction of water with an anhydrous solution of sulfur dioxide and iodine in the presence of a buffer that reacts with hydrogen ions.

In the original titrimetric solution, known as Karl Fischer Reagent, the sulfur dioxide and iodine are dissolved in pyridine and methanol. The test specimen may be titrated with the *Reagent* directly, or the analysis may be carried out by a residual titration procedure. The stoichiometry of the reaction is not exact, and the reproducibility of a determination depends upon such factors as the relative concentrations of the *Reagent* ingredients, the nature of the inert solvent used to dissolve the test specimen, and the technique used in the particular determination. Therefore, an empirically standardized technique is used in order to achieve the desired accuracy. Precision in the method is governed largely by the extent to which atmospheric moisture is excluded from the system. The titration of water is usually carried out with the use of anhydrous methanol as the solvent for the test specimen; however, other suitable solvents may be used for special or unusual test specimens.

Apparatus—Any apparatus may be used that provides for adequate exclusion of atmospheric moisture and determination of the endpoint. In the case of a colorless solution that is titrated directly, the endpoint may be observed visually as a change in color from canary yellow to amber. The reverse is observed in the case of a test specimen that is titrated residually. More commonly, however, the endpoint is determined electrometrically with an apparatus employing a simple electrical circuit that serves to impress about 200 mV of applied potential between a pair of platinum electrodes immersed in the solution to be titrated. At the endpoint of the titration a slight excess of the reagent increases the flow of current to between 50 and 150 microamperes for 30 seconds to 30 minutes, depending upon the solution being titrated. The time is shortest for substances that dissolve in the reagent. With some automatic titrators, the abrupt change in current or potential at the endpoint serves to close a solenoid-operated valve that controls the buret delivering the titrant. Commercially available apparatus generally comprises a closed system consisting of one or two automatic burets and a tightly covered titration vessel fitted with the necessary electrodes and a magnetic stirrer. The air in the system is kept dry with a suitable desiccant, and the titration vessel may be purged by means of a stream of dry nitrogen or current of dry air.

Reagent—Prepare the Karl Fischer Reagent as follows. Add 125 g of iodine to a solution containing 670 mL of methanol and 170 mL of pyridine, and cool. Place 100 mL of pyridine in a 250-mL graduated cylinder, and, keeping the pyridine cold in an ice bath, pass in dry sulfur dioxide until the volume reaches 200 mL. Slowly add this solution, with shaking, to the cooled iodine mixture. Shake to dissolve the iodine, transfer the solution to the apparatus, and allow the solution to stand overnight before standardizing. One mL of this solution when freshly prepared is equivalent to approximately 5 mg of water, but it deteriorates gradually; therefore, standardize it within 1 hour before use, or daily if in continuous use. Protect from light while in use. Store any bulk stock of the reagent in a suitably sealed, glass-stoppered container, fully protected from light, and under refrigeration.

A commercially available, stabilized solution of Karl Fischer type reagent may be used. Commercially available reagents containing solvents or bases other than pyridine or alcohols other than

methanol may be used also. These may be single solutions or reagents formed in situ by combining the components of the reagents present in two discrete solutions. The diluted *Reagent* called for in some monographs should be diluted as directed by the manufacturer. Either methanol or other suitable solvent, such as ethylene glycol monomethyl ether, may be used as the diluent.

Test Preparation—Unless otherwise specified in the individual monograph, use an accurately weighed or measured amount of the specimen under test estimated to contain ~~10 to 250 mg of water~~ ▲2 to 250 mg of water. The amount of water depends on the water equivalency factor of the *Reagent* and on the method of endpoint determination. In most cases, the minimum amount of specimen, in mg, can be estimated using the formula:

$$FCV / KF,$$

in which F is the water equivalency factor of the *Reagent,* in mg per mL; C is the used volume, in percent, of the capacity of the buret; V is the buret volume, in mL; and KF is the limit or reasonable expected water content in the sample, in percent. C is between 30% and 100% for manual titration, and between 10% and 100% for the instrumental method endpoint determination.▲*USP29*

Where the specimen under test is an aerosol with propellant, store it in a freezer for not less than 2 hours, open the container, and test 10.0 mL of the well-mixed specimen. In titrating the specimen, determine the endpoint at a temperature of 10° or higher.

Where the specimen under test is capsules, use a portion of the mixed contents of not fewer than 4 capsules.

Where the specimen under test is tablets, use powder from not fewer than 4 tablets ground to a fine powder in an atmosphere of temperature and relative humidity known not to influence the results.

Where the monograph specifies that the specimen under test is hygroscopic, use a dry syringe to inject an appropriate volume of methanol, or other suitable solvent, accurately measured, into a tared container, and shake to dissolve the specimen. Using the same syringe, remove the solution from the container and transfer it to a titration vessel prepared as directed for *Procedure.* Repeat the procedure with a second portion of methanol, or other suitable solvent, accurately measured, add this washing to the titration vessel, and immediately titrate. Determine the water content, in mg, of a portion of solvent of the same total volume as that used to dissolve the specimen and to wash the container and syringe, as directed for *Standardization of Water Solution for Residual Titrations,* and subtract this value from the water content, in mg, obtained in the titration of the specimen under test. Dry the container and its closure at 100° for 3 hours, allow to cool in a desiccator, and weigh. Determine the weight of specimen tested from the difference in weight from the initial weight of the container.

Standardization of the Reagent—Place enough methanol or other suitable solvent in the titration vessel to cover the electrodes, and add sufficient *Reagent* to give the characteristic endpoint color, or 100 ± 50 microamperes of direct current at about 200 mV of applied potential.

For determination of trace amounts of water (less than 1%), ~~sodium~~ ▲it is preferable to use *Reagent* with a water equivalency factor of not more than 2.0. Sodium▲*USP29* tartrate may be used as a convenient water reference substance. Quickly add ~~150 to 350 mg~~ ▲75 to 125 mg▲*USP29* of sodium tartrate ($C_4H_4Na_2O_6 \cdot 2H_2O$), accurately weighed by difference, and titrate to the endpoint. The water equivalence factor F, in mg of water per mL of reagent, is given by the formula:

$$2(18.02/230.08)(W/V),$$

in which 18.02 and 230.08 are the molecular weights of water and sodium tartrate dihydrate, respectively; W is the weight, in mg, of sodium tartrate dihydrate; and V is the volume, in mL, of the *Reagent* consumed in the second titration.

For the precise determination of significant amounts of water (1% or more), use *Purified Water* as the reference substance. Quickly add between 25 and 250 mg of water, accurately weighed by difference, from a weighing pipet or from a precalibrated syringe or micropipet, the amount taken being governed by the reagent strength and the buret size, as referred to under *Volumetric Apparatus* ⟨31⟩. Titrate to the endpoint. Calculate the water equivalence factor, F, in mg of water per mL of reagent, by the formula:

$$W/V,$$

in which W is the weight, in mg, of the water; and V is the volume, in mL, of the reagent required.

Procedure—Unless otherwise specified, transfer 35 to 40 mL of methanol or other suitable solvent to the titration vessel, and titrate with the *Reagent* to the electrometric or visual endpoint to consume any moisture that may be present. (Disregard the volume consumed, since it does not enter into the calculations.) Quickly add the *Test Preparation,* mix, and again titrate with the *Reagent* to the electrometric or visual endpoint. Calculate the water content of the specimen, in mg, taken by the formula:

$$SF,$$

in which S is the volume, in mL, of the *Reagent* consumed in the second titration; and F is the water equivalence factor of the *Reagent.*

Method Ib (Residual Titration)

Principle—See the information given in the section *Principle* under *Method Ia.* In the residual titration, excess *Reagent* is added to the test specimen, sufficient time is allowed for the reaction to reach completion, and the unconsumed *Reagent* is titrated with a standard solution of water in a solvent such as methanol. The residual titration procedure is applicable generally and avoids the difficulties that may be encountered in the direct titration of substances from which the bound water is released slowly.

Apparatus, Reagent, and Test Preparation—Use *Method Ia.*

Standardization of Water Solution for Residual Titration—Prepare a *Water Solution* by diluting 2 mL of water with methanol or other suitable solvent to 1000 mL. Standardize this solution by titrating 25.0 mL with the *Reagent,* previously standardized as directed under *Standardization of the Reagent.* Calculate the water content, in mg per mL, of the *Water Solution* taken by the formula:

$$V'F/25,$$

in which V' is the volume of the *Reagent* consumed, and F is the water equivalence factor of the *Reagent.* Determine the water con-

In-Process Revision

tent of the *Water Solution* weekly, and standardize the *Reagent* against it periodically as needed.

Procedure—Where the individual monograph specifies that the water content is to be determined by *Method Ib,* transfer 35 to 40 mL of methanol or other suitable solvent to the titration vessel, and titrate with the *Reagent* to the electrometric or visual endpoint. Quickly add the *Test Preparation,* mix, and add an accurately measured excess of the *Reagent.* Allow sufficient time for the reaction to reach completion, and titrate the unconsumed *Reagent* with standardized *Water Solution* to the electrometric or visual endpoint. Calculate the water content of the specimen, in mg, taken by the formula:

$$F(X' - XR),$$

in which F is the water equivalence factor of the *Reagent;* X' is the volume, in mL, of the *Reagent* added after introduction of the specimen; X is the volume, in mL, of standardized *Water Solution* required to neutralize the unconsumed *Reagent;* and R is the ratio, $V'/25$ (mL *Reagent*/mL *Water Solution*), determined from the *Standardization of Water Solution for Residual Titration.*

Method Ic (Coulometric Titration)

Principle—The Karl Fischer reaction is used in the coulometric determination of water. Iodine, however, is not added in the form of a volumetric solution but is produced in an iodide-containing solution by anodic oxidation. The reaction cell usually consists of a large anode compartment and a small cathode compartment that are separated by a diaphragm. Other suitable types of reaction cells (e.g., without diaphragms) may also be used. Each compartment has a platinum electrode that conducts current through the cell. Iodine, which is produced at the anode electrode, immediately reacts with water present in the compartment. When all the water has been consumed, an excess of iodine occurs, which usually is detected electrometrically, thus indicating the endpoint. Moisture is eliminated from the system by pre-electrolysis. Changing the Karl Fischer solution after each determination is not necessary since individual determinations can be carried out in succession in the same reagent solution. A requirement for this method is that each component of the test specimen is compatible with the other components, and no side reactions take place. Samples are usually transferred into the vessel as solutions by means of injection through a septum. Gases can be introduced into the cell by means of a suitable gas inlet tube. Precision in the method is predominantly governed by the extent to which atmospheric moisture is excluded from the system; thus, the introduction of solids into the cell is not recommended, unless elaborate precautions are taken, such as working in a glove-box in an atmosphere of dry inert gas. Control of the system may be monitored by measuring the amount of baseline drift. This method is particularly suited to chemically inert substances like hydrocarbons, alcohols, and ethers. In comparison with the volumetric Karl Fischer titration, coulometry is a micro-method.

Apparatus—Any commercially available apparatus consisting of an absolutely tight system fitted with the necessary electrodes and a magnetic stirrer is appropriate. The instrument's microprocessor controls the analytical procedure and displays the results. Calibration of the instrument is not necessary, as the current consumed can be measured absolutely.

Reagent—See *Reagent* under *Method Ia.*

Test Preparation—Where the specimen is a soluble solid, dissolve an appropriate quantity, accurately weighed, in anhydrous methanol or other suitable solvents. Liquids may be used as such or as accurately prepared solutions in appropriate anhydrous solvents.

Where the specimen is an insoluble solid, the water may be extracted using a suitable anhydrous solvent from which an appropriate quantity, accurately weighed, may be injected into the anolyte solution. Alternatively an evaporation technique may be used in which water is released and evaporated by heating the specimen in a tube in a stream of dry inert gas, this gas being then passed into the cell.

Procedure—Using a dry syringe, quickly inject the *Test Preparation,* accurately measured and estimated to contain 0.5 to 5 mg of water, or as recommended by the instrument manufacturer into the anolyte, mix, and perform the coulometric titration to the electrometric endpoint. Read the water content of the *Test Preparation* directly from the instrument's display, and calculate the percentage that is present in the substance. Perform a blank determination, and make any necessary corrections.

GENERAL CHAPTERS

General Information

BRIEFING

⟨**1065**⟩ **Ion Chromatography.** Because there is no *USP* general information chapter for this subject, a new chapter describing apparatus configurations and recommended procedures for this technique is being proposed.

(PA2: H. Pappa) RTS—41923-1

Add the following:

▲⟨1065⟩ ION CHROMATOGRAPHY

INTRODUCTION

Ion chromatography (IC) is a high-performance liquid chromatography (HPLC) instrumental technique used in *USP* test procedures such as identification and assay tests to measure inorganic anions and cations, organic acids, carbohydrates, sugar alcohols, aminoglycosides, amino acids, proteins, glycoproteins, and potentially other analytes.

In-Process Revision

As dictated by the nature of the analyte, IC has been applied to all aspects of the manufacturing and disposition of pharmaceutical products, including characterization of active ingredients, excipients, degradation products, impurities, and process streams. The following sample types are among those that have been analyzed: raw materials, intermediates (including media and culture broths), bulk active ingredients, diluents, formulated products, production equipment cleaning solutions, and waste streams. The technique is especially valuable for ionic or ionizable (in the mobile phase) analytes that have little or no native UV absorbance. The ability to couple the ion-exchange separation with numerous detection strategies, e.g., pulsed amperometric detection (PAD), expands IC applications to instances where analyte-specific detection strategies can provide the required degree of sensitivity or specificity. Utilization of such strategies allows IC applications to be implemented on appropriately configured HPLC systems. Additionally, ion-exclusion separations and pulsed amperometric detection expand the range of application of IC to aliphatic organic acids as well as to nonionic analytes of significant pharmaceutical interest including alcohols, alditols, carbohydrates, and amino acids. The wide dynamic range of the methodology makes it applicable for the quantification of trace contaminants as well as major product components.

Because IC typically uses dilute acids, alkalis, or salt solutions as the mobile phase, and does not use an organic solvent, IC does not require the purchase of costly organic solvents and hazardous disposal of the waste effluent. The effluent can be disposed of after appropriate neutralization (to ~pH 7) and, when necessary, after dilution with water.

IC allows separation using ion exchange, ion exclusion, or ion-pair approaches. IC separations are based on differences in charge density of the analyte species, which in turn depend on the valence and size of the individual ionic species to be measured. Separations are also performed on the basis of differences in the hydrophobic character of the ionic species. IC is typically performed at ambient temperature. As with other forms of HPLC, IC separations are based on varying capacity factors and typically follow the Knox equation. Ion chromatography is a technique complimentary to the more commonly used reversed-phase and normal-phase HPLC and to atomic absorption and ion-coupled plasma (plasma spectrochemistry) techniques in pharmaceutical analysis.

APPARATUS

IC instruments closely resemble conventional HPLC instruments. Typical components include an autosampler, a high-pressure pump, an injection valve with a sample loop of suitable size (typically 10 to 250 µL), a guard column, an analytical column, an optional suppressor or other forms of a post-column reaction system, a flow-through detector, and a data system ranging in complexity from an integrator to a computerized data system (*Figure 1*). Because mobile phases generally consist of dilute acids, alkalis, or salt solutions, the components in contact with the mobile phase and the sample are typically made from inert materials, such as polyetheretherketone (PEEK). Conventional HPLC systems also may be used provided that their components are compatible with the mobile phase and injected sample solutions. Following suitable preparation, the sample is introduced via the injection valve. After the optional chemical suppression or other post-column reaction on the column effluent, the analyte species are detected using conductivity, amperometry, UV/VIS, or other detection modes. Because IC uses a predominantly ionic mobile phase, a suppressor is often necessary prior to conductometric detection, although non-suppressed conductometric detection has been successfully used in pharmaceutical analysis.

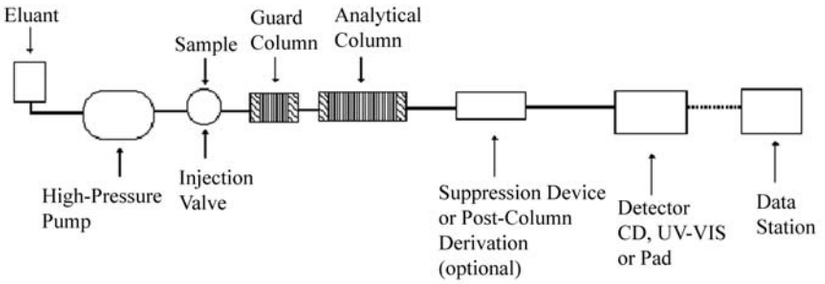

Fig. 1. Components of a typical IC system illustrated schematically; CD = conductivity detector and PAD = pulsed amperometric detector

Stationary and Mobile Phases

As IC has developed and matured as an instrumental technique, the number of ion-exchange materials developed for IC has increased, facilitated by the understanding of the processes taking place at the surface of the stationary phase. In contrast to the silica-based column packing prevalent in classical HPLC, organic polymers are predominately used as support materials for IC. Such materials have a higher stability with respect to extremes in pH and in many cases are compatible with organic solvents. Typically, separation of anions requires the use of polymer-based anion exchangers and dilute bases as mobile phases. However, for cation separations, the stability over the entire pH range that is typical of organic polymers is not necessary, because dilute acids serve as mobile phases. Therefore, silica-based cation exchangers that exhibit a significantly higher chromatographic efficiency are commonly used for the separation of cations.

Depending on the separation mode (ion exchange, ion exclusion, or ion-pair), different types of stationary phases are used. For ion exchange, the stationary phase is either an anion or a cation exchanger. Typically, a strong cation exchanger is used for the ion-exclusion separation of organic acids, and a reversed-phase stationary phase is used when ion-pair is the separation mode. The ion-exchange capacity of a resin is defined as the number of ion-exchange sites per weight equivalent of the column packing and is typically expressed in terms of mEq per g of resin. With ion exchange, the retention times for the analyte ions increase with increasing ion-exchange capacity of the resin. This effect can be partly compensated for by using mobile phases of higher ionic strength. Styrene/divinylbenzene copolymers, polymethacrylate, and polyvinyl resins are the substrate materials used in the manufacturing process of the polymer-based ion exchangers. Organic polymers are functionalized directly at their surface, with the exception of latex-based ion exchangers, where the totally porous latex particle acts as an ion-exchange material. Surface-functionalized, ‘‘pellicular’’ substrates show a much higher chromatographic efficiency compared with the fully functionalized resins.

With ion exchange, a mobile phase consisting of mono- or divalent ionic species, alone or mixed at an optimum ratio, is used to accomplish the separation. In ion-exclusion methods, particularly for organic acids, the mobile phase consists of mineral acids to maintain organic acids in their undisso-

ciated forms. Often, the nature of the analyte dictates the mobile phase and the detection mode used. Typical mobile phases used in IC are described below in the section on detectors.

Detectors

Conductivity detection is by far the most commonly employed mode of detection in IC. Although the original IC development work included the use of low-capacity ion-exchange resins for efficient chromatographic separation and conductometric detection of ions in a chemically suppressed mobile phase, the advances in column technologies as well as instrumentation development allow the use of high-capacity ion exchange today.

In suppressed IC, the background conductance of the ionic mobile phase is significantly reduced as it flows through the suppression device. For example, dilute NaOH, about 10 to 50 mM, used as the mobile phase in IC of anions is converted to H_2O (poor conductivity) when the column effluent containing NaOH flows through a suppressor device present in an acidic form. The analyte ionic species in the column effluent are converted from their sodium or other metal salt forms to highly conducting acid forms (due to higher equivalent conductance of hydrogen ions compared to other cations). Analogous reactions occur in the hydroxide form suppressor in IC of cations, wherein the acidic mobile phase is converted to water, and the analyte cations are converted to highly conducting hydroxide forms (due to higher equivalent conductance of hydroxide ions compared to other anions).

The reduced background conductance and the enhanced signal due to the ionic species result in an enhanced signal-to-noise ratio for the conductometric detection of ions in suppressed IC. This results in reduced background noise and increasing sensitivity and reproducibility of the analysis. The commonly used chemical suppression devices fall into three broad categories. In the first type, the reactions occur across an ion-exchange membrane with the regenerant ions furnished by either a chemical or as products of electrolysis of water. In the second type, the suppression reactions occur in a packed bed of high-exchange capacity resin material, with regeneration either by a chemical or by electrolysis of water. In the third type, although not commonly used, the suppression reactions occur as the eluant stream mixes with the flowing stream of high-capacity resin material.

For pharmaceutical analyses, suppressed conductometric detection may be used for detection of trace ions in high purity waters. The commonly used mobile phases for the separation of anions by suppressed IC include hydroxide ions or a mixture of bicarbonate and carbonate ions. The common mobile phases for separation of cations usually consist of mineral acids or methanesulfonic acid.

Ion-chromatographic analyses also can be performed without chemical suppression, in which case the analytical column effluent flows directly to a conductivity detector. The typical eluants used in nonsuppressed IC are phthalic acid and *p*-hydroxybenzoic acid for the determination of anions and methanesulfonic acid for the determination of cations. The equivalent conductance values of chloride, sulfate, and other common anions are significantly greater than that of the eluant anion, and therefore, a positive peak is detected as the anions are carried through the detector. The equivalent conductance values of sodium, potassium, calcium, magnesium, and other common cations are significantly lower than that of the cation (H^+) in the eluant. In this instance, a negative peak is detected as the cations are carried through the detector.

Nonsuppressed IC is easier to perform, and it is a useful technique for determining ions of weak acids such as cyanide and sulfide, which are nonconductive after chemical suppression but show a higher baseline noise. Pharmaceutical analyses can be performed in the nonsuppressed mode because the quantification limits are usually in the upper mg per L to low percentage levels. While suppressor-based methodologies must often be implemented on the instrument systems specifically designed for this purpose, IC may be performed without the suppressor on an existing HPLC. This is possible because the commonly used eluants in IC include dilute bases or acids that are compatible for use on existing HPLC instruments. When this approach is considered, analysts are encouraged to consult the instrument manufacturer for applicability of the instrument for the IC analysis.

OTHER DETECTORS

Other commonly used detection modes in IC include pulsed amperometry, direct UV detection, or post-column derivatization followed by UV/VIS detection.

Pulsed Amperometric Detection Mode (PAD)—PAD uses a specialized mode of the conventional amperometric technique. This type of detector is commonly used for the detection of electroactive species, e.g., organic compounds such as carbohydrates, sugar alcohols, amino acids, and organic sulfur species. In PAD, analytes are detected by an oxidative desorption process at the surface of an electrode located in the column effluent stream. Following the detection process, a series of potentials are applied for fixed time periods to clean the electrode surface. Unlike conventional amperometry that suffers from electrode surface fouling, a rapidly repeating sequence of different working potentials, referred to as waveform, helps the removal of the products of redox reactions from the electrode surface. For details of application of IC using PAD in the analysis of mono- and oligosaccharides of glycoproteins, see *Glycoprotein Glycan Analysis* ⟨1084⟩.

Direct UV Detection—Direct UV Detection is used for inorganic and organic ions that possess a UV chromophore. These include organic acids, bromide, iodide, nitrate, nitrite, thiosulfate, and cyano-metal complexes. Analogous to the inverse conductometric detection of cations, UV detection may also be performed indirectly. This method is called indirect photometric chromatography (IPC).

Photometric Detection—Photometric detection involves derivatization of the column effluent with a color-forming reagent prior to detection with a visible wavelength. A classic example is the separation of metal ions in which the column effluent is derivatized with 4-(2-pyridylazo)-resorcinol followed by detection at 510 to 530 nm.

SAMPLE PREPARATION

Typically sample preparation for IC includes dilution or filtering through a 0.45-µm filter, or both. Under certain circumstances, samples may require removal of undesirable species through solid-phase extraction (SPE) techniques. For example, a highly alkaline sample can be neutralized by having it pass through a SPE cartridge packed with cation-exchange material in the acidic form.

PROCEDURE

Conductometric detection requires high purity water (generally, resistivity greater than 18 megohm-cm) and high-purity chemicals for the preparation of the mobile phase. For ion-pair separation with UV detection, water and mobile phase components of low UV absorbance should be used.

For ion exchange, the retention time of ions increases with a decrease in the ionic strength and valency (charge) of the mobile phase components. For example, at equimolar concentrations of sodium hydroxide or sodium carbonate mobile phase, capacity factors (k') for anions are smaller with sodium hydroxide as the mobile phase than with sodium carbonate as the mobile phase. Some mobile phases, such as sodium hydroxide, can absorb ambient carbon dioxide, resulting in its composition change and often in baseline artifacts. In this instance, care should be taken to prevent absorption of carbon dioxide by the sodium hydroxide mobile phase.

For ion exclusion, capacity factors of organic acids increase with an increase in ionic strength or concentration of mineral acids but decrease with the increase of the column temperature. Because permeation volume remains constant, these effects are usually small. Addition of a solvent such as acetonitrile shortens the retention of organic acids.

Like other HPLC techniques, IC systems are calibrated by plotting peak responses in comparison with known concentrations of a reference standard, using either an external or internal standardization procedure.▲*USP29*

BRIEFING

⟨1116⟩ Microbiological Evaluation of Clean Rooms and Other Controlled Environments, *USP 28* page 2682. On the basis of (1) comments received, (2) elimination of Federal Standard 209 E, and (3) advances in the field, it is proposed to revise and clarify this general information chapter. To reflect these changes, the title of the chapter has been changed to Microbiological Control and Monitoring Environments Used for the Manufacture of Healthcare Products. Many of the sections and tables of this information chapter have been revised: Table 5 and sections on *Operational Evaluation of the Microbiological Status of Aseptically Filled Products in Clean Rooms and Other Controlled Environments* and an *Overview of the Emerging Technologies for Advanced Aseptic Processing* have been eliminated; and new sections, *Physical Evaluation of Contamination Control Effectiveness* and *Sample Volumes for Active Air Monitoring,* have been added.

~~The purpose of this informational chapter is to review the various issues that relate to aseptic processing of bulk drug substances, dosage forms, and in certain cases, medical devices; and to the establishment, maintenance, and control of the microbiological quality of controlled environments.~~

~~This chapter includes discussions on (1) the classification of a clean room based on particulate count limits; (2) microbiological evaluation programs for controlled environments; (3) training of personnel; (4) critical factors in design and implementation of a microbiological evaluation program; (5) development of a sampling plan; (6) establishment of microbiological Alert and Action levels; (7) methodologies and instrumentation used for microbiological sampling; (8) media and diluents used; (9) identification of microbial isolates; (10) operational evaluation via media fills; and (11) a glossary of terms. Excluded from this chapter is a discussion of controlled environments for use by licensed pharmacies in the preparation of sterile products for home use, which is covered under *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩.~~

~~There are alternative methods to assess and control the microbiological status of controlled environments for aseptic processing. Numerical values included in this chapter are not intended to represent absolute values or specifications, but are informational. Given the variety of microbiological sampling equipment and methods, one cannot reasonably suggest that the attainment of these values guarantees the needed level of microbial control or that excursions beyond values in this chapter indicate a loss of control. The improper application of microbiological sampling and analysis may cause significant variability and the potential for inadvertent contamination. Sampling media and devices, and methods indicated in this chapter, are not specifications but only informational.~~

~~A large proportion of sterile products are manufactured by aseptic processing. Because aseptic processing relies on the exclusion of microorganisms from the process stream and the prevention of microorganisms from entering open containers during filling, product bioburden as well as microbial bioburden of the manufacturing environment are important factors relating to the level of sterility assurance of these products.~~

In-Process Revision

▲The purpose of this informational chapter is to provide information and guidance relative to the monitoring and control of aseptic environments in which pharmaceutical dosage forms, aseptically produced active pharmaceutical ingredients, and, in certain cases, medical devices are manufactured. The guidance provided in this chapter and the monitoring parameters given for microbiological evaluation are to be applied to clean rooms and isolators used for aseptic processing and to other clean environments used for healthcare product manufacturing.

This chapter uses the total particulate air quality classifications provided by the International Standards Organization (ISO) in ISO 14644-1, -2, and -3. These ISO standards, like the United States Federal Standard 209E that they supercede, properly avoid providing guidance specific to the control and monitoring of environments for viable microorganisms. The international standards regarding the design and construction of clean rooms to meet certain total particulate air contamination requirements are broadly applicable to many industries including the electronics, defense, and healthcare industries. However, the healthcare product manufacturing industries, on the basis of many years of practical experience, have developed microbiological monitoring and control requirements unique to their particular requirements. Microbiologically controlled environments are used for a variety of purposes within the healthcare industry. Some uses of controlled environments, for example those used for aseptic processing, are far more critical than those used for other manufacturing operations (e.g., equipment and component preparation, limited bioburden control of nonsterile products, and processing for terminal sterilization). Therefore, requirements for aseptic processing environments for both manned clean rooms and isolators are treated separately from environments used for less critical applications. Excluded from this chapter is a discussion of controlled environments for use by licensed pharmacies in the preparation of sterile products for home use, which is covered in the two general test chapters, *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩ and *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩.

There are a number of sampling methods that can be used to assess and control the microbiological status of controlled environments for aseptic processing. The numerical values for air, surface, and personnel monitoring included in this chapter are guidelines. Given the variety of microbiological sampling equipment and methods, one cannot reasonably suggest that the attainment of these values guarantees the needed level of microbial control or that excursions beyond values in this chapter indicate a loss of control. The assessment of risks associated with manufacturing environments must be made over a significant period of time, and excursions beyond the control levels recommended in this chapter may occasionally occur. The variables involved in microbiological monitoring, especially the lack of accuracy and precision, make it impossible to set firm limits applicable to product release or rejection. The improper application of microbiological sampling and analysis may cause significant variability and the potential for inadvertent contamination. Sampling media, devices, and methods indicated in this chapter are not compendial test methods and are provided for information only.

A large proportion of products labeled sterile products are manufactured by aseptic processing, rather than terminal sterilization. Because aseptic processing relies on the exclusion of microorganisms from the process stream and the prevention of microorganisms from entering open containers during filling, product bioburden as well as bioburden of the manufacturing environment are important factors gov-

erning the microbiological safety of these products. However, it is important to note that the terms aseptic and sterile are not synonymous. Sterile means the complete and unequivocal absence of viable microorganisms or organisms having the potential to reproduce. In the purest microbiological sense, aseptic means the prevention of infection accomplished by the exclusion of pathogenic organisms; however in the context of aseptic healthcare product manufacturing, the term aseptic describes the handling of sterilized materials in a controlled environment designed to maintain microbial contamination at levels known to present minimal risk.

It is not possible to create or maintain a manufacturing environment that is sterile in light of the present state-of-the-art. In any environment where human operators are present microbial contamination at some level is inevitable. Even the most cautious clean room environment design and operation will not obviate the shedding of microorganisms into the environment by human operators. Thus, an expectation of zero contamination at or during every aseptic processing operation is technically unrealistic. There is no way to prove that an aseptic processing environment or the product contact surfaces within that environment are sterile.

In recent years isolator technology has found a broad acceptance in healthcare manufacturing. Isolators are often considered a form of advanced aseptic manufacturing technology. Isolators more effectively control the potential of human-borne contamination, but most isolator designs cannot be proven to wholly exclude operator-shed contamination under all circumstances of use. Gloves, half-suits, or other manipulative devices used to conduct work within an isolator's enclosure may develop leaks resulting in contamination within the isolator enclosure. There is also the potential for introducing contamination into an isolator by operational mistake. It may not be possible to completely eliminate microbial contamination during isolator decontamination or gassing because isolators may contain complex or partially occluded surfaces. The isolator environment therefore cannot be considered a sterile environment, but rather an aseptic one.▲*USP29*

Establishment of Clean Room Classifications

~~The design and construction of clean rooms and controlled environments are covered in Federal Standard 209E. This standard of air cleanliness is defined by the absolute concentration of airborne particles. Methods used for the assignment of air classification of controlled environments and for monitoring of airborne particulates are included. This federal document only applies to airborne particulates within a controlled environment and is not intended to characterize the viable or nonviable nature of the particles.~~

~~The application of Federal Standard 209E to clean rooms and other controlled environments in the pharmaceutical industry has been used by manufacturers of clean rooms to provide a specification for building, commissioning, and maintaining these facilities. However, data available in the pharmaceutical industry provide no scientific agreement on a relationship between the number of nonviable particulates and the concentration of viable microorganisms.~~

~~The criticality of the number of nonviable particulates in the electronic industry makes the application of Federal Standard 209E a necessity, while the pharmaceutical industry has a greater concern for viable particulates (i.e., microorganisms) rather than total particulates as specified in Federal Standard 209E. A definite concern for counts of total particulates in injectable products exists in the pharmaceutical industry (see *Particulate Matter in Injections* ⟨~~788~~⟩).~~

~~The rationale that the fewer particulates present in a clean room, the less likely it is that airborne microorganisms will be present is accepted and can provide pharmaceutical manufacturers and builders of clean rooms and other controlled environments with engineering standards in establishing a properly functioning facility.~~

~~Federal Standard 209E, as applied in the pharmaceutical industry is based on limits of all particles with sizes equal to or larger than 0.5 µm. *Table 1* describes Airborne Particulate Cleanliness Classes in Federal Standard 209E as adapted to the pharmaceutical industry. The pharmaceutical industry deals with Class M3.5 and above. Class M1 and M2 relate to the electronic industry and are shown in *Table 1* for comparison purposes. It is generally accepted that if fewer particulates are present in an operational clean room or other controlled environment, the microbial count under operational conditions will be less, provided that there are no changes in airflow, temperature, and humidity. Clean rooms are maintained under a state of operational control on the basis of dynamic (operational) data.~~

▲The design and construction of clean rooms and controlled environments are covered in ISO 14644. This standard defines the performance of a clean environment with respect to the concentration of total particulates per unit vol-

In-Process Revision

ume in that environment. ISO 14644 stipulates the total particulate counts required for a clean environment to meet the defined air quality classifications. The reader is referred to this standard regarding the design characteristics and certification of clean environments.

A concern for nonviable particulate contamination in injectable products exists in the pharmaceutical industry (see *Particulate Matter in Injections* ⟨788⟩. Unlike the situation with microbial contamination in which experimental data suggest that humans are the only significant source of microbial contamination in the classified clean room, nonviable particulates can also arise from processing equipment. Studies indicate that gowned humans slough off particulate and microbial contamination at a rather consistent ratio. However, the relationship between microbial (viable) and nonviable contamination does not hold for particulates shed by processing equipment. Where equipment is the primary source of particulate matter, the resulting particulates are essentially all nonviable.

The rationale that the fewer total particulates present in a clean room, the less likely it is that airborne microorganisms will be present is valid when human operators are the source of particulate matter. However, it is not possible to clearly distinguish between background total particulate contamination generated largely by mechanical operations and the total particulates contributed by personnel. Therefore, it is both commonplace and proper for clean room environmental monitoring programs to consist of a total particulate and a microbiological component.

Table 1 describes the clean room classifications commonly used in the pharmaceutical industry. The pharmaceutical industry utilizes clean rooms of ISO 14644 Classes 5–8.

Isolators present a different picture because personnel are excluded from the isolator, and manipulations are made utilizing glove-and-sleeve assemblies and half-suits made of thick, flexible plastic (such as polyvinyl chloride). Personnel have far less impact on the microbial quality of the environment within an isolator enclosure than they have on clean room environments.▲*USP29*

▲**Table 1. Airborne Particulate Cleanliness Classes***

Class Name**	Particles ≥0.5 µm
ISO 14644	(m^3)
ISO Class 5	3,520
ISO Class 6	35,200
ISO Class 7	352,000
ISO Class 8	353,000,000

* Taken from ISO International Standard 14644 Part 1 published by the International Standards Organization, May 1999.
** The four ISO 14644-1 Classes given in Table 1 correspond very closely to former US Federal Standard 209E Classifications. The relationships are as follows: ISO 5-Class 100, ISO 6-Class 1000, ISO 7- Class 10,000, ISO 8- Class 100,000.

Specifications for air changes per hour and air velocities are not included in ISO 14644 nor were they in Federal Standard 209E. Typically, clean rooms of ISO Class 8/Class 100,000 are designed to provide a minimum of 20 air chang-

es per hour; clean rooms of ISO Class 7/Class 10,000 are designed to provide more than 50 air changes per hour; and clean rooms of ISO Class 5/Class 100 provide more than 100 air changes per hour, but some manufacturer's design criteria may differ. By diluting and removing contaminants, large volumes of air are likely to reduce airborne contamination in aseptic production. However, optimum conditions vary considerably depending on process characteristics. Typical air velocity standards given for Class 5 aseptic processing are 0.45 meters per second ±20%, measured approximately 30 cm from the filter face. These specifications should be used only as a guide in the design and operation of clean rooms because the precise correlation between air changes per hour, air velocity, and microbial control has not been satisfactorily established experimentally.

It is important to maintain a predominantly unidirectional (either vertical or horizontal) flow of air in a Class 5 clean room environment, particularly when products, product containers, and closures are exposed. When evaluating air movement within a clean room, studying airflow visually by so-called smoke studies or other suitable means is probably more useful than using absolute measures of airflow velocity and change rates. The so-called L-R method developed by Ljundqvist and Reinmuller provides a useful empirical method for evaluating and optimizing the prevention of airborne contamination and can serve as a basis for contamination risk evaluation and mitigation.

Air velocity and change rates are less important in isolators than in clean rooms because personnel in isolators—the major source of microbial contamination—are more carefully separated from the product, product containers, and closures. Air velocities substantially lower than those used in human-scale clean rooms have proven to be adequate in isolator systems. In zones within isolators where particulate matter poses a hazard to product quality, predominantly vertical or horizontal unidirectional airflow may be maintained. Experience, however, has shown that well-controlled mixing or turbulent airflow is satisfactory for many aseptic processes and for sterility testing within isolators (see *Sterility Testing—Validation of Isolator Systems* ⟨1208⟩).▲*USP29*

Importance of a Microbiological Evaluation Program for Controlled Environments

Monitoring of total particulate count in controlled environments, even with the use of electronic instrumentation on a continuous basis, does not provide information on the microbiological content of the environment. The basic limitation of particulate counters is that they measure particles of 0.5 µm or larger. While airborne microorganisms are not free-floating or single cells, they frequently associate with particles of 10 to 20 µm. Particulate counts as well as microbial counts within controlled environments vary with the sampling location and the activities being conducted during sampling. Monitoring the environment for nonviable particulates and microorganisms is an important control function because they both are important in achieving product compendial requirements for *Particulate Matter* and *Sterility* under *Injections* ⟨1⟩.

~~Microbial monitoring programs for controlled environments should assess the effectiveness of cleaning and sanitization practices by and of personnel that could have an impact on the bioburden of the controlled environment. Microbial monitoring, regardless of how sophisticated the system may be, will not and need not identify and quantitate all microbial contaminants present in these controlled environments. However, routine microbial monitoring should provide sufficient information to ascertain that the controlled environment is operating within an adequate state of control.~~

~~Environmental microbial monitoring and analysis of data by qualified personnel will permit the status of control to be maintained in clean rooms and other controlled environments. The environment should be sampled during normal operations to allow for the collection of meaningful data. Microbial sampling should occur when materials are in the area, processing activities are ongoing, and a full complement of operating personnel is on site.~~

~~Microbial monitoring of clean rooms and some other controlled environments, when appropriate, should include quantitation of the microbial content of room air, compressor air that enters the critical area, surfaces, equipment, sanitization containers, floors, walls, and personnel garments (e.g., gowns and gloves). The objective of the microbial monitoring program is to obtain representative estimates of bioburden of the environment. When data are compiled and analyzed, any trends should be evaluated by trained personnel. While it is important to review environmental results on the basis of recommended and specified frequency, it is also critical to review results over extended periods to determine whether trends are present. Trends can be visualized through the construction of statistical control charts that include alert and action levels. The microbial control of controlled environments can be assessed, in part, on the basis of these trend data. Periodic reports or summaries should be issued to alert the responsible manager.~~

~~When the specified microbial level of a controlled environment is exceeded, a documentation review and investigation should occur. There may be differences in the details of the investigation, depending on the type and processing of the product manufactured in the room. Investigation should include a review of area maintenance documentation; sanitization documentation; the inherent physical or operational parameters, such as changes in environ-~~

In-Process Revision

~~mental temperature and relative humidity; and the training status of personnel involved. Following the investigation, actions taken may include reinforcement of training of personnel to emphasize the microbial control of the environment; additional sampling at increased frequency; additional sanitization; additional product testing; identification of the microbial contaminant and its possible source; and an evaluation of the need to reassess the current standard operating procedures and to revalidate them, if necessary.~~

~~Based on the review of the investigation and testing results, the significance of the microbial level being exceeded and the acceptability of the operations or products processed under that condition may be ascertained. Any investigation and the rationale for the course of action should be documented and included as part of the overall quality management system.~~

~~A controlled environment such as a clean zone or clean room is defined by certification according to a relevant clean room operational standard. Parameters that are evaluated include filter integrity, air velocity, air patterns, air changes, and pressure differentials. These parameters can affect the microbiological bioburden of the clean room operation. The design, construction, and operation of clean rooms varies greatly, making it difficult to generalize requirements for these parameters. An example of a method for conducting a particulate challenge test to the system by increasing the ambient particle concentration in the vicinity of critical work areas and equipment has been developed by Ljungquist and Reinmuller.[1] First, smoke generation allows the air movements to be visualized throughout a clean room or a controlled environment. The presence of vortices or turbulent zones can be visualized, and the airflow pattern may be fine tuned to eliminate or minimize undesirable effects. Then, particulate matter is generated close to the critical zone and *sterile field*. This evaluation is done under simulated production conditions, but with equipment and personnel in place.~~

~~Proper testing and optimization of the physical characteristics of the clean room or controlled environment is essential prior to completion of the validation of the microbiological monitoring program. Assurance that the controlled environment is operating adequately and according to its engineering specifications will give a higher assurance that the bioburden of the environment will be appropriate for aseptic processing. These tests should be repeated during routine certification of the clean room or controlled environment and whenever changes made to the operation, such as personnel flow, processing, operation, material flow, air handling systems, or equipment layout, are determined to be significant.~~

▲Total particulate monitoring may provide a better means of evaluating the overall quality of the environment in isolators than in conventional clean rooms. The superior exclusion of human-borne contamination provided by isolators results in a ratio between viable and nonviable contamination that is biased heavily in the direction of nonviable particulates in the isolator environment. Total particulate counting in an isolator is likely to provide an immediate indicator of changes in contamination level within the enclosed environment. Microbial monitoring programs for aseptic processing environments should assess the effectiveness of cleaning and sanitization practices of personnel that could have an impact on the bioburden of the controlled environment. Because isolators are typically decontaminated using an automatic vapor or gas generation system, microbial monitoring is much less important in establishing their efficiency in eliminating bioburden. These automatic decontamination systems are validated directly using an appropriate biological indicator challenge and are controlled to defined exposure parameters during routine use to ensure consistent decontamination performance.

Microbial monitoring will not and need not identify and quantify all microbial contaminants present in these controlled environments. Microbiological monitoring of a clean room is technically a semiquantitative exercise because a truly quantitative evaluation of the environment is not possible given the limitations in sampling equipment, lack of precision of the enumeration methods, and the restricted sample volumes that can be effectively analyzed. Routine microbial monitoring, however, should provide sufficient information to ascertain that the aseptic processing environment is operating within an adequate state of control. The real value of a microbiological monitoring program lies in the consistent, qualitative assessment of environmental conditions over time. Monitoring programs can detect changes in the contamination incidence rate; such changes may be indicative of changes in the state-of-control within the environment.

Environmental microbial monitoring and analysis of data by qualified personnel will assist in ensuring that a suitable state-of-control is maintained in aseptic processing environments. The environment should be sampled during normal operations to allow for the collection of meaningful, process-related data. Microbial sampling should occur when materials are in the area, processing activities are ongoing, and a full complement of operating personnel are within the aseptic processing environment.

~~[1] Interaction Between Air Movements and the Dispersion of Contaminants: Clean Zones with Unidirectional Air Flow, Journal of Parenteral Science and Technology, 47(2), 1993.~~

Microbial monitoring of clean rooms and isolators should include monitoring of compressed gases, surfaces, room/enclosure air, and any other materials and equipment that might produce a risk of contamination. The analysis of contamination trends within an aseptic environment has long been a component of the environmental control program of healthcare product manufacturing environments. In aseptic processing environments, and particularly in ISO Class 5 environments, contamination is infrequently observed; and in isolator enclosures, because of their superior exclusion of human borne contamination, contamination is rarer still. However, given the criticality of these environments, even minor changes in their contamination-control-incident rates can be significant. Therefore, frequent careful review of monitoring data is essential. In less critical environments where microbial contamination may be higher, changes in incident rates should nonetheless be noted, investigated, and corrected.

When contamination incident rates increase from an established norm, documentation review and investigation should occur. Although there may be differences in the details of the investigation, depending on the type and processing of the product manufactured in the clean room or isolator, investigation should include a review of the following: area maintenance documentation; sanitization/decontamination documentation; the occurrence of nonroutine events, the inherent physical or operational parameters, such as changes in environmental temperature and relative humidity; and the training status of personnel involved.

In isolator systems, the loss of glove integrity or the accidental introduction of material that has not been decontaminated are among the most probable causes of detectable microbial contamination. Following the investigation, defined actions should be taken to correct or eliminate the most probable causes of contamination. In aseptic processing applications, given the relative rarity of contamination events in modern facilities, the investigation will often prove inconclusive. When corrective actions are undertaken, they may include reinforcement of training of personnel to emphasize acceptable gowning and aseptic techniques and the microbial control of the environment. Some additional microbiological sampling at an increased frequency may be implemented, but this may not be appropriate in aseptic processing because intrusive or overly intensive sampling may entail a contamination risk in and of itself. Other measures that may be considered to better control microbial contamination include additional sanitization, use of different sanitizing agents, and identification of the microbial contaminant and its possible source. The investigation and the rationale for the course of action chosen as a result of the investigation must be carefully and comprehensively documented.▲*USP29*

Add the following:

▲Physical Evaluation of Contamination Control Effectiveness

As previously stated, clean environments should be certified as described in ISO 14644 to meet their defined classification requirements. The design, construction, and operation of clean rooms vary greatly, making it difficult to generalize requirements for parameters such as filter integrity, air velocity, air patterns, air changes, and pressure differential. However, in particularly critical applications, such as aseptic processing, a more structured approach to physical risk assessment may be appropriate.

A method for assessing the ability of a clean room to resist the effects of contamination emanating from personnel and the environment has been developed by Ljundqvist and Reinmuller [see Interaction Between Air Movements and the Dispersion of Contaminants: Clean Zones with Unidirec-

tional Air Flow, *Journal of Parenteral Science and Technology,* **1993,** *47*(2)]. This method, known as the L-R method, challenges the air filtration and ventilation system by increasing particle concentration in the vicinity of critical work areas and equipment. First, smoke generation allows the air movements to be visualized throughout a clean room or a controlled environment. The presence of vortices or turbulent zones can be visualized, and the airflow pattern may be fine-tuned to minimize undesirable effects. Following visual optimization of airflow, particulate matter is generated close to the critical zone and sterile field. This evaluation is done under simulated production conditions, but with equipment and personnel in place. This type of test can also be used to evaluate the ability of isolator systems, particularly so-called open isolator systems, to resist the effects of contamination generated in the area surrounding the isolator system. It is important to note that the visual evaluation of air movement within clean rooms is a subjective process. Elimination of turbulence or vortices is generally not possible in operational clean rooms containing personnel and equipment. In all cases hard data in the form of total particulate and microbiological monitoring as well as medial fill results take precedence over visualization of airflow patterns using smoke or other suitable techniques.

Proper testing and optimization of the physical characteristics of the clean room or isolator are essential prior to the implementation of the microbiological monitoring program. Assurance that the clean room or isolator is operating in compliance with its predetermined engineering specifications will provide confidence that the ability of the system to control the bioburden and nonviable particulate matter will be appropriate for it's intended use. These tests should be repeated during routine certification of the clean room or isolator and whenever changes made to the operation, such as personnel flow, equipment operation, material flow, air-handling systems, or equipment layout, are determined to be significant.▲*USP29*

Change to read:

Training of Personnel

~~Aseptically processed products require manufacturers to pay close attention to detail and to maintain rigorous discipline and strict supervision of personnel in order to maintain the level of environmental quality appropriate for the sterility assurance of the final product.~~

~~Training of all personnel working in controlled environments is critical. This training is equally important for personnel responsible for the microbial monitoring program, where contamination of the clean working area could inadvertently occur during microbial sampling. In highly automated operations, the monitoring personnel may be the employees who have the most direct contact with the critical zones within the processing area. Monitoring of personnel should be conducted before or after working in the processing area.~~

~~Microbiological sampling has the potential to contribute to microbial contamination due to inappropriate sampling techniques. A formal personnel training program is required to minimize this risk. This formal training should be documented for all personnel entering controlled environments.~~

~~Management of the facility must assure that all personnel involved in operations in clean rooms and controlled environments are well versed in relevant microbiological principles. The training should include instruction on the basic principles of aseptic processing and the relationship of manufacturing and handling procedures to potential sources of product contamination. This training should include instruction on the basic principles of microbiology, microbial physiology, disinfection and sanitation, media selection and preparation, taxonomy, and sterilization as required by the nature of personnel involvement in aseptic processing. Personnel involved in microbial identification will require specialized training on required laboratory methods. Additional training on the management of the environmental data collected must be provided to personnel. Knowledge and understanding of applicable standard operating procedures is critical, especially those standard operating procedures relating to corrective measures that are taken when environmental conditions so dictate. Understanding of regulatory compliance policies and each individual's responsibilities with respect to good manufacturing practices (GMPs) should be an integral part of the training program as well as training in conducting investigations and in analyzing data.~~

~~The major source of microbial contamination of controlled environments is the personnel. Contamination can occur from the spreading of microorganisms by individuals, particularly those with active infections. Only healthy individuals should be permitted access to controlled environments.~~

~~These facts underscore the importance of good personal hygiene and a careful attention to detail in the aseptic gowning procedure used by personnel entering the controlled environment. Once these employees are properly gowned—including complete facial coverage—they must be careful to maintain the integrity of their gloves and suits at all times. Since the major threat of contamination of product being aseptically processed comes from the operating personnel, the control of microbial contamination associated with these personnel is one of the most important elements of the environmental control program.~~

~~The importance of thorough training of personnel working in controlled environments, including aseptic techniques, cannot be overemphasized. The environmental monitoring program, by itself, will not be able to detect all events in aseptic processing that~~

~~could compromise the microbiological quality of the environment. Therefore, periodic media-fill or process-simulation studies to revalidate the process are necessary to assure that the appropriate operating controls and training are effectively maintained.~~

▲Given the central role that good personnel performance plays in the control of contamination in clean environments, proper training and supervision play a crucial part in contamination control. Aseptic processing is the most critical activity conducted in microbiological controlled environments, and manufacturers must pay close attention to the details in all aspects of this endeavor. The maintenance of rigorous discipline and strict supervision of personnel is essential in order to ensure a level of environmental quality appropriate for aseptic processing.

Training of all personnel working in controlled environments is critical. This training is equally important for personnel responsible for the microbial monitoring program, where contamination of the clean working area could inadvertently occur during microbial sampling. In highly automated operations, the monitoring personnel may be the employees who have the most direct contact with the critical zones within the processing area. Microbiological sampling has the potential of contributing to microbial contamination due to inappropriate sampling techniques or placement of personnel in or near the critical zone more frequently than required by the production activity itself. A formal personnel training program is required to minimize this risk. This formal training should be documented for all personnel entering controlled environments.

Management of the facility must assure that all personnel involved in operations in clean rooms and isolators are well versed in relevant microbiological principles. The training should include instruction on the basic principles of aseptic technique and should emphasize the relationship of manufacturing and handling procedures to potential sources of product contamination. Those individuals supervising, auditing, or inspecting microbiological control and monitoring activities should be knowledgeable regarding the basic principles of microbiology, microbial physiology, disinfection and sanitation, media selection and preparation, taxonomy, and sterilization. Ideally both supervisors and inspectors should have academic training in medical or environmental microbiology. Sampling personnel, as well as those individuals working in clean rooms, should be knowledgeable regarding their responsibilities in minimizing the release of microbial contamination into the environment. Personnel involved in microbial identification will require specialized training on required laboratory methods. Additional training should be provided concerning the management of the collection of environmental data. Knowledge and understanding of applicable standard operating procedures is critical, especially those standard operating procedures relating to corrective measures that are taken when environmental conditions so dictate. Understanding of contamination control principles and each individual's responsibilities with respect to good manufacturing practices (GMP), as well as training in conducting investigations and in analyzing data, should be an integral part of the training program.

The major source of microbial contamination of controlled environments is the personnel. Contamination can occur from the spreading of microorganisms by individuals, particularly those with active infections. Only healthy individuals should be permitted access to controlled environments.

The importance of good personal hygiene and a careful attention to detail in the aseptic gowning procedure used by personnel entering the controlled environment cannot be overemphasized. Gowning requirements will differ depending upon the use of the controlled environment being entered. Aseptic processing environments are the most critical and require the use of sterilized gowns with the best available filtration properties. The fullest possible facial

coverage is desirable for aseptic processing environments, and sleeve covers or tape should be considered to minimize leaks at the critical glove/sleeve junction. Once employees are properly gowned they must be careful to maintain the integrity of their gloves and suits at all times. Since the major threat of contamination of product comes from the operating personnel, the control of microbial contamination associated with these personnel is one of the most important elements of the environmental control program. Operators working with isolator systems for aseptic processing are not required to wear sterile, clean room gowns. However, aseptic technique and employee-borne contamination are the principal hazards to safe aseptic operations in isolators as well as in conventional clean rooms. Glove-and-sleeve assemblies can develop leaks that might allow the mechanical transfer of microorganisms to the product. A second glove, worn either under or over the primary isolator glove, could provide an additional level of safety against glove leaks or could act as a hygiene measure. In addition, operators must understand that aseptic technique is an absolute requirement for all manipulations performed with gloves within isolator systems.

The importance of thorough training and careful supervision of personnel working in controlled environments, including use of aseptic techniques, cannot be overemphasized. The environmental monitoring program, by itself, will not be able to detect all events in aseptic processing that could compromise the microbiological quality of the environment. Therefore, periodic media-fill or process simulation studies to revalidate the process are necessary, as is thorough, ongoing supervision of operations, to ensure that the appropriate operating controls and training are effectively maintained.▲*USP29*

Critical Factors Involved in the Design and Implementation of a Microbiological Environmental Control Program

~~An environmental control program should be capable of detecting an adverse drift in microbiological conditions in a timely manner that would allow for meaningful and effective corrective actions. It is the responsibility of the manufacturer to develop, initiate, implement, and document such a microbial environmental monitoring program.~~

~~Although general recommendations for an environmental control program will be discussed, it is imperative that such a program be tailored to specific facilities and conditions. A general microbiological growth medium such as Soybean Casein Digest Medium should be suitable in most cases. This medium may be supplemented with additives to overcome or to minimize the effects of sanitizing agents, or of antibiotics if used or processed in these environments. The detection and quantitation of yeasts and molds should be considered. General mycological media, such as Sabouraud's, Modified Sabouraud's, or Inhibitory Mold Agar are acceptable. Other media that have been validated for promoting the growth of fungi, such as Soybean Casein Digest Agar, can be used. In general, testing for obligatory anaerobes is not performed routinely. However, should conditions or investigations warrant, such as the identification of these organisms in sterility testing facilities, more frequent testing is indicated. The ability of the selected media to detect and quantitate these anaerobes or microaerophilic microorganisms should be evaluated.~~

~~The selection of time and incubation temperatures is made once the appropriate media have been selected. Typically, incubation temperatures in the 22.5 ± 2.5° and 32.5 ± 2.5° ranges have been used with an incubation time of 72 and 48 hours, respectively. Sterilization processes used to prepare growth media for the environmental program should be validated and, in addition, media should be examined for sterility and for growth promotion as indicated under *Sterility Tests* ⟨71⟩. In addition, for the *Growth Promotion* test, representative microflora isolated from the controlled environment or ATCC strain preparations of these isolates may also be used to test media. Media must be able to support growth when inoculated with less than 100 colony-forming units (cfu) of the challenge organisms.~~

~~An appropriate environmental control program should include identification and evaluation of sampling sites and validation of methods for microbiological sampling of the environment.~~

~~The methods used for identification of isolates should be verified using indicator microorganisms (see *Microbial Limits* ⟨61⟩).~~

▲Since the advent of comprehensive environmental monitoring programs in the healthcare product manufacturing industry, the need for these programs to capture adverse trends or drifts has been emphasized. In a modern aseptic processing environment—either isolators or conventional clean rooms—contamination has become increasingly rare. Nevertheless, a monitoring program must be able to detect contamination risk and to apply appropriate countermeasures. Although general recommendations for an environ-

mental monitoring program will be discussed, it is imperative that such a program be tailored to specific facilities and conditions.

Selection of Growth Media—In most cases, a general microbiological growth medium that supports the growth of a wide range of bacteria, yeasts, and molds, such as Soybean–Casein Digest Medium (SCDM), should be suitable for environmental monitoring. This medium may be supplemented with additives to overcome or to minimize the effects of sanitizing agents or of antibiotics if used or processed in these environments. The specific detection of yeasts and molds should be considered; however, the SCDM medium will usually not be overgrown by bacteria. If necessary, general mycological media, such as Sabouraud's, Modified Sabouraud's, or Inhibitory Mold Agar are acceptable. In general, monitoring for strict anaerobes is not performed as they would be a minor component of other microbial populations. However, should conditions or investigations warrant, i.e., conditions such as the identification of these organisms in sterility testing facilities or in sterility test results, then testing for anaerobes would be indicated. The ability of any media used in environmental monitoring, including those selected for their ability to recover specific types of organisms, must be evaluated for their ability to support growth as indicated under *Sterility Tests* ⟨71⟩.

Selection of Culture Conditions—The selection of time and incubation temperatures is made once the appropriate media have been selected. Typically for general microbiological growth media such as SCDM, incubation temperatures in the 22.5 ± 2.5° and 32.5 ± 2.5° ranges have been used with an incubation time not less than 72 hours. There is no data suggesting precise optimum incubation temperatures. Mesophilic bacteria and mold common to the typical facility environment are generally capable of growing over a rather wide range of temperatures. Sterilization processes used to prepare growth media for the environmental program should be validated. When special or selective media are used for monitoring incubation conditions, they should reflect published technical requirements. Contamination should not be introduced into a manufacturing clean room as a result of using contaminated sampling media or equipment. Of particular concern is the use of aseptically prepared sampling media. Wherever possible, sampling media and its wrapping should be terminally sterilized by moist heat, radiation, or other suitable means. If aseptically prepared media must be used, pre-incubation and 100% visual inspection of all sampling media prior to introduction into the clean room are required.▲*USP29*

Establishment of Sampling Plan and Sites

~~During initial start-up or commissioning of a clean room or other controlled environment, specific locations for air and surface sampling should be determined. Consideration should be given to the proximity to the product and whether air and surfaces might be in contact with a product or sensitive surfaces of container-closure systems. Such areas should be considered critical areas requiring more monitoring than non-product-contact areas. In a parenteral vial-filling operation, areas of operation would typically include the container-closure supply, paths of opened containers, and other inanimate objects (e.g., fomites) that personnel routinely handle.~~

~~The frequency of sampling will depend on the criticality of specified sites and the subsequent treatment received by the product after it has been aseptically processed. *Table 2* shows suggested frequencies of sampling in decreasing order of frequency of sampling and in relation to the criticality of the area of the controlled environment being sampled.~~

~~Table 2. Suggested Frequency of Sampling on the Basis of Criticality of Controlled Environment~~

~~Sampling Area~~	~~Frequency of Sampling~~
~~Class 100 or better room designations~~	~~Each operating shift~~
~~Supporting areas immediately adjacent to Class 100 (e.g., Class 10,000)~~	~~Each operating shift~~
~~Other support areas (Class 100,000)~~	~~Twice/week~~
~~Potential product/container contact areas~~	~~Twice/week~~
~~Other support areas to aseptic processing areas but non product contact (Class 100,000 or lower)~~	~~Once/week~~

~~As manual interventions during operation increase, and as the potential for personnel contact with the product increases, the relative importance of an environmental monitoring program increases. Environmental monitoring is more critical for products that are~~

In-Process Revision

~~aseptically processed than for products that are processed and then terminally sterilized. The determination and quantitation of microorganisms resistant to the subsequent sterilization treatment is more critical than the microbiological environmental monitoring of the surrounding manufacturing environments. If the terminal sterilization cycle is not based on the overkill cycle concept but on the bioburden prior to sterilization, the value of the bioburden program is critical.~~

~~The sampling plans should be dynamic with monitoring frequencies and sample plan locations adjusted based on trending performance. It is appropriate to increase or decrease sampling based on this performance.~~

▲During initial start-up or commissioning of a clean room or other controlled environment, specific locations for air and surface sampling should be determined: consideration should be given to the proximity to the product and whether air and surfaces might be in contact with a product or sensitive surfaces of container–closure systems. In aseptic processing the area in which containers, closures, and product are exposed to the environment is often called the critical zone. The entire critical zone should be treated as a sterile field with regard to aseptic operations. A nonsterile object, including the operator's gloved hands or isolator glove, should never be brought into contact with a sterile product, container closure, filling station, or conveying equipment before or during aseptic processing operations. Operators and environmental monitoring personnel should never touch sterile parts, conveyors, filling needles, part hoppers, or any other equipment that is in the product-delivery pathway.

The frequency of sampling depends upon the manufacturing process conducted within an environment. Classified environments used only to provide a lower overall level of bioburden in nonsterile product manufacturing areas require relatively infrequent environmental monitoring. Classified environments in which closed manufacturing operations are conducted, including fermentation and many chemical processes, require fewer monitoring sites and less frequent monitoring because the risk to these processes from microbial contamination originating from the surrounding environment is comparatively low. Microbiological monitoring of environments in which products are filled prior to terminal sterilization is generally less critical than the monitoring of aseptic processing areas. The amount of monitoring required in preterminal sterilization filling operations depends upon the susceptibility of the product being filled to survival and proliferation of microbial contamination. The identification and estimated number of microorganisms resistant to the subsequent sterilization treatment may be more critical than the microbiological monitoring of the surrounding manufacturing environments. It is not possible to recommend microbial control levels for each type of manufacturing environment. The levels established for one ISO Class 7 area, for example, may be inappropriate for another ISO Class 7 environment depending upon the production activities undertaken in each. The user should conduct a risk analysis and develop a rationale for the sampling locations and frequencies selected for each controlled environment. The classification of a clean room is important in establishing control levels. However, this does not imply that all rooms of the same classification should have the same control levels and the same frequency of monitoring, as the monitoring should reflect the microbiological control requirements of manufacturing or processing activities conducted in the area. Formal risk assessment techniques can result in a more scientifically valid contamination control program.

Table 2 suggests frequencies of sampling in decreasing order of frequency of sampling and in relation to the criticality or product risk of the area of the controlled environment being sampled.

Environmental monitoring sampling plans should be dynamic with monitoring frequencies and sample-plan-location-adjustments based on the observed incidence of contamination and ongoing risk analysis. On the basis of long-term observations, it may be appropriate to increase

or decrease sampling at a given location or to eliminate a sampling location altogether. Oversampling of an environment can be as deleterious to the control of contamination as undersampling. Careful consideration of risk and reduction of contamination sources can assist in right-sizing the sampling intensity.

Table 2. Suggested Frequency of Sampling for Aseptic Processing Areas

Sampling Area	Frequency of Sampling
ISO Class 5 or better room designations	Each operating shift (if a Class 5 designation rated hood is used for control of nonviable particulates, microbiological testing is not required)
Isolator systems: active air sampling	Once per manufacturing day or product lot
Isolator systems: surface monitoring	At the end of each monitoring campaign
Aseptic processing area adjacent to ISO Class 5 (e.g., ISO Class 7)	Each operating shift
Other support areas in aseptic processing (ISO Class 8)	Twice/week
Other less critical support areas in aseptic processing (ISO Class 8)	Once/week
Nonaseptic closed operations (ISO Class 7)	Twice/month
Nonaseptic open operations with moderate microbial risk (ISO Class 7)	Once/week
Nonaseptic open operations with higher microbial risk (ISO Class 7)	Once/lot
Nonaseptic closed operations (ISO Class 8)	Once/quarter
Nonaseptic open operations with low microbial risk	Once/quarter
Nonaseptic open operations with moderate microbial risk	Once/month

~~Establishment of Microbiological Alert and Action Levels in Controlled Environments~~

▲Selection of Sample Sites within Clean Rooms and Aseptic Processing Areas▲*USP29*

~~The principles and concepts of statistical process control are useful in establishing Alert and Action levels and in reacting to trends.~~

~~An *Alert level* in microbiological environmental monitoring is that level of microorganisms that shows a potential drift from normal operating conditions. Exceeding the Alert level is not necessarily grounds for definitive corrective action, but it should at least prompt a documented follow-up investigation that could include sampling plan modifications.~~

~~An *Action level* in microbiological environmental monitoring is that level of microorganisms that when exceeded requires immediate follow-up and, if necessary, corrective action.~~

~~*Alert levels* are usually based upon historical information gained from the routine operation of the process in a specific controlled environment.~~

~~In a new facility, these levels are generally based on prior experience from similar facilities and processes; and at least several weeks of data on microbial environmental levels should be evaluated to establish a baseline.~~

~~These levels are usually re-examined for appropriateness at an established frequency. When the historical data demonstrate improved conditions, these levels can be re-examined and changed to reflect the conditions. Trends that show a deterioration of the environmental quality require attention in determining the assignable cause and in instituting a corrective action plan to bring the conditions back to the expected ranges. However, an investigation should be implemented and an evaluation of the potential impact this has on a product should be made.~~

▲ISO 14644 suggests a grid approach for the classification of clean rooms. This approach is appropriate to certify the performance of a classified environment against its design objective. A grid approach, however, is generally less valuable for the evaluation of microbial contamination within clean rooms. Microbial contamination is strongly associated

In-Process Revision

with personnel, therefore microbiological monitoring of unmanned environments is generally of little value because it is not representative of microbiological contamination control during actual production operations.

Microbiological sampling sites are best selected when human activity during manufacturing operations are considered. Careful observation and mapping of a clean room during the qualification phase can provide information concerning the movement and positioning of personnel within these rooms. Such observation can also yield important information about the most frequently conducted manipulations and interventions.

Other areas of concern relative to introduction of contamination into clean rooms are at entry points where equipment and materials move from areas of lower classification to those of higher classification. Therefore, areas within and around doors and airlocks should be included in the monitoring scheme. It has been customary to sample walls and floors, and indeed sampling at these locations provide information relative to the effectiveness of the sanitization program. Sampling at these locations, however, may be relatively infrequent because contamination at these locations is unlikely to affect product. Operators should never touch floors and walls during operation; this would eliminate mechanical transmission of contamination from these surfaces to product. Furthermore, because the most likely route of contamination of product is via an airborne route, the samples most critical to risk assessment are those that measure airborne contamination.

Monitoring of surfaces within the critical zone is also typically done, although this should be done only at the end of operations. Residues of media or diluent from wet swabs on surfaces should be avoided as this could lead to microbial proliferation. Removing any excess diluent or media requires personnel intervention and movement, which can result in release of microbial contamination into the critical zone and disrupt airflow.▲*USP29*

~~**Microbial Considerations and Action Levels for Controlled Environments**~~

▲Establishment of Microbiological Control Parameters in Clean Rooms and Isolators Used for Aseptic Processing▲*USP29*

~~Classification of clean rooms and other controlled environments is based on Federal Standard 209E based on total particulate counts for these environments. The pharmaceutical and medical devices industries have generally adopted the classification of Class 100, Class 10,000, and Class 100,000, especially in terms of construction specifications for the facilities.~~

~~Although there is no direct relationship established between the 209E controlled environment classes and microbiological levels, the pharmaceutical industry has been using microbial levels corresponding to these classes for a number of years; and these levels have been those used for evaluation of current GMP compliance.[2] These levels have been shown to be readily achievable with the current technology for controlled environments. There have been reports and concerns about differences in these values obtained using different sampling systems, media variability, and incubation temperatures. It should be recognized that, although no system is absolute, it can help in detecting changes, and thus trends, in environmental quality. The values shown in *Tables 3*, *4*, and *5* represent individual test results and are suggested only as guides. Each manufacturer's data must be evaluated as part of an overall monitoring program.~~

▲*Table 3* below, shows the microbial levels suggested in the EU GMPs for classified environments. These values can serve as a useful starting point in establishing control parameters. It is important to consider that the values for Class A and Class B environments, which are given as 1 and 3 cfu, respectively, are considered average values from many samples taken over an extended period of time. It should be noted that the European classification scheme is somewhat different from ISO 14644. European Class A can be considered equivalent to ISO Class 5. European Class B, however, has no real analogue within the ISO 14644 classification scheme because it is defined as Class 100 at rest and Class 10,000 in operation. The Class B environment is generally used for the area surrounding the aseptic processing critical zone (ISO 5/EU A) and therefore is most similar to ISO Class 7 or traditional Class 10,000.
