After polymerization is complete (about 30 minutes later), pour off the overlay, and wash the top of the gel several times with water to remove the isobutyl alcohol overlay and any unpolymerized acrylamide. Drain as much fluid as possible from the top of the gel, then remove any remaining water with the edge of a paper towel.

Stacking Gel—In a conical flask, prepare the appropriate volume of solution containing the desired concentration of acrylamide, as shown in *Table 2*. Mix the components in the order shown. Before adding the *Ammonium Persulfate Solution* and the *TEMED*, pour the solution into a disposable filtration unit equipped with a nitrocellulose filter having a 0.45-µm

porosity, and apply vacuum. Allow the solution to degas by swirling the filtration unit, and disconnect the vacuum when no more bubbles are formed in the solution. Add appropriate amounts of *Ammonium Persulfate Solution* and *TEMED* as shown in *Table 2*, swirl, and pour immediately into the gap between the two glass plates of the mold directly onto the surface of the polymerized *Resolving Gel.* Immediately insert a clean polytef comb into the stacking gel solution, being careful to avoid trapping air bubbles. Add more stacking gel solution to fill the spaces of the comb completely. Leave the gel in a vertical position, and allow it to polymerize at room temperature. After polymerization is complete (about 30 minutes later), carefully remove the polytef comb, and proceed as directed below.

Table 2. Preparation of Stacking Gel

	Component Volume (mL) per Gel Mold Volume Below

Electrophoretic Separation

Sample Buffer 1—Dissolve 1.89 g of Tris, 5.0 g of SDS, 50 mg of bromophenol blue, and 25.0 mL of glycerol in 100 mL of water. Adjust with hydrochloric acid to a pH of 6.8, and dilute with water to 125 mL. Before use, dilute with an equal volume of water or sample, and mix.

Sample Buffer 2 (for reducing conditions)—Prepare as directed in *Sample Buffer 1* except to add 12.5 mL of 2-mercaptoethanol before adjusting the pH. Alternatively, prepare as directed for *Sample Buffer 1* except to start with about 1.93 g of Tris and add a suitable quantity of DTT to obtain a final 100 µM DTT concentration.

Running Buffer—Dissolve 151.4 g of Tris, 721.0 g of aminoacetic acid, and 50.0 g of SDS in water; dilute with water to 5000 mL; and mix to obtain a stock solution. Immediately before use, dilute this stock solution with water to 10 times its volume, mix, and adjust to a pH between 8.1 and 8.8.

Procedure—Rinse the wells immediately with water or with the *Running Buffer* to remove any unpolymerized acrylamide. (If necessary, straighten the teeth of the *Stacking Gel* with a blunt hypodermic needle attached to a syringe.) Remove the clamps on one short side, carefully pull out the tubing, and replace the clamps. Proceed similarly on the other short side. Remove the tubing from the bottom part of the gel.

Mount the completed gel in the electrophoresis apparatus. Add the electrophoresis buffers to the top and bottom reservoirs. Remove any bubbles that become trapped at the bottom of the gel between the glass plates. [NOTE—Removal is best done with a bent hypodermic needle attached to a syringe. Never prerun the gel before loading the samples, because that will destroy the discontinuity of the buffer systems. Before loading the sample, carefully rinse the slot with *Running Buffer.*]

In-Process Revision

Prepare the test and standard solutions in the recommended *Sample Buffer*, and treat as directed in the individual monograph. Apply the appropriate volume of each solution to the *Stacking Gel* wells.

Start the electrophoresis under the conditions recommended by the manufacturer of the equipment. Electrophoresis running time and current or voltage may need to be varied in order to achieve optimum separation. Check that the dye front is moving into the *Resolving Gel.* When the dye has reached the bottom of the gel, stop the electrophoresis. Remove the gel assembly from the apparatus, and separate the glass plates. Remove the spacers, cut off and discard the *Stacking Gel*, and immediately proceed with staining.

Detection of Proteins in Gels

Coomassie staining is the most common protein staining method, with a detection level on the order of 1 to 10 µg of protein per band. Silver staining is the most sensitive method for staining proteins in gels, because a band containing 10 to 100 ng can be detected; but the method is more cumbersome and less rugged. All of the steps in gel staining are performed at room temperature with gentle agitation (e.g., on a rocking platform shaker or equivalent). Gloves must be worn when staining the gels to prevent fingerprint residue staining.

Reagents—

Coomassie Staining Solution—Prepare a solution of Coomassie brilliant blue R-250 having a concentration of 1.25 g per L in a mixture of water, methanol, and glacial acetic acid (5 : 4 : 1). Filter, and store at room temperature.

Destaining Solution—Prepare a mixture of water, methanol, and glacial acetic acid (5 : 4 : 1).

Fixing Solution 1—Prepare a mixture of water, methanol, and trichloroacetic acid (5 : 4 : 1).

Fixing Solution 2—Transfer 250 mL of methanol to a 500-mL volumetric flask, add 0.27 mL of formaldehyde, dilute with water to volume, and mix.

Silver Nitrate Reagent—To a mixture of 40 mL of 1 M sodium hydroxide and 3 mL of ammonium hydroxide, add, dropwise and with stirring, 8 mL of a 200 g per L solution of silver nitrate; dilute with water to 200 mL, and mix.

Developing Solution—Transfer 2.5 mL of a citric acid solution (2 in 100) and 0.27 mL of formaldehyde to a 500.0-mL volumetric flask, dilute with water to volume, and mix.

Stopping Solution—Prepare a 10% (v/v) solution of acetic acid.

Coomassie Staining—Immerse the gel in an excess of *Coomassie Staining Solution,* and incubate for at least 1 hour. Remove the *Coomassie Staining Solution*. Destain the gel with an excess of *Destaining Solution.* Change the *Destaining Solution* several times, until the stained protein bands are clearly distinguishable on a clear background. The more thoroughly the gel is destained, the smaller the amount of protein that can be detected. Destaining can be accelerated by including a few g of anion-exchange resin or a small sponge in the *Destaining Solution.* [NOTE—The acid–alcohol solutions used in this procedure do not completely fix proteins in the gel. This can lead to losses of some low molecular weight proteins during the staining and destaining of thin gels. Permanent fixation is obtainable by incubating the gel in *Fixing Solution 1* for 1 hour before it is immersed in the *Coomassie Staining Solution.*]

Silver Staining—Immerse the gel in an excess of *Fixing Solution 2,* and incubate for 1 hour. Remove *Fixing Solution 2,* add fresh *Fixing Solution 2,* and incubate for at least 1 hour, or overnight if convenient. Discard *Fixing Solution 2,* and wash the gel in an excess of water for 1 hour. Soak the gel for 15 minutes in a 1% solution of glutaraldehyde (v/v). Wash the gel twice, for 15 minutes each time, with an excess of water. Soak the gel in fresh *Silver Nitrate Reagent* for 15 minutes in darkness. Wash the gel three times, for 5 minutes each time, with an excess of water. Immerse the gel for about 1 minute in *Developing Solution* until satisfactory staining has been ob-

tained. Stop the development by incubation in the *Stopping Solution* for 15 minutes, then rinse the gel with water, and proceed with drying as indicated below.

Drying of Gels

For Coomassie staining, after the destaining step, incubate the gel in a glycerol solution (1 in 10) for at least 2 hours. For silver staining, add to the final rinsing step a 5-minute incubation in a glycerol solution (1 in 50).

Immerse two sheets of porous cellophane in water, and incubate for 5 to 10 minutes. Place one of the sheets on a drying frame. Carefully lift the gel, and place it on the cellophane sheet. Remove any trapped air bubbles, and pour a few mL of water around the edges of the gel. Place the second sheet on top, and remove any trapped air bubbles. Complete the assembly of the drying frame. Place in a drying oven, leave at room temperature until dry, or use a commercial gel dryer.

Molecular Weight Determination

Molecular weights of proteins are determined by comparison of their mobilities with those of several marker proteins of known molecular weight. Mixtures of proteins with precisely known molecular weights blended for uniform staining are available for calibrating gels. They are available in various molecular weight ranges. Concentrated stock solutions of proteins of known molecular weight are diluted in a sample buffer and loaded on the same gel as the protein sample to be tested.

Immediately after the gel has been run, the position of the bromophenol blue tracking dye is marked to identify the leading edge of the electrophoretic ion front. This can be done by cutting notches in the edges of the gel or by inserting a needle soaked in India ink into the gel at the dye front. After staining, measure the migration distances of each protein band (markers and unknowns) from the top of the *Resolving Gel*. Divide the migration distance of each protein by the distance traveled by the tracking dye. The normalized migration distances so obtained are called the relative mobilities of the proteins (relative to the dye front) and conventionally denoted as R_F. Construct a (semilogarithmic) plot of the logarithm of the molecular weights (M_R) of the protein standards as functions of the R_F values. [NOTE—The graphs are slightly sigmoid.] From the graph so obtained, estimate the unknown molecular weights by linear regression analysis or interpolation, as long as unknown samples are positioned along the linear part of the graph.

If the proteins of the molecular weight marker are not distributed along 80% of the length of the gel and over the required separation range (i.e., the range covering the product and its dimer or the products and its related impurities), and the separation obtained for the relevant protein bands does not show a linear relationship between the logarithm of the molecular weight and the R_F, the test is not valid.

Quantification of Impurities

Where the impurity limit is specified in the individual monograph, a reference solution corresponding to that level of impurity is prepared by diluting the test solution. For example, where the limit is 5.0%, a reference solution is a 1 in 20 dilution of the test solution. No impurity—any band other than the main band—in the electrophoretogram obtained from the test solution is more intense than the main band obtained with the reference solution.

Under validated conditions and when using the Coomassie staining procedure, impurities may be quantified by normalization to the main band, using an integrating densitometer. In this case, the responses must be validated for linearity.■1S (*USP30*)

BRIEFING

⟨1057⟩ Biotechnology-Derived Articles—Total Protein Assay—See briefing under *Biotechnology-Derived Articles—Amino Acid Analysis* ⟨1047⟩.

(BB PP: I. DeVeau) RTS—43939-6

Add the following:

■⟨1057⟩ BIOTECHNOLOGY-DERIVED ARTICLES—TOTAL PROTEIN ASSAY

This chapter provides guidance and procedures used for characterization of biotechnology-derived articles. This chapter is harmonized with the corresponding chapter in *JP* and *EP*. Other characterization tests, also harmonized, are provided in *Biotechnology-Derived Articles—Amino Acid Analysis* ⟨1052⟩, *Biotechnology-Derived Articles—Capillary Electrophoresis* ⟨1053⟩, *Biotechnology-Derived Articles—Isoelectric Focusing* ⟨1054⟩, *Biotechnology-Derived Articles—Peptide Mapping* ⟨1055⟩, and *Biotechnology-Derived Articles—Polyacrylamide Gel Electrophoresis* ⟨1056⟩.

INTRODUCTION

The following procedures are provided as illustrations of the determination of total protein content in pharmacopeial preparations. Other techniques, such as HPLC, are also acceptable if total protein recovery is demonstrated. Many of the total protein assay methods described below can be performed successfully using kits from commercial sources. [NOTE—Where water is required, use distilled water.]

Method 1

Protein in solution absorbs UV light at a wavelength of 280 nm due to the presence of aromatic amino acids, mainly tyrosine and tryptophan. This property is the basis of *Method 1*. Protein determination at 280 nm is mainly a function of the tyrosine and tryptophan content of the protein. If the buffer used to dissolve the protein has a high absorbance relative to that of water, there is an interfering substance in the buffer. This interference can be compensated for when the spectrophotometer is adjusted to zero buffer absorbance. The results may be compromised if the interference results in a large absorbance that challenges the limit of sensitivity of the spectrophotometer. Furthermore, at low concentrations protein can be absorbed onto the cuvette, thereby reducing the content in solution. This can be prevented by preparing samples at higher concentrations or by using a nonionic detergent in the preparation. [NOTE—Keep the *Test Solution*, the *Standard Solution,* and the buffer at the same temperature during testing.]

Test Solution—Dissolve a suitable quantity of the protein under test in the appropriate buffer to obtain a solution having a concentration of 0.2 to 2 mg per mL.

Standard Solution—Unless otherwise specified in the individual monograph, prepare a solution of USP Reference Standard or reference material for the protein under test in the same buffer and at the same concentration as the *Test Solution.*

Procedure—Concomitantly determine the absorbances of the *Standard Solution* and the *Test Solution* in quartz cells at a wavelength of 280 nm with a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩), using the buffer as the blank. To obtain accurate results, the response should be linear in the range of protein concentrations to be assayed.

Light-Scattering—The accuracy of the UV spectroscopic determination of protein can be decreased by the scattering of light by the test specimen. If the proteins in solution exist as particles comparable in size to the wavelength of the measuring light (250 to 300 nm), scattering of the light beam results in an apparent increase in absorbance of the test specimen. To calculate the absorbance at 280 nm due to light-scattering, determine the absorbances of the *Test Solution* at wavelengths of 320, 325, 330, 335, 340, 345, and 350 nm. Using the linear regression method, plot the log of the observed absorbance versus the log of the wavelength, and deter-

mine the standard curve best fitting the plotted points. From the graph so obtained, extrapolate the absorbance value due to light-scattering at 280 nm. Subtract the absorbance due to light-scattering from the total absorbance at 280 nm to obtain the absorbance value of the protein in solution. Filtration with a filter having a 0.2-µm porosity or clarification by centrifugation may be performed to reduce the effect of light-scattering, especially if the solution is noticeably turbid.

Calculations—Calculate the concentration, C_U, of protein in the test specimen by the formula:

$$C_S(A_U / A_S)$$

in which C_S is the concentration of the *Standard Solution;* and A_U and A_S are the corrected absorbances of the *Test Solution* and the *Standard Solution,* respectively (see *Spectrophotometry and Light-Scattering* ⟨851⟩).

Method 2

This method, commonly referred to as the Lowry assay, is based on the reduction by protein of the phosphomolybdic–tungstic mixed acid chromogen in the Folin-Ciocalteu's phenol reagent, resulting in an absorbance maximum at 750 nm. The Folin-Ciocalteu's phenol reagent reacts primarily with tyrosine residues in the protein, which can lead to variation in the response of the assay to different proteins. Because the method is sensitive to interfering substances, a procedure for precipitation of the protein from the test specimen may be used. Where separation of interfering substances from the protein in the test specimen is necessary, proceed as directed below for *Interfering Substances* prior to preparation of the *Test Solution.* The effect of interfering substances can be minimized by dilution, provided the concentration of the protein under test remains sufficient for accurate measurement.

Standard Solutions—Unless otherwise specified in the individual monograph, dissolve the USP Reference Standard or reference material for the protein under test in the buffer used to prepare the *Test Solution.* Dilute portions of this solution with the same buffer to obtain not fewer than five *Standard Solutions* having concentrations between 5 and 100 µg of protein per mL, the concentrations being evenly spaced.

Test Solution—Dissolve a suitable quantity of the protein under test in the appropriate buffer to obtain a solution having a concentration within the range of the concentrations of the *Standard Solutions*. An appropriate buffer will produce a pH in the range of 10.0 to 10.5.

Blank—Use the buffer used for the *Test Solution* and the *Standard Solutions.*

Reagents and **Solutions—**

Copper Sulfate Reagent—Dissolve 100 mg of cupric sulfate and 200 mg of sodium tartrate in water, dilute with water to 50 mL, and mix. Dissolve 10 g of sodium carbonate in water to a final volume of 50 mL, and mix. Slowly pour the sodium carbonate solution into the copper sulfate solution with mixing. Prepare this solution fresh daily.

SDS Solution—Dissolve 5 g of sodium dodecyl sulfate in water, and dilute with water to 100 mL.

Sodium Hydroxide Solution—Dissolve 3.2 g of sodium hydroxide in water, dilute with water to 100 mL, and mix.

Alkaline Copper Reagent—Prepare a mixture of *Copper Sulfate Reagent, SDS Solution,* and *Sodium Hydroxide Solution* (1 : 2 : 1). This reagent may be stored at room temperature for up to 2 weeks.

Diluted Folin-Ciocalteu's Phenol Reagent—Mix 10 mL of Folin-Ciocalteu's phenol TS with 50 mL of water. Store in an amber bottle, at room temperature.

Procedure—To 1 mL of each *Standard Solution,* the *Test Solution,* and the *Blank,* add 1 mL of *Alkaline Copper Reagent,* and mix. Allow to stand at room temperature for 10 minutes. Add 0.5 mL of the *Diluted Folin-Ciocalteu's Phenol Reagent* to each solution, mix each tube immediately, and allow to stand at room temperature for 30 minutes. Determine the absorbances of the solutions from the *Standard Solutions* and the *Test Solution* at the wavelength of maximum absor-

bance at 750 nm with a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩), using the solution from the *Blank* to set the instrument to zero.

Calculations—[NOTE—The relationship of absorbance to protein concentration is nonlinear; however, if the standard curve concentration range is sufficiently small, it will approach linearity.] Using the linear regression method, plot the absorbances of the solutions from the *Standard Solutions* versus the protein concentrations, and determine the standard curve best fitting the plotted points. From the standard curve so obtained and the absorbance of the *Test Solution,* determine the concentration of protein in the *Test Solution.*

INTERFERING SUBSTANCES

In the following procedure, deoxycholate–trichloroacetic acid is added to a test specimen to remove interfering substances by precipitation of proteins before testing. This technique also can be used to concentrate proteins from a dilute solution.

Sodium Deoxycholate Reagent—Prepare a solution of sodium deoxycholate in water having a concentration of 150 mg in 100 mL.

Trichloroacetic Acid Reagent—Prepare a solution of trichloroacetic acid in water having a concentration of 72 g in 100 mL.

Procedure—Add 0.1 mL of *Sodium Deoxycholate Reagent* to 1 mL of a solution of the protein under test. Mix on a vortex mixer, and allow to stand at room temperature for 10 minutes. Add 0.1 mL of *Trichloroacetic Acid Reagent*, and mix on a vortex mixer. Centrifuge at 3000 × *g* for 30 minutes, decant the liquid, and remove any residual liquid with a pipet. Redissolve the protein pellet in 1 mL of *Alkaline Copper Reagent.* Proceed as directed for the *Test Solution*.

NOTE—Color development reaches a maximum in 20 to 30 minutes during incubation at room temperature, after which there is a gradual loss of color. Most interfering substances cause a lower color yield; however, some detergents cause a slight increase in color. A high salt concentration may cause a precipitate to form. Because different protein species may give different color response intensities, the standard protein and test protein should be the same.

Method 3

This method, commonly referred to as the Bradford assay, is based on the absorption shift from 470 nm to 595 nm observed when the brilliant blue G dye binds to protein. The brilliant blue G dye binds most readily to arginyl and lysyl residues in the protein, which can lead to variation in the response of the assay to different proteins.

Standard Solutions—Unless otherwise specified in the individual monograph, dissolve the USP Reference Standard or reference material for the protein under test in the buffer used to prepare the *Test Solution.* Dilute portions of this solution with the same buffer to obtain not fewer than five *Standard Solutions* having concentrations between 100 µg and 1 mg of protein per mL, the concentrations being evenly spaced.

Test Solution—Dissolve a suitable quantity of the protein under test in the appropriate buffer to obtain a solution having a concentration within the range of the concentrations of the *Standard Solutions*.

Blank—Use the buffer used to prepare the *Test Solution* and the *Standard Solutions*.

Coomassie Reagent—Dissolve 100 mg of brilliant blue G* in 50 mL of alcohol. [NOTE—Not all dyes have the same brilliant blue G content, and different products may give different results.] Add 100 mL of phosphoric acid, dilute with water to 1 L, and mix. Pass the solution through filter paper (Whatman No. 1 or equivalent), and store the filtered reagent in an amber bottle at room temperature. [NOTE—Slow precipitation of the dye will occur during storage of the reagent. Filter the reagent before use.]

* Dye purity is important in the reagent preparation. It is intended to propose a reagent footnote to indicate that Serva Blue G (Crescent Chemical Company, Hauppauge, NY) is an acceptable grade.

Procedure—Add 5 mL of the *Coomassie Reagent* to 100 µL of each *Standard Solution,* the *Test Solution*, and the *Blank,* and mix by inversion. Avoid foaming, which will lead to poor reproducibility. Determine the absorbances of the solutions from the *Standard Solutions* and the *Test Solution* at 595 nm with a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩), using the *Blank* to set the instrument to zero. [NOTE—Do not use quartz (silica) spectrophotometer cells: the dye binds to this material. Because different protein species may give different color response intensities, the standard protein and test protein should be the same.]

There are relatively few interfering substances, but detergents and ampholytes in the test specimen should be avoided. Highly alkaline specimens may interfere with the acidic reagent.

Calculations—[NOTE—The relationship of absorbance to protein concentration is nonlinear; however, if the standard curve concentration range is sufficiently small, it will approach linearity.] Using the linear regression method, plot the absorbances of the solutions from the *Standard Solutions* versus the protein concentrations, and determine the standard curve best fitting the plotted points. From the standard curve so obtained and the absorbance of the *Test Solution,* determine the concentration of protein in the *Test Solution.*

Method 4

This method, commonly referred to as the bicinchoninic acid or BCA assay, is based on reduction of the cupric (Cu^{2+}) ion to cuprous (Cu^{1+}) ion by protein. The bicinchoninic acid reagent is used to detect the cuprous ion. The method has few interfering substances. When interfering substances are present, their effect may be minimized by dilution, provided that the concentration of the protein under test remains sufficient for accurate measurement.

Standard Solutions—Unless otherwise specified in the individual monograph, dissolve the USP Reference Standard or reference material for the protein under test in the buffer used to prepare the *Test Solution.* Dilute portions of this solution with the same buffer to obtain not fewer than five *Standard Solutions* having concentrations between 10 and 1200 µg of protein per mL, the concentrations being evenly spaced.

Test Solution—Dissolve a suitable quantity of the protein under test in the appropriate buffer to obtain a solution having a concentration within the range of the concentrations of the *Standard Solutions*.

Blank—Use the buffer used to prepare the *Test Solution* and the *Standard Solutions*.

Reagents—

BCA Reagent—Dissolve about 10 g of bicinchoninic acid, 20 g of sodium carbonate monohydrate, 1.6 g of sodium tartrate, 4 g of sodium hydroxide, and 9.5 g of sodium bicarbonate in water. Adjust, if necessary, with sodium hydroxide or sodium bicarbonate to a pH of 11.25. Dilute with water to 1 L, and mix.

Copper Sulfate Reagent—Dissolve about 2 g of cupric sulfate in water to a final volume of 50 mL.

Copper–BCA Reagent—Mix 1 mL of *Copper Sulfate Reagent* and 50 mL of *BCA Reagent.*

Procedure—Mix 0.1 mL of each *Standard Solution,* the *Test Solution,* and the *Blank* with 2 mL of the *Copper–BCA Reagent.* Incubate the solutions at 37° for 30 minutes, note the time, and allow to come to room temperature. Within 60 minutes following the incubation time, determine the absorbances of the solutions from the *Standard Solutions* and the *Test Solution* in quartz cells at 562 nm with a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩), using the *Blank* to set the instrument to zero. The color intensity continues to increase gradually after the solutions are cooled to room temperature. If substances that will cause interference in the test are present, proceed as directed for *Interfering Substances* under *Method 2*. Because different protein species may give different color response intensities, the standard protein and test protein should be the same.

In-Process Revision

Calculations—[NOTE—The relationship of absorbance to protein concentration is nonlinear; however, if the standard curve concentration range is sufficiently small, it will approach linearity.] Using the linear regression method, plot the absorbances of the solutions from the *Standard Solutions* versus the protein concentrations, and determine the standard curve best fitting the plotted points. From the standard curve so obtained and the absorbance of the *Test Solution,* determine the concentration of protein in the *Test Solution*.

Method 5

This method, commonly referred to as the Biuret assay, is based on the interaction of cupric (Cu^{2+}) ion with protein in an alkaline solution and the resultant development of absorbance at 545 nm.

Standard Solutions—Unless otherwise specified in the individual monograph, prepare a solution of Albumin Human for which the protein content has been previously determined by nitrogen analysis (using the nitrogen-to-protein conversion factor of 6.25) or of the USP Reference Standard or reference material for the protein under test in sodium chloride solution (9 in 1000). Dilute portions of this solution with sodium chloride solution (9 in 1000) to obtain not fewer than three *Standard Solutions* having concentrations between 0.5 and 10 mg per mL, the concentrations being evenly spaced. [NOTE—Low responses may be observed if the sample under test has a significantly different level of proline than that of Albumin Human. A different standard protein may be employed in such cases.]

Test Solution—Prepare a solution of the test protein in sodium chloride solution (9 in 1000) having a concentration within the range of the concentrations of the *Standard Solutions.*

Blank—Use sodium chloride solution (9 in 1000).

Biuret Reagent—Dissolve about 3.46 g of cupric sulfate in 10 mL of hot water, and allow to cool (*Solution 1*). Dissolve about 34.6 g of sodium citrate dihydrate and 20.0 g of sodium carbonate in 80 mL of hot water, and allow to cool (*Solution 2*). Mix *Solution 1* and *Solution 2,* and dilute with water to 200 mL. This *Biuret Reagent* is stable at room temperature for 6 months. Do not use the reagent if it develops turbidity or contains any precipitate.

Procedure—To one volume of a solution of the *Test Solution* add an equal volume of sodium hydroxide solution (6 in 100), and mix. Immediately add a volume of *Biuret Reagent* equivalent to 0.4 volume of the *Test Solution,* and mix. Allow to stand at a temperature between 15° and 25° for not less than 15 minutes. Within 90 minutes after the addition of the *Biuret Reagent*, determine the absorbances of the *Standard Solutions* and the solution from the *Test Solution* at the wavelength of maximum absorbance at 545 nm with a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩), using the *Blank* to set the instrument to zero. [NOTE—Any solution that develops turbidity or a precipitate is not acceptable for calculation of protein concentration.]

Calculations—Using the least-squares linear regression method, plot the absorbances of the *Standard Solutions* versus the protein concentrations, determine the standard curve best fitting the plotted points, and calculate the correlation coefficient for the line. [NOTE—Within the given range of the standards, the relationship of absorbance to protein concentration is approximately linear.] A suitable system is one that yields a line having a correlation coefficient of not less than 0.99. From the standard curve and the absorbance of the *Test Solution,* determine the concentration of protein in the test specimen, making any necessary correction.

Interfering Substances—To minimize the effect of interfering substances, the protein can be precipitated from the initial test specimen as follows. Add 0.1 volume of 50% trichloroacetic acid to 1 volume of a solution of the test specimen, withdraw the supernatant layer, and dissolve the precipitate in a small volume of 0.5 N sodium hydroxide. Use the solution so obtained to prepare the *Test Solution.*

Comments—This test shows minimal difference between equivalent IgG and albumin samples. Addition of the sodium hydroxide and the *Biuret Reagent* as a combined reagent, insufficient mixing after the addition of the sodium hydroxide, or an extended time between the addition of the sodium hydroxide solution and the addition of the *Biuret Reagent* will give IgG samples a higher response than albumin samples. The trichloroacetic acid method used to minimize the effects of interfering substances can also be used to determine the protein content in test specimens at concentrations below 500 µg per mL.

Method 6

This fluorometric method is based on the derivatization of the protein with *o*-phthalaldehyde (OPA), which reacts with the primary amines of the protein (i.e., NH_2-terminal amino acid and the ϵ-amino group of the lysine residues). The sensitivity of the test can be increased by hydrolyzing the protein before testing. Hydrolysis makes the α-amino group of the constituent amino acids of the protein available for reaction with the *o*-phthalaldehyde reagent. The method requires very small quantities of the protein.

Primary amines, such as tris(hydroxymethyl)aminomethane and amino acid buffers, react with *o*-phthalaldehyde and must be avoided or removed. Ammonia at high concentrations will react with *o*-phthalaldehyde as well. The fluorescence obtained when amine reacts with *o*-phthalaldehyde can be unstable. The use of automated procedures to standardize this procedure may improve the accuracy and precision of the test.

Standard Solutions—Unless otherwise specified in the individual monograph, dissolve the USP Reference Standard or reference material for the protein under test in the buffer used to prepare the *Test Solution.* Dilute portions of this solution with the same buffer to obtain not fewer than five *Standard Solutions* having concentrations between 10 and 200 µg of protein per mL, the concentrations being evenly spaced.

Test Solution—Dissolve a suitable quantity of the protein under test in the appropriate buffer to obtain a solution having a concentration within the range of the concentrations of the *Standard Solutions.*

Blank—Use the buffer used to prepare the *Test Solution* and the *Standard Solutions.*

Reagents—

Borate Buffer—Dissolve about 61.83 g of boric acid in water, and adjust with potassium hydroxide to a pH of 10.4. Dilute with water to 1 L, and mix.

Stock OPA Reagent—Dissolve about 120 mg of *o*-phthalaldehyde in 1.5 mL of methanol, add 100 mL of *Borate Buffer,* and mix. Add 0.6 mL of polyoxyethylene (23) lauryl ether, and mix. This solution is stable at room temperature for at least 3 weeks.

OPA Reagent—To 5 mL of *Stock OPA Reagent* add 15 µL of 2-mercaptoethanol. Prepare at least 30 minutes prior to use. This reagent is stable for one day.

Procedure—Adjust each of the *Standard Solutions* and the *Test Solution* to a pH between 8 and 10.5. Mix 10 µL of the *Test Solution* and each of the *Standard Solutions* with 100 µL of *OPA Reagent*, and allow to stand at room temperature for 15 minutes. Add 3 mL of 0.5 N sodium hydroxide, and mix. Using a suitable fluorometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩), determine the fluorescent intensities of solutions from the *Standard Solutions* and the *Test Solution* at an excitation wavelength of 340 nm and an emission wavelength between 440 and 455 nm. [NOTE—The fluorescence of an individual specimen is read only once because irradiation decreases the fluorescent intensity.]

Calculations—The relationship of fluorescence to protein concentration is linear. Using the linear regression method, plot the fluorescent intensities of the solutions from the *Standard Solutions* versus the protein concentrations, and determine the standard curve best fitting the plotted points. From

the standard curve so obtained and the fluorescent intensity of the *Test Solution,* determine the concentration of protein in the test specimen.

Method 7

This method is based on nitrogen analysis as a means of protein determination. Interference caused by the presence of other nitrogen-containing substances in the test specimen can affect the determination of protein by this method. Nitrogen analysis techniques destroy the protein under test but are not limited to protein presentation in an aqueous environment.

Procedure 1—Determine the nitrogen content of the protein under test as directed under *Nitrogen Determination* ⟨461⟩. Commercial instrumentation is available for the Kjeldahl nitrogen assay.

Procedure 2—Commercial instrumentation is available for nitrogen analysis. Most nitrogen analysis instruments use pyrolysis (i.e., combustion of the sample in oxygen at temperatures approaching 1000°), which produces nitric oxide (NO) and similar oxides of nitrogen (NO_x) from the nitrogen present in the test protein. Some instruments convert the nitric oxides to nitrogen gas, which is quantified with a thermal conductivity detector. Other instruments mix nitric oxide (NO) with ozone (O_3) to produce excited nitrogen dioxide (NO_2), which emits light when it decays and can be quantified with a chemiluminescence detector. A protein reference material or reference standard that is relatively pure and is similar in composition to the test proteins is used to optimize the injection and pyrolysis parameters and to evaluate consistency in the analysis.

Calculations—The protein concentration is calculated by dividing the nitrogen content of the sample by the known nitrogen content of the protein. The known nitrogen content of the protein can be determined from the chemical composition of the protein or by comparison with the nitrogen content of the USP Reference Standard or reference material. ■1S (*USP30*)

BRIEFING

⟨**1058**⟩ **Analytical Instrument Qualification,** page 1453 of *PF* 31(5) [Sept–Oct. 2005]. On the basis of comments received, it is proposed to revise this text in order to reflect current practices. Among these changes, the *Performance Qualification* section has been modified in order to accept the system suitability test as proof of suitable performance. In addition, minor editorial changes have been made.

Add the following:

■⟨1058⟩ ANALYTICAL INSTRUMENT QUALIFICATION

INTRODUCTION

A large variety of laboratory instruments and tools, ranging from simple nitrogen evaporators to complex multiple-function technologies (see *Instrument Categories*), are used in the pharmaceutical industry to acquire data to help ensure that products are suitable for their intended use. ~~and that they do not pose high safety risks. The~~ An analyst's objective is to consistently obtain reliable and valid data suitable for the intended purpose. Depending on the applications, users validate their procedures and perform system suitability tests and in-process quality control ~~checks~~ check samples to help ensure that the acquired data are reliable. ~~These activities help enhance the quality of data, and there are specific guidances and procedures for performing these activities.~~ With the increasing sophistication and automation of analytical instruments, an increasing demand has been placed on users to qualify their instruments.

In-Process Revision

Unlike method validation and system suitability activities, analytical instrument qualification (AIQ) currently has no specific guidance or procedures. Competing opinions ~~abound~~ exist regarding instrument qualification and validation procedures and the roles and responsibilities of those who perform them. Consequently, various approaches have been used for instrument qualification, approaches that require varying amounts of resources and generate widely differing amounts of documentation. This chapter provides a scientific approach to AIQ and considers AIQ as one of the major components required for generating reliable and consistent data. Note that a risk-based approach may be used to provide flexibility in the qualification process, depending on the complexity and intended use of the instrumentation. This chapter provides an efficient science- and risk-based process for AIQ. This approach emphasizes AIQ's place in the overall process of obtaining reliable data from analytical instruments. The approach provided in this chapter focuses on scientific value rather than on producing documents.

Validation versus Qualification

Because there is ambiguity in the use of the terms ''validation'' and ''qualification'', in this chapter the term ''validation'' ~~will be~~ is used for processes, ~~and software,~~ including analytical procedures and software procedures, and the term ''qualification'' ~~will be~~ is used for instruments. Thus, the phrase ''analytical instrument qualification'' (AIQ) is used for the process of ensuring that an instrument is suitable for its intended application. ~~The term ''validation'' is reserved for processes including analytical procedures and software procedures.~~

COMPONENTS OF DATA QUALITY

There are four critical components involved in the generation of reliable and consistent data (quality data). *Figure 1* shows these components as layered activities within a quality triangle. Each layer adds to the overall quality. Analytical instrument qualification forms the ~~base~~ basis for generating quality data. The other components essential for generating quality data are analytical method validation, system suitability tests, and quality control ~~checks~~ check samples. These quality components are described below.

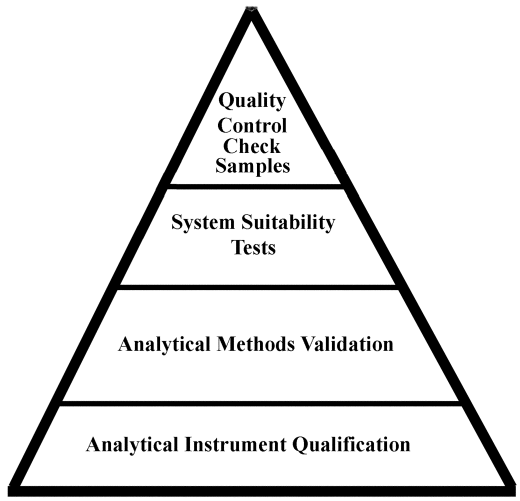

Figure 1. Components of data quality.

Analytical Instrument Qualification

AIQ is the collection of documented evidence that an instrument performs suitably for its intended purpose. ~~and that it is properly maintained and calibrated.~~ Use of a qualified instrument in analyses contributes to confidence in the ~~veracity~~ validity of generated data.

Analytical Method Validation

Analytical method validation is the collection of documented evidence that an analytical procedure does what it purports to do and addresses the required attributes of the procedure. Use of a validated procedure with qualified analytical instruments provides confidence that the procedure will generate test data of acceptable quality. ~~Users of compendial procedures perform validation using the criteria provided in general information chapter *Validation of Compendial Methods*~~

In-Process Revision

⟨~~1225~~⟩. Additional guidance on validation of compendial procedures may be found in the general information chapter *Validation of Compendial Procedures* ⟨1225⟩.

System Suitability Tests

System suitability tests verify that the system will perform ~~according to~~ in accordance with ~~the analyst's expectations and according to~~ the criteria set forth in the procedure. These tests are performed along with the sample analyses to ensure that the system's performance is acceptable at the time of the test. USP general chapter *Chromatography* ⟨621⟩ presents a more detailed discussion of system suitability tests as related to chromatographic systems.

Quality Control ~~Checks~~ Check Samples

Most analyses are performed on instruments ~~calibrated or~~ standardized using reference materials or calibration standards. ~~The calibration or standardization process uses a single- or multiple-point calibration, depending on the instrument and the intended application. The calibration or standardization of an instrument during analysis ensures that the instrument response correlates with the known quantity or quality of the calibration standard or reference material. In addition to calibration or standardization, some~~ Some analyses also require the inclusion of quality control check samples to provide an in-process or ongoing assurance of the test's suitable performance.

The extent of system suitability tests or quality control ~~checks~~ check samples varies for different analyses, depending on their intended use. ~~Chemical analyses, which are largely subject to Good Manufacturing Practices (GMP) regulations and require tighter precision and accuracy, may require more system suitability tests than bioanalytical work, which is largely subject to Good Laboratory Practice (GLP) regulations. Bioanalytical work requires sensitive, specific, broad-range analysis and therefore is generally performed with more quality control checks during sample analysis.~~ Generally, chemical analyses exhibit tighter precision and accuracy than bioanalytical work, and for these analyses system suitability tests are often more appropriate. Due to the inherent variability, bioanalytical analyses are generally performed with more quality control checks during sample analysis. Control check samples are also appropriate when high-variability tests or instruments ~~(i.e., those with a relative standard deviation [RSD] higher than 5%)~~ are considered. Other use-specific considerations may also determine the extent of system suitability tests or quality-control-check sample analysis. Whatever the case, the sum total of such controls provides an important step in delivering quality data for the intended purpose.

In summary, analytical instrument qualification and analytical method validation ensure the quality of analysis *before* conducting the tests. System suitability tests and quality control checks ensure the quality of analytical results *immediately before* or *during* sample analysis.

ANALYTICAL INSTRUMENT QUALIFICATION PROCESS

The following sections address in detail the AIQ process. The other three components of building quality into analytical data—analytical method validation, system suitability tests, and quality control ~~checks~~ check samples—are not within the scope of this chapter.

Qualification Phases

Instrument qualification is not a single continuous process, but instead results from several discrete activities. For convenience, these activities can be grouped into four phases: design qualification (DQ), installation qualification (IQ), operational qualification (OQ), and performance qualification (PQ).

Some of these qualification terms have their roots in manufacturing-process validation. Note, however, that adoption of process validation terms does not imply that all process validation activities are necessary for AIQ. Also, some AIQ activities cover more than one qualification phase and could arguably be performed within any of the phases. It is important that the required AIQ activities be performed; however, within which qualification phase an activity is performed or reported is not as important. *Table 1* accommodates these overlapping activities by letting users perform them under one or another phase as necessary. The user should describe where the activity is performed and reported.

Table 1. Timing, Applicability, and Activities for Each Phase of Analytical Instrument Qualification*

DQ	IQ		OQ		PQ
		Timing and applicability			
Prior to purchase of a new ~~type~~ model of instrument	At installation of each instrument (new, old, or existing unqualified)		After installation or major repair of each instrument		Periodically at specified intervals for each instrument
		Activities			
Assurance of vendor's DQ	System description	⇆	Fixed parameters		Preventive maintenance and repairs
Assurance of adequate support availability from manufacturer	Instrument delivery				~~SOPs for~~ Establish practices to address operation, calibration, maintenance, and change control
Instrument's fitness for use in laboratory	Utilities/facility/environment				
	Network and data storage	⇆	Secure data storage, backup, and archive		
	Assembly and installation				
	Installation verification	⇆	Instrument function tests	⇆	Performance checks

* Activities under each phase are usually performed as given in the table. However, in some cases, it may be more appropriate to perform or combine a given activity with another phase. Such activities spanning more than one qualification phase are shown as connected by double arrows. If an activity listed under a given phase is performed under another phase, it is not necessary to repeat the activity under the phase where the activity is listed. Performing the activity is far more important than the phase under which the activity is performed.

DESIGN QUALIFICATION

Design qualification (DQ) is the documented collection of activities that define the functional and operational specifications of the instrument, based on the intended purpose. Design qualification (DQ) is most suitably performed by the instrument developer or manufacturer. Because the instrument design is already in place for commercial off-the-shelf (COTS) systems, users do not need to repeat ~~all aspects of~~ DQ. However, users should ensure that COTS instruments are suitable for their intended applications and that the manufacturer has adopted a quality system for developing, manufacturing, and testing. Users should also establish that manufacturers and vendors adequately support installation, service, and training. Methods for ascertaining the manufacturer's design qualification and an instrument's suitability for its intended use depend on the nature of the instrument, the complexity of the proposed application, and the extent of the user's previous interaction with the manufacturer. Vendor audits or required vendor-supplied documentation satisfy part of the DQ requirements. The required scope and comprehensiveness of the audits and documentation ~~vary with users' familiarity with the instrument and their previous interactions with the vendor~~ should be based on the risk the instrument will impose on operations.

~~Informal processes also form an important part of DQ. Informal personal communications and networking with peers at technical or user group meetings significantly inform users about the suitability of instrument design for various applications and the quality of vendor support services. Informal site visits to other users' and vendors' facilities to obtain data on representative samples that used the specified instrument are another good source of information about suitability for intended use. In many instances an assessment of the quality of vendor support, gleaned from informal discussions with peer users, significantly influences instrument selection.~~

INSTALLATION QUALIFICATION

~~Installation qualification (IQ) is the documented collection of activities necessary for installing an instrument in the user's environment.~~ Installation qualification (IQ) is the documented collection of activities necessary to establish that an instrument is delivered as designed and specified, and is properly installed in the selected environment, and that this environment is suitable for the intended purpose. IQ applies to an instrument that is new or was pre-owned, or to any instrument that exists on site but has not been previously qualified. Relevant parts of IQ would also apply to a qualified instrument that has been ~~packed and~~ transported to another location or is being reinstalled for other reasons, such as prolonged storage. The activities and documentation typically associated with IQ are as follows.

System Description—Provide a description of the instrument or the collection of instrument components, including its manufacturer, model, serial number, software version, location, etc. Use drawings and flow charts where appropriate.

Instrument Delivery—Ensure that the instrument, software, manuals, supplies, and any other accessories arrive with the instrument as the purchase order specifies and that they are undamaged. For a pre-owned or existing instrument, manuals and documentation should be obtained.

Utilities/Facility/Environment—Verify that the installation site satisfactorily meets vendor-specified environmental requirements. ~~A commonsense judgment for the environment suffices: one need not measure the exact voltage for a standard-voltage instrument or the exact humidity reading for an instrument that will operate at ambient conditions.~~

Network and Data Storage—Some analytical systems require users to provide network connections and data storage capabilities at the installation site. When required, connect the instrument to the network, and check its functionality.

Assembly and Installation—Assemble and install the instrument, and perform any preliminary diagnostics and testing. Assembly and installation of complex instruments are best done by the vendor, specialized engineers, or qualified in-house personnel, whereas users can assemble and install simple ones. For complex instruments, vendor-established installation tests and guides provide a valuable baseline reference for determining instrument acceptance. Any abnormal event observed during assembly and installation merits documenting. ~~If the pre-owned, unqualified existing instrument or transported instrument requires assembly and installation, perform the tasks as specified above, then perform the installation verification procedure, described below.~~ Installation packages purchased from the vendor may, however, need to be supplemented with user-specific criteria.

Installation Verification—Perform the initial diagnostics and testing of the instrument after installation. On obtaining acceptable results, the user and, when present, the installing engineer should confirm that the installation was successful before proceeding with the next qualification phase.

OPERATIONAL QUALIFICATION

After a successful IQ, the instrument is ready for OQ testing. Operational qualification (OQ) is the documented collection of activities necessary to demonstrate that an instrument will function according to its operational specification in the selected environment. The OQ phase may consist of these test parameters.

Fixed Parameters—These tests measure the instrument's nonchanging parameters such as length, height, weight, voltage inputs, acceptable pressures, and loads. If the vendor-supplied specifications for these parameters satisfy the user, the test requirements may be waived. However, if the user wants to confirm the parameters, testing can be performed at the user's site. Fixed parameters do not change over the life of the instrument, and therefore never need redetermination. [NOTE—These tests could also be performed during the IQ phase (see *Table 1*); if so, fixed parameters need not be redetermined as part of OQ testing.]

Secure Data Storage, Backup, and Archiving—When ~~required~~ applicable, test secure data handling such as storage, backup, and archiving at the user's site according to written procedures.

Instrument Function Tests—~~Important instrument~~ Instrument functions should be tested to verify that the instrument operates as intended by the manufacturer. ~~and required by the user.~~ The user should select ~~important~~ instrument parameters for testing according to the instrument's intended use. Vendor-supplied information is useful in identifying specifications for these parameters. Tests should be designed to evaluate the identified parameters. Users, or their qualified designees, should perform these tests to verify that the instrument meets vendor ~~and user specifications~~ specifications in the user's environment.

The extent of OQ testing that an instrument undergoes depends on its intended applications. Therefore, no specific OQ tests for any instrument or application are offered in this chapter. ~~Nevertheless, as a guide to the types of tests possible during OQ, consider the following, which apply to an HPLC unit:~~

- ~~pump flow rate~~
- ~~gradient linearity~~
- ~~detector wavelength accuracy~~
- ~~detector linearity~~
- ~~column oven temperature~~
- ~~injector precision and accuracy~~
- ~~peak retention time precision~~

Routine analytical tests do not constitute OQ testing. OQ tests are specifically designed to verify the instrument's operation according to specifications in the user's environment, and repeating the testing at regular intervals may not be required. However, when the instrument undergoes major repairs or modifications, relevant OQ tests should be repeated to verify whether the instrument continues to operate satisfac-

In-Process Revision

torily. Relevant OQ tests should also be repeated for an instrument that has been transported to another location, although a move within the laboratory, or from one room to another, that does not disturb instrument operation may not require requalification.

OQ tests can be modular or holistic. Modular testing of individual components of a system may facilitate interchanging of such components without requalification. ~~and should be performed whenever possible.~~ Holistic tests, which involve the entire system, are also acceptable. ~~in lieu of modular testing. Having successfully completed OQ testing, the instrument is qualified for use in regulated samples analysis.~~

PERFORMANCE QUALIFICATION

Performance qualification (PQ) is the documented collection of activities necessary to demonstrate that an instrument consistently performs according to the specifications defined by the user, and is appropriate for the intended use. After IQ and OQ have been performed, the instrument's continued suitability for its intended use is demonstrated through performance qualification. The PQ phase may include the following parameters.

Performance Checks—Set up a test or series of tests to verify the acceptable performance of the instrument for its intended use. PQ tests are usually based on the instrument's typical on-site applications ~~Some~~ and may consist of analyzing known components or standards. The tests should be based on good science and reflect the general intended use of the instrument. ~~These~~ Some system suitability tests or quality control checks that are performed concurrently with the test samples can be used to demostrate that the instrument is performing suitably. PQ tests may resemble those performed during OQ, but the specifications for their results can be set differently if required. ~~PQ tests should be performed routinely on a working instrument, not only on a new instrument at installation. Therefore, PQ specifications can be slightly less rigorous than OQ specifications.~~ Nevertheless, user specifications for PQ tests should ~~evince~~ demonstrate trouble-free instrument operation for the intended applications. ~~PQ tests should be performed independently of the routine analytical testing performed on the instrument.~~ As is the case with OQ testing, PQ tests can be modular or holistic. However, because many modules within a system interact, holistic tests generally prove to be more effective because they evaluate the entire system, not simply the system's individual modules.

Testing frequency depends on the ruggedness of the instrument and the criticality of the tests performed. Testing may be unscheduled—for example, each time the instrument is used. It may also be scheduled for regular intervals, such as weekly or monthly. Experience with the instrument can influence this decision. ~~Generally, the same PQ tests are repeated~~ It may be useful to repeat the same PQ tests each time so that a history of the instrument's performance can be compiled. Alternatively, the instrument may be incorporated into an integrated support system to assure that it remains continually qualified. Some system suitability tests or quality control checks that are performed concurrently with the test samples also imply that the instrument is performing suitably. ~~However, although system suitability tests can supplement periodic PQ tests, they cannot replace them.~~

Preventive Maintenance and Repairs—When an instrument fails to meet PQ test specifications, it requires maintenance or repair. A periodic preventive maintenance may also be recommended for many instruments. The relevant PQ test(s) should be repeated after the needed maintenance or repair to ensure that the instrument remains qualified.

~~**Standard Operating Procedure[s]**~~ **Practices for Operation, Calibration, ~~and~~ Maintenance, and Change Control**—Establish ~~standard operating procedures~~ practices to maintain and calibrate the instrument. ~~Use a logbook, binder, or electronic record to document each~~ Each maintenance and calibration activity should be documented.

ROLES AND RESPONSIBILITIES

Users

Users are ultimately responsible for instrument operations and data quality. The user's group encompasses analysts, their supervisors, and organization management. Users should be adequately trained in the instrument's use, and their training records should be maintained as required by the regulations.

Users should also be responsible for qualifying their instruments, because their training and expertise in the use of instruments make them the best-qualified group to design the instrument test(s) and specification(s) necessary for successful AIQ. Consultants, equipment vendors, validation specialists, and quality assurance (QA) personnel can advise and assist as needed, but the final responsibility for qualifying instruments lies with the users. The users must also maintain the instrument in a qualified state by routinely performing PQ.

Quality ~~Assurance~~ Unit

The ~~QA role~~ role of the Quality Unit in AIQ remains the same as for any other regulated ~~study~~ activity. ~~QA~~ Quality personnel should understand the instrument qualification process, and they should learn about the instrument's application by working with the users. Finally, they should review the AIQ process to determine whether it meets regulatory requirements, and ~~they should make certain that the users attest to the scientific validity of the process~~ the intended use of the equipment supported by scientifically valid and documented data.

Manufacturers

Manufacturers and developers are responsible for DQ when designing the instrument. They are also responsible for validation of relevant processes used in manufacturing and assembly of the hardware and for software associated with the instrument. Manufacturers and developers are also responsible for writing stand-alone software for analytical work in a documented quality manner and for the validation of this software. Manufacturers should test the assembled instruments before shipping them to users.

Manufacturers and vendors should make available to users a summary of their validation efforts and the results of final instrument and software tests, and they should provide the critical functional test scripts that can be used to qualify the instrument and software at the user site. For instance, manufacturers and vendors can provide a large database and scripts for functional testing of the network's bandwidth for laboratory information management system (LIMS) software.

Finally, it is desirable that manufacturers and vendors should notify all known users about hardware or software defects discovered after a product's release; offer user training, service, repair, and installation support; and invite user audits as necessary.

SOFTWARE VALIDATION

Software used for analytical work can be classified into three categories: firmware; instrument control, data acquisition, and processing software; and stand-alone software.

Firmware

Computerized analytical instruments contain integrated chips with low-level software (firmware). Such instruments will not function without properly operating firmware, and users generally cannot alter firmware design or function. Firmware is therefore considered a component of the instrument itself. Indeed, the qualification of hardware is not possible without operating it via its firmware. Thus, when the hardware (that is, the analytical instrument) is qualified at the user's site, the integrated firmware is also essentially qualified. No separate on-site qualification of the firmware is needed. Any changes made to firmware versions should be tracked through change control of the instrument (see *Change Control,* below).

Instrument Control, Data Acquisition, and Processing Software

Software for instrument control, data acquisition, and processing for many of today's computerized instruments is loaded on a computer connected to the instrument. Operation of the instrument is then controlled via the software, leaving fewer operating controls on the instrument. Also, the software is needed for data acquisition and postacquisition calculations. Thus, both hardware and software, their functions inextricably intertwined, are critical to providing analytical results.

The manufacturer should perform DQ, validate this software, and provide users with a summary of validation. At the user site, holistic qualification, which involves the entire instrument and software system, is more efficient than modular validation of the software alone. Thus, the user qualifies the instrument control, data acquisition, and processing software by qualifying the instrument according to the AIQ process.

Stand-Alone Software

An authoritative guide for validating stand-alone software, such as LIMS, is available.[1] The validation process is administered by the software developer, who also specifies the development model appropriate for the software. Validation takes place in a series of activities planned and executed through various stages of the development cycle.

The software validation guide cited in the previous paragraphs indicates that user-site testing is an essential part of the software development cycle. Note, however, that user-site testing, though essential, is only part of the validation process for stand-alone software and does not constitute complete validation. Refer to the software validation guide for activities that must be performed at the user site for testing stand-alone software used in analytical work.

CHANGE CONTROL

Changes to the instrument and software become inevitable as manufacturers add new features and correct known defects. However, implementing all such changes may not always benefit users. Users should therefore adopt changes they deem useful or necessary and should also assess the effects of changes to determine what, if any, requalification is required. The change control process enables them to do this.

Change control follows the DQ/IQ/OQ/PQ classification process. For DQ, evaluate the changed parameters, and determine whether need for the change warrants implementing it. If implementation of the change is needed, install the changes to the system during IQ. Evaluate which of the existing OQ and PQ tests need revision, deletion, or addition as a result of the installed change. Where the change calls for additions, deletions, or revisions to the OQ or PQ tests, follow the procedure outlined below.

Operational Qualification—Revise OQ tests as necessitated by the change. Perform the revised OQ testing. If the OQ did not need revision, repeat only the relevant tests affected by the change. This ensures the instrument's effective operation after the change is installed.

Performance Qualification—Revise PQ tests as necessitated by the change. Perform the PQ testing after installation of the change if similar testing is not already performed during OQ. In the future, perform the revised PQ testing.

For changes to firmware and to software for instrument control, data acquisition, and processing, change control is performed through DQ/IQ/OQ/PQ of the affected instrument. Change control for stand-alone software requires user-site testing of changed functionality.

[1] *General Principles of Software Validation: Final Guidance for Industry and FDA Staff,* U.S. Department of Health and Human Services, Food and Drug Administration, Rockville, MD, January 11, 2002. http://www.fda.gov/cdrh/comp/guidance/938.html (accessed September 2004).

AIQ DOCUMENTATION

Two types of documents result from AIQ: static and dynamic.

Static Documents

Static documents are obtained during the DQ, IQ, and OQ phases and should be ~~kept in a "Qualification" binder~~ retained in an accessible manner. Where multiple instruments of one kind exist, documents common to all instruments ~~should go into one binder or section,~~ and documents specific to an instrument ~~should go into that instrument's binder or section~~ may be retained separately. During change control, additional documents ~~can be placed with~~ may supplement the static ones, but previous documents should ~~not be removed~~ be retained. When necessary, such documents may be archived.

Dynamic Documents

Dynamic documents are generated during the OQ and PQ phases when the instrument is maintained or tested for performance. ~~Arranged in a binder or logbook, they provide a running record for the instruments and should be kept with them. These documents may should also be archived as necessary.~~ These documents provide a running record for the instruments and should be retained in a suitable manner which allows for appropriate protection and access.

INSTRUMENT CATEGORIES

Modern laboratories typically include a suite of tools varying from simple nitrogen evaporators to complex automated instruments. Therefore, applying a single set of principles to qualifying such dissimilar instruments would be scientifically inappropriate. Users are most capable of establishing the level of qualification needed for an instrument. On the basis of the level needed, it is convenient to categorize instruments into three groups: A, B, and C, as defined below. Examples of instruments in each group are provided. Note that the list of instruments provided here is for illustration only and is not meant to be exhaustive. It does not provide the exact category for an instrument at a user site. That category should be determined by users for their specific instruments or applications.

The exact grouping of an instrument must be determined by users for their specific requirements. Depending on individual user requirements, the same instrument may appropriately fall into one group for one user and another group for another user. Therefore, a careful selection of groups by users is highly encouraged.

Group A

Conformance of Group A instruments to user requirements is determined by visual observation. Since requirements are often straightforward, documentation of requirements may not be required. No independent qualification process is required. Examples of instruments in this group are nitrogen evaporators, magnetic stirrers, vortex mixers, mortar and pestle sets, ~~water baths,~~ and glass pipets.

Group B

Conformance of Group B instruments to user requirements is determined according to an instrument's standard operating procedures. Conformity assessments are generally unambiguous. Installation of Group B instruments is relatively simple, and causes of their failure are readily discernible by simple observation. Examples of instruments in this group are balances, incubators, ~~IR spectrometers,~~ melting point apparatus, muffle furnaces, light microscopes, pH meters, variable pipets, refractometers, refrigerator-freezers, thermocouples, thermometers, titrators, ovens, water baths, and viscosimeters.

Group C

Conformance of Group C instruments to user requirements is complex and highly method-specific; conformity bounds are determined by the application. Installing these instruments can be a complicated undertaking and may require the assistance

of specialists. A full qualification process, as outlined in this document, should apply to these instruments. Examples of instruments in this group include the following:

- atomic absorption spectrometers
- differential scanning calorimeters
- dissolution apparatus
- electron microscopes
- flame absorption spectrometers
- high-pressure liquid chromatographs
- mass spectrometers
- microplate readers
- thermal gravimetric analyzers
- X-ray fluorescence spectrometers
- X-ray powder diffractometers
- densitometers
- diode-array detectors
- elemental analyzers
- gas chromatographs
- IR spectrometers
- near IR spectrometers
- Raman spectrometers
- UV/Vis spectrometers
- inductively coupled argon–plasma emission spectrometers

~~Again, it must be emphasized that the placement of these instruments in the given three groups is for illustrative purposes only. The exact grouping of an instrument must be determined by users for their specific requirements. Depending on individual user requirements, the same instrument may appropriately fall into one group for one user and another group for another user. Therefore, a careful selection of groups by users is highly encouraged.~~

~~CONCLUSION~~

~~The purpose of the use of analytical instruments is to generate reliable data. Analytical instrument qualification helps fulfill this purpose. No authoritative guide existed that considered the risk of instrument nonperformance and combined that risk with users' scientific knowledge and ability to use the instrument to deliver reliable and consistent data. In the absence of such a guide, the qualification of analytical instruments became a subjective and often fruitless document-generating exercise.~~

~~This chapter is based on the outcome of a user workshop conference on the subject and provides an efficient science- and risk-based process for AIQ. This approach emphasizes AIQ's place in the overall process of obtaining reliable data from analytical instruments. The process provided in this chapter focuses on scientific value rather than on producing documents. Implementing such a process should increase efficiency and remove ambiguous or varying interpretations by different groups.~~ ■1S (*USP30*)

BRIEFING

⟨1070⟩ Emergency Medical Services Vehicles and Ambulances—Storage of Preparations, page 1706 of *PF* 30(5) [Sept.–Oct. 2004]. On the basis of comments received, it is proposed to revise this proposed new general information chapter to delete the *Composite Inventory of Typical Ambulance Service Medications*. This list of the most commonly used medications carried in EMS vehicles is being omitted because of the ever changing nature of the list and to ensure that exclusivity is not assumed. Other changes are editorial in nature.

(P&S: D. Hunt) RTS—42495-1

Add the following:

■⟨1070⟩ EMERGENCY MEDICAL SERVICES VEHICLES AND AMBULANCES—STORAGE OF PREPARATIONS

The storage and handling of pharmaceuticals in emergency vehicles and ambulances should be done so that the attributes of the official articles are preserved. ~~For examples, see the list below for typical articles.~~ There are a number of practices that

need consideration when an effective plan is formulated, evaluated, put in place, and periodically re-evaluated. Those practices are listed here.

Monitoring devices should be in place to record weekly temperatures, and allow the calculation of mean kinetic temperature for conformance to controlled room temperature storage for those vehicles utilized continuously. Measurement should also be made during a typical challenging 24-hour period, and the derived temperature should be used for the calculation of MKT and storage temperature of the sample.

PHARMACEUTICAL STORAGE CABINET MONITORING; LOCATION OF PARKED VEHICLES

Ambulances and other emergency medical response vehicles that routinely carry Pharmacopeial articles should be monitored to verify that temperature profiles and on-board pharmaceutical storage cabinets or cold chests are within established limits. Suitable monitoring devices are to be placed in the pharmaceutical cabinet of each vehicle that records highest and lowest temperatures, at the least, of each hot summer and cold winter day. To avoid temperature extremes, ambulance personnel should consider parking in the shade or in air-conditioned garages in the summer or in heated garages in the winter.

STOCK ROTATION

A program of regular stock rotation should be in place for articles with low rates of turnover. Rotation is understood as transfer of the articles with suitable marking of stock items to an appropriate climate controlled facility or storage cabinet such as in an ambulance bay. Off-vehicle storage of each article is subject to the storage requirement in the approved labeling or the pertinent USP monograph.

PORTABLE CARRYING CASE STORAGE AND MONITORING

The portable bag or carrying case in which drugs are kept is to be insulated, and when not in use, should be kept in a pharmaceutical storage cabinet or at controlled room temperature within facilities. Storage in portable bags or cases only, rather than in on-board cabinets, should be considered to facilitate stock rotation where indicated. The use of time–temperature indicators is recommended to monitor cumulative insult to the contents of all compartments.

ADDITIONAL REQUIREMENTS FOR SOME ARTICLES

All articles are to be protected from excessive heat (40°). If the article requires storage in a cold or dry place or at controlled room temperature, then suitable measures are to be taken to maintain it within the defined limits, see *General Notices—Preservation, Packaging, Storage, and Labeling*. Articles that have the most stringent storage requirements determine the storage of mixed loads.

STORAGE AND HANDLING OF SENSITIVE PREPARATIONS

~~*Environmentally Sensitive Preparations* (see ⟨386⟩)~~ Environmentally sensitive preparations are not to be stored in emergency response vehicles unless the on-board cabinet in which the medications is stored is climate controlled or a time–temperature indicator is attached to each package. If environmentally sensitive preparations must be kept in the EMS vehicle, then the supply of medications should be rotated with reserve stock on a schedule based on local climate, but not longer than every 3 days.

In-Process Revision

USE OF TIME–TEMPERATURE INDICATORS

Attach time–temperature indicators to individual *thermally sensitive preparations* where time outside of the on-board cabinet can exceed 4 days total. On-board cabinets must be insulated and while medications are inside, active heating and cooling devices should be used in accord with the local climate and as specified for the preparations.

~~**COMPOSITE INVENTORY OF TYPICAL AMBULANCE SERVICE MEDICATIONS**~~

~~NOTE—Each vehicle may carry only a portion of the articles herein, or others.~~

REAGENTS, INDICATORS, AND SOLUTIONS

Reagent Specifications

BRIEFING

Acetaldehyde, *USP 29* page 3106. To facilitate the procurement of this reagent and other reagents appearing in this issue of *PF* (see related cross-references), it is proposed to include CAS numbers and relevant synonyms, as necessary.

(HDQ: M. Marques) RTS—43350-1

Change to read:

Acetaldehyde

■*(Ethanal; acetic aldehyde),* ■1S (*USP30*)
CH_3CHO—**44.05**

■[*75-07-0*]■1S (*USP30*)
—Colorless liquid. Miscible with water and with alcohol. Use ACS reagent grade.

In-Process Revision

BRIEFING

Acetanilide, *USP 29* page 3106—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43350-3

Change to read:

Acetanilide

■*(Phenylacetamide; Antifebrin),*■1S (*USP30*)
C_8H_9NO—**135.16**

■[*103-84-4*]■1S (*USP30*)
—White, shiny crystals, usually in scales, or a white, crystalline powder. ▲*USP29* Is stable in air. Freely soluble in alcohol and in chloroform; soluble in boiling water, in ether, and in glycerin; slightly soluble in water.

Melting range ⟨741⟩: between 114° and 116°.

Reaction—Its saturated solution is neutral to litmus.

Loss on drying ⟨731⟩—Dry it over sulfuric acid for 2 hours: it loses not more than 0.5% of its weight.

Residue on ignition (Reagent test): not more than 0.05%.

BRIEFING

Acetic Acid, Glacial, *USP 29* page 3106—See briefing under *Acetaldehyde.*

$CH_3COC_6H_5$—**120.15**

■[*98-86-2*]■1S (*USP30*)
—Liquid. Slightly soluble in water, freely soluble in alcohol and in ether.

Melting range ⟨741⟩: between 19° and 20°.
Refractive index ⟨831⟩: about 1.534 at 20°.
Specific gravity ⟨841⟩: about 1.03.

BRIEFING

***p*-Acetotoluidide,** *USP 29* page 3106—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43350-14

Change to read:

***p*-Acetotoluidide,** $C_9H_{11}NO$—**149.19**

■[*103-89-9*]■1S (*USP30*)
—White to off-white powder.

Assay—Inject an appropriate volume into a gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a flame-ionization detector, helium being used as the carrier gas. The following conditions have been found suitable: a 0.25-mm × 30-m capillary column coated with a 1-μm layer of phase G2; the injection port temperature is maintained at 230°; the detector temperature is maintained at 300°; and the column temperature is maintained at 130° and programmed to rise 10° per minute to 280°. The area of the $C_9H_{11}NO$ peak is not less than 98.5% of the total peak area.

Melting range ⟨741⟩: between 145° and 151°.

BRIEFING

Acetylacetone, *USP 29* page 3106—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43350-15

Change to read:

Acetylacetone *(2,4-Pentanedione;*

■*Diacetylmethane),*■1S (*USP30*)
$C_5H_8O_2$—**100.12**

■[*123-54-6*]■1S (*USP30*)
—Clear, colorless to slightly yellow, flammable liquid. Soluble in water; miscible with alcohol, with chloroform, with acetone, with ether, and with glacial acetic acid.

Assay—Not less than 98% of $C_5H_8O_2$, a suitable gas chromatograph equipped with a flame-ionization detector being used and helium being used as the carrier gas. The following conditions have been found suitable: a 3-mm × 1.83-m stainless steel column containing 10% phase G on support S1A; the injection port and detector temperatures are maintained at 250° and 310°, respectively; the column temperature is programmed to rise 8° per minute, from 50° to 220°.

Refractive index ⟨831⟩: between 1.4505 and 1.4525, at 20°.

BRIEFING

Acetyl Chloride, *USP 29* page 3106—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43350-17

Change to read:

Acetyl Chloride, CH_3COCl—**78.50**

■[*75-36-5*]■1S (*USP30*)
—Clear, colorless liquid. ▲▲*USP29* Is decomposed by water and by alcohol. Miscible with benzene and with chloroform. Use ACS reagent grade.

Specific gravity ⟨841⟩: about 1.1.

In-Process Revision

BRIEFING

Acetylcholine Chloride, *USP 29* page 3106—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43350-18

Change to read:

Acetylcholine Chloride

■*(Trimethylethanaminium Chloride; Acecoline),*■1S (*USP30*)
$[CH_3COOCH_2CH_2N(CH_3)_3]Cl$—**181.66**

■[*60-31-1*]■1S (*USP30*)
—White, crystalline ▲*USP29* powder. Very deliquescent; very soluble in water; freely soluble in alcohol.

Melting range ⟨741⟩—When previously dried at 110° in a capillary tube for 1 hour, it melts between 149° and 152°.

Reaction—A solution (1 in 10) is neutral to litmus.

Residue on ignition (Reagent test): negligible, from 200 mg.

Solubility in alcohol—A solution of 500 mg in 5 mL of alcohol is complete and colorless.

Percent of acetyl (CH_3CO)—Weigh accurately about 400 mg, previously dried at 105° for 3 hours, and dissolve in 15 mL of water in a glass-stoppered conical flask. Add 40.0 mL of 0.1 N sodium hydroxide VS, and heat on a steam bath for 30 minutes. Insert the stopper, allow to cool, add phenolphthalein TS, and titrate the excess alkali with 0.1 N sulfuric acid VS. Determine the exact normality of the 0.1 N sodium hydroxide by titrating 40.0 mL after it has been treated in the same manner as in the test. Each mL of 0.1 N sodium hydroxide is equivalent to 4.305 mg of CH_3CO. Between 23.2% and 24.2% is found.

Percent of chlorine (Cl)—Weigh accurately about 400 mg, previously dried at 105° for 3 hours, and dissolve in 50 mL of water in a glass-stoppered, 125-mL flask. Add with agitation 30.0 mL of 0.1 N silver nitrate VS, then add 5 mL of nitric acid and 5 mL of nitrobenzene, shake, add 2 mL of ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS: each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of Cl. Between 19.3% and 19.8% of Cl is found.

BRIEFING

Acrylic Acid, *USP 29* page 3107—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43350-20

Change to read:

Acrylic Acid

■*(2-Propenoic Acid; Vinylformic Acid),*■1S (*USP30*)
$C_3H_4O_2$—**72.06**

■[*79-10-7*]■1S (*USP30*)
—Colorless liquid. Miscible with water, with alcohol, and with ether.

Assay—Inject an appropriate specimen into a gas chromatograph (see *Chromatography* ⟨621⟩), equipped with a flame-ionization detector, helium being used as the carrier gas. The following conditions have been found suitable: a 0.25-mm × 30-m capillary column coated with a 1-µm layer of phase G2; the injection port temperature is maintained at 150°; the detector temperature is maintained at 300°; and the column temperature is maintained at 50° and programmed to rise 10° per minute to 200°. The area of the $C_3H_4O_2$ peak is not less than 99% of the total peak area.

Refractive index ⟨831⟩: between 1.419° and 1.423° at 20°.

BRIEFING

Adipic Acid, *USP 29* page 3107—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43352-1

Change to read:

Adipic Acid

■*(Hexanedioic Acid; 1,4-Butanedicarboxylic Acid),*■1S (*USP30*)
$C_6H_{10}O_4$—**146.14**

■[*124-04-9*]■1S (*USP30*)
—Colorless to white, crystalline powder. Slightly soluble in water and in cyclohexane; soluble in alcohol, in methanol, and in acetone; practically insoluble in benzene and in petroleum benzin.

Assay—Weigh accurately about 0.3 g, and dissolve in 50 mL of alcohol. Add 25 mL of water, mix, and titrate with 0.5 N sodium hydroxide VS to a pH of 9.5. Perform a blank determination, and make any necessary correction. Each mL of 0.5 N sodium hydroxide is equivalent to 36.54 mg of $C_6H_{10}O_4$. Not less than 98% is found.

Melting range ⟨741⟩: between 151° and 155°, but the range between beginning and end of melting does not exceed 2°.

BRIEFING

■[*1344-28-1*]■1S (*USP30*)
—Use a suitable grade.

BRIEFING

Alumina, Anhydrous, *USP 29* page 3108—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43352-5

Change to read:

Alumina, Anhydrous (*Aluminum Oxide; Alumina specially prepared for use in chromatographic analysis*)

■[*1344-28-1*]■1S (*USP30*)
—A white or practically white powder, 80- to 200-mesh. It does not soften, swell, or decompose in water. It is not acid-washed. Store it in well-closed containers.

BRIEFING

Aluminon, *USP 29* page 3108—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43352-6

Change to read:

Aluminon *(Aurin Tricarboxylic Acid, [tri]Ammonium Salt),* $C_{22}H_{23}N_3O_9$—**473.43**

■[*569-58-4*]■1S (*USP30*)
—Yellowish-brown, glassy powder. Freely soluble in water. Use ACS reagent grade.

BRIEFING

Aluminum, *USP 29* page 3108—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43352-7

Change to read:

Aluminum, Al—**At. Wt. 26.98154**

■[*7429-90-5*]■1S (*USP30*)
—Use ACS reagent grade, which also meets the requirements of the following test.

Arsenic—Place 750 mg in a generator bottle (see *Arsenic in Reagents* under *General Tests for Reagents*), omitting the pledget of cotton. Add 10 mL of water and 10 mL of sodium hydroxide solution (3 in 10), and allow the reaction to proceed for 30 minutes: not more than a barely perceptible stain is produced on the mercuric bromide test paper.

BRIEFING

Aluminum Oxide, Acid-Washed, *USP 29* page 3108—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43352-8

Change to read:

Aluminum Oxide, Acid-Washed (*Alumina specially prepared for use in chromatographic analysis*)—

■[*1344-28-1*]■1S (*USP30*)
—White or practically white powder or fine granules. Very hygroscopic. Store in tight containers.

pH of Slurry—The pH of a well-mixed slurry of 5 g in 150 mL of ammonia-free and carbon dioxide-free water, after 10 minutes' standing, is between 3.5 and 4.5.

Loss on ignition—Weigh accurately about 1 g, and ignite, preferably in a muffle furnace at 800° to 825°, to constant weight: it loses not more than 5.0% of its weight.

Silica—Fuse 500 mg with 10 g of potassium bisulfate for 1 hour in a platinum crucible, cool, and dissolve in hot water: not more than a small amount of insoluble matter remains.

Suitability for chromatographic adsorption—Dissolve 50 mg of *o*-nitroaniline in benzene to make 50.0 mL. Dilute 10 mL of the resulting solution with benzene to 100.0 mL, and mix (*Solution A*).

Weigh quickly about 2 (±0.005) g of specimen in a glass-stoppered weighing bottle, and rapidly transfer it to a dry, glass-stoppered test tube. Add 20.0 mL of *Solution A*, insert the stopper, shake vigorously for 3 minutes, and allow to settle.

Pipet 10 mL of the clear supernatant into a 100-mL volumetric flask, dilute with benzene to volume, and mix (*Solution B*).

Determine the absorbances of *Solutions A* and *B* at 395 nm, with a suitable spectrophotometer, using benzene as the blank. Calculate the quantity, in mg, adsorbed per g of test specimen by the formula:

$$[2(1 - A_B / A_A)] / W$$

in which A_A and A_B are the absorbances of *Solutions A* and *B,* respectively; and W is the weight, in g, of the aluminum oxide. Not less than 0.3 mg of *o*-nitroaniline is adsorbed for each g of the aluminum oxide.

BRIEFING

Aluminum Potassium Sulfate, *USP 29* page 3108—See briefing under *Acetaldehyde.*

■*(Aminoguanidine Hydrogen Carbonate),*■1S (*USP30*)
$CH_6N_4 \cdot H_2CO_3$—**136.11.**

■[*2582-30-1*]■1S (*USP30*)
—White powder.

Assay—Dissolve about 34 mg, accurately weighed, in 50 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary corrections. Each mL of 0.1 N perchloric acid is equivalent to 13.61 mg of $CH_6N_4 \cdot H_2CO_3$. Not less than 98.5% is found.

Melting point ⟨741⟩: about 170°, with decomposition.

BRIEFING

■[*5906-35-4*]■1S *(USP30)*
—Colorless liquid.

Assay—Inject an appropriate specimen into a suitable gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a flame-ionization detector, helium being used as the carrier gas. The following conditions have been found suitable: a 0.25-mm × 30-m capillary column coated with G2. The injection port temperature is maintained at 180°; the column temperature is maintained at 80° and programmed to rise 10° per minute to 230° and then maintained at 230° for 5 minutes. The detector temperature is maintained at 300°. The area of the main peak is not less than 95% of the total peak area.

Refractive index ⟨831⟩: between 1.4840 and 1.4860 at 20°.

BRIEFING

4-Amino-3-hydroxy-1-naphthalenesulfonic Acid, *USP 29* page 3109—See briefing under *Acetaldehyde.*

C_6H_7NO—**109.13**

■[*591-27-5*]■1S *(USP30)*
—Cream-colored to pale yellow flakes. Sparingly soluble in cold water; freely soluble in hot water, in alcohol, and in ether.

Assay—Dissolve about 1.5 g, accurately weighed, in about 400 mL of water in a 500-mL volumetric flask, dilute with water to volume, and mix. Transfer 25.0 mL of this solution to an iodine flask, add 50.0 mL of 0.1 N bromine VS, dilute with 50 mL of water, add 5 mL of hydrochloric acid, and immediately insert the stopper in the flask. Shake for 1 minute, allow to stand for 2 minutes, and add 5 mL of potassium iodide TS through the slightly loosened stopper. Shake thoroughly, allow to stand for 5 minutes, remove the stopper, and rinse it and the neck of the flask with 20 mL of water, adding the rinsing to the flask. Titrate the liberated iodine with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. From the volume of 0.1 N sodium thiosulfate used, calculate the volume, in mL, of 0.1 N bromine consumed by the test specimen. Each mL of 0.1 N bromine is equivalent to 1.819 mg of C_6H_7NO: not less than 99.5% is found.

Melting range ⟨741⟩: between 121° and 123°.

Loss on drying ⟨731⟩—Dry it over calcium chloride for 4 hours: the loss in weight is negligible.

Residue on ignition (Reagent test): negligible, from 2 g.

Change to read:

Ammonium Vanadate *(Ammonium Metavanadate),* NH_4VO_3—**116.98**

■[*7803-55-6*]■1S (*USP30*)
—White, crystalline powder. Slightly soluble in cold water; soluble in hot water and in dilute ammonia TS.

Assay—Weigh accurately about 500 mg, transfer to a suitable container, add 30 mL of water and 2 mL of dilute sulfuric acid (1 in 4), swirl to dissolve, and pass sulfur dioxide gas through the solution until reduction is complete and the solution is bright blue in color. Boil gently while passing a stream of carbon dioxide through the solution to remove any excess sulfur dioxide, then cool, and titrate with 0.1 N potassium permanganate VS. Each mL of 0.1 N potassium permanganate consumed is equivalent to 11.7 mg of NH_4VO_3. Not less than 98.0% is found.

Solubility in ammonium hydroxide—Dissolve 1 g in a mixture of 3 mL of ammonium hydroxide and 50 mL of warm water: the solution is clear and colorless.

Carbonate—To 500 mg add 1 mL of water and 2 mL of diluted hydrochloric acid: no effervescence is produced.

Chloride—Dissolve 250 mg in 40 mL of hot water, add 2 mL of nitric acid, and allow to stand for 1 hour. Filter, and to the filtrate add 0.5 mL of silver nitrate TS: any turbidity produced does not exceed that of a blank containing 0.5 mg of added Cl (0.2%).

Sulfate—Dissolve 500 mg in 50 mL of hot water, and add 2 mL of diluted hydrochloric acid and 1.5 g of hydroxylamine hydrochloride. Heat at 60° for 3 minutes, filter, cool, and add to the filtrate 2 mL of barium chloride TS: no turbidity or precipitate is produced within 30 minutes.

BRIEFING

Amyl Acetate, *USP 29* page 3110—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43354-6

Change to read:

Amyl Acetate *(Isoamyl Acetate),* $CH_3CO_2C_5H_{11}$—**130.18**

■[*2308-18-1*]■1S (*USP30*)
—Clear, colorless liquid. ▲▲*USP29* Slightly soluble in water. Miscible with alcohol, with amyl alcohol, with benzene, and with ether.

Specific gravity ⟨841⟩: about 0.87.

Boiling range (Reagent test, *Method I*): not less than 90%, between 137° and 142°.

Solubility in diluted alcohol—A 1.0-mL portion dissolves in 20 mL of diluted alcohol to form a clear solution.

Acidity—Add 5.0 mL to 40 mL of neutralized alcohol, and, if the pink color is discharged, titrate with 0.10 N sodium hydroxide: not more than 0.20 mL is required to restore the pink color (about 0.02% as CH_3COOH).

Water—A 5-mL portion gives a clear solution with 5 mL of carbon disulfide.

BRIEFING

Amyl Alcohol, *USP 29* page 3110—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43354-7

Change to read:

Amyl Alcohol *(Isoamyl Alcohol),* $C_5H_{11}OH$—**88.15**

■[*598-75-4*]■1S (*USP30*)
—Use ACS reagent grade Isopentyl Alcohol.

BRIEFING

Antimony Pentachloride, *USP 29* page 3111—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43354-14

Change to read:

Antimony Pentachloride, $SbCl_5$—**299.02**

■[*7647-18-9*]■1S (*USP30*)
—Clear, reddish-yellow, oily, hygroscopic, caustic liquid. Fumes in moist air and solidifies by absorption of one molecule of water. Is decomposed by water, soluble in dilute hydrochloric acid and in chloroform. Boils at about 92° at a pressure of 30 mm of mercury and has a specific gravity of about 2.34 at 25°.

Caution—Antimony pentachloride causes severe burns, and the vapor is hazardous.

Assay (*$SbCl_5$*)—Accurately weigh a glass-stoppered, 125-mL flask, quickly introduce about 0.3 mL of the test specimen, and reweigh. Dissolve with 20 mL of diluted hydrochloric acid (1 in 5), and add 10 mL of potassium iodide solution (1 in 10) and 1 mL of carbon disulfide. Titrate the liberated iodine with 0.1 N sodium thiosulfate VS. The brown color will gradually disappear from the solution, and the last traces of free iodine will be collected in the carbon disulfide, giving a pink color. When this pink color disappears the endpoint has been reached. Each mL of 0.1 N sodium thiosulfate is equivalent to 14.95 mg of $SbCl_5$: not less than 99.0% of $SbCl_5$ is found.

Sulfate (Reagent test, *Method II*)—Dissolve 4.3 mL (10 g) in the minimum volume of hydrochloric acid, dilute with water to 150 mL, neutralize with ammonium hydroxide, and filter. To the filtrate add 2 mL of hydrochloric acid: the solution, 10 mL of barium chloride TS being used, yields not more than 1.3 mg of residue, correction being made for a complete blank test (0.005%).

Arsenic—Add 10 mL of a recently prepared solution of 20 g of stannous chloride in 30 mL of hydrochloric acid to 100 mg of specimen dissolved in 5 mL of hydrochloric acid. Mix, transfer to a color-comparison tube, and allow to stand for 30 minutes. Any color in the solution of the specimen should not be darker than that in a control containing 0.02 mg of arsenic (As), which has been treated in the same manner as the test specimen, when viewed downward over a white surface (0.02% of As).

Iron ⟨241⟩—To the residue from the test for *Substances not precipitated by hydrogen sulfide* add 2 mL of hydrochloric acid and 5 drops of nitric acid, and evaporate on a steam bath to dryness. Take up the residue in 2 mL of hydrochloric acid, and dilute with water to 47 mL: the solution shows not more than 0.01 mg of Fe (0.001%).

Other heavy metals (as Pb)—Dissolve the precipitate on the filter paper from the test for *Substances not precipitated by hydrogen sulfide* with 75 mL of a solution containing 6 g of sodium sulfide and 4 g of sodium hydroxide dissolved in water and diluted with water to 100 mL. Collect the filtrate in the original flask containing the remainder of the sulfide precipitate. Warm the solution to dissolve the soluble sulfides, and allow the insoluble sulfides to settle. Filter, wash thoroughly with hydrogen sulfide TS, and dissolve any precipitate remaining on the filter paper with 10 mL of hot diluted hydrochloric acid. Dilute the filtrate with water to 50 mL. Neutralize a 25-mL portion of this solution with 1 N sodium hydroxide, and add 1 mL of 1 N acetic acid and 10 mL of hydrogen sulfide TS. Any brown color should not exceed that produced by 0.05 mg of lead ion in an equal volume of solution containing 1 mL of 1 N acetic acid and 10 mL of hydrogen sulfide TS (0.005%).

Substances not precipitated by hydrogen sulfide (*as SO_4*)—Dissolve 0.90 mL (2 g) in 5 mL of hydrochloric acid, and dilute with 95 mL of water. Precipitate the antimony completely with hydrogen sulfide, allow the precipitate to settle, and filter, being careful not to transfer much of the precipitate to the filter paper. (Retain the precipitate.) To 50 mL of the filtrate, add 0.5 mL of sulfuric acid, evaporate in a tared porcelain crucible to dryness, and ignite at 800 ± 25° for 15 minutes. (Retain the residue.) The weight of the ignited residue should not be more than 0.0010 g greater than the weight obtained in a complete blank test (0.10%).

■[*70-47-3*]■1S (*USP30*)
—Colorless ▲*USP29* crystals. One g dissolves in 50 mL of water; soluble in acids and in alkalies; insoluble in alcohol and in ether. Its neutral or alkaline solutions are levorotatory; its acid solutions are dextrorotatory.

Specific rotation ⟨781⟩: between +31° and +33°, determined in a solution in diluted hydrochloric acid containing the equivalent of 5 g (on the anhydrous basis, as determined by drying at 105° for 5 hours) in each 100 mL.

Residue on ignition (Reagent test): not more than 0.1%.

Chloride (Reagent test)—One g shows not more than 0.03 mg of Cl (0.003%).

Sulfate (Reagent test, *Method I*)—One g shows not more than 0.05 mg of SO_4 (0.005%).

Heavy metals (Reagent test): 0.002%.

Nitrogen content, *Method II* ⟨461⟩: between 18.4% and 18.8% of N is found.

Benzaldehyde, C_7H_6O—**106.12**

■[*100-52-7*]■1S (*USP30*)
—Colorless, strongly refractive liquid. ▲▲*USP29* Soluble in water; miscible with alcohol, with ether, and with fixed and volatile oils.

Assay—Pipet about 1 mL into a tared, glass-stoppered weighing bottle, and weigh accurately. Loosen the stopper, and transfer both the weighing bottle and its contents to a 250-mL conical flask containing 25 mL of a hydro-alcoholic solution of hydroxylamine hydrochloride (prepared by dissolving 34.7 g of hydroxylamine hydrochloride in 160 mL of water, then adding alcohol to make 1000 mL, and neutralizing to bromophenol blue by the addition of sodium hydroxide TS). Using a graduated cylinder to measure the volume, rinse the sides of the flask with an additional 50 mL of this reagent solution. Allow the solution to stand for 10 minutes, add 1 mL of bromophenol blue TS, and titrate the liberated hydrochloric acid with 1 N sodium hydroxide VS. Perform a blank determination with the same quantities of the same reagents, and make any necessary correction. Each mL of 1 N sodium hydroxide consumed is equivalent to 106.1 mg of C_7H_6O. Not less than 98% is found.

Specific gravity ⟨841⟩: between 1.041 and 1.046.

Refractive index ⟨831⟩: between 1.5440 and 1.5465 at 20°.

Hydrocyanic acid—Shake 0.5 mL with 5 mL of water, add 0.5 mL of sodium hydroxide TS and 0.1 mL of ferrous sulfate TS, and warm the mixture gently. Add a slight excess of hydrochloric acid: no greenish-blue color or blue precipitate is observed within 15 minutes.

In-Process Revision

Change to read:

Blue Tetrazolium (*3,3′-(3,3′-Dimethoxy[1,1′-biphenyl]-4,4′-diyl)-bis[2,5-diphenyl-2H-tetrazolium]dichloride*), $C_{40}H_{32}Cl_2N_8O_2$—**727.64**

■[*1871-22-3*]■1S (*USP30*)
—Lemon-yellow crystals. Slightly soluble in water; freely soluble in chloroform and in methanol; insoluble in acetone and in ether.

Solubility in methanol—Dissolve 1 g in 100 mL of methanol: complete solution results, and the solution is clear.

Color—Transfer a portion of the methanol solution obtained in the preceding test to a 1-cm cell, and determine its absorbance at 525 nm, against water as the blank: the absorbance does not exceed 0.20.

Molar absorptivity ⟨851⟩—Its molar absorptivity in methanol, at 252 nm, is not less than 50,000.

Suitability test—

STANDARD PREPARATION—Dissolve in alcohol a suitable quantity of USP Hydrocortisone RS, previously dried at 105° for 3 hours and accurately weighed, and prepare by stepwise dilution a solution containing about 10 µg per mL.

PROCEDURE—Pipet 10-, 15-, and 20-mL portions of *Standard preparation* into separate, glass-stoppered, 50-mL conical flasks. Add 10 mL and 5 mL, respectively, of alcohol to the flasks containing the 10- and 15-mL portions of *Standard preparation,* and swirl to mix. To each of the flasks, and to a fourth flask containing 20 mL of alcohol, add 2.0 mL of a solution prepared by dissolving 50 mg of blue tetrazolium in 10 mL of alcohol, mix, and then add 2.0 mL of a solution prepared by diluting 1 mL of tetramethylammonium hydroxide TS with alcohol to 10 mL. Mix, allow the flasks to stand in the dark for 90 minutes, and determine the absorbances of the three solutions of the steroid standard at 525 nm, with a suitable spectrophotometer, using the solution in the fourth flask as the blank. Plot the absorbances on the abscissa and the amount of hydrocortisone on the ordinate scale of arithmetic coordinate paper, and draw the curve of best fit: the absorbance of each solution is proportional to the concentration, and the absorbance of the solution containing 200 µg of hydrocortisone is not less than 0.50.

BRIEFING

■[*109-69-3*]■1S (*USP30*)
—Clear, colorless, volatile liquid. ▲▲*USP29 [Caution—Highly flammable.]* Practically insoluble in water. Miscible with alcohol and with ether.

Assay—When examined by gas–liquid chromatography, it shows a purity of not less than 98%. The following conditions have been found suitable for assaying the article: a 3-mm × 1.8-m stainless steel column packed with phase G16 on support S1. Helium, flowing at a rate of about 40 mL per minute, is the carrier gas, the detector temperature is about 310°, the injection port temperature is about 230°, and the column temperature is programmed to rise at 10° per minute from 35° to 150°. A flame-ionization detector is employed.

Boiling range ⟨721⟩: between 76° and 80°, within a 2° range.

Refractive index ⟨831⟩: between 1.4015 and 1.4035 at 20°.

Acidity—Add phenolphthalein TS to 75 mL, and titrate with 0.1 N potassium hydroxide in methanol to a faint pink color that persists, with shaking, for 1.5 seconds: not more than 0.91 mL is required (about 0.005% as HCl).

Water ⟨921⟩: not more than 0.02%, determined by the *Titrimetric Method*.

Residue after evaporation—Evaporate about 60 mL (50 g), accurately weighed, in a tared platinum dish on a steam bath, and dry at 105° for 1 hour: not more than 0.005% is found.

BRIEFING

***tert*-Butyl Methyl Ether,** *USP 29* page 3116—See briefing under *Acetaldehyde.*

Cadmium Acetate, *USP 29* page 3117—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43364-18

Change to read:

Cadmium Acetate, $C_4H_6CdO_4 \cdot 2H_2O$—**266.53**

■[*543-90-8*]■1S *(USP30)*
—Colorless, transparent to translucent crystals. ▲▲*USP29* Freely soluble in water; soluble in alcohol.

Insoluble matter (Reagent test): not more than 1 mg, from 20 g (0.005%).

Chloride (Reagent test)—One g shows not more than 0.01 mg of Cl (0.001%).

Sulfate (Reagent test, *Method II*)—Dissolve 10 g in 100 mL of water, add 1 mL of hydrochloric acid, and filter: the residue weighs not more than 1.2 mg more than the residue obtained in a complete blank test (0.005%).

Substances not precipitated by hydrogen sulfide—Dissolve 2 g in a mixture of 135 mL of water and 15 mL of 1 N sulfuric acid, heat to boiling, and pass a rapid stream of hydrogen sulfide through the solution as it cools. Filter, and to 75 mL of the clear filtrate add 0.25 mL of sulfuric acid, then evaporate to dryness, and ignite gently: the residue weighs not more than 1 mg (0.1%).

BRIEFING

Cadmium Nitrate, *USP 29* page 3117—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43364-19

Change to read:

Cadmium Nitrate, $Cd(NO_3)_2 \cdot 4H_2O$—**308.48**

■[*10325-94-7*]■1S *(USP30)*
—Colorless, hygroscopic crystals. Very soluble in water; soluble in alcohol.

Insoluble matter (Reagent test): not more than 1 mg, from 20 g (0.005%).

Chloride (*Cl*) (Reagent test)—One g shows not more than 0.01 mg of Cl (0.001%).

Sulfate (Reagent test, *Method II*)—Evaporate a mixture of 12 g of specimen and 25 mL of hydrochloric acid on a steam bath to dryness. Add another 15 mL of hydrochloric acid, and again evaporate to dryness. Dissolve the residue in 100 mL of water, filter, and add 1 mL of hydrochloric acid: the residue weighs not more than 1.0 mg more than the residue obtained in a blank test (0.003%).

Copper (*Cu*)—Dissolve 0.5 g in 10 mL of water, add 10 mL of *Ammonium Citrate Solution* (see *Lead* ⟨251⟩), and adjust the reaction to a pH of about 9 by the addition of 1 N ammonium hydroxide (about 30 mL). Add 1 mL of sodium diethyldithiocarbamate solution (1 in 1000), and mix. Add 5 mL of amyl alcohol, shake for about 1 minute, and allow the layers to separate: any yellow color in the amyl alcohol layer is not darker than that of a blank to which 0.01 mg of Cu has been added (0.002%).

Iron (*Fe*)—Dissolve 1 g in 15 mL of water, add 2 mL of hydrochloric acid, and boil for 2 minutes. Cool, and add about 30 mg of ammonium persulfate and 15 mL of a solution of potassium thiocyanate in normal butyl alcohol (made by dissolving 10 g of potassium thiocyanate in 10 mL of water, warming the solution to about 30°, diluting with normal butyl alcohol to 100 mL, and shaking until clear). Shake vigorously for 30 seconds, and allow the layers to separate: any red color in the clear alcoholic layer is not darker than that of a blank to which 0.01 mg of Fe has been added (0.001%).

Lead (*Pb*)—Dissolve 1.0 g in 10 mL of water, add 0.2 mL of glacial acetic acid, and filter if necessary. To a 7-mL portion of water add 0.2 mL of glacial acetic acid and 3 mL of *Standard Lead Solution* (see *Lead* ⟨251⟩), and mix, to provide a blank. Then add to each solution 1.0 mL of potassium chromate solution (1 in 10), and mix: after 5 minutes, the test solution is not more turbid than the blank (0.003%).

Substances not precipitated by hydrogen sulfide—Dissolve 2 g in 145 mL of water, add 5 mL of sulfuric acid (1 in 10), heat to boiling, and pass a rapid stream of hydrogen sulfide through the solution as it cools. Filter, and to 75 mL of the clear filtrate add 0.25 mL of sulfuric acid, then evaporate to dryness, and ignite gently: the residue weighs not more than 1 mg (0.1%).

BRIEFING

Calcium Citrate, *USP 29* page 3117—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43373-5

Change to read:

Calcium Citrate, $Ca_3(C_6H_5O_7)_2 \cdot 4H_2O$—**570.49**

■[*813-94-5*]■1S (*USP30*)
—A white, ▲▲*USP29* crystalline powder. Slightly soluble in water; freely soluble in 3 N hydrochloric acid and in 2 N nitric acid; insoluble in alcohol. To 15 mL of hot 2 N sulfuric acid add in small portions and with stirring about 500 mg of calcium citrate. Boil the mixture for 5 minutes, and filter while hot: the cooled filtrate responds to the identification test for *Citrate* ⟨191⟩.

Assay—Accurately weigh about 400 mg of the salt, previously dried at 150° to constant weight, and transfer to a 250-mL beaker. Dissolve the test specimen in 150 mL of water containing 2 mL of 3 N hydrochloric acid, add 15 mL of 1 N sodium hydroxide and 250 mg of hydroxy naphthol blue, and titrate with 0.05 M edetate disodium VS until the solution turns deep blue. Each mL of 0.05 M edetate disodium is equivalent to 8.307 mg of $Ca_3(C_6H_5O_7)_2$: between 97.5% and 101% is found.

In-Process Revision

Calcium oxide and carbonate—Triturate 1 g of calcium citrate with 5 mL of water for 1 minute: the mixture does not turn red litmus blue. Then add 5 mL of warm 3 N hydrochloric acid: only a few isolated bubbles escape.

Hydrochloric acid-insoluble matter—Dissolve 5 g by heating with a mixture of 10 mL of hydrochloric acid and 50 mL of water for 30 minutes: not more than 2.5 mg of insoluble residue remains (0.05%).

Loss on drying ⟨731⟩—Dry it at 150° to constant weight: it loses between 12.2% and 13.3% of its weight.

Arsenic ⟨211⟩—Proceed with 0.50 g as directed for organic compounds (6 ppm of As).

Heavy metals, Method I ⟨231⟩: 0.002%.

Calcium Lactate, $(CH_3CHOHCOO)_2Ca \cdot 5H_2O$—**308.29**

■[*814-80-2*]■1S (*USP30*)
—White ▲*USP29* granules or powder. Is somewhat efflorescent and at 120° becomes anhydrous. One g dissolves in 20 mL of water; practically insoluble in alcohol. Store it in tight containers.

Assay—Accurately weigh about 500 mg, previously dried at 120° for 4 hours, transfer to a suitable container, and dissolve in 150 mL of water containing 2 mL of diluted hydrochloric acid. Add 15 mL of sodium hydroxide TS and 300 mg of hydroxy naphthol blue indicator, and titrate with 0.05 M edetate disodium VS until the solution is deep blue. Each mL of 0.05 M edetate disodium is equivalent to 10.91 mg of $C_6H_{10}CaO_6$. Not less than 98% is found.

Loss on drying ⟨731⟩—Dry it at 120° for 4 hours: it loses between 25.0% and 30.0% of its weight.

Acidity—Add phenolphthalein TS to 20 mL of a 1 in 20 solution, and titrate with 0.10 N sodium hydroxide: not more than 0.50 mL is required to produce a pink color.

Heavy metals (Reagent test)—Dissolve 1 g in 2.5 mL of diluted hydrochloric acid, dilute with water to 40 mL, and add 10 mL of hydrogen sulfide TS: any brown color produced is not darker than that of a control containing 0.02 mg of added Pb (0.002%).

Magnesium and alkali salts—Mix 1 g with 40 mL of water, carefully add 5 mL of hydrochloric acid, heat the solution, boil for 1 minute, and add rapidly 40 mL of oxalic acid TS. Add immediately to the warm mixture 2 drops of methyl red TS, then add ammonia TS dropwise, from a buret, until the mixture is just alkaline. Cool to room temperature, transfer to a 100-mL graduated cylinder, dilute with water to 100 mL, mix, and allow to stand for 4 hours or overnight. Filter, and transfer to a platinum dish 50 mL of the clear filtrate, to which has been added 0.5 mL of sulfuric acid. Evaporate the mixture on a steam bath to a small bulk. Carefully heat over a free flame to dryness, and continue heating to complete decomposition and volatilization of ammonium salts. Finally ignite the residue at 800 ± 25° for 15 minutes: the residue weighs not more than 5 mg (1%).

Volatile fatty acid—Stir about 500 mg with 1 mL of sulfuric acid, and warm: the mixture does not emit an odor of volatile fatty acid.

BRIEFING

Calcium Nitrate, *USP 29* page 3118—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43373-8

Change to read:

In-Process Revision

BRIEFING

***dl*-10-Camphorsulfonic Acid,** *USP 29* page 3118—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43373-10

Change to read:

***dl*-10-Camphorsulfonic Acid,** $C_{10}H_{16}O_4S$—**232.30**

■[*35963-20-3*]■1S (*USP30*)
—White to off-white, crystals or powder. Is optically inactive.
Melting range ⟨741⟩: decomposes at about 199°.

BRIEFING

Capric Acid, *USP 29* page 3118—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43373-11

Change to read:

Capric Acid *(Decanoic Acid),* $C_{10}H_{20}O_2$—**172.26**

■[*334-48-5*]■1S (*USP30*)
—White, solidified melt or fragments. Soluble in alcohol, in chloroform, and in ether; practically insoluble in water.

Assay—Inject an appropriate sample dissolved in acetone into a gas chromatograph (see *Chromatography* ⟨621⟩) that is equipped with a flame-ionization detector and contains a 0.53-mm × 30-m capillary column coated with a layer of phase G25. The carrier gas is helium, flowing at a rate of 9 mL per minute. The chromatograph is programmed as follows. Initially the column temperature is equilibrated at 150°, then the temperature is increased at a rate of 10° per minute to 250°. The injection port temperature is maintained at 240°, and the detector temperature at 265°. The area of the capric acid peak is not less than 98.5% of the toal peak area.

Melting range ⟨741⟩: between 30° and 33°.

BRIEFING

Carbazole, *USP 29* page 3118—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43373-15

Change to read:

Carboxymethoxylamine Hemihydrochloride, $2(C_2H_5NO_3) \cdot HCl$—**218.59**

■[*2921-14-4*]■1S (*USP30*)
—White, crystalline powder. Use a suitable grade.

BRIEFING

Casein, *USP 29* page 3118—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43373-16

Change to read:

Casein—

■[*9000-71-9*]■1S (*USP30*)
—White or slightly yellow, ▲▲*USP29* granular powder. Insoluble in water and in other neutral solvents; readily dissolved by ammonia TS and by solutions of alkali hydroxides, usually forming a cloudy solution.

Residue on ignition (Reagent test)—Ignite 2 g: the residue weighs not more than 20 mg (1.0%).

Loss on drying ⟨731⟩—Dry it at 105° to constant weight: it loses not more than 10.0% of its weight.

Alkalinity—Shake 1 g with 20 mL of water for 10 minutes, and filter: the filtrate is not alkaline to red litmus paper.

Soluble substances—When the filtrate from the *Alkalinity* test is evaporated and dried at 105°, the residue weighs not more than 1 mg (0.1%).

Fats—Dissolve 1 g in a mixture of 10 mL of water and 5 mL of alcoholic ammonia TS, and shake out with two 20-mL portions of solvent hexane. Evaporate the hexane at a low temperature, and dry at 80°: the weight of the residue does not exceed 5 mg (0.5%).

Nitrogen content, Method I ⟨461⟩: between 15.2% and 16.0% of N is found, on the anhydrous basis.

Where vitamin-free casein is required, use casein that has been rendered free from the fat-soluble vitamins by continuous extraction with hot alcohol for 48 hours followed by air-drying to remove the solvent.

BRIEFING

Catechol, *USP 29* page 3118. It is proposed to include a synonym and CAS number and to specify that a suitable grade be used for this reagent.

(HDQ: M. Marques) RTS—43373-17; 43995-1

Change to read:

Catechol *(o-Dihydroxybenzene;*

■*Pyrocathecol),*■1S (*USP30*)
$C_6H_4(OH)_2$—**110.11**

■[*120-80-9*]■1S (*USP30*)
—White crystals, which become discolored on exposure to air and light. Readily soluble in water, in alcohol, in benzene, in ether, in chloroform, and in pyridine, forming clear solutions.

~~*Melting range* ⟨741⟩: between 104° and 105°.~~

~~*Residue on ignition* (Reagent test)—Ignite 500 mg with 5 drops of sulfuric acid: the residue weighs not more than 1 mg (0.2%).~~

■Use a suitable grade with a content of not less than 99%.■1S (*USP30*)

BRIEFING

Cedar Oil, *USP 29* page 3119—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43373-18

Change to read:

Cedar Oil (for clearing microscopic sections)—

■[*8000-27-9*]■1S (*USP30*)
—A selected, distilled oil from the wood of the red cedar, *Juniperus virginiana* Linné (Fam. Pinaceae), should be used for this purpose. Refractive index: about 1.504 at 20°. For use with homogeneous immersion lenses, a specially prepared oil having a refractive index of 1.5150 ± 0.0002 at 20° is required.

BRIEFING

Ceric Sulfate, *USP 29* page 3119—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43373-19

Change to read:

Ceric Sulfate, $Ce(SO_4)_2$ with a variable amount of water—(anhydrous)—**332.24**

■[*13590-82-4*]■1S (*USP30*)
—It may also contain sulfates of other associated rare earth elements. Yellow to orange-yellow crystals or crystalline powder. Practically insoluble in cold water; slowly soluble in cold dilute mineral acids, but more readily soluble when heated with these solvents.

Assay—Weigh accurately about 800 mg, transfer to a flask, add 25 mL of water and 3 mL of sulfuric acid, and warm until dissolved. Cool, and add 60 mL of a mixture of 1 volume of phosphoric acid and 20 volumes of water. Add 25 mL of potassium iodide solution (1 in 10), insert the stopper in the flask, and allow to stand for 15 minutes. Replace the air over the solution with carbon dioxide, and while continuing the flow of carbon dioxide into the flask, titrate the liberated iodine with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Each mL of 0.1 N sodium thiosulfate is equivalent to 33.22 mg of $Ce(SO_4)_2$. Not less than 80.0% is found.

Chloride (Reagent test)—Dissolve 1 g in a mixture of 5 mL of nitric acid and 4 mL of water. Filter, if necessary, and dilute with water to 20 mL. To 10 mL of the dilution add 1 mL of silver nitrate TS, allow to stand for 10 minutes, and filter until clear. To the remaining 10 mL of test solution add 1 mL of silver nitrate TS: any turbidity produced does not exceed that in a control prepared by adding 0.05 mg of Cl to the filtrate obtained from the first 10 mL of test solution (0.01%).

Heavy metals—Heat 500 mg with a mixture of 10 mL of water and 0.5 mL of sulfuric acid until solution is complete. Cool, dilute with water to 50 mL, and bubble hydrogen sulfide gas through the solution until it is saturated: the precipitate that is formed is white or not darker than pale yellow.

Iron—Dissolve 100 mg in a mixture of 5 mL of water and 2 mL of hydrochloric acid, warming if necessary, and cool. Transfer to a glass-stoppered cylinder, dilute with water to 25 mL, and add 5 mL of ammonium thiocyanate TS and 25 mL of ether. Shake gently, but well, and allow the layers to separate: any pink color in the ether layer is not darker than that of a control, similarly prepared, containing 0.02 mg of added Fe (0.02%).

BRIEFING

Chenodeoxycholic Acid, *USP 29* page 3120—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43373-20

Change to read:

Chenodeoxycholic Acid, $C_{24}H_{40}O_4$—**392.57**

■[*474-25-9*]■1S (*USP30*)
—White to off-white powder.

Assay—When tested by thin-layer chromatography, with the use of plates coated with chromatographic reversed-phase C18 mixture, a developing system consisting of 1 N acetic acid in methanol and 1 N acetic acid (19 : 1), and sprayed with a mixture of sulfuric acid and methanol (1 : 1), heated at 110° for 20 minutes, and examined visually and under long-wavelength UV light, a single spot is exhibited.

Melting range ⟨741⟩: between 165° and 168°.

Change to read:

Choline Chloride, $HOCH_2CH_2N(CH_3)_3Cl$—**139.62**

■[*67-48-1*]■1S (*USP30*)
—White crystals or crystalline powder. Very soluble in water. Is hygroscopic. Store in tight containers.

Assay—Transfer about 100 mg, previously dried at 105° for 2 hours and accurately weighed, to a beaker, add 20 mL of water and 1 drop of aluminum chloride solution (1 in 10), and mix. Add slowly 20 mL of a freshly prepared, filtered sodium tetraphenylborate solution (1 in 50), and allow the mixture to stand for 30 minutes with occasional swirling. Pass through a medium-porosity, sintered-glass filter, and wash the beaker and the precipitate with four 10-mL portions of water. The weight of the precipitate, determined after drying at 105° for 2 hours, and multiplied by 0.3298, gives the equivalent weight of $C_5H_{14}ClNO$. Not less than 99.5% is found.

Residue on ignition ⟨281⟩: not more than 0.1%.

■[*485-71-2*]■1S (*USP30*)
—White crystals, crystalline or granular powder. Soluble in alcohol and in chloroform; practically insoluble in water.

Assay—Dissolve about 125 mg, accurately weighed, in 50 mL of glacial acetic acid. Add a few drops of *p*-naphtholbenzein TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 14.72 mg of $C_{19}H_{22}N_2O$. Not less than 99.0% is found.

Loss on drying ⟨731⟩—Dry it at 105° to constant weight: it loses not more than 1.0% of its weight.

Melting range ⟨741⟩: between 200° and 205°.

Specific rotation ⟨781⟩: between –105° and –115°, calculated on the dried basis, determined in a solution in alcohol containing 10 mg per mL.

In-Process Revision

■[*71-48-7*]■1S (*USP30*)
—Red, needlelike crystals. Soluble in water and in alcohol. Use ACS reagent grade.

BRIEFING

Congo Red, *USP 29* page 3122—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43379-1

Change to read:

Congo Red, $C_{32}H_{22}N_6Na_2O_6S_2$—**696.67**

■[*573-58-0*]■1S *(USP30)*
—A dark red or reddish-brown powder. ▲▲*USP29* Decomposes on exposure to acid fumes. Its solutions have a pH of about 8 to 9.5. One g dissolves in about 30 mL of water. Is slightly soluble in alcohol.

Loss on drying ⟨731⟩—Dry it at 105° for 4 hours: it loses not more than 3.0% of its weight.

Residue on ignition—Accurately weigh about 1 g, previously dried at 105° for 4 hours, and place it in a porcelain dish or crucible. Carefully ignite until well charred, cool, add 2 mL of sulfuric acid, and carefully ignite until the residue is white or practically so. Cool, add 0.5 mL of sulfuric acid and 1 mL of nitric acid, evaporate, and again ignite to constant weight: the weight of the sodium sulfate so obtained is between 20.0% and 24.0% of the weight of the dried specimen taken.

Sensitiveness—To 50 mL of carbon dioxide-free water add 0.1 mL of congo red solution (1 in 1000). The red color of the solution is changed to violet by the addition of 0.05 mL of 0.10 N hydrochloric acid and is restored by the subsequent addition of 0.05 mL of 0.10 N sodium hydroxide.

Change to read:

Cyclohexanol, $C_6H_{12}O$—**100.16**

■[*108-93-0*]■1S (*USP30*)
—A clear liquid. ▲▲*USP29* Freely soluble in water. Miscible with alcohol, with ethyl acetate, and with aromatic hydrocarbons.

Assay—When examined by gas-liquid chromatography, using suitable gas chromatographic apparatus and conditions, it shows a purity of not less than 98%.

Melting temperature: about 23°.

Specific gravity: about 0.962, at 20°.

BRIEFING

L-Cystine, *USP 29* page 3122—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43379-14

Change to read:

L-Cystine, $C_6H_{12}N_2O_4S_2$—**240.30**

■[*58-89-3*]■1S (*USP30*)
—A white, crystalline powder. Very slightly soluble in water; soluble in dilute mineral acids and in solutions of alkali hydroxides; insoluble in alcohol and in other organic solvents.

Specific rotation ⟨781⟩: between –215° and –225°, determined in a 2 in 100 solution of test specimen, previously dried over silica gel for 4 hours, in dilute hydrochloric acid (1 in 10) at a temperature of 20°.

Loss on drying ⟨731⟩—Dry it over silica gel for 4 hours: it loses not more than 0.2% of its weight.

Residue on ignition (Reagent test): not more than 0.1%.

BRIEFING

Decanol, *USP 29* page 3122—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43379-15

Change to read:

Decanol *(n-Decyl Alcohol),* $C_{10}H_{22}O$—**158.28**

■[*25339-17-7*]■1S (*USP30*)
—A clear, viscous liquid. Specific gravity: about 0.83 at 20°. Solidifies at about 6.5°. Insoluble in water; soluble in alcohol and in ether.

Assay—When examined by gas-liquid chromatography, using suitable gas chromatographic apparatus and conditions, it shows a purity of not less than 99%.

BRIEFING

Deuterium Oxide, *USP 29* page 3123—See briefing under *Acetaldehyde.*

Change to read:

Deuterium Oxide, D_2O—**20.032**

■[*7789-20-0*]■1S (*USP30*)
—Use a suitable grade having a minimum isotopic purity of 99.8 atom % of deuterium.

BRIEFING

Devarda's Alloy, *USP 29* page 3123—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43379-17

Change to read:

Devarda's Alloy *(Devarda's Metal),*

■[*8049-11-4*]■1S (*USP30*)
—A gray powder composed of 50 parts of copper, 45 parts of aluminum, and 5 parts of zinc.

BRIEFING

Dextran, High Molecular Weight, *USP 29* page 3123 and page 186 of *PF* 32(1) [Jan.–Feb. 2006]—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43379-18

In-Process Revision

Change to read:

Dextran, High Molecular Weight—

■[*9004-54-0*]■1S (*USP30*)
—A dextran molecular weight standard having a weight-average molecular weight, M_W, of 1 to 2×10^6 Da and a weight-average molecular weight to number-average molecular weight ratio, M_W / M_N, of 1.0 to 1.8.

[NOTE—A suitable grade is available from ~~Sigma-Aldrich, www.sigma-aldrich.com.~~]

▲American Polymer Standards Corporation, www.ampolymer.com.]▲*USP30*

BRIEFING

Dextrin, *USP 29* page 3123—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43379-19

Change to read:

Dextrin, $(C_6H_{10}O_5)_n \cdot xH_2O$—

■[*9004-53-9*]■1S (*USP30*)
—A white amorphous powder. Slowly soluble in cold water; more readily soluble in hot water; insoluble in alcohol.

Insoluble matter—Boil 1 g with 30 mL of water in a small flask: the solution is colorless and clear, or not more than opalescent.

Loss on drying ⟨731⟩—Dry it at 105° to constant weight: it loses not more than 10.0% of its weight.

Residue on ignition (Reagent test)—Ignite 1 g with 0.5 mL of sulfuric acid: the residue weighs not more than 5 mg (0.5%).

Chloride (Reagent test)—Dissolve 3 g in 75 mL of boiling water, cool, dilute with water to 75 mL, and filter if necessary. To 25 mL of the filtrate add 2 mL of nitric acid and 1 mL of silver nitrate TS, and allow to stand for 5 minutes: any turbidity produced is not greater than that of a control containing 0.02 mg of added Cl (0.002%).

Sulfate (Reagent test, *Method I*)—To a 25-mL portion of the filtrate from the preceding test add 0.5 mL of diluted hydrochloric acid and 2 mL of barium chloride TS, and allow to stand for 10 minutes: any turbidity produced is not greater than that of a control containing 0.2 mg of added SO_4 (0.02%).

Alcohol-soluble substances—Boil 1 g with 20 mL of alcohol for 5 minutes under a reflux condenser, and filter while hot. Evaporate 10 mL of the filtrate on a steam bath, and dry at 105°: the residue weighs not more than 5 mg (1%).

Reducing sugars—Shake 2 g with 100 mL of water for 10 minutes, and filter until clear. To 50 mL of the filtrate add 50 mL of alkaline cupric tartrate TS, and boil for 3 minutes. Filter through a tared filtering crucible, wash with water, then with alcohol, and finally with ether, and dry at 105° for 2 hours: the precipitate of cuprous oxide weighs not more than 115 mg (corresponding to about 5% of reducing sugars as dextrose).

BRIEFING

3,3′-Diaminobenzidine Hydrochloride, *USP 29* page 3123—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43379-20

Change to read:

3,3′-Diaminobenzidine Hydrochloride, $(NH_2)_2C_6H_3C_6H_3(NH_2)_2 \cdot 4HCl$—**360.11**

■[*7411-49-6*]■1S (*USP30*)
—White to yellowish–tan (occasionally purple), needle-shaped crystals. Soluble in water. Stable in organic solvents but unstable in aqueous solution at room temperature. Store aqueous solutions in a refrigerator.

Insoluble matter—Dissolve 2 g in 100 mL of water, without heating, and filter immediately: the insoluble residue does not exceed 1 mg (0.05%).

Residue on ignition (Reagent test): not more than 1 mg, from 2 g (0.05%).

Suitability test for detection of selenium—Dissolve 1.633 g of selenious acid (H_2SeO_3) in water, and dilute with water to 1 L. Dilute 10 mL of this solution with water to 1 L, to make a solution containing 0.010 mg of Se per mL. Place 1 mL of the resulting solution in a 100-mL beaker, add 2 mL of formic acid solution (1 in 7), and dilute with water to 50 mL. Add 2 mL of 3,3′-diaminobenzidine hydrochloride solution (1 in 200), and allow to stand for 30 to 50 minutes. Adjust with 6 N ammonium hydroxide to a pH between 6 and 7. Transfer to a 125-mL separator, add 10.0 mL of toluene, and shake vigorously for 30 seconds: a distinct yellow color is produced in the toluene layer. A blank containing diaminobenzidine hydrochloride but no selenium standard, treated in the same manner, shows no color in the toluene layer.

BRIEFING

2,3-Diaminonaphthalene, *USP 29* page 3123—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43381-1

BRIEFING

Diatomaceous Silica, Calcined, *USP 29* page 3123—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43381-4

Change to read:

Diatomaceous Silica, Calcined—

■[*68855-54-9*]■1S (*USP30*)
—A form of silica (SiO_2) consisting of fused frustules and fragments of diatoms. It is an amorphous, fine, light pink or white powder. Insoluble in water, in acids, and in dilute solutions of alkali hydroxides.

Loss on ignition—Accurately weigh about 4 g, and ignite to constant weight: it loses not more than 10.0% of its weight.

Organic impurities—It does not darken appreciably upon ignition.

Loss on drying ⟨731⟩—Dry it at 110° for 2 hours: it loses not more than 2.0% of its weight.

[NOTE—Suitable grades are "Chromosorb P" and "Chromosorb W," available from Alltech, www.alltechweb.com.]

BRIEFING

2,6-Dibromoquinone-chlorimide, *USP 29* page 3123—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43381-5

Change to read:

2,6-Dibromoquinone-chlorimide (*2,6-Dibromo-N-chloro-p-benzoquinone Imine; DBQ Reagent*), $C_6H_2Br_2ClNO$—**299.35**

■[*537-45-1*]■1S (*USP30*)
—A yellow, crystalline powder. Insoluble in water; soluble in alcohol and in dilute alkali hydroxide solutions.

Melting range ⟨741⟩: between 82° and 84°.

Solubility in alcohol—A solution of 100 mg in 10 mL of alcohol is not more than faintly turbid.

Residue on ignition (Reagent test)—Ignite 500 mg with 0.5 mL of sulfuric acid: the residue weighs not more than 1 mg (0.2%).

Sensitiveness—To 10 mL of a water solution containing 0.01 mg of phenol add 0.3 mL of a sodium borate buffer (made by dissolving 2.84 g of crystallized sodium borate in 90 mL of warm water, adding 8.2 mL of 1 N sodium hydroxide, and diluting with water to 100 mL) and 0.1 mL of a solution of 10 mg of the test specimen in 20 mL of alcohol: a distinct blue color develops within 10 minutes.

BRIEFING

Dibutylamine, *USP 29* page 3123—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43381-6

Change to read:

Dibutylamine, $C_8H_{19}N$—**129.24**

■[*111-92-2*]■1S (*USP30*)
—Colorless liquid.

Assay—Inject an appropriate volume into a gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a flame-ionization detector, helium being used as the carrier gas. The following conditions have been found suitable: a 0.25-mm × 30-m capillary column coated with a 1-µm layer of phase G2; the injection port temperature is maintained at 200°; the detector temperature is maintained at 300°; and the column temperature is maintained at 100° and programmed to rise 10° per minute to 200°. The area of the $C_8H_{19}N$ peak is not less than 99% of the total peak area.

Refractive index ⟨831⟩: between 1.415 and 1.419 at 20°.

BRIEFING

Dibutyl Phthalate, *USP 29* page 3124—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43381-7

Change to read:

Dibutyl Phthalate, $C_{16}H_{22}O_4$—**278.34**

■[*84-74-2*]■1S (*USP30*)
—Clear, colorless liquid.

Assay—Accurately weigh about 2 g into a suitable flask, add 25.0 mL of 1 N sodium hydroxide and 30 mL of isopropyl alcohol, and mix. Digest the mixture at a temperature near boiling for 30 minutes, then cool in a water bath to room temperature. Add phenolphthalein TS, and titrate with 1 N sulfuric acid VS to the disappearance of the pink color. Perform a complete blank determination, and make any necessary correction. Each mL of 1 N sulfuric acid consumed is equivalent to 139.2 mg of $C_{16}H_{22}O_4$. Not less than 98% is found.

Refractive index ⟨831⟩: between 1.491 and 1.493 at 20°.

Acid content—Accurately weigh about 10 g, and dissolve in 100 mL of an alcohol-ether mixture (1 : 1). Add phenolphthalein TS, and titrate immediately with 0.05 N alcoholic potassium hydroxide VS. Each mL of 0.05 N alcoholic potassium hydroxide is equivalent to 4.15 mg of phthalic acid: not more than 0.02% is found.

BRIEFING

2,5-Dichloroaniline, *USP 29* page 3124—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43381-8

Change to read:

2,5-Dichloroaniline, $Cl_2C_6H_3NH_2$—**162.02**

■[*95-82-9*]■1S (*USP30*)
—White, needle-like crystals. Slightly soluble in water; soluble in alcohol and in ether.

Melting range, Class I ⟨741⟩: between 49° and 50°.

BRIEFING

2,6-Dichloroaniline, *USP 29* page 3124—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43381-9

Change to read:

2,6-Dichloroaniline, $C_6H_5Cl_2N$—**162.02**

■[*608-31-1*]■1S (*USP30*)
—Off-white powder.

Melting range ⟨741⟩: between 38° and 41°.

BRIEFING

***o*-Dichlorobenzene,** *USP 29* page 3124—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43381-10

Change to read:

***o*-Dichlorobenzene,** $C_6H_4Cl_2$—**147.00**

■[*95-50-1*]■1S (*USP30*)
—Clear liquid, having a light yellowish-brown tint (about APHA 20). ▲*USP29* Practically insoluble in water. Miscible with alcohol and with ether. Boils at about 180°.

Assay—When examined by gas–liquid chromatography, with the use of suitable apparatus and conditions, it shows a purity of not less than 98%.

Density: between 1.299 and 1.301.

Refractive index ⟨831⟩: between 1.548 and 1.550 at 25°.

Residue on evaporation—Evaporate 80 mL on a steam bath, and dry at 105° for 1 hour: the residue weighs not more than 50 mg (0.005%).

Acidity—Add phenolphthalein TS to 25 mL of methanol, and titrate with 0.02 N alcoholic potassium hydroxide VS until a faint pink color persists for 15 seconds. Pipet 25 mL of test specimen into the solution; mix, avoiding exposure to the atmosphere; and titrate with 0.02 N alcoholic potassium hydroxide VS: not more than 2.2 mL is required to restore the pink color (about 0.005%).

BRIEFING

Dichlorofluorescein, *USP 29* page 3124—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43381-11

Change to read:

Dichlorofluorescein, $C_{20}H_{10}Cl_2O_5$—**401.20**

■[*76-54-0*]■1S (*USP30*)
—[NOTE—This specification covers both the 4,5- and 2,7-isomers of dichlorofluorescein, either of which is suitable for the preparation of dichlorofluorescein TS.] A weak orange-colored, crystalline powder. Sparingly soluble in water; soluble in alcohol and in solutions of alkali hydroxides.

Residue on ignition (Reagent test)—Ignite 200 mg with 5 drops of sulfuric acid: the residue weighs not more than 1 mg (0.5%).

Sensitiveness—Dissolve 100 mg in 60 mL of alcohol, add 2.5 mL of 0.1 N sodium hydroxide, and dilute with water to 100 mL. Add 1 mL of this solution to a solution of potassium iodide prepared by dissolving 100 mg of potassium iodide, previously dried at 105° to constant weight and accurately weighed, in 50 mL of water containing 1 mL of glacial acetic acid, and titrate with 0.1 N silver nitrate VS until the color of the precipitate changes from pale yellowish orange to pink. The volume of 0.1 N silver nitrate consumed is not more than 0.10 mL greater than the calculated volume, the calculated volume being based upon the KI content of the dried specimen as determined in the *Assay* under *Potassium Iodide* (USP monograph).

BRIEFING

Dichlorofluoromethane, *USP 29* page 3124—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43381-12

Change to read:

Dichlorofluoromethane, $CHCl_2F$—**102.92**

■[*75-43-4*]■1S (*USP30*)
—Colorless gas.

Assay—Inject an appropriate specimen into a gas chromatograph (see *Chromatography*⟨621⟩) equipped with a thermal-conductivity detector, helium being used as the carrier gas. The following conditions have been found suitable: a 0.53-mm × 30-m capillary column coated with a 5-µm layer of phase G2; the injection port temperature is maintained at 200°; the detector temperature is maintained at 200°; and the column temperature is maintained at 0° and programmed to rise 5° per minute to 40°, and then to rise 10° per minute to 180°. The area of the $CHCl_2F$ peak is not less than 98% of the total peak area.

BRIEFING

Change to read:

2,6-Dichlorophenylacetic Acid, $C_8H_6Cl_2O_2$—**205.04**

■[*6575-24-2*]■1S (*USP30*)
—White powder.

Assay—Inject an appropriate specimen into a gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a flame-ionization detector, helium being used as the carrier gas. The following conditions have been found suitable: a 0.25-mm × 30-m capillary column coated with a 1-µm layer of phase G2; the injection port temperature is maintained at 250°; the detector temperature is maintained at 300°;

In-Process Revision

and the column temperature is maintained at 150° and programmed to rise 10° per minute to 280°. The area of the $C_8H_6Cl_2O_2$ peak is not less than 97% of the total peak area.

BRIEFING

Dicyclohexylamine, *USP 29* page 3125—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43381-18

Change to read:

Dicyclohexylamine, $(C_6H_{11})_2NH$—**181.32**

■[*101-83-7*]■1S (*USP30*)
—Clear, strongly alkaline liquid. ▲▲*USP29* Sparingly soluble in water. Miscible with common organic solvents. Density: 0.9104. Solidifies at –0.1°; melts at about 20°.

Assay—Accurately weigh about 400 mg in a tared, small weighing bottle equipped with a well-fitting closure. Transfer the stoppered bottle to a 250-mL beaker, add sufficient glacial acetic acid TS to cover the bottle, and open the bottle under the surface of the acid. Add crystal violet TS, and titrate with 0.1 N perchloric acid VS. Each mL of 0.1 N perchloric acid is equivalent to 18.13 mg of $(C_6H_{11})_2NH$. Not less than 98% is found.

Specific gravity ⟨841⟩: between 0.911 and 0.917.

Boiling range (Reagent test): between 255° and 257°.

Water, *Method I* ⟨921⟩: not more than 0.5%.

BRIEFING

Diethylamine, *USP 29* page 3125—See briefing under *Acetaldehyde.*

Change to read:

***N,N*-Diethylaniline,** $C_6H_5N(C_2H_5)_2$—**149.23**

■[*91-66-7*]■1S (*USP30*)
—Light yellow to amber liquid.

Assay—Inject an appropriate specimen (about 0.2 µL) into a suitable gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a flame-ionization detector, helium being used as the carrier gas flowing at about 40 mL per minute. The following conditions have been found suitable: a 3-mm × 1.8-m stainless steel column containing 20% phase G16 on support S1A; the injection port temperature is maintained at 250°; the column temperature is maintained at 140° and programmed to rise 6° per minute to 200°. The detector temperature is maintained at 310°. The area of the *N*,*N*-diethylaniline peak having a retention time of about 4.9 minutes is not less than 99% of the total peak area.

Refractive index ⟨831⟩: between 1.5405 and 1.5425 at 20°.

BRIEFING

Diethylene Glycol, *USP 29* page 3125—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43382-1

Change to read:

Diethylene Glycol, $C_4H_{10}O_3$—**106.12** ~~[*111-46-6*]~~

■[*111-46-6*]■1S (*USP30*)
—A colorless to faintly yellow, viscous, hygroscopic liquid. Miscible with water, with alcohol, with ether, and with acetone. Insoluble in benzene and in carbon tetrachloride.

Specific gravity ⟨841⟩: between 1.117 and 1.120 at 20°.

Distilling range ⟨721⟩: between 240° and 250°.

Acidity—Transfer 54 mL (60 g) to a 250-mL conical flask, add phenolphthalein TS, and titrate with 0.02 N alcoholic potassium hydroxide VS to the production of a pink color that is stable for at least 15 seconds: not more than 2.5 mL is consumed (0.005% as CH_3COOH).

Water ⟨921⟩: not more than 0.2%.

Residue on ignition ⟨281⟩—Transfer 50 g to a tared platinum dish, heat the dish gently until the vapors ignite, and allow the specimen to burn completely. Ignite the residue at 800 ± 25°, cool, and weigh: the residue weighs not more than 2.5 mg (0.005%).

In-Process Revision

BRIEFING

Diethylene Glycol Succinate Polyester, *USP 29* page 3125—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43382-2

Change to read:

Diethylene Glycol Succinate Polyester, $(OCH_2CH_2OCH_2CH_2OOCCH_2CH_2COO)_n$

■—[*26183-02-8*]■1S (*USP30*)
—Clear, viscous liquid. Soluble in chloroform. Is stabilized by modification of the diethylene glycol succinate polyester, to render it suitable for use in gas–liquid chromatography to a temperature of 200°.
[NOTE—A suitable grade is available from Alltech, www.alltech-web.com.]

BRIEFING

Diethylenetriamine, *USP 29* page 3125—See briefing under *Acetaldehyde.*

■[*522-66-7*]■1S (*USP30*)
—Freely soluble in acetone, in alcohol, and in chloroform; almost insoluble in water.

Assay—

MOBILE PHASE—Prepare a mixture of water, acetonitrile, diethylamine, and methanesulfonic acid (860 : 100 : 20 : 20) and methanol (82 : 18).

PROCEDURE—Inject about 20 µL into a suitable liquid chromatograph (see *Chromatography* ⟨621⟩) equipped with a 235-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. The area of the $C_{20}H_{26}N_2O_2$ peak is not less than 97.5% of the total peak area.

BRIEFING

2,5-Dihydroxybenzoic Acid, *USP 29* page 3125—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43382-9

Change to read:

2,5-Dihydroxybenzoic Acid, $C_7H_6O_4$—**154.12**

■[*303-07-1*]■1S (*USP30*)
—Off-white powder. Freely soluble in alcohol yielding a clear, very pale yellow solution.

Assay—Dissolve about 75 mg, accurately weighed, in 30 mL of methanol. Slowly add 40 mL of water. Titrate with 0.1 N sodium hydroxide VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium hydroxide is equivalent to 15.41 mg of $C_7H_6O_4$. Not less than 99% is found.

Melting range ⟨741⟩: about 207°, with decomposition.

BRIEFING

Diiodofluorescein, *USP 29* page 3125—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43382-10

Change to read:

Diiodofluorescein, $C_{20}H_{10}I_2O_5$—**584.10**

■[*31395-16-1*]■1S (*USP30*)
—Orange-red ▲*USP29* powder. Slightly soluble in water; soluble in alcohol and in solutions of alkali hydroxides.

Residue on ignition—Ignite 200 mg with 5 drops of sulfuric acid: the weight of the residue does not exceed 1.0 mg (0.5%).

Sensitiveness—Accurately weigh about 100 mg of potassium iodide, previously dried at 105° to constant weight, and dissolve it in 50 mL of water. Add 1 mL of diiodofluorescein TS prepared from the test specimen and 1 mL of glacial acetic acid, and titrate with 0.1 N silver nitrate VS until the color of the precipitate changes from brownish-red to a bluish-red. The volume of 0.1 N silver nitrate consumed is not in excess of 0.10 mL over the calculated volume, based on the KI content of the dried potassium iodide determined as follows. Dissolve about 500 mg of potassium iodide, accurately weighed, in about 10 mL of water, and add 35 mL of hydrochloric acid and 5 mL of chloroform. Titrate with 0.05 M potassium iodate VS until the purple color of iodine disappears from the chloroform. Add the last portions of the iodate solution dropwise, agitating vigorously and continuously. After the chloroform has been decolorized, allow the mixture to stand for 5 minutes. If the chloroform develops a purple color, titrate further with the iodate solution. Each mL of 0.05 M potassium iodate is equivalent to 16.60 mg of KI.

BRIEFING

Diisodecyl Phthalate, *USP 29* page 3126—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43382-11

Change to read:

Diisodecyl Phthalate [*Bis*(*isodecyl*)*phthalate*], $C_{28}H_{46}O_4$—**446.66**

■[*26761-40-0*]■1S (*USP30*)
—Use a suitable grade.

BRIEFING

Diisopropyl Ether, *USP 29* page 3126—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43382-12

Change to read:

Diisopropyl Ether *(Isopropyl Ether),* $[(CH_3)_2CH]_2O$—**102.17**

■[*108-20-3*]■1S (*USP30*)
—Colorless, mobile liquid. Slightly soluble in water. Miscible with alcohol and with ether. *[Caution—It is highly flammable. Do not use where it may be ignited. Do not evaporate to the point of near dryness, since it tends to form explosive peroxides.]*

Specific gravity: between 0.716 and 0.720.

Distilling range, Method II ⟨721⟩—Not less than 95% distills between 65° and 70°.

Peroxides—To 10 mL, contained in a clean, glass-stoppered cylinder previously rinsed with a portion of the ether under examination, add 1 mL of freshly prepared potassium iodide solution (1 in 10). Shake, and allow to stand for 1 minute: no yellow color is observed in either layer (about 0.001% as H_2O_2).

Residue on evaporation—[NOTE—If peroxide is present, do not carry out this procedure.] Evaporate 14 mL (10 g) from a tared shallow dish, and dry at 105° for 1 hour: the residue weighs not more than 1 mg (0.01%).

Acidity—Add 2 drops of bromothymol blue TS to 10 mL of water in a glass-stoppered, 50-mL flask, and titrate with 0.010 N sodium hydroxide until a blue color persists after vigorous shaking. Add 5 mL of diisopropyl ether, and titrate with 0.010 N sodium hydroxide: not more than 0.30 mL is required to restore the blue color (0.005% as CH_3COOH).

[NOTE—For spectrophotometric determinations, use diisopropyl ether that meets the following additional requirement.]

Absorbance—Its absorbance at 255 nm, in a 10-mm quartz cell, does not exceed 0.2, water being used as the blank.

BRIEFING

Diisopropylamine, *USP 29* page 3126—See briefing under *Acetaldehyde.*

—Yellow leaflets or yellow, crystalline powder.

Solubility—Insoluble in water; sparingly soluble in chloroform, in ether, or in fatty oils. Dissolve 100 mg in 20 mL of alcohol: the solution is complete or practically so and clear.

Melting range ⟨741⟩: between 115° and 117°.

Residue on ignition ⟨281⟩: not more than 0.1%.

Sensitiveness—Add 0.05 mL of an alcohol solution (1 in 200) and 2 g of ammonium chloride to 25 mL of carbon dioxide-free water: the lemon-yellow color of the solution is changed to orange by the addition of 0.05 mL of 0.1 N hydrochloric acid and restored on the subsequent addition of 0.05 mL of 0.1 N sodium hydroxide.

BRIEFING

***p*-Dimethylaminobenzaldehyde,** *USP 29* page 3127—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43402-4

Change to read:

■[*100-10-7*]■1S *(USP30)*
—Use ACS reagent grade.

BRIEFING

2,6-Dimethylaniline, *USP 29* page 3127—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43402-5

Change to read:

2,6-Dimethylaniline, $C_8H_{11}N$—**121.18**

■[*87-62-7*]■1S *(USP30)*
—Yellow liquid.

Refractive index ⟨831⟩: about 1.5609 at 20°.

BRIEFING

***N,N*-Dimethylaniline,** *USP 29* page 3127—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43402-6

Change to read:

***N,N*-Dimethylaniline,** $C_6H_5N(CH_3)_2$—**121.18**

■[*121-69-7*]■1S *(USP30)*
—Light yellow liquid. Clear, colorless liquid when freshly distilled, but acquiring a reddish to reddish-brown color. Specific gravity: about 0.960. Freezing point about 2°. Insoluble in water; soluble in alcohol, in chloroform, in ether, and in dilute mineral acids.

In-Process Revision

Assay—Inject an appropriate specimen (about 0.2 µL) into a suitable gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a flame-ionization detector, helium being used as the carrier gas flowing at about 40 mL per minute. The following conditions have been found suitable: a 3-mm × 1.8-m stainless steel column containing 20% phase G16 on support S1A; the injection port temperature is maintained at 250°; the column temperature is maintained at 50° and programmed to rise 10° per minute to 200°. The detector temperature is maintained at 310°. The area of the *N,N*-dimethylaniline peak having a retention time of about 11.5 minutes is not less than 99% of the total peak area.

Refractive index ⟨831⟩: between 1.5571 and 1.5591 at 20°.

Boiling range (Reagent test)—Distill 100 mL: the difference between the temperatures observed, when 1 mL and 95 mL have distilled, is not more than 2.5°. Its boiling temperature at a pressure of 760 mm of mercury is 194.2°.

Hydrocarbons—Dissolve 5 mL in a mixture of 10 mL of hydrochloric acid and 15 mL of water: a clear solution results and it remains clear on cooling to about 10°.

Aniline or monomethylaniline—Place 5 mL in a glass-stoppered flask, add 5 mL of a solution of acetic anhydride in benzene (1 in 10), mix, and allow to stand for 30 minutes. Add 30.0 mL of 0.5 N sodium hydroxide VS, shake the mixture, add phenolphthalein TS, and titrate with 0.5 N hydrochloric acid VS. Perform a blank determination, and make any necessary correction. Not more than 0.30 mL of 0.5 N sodium hydroxide is consumed by the test specimen.

BRIEFING

3,4-Dimethylbenzophenone, *USP 29* page 3127—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43402-7

Change to read:

3,4-Dimethylbenzophenone, $C_{15}H_{14}O$—**210.27**

■[*2571-39-3*]■1S (*USP30*)
—White chunks melting at about 45°.

Assay—Inject an appropriate specimen into a suitable gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a flame-ionization detector, helium being used as the carrier gas. The following conditions have been found suitable: a 0.25-mm × 30-m capillary column coated with phase G1: the detector temperature and the injection port temperature are maintained at 300°; the column temperature is maintained at 180° and programmed to rise at the rate of 10° per minute to 280° and held at that temperature for 10 minutes. The area of the main peak is not less than 99% of the total peak area.

BRIEFING

5,5-Dimethyl-1,3-cyclohexanedione, *USP 29* page 3127—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43402-8

Change to read:

5,5-Dimethyl-1,3-cyclohexanedione, $C_8H_{12}O_2$—**140.18**

■[*126-81-8*]■1S (*USP30*)
—White, crystalline solid. Slightly soluble in water; soluble in alcohol, in methanol, in chloroform, and in acetic acid.

Melting range ⟨741⟩: between 148° and 150°.

BRIEFING

Dimethylformamide, *USP 29* page 3127—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43402-9

Change to read:

Dimethylformamide *(N,N-Dimethylformamide),* $HCON(CH_3)_2$—**73.09**

■[*68-12-2*]■1S (*USP30*)
—Use ACS reagent grade.

BRIEFING

***N,N*-Dimethylformamide Diethyl Acetal,** *USP 29* page 3127. It is proposed to delete this reagent. It will be available as a USP Reference Standard.

(HDQ: M. Marques) RTS—43908-3

Delete the following:

~~■***N,N*-Dimethylformamide Diethyl Acetal** **147.22** [*1188-33-6*]
Use a suitable grade.
[NOTE—A suitable grade is available from Sigma-Aldrich, www.sigma-aldrich.com.]■1S (*USP30*)~~

BRIEFING

***N, N*-Dimethyl-1-naphthylamine,** *USP 29* page 3127—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43402-10

In-Process Revision

Change to read:

***N,N*-Dimethyl-1-naphthylamine,** $C_{12}H_{13}N$—**171.24**

■[*86-56-6*]■1S (*USP30*)
—Pale yellow to yellow, aromatic liquid. Soluble in alcohol and in ether.

Assay—Transfer about 250 mg, accurately weighed, to a suitable beaker, add 100 mL of glacial acetic acid, and dissolve by stirring. When solution is complete, titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 17.12 mg of $C_{12}H_{13}N$. Not less than 98% is found.

Refractive index ⟨831⟩: between 1.6210° and 1.6230° at 20°, sodium light being used.

Sulfanilamide test—Dissolve 20 mg of USP Sulfanilamide RS in 100 mL of water to obtain the *Sulfanilamide solution*. Into two 150-mL beakers pipet 1.0 mL and 2.5 mL of the *Sulfanilamide solution,* respectively. Dilute with water to 90 mL. To provide a blank, place 90 mL of water in a third beaker. To each beaker add 8.0 mL of trichloroacetic acid solution (3 in 20) and 1.0 mL of sodium nitrite solution (1 in 1000). Stir the solutions for 5 minutes, then add 10 mL of acetate buffer TS, and 1.0 mL of a 1 in 1000 solution of *N,N*-dimethyl-1-naphthylamine in alcohol. The pH is about 5 to 6, using pH paper. Stir for an additional 5 minutes, then add 20 mL of glacial acetic acid. The pH is about 3 to 4, using pH paper. In comparison with the blank, the beaker containing 1.0 mL of the *Sulfanilamide solution* shows a pink color, while the other beaker shows a deep pink to red color.

BRIEFING

***N,N*-Dimethyloctylamine,** *USP 29* page 3127—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43402-11

Change to read:

***N,N*-Dimethyloctylamine,** $C_{10}H_{23}N$—**157.30**

—Colorless liquid.

Refractive index ⟨831⟩: 1.4243 at 20°.

BRIEFING

2,6-Dimethylphenol, *USP 29* page 3127—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43402-12

Change to read:

2,6-Dimethylphenol, $(CH_3)_2C_6H_3OH$—**122.16**

■[*576-26-1*]■1S (*USP30*)
—White to pale yellow crystalline solid.

Assay—Inject a 1 in 3 solution of it in xylene into a suitable gas chromatograph equipped with a flame-ionization detector, helium being used as the carrier gas at a flow rate of about 40 mL per minute. The following conditions have been found suitable: a 3.2-mm × 1.83-m stainless steel column packed with 10% phase G25 on support S1A; the injection port temperature is maintained at about 250° and the detector temperature at about 310°; the column temperature is programmed to rise at 8° per minute from 100° to 200°. Similarly inject a specimen of xylene. The area of the $C_8H_{10}O$ peak is not less than 98% of the total peak area corrected for xylene.

Melting range ⟨741⟩: between 44° and 46°.

BRIEFING

***N,N*-Dimethyl-*p*-phenylenediamine Dihydrochloride,** *USP 29* page 3127—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43402-13

Change to read:

***N,N*-Dimethyl-*p*-phenylenediamine Dihydrochloride,** $(CH_3)_2NC_6H_4NH_2 \cdot 2HCl$—**209.12**

■[*99-89-9*]■1S (*USP30*)
—Nearly white, fine, crystalline, hygroscopic solid that may have a pinkish cast. Freely soluble in water; soluble in alcohol.

Assay—Transfer about 400 mg, accurately weighed, to a 250-mL beaker, and dissolve in about 75 mL of water. Titrate with 0.1 N sodium hydroxide VS, determining the endpoint potentiometrically. Each mL of 0.1 N sodium hydroxide is equivalent to 10.46 mg of $C_8H_{12}N_2 \cdot 2HCl$. Not less than 98% is found.

Solubility—A solution of 1 g in 10 mL of water produces not more than a slight haze.

BRIEFING

***m*-Dinitrobenzene,** *USP 29* page 3127—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43402-14

Change to read:

***m*-Dinitrobenzene,** $C_6H_4(NO_2)_2$—**168.11**

■[*99-65-0*]■1S (*USP30*)
—Pale yellow crystals or crystalline powder. Almost insoluble in cold water; slightly soluble in hot water. Soluble in chloroform and in benzene; sparingly soluble in alcohol. Is volatile in steam.

Melting range ⟨741⟩: between 89° and 92°.

Residue on ignition (Reagent test): not more than 0.5%.

In-Process Revision

BRIEFING

3,5-Dinitrobenzoyl Chloride, *USP 29* page 3128—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43402-15

Change to read:

3,5-Dinitrobenzoyl Chloride, $C_7H_3ClN_2O_5$—**230.56**

■[*74367-78-5*]■1S (*USP30*)
—Pale yellow, crystalline powder. Freely soluble in dilute sodium hydroxide solutions; soluble in alcohol. *[Caution—Corrosive, moisture-sensitive, lachrymator, and possible mutagen. Store under nitrogen.]*

Melting range ⟨741⟩: between 69° and 71°.

Solubility in sodium hydroxide—A solution of 500 mg in 25 mL of 1 N sodium hydroxide is clear or not more than faintly turbid.

Residue on ignition—Ignite 1 g with 0.5 mL of sulfuric acid: the residue weighs not more than 1 mg (0.1%).

BRIEFING

2,4-Dinitrochlorobenzene, *USP 29* page 3128—See briefing under *Acetaldehyde.*

(HDQ: M. Marques) RTS—43402-16

Change to read:

2,4-Dinitrochlorobenzene, $C_6H_3(NO_2)_2Cl$—**202.55**

■[*97-00-7*]■1S (*USP30*)
—Yellow to brownish-yellow crystals. Insoluble in water; soluble in hot alcohol, in ether, and in benzene.

Melting range ⟨741⟩: between 51° and 53°.

Residue on ignition—Ignite 500 mg with 5 drops of sulfuric acid: the residue weighs not more than 1 mg (0.2%).

BRIEFING

2,4-Dinitrofluorobenzene, *USP 29* page 3128—See briefing under *Acetaldehyde.*

Volumetric Solutions

BRIEFING

Volumetric Solutions, *USP 29* page 3175 and page 1489 of *PF* 31(5) [Sept.–Oct. 2005]. It is proposed to make a correction in the formula used to calculate the normality of *Potassium Hydroxide, Normal (1 N)*.

(HDQ: M. Marques) RTS—43855-1

Change to read:

Potassium Hydroxide, Normal (1 N)
KOH, **56.11**

56.11 g in 1000 mL

Dissolve 68 g of potassium hydroxide in about 950 mL of water. Add a freshly prepared saturated solution of barium hydroxide until no more precipitate forms. Shake the mixture thoroughly, and allow it to stand overnight in a stoppered bottle. Decant the clear liquid, or filter the solution in a tight, polyolefin bottle, and standardize by the procedure set forth for *Sodium Hydroxide, Normal (1 N).*

~~$$N = \frac{\text{g } KHC_8H_4O_4}{0.20423 \times \text{mL NaOH}}$$~~

■$$N = \frac{\text{g } KHC_8H_4O_4}{0.20423 \times \text{mL KOH}}$$■1S (*USP30*)

Change to read:

Sodium Hydroxide, Alcoholic, Tenth-Normal (0.1 N)
NaOH, **40.00**

To 250 mL of alcohol add 2 mL of a 50% ~~(w/w)~~

■(w/v)■2S (*USP29*)
solution of sodium hydroxide.

Dissolve about 200 mg of benzoic acid, accurately weighed, in 10 mL of alcohol and 2 mL of water. Add 2 drops of phenolphthalein TS, and titrate with the alcoholic sodium hydroxide solution until a permanent pale pink color is produced.

$$N = \frac{\text{mg benzoic acid}}{122.1 \times \text{mL sodium hydroxide}}$$

In-Process Revision

REFERENCE TABLES

BRIEFING

Container Specifications for Capsules and Tablets, *USP 29* page 3184 and page 187 of *PF* 32(1) [Jan.–Feb. 2006].

(HDQ) RTS—43284-1

The following table is provided as a reminder for the pharmacist engaged in the typical dispensing situation who already is acquainted with the *Packaging and storage* requirements set forth in the individual monographs. It lists the capsules and tablets that are official in the *United States Pharmacopeia* and indicates the relevant tight (T), well-closed (W), and light-resistant (LR) specifications applicable to containers in which the drug that is repackaged should be dispensed.

This table is not intended to replace, nor should it be interpreted as replacing, the definitive requirements stated in the individual monographs.

BRIEFING

Description and Relative Solubility of USP and NF Articles, *USP 29* page 3191, page 8589 of *PF* 25(4) [July–Aug. 1999], page 9254 of *PF* 25(6) [Nov.–Dec. 1999], page 1135 of *PF* 26(4) [July–Aug. 2000], page 1908 of *PF* 27(1) [Jan.–Feb. 2001], page 554 of *PF* 28(2) [Mar.–Apr. 2002], page 1953 of *PF* 28(6) [Nov.–Dec. 2002], page 266 of *PF* 29(1) [Jan.–Feb. 2003], page 812 of *PF* 29(3) [May–June 2003], page 1684 of *PF* 29(5) [Sept.–Oct. 2003], page 1405 of *PF* 30(4) [July–Aug. 2004], page 1822 of *PF* 30(5) [Sept.–Oct. 2004], page 2183 of *PF* 30(6) [Nov.–Dec. 2004], page 122 of *PF* 31(1) [Jan.–Feb. 2005], page 591 of *PF* 31(2) [Mar.–Apr. 2005], page 861 of *PF* 31(3) [May–June 2005], page 1193 of *PF* 31(4) [July–Aug. 2005], page 1491 of *PF* 31(5) [Sept.–Oct. 2005], page 1703 of *PF* 31(6) [Nov.–Dec. 2005], and page 188 of *PF* 32(1) [Jan.–Feb. 2006].

(HDQ) RTS—42654-1; 43284-1; 43401-1; 43513-1

Add the following:

■**Coconut Oil:** Clear, white to light yellow-tan, viscous liquid. Freely soluble in methylene chloride and in light petroleum (bp: 65° to 70°); very slightly soluble in alcohol; practically insoluble in water. *NF category:* Coating agent; emulsifying and/or solubilizing agent.■1S (*NF25*)

Add the following:

■**Dantrolene Sodium:** Fine orange to orange-brown powder. Sparingly soluble in acetone, in dimethyformamide, and in glycerine.■1S (*USP30*)

Add the following:

■**Polyvinyl Acetate:** Colorless to light yellow granules or beads. Freely soluble in ethyl acetate; soluble in alcohol, in acetone, and in chloroform; practically insoluble in water. *NF category:* Coating agent; desiccant; tablet binder.■1S (*NF25*)

Add the following:

■**Valganciclovir Hydrochloride:** White to off-white powder. Very soluble in 2-propanol; freely soluble in alcohol; slightly soluble in hexane; practically insoluble in acetone or in ethyl acetate.■1S (*USP30*)

In-Process Revision

Pending Proposals

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *Pharmacopeial Forum (PF)* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in the *USP–NF*, its *Supplements*, or an *IRA.* Those items that have not yet been adopted are marked as *Pending Proposals.*

The *Pending Proposals* list contains these items separated into the following categories: General Notices and Requirements; *USP* monographs; Dietary Supplements Monographs; General Chapters; Reference Tables; Excipients; and *NF* Monographs. Each entry in the *Pending Proposals* list contains the monograph title and the citation of the most recent publication of the monograph. When the appropriate USP Expert Committee is considering advancing to official status a pending proposal that is more than 2 years old, it is republished in *PF* for additional opportunity for public review and comment. Reprints of *PF* proposals may be purchased from USP by sending a written request for information to custsvc@usp.org.

To check the status of a *Pending Proposal,* please contact USP as directed below.

- The briefing accompanying the monograph or general chapter lists the names of the Scientific Liaisons responsible for the proposed revisions. The contact information (phone number and email) for the Scientific Liaison is available in the *Staff Directory* section of *How to Use PF*. For *USP–NF Online* subscribers, the name and contact information for the assigned Scientific Liaison is available in the *Auxiliary Information* portion of each monograph.
- Call USP at 301-816-8344 and ask to speak with the Scientific Liaison assigned to the monograph or general chapter of interest.
- Submit questions by email to stdsmonographs@usp.org. Please indicate the name of the monograph or general chapter in the subject line of the email.

Following these lists the reader will find the *Canceled Proposals* list. These are items that were published in *PF* and were pending, but have since been canceled. This list contains cumulative entries for the six issues per volume of *PF* [i.e., 32(1) through 32(6)]. Note that canceled proposals may be republished in *PF* to be considered for future adoption into the *USP–NF.*

Title and Proposal	***PF Volume, Issue, and Page Numbers of Pending Proposals***		
	Vol.	***No.***	***Page(s)***
General Notices—*Tests and Assays—Foreign Substances and Impurities; Preservation, Packaging, Storage, and Labeling—Storage Temperature and Humidity; Repackaging Instructions; Guidelines for Packaging and Storage Statements in USP–NF Monographs* (*Controlled Cold Temperature*-added)	31	3	718
<u>*USP Monographs*</u>			
Acetaminophen—*Packaging and storage*	31	4	1024
Acetaminophen Extended-Release Tablets—*Packaging and storage*	30	4	1161
Acetazolamide Oral Solution (new)	32	1	43
Acetazolamide Oral Suspension (new)	32	1	44
Acetylcysteine—*USP Reference standards, Assay*	31	3	726
Medical Air—*Definition, Packaging and storage*	31	4	1024
Albendazole Oral Suspension—*Labeling*	32	1	46
Alprazolam Oral Suspension (new)	32	1	46
Albumin Human—*Definition, Packaging and storage, Expiration date, Labeling, USP Reference standards* (add), *Identification A, B* (add), *Bacterial endotoxins* (add), *Safety* (add), *Sterility* (add), *pH* (add), *Molecular size distribution* (add), *Heat stability* (add), *Incubation* (add) *Prekallikrein activator* (add), *Protein content* (add), *Heme content* (add), *Potassium content* (add), *Sodium content* (add)	31	5	1338
Albuterol Tablets—*Assay*	31	3	726
Alendronate Sodium—*Packaging and storage*	31	5	1344
Allopurinol—*USP Reference standards, Assay*	28	5	1386
Alumina, Magnesia, and Calcium Carbonate Tablets—*Title* (name change)	29	6	1835
Alumina, Magnesia, and Calcium Carbonate Chewable Tablets (new)	29	6	1836
Alumina, Magnesia, Calcium Carbonate, and Simethicone Tablets—*Title* (name change)	29	6	1837
Alumina, Magnesia, Calcium Carbonate, and Simethicone Chewable Tablets (new)	29	6	1837
Alumina, Magnesia, and Simethicone Tablets—*Title* (name change)	29	6	1841
Alumina, Magnesia, and Simethicone Chewable Tablets (new)	29	6	1842
Amantadine Hydrochloride—*Chromatographic purity*	31	5	1344
Amiloride Hydrochloride and Hydrochlorothiazide Tablets—*Dissolution*	31	4	1025

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Amitriptyline Hydrochloride—*USP Reference standards, Identification, Chromatographic purity* (delete), *Related compounds* (add), *Assay*	31	6	1606
Amoxicillin Capsules—*Labeling* (add), *Dissolution*	32	1	47
Amoxicillin and Clavulanate Potassium for Oral Suspension—*Water* (delete)	31	4	1026
Anecortave Acetate (new)	30	2	445
Anecortave Acetate Injectable Suspension (new)	30	2	447
Aprotinin (new)	31	3	732
Aprotinin Injection (new)	31	3	736
Aspartic Acid—*Chloride*	31	5	1345
Aspirin Boluses—*Dissolution*	31	4	1026
Atenolol—*Assay*	31	5	1345
Azathioprine Oral Suspension (new)	32	1	48
Aztreonam for Injection—*Assay*	31	3	737
Baclofen Oral Solution (new)	32	1	49
Baclofen Oral Suspension (new)	32	1	51
Benazepril Hydrochloride (new)	31	4	1027
Benazepril Hydrochloride Tablets (new)	32	1	52
Benzonatate Capsules—*Dissolution* (add)	32	1	55
Betamethasone Oral Solution—*Thin-layer chromatographic identification test*	31	4	1032
Bethanechol Chloride Oral Solution (new)	32	1	55
Bethanechol Chloride Oral Suspension (new)	32	1	57
Bicalutamide (new)	31	3	738
Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Metal or Plastic Carriers (new)	30	1	63
Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions (new)	30	1	66
Biphasic Isophane Insulin Human Suspension (new)	31	4	1033
Bismuth Subsalicylate Oral Suspension (new)	31	4	1035
Bismuth Subsalicylate Tablets (new)	31	3	741
Bromocriptine Mesylate—*Chromatographic purity*	31	5	1346
Bromocriptine Mesylate Capsules—*Dissolution*	32	1	58
Budesonide (new)	30	6	1978
Buspirone Hydrochloride—*Content of chloride*	31	3	742
Butorphanol Tartrate Nasal Solution (new)	31	5	1346
Calcitonin Salmon (new)	31	4	1036
Calcitonin Salmon Nasal Solution (new)	30	4	1178
Calcitonin Salmon Injection (new)	30	4	1177
Calcitriol (new)	32	1	58
Calcitriol Injection (new)	32	1	61
Calcium Carbonate and Magnesia Tablets—*Title* (name change)	29	6	1852
Calcium Carbonate and Magnesia Chewable Tablets (new)	29	6	1852
Calcium Carbonate, Magnesia, and Simethicone Tablets—*Title* (name change)	29	6	1853
Calcium Carbonate, Magnesia, and Simethicone Chewable Tablets (new)	29	6	1854
Calcium Lactate—*USP Reference standards* (add), *Identification*	31	6	1608
Calcium Lactate Tablets—*Identification*	31	6	1609
Calcium Pantothenate—*USP Reference standards, Ordinary impurities*	32	1	62
Camphor—*Water*	31	3	742
Captopril Oral Solution (new)	32	1	63
Captopril Oral Suspension (new)	32	1	64
Carbamazepine—*USP Reference standards, Chromatographic purity (Related compounds), Assay*	32	1	65
Carbamazepine Tablets—*Dissolution*	31	4	1044
Carbon Dioxide—*Definition, Packaging and storage*	31	4	1045
Carboxymethylcellulose Sodium—*Heavy metals*	31	5	1349
Carboxymethylcellulose Sodium Paste—*Heavy metals*	31	5	1349
Cefaclor Tablets (new)	29	6	1858
Cefadroxil for Oral Suspension—*Water*	31	4	1045
Cefonicid for Injection—*Assay*	32	1	67
Ceftazidime—*USP Reference standards, Assay*	32	1	67

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Ceftazidime Injection—*USP Reference standards*	32	1	68
Ceftazidime for Injection—*USP Reference standards*	32	1	68
Chlorthalidone—*USP Reference standards, Limit of 4'-chloro-3'-sulfamoyl-2-benzophenone carboxylic acid (CCA) (Limit of chlorthalidone related compound A), Assay*	32	1	68
Cilostazol (new)	32	1	69
Cimetidine Tablets—*Dissolution*	32	1	72
Citalopram Hydrobromide (new)	31	3	742
Citalopram Tablets (new)	31	4	1046
Anhydrous Citric Acid *(Harmonization), Sulfate*	31	3	749
Citric Acid Monohydrate *(Harmonization), Sulfate*	31	3	750
Citric Acid, Magnesium Oxide, and Sodium Carbonate Irrigation—*USP Reference standards, Assay for citric acid (delayed implementation to January 1, 2009)*	31	2	394
Cladribine (new)	31	2	395
Cladribine—*Specific rotation, Related compounds, Limit of residual solvents*	31	6	1609
Clindamycin Hydrochloride Oral Solution—*pH*	31	5	1350
Clonazepam Oral Suspension (new)	32	1	73
Clopidogrel Bisulfate—*Related compounds, Assay*	32	1	74
Clopidogrel Tablets—*Related compounds, Assay*	32	1	76
Clotrimazole Lozenges—*Dissolution*	32	1	78
Cloxacillin Benzathine—*Assay*	31	4	1050
Cloxacillin Benzathine Intramammary Infusion—*Assay*	31	4	1051
Cyanocobalamin—*Pseudo cyanocobalamin*	31	5	1350
Cyclopropane—*Definition, Packaging and storage*	31	4	1052
Cyclosporine Capsules—*Labeling* (add), *USP Reference standards, Identification A, B, Dissolution, Droplet size* (add), *Content of alcohol* (add), *Assay*	27	4	2721
Dalteparin Sodium (new)	30	5	1598
Dapsone—*Assay*	31	3	750
Desmopressin Acetate (new)	31	4	1052
Desmopressin Injection (new)	31	4	1057
Desmopressin Nasal Spray Solution (new)	31	4	1059
Desogestrel (new)	28	6	1785
Desogestrel and Ethinyl Estradiol Tablets (new)	30	5	1604
Diclofenac Potassium (new)	31	5	1350
Diclofenac Potassium Tablets (new)	31	5	1352
Diclofenac Sodium Delayed-Release Tablets—*Identification*	31	3	751
Diclofenac Sodium Extended-Release Tablets (new)	30	2	476
Didanosine (new)	31	5	1355
Didanosine for Oral Solution (new)	31	5	1357
Didanosine Tablets (new)	31	5	1359
Digoxin Oral Solution—*Assay*	31	5	1361
Dihydroxyaluminum Sodium Carbonate Tablets—*Title* (name change)	29	6	1873
Dihydroxyaluminum Sodium Carbonate Chewable Tablets (new)	29	6	1873
Diltiazem Hydrochloride Oral Solution (new)	32	1	79
Diltiazem Hydrochloride Oral Suspension (new)	32	1	80
Diphenoxylate Hydrochloride and Atropine Sulfate Oral Solution—*Identification, Assay for diphenoxylate hydrochloride* (delete), *Assay for atropine sulfate* (delete), *Assay* (add)	31	6	1612
Diphenoxylate Hydrochloride and Atropine Sulfate Tablets—*Identification, Assay for diphenoxylate hydrochloride* (delete), *Assay for atropine sulfate* (delete), *Assay* (add)	31	6	1614
Diphtheria Toxin for Schick Test (delete)	31	6	1616
Dipyridamole Oral Suspension (new)	32	1	81
Divalproex Sodium (new)	31	5	1362
Docusate Calcium—*Limit of bis(2-ethylhexyl)maleate*	31	3	752
Docusate Potassium—*Limit of bis(2-ethylhexyl)maleate*	31	3	753
Docusate Sodium—*Limit of bis(2-ethylhexyl)maleate*	31	3	753
Dolasetron Mesylate Oral Solution (new)	32	1	83

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Dolasetron Mesylate Oral Suspension (new)	32	1	84
Doxazosin Mesylate (new)	29	5	1470
Doxazosin Tablets (new)	29	1	64
Dronabinol—*USP Reference standards, Identification, Limit of* Δ^8*-tetrahydrocannabinol* (delete), *Related compounds* (add), *Assay*	32	1	86
Drospirenone (new)	31	3	754
Egg Phospholipids (new)	31	3	757
Enoxaparin Sodium (new)	29	6	1876
Enoxaparin Sodium Injection (new)	31	3	761
Ensulizole—*USP Reference standards, Assay*	31	6	1617
Estradiol and Norethindrone Acetate Tablets (new)	31	5	1364
Estradiol Transdermal System (new)	31	4	1063
Estradiol Vaginal Tablets (new)	31	6	1617
Conjugated Estrogens—*Definition*	30	3	840
Synthetic Conjugated Estrogens (new)	31	6	1620
Ethinyl Estradiol Tablets—*Disintegration* (delete), *Dissolution* (add), *Related compounds*	31	4	1067
Ethyl Chloride—*Alcohol* (delete)	31	5	1368
Etidronate Disodium—*Limit of phosphite*	31	6	1625
Felodipine Extended-Release Tablets—*Labeling* (add), *Dissolution*	32	1	89
Fenofibrate (new)	31	3	763
Fentanyl (new)	31	6	1626
Fexofenadine Hydrochloride (postponed indefinitely)	31	3	703
Fexofenadine Hydrochloride Capsules (postponed indefinitely)	31	3	705
Fexofenadine Hydrochloride Tablets (new)	30	6	1997
Fexofenadine Hydrochloride and Pseudoephedrine Hydrochloride Extended-Release Tablets (new)	31	2	403
Fluconazole—*Definition, Labeling* (add), *USP Reference standards, Melting range* (delete), *Related compounds*	31	5	1368
Flucytozine Oral Suspension (new)	32	1	92
Flumazenil—*USP Reference standards, Related compounds, Assay*	32	1	94
Fluorometholone Acetate (new)	31	5	1371
Flurazepam Hydrochloride—*Identification*	31	3	766
Flurbiprofen—*Identification*	31	4	1069
Fluticasone Propionate—*Chemical information, Definition, Content of acetone, Assay*	32	1	95
Fluticasone Propionate Nasal Spray (new)	32	1	97
Fluvastatin Sodium—*Packaging and storage, USP Reference standards, Identification, Loss on drying* (add), *Water* (delete), *Chromatographic purity*	32	1	103
Fluvastatin Capsules—*USP Reference standards, Identification, Chromatographic purity*	32	1	105
Fluvoxamine Maleate Tablets (new)	30	5	1622
Formoterol Fumarate (new)	32	1	106
Fosinopril Sodium (new)	32	1	110
Fosinopril Sodium Tablets (new)	30	6	2004
Fosinopril Sodium and Hydrochlorothiazide Tablets (new)	30	6	2006
Gabapentin (new)	31	1	50
Ganciclovir Oral Suspension (new)	32	1	113
Gemcitabine for Injection—*USP Reference standards, Chromatographic purity*	31	6	1630
Gemcitabine Hydrochloride—*USP Reference standards*	32	1	114
Glipizide and Metformin Hydrochloride Tablets (new)	31	6	1631
Glucagon—*Assay*	31	6	1635
Glutaral Concentrate—*Specific gravity*	31	3	766
Glyburide Tablets—*Dissolution*	29	2	418
Glyburide and Metformin Hydrochloride Tablets (new)	31	3	766
Glycopyrrolate Tablets—*Identification*	31	4	1077
Gonadorelin Acetate (new)	30	4	1250
Goserelin Acetate (new)	31	6	1637
Helium—*USP Reference standards* and *Assay* (postponed indefinitely)	31	4	1014

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Helium—*Definition, Packaging and storage*	31	4	1077
Hepatitis B Virus Vaccine Inactivated (delete)	31	6	1641
Hydrocodone Bitartrate—*USP Reference standards* *Ordinary impurities* (delete), *Related compounds* (add)	30	5	1628
Hydrocodone Bitartrate and Homatropine Methylbromide Tablets (new)	30	3	853
Hydroxyzine Hydrochloride—*USP Reference standards, Chromatographic purity*	32	1	114
Hyoscyamine Sulfate—*USP Reference standards, Identification, Melting temperature* (delete), *Loss on drying* (delete), *Water* (add), *Residue on ignition, Other alkaloids* (delete), *Readily carbonizable substances* (delete), *Chromatographic purity* (add), *Assay*	31	4	1078
Hyoscyamine Sulfate Elixir—*Identification*	31	5	1372
Hyoscyamine Sulfate Injection—*Identification*	31	5	1373
Hyoscyamine Sulfate Oral Solution—*Identification*	31	5	1373
Hyoscyamine Sulfate Tablets—*Identification*	31	5	1374
Hypromellose Ophthalmic Solution—*Identification*	31	3	771
Ibuprofen—*Assay*	31	5	1374
Insulin—*USP Reference standards*	31	5	1375
Insulin Human—*USP Reference standards*	31	5	1375
Sodium Iodide I 123 Capsules—*Definition*	31	6	1642
Sodium Iodide I 123 Solution—*Definition, Radionuclidic purity, Bacterial endotoxins, pH*	31	6	1642
Sodium Iodide I 131 Solution—*pH*	31	6	1643
Iodoform—*Molecular weight*	32	1	115
Irbesartan—*Limit of azide*	32	1	115
Irbesartan Tablets (new)	31	4	1080
Irbesartan and Hydrochlorothiazide Tablets (new)	29	4	1036
Isopropyl Alcohol—*USP Reference standards* (add), *Identification*	31	5	1375
Isosorbide Dinitrate Tablets—*Dissolution, Assay*	31	5	1375
Isosorbide Dinitrate Chewable Tablets—*Assay*	31	5	1376
Isosorbide Dinitrate Extended-Release Tablets—*Assay*	31	5	1376
Isosorbide Dinitrate Sublingual Tablets—*Assay*	31	5	1377
Diluted Isosorbide Mononitrate—*USP Reference standards, Identification, pH* (delete), *Water* (delete), *Residue on ignition* (delete), *Related compounds, Assay*	31	6	1643
Isosorbide Mononitrate Tablets (new)	29	5	1513
Isosorbide Mononitrate Extended-Release Tablets (new)	31	4	1082
Ivermectin—*Specific rotation, Limit of alcohol and formamide*	31	6	1645
Ketoprofen—*Assay*	31	3	772
Ketoprofen Extended-Release Capsules (new)	31	5	1378
Labetalol Hydrochloride Oral Solution (new)	32	1	116
Labetalol Hydrochloride Oral Suspension (new)	32	1	117
Leflunomide (new)	31	5	1380
Leflunomide Tablets (new)	31	5	1383
Leuprolide Acetate (new)	30	3	882
Levocabastine Hydrochloride (new)	31	6	1647
Lidocaine and Prilocaine Cream (new)	31	4	1087
Lindane—*Definition, Assay*	31	6	1648
Lipid Injectable Emulsion (new)	31	2	416
Lisinopril Tablets—*Dissolution*	31	4	1090
Lovastatin—*Assay*	32	1	118
Magaldrate and Simethicone Tablets—*Title* (name change)	29	6	1918
Magaldrate and Simethicone Chewable Tablets (new)	29	6	1919
Magnesium Carbonate and Citric Acid for Oral Solution—*USP Reference standards* (add), *Content of anhydrous citric acid, Other requirements (delayed implementation to January 1, 2009)*	31	2	419
Magnesium Carbonate, Citric Acid, and Potassium Citrate for Oral Solution (new)	31	5	1386
Magnesium Chloride—*Identification*	31	2	420

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Magnesium Citrate Oral Solution—*USP Reference standards* (add), *Assay for anhydrous citric acid (delayed implementation to January 1, 2009)*	31	2	420
Magnesium Citrate for Oral Solution—*USP Reference standards* (add), *Content of anhydrous citric acid, Other requirements (delayed implementation to January 1, 2009)*	31	2	421
Magnesium Oxide—*Labeling, Bulk density* (add)	31	4	1091
Mangafodipir Trisodium—*Limit of residual solvents*	31	6	1650
Mebendazole Oral Suspension—*Labeling*	32	1	119
Megestrol Acetate Oral Suspension—*Dissolution*	31	5	1387
Meloxicam (new)	31	1	57
Metformin Hydrochloride—*Related compounds*	31	4	1092
Metformin Hydrochloride Tablets—*Identification, Related compounds*	31	4	1093
Metformin Hydrochloride Extended-Release Tablets (new)	31	3	772
Methoxyflurane—*Foreign odor* (delete)	31	5	1388
Methylcellulose Ophthalmic Solution—*Identification*	31	3	780
Methylcellulose Oral Solution—*Identification*	31	3	780
Methylcellulose Tablets—*Identification*	31	3	780
Metolazone Oral Suspension (new)	32	1	119
Metoprolol Tartrate Oral Solution (new)	32	1	121
Metoprolol Tartrate Oral Suspension (new)	32	1	122
Metronidazole Benzoate—*USP Reference standards, Related compounds*	31	3	781
Miconazole Nitrate Cream—*Identification*	32	1	123
Miconazole Nitrate Vaginal Suppositories—*Assay*	31	5	1389
Mirtazapine—*Heavy metals*	31	6	1650
Modafinil (new)	30	5	1634
Modafinil Tablets (new)	30	5	1636
Morphine Sulfate Extended-Release Capsules—*Packaging and storage* (add)	32	1	124
Mupirocin Calcium (new)	31	2	430
Mupirocin Cream (new)	31	2	432
Naphazoline Hydrochloride—*Definition, Assay*	31	4	1093
Naproxen Delayed-Release Tablets—*Packaging and storage* (add)	32	1	124
Narasin Granular—*Molecular weight, Assay*	32	1	124
Narasin Premix—*Assay*	32	1	126
Nefazodone Hydrochloride (new)	31	4	1094
Nefazodone Hydrochloride Tablets (new)	31	4	1096
Nitrous Oxide—*USP Reference standards, Identification,* and *Assay* (postponed indefinitely)	31	4	1014
Nitrous Oxide—*Definition, Packaging and storage, Assay*	31	4	1099
Norgestimate—*USP Reference standards, Limit of residual solvents, Chromatographic purity, Assay*	31	5	1390
Norgestimate and Ethinyl Estradiol Tablets (new)	29	1	87
Ofloxacin—*Chromatographic purity* (delete), *Related compounds* (add)	30	4	1274
Omeprazole—*Chromatographic purity*	31	4	1100
Omeprazole Delayed-Release Capsules—*Identification, Chromatographic purity*	31	5	1392
Ondansetron Hydrochloride—*Limit of ondansetron related compound D, Assay*	32	1	126
Ondansetron Hydrochloride Oral Suspension (new)	32	1	127
Ondansetron Injection—*Chromatographic purity*	31	6	1651
Ondansetron Oral Solution—*Packaging and storage* (add), *Limit of ondansetron related compound D, Related compounds*	32	1	128
Ondansetron Orally Disintegrating Tablets (new)	31	4	1101
Orphenadrine Citrate Injection—*Assay*	31	6	1651
Oxandrolone—*Definition, USP Reference standards, Identification B, Ordinary impurities* (delete), *Related compounds* (add), *Assay*	31	1	64
Oxaprozin—*Packaging and storage* (add)	32	1	130
Oxaprozin Tablets—*Packaging and storage* (add)	32	1	130

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Oxybutynin Chloride Extended-Release Tablets (new)	31	6	1652
Oxycodone Hydrochloride Extended-Release Tablets (new)	31	4	1104
Oxygen—*Definition, Packaging and storage*	31	4	1107
Oxygen 93 Percent—*Definition, Packaging and storage*	31	4	1107
Pamidronate Disodium (new)	31	4	1108
Pamidronate Disodium for Injection (new)	31	4	1111
Pancuronium Bromide (new)	32	1	130
Paricalcitol—*Identification, Chromatographic purity, Assay*	32	1	132
Pectin—*Identification*	31	3	783
Penicillamine Capsules—*Dissolution*	31	2	436
Pentazocine and Acetaminophen Tablets (new)	28	6	1838
Pentobarbital Sodium—*Labeling* (add), *USP Reference standards, Other requirements* (add)	31	1	73
Petrolatum (new)—*Harmonization*	28	2	569
White Petrolatum (new)—*Harmonization*	28	2	570
Phenytoin Tablets—*Title* (name change)	29	6	1965
Phenytoin Chewable Tablets (new)	29	6	1965
Piperacillin and Tazobactam Injection (new)	31	2	437
Piperacillin and Tazobactam for Injection (new)	31	2	439
Piroxicam Cream (new)	32	1	134
PEG 3350 and Electrolytes for Oral Solution—*Title* (name change—*delayed implementation to February 1, 2009*), *Definition, Assay for potassium and sodium*	31	5	1393
Potassium and Sodium Bicarbonates and Citric Acid Effervescent Tablets for Oral Solution—*USP Reference standards* (add), *Assay for anhydrous citric acid (delayed implementation to January 1, 2009)*	31	2	440
Potassium Bitartrate—*Limit of ammonia*	31	3	786
Potassium Citrate Extended-Release Tablets—*USP Reference standards* (add), *Assay (delayed implementation to January 1, 2009)*	31	2	443
Potassium Citrate and Citric Acid Oral Solution—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	2	444
Potassium Iodide Oral Solution—*Definition*	31	3	786
Potassium Sodium Tartrate—*Limit of ammonia*	31	3	787
Pravastatin Sodium (new)	31	5	1394
Prednicarbate (new)	31	5	1398
Prednicarbate Cream (new)	31	6	1655
Prednicarbate Ointment (new)	31	6	1657
Pseudoephedrine Sulfate—*Ordinary impurities*	32	1	135
Quinapril Tablets—*Packaging and storage*	29	4	1071
Quinidine Sulfate Oral Suspension (new)	32	1	136
Ramipril—*Definition, Assay*	31	3	787
Ranitidine Hydrochloride—*USP Reference standards, Chromatographic purity, Assay*	30	6	2033
Oral Rehydration Salts—*USP Reference standards* (add), *Identification F* (delete), *Assay for citrate (delayed implementation to January 1, 2009)*	31	5	1399
Rifampin and Isoniazid Capsules—*Dissolution*	30	2	533
Rifampin, Isoniazid, and Pyrazinamide Tablets—*Dissolution*	30	2	534
Risperidone (new)	31	6	1659
Ritonavir (new)	31	3	788
Rubella and Mumps Virus Vaccine Live (delete)	31	6	1662
Saccharin Calcium (new)—*Harmonization*	31	2	607
Saccharin Sodium (new)—*Harmonization*	31	4	1225
Saquinavir Mesylate—*Identification*	31	5	1400
Schick Test Control (delete)	31	6	1662
Senna—*Title, Definition, Packaging and storage, Labeling* (add), *USP Reference standards* (add), *Botanic characteristics, Identification, Microbial enumeration* (add) *Loss on drying* (add), *Total ash* (add), *Assay* (add)	32	1	137
Senna Pods (new)	32	1	140

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Sennosides—*Definition, Packaging and storage, Residue on ignition*	32	1	141
Sevoflurane (new)	30	1	178
Simvastatin—*Identification, Chromatographic purity, Limit of lovastatin* (delete), *Assay*	32	1	141
Sodium Bicarbonate—*Normal carbonate, Limit of ammonia*	31	3	795
Sodium Bicarbonate Injection—*Packaging and storage*	31	5	1401
Sodium Chloride—*Identification, Loss on drying, Limit of phosphates, Limit of potassium*	31	5	1401
Sodium Citrate and Citric Acid Oral Solution—*USP Reference standards* (add), *Assay for sodium citrate (delayed implementation to April 1, 2009)*	31	3	797
Sodium Lactate Injection—*Identification B* (delete)	31	5	1402
Sodium Phosphates Rectal Solution—*Assay*	31	5	1403
Sodium Salicylate Tablets—*USP Reference standards* (add)	31	4	1116
Sorbitol Solution—*Microbial limits* (add)	29	4	1078
Stavudine Capsules—*Assay*	31	5	1403
Succinylcholine Chloride—*Limit of ammonium salts* (delete), *Chromatographic purity*	31	5	1404
Sulfamethazine Granulated—*Assay*	31	3	797
Sumatriptan Succinate Oral Suspension (new)	32	1	144
Talc—*Packaging and storage* (new), *Limit of iron, Limit of calcium, Limit of aluminum*	31	6	1662
Tazobactam (new)	31	4	1116
Technetium Tc 99m Fanolesomab Injection (new)—*Packaging and storage* (add)	31	5	1405
Temazepam—*Identification*	32	1	145
Terbutaline Sulfate Inhalation Aerosol—*USP Reference standards, Assay*	31	2	450
Thalidomide—*Microbial limits, Chromatographic purity*	32	1	146
Thiabendazole Tablets—*Title* (name change)	29	6	1991
Thiabendazole Chewable Tablets (new)	29	6	1991
Thimerosal—*Identification*	32	1	147
Thioridazine Hydrochloride—*Identification*	31	3	798
Tilmicosin—*Definition, Related compounds, Assay*	31	3	798
Titanium Dioxide—*Definition, Packaging and storage, Labeling, Loss on ignition, Water-soluble substances, Acid-soluble substances, Limit of lead* (add), *Limit of antimony* (add), *Limit of mercury* (add), *Organic volatile impurities* (delete), *Assay*	30	4	1301
Tizanidine Tablets (new)	32	1	147
Tolazamide—*Chromatographic purity*	31	4	1118
Topiramate (new)	30	4	1307
Tramadol Hydrochloride (new)	31	2	458
Tramadol Hydrochloride Tablets (new)	31	2	462
Travoprost (new)	31	4	1119
Travoprost Ophthalmic Solution (new)	31	4	1121
Triamcinolone Acetonide—*USP Reference standards, Assay*	31	3	800
Tricitrates Oral Solution—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	2	465
Triclosan—*USP Reference standards; Limit of monochlorophenols and 2,4-dichlorophenol; Limit of 1,3,7-trichlorodibenzo-p-dioxin, 2,8-dichlorodibenzo-p-dioxin, 2,8-dichlorodibenzofuran, and 2,4,8-trichlorodibenzofuran; Assay*	31	5	1408
Trimethoprim—*Packaging and storage*	31	5	1409
Tryptophan—*Chloride, Sulfate*	31	5	1410
Tylosin Tartrate (new)	31	5	1410
Ursodiol Capsules—*Dissolution*	31	3	800
Valsartan (new)	32	1	150
Valsartan and Hydrochlorothiazide Tablets (new)	31	4	1123
Valproic Acid Injection (new)—*Title (delayed implementation to October 1, 2007)*	31	5	1412
Vancomycin Hydrochloride—*USP Reference standards, Limit of monodechlorovancomycin* (add)	30	6	2055
Vasopressin—*Identification*	31	4	1127

HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps **(*Stages*)**.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

PHARMACOPEIAL PREVIEWS

This section contains potential revisions not yet targeted for official adoption. These may include drafts for new monographs or chapters; drafts for standards that would require new or unusual technology; drafts for which more data are required; or changes that would affect numerous monographs, thus having a broad impact on individual products. Readers should review the drafts in this section and provide comments to the appropriate staff liaison whose name is cited in the Briefing (use the *Staff Directory* to find the contact information).

Briefings Each Preview is preceded by a Briefing in the following format:

BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being used, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How To Use PF*), the name of the scientific staff liaison who handled this item, and the USP tracking correspondence number, as shown in the example below:

(DSN: L. Evans) RTS—55678-1

Symbols No symbols are used in this section, as Previews are not yet targeted for official adoption.

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of authoritative committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* and *Pharmacopeial Previews* sections. Readers interested in submitting comments should see *Instructions to Authors.*

Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP–NF* revision will be considered for publication in the *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention (USPC) and may not be published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

References—Consult a current copy of the *Pharmacopeial Forum* and the *ACS Style Guide* for assistance with reference style.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Contact Person—When submitting a manuscript, designate one author of the article as correspondent and include that author's full address, telephone number, fax number, and e-mail address.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Graphics that cannot be submitted electronically must be camera-ready, of easily reproducible quality and size, and clearly labeled. Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

The Role of Container–Closure Systems in Stability Testing For Climate Zone IV*

H. Lockhart, *Michigan State University;* S. Selke, *Michigan State University;* S. Yoon, *Eli Lilly and Company*

ABSTRACT The authors suggest that designation of long-term stability test conditions must include the effect of barrier packaging on the atmosphere inside the package. In December 2004, the Association of South East Asian Nations (ASEAN) proposed to the World Health Organization (WHO) that the standard for long-term stability testing for markets in Climate Zone IV be changed from 30 °C, 65% relative humidity (RH) to 30 °C, 75% RH. The argument for this proposal was based on the effect of absolute humidity on drug products. It did not take into account the effect of barrier packaging on control of the absolute humidity inside the package. The authors stipulate that selection of stability test conditions must include consideration of package permeation, storage temperature, and the permeation driving force, i.e., partial pressure for water vapor. The authors show that for challenge of the packaged drug product, relative humidities lower than 75% at 30 °C would adequately represent the ASEAN countries' Climate Zone average condition of 27 °C, 79% RH. Laboratory testing is advised.

INTRODUCTION

Some questions have been raised during international discussions of test conditions for stability testing for Climate Zone IV (*1–5*). The current ASEAN Climate Zone IV is 30 °C, 66% RH. At the ''Consultation to Discuss Stability Studies in a Global Environment'' on 13–14 December 2004 at WHO Headquarters in Geneva, it was proposed by the ASEAN countries that stability test conditions for Climate Zone IV should be changed to 30 °C and 75% RH. This would result in a change to the WHO Guidelines for stability testing. The ''Recommendations Agreed To by the Meeting'' (*1*) recognized three options available to WHO. The options are the following: 1) revert to 30 °C, 70% RH; 2) change to 30 °C, 75% RH; or 3) add a new Climate Zone IVb (30 °C, 75% RH), making the present 30 °C, 65% RH the stability test condition for Climate Zone IVa. Delegates were charged with the task of providing feedback and recommendations from their constituencies to WHO about the options.

Two items in the discussions during the Consultation deserve comment. First, the presenters favoring 30 °C, 75% RH based their arguments on the assumption that absolute humidity is the governing atmospheric condition for permeation of moisture into a container–closure system. This is not so. The atmospheric driving force for moisture permeation into a container is the pressure differential for water vapor between the inside and the outside of the container–closure system.

Second, two presenters (*3,4*) and one author (*5*) stated that glass bottles and high-density polyethylene (HDPE) bottles are impermeable to moisture when they have metal caps or high-density polyethylene caps. This, also, is not true.

This *Stimuli* article is intended to serve as feedback to WHO on the subject of the function of the container–closure system during stability testing. It addresses the questions of impermeability and the forces that drive permeation.

MOISTURE PERMEATION MECHANISM OF CONTAINER–CLOSURE SYSTEMS

Nearly all container–closure systems are permeable to water vapor (moisture). Only a few are not. Among the moisture-permeable container–closure systems commonly used in the pharmaceutical industry are the following: HDPE containers with any metal or plastic screw closures, low-density polyethylene (LDPE) containers with any metal or plastic closures, glass containers with any metal or plastic closure, polyvinyl chloride (PVC) blisters with lidding, PVC/polyvinylidene chloride (PVdC) blisters with lidding, and PVC/Aclar blisters with lidding.

Examples of moisture-impermeable container–closure systems include flame-sealed glass ampuls, and possibly aluminum (Al/Al) blisters. These Al/Al blisters usually test at or near zero permeation, but given a long enough time of exposure to test conditions, a low permeation rate may be found. Permeation into Al/Al blisters may happen through the seal or through pinholes in the aluminum foil.

Bottle container–closure systems have a container and a closure. The closure consists of two parts, the cap and the cap liner. The closure's moisture seal is the cap liner, which consists of the facing, which is a barrier material, and a resilient backing material. The backing material serves to keep the facing (the barrier) in close contact with the top of the container finish (the threaded neck).

Permeation into glass containers varies depending on the kind of material in the liner and the size (area) of the liner. The larger the area, the greater is the permeation. In *Table 1,* the 90-mL bottle with a 38-mm diameter cap size has a much larger area of liner facing than does the 30-mL bottle with only a 28-mm diameter cap size. The permeation for the metal cap with pulp/vinyl/wax liner is correspondingly higher for the 90-mL bottle than it is for the 30-mL bottle.

* Correspondence should be addressed to: Desmond Hunt, Ph.D., Senior Scientific Associate, Department of Standards Development, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852-1790; tel. 301.816.8341; e-mail dgh@usp.org.

Table 1. Water Vapor Transmission Rate (WVTR) at 37 °C, 85% RH for Glass Containers with a Variety of Closures (*6*)

Container Size	Cap Size*	Cap Material	Cap Liner Material	WVTR, mg/day
30 mL	28/400	Polystyrene	Pulp/vinyl/wax	5.4
		Polypropylene	Pulp/vinyl/wax	7.9
		Metal	Pulp/vinyl/wax	3.6
45 mL	33/400	Polystyrene	Pulp/foil/PVdC/wax	0.0
			Pulp/foil/vinyl/wax	3.6
		Metal	Pulp/foil/PVdC/wax + glassine innerseal	0.2
60 mL	33/400	Metal	Pulp/foil/vinyl	3.5
90 mL	38/400	Metal	Pulp/vinyl/wax	16.3
			Pulp/Aclar	0.43

* Cap size numbers: diameter of the thread in mm/style number of thread.

Also in *Table 1,* within each size class the permeation is different for different liners. For the 45-mL bottle, the foil/PVdC liner facing was so effective that this test produced a 0.0 permeation result. Foil/vinyl is a much less effective barrier, and that is shown in the WVTR of 3.6 mg/day.

The cap material often does not appreciably participate in the promotion or limitation of permeation. Note that in *Table 1* for the 45-mL bottle differences in permeation are explained by the difference in liner materials, not by the material of which the cap is made. Polystyrene is known to be a very poor barrier to water, and metal is known to be a good barrier. Yet the metal cap shows a permeation value and the polystyrene cap shows none. The difference is that a waxed glassine paper innerseal was incorporated in the metal cap's liner system.

Permeation of moisture into plastic containers is the result of ingress of water vapor through the wall of the container and the ingress of water vapor through the liner in the cap (see *Tables 2* and *3*). All that was said above about the effect of cap size and liner material is true for the caps used on plastic containers. During any test, permeation through the cap liner is confounded by permeation through the bottle wall. The two permeations can be separated. When a plastic bottle container–closure system is exposed to test conditions, the permeation of the bottle alone can be measured by making a hermetic wax seal on the closures of additional bottles and exposing the bottles to the same test conditions. The information presented in *Table 3* is the result of conducting such a test and then subtracting the bottle wall permeation from the whole-package permeation to get the closure permeation.

Table 2. WVTR at 37 °C, 85% RH for HDPE Containers with a Variety of Closures (*6*)

Container Size	Cap Size	Cap Material	Cap Liner Material	WVTR, mg/day
45 mL	28/400	Metal	Pulp/foil/PVdC/wax	0.93
			Pulp/vinyl/wax	4.0
160 mL	38/400	Metal	Pulp/foil/PVdC/wax	1.7
		Polystyrene	Pulp/foil/PVdC/wax	1.2
		Polypropylene	Pulp/foil/ vinyl/wax	9.6
480 mL	43/400	Metal	Pulp/foil/PVdC/wax	3.3

Table 3. WVTR at 37 °C, 85% RH for HDPE Containers and Various Closures, Showing Each Separately (*6*)

Container Size	Cap Size	Cap Material	Cap Liner Material	WVTR, mg/day
90 mL	38/400	Metal	Pulp/foil/PVdC/wax	1.5
	Permeation through container wall*			1.3
	Permeation through closure**			0.2
90 mL	38/400	Metal	Pulp/wax	8.3
	Permeation through container wall*			1.3
	Permeation through closure**			7.0
160 mL	38/400	Metal	Pulp/foil/PVdC/wax	1.4
	Permeation through container wall*			1.1
	Permeation through closure**			0.3
160 mL	38/400	Polypropylene	Pulp/foil/PVC/wax	9.6
	Permeation through container wall*			1.2
	Permeation through closure**			8.4

* Closure sealed with wax to form a hermetic seal, giving container wall permeation.
** Closure permeation obtained by subtracting wall permeation from container–closure permeation.

One of the most widely used container–closure systems is an HDPE bottle with induction heat sealed liner. Typical moisture permeation for a 50-mL bottle with 28/400 closure is 1.34 mg/d when tested at 40 °C, 75% RH. The bottle material is HDPE, the cap is polypropylene (PP), and the liner material is pulp/wax/Al foil/PE. This permeation value can be compared with 0.93 mg/d for the 45-mL, 28/400 bottle at the top of *Table 2*. The cap liners are the same size, the 50-mL bottle is slightly larger in surface area, and the test temperature is 3 °C higher for the 50-mL bottle than for the 45-mL bottle. The driving force (the pressure differential for water) is higher [41.5 mm Hg (55.3 mbar)] at 40 °C, 75% RH than at 37 °C, 85% RH [40.0 mm Hg (53.3 mbar)]. These factors all serve to explain why the induction heat sealed aluminum foil barrier system has a slightly higher permeation rate than does the PVdC barrier system. Temperature and water vapor pressure differential are the forces that drive permeation of moisture into container–closure systems. The theory is explained in the following section.

WATER VAPOR TRANSMISSION INTO PACKAGES

As discussed, water vapor can transfer from the storage environment into sealed packages by several mechanisms. One mechanism is convective mass transfer through channel or pinhole defects in the package. This mechanism will not be considered further because such packages have gross defects that should be identified through normal quality control systems. The remaining mechanisms are diffusion of water vapor through microscopic imperfections in the container seal or the container wall, and bulk diffusion of water vapor through semipermeable materials such as plastics.

Both of these types of transport of permeants through packages are well described by Fick's first and second laws of diffusion:

$$F = -D\frac{\partial C}{\partial x} \quad (1)$$

and

$$\frac{\partial C}{\partial t} = D\frac{\partial^2 C}{\partial x^2} \quad (2)$$

where F is the rate of mass transfer for the permeating substance per unit area, D is the diffusion coefficient, C is the concentration of the diffusing substance (within the material in question), x is the spatial coordinate in the direction of transfer, and t is time (*7–9*).

To make this equation more useful for calculating permeation through packages, it is necessary to relate C, the concentration of the substance within the package material, to the storage conditions and the conditions within the package headspace. This is commonly done using Henry's law, which relates partial pressure of a component in the gas phase to concentration of the substance in the solid or liquid phase that is in equilibrium with that gas phase:

$$C = Sp \quad (3)$$

where S is the Henry's law constant, or solubility coefficient, of the permeating substance in the solid or liquid phase, C is the concentration of the diffusing substance in the solid or liquid phase, and p is the partial pressure of the permeating sub-

stance in the gas phase (*8*). This relationship holds well for most substances dissolving in polymers, including water vapor, when the concentration of the permeant is low.

Putting these relationships together and assuming steady-state transfer gives us the classic equation describing permeation that holds when D and S are independent of concentration:

$$P = DS = \frac{q\ell}{At\Delta p} \quad (4)$$

where P is the permeability coefficient, D is the diffusion coefficient, S is the solubility coefficient, q is the amount of permeant transferred through the material during time t, A is the area available for permeation, ℓ is the thickness of the material being permeated (assumed constant), and Δp is the difference in partial pressure of the permeating substance in the gas phase in contact with the two surfaces of the material (*8*). It is important to note that the difference in partial pressure is required in this equation, not the difference in relative humidity (RH) nor the difference in either mass fraction or volume fraction of water vapor in the air. Of course, the partial pressure can be calculated if temperature is known, along with either RH, mass fraction, or volume fraction of water vapor.

The assumption that D and S are independent of concentration is generally accurate for water vapor permeating through polymers that do not strongly interact with water, such as polyolefins (e.g., polyethylene and polypropylene). It is not accurate for interacting systems, such as permeation of hydrocarbons through polyolefins, or permeation of water through ethylene vinyl alcohol. Such cases require a more complex analysis than the one that follows.

When the mass transfer is not at steady state, equation (4) still holds for differential times t and can be integrated over time. When water vapor is permeating into a package that is maintained at constant temperature and relative humidity and the package contains a desiccant, steady-state permeation usually can be assumed, because the desiccant maintains the partial pressure of water vapor inside the package at a uniform low value (near zero). The time to reach steady state depends on the thickness of the material, its initial condition, and its barrier characteristics but generally is short in relation to desired shelf life.

When water vapor is permeating into a package that is maintained at constant temperature and relative humidity but does not contain a desiccant, the water vapor partial pressure inside the package changes with time, so steady state usually cannot be assumed. In such cases, the moisture sorption isotherm for the product can be used to relate the moisture content of the product to the partial pressure inside the package. This assumes that moisture in the product and the package headspace equilibrate relatively rapidly in comparison to the rate of transfer of moisture through the package and that chemical consumption of water is negligible. In most cases of pharmaceutical packaging, these are good assumptions.

When the thickness of a material varies, equation (4) still holds for differential areas, A, of the material and can be integrated over the entire area. More commonly, measurements of the permeability coefficient are simply made for the whole package, and the equation is written as:

$$P^* = \frac{q}{t\Delta p} \quad (5)$$

where P^* is the per-package permeability coefficient for the specific package, with thickness and area incorporated. As is the case for equation (4), equation (5) can be written for a differential time t and integrated if permeation is not at steady state.

Measurements for moisture permeation through package materials or packages frequently are reported as a WVTR, determined at specified conditions, rather than as a permeability coefficient. For use in calculations, WVTR can be transformed into a permeability coefficient by dividing by the partial pressure difference at which the WVTR was determined, as follows:

$$P = \frac{WVTR}{\Delta p_{test}} \quad (6)$$

where Δp_{test} is the difference in water vapor partial pressure on the two sides of the material. If the WVTR is reported for a whole package, then use of equation (6) will yield a whole-package permeability coefficient.

PERMEABILITY COEFFICIENT

The permeability coefficient for a specific permeant/material combination depends, in theory, only on the type of permeant, the type of material, and on temperature. It does not depend on the concentration of the permeant, the thickness of the material, or other characteristics. In practice, there is likely to be some dependence of the permeability coefficient on the permeant concentration if there is interaction between the permeant and the material (*9, 10*).

For example, interaction of polyethylene with hydrocarbons can result in swelling of the polymer matrix and therefore in an increase in the diffusion coefficient, resulting in an increase in the permeability coefficient. Also, there may be some influence of thickness and, more generally, processing conditions, especially for semicrystalline polymers. Sorption and diffusion in semicrystalline polymers occurs predominantly in the amorphous regions. Therefore, if processing conditions result in an increase in crystallinity, the permeability coefficient will be decreased. If processing conditions result in a decrease in crystallinity, the permeability coefficient will increase. Other processing conditions that decrease free volume without necessarily increasing crystallinity have a similar effect. This is why orientation of polymers generally results in an improved barrier. Thickness plays a role because thickness affects heat transfer, which in turn affects the time during which a polymer remains at conditions that allow crystallization to occur.

A permeability coefficient for a whole package system depends, by its nature, on that particular package. However, the PQRI Working Group has shown that permeation behavior of a particular container can be generalized to provide useful information about the ability of other containers to provide sufficient moisture protection when rates are expressed on a per-unit-product basis (*11*).

The relationship between the permeability coefficient and temperature is somewhat complex. Both solubility and diffusion are affected by temperature. Diffusion increases with increasing temperature, following an Arrhenius relationship. Solubility may either increase or decrease with increasing temperature. For volatile substances, it is common for solubility to decrease as temperature increases, but for solids and liquids, solubility generally increases as temperature increases. Over reasonably small temperature ranges (and provided the temperature range does not span a polymer's glass transition temperature, T_g), the permeability coefficient typically exhibits an Arrhenius dependence on temperature:

$$P = Ae^{\frac{-E_a}{RT}} \quad (7)$$

where A is the pre-exponential term, E_a is the activation energy (determined by a best fit of P values at different temperatures), T is the absolute temperature, and R is the gas constant (8.314 J mol^{-1} K^{-1}) (*9*).

For ease of calculation, this formula is generally rewritten using a known value of P at one temperature, along with the activation energy, to calculate P at another temperature:

$$P_2 = P_1 e^{\frac{E_a}{R}\left(\frac{1}{T_1} - \frac{1}{T_2}\right)} \quad (8)$$

Here P_2 is the value to be determined at temperature T_2, and P_1 is the known value at temperature T_1. The negative sign in the original exponent has now been incorporated into the temperature difference term.

DETERMINATION OF ZONE IV STABILITY TEST CONDITIONS BASED ON WATER VAPOR PERMEATION

The primary determinants of moisture-related product failure are the amount of water uptake by the product, time, and temperature. The amount and timing of water uptake are themselves determined by the barrier characteristics of the package, the storage conditions, and the conditions internal to the package (e.g., water vapor partial pressure in the package headspace).

The goal of stability testing is to provide some degree of certainty that the product will remain efficacious during its labeled shelf life. Currently there is debate about the appropriateness of real-time test conditions for Zone IV countries. ASEAN has proposed test conditions of 30 °C and 75% RH rather than the current conditions of 30 °C and 65% RH adopted in 2003. They argue that these conditions more accurately reflect the hot and humid conditions that characterize ASEAN countries, along with other areas such as Brazil, Cuba, China, and India. Their argument is that absolute humidity (kg water/kg dry air) is the best guideline for determining the conditions to be used for long-term stability testing. Average values of absolute humidity are reported to range from 0.0175 to 0.0186 kg water/kg dry air, depending on the methods used to determine the average. Average temperature and RH values for ASEAN nations are reported as 27 °C and 79% RH (*2, 3*).

ASEAN considered only the absolute humidity and temperature in determining appropriate test conditions. However, it is the moisture inside the package that actually affects product stability, not the moisture in the environment. Further, although the absolute humidity of the package headspace may or may not be useful in determining the effect of water on the product, it is not useful in determining the amount of moisture that will permeate into a package. The difference in partial pressure of water vapor inside and outside the package is, along with temperature, the determining factor in how much moisture will permeate into the package. The rate of permeation and the moisture uptake characteristics of the product determine the partitioning of the permeating moisture between the product and the package headspace, thus determining the equilibrium vapor pressure of water in the package headspace and hence the absolute humidity inside the package.

In cases when the product absorbs all or nearly all of the permeating moisture (e.g., in packaging desiccant), the package usually reaches steady state relatively quickly compared to the product's shelf life. Steady-state moisture gain can be calculated easily from equation (4) or (5). As an example, assume use of a polypropylene (PP) vial with a surface area of 7.13×10^{-3} m^2 and an average wall thickness of 0.001 m; for simplicity, further assume no permeation through the closure. A typical WVTR for PP is 200 g μm/m^2 d at the standard conditions of 37.8 °C, 90% RH (*12*). The activation energy for water vapor permeation for PP has been tabulated as 42 kJ/mol (*10*).

The steady-state water vapor permeation rate for this vial at any given set of conditions can be calculated from equation (4) rearranged as follows:

$$\frac{q}{t} = \frac{P A \Delta p}{\ell} \quad (9)$$

The first step is to calculate the permeability coefficient for water vapor for PP, from the reported WVTR value for the material and the conditions at which it was determined, using the saturation vapor pressure of water at 37.8 °C of 42.175 mm Hg:

$$P = \frac{WVTR}{\Delta p_{test}} = \frac{200\ g\ \mu m}{m^2\ d\ 0.90(42.175\ mm\ Hg)} = \frac{5.269\ g\ \mu m}{m^2\ d\ mm\ Hg} \quad (10)$$

If desired, we can also calculate the per-package permeability coefficient:

$$P^* = P \times \frac{Area}{Thickness} = 5.269 \frac{g\,\mu m}{m^2\,d\,mm\,Hg} \times \frac{0.00713\ m^2}{1000\ \mu m} = 3.7568 \times 10^{-5} \frac{g}{d\ pkg\ mm\,Hg} \quad (11)$$

If we assume that *P* does not vary with temperature, we can obtain the values in *Table 4* for WVTR at various conditions. *Table 4* also shows absolute humidity calculated by the following equation:

$$AH = \frac{0.018\,p_D}{0.029(p - p_D)} \quad (12)$$

where *AH* is absolute humidity, in kg water/kg dry air; p_D is the partial pressure, in mbar, of water; *p* is total atmospheric pressure, in mbar; 0.018 is the molar mass of water, in kg; and 0.029 is the molar mass of dry air, in kg *(13)*. Saturation vapor pressures are obtained from Perry and Chilton (*14*). These tabulated values are more accurate than values calculated using Wexler's equation.

Table 4. WVTR for the Example PP Vial at Various Conditions, Assuming *P* Does Not Vary with Temperature

T, °C	p_{sat}, mm Hg	*RH,* %	p_D, mm Hg (mbar)	*AH,* kg water/ kg dry air	WVTR, g/day
25	23.756	80	19.004 (25.338)	0.01592	0.0007140
27	26.739	79	21.124 (28.163)	0.01774	0.0007936
27.8	28.021	79	22.137 (29.513)	0.01862	0.0008316
30	31.824	60	19.094 (25.457)	0.01600	0.0007173
30	31.824	65	20.386 (27.579)	0.01737	0.0007771
30	31.824	70	22.277 (29.700)	0.01874	0.0008369
30	31.824	75	23.868 (31.821)	0.02012	0.0008967

From the values above it can be seen that, even assuming that *P* does not increase as temperature increases, it can be calculated that more water vapor will permeate into a container at 30 °C and 70% RH than at 27 °C and 79% RH or even at 27.8 °C and 79% RH. This holds true regardless of the container characteristics because the WVTR for a given container will be proportional to partial pressure difference.

Of course, assuming that *P* does not increase with increasing temperature is a poor assumption. The increase in permeation with temperature provides an additional safety margin when test conditions of 30 °C and 70% RH are used to determine stability in Zone IV countries.

For the vial above, we can calculate *P* for water vapor at other desired temperatures from the value of *P* at 37.8 °C, using equation (8), obtaining the values shown in *Table 5*.

Table 5. Water Vapor Permeability Coefficients for PP

Temperature, °C	*P* for Water Vapor, g μm/m² d mm Hg
37.8	5.269
23	2.340
25	2.623
27	2.937
27.8	3.071
30	3.469
37.8	5.269

We can now use these values to calculate a more accurate steady-state water vapor transmission rate for the vial at various storage conditions, resulting in the values shown in *Table 6*.

Table 6. WVTR for the Example PP Vial at Various Conditions, Correcting for Variation in *P* with Temperature

T, °C	*P,* g μm/ m² d mm Hg	*RH,* %	WVTR, g/day
25	2.623	80	0.0003554
27	2.937	79	0.0004424
27.8	3.071	79	0.0004847
30	3.469	60	0.0004723
30	3.469	65	0.0005116
30	3.469	70	0.0005510
30	3.469	75	0.0005904

It can be seen that in this case the WVTR even at 30 °C and 60% RH will be higher than the WVTR at 27 °C and 79% RH, although not as high as the WVTR at 27.8 °C and 79% RH. The WVTR at 30 °C and 65% RH will be higher than the WVTR at either 27 °C or 27.8 °C and 79% RH. The WVTR at 30 °C and 70% RH is even larger and, for this vial, will be 13.7% higher than at 27.8 °C and 79% RH.

The magnitude of these differences depends on the activation energy of permeation for the container in question but not on its surface area or thickness. For example, if this vial were LDPE, instead of PP, a typical WVTR would be 440 g μm/m² d at the standard conditions of 37.8 °C, 90% RH

(Selke, 1997), resulting in a value for P of 11.59 g μm/m² d mm Hg. The activation energy is 34 kJ/mol (*10*). *Table 7* shows the calculated WVTRs.

Table 7. WVTR for the Example Vial Made from LDPE, Correcting for Variation in *P* with Temperature

T, °C	*P*, g μm/ m² d mm Hg	*RH,* %	WVTR, g/day
25	6.590	80	0.000893
27	7.221	79	0.001088
27.8	7.487	79	0.001182
30	8.263	60	0.001125
30	8.263	65	0.001219
30	8.263	70	0.001312
30	8.263	75	0.001407

For the LDPE vial, moisture gain at 30 °C and 65% RH will be 3% higher than at 27.8 °C and 79% RH.

The situation is more complicated when the water vapor partial pressure inside the package increases during the storage period, because the contents absorb some but not all of the permeating moisture. The permeation rate is governed by the difference between the water vapor pressure inside and outside of the package, so it can be affected by the package contents. In such cases, permeation is not at steady state, and a more complex analysis is required and must take into consideration the moisture sorption isotherm of the package contents.

CONCLUSION

This paper presents the theory to support using the effect of climate on package permeation as the basis for designating stability test conditions for Climate Zone IV. It demonstrates that temperature, partial pressure for water vapor, and package permeation control the amount of water that becomes available to the product. Absolute humidity does not enter the equation at all. The selection of stability test conditions to represent Climate Zone IV can be made only through consideration of storage temperature, partial pressure for water vapor, and moisture permeability of the package.

The theoretical argument suggests that the current WHO Zone IV real-time stability conditions of 30 °C, 65% RH are adequate. This has not been tested by direct experimentation. Laboratory studies are now being designed to gather data for appropriate stability test conditions. These studies will focus on the permeation behavior of drug product packaging materials at temperatures and relative humidities characteristic of Zone IV conditions.

NOMENCLATURE

This section includes supplements to the latest edition of the *USP Dictionary of USAN and International Drug Names* that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

USP Dictionary of USAN and International Drug Names
2005 USP DICTIONARY SUPPLEMENT 6

IMPORTANT—Save this Supplement. This and all supplements appearing in *PF* are needed to keep the 2005 edition of the USP Dictionary (USPD) up-to-date. The cumulative contents of the supplements to the current (2005) edition will be included in the next complete edition of the Dictionary.

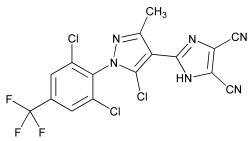
Revisions of United States Adopted Names (USAN)

The following are revisions of existing United States Adopted Names (USAN) and other names.

Fampronil

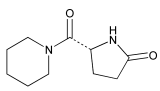
Change the chemical information and structure to read:

$C_{16}H_6Cl_3F_3N_6$. 445.61. 2-{5-Chloro-1-[2,6-dichloro-4-(trifluoromethyl)phenyl]-3-methyl-1*H*-pyrazol-4-yl}-1*H*-imidazole-4,5-dicarbonitrile. *CAS-134183-95-2.* INN.



Fasoracetam

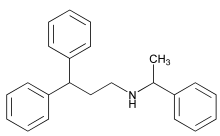
Change the chemical structure to read:



Fendiline

Change the chemical information and structure to read:

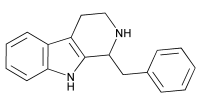
$C_{23}H_{25}N$. 315.45. *N*-(3,3-Diphenylpropyl)-α-methylbenzylamine. *CAS-13042-18-7.* INN; MI.



Fenharmane

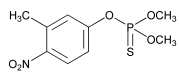
Change the chemical information and structure to read:

$C_{18}H_{18}N_2$. 262.35. 1-Benzyl-2,3,4,9-tetrahydro-1*H*-pyrido[4,3-*b*]indole. *CAS-3851-30-7.* INN.



Fenitrothion

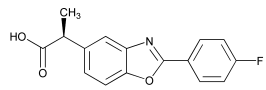
Change the chemical structure to read:



Flunoxaprofen

Change the chemical information and structure to read:

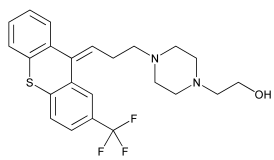
$C_{16}H_{12}FNO_3$. 285.27. (*S*)-(+)-2-(*p*-Fluorophenyl)-α-methyl-5-benzoxazoleacetic acid. *CAS-66934-18-7.* INN; MI.



Flupentixol

Change the chemical information and structure to read:

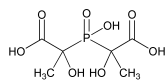
$C_{23}H_{25}F_3N_2OS$. 434.52. (*Z*)-2-Trifloromethyl-9-[3-[4-(2-hydroxyethyl)piperazin-1-yl]propylidene]thioxanthene. *CAS-2709-56-0.* INN; BAN; DFC; MI. *[Name previously used: Flupenthixol.]* ✧*N-7009; LC 44.*



Foscolic Acid

Change the chemical formula and structure to read:

$C_6H_{11}O_8P$.



Mitomycin

Change the chemical structure to read:

PHARMACOPEIAL FORUM VOL. 32 NO. 3 MAY–JUNE 2006

* The *USP–NF* (*USP 30–NF 25*), the *Supplement* (*Supp*), or the *Interim Revision Announcement* (*IRA*) for which the revision proposal is targeted is shown in parentheses next to each proposed item.

THE JOURNAL OF STANDARDS DEVELOPMENT AND OFFICIAL COMPENDIA REVISION

Please address comments on *PF* content to Executive Secretariat
USP–NF, 12601 Twinbrook Pkwy.
Rockville, MD 20852

Telephone: 1-301-816-8345
Fax: 1-301-816-8373
http://www.usp.org

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI),* in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences.*

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

ISSN: 0363-4655

Printed in USA by Port City Press, Baltimore, Maryland

STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum* (*PF*), for the development of official pharmaceutical standards.

USP publishes *Pharmacopeial Forum* (*PF*) bimonthly as the working vehicle of the USP Council of Experts. *PF* provides interested parties an opportunity to review and comment as the Council of Experts develops or revises standards for the *United States Pharmacopeia* and the *National Formulary* (*USP–NF*).

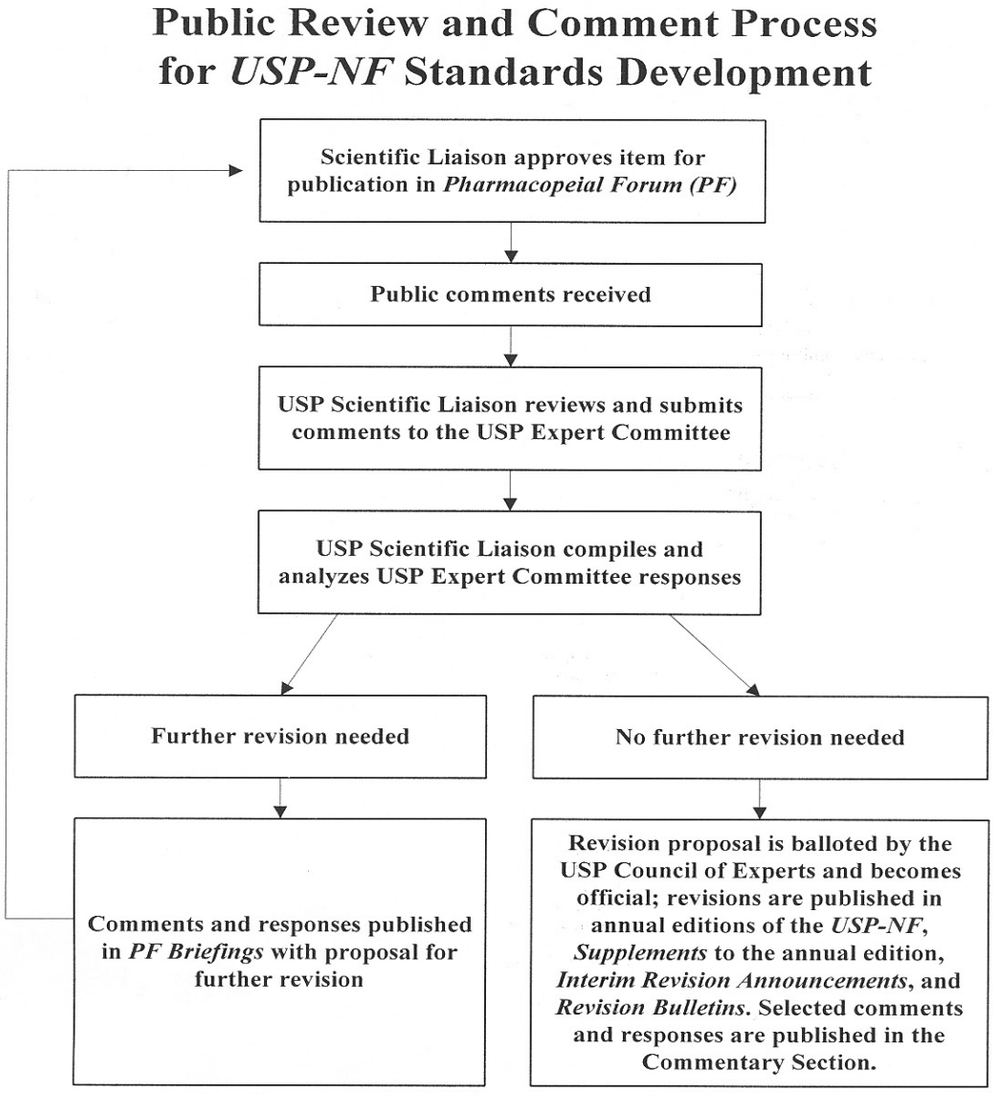
PF includes the following:

1. Potential revisions—entirely new standards, revision ideas, and drafts not yet targeted for official adoption (*Pharmacopeial Previews*)
2. Proposed revisions—new or revised standards targeted for official adoption (*In-Process Revision*)
3. Adopted revisions—new or revised standards that become official and binding before the publication of the next *USP–NF* or *Supplement* (*Interim Revision Announcement*)

USP welcomes comments and data on potential, proposed, or official standards.* Comments, along with USP's responses, will be published either in *PF Briefings*, the *Commentary* section of *PF*, the *Commentary* section of *Supplements* to *USP–NF*, or the *Commentary* section of *USP–NF*.

* If you are not immediately able to submit comments but you intend to do so, please notify USP by using the Intent to Comment form provided before the section *Chromatographic Reagents Used in USP–NF and PF*.

The chart below shows the public review and comment process and its relationship to standards development.



Questions on the process should be addressed to Director, Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: execsec@usp.org).

HOW TO USE *PF*

This section provides descriptions of the various parts of *PF*. It also includes *Committee Designations* and the *Staff Directory.*

The content of the different sections of *PF* is briefly described below. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a *Request for Revision* is available in the *Guideline for Submitting Requests for Revision to the USP–NF* on the USP website (www.usp.org/USPNF/submitMonograph/subGuide.html).

Proposed and Adopted Revisions to the *USP–NF*

Section	Content	How Readers Can Respond
Pharmacopeial Previews Early ideas for revisions	•BRIEFING: Scientific rationale for potential inclusion or change. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •Potential revisions not yet targeted for official adoption that require a longer public review and comment process because of issues such as: — the controversial nature of an item; — the application of new technologies that require further study; and — articles produced by multiple sources.	Review drafts and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview.*
In-Process Revision Revisions targeted for adoption	•BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see *Standards Development*). New or revised text is marked with symbols (■ or ● or ▲) to specify the tentative earliest date on which the revision would be officially adopted.	Review material and send comments promptly to USP staff liaison (see the *Staff Directory*). Guidelines on how to comment are found at the end of the *Policies and Announcements* section.
Harmonization Items the Pharmacopeial Discussion Group (PDG) is working to harmonize internationally	•BRIEFING: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. The stage determines whether an item appears under *Pharmacopeial Previews* or under *In-Process Revision,* both separate sections of *Harmonization.* •For *In-Process Revision,* new or revised text is marked with symbols (■) to specify the tentative, earliest date on which the revision would be officially adopted.	Review material and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview* or *In-Process Revision.*
Interim Revision Announcement Adopted standards	Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols ●.	Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance.
Pending Proposals	In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *PF* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in either the *USP–NF*, its supplements, or an *IRA*. Those items that have not yet been adopted are still pending.	Review items to track pending proposals.
Canceled Proposals	Canceled proposals are items that were published in *PF* and were pending, but have since been canceled. Note that canceled proposals may be republished to be considered in the future for adoption into the *USP–NF*.	Review items to track canceled proposals.

Other Sections

Committee Designations
Names of the committees (composed of volunteer scientific experts) that USP staff work with on the development of standards.

Staff Directory
Names of all USP scientific staff liaisons with contact information.

Policies and Announcements
- General scientific and policy issues affecting *USP–NF* standards and processes
- Update on standards-related issues being considered by USP
- Where to find summaries of meetings of the Council of Experts
- Guidelines on how to comment
- Publication and comment schedules

Stimuli to the Revision Process
- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

Nomenclature
- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the *USP Dictionary of USAN and International Drug Names*
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

Index
Cumulative directory for the content of all issues of *PF* beginning with *PF* 32(1).

Reference Standards Catalog
List of official USP Reference Standards specified in *USP–NF*, along with availability and ordering information.

Chromatographic Reagents Used in USP–NF and Pharmacopeial Forum
Update of chromatographic reagents based on the proposals published in this issue of *PF*.

POLICIES AND ANNOUNCEMENTS

This section includes information about general scientific and policy issues that may have an impact on *USP–NF* standards and processes and announcements about issues being considered by USP. This section also includes publication and comment schedules.

STANDARDS DIVISION REORGANIZED. USP has recently made changes in support of the work of the Council of Experts and its Expert Committee members. These changes cap a series of previous efforts to improve service to the Council, all with the goal of assuring both the USP Board of Trustees and the Council of Experts and its Expert Committees that they are getting the best possible support from USP staff. The key change now is the creation of a new Standards Division that ties together all of USP's Council of Experts support into one area to be headed by a Chief Standards Officer (CSO). Dr. Roger Williams will serve as the CSO on an interim basis until a suitable candidate can be hired. The Division is one of four in the organization, the others being Legal, Finance and Accounting, and Business.

A matrix management approach will be used in the new Division, which consists of five departments and one group. These are: the Department of Standards Development (DSD—Todd Cecil, Vice President); the Department of Patient Safety (DPS—Diane Cousins, Vice President); the Information Development Group (IDG—Deborah Perfetto, Group Director); the Department of International Affairs (IA—Nancy Blum, Vice President); the Department of Volunteer and Organizational Affairs (VOA—Angela Long, Vice President); and the Department of Monograph and Reference Standards Development (MRSD—Ronald Manning, Vice President). The first four Departments and Groups work "vertically" in the matrix to support the Council of Experts. The final two (VOA and MRSD) provide support "laterally," together with other units outside the organization.

A key to the success of the new Division will be the creation of staff Teams, headed by Group Directors, who will manage the many activities for a specific area, both from within the Division and from other Divisions, needed to achieve success on behalf of the Council of Experts. As part of these changes and in response to recent Board decisions, other USP staff will refocus their energies in support of the organization. As an example, Dr. Eric Sheinin, who has provided distinguished support to the Council of Experts over the last several years, will focus on implementing, with Mr. John Fowler, USP's new verification programs for pharmaceutical ingredients, approved for development by the USP Board of Trustees at their December 2005 meeting. The need for Dr. Sheinin's assistance here is based on his many years at FDA doing similar work.

USP has high hopes that this re-organization will greatly improve the delivery of standards-setting services to the Council of Experts and its Expert Committees and, in turn, facilitate their work in making USP's products and services available to direct customers and healthcare constituencies throughout the world.

Staff Promotions Announced. In support of this reorganization, Dr. Williams announced the following staff appointments:

- *Ian DeVeau* has been appointed as Director, Veterinary Drugs and Radiopharmaceuticals Group. In his new role he will oversee the revision and expansion of the *USP–NF* in the area of veterinary drugs and radiopharmaceuticals and the revision and development of information monographs concerning the clinical uses of these products.
- *Gabriel Giancaspro* has been appointed as Director, Dietary Supplements. In his new role he will oversee the revision and expansion of the *USP–NF* in the area of Dietary Supplements and the development of information concerning these products.
- *Tina Morris* has been promoted to Director, Biologics and Biotechnology Group. In this role she coordinates the activities of the four core Expert Committees in the B&B area, as well as cross-cutting B&B standards-setting activities. She also directs the development of new lines of B&B reference standards at USP, including procedural standards, ancillary materials standards, DNA & genetic testing standards, and reagent Reference Standards.
- *Karen Russo* has been promoted to Director, Small Molecules and Monograph Acquisition Group. In this position, she serves a coordinating role with the pharmaceutical industry for monograph development and acquisition efforts. Dr. Russo oversees a staff of scientific liaisons working with the USP Council of Experts to provide the scientific content for monographs.
- *Catherine Sheehan* has been promoted to Director, Excipients. In this role she coordinates the activities of the three core Expert Committees in the excipient area, as well as excipient standards-setting activities. She also coordinates the development of new excipient Reference Standards at USP, including procedural standards.

David A. Porter will continue as Director, General Chapters, rounding out the six group directors in DSD.

- *Joy Chacon* is VOA's new Director of Compendial Operations. In her new role, Ms. Chacon will oversee the project management approaches for the new Standards Development Teams and will lead a group of Project Managers and administrative staff. She will support the Team Leader (DSD Group Director) in the facilitation of Team activities.
- *Jennifer Payette* is VOA's new Director of Stakeholder and Organizational Affairs. Her new responsibilities include directing the activities and collaborating on strategy for USP's program of domestic and international Stakeholder Forums and Project Teams, and directing and seeking opportunities for organizational outreach including developing special programs and building relations with scientific, trade, and standards-setting organizations.

COORDINATION OF OFFICIAL NEW MONOGRAPHS, REVISIONS, AND USP REFERENCE STANDARDS. USP is pleased to announce a change in the way that we coordinate the adoption of official new monographs and revisions with the release of the required Reference Standards. Beginning with the *Second Supplement* to *USP 29–NF 24,* new monographs and revisions to existing monographs will not be published as official standards until the required USP Reference Standards are available. Monographs may be made available on a case-by-case basis without USP Reference Standards availability, but this should be a rare occasion. This effort will temporarily slow the presentation of new monographs that are published in the *USP–NF,* but will ultimately lead to better public standards.

USP OPENS FACILITY IN INDIA. In February the U.S. Pharmacopeia established its first overseas site in its 185-year history—with the inauguration of its state-of-the-art laboratory and office at ICICI Knowledge Park, Shameerpet, in Hyderabad. Dr. Darrell R. Abernethy, President, USP, inaugurated the facility in the presence of a distinguished gathering of USP-India Board members, senior management, advisory group members, stakeholders, and other invitees. The setting-up of the site was a significant step forward for USP, which, over the years, has worked with the Indian national and state governments and Indian manufacturers on many scientific and policy initiatives. With the new site in India, USP will now be physically closer to these groups so that it can expand this cooperation. Outside the U.S., India has the largest number of U.S. FDA-approved plants. USP will be working closely with the Indian Pharmacopeia.

The inauguration of the site was preceded by meetings of the USP-India Board of Directors, the USP-India Advisory Group, and the India Stakeholder Forum. The establishment of USP-India is in line with fulfilling USP's global public health strategy and its primary goal of providing "Good Pharmaceutical Care for All." Working with many constituencies and stakeholders around the world, USP supports the availability of safe and effective good quality therapeutic products for consumers everywhere.

The USP also held its 5th Annual Scientific Meeting in Hyderabad with a joint symposium sponsored by USP, the Parenteral Drug Association, and the Indian Stakeholder Forum. The meeting discussed matters of interest to industry scientists engaged in the manufacture, analysis, and quality control of pharmaceutical and biotechnology products; exporters of bulk pharmaceuticals; and regulatory agencies.

USP ISSUES INTERIM REVISION ANNOUNCEMENT FOR GENERAL CHAPTER ⟨231⟩ HEAVY METALS. In response to comments from industry, USP is reverting back to the Heavy Metals text that appeared in *USP 28–NF 23* for *Heavy Metals, Method II*. The *USP 28–NF 23* test has been used in industry for some time. The search continues for a more robust and practical method.

Should you have any questions, please contact Kahkashan Zaidi, Ph.D., Senior Scientist, General Chapters (301-816-8269 or kxz@usp.org).

COMMENTS ON RESIDUAL SOLVENTS DUE JUNE 1, 2006. The June 1 deadline is approaching to send comments to USP regarding the *Residual Solvents* test, following the retraction notice that was included on page 14 of the *USP 29–NF 24:*

"*Residual Solvents* ⟨467⟩: *meet the requirements." is hereby withdrawn from all monographs in the USP and the NF. This retraction is made to allow the USP Council of Experts further time to evaluate the most appropriate manner to implement the Residual Solvents test. The General Notices statement concerning the application of Residual Solvents to all monographs is unaffected by this retraction.*

This notice also serves as an additional request for comments on this issue from all users of the USP. Please forward your comments to:

Todd Cecil, Ph.D.
Vice President
Department of Standards Development
USP
12601 Twinbrook Parkway
Rockville, MD 20852

Comments must be received by June 1, 2006 to ensure consideration.

EXPERT COMMITTEE SUMMARIES AVAILABLE ON THE USP WEB SITE. Summaries of the first meetings of the cycle for the 2005–2010 Standards Expert Committees are now posted and available at http://www.usp.org/USPNF/meetingSummaries/.

PHARMACOPEIAL EDUCATION COURSES. USP's Pharmacopeial Education courses offer specialized instruction for chemists, other scientists, and professionals in the pharmaceutical and allied industries. USP scientists who play a key role in establishing official USP standards teach these courses and provide expert insights on the practical applications of official test procedures and best practices in using the *USP–NF* and other USP resources. The courses also give participants an opportunity to learn how to get involved in USP's standards-setting processes and the benefits of participating in standards development. Courses offered in 2006 are listed below. For more information and to register, visit www.usp.org. To discuss how USP can bring courses to a location of your choice or design a custom course package for you, call 301-816-8237, or e-mail PharmacopeialEducation@usp.org.

Calendar of Forthcoming Pharmacopeial Education Courses as of May 2006 (open to public, not on-site at a company)

Date	Name of Course	Location	Price
2-May-06	Effectively Using the *USP–NF*—Sessions I & II	Istanbul, Turkey	*
3-May-06	Analytical Method Validation	Istanbul, Turkey	*
24-May-06	Effectively Using the *USP–NF*—Sessions I & II	Chicago, IL	$595
31-May-06	Effectively Using the *USP–NF*—Sessions I & II	Toronto, Canada	**
6-Jun-06	Analytical Method Validation (in Spanish)	Barcelona, Spain	***
6-Jun-06	Analytical Method Validation	Montreal, Canada	****

VISIT THE USP WEB SITE AT ⟨http://www.usp.org⟩. Various resources related to Pharmacopeial standards are presented, including highlights from *PF.*

INTERNATIONAL CORRESPONDENCE. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia, with a copy to USP, for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows:

Technical Secretariat of the European
Pharmacopoeia Commission
B.P. 907
F 67029 Strasbourg Cedex 1
France

NAKASHIMA Nobumasa
Evaluation and Licensing Division
Pharmaceutical and Medical Safety Bureau
Ministry of Health, Labour and Welfare, Japan
Tel. +81-3-3595-2431, Fax +81-3-3597-9535
E-mail: nakashima-nobumasa@mhlw.go.jp

HOW TO SUBMIT COMMENTS. The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. Submissions concerning a particular item that has appeared in an issue of *PF* should be submitted to the appropriate USP scientific staff liaison identified at the end of the *Briefing* accompanying each item. To submit comments and data to a liaison, use the e-mail address and telephone numbers listed in the *Staff Directory* included in every *PF.*

Please note that *USP–NF* is being published in an annual edition with one main book and two *Supplements* a year. In addition, the schedule provided below will repeat every year so that users will know what to expect and become familiar with the deadlines.

For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or FAX number 301-816-8373.

NEW *PHARMACOPEIAL FORUM* PUBLIC REVIEW AND COMMENT PERIOD DEADLINES. The full year's listing of comment period deadlines and the targeted official publications appears below. In accordance with the Rules and Procedures of the 2005–2010 Council of Experts*, USP is implementing the 90-day comment period by providing a deadline for each issue of *PF* unless otherwise stated in the individual briefing.

The listing of comment period deadlines and the targeted official publications appears below.

Pharmacopeial Forum	Comment Deadline	Targeted Official Publication	Publication Date	Official Date
PF 31(6)	April 17, 2006	*USP 30–NF 25*	November 2006	January 2007
PF 32(1)	April 17, 2006			
PF 32(2)	June 15, 2006	*USP 30–NF 25 1st Supplement*	February 2007	April 2007
PF 32(3)	August 15, 2006			
PF 32(4)	October 16, 2006	*USP 30–NF 25 2nd Supplement*	June 2007	August 2007
PF 32(5)	December 15, 2006			
PF 32(6)	February 15, 2007	*USP 31–NF 26*	November 2007	January 2008
PF 33(1)	April 16, 2007			
PF 33(2)	June 15, 2007	*USP 31–NF 26 1st Supplement*	February 2008	April 2008

* ***Section 9.04(b) of the Rules and Procedures of the 2005–2010 Council of Experts***
A period of at least ninety (90) days from the date of publication will be allowed for public review and comment. The time allowed for public comments shall be noted in the publication in the PF. For good cause shown, the Chairperson may alter the time specified.

All official revisions are published in the annual edition or *Supplements* to *USP–NF* (twice yearly). Between these publications, official revisions are published in *PF* in the *Interim Revision Announcement;* these revisions are also incorporated in the upcoming *Supplement.* The official publication in which an *IRA* is incorporated will depend upon publication deadlines. The 5th *IRA* and the 6th *IRA* will not appear until *Supplement 1*. See table below. The electronic version of *USP–NF* is updated as each *Supplement* becomes available and, therefore, contains all official text up to and including the contents of the latest *Supplement.* The new table below outlines the publications and their release and official dates, and the book or supplement which supersedes them.

Publication Schedules

Publication	Release Date	Official Date	Superseded by
USP 29–NF 24	Nov. 1, 2005	Jan. 1, 2006	*1st Supplement*
1st Supplement	Feb. 1, 2006	Apr. 1, 2006	*2nd Supplement*
1st *IRA* [*PF* 32(1)]	Jan. 1, 2006	Feb. 1, 2006	*2nd Supplement*
2nd *IRA* [*PF* 32(2)]	Mar. 1, 2006	Apr. 1, 2006	*2nd Supplement*
3rd *IRA* [*PF* 32(3)]	May 1, 2006*	June 1, 2006*	*USP 30–NF 25*
2nd Supplement	June 1, 2006*	Aug. 1, 2006*	*USP 30–NF 25*
4th *IRA* [*PF* 32(4)]	July 1, 2006*	Aug. 1, 2006*	*USP 30–NF 25*
5th *IRA* [*PF* 32(5)]	Sept. 1, 2006*	Oct. 1, 2006*	*1st Supplement USP 30–NF 25*
6th *IRA* [*PF* 32(6)]	Nov. 1, 2006*	Dec. 1, 2006*	*1st Supplement USP 30–NF 25*
USP 30–NF 25	Nov. 1, 2006*	Jan. 1, 2007*	

*Tentative

PRIORITY NEW MONOGRAPH ITEMS. USP is seeking monographs for the following drug substances and drug products that are or soon will be off patent and thus are of the highest priority. USP also is seeking monographs for the excipients listed below. Monographs are marked received upon receipt of monograph proposal. Received monographs are removed from this list upon publication in *Pharmacopeial Forum.* (This list has been updated as of March 6, 2006.) For additional information, contact Karen A. Russo, Ph.D., kar@usp.org. Monograph sponsors should consult USP's Guideline for Submitting Requests for Revision to the *USP–NF.*

Noncomplex Actives (Drug Substances)

Acarbose	Alatrofloxacin Mesylate	Alfuzosin
Allopurinol Sodium	Aminopromazine Fumarate	Aminopterin Sodium
Amlodipine Besylate ***(Received)***	Anagrelide Hydrochloride	Arsenic Trioxide
Azelaic Acid	Balsalazide Disodium	Bentoquatam
Bepridil Hydrochloride	Bivalirudin	Cabergoline
Calcipotriene	Calcium Trisodium Pentetate	Calfactant
Candesartan Cilexetil	Carmustine ***(Received)***	Carvedilol
Cefdinir ***(Received)***	Cefditoren Pivoxil	Ceftibuten
Cetrorelix	Cevimeline	Chloroxine
Colfosceril	Cytarabine Liposome	Dalfopristin
Dapirazole Hydrochloride	Desirudin	Desonide ***(Received)***
Dexrazoxane	Difloxacin Hydrochloride	Docosanol
Entacapone	Epoprostenol	Erythromycin Phosphate
Erythromycin Thiocyanate	Esmolol	Esomeprazole Magnesium ***(Received)***
Estazolam	Estradiol Benzoate	Estramustine Phosphate Sodium
Ethanolamine Oleate	Etomidate	Etoposide Phosphate
Exemestane	Felbamate	Fluoromethane F 18
Foscarnet Sodium	Fosfomycin Tromethamine	Gadobenate Dimeglumine
Gadopentetic Acid	Galantamine Hydrobromide	Gallium Nitrate
Ganirelix	Glyceryl Aminobenzoate	Granisetron
Halobetasol Propionate	Haloperidol Decanoate ***(Received)***	Hydrocodone Polistirex
Ibandronate Sodium	Imipramine Pamoate	Imiquimod
Irinotecan	Isosulfan Blue	Itraconazole
Lamotrigine ***(Received)***	Latanoprost	Lawsone
Levetriacepam	Levobetaxolol	Levomethadyl Acetate
Lomustine	Lopinavir	Metipranolol Hydrochloride
Midazolam Hydrochloride	Mifepristone	Miglitol

Noncomplex Actives (Drug Substances) *(Continued)*

Misoprostol ***(Received)***	Mivacurium	Moexipril
Nalbuphine Hydrochloride	Nalmefene Hydrochloride	Nateglinide ***(Received)***
Nedocromil Sodium	Nicardipine Hydrochloride	Nilutamide
Nisoldipine	Olopatadine	Olsalazine Sodium
Orbifloxacin	Orlistat Received	Oxcarbazepine ***(Received)***
Pantoprazole Sodium ***(Received)***	Pemoline	Pentamidine Isethionate
Piperonyl Butoxide	Pirbuterol Acetate	Poractant Alpha
Prednicarbate ***(Received)***	Proguanil	Quetiapine Fumarate
Rose Bengal	Salmeterol Xinafoate	Sertraline Hydrochloride ***(Received)***
Sodium Phenylbutyrate	Sterile Methotrexate Sodium	Streptozocin
Sulfacytine	Tacrolimus	Terbinafine Hydrochloride
Terconazole	Tiludronate Disodium	Tiopronin
Tranexamic Acid	Trimipramine Maleate ***(Received)***	Trovafloxacin Mesylate
Voriconazole	Zinc Tridosium Pentetate	

Noncomplex Actives (Drug Products)

Abacavir Sulfate, Lamivudine, and Zidovudine Tablets	Acarbose Tablets	Acetaminophen, Butalbital, Caffeine, and Codeine Phosphate Capsules
Acetaminophen, Clemastine Fumarate, and Pseudoephedrine Hydrochloride Tablets	Acetazolamide Extended-Release Capsules	Albuterol Extended-Release Tablets
Albuterol for Inhalation	Albuterol Inhalation Aerosol	Alendronate Sodium Oral Solution
Alfuzosin Tablets	Allopurinol for Injection	Alprazolam Extended-Release Tablets
Alprostadil Urethral Suppository	Aminopromazine Fumarate and Neomycin Sulfate Tablets	Aminopromazine Fumarate Injection
Aminopromazine Fumarate Tablets	Aminopterin Sodium Tablets	Amlodipine and Benazepril Hydrochloride Capsules
Amphotericin B Injection	Anagrelide Hydrochloride Capsules	Arsenic Trioxide Injection
Atovaquone and Proguanil Hydrochloride Tablets	Atovaquone Tablets	Auranofin Capsules
Azatadine Maleate and Pseudoephedrine Sulfate Extended-Release Tablets	Azelaic Acid Cream	Azithromycin for Injection
Azithromycin Tablets	Baclofen Injection	Balsalazide Disodium Capsules
Beclomethasone Dipropionate Inhalation Aerosol	Beclomethasone Dipropionate Metered-Dose Nasal Suspension	Bentoquatam Topical Suspension
Benzocaine and Cetylpyridinium Chloride Lozenges	Benzocaine and Menthol Lotion	Benzphetamine Hydrochloride Tablets
Bepridil Tablets	Bicalutamide Tablets	Bivalirudin Injection
Brompheniramine Maleate, Dextromethorphan Hydrobromide, and Pseudoephedrine Hydrochloride Oral Solution	Budesonide Inhalation Aerosol	Budesonide Metered-Dose Inhalation Aerosol
Bupivacaine and Lidocaine Hydrochlorides Injection	Buprenorphine Hydrochloride Injection	Butalbital and Acetaminophen Capsules
Butalbital and Acetaminophen Tablets	Butorphanol Tartrate Nasal Solution ***(Received)***	
Cabergoline Tablets	Calcipotriene Cream	
Calcipotriene Ointment	Calcipotriene Topical Solution	Calcitriol Capsules
Calcitriol Oral Solution	Calcium Acetate Capsules	Calcium Trisodium Pentetate Injection
Calfactant Intratracheal Suspension	Carbidopa and Levodopa Extended-Release Tablets	Carbidopa and Levodopa Tablets for Oral Suspension
Carbidopa, Levidopa, and Entacapone Tablets	Carmustine for Injection	Carmustine Implant
Carvedilol Tablets	Cefdinir Tablets	Cefditoren Pivoxil Tablets
Ceftibuten Capsules	Ceftibuten for Oral Suspension	Ceftiofur Hydrochloride Oral Suspension
Cetirizine Hydrochloride Oral Solution	Cetirizine Hydrochloride Tablets	Cetrorelix Injection
Cevimeline Hydrochloride Capsules	Chloroxine Cream	Chlorpromazine Hydrochloride Extended-Release Capsules
Choline and Magnesium Salicylates Oral Solution	Choline and Magnesium Salicylates Tablets	Choline Salicylate Oral Solution
Ciclopirox Shampoo	Ciclopirox Topical Gel	Ciclopirox Topical Solution

Noncomplex Actives (Drug Products) *(Continued)*		
Cilostazol Tablets ***(Received)***	Cimetidine Oral Solution	Ciprofloxacin Hydrochloride and Hydrocortisone Otic Suspension
Ciprofloxacin Otic Solution	Citalopram Hydrobromide Oral Solution	Citric Acid, Gluconolactone, and Magnesium Carbonate Irrigation
Cladribine Injection	Clemastine Fumarate Syrup	Clobetasol Propionate Gel
Clonazepam Orally Disintegrating Tablets	Clorazepate Dipotassium Capsules	Clorazepate Dipotassium Extended-Release Tablets
Clotrimazole and Betamethasone Dipropionate Lotion	Colestipol Hydrochloride Tablets	Colfosceril and Tyloxapol Suspension
Compound Undecylenic Acid Cream	Compound Undecylenic Acid Topical Powder	Conjugated Estrogens and Medroxyprogesterone Acetate Tablets
Cromolyn Sodium Metered-Dose Nasal Solution	Cyclosporine Modified Capsules	Cyclosporine Modified Oral Solution
Cyclosporine Ointment	Cyclosporine Topical Solution	Cysteamine Bitartrate Capsules
Cytarabine Liposome Injection	Dalfopristin and Quinupristin Injection	Dantrolene Sodium Capsules ***(Received)***
Dantrolene Sodium for Injection ***(Received)***	Dantrolene Sodium Oral Suspension	Dapiprazole for Ophthalmic Solution
Desirudin for Injection	Desonide Cream	Dexrazoxane for Injection
Dextroamphetamine Sulfate Extended-Release Capsules	Dextromethorphan Polistirex Extended-Release Oral Suspension	Diazepam Injectable Emulsion
Diclofenac Sodium Ophthalmic Solution	Diethylpropion Hydrochloride Extended-Release Tablets	Difenoxin and Atropine Tablets
Difloxacin Hydrochloride Tablets	Dihydroergotamine Mesylate Metered Spray	Diltiazem Malate Extended-Release Tablets
Dinoprostone Vaginal Suppositories	Diphenhydramine Hydrochloride and Acetaminophen Tablets	Divalproex Sodium Delayed-Release Capsules
Dorzolamide and Timolol Ophthalmic Solution	Dorzolamide Ophthalmic Solution	Doxacurium Chloride Injection
Doxepin Hydrochloride Cream	Doxycycline Oral Gel	Econazole Nitrate Cream
Edrophonium Chloride and Atropine Sulfate Injection	Enalapril Maleate and Diltiazem Malate Extended-Release Tablets	Enalapril Maleate and Felodipine Extended-Release Tablets
Enalaprilat Injection	Entacapone Tablets	Ephedrine Sulfate and Guaifenesin Tablets
Epoprostenol for Injection	Epoprostenol Injection	Esmolol Hydrochloride Injection
Esomeprazole Magnesium Capsules	Estazolam Tablets	Estramustine Phosphate Sodium Capsules
Ethanolamine Oleate Injection	Etidronate Disodium Injection Concentrate	Etomidate Injection
Exemestane Tablets	Famotidine Orally Disintegrating Tablets	Felbamate Oral Suspension
Felbamate Tablets	Fentanyl Lozenges	Fentanyl Transdermal System ***(Received)***
Ferrous Fumarate and Docusate Sodium Extended-Release Capsules	Flavoxate Hydrochloride	Flavoxate Hydrochloride Tablets
Fluconazole Injection	Fluconazole Tablets	Flunisolide Inhalation Aerosol
Flunisolide Nasal Spray	Fluocinolone Acetonide Shampoo	Fluorescein Sodium Ophthalmic Solution
Fluorometholone Ointment	Fluticasone Propionate Cream ***(Received)***	Fluticasone Propionate Inhalation Powder
Fluticasone Propionate Ointment ***(Received)***	Fluticasone Propionate Pressurized Inhaler	Foscarnet Sodium Injection
Fosfomycin for Oral Solution	Gabapentin Oral Solution	Gabapentin Tablets ***(Received)***
Gadobenate Dimeglumine Injection	Galantamine Hydrobromide Tablets ***(Received)***	Gallium Nitrate Injection
Ganciclovir Capsules	Ganirelix Acetate Injection	Gatifloxacin Injection
Gatifloxacin Tablets	Gentamicin Sulfate Oral Solution	Gentamicin Sulfate Soluble Powder
Glimepiride Tablets ***(Received)***	Glipizide Extended-Release Tablets	Granisetron Injection
Granisetron Tablets	Guaifenesin and Salts Of Dextromethorphan and Pseudoephedrine Oral Solution	Guaifenesin and Pseudoephedrine Hydrochloride Extended-Release Tablets
Guanidine Hydrochloride	Guanidine Hydrochloride Tablets	Halobetasol Propionate Cream
Halobetasol Propionate Ointment	Haloperidol Decanoate Injection	Haloperidol Lactate Injection
Haloperidol Lactate Oral Concentrate	Hydralazine Hydrochloride and Hydrochlorothiazide Capsules	Hydrochlorothiazide Capsules
Hydrochlorothiazide Oral Solution Concentrate	Hydrocodone Bitartrate and Acetaminophen Oral Solution	Hydrocodone Bitartrate and Aspirin Tablets
Hydrocodone Bitartrate and Guaifenesin Oral Solution	Hydrocodone Bitartrate and Homatropine Methylbromide Syrup	Hydrocodone Bitartrate and Homatropine Methylbromide Tablets

Noncomplex Actives (Drug Products) *(Continued)*

Hydrocortisone Acetate Dental Paste	Hydrocortisone Acetate Rectal Foam Aerosol	Hydrocortisone Butyrate Lotion
Hydroflumethiazide and Reserpine Tablets	Hydromorphone Hydrochloride Oral Solution	Hydroquinone Lotion
Ibandronate Sodium Tablets	Ibuprofen Capsules	Idarubicin Hydrochloride Injection
Imipramine Pamoate Capsules	Imiquimod Topical Cream	Ipratropium Bromide Inhalation Aerosol
Ipratropium Bromide Inhalation Solution	Irinotecan Hydrochloride Injection	Isosulfan Blue Injection
Isradipine Extended-Release Tablets	Itraconazole Injection	Itraconazole Oral Solution
Ketoconazole Cream	Ketoconazole Shampoo	Ketoprofen Capsules
Ketoprofen Extended-Release Capsules	Ketoprofen Tablets	Ketotifen Fumarate
Ketotifen Fumarate Ophthalmic Solution	Lactic Acid Lotion	Lamivudine Tablets
Latanoprost Ophthalmic Solution	Leucovorin Calcium for Injection	Levetriacepam Tablets
Levobetaxolol Ophthalmic Suspension	Levocabastine Ophthalmic Suspension	Levofloxacin Solution
Levomethadyl Acetate Hydrochloride Oral Concentrate	Lincomycin Hydrochloride and Spectinomycin Sulfate Soluble Powder	Liothyronine Injection
Lisinopril and Hydrochlorothiazide Tablets	Lomustine Capsules	Lopinavir and Ritonavir Solution
Lopinavir Capsule	Lopinavir Solution	Loratadine and Pseudoephedrine Sulfate Extended-Release Tablets ***(Received)***
Loratadine Orally Disintegrating Tablets	Losartan Potassium Tablets	Mefloquine Hydrochloride Tablets
Melphalan for Injection	Mesalamine Suppositories	Mesoridazine Besylate Concentrate
Metaraminol Bitartrate Injection	Methacholine Chloride for Inhalation Solution	Methadone Hydrochloride Oral Concentrate
Methocarbamol and Aspirin Tablets	Methoxsalen Softgels	Methyclothiazide and Deserpidine Tablets
Methylphenidate Hydrochloride Chewable Tablets	Metipranolol Ophthalmic Solution	Metronidazole Capsules
Metronidazole Cream	Metronidazole Extended-Release Tablets	Metronidazole Hydrochloride for Injection
Metronidazole Lotion	Miconazole Nitrate Topical Aerosol	Midazolam Hydrochloride Injection ***(Received)***
Mifepristone Tablets	Miglitol Tablets	Milrinone Injection
Misoprostol Tablets ***(Received)***	Mivacurium in Dextrose Injection	Mivacurium Injection
Moexipril Hydrochloride and Hydrochlorothiazide Tablets	Moexipril Hydrochloride Tablets	Molindone Hydrochloride Oral Solution
Morphine Sulfate for Injection Concentrate	Morphine Sulfate Oral Solution	Morphine Sulfate Oral Solution Concentrate
Morphine Sulfate Tablets	Mycophenolate Mofetil Capsules	Mycophenolate Mofetil Oral Solution
Mycophenolate Mofetil Tablets	Nalbuphine Hydrochloride Injection	Nalmefene Hydrochloride Injection
Naphazoline Hydrochloride and Pheniramine Maleate Ophthalmic Solution		Naproxen Extended-Release Tablets
Nateglinide Tablets	Nedocromil Sodium Inhalation Aerosol	Neomycin Sulfate Oral Powder
Nevirapine Oral Suspension ***(Received)***	Nevirapine Tablets ***(Received)***	Nicardipine Hydrochloride Capsules
Nilutamide Tablets	Nimodipine Capsules	Nisoldipine Extended-Release Tablets
Nitroglycerin Solution in Acrylic Adhesive	Nizatidine Tablets	Ofloxacin in Dextrose Injection
Ofloxacin Injection	Ofloxacin Tablets ***(Received)***	Olopatadine Ophthalmic Solution
Olsalazine Sodium Capsules	Ondansetron Oral Solution ***(Received)***	Ondansetron Tablets
Orbifloxacin Tablets	Orlistat Capsules ***(Received)***	Orphenadrine Citrate Extended-Release Tablets
Orphenadrine Citrate, Aspirin, and Caffeine Tablets	Oxcarbazepine Suspension	Oxcarbazepine Tablets
Oxiconazole Cream	Pancuronium Bromide Injection ***(Received)***	Pantoprazole Sodium for Injection
Pantoprazole Sodium Tablets	Paroxetine Hydrochloride Extended-Release Tablets	Paroxetine Oral Suspension
Pemirolast Potassium Ophthalmic Solution	Pemoline Tablets	Penicillin G Potassium Tablets for Oral Solution
Pentaerythritol Tetranitrate Extended-Release Capsules	Pentaerythritol Tetranitrate Extended-Release Tablets	Pentamidine Isethionate for Inhalation
Pentamidine Isethionate for Injection	Pentazocine Hydrochloride and Acetaminophen Tablets	Phendimetrazine Tartrate Extended-Release Capsules
Phenobarbital Capsules	Phentermine Resin Complex	Phentermine Resin Complex Capsules

Noncomplex Actives (Drug Products) *(Continued)*		
Phenylephrine Hydrochloride and Chlorpheniramine Maleate Extended-Release Capsules	Phenylephrine Hydrochloride, Chlorpheniramine Maleate, and Acetaminophen Extended-Release Tablets	Pilocarpine Hydrochloride Ophthalmic Gel
Pilocarpine Hydrochloride Ophthalmic Ointment	Pilocarpine Hydrochloride Tablets	Piperonyl Butoxide and Pyrethrins Aerosol Foam
Pirbuterol Acetate Inhalation Aerosol	Poractant Alpha Supension	Porfimer Sodium for Injection
Povacrylate Solution	Povacrylate-Iodine Topical Solution	Povidone-Iodine Gauze
Povidone-Iodine Swabsticks	Povidone-Iodine Topical Aerosol Foam	Povidone-Iodine Vaginal Suppositories
Pramipexole Dihydrochloride Tablets	Prazosin Hydrochloride and Polythiazide Capsules	Prednisolone Sodium Phosphate Oral Solution
Prochlorperazine Maleate Extended-Release Capsules	Progesterone Capsules	Promethazine and Phenylephrine Hydrochlorides and Codeine Phosphate Syrup
Promethazine and Phenylephrine Hydrochlorides Syrup	Promethazine Hydrochloride and Codeine Phosphate Oral Solution	Promethazine Hydrochloride and Dextromethorphan Hydrobromide Syrup
Propafenone Hydrochloride Tablets	Pseudoephedrine Hydrochloride and Brompheniramine Maleate Extended-Release Tablets	Pseudoephedrine Hydrochloride and Naproxen Sodium Extended-Release Tablets
Pseudoephedrine Hydrochloride, Chlorpheniramine Maleate, and Codeine Phosphate Oral Solution	Pseudoephedrine Hydrochloride, Guaifenesin, and Codeine Phosphate Oral Solution	Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Extended-Release Tablets
Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Oral Solution	Pseudoephedrine Sulfate, Dexbrompheniramine Maleate, and Acetaminophen Extended-Release Tablets	
Pyrilamine Maleate Injection	Quinidine Sulfate Injection	
Ramipril Capsules	Ranitidine Capsules	Rauwolfia Serpentina and Endroflumethiazide Tablets
Reserpine and Polythiazide Tablets	Rimantadine Hydrochloride Oral Solution	Risperidone Oral Solution
Risperidone Orally Disintegrating Tablets	Risperidone Tablets ***(Received)***	Rivastigmine Tartrate Capsules
Rivastigmine Tartrate Oral Solution	Rocuronium Bromide Injection	Ropinirole Hydrochloride Tablets
Rose Bengal Ophthalmic Solution	Rosiglitazone Maleate Tablets	Salicylic Acid and Sulfur Cleansing Lotion
Salicylic Acid and Sulfur Lotion	Salicylic Acid and Sulfur Shampoo	Salicylic Acid Cream
Salicylic Acid Ointment	Salmeterol Inhalation Aerosol	Salmeterol Xinafoate Inhalation Powder
Scopolamine Transdermal System	Selegiline Hydrochloride Capsules	Serpacwa Topical Cream
Sertraline Hydrochloride Oral Solution	Sibutramine Hydrochloride Capsules	Sodium Bicarbonate and Sodium Citrate for Oral Solution
Sodium Bicarbonate, Sodium Citrate, and Sodium Tartrate for Oral Suspension	Sodium Chlorophyllin Copper Complex Tablets	Sodium Iodide Injection
Sodium Phenylbutyrate Oral Powder	Sodium Phenylbutyrate Tablets	Sodium Phosphates for Oral Suspension
Sodium Phosphates Tablets	Sodium Salicylate and Sulfur Shampoo	Sterile Talc Aerosol
Streptozocin for Injection	Sucralfate Oral Suspension	Sulconazole Nitrate Cream
Sulfacetamide Sodium and Fluorometholone Ophthalmic Suspension	Sulfacetamide Sodium and Prednisolone Sodium Phosphate Ophthalmic Solution	Sulfacytine Tablets
Sulfanilamide Vaginal Cream	Sulfasalazine Oral Suspension	Sulisobenzone Lotion
Sumatriptan Injection	Sumatriptan Tablets	Tacrolimus Capsules
Tacrolimus Injection	Tacrolimus Ointment	Tamsulosin Hydrochloride Capsules
Technetium Tc 99m Teboroxime Injection	Tenofovir Disoproxil Fumarate Tablets	Terbinafine Hydrochloride Cream
Terbinafine Tablets	Terbinafine Topical Solution	Terconazole Vaginal Cream
Terconazole Vaginal Suppositories	Testosterone Transdermal System	Tetracycline Hydrochloride Periodontal Fiber
Theophylline Extended-Release Tablets	Tioconazole Vaginal Ointment	Tiopronin Tablets
Tolnaftate Topical Aerosol Solution	Topiramate Capsules	Topiramate Tablets
Torsemide Injection	Torsemide Tablets	Trandolapril and Verapamil Hydrochloride Extended-Release Tablets
Trandolapril Tablets	Tranexamic Acid Injection	Tranylcypromine Sulfate
Tranylcypromine Sulfate Tablets	Tretinoin Capsules	Tretinoin Microsphere Gel
Triamcinolone Acetonide Metered-Dose Nasal Suspension	Trifluridine Ophthalmic Solution	Trimetrexate for Injection
Trimipramine Maleate Capsules	Triprolidine and Pseudoephedrine Hydrochlorides and Codeine Phosphate Syrup	Trolamine Salicylate Cream
Trolamine Salicylate Gel	Trolamine Salicylate Topical Emulsion	Trovafloxacin Injection
Trovafloxacin Mesylate for Injection	Undecylenic Acid Topical Foam Aerosol	Unoprostone Isopropyl Ophthalmic Solution
Urea Cream	Vecuronium Bromide for Injection	Venlafaxine Extended-Release Capsules

Noncomplex Actives (Drug Products) *(Continued)*

Venlafaxine Tablets	Verapamil Hydrochloride Capsules	Verapamil Hydrochloride Extended-Release Capsules
Voriconazole Injection	Voriconazole Oral Suspension	Voriconazole Tablets
Yttrium Y-90 Chloride Solution	Yttrium Y-90 Glass Microspheres	Yttrium Y-90 Microspheres Injection
Zidovudine and Lamivudine Tablets	Zinc Acetate Capsules	Zinc Tridosium Pentetate Injection
Ziprasidone Hydrochloride Capsules	Zoledronic Acid for Injection	

Excipients

Acetone Sodium Bisulfite	Acetylated Monoglycerides	Aconitic Acid (Achilleic Acid)
Acrylic Acid-Octyl Acrylate Copolymer	Albumin Colloidal	Aliphatic Polyesters
Allantoin-Sodium Pyrrolidone Carboxylate	Aluminum Ammonium Sulfate	Aluminum Ammonium Sulfate
Aluminum Lactate	Aluminum Oxide	Aluminum Potassium Sulfate
Aluminum Silicate	Aluminum Sodium Sulfate	Aluminum Stearate
Ammonium Bicarbonate	Ammonium Calcium Alginate	Ammonium Phosphate
Batylalcohol Monostearate	Beeswax, Synthetic	Benzododecinium Bromide
Benzyl Chloride	Benzyl Nicotinate	Beta Naphthol
Brominated Vegetable Oil	Butadiene-Styrene Rubber	Butylated Hydromethylphenol
Butylene Glycol	Butylphthalyl Butylglycolate	Calcium Acid Pyrophosphate
Calcium Alginate	Calcium Alginate and Ammonium Alginate	Calcium Bromide
Calcium Chloride Solution	Calcium Glycerophosphate ***(Received)***	Calcium Phosphate Monobasic
Calcium Propionate	Calcium Pyrophosphate	Calcium Sorbate
Calcium Stearoyl Lactylate	Caldiamide Sodium	Calteridol Calcium
Canola Oil	Capric Acid	Caprylic/Capric Diglyceril Succinate
Carbon	Carboxymethyl Starch	Carboxymethylamylopectin Sodium
Carboxymethylcellulose Potassium	Cetostearyl Isononanoate	Chlorodifluoroethane
Cholic Acid	Cinnamaldehyde	Cocamide Diethanolamine
Cocamide Oxide	Coconut Oil	Coconut Oil Hydrogenated ***(Received)***
Cocoyl Caprylocaprate	Crystal Gum	Cutina
Cystine	Dammar Gum	Decanoic Acid
Decyl Oleate	Dehydroacetic Acid	Desoxycholic Acid
Dextrin Palmitate	Dextrins Modified	Diacetyl Tartaric Acid Esters of Mono- and Diglycerides
Dicetyl Phosphate	Dichlorofluoromethane	Diethyl Sebacate
Difluoroethane	Diglycol Stearate	Diisobutyl Adipate
Diisopropyl Adipate	Diisopropylbenzothiazyl-2-Sulfenamide	Dilauryl Thiodipropionate
Dimethyl Dicarbonate	Dimyristoyl Lecithin	Dimyristoyl Phosphatidylglycerol
Dipropylene Glycol	Disodium Edisylate	Disodium Guanylate
Disodium Inosinate	Disodium Monooleamide Sulfasuccinate	D-Mannose
Docusate Sodium/Sodium Benzoate	Erythorbic Acid	Erythrosine
Ethoxylated Mono- and Diglycerides	Ethoxyquin	Ethyl Hexanediol
Ethyl Linoleate	Ethyl Maltol	Ethylene Dichloride
Ethylurea	Ferric Ammonium Citrate	Ferric Citrate
Ferric Oxide, Brown	Ferric Phosphate	Ferric Pyrophosphate
Ferrous Citrate	Ferrous Glycinate	Ferrous Lactate
Fluorochlorohydrocarbons	Formic Acid	Furcelleran
Gamma-Cyclodextrin	Gentistic Acid	Geraniol
Glutamic Acid Hydrochloride	Gluten	Glycerol Ester of Gum Rosin (Ester Gum)
Glyceryl Laurate	Glyceryl Palmitate	Glyceryl Ricinoleate
Glyceryl Tristearate	Glycine Hydrochloride	Glycofurol
Glycol Stearate	Heptafluoropropane	Heptylparaben
Hexadecyl Isostearate	Hexane	Hexanetriol(-1,2,6-)
Hydrocarbon Gel	Hydrogenated Starch Hydrolysate	Hydroxyethylmethylcellulose
Hydroxylated Lecithin	Hydroxypropyl Beta Cyclodextrin	Indigotine
Inositol	Iron Carbonyl	Iron Subcarbonate
Isobutylated-Isoprene Copolymer	Isooctylacrylate	Isopropyl Isostearate
Isopropyl Stearate	Isostearic Acid	Isostearyl Alcohol

Excipients *(Continued)*		
Lactobionic Acid	Lactose Ferrin, Bovine	Lactylated Fatty Acid Esters of Glycerol and Propylene Glycol
Lactylic Esters of Fatty Acids	Lanolin (Wool Fat), Hydrogenated	Lanolin Alcohols, Acetylated
Lanolin Hydrous	L-Ascorbyl Stearate	Lauramine Oxide
Lauric Myristic Diethanolamide	Lauric Acid	Lauric Diethanolamide
Lavender Oil	L-Cysteine Monohydrochloride	Lecithin, Hydroxylated
L-Glutamic Acid	Linoleic Acid	L-Leucine
Macrogol Sorbitan Tristearate	Macrogolglycerol Cocoates	Macrogolglycerol Triisostearate
Magnesium Aluminum Silicate Hydrate	Magnesium Aspartame Dihydrate	Magnesium Aspartate
Magnesium Phosphate Tribasic	Magnesium Phosphate, Diabasic, Trihydrate	Magnesium Tartrate
Malt Syrup	Maltitol Syrup	Maltol Isobutyrate
Manganese Chloride	Manganese Citrate	Manganese Glycerophosphate
Manganese Hypophosphite	Medical Antifoam Emulsion C	Medronate Disodium
Medronic Acid	Methyl Chloride	Methylchloroisothiazolinone
Methylisothiazolinone	Microcrystalline Cellulose, Silicified ***(Received)***	Mineral Spirits
Monoisostearyl Glyceryl Ester	Monopotassium Glutamate Monohydrate	Monosodium Citrate
Mullein Leaf	Myristyl Gamma-Picolinium Chloride	Myristyl Lactate
N,N-Bis(2-Hydroxyethyl) Stearamide	*N*-Acetyl-L- Methionine	Naphtha
N-Methylpyrrolidone ***(Received)***	Non-Pareil Seeds	Nutmeg Oil
Octanoic Acid	Oxystearin	Palm Kernel Oil ***(Received)***
Palm Oil	Pentasodium Triphosphate	Pentetate Calcium Trisodium
Pentetate Pentasodium	Phenprobamate	Phenylmercuric Acetate
Phenylmercuric Nitrate	Pine Oil	Polacrilin
Polydextrose ***(Received)***	Polydextrose Solution	Polyglycerol Esters Of Fatty Acids
Polyglycerol Polyricinoleic Acid	Polyoxyethylene Castor Oil (USP has 35)	Polyoxyl Stearate (USP has 40)
Polypropylene Oleate	Polypropylene Stearyl Ether	Polysorbate 65
Polyvinylacetal	Polyvinylacetal Diethylanoacetate	Polyvinylpolypyrrolidone
Polyvinylpyrrolidone Ethylcellulose	Potassium Acid Tartrate	Potassium Bromate
Potassium Carbonate Solution	Potassium Dichloroisocyanurate	Potassium Gibberellate
Potassium Glycerophospate	Potassium Nitrite	Potassium Phosphate
Potassium Phosphate Tribasic	Potassium Polymetaphosphate	Potassium Pyrophosphate
Potassium Stearate	Potassium Sulfate	Potassium Sulfite
Potassium Tripolyphosphate	Potasssium Iodate	Propyl Propionate
Propylene Glycol Diacetate	Propylene Glycol Mono- and Diesters	Purified Polyoxyl 35 Castor Oil ***(Received)***
Rapeseed Oil, Hydrogenated ***(Received)***	Rapeseed Oil, Superglycerinated ***(Received)***	Rice Bran Wax
Rosin	Silicone	Sodium Acid Pyrophosphate
Sodium Aluminosilicate	Sodium Aluminum Phosphate Acidic	Sodium Aluminum Phosphate Basic
Sodium Aspartate	Sodium Bisulfate	Sodium Bisulfite
Sodium Carbonate Hydrate	Sodium Carboxymethyl Betaglucan	Sodium Caseinate
Sodium Chlorate	Sodium Citrate, Dibasic	Sodium Citrate, Monobasic
Sodium Dehydroacetate	Sodium Diacetate	Sodium Erythorbate
Sodium Ferric Pyrophosphate	Sodium Ferrocyanide	Sodium Hypophosphite
Sodium Laureth Sulfate	Sodium Lauroyl Sarcosinate	Sodium Lauryl Sulfoacetate
Sodium Magnesium Aluminosilicate	Sodium Magnesium Silicate	Sodium Malate
Sodium Metaphosphate, Insoluble	Sodium Metasilicate	Sodium Methylate
Sodium Polyphosphates Glassy	Sodium Potassium Tripolyphosphate	Sodium Pyrophosphate
Sodium Pyrrolidone Carboxylate	Sodium Sesquicarbonate	Sodium Sesquinoleate
Sodium Stearoyl Lactylate	Sodium Thiomalate	Sodium Trimetaphosphate
Sodium Trioleate	Sodium Tripolyphosphate	Soy Polysaccharides
Stannous Chloride	Stannous Tartrate	Starch, Pregelatinized Corn
Starch, Pregelatinized Tapioca	Stearalkonium Chloride	Stearyl Citrate
Stearyl Monoglyceridyl Citrate	Succinylated Monoglycerides	Sucrose Acetate Isobutyrate
Sucrose Fatty Acid Esters	Sucrose Stearate	Sugar Fruit Fine
Sulfobutyl Ether Beta Cyclodextran	Tallow	Tallow Glycerides
Tallow Oil	Tetrafluoroethane	Thioglycerol
Thyme Oil	Tribehenin	Tricetearet-4 Phosphate

Excipients *(Continued)*

Trichloroethylene	Trimyristin	Trisidium Citrate
Trolamine Lauryl Sulfate	Vegetable Oil	Wheat Flour
Wheat Germ Oil	Wheat Gluten	Whey

INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- New adopted (official) revisions to the *USP–NF* that become effective before the effective date of the next *Supplement* or that were not ready for adoption by the closing date for the upcoming *Supplement*. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.

Symbols—Interim revisions are shown with new text (if any) enclosed in circles, •new text•. Text enclosed in squares, ▪new text▪, has already been adopted in a *Supplement*. Where the symbols appear together with no enclosed text, such as •• or ▪▪, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by a number that indicates the *IRA* or *Supplement* in which the revision first appeared. For example, •2 indicates that the revision was officially adopted in the *Second Interim Revision Announcement*, and ▪2S (*USP29*) indicates that the revision was officially adopted in the *Second Supplement* to *USP 29*.

Errata—At the end of the *Interim Revision Announcement* section is a list of errata and corrections to *USP 29–NF 24*. The page number indicates where the item is found in *USP–NF*. If necessary, this list will be updated with every issue of *PF*. This information will also be cumulative in the next available *Supplement*, and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

THIRD INTERIM REVISION ANNOUNCEMENT to *USP 29* and to *NF 24*

By authority of the United States Pharmacopeial Convention, Inc.
Prepared by the Council of Experts and published by the Board of Trustees

John W. Mauger, *Chair*
USP Board of Trustees

Roger L. Williams, *Executive Vice President*
and *Chairman, USP Council of Experts*

Roger L. Williams, M.D., *Chief Standards Officer, Acting*

Official June 1, 2006 **Released May 1, 2006**

All inquiries and comments regarding *USP 29* text and *NF 24* text should be addressed to the Executive Secretariat, *USP–NF*, 12601 Twinbrook Parkway, Rockville, MD 20852.

New USP Reference Standards

The following USP Reference Standards, which were not available when the associated monograph was made official, have since become available. The respective official date of each *USP 29* or *NF 24* standard, test, or assay requiring the use of the following USP Reference Standards is indicated in parentheses after the name of the Reference Standard.

USP Berberine Chloride (May 1, 2006)
USP Budesonide RS (September 1, 2006)
USP Fluticasone Propionate RS (November 1, 2006)
USP Fluticasone Propionate Resolution Mixture RS (September 1, 2006)
USP Fluticasone Propionate System Suitability Mixture RS (September 1, 2006)
USP Fluvastatin Related Compound B RS (November 1, 2006)
USP Hydrastine RS (May 1, 2006)
USP Mefloquine Hydrochloride RS (May 1, 2006)
USP Mefloquine Related Compound A RS (May 1, 2006)
USP Norphenylephrine Hydrochloride RS (May 1, 2006)
USP Ondansetron RS (May 1, 2006)
USP Polyisobutylene RS (November 1, 2006)
USP Ropivocaine Hydrochloride RS (November 1, 2006)
USP Ropivacaine Related Compound A RS (September 1, 2006)
USP Ropivacaine Related Compound B RS (September 1, 2006)
USP Somatropin RS (May 1, 2006)
USP Tiagabine Related Compound A RS (May 1, 2006)
USP Racemic Tiagabine Hydrochloride Mixture RS (May 1, 2006)
USP Tiagabine Hydrochloride RS (May 1, 2006)
USP Tinidazole Related Compound B RS (September 1, 2006)

Unavailable First-Time Official USP Reference Standards

The official dates of any *USP 29* or *NF 24* standards, tests, or assays requiring the use of the following new USP Reference Standards are postponed until further notice pending availability of the respective Reference Standards. This listing was updated as of March 6, 2006.

USP Albumin Human RS
USP Alteplase RS
USP Amifostine RS
USP Amifostine Thiol RS
USP Antithrombin III Human RS
USP Aprotinin RS
USP Aprotinin System Suitability RS
USP Cetrimonium Bromide RS
USP Citalopram Hydrobromide RS
USP Cladribine RS
USP Cladribine Related Compound A RS
USP Copolymer Polypropylene RS
USP Decoquinate RS
USP Cryopreserved Human Fibroblast-Derived Dermal Substitute Reference Photomicrographs RS
USP Diethylstilbestrol Diphosphate RS
USP Docosyl Ferulate RS
USP Powdered *Echinacea pallida* Extract RS
USP Escin RS
USP Eucatropine Hydrochloride RS
USP Fludeoxyglucose Related Compound B RS
USP Fluvastatin Sodium RS
USP Fluvastatin Related Compound A RS
USP Gabapentin Related Compound B RS
USP Ginkgo Terpene Lactones RS
USP Powdered American Ginseng Extract RS
USP Glyceryl Distearate RS
USP Glyceryl Monolinoleate RS
USP Glyceryl Monooleate RS
USP Gonadorelin Hydrochloride RS
USP Hemoglobin RS
USP Hexacosanol RS
USP Irbesartan RS
USP Irbesartan Related Compound A RS

MONOGRAPHS (USP)

Amoxicillin Capsules

Add the following:

•**Labeling**—When more than one *Dissolution Test* is given, the labeling states the *Dissolution Test* used only if *Test 1* is not used.•(3)

Change to read:

Dissolution ⟨711⟩—

•TEST 1—•(3)

Medium: water; 900 mL.

Apparatus 1: 100 rpm, for Capsules containing 250 mg.

Apparatus 2: 75 rpm, for Capsules containing 500 mg.

Time: 60 minutes.

Procedure—Determine the amount of $C_{16}H_{19}N_3O_5S$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 272 nm on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Amoxicillin RS in the same *Medium.*

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{16}H_{19}N_3O_5S$ is dissolved in 60 minutes.

•TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: water; 900 mL.

Apparatus 1: 100 rpm.

Time: 90 minutes.

Procedure—Determine the amount of $C_{16}H_{19}N_3O_5S$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 272 nm on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Amoxicillin RS in the same *Medium.*

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{16}H_{19}N_3O_5S$ is dissolved in 90 minutes.•(3)

Clopidogrel Tablets

Change to read:

Related compounds—

Phosphate buffer and *Mobile phase*—Prepare as directed in the *Assay* under *Clopidogrel Bisulfate*.

System suitability solution—Dissolve accurately weighed quantities of USP Clopidogrel Bisulfate RS, USP Clopidogrel Related Compound A RS, USP Clopidogrel Related Compound B RS, and USP Clopidogrel Related Compound C RS in methanol. Dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having concentrations of about 1 µg per mL, 1 µg per mL, 2 µg per mL, and 3 µg per mL, respectively.

Standard solution—Dissolve accurately weighed quantities of USP Clopidogrel Related Compound A RS and USP Clopidogrel Related Compound C RS in methanol. Dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having known concentrations of about 1 µg per mL and 5 µg per mL, respectively.

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 75 mg of clopidogrel, to a 200-mL volumetric flask, add 5 mL of methanol, dilute with *Mobile phase* to volume, and mix. Allow to stand for 10 minutes, and mix. Pass a portion of this solution through a filter having a 0.45-µm or finer porosity, and use the filtrate after discarding the first 5 mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and 4.6-mm × 15-cm column that contains packing L57. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between clopidogrel and each of the two enantiomers of clopidogrel related compound B is not less than 2.5. [NOTE—The relative retention times are about 0.5 for clopidogrel related compound A, 0.8 and 1.2 for the two enantiomers of clopidogrel related compound B, 1.0 for clopidogrel, and 2.0 for clopidogrel related compound C.] Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 15%.

Procedure—Inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of related compounds in the portion of Tablets taken by the formula:

$$20(C/W)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of the appropriate USP Reference Standard in the *Standard solution; W* is the weight, in mg, of clopidogrel in the portion of Tablets used to prepare the *Test solution* based on the labeled quantity of clopidogrel per Tablet, Tablet weight, and the weight of the portion of Tablets used; and r_U and r_S are the peak responses of the corresponding related compounds obtained from the *Test solution* and the *Standard solution,* respectively: not more than •1.2%•(3) of clopidogrel related compound A is found, not more than •1.5%•(3) of clopidogrel related compound C is found, not more than 0.2% of any other single impurity (excluding clopidogrel related compound B) is found, and not more than •2.5%•(3) of total impurities (excluding clopidogrel related compound B) is found.

Felodipine Extended-Release Tablets

Add the following:

•**Labeling**—When more than one test for *Dissolution* is given, the *Labeling* section states the test for *Dissolution* used only if *Test 1* is not used.•(3)

Change to read:

Dissolution ⟨711⟩—

•TEST 1—•(3)

Medium: pH 6.5 phosphate buffer with 1% sodium lauryl sulfate; 500 mL. (*Medium* is prepared as follows. Transfer 206 mL of 1 M monobasic sodium phosphate monohydrate, 196 mL of 0.5 M dibasic sodium phosphate anhydrous, and 50.0 g of sodium lauryl sulfate to a 5000-mL volumetric flask. Add approximately 4000 mL of water, and mix well. If necessary, adjust with 1 N sodium hydroxide to a pH of 6.5. Dilute with water to volume, and mix well.)

Apparatus 2: 50 rpm.
Times: 2, 6, and 10 hours.
Buffer solution—Prepare as directed in the *Assay.*
Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, *Buffer solution,* and methanol (2.5 : 2 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).
Standard stock solution—Dissolve an accurately weighed quantity of USP Felodipine RS in alcohol to obtain a solution having a known concentration of 0.25 mg per mL.
Standard solution—Dilute an accurately measured volume of the *Standard stock solution* quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration of USP Felodipine RS equivalent to the concentration that would result from about 60% dissolution of a single Tablet in 500 mL of *Medium.*
Test solution—Place each Tablet in a specially made quadrangular basket of stainless steel wire gauze, soldered in one of its upper, narrow sides to the end of a steel rod (see *Figure 1*). Place the tablet cover in the horizontal diagonal of the basket. Put the rod assembly up through the cover of the dissolution vessel, and fix it by means of two teflon nuts, 3.2 cm from the center of the vessel, or by any other appropriate means. Adjust the lower edge of the bottom of the basket to approximately 1 cm above the top of the paddle blade (see *Figure 2*). Orient the large side of the basket tangentially to the flow stream with the Tablet standing on its edge. Pass a 10-mL portion of the solution under test, obtained at each time interval, through a suitable filter.
Chromatographic system—Proceed as directed in the *Assay.*
Procedure—Separately inject equal volumes (100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of felodipine ($C_{18}H_{19}Cl_2NO_4$) dissolved in the *Medium* by the formula:

$$CD(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Felodipine RS in the *Standard solution; D* is the dilution factor used in preparing the *Test solution;* and r_U and r_S are the felodipine peak areas obtained from the *Test solution* and the *Standard solution,* respectively.
Tolerances—The percentages of the labeled amount of $C_{18}H_{19}Cl_2NO_4$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
2	between 10% and 30%
6	between 42% and 68%
10	not less than 75%

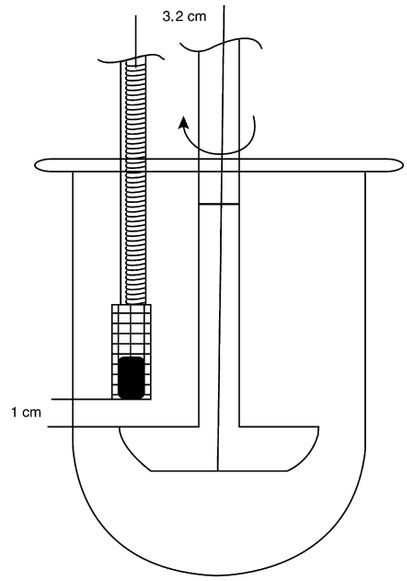

Figure 2. Drug Release Stationary Tablet Basket Configuration Diagram

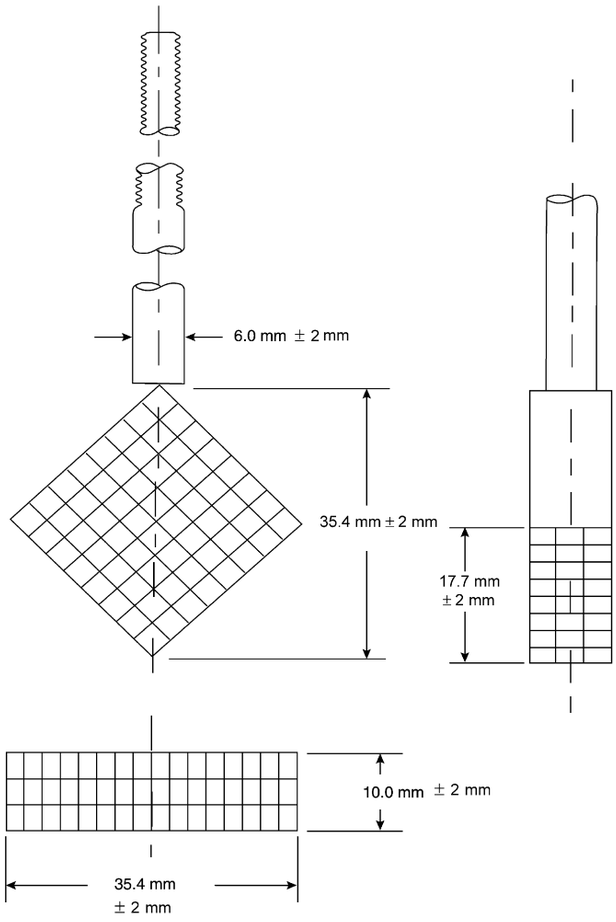
(Official April 1, 2006)

•TEST 2—
Medium: 1% (w/v) polysorbate 80 in water; 500 mL.
Apparatus 1: 100 rpm.
Times: 1, 4, and 8 hours.
Determine the amount of $C_{18}H_{19}Cl_2NO_4$ dissolved by employing the following method.
Buffer solution—Transfer 6.9 g, accurately weighed, of monobasic sodium phosphate into a 1-L volumetric flask containing about 400 mL of water. Add 8.0 mL of 1 M phosphoric acid, dilute with water to volume, and mix.
Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution,* acetonitrile, and methanol (2 : 2 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).
Standard stock solution—Transfer 40 mg, accurately weighed, of USP Felodipine RS into a 200-mL volumetric flask, add about 200 mL of methanol. Sonicate for 2 minutes, cool, dilute with methanol to volume, and mix.
Standard working solutions—Transfer the appropriate volume of *Standard stock solution* into a suitable volumetric flask according to the following table.

Tablet Label Claim (mg)	Volume Transferred (mL)	Volumetric Flask (mL)
10	10	100
5	5	100
2.5	2.5	100

Dilute with *Medium* to volume, and mix.
Test solution—Pass a portion of the solution under test through a suitable 0.45-µm filter. Replace the withdrawn amount with *Medium.*
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard working solution,* and record the peak responses as directed for *Procedure:* the capacity factor *(k′)* is not less than 5, the column efficiency *(N)* is not less than 1500 theoretical plates, the tailing factor is not more than 1.5, and the relative standard deviation for replicate injections is not more than 2.0%.

Interim Revision Announcement



NOTES

1. Rod and Basket with a Tablet cover placed in the horizontal diagonal of the basket.
2. Basket and Tablet cover material; stainless steel.
3. Basket gauze wire size: 8 mesh.

Figure 1. Stationary Tablet Basket

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard working solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of felodipine ($C_{18}H_{19}Cl_2NO_4$) dissolved by the formula:

$$C_U = \frac{r_U \times C_S}{r_S}$$

in which C_U is the concentration, in mg per mL, of felodipine in the sample at each time point; r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard working solution,* respectively; and C_S is the concentration, in mg per mL, of felodipine in the *Standard working solution.*

Calculate the amount, in percentage, of felodipine ($C_{18}H_{19}Cl_2NO_4$) dissolved, with volume correction, by the formula:

$$\frac{\left[\left\{C_N \times \left[500 - V_U(n-1)\right]\right\} + \left[\sum_{i=1}^{n-1} C_i \times V_U\right]\right] \times 100}{LC}$$

in which C_N is the concentration, in mg per mL, of felodipine in the *Test solution* at each time point; 500 is the volume, in mL, of *Medium;* V_U is the volume, in mL, of sample withdrawn at each time point; n is the time point (at 4 hours, $n + 1$), summation of the concentration of the *Test solution* from the first to the $(n - 1)^{th}$ time point (only applicable for $n = 2$); 100 is the conversion factor to percentage; and LC is the tablet label claim, in mg.

Tolerances—The percentages of the labeled amount of felodipine dissolved at the times specified conform to *Acceptance Table 1.*

Time (hours)	Amount dissolved
1	between 5% and 30%
4	between 45% and 70%
8	not less than 80%

Interim Revision Announcement

Tizanidine Hydrochloride

Change to read:

Assay—

Buffer solution—Dissolve 6.8 g of monobasic potassium phosphate in 1000 mL of water, and adjust with 5.3 N potassium hydroxide to a pH of 7.5 ± 0.05.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile •(80 : 20).•$_3$ Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability preparation—Dissolve suitable quantities of USP Tizanidine Hydrochloride RS and USP Tizanidine Related Compound C RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution containing about 0.00012 mg per mL and 0.046 mg per mL, respectively.

Standard preparation—Dissolve an accurately weighed quantity of USP Tizanidine Hydrochloride RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.046 mg per mL.

Assay preparation—Transfer about 23 mg of Tizanidine Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 15-cm column that contains packing L7. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 35°. Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.5 for tizanidine related compound C and 1.0 for tizanidine; the resolution, *R,* between tizanidine and tizanidine related compound C is not less than 13.0; and the tailing factor for the tizanidine peak is not more than 1.6. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_9H_8ClN_5S \cdot HCl$ in the portion of Tizanidine Hydrochloride taken by the formula:

$$500C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Tizanidine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Interim Revision Announcement

GENERAL CHAPTERS

General Tests and Assays

Chemical Tests and Assays

LIMIT TESTS

⟨231⟩ HEAVY METALS

Change to read:

METHOD II

NOTE—This method does not recover mercury.

•**pH 3.5 Acetate Buffer**—Prepare as directed under *Method I.*

Standard Preparation—Prepare as directed under *Method I.*

Test Preparation—Use a quantity, in g, of the substance to be tested as calculated by the formula:

$$2.0 / (1000L)$$

in which L is the *Heavy metals* limit, in percentage. Transfer the weighed quantity of the substance to a suitable crucible, add sufficient sulfuric acid to wet the substance, and carefully ignite at a low temperature until thoroughly charred. (The crucible may be loosely covered with a suitable lid during the charring.) Add to the carbonized mass 2 mL of nitric acid and 5 drops of sulfuric acid, and heat cautiously until white fumes no longer are evolved. Ignite, preferably in a muffle furnace, at 500° to 600°, until the carbon is completely burned off. Cool, add 4 mL of 6 N hydrochloric acid, cover, digest on a steam bath for 15 minutes, uncover, and slowly evaporate on a steam bath to dryness. Moisten the residue with 1 drop of hydrochloric acid, add 10 mL of hot water, and digest for 2 minutes. Add 6 N ammonium hydroxide dropwise until the solution is just alkaline to litmus paper, dilute with water to 25 mL, and adjust with 1 N acetic acid to a pH between 3.0 and 4.0, using short-range pH indicator paper as external indicator. Filter if necessary, rinse the crucible and the filter with 10 mL of water, combine the filtrate and rinsing in a 50-mL color-comparison tube, dilute with water to 40 mL, and mix.

Procedure—To each of the tubes containing the *Standard Preparation* and the *Test Preparation,* add 2 mL of *pH 3.5 Acetate Buffer,* then add 1.2 mL of thioacetamide–glycerin base TS, dilute with water to 50 mL, mix, allow to stand for 2 minutes, and view downward over a white surface*: the color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*.•[3]

Interim Revision Announcement

* In those countries or jurisdictions where thioacetamide cannot be used, add 10 mL of freshly prepared hydrogen sulfide TS to each of the tubes, mix, allow to stand for 5 minutes, and view downward over a white surface.

ERRATA

Following is a list of errata and corrections to *USP 29–NF 24*. The page number indicates where the item is found in *USP 29–NF 24*. If necessary, this list will be updated with every issue of *PF*. This information will also be available as a cumulative table in future *Supplements* and will appear in its corrected form in a future annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement. USP staff is available to respond to questions regarding the accuracy of a particular requirement by calling 1-800-822-USPC.

Page	Title	Section	Description
530	*Clarithromycin Extended-Release Tablets*	*Dissolution, Test 2*	Lines 18 through 20 under *Procedure:* Change "*n* is the time point (at 2 hours, n = 1), summation of the concentration of the *Test solution* from the first to the (*n* –1)th time point (only applicable for $n \geq 2$)" to: *n* is the number of time points [NOTE—The summation of the amount of clarithromycin removed at previous sampling time points is applicable only where $n > 1$]
2277	*Yohimbine Injection*	*Assay*	Lines 6 through 10 under *Procedure:* Change "(354.45/390.01)(25,000*C*/*V*)(r_u/r_s), in which 354.45 and 390.91 are the molecular weights of yohimbine and yohimbine hydrochloride, respectively; *C* is the concentration, in mg per mL, of USP Yohimbine Hydrochloride RS in the *Standard preparation; V* is the volume, in mL" to: (354.45/390.01)(25,000*C*/*V*)(r_u/r_s), in which 354.45 and 390.91 are the molecular weights of yohimbine and yohimbine hydrochloride, respectively; *C* is the concentration, in mg per mL, of USP Yohimbine Hydrochloride RS in the *Standard preparation; V* is the volume, in µL

IN-PROCESS REVISION

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) items that previously appeared under *Pharmacopeial Previews* and are now formally proposed as revisions, (2) proposed revisions placed directly under *In-Process Revision,* or (3) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the staff liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

BRIEFING

> **Name of Item**, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How to Use PF*), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
>
> (DSN: L. Evans) RTS—C55678

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type (print edition only), as shown in the examples below:

•new text•

if slated for an *Interim Revision Announcement to USP 29–NF 24* (*IRA*);

▲new text▲*USP30*

if slated for *USP 30–NF 25*; and

■new text■

if slated for a *Supplement to USP–NF*. The same symbols *not* set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as •• or ■■ or ▲▲, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •2 indicates that the revision is proposed for the *Second Interim Revision Announcement*, ■2S (*USP 29*) indicates that the proposed revision is slated for the *Second Supplement to USP 29*, and ▲*USP30* and ▲*NF25* indicate that the revisions are proposed for *USP 30* and *NF 25*, respectively.

Official Title Changes Where the specification ***"Monograph title change"*** is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

In-Process Revision

MONOGRAPHS (USP)

BRIEFING

Aluminum Sulfate and Calcium Acetate Powder for Topical Solution. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed. It is based on validation data received and on the monograph for *Aluminum Sulfate and Calcium Acetate Tablets for Topical Solution* (see *USP 29* page 107). The proposed monograph was created by request of FDA to amend the OTC monograph for astringent drug products to allow for the marketing of products covered by this proposed new *USP* monograph.

(MD-AA: B. Davani) RTS—C42878

Add the following:

■Aluminum Sulfate and Calcium Acetate Powder for Topical Solution

» Aluminum Sulfate and Calcium Acetate Powder for Topical Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aluminum sulfate tetradecahydrate [$Al_2(SO_4)_3 \cdot 14H_2O$] and calcium acetate monohydrate ($C_4H_6CaO_4 \cdot H_2O$).

Packaging and storage—Preserve in single-unit containers, and protect from excessive heat.

Identification—

A: Place approximately 0.25 g of Aluminum Sulfate and Calcium Acetate Powder for Topical Solution in a test tube. Add 10 mL of water and 0.25 g of calcium carbonate. Heat on a steam bath for 10 minutes, and filter. Add 3 to 4 drops of ferric chloride TS to the filtrate. A reddish-brown color or precipitate indicates acetate. [NOTE—After the addition of the ferric chloride TS, the solution may be heated for 1 minute to speed the reaction.]

B: Suspend 2 g of sample in 50 mL of water, and filter. The filtrate responds to the tests for *Sulfate* ⟨191⟩ and for *Calcium* ⟨191⟩.

pH ⟨791⟩**:** between 4.0 and 4.8 in a solution (1 in 200).

Assay for aluminum sulfate—

Assay preparation—Transfer 10 g of Aluminum Sulfate and Calcium Acetate Powder for Topical Solution, accurately weighed, to a 1000-mL volumetric flask. Add 100 mL of 1.2 M hydrochloric acid and approximately 250 mL of water. Heat on a steam bath or hot plate until dissolved. Cool, dilute with water to volume, and mix. [NOTE—Retain a portion of this *Assay preparation* for the *Assay for calcium acetate.*]

Procedure—Transfer a 5.0-mL aliquot of the *Assay preparation* to a 250-mL conical flask. Add 40.0 mL of 0.01 M edetate disodium VS and 20 mL of acetic acid–ammonium acetate buffer TS, and mix well. Add 50 mL of alcohol and 2 mL of dithizone TS. [NOTE—Follow the given order of addition.] Titrate with 0.02 M zinc sulfate VS until the color changes from green-violet to clear rose-pink. Perform a blank titration, substituting 5.0 mL of water for the *Assay preparation*. Each mL of 0.01 M edetate disodium is equivalent to 2.972 mg of aluminum sulfate tetradecahydrate [$Al_2(SO_4)_3 \cdot 14H_2O$]. Calculate the percentage of aluminum sulfate tetradecahydrate [$Al_2(SO_4)_3 \cdot 14H_2O$] by the formula:

$$[(1000)(100)C_F M(V_B - V_U)] / 5.0M_T W$$

in which 1000/5.0 is the dilution factor; 100 is the conversion factor to percentage; C_F is the conversion factor (2.972 mg of sample per mL of 0.01 M edetate disodium); M is the actual molarity of the titrant; V_B is the blank titration volume, in mL; V_U is the sample titration volume, in mL; M_T is the theoretical molarity of the titrant (0.02); and W is the weight of the sample, in mg.

Assay for calcium acetate—

Procedure—Transfer a 5.0-mL aliquot of the *Assay preparation* retained from the *Assay for aluminum sulfate* to a 250-mL conical flask. Add 1 to 2 mL of 50% triethanolamine to mask the aluminum. Mix well. Add 100 mL of water, 15 mL of 1 N sodium hydroxide, and approximately 300 mg of hydroxy naphthol blue. [NOTE—Follow the given order of addition.] Titrate the solution with 0.01 M edetate disodium VS. The indicator will change from purple to a clear blue color at the endpoint. Each mL of 0.01 M edetate disodium is equivalent to 1.762 mg of calcium acetate monohydrate ($C_4H_6CaO_4 \cdot H_2O$). Calculate the percentage of calcium acetate monohydrate ($C_4H_6CaO_4 \cdot H_2O$) by the formula:

$$[(1000)(100)V_U C_F M] / 5.0 M_T W$$

in which 1000/5.0 is the dilution factor; 100 is the conversion factor to percentage; V_U is the sample titration volume, in mL; C_F is the conversion factor (1.762 mg of sample per mL of 0.01 M edetate disodium); M is the actual molarity of the titrant; M_T is the theoretical molarity of the titrant (0.01); and W is the weight of the sample, in mg.■1S (*USP30*)

BRIEFING

Amifostine, *USP 29* page 125. It is proposed to correct the equation for calculating the percentage of amifostine thiol in the test for *Related compounds.* In the absence of any adverse comments, it is proposed to implement this revision via the *Fifth Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of October 1, 2006.

(MD-CV: S. Ramakrishna) RTS—C44547

Change to read:

Related compounds—

Mobile phase—Dissolve 1.0 mL of nonafluorobutane sulfonic acid in 1200 mL of HPLC grade water, add 400 µL of trifluoroacetic acid, and adjust with triethylamine to a pH of 2.5. Prepare a degassed mixture of this solution and acetonitrile (68 : 32).

Blank solution—Use water.

Standard thiol solution—Transfer about 12.4 mg of USP Amifostine Thiol RS, accurately weighed, to a 100-mL volumetric flask. Dissolve in and dilute with water to volume, and mix. [NOTE—Inject immediately after preparation, or refrigerate until use. The solution is stable for 48 hours if maintained at about 5°.]

System suitability solution—Dissolve about 5.0 mg of USP Amifostine RS, accurately weighed, in 1 mL of *Standard thiol solution,* and mix. [NOTE—Inject immediately after preparation, or refrigerate until use. The solution is stable for 12 hours if maintained at about 5°.]

Test solution—Transfer about 50 mg of Amifostine, accurately weighed, to a 1-mL volumetric flask. Dissolve in and dilute with water to volume, and mix. [NOTE—Inject immediately after preparation, or refrigerate until use. The solution is stable for 48 hours if maintained at about 5°.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The column temperature is maintained at 30°, and the temperature of the solutions to be injected is maintained at 2° to 8°. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution* and the *Standard thiol solution,* and record the peak responses as directed for *Procedure:* the resolution between the amifostine and amifostine thiol peaks is not less than 2.0; the column efficiency calculated for the amifostine thiol peak is not less than 2300 theoretical plates; the tailing factor is not more than 4.0; the capacity factor, k', is more than 0.5; and the relative standard deviation for replicate injections is not more than 4.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard thiol solution,* the *Test solution,* and the *Blank solution* into the chromatograph, record the chromatograms, and measure the responses of all the peaks, excluding the peaks corresponding to those obtained from the *Blank solution*. Calculate the percentage of amifostine thiol in the portion of Amifostine taken by the formula:

~~$(134.24/207.17)1000(C/W)(r_U/r_S)$~~

$$\bullet(134.24/207.17)100(C/W)(r_U/r_S)\bullet_S$$

in which 134.24 and 207.17 are the molecular weights of amifostine thiol and amifostine thiol dihydrochloride, respectively; C is the concentration, in mg per mL, of amifostine thiol dihydrochloride in the *Standard thiol solution; W* is the weight, in mg, of Amifostine taken to prepare the *Test solution;* and r_U and r_S are the amifostine thiol peak responses obtained from the *Test solution* and the *Standard thiol solution,* respectively. Calculate the percentage of each of the other impurities in the portion of Amifostine taken by the formula:

$$100(r_i / r_A)$$

in which r_i and r_A are the peak responses for each impurity and amifostine, respectively, obtained from the *Test solution:* not more than 0.1% of any individual impurity, excluding amifostine thiol, is found; and not more than 0.3% of total impurities, including amifostine thiol, is found.

In-Process Revision

BRIEFING

Amifostine for Injection, *USP 29* page 126. It is proposed to correct the equation for calculating the percentage of amifostine thiol and also the equation for calculating the percentage of amifostine disulfide in the test for *Related compounds.* In addition, it is proposed to add a *Test solution* subsection under *Related compounds* and also to make minor editorial changes. In the absence of any adverse comments, it is proposed to implement this revision via the *Fifth Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of October 1, 2006.

(MD-CV: S. Ramakrishna) RTS—C44548

Change to read:

Related compounds—

Mobile phase, Blank solution, and *System suitability solution* ~~and *Test solution*~~—Prepare as directed in the test for *Related compounds* under *Amifostine.*

Standard thiol solution—Transfer about 40.1 mg of USP Amifostine Thiol RS, accurately weighed, to a 50-mL volumetric flask. Dissolve in and dilute with water to volume, and mix. [NOTE—Inject immediately after preparation, or refrigerate until use. The solution is stable for 48 hours if maintained at about 5°.]

Standard disulfide solution—Transfer about 18.6 mg of USP Amifostine Disulfide RS, accurately weighed, to a 100-mL volumetric flask. Dissolve in and dilute with water to volume, and mix. [NOTE—Inject immediately after preparation, or refrigerate until use. The solution is stable for 48 hours if maintained at about 5°.]

•*Test solution*—Transfer about 50 mg of Amifostine for Injection, accurately weighed, to a 1-mL volumetric flask, dissolve in and dilute with water to volume, and mix. [NOTE—Inject immediately after preparation, or refrigerate until use. The solution is stable for 48 hours if maintained at about 5°.]•

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a detector capable of recording at both 220 nm and 247 nm, and a 4.6-mm × 25-cm column that contains packing L1. The column temperature is maintained at 30°, and the temperature of solutions to be injected is maintained at between 2° and 8°. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution,* the *Standard disulfide solution,* and the *Standard thiol solution,* and record the peak responses as directed for *Procedure:* the column efficiency calculated for the amifostine thiol peak is not less than 2300 theoretical plates; the tailing factor is not more than 4.0; the capacity factor, k', is more than 0.5; and the relative standard deviation for replicate injections is not more than 4.0%. The column efficiency calculated for the amifostine disulfide peak is not less than 2000 theoretical plates; the tailing factor is not more than 4.5; the capacity factor, k', is more than 2.2; and the relative standard deviation for replicate injections is not more than 4.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard thiol solution,* the *Standard disulfide solution,* the *Test solution,* and the *Blank solution* into the chromatograph, record the chromatograms, and measure the responses of all the peaks except the peaks corresponding to those obtained from the *Blank solution.* Calculate the percentage of amifostine thiol in the portion of Amifostine for Injection taken by the formula:

~~$(134.24/207.17)1000(C/W)(r_U/r_S)$~~

$$\bullet(134.24/207.17)100(C/W)(r_U/r_S)\bullet_{5}$$

in which 134.24 and 207.17 are the molecular weights of amifostine thiol and amifostine thiol dihydrochloride, respectively; C is the concentration, in mg per mL, of amifostine thiol dihydrochloride in the *Standard thiol solution; W* is the weight, in mg, of Amifostine taken to prepare the *Test solution;* and r_U and r_S are the amifostine thiol peak responses recorded at 220 nm, obtained from the *Test solution* and the *Standard thiol solution,* respectively. Calculate the percentage of amifostine disulfide in the portion of Amifostine for Injection taken by the formula:

~~$(266.47/412.31)(10C)(r_U/r_S)$~~

$$\bullet(266.47/412.31)(100C/W)(r_U/r_S)\bullet_{5}$$

in which 266.47 and 412.31 are the molecular weights of amifostine disulfide and amifostine disulfide tetrahydrochloride, respectively; C is the concentration, in mg per mL, of USP Amifostine Disulfide RS in the *Standard disulfide solution;* and r_U and r_S are the peak responses recorded at 247 nm, obtained from the *Test solution* and the *Standard disulfide solution,* respectively: not more than 2.0% of total impurities, including amifostine thiol and amifostine disulfide, is found. Calculate the percentage of each of the other impurities in the portion of Amifostine for Injection taken by the formula:

$$100(r_i/r_A)$$

in which r_i and r_A are the peak responses for each impurity and amifostine, respectively, obtained from the *Test solution:* not more than 0.1% of any individual impurity except amifostine thiol is found.

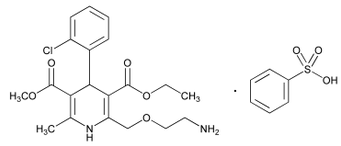
BRIEFING

Amlodipine Besylate. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on the Amlodipine Besilate monograph in the *European Pharmacopoeia* 5.5, is being proposed. The liquid chromatographic procedure in the *Related compounds Test 2* and in the *Assay* is based on analyses performed with the Waters Symmetry or Waters Nova-Pak brand of L1 column. The typical retention time observed for amlodipine is about 7.5 minutes.

(MD-CV: E. Gonikberg) RTS—C44144

Add the following:

■Amlodipine Besylate



$C_{20}H_{25}ClN_2O_5 \cdot C_6H_6O_3S$ 567.05

3,5-Pyridinedicarboxylic acid, 2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-1,4-dihydro-6-methyl-, 3-ethyl 5-methyl ester, (±)-, monobenzenesulfonate.

3-Ethyl 5-methyl (±)-2-[(2-aminoethoxy)methyl]-4-(*o*-chlorophenyl)-1,4-dihydro-6-methyl-3,5-pyridinedicarboxylate, monobenzenesulfonate [*111470-99-6*].

» Amlodipine Besylate contains not less than 97.0 percent and not more than 102.0 percent of $C_{20}H_{25}ClN_2O_5 \cdot C_6H_6O_3S$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight containers, protected from light. Store at room temperature.

USP Reference standards ⟨11⟩**—***USP Amlodipine Besylate RS.*

Identification—

A: *Infrared Absorption* ⟨197M⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Optical rotation ⟨781A⟩**:** between -0.10° and +0.10°, measured at 20°.

Test solution: 10 mg per mL, in methanol.

Water, *Method I* ⟨921⟩**:** not more than 0.5%.

Residue on ignition ⟨281⟩**:** not more than 0.2%.

Heavy metals, *Method II* ⟨231⟩**:** 0.002%.

Related compounds—

TEST 1—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Test solution—Transfer 140 mg of Amlodipine Besylate to a 2-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix.

System suitability solution—Transfer about 14 mg of USP Amlodipine Besylate RS to a suitable container, dissolve in 0.2 mL of methanol, and mix.

Standard stock solution—Dissolve an accurately weighed quantity of USP Amlodipine Besylate RS in methanol to obtain a solution containing 7.0 mg per mL.

Standard solution 1—Transfer 3.0 mL of the *Standard stock solution* to a 100-mL volumetric flask, dilute with methanol to volume, and mix.

Standard solution 2—Transfer 1.0 mL of the *Standard stock solution* to another 100-mL volumetric flask, dilute with methanol to volume, and mix.

Application volume: 10 µL.

Developing solvent system—Use the upper layer of a mixture of methyl isobutyl ketone, water, and glacial acetic acid (50 : 25 : 25).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. Dry the plate for 15 minutes at 80°. Examine the plate under UV light at 254 nm and 365 nm. The chromatogram from the *System suitability solution* shows two clearly separated minor spots with R_F values of about 0.18 and 0.22. Compare the intensities of any secondary spots observed in the chromatogram of the *Test solution* with those of the principal spots in the chromatograms of the *Standard solutions*. Any spot obtained from the *Test solution,* except for the principal spot, is not greater in size than the spot

In-Process Revision

obtained from *Standard solution 1* (0.3%), and at most two spots are more intense than the spot obtained from *Standard solution 2* (0.1%).

TEST 2—

pH 3.0 Buffer and *Mobile phase*—Prepare as directed in the *Assay.*

System suitability solution—Dissolve about 5 mg of Amlodipine Besylate in 5 mL of hydrogen peroxide, and heat at 70° for 45 minutes.

Standard solution—Dissolve an accurately weighed quantity of USP Amlodipine Besylate RS in *Mobile phase* to obtain a solution having a known concentration of about 0.003 mg per mL.

Test solution—Transfer about 50 mg of Amlodipine Besylate, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—Prepare as directed in the *Assay.* Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between amlodipine impurity A and amlodipine is not less than 4.5. [NOTE—For the purpose of identification, the relative retention times are about 0.2 for benzene sulfonate, 0.5 for amlodipine impurity A, and 1.0 for amlodipine. Amlodipine impurity A is 3-ethyl 5-methyl 2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-6-methylpyridine-3,5-dicarboxylate.] Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the standard deviation for replicate injections is not more than 10.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for a period of time that is about 3 times the retention time of amlodipine, and measure the peak responses. Calculate the percentage of each impurity in the portion of Amlodipine Besylate taken by the formula:

$$100(1/F)(C_S/C_T)(r_i/r_S)$$

in which F is the relative response factor, which is equal to 0.5 for amlodipine impurity A and to 1.0 for other impurities; C_S and C_T are the concentrations, in mg per mL, of amlodipine besylate in the *Standard solution* and the *Test solution,* respectively; r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the peak response for amlodipine besylate obtained from the *Standard solution:* not more than 0.3% of amlodipine impurity A is found, and not more than 0.3% of total other impurities is found. Disregard any peak less than 0.03%, and disregard any peak due to benzene sulfonate.

Assay—

pH 3.0 Buffer—Dissolve 7.0 mL of triethylamine in 800 mL of water. Adjust with phosphoric acid to a pH of 3.0 ± 0.1, and dilute with water to 1 L.

Mobile phase—Prepare a filtered and degassed mixture of *pH 3.0 Buffer,* methanol, and acetonitrile (50 : 35 : 15). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Amlodipine Besylate RS in *Mobile phase* to obtain a solution having a known concentration of about 0.05 mg per mL.

Assay preparation—Transfer about 50 mg of Amlodipine Besylate, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 237-nm detector and a 3.9-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure

the responses for the major peaks. Calculate the percentage of $C_{20}H_{25}ClN_2O_5 \cdot C_6H_6O_3S$ in the portion of Amlodipine Besylate taken by the formula:

$$100(C_S/C_U)(r_U/r_S)$$

in which C_S and C_U are the concentrations, in mg per mL, of amlodipine besylate in the *Standard preparation* and the *Assay preparation,* respectively; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP30*)

BRIEFING

Calcitonin Salmon, page 1036 of *PF* 31(4) [July–Aug. 2005]. It is proposed to modify the Definition to allow for a peptide that is produced using recombinant DNA technology.

(BB PP: L. Callahan) RTS—C44540

Add the following:

■Calcitonin Salmon

$C_{145}H_{240}N_{44}O_{48}S_2$ 3432 daltons [*47931-85-1*].

» Calcitonin Salmon is a ~~synthetic polypeptide that has the same sequence as that of the hormone that regulates calcium metabolism and is secreted by the ultimobranchial gland of salmon. It lowers the calcium concentration in the plasma of mammals by diminishing the rate of bone resorption.~~ polypeptide that has the same sequence as that of the hormone that regulates calcium metabolism and is secreted by the ultimobranchial gland of salmon. It is produced from either synthetic processes or microbial processes using recombinant DNA (rDNA) technology. The host-cell derived proteins content and the host-cell or vector-derived DNA content of Calcitonin Salmon produced from an rDNA process are determined by validated methods. It contains not less than 90.0 percent and not more than 105.0 percent of calcitonin salmon, calculated on an acetic acid-free and dried basis.

NOTE—One mg of acetic acid-free, anhydrous Calcitonin Salmon is equivalent to 6000 USP Calcitonin Salmon Units.

Packaging and storage—Preserve in tight containers. Store in a refrigerator, protected from light.

Labeling—The labeling states that the material is synthetic.

USP Reference standards ⟨11⟩—*USP Calcitonin Salmon RS. USP Calcitonin Salmon Related Compound A RS* (*N*-acetyl-cys[1]-calcitonin). ~~*USP Endotoxin RS.*~~

Identification—

~~**A:**~~ The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation,* obtained as directed in the *Assay.*

~~**B:** The UV absorption spectrum of a 0.1% solution (based on free peptide) in 0.01 N hydrochloric acid exhibits a minima and a maxima at the same wavelengths as those of a similar solution of USP Calcitonin Salmon RS, concomitantly measured. The absorbance at approximately 275 nm (maxima) is about 0.40 to 0.55, and the ratio of the absorbance at 275 nm (maxima) and 254 nm (minima) is between 1.6 and 2.5.~~

Amino acid profile (see *Amino Acid Analysis* ~~*Method 1,*~~ under *Biotechnology-Derived Articles—Tests* ⟨1047⟩)—[NOTE—The concentration of amino acids in the *Internal*

In-Process Revision

standard solution, the *Standard amino acid solution,* and the *Standard solution* and the amount of material used to prepare the *Test solution* can be adjusted depending on the method used for amino acid analysis. The concentrations given are based on analysis using *Method 1.*]

Internal standard solution—Prepare a 1-mM solution of γ-aminobutyric acid.

Standard amino acid solution—Prepare a mixture containing equimolar amounts of ammonia and the L form of lysine, histidine, arginine, aspartic acid, threonine, serine, proline, valine, glutamic acid, glycine, leucine, and tyrosine, together with half the equimolar amount of L-cystine, in 0.1 M hydrochloric acid. The final concentration is about 2.5 mM for each amino acid.

Standard solution—Transfer 5 mL of the *Internal standard solution* and 2 mL of the *Standard amino acid solution* into a 50-mL volumetric flask, dilute with 0.1 M hydrochloric acid to volume, and mix.

Test solution—Place about 1.5 mg of an accurately weighed quantity of Calcitonin Salmon into a heavy-wall ignition tube, add 1.0 mL of 6 N hydrochloric acid, allow to cool, immerse the lower half of the tube in a freezing mixture until the contents are frozen, evacuate to approximately 10 μM, purge with nitrogen (repeat the evacuation and nitrogen purge three times), and seal the tube while it is under a 10-μM vacuum. Heat for 16 hours at 110° to 115° in an air oven. Cool, open the tube, dry in a vacuum desiccator, remove the contents, and allow to cool to room temperature. Dissolve in 0.1 M hydrochloric acid, transfer to a 10-mL volumetric flask, add 1 mL of *Internal standard solution,* dilute with 0.1 M hydrochloric acid to volume, and mix.

Procedure—Standardize the amino acid analyzer, using the *Standard solution.* Inject the *Test solution* into the amino acid analyzer, and determine the relative proportion of amino acids.

Calculation of amino acid profile—Express the content of each amino acid in moles, using an internal standard calibration technique. Calculate the relative proportions of the amino acids by taking as equivalent to 1 the sum of the number of moles of aspartic acid, glutamic acid, proline, glycine, valine, leucine, histidine, arginine, and lysine divided by 20. ~~For threonine and serine, perform the same calculation, and correct the concentrations for degradation by adding 5% and 10%, respectively, to their indicated results.~~ The requirements are met if the values fall within the following limits: aspartic acid, 1.8 to 2.2; glutamic acid, 2.7 to 3.3; proline, 1.7 to 2.3; glycine, 2.7 to 3.3; valine, 0.9 to 1.1; leucine, 4.5 to 5.3; histidine, 0.9 to 1.1; arginine, 0.9 to 1.1; lysine, 1.8 to 2.2; serine, 3.2 to 4.2; threonine, 4.2 to 5.2; tyrosine, 0.7 to 1.1; half cystine, 1.4 to 2.1.

Bioidentity—

RPMI 1640 with L-glutamine—Prepare a mixture of the ingredients, in the quantities shown below, in sufficient water to obtain 1 L of *RPMI 1640 with L-glutamine* solution, and sterilize by filtration.

Calcium Nitrate	100.00 mg
Potassium Chloride	400.00 mg
Magnesium Sulfate, Anhydrous	48.84 mg
Potassium Chloride	400 mg
Sodium Chloride	6000 mg
Sodium Phosphate, Dibasic, Anhydrous	800 mg
Sodium Bicarbonate	2000 mg
Glycine	10 mg
L-Arginine	200 mg
L-Asparagine	50 mg
L-Aspartic Acid	20 mg
L-Cystine Dihydrochloride	65 mg
L-Glutamic Acid	20 mg
L-Glutamine	300 mg
L-Histidine	15 mg
L-Hydroxyproline	20 mg
L-Isoleucine	50 mg
L-Leucine	50 mg
L-Lysine Hydrochloride	40 mg
L-Methionine	15 mg
L-Phenylalanine	15 mg

L-Proline	20 mg
L-Serine	30 mg
L-Threonine	20 mg
L-Tryptophan	5 mg
L-Tyrosine Disodium Salt Dihydrate	29 mg
L-Valine	20 mg
Biotin	0.2 mg
Choline Chloride	3 mg
D-Calcium Pantothenate	0.25 mg
Folic Acid	1 mg
i-Inositol	35 mg
Niacinamide	1 mg
Para-Aminobenzoic Acid	1 mg
Pyridoxine Hydrochloride	1 mg
Riboflavin	0.2 mg
Thiamine Hydrochloride	1 mg
Vitamin B_{12}	0.005 mg

Medium A (growth medium)—Using aseptic technique, prepare the following tissue culture medium.

RPMI 1640 with L-glutamine	500 mL
Fetal bovine serum	50 mL
1 M HEPES	5 mL
Penicillin/streptomycin solution (10,000 IU per mL /10 mg per mL)	5 mL
Human insulin	10 IU
Hydrocortisone	0.5 mg

Medium B (stimulation medium)—Dissolve 5 g of albumin bovine serum (BSA) in 500 mL of 2 mM *RPMI 1640 with L-glutamine.*

2% BSA solution—Dissolve 50 mg of albumin bovine serum in 25 mL of water. [NOTE—Use within 1 day.]

Formic acid/BSA solution—Add 25 mL of 0.1 M formic acid and 5 mL of *2% BSA solution* to a 50-mL volumetric flask, dilute with water to volume, and mix. [NOTE—Use within 2 days.]

Trypsin–EDTA solution (tetrasodium ethylenediamine-tetraacetate)—Prepare a sterile filtered solution containing 0.25% trypsin and 0.53 mM EDTA.

Dulbecco's phosphate buffered saline—Dissolve 8 g of sodium chloride, 1.15 g of dibasic sodium phosphate, 0.2 g of monobasic potassium phosphate, 0.2 g of potassium chloride, 0.1 g of calcium chloride, and 0.1 g of magnesium chloride in 1 L of water.

Standard stock solution—Dissolve an accurately weighed quantity of USP Calcitonin Salmon RS in *Formic acid/BSA solution* to obtain a solution having a known concentration of about 20 µg per mL.

Positive control solution—Quantitatively dilute the *Standard stock solution* with *Medium B* to obtain a solution of USP Calcitonin Salmon RS having a known concentration of 1 ng per mL.

Negative control solution: Medium B.

Standard solution A—Quantitatively dilute the *Standard stock solution* with *Medium B* to obtain a solution of USP Calcitonin Salmon RS having a known concentration of 0.1 ng per mL.

Standard solution B—Quantitatively dilute *Standard solution A* with *Medium B* to obtain a solution of USP Calcitonin Salmon RS having a known concentration of 0.033 ng per mL.

Standard solution C—Quantitatively dilute *Standard solution B* with *Medium B* (1 : 2) to obtain a solution of USP Calcitonin Salmon RS having a known concentration of 0.011 ng per mL.

Standard solution D—Quantitatively dilute *Standard solution C* with *Medium B* (1 : 2) to obtain a solution of USP Calcitonin Salmon RS having a known concentration of 0.0037 ng per mL.

Test stock solution—Dissolve an accurately weighed quantity of Calcitonin Salmon in *Formic acid/BSA solution* to obtain a solution having a concentration of about 20 µg per mL.

Test solution A—Quantitatively dilute the *Test stock solution* with *Medium B* to obtain a solution of Calcitonin Salmon having a concentration of 0.1 ng per mL.

Test solution B—Quantitatively dilute *Test solution A* with *Medium B* (1 : 2) to obtain a solution of Calcitonin Salmon having a concentration of 0.033 ng per mL.

Test solution C—Quantitatively dilute *Test solution B* with *Medium B* (1 : 2) to obtain a solution of Calcitonin Salmon having a concentration of 0.011 ng per mL.

Test solution D—Quantitatively dilute *Test solution C* with *Medium B* (1 : 2) to obtain a solution of Calcitonin Salmon having a concentration of 0.0037 ng per mL.

Cell culture preparation—Prepare a cell culture of the human mammary tumor cell line T-47D. Cells are propagated using *Medium A* at 37° and 5% carbon dioxide. The medium is changed every 2 days, and cells are passaged every 5 to 9 days, using *Trypsin–EDTA solution* with a 1 : 4 subculture.

Cell suspension—For the test, use a cell culture that is 5 to 9 days old. Remove the cell culture medium from the flask by aspiration, add 10 mL of *Dulbecco's phosphate buffered saline,* and rock the culture flask to rinse the entire monolayer. Remove the liquid by aspiration, add 2 mL of *Trypsin–EDTA solution,* spread over the entire monolayer, allow to stand for 3 to 5 minutes, and add 10 mL of *Medium A.* Homogenize the cell suspension using a pipet, transfer to a 15-mL polypropylene tube, centrifuge at about 220 × *g* for 5 minutes, pour off the supernatant, and resuspend the cell pellet in 10 mL of *Medium A.* Count the cells, and adjust the cell density through dilution, using *Medium A,* to 2.5×10^4 cells per mL.

Procedure—Place 200 µL of the *Cell suspension* into each well of a 96-well culture plate (the *tissue culture plate*), and incubate for 18 to 24 hours at 37° and 5% carbon dioxide. Fill each well of an empty round-bottomed 96-well culture plate (the *prepared plate*) with 150 µL of one of the following solutions: *Positive control solution, Negative control solution, Standard solutions A–D,* and *Test solutions A–D,* so that each solution fills at least five wells on the prepared plate. After incubation, remove the culture medium from the tissue culture plate. Using an 8-channel or 12-channel pipet, rapidly transfer 100 µL of solution from each well of the prepared plate to each well of the tissue culture plate. Incubate for 15 minutes at ambient temperature, remove the solution from each well, stop stimulation by immediately adding an appropriate cell-lysis buffer, and quantitate cAMP produced within the cells, using a validated kit. Perform the test three times, using three different 96-well culture plates. [NOTE—Some kits include a cell-lysis reagent and a sequestering agent for the cell-lysis reagent. The range of the test kit is between 0.05 ng and 10 ng per mL of cAMP. The number of cells used in the assay may vary depending on the validated kit used to quantitate cAMP.] Potency is determined by a 3-dose, 6-point parallel-line assay, using standard statistical methods. The calculation is carried out using both the lower three concentrations and the upper three concentrations. For the assay to be valid, the requirements for regression and parallelism must be met. If the requirements for validity are met to the same extent in both assessments (the lower and the higher assessments), the final result is determined from the concentration range that shows the higher value when the common slope is divided by the mean square error. The potency levels determined from all three performances of the test are homogeneous, and the confidence limits for all three determinations are between 64% and 156% of the calculated potency.

~~**Bacterial endotoxins** ⟨85⟩—It contains not more than 1000 USP Endotoxin Units per mg of calcitonin salmon.~~

Microbial limits ⟨61⟩—The test is performed on a portion of about 0.2 g, accurately weighed. The total aerobic microbial count does not exceed 100 cfu per g. ~~It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa.*~~

In-Process Revision

pH ⟨791⟩**:** between 4.0 and 6.0 in a 1% solution in carbon dioxide-free water.

Water, *Method Ic* ⟨921⟩**:** not more than 10%.

Heavy metals, *Method II* ⟨231⟩**:** 0.005%.

Limit of trifluoroacetic acid [NOTE—Use deionized, degassed water where water is indicated.]

Solution A: Water.

Solution B: 0.005 N sodium hydroxide.

Solution C: 0.1 N sodium hydroxide.

Mobile phase—Use variable mixtures of *Solution A, Solution B,* and *Solution C* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Chloride stock standard solution—Dissolve an accurately weighed quantity of sodium chloride in water to obtain a solution having a concentration of the chloride ion of about 0.1 mg per mL.

Trifluoroacetic acid stock standard solution—Dissolve an accurately weighed quantity of trifluoroacetic acid in water to obtain a solution having a concentration of trifluoroacetic acid of about 0.1 mg per mL.

Resolution solution—Pipet 0.2 mL of *Chloride stock standard solution* and 0.5 mL of *Trifluoroacetic acid stock standard solution* into a 100-mL volumetric flask, dilute with water to volume, and mix to obtain a solution that contains 0.2 µg of chloride and 0.5 µg of trifluoroacetate per mL, respectively.

Standard solutions—Pipet 0.2 mL, 0.5 mL, 1.0 mL, and 2.0 mL of *Trifluoroacetic acid stock standard solution* into ordered 100-mL volumetric flasks. Dilute with water to volume and mix to obtain solutions that contain concentrations of about 0.2 µg, 0.5 µg, 1.0 µg, and 2.0 µg of trifluoroacetate per mL, respectively.

Test solution—Transfer about 10 mg of Calcitonin Salmon, accurately weighed, to a 5-mL volumetric flask. Dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The ion chromatograph is equipped with a conductivity detector, a 4-mm × 5-cm anion exchange guard column containing packing L31, a 4-mm × 25-cm anion exchange analytical column containing packing L31, a high capacity anion trap column in hydroxide form in the eluant line in front of the injection valve, and a micromembrane anion self-regenerating suppressor. The flow rate is about 2.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	*Solution C* (%)	Elution
0–2	90	10	0	isocratic
2–5	90 → 0	10 → 100	0	linear gradient
5–15	0	100 → 65	0 → 35	linear gradient
15–20	0 → 90	65 → 10	35 → 0	linear gradient

Chromatograph the *Resolution solution,* and record the peak responses as directed for the *Procedure:* the resolution, *R,* between the chloride peak and the trifluoroacetic acid peak is not less than 3; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 100 µL) of each of the *Standard solutions* and the *Test solution* into the chromatograph, record the chromatograms, and measure the area of peak responses. Plot the response of the trifluoroacetic acid peak in the *Standard solutions* versus the concentration of trifluoroacetic acid, and draw the straight line best fitting the plotted points. From the graphs so obtained, determine a concentration value, *C,* in µg per mL for trifluoroacetic acid. Calculate the quantity, in ppm, for trifluoroacetic acid in Calcitonin Salmon by the formula:

$$5000(C/W),$$

in which *W* is the weight in mg of Calcitonin Salmon taken to prepare the *Test solution:* not more than 200 ppm of trifluoroacetic acid is found.

In-Process Revision

~~**Limit of residual solvents**—~~

~~*Standard stock solution*—Prepare a solution containing about 300 µg of methanol, 40 µg of acetonitrile, 60 µg of methylene chloride, 500 µg of *tert* butyl methyl ether, and 90 µg of dimethylformamide per mL of methyl sulfoxide.~~

~~*Standard solution*—Transfer 5 mL of the *Standard stock solution* to a 25-mL volumetric flask, and dilute with dimethyl sulfoxide to volume. Transfer 1 mL of the *Standard solution* to a 20-mL headspace vial fitted with a septum and a crimp cap, and seal the vial.~~

~~*Test solution 1*—Transfer about 100 mg of Calcitonin Salmon, accurately weighed, to a 20-mL headspace vial fitted with a septum and a crimp cap, add 1 mL of dimethyl sulfoxide, seal the vial, and mix.~~

~~*Test solution 2*—Transfer about 100 mg of Calcitonin Salmon, accurately weighed, to a 20-mL headspace vial fitted with a septum and a crimp cap, add 1 mL of *Standard solution,* seal the vial, and mix.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a headspace injector and a flame ionization detector and contains a 0.32-mm × 60-m fused silica column coated with a 1.0-µm film of stationary phase G38. Nitrogen is used as the carrier gas, flowing at a rate of about 25 mL per minute. The column temperature is maintained at 45° for 2 minutes, then increased at a rate of 10° per minute to 75°, then increased at a rate of 5° per minute to 170° and maintained at 170° for 3 minutes. The split injector temperature is maintained at about 200°, and the detector temperature is maintained at about 170°. The transfer loop and transfer line temperature is 170°, and the pressurize time is 0.5 minute. The *Standard solution* vial and the *Test solutions 1* and *2* vials are maintained at about 90°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.55 for methanol, 0.76 for acetonitrile, 1.0 for methylene chloride, 1.2 for *tert* butyl methyl ether, and 2.3 for dimethylformamide; and the relative standard deviation, determined from peak areas for each peak, for six replicate injections is not more than 10%.~~

~~*Procedure*—Separately inject equal volumes (about 1 mL) of headspace from vials of *Test solution 1* and *Test solution 2* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of methanol, acetonitrile, methylene chloride, *tert* butyl methyl ether, and dimethylformamide in the Calcitonin Salmon taken by the formula:~~

$$100(r_{U1})(C)/(r_{U2})(W_{U1}) \quad (r_{U1})(W_{U2}),$$

~~in which C is the concentration, in mg per mL, of the relevant analyte in the *Standard solution;* W_{U1} and W_{U2} are the weights, in mg, of Calcitonin Salmon taken to prepare *Test solution 1* and *Test solution 2,* respectively; and r_{U1} and r_{U2} are the peak areas of the corresponding analyte obtained from *Test solution 1* and *Test solution 2,* respectively: not more than 3000 µg of methanol, 400 µg of acetonitrile, 600 µg of methylene chloride, 5000 µg of *tert* butyl methyl ether, and 900 µg of dimethylformamide per g of Calcitonin Salmon are found.~~

Organic volatile impurities ⟨467⟩**:** meets the requirements.

Acetic acid content—

Internal standard stock solution—Mix 1 mL of dioxane with water to obtain 100 mL of solution.

Standard solution—Transfer approximately 100 mg of glacial acetic acid, accurately weighed, and 10 mL of *Internal standard stock solution* to a 100-mL volumetric flask, dilute with water to volume, and mix.

Test solution—Transfer about 100 mg of Calcitonin Salmon, accurately weighed, to a 10-mL volumetric flask, add 1 mL of *Internal standard stock solution,* dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm × 3-m glass column packed with 10% liquid phase G35, 1% phosphoric acid, on support S1A.

In-Process Revision

Nitrogen is the carrier gas, flowing at a rate of about 30 mL per minute. The column temperature is maintained at 70° for 4 minutes, then increased at a rate of 8° per minute to 120°, then maintained at 120° for 4 minutes. The injection port and detector temperatures are maintained isothermally at about 200°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the retention times are about 3 minutes for acetic acid and 1 minute for dioxane; the resolution, *R,* between dioxane and acetic acid is not less than 8; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 4 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of acetic acid in the portion of Calcitonin Salmon taken by the formula:

$$1000(C/W)(R_U/R_S)$$

in which C is the concentration, in mg per mL, of acetic acid in the *Standard solution; W* is the weight, in mg, of Calcitonin Salmon used to prepare the *Test solution;* and R_U and R_S are the peak response ratios of acetic acid to dioxane obtained from the *Test solution* and the *Standard solution,* respectively: not less than 4.0% and not more than 15.0% is found.

Related peptides and other related substances—

Test solution—Prepare as directed for the *Assay preparation* in the *Assay.*

Solution A, Solution B, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Procedure—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the area percentage of each peak observed in the chromatogram. Disregard any peaks due to the solvent and any peaks whose area is less than 0.1% of the principal peak. No peak other than the principal peak constitutes more than 3.0% of the total area of all peaks. The sum of the areas of all the peaks apart from the principal peak is not greater than 5.0% of the sum of the areas of all the peaks including the principal peak.

Other requirements—Where the label states that Calcitonin Salmon is sterile, it meets the requirements for *Sterility* ⟨71⟩ under *Calcitonin Salmon Injection.*

Assay—

Solution A—Dissolve ~~3.62~~ 3.26 g of tetramethylammonium hydroxide pentahydrate in 900 mL of water, add 100 mL of acetonitrile, and mix. Adjust with phosphoric acid to a pH of 2.5, pass through a filter having a 0.5-µm or finer porosity, and degas.

Solution B—Dissolve 1.45 g of tetramethylammonium hydroxide pentahydrate in 400 mL of water, add 600 mL of acetonitrile, and mix. Adjust with phosphoric acid to a pH of 2.5, pass through a filter having a 0.5-µm or finer porosity, and degas.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer about 10.0 mg of USP Calcitonin Salmon RS, accurately weighed, into a 10-mL volumetric flask, dissolve in and dilute with *Solution A* to volume, and mix.

System suitability solution—Dissolve the contents of a vial of USP Calcitonin Salmon Related Compound A RS in 0.4 mL of *Solution A,* add 0.1 mL of the *Standard preparation,* and mix.

Assay preparation—Transfer about 10.0 mg of Calcitonin Salmon, accurately weighed, into a 10-mL volumetric flask, dissolve in and dilute with *Solution A,* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1.

In-Process Revision

The column temperature is maintained at about 65°. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–30	72→48	28→52	linear gradient
30–32	48→72	52→28	linear gradient
32–55	72	28	isocratic

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.15 for calcitonin salmon related compound A and 1.0 for calcitonin salmon; the resolution, *R,* between calcitonin salmon related compound A and calcitonin salmon is not less than 3; the tailing factor is not more than 2.5; and the relative standard deviation for replicate injections is not more than 3%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of calcitonin salmon ($C_{145}H_{240}N_{44}O_{48}S_2$) in the portion of Calcitonin Salmon taken by the formula:

$$P(W_S / W_U)(r_U / r_S)$$

in which P is the percentage of calcitonin salmon in USP Calcitonin Salmon RS; W_S is the weight, in mg, of USP Calcitonin Salmon RS taken to prepare the *Standard preparation;* W_U is the weight, in mg, of Calcitonin Salmon used to prepare the *Assay preparation;* and r_U and r_S are the main peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP30*)

BRIEFING

Calcitonin Salmon Nasal Solution, page 1178 of *PF* 30(4) [July–Aug. 2004]. The monograph is being modified to allow for the use of material derived using recombinant DNA technology.

(BB PP: L. Callahan) RTS—C42086

Add the following:

■Calcitonin Salmon Nasal Solution

» Calcitonin Salmon Nasal Solution is a solution of Calcitonin Salmon in a suitable diluent. It contains suitable preservatives, and is packaged in a form suitable for nasal administration so that the required dosage can be controlled as required. Each mL of Calcitonin Salmon Nasal Solution possesses an activity of not less than 80 percent and not more than 110 percent of that stated on the label.

Packaging and storage—Preserve in containers suitable for spraying the contents into the nasal cavities in a controlled individualized dosage. Store unopened containers in a refrigerator, and opened containers at room temperature.

Labeling—Label it to indicate that it is for intranasal administration only. ~~Label it to state that the origin is synthetic.~~ The labeling also states that it has been prepared either with Calcitonin Salmon of synthetic origin or Calcitonin Salmon of rDNA origin. Label it to state that it is to be stored in a refrigerator and that freezing is to be avoided. Label it to indicate the activity in USP Calcitonin Salmon Units per mL.

USP Reference standards ⟨11⟩—*USP Calcitonin Salmon RS. USP Calcitonin Salmon Related Compound A RS.*

In-Process Revision

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Microbial limits ⟨61⟩**—**The total aerobic microbial count does not exceed 100 cfu per g, and the total combined molds and yeast count does not exceed 50 cfu per g. It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa.*

pH ⟨791⟩**:** between 3.5 and 4.5.

Assay—

Solution A, Solution B, Mobile phase, and *Chromatographic system*—Proceed as directed in the *Assay* under *Calcitonin Salmon* .

Standard stock preparation and *Standard preparation*—Prepare as directed in the *Assay* under *Calcitonin Salmon Injection.*

System suitability solution—Prepare as directed for *Resolution solution* under *Calcitonin Salmon Injection.*

Diluent—Dissolve 0.75 g of sodium chloride, 0.2 g of sodium acetate, and 0.2 g of glacial acetic acid in 100 mL of water, and mix.

Assay preparation—Transfer 1 mL of Nasal Solution to a 10-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Procedure—Separately inject equal volumes (about 200 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the potency, in USP Calcitonin Salmon Units per mL, in the Nasal Solution taken by the formula:

$$10C(r_U/r_S)$$

in which C is the concentration of the *Standard preparation,* in USP Calcitonin Salmon Units per mL; and r_U and r_S are the main peak areas from the *Assay preparation* and *Standard preparation,* respectively.■1S *(USP30)*

BRIEFING

Chlorhexidine Gluconate Oral Rinse, *USP 29* page 476; **Chlorhexidine Gluconate Solution,** *USP 29* page 477. It is proposed to correct the molecular weight of chlorohexidine acetate given in the *Assay.*

in which the terms are as defined therein.

BRIEFING

Chlorhexidine Gluconate Solution, *USP 29* page 477—See briefing under *Chlorhexidine Gluconate Oral Rinse*.

(MD-AA: B. Davani) RTS—C44179

Change to read:

Assay—

Diluent—Prepare a solution of 27.6 g of monobasic sodium phosphate in about 1.5 L of water. Adjust with phosphoric acid to a pH of 3.0, dilute with water to 2000 mL, and mix.

Solution A—Prepare a solution of 27.6 g of monobasic sodium phosphate and 10 mL of triethylamine in about 1.5 L of water. Adjust with phosphoric acid to a pH of 3.0, dilute with water to 2000 mL, and mix. Prepare a mixture of this solution and acetonitrile (70 : 30). [NOTE—Small adjustments in the acetonitrile content may be made to meet acceptable resolution criteria (see *System Suitability* under *Chromatography* ⟨621⟩).] Degas before use and sparge with helium during the analysis.

Solution B—Use acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

In-Process Revision

System suitability solution—Prepare a solution in *Diluent* containing about 50 µg of USP Chlorhexidine Acetate RS per mL and 1 µg of *p*-chloroaniline per mL.

Standard preparation—Prepare a solution of USP Chlorhexidine Acetate RS in water having a known concentration of about 1 mg per mL. Dilute quantitatively an accurately measured volume of this stock solution with *Diluent* to obtain a solution having a known concentration of about 50 µg per mL.

Assay preparation—Transfer 5.0 mL of Solution to a 250-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 250-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 239-nm detector and a 4.6-mm × 25-cm column that contains base-deactivated 5-µm packing L1 and is maintained at a constant temperature of about 40°. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibration
0–9	100	0	isocratic
9–10	100→45	0→55	linear gradient
10–15	45	55	isocratic
15–16	45→100	55→0	linear gradient
16–21	100	0	re-equilibration

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between chlorhexidine and *p*-chloroaniline is not less than 3; and the relative standard deviation for replicate injections is not more than 2.0% determined from the chlorhexidine peak, and not more than 5.0% determined from the *p*-chloroaniline peak.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak areas for chlorhexidine. Calculate the percentage (w/v) of chlorhexidine gluconate ($C_{22}H_{30}Cl_2N_{10} \cdot 2C_6H_{12}O_7$) in the portion of Solution taken by the formula:

~~$(897.77/625.66)(0.25C)(r_U/r_S)$~~

■$(897.77/625.55(0.25C)(r_U / r_S)$■1S *(USP30)*

in which 897.77 and ~~625.66~~

■625.55■1S *(USP30)*
are the molecular weights of chlorhexidine gluconate and chlorhexidine acetate, respectively; *C* is the concentration, in µg per mL, of USP Chlorhexidine Acetate RS in the *Standard preparation;* and r_U and r_S are the peak areas for chlorhexidine obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Chlorophyllin Copper Complex Sodium, *USP 29* page 478. On the basis of comments received, the concentrations of two standard solutions in the *Content of total copper* section are being corrected.

(MD-OOD: F. Mao) RTS—C44268

Change to read:

Content of total copper—

Copper stock solution—Transfer 1.000 g of copper to a 1000-mL volumetric flask, dissolve in 20 mL of nitric acid, dilute with 0.2 N nitric acid to volume, and mix. This solution contains 1000 µg of copper per mL. Store in a polyethylene bottle.

Standard solutions—Pipet 5.0 mL of *Copper stock solution* into a 500-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0, 10.0, 15.0, and 20.0 mL, respectively, of this solution to separate 100-mL volumetric flasks, dilute the contents of each flask with water to volume, and mix. These *Standard solutions* contain 0.5, 1.0, ~~2.0, and 3.0~~

■1.5, and 2.0■1S *(USP30)*
µg of copper per mL, respectively.

Test solution—Transfer about 100 mg of previously dried Chlorophyllin Copper Complex Sodium, accurately weighed, to a Kjeldahl flask. Add 2.0 mL of sulfuric acid, 1.0 mL of nitric acid, and 1.0 mL of hydrogen peroxide, and carefully heat under a fume hood until a light green color is obtained. [NOTE—If the solution has any hint of a brown tint, continue to add 0.5-mL portions of nitric acid until a green color is obtained.] Cool, transfer the contents quantitatively to a 1000-mL volumetric flask with several portions of water, dilute the contents of the flask with water to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Standard solutions* and the *Test solution* at the copper emission line of 324.8 nm with an atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with a copper hollow-cathode lamp and an air–acetylene flame, using water as the blank. Plot the absorbances of the *Standard solutions* versus the concentration, in µg per mL, of copper, and draw the straight line best fitting the four plotted points. From the graph so obtained, determine the concentration, *C,* in µg per mL, of copper in the *Test solution*. Calculate the percentage of copper in the portion of Chlorophyllin Copper Complex Sodium taken by the formula:

$$500C / W$$

in which *W* is the weight, in mg, on the dried basis, of Chlorophyllin Copper Complex Sodium taken to prepare the *Test solution:* not less than 4.25% is found.

BRIEFING

Cimetidine, *USP 29* page 512. It is proposed to delete the reference to the use of previously dried material in *Identification* test *A* in accordance with changes to the directions for use of the USP Cimetidine Reference Standard. It is also proposed to add a formula to the *Procedure* in the test for *Chromatographic purity* to calculate the percentage of impurities.

(MD-GRE: E. Gonikberg) RTS—C44267

Change to read:

Identification—

A: ~~The IR absorption spectrum of a potassium bromide dispersion of it, previously dried, exhibits maxima only at the same wavelengths as that of a similar preparation of USP Cimetidine RS.~~

■*Infrared Absorption* ⟨197K⟩.■1S *(USP30)*

B: The UV absorption spectrum of a solution (1 in 80,000) in 0.1 N sulfuric acid exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Cimetidine RS, concomitantly measured.

Change to read:

Chromatographic purity—

Mobile phase—Mix 240 mL of methanol, 0.3 mL of phosphoric acid (85%), 940 mg of sodium 1-hexanesulfonate, and sufficient water to make 1 L. Filter before use. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Prepare a solution of USP Cimetidine RS in *Mobile phase* having a concentration of 0.80 µg per mL.

Test solution—Transfer 100.0 mg of Cimetidine, accurately weighed, to a 250-mL volumetric flask, dissolve in about 50 mL of *Mobile phase*, and dilute with *Mobile phase* to volume. Mix, sonicate for 15 minutes, and mix again.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard solution,* and record the peak response as directed for *Procedure:* the capacity factor, k', is not less than 3.0; the number of theoretical plates, n, is not less than 2000; and the relative standard deviation of the response for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. ~~The sum of all the peak responses, excluding the cimetidine response, from the *Test preparation* is not more than 5 times the cimetidine response from the *Standard preparation,* and no single peak response is greater than that of the cimetidine response from the *Standard preparation*.~~

■Calculate the percentage of each impurity in the portion of Cimetidine taken by the formula:

$$100(0.001C_S)/C_U)(r_U/r_S)$$

in which C_S is the concentration, in µg per mL, of cimetidine in the *Standard solution,* the multiplier of 0.001 is for conversion of µg per mL to mg per mL; C_U is the concentration, in mg per mL, of cimetidine in the *Test solution;* r_U is the peak response for each impurity obtained from the *Test solution;* and r_S is the response of the cimetidine peak obtained from the *Standard solution:* not more than 0.2% of any single impurity is found, and not more than 1.0% of total impurities is found.■1S *(USP30)*

BRIEFING

Citalopram Tablets, page 1046 of *PF* 31(4) [July–Aug. 2005]. On the basis of comments received and the acceptance criteria of the approved generic products, it is proposed to modify the acceptance criteria in the *Related compounds* section.

(MD-PP: R. Ravichandran) RTS—C43544

Add the following:

■Citalopram Tablets

» Citalopram Tablets contain an amount of Citalopram Hydrobromide equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of citalopram free base ($C_{20}H_{21}FN_2O$).

Packaging and storage—Preserve in well-closed containers. Store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Citalopram Hydrobromide RS. USP Citalopram Related Compound A RS. USP Citalopram Related Compound B RS. USP Citalopram Related Compound C RS. USP Citalopram Related Compound E RS. USP Citalopram Related Compound F RS.*

Change to read:

Identification—

A: *Infrared Absorption* ⟨197K⟩—

Test specimen—Extract finely ground Tablet powder containing about 200 mg of citalopram with 30 mL of water, and filter. Add 1 mL of 1 N sodium hydroxide ■to the filtrate,■1S *(USP30)* and extract with 50 mL of cyclohexane by shaking for 10 minutes. Pass the cyclohexane layer through a silicone-treated filter paper into a beaker. Reduce the filtrate down to 3 mL, using gentle heat as necessary. Transfer the hot solution to a small centrifuge tube. Induce crystallization while cooling by scratching the side of the test tube with a

In-Process Revision

spatula. Centrifuge the mixture, and decant off the cyclohexane. Dry the residue under vacuum in a desiccator. Mix approximately 2 mg of the residue with approximately 300 mg of potassium bromide, and record the IR spectrum.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

C: A solution of 2 mg per mL equivalent of citalopram in water meets the requirements of the test for *Bromide* ⟨191⟩.

Dissolution ⟨711⟩—

Medium: pH 1.5 buffer (prepared by transferring 118 mL of 1 N hydrochloric acid and 82 mL of 1 N sodium hydroxide to a 1000-mL volumetric flask, diluting with water to volume, and adjusting with 1 N sodium hydroxide to a pH of 1.5); 800 mL, deaerated.

Apparatus 1: 100 rpm.

Time: 30 minutes.

Procedure—Determine the amount of citalopram hydrobromide dissolved by employing UV absorption at the wavelength of maximum absorbance at about 239 nm on portions of the solution under test passed through a 0.45-µm PVDF filter, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration (about 12 µg per mL) of USP Citalopram Hydrobromide RS in the same *Medium.* Calculate the amount of citalopram hydrobromide dissolved, in percentage, by the formula:

$$\frac{A_U \times C_S \times 324.39 \times D \times 800 \times 100}{A_S \times 405.30 \times L}$$

in which A_U and A_S are the absorbances obtained from the solution under test and the Standard solution, respectively; C_S is the concentration, in mg per mL, of the Standard solution; D is the dilution factor of the solution under test; 800 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; 324.39 and 405.30 are the molecular weights of citalopram and citalopram hydrobromide, respectively; and L is the tablet label claim, in mg, of citalopram.

Tolerances—Not less than 80% (Q) of the labeled amount of citalopram hydrobromide is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

Buffer, Diluent, Internal standard solution, Mobile phase, and *Chromatographic system*—Proceed as directed in the *Assay.*

Test solution—Transfer 1 Tablet to a 100-mL volumetric flask, add 10 mL of *Buffer,* and shake by mechanical means until disintegrated. Add 40 mL of methanol, and sonicate for about 5 minutes. Allow to cool to room temperature. Add a sufficient volume of *Internal standard solution,* and dilute, stepwise if necessary, with *Diluent* to volume to obtain a *Test solution* having a concentration of about 0.1 mg per mL of citalopram and 0.025 mg per mL of the internal standard. Pass a portion of this solution through a membrane filter (PVDF) having a 0.45-µm or finer porosity, and use the filtrate.

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Procedure—Proceed as directed in the *Assay.* Calculate the quantity, in mg, of ($C_{20}H_{21}FN_2O$) in the portion of sample taken by the formula:

$$100(CV)(R_U / R_S)(324.39/405.30)$$

in which C is the concentration, in mg per mL, of USP Citalopram Hydrobromide RS in the *Standard solution; V* is the final volume, in mL, required to obtain the *Test solution; R_U* and R_S are the ratios of the peak responses of citalopram to the Internal standard in the *Test solution* and the *Standard solution,* respectively; and 324.39 and 405.30 are the molecular weights of citalopram and citalopram hydrobromide, respectively.

In-Process Revision

Related compounds—

Phosphate buffer—Dissolve 3.15 g of potassium dihydrogen phosphate and 3.60 g of disodium hydrogen phosphate ($Na_2HPO_4 \cdot 12H_2O$) in 1 L of water.

Mobile phase—Prepare a filtered and degassed mixture of *Phosphate buffer,* methanol, and acetonitrile (55 : 38 : 7). Adjust with phosphoric acid to a pH of 6.5. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Dissolve an accurately weighed quantity of USP Citalopram Hydrobromide RS in *Mobile phase* to obtain a solution having a known concentration of about 0.5 mg per mL.

Standard solution—Prepare a solution having a concentration of 0.625 µg per mL of citalopram hydrobromide through stepwise dilution of the *Standard stock solution* with *Mobile phase*.

Sensitivity solution—Prepare a solution having a concentration of 0.05 µg per mL of citalopram hydrobromide through stepwise dilution of the *Standard solution* with *Mobile phase*.

Related compounds stock solutions—Separately dissolve accurately weighed quantities of USP Citalopram Related Compound A RS, USP Citalopram Related Compound B RS, USP Citalopram Related Compound C RS, and USP Citalopram Related Compound E RS in *Mobile phase* to obtain stock solutions having known concentrations of about 0.1 mg per mL of each compound.

Peak identification solution—Prepare a mixture containing about 0.001 mg per mL each of USP Citalopram Related Compound A RS, USP Citalopram Related Compound B RS, USP Citalopram Related Compound C RS, and USP Citalopram Related Compound E RS, using the *Standard stock solution* as the diluent.

Resolution solution—Dilute 0.5 mL of *Citalopram related compound C stock solution* and 25.0 mL of the *Standard stock solution* with *Mobile phase* to 50 mL to obtain a solution containing 0.01 mg per mL of citalopram related compound C and 0.25 mg per mL of citalopram hydrobromide.

Test solution—Transfer 10 Tablets into a 200-mL volumetric flask, add 25 mL of *Phosphate buffer,* and shake by mechanical means until disintegrated. Add about 100 mL of a mixture of methanol and water (50 : 50), mix, and sonicate for about 5 minutes. Allow to cool, dilute with a mixture of methanol and water (50 : 50) to volume, and mix thoroughly. Allow the excipients to settle. Dilute as necessary to obtain a final concentration of 0.5 mg per mL of citalopram. Pass a portion of this solution through a polytetrafluoroethylene (PTFE) membrane filter having a 0.45-µm or finer porosity, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 239-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The column temperature is maintained at 45°. The flow rate is about 0.8 mL per minute. Inject the *Standard solution,* and record the peak responses as directed for *Procedure:* the citalopram peak shows no shoulders or excessive tailing; the capacity factor, *k′,* is not less than 3.5; the column efficiency is not less than 5000 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation of ~~both the retention time and~~ ■1S (*USP30*) the response for replicate injections is not more than 5%. Inject the *Sensitivity solution* into the chromatograph, and verify that the signal-to-noise ratio is at least 3. Inject the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between citalopram related compound C and citalopram is not less than 3. Inject the *Peak identification solution,* and record the responses as directed for *Procedure:* the four related compound peaks are baseline resolved from each other and the citalopram peak. ■[NOTE—For identification purposes, approximate relative retention times are given in *Table 1*.]■1S (*USP30*)

In-Process Revision

Procedure—Inject a volume (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in each Tablet by the formula:

$$100(r_i / r_S)(324.39 / 405.30)(C_S / C_T)(1/F)$$

in which r_i is the individual peak response for each citalopram related compound obtained from the *Test solution;* r_S is the response of the corresponding peak in the *Standard solution;* 324.39 and 405.30 are the molecular weights of citalopram and citalopram hydrobromide, respectively; C_S and C_T are the concentrations, in mg per mL, of citalopram hydrobromide in the *Standard solution* and the *Test solution,* respectively; and F is the relative response factor of each impurity relative to citalopram (free base). The limits for the related compounds are listed in *Table 1.*

Change to read:

Assay—

Buffer—Transfer about 0.71 g of anhydrous dibasic sodium phosphate to a 500-mL volumetric flask, and add about 250 mL of water. Shake to dissolve, then dilute with water to volume.

Diluent—Prepare a solution of methanol and *Buffer* (80 : 20).

internal standard solution—Dissolve an accurately weighed amount of USP Citalopram Related Compound F RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.25 mg per mL.

Mobile phase—Prepare a filtered and degassed solution of *Diluent* containing about 770 mg of dodecyltrimethylammonium bromide per L. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Dissolve an accurately weighed quantity of USP Citalopram Hydrobromide RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 1.25 mg of citalopram hydrobromide per mL.

Standard preparation—Pipet 5.0 mL of the *Standard stock preparation* and 5.0 mL of the *internal standard solution* into a 50-mL volumetric flask. Dilute with *Diluent* to volume, and mix.

Table 1

Assay preparation—Transfer 10 Tablets to a 200-mL volumetric flask, add 25 mL of *Buffer,* and shake by mechanical means until disintegrated. Add 100 mL of methanol, and sonicate for about 5 minutes. Allow to cool to room temperature, then dilute with *Diluent* to volume. Allow to stand until the residue settles before taking an aliquot for dilution. Transfer an accurately measured volume of the clear supernatant to a 50-mL volumetric flask to obtain a final concentration between 0.090 and 0.10 mg per mL of citalopram, ■based on the label claim.■1S (*USP30*) Add 5.0 mL of *internal standard solution,* dilute with *Diluent* to volume, and mix. Pass a portion through a filter (PTFE) having a 0.45-µm or finer porosity.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. The column temperature is maintained at 45°. Inject the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.36 for citalopram related compound F and 1.0 for citalopram; the resolution, *R,* between citalopram and citalopram related compound F is not less than 1.5; the column efficiency is not less than 2000 theoretical plates, calculated from the citalopram peak; and the relative standard deviation for replicate injections is not more than 1.5% for the citalopram peak.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the citalopram peaks. Calculate the quantity, in percent of label claim, of citalopram per Tablet taken by the formula:

$$100(C_S / C_U)(324.39/405.30)(R_U / R_S)$$

in which C_S and C_U are the concentrations, in mg per mL, of USP Citalopram Hydrobromide RS in the *Standard preparation* and Citalopram Hydrobromide in the *Assay preparation,* respectively; 324.39 and 405.30 are the molecular weights of citalopram and citalopram hydrobromide, respectively; and R_U and R_S are the ratios of the peak responses of citalopram to the internal standard obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP29*)

BRIEFING

Cladribine, page 3563 of the *First Supplement,* and page 1609 of *PF* 31(6) [Nov.–Dec. 2005]. On the basis of comments received, it is proposed to revise the acceptance criterion for *Water.* In the absence of any significant adverse comments, it is proposed to implement this revision via the *Fifth Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of October 1, 2006.

Limit of residual solvents—

Standard solution—Transfer 15 µL of methanol and 24 µL of alcohol to a 100-mL volumetric flask containing 80 mL of water, dilute with water to volume, and mix. Transfer 3 mL of the solution to a 20-mL headspace vial. The concentrations of methanol and alcohol in the *Standard solution* are 119 µg per mL and 198 µg per mL, respectively.

Test solution—In a 20-mL headspace vial, dissolve 200 mg of Cladribine, accurately weighed, in 5 mL of water.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a headspace injector and a flame-ionization detector and contains a 0.53-mm × 30-m column coated with a 5-µm film of liquid phase G16. The carrier gas is nitrogen, flowing at a rate of 4 mL per minute. The split ratio is 5 : 1. Vials containing the *Standard solution* and the *Test solution* are equilibrated for 10 minutes at 80° in the headspace sampler. The chromatograph is programmed as follows. Initially the temperature of the column is maintained at 80° for 6 minutes, then increased at a rate of 25° per minute to 240°, and held at 240° for 20 minutes. The injection port temperature and the detector temperature are maintained at 250°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between alcohol and methanol is not less than 1.5; and the relative standard deviation for replicate injections is not more than 10.0% for each of the two solvents.

Procedure—Separately inject equal volumes (about 1 mL) of the gaseous headspace of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the concentration, in ppm, of each residual solvent in the portion of Cladribine taken by the formula:

$$5000(C/W)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of the respective individual solvent in the *Standard solution; W* is the quantity, in mg, of Cladribine taken to prepare the *Test solution;* and r_U and r_S are the peak responses of the relevant solvent obtained from the *Test solution* and the *Standard solution,* respectively: not more than 5000 ppm of alcohol is found, and not more than ~~450 ppm~~ ▲3000 ppm▲*USP30* of methanol is found.

BRIEFING

Clarithromycin Extended-Release Tablets, *USP 29* page 530. In *Dissolution Test 2* it is proposed to add a compliance statement, as well as a column temperature in the *Chromatographic system,* and a revised formula in the *Procedure* to calculate the amount, in percentage, of clarithromycin dissolved with volume correction. It is also proposed to add a *Dissolution Test 3* and a *Dissolution Test 4* because FDA recently approved new generic versions of this product. The chromatographic procedure in *Dissolution Test 3* was developed using the YMC-Pack ODS-AQ or YMC-Pack ODS-AM brand of L1 packing. The chromatographic procedure in *Dissolution Test 4* was developed using LiChrospher 60 RP-Select brand of L7 packing. In the absence of any significant adverse comment, it is proposed to implement all of these proposed changes via the *Fifth Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of October 1, 2006.

▲**Dissolution** ⟨711⟩▲*USP29*—

TEST 1—

Medium: 0.3 M phosphate buffer, pH 6.0 (prepared by dissolving 816.5 g of monobasic potassium phosphate and 48 g of sodium hydroxide in about 4 L of water, mixing, and diluting with water to 20 L. Adjust with either concentrated phosphoric acid or 1 N sodium hydroxide to a pH of 6.0 ± 0.05); 900 mL.

Apparatus 2: 75 rpm.

Times: 30, 45, 60, and 120 minutes.

Determine the percentages of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved using the following method.

Standard solutions—Prepare five solutions of USP Clarithromycin RS dissolved in acetonitrile and diluted with *Medium,* with known concentrations over the range of about 60 to 600 µg per mL.

Test solution—Use portions of the solution under test passed through a 35-µm polyethylene filter.

Chromatographic system—Proceed as directed in the *Assay.*

Procedure—Separately inject equal volumes (about 50 µL) of the five *Standard solutions* and the *Test solution* into the chromatograph, and measure the responses for the major peaks. Perform a linear

In-Process Revision

regression analysis to generate a standard curve using the peak area of each *Standard solution* versus its concentration. Determine the amount of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved at each specified time interval, using the peak area of each *Test solution* and the linear regression statistics for the *Standard solutions.*

Tolerances—The percentages of the labeled amounts of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved at the times specified conform to the following *Acceptance Table.*

▲TEST 2—

•If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.•5

Medium: 0.05 M phosphate buffer, pH 6.8 containing 0.5% of sodium lauryl sulfate; 900 mL, degassed by sonication and vacuum.

Apparatus 1: 100 rpm.

Times: 2, 12, and 24 hours.

Determine the percentages of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved using the following method.

0.067 M Phosphate buffer, pH 2.5—Dissolve 9.2 g of monobasic sodium phosphate monohydrate in about 800 mL of water. Adjust with phosphoric acid to a pH of 2.5. Dilute with water to 1000 mL.

Mobile phase—Prepare a filtered and degassed mixture of methanol and *0.067 M Phosphate buffer, pH 2.5* (65 : 35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Transfer about 56 mg of USP Clarithromycin RS, accurately weighed, to a 100-mL volumetric flask. Add 10 mL of methanol, and sonicate to dissolve. Dilute with *Medium* to volume.

Test solution—Centrifuge the solution under test at 2500 rpm for 10 minutes.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute.

•The column temperature is maintained at 50°.•5

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; the column efficiency is not less than 2000; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Determine the amount, in percentage, of clarithromycin dissolved by the formula:

$$C_U = \frac{r_U \times C_S}{r_S}$$

in which C_U is the concentration, in mg per mL, of clarithromycin in the sample at each time point; r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; and C_S is the concentration, in mg per mL, of clarithromycin in the *Standard solution.*

Calculate the amount, in percentage, of clarithromycin dissolved with volume correction:

$$\frac{\{C_n \times [900 - V_U(n-1)]\} + [\sum_{i=1}^{n-1} C_i \times V_U] \times 100}{LC}$$

•$$\frac{[\{C_n \times [900 - V_U(n-1)]\} + [\sum_{i=1}^{n-1} C_i \times V_U]] \times 100}{LC}$$•5

in which C_n is the concentration, in mg per mL, of clarithromycin in the *Test solution* at each time point; 900 is the volume, in mL, of *Medium;* V_U is the volume, in mL, of sample withdrawn at each time point; n is the number of time points [NOTE—The summation of the amount of clarithromycin removed at previous sampling time points is applicable only where $n > 1$]; 100 is the conversion factor to percentage; and LC is the Tablet label claim.

Acceptance Table

Level	Time (minutes)	Amount dissolved (individual limits)	Amount dissolved (average limits)

24	not less than 80%

▲*USP29*

•TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium: Acetate buffer, pH 4.75 (prepared by dissolving 3.59 g of sodium acetate trihydrate and 11.0 mL of 2 N acetic acid in 1000 mL of water, and adjusting with 2 N acetic acid to a pH of 4.75); 1000 mL.

Apparatus 1: 10 mesh; 50 rpm.

Times: 1, 2, 4, 8, and 12 hours.

Determine the percentages of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved by employing the following method.

0.067 M Phosphate buffer—Dissolve 9.12 g of monobasic potassium phosphate in 1000 mL of water, and mix.

Mobile phase—Prepare a filtered and degassed mixture of methanol and *0.067 M Phosphate buffer* (65 : 35), mix, and adjust with phosphoric acid to a pH of 4.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Dissolve quantitatively an accurately weighed quantity of USP Clarithromycin RS in methanol, shaking and sonicating if necessary to ensure dissolution, to obtain a stock solution having a known concentration of about 625 µg of clarithromycin per mL, taking into account the stated potency, in µg per mg, of USP Clarithromycin RS.

Standard solution—Transfer 10.0 mL of the *Standard stock solution* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. This solution contains about 125 µg of clarithromycin per mL.

System suitability solution—Dissolve quantitatively an accurately weighed quantity of USP Clarithromycin Related Compound A RS in methanol to obtain a solution containing about 625 µg of clarithromycin related compound A per mL. Transfer 10 mL of this solution and 10 mL of the *Standard stock solution* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Test solution—Withdraw 10-mL of the solution under test. Transfer 3 mL to a 25-mL volumetric flask, and dilute with *Mobile phase* to volume. Pass portions of this dilution through a 0.45-µm filter. Replace 10 mL of *Medium* in each vessel.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 50°. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.75 for clarithromycin and 1.0 for clarithromycin related compound A; and the resolution, *R,* between clarithromycin and clarithromycin related compound A is not less than 2.0. Chromatograph the *Standard solution,* and record the responses as directed for *Procedure:* the column efficiency, determined from the clarithromycin peak, is not less than 750 theoretical plates; the tailing factor is not less than 0.9 and not more than 2; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Determine the amount, in percentage, of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved by the formula:

$$C_U = \frac{r_U \times C_S \times 100}{r_S \times 6C}$$

in which C_U is the concentration, in mg per mL, of clarithromycin in the sample at each time point; r_U and r_S are the peak responses obtained from the *Test solution* and the

Standard solution, respectively; and C_S is the concentration, in mg per mL, of clarithromycin in the *Standard solution;* 100 is the conversion factor to percentage; and *LC* is the Tablet label claim in mg.

Calculate the amount, in percentage, of clarithromycin dissolved with volume correction at time points $n \geq 2$:

$$\frac{[\{C_n \times [1000]\} + [\sum_{i=1}^{n-1} C_i \times V_u]] \times 100}{LC}$$

in which C_n is the concentration, in mg per mL, of clarithromycin in the *Test solution* at each time point; 900 is the volume, in mL, of *Medium;* V_U is the volume, in mL, of sample withdrawn at each time point; n is the time point (at 2 hours, $n = 2$), summation of the concentration of the *Test solution* from the first to the $(n-1)$th time point (only applicable for $n \geq 2$); 100 is the conversion factor to percentage; and *LC* is the Tablet label claim in mg.

Tolerances—The percentages of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	not more than 15%
2	between 10% and 30%
4	between 35% and 55%
8	not less than 80%
12	not less than 90%

TEST 4 —If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

Medium: phosphate buffer, pH 6.0 (prepared by dissolving 68.0 g of potassium dihydrogen phosphate and 1.8 g of sodium hydroxide in 10 L of water, and adjusting with dilute sodium hydroxide or phosphoric acid to a pH of 6.0 ± 0.1); 900 mL.

Apparatus 2: 50 rpm.

Times: 2, 4, 8, and 12 hours.

Determine the percentages of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved by employing the following method.

Buffer solution—Dissolve 6.8 g of potassium dihydrogen phosphate in 1 L of water. Adjust with dilute sodium hydroxide or phosphoric acid to a pH of 4.5 ± 0.1.

Mobile phase—Prepare a filtered and degassed mixture of methanol and *Buffer solution* (64 : 36). Make adjustments if necessary (see *System suitability* under *Chromatography* ⟨621⟩).

Standard solution—Transfer about 20 mg of USP Clarithromycin RS, accurately weighed, to a 50-mL volumetric flask. Add about 30 mL of *Medium,* and sonicate until dissolved, about 10 minutes. Add 2 mL of methanol, and dilute with *Medium* to volume.

Test solution—Use the solution under test passed through a 0.45-µm suitable filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 203-nm detector and a 4.0-mm × 12.5-cm column that contains 5-µm packing L7. The flow rate is about 1.0 mL per minute. The column is maintained at 30°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Determine the amount, in percentage, of clarithromycin dissolved by the formula:

$$C_U = \frac{r_U \times C_S}{r_S}$$

In-Process Revision

in which C_U is the concentration, in mg per mL, of clarithromycin in the *Test solution* at each time point; r_U and r_S are the peak responses obtained from the *Test solution* and *Standard solution,* respectively; and C_S is the concentration, in mg per mL, of clarithromycin in the *Standard solution*.

Calculate the amount, in percentage, of clarithromycin dissolved at each time point by the formula:

$$\frac{C_n \times [900 - (n-1) \times V_S] + (C_1 + C_2 + ... + C_{n-1}) \times V_S \times 100}{LC}$$

in which C_n is the concentration, in mg per mL, of clarithromycin in the *Test solution* at each time point; 900 is the volume, in mL, of *Medium; V_S* is the volume, in mL, of the sample taken at each time point; and *LC* is the Tablet label claim, in mg.

Tolerances—The percentages of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
2	not more than 25%
4	between 20% and 40%
8	between 45% and 75%
12	not less than 80%

•S

BRIEFING

Crystallized Trypsin, *USP 29* page 2223. On the basis of comments received, it is proposed to change the definition to allow for the use of porcine-derived material.

(BB PP: L. Callahan) RTS—C44565

Change to read:

» Crystallized Trypsin is a proteolytic enzyme crystallized from an extract of the ~~pancreas gland of the ox, *Bos taurus* Linné (Fam. Bovidae)~~

▪pancreas of healthy bovine or porcine animals, or both.▪1S (*USP30*)

When assayed as directed herein, it contains not less than 2500 USP Trypsin Units in each mg, calculated on the dried basis, and not less than 90.0 percent and not more than 110.0 percent of the labeled potency.

NOTE—Determine the suitability of the substrates and check the adjustment of the spectrophotometer by performing the *Assay* using USP Crystallized Trypsin Reference Standard.

BRIEFING

Dantrolene Sodium for Injection. Because there is no existing *USP* monograph for this dosage form, a new monograph based on validated methods of analysis is being proposed. The proposed liquid chromatographic procedures in the test for *Related compounds* and the *Assay* are based on analyses performed with the Waters Symmetry C18 brand of L1 column. Typical retention time for dantrolene related compound B is about 2.3 minutes and for dantrolene is about 3.3 minutes.

(MD-PP: R. Ravichandran; MSA: R. Tirumalai) RTS—C42656

Add the following:

▪Dantrolene Sodium for Injection

» Dantrolene Sodium for Injection is a sterile, nonpyrogenic, lyophilized formulation containing Dantrolene Sodium, and one or more suitable buffering or sequestering agents. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{14}H_9N_4NaO_5 \cdot 3½H_2O$.

Packaging and storage—Preserve in tight containers. Store at controlled room temperature, and protect from light.

In-Process Revision

USP Reference standards ⟨11⟩—*USP Dantrolene RS. USP Dantrolene Related Compound B RS. USP Endotoxin RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩—

Test specimen—To 0.5 g of Dantrolene Sodium for Injection, add 10 mL of 0.1 N hydrochloric acid and 10 mL of ethyl acetate, and mix. Allow the phases to separate, and transfer the upper ethyl acetate phase to a suitable glass container. Evaporate the solvent, dry the residue at 105° for 10 minutes, and use the residue.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Bacterial endotoxins ⟨85⟩—It contains not more than 0.5 USP Endotoxin Unit per mg of dantrolene sodium.

Sterility ⟨71⟩**:** meets the requirements.

Uniformity of dosage units ⟨905⟩**:** meets the requirements.

pH ⟨791⟩—Dissolve the contents of 1 vial in 60 mL of USP Water for Injection. The pH is between 8.8 and 11.0.

Water, *Method Ia* ⟨921⟩**:** not more than 3.0%.

Related compounds—

Mobile phase and *Diluent*—Proceed as directed in the *Assay.*

Standard solution—Transfer 10 mg of USP Dantrolene Related Compound B RS, accurately weighed, into a 50-mL volumetric flask, and dissolve in 2.5 mL of dimethylformamide. Add 2.5 mL of glacial acetic acid, and dilute with acetone to volume to obtain a solution having a known concentration of about 0.2 mg per mL. Dilute with *Diluent* to obtain a solution having a known concentration of about 0.002 mg per mL of dantrolene related compound B.

Test solution—Use the *Assay preparation.*

Chromatographic system—Proceed as directed in the *Assay.* Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections for dantrolene related compound B is not more than 5.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of dantrolene related compound B in the portion of Dantrolene Sodium for Injection taken by the formula:

$$100(r_U / r_S)(C_S / C_T)$$

in which r_U is the peak response for dantrolene related compound B obtained from the *Test solution;* r_S is the corresponding peak response in the *Standard solution;* C_S is the concentration, in mg per mL, of dantrolene related compound B in the *Standard solution;* and C_T is the concentration, in mg per mL, of dantrolene sodium hydrate in the *Test solution.* Not more than 8% of dantrolene related compound B is found.

Other requirements: meets the requirements under *Injections* ⟨1⟩.

Assay—

Buffer—Dissolve 3.3 mg of ammonium acetate in 1 L of water, and adjust with acetic acid to a pH of 4.5 ± 0.1.

Solution A—Prepare a filtered and degassed mixture of *Buffer,* acetonitrile, and glacial acetic acid (120 : 80 : 7).

Solution B—Prepare a filtered and degassed mixture of acetonitrile and water (70 : 30).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B,* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of acetonitrile and water (60 : 40).

In-Process Revision

Standard preparation—Transfer 40 mg of USP Dantrolene RS, accurately weighed, into a 50-mL volumetric flask, and dissolve in 2.5 mL of dimethylformamide. Add 2.5 mL of glacial acetic acid, and dilute with acetone to volume to obtain a solution having a known concentration of about 0.8 mg per mL. Dilute this solution with *Diluent* to obtain a solution having a known concentration of about 0.08 mg per mL of dantrolene.

Assay preparation—Using 70 mL of water for each vial, transfer the entire contents of the required number of vials to a suitable flask necessary to obtain a solution having a known concentration of about 0.1 mg of dantrolene sodium hydrate per mL. Sonicate for 2 to 5 minutes to dissolve the sample. Dilute with *Diluent* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 365-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as in *Table 1*:

Table 1

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–8	100	0	isocratic
8–8.1	100→0	0→100	linear gradient
8.1–13	0	100	isocratic
13–13.1	0→100	100→0	linear gradient
13.1–20	100	0	re-equilibration

Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections for dantrolene is not more than 1.5%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for dantrolene. Calculate the percentage of $C_{14}H_9N_4NaO_5 \cdot 3½H_2O$ in the portion of Dantrolene Sodium for Injection taken by the formula:

$$(399.29/314.25)(r_U/r_S)(C_S/C_U)$$

in which 399.29 and 314.25 are the molecular weights of dantrolene sodium hydrate and dantrolene, respectively; r_U and r_S are the peak responses for dantrolene obtained from the *Assay preparation* and *Standard preparation,* respectively; C_S is the concentration, in mg per mL, of dantrolene in the *Standard preparation;* and C_U is the concentration, in mg per mL, of dantrolene sodium hydrate in the *Assay preparation.* ■1S (*USP30*)

BRIEFING

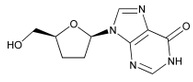
Didanosine, page 1355 of *PF* 31(5) [Sept.–Oct. 2005]. On the basis of comments received, the following revisions are proposed:

1. Clarify the test for *Optical rotation* as a test for *Specific rotation*.
2. Change the acceptance limit for a specified impurity in the test for *Related compounds* based on the regulatory submission.
3. Reformat the formula calculations in the test for *Related compounds* and in the *Assay* based on the recommendations highlighted in a recent stimuli article published on page 626 of *PF* 31(2) [Mar.–Apr. 2005].
4. A note has been added in the test for *Related compounds* and in the *Assay* to report that the relative retention times of components are for information purposes only and not as part of the system suitability requirements. In addition, minor editorial changes have been made in the *Assay.*

(MD-AA: B. Davani) RTS—C43731; C44093

Add the followng:

■Didanosine



$C_{10}H_{12}N_4O_3$ 236.23

Inosine,2′,3′-dideoxy-.

2′,3′-Dideoxyinosine [*69655-05-6*].

» Didanosine contains not less than 98.0 percent and not more than 102.0 percent of $C_{10}H_{12}N_4O_3$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Didanosine RS. USP Didanosine Related Compound A RS. USP Didanosine Related Compound B RS. USP Didanosine System Suitability Mixture RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Water, *Method I* ⟨921⟩**:** not more than 2.0%.

Residue on ignition ⟨281⟩**:** not more than 0.2%.

Heavy metals, *Method II* ⟨231⟩**:** not more than 20 ppm.

~~**Optical rotation** ⟨781⟩~~ **Specific rotation** ⟨781S⟩**:** between –28° and –24°, anhydrous.

Test solution: 10 mg per mL, in water.

Related compounds—

0.01 M Ammonium acetate buffer solution—Prepare as directed in the *Assay.*

Diluent—Adjust the pH of *0.01 M Ammonium acetate buffer solution* with sodium hydroxide to 9, and mix. Prepare a degassed mixture of *0.01 M Ammonium acetate buffer solution* and acetonitrile (19 : 1).

Solution A—Prepare a filtered and degassed mixture of *0.01 M Ammonium acetate buffer solution* and acetonitrile (19 : 1).

Solution B—Prepare a filtered and degassed mixture of *0.01 M Ammonium acetate buffer solution* and acetonitrile (3 : 1).

Standard stock solution A—Dissolve an accurately weighed quantity of USP Didanosine Related Compound A RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.05 mg per mL.

Standard stock solution B—Dissolve an accurately weighed quantity of USP Didanosine RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.025 mg per mL.

Standard stock solution C—Dissolve an accurately weighed quantity of USP Didanosine Related Compound B RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.025 mg per mL.

Standard solution—Transfer 5.0 mL of *Standard stock solution A,* 3.0 mL of *Standard stock solution B,* and 3.0 mL of *Standard stock solution C* into a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix.

System suitability solution—Dissolve an accurately weighed quantity of USP Didanosine System Suitability Mixture RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.5 mg per mL.

Test solution—Transfer about 50 mg of Didanosine, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 2.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–15	100	0	isocratic
15–20	100→0	0→100	linear gradient
20–30	0	100	isocratic
30–35	0→100	100→0	linear gradient
35–45	100	0	re-equilibration

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* ~~didanosine elutes between 6 and 7.5 minutes; the relative retention times are about 1.0 for didanosine, 0.28 for didanosine related compound A, and 2.11 for didanosine related compound B; and~~ the relative standard deviation for replicate injections determined on the didanosine related compound A peak is not more than 2.0%. [NOTE—For information purposes only, didanosine elutes between 6 and 7.5 minutes; the relative retention times are about 1.0 for didanosine, 0.28 for didanosine related compound A, and 2.11 for didanosine related compound B. 5′-Deoxydideoxyadenosine, a potential impurity not added to the solution, elutes at a relative retention time of 3.1 minutes.] Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* ~~the relative retention times are 1.0 for didanosine, 0.39 for inosine, 0.45 for 2′-deoxyinosine, 0.51 for 3′-deoxyinosine, 0.59 for 2′,3′-anhydroinosine, and 0.81 for dideoxydidehydroinosine;~~ the resolution, *R,* between didanosine and dideoxydidehydroinosine is not less than 3.0; and the column efficiency determined on the dideoxydidehydroinosine peak is not less than 6000 theoretical plates. [NOTE—For information purposes only, the relative retention times are about 1.0 for didanosine, 0.39 for inosine, 0.45 for 2′-deoxyinosine, 0.51 for 3′-deoxyinosine, 0.59 for 2′,3′-anhydroinosine, and 0.81 for dideoxydidehydroinosine.]

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for 30 minutes, and measure all of the peak responses. Calculate the percentage of didanosine related compound A, 5′-deoxydideoxyadenosine, and each other impurity in the portion of Didanosine taken by the formula:

~~$10{,}000(C/W)(r_u/r_s)$~~

$$100(C_S/C_U)(r_U/r_S)$$

in which ~~*C* is the concentration, in mg per mL, of USP Didanosine RS or USP Didanosine Related Compound A RS in the *Standard solution; W* is the weight, in mg, of the sample; r_u is the peak response of the *Test solution; and*~~ C_S is the concentration, in mg per mL, of USP Didanosine RS or USP Didanosine Related Compound A RS in the *Standard solution;* C_U is the concentration, in mg per mL, of the *Test solution;* r_U is the peak response of the *Test solution;* and r_S is the peak response of USP Didanosine RS or USP Didanosine Related Compound A RS in the *Standard solution.* Use the peak response of Didanosine in the *Standard solution* to calculate other individual impurities: not more than 0.5% of didanosine related compound A is found; not more than 0.2% of each specified impurity at the relative retention times of about 0.39, ~~0.45,~~ 0.51, 0.59, 0.81, 2.1, and 3.1 is found; not more than 0.3% of a specified impurity at the relative rentention time of 0.45 is found; not more than 0.1% of each other impurity is found; and not more than 1.0% of total impurities is found.

Assay—

0.01M Ammonium acetate buffer solution—Dissolve 1.54 g of ammonium acetate in a 2000-mL volumetric flask, dilute with water to volume, and mix.

In-Process Revision

Mobile phase—Prepare a filtered and degassed mixture of *0.01 M Ammonium acetate buffer solution* and acetonitrile (21 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Didanosine RS in water to obtain a solution containing 0.1 mg per mL.

Assay preparation—Transfer an accurately weighed quantity of 50 mg of Didanosine to a 500-mL volumetric flask. Dissolve in and dilute with water to volume. Mix the sample for 1 hour to dissolve completely before use.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* ~~the relative retention time of didanosine is between 7 and 11 minutes,~~ the column efficiency is not less than 6000 theoretical plates; the tailing factor is not more than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%. [NOTE—For information purposes only, the retention time of didanosine is between 7 and 11 minutes.]

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate ~~the quantity, in mg, of $C_{10}H_{12}N_4O_3$ in the portion of Didanosine taken by the formula:~~

~~$$500C(r_U/r_S)$$~~

the percentage of $C_{10}H_{12}N_4O_3$ in the portion of Didanosine taken by the formula:

$$500(C/W)(100)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Didanosine RS in the *Standard preparation; W* is the weight, in mg, of Didanosine taken for the *Assay preparation;* 100 is the conversion factor to percentage; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP30*)

BRIEFING

Didanosine Tablets, page 1359 of *PF* 31(5) [Sept.–Oct. 2005]. On the basis of comments received, the following revisions are proposed:

1. In the *Labeling* section, change "Label chewable Tablets" to "Label the Tablets" because the title of the monograph does not contain the word "chewable".
2. Delete the TLC test for *Identification* because there is already an HPLC test for this purpose and TLC is not considered as a complementary test in this case.
3. A note has been added in the test for *Related compounds* and in the *Assay* to report that the relative retention times are for information purposes only and not as part of the system suitability requirements.
4. Correct the formula used in the test for *Related compounds.* Additionally, clarification of the storage condition for the *Standard solution* and some editorial changes have been made.

(MD-AA: B. Davani) RTS—C43733

Add the following:

■Didanosine Tablets

» Didanosine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of didanosine ($C_{10}H_{12}N_4O_3$).

Packaging and storage—Preserve in tight containers, and store between 15° and 30°.

Labeling—Label ~~chewable~~ the Tablets to indicate that they are to be chewed before swallowing or dispersed in liquid before administration.

In-Process Revision

USP Reference standards ⟨11⟩—*USP Didanosine RS. USP Didanosine Related Compound A RS.*

Identification—

~~**A:** *Thin-Layer Chromatographic Identification Test* ⟨201⟩—~~

~~*Adsorbent*—Merck silica gel 60 with fluorescent indicator, or equivalent.~~

~~*Test solution*—Place 1 Tablet in sufficient methanol to make a 1 mg per mL solution. Stir to dissolve, and pass through a 0.45 µm filter.~~

~~*Standard solution*—Transfer 10 mg of USP Didanosine RS into a 10 mL volumetric flask. Dissolve in and dilute with methanol to volume.~~

~~*Developing solvent solution:*—A mixture of 1-butanol, methanol, ethyl acetate, and ammonium hydroxide (11 : 3 : 3 : 3).~~

~~*Procedure*—Spot 10 µL each of the *Test solution* and the *Standard solution* onto the chromatographic plate, approximately 2 cm from the bottom and 2 cm apart. Allow the plate to air dry. Place in a chromatographic chamber, and develop, allowing the developing solution to travel at least 10 cm from the spotting line. Allow the plate to air dry. View under shortwave light (254 nm). Didanosine appears as a blue spot.~~

~~**B:**~~ The retention time of the major peak in the chromatogram of the *Diluted assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—[To come.]

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Loss on drying ⟨731⟩—Dry 4 Tablets at 130° for 16 hours: they lose not more than 6% of their weight.

Related compounds—

0.01 M Ammonium acetate buffer solution—Prepare as directed in the *Assay.*

Mobile phase—Prepare a filtered and degassed mixture of *0.01 M Ammonium acetate buffer solution* and methanol (99 : 1).

Standard stock solution—Transfer 25 mg of USP Didanosine Related Compound A RS to a 200-mL volumetric flask. Dissolve in and dilute with water to volume, and mix. [NOTE—Use this solution within 48 hours of preparation.]

Standard solution—Transfer 3 mL of the *Standard stock solution* to a 250-mL volumetric flask. Dilute with water to volume, and mix. [NOTE—Use this solution within 48 hours of preparation of the *Standard stock solution*.]

Test solution—Proceed as directed for the *Assay preparation.*

Diluted test solution—Dilute the *Test solution,* quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a concentration of about 0.1 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a variable wavelength detector set at 275 nm, a 4-mm × 12.5-cm column that contains 5-µm packing L7, and a matching guard column. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard solution* as directed for *Procedure:* ~~the retention time of didanosine related compound A is between 1.5 and 2.5 minutes;~~ the column efficiency is not less than 1000 theoretical plates; and the relative standard deviation for replicate injections is not more than 5.0%. [NOTE—For information purposes only, didanosine related compound A, with the retention time between 1.5 and 2.5 minutes, is hypoxanthine.]

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Diluted test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks, carrying out the chromatography for approximately 30 minutes. Calculate

the percentage of didanosine related compound A in the portion of Tablets taken by the formula:

~~$100(CVDL/N)(r_U/r_S)$~~

$$100(CVD/NL)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Didanosine Related Compound A RS in the *Standard solution;* V is the volume, in mL, of the *Test solution;* D is the dilution factor of the *Diluted test solution;* N is the number of Tablets used to prepare the *Test solution;* L is the label claim of didanosine, in mg per Tablet; and r_U and r_S are the peak responses obtained from the *Diluted test solution* and the *Standard solution,* respectively. Not more than 0.7% of didanosine related compound A is found. Calculate the percentage of any other ~~impurities~~ impurity by the formula:

$$100(r_i/r_s)$$

in which r_i is the peak response of any other individual impurity obtained upon chromatographing the *Diluted test solution;* and r_s is the sum of the responses of all the peaks in the chromatogram of the *Diluted test solution,* including those of didanosine and hypoxanthine: not more than 0.2% of any other individual impurity is found; and not more than 1.2% of total impurities, excluding hypoxanthine, is found.

Assay—

0.01 M Ammonium acetate buffer solution—Dissolve 1.54 g of ammonium acetate in a 2000-mL volumetric flask, dilute with water to volume, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *0.01 M Ammonium acetate buffer solution* and methanol (95 : 5). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Didanosine RS in water to obtain a solution containing 0.1 mg per mL. [NOTE—Use this solution within 24 hours of preparation.]

Assay preparation—Transfer not fewer than 5 crushed Tablets to a 500-mL volumetric flask. Dissolve in 250 mL of water, dilute with water to volume, and shake for about 10 minutes.

Diluted assay preparation—Dilute the *Assay preparation,* quantitatively, and stepwise if necessary, with water to obtain a solution containing about 0.1 mg of didanosine per mL. [NOTE—Use this solution within 72 hours of preparation; because of the buffering agents in the Tablets, the *Assay preparation* is stable longer than the *Standard preparation.*]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a variable wavelength detector set at 275 nm, a 4-mm × 12.5-cm column that contains 5-µm packing L7, and a matching guard column. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* ~~the retention time of didanosine is greater than 3.0 minutes;~~ the column efficiency is not less than 2000 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%. [NOTE—For information purposes only, the retention time of didanosine is greater than 3.0 minutes.]

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Diluted assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg per Tablet, of didanosine ($C_{10}H_{12}N_4O_3$) taken by the formula:

$$[CVD(r_U/r_S)]/N$$

in which C is the concentration, in mg per mL, of USP Didanosine RS in the *Standard preparation;* V is the volume, in mL, of the *Assay preparation;* D is the dilution factor of the *Diluted assay preparation;* r_U and r_S are the peak responses of the *Diluted assay preparation* and the *Standard preparation,* respectively; and N is the number of Tablets used to prepare the *Assay preparation.* ■1S (*USP30*)

In-Process Revision

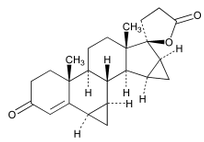
BRIEFING

Drospirenone, page 754 of *PF* 31(3) [May–June 2005]. It is proposed to revise this monograph to correct the chemical structure and chemical formula and to provide additional information in the test for *Specific rotation*. It is also proposed to revise the test for *Chromatographic purity* to correct the injection volume and the formula and to delete the relative response factors because they are not used in the formula. In addition, a minor editorial correction has been made in the *Assay*.

(MD-PS: D. Bempong) RTS—C43347; C43739; C43756

Add the following:

■Drospirenone



~~$C_{24}H_{30}O_3 \cdot 5H_2O$~~

$C_{24}H_{30}O_3$ 366.49

(6*R*,7*R*,8*R*,9*S*,10*R*,13*S*,14*S*,15*S*,16*S*,17*S*)-1,3′,4′,6,6a,7,8,9,10,11,12,13,14,15,15a,16-Hexadecahydro-10,13-dimethylspiro-[17*H*-dicyclopropa[6,7 : 15,16]-cyclopenta[*a*]phenanthrene-17,2′(5′*H*)-furan]-3,5′(2*H*)-dione.

17-Hydroxy-6β,7β: 15β,16β-dimethylene-3-oxo-17α-pregn-4-ene-21-carboxylic acid, γ-lactone [*67392-87-4*].

» Drospirenone contains not less than 98.0 percent and not more than 102.0 percent of $C_{24}H_{30}O_3$, calculated on the anhydrous, solvent-free basis.

Packaging and storage—Preserve in tight containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Drospirenone RS.*

Identification—

A: *Infrared Absorption* ⟨197M⟩.

B: The retention time of the major peaks in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Melting range, *Class 1* ⟨741⟩: between 198° and 203°. [NOTE—Dry over silica gel for not less than 24 hours prior to testing.]

Specific rotation ⟨781S⟩**:** between –186° and –196° on the anhydrous and solvent-free basis (10 mg per mL in methanol).

Water, *Method I* ⟨921⟩**:** not more than 0.2%.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩**:** not more than 0.002%.

Organic volatile impurities, *Method IV* ⟨467⟩**:** meets the requirements.

Solvent—Use dimethylformamide.

Limit of 1,2-dimethoxyethane and diisopropyl ether—

Standard solution—Prepare a solution of 1,2-dimethoxyethane and diisopropyl ether in dimethylformamide to obtain a solution having known concentrations of about 0.1 mg per mL and 0.05 mg per mL, respectively.

Test solution—Dissolve an accurately weighed portion of Drospirenone in dimethylformamide to obtain a solution having a known concentration of about 50 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a headspace injector, a flame-ionization detector, and a 0.25-mm × 30-m capillary column coated with a 1.4-µm film of liquid phase G43. The column temperature is programmed according to the following steps: it is held at 40° for 10 minutes, then increased at a rate of 5° per minute to 70°; it is then increased at a rate of 30° per minute to 220°. The injection port temperature is maintained at 160°, and the detector

In-Process Revision

temperature is maintained at 250°. The carrier gas is helium, flowing at a rate of about 32 ± 8 cm per second. [NOTE—For pressure-controlled systems, a column pressure of approximately 130 kPa will be necessary.] Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.6 for diisopropyl ether and 1.0 for 1,2-dimethoxyethane; and the relative standard deviation for the *Standard solution* is not more than 4.0%.

Procedure—Transfer 2.0 mL each of the *Test solution* and the *Standard solution* to separate headspace vials, and seal. The vials are maintained at 80° for 60 minutes prior to headspace injection. Record the chromatograms, and measure the peak areas for the 1,2-dimethoxyethane and diisopropyl ether peaks. Separately calculate the percentage of 1,2-dimethoxyethane and diisopropyl ether in the portion of Drospirenone taken by the formula:

$$100(C_S/C_U)(r_U/r_S)$$

in which C_S is the concentration, in mg per mL, of 1,2-dimethoxyethane or diisopropyl ether in the *Standard solution;* C_U is the concentration, in mg per mL, of Drospirenone in the *Test solution;* and r_U and r_S are the 1,2-dimethoxyethane or diisopropyl ether peak areas in the chromatograms obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.2% of 1,2-dimethoxyethane and 0.1% of diisopropyl ether are found.

Chromatographic purity—

Solution A, Solution B, Mobile phase, Diluent, and *Chromatographic system*—Prepare as directed in the *Assay.*

Standard solution—Prepare as directed for the *Standard preparation* in the *Assay.*

Test solution—Prepare as directed for the *Assay preparation* in the *Assay.*

Procedure—Separately inject equal volumes (about ~~10 L~~ 10 µL) of the *Standard solution,* the *Test solution,* and the ~~*Diluting solution*~~ *Diluent* into the chromatograph, and record the chromatograms. Calculate the percentage of each impurity in the portion of Drospirenone taken by the formula:

~~$100F(r_i/r_s)$~~

$$100(r_i/r_s)$$

in which ~~*F* is the relative response factor equal to 1.3 for 15β,16β methylene 3-oxo-4,6-pregnadiene-21,17-carbolactone with a relative retention time of 0.78, 0.5 for 15β,16β-methylene-3-oxo-17α-pregn-4-ene-21,17-carbolactone with a relative retention time of 0.73, and 1.0 for all other impurities;~~ r_i is the peak area for each impurity; and r_s is the sum of the responses of all the peaks. Disregard peaks that are less than 0.05% of the drospirenone peak. Not more than 0.1% of any individual impurity is found; and not more than 0.4% of total impurities is found.

Assay—

Solution A—Use water.

Solution B—Use acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B,* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a degassed mixture of water and acetonitrile (1 : 1).

Standard preparation—Dissolve accurately weighed quantities of USP Drospirenone RS in *Diluent* to obtain a solution having known concentrations of about 2 mg per mL.

Assay preparation—Transfer about 20 mg of Drospirenone, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 245-nm detector and a 4.0-mm × 25-cm column containing 5-µm packing L1 that is maintained at a constant temperature of about 30°. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–28.5	64	36	isocratic
28.5–45	64→10	36→90	linear gradient
45–45.5	10→0	90→100	linear gradient
45.5–52	0	100	isocratic
52–53	0→64	100→36	linear gradient
53–80	64	36	re-equilibration

Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 7000 theoretical plates; the tailing factor is not more than 2.5; and the relative standard deviation for replicate injections is not more than 1.0%. No peaks with a signal-to-noise ratio greater than 10 should be present in the chromatogram of the ~~*Diluting solution*~~ *Diluent* between 5 and 45 minutes.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the response for the drospirenone peak. Calculate the quantity, in mg, of $C_{24}H_{30}O_3$ in the portion of Drospirenone taken by the formula:

$$10C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Drospirenone RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■1S (*USP30*)

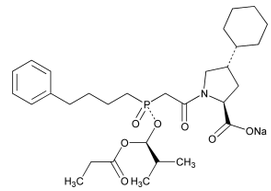
BRIEFING

Fosinopril Sodium, page 110 of *PF* 32(1) [Jan.–Feb. 2006]. On the basis of comments received, it is proposed to add two additional impurities to the table in the test for *Related compounds*. In accordance with the originator's NDA submission, the limits for those impurities are 0.3% for *Impurity 1* and 0.2% for *Impurity 2*.

(MD-CV: S. Ramakrishna) RTS—C44484

Add the following:

■Fosinopril Sodium



$C_{30}H_{45}NNaO_7P$ 585.64

L-Proline, 4-cyclohexyl-1-[[[2-methyl-1-(1-oxopropoxy)propoxy](4-phenylbutyl)phosphinyl]acetyl]-, sodium salt, [1[*S*(R*)*],2α,4β]-.

(4*S*)-4-Cyclohexyl-1-[*(R)*-[*(S)*-1-hydroxy-2-methylpropoxy](4-phenylbutyl)phosphinyl]acetyl-L-proline propionate (ester), sodium salt [*88889-14-9*].

» Fosinopril Sodium contains not less than 97.5 percent and not more than 102.0 percent of $C_{30}H_{45}NNaO_7P$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight containers, and store at controlled room temperature.

Related compounds—

TEST 1—

Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Test solution—Use the *Assay preparation*.

Procedure—Proceed as directed in the *Assay,* and measure the areas for each component in the chromatogram obtained, carrying out the chromatography to four times the retention time of the fosinopril sodium peak. Calculate the percentage of each individual related compound by the formula:

$$100(r_i / r_s)$$

in which r_i is the response of any individual peak, other than the fosinopril sodium peak; and r_s is the sum of the responses of all the peaks. [NOTE—If present, two more diastereomers may not be resolved from fosinopril related compound B by this method. These peaks, appearing at a relative retention time of 0.7, should be integrated together to determine conformance with the limit in *Table 1*.]

Table 1

Relative Retention Time	Fosinopril Related Compound	Test	Limit (%)
2.0	A[1]	1	0.3
0.7	B[2]	1	1.0
1.2	C[3]	2	0.3
1.3	D[4]	2	0.3
0.8	E[5]	3	0.3
0.9	F[6]	3	0.3
0.12	Impurity 1[7]	1	0.3
0.24	Impurity 2[8]	1	0.2

[1] (4*S*)-4-Cyclohexyl-1-[(4-phenylbutyl)phosphinyl]acetyl-L-proline
[2] (4*R*)-4-Cyclohexyl-1-[*(R)*-[*(S)*-1-hydroxy-2-methylpropoxy](4-phenylbutyl)phosphinyl]acetyl-D-proline propionate (ester)

[8] 2-(*(RS)*-(*(SR)*-2-Methyl-1-(propionyloxy)propoxy)(4-phenylbutyl)-phosphinyl)acetic acid

TEST 2—

Mobile phase—Prepare a degassed mixture of acetonitrile, water, and phosphoric acid (4000 : 15 : 2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Resolution solution—Transfer about 1 mg each of USP Fosinopril Sodium RS, USP Fosinopril Related Compound C RS, and USP Fosinopril Related Compound D RS to a 100-mL volumetric flask. Dissolve in and dilute with the *Standard solution* to volume, and mix.

Test solution—Use the *Assay preparation.*

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 25-cm column that contains packing L12. The column temperature is maintained at 45°. The flow rate is about 0.9 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between fosinopril sodium and fosinopril related compound C is not less than 1.5.

Procedure—Inject about 20 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak areas, carrying out the chromatography to two times the retention time of the fosinopril sodium peak. Calculate the percentages of fosinopril related compound C and fosinopril related compound D only by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response of fosinopril related compound C or fosinopril related compound D; and r_s is the sum of the responses of all the peaks.

TEST 3—

0.2% Phosphoric acid solution—Prepare a 1 in 500 solution of phosphoric acid.

Mobile phase—Prepare a degassed mixture of acetonitrile and *0.2% Phosphoric acid solution* (560 : 440). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—Transfer about 1 mg each of USP Fosinopril Sodium RS, USP Fosinopril Related Compound E RS, and USP Fosinopril Related Compound F RS to a 100-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix.

Test solution—Transfer about 10 mg of Fosinopril Sodium, accurately weighed, to a 50-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 205-nm detector and a 4.6-mm × 25-cm column that contains packing L11. The column temperature is maintained at 45°. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between fosinopril related compound F and fosinopril sodium is not less than 1.5, and the resolution between fosinopril related compound E and fosinopril related compound F is not less than 1.5.

Procedure—Inject about 20 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak areas, carrying out the chromatography to four times the retention time of the fosinopril sodium peak. Calculate the percentages of fosinopril related compound E and fosinopril related compound F only, ~~by~~ using the formula below:

$$100(r_i / r_s)$$

in which r_i is the peak response of fosinopril related compound E or fosinopril related compound F; and r_s is the sum of the responses of all the peaks. In addition to not exceeding the limits for impurities in *Table 1,* not more than 0.1% of any other individual impurity is found (calculated as directd for the *Procedure* in TEST 1); and not more than 1.5% of total impurities is found.

~~**Organic volatile impurities,** *Method I*~~ **Residual solvents** ⟨467⟩**:** meets the requirements.

Assay—

Mobile phase—Prepare a degassed mixture of acetonitrile, water, and phosphoric acid (2000 : 10 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Transfer about 10 mg of USP Fosinopril Sodium RS, and about 1 mg each of USP Fosinopril Related Compound A RS and USP Fosinopril Related Compound B RS to a 100-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix.

Standard preparation—Dissolve an accurately weighed quantity of USP Fosinopril Sodium RS in *Mobile phase* to obtain a solution having a known concentration of about 0.10 mg per mL.

Assay preparation—Transfer about 25 mg of Fosinopril Sodium, accurately weighed, to a 250-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 214-nm detector and a 3.9-mm × 15-cm column that contains packing L3. The column temperature is maintained at 33°. The flow rate is about 1.2 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between fosinopril related compound B and fosinopril sodium is not less than 2.0; and the relative standard deviation of the fosinopril sodium peak response for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in mg, of $C_{30}H_{45}NNaO_7P$ in the portion of Fosinopril Sodium taken by the formula:

$$250C_S(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Fosinopril Sodium RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard prepapration,* respectively. ■1S (*USP30*)

In-Process Revision

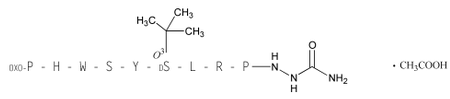
BRIEFING

Goserelin Acetate, page 1637 of *PF* 31(6) [Nov.–Dec. 2005]. On the basis of comments received, it is proposed to add definite requirements on chemical shift differences in the test for *Amino acid content.*

(BB PP: L. Callahan) RTS—C44471

Add the following:

▲Goserelin Acetate



$C_{59}H_{84}N_{18}O_{14} \cdot xC_2H_4O_2$

Luteinizing hormone-releasing factor (pig), 6-[*O*-(1,1-dimethylethyl)-D-serine]-10-deglycinamide-, 2-(aminocarbonyl)hydrazide, acetate (salt) [*145781-92-6*].

1-(5-Oxo-L-prolyl-L-histidyl-L-tryptophyl-L-seryl-L-tyrosyl-*O-tert*-butyl-D-seryl-L-leucyl-L-arginyl-L-prolyl)semicarbazide (Goserelin) 1269.41 [*65807-02-5*].

» Goserelin Acetate is a synthetic nonapeptide analog of the hypothalmic decapeptide, gonadorelin. It is obtained by chemical synthesis and is available as an acetate salt. It contains not less than 94.5 percent and not more than 103.0 percent of goserelin ($C_{59}H_{84}N_{18}O_{14}$), calculated on the anhydrous and acetic acid-free basis.

Packaging and storage—Preserve in a tight, light-resistant container, and store in a refrigerator.

USP Reference standards ⟨11⟩—*USP Endotoxin RS. USP Goserelin Acetate RS. USP Goserelin Related Compound A RS. USP Goserelin Validation Mixture RS.*

~~**Identification—**~~

~~**A:** *Nuclear Magnetic Resonance* ⟨761⟩—~~

~~*Standard solution*—Prepare a 10% w/v solution of USP Goserelin Acetate RS in deuterium oxide, and adjust with deuterated acetic acid-d4 to a pH of 4.~~

~~*Test solution*—Prepare a 10% w/v solution of Goserelin Acetate in deuterium oxide, and adjust with deuterated acetic acid-d4 to a pH of 4.~~

~~*Procedure*—Obtain a ^{13}C, proton decoupled NMR spectrum of both the *Standard solution* and the *Test solution*. The spectra from both solutions should be qualitatively similar, and all the resonances from the spectrum of the *Standard solution* should be present in the spectrum of the *Test solution* and have the same chemical shift values; any other resonances in the spectrum of the *Test solution* should be identified.~~

~~**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay*.~~

Specific rotation ⟨781S⟩**:** between –52° and –56°.

Test solution: 2 mg per mL, in water, calculated on the anhydrous and acetic acid-free basis.

Bacterial endotoxins ⟨85⟩—It contains not more than 16 USP Endotoxin Units of goserelin per mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

Water, *Method I* ⟨921⟩**:** not more than 10.0%.

Limit of acetic acid—

Mobile phase—Transfer 49.04 g of sulfuric acid to a 1000-mL volumetric flask, dilute with water to volume, and mix. Accurately transfer 20 mL of this solution to a 2000-mL volumetric flask, dilute with water to volume, mix, filter, and degas.

Test solution—Dissolve about 20 mg of Goserelin Acetate, accurately weighed, in 2 to 3 mL of *Mobile phase*. Connect a 1-mL cartridge containing L44 packing to a 1-mL cartridge containing L2 packing, which is then attached to a suitable vacuum apparatus. With the vacuum applied, wash the cartridge combination with 2 mL of methanol followed by 15 mL of *Mobile phase,* and discard the washings. Quantitatively apply the solution containing Goserelin Acetate to the cartridge combination, and wash through the cartridge system with several small volumes of *Mobile phase*. Collect the solution and washings in a 10-mL volumetric flask, and dilute with *Mobile phase* to volume.

Standard solution—Transfer 2.0 mL of glacial acetic acid to a 500-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a standard stock solution. Transfer 5.0 mL of the standard stock solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—[NOTE—Condition the column for about 24 hours until a stable baseline is obtained.] The liquid chromatograph is equipped with a 206-nm detector and a 7.8-mm × 30-cm column that contains packing L17. The column temperature is maintained at 65°, and the flow rate is about 0.8 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the retention time is about 11 minutes for acetic acid; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 3.1%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of acetic acid in the portion of Goserelin Acetate taken by the formula:

$$(1.049/5)(r_U / r_S)(1/W)$$

in which 1.049 is the weight, in g per mL, of glacial acetic acid; r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; and W is the sample weight of Goserelin Acetate, in g, taken to prepare the *Test solution* and corrected (for purposes of the calculation) to eliminate the water content, which is determined immediately prior to the test. The content of acetic acid is between 4.5% and 15.0%.

In-Process Revision

Related compounds—

Mobile phase, Resolution solution, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution and *Diluted standard solution*—Use the *Standard preparation* and the *Diluted standard preparation,* respectively, prepared as directed in the *Assay.*

Test solution—Use the *Assay preparation*.

Diluted test solution—Transfer 1 mL of the *Test solution* into a 100-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Separately inject equal volumes (about 10 µL) of the *Test solution, Diluted test solution, Resolution solution,* and *System suitability solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of goserelin-related impurities in the portion of Goserelin Acetate taken by the formula:

$$r_i / r_S$$

in which r_i is the peak area response for any individual impurity in the *Test solution;* and r_S is the peak area response of the main goserelin peak in the *Diluted test solution:* not more than 1.0% of decarbamoylgoserelin is found, not more than 0.5% of any other impurity is found, and not more than 2.5% of total impurities is found.

Change to read:

Amino acid content, *Nuclear Magnetic Resonance* ⟨761⟩—[NOTE—Concentrations of goserelin in both the *Standard solution* and the *Test solution* must be the same (within 5% of each other) but can be adjusted based on the quality of the ^{13}C spectrum obtained. The spectra must be acquired under the same conditions for both the *Standard solution* and the *Test solution*. The spectra obtained are of sufficient quality to allow quantification of the integrals of the resonances specified below to be obtained. Integrals and spectra of both the *Standard solution* and the *Test solution* can be repeated and averaged.]

Standard solution—Dissolve USP Goserelin Acetate RS in deuterium oxide to obtain a solution having a known concentration of about 10% w/v, and adjust with deuterated acetic acid-d4 to a pH of 4.

Test solution—Prepare a 10% w/v solution of Goserelin Acetate in deuterium oxide, and adjust with deuterated acetic acid-d4 to a pH of 4.

Procedure—Obtain a ^{13}C, proton-decoupled NMR spectrum of both the *Standard solution* and the *Test solution*. The spectra from both solutions are qualitatively similar, and all the resonances from the spectrum of the *Standard solution* are present in the spectrum of the *Test solution* and have the same chemical shift values ■(±0.1 ppm for goserelin, ±0.5 ppm for acetate);■1S *(USP30)* identify any other resonances in the spectrum of the *Test solution.* The relative amino acid ratio between the *Standard solution* and the *Test solution* can be calculated as follows. Integrate the resonances at the approximate ppm corresponding to each amino acid in the following table.

Amino Acids	Resonances (ppm)
Azo-glycine	162.2
Histidine	118.4
Tyrosine	116.7
tert-Butyl serine	62.5
Serine	62.2
Tryptophan	55.7
Arginine	41.8
Pyroglutamic acid	26.3
Proline	26.0
Leucine	23.5

In-Process Revision

Calculate the ratio of each of the amino acids from the integrals of the *Standard solution* and the *Test solution* by the formula:

$$r_U / r_S$$

in which r_U and r_S are the integrals of the resonances of a designated amino acid obtained from the *Test solution* and the *Standard solution,* respectively. The resulting ratios fall within the following limits: histidine, tyrosine, *tert*-butyl serine, serine, tryptophan, arginine, pyroglutamic acid, proline, and leucine 0.9 to 1.1; azo-glycine 0.8 to 1.2.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and trifluoroacetic acid (1600 : 400 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve the contents of a vial of USP Goserelin Validation Mixture RS with 1 mL of water.

Standard preparation—Dissolve an accurately weighed quantity of USP Goserelin Acetate RS in water to obtain a solution having a known concentration of about 1 mg per mL.

Diluted standard preparation—Transfer 1 mL of the *Standard preparation* to a 10–mL volumetric flask, dilute with water to volume, and mix.

Resolution solution—Dissolve the contents of a vial of USP Goserelin Related Compound A RS in water to obtain a concentration of 0.1 mg per mL, and mix with an equal volume of *Diluted standard preparation.*

Assay preparation—Transfer about 25 mg of Goserelin Acetate, accurately weighed, to a 25-mL volumetric flask. Dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains 3.5-µm packing L1. The column temperature is maintained between 50° and 55°, and the flow rate is about 1 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the retention time for goserelin is between 40 and 50 minutes, the relative retention times are about 0.67 for 4-D-ser-goserelin, 0.89 for decarbamoylgoserelin, 0.92 for 5-D-tyr-goserelin, 0.94 for 2-D-his-goserelin, and 1.0 for goserelin; and the resolution, *R,* between 4-D-ser-goserelin and goserelin is not less than 7.0. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* two peaks, corresponding to decarbamoylgoserelin and 2-D-his-goserelin and eluting prior to the principal peak, are visible; three peaks eluting after the principal peak are visible; the column efficiency for the principal peak is not less than 2000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of goserelin ($C_{59}H_{84}N_{18}O_{14}$) in the portion of Goserelin Acetate taken (where sample weight has been corrected for water and acetic acid content, both determined immediately prior to the assay) by the formula:

$$25C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Goserelin Acetate RS in the *Standard preparation;* and r_U and r_S are the goserelin peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ▲*USP30*

Assay—

Mobile phase—Dilute 0.7 mL of phosphoric acid with water to obtain 1000 mL of 0.01 M phosphoric acid. Prepare a mixture of this solution and acetonitrile (63 : 37). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of acetonitrile and water (1 : 1).

Internal standard solution—Prepare a solution of benzophenone in acetonitrile containing about 3.2 mg per mL.

Standard preparation—Quantitatively dissolve an accurately weighed quantity of USP Ibuprofen RS in *Diluent* to obtain a stock solution having a known concentration of about 1.2 mg per mL. Transfer 20.0 mL of this stock solution and 5.0 mL of *Internal standard solution* to a 50-mL volumetric flask, dilute with acetonitrile to volume, mix, and filter. This solution contains about 0.48 mg of ibuprofen per mL.

Density—Using a tared 50-mL volumetric flask, weigh 50 mL of Oral Suspension that has been previously well shaken to ensure homogeneity, allow to stand until the entrapped air has risen, and finally invert carefully just prior to transferring it to the volumetric flask. From the observed weight of 50 mL of the Oral Suspension, calculate the density, in g per mL, of the Oral Suspension.

Assay preparation—Transfer an accurately weighed portion of Oral Suspension, equivalent to about 60 mg of ibuprofen, to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix (stock solution). Transfer 20.0 mL of this stock solution and 5.0 mL of *Internal standard solution* to a second 50-mL volumetric flask, dilute with acetonitrile to volume, mix, and filter. [NOTE—Retain a portion of the stock solution for use in the test for ~~*Limit of 4-isobutylacetophenone*~~

■*Limit of ibuprofen related compound C.*]■1S *(USP30)*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L7. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.9 for benzophenone and 1.0 for ibuprofen; the resolution, *R,* between benzophenone and ibuprofen is not less than 1.5; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $C_{13}H_{18}O_2$ in each mL of the Oral Suspension taken by the formula:

$$125C(D/W_U)(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Ibuprofen RS in the *Standard preparation; D* is the density, in g per mL, of Oral Suspension; W_U is the weight, in g, of the portion of Oral Suspension taken to prepare the *Assay preparation;* and R_U and R_S are the ratios of the ibuprofen peak areas to the benzophenone peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.

In-Process Revision

Identification—

A: *Infrared Absorption* ⟨197K⟩—

Test specimen: Transfer 1 Tablet into a suitable vial. Add 10 mL of methanol, and sonicate for 10 minutes. Pass the solution through a glass microfiber membrane filter having a 0.45-µm or finer porosity, and evaporate to dryness, using a stream of nitrogen. Mix approximately 1 mg of the residue with approximately 250 mg of potassium bromide, and mix well to obtain a homogenous mixture. The IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of a potassium bromide dispersion of a similar preparation using USP Irbesartan RS.

B: The relative retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: ~~0.01 N hydrochloric acid~~ 0.1 N hydrochloric acid; ~~900 mL~~ 1000 mL.

Apparatus 2: 50 rpm.

Time: ~~45 minutes~~ 20 minutes.

Procedure—Determine the amount of ($C_{25}H_{28}N_6O$) dissolved by employing UV absorption at the wavelength of maximum absorbance at about ~~254 nm on filtered portions of the solution under test,~~ 244 nm on portions of the solution under test, passed through a 0.45-µm filter of acrylic copolymer on a nylon support,* and suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Irbesartan RS in the same *Medium*. Calculate the amount of ($C_{25}H_{28}N_6O$) dissolved, in percentage, by the formula:

$$\frac{A_U \times C_S \times 1000 \times 100}{A_S \times L}$$

in which A_U and A_S are the absorbances obtained from the solution under test and the Standard solution, respectively; C_S is the concentration, in mg per mL, of the Standard solution; 1000 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and L is the label claim, in mg, of irbesartan.

Tolerances—Not less than ~~75%~~ 80% *(Q)* of the labeled amount of ($C_{25}H_{28}N_6O$) is dissolved in ~~45 minutes~~ 20 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

~~**Chromatographic purity**~~

~~*Diluent, Mobile phase, Standard preparation,* and *Chromatographic system*—Proceed as directed in the *Assay.* under *Irbesartan.*~~

~~*Test solution*—Use the *Assay preparation.*~~

~~*Procedure*—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:~~

~~$100(r_i/r_s)$~~

~~in which r_i is the peak response for each impurity; and r_s is the sum of the responses of all the peaks: not more than 1.0% of any individual impurity is found, and not more than 2.0% of total impurities is found.~~

Related compounds—

Buffer solution, Mobile phase, System suitability preparation, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Test solution—Use the *Assay preparation.*

In-Process Revision

* A suitable filter is Acrodisc, manufactured by Gelman Sciences and distributed by Pall Corp. (www.pall.com).

Procedure—Inject a volume of about 15 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each impurity; and r_s is the sum of the responses of all the peaks: not more than 0.3% of irbesartan related compound A is found; not more than 0.2% of any individual impurity is found; and not more than 0.6% of total impurities is found.

Assay—

~~*Diluent, Triethylamine solution, and Mobile phase*—Proceed as directed in the *Assay* under *Irbesartan.*~~

~~*Diluent*—Prepare a solution of phosphoric acid (1 in 100).~~

~~*Triethylamine solution*—Add 1.0 mL of triethylamine to 1000 mL of water, mix, and adjust with phosphoric acid to a pH of 3.5.~~

~~*Mobile phase*—Prepare a filtered and degassed mixture of *Triethylamine solution* and acetonitrile (1 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~

~~*Standard preparation*—Dissolve an accurately weighed quantity of USP Irbesartan RS in *Diluent* to obtain a solution having a known concentration of about 0.1 mg per mL.~~

~~*Assay preparation*—Weigh and finely powder not fewer than 30 Tablets. Transfer an accurately weighed portion of powder, equivalent to about 10 mg of irbesartan, to a 100-mL volumetric flask. Add about 80 mL of *Diluent,* and stir on a magnetic stir plate for 15 minutes. Dilute with *Diluent* to volume, and mix. Centrifuge a portion of this solution for 10 minutes, and use the clear supernatant.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay* under *Irbesartan.* The liquid chromatograph is equipped with a fluorometric detector that has an excitation wavelength of 250 nm and an emission wavelength of 371 nm, and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 1000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.~~

Buffer solution—Dilute about 5.5 mL of phosphoric acid in approximately 950 mL of water, and add triethylamine, slowly and dropwise, to adjust to a pH of 3.0. Further dilute this solution with water to a final volume of 1 L.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (60 : 40). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability preparation—Dissolve accurately weighed quantities of USP Irbesartan RS and USP Irbesartan Related Compound A RS in methanol to obtain a solution having a known concentration of about 0.1 mg per mL of each of the USP Reference Standards.

Standard preparation—Dissolve an accurately weighed quantity of USP Irbesartan RS in methanol to obtain a solution having a known concentration of about 0.15 mg per mL.

Assay preparation—Weigh and finely powder not fewer than 5 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 15 mg of irbesartan, to a 100-mL volumetric flask. Add methanol up to about three-fourths of the volume of the flask. Sonicate for 15 minutes, with stirring at 5-minute intervals. Dilute with methanol to volume, and pass a portion of this solution through a glass microfiber membrane filter having a 0.45-µm or finer porosity.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1.

The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between irbesartan and irbesartan related compound A is not less than 2.0. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for five replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about ~~20~~ 15 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of irbesartan ($C_{25}H_{28}N_6O$) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Irbesartan RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP30*)

BRIEFING

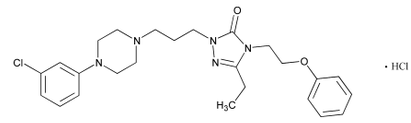
Nefazodone Hydrochloride, page 1094 of *PF* 31(4) [July–Aug. 2005]. It is proposed to correct the relative retention times for nefazodone related compound A and nefazodone related compound B in the *Chromatographic system* in the *Related compounds* test, which were inadvertently switched. It is also proposed to indicate in the same test that the relative retention times provided are intended for information purposes only. In the absence of any significant adverse comment, it is proposed to implement this revision via the *Fifth Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of October 1, 2006.

(MD-PP: R. Ravichandran) RTS—C44415

In-Process Revision

Add the following:

■Nefazodone Hydrochloride



$C_{25}H_{32}ClN_5O_2 \cdot HCl$ 506.47

3*H*-1,2,4-Triazol-3-one, 2-[3-[4-(3-chlorophenyl)-1-piperazinyl]propyl]-5-ethyl-2,4-dihydro-4-(2-phenoxyethyl)-, monohydrochloride.

1-[3-[4-(*m*-Chlorophenyl)-1-piperazinyl]propyl]-3-ethyl-4-(2-phenoxyethyl)-Δ^2-1,2,4-triazolin-5-one monohydrochloride [*82752-99-6*].

» Nefazodone Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of $C_{25}H_{32}ClN_5O_2 \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers. Store at a temperature between 15° and 30°.

USP Reference standards ⟨11⟩—*USP Nefazodone Hydrochloride RS. USP Nefazodone Related Compound A RS. USP Nefazodone Related Compound B RS.*

Completeness of solution ⟨641⟩—A solution of 25 mg per mL in methanol meets the requirements.

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: A solution of 10 mg per mL meets the requirements of the test for *Chloride* ⟨191⟩.

Loss on drying ⟨731⟩—Dry it in vacuum at 105° for 3 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩: not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩: 0.001%.

Add the following:

•Related compounds—

Diluent—Prepare a solution of water and acetonitrile (50 : 50).

Solution A—Dissolve 0.77 g of ammonium acetate in about 950 mL of water. Adjust with triethylamine to a pH of 7.10 ± 0.05. Dilute with water to 1 L. Filter and degas.

Solution B—Use filtered and degassed acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Dissolve an accurately weighed amount of USP Nefazodone Hydrochloride RS in *Diluent* to obtain a solution containing 0.1 mg per mL of nefazodone hydrochloride.

Nefazodone related compound A stock solution and *Nefazodone related compound B stock solution*—Transfer about 20 mg each of USP Nefazodone Related Compound A RS and USP Nefazodone Related Compound B RS, accurately weighed, into separate 200-mL volumetric flasks. Dissolve in and dilute with *Diluent* to volume.

Resolution solution—Pipet 5.0 mL of *Nefazodone related compound A stock solution* and 5.0 mL of *Nefazodone related compound B stock solution* into a 100-mL volumetric flask. Dilute with *Standard stock solution* to volume, and mix. This solution contains about 90 µg per mL of nefazodone hydrochloride, and about 5 µg per mL each of nefazodone related compounds A and B.

Standard solution—Pipet 2.0 mL each of the *Standard stock solution, Nefazodone related compound A stock solution,* and *Nefazodone related compound B stock solution* into a 200-mL volumetric flask. Dilute with *Diluent* to volume, and mix well to obtain a final concentration of 1 µg per mL each of nefazodone hydrochloride, nefazodone related compound A, and nefazodone related compound B.

Test solution—Transfer about 100 mg of Nefazodone Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 250-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.7 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	50	50	equilibration
0–10	50→45	50→55	linear gradient
10–16	45→35	55→65	linear gradient
16–25	35	65	isocratic
25–26	35→50	65→50	linear gradient
26–35	50	50	re-equilibration

Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* ~~the relative retention times are about 0.94 for nefazodone related compound A, 1.0 for nefazodone hydrochloride, and 1.2 for nefazodone related compound B.~~ the resolution, *R,* between nefazodone related compound A and nefazodone hydrochloride is not less than 1.5, and it is not less than 4.0 between nefazodone hydrochloride and nefazodone related compound B. Chromatograph the *Standard solution,* and measure the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 5.0% for nefazodone related compound A and nefazodone related compound B. [NOTE—For identification purposes, the approximate relative retention times are about 1.2 for nefazodone related compound A, 1.0 for nefazodone hydrochloride, and 0.94 for nefazodone related compound B.]

Procedure—Inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each nefazodone related compound in the portion of Nefazodone Hydrochloride taken by the formula:

$$100(C_S / C_T)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of the relevant USP Reference Standard in the *Standard solution;* C_T is the concentration of Nefazodone Hydrochloride, in mg per mL, in the *Test solution;* and r_U and r_S are the peak areas of the corresponding nefazodone related compound obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.2% of nefazodone related compound A is found; not more than 0.2% of nefazodone related compound B is found; not more than 0.1% of any unknown impurity is found; and not more than 0.5% of total impurities is found. [NOTE—Use the peak area for nefazodone hydrochloride in the *Standard solution* as r_S to calculate any unknown impurity.]•S

Organic volatile impurities, *Method I* ⟨467⟩**:** meets the requirements.

Assay—Dissolve about 800 mg of Nefazodone Hydrochloride, accurately weighed, in 50 mL of glacial acetic acid, and add 15 mL of 3% (v/v) mercuric acetate in glacial acetic acid. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N perchloric acid VS is equivalent to 50.65 mg of $C_{25}H_{32}ClN_5O_2 \cdot HCl$.■2S *(USP29)*

In-Process Revision

BRIEFING

Nefazodone Hydrochloride Tablets, page 1096 of *PF* 31(4) [July–Aug. 2005].

1. On the basis of comments received, it is proposed to revise the test for *Related compounds* to delete 1,3-Bis[4-(3-chlorophenyl)piperazine-1-yl]propane from the list of specified impurities. It is also proposed to increase the limit of any individual unknown impurity from 0.1% to 0.2%.
2. The relative retention times (RRT) for nefazodone related compound A and nefazodone related compound B previously published in the test for *Related compounds* were inadvertently reversed. It is proposed to correct the erroneous RRT values.
3. System suitability requirements in the *Assay* and in the test for *Related compounds* have been appropriately separated to improve clarity. Also, the plate count requirement in the *Assay* has been deleted as a system suitability requirement.
4. It is also proposed to add a *Note* under *Chromatographic system* in the test for *Related compounds* to indicate that the RRT values are intended for informational purposes only.
5. Also, the *Packaging and storage* statement has been revised in accordance with the *General Notices.*

Other editorial changes have also been made.

(MD-PP: R. Ravichandran) RTS—C44417

Add the following:

■Nefazodone Hydrochloride Tablets

» Nefazodone Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of nefazodone hydrochloride ($C_{25}H_{32}ClN_5O_2 \cdot HCl$).

Packaging and storage—Preserve in tight containers. ~~Store between 15° and 30°.~~ Store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Nefazodone Hydrochloride RS. USP Nefazodone Related Compound A RS. USP Nefazodone Related Compound B RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: 0.1 N hydrochloric acid; 900 mL, deaerated.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Standard stock solution—Transfer about 70 mg of USP Nefazodone Hydrochloride RS, accurately weighed, to a 50-mL volumetric flask. Add 2.5 mL of methanol, dilute with *Medium* to volume, and mix.

Standard solution—Dilute the *Standard stock solution* with *Medium* in such a way that the final concentration is similar to the one expected in the *Test solution.*

Test solution—Use portions of the solution under test passed through a 0.45-µm PVDF filter, discarding the first 5 mL.

Procedure—Determine the percentage of the labeled amount of nefazodone hydrochloride dissolved by employing UV absorption, using a suitable spectrophotometer, at the wavelength of maximum absorbance at about 246 nm, on the *Test solution* in comparison with the *Standard solution,* using *Medium* as the blank. Calculate the percentage of nefazodone hydrochloride ($C_{25}H_{32}ClN_5O_2 \cdot HCl$) dissolved by the formula:

$$\frac{A_U \times C_S \times 900 \times 100}{A_S \times LC}$$

in which A_U and A_S are the absorbances obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of the USP Nefazodone Hydrochloride RS in the *Standard solution;* 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the tablet label claim, in mg.

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{25}H_{32}ClN_5O_2 \cdot HCl$ is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Related compounds—

~~*Diluted acetic acid*~~ *Dilute acetic acid, Buffer solution,* and *Mobile phase* ~~*Nefazodone related compound A stock solution, Nefazodone related compound B stock solution, System suitability preparation,* and *Chromatographic system*~~—Proceed as directed in the *Assay.*

Nefazodone related compound A stock solution—Prepare a solution of USP Nefazodone Related Compound A RS in *Mobile phase* having a known concentration of about 80 µg per mL.

Nefazodone related compound B stock solution—Prepare a solution of USP Nefazodone Related Compound B RS in *Mobile phase* having a known concentration of about 80 µg per mL.

System suitability solution—Transfer about 10 mg of USP Nefazodone Hydrochloride RS into a 10-mL volumetric flask. Add 2.0 mL of *Nefazodone related compound A stock solution* and 2.0 mL of *Nefazodone related compound B stock solution,* and mix to dissolve the nefazodone hydrochloride. Dilute with *Mobile phase* to volume, and mix.

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Test solution—Use the *Assay stock preparation,* prepared as directed in the *Assay.*

Chromatographic system—Prepare as directed in the *Assay.* Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure*. Identify the peaks using the relative retention times given in *Table 1:* the resolution, *R,* between nefazodone related compound A and nefazodone hydrochloride is not less than 2.0; and the resolution, *R,* between nefazodone related compound B and nefazodone hydrochloride is not less than 1.5. [NOTE—Approximate relative retention times are provided in *Table 1* for informational purposes only.]

Procedure—Inject ~~a volume (about 10 µL) of the~~ equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatogram,

In-Process Revision

and measure the peak responses. Calculate the percentage of individual nefazodone related compounds in the portion of Tablets taken by the formula:

$$100(r_U / r_S)(C_S / C_T)(1/F)$$

in which r_U is the individual peak response for each nefazodone related compound obtained from the *Test solution;* r_S is the response of the corresponding peak in the *Standard solution,* respectively; C_S and C_T are the concentrations, in mg per mL, of nefazodone hydrochloride in the *Standard solution* and the *Test solution,* respectively; and F is the relative response factor obtained from *Table 1.* The related compound requirements are listed in *Table 1.*

Assay—

~~*Diluted acetic acid*~~ —*Dilute acetic acid*—Prepare a mixture of acetic acid and water (1 : 1).

Buffer solution—Dissolve 0.77 g of ammonium acetate in 1 L of water. Add 1.0 mL of triethylamine, and mix well. Adjust with ~~*Diluted acetic acid*~~ *Dilute acetic acid* to a pH of 7.10 ± 0.05, and mix.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and *Buffer solution* (58 : 42). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

~~*Nefazodone related compound A stock solution*—Prepare a solution of USP Nefazodone Related Compound A RS in *Mobile phase* having a known concentration of about 80 µg per mL.~~

~~*Nefazodone related compound B stock solution*—Prepare a solution of USP Nefazodone Related Compound B RS in *Mobile phase* having a known concentration of about 80 µg per mL.~~

~~*System suitability preparation*—Transfer about 10 mg of USP Nefazodone Hydrochloride RS into a 10-mL volumetric flask. Add 2.0 mL of *Nefazodone related compound A stock solution* and 2.0 mL of *Nefazodone related compound B stock solution,* and mix to dissolve the nefazodone hydrochloride. Dilute with *Mobile phase* to volume, and mix.~~

Standard preparation—Prepare a solution of USP Nefazodone Hydrochloride RS in *Mobile phase* having a known concentration of about 0.1 mg per mL.

Assay stock preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 250 mg of nefazodone hydrochloride, based on the label claim, to a 250-mL volumetric flask, add about 125 mL of *Mobile phase*, and sonicate for about 10 minutes with occasional shaking. Dilute with *Mobile phase* to volume, and mix to obtain a solution having a concentration of about 1 mg per mL of nefazodone hydrochloride. Pass a portion of this solution through a filter

In-Process Revision

Table 1

Related Compound	Relative Retention Time	Relative Response Factor *(F)*	Limit (%)
Nefazodone related compound A	~~0.9~~ 1.4	~~1.0~~ 1.2	0.2
Nefazodone related compound B	~~1.4~~ 0.9	~~1.2~~ 1.0	0.2
~~1,3-Bis[4-(3-chlorophenyl)piperazine-1-yl]propane~~	~~2.2~~	~~1.6~~	~~0.2~~
~~Unknown~~ Any individual unknown impurity	—	1.0	~~0.1~~ 0.2 each
Total known and unknown	—	—	0.5

having a 0.45-µm or finer porosity, and use the filtrate, which has a concentration of about 1 mg per mL of nefazodone hydrochloride.

Assay preparation—Transfer 5.0 mL of *Assay stock preparation* into a 50-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix to obtain a solution having a concentration of 0.1 mg per mL of nefazodone hydrochloride.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 250-nm detector and a 4.6-mm × 25-cm column containing 5-µm L1 packing. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 30°. ~~Inject the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.9 for nefazodone related compound A, 1.0 for nefazodone hydrochloride, and 1.4 for nefazodone related compound B; the resolution, *R,* between nefazodone related compound A and nefazodone hydrochloride is not less than 1.5, and the resolution, *R,* between nefazodone related compound B and nefazodone hydrochloride is not less than 2.0.~~ Inject the *Standard preparation,* and record the peak responses as directed for *Procedure:* ~~the column efficiency is not less than 2000 theoretical plates;~~ the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in percent of label claim, of nefazodone hydrochloride ($C_{25}H_{32}ClN_5O_2 \cdot HCl$) in the portion of Tablets taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which C_S and C_U are the concentrations, in mg per mL, of nefazodone hydrochloride in the *Standard preparation* and the *Assay preparation,* respectively; and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■1S (*USP30*)

BRIEFING

Nevirapine Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with the Nova-Pack C18 (Waters) brand of L1 column. Typical retention times are about 4 minutes for nevirapine and about 6 minutes for nevirapine related compound A.

(MD-AA: B. Davani; BPC: M. Marques) RTS—C42828; C43839

Add the following:

■Nevirapine Tablets

» Nevirapine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of nevirapine ($C_{15}H_{14}N_4O$).

Packaging and storage—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards ⟨11⟩**—***USP Nevirapine Anhydrous RS. USP Nevirapine Related Compound A RS.*

In-Process Revision

Identification—

A: *Infrared Absorption* ⟨197K⟩—

Test specimen—Transfer a portion of powdered Tablets equivalent to 25 mg of nevirapine to a 50-mL volumetric flask. Dissolve in 10 mL of methylene chloride. Swirl the solution for about 30 to 60 seconds, and pass through a medium sintered-glass, fritted vacuum funnel. Using a glass syringe, pass the filtrate through a 0.45-µm Teflon filter. Dry the extract at 105° for a minimum of 1 hour.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: 0.1 M phosphate buffer, pH 2.0, prepared by transferring 3.9 mL of concentrated phosphoric acid and 5.73 g of monobasic sodium phosphate monohydrate to a 1-L volumetric flask, dissolving in and diluting with water to volume, and if necessary, adjusting with phosphoric acid to a pH of 2.0 ± 0.02; 900 mL.

Apparatus 2: 50 rpm. Use stainless steel paddles only. Do not use paddles coated with polytetrafluoroethylene.

Time: 60 minutes.

Determine the amount of $C_{15}H_{14}N_4O$ dissolved by employing the following method.

Mobile phase, Diluent, and *Chromatographic system*—Proceed as directed in the *Assay.*

Stock standard solution 1—Transfer 27 mg, accurately weighed, of USP Nevirapine Anhydrous RS into a 500-mL volumetric flask. Add 50 mL of alcohol, followed by 250 mL of *Medium*. Sonicate for about 20 minutes to dissolve, allow to cool to room temperature, and dilute with *Medium* to volume.

Stock standard solution 2—Transfer 7 mg, accurately weighed, of USP Nevirapine Related Compound A RS into a 250-mL volumetric flask. Add about 2 mL of *Diluent,* sonicate until completely dissolved, and dilute with *Medium* to volume.

Standard solution—Transfer 25.0 mL of the *Stock standard solution 1* into a 100-mL volumetric flask, dilute with *Medium* to volume, and mix well.

Resolution solution—Transfer 25.0 mL of *Stock standard solution 1* into a 50-mL volumetric flask, and dilute with *Medium* to volume. Transfer 25.0 mL of this solution into a 50-mL volumetric flask, dilute with *Stock standard solution 2* to volume, and mix well.

Test solution—Pass 20 mL of the solution under test through a nylon or glass fiber 0.45-µm filter, and dilute with *Medium* to obtain a solution having a final concentration of about 0.0135 mg of nevirapine per mL.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Determine the amount of $C_{15}H_{14}N_4O$ dissolved by the formula:

$$\frac{r_U \times W_S \times D_S \times 900 \times 100}{r_S \times D_U \times LC}$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; W_S is the amount, in mg, of USP Nevirapine Anhydrous RS taken; D_S is the dilution factor for the *Standard solution;* 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; D_U is the dilution factor for the *Test solution;* and *LC* is the Tablet label claim in mg.

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{15}H_{14}N_4O$ is dissolved in 60 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Chromatographic purity—

Mobile phase, Diluent, Resolution solution, Stock standard solution 1, and *Stock standard solution 2*—Proceed as directed in the *Assay.*

In-Process Revision

Standard solution—Quantitatively dilute *Stock standard solution 1* with *Diluent* to obtain a solution having a known concentration of about 0.125 µg of nevirapine per mL.

Test solution—Use the *Assay preparation,* as obtained in the *Assay.*

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay* except that the relative standard deviation for replicate injections of the *Standard solution* is not more than 5.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for at least 13 minutes, and measure the peak responses. Calculate the percentage of each impurity/degradation product in the portion of Tablets taken by the formula:

$$8000(C/W)(A/L)(r_i/r_S)(100)$$

in which C is the concentration, in mg per mL, of USP Nevirapine Anhydrous RS in the *Standard solution; W* is the weight, in mg, of powdered Tablets taken to prepare the *Test solution; A* is the average weight of each Tablet, in mg; L is the labeled amount, in mg, of nevirapine in each Tablet; r_i is the peak response obtained for each impurity/degradation product in the *Test solution;* and r_S is the peak response for nevirapine in the *Standard solution*. Disregard all peaks due to the solvent or excipients and impurity peaks less than 0.1%. Not more than 0.1% of any individual unknown impurity/degradation product is found; and not more than 0.2% of total unknown impurities/degradation products is found.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (77 : 23). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of dehydrated alcohol and water (1 : 1).

Stock standard solution 1—Transfer about 25 mg of USP Nevirapine Anhydrous RS, accurately weighed, into a 250-mL volumetric flask, and dissolve in and dilute with *Diluent* to volume.

Stock standard solution 2—Transfer about 5 mg of USP Nevirapine Related Compound A RS, accurately weighed, into a 50-mL volumetric flask, and dissolve in and dilute with *Diluent* to volume.

Standard preparation—Transfer 25.0 mL of *Stock standard solution 1* into a 100-mL volumetric flask, and dilute with *Diluent* to volume. The final concentration is about 0.025 mg of nevirapine per mL.

Resolution solution—Transfer 25.0 mL of *Stock standard solution 1* and 25.0 mL of *Stock standard solution 2* into a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix well.

Assay preparation—Weigh and finely powder not fewer than 20 tablets. Transfer an accurately weighed portion of the powder, equivalent to 200 mg of nevirapine into a 200-mL volumetric flask, and add about 150 mL of *Diluent*. Sonicate the solution for about 20 minutes, and then shake for about 20 minutes. Cool to room temperature, dilute with *Diluent* to volume, and mix. Centrifuge a portion of the resulting solution at about 1500 rpm for about 5 minutes. Transfer 5.0 mL of the supernatant into a 200-mL volumetric flask, and dilute with *Diluent* to volume. Filter, and discard the first 2 mL of filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 214-nm detector and a 3.9-mm × 15-cm column containing L1 packing. The column is maintained at ambient temperature. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution* (about 20 µL), and record the peak responses as directed for *Procedure:* the resolution, *R,* between nevirapine and nevirapine related compound A is not less than 3.0. Chromatograph the *Standard preparation,* and record the

peak responses as directed for *Procedure:* the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the nevirapine peak. Calculate the quantity, in mg, of nevirapine ($C_{15}H_{14}N_4O$) in the portion of Tablets taken by the formula:

$$8000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Nevirapine Anhydrous RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP30*)

BRIEFING

Oxybutynin Chloride, *USP 29* page 1602. On the basis of comments received, it is proposed to use a relative response factor of 1.0 for unknown impurities in the test for *Related compounds,* which is the generally accepted approach within the industry.

(MD-GRE: E. Gonikberg) RTS—C44481

In-Process Revision

Change to read:

Related compounds—

Phosphate buffer and *Mobile phase*—Prepare as directed in the *Assay.*

System suitability stock solution—Dissolve accurately weighed quantities of USP Oxybutynin Related Compound B RS and USP Oxybutynin Related Compound C RS in *Mobile phase* to obtain a solution having known concentrations of about 100 µg of each USP Reference Standard per mL.

Standard stock solution—Dissolve an accurately weighed quantity of USP Oxybutynin Chloride RS in *Mobile phase* to obtain a solution having a known concentration of about 1.0 mg per mL.

System suitability solution—Transfer 10.0 mL of the *System suitability stock solution* to a 100-mL volumetric flask, add 10.0 mL of the *Standard stock solution,* and dilute with *Mobile phase* to volume.

Standard solution—Transfer 15.0 mL of the *Standard stock solution* to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume. Transfer 5.0 mL of the solution obtained to a separate 100-mL volumetric flask, and dilute with *Mobile phase* to volume. This solution contains about 7.5 µg of USP Oxybutynin Chloride RS per mL.

Test solution—Transfer about 50 mg of Oxybutynin Chloride, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system—Prepare as directed in the *Assay.* Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between oxybutynin related compound B and oxybutynin related compound C is not less than 1.1; and the relative standard deviation for replicate injections, determined from the oxybutynin peak, is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for a total time of not less than twice the retention time of the oxybutynin peak, and measure all the peak responses (see *Table 1* for known impurities). Calculate the percentage of each impurity in the portion of Oxybutynin Chloride taken by the formula:

$$(C/W)(1/F)(r_U / r_S)$$

in which C is the concentration, in µg per mL, of USP Oxybutynin Chloride RS in the *Standard solution; W* is the weight, in mg, of Oxybutynin Chloride taken to prepare the *Test solution; F* is the relative response factor for each impurity (see *Table 1* for the values); and r_U and r_S are the peak responses for each impurity obtained from the *Test solution* and for the oxybutynin peak in the *Standard solution,* respectively. [NOTE—For unknown impurities, use the relative response factor of ~~the closest known impurity.~~ ■1.0.]■1S (*USP30*)

Table 1

Compound Name	Relative Retention Time	Relative Response Factor *(F)*	Limit (%)
Oxybutynin related compound A[1]	0.08	1.4	0.5
Diphenyl analog of oxybutynin chloride[2]	0.37	2.7	0.1
Oxybutynin related compound B[3]	0.65	1.3	1.0
Oxybutynin related compound C[4]	0.79	1.0	1.0
Cyclohexenyl analog of oxybutynin chloride[5]	1.8	0.4	1.0
Ethylpropyl analog of oxybutynin chloride[6]	1.9	1.0	0.1

[1] phenylcyclohexylglycolic acid (cyclohexylmandelic acid, or CHMA)
[2] 4-(diethylamino)but-2-ynyl 2-hydroxy-2,2-diphenylacetate
[3] methyl ester of phenylcyclohexylglycolic acid (methyl ester of cyclohexylmandelic acid, or CHMME)
[4] methylethyl analog of oxybutynin chloride (4-(ethylmethylamino) but-2-ynyl (±)-2-cyclohexyl-2-hydroxy-2-phenylacetate)
[5] 4-(diethylamino)but-2-ynyl (±)-2-(cyclohex-3-enyl)-2-cyclohexyl-2-hydroxyacetate
[6] 4-(ethylpropylamino)but-2-ynyl (±)-2-cyclohexyl-2-hydroxy-2-phenylacetate

In addition to not exceeding the limits for each impurity in *Table 1,* not more than 0.1% of any other single impurity is found; and not more than 1.0% of total impurities is found.

BRIEFING

Paroxetine Hydrochloride, *USP 29* page 1644 and page 1112 of *PF* 31(4) [July–Aug. 2005]. Comments were received regarding the difficulty of meeting the system suitability requirements in the *Assay,* particularly the tailing factor and the requirement for the resolution in the *Chromatographic system* section. On the basis of supporting data received, it is proposed to change the tailing factor requirement from "not more than 1.6" to "not more than 2.0", and to allow the flexibility in the *Mobile phase* composition to meet the system suitability requirements. The original method for the *Assay* was validated with the Zorbax TMS brand column; the proposed revised procedure for the *Assay* will also allow the use of the Adsorbosphere XL brand L13 column.

Limit of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine—

▲*Solution A*—Dissolve about 30 g of sodium perchlorate in about 900 mL of water. Add 3.5 mL of phosphoric acid and 2.4 mL of triethylamine. Dilute with water to volume, and mix. Adjust with phosphoric acid or triethylamine to a pH of 2.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Solution B: acetonitrile, filtered and degassed.

Diluent: a mixture of water and acetonitrile (4 : 1).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments to either solution as necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of ~~USP Paroxetine Hydrochloride Related Compound E RS,~~ ■USP Paroxetine Related Compound E Mixture RS,■2S *(USP29)* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 42 ng per mL of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine.

Test solution—Transfer about 420 mg of Paroxetine Hydrochloride, accurately weighed, to a 10-mL volumetric flask, and dissolve in about 7 mL of *Diluent* with sonication. Dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 242-nm detector and a 4.0-mm × 25-cm column that contains packing L1. The column temperature is maintained at 30°. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	85	15	equilibration
0–20	85→80	15→20	linear gradient
20–27	80→55	20→45	linear gradient
27–36	55	45	isocratic
36–38	55→85	45→15	linear gradient
38–45	85	15	re-equilibration

Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the relative retention times are 0.6 for 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine and 1.0 for paroxetine; and the relative standard deviation for replicate injections is not more than 15.0% for the 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine peak.

Procedure—Separately inject equal volumes (about 75 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine in the portion of Paroxetine Hydrochloride taken by the formula:

$$1000(CI/W)(r_i/r_S)$$

in which C is the concentration, in mg per mL, of ~~USP Paroxetine Hydrochloride Related Compound E RS~~ ■USP Paroxetine Related Compound E Mixture RS■2S *(USP29)* in the *Standard solution; I* is the fraction, by weight, of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine in ~~USP Paroxetine Hydrochloride Related Compound E RS;~~ ■USP Paroxetine Hydrochloride Related Compound E Mixture RS;■2S *(USP29)* W is the weight, in mg, of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the *Test solution;* and r_i and r_S are the peak areas for 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.0001% of 1-methyl-4-(*p*-fluorophenyl)-1,2,3,6-tetrahydropyridine is found.▲*USP29*

Change to read:

Chromatographic purity—[NOTE—Perform all related impurities methods unless the manufacturer has assurance, based on knowledge of the manufacturing process, that one of the tests is not relevant to the manufacturer's material.]

TEST 1—

Solution A—Prepare a filtered and degassed mixture of water, tetrahydrofuran, and trifluoroacetic acid (180 : 20 : 1).

Solution B—Prepare a filtered and degassed mixture of acetonitrile, tetrahydrofuran, and trifluoroacetic acid (180 : 20 : 1).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent: a mixture of water and tetrahydrofuran (9 : 1).

Standard solution—Dissolve an accurately weighed quantity of USP Paroxetine Hydrochloride RS, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 1 µg per mL.

System suitability solution—▲Dissolve, by sonication if necessary, a suitable quantity of ~~USP Paroxetine Hydrochloride for System Suitability RS~~ ■USP Paroxetine System Suitability Mixture A RS■2S *(USP29)* in *Diluent* to obtain a solution having a known concentration of about 1 mg per mL.▲*USP29*

In-Process Revision

Test solution—Transfer about 25 mg of Paroxetine Hydrochloride, accurately weighed, to a 25-mL volumetric flask, dissolve in 20 mL of *Diluent,* sonicate, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 285-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 1 mL per minute. The column temperature is maintained at 40°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	80	20	equilibration
0–30	80	20	isocratic
30–50	80→20	20→80	linear gradient
50–60	20	80	isocratic
60–70	20→80	80→20	linear gradient

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about ▲0.66 for paroxetine related compound A, 0.73 for paroxetine related compound B, and 1.0 for paroxetine;▲*USP29* the resolution, *R,* between paroxetine related compound A and paroxetine related compound B is not less than 2.0; the tailing factor of the paroxetine related compound A peak is between 0.8 and 2.0; and the relative standard deviation for replicate injections is not more than 2.0% for paroxetine related compound A.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution,* the *Test solution,* and the *Diluent* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of each impurity in the portion of Paroxetine Hydrochloride taken by the formula:

$$2500(C/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Paroxetine Hydrochloride RS in the *Standard solution; W* is the weight, in mg, of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the *Test solution;* r_U is the peak area of each impurity in the *Test solution,* excluding the peaks obtained from the chromatogram of the *Diluent;* and r_S is the peak area of paroxetine obtained from the *Standard solution:* not more than 0.3% of any peak at a retention time of paroxetine related compound B is found; not more than 0.1% of any other individual impurity is found; and not more than 1.0% of total impurities is found.

TEST 2—

Phosphate buffer—Dissolve 3.4 g of monobasic potassium phosphate and 3.4 g of tetrabutylammonium hydrogen sulfate in 1.0 L of water.

Solution A—Prepare a filtered and degassed mixture of *Phosphate buffer* and acetonitrile (98 : 2).

Solution B—Prepare a filtered and degassed mixture of *Phosphate buffer* and acetonitrile (6 : 4).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent: a mixture of *Phosphate buffer* and acetonitrile (9 : 1).

Standard solution—Dissolve an accurately weighed quantity of USP Paroxetine Hydrochloride RS, USP Paroxetine Related Compound B RS, USP Paroxetine Related Compound F RS, and USP Paroxetine Related Compound G RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having known concentrations of about 4 µg per mL, 10 µg per mL, 10 µg per mL, and 4 µg per mL, respectively.

Identification solution—Dissolve an accurately weighed quantity of Paroxetine Hydrochloride, USP Paroxetine Related Compound B RS, USP Paroxetine Related Compound F RS, and USP Paroxetine Related Compound G RS in *Diluent* to obtain a solution having known concentrations of about 2 mg per mL, 10 µg per mL, 10 µg per mL, and 4 µg per mL, respectively.

Test solution—Transfer about 25 mg of Paroxetine Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 3.9-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibration
0–5	100	0	isocratic
5–70	100→40	0→60	linear gradient
70–90	40→0	60→100	linear gradient
90–95	0	100	isocratic
95–95.1	0→100	100→0	linear gradient
95.1–110	100	0	re-equilibration

Chromatograph the *Identification solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.91 for paroxetine related compound B, about 0.96 for paroxetine related compound F, 1.0 for paroxetine, and about 1.34 for paroxetine related compound G. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 10.0% for the paroxetine related compound B, paroxetine related compound F, paroxetine hydrochloride, and paroxetine related compound G peaks.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of paroxetine related compound B, paroxetine related compound F, and paroxetine related compound G in the portion of Paroxetine Hydrochloride taken by the formula:

$$5000(C/W)(r_i/r_S)$$

in which C is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard solution; W* is the weight, in mg, of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the *Test solution;* and r_i and r_S are the peak areas for the corresponding impurity in the *Test solution* and the *Standard solution,* respectively: not more than 0.5% of paroxetine related compound B is found; not more than 0.2% of paroxetine related compound F is found; and not more than 0.2% of paroxetine related compound G is found. Calculate the percentage of any unknown impurity in the portion of Paroxetine Hydrochloride taken by the formula:

$$5000(C/W)(r_i/r_S)$$

in which C is the concentration, in mg per mL, of USP Paroxetine Hydrochloride RS in the *Standard solution; W* is the weight, in mg, of Paroxetine Hydrochloride, on the anhydrous basis, used to prepare the *Test solution;* r_i is the peak area for any unknown impurity in the *Test solution;* and r_S is the peak area of paroxetine in the *Standard solution:* not more than 0.1% of any single unknown impurity is found, and not more than 1.0% of total impurities is found.

Assay—

Acetate buffer—Prepare a 0.05 M solution of ammonium acetate in water, adjust with glacial acetic acid to a pH of 4.5, mix, and filter.

Mobile phase—Prepare a filtered and degassed mixture of *Acetate buffer,* acetonitrile, and triethylamine ~~(60 : 40 : 1).~~

■(70 : 30 : 1). [NOTE—The *Acetate buffer*–acetonitrile–triethylamine ratio can be varied between 70 : 40 : 1 and 75 : 25 : 1 to meet the system suitability requirements.]■1S (*USP30*)

Adjust with glacial acetic acid to a pH of 5.5. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

In-Process Revision

System suitability solution—Dissolve suitable quantities of USP Paroxetine Related Compound B RS and USP Paroxetine Hydrochloride RS in water to obtain a solution having known concentrations of about 0.5 mg of each USP Reference Standard per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Paroxetine Hydrochloride RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.5 mg per mL.

Assay preparation—Transfer about 50 mg of Paroxetine Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 295-nm detector and a 4.6-mm × 25-cm column that contains packing L13. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* ~~the relative retention times are about 0.9 for paroxetine related compound B and 1.0 for paroxetine;~~

■ ■1S (*USP30*)
the resolution, *R,* between paroxetine related compound B and paroxetine is not less than 2.0; ~~the column efficiency determined from the paroxetine peak is not less than 3000 theoretical plates; the tailing factor for the paroxetine peak is not more than 1.6;~~

■the tailing factor for the paroxetine peak is not more than 2.0;■1S (*USP30*)
and the relative standard deviation for replicate injections is not more than 2.0%.

■[NOTE—For information purposes, the approximate relative retention times are about 0.9 for paroxetine related compound B and 1.0 for paroxetine.]■1S (*USP30*)

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{19}H_{20}FNO_3 \cdot HCl$ in the portion of Paroxetine Hydrochloride taken by the formula:

$$100C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Paroxetine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

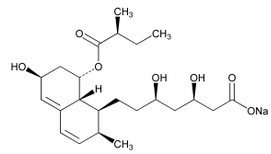
Pravastatin Sodium, page 1394 of *PF* 31(5) [Sept.–Oct. 2005].

1. It is proposed to change the acceptance criteria in the Definition from "not less than 98.0 percent and not more than 102.0 percent" to "not less than 97.5 percent and not more than 102.0 percent". These limits are representative of marketed products.
2. Comments were received that different manufacturers have different storage conditions for this material, supported by stability data. It is proposed to use a flexible monograph approach to indicate that manufacturers could store the material as per their labeling instruction. Possible storage conditions would also be listed.
3. Because Pravastatin Sodium is highly hygroscopic, it is proposed to use USP Pravastatin 1,1,3,3-Tetramethylbutylamine RS in the test for *Chromatographic purity* and in the *Assay.*
4. On the basis of comments received, the name for pravastatin sodium related compound A is corrected, and the complete chemical name is added to the monograph. In addition, minor corrections to the Pravastatin Sodium chemical name and to the composition of *Solution A* under the *Assay* are proposed.

(MD-GRE: E. Gonikberg) RTS—C44138; C44072

Add the following:

■Pravastatin Sodium



$C_{23}H_{35}NaO_7$ 446.51

~~1-Napththalenecheptanoic acid,~~ 1-Naphthaleneheptanoic acid, 1,2,6,7,8,8a-hexahydro-β,δ,6-trihydroxy-2-methyl-8-(2-methyl-1-oxobutoxy)-, monosodium salt, [1*S*-[1α(β*S**,δ*S**),2α,6α,8β(*R**),8aα]]-.

Sodium (+)-(β*R*,δ*R*,1*S*, 2*S*,6*S*,8*S*,8a*R*)-1,2,6,7,8,8a-hexahydro-β,δ,6,8-tetrahydroxy-2-methyl-1-naphthaleneheptanoate, 8-[(2*S*)-2-methylbutyrate] [*81131-70-6*].

» Pravastatin Sodium contains not less than ~~98.0~~ 97.5 percent and not more than 102.0 percent of $C_{23}H_{35}NaO_7$, calculated on the anhydrous and solvent-free basis.

Packaging and storage—Preserve in tight containers. ~~Store under nitrogen in a cold place.~~ Store as per labeling instructions. Possible storage conditions could include the following, in the presence of stability data supporting the condition: Store under nitrogen in a cold place. Store at room temperature.

In-Process Revision

Heavy metals, *Method II* ⟨231⟩**:** 0.002%.

Limit of alcohol *(if present)—*

Test solution—Transfer about 0.2 g of Pravastatin Sodium, accurately weighed, to a 20-mL volumetric flask, dilute with water to volume, and mix. Pipet 5 mL of this solution into a vial fitted with a septum and a crimp cap, add 1 mL of water, seal the vial, and mix. Heat the sealed vial at 80° for 60 minutes.

Standard solution—Pipet 2 mL of dehydrated alcohol into a 100-mL volumetric flask, dilute with water to volume, and mix. Pipet 10 mL of this solution into a 100-mL volumetric flask, dilute with water to volume, and mix. Pipet 1 mL of this solution into a vial fitted with a septum and a crimp cap, and calculate the amount of alcohol, W_A, added, in g, the specific gravity of dehydrated alcohol being 0.79 g per mL. Add 5 mL of the *Test solution* to the same vial, seal the vial, and mix. Heat the sealed vial at 80° for 60 minutes.

Blank solution—Pipet 6 mL of water into a vial fitted with a septum and a crimp cap, and seal the vial. Heat the sealed vial at 80° for 60 minutes.

Chromatographic system (see *Chromatography* ⟨621⟩—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 30-m fused silica capillary column coated with a 3-µm film of stationary phase G43. The carrier gas is helium, with a split ratio of 1 : 5, and flowing with a linear velocity of about 35 cm per second. The chromatograph is programmed as follows. The column temperature is maintained at 40° for 20 minutes, then the temperature is increased at a rate of 10° per minute to 240°, and maintained at 240° for 20 minutes. The transfer line temperature is maintained at 85°, the injection port temperature is maintained at 140°, and the detector is maintained at 250°. Chromatograph the *Blank solution,* and record the peak responses as directed for *Procedure:* no interfering peaks are observed.

Procedure—Separately inject equal volumes (about 1 mL) of headspace gas of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the percentage (w/w) of alcohol in the portion of Pravastatin Sodium taken by the formula:

$$100(W_A / W)(V/5)[r_U / (r_S - r_U)]$$

in which W_A is as defined above; W is the weight, in g, of Pravastatin Sodium taken to prepare the *Test solution; V* is the volume, in mL, of the *Test solution;* 5 is the volume, in mL, of the *Test solution* taken; and r_U and r_S are the peak area responses of alcohol obtained from the *Test solution* and the *Standard solution,* respectively: not more than 3.0% is found.

Chromatographic purity—[NOTE—The *Standard solution* and the *Test solution* are maintained at 15° until injected into the chromatograph.]

Diluent—Prepare a mixture of methanol and water (1 : 1).

Buffer pH 7.0—Prepare a 0.08 M phosphoric acid solution, adjust with triethylamine to a pH of 7.0, and mix.

Solution A—Prepare a filtered and degassed mixture of water, *Buffer pH 7.0,* and acetonitrile (52 : 30 : 18).

Solution B—Prepare a filtered and degassed mixture of acetonitrile, *Buffer pH 7.0,* and water (60 : 30 : 10).

In-Process Revision

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of ~~USP Pravastatin Sodium RS~~ USP Pravastatin 1,1,3,3-Tetramethylbutylamine RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about ~~1 µg per mL~~ 1.25 µg of pravastatin 1,1,3,3-tetramethylbutylamine per mL.

System suitability solution—Dissolve accurately weighed quantities of ~~USP Pravastatin Sodium RS~~ USP Pravastatin 1,1,3,3-Tetramethylbutylamine RS and USP Pravastatin Related Compound A RS in *Diluent* to obtain a solution containing about ~~0.5 mg of USP Pravastatin Sodium RS~~ 0.6 mg of USP Pravastatin 1,1,3,3-tetramethylbutylamine RS and 0.001 mg of USP Pravastatin Related Compound A RS per mL. [NOTE—USP Pravastatin Related Compound A RS is a sodium salt of ~~6α-hydroxyisocompactin acid~~ 3α-hydroxyisocompactin acid.]

Test solution—Transfer about 50 mg of Pravastatin Sodium, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩—The liquid chromatograph is equipped with a 238-nm detector and a 4.6-mm × 7.5-cm column that contains 3.5-µm packing L1. Alternatively, a 4.0-mm × 10-cm column that contains 3-µm packing L1 can be used. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–3.0	100	0	isocratic
3.0–26.5	100→0	0→100	linear gradient
26.5–26.6	0→100	100→0	linear gradient
26.6–30.0	100	0	re-equilibration

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.0 for pravastatin and 1.1 for pravastatin related compound A; and the resolution, *R,* between pravastatin and pravastatin related compound A is not less than 2.0. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 10.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, identify the impurities listed in *Table 1,* and measure the peak responses. Calculate the percentage of each impurity in the portion of Pravastatin Sodium taken by the formula:

~~$100C(V/W)(r_i/r_s)$~~

$$100 \times (446.51/553.78)C(V/W)(r_i/r_S)$$

in which 446.51 and 553.78 are the molecular weights of pravastatin sodium and pravastatin 1,1,3,3-tetramethylbutylamine, respectively; ~~*C* is the concentration, in mg per mL, of USP Pravastatin Sodium RS in the *Standard solution;*~~ *C* is the concentration, in mg per mL, of pravastatin 1,1,3,3-tetramethylbutylamine in the *Standard solution; V* is the volume, in mL, of the *Test solution; W* is the weight, in mg, of Pravastatin Sodium taken to prepare the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the pravastatin peak response obtained from the *Standard solution*. In addition to not exceeding the

In-Process Revision

limits for each impurity specified in *Table 1,* not more than 0.1% of any other individual impurity is found, and not more than 0.6% of total impurities is found.

Table 1

Name	Relative Retention Time	Limit (%)
3″-Hydroxypravastatin	0.33	0.2
6′-Epipravastatin	0.92	0.3
~~6α-Hydroxyisocompactin~~ 3α-Hydroxyisocompactin[1]	1.1	0.2
Pentanoyl impurity[2]	1.2	0.2
Pravastatin lactone	1.8	0.2
Compactin	3.1	0.2

[1] Sodium (3*R,*5*R*)-3,5-dihydroxy-7-[(1*S,*2*S,*3*S,*8*S,*8a*R*)-3-hydroxy-2-methyl-8-[[(2*S*)-2-methylbutanoyl]oxy]-1,2,3,7,8,8a-hexahydronaphthalen-1-yl]heptanoate(pravastatin related compound A).

[2] (3*R*,5*R*)-3,5-dihydroxy-7-[(1*S*,2*S*,6*S*,8*S*,8a*R*)-6-hydroxy-2-methyl-8-[[(2*S*)-2-methylpentanoyl]oxy]-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]heptanoic acid.

Assay—

Solution A—Prepare a ~~0.05 M~~ 0.08M phosphoric acid solution, adjust with a 25% sodium hydroxide solution to a pH of 5.0, mix, filter, and degas.

Solution B—Use acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of ~~USP Pravastatin Sodium RS~~ USP Pravastatin 1,1,3,3-Tetramethylbutylamine RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about ~~0.2 mg per mL~~ 0.25 mg of pravastatin 1,1,3,3-tetramethylbutylamine per mL.

System suitability preparation—Dissolve accurately weighed quantities of ~~USP Pravastatin Sodium RS~~ USP Pravastatin 1,1,3,3-Tetramethylbutylamine RS and USP Pravastatin Related Compound A RS in methanol to obtain a solution containing about ~~0.2 mg of USP Pravastatin Sodium RS~~ 0.25 mg of USP Pravastatin 1,1,3,3-Tetramethylbutylamine RS and 0.001 mg of USP Pravastatin Related Compound A RS per mL.

Assay preparation—Transfer about 20 mg of Pravastatin Sodium, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩—The liquid chromatograph is equipped with a 238-nm detector and a 4.0-mm × 10-cm column that contains 3-µm packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–7.0	80→72	20→28	linear gradient
7.0–10.0	72→50	28→50	linear gradient
10.0–17.0	50	50	isocratic
17.0–17.1	50→80	50→20	linear gradient
17.1–20.0	80	20	re-equilibration

Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.0 for pravastatin and 1.2 for pravastatin related compound A; the resolution, *R,* between pravastatin and pravastatin related compound A is not less than 1.2; and the relative standard deviation for replicate injections for the pravastatin peak is not more than 2.0%.

In-Process Revision

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the pravastatin peaks. Calculate the quantity, in mg, of $C_{23}H_{35}NaO_7$ in the portion of Pravastatin Sodium taken by the formula:

~~$VC(r_u/r_s)$~~

$$(446.51/553.78)VC(r_U/r_S)$$

in which 446.51 and 553.78 are the molecular weights of pravastatin sodium and pravastatin 1,1,3,3-tetramethylbutylamine, respectively; V is the volume, in mL, of the *Assay preparation;* ~~C is the concentration, in mg per mL, of USP Pravastatin Sodium RS in the *Standard preparation;*~~ C is the concentration, in mg per mL, of pravastatin 1,1,3,3-tetramethylbutylamine in the *Standard preparation;* and r_U and r_S are the responses of the pravastatin peak obtained from the *Assay preparation* and the *Standard preparation,* respectively.■ IS *(USP30)*

BRIEFING

Pravastatin Sodium Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph, based on validated methods of analysis, is being proposed. Because Pravastatin Sodium is highly hygroscopic, USP Pravastatin 1,1,3,3-Tetramethylbutylamine RS is used as a Reference Standard for quantitative applications. The liquid chromatographic procedure in the test for *Related compounds* and in the *Assay* is based on analyses performed with the Spherisorb or Nova-Pak brand of endcapped L1 column. The typical retention time for the pravastatin peak is about 3 to 5 minutes.

(MD-GRE: E. Gonikberg; BPC: M. Marques) RTS—C43516

Add the following:

■Pravastatin Sodium Tablets

» Pravastatin Sodium contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of pravastatin sodium ($C_{23}H_{35}NaO_7$).

Packaging and storage—Preserve in tight containers. Store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Pravastatin Related Compound B RS. USP Pravastatin Sodium RS. USP Pravastatin 1,1,3,3-Tetramethylbutylamine RS.*

Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

B: *Ultraviolet Absorption* ⟨197U⟩—Finely powder a number of Tablets, and extract a portion equivalent to about 10 mg of pravastatin sodium with water. The UV absorption spectrum of a solution of pravastatin sodium in water containing about 10 µg per mL exhibits maxima at the same wavelength as that of a similar solution of USP Pravastatin Sodium RS, concomitantly measured between 220 and 340 nm.

Dissolution ⟨711⟩—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Procedure—Determine the amount of $C_{23}H_{35}NaO_7$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 238 nm on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Pravastatin 1,1,3,3-

In-Process Revision

Tetramethylbutylamine RS in the same *Medium.* [NOTE—To express the concentration of the Standard solution as pravastatin sodium, use the conversion factor of (446.51/553.78), in which 446.51 and 553.78 are the molecular weights of pravastatin sodium and pravastatin 1,1,3,3-tetramethylbutylamine, respectively.]

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{23}H_{35}NaO_7$ is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Related compounds—

Mobile phase and *Chromatographic system*—Proceed as directed in the *Assay.*

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay.* [NOTE—Use this solution within 24 hours of preparation.]

Procedure—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatograms for up to 4 times the retention time of the pravastatin peak, identify the impurities listed in *Table 1,* and measure the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response of the individual impurity, and r_s is the sum of the responses of all the peaks obtained from the *Test solution.* In addition to not exceeding the limits of each impurity in *Table 1*, not more than 0.2% of any unspecified individual impurity is found, and not more than 3% of total impurities is found. Disregard the peak due to pravastatin related compound B that elutes at the relative retention time of about 0.7 and the peak due to 3″-hydroxypravastatin at the relative retention time of about 0.3 as these impurities are controlled in the drug substance monograph. Disregard any impurity that is less than 0.05%.

Table 1

Name	Relative Retention Time	Limit (%)
Oxidation impurity[1]	0.5	1
Pravastatin sodium	1.0	n/a
Specified unknown impurity 1	1.6	0.2
Specified unknown impurity 2	1.8	0.2
Pravastatin lactone	2.1	2
Specified unknown impurity 3	2.8	0.2
Specified unknown impurity 4	3.2	0.2
Specified unknown impurity 5	3.8	0.2

[1] Sodium (3*R*,5*R*)-3,5-dihydroxy-7-((1*S*,2*S*)-6-hydroxy-2-methyl-1,2-dihydronaphthalen-1-yl)heptanoate.

Assay—[NOTE—The *Standard preparation*, *Assay stock preparation,* and *Assay preparation* can be stored for up to 7 days at room temperature.]

Mobile phase—Prepare a filtered and degassed mixture of methanol, water, glacial acetic acid, and triethylamine (500 : 500 : 1 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent 1—Transfer 16.4 g of anhydrous sodium acetate into a 2000-mL volumetric flask. Add 1600 mL of water, adjust with glacial acetic acid to a pH of 5.6, dilute with water to volume, and mix.

Diluent 2—Prepare a mixture of *Diluent 1* and methanol (80 : 20).

Standard preparation—Transfer an accurately weighed quantity of USP Pravastatin 1,1,3,3-Tetramethylbutylamine RS to a suitable volumetric flask, and dissolve in *Diluent 1* using sonication to obtain a solution having a known concentration of about 0.6 mg of pravastatin 1,1,3,3-tetramethylbutylamine per mL. Dilute 5.0 mL of this solution with *Diluent 2* to 25.0 mL, and mix.

Assay stock preparation—Transfer not fewer than 5 Tablets to a suitable volumetric flask with at least a ($NL \times 2$)-mL capacity, N being the number of Tablets transferred, and L

In-Process Revision

being the label claim per Tablet, filled to at least 80% capacity with *Diluent 1.* [NOTE—It is necessary to fill the flask to 80% capacity to maintain the correct pH throughout the preparation.] Shake for at least 1 hour, and then sonicate for at least 15 minutes with periodic shaking of the flask by hand, until the Tablets have completely disintegrated. Allow to cool, and then dilute with *Diluent 1* to volume. Centrifuge a portion of the solution for 15 minutes at 2000 rpm, or filter.

Assay preparation—Dilute approximately 5 mL of the *Assay stock preparation* with *Diluent 2* to obtain a solution having an expected concentration of about 0.1 mg per mL, based on the label claim.

Resolution solution—Transfer about 2 mg of USP Pravastatin Related Compound B RS to a 10-mL volumetric flask. Dissolve in and dilute with methanol to volume. Transfer 0.1 mL of this solution and 1.0 mL of the *Standard preparation* to a small tube, and mix. [NOTE—Pravastatin related compound B is the 6′-epipravastatin sodium.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 238-nm detector and a 4.6-mm × 5-cm column than contains endcapped packing L1. Alternatively, a 3.9- × 7.5-cm column containing endcapped packing L1 can be used. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.7 for pravastatin related compound B and 1.0 for pravastatin; the resolution, *R,* between the pravastatin related compound B and the pravastatin peaks is not less than 3.0. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak response for pravastatin. Calculate the percentage of pravastatin sodium ($C_{23}H_{35}NaO_7$) in the portion of Tablets taken by the formula:

$$100 \times (446.51/553.78)(CVD/NL)(r_U/r_S)$$

in which 100 is the conversion factor to percentage; 446.51 and 553.78 are the molecular weights of pravastatin sodium and pravastatin 1,1,3,3-tetramethylbutylamine, respectively; *C* is the concentration, in mg per mL, of pravastatin 1,1,3,3-tetramethylbutylamine in the *Standard preparation; V* is the volume, in mL, of the *Assay stock preparation; D* is the dilution factor of the *Assay preparation; N* is the number of Tablets taken to prepare the *Assay stock preparation; L* is the label claim, in mg of pravastatin sodium per Tablet; and r_U and r_S are the pravastatin peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP30*)

BRIEFING

Prednicarbate Cream, page 1655 of *PF* 31(6) [Nov.–Dec. 2005]; **Prednicarbate Ointment,** page 1657 of *PF* 31(6)[Nov.–Dec. 2005]. In the test for *Related compounds* and in the *Assay,* it is proposed (1) to rename the related compound 1,2-dihydroprednicarbate as USP Prednicarbate Related Compound A and (2) to rename the related compounds prednisolone-17-ethylcarbonate and prednisolone-21-propionate as USP Prednicarbate Related Compound B RS and USP Prednicarbate Related Compound C RS, respectively. It is also proposed to simplify the procedure for preparing *Solution 1* in the *Assay.*

(MD-PS: D. Bempong) RTS—C44285

In-Process Revision

Add the following:

■Prednicarbate Cream

» Prednicarbate Cream contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of prednicarbate ($C_{27}H_{36}O_8$). It may contain a suitable preservative.

Packaging and storage—Preserve in tight, light-resistant containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Prednicarbate RS. USP Prednicarbate Related Compound A RS. USP Prednicarbate Related Compound B RS. USP Prednicarbate Related Compound C RS.*

Identification—The retention time of the prednicarbate peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Consistency—At room temperature, a string of Cream having a length of 2 cm retains its shape on a glass plate for at least 10 minutes. It can be spread easily and has no visible lumps.

Microbial limits ⟨61⟩—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*. The total aerobic bacterial count does not exceed 100 cfu per g.

Minimum fill ⟨755⟩**:** meets the requirements.

pH ⟨791⟩**:** between 3.5 and 5.0, in a solution prepared in the following manner. Add 15 mL of boiling water to 3.5 g of Cream in a 50-mL centrifuge tube, and shake vigorously until an emulsion is formed. Loosen the cap, and place in a steam bath for 5 minutes. Centrifuge the hot solution. After cooling to room temperature, collect the lower aqueous solution in a glass tube, and determine the pH.

Related compounds—

Solution A, Solution B, Mobile phase, Solution 1, Solution 2, and *Resolution solution*—Prepare as directed in the *Assay.*

Standard stock solution—Prepare as directed for *Standard stock preparation* in the *Assay.*

Standard solution—Prepare as directed for *Standard preparation* in the *Assay.*

System sensitivity solution—Dilute 1.0 mL of the *Standard solution* with dehydrated alcohol to 50.0 mL. Dilute 1.0 mL of the solution thus obtained with *Solution A* to 20.0 mL.

Test solution—Prepare as directed for the *Assay preparation.*

Chromatographic system—Proceed as directed in the *Assay.* Chromatograph the *System sensitivity solution:* the signal-to-noise ratio is not less than 3. ~~Chromatograph the *Test solution,* and record the responses of all the peaks other than the prednicarbate peak, as directed for *Procedure:* the relative retention times are about 0.57 for prednisolone 17-ethylcarbonate, 0.64 for prednisolone 21-propionate, 1.0 for prednicarbate, and 1.04 for 1,2-dihydroprednicarbate.~~ Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.57 for prednicarbate related compound B, 0.64 for prednicarbate related compound C, 1.0 for prednicarbate, and 1.04 for prednicarbate related compound A.

In-Process Revision

Procedure—Inject a volume (about 60 µL) of *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each related compound and unknown impurity in the portion of Cream taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each individual impurity obtained from the *Test solution,* and r_s is the sum of the peak responses obtained from the *Test solution:* not more than 2.0% of ~~prednisolone 17-ethylcarbonate and prednisolone 21-propionate~~ prednicarbate related compound B and prednicarbate related compound C is found; not more than 0.1% of any individual related compound is found; and not more than 5.0% of total related compounds is found.

Assay—

Solution A—Prepare a 0.01 M solution of monobasic potassium phosphate in water.

Solution B—Prepare a mixture of acetonitrile and dehydrated alcohol (2 : 1).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Dissolve an accurately weighed quantity of USP Prednicarbate RS in dehydrated alcohol, and dilute quantitatively, and stepwise if necessary, with dehydrated alcohol to obtain a solution having a known concentration of 0.3 mg per mL.

Standard preparation—Transfer 10.0 mL of *Standard stock preparation* to a 100-mL volumetric flask, add 15 mL of tetrahydrofuran and 30 mL of *Solution B,* and dilute with *Solution A* to volume.

Assay preparation—Transfer an accurately weighed quantity of Cream, equivalent to about 3.0 mg of prednicarbate, to a 100-mL volumetric flask. Add 15 mL of tetrahydrofuran, shake vigorously, and allow to stand in an ultrasonic bath until the sample has dissolved. Add 20 mL of dehydrated alcohol, and shake vigorously. Add 20 mL of acetonitrile, and shake vigorously. Immediately dilute with *Solution A* to volume, and shake vigorously. Allow to stand in an ice bath for at least 15 minutes. Shake the samples vigorously, and pass through a folded paper filter. Pass the filtrate through a membrane filter of 0.45-µm porosity.

Solution 1—~~Transfer about 15 mg each of prednisolone 17-ethylcarbonate and prednisolone 21-propionate, accurately weighed, to a 50-mL volumetric flask, and dissolve in and dilute with dehydrated alcohol to volume.~~ Prepare a solution containing 0.3 mg per mL each of USP Prednicarbate Related Compound B RS and USP Prednicarbate Related Compound C RS in dehydrated alcohol.

Solution 2—Transfer about 15 mg of ~~1,2-dihydroprednicarbate,~~ USP Prednicarbate Related Compound A RS, accurately weighed, to a 50-mL volumetric flask; add 1.0 mL of *Solution 1,* and dilute with dehydrated alcohol to volume.

Resolution solution—Transfer 10.0 mL of the *Standard preparation* to a volumetric flask; add 1.0 mL of *Solution 2,* 1 mL of tetrahydrofuran, and 2 mL of acetonitrile; and dilute with *Solution A* to 20.0 mL.

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 243-nm detector and a 4.0-mm × 25-cm column that contains 5-µm packing L1. The column temperature is maintained at 40°. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–5	67	33	equilibration
5–45	67→40	33→60	linear gradient
45–50	40	60	isocratic
50–55	40→20	60→80	linear gradient
55–70	20	80	isocratic
70–75	20→67	80→33	linear gradient
75–85	67	33	isocratic

Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between prednicarbate and ~~1,2-dihydroprednicarbate~~ prednicarbate related compound A is not less than 1.5. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor for the prednicarbate peak is between 0.7 and 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 60 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of prednicarbate ($C_{27}H_{36}O_8$) in each g of Cream taken by the formula:

$$100(C/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Prednicarbate RS in the *Standard preparation; W* is the weight, in g, of Cream taken; and r_U and r_S are the prednicarbate peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■1S (*USP30*)

BRIEFING

Prednicarbate Ointment, page 1657 of *PF* 31(6) [Nov.–Dec. 2005]—See briefing under *Prednicarbate Cream.*

(MD-PS: D. Bempong) RTS—C44286

Add the following:

■Prednicarbate Ointment

» Prednicarbate Ointment contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of prednicarbate ($C_{27}H_{36}O_8$), in a suitable ointment base.

Packaging and storage—Preserve in tight, light-resistant containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Prednicarbate RS. USP Prednicarbate Related Compound A RS. USP Prednicarbate Related Compound B RS. USP Prednicarbate Related Compound C RS.*

Identification—It meets the requirements of the *Identification* test under *Prednicarbate Cream*.

Consistency—At room temperature, a string of Ointment having a length of 2 cm retains its shape on a glass plate for at least 10 minutes. It can be spread easily and has no visible lumps.

In-Process Revision

Microbial limits ⟨61⟩—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*. The total aerobic bacterial count does not exceed 100 cfu per g.

Minimum fill ⟨755⟩**:** meets the requirements.

Related compounds—

Solution A, Solution B, Mobile phase, Solution 1, Solution 2, and *Resolution solution*—Prepare as directed for the *Assay* under *Prednicarbate Cream.*

Standard stock solution—Prepare as directed for the *Standard stock preparation* under *Prednicarbate Cream.*

System sensitivity solution—Prepare as directed in the test for *Related compounds* under *Prednicarbate Cream.*

Test solution—Prepare as directed for the *Assay preparation* under *Prednicarbate Cream.*

Chromatographic system—Prepare as directed for the *Assay* under *Prednicarbate Cream.* Chromatograph the ~~*Resolution solution,*~~ *System sensitivity solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio is not less than 3. Chromatograph the ~~*Test solution,* and record the responses of all the peaks other than the prednicarbate peak, as directed for *Procedure:* the relative retention times are about 0.57 for prednisolone 17-ethylcarbonate, 0.64 for prednisolone 21-propionate, 1.0 for prednicarbate, and 1.04 for 1,2 dihydroprednicarbate.~~ *Resolution solution,* and record the responses as directed for *Procedure:* the relative retention times are about 0.57 for prednicarbate related compound B, 0.64 for prednicarbate related compound C, 1.0 for prednicarbate, and 1.04 for prednicarbate related compound A.

Procedure—Inject a volume (about 60 µL) of the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each related compound and unknown impurity in the portion of Ointment taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each impurity obtained from the *Test solution,* and r_s is the sum of all the peak responses obtained from the *Test solution:* not more than 2.0% of ~~prednisolone 17-ethylcarbonate and prednisolone 21-propionate~~ prednicarbate related compound B and prednicarbate related compound C is found; not more than 0.1% of any individual related compound is found; and not more than 5.0% of total related compounds is found.

Assay—

Solution A, Solution B, Mobile phase, Standard stock preparation, Standard preparation, Assay preparation, Solution 1, Solution 2, and *Resolution solution*—Prepare as directed in the *Assay* under *Prednicarbate Cream*.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 243-nm detector and a 4.0-mm × 25-cm column that contains 5-µm packing L1. The column temperature is maintained at 40°. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–5	67	33	equilibration
5–45	67→40	33→60	linear gradient
45–50	40	60	isocratic
50–55	40→20	60→80	linear gradient
55–70	20	80	isocratic
70–75	20→67	80→33	linear gradient
75–85	67	33	isocratic

Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between prednicarbate and ~~1,2 dihydroprednicarbate~~ prednicarbate related compound A is not less than 1.5. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor for the prednicarbate peak is between 0.7 and 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 60 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of prednicarbate ($C_{27}H_{36}O_8$) in each g of Ointment taken by the formula:

$$100(C/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Prednicarbate RS in the *Standard preparation; W* is the weight, in g, of Ointment taken; and r_U and r_S are the prednicarbate peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■1S (*USP30*)

BRIEFING

Saquinavir Capsules, *USP 29* page 1946. It is proposed to specify the final volume of the *Citrate buffer* in the *Dissolution* test.

(BPC: M. Marques) RTS—C43922

Change to read:

Dissolution ⟨711⟩—

Citrate buffer— ~~Prepare a degassed solution containing 5.82 mg of anhydrous dibasic sodium phosphate and 16.7 mg of citric acid monohydrate in water. Adjust to a pH of 3.0.~~

■Transfer 5.82 g of anhydrous dibasic sodium phosphate and 16.7 g of citric acid monohydrate to a 1-L volumetric flask. Dissolve in and dilute with water to volume. ■1S (*USP30*)

Medium: Citrate buffer; 900 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Procedure—Determine the amount of $C_{38}H_{50}N_6O_5$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 240 nm on filtered portions of the solution under test, suitably diluted with *Medium,* in comparision with a Standard solution having a known concentration of USP Saquinavir Mesylate RS in the same *Medium*.

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{38}H_{50}N_6O_5$ is dissolved in 45 minutes.

BRIEFING

Sodium Fluoride and Phosphoric Acid Topical Solution, *USP 29* page 1982. It is proposed to delete this monograph because it is identical with the monograph for *Sodium Fluoride and Acidulated Phosphate Topical Solution*.

(MD-GRE: E. Gonikberg) RTS—C44451

Delete the following:

■~~Sodium Fluoride and Phosphoric Acid Topical Solution~~

~~» Sodium Fluoride and Phosphoric Acid Topical Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluoride ion.~~

~~**Packaging and storage**— Preserve in tight, plastic containers.~~

~~**Labeling**— Label Topical Solution in terms of the content of sodium fluoride (NaF) and in terms of the content of fluoride ion.~~

~~**USP Reference standards** ⟨11⟩— *USP Sodium Fluoride RS.*~~

~~**pH** ⟨791⟩— Using 40 mL of Topical Solution, proceed as directed in the test for *pH* under *Sodium Fluoride and Phosphoric Acid Gel:* the pH is between 3.0 and 4.5.~~

~~**Residual solvents** ⟨467⟩**:** — meets the requirements.~~

~~(Official January 1, 2007)~~

~~**Other requirements**— It responds to the *Identification* tests under *Sodium Fluoride and Phosphoric Acid Gel.*~~

~~**Assay**— [NOTE—Store all solutions, except *Buffer solution,* in plastic containers.]~~

~~*Buffer solution* and *Standard preparations*— Prepare as directed in the *Assay* under *Sodium Fluoride Oral Solution.*~~

~~*Assay preparation*— Transfer an accurately measured volume of Topical Solution, equivalent to about 20 mg of fluoride ion, to a 1000-mL volumetric flask, add water to dissolve, dilute with water to volume, and mix.~~

~~*Procedure*— Proceed as directed for *Procedure* in the *Assay* under *Sodium Fluoride Oral Solution*. Calculate the quantity, in mg, of fluoride ion in each mL of the Topical Solution taken by the formula:~~

~~C/V~~

~~in which C is the determined concentration of fluoride ion, in µg per mL, in the *Assay preparation;* and V is the volume, in mL, of Topical Solution taken.~~ ■1S (*USP30*)

In-Process Revision

BRIEFING

Sodium Salicylate Tablets, *USP 29* page 1991 and page 1116 of *PF* 31(4) [July–Aug. 2005]. It is proposed to correct the wavelength of maximum absorption in the test for *Dissolution.*

(BPC: M. Marques) RTS—C43348

Add the following:

■**USP Reference standards** ⟨11⟩—*USP Sodium Salicylate RS.* ■2S (*USP29*)

Change to read:

Dissolution ⟨711⟩—
Medium: water; 900 mL.
Apparatus 1: 100 rpm.
Time: 45 minutes.
Procedure—Determine the amount of $C_7H_5NaO_3$ dissolved from UV absorbances at the wavelength of maximum absorbance at about ~~266 nm.~~

■230 nm,■1S (*USP30*)
using filtered portions of the solution under test, diluted with water, if necessary, in comparison with a Standard solution having a known concentration of USP Sodium Salicylate RS in the same *Medium*.
Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_7H_5NaO_3$ is dissolved in 45 minutes.

BRIEFING

Vinorelbine Injection, *USP 29* page 2257 and page 3586 of the *First Supplement.* On the basis of comments received, it is proposed to make the following changes:
1. Change the assay percentage limits, shown in the Definition, from "not less than 92.5 percent and not more than 105.0 percent" to "not less than 90.0 percent and not more than 110.0 percent."
2. In the *Assay* section, for clarification, change the formula to ensure that the quantity calculated is vinorelbine, not vinorelbine tartrate.
3. In the *Assay* section, change the concentration of the *Standard preparation* from vinorelbine to vinorelbine tartrate.

In the absence of significant adverse comment, it is proposed to implement this revision via the *Fifth Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of October 1, 2006.

(MD-OOD: F. Mao) RTS—C44125; C44257

Change to read:

» Vinorelbine Injection is a sterile solution of Vinorelbine Tartrate in Water for Injection. It contains not less than ~~92.5~~

•90.0•5
percent and not more than ~~105.0~~

•110.0•5
percent of the labeled amount of vinorelbine ($C_{45}H_{54}N_4O_8$).
Caution—Handle Vinorelbine Injection with great care, because it is a potent cytotoxic agent.

Change to read:

■**Assay—**
Phosphate buffer, Mobile phase, and *System suitability solution*—Proceed as directed in the test for *Related compounds* under *Vinorelbine Tartrate*.
Standard preparation—Dissolve an accurately weighed quantity of USP Vinorelbine Tartrate RS in water to obtain a solution having a known concentration of about ~~0.10 mg of vinorelbine (base)~~

•0.14 mg•5
per mL.
Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 10 mg of vinorelbine, to a 100-mL volumetric flask, dilute with water to volume, and mix.
Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a diode-array detector and a 3.9-mm × 15-cm column that contains packing L1. The column temperature is maintained at 40°. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.8 for the photodegradation product, 1.0 for vinorelbine, and about 1.2 for vinorelbine related compound A; and the relative retention, α, between vinorelbine tartrate and vinorelbine related compound A is not less than 1.1.
Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the vinorelbine peaks, using a diode array detector. Calculate the quantity, in mg, of vinorelbine ($C_{45}H_{54}N_4O_8$) in each mL of the Injection taken by the formula:

~~$C(L/D)(r_u/r_s)$,~~

•$(778.93/1079.11)C(L/D)(r_u/r_s)$

in which 778.93 and 1079.11 are the molecular weights of vinorelbine and vinorelbine tartrate, respectively;•5
C is the concentration, in mg per mL, of USP Vinorelbine Tartrate RS in the *Standard preparation; L* is the labeled quantity, in mg, of vinorelbine in each mL of Injection taken; D is the concentration, in mg per mL, of vinorelbine in the *Assay preparation;* and r_U and r_S are the peak responses at 267 nm obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP29*)

DIETARY SUPPLEMENTS—MONOGRAPHS

BRIEFING

Methylsulfonylmethane; Methylsulfonylmethane Tablets. Because there are no existing *USP* monographs for these dietary supplements, new monographs, based on validated methods of analysis, are being proposed. The gas chromatographic procedures in the test for *Chromatographic purity and limit of dimethyl sulfoxide* and in the *Assay* are based on analyses performed with the Zebron ZB-1 brand of G2 column. The typical retention time for the methylsulfonylmethane peak is about 4.4 minutes.

(DSN: L. Evans; MSA: R. Tirumalai) RTS—C44099

Add the following:

■Methylsulfonylmethane

$C_2H_6O_2S$ 94.13

Dimethyl sulfone

Sulfonylbismethane [*67-71-0*].

» Methylsulfonylmethane contains not less than 98.0 percent and not more than 102.0 percent of $C_2H_6O_2S$, calculated on the anhydrous basis. The chromatographic purity is not less than 99.8%.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards ⟨11⟩**—***USP Methylsulfonylmethane RS. USP Dimethyl Sulfoxide RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Melting range ⟨741⟩: between 108.5° and 110.5°.

Microbial enumeration ⟨2021⟩**—**It meets the requirements of the tests for absence of *Escherichia coli* in 10 g. The total aerobic microbial count does not exceed 1000 cfu per g or mL, and the total combined molds and yeasts count does not exceed 100 cfu per g or mL.

Water, *Method I* ⟨921⟩**:** not more than 0.1%.

Heavy metals, *Method I* ⟨231⟩**:** 3 µg per g.

Chromatographic purity and limit of dimethyl sulfoxide—

Standard stock solution—Dissolve an accurately weighed quantity of USP Dimethyl Sulfoxide RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 1.0 mg of USP Dimethyl Sulfoxide RS per mL.

Sensitivity check solution—Dilute the *Standard stock solution* with methanol to obtain a solution having a concentration of 0.001 mg per mL.

System suitability solution—In a 50-mL volumetric flask, dissolve 20 mg of USP Methylsulfonylmethane RS in 5 mL of the *Standard stock solution,* dilute with methanol to volume, and mix to obtain a solution having a known concentration of about 0.1 mg of USP Dimethyl Sulfoxide RS per mL and 0.4 mg of USP Methylsulfonylmethane RS per mL.

Test solution—Transfer about 100 mg of methylsulfonylmethane, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Sonicate at 50° for 1 minute, allow to cool to room temperature, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 30-m capillary column coated with 5-µm phase G2. The column temperature is maintained at 120°. Helium is used as the carrier gas, flowing at a rate of 30 mL per minute. The split ratio is 20 : 1. The injection port temperature is maintained at 250°, and the detector temperature is maintained at 250°. Chromatograph the *Sensitivity check solution:* the dimethyl sulfoxide peak

In-Process Revision

height to the noise height ratio is not less than 10, noise height being determined by a suitable procedure. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between dimethyl sulfoxide and methylsulfonylmethane is not less than 2.0.

Procedure—Inject a volume (about 1 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the responses for the major peaks. Calculate the percentage of each impurity in the portion of Methylsulfonylmethane taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the response of each individual impurity in the chromatogram of the *Test solution;* and r_s is the sum of the responses of all of the peaks other than the solvent peak: not more than 0.1% of dimethyl sulfoxide is found; not more than 0.05% of any other individual impurity is found; and the sum of all impurities, including dimethyl sulfoxide, is not more than 0.2%.

Assay—

Diluent—Transfer about 950 mL of methanol to a 1-L volumetric flask. Add 0.60 mL of di(ethylene glycol) methyl ether, and dilute with methanol to volume.

Standard preparation—Dissolve an accurately weighed quantity of USP Methylsulfonylmethane RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.4 mg per mL. Sonicate at 50° for 1 minute, allow to cool to room temperature, and mix.

Assay preparation—Transfer about 40 mg of Methylsulfonylmethane, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix. Sonicate at 50° for 1 minute, allow to cool to room temperature, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 30-m capillary column coated with 5-µm phase G2. The column temperature is maintained at 120°. Helium is used as the carrier gas, flowing at a rate of 30 mL per minute. The split ratio is 20 : 1. The injection port temperature is maintained at 250°, and the detector is maintained at 250°. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_2H_6O_2S$ in the portion of Methylsulfonylmethane taken by the formula:

$$100C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Methylsulfonylmethane RS in the *Standard preparation;* and R_U and R_S are the peak response ratios of methylsulfonylmethane to di(ethylene glycol) methyl ether obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■1S (*USP30*)

BRIEFING

Methylsulfonylmethane Tablets—See briefing under *Methylsulfonylmethane.*

(DSN: L. Evans; DS-BA: D. Cairatti) RTS—C44099

In-Process Revision

Add the following:

■Methylsulfonylmethane Tablets

» Methylsulfonylmethane Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of methylsulfonylmethane ($C_2H_6O_2S$).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩**—***USP Methylsulfonylmethane RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Disintegration and dissolution ⟨2040⟩**:** meet the requirements for *Disintegration* only; 30 minutes.

Weight variation ⟨2091⟩**:** meet the requirements.

Assay—

Diluent, Standard preparation, and *Chromatographic system*—Proceed as directed in the *Assay* under *Methylsulfonylmethane*.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Dissolve an accurately weighed portion of the finely powdered material, equivalent to about 1 Tablet, in *Diluent,* mix, and sonicate for 15 minutes at 50°. Allow to cool to room temperature, dilute with *Diluent* to volume, and mix. Quantitatively dilute with *Diluent* to obtain a final concentration of 0.4 mg of methylsulfonylmethane per mL. Transfer about 1 mL of the suspension to a 1.5-mL microcentrifuge tube, and centrifuge for 20 seconds. Use the supernatant.

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of methylsulfonylmethane ($C_2H_6O_2S$) in the portion of Tablets taken by the formula:

$$DC(R_U / R_S)$$

in which D is the dilution factor; C is the concentration, in mg per mL, of USP Methylsulfonylmethane RS in the *Standard preparation;* and R_U and R_S are the peak response ratios of methylsulfonylmethane to di(ethylene glycol) methyl ether obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP30*)

MONOGRAPHS (NF)

BRIEFING

Polyisobutylene, *NF 24* page 3399. On the basis of comments received, it is proposed to revise the specification limit in the test for *Loss on drying* from 0.1% to 0.3%. This limit is representative of marketed products and consistent with the official limit for *Volatiles* in the Polyisobutylene monograph in the *Food Chemicals Codex, Fifth Edition,* page 344.

(EM2: H. Wang) RTS—C44344

USP Reference Standards—*USP Alcohol Determination—Acetonitrile RS. USP Alcohol Determination—Alcohol RS.*

▪Method IIa■2S (*USP29*)

Apparatus—Under typical conditions, use a gas chromatograph equipped with a flame-ionization detector and a 4-mm × 1.8-m glass column packed with 100- to 120-mesh chromatographic column packing support S3, using nitrogen or helium as the carrier. Prior to use, condition the column overnight at 235° with a slow flow of carrier gas. The column temperature is maintained at 120°, and the injection port and detector temperatures are maintained at 210°. Adjust the carrier flow and temperature so that acetonitrile, the internal standard, elutes in 5 to 10 minutes.

Solutions—

Test Stock Preparation—Dilute the specimen under examination stepwise with water to obtain a solution containing approximately 2% (v/v) of alcohol.

Test Preparation—Pipet 5 mL each of the *Test Stock Preparation* and the USP Alcohol Determination—Acetonitrile RS [NOTE—Alternatively, a 2% aqueous solution of acetonitrile of suitable quality may be used as the internal standard solution] into a 50-mL volumetric flask, dilute with water to volume, and mix.

Standard Preparation—Pipet 5 mL each of the USP Alcohol Determination—Alcohol RS and the USP Alcohol Determination—Acetonitrile RS [NOTE—Alternatively, a 2% aqueous solution of acetonitrile of suitable quality may be used as the internal standard solution] into a 50-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Inject about 5 µL each of the *Test Preparation* and the *Standard Preparation,* in duplicate, into the gas chromatograph, record the chromatograms, and determine the peak response ratios. Calculate the percentage of alcohol (v/v) in the specimen under test according to the formula:

$$CD(R_U / R_S)$$

in which C is the labeled concentration of USP Alcohol Determination—Alcohol RS; D is the dilution factor (the ratio of the volume of the *Test Stock Preparation* to the volume of the specimen taken); and R_U and R_S are the peak response ratios obtained from the *Test Preparation* and the *Standard Preparation,* respectively.

System Suitability Test—In a suitable chromatogram, the resolution factor, R, is not less than 2; the tailing factor of the alcohol peak is not greater than 2.0; and six replicate injections of the *Standard Preparation* show a relative standard deviation of not more than 2.0% in the ratio of the peak of alcohol to the peak of the internal standard.

▪Method IIb

Apparatus—The gas chromatograph is equipped with a split injection port with a split ratio of 5 : 1, a flame-ionization detector, and a 0.53-mm × 30-m capillary column coated with a 3.0-µm film of phase G43. Helium is used as the carrier gas at a linear velocity of 34.0 cm per second. The chromatograph is programmed to maintain the column temperature at 50° for 5 minutes, then to increase the temperature at a rate of 10° per minute to 200°, and hold at this temperature for 4 minutes. The injection port temperature is maintained at 210° and the detector temperature at 280°.

Solutions—

Test Stock Preparation—Dilute the specimen under examination stepwise with water to obtain a solution containing approximately 2% (v/v) of alcohol.

Test Preparation—Pipet 5 mL each of the *Test Stock Preparation* and the USP Alcohol Determination—Acetonitrile RS [NOTE—Alternatively, a 2% aqueous solution of acetonitrile of suitable quality may be used as the internal standard solution] into a 25-mL volumetric flask, dilute with water to volume, and mix.

Standard Preparation—Pipet 5 mL each of the USP Alcohol Determination—Alcohol RS and the USP Alcohol Determination—Acetonitrile RS [NOTE—Alternatively, a 2% aqueous solution of acetonitrile of suitable quality may be used as the internal standard solution] into a 25-mL volumetric flask, dilute with water to volume, and mix.

In-Process Revision

Procedure—Inject about 0.2 ■to 0.5■1S *(USP30)* µL each of the *Test Preparation* and the *Standard Preparation,* in duplicate, into the gas chromatograph, record the chromatograms, and determine the peak response ratios. Calculate the percentage of alcohol (v/v) in the specimen under test according to the formula:

$$CD(R_U / R_S)$$

in which C is the labeled concentration of USP Alcohol Determination—Alcohol RS; D is the dilution factor (the ratio of the volume of the *Test Stock Preparation* to the volume of the specimen taken); and R_U and R_S are the peak response ratios obtained from the *Test Preparation* and the *Standard Preparation,* respectively.

System Suitability Test—In a suitable chromatogram, the resolution factor, *R,* between alcohol and the internal standard is not less than 4; the tailing factor of the alcohol peak is not greater than 2.0; and six replicate injections of the *Standard Preparation* show a relative standard deviation of not more than 4.0% in the ratio of the peak of alcohol to the peak of the internal standard.■2S *(USP29)*

BRIEFING

〈**621**〉 **Chromatography,** *USP 29* page 2639, page 3595 of the *First Supplement,* page 265 of the *Second Interim Revision Announcement* pertaining to *USP 29–NF 24,* and page 825 of *PF* 31(3) [May–June 2005]. In the *Chromatographic Reagents* section it is proposed to expand the particle size ranges for the designations L1, L7, and L11. Proposed changes are being made in designation L60. Also, some new column designations are being added.

SYSTEM SUITABILITY

System suitability tests are an integral part of gas and liquid chromatographic methods. They are used to verify that the ▲detection sensitivity,▲*USP29* ●(Postponed indefinitely)●2 resolution, and reproducibility of the chromatographic system are adequate for the analysis to be done. The tests are based on the concept that the equipment, electronics, analytical operations, and samples to be analyzed constitute an integral system that can be evaluated as such.

▲The detection sensitivity is a measure used to ensure the suitability of a given chromatographic procedure for the complete detection of the impurities in the *Chromatographic purity* or *Related compounds* tests by injecting a volume of a quantitation limit solution equal to that of the *Test solution*. Unless otherwise specified in the individual monograph, the quantitation limit solution may be prepared by dissolving the drug substance Reference Standard in the same solvent as that used for the *Test solution* at a 0.05% concentration level relative to the amount of drug substance in the *Test solution* for drug substances, and a 0.1% level relative to the amount of drug substance in the *Test solution* for drug products. The signal-to-noise ratio for the drug substance peak obtained with the quantitation limit solution should be not less than 10.▲*USP29* ●(Postponed indefinitely)●2

The resolution, *R,* [NOTE—All terms and symbols are defined in the *Glossary of Symbols*] is a function of column efficiency, *N,* and is specified to ensure that closely eluting compounds are resolved from each other, to establish the general resolving power of the system, and to ensure that internal standards are resolved from the drug. Column efficiency may be specified also as a system suitability requirement, especially if there is only one peak of interest in the chromatogram; however, it is a less reliable means to ensure resolution than direct measurement. Column efficiency is a measure of peak sharpness, which is important for the detection of trace components.

Replicate injections of a standard preparation used in the assay or other standard solution are compared to ascertain whether requirements for precision are met. Unless otherwise specified in the individual monograph, data from five replicate injections of the analyte are used to calculate the relative standard deviation, S_R, if the requirement is 2.0% or less; data from six replicate injections are used if the relative standard deviation requirement is more than 2.0%.

The tailing factor, *T,* a measure of peak symmetry, is unity for perfectly symmetrical peaks and its value increases as tailing becomes more pronounced (see *Figure 2*). In some cases, values less than unity may be observed. As peak asymmetry increases, integration, and hence precision, becomes less reliable.

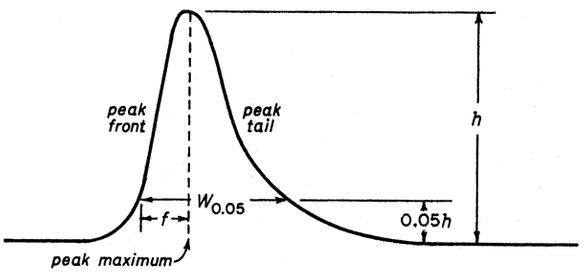

Figure 2. Asymmetrical chromatographic peak

These tests are performed by collecting data from replicate injections of standard or other solutions as specified in the individual monograph. The specification of definitive parameters in a monograph does not preclude the use of other suitable operating conditions (see *Procedures* under *Tests and Assays* in the *General Notices*). ~~Adjustments of operating conditions to meet system suitability requirements may be necessary.~~

■If adjustments of operating conditions to meet system suitability requirements are necessary, each of the following is the maximum ~~specification~~ variation that can be considered, unless otherwise directed in the monograph. Adjustments are permitted only when ~~Reference Standards~~ suitable standards (including Reference Standards) are available for all ~~analytes~~ compounds used in the suitability test and only when those

In-Process Revision

standards are used to show that the adjustments have improved the quality of the chromatography in meeting system suitability requirements. Adjustments to chromatographic systems performed in order to comply with system suitability requirements are not to be made to compensate for column failure or to circumvent replacing a deteriorated column. ~~The changes described below may require additional validation data unless the user can verify the suitability of the method under the new conditions. This verification consists of assessing the analytical performance characteristics that can be affected by the change (e.g., specificity, linearity, precision, accuracy) to ensure the adequacy of the method. Multiple adjustments that may have a cumulative effect in the performance of the system are to be avoided.~~ The changes described below may require additional validation data. The user should verify the suitability of the method under the new conditions by assessing the relevant analytical performance characteristics potentially affected by the change. *Tables 1* and *2* in the general information chapter *Verification of Compendial Procedures* ⟨1226⟩ provide lists of analytical performance validation characteristics that may require assessment. Multiple adjustments can have a cumulative effect in the performance of the system and should be considered carefully before implementation.

pH of Mobile Phase (HPLC)—The pH of the aqueous buffer used in the preparation of the mobile phase can be adjusted to within ~~0.2~~ ±0.2 units of the value or range specified.

Concentration of Salts in Buffer (HPLC)—The concentration of the salts used in the preparation of the aqueous buffer used in the mobile phase can be adjusted to within ±10%, provided the permitted pH variation (see above) is met.

Ratio of Components in Mobile Phase (HPLC)—~~The amount of the minor~~ The following adjustment limits apply to minor components of the mobile phase (specified at 50% or less). The amount(s) of these component(s) can be adjusted by ±30% relative. ~~or ±2% absolute (i.e., in relation to the total mobile phase), whichever is larger.~~ However, the change in any component cannot exceed ±10% absolute (i.e., in relation to the total mobile phase), nor can the final concentration of any component be reduced to zero. Adjustment can be made to one minor component in a ternary mixture. Examples of adjustments for binary and ternary mixtures are given below.

Binary Mixtures—

SPECIFIED RATIO OF 50 : 50—Thirty percent of 50 is 15% absolute, but this exceeds the maximum permitted change of ±10% absolute in either component. Therefore, the mobile phase ratio may be adjusted only within the range of 40 : 60 to 60 : 40.

~~SPECIFIED RATIO OF 95 : 5 Thirty percent of 5 is 1.5% absolute. However, because adjustments up to ±2% absolute are allowed, the ratio may be adjusted within the range of 93 : 7 to 97 : 3.~~

SPECIFIED RATIO OF 2 : 98—Thirty percent of 2 is 0.6% absolute. ~~In this case an absolute adjustment of ±2% is not allowed because it would reduce the amount of the first component to zero.~~ Therefore the maximum allowed adjustment is within the range of 1.4 : 98.6 to 2.6 : 97.4.

Ternary Mixtures—

SPECIFIED RATIO OF 60 : 35 : 5—For the second component, 30% of 35 is 10.5% absolute, which exceeds the maximum permitted change of ±10% absolute in any component. Therefore the second component may be adjusted only within the range of 25% to 45% absolute. For the third component, 30% of 5 is 1.5% absolute. ~~Since ±2% absolute is permitted and provides more flexibility, the third component may be adjusted within the range of 3% to 7% absolute.~~ In all cases, a sufficient quantity of the first component is used to give a total of 100%. Therefore, mixture ranges of 50 : 45 : 5 to 70 : 25 : 5 or ~~58 : 35 : 7 to 62 : 35 : 3~~ 58.5 : 35 : 6.5 to 61.5 : 35 : 3.5 would meet the requirement.

~~Detector~~ Wavelength of UV-Visible Detector (HPLC)—Deviations from the wavelengths specified in the method are not permitted. The procedure specified by the detector manufacturer, or another validated procedure, is to be used to verify that error in the detector wavelength is, at most, ±3 nm.

In-Process Revision

Column Length (GC, HPLC): can be adjusted by as much as ~~70%.~~ ±70%.

Column Inner Diameter (GC, HPLC): can be adjusted by as much as ~~±25% 50%.~~ ±25% for HPLC and ±50% for GC.

Film Thickness (Capillary GC): can be adjusted by as much as –50% to 100%.

Particle Size (HPLC): can be reduced by as much as 50%.

Particle Size (GC): going from a larger to a smaller or a smaller to a larger (if it is the same "Range Ratio", which is the diameter of the largest particle divided by the diameter of the smallest particle) particle size GC mesh support is acceptable, provided the chromatography meets the requirements of the system suitability.

Flow Rate (GC, HPLC): can be adjusted by as much as ±50%.

Injection Volume (GC, HPLC): can be reduced as far as is consistent with accepted precision and detection limits. ~~It may be increased to as much as twice the volume specified, provided there are no adverse effects on factors such as baseline, peak shapes, resolution, linearity, and retention times.~~

Column Temperature (HPLC): can be adjusted by as much as ~~±20°.~~ ±10°. Column thermostating is recommended to improve control and reproducibility of retention time.

~~**Column**~~ **Oven Temperature (GC):** can be adjusted by as much as ~~±2%, in terms of absolute temperature.~~ ±10%.

Oven Temperature Program (GC)—Adjustment of temperatures is permitted as stated above. For the times specified for the temperature to be maintained or for the temperature to be changed from one value to another, an adjustment of up to ±20% is permitted.

~~**Gradient Elution (HPLC)** The configuration of the equipment employed may significantly alter the resolution, retention time, and relative retentions described in the method. Should this occur, it may be due to excess dwell time, which is the volume between the point at which the two eluants meet and the top of the column.~~ ■2S (*USP29*)

Unless otherwise directed in the monograph, system suitability parameters are determined from the analyte peak.

■Relative retention times may be provided in monographs for informational purposes only, to aid in peak identification. There are no acceptance criteria applied to relative retention times.■2S (*USP29*)

To ascertain the effectiveness of the final operating system, it should be subjected to suitability testing. Replicate injections of the standard preparation required to demonstrate adequate system precision may be made before the injection of samples or may be interspersed among sample injections. System suitability must be demonstrated throughout the run by injection of an appropriate control preparation at appropriate intervals. The control preparation can be a standard preparation or a solution containing a known amount of analyte and any additional materials useful in the control of the analytical system, such as excipients or impurities. Whenever there is a significant change in equipment or in a critical reagent, suitability testing should be performed before the injection of samples. No sample analysis is acceptable unless the requirements of system suitability have been met. Sample analyses obtained while the system fails

■system suitability■2S (*USP29*)
requirements are unacceptable.

CHROMATOGRAPHIC REAGENTS

The following list of packings (L), phases (G), and supports (S) is intended to be a convenient reference for the chromatographer. [NOTE—Particle sizes given in this listing are those generally provided. Where other, usually finer, sizes are required, the individual monograph specifies the desired particle size. Within any category of packings or phases listed below, there may be a wide range of columns available. Where it is necessary to define more specifically the chromatographic conditions, the individual monograph so indicates.]

Packings

L1—Octadecyl silane chemically bonded to porous silica or ceramic micro-particles, ~~3~~

■1.5■1S (*USP30*)
to 10 µm in diameter, ■or a monolithic silica rod.■1S (*USP29*)

L2—Octadecyl silane chemically bonded to silica gel of a controlled surface porosity that has been bonded to a solid spherical core, 30 to 50 µm in diameter.

L3—Porous silica particles, 5 to 10 µm in diameter.

L4—Silica gel of controlled surface porosity bonded to a solid spherical core, 30 to 50 µm in diameter.

L5—Alumina of controlled surface porosity bonded to a solid spherical core, 30 to 50 µm in diameter.

L6—Strong cation-exchange packing–sulfonated fluorocarbon polymer coated on a solid spherical core, 30 to 50 µm in diameter.

L7—Octylsilane chemically bonded to totally porous silica particles, ~~3~~

■1.5■1S (*USP30*)
to 10 µm in diameter.

L8—An essentially monomolecular layer of aminopropylsilane chemically bonded to totally porous silica gel support, 3 to 10 µm in diameter.

In-Process Revision

L9—■ ■1S (*USP29*) Irregular or spherical, totally porous silica gel having a chemically bonded, strongly acidic cation-exchange coating, ■3 to 10 µm in diameter.■1S (*USP29*)

L10—Nitrile groups chemically bonded to porous silica particles, 5 to 10 µm in diameter.

L11—Phenyl groups chemically bonded to porous silica particles, ~~5~~

■1.5■1S (*USP30*)
to 10 µm in diameter.

L12—A strong anion-exchange packing made by chemically bonding a quaternary amine to a solid silica spherical core, 30 to 50 µm in diameter.

L13—Trimethylsilane chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L14—Silica gel having a chemically bonded, strongly basic quaternary ammonium anion-exchange coating, 5 to 10 µm in diameter.

L15—Hexylsilane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

L16—Dimethylsilane chemically bonded to porous silica particles, 5 to 10 µm in diameter.

L17—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form, 7 to 11 µm in diameter.

L18—Amino and cyano groups chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L19—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the calcium form, about 9 µm in diameter.

L20—Dihydroxypropane groups chemically bonded to porous silica particles, 5 to 10 µm in diameter.

L21—A rigid, spherical styrene-divinylbenzene copolymer, 5 to 10 µm in diameter.

L22—A cation-exchange resin made of porous polystyrene gel with sulfonic acid groups, about 10 µm in size.

L23—An anion-exchange resin made of porous polymethacrylate or polyacrylate gel with quaternary ammonium groups, about 10 µm in size.

L24—A semi-rigid hydrophilic gel consisting of vinyl polymers with numerous hydroxyl groups on the matrix surface, 32 to 63 µm in diameter.

■[NOTE—Available as YMC-Pack PVA-SIL manufactured by YMC Co., Ltd. and distributed by Waters Corp. (www.waters.com).]■1S (*USP29*)

L25—Packing having the capacity to separate compounds with a molecular weight range from 100–5000 (as determined by polyethylene oxide), applied to neutral, anionic, and cationic water-soluble polymers. A polymethacrylate resin base, cross-linked with polyhydroxylated ether (surface contained some residual carboxyl functional groups) was found suitable.

L26—Butyl silane chemically bonded to totally porous silica particles, ■3■1S (*USP29*) to 10 µm in diameter.

L27—Porous silica particles, 30 to 50 µm in diameter.

L28—A multifunctional support, which consists of a high purity, 100 Å, spherical silica substrate that has been bonded with anionic exchanger, amine functionality in addition to a conventional reversed phase C8 functionality.

L29—Gamma alumina, reverse-phase, low carbon percentage by weight, alumina-based polybutadiene spherical particles, 5 µm in diameter with a pore volume of 80 Å.

L30—Ethyl silane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

L31—A ■hydroxide-selective,■1S (*USP29*) strong anion-exchange resin-quaternary amine bonded on latex particles attached to a core of 8.5-µm macroporous particles having a pore size of 2000 Å and consisting of ethylvinylbenzene cross-linked with 55% divinylbenzene.

L32—A chiral ligand-exchange packing–L-proline copper complex covalently bonded to irregularly shaped silica particles, 5 to 10 µm in diameter.

L33—Packing having the capacity to separate dextrans by molecular size over a range of 4000 to 500,000 Da. It is spherical, silica-based, and processed to provide pH stability.

■[NOTE—Available as TSKgel G4000 SWXL from Tosoh Biosep (www.tosohbiosep.com).]■1S (*USP29*)

L34—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the lead form, about 9 µm in diameter.

L35—A zirconium-stabilized spherical silica packing with a hydrophilic (diol-type) molecular monolayer bonded phase having a pore size of 150 Å.

L36—A 3,5-dinitrobenzoyl derivative of L-phenylglycine covalently bonded to 5-µm aminopropyl silica.

L37—Packing having the capacity to separate proteins by molecular size over a range of 2,000 to 40,000 Da. It is a polymethacrylate gel.

L38—A methacrylate-based size-exclusion packing for water-soluble samples.

L39—A hydrophilic polyhydroxymethacrylate gel of totally porous spherical resin.

L40—Cellulose tris-3,5-dimethylphenylcarbamate coated porous silica particles, 5 to 20 µm in diameter.

L41—Immobilized α_1-acid glycoprotein on spherical silica particles, 5 µm in diameter.

L42—Octylsilane and octadecylsilane groups chemically bonded to porous silica particles, 5 µm in diameter.

L43—Pentafluorophenyl groups chemically bonded to silica particles by a propyl spacer, 5 to 10 µm in diameter.

L44—A multifunctional support, which consists of a high purity, 60 Å, spherical silica substrate that has been bonded with a cationic exchanger, sulfonic acid functionality in addition to a conventional reversed phase C8 functionality.

L45—Beta cyclodextrin bonded to porous silica particles, 5 to 10 µm in diameter.

L46—Polystyrene/divinylbenzene substrate agglomerated with quaternary amine functionalized latex beads, about 10 µm in diameter.

L47—High-capacity anion-exchange microporous substrate, fully functionalized with trimethlyamine groups, 8 µm in diameter.

■[NOTE—Available as CarboPac MA1 and distributed by Dionex Corp. (www.dionex.com).]■1S (*USP29*)

L48—Sulfonated, cross-linked polystyrene with an outer layer of submicron, porous, anion-exchange microbeads, 15 µm in diameter.

L49—A reversed-phase packing made by coating a thin layer of polybutadiene onto spherical porous zirconia particles, 3 to 10 µm in diameter.

■[NOTE—Available as Zirchrom PBD, manufactured by ZirChrom Separations, Inc., distributed by Alltech, www.Alltechweb.com.]■1S (*USP29*)

L50—Multifunction resin with reversed-phase retention and strong anion-exchange functionalities. The resin consists of ethylvinylbenzene, 55% cross-linked with divinylbenzene copolymer, 3 to 15 µm in diameter, and a surface area not less than 350 m^2 per g. Substrate is coated with quaternary ammonium functionalized latex particles consisting of styrene cross-linked with divinylbenzene.

■[NOTE—Available as OmniPac PAX-500 and distributed by Dionex Corp. (www.dionex.com).]■1S (*USP29*)

L51—Amylose tris-3,5-dimethylphenylcarbamate-coated, porous, spherical, silica particles, 5 to 10 µm in diameter.

■[NOTE—Available as Chiralpak AD from Chiral Technologies, Inc., (www.chiraltech.com).]■1S (*USP29*)

L52—A strong cation exchange resin made of porous silica with sulfopropyl groups, 5 to 10 µm in diameter.

■[NOTE—Available as TSK IC SW Cation from Tosoh Biosep (www.tosohbiosep.com).]■1S (*USP29*)

L53—Weak cation-exchange resin consisting of ethylvinylbenzene, 55% cross-linked with divinylbenzene copolymer, 3 to 15 µm diameter. Substrate is surface grafted with carboxylic acid and/or phosphoric acid functionalized monomers. Capacity not less than 500 µEq/column.

■[NOTE—Available as IonPac CS14 distributed by Dionex Corp. (www.dionex.com).]■1S (*USP29*)

L54—A size exclusion medium made of covalent bonding of dextran to highly cross-linked porous agarose beads, about 13 µm in diameter.

■[NOTE—Available as Superdex Peptide HR 10/30 from Amersham Pharmacia Biotech (www.amershambiosciences.com).]■1S (*USP29*)

L55—A strong cation-exchange resin made of porous silica coated with polybutadiene–maleic acid copolymer, about 5 µm in diameter.

In-Process Revision

■[NOTE—Available as IC-Pak C M/D from Waters Corp. (www.waters.com).]■1S *(USP29)*

L56—Propyl silane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

■[NOTE—Available as Zorbax SB-C3 from Agilent Technologies. (www.agilent.com/chem).]■1S *(USP29)*

L57—A chiral-recognition protein, ovomucoid, chemically bonded to silica particles, about 5 µm in diameter, with a pore size of 120 Å.

■[NOTE—Available as Ultron ES-OVM from Agilent Technologies (www.agilent.com/chem).]■1S *(USP29)*

L58—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the sodium form, about 7 to 11 µm in diameter.

■[NOTE—Available as Aminex HPX-87N from Bio-Rad Laboratories, (2000/01 catalog, #125-0143) www.bio-rad.com.]■1S *(USP29)*

L59—Packing having the capacity to separate proteins by molecular weight over the range of 10 to 500 kDa. It is spherical (10 µm), silica-based, and processed to provide hydrophilic characteristics and pH stability.

■[NOTE—Available as TSKgel G3000SW Column (analytical column) and TSKgel Guard (guard column) from Tosoh Biosep (part numbers 05789 and 05371, respectively) (www.tosohbiosep.com).]■1S *(USP29)*

L60—Spherical, porous silica gel, ~~3 or 5 µm~~

■10 µm or less■1S *(USP30)*
in diameter, the surface of which has been covalently modified with ~~palmitamidopropyl~~

■alkyl amide■1S *(USP30)*
groups and endcapped.

■[NOTE—Available as Supelcosil ABZ from Supelco (http://www.sigmaaldrich.com/Brands/Supelco_Home.html).]■1S *(USP29)*

L61—A hydroxide selective strong anion-exchange resin consisting of a highly cross-linked core of 13 µm microporous particles having a pore size less than 10 Å units and consisting of ethylvinylbenzene cross-linked with 55% divinylbenzene with a latex coating composed of 85 nm diameter microbeads bonded with alkanol quaternary ammonium ions (6%).

■[NOTE—Available as Ion Pac AS-11 and AG-11 from Dionex (www.dionex.com).]■1S *(USP29)*

L62—C30 silane bonded phase on a fully porous spherical silica, 3 to 15 µm in diameter.

~~L## (Enoxaparin Sodium, Dowex 1X8)—[To come.]~~

~~L## (Enoxaparin Sodium, Dowex 50WX2)—[To come.]~~

■L## (Dalteparin Sodium, anion-exchange Dowex 1X8)—[To come.]

L## (Dalteparin Sodium, cation-exchange Dowex 50WX2)—[To come.]■2S *(USP29)*

■L## (Glucosamine, Shodex NH2P-50)—Polyamine chemically bonded to cross-linked polyvinyl alcohol polymer, 5 µm in diameter.

[NOTE—Available as Shodex NH2P-50 from Shodex (www.shodex.com).]

L## [Valganciclovir Hydrochloride, Crownpak CR(+)]—A crown ether coated on a 5-µm particle size silica gel substrate. The active site is *(S)*-18-crown-6-ether.

[NOTE—Available as Crownpak CR(+) from Daicel (www.daicel.com).]

L## (Trehalose, Sugar KS-801)—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the sodium form, 6 to 17 µm in diameter.

[NOTE—Available as Sugar KS-801 from Shodex (www.shodex.com).]

L## (Levalbuterol, Chirobiotic T)—Glycopeptide teicoplanin linked through multiple covalent bonds to a 100-Å units spherical silica.

[NOTE—Available as Chirobiotic T from Astec (www.astecusa.com).]■1S *(USP30)*

Phases

G1—Dimethylpolysiloxane oil.
G2—Dimethylpolysiloxane gum.
G3—50% Phenyl-50% methylpolysiloxane.
G4—Diethylene glycol succinate polyester.
G5—3-Cyanopropylpolysiloxane.
G6—Trifluoropropylmethylpolysiloxane.
G7—50% 3-Cyanopropyl-50% phenylmethylsilicone.
G8—80% Bis(3-cyanopropyl)-20% 3-cyanopropylphenylpolysiloxane (percentages refer to molar substitution).
G9—Methylvinylpolysiloxane.
G10—Polyamide formed by reacting a C_{36} dicarboxylic acid with 1,3-di-4-piperidylpropane and piperidine in the respective mole ratios of 1.00 : 0.90 : 0.20.
G11—Bis(2-ethylhexyl) sebacate polyester.
G12—Phenyldiethanolamine succinate polyester.
G13—Sorbitol.
G14—Polyethylene glycol (av. mol. wt. of 950 to 1050).
G15—Polyethylene glycol (av. mol. wt. of 3000 to 3700).
G16—Polyethylene glycol compound (av. mol. wt. about 15,000). A high molecular weight compound of polyethylene glycol with a diepoxide linker. Available commercially as Polyethylene Glycol Compound 20M, or as Carbowax 20M, from suppliers of chromatographic reagents.
G17—75% Phenyl-25% methylpolysiloxane.
G18—Polyalkylene glycol.
G19—25% Phenyl-25% cyanopropyl-50% methylsilicone.
G20—Polyethylene glycol (av. mol. wt. of 380 to 420).
G21—Neopentyl glycol succinate.
G22—Bis(2-ethylhexyl) phthalate.
G23—Polyethylene glycol adipate.
G24—Diisodecyl phthalate.
G25—Polyethylene glycol compound TPA. A high molecular weight compound of a polyethylene glycol and a diepoxide that is esterified with terephthalic acid. ■[NOTE—Available commercially as Carbowax 20M-TPA from suppliers of chromatographic reagents.]■1S *(USP29)*
G26—25% 2-Cyanoethyl-75% methylpolysiloxane.
G27—5% Phenyl-95% methylpolysiloxane.
G28—25% Phenyl-75% methylpolysiloxane.
G29—3,3′-Thiodipropionitrile.
G30—Tetraethylene glycol dimethyl ether.
G31—Nonylphenoxypoly(ethyleneoxy)ethanol (av. ethyleneoxy chain length is 30); Nonoxynol 30.
G32—20% Phenylmethyl-80% dimethylpolysiloxane.
G33—20% Carborane-80% methylsilicone.

G34—Diethylene glycol succinate polyester stabilized with phosphoric acid.

G35—A high molecular weight compound of a polyethylene glycol and a diepoxide that is esterified with nitroterephthalic acid.

G36—1% Vinyl-5% phenylmethylpolysiloxane.

G37—Polyimide.

G38—Phase G1 containing a small percentage of a tailing inhibitor.

■[NOTE—A suitable grade is available commercially as "SP2100/0.1% Carbowax 1500" from Supelco, Inc. (http://www.sigmaaldrich.com/Brands/Supelco_Home.html).]■1S (*USP29*)

G39—Polyethylene glycol (av. mol. wt. about 1500).

G40—Ethylene glycol adipate.

G41—Phenylmethyldimethylsilicone (10% phenyl-substituted).

G42—35% phenyl-65% dimethylpolysiloxane (percentages refer to molar substitution).

G43—6% cyanopropylphenyl-94% dimethylpolysiloxane (percentages refer to molar substitution).

G44—2% low molecular weight petrolatum hydrocarbon grease and 1% solution of potassium hydroxide.

G45—Divinylbenzene-ethylene glycol-dimethylacrylate.

G46—14% Cyanopropylphenyl-86% methylpolysiloxane.

G47—Polyethylene glycol (av. mol. wt. of about 8000).

G48—Highly polar, partially cross-linked cyanopolysiloxane.■■1S (*USP29*)

Supports

NOTE—Unless otherwise specified, mesh sizes of 80 to 100 or, alternatively, 100 to 120 are intended.

S1A—Siliceous earth for gas chromatography has been flux-calcined by mixing diatomite with Na_2CO_3 flux and calcining above 900°. The siliceous earth is acid-washed, then water-washed until neutral, but not base-washed. The siliceous earth may be silanized by treating with an agent such as dimethyldichlorosilane ■[NOTE—Unless otherwise specified in the individual monograph, silanized support is intended.]■1S (*USP29*) to mask surface silanol groups.

S1AB—The siliceous earth as described above is both acid- and base-washed. ■[NOTE—Unless otherwise specified in the individual monograph, silanized support is intended.]■1S (*USP29*)

S1C—A support prepared from crushed firebrick and calcined or burned with a clay binder above 900° with subsequent acid-wash. It may be silanized.

S1NS—The siliceous earth is untreated.

S2—Styrene-divinylbenzene copolymer having a nominal surface area of less than 50 m^2 per g and an average pore diameter of 0.3 to 0.4 µm.

S3—Copolymer of ethylvinylbenzene and divinylbenzene having a nominal surface area of 500 to 600 m^2 per g and an average pore diameter of 0.0075 µm.

S4—Styrene-divinylbenzene copolymer with aromatic –O and –N groups, having a nominal surface area of 400 to 600 m^2 per g and an average pore diameter of 0.0076 µm.

S5—40- to 60-mesh, high-molecular weight tetrafluorethylene polymer.

S6—Styrene-divinylbenzene copolymer having a nominal surface area of 250 to 350 m^2 per g and an average pore diameter of 0.0091 µm.

S7—Graphitized carbon having a nominal surface area of 12 m^2 per g.

S8—Copolymer of 4-vinyl-pyridine and styrene-divinylbenzene.

S9—A porous polymer based on 2,6-diphenyl-*p*-phenylene oxide.

S10—A highly polar cross-linked copolymer of acrylonitrite and divinylbenzene.

S11—Graphitized carbon having a nominal surface area of 100 m^2 per g modified with small amounts of petrolatum and polyethylene glycol compound. ■[NOTE—Commercially available as SP1500 on Carbopack B from Supelco (www.sigmaaldrich.com/Brands/Supelco_Home.html).]■1S (*USP29*)

S12—Graphitized carbon having a nominal surface area of 100 m^2 per g.

BRIEFING

〈**730**〉 **Plasma Spectrochemistry,** *USP 29* page 2700. On the basis of comments received, a revision of this chapter is proposed, as written by the Expert Committee for General Chapters. Tables listing primary- and secondary-analysis wavelengths have not been included in this proposal because instrument manufacturers provide analytical wavelength information that is specific to, and most applicable to, each spectrometer design.

(GC: K. Zaidi) RTS—C42042

〈730〉 PLASMA SPECTROCHEMISTRY

~~Plasma-based instrumental techniques that are useful for pharmaceutical analyses fall into two major categories: those based on inductively coupled plasma, and those where a plasma is generated on the surface of the sample. Inductively coupled plasma (ICP) is a high-temperature excitation source that desolvates, vaporizes, atomizes, excites, and ionizes atoms. The excited analyte ions and atoms are subsequently detected by any of a variety of plasma based spectrochemical means, including inductively coupled plasma–atomic emission spectroscopy (ICP–AES), also known as inductively coupled plasma–optical emission spectroscopy (ICP–OES) and inductively coupled plasma–mass spectrometry (ICP–MS). ICP–AES and ICP–MS may be used for either single- or multi-element analysis and provide good general-purpose procedures for either sequential or simultaneous analyses over an extended linear range with good sensitivity.~~

~~An emerging technique in plasma spectrochemistry is laser-induced breakdown spectroscopy (LIBS). In LIBS, a solid, liquid, or gas sample is heated directly by a pulsed laser, and brought to a transient high-energy plasma state where the sample components are reduced to atoms, molecular fragments, and larger clusters. Emissions from the atoms and ions in the sample are collected, typically using fiber optics, and measured using an array detector such as a charge-coupled device (CCD). LIBS can be used for qualitative analysis or against a working standard curve for quantitative analysis. While LIBS is not currently in wide use by the pharmaceutical industry, LIBS is suited for at-line or on-line measurements in a production setting as well as in the laboratory. Because of its potential, it should be considered a viable technique for plasma spectrochemistry in the pharmaceutical laboratory. However, because LIBS is still an emerging technique, details will not be further discussed in this general chapter.~~

~~SAMPLE PREPARATION~~

~~Sample preparation is critical to the success of plasma-based analysis, and it is the first step in performing any analysis via ICP–AES or ICP–MS. Plasma-based techniques are heavily dependent on sample transport into the plasma, and because ICP–AES and ICP–MS share the same sample introduction system, the means by which samples are prepared may be applicable to either technique. The most conventional means by which samples are introduced into the plasma is via solution nebulization. If solution nebulization is employed, solid samples must be dissolved in order to be presented into the plasma for analysis. Samples may be dissolved in any appropriate solvent. There is a strong preference for the use of aqueous or dilute nitric acid solutions, due to minimal interferences with these solvents, when compared to other solvent choices. Hydrogen peroxide, hydrochloric acid, sulfuric acid, perchloric acid, combinations of acids, or various concentrations of acids may all be used to dissolve the sample for~~

In-Process Revision

analysis. Dilute hydrofluoric acid may also be used, but great care must be taken to ensure the safety of the analyst, as well as to protect the equipment when using this acid. Additionally, alternative means of dissolving the sample may be employed. These include, but are not limited to, the use of dilute bases, straight or diluted organic solvents, combinations of acids or bases, or combinations of organic solvents.

When analyzing samples that are presented to the plasma via solution nebulization, it is important to consider the potential interferences that may arise from the solvent used. In all cases, when samples are to be analyzed using ICP–MS, use an appropriate internal standard. In cases where sample viscosity differs from the standard viscosity, matrix matching or an appropriate internal standard should also be used for ICP–AES analysis. In either event, the selection of an appropriate internal standard should consider the analyte in question, ionization energy, wavelengths or masses, and the nature of the sample matrix.

Where a sample is not found to be soluble in any acceptable solvent, a variety of digestion techniques may be employed. These include hot-plate digestion, or microwave assisted digestions, including open-vessel and closed-vessel digestions. The decision regarding the type of digestion technique to use is dependent on the nature of the sample being digested, as well as on the analytes of interest. Because some metals are volatile (e.g., mercury and selenium), open-vessel or hot-plate digestions are not appropriate for all analytes.

Use acids, bases, and hydrogen peroxide of ultra high purity. Deionized water must be at least 18 megohm. Check diluents for interferences prior to their use in an analysis. Because it is not always possible to obtain organic solvents that are free of metals, use organic solvents of the highest quality possible with regard to metal contaminants.

SAMPLE INTRODUCTION

There are two ways to introduce the sample into the nebulizer: by using a peristaltic pump or by self-aspiration. The peristaltic pump is used to ensure that the flow rate of sample and standard solution to the nebulizer is the same irrespective of sample viscosity. In some cases, self-aspiration can be used, where a peristaltic pump is not required.

A wide variety of nebulizer types is available, including pneumatic (concentric and cross-flow), grid, and ultrasonic nebulizers. Micronebulizers, high efficiency nebulizers, direct injection high efficiency nebulizers, and flow injection nebulizers are also available. The selection of the nebulizer for a given analysis should consider the sample matrix, analyte, and sensitivity desired. Some nebulizers are better suited for use with solutions containing a high concentration of dissolved solids, while others are better suited for use with organic solutions.

Once a sample leaves the nebulizer, it enters the spray chamber, which is designed to permit only the smallest droplets of sample into the plasma. The spray chamber functions to remove the larger sample droplets generated during the nebulization process, and as a result, typically only 1% to 2% of the sample aerosol reaches the ICP. As with nebulizers, there is more than one type of spray chamber available for use with ICP–AES or ICP–MS. Examples include the Scott double pass spray chamber, as well as cyclonic spray chambers of various configurations. The spray chamber must be compatible with the sample and solvent and must equilibrate and washout in as short a time as possible. When selecting a spray chamber, the nature of the sample matrix, the desired sensitivity, and the analyte should be considered.

In addition to solution nebulization, it is possible to perform analyses using solid samples via laser ablation (LA). In such instances, the sample directly enters the torch. LA–ICP and LA–ICP–MS are better suited for qualitative analyses of pharmaceutical compounds, due to the difficulty in obtaining appropriate standards. Nonetheless, quantitative analyses may be performed if it can be demonstrated that the standards used are adequate. This must be demonstrated through appropriate method validation.

STANDARD PREPARATION

Single- or multi-element standard solutions, whose concentrations are traceable to primary reference standards, such as those of the National Institute of Standards and Technology (NIST), may be purchased for use in the preparation of working standard solutions. Alternatively, standard solutions of elements may be accurately prepared from standard materials and their concentration determined independently, as appropriate. Where possible, standards, blanks, and sample solutions should be matrix matched to minimize matrix interference. In cases where matrix matching is not possible, an appropriate internal standard or the method of standard additions should be used for ICP–AES. Standards and blank solutions to be used for ICP–MS analysis should always contain an appropriate internal standard. In either event, the selection of an appropriate internal standard should consider the analyte in question, their ionization energies, their wavelengths or masses, and the nature of the sample matrix.

ICP

The components that make up the ICP excitation source include the argon gas supply, torch, radio frequency (RF) induction coil, and RF generator. Argon gas is typically used in ICP, although other gases may also be used, depending on the instrumentation available. The use of gases other than argon is not common practice. The plasma torch consists of three concentric quartz tubes designated the inner, the intermediate, and the outer tube. The nebulizer gas flow helps to create a fine aerosol of the sample solution, and the sample is then carried through the inner tube of the torch and into the plasma. The intermediate tube carries the auxiliary gas. The auxiliary gas flow helps to lift the plasma off of the inner and intermediate tubes to prevent melting and the deposition of carbon and salts on the inner tube. The outer tube carries the plasma or coolant gas, which is used to form and sustain the plasma. The tangential flow of the coolant gas through the torch constricts the plasma and prevents the ICP from expanding to fill the outer tube, preventing the torch from melting. An RF induction coil, also called the load coil, surrounds the torch and produces an oscillating magnetic field which, in turn, sets up an oscillating current in the ions and electrons of the argon. In the load coil of the RF generator, the energy transfer between the coil and the argon creates a self-sustaining plasma. Collisions of the ions and electrons of the argon ionize and excite the analyte atoms in the high-temperature plasma. The plasma operates at temperatures of 6,000 to 10,000 K, such that essentially all covalent bonds and analyte-to-analyte interactions have been eliminated.

ICP–AES

An inductively coupled plasma may utilize either an optical or a mass spectral detection system. In the former case, ICP–AES, analyte detection is dependent on the emission wavelength of the analyte in question. Due to differences in technology, a wide variety of ICP–AES systems are available, each with different capabilities, as well as different advantages and disadvantages. Simultaneous systems are capable of analyzing multiple elements at the same time, thereby shortening analysis time. Sequential systems move from one wavelength to the next to perform analyses, and usually provide a larger number of analytical lines to choose from. Charge coupled devices and charge injection devices, with detectors on a chip, make it possible to combine the advantages of both simultaneous and sequential systems, providing the rapid analysis of the simultaneous units with a wider selection of analytical lines as found with sequential units.

In addition, the ICP can be oriented in either axial or radial (also called lateral) configurations. The torch is positioned horizontally in axial plasmas, and the sample is viewed "end-on"; while it is positioned vertically in radial plasmas, and the sample is viewed from the side. Axial viewing of the plasma can provide a more sensitive signal response; however, in some situations where background or sample interference is significant at the wavelength of interest, radial viewing may yield more reliable results. Because of the wide range of elemental concentrations in some real-world samples and because of complex matrix problems, there are many cases where radial is better than axial or vice versa. Methods validated using an instrument with a radial configuration may not be completely transferable to an instrument with an axial configuration, and vice versa.

Additionally, dual-view instrument systems are available, making it possible for the analyst to take advantage of either torch configuration. The selection of torch configuration is dependent on the sample

matrix, analyte in question, analytical wavelength used, cost of instrumentation, required sensitivity, and type of instrumentation available in a given laboratory.

Regardless of torch configuration or detector technology, ICP–AES is a technique which provides a quantitative measurement of the optical emission from excited atoms or ions at specific wavelengths. These measurements are then used to determine the analyte concentration in a given sample. Upon excitation, an atom emits an array of different frequencies of light that is characteristic of the distinct energy transition allowed for that element. The intensity of the light is generally proportional to the analyte concentration. It is necessary to correct for the background signal from the plasma. Sample concentration measurements are usually determined from a working curve of known standards in the concentration range of interest. It is, however, also possible to perform a single-point calibration under certain circumstances, such as with limit tests.

Since there are distinct transitions between atomic energy levels, emission lines have narrow bandwidths. Spectral separation of multiple emission lines requires a high-resolution spectrometer. The decision regarding which spectral line to measure should include an evaluation of potential spectral interferences. All atoms in a sample are excited simultaneously, however, so samples containing multiple elements can lead to spectral overlap. Spectral interference can also be caused by background emission from the sample or plasma. Modern ICP's usually have background correction available and a number of background correction techniques may be applied. Simple background correction typically involves measuring the background emission intensity at some point away from the main peak and subtracting this value from the total signal being measured. Mathematical modeling to subtract the interfering signal as a background correction may also be performed.

The selection of the analytical line is critical to the success of an analysis, regardless of torch configuration or detector type. Though some wavelengths are most often considered to be the primary analytical wavelengths, because there can be a tremendous variety of sample matrices, the selection of the analytical wavelength must be considered in the context of the sample matrix, the composition of the sample itself, the type of instrument being used, and the sensitivity required. Analysts might first choose to start with the wavelengths recommended by the manufacturer of their particular instrument and select alternate wavelengths based on manufacturer recommendations or published wavelength tables.

Forward power, gas flow rates, and torch position may all be optimized to provide the best signal. When organic solvents are used, it is often necessary to use a higher forward power setting than would be used for aqueous solutions, as well as a reduction in the nebulizer gas flow. When using organic solvents, it may also be necessary to bleed small amounts of oxygen into the torch to prevent carbon build-up in the torch.

Calibration

The wavelength accuracy for ICP–AES detection must comply with the manufacturer's applicable operating procedures. The instrument must be standardized for quantification at time of use. Due to the inherent differences between the types of instruments available, there is no general "system suitability" procedure that may be employed. Tests recommended by the instrument manufacturer for a given ICP–AES instrument should be followed. These may include, but are not limited to, use of a multi-element wavelength calibration using a reference solution, internal mercury (Hg) calibration, and peak search. Perform system checks in accordance with the manufacturer's recommendations.

Because ICP–AES is a technique that is generally considered to be linear over a range of 10^6 to 10^8 orders of magnitude, it is not always necessary to continually demonstrate linearity by the use of a standard curve. It is possible to calibrate with a blank and a single standard once a method has been developed and is in routine use. For new methods, it is advisable that suitable linearity be demonstrated throughout the range of test measurements to be performed. An appropriate blank solution and standards that bracket the expected range of the sample concentrations should be assayed and the detector response plotted as a function of analyte concentration. However, it may not always be possible to analyze a bracketing standard when an analysis is performed at or near the detection limit. This is acceptable. The number and concentration of standard solutions used should be based on the analyte in question, the desired sensitivity, and the sample matrix. Use regression analysis of the standard plot to evaluate the linearity of detector response, and individual monographs may require criteria for the residual error of the regression line. Optimally, a correlation coefficient of not less than 0.99, or as indicated in the individual monograph, should be demonstrated for the working standard curve. Here, too, however, the nature of the sample matrix, the analyte(s), the desired sensitivity, and the type of instrumentation available may dictate a poorer correlation coefficient than 0.99. The analyst should use caution when proceeding with such an analysis, and should use additional working standards.

To demonstrate the stability of the system over the analysis time since initial standardization, a solution used in the initial standard curve must be reassayed as a check standard at appropriate intervals throughout the analysis of the sample set. Appropriate intervals may be as deemed adequate by the analyst, based on the analysis being performed. The reassayed standard should agree with its theoretical value to within ±10% for single-element analyses when analytical wavelengths are between 200 and 500 nm, or concentrations are > 1 µg per mL. The reassayed standard should agree with its theoretical value to within ±20% for multi-element analyses, when analytical wavelengths are < 200 nm or > 500 nm, or at concentrations < 1 µg per mL. In cases where an individual monograph provides different guidance regarding the reassayed check standard, the requirements of the monograph take precedence.

Procedure

Follow the procedure as directed in the individual monograph for the instrumental parameters. Due to differences in manufacturers' equipment configurations, the manufacturer's suggested default conditions may be used and modified as needed. The specification of definitive parameters in a monograph does not preclude the use of other suitable operating conditions, and adjustments of operating conditions may be necessary. Alternate conditions must be supported by suitable validation data, and the conditions in the monograph will take precedence for official purposes. Data collected from a single sample introduction are treated as a single result. This result may be the average of data collected from replicate sequential readings from a single solution introduction of the appropriate standard or sample preparations. Sample concentrations are calculated versus the working standard curve generated by plotting the detector response versus the concentration of the analyte in the standard preparations. This calculation is normally performed by the instrument.

The method of standard additions or internal standards may be employed for situations where matrix interferences would result in an inaccurate analyte determination. The method of standard additions involves adding a known concentration of the analyte element to the sample at several concentration levels. The instrument response is plotted against the concentration of the added analyte element, and a linear regression line is drawn through the data points. The absolute value of the *x* intercept multiplied by any dilution factor is the concentration of the analyte in the sample.

ICP–MS

When an inductively coupled plasma utilizes a mass spectral detection system, the technique is referred to as inductively coupled plasma–mass spectrometry (ICP–MS). In this technique, analyte detection is dependent on the masses of the various elemental components of a sample. ICP–MS is an elemental technique, whereby, due to the heat intensity of the plasma source, a sample is, theoretically, reduced to its ionic components. As is the case with ICP–AES, due to differences in technology, a wide variety of ICP–MS instrumentation systems are available.

The systems most commonly in use are quadrupole-based systems. Gaining in interest is time-of-flight ICP–MS. Although still not in widespread use, this approach may see greater use in the future. Additionally, high-resolution instruments are also available.

Regardless of instrument design or configuration, ICP–MS is a technique that provides a quantitative measurement of the components of the sample. Ions are generated from the analyte atoms by the plasma. The analyte ions are then extracted from the plasma using

In-Process Revision

the sampling cone. The skimmer cone, located behind the sampling cone "skims" the ions as they emerge from the sampling cone, where they are then passed into the mass spectrometer. The mass spectrometer separates the ions in a magnetic field according to their mass-to-charge *(m/z)* ratios. The ICP–MS has a mass range up to 240 atomic mass units (amu). Depending on the equipment configuration, sample adducts with diluents or their decomposition products, oxides, and multiply charged element ions produced within the plasma may increase the complexity of the resulting mass spectra. Interferences can be minimized by appropriate optimization of operational parameters, including gas flow (nebulizer, plasma, and auxiliary gas flow rates), sample flow, RF power, extraction lens voltage, etc., or through the use of collision or reaction cells, or cool plasma operation, if available on a given instrument. Unless a laboratory is generating or examining isotopes that are not naturally occurring, a list of naturally occurring isotopes will provide the analyst with acceptable isotopes for analytical purposes. Additionally, tables of commonly found interferences and polyatomic isobaric interferences and correction factors may be used.

ICP–MS is generally more sensitive than ICP–AES. The ability of a mass spectrometer to monitor a single ion of a specific mass/charge ratio is a major advantage of ICP–MS for determination of very low analyte concentrations or when elimination of matrix inferences is required. Analytes can often be detected at the parts per trillion (ppt) level using ICP–MS.

The selection of the analytical mass to use is critical to the success of an analysis, regardless of instrument design. Though some masses are often considered to be the primary analytical masses, because there can be a tremendous variety of sample matrices, the recommendation of a specific mass for a given element is not possible. Selection of an analytical mass is always considered in the context of the sample matrix, the type of instrument being used, and the sensitivity required. Analysts might first choose to start with masses recommended by the manufacturer of their particular instrument and select alternate masses based on manufacturer's recommendations or published tables of naturally occurring isotopes.

Optimization of an ICP–MS method is also highly dependent on the plasma parameters and means of sample introduction. Forward power, gas flow rates, and torch position may all be optimized to provide the best signal. When organic solvents are used, it is often necessary to use a higher forward power setting than would be used for aqueous solutions and to reduce the nebulizer flow rate. Additionally, when using organic solvents, it may be necessary to titrate small amounts of oxygen into the auxiliary gas to prevent carbon build-up in the torch. The use of a platinum tipped sampling or skimmer cone may also be required to reduce cone degradation with some organic solvents.

Calibration

The mass spectral accuracy for ICP–MS detection must be in accordance with the applicable operating procedures. The instrument must be standardized for quantification at time of use. Due to the inherent differences between the types of instruments available, there is no general "system suitability" procedure that may be employed. Analysts should refer to the tests recommended by the instrument manufacturer for a given ICP–MS instrument. These may include, but are not limited to, tuning on a reference mass or masses, peak search, and mass calibration. Perform system checks recommended by the instrument manufacturer.

Because ICP–MS is a technique that is generally considered to be linear over a range of 10^6 to 10^8 orders of magnitude, it is not always necessary to continually demonstrate linearity by the use of a standard curve. It is common practice to calibrate with a blank and a single standard, once a method has been developed and is in routine use. For new methods, it is advisable that suitable linearity be demonstrated through the range of test measurements to be performed. An appropriate blank solution and standards that bracket the expected range of the sample concentrations should be assayed and the detector response plotted as a function of analyte concentration. The number and concentration of standard solutions used should be based on the analyte in question, the desired sensitivity, and the sample matrix, and should be left to the discretion of the analyst. Optimally, a correlation coefficient of not less than 0.99, or as indicated in the individual monograph, should be demonstrated for the working standard curve. Here, too, however, the nature of the sample matrix, the analyte, the desired sensitivity, and the type of instrumentation available may dictate a poorer correlation coefficient than 0.99. The analyst should use caution when proceeding with such an analysis and should use additional working standards.

To demonstrate the stability of the system over the analysis time since initial standardization, a solution used in the initial standard curve must be reassayed as a check standard at appropriate intervals through the analysis of the sample set. Appropriate intervals may be established as after every fifth or tenth sample, or as deemed adequate by the analyst, based on the analysis being performed. The reassayed standard should agree with its theoretical value to within $\pm 10\%$ for single element analyses when analytical masses are free of interferences and when concentrations are > 1 ng per mL. The reassayed standard should agree with its theoretical value to within $\pm 20\%$ for multi-elemental analyses, or when concentrations are < 1 ng per mL. In cases where an individual monograph provides different guidance regarding the reassayed check standard, the requirements of the monograph take precedence.

Procedure

Follow the procedure as directed in the individual monograph for the detection mode and instrument parameters. The specification of definitive parameters in a monograph does not preclude the use of other suitable operating conditions, and adjustments of operating conditions may be necessary. Alternate conditions must be supported by suitable validation data, and the conditions in the monograph will take precedence for official purposes. Due to differences in manufacturers' equipment configurations, the analyst may wish to begin with the manufacturer's suggested default conditions and modify them as needed. Data collected from a single sample introduction are treated as a single result. Data collected from replicate sequential readings from a single solution introduction of the appropriate standard or sample preparations should be averaged as a single result. Sample concentrations are calculated versus the working standard curve generated by plotting the detector response versus the concentration of the analyte in the standard preparations. With modern instruments, this calculation is normally performed by the instrument. Data collected from two or three sequential readings from a single solution introduction of the appropriate standard or sample preparations are averaged as a single result. Sample concentrations are calculated versus the working standard curve generated by plotting the detector response versus the concentration of the analyte in the standard preparations. With modern instruments, this calculation is performed by the instrument.

The method of standard additions may be employed for situations where matrix interferences would result in an inaccurate analyte determination. This method involves adding a known concentration of the analyte element to the sample at several concentration levels. The instrument response is plotted against the concentration of the added analyte element and a linear regression line is drawn through the data points. The absolute value of the x intercept multiplied by any dilution factor is the concentration of the analyte in the sample.

GLOSSARY

AUXILIARY GAS: The auxiliary gas is used to "lift" the plasma off of the surface of the torch, thereby preventing melting of the intermediate tube and the formation of carbon and salt deposits on the inner tube.

AXIAL VIEWING: A configuration of the plasma for AES where the plasma is directed toward the spectrometer optical path, also called "end-on."

COLLISION CELL: A design feature on ICP–MS instruments. Collision cells are used to eliminate or minimize interferences from argon and facilitate the analysis of elements that might be affected by those interferences.

COOLANT OR PLASMA GAS: The coolant gas is the main gas supply for the plasma.

~~COOL PLASMA: Plasma conditions used for ICP–MS that result in a plasma that is cooler than normally used for an analysis. This is achieved by using a lower forward power setting and is used to help minimize isotopic interferences caused by argon.~~

~~FORWARD POWER: The number of watts used to ignite and sustain the plasma during an analysis. Forward power requirements may vary, depending on sample matrix and analyte.~~

~~INTERNAL STANDARD: An element in an analysis added to or present in the same concentration in blanks, standards, and samples to act as an intensity reference for the analysis. An internal standard may be used for ICP–AES work and should always be used for quantitative ICP–MS analyses.~~

~~LATERAL VIEWING: See also *Radial Viewing*.~~

~~*m*: The ion mass of interest.~~

~~MULTIPLY CHARGED IONS: Atoms that, when subjected to high ionization energies, can form doubly or triply charged ions (X^{++} or X^{+++}, etc.) such that when detected by MS, the apparent mass will be ½ or $\frac{1}{3}$ that of the atomic mass.~~

~~NEBULIZER: Used to form a consistent sample aerosol that mixes with the argon gas.~~

~~NEBULIZER GAS: One of three regions of argon gas flow in a torch. The nebulizer gas is used to help create a fine mist of the sample when using solution nebulization. This fine mist is then directed through the center tube of the torch and into the plasma.~~

~~PLASMA GAS: See also *Coolant Gas*.~~

~~RADIAL VIEWING: A configuration of the plasma for AES where the plasma is directed orthogonal to the spectrometer optic path, also called "side-on viewing." See also *Lateral Viewing*.~~

~~REACTION CELL: Similar to collision cell. Designed to reduce or eliminate interferences.~~

~~SAMPLING CONE: A metal cone (usually nickel, aluminum, or platinum tipped) with a small opening, through which ionized sample flows after leaving the plasma.~~

~~SEQUENTIAL: A type of detector configuration for AES where discrete emission lines are observed by scanning across the spectral range using a monochromator.~~

~~SIMULTANEOUS: A type of detector configuration for AES where all selected emission lines are observed at the same time, using a polychromator, offering increased analysis speed for multi-element samples.~~

~~SKIMMER CONE: A metal cone, with an opening that is smaller than that of the sampling cone, through which ionized sample flows after leaving the sampling cone and prior to entering the vacuum region of an ICP–MS.~~

~~STANDARD ADDITIONS: A method used to determine the actual analyte concentration in a sample when viscosity effects may cause erroneous results.~~

~~TORCH: A series of three concentric quartz tubes in which the ICP is formed.~~

In-Process Revision

■Plasma-based instrumental techniques that are useful for pharmaceutical analyses fall into two major categories: those based on the inductively coupled plasma, and those where a plasma is generated at or near on the surface of the sample. An inductively coupled plasma (ICP) is a high-temperature excitation source that desolvates, vaporizes, and atomizes aerosol samples and ionizes the resulting atoms. The excited analyte ions and atoms can then subsequently be detected by observing their emission lines, a method termed inductively coupled plasma–atomic emission spectroscopy (ICP–AES), also known as inductively coupled plasma–optical emission spectroscopy (ICP–OES); or the excited or ground state ions can be determined by a technique known as inductively coupled plasma–mass spectrometry (ICP–MS). ICP–AES and ICP–MS may be used for either single- or multi-element analysis, and they provide good general-purpose procedures for either sequential or simultaneous analyses over an extended linear range with good sensitivity.

An emerging technique in plasma spectrochemistry is laser-induced breakdown spectroscopy (LIBS). In LIBS, a solid, liquid, or gaseous sample is heated directly by a pulsed laser, or indirectly by a plasma generated by the laser. As a result, the sample is volatilized at the laser beam contact point, and the volatilized constituents are reduced to atoms, molecular fragments, and larger clusters in the plasma that forms at or just above the surface of the sample. Emission from the atoms and ions in the sample is collected, typically using fiber optics or a remote viewing system, and measured using an array detector such as a charge-coupled device (CCD). LIBS can be used for qualitative analysis or against a working standard curve for quantitative analysis. Although LIBS is not currently in wide use by the pharmaceutical industry, it might be suited for at-line or on-line measurements in a production setting as well as in the laboratory. Because of its potential, it should be considered a viable technique for plasma spectrochemistry in the pharmaceutical laboratory. However, because LIBS is still an emerging technique, details will not be further discussed in this general chapter.[1]

SAMPLE PREPARATION

Sample preparation is critical to the success of plasma-based analysis and is the first step in performing any analysis via ICP–AES or ICP–MS. Plasma-based techniques are heavily dependent on sample transport into the plasma, and because ICP–AES and ICP–MS share the same sample introduction system, the means by which samples are prepared may be ap-

[1] Yueh F-Y, Singh JP, Zhang H. Laser-induced breakdown spectroscopy, elemental analysis. In: *Encyclopedia of Analytical Chemistry: Instrumentation and Applications.* New York: Wiley; 2000:2066–2087.

plicable to either technique. The most conventional means by which samples are introduced into the plasma is via solution nebulization. If solution nebulization is employed, solid samples must be dissolved in order to be presented into the plasma for analysis. Samples may be dissolved in any appropriate solvent. There is a strong preference for the use of aqueous or dilute nitric acid solutions, because there are minimal interferences with these solvents compared to other solvent choices. Hydrogen peroxide, hydrochloric acid, sulfuric acid, perchloric acid, combinations of acids, or various concentrations of acids can all be used to dissolve the sample for analysis. Dilute hydrofluoric acid may also be used, but great care must be taken to ensure the safety of the analyst, as well as to protect the quartz sample introduction equipment when using this acid; specifically, the nebulizer, spray chamber, and inner torch tube should be manufactured from hydrofluoric acid-tolerant materials. Additionally, alternative means of dissolving the sample can be employed. These include, but are not limited to, the use of dilute bases, straight or diluted organic solvents, combinations of acids or bases, and combinations of organic solvents.

When samples are introduced into the plasma via solution nebulization, it is important to consider the potential matrix effects and interferences that might arise from the solvent. The use of an appropriate internal standard and/or matching the standard matrix with samples should be applied for ICP–AES and ICP–MS analyses in cases where accuracy and precision are not adequate. In either event, the selection of an appropriate internal standard should consider the analyte in question, ionization energy, wavelengths or masses, and the nature of the sample matrix.

Where a sample is found to be soluble in any acceptable solvent, a variety of digestion techniques can be employed. These include hot-plate digestion and microwave-assisted digestions, including open-vessel and closed-vessel approaches. The decision regarding the type of digestion technique to use depends on the nature of the sample being digested, as well as on the analytes of interest.

Open-vessel digestion is generally not recommended for the analysis of volatile metals, e.g., selenium and mercury. The suitability of a digestion technique, whether open-vessel or closed-vessel, should be supported by spike recovery experiments in order to verify that, within an acceptable tolerance, volatile metals have not been lost during sample preparation. Use acids, bases, and hydrogen peroxide of ultra-high purity, especially when ICP–MS is employed. Deionized water must be at least 18 megohm. Check diluents for interferences before they are used in an analysis. Because it is not always possible to obtain organic solvents that are free of metals, use organic solvents of the highest quality possible with regard to metal contaminants.

It is important to consider the selection of the type, material of construction, pretreatment, and cleaning of analytical labware used in ICP–AES and ICP–MS analyses. The material must be inert and, depending on the specific application, resistant to caustics, acids, and/or organic solvents. For some analyses, diligence must be exercised to prevent the adsorption of analytes onto the surface of a vessel, particularly in ultra-trace analyses. Contamination of the sample solutions from metal and ions present in the container can also lead to inaccurate results.

The use of labware that is not certified to meet Class A tolerances for volumetric flasks is acceptable if the linearity, accuracy, and precision of the method have been experimentally demonstrated to be suitable for the purpose at hand.

SAMPLE INTRODUCTION

There are two ways to introduce the sample into the nebulizer: by a peristaltic pump and by self-aspiration. The peristaltic pump is preferred and serves to ensure that the flow rate of sample and standard solution to the nebulizer is the same irrespective of sample viscosity. In some cases, where a peristaltic pump is not required, self-aspiration can be used.

A wide variety of nebulizer types is available, including pneumatic (concentric and cross-flow), grid, and ultrasonic nebulizers. Micronebulizers, high-efficiency nebulizers, di-

rect-injection high-efficiency nebulizers, and flow-injection nebulizers are also available. The selection of the nebulizer for a given analysis should consider the sample matrix, analyte, and desired sensitivity. Some nebulizers are better suited for use with viscous solutions or those containing a high concentration of dissolved solids, whereas others are better suited for use with organic solutions.

Note that the self-aspiration of a fluid is due to the Bernoulli, or Venturi, effect. Not all types of nebulizers will support self-aspiration. The use of a concentric nebulizer, for example, is required for self-aspiration of a solution.

Once a sample leaves the nebulizer as an aerosol, it enters the spray chamber, which is designed to permit only the smallest droplets of sample solution into the plasma. The spray chamber functions to prevent larger sample from entering the plasma; as a result, typically only 1% to 2% of the sample aerosol reaches the ICP, although some special-purpose nebulizers have been designed that permit virtually all of the sample aerosol to enter the ICP. As with nebulizers, there is more than one type of spray chamber available for use with ICP–AES or ICP–MS. Examples include the Scott double-pass spray chamber, as well as cyclonic spray chambers of various configurations. The spray chamber must be compatible with the sample and solvent and must equilibrate and wash out in as short a time as possible. When a spray chamber is selected, the nature of the sample matrix, the nebulizer, the desired sensitivity, and the analyte should all be considered.

Gas and liquid chromatography systems can be interfaced with ICP–AES and ICP–MS for molecular speciation, ionic speciation, or other modes of separation chemistry, based on elemental emission or mass spectrometry.

Ultimately, the selection of sample introduction hardware should be demonstrated experimentally to provide sufficient specificity, sensitivity, linearity, accuracy, and precision of the analysis at hand.

In addition to solution nebulization, it is possible to analyze solid samples directly via laser ablation (LA). In such instances, the sample enters the torch as a solid aerosol. LA–ICP–AES and LA–ICP–MS are better suited for qualitative analyses of pharmaceutical compounds because of the difficulty in obtaining appropriate standards. Nonetheless, quantitative analyses can be performed if it can be demonstrated through appropriate method validation that the available standards are adequate.[2]

STANDARD PREPARATION

Single- or multi-element standard solutions, whose concentrations are traceable to primary reference standards, such as those of the National Institute of Standards and Technology (NIST), can be purchased for use in the preparation of working standard solutions. Alternatively, standard solutions of elements can be accurately prepared from standard materials and their concentrations, determined independently, as appropriate. Working standard solutions, especially those used for ultra-trace analyses, may have limited shelf life. As a general rule, working standard solutions should be retained for no more than 24 hours unless stability is demonstrated experimentally. The selection of the standard matrix is of fundamental importance in the preparation of element standard solutions. Spike recovery experiments should be conducted with specific sample matrices in order to determine the accuracy of the method. If sample matrix effects cause excessive inaccuracies, standards, blanks, and sample solutions should be matrix matched, if possible, in order to minimize matrix interferences.

In cases where matrix matching is not possible, an appropriate internal standard or the method of standard additions should be used for ICP–AES or ICP–MS. Internal standards can also be introduced through a T connector into the sample uptake tubing. In any event, the selection of an appropriate internal standard should consider the analytes in question, their ionization and excitation energies, their chemical behavior, their wavelengths or masses, and the nature of the sample ma-

[2] For additional information on laser ablation, see Russo R, Mao X, Borisov O, Liu H. Laser ablation in atomic spectrometry. In: *Encyclopedia of Analytical Chemistry: Instrumentation and Applications.* New York: Wiley; 2000.

trix. Ultimately, the selection of an internal standard should be demonstrated experimentally to provide sufficient specificity, sensitivity, linearity, accuracy, and precision of the analysis at hand.

The method of standard additions involves adding a known concentration of the analyte element to the sample at no fewer than two concentration levels plus an unspiked sample preparation. The instrument response is plotted against the concentration of the added analyte element, and a linear regression line is drawn through the data points. The absolute value of the *x*-intercept multiplied by any dilution factor is the concentration of the analyte in the sample.

The presence of dissolved carbon at concentrations of a small percentage in aqueous solutions enhances ionization of selenium and arsenic in an inductively coupled argon plasma. This phenomenon frequently results in a positive bias for ICP–AES and ICP–MS selenium and arsenic quantification measurements, which can be remedied by using the method of standard additions or by adding a small percentage of carbon, such as analytically pure glacial acetic acid, to the linearity standards.

ICP

The components that make up the ICP excitation source include the argon gas supply, torch, radio frequency (RF) induction coil, impedance-matching unit, and RF generator. Argon gas is almost universally used in an ICP. The plasma torch consists of three concentric tubes designated as the inner, the intermediate, and the outer tube. The intermediate and outer tubes are almost universally made of quartz. The inner tube can be made of quartz or alumina if the analysis is conducted with solutions containing hydrofluoric acid. The nebulizer gas flow carries the aerosol of the sample solution into and through the inner tube of the torch and into the plasma. The intermediate tube carries the intermediate (sometimes referred to as the auxiliary) gas. The intermediate gas flow helps to lift the plasma off the inner and intermediate tubes to prevent their melting and the deposition of carbon and salts on the inner tube. The outer tube carries the outer (sometimes referred to as the plasma or coolant) gas, which is used to form and sustain the toroidal plasma. The tangential flow of the coolant gas through the torch constricts the plasma and prevents the ICP from expanding to fill the outer tube, keeping the torch from melting. An RF induction coil, also called the load coil, surrounds the torch and produces an oscillating magnetic field, which in turn sets up an oscillating current in the ions and electrons produced from the argon. The impedance-matching unit serves to couple the RF energy from the generator efficiently to the load coil. The unit can be of either the active or the passive type. An active matching unit adjusts the impedance of the RF power by means of a capacitive network, whereas the passive type adjusts the impedance directly through the generator circuitry. Within the load coil of the RF generator, the energy transfer between the coil and the argon creates a self-sustaining plasma. Collisions of the ions and electrons liberated from the argon ionize and excite the analyte atoms in the high-temperature plasma. The plasma operates at temperatures of 6,000 to 10,000 K, so most covalent bonds and analyte-to-analyte interactions have been eliminated.

ICP–AES

An inductively coupled plasma can use either an optical or a mass spectral detection system. In the former case, ICP–AES, analyte detection is achieved at an emission wavelength of the analyte in question. Because of differences in technology, a wide variety of ICP–AES systems are available, each with different capabilities, as well as different advantages and disadvantages. Simultaneous-detection systems are capable of analyzing multiple elements at the same time, thereby shortening analysis time and improving background detection and

correction. Sequential systems move from one wavelength to the next to perform analyses, and often provide a larger number of analytical lines from which to choose. Array detectors, including charge-coupled devices and charge-injection devices, with detectors on a chip, make it possible to combine the advantages of both simultaneous and sequential systems. These types of detection devices are used in the most powerful spectrometers, providing rapid analysis and a wide selection of analytical lines.

The ICP can be viewed in either axial or radial (also called lateral) mode. The torch is usually positioned horizontally in axially viewed plasmas and is viewed end on, whereas it is positioned vertically in radially viewed plasmas and is viewed from the side. Axial viewing of the plasma can provide higher signal-to-noise ratios (better detection limits and precision); however, it also incurs greater matrix and spectral interferences. Methods validated on an instrument with a radial configuration will probably not be completely transferable to an instrument with an axial configuration, and vice versa.

Additionally, dual-view instrument systems are available, making it possible for the analyst to take advantage of either torch configuration. The selection of the optimal torch configuration will depend on the sample matrix, analyte in question, analytical wavelength(s) used, cost of instrumentation, required sensitivity, and type of instrumentation available in a given laboratory.

Regardless of torch configuration or detector technology, ICP–AES is a technique that provides a qualitative and/or quantitative measurement of the optical emission from excited atoms or ions at specific wavelengths. These measurements are then used to determine the analyte concentration in a given sample. Upon excitation, an atom or atomic ion emits an array of different frequencies of light that are characteristic of the distinct energy transition allowed for that element. The intensity of the light is generally proportional to the analyte concentration. It is necessary to correct for the background emission from the plasma. Sample concentration measurements are usually determined from a working curve of known standards over the concentration range of interest. It is, however, also possible to perform a single-point calibration under certain circumstances, such as with limit tests, if the methodology has been validated for sufficient specificity, sensitivity, linearity, accuracy, precision, ruggedness, and robustness.

Because there are distinct transitions between atomic energy levels, and because the atoms in an ICP are rather dilute, emission lines have narrow bandwidths. However, because the emission spectra from the ICP contain many lines, and because ‘‘wings’’ of these lines overlap to produce a nearly continuous background on top of the continuum that arises from the recombination of argon ions with electrons, a high-resolution spectrometer is required in ICP–AES. The decision regarding which spectral line to measure should include an evaluation of potential spectral interferences. All atoms in a sample are excited simultaneously; however, the presence of multiple elements in some samples can lead to spectral overlap. Spectral interference can also be caused by background emission from the sample or plasma. Modern ICPs usually have background correction available, and a number of background correction techniques can be applied. Simple background correction typically involves measuring the background emission intensity at some point away from the main peak and subtracting this value from the total signal being measured. Mathematical modeling to subtract the interfering signal as a background correction can also be performed with certain types of ICP–AES spectrometers.

The selection of the analytical spectral line is critical to the success of an ICP–AES analysis, regardless of torch configuration or detector type. Though some wavelengths are preferred, the final choice must be made in the context of the

sample matrix, the type of instrument being used, and the sensitivity required. Analysts might choose to start with the wavelengths recommended by the manufacturer of their particular instrument and select alternative wavelengths based on manufacturer recommendations or published wavelength tables.[3,4,5,6,7] Ultimately, the selection of analytical wavelengths should be demonstrated experimentally to provide sufficient specificity, sensitivity, linearity, accuracy, and precision of the analysis at hand.

Forward power, gas flow rates, viewing height, and torch position can all be optimized to provide the best signal. However, it must also be kept in mind that these same variables can influence matrix and spectral interferences.

In general, it is desirable to operate the ICP under robust conditions, which can be gauged on the basis of the MgII / MgI line pair at (280.270 nm / 285.213 nm). If that ratio of intensities is above 6.0 in an aqueous solution, the ICP is said to be *robust,* and is less susceptible to matrix interferences. A ratio of about 10.0 is generally what is sought. Note that the term *robust conditions* is unrelated to *robustness* as applied to analytical method validation. Operation of an instrument with an MgII / MgI ratio greater than 6.0 is not mandated, but is being suggested as a means of optimizing instrument parameters in many circumstances.

The analysis of the Group I elements can be an exception to this strategy. When atomic ions are formed from elements in this group, they assume a noble gas electron configuration, with correspondingly high excitation energy. Because the first excited state of these ions is extremely high, few are excited, so emission intensity is correspondingly low. This situation can be improved by reducing the fractional ionization, which can in turn be achieved by using lower forward power settings in combination with adjusted viewing height or nebulizer gas flow, or by adding an ionization suppression agent to the samples and standards.

When organic solvents are used, it is often necessary to use a higher forward power setting, higher intermediate and outer gas flows, and a lower nebulizer gas flow than would be employed for aqueous solutions, as well as a reduction in the nebulizer gas flow. When using organic solvents, it may also be necessary to bleed small amounts of oxygen into the torch to prevent carbon buildup in the torch.

Calibration

The wavelength accuracy for ICP–AES detection must comply with the manufacturer's applicable operating procedures. Because of the inherent differences among the types of instruments available, there is no general system suitability procedure that can be employed. Calibration routines recommended by the instrument manufacturer for a given ICP–AES instrument should be followed. These might include, but are not limited to, use of a multi-element wavelength calibration with a reference solution, internal mercury (Hg) wavelength calibration, and peak search. The analyst should perform system checks in accordance with the manufacturer's recommendations.

Standardization

The instrument must be standardized for quantification at time of use. However, because ICP–AES is a technique generally considered to be linear over a range of 6 to 8 orders of magnitude, it is not always necessary to continually demonstrate linearity by the use of a standard curve composed of multiple standards. Once a method has been developed and is in routine use, it is possible to calibrate with a blank and a single standard. One-point standardizations are suitable for conducting limit tests on production materials and final products if the methodology has been rigorously validated for suf-

ficient specificity, sensitivity, linearity, accuracy, precision, ruggedness, and robustness. The use of a single-point standardization is also acceptable for qualitative ICP–AES analyses, where the purpose of the experiment is to confirm the presence or absence of elements without the requirement of an accurate quantification.

An appropriate blank solution and standards that bracket the expected range of the sample concentrations should be assayed and the detector response plotted as a function of analyte concentration, as in the case where the concentration of a known component is being determined within a specified tolerance. However, it is not always possible to employ a bracketing standard when an analysis is performed at or near the detection limit. This lack of use of a bracketing standard is acceptable for analyses conducted to demonstrate the absence or removal of elements below a specified limit. The number and concentrations of standard solutions used should be based on the purpose of the quantification, the analyte in question, the desired sensitivity, and the sample matrix. Regression analysis of the standard plot should be employed to evaluate the linearity of detector response, and individual monographs may set criteria for the residual error of the regression line. Optimally, a correlation coefficient of not less than 0.99, or as indicated in the individual monograph, should be demonstrated for the working curve. Here, too, however, the nature of the sample matrix, the analyte(s), the desired sensitivity, and the type of instrumentation available may dictate a correlation coefficient lower than 0.99. The analyst should use caution when proceeding with such an analysis, and should employ additional working standards.

To demonstrate the stability of the system's initial standardization, a solution used in the initial standard curve must be reassayed as a check standard at appropriate intervals throughout the analysis of the sample set. The reassayed standard should agree with its expected value to within $\pm 10\%$, or as specified in an individual monograph, for single-element analyses when analytical wavelengths are between 200 and 500 nm, or concentrations are > 1 µg per mL. The reassayed standard should agree with its theoretical value to within $\pm 20\%$, or as specified in an individual monograph, for multi-element analyses, when analytical wavelengths are < 200 nm or > 500 nm, or at concentrations of < 1 µg per mL. In cases where an individual monograph provides different guidance regarding the reassayed check standard, the requirements of the monograph take precedence.

Procedure

Follow the procedure as directed in the individual monograph for the instrumental parameters. Because of differences in manufacturers' equipment configurations, the manufacturer's suggested default conditions may be used and modified as needed. The specification of definitive parameters in a monograph does not preclude the use of other suitable operating conditions, and adjustments of operating conditions may be necessary. Alternative conditions must be supported by suitable validation data, and the conditions in the monograph will take precedence for official purposes. Data collected from a single sample introduction are treated as a single result. This result might be the average of data collected from replicate sequential readings from a single solution introduction of the appropriate standard or sample solution. Sample concentrations are calculated versus the working curve generated by plotting the detector response versus the concentration of the analyte in the standard solutions. This calculation is often performed directly by the instrument.

ICP–MS

When an inductively coupled plasma uses a mass spectral detection system, the technique is referred to as inductively coupled plasma–mass spectrometry (ICP–MS). In this technique, analytes are detected directly at their atomic masses. Because these masses must be charged to be detected in ICP–MS, the method relies on the ability of the plasma source

to both atomize and ionize sample constituents. As is the case with ICP–AES, a wide variety of ICP–MS instrumentation systems are available.

The systems most commonly in use are quadrupole-based systems. Gaining in interest is time-of-flight ICP–MS. Although still not in widespread use, this approach may see greater use in the future. Additionally, high-resolution sector field instruments are available.

Regardless of instrument design or configuration, ICP–MS provides both a qualitative and a quantitative measurement of the components of the sample. Ions are generated from the analyte atoms by the plasma. The analyte ions are then extracted from the atmospheric-pressure plasma through a sampling cone into a lower-pressure zone, ordinarily held at a pressure near 1 Torr. In this extraction process, the sampled plasma gases, including the analyte species, form a supersonic beam, which dictates many of the properties of the resulting analyte ions. A skimmer cone, located behind the sampling cone, ''skims'' the supersonic beam of ions as they emerge from the sampling cone. Behind the skimmer cone is a lower-pressure zone, often held near a milliTorr. Lastly, the skimmed ions pass a third-stage orifice to enter a zone held near a microTorr, where they encounter ion optics and are passed into the mass spectrometer. The mass spectrometer separates the ions according to their mass-to-charge *(m/z)* ratios. The ICP–MS has a mass range up to 240 atomic mass units (amu). Depending on the equipment configuration, analyte adducts can form with diluents, with argon, or with their decomposition products. Also formed are oxides and multiply-charged analyte ions, which can increase the complexity of the resulting mass spectra. Interferences can be minimized by appropriate optimization of operational parameters, including gas flows (central, intermediate, and outer gas flow rates), sample-solution flow, RF power, extraction-lens voltage, etc., or by the use of collision or reaction cells, or cool plasma operation, if available on a given instrument. Unless a laboratory is generating or examining isotopes that do not naturally occur, a list of naturally occurring isotopes will provide the analyst with acceptable isotopes for analytical purposes. Isotopic patterns also serve as an aid to element identification and confirmation. Additionally, tables of commonly found interferences and polyatomic isobaric interferences and correction factors can be used.

ICP–MS generally offers considerably lower (better) detection limits than ICP–AES, largely because of the extremely low background that it generates. This ability is a major advantage of ICP–MS for determination of very low analyte concentrations or when elimination of matrix interferences is required. In the latter case, some interferences can be avoided simply by additional dilution of the sample solution. In some applications, analytes can be detected below the parts per trillion (ppt) level using ICP–MS. As a general rule, ICP–MS as a technique requires that samples contain significantly less total dissolved solids than does ICP–AES.

The selection of the analytical mass to use is critical to the success of an ICP–MS analysis, regardless of instrument design. Though some masses are often considered to be the primary ones, because of their high natural abundance, an alternative mass for a given element is often used to avoid spectral overlaps (isobaric interferences). Selection of an analytical mass must always be considered in the context of the sample matrix, the type of instrument being used, and the concentrations to be measured. Analysts might choose to start with masses recommended by the manufacturer of their particular instrument and select alternate masses based on manufacturer's recommendations or published tables of naturally occurring isotopes.[8]

Optimization of an ICP–MS method is also highly dependent on the plasma parameters and means of sample introduction. Forward power, gas flow rates, and torch position may all be optimized to provide the best signal. When organic solvents are used, it is often necessary to use a higher forward power setting and a lower nebulizer flow rate than would be used for aqueous solutions. Additionally, when organic solvents are used, it might be necessary to introduce small amounts of ox-

[8] Horlick G, Montaser A. Analytical characteristics of ICPMS. In: Montaser A, Editor. *Inductively Coupled Plasma Mass Spectrometry.* New York: Wiley-VCH; 1998:516–518.

ygen into the central or intermediate gas to prevent carbon buildup in the torch or on the sampler cone orifice. The use of a platinum-tipped sampling or skimmer cone may also be required in order to reduce cone degradation with some organic solvents.

Calibration

The mass spectral accuracy for ICP–MS detection must be in accordance with the applicable operating procedures. Because of the inherent differences between the types of instruments available, there is no general system suitability procedure that can be employed. Analysts should refer to the tests recommended by the instrument manufacturer for a given ICP–MS instrument. These may include, but are not limited to, tuning on a reference mass or masses, peak search, and mass calibration. The analyst should perform system checks recommended by the instrument manufacturer.

Standardization

The instrument must be standardized for quantification at the time of use. Because the response (signal vs. concentration) of ICP–MS is generally considered to be linear over a range of 6 to 8 orders of magnitude, it is not always necessary to continually demonstrate linearity by the use of a working curve. Once a method has been developed and is in routine use, it is common practice to calibrate with a blank and a single standard. One-point standardizations are suitable for conducting limit tests on production materials and final products, provided that the methodology has been rigorously validated for sufficient specificity, sensitivity, linearity, accuracy, precision, ruggedness, and robustness. An appropriate blank solution and standards that bracket the expected range of the sample concentrations should be assayed and the detector response plotted as a function of analyte concentration. The number and concentration of standard solutions used should be based on the analyte in question, the expected concentrations, and the sample matrix, and should be left to the discretion of the analyst. Optimally, a correlation coefficient of not less than 0.99, or as indicated in the individual monograph, should be demonstrated for the working standard curve. Here, too, however, the nature of the sample matrix, the analyte, the desired sensitivity, and the type of instrumentation available might dictate a correlation coefficient lower than 0.99. The analyst should use caution when proceeding with such an analysis and should employ additional working standards.

To demonstrate the stability of the system since initial standardization, a solution used in the initial standard curve must be reassayed as a check standard at appropriate intervals throughout the analysis of the sample set. Appropriate intervals may be established as occurring after every fifth or tenth sample, or as deemed adequate by the analyst, on the basis of the analysis being performed. The reassayed standard should agree with its expected value to within $\pm 10\%$ for single-element analyses when analytical masses are free of interferences and when concentrations are > 1 ng per mL. The reassayed standard should agree with its expected value to within $\pm 20\%$ for multi-element analyses, or when concentrations are < 1 ng per mL. In cases where an individual monograph provides different guidance regarding the reassayed check standard, the requirements of the monograph take precedence.

The method of standard additions should be employed in situations where matrix interferences are expected or suspected. This method involves adding a known concentration of the analyte element to the sample solution at no fewer than two concentration levels. The instrument response is plotted against the concentration of the added analyte element, and a linear regression line is drawn through the data points. The absolute value of the *x*-intercept multiplied by any dilution factor is the concentration of the analyte in the sample.

Procedure

Follow the procedure as directed in the individual monograph for the detection mode and instrument parameters. The specification of definitive parameters in a monograph does not preclude the use of other suitable operating condi-

tions, and adjustments of operating conditions may be necessary. Alternative conditions must be supported by suitable validation data, and the conditions in the monograph will take precedence for official purposes. Because of differences in manufacturers' equipment configurations, the analyst may wish to begin with the manufacturer's suggested default conditions and modify them as needed. Data collected from a single sample introduction are treated as a single result. Data collected from replicate sequential readings from a single introduction of the appropriate standard or sample solutions are averaged as a single result. Sample concentrations are calculated versus the working curve generated by plotting the detector response versus the concentration of the analyte in the standard solutions. With modern instruments, this calculation is often performed by the instrument.

GLOSSARY

AUXILIARY GAS: See *Intermediate (or Auxiliary) Gas.*

AXIAL VIEWING: A configuration of the plasma for AES in which the plasma is directed toward the spectrometer optical path, also called "end-on viewing."

CENTRAL (OR NEBULIZER) GAS: One of three argon gas flows in an ICP torch. The central gas is used to help create a fine mist of the sample solution when solution nebulization is employed. This fine mist is then directed through the central tube of the torch and into the plasma.

COLLISION CELL: A design feature of some ICP–MS instruments. Collision cells are used to reduce interferences from argon species or polyatomic ions and facilitate the analysis of elements that might be affected by those interferences.

COOL PLASMA: Plasma conditions used for ICP–MS that result in a plasma that is cooler than that normally used for an analysis. This condition is achieved by using a lower forward power setting and higher central-gas flow rate, and is used to help reduce isotopic interferences caused by argon and some polyatomic ions.

COOLANT GAS: See *Outer (or Coolant or Plasma) Gas.*

FORWARD POWER: The number of watts used to ignite and sustain the plasma during an analysis. Forward power requirements may vary, depending on sample matrix and analyte.

INTERMEDIATE (OR AUXILIARY) GAS: Gas used to "lift" the plasma off the surface of the torch, thereby preventing melting of the intermediate tube and the formation of carbon and salt deposits on the inner tube.

INTERNAL STANDARD: An element added to or present in the same concentration in blanks, standards, and samples to act as an intensity reference for the analysis. An internal standard should be used for ICP–AES work and must always be used for quantitative ICP–MS analyses.

LATERAL VIEWING: See *Radial Viewing.*

m: The ion mass of interest.

MULTIPLY-CHARGED IONS: Atoms that, when subjected to the high-ionization temperature of the ICP, can form doubly or triply charged ions (X^{++}, X^{+++}, etc.). When detected by MS, the apparent mass of these ions will be ½ or $\frac{1}{3}$ that of the atomic mass.

NEBULIZER: Used to form a consistent sample aerosol that mixes with the argon gas, which is subsequently sent into the ICP.

OUTER (OR COOLANT OR PLASMA) GAS: The main gas supply for the plasma.

PLASMA GAS: See *Outer (or Coolant or Plasma) Gas.*

RADIAL VIEWING: A configuration of the plasma for AES in which the plasma is viewed orthogonal to the spectrometer optic path. Also called "side-on viewing." See also *Lateral Viewing.*

REACTION CELL: Similar to *Collision Cell,* but operating on a different principle. Designed to reduce or eliminate spectral interferences.

SAMPLING CONE: A metal cone (usually nickel-, aluminum-, or platinum-tipped) with a small opening, through which ionized sample material flows after leaving the plasma.

SEQUENTIAL: A type of detector configuration for AES or MS in which discrete emission lines or isotopic peaks are observed by scanning or hopping across the spectral range by means of a monochromator or scanning mass spectrometer.

SIMULTANEOUS: A type of detector configuration for AES or MS in which all selected emission lines or isotopic peaks are observed at the same time by using a polychromator or simultaneous mass spectrometer, offering increased analysis speed for analyses of multi-element samples.

SKIMMER CONE: A metal cone through which ionized sample flows after leaving the sampling cone and before entering the high-vacuum region of an ICP–MS.

STANDARD ADDITIONS: A method used to determine the actual analyte concentration in a sample when viscosity or matrix effects might cause erroneous results.

TORCH: A series of three concentric tubes, usually manufactured from quartz, in which the ICP is formed.■1S *(USP30)*

BRIEFING

⟨**785**⟩ **Osmolality and Osmolarity,** *USP 29* page 2718 and page 845 of *PF* 31(3) [May–June 2005]. It is proposed to correct the molecular weight of vancomycin and the number of decimal places for the molecular weight of sodium chloride in the section on *Osmolarity.* Also, revisions are proposed in the *Procedure* for the section *Measurement of Osmolality,* indicating that the manufacturer's instructions for calibration are to be used.

Change to read:

OSMOLARITY

Osmolarity of a solution is a theoretical quantity expressed in osmoles per L (Osmol per L) of a solution and is widely used in clinical practice because it expresses osmoles as a function of volume. Osmolarity cannot be measured but is calculated theoretically from the experimentally measured value of osmolality.

Sometimes, osmolarity (ξ_c) is calculated theoretically from the molar concentrations:

$$\xi_c = \Sigma \nu_i c_i$$

where ν_i is as defined above, and c_i is the molar concentration of the i^{th} solute in solution. For example, the osmolarity of a solution prepared by dissolving 1 g of vancomycin in 100 mL of 0.9% sodium chloride solution can be calculated as follows:

~~[3 × 10 g/L/1468 (mol. wt. of vancomycin) + 2 × 9 g/L/58.5 (mol. wt. of sodium chloride)] × 1000 = 328 mOsmol/L~~

~~■[3 × 10 g/L/1485.71(mol. wt. of vancomycin) + 2 × 9 g/L/58.5(mol. wt. of sodium chloride)] × 1000 = 328 mOsmol/L■2S *(USP30)*~~

■[3 × 10 g/L/1449.25(mol. wt. of vancomycin) + 2 × 9 g/L/58.44(mol. wt. of sodium chloride)] × 1000 = 329 mOsmol/L■1S *(USP30)*

The results suggest that the solution is slightly hyperosmotic because the osmolality of blood ranges between 285 and 310 mOsmol per kg. However, the solution is found to be hypo-osmotic and has an experimentally determined osmolality of 255 mOsmol per kg.[1] The example illustrates that osmolarity values calculated theoretically from the concentration of a solution should be interpreted cautiously and may not represent the osmotic properties of infusion solutions.

The discrepancy between theoretical (osmolarity) and experimental (osmolality) results is, in part, due to the fact that osmotic pressure is related to osmolality and not osmolarity. More significantly, the discrepancy between experimental results and the theoretical calculation is due to the fact that the osmotic pressure of a real solution is less than that of an ideal solution because of interactions between solute molecules or between solute and solvent molecules in a solution. Such interactions reduce the pressure exerted by solute molecules on a semipermeable membrane, reducing experimental values of osmolality compared to theoretical values. This difference is related to the molal osmotic coefficient ($\Phi_{m,i}$). The example also illustrates the importance of determining the osmolality of a solution experimentally, rather than calculating the value theoretically.

Change to read:

MEASUREMENT OF OSMOLALITY

The osmolality of a solution is commonly determined by the measurement of the freezing point depression of the solution.

Apparatus—The apparatus, an osmometer for freezing point depression measurement, consists of the following: a means of cooling the container used for the measurement; a resistor sensitive to temperature (thermistor), with an appropriate current- or potential-difference measurement device that may be graduated in temperature change or in osmolality; and a means of mixing the sample.

Osmometers that measure the vapor pressures of solutions are less frequently employed. They require a smaller volume of specimen (generally about 5 µL), but the accuracy and precision of the resulting osmolality determination are comparable to those obtained by the use of osmometers that depend upon the observed freezing points of solutions.

Standard Solutions—Prepare *Standard Solutions* as specified in *Table 1,* as necessary.

[1] Kastango, E.S. and Hadaway, L. International Journal of Pharmaceutical Compounding 5, (2001) 465-469.

Table 1. Standard Solutions for Osmometer Calibration[2]

Standard Solutions (Weight in g of sodium chloride per kg of water)	Osmolality (mOsmol/kg) (ξ_m)	Molal Osmotic Coefficient ($\Phi_{m,\,NaCl}$)	Freezing Point Depression (°) ΔT_f
3.087	100	0.9463	0.186
6.260	200	0.9337	0.372
9.463	300	0.9264	0.558
12.684	400	0.9215	0.744
15.916	500	0.9180	0.930
19.147	600	0.9157	1.116
22.380	700	0.9140	1.302

[2] Adapted from the *European Pharmacopoeia,* 4th Edition, 2002, p. 50.

Test Solution—For a solid for injection, constitute with the appropriate diluent as specified in the instructions on the labeling. For solutions, use the sample as is. [NOTE—A solution can be diluted to bring it within the range of measurement of the osmometer, if necessary, but the results must be expressed as that of the diluted solution and must NOT be multiplied by a dilution factor to calculate the osmolality of the original solution,

▲unless otherwise indicated in the monograph.▲*USP30*
The molal osmotic coefficient is a function of concentration. Therefore, it changes with dilution.]

Procedure—~~Set the zero of the apparatus using water. To calibrate the apparatus, choose at least two solutions from *Table 1* such that the osmolalities of the *Standard Solutions* span the expected range of osmolality of the *Test Solution.*~~

~~[■NOTE—If the instrument does not calibrate with multiple standards, calibrate the instrument by the manufacturer's instructions and confirm the instrument calibration with at least two solutions from *Table 1* such that the osmolalities of the *Standard Solutions* span the expected range of osmolality of the *Test Solution*. The instrument reading should be within ± 2 mOsmol/kg from the *Standard Solution* (over the standard range of 100 to 700 mOsmol/kg).]■2S *(USP30)*■ First, calibrate the instrument by the manufacturer's instructions. Confirm the instrument calibration with at least two solutions from *Table 1* such that the osmolalities of the *Standard Solutions* span the expected range of osmolality of the *Test Solution*. The instrument reading should be within ± 2 mOsmol/kg from the *Standard Solution* (over the standard range of 100 to 700 mOsmol/kg).■1S *(USP30)*
Introduce an appropriate volume of each *Standard Solution* into the measurement cell as per the manufacturer's instructions, and start the cooling system. Usually, the mixing device is programmed to operate at a temperature below the lowest temperature expected from the freezing point depression. The apparatus indicates when the equilibrium is attained. Calibrate the osmometer using an appropriate adjustment device such that the reading corresponds to either the osmolality or freezing point depression value of the *Standard Solution* shown in *Table 1.* [NOTE—Some instruments indicate osmolality and some others show freezing point depression.] Before each measurement, rinse the measurement cell at least twice with the solution to be tested. Repeat the procedure with each *Test Solution.* Read the osmolality of the *Test Solution* directly, or calculate it from the measured freezing point depression.

Assuming that the value of the osmotic coefficient is essentially the same whether the concentration is expressed in molality or molarity, the experimentally determined osmolality of a solution can be converted to osmolarity in the same manner in which the concentration of a solution is converted from molality to molarity. Unless a solution is very concentrated, the osmolarity of a solution (ξ_c) can be calculated from its experimentally determined osmolality (ξ_m):

$$\xi_c = 1000\xi_m / (1000 / \rho + \Sigma w_i \nu_i)$$

where w_i is the weight in g; and ν_i is the partial specific volume, in mL per g, of the i^{th} solute. The partial specific volume of a solute is the change in volume of a solution when an additional 1 g of solute is dissolved in the solution. This volume can be determined by the measurement of densities of the solution before and after the addition of the solute. The partial specific volumes of salts are generally very small, around 0.1 mL per g. However, those of other solutes are generally higher. For example, the partial specific volumes of amino acids are in the range of 0.6–0.9 mL per g.

▲It can be shown from the above equation correlating osmolarity with osmolality that,

$$\xi_c = \xi_m (\rho - c)$$

where ρ is the density of the solution, and c is the total solute concentration, both expressed in g per mL. Thus, alternatively, the osmolarity can also be calculated from experimentally determined osmolality from the measurement of density of the solution by a suitable method and the total weight of the solute, after correction for water content, dissolved per mL of the solution.▲*USP30*

BRIEFING

⟨797⟩ Pharmaceutical Compounding—Sterile Preparations, *USP 29* page 2735 and page 413 of the *Pharmacists' Pharmacopeia.* Following entry into official status of this General Chapter in 2004, USP received more than 1500 comments at its five 2004 and 2005 Compounding and Packaging Workshops and also from e-mail. These comments were carefully considered by the Sterile Compounding Expert Committee in the 2000–2005 cycle. In 2004, USP created a web site to inform practitioners of the on-going deliberations of the Committee. This Committee concluded its work at the time of the USP Convention in March 2005, which was taken up again by its successor Committee in the present cycle (2005–2010). The current Committee held its first meeting in July 2005 and considered additional changes based on their own deliberations and further public response. Additional meetings both by telephone and at USP Headquarters in November 2005 resulted in extensive revisions to the official text, which are presented in this *In-Process Revision*. Some of the proposed revisions include new definitions and new sections, as well as revision to the standard published in 2004. Guidance in modifying the standard was sought from other organizations such as the National Institute for Occupational Safety and Health and Food and Drug Administration. There are now 59 sections and subsections in the proposed standard, with major revisions/additions noted in the following: *Introduction*—This section has been re-organized with an addition of new terms and changes to previous ones; *Immediate Use CSPs*—This is a new section to allow exemptions to areas where CSPs are prepared in the case of emergency; *Hazardous Drugs as CSPs*—This is a new section that requires that all compounding personnel be fully trained in handling, storage, and disposing of hazardous drugs; *Radiopharmaceuticals as CSPs*—This new section describes radiopharmaceuticals risk levels and also refers practitioners who compound radiopharmaceuticals to another USP General Chapter *(Radiopharmaceuticals for Positron Emission Tomography Compounding* ⟨823⟩*);Facility Design and Environmental Controls*—This section has been revised to describe environmental design, primary engineering control areas such as buffer room, cleanroom, use of barrier isolator [Compounding Aseptic Isolator (CAI)] and HEPA filters, and the ISO environment for compounding facilities and equipment; *Environment Monitoring*—This section has been revised to discuss total particle count, surface sampling, air sampling, and personnel; *Personnel Cleansing and Garbing*—This section has been revised to provide clear understanding of personnel cleansing and garbing procedures and the disinfecting process.

⟨797⟩ PHARMACEUTICAL COMPOUNDING—STERILE PREPARATIONS

Change to read:

INTRODUCTION

~~This chapter provides procedures and requirements for compounding sterile preparations.~~

~~Sterile compounding differs from nonsterile compounding (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩ and *Good Compounding Practices* ⟨1075⟩) primarily by requiring a test for sterility. Sterile compounding also requires cleaner facilities; specific training and testing of personnel in principles and practices of aseptic manipulations; air quality evaluation and maintenance; and sound knowledge of sterilization and solution stability principles and practices. Greater care is required for aqueous injections that are compounded sterile preparations (CSPs)—the most common CSPs used in therapy. Aqueous injections for administration into the vascular and central nervous systems pose the greatest risk of harm to patients if there are issues of nonsterility and large errors in ingredients.~~

~~The intent of this chapter is to prevent harm and fatality to patients that could result from microbial contamination (nonsterility), excessive bacterial endotoxins, large content errors in the strength of correct ingredients, and incorrect ingredients in CSPs. The quality control and testing for CSPs in this chapter are appropriate and necessary. The content of this chapter applies to health care institutions, pharmacies, physician practice facilities, and other facilities in which CSPs are prepared, stored, and dispensed. For the purposes of this chapter, CSPs include any of the following:~~

~~a. Preparations prepared according to the manufacturer's labeled instructions and other manipulations when manufacturing sterile products that expose the original contents to potential contamination.~~

~~b. Preparations containing nonsterile ingredients or employing nonsterile components and devices that must be sterilized before administration.~~

~~c. Biologics, diagnostics, drugs, nutrients, and radiopharmaceuticals that possess either of the above two characteristics and which include, but are not limited to, baths and soaks for live organs and tissues, implants, inhalations, injections, powders for injection, irrigations, metered sprays, and ophthalmic and otic preparations.~~

■The objective of this chapter is to describe conditions and practices to prevent harm, including death, to patients that could result from the following: 1) microbial contamination (nonsterility), 2) excessive bacterial endotoxins, 3) variability in the intended strength of correct ingredients that exceeds either monograph limits for official articles (see "official" and "article" in the *General Notices and Requirements*) or 10% for nonofficial articles, 4) unintended chemical and physical contaminants, and 5) incorrect types and qualities of ingredients in Compounded Sterile Preparations (CSPs). Nonsterile CSPs are potentially most hazardous to patients when administered into body cavities, central nervous and vascular systems, eyes, and joints; and when used as baths for live organs and tissues. When CSPs contain excessive bacterial endotoxins (see *Bacterial Endotoxins Test* ⟨85⟩), they are potentially most hazardous to patients when administered into the central nervous system.

To achieve these five objectives, this chapter provides practice and quality standards for CSPs of drugs and nutrients. The standards in this chapter pertain to all pre-administration manipulations and procedures of CSPs, including preparation, storage, and transportation. The standards in this chapter do not pertain to the clinical administration of CSPs to patients via application, implantation, infusion, inhalation, injection,

insertion, instillation, and irrigation, which are the routes of administration. The following four specific categories of CSPs are described in this chapter: *Low-Risk Level, Medium-Risk Level,* and *High-Risk Level CSPs;* and *Immediate Use CSPs*. Sterile compounding differs from nonsterile compounding (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩ and *Good Compounding Practices* ⟨1075⟩) primarily by requiring the maintenance of sterility when compounding exclusively with sterile ingredients and components, i.e., *Immediate Use CSPs, Low-Risk Level CSPs,* and *Medium-Risk Level CSPs;* and the achievement of sterility when compounding with nonsterile ingredients and components, i.e., *High-Risk Level CSPs*. Some differences between standards for sterile compounding in this chapter and those for nonsterile compounding in chapter ⟨795⟩ include, but are not limited to ISO classified air environments (see *Table 1*); personnel garbing and gloving; personnel training and testing in principles and practices of aseptic manipulations and sterilization; environmental quality specifications and monitoring; and disinfection of gloves and surfaces of ISO Class 5 (see *Table 1*) sources.

Table 1. International Organization of Standardization (ISO) Classification of Particulate Matter in Room Air [Limits are in particles 0.5 μm and larger per cubic meter (current ISO) and cubic feet (former Federal Standard No. 209E, FS 209E).][*]

Class Name		Particle Count	
ISO Class	U.S. FS 209E	ISO, m^3	FS 209E, $ft.^3$
3	Class 1	35.2	1
4	Class 10	352	10
5	Class 100	3520	100
6	Class 1000	35,200	1000
7	Class 10,000	352,000	10,000
8	Class 100,000	3,520,000	100,000

[*] Adapted from former Federal Standard No. 209E, General Services Administration, Washington, DC, 20407 (September 11, 1992) and ISO 4644-1 : 1999, Cleanrooms and associated controlled environments—Part 1: Classification of air cleanliness. For example, 3520 particles of 0.5 μm per m^3 or larger (ISO Class 5) is equivalent to 100 particles per ft^3 (Class 100) (1 m^3 = 35.2 ft^3).

The standards in this chapter are intended to apply to all persons who prepare CSPs and all places where CSPs are prepared, e.g., hospitals and other healthcare institutions, patient treatment clinics, pharmacies, physicians' practice facilities, and other locations and facilities in which CSPs are prepared, stored, and transported. Persons who perform sterile compounding include pharmacists, nurses, pharmacy technicians, and physicians. These terms recognize both that most sterile compounding is performed by or under the supervision of pharmacists in pharmacies and that this chapter applies to all healthcare personnel who prepare, store, and transport CSPs. For the purposes of this chapter, CSPs include any of the following:

(1) Biologics, diagnostics, drugs, nutrients, and radiopharmaceuticals that possess any of the characteristics in parts (2) and (3) below and that include the following preparations that must be sterile when they are administered to patients: aqueous bronchial and nasal inhalations, baths and soaks for live organs and tissues, injections (e.g., colloidal dispersions, emulsions, solutions, and suspensions), irrigations for wounds and body cavities, ophthalmic drops and ointments, and tissue implants.

(2) Manufactured sterile products that are prepared either strictly according to the instructions appearing in manufacturers' approved labeling (product package inserts) or that are prepared differently than published in such labeling. [NOTE—The FDA states that "Compounding does not include mixing, reconstituting, or similar acts that are performed in accordance with the directions contained in approved labeling provided by the product's manufacturer and other manufacturer directions consistent with that labeling" (see http://www.fda.gov/cder/fdama/difconc.htm). However, the FDA approved labeling (product package insert) rarely describes environmental quality, e.g., ISO Class air designation, exposure durations to non-ISO classified air, personnel garbing and gloving, and other aseptic precautions by which sterile products are to be prepared for administration. Beyond-use expo-

sure and storage dates or times (see *General Notices and Requirements* and *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩) for sterile products that have been either opened or prepared for administration are not specified in all package inserts for all sterile products. Furthermore, when such durations are specified, they usually refer to chemical stability and not necessarily to microbiological purity or safety.]

(3) The three contamination categories for CSPs described in the section *CSP Microbial Contamination Risk Levels* are assigned primarily according to the potential for microbial contamination during compounding *Low-Risk Level* and *Medium-Risk Level CSPs,* or the potential for not sterilizing *High-Risk Level CSPs,* any of which would subject patients to risk of harm, including death. Therefore *High-Risk Level CSPs* (see the specific criteria described in the *CSP Microbial Contamination Risk Levels* section) must be sterilized before being administered to patients.

ORGANIZATION OF THIS CHAPTER■1S (*USP30*)

The sections in this chapter are organized to facilitate practitioners' understanding of the fundamental accuracy and quality practices of CSPs. They provide a foundation for the development and implementation of essential procedures for the safe preparation of CSPs ~~in the three risk levels,~~

■at *Low-Risk, Medium-Risk,* and *High-Risk Level CSPs;* and *Immediate Use CSPs,*■1S (*USP30*)
which are classified according to the potential for microbial, chemical, and physical contamination. The chapter is divided into the following main sections:

- ~~Responsibilities of all compounding personnel~~
- ~~The basis for the classification of a CSP into a low-, medium, and high-risk level, with examples of CSPs and their quality assurance practices in each of these risk levels~~
- ~~Verification of compounding accuracy and sterilization~~
- ~~Personnel training and evaluation in aseptic manipulation skills, including representative sterile microbial culture medium transfer and fill challenges~~
- ~~Environmental quality and control during the processing of CSPs~~
- ~~Equipment used in the preparation of CSPs~~
- ~~Verification of automated compounding devices for parenteral nutrition compounding~~
- ~~Finished preparation release checks and tests~~
- ~~Storage and beyond-use dating~~
- ~~Maintaining product quality and control after CSPs leave the compounding facility, including education and training of personnel~~
- ~~Packing, handling, storage, and transport of CSPs~~
- ~~Patient or caregiver training~~
- ~~Patient monitoring and adverse events reporting~~
- ~~A quality assurance program for CSPs It is the ultimate responsibility of all personnel who prepare CSPs to understand these fundamental practices and precautions, to develop and implement appropriate procedures, and to continually evaluate these procedures and the quality of final CSPs to prevent harm and fatality to patients who are treated with CSPs.~~

■• Definitions of chapter terminology
- Responsibility of compounding personnel
- CSP microbial contamination risk levels
- Single-dose and multiple-dose containers
- Hazardous drugs as CSPs
- Radiopharmaceuticals as CSPs
- Verification of compounding accuracy and sterility
- Sterilization methods
- Personnel training and evaluation in aseptic manipulation skills
- Environmental quality and control
- Cleaning and disinfecting the sterile compounding areas
- Personnel cleansing and garbing
- Suggested standard operating procedures
- Environmental monitoring
- Processing
- Verification of automated compounding devices for parenteral nutrition compounding
- Finished preparation release checks and tests
- Storage and beyond-use dating
- Maintaining sterility, purity, and stability of dispensed and distributed CSPs
- Packing and transporting CSPs

In-Process Revision

Add the following:

▪DEFINITIONS

Anteroom—An anteroom is an ISO Class 8 (see *Table 1*) or better area where personnel perform hand hygiene and garbing procedures, staging of components, order entry, CSP labeling and other high-particulate generating activities. It is also a transition area that 1) provides assurance that pressure relationships are constantly maintained so that air flows from clean to dirty areas and 2) that reduces the need for the heating, ventilating and air conditioning (HVAC) control system to respond to large disturbances.[1]

Aseptic Processing (see *Microbiological Evaluation of Cleanrooms* ⟨1116⟩)—Aseptic processing is a mode of processing pharmaceutical and medical products that involves the separate sterilization of the product and of the package (containers–closures or packaging material for medical devices) and the transfer of the product into the container and its closure under microbiologic critically controlled conditions.

Beyond-Use Date (see *General Notices and Requirements* and *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩)—For the purpose of this chapter, the beyond-use date is the date or time after which the CSPs shall not be stored or transported. The beyond-use date is determined from the date or time the preparation is compounded.

Biological Safety Cabinet, *Class II* (BSC)—The BSC is a ventilated cabinet for personnel, product, and environmental protection having an open front with inward airflow for personnel protection, downward HEPA filtered laminar airflow for product protection, and HEPA filtered exhausted air for environmental protection.

Buffer Area, Buffer or Core Room, Buffer or Cleanroom Areas, Buffer Room Area, Buffer or Clean Area—This is an ISO Class 7 (see *Table 1*) area where the primary engineering control area (see below) is physically located. Activities that occur in this area include the preparation and staging of components and supplies used when compounding CSPs.

Cleanroom (see *Microbiological Evaluation of Cleanrooms* ⟨1116⟩ and also *Buffer Area*)—A cleanroom is a room in which the concentration of airborne particles is controlled to meet a specified airborne particulate cleanliness class. Microorganisms in the environment are monitored so that a microbial level for air, surface, and personnel gear are not exceeded for a specified cleanliness class.

Compounding Aseptic Isolator (CAI)—The CAI is a form of barrier isolator specifically designed for compounding pharmaceutical ingredients or preparations. It is designed to maintain an aseptic compounding environment within the isolator throughout the compounding and material transfer processes. Air exchange into the isolator from the surrounding environment should not occur unless it has first passed through a microbially retentive filter (HEPA minimum).[2]

Critical Area—A critical area is an ISO Class 5 (see *Table 1*) environment.

Critical Sites—Critical sites include sterile ingredients of CSPs and locations on devices and components used to prepare, package, and transfer CSPs that provide opportunity for exposure to contamination.

Disinfectant—A disinfectant is an agent that frees from infection, usually a chemical agent but sometimes a physical one, and that destroys disease-causing pathogens or other harmful microorganisms but may not kill bacterial spores. It refers to substances applied to inanimate objects.

Labeling (see *General Notices and Requirements* and www.fda.gov/cder/drugsatfda/glossary.htm)—A term that designates all labels and other written, printed, or graphic matter upon an immediate container of an article or preparation or

[1] See *American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc. (ASHRAE), Laboratory Design Guide.*

[2] *CETA Applications Guide for the Use of Compounding Isolators in Compounding Sterile Preparations in Healthcare Facilities,* CAG-001-2005, Controlled Environment Testing Association (CETA), November 8, 2005.

upon; or in, any package or wrapper in which it is enclosed, except any outer shipping container. The term ''label'' designates that part of the labeling upon the immediate container.

Media-Fill Test (see *Microbiological Evaluation of Cleanrooms* ⟨1116⟩)—A media fill test is used to qualify aseptic technique of compounding personnel or processes and to ensure that the processes used are able to produce sterile product without microbial contamination. During this test, a microbiological growth medium such as Soybean–Casein Digest Medium (SCDM) is substituted for the actual drug product to simulate admixture compounding.[3] The issues to consider in the development of a media fill test are the following: media-fill procedures, media selection, fill volume, incubation, time and temperature, inspection of filled units, documentation, interpretation of results, and possible corrective actions required.

Multiple-Dose Container (see *General Notices and Requirements* and *Containers for Injections* under *Injections* ⟨1⟩)—A multiple-dose container is a multiple-unit container for articles or preparations intended for parenteral administration only and usually contains antimicrobial preservatives. The beyond-use date for an opened or entered (e.g., needle-punctured) multiple-dose container with antimicrobial preservatives is 28 days (see *Antimicrobial Effectiveness Testing* ⟨51⟩), unless otherwise specified by the manufacturer.

Negative Pressure Room—A room that is at a lower pressure compared to adjacent spaces and, therefore, the net flow of air is *into* the room.[1]

Pharmacy Bulk Package (see *Containers for Injections* under *Injections* ⟨1⟩)—The pharmacy bulk package is a container of a sterile preparation for parenteral use that contains many single doses. The contents are intended for use in a pharmacy admixture program and are restricted to the preparation of admixtures for infusion or, through a sterile transfer device, for the filling of empty sterile syringes. The closure shall be penetrated only one time after constitution with a suitable sterile transfer device or dispensing set, which allows measured dispensing of the contents. The pharmacy bulk package is to be used only in a suitable work area such as a laminar flow hood (or an equivalent clean air compounding area).

Where a container is offered as a *Pharmacy Bulk Package,* the label shall (a) state prominently ''Pharmacy Bulk Package—Not for Direct Infusion,'' (b) contain or refer to information on proper techniques to help assure safe use of the product, and (c) bear a statement limiting the time frame in which the container may be used once it has been entered, provided it is held under the labeled storage conditions.

Primary Engineering Control—It is a device or room that provides an ISO Class 5 (see *Table 1*) environment for the exposure of critical sites when compounding CSPs. Such devices include, but may not be limited to, laminar airflow workbenches (LAFWs), biological safety cabinets (BSCs), and compounding aseptic isolators (CAIs).

Preparation—For the purposes of this chapter, a preparation, or a CSP, is a sterile drug or nutrient compounded in a licensed pharmacy or other healthcare-related facility pursuant to the order of a licensed prescriber; the article may or may not contain sterile products.

Product—For the purposes of this chapter, a product is a commercially manufactured sterile drug or nutrient that has been evaluated for safety and efficacy by the U.S. Food and Drug Administration (FDA). Products are accompanied by full prescribing information, which is commonly known as the FDA-approved manufacturer's labeling or product package insert.

Positive Pressure Room—A positive pressure room is one that is at a higher pressure compared to adjacent spaces and, therefore, the net airflow is *out of* the room.[1]

Single-Dose Container (see *General Notices and Requirements* and *Containers for Injections* under *Injections* ⟨1⟩)—A single-dose container is a single-unit container for articles (see *General Notices and Requirements*) or preparations intended for parenteral administration only. It is intended for a single use. A single-dose container is labeled as such. Examples of

[3] Swarbrick J, Boylan J, *Encyclopedia of Pharmaceutical Technology,* Vol 7.

In-Process Revision

single-dose containers include prefilled syringes, cartridges, fusion-sealed containers, and closure-sealed containers when so labeled.

Sterilizing Grade Filter—A sterile grade filter is a filter that will remove all microorganisms from a fluid stream, producing a sterile effluent. Such filters typically have a nominal porosity of 0.2 µm.

Sterilization by Filtration—Passage of a fluid or solution through a sterilizing grade filter to produce a sterile effluent.

Terminal Sterilization—Terminal sterilization is the application of a lethal process, e.g., steam under pressure or autoclaving, to sealed containers for the purpose of achieving a predetermined sterility assurance level (SAL) of usually less than 10^{-6}, i.e., or a probability of less than one in one million of a nonsterile unit.[4]

Unidirectional Flow (see U.S. Food and Drug Administration, Guidance for Industry Sterile Drug Products Produced by Aseptic Processing—Current Good Manufacturing Practice)—An airflow moving in a single direction, in a robust and uniform manner, and at sufficient speed to reproducibly sweep particles away from the critical processing or testing area.■1S (*USP30*)

RESPONSIBILITY OF COMPOUNDING PERSONNEL

Compounding personnel are responsible for ensuring that CSPs are accurately identified, measured, diluted, and mixed; and are correctly purified, sterilized, packaged, sealed, labeled, stored, dispensed, and distributed. These performance responsibilities include maintaining appropriate cleanliness conditions and providing labeling and supplementary instructions for the proper clinical administration of CSPs.

Compounding supervisors shall ensure through either direct measurement or appropriate information sources that specific CSPs maintain their labeled strength within monograph limits for USP articles, or within 10% if not specified, until their beyond-use dates. All CSPs are prepared in a manner that maintains sterility and minimizes the introduction of particulate matter.

A written quality assurance procedure includes the following in-process checks that are applied, as is appropriate, to specific CSPs: accuracy and precision of measuring and weighing; the requirement for sterility; methods of sterilization and purification; safe limits and ranges for strength of ingredients, bacterial endotoxins, particulate matter, and pH; labeling accuracy and completeness; beyond-use date assignment; and packaging and storage requirements. The dispenser shall, when appropriate and practicable, obtain and evaluate results of testing for identity, strength, purity, and sterility before a CSP is dispensed. Qualified licensed healthcare professionals who supervise compounding and dispensing of CSPs shall ensure that the following objectives are achieved.

1. Compounding personnel are adequately skilled, educated, instructed, and trained to correctly perform and document the following activities in their sterile compounding duties:
   a. Perform antiseptic hand cleansing and disinfection of nonsterile compounding surfaces;
   b. Select and appropriately don protective ~~gloves, goggles, gowns, masks, and hair and shoe covers;~~ ■garb;■1S (*USP30*)
   c. ~~Use laminar flow clean-air hoods, barrier isolators, and other contamination control devices that are appropriate for the risk level;~~ ■Maintain or achieve sterility of CSPs in ISO Class 5 (see *Table 1*) primary engineering devices, and protect personnel and compounding environments from contamination by radioactive, cytotoxic, and chemotoxic drugs (see *Hazardous Drugs as CSPs* section and *Radiopharmaceuticals as CSPs* section);■1S (*USP30*)
   d. Identify, weigh, and measure ingredients; and
   e. Manipulate sterile products aseptically, sterilize high-risk level CSPs, and label and quality inspect CSPs.
2. Ingredients have their correct identity, quality, and purity.
3. Opened or partially used packages of ingredients for subsequent use in CSPs are properly stored under restricted access conditions in the compounding facility. Such packages cannot be used when visual inspection detects unauthorized breaks in the container, closure, and seal; when the contents do not possess the expected appearance, aroma, and texture; when the contents do not pass identification tests specified by the compounding facility; and when either the beyond-use or expiration date has been exceeded.
4. To minimize the generation of bacterial endotoxins, water-containing CSPs that are nonsterile during any phase of the compounding procedure are sterilized within 6 hours after completing the preparation.
5. Sterilization methods achieve sterility of CSPs while maintaining the labeled strength of active ingredients and the physical integrity of packaging.
6. Measuring, mixing, sterilizing, and purifying devices are clean, appropriately accurate, and effective for their intended uses.
7. Potential harm from added substances and differences in rate and extent of bioavailability of active ingredients for other than oral route of administration are carefully evaluated before such CSPs are dispensed and administered.
8. Packaging selected for CSPs is appropriate to preserve the sterility and strength until the beyond-use date.
9. While being used, the compounding environment maintains the sterility or the presterilization purity, whichever is appropriate, of the CSP.
10. Labels on CSPs list the names and amounts or concentrations of ~~all ingredients~~ ■active ingredients and the labels or labeling (see *Labels and Labeling* in *Preservation, Packaging, Storage, and Labeling* section in the *General Notices and Requirements*) of injections list the names and amounts or concentrations of all ingredients (see *Injections* ⟨1⟩).■1S (*USP30*)

[4] U.S. Food and Drug Administration, Guidance for Industry Sterile Drug Products Produced by Aseptic Processing—Current Good Manufacturing Practice, September 2004 (http://www.fda.gov/cder/guidance/5882fnl.htm).

In-Process Revision

Before being dispensed, and/or administered, the clarity of solutions is visually confirmed; also, the identity and amounts of ingredients, procedures to prepare and sterilize CSPs, and specific release criteria are reviewed to ensure their accuracy and completeness.

11. Beyond-use dates are assigned on the basis of direct testing or extrapolation from reliable literature sources and other documentation (see *Stability Criteria* and *Beyond-Use Dating* under *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).
12. Procedures for measuring, mixing, dilution, purification, sterilization, packaging, and labeling conform to the correct sequence and quality established for the specified CSP.
13. Deficiencies in compounding, labeling, packaging, and quality testing and inspection can be rapidly identified and corrected.
14. When time and personnel availability so permit, compounding manipulations and procedures are separated from postcompounding quality inspection and review before CSPs are dispensed and administered.

This chapter emphasizes the need to maintain high standards for the quality and control of processes, components, and environments; and for the skill and knowledge of personnel who prepare CSPs. The rigor of in-process quality-control checks and of postcompounding quality inspection and testing increases with the potential hazard of the route of administration. For example, nonsterility, excessive bacterial endotoxin contamination, large errors in strength of correct ingredients, and incorrect ingredients in CSPs are potentially more dangerous to patients when the CSPs are administered into the vascular and central nervous systems than when administered by most other routes.

Change to read:

CSP MICROBIAL CONTAMINATION RISK LEVELS

The appropriate risk level—low, medium, or high—is assigned according to the corresponding probability of contaminating a CSP with (1) microbial contamination (microbial organisms, spores, and endotoxins) and (2) chemical and physical contamination (foreign chemicals and physical matter). Potential sources of contamination include, but are not limited to, solid and liquid matter from compounding personnel and objects; nonsterile components employed and incorporated before terminal sterilization; inappropriate conditions within the restricted compounding environment; prolonged presterilization procedures with aqueous preparations; and nonsterile dosage forms used to compound CSPs.

The characteristics described below for low-risk, medium-risk, and high-risk CSPs are intended as a guide to the breadth and depth of care necessary in compounding, but they are neither exhaustive nor prescriptive. The licensed healthcare professionals who supervise compounding are responsible for determining the procedural and environmental quality practices and attributes that are necessary for the risk level they assign to specific CSPs.

These risk levels apply to the quality of CSPs immediately after the final aseptic mixing or filling or immediately after the final sterilization, unless precluded by the specific characteristics of the preparation. ~~, such as lipid-based emulsions where administration must be completed within 12 hours of preparation~~

■■1S (*USP30*)
Upon subsequent storage and shipping of freshly finished CSPs, an increase in the risks of chemical degradation of ingredients, contamination from physical damage to packaging, and permeability of plastic and elastomeric packaging is expected. In such cases, compounding personnel

■are to■1S (*USP30*)
consider the potential additional risks to the integrity of CSPs when assigning beyond-use dates. The pre-administration ~~exposure~~

■■1S (*USP30*)
duration and temperature limits specified in the following low-risk, medium-risk, and high-risk level sections apply in the absence of direct ~~testing results or appropriate information sources that justify different limits for specific CSPs. For a summary of the criteria according to risk levels, please see the *Appendix*.~~

■sterility testing results that justify different limits for specific CSPs.■1S (*USP30*)

Low-Risk Level CSPs

CSPs compounded under all the following conditions are at a low risk of contamination.

Low-Risk Conditions—

1. The CSPs are compounded with aseptic manipulations entirely within ISO Class 5 (see *Table 1*) or better air quality using only sterile ingredients, products, components, and devices.
2. The compounding involves only transfer, measuring, and mixing manipulations ~~with closed or sealed packaging systems that are performed promptly and attentively.~~

   ■using no more than three commercially manufactured sterile products and entries into one container package (e.g., bag, vial) of sterile product to make the CSP.■1S (*USP30*)
3. Manipulations are limited to aseptically opening ampuls, penetrating sterile stoppers on vials with sterile needles and syringes, and transferring sterile liquids in sterile syringes to sterile administration devices, ~~and packages of other sterile products,~~

   ■package containers of other sterile products, and containers for storage and dispensing.■1S (*USP30*)
4. For a low-risk preparation, in the absence of passing a sterility test

   ■(see *Sterility Tests* ⟨71⟩),■1S (*USP30*)
   the storage periods cannot exceed the following time periods: before administration, the CSPs are properly stored and are exposed for not more than 48 hours at controlled room temperature (see *General Notices and Requirements*), for not more than 14 days at a cold temperature (see *General Notices and Requirements*), and for 45 days in solid frozen state at –20° or colder.

Examples of Low-Risk Compounding—

1. Single

   ■volume■1S (*USP30*)
   transfers of sterile dosage forms from ampuls, bottles, bags, and vials using sterile syringes with sterile needles, other administration devices, and other sterile containers. The ~~content of ampuls require sterile filtration~~

   ■solution content of ampuls should be passed through a sterile filter■1S (*USP30*)
   to remove any particles.
2. Simple aseptic measuring and transferring with not more than three (3) manufactured products including an infusion or diluent solution to compound drug admixtures and nutritional solutions.

Quality Assurance—Quality assurance practices include, but are not limited to, the following:

1. Routine disinfection and air quality testing of the direct compounding environment to minimize microbial surface contamination and maintain ISO Class 5 (see *Table 1*) air quality.
2. Visual confirmation that compounding personnel are properly donning and wearing appropriate items and types of protective garments and goggles.
3. Review of all orders and packages of ingredients to ensure that the correct identity and amounts of ingredients were compounded.

In-Process Revision

4. Visual inspection of CSPs to ensure the absence of particulate matter in solutions, the absence of leakage from vials and bags, and the accuracy and thoroughness of labeling.

Example of a Media-Fill Test Procedure—This, or an equivalent test, is performed at least annually by each person authorized to compound in a low-risk level under conditions that closely simulate the most challenging or stressful conditions encountered during compounding of low-risk level CSPs. Once begun, this test is completed without interruption. Within an ISO Class 5 ~~air quality environment, (see *Table 1*)~~

■(see *Table 1*) air quality environment,■1S (*USP30*)
three sets of four 5-mL aliquots of sterile Soybean–Casein Digest Medium are transferred with the same sterile 10-mL syringe and vented needle combination into separate sealed, empty, sterile 30-mL clear vials (i.e., four 5-mL aliquots into each of three 30-mL vials). Sterile adhesive seals are aseptically affixed to the rubber closures on the three filled vials, then the vials are incubated as described in the *Personnel Training and Evaluation in Aseptic Manipulation Skills* section.

Medium-Risk Level CSPs

When CSPs are compounded aseptically under *Low-Risk Conditions,* and one or more of the following conditions exists, such CSPs are at a medium risk of contamination.

Medium-Risk Conditions—

1. Multiple individual or small doses of sterile products are combined or pooled to prepare a CSP that will be administered either to multiple patients or to one patient on multiple occasions.
2. The compounding process includes complex aseptic manipulations other than the single-volume transfer.
3. The compounding process requires unusually long duration, such as that required to complete dissolution or homogeneous mixing.
4. ~~The sterile CSPs do not contain broad spectrum bacteriostatic substances, and they are administered over several days (e.g., an externally worn or implanted infusion device).~~
5. ~~For a medium risk preparation, in the absence of passing a sterility test the storage periods cannot exceed the following time periods: before administration, the CSPs are properly stored and are exposed for not more than 30 hours at controlled room temperature (see *General Notices and Requirements*), for not more than 7 days at a cold temperature (see *General Notices and Requirements*), and for 45 days in solid frozen state at –20° or colder.~~

■4. For a medium-risk preparation, in the absence of passing a sterility test (see *Sterility Tests* ⟨71⟩), the storage periods cannot exceed the following time periods: before administration, the CSPs are properly stored and are exposed for not more than 30 hours at controlled room temperature (see *General Notices and Requirements*), for not more than 9 days at a cold temperature (see *General Notices and Requirements*), and for 45 days in solid frozen state at –20° or colder.■1S (*USP30*)

Examples of Medium-Risk Compounding—

1. Compounding of total parenteral nutrition fluids using manual or automated devices during which there are multiple injections, detachments, and attachments of nutrient source products to the device or machine to deliver all nutritional components to a final sterile container.
2. Filling of reservoirs of injection and infusion devices with ~~multiple~~ ■more than three■1S (*USP30*) sterile drug products and evacuation of air from those reservoirs before the filled device is dispensed.
3. ~~Filling of reservoirs of injection and infusion devices with volumes of sterile drug solutions that will be administered over several days at ambient temperatures between 25° and 40°.~~

■■1S (*USP30*)
3. Transfer of volumes from multiple ampuls or vials into ~~a single, final sterile container or product.~~ ■one or more final sterile containers.■1S (*USP30*)

Quality Assurance—Quality assurance procedures for medium-risk level CSPs include all those for low-risk level CSPs, as well as a more challenging media-fill test passed annually, or more frequently.

Example of a Media-Fill Test Procedure—This, or an equivalent test, is performed

■at least annually■1S (*USP30*)
under conditions that closely simulate the most challenging or stressful conditions encountered during compounding. This test is completed without interruption within an ISO Class 5 ~~air quality environment.(see *Table 1*)~~

■(see *Table 1*) air quality environment.■1S (*USP30*)
Six 100-mL aliquots of sterile Soybean–Casein Digest Medium are aseptically transferred by gravity through separate tubing sets into separate evacuated sterile containers. The six containers are then arranged as three pairs, and a sterile 10-mL syringe and 18-gauge needle combination is used to exchange two 5-mL aliquots of medium from one container to the other container in the pair. For example, after a 5-mL aliquot from the first container is added to the second container in the pair, the second container is agitated for 10 seconds, then a 5-mL aliquot is removed and returned to the first container in the pair. The first container is then agitated for 10 seconds, and the next 5-mL aliquot is transferred from it back to the second container in the pair. Following the two 5-mL aliquot exchanges in each pair of containers, a 5-mL aliquot of medium from each container is aseptically injected into a sealed, empty, sterile 10-mL clear vial, using a sterile 10-mL syringe and vented needle. Sterile adhesive seals are aseptically affixed to the rubber closures on the three filled vials, then the vials are incubated as described in the *Personnel Training and Evaluation in Aseptic Manipulation Skills* section.

High-Risk Level CSPs

CSPs compounded under any of the following conditions are either contaminated or at a high risk to become contaminated with infectious microorganisms.

High-Risk Conditions—

1. Nonsterile ingredients, including manufactured products for routes of administration other than those listed under *c.* in the *Introduction* are incorporated or a nonsterile device is employed before terminal sterilization.
2. ~~Sterile ingredients, components, devices, and mixtures are exposed to air quality inferior to ISO Class 5 (see *Table 1*). This includes storage in environments inferior to ISO Class 5 of opened or partially used packages of manufactured sterile products that lack antimicrobial preservatives.~~

■Sterile contents of commercially manufactured products, CSPs that lack effective antimicrobial preservatives, and sterile surfaces of devices and containers for the preparation, transfer, sterilization, and packaging of CSPs are exposed to air quality worse than ISO Class 5 (see *Table 1*) for more than 1 hour (see *Immediate Use CSPs* section).■1S (*USP30*)

In-Process Revision

3. ~~Nonsterile preparations are exposed for at least 6 hours before being sterilized.~~

■Before sterilization, nonsterile procedures such as weighing and mixing are conducted in air quality worse than ISO Class 7 (see *Table 1*), compounding personnel are improperly garbed and gloved (see *Personnel Cleansing and Garbing*); or water-containing preparations are stored for more than 6 hours.■1S (*USP30*)

4. It is assumed, and not verified by examination of labeling and documentation from suppliers or by direct determination, that the chemical purity and content strength of ingredients meet their original or compendial specifications in unopened or in opened packages of bulk ingredients (see *Ingredient Selection* under *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).
5. For a

■sterilized■1S (*USP30*)
high-risk preparation, in the absence of passing a sterility test, the storage periods cannot exceed the following time periods: before administration, the CSPs are properly stored and are exposed for not more than 24 hours at controlled room temperature (see *General Notices and Requirements*), for not more than 3 days at a cold temperature (see *General Notices and Requirements*), and for 45 days in solid frozen state at –20° or colder.

All nonsterile measuring, mixing, and purifying devices are rinsed thoroughly with sterile, pyrogen-free water, and then thoroughly drained or dried immediately before use for high-risk compounding. All high-risk CSP solutions subjected to terminal sterilization are passed through a filter with a nominal porosity not larger than 1.2 µm preceding or during filling into their final ~~containers. Sterilization of high-risk level CSPs by filtration is conducted entirely within an ISO Class 5 or superior air quality environment (see *Table 1*.)~~

■containers to remove particulate matter. Sterilization of high-risk level CSPs by filtration shall be performed with a sterile 0.22-µm porosity filter entirely within an ISO Class 5 (see *Table 1*) or superior air quality environment.■1S (*USP30*)

Examples of High-Risk Compounding—

1. Dissolving nonsterile bulk drug and nutrient powders to make solutions, which will be terminally sterilized.
2. ~~Sterile ingredients, components, devices, and mixtures are exposed to air quality inferior to ISO Class 5 (see *Table 1*). This includes storage in environments inferior to ISO Class 5 of opened or partially used packages of manufactured sterile products that lack antimicrobial preservatives.~~

■Exposing the sterile ingredients and components used to prepare and package CSPs to room air quality worse than ISO Class 5 (see *Table 1*) for more than 1 hour (see *Immediate Use CSPs* section).■1S (*USP30*)

3. Measuring and mixing sterile ingredients in nonsterile devices before sterilization is performed.
4. Assuming, without appropriate evidence or direct determination, that packages of bulk ingredients contain at least 95% by weight of their active chemical moiety and have not been contaminated or adulterated between uses.

Quality Assurance—Quality assurance procedures for high-risk level CSPs include all those for low-risk level CSPs. In addition, a media-fill test that represents high-risk level compounding is performed semiannually by each person authorized to compound high-risk level CSPs.

Example of a Media-Fill Test Procedure CSPs Sterilized by Filtration—This, or an equivalent test, is performed under conditions that closely simulate the most challenging or stressful conditions encountered when compounding high-risk level CSPs.

■[NOTE—Sterility tests for autoclaved CSPs are not required unless they are prepared in batches of more than 25 units.]■1S (*USP30*)

This test is completed without interruption in the following sequence:

1. Dissolve 3 g of nonsterile commercially available Soybean–Casein Digest Medium in 100 mL of nonbacteriostatic water to make a 3%

■nonsterile■1S (*USP30*)
solution.
2. Draw 25 mL of the medium into each of three 30-mL sterile syringes. Transfer 5 mL from each syringe into separate sterile 10-mL vials. These vials are the ~~controls and they generate exponential microbial growth,~~

■positive controls to generate exponential microbial growth, which is■1S (*USP30*)
indicated by visible turbidity upon incubation.
3. Under aseptic conditions and using aseptic techniques, affix a sterile 0.2-µm porosity filter unit and a 20-gauge needle to each syringe. Inject the next 10 mL from each syringe into three separate 10-mL sterile vials. Repeat the process for three more vials. Label all vials, affix sterile adhesive seals to the closure of the nine vials, and incubate them at 25° to 35°. Inspect for microbial growth over 14 days as described in the *Personnel Training and Evaluation in Aseptic Manipulation Skills* section.

Add the following:

■IMMEDIATE USE CSPs

For the purpose of emergency or immediate patient care, CSPs are exempted from the requirements described in this chapter for *Low-Risk Level, Medium-Risk Level,* and *High-Risk Level CSPs* when all of the following criteria are met:

1. Only simple aseptic measuring and transfer manipulations are performed with not more than three (3) sterile nonhazardous commercial drug and diagnostic radiopharmaceutical drug products, including an infusion or diluent solution.
2. Unless required for the preparation, the preparation procedure occurs continuously without delays or interruptions and does not exceed 1 hour.
3. At no point during preparation and prior to administration are critical surfaces and ingredients of the CSP directly exposed to contact contamination such as human touch,

In-Process Revision

cosmetic flakes or particulates, blood, human body substances (excretions and secretions e.g., nasal and oral), and nonsterile inanimate sources.

4. Administration begins not later than one (1) hour following the start of preparing the CSP.
5. When the CSP is not administered by the person who prepared it, or its administration is not witnessed by the person who prepared it, the CSP shall bear a label listing patient identification information such as name and identification number(s), the names and amounts of all ingredients, the name or initials of the person who prepared the CSP, and the exact 1-hour beyond-use time and date.
6. If administration has not begun within one (1) hour following the start of preparing the CSP, the CSP is promptly and safely discarded. *Immediate Use CSPs* shall not be stored for later use.

CSPs containing three (3) or fewer commercial sterile drug products that are stored in excess of one (1) hour before beginning to be administered must comply with the *Low-Risk Level* standards; CSPs containing more than three (3) commercial sterile drug products and those requiring complex manipulations and/or preparation methods must comply with the *Medium-Risk Level* standards; and CSPs prepared from nonsterile ingredients or components must comply with the *High-Risk Level* standards in this chapter. Because of known safety risks of hazardous drugs to healthcare workers and other nonpatients who may be exposed to them, hazardous drugs such as cancer chemotherapy drugs and all those on the National Institute for Occupational Safety and Health list (NIOSH)[5] shall not be prepared as *Immediate Use CSPs*. Hazardous drugs must be prepared using suitable ISO Class 5 (see *Table 1*) environment containment equipment and/or devices in a manner fully compliant with the standards in this chapter including the *Hazardous Drugs as CSPs* section. Personnel who prepare and administer *Immediate Use CSPs* are responsible for recognizing the potential harm to patients that may result when such CSPs are microbially contaminated and administered over long durations. Compounding in worse than ISO Class 5 (see *Table 1*) conditions increases the likelihood of microbial contamination, and administration durations exceeding a few hours increase the potential for clinically significant microbial colonization; thus, for patient harm.▪1S (*USP30*)

[5] NIOSH, see Appendix A at http://www.cdc.gov/niosh/docs/2004-165/.

Add the following:

▪SINGLE-DOSE AND MULTIPLE-DOSE CONTAINERS

Opened or needle-punctured single-dose containers such as ampuls, bags, bottles, syringes, and vials of sterile products and CSPs shall be used within 1 hour if opened in worse than ISO Class 5 (see *Table 1*) air quality (see *Immediate Use CSPs* section), and any remaining contents must be discarded. Single-dose vials exposed to ISO Class 5 (see *Table 1*) or cleaner air may be used up to 6 hours after initial needle puncture. Opened single-dose ampuls shall not be stored for any time period.

Multiple-dose containers (e.g., vials) are formulated for removal of portions on multiple occasions because they contain antimicrobial preservatives. The beyond-use date after initially entering or opening (e.g., needle-punctured) multiple-dose containers is 28 days (see *Antimicrobial Effectiveness Testing* ⟨51⟩), unless otherwise specified by the manufacturer.▪1S (*USP30*)

Add the following:

▪HAZARDOUS DRUGS AS CSPs

Although the potential therapeutic benefits of compounded sterile preparations (CSPs) outweigh the risks of their adverse effects in ill patients, exposed healthcare workers risk similar adverse effects with no therapeutic benefit. Occupational exposure to hazardous drugs (see "Sample list of drugs that should be handled as hazardous" in Appendix A of NIOSH Publication No. 2004-165: *Preventing Occupational Exposure to Antineoplastic and Other Hazardous Drugs in Health Care*

Settings at http://www.cdc.gov/niosh/docs/2004-165/) can result in (1) acute effects, such as skin rashes; (2) chronic effects, including adverse reproductive events; and (3) possibly cancer.

Hazardous drugs shall only be prepared for administration under conditions that protect the healthcare workers and other personnel in the preparation and administration area. Hazardous drugs shall be stored separately from other inventory in a manner to prevent contamination and personnel exposure. Such storage is preferably within a containment area such as a negative pressure room. The storage area must have sufficient general exhaust ventilation, at least 12 air exchanges per hour (ACPH)[6] to dilute and remove any airborne contaminants. Hazardous drugs shall be handled with caution using appropriate chemotherapy gloves during distribution, receiving, stocking, inventorying, preparing for administration, and disposal.

Hazardous drugs shall be prepared in an ISO Class 5 (see *Table 1*) environment with protective engineering controls in place, and following aseptic practices specified for the appropriate contamination risk levels defined in this chapter. Access shall be limited to areas where drugs are stored and prepared to protect persons not involved in drug preparation. All hazardous drugs shall be prepared in a Class II or III biological safety cabinet (BSC), or a compounding aseptic isolator (CAI) that meets or exceeds the standards for CAI in this chapter. When other primary engineering controls, e.g., closed-system vial-transfer devices (CSTD) are used, this shall be within the BSC or CAI to provide backup containment and ISO Class 5 (see *Table 1*) environment. The ISO Class 5 (see *Table 1*) BSC or CAI shall be placed in an ISO Class 7 (see *Table 1*) room that is physically separated, i.e., a different room, from other preparation areas, and optimally has no less than 0.01-inch water column negative pressure[1] to adjacent positive pressure ISO Class 7 (see *Table 1*), or better, anterooms, thus providing inward airflow to contain any airborne drug. If a compounding isolator that meets the requirements of this chapter is used outside of a cleanroom, the room must maintain a minimum negative pressure of 0.01 inch water column and have a minimum of 12 air changes per hour (ACPH). Note that an anteroom leading to a positive pressure room may be ISO Class 8 (see *Table 1*) but an anteroom leading to a negative pressure room shall meet at least ISO Class 7 (see *Table 1*) criteria so that air drawn into the negative pressure environment is of the same ISO Class 7 (see *Table 1*) quality. A pressure indicator shall be installed that can be readily monitored for correct room pressurization. The BSC and CAI optimally shall be 100% vented to the outside air through HEPA filtration (see the Ventilated cabinet section at http://www.cdc.gov/niosh/docs/2004-165/). In facilities that prepare a very low volume of hazardous drugs (e.g., less than 5 preparations/week), the use of two tiers of containment, e.g., CSTD within a BSC or CAI that are located in a non-negative pressure room is acceptable. In addition, containment of the finished hazardous product shall be maintained throughout the administration/disposal phase utilizing needleless or closed administration systems.

Appropriate personnel protective equipment (PPE) shall be worn when compounding in a BSC or CAI, and when using CSTD devices. Appropriate PPE may include gowns, face masks, eye protection, hair covers, shoe covers or dedicated shoes, double gloving, and complying with manufacturers' recommendations when using CAI (http://www.cdc.gov/niosh/docs/2004-165/).

All personnel who compound hazardous drugs shall be fully trained in the storage, handling, and disposal of these drugs. This training shall occur prior to preparing or handling hazardous CSPs, and its effectiveness shall be verified by testing specific hazardous drugs preparation techniques; such verification shall be documented for each person at least annually. This training must include didactic overview of hazardous drugs including mutagenic, teratogenic, and carcinogenic properties, and it shall include ongoing training for each new hazardous drug that enters the marketplace. Compounding personnel of

[6] Guidelines for Environmental Infection Control in Health-Care Facilities, Recommendations of CDC and the Healthcare Infection Control Practices Advisory Committee (HICPAC), MMWR, vol. 52, no. RR-10, June 6, 2003, figure 3, pg. 12.

In-Process Revision

reproductive capability must confirm in writing that they understand the risks of handling hazardous drugs. The training shall include at least the following: (1) safe aseptic manipulation practices; (2) negative pressure techniques when utilizing BSC or CAI; (3) correct use of CSTD devices; (4) containment, clean-up, and disposal procedures for breakages and spills; and (5) treatment of personnel contact and inhalation exposure.

[NOTE—Because standards of assay and unacceptable quantities of contamination of each drug have not been established in the literature, the following paragraph is a recommendation only. Future standards will be adopted as these assay methods are developed and proven.] Ongoing quality assurance shall be an integral part of hazardous drug preparation. In order to assure containment, especially in operations preparing large volumes of hazardous drugs, environmental sampling to detect uncontained hazardous drugs needs to be performed routinely: e.g., initially as a benchmark and at least every 6 months. This sampling shall include surface wipe sampling of the working area of BSC and CAI, counter tops where finished preparations are placed, areas adjacent to BSC and CAI, including the floor directly under the working area, and patient administration areas. Common marker hazardous drugs that can be assayed include cyclophosphamide, ifosfamide, methotrexate and fluorouracil. If any measurable contamination (cyclophosphamide levels greater than 1.00 ng/cm^2 has been found to cause human uptake) is found by any of these quality assurance procedures, practitioners shall make the decision to identify, document, and contain the cause of contamination. Such action may include retraining, thorough cleaning, and improving engineering controls.

Disposal of all hazardous drug wastes shall comply with all applicable federal and state regulations. All personnel who perform routine custodial waste removal and cleaning activities in storage and preparation areas for hazardous drugs shall be trained in appropriate procedures to protect themselves and prevent contamination. The NIOSH Publication No. 2004-165 at www.cdc.gov/niosh/docs/2004-165/ and the references under the heading, Sterile Hazardous Preparations at http://www.ashp.org/SterileCpd/ are recommended sources for education and training in principles and practices of safety with hazardous drugs.■1S (*USP30*)

Add the following:

▪RADIOPHARMACEUTICALS AS CSPs

Compounding of radiopharmaceuticals for positron emission tomography (PET) shall be performed as specified in the general test chapter *Radiopharmaceuticals for Positron Emission Tomography—Compounding* ⟨823⟩. In the case of PET compounding, chapter ⟨823⟩ supersedes this chapter.

For the purposes of this chapter, the following shall be designated *Low-Risk Level CSPs*: (1) radiopharmaceutical dosage units with volumes of 15 mL and less and expiration times of 18 hours and shorter, such as those prepared from eluates from technetium-99m/molybdenum 99 generator systems; and (2) commercially manufactured cyclotron radiopharmaceuticals that contain preservatives and bear expiration times of 72 hours or shorter. These radiopharmaceuticals shall be compounded using appropriately shielded vials and syringes in a properly functioning and certified vertical LAFW, Class II Type B2 BSC, or other suitable containment device (e.g., CAI) located in an ISO Class 8 (see *Table 1*) or cleaner air environment to permit compliance with special handling, shielding, and negative air flow requirements. Radiopharmaceutical vials, designed for multi-use, compounded with technetium-99m, exposed to ISO Class 5 (see *Table 1*) environment and punctured by needles with no direct contact contamination may be used up to the time indicated by manufacturer's recommendations. Storage and transport of properly shielded vials of radiopharmaceutical CSPs may occur in a limited access ambient environment without a specific ISO Class designation.

Technetium-99m/molybdenum-99 generator systems shall be stored and eluted (operated) under conditions recommended by manufacturers and applicable state and federal

regulations. Such generator system shall be eluted in an ISO Class 8 (see *Table 1*) or cleaner air environment to permit special handling, shielding, and air flow requirements. To limit acute and chronic radiation exposure of inspecting personnel to a level that is as low as reasonably achievable (ALARA), direct visual inspection of radiopharmaceutical CSPs containing high concentrations or doses of radioactivity shall be avoided.■1S (*USP30*)

Change to read:

VERIFICATION OF COMPOUNDING ACCURACY AND ~~STERILIZATION~~

■STERILITY■1S (*USP30*)

The compounding procedures and sterilization methods for CSPs correspond to correctly designed and verified written documentation in the compounding facility. Verification requires ~~planned testing designed to demonstrate effectivenes of all procedures critical to the~~

■planned testing, monitoring, and documentation to demonstrate adherence to environmental quality requirements, personnel practices, and procedures critical to achieving and maintaining sterility,■1S (*USP30*)
accuracy, and purity of finished CSPs. For example, sterility testing (see *Test for Sterility of the Product To Be Examined* under *Sterility Tests* ⟨71⟩) may be applied to specimens of low- and medium-risk CSPs, and standard nonpathogenic bacterial cultures may be added to nondispensable specimens of high-risk CSPs before terminal sterilization for subsequent evaluation by sterility testing. Packaged and labeled CSPs are visually inspected for physical integrity and expected appearance, including final fill amount. ~~To ensure that the identities and concentrations of ingredients are accurate, and in the absence of reliable observations and data to confirm and extrapolate those parameters, samples of CSPs are assayed.~~

■The accuracy of identities, concentrations, amounts, and purities of ingredients in CSPs is confirmed by reviewing labels on packages, observing and documenting correct measurements with approved and correctly standardized devices, and reviewing information in labeling and certificates of analysis provided by suppliers. When the correct identity, purity, strength, and sterility of ingredients and components of CSPs cannot be confirmed (e.g., in the case of unlabeled syringes, opened ampuls, punctured stoppers of vials and bags, or containers of ingredients with incomplete labeling), such ingredients and components shall be discarded immediately.

Some individual ingredients, such as bulk drug substances, are not labeled with expiration dates when they are stable indefinitely in their commercial packages under their labeled storage conditions. However, despite retaining full chemical stability, such ingredients may gain or lose moisture during storage and use. Changes in moisture content may require testing (see *Loss on Drying* ⟨731⟩) to determine the correct amount to weigh for accurate content of active chemical moieties in CSPs (see *Pharmaceutical Calculations in Prescription Compounding* ⟨1160⟩).

Although not required, a quantitative stability-indicating chemical assay is recommended to ensure compounding accuracy of CSPs, especially those that contain drug ingredients with a narrow therapeutic plasma concentration range.■1S (*USP30*)

Sterilization Methods

The licensed healthcare professionals who supervise compounding are responsible for determining that the selected sterilization method (see *Methods of Sterilization* under *Sterilization and Sterility Assurance of Compendial Articles* ⟨1211⟩) both sterilizes and maintains the strength, purity, quality, and packaging integrity of CSPs. The selected sterilization process is expected from experience and appropriate information sources

■(e.g., see *Sterilization and Sterility Assurance of Compendial Articles* ⟨1211⟩■1S (*USP30*)
—and, preferably, verified wherever possible—to achieve sterility in the particular CSPs. General guidelines for matching CSPs and components to appropriate sterilization methods include the following:

1. CSPs have been ascertained to remain physically and chemically stable when subjected to the selected sterilization method.
2. Glass and metal devices may be covered tightly with aluminum foil, then exposed to dry heat in an oven at a mean temperature of 250° for ~~2 hours~~

   ■30 minutes■1S (*USP30*)
   to achieve sterility and depyrogenation (see *Dry-Heat Sterilization* under *Sterilization and Sterility Assurance of Compendial Articles* ⟨1211⟩and *Bacterial Endotoxins Test* ⟨85⟩). Such items are either used immediately or stored until use in an environment suitable for compounding low- and medium-risk CSPs.
3. Personnel ascertain from appropriate information sources that the sterile microporous membrane filter used to sterilize CSP solutions, either during compounding or administration, is chemically and physically compatible with the CSP.

In-Process Revision

~~STERILIZATION BY FILTRATION~~

▪Sterilization of High-Risk Level CSPs by Filtration▪1S (*USP30*)

Commercially available sterile filters must be approved for human-use applications in sterilizing pharmaceutical fluids. ~~Both filters that must be sterilized before processing CSPs and those filters that are commercially available, disposable, sterile, and pyrogen-free have a nominal porosity of 0.2 µm, which includes 0.22 µm porosity.~~

▪Sterile filters used to sterilize CSPs shall be pyrogen-free and have a nominal porosity of 0.2 µm or 0.22 µm.▪1S (*USP30*) They should be certified by the manufacturer to retain at least 10^7 microorganisms of a strain of *Brevundimonas (Pseudomonas) diminuta* on each cm^2 of upstream filter surface ~~under conditions similar to those in which the CSPs will be sterilized. In emergency situations when sterile 0.2-µm porosity membranes are not available, filters of the same composition and 0.45-µm nominal porosity may be used. Sterilizing filters with 0.2-µm and 0.45-µm nominal porosities will not remove bacterial endotoxins and viruses by physical retention.The~~

▪area under conditions similar to those in which the CSPs will be sterilized (see *High-Risk Conditions* in *High-Risk Level CSPs* section).▪1S (*USP30*)

~~The supervising health care professional~~

▪The compounding supervisor▪1S (*USP30*) must ensure, directly or from appropriate documentation, that the filters are chemically and physically stable at the pressure and temperature conditions to be used

▪and have enough capacity to filter volumes,▪1S (*USP30*) and that the filters will achieve sterility and maintain prefiltration pharmaceutical quality, ~~of the specific CSP. The filter dimensions and material~~

▪including strength of ingredients, of the specific CSP. The filter dimensions and liquid material to be sterile-filtered▪1S (*USP30*) must permit the sterilization process to be completed rapidly without the replacement of the filter during the process. When CSPs are known to contain excessive particulate matter, a prefilter or larger porosity membrane is placed upstream from the sterilizing filter to remove gross particulate contaminants in order to maximize the efficiency of the sterilizing filter.

~~When filter devices are assembled from separate nonsterile components by compounding personnel, such devices shall be identified to be sterile and ascertained to be effective under relevant conditions before they are used to sterilize CSPs. For example, sterility can be identified using biological indicators (see *Biological Indicators* ⟨1035⟩). Filter units used to sterilize CSPs~~

▪Filter units used to sterilize CSPs must▪1S (*USP30*) also be subjected to the manufacturer's recommended integrity test, such as the bubble point test.

~~When commercially available sterile disposable filter devices are used, the Compounding personnel may accept the written certification from suppliers that the filters retain at least 10^5 cfu of *Brevundimonas (Pseudomonas) diminuta* on each cm^2 of filter surface.~~

▪▪1S (*USP30*)

Compounding personnel must ascertain that selected filters will achieve sterilization of the particular CSPs being sterilized. Large deviations from usual or expected chemical and physical properties of CSPs,

▪for example, water-miscible alcohols,▪1S (*USP30*) may cause undetectable damage to filter integrity and shrinkage of microorganisms to sizes smaller than filter porosity.

~~Sterile, commercially available sterilizing filter devices for use on handheld syringes may be checked by feeling for greater resistance on the plunger when filtering air after an aqueous fluid has been filtered.~~

▪▪1S (*USP30*)

~~STEAM STERILIZATION~~

▪Sterilization of High-Risk Level CSPs by Steam▪1S (*USP30*)

The process of thermal sterilization employing saturated steam under pressure, or autoclaving, is the preferred method to terminally sterilize aqueous preparations that have been verified to maintain their full chemical and physical stability under the conditions employed (see *Steam Sterilization* under *Sterilization and Sterility Assurance of Compendial Articles* ⟨1211⟩). To achieve sterility, ~~it is necessary that all materials~~

▪all materials are to▪1S (*USP30*) be exposed to steam at 121°, under a pressure of about one atmosphere or 15 psi, for the duration verified by testing to achieve sterility of the items, which is usually 20 to 60 minutes for CSPs. An allowance must be made for the time required for the material to reach 121° before the sterilization exposure duration is timed.

Not directly exposing items to pressurized steam may result in survival of microbial organisms and spores. Before their sterilization, plastic, glass, and metal devices are tightly wrapped in low particle shedding paper or fabrics, or sealed in envelopes that prevent post-sterilization microbial penetration. Immediately before filling ampuls and vials that will be steam sterilized, solutions are passed through a filter having a porosity not larger than 1.2 µm for removal of particulate matter. Sealed containers must be able to generate steam internally; thus, stoppered and crimped empty vials must contain a small amount of moisture to generate steam.

The description of steam sterilization conditions and duration for specific CSPs is included in written documentation in the compounding facility. The effectiveness of steam sterilization is verified using appropriate biological indicators (see *Biological Indicators* ⟨1035⟩) or other confirmation methods (see *Sterilization and Sterility Assurance of Compendial Articles* ⟨1211⟩ or *Sterility Tests* ⟨71⟩).

▪Sterilization of High-Risk Level CSPs by Dry Heat

Dry heat sterilization is usually done as a batch process in an oven designed for sterilization. Heated filtered air should be evenly distributed throughout the chamber by a blower device. The oven should be equipped with a system for controlling temperature and exposure period. Sterilization by dry heat requires higher temperatures and longer exposure times than

sterilization by steam. Dry heat should only be used for those materials that cannot be sterilized by steam, when the moisture would either damage or be impermeable to the materials. During sterilization sufficient space should be left between materials to allow for good circulation of the hot air. The effectiveness of dry heat sterilization shall be verified using appropriate biological indicators (see *Biological Indicators* ⟨1035⟩) and temperature sensing devices.■1S (*USP30*)

PERSONNEL TRAINING AND EVALUATION IN ASEPTIC MANIPULATION SKILLS

Personnel who prepare CSPs must be ~~provided with appropriate training from~~

■trained conscientiously and skillfully by■1S (*USP30*)
expert personnel, audio–video instructional sources, and professional publications in the theoretical principles and practical skills of aseptic manipulations

■and in achieving and maintaining ISO Class 5 (see *Table 1*)

environmental conditions■1S (*USP30*)
before they begin to prepare CSPs. Compounding personnel shall perform didactic review and pass written and media-fill testing of aseptic manipulative skills initially; at least annually thereafter for low- and medium-risk level compounding; and semiannually for high-risk level compounding. Compounding personnel who fail written tests, or whose media-fill test vials result in gross microbial colonization, must be immediately reinstructed and re-evaluated by expert compounding personnel to ensure correction of all aseptic practice deficiencies.

Media-Fill Challenge Testing—The skill of personnel to aseptically prepare CSPs may be evaluated using sterile fluid bacterial culture media-fill ~~validation,~~

■verification,[7]■1S (*USP30*)
(i.e., sterile bacterial culture medium transfer via a sterile syringe and needle). Media-fill testing is used to assess the quality of the aseptic skill of compounding personnel. Media-fill tests represent the most challenging or stressful conditions actually encountered by the personnel being evaluated when they prepare particular risk level CSPs and when sterilizing high-risk level CSPs.

Commercially available sterile fluid culture media, such as Soybean–Casein Digest Medium (see *Sterility Tests* ⟨71⟩), shall be able to promote exponential colonization of bacteria that are most likely to be transmitted to CSPs from the compounding personnel and environment. Media-filled vials are

■generally■1S (*USP30*)
incubated ~~at 25° to 35°~~

■within a range of 20° to 35°■1S (*USP30*)
for 14 days. Failure is indicated by visible turbidity in the medium on or before 14 days.

~~**Example of a Media-Fill Test Procedure**—Perform the test as directed in *Quality Assurance* in the *Low-Risk Level CSPs* section.~~

[7] FDA Guideline on Guidance for Industry Sterile Drug Products Produced by Aseptic Processing—Current Good Manufacturing Practice, September 2004 (http://www.fda.gov/cder/guidance/5882fnl.htm).

Change to read:

ENVIRONMENTAL QUALITY AND CONTROL

Achieving and maintaining sterility and overall freedom from contamination of a pharmaceutical product is dependent upon the quality status of the components incorporated, the process utilized, personnel performance, and the environmental conditions under which the process is performed. The standards required for the environmental conditions depend upon the amount of exposure of the CSP to the immediate environment anticipated during processing. The quality and control of environmental conditions for each risk level of operation are explained in this section. In addition, operations using nonsterile components require the use of a method of preparation designed to produce a sterile product.

~~Critical Site Exposure~~

■Exposure of Critical Sites■1S (*USP30*)

~~The degree of exposure of the product during processing will be affected by the length of time of exposure, the size of the critical site exposed, and the nature of the critical site.~~

~~A critical site is any opening providing a direct pathway between a sterile product and the environment or any surface coming in direct contact with the product and the environment. The risk of such a site picking up contamination from the environment increases with time of exposure. Therefore, the processing plan and the intent of the operator should give due consideration to organization, efficiency, and speed in order to keep such exposure time to a minimum. For example, an ampul should not be opened unnecessarily in advance of use.~~

■Critical sites include ingredients of CSPs and locations on devices and components used to prepare, package, and transfer CSPs that provide opportunity for exposure to contamination. The risk of critical sites becoming contaminated increases with the duration of exposure, the potency and concentration of the contaminants, and the spatial area of the critical sites. Critical sites for low-, medium-, and high-risk level CSPs must not be exposed to air quality worse than ISO Class 5 (see *Table 1*).■1S (*USP30*)

The size of the critical site affects the risk of contamination entering the product: the greater the exposed area, the greater the risk. ~~An open~~

■For example, an open ampul,■1S (*USP30*)
vial, or bottle exposes to contamination a critical site of much larger area than the tip of a 26-gauge needle. Therefore, the risk of contamination when entering an open

■ampul,■1S (*USP30*)
vial, or bottle is much greater than during the momentary exposure of a needle tip.

The nature of a critical site also affects the risk of contamination. The relatively rough, permeable surface of an elastomeric closure retains microorganisms and other contaminants, after swabbing with ~~an alcohol~~

■a 70% isopropyl alcohol (IPA)■1S (*USP30*)
pad, more readily than does the smoother glass surface of the neck of an ampul. Therefore, the surface disinfection can be expected to be more effective for an ampul.

In-Process Revision

~~Once the ampul is open, the critical site of exposure is greatly increased, creating a pathway with the potential for introduction of glass, fiber, and dust into the fluid contained in the ampul.~~

■1S (*USP30*)
The prevention or elimination of

■physical contact contamination and■1S (*USP30*)
airborne particles must be given high priority. Airborne contaminants,

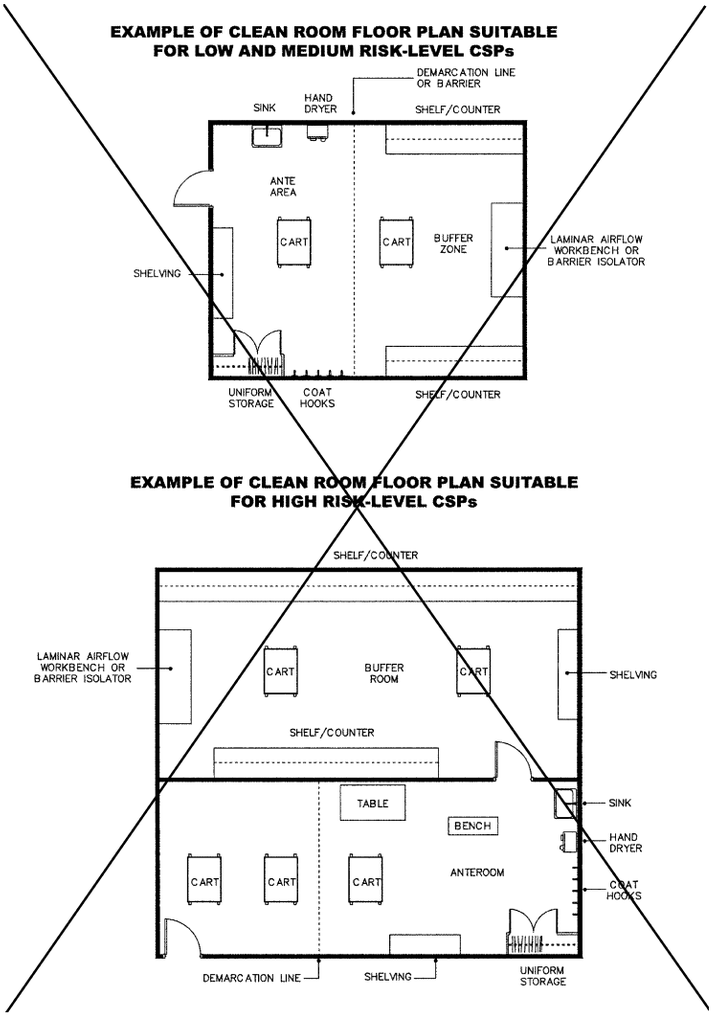
■especially those generated by sterile compounding personnel,■1S (*USP30*)
are much more likely to reach critical sites than contaminants that are adhering to the floor or other surfaces below the work level. Further, particles that are relatively large or of high density settle from the airspace more quickly, and thus ~~can be removed from the vicinity of critical sites.~~

■they must be precluded from ISO Class 5 (see *Table 1*) environments in which critical sites are exposed.■1S (*USP30*)

~~Clean Rooms and Barrier Isolators~~

■ISO Class 5 Air Sources, Cleanrooms, Buffer Zones, and Anterooms■1S (*USP30*)

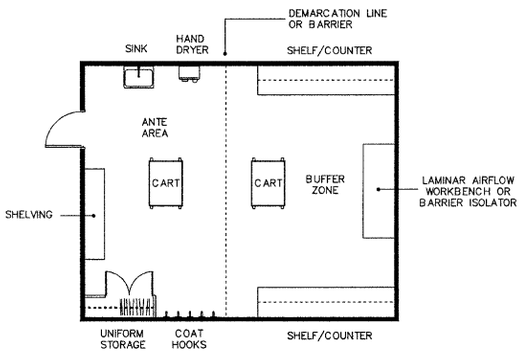
~~In general, sterile product preparation facilities utilize laminar airflow workbenches (LAFWs) to provide an adequate critical site environment. A discussion of the necessary facilities and proper procedures for preparing sterile products using LAFWs in clean rooms is presented below. The use of alternative systems in clean rooms that have been verified to achieve the same or better level of environmental quality as that achieved by properly operated LAFWs may also be utilized. An emerging alternative technology utilizes barrier isolator systems to minimize the extent of personnel contact and interaction, to separate the external environment from the critical site, and to provide an ISO Class 5 environment (see *Table 1* for preparing CSPs. A well-designed positive pressure barrier isolator, supported by adequate procedures for its maintenance, monitoring, and control, may offer an acceptable alternative to the use of conventional LAFWs in clean rooms for aseptic processing. An example of the arrangement of a clean-room floor plan for low- and medium-risk level CSPs is illustrated in the first drawing in *Figure 1*. The second drawing in *Figure 1* depicts an appropriate multicompartment clean-room floor plan for high-risk level CSPs.~~



~~Fig. 1~~

■The most common sources of ISO Class 5 (see *Table 1*) air quality for exposure of critical sites are horizontal and vertical LAFWs and CAIs. A cleanroom (see *Microbiological Evaluation of Cleanrooms and Other Controlled Environments* ⟨1116⟩) is a compounding environment that is supplied with high-efficiency particulate air (HEPA), or HEPA-filtered air, that meets ISO Class 7 (see *Table 1*), the access to which is limited to personnel trained and authorized to perform sterile compounding and facility cleaning. A buffer zone is an area that provides at least ISO Class 7 (see *Table 1*) air quality. An anteroom or ante-area provides at least ISO Class 8 air quality. *Figure 1* illustrates placement of LAFWs in cleanrooms used for low-risk and medium-risk level (top) and high-risk level (bottom) sterile compounding. The floor plans depicted in *Figure 1* are suggestions only, not restrictive or prescriptive requirements. Placement of devices (e.g., computers and printers) and objects (e.g., carts and cabinets) that are not essential to compounding in buffer zones and cleanrooms is dictated by their effect on the required environmental quality of air atmospheres and surfaces, which must be verified by monitoring (see the *Environmental Monitoring* section). It is the responsibility of each compounding facility to ensure that each source of ISO Class 5 (see *Table 1*) environment for exposure of critical sites and sterilization by filtration is properly located, operated, maintained, monitored, and verified.

EXAMPLE OF CLEAN ROOM FLOOR PLAN SUITABLE FOR LOW AND MEDIUM RISK-LEVEL CSPs



EXAMPLE OF CLEAN ROOM FLOOR PLAN SUITABLE FOR HIGH RISK-LEVEL CSPs

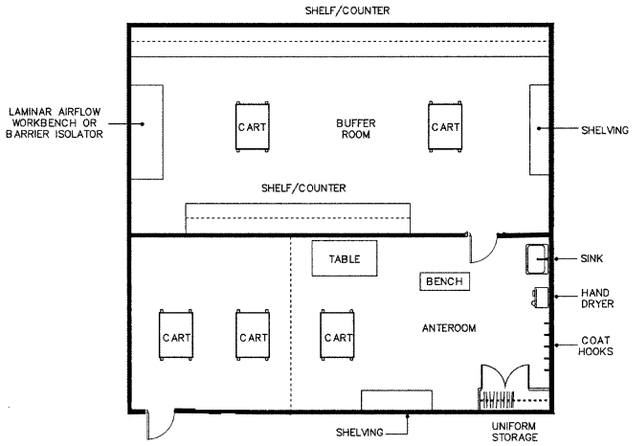


Figure 1■1S (*USP30*)

~~**Environmental Controls**~~

▪**Facility Design and Environmental Controls**▪1S (*USP30*)

~~Engineering controls reduce the potential for airborne contamination in workspaces by limiting the amount and size of contaminants in the CSP processing environment. Primary engineering controls are used and generally include horizontal flow clean benches, vertical flow clean benches, biological safety cabinets, and barrier isolators. Primary environmental control must provide at least ISO Class 5 quality of air (see *Table 1*) to which sterile ingredients and components of CSPs are directly exposed. Secondary engineering controls generally provide a buffer zone or buffer room as a core for the location of the workbenches or isolators.~~

▪Compounding facilities are physically designed and environmentally controlled to minimize airborne contamination contacting critical sites. Primary engineering controls typically include, but are not limited to, LAFWs, BSCs, and CAIs, which provide an ISO Class 5 (see *Table 1*) environment for the exposure of critical sites. Primary engineering controls must maintain ISO Class 5 (see *Table 1*) or better conditions for 0.5-µm particles (dynamic operating conditions) while compounding CSPs. Secondary engineering controls such as cleanrooms and anterooms generally provide a buffer zone or buffer room as a core for the location of the primary engineering control. Buffer zones or cleanrooms are designed to maintain at least ISO Class 7 (see *Table 1*) conditions for 0.5-µm particles under dynamic conditions and ISO Class 8 (see *Table 1*) conditions for 0.5-µm and larger particles under dynamic conditions for the anterooms and ante-areas. Airborne contamination control is achieved in the primary engineering control through the use of HEPA filters. The airflow in the primary engineering control is typically unidirectional (laminar flow) and because of the particle collection efficiency of the filter, the "first air" at the face of the filter is, for the purposes of aseptic compounding, free from airborne particulate contamination. HEPA-filtered air should be supplied in critical areas (ISO Class 5, see *Table 1*) at a velocity sufficient to sweep particles away from the compounding area and maintain unidirectional airflow during operations. Proper design and control prevents turbulence and stagnant air in the critical area. In situ air pattern analysis via smoke studies should be conducted at the critical area to demonstrate unidirectional airflow and sweeping action over and away from the product under dynamic conditions.[7] The principles of HEPA filtered unidirectional airflow in the work environment must be understood and practiced in the compounding process in order to achieve the desired environmental conditions. Policies and procedures for maintaining and working within the primary engineering control area must be written and followed. The policies and procedures will be determined by the scope and risk levels of the aseptic compounding activities utilized during the preparation of the CSPs. The CSP work environment is designed to have the cleanest work surfaces (primary engineering controls) located in a buffer area. The buffer area should maintain at least ISO Class 7 (see *Table 1*) conditions for 0.5-µm and larger particles under dynamic operating conditions. The room should be segregated from surrounding, unclassified spaces to reduce the risk of contaminants being blown, dragged, or otherwise introduced into the filtered unidirectional airflow environment and this segregation should be continuously monitored. For rooms providing a physical separation, through the use of walls, doors and pass-throughs, a minimum differential positive pressure of 0.02 to 0.05 inches water column is required. For cleanrooms or buffer zones not physically separated from the anteroom, the principle of displacement airflow should be employed. This concept utilizes a low pressure differential, high airflow principle. Using displacement airflow typically requires an air velocity of 40 feet per minute (fpm) or more from the buffer room across the line of demarcation into the ante-area. The displacement concept is not applied to high risk compounding applications.[8] The primary engineering control should be placed within a buffer room in such a manner as to avoid conditions that could adversely affect its operation. For example, strong air currents from opened doors, personnel traffic, or air streams from the HVAC systems can disrupt the unidirectional airflow in open-faced workbenches. The operators may also create disruptions

[8] ISO 14644-4 : 2001 Cleanrooms and associated controlled environments—Design, construction, and start-up, *Case Postale 56,* CH-1211 Geneve 20, Switzerland, tel. +41 22 749 01 11.

in airflow by their own movements and by the placement of objects onto the work surface. The primary engineering control should be placed out of the traffic flow and in a manner to avoid disruption from the HVAC system and room cross-drafts. Room air exchanges are typically expressed as air changes per hour (ACPH). Adequate HEPA filtered airflow supplied to the cleanroom and anteroom is required to maintain cleanliness classification during operational activity through the number of air changes per hour. Factors that should be considered when determining air-change requirements include number of personnel working in the room, compounding processes that generate particulates, as well as temperature effects. An ISO Class 7 (see *Table 1*) cleanroom supplied with HEPA filtered air shall receive an ACPH of not less than 30. The primary engineering control is a good augmentation to generating air changes in the air supply of a room but cannot be the sole source of HEPA filtered air. If the room has an ISO Class 5 (see *Table 1*) recirculating device, a minimum of 15 ACPH through the room supply HEPA filters is adequate providing the combined ACPH is not less than 30. More air changes may be required based on the number of personnel and processes. HEPA filtered supply air is introduced at the ceiling with low-wall mounted returns, creating a general top-down dilution of room air with HEPA filtered make-up air. Ceiling mounted returns are not recommended. All HEPA filters should be efficiency tested using the most penetrating particle size and should be leak tested at the factory and then leak tested again in situ after installation.[9] Activities and tasks carried out within the buffer area should be limited to only those necessary when working within a controlled environment. Only the furniture, equipment, supplies, and other material required for the compounding activities to be performed should be brought into the room. They should be nonpermeable, nonshedding, cleanable, and resistant to disinfectants. Whenever such items are brought into the room, they should first be cleaned and disinfected. Whenever possible, equipment and other items used in the buffer area should not be taken out of the room except for calibration, servicing, or other activities associated with the proper maintenance of the item. The surfaces of ceilings, walls, floors, fixtures, shelving, counters, and cabinets in the buffer area should be smooth, impervious, free from cracks and crevices, and nonshedding, thereby promoting cleanability and minimizing spaces in which microorganisms and other contaminants may accumulate. The surfaces should be resistant to damage by disinfectant agents. Junctures of ceilings to walls should be coved or caulked to avoid cracks and crevices where dirt can accumulate. If ceilings consist of inlaid panels, the panels should be impregnated with a polymer to render them impervious and hydrophobic, and they should be caulked around each perimeter to seal them to the support frame. Walls may be constructed of flexible material (e.g., heavy gauge polymer), panels locked together and sealed, or of epoxy-coated gypsum board. Preferably, floors are overlaid with wide sheet vinyl flooring with heat-welded seams and coving to the sidewall. Dust-collecting overhangs, such as ceiling utility pipes, or ledges, such as windowsills, should be avoided. The exterior lens surface of ceiling lighting fixtures should be smooth, mounted flush, and sealed. Any other penetrations through the ceiling or walls should be sealed. The buffer area shall not contain sources of water (sinks) or floor drains. Work surfaces should be constructed of smooth, impervious materials, such as stainless steel or molded plastic, so that they are easily cleaned and disinfected. Carts should be of stainless steel wire, nonporous plastic, or sheet metal construction with good quality, cleanable casters to promote mobility. Storage shelving, counters, and cabinets should be smooth, impervious, free from cracks and crevices, nonshedding, cleanable, and disinfectable. Their number, design, and manner of installation should promote effective cleaning and disinfection. Placement of devices (e.g., computers and printers) and objects (e.g., carts and cabinets) that are not essential to compounding in buffer zones and

[9] By definition (IEST RP CC 001.4), HEPA filters are a minimum of 99.97% efficient when tested using 0.3-µm thermally generated particles and a photometer or rated at their most penetrating particle size using a particle counter.

cleanrooms is dictated by their effect on the required environmental quality of air atmospheres and surfaces, which must be verified by monitoring.■ IS (*USP30*)

Table 1. International Organization of Standardization (ISO) Classification of Particulate Matter in Room Air [Limits are in particles 0.5 µm and larger per cubic meter (current ISO) and cubic feet (former Federal Standard No. 209E, FS 209E).][a]

Class Name		Particle	
ISO Class	U.S. FS 209E	ISO, m³	FS 209E, ft.³
3	Class 1	35.2	1
4	Class 10	352	10
5	Class 100	3520	100
6	Class 1000	35,200	1000
7	Class 10,000	352,000	10,000
8	Class 100,000	3,520,000	100,000

[a] Adapted from Federal Standard No. 209E, General Services Administration, Washington, DC, 20407 (September 11, 1992) and ISO 4644-1:1999, Cleanrooms and associated controlled environments—Part 1: Classification of air cleanliness. For example, 3520 particles of 0.5 µm per m³ or larger (ISO Class 5) is equivalent to 100 particles per ft³ (Class 100).

Airflow through high efficiency particulate air (HEPA) filters is unidirectional or columnar, and because of the pore size of the filter, the "first air" at the face of the filter is, for the purposes of aseptic compounding, free from airborne particulate contamination. Barrier isolators provide a suitable environment by restricting any ambient air from the work chamber. These systems are not as sensitive to external environments as the HEPA-filtered unidirectional airflow units.

Several aspects of barrier isolation and filtered unidirectional airflow in the work environment must be understood and practiced in the compounding process. Policies and procedures for maintaining and working in the prescribed conditions for aseptic processing must be prepared, updated, maintained, and implemented and are determined by the scope and risk levels of the activities undertaken in the CSP compounding operation.

In general, the CSP work environment is designed to have the cleanest work surfaces (horizontal or vertical clean benches, biological safety cabinets, or isolators) located in a buffer area, which is preceded by an anteroom that provides a clean area for donning personnel barriers, such as hair covers, gloves, gowns, or full clean-room attire. The class limit of the buffer or core room has to be demonstrably better than that of ambient air to reduce the risk of contaminants being blown, dragged, or otherwise introduced into the filtered unidirectional airflow environment. For example, strong air currents from opened doors, personnel traffic, or air streams from the heating, ventilating, and air conditioning systems can easily disrupt the unidirectional, columnar airflow in the open-faced work benches. The operators may also introduce disruptions in flow by their own movements and by the placement of objects onto the work surface.

Buffer or clean-room areas in which LAFWs are located are to provide at least ISO Class 8 air quality (see *Table 1*). Measuring, weighing, mixing, and other manipulations of nonsterile in-process CSPs are also performed in air quality of at least ISO Class 8 (see *Table 1*). Appropriate air conditioning and humidity controls must be in place for the buffer area.

Tasks carried out within the buffer area should be limited to those for which a controlled environment is necessary. Only the furniture, equipment, supplies, and other goods required for the tasks to be performed may be brought into this room, and they should be nonpermeable, nonshedding, and resistant to disinfectants. Whenever such items are brought into the room, they should first be cleaned and sanitized. Whenever possible, equipment and other items used in the buffer area should not be taken from the room except for calibration, servicing, or other activity associated with the proper maintenance of the item.

The surfaces of ceilings, walls, floors, fixtures, shelving, counters, and cabinets in the buffer area should be smooth, impervious, free from cracks and crevices, and nonshedding, thereby promoting cleanability and minimizing spaces in which microorganisms and other contaminants may accumulate. The surfaces should be resistant to damage by sanitizing agents. Junctures of ceilings to walls should be coved or caulked to avoid cracks and crevices where dirt can accumulate. If ceilings consist of inlaid panels, the panels should be impregnated with a polymer to render them impervious and hydrophobic, and they should be caulked around each perimeter to seal them to the support frame. Walls may be of panels locked together and sealed or of epoxy-coated gypsum board. Preferably, floors are overlaid with wide sheet vinyl flooring with heat-welded seams and coving to the sidewall. Dust collecting overhangs, such as ceiling utility pipes, or ledges, such as windowsills, should be avoided. The exterior lens surface of ceiling lighting fixtures should be smooth, mounted flush, and sealed. Any other penetrations through the ceiling or walls should be sealed.

The buffer area should contain no sinks or floor drains. Work surfaces should be constructed of smooth, impervious materials, such as stainless steel or molded plastic, so that they are readily cleanable and sanitizable. Carts should be of stainless steel wire or sheet metal construction with good quality, cleanable casters to promote mobility. Storage shelving, counters, and cabinets should be smooth, impervious, free from cracks and crevices, nonshedding, cleanable, and sanitizable. Their number, design, and manner of installation should promote effective cleaning and sanitizing.

CSP Environment

The contamination reduction conditions and procedures in this section include LAFWs being located within buffer or clean-room areas that maintain at least an ISO Class 8 (see *Table 1*). It is preferred, but not necessary, to locate barrier isolators within such a buffer air quality area. The frequency and amount of personnel access to buffer air quality areas is restricted to minimize contaminants, while allowing delivery of essential materials for CSPs. Food, drinks, and materials exposed in patient care and treatment areas must never be introduced into areas where components and ingredients for CSPs are present.

In an area near, but physically isolated from the buffer room area—the anteroom area—supplies, such as needles, syringes, ampuls, bags, vials of parenteral fluids, and packages of transfer tubing sets for large volume fluids are uncartoned and disinfected.

Hand sanitizing and gowning activities also occur in the anteroom area adjacent to the buffer area. Faucet handles are designed to be hands free. Before processing CSPs, hands are resanitized after donning all appropriate garb, except for gloves. A demarcation line or barrier identifies the separation of the buffer area from the anteroom area. Compounding personnel must be capable of accessing the buffer area without use of their hands. Anteroom areas adjacent to buffer areas are intended to minimize the introduction of contaminants into buffer areas.

▪Placement of Primary Engineering Controls Within ISO Class 7 Buffer Areas

Primary engineering controls (LAFWs, BSCs, and CAIs) are located within a restricted access ISO Class 7 (see *Table 1*) buffer area within a cleanroom with the exception below (see *Figure 1*). Only authorized personnel and materials required for compounding and cleaning are permitted in the buffer area. Presterilization procedures for high-risk level CSPs, such as weighing and mixing, shall be completed in an ISO Class 8 (see *Table 1*) or better environment.

In-Process Revision

CAIs must be placed in an ISO Class 7 (see *Table 1*) cleanroom *unless* they meet all of the following conditions: The isolator must provide isolation from the room and maintain ISO Class 5 (see *Table 1*) during dynamic operating conditions including transferring ingredients, components, and devices into and out of the isolator and during preparation of CSPs. Particle counts sampled approximately 6 to 12 inches upstream of the critical exposure site must maintain ISO Class 5 (see *Table 1*) levels during compounding operations. It is incumbent on the compounding personnel to obtain documentation from the manufacturer that the CAI will meet this standard when located in worse than ISO Class 7 (see *Table 1*) environments.

Additional Personnel Requirements

Food, drinks, and materials exposed in patient-care and treatment areas, must not enter anterooms, ante-areas, and buffer areas where components and ingredients of CSPs are present. When compounding activities require the manipulation of a patient's blood-derived or other biological material (e.g., radiolabeling a patient's or a donor's white-blood cells), the manipulations must be clearly separated from routine paths and equipment used in CSP preparation activities, and they must be controlled by specific standard operating procedures in order to avoid any cross-contamination. Packaged compounding supplies and components, such as needles, syringes, tubing sets, and small- and large-volume parenterals, should be uncartoned and wiped down with a disinfectant that does not leave a residue (e.g., 70% IPA) when possible in an anteroom-type area, of ISO Class 8 (see *Table 1*) air quality, before being passed into the buffer areas. Personnel hand hygiene and garbing procedures are also performed in the anteroom or ante-area, which may contain a sink that enables hands-free use with a closed system of soap dispensing to minimize the risk of extrinsic contamination. There shall be some demarcation designation that separates the anteroom, or ante-area, from the buffer area. Adequate provision for performing antiseptic hand cleansing utilizing an alcohol-based surgical hand scrub with persistent activity followed by the donning of sterile gloves should be provided after entry into the buffer area. ■1S (*USP30*)

~~**Cleaning and Sanitizing the Workspaces**~~

■Cleaning And Disinfecting The Sterile Compounding Areas■1S (*USP30*)

~~The cleaning, sanitizing, and organizing of the direct and contiguous compounding areas (DCCA) is the responsibility of trained operators (pharmacists and technicians) following written procedures and is performed at the beginning of each shift.~~

■The cleaning and disinfecting practices and frequencies in this section apply to direct and contiguous compounding areas (DCCAs), which include ISO Class 5 (see *Table 1*) compounding areas for exposure of critical sites as well as buffer rooms, anterooms, and ante-areas (see *Table 2*). Trained compounding personnel are responsible for developing and practicing written procedures for cleaning and disinfecting the DCCAs. These procedures shall be conducted at the beginning of each work shift and when there are spills or environmental quality breaches. ■1S (*USP30*)

Before compounding is performed, all items are removed from the DCCA and all surfaces are cleaned of loose material and residue from spills, followed by an application of a residue-free ~~sanitizing agent, that is left on for a time sufficient to exert its antimicrobial effect.[10]~~

~~Work surfaces near the DCCA in the buffer or clean area are cleaned in a similar manner, including counter tops and supply carts. Storage shelving is emptied of all supplies and then cleaned and sanitized at least weekly, using approved agents.~~

■disinfecting agent (e.g., IPA), that is left on for a time sufficient to exert its antimicrobial effect. Work surfaces in the ISO Class 7 (see *Table 1*) buffer areas and ISO Class 8 (see *Table 1*) anterooms or ante-areas are cleaned and disinfected at least daily, and dust and debris are removed when necessary from storage sites for compounding ingredients and supplies, using a method that does not degrade the ISO Class 7 or 8 (see *Table 1*) air quality (see *Disinfectants and Antiseptics* ⟨1072⟩).

~~[10] Approved by the pharmacist in charge.~~

In-Process Revision

Table 2. Minimum Frequency of Cleaning and Disinfecting Sterile Compounding Areas

Site	Minimum Frequency
ISO Class 5 (see *Table 1*) Primary Engineering Control (e.g., LAFW, BSC, CAI)	At the beginning of each shift
Counters and easily cleanable work surfaces	Daily
Floors	Daily
Walls	Monthly
Ceilings	Monthly
Storage shelving	Monthly

■1S (*USP30*)

Floors in the buffer or clean area are cleaned by mopping once daily when no aseptic operations are in progress. Mopping may be performed by trained and supervised custodial personnel using approved agents described in the written procedures. Only approved cleaning and ~~sanitizing~~

■disinfecting■1S (*USP30*)
agents are used with careful consideration of compatibilities, effectiveness, and inappropriate or toxic residues. Their schedules of use and methods of application are in accord with written procedures. All cleaning tools, such as wipers, sponges, and mops, are nonshedding and dedicated to use in the buffer or clean area. Floor mops may be used in both the buffer or clean area and anteroom area, but only in that order. Most wipers are discarded after one use. If cleaning tools are reused, their cleanliness is maintained by thorough rinsing and disinfecting after use and by storing in a clean environment between uses. Trash is collected in suitable plastic bags and removed with minimal agitation.

In the anteroom area,

■walls, ceilings, and shelving shall be cleaned monthly.■1S (*USP30*)
Supplies and equipment removed from shipping cartons are wiped with a ~~sanitizing agent, such as sterile 70% isopropyl alcohol (IPA)[2], which is checked periodically for contamination. Alternatively, if supplies are planned to be~~

■disinfecting agent, such as IPA. The IPA shall be delivered from a wash or spray bottle, the discharge opening of which must not contact any objects or materials before contacting the surfaces to be disinfected. Wiping with small IPA swabs that are commercially available in individual foil-sealed packages is preferred for disinfecting stoppers on bags and vials before they are pierced with sterile needles and for necks of ampuls before they are broken. The surface of IPA swabs for disinfecting stoppers must not contact any other object before contacting the stoppers. After IPA is sprayed or wiped on a surface to be disinfected, allow the IPA to remain for at least 30 seconds before the surface is contacted to prepare CSPs. Alternatively, if supplies are■1S (*USP30*)
received in sealed pouches, the pouches can be removed as the supplies are introduced into the buffer or clean area without the need to ~~sanitize~~

■disinfect■1S (*USP30*)
the individual supply items. No shipping or other external cartons may be taken into the buffer or clean area.

Cleaning and ~~sanitizing of the anteroom area is performed at least weekly~~

■disinfecting of counters and other easily cleanable surfaces of the anteroom area is performed at least daily■1S (*USP30*)
by trained and supervised custodial personnel, in accordance with written procedures. However, floors are cleaned and ~~sanitized~~

■disinfected■1S (*USP30*)
daily, always proceeding from the buffer or clean area to the anteroom area. ~~Storage shelving is emptied of all supplies and cleaned and sanitized at planned intervals, preferably monthly.~~

■Storage shelving, emptied of all supplies, walls, and ceilings are cleaned and disinfected at planned intervals, monthly if not more frequently.■1S (*USP30*)

~~These cleaning and sanitizing procedures apply to both low risk and high risk operations.~~

■■1S (*USP30*)

Personnel Cleansing and ~~Gowning~~

■Garbing■1S (*USP30*)

~~Personnel are critical keys to the maintenance of asepsis when carrying out their assigned responsibilities. They must be thoroughly trained in aseptic techniques and be highly motivated to maintain these standards each time they prepare a sterile product.~~

~~Prior to entering the buffer or clean area, operators should remove outer lab jackets or the like, makeup, and jewelry and should thoroughly scrub hands and arms to the elbow. After drying hands and arms they should properly don clean, nonshedding uniform components, including hair covers, shoe covers, knee-length coats or coveralls, and appropriate protective gloves, in that order. The coats should fit snugly at the wrists and be zipped or snapped closed in the front. Shoe covers should be donned so that feet then touch the floor only on the clean side of the bench or other demarcation. Face masks should be donned just before beginning activities in the DCCA to minimize airborne contaminants from coughing, sneezing, and talking.~~

~~When preparing CSPs in a vertical flow LAFW with a transparent shield between the face of the operator and sterile components, or when using an isolator, wearing a face mask is optional, but head and facial hair must be covered.~~

~~Appropriate powder-free protective gloves are sterile or, if nonsterile, are sanitized with an appropriate antimicrobial cleaner such as 70% alcohol before use. Protective gloves are put on as the last uniform component. When nonsterile gloves, chosen for their chemically protective composition, are used, they are disinfected with sterile 70% isopropyl alcohol or an antimicrobial agent that is allowed to evaporate before beginning compounding procedures. Sterile and sanitized gloves do not remain sterile and clean during compounding activities because they come in contact with nonsterile surfaces and air. Therefore, compounding personnel must be trained to avoid touching sterile surfaces of packages, transfer devices, and components within ISO Class 5 or superior environments (see *Table 1*). Dur-~~

[2] ~~NOTE—70% isopropyl alcohol (IPA) may harbor resistant microbial spores. Therefore, IPA used in aseptic areas should always be filtered through a 0.2-µm hydrophobic filter to render it sterile.~~

In-Process Revision

~~ing protracted compounding activities, personnel should intermittently resanitize their gloves with sterile 70% isopropyl alcohol.~~

~~Proper scrubbing and gowning immediately prior to entry into the buffer or clean area is required of all personnel, without exception. Should the operator find it necessary to leave the room, the coat may be carefully removed at the entrance and hung inside out for re-donning upon re-entry, but only during the same shift. However, hair covers, masks, shoe covers, and gloves should be discarded and new ones donned prior to re-entry.~~

~~For high-risk operations, it is especially critical to minimize the risk of contamination on lab coats, coveralls, and other garb to be worn in the buffer or clean area. Preferably, fresh clean garb should be donned upon each entry into the buffer or clean area to avoid liberating contaminants from previously worn garb. Alternatively, garb that has been worn may be removed with the intention of regarbing for re-entry into the buffer or clean area and stored during the interim under proper control and protection in the anteroom area. Garb worn or taken outside the confines of the anteroom area cannot be worn in the buffer or clean area.~~

~~Dispersion of particles from body surfaces, such as from skin rashes, sunburn, or cosmetics, increases the risk of contamination of critical sites and must be appropriately controlled or minimized. If severe, the operator must be excluded from the buffer or clean area until the condition is remedied, especially for high-risk operations.~~

■The careful cleansing of hands and arms, and correct donning of personal protective equipment (PPE) by compounding personnel, constitute the first major step in preventing microbial contamination in CSPs. Personnel must also be thoroughly competent and highly motivated to perform flawless aseptic manipulations with ingredients, devices, and components of CSPs. Squamous cells are normally shed from the human body at a rate of 10^6 or more per hour, and those skin particles are laden with microorganisms.[10,11] When persons are afflicted with rashes, sunburn, weeping sores, conjunctivitis, active respiratory infection, as well as when they wear sheddable cosmetics, they shed these particles at even higher rates. Particles shed from compounding personnel pose an increased risk of microbial contamination of critical sites of CSPs. Therefore, compounding personnel with such afflictions as mentioned above shall be excluded from working in ISO Class 5 and ISO Class 7 (see *Table 1*) compounding areas until their condition is remedied. Personnel wearing cosmetics that may shed and could contact critical sites shall not be permitted to prepare CSPs until the cosmetics are sufficiently removed from the skin.

Before entering the clean area, compounding personnel must remove the following: personal outer garments (e.g., bandannas, coats, hats, jackets, scarves, sweaters, vests); all cosmetics, because they shed flakes and particles; and all hand, wrist, and other body jewelry that can interfere with the effectiveness of PPE (e.g., fit of gloves and cuffs of sleeves, or visible body piercing above the neck). The wearing of artificial nails or extenders is prohibited while working in the sterile compounding environment. Natural nails must also be kept neat and trimmed. Personnel must don the following PPE and perform hand hygiene in an order that proceeds from the dirtiest to cleanest activities. Garbing activities considered the dirtiest include donning of dedicated shoes or shoe covers, head and facial hair covers (e.g., beard covers in addition to face masks), and face mask/eye shield. Eye shields are optional unless working with irritants like germicidal disinfecting agents.

After donning dedicated shoes or shoe covers, head and facial hair covers, and face masks, perform a hand hygiene procedure by removing debris from underneath fingernails using a nail cleaner under running warm water followed by vigorous hand washing. Wash hands and arms to the elbows for at least 30 seconds with either a plain (nonantimicrobial) soap, or antimicrobial soap, and water while in the anteroom/ante-area. The use of antimicrobial scrub brushes is not recommended as they can cause skin irritation and skin damage. Hands and forearms will be completely dried using either a lint-free disposable towels or an electronic hand dryer. After completion of hand washing, don nonshedding disposable gowns with sleeves that fit snugly around the wrists.

Once inside the clean area, prior to donning sterile, powder-free gloves, antiseptic hand cleansing must be performed using an alcohol-based surgical hand scrub with persistent activity[12] (e.g., alcohol-based preparations containing either 0.5%

[10] Agalloco J, Akers JE. Aseptic Processing: A Vision of the Future. Pharmaceutical Technology, 2005. Aseptic Processing supplement, s16.

[11] Eaton T. Microbial Risk Assessment for Aseptically Prepared Products. Am Pharm Rev. 2005; 8 (5, Sep/Oct): 46–51.

[12] *Guideline for Hand Hygiene in Health care Settings,* MMWR, October 25, 2002, vol. 51, No. RR-16 available on the Internet at http://www.cdc.gov/handhygiene/.

or 1.0% chlorhexidine gluconate) following manufacturers' recommendations. Allow hands to dry thoroughly before donning sterile gloves.

Sterile gloves shall be the last item donned before compounding begins. Gloves become contaminated when they contact nonsterile surfaces during compounding activities. Disinfection of contaminated gloves may be accomplished by applying 70% IPA to all contact surface areas of the gloves and letting the gloves dry thoroughly. Only use gloves that have been tested for compatibility with alcohol disinfection by the manufacturer. Routine application of 70% IPA should occur throughout the compounding day and whenever nonsterile surfaces (e.g. vials, counter tops, chairs, and carts) are touched. Gloved hands shall also be routinely inspected for holes, punctures, or tears and replaced immediately if detected, along with performing antiseptic hand cleansing as indicated above. Compounding personnel must be trained and evaluated in the avoidance of touching critical sites with contaminated gloves.

When compounding personnel must temporarily exit the ISO Class 7 (see *Table 1*) environment during a work shift, the exterior gown, if not visibly soiled, may be removed and retained in the ISO Class 8 (see *Table 1*) anteroom/ante-area, to be re-donned during that same work shift only. However, shoe covers, hair and facial hair covers, face mask/eye shield, and gloves must be replaced with new ones before re-entering the ISO Class 7 (see *Table 1*) clean environment along with performing proper hand hygiene.

During high-risk compounding activities that precede terminal sterilization, such as weighing and mixing, compounding personnel shall be garbed and gloved the same as when performing compounding in an ISO Class 5 (see *Table 1*) environment. Properly garbed and gloved compounding personnel who are exposed to air quality that is either known or suspected to be worse than ISO Class 8 (see *Table 1*) must re-garb PPE along with washing their hands properly, performing antiseptic hand cleansing with a waterless alcohol-based surgical scrub, and donning sterile gloves upon re-entering the ISO Class 7 (see *Table 1*) clean area. When CAIs[2] are the source of the ISO Class 5 (see *Table 1*) environment, the garbing and gloving requirements for compounding personnel should be as described above, unless the isolator manufacturer can provide written documentation based on validated environmental testing that any component(s) of PPE or personnel cleansing are not required.■1S (*USP30*)

SUGGESTED STANDARD OPERATING PROCEDURES

The pharmacy should have written, properly approved standard operating procedures (SOPs) designed to ensure the quality of the environment in which a CSP is prepared. The following procedures are recommended:

1. Access to the buffer or clean area is restricted to qualified personnel with specific responsibilities or assigned tasks in the area.
2. All cartoned supplies are decontaminated in the anteroom area by removing them from shipping cartons and wiping or spraying with a disinfecting agent, such as ~~sterile IPA, while being transferred to a clean, sanitized~~

   ■IPA, while being transferred to a clean, disinfected■1S (*USP30*)

   cart or other conveyance for introduction into the buffer or clean area. Individual pouched supplies need not be wiped because the pouches can be removed as these supplies are introduced into the buffer or clean area.
3. Supplies required frequently or otherwise needed close at hand but not necessarily needed for the scheduled operations of the shift are decontaminated and stored on the shelving in the anteroom area.
4. Carts used to bring supplies from the storeroom cannot be rolled beyond the demarcation line in the anteroom area, and carts used in the buffer or clean area cannot be rolled outward beyond the demarcation line unless cleaned and ~~sanitized~~

   ■disinfected■1S (*USP30*)

   before returning.
5. Generally, supplies required for the scheduled operations of the shift are prepared and brought into the buffer or clean area, preferably on one or more movable carts. Supplies that are required for back-up or general support of operations may be stored on the designated shelving in the buffer or clean area, but avoid excessive accumulation of supplies.
6. Objects that shed particles cannot be brought into the buffer or clean area, including pencils, cardboard cartons, paper towels, and cotton items. Only nonshedding paper-related products (boxes, work records, and so forth) can be brought into the buffer or clean area.
7. Traffic flow in and out of the buffer or clean area must be minimized.
8. Personnel preparing to enter the buffer or clean area must remove all jewelry from hands and arms.
9. Personnel entering the buffer or clean area must first scrub hands and arms with soap, including using a scrub brush on the fingers and nails. ~~An air dryer or disposable nonshedding towels are used to dry hands and arms after washing.~~

   ■■1S (*USP30*)
10. Personnel entering the buffer or clean area ~~, after scrubbing, should don attire as described under *Personnel Cleansing and Gowning*.~~

    ■must scrub and should don attire as described in the *Personnel Cleansing and Garbing* section.■1S (*USP30*)

In-Process Revision

11. No chewing gum,

■drinks,■1S (*USP30*)
candy, or food items may be brought into the buffer or clean area or anteroom area.

12. At the beginning of each compounding activity session, and after liquids are spilled, the surfaces of the direct compounding environment are first cleaned with *Purified Water* to remove water soluble residues. Immediately thereafter, the same surfaces are ~~sanitized with sterile 70% isopropyl alcohol,~~

■disinfected with IPA■1S (*USP30*)
or other effective antimicrobial agents, using a nonlinting wipe.

13. When LAFWs or ~~are used as the ISO Class 5 air quality environment, (see *Table 1*),~~

■CAIs are used as the ISO Class 5 (see *Table 1*) air quality environment,■1S (*USP30*)
their blowers must be operated continuously during compounding activity, including during interruptions of less than 8 hours. When the blower is turned off and before other personnel enter to perform compounding activities, only one person can enter the contiguous buffer area for the purposes of turning on the blower (for at least 30 minutes) and of ~~sanitizing~~

■disinfecting■1S (*USP30*)
the work surfaces.

14. Traffic in the area of the DCCA is minimized and controlled. The DCCA is shielded from all less clean air currents that are of higher velocity than the clean laminar airflow.
15. Supplies to be utilized in the DCCA for the planned procedures are accumulated and then decontaminated by wiping or spraying the outer surface with IPA or removing the outer wrap at the edge of the DCCA as the item is introduced into the aseptic work area.
16. After proper introduction into the DCCA of supply items required for and limited to the assigned operations, they are so arranged that a clear, uninterrupted path of HEPA-filtered air will bathe all critical sites at all times during the planned procedures. That is, no objects may be placed ~~behind~~

■between the first air from HEPA filters and■1S (*USP30*)
an exposed critical site in a horizontal position or above in the vertical LAFW.

17. All supply items are arranged in the DCCA so as to reduce clutter and to provide maximum efficiency and order for the flow of work.
18. All procedures are performed in a manner designed to minimize the risk of touch contamination. Gloves are ~~sanitized~~

■disinfected■1S (*USP30*)
with adequate frequency with an approved disinfectant.

19. All rubber stoppers of vials and bottles and the necks of ampuls are ~~sanitized~~

■disinfected■1S (*USP30*)
with IPA prior to the introduction of a needle or spike for the removal of product.

20. After the preparation of every admixture, the contents of the container are thoroughly mixed and then inspected for the presence of particulate matter, evidence of incompatibility, or other defects.
21. After procedures are completed, used syringes, bottles, vials, and other supplies are removed, but with a minimum of exit and re-entry into the DCCA to minimize the risk of introducing contamination into the aseptic workspace.

~~Environmental Monitoring~~

~~In addition to the evaluation and verification of personnel aseptic techniques and of the adequacy of compounding processes and procedures (see *Personnel Training and Evaluation in Aseptic Manipulation Skills* section), assessment and verification of the adequacy of the sterile compounding environment is essential, especially for preparing high-risk preparations. Evaluation of environmental quality is performed by measuring both the total number of particles and the number of viable microorganisms in the controlled air environments of the compounding area.~~

~~Certification that each LAFW and barrier isolator is functioning properly and meets the air quality requirement of ISO Class 5 (refer to *Clean Rooms and Barrier Isolators* and *Table 1* in the *Environmental Quality and Control* section) is performed by a qualified operator(s) using current, state-of-the-art electronic air sampling at least every six months and whenever the LAFW or barrier isolator is relocated. Similarly, the air quality of the buffer or clean area and anteroom area is evaluated by a qualified operator(s) for conformance to ISO Class 7 and ISO Class 8 requirements, as appropriate, at least every six months and when renovations occur. These records are maintained and reviewed by the supervising pharmacist or other designated employee.~~

~~Evaluation of airborne microorganisms in the controlled air environments (LAFW, barrier isolators, buffer or clean area, and anteroom area) is performed by properly trained individuals using suitable electric air samplers or by exposing sterile nutrient agar plates for a suitable time frame. For either approach, the air sampling is performed at locations judged by compounding personnel to be the most prone to contamination during compounding activities: this includes zones of air backwash turbulence within LAFWs and other areas where air backwash turbulence may enter the compounding area. Such evaluations are performed as a regular and ongoing process at least monthly for sterile compounding areas used for low- and medium-risk preparations and at least weekly for areas used for high-risk preparations.~~

~~For electric air samplers that actively collect volumes of air for evaluation, the instructions for verification and use of these devices must be followed. When using the passive exposure of sterile nutrient agar settling plates, the covers are removed and the media is exposed for a period usually lasting 1 hour or longer to collect viable microorganisms as they fall from the environment. At the end of the designated exposure period, the plates are recovered and incubated at a temperature and for a time period conducive to multiplication of microorganisms on the nutrient agar—usually at 30° to 35° for a minimum of 48 hours. The number of discrete colonies of microorganisms are then counted and reported as colony forming units (cfu). This provides a measurement of the level of microbial contamination in the air within the tested environment.~~

~~The greatest value of viable microorganism monitored in the air of the compounding environment is realized when normal baseline cfu counts are determined over a period of time. Determining the baseline cfu counts permits identification of a trend toward increasing microbial cfu counts. A sufficiently increasing trend in cfu counts over time must prompt a re-evaluation of the adequacy of cleaning procedures, operational procedures, and air filtration efficiency within the sterile compounding location. Action may be warranted when an increasing trend to 50% above the baseline for areas used for high- and medium-risk preparations or to 100% above baseline for areas used for low-risk preparations is found.~~

~~A written plan and schedule for the environmental monitoring procedures for airborne microorganisms must be established and followed. The plan must be adequate to evaluate the various controlled air environment areas (LAFW, barrier isolator, buffer or clean area, and anteroom area) of the sterile compounding facility. All compounding personnel are trained in and educated about the importance of this environmental monitoring process. For sterile compounding areas used for low- and medium-risk preparations, a minimum of monthly evaluation is appropriate. For sterile compounding areas used for high-risk preparations, at least weekly evaluation is appropriate.~~

■■1S (*USP30*)

In-Process Revision

Add the following:

▪ENVIRONMENTAL MONITORING

Assessment and verification of the adequacy of the aseptic compounding environment is essential. Environmental monitoring programs are designed to promptly identify potential sources of contamination, allowing for implementation of corrective actions in order to minimize the possibility of CSP contamination. This program provides information, which demonstrates that the engineering controls, disinfecting procedures, and employee work practices create an environment within the compounding area that consistently maintains acceptably low microbial levels. The compounding area includes the ISO Class 5 (see *Table 1*) primary engineering controls. ISO Class 7 (see *Table 1*) buffer room (cleanroom) and ISO Class 8 (see *Table 1*) anteroom or ante-area. The value of an environmental monitoring program lies in the consistent, quantitative assessment of environmental conditions in these areas over time.

Sampling Plan

The evaluation of environmental quality is performed by measuring the number of airborne viable particles (microorganisms) in the ISO classified air environments within the compounding area and the total number of particles (nonviable and viable). The environmental quality of the ISO classified areas as it pertains to microbial bioburden is evaluated by assessing the number of viable and nonviable particles in the air.

An environmental sampling plan shall be developed for monitoring airborne viable particles. Selected sampling sites should include multiple locations within each ISO Class 5 (see *Table 1*) environment and in the ISO Class 7 and 8 (see *Table 1*) areas. The plan should include location, method of sampling, volume of air sampled, frequency of sampling, time of day as related to activity in the compounding area, and action levels.

Monitoring of the data generated by the program can detect changes in the microbial bioburden; such changes may be allowed for indication of changes in the state-of-control within the environment. It is recommended that compounding personnel refer to *Microbiological Evaluation of Cleanrooms and Other Controlled Environments* ⟨1116⟩ and the *CDC Guidelines for Environmental Infection Control in Healthcare Facilities–2003*[7,13] for more information. Although ⟨1116⟩ is an informational chapter and not applicable to controlled environments for use by licensed pharmacies, it can provide valuable information in helping compounding sites establish a robust environmental monitoring program. Changes in the microbial bioburden found during monitoring can allow for detection and resolution of problems in the system before loss of control of the environment.

Growth Media

A general microbiological growth medium such as Soybean–Casein Digest Medium (also known as trypticase soy broth or agar (TSA) should be used to support the growth of bacteria. Malt extract agar (MEA) or some other media that supports the growth of fungi should also be used. Media used for surface sampling must be supplemented with additives to neutralize the effects of disinfecting agents (e.g., TSA with lecithin and polysorbate 80).

Air Sampling

Evaluation of airborne microorganisms in the controlled air environments (LAFWs, CAIs, BSCs, buffer or clean areas, and anterooms/areas) is performed by properly trained individuals using suitable electric air samplers. Impaction is the preferred method of active air sampling.

Use of settling plates for qualitative air sampling cannot be relied upon and shall not be used solely to determine the quality of air in the controlled environment. The settling of parti-

[13] CDC Guideline for Environmental Infection Control in Health-Care Facilities, 2003 (http://www.cdc.gov/mmwr/preview/mmwrhtml/rr5210a1.htm).

cles by gravity onto culture plates is highly dependent on the particle size and is strongly influenced by air movement. Given the unpredictable and uncontrollable nature of ambient particle movement, pharmacists or technicians cannot directly relate the number of colony-forming units (cfu) on a settling plate to the concentrations of the corresponding particles in the sampled environment.

Samples collected by gravity on settling plates are not suitable substitutes for volumetric air samples and should not be used to determine the relative air concentrations of different microorganisms because of the method's collection bias.

Air sampling shall be performed at locations that are prone to contamination during compounding activities and during other activities like staging, labeling, gowning, and cleaning. Locations should include zones of air backwash turbulence within laminar airflow workbench and other areas where air backwash turbulence may enter the compounding area (doorways, in and around ISO Class 5 (see *Table 1*) engineering controls and environments).

The instructions in the manufacturer's user manual for verification and use of these electric air samplers that actively collect volumes of air for evaluation must be followed. A sufficient volume of air should be tested per location in order to maximize sensitivity. These air sampling devices need to be serviced and calibrated as recommended by the manufacturer. Consideration should be given to the overall effect the chosen sampling method will have on the unidirectional airflow within a compounding environment.

Collection Methods—There are a number of different manufacturers of electric air sampling equipment. It is important that compounding personnel refer to the manufacturers' recommended procedures when using the equipment to perform active air sampling procedures. It is recommended that compounding personnel also refer to *Methodology and Instrumentation for Quantitation of Viable Airborne Microorganisms* under *Microbiological Evaluation of Cleanrooms and Other Controlled Environments* ⟨1116⟩, which can provide more information on the use of active air samplers and the volume of air that should be sampled to detect environmental bioburden excursions.

Sampling Frequency—Active electronic air sampling that is designed not to interrupt airflow while sampling shall be performed and the results evaluated at least monthly for low- and medium-risk level compounding operations and at least weekly for high-risk level compounding operations. More frequent sampling will provide earlier detection of loss of environmental control.

Surface Sampling

Surface sampling is recommended but not required. Surface sampling can be an important component of the microbial environmental monitoring program in controlled environments. It is also useful to evaluate cleaning procedures and employee work practices. Surface sampling should only be performed when no compounding activity is occurring on or near the surface to be tested. For these reasons, sampling is often performed at the end of a shift or the end of the work day. Surface sampling may be performed in all ISO classified areas and can be accomplished using contact plates and/or swabs. Sample areas should be defined on the sample plan or form. The sample size usually ranges from 24 to 30 cm^2. Contact plates are filled with general growth medium and neutralizing agents such as lecithin and polysorbate 80. Swabs should contain a transport medium and are most appropriate for irregular surfaces.

Collection Methods—To sample using a contact plate, gently touch the area with the agar surface and roll the plate across the surface to be sampled. The contact plates should be incubated as stated in the subsection *Sampling Plate Incubation Period.* The contact plate will leave a media residue behind. Therefore, immediately after sampling with the contact plate the sampled area should be thoroughly cleaned and disinfected prior to resuming compounding.

To sample an area with a swab, rub the swab in a twisting motion across the surface within a defined surface area template. After collection of the sample, the swab is placed in an appropriate media containing a neutralizer, processed by appropriate means, and plated to the desired nutrient agar. Results should be reported as cfu per surface area.

Sampling Frequency—Surface sampling should be performed when no other activities are occurring in critical areas and the results evaluated at least monthly for low- and medium-risk level compounding operations and at least weekly for high-risk level compounding operations. More frequent sampling will provide earlier detection of loss of environmental control.

Glove Fingertips Sampling

Personnel monitoring is required because direct touch contamination is the most likely source of introducing microorganisms into CSPs. Contact agar plates are used to sample gloved fingertips after compounding CSPs immediately after exiting the ISO Class 5 (see *Table 1*) environment. Glove fingertip sampling must occur outside of the ISO Class 5 (see *Table 1*) environment. Do not disinfect gloves with IPA immediately prior to sampling. Disinfecting gloves immediately before sampling will provide false negative results. The minimum sampling schedule is provided in *Table 3.* Plates filled with nutrient agar with neutralizing agents added are used when sampling personnel fingertips. Personnel should "touch" the agar with the fingertips of both hands in a manner to create a slight impression in the agar. The gloves must be discarded and hand hygiene performed after performing this procedure.

When a finger plate result for personnel monitoring after proper incubation exceeds the action limit, a review of hand hygiene and garbing procedures as well as glove and surface disinfection procedures and work practices should occur.

Air and Surface Sampling Frequencies

The sampling frequency table *(Table 3)* details the required sampling intervals for each of the respective CSP risk level compounding areas. If two or more risk levels of compounding (e.g., medium- and high-risk level) activity should occur in a pharmacy, then the more stringent frequency of sampling must be performed routinely. If compounding occurs in multiple locations within an institution (e.g., main pharmacy and satellites), environmental monitoring is required for each individual compounding area.

Table 3. Environmental Monitoring Sampling Schedule

	Low-Risk Level CSPs	Medium-Risk Level CSPs	High-Risk Level CSPs
Required air sampling	Once a month	Once a month	Weekly
Required glove fingertips[a]	Weekly	Weekly	Daily
Recommended ISO surface sampling	Weekly	Weekly	Daily

[a] At least one individual or 10% of the compounding personnel, whichever is larger, to be sampled.

Sampling Plate Incubation Period

At the end of the designated sampling or exposure period for all environmental monitoring activities (air, surface, or personnel), the plates are recovered, covers secured, inverted and incubated at a temperature and for a time period conducive to multiplication of microorganisms. Trypticase soy broth or agar (TSA) should be incubated at between 33° and 37° for 2 days. Malt extract agar (MEA) or other suitable fungal media should be incubated at between 26° and 30° for 7 days.

Action Limits, Documentation, and Data Evaluation

The greatest value of viable microbial monitoring in the air and on surfaces of the aseptic environment are realized when normal baseline cfu counts are determined over a period of time. Environmental monitoring data shall be collected and trended as a means of evaluating the overall control of the compounding environment.

The number of discrete colonies of microorganisms are counted and reported as cfu and documented on an environmental monitoring form. Counts from air monitoring need to be transformed into cfu/cubic meter of air and evaluated for adverse trends.

Action levels shall be determined based on baseline data gathered. *Table 4* should only be used as a guideline or as interim levels until baseline data has been gathered. Determining the baseline cfu counts permits identification of an increasing trend of microbial cfu. An increasing trend in cfu counts should prompt a re-evaluation of the adequacy of cleaning procedures, operational procedures, personnel work practices, and air filtration efficiency within the aseptic compounding location. When action levels are exceeded, an investigation into the source of the contamination shall be conducted. Sources could include heating, ventilating, and air conditioning (HVAC) systems, damaged HEPA filters, and changes in personnel garbing habits or working practices. Eliminate the source of the problem, clean the affected area, and then resample.

Table 4. Action Levels (Counts) of Microbial Colony-Forming Units (cfu) per Cubic Meter of Air or Contact Plate[a]

ISO Class of Sampled Location	Sampled Sources and Their Action Levels (Counts) of Microbial cfu		
	Active Air[b] (required)	Glove Fingertip (required)	Inanimate Surfaces (recommended)
5	> 3	> 3	> 3
7	> 20	not required	> 20
8	> 100	not required	> 100

[a] The cfu action levels are adapted from those in *Microbiological Evaluation of Cleanrooms and Other Controlled Environments* ⟨1116⟩.
[b] At least one cubic meter, m^3, or 1000 liters, L, of air must be sampled.

Nonviable Particle Facility Environmental Monitoring Program

A program to monitor nonviable particles differs from that of viable particles in that it is intended to directly measure the performance of the engineering controls used to create the various levels of air cleanliness, e.g., ISO Class 5, ISO Class 7, or ISO Class 8 (see *Table 1*).

Engineering Control Performance Verification

Primary (e.g., LAFWs, BSCs, and CAIs) and secondary (e.g., buffer and ante rooms/areas) engineering controls are essential components of the overall contamination control strategy for aseptic compounding. As such, it is imperative that they perform as designed and the resulting levels of contamination are within acceptable limits. Certification procedures

such as those outlined in the CETA Certification Guide for Sterile Compounding Facilities (CAG-003-2005) should be performed by a qualified individual no less than every 6 months and whenever the device or room is relocated, altered, or major service to the facility is performed.

Total Particle Counts—Certification that each ISO classified area, e.g., ISO Class 5, ISO Class 7, and ISO Class 8 (see *Table 1*) is within established guidelines shall be performed no less than every 6 months and whenever the LAFW, BSC, or CAI is relocated or the physical structure of the buffer room or anteroom/area has been altered. Testing shall be performed by qualified operators using current, state-of-the-art electronic equipment with the following results:

- Not more than 3,520 particles 0.5 µm size and larger per cubic meter of air (ISO Class 5, see *Table 1*) for any LAFW, BSC, and CAI;
- Not more than 352,000 particles of 0.5 µm size and larger per cubic meter of air (ISO Class 7, see *Table 1*) for any buffer room;
- Not more than 3,520,000 particles of 0.5 µm size and larger per cubic meter of air (ISO Class 8, see *Table 1*) for any anteroom/area.

All certification records shall be maintained and reviewed by the supervising pharmacist or other designated employee to ensure that the controlled environments comply with the proper air cleanliness, room pressures, and air changes per hours. (Refer to Cleanrooms, CAIs, and *Table 1* in the *Environmental Quality and Control* section.)

Pressure Differential Monitoring

A pressure gauge or velocity meter shall be installed to monitor the pressure differential or airflow between the cleanroom and anteroom and the anteroom and the general pharmacy area. The results should be reviewed and documented on a daily basis in a log. The pressure between the ISO Class 7 (see *Table 1*) and general pharmacy area should not be less than 5 Pa (0.02-inch water column, w.c.). Facilities used to compound low-risk CSPs utilizing directional airflow should maintain a minimum velocity of 0.2 m/s (40 fpm).■1S (*USP30*)

Change to read:

PROCESSING

A written description of specific training and performance evaluation program for individuals involved in the use of aseptic techniques for the preparation of sterile products must be developed for each site. This program equips the personnel with the appropriate knowledge and trains them in the required skills necessary to perform the assigned tasks. Each person assigned to the aseptic area in the preparation of sterile products must successfully complete specialized training in aseptic techniques and aseptic area practices prior to preparing CSPs (see *Personnel Training and Evaluation in Aseptic Manipulation Skills* section).

~~Aseptic Technique~~

~~Critical operations are carried out by appropriately trained and qualified personnel in a DCCA using proper aseptic techniques described in a written procedure (see *Suggested Standard Operating Procedures and Hazardous Drugs* section)Aseptic technique is equally applicable to the preparation of sterile sensitizing and chemotoxic agents. However, it is essential to recognize that additional precautions must be utilized to protect the personnel and the compounding environment from the potential adverse effects of these chemotoxic products. The minimum requirements for this process include the following: working and verified vertical LAFW, barrier isolator, or other environmental containment and control device with biohazard control capabilities; the protective capabilities of gowns, masks, bouffants, and gloves; sprayback and spill control techniques and equipment; the use specialized compounding devices and equipment; and proper disposal.~~

■■1S (*USP30*)

Components

Compounding personnel ascertain that ingredients for CSPs are of the correct identity and appropriate quality using the following information: vendors' labels, labeling, certificates of analysis, direct chemical analysis, and knowledge of compounding facility storage conditions.

STERILE INGREDIENTS AND COMPONENTS

Commercially available sterile drug products, sterile ready-to-use containers and devices are examples of sterile components. A written procedure for unit-by-unit physical inspection preparatory to use is followed to ensure that these components are sterile, free from defects, and otherwise suitable for their intended use.

NONSTERILE INGREDIENTS AND COMPONENTS

If any nonsterile components, including containers, devices, and ingredients, are used to make a CSP, such CSPs must be ~~compounded at a high-risk level.~~

■high-risk.■1S (*USP30*)
Nonsterile active ingredients and added substances, or excipients, for CSPs should preferably be official *USP* or *NF* articles. When nonofficial ingredients are used, they must be accompanied by certificates of analysis from their suppliers to aid compounding personnel in judging the identity, quality, and purity in relation to the intended

In-Process Revision

use in a particular CSP. Physical inspection of a package of ingredients is necessary in order to detect breaks in the container, looseness in the cap or closure, and deviation from the expected appearance, aroma, and texture of the contents.

Bulk, or unformulated, drug substances and added substances, or excipients, must be stored in tightly closed containers under temperature, humidity, and lighting conditions that are either indicated in official monographs or approved by suppliers; also the date of receipt in the compounding facility must be clearly and indelibly marked on each package of ingredient. After receipt by the compounding facility, packages of ingredients that lack a supplier's expiration date cannot be used after one year, unless either appropriate inspection or testing indicates that the ingredient has retained its purity and quality for use in CSPs.

Careful consideration and evaluation of nonsterile ingredient sources is especially warranted when the CSP will be administered into the vascular system, central nervous system, and eyes.

Upon receipt of each lot of the bulk drug substance or excipient used for CSPs, the individual compounding the preparation performs a visual inspection of the lot for evidence of deterioration, other types of unacceptable quality, and wrong identification. The bulk drug substance or excipient visual inspection is performed on a routine basis as described in the written protocol.

Equipment

It is necessary that equipment, apparatus, and devices used to compound a CSP be consistently capable of operating properly and within acceptable tolerance limits. Written procedures outlining required equipment calibration, annual maintenance, monitoring for proper function, controlled procedures for use of the equipment and specified time frames for these activities are established and followed. Routine maintenance and time intervals are also outlined in these written procedures. Results from the equipment calibration, annual maintenance reports, and routine maintenance are kept on file for the lifetime of the equipment. Personnel are prepared through an appropriate combination of specific training and experience to operate or manipulate any piece of equipment, apparatus, or device they may use when preparing CSPs. Training includes gaining the ability to determine whether any item of equipment is operating properly or is malfunctioning.

Change to read:

FINISHED PREPARATION RELEASE CHECKS AND TESTS

All high-risk level CSPs ~~for administration by injection into the vascular and central nervous systems~~

■■ IS (*USP30*)
that are prepared in groups of more than 25 identical individual single-dose packages (such as ampuls, bags, syringes, and vials), or in multiple-dose vials for administration to multiple patients, or are exposed longer than 12 hours at 2° to 8° and longer than 6 hours at warmer than 8° before they are sterilized are tested to ensure that they are sterile (see *Sterility Tests* ⟨71⟩) and do not contain excessive bacterial endotoxins (see *Bacterial Endotoxins Test* ⟨85⟩).

■Inspection of Solution Dosage Forms and Review of Compounding Procedures

All CSPs that are intended to be solutions must be visually examined for the presence of particulate matter and not administered or dispensed when such matter is observed. The prescription orders, written compounding procedure, preparation records, and expended materials used to make CSPs at all contamination risk levels are inspected for accuracy of correct identities and amounts of ingredients, aseptic mixing and sterilization, packaging, labeling, and expected physical appearance before they are administered or dispensed.■ IS (*USP30*)

Physical Inspection

Finished CSPs are individually inspected in accordance with written procedures after compounding. If not distributed promptly, these ~~products~~

■CSPs■ IS (*USP30*)
are individually inspected just prior to leaving the storage area. Those ~~products~~

■CSPs■ IS (*USP30*)
that are not immediately distributed are stored in an appropriate location as described in the written procedures. Immediately after compounding and as a condition of release, each ~~product~~

■CSP■ IS (*USP30*)
unit, where possible, should be inspected against lighted white or black background or both for evidence of visible particulates or other foreign matter. Prerelease inspection also includes container–closure integrity and any other apparent visual defect. ~~Products~~

■CSPs■ IS (*USP30*)
with observed defects should be immediately discarded or marked and segregated from acceptable products in a manner that prevents their administration. When ~~products~~

■CSPs■ IS (*USP30*)
are not distributed promptly after preparation, a predistribution inspection is conducted to ensure that a CSP with defects, such as precipitation, cloudiness, and leakage, which may develop between the time of release and the time of distribution, is not released.

Compounding Accuracy Checks

Written procedures for double-checking compounding accuracy must be followed for every CSP during preparation and immediately prior to release. The double check system should meet state regulations and include label accuracy and accuracy of the addition of all drug products or ingredients used to prepare the finished product and their volumes or quantities. The used additive containers and, for those additives for which the entire container was not expended, the syringes used to measure the additive, should be quarantined with the final products until the final product check is completed. Compounding personnel must visually confirm that ingredients measured in syringes match the written order being compounded. Preferably, a person other than the compounder can verify that correct volumes of correct ingredients were measured to make each CSP. For example, compounding personnel would pull the syringe plunger back to the volume measured.

When practical, confirm accuracy of measurements by weighing a volume of the measured fluid, then calculating that volume by dividing the weight by the accurate value of the density, or specific gravity, of the measured fluid. Correct density or specific gravity values programmed in automated compounding devices, which measure by weight using the quotient of the programmed volume divided by the density or specific gravity, must be confirmed to be accurate before and after delivering volumes of the liquids assigned to each chan-

In-Process Revision

nel or port. These volume accuracy checks and the following additional safety and accuracy checks in this section must be included in the standard operating procedures manual of the CSP facility.

Sterility Testing

All high-risk level CSPs ~~for administration by injection into the vascular and central nervous systems~~

■■1S (*USP30*)
that are prepared in groups of more than 25 identical individual single-dose packages (such as ampuls, bags, syringes, vials), or in multiple-dose vials for administration to multiple patients, or exposed longer than 12 hours at 2° to 8° and longer than 6 hours at warmer than 8° before they are sterilized must be tested to ensure that they are sterile (see *Sterility Tests* ⟨71⟩) before they are dispensed or administered. The *Membrane Filtration* method is the method of choice where feasible (e.g., components are compatible with the membrane). A method not described in the *USP* may be used if verification results demonstrate that the alternative is at least as effective and reliable as the *USP Membrane Filtration* method or the *USP Direct Inoculation of the Culture Medium* method where the *Membrane Filtration* method is not feasible.

~~In such a case, a written procedure requiring daily observation of the media and requiring an immediate recall if there is any evidence of microbial growth must be available.~~

■When high-risk level CSPs are dispensed before receiving the results of their sterility tests, there shall be a written procedure requiring daily observation of the incubating test specimens and immediate recall of the dispensed CSPs when there is any evidence of microbial growth in the test specimens.■1S (*USP30*)
In addition, the patient and the physician of the patient to whom a potentially contaminated CSP was administered are notified of the potential risk. Positive sterility test results should prompt a rapid and systematic investigation of aseptic technique, environmental control, and other sterility assurance controls to identify sources of contamination and correct problems in the methods or processes.

Bacterial Endotoxin (Pyrogen) Testing

All high-risk level CSPs, ~~for administration by injection into the vascular and central nervous systems~~

■except those for inhalation and ophthalmic administration,■1S (*USP30*)
that are prepared in groups of more than 25 identical individual single-dose packages (such as ampuls, bags, syringes, vials), or in multiple-dose vials for administration to multiple patients, or exposed longer than 12 hours at 2° to 8° and longer than 6 hours at warmer than 8° before they are sterilized must be tested to ensure that they do not contain excessive bacterial endotoxins (see *Bacterial Endotoxins Test* ⟨85⟩

■and *Pyrogen Test* ⟨151⟩).■1S (*USP30*)
In the absence of a bacterial endotoxins limit in the official monograph or other CSP formula source, the CSP must not exceed the amount of USP Endotoxin Units (EU per hour per kg of body weight or m^2 of body surface area) specified in the above chapter for the appropriate route of administration.

Identity and Strength Verification of Ingredients

Compounding facilities must have at least the following written procedures for verifying the correct identity and quality of CSPs before they are dispensed and administered:

1. That labels of CSPs bear correct names and amounts or concentrations of ingredients; the total volume; the beyond-use date; the appropriate route(s) of administration; the storage conditions; and other information for safe use.
2. That there are correct identities, purities, and amounts of ingredients by comparing the original written order to the written compounding record for the CSP.
3. That correct fill volumes in CSPs and correct quantities of filled units of the CSPs were obtained. When the strength of finished CSPs cannot be confirmed to be accurate, based on the above three inspections, the CSPs must be assayed by methods that are specific for the active ingredients.

~~To inhibit microbial growth from undetected contamination, finished CSPs that will not be immediately dispensed and administered must be refrigerated at 2° to 8°, unless their chemical and physical stability are known to be adversely affected by cold temperatures. When CSPs are filled into patient-worn infusion devices that are likely to attain temperatures exceeding 30° for more than 24 hours, the chemical and physical stability at such temperatures and durations must be confirmed from either appropriate literature sources or direct testing.~~

■■1S (*USP30*)

Change to read:

STORAGE AND BEYOND-USE DATING

Beyond-use dates for compounded preparations are usually assigned based on professional experience, which should include careful interpretation of appropriate information sources for the same or similar formulations (see *Stability Criteria and Beyond-Use Dating* in the general test chapter *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩). Beyond-use dates for CSPs are rarely based on preparation-specific chemical assay results, which are used with the Arrhenius equation to determine expiration dates (see *General Notices and Requirements*) for manufactured products. The majority of CSPs are aqueous solutions in which hydrolysis of dissolved ingredients is the most common chemical degradation reaction. The extent of hydrolysis and other heat-catalyzed degradation reactions at any particular time point in the life of a CSP represents the thermodynamic sum of exposure temperatures and durations. Such lifetime stability exposure is represented in the mean kinetic temperature calculation (see *Pharmaceutical Calculations in Prescription Compounding* ⟨1160⟩). Drug hydrolysis rates increase exponentially with arithmetic temperature increase; thus, exposure of a beta-lactam antibiotic solution for 1 day at controlled room temperature (see *General Notices and Requirements*) will have an equivalent effect on the extent of hydrolysis of approximately 3 to 5 days in cold temperatures (see *General Notices and Requirements*).

Personnel who prepare, dispense, and administer CSPs must store them strictly in accordance with the conditions stated on the label of ingredient products and finished CSPs. When CSPs are known to have been exposed to temperatures warmer than the warmest labeled limit, but not exceeding 40° (see *General Notices and Requirements*) for more than 4 hours, such CSPs should be discarded, unless appropriate documentation or direct assay data confirms their continued stability.

Determining Beyond-Use Dates

■Beyond-use dates and expiration dates are not the same (see *General Notices and Requirements*). Expiration dates for the chemical and stability of manufactured sterile products are determined from results of rigorous analytical and performance testing, and they are specific for a particular formulation in its container and at stated exposure conditions of illumination and temperature.■1S (*USP30*)

When CSPs deviate from conditions in the approved labeling of manufactured products contained in CSPs, compounding personnel may consult the manufacturer of particular products for advice on assigning beyond-use dates based on chemical and physical stability parameters. Beyond-use dates for CSPs that are prepared strictly in accordance with manufacturers' product labeling must be those specified in that labeling, or from appropriate literature sources or direct testing. Beyond-use dates for CSPs that lack justification from either appropriate literature sources or by direct testing evidence must be assigned as described in the section *Stability Criteria and Beyond-Use Dating* in the general test chapter *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩.

In addition, the pharmacist may refer to applicable publications to obtain relevant stability, compatibility, and degradation information regarding the drug or its congeners. When assigning a beyond-use date, pharmacists should consult and apply drug-specific and general stability documentation and literature where available, and they should consider the nature of the drug and its degradation mechanism, the container in which it is packaged, the expected storage conditions, and the intended duration of therapy (see *Expiration Date and Beyond-Use Date* under *Labeling* in the *General Notices and Requirements*). Stability information must be carefully interpreted in relation to the actual compounded formulation and conditions for storage and use. Predictions based on other evidence, such as publications, charts, tables, and so forth would result in theoretical beyond-use dates. Theoretically predicted beyond-use dating introduces varying degrees of assumptions, and hence a likelihood of error or at least inaccuracy. The degree of error or inaccuracy would be dependent on the extent of differences between the CSP's characteristics (such as composition, concentration of ingredients, fill volume, or container type and material) and the characteristics of the products from which stability data or information is to be extrapolated. The greater the doubt of the accuracy of theoretically predicted beyond-use dating, the greater the need to determine dating periods experimentally. Theoretically predicted beyond-use dating periods should be carefully considered for CSPs prepared from nonsterile bulk active ingredients having therapeutic activity, especially where these CSPs are expected to be compounded routinely. When CSPs will be distributed to and administered in residential locations other than healthcare facilities, the effect of potentially uncontrolled and unmonitored temperature conditions must be considered when assigning beyond-use dates. It must be ascertained that CSPs will not be exposed to warm temperatures (see *General Notices and Requirements*) unless the compounding facility has evidence to justify stability of CSPs during such exposure.

It should be recognized that the truly valid evidence of stability for predicting beyond-use dating can be obtained only through product-specific experimental studies. Semiquantitative procedures, such as thin-layer chromatography (TLC), may be acceptable for many CSPs. However, quantitative stability-indicating assays, such as high performance liquid chromatographic (HPLC) assays, would be more appropriate for certain CSPs. Examples include CSPs with a narrow therapeutic index, where close monitoring or dose titration is required to ensure therapeutic effectiveness and to avoid toxicity; where a theoretically established beyond-use dating period is supported by only marginal evidence; or where a significant margin of safety cannot be verified for the proposed beyond-use dating period. In short, because beyond-use dating periods established from product-specific data acquired from the appropriate instrumental analyses are clearly more reliable than those predicted theoretically, the former approach is strongly urged to support dating periods exceeding 30 days.

To ensure consistent practices in determining and assigning beyond-use dates, the pharmacy should have written policies and procedures governing the determination of the beyond-use dates for all compounded products. When attempting to predict a theoretical beyond-use date, a compounded or an admixed product should be considered as a unique system that has physical and chemical properties and stability characteristics that differ from its components. For example, antioxidant, buffering, or antimicrobial properties of a sterile vial for injection (SVI) might be lost upon its dilution, with the potential of seriously compromising the chemical stability of the SVI's active ingredient or the physical or microbiological stability of the SVI formulation in general. Thus, the properties stabilized in the SVI formulation usually cannot be expected to be carried over to the compounded or admixed product. Product-specific, experimentally determined stability data evaluation protocols are preferable to published stability information. Pharmacists should consult the general information chapter under *Pharmaceutical Stability* ⟨1150⟩ for the appropriate stability parameters to be considered when initiating or evaluating a product-specific stability study.

Compounding personnel who assign beyond-use dates to CSPs when lacking direct chemical assay results must critically interpret and evaluate the most appropriate available information sources to decide a conservative and safe beyond-use date. The standard operating procedures manual of the compounding facility and each specific CSP formula record must describe the general basis used to assign the beyond-use date and storage conditions.

~~If multiple-dose parenteral medication vials (MDVs) are used, refrigerate the MDVs after they are opened unless otherwise specified by the manufacturer. Discard the MDVs when empty, when suspected or visible contamination occurs, or when the manufacturer's stated expiration date is reached, provided the manufacturer's storage conditions have been adhered to. Expiration dating not specifically referenced in the package insert should not exceed 30 days once the vial has been opened.~~

■When manufactured multiple-dose vials (MDVs; see *Preservation, Packaging, Storage,* and *Labeling* in the *General Notices and Requirements*) of sterile ingredients are used in CSPs, the stoppers of the MDVs are inspected for physical integrity and disinfected by wiping with an IPA swab before each penetration with a sterile withdrawal device. When contaminants or abnormal properties are suspected or observed in MDVs, such MDVs shall be discarded. The beyond-use date after initially entering or opening (e.g., needle-punctured) multiple-dose containers is 28 days (see *Antimicrobial Effectiveness Testing* ⟨51⟩), unless otherwise specified by the manufacturer.

Proprietary Bag and Vial Systems

Sterility storage and stability beyond-use times for attached and activated (activated is defined as allowing contact of the previously separate diluent and drug contents) container pairs of drug products for intravascular administration, such as ADD-Vantage® and Mini Bag Plus® are as indicated by the

In-Process Revision

manufacturers. In other words, follow manufacturers' instructions for handling and storing ADD-Vantage®, Mini Bag Plus®, Add A Vial®, Add-Ease® products, and any others.■1S (*USP30*)

Monitoring Controlled Storage Areas

To ensure that product potency is retained through the manufacturer's labeled expiration date, pharmacists must monitor the drug storage areas within the pharmacy. Controlled temperature ~~storage areas in the pharmacy (refrigerators, 2° to 8°; freezers, –20° to –10°; and incubators, 30° to 35°; etc.)~~

■areas in compounding facilities include the following: controlled room temperature, 15°to 30° with mean kinetic temperature 25°; cold temperature, 2° to 8°; freezing temperature, –10° and colder (see *General Notices)* if needed to achieve freezing; and microbial culture media at the media-specific temperature range. A controlled temperature area■1S (*USP30*) should be monitored at least once daily and the results documented on a temperature log. Additionally, pharmacy personnel should note the storage temperature when placing the product into or removing the product from the storage unit in order to monitor any temperature aberrations. Suitable temperature recording devices may include a calibrated continuous recording device or a National Bureau of Standards calibrated thermometer that has adequate accuracy and sensitivity for the intended purpose and should be properly calibrated at suitable intervals. If the pharmacy uses a continuous temperature recording device, pharmacy personnel should verify at least once daily that the recording device itself is functioning properly.

The temperature sensing mechanisms should be suitably placed in the controlled temperature storage space to reflect accurately its true temperature. In addition, the pharmacy should adhere to appropriate procedures of all controlled storage spaces to ensure that such spaces are not subject to significantly prolonged temperature fluctuations as may occur, for example, by leaving a refrigerator door open too long.

Change to read:

~~MAINTAINING PRODUCT QUALITY AND CONTROL AFTER THE CSP LEAVES THE PHARMACY~~

■MAINTAINING STERILITY, PURITY, AND STABILITY OF DISPENSED AND DISTRIBUTED CSPs■1S (*USP30*)

~~Sterile Preparations for Institutional Use~~

~~This section pertains to the responsibilities of the pharmacy for maintaining product quality and control after the CSP leaves the pharmacy for distribution and use within the organized health care system to which the pharmacy belongs. The pharmacy is responsible for the quality of all CSPs prepared by or dispensed from the pharmacy, throughout the life cycle of the CSP, regardless of where the CSP exists physically within the organized health care system.~~

■This section summarizes the responsibilities of pharmacy departments for maintaining quality and control of CSPs that are dispensed and administered within their parent healthcare organizations.[14]

Compounding personnel shall ensure proper storage and security of CSPs prepared by or dispensed from the compounding facility, until either their beyond-use dates are reached or they are administered to patients.■1S (*USP30*)
In fulfilling this general responsibility, the ~~pharmacy~~

■compounding facility■1S (*USP30*)
is responsible for the proper packaging, handling, transport, and storage of CSPs prepared by or dispensed from it, including the appropriate education, training, and supervision of ~~pharmacy~~

■compounding■1S (*USP30*)
personnel assigned to these functions. The ~~pharmacy~~

■compounding facility■1S (*USP30*)
should assist in the education and training of ~~nonpharmacy~~

■noncompounding■1S (*USP30*)
personnel responsible for carrying out any aspect of these functions.

Establishing, maintaining, and assuring compliance with comprehensive written policies and procedures encompassing these responsibilities is a further responsibility of the ~~pharmacy~~

■compounding facility.■1S (*USP30*)
Where ~~nonpharmacy~~

■noncompounding■1S (*USP30*)
personnel are assigned tasks involving any of these responsibilities, the policies and procedures encompassing those tasks should be developed by ~~the pharmacy in consultation with other institutional departments as appropriate.~~

■compounding supervisors. The quality and control activities related to distribution of CSPs are summarized in the following five subsections.■1S (*USP30*)
Activities or concerns that should be addressed as the ~~pharmacy~~

■compounding facility■1S (*USP30*)
fulfills these responsibilities are as follows.

Packaging, Handling, and Transport

Inappropriate processes or techniques involved with packaging, handling, and transport can adversely affect ~~product quality and package integrity. While pharmacy~~

■quality and package integrity of CSPs. While compounding■1S (*USP30*)
personnel routinely perform many of the tasks associated with these functions, some tasks, such as transport, handling, and placement into storage, may be fulfilled by ~~nonpharmacy~~

■noncompounding■1S (*USP30*)
personnel who are not under the direct administrative control of the ~~pharmacy~~

■compounding facility.■1S (*USP30*)

[14] Accrediting organizations require that sterile drug and nutrient compounding be controlled by the pharmacy departments of its accredited institutions.

Under these circumstances, appropriate written policies and procedures are established by the ~~pharmacy~~

■compounding facility■1S (*USP30*)
with the involvement of other departments or services whose personnel are responsible for carrying out those CSP-related functions for which the ~~pharmacy~~

■compounding facility■1S (*USP30*)
has a direct interest. The performance of the ~~nonpharmacy~~

■noncompounding■1S (*USP30*)
personnel is monitored for compliance to established policies and procedures.

The critical requirements that are unique to CSPs and that are necessary to ensure ~~product~~

■CSP■1S (*USP30*)
quality and packaging integrity must be addressed in written procedures. For example, techniques should be specified to prevent the depression of syringe plungers or dislodging of syringe tips during handling and transport. Additionally, disconnection of system components (for example, where CSPs are dispensed with administration sets attached to them) must be prevented throughout the ~~life cycle of the product.~~

■beyond-use date of the CSP.■1S (*USP30*)
Foam padding or inserts are particularly useful where CSPs are transported by pneumatic tube systems. Regardless of the methods used, the ~~pharmacy~~

■compounding facility■1S (*USP30*)
has to evaluate their effectiveness and the reliability of the intended protection. Evaluation should be continuous, for example, through a surveillance system, including a system of problem reporting to the ~~pharmacy~~

■compounding facility.■1S (*USP30*)
Inappropriate transport and handling can adversely affect the quality of certain CSPs having unique stability concerns. For example, the physical shaking that might occur during pneumatic tube transport, or undue exposure to heat or light, have to be addressed on a product-specific basis. Alternate transport modes or special packaging measures might be needed for the proper assurance of quality of these CSPs. The use of tamper-proof closures and seals on CSP ports can add an additional measure of security to ensure product integrity regardless of transport method used.

Chemotoxic and other hazardous CSPs require safeguards to maintain the integrity of the CSP and to minimize the exposure potential of these products to the environment and to personnel who may come in contact with them.

■Transportation by pneumatic tube should be discouraged because of potential breakage and contamination.■1S (*USP30*)
Special requirements associated with the packaging, transport, and handling of these agents include the prevention of accidental exposures or spills and the training of personnel in the event of an exposure or spill. Examples of special requirements of these agents also include exposure-reducing strategies such as the use of Luer lock syringes and connections, syringe caps, the capping of container ports, sealed plastic bags, impact-resistant containers, and cautionary labeling. ~~Appropriate cushioning for pneumatic tube transport should be selected and evaluated to ensure that the products so conveyed can withstand the stresses induced by the system. Pneumatic transport of nonevaluated packaging alternatives should be avoided. Additional references should be consulted as necessary for further information on handling chemotoxic and other hazardous drugs.~~

■■1S (*USP30*)

Use and Storage

The pharmacy

■or other compounding facility■1S (*USP30*)
is responsible for ensuring that CSPs in the patient-care setting maintain their quality until administered. The immediate labeling of the CSP container will display prominently and understandably the requirements for proper storage and expiration dating. Delivery and patient-care-setting personnel must be properly trained to deliver the CSP to the appropriate storage location. Outdated and unused CSPs must be returned to the pharmacy ~~for disposal or possible reuse.~~

■or other compounding facility for disposition.■1S (*USP30*)
Written procedures have to exist to ensure that storage conditions in the patient-care setting are suitable for the CSP-specific storage requirements. Procedures include daily monitoring and documentation of drug storage refrigerators to ensure temperatures between 2° and 8° and the monthly inspection of all drug storage locations by pharmacy personnel. Inspections must confirm compliance with appropriate storage conditions, separation of drugs and food, proper use of multiple-dose containers, and the avoidance of using single-dose products as multiple-dose containers. CSPs, as well as all other drug products, must be stored in the patient-care area in such a way as to secure them from unauthorized personnel, visitors, and patients.

~~Administration~~

■Readying for Administration■1S (*USP30*)

Procedures essential for generally ensuring ~~product~~

■■1S (*USP30*)
quality, especially sterility assurance, when readying a CSP for its subsequent administration include proper hand-washing, aseptic technique, site care, and change of administration sets. Additional procedures may also be essential for certain ~~products,~~

■CSPs,■1S (*USP30*)
devices, or techniques. Examples where such special procedures are needed include in-line filtration, the operation of automated infusion control devices, and the replenishment of ~~drug products~~

■CSPs■1S (*USP30*)
into the reservoirs of implantable or portable infusion pumps.

■When CSPs are likely to be exposed to warmer than 30° for more than 1 hour during their administration to patients, the maintenance of their sterility and stability must be confirmed from either relevant and reliable sources or direct testing.■1S (*USP30*)

Redispensed CSPs

~~The pharmacy must have the sole authority for determining whether a CSP not administered as originally intended can be used for an alternate patient or under alternate conditions. All CSPs that are not used as originally intended must be returned to the pharmacy for appropriate disposition, which may include redispensing, but only if adequate continuing quality can be fully ensured.~~

■The pharmacy or other compounding facility must have the sole authority to determine when unopened, returned CSPs may be redispensed. Returned CSPs may be redispensed only

In-Process Revision

when personnel responsible for sterile compounding can ensure that such CSPs are sterile, pure, and stable (contain labeled strength of ingredients).■1S (*USP30*)
The following may provide such assurance: the CSP was maintained under continuous refrigeration and protected from light, if required; and no evidence of tampering or any readying for use outside the pharmacy exists. ~~, and there is sufficient time remaining until the originally assigned beyond-use time and date will be reached~~

■Assignment of new storage times and beyond-use dates that exceed the original dates for returned CSPs is permitted only when there is supporting evidence from sterility testing and quantitative assay of ingredients.■1S (*USP30*)
Thus, initial preparation and thaw times should be documented and reliable measures should have been taken to prevent and detect tampering. Compliance with all procedures associated with maintaining product quality is essential. The CSP must not be redispensed if there is not adequate assurance that product quality and packaging integrity (including the connections of devices, where applicable) were continuously maintained between the time the CSP left and the time that it was returned. ~~to the pharmacy~~

■■1S (*USP30*)
Additionally, CSPs must not be redispensed if redispensing cannot be supported by the originally assigned beyond-use time.

Education and Training

The assurance of CSP quality and packaging integrity is highly dependent upon the proper adherence of all personnel to the pertinent written procedures. The ~~pharmacy~~

■compounding personnel■1S (*USP30*)
must design, implement, and maintain a formal education, training, and competency assessment program that encompasses all the functions and tasks addressed in the foregoing sections and all personnel to whom such functions and tasks are assigned. This program includes the assessment and documentation of procedural breaches, administration mishaps, side effects, allergic reactions, and complications associated with dosage or administration, such as extravasation. This program should be coordinated with the institution's adverse-event and incident reporting programs.

Add the following:

■ACRONYMS

ACD	automated compounding devices
ACPH	air changes per hour
ALARA	as low as reasonably achievable
ASHRAE	American Society of Heating, Refrigerating and Air-Conditioning Engineers
BSC	biological safety cabinet
CAI	compounding aseptic isolator
CDC	Centers for Disease Control and Prevention
CETA	Controlled Environment Testing Association
cfu	colony-forming units
CSPs	compounded sterile preparations
CSTD	closed-system vial-transfer devices
DCCA	direct and contiguous compounding areas
EU	Endotoxin Unit
FDA	Food and Drug Administration
FPM	feet per minute
HEPA	high efficiency particulate air
HICPAC	Healthcare Infection Control Practices Advisory Committee
HPLC	high performance liquid chromatography
HVAC	heating, ventilation, and air conditioning
IPA	isopropyl alcohol
LAFW	laminar airflow workbenches
MDVs	multiple-dose vials
MEA	malt extract agar
MMWR	Morbidity and Mortality Weekly Report
NBS	National Bureau of Standards

CRITERIA	LOW RISK LEVEL	MEDIUM RISK LEVEL	HIGH RISK LEVEL
CSP Work Environment	• Appropriate solid surfaces • Limited (but necessary) furniture, fixtures, etc. • Anteroom area • Buffer zone	See low-risk level.	See low-risk level.
Equipment	• Written policies and procedures that address calibration, routine maintenance, personnel training	See low-risk level.	See low-risk level.
Components	• Written policies and procedures that address Sterile components	See low-risk level.	Sterile and nonsterile drug components must meet the compendial standards if available • Written policies and procedures that address — Sterile components — Nonsterile components
Processing: Aseptic Technique	• Written policies and procedures that address specific training and performance evaluation • Critical operations are carried out in a Direct Compounding Common Area (DCCA)	See low-risk level.	See low-risk level.
Environmental Control	• Policies and procedures that address — Cleaning and sanitizing the workspaces (DCCA) — Personnel and gowning — Standard operating procedures	See low-risk level.	See low-risk level.
Verification Procedures • Sterility Testing	Not required	Not required	Yes, recommended
Verification Procedures • Environmental Monitoring	• Certification of LAFW and barrier isolates every six (6) months • Certification of the buffer room/zone and anteroom/zone every six (6) months • Bacterial monitoring using an appropriate manner at least monthly	See low-risk level.	See low-risk level.
Verification Procedures • Personnel Training and Education	Initially and annually thereafter • Didactic review • Written testing • Media fill testing	See low-risk level.	See low-risk level.

APPENDIX

■Principle Competencies, Conditions, Practices, and Quality Assurances That Are Required (▶ "shall" or "must") and Recommended (• "should" or "is advised") in USP Chapter ⟨797⟩

NOTE—This tabular appendix selectively abstracts and condenses the full text of ⟨797⟩ for rapid reference only. Compounding personnel are responsible for the full text and all official USP terminology, content, and conditions therein.

⟨797⟩ Section	**Competencies, Conditions, and Practices**
INTRODUCTION	• Chapter purpose is to prevent harm and death to patients treated with CSPs. ▶ Chapter pertains to preparation, storage, and transportation, but not administration, of CSPs. ▶ Personnel and facilities to which ⟨797⟩ applies; therefore, for whom and at which facility the standards may be enforced by regulatory and accreditation authorities. ▶ Types of preparations designated to be CSPs according to their physical forms, and their sites and routes of administration to patients.
DEFINITIONS	▶ Several that are important to ⟨797⟩.
Pharmacy Bulk Package	▶ One penetration of the closure with sterile devices in ISO Class 5 or cleaner air to obtain multiple single doses. ▶ Labeled "Pharmacy Bulk Package—Not for Direct Infusion." ▶ Beyond-use time after initial entry is that stated by the manufacturer.
RESPONSIBILITY OF COMPOUNDING PERSONNEL	▶ Practices and quality assurance procedures required to prepare, store, and transport CSPs that are sterile, and acceptably accurate, pure, and stable.
CSP MICROBIAL CONTAMINATION RISK LEVELS	▶Proper training and evaluation of personnel, proper cleansing and garbing of personnel, proper cleaning and disinfecting of compounding work environments, and proper maintenance and monitoring of controlled environmental locations (all of which are detailed in their respective sections).
Low-Risk Level CSPs	▶ Aseptic manipulations within an ISO Class 5 environment using three or fewer sterile products and entries into any container. ▶ In absence of passing sterility test, store not more than 48 hours at controlled room temperature, 14 days at cold temperature, and 45 days in solid frozen state at –20° or colder. ▶ Media-fill test at least annually by compounding personnel.

APPENDIX

■Principle Competencies, Conditions, Practices, and Quality Assurances That Are Required (▶ "shall" or "must") and Recommended (● "should" or "is advised") in USP Chapter ⟨797⟩

NOTE—This tabular appendix selectively abstracts and condenses the full text of ⟨797⟩ for rapid reference only. Compounding personnel are responsible for the full text and all official USP terminology, content, and conditions therein. *(Continued)*

⟨797⟩ Section	Competencies, Conditions, and Practices
Medium-Risk Level CSPs	▶ Aseptic manipulations within an ISO Class 5 environment using prolonged and complex mixing and transfer, or more than three sterile products and entries into any container, or pooling ingredients from multiple sterile products to prepare multiple CSPs. ▶ In absence of passing sterility test, store not more than 30 hours at controlled room temperature, 9 days at cold temperature, and 45 days in solid frozen state at –20° or colder. ▶ Media-fill test at least annually by compounding personnel.
High-Risk Level CSPs	▶ Confirmed presence of nonsterile ingredients and devices, or confirmed or suspected exposure of sterile ingredients for more than 1 hour to air quality inferior to ISO Class 5 before final sterilization. ▶ Sterilization method verified to achieve sterility for the quantity and type of containers. ▶ Meet allowable limits for bacterial endotoxins. ▶ Maintain acceptable strength and purity of ingredients and integrity of containers after sterilization. ▶ In absence of passing sterility test, store not more than 24 hours at controlled room temperature, 3 days at cold temperature, and 45 days in solid frozen state at –20° or colder. ▶ Media-fill test at least semiannually by compounding personnel.
IMMEDIATE USE CSPs	▶ Fully comply with all six specified criteria.
SINGLE-DOSE AND MULTIPLE-DOSE CONTAINERS	▶ Beyond-use date 28 days, unless specified otherwise by the manufacturer, for closure sealed multiple-dose containers after initial opening or entry. ▶ Beyond-use time of 6 hours, unless specified otherwise by the manufacturer, for closure sealed single-dose containers in ISO Class 5 or cleaner air after initial opening or entry. ▶ Beyond-use time of 1 hour for closure sealed single-dose containers after being opened or entered in worse than ISO Class 5 air. ▶ Storage of opened single-dose ampuls is not permitted.

⟨797⟩ Section	Competencies, Conditions, and Practices
HAZARDOUS DRUGS AS CSPs	▶ Appropriate personnel protective equipment. ▶ Appropriate primary engineering controls (BSCs and CAIs) for concurrent personnel protection and exposure of critical sites are in a separate ISO Class 7 room with at least 0.01-inch water column negative pressure. ▶ Segregated drug storage is in a room with at least 12 air changes per hour (ACPH). ▶ CAIs that maintain ISO Class 5 environment within the compounding chamber when located in air quality worse than ISO Class 7 must be located in rooms with a minimum of 0.01-inch water column negative pressure and 12 air changes per hour (ACPH). ▶ Annual documentation of full training of personnel regarding storage, handling, and disposal of hazardous drugs. • Total external exhaust of primary engineering controls. • Negative pressure in drug storage rooms. • Assay of surface wipe samples every 6 months.
RADIOPHARMACEUTICALS AS CSPs	▶ Positron Emission Tomography is according to USP chapter ⟨823⟩. ▶ Appropriate primary engineering controls and radioactivity containment and shielding. ▶ Location of primary engineering controls permitted in ISO Class 8 controlled environment. ▶ Technetium-99m/molybdenum-99 generators used according to manufacturer, state, and federal requirements.
VERIFICATION OF COMPOUNDING ACCURACY AND STERILITY	▶ Review labels and document correct measurements, aseptic manipulations, and sterilization procedures to confirm correct identity, purity, and strength of ingredients in, and sterility of CSPs.
Sterilization Methods	▶ Verify methods achieve sterility while maintaining appropriate strength, purity, quality, and packaging integrity. ▶ Prove sterility of High-risk level batches of more than 25 units by USP chapter ⟨71⟩ or superior sterility testing. • Prove effectiveness for High-risk level of 25 units or less by USP chapter ⟨71⟩, equivalent, or superior sterility testing.

APPENDIX

■Principle Competencies, Conditions, Practices, and Quality Assurances That Are Required (▶ "shall" or "must") and Recommended (• "should" or "is advised") in USP Chapter ⟨797⟩

⟨797⟩ Section	Competencies, Conditions, and Practices
Sterilization of High-Risk Level CSPs by Filtration	▶ Nominal 0.2-µm porosity sterile membranes that are chemically and physically compatible with the CSP. ▶ Complete rapidly without filter replacement. ▶ Subject filter to manufacturer's recommended integrity test, e.g., bubble point test, after filtering CSPs.
Sterilization of High-Risk Level CSPs by Steam	▶ Test to verify the mass of containers to be sterilized will be sterile after the selected exposure duration in the particular autoclave. ▶ Ensure live steam contacts all ingredients and surfaces to be sterilized. ▶ Pass solutions through a 1.2-µm or smaller porosity filter into final containers to remove particulates before sterilization.
PERSONNEL TRAINING AND EVALUATION IN ASEPTIC MANIPULATION SKILLS	▶ Pass didactic and media-fill testing initially, followed by annually.
ENVIRONMENTAL QUALITY AND CONTROL Exposure of Critical Sites	▶ ISO Class 5 or better air. ▶ Preclude direct contact (e.g., touch and secretions) contamination.
Facility Design and Environmental Controls	▶ Primary engineering controls provide unidirectional (i.e., laminar) HEPA air at a velocity sufficient to prevent airborne particles from contacting critical sites. ▶ Cleanrooms for nonhazardous and nonradioactive CSPs are supplied with HEPA that enters from ceilings with return vents low on walls, and provide not less than 30 air changes per hour. ▶ Buffer rooms or zones maintain 0.02- to 0.05-inch water column positive pressure, and do not contain sinks or drains. ▶ Air velocity from buffer rooms or zones to anterooms or ante-areas is at least 40 feet per minute. • Surfaces and essential furniture in buffer rooms or zones and cleanrooms are nonporous, smooth, nonshedding, impermeable, cleanable, and resistant to disinfectants.

⟨797⟩ Section	**Competencies, Conditions, and Practices**
Placement of Primary Control within ISO Class 7 Buffer Areas	▶ Primary engineering controls for nonhazardous and nonradioactive CSPs are located in cleanrooms, except for CAIs that are proven to maintain ISO Class 5 air when particle counts are sampled 6 to 12 inches upstream of critical site exposure areas during performance of normal inward and outward transfer of materials, and compounding manipulations when such CAIs are located in air quality worse than ISO Class 7. ▶ Food, drinks, and items exposed in patient care areas, and unpacking of bulk supplies and personnel cleansing and garbing are prohibited from buffer areas or rooms. ▶ Demarcation designation between buffer areas or rooms and anterooms or ante-areas. ▶ Antiseptic hand cleansing and sterile gloves in buffer areas or rooms.
Cleaning and Disinfecting the Sterile Compounding Areas	▶ Trained personnel write detailed procedures including cleansers, disinfectants, and nonshedding wipe and mop materials. ▶ Work surfaces in ISO Class 7 and 8 areas cleaned at least daily. ▶ Floors in ISO Class 7 and 8 areas cleaned daily when no compounding occurs. ▶ IPA (70% isopropyl alcohol) remains on surfaces to be disinfected for at least 30 seconds before such are used to prepare CSPs. ▶ Emptied shelving, walls, and ceilings in anterooms and ante-areas cleaned at least monthly.

APPENDIX

■Principle Competencies, Conditions, Practices, and Quality Assurances That Are Required (▶ "shall" or "must") and Recommended (• "should" or "is advised") in USP Chapter ⟨797⟩

⟨797⟩ Section	Competencies, Conditions, and Practices
Personnel Cleansing and Garbing	▶ Personnel with rashes, sunburn, weeping sores, conjunctivitis, active respiratory infection, and sheddable cosmetics are prohibited from preparing CSPs. ▶ Compounding personnel remove personal outer garments; cosmetics; artificial nails; hand, wrist, and body jewelry that can interfere with the fit of gowns and gloves; and visible body piercing above the neck. ▶ Order of compounding garb and cleansing in anteroom or ante-area: shoes or shoe covers, head and facial hair covers, face mask, fingernail cleansing, hand and forearm washing and drying; nonshedding gown. ▶ Order of cleansing and gloving in buffer room or area: hand cleansing with a persistently active alcohol-based product containing 0.5% to 1.0% chlorhexidine gluconate, allow hands to dry; sterile gloves. ▶ Routinely disinfect gloves with IPA after contacting nonsterile objects. ▶ Inspect gloves for holes and replace when breaches are detected. ▶ Personnel repeat proper procedures after they are exposed to direct contact contamination or worse than ISO Class 8 air. ▶ These requirements are exempted only for Immediate Use CSPs and CAIs for which manufacturers provide written documentation based on validated testing that such personnel practices are not required to maintain sterility in CSPs.
STANDARD OPERATING PROCEDURES	▶ All facilities are required to have these, and they must include at least the items enumerated in this section.
ENVIRONMENTAL MONITORING Sampling Plan	▶ Plan includes locations, methods, air volumes, frequency, and time of day sampling occurs in ISO Class 5, 7, and 8 controlled environments.
Growth Media	• Typical media to support bacterial and fungal growth in contact samples.
Air Sampling	▶ At least monthly by active electronic air sampling in controlled ISO Class 5, 7, and 8 areas for preparing Low- and Medium-risk level CSPs, and at least weekly in those areas where High-risk level CSPs are prepared. • Improve environmental controls and aseptic personnel practices when $\geq$3, $\geq$20, and $\geq$100 microbial cfu per m^3 air are detected in, respectively, ISO Class 5, 7, and 8 controlled environments.

In-Process Revision

⟨797⟩ Section	Competencies, Conditions, and Practices
Surface Sampling	• Surfaces in primary engineering controls using sterile contact agar plates or swabs. • At least monthly in ISO Class 5, 7, and 8 areas for preparing Low- and Medium-risk level CSPs, and at least weekly in those areas where High-risk level CSPs are prepared. • Improve cleaning, disinfecting, and personnel aseptic practices when $\geq$3, $\geq$5, and $\geq$100 microbial cfu per 24 to 30 cm^2 area are detected in, respectively, ISO Class 5, 7, and 8 controlled environments.
Personnel Monitoring	▶ Fingertips of gloves of at least one member or 10% of compounding personnel, whichever is greater, using sterile agar plates weekly when compounding Low- and Medium-risk level CSPs, and daily when compounding High-risk level CSPs. • Improve cleaning, disinfecting, and personnel aseptic practices when $\geq$3 microbial cfu are detected per sample.
Total Particle Counts	▶ Active electronic air sampling in ISO Class 5, 7, and 8 controlled areas at least every 6 months, and when primary engineering controls are relocated and physical structures are changed in cleanrooms, buffer rooms or zones, and anterooms or ante-areas.
Pressure Differential Monitoring	• Pressure differential between ISO Class 7 cleanrooms and surrounding uncontrolled environment is not less than 0.02-inch water column.
FINISHED PREPARATION RELEASE CHECKS AND TESTS Inspection of Solution Dosage Forms and Review of Compounding Procedures	▶ Review procedures and documents to ensure sterility, purity, correct identities and amounts of ingredients, and stability. ▶ Visually inspect for abnormal particulate matter and color, and intact containers and seals.
Sterility Testing	▶ High-risk level CSPs prepared in batches of more than 25 identical containers, or exposed longer than 12 hours at 2° to 8° and 6 hours at warmer than 8° before being sterilized.
Bacterial Endotoxin (Pyrogen) Testing	▶ High-risk level CSPs, excluding those for inhalation and ophthalmic administration, prepared in batches of more than 25 identical containers, or exposed longer than 12 hours at 2° to 8° and 6 hours at warmer than 8° before being sterilized.

APPENDIX

⟨797⟩ Section	Competencies, Conditions, and Practices
Identity and Strength Verification of Ingredients	▶ Written procedures to verify correct identity, quality, amounts, and purities of ingredients used in CSPs. ▶ Written procedures to ensure labels of CSPs contain correct names and amounts or concentrations of ingredients, total volumes, beyond-use dates, storage conditions, and route(s) of administration.
STORAGE AND BEYOND-USE DATING Determining Beyond-Use Dates	▶ Use the general criteria in USP ⟨795⟩ in the absence of direct stability-indicating assays or authoritative literature that supports longer or shorter durations.
MAINTAINING STERILITY, PURITY, AND STABILITY OF DISPENSED AND DISTRIBUTED CSPs	▶ Written procedures for proper packaging, storage, and transportation conditions to maintain sterility, quality, purity, and strength of CSPs.
Redispensed CSPs	▶ When sterility, and acceptable purity, strength, and quality can be ensured. ▶ Assignment of sterility storage times and stability beyond-use dates that occur later than those of originally dispensed CSPs must be based on results of sterility testing and quantitative assay of ingredients.
PACKAGING AND TRANSPORTING CSPs	▶ Packaging maintains physical integrity, sterility, stability, and purity of CSPs. ▶ Modes of transport that maintain appropriate temperatures and prevent damage to CSPs.
PATIENT OR CAREGIVER TRAINING	▶ Multiple component formal training program to ensure patients and caregivers understand the proper storage, handling, use, and disposal of CSPs.
PATIENT MONITORING AND ADVERSE EVENTS REPORTING	▶ Written standard procedures describe means for patients to ask questions and report concerns and adverse events with CSPs, and for compounding supervisors to correct and prevent future problems. • Adverse events and defects with CSPs reported to FDA's MedWatch and USP's MEDMARX programs.■1S (*USP30*)

In-Process Revision

GENERAL CHAPTERS

General Information

BRIEFING

〈**1065**〉 **Ion Chromatography,** *USP 29* page 2898. On the basis of comments received, it is proposed to revise the *Apparatus* section to specify the use of a metal-free tubing system for trace metal analysis. In addition, it is proposed to clarify wording in the *Direct UV Detection* and *Photometric Detection* subsections under *Detectors*.

(GC: H. Pappa) RTS—C43030

Change to read:

APPARATUS

IC instruments closely resemble conventional HPLC instruments. Typical components include an autosampler, a high-pressure pump, an injection valve with a sample loop of suitable size (typically 10 to 250 µL), a guard column, an analytical column, an optional suppressor or other forms of a post-column reaction system, a flow-through detector, and a data system ranging in complexity from an integrator to a computerized data system (*Figure 1*). Because mobile phases generally consist of dilute acids, alkalis, or salt solutions, the components in contact with the mobile phase and the sample are typically made from inert materials, such as polyetheretherketone. Conventional HPLC systems also may be used provided that their components are compatible with the mobile phase and injected sample solutions.

■A metal-free tubing system should be used for trace metal analysis.■1S (*USP30*)

Following suitable preparation, the sample is introduced via the injection valve. After the optional chemical suppression or other post-column reaction on the column effluent, the analyte species are detected using conductivity, amperometry, UV/VIS, or other detection modes. Because IC uses a predominantly ionic mobile phase, a suppressor is often necessary prior to conductometric detection, although nonsuppressed conductometric detection has been successfully used in pharmaceutical analysis.

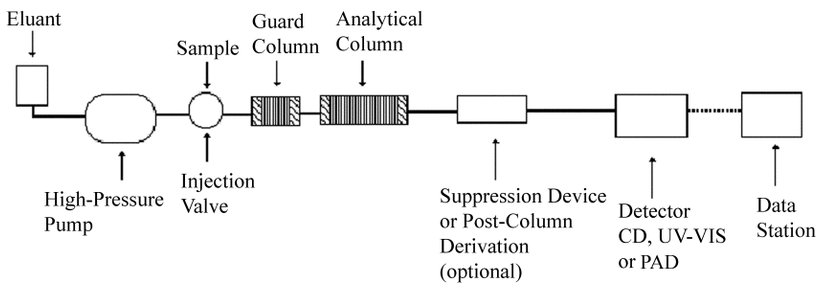

Figure 1. Components of a typical IC system illustrated schematically; CD = conductivity detector and PAD = pulsed amperometric detector.

Stationary and Mobile Phases

As IC has developed and matured as an instrumental technique, the number of ion-exchange materials developed for IC has increased, facilitated by the understanding of the processes taking place at the surface of the stationary phase. In contrast to the silica-based column packing prevalent in classical HPLC, organic polymers are predominately used as support materials for IC. Such materials have a higher stability with respect to extremes in pH and in many cases are compatible with organic solvents. Typically, separation of anions requires the use of polymer-based anion exchangers and dilute bases as mobile phases. However, for cation separations, the stability over the entire pH range that is typical of organic polymers is not necessary, because dilute acids serve as mobile phases. Therefore, silica-based cation exchangers that exhibit a significantly higher chromatographic efficiency are commonly used for the separation of cations.

Depending on the separation mode (ion exchange, ion exclusion, or ion-pair), different types of stationary phases are used. For ion exchange, the stationary phase is either an anion or a cation exchanger. Typically, a strong cation exchanger is used for the ion-exclusion separation of organic acids, and a reversed-phase stationary phase is used when ion-pair is the separation mode. The ion-exchange capacity of a resin is defined as the number of ion-exchange sites per weight equivalent of the column packing and is typically expressed in terms of mEq per g of resin. With ion exchange, the retention times for the analyte ions increase with increasing ion-exchange capacity of the resin. This effect can be partly compensated for by using mobile phases of higher ionic strength. Styrene/divinylbenzene copolymers, polymethacrylate, and polyvinyl resins are the substrate materials used in the manufacturing process of the polymer-based ion exchangers. Organic polymers are functionalized directly at their surface, with the exception of latex-based ion exchangers, where the totally porous latex particle acts as an ion-exchange material. Surface-functionalized, ''pellicular'' substrates show a much higher chromatographic efficiency compared with the fully functionalized resins.

With ion exchange, a mobile phase consisting of mono- or divalent ionic species, alone or mixed at an optimum ratio, is used to accomplish the separation. In ion-exclusion methods, particularly for organic acids, the mobile phase consists of mineral acids to maintain

In-Process Revision

organic acids in their undissociated forms. Often, the nature of the analyte dictates the mobile phase and the detection mode used. Typical mobile phases used in IC are described below in the section on detectors.

Detectors

Conductivity detection is by far the most commonly employed mode of detection in IC. Although the original IC development work included the use of low-capacity ion-exchange resins for efficient chromatographic separation and conductometric detection of ions in a chemically suppressed mobile phase, the advances in column technologies as well as instrumentation development allow the use of high-capacity ion exchange today.

In suppressed IC, the background conductance of the ionic mobile phase is significantly reduced as it flows through the suppression device. For example, dilute NaOH, about 10 to 50 mM, used as the mobile phase in IC of anions is converted to H_2O (poor conductivity) when the column effluent containing NaOH flows through a suppressor device present in an acidic form. The analyte ionic species in the column effluent are converted from their sodium or other metal salt forms to highly conducting acid forms (due to higher equivalent conductance of hydrogen ions compared to other cations). Analogous reactions occur in the hydroxide form suppressor in IC of cations, wherein the acidic mobile phase is converted to water, and the analyte cations are converted to highly conducting hydroxide forms (due to higher equivalent conductance of hydroxide ions compared to other anions).

The reduced background conductance and the enhanced signal due to the ionic species result in an enhanced signal-to-noise ratio for the conductometric detection of ions in suppressed IC. This results in reduced background noise and increasing sensitivity and reproducibility of the analysis. The commonly used chemical suppression devices fall into three broad categories. In the first type, the reactions occur across an ion-exchange membrane with the regenerant ions furnished by either a chemical or as products of electrolysis of water. In the second type, the suppression reactions occur in a packed bed of high-exchange capacity resin material, with regeneration either by a chemical or by electrolysis of water. In the third type, although not commonly used, the suppression reactions occur as the eluant stream mixes with the flowing stream of high-capacity resin material.

For pharmaceutical analyses, suppressed conductometric detection may be used for detection of trace ions in high purity waters. The commonly used mobile phases for the separation of anions by suppressed IC include hydroxide ions or a mixture of bicarbonate and carbonate ions. The common mobile phases for separation of cations usually consist of mineral acids or methanesulfonic acid.

Ion-chromatographic analyses also can be performed without chemical suppression, in which case the analytical column effluent flows directly to a conductivity detector. The typical eluants used in nonsuppressed IC are phthalic acid and *p*-hydroxybenzoic acid for the determination of anions and methanesulfonic acid for the determination of cations. The equivalent conductance values of chloride, sulfate, and other common anions are significantly greater than that of the eluant anion, and therefore, a positive peak is detected as the anions are carried through the detector. The equivalent conductance values of sodium, potassium, calcium, magnesium, and other common cations are significantly lower than that of the cation (H^+) in the eluant. In this instance, a negative peak is detected as the cations are carried through the detector.

Nonsuppressed IC is easier to perform, and it is a useful technique for determining ions of weak acids such as cyanide and sulfide, which are nonconductive after chemical suppression but show a higher baseline noise. Pharmaceutical analyses can be performed in the nonsuppressed mode because the quantification limits are usually in the upper mg per L to low percentage levels. While suppressor-based methodologies must often be implemented on the instrument systems specifically designed for this purpose, IC may be performed without the suppressor on an existing HPLC. This is possible because the commonly used eluants in IC include dilute bases or acids that are compatible for use on existing HPLC instruments. When this approach is considered, analysts are encouraged to consult the instrument manufacturer for applicability of the instrument for the IC analysis.

OTHER DETECTORS

Other commonly used detection modes in IC include pulsed amperometry, direct UV detection, or post-column derivatization followed by UV/VIS detection.

Pulsed Amperometric Detection Mode (PAD)—PAD uses a specialized mode of the conventional amperometric technique. This type of detector is commonly used for the detection of electroactive species, e.g., organic compounds such as carbohydrates, sugar alcohols, amino acids, and organic sulfur species. In PAD, analytes are detected by an oxidative desorption process at the surface of an electrode located in the column effluent stream. Following the detection process, a series of potentials are applied for fixed time periods to clean the electrode surface. Unlike conventional amperometry that suffers from electrode surface fouling, a rapidly repeating sequence of different working potentials, referred to as waveform, helps the removal of the products of redox reactions from the electrode surface. For details of application of IC using PAD in the analysis of mono- and oligosaccharides of glycoproteins, see *Glycoprotein Glycan Analysis* ⟨1084⟩.

Direct

■and Indirect■1S *(USP30)*

UV Detection—Direct UV Detection is used for inorganic and organic ions that possess a UV chromophore. These include organic acids, bromide, iodide, nitrate, nitrite, thiosulfate, and cyano-metal complexes. Analogous to the inverse conductometric detection of cations, UV detection may also be performed indirectly. This method is called indirect photometric chromatography (IPC).

Photometric Detection—Photometric detection involves ~~derivatization~~

■chelation■1S *(USP30)*
of the

■metal ions in■1S *(USP30)*
column effluent with a color-forming reagent prior to detection with a visible wavelength. A classic example is the separation of metal ions in which the column effluent is ~~derivatized~~

■chelated■1S *(USP30)*
with 4-(2-pyridylazo)-resorcinol followed by detection at 510 to 530 nm.

BRIEFING

⟨1118⟩ Monitoring Devices—Time, Temperature, and Humidity, *USP 29* page 2976. It is proposed to revise the *Electronic Time—Temperature History Recorders* section to include a statement that acknowledges the existence of radio frequency devices used in monitoring pharmacopeial articles during storage and shipping.

(P&S: D. Hunt) RTS—C44226

In-Process Revision

Change to read:

ELECTRONIC TIME–TEMPERATURE HISTORY RECORDERS

These devices, which may serve as an alternative to chemical-based TTIs, use one of the electronic temperature measurement technologies described above and create a record of the temperature history experienced by a device. Some are simple electronic devices that record and save temperature values representative of the cumulative temperature history over a period of time. These may be designated as electronic TTIs. They have the advantages of being able to calculate the Mean Kinetic Temperature (MKT) based on the measurements recorded and they can be calibrated.

Data Loggers—A more capable device records the temperature at very short intervals and is able to download the temperature history record to a peripheral system, such as a personal computer. Such devices may be termed electronic temperature data loggers. In addition, data loggers may record the humidity using sensors described below. ~~A data logger may be permanently fixed within a storage environment or it may be portable and travel with a product.~~

■Data loggers may be permanently fixed within a storage facility or they may be portable and travel with a product. Data loggers equipped with radio frequency capability can be used to remotely monitor temperature and humidity of a product while in transit, with the option of being able to download the recorded data when the data loggers arrive at a destination.■1S (*USP30*)

REAGENTS, INDICATORS, AND SOLUTIONS

Reagent Specifications

BRIEFING

Diisopropyl Ether, *USP 29* page 3126 and page 654 of *PF* 32(2) [Mar.–Apr. 2006]. It is proposed to update the specifications for this reagent to reflect the materials available commercially.

(HDQ: M. Marques) RTS—C44419

Change to read:

Diisopropyl Ether *(Isopropyl Ether),* $[(CH_3)_2CH]_2O$—**102.17**

■[*108-20-3*]■1S (*USP30*)
—Colorless, mobile liquid. Slightly soluble in water. Miscible with alcohol and with ether. *[Caution—It is highly flammable. Do not use where it may be ignited. Do not evaporate to the point of near dryness, since it tends to form explosive peroxides.]*

~~*Specific gravity*— between 0.716 and 0.720.~~

~~*Distilling range, Method II* ⟨721⟩— Not less than 95% distills between 65° and 70°.~~

~~*Peroxides*— To 10 mL, contained in a clean, glass-stoppered cylinder previously rinsed with a portion of the ether under examination, add 1 mL of freshly prepared potassium iodide solution (1 in 10). Shake, and allow to stand for 1 minute: no yellow color is observed in either layer (about 0.001% as H_2O_2).~~

~~*Residue on evaporation*— [NOTE—*If peroxide is present, do not carry out this procedure.*] Evaporate 14 mL (10 g) from a tared shallow dish, and dry at 105° for 1 hour: the residue weighs not more than 1 mg (0.01%).~~

~~*Acidity*— Add 2 drops of bromothymol blue TS to 10 mL of water in a glass-stoppered, 50-mL flask, and titrate with 0.010 N sodium hydroxide until a blue color persists after vigorous shaking. Add 5 mL of diisopropyl ether, and titrate with 0.010 N sodium hydroxide: not more than 0.30 mL is required to restore the blue color (0.005% as CH_3COOH).~~

~~[NOTE—For spectrophotometric determinations, use diisopropyl ether that meets the following additional requirement.]~~

~~*Absorbance*— Its absorbance at 255 nm, in a 10-mm quartz cell, does not exceed 0.2, water being used as the blank.~~

■Use ACS reagent grade.■1S (*USP30*)

BRIEFING

2,4-Dinitrophenylhydrazine, *USP 29* page 3128. It is proposed to include the CAS number and some synonyms to facilitate the procurement of these reagents.

(HDQ: M. Marques) RTS—43402-18

Change to read:

2,4-Dinitrophenylhydrazine, $2,4\text{-}C_6H_3(NO_2)_2NHNH_2$—**198.14**

■[*119-26-6*]■1S (*USP30*)
—Orange-red crystals, which under the microscope appear individually to be lemon-yellow, lath-like needles. Very slightly soluble in water; slightly soluble in alcohol; moderately soluble in dilute inorganic acids.

Melting range ⟨741⟩: between 197° and 200°.

Solubility in sulfuric acid—Dissolve 500 mg in a mixture of 25 mL of sulfuric acid and 25 mL of water: the solution is clear or not more than slightly turbid.

Residue on ignition (Reagent test): negligible, from 500 mg.

BRIEFING

Dioxane, *USP 29* page 3128—See briefing under *2,4-Dinitrophenylhydrazine.*

Change to read:

Dioxane *(Diethylene Dioxide; 1,4-Dioxane),* $C_4H_8O_2$—**88.11**

■[*123-91-1*]■1S (*USP30*)
—Use ACS reagent grade.

BRIEFING

Diphenyl Ether, *USP 29* page 3128—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43402-20

Change to read:

Diphenyl Ether *(Phenyl Ether),* $(C_6H_5)_2O$—**170.21**

■[*101-84-8*]■1S (*USP30*)
—A colorless liquid. Insoluble in water; soluble in glacial acetic acid and in most organic solvents. Boils at about 259°.

Melting range ⟨741⟩: between 26° and 28°.

BRIEFING

Diphenylamine, *USP 29* page 3128—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43403-1

Change to read:

Diphenylamine, $(C_6H_5)_2NH$—**169.22**

■[*122-39-4*]■1S (*USP30*)
—Use ACS reagent grade.

BRIEFING

Diphenylcarbazide, *USP 29* page 3128—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43403-2

Change to read:

Diphenylcarbazide, $(C_6H_5NHNH)_2CO$—**242.28**

■[*140-22-7*]■1S (*USP30*)
—Use ACS reagent grade 1,5-Diphenylcarbohydrazide.

BRIEFING

Diphenylcarbazone, *USP 29* page 3128—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43403-3

Change to read:

Diphenylcarbazone *[Diphenylcarbazone compd. with s-Diphenylcarbazide (1 : 1)],* $C_6H_5NHNHCON{:}\ NC_6H_5 \cdot C_6H_5NHNHCONHNHC_6H_5$—**482.54**

■[*538-62-5*]■1S (*USP30*)
—Use ACS reagent grade Diphenylcarbazone Compound with *s*-Diphenylcarbazide (1 : 1).

BRIEFING

2,2-Diphenylglycine, *USP 29* page 3128—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43403-4

Change to read:

2,2-Diphenylglycine, $C_{14}H_{13}NO_2$—**227.26**

■[*3060-50-2*]■1S (*USP30*)
—Off-white powder. Melts at about 244°, with decomposition.

Assay—Dissolve about 115 mg, accurately weighed, in 30 mL of methanol. Slowly add about 20 mL of water, heating slightly if necessary for complete solution. Titrate with 0.1 N sodium hydroxide VS, determining the endpoint potentiometrically. Perform a blank determination and make any necessary correction. Each mL of 0.1 N sodium hydroxide is equivalent to 22.73 mg of $C_{14}H_{13}NO_2$. Not less than 98.0% is found.

In-Process Revision

BRIEFING

Dipropyl Phthalate, *USP 29* page 3128—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43403-5

Change to read:

Dipropyl Phthalate, $C_{14}H_{18}O_4$—**250.29**

■[*131-16-8*]■1S (*USP30*)
—Viscous, colorless liquid.

Assay—

MOBILE PHASE—Prepare a mixture of acetonitrile and water (52 : 48).

PROCEDURE—Inject about 20 µL into a suitable liquid chromatograph (see *Chromatography* ⟨621⟩) equipped with a 230-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 2.0 mL per minute. The area of the $C_{14}H_{18}O_4$ peak is not less than 99% of the total peak area.

Refractive index ⟨831⟩: between 1.495 and 1.499 at 20°.

BRIEFING

4,4′-Dipyridyl Dihydrochloride, *USP 29* page 3128—See briefing under *2,4-Dinitrophenylhydrazine.*

—Red to brownish-red pieces or powder. Use ACS reagent grade.

BRIEFING

Epiandrosterone, *USP 29* page 3129—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43403-14

Change to read:

Epiandrosterone, $C_{19}H_{30}O_2$—**290.44**

■[*481-29-8*]■1S (*USP30*)
—White, crystalline powder.

Assay—When tested by thin-layer chromatography (see *Chromatography* ⟨621⟩) with the use of plates coated with chromatographic silica gel mixture and a developing system consisting of a mixture of toluene and ethanol (9 : 1), examined under short-wavelength UV light, a single spot is exhibited, with trace impurities.

Melting range ⟨741⟩: between 172° and 177°.

BRIEFING

Equilenin, *USP 29* page 3129—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43403-15

Change to read:

Equilenin, $C_{18}H_{18}O_2$—**266.33**

■[*517-09-9*]■1S (*USP30*)
—Colorless or white crystals or crystalline powder. Insoluble in water; soluble in chloroform and in dioxane; moderately soluble in alcohol.

Melting range, Class II ⟨741⟩: between 256° and 260°.

Specific rotation ⟨781⟩: between +85° and +88°, determined in a solution in dioxane containing 75 mg of equilenin in each 10 mL.

Absorption maxima—An alcohol solution exhibits absorption maxima at 231, 282, 325, and 340 nm.

BRIEFING

Eriochrome Cyanine R, *USP 29* page 3129—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43403-16

Change to read:

Eriochrome Cyanine R, $C_{23}H_{15}Na_3O_9S$—**536.40**

■[*3564-18-9*]■1S (*USP30*)
—Dark, red-brown powder. Freely soluble in water; insoluble in alcohol.

In-Process Revision

Solubility—200 mg in 100 mL of water yields a solution that remains clear and free from undissolved matter for 30 minutes.

Loss on drying ⟨731⟩—Dry it in vacuum over silica gel to constant weight: it loses not more than 2% of its weight.

Residue on ignition (Reagent test)—0.5 g, treated with 1 mL of sulfuric acid and 2 mL of nitric acid, yields between 42.0% and 44.0% of the dry weight (theoretical yield is 42.9% of Na_2SO_4).

Sensitiveness—Add 2 mL of a solution (1 in 1000) to 1 mL of aluminum sulfate solution (1 in 10,000), heat at 37 ± 3° for 5 minutes, cool, and add 1 mL of sodium acetate TS: a strong red to red-violet color is produced in not more than 5 minutes.

BRIEFING

Ethanesulfonic Acid, *USP 29* page 3129—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43403-18

Change to read:

Ethanesulfonic Acid, $C_2H_5SO_3H$—**110.13**

■[*594-45-6*]■1S (*USP30*)
—Colorless to light yellow liquid. Soluble in water.

Assay—Accurately weigh about 300 mg, dissolve in 30 mL of water, add phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS. Each mL of 0.1 N sodium hydroxide is equivalent to 11.013 mg of $C_2H_5SO_3H$: between 94.0% and 106.0% is found.

Refractive index ⟨831⟩: between 1.432 and 1.436 at 20°.

BRIEFING

2-Ethoxyethanol, *USP 29* page 3129—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43404-11

Change to read:

Ethylene Glycol, $HOCH_2CH_2OH$—**62.07**

■[*107-21-1*]■1S *(USP30)*
—Clear, colorless, slightly viscous, hygroscopic ▲▲*USP29* liquid. Slightly soluble in ether; practically insoluble in benzene. Miscible with water and with alcohol.

Specific gravity ⟨841⟩: about 1.11.

Boiling range (Reagent test): between 194° and 200°.

Residue on ignition—Evaporate 100 mL (110 g) in a tared evaporating dish over a flame until the vapors continue to burn after the flame is removed. Allow the vapors to burn until the specimen is consumed. Ignite at 800 ± 25° for 1 hour, cool, and weigh: the residue weighs not more than 5.5 mg (0.005%).

Acidity—Add 0.2 mL of phenol red TS to 50 mL of water, and titrate with 0.1 N sodium hydroxide to a red endpoint. Add 50 mL (55 g) of ethylene glycol, and titrate with 0.1 N sodium hydroxide: not more than 1 mL is required to restore the red color (0.01% as CH_3COOH).

Chloride (Reagent test)—A 4.5-mL (5-g) portion shows not more than 0.025 mg of Cl (5 ppm).

Water, Method I ⟨921⟩: not more than 0.20%.

BRIEFING

1-Ethylquinaldinium Iodide, *USP 29* page 3130—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43404-12

Change to read:

1-Ethylquinaldinium Iodide, $C_{12}H_{14}IN$—**299.15**

■[*606-55-3*]■1S *(USP30)*
—Yellow-green solid. Sparingly soluble in water.

Assay—Dissolve about 290 mg, accurately weighed, in 100 mL of water, and add 10 mL of glacial acetic acid. Titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically, using a silver-ion selective electrode and a calomel reference electrode containing 1 M potassium nitrate. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N silver nitrate is equivalent to 29.92 mg of $C_{12}H_{14}IN$: not less than 97.0% is found.

BRIEFING

Fast Blue B Salt, *USP 29* page 3130—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43404-14

Change to read:

Fast Blue B Salt, $C_{14}H_{12}N_4O_2 \cdot ZnCl_4$—**475.47**

■[*91-91-8*]■1S *(USP30)*
—Green powder.

Loss on drying ⟨731⟩—Dry it in vacuum at 110° for 1 hour: it loses not more than 5.0% of its weight.

Absorbance—Dissolve 50 mg in 100 mL of water. In a second container dissolve 100 mg of 2-naphthol in 100 mL of 2-methoxyethanol. Pipet 5 mL of the test solution and 10 mL of the 2-naphthol solution into a 100-mL volumetric flask, and dilute with acetone to volume. For the blank, pipet 5 mL of water and 10 mL of 2-naphthol solution into a second 100-mL volumetric flask, and dilute with acetone to volume. Determine the absorbance of the test solution in a 1-cm cell at the wavelength of maximum absorbance at about 545 nm, with a suitable spectrophotometer, using the blank to set the instrument: the absorbance is not less than 0.80.

BRIEFING

Fast Blue BB Salt, *USP 29* page 3130—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43404-13

Change to read:

Fast Blue BB Salt, $(C_{17}H_{18}ClN_3O_3)_2 \cdot ZnCl_2$—**831.89**

■[*15710-69-7*]■1S *(USP30)*
—Yellow powder melting at about 162°, with decomposition. Sparingly soluble in water.

Chloride—Transfer about 80 mg, accurately weighed, to a suitable beaker. Add 25 mL of acetone, 25 mL of water, and 500 mg of sodium nitrate. Stir until solution is complete. Titrate with 0.01 N silver nitrate VS, determining the endpoint potentiometrically. Perform a blank determination and make any necessary correction. Not less than 15.0% of chloride is found.

BRIEFING

Ferric Chloride, *USP 29* page 3130—See briefing under *2,4-Dinitrophenylhydrazine.*

BRIEFING

Ferric Sulfate, *USP 29* page 3130—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43404-17

Change to read:

Ferric Sulfate, $Fe_2(SO_4)_3 \cdot xH_2O$—

■[*10028-22-5*]■1S *(USP30)*
—Grayish-white, hygroscopic powder, or fawn-colored pearls, slowly soluble in water.

Assay—Accurately weigh about 700 mg, and dissolve it in a mixture of 50 mL of water and 3 mL of hydrochloric acid in a glass-stoppered flask. Add 3 g of potassium iodide, and allow to stand in the dark for 30 minutes. Then dilute with 100 mL of water, and titrate with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Each mL of 0.1 N sodium thiosulfate is equivalent to 5.585 mg of Fe: not less than 21.0% and not more than 23.0% is found.

Insoluble matter (Reagent test)—A 10-g portion, dissolved in a mixture of 100 mL of water and 5 mL of sulfuric acid, shows not more than 2 mg of insoluble matter (0.02%).

Chloride—Dissolve 1 g by warming with a mixture of 10 mL of water and 1 mL of nitric acid, add 4 mL of additional nitric acid, and dilute with water to 50 mL. To 25 mL add 1 mL of phosphoric acid and 1 mL of silver nitrate TS. Any turbidity does not exceed that produced in a control containing 0.01 mg of chloride ion (Cl), 1 mL of nitric acid, 1 mL of phosphoric acid, and 1 mL of silver nitrate TS (0.002%).

Ferrous iron—Dissolve 4 g by warming with 50 mL of dilute sulfuric acid (1 in 10), cool, and titrate with 0.1 N potassium permanganate: not more than 0.16 mL is required to produce a permanent pink color (0.02% as Fe+2). [NOTE—Because the reagents used in the tests for *Copper* and *Zinc* may contain excessive amounts of copper and zinc, they should first be purified by extracting with *Dithizone Extraction Solution* (see *Lead* ⟨251⟩).]

Copper—Dissolve 1.2 g in 100 mL of water. To 10 mL add 50 mL of a solution containing 5 g of ammonium tartrate and 5 mL of ammonium hydroxide. Add 10 mL of *Standard Dithizone Solution* (see *Lead* ⟨251⟩), shake for 2 minutes, draw off the dithizone layer, and compare the pink color with that in a control containing 6 µg of copper ion (Cu) and treated exactly as the 10-mL portion of test solution. If the color in the test solution is less than that in the control, then the test specimen contains less than the limit of both *Copper* and *Zinc*. If the color in the test solution is more than that in the control, add 15 mL of dilute hydrochloric acid (1 in 250), and shake for 2 minutes. Draw off the dithizone solution, and shake with a second 15 mL of dilute hydrochloric acid (1 in 250) for 2 minutes. Draw off the dithizone, combine the two acid extracts, and reserve for the *Zinc* test. Any pink color in the dithizone solution is not darker than that in the control solution treated exactly as the test solution (0.005%).

Zinc—To the combined acid extracts saved from the *Copper* test, add 0.5 M sodium acetate to bring the pH between 5.0 and 5.5, and then add 1 mL of 0.1 N sodium thiosulfate. Add 10 mL of *Standard Dithizone Solution* (see *Lead* ⟨251⟩), shake for 2 minutes, and allow the layers to separate. Draw off the dithizone, and discard the water layer. Any pink color is not greater than that in a control prepared by adding 0.006 mg of zinc ion (Zn) to the combined acid extracts from the control used in the test for *Copper* (0.005%).

Nitrate—Dissolve 10 g in 100 mL of dilute sulfuric acid (1 in 100), heat to boiling, and pour, slowly, into a mixture of 140 mL of water and 50 mL of stronger ammonia TS. Filter through a folded filter while still hot, wash with hot water until the volume of the filtrate is 300 mL, mix, and cool. To 15 mL of this solution add 1 mL

In-Process Revision

of sodium chloride solution (1 in 200), 0.10 mL of indigo carmine TS, and 15 mL of sulfuric acid. The blue color is not completely discharged at the end of 5 minutes (0.01%).

Substances not precipitated by ammonia—Evaporate to dryness 30 mL of the filtrate obtained in the test for *Nitrate*, and ignite gently: the weight of residue does not exceed 1 mg (0.10%).

BRIEFING

Ferrous Sulfate, *USP 29* page 3131—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43404-18

Change to read:

Ferrous Sulfate, $FeSO_4 \cdot 7H_2O$—**278.02**

■[*7720-78-7*]■1S (*USP30*)
—Use ACS reagent grade.

BRIEFING

Fluorene, *USP 29* page 3131—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43404-19

Change to read:

Fluorene, $C_{13}H_{10}$—**166.22**

■[*86-73-7*]■1S (*USP30*)
—White to off-white crystals or powder. Soluble in benzene, in carbon disulfide, in ether, and in hot alcohol; freely soluble in glacial acetic acid.

Solubility test—One g dissolves in 10 mL of acetone to yield a clear and complete solution.

Melting range ⟨741⟩: between 113° and 117°, within a 2° range.

BRIEFING

9-Fluorenylmethyl Chloroformate, *USP 29* page 3131—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43404-20

Change to read:

9-Fluorenylmethyl Chloroformate, $C_{15}H_{11}ClO_2$—**258.70**

■[*28920-43-6*]■1S (*USP30*)
—Clear, colorless solid. Melts at about 62°.

BRIEFING

Fluorescamine, *USP 29* page 3131—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43407-1

Change to read:

Fluorescamine, $C_{17}H_{10}O_4$—**278.26**

■[*38183-12-9*]■1S (*USP30*)
—White to off-white powder. Very slightly soluble in water; freely soluble in methylene chloride; soluble in alcohol; slightly soluble in chloroform.

Assay—Dissolve about 600 mg in 75 mL of dimethylformamide, and titrate with 0.1 N lithium methoxide to a blue endpoint, using 1% thymol blue in dimethylformamide as the indicator. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N lithium methoxide is equivalent to 27.83 mg of $C_{17}H_{10}O_4$. Not less than 99% is found.

Loss on drying ⟨731⟩—Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.

BRIEFING

4′-Fluoroacetophenone, *USP 29* page 3131—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43407-2

Change to read:

4′-Fluoroacetophenone, $FC_6H_4COCH_3$—**138.14**

■[*403-42-9*]■1S (*USP30*)
—Colorless liquid.

Assay—Inject an appropriate specimen into a suitable gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a flame-ionization detector, helium being used as the carrier gas. The following conditions have been found suitable: a 25-mm × 30-m capillary column coated with a 1-µm layer of phase G2; the injection port temperature is maintained at 200°; the detector temperature is maintained at 250°; the column temperature is maintained at 100° and programmed to rise 10° per minute to 250°. The area of the $FC_6H_4COCH_3$ peak is not less than 99% of the total peak area.

Refractive index ⟨831⟩: 1.510 at 20°.

BRIEFING

Formamide, *USP 29* page 3131—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43407-3

Change to read:

Formamide, $HCONH_2$—**45.04**

■[*75-12-7*]■1S (*USP30*)
—Use ACS reagent grade.

Preparation for Digitoxin Assay—To ensure freedom from ammonia, treat Formamide as follows. Shake a suitable quantity of formamide with about 10% of its weight of anhydrous potassium carbonate for 15 minutes, and filter. Distill the filtrate in an all-glass apparatus under vacuum at a pressure of about 25 mm of mercury or less. Reject the first portion of distillate containing water, and collect the fraction that boils at about 115° at a pressure of 25 mm of mercury or at 101° at a pressure of 12 mm of mercury. Store in tight containers, protected from light.

BRIEFING

Formic Acid, *USP 29* page 3131—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43407-4

Change to read:

Formic Acid, HCOOH—**46.03**

■[*64-18-6*]■1S (*USP30*)
—Use ACS reagent grade Formic Acid, 88 Percent.

BRIEFING

Formic Acid, 96 Percent, *USP 29* page 3131—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43407-5

Change to read:

Formic Acid, 96 Percent, HCOOH—**46.03**

■[*64-18-6*]■1S (*USP30*)
—Use ACS reagent grade Formic Acid, 96 Percent.

(HDQ: M. Marques) RTS—43407-8

Change to read:

Fuchsin, Basic—

■[*632-99-5*]■1S (*USP30*)
—A mixture of rosaniline and pararosaniline hydrochlorides. Crystals or crystalline fragments with a glossy, greenish-bronze luster. Soluble in water, in alcohol, and in amyl alcohol.

To 10 mL of a solution (1 in 500) add 10 mL of ammonia TS and 500 mg of zinc dust, and agitate the mixture: the solution becomes colorless. Place a few drops of the decolorized solution on filter paper and nearby, on the same paper, place a few drops of diluted hydrochloric acid: a red color develops at the zone of contact.

Loss on drying ⟨731⟩—Dry it at 105° to constant weight: it loses not more than 5.0% of its weight.

Residue on ignition (Reagent test)—Ignite 1 g with 0.5 mL of sulfuric acid: the residue weighs not more than 3 mg (0.3%).

BRIEFING

Gadolinium (Gd III) Acetate Hydrate, *USP 29* page 3132—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43407-7

BRIEFING

Hexane, Solvent, *USP 29* page 3133—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43408-6

Change to read:

Hexane, Solvent *(Petroleum Benzin; Petroleum Ether, Ligroin)*

■[*8032-32-4*]■1S *(USP30)*
—Clear, volatile liquid. ▲▲*USP29* Practically insoluble in water; soluble in absolute alcohol. Miscible with ether, with chloroform, with benzene, and with most fixed and volatile oils.
Caution—It is dangerously flammable. Keep it away from flames, and store in tight containers in a cool place.
Use ACS reagent grade Petroleum Ether.

In-Process Revision

BRIEFING

Hexanitrodiphenylamine, *USP 29* page 3133—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43408-7

Change to read:

Hexanitrodiphenylamine *(Dipicrylamine),* $C_{12}H_5N_7O_{12}$—**439.21**

■[*131-73-7*]■1S *(USP30)*
—Yellow-gold powder or prisms. *[Caution—Explosive.]* Usually contains about 15% of water as a safety precaution. Insoluble in water, in alcohol, in acetone, and in ether; soluble in glacial acetic acid and in alkalies.

Water, *Method I* ⟨921⟩ : not more than 16%.

BRIEFING

Hexanophenone, *USP 29* page 3133—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43408-8

Change to read:

Hexanophenone, $C_{12}H_{16}O$—**176.25**

■[*942-92-7*]■1S *(USP30)*
—Yellow liquid.

Assay—Inject an appropriate specimen into a suitable gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a flame-ionization detector, helium being used as the carrier gas. The following conditions have been found suitable: a 0.25-mm × 30-m capillary column coated with a 1-µm layer of phase G3; the injection port temperature is maintained at 280°; the detector temperature is maintained at 300°; the column temperature is maintained at 180° and programmed to rise 10° per minute to 280°. The area of the $C_{12}H_{16}O$ peak is not less than 98% of the total peak area.

Refractive index ⟨831⟩: 1.511 ± 0.002 at 20°.

BRIEFING

Hydrazine Hydrate, 85% in Water, *USP 29* page 3133 and page 186 of *PF* 32(1) [Jan.–Feb. 2006]—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43408-9

Change to read:

Hydrazine Hydrate, 85% in Water, $(NH_2)_2 \cdot H_2O$—**50.06**

■[*7803-57-8*]■1S *(USP30)*
—Colorless liquid.

Assay—Transfer 600 mg, accurately weighed, to a 100-mL volumetric flask. Dilute with water to volume, and mix. Pipet 10 mL into a suitable beaker, and add 1.0 g of sodium bicarbonate and 50.0 mL of 0.1 N iodine VS. Titrate the excess iodine with 0.1 N sodium thiosulfate VS, using starch TS as the indicator. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N iodine is equivalent to ~~12.52 mg~~

▲1.252 mg▲*USP30*
of $(NH_2)_2 \cdot H_2O$. Not less than 83% is found.

BRIEFING

Hydrazine Dihydrochloride, *USP 29* page 3133—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43408-10

Change to read:

Hydrazine Dihydrochloride, $(NH_2)_2 \cdot 2HCl$—**104.97**

■[*5341-61-7*]■1S *(USP30)*
—White powder.

Assay—Dissolve about 34 mg, accurately weighed, in 50 mL of water. Add carefully while stirring, 1 g of sodium bicarbonate. *[Caution—There may be a rapid evolution of carbon dioxide.]* Titrate with 0.1 N iodine solution, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary corrections. Each mL of 0.1 N iodine solution is equivalent to 2.63 mg of $(NH_2)_2 \cdot 2HCl$. Not less than 98% is found.

BRIEFING

Hydriodic Acid, *USP 29* page 3133—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43408-11

Change to read:

Hydriodic Acid, HI—**127.91**

■[*10034-85-2*]■1S *(USP30)*
—Use ACS reagent grade (containing not less than 47.0% of HI).

[NOTE—For methoxy determination (see *Methoxy Determination* ⟨431⟩), use hydriodic acid ACS reagent grade 55%. Use this grade also for alkoxyl determinations in assays in the individual monographs.]

In-Process Revision

BRIEFING

Hydrochloric Acid, *USP 29* page 3133—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43408-12

Change to read:

Hydrochloric Acid, HCl—**36.46**

■[*7647-01-0*]■1S (*USP30*)
—Use ACS reagent grade.

BRIEFING

Hydrochloric Acid, Diluted, *USP 29* page 3133—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43408-12

Change to read:

Hydrochloric Acid, Diluted (10 percent)—

■[*7647-01-0*]■1S (*USP30*)
—Prepare by mixing 226 mL of hydrochloric acid with sufficient water to make 1000 mL.

BRIEFING

Hydrofluoric Acid, *USP 29* page 3133—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43408-13

Change to read:

Hydrofluoric Acid, HF—**20.01**

■[*7664-39-3*]■1S (*USP30*)
—Use ACS reagent grade.

BRIEFING

Hydrogen Peroxide, 30 Percent, *USP 29* page 3133—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43408-14

Change to read:

Hydrogen Peroxide, 30 Percent, H_2O_2—**34.01**

■[*7722-84-1*]■1S (*USP30*)
—Use ACS reagent grade.

BRIEFING

Hydrogen Sulfide, *USP 29* page 3133—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43408-15

Change to read:

Hydrogen Sulfide, H_2S—**34.08**

■[*7783-06-4*]■1S (*USP30*)
—Colorless, poisonous gas, heavier than air. Soluble in water. Is generated by treating ferrous sulfide with diluted sulfuric or diluted hydrochloric acid. Other sulfides yielding hydrogen sulfide with diluted acids may be used. Is also available in compressed form in cylinders.

BRIEFING

Hydroquinone, *USP 29* page 3134—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43408-16

Change to read:

Hydroquinone, $C_6H_4(OH)_2$—**110.11**

■[*123-31-9*]■1S (*USP30*)
—Fine, colorless or white, needle crystals. Darkens on exposure to air and light. Soluble in water, in alcohol, and in ether.

Assay—Accurately weigh about 250 mg, and dissolve in a mixture of 100 mL of water and 10 mL of 0.1 N sulfuric acid in a 250-mL conical flask. Add 3 drops of a 1 in 100 solution of diphenylamine in sulfuric acid, and titrate with 0.1 N ceric sulfate VS until the solution is red-violet in color. Each mL of 0.1 N ceric sulfate is equivalent to 5.506 mg of $C_6H_4(OH)_2$. Not less than 99% is found.

Melting range ⟨741⟩: between 172° and 174°.

BRIEFING

3′-Hydroxyacetophenone, *USP 29* page 3134—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43408-17

Change to read:

3′-Hydroxyacetophenone, $C_8H_8O_2$—**136.15**

■[*121-71-1*]■1S (*USP30*)
—Light brown powder chips and chunks. Melts at about 96°. Sparingly soluble in chloroform, yielding a clear, light yellow solution.

Assay—Inject an appropriate specimen into a suitable gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a flame-ionization detector, helium being used as the carrier gas. The following conditions have been found suitable: a 0.25-mm × 30-m capillary column coated with G1; the detector and the injection port temperatures are maintained at 300°; the column temperature is maintained at 180° and programmed to rise 10° per minute to 280° and held at that temperature for 10 minutes. The area of the main peak is not less than 97% of the total peak area.

BRIEFING

4′-Hydroxyacetophenone, *USP 29* page 3134—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43408-18

Change to read:

4′-Hydroxyacetophenone, $HOC_6H_4COCH_3$—**136.15**

■[*99-93-4*]■1S (*USP30*)
—Gray powder, melting at about 109°.

BRIEFING

***p*-Hydroxybenzoic Acid,** *USP 29* page 3134—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43408-19

Change to read:

***p*-Hydroxybenzoic Acid,** $C_7H_6O_3$—**138.12**

■[*99-96-7*]■1S (*USP30*)
—White crystals.

Assay—Transfer about 700 mg, accurately weighed, to a suitable container, and dissolve in 50 mL of acetone. Add 100 mL of water, mix, and titrate with 0.5 N sodium hydroxide VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.5 N sodium hydroxide is equivalent to 69.06 mg of $C_7H_6O_3$: not less than 97% is found.

Melting range ⟨741⟩: over a range of 2° that includes 216°.

BRIEFING

4-Hydroxybenzoic Acid Isopropyl Ester, *USP 29* page 3134—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43408-20

Change to read:

4-Hydroxybenzoic Acid Isopropyl Ester, $HOC_6H_4COOCH(CH_2)_2$—**180.18**

■[*4191-73-5*]■1S (*USP30*)
—Use a suitable grade.

Melting range ⟨741⟩: between 84° and 87°.

[NOTE—A suitable grade is available from TCI America, www.tciamerica.com.]

BRIEFING

1-Hydroxybenzotriazole Hydrate, *USP 29* page 3134—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43417-1

Change to read:

1-Hydroxybenzotriazole Hydrate, $C_6H_5N_3O \cdot xH_2O$—**135.13** (anhydrous)

■[*123333-53-9*]■1S (*USP30*)
—White, crystalline powder. Sparingly soluble in alcohol yielding a clear, pale yellow solution.

BRIEFING

2-Hydroxybenzyl Alcohol, *USP 29* page 3134—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43417-2

Change to read:

2-Hydroxybenzyl Alcohol, $C_7H_8O_2$—**124.14**

■[*90-01-7*]■1S (*USP30*)
—Off-white flakes. Very soluble in alcohol, in chloroform, and in ether; soluble in 15 parts water and in benzene.

In-Process Revision

Assay—Inject an appropriate specimen into a gas chromatograph (see *Chromatography* ⟨621⟩), equipped with a flame-ionization detector, helium being used as the carrier gas. The following conditions have been found suitable: a 0.25-mm × 30-m capillary column coated with a 1-µm layer of phase G2; the injection port temperature is maintained at 250°; the detector temperature is maintained at 300°; and the column temperature is maintained at 150° and programmed to rise 10° per minute to 280°. The area of the $C_7H_8O_2$ peak is not less than 99% of the total peak area.

Melting range ⟨741⟩: between 83° and 85°.

BRIEFING

4-Hydroxyisophthalic Acid, *USP 29* page 3134—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43417-3

Change to read:

4-Hydroxyisophthalic Acid, $C_8H_6O_4$—**182.13**

■[*636-46-4*]■1S (*USP30*)
—Colorless branched needles. Freely soluble in alcohol and in ether.

Melting range ⟨741⟩: between 308° and 310°, with decomposition at 314° to 315°.

BRIEFING

Hydroxylamine Hydrochloride, *USP 29* page 3134—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43417-4

Change to read:

Hydroxylamine Hydrochloride, $NH_2OH \cdot HCl$—**69.49**

■[*5470-11-1*]■1S (*USP30*)
—Use ACS reagent grade.

BRIEFING

Hydroxy Naphthol Blue, *USP 29* page 3134—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43417-5

Change to read:

Hydroxy Naphthol Blue *(1-(2-Naphtholazo-3,6-disulfonic Acid)-2-naphthol-4-sulfonic Acid, Disodium Salt),* $C_{20}H_{12}N_2O_{11}S_3Na_2$—**598.50**

■[*165660-27-5*]■1S (*USP30*)
—Deposited on crystals of sodium chloride in the concentration of about 1%. Use ACS reagent grade.

BRIEFING

D-α-4-Hydroxyphenylglycine, *USP 29* page 3134—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43417-6

Change to read:

D-α-4-Hydroxyphenylglycine, $C_8H_9NO_3$—**167.16**

■[*22818-40-2*]■1S (*USP30*)
—Shiny leaflets. Sparingly soluble in water, in alcohol, in acetone, in ether, in chloroform, in ethyl acetate, in benzene, and in glacial acetic acid; soluble in alkalies and in mineral acids; freely soluble in warm 20% v/v hydrochloric acid.

Melting range ⟨741⟩: between 220° and 247°, with decomposition.

BRIEFING

4-(4-Hydroxyphenyl)-2-butanone, *USP 29* page 3134—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43417-7

Change to read:

4-(4-Hydroxyphenyl)-2-butanone, $C_{10}H_{12}O_2$—**164.20**

■[*5471-51-2*]■1S (*USP30*)
—White powder.

Assay—Inject an appropriate volume into a gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a flame-ionization detector, helium being used as the carrier gas. The following conditions have been found suitable: a 0.25-mm × 30-m capillary column coated with a 1-µm layer of phase G43; the injection port temperature is maintained at 280°; the detector temperature is maintained at 300°; the column temperature is maintained at 180° and programmed to rise 10° per minute to 280°. The area of the $C_{10}H_{12}O_2$ peak is not less than 98.5% of the total peak area.

Melting range ⟨741⟩: between 81° and 87°.

BRIEFING

8-Hydroxyquinoline, *USP 29* page 3134—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43417-8

Change to read:

8-Hydroxyquinoline *(Oxine),* C_9H_7NO—**145.16**

■[*148-24-3*]■1S *(USP30)*
—Use ACS reagent grade 8-Quinolinol.

BRIEFING

Hypophosphorous Acid, 50 Percent, *USP 29* page 3134—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43417-9

Change to read:

Hypophosphorous Acid, 50 Percent *(Hypophosphorous Acid),* HPH_2O_2—**66.00**

■[*6303-21-5*]■1S *(USP30)*
—A colorless to faintly yellow liquid. Miscible with water and with alcohol.

Assay—Accurately weigh about 4 mL, dilute with 25 mL of water, add methyl red TS, and titrate with 1 N sodium hydroxide VS: each mL of 1 N sodium hydroxide is equivalent to 66.00 mg of HPH_2O_2. Not less than 48% is found.

Chloride—Add 0.2 mL to a mixture of 10 mL of silver nitrate TS and 5 mL of nitric acid, and heat until brown fumes are no longer evolved: any white, insoluble residue remaining is negligible.

Phosphate—Dilute 1 mL with water to 50 mL, render alkaline with ammonia TS, filter if a precipitate is formed, and add to the filtrate 5 mL of magnesia mixture TS: not more than a slight precipitate is formed within 5 minutes.

Sulfate (Reagent test, *Method I*)—Dilute 1 mL with water to 50 mL: 20 mL of the solution shows not more than 0.2 mg of SO_4.

BRIEFING

Imidazole, *USP 29* page 3134—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43417-10

Change to read:

Imidazole, $C_3H_4N_2$—**68.08**

■[*288-32-4*]■1S *(USP30)*
—White to light yellow crystals. Freely soluble in water. Use ACS reagent grade.

BRIEFING

Indene, *USP 29* page 3134—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43417-12

Change to read:

Indene, C_9H_8—**116.16**

■[*95-13-6*]■1S *(USP30)*
—Colorless liquid.

Assay—Inject an appropriate specimen into a suitable gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a flame-ionization detector, helium being used as the carrier gas. The following conditions have been found suitable: a 0.25-mm × 10-m capillary column coated with a 1-μm layer of methylsilicone; the injection port temperature is maintained at 200°; the detector temperature is maintained at 300°; the column temperature is maintained at 100° and programmed to rise 10° per minute to 250°. The area of the indene peak is not less than 99% of the total peak area.

Refractive index ⟨831⟩: between 1.5749 and 1.5769 at 20°.

BRIEFING

Inosine, *USP 29* page 3135—See briefing under *2,4-Dinitrophenylhydrazine.*

Isobutyl Acetate, *USP 29* page 3135—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43417-19

Change to read:

Isobutyl Acetate, $C_6H_{12}O_2$—**116.16**

■[*110-19-0*]■1S (*USP30*)
—Clear, colorless liquid. Slightly soluble in water. Miscible with alcohol.

Assay—Inject an appropriate specimen into a suitable gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a flame-ionization detector, helium being used as the carrier gas. The following conditions have been found suitable: a 0.25-mm × 30-m capillary column coated with G2. The injection port temperature is maintained at 130°; the column temperature is maintained at 30° and programmed to rise 10° per minute to 180° and held there for 10 minutes. The detector temperature is maintained at 300°. The area of the main peak is not less than 99% of the total peak area.

Specific gravity ⟨841⟩: between 0.863 and 0.868.

Refractive index ⟨831⟩: between 1.3900 and 1.3920 at 20°.

BRIEFING

Isobutyl Alcohol, *USP 29* page 3135—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43417-20

In-Process Revision

Change to read:

Isobutyl Alcohol (*2-Methyl-1-propanol*), $(CH_3)_2CHCH_2OH$—**74.12**

■[*78-83-1*]■1S (*USP30*)
—Use ACS reagent grade.

BRIEFING

Isonicotinic Acid, *USP 29* page 3135—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43418-1

Change to read:

Isonicotinic Acid, $C_6H_5NO_2$—**123.11**

■[*52-22-1*]■1S (*USP30*)
—Use a suitable grade.

BRIEFING

Isopropyl Alcohol, *USP 29* page 3135—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43418-2

Change to read:

Isopropyl Alcohol *(2-Propanol),* $(CH_3)_2CHOH$—**60.10**

■[*67-63-0*]■1S (*USP30*)
—Use ACS reagent grade.
[NOTE—For use in assays and tests involving UV spectrophotometry, use ACS reagent grade Isopropyl Alcohol Suitable for Use in UV Spectrophotometry.]

BRIEFING

Isopropyl Alcohol, Dehydrated, *USP 29* page 3135—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43418-3

Change to read:

Isopropyl Alcohol, Dehydrated—

■[*67-63-0*]■1S (*USP30*)
—Use Isopropyl Alcohol that previously has been dried by being shaken with a suitable molecular sieve capable of adsorbing water, and filtered.

BRIEFING

Isopropyl Myristate, *USP 29* page 3135—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43418-5

Change to read:

Isopropyl Myristate, $C_{17}H_{34}O_2$—**270.45**

■[*110-27-0*]■1S (*USP30*)
—Use *Isopropyl Myristate* (NF monograph). For use as a solvent in sterility test procedures, Isopropyl Myristate conforms to the following additional specification:

pH of water extract—Transfer 100 mL to a 250-mL centrifuge bottle, add 10 mL of twice-distilled water, close the bottle with a suitable closure, and shake vigorously for 60 minutes. Centrifuge the mixture at 1800 rpm for 20 minutes, aspirate the upper (isopropyl myristate) layer, and determine the pH of the residual water layer: the pH is not less than 6.5.

Isopropyl Myristate not conforming to the test for *pH of water extract* may be rendered suitable for use in sterility test procedures as follows:

Using a 20-mm × 20-cm glass column, add activated alumina, and tamp down to a height of 15 cm. Pass 500 mL of the isopropyl myristate through the column, using a slight positive pressure to maintain an even flow, and use the eluate collected directly in the sterility test procedure.

BRIEFING

Isopropylamine, *USP 29* page 3136—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43418-6

Change to read:

Isopropylamine *(2-Aminopropane),* $C_3H_7NH_2$—**59.11**

■[*75-31-0*]■1S (*USP30*)
—Clear, colorless, flammable liquid. ▲▲*USP29* Miscible with water, with alcohol, and with ether.

Assay—Transfer about 0.2 g, accurately weighed, to a suitable container, add 50 mL of water, and mix. Titrate with 0.1 N hydrochloric acid VS, using a mixture of bromocresol green TS and methyl red TS (5 : 1) as indicator. Each mL of 0.1 N hydrochloric acid is equivalent to 59.11 mg of C_3H_9N. Not less than 98% is found.

Boiling range (Reagent test)—Not less than 95% distills between 31° and 33°.

Refractive index ⟨831⟩: between 1.3743 and 1.3753, at 20°.

Change to read:

Lead Monoxide *(Litharge),* PbO—**223.20**

■[*1317-36-8*]■1S (*USP30*)
—Heavy, yellowish or reddish-yellow powder. Insoluble in water and in alcohol; soluble in acetic acid, in diluted nitric acid, and in warm solutions of the fixed alkali hydroxides.

Assay—Accurately weigh about 300 mg, freshly ignited in a muffle furnace at 600 ± 50°, and dissolve it by warming with 10 mL of water and 1 mL of glacial acetic acid. Dilute with 75 mL of water, heat to boiling, add 50.0 mL of 0.1 N potassium dichromate VS, and boil for 2 to 3 minutes. Cool, transfer to a 200-mL volumetric flask with the aid of water, dilute with water to volume, mix, and allow to settle. Withdraw 100.0 mL of the clear liquid, and transfer to a glass-stoppered flask. Add 10 mL of diluted sulfuric acid and 1 g of potassium iodide, insert the stopper, mix gently, and allow to stand for 10 minutes. Then titrate the liberated iodine, representing the excess of dichromate, with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached: each mL of 0.1 N potassium dichromate is equivalent to 7.440 mg of PbO. Not less than 98% is found.

Insoluble in acetic acid—Dissolve 2 g in 30 mL of dilute glacial acetic acid (1 in 2), boil gently for 5 minutes, filter, wash the residue with diluted acetic acid, and dry at 105° for 2 hours: the residue weighs not more than 10 mg (0.5%).

Substances not precipitated by hydrogen sulfide—Completely precipitate the lead from the filtrate obtained in the test for *Insoluble in acetic acid* by passing hydrogen sulfide into it, filter, and wash the precipitate with 20 mL of water. To one-half of the mixed filtrate and washings add 5 drops of sulfuric acid, evaporate to dryness, and ignite at 800 ± 25° for 15 minutes: the residue weighs not more than 5 mg (0.5%).

Volatile substances—Accurately weigh about 5 g, and heat strongly in a covered porcelain crucible: it loses not more than 2.0% of its weight.

—White, crystalline flakes.

Assay—Inject an appropriate specimen into a gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a flame-ionization detector, helium being used as the carrier gas. The following conditions have been found suitable: a 0.25-mm × 30-m capillary column coated with a 1-µm layer of phase G8; the injection port temperature is maintained at 220°; the detector temperature is maintained at 220°; the column temperature is maintained at 180° and programmed to rise 4° per minute to 220°. The area of the $C_{18}H_{36}O_2$ peak is not less than 99% of the total peak area.
Melting range ⟨741⟩: between 31° and 32°.

BRIEFING

Methyl Iodide, *USP 29* page 3138—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43421-11

Change to read:

Methyl Iodide, CH_3I—**141.94**

■[*74-88-4*]■1S *(USP30)*
—Colorless, heavy, transparent liquid. Slightly soluble in water. Miscible with alcohol, with ether, and with solvent hexane. Turns brown on exposure to light as a result of liberation of iodine.

Assay—Add 1 mL to a 100-mL volumetric flask tared with 10 mL of alcohol. Weigh again, add alcohol to volume, and mix. Pipet 20 mL into a glass-stoppered flask, and add 50.0 mL of 0.1 N silver nitrate VS and 2 mL of nitric acid. Insert the stopper immediately, shake frequently during 2 hours, and allow to stand in the dark overnight. Shake again for 2 hours, then add 50 mL of water and 3 mL of ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS. Each mL of 0.1 N silver nitrate is equivalent to 14.19 mg of CH_3I: not less than 98.5% is found.

Boiling range (Reagent test)—Distill 50 mL into a chilled, partly closed receiver: not less than 48 mL distills between 41.5° and 43°.

Density: between 2.270 and 2.285.

Residue on evaporation—Evaporate 4 mL (10 g) on a steam bath, and dry the residue at 105° for 1 hour: the residue weighs not more than 1 mg (0.01%).

Acidity—Shake 3 mL with 5 mL of water for 30 seconds, and immediately draw off the lower layer: the aqueous layer is neutral to litmus, and when 1 mL of silver nitrate TS is added, it shows not more than a slight opalescence.

BRIEFING

Methyl Laurate, *USP 29* page 3138—See briefing under *2,4-Dinitrophenylhydrazine.*

1-Naphthylamine Hydrochloride, $C_{10}H_7NH_2 \cdot HCl$—**179.65**

■[*552-46-5*]■1S (*USP30*)
—White, crystalline powder that turns bluish upon exposure to light and air. Soluble in water, in alcohol, and in ether.

A 1 in 100 solution, made slightly acid with acetic acid, gives a violet color with 5 drops of ferric chloride TS. A 1 in 40 solution in diluted acetic acid is colorless and not more than slightly opalescent.

Residue on ignition (Reagent test)—Ignite 200 mg with a few drops of sulfuric acid: the weight of the residue is negligible.

BRIEFING

BRIEFING

***β*-Nicotinamide Adenine Dinucleotide,** *USP 29* page 3140—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43556-4

Change to read:

***β*-Nicotinamide Adenine Dinucleotide,** $C_{21}H_{27}N_7O_{14}P_2$—**663.4**

■[*53-84-9*]■1S (*USP30*)
—White, very hygroscopic powder. Freely soluble in water.

Assay—Dissolve 17.9 g of anhydrous dibasic sodium phosphate in water to make 500 mL (*Solution A*). Dissolve 6.8 g of monobasic potassium phosphate in water to make 500 mL (*Solution B*). To a volume of *Solution A*, add *Solution B* until the mixture is adjusted to a pH of 7.0 (about 2 : 1 by volume of *Solutions A* and *B*) to obtain a *pH 7.0 Buffer*. Transfer about 25 mg of *β*-nicotinamide adenine dinucleotide, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Transfer 0.2 mL of this solution to a 10-mL volumetric flask, dilute with *pH 7.0 Buffer* to volume, and mix. Use this solution as the *Assay preparation*. Determine the absorbances of the *Assay preparation* and the *pH 7.0 Buffer* in 1-cm cells at a wavelength of 260 nm, using water as the reference. Calculate the quantity, in mg, of $C_{21}H_{27}N_7O_{14}P_2$ in the portion of *β*-nicotinamide adenine dinucleotide taken by the formula:

$$(0.6634/17.6)(10/0.2)(25)(A_A - A_B)$$

in which A_A and A_B are the absorbances of the *Assay preparation* and the *pH 7.0 Buffer,* respectively. Not less than 94.5% is found.

—Use ACS reagent grade.

BRIEFING

***p*-Nitrobenzenediazonium Tetrafluoroborate,** *USP 29* page 3141—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43556-14

Change to read:

***p*-Nitrobenzenediazonium Tetrafluoroborate,** $NO_2C_6H_4N_2BF_4$ **—236.92**

■[*456-27-9*]■1S (*USP30*)
—Yellow-gold crystals. Soluble in acetonitrile. *[Caution—Shock-sensitive; keep refrigerated.]*

Assay—Transfer about 30 mg, accurately weighed, to a low-actinic, 100-mL volumetric flask. Dissolve in 0.01 N hydrochloric acid, dilute with 0.01 N hydrochloric acid to volume, and mix. Using low-actinic glassware, dilute 2.0 mL of the resulting solution with spectrophotometric grade methanol to 50.0 mL. Measure the absorbance of this solution in a 1-cm cell at about 255 nm, using methanol as the blank. Calculate the absorptivity of the solution by dividing the measured absorbance by the concentration in g per mL. Calculate the assay value by the formula:

$$100a / 59.4$$

in which a is the absorptivity of the solution: not less than 95.0% is found.

BRIEFING

4-(*p*-Nitrobenzyl)pyridine, *USP 29* page 3141—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43556-15

Change to read:

4-(*p*-Nitrobenzyl)pyridine, $C_{12}H_{10}N_2O_2$**—214.22**

■[*1083-48-3*]■1S (*USP30*)
—Yellow crystals. Soluble in acetone.

Insoluble matter—Dissolve 1 g in 10 mL of acetone: the solution is clear and complete.

Melting range ⟨741⟩: between 71° and 74°.

BRIEFING

Nitromethane, *USP 29* page 3141—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43556-16

Change to read:

Nitromethane, CH_3NO_2**—61.04**

■[*75-52-5*]■1S (*USP30*)
—Use ACS reagent grade.

BRIEFING

5-Nitro-1,10-phenanthroline, *USP 29* page 3141—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43556-17

Change to read:

5-Nitro-1,10-phenanthroline, $C_{12}H_7N_3O_2$**—225.20**

■[*4199-88-6*]■1S (*USP30*)
—White ▲▲*USP29* powder. Soluble in water.

Melting range ⟨741⟩**:** between 198° and 200°.

Suitability as redox indicator—Dissolve 25 mg in a minimum volume of diluted sulfuric acid, add 10 mg of ferrous sulfate, and dilute with water to 100 mL: the solution is deep red in color and exhibits an absorption maximum at 510 nm. To 1.0 mL of the solution add 1.0 mL of 0.01 M ceric sulfate: the red color is discharged.

BRIEFING

1-Nitroso-2-naphthol, *USP 29* page 3141—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43556-17

Change to read:

1-Nitroso-2-naphthol, $C_{10}H_7NO_2$**—173.17**

■[*131-91-9*]■1S (*USP30*)
—Brown to yellowish-brown powder. Insoluble in water; soluble in alcohol, in benzene, in ether, in carbon tetrachloride, and in acetic acid.

Assay—Transfer about 250 mg, previously dried over silica gel to constant weight and accurately weighed, to a glass-stoppered flask, and dissolve in 10 mL of sodium hydroxide solution (1 in 10). Cool the solution in an ice bath, add dilute sulfuric acid (1 in 6) until a slight, permanent precipitate is formed and the solution is slightly acid, then add 3 g of potassium iodide, shake to dissolve, add 20 mL of dilute sulfuric acid (1 in 6), immediately insert the stopper in the flask, and allow to stand in the dark for 2 hours. Titrate the liberated iodine with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Perform a complete blank determination, and make any necessary correction. Each mL of 0.1 N sodium thiosulfate is equivalent to 8.66 mg of $C_{10}H_7NO_2$: not less than 95.0% is found.

Melting range ⟨741⟩: between 109° and 111°.

Residue on ignition (Reagent test): not more than 0.2%.

BRIEFING

Nitroso R Salt, *USP 29* page 3141—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43556-18

Change to read:

Nitroso R Salt *(1-Nitroso-2-naphthol-3,6-disodium Disulfonate),* $NOC_{10}H_4OH(SO_3Na)_2$—**377.26**

■[*525-05-3*]■1S (*USP30*)
—Yellow crystals or crystalline powder. One g dissolves in about 40 mL of water; insoluble in alcohol.

Sensitiveness—Dissolve 500 mg of sodium acetate in a solution of 0.4 mg of cobaltous chloride (0.1 mg of cobalt) in 5 mL of water. Add 1 mL of diluted acetic acid, and follow with 1 mL of a solution of the nitroso R salt (1 in 500): a red color, which is produced at once, persists when the solution is boiled with 1 mL of hydrochloric acid for 1 minute.

BRIEFING

Nitrous Oxide Certified Standard, *USP 29* page 3141—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43556-19

Change to read:

Nitrous Oxide Certified Standard—

■[*10024-97-2*]■1S (*USP30*)
—A container of 99.9% nitrous oxide. It is available from most suppliers of specialty gases.

BRIEFING

Nonadecane, *USP 29* page 3141—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43556-20

Change to read:

Nonadecane, $C_{19}H_{40}$—**268.52**

■[*629-92-5*]■1S (*USP30*)
—White solid.

Assay—Inject an appropriate specimen into a suitable gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a thermal conductivity detector, helium being used as the carrier gas. The following conditions have been found suitable: 3-mm × 1.8-m stainless steel column containing 5% phase G2 on support S1AB; the injection port temperature is maintained at 330°; the detector temperature is maintained at 300°; and the oven temperature is held initially at 190° and allowed to rise gradually to 250°. The area of the nonadecane peak is not less than 99% of the total peak area.

Melting range ⟨741⟩: between 31.5° and 33.5°.

BRIEFING

Nonanoic Acid, *USP 29* page 3141—See briefing under *2,4-Dinitrophenylhydrazine.*

(HDQ: M. Marques) RTS—43576-1

Change to read:

Nonanoic Acid, $C_9H_{18}O_2$—**158.24**

■[*112-05-0*]■1S (*USP30*)
—Clear, colorless to faint yellow liquid. Miscible with water and with methanol.

Assay—Accurately weigh about 500 mg, transfer to a suitable container, add 30 mL of water, and mix. Add 40 mL of water, and mix. Add phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS. Each mL of 0.1 N sodium hydroxide is equivalent to 15.82 mg of $C_9H_{18}O_2$: not less than 96.0% of $C_9H_{18}O_2$ is found.

Refractive index ⟨831⟩: about 1.432 at 20°.

Volumetric Solutions

BRIEFING

Volumetric Solutions, *USP 29* page 3175 and page 660 of *PF* 32(2) [Mar.–Apr. 2006]. It is proposed to correct the equivalent for *Sodium Hydroxide, Normal (1 N)* and to update the instructions for drying the primary standard used to standardize *Sodium Thiosulfate, Tenth-Normal (0.1 N)*.

(HDQ: M. Marques) RTS—C44418; C44427

Change to read:

Potassium Hydroxide, Normal (1 N)
KOH, **56.11**

56.11 g in 1000 mL

Dissolve 68 g of potassium hydroxide in about 950 mL of water. Add a freshly prepared saturated solution of barium hydroxide until no more precipitate forms. Shake the mixture thoroughly, and allow it to stand overnight in a stoppered bottle. Decant the clear liquid, or filter the solution in a tight, polyolefin bottle, and standardize by the procedure set forth for *Sodium Hydroxide, Normal (1 N)*.

~~$$N = \frac{\text{g } KHC_8H_4O_4}{0.20423 \times \text{mL NaOH}}$$~~

$$N = \frac{\text{g } KHC_8H_4O_4}{0.20423 \times \text{mL KOH}}$$ ■1S (*USP30*)

Change to read:

Sodium Hydroxide, Normal (1 N)
NaOH, **40.00**

40.00 g in 1000 mL

Dissolve 162 g of sodium hydroxide in 150 mL of carbon dioxide-free water, cool the solution to room temperature, and filter through hardened filter paper. Transfer 54.5 mL of the clear filtrate to a tight, polyolefin container, and dilute with carbon dioxide-free water to 1000 mL.

Accurately weigh about 5 g of potassium biphthalate, previously crushed lightly and dried at 120° for 2 hours, and dissolve in 75 mL of carbon dioxide-free water. Add 2 drops of phenolphthalein TS, and titrate with the sodium hydroxide solution to the production of a permanent pink color. Each ~~204.2 mg~~

■204.23 mg■1S (*USP30*)
of potassium biphthalate is equivalent to 1 mL of 1 N sodium hydroxide.

$$N = \frac{\text{g } KHC_8H_4O_4}{0.20423 \times \text{mL NaOH solution}}$$

NOTES—(1) Solutions of alkali hydroxides absorb carbon dioxide when exposed to air. They should be preserved in bottles having well-fitted, suitable stoppers, provided with a tube filled with a mixture of sodium hydroxide and lime (soda-lime tubes) so that air entering the container must pass through this tube, which will absorb the carbon dioxide. (2) Prepare solutions of lower concentration (e.g., 0.1 N, 0.01 N) by quantitatively diluting accurately measured volumes of the 1 N solution with sufficient carbon dioxide-free water to yield the desired concentration.

Restandardize the solution frequently.

Change to read:

Sodium Hydroxide, Alcoholic, Tenth-Normal (0.1 N)
NaOH, **40.00**

To 250 mL of alcohol add 2 mL of a 50% ~~(w/w)~~

■(w/v)■2S (*USP29*)
solution of sodium hydroxide.

Dissolve about 200 mg of benzoic acid, accurately weighed, in 10 mL of alcohol and 2 mL of water. Add 2 drops of phenolphthalein TS, and titrate with the alcoholic sodium hydroxide solution until a permanent pale pink color is produced.

$$N = \frac{\text{mg benzoic acid}}{122.1 \times \text{mL sodium hydroxide}}$$

Change to read:

Sodium Thiosulfate, Tenth-Normal (0.1 N)
$Na_2S_2O_3 \cdot 5H_2O$, **248.19**

24.82 g in 1000 mL

Dissolve about 26 g of sodium thiosulfate and 200 mg of sodium carbonate in 1000 mL of recently boiled and cooled water. Standardize the solution as follows.

Accurately weigh about 210 mg of primary standard potassium dichromate, previously pulverized and dried ~~at 120° for 4 hours,~~

■according to the instructions on its label, if necessary, ■1S (*USP30*)
and dissolve in 100 mL of water in a glass-stoppered, 500-mL flask. Swirl to dissolve the solid, remove the stopper, and quickly add 3 g of potassium iodide, 2 g of sodium bicarbonate, and 5 mL of hydrochloric acid. Insert the stopper gently in the flask, swirl to mix, and allow to stand in the dark for exactly 10 minutes. Rinse the stopper and the inner walls of the flask with water, and titrate the liberated iodine with the sodium thiosulfate solution until the solution is yellowish green in color. Add 3 mL of starch TS, and continue the titration until the blue color is discharged. Perform a blank determination.

Restandardize the solution as frequently as supported by laboratory stability data. In the absence of such data, restandardize the solution weekly.

$$N = \frac{\text{mg } K_2Cr_2O_7}{49.04 \times \text{mL } Na_2S_2O_3}$$

In-Process Revision

REFERENCE TABLES

BRIEFING

Container Specifications for Capsules and Tablets, *USP 29* page 3184, page 3625 of the *First Supplement,* and page 661 of *PF* 32(2) [Mar.–Apr. 2006].

(HDQ) RTS—C42828; C42839; C43516; C44099

The following table is provided as a reminder for the pharmacist engaged in the typical dispensing situation who already is acquainted with the *Packaging and storage* requirements set forth in the individual monographs. It lists the capsules and tablets that are official in the *United States Pharmacopeia* and indicates the relevant tight (T), well-closed (W), and light-resistant (LR) specifications applicable to containers in which the drug that is repackaged should be dispensed.

This table is not intended to replace, nor should it be interpreted as replacing, the definitive requirements stated in the individual monographs.

Container Specifications for Capsules and Tablets

Monograph Title	*Container Specification*
Add the following:

BRIEFING

Description and Relative Solubility of USP and NF Articles, *USP 29* page 3191, page 3625 of the *First Supplement,* page 8589 of *PF* 25(4) [July–Aug. 1999], page 9254 of *PF* 25(6) [Nov.–Dec. 1999], page 1135 of *PF* 26(4) [July–Aug. 2000], page 1908 of *PF* 27(1) [Jan.–Feb. 2001], page 554 of *PF* 28(2) [Mar.–Apr. 2002], page 1953 of *PF* 28(6) [Nov.–Dec. 2002], page 266 of *PF* 29(1) [Jan.–Feb. 2003], page 812 of *PF* 29(3) [May–June 2003], page 1684 of *PF* 29(5) [Sept.–Oct. 2003], page 1405 of *PF* 30(4) [July–Aug. 2004], page 1822 of *PF* 30(5) [Sept.–Oct. 2004], page 2183 of *PF* 30(6) [Nov.–Dec. 2004], page 122 of *PF* 31(1) [Jan.–Feb. 2005], page 591 of *PF* 31(2) [Mar.–Apr. 2005], page 861 of *PF* 31(3) [May–June 2005], page 1193 of *PF* 31(4) [July–Aug. 2005], page 1491 of *PF* 31(5) [Sept.–Oct. 2005], page 1703 of *PF* 31(6) [Nov.–Dec. 2005], page 188 of *PF* 32(1) [Jan.–Feb. 2006], and page 662 of *PF* 32(2) [Mar.–Apr. 2006].

(HDQ) RTS—C43054; C44099; C44144

Add the following:

■**Amlodipine Besylate:** A white or almost white powder. Freely soluble in methanol; sparingly soluble in alcohol; slightly soluble in 2-propanol and in water.■1S (*USP30*)

Add the following:

■**Methylsulfonylmethane:** White powder or flake crystal. Melts at about 109°. Freely soluble in water, in methanol, in alcohol, and in acetone. Sparingly soluble in ether.■1S (*USP30*)

Change to read:

Milrinone: White to tan, crystalline solid. Is hygroscopic. Freely soluble in dimethyl sulfoxide; ~~practically insoluble in water, in chloroform, and in methanol.~~

■very slightly soluble in methanol; practically insoluble in water and in chloroform.■1S (*USP30*)

In-Process Revision

Pending Proposals

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *Pharmacopeial Forum (PF)* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in the *USP–NF*, its *Supplements*, or an *IRA.* Those items that have not yet been adopted are marked as *Pending Proposals.*

The *Pending Proposals* list contains these items separated into the following categories: General Notices and Requirements; *USP* monographs; Dietary Supplements Monographs; General Chapters; Reference Tables; Excipients; and *NF* Monographs. Each entry in the *Pending Proposals* list contains the monograph title and the citation of the most recent publication of the monograph. When the appropriate USP Expert Committee is considering advancing to official status a pending proposal that is more than 2 years old, it is republished in *PF* for additional opportunity for public review and comment. Reprints of *PF* proposals may be purchased from USP by sending a written request for information to custsvc@usp.org.

To check the status of a *Pending Proposal,* please contact USP as directed below.

- The briefing accompanying the monograph or general chapter lists the names of the Scientific Liaisons responsible for the proposed revisions. The contact information (phone number and email) for the Scientific Liaison is available in the *Staff Directory* section of *How to Use PF*. For *USP–NF Online* subscribers, the name and contact information for the assigned Scientific Liaison is available in the *Auxiliary Information* portion of each monograph.
- Call USP at 301-816-8344 and ask to speak with the Scientific Liaison assigned to the monograph or general chapter of interest.
- Submit questions by email to stdsmonographs@usp.org. Please indicate the name of the monograph or general chapter in the subject line of the email.

Following these lists the reader will find the *Canceled Proposals* list. These are items that were published in *PF* and were pending, but have since been canceled. This list contains cumulative entries for the six issues per volume of *PF* [i.e., 32(1) through 32(6)]. Note that canceled proposals may be republished in *PF* to be considered for future adoption into the *USP–NF.*

Nitrous Oxide—*Definition, Packaging and storage, Assay*	31	4	1099
Norgestimate—*USP Reference standards, Limit of residual solvents, Chromatographic purity, Assay*	31	5	1390
Norgestimate and Ethinyl Estradiol Tablets (new)	29	1	87
Ofloxacin—*Chromatographic purity* (delete), *Related compounds* (add)	30	4	1274
Omeprazole—*Chromatographic purity*	31	4	1100
Omeprazole Delayed-Release Capsules—*Identification, Chromatographic purity*	31	5	1392
Ondansetron Hydrochloride—*Limit of ondansetron related compound D, Assay*	32	1	126
Ondansetron Hydrochloride Oral Suspension (new)	32	1	127

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Ondansetron Injection—*Chromatographic purity*	31	6	1651
Ondansetron Oral Solution—*Packaging and storage* (add), *Limit of ondansetron related compound D, Related compounds*	32	1	128
Ondansetron Orally Disintegrating Tablets (new)	31	4	1101
Orphenadrine Citrate Injection—*Assay*	31	6	1651
Oxandrolone—*Definition, USP Reference standards, Identification B, Ordinary impurities* (delete), *Related compounds* (add), *Assay*	31	1	64
Oxaprozin—*Packaging and storage* (add)	32	1	130
Oxaprozin Tablets—*Packaging and storage* (add)	32	1	130
Oxybutynin Chloride Extended-Release Tablets (new)	31	6	1652
Oxycodone Hydrochloride Extended-Release Tablets (new)	31	4	1104
Oxygen—*Definition, Packaging and storage*	31	4	1107
Oxygen 93 Percent—*Definition, Packaging and storage*	31	4	1107
Paclitaxel—*USP Reference standards, Related compounds*	32	2	361
Pamidronate Disodium (new)	31	4	1108
Pamidronate Disodium for Injection (new)	31	4	1111
Pancuronium Bromide (new)	32	1	130
Paricalcitol—*Identification, Chromatographic purity, Assay*	32	1	132
Pectin—*Identification*	31	3	783
Penicillamine Capsules—*Dissolution*	31	2	436
Pentazocine and Acetaminophen Tablets (new)	28	6	1838
Pentobarbital Sodium—*Labeling* (add), *USP Reference standards, Other requirements* (add)	31	1	73
Pentobarbital Sodium Injection—*Identification, Assay*	32	2	364
Petrolatum (new)—*Harmonization*	28	2	569
White Petrolatum (new)—*Harmonization*	28	2	570
Phenytoin Tablets—*Title* (name change)	29	6	1965
Phenytoin Chewable Tablets (new)	29	6	1965
Piperacillin and Tazobactam Injection (new)	31	2	437
Piperacillin and Tazobactam for Injection (new)	31	2	439
Piroxicam Cream (new)	32	1	134
PEG 3350 and Electrolytes for Oral Solution—*Title* (name change—*delayed implementation to February 1, 2009*), *Definition, Assay for potassium and sodium*	31	5	1393
Potassium and Sodium Bicarbonates and Citric Acid Effervescent Tablets for Oral Solution—*USP Reference standards* (add), *Assay for anhydrous citric acid (delayed implementation to January 1, 2009)*	31	2	440
Potassium Bitartrate—*Limit of ammonia*	31	3	786
Potassium Citrate Extended-Release Tablets—*USP Reference standards* (add), *Assay (delayed implementation to January 1, 2009)*	31	2	443
Potassium Citrate and Citric Acid Oral Solution—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	2	444
Potassium Iodide Oral Solution—*Definition*	31	3	786
Potassium Perchlorate—*USP Reference standards* (delete), *Assay*	32	2	364
Potassium Sodium Tartrate—*Limit of ammonia*	31	3	787
Pravastatin Sodium (new)	31	5	1394
Prednicarbate (new)	31	5	1398
Prednicarbate Cream (new)	31	6	1655
Prednicarbate Ointment (new)	31	6	1657
Prednisolone Sodium Phosphate—*USP Reference standards, Identification*	32	2	365
Promethazine Hydrochloride—*USP Reference standards, Related substances*	32	2	365
Promethazine Hydrochloride Tablets—*USP Reference standards, Related compounds, Assay*	32	2	367
Pseudoephedrine Sulfate—*Ordinary impurities*	32	1	135
Pyridoxine Hydrochloride Injection—*Assay*	32	2	369
Quazepam Tablets—*USP Reference standards, Assay*	32	2	370
Quinapril Tablets—*Packaging and storage*	29	4	1071
Quinidine Sulfate Oral Suspension (new)	32	1	136
Ramipril—*Definition, Assay*	31	3	787
Ranitidine Hydrochloride—*USP Reference standards, Chromatographic purity, Assay*	30	6	2033

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Oral Rehydration Salts—*USP Reference standards* (add), *Identification F* (delete), *Assay for citrate (delayed implementation to January 1, 2009)*	31	5	1399
Rifampin and Isoniazid Capsules—*Dissolution*	30	2	533
Rifampin, Isoniazid, and Pyrazinamide Tablets—*Dissolution*	30	2	534
Risperidone (new)	31	6	1659
Ritonavir (new)	32	2	370
Ropivacaine Hydrochloride Injection (new)	32	2	374
Rubella and Mumps Virus Vaccine Live (delete)	31	6	1662
Saccharin Calcium (new)—*Harmonization*	31	2	607
Saccharin Sodium (new)—*Harmonization*	31	4	1225
Saquinavir Mesylate—*Identification*	31	5	1400
Schick Test Control (delete)	31	6	1662
Senna—*Title, Definition, Packaging and storage, Labeling* (add), *USP Reference standards* (add), *Botanic characteristics, Identification, Microbial enumeration* (add) *Loss on drying* (add), *Total ash* (add), *Assay* (add)	32	1	137
Senna Pods (new)	32	1	140
Sennosides—*Definition, Packaging and storage, Residue on ignition*	32	1	141
Sevoflurane (new)	30	1	178
Simvastatin—*Identification, Chromatographic purity, Limit of lovastatin* (delete), *Assay*	32	1	141
Sodium Bicarbonate—*Normal carbonate, Limit of ammonia*	31	3	795
Sodium Bicarbonate Injection—*Packaging and storage*	31	5	1401
Sodium Chloride—*Limit of phosphates*	31	5	1401
Sodium Chloride—*Identification, Loss on drying, Limit of potassium (postponed indefinitely)*	32	2	264
Sodium Citrate and Citric Acid Oral Solution—*USP Reference standards* (add), *Assay for sodium citrate (delayed implementation to April 1, 2009)*	31	3	797
Sodium Lactate Injection—*Identification B* (delete)	31	5	1402
Sodium Phosphates Rectal Solution—*Assay*	31	5	1403
Sodium Salicylate Tablets—*USP Reference standards* (add)	31	4	1116
Sorbitol Solution—*Microbial limits* (add)	29	4	1078
Spironolactone and Hydrochlorothiazide Tablets—*Dissolution*	32	2	376
Stavudine Capsules—*Assay*	31	5	1403
Succinylcholine Chloride—*Limit of ammonium salts* (delete), *Chromatographic purity*	31	5	1404
Sulfamethazine Granulated—*Assay*	31	3	797
Sumatriptan Succinate Oral Suspension (new)	32	1	144
Talc—*Packaging and storage* (add), *Limit of iron, Limit of calcium, Limit of aluminum*	31	6	1662
Tazobactam (new)	31	4	1116
Technetium Tc 99m Fanolesomab Injection (new)—*Packaging and storage* (add)	31	5	1405
Temazepam—*Identification*	32	1	145
Terbutaline Sulfate Inhalation Aerosol—*USP Reference standards, Assay*	31	2	450
Thalidomide—*Microbial limits, Chromatographic purity*	32	1	146
Thiabendazole Tablets—*Title* (name change)	29	6	1991
Thiabendazole Chewable Tablets (new)	29	6	1991
Thimerosal—*Identification*	32	1	147
Thioridazine Hydrochloride—*Identification*	31	3	798
Tilmicosin—*Definition, Related compounds, Assay*	31	3	798
Titanium Dioxide—*Definition, Packaging and storage, Labeling, Loss on ignition, Water-soluble substances, Acid-soluble substances, Limit of lead* (add), *Limit of antimony* (add), *Limit of mercury* (add), *Organic volatile impurities* (delete), *Assay*	30	4	1301
Tizanidine Tablets (new)	32	1	147
Tolazamide—*Chromatographic purity*	31	4	1118
Topiramate (new)	30	4	1307
Tramadol Hydrochloride (new)	31	2	458
Tramadol Hydrochloride Tablets (new)	31	2	462
Travoprost (new)	31	4	1119
Travoprost Ophthalmic Solution (new)	31	4	1121
Triamcinolone Acetonide—*USP Reference standards, Assay*	31	3	800

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Tricitrates Oral Solution—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	2	465
Triclosan—*Assay*	32	2	377
Trimethoprim—*Packaging and storage*	31	5	1409
Tryptophan—*Chloride, Sulfate*	31	5	1410
Tylosin Tartrate (new)	31	5	1410
Ursodiol Capsules—*Dissolution*	31	3	800
Valganciclovir Hydrochloride (new)	32	2	379
Valganciclovir Tablets (new)	32	2	384
Valsartan (new)	32	1	150
Valsartan and Hydrochlorothiazide Tablets (new)	31	4	1123
Valproic Acid Injection (new)—*Title (delayed implementation to October 1, 2008)*	32	2	387
Vancomycin Hydrochloride—*USP Reference standards, Limit of monodechlorovancomycin* (add)	30	6	2055
Vasopressin—*Identification*	31	4	1127
Verapamil Hydrochloride—*USP Reference standards Identification, Chromatographic purity*	32	2	389
Verapamil Hydrochloride Injection—*USP Reference standards, Related compounds*	32	1	154
Verapamil Hydrochloride Oral Solution (new)	32	1	155
Verapamil Hydrochloride Oral Suspension (new)	32	1	156
Verapamil Hydrochloride Tablets—*USP Reference standards, Related compounds*	32	1	158
Pure Steam (new)	31	2	467
Water for Hemodialysis—*Bacterial endotoxins*	31	2	468
Sterile Water for Inhalation—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add), *Oxidizable substances*	31	3	802
Sterile Water for Injection—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add), *Oxidizable substances*	31	3	803
Sterile Water for Irrigation—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add), *Oxidizable substances*	31	3	804
Sterile Purified Water—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add), *Oxidizable substances*	31	3	804
Zidovudine Tablets—*USP Reference standards, Related compounds, Assay*	32	1	158
<u>*Dietary Supplements Monographs*</u>			
Ademetionine Disulfate Tosylate (new)	31	2	469
Acesulfame Potassium—*Packaging and storage* (add), *Limit of fluoride*	31	3	811
Black Cohosh (new)	28	5	1455
Powdered Black Cohosh (new)	28	5	1460
Powdered Black Cohosh Extract (new)	28	5	1461
Black Cohosh Tablets (new)	28	5	1462
Ethylcellulose Aqueous Dispersion—*Identification*	31	3	811
Ethylparaben—*Identification*	31	3	812
Gamma Cyclodextrin (new)	31	3	812
Ginger—*Packaging and storage, Labeling, USP Reference standards, Identification, Microbial enumeration, Alcohol-soluble extractives, Limit of shogaols, Content of gingerols and gingerdiones*	32	1	160
Powdered Ginger—*Packaging and storage, USP Reference standards*	32	1	162
Ginger Capsules—*USP Reference standards, Content of gingerols, gingerdiones, and shogaols*	32	1	163
Ginger Tincture—*USP Reference standards, Thin-layer chromatographic identification test, Microbial enumeration, Content of gingerols*	32	1	163
Ginkgo—*Definition, Packaging and storage, USP Reference standards, Thin-layer chromatographic identification test, Microbial enumeration, Content of terpene lactones*	32	1	164
Powdered Ginkgo Extract (new)	32	1	166

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Ginkgo Capsules (new)	32	1	172
Ginkgo Tablets (new)	32	1	174
Lutein—*Definition, Packaging and storage, Identification, Zeaxanthin and other related compounds, Content of lutein, Content of total carotenoids*	31	4	1133
Lutein Preparation—*Definition, Packaging and storage, Identification, Zeaxanthin and other related compounds, Content of lutein, Content of total carotenoids*	31	4	1134
Tomato Extract Containing Lycopene—*Microbial enumeration, Limit of aflatoxins*	30	2	578
Maleic Acid—*Identification*	31	3	815
Maltose—*Water*	31	3	815
Fish Oil Containing Omega-3 Acids (new)	31	2	474
Fish Oil Containing Omega-3 Acids Capsules (new)	31	2	481
Olive Oil—*Definition, Labeling* (add), *Teaseed oil*	31	3	815
Phenoxyethanol—*Chromatographic purity, Assay*	31	3	816
Polyethylene Glycol (new)—*Harmonization*	31	3	897
Polyoxyl 10 Oleyl Ether—*Free ethylene oxide*	31	3	816
Polyoxyl 20 Oleyl Cetostearyl Ether—*Free ethylene oxide*	31	3	817
Pygeum Extract—*Packaging and storage*	30	3	956
Sodium Benzoate—*USP Reference standards* (add), *Identification*	31	3	818
Sucrose (new)—*Harmonization*	31	3	902
Sugar Spheres—*Identification, Specific rotation*	31	3	819
Tagatose (new)	31	3	819
Thymol—*USP Reference standards* (add), *Identification*	31	3	821
Ubidecarenone—*USP Reference standards, Assay*	31	1	86
Ubidecarenone Capsules—*USP Reference standards, Assay*	31	1	86
Valerian—*Packaging and storage, Extractable matter, Microbial enumeration*	32	2	394
Powdered Valerian—*Packaging and storage, Labeling, Botanic characteristics*	32	2	395
Valerian Tablets—*Packaging and storage, USP Reference standards*	32	2	395
Xanthan Gum—*Assay*	31	3	821

HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps **(*Stages*)**.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

PHARMACOPEIAL PREVIEWS

This section contains potential revisions not yet targeted for official adoption. These may include drafts for new monographs or chapters; drafts for standards that would require new or unusual technology; drafts for which more data are required; or changes that would affect numerous monographs, thus having a broad impact on individual products. Readers should review the drafts in this section and provide comments to the appropriate staff liaison whose name is cited in the Briefing (use the *Staff Directory* to find the contact information).

Briefings Each Preview is preceded by a Briefing in the following format:

BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being used, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How To Use PF*), the name of the scientific staff liaison who handled this item, and the USP tracking correspondence number, as shown in the example below:

(DSN: L. Evans) RTS—55678-1

Symbols No symbols are used in this section, as Previews are not yet targeted for official adoption.

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of authoritative committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* and *Pharmacopeial Previews* sections. Readers interested in submitting comments should see *Instructions to Authors.*

Pharmacopeial Forum
Vol. 32(3) [May–June 2006]

Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP–NF* revision will be considered for publication in the *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention (USPC) and may not be published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

References—Consult a current copy of the *Pharmacopeial Forum* and the *ACS Style Guide* for assistance with reference style.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Contact Person—When submitting a manuscript, designate one author of the article as correspondent and include that author's full address, telephone number, fax number, and e-mail address.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Graphics that cannot be submitted electronically must be camera-ready, of easily reproducible quality and size, and clearly labeled. Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

Pharmacopeial Forum
Executive Secretariat, USP

Rockville, MD 20852

NOMENCLATURE

This section includes supplements to the latest edition of the *USP Dictionary of USAN and International Drug Names* that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

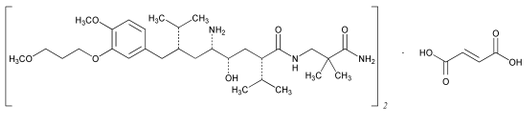
USP Dictionary of USAN and International Drug Names
2006 USP DICTIONARY SUPPLEMENT 1

IMPORTANT—Save this Supplement. This and all supplements appearing in *PF* are needed to keep the 2006 edition of the USP Dictionary (USPD) up-to-date. The cumulative contents of the supplements to the current (2006) edition will be included in the next complete edition of the Dictionary.

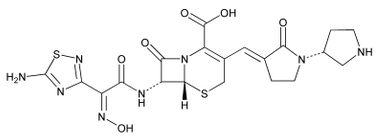
Newly Approved United States Adopted Names (USAN), Released for Publication

The following are newly established United States Adopted Names (USAN). These names will not be listed cumulatively; see preceding and succeeding numbers of *PF* for other new USAN to supplement the Dictionary main volume.

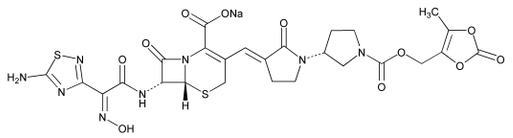
Aliskiren Fumarate [*2006*] (a lis kye′ ren fue′ ma rate). $(C_{30}H_{53}N_3O_6)_2 \cdot C_4H_4O_4$. 1219.60. (1) Benzeneoctanamide, δ-amino-*N*-(3-amino-2,2-dimethyl-3-oxopropyl)-γ-hydroxy-4-methoxy-3-(3-methoxypropoxy)-α,ζ-bis(1-methylethyl)-, (α*S*, γ*S*, δ*S*, ζ*S*)-, (2*E*)-2-butenedioate (2:1) (salt); (2) Bis(2*S*,4*S*,5*S*,7*S*)-5-amino-*N*-(3-amino-2,2-dimethyl-3-oxopropyl)-4-hydroxy-7-[4-methoxy-3-(3-methoxypropoxy)benzyl]-8-methyl-2-(1-methylethyl)nonanamide] (2*E*)-but-2-enedioate. *CAS-173334-58-2*. *Treatment of essential hypertension (renin inhibitor).* (Novartis Pharma AG, Switzerland) ✧*SPP100*



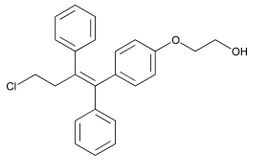
Ceftobiprole [*2006*] (sef toe′ bye prole). $C_{20}H_{22}N_8O_6S_2$. 534.60. (1) 5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[[(2*Z*)-(5-amino-1,2,4-thiadiazol-3-yl)(hydroxyimino)acetyl]-amino]-8-oxo-3-[(*E*)-[(3′*R*)-2-oxo[1,3′-bipyrrolidin]-3-ylidene]-methyl]-, (6*R*,7*R*)-; (2) (6*R*,7*R*)-7-[(2*Z*)-2-(5-Amino-1,2,4-thiadiazol-3-yl)-2-(hydroxyimino)acetamido]-8-oxo-3-[(*E*){(3′*R*)-2-oxo-[1,3′-bipyrrolidin]-3-ylidene}methyl]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid. *CAS-209467-52-7*. INN. *Broad spectrum antibiotic.* (Antibioticos S.p.A.); (Johnson & Johnson) ✧*BAL9141-000; Ro 63-9141*



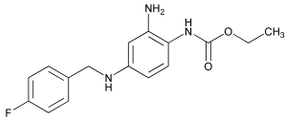
Ceftobiprole Medocaril [*2006*] (sef toe′ bi prole me dok′ a ril). $C_{26}H_{25}N_8NaO_{11}S_2$. 712.64. (1) 5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[[(2*Z*)-(5-amino-1,2,4-thiadiazol-3-yl)(hydroxyimino)acetyl]amino]-3-[(*E*)-[(3′*R*)-1′-[[(5-methyl-2-oxo-1,3-dioxol-4-yl)methoxy]carbonyl]-2-oxo[1,3′-bipyrrolidin]-3-ylidene]methyl]-8-oxo-, monosodium salt, (6*R*,7*R*)-; (2) (6*R*,7*R*)-7-[(2*Z*)-2-(5-Amino-1,2,4-thiadiazol-3-yl)-2-(hydroxyimino)acetamido]-3-[(*E*)[(3′*R*)-1′-[(5-methyl-2-oxo-1,3-dioxol-4-yl)methoxycarbonyl]-2-oxo-[1,3′-bipyrrolidin]-3-ylidene]-methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid monosodium salt. *CAS-252188-71-9; CAS-376653-43-9*. INN. *Broad spectrum antibiotic.* (Antibioticos S.p.A.); (Johnson & Johnson) ✧*BAL5788; BAL5788-001; Ro 65-5788*



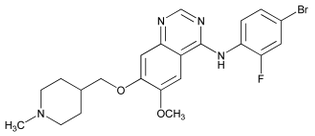
Ospemifene [*2006*] (os pem′ i feen). $C_{24}H_{23}ClO_2$. 378.89. (1) Ethanol, 2-[4-[(1*Z*)-4-chloro-1,2-diphenyl-1-butenyl]phenoxy]-; (2) 2-[*p*-[(*Z*)-4-Chloro-1,2-diphenyl-1-butenyl]phenoxy]ethanol. *CAS-128607-22-7*. INN; BAN. *Treatment of vaginal atrophy, osteoporosis, and vasomotor symptoms.* (Quatrx) ✧*FC-1271a; Fc-1271*



Retigabine [*2006*] (re tig′ a been). $C_{16}H_{18}FN_3O_2$. 303.33. (1) Carbamic acid, [2-amino-4-[[(4-fluoro-phenyl)methyl]amino]phenyl]-ethyl ester; (2) *N*-[2-Amino-4-(4-fluorobenzylamino)-phenyl]-carbamic acid ethyl ester. *CAS-150812-12-7*. INN. *Antiepileptic, adjunctive therapy for partial onset seizures.* (Valeant) ✧*D-23129*



Vandetanib [*2006*] (van det′ a nib). $C_{22}H_{24}BrFN_4O_2$. 475.40. (1) 4-Quinazolinamine, *N*-(4-bromo-2-fluorophenyl)-6-methoxy-7-[(1-methyl-4-piperidinyl)methoxy]-; (2) *N*-(4-Bromo-2-fluorophenyl)-6-methoxy-7-[(1-methylpiperidin-4-yl)methoxy]quinazolin-4-amine.*CAS-443913-73-3; CAS-338992-00-0* [replaced]. INN; BAN. *Treatment of nonsmall cell lung cancer and other solid tumors.* Zactima (AstraZeneca) ✧*ZD6474*

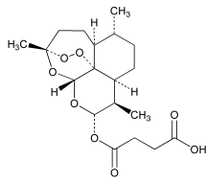


Revisions of United States Adopted Names (USAN)

The following are revisions of existing United States Adopted Names (USAN) and other names.

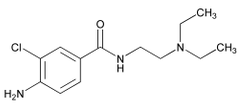
Artesunate

Change the chemical structure to read:



Declopramide

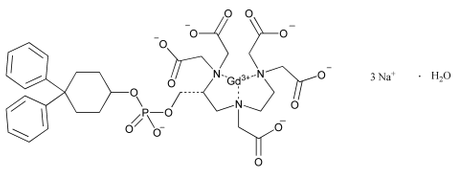
Add the chemical structure to read:



Gadofosveset Trisodium

Change the chemical information and structure to read:

[*1999*] (gad″ oh fos′ ve set). $C_{33}H_{40}GdN_3Na_3O_{15}P$. 975.87. [Gadofosveset is INN.] (1) Gadolinate(3-), aqua [[4-[bis[(carboxy-κ*O*)methyl]amino-κ*N*]-6,9-bis[(carboxy-κ*O*)methyl]-1-[(4,4-diphenylcyclohexyl)oxy]-1-hydroxy-2-oxa-6,9-diaza-1-phosphaundecan-11-oic acid- κ*N*6, κ*N*9, κ*O*11] 1-oxidato(6-)]-, trisodium; (2) Trisodium [*N*-[2-[bis(carboxymethyl)amino]ethyl]-*N*-[(*R*)-2-[bis(carboxymethyl)amino]-3-hydroxypropyl]glycine 4,4-diphenylcyclohexyl hydrogen phosphato (6-)]gadolinate(3-). *CAS-211570-55-7; CAS-193901-90-5* [anhydrous]. *Diagnostic contrast agent for vascular enhancement of MRI scans.* (Mallinckrodt) ✧*MS 32520*



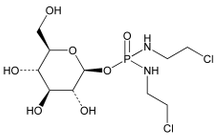
Gallium Nitrate

Delete the chemical structure.

Glufosfamide

Change the chemical information and add structure to read:

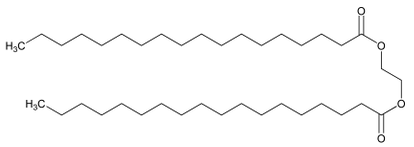
β-D-Glucopyranose 1-[*N,N*′-bis(2-chloroethyl)]phosphorodiamidate.



Glycol Distearate

Add the CAS number and structure to read:

CAS-627-83-8



Guaiacol

Add a chemical name and structure to read:

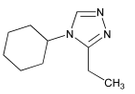
2-methoxyphenol.

Hemoglobin

Delete the chemical structure.

Hexazole

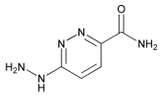
Add the chemical structure to read:



Nomenclature

Hydracarbazine

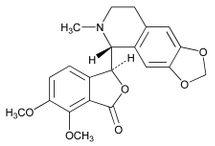
Change the chemical structure to read:



Hydrastine

Add the chemical information and structure to read:

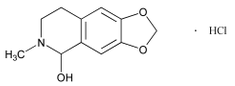
$C_{21}H_{21}NO_6$. 383.39. (1) Phthalide (*S*)-6,7-dimethoxy-3-(*R*)-(5,6,7,8-tetrahydro-6-methyl-1,3-dioxolo(4,5-*g*)isoquinolin-5-yl)-; (2) (*S*)-6,7-Dimethoxy-3-(*R*)-(6-methyl-5,6,7,8-tetrahydro-[1,3]dioxolo[4,5-*g*]isoquinolin-5-yl)isobenzofuran-1(3*H*)-one. *CAS-118-08-1.* USP IX; MI.



Hydrastinine Hydrochloride

Add the chemical information and structure to read:

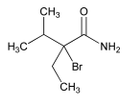
$C_{11}H_{13}NO_3 \cdot HCl$. 207.23. (1) 1,3-Dioxolo(4,5-*g*)isoquinolin-5-ol, hydrochloride; (2) 5,6,7,8-Tetrahydro-6-methyl-5,6,7,8-Tetrahydro-6-methyl-1,3-dioxolo(4,5-*g*)isoquinolin-5-ol, hydrochloride.



Ibrotamide

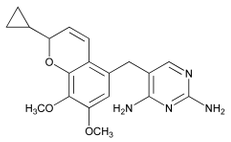
Change the chemical information and structure to read:

(1) Butanamide, 2-bromo-2-ethyl-3-methyl-; (2) 2-Bromo-2-ethyl-isovaleramide. *CAS-466-14-8.* INN; DCF; MI.



Iclaprim

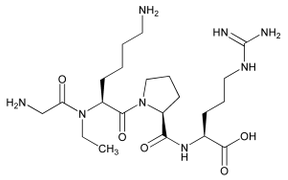
Add the chemical structure to read:



Icrocaptide

Add the molecular weight and chemical structure to read:

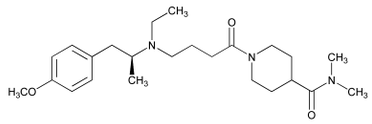
484.59.



Idaverine

Change the chemical information and structure to read:

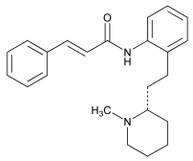
(+)-1-(4-{Ethyl[(*S*)-*p*-methoxy-α-methylphenethyl]amino}butyryl)-*N,N*-dimethylisonipecotamide.



Iferanserin

Add the molecular weight and chemical structure to read:

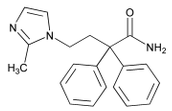
348.48.



Imidafenacin

Add the molecular weight and chemical structure to read:

319.40.



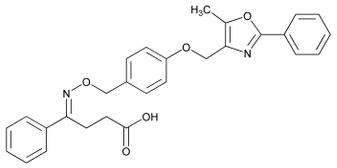
Imiglitazar

Add the molecular weight to read:

470.52.

Change the chemical information and structure to read:

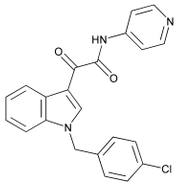
(*E*)-4-[({4-[(5-Methyl-2-phenyl-1,3-oxazol-4-yl)methoxy]phenyl}-methoxy)imino]-4-phenylbutanoic acid.



Indibulin

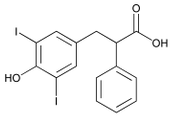
Add the molecular weight and chemical structure to read:

389.83.



Iodoalphionic Acid

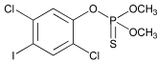
Add the chemical structure to read:



Iodofenphos

Change the chemical formula, molecular weight, and structure to read:

$C_8H_8Cl_2IO_3PS$. 413.00.



Iodol

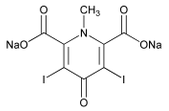
Add the chemical formula, molecular weight, and structure to read:

C_4HI_4N. 570.68.

Iodomethamate

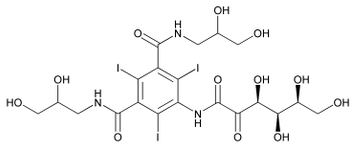
Add the chemical information and structure to read:

$C_8H_3I_2NNa_2O_5$. 492.90. 1,4-Dihydro-3,5-diiodo-1-methyl-4-oxo-2,6-pyridinedicarboxylic acid, disodium salt.



Iogulamide

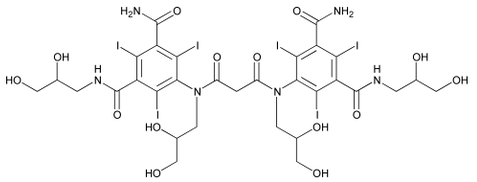
Change the chemical structure to read:



Iosimenol

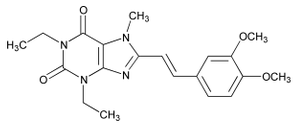
Change the chemical name and add the structure to read:

5,5′-[Propanedioylbis[(2,3-dihydroxypropyl)imino]]bis[*N*-(2,3-dihydroxypropyl)-2,4,6-triiodoisophthalamide].



Istradefylline

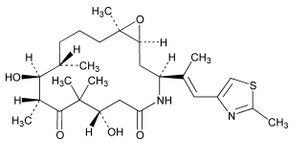
Add the chemical structure to read:



Ixabepilone

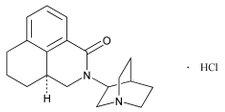
Change the chemical information and add the structure to read:

(2) (1*S*,3*S*,7*S*,10*R*,11*S*,12*S*,16*R*)-7,11-Dihydroxy-8,8,10,12,16-pentamethyl-3-[(1*E*)-1-methyl-2-(2-methylthiazol-4-yl)ethenyl]-17-oxa-4-azabicyclo[14.1.0]heptadecane-5,9-dione.



Palonosetron

Change the chemical structure to read:



Proposed International Nonproprietary Names

The following 73 names have been selected by the World Health Organization (WHO) as Proposed International Nonproprietary Names. This list, with chemical names or descriptions and the molecular formulae, appears in *WHO Drug Information,* Vol. 19, No. 4, 2005.

Any comments or formal objections to the proposed names should be addressed to Helene Biernacki, Research Associate, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

Proposed INN	Therapeutic Indication
Alcaftadine	*Tricyclic histamine-H_1 receptor antagonist*
Amibegron	*β_3-adrenoreceptor agonist*
Apadenoson	*Adenosine A receptor agonist*
Aplaviroc	*Antiviral*
Axitinib	*Antineoplastic*
Bosutinib	*Antineoplastic*
Brecanavir	*Antiviral*
Capeserod	*Serotonin partial agonist*
Casopitant	*Neurokinin NK1 receptor antagonist*
Celivarone	*Anti-arrhythmic*
Cevoglitazar	*Antidiabetic*
Darapladib	*Phospholipase A_2 inhibitor*
Dasatinib	*Antineoplastic*
Denagliptin	*Antidiabetic*
Denosumab	*Immunological agent*
Dexamethasone Cipecilate	*Steroidal anti-inflammatory*
Diaplasinin	*Inhibitor of plasminogen activator inhibitor-type 1 (PAI-1)*
Dilopetine	*Antidepressant*
Disomotide	*Immunological agent for active immunization*
Dutacatib	*Cathepsin K inhibitor*
Eltrombopag	*Thrombopoietin receptor agonist*
Eprodisate	*Inhibition of amyloid A fibril formation and deposition*
Fimasartan	*Angiotensin II receptor antagonist*
Fosaprepitant	*Neurokinin NK1 receptor antagonist*
Fospropofol	*General anesthetic*
Gabapentin Enacarbil	*Gabamimetic agent*
Goxalapladib	*Phospholipase A_2 inhibitor*
Incyclinide	*Anti-inflammatory agent*
Indantadol	*Analgesic*
Ipilimumab	*Immunomodulator*
Iratumumab	*Antineoplastic*
Larotaxel	*Antineoplastic*
Lisdexamfetamine	*Central stimulant*
Lodenafil Carbonate	*Vasodilator*
Masilukast	*Leukotriene receptor antagonist*
Mavacoxib	*Selective cyclo-oxygenase inhibitor (veterinary drug)*
Nilotinib	*Antineoplastic*
Nimotuzumab	*Antineoplastic*
Obatoclax	*Antineoplastic*
Ocrelizumab	*Immunomodulator, Antirheumatic*
Oglemilast	*Anti-asthmatic, Anti-allergic*
Olaparib	*Antineoplastic*
Orvepitant	*Neurokinin NK1 receptor antagonist*
Ovemotide	*Immunological agent for active immunization*
Ozarelix	*GnRH antagonist*
Paquinimod	*Immunomodulator*
Parogrelil	*Inhibition of PDE-II, PDE-IV, and TxA_2 synthetase*
Pazopanib	*Antineoplastic*
Relacatib	*Cathepsin K inhibitor*
Rilapladib	*Phospholipase A_2 inhibitor*
Rolipoltide	*Immunomodulator*
Romidepsin	*Antineoplastic*
Rotigaptide	*Anti-arrythmic*
Sapacitabine	*Antineoplastic*
Simotaxel	*Antineoplastic*
Sitagliptin	*Antidiabetic*
Sontuzumab	*Antineoplastic*
Sotirimod	*Immunomodulator*
Stamulumab	*Immunological agent*
Tadocizumab	*Antithrombotic*
Talotrexin	*Antineoplastic*
Telaprevir	*Antiviral*
Ticilimumab	*Antineoplastic*
Tiplasinin	*Inhibitor of plasminogen activator inhibitor-type 1 (PAI-1)*
Tramiprosate	*Inhibition of amyloid A fibril formation and deposition*
Transferrin Aldifitox	*Antineoplastic*
Tucotuzumab Celmoleukin	*Antineoplastic*
Velafermin	*Induction of epithelial and mesenchymal cell growth*
Verpasep Caltespen	*Immunological agent*
Vicriviroc	*Antiviral*
Vorinostat	*Antineoplastic*
Zibotentan	*Endothelin receptor antagonist*
Zotarolimus	*Immunosuppressant*

Nomenclature

INDEX

USP CATALOG

The complete USP Catalog may be downloaded from USP's website at www.usp.org.

If you wish to receive your own free printed copy of the complete USP Catalog call Maureen Rawson at 1-800-227-8772 ext.8237 or 301.816.8237. You may also email your request to marketing@usp.org.

New Items at a Glance

See what's new in USP Reference Standards. For your convenient and quick reference, here's a list of Reference Standards released by USP over the past year.

This list is continuously updated with the newest Reference Standards released within the past 12 months.

Cat. No.	Description	Curr. Lot	Price
1006801	Acetone (1.5 mL/ampule; 3 ampules)	F0D028	$168
1011007	Acitretin (200 mg)	F0E266	$394
1011018	Acitretin Related Compound A (20 mg)	F0E264	$536
1011029	Acitretin Related Compound B (20 mg)	F0E265	$536
1019712	Amiloride Related Compound A (30 mg) (AS)	F0E287	$526
1034909	Anecortave Acetate (200 mg)	F0E298	$168
1034910	Anecortave Acetate Related Compound A (20 mg)	F0E299	$526
1042102	L-Arabinitol (500 mg)	F0E311	$168
1065210	Berberine Chloride (50 mg)	F0E185	$281
1071202	Bicalutamide (200 mg)	F0E321	$168
1071213	Bicalutamide Related Compound A (25 mg)	F0E322	$526
1078201	Budesonide (200 mg)	F0E302	$168
1086301	Calcitriol (10 mg)	F0E062	$1,352
1086312	Calcitriol Solution (5 mL)	F0D330	$208
1086888	Calcium Lactate (1 g)	F0D227	$168
1086935	Calcium Levulinate (1 g) (AS)	F0E142	$168
1091040	Caprylic Acid (300 mg)	F0D378	$168
1496802	Parachlorophenol (500 mg)	F0E061	$168
1134346	Ciprofloxacin Related Compound A (25 mg) (AS)	F0E333	$526
1134390	Clarithromycin Identity (100 mg)	F0E141	$526
1140430	Clopidogrel Bisulfate (125 mg)	F0E115	$753
1140586	Clopidogrel Related Compound A (20 mg)	F0E117	$640
1140597	Clopidogrel Related Compound B (20 mg)	F0E119	$640
1140600	Clopidogrel Related Compound C (20 mg)	F0E118	$640
1145207	Cod Liver Oil (1 g)	F0D400	$168
1162148	Cytosine (100 mg)	F0E284	$168
1046089	N-Demethylazithromycin (15 mg)	F0E068	$526
1187954	2,4-Dichlorophenol (100 mg)	F0E113	$168
1241903	Erythritol (200 mg)	F0E313	$168
1268513	Etidronate Disodium Related Compound A (300 mg)	F0E227	$526
1270446	Fexofenadine Related Compound C (15 mg) (AS)	F0E291	$526
1273819	Flumazenil Related Compound A (20 mg)	F0E147	$675
1273820	Flumazenil Related Compound B (20 mg)	F0E148	$675
1285873	Fluticasone Propionate (100 mg)	F0F036	$832
1285884	Fluticasone Propionate Resolution Mixture (25 mg)	F0E123	$675
1285895	Fluticasone Propionate System Suitability Mixture (25 mg)	F0E122	$675
1285964	Fluvastatin Related Compound B (25 mg)	F0F017	$526
1285942	Fluvastatin for System Suitability (25 mg)	F0F016	$526
1287369	Gabapentin Related Compound E (25 mg)	F0E190	$526
1292303	Glimepiride (200 mg)	F0E228	$250
1292314	Glimepiride Related Compound A (20 mg)	F0E232	$526
1292325	Glimepiride Related Compound B (20 mg)	F0E233	$526
1292336	Glimepiride Related Compound C (20 mg)	F0E234	$526
1292347	Glimepiride Related Compound D (20 mg)	F0E235	$526
1295516	Glyburide Related Compound A (25 mg)	F0E224	$526
1313210	Hydrastine (10 mg)	F0E204	$281
1335010	Hyoscyamine Related Compound A (10 mg)	F0E250	$526
1342321	Insulin Lispro (5.97 mg)	F0E140	$168
1349626	Isomalt (200 mg)	F0E263	$168
1374292	Magnesium Phosphate (2 g) (AS)	F0E107	$168
1379059	Mefloquine Hydrochloride (100 mg)	F0E165	$168
1379060	Mefloquine Related Compound A (20 mg)	F0E166	$526
1380105	Melatonin (100 mg) (AS)	F0E027	$179
1379401	Meloxicam (400 mg)	F0E158	$281
1379412	Meloxicam Related Compound A (25 mg)	F0E167	$526
1379423	Meloxicam Related Compound B (25 mg)	F0E168	$526
1379434	Meloxicam Related Compound C (30 mg)	F0E159	$526
1379445	Meloxicam Related Compound D (30 mg)	F0E160	$526
1396331	Metformin Related Compound B (25 mg)	F0F019	$526
1396342	Metformin Related Compound C (25 mg)	F0E343	$526
1424109	Methyl Alcohol (3 x 1.5 mL)	F0D015	$168
1445404	Modafinil **CIV** (200 mg)	F0D351	$270
1448990	Myristic Acid (200 mg)	F0E120	$168
1460204	Neotame (200 mg)	F0F044	$168
1460215	Neotame Related Compound A (15 mg)	F0F045	$526
1473206	Norphenylephrine Hydrochloride (25 mg)	F0E205	$526
1478119	Ofloxacin Related Compound A (25 mg)	F0E276	$526
1478571	Ondansetron (300 mg)	F0E281	$225
1491015	Oxytetracycline Hydrochloride (200 mg) (AS)	F0E258	$168
1500353	Paroxetine System Suitability Mixture A (50 mg)	F0E150	$526
1534402	Phenyltoloxamine Citrate (100 mg)	F0E127	$168
1534413	Phenyltoloxamine Related Compound A (50 mg)	F0E128	$526
1546401	Polyethylene Glycol 200 (1 g)	F0E316	$168
1546423	Polyethylene Glycol 300 (1 g)	F0E336	$168
1546445	Polyethylene Glycol 400 (1 g)	F0E344	$168
1546525	Polyethylene Glycol 3000 (1 g)	F0F013	$168
1546547	Polyethylene Glycol 3350 (1 g)	F0F012	$168
1546966	Polyisobutylene (1 g)	F0E108	$168
1547200	Polyoxyl 35 Castor Oil (1 g)	F0E116	$168

New Items at a Glance *(Continued)*

Cat. No.	Description	Curr. Lot	Price
1547801	Polyoxyl 20 Cetostearyl Ether (100 mg)	F0C292	$168
1372402	Polyoxyl Lauryl Ether (500 mg)	F0E253	$168
1547346	Polyoxyl 2 Stearyl Ether (1 g) (AS)	F0D353	$168
1372606	Polyoxyl 10 Stearyl Ether (1 g)	F0D354	$168
1547368	Polyoxyl 20 Stearyl Ether (1 g) (AS)	F0D355	$168
1557000	Prednisolone Sodium Phosphate (100 mg)	F0E300	$168
1578554	Prostaglandin B1 (25 mg)	F0E022	$1,352
1598338	Ramipril Related Compound C (20 mg)	F0E157	$526
1598450	Ranitidine Resolution Mixture (20 mg)	F0E323	$1,052
1605500	Ropivacaine Hydrochloride (200 mg)	F0E334	$168
1605512	Ropivacaine Related Compound A (25 mg)	F0E315	$526
1605523	Ropivacaine Related Compound B (50 mg)	F0E318	$526
1612404	Sesame Oil (1 mL/ampule; 2 ampules) (AS)	F0E134	$168
1612415	Sesame Oil Related Compound A (6 mg/vial; 3 vials)	F0E131	$526
1612426	Sesame Oil Related Compound B (6 mg/vial; 3 vials)	F0E132	$526
1614363	Sodium Lauryl Sulfate (1 g) (AS)	F0D381	$168
1614670	Sodium Starch Glycolate Type B (400 mg)	F0E222	$168
1615708	Somatropin (8.63 USP Somatropin Units/vial)	F0E191	$182
1619017	Spironolactone Related Compound A (100 mg) (AS)	F0E184	$526
1642019	Sulindac Related Compound A (20 mg)	F0E314	$526
1667280	Tiagabine Hydrochloride (300 mg)	F0E178	$260
1667235	Racemic Tiagabine Hydrochloride Mixture (25 mg)	F0E179	$526
1667224	Tiagabine Related Compound A (15 mg)	F0E177	$526
1667355	Tiamulin (100 mg)	F0E219	$168
1667541	Tinidazole Related Compound B (20 mg)	F0E274	$526
1672010	o-Toluenesulfonamide (200 mg)	F0E163	$263
1672020	p-Toluenesulfonamide (200 mg)	F0E162	$263
1682217	Triclosan Related Compounds Mixture A (1.2 mL/ampule; 3 ampules)	F0E292	$526
1705323	Ubidecarenone Related Compound A (15 mg)	F0E210	$526
1708718	Valproic Acid Related Compound B (50 mg) (AS)	F0E201	$526
1711428	Verapamil Related Compound D (50 mg)	F0E342	$526

New Lots in Distribution

Cat. No.	Description	Curr. Lot.	Purity Value/Conc.	Change Code*	Previous Lot/Valid Use Date	CAS No.	Price
1042102	L-Arabinitol (500 mg)	F0E311	1.00 mg/mg (an)	1		[7643-75-6]	$168
1071202	Bicalutamide (200 mg)	F0E321	0.999 mg/mg (ai)	1		[90357-06-5]	$168
1071213	Bicalutamide Related Compound A (25 mg) (N-[4-cyano-3-(trifluoromethyl)phenyl]-3-[(4-fluoro-phenyl)sulfinyl]-2-hydroxy-2-methyl-propanamide)	F0E322		1		n/f	$526
1134346	Ciprofloxacin Related Compound A (25 mg) (AS) (7-Chloro-1-cyclopropyl-4-oxo-6-(piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid hydrochloride salt)	F0E333		1		n/f	$526
1285873	Fluticasone Propionate (100 mg)	F0F036	0.989 mg/mg (ai)	1		[80474-14-2]	$832
1285964	Fluvastatin Related Compound B (15 mg) ([R*,S*-E]-(+/-)-7-[3-(4-fluorophenyl)-1-methylethyl-1H-indol-2-yl]-3,5-dihydroxy-6-heptenoic acid 1,1, dimethylethyl ester)	F0F017		1		[129332-29-2]	$526
1285942	Fluvastatin for System Suitability (25 mg) (Fluvastatin sodium and fluvastatin sodium anti-isomer ([R*,R*-E]-(+/-)-7-[3-(4-Fluorophenyl)-1-(methyl-ethyl)-1H-indol-2-yl]-3,5-dihydroxy-6-heptenoic acid monosodium salt))	F0F016		1		n/f	$526
1396331	Metformin Related Compound B (25 mg) (1-Methylbiguanide hydrochloride)	F0F019		1		[1674-62-0]	$526
1396342	Metformin Related Compound C (25 mg) (N,N-Dimethyl-[1,3,5]triazine-2,4,6-triamine)	F0E343		1		[1985-46-2]	$526
1460204	Neotame (200 mg)	F0F044	0.954 mg/mg (ai)	1		[165450-17-9]	$168
1460215	Neotame Related Compound A (15 mg) (N-[N-(3,3-dimethylbutyl)-L-alpha-aspartyl]-L-phenylalanine)	F0F045	1.00 mg/mg (ai)	1		n/f	$526
1546401	Polyethylene Glycol 200 (1 g)	F0E316		1		[25322-68-3]	$168
1546423	Polyethylene Glycol 300 (1 g)	F0E336		1		[25322-68-3]	$168
1546445	Polyethylene Glycol 400 (1 g)	F0E344		1		[25322-68-3]	$168
1546525	Polyethylene Glycol 3000 (1 g)	F0F013		1		[25322-68-3]	$168
1546547	Polyethylene Glycol 3350 (1 g)	F0F012		1		[25322-68-3]	$168
1546966	Polyisobutylene (1 g)	F0E108		1		[9003-27-4]	$168
1598450	Ranitidine Resolution Mixture (20 mg)	F0E323		1		n/f	$1,052
1605500	Ropivacaine Hydrochloride (200 mg)	F0E334	0.943 mg/mg (ai)	1		[132112-35-7]	$168
1605512	Ropivacaine Related Compound A (25 mg) (2,6-dimethylaniline hydrochloride)	F0E315	1.00 mg/mg (ai)	1		[21436-98-6]	$526
1605523	Ropivacaine Related Compound B (50 mg) ((R)-(+)-1-Propylpiperidine-2-carboxylic acid (2,6-dimethylphenyl)-amide hydrochloride monohydrate)	F0E318		1		[112773-90-7]	$526
1614363	Sodium Lauryl Sulfate (1 g) (AS)	F0D381		1		[151-21-3]	$168
1642019	Sulindac Related Compound A (20 mg) (trans-sulindac)	F0E314		1		[53933-60-1]	$526
1708718	Valproic Acid Related Compound B (50 mg) ((2RS)-2-(1-methylethyl)pentanoic acid) (AS)	F0E201		1		[62391-99-5]	$526
1711428	Verapamil Related Compound D (50 mg) (5,5'-[[2-(3,4)dimethoxyphenyl)ethyl]imino]bis[2-(3,4-dimethoxyphenyl)-2-(1-methylethyl)pentanenitrile] hydrochloride)	F0E342		1		[190850-50-1]	$526
1009923	Acetyltriethyl Citrate (500 mg)	G0E085		2	F-1 (01/07) F (05/02)	[77-89-4]	$168
1055002	Benzoic Acid (300 mg)	G0D223	1.000 mg/mg (dr)	2	F6B173 (02/07) F-5 (03/04) F-4 (07/01)	[65-85-0]	$168

New Lots in Distribution

Cat. No.	Description	Curr. Lot.	Purity Value/Conc.	Change Code*	Previous Lot/Valid Use Date	CAS No.	Price
1176506	Dexamethasone Acetate (200 mg)	H0E339	0.996 mg/mg (dr)	2	G (12/06) F-1 (06/99)	[1177-87-3]	$168
1177000	Dexamethasone Phosphate (200 mg)	K0E275	0.996 mg/mg (dr)	2	J1B070 (01/07) J (08/03) I (03/00)	[312-93-6]	$168
1242000	Erythromycin (250 mg)	M1E251	96.7% Erythromycin A 978 ug/mg (ai) (microbial)	2	M (02/07) L (08/99)	[114-07-8]	$168
1270377	Fexofenadine Hydrochloride (200 mg)	F1E289	0.996 mg/mg (ai)	2	F0D244 (02/07)	[138452-21-8]	$168
1354207	Isradipine (200 mg)	H0E252	0.995 mg/mg (dr)	2	G0B054 (01/07) F (05/03)	[75695-93-1]	$168
1365000	Levothyroxine (500 mg)	L0D226	0.994 mg/mg (dr)	2	K (12/06) J (10/00)	[51-48-9]	$168
1431603	Methyl Palmitate (300 mg)	G0E329	1.00 mg/mg (ai)	2	F(02/07)	[112-39-0]	$168
1438001	Methyltestosterone **CIII** (200 mg)	J1E324	0.996 mg/mg (dr)	2	J (02/07) I (11/01)	[58-18-4]	$224
1440003	Methysergide Maleate (350 mg)	H1F038	0.997 mg/mg (dr)	2,3	H (12/06)	[129-49-7]	$260
1445470	Mometasone Furoate (200 mg)	H0E009	0.998 mg/mg (dr)	2	G0B073 (01/07) F-1 (04/03) F (02/01)	[83919-23-7]	$168
1457006	Naphazoline Hydrochloride (200 mg)	L0E207	0.989 mg/mg (dr)	2	K (02/07)	[550-99-2]	$168
1458009	Neomycin Sulfate (200 mg)	L3E135	782 ug/mg (dr)	2	L-2 (01/07) L-1 (09/01) L (02/99)	[1405-10-3]	$168
1461003	Niacin (200 mg)	I0E295	0.998 mg/mg (ai)	2	H2C121 (02/07) H-1 (01/05)	[59-67-6]	$168
1494079	Pancreatin Lipase (2 g)	I1E327	21.2 USP Units of Lipase Activity/mg (ai)	2	I (12/06) H-1 (03/01)	[8049-47-6]	$168
1500251	Paroxetine Related Compound D (10 mg) (AS) (cis-Paroxetine hydrochloride)	G0E096		2,3	F0C228 (12/06)	n/f	$526
1500262	Paroxetine Related Compound E Mixture (25 mg) (1-Methyl-4-(p-fluorophenyl)-1,2,3,6-tetrahydro-pyridine in Paroxetine Hydrochloride Matrix)	F1F028	0.86 ng/mg (ai)	2	F0D225 (11/06)	n/f	$526
1500284	Paroxetine Related Compound G (0.4 mg) ((+/-)-trans-3-[(1,3-benzodioxol-5-yloxy)methyl]-4-(4''-fluorophenyl-4'-phenyl)piperidine hydrochloride)	G0E121	0.4 mg in ~1.5 mg povidone	2,3	F0D110 (12/06)	n/f	$526
1535507	Phenytoin Sodium (200 mg)	H1E335	1.000 mg/mg (dr) (UV)	2	H (02/07) G (05/99)	[630-93-3]	$168
1623502	Succinylcholine Chloride (500 mg)	H1E325	0.995 mg/mg (an)	2	H (12/06)	[71-27-2]	$168
1636005	Sulfasalazine (125 mg)	G3F035	1.000 mg/mg (dr)	2	G-2 (02/07) G-1 (06/99)	[599-79-1]	$134
1699005	Tropicamide (200 mg)	H0E307	0.99 mg/mg (ai)	2,3	G-1 (01/07) G (02/99)	[1508-75-4]	$134
1719102	Warfarin Related Compound A (50 mg) (3-(o-hydroxyphenyl)-5-phenyl-2-cyclohexen-1-one)	H0E268		2	G1B111 (02/07) G (01/04)	[37209-23-7]	$168

USP Reference Standards and Authentic Substances

Cat. No.	Description	Curr. Lot.	Purity Value/Conc.	Change Code*	Previous Lot/Valid Use Date	CAS No.	Price
1000601	Acebutolol Hydrochloride (125 mg)	F-1				[34381-68-5]	$168
1001003	Acenocoumarol (200 mg)	G0D300			F (10/05)	[152-72-7]	$168
1001502	Acepromazine Maleate (250 mg)	F-2			F-1 (05/02)	[3598-37-6]	$168
1002505	Acesulfame Potassium (200 mg)	F0C136				[55589-62-3]	$281

Notice to the USP Executive Secretariat of Intent to Comment

Date: _____

Mail to: Executive Secretariat, *USP-NF*
12601 Twinbrook Parkway
Rockville, MD 20852

I am unable to comment at present, but please be informed of my intent to comment at a later date, on the topics as indicated below.

Note: Please include a brief summary of intended comments to help USP make a decision on the reverse. Submitters should comment not later than the next comment deadline.

Monograph/General Chapter Title	With reference to the proposal(s) in *Pharmacopeial Forum*			Estimated date USP can expect comments
	PF Vol.	No.	Pages	

Submitter information (please type or print):

Name: _____

Company: _____

Address: _____

_____

_____

_____

Phone: _____

Fax: _____

E-mail: _____

**Note—specifying the date(s) by which you expect to submit comments to the Executive Secretariat will not necessarily result in a deferment of the implementation of the proposal to which you refer above.*

CHROMATOGRAPHIC REAGENTS USED IN *USP–NF* AND *PHARMACOPEIAL FORUM*

This is a update based on the proposals published in this issue of *PF*.

CHROMATOGRAPHIC REAGENTS USED IN *USP–NF* AND *PHARMACOPEIAL FORUM*

This is a update based on the proposals published in this issue of *PF*.

Chromatographic Reagents Used in *USP-NF* and *Pharmacopeial Forum*
May–June 2006

AMLODIPINE BESYLATE (DSD Mgh #3570)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L1	Nova-Pak C18	Assay and Related compounds	Alternative column. 3.9 mm × 15 cm, 4 µm, manufacturer Waters.
32(3)	L1	Symmetry C-18	Assay and Related compounds	3.9 mm x 15 cm, 5 µm, manufacturer Waters.

BEMOTRIZINOL (DSD Mgh #1131)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L1	Hypersil BDS C-18	Assay and Related compounds	3 mm × 12.5 cm, 3 µm, manufacturer Thermo Electron.

CAPECITABINE (DSD Mgh #12330)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L1	Inertsil ODS-2	Assay and Chromatographic purity	4.6 mm × 25 cm, 5 µm, manufacturer GL Sciences.

CAPECITABINE TABLETS (DSD Mgh #12335)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L1	Inertsil ODS-2	Assay and Chromatographic purity	4.6 mm × 25 cm, 5 µm, manufacturer GL Sciences.

CLARITHROMYCIN EXTENDED-RELEASE TABLETS (DSD Mgh #17997)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(4)	L7	LiChrospher 60 RP-Select B	Dissolution	Dissolution, Test 4. 4.0 mm × 12.5 cm, 5 µm, manufacturer Merck KGaA.

CONJUGATED ESTROGENS TABLETS (DSD Mgh #30900)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(4)	L1	Bio-Sil ODS	Dissolution	Dissolution, Test 4, Test 5, Test 6. 4.6 mm × 3.0 cm, 3 µm, manufacturer BioRad.

GLIPIZIDE (DSD Mgh #35030)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L43	Discovery HS F5	Assay and Related compounds	Alternative column. 4.6 mm × 25 cm, 5 µm, manufacturer Supelco.
32(3)	L43	Curosil PFP	Assay and Related compounds	4.6 mm × 25 cm, 5 µm, manufacturer Phenomenex.

GLIPIZIDE AND METFORMIN HYDROCHLORIDE TABLETS (DSD Mgh #847)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(4)	L1	Symmetry C-18	Dissolution	4.6 mm × 15 cm, 5 µm, manufacturer Waters.

GLYCERYL MONOSTEARATE (DSD Mgh #35490)

PF	LGS#	Reagent Brand	Type of Test	Comments
0(0)	L21	PLgel	Assay for	Assay for monoglycerides. 7.5 mm × 60 cm, 5 µm, 100 Å, manufacturer Phenomenex.

MELOXICAM ORAL SUSPENSION (DSD Mgh #2140)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(4)	L1	Kromasil C18	Assay and Chromatographic purity	4 mm × 12.5 cm, manufacturer EKA Nobel.

METHYLSULFONYLMETHANE (DSD Mgh #53000)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(2)	G2	Zebron ZB-1	Assay and Chromatographic purity	0.53 mm × 30 m, 5 µm, manufacturer Phenomenex.

METHYLSULFONYLMETHANE TABLETS (DSD Mgh #2187)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(2)	G2	Zebron ZB-1	Assay	0.53 mm × 30 m, 5 µm, manufacturer Phenomenex.

MODAFINIL (DSD Mgh #54521)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L1	Inertsil ODS-2	Related compounds	Related compounds, Test 2. 4.6 mm × 25 cm, 5 µm, manufacturer GL Sciences.

NEVIRAPINE ORAL SUSPENSION (DSD Mgh #56488)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(4)	L10	Zorbax SB-CN	Assay and Related compounds	Guard column. 4.6 mm × 12.5 mm, 5 µm; analytical column. 4.6 mm × 15 cm, 3.5 µm, manufacturer Agilent.
32(4)	L1	Symmetry C-18	Dissolution	Guard column. 3.9 mm × 20 mm; analytical column. 3.9 mm × 15 cm, 5 µm, manufacturer Waters.

ORLISTAT (DSD Mgh #58790)

PF	LGS#	Reagent Brand	Type of Test	Comments
31(3)	L1	Aminoquant	Impurity test	Impurity, Test 5. 2.1 mm × 20 cm, manufacturer Agilent.
32(3)	G27	DB-5	Limit of	Limit of related compound B. 32 mm × 30 m, 0.25 µm, manufacturer J&W Scientific.
32(3)	L1	Nova-Pak C18	Assay and Impurity Test	Test 3. 3.9 mm × 15 cm, 4 µm, manufacturer Waters.

PAROXETINE HYDROCHLORIDE (DSD Mgh #61180)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L13	Adsorbosphere TMS	Assay	4.6 mm × 25 cm, 5 µm, manufacturer Grace Davison–Alltech.

PERMETHRIN (DSD Mgh #62530)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L1	Inertsil ODS-2	Assay and Related compounds	4.6 mm × 15 cm, 5 µm, manufacturer GL Sciences.

PERMETHRIN CREAM (DSD Mgh #62535)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L1	Inertsil ODS-2	Assay and Related compounds	4.6 mm × 15 cm, 5 µm, manufacturer GL Sciences.

PRAVASTATIN SODIUM TABLETS (DSD Mgh #68368)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L1	Nova-Pak C18	Assay and Related compounds	Alternative column. 3.9 mm × 7.5 cm, 4 µm, manufacturer Waters.
32(3)	L1	Spherisob ODS-2	Assay and Related compounds	4.6 mm × 5 cm, 3 or 5 µm, endcapped, manufacturer Waters.

RISPERIDONE TABLETS (DSD Mgh #73744)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L1	Zorbax SB-C18	Dissolution and Uniformity of dosage units	4.6 mm × 15 cm, 5 µm, manufacturer Agilent.
32(3)	L1	Zorbax SB-C18	Assay and Related compounds	4.6 mm × 15 cm, 5 µm, manufacturer Agilent.

SPIRONOLACTONE (DSD Mgh #77860)

PF	LGS#	Reagent Brand	Type of Test	Comments
0(0)	L1	TSKgel ODS-80Tm	Assay	4.6 mm × 15 cm, manufacturer Tosoh Corp.

Chromatographic Reagents Used in *USP-NF* and *Pharmacopeial Forum*
May–June 2006

AMLODIPINE BESYLATE (DSD Mgh #3570)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L1	Nova-Pak C18	Assay and Related compounds	Alternative column. 3.9 mm × 15 cm, 4 µm, manufacturer Waters.
32(3)	L1	Symmetry C-18	Assay and Related compounds	3.9 mm x 15 cm, 5 µm, manufacturer Waters.

BEMOTRIZINOL (DSD Mgh #1131)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L1	Hypersil BDS C-18	Assay and Related compounds	3 mm × 12.5 cm, 3 µm, manufacturer Thermo Electron.

CAPECITABINE (DSD Mgh #12330)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L1	Inertsil ODS-2	Assay and Chromatographic purity	4.6 mm × 25 cm, 5 µm, manufacturer GL Sciences.

CAPECITABINE TABLETS (DSD Mgh #12335)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L1	Inertsil ODS-2	Assay and Chromatographic purity	4.6 mm × 25 cm, 5 µm, manufacturer GL Sciences.

CLARITHROMYCIN EXTENDED-RELEASE TABLETS (DSD Mgh #17997)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(4)	L7	LiChrospher 60 RP-Select B	Dissolution	Dissolution, Test 4. 4.0 mm × 12.5 cm, 5 µm, manufacturer Merck KGaA.

CONJUGATED ESTROGENS TABLETS (DSD Mgh #30900)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(4)	L1	Bio-Sil ODS	Dissolution	Dissolution, Test 4, Test 5, Test 6. 4.6 mm × 3.0 cm, 3 µm, manufacturer BioRad.

GLIPIZIDE (DSD Mgh #35030)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L43	Discovery HS F5	Assay and Related compounds	Alternative column. 4.6 mm × 25 cm, 5 µm, manufacturer Supelco.
32(3)	L43	Curosil PFP	Assay and Related compounds	4.6 mm × 25 cm, 5 µm, manufacturer Phenomenex.

GLIPIZIDE AND METFORMIN HYDROCHLORIDE TABLETS (DSD Mgh #847)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(4)	L1	Symmetry C-18	Dissolution	4.6 mm × 15 cm, 5 µm, manufacturer Waters.

GLYCERYL MONOSTEARATE (DSD Mgh #35490)

PF	LGS#	Reagent Brand	Type of Test	Comments
0(0)	L21	PLgel	Assay for	Assay for monoglycerides. 7.5 mm × 60 cm, 5 µm, 100 Å, manufacturer Phenomenex.

MELOXICAM ORAL SUSPENSION (DSD Mgh #2140)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(4)	L1	Kromasil C18	Assay and Chromatographic purity	4 mm × 12.5 cm, manufacturer EKA Nobel.

METHYLSULFONYLMETHANE (DSD Mgh #53000)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(2)	G2	Zebron ZB-1	Assay and Chromatographic purity	0.53 mm × 30 m, 5 µm, manufacturer Phenomenex.

METHYLSULFONYLMETHANE TABLETS (DSD Mgh #2187)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(2)	G2	Zebron ZB-1	Assay	0.53 mm × 30 m, 5 µm, manufacturer Phenomenex.

MODAFINIL (DSD Mgh #54521)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L1	Inertsil ODS-2	Related compounds	Related compounds, Test 2. 4.6 mm × 25 cm, 5 µm, manufacturer GL Sciences.

NEVIRAPINE ORAL SUSPENSION (DSD Mgh #56488)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(4)	L10	Zorbax SB-CN	Assay and Related compounds	Guard column. 4.6 mm × 12.5 mm, 5 µm; analytical column. 4.6 mm × 15 cm, 3.5 µm, manufacturer Agilent.
32(4)	L1	Symmetry C-18	Dissolution	Guard column. 3.9 mm × 20 mm; analytical column. 3.9 mm × 15 cm, 5 µm, manufacturer Waters.

ORLISTAT (DSD Mgh #58790)

PF	LGS#	Reagent Brand	Type of Test	Comments
31(3)	L1	Aminoquant	Impurity test	Impurity, Test 5. 2.1 mm × 20 cm, manufacturer Agilent.
32(3)	G27	DB-5	Limit of	Limit of related compound B. 32 mm × 30 m, 0.25 µm, manufacturer J&W Scientific.
32(3)	L1	Nova-Pak C18	Assay and Impurity Test	Test 3. 3.9 mm × 15 cm, 4 µm, manufacturer Waters.

PAROXETINE HYDROCHLORIDE (DSD Mgh #61180)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L13	Adsorbosphere TMS	Assay	4.6 mm × 25 cm, 5 µm, manufacturer Grace Davison–Alltech.

PERMETHRIN (DSD Mgh #62530)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L1	Inertsil ODS-2	Assay and Related compounds	4.6 mm × 15 cm, 5 µm, manufacturer GL Sciences.

PERMETHRIN CREAM (DSD Mgh #62535)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L1	Inertsil ODS-2	Assay and Related compounds	4.6 mm × 15 cm, 5 µm, manufacturer GL Sciences.

PRAVASTATIN SODIUM TABLETS (DSD Mgh #68368)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L1	Nova-Pak C18	Assay and Related compounds	Alternative column. 3.9 mm × 7.5 cm, 4 µm, manufacturer Waters.
32(3)	L1	Spherisob ODS-2	Assay and Related compounds	4.6 mm × 5 cm, 3 or 5 µm, endcapped, manufacturer Waters.

RISPERIDONE TABLETS (DSD Mgh #73744)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(3)	L1	Zorbax SB-C18	Dissolution and Uniformity of dosage units	4.6 mm × 15 cm, 5 µm, manufacturer Agilent.
32(3)	L1	Zorbax SB-C18	Assay and Related compounds	4.6 mm × 15 cm, 5 µm, manufacturer Agilent.

SPIRONOLACTONE (DSD Mgh #77860)

PF	LGS#	Reagent Brand	Type of Test	Comments
0(0)	L1	TSKgel ODS-80Tm	Assay	4.6 mm × 15 cm, manufacturer Tosoh Corp.

Table of Contents*

PHARMACOPEIAL FORUM VOL. 32 NO. 4 **JULY–AUG. 2006**

* The *USP–NF* (*USP 30–NF 25*), the *Supplement* (*Supp*), or the *Interim Revision Announcement* (*IRA*) for which the revision proposal is targeted is shown in parentheses next to each proposed item.

THE JOURNAL OF STANDARDS DEVELOPMENT AND OFFICIAL COMPENDIA REVISION

Please address comments on *PF* content to Executive Secretariat
USP–NF, 12601 Twinbrook Pkwy.
Rockville, MD 20852

Telephone: 1-301-816-8345
Fax: 1-301-816-8373
http://www.usp.org

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI),* in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences.*

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

Printed in USA by Port City Press, Baltimore, Maryland

ISSN: 0363-4655

Moving?
Our subscribers' records and publication labels are computer-generated. Please send your new address, and your latest label, or an exact copy of it, to: USPC, *PF* Customer Service Dept., 12601 Twinbrook Parkway, Rockville, MD 20852.
Fax: (301) 816-8148.

STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum* (*PF*), for the development of official pharmaceutical standards.

USP publishes *Pharmacopeial Forum* (*PF*) bimonthly as the working vehicle of the USP Council of Experts. *PF* provides interested parties an opportunity to review and comment as the Council of Experts develops or revises standards for the *United States Pharmacopeia* and the *National Formulary* (*USP–NF*).

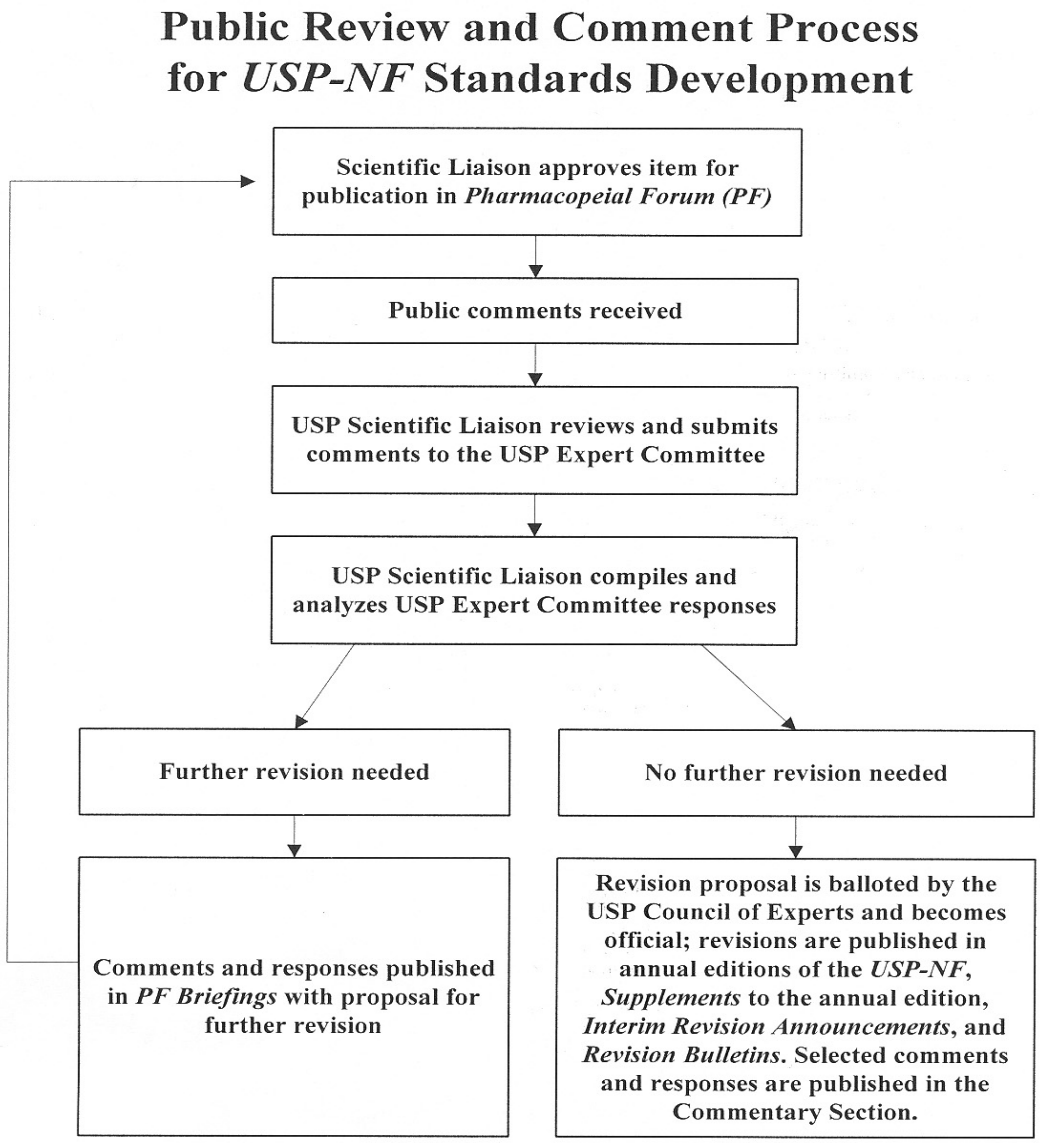
PF includes the following:

1. Potential revisions—entirely new standards, revision ideas, and drafts not yet targeted for official adoption (*Pharmacopeial Previews*)
2. Proposed revisions—new or revised standards targeted for official adoption (*In-Process Revision*)
3. Adopted revisions—new or revised standards that become official and binding before the publication of the next *USP–NF* or *Supplement* (*Interim Revision Announcement*)

USP welcomes comments and data on potential, proposed, or official standards.* Comments, along with USP's responses, will be published either in *PF Briefings*, the *Commentary* section of *PF*, the *Commentary* section of *Supplements* to *USP–NF*, or the *Commentary* section of *USP–NF*.

* If you are not immediately able to submit comments but you intend to do so, please notify USP by using the Intent to Comment form provided before the section *Chromatographic Reagents Used in USP–NF and PF*.

The chart below shows the public review and comment process and its relationship to standards development.



Questions on the process should be addressed to Director, Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: execsec@usp.org).

HOW TO USE *PF*

This section provides descriptions of the various parts of *PF*. It also includes *Committee Designations* and the *Staff Directory*.

The content of the different sections of *PF* is briefly described below. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a *Request for Revision* is available in the *Guideline for Submitting Requests for Revision to the USP–NF* on the USP website (www.usp.org/USPNF/submitMonograph/subGuide.html).

Proposed and Adopted Revisions to the *USP–NF*

Section	Content	How Readers Can Respond
Pharmacopeial Previews Early ideas for revisions	•BRIEFING: Scientific rationale for potential inclusion or change. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •Potential revisions not yet targeted for official adoption that require a longer public review and comment process because of issues such as: — the controversial nature of an item; — the application of new technologies that require further study; and — articles produced by multiple sources.	Review drafts and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview.*
In-Process Revision Revisions targeted for adoption	•BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see *Standards Development*). New or revised text is marked with symbols (■■ or ●● or ▲▲) to specify the tentative earliest date on which the revision would be officially adopted.	Review material and send comments promptly to USP staff liaison (see the *Staff Directory*). Guidelines on how to comment are found at the end of the *Policies and Announcements* section.
Harmonization Items the Pharmacopeial Discussion Group (PDG) is working to harmonize internationally	•BRIEFING: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. The stage determines whether an item appears under *Pharmacopeial Previews* or under *In-Process Revision,* both separate sections of *Harmonization.* •For *In-Process Revision,* new or revised text is marked with symbols (■■) to specify the tentative, earliest date on which the revision would be officially adopted.	Review material and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview* or *In-Process Revision.*
Interim Revision Announcement Adopted standards	Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols ●●.	Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance.
Pending Proposals	In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *PF* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in either the *USP–NF*, its supplements, or an *IRA*. Those items that have not yet been adopted are still pending.	Review items to track pending proposals.
Canceled Proposals	Canceled proposals are items that were published in *PF* and were pending, but have since been canceled. Note that canceled proposals may be republished to be considered in the future for adoption into the *USP–NF.*	Review items to track canceled proposals.

Other Sections

Committee Designations
Names of the committees (composed of volunteer scientific experts) that USP staff work with on the development of standards.

Staff Directory
Names of all USP scientific staff liaisons with contact information.

Policies and Announcements
- General scientific and policy issues affecting *USP–NF* standards and processes
- Update on standards-related issues being considered by USP
- Where to find summaries of meetings of the Council of Experts
- Guidelines on how to comment
- Publication and comment schedules

Stimuli to the Revision Process
- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

Nomenclature
- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the *USP Dictionary of USAN and International Drug Names*
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

Index
Cumulative directory for the content of all issues of *PF* beginning with *PF* 32(1).

Reference Standards Catalog
List of official USP Reference Standards specified in *USP–NF*, along with availability and ordering information.

Chromatographic Reagents Used in USP–NF and Pharmacopeial Forum
Update of chromatographic reagents based on the proposals published in this issue of *PF*.

EXPERT COMMITTEE DESIGNATIONS*

2005–2010

AER	Aerosols
BB BBP	B&B Blood and Blood Products
BB CGT	B&B Cell, Gene, and Tissue Therapies
BB PP	B&B Proteins and Polysaccharides
BB VV	B&B Vaccines and Virology
BPC	Biopharmaceutics
CRX	Compounding Pharmacy
DS-BA	Dietary Supplements—Bioavailability
DSB	Dietary Supplements—Botanicals
DS-GC	Dietary Supplements—General Chapters
DSI	Dietary Supplements—Information

POLICIES AND ANNOUNCEMENTS

This section includes information about general scientific and policy issues that may have an impact on *USP–NF* standards and processes and announcements about issues being considered by USP. This section also includes publication and comment schedules.

CHANGES ADOPTED FOR THE *RULES AND PROCEDURES OF THE 2005–2010 COUNCIL OF EXPERTS.* The 2005–2010 USP Council of Experts has voted to approve changes to the *Rules and Procedures of the 2005–2010 Council of Experts,* which were originally adopted on a provisional basis in April 2005. Pursuant to USP's Bylaws, the revised *Rules and Procedures* will be made available to USP's Convention membership for comment and will become effective following review and approval by USP's Board of Trustees and formal adoption by the Council of Experts.

Details about the changes of the revised *Rules and Procedures* are captured in a USP Statement titled "Recent Modifications to the USP Standards-Setting Process," which is posted on USP's website (http://www.usp.org/USPNF/notices/). The changes to the Rules include provisions that:

- Reinforce the ability of an Expert Committee to finalize and approve revisions to the *USP–NF* without the need to republish the proposed revisions in the *Pharmacopeial Forum (PF);*
- Allow the use of USP's website and other vehicles in addition to the *PF* to communicate proposed revisions to the *USP–NF;*
- Require USP to publish summaries of the public comments it receives on proposed revisions to the *USP–NF* and Expert Committee responses to such comments;
- Increase to six months the time between publication of revisions to the *USP–NF* and the date on which such revisions generally become official;
- More closely synchronize the official date of revisions to the *USP–NF* with the date on which any new official USP reference standards called for in such revisions are released;
- Clarify the requirements and process for establishing standards in an expedited fashion through *Interim Revision Announcements* and Revision Bulletins;
- Facilitate the development of monographs for articles pending approval at FDA, so that such monographs can be made available and can immediately become official upon FDA approval;
- Allow for the development of monographs for medicines legally marketed outside of the U.S. that are used to treat neglected diseases; and
- Enable FDA representatives to more fully participate in USP's Expert Committee meetings.

Please direct any comments or questions on this topic to Susan de Mars, Chief Legal Officer (301-816-8296 or sdm@usp.org).

IMPLEMENTATION PERIOD FOR UPCOMING OFFICIAL REVISIONS TO THE USP–NF EXTENDED. To provide additional time to adopt revisions made to the compendia, USP is pleased to announce that effective beginning with the publication of *USP 30–NF 25,* implementation periods for revisions to official text in *United States Pharmacopeia–National Formulary (USP–NF)* and its *Supplements* are being extended. This change responds to stakeholder requests (see the *Pharmacopeial Forum (PF)* 31(2) *Stimuli* article, "The USP Revision Process: Recommendations for Enhancements"). As a result of this change, users will have six months from the publication date to implement new official texts as opposed to the previous 60-day period. The complete revised Publication Schedule for *USP 30–NF 25* reflecting this new six month implementation period is outlined below.

Publication Schedule for *USP 30–NF 25*

***USP–NF* Publication**	**Publication Date**	**Official Date**
USP–NF (Book)	November 2006	May 1, 2007
Supplement One	February 2007	August 1, 2007
Supplement Two	June 2007	December 1, 2007

Users may implement the newly official texts prior to the official date and the use becomes mandatory on the official date.

Please direct any comments or questions on this topic to Beryl Voigt, Director, Executive Secretariat (301-816-8155 or execsec@usp.org).

COORDINATION OF *PF* SUBMISSIONS AND NEW USP REFERENCE STANDARDS. USP recently announced a new process in which revisions and new monographs will not be published as official standards until the required USP Reference Standards are available for purchase [see *Policies and Announcements, PF* 32(3)]. We are pleased to announce another process change to better synchronize the availability of USP Reference Standards and the adoption of new documentary standards in the *USP–NF.* Effective March 28, 2006, any revision proposal involving the use of a first-time USP Reference Standard will be scheduled for publication in the *PF* only after a suitable reference standard bulk candidate has been received by USP. The timing of this new process affects regular revisions (not new monographs/general chapters) submitted to *PF* 32(4) and all revisions and new monographs/general chapters beginning with *PF* 32(5). While we acknowledge that this may cause a brief delay in publication of some proposed revisions and new monographs, we believe this process change is a benefit to USP customers and will ultimately lead to better public standards. It is anticipated that there may be some exceptions to this new process on a case-by-case basis.

Please direct any comments or questions on this topic to Beryl Voigt, Director, Executive Secretariat (301-816-8155 or execsec@usp.org).

IMMEDIATE IRA COMMENTARY

RESIDUAL SOLVENTS: GENERAL NOTICES AND GENERAL CHAPTER ⟨467⟩—IMPLEMENTATION DATE DELAYED—The Executive Committee of the Council of Experts has voted to delay the implementation date for the new requirements related to USP General Chapter ⟨467⟩ from January 1, 2007 to July 1, 2007. This decision affects two sections of the *USP–NF: General Notices* and the General Chapter. This decision is presented in the 4th IRA in this issue of *Pharmacopeial Forum,* which states: "The implementation date of the section on *Residual Solvents* in the *General Notices* and the change in the title of General Chapter ⟨467⟩ from *Organic Volatile Impurities* to *Residual Solvents* will be delayed from January 1, 2007 to July 1, 2007." Additionally, the section in ⟨467⟩ titled *Other Analytical Procedures,* originally slated to be deleted at the time when the title changes, will be kept in the chapter until the new implementation date.

Users should also recall that references to "*Residual Solvents* ⟨467⟩: meet the requirements" were retracted from *USP–NF* monographs according to the Notice of Retraction issued by USP on January 1, 2006. Specifications for *Organic Volatile Impurities* ⟨467⟩ in *USP–NF* monographs will remain official until **July 1, 2007.**

After July 1, 2007, the change in the title of General Chapter ⟨467⟩ and the *General Notices* statement on *Residual Solvents* will be effective, and references to *Organic Volatile Impurities* will be deleted from monographs.

Please direct any comments or questions to Horacio Pappa, Ph.D., Senior Scientist (301-816-8319 or hp@usp.org).

IMMEDIATE IRA FOR *TABLETS CONTAINING AT LEAST THREE OF THE FOLLOWING—ACETAMINOPHEN AND SALTS OF CHLORPHENIRAMINE, DEXTROMETHORPHAN, AND PSEUDOEPHEDRINE*—The *Dissolution* test for *Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine* is being revised to add an additional *Dissolution* procedure *(Test 2)* to provide appropriate standards for a product already on the market.

Please direct any comments or questions to Margareth Marques, Ph.D., Senior Scientist (301-816-8106 or mrm@usp.org) or Clydewyn Anthony, Ph.D., Scientist (301-816-8139 or cma@usp.org).

IMMEDIATE IRA FOR *NITROFURANTOIN CAPSULES*—The *Nitrofurantoin Capsules* test for *Dissolution* is being revised to include an additional *Dissolution* procedure *(Test 3)* to provide appropriate standards for an FDA-approved product.

Please direct any comments or questions to Margareth Marques, Ph.D., Senior Scientist (301-816-8106 or mrm@usp.org) or Behnam Davani, Ph.D., M.B.A., Senior Scientist (301-816-8394 or bd@usp.org).

IMMEDIATE IRA FOR *ZINC SULFATE TABLETS*—The *Zinc Sulfate Tablets* tests for *Identification* are being revised to describe the preparation of several solutions used in the procedures. The test for *Dissolution* is also being replaced with a test for *Disintegration* because of the performance characteristics of this product. Immediate revisions to this monograph are necessary to support the efforts by the United Nations International Children's Emergency Fund (UNICEF), the United States Agency for International Development (USAID), and the World Health Organization (WHO). Although the product is not approved by the FDA, USP is giving this monograph special consideration to support efforts by the aforementioned organizations to ensure the availability of quality public standards for this product marketed outside the United States.

Please direct any comments or questions to Margareth Marques, Ph.D., Senior Scientist (301-816-8106 or mrm@usp.org) or Horacio Pappa, Ph.D., Senior Scientist (301-816-8319 or hp@usp.org) or Lawrence Evans, Ph.D., Scientist (301-816-8389 or le@usp.org).

USP INFORMATION EXPERT COMMITTEE MEMBERS ELECTED. USP is pleased to announce that Expert Committee members have been elected to 14 of the 16 Information Expert Committees. A complete list of newly elected members is available at http://www.usp.org/aboutUSP/governance/expertList.html.

USP ANNUAL SCIENTIFIC MEETING 2006. USP will host its third Annual Scientific Meeting, September 26–29, 2006 at the Marriott Denver City Center, Denver, Colorado. This year's topics include:

- Track I: Biologics and Biotechnology
- Track II: Reference Standards
- Track III: Dietary Supplements
- Track IV: Excipients and Harmonization
- Track V: USP—Working for You
- Track VI: Impurities in Drug Substances and Products
- One Day Track: Chromatography
- Special Topic: International Activities

Many members of USP's Council of Experts, Expert Committees are presenting at the various track sessions. USP anticipates that the collegial exchange of comments during session discussions will provide the Expert Committees with a better understanding of the varied perspectives of USP's many audiences. This year's Annual Scientific Meeting also will feature an expanded exhibit program and a spouse/guest program.

For more information and to register, go to www.usp.org/conferences, call (301) 816-8134, or e-mail conferences@usp.org.

PHARMACOPEIAL EDUCATION COURSES. USP's Pharmacopeial Education courses offer specialized instruction for chemists, other scientists, and professionals in the pharmaceutical and allied industries. USP scientists who play a key role in establishing official USP standards teach these courses and provide expert insights on the practical applications of official test procedures and best practices in using the *USP–NF* and other USP resources. The courses also give participants an opportunity to learn how to get involved in USP's standards-setting processes and the benefits of participating in standards development. Courses offered in 2006 are listed below. For more information and to register, visit www.usp.org. To discuss how USP can bring courses to a location of your choice or design a custom course package for you, call 301-816-8237, or e-mail PharmacopeialEducation@usp.org.

Calendar of Forthcoming Pharmacopeial Education Courses as of July 1, 2006

Date	Name of Course	Location	Price
15-Aug-06	Basic Statistics and their Applications to the *USP–NF*	PRChem, Puerto Rico	*
16-Aug-06	Effectively Using the *USP–NF*—Sessions I and II	PRChem, Puerto Rico	*
23-Aug-06	Effectively Using the *USP–NF*—Session I	USP Headquarters, Rockville, MD	$895
24-Aug-06	Effectively Using the *USP–NF*—Session II	USP Headquarters, Rockville, MD	$895 $1,695 both days
26-Sep-06	Effectively Using the *USP–NF*—Sessions I and II	Denver, CO (USP Annual Scientific Meeting)	$595
26-Sep-06	Fundamentals of Microbiological Testing	Denver, CO (USP Annual Scientific Meeting)	$595
3-4 Oct-06	Fundamentals of Dissolution—Lecture and Laboratory	North Brunswick, NJ	$1,695
10-11 Oct-06	Fundamentals of Dissolution—Lecture and Laboratory (in English with assistance for German)	Basel, Switzerland	**
12-13 Oct-06	Fundamentals of Dissolution—Lecture and Laboratory (in English with assistance for French)	Basel, Switzerland	**
18-Oct-06	Effectively Using the *USP–NF*—Sessions I and II	Brussels, Belgium	$595
19-Oct-06	Analytical Method Validation	Brussels, Belgium	$595
8-9 Nov-06	Fundamentals of Dissolution—Lecture and Laboratory (in English with assistance for Italian)	Milan, Italy	**
14-15 Nov-06	Fundamentals of Dissolution—Lecture and Laboratory (in English with assistance for Italian)	Rome, Italy	**

INTERNATIONAL CORRESPONDENCE. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia, with a copy to USP, for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows:

Technical Secretariat of the European
Pharmacopoeia Commission
B.P. 907
F 67029 Strasbourg Cedex 1
France

NAKASHIMA Nobumasa
Evaluation and Licensing Division
Pharmaceutical and Medical Safety Bureau
Ministry of Health, Labour and Welfare, Japan
Tel. +81-3-3595-2431, Fax +81-3-3597-9535
E-mail: nakashima-nobumasa@mhlw.go.jp

HOW TO SUBMIT COMMENTS. The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. Submissions concerning a particular item that has appeared in an issue of *PF* should be submitted to the appropriate USP scientific staff liaison identified at the end of the *Briefing* accompanying each item. To submit comments and data to a liaison, use the e-mail address and telephone numbers listed in the *Staff Directory* included in every *PF*.

Please note that *USP–NF* is being published in an annual edition with one main book and two *Supplements* a year. In addition, the schedule provided below will repeat every year so that users will know what to expect and become familiar with the deadlines.

For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or FAX number 301-816-8373.

***PHARMACOPEIAL FORUM* PUBLIC REVIEW AND COMMENT PERIOD DEADLINES.** The full year's listing of comment period deadlines and the targeted official publications appears below. In accordance with the Rules and Procedures of the 2005–2010 Council of Experts*, USP has implement a 90-day comment period by providing a deadline for each issue of *PF* unless otherwise stated in the individual briefing.

The listing of comment period deadlines and the targeted official publications appears below.

Pharmacopeial Forum	Comment Deadline	Targeted Official Publication	Publication Date	Official Date
PF 32(2)	June 15, 2006	*USP 30–NF 25 1st Supplement*	February 2007	August 2007
PF 32(3)	August 15, 2006			
PF 32(4)	October 16, 2006	*USP 30–NF 25 2nd Supplement*	June 2007	December 2007
PF 32(5)	December 15, 2006			
PF 32(6)	February 15, 2007	*USP 31–NF 26*	November 2007	May 2008
PF 33(1)	April 16, 2007			
PF 33(2)	June 15, 2007	*USP 31–NF 26 1st Supplement*	February 2008	April 2008
PF 33(3)	August 15, 2007			

* ***Section 9.04(b) of the Rules and Procedures of the 2005–2010 Council of Experts***
A period of at least ninety (90) days from the date of publication will be allowed for public review and comment. The time allowed for public comments shall be noted in the publication in the PF. For good cause shown, the Chairperson may alter the time specified.

All official revisions are published in the annual edition or *Supplements* to *USP–NF* (twice yearly). Between these publications, official revisions are published in *PF* in the *Interim Revision Announcement;* these revisions are also incorporated in the upcoming *Supplement.* The official publication in which an *IRA* is incorporated will depend upon publication deadlines. The 5th *IRA* and the 6th *IRA* will not appear until *Supplement 1*. See table below. The electronic version of *USP–NF* is updated as each *Supplement* becomes available and, therefore, contains all official text up to and including the contents of the latest *Supplement.* The new table below outlines the publications and their release and official dates, and the book or supplement which supersedes them.

Publication Schedules

Publication	Release Date	Official Date	Superseded by
1st *IRA* [*PF* 32(1)]	Jan. 1, 2006	Feb. 1, 2006	*2nd Supplement*
2nd *IRA* [*PF* 32(2)]	Mar. 1, 2006	Apr. 1, 2006	*2nd Supplement*
3rd *IRA* [*PF* 32(3)]	May 1, 2006	June 1, 2006	*USP 30–NF 25*
2nd Supplement	June 1, 2006	Aug. 1, 2006	*USP 30–NF 25*
4th *IRA* [*PF* 32(4)]	July 1, 2006	Aug. 1, 2006	*USP 30–NF 25*
5th *IRA* [*PF* 32(5)]	Sept. 1, 2006*	Oct. 1, 2006*	*1st Supplement USP 30–NF 25*
6th *IRA* [*PF* 32(6)]	Nov. 1, 2006*	Dec. 1, 2006*	*1st Supplement USP 30–NF 25*
USP 30–NF 25	Nov. 1, 2006*	May 1, 2007*	*1st Supplement USP 30–NF 25*
1st *IRA* [*PF* 33(1)]	Jan. 1, 2007*	Feb. 1, 2007*	*2nd Supplement USP 30–NF 25*
2nd *IRA* [*PF* 33(2)]	Mar. 1, 2007*	Apr. 1, 2007*	*2nd Supplement USP 30–NF 25*

* Tentative

PRIORITY NEW MONOGRAPH ITEMS. USP is seeking monographs for the following drug substances and drug products that are or soon will be off patent and thus are of the highest priority. USP also is seeking monographs for the excipients listed below. Monographs are marked received upon receipt of monograph proposal. Received monographs are removed from this list upon publication in *Pharmacopeial Forum.* (This list has been updated as of April 21, 2006.) For additional information, contact Karen A. Russo, Ph.D., kar@usp.org. Monograph sponsors should consult USP's *Guideline for Submitting Requests for Revision to the USP–NF.*

Noncomplex Actives (Drug Substances)

Acarbose	Alatrofloxacin Mesylate	Alfuzosin
Allopurinol Sodium	Aminopromazine Fumarate	Aminopterin Sodium
Amlodipine Besylate ***(Received)***	Anagrelide Hydrochloride ***(Received)***	Arsenic Trioxide
Azelaic Acid	Balsalazide Disodium	Bentoquatam
Bepridil Hydrochloride	Bivalirudin	Cabergoline
Calcipotriene	Calcium Trisodium Pentetate	Calfactant
Candesartan Cilexetil	Carmustine ***(Received)***	Carvedilol ***(Received)***
Cefdinir ***(Received)***	Cefditoren Pivoxil	Ceftibuten
Cetrorelix	Cevimeline	Chloroxine
Colfosceril	Cytarabine Liposome	Dalfopristin
Dapirazole Hydrochloride	Desirudin	Desonide ***(Received)***
Dexrazoxane	Difloxacin Hydrochloride	Docosanol
Entacapone	Epoprostenol Sodium ***(Received)***	Erythromycin Phosphate
Erythromycin Thiocyanate	Esmolol	Esomeprazole Magnesium ***(Received)***
Estazolam	Estradiol Benzoate	Estramustine Phosphate Sodium
Ethanolamine Oleate	Etomidate	Etoposide Phosphate
Exemestane	Felbamate	Flavoxate Hydrochloride Fluoromethane F 18
Fluoromethane F 18	Foscarnet Sodium	Fosfomycin Tromethamine
Gadobenate Dimeglumine	Gadopentetic Acid	Galantamine Hydrobromide ***(Received)***
Gallium Nitrate	Ganirelix	Glyceryl Aminobenzoate
Granisetron	Halobetasol Propionate	Haloperidol Decanoate ***(Received)***
Hydrocodone Polistirex	Ibandronate Sodium	Imipramine Pamoate
Imiquimod	Irinotecan	Isosulfan Blue
Itraconazole	Lamotrigine ***(Received)***	Latanoprost
Lawsone	Levetriacepam	Levobetaxolol
Levomethadyl Acetate	Lomustine	Lopinavir

Noncomplex Actives (Drug Substances) *(Continued)*

Metipranolol Hydrochloride	Midazolam Hydrochloride	Mifepristone
Miglitol	Misoprostol ***(Received)***	Mivacurium
Moexipril	Nalbuphine Hydrochloride	Nalmefene Hydrochloride
Nateglinide ***(Received)***	Nedocromil Sodium	Nicardipine Hydrochloride
Nilutamide	Nisoldipine	Olopatadine
Olsalazine Sodium	Orbifloxacin ***(Received)***	Orlistat ***(Received)***
Oxcarbazepine ***(Received)***	Pantoprazole Sodium ***(Received)***	Pemoline
Pentamidine Isethionate	Piperonyl Butoxide	Pirbuterol Acetate
Poractant Alpha		Proguanil
Quetiapine Fumarate	Rose Bengal	Salmeterol Xinafoate
Sertraline Hydrochloride ***(Received)***	Sodium Phenylbutyrate	Sterile Methotrexate Sodium
Streptozocin	Sulfacytine	Tacrolimus
Terbinafine Hydrochloride	Terconazole	Tiludronate Disodium
Tiopronin	Tranexamic Acid	Trimipramine Maleate ***(Received)***
Trovafloxacin Mesylate	Voriconazole	Zinc Tridosium Pentetate

Noncomplex Actives (Drug Products)

Abacavir Sulfate, Lamivudine, and Zidovudine Tablets	Acarbose Tablets	Acetaminophen, Butalbital, Caffeine, and Codeine Phosphate Capsules
Acetaminophen, Clemastine Fumarate, and Pseudoephedrine Hydrochloride Tablets	Acetazolamide Extended-Release Capsules	Albuterol Extended-Release Tablets
Albuterol for Inhalation	Albuterol Inhalation Aerosol	Alendronate Sodium Oral Solution
Alfuzosin Tablets	Allopurinol for Injection	Alprazolam Extended-Release Tablets
Alprostadil Urethral Suppository	Aminopromazine Fumarate and Neomycin Sulfate Tablets	Aminopromazine Fumarate Injection
Aminopromazine Fumarate Tablets	Aminopterin Sodium Tablets	Amlodipine and Benazepril Hydrochloride Capsules
Amphotericin B Injection	Anagrelide Hydrochloride Capsules	Arsenic Trioxide Injection
Atovaquone and Proguanil Hydrochloride Tablets	Atovaquone Tablets	Auranofin Capsules
Azatadine Maleate and Pseudoephedrine Sulfate Extended-Release Tablets	Azelaic Acid Cream	Azithromycin for Injection
Azithromycin Tablets	Baclofen Injection	Balsalazide Disodium Capsules
Beclomethasone Dipropionate Inhalation Aerosol	Beclomethasone Dipropionate Nasal Suspension	Bentoquatam Topical Suspension
Benzocaine and Cetylpyridinium Chloride Lozenges	Benzocaine and Menthol Lotion	Benzphetamine Hydrochloride Tablets
Bepridil Tablets	Bicalutamide Tablets	Bivalirudin Injection
Brompheniramine Maleate, Dextromethorphan Hydrobromide, and Pseudoephedrine Hydrochloride Oral Solution	Budesonide Inhalation Aerosol	Bupivacaine and Lidocaine Hydrochlorides Injection
Buprenorphine Hydrochloride Injection	Butalbital and Acetaminophen Capsules	Butalbital and Acetaminophen Tablets
Calcipotriene Cream	Calcipotriene Ointment	Calcipotriene Topical Solution
		Cabergoline Tablets
Calcitriol Capsules	Calcitriol Oral Solution	Calcium Acetate Capsules
Calcium Trisodium Pentetate Injection	Calfactant Intratracheal Suspension	Carbidopa and Levodopa Extended-Release Tablets ***(Received)***
Carbidopa and Levodopa Tablets for Oral Suspension	Carbidopa, Levodopa, and Entacapone Tablets	Carmustine for Injection ***(Received)***
Carmustine Implant	Carvedilol Tablets ***(Received)***	Cefdinir Tablets
Cefditoren Pivoxil Tablets	Ceftibuten Capsules	Ceftibuten for Oral Suspension
Ceftiofur Hydrochloride Oral Suspension	Cetirizine Hydrochloride Oral Solution	Cetirizine Hydrochloride Tablets ***(Received)***
Cetrorelix Injection	Cevimeline Hydrochloride Capsules	Chloroxine Cream
Chlorpromazine Hydrochloride Extended-Release Capsules	Choline and Magnesium Salicylates Oral Solution	Choline and Magnesium Salicylates Tablets
Choline Salicylate Oral Solution	Ciclopirox Shampoo	Ciclopirox Topical Gel
Ciclopirox Topical Solution	Cilostazol Tablets ***(Received)***	Cimetidine Oral Solution

Noncomplex Actives (Drug Products) *(Continued)*

Ciprofloxacin Hydrochloride and Hydrocortisone Otic Suspension	Ciprofloxacin Otic Solution	Citalopram Hydrobromide Oral Solution
Citric Acid, Gluconolactone, and Magnesium Carbonate Irrigation	Cladribine Injection	Clemastine Fumarate Syrup
Clobetasol Propionate Gel	Clonazepam Orally-Disintegrating Tablets	Clorazepate Dipotassium Capsules
Clorazepate Dipotassium Extended-Release Tablets	Clotrimazole and Betamethasone Dipropionate Lotion	Colestipol Hydrochloride Tablets
Colfosceril and Tyloxapol Suspension	Compound Undecylenic Acid Cream	Compound Undecylenic Acid Topical Powder
Conjugated Estrogens and Medroxyprogesterone Acetate Tablets	Cromolyn Sodium Nasal Solution	Cyclosporine Modified Capsules
Cyclosporine Modified Oral Solution	Cyclosporine Ointment	Cyclosporine Topical Solution
Cysteamine Bitartrate Capsules	Cytarabine Liposome Injection	Dalfopristin and Quinupristin Injection
Dantrolene Sodium Capsules ***(Received)***	Dantrolene Sodium for Injection ***(Received)***	Dantrolene Sodium Oral Suspension
Dapiprazole for Ophthalmic Solution	Desirudin for Injection	Desonide Cream
Dexrazoxane for Injection	Dextroamphetamine Sulfate Extended-Release Capsules	Dextromethorphan Polistirex Extended-Release Oral Suspension
Diazepam Injectable Emulsion	Diclofenac Sodium Ophthalmic Solution	Diethylpropion Hydrochloride Extended-Release Tablets
Difenoxin and Atropine Tablets	Difloxacin Hydrochloride Tablets	Dihydroergotamine Mesylate Metered Spray
Diltiazem Malate Extended-Release Tablets	Dinoprostone Vaginal Suppositories	Diphenhydramine Hydrochloride and Acetaminophen Tablets
Divalproex Sodium Delayed-Release Capsules	Dorzolamide and Timolol Ophthalmic Solution	Dorzolamide Ophthalmic Solution
Doxacurium Chloride Injection	Doxepin Hydrochloride Cream	Doxycycline Oral Gel
Econazole Nitrate Cream	Edrophonium Chloride and Atropine Sulfate Injection	Enalapril Maleate and Diltiazem Malate Extended-Release Tablets
Enalapril Maleate and Felodipine Extended-Release Tablets	Enalaprilat Injection	Entacapone Tablets
Ephedrine Sulfate and Guaifenesin Tablets	Epoprostenol for Injection	Epoprostenol Injection
Esmolol Hydrochloride Injection	Esomeprazole Magnesium Capsules	Estazolam Tablets
Estramustine Phosphate Sodium Capsules	Ethanolamine Oleate Injection	Etidronate Disodium Injection Concentrate
Etomidate Injection	Exemestane Tablets	Famotidine Orally Disintegrating Tablets
Felbamate Oral Suspension	Felbamate Tablets	Fentanyl Lozenges
Fentanyl Transdermal System ***(Received)***	Ferrous Fumarate and Docusate Sodium Extended- Release Capsules	Flavoxate Hydrochloride Tablets
Fluconazole Injection ***(Received)***	Fluconazole Tablets	Flunisolide Inhalation Aerosol
Flunisolide Nasal Spray	Fluocinolone Acetonide Shampoo	Fluorescein Sodium Ophthalmic Solution
Fluorometholone Ointment	Fluticasone Propionate Cream ***(Received)***	Fluticasone Propionate Inhalation Powder
Fluticasone Propionate Ointment ***(Received)***	Fluticasone Propionate Pressurized Inhaler	Foscarnet Sodium Injection
Fosfomycin for Oral Solution	Gabapentin Oral Solution	Gabapentin Tablets ***(Received)***
Gadobenate Dimeglumine Injection	Galantamine Hydrobromide Tablets ***(Received)***	Gallium Nitrate Injection
Ganciclovir Capsules	Ganirelix Acetate Injection	Gatifloxacin Injection
Gatifloxacin Tablets	Gentamicin Sulfate Oral Solution	Gentamicin Sulfate Soluble Powder
Glimepiride Tablets ***(Received)***	Glipizide Extended-Release Tablets	Granisetron Injection
Granisetron Tablets	Guaifenesin and Salts Of Dextromethorphan and Pseudoephedrine Oral Solution	Guaifenesin and Pseudoephedrine Hydrochloride Extended-Release Tablets
Guanidine Hydrochloride	Guanidine Hydrochloride Tablets	Halobetasol Propionate Cream
Halobetasol Propionate Ointment	Haloperidol Decanoate Injection	Haloperidol Lactate Injection
Haloperidol Lactate Oral Concentrate	Hydralazine Hydrochloride and Hydrochlorothiazide Capsules	Hydrochlorothiazide Capsules
Hydrochlorothiazide Oral Solution Concentrate	Hydrocodone Bitartrate and Acetaminophen Oral Solution	Hydrocodone Bitartrate and Aspirin Tablets
Hydrocodone Bitartrate and Guaifenesin Oral Solution	Hydrocodone Bitartrate and Homatropine Methylbromide Syrup	Hydrocodone Bitartrate and Homatropine Methylbromide Tablets
Hydrocortisone Acetate Dental Paste	Hydrocortisone Acetate Rectal Foam Aerosol	Hydrocortisone Butyrate Lotion
Hydroflumethiazide and Reserpine Tablets	Hydromorphone Hydrochloride Oral Solution	Hydroquinone Lotion

Noncomplex Actives (Drug Products) *(Continued)*

Ibandronate Sodium Tablets	Ibuprofen Capsules	Idarubicin Hydrochloride Injection
Imipramine Pamoate Capsules	Imiquimod Topical Cream	Ipratropium Bromide Inhalation Aerosol
Ipratropium Bromide Inhalation Solution	Irinotecan Hydrochloride Injection	Isosulfan Blue Injection
Isradipine Extended-Release Tablets	Itraconazole Injection	Itraconazole Oral Solution
Ketoconazole Cream	Ketoconazole Shampoo	Ketoprofen Capsules
Ketoprofen Extended-Release Capsules	Ketoprofen Tablets	Ketotifen Fumarate
Ketotifen Fumarate Ophthalmic Solution	Lactic Acid Lotion	Lamivudine Tablets
Latanoprost Ophthalmic Solution	Leucovorin Calcium for Injection	Levetriacepam Tablets
Levobetaxolol Ophthalmic Suspension	Levocabastine Ophthalmic Suspension	Levofloxacin Solution
Levomethadyl Acetate Hydrochloride Oral Concentrate	Lincomycin Hydrochloride and Spectinomycin Sulfate Soluble Powder	Liothyronine Injection
Lisinopril and Hydrochlorothiazide Tablets	Lomustine Capsules	Lopinavir and Ritonavir Solution
Lopinavir Capsules	Lopinavir Solution	Loratadine and Pseudoephedrine Sulfate Extended-Release Tablets ***(Received)***
Loratadine Orally-Disintegrating Tablets	Losartan Potassium Tablets	Mefloquine Hydrochloride Tablets
Melphalan for Injection	Mesalamine Suppositories	Mesoridazine Besylate Concentrate
Metaraminol Bitartrate Injection	Methacholine Chloride for Inhalation Solution	Methadone Hydrochloride Oral Concentrate
Methocarbamol and Aspirin Tablets	Methoxsalen Softgels	Methyclothiazide and Deserpidine Tablets
Methylphenidate Hydochloride Chewable Tablets	Metipranolol Ophthalmic Solution	Metronidazole Capsules
Metronidazole Cream	Metronidazole Extended-Release Tablets	Metronidazole Hydrochloride for Injection
Metronidazole Lotion	Miconazole Nitrate Topical Aerosol	Midazolam Hydrochloride Injection ***(Received)***
Mifepristone Tablets	Miglitol Tablets	Milrinone Injection
Misoprostol Tablets ***(Received)***	Mivacurium In Dextrose Injection	Mivacurium Injection
Moexipril Hydrochloride and Hydrochloro thiazide Tablets	Moexipril Hydrochloride Tablets	Molindone Hydrochloride Oral Solution
Morphine Sulfate for Injection Concentrate	Morphine Sulfate Oral Solution	Morphine Sulfate Oral Solution Concentrate
Morphine Sulfate Tablets	Mycophenolate Mofetil Capsules	Mycophenolate Mofetil Oral Solution
Mycophenolate Mofetil Tablets	Nalbuphine Hydrochloride Injection	Nalmefene Hydrochloride Injection
Naphazoline Hydrochloride and Pheniramine Maleate Ophthalmic Solution		Naproxen Extended-Release Tablets
Nateglinide Tablets	Nedocromil Sodium Inhalation Aerosol	Neomycin Sulfate Oral Powder
Nevirapine Oral Suspension ***(Received)***	Nevirapine Tablets ***(Received)***	Nicardipine Hydrochloride Capsules
Nilutamide Tablets	Nimodipine Capsules	Nisoldipine Extended-Release Tablets
Nitroglycerin Solution in Acrylic Adhesive	Nizatidine Tablets	Ofloxacin In Dextrose Injection
Ofloxacin Injection	Ofloxacin Tablets ***(Received)***	Olopatadine Ophthalmic Solution
Olsalazine Sodium Capsules	Ondansetron Tablets	Orbifloxacin Tablets
Orlistat Capsules ***(Received)***	Orphenadrine Citrate Extended-Release Tablets	Orphenadrine Citrate, Aspirin, and Caffeine Tablets
Oxcarbazepine Suspension	Oxcarbazepine Tablets	Oxiconazole Cream
Pancuronium Bromide Injection ***(Received)***	Pantoprazole Sodium for Injection	Pantoprazole Sodium Tablets
Paroxetine Hydrochloride Extended-Release Tablets	Paroxetine Oral Suspension	Pemirolast Potassium Ophthalmic Solution
Pemoline Tablets	Penicillin G Potassium Tablets for Oral Solution	Pentaerythritol Tetranitrate Extended-Release Capsules
Pentaerythritol Tetranitrate Extended-Release Tablets	Pentamidine Isethionate for Inhalation	Pentamidine Isethionate for Injection
Pentazocine Hydrochloride and Acetaminophen Tablets	Phendimetrazine Tartrate Extended-Release Capsules	Phenobarbital Capsules
Phentermine Resin Complex	Phentermine Resin Complex Capsules	Phenylephrine Hydrochloride and Chlorpheniramine Maleate Extended-Release Capsules
Phenylephrine Hydrochloride, Chlorpheniramine Maleate, and Acetaminophen Extended-Release Tablets	Pilocarpine Hydrochloride Ophthalmic Gel	Pilocarpine Hydrochloride Ophthalmic Ointment

Noncomplex Actives (Drug Products) *(Continued)*

Pilocarpine Hydrochloride Tablets	Piperonyl Butoxide and Pyrethrins Aerosol Foam	Pirbuterol Acetate Inhalation Aerosol
Poractant Alpha Supension	Porfimer Sodium for Injection	Povacrylate Solution
Povacrylate-Iodine Topical Solution	Povidone-Iodine Gauze	Povidone-Iodine Swabsticks
Povidone-Iodine Topical Aerosol Foam	Povidone-Iodine Vaginal Suppositories	Pramipexole Dihydrochloride Tablets
Prazosin Hydrochloride and Polythiazide Capsules	Prednisolone Sodium Phosphate Oral Solution	Prochlorperazine Maleate Extended-Release Capsules
Progesterone Capsules	Promethazine and Phenylephrine Hydrochlorides and Codeine Phosphate Syrup	Promethazine and Phenylephrine Hydrochlorides Syrup
Promethazine Hydrochloride and Codeine Phosphate Oral Solution	Promethazine Hydrochloride and Dextromethorphan Hydrobromide Syrup	Propafenone Hydrochloride Tablets
Pseudoephedrine Hydrochloride and Brompheniramine Maleate Extended-Release Tablets	Pseudoephedrine Hydrochloride and Naproxen Sodium Extended-Release Tablets	Pseudoephedrine Hydrochloride, Chlorpheniramine Maleate, and Codeine Phosphate Oral Solution
Pseudoephedrine Hydrochloride, Guaifenesin, and Codeine Phosphate Oral Solution	Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Extended-Release Tablets	Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Oral Solution
	Pyrilamine Maleate Injection	
Pseudoephedrine Sulfate, Dexbrompheniramine Maleate, and Acetaminophen Extended-Release Tablets	Quinidine Sulfate Injection	Ramipril Capsules
Ranitidine Capsules	Rauwolfia Serpentina and Endroflumethiazide Tablets	Reserpine and Polythiazide Tablets
Rimantadine Hydrochloride Oral Solution	Risperidone Oral Solution	Risperidone Orally Disintegrating Tablets
Risperidone Tablets ***(Received)***	Rivastigmine Tartrate Capsules	Rivastigmine Tartrate Oral Solution
Rocuronium Bromide Injection	Ropinirole Hydrochloride Tablets	Rose Bengal Ophthalmic Solution
Rosiglitazone Maleate Tablets	Salicylic Acid and Sulfur Cleansing Lotion	Salicylic Acid and Sulfur Lotion
Salicylic Acid and Sulfur Shampoo	Salicylic Acid Cream	Salicylic Acid Ointment
Salmeterol Inhalation Aerosol	Salmeterol Xinafoate Inhalation Powder	Scopolamine Transdermal System
Selegiline Hydrochloride Capsules	Serpacwa Topical Cream	Sertraline Hydrochloride Oral Solution
Sibutramine Hydrochloride Capsules	Sodium Bicarbonate and Sodium Citrate for Oral Solution	Sodium Bicarbonate, Sodium Citrate, and Sodium Tartrate for Oral Suspension
Sodium Chlorophyllin Copper Complex Tablets	Sodium Iodide Injection	Sodium Phenylbutyrate Oral Powder
Sodium Phenylbutyrate Tablets	Sodium Phosphates for Oral Suspension	Sodium Phosphates Tablets
Sodium Salicylate and Sulfur Shampoo	Sterile Talc Aerosol	Streptozocin for Injection
Sucralfate Oral Suspension	Sulconazole Nitrate Cream	Sulfacetamide Sodium and Fluorometholone Ophthalmic Suspension
Sulfacetamide Sodium and Prednisolone Sodium Phosphate Ophthalmic Solution	Sulfacytine Tablets	Sulfanilamide Vaginal Cream
Sulfasalazine Oral Suspension	Sulisobenzone Lotion	Sumatriptan Injection
Sumatriptan Tablets	Tacrolimus Capsules	Tacrolimus Injection
Tacrolimus Ointment	Tamsulosin Hydrochloride Capsules	Technetium Tc 99m Teboroxime Injection
Tenofovir Disoproxil Fumarate Tablets	Terbinafine Hydrochloride Cream	Terbinafine Tablets
Terbinafine Topical Solution	Terconazole Vaginal Cream	Terconazole Vaginal Suppositories
Testosterone Transdermal System	Tetracycline Hydrochloride Periodontal Fiber	Theophylline Extended-Release Tablets
Tioconazole Vaginal Ointment	Tiopronin Tablets	Tolnaftate Topical Aerosol Solution
Topiramate Capsules	Topiramate Tablets	Torsemide Injection
Torsemide Tablets	Trandolapril and Verapamil Hydrochloride Extended-Release Tablets	Trandolapril Tablets
Tranexamic Acid Injection	Tranylcypromine Sulfate	Tranylcypromine Sulfate Tablets
Tretinoin Capsules	Tretinoin Microsphere Gel	Triamcinolone Acetonide Nasal Suspension
Trifluridine Ophthalmic Solution	Trimetrexate for Injection	Trimipramine Maleate Capsules
Triprolidine and Pseudoephedrine Hydrochlorides and Codeine Phosphate Syrup	Trolamine Salicylate Cream	Trolamine Salicylate Gel
Trolamine Salicylate Topical Emulsion	Trovafloxacin Injection	Trovafloxacin Mesylate for Injection
Undecylenic Acid Topical Foam Aerosol	Unoprostone Isopropyl Ophthalmic Solution	Urea Cream
Vecuronium Bromide for Injection	Venlafaxine Extended-Release Capsules	Venlafaxine Tablets

Noncomplex Actives (Drug Products) *(Continued)*

Verapamil Hydrochloride Capsules	Verapamil Hydrochloride Extended-Release Capsules	Voriconazole Injection
Voriconazole Oral Suspension	Voriconazole Tablets	Yttrium Y-90 Chloride Solution
Yttrium Y-90 Glass Microspheres	Yttrium Y-90 Microspheres Injection	Zidovudine and Lamivudine Tablets ***(Received)***
Zinc Acetate Capsules	Zinc Tridosium Pentetate Injection	Ziprasidone Hydrochloride Capsules
Zoledronic Acid for Injection		

Excipients

Acetone Sodium Bisulfite	Acetylated Monoglycerides	Aconitic Acid (Achilleic Acid)
Acrylic Acid-Octyl Acrylate Copolymer	Albumin Colloidal	Aliphatic Polyesters
Allantoin-Sodium Pyrrolidone Carboxylate	Aluminum Ammonium Sulfate	Aluminum Ammonium Sulfate
Aluminum Lactate	Aluminum Oxide	Aluminum Potassium Sulfate
Aluminum Silicate	Aluminum Sodium Sulfate	Aluminum Stearate
Ammonium Bicarbonate	Ammonium Calcium Alginate	Ammonium Phosphate
Beeswax, Synthetic	Benzododecinium Bromide	Benzyl Chloride
Benzyl Nicotinate	Beta Naphthol	Brominated Vegetable Oil
Butadiene-Styrene Rubber	Butylalcohol Monostearate	Butylated Hydromethylphenol
Butylene Glycol	Butylphthalyl Butylglycolate	Calcium Acid Pyrophosphate
Calcium Alginate	Calcium Alginate and Ammonium Alginate	Calcium Bromide
Calcium Chloride Solution	Calcium Glycerophosphate ***(Received)***	Calcium Phosphate Monobasic
Calcium Propionate	Calcium Pyrophosphate	Calcium Sorbate
Calcium Stearoyl Lactylate	Caldiamide Sodium	Calteridol Calcium
Canola Oil	Capric Acid	Caprylic/Capric Diglyceril Diglyceryl Succinate
Carbon	Carboxymethyl Starch	Carboxymethylamylopectin Sodium
Carboxymethylcellulose Potassium	Cetostearyl Isononanoate	Chlorodifluoroethane
Cholic Acid	Cinnamaldehyde	Cocamide Diethanolamine
Cocamide Oxide	Cocoyl Caprylocaprate	Crystal Gum
Cutina	Cystine	Dammar Gum
Decanoic Acid	Decyl Oleate	Dehydroacetic Acid
Desoxycholic Acid	Dextrin Palmitate	Dextrins Modified
Diacetyl Tartaric Acid Esters Of Mono- and Diglycerides	Dicetyl Phosphate	Dichlorofluoromethane
Diethyl Sebacate	Difluoroethane	Diglycol Stearate
Diisobutyl Adipate	Diisopropyl Adipate	Diisopropylbenzothiazyl-2-Sulfenamide
Dilauryl Thiodipropionate	Dimethyl Dicarbonate	Dimyristoyl Lecithin
Dimyristoyl Phosphatidylglycerol	Dipropylene Glycol	Disodium Edisylate
Disodium Guanylate	Disodium Inosinate	Disodium Monooleamide Sulfasuccinate
D-Mannose	Docusate Sodium/Sodium Benzoate	Erythorbic Acid
Erythrosine	Ethoxylated Mono- and Diglycerides	Ethoxyquin
Ethyl Hexanediol	Ethyl Linoleate	Ethyl Maltol
Ethylene Dichloride	Ethylurea	Ferric Ammonium Citrate
Ferric Citrate	Ferric Oxide, Brown	Ferric Phosphate
Ferric Pyrophosphate	Ferrous Citrate	Ferrous Glycinate
Ferrous Lactate	Fluorochlorohydrocarbons	Formic Acid
Furcelleran	Gamma-Cyclodextrin	Gentistic Acid
Geraniol	Glutamic Acid Hydrochloride	Gluten
Glycerol Ester Of Gum Rosin (Ester Gum)	Glyceryl Laurate	Glyceryl Palmitate
Glyceryl Ricinoleate	Glyceryl Tristearate	Glycine Hydrochloride
Glycofurol	Glycol Stearate	Heptafluoropropane
Heptylparaben	Hexadecyl Isostearate	Hexane
Hexanetriol(-1,2,6-)	Hydrocarbon Gel	Hydrogenated Starch Hydrolysate
Hydroxyethylmethylcellulose	Hydroxylated Lecithin	Hydroxypropyl Beta Cyclodextrin
Indigotine	Inositol	Iron Carbonyl
Iron Subcarbonate	Isobutylated- Isoprene Copolymer	Isooctylacrylate
Isopropyl Isostearate	Isopropyl Stearate	Isostearic Acid
Isostearyl Alcohol	Lactobionic Acid	Lactose Ferrin, Bovine

Excipients *(Continued)*

Lactylated Fatty Acid Esters of Glycerol and Propylene Glycol	Lactylic Esters Of Fatty Acids	Lanolin (Wool Fat), Hydrogenated
Lanolin Alcohols, Acetylated	Lanolin Hydrous	L-Ascorbyl Stearate
Lauramine Oxide	Lauric Myristic Diethanolamide	Lauric Acid
Lauric Diethanolamide	Lavender Oil	L-Cysteine Monohydrochloride
Lecithin, Hydroxylated	L-Glutamic Acid	Linoleic Acid
L-Leucine	Macrogol Sorbitan Tristearate	Macrogolglycerol Cocoates
Macrogolglycerol Triisostearate	Magnesium Aluminum Silicate Hydrate	Magnesium Aspartame Dihydrate
Magnesium Aspartate	Magnesium Phosphate Tribasic	Magnesium Phosphate, Diabasic, Trihydrate
Magnesium Tartrate	Malt Syrup	Maltitol Syrup
Maltol Isobutyrate	Manganese Chloride	Manganese Citrate
Manganese Glycerophosphate	Manganese Hypophosphite	Medical Antifoam Emulsion C
Medronate Disodium	Medronic Acid	Methyl Chloride
Methylchloroisothiazolinone	Methylisothiazolinone	Microcrystalline Cellulose, Silicified ***(Received)***
Mineral Spirits	Monoisostearyl Glyceryl Ester	Monopotassium Glutamate Monohydrate
Monosodium Citrate	Mullein Leaf	Myristyl Gamma-Picolinium Chloride
Myristyl Lactate	*N,N*-Bis(2-hydroxyethyl)stearamide	*N*-Acetyl-L- Methionine
Naphtha	*N*-Methylpyrrolidone ***(Received)***	Non-Pareil Seeds
Nutmeg Oil	Octanoic Acid	Oxystearin
Palm Kernel Oil ***(Received)***	Palm Oil	Pentasodium Triphosphate
Pentetate Calcium Trisodium	Pentetate Pentasodium	Phenprobamate
Phenylmercuric Acetate	Phenylmercuric Nitrate	Pine Oil
Polacrilin	Polydextrose ***(Received)***	Polydextrose Solution
Polyglycerol Esters Of Fatty Acids	Polyglycerol Polyricinoleic Acid	Polyoxyethylene Castor Oil—(USP has 35)
Polyoxyl Stearate—(USP has 40)	Polypropylene Oleate	Polypropylene Stearyl Ether
Polysorbate 65	Polyvinylacetal	Polyvinylacetal Diethylanoacetate
Polyvinylpolypyrrolidone	Polyvinylpyrrolidone Ethylcellulose	Potassium Acid Tartrate
Potassium Bromate	Potassium Carbonate Solution	Potassium Dichloroisocyanurate
Potassium Gibberellate	Potassium Glycerophosphate	Potassium Iodate
Potassium Nitrite	Potassium Phosphate	Potassium Phosphate Tribasic
Potassium Polymetaphosphate	Potassium Pyrophosphate	Potassium Stearate
Potassium Sulfate	Potassium Sulfite	Potassium Tripolyphosphate
Propyl Propionate	Propylene Glycol Diacetate	Propylene Glycol Mono- and Diesters
Purified Polyoxyl 35 Castor Oil ***(Received)***	Rapeseed Oil, Hydrogenated ***(Received)***	Rapeseed Oil, Superglycerinated ***(Received)***
Rice Bran Wax	Rosin	Silicone
Sodium Acid Pyrophosphate	Sodium Aluminosilicate	Sodium Aluminum Phosphate Acidic
Sodium Aluminum Phosphate Basic	Sodium Aspartate	Sodium Bisulfate
Sodium Bisulfite	Sodium Carbonate Hydrate	Sodium Carboxymethyl Betaglucan
Sodium Caseinate	Sodium Chlorate	Sodium Citrate, Dibasic
Sodium Citrate, Monobasic	Sodium Dehydroacetate	Sodium Diacetate
Sodium Erythorbate	Sodium Ferric Pyrophosphate	Sodium Ferrocyanide
Sodium Hypophosphite	Sodium Laureth Sulfate	Sodium Lauroyl Sarcosinate
Sodium Lauryl Sulfoacetate	Sodium Magnesium Aluminosilicate	Sodium Magnesium Silicate
Sodium Malate	Sodium Metaphosphate, Insoluble	Sodium Metasilicate
Sodium Methylate	Sodium Polyphosphates Glassy	Sodium Potassium Tripolyphosphate
Sodium Pyrophosphate	Sodium Pyrrolidone Carboxylate	Sodium Sesquicarbonate
Sodium Sesquinoleate	Sodium Stearoyl Lactylate	Sodium Thiomalate
Sodium Trimetaphosphate	Sodium Trioleate	Sodium Tripolyphosphate
Soy Polysaccharides	Stannous Chloride	Stannous Tartrate
Starch, Pregelatinized Corn	Starch, Pregelatinized Tapioca	Stearalkonium Chloride
Stearyl Citrate	Stearyl Monoglyceridyl Citrate	Succinylated Monoglycerides
Sucrose Acetate Isobutyrate	Sucrose Fatty Acid Esters	Sucrose Stearate
Sugar Fruit Fine	Sulfobutyl Ether Beta Cyclodextran	Tallow
Tallow Glycerides	Tallow Oil	Tetrafluoroethane
Thioglycerol	Thyme Oil	Tribehenin
Tricetеareth-4 Phosphate	Trichloroethylene	Trimyristin

Excipients *(Continued)*

Trolamine Lauryl Sulfate	Vegetable Oil	Wheat Flour
Wheat Germ Oil	Wheat Gluten	Whey

INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- New adopted (official) revisions to the *USP–NF* that become effective before the effective date of the next *Supplement* or that were not ready for adoption by the closing date for the upcoming *Supplement*. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.

Symbols—Interim revisions are shown with new text (if any) enclosed in circles, •new text•. Text enclosed in squares, ■new text■, has already been adopted in a *Supplement*. Where the symbols appear together with no enclosed text, such as •• or ■■, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by a number that indicates the *IRA* or *Supplement* in which the revision first appeared. For example, •2 indicates that the revision was officially adopted in the *Second Interim Revision Announcement,* and ■2S (*USP29*) indicates that the revision was officially adopted in the *Second Supplement* to *USP 29*.

Errata—At the end of the *Interim Revision Announcement* section is a list of errata and corrections to *USP 29–NF 24*. The page number indicates where the item is found in *USP–NF*. If necessary, this list will be updated with every issue of *PF*. This information will also be cumulative in future *Supplements,* and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

FOURTH INTERIM REVISION ANNOUNCEMENT to *USP 29* and to *NF 24*

By authority of the United States Pharmacopeial Convention, Inc.
Prepared by the Council of Experts and published by the Board of Trustees

John W. Mauger, *Chair*
USP Board of Trustees

Roger L. Williams, *Executive Vice President*
and *Chairman, USP Council of Experts*

Roger L. Williams, M.D., *Chief Standards Officer, Acting*

Official August 1, 2006 **Released July 1, 2006**

All inquiries and comments regarding *USP 29* text and *NF 24* text should be addressed to the Executive Secretariat, *USP–NF*, 12601 Twinbrook Parkway, Rockville, MD 20852.

New USP Reference Standards

The following USP Reference Standards, which were not available when the associated monograph was made official, have since become available. The respective official date of each *USP 29* or *NF 24* standard, test, or assay requiring the use of the following USP Reference Standards is indicated in parentheses after the name of the Reference Standard.

USP Budesonide RS (September 1, 2006)
USP Escin RS (January 1, 2007)
USP Fluticasone Propionate RS (November 1, 2006)
USP Fluticasone Propionate Resolution Mixture RS (September 1, 2006)
USP Fluticasone Propionate System Suitability Mixture RS (September 1, 2006)
USP Fluvastatin Related Compound B RS (November 1, 2006)
USP Polyisobutylene RS (November 1, 2006)
USP Ropivocaine Hydrochloride RS (November 1, 2006)
USP Ropivacaine Related Compound A RS (September 1, 2006)
USP Ropivacaine Related Compound B RS (September 1, 2006)
USP Sulisobenzone RS (January 1, 2007)
USP Tinidazole Related Compound B RS (September 1, 2006)

Unavailable First-Time Official USP Reference Standards

The official dates of any *USP 29* or *NF 24* standards, tests, or assays requiring the use of the following new USP Reference Standards are postponed until further notice pending availability of the respective Reference Standards. This listing was updated as of May 5, 2006.

USP Albumin Human RS
USP Alteplase RS
USP Amifostine RS
USP Amifostine Thiol RS
USP Antithrombin III Human RS
USP Aprotinin RS
USP Aprotinin System Suitability RS
USP Cetrimonium Bromide RS
USP Citalopram Hydrobromide RS
USP Cladribine RS
USP Cladribine Related Compound A RS
USP Copolymer Polypropylene RS
USP Decoquinate RS
USP Cryopreserved Human Fibroblast-Derived Dermal Substitute Reference Photomicrographs RS
USP Diethylstilbestrol Diphosphate RS
USP Docosyl Ferulate RS
USP Powdered *Echinacea pallida* Extract RS
USP Eucatropine Hydrochloride RS
USP Fludeoxyglucose Related Compound B RS
USP Fluvastatin Sodium RS
USP Fluvastatin Related Compound A RS
USP Gabapentin Related Compound B RS
USP Ginkgo Terpene Lactones RS
USP Powdered American Ginseng Extract RS
USP Glyceryl Distearate RS
USP Glyceryl Monolinoleate RS
USP Glyceryl Monooleate RS
USP Gonadorelin Hydrochloride RS
USP Hemoglobin RS
USP Hexacosanol RS
USP Irbesartan RS
USP Irbesartan Related Compound A RS
USP Isosorbide Mononitrate RS
USP Isosorbide Mononitrate Related Compound A RS
USP Lamivudine Resolution Mixture B RS
USP Alpha Lipoic Acid RS
USP Maritime Pine Extract RS
USP Mecamylamine Related Compound A RS
USP Menotropins RS
USP Methyldopa-Glucose Reaction Product RS
USP Mibolerone RS
USP Narasin RS
USP Naratriptan Resolution Mixture RS
USP Near Infrared Calibrator RS
USP Nimodipine RS
USP Nimodipine Related Compound A RS
USP Paricalcitol Solution RS
USP Cultured Rat Pheochromocytoma Reference Photomicrographs RS
USP Polyoxyl 10 Oleyl Ether RS
USP Potassium Perchlorate RS
USP Pygeum Extract RS
USP Pyrethrum Extract RS
USP Quinapril Hydrochloride RS
USP Ramipril Related Compound B RS
USP Powdered St. John's Wort Extract RS
USP Saccharin Sodium RS
USP Sargramostim RS
USP Sincalide RS
USP Human Fibroblast-Derived Temporary Skin Substitute Reference Photomicrographs RS
USP Δ^8-Tetrahydrocannabinol RS
USP Δ^9-Tetrahydrocannabinol RS
USP Tizanidine Hydrochloride RS
USP Tizanidine Related Compound A RS
USP Tizanidine Related Compound B RS
USP Tizanidine Related Compound C RS
USP Valrubicin RS
USP Valrubicin Related Compound A RS
USP Vasopressin RS

GENERAL NOTICES AND REQUIREMENTS

Change to read:

TESTS AND ASSAYS

Apparatus—A specification for a definite size or type of container or apparatus in a test or assay is given solely as a recommendation. Where volumetric flasks or other exact measuring, weighing, or sorting devices are specified, this or other equipment of at least equivalent accuracy shall be employed. (See also *Thermometers* ⟨21⟩, *Volumetric Apparatus* ⟨31⟩, and *Weights and Balances* ⟨41⟩.) Where low-actinic or light-resistant containers are specified, clear containers that have been rendered opaque by application of a suitable coating or wrapping may be used.

Where an instrument for physical measurement, such as a spectrophotometer, is specified in a test or assay by its distinctive name, another instrument of equivalent or greater sensitivity and accuracy may be used. In order to obtain solutions having concentrations that are adaptable to the working range of the instrument being used, solutions of proportionately higher or lower concentrations may be prepared according to the solvents and proportions thereof that are specified for the procedure.

Where a particular brand or source of a material, instrument, or piece of equipment, or the name and address of a manufacturer or distributor, is mentioned (ordinarily in a footnote), this identification is furnished solely for informational purposes as a matter of convenience, without implication of approval, endorsement, or certification. Items capable of equal or better performance may be used if these characteristics have been validated.

Where the use of a centrifuge is indicated, unless otherwise specified, the directions are predicated upon the use of apparatus having an effective radius of about 20 cm (8 inches) and driven at a speed sufficient to clarify the supernatant layer within 15 minutes.

Unless otherwise specified, for chromatographic tubes and columns the diameter specified refers to internal diameter (ID); for other types of tubes and tubing the diameter specified refers to outside diameter (OD).

Steam Bath—Where the use of a steam bath is directed, exposure to actively flowing steam or to another form of regulated heat, corresponding in temperature to that of flowing steam, may be used.

Water Bath—Where the use of a water bath is directed without qualification with respect to temperature, a bath of vigorously boiling water is intended.

Foreign Substances and Impurities—Tests for the presence of foreign substances and impurities are provided to limit such substances to amounts that are unobjectionable under conditions in which the article is customarily employed (see also *Impurities in Official Articles* ⟨1086⟩).

While one of the primary objectives of the Pharmacopeia is to assure the user of official articles of their identity, strength, quality, and purity, it is manifestly impossible to include in each monograph a test for every impurity, contaminant, or adulterant that might be present, including microbial contamination. These may arise from a change in the source of material or from a change in the processing, or may be introduced from extraneous sources. Tests suitable for detecting such occurrences, the presence of which is inconsistent with applicable good manufacturing practice or good pharmaceutical practice, should be employed in addition to the tests provided in the individual monograph.

Other Impurities—Official substances may be obtained from more than one process, and thus may contain impurities not considered during preparation of monograph assays or tests. Wherever a monograph includes a chromatographic assay or purity test based on chromatography, other than a test for organic volatile impurities, and that monograph does not detect such an impurity, solvents excepted, the impurity shall have its amount and identity, where both are known, stated under the heading *Other Impurity(ies)* by the labeling (certificate of analysis) of the official substance.

The presence of any unlabeled impurity in an official substance is a variance from the standard if the content is 0.1% or greater. Tests suitable for detecting and quantitating unlabeled impurities, when present as the result of process change or other identifiable, consistent occurrence, shall be submitted to the USP for inclusion in the individual monograph. Otherwise, the impurity shall be identified, preferably by name, and the amount listed under the heading *Other Impurity(ies)* in the labeling (certificate of analysis) of the official substance. The sum of all *Other Impurities* combined with the monograph-detected impurities does not exceed 2.0% (see *Ordinary Impurities* ⟨466⟩), unless otherwise stated in the monograph.

Categories of drug substances excluded from *Other Impurities* requirements are fermentation products and semi-synthetics derived therefrom, radiopharmaceuticals, biologics, biotechnology-derived products, peptides, herbals, and crude products of animal or plant origin. Any substance known to be toxic must not be listed under *Other Impurities.*

Residual Solvents—The requirements are stated in •*Residual Solvents*•$_{4}$ ⟨467⟩ together with information in *Impurities in Official Articles* ⟨1086⟩. Thus all drug substances, excipients, and products are subject to relevant control of residual solvents, even when no test is specified in the individual monograph. The requirements have been aligned with the ICH guideline on this topic. If solvents are used during production, they are of suitable quality. In addition, the toxicity and residual level of each solvent are taken into consideration, and the solvents are limited according to the principles defined and the requirements specified in •*Residual Solvents*•$_{4}$ ⟨467⟩, using the general methods presented therein or other suitable methods. (Official •July•$_{4}$ 1, 2007)

Procedures—Assay and test procedures are provided for determining compliance with the Pharmacopeial standards of identity, strength, quality, and purity.

In performing the assay or test procedures in this Pharmacopeia, it is expected that safe laboratory practices will be followed. This includes the use of precautionary measures, protective equipment, and work practices consistent with the chemicals and procedures used. Prior to undertaking any assay or procedure described in this Pharmacopeia, the individual should be aware of the hazards associated with the chemicals and the procedures and means of protecting against them. This Pharmacopeia is not designed to describe such hazards or protective measures.

Every compendial article in commerce shall be so constituted that when examined in accordance with these assay and test procedures, it meets all the requirements in the monograph defining it. However, it is not to be inferred that application of every analytical procedure in the monograph to samples from every production batch is necessarily a prerequisite for ensuring compliance with Pharmacopeial standards before the batch is released for distribution. Data derived from manufacturing *process validation* studies and from *in-process controls* may provide greater assurance that a batch meets a particular monograph requirement than analytical data derived from an examination of finished units drawn from that batch. On the basis of such assurances, the analytical procedures in the monograph may be omitted by the manufacturer in judging compliance of the batch with the Pharmacopeial standards.

Automated procedures employing the same basic chemistry as those assay and test procedures given in the monograph are recognized as being equivalent in their suitability for determining compliance. Conversely, where an automated procedure is given in the monograph, manual procedures employing the same basic chemistry are recognized as being equivalent in their suitability for determining compliance. Compliance may be determined also by the use of alternative methods, chosen for advantages in accuracy, sensitivity, precision, selectivity, or adaptability to automation or computerized data reduction or in other special circumstances. Such alternative or automated procedures or methods shall be validated. However, Pharmacopeial standards and procedures are interrelated; therefore, where a difference appears or in the event of dispute, only the result obtained by the procedure given in this Pharmacopeia is conclusive.

In the performance of assay or test procedures, not fewer than the specified number of dosage units should be taken for analysis. Proportionately larger or smaller quantities than the specified weights and volumes of assay or test substances and Reference Standards may be taken, provided the measurement is made with at least equivalent accuracy and provided that any subsequent steps, such as dilutions, are adjusted accordingly to yield concentrations equivalent to those specified and are made in such manner as to provide at least

equivalent accuracy. To minimize environmental impact or contact with hazardous materials, apparatus and chemicals specified in Pharmacopeial procedures also may be proportionally changed.

Where it is directed in an assay or a test that a certain quantity of substance or a counted number of dosage units is to be examined, the specified quantity or number is a minimal figure (the singlet determination) chosen only for convenience of analytical manipulation; it is not intended to restrict the total quantity of substance or number of units that may be subjected to the assay or test or that should be tested in accordance with good manufacturing practices.

Where it is directed in the assay of Tablets to "weigh and finely powder not fewer than" a given number, usually 20, of the Tablets, it is intended that a counted number of Tablets shall be weighed and reduced to a powder. The portion of the powdered tablets taken for assay is representative of the whole Tablets and is, in turn, weighed accurately. The result of the assay is then related to the amount of active ingredient per Tablet by multiplying this result by the average Tablet weight and dividing by the weight of the portion taken for the assay.

Similarly, where it is directed in the assay of Capsules to remove, as completely as possible, the contents of not fewer than a given number, usually 20, of the Capsules, it is intended that a counted number of Capsules should be carefully opened and the contents quantitatively removed, combined, mixed, and weighed accurately. The portion of mixed Capsules contents taken for the assay is representative of the contents of the Capsules and is, in turn, weighed accurately. The result of the assay is then related to the amount of active ingredient per Capsule by multiplying this result by the average weight of Capsule content and dividing by the weight of the portion taken for the assay.

Where the definition in a monograph states the tolerances as being "calculated on the dried (or anhydrous or ignited) basis," the directions for drying or igniting the sample prior to assaying are generally omitted from the *Assay* procedure. Assay and test procedures may be performed on the undried or unignited substance and the results calculated on the dried, anhydrous, or ignited basis, provided a test for *Loss on drying,* or *Water,* or *Loss on ignition,* respectively, is given in the monograph. Results are calculated on an "as-is" basis unless otherwise specified in the monograph. Where the presence of moisture or other volatile material may interfere with the procedure, previous drying of the substance is specified in the individual monograph and is obligatory.

Throughout a monograph that includes a test for *Loss on drying* or *Water,* the expression "previously dried" without qualification signifies that the substance is to be dried as directed under *Loss on drying* or *Water* (gravimetric determination).

Unless otherwise directed in the test or assay in the individual monograph or in a general chapter, USP Reference Standards are to be dried before use, or used without prior drying, specifically in accordance with the instructions given in the chapter *USP Reference Standards* ⟨11⟩, and on the label of the Reference Standard. Where the label instructions differ in detail from those in the chapter, the label text is determinative.

In stating the appropriate quantities to be taken for assays and tests, the use of the word "about" indicates a quantity within 10% of the specified weight or volume. However, the weight or volume taken is accurately determined, and the calculated result is based upon the exact amount taken. The same tolerance applies to specified dimensions.

Where the use of a pipet is directed for measuring a specimen or an aliquot in conducting a test or an assay, the pipet conforms to the standards set forth under *Volumetric Apparatus* ⟨31⟩, and is to be used in such manner that the error does not exceed the limit stated for a pipet of its size. Where a pipet is specified, a suitable buret, conforming to the standards set forth under *Volumetric Apparatus* ⟨31⟩, may be substituted. Where a "to contain" pipet is specified, a suitable volumetric flask may be substituted.

Expressions such as "25.0 mL" and "25.0 mg," used with respect to volumetric or gravimetric measurements, indicate that the quantity is to be "accurately measured" or "accurately weighed" within the limits stated under *Volumetric Apparatus* ⟨31⟩ or under *Weights and Balances* ⟨41⟩.

The term "transfer" is used generally to specify a quantitative manipulation.

The term "concomitantly," used in such expressions as "concomitantly determine" or "concomitantly measured," in directions for assays and tests, is intended to denote that the determinations or measurements are to be performed in immediate succession. See also *Use of Reference Standards* under *Spectrophotometry and Light-Scattering* ⟨851⟩.

Where it is directed that "any necessary correction" be made by a blank determination, the determination is to be conducted using the same quantities of the same reagents treated in the same manner as the solution or mixture containing the portion of the substance under assay or test, but with the substance itself omitted.

Desiccator—The expression "in a desiccator" specifies the use of a tightly closed container of suitable size and design that maintains an atmosphere of low moisture content by means of silica gel or other suitable desiccant.

A "vacuum desiccator" is one that maintains the low-moisture atmosphere at a reduced pressure of not more than 20 mm of mercury or at the pressure designated in the individual monograph.

Dilution—Where it is directed that a solution be diluted "quantitatively and stepwise," an accurately measured portion is to be diluted by adding water or other solvent, in the proportion indicated, in one or more steps. The choice of apparatus to be used should take into account the relatively larger errors generally associated with using small-volume volumetric apparatus (see *Volumetric Apparatus* ⟨31⟩).

Drying to Constant Weight—The specification "dried to constant weight" means that the drying shall be continued until two consecutive weighings do not differ by more than 0.50 mg per g of substance taken, the second weighing following an additional hour of drying.

Filtration—Where it is directed to "filter," without further qualification, the intent is that the liquid be passed through suitable filter paper or equivalent device until the filtrate is clear.

Identification Tests—The Pharmacopeial tests headed *Identification* are provided as an aid in verifying the identity of articles as they are purported to be, such as those taken from labeled containers. Such tests, however specific, are not necessarily sufficient to establish proof of identity; but failure of an article taken from a labeled container to meet the requirements of a prescribed identification test indicates that the article may be mislabeled. Other tests and specifications in the monograph often contribute to establishing or confirming the identity of the article under examination.

Ignition to Constant Weight—The specification "ignite to constant weight" means that the ignition shall be continued, at 800 ± 25° unless otherwise indicated, until two consecutive weighings do not differ by more than 0.50 mg per g of substance taken, the second weighing following an additional 15-minute ignition period.

Indicators—Where the use of a test solution ("TS") as an indicator is specified in a test or an assay, approximately 0.2 mL, or 3 drops, of the solution shall be added, unless otherwise directed.

Logarithms—Logarithms used in the assays are to the base 10.

Microbial Strains—Where a microbial strain is cited and identified by its ATCC catalog number, the specified strain shall be used directly or, if subcultured, shall be used not more than five passages removed from the original strain.

Negligible—This term indicates a quantity not exceeding 0.50 mg.

Odor—Terms such as "odorless," "practically odorless," "a faint characteristic odor," or variations thereof, apply to examination, after exposure to the air for 15 minutes, either of a freshly opened package of the article (for packages containing not more than 25 g) or (for larger packages) of a portion of about 25 g of the article that has been removed from its package to an open evaporating dish of about 100-mL capacity. An odor designation is descriptive only and is not to be regarded as a standard of purity for a particular lot of an article.

Pressure Measurements—The term "mm of mercury" used with respect to measurements of blood pressure, pressure within an apparatus, or atmospheric pressure refers to the use of a suitable manometer or barometer calibrated in terms of the pressure exerted by a column of mercury of the stated height.

Solutions—Unless otherwise specified in the individual monograph, all solutions called for in tests and assays are prepared with *Purified Water.*

An expression such as "(1 in 10)" means that 1 part *by volume* of a liquid is to be diluted with, or 1 part *by weight* of a solid is to be dissolved in, sufficient of the diluent or solvent to make the volume of the finished solution 10 parts *by volume.*

An expression such as "(20 : 5 : 2)" means that the respective numbers of parts, by volume, of the designated liquids are to be mixed, unless otherwise indicated.

The notation "VS" after a specified volumetric solution indicates that such solution is standardized in accordance with directions given in the individual monograph or under *Volumetric Solutions* in the section *Reagents, Indicators, and Solutions,* and is thus differentiated from solutions of approximate normality or molarity.

Where a standardized solution of a specific concentration is called for in a test or an assay, a solution of other normality or molarity may be used, provided allowance is made for the difference in concentration and provided the error of measurement is not increased thereby.

Specific Gravity—Unless otherwise stated, the specific gravity basis is 25°/25°, i.e., the ratio of the weight of a substance in air at 25° to the weight of an equal volume of water at the same temperature.

Temperatures—Unless otherwise specified, all temperatures in this Pharmacopeia are expressed in centigrade (Celsius) degrees, and all measurements are made at 25°. Where moderate heat is specified, any temperature not higher than 45° (113° F) is indicated. See *Storage Temperature* under *Preservation, Packaging, Storage, and Labeling* for other definitions.

Time Limit—In the conduct of tests and assays, 5 minutes shall be allowed for the reaction to take place unless otherwise specified.

Vacuum—The term "in vacuum" denotes exposure to a pressure of less than 20 mm of mercury unless otherwise indicated.

Where drying in vacuum over a desiccant is directed in the individual monograph, a vacuum desiccator or a vacuum drying pistol, or other suitable vacuum drying apparatus, is to be used.

Water—Where water is called for in tests and assays, *Purified Water* is to be used unless otherwise specified. For special kinds of water such as "carbon dioxide–free water," see the introduction to the section *Reagents, Indicators, and Solutions*. For *High-Purity Water* see *Containers* ⟨661⟩.

Water and Loss on Drying—Where the water of hydration or adsorbed water of a Pharmacopeial article is determined by the titrimetric method, the test is generally given under the heading *Water.* Monograph limits expressed as a percentage are figured on a weight/weight basis unless otherwise specified. Where the determination is made by drying under specified conditions, the test is generally given under the heading *Loss on drying.* However, *Loss on drying* is most often given as the heading where the loss in weight is known to represent residual volatile constituents, including organic solvents as well as water.

Test Results, Statistics, and Standards—Interpretation of results from official tests and assays requires an understanding of the nature and style of compendial standards, in addition to an understanding of the scientific and mathematical aspects of laboratory analysis and quality assurance for analytical laboratories.

Confusion of compendial standards with release tests and with statistical sampling plans occasionally occurs. Compendial standards define what is an acceptable article and give test procedures that demonstrate that the article is in compliance. These standards apply at any time in the life of the article from production to consumption. The manufacturer's release specifications, and compliance with good manufacturing practices generally, are developed and followed to ensure that the article will indeed comply with compendial standards until its expiration date, when stored as directed. Thus, when tested from the viewpoint of commercial or regulatory compliance, any specimen tested as directed in the monograph for that article shall comply.

Tests and assays in this Pharmacopeia prescribe operation on a single specimen, that is, the singlet determination, which is the minimum sample on which the attributes of a compendial article should be measured. Some tests, such as those for *Dissolution* and *Uniformity of dosage units,* require multiple dosage units in conjunction with a decision scheme. These tests, albeit using a number of dosage units, are in fact the singlet determinations of those particular attributes of the specimen. These procedures should not be confused with statistical sampling plans. Repeats, replicates, statistical rejection of outliers, or extrapolations of results to larger populations are neither specified nor proscribed by the compendia; such decisions are dependent on the objectives of the testing. Commercial or regulatory compliance testing, or manufacturer's release testing, may or may not require examination of additional specimens, in accordance with predetermined guidelines or sampling strategies. Treatments of data handling are available from organizations such as ISO, IUPAC, and AOAC.

Where the *Content Uniformity* determinations have been made using the same procedure specified in the *Assay,* the average of all of the individual *Content Uniformity* determinations may be used as the *Assay* value.

Description—Information on the "description" pertaining to an article, which is relatively general in nature, is provided in the reference table *Description and Relative Solubility of USP and NF Articles* in this Pharmacopeia for those who use, prepare, and dispense drugs and/or related articles, solely to indicate properties of an article complying with monograph standards. The properties are not in themselves standards or tests for purity even though they may indirectly assist in the preliminary evaluation of an article.

Solubility—The statements concerning solubilities given in the reference table *Description and Relative Solubility of USP and NF Articles* for Pharmacopeial articles are not standards or tests for purity but are provided primarily as information for those who use, prepare, and dispense drugs and/or related articles. Only where a quantitative solubility test is given, and is designated as such, is it a test for purity.

The approximate solubilities of Pharmacopeial substances are indicated by the descriptive terms in the accompanying table. Soluble

Descriptive Term	Parts of Solvent Required for 1 Part of Solute
Very soluble	Less than 1
Freely soluble	From 1 to 10
Soluble	From 10 to 30
Sparingly soluble	From 30 to 100
Slightly soluble	From 100 to 1000
Very slightly soluble	From 1000 to 10,000
Practically insoluble, or Insoluble	Greater than or equal to 10,000

Pharmacopeial articles, when brought into solution, may show traces of physical impurities, such as minute fragments of filter paper, fibers, and other particulate matter, unless limited or excluded by definite tests or other specifications in the individual monographs.

Interchangeable Methods—Certain general chapters contain a statement that the text in question is harmonized with the corresponding text of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia* and that these texts are interchangeable. Therefore, if a substance or preparation is found to comply with a requirement using an interchangeable method from one of these pharmacopeias, it should comply with the requirements of the *United States Pharmacopeia.* However, where a difference appears, or in the event of dispute, only the result obtained by the procedure given in this Pharmacopeia is conclusive.

MONOGRAPHS (USP)

Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine

Change to read:

Labeling—The label for each article encompassed by this monograph bears a name composed of the active ingredients. The label states the name and quantity of each active ingredient and indicates its function (or purpose) in the article.•When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.•4

Change to read:

Dissolution, *Procedure for a Pooled Sample* ⟨711⟩—

•TEST 1—•4

Medium: ■pH 5.8 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*);■1S (*USP29*) 900 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Test preparation—Mix 9.0 mL of a filtered portion of the solution under test with 1.0 mL of 1% phosphoric acid solution.

Procedure—Determine the amounts of pseudoephedrine hydrochloride or pseudoephedrine sulfate (as appropriate), acetaminophen, chlorpheniramine maleate, and dextromethorphan hydrobromide dissolved, employing the procedures set forth in the *Assay for pseudoephedrine hydrochloride* or *Assay for pseudoephedrine sulfate, Assay for acetaminophen, Assay for chlorpheniramine maleate,* and *Assay for dextromethorphan hydrobromide,* respectively, making any necessary volumetric adjustments.

Tolerances—Not less than 75% *(Q)* of the labeled amounts of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) or pseudoephedrine sulfate [$(C_{10}H_{15}NO)_2 \cdot H_2SO_4$], acetaminophen ($C_8H_9NO_2$), chlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$), and dextromethorphan hydrobromide ($C_{18}H_{25}NO \cdot HBr \cdot H_2O$) are dissolved in 45 minutes.

•TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

Medium: water; 900 mL.

Apparatus, Time, Test preparation, Procedure, and *Tolerances*—Proceed as directed for *Test 1.*•4

Amoxicillin Tablets

Change to read:

Dissolution ⟨711⟩—

Medium: water; 900 mL.

Apparatus 2: 75 rpm.

Time: 30 minutes.

Determine the amount of $C_{16}H_{19}N_3O_5S$ dissolved by employing the following method.

pH 5.0 Buffer—Dissolve 27.2 g of monobasic potassium phosphate in 3 L of water, adjust with a 45% (w/w) solution of potassium hydroxide to a pH of 5.0 ± 0.1, dilute with water to obtain 4 L of solution, and mix.

Mobile phase—Prepare a mixture of *pH 5.0 Buffer* and acetonitrile (3900 : 100), and pass through a filter having a 0.5-µm or finer porosity. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Amoxicillin RS in *pH 5.0 Buffer* to obtain a solution having a known concentration of about 0.05 mg per mL. Use this solution within 6 hours.

Test solution—Pass a portion of the solution under test through a filter having a 0.5-µm or finer porosity. Quantitatively dilute an accurately measured volume of the filtrate with water to obtain a solution having an estimated concentration of about 0.045 mg of amoxicillin per mL. Use this solution within 6 hours.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector, a 3.9-mm × 30-cm analytical column that contains packing L1, and a 2-mm × 2-cm guard column that contains packing L2. The analytical column is maintained at a constant temperature of about 40 ± 1°. The flow rate is about 0.7 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the capacity factor, k', is between 1.1 and 2.8; the column efficiency is not less than 1700 theoretical plates; the tailing factor is not more than 2.5; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of amoxicillin ($C_{16}H_{19}N_3O_5S$) dissolved by the formula:

$$0.9DCP(r_U/r_S)$$

in which D is the dilution factor used in preparing the *Test solution;* C is the concentration, in mg per mL, of USP Amoxicillin RS in the *Standard solution;* P is the stated content, in µg of amoxicillin ($C_{16}H_{19}N_3O_5S$) per mg, of USP Amoxicillin RS; and r_U and r_S are the amoxicillin peak responses obtained from the *Test solution* and the *Standard solution,* respectively.

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{16}H_{19}N_3O_5S$ is dissolved in 30 minutes.

FOR PRODUCTS LABELED AS CHEWABLE TABLETS—Proceed as directed above.

•FOR CHEWABLE TABLETS LABELED TO CONTAIN 200 MG OR 400 MG—•4

Time: 20 minutes.

Tolerances—Not less than 70% *(Q)* of the labeled amount of $C_{16}H_{19}N_3O_5S$ is dissolved in 20 minutes.

•FOR CHEWABLE TABLETS LABELED TO CONTAIN 125 MG OR 250 MG—

Time: 90 minutes.

Tolerances—Not less than 70% *(Q)* of the labeled amount of $C_{16}H_{19}N_3O_5S$ is dissolved in 90 minutes.•4

FOR VETERINARY PRODUCTS—Proceed as directed above, except to use *Apparatus 2* at 100 rpm.

Fluoxetine Delayed-Release Capsules

Change to read:

Chromatographic purity—

Ion-pair solution—Dissolve about 6.5 g of sodium 1-octanesulfonate and 2.9 g of anhydrous sodium acetate in 1 L of water, and adjust with glacial acetic acid to a pH of 5.0.

Mobile phase—Prepare a filtered and degassed mixture of *Ion-pair solution* and acetonitrile (58 : 42). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Degraded fluoxetine solution—Dissolve a quantity of USP Fluoxetine Hydrochloride RS in 1.0 N sulfuric acid to obtain a solution containing about 2.2 mg per mL. Heat to 85° for 3 hours, and cool to room temperature.

Interim Revision Announcement

Fluoxetine related compound solution—Dissolve a quantity of USP Fluoxetine Related Compound C RS in *Mobile phase* to obtain a solution containing about 0.5 mg per mL.

System suitability solution—Transfer about 13.5 mg of USP Fluoxetine Hydrochloride RS to a 100-mL volumetric flask, add 2 mL of *Degraded fluoxetine solution* and 2 mL of *Fluoxetine related compound solution,* and dissolve in and dilute with *Mobile phase* to volume. Transfer 10.0 mL of this solution to a 250-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Detector sensitivity solution—•Transfer 2 mL of the *System suitability solution* to a 25-mL volumetric flask, and dilute with *Mobile phase* to volume.•[4]

Test solution—Weigh and finely powder not fewer than 20 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of fluoxetine, to a 250-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Filter before injection.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 15-cm column that contains 3.5-µm packing L7. The column temperature is maintained at 30°. The flow rate is about 1 mL per minute. Inject the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.49 for α,α,α-trifluoro-*p*-cresol, 0.70 for fluoxetine related compound C, and 1.0 for fluoxetine; the resolution, *R,* between α,α,α-trifluoro-*p*-cresol and fluoxetine related compound C is not less than 2.0; and the resolution, *R,* between fluoxetine related compound C and fluoxetine is not less than 6.0. Chromatograph the *Detector sensitivity solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio for the fluoxetine peak is not less than 10.

Procedure—Inject a volume (about 50 µL) of the *Test solution* into the chromatograph, record the chromatogram for at least three times the retention time of the fluoxetine peak, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Capsules taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each impurity, and r_s is the sum of the responses of all the peaks: not more than 0.2% of any individual impurity is found, and not more than 0.7% of total impurities is found.

Nifedipine Extended-Release Tablets

Change to read:

Dissolution ⟨711⟩—

TEST 1—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1.*

Medium: water; 50 mL.

Apparatus 7 (see *Drug Release* ⟨724⟩): 15 to 30 cycles per minute. Do not use the reciprocating disk, but use a 25-cm Plexiglas rod, the perimeter of the Tablets being affixed to the rod with a water-insoluble glue. The solution containers are 25-mm test tubes, 150 to 200 mm in length, and the water bath is maintained at 37 ± 0.5°. At the end of each specified test interval, the systems are transferred to the next row of new test tubes containing 50 mL of fresh *Medium*.

Times: 4, 8, 12, 16, 20, and 24 hours.

Diluting solution: a mixture of methanol and water (1 : 1).

Standard solutions—Transfer about 50 mg of USP Nifedipine RS, accurately weighed, to a 100-mL volumetric flask, dissolve in 50 mL of methanol, dilute with water to volume, and mix to obtain a Standard stock solution. Quantitatively dilute this Standard stock solution with *Diluting solution* to obtain solutions having suitable known concentrations.

Test solution—Use portions of the solution under test, passed through a 0.4-µm filter, suitably diluted with methanol, and stepwise, if necessary, with *Diluting solution* to obtain a final mixture consisting of equal parts of methanol and water.

Procedure—Determine the amount of $C_{17}H_{18}N_2O_6$ released in the *Test solution* at each 4-hour interval by employing UV absorption at the wavelength of maximum absorbance at about 338 nm, in 0.5-cm cells. [NOTE—For the 4-hour time period, determine the absorbance at 456 nm, and use this determination to correct for excipient interference.]

Tolerances—The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$), released in vivo and dissolved at the times specified, conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved*
4	between 5% and 17%
8	—
12	between 43% and 80%
16	—
20	—
24	not less than 80%

* The amount dissolved is expressed in terms of the labeled Tablet strength rather than in terms of the labeled total contents.

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

Buffer concentrate—Transfer 330.9 g of dibasic sodium phosphate and 38 g of citric acid to a 1-L volumetric flask, add water to dissolve, add 10 mL of phosphoric acid, dilute with water to volume, and mix.

Medium—Mix 125.0 mL of *Buffer concentrate* and 1 L of 10% sodium lauryl sulfate solution, and dilute to 10 L. Adjust if necessary to a pH of 6.8; 900 mL.

Apparatus 2: 50 rpm, with sinkers (see *Figure 1*).

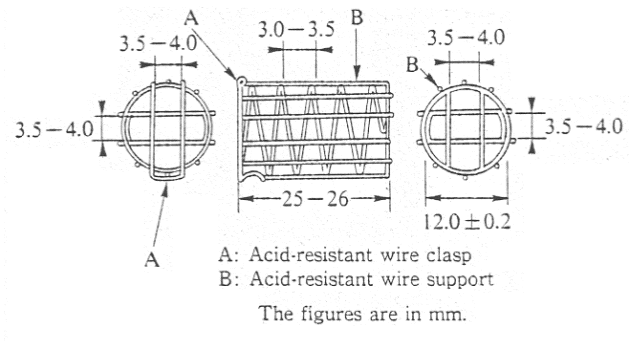

Figure 1 (printed with permission of the Japanese Pharmacopoeia)

Times: 3, 6, and 12 hours.

Determine the amount of nifedipine ($C_{17}H_{18}N_2O_6$) dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (70 : 30). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Nifedipine RS in methanol to obtain a solution having a known concentration of about 1.11 mg per mL. Dilute quantitatively and stepwise with *Medium* to obtain a solution having a known concentration of 0.1 mg per mL.

Chromatographic system—The liquid chromatograph is equipped with a 350-nm detector and a 4.0-mm × 125-mm column that contains 3-µm packing L1. The flow rate is about 1.5 mL per minute. The column is maintained at about 40°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 2000 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of filtered portions of the *Standard solution* and the solution under test into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Determine the amount of nifedipine ($C_{17}H_{18}N_2O_6$) dissolved.

Tolerances—The percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$) released in vivo and dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
3	between 10% and 30%
6	between 40% and 65%
12	not less than 80%

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3.*

FOR TABLETS LABELED TO CONTAIN 30 MG OF NIFEDIPINE—

Phase 1:

Medium: 0.05 M phosphate buffer, pH 7.5; 900 mL.

Apparatus 2: 100 rpm.

Time: 1 hour.

Standard solution—Prepare a solution in *Medium* having an accurately known concentration of about 0.034 mg of USP Nifedipine RS per mL. [NOTE—If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.]

Procedure—[NOTE—After the run, take the Tablet out of the dissolution vessel, adapt a sinker to it, and transfer the Tablet with the sinker to the dissolution vessel containing the *Medium* for *Phase 2*.] Determine the amount of $C_{17}H_{18}N_2O_6$ released in *Phase 1* from UV absorbances at the wavelength of maximum absorbance at about 238 nm, using filtered portions of the solution under test, in comparison with the *Standard solution*, using the *Medium* as the blank.

Phase 2:

Medium: 0.5% sodium lauryl sulfate in simulated gastric fluid without enzyme, pH 1.2; 900 mL.

Apparatus 2: 100 rpm.

Times: 1, 4, 8, and 12 hours.

Standard solution—Prepare a solution in *Medium* having an accurately known concentration of about 0.034 mg of USP Nifedipine RS per mL. [NOTE—If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.]

Procedure—Determine the amount of $C_{17}H_{18}N_2O_6$ released in *Phase 2* from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the *Standard solution*, using *Medium* as the blank.

Tolerances—The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$), released in vivo and dissolved at the times specified, conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved*
1	not more than 30%
4	between 30% and 55%
8	not less than 60%
12	not less than 80%

* For each dosage unit, add the amount dissolved in phosphate buffer, pH 7.5 from *Phase 1* to the amount dissolved at each time point in *Phase 2*.

FOR TABLETS LABELED TO CONTAIN 60 MG OF NIFEDIPINE—

Phase 1:

Medium: 0.05 M phosphate buffer, pH 7.5; 900 mL.

Procedure—[NOTE—After the run, take the Tablet out of the dissolution vessel, adapt a sinker to it, and transfer the Tablet with the sinker to the dissolution vessel containing the *Medium* for *Phase 2*.] Determine the amount of $C_{17}H_{18}N_2O_6$ released in *Phase 1* from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the *Standard solution*, using the *Medium* as the blank.

Apparatus 2: 100 rpm.

Time: 25 minutes.

Standard solution—Prepare a solution in *Medium* having an accurately known concentration of about 0.067 mg of USP Nifedipine RS per mL. If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.

Phase 2:

Medium: 0.5% sodium lauryl sulfate in simulated gastric fluid without enzyme, pH 1.2; 900 mL.

Apparatus 2: 100 rpm.

Times: 1, 4, 8, and 12 hours.

Standard solution—Prepare a solution in *Medium* having an accurately known concentration of about 0.067 mg of USP Nifedipine RS per mL. [NOTE—If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.]

Procedure—Determine the amount of $C_{17}H_{18}N_2O_6$ released in *Phase 2* from UV absorbances at the wavelength of maximum absorbance at about 238 nm, using filtered portions of the solution under test, in comparison with the *Standard solution,* using *Medium* as the blank.

Tolerances—The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$), released in vivo and dissolved at the times specified, conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved*
1	not more than 30%
4	between 40% and 70%
8	not less than 70%
12	not less than 80%

* For each dosage unit, add the amount dissolved in phosphate buffer, pH 7.5 from *Phase 1* to the amount dissolved at each time point in *Phase 2*.

TEST 4—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 4.*

Medium: 0.5% sodium lauryl sulfate in simulated gastric fluid without enzyme, pH 1.2; 900 mL.

Apparatus 2: 100 rpm.

Times: 1, 4, and 12 hours.

Standard solution—Prepare a solution in *Medium* having an accurately known concentration of about 0.067 mg of USP Nifedipine RS per mL for Tablets labeled to contain 60 mg, and about 0.034 mg of USP Nifedipine RS per mL for Tablets labeled to contain 30 mg. [NOTE—If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.]

Procedure—Determine the amount of $C_{17}H_{18}N_2O_6$ released from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the *Standard solution,* using the *Medium* as the blank.

Tolerances—The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$), released at the times specified, conform to *Acceptance Table 2*.

FOR TABLETS LABELED TO CONTAIN 30 MG OF NIFEDIPINE

Time (hours)	Amount dissolved
1	between 12% and 35%
4	between 44% and 67%
12	not less than 80%

FOR TABLETS LABELED TO CONTAIN 60 MG OF NIFEDIPINE

Time (hours)	Amount dissolved
1	between 10% and 30%
4	between 40% and 63%
12	not less than 80%

(Official April 1, 2006)

•TEST 5—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 5*.

Medium: water; 50 mL.

Apparatus 7 (see *Drug Release* ⟨724⟩)—Use a 25-cm Plexiglas rod, the perimeter of the Tablets being affixed to the rod with a water-insoluble glue; 30 dips per minute. The solution containers are 25-mm test tubes, 150 to 200 mm in length, and the water bath is maintained at 37 ± 0.5°.

Times: 4, 12, and 24 hours.

Diluting solution 1—Prepare a mixture of methanol and acetonitrile (1 : 1).

Diluting solution 2—Prepare a mixture of *Diluting solution 1* and water (1 : 1).

Standard solutions—Transfer about 50 mg of USP Nifedipine RS, accurately weighed, to a 100-mL volumetric flask, dissolve in 50 mL of *Diluting solution 1,* dilute with water to volume, and mix. Quantitatively dilute this solution with *Diluting solution 2* to obtain solutions having known concentrations of 0.01 mg per mL, 0.05 mg per mL, and 0.20 mg per mL that are used at 4, 12, and 24 hours sampling, respectively.

Procedure—[NOTE—For the 4-hour time period, filter the solution under test, and determine the absorbance at 456 nm. Use this absorbance value to correct for excipient interference at the other time points.] Determine the amount of nifedipine released at each interval by employing UV absorption at the wavelength of maximum absorbance at about 338 nm on portions of the solution under test passed through a suitable 0.45-µm filter, suitably diluted, if necessary, with *Diluting solution 1* and water to obtain a final mixture of water, methanol, and acetonitrile (2 : 1 : 1), in comparison with the appropriate *Standard solution,* using 0.5-cm cells, and *Diluting solution 2* as the blank.

Tolerances—The cumulative percentages of the labeled amount of nifedipine, released in vivo and dissolved at the times specified, conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
4	not more than 14%
12	between 39% and 75%
24	not less than 75%

•4

Sterile Water for Inhalation

Change to read:

Oxidizable substances—To 100 mL add 10 mL of 2 N sulfuric acid, and heat to boiling. For Sterile Water for Inhalation in containers having a fill volume of less than 50 mL, add 0.4 mL of •0.02 $M_{•4}$ potassium permanganate, and boil for 5 minutes; where the fill volume is 50 mL or more, add 0.2 mL of •0.02 $M_{•4}$ potassium permanganate, and boil for 5 minutes. If a precipitate forms, cool in an ice bath to room temperature, and pass through a sintered-glass filter: the pink color does not completely disappear.

Sterile Water for Injection

Change to read:

Oxidizable substances—To 100 mL add 10 mL of 2 N sulfuric acid, and heat to boiling. For Sterile Water for Injection in containers having a fill volume of less than 50 mL, add 0.4 mL of •0.02 $M_{•4}$ potassium permanganate, and boil for 5 minutes; where the fill volume is 50 mL or more, add 0.2 mL of •0.02 $M_{•4}$ potassium permanganate, and boil for 5 minutes. If a precipitate forms, cool in an ice bath to room temperature, and pass through a sintered-glass filter: the pink color does not completely disappear.

Sterile Water for Irrigation

Change to read:

Oxidizable substances—To 100 mL add 10 mL of 2 N sulfuric acid, and heat to boiling. For Sterile Water for Irrigation in containers having a fill volume of less than 50 mL, add 0.4 mL of •0.02 $M_{•4}$ potassium permanganate, and boil for 5 minutes; where the fill volume is 50 mL or more, add 0.2 mL of •0.02 $M_{•4}$ potassium permanganate, and boil for 5 minutes. If a precipitate forms, cool in an ice bath to room temperature, and pass through a sintered-glass filter: the pink color does not completely disappear.

Sterile Purified Water

Change to read:

Oxidizable substances—To 100 mL, add 10 mL of 2 N sulfuric acid, and heat to boiling. For Sterile Purified Water in containers having a fill volume of less than 50 mL, add 0.4 mL of •0.02 $M_{•4}$ potassium permanganate, and boil for 5 minutes; where the fill volume is 50 mL or more, add 0.2 mL of •0.02 $M_{•4}$ potassium permanganate, and boil for 5 minutes. If a precipitate forms, cool in an ice bath to room temperature, and pass through a sintered-glass filter: the pink color does not completely disappear.

Water for Hemodialysis

Change to read:

Oxidizable substances—To 100 mL, add 10 mL of 2 N sulfuric acid, and heat to boiling. Add ▲0.2 mL▲*USP29* of •0.02 $M_{•4}$ potassium permanganate, and boil for 5 minutes. The pink color does not completely disappear; or alternatively follow the test method for *Total Organic Carbon* ⟨643⟩.

Interim Revision Announcement

Zinc Sulfate Tablets

Change to read:

Identification—

Test solution—•Dissolve a portion of powdered Tablets in water to obtain a solution containing about 0.05 g of zinc sulfate per mL.

Glycerin solution: a mixture of glycerin and water (85 : 15).

Sodium sulfide solution—Dissolve 12 g of sodium sulfide with heating in a 45-mL mixture of *Glycerin solution* and water (29 : 10), allow to cool, and dilute with the same mixture of solvents to 100 mL. The solution should be colorless.

Hydrochloric acid solution—Transfer 20 g of hydrochloric acid to a 100-mL volumetric flask, dilute with water to volume, and mix.

Barium chloride solution—Transfer 61 g of barium chloride to a 1000-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Sodium hydroxide solution—Transfer 42 g of sodium hydroxide to a 100-mL volumetric flask, dilute with water to volume, and mix.

Ammonium chloride solution—Transfer 107 g of ammonium chloride to a 1000-mL volumetric flask, dilute with water to volume, and mix.•4

A: •To 5 mL of the *Test solution* add 1 mL of *Hydrochloric acid solution* and 1 mL of *Barium chloride solution.* A white precipitate is formed.•4

B: •To 5 mL of the *Test solution* add 0.2 mL of *Sodium hydroxide solution.* A white precipitate is formed. Add an additional 2 mL of *Sodium hydroxide solution* and the precipitate dissolves. Add 10 mL of *Ammonium chloride solution* and the solution remains clear. Add 0.1 mL of *Sodium sulfide solution* and a white precipitate is formed•4

Delete the following:

•**Dissolution—**

Medium: purified water with resistivity below 1 µS/cm; 750 mL.

Apparatus: basket-rack assembly (see *Disintegration* ⟨701⟩).

Time: 20 seconds.

Procedure—Place 1 Tablet in each of the six tubes of the basket, lower the basket-rack assembly into the beaker containing the *Medium,* and introduce the electrode of the resistivity meter into the beaker without hindering the motion of the basket. Measure the resistivity every 2 seconds.

Tolerances—The disintegration of the Tablets is complete in 20 seconds, and the resistivity stabilizes at about 255 to 260 µS in 20 seconds.•4

Add the following:

•**Disintegration** ⟨701⟩**:** 60 seconds.•4

Interim Revision Announcement

DIETARY SUPPLEMENTS—MONOGRAPHS

Valerian

Change to read:

USP Reference standards ⟨11⟩—•4 *USP Valerenic Acid RS.*

Change to read:

Identification—

A: Transfer about 0.2 g of freshly powdered Valerian to a test tube, add 5 mL of methylene chloride, shake several times, and allow to stand for 5 minutes. Filter, wash the filter with 2 mL of methylene chloride, and combine the filtrate and washings in one container. Heat the combined filtrate and washings on a water bath for the minimum time required to evaporate the solvent, and dissolve the residue in 0.2 mL of methylene chloride.•4 To about 0.1 mL of this solution, add 3 mL of a mixture of equal volumes of glacial acetic acid and 25% hydrochloric acid, and shake several times: a blue color develops within 15 minutes.
•4

•**B:**•4 The retention time of the valerenic acid peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *Standard solution*, as obtained in the test for *Content of valerenic acid.*

Powdered Valerian

ERRATA

Following is a list of errata and corrections to *USP 29–NF 24*. The page number indicates where the item is found in *USP 29–NF 24*. If necessary, this list will be updated with every issue of *PF*. This information will also be available as a cumulative table in future *Supplements* and will appear in its corrected form in a future annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement. USP staff is available to respond to questions regarding the accuracy of a particular requirement by calling 1-800-822-USPC.

Page	Title	Section	Description
664	*Dextroamphetamine Sulfate Tablets*	*Identification A*	Line 4: Change "into a 250-mL separator, add 5 mL of 2.5 N sodium hydroxide, and mix." to: into a 250-mL separator, add 5 mL of 2.5 N sodium hydroxide, mix, and extract with 60 mL of ether.
		Isomeric purity	Line 15: Change "With the aqueous phase in the separator, preventing it from" to: Add to the aqueous phase in the separator 2.5 g of sodium bicarbonate. Preventing it from
3273	*Ammonium Sulfate*	*Limit of phosphate*	Line 6 under *Procedure:* Change "made with 2.0 mL of the *Standard Phosphate Solution*" to: made with 0.2 mL of the *Standard Phosphate Solution*
Supplement 1			
3580	*Saccharin Sodium*	*Organic volatile impurities*	Line 1: Change "*Method I*" to: *Method IV*

Interim Revision Announcement

IN-PROCESS REVISION

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) items that previously appeared under *Pharmacopeial Previews* and are now formally proposed as revisions, (2) proposed revisions placed directly under *In-Process Revision,* or (3) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the staff liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

BRIEFING

> **Name of Item**, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How to Use PF*), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
> (DSN: L. Evans) RTS—55678-1

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type (print edition only), as shown in the examples below:

•new text•

if slated for an *Interim Revision Announcement to USP 29–NF 24* (*IRA*);

▲new text▲*USP30*

if slated for *USP 30–NF 25*; and

■new text■

if slated for a *Supplement to USP–NF*. The same symbols *not* set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as •• or ■■ or ▲▲, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •2 indicates that the revision is proposed for the *Second Interim Revision Announcement*, ■2S (*USP 29*) indicates that the proposed revision is slated for the *Second Supplement to USP 29*, and ▲*USP30* and ▲*NF25* indicate that the revisions are proposed for *USP 30* and *NF 25*, respectively.

Official Title Changes Where the specification ***"Monograph title change"*** is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

MONOGRAPHS (USP)

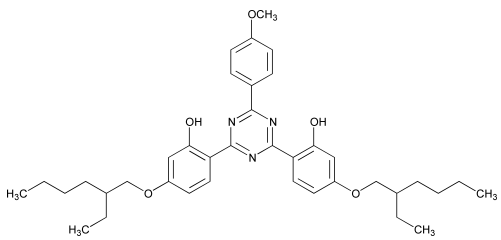
BRIEFING

Bemotrizinol. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on validated methods, is being proposed. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with the Hypersil BDS brand of L1 column. The typical retention time for bemotrizinol is about 13 minutes.

(MD-OOD: C. Anthony) RTS—C41734

Add the following:

■Bemotrizinol



$C_{38}H_{49}N_3O_5$ 627.80

Phenol, 2,2′-[6-(4-methoxyphenyl)-1,3,5-triazine-2,4-diyl]-bis[5-[(2-ethylhexyl)oxy]].

2,2′-[6-(4-Methoxyphenyl)-1,3,5-triazine-2,4-diyl]bis[5-[(2-ethylhexyl)oxy]phenol] [*CAS-187393-00-6*].

» Bemotrizinol contains not less than 96.5 percent and not more than 100.0 percent of $C_{38}H_{49}N_3O_5$, calculated on the as-is basis.

Packaging and storage—Preserve in well-closed containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Bemotrizinol RS.*

Identification—

A: *Ultraviolet Absorption* ⟨197U⟩—

Spectral range: 210 to 750 nm.

Solution: 10 mg per mL.

Medium: 1,4-dioxane.

Ratio: A_{308}/A_{342} is about 0.9.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Heavy metals, *Method I* ⟨231⟩**:** 0.002%.

Limit of residual solvents—

Sample cartridge—Transfer 50 mg of Bemotrizinol to a previously weighed thermodesorption glass tube, and reweigh. Determine the weight of Bemotrizinol using the weight by difference method. Place two glass wool plugs into each end of the tube to hold the packed sample in the tube.

Standard solution—Dissolve 10 µL of acetone, 5 µL of 2-butanol, and 2 µL of *N,N*-dimethylformamide in 10 mL of methanol.

Reference cartridge—Weigh an empty thermodesorption glass tube. Add enough S9 support (60- to 80-mesh) to obtain 100 mg. Place two glass wool plugs into each end of the tube. With a syringe, inject 3 µL of the *Standard solution* into the cartridge, corresponding to 2.37 µg of acetone, 1.22 µg of 2-butanol, and 0.57 µg of *N,N*-dimethylformamide. After purging with nitrogen for 1.5 minutes (15 mL per minute), transfer the cartridge to the thermodesorption device.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a thermodesorption device, a cryo-trap injector cooled by liquid nitrogen, and a flame-ionization detector, and contains a 0.53-mm × 30-m column coated with a 3-µm film of liquid phase G43. The carrier gas is nitrogen, flowing at a rate of 64 cm per second. The chromatograph is programmed as follows. Initially the temperature of the thermodesorption unit is set at 30°, then the temperature is increased at a rate of 60° per minute to

In-Process Revision

150°, and maintained at 150° for 8 minutes. The initial temperature of the cryo-trap is set at –150°, then the temperature is increased at a rate of 12° per second (after sample transfer) to 300° and maintained at 300° for 2 minutes. Initially the temperature of the column is maintained at 40° for 2 minutes, then the temperature is increased at a rate of 8° per minute to 120°, and then the temperature is increased at a rate of 20° per minute to 250° and maintained at 250° for 5 minutes. The transfer line from the cryo-trap to the column is maintained at 300°, and the detector is maintained at 260°. Chromatograph the *Reference cartridge* and the *Sample cartridge*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 5% for each of the solvents.

Procedure—Attach the *Sample cartridge* and the *Reference cartridge* to the cryo-trap injector, and allow the analyte to thermodesorb. Increase the temperature of the cryo-trap injector to facilitate the rapid transfer of analyte to the column, record the chromatograms, and measure the responses for the major peaks. Calculate the concentration of each residual solvent in the portion of Bemotrizinol taken by the formula:

$$1000(W_S / W_U)(r_U / r_S)$$

in which W_S is the weight, in µg, of the individual solvent spiked on the *Reference cartridge;* W_U is the weight of Bemotrizinol, in mg, spiked on the *Sample cartridge;* r_U is the peak response obtained from the *Sample cartridge;* and r_S is the peak response of the solvent obtained from the *Reference cartridge:* not more than 50 ppm of acetone is found; not more than 50 ppm of 2-butanol is found; and not more than 10 ppm of *N,N*-dimethylformamide is found.

Related compounds—

Diluent, Buffer, Solution A, Solution B, Mobile phase, and *Chromatographic system*—Proceed as directed in the *Assay.*

Test solution—Transfer about 500 mg of Bemotrizinol, accurately weighed, to a 100-mL volumetric flask, dissolve by sonication in 80 mL of 1,4-dioxane, dilute with 1,4-dioxane to volume, and mix. Transfer 5 mL of the solution to a 25-mL volumetric flask, and dilute with *Diluent* to volume to obtain a solution having a concentration of about 1.0 mg per mL.

Standard stock solution—Transfer about 25 mg of USP Bemotrizinol RS, accurately weighed, to a 100-mL volumetric flask. Dissolve by sonication for 5 minutes in 60 mL of 1,4-dioxane. Cool to room temperature, dilute with 1,4-dioxane to volume, and mix.

Standard solution—Pipet 2.0 mL of the *Standard stock solution* into a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix to obtain a solution having a known concentration of 10 µg per mL.

Sensitivity check solution—Pipet 2.0 mL of the *Standard stock solution* into a 100-mL volumetric flask, dilute with 1,4-dioxane to volume, and mix. Pipet 5.0 mL of this solution into a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix to obtain a solution having a concentration of 0.25 µg per mL.

Procedure—Separately inject a volume (about 20 µL) of the *Test solution,* the *Standard solution,* and the *Sensitivity check solution* into the chromatograph; record the chromatograms; measure the peak responses of bemotrizinol in the *Standard solution,* the *Test solution,* and the *Sensitivity check solution;* and measure the response of any impurity peak in the *Test solution* with a response greater than that obtained for bemotrizinol in the *Sensitivity check solution.* Calculate the percentage of each impurity in the portion of Bemotrizinol taken by the formula:

$$50(C/FW)(r_i / r_S)$$

in which C is the concentration, in µg per mL, of USP Bemotrizinol RS in the *Standard solution;* F is the relative response factor; W is the weight, in mg, of Bemotrizinol taken; r_i is the peak response for each individual impurity in

the *Test solution* with a response equal to or greater than the bemotrizinol peak obtained from the *Sensitivity check solution;* and r_S is the response of the bemotrizinol peak obtained from the *Test solution*.

Assay—

Diluent—Prepare a mixture containing 1,4-dioxane and water (80 : 20).

Buffer—Transfer 600 mg of ammonium formate to a 1000-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Adjust with formic acid to a pH of 4.6.

Solution A—Use the *Buffer,* filtered and degassed.

Solution B—Use 1,4-dioxane.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer about 50 mg of USP Bemotrizinol RS, accurately weighed, to a 50-mL volumetric flask. Dissolve by sonication in 40 mL of 1,4-dioxane. Cool to room temperature, dilute with 1,4-dioxane to volume, and mix. Pipet 5.0 mL of this solution into a 50-mL volumetric flask, and dilute with *Diluent* to volume.

Assay preparation—Transfer about 50 mg of Bemotrizinol, accurately weighed, to a 50-mL volumetric flask. Dissolve by sonication in 40 mL of 1,4-dioxane. Cool to room temperature, dilute with 1,4-dioxane to volume, and mix. Pipet 5.0 mL of this solution into a 50-mL volumetric flask, and dilute with *Diluent* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 332-nm detector and a 3.0-mm × 12.5-cm column that contains packing L1. The flow rate is about 0.3 mL per minute. The column temperature is maintained at 35°. The chromatograph is programmed as follows.

Impurity	Relative Retention Time	Response Factor (*F*)	Limit (%)
2-[2-Hydroxy, 4-(2-ethylhexyloxy)phenyl], 4-(resorcin-4-yl), 6-(4-methoxyphenyl) 1,3,5-triazine	0.26	1.11	< 1.0
2-Hydroxy, 4-(2-ethylhexyloxy)benzophenone	0.30	0.4	< 1.0
Impurity A	0.35	1.11	< 1.0
2-[4-(2-Ethylhexyloxy), 2-hydroxyphenyl], 4,6-bis-(4-methoxyphenyl) 1,3,5-triazine	0.39	1.11	< 1.0
2-[2,4-Bis-(2-ethylhexyloxy)phenyl], 4-[2-hydroxy, 4-(2-ethylhexyloxy)phenyl], 6-[4-methoxyphenyl] 1,3,5-triazine	1.46	0.77	< 1.0
Impurity B	1.62	0.77	< 1.0
2,4,6-Tris-[2-hydroxy, 4-(2-ethylhexyloxy)phenyl] 1,3,5-triazine	1.66	0.67	< 1.0
2,4-Bis-[2-hydroxy, 4-(2-ethylhexyloxy)phenyl], 6-[4-2-ethyl-hexyloxy)phenyl] 1,3,5-triazine	1.69	0.83	< 1.0
Any other unknown impurity	—	1.0	< 1.0
Total impurities	—	—	< 2.5

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–5	20	80	isocratic
5–25	20→0	80→100	linear gradient
25–27	0	100	isocratic
27–27.1	0→20	100→80	linear gradient
38	20	80	isocratic

Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections of the *Standard preparation* is not more than 1.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{38}H_{49}N_3O_5$ in the portion of Bemotrizinol taken by the formula:

$$500C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Bemotrizinol RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP30*)

BRIEFING

Bupropion Hydrochloride Extended-Release Tablets, *USP 29* page 322 and page 312 of *PF* 32(2) [Mar.–Apr. 2006]. In *Dissolution Test 4,* it is proposed to correct the cell path length and the tolerances at the 8-hour time point.

Drug release ⟨724⟩—

■FOR PRODUCTS LABELED FOR DOSING EVERY 12 HOURS—■1S (*USP30*)

TEST 1—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Times: 1, 4, and 8 hours.

Procedure—Determine the amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 298 nm, using a 1.0-cm cell, on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Bupropion Hydrochloride RS in the same *Medium.*

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 1.*

Time (hours)	Amount dissolved
1	between 25% and 45%
4	between 60% and 85%
8	not less than 80%

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 2.*

Medium: 0.1 N hydrochloric acid, pH 1.5

■(prepared by transferring about 50 mL of concentrated hydrochloric acid to 6000 mL of water, adding about 18 g of sodium hydroxide, mixing, and adjusting with either diluted sodium hydroxide or hydrochloric acid to a pH of 1.5 ± 0.05.);■1S (*USP30*)
900 mL,

■deaerated.■1S (*USP30*)

Apparatus 1: 50 rpm.

Times: 1, 2, 4, and 6 hours.

Determine the percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved by employing the following method.

Buffer solution—Dissolve 3.45 g of monobasic sodium phosphate monohydrate in 996 mL of water, add 4.0 mL of triethylamine, and mix. Adjust with phosphoric acid to a pH of 2.80 ± 0.05.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and methanol (65 : 35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Bupropion Hydrochloride RS in *Medium,* and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration similar to the one expected in the *Test solution.*

Test solution—Use portions of the solution under test, and pass through a 0.45-µm nylon filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 298-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 2000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of bupropion hydrochloride dissolved at each time point.

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 1.*

Time (hours)	Amount dissolved
1	between 25% and 50%
2	between 40% and 65%
4	between 65% and 90%
6	not less than 80%

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 3.*

Medium, Apparatus, and *Procedure*—Proceed as directed for *Test 1,* except to use the wavelength at about 250 nm.

Times: 1, 2, 4, and 6 hours.

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 1.*

Time (hours)	Amount dissolved
1	between 30% and 55%
2	between 50% and 75%
4	between 70% and 90%
6	not less than 80%

(Official April 1, 2006)

BRIEFING

Butorphanol Tartrate Nasal Solution, page 1346 of *PF* 31(5) [Sept.–Oct. 2005]. On the basis of comments received, it is proposed to make the following revisions. The test for *Microbial limits* is revised. The test for *Delivered dose uniformity over the entire contents* is deleted, because this test is appropriate only for metered-dose inhalers, not for nasal sprays. The preparation of the *Mobile phase* is revised in both the test for *Related compounds* and the *Assay,* to make it more acceptable for the proposed methods. The column length specification for the *Chromatographic system* in the *Assay* is changed. Minor editorial changes have also been made.

(MD-CCA: C. Anthony) RTS—C45970

Add the following:

■Butorphanol Tartrate Nasal Solution

» Butorphanol Tartrate Nasal Solution is an aqueous solution of butorphanol tartrate for administration as a metered spray to the nasal mucosa. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of butorphanol tartrate ($C_{21}H_{29}NO_2 \cdot C_4H_6O_6$).

Packaging and storage—Preserve in tight containers at controlled room temperature. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards ⟨11⟩—*USP Butorphanol Tartrate RS.*

Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

In-Process Revision

B: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Prepare a composite solution by pooling the contents of three containers of Nasal Solution into a suitable vessel. Transfer 1.0 mL of pooled sample to a 10-mL volumetric flask, and dilute with methanol to volume.

Standard solution—Dissolve an accurately weighed quantity of USP Butorphanol Tartrate RS in methanol to obtain a solution having a known concentration of about 1.0 mg per mL.

Developing solvent system—Prepare a mixture of chloroform, methanol, benzene, and ammonium hydroxide (17 : 5 : 4 : 1). Mix thoroughly. *[Caution—Prepare in a hood while wearing appropriate safety gloves, lab coat, and protective eyewear.]*

Spray reagent—Prepare a 1 in 10 solution of chloroplatinic acid in water. To 0.5 mL of this solution, add 33 mL of water and 1 g of potassium iodide. Prepare fresh daily.

Procedure—Proceed as directed in the chapter, except to spray the plate with *Spray reagent.* The typical R_F value is about 0.7 for butorphanol tartrate.

Osmolality ⟨785⟩**:** between 252 and 292 mOsmol per kg.

Microbial limits ⟨61⟩~~— The total aerobic count is not more than 100 cfu per mL, and the total combined molds and yeasts count is not more than 100 cfu per mL. It meets the requirements of the tests for absence of *Coliforms, Staphylococcus aureus,* and *Pseudomonas aeruginosa.*~~ The total aerobic microbial count does not exceed 1000 cfu per g or mL, and the total combined molds and yeasts count does not exceed 100 cfu per g or mL. It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa.*

pH ⟨791⟩**:** between 4.0 and 6.0.

~~**Delivered dose uniformity over the entire contents:** meets the requirements for *Metered-Dose Inhalers* under *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers* ⟨601⟩.~~

Related compounds—

Phosphate buffer (0.025 M)—Prepare as directed in the *Assay.*

Mobile phase—Prepare a filtered and degassed mixture of phosphate buffer, acetonitrile, and triethylamine ~~(85 : 15 : 5)~~ (85 : 15 : 5.1). Mix thoroughly, and adjust with 85.0% phosphoric acid to a pH of 3.0 ± 0.1. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Butorphanol Tartrate RS in water, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.005 mg per mL.

Sensitivity solution—Transfer 2.5 mL of the *Standard solution* to a 50-mL volumetric flask, dilute with water to volume, and mix. Do not filter.

Test solution—Prepare a composite solution by pooling a minimum of four containers of Nasal Solution into a suitable glass vessel. Transfer the equivalent of 50 mg of butorphanol tartrate to a 50-mL volumetric flask. Dilute with water to volume, and mix. Do not filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector, ~~and a 4.6 × 250 mm~~ a 4.6-mm × 25-cm column that contains 5-µm packing L11, and a ~~4.6 × 10 mm~~ 4.6-mm × 1-cm guard column packed with 5-µm packing L11. The column temperature is maintained at 40°. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for six replicate injections is not more than 10.0%. Chromatograph the *Sensitivity solution,* and record the peak responses as directed for *Procedure:* the peak height for butorphanol tartrate is greater than or equal to three times the baseline noise.

Procedure—Separately inject equal volumes (about 60 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the butorphanol tartrate peak in the *Standard*

In-Process Revision

solution and for all known and unknown related compounds in the *Test solution.* The chromatographic run time is about 40 minutes. Calculate the percentage of each related compound (see *Table 1*) and each unknown impurity in the portion of Nasal Solution taken by the formula:

$$5000(C/VLA)(r_i/r_S)$$

in which C is the concentration, in mg per mL, of USP Butorphanol Tartrate RS in the *Standard solution; V* is the volume of sample taken; *LA* is the labeled amount, in mg per mL, of butorphanol tartrate in the sample; r_i is the peak response of each known or unknown related compound in the *Test solution;* and r_S is the peak response of butorphanol tartrate in the *Standard solution:* the impurities meet the requirements specified in *Table 1.*

Table 1

Compound	Relative Retention Time	Limit (%)
3,14-Dihydroxymorphinan	0.3	0.3
Δ6-Butorphanol	0.7	0.5
Butorphanol tartrate	1.0	—
Unknown impurity	—	0.3
Total impurities	—	1.0

Assay—

Phosphate buffer (0.025 M)—Transfer 3.4 g of monobasic potassium phosphate into a 1000-mL volumetric flask. Dilute with water to volume, and filter. ~~Mix, and adjust with phosphoric acid to a pH of 3.0 ± 0.1.~~

Mobile phase—Prepare a filtered and degassed mixture of phosphate buffer, acetonitrile, and triethylamine (85 : 15 : 2). Mix thoroughly, and adjust with 85.0% phosphoric acid to a pH of 3.0 ± 0.1. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Butorphanol Tartrate RS in *Mobile phase* to obtain a solution having a known concentration of 0.2 mg per mL. Mix, and filter, discarding the first 2 mL of the filtrate. The *Standard preparation* is stable for at least 108 hours.

Assay preparation—Prepare a composite solution by pooling a minimum of four containers of Nasal Solution into a suitable glass vessel. Transfer the equivalent of 20 mg of butorphanol tartrate to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume, mix, and filter, discarding the first 2 mL of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector, a ~~4.6 × 250 mm~~ 4.6-mm × 15-cm column that contains 5-µm packing L11, and a ~~4.6 × 10 mm~~ 4.6-mm × 1-cm guard column that contains 5-µm packing L11. The column temperature is maintained at 30°. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor for the butorphanol tartrate peak is not more than 2.0; and the relative standard deviation for five replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the butorphanol tartrate peak. Calculate the quantity, in mg, of butorphanol tartrate ($C_{21}H_{29}NO_2 \cdot C_4H_6O_6$) in the portion of Nasal Solution taken by the formula:

$$100C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Butorphanol Tartrate RS in the *Standard preparation;* and r_U and r_S are the peak responses for butorphanol tartrate obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP30*)

In-Process Revision

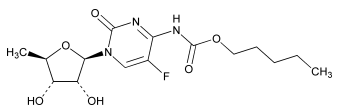
BRIEFING

Capecitabine; Capecitabine Tablets. Because there are no existing *USP* monographs for this drug substance and dosage form, new monographs, based on validation data received, are being proposed. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with the Metachem Technologies Inertsil ODS-2 brand of L1 column. The typical retention time for capecitabine is about 22 minutes.

(MD-OOD: F. Mao) RTS—C43499

Add the following:

■Capecitabine



$C_{15}H_{22}FN_3O_6$ 359.35

Carbamic acid, [1-(5-deoxy-β-D-ribofuranosyl)-5-fluoro-1,2-dihydro-2-oxo-4-pyrimidinyl]-, pentyl ester.

Pentyl 1-(5-deoxy-β-D-ribofuranosyl)-5-fluoro-1,2-dihydro-2-oxo-4-pyrimidinecarbamate [*154361-50-9*].

» Capecitabine contains not less than 98.0 percent and not more than 102.0 percent of $C_{15}H_{22}FN_3O_6$, calculated on the anhydrous and solvent-free basis.

Packaging and storage—Preserve in tight containers. Store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Capecitabine RS. USP Capecitabine Related Compound A RS. USP Capecitabine Related Compound B RS. USP Capecitabine Related Compound C RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩—

Test specimen: 2 mg of sample in 300 mg of potassium bromide.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Water, *Method Ic* ⟨921⟩**:** not more than 0.3%.

Specific rotation ⟨781S⟩**:** between +96.0° and +100.0°.

Test solution: 10 mg per mL, on the anhydrous and solvent-free basis, in methanol, at 20°.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩**:** not more than 20 ppm.

Related compounds—

Diluent, Solution A, Solution B, Peak identification solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay.*

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Capecitabine taken by the formula:

$$100(1/F)(C_S/C_U)(r_I/r_S)$$

in which F is the relative response factor for each impurity obtained from *Table 1;* C_S is the concentration, in mg per mL, of USP Capecitabine RS in the *Standard solution;* C_U is the concentration, in mg per mL, of capecitabine in the *Test solution;* r_I is the peak response for each impurity obtained from the *Test solution;* and r_S is the peak response for capecitabine obtained from the *Standard solution.* The limits are given in *Table 1.*

Assay—

Diluent—Prepare a mixture of water, methanol, and acetonitrile (60 : 35 : 5).

In-Process Revision

Table 1

Compound	Relative Retention Time	Relative Response Factor (*F*)	Limit (%)
Capecitabine related compound A	0.18	1.05	≤0.3

2′,3′-Di-*O*-acetyl-5′-deoxy-5-fluoro-N4-(pentyloxy-carbonyl)cytidine	1.37	0.85	≤0.1
Individual unspecified impurity	—	1.00	≤0.1
Total unspecified impurities	—	—	≤0.5
Total impurities	—	—	≤1.5

Diluted acetic acid—Prepare a 0.1% (v/v) mixture of acetic acid in water.

Solution A—Prepare a mixture of *Diluted acetic acid,* methanol, and acetonitrile (60 : 35 : 5).

Solution B—Prepare a mixture of methanol, *Diluted acetic acid,* and acetonitrile (80 : 15 : 5).

Standard preparation—Dissolve an accurately weighed quantity of USP Capecitabine RS in *Diluent*, and sonicate if necessary, to obtain a solution having a known concentration of about 0.6 mg per mL.

Peak identification solution—Dissolve suitable quantities of USP Capecitabine RS, USP Capecitabine Related Compound A RS, USP Capecitabine Related Compound B RS, and USP Capecitabine Related Compound C RS in

Diluent, and sonicate if necessary, to obtain a solution having known concentrations of about 0.06 mg each per mL. Quantitatively dilute this solution with *Diluent* to obtain a solution having known concentrations of about 0.6 µg of each per mL.

Assay preparation—Dissolve an accurately weighed quantity of Capecitabine in *Diluent,* and sonicate if necessary, to obtain a solution having a known concentration of about 0.6 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 250-nm detector, a refrigerated autosampler at 5°, and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. The column temperature is maintained at 40°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–5	100	0	isocratic
5–20	100→49	0→51	linear gradient
20–30	49	51	isocratic
30–31	49→100	51→0	linear gradient
31–40	100	0	equilibration

Chromatograph the *Diluent,* followed by the *Peak identification solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between USP Capecitabine Related Compound A RS and USP Capecitabine Related Compound B RS is not less than 1.0. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor of the capecitabine peak is not greater than 1.5, and the relative standard deviation for replicate injections of the capecitabine peak is not more than 2.0%. [NOTE—For the purpose of peak identification, the approximate relative retention times are given in *Table 1*. The relative retention times are measured with respect to capecitabine.]

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the capecitabine peaks. Calculate the quantity, in percentage, of $C_{15}H_{22}FN_3O_6$ in the portion of Capecitabine taken by the formula:

$$100(C_S/C_U)(r_U/r_S)$$

in which C_S is the concentration, in mg per mL, of USP Capecitabine RS in the *Standard preparation;* C_U is the concentration of capecitabine in the *Assay preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■2S (*USP30*)

BRIEFING

Add the following:

■Capecitabine Tablets

» Capecitabine Tablets contain not less than 93.0 percent and not more than 105.0 percent of the labeled amount of capecitabine ($C_{15}H_{22}FN_3O_6$).

Packaging and storage—Preserve in tight containers. Store at controlled room temperature.

In-Process Revision

USP Reference standards ⟨11⟩—*USP Capecitabine RS. USP Capecitabine Related Compound A RS. USP Capecitabine Related Compound B RS. USP Capecitabine Related Compound C RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩—Bands in the region of 1500–1760 cm^{-1} obtained for the test sample correspond to the bands obtained for USP Capecitabine RS.

Test specimen—Grind one Tablet to a fine powder with a mortar and pestle. Mix 1 mg of this sample with 300 mg of potassium bromide.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: water; 900 mL, degassed.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Standard solution—For Tablets labeled to contain 150 mg: Transfer 17 mg, accurately weighed, of USP Capecitabine RS to a 100-mL volumetric flask, dissolve in and dilute with *Medium* to volume, and mix. For Tablets labeled to contain 500 mg: Transfer 28 mg, accurately weighed, of USP Capecitabine RS to a 50-mL volumetric flask, dissolve in and dilute with *Medium* to volume, and mix.

Test solution—Pass a portion of the solution under test through a 0.45-µm fiberglass filter.

Procedure—Determine the amount of capecitabine ($C_{15}H_{22}FN_3O_6$) dissolved by employing UV absorption at the wavelength of maximum absorbance at about 304 nm (for Tablets labeled to contain 150 mg) and at about 325 nm (for Tablets labeled to contain 500 mg) on portions of the *Test solution*, suitably diluted with *Medium*, if necessary, in comparison with the appropriate *Standard solution*, using a 1-mm quartz cell. Calculate the amount, in percentage, of $C_{15}H_{22}FN_3O_6$ dissolved by the formula:

$$\frac{A_U \times C_S \times 900 \times 100}{A_S \times LC}$$

in which A_U and A_S are the absorbances obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of capecitabine ($C_{15}H_{22}FN_3O_6$) in the *Standard solution;* 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the Tablet label claim, in mg.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{15}H_{22}FN_3O_6$ is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Related compounds—

Diluent, Solution A, Solution B, Peak identification solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay.*

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(1/F)(C_S/C_U)(r_I/r_S)$$

in which F is the relative response factor for each impurity obtained from *Table 1;* C_S is the concentration, in mg per mL, of USP Capecitabine RS in the *Standard solution;* C_U is the concentration, in mg per mL, of capecitabine in the *Test solution;* r_I is the peak response for each impurity obtained from the *Test solution,* and r_S is the peak response for capecitabine obtained from the *Standard solution*. The limits are given in *Table 1.*

Table 1

Compound	Relative Retention Time	Relative Response Factor *(F)*	Limit (%)
Capecitabine related compound A	0.18	1.05	≤ 1.0
Capecitabine related compound B	0.19	0.81	≤ 1.0
Capecitabine	1.00	1.00	—
Capecitabine related compound C	1.11	0.91	≤ 0.5
Individual unspecified impurity	—	1.00	≤ 0.1
Total unspecified impurities	—	—	≤ 0.5
Total impurities	—	—	≤ 2.0

Assay—

Diluent—Prepare a mixture of water, methanol, and acetonitrile (60 : 35 : 5).

Diluted acetic acid—Prepare a 0.1% (v/v) mixture of acetic acid in water.

Solution A—Prepare a mixture of *Diluted acetic acid,* methanol, and acetonitrile (60 : 35 : 5).

Solution B—Prepare a mixture of methanol, *Diluted acetic acid,* and acetonitrile (80 : 15 : 5).

Standard preparation—Dissolve an accurately weighed quantity of USP Capecitabine RS in *Diluent,* and sonicate if necessary, to obtain a solution having a known concentration of about 0.6 mg per mL.

Peak identification solution—Dissolve suitable quantities of USP Capecitabine RS, USP Capecitabine Related Compound A RS, USP Capecitabine Related Compound B RS, and USP Capecitabine Related Compound C RS in *Diluent,* and sonicate if necessary, to obtain a solution having known concentrations of about 0.06 mg of each per mL. Quantitatively dilute this solution with *Diluent* to obtain a solution having known concentrations of about 0.6 µg of each per mL.

Assay preparation—Grind not fewer than 20 Tablets to a fine powder. Dissolve an accurately weighed quantity of powdered Tablets, dilute quantitatively with *Diluent,* and sonicate if necessary, to obtain a solution having a known concentration of about 0.6 mg per mL. Pass through a PVDF 0.45-µm membrane filter, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 250-nm detector, a refrigerated autosampler maintained at 5°, and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. The column temperature is maintained at 40°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–5	100	0	isocratic
5–20	100→49	0→51	linear gradient
20–30	49	51	isocratic
30–31	49→100	51→0	linear gradient
31–40	100	0	equilibration

Chromatograph the *Diluent* and the *Peak identification solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between capecitabine related compound A and capecitabine related compound B is not less than 1.0. Chromatograph the *Standard preparation;* and record the peak responses as directed for *Procedure:* the tailing factor of the capecitabine peak is not greater than 1.5; and the relative standard deviation for replicate injections of the capecitabine peak is not more than 2.0%. [NOTE—For the purpose of peak identification the approximate relative retention times are given in *Table 1.* The relative retention times are measured with respect to capecitabine.]

In-Process Revision

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the capecitabine peaks. Calculate the quantity, in percentage, of $C_{15}H_{22}FN_3O_6$ in the portion of Tablets taken by the formula:

$$100\ (C_S / C_U)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Capecitabine RS in the *Standard preparation;* C_U is the concentration of capecitabine in the *Assay preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP30*)

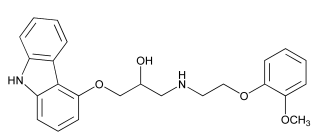
BRIEFING

Carvedilol. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on validated methods of analysis, is being proposed. The liquid chromatographic procedure in the test for *Related compounds* and in the *Assay* is based on analyses performed with the YMC Pro brand of L7 column. The typical retention time for the carvedilol peak is about 5 minutes.

(MD-CV: S. Ramakrishna) RTS—C44223

Add the following:

■Carvedilol



$C_{24}H_{26}N_2O_4$ 406.47

2-Propanol, 1-(9*H*-carbazol-4-yloxy)-3-[[2-(2-methoxyphenoxy)ethyl]amino]-, (±)-.

(±)-1-Carbazol-4-yloxy)-3-[[2-(*o*-methoxyphenoxy)ethyl]amino]-2-propanol [*72956-09-3*].

» Carvedilol contains not less than 99.0 percent and not more than 101.0 percent of $C_{24}H_{26}N_2O_4$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers, and store at 25°; excursions permitted between 15° and 30°.

USP Reference standards ⟨11⟩—*USP Carvedilol RS. USP Carvedilol Related Compound A RS. USP Carvedilol Related Compound B RS. USP Carvedilol Related Compound C RS. USP Carvedilol Related Compound D RS. USP Carvedilol Related Compound E RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Loss on drying ⟨731⟩**—**Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

Heavy metals, *Method II* ⟨231⟩**:** not more than 0.001%.

Residue on ignition ⟨281⟩**:** not more than 0.1%, using a 1-g specimen.

Related compounds—

Buffer and *Mobile phase*—Proceed as directed in the *Assay.*

System suitability solution—Dissolve accurately weighed quantities of USP Carvedilol RS and USP Carvedilol Related Compound C RS in *Mobile phase* to obtain a solution having known concentrations of about 0.05 mg per mL of each USP Reference Standard.

Standard solution—Dissolve accurately weighed quantities of each of USP Carvedilol RS, USP Carvedilol Related Compound A RS, USP Carvedilol Related Compound B RS, USP Carvedilol Related Compound C RS, USP Carvedilol

In-Process Revision

Related Compound D RS, and USP Carvedilol Related Compound E RS, in *Mobile phase,* to obtain a solution having known concentrations of about 0.001 mg per mL of each of USP Carvedilol RS and USP Carvedilol Related Compounds A, B, D, and E RS, and 0.2 µg per mL of USP Carvedilol Related Compound C RS.

Test solution—Prepare a solution of Carvedilol in *Mobile phase* having a concentration of about 1 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a dual wavelength detector (use 220 nm for quantitating carvedilol related compound E and 240 nm for carvedilol and all other related compounds) and a 4.6-mm × 15-cm column that contains 5-µm packing L7. The flow rate is about 1.0 mL per minute, and the run time is 60 minutes. The column temperature is maintained at 55°. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between carvedilol and carvedilol related compound C is not less than 17.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of carvedilol related compounds A, B, C, D, and E in Carvedilol taken by the formula:

$$100(C_S / C_U)(r_i / r_S)$$

in which C_S is the concentration, in mg per mL, of each of the known impurities in the *Standard solution;* C_U is the concentration, in mg per mL, of Carvedilol in the *Test solution;* r_i is the peak response of each impurity obtained from the *Test solution;* and r_S is the peak response of each impurity obtained from the *Standard solution*. To calculate the percentage of other impurities in the formula, use the concentration of USP Carvedilol RS for C_S.

Name	Relative Retention Time	Limit (%)
Carvedilol related compound A[1]	0.52	0.1
Carvedilol related compound B[2]	8.5	0.1
Carvedilol	1.0	—
Carvedilol related compound C[3]	—	0.02
Carvedilol related compound D[4]	5.0	0.1
Carvedilol related compound E[5]	0.35	0.1
Any other individual impurity	—	0.1

[1] 1-[[9-[2-hydroxy-3-[[2-(2-methoxyphenoxy)ethyl]amino]propyl]-9*H*-carbazol-4-yl]oxy]-3-[[2-(2-methoxyphenoxy)ethyl]amino]propan-2-ol.
[2] 1,1′-[[2-(2-methoxyphenoxy)ethyl]nitrilo]bis[3-(9*H*-carbazol-4-yloxy)propan-2-ol].
[3] (2*RS*)-1-[benzyl[2-(2-methoxyphenoxyethyl]amino]-3-(9*H*-cabazol-4-yloxy)propan-2-ol.
[4] 4-(2,3-Epoxypropoxy)carbazole.
[5] 2-(2-Methoxyphenoxy)ethylamine.

In addition to not exceeding the limits for impurities in *Table 1,* not more than 0.5% of total impurities is found. [NOTE—Disregard any impurity less than 0.01% calculated using the *Standard solution.*]

Assay—

Buffer—Dissolve 2.72 g of monobasic potassium phosphate, accurately weighed, in 1000 mL of water, and adjust with dilute phosphoric acid to a pH of 2.0.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer* and acetonitrile (69 : 31). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

In-Process Revision

System suitability solution—Dissolve accurately weighed quantities of USP Carvedilol RS and USP Carvedilol Related Compound A RS in *Mobile phase* to obtain a solution having known concentrations of about 0.05 mg per mL of each USP Reference Standard.

Standard preparation—Dissolve an accurately weighed quantity of USP Carvedilol RS in *Mobile phase* to obtain a solution having a known concentration of about 0.04 mg per mL.

Assay preparation—Transfer an accurately weighed quantity of about 20 mg of Carvedilol to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. In a standardized volumetric flask transfer 10 mL of this solution, and further dilute with *Mobile phase* to 50 mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L7. The flow rate is about 1.0 mL per minute, and the run time is about 60 minutes. The column temperature is maintained at 55°. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between carvedilol and carvedilol related compound A is not less than 4.0; the tailing factor for carvedilol is not more than 1.5; and the relative standard deviation is not more than 2%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate on the dried basis the quantity, in mg, of $C_{24}H_{26}N_2O_4$ in the portion of Carvedilol taken by the formula:

$$500C_S(r_S/r_U)$$

in which C_S is the concentration, in mg per mL, of USP Carvedilol RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■2S (*USP30*)

BRIEFING

Ciprofloxacin Injection, *USP 29* page 518 and page 326 of *PF* 32(2) [Mar.–Apr. 2006]. On the basis of supporting data and comments received, the bacterial endotoxin limit is revised according to the FDA guideline indicating that if the pediatric dose per kg is higher than the adult dose, then it shall be the dose used in the formula to calculate the endotoxin limit.

(MD-AA: B. Davani; MSA: R. Tirumalai) RTS—C44476

Assay—

~~*Mobile phase* and *Chromatographic system*—Proceed as directed in the *Assay* under *Ciprofloxacin*.~~

■*Mobile phase*—Prepare a filtered and degassed mixture of 0.025 M phosphoric acid, previously adjusted with triethylamine to a pH of 3.0 ± 0.1, and acetonitrile (87 : 13). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).■1S *(USP30)*

Standard preparation—Quantitatively dissolve an accurately weighed quantity of USP Ciprofloxacin Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about ~~0.3 mg~~

■0.5 mg■1S *(USP30)* per mL.

Resolution solution—~~Dissolve a quantity of USP Ciprofloxacin Ethylenediamine Analog RS in *Standard preparation* to obtain a solution having a concentration of about 0.25 mg per mL.~~

■Prepare a 0.025 mg per mL solution of USP Ciprofloxacin Ethylenediamine Analog RS in *Mobile phase.* Transfer 1.0 mL of this solution to a 10-mL volumetric flask, dilute with *Standard preparation* to volume, and mix.■1S *(USP30)*

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 25 mg of ciprofloxacin, to a ~~100-mL~~

■50-mL■1S *(USP30)* volumetric flask, dilute with *Mobile phase* to volume, and mix.

■*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 278-nm detector and a 4.6-mm × 25-cm column that contains packing L1 and is maintained at a temperature of 30 ± 1°. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the ciprofloxacin ethylenediamine analog peak and the ciprofloxacin peak is not less than 6. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency, determined from the ciprofloxacin peak, is not less than 2500 theoretical plates; the tailing factor for the ciprofloxacin peak is not more than 2.5; and the relative standard deviation for replicate injections is not more than 1.5%. [NOTE—For the purpose of identification, the relative retention times are about 0.7 for ciprofloxacin ethylenediamine analog and 1.0 for ciprofloxacin.]■1S *(USP30)*

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of ciprofloxacin in each mL of the Injection taken by the formula:

~~(331.34/367.81)(100*C*/*V*)(r_U/r_S)~~

■(331.34/367.81)(50*C*/*V*)(r_U/r_S)■1S *(USP30)*

in which 331.34 and 367.81 are the molecular weights of ciprofloxacin and anhydrous ciprofloxacin hydrochloride, respectively; *C* is the concentration, in mg per mL, of USP Ciprofloxacin Hydrochloride RS in the *Standard preparation,* calculated on the anhydrous basis; *V* is the volume, in mL, of Injection taken to prepare the *Assay preparation;* and r_U and r_S are the ciprofloxacin peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Citalopram Hydrobromide, page 3562 of the *First Supplement* and page 742 of *PF* 31(3) [May–June 2005]. On the basis of comments received, the following changes are proposed.

1. The total impurity limit in the test for *Related compounds* is raised from 0.2% to 0.5%.
2. A specific requirement in the *Labeling* section is added to reflect the flexibility in the monograph.
3. Five new Reference Standards have been added, to be used in *Test 2.* Of these, USP Citalopram Related Compound G RS is the chloro analog, and USP Citalopram Related Compound H RS is the bromo analog.
4. A note for clarification has been added at the beginning of the test for *Related compounds.*
5. In the tests for *Related compounds, Test 2* for impurities has been added. The test has been validated with the Waters Symmetry brand C18 column. Under the chromatographic conditions, the typical retention time of citalopram is about 13 minutes; that of the chloro analog is 29 minutes; and that of the bromo analog is 30 minutes.

(MD-PP: R. Ravichandran) RTS—C43102

Add the following:

■**Labeling—**If a test for *Related compounds* other than *Test 1* is used, then the labeling states with which *Related compounds* test the article complies.■2S *(USP30)*

In-Process Revision

Change to read:

USP Reference standards ⟨11⟩— ~~*USP Citalopram Hydrobromide RS. USP Citalopram Hydrobromide Related Compound D RS.*~~

■*USP Citalopram Hydrobromide RS. USP Citalopram Related Compound A RS. USP Citalopram Related Compound C RS. USP Citalopram Related Compound D RS. USP Citalopram Related Compound G RS. USP Citalopram Related Compound H RS.*■2S (*USP30*)

Add the following:

■**Related compounds—**

NOTE—On the basis of the synthetic route used, perform either *Test 1* or *Test 2*. However, if the chloro and bromo analogs are potential related compounds in the synthetic route used, *Test 2* is recommended.

TEST 1—

Buffer, Mobile phase, Diluent, and *Chromatographic system*—Proceed as directed in the *Assay.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay*.

Working standard solution—Dilute the *Standard solution* with *Mobile phase,* quantitatively and stepwise if necessary, to obtain a solution having a concentration of 0.625 µg per mL of citalopram hydrobromide.

System suitability solution—Dissolve an accurately weighed quantity of USP Citalopram Hydrobromide RS and USP Citalopram Related Compound D RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.001 mg per mL.

Sensitivity solution—Dilute 5.0 mL of the *Working standard solution* with *Diluent* to 50 mL to obtain a solution having 0.0625 µg of citalopram hydrobromide per mL.

Test solution—Use the *Assay preparation*.

Chromatographic system (see *Chromatography* ⟨621⟩)—Inject the *Diluent* as directed for *Procedure* to verify that there are no interfering peaks. Chromatograph the *Sensitivity solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio is at least 3. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between citalopram related compound D and citalopram is not less than 1.8; the tailing factor for the citalopram hydrobromide peak is not less than 0.8 and not more than 1.5; and the relative standard deviation for replicate injections, based on the citalopram peak, is not more than 5%.

NOTE—For the purpose of identification, the approximate relative retention times are 0.90 for citalopram related compound D and 1.0 for citalopram hydrobromide.

Procedure—Separately inject equal volumes (about 20 µL) of the *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms for about 40 minutes, and measure the responses for the major peaks. Calculate the percentage of related compounds in the portion of Citalopram Hydrobromide taken by the formula:

$$100(C_S / C_T)(r_i / r_S)(324.39/405.30)(1/F)$$

in which C_S and C_T are the concentrations, in mg per mL, of Citalopram Hydrobromide in the *Working standard solution* and the *Test solution,* respectively; r_i is the peak response for each impurity obtained from the *Test solution;* r_S is the peak response for the citalopram peak, obtained from the *Working standard solution;* 324.39 and 405.30 are the molecular weights for citalopram and citalopram hydrobromide, respectively; and F is the relative response factor for each impurity relative to citalopram (free base), as presented in *Table 1.*

TEST 2—

Buffer—Dissolve about 2.7 g of monobasic potassium phosphate in 1000 mL of water, add 1 mL of *N,N*-dimethyloctylamine, stir, and adjust with phosphoric acid to a pH of 3.0.

Diluent—Prepare a mixture of *Buffer* and acetonitrile (70 : 30).

Solution A—Prepare a mixture of *Buffer,* methanol, and tetrahydrofuran (70 : 24 : 6).

Table 1

Related Compound	Relative Retention Time	Relative Response Factor (*F*)	Limit (%)
1-(3-Dimethylaminopropyl)-1-(4′-fluorophenyl)-5-(4-dimethyl-aminobutyryl)-1,3-dihydrobenzofuran	0.13	0.34	NMT* 0.1
Citalopram related compound A	0.18	0.77	NMT 0.1
4-[4-Dimethylamino-1-(4′-fluorophenyl)-1-hydroxy-1-butyl]-3-hydroxymethyl benzonitrile	0.26	0.99	NMT 0.1
Citalopram related compound B	0.40	0.98	NMT 0.1
Citalopram related compound C	0.67	0.69	NMT 0.1
Citalopram related compound D	0.90	1.04	NMT 0.1
Citalopram hydrobromide	1.0	1.0	—
Citalopram related compound E	1.29	0.91	NMT 0.1
~~Unkown~~ Individual unknown impurity	—	1.0	NMT 0.1 each
~~Total known and unknown~~ Total impurities	—	—	~~NMT 0.2%~~ NMT 0.5%

* NMT = not more than.

Solution B—Prepare a mixture of acetonitrile and *Buffer* (80 : 20).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed in *Table 2* for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve accurately weighed quantities of USP Citalopram Hydrobromide RS, USP Citalopram Related Compound A RS, USP Citalopram Related Compound C RS, USP Citalopram Related Compound D RS, USP Citalopram Related Compound G RS, and USP Citalopram Related Compound H RS in *Diluent* to obtain a final solution having a concentration of 1.5 µg per mL of each compound.

Test solution—Dissolve an accurately weighed quantity of Citalopram Hydrobromide in a suitable volume of *Diluent* to obtain a solution having a final concentration of 1.5 mg per mL of citalopram hydrobromide.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 224-nm detector and a 4.6-mm × 25-cm column that contains 3-µm packing L1. The flow rate is about 0.8 mL per minute. The column temperature is maintained at 40°. The chromatograph is programmed as shown in *Table 2.*

Table 2

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–18	100	0	isocratic
18–40	100→10	0→90	linear gradient
40–45	10	90	isocratic
45–46	10→100	90→10	linear gradient
46–55	100	0	re-equilibration

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between citalopram and citalopram related compound D is not less than 2.0, and that between citalopram related

In-Process Revision

compound G and citalopram related compound H is not less than 4.0; and the relative standard deviation for the citalopram peak in replicate injections is not more than 2.0%.

NOTE—For the purpose of identification, the approximate relative retention times of citalopram related compounds are provided in *Table 3*.

Procedure—Inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all the peak responses. Calculate the percentage of each citalopram related compound in the portion of Citalopram Hydrobromide taken by the formula:

$$100(C_S / C_T)(r_i / r_S)(324.39/405.30)$$

in which C_S is the concentration, in mg per mL, of each citalopram related compound in the *Standard solution;* C_T is the concentration of citalopram hydrobromide in the *Test solution;* r_i is the peak area of each impurity obtained from the *Test solution;* r_S is the peak area of each corresponding impurity obtained from the *Standard solution;* and 324.39 and 405.30 are the molecular weights of citalopram free base and citalopram hydrobromide, respectively.

Table 3

Related Compound	Relative Retention Time	Limit (%)
Citalopram related compound A	0.40	NMT* 0.10
Citalopram related compound C	0.88	NMT 0.10
Citalopram	1.0	—
Citalopram related compound D	1.09	NMT 0.10
Citalopram related compound G	2.20	NMT 0.10
Citalopram related compound H	2.30	NMT 0.10
Individual unspecified impurity	—	NMT 0.10
Total specified and unspecified impurities	—	NMT 0.50

*NMT = not more than.

■2S (*USP30*)

BRIEFING

Dantrolene Sodium Capsules. Because there is no existing *USP* monograph for this dosage form, a new monograph, based on validation data received, is being proposed. The proposed liquid chromatographic procedures in the test for *Related compounds* and the *Assay* are based on analyses performed with the Waters Symmetry C18 brand of L1 packing. The typical retention time for dantrolene related compound B is about 2.3 minutes, and that for dantrolene is about 3.3 minutes.

(MD-PP: R. Ravichandran; BPC: M. Marques) RTS—C42655

Add the following:

■Dantrolene Sodium Capsules

» Dantrolene Sodium Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dantrolene sodium ($C_{14}H_9N_4NaO_5 \cdot 3½H_2O$).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards ⟨11⟩—*USP Dantrolene RS. USP Dantrolene Related Compound B RS. USP Dantrolene Sodium RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: 0.5% methylbenzethonium chloride in water, pH 6.8; 900 mL, deaerated.

Apparatus 1: 100 rpm.

Time: 40 minutes.

Determine the amount of $C_{14}H_9N_4NaO_5 \cdot 3½H_2O$ dissolved by employing the following method.

Standard solution 1 (for capsules labeled to contain 100 mg)—Accurately weigh 25 mg of USP Dantrolene RS into a 250-mL volumetric flask. Dissolve in 5.0 mL of dimethylformamide. Add 200 mL of *Medium* and 10.0 mL of 0.1 N potassium hydroxide. Mix, dilute with *Medium* to volume, and mix. Pass through a 0.45-µm polytetrafluoroethylene (PTFE) filter, previously wetted with a few drops of isopropyl alcohol, discarding the first 5 mL.

Standard solution 2 (for capsules labeled to contain 50 mg)—Transfer 25.0 mL of *Standard solution 1* to a 50-mL volumetric flask containing 0.5 mL of 0.1 N potassium hydroxide. Dilute with *Medium* to volume, and mix. Pass through a 0.45-µm PTFE filter, previously wetted with a few drops of isopropyl alcohol, discarding the first 5 mL.

Standard solution 3 (for capsules labeled to contain 25 mg)—Transfer 25.0 mL of *Standard solution 1* to a 100-mL volumetric flask containing 1.0 mL of 0.1 N potassium hydroxide. Dilute with *Medium* to volume, and mix. Pass through a 0.45-µm PTFE filter, previously wetted with a few drops of isopropyl alcohol, discarding the first 5 mL.

Test solution—Withdraw 10 mL of the solution under test. Pass through a 0.45-µm PTFE filter, previously wetted with a few drops of isopropyl alcohol. Discard the first 5 mL. Collect the filtered solution in a tube that contains 1 drop of 1 N potassium hydroxide, and mix.

System suitability—[NOTE—All absorbance values should be obtained on solutions within 2 hours of their preparation.] Using a 0.1-cm cell, measure the absorbance of *Medium,* using water as the blank, and measure the absorbance of each of the three *Standard solutions* using *Medium* as the blank, at the wavelength of maximum absorbance at about 395 nm. The system is considered suitable for use if the following criteria are met: the absorbance of *Medium* is less than 10% of the absorbance of *Standard solution 1;* the absorbance of *Standard solution 2* is between 0.3 and 0.5; and the ratio of the absorbance of *Standard solution 1* to that of *Standard solution 3* is 4.00 ± 0.10.

Determine the amount of $C_{14}H_9N_4NaO_5 \cdot 3½H_2O$ dissolved by measuring the absorbance of the *Test solution* at the wavelength of maximum absorbance at about 395 nm in comparison with the appropriate *Standard solution,* using an 0.1-cm cell and *Medium* as the blank. All absorbance values are obtained on solutions within 2 hours of their preparation. Calculate the percentage of $C_{14}H_9N_4NaO_5 \cdot 3½H_2O$ dissolved by the formula:

$$\frac{A_U \times C_S \times 900 \times 100}{A_S \times 0.79186 \times LC}$$

in which A_U and A_S are the absorbances obtained from the *Test solution* and the *Standard solution*, respectively; C_S is the concentration, in mg per mL, of dantrolene in the *Standard solution;* 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; 0.79186 is the correction for water of hydration and sodium contained in the dantrolene sodium monohydrate form of the drug, assuming that the bulk drug contains 15% of water and 6.84% of sodium; and *LC* is the capsule label claim, in mg.

In-Process Revision

Tolerances—Not less than 75% (*Q*) of the labeled amount of $C_{14}H_9N_4NaO_5 \cdot 3½H_2O$ is dissolved in 40 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Related compounds—

Diluent, Solution A, Solution B, Mobile phase, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Transfer 5 mg, accurately weighed, of USP Dantrolene Related Compound B RS into a 50-mL volumetric flask, and dissolve in 2.5 mL of dimethylformamide. Add 2.5 mL of glacial acetic acid, and dilute with acetone to volume. The final concentration is about 0.1 mg per mL. Quantitatively dilute this solution with *Diluent* to obtain a solution having a known concentration of about 0.0005 mg per mL of dantrolene related compound B.

Test solution—Use the *Assay preparation.*

Procedure—Inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of dantrolene related compound B in the portion of Capsules taken by the formula:

$$100(r_U / r_S)(C_S / C_T)$$

in which r_U is the individual peak response for dantrolene related compound B obtained from the *Test solution;* r_S is the response of the corresponding peak in the *Standard solution;* C_S is the concentration, in mg per mL, of dantrolene related compound B in the *Standard solution;* and C_T is the concentration, in mg per mL, of dantrolene sodium in the *Test solution:* not more than 2% of dantrolene related compound B is found.

Assay—

Diluent—Prepare a solution of acetonitrile and water (70 : 30).

Buffer solution—Dissolve 3.3 g of ammonium acetate in 1 L of water.

Solution A—Prepare a filtered and degassed mixture of *Buffer solution,* acetonitrile, and glacial acetic acid (120 : 76 : 7).

Solution B—Prepare a filtered and degassed mixture of acetonitrile and water (70 : 30).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B,* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Use the *Standard solution,* prepared as directed in the test for *Related compounds.*

Standard preparation—Transfer 40 mg, accurately weighed, of USP Dantrolene RS to a 50-mL volumetric flask, and dissolve in 2.5 mL of dimethylformamide. Add 2.5 mL of glacial acetic acid, and dilute with acetone to volume. The final concentration is about 0.8 mg per mL. Quantitatively dilute this solution with *Diluent* to obtain a solution having a known concentration of about 0.08 mg per mL of dantrolene.

Assay preparation—Mix the combined contents of not fewer than 20 Capsules, and transfer an accurately weighed portion, equivalent to the average weight of one Capsule, to a 50-mL volumetric flask. Add 10 mL of dimethylformamide, and sonicate for 15 minutes to dissolve. Add 5 mL of glacial acetic acid, and dilute with acetone to volume. Quantitatively dilute this solution with *Diluent* to obtain a solution having 0.1 mg per mL of dantrolene sodium, and pass through a 0.45-µm nylon filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 365-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–8	100	0	isocratic
8–8.1	100→0	0→100	linear gradient
8.1–13	0	100	isocratic

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
13–13.1	0→100	100→0	linear gradient
13.1–20	100	0	re-equilibration

Separately inject the *System suitability solution* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections for dantrolene is not more than 1.0%. [NOTE—For the purpose of peak identification, the approximate relative retention times are 0.68 for dantrolene related compound B and 1.0 for dantrolene.]

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the dantrolene peaks. Calculate the percentage of dantrolene sodium ($C_{14}H_9N_4NaO_5 \cdot 3½H_2O$) in the portion of Capsules taken by the formula:

$$100(399.29/314.25)(r_U / r_S)(C_S / C_U)$$

in which 399.29 is the molecular weight of dantrolene sodium; 314.25 is the molecular weight of dantrolene; r_U and r_S are the peak responses for dantrolene obtained from the *Assay preparation* and the *Standard preparation,* respectively; C_S is the concentration, in mg per mL, of dantrolene in the *Standard preparation;* and C_U is the concentration, in mg per mL, of dantrolene sodium ($C_{14}H_9N_4NaO_5 \cdot 3½H_2O$) in the *Assay preparation.* ■2S (*USP30*)

BRIEFING

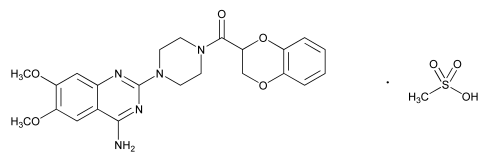
Doxazosin Mesylate, page 1470 of *PF* 29(5) [Sept.–Oct. 2003]. On the basis of comments received, it is proposed to revise the following test methods:

- *Loss on drying:* The limit in the test for *Loss on drying* is changed from 1% to 2%, which is in agreement with the FDA requirements.
- The test for *Chromatographic purity* is changed to a test for *Related compounds.*
- *Related compounds* and *Assay:* The revisions in the test for *Related compounds* and in the *Assay* are intended to provide a very sensitive detection of all impurities. The proposed changes are based on validated procedures and in agreement with the FDA requirements. The test for *Related compounds* and the *Assay* employ a reverse-phase HPLC method, using a LiChrospher 60 RP Select B 5-µm column. The typical retention time for doxazosin mesylate is about 24 minutes.

(MD-CV: S. Ramakrishna) RTS—C41770

Add the following:

■Doxazosin Mesylate



$C_{23}H_{25}N_5O_5 \cdot CH_4O_3S$ ~~547.59~~ 547.58

Piperazine, 1-(4-amino-6,7-dimethoxy-2-quinazolinyl)-4-[(2,3-dihydro-1,4-benzodioxin-2-yl)carbonyl]-, monomethanesulfonate.

1-(4-Amino-6,7-dimethoxy-2-quinazolinyl)-4-(1,4-benzodioxan-2-ylcarbonyl)piperazine monomethanesulfonate [*77883-43-3*].

» Doxazosin Mesylate contains not less than 98.0 percent and not more than 102.0 percent of $C_{23}H_{25}N_5O_5 \cdot CH_4O_3S$, calculated on the ~~anhydrous~~ dried basis.

In-Process Revision

Packaging and storage—Preserve in well-closed containers, and store below 30°.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the percentage of each impurity in the portion of Doxazosin Mesylate taken by the formula:

~~$0.1F(C_S/C_T)(r_i/r_S)$,~~

~~$(100F(C_S/C_T)(r_i/r_S)$~~

$$100(C_S/C_T)(r_i/r_S)$$

in which ~~the response factor, *F,* is 0.6 for terazosin related compound A and 0.55 for terazosin related compound C;~~ C_S is the concentration, in mg per mL, of ~~USP Doxazosin Mesylate~~ each Reference Standard in the *Standard solution;* C_T is the concentration, in mg per mL, of doxazosin mesylate in the *Test solution;* r_i is the peak response for each individual impurity~~, excluding solvent peaks,~~ obtained from the *Test solution;* and r_S is the peak response for each individual impurity obtained from the *Standard solution:* not more than 0.3% of terazosin related compound A is found; not more than ~~0.1%~~ 0.25% of any other identified individual impurity is found; not more than 0.10% of any other unidentified impurity is found; and not more than 1.0% of total impurities is found. Calculate the percentages of doxazosin related compound G and doxazosin related compound H in the portion of Doxazosin Mesylate taken by the formula:

$$(100/F)(C_S/C_T)(r_i/r_S)$$

in which the response factor, *F,* is 0.735 for doxazosin related compound G and 0.769 for doxazosin related compound H; C_S is the concentration, in mg per mL, of USP Doxazosin RS in the *Standard solution;* C_T is the concentration, in mg per mL, of doxazosin mesylate in the *Test solution;* r_i is the peak response of doxazosin related compound G or doxazosin

In-Process Revision

related compound H in the *Test solution;* and r_S is the peak response of USP Doxazosin Mesylate RS in the *Standard solution.*

Assay—

~~*Buffer solution*—Prepare a 0.05 M solution of monobasic potassium phosphate by disolving 0.68 g of monobasic potassium phosphate in 100 mL of water. Adjust with phosphoric acid to a pH of 3.0 ± 0.1.~~

~~*Mobile phase*—Prepare a filtered and degassed mixture of *Buffer solution*, methanol, and acetonitrile (6 : 4 : 1.5). Make adjustments if necessary (see *System suitability* under *Chromatography* ⟨621⟩).~~

~~*Standard preparation*—Dissolve an accurately weighed quantity of USP Doxazosin Mesylate RS in methanol to obtain a solution having a known concentration of about 0.30 mg per mL. Quantitatively dilute a volume of this solution with *Mobile phase* to obtain a solution having a known concentration of about 15.0 µg of USP Doxazosin Mesylate RS per mL.~~

~~*Assay preparation*—Transfer about 75 mg of Doxazosin Mesylate, accurately weighed, to a 250 mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Quantitatively dilute a known volume of this solution with *Mobile phase* to obtain a solution having a concentration of about 15.0 µg per mL.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 246-nm detector and a 3.9 mm × 15.0 cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the capacity factor, k′, is not less than 4.5; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.~~

~~*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{32}H_{35}N_5O_8 \cdot CH_4SO_4$ in the portion of Doxazosin Mesylate taken by the formula:~~

~~$$5C(r_U/r_S),$$~~

~~in which C is the concentration, in µg per mL, of USP Doxazosin Mesylate RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.~~

~~*Buffer solution*—Transfer 3.4 g of monobasic potassium phosphate into a 1 liter flask, and add 800 mL of water and 4.0 mL of triethylamine to dissolve. Adjust with phosphoric acid to a pH of 4.5, and dilute with water to volume.~~

Solvent A—Dissolve 5 g of phosphoric acid (84%–86%) in 100 mL of water.

Solvent B—Use acetonitrile.

Solvent C—Use water.

Solvent D—Prepare a mixture of 100 mL of *Solvent B* and 2 g of phosphoric acid (84%–86%).

Mobile phase—~~Prepare a filtered and degassed mixture of methanol and *Buffer solution* (11 : 9).~~ Use variable mixtures of degassed *Solvent A, Solvent B,* and *Solvent C,* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve accurately weighed quantities of USP Doxazosin Related Compound A RS and USP Doxazosin Related Compound B RS in approximately 2.5 mL of *Solvent D.* Further dilute this solution quantitatively, and stepwise if necessary, with *Solvent C* and *Solvent D* to obtain a final solution having a known concentration of 12 µg per mL of each of the related compounds. The final ratio of *Solvent C* and *Solvent D* is maintained at 9 : 1. Sonicate briefly to dissolve completely.

~~*Diluent:*—Dissolve 2.7 mL of phosphoric acid in 2 liters of water. Adjust with 1 M sodium hydroxide to a pH of 2.5, and mix. a mixture of methanol and 0.1 N hydrochloric acid (9 : 1).~~

Standard preparation—Dissolve an accurately weighed quantity of USP Doxazosin Mesylate RS ~~in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a final concentration of about 49 µg per mL.~~ in approximately 2 mL of *Solvent D,* and dilute with *Solvent C* and *Solvent D* to obtain a solution having a known concentration of 0.6 mg per mL. The final ratio of *Solvent C* and *Solvent D* is maintained at 9 : 1. Sonicate briefly to dissolve completely.

Assay preparation— ~~Transfer about 98 mg of Doxazosin Mesylate to a 200-mL volumetric flask, dissolve in and dilute with *Diluent* to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.~~ Dissolve an accurately weighed quantity of Doxazosin Mesylate in approximately 2 mL of *Solvent D,* and dilute with *Solvent C* and *Solvent D* to obtain a solution having a concentration of 0.6 mg per mL, based on the labeled quantity of doxazosin mesylate. The final ratio of *Solvent C* and *Solvent D* is maintained at 9 : 1. Sonicate briefly to dissolve completely.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a ~~245~~ 210-nm detector and a 4-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about ~~1~~ 0.8 mL per minute, and the column temperature is maintained at ~~40°~~ 35°. The chromatograph is programmed as follows.

Time (min)	*Solvent A* (%)	*Solvent B* (%)	*Solvent C* (%)	Elution
0–10	20	10→22	70→58	linear gradient
10–35	20	22→50	58→30	linear gradient
35–40	20	50	30	equilibration

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* ~~the capacity factor, *k'*, for doxazosin is not less than 2.0; the column efficiency is not less than 1000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.~~ the resolution, *R,* between doxazosin related compound A and doxazosin related compound B is not less than 4.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the doxazosin mesylate peaks. Calculate the ~~quantity, in mg,~~ percentage of $C_{23}H_{25}N_5O_5 \cdot CH_4O_3S$ in the portion of Doxazosin Mesylate taken by the formula:

$$~~2C(r_U/r_S)~~$$

~~in which *C* is the concentration, in µg per mL, of USP Doxazosin Mesylate RS in the *Standard preparation;* and R_U and r_S are the peak responses obtained from the *Assay preparation* and *Standard preparation,* respectively.~~

$$100C_S/C_T(r_U/r_S)$$

in which C_S is the concentration, in mg per mL, of USP Doxazosin Mesylate RS in the *Standard preparation;* C_T is the concentration, in mg per mL, of USP Doxazosin Mesylate in the *Assay preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■2S *(USP30)*

BRIEFING

Edetate Disodium, *USP 29* page 779; **Edetate Disodium Injection,** *USP 29* page 780. To address frequent inquiries, it is proposed to clarify the calculations in the *Assay.*

(MD-GRE: E. Gonikberg) RTS—C45005

Change to read:

Assay—

Assay preparation—Dissolve about 5 g of Edetate Disodium, accurately weighed, in about 100 mL of water contained in a 250-mL volumetric flask, add water to volume, and mix.

In-Process Revision

Procedure—Place about 200 mg of chelometric standard calcium carbonate, previously dried at 110° for 2 hours, cooled in a desiccator, and accurately weighed, in a 400-mL beaker, add 10 mL of water, and swirl to form a slurry. Cover the beaker with a watch glass, and without removing the latter, add 2 mL of 3 N hydrochloric acid from a pipet. Swirl the contents of the beaker, and dissolve the calcium carbonate. Wash down the sides of the beaker, the outer surface of the pipet, and the watch glass with water, and dilute with water to about 100 mL. While stirring the solution, preferably with a magnetic stirrer, add about 30 mL of the *Assay preparation* from a 50-mL buret. Add 15 mL of 1 N sodium hydroxide and 0.30 g of hydroxy naphthol blue, and continue the titration with the *Assay preparation* to a blue endpoint. Calculate the weight, in mg, of $C_{10}H_{14}N_2Na_2O_8$ in the portion of Edetate Disodium taken by the formula:

~~$839.8(W/V)$,~~

■$(336.21/100.09)W(V_T/V)$■2S (*USP30*)

in which

■336.21 and 100.09 are the molecular weights of edetate disodium and calcium carbonate, respectively;■2S (*USP30*)
W is the weight, in mg, of calcium carbonate;

■V_T is the volume, in mL, of the *Assay preparation;*■2S (*USP30*)
and V is the volume, in mL, of the *Assay preparation* consumed in the titration.

BRIEFING

Edetate Disodium Injection, *USP 29* page 780—See briefing under *Edetate Disodium.*

(MD-GRE: E. Gonikberg) RTS—C45005

Change to read:

Assay—

Assay preparation—Dilute an accurately measured volume of Injection, equivalent to about 2 g of edetate disodium, with water to volume in a 100-mL volumetric flask, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Edetate Disodium*. ~~but use the formula:~~

~~$335.9(W/V)$,~~

~~in calculating the weight of $C_{10}H_{14}N_2Na_2O_8$.~~

■Calculate the weight, in mg, of $C_{10}H_{14}N_2Na_2O_8$ in the volume of Injection taken by the formula:

$(336.21/100.09)W(V_T/V)$

in which 336.21 and 100.09 are the molecular weights of edetate disodium and calcium carbonate, respectively; W is the weight, in mg, of calcium carbonate; V_T is the volume, in mL, of the *Assay preparation*; and V is the volume, in mL, of the *Assay preparation* consumed in the titration.■2S (*USP30*)

BRIEFING

Estradiol Vaginal Tablets, page 1617 of *PF* 31(6) [Nov.–Dec. 2005]. It is proposed to make the following revisions: (1) change the official title of this monograph to Estradiol Vaginal Inserts. The term "Inserts" was adopted by the Expert Committee on Nomenclature for vaginal preparations that are produced in the form of tablets or soft gel capsules. References to "Tablets" have been changed to "Inserts" throughout the monograph; (2) revise the *Thin-Layer Chromatographic Identification Test* to indicate that a high-performance thin-layer chromatographic plate is used; (3) revise the test for *Microbial limits* to provide limits that are consistent with the proposed harmonized General Chapter *Microbial Quality of Nonsterile Pharmaceutical Products* ⟨1111⟩; (4) and in the *Assay* change the concentration of the *Standard preparation* to match that of the *Assay preparation* and correct the formula.

(MD-PS: D. Bempong; MSA: R. Tirumalai) RTS—C44840; C44967

Add the following:

■Estradiol Vaginal ~~Tablets~~ Inserts

» Estradiol Vaginal ~~Tablets~~ Inserts contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of estradiol ($C_{18}H_{24}O_2$).

Packaging and storage—Each ~~Tablet~~ Insert is contained in a single-unit HG-polyethylene/polyethylene applicator. Each applicator with the inset ~~tablet~~ is packed separately in a laminated blister consisting of aluminum and polyvinylchloride foil. Preserve in a tight container, and store at controlled room temperature.

In-Process Revision

USP Reference standards ⟨11⟩—*USP Estradiol RS. USP Estradiol Related Compound A RS. USP Estradiol Related Compound B RS. USP Estrone RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Adsorbent—Use a suitable high-performance thin-layer chromatographic plate.

Test solution—Place 30 ~~Tablets~~ Inserts into a vessel, add 500 mL of water, and allow to disintegrate by shaking overnight. Add 50.0 mL of ether, and shake for 2 minutes. Pass the ether layer through cotton wool and anhydrous sodium phosphate, shake with three 50-mL aliquots of ether, and evaporate to dryness. Dissolve the residue in 5 mL of ether, and quantitatively transfer to a fresh vessel. Evaporate to dryness, and reconstitute with 150 µL of absolute alcohol.

Standard solution—Dissolve suitable quantities of USP Estradiol RS, USP Estradiol Related Compound A RS, and USP Estrone RS, accurately weighed, in absolute alcohol to obtain a solution having known concentrations of 5 mg per mL, 0.25 mg per mL, and 0.25 mg per mL, respectively.

Application volume: 5 µL.

Developing solvent system: a mixture of chloroform and acetone (9 : 1).

Procedure—Proceed as directed in the chapter using the *Developing solvent system* described above. Develop the chromatogram three times over a path of about 8 cm, allowing the chromatogram to dry for 1 minute between each run. After the third run, allow the plate to air-dry. After removal of the plate, marking of the solvent front, and allowing solvent evaporation as described in the chapter, heat at 100° for about 15 minutes. Allow the plate to cool, and then immerse it in a mixture of absolute alcohol and concentrated sulfuric acid (95 : 5). Remove it immediately, place the plate on absorbing paper, and allow it to air-dry. Heat the plate at 100° until it is developed. Examine under UV light at λ = 365 nm. The principal spot obtained from the *Test solution* and the *Standard solution* has the same color and R_F value.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Microbial limits ⟨61⟩—The total aerobic microbial count does not exceed ~~1000 cfu per g~~ 100 cfu per g, and the total combined molds and yeasts count does not exceed ~~100 cfu per g. Tablets~~ 10 cfu per g. Inserts meet the requirements of the tests for absence of ~~*Salmonella* species and *Escherichia coli.*~~ *Pseudomonas aeruginosa, Staphylococcus aureus,* and *Candida albicans*.

Dissolution ⟨711⟩—[To come.]

Loss on drying ⟨731⟩—Dry about 1200 mg of finely powdered ~~Tablets~~ Inserts in a tared evaporating dish at a pressure not exceeding 25 mm of mercury at 60° for 3 hours: it loses not more than 7.0% of its weight.

Chromatographic purity—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (5 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve accurately weighed quantities of USP Estradiol RS and USP Estradiol Related Compound B RS to obtain a solution having a known concentration of about 100 µg per mL and about 0.525 µg per mL, respectively.

Test solution—Place 12 ~~Tablets~~ Inserts, equivalent to about 300 µg of estradiol, into a 50-mL volumetric flask. Add 50 mL of absolute alcohol, stir for 16 hours with a magnetic stirrer, and shake thoroughly. Centrifuge the suspension, and evaporate 10.0 mL of the supernatant to dryness. Dissolve the residue in 1.0 mL of water and 7.0 mL of a mixture of toluene and acetone (5 : 2), mix on a whirl mixer, allow to stand for 1 hour, and evaporate 5 mL of the organic phase to dryness.

The residue is reconstituted in 450 µL of absolute alcohol, to obtain a solution containing about 0.08 µg of estradiol per mL, and centrifuged. Use the supernatant as the *Test solution.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.96 for estradiol related compound B and 1.0 for estradiol; and the resolution, *R,* between estradiol related compound B and estradiol is not less than 2.0.

Procedure—Inject a volume (about 25 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure all the peak responses. Calculate the percentage of each estradiol related impurity in the portion of ~~Tablets~~ Inserts taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each impurity, and r_s is the sum of the responses of all the peaks: not more than 1.0% of any individual impurity is found; and not more than 3.0% of total impurities is found. The impurities meet the requirements specified in the table below.

Compound	Relative Retention Time	Relative Response Factor	Limit (%)
6α-Hydroxy estradiol	0.54	1.0	1.0
6β-Hydroxy estradiol	0.60	1.0	1.0
6-Keto estradiol	0.71	1.0	1.0
16-Keto estradiol	0.74	1.0	1.0
6-Keto estrone	0.85	1.0	1.0
β-Equilenol	0.91	1.0	1.0
Estradiol related compound B (6-Dehydroestradiol)	0.96	1.0	1.0
Estradiol	1.0	1.0	—
Estradiol related compound A (α-Estradiol)	1.05	1.0	1.0
Estrone	1.13	1.0	1.0
4-Methyl estradiol	1.17	1.0	1.0
Total impurities	—	—	1.0

Assay—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (5 : 1).

Solvent solution—Prepare a mixture of water and absolute alcohol (1 : 1).

Estrone standard stock solution—Prepare a solution of USP Estrone RS in absolute alcohol having a known concentration of 0.4 mg per mL.

Estradiol standard stock solution—Prepare a solution of USP Estradiol RS in absolute alcohol having a known concentration of 0.5 mg per mL.

System suitability preparation—Transfer 400 µL of *Estradiol standard stock solution* and 200 µL of *Estrone standard stock solution* to a 100-mL volumetric flask, and dilute with *Solvent solution* to volume.

Standard ~~solution~~ preparation—Pipet 500 µL of *Estradiol standard stock solution* into a 250-mL flask, and dilute with *Solvent solution* to volume to obtain a solution having a known concentration of about ~~1.0 µg per mL.~~ 2.5 µg per mL.

Assay preparation—Add 10 ~~Tablets~~ Inserts into a measured amount of *Solvent solution* to obtain a solution having an estradiol concentration of about 2.5 µg per mL. Stir the mixture overnight with a magnetic stirrer, shake thoroughly, and centrifuge if necessary.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 205-nm detector and a 3.9-mm × 30-cm column that contains 4-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph

In-Process Revision

the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between estradiol and estrone is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of estradiol ($C_{18}H_{24}O_2$) in the portion of ~~Tablets~~ Inserts taken by the formula:

~~$100(C/)(r_U/r_S)$~~

$$DC(r_U/r_S)$$

in which D is the dilution factor used in the preparation of the *Assay preparation, C* is the concentration, in mg per mL, of USP Estradiol RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and *Standard preparation,* respectively.■2S (*USP30*)

BRIEFING

Conjugated Estrogens Tablets, *USP 29* page 851. It is proposed to add a *Dissolution Test 4* for a product labeled to contain 1.25 mg; a *Dissolution Test 5* for some products labeled to contain 0.3 mg, 0.45 mg, and 0.625 mg; and a *Dissolution Test 6* for a product labeled to contain 0.9 mg. The chromatographic procedures in all these tests were validated using a Bio-Sil ODS brand of column containing packing L1. In the absence of any adverse comments, it is proposed to implement this revision via the *Sixth Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of December 1, 2006.

(BPC: M. Marques) RTS—C43053; C43963

Change to read:

Dissolution ⟨711⟩—Proceed as directed for *Extended-Release Articles.*

TEST 1 (for products labeled as 0.3-, 0.45-, and 0.625-mg tablets)—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1.*

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

•*Times:* 2, 5, and 8 hours.•6

Mobile phase—Prepare a filtered and degassed mixture of 0.025 M monobasic potassium phosphate and acetonitrile (3 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Transfer 10 Tablets to a 1000-mL volumetric flask, dilute with water to volume, and stir vigorously by mechanical means for at least 3 hours. Pipet a filtered 100-mL aliquot of the solution into a 900-mL volumetric flask, and dilute with water to volume.

Test solution—Filter a portion of the solution under test. [NOTE—It is recommended that the filters selected be tested for binding affinity.]

Chromatographic system—The liquid chromatograph is equipped with a 205-nm detector and a 4.6-mm × 3.0-cm column that contains 3-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph replicate injections of the *Standard solution,* and record the responses as directed for *Procedure:* the relative retention times are about 0.9 for equilin sulfate and 1.0 for estrone sulfate, the estrone sulfate peak being the last major peak in the chromatogram; the resolution, *R,* between equilin sulfate and estrone sulfate is not less than 1.5; and the relative standard deviation for the estrone sulfate peak is not more than 1.5%. [NOTE—If estrone is present it may be retained on the column for a period longer than 50 minutes and interfere in later chromatographic runs.]

Procedure—Separately inject equal volumes (between 20 and 200 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the estrone sulfate peaks. Calculate the percentage of estrone sodium sulfate released by the formula:

$$100(r_U/r_S)$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively.

Times and *Tolerances*—The percentages of estrone sodium sulfate dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
2	between 19% and 49%
5	between 66% and 96%
8	not less than 80%

TEST 2 (for products labeled as 0.9-mg tablets)—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

Medium, Apparatus,

•*Times,*•6

Mobile phase, Standard solution, Test solution, Chromatographic system, and *Procedure*—Proceed as directed for *Test 1.*

Times and *Tolerances*—The percentages of estrone sodium sulfate dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
2	between 12% and 37%
5	between 57% and 85%
8	not less than 80%

In-Process Revision

TEST 3 (for products labeled as 1.25- and 2.50-mg tablets)—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3.*

Medium, Apparatus, Mobile phase, Standard solution, Test solution, Chromatographic system, and *Procedure*—Proceed as directed for *Test 1.*

•*Times:* 2, 5, 8, and 12 hours.•[6]

Times and *Tolerances*—The percentages of estrone sodium sulfate dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
2	between 3% and 22%
5	between 37% and 67%
8	between 66% and 96%
12	not less than 80%

(Official April 1, 2006)

•TEST 4 (for products labeled as 1.25-mg tablets)—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

Medium: acetate buffer, pH 4.5; 900 mL.

Apparatus 2: 50 rpm, with sinkers.

Times: 2, 4, 8, and 12 hours.

Mobile phase—Prepare a filtered and degassed mixture of 0.025 M monobasic potassium phosphate and acetonitrile (78 : 22). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Accurately weigh 20 Tablets and determine the average tablet weight. Grind the Tablets to a uniform fine powder. Accurately weigh a portion of the powdered Tablets equivalent to the average tablet weight, transfer to a 900-mL volumetric flask, and dilute with *Medium* to volume. Stir vigorously by mechanical means for at least 2 hours or until the dissolution of the powder is complete. Pass a portion of the extract through a suitable 10-µm filter.

Test solution—Pass a portion of the solution under test through a suitable 10-µm filter. [NOTE—It is recommended that the filters selected be tested for binding affinity.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 3.2-mm × 5.0-cm column that contains 5-µm packing L1. The flow rate is about 0.8 mL per minute. Chromatograph replicate injections of the *Standard solution,* and record the responses as directed for *Procedure:* the relative retention times are about 0.9 for equilin sulfate and 1.0 for estrone sulfate, the estrone sulfate peak being the last major peak in the chromatogram; the resolution, *R,* between equilin sulfate and estrone sulfate is not less than 1.2; and the relative standard deviation for the estrone sulfate peak is not more than 2.0%. [NOTE—If estrone is present, it may be retained on the column for a period longer than 50 minutes and interfere in later chromatographic runs.]

Procedure—Separately inject equal volumes (between 20 and 200 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the estrone sulfate peaks. Calculate the percentage of estrone sulfate released by the formula:

$$100\left(\frac{r_U}{r_S}\right)$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively.

Times and *Tolerances*—The percentages of estrone sodium sulfate dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
2	between 11% and 31%
4	between 43% and 63%
8	between 75% and 95%
12	not less than 87%

TEST 5 (for products labeled as 0.3-, 0.45-, and 0.625-mg tablets)—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5*.

Medium, Apparatus, Mobile phase, Standard solution, Test solution, Chromatographic system, and *Procedure*—Proceed as directed for *Test 4*.

Times: 1, 3, and 8 hours.

Times and *Tolerances*—The percentages of estrone sodium sulfate dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 6% and 26%
3	between 48% and 68%
8	not less than 87%

TEST 6 (for products labeled as 0.9-mg tablets)—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 6*.

Medium, Apparatus, Mobile phase, Standard solution, Test solution, Chromatographic system, and *Procedure*—Proceed as directed for *Test 4*.

Times: 1, 3, and 8 hours.

Times and *Tolerances*—The percentages of estrone sodium sulfate dissolved at the times specified conform to *Acceptance Table 2*. •6

Time (hours)	Amount dissolved
1	between 3% and 23%
3	between 41% and 61%
8	not less than 80%

BRIEFING

Glipizide and Metformin Hydrochloride Tablets, page 1631 of *PF* 31(6) [Nov.–Dec. 2005]. It is proposed to add a *Dissolution* test to this monograph. The chromatographic procedure in this test was developed using the Symmetry C18 brand of column containing packing L1. Using this column the retention time for glipizide is about 6.3 minutes.

(BPC: M. Marques) RTS—C42796

Add the following:

■Glipizide and Metformin Hydrochloride Tablets

» Glipizide and Metformin Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of glipizide ($C_{21}H_{27}N_5O_4S$) and metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$).

Packaging and storage—Preserve in well-closed containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Glipizide RS. USP Glipizide Related Compound A RS. USP Metformin Hydrochloride RS. USP Metformin Related Compound A RS.*

Identification—

A: GLIPIZIDE—

Infrared Absorption ⟨197A⟩—Prepare the test specimen as follows. Transfer not fewer than 10 Tablets to a suitable container, add 10 mL of methanol, and shake to remove any tablet coating. Drain the methanol, add 20 mL of water, and stir until the Tablets dissolve (about 1 hour). Transfer the solution to a separatory funnel, and extract twice with 10-mL portions of chloroform, shaking for approximately 5 minutes. Transfer the lower organic layer into a beaker containing 3 to 4 g of anhydrous magnesium sulfate. Repeat the extraction of the solution in the separatory funnel two more times, each time using 20-mL portions of chloroform. Swirl the mixture

In-Process Revision

in the beaker for about 1 minute. Filter, and collect the filtrate. Evaporate the solvent under vacuum, and dry the residue under vacuum for 4 hours at 105°. Mound the residue onto a diamond cell: the IR spectrum so obtained exhibits maxima only at the same wavelengths as a similarly obtained spectrum of USP Glipizide RS.

B: GLIPIZIDE—

The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay for glipizide.*

C: METFORMIN HYDROCHLORIDE—

The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay for metformin hydrochloride.*

Dissolution ⟨711⟩ ~~[To come.]~~

Medium: 0.05 M phosphate buffer, pH 6.8 ± 0.05 (Prepared by dissolving 12.96 g of monobasic potassium phosphate and 1.66 g of sodium hydroxide in approximately 400 mL of water, and diluting with water to 2000 mL. Adjust the pH, if necessary, with diluted sodium hydroxide. [NOTE—Tight control of the pH is critical.]); 1000 mL.

Apparatus 2: 50 rpm.

Times: 45 minutes for glipizide, 30 minutes for metformin hydrochloride.

Determine the amount of glipizide ($C_{21}H_{27}N_5O_4S$) dissolved by employing the following method.

Buffer solution—Dissolve approximately 3.4 g of monobasic potassium phosphate in approximately 800 mL of water. Adjust with 10 N sodium hydroxide solution to a pH of 6.0 ± 0.1. Dilute with water to 1000 mL, and mix.

Mobile phase—Prepare a filtered and degassed mixture of methanol and *Buffer solution* (13 : 12). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Transfer about 50 mg of USP Glipizide RS, accurately weighed, to a 1000-mL low-actinic volumetric flask, and dissolve in 100 mL of methanol. Dilute with *Medium* to volume, and sonicate for about 5 minutes. [NOTE—This solution is stable for 7 days at 5° when protected from the light.]

Working standard solution—Dilute the *Standard solution* with *Medium* in order to obtain a solution containing *L*/1000 mg per mL, with *L* being the glipizide tablet label claim, in mg.

Test solution—After the specified time, withdraw about 10 mL of the solution under test. Pass the solution through a 0.45-µm PVDF filter or a 1.0-µm glass fiber filter, discarding the first mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Working standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms running for about 8 minutes, and measure the peak response for glipizide. Calculate the amount of glipizide ($C_{21}H_{27}N_5O_4S$) dissolved by the formula:

$$\frac{r_U \times C_S \times 1000 \times 100}{r_S \times LC}$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Working standard solution,* respectively; C_S is the concentration, in mg per mL, of glipizide in the *Working standard solution;* 1000 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the tablet label claim for glipizide, in mg.

Determine the amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved by employing the following method.

Test solution—After the specified time, withdraw about 10 mL of the solution under test. Pass the solution through a 0.45-µm PVDF filter or a 1.0-µm glass fiber filter, discarding the first mL.

Procedure—Determine the amount of metformin hydrochloride dissolved by employing UV absorption at the wavelength of maximum absorbance at about 233 nm on portions of the *Test solution,* suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium*. Calculate the amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved by the formula:

$$\frac{A_U \times C_S \times 1000 \times 100}{A_S \times LC}$$

in which A_U and A_S are the absorbances obtained from the *Test solution* and the *Working standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Working standard solution;* 1000 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the tablet label claim for metformin hydrochloride, in mg.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{21}H_{27}N_5O_4S$ is dissolved in 45 minutes. Not less than 80% *(Q)* of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Related compounds—

GLIPIZIDE—

Ammonium phosphate buffer, Solution A, Solution B, and *Chromatographic system*—Prepare as directed in the *Assay for glipizide*.

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay for glipizide*.

Procedure—Inject about 50 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of glipizide related compound A (approximate relative retention time 0.92) and other individual impurities in the portion of Tablets taken by the formula:

$$100(1/F)(r_i / r_s)$$

in which F is the relative response factor for each impurity and is equal to 1.4 for glipizide related compound A and 1.0 for all other peaks; r_i is the peak response of each impurity; and r_s is the sum of the responses of all the peaks: not more than 2.0% of glipizide related compound A is found; not more than 0.5% of any other individual glipizide related impurity (eluting after approximately 8 minutes) is found; and not more than 1.0% total impurities, excluding glipizide related compound A, is found. [NOTE—Disregard the broad peak due to metformin that elutes before 8 minutes. Disregard any peak observed in the blank, and disregard any peak less than 0.05%.]

Chromatographic purity—

METFORMIN HYDROCHLORIDE—

Solution A, Solution B, Mobile phase, and *Chromatographic system*—Prepare as directed in the *Assay for metformin hydrochloride*.

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay for metformin hydrochloride.*

Procedure—Inject about 25 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(r_i / r_s)$$

In-Process Revision

in which r_i is the peak response for each impurity, and r_s is the sum of the responses of all the peaks: not more than 0.1% of any individual impurity is found; and not more than 0.5% of total impurities is found. [NOTE—Disregard any peak less than 0.05%, and disregard any peak observed in the blank.]

Assay for glipizide—

Ammonium phosphate buffer—Dissolve 2.6 g of dibasic ammonium phosphate in water, and dilute with water to 1000 mL. Adjust with ammonium hydroxide to a pH of 8.0.

Solution A—Prepare a degassed mixture of water, *Ammonium phosphate buffer,* and acetonitrile (14 : 5 : 1).

Solution B—Prepare a degassed mixture of acetonitrile, *Ammonium phosphate buffer,* and water (2 : 1 : 1).

Diluent—Use a mixture of acetonitrile and water (60 : 40).

Standard stock preparation—Transfer an accurately weighed quantity of USP Glipizide RS to a suitable low-actinic volumetric flask. Dissolve first in acetonitrile, using 60% of the final volume, by sonicating for about 20 minutes, then dilute with water to volume to obtain a solution having a known concentration of about 0.1 mg of glipizide per mL. [NOTE—The solution is stable for 2 weeks when stored at 5° protected from light.]

Standard preparation—Transfer 25.0 mL of *Standard stock preparation* to a 200-mL low-actinic volumetric flask. Dilute first with 75 mL of *Diluent,* and bring to volume with water to obtain a solution having a known glipizide concentration of approximately 0.0125 mg per mL. [NOTE—The solution is stable for 2 weeks when stored at 5° protected from light.]

System suitability preparation—Transfer approximately 5 mg of USP Glipizide Related Compound A RS to a 500-mL volumetric flask, and fill halfway with acetonitrile. Sonicate for about 30 minutes to dissolve, and dilute with acetonitrile to volume. Transfer 1 mL of this solution to a 50-mL low-actinic volumetric flask, and dilute with *Standard preparation* to volume.

Assay preparation—Transfer not fewer than 5 Tablets to a suitable volumetric flask, and fill halfway with *Diluent*. Sonicate for 30 minutes, and shake vigorously for another 30 minutes to dissolve. Dilute with water to volume, and mix to obtain a solution with a final glipizide concentration of about 0.0125 mg per mL. Pass a portion of this solution through a nylon or PVDF filter having a 0.2-µm porosity, and use the filtrate. [NOTE—The solution is stable for 2 weeks when stored at 5° protected from light.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 223-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L7. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–3	100	0	isocratic
3–18	100→0	0→100	linear gradient
18–20	0	100	isocratic
20–22	0→100	100→0	linear gradient
22–30	100	0	re-equilibration

Chromatograph the *System suitability preparation* and the *Standard preparation,* and record the peak responses as directed for *Procedure*. For the *System suitability preparation,* the relative retention times are about 0.92 for glipizide related compound A and 1.0 for glipizide; the resolution, *R,* between glipizide related compound A and glipizide is greater than 1.2. For the *Standard preparation,* the relative standard deviation for replicate injections is less than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the glipizide peaks. Calculate the quantity, in mg per Tablet, of glipizide ($C_{21}H_{27}N_5O_4S$) by the formula:

$$CV(r_U / r_S) / N$$

in which C is the concentration, in mg per mL, of USP Glipizide RS in the *Standard preparation; V* is the volume, in mL, of the *Assay preparation;* r_U and r_S are the glipizide peak

responses obtained from the *Assay preparation* and the *Standard preparation,* respectively; and *N* is the number of Tablets taken to prepare the *Assay preparation.*

Assay for metformin hydrochloride—

Solution A—Prepare a 50 mM hexanesulfonic acid solution by dissolving 9.41 g of sodium 1-hexanesulfonate in 1000 mL of water, and adjusting with trifluoroacetic acid to a pH of 2.0.

Solution B—Prepare a solution of water and acetonitrile (60 : 40).

Mobile phase—Prepare a degassed mixture of water, *Solution A,* and *Solution B* (50 : 30 : 20). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent pH 2.0—Prepare a mixture of water, *Solution A*, and acetonitrile (63 : 30 : 7).

Standard preparation—Dissolve an accurately weighed quantity of USP Metformin Hydrochloride RS in *Diluent pH 2.0* to obtain a solution having a known concentration of about 0.1 mg per mL.

System suitability preparation—Dissolve a suitable quantity of USP Metformin Related Compound A RS in water to obtain a solution containing about 5 µg per mL. Pipet 0.5 mL of this solution into a 50-mL volumetric flask, and dilute with the *Standard preparation* to volume.

Assay preparation—Quantitatively dilute a portion of the *Assay preparation,* obtained as directed for *Assay for glipizide,* with *Diluent pH 2.0,* to obtain a solution having an expected concentration of about 0.1 mg of metformin hydrochloride per mL, based on the label claim. Pass a portion of this solution through a nylon or PVDF filter having a 0.2-µm porosity, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 218-nm detector and a 4.6-mm × 15-cm column that contains 3.5-µm packing L11. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 30°. Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.26 for metformin related compound A and 1.0 for metformin; the resolution, *R,* between the two peaks is not less than 3.0; and the relative standard deviation for replicate injections, determined from the metformin peak, is less than 2.0%.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg per Tablet, of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) by the formula:

$$CVD(r_U / r_S)/N$$

in which *C* is the concentration, in mg per mL, of USP Metformin Hydrochloride RS in the *Standard preparation; V* is the volume, in mL, of the *Assay preparation*, as prepared under the *Assay for glipizide; D* is the dilution factor of the *Assay preparation;* r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively; and *N* is the number of Tablets used to prepare the *Assay preparation.* ■2S (*USP30*)

BRIEFING

Glyburide Tablets, *USP 29* page 1011. It is proposed to add *Dissolution* tests for some of the products approved for the USA market. The liquid chromatographic procedures in *Dissolution Test 1* are based on analyses performed with a Rexchrom Workhorse II brand of L1 column. The liquid chromatographic procedures in *Dissolution Test 2* are based on analyses performed with a Lichrosorb RP-8 brand of L7 column. The liquid chromatographic procedures in *Dissolution Test 3* are based on analyses performed with a Zorbax C8 brand of L7 column.

(BPC: M. Marques) RTS—C41785; C41796; C44745

Add the following:

■**Labeling—**When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used. ■2S (*USP30*)

In-Process Revision

Add the following:

■**Dissolution** ⟨711⟩—

TEST 1—

Medium: 0.05 M phosphate buffer, pH 9.5; 500 mL.

Apparatus 2: 75 rpm.

Time: 45 minutes.

Determine the percentage of the labeled amount of $C_{23}H_{28}ClN_3O_5S$ dissolved using the following method. [NOTE—Use low-actinic volumetric flasks.]

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (1 : 1), and add 4.0 mL of phosphoric acid per L of solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Transfer about 15 mg of USP Glyburide RS, accurately weighed, to a 100-mL volumetric flask, dissolve in *Medium* with sonication until dissolved, about 25 minutes, and dilute with *Medium* to volume.

Standard solutions—Dilute the *Standard stock solution* quantitatively, and stepwise if necessary, with *Medium* to obtain solutions having known concentrations of 0.003 mg per mL (for Tablets labeled to contain 1.5 mg), 0.006 mg per mL (for Tablets labeled to contain 3.0 mg), 0.009 mg per mL (for Tablets labeled to contain 4.5 mg), and 0.012 mg per mL (for Tablets labeled to contain 6.0 mg).

Test solution—Pass a portion of the solution under test through a suitable 0.45-µm filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 30-cm column that contains 10-µm packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 4000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 3.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Determine the amount, in percentage, of $C_{23}H_{28}ClN_3O_5S$ dissolved by the formula:

$$\frac{r_U \times C_S \times 500 \times 100}{r_S \times LC}$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Standard solution;* 500 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the Tablet label claim in mg.

Tolerances—Not less than 70% *(Q)* of the labeled amount of $C_{23}H_{28}ClN_3O_5S$ is dissolved in 45 minutes.

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: 0.05 M phosphate buffer, pH 8.5; 900 mL.

Apparatus 2: 50 rpm.

Time: 60 minutes.

Determine the percentage of the labeled amount of $C_{23}H_{28}ClN_3O_5S$ dissolved using the following method.

Mobile phase—Prepare a filtered and degassed mixture of 520 mL of water containing 2.6 g of monobasic ammonium phosphate and 480 mL of acetonitrile. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Transfer about 67 mg of USP Glyburide RS, accurately weighed, to a 500-mL volumetric flask, dissolve in 40 mL of methanol with sonication for 5 minutes, and dilute with *Medium* to volume.

Standard solutions—Dilute the *Standard stock solution* quantitatively, and stepwise if necessary, with *Medium* to obtain solutions having known concentrations of 0.0017 mg per mL (for Tablets labeled to contain 1.5 mg), 0.0034 mg per

mL (for Tablets labeled to contain 3 mg), 0.0047 mg per mL (for Tablets labeled to contain 4.5 mg), and 0.0067 mg per mL (for Tablets labeled to contain 6 mg).

Test solution—Pass a portion of the solution under test through a suitable 0.5-µm filter.

Chromatographic system—The liquid chromatograph is equipped with a 215-nm detector and a 4.0-mm × 25-cm column that contains 10-µm packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Determine the amount, in percentage, of $C_{23}H_{28}ClN_3O_5S$ dissolved by the formula:

$$\frac{r_U \times C_S \times 900 \times 100}{r_S \times LC}$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Standard solution;* 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the Tablet label claim in mg.

Tolerances—Not less than 60% *(Q)* of the labeled amount of $C_{23}H_{28}ClN_3O_5S$ is dissolved in 60 minutes.

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium: 0.05 M phosphate buffer, pH 7.5; 900 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Determine the percentage of the labeled amount of $C_{23}H_{28}ClN_3O_5S$ dissolved using the following method.

Mobile phase—Proceed as directed for the *Assay.*

Diluent—Prepare a mixture of acetonitrile and water (5 : 1).

Standard solution—Transfer about 66.6 mg of USP Glyburide RS, accurately weighed, to a 100-mL volumetric flask, and dissolve in and dilute with *Diluent* to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, and dilute with *Medium* to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, and dilute with *Medium* to volume.

Test solution—Pass a portion of the solution under test through a suitable 0.45-µm filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 75 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Determine the amount, in percentage, of $C_{23}H_{28}ClN_3O_5S$ dissolved by the formula:

$$\frac{r_U \times C_S \times 900 \times 100}{r_S \times LC}$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Standard solution;* 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the Tablet label claim in mg.

Tolerances—Not less than 70% *(Q)* of the labeled amount of $C_{23}H_{28}ClN_3O_5S$ is dissolved in 45 minutes. ■2S *(USP30)*

In-Process Revision

BRIEFING

Hydrocortisone Tablets, *USP 29* page 1069. It is proposed to revise the test for *Uniformity of dosage units* and the *Assay* to provide information needed to perform these tests because the cross reference provided in the monograph is no longer valid. It is also proposed to revise the *USP Reference standards* section to add USP Prednisone RS, which is used as an internal standard in the *Assay* and in the test for *Uniformity of dosage units*.

(MD-PS: D. Bempong) RTS—C44869

Change to read:

Uniformity of dosage units ⟨905⟩: meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

~~*Mobile solvent, Internal standard solution,* and *Standard preparation*—Prepare as directed in the *Assay* under *Hydrocortisone.*~~

■*Mobile phase, Internal standard solution,* and *Standard preparation*—Prepare as directed in the *Assay.*■2S (*USP30*)

Test preparation—Transfer 1 Tablet to a suitable container and add about 0.3 mL of water directly on the Tablet. Allow the Tablet to stand for about 5 minutes. Shake the container to break up the Tablet and sonicate briefly to ensure complete disintegration. Add a few small glass beads and 50.0 mL of *Internal standard solution* to the container. Shake the container for about 30 minutes. Dilute an accurately measured volume of the clear supernatant with a known, accurately measured volume of *Internal standard solution* to obtain a final concentration of 0.1 mg per mL. Shake the contents of the container to mix, and analyze the clear solution as directed for *Procedure*.

~~*Procedure*~~

■*Chromatographic system* and *Procedure*—■2S (*USP30*)
~~Proceed as directed for *Procedure* in the *Assay* under *Hydrocortisone*~~

■Proceed as directed in the *Assay.*■2S (*USP30*)
Calculate the quantity, in mg, of $C_{21}H_{30}O_5$ in the Tablet taken by the formula:

$$50(F_2/F_1)C(R_U/R_S)$$

in which F_1 is the volume, in mL, of the supernatant aliquot of the solution from the Tablet taken for dilution; F_2 is the final volume, in mL, of the *Test preparation;* and the other terms are as defined for ~~*Procedure* in the *Assay* under *Hydrocortisone*.~~

■*Procedure* in the *Assay.*■2S (*USP30*)

Assay—

~~*Mobile solvent, Internal standard solution,* and *Standard preparation*—Prepare as directed in the *Assay* under *Hydrocortisone.*~~

■*Mobile phase*—Prepare a solution containing a mixture of butyl chloride, water-saturated butyl chloride, tetrahydrofuran, methanol, and glacial acetic acid (95 : 95 : 14 : 7 : 6).

Internal standard solution—Prepare a solution of USP Prednisone RS in water-saturated chloroform containing 0.06 mg per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Hydrocortisone RS in *Internal standard solution* to obtain a solution having a known concentration of about 0.1 mg per mL.■2S (*USP30*)

Assay preparation—Weigh and finely powder not fewer than 10 Tablets. Weigh a portion of the powder, equivalent to about 5 mg of hydrocortisone, and transfer to a suitable container. Add 50.0 mL of *Internal standard solution.* Shake vigorously for 30 minutes, and centrifuge a portion of this mixture. Use the clear supernatant.

■*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L3. The flow rate is 0.9 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between hydrocortisone and prednisone is not less than 3.0; and the relative standard deviation for four replicate injections is not more than 2.0%.■2S (*USP30*)

Procedure—~~Proceed as directed for *Procedure* in the *Assay* under *Hydrocortisone.*~~

■Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks.■2S (*USP30*)
Calculate the quantity, in mg, of hydrocortisone ($C_{21}H_{30}O_5$) in the portion of Tablets taken by the formula:

$$50C(R_U/R_S)$$

in which ~~the terms are as defined therein.~~

■C is the concentration, in mg per mL, of USP Hydrocortisone RS in the *Standard preparation;* and R_U and R_S are the peak response ratios of the hydrocortisone peak to the internal standard peak obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP30*)

In-Process Revision

BRIEFING

Hypromellose Ophthalmic Solution, *USP 29* page 1099 and page 3572 of the *First Supplement.* On the basis of comments received, it is proposed to revise the formula in the *Procedure* in the *Assay.*

(MD-OOD: F. Mao) RTS—C45710

Change to read:

Assay—

Standard preparation—Dissolve a suitable quantity of USP Hypromellose RS, accurately weighed, in water, and dilute quantitatively with water to obtain a solution having a known concentration of about 100 µg per mL.

Assay preparation—Dilute an accurately measured volume of Ophthalmic Solution quantitatively with water to obtain a solution having an equivalent concentration of about 100 µg of hypromellose per mL.

Procedure—Pipet 2 mL each of the *Standard preparation,* the *Assay preparation,* and water to provide a blank, into separate, glass-stoppered test tubes. To each tube add 5.0 mL of diphenylamine solution (prepared by dissolving 3.75 g of colorless diphenylamine crystals in 150 mL of glacial acetic acid and diluting the solution with 90 mL of hydrochloric acid), mix, and immediately insert the tubes into an oil bath at 105° to 110° for 30 minutes, the temperature being kept uniform within 0.1° during heating. Remove the tubes, and place them in an ice-water bath for 10 minutes or until thoroughly cool. At room temperature and using a suitable spectrophotometer, concomitantly determine the absorbances of the solutions from the *Standard preparation* and the *Assay preparation* at 635 nm, using the water solution as the blank. Calculate the quantity, in mg, of hypromellose in each mL of the Ophthalmic Solution taken by the formula:

~~$0.001C(d/V)(A_u/A_s)$~~

■$0.001Cd(A_U/A_S)$■2S (*USP30*)

in which C is the concentration, in µg per mL, of USP Hypromellose RS in the *Standard preparation;* ~~*V* is the volume, in mL, of Ophthalmic Solution taken;~~

■■2S (*USP30*)
d is the dilution factor ~~of *V*~~

■■2S (*USP30*)
used to obtain the *Assay preparation;* and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Irbesartan, *USP 29* page 1177 and page 799 of *PF* 32(3) [May–June 2006]. It is proposed to revise the test for *Related compounds* to change the quantitation of other impurities from using the related compound A peak as the reference peak to using the drug substance peak as the reference peak. Also, the *Dilute standard solution* under the test for *Related compounds* and the *Assay* is being deleted as it is not a part of the original submission and is not used in any part of the monograph.

(MD-CV: S. Ramakrishna) RTS—C45897

Change to read:

Limit of azide—

Mobile phase—Prepare a filtered and degassed 0.1 N sodium hydroxide solution (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Transfer about 25 mg of sodium azide, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Pipet 250 µL of this solution into a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. This solution contains about 0.312 µg of sodium azide per mL.

Test solution—Transfer about 100 mg of Irbesartan, accurately weighed, to a 5-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a conductimetric detector and a 4.0-mm × 25-cm column that contains packing ~~L46~~

■L31.■1S (*USP30*)
The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio for the azide peak is not less than 10.

Procedure—Separately inject equal volumes (about 200 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas for azide. Calculate the amount of azide, in ppm, in the portion of Irbesartan taken by the formula:

$$1000(C_S/C_T)(42.02/65.01)(r_U/r_S)$$

in which C_S is the concentration, in µg per mL, of sodium azide in the *Standard solution;* C_T is the concentration, in mg per mL, of Irbesartan in the *Test solution;* 42.02 is the molecular weight of azide; 65.01 is the molecular weight of sodium azide; r_U is the peak area for azide obtained from the *Test solution;* and r_S is the peak area for azide obtained from the *Standard solution:* not more than 10 ppm of azide is found.

Change to read:

Related compounds—

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay.* Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the area for the irbesartan related compound A peak. Calculate the percentage of irbesartan related compound A in the portion of Irbesartan taken by the formula:

$$100(C_S / C_T)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Irbesartan Related Compound A RS in the *Standard solution;* C_T is the concentration, in mg per mL, of Irbesartan in the *Test solution;* r_U is the peak response for irbesartan related compound A obtained from the *Test solution;* and r_S is the peak response for irbesartan related compound A obtained from the *Standard solution.*

■Calculate the percentage of other impurities in the portion of Irbesartan taken by the formula:

$$100(C_S / C_T)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Irbesartan RS in the *Standard solution;* C_T is the concentration, in mg per mL, of Irbesartan in the *Test solution;* and r_U and r_S are the peak responses for each of the other impurities and USP Irbesartan RS obtained from the *Test solution* and the *Standard solution,* respectively:■2S (*USP30*)
not more than 0.2% of irbesartan related compound A is found; not more than 0.1% of any other impurity is found; and not more than 0.5% of total impurities is found.

Change to read:

Assay—

pH 3.2 Phosphate buffer—Mix 5.5 mL of phosphoric acid with about 950 mL of water, and adjust with triethylamine to a pH of 3.2.

Mobile phase—Prepare a filtered and degassed mixture of *pH 3.2 Phosphate buffer* and acetonitrile (67 : 33). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—Dissolve accurately weighed quantities of USP Irbesartan RS and USP Irbesartan Related Compound A RS in methanol to obtain a solution having known concentrations of about 0.05 mg of each per mL.

~~*Dilute standard solution*—Dissolve an accurately weighed quantity of USP Irbesartan RS in methanol to obtain a solution having a known concentration of about 1 µg per mL.~~

■■2S (*USP30*)

Standard preparation—Dissolve an accurately weighed quantity of USP Irbesartan RS in methanol to obtain a solution having a known concentration of about 0.5 mg per mL.

Assay preparation—Transfer about 50 mg of Irbesartan, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.0-mm × 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.8 for irbesartan related compound A and 1.0 for irbesartan; the resolution, *R,* between irbesartan and irbesartan related compound A is not less than 2.0. Chromatograph the *Standard preparation,* and record the peak response as directed for *Procedure:* the standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the quantity, in mg, of $C_{25}H_{28}N_6O$ in the portion of Irbesartan taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Irbesartan RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Levodopa, *USP 29* page 1242. In ICH guidelines, there are no specific requirements given for the total unknown impurity category. The difference between the total impurities limit and the sum of all the individual impurities serves as the control for total unknown impurities. Based on this guideline, it is proposed to delete the redundant acceptance criterion for total unknown impurities.

(MD-PP: R. Ravichandran) RTS—C43540

BRIEFING

Lisinopril Tablets, *USP 29* page 1263 and page 1090 of *PF* 31(4) [July–Aug. 2005]. As suggested by the monograph originator, it is proposed to revise the *Assay* based on the modifications of the current validated test method. The proposed changes include modifications in the *Mobile phase* and parts of the *Chromatographic system* (flow rate, theoretical plates, capacity factor, %RSD of the replicate injections) which are inconsistent with the most recent validated procedure.

(MD-CV: S. Ramakrishna) RTS—C41606

Dissolution ~~*Procedure for a Pooled Sample*~~
■■2S *(USP29)*
⟨711⟩—
Medium: 0.1 N hydrochloric acid; 900 mL.
Apparatus 2: 50 rpm.
Time: 30 minutes.
Determine the amount of lisinopril dissolved using the following method.
Mobile phase and *Chromatographic system*—Prepare as directed in the *Assay.*
~~*Procedure*~~

■PROCEDURE FOR POOLED SAMPLE—Proceed as directed for *Procedure* in *Apparatus 1 and Apparatus 2, Immediate-Release Dosage Forms* under *Dissolution* ⟨711⟩. Combine equal volumes of the filtered solutions of the 6 or 12 individual specimens withdrawn, and use the pooled sample as the test solution.■2S *(USP29)*
Inject a volume of ~~a filtered portion of the solution under test~~

■the pooled sample■2S *(USP29)*
into the chromatograph, record the chromatogram, and measure the response for the major peak. Calculate the quantity of $C_{21}H_{31}N_3O_5$ dissolved in comparison with a Standard solution having a known concentration of USP Lisinopril RS in the same medium and similarly chromatographed.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{21}H_{31}N_3O_5$ in the Tablets is dissolved in 30 minutes:

■the requirements are met if the quantities of active ingredient dissolved from the pooled sample conform to the accompanying *Acceptance Table for a Pooled Sample*. Continue testing through the three stages unless the results conform at either S_1 or S_2. The quantity, *Q,* is the amount of dissolved active ingredient specified, expressed as a percentage of the labeled content.

Acceptance Table for a Pooled Sample

Stage	Number Tested	Acceptance Criteria
S_1	6	Average amount dissolved is not less than Q + 10%.
S_2	6	Average amount dissolved (S_1 + S_2) is equal to or greater than Q + 5%.
S_3	12	Average amount dissolved (S_1 + S_2 + S_3) is equal to or greater than Q.

PROCEDURE FOR UNIT SAMPLE—Proceed as directed for *Procedure* in *Apparatus 1 and Apparatus 2, Immediate-Release Dosage Forms* under *Dissolution* ⟨711⟩. Inject a volume of a filtered portion of the solution under test into the chromatograph, record the chromatogram, and measure the response for the major peak. Calculate the amount of $C_{21}H_{31}N_3O_5$ dissolved in comparison with a Standard solution having a known concentration of USP Lisinopril RS in *Medium* and similarly chromatographed.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{21}H_{31}N_3O_5$ is dissolved in 30 minutes.■2S *(USP29)*

of acetonitrile, mix, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of water and methanol (4 : 1).

Standard preparation—Dissolve an accurately weighed quantity of USP Lisinopril RS in *Diluent* to obtain a solution having a known concentration of about 0.2 mg per mL.

Assay preparation—Transfer to a suitable size volumetric flask 10 Tablets, which when diluted with *Diluent* will yield a solution having a concentration of about 0.2 mg per mL. Add *Diluent,* and sonicate for 5 minutes. Shake the flask by mechanical means for 20 minutes, dilute with *Diluent* to volume, mix, and filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 20-cm column that contains packing L7 and is maintained at a temperature of 40°. The flow rate is about ~~1.5 mL~~

■1 mL■2S (*USP30*)
per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency determined from the analyte peak is not less than ~~850~~

■700■2S (*USP30*)
theoretical plates, the tailing factor for the analyte peak is not more than 2.0, the capacity factor, k', for the analyte peak is ~~not less than 2.0~~

■greater than 1.5,■2S (*USP30*)
and the relative standard deviation for replicate injections is not more than ~~2.0%~~

■2%.■2S (*USP30*)

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of $C_{21}H_{31}N_3O_5$ in each Tablet taken by the formula:

$$(L/D)C(r_U/r_S)$$

in which L is the labeled quantity, in mg, of lisinopril in each Tablet, D is the concentration, in mg per mL, of lisinopril in the *Assay preparation* based on the labeled quantity per Tablet and the extent of dilution; C is the concentration, in mg per mL, calculated on the anhydrous basis, of USP Lisinopril RS in the *Standard preparation;* and r_U and r_S are the lisinopril peak area responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Magnesium Hydroxide, *USP 29* page 1298; **Magnesium Hydroxide Paste,** *USP 29* page 1298. It is proposed to replace the current test for *Lead* ⟨251⟩, which uses a wet chemistry color comparison method, with a new test for *Limit of lead* that uses inductively coupled plasma (ICP) methodology. In the Magnesium Hydroxide monograph, it is also proposed to tighten the limit of lead to 0.00015% (1.5 ppm). The procedure was validated using an inductively coupled plasma–mass spectrometer (ICP–MS). Manufacturers who can provide validation data using an inductively coupled plasma–atomic emission spectrometer (ICP–AES) are encouraged to submit the information to the Expert Committee.

It is also proposed to add the test for *Limit of lead* to the Magnesium Hydroxide Paste monograph.

(MD-GRE: E. Gonikberg) RTS—C41832

Delete the following:

■~~**Lead** ⟨251⟩—Prepare a *Test Preparation* by dissolving 1 g of Magnesium Hydroxide in 20 mL of 3 N hydrochloric acid. Use 10 mL of *Diluted Standard Lead Solution* (10 µg of Pb) for the test: the limit is 0.001%.~~■2S (*USP30*)

Add the following:

■**Limit of lead—**[NOTE—When water is specified as a diluent, use deionized ultra-filtered water.]

Blank solution—Transfer 3.0 mL of nitric acid to a 50-mL volumetric flask, and dilute with water to volume.

Thallium internal standard 20 ppb—[NOTE—Use this solution only if an ICP–MS instrument is used. This internal standard is added in-line via a mixing block between the sample probe and the spray chamber.] Dilute 20.0 mL of a commercially prepared thallium ICP standard solution (1000 ppb) with water to 1 L.

Dilute nitric acid—Dilute 2.0 mL of nitric acid with water to 100 mL.

Standard stock solution 100 ppb—Prepare this solution fresh every two months. Quantitatively dilute an accurately measured volume of a commercially prepared lead ICP standard (1000 ppm) with *Dilute nitric acid*, to obtain a solution containing 10 ppm of lead. Further dilute this solution with *Dilute nitric acid* to obtain a solution containing 1000 ppb of lead. Transfer 10.0 mL of this solution to a separate 100-mL volumetric flask, add 2.0 mL of nitric acid, and dilute with water to volume.

Standard solutions—Prepare these solutions fresh weekly. [NOTE—The concentrations specified below are recommended if an ICP–MS instrument is used. If an ICP–AES instrument is used, the concentrations of the *Standard solutions* may be modified to adapt to the working range of the instrument.] Transfer 5.0 mL of the *Standard stock solution 100 ppb* to a 50-mL volumetric flask, add 3.0 mL of nitric acid, and dilute with water to volume (*Standard lead solution 10 ppb*). Transfer 5.0 mL of *Standard lead solution 10 ppb* to a 50-mL volumetric flask, add 3.0 mL of nitric acid, and dilute with water to volume (*Standard lead solution 1 ppb*).

Test solution—[NOTE—The concentration specified below is recommended if an ICP–MS instrument is used. If an ICP–AES instrument is used, the concentration of the *Test solution* may be modified to adapt to the working range of the instrument.] Accurately weigh about 0.25 g of Magnesium Hydroxide. Cautiously add 3.0 mL of nitric acid, and mix until the sample is dissolved. Accurately transfer this solution to a 50-mL volumetric flask, and dilute with water to volume.

Procedure (see *Plasma Spectrochemistry* ⟨730⟩)—The inductively coupled plasma–mass spectrometer (ICP–MS) is equipped with a quadrupole mass spectrometer and an ion detector maintained under vacuum. The instrument should read all isotopes for lead (206, 207, and 208 amu) and the thallium internal standard (205 amu), and should report the total lead content using the most naturally abundant isotope at 208 amu. Alternatively, lead could be determined using an inductively coupled plasma–atomic emission spectrometer (ICP–AES) by measuring the emission at 220.353 nm, with the settings optimized as directed by the manufacturer. [NOTE—To minimize matrix interference when using an ICP–AES instrument, it is recommended that the method of standard additions be used.]

Instrument performance must be verified to conform to the manufacturer's specifications for resolution and sensitivity. Before analyzing samples, the instrument must pass a suitable performance check. Generate the calibration curve using the *Blank solution, Standard lead solution 1 ppb,* and *Standard lead solution 10 ppb:* a linear regression coefficient is not less than 0.999.

Aspirate the *Test solution,* at least in duplicate, and calculate the amount of lead using the calibration curve. Report the average reading as the lead content of the sample. Calculate the content of lead in the portion of Magnesium Hydroxide taken: not more than 0.00015% (1.5 ppm) is found.■2S (*USP30*)

BRIEFING

Magnesium Hydroxide Paste *USP 29* page 1298—See briefing under *Magnesium Hydroxide.* In addition to adding a test for *Limit of lead,* it is proposed to widen the acceptance criteria in the Definition to "not less than 28.0 percent and not more than 70.0 percent", to include currently manufactured grades of Magnesium Hydroxide Paste. This range only slightly broadens the current lower limit of 29.0% and avoids an overlap with the highest concentration permitted in the *Milk of Magnesia* monograph. The proposed upper limit in the Definition for Magnesium Hydroxide Paste is based on data that demonstrates that the product at this concentration still has the consistency of a heavy paste. The test for *Soluble alkalies* is also revised to clarify the amount of Paste taken for the test.

(MD-GRE: E. Gonikberg) RTS—C41291

Change to read:

» Magnesium Hydroxide Paste is an aqueous paste of magnesium hydroxide. ~~each 100 g of which contains not less than 29.0 g and not more than 33.0 g of magnesium hydroxide [$Mg(OH)_2$].~~

■It contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of magnesium hydroxide [$Mg(OH)_2$], the labeled amount being not less than 28.0 percent and not more than 70.0 percent of magnesium hydroxide.■2S (*USP30*)

Change to read:

Soluble alkalies—~~Mix 25.0 g of Paste with 75.0 mL of water,~~

■Accurately weigh a portion of Paste, equivalent to about 7.75 g of magnesium hydroxide, and mix with 75.0 mL of water.■2S (*USP30*)
Transfer about 25 mL of this diluted Paste to a filter, and reject the first 5 mL of the filtrate. [NOTE—Retain the remaining diluted Paste for the tests for *Carbonate and acid-insoluble matter,* ~~*Arsenic,*~~ ■■2S (*USP30*) and *Heavy metals*.] Dilute 5 mL of the clear filtrate with 40 mL of water. Add 1 drop of methyl red TS, and titrate the solution with 0.10 N sulfuric acid to the production of a persistent pink color: not more than 1.0 mL of the acid is required.

Add the following:

■Limit of lead—

Blank solution, Thallium internal standard 20 ppb, Dilute nitric acid, Standard stock solution 100 ppb, and *Standard solutions*—Proceed as directed for the test for *Limit of lead* under *Magnesium Hydroxide.*

In-Process Revision

Test solution—Accurately weigh an amount of Paste equivalent to 0.25 g of magnesium hydroxide. Cautiously add 3.0 mL of nitric acid, and mix until the sample is dissolved. Accurately transfer this solution to a 50-mL volumetric flask, and dilute with water to volume. [NOTE—This concentration is recommended if an ICP–MS instrument is used. If an ICP–AES instrument is used, the concentration of the *Test solution* may be modified to adapt to the working range of the instrument.]

Procedure—Proceed as directed for the test for *Limit of lead* under *Magnesium Hydroxide.* Calculate the content of lead in the portion of Paste taken based on the content of magnesium hydroxide in the Paste, as determined in the *Assay:* not more than 0.00015% (1.5 ppm) is found.■2S (*USP30*)

Chromatographic chamber—Line a suitable chamber (see *Chromatography* ⟨621⟩) with absorbent paper, and pour into the chamber 250 mL of a mixture of chloroform, methanol, and ammonium hydroxide (80 : 15 : 2). Saturate the chamber for 1.5 hours before using.

Detecting reagent—Prepare separate solutions of potassium iodide (1 in 100) and soluble starch (prepared by triturating 3 g in 10 mL of cold water and adding the mixture to 90 mL of boiling water with constant stirring). Just prior to use, mix 10 mL of each solution with 3 mL of alcohol.

Procedure—Apply separately 5-µL portions of the *Test solution* and each of the *Standard dilutions* to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel mixture. Place the plate in the *Chromatographic chamber,* seal the chamber, and allow the chromatogram to develop until the solvent front has moved about three-fourths of the length of the plate. Remove the plate, and dry in a current of warm air until the odor of ammonia is no longer perceptible (about 45 minutes). Place a beaker containing 0.5 g of potassium permanganate in a chamber. Add 5 mL of 6 N hydrochloric acid to the beaker, and allow to equilibrate for 5 minutes. Place the plate in the chamber for 5 minutes. Remove the plate from the chamber, allow to stand in a current of cool air for 1 hour, and spray with *Detecting reagent.* If spots other than the principal spot are observed in the lane of the *Test solution,* estimate the concentration of each by comparison with the *Standard dilutions:* the spots from the 1.0, 0.5, 0.2, and 0.1 mg per mL *Standard dilutions* correspond to 1.0%, 0.5%, 0.2%, and 0.1% of impurities, respectively; and the sum of any observed impurities in the *Test solution* is not greater than 1.0%.

BRIEFING

Metoprolol Tartrate, *USP 29* page 1420. On the basis of comments received, it is proposed to revise the test for *Chromatographic purity* to change the diluent used in the preparation of the *Standard solution,* the *Standard dilutions,* and the *Test solution* from chloroform to methanol. The proposed change is intended to avoid the streaking of the metoprolol spot which could be related to the lack of absorption of the material onto the stationary phase prior to development followed by a gradual dissolution during the chromatographic development process.

(MD-CV: S. Ramakrishna) RTS—C41259

Change to read:

Chromatographic purity—

Standard solution and *Standard dilutions*—Dissolve a suitable quantity of USP Metoprolol Tartrate RS, accurately weighed, in ~~chloroform~~

has a potency equivalent to not less than 595 µg of netilmicin ($C_{21}H_{41}N_5O_7$) per mg,

■calculated on the dried basis. [NOTE—Netilmicin Sulfate is extremely hygroscopic. Protect from exposure to moisture.]■2S (*USP30*)

Change to read:

Assay—

Dilute phosphoric acid—Dilute 5.0 mL of phosphoric acid with water to 1000 mL, and mix.

Mobile phase—Dissolve 20.22 g of sodium 1-heptanesulfonate in *Dilute phosphoric acid,* dilute with *Dilute phosphoric acid* to 1000 mL, and mix. To 620 mL of this solution add 380 mL of acetonitrile, mix, and pass through a filter having a 0.45-µm porosity. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—Prepare a solution in *Mobile phase* containing about 1 mg of USP Netilmicin Sulfate RS and 1 mg of USP Sisomicin Sulfate RS per mL.

Standard preparation—~~Transfer about 50 mg of USP Netilmicin Sulfate RS to a low-actinic, previously accurately tared, 50-mL volumetric flask. Place the flask in a vacuum desiccator under a vacuum of less than 5 mm of mercury for 1 hour. Accurately weigh the flask, and determine the dry weight of the USP Netilmicin Sulfate RS taken. Dissolve in and dilute with *Mobile phase* to volume, and mix.~~

■[NOTE—Use low-actinic glassware.] Dissolve an accurately weighed quantity of USP Netilmicin Sulfate RS in *Mobile phase* to obtain a solution having a known concentration of about 1 mg per mL.■2S *(USP30)*

Assay preparation—~~Transfer about 50 mg of Netilmicin Sulfate to a low-actinic, previously accurately tared, 50-mL volumetric flask. Place the flask in a vacuum desiccator under a vacuum of less than 5 mm of mercury for 1 hour. Accurately weigh the flask, and determine the dry weight of the Netilmicin Sulfate taken. Dissolve in and dilute with *Mobile phase* to volume, and mix.~~

■[NOTE—Use low-actinic glassware.] Transfer about 50 mg of Netilmicin Sulfate, accurately weighed, to a 50-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix.■2S *(USP30)*

Chromatographic system (see *Chromatography* ⟨621⟩)—The chromatograph is equipped with a 205-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between sisomicin and netilmicin is not less than 1. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 3000 theoretical plates; the tailing factor is not more than 2; and the relative standard deviation for replicate injections is not more than 1%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, and measure the area responses for the major peaks. Calculate the quantity, in µg, of netilmicin ($C_{21}H_{41}N_5O_7$) per mg of Netilmicin Sulfate taken by the formula:

$$(W_S P/W_U)(r_U/r_S)$$

in which W_S is the dry weight, in mg, of USP Netilmicin Sulfate RS taken to prepare the *Standard preparation; P* is the designated potency, in µg of netilmicin ($C_{21}H_{41}N_5O_7$) per mg, of the USP Netilmicin Sulfate RS; W_U is the dry weight, in mg, of the Netilmicin Sulfate taken to prepare the *Assay preparation;* and r_U and r_S are the netilmicin peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Nevirapine Oral Suspension. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with a 3.5-µm Zorbax SB-CN brand of L10 column. Typical retention times are about 22 minutes for nevirapine, about 20 minutes for nevirapine related compound A, and about 23 minutes for nevirapine related compound B. The chromatographic procedure in the *Dissolution* test was developed using a Symmetry C18 brand of L1 column.

(MD-AA: B. Davani; BPC: M. Marques) RTS—C43396

Add the following:

■Nevirapine Oral Suspension

» Nevirapine Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of nevirapine ($C_{15}H_{14}N_4O$).

Packaging and storage—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards ⟨11⟩—*USP Nevirapine Anhydrous RS. USP Nevirapine Related Compund A RS. USP Nevirapine Related Compound B.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Ferric chloride–potassium ferricyanide reagent—Dissolve 1.35 g of ferric chloride in 25 mL of water. Dissolve 1.64 g of potassium ferricyanide in 25 mL of water. Mix the two solutions immediately before use.

Test solution—Transfer a volume of Oral Suspension, equivalent to about 10 mg of nevirapine, to an 8-mL glass stoppered tube. Pipet 2.0 mL of chloroform into the tube, and shake. Allow the two phases to separate, and then using a disposable glass Pasteur pipet, remove some of the organic layer from the bottom, and transfer to another container.

In-Process Revision

Standard solution—Dissolve a suitable quantity of USP Nevirapine Anhydrous RS in chloroform to obtain a solution having a known concentration of about 5 mg per mL.

Procedure—Separately apply 5-µL portions of the *Test solution* and the *Standard solution* to a thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel 60 F254. Allow the spots to dry, and develop the chromatogram in a chamber saturated with a solvent system consisting of a mixture of ethyl acetate, isopropanol, and concentrated ammonium hydroxide (18 : 2 : 0.1) until the solvent front has moved about 6 to 7 cm from the point of application. Remove the plate from the chamber, mark the solvent front, and dry. Examine the chromatograms under UV light at 254 nm, and outline the spots with a soft pencil. Spray the plate with *Ferric chloride–potassium ferricyanide reagent:* the R_F value (approximately 0.4 to 0.5) of the principal blue spot under UV and after spraying, obtained from the *Test solution,* corresponds to that obtained from the *Standard solution.*

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Viscosity ⟨911⟩**:** not less than 400 centipoises, determined using a suitable rotational viscometer with Spindle No. 3, a spindle speed of 100 rpm, and at a temperature of 25 ± 0.1° for the Standard and the sample.

Microbial limits ⟨61⟩—It meets the requirements of the tests for absence of *Escherichia coli.* The total aerobic microbial count does not exceed 100 cfu per mL, and the total combined molds and yeasts count does not exceed 10 cfu per mL.

Dissolution ⟨711⟩—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 2: 25 rpm.

Time: 45 minutes.

Determine the amount of $C_{15}H_{14}N_4O$ dissolved by employing the following method.

Diluent: a mixture of dehydrated alcohol and water (1 : 1).

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (77 : 23). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Transfer about 10 mg of USP Nevirapine Anhydrous RS and 15 mg of methylparaben into a 250-mL volumetric flask. Dissolve in approximately 2 mL of *Diluent,* and dilute with *Medium* to volume.

Standard solution—Transfer about 28 mg of USP Nevirapine Anhydrous RS, accurately weighed, into a 500-mL volumetric flask. Add 2 mL of *Diluent,* and sonicate for about 1 minute. Note that the Standard will not be completely dissolved at this point. Dilute with *Medium* to volume, and visually examine the solution to ensure that the Standard is completely dissolved. The final concentration is about 0.056 mg of nevirapine per mL.

Test solution—For sample mixing, gently shake the bottle for approximately 10 seconds by inverting it slowly and rotating it from side to side. The sample should be free of air bubbles. Do not sonicate the sample. Using a 1- to 10-mL suitable positive displacement pipet set at 5 mL, withdraw the equivalent of 50 mg of nevirapine. Remove excess Oral Suspension by wiping the outside of the tip carefully so as not to touch the opening of the tip. Introduce the sample into the dissolution vessel over a 1- to 2-second time period by immersing the tip of the pipet midway between the paddle and the side of the vessel, approximately 1 cm below the meniscus. Similarly dispense the Oral Suspension into the other vessels. At 45 minutes, withdraw 5 mL of the solution under test, and pass through a 0.45-µm nylon filter, discarding the first 2 mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The chromatograph is equipped with a 214-nm detector, a 3.9-mm × 20-mm guard column that contains packing L1, and a 3.9-mm × 15-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution,* and record the

peak responses as directed for *Procedure:* the resolution, *R,* between nevirapine and methylparaben is not less than 5.0; and the tailing factor for the nevirapine peak is not more than 1.8. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for at least 14 minutes, and measure the responses for the nevirapine peaks. Calculate the percentage of $C_{15}H_{14}N_4O$ dissolved by the formula:

$$\frac{r_U \times C_S \times 900 \times 100}{r_S \times V \times LC}$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of USP Nevirapine Anhydrous RS in the *Standard solution;* 900 is the volume, in mL, of the *Medium;* 100 is the conversion factor to percentage; V is the volume, in mL, of Oral Suspension taken; and LC is the Oral Suspension label claim, in mg per mL.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{15}H_{14}N_4O$ is dissolved in 45 minutes.

Uniformity of dosage units ⟨905⟩**:** meets the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

Test solution—Proceed as directed for the *Assay preparation* in the *Assay,* except to withdraw the equivalent of 1 dosage unit of Oral Suspension.

pH ⟨791⟩**:** between 5.4 and 6.0.

Related compounds—

Potassium phosphate buffer, Solution A, Solution B, Mobile phase, and *Diluent*—Proceed as directed in the *Assay.*

System suitability solution—Proceed as directed in the *Assay.*

Standard stock solution—Use the *Standard stock preparation,* prepared as directed in the *Assay.*

Standard solution—Dilute the *Standard stock solution* quantitatively with *Diluent* to obtain a solution having a known concentration of about 0.3 µg of nevirapine per mL.

Weight determination—Use the weight obtained as directed for *Weight determination* in the *Assay.*

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay.*

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay:* the relative standard deviation for replicate injections of the *Standard solution* is not more than 10.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each unknown impurity in the portion of Oral Suspension taken by the formula:

$$200(C/W_U)(W_A/5)(r_U/r_S)(100/L)$$

in which C is the concentration, in mg per mL, of USP Nevirapine Anhydrous RS in the *Standard solution;* W_U is the sample weight, in g, taken to prepare the *Test solution;* W_A is the weight, in g, of 5 mL of Oral Suspension, obtained as directed for *Weight determination;* L is the labeled amount, in mg per mL, of nevirapine in the Oral Suspension; r_U is the peak response obtained for each impurity in the *Test solution;* and r_S is the peak response for nevirapine in the *Standard solution*. Not more than 0.1% of any individual unknown impurity is found; and not more than 0.2% of total impurities is found. [NOTE—The excipients and their degradation products should not be included in the determination of impurities.]

In-Process Revision

Assay—

Diluent—Prepare a mixture of water and methanol (80 : 20).

Potassium phosphate buffer—Dissolve 13.6 g of monobasic potassium phosphate in approximately 1900 mL of water, and adjust with phosphoric acid to a pH of 3.0. Transfer to a 2000-mL volumetric flask, and dilute with water to volume. Mix, filter, and degas.

Solution A: a mixture of *Potassium phosphate buffer* and acetonitrile (97 : 3).

Solution B: a mixture of *Potassium phosphate buffer* and acetonitrile (76 : 24).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Transfer about 50 mg of USP Nevirapine Anhydrous RS, accurately weighed, into a 50-mL volumetric flask. Add 20 mL of methanol, and sonicate with intermittent swirling until the sample dissolves. Add water to about 1 cm below the meniscus, cool to room temperature, and dilute with water to volume. The concentration is about 1 mg of nevirapine per mL.

Standard preparation—Dilute the *Standard stock preparation* quantitatively with *Diluent* to obtain a solution having a known concentration of about 0.3 mg of nevirapine per mL.

Stock impurity preparation—Transfer about 3 mg of USP Nevirapine Related Compound A RS and 3 mg of USP Nevirapine Related Compound B RS, accurately weighed, into a 100-mL volumetric flask, add 20 mL of methanol, and sonicate to dissolve. Add water to about 1 cm below the meniscus, cool to room temperature, dilute with water to volume, and mix.

System suitability solution—Transfer 15.0 mL of *Standard stock preparation* and 2.0 mL of *Stock impurity preparation* into a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Weight determination—Using a 1- to 10-mL suitable pipet and a positive displacement tip, withdraw 5.0 mL of the Oral Suspension. The sample should be free of air bubbles. Dispense into a tared vial, and record the weight of the Oral Suspension to ± 0.1 mg.

Assay preparation—Using a 1- to 10-mL suitable pipet and a positive displacement tip, withdraw the equivalent of 60 mg of nevirapine. The sample should be free of air bubbles. Remove the excess Oral Suspension by wiping the outside of the tip carefully so as not to touch the opening of the tip, and deliver the sample into a 200-mL tared volumetric flask. Record the sample weight to the nearest ± 0.1 mg. Add 40 mL of methanol, and sonicate for about 5 minutes with intermittent swirling. Add water to about 1 cm below the meniscus. Do not shake the flask. Allow the solution to attain room temperature, and dilute with water to volume. Shake the flask gently, and allow to stand for about 5 minutes.

Chromatographic system ⟨621⟩—The liquid chromatograph is equipped with a 254-nm detector, a 4.6-mm × 12.5-mm guard column that contains 5-µm packing L10, and a 4.6-mm × 15-cm analytical column that contains 3.5-µm packing L10. The column temperature is maintained at 35°. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–1	100	0	isocratic
1–31	100→0	0→100	linear gradient
31–32	0→100	100→0	linear gradient
32–42	100	0	equilibration

Chromatograph the *System suitability solution* (about 20 µL), and record the peak responses as directed for *Procedure:* the resolution, *R,* between nevirapine and nevirapine related compound A is not less than 3.0, and the resolution, *R,* between nevirapine and nevirapine related compound B is not less than 1.7; and the tailing factor for the nevirapine peak is not more than 1.5. Chromatograph the *Standard preparation,*

and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the nevirapine peak. Calculate the quantity, in mg, of nevirapine ($C_{15}H_{14}N_4O$) in each mL of the Oral Suspension taken by the formula:

$$200(C/W_U)(W_A/5)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Nevirapine Anhydrous RS in the *Standard preparation;* W_U is the sample weight, in g, of Oral Suspension taken to prepare the *Assay preparation;* W_A is the weight, in g, of 5 mL of Oral Suspension obtained as directed for *Weight determination;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S *(USP30)*

BRIEFING

Norgestimate, *USP 29* page 1560 and page 1390 of *PF* 31(5) [Sept.–Oct. 2005]. It is proposed to change the name of the impurity USP Norgestimate Oxime Mixture RS to USP Deacetylnorgestimate RS to distinguish the impurity from the drug substance which is also an oxime mixture.

Limit of residual solvents ⟨467⟩—

Internal standard solution—Prepare a solution of isobutyl alcohol in dimethylformamide containing 2 µL of isobutyl alcohol per 100 mL of solution.

Standard solution—Prepare a solution in *Internal standard solution* containing 5 µL each of acetone, alcohol, chloroform, diisopropyl ether, and methanol per 100 mL of solution.

System suitability solution—Dilute a portion of the *Standard solution* with *Internal standard solution* to obtain a solution containing 0.05 µL each of acetone, alcohol, chloroform, diisopropyl ether, and methanol per 100 mL of solution.

Test solution—Transfer about 40 mg of Norgestimate and 2 mL of *Internal standard solution* to a 5-mL volumetric flask or a suitable vial, and shake well to dissolve.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.53-mm × 30-m fused-silica capillary column bonded with a 1-µm layer of phase G16, and a split injection system. The detector temperature is about 250°, and the injection port temperature is about 180°. The column temperature is programmed as follows. It is maintained at about 65° for 2.5 minutes, increased at a rate of 35° per minute to 100°, maintained for 2 minutes, then at a rate of 30° per minute increased to 160°, and maintained for 2.5 minutes. The carrier gas is helium, flowing at a rate of about 6 mL per minute, and the split flow rate is about 16 mL per minute. Chromatograph the *Internal standard solution,* the *Standard solution,* and the *System suitability solution,* and record the peak responses as directed for *Procedure:* there are no interfering peaks due to dimethylformamide; the retention time of isobutyl alcohol in the chromatogram of the *Internal standard solution* is between 4 and 5 minutes; the signal-to-noise ratio for alcohol obtained from the *System suitability solution* is not less than 2.0; and the relative standard deviation for replicate injections of the *Standard solution,* determined from the peak response ratios of each solvent to the internal standard, is not more than 3.0%.

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of each solvent in the portion of Norgestimate taken by the formula:

$$200(CD/W)(R_U/R_S)$$

in which C is the concentration, in mL per mL, of each solvent in the *Standard solution; D* is the density, in mg per mL, of each solvent; W is the weight, in mg, of Norgestimate taken to prepare the *Test solution;* and R_U and R_S are the peak response ratios of the appropriate analyte to the internal standard obtained from the *Test solution* and the *Standard solution,* respectively.

■*Option 1:* not■2S *(USP29)*
more than 0.5% each of acetone and alcohol is found; not more than 0.05% of diisopropyl ether is found; not more than 0.006% of chloroform is found; and not more than 0.3% of methanol is found.

In-Process Revision

Calculate the percentage of each impurity in the volume of Injection taken by the formula:

$$100(r_i/r_s)$$

in which r_i is the peak response for each impurity; and r_s is the sum of the responses of all of the peaks: not more than 0.2% of any individual impurity is found, and the total of all impurities,

▲including the percentage of ondansetron related compound D determined in the test for *Limit of ondansetron related compound D,*▲*USP30* is not more than 0.5%.

BRIEFING

Pancuronium Bromide Injection. Because there is no existing *USP* monograph for this drug product, a new monograph, based on submitted data, is being proposed. The typical migration time for pancuronium bromide in the capillary electrophoresis procedure in the test for *Related compounds* and in the *Assay* is about 10.4 minutes.

(MD-PS: D. Bempong) RTS—C43837

Add the following:

■Pancuronium Bromide Injection

» Pancuronium Bromide Injection is a sterile isoosmotic solution of Pancuronium Bromide in Water for Injection. It contains not less than 92.0 percent and not more than 105.0 percent of the labeled amount of pancuronium bromide ($C_{35}H_{60}Br_2N_2O_4$). It contains a suitable tonicity-adjusting agent.

Packaging and storage—Preserve in tight, light-resistant, single-dose *Containers for Injections,* as described under *Injections* ⟨1⟩, preferably of Type 1 glass. Store in a refrigerator between 2° and 8°, protected from light.

USP Reference standards ⟨11⟩—*USP Endotoxin RS. USP Pancuronium Bromide RS. USP Pancuronium Bromide Related Compound A RS. USP Pancuronium Bromide Related Compound B RS. USP Pancuronium Bromide Related Compound C RS. USP Pancuronium Internal Standard RS. USP Vecuronium Bromide Related Compound C RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Adsorbent: a 0.2-mm layer of chromatographic silica gel 60 mixture.

Test solution—Pipet a measured volume of Injection, equivalent to 1 mg of pancuronium bromide, into a suitable container, and evaporate at room temperature with the aid of a stream of nitrogen. Dilute with acetonitrile to obtain a solution having a concentration of about 0.5 mg of pancuronium bromide per mL, sonicate for about 1 minute, and centrifuge.

Standard solution—Dissolve an accurately weighed quantity of USP Pancuronium Bromide RS in acetonitrile to obtain a solution having a concentration of about 0.5 mg of pancuronium bromide per mL of acetonitrile.

Application volume: 2 µL.

Developing solvent system: a mixture of 2-propanol, acetonitrile, and a 400 g per L solution of sodium iodide (85 : 10 : 5).

Procedure—Proceed as directed in the chapter. After chromatography is completed, dry the plate at room temperature for at least 30 minutes. Spray the plate with a 20 g per L solution of sodium nitrite, and allow to dry for 5 minutes. Spray the plate with Dragendorff's TS, and cover the plate with a transparent glass cover. Visualize the spots in daylight: the intensity and R_F value of the principal spot obtained from the *Test solution* correspond to those obtained from the *Standard solution.*

B: The migration time of the major peak in the electropherogram of the *Assay preparation* corresponds to that in the electropherogram of the *Standard preparation,* as obtained in the *Assay.*

Bacterial endotoxins ⟨85⟩**:** not more than 50 USP Endotoxin Units per mg of pancuronium bromide.

pH ⟨791⟩**:** between 3.8 and 4.2.

Particulate matter ⟨788⟩**:** meets the requirements for small-volume injections.

Related compounds (see *Capillary Electrophoresis* ⟨727⟩)—

Operating buffer and *Diluent*—Prepare as directed in the *Assay.*

Internal standard I solution—Dissolve an accurately weighed quantity of USP Vecuronium Bromide Related Compound C RS in *Diluent* to obtain a solution having a known concentration of about 2 µg per mL.

Standard stock solution—Dissolve an accurately weighed quantity of USP Pancuronium Bromide Related Compound A RS, USP Pancuronium Bromide Related Compound B RS, and USP Pancuronium Bromide Related Compound C RS in *Internal standard I solution* to obtain a solution having a known concentration of about 40 µg, 100 µg, and 100 µg per mL, respectively.

Standard solution—Transfer 2.0 mL of the *Standard stock solution* to a 50-mL volumetric flask. Dilute with *Internal standard I solution* to volume, and mix.

Test solution—Pipet a measured volume of Injection, equivalent to 4 mg of pancuronium bromide, into a 20-mL volumetric flask, dilute with *Internal standard I solution* to volume, and mix.

Electrophoretic system (see *Capillary Electrophoresis* ⟨727⟩)—Proceed as directed in the *Assay.* Inject the *Standard solution,* record the electropherogram, and measure the peak responses as directed for *Procedure:* the relative migration times, based on the migration time of the pancuronum bromide, are 0.931, 0.968, 0.974, and 0.939 for pancuronium bromide related compound A, pancuronium bromide related compound B, pancuronium bromide related compound C, and vecuronium bromide related compound C, respectively; the resolution, *R,* between pancuronium bromide related compound B and pancuronium bromide related compound C in the electropherogram of the *Standard solution* is not less than 1.5; and the relative standard deviation for replicate injections of the *Standard solution,* determined from the relative area responses of the impurity peaks, is not more than 10%.

Procedure—For the *Test solution* and the *Standard solution,* proceed as directed in the *Assay* for the *Assay preparation* and the *Standard preparation.* Calculate the percentage of each pancuronium bromide related compound in the portion of Injection taken by the formula:

$$100C_S / C_T[(20 - V)/V](R_U / R_S)$$

in which C_S is the concentration, in mg per mL, of each impurity in the *Standard solution;* C_T is the concentration, in mg per mL, of pancuronium bromide in the Injection; V is the volume, in mL, of Injection taken to prepare the *Test solution;* and R_U and R_S are the ratios of the individual peak area responses of the impurities to the peak area response of vecuronium bromide related compound C in the electropherograms obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.4% of pancuronium bromide related compound A is found; not more than 3.0% of pancuronium bromide related compound B is found; not more than 2.0% of pancuronium bromide related compound C is found; and not more than 5.0% of total impurities is found.

Other requirements—It meets the requirements under *Injections* ⟨1⟩.

Assay (see *Capillary Electrophoresis* ⟨727⟩)—

Diluent: 1 mM phosphoric acid.

Internal standard II solution—Dissolve an accurately weighed quantity of USP Pancuronium Internal Standard RS in *Diluent* to obtain a solution having a known concentration of about 0.15 mg per mL.

Operating buffer—Prepare a solution of tubocurarine chloride in water having a concentration of 2.52 mg per mL. Adjust the solution with a 2.5% phosphoric acid solution to a pH of 3.0, pass through a 0.22-µm filter, and degas.

Standard stock preparation—Dissolve an accurately weighed quantity of USP Pancuronium Bromide RS in *Internal standard II solution* to obtain a solution having a known concentration of about 1 mg per mL.

Standard preparation—Transfer 10 mL of the *Standard stock preparation* to a 50-mL volumetric flask, dilute with *Internal standard II solution* to volume, and mix.

Assay preparation—Pipet a measured volume of Injection, equivalent to 4 mg of pancuronium bromide, into a 20-mL volumetric flask, dilute with *Internal standard II solution* to volume, and mix.

Control solution—Using *Internal standard II solution,* prepare a solution containing 200 µg of pancuronium bromide and each of the following related compounds having the following concentrations: 0.8 µg per mL of USP Pancuronium Bromide Related Compound A RS, 2 µg per mL of USP Pancuronium Bromide Related Compound B RS, and 2 µg per mL of USP Pancuronium Bromide Related Compound C RS.

Electrophoretic system (see *Capillary Electrophoresis* ⟨727⟩)—The capillary electrophoretic system is equipped with a 235-nm and 350-nm detector and a 50-µm × 56-cm capillary that contains a polyvinyl alcohol coating. The capillary is maintained at 20°, and the polarity is positive. Inject the *Standard preparation,* the *Internal standard II solution,* and the *Control solution,* and record the ratio of the peak area responses as directed for *Procedure:* in the electropherogram of the *Internal standard II solution,* the relative area of the impurity peak, which may be present at the position of the pancuronium bromide peak, should contribute not more than 3% with respect to the relative area of the pancuronium bromide peak in the *Standard preparation;* in the electropherogram of the *Control solution,* the resolution, *R,* between pancuronium bromide related compound B and pancuronium bromide related compound C is not less than 1.5, and that between the pancuronium bromide peak and any related compound eluting close to the pancuronium bromide peak is not less than 1.5; and the relative standard deviation for replicate injections of the *Standard preparation,* determined from the relative area responses of the pancuronium bromide peaks, is not more than 1.5%.

Procedure—Before performing each injection, flush the capillary with *Operating buffer* for 3 minutes. Separately inject equal volumes (about 50 mbar for 20 seconds) of the *Standard preparation* and the *Assay preparation,* each injection followed by a coinjection of *Operating buffer* (about 50 mbar for 2 seconds). Between 0 and 1 minute, increase the voltage at an equal rate from 0 to 25 kV; and between minutes 1 and 13 after the hydrodynamic injection, apply a constant voltage of 25 kV. Perform an indirect detection at 350 nm, using a reference wavelength of 235 nm, both with a bandwidth of 8 nm. Calculate the quantity, in mg, of pancuronium bromide ($C_{35}H_{60}Br_2N_2O_4$) in each mL of Injection taken by the formula:

$$C[(20 - V)/V](R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Pancuronium Bromide RS in the *Standard preparation; V* is the volume, in mL, of Injection taken to prepare the *Assay preparation;* and R_U and R_S are the ratios of the peak area responses of pancuronium bromide to those of the pancuronium internal standard obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■2S (*USP30*)

In-Process Revision

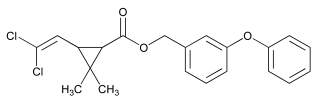
BRIEFING

Permethrin. Because there is no existing *USP* monograph for this drug substance, a new monograph is being proposed. The liquid chromatographic procedure in the *Assay* is based on analysis performed with the Inertsil-OD-2 brand of L1 column. The typical retention time is about 10.7 minutes for the first eluted isomer of permethrin and about 12.6 minutes for the second eluted isomer.

(MD-OOD: C. Anthony) RTS—C30631

Add the following:

■Permethrin



$C_{21}H_{20}Cl_2O_3$ 391.29

Cyclopropanecarboxylic acid, 3-(2,2-dichloroethenyl)-2,2-dimethyl-, (3-phenoxyphenyl)methyl ester.

m-Phenoxybenzyl (±)-3-(2,2-dichlorovinyl)-2,2-dimethylcyclopropanecarboxylate.

(±)-3-Phenoxybenzyl 3-(2,2-dichlorovinyl)-2,2-dimethylcyclopropanecarboxylate [*52645-53-1*].

» Permethrin is a mixture of *cis* and *trans* isomers. It contains not less than 23.0 percent and not more than 27.0 percent of the *cis* isomer, not less than 73.0 percent and not more than 77.0 percent of the *trans* isomer, and the sum of both isomers is not less than 98.0 percent and not more than 102.0 percent of $C_{21}H_{20}Cl_2O_3$, calculated on the as-is basis.

Packaging and storage—Preserve in well-closed containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Permethrin RS. USP Permethrin Related Compound A RS. USP Permethrin Related Compound B RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention times of the two major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Residue on ignition ⟨281⟩**:** not more than 0.2%.

Related compounds—[NOTE—Prior to and during sampling, Permethrin and USP Permethrin RS should be gradually warmed to between 65° and 70°, and uniformly mixed by means of a hot plate with mechanical stirring, to preserve the *cis/trans* isomer ratio.]

Mobile phase—Prepare as directed in the *Assay.*

Standard solution—Dissolve accurately weighed quantities of USP Permethrin RS, USP Permethrin Related Compound A RS (3-phenoxybenzyl alcohol), and USP Permethrin Related Compound B RS (3-phenoxybenzaldehyde) in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having known concentrations of 250 µg per mL, 1.25 µg per mL, and 1.25 µg per mL, respectively.

Test solution—Prepare as directed for the *Assay preparation* in the *Assay.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 272-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is 1.5 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention time is 1.2 for the *cis* isomer with respect to the *trans* isomer; the resolution, *R,* between the *cis* and *trans* isomers of permethrin is not less than 2.8; the relative standard deviation for replicate injections is not more than 2.0% for the sum of the *cis* and

In-Process Revision

trans isomers of permethrin, and not more than 10.0% for permethrin related compound A and permethrin related compound B.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentages of permethrin related compound A and permethrin related compound B in the portion of Permethrin taken by the formula:

$$50(C/W)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Permethrin Related Compound A RS or USP Permethrin Related Compound B RS in the *Standard solution; W* is the weight, in mg, of Permethrin taken; and r_U and r_S are the peak responses for each related compound obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.5% of either permethrin related compound A or permethrin related compound B is found. Calculate the percentage of any other unknown impurity in the portion of Permethrin taken by the formula:

$$100(r_U/r_s)$$

in which r_U is the peak response for each individual impurity other than permethrin related compound A and permethrin related compound B; and r_s is the sum of the peak responses for all of the peaks: not more than 0.5% of any individual impurity is found, and not more than 2.0% of total impurities, including permethrin related compound A and permethrin related compound B is found.

Assay—[NOTE—Prior to and during sampling, Permethrin and USP Permethrin RS should be gradually warmed to between 65° and 70°, and uniformly mixed by means of a hot plate with mechanical stirring, to preserve the *cis/trans* isomer ratio.]

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (3 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Permethrin RS in acetonitrile, and dilute quantitatively with *Mobile phase* to obtain a solution having a known concentration of 0.25 mg per mL.

Assay preparation—Transfer about 125 mg of Permethrin, accurately weighed, to a 50-mL volumetric flask, dissolve in acetonitrile, dilute with *Mobile phase* to volume, and mix. Transfer 10 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 272-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the *cis* and *trans* isomers of permethrin is not less than 2.8; and the relative standard deviation for replicate injections is not less than 2.0% for the *cis* and *trans* isomers of permethrin.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{21}H_{20}Cl_20_3$ in the portion of Permethrin taken by the formula:

$$500C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Permethrin RS in the *Standard preparation;* and r_U and r_S are the sums of the peak responses for the *cis* and *trans* isomers obtained from the *Assay preparation* and the *Standard*

preparation, respectively. Calculate the percentage of *cis* or *trans* isomer in the portion of Permethrin taken by the formula:

$$50{,}000(C/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of *cis*- or *trans*-permethrin isomer in the *Standard preparation; W* is the weight, in mg, of Permethrin taken; r_U is the peak response for the *cis*- or *trans*-permethrin isomer obtained from the *Assay preparation;* and r_S is the peak response for the *cis*- or *trans*-permethrin isomer obtained from the *Standard preparation.* ■2S (*USP30*)

USP Reference standards ⟨11⟩—*USP Permethrin RS. USP Permethrin Related Compound A RS. USP Permethrin Related Compound B RS.*

Identification—The retention times of the two major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Microbial limits ⟨61⟩**—**It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*. The total aerobic microbial count does not exceed 100 cfu per g or 100 cfu per mL, and the total combined molds and yeasts count does not exceed 10 cfu per g or 10 cfu per mL.

Minimum fill ⟨755⟩**:** meets the requirements.

pH ⟨791⟩**:** between 4.5 and 6.5.

Test solution—Prepare a 10% w/w mixture of the substance under test in a solution containing 2 mg of potassium chloride per 1 mL of water.

Related compounds—[NOTE—Prior to and during sampling, Permethrin Cream and USP Permethrin RS should be gradually warmed to between 65° and 70°, and uniformly mixed by means of a hot plate with mechanical stirring, to preserve the *cis/trans* isomer ratio.]

Mobile phase—Prepare as directed in the *Assay.*

Standard solution—Dissolve accurately weighed quantities of USP Permethrin RS, USP Permethrin Related Compound A RS (3-phenoxybenzyl alcohol), and USP Permethrin Related Compound B RS (3-phenoxybenzaldehyde) in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having known concentrations of 250 µg per mL, 1.25 µg per mL, and 1.25 µg per mL, respectively.

Test solution—Prepare as directed for the *Assay preparation* in the *Assay.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 272-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing

BRIEFING

Permethrin Cream. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed. The liquid chromatographic procedures in the *Assay* are based on analyses performed with the Symmetry brand of L1 column. The typical retention time is about 10.7 minutes for the first eluted isomer of permethrin and about 12.6 minutes for the second eluted isomer.

BRIEFING

PEG 3350 and Electrolytes for Oral Solution, *USP 29* page 1749. The previous revision proposal that was published on page 1393 of *PF* 31(5) [Sept.–Oct. 2005] has been canceled. It is proposed to change the official title of this monograph to Polyethylene Glycol 3350 and Electrolytes for Oral Solution. In accordance with the procedures of the USP Nomenclature Expert Committee, the term PEG is not appropriate for official titles; the proposed revision eliminates its use. In addition, minor editorial style changes have been made. In the absence of any significant adverse comments, the revision to the official title will appear in the *Second Supplement* to *USP 30–NF 25,* but with a delayed implementation date of **August 1, 2012.**

~~PEG 3350 and Electrolytes for Oral Solution~~

■Polyethylene Glycol 3350 and Electrolytes for Oral Solution■2S (*USP30*)

(Title for this monograph—to become official August 1, 2012). (Prior to August 1, 2012, the current practice of labeling the article of commerce with the name PEG 3350 and Electrolytes for Oral Solution may be continued. Use of the name Polyethylene Glycol 3350 and Electrolytes for Oral Solution will be permitted as of August 1, 2007, but the use of this name will not be mandatory until August 12, 2012. The 60-month extension will provide the time needed by the manufacturers and users to make necessary changes.)

Change to read:

» ~~PEG 3350 and Electrolytes for Oral Solution~~

■Polyethylene Glycol 3350 and Electrolytes for Oral Solution■2S (*USP30*)
is a mixture of Polyethylene Glycol 3350, Sodium Bicarbonate, Sodium Chloride, Sodium Sulfate (anhydrous), and Potassium Chloride. When constituted as directed in the labeling it contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of polyethylene glycol 3350, potassium (K^+), sodium (Na^+), bicarbonate (HCO_3^-), chloride (Cl^-), and sulfate ($SO_4^=$), the labeled amounts per L being 10 mmol (10 mEq) of potassium, 125 mmol (125 mEq) of sodium, 20 mmol (20 mEq) of bicarbonate, 35 mmol (35 mEq) of chloride, and 40 mmol (80 mEq) of sulfate.

Change to read:

Assay for potassium and sodium—

Mobile phase—Dilute 0.5 mL of nitric acid with water to obtain 4000 mL of solution. Degas, and place the solution in a suitable plastic container. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Internal standard solution—Dissolve a suitable quantity of ammonium bromide in water to obtain a solution having a concentration of about 2 mg per mL.

Standard preparation—To a 100-mL volumetric flask transfer about 90 mg of potassium chloride, previously dried at 105° for 2 hours and accurately weighed, and about 880 mg of sodium chloride, previously dried at 105° for 2 hours and accurately weighed, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 500-mL volumetric flask, add 10.0 mL of *Internal standard solution,* dilute with water to volume, and mix. Pass this solution through a filter having a 0.5-µm or finer porosity, and store the filtrate in a suitable plastic container. This *Standard preparation* contains about 9 µg (0.00012 mEq) of potassium chloride and about 88 µg (0.0015 mEq) of sodium chloride per mL.

Assay preparation—Constitute the contents of a container of ~~PEG 3350 and Electrolytes for Oral Solution~~

■Polyethylene Glycol 3350 and Electrolytes for Oral Solution■2S (*USP30*)
with an accurately measured volume of water, as specified in the labeling. Transfer 6.0 mL of this stock solution, equivalent to about 0.06 mEq of potassium, to a 500-mL volumetric flask, add 10 mL of *Internal standard solution,* dilute with water to volume, and mix. This solution contains about 0.00012 mEq of potassium and 0.0015 mEq of sodium per mL. [NOTE—Reserve the remaining portion of the stock solution for the *Assay for bicarbonate,* and reserve the remaining portion of the *Assay preparation* for the *Assay for chloride and sulfate* and the *Assay for polyethylene glycol 3350*.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a conductivity detector, a 4-mm × 5-cm guard column containing packing L22, and a 4-mm × 30-cm analytical column maintained at 35 ± 1° containing packing L22. The flow rate is about 0.9 mL per minute. Chromatograph the *Standard preparation* as directed for *Procedure:* the relative retention times are about 0.6 for sodium, 0.8 for ammonium, and 1.0 for potassium; the resolution, *R,* between the sodium and ammonium peaks is not less than 1.1, and between the ammonium and potassium peaks is not less than 0.9. [NOTE—Maintain column backpressure at less than 1000 pounds per square inch. Backpressure may be reduced by changing the in-line filters and frits in the columns. Column efficiency may be improved by backflushing the analytical column with 30 mL of 0.1 *N* nitric acid or by injecting four successive 100-µL portions of 0.1 *N* nitric acid into the chromatograph.]

Procedure—[NOTE—Use peak heights where peak responses are indicated.] Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the mEq of potassium per L of constituted Oral Solution taken by the formula:

$$(500 / 74.55)(C / 6)(R_U / R_S)$$

in which 74.55 is the molecular weight of potassium chloride; C is the concentration, in µg per mL, of potassium chloride in the *Standard preparation;* and R_U and R_S are the peak response ratios of potassium to ammonium obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the mEq of sodium per L of constituted Oral Solution taken by the formula:

$$(500 / 58.44)(C / 6)(R_U / R_S)$$

in which 58.44 is the molecular weight of sodium chloride; C is the concentration, in µg per mL, of sodium chloride in the *Standard preparation;* and R_U and R_S are the peak response ratios of sodium to ammonium obtained from the *Assay preparation* and the *Standard preparation,* respectively.

In-Process Revision

BRIEFING

Promethazine Hydrochloride, *USP 29* page 1824 and page 365 of *PF* 32(2) [Mar.–Apr. 2006]; **Promethazine Hydrochloride Tablets,** *USP 29* page 1826 and page 367 of *PF* 32(2) [Mar.–Apr. 2006]. It is proposed to change the name of the impurity Reference Standard USP Promethazine Related Compound A RS to USP Phenothiazine RS, because the currently available USP Phenothiazine RS and USP Promethazine Related Compound A RS are the same compound. The proposed changes are found in the *USP Reference standards* section and in the test for *Related compounds.*

Change to read:

Related ~~substances~~

■compounds—■ 2S *(USP30)*

~~*Standard preparation* and *Standard dilutions*—Dissolve an accurately weighed quantity of USP Promethazine Hydrochloride RS in methylene chloride to obtain a solution containing 10.0 mg per mL (*Standard preparation*). Prepare a series of quantitative dilutions of the *Standard preparation* in methylene chloride to contain 0.2, 0.1, 0.05, and 0.025 mg per mL (*Standard dilutions*) corresponding to 2.0%, 1.0%, 0.5%, and 0.25% of impurities, respectively.~~

~~*Test solution*—Dissolve 100 mg, accurately weighed, of Promethazine Hydrochloride in 10.0 mL of methylene chloride.~~

~~*Procedure*—Using a 20- × 20-cm thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of silica gel mixture, apply 10-µL portions of the *Test preparation,* the *Standard preparation,* and each of the *Standard dilutions* 2.5 cm from the lower edge of the plate. Develop the plate in an unsaturated tank containing a mixture of ethyl acetate, acetone, alcohol, and ammonium hydroxide (90 : 45 : 2 : 1). After the solvent has moved not less than 10 cm, air-dry the plate, and view under short-wavelength UV light: the R_F value of the principal spot obtained from the *Test preparation* corresponds to that from the *Standard preparation.* Estimate the concentration of any other spots observed in the lane for the *Test preparation* by comparison with the *Standard dilutions:* the sum of the impurities is not greater than 2.0%, and no single impurity is greater than 1.0%.~~

■*Buffer solution*—Dissolve 1.35 g of monobasic potassium phosphate in 500 mL of water, and adjust with triethylamine to a pH of 7.0 ± 0.5.

Mobile phase—Prepare a mixture containing 450 mL of *Buffer solution,* 350 mL of acetonitrile, and 200 mL of methanol. Pass the mixture through a membrane filter having a porosity of 0.45 µm, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve suitable quantities of USP Promethazine Hydrochloride RS and ~~USP Promethazine Related Compound A RS~~ USP Phenothiazine RS in *Mobile phase,* and dilute quantitatively with *Mobile phase* to obtain a solution having known concentrations of about 1.0 µg per mL and 0.4 µg per mL, respectively.

Test solution—Transfer 20 mg of Promethazine Hydrochloride, accurately weighed, to a 100-mL volumetric flask, add about 50 mL of *Mobile phase,* and shake to dissolve. Dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The column temperature is maintained at 25°, and the samples are maintained at about 4° in a refrigerated autosampler. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between ~~promethazine related compound A~~ phenothiazine and promethazine is not less than 2.0; and the relative standard deviation for replicate injections, calculated for promethazine, is not more than 5.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, and allow the *Test solution* to elute for not less than two times the retention time of promethazine. Record the chromatograms, and measure the peak responses. Calculate the percentage of ~~promethazine related compound~~

~~A~~ phenothiazine in the portion of Promethazine Hydrochloride taken by the formula:

$$100(C_S / C_U)(r_A / r_S)$$

in which C_S is the concentration, in mg per mL, of ~~USP Promethazine Related Compound A RS~~ USP Phenothiazine RS in the *Standard solution;* C_U is the concentration, in mg per mL, of Promethazine Hydrochloride in the *Test solution;* r_A is the peak response for ~~promethazine related compound A~~ phenothiazine obtained from the *Test solution;* and r_S is the peak response for ~~promethazine related compound A~~ phenothiazine obtained from the *Standard solution*. Calculate the percentage of any other impurity in the portion of Promethazine Hydrochloride taken by the formula:

$$100(1/F)(C_S / C_U)(r_i / r_S)$$

in which F is the relative response factor (see accompanying table for values) for each impurity; C_S is the concentration, in mg per mL, of USP Promethazine Hydrochloride RS in the *Standard solution;* C_U is the concentration, in mg per mL, of Promethazine Hydrochloride in the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the peak response for phenothiazine obtained from the *Standard solution.* The limits are as specified in the accompanying table.

Compound Name	Relative Retention Time	Relative Response Factor (F)	Limit (w/w, %)
Promethazine sulfoxide[1]	about 0.13	0.23	0.2
~~Promethazine related compound A (phenothiazine)~~ Phenothiazine	about 0.8	—	0.2
Promethazine hydrochloride	1.0	—	—
Isopromethazine hydrochloride[2]	about 1.6	1.0	0.5
Individual unknown impurity	—	1.0	0.10

the test or assay specimens, the Reference ~~Standard~~

■Standards,■2S (*USP30*)
and solutions containing them by conducting the procedures without delay, and under subdued light or using low-actinic glassware.

Add the following:

■**Related compounds—**

Buffer solution and *Mobile phase*—Proceed as directed in the *Assay.*

Standard solution—Dissolve suitable quantities of USP Promethazine Hydrochloride RS and ~~USP Promethazine Related Compound A RS~~ USP Phenothiazine RS in *Mobile phase,* and dilute with *Mobile phase* to obtain a solution having known concentrations of about 1.0 µg per mL and 0.4 µg per mL, respectively.

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of powder, equivalent to about 20 mg of promethazine hydrochloride, to a 100-mL volumetric flask, and add about 50 mL of *Mobile phase*. Sonicate for about 1 minute, and shake by mechanical means for 5 minutes. Cool to room temperature, dilute with *Mobile phase* to volume, mix, and pass through a nylon filter having a porosity of 0.45 µm. Discard the first 10 mL of filtrate.

Chromatographic system—Proceed as directed in the *Assay.* Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between ~~promethazine related compound A~~ phenothiazine and promethazine is not less than 2.0; and the relative standard deviation for replicate injections, calculated for promethazine, is not more than 5.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, and allow the *Test solution* to elute for not less than two times the retention time of promethazine. Record the chromatograms, and measure the peak responses. Calculate the percentage of ~~promethazine related compound A~~ phenothiazine in the portion of Tablets taken by the formula:

$$100(C_S / C_U)(r_A / r_S)$$

in which C_S is the concentration, in mg per mL, of ~~USP Promethazine Related Compound A RS~~ USP Phenothiazine RS in the *Standard solution;* C_U is the concentration, in mg per mL, of promethazine hydrochloride in the *Test solution,* based on the label claim; r_A is the peak response of ~~promethazine related compound A~~ phenothiazine obtained from the *Test solution;* and r_S is the peak response of ~~promethazine related compound A~~ phenothiazine obtained

from the *Standard solution.* Calculate the percentage of any other impurity in the portion of Tablets taken by the formula:

$$100(1/F)(C_S/C_U)(r_i/r_S)$$

in which F is the relative response factor (see accompanying table for values) for each impurity; C_S is the concentration, in mg per mL, of USP Promethazine Hydrochloride RS in the *Standard solution;* C_U is the concentration of promethazine hydrochloride (based on the label claim), in mg per mL, in the *Test solution;* r_i is the peak response of each impurity obtained from the *Test solution;* and r_S is the peak response of promethazine obtained from the *Standard solution.* The limits are as specified in the accompanying table.

Change to read:

Assay—

~~*Buffered palladium chloride solution*—Transfer 500 mg of palladium chloride to a 250-mL beaker, add 5 mL of hydrochloric acid, and warm on a steam bath. Add 200 mL of hot water in small quantities while stirring until solution is complete. Cool, dilute with water to 500 mL, and mix. Transfer 25 mL of this solution to a 500-mL volumetric flask. Add 50 mL of 1 N sodium acetate and 48 mL of 1 N hydrochloric acid, dilute with water to volume, and mix.~~

~~*Standard preparation*—Transfer about 31 mg of USP Promethazine Hydrochloride RS, accurately weighed, to a low-actinic 250-mL volumetric flask. Dissolve in 0.1 N hydrochloric acid, dilute with 0.1 N hydrochloric acid to volume, and mix.~~

~~*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 6.25 mg of promethazine hydrochloride, to a low-actinic 125-mL separator. Add 20 mL of saturated potassium chloride solution, 10 mL of 1 N sodium hydroxide, and 10 mL of methanol, and extract the promethazine with three 20-mL portions of *n*-heptane. Filter the heptane extracts through anhydrous sodium sulfate and collect them in a low-actinic 125-mL separator. Extract the promethazine from the *n*-heptane solution with three 15-mL portions of 0.1 N hydrochloric acid, collect the acid extracts in a low-actinic 50-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix.~~

~~*Procedure*—Into separate test tubes, pipet 2 mL portions of the *Standard preparation,* the *Assay preparation,* and 0.1 N hydrochloric acid to provide a blank. Add 3.0 mL of *Buffered palladium chloride solution* to each tube, and mix. Concomitantly determine the absorbances of the solutions at the wavelength of maximum absorbance at about 470 nm, using a suitable spectrophotometer, and using the blank in the reference cell. Calculate the quantity, in mg, of promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$) in the portion of Tablets taken by the formula:~~

~~$$50C(A_U/A_S)$$~~

~~in which C is the concentration, in mg per mL, of USP Promethazine Hydrochloride RS in the *Standard preparation;* and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation,* respectively.~~

■*Buffer solution*—Dissolve 1.35 g of potassium phosphate monobasic in 500 mL of water, and adjust with triethylamine to a pH of 7.0 ± 0.5.

Mobile phase—Mix 450 mL of *Buffer solution,* 350 mL of acetonitrile, and 200 mL of methanol. Pass through a membrane filter having a porosity of 0.45 µm, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Promethazine Hydrochloride RS in *Mobile phase,* and dilute with *Mobile phase* to obtain a solution having a known concentration of about 4 µg per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of powder, equivalent to about 50 mg of promethazine

Compound Name	Relative Retention Time	Relative Response Factor (F)	Limit (w/w, %)
Promethazine sulfoxide[1]	about 0.13	0.23	0.2
~~Promethazine-related compound A~~ ~~(phenothiazine)~~ Phenothiazine	about 0.8	—	0.2
Promethazine hydrochloride	1.0	—	—
Isopromethazine hydrochloride[2]	about 1.6	1.0	0.5

In-Process Revision

hydrochloride, to a 250-mL volumetric flask, and add about 100 mL of *Mobile phase*. Sonicate for 30 minutes with intermittent shaking, and shake by mechanical means for an additional 30 minutes. Dilute with *Mobile phase* to volume, mix, and pass through a nylon filter having a porosity of 0.45 µm. Discard the first 10 mL of filtrate. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.2 mL per minute. The column temperature is maintained at 25°, and the samples are maintained at 4° in a refrigerated autosampler. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for the promethazine peaks. Calculate the quantity, in mg, of promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$) in the portion of Tablets taken by the formula:

$$(250)50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Promethazine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■2S (*USP30*)

BRIEFING

Risperidone Tablets. Because there is no existing USP monograph for this dosage form, a new monograph is being proposed. The liquid chromatographic procedures in the tests for *Dissolution* and *Uniformity of dosage units* were validated with a Zorbax SB brand of L1 column, in which risperidone elutes at about 2 minutes. An alternative column for these two tests is the Inertsil ODS. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* were also validated with a Zorbax SB brand of L1 column. The typical retention time obtained for risperidone in these tests is about 11 minutes.

(MD-PP: R. Ravichandran; BPC: M. Marques) RTS— C44132

Add the following:

■Risperidone Tablets

» Risperidone Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of risperidone ($C_{23}H_{27}FN_4O_2$).

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Risperidone RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩—

Test solution—Grind an appropriate number of Tablets to prepare a 550 ± 50 µg per mL solution of risperidone in ethyl acetate. Shake the solution for 30 minutes, and centrifuge for 20 minutes. Evaporate 5 mL of the supernatant with the aid of a stream of nitrogen to 2 mL on a warm water bath. Add 150 ± 50 mg of KBr powder, mix well, and evaporate to dryness. Grind the dried mixture, and press a small amount into a transparent pellet.

Standard solution—Grind about 2 mg of USP Risperidone RS with about 200 mg of KBr powder, and press into a transparent pellet.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: 0.1 N hydrochloric acid; 500 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Determine the amount of $C_{23}H_{27}FN_4O_2$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (65 : 35), and add 1 mL of trifluoroacetic acid to each 1 L of the mixture. Adjust with ammonium hydroxide to a pH of 3.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Risperidone RS in *Medium,* and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration of about 0.006 mg per mL.

Test solution—Use portions of the solution under test, and pass through a suitable filter having a porosity of 35 µm.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 237-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution* and the *Test solution* as directed for *Procedure:* the retention time of risperidone is about 2.1 minutes, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of $C_{23}H_{27}FN_4O_2$ dissolved by the formula:

$$\frac{r_U \times C_S \times 500 \times 100}{r_S \times LC}$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution*, respectively; C_S is the concentration, in mg per mL, of USP Risperidone RS in the *Standard solution;* 500 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the Tablet label claim in mg.

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{23}H_{27}FN_4O_2$ is dissolved in 45 minutes.

Uniformity of dosage units ⟨905⟩—

Mobile phase and *Chromatographic system*—Proceed as directed for *Dissolution*.

Standard solution—Dissolve an accurately weighed quantity of USP Risperidone RS in a suitable volumetric flask, and dilute quantitatively with 0.1 N hydrochloric acid to obtain a solution having a known concentration of about 0.03 mg of risperidone per mL.

Test solution—Transfer one Tablet into a 100-mL volumetric flask, add 50 mL of 0.1 N hydrochloric acid, and shake mechanically for about 30 minutes. Dilute with 0.1 N hydrochloric acid to volume, and mix. Pass a portion of this solution through a suitable filter having a 0.2-µm or finer porosity, and use the filtrate.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the risperidone peak. Calculate the quantitiy, in mg, of risperidone ($C_{23}H_{27}FN_4O_2$) in the portion of Tablets taken by the formula:

$$C(r_U/r_S)100$$

in which C is the concentration, in mg per mL, of USP Risperidone RS in the *Standard solution;* and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively.

Related compounds—

Mobile phase and *Diluent*—Proceed as directed in the *Assay.*

Standard solution—Prepare as directed for the *Standard preparation* in the *Assay.*

Diluted sodium hydroxide—To 1 L of water in a beaker, add 0.1 N sodium hydroxide dropwise to obtain a pH of about 8.5.

Diluted hydrogen peroxide—Dilute 1 mL of hydrogen peroxide with water to 500 mL.

Peak identification solution—Suspend 10 mg of USP Risperidone RS in 10 mL of *Diluted sodium hydroxide* in a 100-mL volumetric flask. Store the flask at 90° for 24 hours. Cool the solution to room temperature. Add 10 mL of aqueous *Diluted hydrogen peroxide* to the flask, and store at 90° for an additional two hours. Cool the mixture to room temperature, and dilute with methanol to volume.

Test solution—Use the *Assay preparation.*

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay.* Chromatograph about 20 µL of the *Peak identification solution,* record the peak responses as directed for *Procedure,* and identify the peaks using the relative retention times given in *Table 1:* the resolution, R, between the *trans-N*-oxide and *cis-N*-oxide is not less than 1.2. [NOTE—The approximate relative retention times given in *Table 1* are for identification purposes only.]

Procedure—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the responses for all of the peaks. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(1/R)(r_i/r_S)$$

in which R is the appropriate relative response factor as listed in *Table 1;* r_i is the peak response for each impurity in the *Test solution;* and r_S is the peak response of risperidone in the *Test solution:* not more than 0.3% of any individual unidentified impurity is found, not more than 0.5% of any individual specified impurity is found, and not more than 1.0% of total impurities is found.

Assay—

Diluent—Prepare a degassed mixture of methanol and water (80 : 20).

Solution A—Prepare a filtered and degassed mixture of water, acetonitrile, and trifluroacetic acid (80 : 19.5 : 0.1). Adjust with ammonium hydroxide to a pH of 3.0.

Solution B—Prepare a filtered and degassed mixture of water, methanol, and trifluoroacetic acid (61 : 39 : 0.1). Adjust with ammonium hydroxide to a pH of 3.0.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer an accurately weighed quantity of USP Risperidone RS to a suitable volumetric flask, and dissolve in and dilute quantitatively with *Diluent* to obtain a solution having a known concentration of about 0.1 mg per mL.

Assay preparation—Transfer an accurately weighed portion of not fewer than 10 Tablets to a volumetric flask that can accommodate a final concentration of 0.1 mg of risperidone per mL. Add an appropriate amount of water equivalent to 20% of the total volume of the volumetric flask, and mechanically shake for about 30 minutes. Add a volume of methanol equivalent to 60% of the total volume of the volumetric flask, and mechanically shake for about 30 minutes. Dilute with methanol to volume, and mix to obtain the final 0.1 mg per mL concentration. Pass a portion of this solution through a suitable filter having a 0.45-µm or finer porosity, and use the filtrate.

Table 1

Peak Identfication	Approximate Relative Retention Time *(RRT)*	Relative Response Factor *(R)*	Limit of Impurity
Bicyclorisperidone[1]	0.68	0.81	Not more than 0.5%
Risperidone	1.0	1.0	—
Risperidone *trans-N*-oxide[2]	1.65	—	Not quantified. Used for identification and system suitability check only.
Risperidone *cis-N*-oxide[3]	1.81	0.95	Not more than 0.5%
Any other unidentified impurity	—	1.0	Not more than 0.3%
Total impurities	—	—	Not more than 1.0%

[1] 3-(4-fluoro-2-hydroxyphenyl)-1-[2-(6,7,8,9-tetrahydro-2-methyl-4-oxo-*4H*-pyrido-[1,2-a]pyrimidin-3-yl)ethyl]-2-aza-1-azoniabicyclo[2.2.2]oct-2-ene iodide.
[2] *trans*-3-[2-[4-(6-fluoro-1,2-benzisoxazol-3-yl)-1-piperidinyl]ethyl]-6,7,8,9-tetrahydro-2-methyl-*4H*-pyrido[1,2-a]pyrimidin-4-one, *N*-oxide monohydrate.
[3] *cis*-3-[2-[4-(6-fluoro-1,2-benzisoxazol-3-yl)-1-piperidinyl]ethyl]-6,7,8,9-tetrahydro-2-methyl-*4H*-pyrido[1,2-a]pyrimidin-4-one, *N*-oxide monohydrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 275-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 2.5 mL per minute. The column is maintained at room temperature. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–8	100	0	isocratic
8–16	100→0	0→100	linear gradient
16–20	0	100	isocratic
20–21	0→100	100→0	linear gradient
21–30	100	0	re-equilbration

Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor of risperidone is not more than 2.5, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the risperidone peak. Calculate the quantity, in mg, of risperidone ($C_{23}H_{27}FN_4O_2$) in the portion of Tablets taken by the formula:

$$100(C_S/C_U)(r_U/r_S)$$

in which C_S is the concentration, in mg per mL, of USP Risperidone RS in the *Standard preparation;* C_U is the concentration of risperidone in the *Assay preparation;* and r_U and r_S are the peak responses of risperidone obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP30*)

In-Process Revision

BRIEFING

Ritonavir, page 3577 of the *First Supplement* and page 370 of *PF* 32(2) [Mar.–Apr. 2006]. The test for *X-ray diffraction* ⟨941⟩ is currently used as one of the *Identification* tests in this monograph because Ritonavir has several polymorphic forms with different solubility properties and thus different bioavailability characteristics. Therefore, it is important to control the polymorphic form of the drug substance for the appropriate use. However, it is also suggested that the control of the polymorph in the drug substance depends on the dosage form and the manufacturing process. For instance, the polymorphic form may not be critical for liquid dosage forms. In addition, *X-ray diffraction* used as an *Identification* test may unnecessarily exclude the use of different polymorphs of the drug substance and can be considered a lock-out specification. Based on these comments, the following revisions have been proposed:

1. The test for *X-ray diffraction* is moved from the *Identification* section to a test section.
2. A statement is added to *X-ray diffraction* that states the test is needed only if the drug substance is used for the solid dosage forms.

These revisions are also consistent with the USP flexible monograph policy which allows the use of different polymorphic forms when approved by FDA. The details of this policy are highlighted in *Policies Relating to Polymorphism, Degree of Hydration, Particle Size, Specific Surface Area, and Impurities* under *Policies and Announcements* on page 690 of *PF* 31(3) [May–June 2005].

BRIEFING

Saccharin Calcium, *USP 29* page 1937 and page 3579 of the *First Supplement;* **Saccharin Sodium,** *USP 29* page 1938, page 3580 of the *First Supplement,* and page 1226 of *PF* 31(4) [July–Aug. 2005]. On the basis of data received, the current drying condition "at 105° for 2 hours" in *Identification* test *A* is not sufficient. Therefore, it is proposed to change the specimen drying condition for this test to dry at "105° to constant weight".

(EM1: K. Moore) RTS—C46104

Change to read:

Identification—

A: *Infrared Absorption* ⟨197K⟩—
Test specimen—Dry the specimen at 105° ~~for 2 hours before use.~~

■to constant weight.■2S (*USP30*)

B: To a solution (1 in 10) add 2 drops of methyl red TS, and neutralize with 6 N ammonium hydroxide. Add 3 N hydrochloric acid, dropwise, until the solution is acid to the indicator. Upon the addition of ammonium oxalate TS, a white precipitate is formed. This precipitate is insoluble in 6 N acetic acid but dissolves in hydrochloric acid.

C: Calcium salts moistened with hydrochloric acid impart a transient yellowish-red color to a nonluminous flame.

and heat to boiling. Allow to cool in ice water and, if necessary, rub the inside of the test tube with a glass rod. A dense precipitate is formed.

■*Potassium pyroantimonate solution*—Dissolve 2 g of potassium pyroantimonate in 95 mL of hot water. Cool quickly, and add a solution containing 2.5 g of potassium hydroxide in 50 mL of water and 1 mL of sodium hydroxide solution (8.5 in 100). Allow to stand for 24 hours, filter, and dilute with water to 150 mL.■2S (*USP29*)

C: Sodium salts impart an intense yellow color to a nonluminous flame.

In-Process Revision

BRIEFING

Tiamulin Fumarate, *USP 29* page 2144. On the basis of data and information received, it is proposed to make several changes to this monograph. In the chemical information section, the synonym for this drug substance "Tiamulin Hydrogen Fumarate" is added. This change is for information only and does not reflect a proposed change in official title. The following changes are proposed to reflect the approved quality of this drug substance in distribution. In the Definition, the *Assay* limits are changed to not less than 97.0 percent and not more than 102.0 percent on the dried basis. The upper limit for the *Melting temperature* is raised from 149° to 152°. In the test for *Chromatographic purity* the impurity limit is raised from not more than 2.0% to not more than 3.0%.

Test solution—Use the *Assay preparation* prepared as directed in the *Assay.*

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatogram, identify the tiamulin fumarate peak, and measure all the peak responses. [NOTE—Possible tiamulin fumarate impurities include, but are not limited to, pleuromutilin, mutilin, 14-acetyl mutilin, 11-monoacetyl mutilin, tiamulin related compound A, 11,14-diacetyl mutilin, 8-dimethylderivative, bisdimethyl-thioderivative, and 11-ketoderivative, their retention times, relative to tiamulin fumarate, being about 0.25, 0.3, 0.5, 0.6, 0.8, 1.1, 1.3, 1.4, and 2.3, respectively.] Calculate the area percentage of each impurity, relative to tiamulin fumarate, in the portion of Tiamulin Fumarate taken by the formula:

$$100(r_i / r_U)$$

in which r_i and r_U are the peak responses of each impurity and tiamulin fumarate, respectively: not more than 1.0% of any identified impurity is found; not more than 0.5% of any unidentified impurity is found; and not more than ~~2.0%~~ ■3.0%■2S (*USP30*) of total impurities is found.

BRIEFING

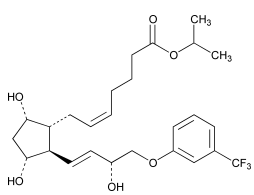
Travoprost, page 1119 of *PF* 31(4) [July–Aug. 2005]. On the basis of comments received, it is proposed to make the following changes:

1. Indicate that the *Assay* calculation is based on the anhydrous and solvent-free basis.
2. Revise the cautionary statement.
3. In *Identification* test *A,* replace *Infrared Absorption* with *Thin-Layer Chromatographic Identification Test*.
4. In the test for *Limit of ethyl acetate,* change the column inner diameter.
5. In the test for *Limit of ethyl acetate,* change the retention time of ethyl acetate and add a *Note*.
6. In *Table 1* in the test for *Related compounds,* change the impurity names and the relative response factor for the 15-*epi* diastereomer.

(MD-OOD: F. Mao) RTS—C43225

Add the following:

■Travoprost



$C_{26}H_{35}F_3O_6$ 500.55

[1*R*-[1α(*Z*),2β(1*E*,3*R**),3α,5α]]-7-[3,5-Dihydroxy-2-[3-hydroxy-4-[3-(trifluoromethyl)phenoxy]-1-butenyl]cyclopentyl]-5-heptenoic acid, 1-methylethyl ester.

(*Z*)-7-[(1*R*,2*R*,3*R*,5*S*)-3,5-Dihydroxy-2-[(1*E*,3*R*)-3-hydroxy-4-[(α,α,α-trifluoro-*m*-isopropyl-tolyl)oxy]-1-butenyl]cyclopentyl]-5-heptenoate [*157283-68-6*].

» Travoprost contains not less than 96.0 percent and not more than 102.0 percent of $C_{26}H_{35}F_3O_6$, calculated on the anhydrous and solvent-free basis.

Caution—Great care should be taken to avoid ~~inhalation and~~ contact with the body.

Packaging and storage—Preserve at –25° to –15° in tight, light-resistant containers under a nitrogen atmosphere.

USP Reference standards ⟨11⟩—*USP Travoprost RS.*

Identification—

A: ~~*Infrared Absorption* ⟨197F⟩~~ *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Use the *Assay preparation.*

Standard solution—Use USP Travoprost RS.

Developing solvent system: a mixture of ethyl acetate and ethanol (4 : 1).

Spray reagent: 20% solution of phosphomolybdic acid in ethanol.

Procedure—Separately apply 20 µL each of the *Test solution* and the *Standard solution* to a thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with silica gel that contains 20% silver nitrate. [NOTE—To keep the spot size small, it is usually necessary to apply approximately 1 to 2 µL at a time, allowing the spot to dry between each application.] Proceed as directed in the chapter. Spray the plate with *Spray reagent,* and heat it in an oven at 80° to 100°. The travoprost will appear as black spots.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Specific rotation ⟨781S⟩**:** from +52.0° to +58.0°, at 365 nm.

Test solution: 20 mg per mL, in dehydrated alcohol.

Water, *Method Ia* ⟨921⟩**:** not more than 1.0%, determined on a 0.2-g specimen. Use a solvent mixture of acetonitrile and methanol (1 : 1) and a titrant for which 1 mL is equivalent to 2 mg of water.

Limit of ethyl acetate—

Standard solution—Dilute an accurately measured quantity of ethyl acetate in *N,N*-dimethylacetamide to obtain a solution having a known concentration of about 50 µg per mL.

Test solution—Dissolve an accurately weighed quantity of Travoprost in *N,N*-dimethylacetamide to obtain a solution having a concentration of about 20 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and contains a ~~0.53-m~~ 0.53-mm × 30-m column coated with a 1-µm film of liquid phase G16. The carrier gas is helium, flowing at a rate of 4 mL per minute. The chromatograph is programmed as follows. Initially the temperature of the column is maintained at 55° for 6 minutes, then the temperature is increased at a rate of 25° per minute to 240° and maintained at 240° for 20 minutes. The injection port temperature is maintained at 140°, and the detector temperature is maintained at 240°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the retention time is about ~~3.5 minutes~~ 2 to 5 minutes for ethyl acetate [NOTE—For the purpose of the peak identification, the approximate retention time range of ethyl acetate is given.]; the resolution, *R,* between ethyl acetate and any adjacent peak is not less than 1.5; and the relative standard deviation for replicate injections is not more than 15.0%.

In-Process Revision

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the concentration, in ppm, of ethyl acetate in the portion of Travoprost taken by the formula:

$$C_S / C_U (r_U / r_S)$$

in which C_S is the concentration, in µg per mL, of ethyl acetate in the *Standard solution;* C_U is the concentration, in g per mL, of Travoprost in the *Test solution;* and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; not more than 5000 ppm of ethyl acetate is found.

Related compounds—

Buffer, Mobile phase, Standard preparation, and *Chromatographic system*—Proceed as directed in the *Assay.*

Test solution—Use the *Assay preparation*.

Procedure—Inject a volume (about 100 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Travoprost taken by the formula:

$$100(1/F)(r_i / r_s)$$

in which F is the relative response factor for each impurity; r_i is the individual peak response of each individual impurity; and r_s is the sum of the responses of all the peaks. In addition to not exceeding the limits for each impurity in *Table 1,* not more than 0.1% of any other individual impurity is found, and not more than 4.0 % of total impurities is found.

Assay—

Buffer—Add 2.0 mL of phosphoric acid to 1 L of water. Adjust with sodium hydroxide to a pH of 3.0.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer* and acetonitrile (7 : 3). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Use USP Travopost RS without dilution (0.5 mg per mL).

Assay preparation—Transfer about 25 mg of Travoprost, accurately weighed, to a 50-mL volumetric flask, and dissolve in 15 mL of acetonitrile. Add 25 mL of water, mix, and wait until the solution reaches room temperature. Dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 5-cm column that contains packing L1. The flow rate is about 3.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between travoprost and any adjacent peak is not less than 1.5; the column efficiency is not less than 1500 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{26}H_{35}F_3O_6$ in the portion of Travoprost taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Travoprost RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP30*)

BRIEFING

Travoprost Ophthalmic Solution, page 1121 of *PF* 31(4) [July–Aug. 2005]. On the basis of comments received, it is proposed to revise the cautionary statement. It is also proposed to revise the limit of travoprost related compound A in the test for *Limit of travoprost related compound A*.

(MD-OOD: F. Mao) RTS—C43225

Add the following:

■Travoprost Ophthalmic Solution

» Travoprost Ophthalmic Solution is a sterile buffered aqueous solution of Travoprost. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of travoprost ($C_{26}H_{35}F_3O_6$). It may contain suitable stabilizers, buffers, and antimicrobial agents.

Caution—Great care should be taken to avoid ~~inhalation of Travoprost and~~ exposure to the body.

Packaging and storage—Preserve in tight, light-resistant containers. Store between 2° to 25°.

USP Reference standards ⟨11⟩—*USP Travoprost RS. USP Travoprost Related Compound A RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Sterility—It meets the requirements under *Sterility Tests* ⟨71⟩ when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined.*

pH ⟨791⟩**:** between 5.5 and 6.5.

Limit of travoprost related compound A—

Buffer—Add 2.0 mL of phosphoric acid to 2.0 L of water, and adjust with sodium hydroxide to a pH of 3.0.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer* and acetonitrile (19 : 6). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

In-Process Revision

Standard solution—Dilute USP Travoprost Related Compound A RS with a mixture of water and acetonitrile (80 : 20), and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.3 µg of travoprost related compound A per mL.

Test solution—Use the Ophthalmic Solution without dilution.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 5-cm column that contains packing L1. The flow rate is about 3.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 2000 theoretical plates; and the relative standard deviation for replicate injections is not more than 10.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of USP Travoprost Related Compound A RS in each mL of the Ophthalmic Solution taken by the formula:

$$C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Travoprost Related Compound A RS in the *Standard solution;* and r_U and r_S are the peak responses of travoprost related compound A obtained from the *Test solution* and the *Standard solution,* respectively: not more than ~~0.3%~~ 0.2% is found.

Limit of degradation products—

Buffer, Mobile phase, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Prepare as directed for *Standard preparation* in the *Assay.*

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay.*

Procedure—Measure the responses for the 5,6-*trans* isomer and the 15-keto derivative. Calculate the quantity, in mg, of each degradation product in each mL of the Ophthalmic Solution taken by the formula:

$$(C/F)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of travoprost in the *Standard solution; F* is the relative response factor for each known degradation product; r_U is the peak response for each degradation product obtained from the *Test solution;* and r_S is the travoprost peak response obtained from the *Standard solution:* not more than 5.0% of the 5,6-*trans* isomer (relative retention time of about 1.1 and relative response factor, F, = 1.0) is found; not more than 0.3% of the 15-keto derivative (relative retention time of about 1.4 and relative response factor, F, = 1.7) is found; and the sum of all degradation products, including the amount of travoprost related compound A obtained in the test for the *Limit of travoprost related compound A* is not more than 5.5%.

Assay—

Buffer—Dissolve 4.35 g of sodium 1-octanesulfonate, in 2.0 L of water. Adjust with phosphoric acid to a pH of 3.5.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer* and acetonitrile (33 : 17). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dilute USP Travoprost RS with a mixture of water and acetonitrile (7 : 3), and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.04 mg of travoprost per mL.

Assay preparation—Use the Ophthalmic Solution without dilution.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as

directed for *Procedure:* the resolution, *R,* between travoprost and any adjacent peak is not less than 1.5; the column efficiency is not less than 2000 theoretical plates; and the relative standard deviation for replicate injections for the travoprost peak is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of travoprost ($C_{26}H_{35}F_3O_6$) in each mL of the Ophthalmic Solution taken by the formula:

$$C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Travoprost RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S *(USP30)*

BRIEFING

Triamcinolone Diacetate, *USP 29* page 2186. Because this monograph provides a test for *Water* and not a test for *Loss on drying,* it is proposed to revise the Definition and *Identification* test *B* to delete references to "dried basis" determinations and to indicate that determinations are made on the "anhydrous basis".

(MD-PS: D. Bempong) RTS—C44818

DIETARY SUPPLEMENTS—MONOGRAPHS

BRIEFING

Cat's Claw, page 1071 of *PF* 30(3) [May–June 2004]; **Powdered Cat's Claw,** page 1075 of *PF* 30(3) [May–June 2004]; **Powdered Cat's Claw Extract,** page 1075 of *PF* 30(3) [May–June 2004]; **Cat's Claw Capsules,** page 1077 of *PF* 30(3) [May–June 2004]; **Cat's Claw Tablets,** page 1078 of *PF* 30(3) [May–June 2004]. These new monographs, which previously appeared in *Pharmacopeial Previews,* are now forwarded with some changes to *In-Process Revision.* Changes are proposed in *Identification* test *A* and the test for *Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindoles* in order to improve the chromatographic procedures. Changes are also proposed in the test for *Microbial enumeration* to comply with the general chapter *Microbiological Attributes of Nonsterile Nutritional and Dietary Supplements* ⟨2023⟩.

(DSB: M. Sharaf) RTS—C45484

Add the following:

■Cat's Claw

» Cat's Claw consists of the inner bark of the stems of *Uncaria tomentosa* (Willd.) DC. (Fam. Rubiaceae). It contains not less than 0.3 percent of pentacyclic oxindole alkaloids, calculated on the dried basis, as the sum of speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine.

In-Process Revision

Packaging and storage—Preserve in tight, light-resistant containers, and store at room temperature.

Labeling—The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.

USP Reference standards ⟨11⟩—*USP Isopteropodine RS. USP Powdered Cat's Claw Extract RS.*

Botanic characteristics—[NOTE—The pharmacopeial article is constituted only by the stem inner bark of *U. tomentosa* (Willd.) DC. Descriptions of other parts of the plant are given to aid in the collection of the right species. Compliance should be determined using the entire monograph and not only the botanical description.]

Macroscopic—Cat's Claw is a woody vine with a main stem up to 20 cm in diameter and 30 m long. The branches are obtusely quadrangular and generally puberulous. Stipules in the buds are densely tomentose in the upper side (different from *U. guianensis* in which the stipules are glabrous) with the hairs, often with curved tips, meshed together and with the longer hairs of the leaf helping to connect the pair of stipules along the margins, but split when older (different from *U. guianensis* in which the stipules separate early in the bud development). Thorns are straight to sickle-shaped, not spirally twisted (different from *U. guianensis*), very pungent and woody, from 8 to 20 mm long and 3 to 6 mm wide. When recently cut, the color of the inner bark can be whitish gray, yellowish brown, or dark red, with longitudinal fissures and persistent rhytidome. The internal part has a slightly dusty fibrous and laminar texture with a characteristic ferruginous dust and an extremely astringent taste. The terminal branches have a quadrangular section and yellowish green internal medulla.

Microscopic—The periderm with cork (phellem) is constituted by 6 to 8 rows of cells having walls evenly thickened, a compressed phellogen [NOTE—The periderm and phellogen should be absent in the pharmacopeial article], and a phelloderm with 1 to 7 rows of sclereids. The secondary cortex with concentric rings of fibers are separated by rings of parenchyma; rings of fibers are frequently interrupted by radial rows of parenchyma cells (predominately 1 cell broad) or narrow medullary rays (few cells broad), forming rectangular bundles of fibers in a regular network; in longitudinal view the fibers appear with numerous conspicuous pits; calcium oxalate microcrystals (sand-like) are abundant in the parenchyma, but usually absent as large polyhedral crystals or in the form of styloids with bifurcated endings, the latter forms typically present in the parenchyma of *U. guianensis;* a brown substance is dispersed in parenchyma cells; starch is abundant, granules are solitary (circular in outline, up to 10 µm in diameter) or compound (2 to 3 components up to 15 µm in diameter).

Identification—

A: *Thin Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Transfer about ~~1 g~~ 5 g of the powdered Cat's Claw to a screw-capped centrifuge tube. Add 10 mL of methanol, and sonicate for 5 minutes, shaking occasionally. Heat the mixture in a water bath at 60° for 15 minutes, cool, and filter. Apply 20 µL to the plate in bands that are 1 cm in length.

Standard solution—~~Transfer about 100 mg of USP Powdered Cat's Claw Extract RS to a screw-capped centrifuge tube. Add 10 mL of methanol, and sonicate for 5 minutes, shaking occasionally. Heat in a water bath at 60° for 15 minutes, cool, and filter. Apply 20 µL to the plate in bands that are 1 cm in length.~~ Transfer about 100 mg of USP Powdered Cat's Claw Extract RS to a screw-capped centrifuge tube. Add 2 mL of methanol, and sonicate for 5 minutes, shaking occasionally, cap, heat in a water bath at 60° for 15 minutes, cool, and centrifuge. Apply 20 µL to the plate in bands that are 1 cm in length.

Developing solvent system—Prepare a solution of ethyl acetate and hexane (95 : 5).

Spray reagent A—Dissolve 0.85 g of basic bismuth nitrate in 10 mL of glacial acetic acid and 40 mL of water by heating. Filter if necessary (Solution A). Dissolve 8 g of potassium

In-Process Revision

iodide in 30 mL of water (Solution B). Mix Solution A and Solution B (1 : 1) to obtain a stock solution. Dilute 1 mL of the stock solution with 2 mL of glacial acetic acid and 10 mL of water.

Spray reagent B—Use a 10% solution of sodium nitrite in water.

Procedure—Develop the chromatogram to a length of not less than 12 cm, and dry the plate in a current of air. Examine the plates under short UV light: ~~the chromatogram obtained from the *Test solution* shows quenching zones that correspond in R_F value to those for speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine in the chromatogram obtained from the *Standard solution.* Other quenching zones of varying intensities may be observed in the chromatogram obtained from the *Test solution.*~~ the chromatogram obtained from the *Test solution* shows multiple zones that correspond in R_F values to those observed in the chromatogram obtained from the *Standard solution.* Other zones of varying intensities may be observed in the chromatogram obtained from the *Test solution.*

Spray the plate with *Spray reagent A* followed by *Spray reagent B,* and examine the plate under daylight: ~~the chromatogram obtained from the *Test solution* shows orange-brown zones that correspond in color and R_F value to those for speciophylline, pteropodine, and isopteropodine in the chromatogram obtained from the *Standard solution.* Other colored zones of varying intensities may be observed in the chromatogram obtained from the *Test solution.*~~ the chromatogram obtained from the *Test solution* shows multiple orange-brown zones that correspond in color and R_F values to those observed in the chromatogram obtained from the *Standard solution.* Other colored zones of varying intensities may be observed in the chromatogram obtained from the *Test solution.*

B: The chromatogram of the *Test solution* exhibits peaks for speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine at retention times that correspond to those in the chromatogram of *Standard solution 1,* as obtained in the test for *Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindoles.*

Microbial enumeration ⟨2021⟩—It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli.* The total aerobic microbial count does not exceed 10^5 per g, the total combined molds and yeasts count does not exceed 10^3 per g, ~~and the enterobacterial count is not more than 10^2 per g.~~ and the bile-tolerant Gram-negative bacteria does not exceed 10^3 per g.

Loss on drying ⟨731⟩—Dry at 105° for 2 hours: it loses not more than 7.0% of its weight.

Foreign organic matter ⟨561⟩**:** not more than 2.0%.

Total ash ⟨561⟩**:** not more than 8.0%.

Acid-insoluble ash ⟨561⟩**:** not more than 2.0%.

Pesticide residues ⟨561⟩**:** meets the requirements.

Heavy metals, *Method III* ⟨231⟩**:** not more than 20 µg per g.

Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindoles—

Solution A—Prepare a filtered and degassed 10 mM pH 7.0 phosphate buffer by mixing 6 mL of 1 N sodium hydroxide, 10 mL of 1 M monobasic potassium phosphate, and sufficient water to make 1000 mL, and adjusting to a pH of 7.0 ± 0.1 by adding more of either solution.

Solution B—Use filtered and degassed acetonitrile.

Solution C—Prepare a filtered and degassed solution of methanol and glacial acetic acid (99 : 1).

Mobile phase—Use variable mixtures of *Solution A, Solution B,* and *Solution C* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution 1—Dissolve an accurately weighed quantity of USP Powdered Cat's Claw Extract RS in methanol, shaking for 1 minute. Dilute with methanol to

In-Process Revision

obtain a solution having a known concentration of about 0.5 mg of the labeled amount of total oxindole alkaloids per mL. Pass through a filter having a 0.45-µm or finer porosity.

Standard solution 2—Dissolve an accurately weighed quantity of USP Isopteropodine RS in methanol. Dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.1 mg per mL. Pass through a nylon filter having a 0.45-µm or finer porosity.

Test solution—Accurately weigh approximately 750 mg of ground Cat's Claw, and place in a 10-mL centrifuge tube. Sonicate with 2.5 mL of methanol for 10 minutes. Centrifuge, and transfer this solution to a 10-mL volumetric flask. Repeat the above extraction three additional times combining the extracts in the 10-mL volumetric flask, and dilute with methanol to volume. Transfer about 3 mL of the solution to a test tube containing 300 mg of polyamide powder, and shake for 1 minute. Pass through a nylon filter having a 0.45-µm or finer porosity, discarding the first part of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 245-nm detector and a 4.6-mm × 10-cm column that contains ~~end packed~~ endcapped 3-µm packing L1. The flow rate is about 0.75 mL per minute. The chromatograph is programmed as follows. Inject into the chromatograph *Standard solution 1,* and record the peak responses as directed for *Procedure:* the chromatograms obtained are similar to the Reference Chromatogram provided with the USP Powdered Cat's Claw Extract RS; the tailing factor for isopteropodine is not more than 2.0; and the relative standard deviation for replicate injections of *Standard solution 1* is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of *Standard solution 1, Standard solution 2,* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the analyte peaks. Identify the retention times of the peaks corresponding to speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine by comparison of the chromatogram of *Standard solution 1* ~~with that obtained from the Reference Chromatogram.~~ with the Reference Chromatogram provided with the lot of the USP Powdered Cat's Claw Extract RS used. Separately calculate the percentages of speciophylline, uncarine F, mitraphylline, isomitraphylline, rhynchophylline, isorhynchophylline, pteropodine, and isopteropodine in the portion of Cat's Claw taken by the formula:

$$(C/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Isopteropodine RS in *Standard solution 2; W* is the weight, in g, of Cat's Claw taken to prepare the *Test solution;* r_U is the peak response for each relevant alkaloid obtained from the *Test solution;* and r_S is the peak response for isopteropodine obtained from *Standard solution 2*. Calculate the content of pentacyclic oxindole alkaloids by adding the percentages of speciophylline, uncarine F, mitraphylline, isomitraphylline,

Time (minutes)	*Solution A* (%)	*Solution B* (%)	*Solution C* (%)	Elution
0–17	65	35	0	isocratic
~~17–22~~ 17–25	65→50	35→50	0	linear gradient
~~22–28~~ 25–30	50	50	0	isocratic
~~28–29~~ 30–31	50→0	50→0	0→100	linear gradient
~~29–34~~ 31–36	0	0	100	isocratic
~~34–39~~ 36–39	0→65	0→35	100→0	linear gradient
39–49	65	35	0	equilibration

pteropodine, and isopteropodine. Calculate the content of tetracyclic oxindole alkaloids by adding the individual percentages of rhynchophylline and isorhynchophylline: not more than 0.05 percent of tetracyclic oxindole alkaloids is found.■2S (*USP30*)

BRIEFING

Powdered Cat's Claw, page 1075 of *PF* 30(3) [May–June 2004]—See briefing under *Cat's Claw.*

(DSB: M. Sharaf) RTS—C45499

Add the following:

■Powdered Cat's Claw

» Powdered Cat's Claw is Cat's Claw reduced to a powder or very fine powder. It contains not less than 0.3 percent of pentacyclic oxindole alkaloids, calculated on the dried basis, as the sum of speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine.

Packaging and storage—Preserve in tight, light-resistant containers, and store at room temperature.

Labeling—The label states the Latin binomial and, following the official name, the part of the plant from which the article was derived.

USP Reference standards ⟨11⟩—*USP Isopteropodine RS. USP Powdered Cat's Claw Extract RS.*

Botanic characteristics—Presence of fragments of cork and suberized cells, with cell walls evenly thickened. Presence of phelloderm sclereids. Fragments of fibers crossed by vascular rays are darkened due to the presence of sand-like calcium oxalate microcrystals. Solitary or two- to three-compound starch grains up to 15 μm in diameter. Absence of styloids, typically present in *U. guianensis.*

Other requirements—It meets the requirements of the tests for *Identification, Microbial enumeration, Loss on drying, Total ash, Acid-insoluble ash, Pesticide residues, Heavy metals,* and *Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindole alkaloids* under *Cat's Claw.*■2S (*USP30*)

BRIEFING

Powdered Cat's Claw Extract, page 1075 of *PF* 30(3) [May–June 2004]—See briefing under *Cat's Claw.*

(DSB: M. Sharaf) RTS—C45502

Add the following:

■Powdered Cat's Claw Extract

» Powdered Cat's Claw Extract is prepared from Cat's Claw by extraction with hydroalcoholic mixtures or other suitable solvents. The ratio of plant material to extract is between 4 : 1 and 6 : 1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of pentacyclic oxindole alkaloids, calculated on the dried basis, as the sum of speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine. It may contain suitable added substances.

In-Process Revision

Packaging and storage—Preserve in tight, light-resistant containers, and store at room temperature.

Labeling—The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. The label also indicates the content of pentacyclic oxindole alkaloids, the extracting solvent or solvent mixture used for preparation, and the ratio of the starting crude plant material to Powdered Extract. It meets the requirements for *Labeling* under *Botanical Extracts* ⟨565⟩.

USP Reference standards ⟨11⟩—*USP Isopteropodine RS. USP Powdered Cat's Claw Extract RS.*

Identification—

A: *Thin Layer Chromatographic Identification Test* ⟨201⟩—

Standard solution, Developing solvent system, Spray reagent A, Spray reagent B, and *Procedure*—Proceed as directed for *Thin-Layer Chromatographic Identification Test* ⟨201⟩ under *Cat's Claw.*

Test solution—Shake a quantity of Powdered Extract, equivalent to 25 mg of the labeled amount of pentacyclic oxindole alkaloids, in 20 mL of methanol. Allow to stand for 15 minutes before use.

B: The chromatogram of the *Test solution* exhibits peaks for speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine at retention times that correspond to those in the chromatogram of *Standard solution 1,* as obtained in the test for *Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindole alkaloids.* The sum of the peak areas for the tetracyclic oxindole alkaloids rhynchophylline and isorhynchophylline is less than 25% of the total peak areas detected for pentacyclic oxindole alkaloids.

Microbial enumeration ⟨2021⟩**:** meet the requirements of the tests for absence of *Salmonella* species and *Escherichia coli.* The total aerobic microbial count does not exceed 10^4 per g, and the total combined molds and yeasts count does not exceed 10^3 per g. ~~, and the enterobacterial count is not more than 10^2 per g.~~

Loss on drying ⟨731⟩**—**Dry 1g at 105° for 2 hours: it loses not more than 10.0% of its weight.

Heavy metals, *Method II* ⟨231⟩**:** not more than 10 µg per g.

Organic volatile impurities, *Method VI* ⟨467⟩**:** meets the requirements.

Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindoles—

Solution A, Solution B, Solution C, Mobile phase, Standard solution 1, Standard solution 2, and *Chromatographic system*—Proceed as directed in the test for *Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindoles* under *Cat's Claw.*

Test solution—Transfer an accurately weighed quantity of Powdered Extract, equivalent to about 5 mg of the labeled content of pentacyclic oxindole alkaloids, to a 10-mL centrifuge tube. Add 2.5 mL of methanol, and sonicate for 10 minutes. Centrifuge, and transfer the supernatant to a 10-mL volumetric flask. Repeat the above extraction three additional times combining the extracts in the 10-mL volumetric flask, and dilute with methanol to volume. Transfer about 3 mL of the solution to a test tube containing 300 mg of polyamide powder, and shake for 1 minute. Pass through a nylon filter having a 0.45-µm or finer porosity, discarding the first part of the filtrate. ~~Centrifuge, or pass through a filter having a 0.45-µm or finer porosity.~~

Procedure—Proceed as directed in the test for *Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindole alkaloids* under *Cat's Claw.* Separately calculate the percentage of each relevant alkaloid in the portion of Powdered Extract taken by the formula:

$$(C/W)(r_U/r_S)$$

in which W is the weight, in g, of Powdered Extract taken to prepare the *Test solution;* and the other terms are as defined therein. Calculate the percentage of pentacyclic oxindole alkaloids in the Powdered Extract taken by adding the individual percentages of speciophylline, uncarine F, mitra-

In-Process Revision

phylline, isomitraphylline, pteropodine, and isopteropodine. Calculate the percentage of tetracyclic oxindole alkaloids in the Powdered Extract taken by adding the individual percentages of rhynchophylline and isorhynchophylline: not more than 25% of the labeled amount of pentacyclic oxindole alkaloids is found.

Other requirements—It meets the requirements for *Residual Solvents* and *Pesticide Residues* under *Botanical Extracts* ⟨565⟩.■2S (*USP30*)

BRIEFING

Cat's Claw Capsules, page 1077 of *PF* 30(3) [May–June 2004]—See briefing under *Cat's Claw.*

(DSB: M. Sharaf) RTS—C45503

Add the following:

■Cat's Claw Capsules

» Cat's Claw Capsules contain Powdered Cat's Claw Extract. Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of Powdered Extract, calculated as pentacyclic oxindole alkaloids.

Packaging and storage—Preserve in tight, light-resistant containers, and store at room temperature.

Labeling—The label states the Latin binomial and, following the official name, the article from which the Capsules were prepared. If prepared with Extract, the label also indicates the quantity, in mg, of Extract per Capsule and the content, in mg, of pentacyclic oxindole alkaloids per 100 mg of Powdered Extract.

USP Reference standards ⟨11⟩—*USP Isopteropodine RS. USP Powdered Cat's Claw Extract RS.*

Identification—The chromatogram of the *Test solution* exhibits peaks for speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine at retention times that correspond to those in the chromatogram of *Standard solution 1,* as obtained in the test for *Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindole alkaloids*. The content of tetracyclic oxindole alkaloids, calculated as the sum of rhynchophylline and isorhynchophylline, is not more than 25% of the labeled amount of pentacyclic oxindole alkaloids.

Microbial enumeration ⟨2021⟩: meet the requirements of the tests for absence of *Salmonella* species and *Escherichia coli.* The total aerobic microbial count does not exceed 10^4 per g, and the total combined molds and yeasts count does not exceed 10^3 per g. ~~, and the enterobacterial count is not more than 10^2 per g.~~

Disintegration ⟨2040⟩: meet the requirements for disintegration of botanical dosage forms.

Weight variation ⟨2091⟩: meet the requirements.

Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindole alkaloids—

Solution A, Solution B, Solution C, Mobile phase, Standard solution 1, Standard solution 2, and *Chromatographic system*—Proceed as directed in the test for *Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindole alkaloids* under *Cat's Claw.*

Test solution—Weigh accurately the contents of not fewer than 20 Capsules, and pulverize, using a mortar and pestle. Transfer an accurately weighed quantity of the powder, equivalent to 20 mg of the labeled amount of pentacyclic oxindole alkaloids, to a 50-mL centrifuge tube. Sonicate with 10 mL of methanol for 10 minutes. Centrifuge, and transfer this solution to a 50-mL volumetric flask. Repeat the above extraction three additional times combining the extracts in the 50-mL volumetric flask, and dilute with methanol to volume.

In-Process Revision

Transfer about 3 mL of the solution to a test tube containing 300 mg of polyamide powder, and shake for 1 minute. Pass through a nylon filter having a 0.45-µm or finer porosity, discarding the first part of the filtrate.

Procedure—Proceed as directed in the test for *Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindole alkaloids* under *Cat's Claw*. Calculate the content of each relevant alkaloid, in mg, in the portion of Capsules taken by the formula:

$$50C(r_U / r_S)$$

in which the terms are as defined therein. Calculate the content of total pentacyclic oxindole alkaloids by adding the individual contents of speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine. Calculate the content of tetracyclic oxindole alkaloids by adding the individual contents of rhynchophylline and isorhynchophylline: not more than 25% of the labeled amount of pentacyclic oxindole alkaloids is found. ■2S (*USP30*)

BRIEFING

Cat's Claw Tablets, page 1078 of *PF* 30(3) [May–June 2004]—See briefing under *Cat's Claw.*

(DSB: M. Sharaf) RTS—C45504

Add the following:

■Cat's Claw Tablets

» Cat's Claw Tablets contain Powdered Cat's Claw Extract. Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of Powdered Extract, calculated as pentacyclic oxindole alkaloids.

Packaging and storage—Preserve in tight, light-resistant containers, and store at room temperature.

Labeling—The label states the Latin binomial and, following the official name, the article from which Tablets were prepared. The label also indicates the quantity, in mg, of Powdered Extract per Tablet. Label Tablets to indicate the content, in mg, of pentacyclic oxindole alkaloids per 100 mg of Powdered Extract.

USP Reference standards ⟨11⟩—*USP Isopteropodine RS. USP Powdered Cat's Claw Extract RS.*

Identification—The chromatogram of the *Test solution* exhibits peaks for speciophylline, uncarine F, mitraphylline, isomitraphylline, pteropodine, and isopteropodine at retention times that correspond to those in the chromatogram of *Standard solution 1,* as obtained in the test for *Content of pentacyclic oxindole alkaloids and limit of tetracyclic oxindole alkaloids*. The content of tetracyclic oxindole alkaloids, calculated as the sum of rhynchophylline and isorhynchophylline, is not more than 25% of the labeled amount of pentacyclic oxindole alkaloids.

Microbial enumeration ⟨2021⟩**:** meet the requirements of the tests for absence of *Salmonella* species and *Escherichia coli.* The total aerobic microbial count does not exceed 10^4 per g, and the total combined molds and yeasts count does not exceed 10^3 per g. ~~, and the enterobacterial count is not more than 10^2 per g.~~

BRIEFING

Black Cohosh, Powdered Black Cohosh, Powdered Black Cohosh Extract, Black Cohosh Tablets. These monographs, previously proposed in *PF* 28(5) [Sept.–Oct. 2002], have been canceled, and new monographs are proposed, with the following changes: in the *Identification* tests, changes were made, and a third test has been added. In *Identification* test *C,* it is proposed that the ratio of the peak areas of cimigenol–arabinoside to cimigenol–xyloside be not less than 0.4, as determined in the chromatogram of the test for *Content of triterpene glycosides.* This ratio, based on data available to USP, is proposed as a way to differentiate *Actaea racemosa* from *Cimicifuga foetida.* The *Microbial enumeration* test has been changed to comply with the general chapter *Microbial Attributes of Nonsterile Nutritional and Dietary Supplements* ⟨2023⟩. A test for *Loss on drying* has been added. Corrections have been made in the table showing relative retention times of characteristic markers in the test for *Content of triterpene glycosides.*

(DSB: M. Sharaf) RTS—C39733

Add the following:

■Black Cohosh

» Black Cohosh consists of the dried rhizome and roots of *Actaea racemosa* L. [*Cimicifuga racemosa* (L.) Nutt.] (Fam. Ranunculaceae). It is harvested in the summer. It contains not less than 0.4 percent of triterpene glycosides, calculated as 23-*epi*-26-deoxyactein* ($C_{37}H_{56}O_{10}$) on the dried basis.

Packaging and storage—Preserve in a well-closed, light-resistant container. Protect from moisture, and store at room temperature.

* 23-*epi*-26-deoxyactein is sometimes referred to as 27-deoxyactein.

In-Process Revision

Labeling—The label states the Latin binomial and, following the official name, the parts of the plant contained in the article.

USP Reference standards ⟨11⟩—*USP Actein RS. USP 23-epi-26-Deoxyactein RS. USP Powdered Black Cohosh Extract RS.*

Botanic characteristics—

Macroscopic—The Black Cohosh rhizome is dark brown, longitudinally grooved, rough, strongly knotty, and somewhat curled and irregular. It is 15 cm long and up to 2.5 cm thick. The upper surface is covered with numerous round scars of the earlier stalks; laterally, it is clearly curled, and the lower surface is covered with thin, longitudinally grooved, dark brown, easily breakable roots. The fracture is horny and fibrous. The transverse surface shows a thin outer bark surrounding a ring of numerous pale, narrow wedges of vascular tissue alternating with dark medullary rays and a large central pith. Black Cohosh roots are dark brown, between 1 and 3 mm in diameter, brittle, nearly cylindrical or obtusely quadrangular, and longitudinally wrinkled. The fracture is short. The transverse surface shows a distinct cambium line separating a wide outer bark from a central region composed of three to six wedges of lignified xylem tissue united by their apices and separated by broad nonlignified medullary rays.

Microscopic—In a surface view, suberous epidermal cells are tabular with moderately thickened walls. The parenchymatous cortex is filled with starch. Xylem wedges are lignified and composed of numerous small vessels with bordered pits or reticulately thickened walls, thin-walled fibers, and xylem parenchyma. The parenchyma of the pith is unlignified. Medullary rays are filled with starch granules, which are spherical or polygonal and are mostly simple or two to three compounded but can be up to six compounded. Individual starch granules are between 3 and 15 µm in diameter, each with a somewhat central slit-shaped hilum.

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Adsorbent: chromatographic silica gel mixture with an average particle size of 10 to 15 µm (TLC plates).

Test solution—Transfer about 5 g of powdered Black Cohosh to a screw-capped centrifuge tube, add 10 mL of a mixture of alcohol and water (7 : 3), and heat on a steam bath for 10 minutes. Centrifuge, and use the clear supernatant.

Standard solution 1—Dissolve about 100 mg of USP Powdered Black Cohosh Extract RS in 1 mL of methanol.

Standard solution 2—Dissolve amounts of USP Actein RS, USP 23-*epi*-26-Deoxyactein RS, and isoferulic acid in methanol to obtain a solution having concentrations of about 1 mg per mL each.

Application volume: 10 µL.

Developing solvent system—Use the upper phase of a mixture of butyl alcohol, water, and glacial acetic acid (50 : 40 : 10).

Spray reagent—Prepare a mixture of methanol, glacial acetic acid, sulfuric acid, and *p*-anisaldehyde (85 : 10 : 5 : 0.5). [NOTE—Store in a refrigerator. The reagent is colorless; discard if color appears.]

Procedure—Develop the chromatograms until the solvent front has moved about 15 cm, and dry the plate with the aid of a current of air. Examine the plate under UV light at a wavelength of 365 nm: the chromatogram of the *Test solution* exhibits main zones similar in position and color to the main zones in the chromatogram of *Standard solution 1*. In the upper third of the plate, the chromatogram of the *Test solution* exhibits a blue fluorescent zone at the level of the zone due to isoferulic acid in the chromatogram of *Standard solution 2*. Spray the plate with *Spray reagent,* heat at 100° for 5 minutes, and examine in daylight. The chromatogram of the *Test solution* exhibits main zones similar in position and color to the main zones in the chromatogram of *Standard solution 1*. The chromatogram of *Standard solution 2* exhibits red-violet zones due to actein and 23-*epi*-26-deoxyactein. The

chromatogram of the *Test solution* exhibits several greenish-brown spots in the lower third of the plate and several violet zones above; two of these violet zones occur at R_F values similar to those due to actein and 23-*epi*-26-deoxyactein in the chromatogram of *Standard solution 2*.

B: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Adsorbent: chromatographic silica gel mixture with an average particle size of 5 µm (HPTLC plates).

Test solution—Transfer about 0.5 g of powdered Black Cohosh to a screw-capped tube, add 5 mL of methanol, sonicate for 10 minutes, and filter into a 10-mL volumetric flask. Wash the residue on the filter paper four times, using 1 mL of methanol for each washing; add the washings to the volumetric flask; and dilute with methanol to volume.

Standard solution 1—Use about 0.5 mL of the *Standard solution 1* that was prepared in *Identification* test *A,* and dilute with methanol to 2 mL.

Standard solution 2—Use about 1.0 mL of the *Standard solution 2* that was prepared in *Identification* test *A,* and dilute with methanol to 5 mL.

Application volume: 2 µL as an 8-mm band.

Developing solvent system—Prepare a mixture of toluene, ethyl formate, and formic acid (50 : 30 : 20).

Spray reagent—Proceed as directed for *Identification* test *A.*

Procedure—Develop the chromatograms until the solvent front has moved about two-thirds of the length of the plate, and dry the plate with the aid of a current of air. Spray the plate with *Spray reagent,* heat at 100° for 5 minutes, and examine in daylight. The chromatogram of the *Test solution* exhibits main zones similar in position and color to the main zones in the chromatogram of *Standard solution 1.* The chromatogram of *Standard solution 2* exhibits red-violet zones due to actein and 23-*epi*-26-deoxyactein at R_F values of about 0.5 and 0.4, respectively. The chromatogram of the *Test solution* exhibits zones similar in color and R_F values to those due to actein and 23-*epi*-26-deoxyactein in the chromatogram of *Standard solution 2*.

C: The chromatogram of the *Test solution* exhibits peaks for cimiracemoside A, 26-deoxycimicifugoside, (26*S*)-actein, 23-*epi*-26-deoxyactein, cimigenol–arabinoside, and cimigenol–xyloside at retention times corresponding to those compounds in the chromatogram of the *Standard solution*, as obtained in the test for *Content of triterpene glycosides*. The ratio of the peak areas of cimigenol–arabinoside to cimigenol–xyloside is not less than 0.4 (distinction from *Cimicifuga foetida*).

Microbial enumeration ⟨2021⟩—It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*. The total aerobic microbial count does not exceed 10^5 cfu per g, the total combined molds and yeast count does not exceed 10^3 cfu per g, and the bile-tolerant Gram-negative bacteria count does not exceed 10^3 cfu per g.

Loss on drying ⟨731⟩—Dry it at 105° for two hours: it loses not more than 12.0% of its weight.

Foreign organic matter ⟨561⟩**:** not more than 2.0% of foreign organic matter, and not more than 5.0% of stem bases.

Total ash ⟨561⟩**:** not more than 10.0%.

Acid-insoluble ash ⟨561⟩**:** not more than 4.0%.

Alcohol-soluble extractives, *Method 2* ⟨561⟩**:** not less than 8.0%, using a mixture of alcohol and water (1 : 1) instead of alcohol.

Pesticide residues ⟨561⟩**:** meets the requirements.

Heavy metals ⟨231⟩**:** not more than 10 µg per g.

Content of triterpene glycosides—

Solution A—Use filtered and degassed 0.05% trifluoroacetic acid in water.

Solution B—Use filtered and degassed acetonitrile.

Mobile phase—Use variable quantities of *Solution A, Solution B,* and water as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve amounts of USP Actein RS and USP 23-*epi*-26-Deoxyactein RS in methanol to obtain a solution having concentrations of about 0.1 mg per mL of each.

Standard solution—Dissolve an accurately weighed quantity of USP Powdered Black Cohosh Extract RS in methanol with shaking for 1 minute, and dilute with methanol to obtain a solution having a known concentration of about 30 mg per mL. Pass through a membrane filter having a 0.45-µm or finer porosity.

23-epi-26-Deoxyactein standard solutions—Dissolve an accurately weighed quantity of USP 23-*epi*-26-Deoxyactein RS in methanol with shaking for 1 minute. Dilute quantitatively, and stepwise if necessary, to obtain solutions having known concentrations of about 500, 100, 50, 25, and 12.5 µg per mL. Pass through a membrane filter having a 0.45-µm or finer porosity.

Test solution—Accurately weigh approximately 750 mg of ground plant material, and place into a 20-mL polytef-capped centrifuge tube. Pipet 15 mL of methanol, mix, sonicate for 30 minutes, centrifuge, and transfer the supernatant to an evaporation flask. Repeat the extraction twice. Evaporate the combined extracts under vacuum at 45° to 50°. Dissolve the residue in methanol, and quantitatively transfer to a 10-mL volumetric flask. Dilute with methanol to volume, and pass through a membrane filter having a 0.45-µm or finer porosity.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with an evaporative light-scattering detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.6 mL per minute. The column temperature is maintained at 35°. The detector is set up according to the manufacturer's instruction in order to achieve a signal-to-noise ratio of not less than 10 for the 12.5 µg per mL *23-epi-26-Deoxyactein standard solution.* The chromatograph is programmed as follows.

Time (minutes)	Water (%)	*Solution A* (%)	*Solution B* (%)	Elution
0–8	0	80	20	isocratic
8–15	68	0	32	isocratic
15–55	68→36	0	32→64	linear gradient
55–65	36→5	0	64→95	linear gradient
65–70	5	0	95	isocratic
70–85	5→0	0→80	95→20	linear gradient

Chromatograph the *Standard solution,* the 100 µg per mL *23-epi-26-Deoxyactein standard solution*, and the *System suitability solution,* and record the peak responses as directed for *Procedure:* the chromatogram of the *Standard solution* is similar to the Reference Chromatogram provided with the lot of USP Powdered Black Cohosh Extract RS; the resolution, *R,* between the (26*S*)-actein and the 23-*epi*-26-deoxyactein peaks in the chromatogram of the *System suitability solution* is not less than 1.0; the tailing factor for the 23-*epi*-26-deoxyactein peak in the chromatogram of the 100 µg per mL *23-epi-26-Deoxyactein standard solution* is not more than 2.0; and the relative standard deviation of the logarithm of the area responses for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *System suitability solution, the 23-epi-26-Deoxyactein standard solutions*, the *Standard solution,* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the analyte peaks. Using the chromatogram of the *Standard solution* and the Reference Chromatogram provided with the lot of USP Powdered Black Cohosh Extract RS, identify the retention times of the peaks

corresponding to the triterpene glycosides. The approximate relative retention times of the triterpene glycosides are provided in the following table.

Compound	Relative Retention Time
Cimicifugoside H-1	0.61
Cimiracemoside A	0.78
(26*R*)-Actein	0.94
26-Deoxycimicifugoside	0.96
(26*S*)-Actein	0.98
23-*epi*-26-Deoxyactein	1.00
Acetyl-shengmanol–xyloside	1.03
Cimigenol–arabinoside	1.08
Cimigenol–xyloside (cimicifugoside)	1.13
26-Deoxyactein	1.22
25-Acetyl-cimigenol–arabinoside	1.60
(24*S*)-25-Acetyl-cimigenol–xyloside	1.64
25-*O*-Methyl-cimigenol–arabinoside	1.90
25-*O*-Methyl-cimigenol–xyloside	1.93

Plot the logarithms of the peak area responses versus the logarithms of the concentrations, in µg per mL, of the *23-epi-26-Deoxyactein standard solutions,* and determine the regression line using a least-squares analysis. The correlation coefficient for the regression line is not less than 0.995. From the graphs so obtained, determine the concentration, *C*, in µg per mL, of the relevant analyte in the *Test solution*. Separately calculate the percentages of cimicifugoside H-1, cimiracemoside A, (26*R*)-actein, 26-deoxycimicifugoside, (26*S*)-actein, 23-*epi*-26-deoxyactein, acetyl-shengmanol–xyloside, cimigenol–arabinoside, cimigenol–xyloside (cimicifugoside), 26-deoxyactein, 25-acetyl-cimigenol–arabinoside, (24*S*)-25-acetyl-cimigenol–xyloside, 25-*O*-methyl-cimigenol–arabinoside, and 25-*O*-methyl-cimigenol–xyloside as 23-*epi*-26-deoxyactein ($C_{37}H_{56}O_{10}$) in the portion of Black Cohosh taken by the formula:

$$(C/W)$$

in which *C* is the concentration, in µg per mL, of the relevant analyte in the *Test solution,* as obtained above; and *W* is the weight, in mg, of Black Cohosh taken to prepare the *Test solution*. Calculate the content of triterpene glycosides, in percentage, in the portion of Black Cohosh taken by adding all of the percentages calculated for the individual analytes.■2S (*USP30*)

BRIEFING

Powdered Black Cohosh—See briefing under *Black Cohosh.*

(DSB: M. Sharaf) RTS—C39927

Add the following:

■Powdered Black Cohosh

» Powdered Black Cohosh is Black Cohosh reduced to a powder or a very fine powder. It contains not less than 0.4 percent of triterpene glycosides, calculated as 23-*epi*-26-deoxyactein ($C_{37}H_{56}O_{10}$) on the dried basis.

Packaging and storage—Preserve in well-closed, light-resistant containers, and protect from moisture.

Labeling—The label states the Latin binomial and, following the official name, the parts of the plant from which the article was derived.

In-Process Revision

USP Reference standards ⟨11⟩—*USP Powdered Black Cohosh Extract RS. USP 23-epi-26-Deoxyactein RS.*

Botanic characteristics—The material is a light to dark brown powder, is odorless or has a slight odor, and has an acrid and bitter taste. It shows numerous starch granules with concentric striations, simple or compound. The individual granules are spherical or more or less polygonal and are between 3 and 15 µm in diameter, each with a somewhat central slit-shaped hilum. Vessels with bordered pits occur, as do lignified fibers. Reddish to brown fragments of suberized epidermis with more or less tabular cells occur.

Other requirements—It meets the requirements of the tests for *Identification, Microbial enumeration, Loss on drying, Total ash, Acid-insoluble ash, Alcohol-soluble extractives, Pesticide residues, Heavy metals,* and *Content of triterpene glycosides* under *Black Cohosh*.■2S *(USP30)*

BRIEFING

Powdered Black Cohosh Extract—See briefing under *Black Cohosh.*

(DSB: M. Sharaf) RTS—C39927

Add the following:

■Powdered Black Cohosh Extract

» Powdered Black Cohosh Extract is prepared from Black Cohosh by extraction with hydroalcoholic mixtures or other suitable solvents. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of triterpene glycosides, calculated as 23-*epi*-26-deoxyactein ($C_{37}H_{56}O_{10}$) on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers, and store in a cool place.

Labeling—It meets the requirements for *Labeling* under *Botanical Extracts* ⟨565⟩. Label it to indicate the content of triterpene glycosides, in percentage, calculated as 23-epi-26-deoxyactein.

USP Reference standards ⟨11⟩—*USP Actein RS. USP Powdered Black Cohosh Extract RS. USP 23-epi-26-Deoxyactein RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Shake a quantity of Powdered Extract, equivalent to about 25 mg of triterpene glycosides, in 10 mL of methanol. Allow to stand for 15 minutes before use.

Standard solution 1, Standard solution 2, Developing solvent system, Spray reagent, and *Procedure*—Proceed as directed for *Identification* test *A* under *Black Cohosh*.

B: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Dilute 1 mL of the solution prepared in *Identification* test *A* with methanol to 10 mL.

Standard solution 1, Standard solution 2, Developing solvent system, Spray reagent, and *Procedure*—Proceed as directed for *Identification* test *B* under *Black Cohosh*.

C: The chromatogram of the *Test solution* exhibits peaks for cimiracemoside A, 26-deoxycimicifugoside, (26*S*) actein, 23-*epi*-26-deoxyactein, cimigenol–arabinoside, and cimigenol–xyloside at retention times corresponding to those compounds in the chromatogram of the *Standard solution,* as obtained in the test for *Content of triterpene glycosides*. The ratio of the peak areas of cimigenol–arabinoside to cimigenol–xyloside is not less than 0.4 (distinction from *Cimicifuga foetida*).

Microbial enumeration ⟨2021⟩—It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*. The total bacterial count does not exceed 10^4 cfu per g, and the total combined molds and yeasts count does not exceed 10^3 cfu per g.

Loss on drying ⟨731⟩**:** not more than 5.0%.

Heavy metals, *Method II* ⟨231⟩**:** 10 µg per g.

Organic volatile impurities, *Method VI* ⟨467⟩**:** meets the requirements.

Content of triterpene glycosides—

Solution A, Solution B, Mobile phase, System suitability solution, Standard solution, 23-epi-26-Deoxyactein standard solutions, and *Chromatographic system*—Proceed as directed in the test for *Content of triterpene glycosides* under *Black Cohosh.*

Test solution—Transfer an accurately weighed quantity of Powdered Extract, equivalent to about 7.5 mg of triterpene glycosides, to a 10-mL volumetric flask, add 7 mL of methanol, and sonicate for 30 minutes. Dilute with methanol to volume, and mix. Centrifuge, or pass through a filter having a 0.45-µm or finer porosity.

Procedure—Proceed as directed in the test for *Content of triterpene glycosides* under *Black Cohosh*. Calculate the content of triterpene glycosides, in percentage, in the portion of Powdered Extract taken by adding all of the percentages calculated for individual analytes.

Other requirements—It meets the requirements for *Residual Solvents* and *Pesticide Residues* under *Botanical Extracts* ⟨565⟩.■2S (*USP30*)

BRIEFING

Black Cohosh Fluidextract. A new monograph is proposed for *Black Cohosh Fluidextract,* an article used in the manufacture of some black cohosh products. See also briefing under *Black Cohosh.*

(DSB: M. Sharaf) RTS—C45567

Add the following:

■Black Cohosh Fluidextract

» Black Cohosh Fluidextract is prepared from Black Cohosh by extraction with hydroalcoholic mixtures or isopropanol–water mixtures. Each mL contains the extracted constituents of 1 g of the plant material. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of triterpene glycosides, calculated as 23-*epi*-26-deoxyactein ($C_{37}H_{56}O_{10}$).

Packaging and storage—Preserve in tight, light-resistant containers, and store in a cool place.

Labeling—It meets the requirements for *Labeling* under *Botanical Extracts* ⟨565⟩. Label it to indicate the content, in percentage, of triterpene glycosides, calculated as 23-*epi*-26-deoxyactein.

USP Reference standards ⟨11⟩—*USP Actein RS. USP Powdered Black Cohosh Extract RS. USP 23*-epi-*26-Deoxyactein RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Use the Fluidextract.

Standard solution 1, Standard solution 2, Developing solvent system, Spray reagent, and *Procedure*—Proceed as directed for *Identification* test *A* under *Black Cohosh*.

In-Process Revision

B: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Use the Fluidextract, diluting if necessary with a suitable solvent to obtain a solution containing about 0.25 mg per mL of triterpene glycosides.

Standard solution 1, Standard solution 2, Developing solvent system, Spray reagent, and *Procedure*—Proceed as directed for *Identification* test *B* under *Black Cohosh*.

C: The chromatogram of the *Test solution* exhibits peaks for cimiracemoside A, 26-deoxycimicifugoside, (26*S*)-actein, 23-*epi*-26-deoxyactein, cimigenol-arabinoside, and cimigenol-xyloside at retention times corresponding to those compounds in the chromatogram of the *Standard solution,* as obtained in the test for *Content of triterpene glycosides*. The ratio of the peak areas of cimigenol-arabinoside to cimigenol-xyloside is not less than 0.4 (in distinction from *Cimicifuga foetida*).

Microbial enumeration ⟨2021⟩—The total bacterial count does not exceed 10^4 per g, and the total combined molds and yeasts count does not exceed 10^3 per g.

Heavy metals, *Method II* ⟨231⟩: 10 µg per g.

Content of triterpene glycosides—

*Solution A, Solution B, Mobile phase, System suitability solution, Standard solution, 23-*epi*-26-Deoxyactein standard solutions,* and *Chromatographic system*—Proceed as directed in the test for *Content of triterpene glycosides* under *Black Cohosh.*

Test solution—Use the Fluidextract, diluting if necessary with a suitable solvent to obtain a solution containing about 0.75 mg per mL of triterpene glycosides. Centrifuge, or pass through a filter having a 0.45-µm or finer porosity.

Procedure—Proceed as directed in the test for *Content of triterpene glycosides* under *Black Cohosh*. Calculate the content of triterpene glycosides, in percentage, in the portion of Fluidextract taken by adding the percentages calculated for the individual analytes.

Other requirements—It meets the requirements for *Residual Solvents* and *Pesticide Residues* under *Botanical Extracts* ⟨565⟩.■2S (*USP30*)

BRIEFING

Black Cohosh Tablets—See briefing under *Black Cohosh.*

(DSB: M. Sharaf) RTS—C39927

Add the following:

■Black Cohosh Tablets

» Black Cohosh Tablets contain Powdered Black Cohosh Extract or Black Cohosh Fluidextract. Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of Powdered Extract or Fluidextract, represented by the content of triterpene glycosides, calculated as 23-*epi*-26-deoxyactein ($C_{37}H_{56}O_{10}$).

Packaging and storage—Preserve in tight, light-resistant containers, and store at room temperature.

Labeling—The label states the Latin binomial and, following the official name, the article from which the Tablets were prepared. The label also indicates the amount, in mg per Tablet, of Powdered Extract or Fluidextract; the solvents used to prepare the Powdered Extract or Fluidextract; and the ratio of starting crude plant material to Powdered Extract or Fluidextract. Label it to indicate the content, in percentage, of triterpene glycosides as 23-*epi*-26-deoxyactein in the Powdered Extract or Fluidextract used to prepare the Tablets.

USP Reference standards ⟨11⟩—*USP Actein RS. USP Powdered Black Cohosh Extract RS. USP 23-epi-26-Deoxyactein RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Take 10 mL of the *Test solution* prepared for *Identification* test *B,* evaporate to dryness, and redissolve in 1 mL of methanol.

Standard solution 1, Standard solution 2, Developing solvent system, Spray reagent, and *Procedure*—Proceed as directed for *Identification* test *A* under *Black Cohosh.*

B: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Transfer a portion of powdered Tablets, equivalent to the labeled amount of Powdered Extract or Fluidextract containing about 25 mg of triterpene glycosides, to a suitable flask, add 25 mL of water, shake to disperse, and sonicate for 10 minutes. Add 75 mL of methanol, and sonicate for 10 minutes. Allow to stand for 15 minutes, and use the clear supernatant.

Standard solution 1, Standard solution 2, Developing solvent system, Spray reagent, and *Procedure*—Proceed as directed for *Identification* test *B* under *Black Cohosh.*

C: The chromatogram of the *Test solution* exhibits peaks for cimiracemoside A, 26-deoxycimicifugoside, (26*S*) actein, 23-*epi*-26-deoxyactein, cimigenol–arabinoside, and cimigenol–xyloside at retention times corresponding to those compounds in the chromatogram of the *Standard solution,* as obtained in the test for *Content of triterpene glycosides*. The ratio of the peak areas of cimigenol–arabinoside to cimigenol–xyloside is not less than 0.4 (distinction from *Cimicifuga foetida*).

Weight variation ⟨2091⟩: meet the requirements.

Disintegration ⟨2040⟩: meet the requirements under *Botanical Dosage Forms.*

Dissolution ⟨2040⟩—[To come.]

Microbial enumeration ⟨2021⟩—Tablets meet the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*. The total bacterial count does not exceed 10^4 cfu per g, and the total combined molds and yeasts count does not exceed 10^3 cfu per g.

Content of triterpene glycosides—

Solution A, Solution B, Mobile phase, System suitability solution, Standard solution, 23-epi-26-Deoxyactein standard solutions, and *Chromatographic system*—Proceed as directed in the test for *Content of triterpene glycosides* under *Black Cohosh.*

Test solution—Accurately weigh not fewer than 20 Tablets, and finely powder with a mortar and pestle. Transfer an accurately weighed quantity of the powder, equivalent to about 8 mg of triterpene glycosides, to a suitable polytef-capped centrifuge tube. Add 3 mL of water, shake to disperse, and sonicate for 10 minutes at 60°. Add 3 mL of methanol, and sonicate for 10 minutes. Centrifuge, and transfer the clear supernatant to a 10-mL volumetric flask. Wash the residue twice with 1.5 mL of a mixture of methanol and water (1 : 1), and transfer the washings to the volumetric flask. Dilute with a mixture of methanol and water (1 : 1) to volume, mix, and pass through a membrane filter having a 0.45-µm or finer porosity.

Procedure—Proceed as directed in the test for *Content of triterpene glycosides* under *Black Cohosh.* From the chromatogram obtained, determine the concentration, *C,* in µg per mL, of each triterpene glycoside. Calculate the quantity, in mg, of triterpene glycosides in the portion of Tablets taken by the formula:

$$C_T/100$$

in which C_T is the sum of the concentrations *C,* in µg per mL, of all the relevant triterpene glycosides, calculated as 23-*epi*-26-deoxyactein. ■2S (*USP30*)

In-Process Revision

BRIEFING

Glucosamine Tablets, *USP 29* page 2343. It is proposed to revise the test for *Disintegration and dissolution* to make the dissolution requirements for glucosamine consistent with those of *Glucosamine and Chondroitin Sulfate Sodium Tablets*.

(DS-BA: D. Cairatti) RTS—C44053

Change to read:

Disintegration and dissolution ⟨2040⟩: meet the requirements for *Dissolution.*

Medium: water; 900 mL.

Apparatus 2: ~~50 rpm.~~

■75 rpm.■2S (*USP30*)

Time: ~~45 minutes.~~

■60 minutes.■2S (*USP30*)

Determine the amount of $C_6H_{13}NO_5$ dissolved by employing the following method.

Phosphate buffer, Mobile phase, and *Chromatographic system*—Proceed as directed in the *Assay* under *Glucosamine Hydrochloride.*

Standard solution—Dissolve an accurately weighed quantity of USP Glucosamine Hydrochloride RS in water to obtain a solution having a known concentration of about 1.0 mg per mL. Dilute with a suitable quantity of water, if necessary.

Test solution—Use the solution under test.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the glucosamine peaks. Calculate the amount, in mg, of $C_6H_{13}NO_5$ dissolved by the formula:

$$(179.17/215.63)(900C)(r_U/r_S)$$

in which 179.17 and 215.63 are the molecular weights of glucosamine and glucosamine hydrochloride, respectively; C is the concentration, in mg per mL, of USP Glucosamine Hydrochloride RS in the *Standard solution;* and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively.

Tolerances—Not less than 75% of the labeled amount of $C_6H_{13}NO_5$ is dissolved in ~~45 minutes.~~

■60 minutes.■2S (*USP30*)

BRIEFING

Glucosamine and Methylsulfonylmethane Tablets—See briefing under *Glucosamine, Chondroitin Sulfate Sodium and Methylsulfonylmethane Tablets.*

(DSN: L. Evans; DS-BA: D. Cairatti) RTS—C45407

Add the following:

■Glucosamine and Methylsulfonylmethane Tablets

» Glucosamine and Methylsulfonylmethane Tablets are prepared from either Glucosamine Hydrochloride, Glucosamine Sulfate Sodium Chloride, Glucosamine Sulfate Potassium Chloride, or a mixture of any of them, with Methylsulfonylmethane. Tablets contain not less than 90.0 percent and not more than 120.0 percent of the labeled amount of glucosamine ($C_6H_{13}NO_5$) and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of methylsulfonylmethane ($C_2H_6O_2S$).

Packaging and storage—Preserve in tight, light-resistant containers.

Labeling—The label indicates the types of glucosamine salts contained in the article.

USP Reference standards ⟨11⟩—*USP Glucosamine Hydrochloride RS. USP Methylsulfonylmethane RS.*

Identification—

A: The retention times of the major peaks in the chromatogram of the *Test solution* correspond to those in the chromatogram of the *Standard solution,* as obtained in the test for *Content of glucosamine (presence of glucosamine)* under *Glucosamine and Chondroitin Sulfate Sodium Tablets.*

In-Process Revision

B: The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation,* as obtained in the test for *Content of methylsulfonylmethane* under *Methylsulfonylmethane Tablets*.

Disintegration and dissolution ⟨2040⟩**:** meet the requirements for *Dissolution*.

Medium: water; 900 mL.

Apparatus 2: 75 rpm.

Time: 60 minutes.

Determine the amount of glucosamine ($C_6H_{13}NO_5$) dissolved by employing the following method.

Diluent, 0.2 M Borate buffer, Derivatizing reagent, Mobile phase, and *Chromatographic system*—Proceed as directed in the test for *Content of glucosamine.*

Standard solution—Prepare as directed in the test for *Content of glucosamine.* Dilute with a suitable quantity of water, if necessary.

Test solution—Use the solution under test.

Procedure—Proceed as directed in the test for *Content of glucosamine.* Calculate the quantity, in mg, of glucosamine ($C_6H_{13}NO_5$) dissolved by the formula:

$$(179.17/215.63)(900C)(r_U/r_S)$$

in which the terms are as defined therein.

Tolerances—Not less than 75% of the labeled amount of $C_6H_{13}NO_5$ is dissolved in 60 minutes.

Weight variation ⟨2091⟩**:** meet the requirements.

Content of glucosamine—

Diluent, 0.2 M Borate buffer, Derivatizing reagent, Mobile phase, Standard solution, Test solution, Chromatographic system, and *Procedure*—Proceed as directed in the test for *Content of glucosamine* under *Glucosamine and Chondroitin Sulfate Sodium Tablets*.

Content of methylsulfonylmethane—

Diluent, Standard preparation, and *Chromatographic system*—Proceed as directed in the *Assay* under *Methylsulfonylmethane*.

Assay preparation and *Procedure*—Proceed as directed in the *Assay* under *Methylsulfonylmethane Tablets*.■2S (*USP30*)

BRIEFING

Glucosamine, Chondroitin Sulfate Sodium and Methylsulfonylmethane Tablets; Glucosamine and Methylsulfonylmethane Tablets. Because there are no existing *USP* monographs for these dietary supplements, new monographs, based on validated methods of analysis, are being proposed. The liquid chromatographic procedure in the test for *Content of glucosamine* is based on analyses performed with the Genesis brand of L1 column. Typical retention times are 4.5 minutes for the β-anomer and 8.1 minutes for the α-anomer. The gas chromatographic procedure in the test for *Content of methylsulfonylmethane* is based on analyses performed with the Zebron ZB-1 brand of G2 column. The typical retention time for the methylsulfonylmethane peak is about 4.4 minutes. The test for *Content of methylsulfonylmethane* references the *Assay* in the *Methylsulfonylmethane Tablets* monograph proposed in *PF* 32(3).

(DSN: L. Evans; DS-BA: D. Cairatti) RTS—C45407

Add the following:

■Glucosamine, Chondroitin Sulfate Sodium and Methylsulfonylmethane Tablets

» Glucosamine, Chondroitin Sulfate Sodium and Methylsulfonylmethane Tablets are prepared from either Glucosamine Hydrochloride, Glucosamine Sulfate Sodium Chloride, Glucosamine Sulfate Potassium Chloride, or a mixture of any of them, with Chondroitin Sulfate Sodium and Methylsulfonylmethane. Tablets contain not less than 90.0 percent and not more than 120.0 percent of the

In-Process Revision

labeled amounts of chondroitin sulfate sodium and glucosamine ($C_6H_{13}NO_5$) and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of methylsulfonylmethane ($C_2H_6O_2S$).

NOTE—Chondroitin Sulfate Sodium is extremely hygroscopic once dried. Avoid exposure to atmosphere, and weigh promptly.

Packaging and storage—Preserve in tight, light-resistant containers.

Labeling—The label indicates the types of glucosamine salts contained in the article and the species source from which chondroitin was derived. Label it to state the source(s) of chondroitin sulfate sodium, whether bovine, porcine, avian, or a mixture of any of them. The label states on the front panel the content of chondroitin sulfate sodium on the dried basis.

USP Reference standards ⟨11⟩*—USP Chondroitin Sulfate Sodium RS. USP Glucosamine Hydrochloride RS. USP Methylsulfonylmethane RS.*

Identification—

Procedure (see *Electrophoresis* ⟨726⟩)—Proceed as directed for *Electrophoretic purity* under *Chondroitin Sulfate Sodium (presence of chondroitin sulfate).*

C: The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation,* as obtained in the test for *Content of methylsulfonylmethane.*

Disintegration and dissolution ⟨2040⟩**:** meet the requirements for *Dissolution*.

Medium: water; 900 mL.

Apparatus 2: 75 rpm.

Time: 60 minutes.

Determine the amount of glucosamine ($C_6H_{13}NO_5$) dissolved by employing the following method.

Diluent, 0.2 M Borate buffer, Derivatizing reagent, Mobile phase, and *Chromatographic system*—Proceed as directed in the test for *Content of glucosamine.*

Standard solution—Prepare as directed in the test for *Content of glucosamine.* Dilute with a suitable quantity of water, if necessary.

Test solution—Use the solution under test.

Procedure—Proceed as directed in the test for *Content of glucosamine.* Calculate the quantity, in mg, of glucosamine ($C_6H_{13}NO_5$) dissolved by the formula:

$$(179.17/215.63)(900C)(r_U/r_S)$$

in which the terms are as defined therein.

Tolerances—Not less than 75% of the labeled amount of $C_6H_{13}NO_5$ is dissolved in 60 minutes.

Determine the amount of chondroitin sulfate sodium dissolved by employing the following method.

Cetylpyridinium chloride solution, Diluent, and *Test solution*—Prepare as directed in the test for *Content of chondroitin sulfate sodium* under *Chondroitin Sulfate Sodium Tablets.*

Standard solutions—Prepare as directed in the test for *Content of chondroitin sulfate sodium* under *Chondroitin Sulfate Sodium.*

In-Process Revision

Procedure—Proceed as directed in the test for *Content of chondroitin sulfate sodium* under *Chondroitin Sulfate Sodium Tablets,* adjusting the volume of the sample and/or the concentrations of the standards, if necessary. Calculate the quantity, in mg, of chondroitin sulfate sodium dissolved by the formula:

$$900C$$

in which C is the concentration, in mg per mL, of chondroitin sulfate sodium in the solution under test.

Tolerances—Not less than 75% of the labeled amount of chondroitin sulfate sodium is dissolved in 60 minutes.

Weight variation ⟨2091⟩**:** meet the requirements.

Content of glucosamine—

Diluent, 0.2 M Borate buffer, Derivatizing reagent, Mobile phase, Standard solution, Test solution, Chromatographic system, and *Procedure*—Proceed as directed in the test for *Content of glucosamine* under *Glucosamine and Chondroitin Sulfate Sodium Tablets.*

Content of chondroitin sulfate sodium—

Cetylpyridinium chloride solution, Diluent, Test solution, and *Procedure*—Proceed as directed in the test for *Content of chondroitin sulfate sodium* under *Chondroitin Sulfate Sodium Tablets*.

Standard solutions—Prepare as directed in the test for *Content of chondroitin sulfate sodium* under *Chondroitin Sulfate Sodium.*

Content of methylsulfonylmethane—

Diluent, Standard preparation, and *Chromatographic system*—Proceed as directed in the *Assay* under *Methylsulfonylmethane*.

Assay preparation and *Procedure*—Prepare as directed in the *Assay* under *Methylsulfonylmethane Tablets*.■2S (*USP30*)

BRIEFING

Maritime Pine, *USP 29* page 2359. In order to minimize analytical variability, it is proposed to use USP Maritime Pine Extract RS in the determination of the *Content of procyanidins* instead of the absorptivity value. The wavelength of the test has been changed from 546 nm to the wavelength of maximum absorption at 551 nm. In addition, editorial style changes have been made.

(DSB: M. Sharaf) RTS—C44237

Change to read:

Identification—

A: Pulverize 1 g of the dried Maritime Pine. Add 10 mg of the powdered material to 1 mL of methanol. Add 6 mL of a mixture of butanol and hydrochloric acid (95 : 5 v/v). Heat for 2 minutes in a water bath: the solution turns red.

B: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Test solution—Add 2 g of the powdered dried material to 20 mL of water. Place in a water bath for 20 minutes, and centrifuge. Extract the supernatant with 40 mL of ethyl acetate. Evaporate the ethyl acetate layer to dryness under a stream of nitrogen, with gentle heating. Dissolve the residue so obtained in 0.25 mL of alcohol.

Standard solution—Prepare a solution of USP Maritime Pine Extract RS in alcohol, having a concentration of about 25 mg per mL. [NOTE—Retain a portion of this solution for use in *Identification* test *C*.]

Application volume: 5 µL.

Developing solvent system: ~~a mixture of ethyl acetate, methanol, and water (100 : 10 : 6).~~

■a mixture of ethyl acetate, formic acid, and water (100 : 10 : 6).■2S (*USP30*)

Spray reagent: a mixture of alcohol and phosphoric acid (1 : 1), containing 1% of vanillin.

Procedure— ~~Proceed as directed in the chapter, except to dry the plate with the aid of a current of air, spray with the *Spray reagent,* and dry at 110° for 10 minutes. A red band appears in the upper part of the chromatogram of the *Test solution*, at an R_F value of about 0.82, corresponding to a similar band in the chromatogram of the *Standard solution (presence of catechin).* The lower part of the chromatogram of the *Test solution* also shows red bands, at an R_F value of about 0.45 *(presence of oligomeric and polymeric procyanidins).* Two other red bands in the chromatogram of the *Test solution* correspond to those at similar R_F values in the chromatogram of the *Standard solution (presence of dimeric procyanidins).* A blue band appears in the chromatogram of the *Test solution* between the bands for catechin and the dimeric procyanidins, corresponding in color and R_F value to a similar band in the chromatogram of the *Standard solution.*~~

■Proceed as directed in the chapter, except to dry the plate with the aid of a current of air, spray the plate with the *Spray reagent,* and heat at 115° for 15 minutes. Three red bands appear in the middle third of the chromatogram of the *Standard solution* corresponding to two dimeric procyanidins and catechin. The chromatogram of the *Standard solution* also exhibits a blue band between the upper band due to upper dimeric procyanidins and the band due to catechin. The

In-Process Revision

chromatogram of the *Test solution* contains bands that correspond to those found in the chromatogram of the *Standard solution.*■2S *(USP30)*

C: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—
Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.
Test solution—Use the *Test solution* prepared as directed for *Identification* test *B*.
Standard solution 1—Use the *Standard solution* prepared as directed for *Identification* test *B.*
Standard solution 2—Prepare a solution of ferulic acid and protocatechuic acid containing 1 mg of each per mL.
Application volume: 10 µL.
Developing solvent system: a mixture of methylene chloride, methanol, glacial acetic acid, and water (80 : 15 : 2 : 2).
Spray reagent—Prepare a 5% ferric chloride solution in methanol.
Procedure— ~~Proceed as directed in the chapter, except to dry the plate at 110° and examine the plate under short-wavelength UV light. The upper third of the chromatogram of the *Test solution* exhibits three bands. The uppermost band is close to the solvent front. The middle third of the chromatogram of the *Test solution* exhibits a band corresponding in R_F value to the bands in the chromatograms of *Standard solution 1* and *Standard solution 2 (presence of ferulic acid).* The lower third of the chromatogram of the *Test solution* exhibits a band corresponding to bands of similar R_F value in the chromatograms of *Standard solution 1* and *Standard solution 2 (presence of protocatechuic acid).* A band near the origin is also visible in the chromatogram of the *Test solution.* Spray the plate with the *Spray reagent,* and dry at 110°. The bands due to ferulic acid and protocatechuic acid turn grayish green and orange, respectively. A grayish green band becomes visible in the chromatogram of the *Test solution* above the protocatechuic acid band *(presence of caffeic acid).* The band near the origin of the chromatogram of the *Test solution* turns orange.~~

■Proceed as directed in the chapter, except to dry the plate at 110° and to examine the plate under short-wavelength and long-wavelength UV light. The chromatograms of *Standard solution 1* and *Standard solution 2* exhibit bands in the middle third and upper third that correspond to protocatechuic acid and ferulic acid, respectively. Spray the plate with the *Spray reagent,* and heat at 115° for 15 minutes. The bands due to ferulic acid and protocatechuic acid turn grayish green. Grayish-green bands become visible in the chromatogram of *Standard solution 1* above and below protocatechuic acid indicating the presence of caffeic acid and catechin, respectively. The chromatogram of the *Test solution* exhibits bands due to catechin, protocatechuic acid, caffeic acid, and ferulic acid that correspond in color and R_F values to those in the chromatogram of *Standard solution 1* and *Standard solution 2.*■2S *(USP30)*
