Table of Contents*

PHARMACOPEIAL FORUM VOL. 32 NO. 1 JAN.–FEB. 2006

* The *USP–NF* (*USP30–NF25*), the *Supplement* (*Supp*), or the *Interim Revision Announcement* (*IRA*) for which the revision proposal is targeted is shown in parentheses next to each proposed item.

THE JOURNAL OF STANDARDS DEVELOPMENT AND OFFICIAL COMPENDIA REVISION

Please address comments on *PF* content to Executive Secretariat
USP–NF, 12601 Twinbrook Pkwy.
Rockville, MD 20852

Telephone: 1-301-816-8345
Fax: 1-301-816-8373
http://www.usp.org

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI),* in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences.*

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

ISSN: 0363-4655

Printed in Canada by Webcom Limited, Toronto, Ontario

STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum* (*PF*), for the development of official pharmaceutical standards.

USP publishes *Pharmacopeial Forum* (*PF*) bimonthly as the working vehicle of the USP Council of Experts. *PF* provides interested parties an opportunity to review and comment as the Council of Experts develops or revises standards for the *United States Pharmacopeia* and the *National Formulary* (*USP–NF*).

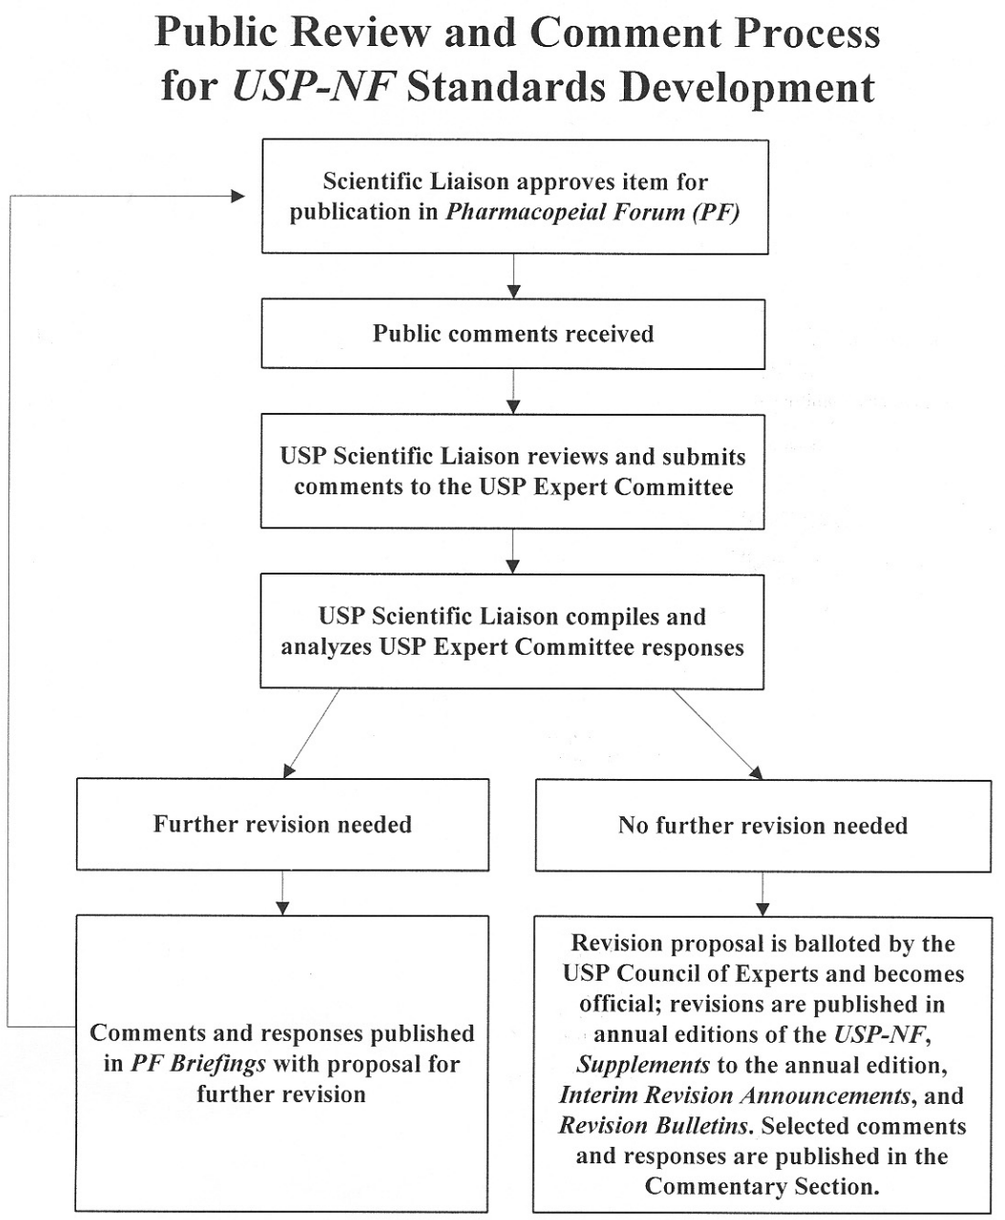
PF includes the following:

1. Potential revisions—entirely new standards, revision ideas, and drafts not yet targeted for official adoption (*Pharmacopeial Previews*)
2. Proposed revisions—new or revised standards targeted for official adoption (*In-Process Revision*)
3. Adopted revisions—new or revised standards that become official and binding before the publication of the next *USP–NF* or *Supplement* (*Interim Revision Announcement*)

USP welcomes comments and data on potential, proposed, or official standards.* Comments, along with USP's responses, will be published either in *PF Briefings*, the *Commentary* section of *PF*, the *Commentary* section of *Supplements* to *USP–NF*, or the *Commentary* section of *USP–NF*.

* If you are not immediately able to submit comments but you intend to do so, please notify USP by using the Intent to Comment form provided before the section *Chromatographic Reagents Used in USP–NF and PF*.

The chart below shows the public review and comment process and its relationship to standards development.



Questions on the process should be addressed to Director, Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: execsec@usp.org).

HOW TO USE *PF*

This section provides descriptions of the various parts of *PF*. It also includes *Committee Designations* and the *Staff Directory.*

The content of the different sections of *PF* are briefly described below. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a *Request for Revision* is available in the *Guideline for Submitting Requests for Revision to the USP–NF* on the USP website (www.usp.org/USPNF/submitMonograph/subGuide.html).

Proposed and Adopted Revisions to the *USP–NF*

Section	Content	How Readers Can Respond
Pharmacopeial Previews Early ideas for revisions	•BRIEFING: Scientific rationale for potential inclusion or change. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •Potential revisions not yet targeted for official adoption that require a longer public review and comment process because of issues such as: — the controversial nature of an item; — the application of new technologies that require further study; and — articles produced by multiple sources.	Review drafts and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview.*
In-Process Revision Revisions targeted for adoption	•BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see *Standards Development*). New or revised text is marked with symbols (■ or ● or ▲) to specify the tentative earliest date on which the revision would be officially adopted.	Review material and send comments promptly to USP staff liaison (see the *Staff Directory*). Guidelines on how to comment are found at the end of the *Policies and Announcements* section.
Harmonization Items the Pharmacopeial Discussion Group (PDG) is working to harmonize internationally	•BRIEFING: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. The stage determines whether an item appears under *Pharmacopeial Previews* or under *In-Process Revision,* both separate sections of *Harmonization.* •For *In-Process Revision,* new or revised text is marked with symbols (■) to specify the tentative, earliest date on which the revision would be officially adopted.	Review material and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview* or *In-Process Revision.*
Interim Revision Announcement Adopted standards	Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols ●.	Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance.
Pending Proposals	In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *PF* to allow the public an opportunity to review and comment upon it. When an item is adopted it is published in either the *USP–NF*, its supplements, or an *IRA*. Those items that have not yet been adopted are still pending.	Review items to track pending proposals.
Canceled Proposals	Canceled proposals are items that were published in *PF* and were pending, but have since been canceled. Note that canceled proposals may be republished to be considered in the future for adoption into the *USP–NF.*	Review items to track canceled proposals.

Other Sections

Committee Designations
Names of the committees (composed of volunteer scientific experts) that USP staff work with on the development of standards.

Staff Directory
Names of all USP scientific staff liaisons with contact information.

Policies and Announcements
- General scientific and policy issues affecting *USP–NF* standards and processes
- Update on standards-related issues being considered by USP
- Where to find summaries of meetings of the Council of Experts
- Guidelines on how to comment
- Publication and comment schedules

Stimuli to the Revision Process
- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

Nomenclature
- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the *USP Dictionary of USAN and International Drug Names*
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

Index
Cumulative directory for the content of all issues of *PF* beginning with *PF* 32(1).

Reference Standards Catalog
List of official USP Reference Standards specified in *USP–NF*, along with availability and ordering information.

Chromatographic Reagents Used in USP–NF and Pharmacopeial Forum
Update of chromatographic reagents based on the proposals published in this issue of *PF*.

EXPERT COMMITTEE DESIGNATIONS*

2005–2010

AER	Aerosols
BB BBP	B&B Blood and Blood Products
BB CGT	B&B Cell, Gene, and Tissue Therapies
BB PP	B&B Proteins and Polysaccharides

POLICIES AND ANNOUNCEMENTS

This section includes information about general scientific and policy issues that may have an impact on *USP–NF* standards and processes and announcements about issues being considered by USP. This section also includes publication and comment schedules.

GENERAL CHAPTERS ⟨1⟩ AND ⟨905⟩ POSTPONEMENTS—CLARIFICATION. Two postponements that appeared in the *Fifth IRA* and *Sixth IRA* respectively for ⟨1⟩ *Injections,* and ⟨905⟩ *Uniformity of Dosage Units,* do not appear as postponed in the *USP 29–NF 24*. This is due to USP's publication schedule, which slates the *Fifth IRA* and *Sixth IRA* for the *First Supplement* to *USP 29–NF 24*, rather than to the book. The *First Supplement* is scheduled to be published February 15 and official April 1, 2006. The complete publication schedule is available on page 30.

For general chapter ⟨1⟩ *Injections,* USP has postponed the text for *Printing on Ferrules and Cap Overseals* that was to become official on October 1, 2005 as stated in *USP 28–NF 23*. The reason for the postponement is that the Parenteral Products-Industrial, Nomenclature, and Safe Medication Use Expert Committees have approved a revision of this section that also appears in *Pharmacopeial Forum* 31(5) with an implementation date of February 1, 2009.

For general chapter ⟨905⟩ *Uniformity of Dosage Units,* USP has postponed the official date from April 1, 2006 to January 1, 2007, to provide additional time for the Pharmacopeial Discussion Group to evaluate comments received concerning this revision.

Further information about these postponements is available on USP's website (www.usp.org). If you have any questions, please contact Beryl Voigt, Director, Executive Secretariat (301-816-8155 or bev@usp.org).

USP ISSUES NOTICE OF RETRACTION FOR RESIDUAL SOLVENTS. Please note the following retraction notice that has been included on page 14 of the *USP 29–NF 24*.

"*Residual Solvents ⟨467⟩: meet the requirements." is hereby withdrawn from all monographs in the USP and the NF. This retraction is made to allow the USP Council of Experts further time to evaluate the most appropriate manner to implement the Residual Solvents test. The General Notices statement concerning the application of Residual Solvents to all monographs is unaffected by this retraction.*

This notice also serves as an additional request for comments on this issue from all users of the USP. Please forward your comments to:

Todd Cecil, Ph.D.
Vice President
Department of Standards Development
USP
12601 Twinbrook Parkway
Rockville, MD 20852

Comments must be received by June 1, 2006 to ensure consideration.

REVISIONS TO GOLDENSEAL MONOGRAPHS. It is proposed to use Hydrastine free base as the USP Reference Standard because the water sorption analysis showed greater stability than the currently official hydrochloride form. Correction factors are accordingly removed from the procedures. These revisions are proposed to bring the procedures in the monographs in agreement with the free base form of Reference Standard materials already released by USP. Since these revisions do not change the essence of the procedures, they are intended to become official via immediate *Interim Revision Announcement.*

USP DIRECTOR OF EXECUTIVE SECRETARIAT NAMED. Beryl E. Voigt has been named the new Director, Executive Secretariat. Ms. Voigt joined USP in 1994 and worked her way up in the Research and Development Laboratory from Senior Chemist II to Senior Group Leader, where she was responsible for the administration of many RDL responsibilities. Prior to joining USP, she served in various chemist positions for pharmaceutical companies in Maryland, Pennsylvania, and New Jersey. Ms. Voigt earned her B.S. in Chemistry with a management option from Carnegie-Mellon University. Ms. Voigt will be responsible for many of the procedural responsibilities for USP Expert Committees and the standards-setting process.

EXPERT COMMITTEE SUMMARIES AVAILABLE ON THE USP WEBSITE. Summaries of the first meetings of the cycle for the 2005–2010 Standards Expert Committees are now posted and available at http://www.usp.org/USPNF/meetingSummaries/.

USP ANNOUNCES THE CHAIRS OF THE INFORMATION EXPERT COMMITTEES. USP is pleased to announce the following individuals who were elected to the USP Council of Experts in September as chairs of Information Expert Committees. Two individuals declined their appointments, resulting in vacancies for the Clinical Toxicology and Nephrology and Urology Expert Committees. Another election to fill these vacancies will take place in the future. Expert Committee members for these Expert Committees will be elected in the Spring of 2006.

Cardiology: Sarah A. Spinler, Pharm.D.; Clinical: Toxicology Vacant; Dermatology: Dennis P. West, Ph.D.; Endocrinology: Karim A. Calis, Pharm.D., M.P.H.; Gastroenterology: Bruce Bacon, M.D.; Hematology: Patrick A. McKee, M.D.; Immunology: John D. Grabenstein,

Ph.D.; Infectious Diseases: Douglas W. MacPherson, M.D.; Nephrology and Urology: Vacant; Neurology/Otorhinolaryngology/Ophthalmology: Mitchell F. Brin, M.D.; Oncology: Barbara A. Burtness, M.D.; Psychiatry: Amy H. Schwartz, Pharm.D., B.C.P.S.; Pulmonary: Elliott Israel, M.D.; Rheumatology: David H. Campen, M.D.; Special Populations/Clinical Pharmacology: Joseph T. Hanlon, Pharm.D.; Therapeutic Decision Making: Nancy Jo Braden, M.D.

USP SEEKS SUBMISSION OF PROPOSALS FOR STABILITY INDICATING ASSAY PROCEDURES FOR STEROIDS. The assay procedures for steroids in many *USP–NF* monographs are not stability indicating. In an effort to update the monographs, the Monograph Development—Pulmonary and Steroids Expert Committee is seeking submission of proposals of stability indicating assay procedures for steroids, preferably HPLC- or GC-based, for inclusion in the following *USP–NF* monographs to replace the current procedures that are not stability indicating. The submissions should include data and other information recommended in the *USP Guideline for Submitting Requests for Revision to the USP–NF* at http://www.usp.org/pdf/EN/USPNF/revisionGuide.pdf. Each submission should include analytical validation data, data demonstrating that the procedure is stability indicating, and results of analysis from three commercial batches. Please submit proposals for steroid assay procedures for the following *USP–NF* monographs to Daniel Bempong, Ph.D., or contact him for the details at 301-816-8143 or dkb@usp.org.

Drug Substance:

Clocortolone Pivalate
Danazol
Desoxycorticosterone Acetate
Estriol
Fludrocortisone Acetate
Flumethasone Pivalate
Hydrocortisone Sodium Phosphate
Hydrocortisone Sodium Succinate
Hydroxyprogesterone Caproate
Levonorgestrel
Meprednisone
Mestranol
Methylprednisolone Sodium Succinate
Nandrolone Phenpropionate
Norethindrone
Norethindrone Acetate
Norethynodrel
Norgestrel
Oxandrolone
Oxymetholone
Paramethasone Acetate
Prednisolone Hemisuccinate
Prednisolone Sodium Phosphate
Testosterone
Testosterone Enanthate
Testosterone Propionate

Dosage Form:

Betamethasone Oral Solution
Clocortolone Pivalate Cream
Desoxycorticosterone Acetate Injection
Desoxycorticosterone Acetate Pellets
Dexamethasone Gel
Dexamethasone Sodium Inhalation Aerosol
Dexamethasone Tablets
Dexamethasone Topical Aerosol
Estradiol Injectable Suspension
Estradiol Tablets
Estrone Injection
Flumethasone Pivalate Cream
Hydrocortisone Acetate Injectable Suspension
Hydrocortisone Acetate Ophthalmic Ointment
Hydrocortisone Acetate Ophthalmic Suspension
Hydrocortisone Injectable Suspension
Hydrocortisone Sodium Phosphate Injection
Hydroxyprogesterone Caproate Injection
Methylprednisolone Acetate Cream
Methyltestosterone Capsules
Methyltestosterone Tablets
Nandrolone Phenpropionate Injection
Norethindrone Acetate Tablets
Norethindrone Acetate and Ethinyl Estradiol Tablets (assay for both steroids)
Norethindrone Tablets
Norgestrel Tablets
Oxymetholone Tablets
Paramethasone Acetate Tablets
Penicillin G Procaine, Dihydrostreptomycin Sulfate, and Prednisolone Injectable Suspension (assay for Prednisolone)
Neomycin Sulfate, Sulfacetamide Sodium, and Prednisolone Acetate Ophthalmic Ointment (assay for Prednisolone Acetate)
Prednisolone Sodium Phosphate Injection
Prednisolone Sodium Phosphate Ophthalmic Solution
Neomycin Sulfate and Prednisolone Sodium Phosphate Ophthalmic Ointment (assay for Prednisolone Sodium Phosphate)

Prednisolone Sodium Succinate for Injection
Prednisolone Cream
Progesterone Intrauterine Contraceptive System
Testosterone Enanthate Injection
Testosterone Injectable Suspension
Testosterone Propionate Injection

CALL FOR HIGH PRIORITY MONOGRAPHS FOR DRUG SUBSTANCES AND PRODUCTS AND EXCIPIENTS. USP is seeking monographs for the following drug substances and drug products that are, or soon will be, off patent and thus are of the highest priority. USP also is seeking monographs for the excipients listed below (updated as of September 1, 2005). Monograph sponsors should consult the *USP Guideline for Submitting Requests for Revision to the USP–NF* at http://www.usp.org/pdf/EN/USPNF/revisionGuide.pdf.

For further information, contact Karen Russo, Ph.D., kar@usp.org.

Noncomplex Actives (Drug Substances)

Acarbose	Alatrofloxacin Mesylate	Alfuzosin
Allopurinol Sodium	Aminopromazine Fumarate	Aminopterin Sodium
Amlodipine	Anagrelide Hydrochloride ***(Received)***	Arsenic Trioxide
Azelaic Acid	Balsalazide Disodium	Bentoquatam
Bepridil Hydrochloride	Bicalutamide ***(Received)***	Bivalirudin
Budesonide ***(Received)***	Cabergoline	Calcipotriene
Calcium Trisodium Pentetate	Calfactant	Candesartan Cilexetil
Carmustine	Carvedilol	Cefdinir
Cefditoren Pivoxil	Ceftibuten	Cetirizine Hydrochloride ***(Received)***
Cetrorelix	Cevimeline	Chloroxine
Cilostazol ***(Received)***	Citalopram Hydrobromide ***(Received)***	Colfosceril
Cytarabine Liposome	Dalfopristin	Dantrolene Sodium ***(Received)***
Dapirazole Hydrochloride	Desirudin	Dexrazoxane
Didanosine ***(Received)***	Difloxacin Hydrochloride	Divalproex Sodium ***(Received)***
Docosanol	Entacapone	Epoprostenol
Erythromycin Phosphate	Erythromycin Thiocyanate	Esomeprazole Magnesium
Esmolol	Estazolam	Estramustine Phosphate Sodium
Estradiol Benzoate	Ethanolamine Oleate	Etomidate
Etoposide Phosphate	Exemestane	Felbamate
Fentanyl ***(Received)***	Fluoromethane F 18	Foscarnet Sodium
Fosfomycin Tromethamine	Gadobenate Dimeglumine	Galantamine Hydrobromide
Gadopentetic Acid	Gallium Nitrate	Ganirelix
Glyceryl Aminobenzoate	Granisetron	Halobetasol Propionate
Haloperidol Decanoate ***(Received)***	Hydrocodone Polistirex	Hydrocortisone ***(Received)***
Ibandronate Sodium	Imipramine Pamoate	Imiquimod
Irinotecan	Isosulfan Blue	Itraconazole
Lamotrigine ***(Received)***	Latanoprost	Lawsone
Levetriacepam	Levobetaxolol	Levocabastine Hydrochloride ***(Received)***
Levofloxacin ***(Received)***	Levomethadyl Acetate	Lomustine
Lopinavir	Metipranolol Hydrochloride	Midazolam Hydrochloride
Miglitol	Mifepristone	Misoprostol ***(Received)***
Mivacurium	Moexipril	Nalbuphine Hydrochloride
Nalmefene Hydrochloride	Nateglinide	Nedocromil
Nicardipine Hydrochloride	Nilutamide	Nisoldipine
Olopatadine	Olsalazine Sodium	Orbifloxacin
Orlistat ***(Received)***	Oxcarbazepine ***(Received)***	Pancuronium Bromide ***(Received)***
Pantoprazole Sodium	Pemoline	Pentamidine Isethionate
Piperonyl Butoxide	Pirbuterol Acetate	Poractant Alpha
Prednicarbate ***(Received)***	Proguanil	Quetiapine Fumarate

Noncomplex Actives (Drug Substances) *(Continued)*

Risperidone ***(Received)***	Rose Bengal	Salmeterol Xinafoate
Sodium Phenylbutyrate	Simethicone Powder	Sterile Methotrexate Sodium
Streptozocin	Sulfacytine	Tacrolimus
Terbinafine Hydrochloride	Terconazole	Tiludronate Disodium
Tiopronin	Tranexamic Acid	Trimipramine Maleate
Trovafloxacin Mesylate	Voriconazole	Zinc Tridosium Pentetate

Noncomplex Actives (Drug Products)

Abacavir Sulfate, Lamivudine, and Zidovudine Tablets	Acarbose Tablets	Acetaminophen, Butalbital, Caffeine, and Codeine Phosphate Capsules
Acetaminophen, Clemastine Fumarate and Pseudoephedrine Hydrochloride Tablets	Acetazolamide Extended-Release Capsules	Albuterol Extended-Release Tablets
Albuterol for Inhalation	Albuterol Inhalation Aerosol	Alendronate Sodium Oral Solution
Alfuzosin Tablets	Allopurinol For Injection	Alprazolam Extended-Release Tablets
Alprostadil Urethral Supository	Aminopromazine Fumarate and Neomycin Sulfate Tablets	Aminopromazine Fumarate Injection
Aminopromazine Fumarate Tablets	Amlodipine and Benazepril Hydrochloride Capsules	Aminopterin Sodium Tablets
Amphotericin B Injection	Anagrelide Hydrochloride Capsules	Arsenic Trioxide Injection
Atovaquone and Proguanil Hydrochloride Tablets	Atovaquone Tablets	Auranofin Capsules
Azatadine Maleate and Pseudoephedrine Sulfate Extended-Release Tablets	Azelaic Acid Cream	Azithromycin for Injection
Azithromycin Tablets	Baclofen Injection	Balsalazide Disodium Capsules
Beclomethasone Dipropionate Inhalation Aerosol	Beclomethasone Dipropionate Metered-Dose Nasal Suspension	Bentoquatam Topical Suspension
Benzocaine and Cetylpyridinium Chloride Lozenges	Benzocaine and Menthol Lotion	Benzphetamine Hydrochloride Tablets
Bepridil Tablets	Bicalutamide Tablets	Brompheniramine Maleate, Dextromethorphan Hydrobromide and Pseudoephedrine Hydrochloride Oral Solution
Bivalirudin Injection	Budesonide Metered-Dose Inhalation Aerosol	Budesonide Inhalation Aerosol
Bupivacaine and Lidocaine Hydrochlorides Injection	Buprenorphine Hydrochloride Injection	Butalbital and Acetaminophen Capsules
Butalbital and Acetaminophen Tablets	Butorphanol Tartrate Nasal Solution ***(Received)***	Calcipotriene Topical Solution Cabergoline Tablets
Calcipotriene Cream	Calcipotriene Ointment	Calcitriol Capsules
Calcitriol Oral Solution	Calcium Acetate Capsules	Calfactant Intratracheal Suspension
Calcium Trisodium Pentetate Injection	Carbidopa and Levodopa Extended-Release Tablets	Carbidopa and Levodopa Tablets for Oral Suspension
Carbidopa, Levidopa, and Entacapone Tablets	Carmustine Implant	Carmustine for Injection
Carvedilol Tablets	Cefditoren Pivoxil Tablets	Cefdinir Tablets
Ceftibuten Capsules	Ceftibuten for Oral Suspension	Cetirizine Hydrochloride Oral Solution
Ceftiofur Hydrochloride Oral Suspension	Cetrorelix Injection	Cetirizine Hydrochloride Tablets
Cevimeline Hydrochloride Capsules	Choline and Magnesium Salicylates Oral Solution	Chloroxine Cream
Chlorpromazine Hydrochloride Extended-Release Capsules	Ciclopirox Shampoo	Choline and Magnesium Salicylates Tablets
Choline Salicylate Oral Solution	Ciclopirox Topical Gel	Ciclopirox Topical Solution
Ciprofloxacin Hydrochloride and Hydrocortisone Otic Suspension	Cilostazol Tablets	Cimetidine Oral Solution

Noncomplex Actives (Drug Products) *(Continued)*		
Citalopram Hydrobromide Oral Solution	Citalopram Hydrobromide Tablets ***(Received)***	Ciprofloxacin Otic Solution
Cladribine Injection	Citric Acid, Gluconolactone, and Magnesium Carbonate Irrigation	Clonazepam Orally-Disintegrating Tablets
Clemastine Fumarate Syrup	Clobetasol Propionate Gel	Clotrimazole and Betamethasone Dipropionate Lotion
Clorazepate Dipotassium Capsules	Clorazepate Dipotassium Extended-Release Tablets	Colfosceril and Tyloxapol Suspension
Colestipol Hydrochloride Tablets	Conjugated Estrogens and Medroxyprogesterone Acetate Tablets	Compound Undecylenic Acid Cream
Compound Undecylenic Acid Topical Powder	Cyclosporine Modified Oral Solution	Cromolyn Sodium Metered-Dose Nasal Solution
Cyclosporine Modified Capsules	Cysteamine Bitartrate Capsules	Cyclosporine Ointment
Cyclosporine Topical Solution	Cytarabine Liposome Injection	Dantrolene Sodium Capsules ***(Received)***
Dalfopristin and Quinupristin Injection	Dapiprazole for Ophthalmic Solution	Dantrolene Sodium for Injection ***(Received)***
Dantrolene Sodium Oral Suspension	Desirudin for Injection	Desonide ***(Received)***
Desonide Cream	Dexrazoxane for Injection	Dextroamphetamine Sulfate Extended-Release Capsules
Dextromethorphan Polistirex Extended-Release Oral Suspension	Diazepam Injectable	Diclofenac Sodium Ophthalmic Solution
Didanosine Chewable Tablets ***(Received)***	Didanosine for Oral Solution ***(Received)***	Diethylpropion Hydrochloride Extended-Release Tablets
Difenoxin and Atropine Tablets	Difloxacin Hydrochloride Tablets	Dihydroergotamine Mesylate Metered Spray
Diltiazem Malate Extended-Release Tablets	Dinoprostone Vaginal Suppositories	Diphenhydramine Hydrochloride and Acetaminophen Tablets
Divalproex Sodium Delayed-Release Capsules	Dorzolamide and Timolol Ophthalmic Solution	Dorzolamide Ophthalmic Solution
Doxacurium Chloride Injection	Doxepin Hydrochloride Cream	Doxycycline Oral Gel
Econazole Nitrate Cream	Edrophonium Chloride and Atropine Sulfate Injection	Emulsion
Enalaprilat Injection	Enalapril Maleate and Diltiazem Malate Extended-Release Tablets	Enalapril Maleate and Felodipine Extended-Release Tablets
Entacapone Tablets	Ephedrine Sulfate and Guaifenesin Tablets	Epoprostenol for Injection
Epoprostenol Injection	Esmolol Hydrochloride Injection	Esomeprazole Magnesium Capsules
Estazolam Tablets	Estramustine Phosphate Sodium Capsules	Ethanolamine Oleate Injection
Etomidate Injection	Etidronate Disodium Injection Concentrate	Exemestane Tablets
Famotidine Injection ***(Received)***	Famotidine Orally Disintegrating Tablets	Felbamate Oral Suspension
Felbamate Tablets	Fentanyl Lozenges	Fentanyl Transdermal System
Ferrous Fumarate and Docusate Sodium Extended- Release Capsules	Flavoxate Hydrochloride	Flavoxate Hydrochloride Tablets
Fluconazole Injection	Flunisolide Nasal Spray	Fluconazole Tablets
Flunisolide Inhalation Aerosol	Fluocinolone Acetonide Shampoo	Fluorescein Sodium Ophthalmic Solution
Fluticasone Propionate Inhalation Powder	Fluorometholone Ointment	Fluticasone Propionate Cream ***(Received)***
Fluticasone Propionate Ointment ***(Received)***	Fluticasone Propionate Pressurized Inhaler	Foscarnet Sodium Injection
Fosfomycin for Oral Solution	Gabapentin Oral Solution	Gabapentin Tablets
Gadobenate Dimeglumine Injection	Gallium Nitrate Injection	Galantamine Hydrobromide Tablets
Ganirelix Acetate Injection	Ganciclovir Capsules	Gentamicin Sulfate Oral Solution
Gatifloxacin Injection	Gatifloxacin Tablets	Glipizide Extended-Release Tablets
Gentamicin Sulfate Soluble Powder	Glimepiride Tablets	Granisetron Tablets
Granisetron Injection	Guaifenesin and Pseudoephedrine Hydrochloride Extended-Release Tablets	Guaifenesin and Salts of Dextromethorphan and Pseudoephedrine Oral Solution

Noncomplex Actives (Drug Products) *(Continued)*

Guanidine Hydrochloride	Guanidine Hydrochloride Tablets	Halobetasol Propionate Ointment
Halobetasol Propionate Cream	Haloperidol Decanoate Injection	Haloperidol Lactate Injection
Haloperidol Lactate Oral Concentrate	Hydrochlorothiazide Oral Solution Concentrate	Hydrocodone Bitartrate and Acetaminophen Oral Solution
Hydralazine Hydrochloride and Hydrochlorothiazide Capsules	Hydrocodone Bitartrate and Homatropine Methylbromide Syrup	Hydrochlorothiazide Capsules
Hydrocodone Bitartrate and Guaifenesin Oral Solution	Hydrocodone Bitartrate and Aspirin Tablets	Hydrocortisone Butyrate Lotion
Hydrocodone Bitartrate and Homatropine Methylbromide Tablets	Hydrocortisone Acetate Rectal Foam Aerosol	Hydroquinone Lotion
Hydrocortisone Acetate Dental Paste	Hydroflumethiazide and Reserpine Tablets	Hydromorphone Hydrochloride Oral Solution
Ibuprofen Capsules	Ibandronate Sodium Tablets	Idarubicin Hydrochloride Injection
Imipramine Pamoate Capsules	Imiquimod Topical Cream	Ipratropium Bromide Inhalation Aerosol
Ipratropium Bromide Inhalation Solution	Irinotecan Hydrochloride Injection	Isosulfan Blue Injection
Isradipine Extended-Release Tablets	Itraconazole Injection	Itraconazole Oral Solution
Ketoconazole Cream	Ketoconazole Shampoo	Ketoprofen Capsules
Ketoprofen Extended-Release Capsules	Ketotifen Fumarate	Ketotifen Fumarate Ophthalmic Solution
Ketoprofen Tablets	Lactic Acid Lotion	Lamivudine Tablets
Latanoprost Ophthalmic Solution	Levetriacepam Tablets	Levobetaxolol Ophthalmic Suspension
Levocabastine Ophthalmic Suspension	Leucovorin Calcium for Injection	Levomethadyl Acetate Hydrochloride Oral Concentrate
Levofloxacin Solution	Lidocaine and Prilocaine Cream ***(Received)***	Lincomycin Hydrochloride and Spectinomycin Sulfate Soluble Powder
Liothyronine Injection	Lisinopril and Hydrochlorothiazide Tablets	Lomustine Capsules
Lopinavir Capsules	Lopinavir Solution	Lopinavir and Ritonavir Solution
Loratadine and Pseudoephedrine Sulfate Extended-Release Tablets ***(Received)***	Loratadine Orally-Disintegrating Tablets	Losartan Potassium Tablets
Mesalamine Suppositories	Methacholine Chloride for Inhalation Solution	Mesoridazine Besylate Concentrate
Mefloquine Hydrochloride Tablets	Methoxsalen Softgels	Methadone Hydrochloride Oral Concentrate
Melphalan for Injection	Metaraminol Bitartrate Injection	Methyclothiazide and Deserpidine Tablets
Methocarbamol and Aspirin Tablets	Metipranolol Ophthalmic Solution	Metronidazole Cream
Metronidazole Lotion	Metronidazole Extended-Release Tablets	Methylphenidate Hydochloride Chewable Tablets
Metronidazole Capsules	Midazolam Hydrochloride Injection	Metronidazole Hydrochloride for Injection
Miconazole Nitrate Topical Aerosol	Mifepristone Tablets	Miglitol Tablets
Milrinone Injection	Misoprostol Dispersion ***(Received)***	Misoprostol Tablets ***(Received)***
Mivacurium in Dextrose Injection	Mivacurium Injection	Moexipril Hydrochloride and Hydrochlorothiazide Tablets
Moexipril Hydrochloride Tablets	Molindone Hydrochloride Oral Solution	Morphine Sulfate for Injection Concentrate
Morphine Sulfate Oral Solution	Morphine Sulfate Oral Solution Concentrate	Morphine Sulfate Tablets
Mycophenolate Mofetil Tablets	Mycophenolate Mofetil Oral Solution	Mycophenolate Mofetil Capsules
Nalbuphine Hydrochloride Injection	Naproxen Extended-Release Tablets	Naphazoline Hydrochloride and Pheniramine Maleate Ophthalmic Solution
Naphazoline Hydrochloride and Pheniramine Maleate Ophthalmic Solution	Nalmefene Hydrochloride Injection	Nateglinide Tablets
Nedocromil Sodium Inhalation Aerosol	Neomycin Sulfate Oral Powder	Nevirapine Oral Suspension ***(Received)***
Nevirapine Tablets ***(Received)***	Nicardipine Hydrochloride Capsules	Nilutamide Tablets
Nimodipine Capsules	Nisoldipine Extended-Release Tablets	Nitroglycerin Solution In Acrylic Adhesive
Nizatidine Tablets	Ofloxacin Injection	Ofloxacin in Dextrose Injection
Ofloxacin Tablets ***(Received)***	Olopatadine Ophthalmic Solution	Olsalazine Sodium Capsules
Ondansetron Oral Solution	Ondansetron Tablets	Orbifloxacin Tablets
Orlistat Capsule ***(Received)***	Orphenadrine Citrate, Aspirin, and Caffeine Tablets	Orphenadrine Citrate Extended Release Tablets

Noncomplex Actives (Drug Products) *(Continued)*

Oxcarbazepine Suspension	Oxcarbazepine Tablets	Oxiconazole Cream
Pancuronium Bromide Injection ***(Received)***	Pantoprazole Sodium Tablets	Pantoprazole Sodium for Injection
Paroxetine Hydrochloride Extended-Release Tablets	Paroxetine Oral Suspension	Pemirolast Potassium Ophthalmic Solution
Pemoline Tablets	Penicillin G Potassium Tablets for Oral Solution	Pentaerythritol Tetranitrate Extended-Release Capsules
Pentaerythritol Tetranitrate Extended-Release Tablets	Pentamidine Isethionate for Inhalation	Pentamidine Isethionate for Injection
Pentazocine Hydrochloride and Acetaminophen Tablets	Permethrin Cream ***(Received)***	Phendimetrazine Tartrate Extended-Release Capsules
Phenobarbital Capsules	Phentermine Resin Complex	Phenylephrine Hydrochloride and Chlorpheniramine Maleate Extended-Release Capsules
Phenylephrine Hydrochloride, Chlorpheniramine Maleate, and Acetaminophen Extended-Release Tablets	Phentermine Resin Complex Capsules	Phosphate Oral Solution
Pilocarpine Hydrochloride Ophthalmic Gel	Pilocarpine Hydrochloride Ophthalmic Ointment	Pilocarpine Hydrochloride Tablets
Piperonyl Butoxide and Pyrethrins Aerosol Foam	Pirbuterol Acetate Inhalation Aerosol	Povacrylate Solution
Poractant Alpha Supension	Porfimer Sodium for Injection	Povacrylate-Iodine Topical Solution
Povidone-Iodine Gauze	Povidone-Iodine Swabsticks	Povidone-Iodine Topical Aerosol Foam
Povidone-Iodine Vaginal Suppositories	Pramipexole Dihydrochloride Tablets	Prazosin Hydrochloride and Polythiazide Capsules
Prednicarbate Cream ***(Received)***	Prednicarbate Ointment ***(Received)***	Prednisolone Sodium Phosphate Oral Solution
Prochlorperazine Maleate Extended-Release Capsules	Progesterone Capsules	Promethazine Hydrochloride and Codeine Phosphate Oral Solution
Promethazine Hydrochloride and Dextromethorphan Hydrobromide Syrup	Promethazine and Phenylephrine Hydrochlorides and Codeine Phosphate Syrup	Promethazine and Phenylephrine Hydrochlorides Syrup
Propafenone Hydrochloride Tablets	Pseudoephedrine Hydrochloride and Brompheniramine Maleate Extended-Release Tablets	Pseudoephedrine Hydrochloride and Naproxen Sodium Extended-Release Tablets
Pseudoephedrine Hydrochloride, Chlorpheniramine Maleate, and Codeine Phosphate Oral Solution	Pseudoephedrine Hydrochloride, Guaifenesin, and Codeine Phosphate Oral Solution	Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Extended-Release Tablets Pyrilamine Maleate Injection
Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Oral Solution	Pseudoephedrine Sulfate, Dexbrompheniramine Maleate, and Acetaminophen Extended-Release Tablets	Quinidine Sulfate Injection
Ramipril Capsules	Ranitidine Capsules	Rauwolfia Serpentina and Endroflumethiazide Tablets
Reserpine and Polythiazide Tablets	Rimantadine Hydrochloride Oral Solution	Risperidone Oral Solution
Risperidone Orally-Disintegrating Tablets	Risperidone Tablets	Rivastigmine Tartrate Capsules
Rivastigmine Tartrate Oral Solution	Rocuronium Bromide Injection	Ropinirole Hydrochloride Tablets
Rose Bengal Ophthalmic Solution	Rosiglitazone Maleate Tablets	Salicylic Acid and Sulfur Cleansing Lotion
Salicylic Acid and Sulfur Lotion	Salicylic Acid and Sulfur Shampoo	Salicylic Acid Cream
Salicylic Acid Ointment	Salmeterol Inhalation Aerosol	Salmeterol Xinafoate Inhalation Powder
Scopolamine Transdermal System	Selegiline Hydrochloride Capsules	Serpacwa Topical Cream
Sertraline Hydrochloride Oral Solution	Sibutramine Hydrochloride Capsules	Sodium Bicarbonate and Sodium Citrate for Oral Solution
Sodium Bicarbonate, Sodium Citrate, and Sodium Tartrate for Oral Suspension	Sodium Chlorophyllin Copper Complex Tablets	Sodium Iodide Injection
Sodium Phenylbutyrate Oral Powder	Sodium Phenylbutyrate Tablets	Sodium Phosphates for Oral Suspension
Sodium Phosphates Tablets	Sodium Salicylate and Sulfur Shampoo	Sterile Talc Aerosol
Streptozocin for Injection	Sucralfate Oral Suspension	Sulconazole Nitrate Cream
Sulfacetamide Sodium and Prednisolone Sodium Phosphate Ophthalmic Solution	Sulfacetamide Sodium and Fluorometholone Ophthalmic Suspension	Sulfacytine Tablets
Sulfanilamide Vaginal Cream	Sulfasalazine Oral Suspension	Sumatriptan Tablets

Noncomplex Actives (Drug Products) *(Continued)*

Sulisobenzone Lotion	Sumatriptan Injection	Tacrolimus Capsules
Tacrolimus Ointment	Tacrolimus Injection	Tamsulosin Hydrochloride Capsules
Technetium Tc 99m Teboroxime Injection	Tenofovir Disoproxil Fumarate Tablets	Terbinafine Hydrochloride Cream
Terbinafine Tablets	Terbinafine Topical Solution	Terconazole Vaginal Cream
Terconazole Vaginal Suppositories	Testosterone Transdermal System	Tetracycline Hydrochloride Periodontal Fiber
Theophylline Extended-Release Tablets	Tioconazole Vaginal Ointment	Tiopronin Tablets
Tolnaftate Topical Aerosol Solution	Topiramate Capsules	Topiramate Tablets
Torsemide Injection	Torsemide Tablets	Trandolapril and Verapamil Hydrochloride Extended-Release Tablets
Trandolapril Tablets	Tranexamic Acid Injection	Tranylcypromine Sulfate
Tranylcypromine Sulfate Tablets	Tretinoin Capsules	Tretinoin Microsphere Gel
Triamcinolone Acetonide Metered-Dose Nasal Suspension	Trifluridine Ophthalmic Solution	Trimetrexate for Injection
Trimipramine Maleate Capsules	Triprolidine and Pseudoephedrine Hydrochlorides and Codeine Phosphate Syrup	Trolamine Salicylate Cream
Trolamine Salicylate Gel	Trolamine Salicylate Topical Emulsion	Trovafloxacin Injection
Trovafloxacin Mesylate for Injection	Undecylenic Acid Topical Foam Aerosol	Unoprostone Isopropyl Ophthalmic Solution
Urea Cream	Valproic Acid Injection ***(Received)***	Vecuronium Bromide for Injection
Venlafaxine Extended-Release Capsules	Venlafaxine Tablets	Verapamil Hydrochloride Capsules
Verapamil Hydrochloride Extended-Release Capsules	Voriconazole Injection	Voriconazole Oral Suspension
Voriconazole Tablets	Yttrium Y-90 Chloride Solution	Yttrium Y-90 Glass Microspheres
Yttrium Y-90 Microspheres Injection	Ziprasidone Hydrochloride Capsules	Zidovudine and Lamivudine Tablets
Zinc Acetate Capsules	Zoledronic Acid for Injection	Zinc Tridosium Pentetate Injection

Excipients

Acetone Sodium Bisulfite	Acetylated Monoglycerides	*N*-Acetyl-L-Methionine
Aconitic Acid (Achilleic Acid)	Acrylic Acid-Octyl Acrylate Copolymer	Albumin Colloidal
Aliphatic Polyesters	Aluminum Ammonium Sulfate	Aluminum Hydroxide
Aluminum Lactate	Aluminum Oxide	Aluminum Ammonium Sulfate
Aluminum Potassium Sulfate	Aluminum Silicate	Aluminum Sodium Sulfate
Aluminum Stearate	Allantoin-Sodium Pyrrolidone Carboxylate	Ammonium Bicarbonate
Ammonium Calcium Alginate	Ammonium Phosphate	L-Ascorbyl Stearate
L-Asparagine	Batylalcohol Monostearate	Beeswax, Synthetic
Benzododecinium Bromide	Benzyl Chloride	Benzyl Nicotinate
Brominated Vegetable Oil	Butadiene-Styrene Rubber	Beta Naphthol
Butylene Glycol	Butylphthalyl Butylglycolate	Butylated Hydromethylphenol
Calcium Alginate	Calcium Alginate and Ammonium Alginate	Calcium Acid Pyrophosphate
Calcium Chloride Solution	Calcium Glycerophosphate ***(Received)***	Calcium Bromide
Calcium Phospahte Dibasic, Monohydrate	Calcium Phosphate Monobasic	Calcium Phosphate Dibasic, Anhydrous
Calcium Pyrophosphate	Calcium Sorbate	Calcium Propionate
Calcium Sulfate Dihydrate	Calcium Sulfate, Anhydrous	Calcium Stearoyl Lactylate
Calteridol Calcium	Canola Oil	Caldiamide Sodium
Caprylic/Capric Diglyceril Succinate	Carbon	Capric Acid
Carboxymethylamylopectin Sodium	Carboxymethylcellulose Potassium	Carboxymethyl Starch
Cetostearyl Isononanoate	Cholic Acid	Cinnamaldehyde
Chlorodifluoroethane	Cocamide Diethanolamine	Cocamide Oxide
Coconut Oil Hydrogenated	Cocoyl Caprylocaprate	Coconut Oil
Crystal Gum	Cutina	Copper Sulfate
L-Cysteine Monohydrochloride	Dammar Gum	Cystine

Excipients *(Continued)*		
Decanoic Acid	Decyl Oleate	Dehydroacetic Acid
Desoxycholic Acid	Dextrin Palmitate	Dextrins Modified
Diacetyl Tartaric Acid Esters of Mono- and Diglycerides	Dicetyl Phosphate	Dichlorofluoromethane
Diethylene Glycol Monopalmitostearate	Diethyl Sebacate	Difluoroethane
Diglycol Stearate	Diisopropanolamine ***(Received)***	Diisobutyl Adipate
Diisopropyl Adipate	Diisopropylbenzothiazyl-2-Sulfenamide	Dilauryl Thiodipropionate
Dimethyl Dicarbonate	Dimyristoyl Lecithin	Dimyristoyl Phosphatidylglycerol
Dioctyl Sodium Sulfosuccinate	Dipropylene Glycol	Disodium Edisylate
Disodium Guanylate	Disodium Inosinate	Disodium Monooleamide Sulfasuccinate
Docusate Sodium/Sodium Benzoate	Erythritol ***(Received)***	Erythorbic Acid
Erythrosine	Ethoxylated Mono- and Diglycerides	Ethoxyquin
Ethyl Hexanediol	Ethyl Linoleate	Ethyl Maltol
Ethylene Dichloride	Ethylene Glycol Monopalmitostearate	Ethylurea
Ferric Ammonium Citrate	Ferric Citrate	Ferric Oxide, Brown
Ferric Phosphate	Ferric Pyrophosphate	Ferrous Citrate
Ferrous Glycinate	Ferrous Lactate	Fluorochlorohydrocarbons
Formic Acid	Furcelleran	Gamma-Cyclodextrin
Gentistic Acid	Geraniol	L-Glutamic Acid
Glutamic Acid Hydrochloride	Gluten	Glycerol Ester of Gum Rosin (Ester Gum)
Glyceryl Laurate	Glyceryl Palmitate	Glyceryl Ricinoleate
Glyceryl Tristearate	Glycine Hydrochloride	Glycofurol
Glycol Stearate	Heptafluoropropane	Heptylparaben
Hexadecyl Isostearate	Hexane	Hexanetriol(-1,2,6-)
Hydrocarbon Gel	Hydrogenated Starch Hydrolysate	Hydroxyethylmethylcellulose
Hydroxylated Lecithin	Hydroxypropyl Beta Cyclodextrin	Indigotine
Inositol	Iron Carbonyl	Iron Subcarbonate
Isobutylated-Isoprene Copolymer	Isooctylacrylate	Isopropyl Isostearate
Isopropyl Stearate	Isostearic Acid	Isostearyl Alcohol
Lactobionic Acid	Lactose Ferrin, Bovine	Lactylated Fatty Acid Esters of Glycerol and Propylene Glycol
Lactylic Esters of Fatty Acids	Lanolin Anhydrous	Lanolin Alcohols, Acetylated
Lanolin (Wool Fat), Hydrogenated	Lanolin Hydrous	Lauramine Oxide
Lauric Acid	Lauric Diethanolamide	Lauric Myristic Diethanolamide
Lavender Oil	Lecithin, Hydroxylated	L-Leucine
Linoleic Acid	Macrogol Lauryl Ether	Macrogol Oleate
Macrogol Sorbitan Tristearate	Macrogol Stearyl Ether	Macrogolglycerol Cocoates
Macrogolglycerol Triisostearate	Magnesium Aluminum Silicate Hydrate	Magnesium Aspartate
Magnesium Aspartame Dihydrate	Magnesium Phosphate, Dibasic, Trihydrate	Magnesium Phosphate Tribasic
Magnesium Tartrate	Maltitol ***(Received)***	Maltitol Syrup
Maltol Isobutyrate	Malt Syrup	Manganese Chloride
Manganese Citrate	Manganese Glycerophosphate	Manganese Hypophosphite
D-Mannose	Medical Antifoam Emulsion C	Medronate Disodium
Medronic Acid	Methyl Chloride	Methylchloroisothiazolinone
Methyl Hydroxyethyl Cellulose	Methylisothiazolinone	*N*-Methylpyrrolidone ***(Received)***
Microcrystalline Cellulose, Silicified ***(Received)***	Mineral Spirits	Monoisostearyl Glyceryl Ester
Monopotassium Glutamate Monohydrate	Monosodium Citrate	Mullein Leaf
Myristyl Gamma-Picolinium Chloride	Myristyl Lactate	*N,N*-Bis(2-Hydroxyethyl)Stearamide
Naphtha	Non-Pareil Seeds	Nutmeg Oil
Octanoic Acid	Oleyl Oleate ***(Received)***	Oxystearin
Palm Kernel Oil	Palm Oil	Pentasodium Triphosphate
Pentetate Calcium Trisodium	Pentetate Pentasodium	Phenprobamate

Excipients *(Continued)*

Phenylmercuric Borate	Pine Oil	Polacrilin
Polyacrylate Dispersion 30 Percent ***(Received)***	Polydextrose	Polydextrose Solution
Polyglycerol Esters of Fatty Acids	Polyglycerol Polyricinoleic Acid	Polyoxyethylene Castor Oil (USP has 35)
Polyoxyl Stearate (USP has 40)	Polypropylene Oleate	Polyvinyl Acetate
Polyvinylacetal	Polyvinylacetal Diethylanoacetate	Polyvinylpolypyrrolidone
Polypropylene Stearyl Ether	Polyvinylpyrrolidone Ethylcellulose	Polysorbate 65
Potassium Acid Tartrate	Potassium Alginate ***(Received)***	Potassium Bromate
Potassium Carbonate Solution	Potassium Dichloroisocyanurate	Potassium Gibberellate
Potassium Glycerophospate	Potasssium Iodate	Potassium Nitrite
Potassium Phosphate	Potassium Phosphate Tribasic	Potassium Polymetaphosphate
Potassium Pyrophosphate	Potassium Stearate	Potassium Sulfate
Potassium Sulfite	Potassium Tripolyphosphate	Propylene Glycol Diacetate
Propylene Glycol Mono- and Diesters	Propylene Glycol Monolaurate ***(Received)***	Propyl Propionate
Purified Polyoxyl 35 Castor Oil ***(Received)***	Rapeseed Oil, Hydrogenated	Rapeseed Oil, Superglycerinated
Rice Bran Wax	Rosin	Silicone
Sodium Acid Pyrophosphate	Sodium Aluminosilicate	Sodium Aluminum Phosphate Acidic
Sodium Aluminum Phosphate Basic	Sodium Aspartate	Sodium Bisulfate
Sodium Bisulfite	Sodium Carbonate Hydrate	Sodium Carboxymethyl Betaglucan
Sodium Caseinate	Sodium Chlorate	Sodium Citrate, Dibasic
Sodium Citrate, Monobasic	Sodium Cyclamate	Sodium Dehydroacetate
Sodium Diacetate	Sodium Erythorbate	Sodium Ferric Pyrophosphate
Sodium Ferrocyanide	Sodium Hypophosphite	Sodium Laureth Sulfate
Sodium Lauroyl Sarcosinate	Sodium Lauryl Sulfoacetate	Sodium Magnesium Aluminosilicate
Sodium Magnesium Silicate	Sodium Malate	Sodium Metaphosphate, Insoluble
Sodium Metasilicate	Sodium Methylate	Sodium Polyphosphates Glassy
Sodium Potassium Tripolyphosphate	Sodium Pyrophosphate	Sodium Pyrrolidone Carboxylate
Sodium Sesquicarbonate	Sodium Sesquinoleate	Sodium Stearoyl Lactylate
Sodium Thiomalate	Sodium Trimetaphosphate	Sodium Trioleate
Sodium Tripolyphosphate	Soy Polysaccharides	Stannous Chloride
Stannous Tartrate	Starch, Pregelatinized Corn	Starch, Pregelatinized Tapioca
Stearalkonium Chloride	Stearyl Citrate	Stearyl Monoglyceridyl Citrate
Succinylated Monoglycerides	Sucrose Acetate Isobutyrate	Sucrose Fatty Acid Esters
Sucrose Stearate	Sucrose Syrup	Sugar Fruit Fine
Sulfobutyl Ether Beta Cyclodextran	Tallow	Tallow Glycerides
Tallow Oil	Tetrafluoroethane	Thioglycerol
Thyme Oil	Tribehenin	Tricetеareth-4 Phosphate
Trichloroethylene	Trimyristin	Trisidium Citrate
Trolamine Lauryl Sulfate	Vegetable Oil	Wheat Flour
Wheat Gluten	Wheat Germ Oil	Whey

PHARMACOPEIAL EDUCATION COURSES. USP's Pharmacopeial Education courses offer specialized instruction for chemists, other scientists, and professionals in the pharmaceutical and allied industries. USP scientists who play a key role in establishing official USP standards teach these courses and provide expert insights on the practical applications of official test procedures and best practices in using the *USP–NF* and other USP resources. The courses also give participants an opportunity to learn how to get involved in USP's standards-setting processes and the benefits of participating in standards development. Courses offered in 2005 and 2006 are listed below. For more information and to register, visit www.usp.org. To discuss how USP can bring courses to a location of your choice or design a custom course package for you, call 301-816-8237, or e-mail PharmacopeialEducation@usp.org.

2005–2006 Calendar of Pharmacopeial Education Courses

Date	Name of Course	Location
November 4	Fundamentals of Microbiological Testing	California State University, Fullerton, CA
November 15	Basic Statistics and Their Practical Applications to the *USP–NF*	North Carolina State University, Raleigh, NC
December 7	Effectively Using the *USP–NF:* Session I	Brussels, Belgium
December 8	Effectively Using the *USP–NF:* Session II	Brussels, Belgium
January 18	Effectively Using the *USP–NF:* Sessions I & II	California State University, Fullerton, CA
January 24–25	Fundamentals of Dissolution: Lecture & Lab	North Brunswick, NJ
February 14	Effectively Using the *USP–NF:* Sessions I & II	Basel, Switzerland
February 15	Analytical Method Validation	Basel, Switzerland
February 23	Effectively Using the *USP–NF:* Sessions I & II	North Carolina State University, Raleigh, NC
March 29	Basic Statistics and Their Practical Applications to the *USP–NF*	New Jersey, hosted by NJPQCA
April 19	Effectively Using the *USP–NF:* Session I	USP Headquarters, Rockville, MD
April 20	Effectively Using the *USP–NF:* Session II	USP Headquarters, Rockville, MD

VISIT THE USP WEB SITE AT ⟨http://www.usp.org⟩. Various resources related to Pharmacopeial standards are presented, including highlights from *PF.*

INTERNATIONAL CORRESPONDENCE. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia, with a copy to USP, for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows:

Technical Secretariat of the European
Pharmacopoeia Commission
B.P. 907
F 67029 Strasbourg Cedex 1
France

NAKASHIMA Nobumasa
Evaluation and Licensing Division
Pharmaceutical and Medical Safety Bureau
Ministry of Health, Labour and Welfare, Japan
Tel. +81-3-3595-2431, Fax +81-3-3597-9535
E-mail: nakashima-nobumasa@mhlw.go.jp

HOW TO SUBMIT COMMENTS. The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. Submissions concerning a particular item that has appeared in an issue of *PF* should be submitted to the appropriate USP scientific staff liaison identified at the end of the *Briefing* accompanying each item. To submit comments and data to a liaison, use the e-mail address and telephone numbers listed in the *Staff Directory* included in every *PF.*

Please note that *USP–NF* is being published in an annual edition with one main book and two *Supplements* a year. In addition, the schedule provided below will repeat every year so that users will know what to expect and become familiar with the deadlines.

In the future, USP anticipates including the comment submission deadline in each briefing of every revision proposal when it is published for public review and comment.

For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or FAX number 301-816-8373.

NEW *PHARMACOPEIAL FORUM* PUBLIC REVIEW AND COMMENT PERIOD DEADLINES. In *Pharmacopeial Forum* 31(5) (page 1308), USP announced that the comment period for *PF* proposals targeted for the *USP–NF* and its *Supplements* has been extended to a period of 90 days from the date of publication, as opposed to the 60-day period previously provided.

The comment deadlines for *PF* 31(6) and beyond were inadvertently omitted from the *Policies and Announcements* section of *PF* 31(6). The full year's listing of comment period deadlines and the targeted official publications appear below. In accordance with the Rules and Procedures of the 2005–2010 Council of Experts*, USP is implementing the 90-day comment period by providing a deadline for each issue of *PF* unless otherwise stated in the individual briefing. Note that *PF* 31(6) and *PF* 32(1) have a combined comment deadline (April 17, 2006) due to the omission of the comment deadline dates in *PF* 31(6). Individual comment deadlines begin with *PF* 32(2) March–April 2006.

We apologize for any inconvenience this may have caused.

Publication and Comment Schedule

Pharmacopeial Forum	Comment Deadline	Targeted Official Publication	Publication Date	Official Date
PF 31(6)	April 17, 2006	*USP 30–NF 25*	November 2006	January 2007
PF 32(1)	April 17, 2006			
PF 32(2)	June 15, 2006	*USP 30–NF 25 1st Supplement*	February 2007	April 2007
PF 32(3)	August 15, 2006			
PF 32(4)	October 16, 2006	*USP 30–NF 25 2nd Supplement*	June 2007	August 2007
PF 32(5)	December 15, 2006			
PF 32(6)	February 15, 2007	*USP 31–NF 26*	November 2007	January 2008
PF 33(1)	April 16, 2007			

All official revisions are published in the annual edition or *Supplements* to *USP–NF* (twice yearly). Between these publications, official revisions are published in *PF* in the *Interim Revision Announcement;* these revisions are also incorporated in the upcoming *Supplement.* The official publication in which an *IRA* is incorporated will depend upon publication deadlines. The 5th *IRA* and the 6th *IRA* will not appear until *Supplement 1*. See table below. The electronic version of *USP–NF* is updated as each *Supplement* becomes available and, therefore, contains all official text up to and including the contents of the latest *Supplement.* The new table below outlines the publications and their release and official dates, and the book or supplement which supersedes them.

* ***Section 9.04(b) of the Rules and Procedures of the 2005–2010 Council of Experts***
A period of at least ninety (90) days from the date of publication will be allowed for public review and comment. The time allowed for public comments shall be noted in the publication in the PF. For good cause shown, the Chairperson may alter the time specified.

Publication Schedules

Publication	Release Date	Official Date	Superseded by
USP 29–NF 24	Nov. 1, 2005	Jan. 1, 2006	*1st Supplement*
1st Supplement	Feb. 1, 2006*	Apr. 1, 2006*	*2nd Supplement*
1st *IRA* [*PF* 32(1)]	Jan. 1, 2006*	Feb. 1, 2006*	*2nd Supplement*
2nd *IRA* [*PF* 32(2)]	Mar. 1, 2006*	Apr. 1, 2006*	*2nd Supplement*
3rd *IRA* [*PF* 32(3)]	May 1, 2006*	June 1, 2006*	*USP 30–NF 25*
2nd Supplement	June 1, 2006*	Aug. 1, 2006*	*USP 30–NF 25*
4th *IRA* [*PF* 32(4)]	July 1, 2006*	Aug. 1, 2006*	*USP 30–NF 25*
5th *IRA* [*PF* 32(5)]	Sept. 1, 2006*	Oct. 1, 2006*	*1st Supplement USP 30–NF 25*
6th *IRA* [*PF* 32(6)]	Nov. 1, 2006*	Dec. 1, 2006*	*1st Supplement USP 30–NF 25*
USP 30–NF 25	Nov. 1, 2006*	Jan. 1, 2007*	

*Tentative

INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- New adopted (official) revisions to the *USP–NF* that become effective before the effective date of the next *Supplement* or that were not ready for adoption by the closing date for the upcoming *Supplement*. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.

Symbols—Interim revisions are shown with new text (if any) enclosed in circles, •new text•. Text enclosed in squares, ▪new text▪, has already been adopted in a *Supplement*. Where the symbols appear together with no enclosed text, such as •• or ▪▪, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by a number that indicates the *IRA* or *Supplement* in which the revision first appeared. For example, •2 indicates that the revision was officially adopted in the *Second Interim Revision Announcement*, and ▪2S (*USP29*) indicates that the revision was officially adopted in the *Second Supplement* to *USP 29*.

Errata—At the end of the *Interim Revision Announcement* section is a list of errata and corrections to *USP 29–NF 24*. The page number indicates where the item is found in *USP–NF*. If necessary, this list will be updated with every issue of *PF*. This information will also be cumulative in the next available *Supplement*, and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

FIRST INTERIM REVISION ANNOUNCEMENT to *USP 29* and to *NF 24*

By authority of the United States Pharmacopeial Convention, Inc.
Prepared by the Council of Experts and published by the Board of Trustees

John W. Mauger, *Chair*
USP Board of Trustees

Roger L. Williams, *Executive Vice President*
and *Chairman, USP Council of Experts*

Eric B. Sheinin, Ph.D., *Chief Science Officer*

Official February 1, 2006 **Released January 1, 2006**

All inquiries and comments regarding *USP 29* text and *NF 24* text should be addressed to the Executive Secretariat, *USP–NF*, 12601 Twinbrook Parkway, Rockville, MD 20852.

New USP Reference Standards

The following USP Reference Standards, which were not available when the associated monograph was made official, have since become available. The respective official date of each *USP 29* or *NF 24* standard, test, or assay requiring the use of the following USP Reference Standards is indicated in parentheses after the name of the Reference Standard.

USP Ademetionine Disulfate Tosylate RS (January 1, 2006)
USP Berberine Chloride (May 1, 2006)
USP Bupropion Hydrochloride Related Compound A RS (January 1, 2006)
USP Bupropion Hydrochloride Related Compound C RS (January 1, 2006)
USP Bupropion Hydrochloride Related Compound F RS (January 1, 2006)
USP Ciclopirox RS (January 1, 2006)
USP Ciclopirox Related Compound A RS (January 1, 2006)
USP Ciclopirox Related Compound B RS (January 1, 2006)
USP Clopidogrel Bisulfate RS (March 1, 2006)
USP Clopidogrel Bisulfate Related Compound A RS (March 1, 2006)
USP Clopidogrel Bisulfate Related Compound B RS (March 1, 2006)
USP Clopidogrel Bisulfate Related Compound C RS (March 1, 2006)
USP Desoaminylazithromycin RS (January 1, 2006)
USP Eleutheroside B RS (January 1, 2006)
USP Eleutheroside E RS (January 1, 2006)
USP Galactitol RS (January 1, 2006)
USP Hydrastine RS (May 1, 2006)
USP Insulin Lispro RS (March 1, 2006)
USP Maltose Monohydrate RS (January 1, 2006)
USP Mefloquine Hydrochloride RS (May 1, 2006)
USP Mefloquine Related Compound A RS (May 1, 2006)
USP Norphenylephrine Hydrochloride RS (May 1, 2006)
USP Ondansetron RS (May 1, 2006)
USP Polyoxyl 20 Cetostearyl Ether RS (March 1, 2006)
USP Polyoxyl 20 Stearyl Ether RS (March 1, 2006)
USP Prilocaine RS (January 1, 2006)
USP Prilocaine Related Compound A RS (January 1, 2006)
USP Propofol RS (January 1, 2006)
USP Propofol Related Compound A RS (January 1, 2006)
USP Propofol Related Compound B RS (January 1, 2006)
USP Propofol Related Compound C RS (January 1, 2006)
USP Propofol Resolution Mixture C RS (January 1, 2006)
USP Residual Solvents Class 2—Mixture B RS (January 1, 2006)
USP Sodium Benzoate RS (January 1, 2006)
USP Somatropin RS (May 1, 2006)
USP Stavudine RS (January 1, 2006)
USP Stavudine System Suitability Mixture RS (January 1, 2006)
USP Sulfaquinoxaline Related Compound A RS (January 1, 2006)
USP Tiagabine Related Compound A RS (May 1, 2006)
USP Racemic Tiagabine Hydrochloride Mixture RS (May 1, 2006)
USP Tiagabine Hydrochloride RS (May 1, 2006)
USP Tagatose RS (January 1, 2006)

Unavailable First-Time Official USP Reference Standards

The official dates of any *USP 29* or *NF 24* standards, tests, or assays requiring the use of the following new USP Reference Standards are postponed until further notice pending availability of the respective Reference Standards. This listing was updated as of November 1, 2005.

USP Albumin Human RS
USP Alteplase RS
USP Amifostine RS
USP Amifostine Thiol RS
USP Antithrombin III Human RS
USP Budesonide RS
USP Cetrimonium Bromide RS
USP Copolymer Polypropylene RS
USP Decoquinate RS
USP Cryopreserved Human Fibroblast-Derived Dermal Substitute Reference Photomicrographs RS
USP Diethylstilbestrol Diphosphate RS
USP Powdered *Echinacea pallida* Extract RS
USP Escin RS
USP Eucatropine Hydrochloride RS
USP Fludeoxyglucose Related Compound B RS
USP Fluticasone Propionate RS
USP Fluvastatin Sodium RS
USP Fluvastatin Related Compound A RS
USP Fluvastatin Related Compound B RS
USP Ginkgo Terpene Lactones RS
USP Powdered American Ginseng Extract RS
USP Glyceryl Distearate RS
USP Glyceryl Monolinoleate RS
USP Glyceryl Monooleate RS
USP Gonadorelin Hydrochloride RS
USP Hemoglobin RS
USP Hexacosanol RS
USP Irbesartan RS
USP Irbesartan Related Compound A RS
USP Isosorbide Mononitrate RS
USP Isosorbide Mononitrate Related Compound A RS
USP Alpha Lipoic Acid RS
USP Maritime Pine Extract RS
USP Mecamylamine Related Compound A RS
USP Menotropins RS
USP Methyldopa-Glucose Reaction Product RS
USP Mibolerone RS
USP Narasin RS
USP Near Infrared Calibrator
USP Nimodipine RS
USP Nimodipine Related Compound A RS
USP Paricalcitol Solution RS
USP Cultured Rat Pheochromocytoma Reference Photomicrographs RS
USP Polyisobutylene RS
USP Polyoxyl 10 Oleyl Ether RS
USP Potassium Perchlorate RS
USP Pygeum Extract RS
USP Pyrethrum Extract RS
USP Quinapril Hydrochloride RS
USP Ramipril Related Compound B RS
USP Powdered St John's Wort Extract RS
USP Sargramostim RS
USP Sincalide RS
USP Human Fibroblast-Derived Temporary Skin Substitute Reference Photomicrographs RS
USP Sulisobenzone RS
USP Δ^8-Tetrahydrocannabinol RS
USP Δ^9-Tetrahydrocannabinol RS
USP Powdered Valerian RS
USP Valrubicin RS
USP Valrubicin Related Compound A RS
USP Vasopressin RS

MONOGRAPHS (USP)

Lithium Carbonate Extended-Release Tablets

Change to read:

Dissolution ⟨711⟩—

TEST 1—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1.*

Medium: dilute hydrochloric acid (7 in 1000); 800 mL.

Apparatus 1: 100 rpm.

Times: 15, 45, 90, and 120 minutes.

Procedure—At each *Time,* withdraw 8.0 mL of the solution under test, and pass through a filter having a 35-µm or finer porosity. Using the filtrate as the *Assay preparation,* suitably diluted with *Medium* if necessary, and using *Medium* to prepare the *Standard preparation,* determine the amount of Li_2CO_3 dissolved by employing a flame photometer, as directed in the *Assay.*

Tolerances—The percentages of the labeled amount of Li_2CO_3 dissolved at the specified times conform to *Acceptance Table 2.*

Time (minutes)	Amount dissolved
15	between 2% and 16%
45	between 25% and 45%
90	between 60% and 85%
120	not less than 85%

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

Apparatus and *Procedure*—Proceed as directed for *Test 1.*

Medium: water; 900 mL.

Times: 1, 3, and 7 hours.

Tolerances—The percentages of the labeled amount of Li_2CO_3 dissolved at the specified times conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
1	not more than 40%
3	between 45% and 75%
7	not less than 70%

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3.*

Medium: water; 250 mL.

Apparatus 3: 6 dips per minute, 20-mesh top screen and 100-mesh bottom screen.

Procedure—Proceed as directed for *Test 1.*

Times and *Tolerances*—The percentages of the labeled amount of Li_2CO_3 dissolved at the specified times conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
1	between 10% and 45%
2	between 25% and 75%
6	not less than 70%

TEST 4—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4.*

Medium, Apparatus, Times, and *Procedure*—Proceed as directed for *Test 1.*

Tolerances—The percentages of the labeled amount of Li_2CO_3 dissolved at the specified times conform to *Acceptance Table 2.*

Time (minutes)	Amount dissolved
15	•not more than 15%•1
45	between 20% and 45%
90	•between 50% and 80%•1
120	not less than •70%•1

•TEST 5—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5.*

Medium: water, 900 mL.

Apparatus 1: 100 rpm.

Times: 30, 90, and 150 minutes.

Procedure—Pass a portion of the solution under test through a 0.8-µm mixed cellulose esters filter discarding the first 10 mL. Using the rest of the filtrate as the *Assay preparation,* suitably diluted with *Medium,* if necessary, and using *Medium* to prepare the *Standard preparation,* determine the amount of Li_2CO_3 dissolved by employing a flame photometer, as directed in the *Assay.*

Tolerances—The percentages of the labeled amount of Li_2CO_3 dissolved at the specified times conform to *Acceptance Table 2.*

Time (minutes)	Amount dissolved
30	between 10% and 30%
90	between 55% and 75%
150	not less than 85%

•1

(Official April 1, 2006)

DIETARY SUPPLEMENTS—MONOGRAPHS

Goldenseal

Change to read:

USP Reference standards ⟨11⟩—*USP Berberine Chloride RS. USP Hydrastine* ••1 *RS.*

Change to read:

Thin-layer chromatographic identification test ⟨201⟩—

Test solution—Finely powder the rhizome and the root, transfer 0.5 g of the powder to a suitable glass vial, add 0.5 mL of 10% sodium carbonate, and mix. Add 5 mL of methanol, and heat for 10 minutes in a water bath at 60°. Cool to room temperature, filter, and dry under a stream of nitrogen. Add 0.5 mL of methanol to dissolve the residue.

Standard solution—Dissolve accurately weighed quantities of USP Berberine Chloride RS and USP Hydrastine ••1 RS in methanol to obtain a solution having a concentration of 0.5 mg of each USP Reference Standard per mL.

Application volume: 10 µL to 20 µL, as bands.

Developing solvent system: a mixture of ethyl acetate, butyl alcohol, formic acid, and water (50 : 30 : 10 : 10).

Procedure—Proceed as directed in the chapter, except to air-dry the plates, and examine them under UV light at about 365 nm. The chromatograms show zones having a lemon-yellow fluorescence due to berberine at an R_F value of about 0.53 and a blue-white fluorescence due to hydrastine at an R_F value of about 0.42.

Change to read:

Content of berberine and hydrastine and limit of palmatine—

Mobile phase—Dissolve 9.93 g of monobasic potassium phosphate in 730 mL of distilled water. Add 270 mL of acetonitrile, mix, filter, and degas. Make other adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve accurately weighed quantities of USP Berberine Chloride RS and USP Hydrastine •$_{1}$ RS in a mixture of water and methanol (1 : 1), and dilute quantitatively, and stepwise if necessary, to obtain a solution containing about 0.05 mg of each USP Reference Standard per mL.•$_{1}$

System suitability solution—Prepare a solution of palmatine in a mixture of water and methanol (1 : 1) having a known concentration of about 0.05 mg per mL. Mix equal volumes of this solution and the *Standard solution.*

Test solution—Finely powder a quantity of Goldenseal, and transfer 0.12 g, accurately weighed, to a 50-mL volumetric flask. Add 40 mL of a mixture of 0.1 M monobasic potassium phosphate and acetonitrile (60 : 40). Sonicate for 5 minutes, and shake for 10 minutes on a rotation shaker. Dilute with the mixture of 0.1 M monobasic potassium phosphate and acetonitrile (60 : 40), mix, and filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 235-nm detector and a 4.6- × 150-mm column that contains packing L1. The flow rate is about 1.8 mL per minute. Inject the *Standard solution* into the chromatograph, and record the peak responses as directed for *Procedure:* the capacity factor, k', determined from the hydrastine and berberine peaks is not less than 3.0; the column efficiency is not less than 5000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.5%. Inject the *System suitability solution* into the chromatograph, and record the peak responses as directed for *Procedure:* identify the locus for palmatine, and calculate the resolution, R, with respect to hydrastine and berberine: the resolution, R, between berberine and palmatine is not less than 1.5, and the resolution, R, between hydrastine and palmatine is not less than 1.5.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentages of berberine and hydrastine in the portion of Goldenseal taken by the formula:

$$100(CV/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of berberine or hydrastine in the respective USP Reference Standard in the *Standard solution;* •$_{1}$ V is the final volume, in mL, of the *Test solution;* W is the weight, in mg, of Goldenseal taken; and r_U and r_S are the peak areas for berberine and hydrastine obtained from the *Test solution* and the *Standard solution,* respectively. Using the values obtained from the chromatogram of the *Test solution,* divide the peak area of berberine by the peak area of any peak at the locus for palmatine (if present): the ratio is more than 50 : 1.

Powdered Goldenseal

Interim Revision Announcement

ERRATA

Following is a list of errata and corrections to *USP 29–NF 24*. The page number indicates where the item is found in *USP 29–NF 24*. If necessary, this list will be updated with every issue of *PF*. This information will also be available as a cumulative table in the next available *Supplement* and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement. USP staff are available to respond to questions regarding the accuracy of a particular requirement by calling 1-800-822-USPC.

Page	Title	Section	Description
2144	*Tiamulin Fumarate*	*Limit of residual solvents*	Line 7 under *Procedure:* Change "$1.25(W_S/W_U)(R_U/R_S)$" to: $(W_S/W_U)(R_U/R_S)$
2264	*Sterile Water for Inhalation*	*Ammonia*	Lines 8 and 9: Change "(furnished by using 1.76 mL of 1.0 N ammonium hydroxide)" to: (furnished by adding 1 mL of the final solution prepared by diluting 3.0 mL of ammonia TS with *High-Purity Water* to 100 mL; 1.0 mL of this solution is further diluted to 100 mL)
		Oxidizable substances	Lines 3 and 4: Change "0.1 N potassium permanganate" to: 0.1 M potassium permanganate Lines 5 and 6: Change "0.1 N potassium permanganate" to: 0.1 M potassium permanganate
2264	*Sterile Water for Injection*	*Ammonia*	Lines 8 and 9: Change "(furnished by using 1.76 mL of 1.0 N ammonium hydroxide)" to: (furnished by adding 1 mL of the final solution prepared by diluting 3.0 mL of ammonia TS with *High-Purity Water* to 100 mL; 1.0 mL of this solution is further diluted to 100 mL)
		Oxidizable substances	Lines 3 and 4: Change "0.1 N potassium permanganate" to: 0.1 M potassium permanganate Lines 5 and 6: Change "0.1 N potassium permanganate" to: 0.1 M potassium permanganate
2265	*Sterile Water for Irrigation*	*Ammonia*	Lines 8 and 9: Change "(furnished by using 1.76 mL of 1.0 N ammonium hydroxide)" to: (furnished by adding 1 mL of the final solution prepared by diluting 3.0 mL of ammonia TS with *High-Purity Water* to 100 mL; 1.0 mL of this solution is further diluted to 100 mL)
		Oxidizable substances	Lines 3 and 4: Change "0.1 N potassium permanganate" to: 0.1 M potassium permanganate Lines 5 and 6: Change "0.1 N potassium permanganate" to: 0.1 M potassium permanganate
2265	*Sterile Purified Water*	*Oxidizable substances*	Lines 3 and 4: Change "0.1 N potassium permanganate" to: 0.1 M potassium permanganate Lines 5 and 6: Change "0.1 N potassium permanganate" to: 0.1 M potassium permanganate
2266	*Water for Hemodialysis*	*Oxidizable substances*	Lines 2 and 3: Change "0.1 N potassium permanganate" to: 0.1 M potassium permanganate
3297	*Carbomer Homopolymer*	*Limit of acrylic acid*	Line 1: Change "*0.01 M Phosphate buffer*—Dissolve 1.361 g of monobasic potassium phosphate in 100 mL of water, and mix" to: *0.01 M Phosphate buffer*—Dissolve 1.361 g of monobasic potassium phosphate in 1000 mL of water, and mix
3342	*Glyceryl Monolinoleate*	*Identification A*	Lines 1 and 2 under *Test solution:* Change "a solution in methylene chloride containing about 0.05 µg per mL" to: a solution in methylene chloride containing 0.05 g per mL Lines 1 and 2 under *Spray reagent:* Change "a solution containing 0.02 µg of rhodamine B in 0.2 µL of alcohol" to: a solution containing 0.02 g of rhodamine B in 0.2 L of alcohol

Interim Revision Announcement

IN-PROCESS REVISION

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) items that previously appeared under *Pharmacopeial Previews* and are now formally proposed as revisions, (2) proposed revisions placed directly under *In-Process Revision,* or (3) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the staff liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

BRIEFING

> **Name of Item**, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How to Use PF*), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
>
> (DSN: L. Evans) RTS—55678-1

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type, as shown in the examples below:

•new text•

if slated for an *Interim Revision Announcement to USP 29–NF 24* (*IRA*);

▲new text▲*USP30*

if slated for *USP 30–NF 25*; and

■new text■

if slated for a *Supplement to USP–NF*. The same symbols *not* set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as •• or ■■ or ▲▲, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •2 indicates that the revision is proposed for the *Second Interim Revision Announcement*, ■2S (*USP 29*) indicates that the proposed revision is slated for the *Second Supplement to USP 29*, and ▲*USP30* and ▲*NF25* indicate that the revisions are proposed for *USP 30* and *NF 25*, respectively.

Official Title Changes Where the specification ***"Monograph title change"*** is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

MONOGRAPHS (USP)

BRIEFING

Acetazolamide Oral Solution. Because there are no existing *USP* monographs for several Oral Solutions, new monographs are being proposed. Each monograph is based on its corresponding Oral Suspension, published in *Pharmacopeial Previews,* on pages 915–949 of *PF* 31(3) [May–June 2005]. See also the briefing under *Acetazolamide Oral Suspension.* A vehicle is specified for each Oral Solution. The new monographs are as follows:

Acetazolamide Oral Solution
Bethanechol Chloride Oral Solution
Captopril Oral Solution
Diltiazem Hydrochloride Oral Solution
Dolasetron Mesylate Oral Solution
Labetalol Hydrochloride Oral Solution
Metoprolol Tartrate Oral Solution
Verapamil Hydrochloride Oral Solution

(CRX: C. Okeke) RTS—43131-2

Add the following:

▲Acetazolamide Oral Solution

» Acetazolamide Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of acetazolamide ($C_4H_6N_4O_3S_2$). Prepare Acetazolamide Oral Solution 25 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩.

Acetazolamide powder	2.5 g
Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

See also *Acetazolamide Oral Suspension*): Dissolve Acetazolamide powder in about 20 mL of Cherry Syrup in a mortar, and mix to a uniform paste. Add the Cherry Syrup in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough Cherry Syrup to bring to final volume, and mix.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature or in a cold place.

Labeling—Label it to state that it is to be well shaken before use, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Acetazolamide RS.*

pH ⟨791⟩**:** between 3.1 and 3.9.

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Mobile phase—Dissolve 4.1 g of anhydrous sodium acetate in 950 mL of water, add 20 mL of methanol and 30 mL of acetonitrile, and mix. Adjust with glacial acetic acid to a pH of 4.0. Filter and degas the solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Transfer about 25 mg of USP Acetazolamide RS, accurately weighed, to a 50-mL volumetric flask, add 5.0 mL of 0.5 N sodium hydroxide, and mix to dissolve. Dilute with water to volume, and mix.

Standard preparation—Transfer 25.0 mL of the *Standard stock preparation* to a 50-mL volumetric flask, and dilute with water to obtain a solution having a known concentration of 250 µg per mL.

Assay preparation—Agitate the container of Oral Solution for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix on a vortex mixer for 30 seconds. Pipet 1.0 mL into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 3 minutes, and the relative standard deviation for replicate injections is not more than 1.1%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of acetazolamide ($C_4H_6N_4O_3S_2$) in the volume of Oral Solution taken by the formula:

$$100(C/V)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Acetazolamide RS in the *Standard preparation; V* is the volume, in mL, of Oral Solution taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Acetazolamide Oral Suspension, page 917 of *PF* 31(3) [May–June 2005]. This and the following monographs, which were presented in *Pharmacopeial Previews* in *PF* 31(3) [May–June 2005], are now forwarded to *In-Process Revision* with a few editorial revisions.

Alprazolam Oral Suspension
Azathioprine Oral Suspension
Bethanechol Chloride Oral Suspension
Captopril Oral Suspension
Clonazepam Oral Suspension
Diltiazem Hydrochloride Oral Suspension
Dipyridamole Oral Suspension
Dolasetron Mesylate Oral Suspension
Flucytosine Oral Suspension
Ganciclovir Oral Suspension [A title change is proposed; presented as Ganciclovir Oral Solution in *PF* 31(3)]
Labetalol Hydrochloride Oral Suspension
Metolazone Oral Suspension
Metoprolol Tartrate Oral Suspension
Ondansetron Hydrochloride Oral Suspension
Quinidine Sulfate Oral Suspension
Sumatriptan Succinate Oral Suspension
Verapamil Hydrochloride Oral Suspension

(CRX: C. Okeke) RTS—43131-1

Add the following:

▲Acetazolamide Oral Suspension

» Acetazolamide Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of acetazolamide ($C_4H_6N_4O_3S_2$). Prepare Acetazolamide Oral Suspension 25 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩. See also *Acetazolamide Oral Solution*):

In-Process Revision

Acetazolamide	2.5 g
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free), and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

NOTE— ~~If Cherry Syrup, *NF* is used, it becomes a solution.~~ If Tablets are used instead of bulk powder, the preparation becomes a suspension and should be labeled as such.

If using Tablets place the Tablets in a mortar and comminute the Tablets to a fine powder, or add Acetazolamide powder. Add about 20 mL of the Vehicle, and mix to a uniform paste. Add the Vehicle in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough liquid Vehicle to bring to final volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken before use, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Acetazolamide RS.*

pH ⟨791⟩**:** between 4.0 and 5.0 (Vehicle for Oral Solution and Vehicle for Oral Suspension), and between 3.1 and 3.9 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Mobile phase—Dissolve 4.1 g of anhydrous sodium acetate in 950 mL of water, add 20 mL of methanol and 30 mL of acetonitrile, and mix. Adjust with glacial acetic acid to a pH of 4.0. Filter and degas the solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Transfer about 25 mg of USP Acetazolamide RS, accurately weighed, to a 50-mL volumetric flask, add 5.0 mL of 0.5 N sodium hydroxide, and mix to dissolve. Dilute with water to volume, and mix.

Standard preparation—Transfer 25.0 mL of the *Standard stock preparation* to a 50-mL volumetric flask, and dilute with water to obtain a solution having a known concentration of 250 µg per mL.

Assay preparation—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample solution to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 3 minutes, and the relative standard deviation for replicate injections is not more than 1.1%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and

measure the responses for the major peaks. Calculate the quantity, in mg, of acetazolamide ($C_4H_6N_4O_3S_2$) in the volume of Oral Suspension taken by the formula:

$$100(C/V)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Acetazolamide RS in the *Standard preparation;* V is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Albendazole Oral Suspension, *USP 29* page 61. USP acknowledges that Albendazole Oral Suspension is approved in several countries for human use. It is proposed to change the specified labeling requirements so that manufacturers can use the USP Albendazole Oral Suspension monograph for these drug products.

(VET: I. DeVeau) RTS—43400-1

Change to read:

Labeling~~—Label~~

▲For products marketed in the United States, label▲*USP30* it to indicate that it is for veterinary use only.

BRIEFING

Alprazolam Oral Suspension, page 918 of *PF* 31(3) [May–June 2005]—See briefing under *Acetazolamide Oral Suspension*.

(CRX: C. Okeke) RTS—43131-3

Add the following:

▲Alprazolam Oral Suspension

» Alprazolam Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of alprazolam ($C_{17}H_{13}ClN_4$). Prepare Alprazolam Oral Suspension 1 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Alprazolam	100 mg
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free), and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

NOTE—~~If Cherry Syrup, *NF* is used, it becomes a solution.~~ If Tablets are used instead of bulk powder, the preparation becomes a suspension and should be labeled as such.

If using Tablets, place the Tablets in a suitable mortar, and comminute or triturate to a fine powder, or add Alprazolam powder. Add about 20 mL of the Vehicle, and mix until a uniform paste is formed. Add the Vehicle in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add sufficient Vehicle to bring to final volume, and mix well.

In-Process Revision

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature, or under refrigeration.

Labeling—Label it to state that it is to be well shaken before use, and to state the beyond-use date.

USP Reference standards ⟨11⟩—*USP Alprazolam RS.*

pH ⟨791⟩**:** between 4.2 and 4.7 (Vehicle for Oral Solution and Vehicle for Oral Suspension) and between 3.4 and 4.2 (Cherry Syrup).

Beyond-use date: 45 days after the day on which it was compounded.

Assay—

Buffer solution—Prepare a 0.04 M sodium acetate solution, and adjust with glacial acetic acid to a pH of 2.4.

Mobile phase—Prepare a filtered and degassed solution of *Buffer solution,* methanol, and acetonitrile (47 : 45 : 8). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Alprazolam RS in *Mobile phase,* and quantitatively dilute with *Mobile phase* to obtain a solution having a known concentration of about 20 µg per mL.

Assay preparation—Agitate the container of Alprazolam Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample into a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 0.6 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 10 minutes, and the relative standard deviation for replicate injections is not more than 1.4%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of alprazolam ($C_{17}H_{13}ClN_4$) in each mL of Oral Suspension taken by the formula:

$$50(C/V)(r_U / r_S)$$

in which C is the concentration, in µg per mL, of USP Alprazolam RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Amoxicillin Capsules, *USP 29* page 158. It is proposed to add a *Dissolution Test 2* for a generic product approved by FDA. In the absence of any adverse comments, it is proposed to implement this revision via the *Third Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of June 1, 2006.

(BPC: M. Marques) RTS— 43726-1; 43727-1

Add the following:

•**Labeling—**When more than one *Dissolution Test* is given, the labeling states the *Dissolution Test* used only if *Test 1* is not used.•3

In-Process Revision

Change to read:

Dissolution ⟨711⟩—

•TEST 1—•[3]

Medium: water; 900 mL.

Apparatus 1: 100 rpm, for Capsules containing 250 mg.

Apparatus 2: 75 rpm, for Capsules containing 500 mg.

Time: 60 minutes.

Procedure—Determine the amount of $C_{16}H_{19}N_3O_5S$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 272 nm on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Amoxicillin RS in the same *Medium.*

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{16}H_{19}N_3O_5S$ is dissolved in 60 minutes.

•TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: water; 900 mL.

Apparatus 1: 100 rpm.

Time: 90 minutes.

Procedure—Determine the amount of $C_{16}H_{19}N_3O_5S$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 272 nm on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Amoxicillin RS in the same *Medium.*

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{16}H_{19}N_3O_5S$ is dissolved in 90 minutes.•[3]

BRIEFING

Azathioprine Oral Suspension, page 920 of *PF* 31(3) [May–June 2005]—See briefing under *Acetazolamide Oral Suspension.*

(CRX: C. Okeke) RTS—43131-4

Add the following:

▲Azathioprine Oral Suspension

» Azathioprine Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of azathioprine ($C_9H_7N_7O_2S$). Prepare Azathioprine Oral Suspension 50 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Azathioprine	5 g
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free), and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

NOTE—~~If Cherry Syrup, *NF* is used, it becomes a solution.~~ If Tablets are used instead of bulk powder, the preparation becomes a suspension and should be labeled as such.

If using Tablets, comminute them to a fine powder in a suitable mortar, or add Azathioprine powder to the mortar. Add about 10 mL of the Vehicle, and mix to a uniform paste. Add the Vehicle in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add sufficient Vehicle to bring to final volume, and mix well.

In-Process Revision

[Caution—Avoid skin contact or inhalation of azathioprine by using protective gloves and a fume hood or surgical mask.]

Packaging and storage—Preserve in tight, light-resistant containers. Store at room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken before use, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Azathioprine RS.*

pH ⟨791⟩**:** between 3.9 and 4.7 (Vehicle for Oral Solution and Vehicle for Oral Suspension) and between 3.1 and 3.9 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Mobile phase—Dissolve 1.1 g of sodium 1-heptanesulfonate in 700 mL of water, add 300 mL of methanol, and mix. Adjust with 1 N hydrochloric acid to a pH of 3.5. Filter, and degas the solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve about 25 mg of USP Azathioprine RS, accurately weighed, in a 50-mL volumetric flask. Add about 15 mL of methanol and 0.5 mL of ammonium hydroxide to the flask, swirl and sonicate for 2 minutes. Dilute with methanol to volume, and mix. Transfer 10 mL of this solution to a 50-mL volumetric flask, dilute with water to volume, and mix.

Assay preparation—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample solution into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 4 minutes, and the relative standard deviation for replicate injections is not more than 1.3%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of azathioprine ($C_9H_7N_7O_2S$) in the volume of Oral Suspension taken by the formula:

$$100(C/V)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Azathioprine RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Baclofen Oral Solution, page 921 of *PF* 31(3) [May–June 2005]. This new *USP* monograph, which previously appeared in *Pharmacopeial Previews,* is now forwarded to *In-Process Revision.* In the Definition, in the preparation instructions for the Oral Solution, it is proposed to allow the use of only Baclofen powder, rather than the use of either the powder or the Tablet form. Minor editorial changes have also been made.

(CRX: C. Okeke) RTS—43131-5

In-Process Revision

Add the following:

▲Baclofen Oral Solution

» Baclofen Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of Baclofen ($C_{10}H_{12}ClNO_2$). Prepare Baclofen Oral Solution 5 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩. See also *Baclofen Oral Suspension*):

Baclofen	500 mg
Glycerin	5 mL
Syrup, *NF,* a sufficient quantity to make	100 mL

~~If using Tablets, comminute the Baclofen Tablets to a fine powder in a suitable mortar, or~~ Add Baclofen powder to the mortar. Add about 5 mL of the Glycerin to wet the powder, and triturate the powder to form a fine paste. Add about 5 mL of the Syrup to the paste, triturate well, and transfer the contents, stepwise and quantitatively, to a calibrated bottle. Rinse the mortar with additional portions of the Syrup, and transfer the contents to the container; repeat as necessary with sufficient Syrup to final volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store in a cold place.

Labeling—Label it to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Baclofen RS.*

pH ⟨791⟩**:** between 5.0 and 6.0.

Beyond-use date: 35 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a solution of 0.05 M monobasic sodium phosphate and acetonitrile (80 : 20), and adjust with phosphoric acid to a pH of 3.5. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Dissolve an accurately weighed quantity of USP Baclofen RS in water to obtain a concentration of about 1.0 mg per mL.

Standard preparation—Dilute the *Standard stock preparation* with water to obtain a solution having a known concentration of 5 µg per mL.

Assay preparation—Shake thoroughly by hand each bottle of Oral Solution. Pipet 0.5 mL of Oral Solution from each bottle into a 500-mL volumetric flask, dilute with water to volume to obtain a concentration of 5 µg per mL, and pass through a 0.22-µm polyvinylidenefluoride (PVDF) filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 5.5 for baclofen; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 15 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and

In-Process Revision

measure the responses for the major peaks. Calculate the quantity, in mg, of baclofen ($C_{10}H_{12}ClNO_2$) in the volume of Oral Solution taken by the formula:

$$1000(C/V)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Baclofen RS in the *Standard preparation;* V is the volume, in mL, of Oral Solution taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Baclofen Oral Suspension—See briefing under *Acetazolamide Oral Suspension.*

(CRX: C. Okeke) RTS—43150-1

Add the following:

▲Baclofen Oral Suspension

» Baclofen Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of baclofen ($C_{10}H_{12}ClNO_2$). Prepare Baclofen Oral Suspension 5 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩. See also *Baclofen Oral Solution*). [NOTE—Use Tablets instead of bulk powder.]:

Baclofen	500 mg
Glycerin	5 mL
Syrup, *NF,* a sufficient quantity to make	100 mL

Comminute the Baclofen Tablets to a fine powder in a suitable mortar. Add about 5 mL of the Glycerin to wet the powder, and triturate the powder to form a fine paste. Add about 5 mL of the Syrup to the paste, triturate well, and transfer, stepwise and quantitatively, the contents to a calibrated bottle. Rinse the mortar with additional portions of the Syrup, and transfer the contents to the container; repeat as necessary with sufficient Syrup to final volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store in a cold place.

Labeling—Label it to state that it is to be well shaken, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Baclofen RS.*

pH ⟨791⟩**:** between 5.0 and 6.0.

Beyond-use date: 35 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a suspension of 0.05 M monobasic sodium phosphate and acetonitrile (80 : 20), and adjust with phosphoric acid to a pH of 3.5. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Dissolve an accurately weighed quantity of USP Baclofen RS in water to obtain a concentration of about 1.0 mg per mL.

Standard preparation—Dilute the *Standard stock preparation* with water to obtain a suspension having a known concentration of 5 µg per mL.

Assay preparation—Shake thoroughly by hand each bottle of Oral Suspension. Pipet 0.5 mL of Oral Suspension from each bottle to a 500-mL volumetric flask, dilute with water to volume to obtain a concentration of 5 µg per mL, and pass through a 0.22-µm polyvinylidenefluoride (PVDF) filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 5.5 for baclofen; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 15 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of baclofen ($C_{10}H_{12}ClNO_2$) in the volume of Oral Suspension taken by the formula:

$$1000(C/V)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Baclofen RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Benazepril Hydrochloride Tablets, page 606 of *PF* 29(3) [May–June 2003]. It is proposed to revert the composition and volume of the *Medium* in the *Dissolution* test to the original submission to reflect the dissolution conditions approved by FDA for this product.

(BPC: M. Marques) RTS—43361-1

Add the following:

▲Benazepril Hydrochloride Tablets

» Benazepril Hydrochloride Tablets contain ~~an amount of Benazepril Hydrochloride equivalent to~~ not less than 90.0 percent and not more than 110.0 percent of the labeled amount of benazepril hydrochloride ($C_{24}H_{28}N_2O_5 \cdot HCl$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards ⟨11⟩**—***USP Benazepril Hydrochloride RS. USP Benazepril Related Compound B RS. USP Benazepril Related Compound C RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Finely powder not fewer than 20 Tablets, and transfer an accurately weighed portion of the powder, equivalent to about 50 mg of benazepril hydrochloride, to a 50-mL volumetric flask. Add about 30 mL of methanol,

In-Process Revision

and shake by mechanical means for 15 minutes. Dilute with methanol to volume, mix, and centrifuge. Pass an aliquot of the supernatant through a suitable filter, discarding the first 6 mL of the filtrate.

Application volume: 20 µL.

Developing solvent system: a mixture of ethyl acetate, methanol, and ammonium hydroxide (80 : 20 : 15).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: ~~water; 500 mL.0.1 N hydrochloric acid; 900 mL.~~ water, 500 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Determine the amount of $C_{24}H_{28}N_2O_5 \cdot HCl$ dissolved by employing the following method.

Tetrabutylammonium bromide solution, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Procedure—Inject ~~about 60 µL~~ about 60 µL, or an amount of a filtered portion of the solution under test, equivalent to about ~~12 µg~~ 1.2 µg of benazepril, into the chromatograph. The amount of benazepril injected should not exceed 1.5 µg. Record the chromatogram, and measure the responses for the major peaks. Determine the quantity, in mg, of $C_{24}H_{28}N_2O_5 \cdot HCl$ dissolved in comparison with a Standard solution having a known concentration of USP Benazepril Hydrochloride RS in the same *Medium* and similarly chromatographed.

Tolerances—Not less than ~~85%~~ 80% *(Q)* of the labeled amount of $C_{24}H_{28}N_2O_5 \cdot HCl$ is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

Tetrabutylammonium bromide solution, Mobile phase, System suitability solution, Standard preparation, and *Chromatographic system*—Proceed as directed in the *Assay.*

Test preparation—Transfer 1 Tablet to a ~~100 mL~~ suitable volumetric flask, add ~~about 60-50 mL~~ a volume of *Mobile phase,* equivalent to about 50% of the volume of the flask, sonicate for 5 minutes, and then shake by mechanical means for not less than 10 minutes. Dilute quantitatively, and stepwise if necessary, with ~~sufficient~~ *Mobile phase* to ~~volume,~~ obtain a final concentration of about 0.2 mg per mL, mix, and pass a portion of the solution through a suitable filter, discarding the first 6 mL of the filtrate.

Procedure—Proceed as directed in the *Assay*, except to inject the *Test preparation* instead of the *Assay preparation*. Calculate the quantity, in mg, of benazepril hydrochloride ($C_{24}H_{28}N_2O_5 \cdot HCl$) in the Tablet taken by the formula:

~~$100C(r_U/r_S)$~~

$$VDC(r_U/r_S)$$

in which V is the volume, in mL, of the initial flask used to prepare the *Test preparation; D* is the dilution factor in subsequent dilutions of *V,* if necessary, to prepare the *Test preparation; C* is the concentration, in mg per mL, of USP Benazepril Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the benazepril hydrochloride peak responses obtained from the *Test preparation* and the *Standard preparation,* respectively.

Related compounds—

Tetrabutylammonium bromide solution, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Dissolve an accurately weighed quantity of USP Benazepril Related Compound C RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.006 mg per mL.

Test solution—Use the *Assay preparation*.

Procedure—Separately inject equal volumes (about 80 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses of the peaks for benazepril related compound C. Calculate the percentage of benazepril related compound C in the portion of Tablets taken by the formula:

$$100(C_S/C_T)(r_U/r_S)$$

in which C_S is the concentration, in mg per mL, of USP Benazepril Related Compound C RS in the *Standard solution;* C_T is the concentration, in mg per mL, of benazepril hydrochloride in the *Test solution;* and r_U and r_S are the peak responses for benazepril related compound C obtained from the *Test solution* and the *Standard solution,* respectively: not more than 3.0% of benazepril related compound C is found. Calculate the percentage of each impurity (other than benazepril related compound C) in the portion of Tablets taken by the formula:

$$100(r_i/r_s)$$

in which r_i is the peak response for each impurity obtained from the *Test solution;* and r_s is the sum of the responses of all the peaks (including benazepril related compound C): not more than 1.0% of any individual impurity is found; and not more than 2.0% of total impurities is found, the results for all impurities (~~including~~ excluding benazepril related compound C) being added.

Assay—

Tetrabutylammonium bromide solution, Mobile phase, System suitability solution, Standard preparation, and *Chromatographic system*—Proceed as directed in the *Assay* under *Benazepril Hydrochloride.*

Assay preparation—Finely powder not fewer than 20 Tablets, and transfer an accurately weighed portion of the powder, equivalent to about 50 mg of benazepril hydrochloride, to a 250-mL volumetric flask. Add about 150 mL of *Mobile phase,* and shake by mechanical means for 30 minutes. Dilute with *Mobile phase* to volume, mix, and centrifuge. Pass an aliquot of the supernatant through a suitable filter, discarding the first 6 mL of the filtrate.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Calculate the quantity, in mg, of benazepril hydrochloride ($C_{24}H_{28}N_2O_5 \cdot HCl$) in the portion of Tablets taken by the formula:

$$250C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Benazepril Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the benazepril hydrochloride peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

In-Process Revision

BRIEFING

Benzonatate Capsules, *USP 29* page 256. It is proposed to add a *Dissolution* test to this monograph.

(BPC: M. Marques) RTS—43360-1

Add the following:

▲**Dissolution** ⟨711⟩—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Determine the amount of benzonatate dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of 0.04 M monobasic potassium phosphate solution and acetonitrile (3 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Transfer 50 mg, accurately weighed, of USP Benzonatate RS to a 100-mL volumetric flask, and add about 50 mL of water. Sonicate for 10 minutes, cool, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, and dilute with water to volume.

Test solution—Pass a portion of the solution under test through a 0.45-µm filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 310-nm detector and a 4.0-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 15 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of benzonatate dissolved by the formula:

$$\frac{r_U \times C_S \times 900 \times 100}{r_S \times LC}$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of USP Benzonatate RS in the *Standard solution;* 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the tablet label claim, in mg.

Tolerances—Not less than 80% *(Q)* of the labeled amount of benzonatate is dissolved in 30 minutes.▲*USP30*

BRIEFING

Bethanechol Chloride Oral Solution—See briefing under *Acetazolamide Oral Solution.*

(CRX: C. Okeke) RTS—42993-3

Add the following:

▲Bethanechol Chloride Oral Solution

» Bethanechol Chloride Oral Solution contains not less than 90.0 percent and not more than

In-Process Revision

110.0 percent of the labeled amount of bethanechol chloride ($C_7H_{17}ClN_2O_2$). Prepare Bethanechol Chloride Oral Solution 5 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩. See also *Bethanechol Chloride Oral Suspension*):

Bethanechol Chloride powder	500 mg
Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

Dissolve Bethanechol Chloride powder in about 20 mL of Cherry Syrup in a mortar, and mix to a uniform paste. Add the Cherry Syrup in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough Cherry Syrup to bring to final volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store at room temperature, or in a cold place.

Labeling—Label it to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Bethanechol Chloride RS.*

pH ⟨791⟩**:** between 2.6 and 3.4.

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

*Mobile phase—*Prepare a filtered and degassed solution of water and acetonitrile (67 : 33). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

*Standard preparation—*Dissolve an accurately weighed quantity of USP Bethanechol Chloride RS in *Mobile phase,* and dilute quantitatively with *Mobile phase* to obtain a solution having a known concentration of about 500 µg per mL.

*Assay preparation—*Agitate the container of Oral Solution for 30 minutes on a rotating mixer, remove a 10-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 2.0 mL of the sample into a 20-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)*—*The liquid chromatograph is equipped with a 200-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L11. The flow rate is about 0.7 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 3 minutes, and the relative standard deviation for replicate injections is not more than 3.1%.

*Procedure—*Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of bethanechol chloride ($C_7H_{17}ClN_2O_2$) in the volume of Oral Solution taken by the formula:

$$10(C/V)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Bethanechol Chloride RS in the *Standard preparation; V* is the volume, in mL, of Oral Solution taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

In-Process Revision

BRIEFING

Bethanechol Chloride Oral Suspension, page 923 of *PF* 31(3) [May–June 2005]—See briefing under *Acetazolamide Oral Suspension*.

(CRX: C. Okeke) RTS—43131-6

Add the following:

▲Bethanechol Chloride Oral Suspension

» Bethanechol Chloride Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of bethanechol chloride ($C_7H_{17}ClN_2O_2$). Prepare Bethanechol Chloride Oral Suspension 5 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩. See also *Bethanechol Chloride Oral Solution*):

Bethanechol Chloride	~~500 g~~ 500 mg
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free), and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF*, a sufficient quantity	
to make	100 mL

[NOTE—~~If Cherry Syrup, *NF* is used, it becomes a solution.~~ If Tablets are used instead of the bulk powder, the preparation becomes a suspension and should be labeled as such.]

If using Bethanechol Chloride Tablets, add to a suitable mortar and comminute to a fine powder, or add the Bethanechol Chloride powder to the mortar. Add about 20 mL of the Vehicle, and mix to a uniform paste. Add the Vehicle in ~~geometric~~ small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add sufficient Vehicle to final volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store at room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Bethanechol Chloride RS.*

pH ⟨791⟩**:** between 4.0 and 4.8 (Vehicle for Oral Solution and Vehicle for Oral Suspension), and between 2.6 and 3.4 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a filtered and degassed solution of water and acetonitrile (67 : 33). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Bethanechol Chloride RS in *Mobile phase,* and quantitatively dilute with *Mobile phase* to obtain a solution having a known concentration of about 500 µg per mL.

In-Process Revision

Assay preparation—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 10-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 5.0 mL of the sample into a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 200-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L## (see *Chromatography* ⟨621⟩). The flow rate is about 0.7 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 3 minutes, and the relative standard deviation for replicate injections is not more than 3.1%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of bethanechol chloride ($C_7H_{17}ClN_2O_2$) in the volume of Oral Suspension taken by the formula:

$$10(C/V)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Bethanechol Chloride RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Bromocriptine Mesylate Capsules, *USP 29* page 308. It is proposed to specify that the quantitative procedure used in the *Dissolution* test should be the one described in *Dissolution Test 1* under *Bromocriptine Mesylate Tablets.*

(BPC: M. Marques) RTS—43495-1

Change to read:

Dissolution ⟨711⟩—
Medium: 0.1 N hydrochloric acid; 500 mL.
Apparatus 2: 50 rpm.
Time: 60 minutes.
Procedure—Determine the amount of bromocriptine mesylate ($C_{32}H_{40}BrN_5O_5 \cdot CH_4SO_3$) dissolved using the *Procedure* for *Dissolution*

▲*Test 1*▲*USP30*
under *Bromocriptine Mesylate Tablets,* making any necessary volumetric adjustments.
Tolerances—Not less than 75% *(Q)* of the labeled amount of bromocriptine mesylate ($C_{32}H_{40}BrN_5O_5 \cdot CH_4SO_3$) is dissolved in 60 minutes.

BRIEFING

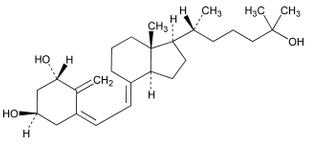
Calcitriol, page 1433 of *PF* 29(5) [Sept.–Oct. 2003]. On the basis of comments received, it is proposed to establish limits for individual impurities under the test for *Chromatographic purity.* Because calcitriol in solution exists in equilibrium with pre-calcitriol, and the pharmacological activity of calcitriol is due to both compounds, a clarification is added that the pre-calcitriol peak should be included in the *Assay* calculation. The Definition is revised to specify the calculation on the solvent-free basis. In addition, editorial changes have been made throughout the monograph.

(MD-GRE: E. Gonikberg) RTS—41042-1

In-Process Revision

Add the following:

▲Calcitriol



$C_{27}H_{44}O_3$ 416.64

9,10-Secocholesta-5,7,10(19)-triene-1,3,25-triol, (1α,3*β*,5*Z*,7*E*)-.

(5*Z*,7*E*)-9,10-Secocholesta-5,7,10(19)-triene-1α,3*β*,25-triol [*32222-06-3*].

» Calcitriol contains not less than 97.0 percent and not more than 103.0 percent of $C_{27}H_{44}O_3$, calculated on the ~~anhydrous~~ solvent-free basis.

Caution—Care should be taken to prevent inhaling particles of Calcitriol and exposing the skin to it.

Packaging and storage—Preserve in tight, light-resistant containers, and store under nitrogen in a refrigerator between 2° and 8°.

USP Reference standards ⟨11⟩**—***USP Calcitriol RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Chromatographic purity—[NOTE—~~Avoid~~ Carry out the procedure as rapidly as possible, avoiding unnecessary exposure of solutions to light and air.]

Tris buffer solution, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard stock solution—Prepare as directed for *Standard preparation* in the *Assay.*

Standard solution—Transfer 1.0 mL of the *Standard stock solution* to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Test solution—Prepare as directed for *Assay preparation.*

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for at least two times the retention time of the calcitriol peak, identify the impurities listed in *Table 1,* and measure the peak responses. ~~disregarding any peak having an area less than 0.1 times that of the main peak in the chromatogram of the *Standard solution.*~~ Calculate the percentage of any individual impurity in the portion of Calcitriol taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response of any individual peak other than the main calcitriol peak and the pre-calcitriol peak; and r_s is the sum of the responses of all the peaks: ~~not more than~~

In-Process Revision

~~0.5% of any individual impurity is found; and~~ in addition to not exceeding the limits in *Table 1,* not more than 1.0% of total impurities is found. Disregard any peak less than 0.1%.

Table 1

Name	Relative Retention Time	Limit (%)
Triazoline adduct of pre-calcitriol	0.43	0.1
trans-Calcitriol[1]	0.96	0.25
1β-Calcitriol[2]	1.15	0.1
Methylene calcitriol[3]	1.5	0.25
Any other individual unidentified impurity	—	0.1

[1] (5*E*,7*E*)-9,10-secocholesta-5,7,10(19)-triene-1α,3β,25-triol
[2] (5*Z*,7*E*)-9,10-secocholesta-5,7,10(19)-triene-1β,3β,25-triol
[3] (5*Z*,7*E*)-1α,3β-dihydroxy-17-((*R*)-7-hydroxy-7-methyloctan-2-yl)-9,10-secoandrosta-5,7,10(19)-triene

Assay—[NOTE—~~Avoid~~ Carry out the procedure as rapidly as possible, avoiding unnecessary exposure of solutions to light and air.]

Tris buffer solution—Dissolve 1.0 g of tris(hydroxymethyl)aminomethane in 900 mL of water, adjust with phosphoric acid to a pH of 7.0 to 7.5, dilute with water to make 1000 mL, and mix.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and *Tris buffer solution* (55 : 45). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Prepare a solution of USP Calcitriol RS in *Mobile phase* (without heating) having a known concentration of about 100 µg of calcitriol per mL.

System suitability solution—Heat 2.0 mL of the *Standard preparation* at 80° for 30 minutes.

Assay preparation—~~Transfer about 1.0 mg of Calcitriol, accurately weighed, to a 10 mL volumetric flask, dissolve in and dilute with Mobile phase to volume without heating, and mix.~~ Prepare a solution of Calcitriol in *Mobile phase* (without heating) having a concentration of about 100 µg of calcitriol per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The flow rate is about 1 mL per minute. The column temperature is maintained at 40°. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.9 for pre-calcitriol and 1.0 for calcitriol; and the resolution, *R,* between pre-calcitriol and calcitriol is not less than 3.5. ~~and the relative standard deviation for replicate injections, determined from the calcitriol peak, is not more than 1.0%.~~ Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 10,000 theoretical plates; and the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and

In-Process Revision

measure the responses for the ~~major~~ calcitriol and pre-calcitriol peaks. Calculate the ~~quantity, in µg,~~ percentage of $C_{27}H_{44}O_3$ in the portion of Calcitriol taken by the formula:

~~$10C(r_U / r_S)$~~

$$100(C_S / C_U)(r_U / r_S)$$

in which ~~*C* is the concentration, in µg per mL, of calcitriol in the *Standard preparation;*~~ C_S and C_U are the concentrations, in µg per mL, of calcitriol in the *Standard preparation* and the *Assay preparation,* respectively; and r_U and r_S are the sums of calcitriol and pre-calcitriol peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ▲*USP30*

BRIEFING

Calcitriol Injection, page 1434 of *PF* 29(5) [Sept.–Oct. 2003]. On the basis of comments received, it is proposed to make the following changes:

1. In the Definition, change "terminally sterilized" to "sterile".
2. In the *Packaging and storage* section, delete the specific temperature range.
3. In the *pH* section, widen the range to reflect the characteristics of the FDA-approved products, and modify the instructions.
4. Delete the test for *Aluminum.*
5. In the subsection *Procedure* in the *Assay,* make changes in the formula.

(MD-GRE: E. Gonikberg) RTS—41043-1; 41053-1

Add the following:

▲Calcitriol Injection

» Calcitriol Injection is a ~~terminally sterilized~~ sterile solution of Calcitriol. It contains an amount of Calcitriol equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of calcitriol ($C_{27}H_{44}O_3$). It contains no antimicrobial agents.

Packaging and storage—Preserve in single-dose containers, preferably of Type I glass, protected from light. Store at controlled room temperature. ~~(15° to 30°).~~

USP Reference standards ⟨11⟩—*USP Endotoxin RS. USP Calcitriol Solution RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Bacterial endotoxins ⟨85⟩—It contains not more than 100 USP Endotoxin Units per µg of calcitriol.

pH ⟨791⟩**:** between 5.9 and ~~7.0,~~ 8.0, determined on a portion to which, if necessary, 0.30 mL of saturated potassium chloride solution has been added for each 100 mL of Injection.

Particulate matter ⟨788⟩**:** meets the requirements for small-volume injections.

~~**Aluminum** ⟨206⟩**:** not more than 1 µg per mL.~~

Other requirements—It meets the requirements under *Injections* ⟨1⟩.

Assay—[NOTE—Avoid unnecessary exposure of solutions to light or air.]

In-Process Revision

Mobile phase—Prepare a filtered and degassed mixture of methanol and water (74 : 26). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩) so that the retention time for calcitriol is not less than 20 minutes.

Standard preparation—Transfer 3.0 mL of USP Calcitriol Solution RS, equilibrated to room temperature, to a container; add 3.0 mL of water; and mix.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 3 µg of calcitriol, to a container; add a sufficient amount of water to dilute to a total volume of 3.0 mL; add 3.0 mL of methanol; and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 264-nm detector, a 4.6-mm × 4.5-cm guard column that contains 5-µm packing L1, and a 4.6-mm × 7.5-cm analytical column that contains 3-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg, of calcitriol ($C_{27}H_{44}O_3$) in each mL of the Injection taken by the formula:

~~$6C(r_U / r_S)$,~~

$$C(r_U / r_S)$$

in which C is the concentration, in µg per mL, of calcitriol ~~in the *Standard preparation,* calculated based on the content of calcitriol~~ in the USP Calcitriol Solution RS; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ▲*USP30*

BRIEFING

Calcium Pantothenate, *USP 29* page 358. In the preparation of the *Standard solution* in the test for *Ordinary impurities,* it is proposed to substitute USP Beta Alanine RS for 3-aminopropionic acid. Because beta alanine is the common name for 3-aminopropionic acid, this revision does not change the composition of the *Standard solution.*

(DSN: L. Evans) RTS—43719-1

Change to read:

USP Reference standards ⟨11⟩—

▲*USP Beta Alanine RS.* ▲*USP30*
USP Calcium Pantothenate RS.

Change to read:

Ordinary impurities ⟨466⟩—
Test solution: water.
Standard solution: water. Use ~~3-aminopropionic acid,~~ ▲USP Beta Alanine RS, ▲*USP30* in place of USP Calcium Pantothenate RS, as the Standard.
Eluant: a mixture of alcohol and water (65 : 35).
Visualization: 4.
Limit: 1.0%.

In-Process Revision

BRIEFING

Captopril Oral Solution—See briefing under *Acetazolamide Oral Solution.*

(CRX: C. Okeke) RTS—43128-2

Add the following:

▲Captopril Oral Solution

» Captopril Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of captopril ($C_9H_{15}NO_3S$). Prepare Captopril Oral Solution 0.75 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩. See also *Captopril Oral Suspension*):

Captopril powder	75 mg
Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

Dissolve Captopril powder in about 10 mL of Cherry Syrup in a mortar, and mix to a uniform paste. Add the Cherry Syrup in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough Cherry Syrup to bring to final volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store in a cold place.

Labeling—Label it to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Captopril RS.*

pH ⟨791⟩**:** between 4.0 and 4.2.

Beyond-use date: 7 days after the day on which it was compounded.

Assay—

*Mobile phase—*Prepare a filtered and degassed mixture of methanol and water (11 : 9) containing 0.5 mL of phosphoric acid. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

*Standard preparation—*Dissolve USP Captopril RS in water to obtain a solution having a known concentration of 7.5 µg per mL.

*Assay preparation—*Agitate the container of Oral Solution for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)*—*The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 5.0 minutes, and the relative standard deviation for replicate injections is not more than 0.9%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of captopril ($C_9H_{15}NO_3S$) in the volume of Oral Solution taken by the formula:

$$100(C/V)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Captopril RS in the *Standard preparation; V* is the volume, in mL, of Oral Solution taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Captopril Oral Suspension, page 924 of *PF* 31(3) [May–June 2005]—See briefing under *Acetazolamide Oral Suspension.*

(CRX: C. Okeke) RTS—43131-7

In-Process Revision

Add the following:

▲Captopril Oral Suspension

» Captopril Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of captopril ($C_9H_{15}NO_3S$). Prepare Captopril Oral Suspension 0.75 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩. See also *Captopril Oral Solution*):

Captopril	~~100 mg~~ 75 mg
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free), and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,* a sufficient quantity to make	~~134 mL~~ 100 mL

NOTE—If Tablets are used instead of bulk powder, the preparation becomes a suspension and should be labeled as such.

If using Tablets place the required number of Captopril Tablets in a suitable mortar and comminute to a fine powder, or add Captopril powder to the mortar. Add about 10 mL of the Vehicle, and mix to a uniform paste. Add the remainder of the Vehicle in small portions, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a graduate. Add sufficient quantity of Vehicle to final volume of 100 mL.

Packaging and storage—Preserve in tight, light-resistant containers. Store in a cold place.

Labeling—Label it to state that it is to be well shaken, and to state the beyond-use date.

USP Reference standards ⟨11⟩—*USP Captopril RS.*

pH ⟨791⟩**:** between 4.0 and 5.0.

Beyond-use date: 7 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of methanol and water (11 : 9) containing 0.5 mL of phosphoric acid. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve USP Captopril RS in water to obtain a solution having a known concentration of 7.5 µg per mL.

Assay preparation—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 5.0 minutes, and the relative standard deviation for replicate injections is not more than 0.9%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of captopril ($C_9H_{15}NO_3S$) in the volume of Oral Suspension taken by the formula:

$$100(C/V)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Captopril RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Carbamazepine, *USP 29* page 369. It is proposed to change the name of the test for *Chromatographic purity* to *Related compounds.* It is also proposed to revise the test for *Related compounds* and the *Assay* to rename 10,11-dihydrocarbamazepine and iminostilbene as carbamazepine related compound A and carbamazepine related compound B, respectively. The *USP Reference standards* section is being revised to add USP Carbamazepine Related Compound A RS and USP Carbamazepine Related Compound B RS.

Assay—

Mobile phase—Prepare a 1000-mL mixture of water, methanol, and tetrahydrofuran (85 : 12 : 3), add 0.22 mL of formic acid, mix, then add 0.5 mL of triethylamine, and mix. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve accurately weighed quantities of USP Carbamazepine RS and ~~10,11-dihydrocarbamazepine~~

▲USP Carbamazepine Related Compound A RS▲*USP30* in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having known concentrations of about 0.1 and 0.5 mg per mL, respectively. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, and dilute with a mixture of methanol and water (1 : 1) to volume.

Standard preparation—Dissolve an accurately weighed quantity of USP Carbamazepine RS in methanol, and dilute quantitatively with methanol to obtain a solution having a known concentration of about 2 mg per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, and dilute with a mixture of methanol and water (1 : 1) to volume.

Assay preparation—Transfer about 100 mg of Carbamazepine, accurately weighed, to a 50-mL volumetric flask, and dissolve in and dilute with methanol to volume. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, and dissolve in and dilute with a mixture of methanol and water (1 : 1) to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains packing L10. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation* and the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between ~~10,11-dihydrocarbamazepine~~

▲carbamazepine related compound A▲*USP30* and carbamazepine in the *System suitability solution* is not less than 1.70; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{15}H_{12}N_2O$ in the portion of Carbamazepine taken by the formula:

$$500C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Carbamazepine RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

In-Process Revision

BRIEFING

Cefonicid for Injection, *USP 29* page 417. It is proposed to correct the tailing factor in the *Chromatographic system* and define the terms in the calculation in the *Assay.*

(MD-ANT: B. Gilbert) RTS—43613-1

Change to read:

Assay—

Mobile phase—Prepare a mixture of water, methanol, and 0.2 M monobasic ammonium phosphate (33 : 5 : 3). Pass through a filter having a 0.5-µm or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Cefonicid Sodium RS in *Mobile phase* to obtain a solution having a known concentration of about 200 µg of cefonicid ($C_{18}H_{18}N_6O_8S_3$) per mL.

Assay preparation 1 (where it is represented as being in a single-dose container)—Constitute Cefonicid for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and quantitatively dilute with *Mobile phase* to obtain a solution containing about 200 µg of cefonicid per mL.

Assay preparation 2 (where the label states the quantity of cefonicid in a given volume of constituted solution)—Constitute Cefonicid for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Quantitatively dilute an accurately measured volume of the constituted solution with *Mobile phase* to obtain a solution containing about 200 µg of cefonicid per mL.

Resolution solution—Dissolve a quantity of USP Cefonicid Sodium RS in *Mobile phase* to obtain a solution containing about 0.2 mg per mL. Heat on a steam bath for 30 minutes, and cool. This *Resolution solution* contains a mixture of cefonicid and desacetyl cefonicid.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation* and the *Resolution solution,* and record the peak responses as directed for *Procedure:* ~~the column efficiency determined from the analyte peak is not less than 1500 theoretical plates, the tailing factor for the analyte peak is not more than 1.3,~~

▲▲*USP30*
the resolution, *R,* between the cefonicid peak and the desacetyl cefonicid peak is not less than 1.1; the column efficiency determined from the analyte peak is not less than 1500 theoretical plates; the tailing factor for the analyte peak is not more than 2.0; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of cefonicid ($C_{18}H_{18}N_6O_8S_3$) withdrawn from the container, or in the portion of constituted solution taken by the formula:

$$(L / D)(C)(r_U / r_S)$$

in which L is the labeled quantity, in mg, of cefonicid in the container, or in the volume of constituted solution taken; D is the concentration, in µg per mL, of cefonicid in *Assay preparation 1* or *Assay preparation 2,* based on the labeled quantity in the container or in the portion of constituted solution taken, respectively, and the extent of dilution;

▲C is the concentration, in µg per mL, of cefonicid in the *Standard preparation;*▲*USP30*
and r_U and r_S are the peak responses obtained from the relevant *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Ceftazidime, *USP 29* page 434; **Ceftazidime Injection,** *USP 29* page 435; **Ceftazidime for Injection,** *USP 29* page 435. It is proposed to change the name of USP Delta-3-Ceftazidime Isomer RS to USP Ceftazidime, Delta-3-Isomer RS, in accordance with current USP Reference Standard naming conventions.

(MD-ANT: B. Gilbert) RTS—42483-1

Change to read:

USP Reference standards ⟨11⟩—~~*USP Delta-3-Ceftazidime Isomer RS.*~~

▲*USP Ceftazidime, Delta-3-Isomer RS.*▲*USP30*
USP Ceftazidime Pentahydrate RS. USP Endotoxin RS.

Change to read:

Assay—

pH 7 Buffer—Dissolve 42.59 g of anhydrous dibasic sodium phosphate and 27.22 g of monobasic potassium phosphate in water to make 1000 mL of solution.

Mobile phase—Mix 40 mL of acetonitrile and 200 mL of *pH 7 Buffer*, and dilute with water to obtain 2000 mL of solution. Filter, using a filter having a porosity of 1 µm or finer, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer about 29 mg of USP Ceftazidime Pentahydrate RS, accurately weighed, to a 25-mL volumetric flask containing 2.5 mL of *pH 7 Buffer,* and shake until dissolved. Dilute with water to volume, and mix. [NOTE—Protect this solution from light.] Immediately prior to chromatography, transfer 5.0 mL of this stock solution to a 50-mL volumetric flask, dilute with water to volume, and mix. This solution contains about 100 µg of ceftazidime ($C_{22}H_{22}N_6O_7S_2$) per mL.

Assay preparation—Transfer about 115 mg of Ceftazidime, accurately weighed, to a 100-mL volumetric flask containing 10.0 mL of *pH 7 Buffer,* and shake until dissolved. Dilute with water to volume, and mix. [NOTE—Protect this solution from light.] Immediately prior to chromatography, transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with water to volume, and mix.

Resolution solution—Prepare a solution of ~~USP Delta-3-Ceftazidime Isomer RS~~

▲USP Ceftazidime, Delta-3-Isomer RS▲*USP30*
in *pH 7 Buffer* containing about 0.1 mg per mL. Immediately prior to chromatography, mix 1 mL of this solution with 8 mL of water and 1 mL of the stock solution used to prepare the *Standard preparation.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure:* the resolution, *R,* between ceftazidime and ~~the delta-3-ceftazidime isomer~~

▲ceftazidime, delta-3-isomer▲*USP30*
is not less than 2.0. Chromatograph the *Standard preparation,* and record the responses as directed for *Procedure:* the tailing factor for the analyte peak is not less than 0.75 and not more than 1.5, and the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{22}H_{22}N_6O_7S_2$ in the portion of Ceftazidime taken by the formula:

$$C(r_U / r_S)$$

in which C is the concentration, in µg per mL, of ceftazidime ($C_{22}H_{22}N_6O_7S_2$) in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

in which *C* is the concentration, in mg per mL, of USP Chlorthalidone RS in the *Standard preparation;* and R_U and R_S are the peak response ratios of chlorthalidone and the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

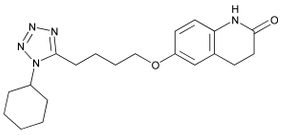
BRIEFING

Cilostazol. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on validated methods of analysis, is being proposed. The liquid chromatographic procedure in the test for *Related compounds* and in the *Assay* is based on analyses performed with the XTerra RP8 brand of L7 column. The typical retention time for the cilostazol peak is about 7 minutes.

(MD-CV: E. Gonikberg) RTS—42064-1

Add the following:

▲Cilostazol



$C_{20}H_{27}N_5O_2$ 369.46

2(1*H*)-Quinolinone, 6-[4-(1-cyclohexyl-1*H*-tetrazol-5-yl)-butoxy]-3,4-dihydro-.

6-[4-(1-Cyclohexyl-1*H*-tetrazol-5-yl)butoxy]-3,4-dihydrocarbostyril [*73963-72-1*].

» Cilostazol contains not less than 98.0 percent and not more than 102.0 percent of $C_{20}H_{27}N_5O_2$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers, and store at room temperature.

USP Reference standards ⟨11⟩**—***USP Cilostazol RS. USP Cilostazol Related Compound A RS. USP Cilostazol Related Compound B RS. USP Cilostazol Related Compound C RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

Loss on drying ⟨731⟩—Dry it at 110° for 3 hours: it loses not more than 0.25% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Chloride ⟨221⟩**—**

Test solution—Dissolve 0.5 g of Cilostazol in 40 mL of dimethylformamide, add 6 mL of diluted nitric acid and dimethylformamide to make 50 mL.

Control solution—To 25 mL of 0.01 M hydrochloric acid add 6 mL of diluted nitric acid and dimethylformamide to make 50 mL.

Procedure—Add 1 mL of silver nitrate TS to the *Test solution* and to the *Control solution,* mix well, and allow to stand for 5 minutes, protecting from direct sunlight. Compare the opalescence developed in both solutions against a black background by viewing downward or transversely. The opalescence developed in the *Test solution* is not more than that of the *Control solution* (0.018%).

Heavy metals, *Method II* ⟨231⟩**:** 0.001%.

Related compounds—

Diluent, Solution A, Solution B, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Dissolve accurately weighed quantities of USP Cilostazol RS and USP Cilostazol Related Compound C RS in acetonitrile, with sonication if necessary, to obtain a solution having known concentrations of about 0.5 mg per mL of each component. Transfer 4 mL of this solution to a 10-mL volumetric flask, and dilute with water to volume. Further dilute this solution, stepwise if necessary, with *Diluent* to obtain a solution having known concentrations of about 0.4 µg per mL of each component.

Test solution—Transfer about 20 mg of Cilostazol, accurately weighed, to a 50-mL volumetric flask, dissolve in 20 mL of acetonitrile, with sonication if necessary. Dilute with water to volume, and mix.

In-Process Revision

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of cilostazol related compound C by the formula:

$$0.1(C_S / C_T)(r_U / r_S)$$

in which C_S is the concentration, in µg per mL, of cilostazol related compound C in the *Standard solution;* C_T is the concentration, in mg per mL, of cilostazol in the *Test solution;* r_U is the peak response for cilostazol related compound C obtained from the *Test solution;* and r_S is the peak response for cilostazol related compound C obtained from the *Standard solution*. Calculate the percentage of other impurities by the formula:

$$0.1(1/F)(C_S / C_T)(r_U / r_S)$$

in which F is the relative response factor from *Table 1;* C_S is the concentration, in µg per mL, of cilostazol in the *Standard solution;* C_T is the concentration, in mg per mL, of cilostazol in the *Test solution;* r_U is the peak response for any other impurity obtained from the *Test solution;* and r_S is the peak response for cilostazol obtained from the *Standard solution*.

Table 1

Name	Relative Retention Time	Relative Response Factor *(F)*	Limit (%)
Cilostazol related compound A[1]	0.2	1.7	0.1
Cilostazol related compound B[2]	0.9	0.58	0.1
Cilostazol	1.0	1.0	—
Cilostazol related compound C[3]	1.9	n/a	0.1
Any other individual impurity	—	1.0	0.1

[1] 6-Hydroxy-3,4-dihydro-1*H*-quinolin-2-one
[2] 6-[4-(1-Cyclohexyl-1*H*-tetrazol-5-yl)-butoxy]-1*H*-quinolin-2-one
[3] 1,6-Bis-[4-(1-cyclohexyl-1*H*-tetrazol-5-yl)-butoxy]-1*H*-quinolin-2-one

In addition to not exceeding the limits for impurities in *Table 1,* not more than 0.4% of total impurities is found.

Assay—

Diluent—Use a mixture of water and acetonitrile (60 : 40).

Solution A—Use a mixture of water and acetonitrile (70 : 30).

Solution B—Use a mixture of water and acetonitrile (50 : 50).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Prepare a solution in *Diluent* having known concentrations of about 0.05 mg per mL each of USP Cilostazol RS, USP Cilostazol Related Compound A RS, and USP Cilostazol Related Compound B RS.

Standard preparation—Dissolve an accurately weighed quantity of USP Cilostazol RS in acetonitrile, with sonication if necessary, to obtain a solution having a known concentration of about 1.0 mg per mL. Transfer 4 mL of this solution to a 10-mL volumetric flask, and dilute with water

to volume. Further dilute this solution with *Diluent* to obtain a solution having a known concentration of about 0.04 mg per mL.

Assay preparation—Transfer about 20 mg of Cilostazol, accurately weighed, to a 50-mL volumetric flask, dissolve in 20 mL acetonitrile, sonicate if necessary, dilute with water to volume, and mix. Transfer 1 mL of this solution to a 10-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 10-cm column that contains 3.5-µm packing L7. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 40°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–6.5	100→50	0→50	linear gradient
6.5–10	50→0	50→100	linear gradient
10–20	0	100	isocratic
20–20.1	0→100	100→0	linear gradient
20.1–28	100	0	re-equilibration

Chromatograph the *System suitability solution,* identify the components using *Table 1,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between cilostazol related compound B and cilostazol is not less than 3.0; the tailing factor for the cilostazol peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{20}H_{27}N_5O_2$ in the portion of Cilostazol taken by the formula:

$$500C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of cilostazol in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ▲*USP30*

BRIEFING

Cimetidine Tablets, *USP 29* page 512. For the *Dissolution* test, it is proposed to add the option of using a 20-mesh basket for the 800-mg strength of this product because of clogging.

(BPC: M. Marques) RTS—43066-1

Change to read:

Dissolution ⟨711⟩—
Medium: 0.01 N hydrochloric acid; 900 mL.
Apparatus 1: 100 rpm.

▲A 20-mesh basket may be used for 800-mg strength Tablets. ▲*USP30*
Time: 15 minutes.
Procedure—Determine the amount of $C_{10}H_{16}N_6S$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 218 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, in comparison with a Standard solution having a known concentration of USP Cimetidine RS in the same *Medium*.
Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{10}H_{16}N_6S$ is dissolved in 15 minutes.

In-Process Revision

BRIEFING

Clonazepam Oral Suspension, page 927 of *PF* 31(3) [May–June 2005]—See briefing under *Acetazolamide Oral Suspension.*

(CRX: C. Okeke) RTS—43131-9

Add the following:

▲Clonazepam Oral Suspension

» Clonazepam Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of clonazepam ($C_{15}H_{10}ClN_3O_3$). Prepare Clonazepam Oral Suspension 0.1 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Clonazepam	10 mg
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free), and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

NOTE— ~~If Cherry Syrup, *NF* is used, it becomes a solution.~~ If Tablets are used instead of bulk powder, the preparation becomes a suspension and should be labeled as such.

If using Tablets, comminute the Tablets into a fine powder in a suitable mortar, or add Clonazepam powder to the mortar. Add approximately 10 mL of the Vehicle, and mix to a uniform paste. Add the Vehicle in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough Vehicle to bring to final volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken before use, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Clonazepam RS.*

pH ⟨791⟩**:** between 4.0 and 4.4 (Vehicle for Oral Solution and Vehicle for Oral Suspension), and between 2.5 and 3.3 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a filtered and degassed solution of water, methanol, and acetonitrile (4 : 3 : 3). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Dissolve an accurately weighed quantity of USP Clonazepam RS in acetonitrile to obtain a concentration of about 0.5 mg per mL.

Standard preparation—Dilute the *Standard stock preparation* with acetonitrile to obtain a solution having a known concentration of 25 µg per mL.

Assay preparation—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex

In-Process Revision

mixer for 30 seconds. Pipet 2.5 mL of the sample solution into a 10-mL volumetric flask, and dilute with acetonitrile to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 10-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time of clonazepam is about 7 minutes; and the relative standard deviation for replicate injections is not more than 1.8%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of clonazepam ($C_{15}H_{10}ClN_3O_3$) in the volume of Oral Suspension taken by the formula:

$$4(C/V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Clonazepam RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

In-Process Revision

BRIEFING

Clopidogrel Bisulfate, *USP 29* page 562; **Clopidogrel Tablets,** *USP 29* page 562. On the basis of comments received, it is proposed to revise the test for *Related compounds* to modify the preparation of the *Standard solution,* to specify system suitability requirements under the *Chromatographic system,* to clarify the calculation of the content of clopidogrel related compound B in the *Procedure,* and to add a formula for the calculation of the content of unknown impurities.

It is also proposed to revise the *Assay* to modify the composition of the *System suitability solution* and the preparation of the *Standard preparation*. In addition, it is proposed to add a *Note* regarding bisulfate salt equivalents of the USP Clopidogrel Related Compounds RS.

Other editorial revisions have also been made.

(MD-CV: E. Gonikberg) RTS—43631-1

Assay—

▲[NOTE—For all clopidogrel related compounds, the concentrations are expressed as bisulfate salts. Use bisulfate salt equivalents stated on USP Reference Standards labels to calculate the concentrations as appropriate.]▲*USP30*

Phosphate buffer—Dissolve 1.36 g of monobasic potassium phosphate in about 500 mL of water, and dilute with water to 1000 mL.

Mobile phase—Prepare a filtered and degassed mixture of *Phosphate buffer* and acetonitrile (75 : 25). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

~~*Standard stock solution*—Transfer about 100 mg of USP Clopidogrel Bisulfate RS, accurately weighed, to a 100-mL volumetric flask. Dissolve in and dilute with methanol to volume, and mix.~~

~~*Standard preparation*—Dilute a suitable portion of *Standard stock solution,* accurately measured, with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.~~

In-Process Revision

▲*Standard preparation*—Dissolve an accurately weighed quantity of USP Clopidogrel Bisulfate RS in methanol to obtain a solution having a known concentration of about 1.0 mg of clopidogrel bisulfate per mL. Dilute a suitable portion of this solution, accurately measured, with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.▲*USP30*

System suitability solution—~~Dissolve an accurately weighed quantity of USP Clopidogrel Related Compound B RS in methanol, and mix with a suitable portion of *Standard stock solution,* to obtain concentrations of about 1.0 and 0.5 mg per mL, respectively. Dilute this solution with *Mobile phase,* and mix to obtain a solution having a final concentration of about 0.05 mg per mL of clopidogrel bisulfate and about 0.1 mg per mL of clopidogrel related compound B.~~

▲Dissolve accurately weighed quantities of USP Clopidogrel Bisulfate RS and USP Clopidogrel Related Compound B RS in methanol, and quantitatively dilute with methanol to obtain a solution having concentrations of about 100 µg per mL and 200 µg per mL, respectively. Transfer 5 mL of this solution to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.▲*USP30*

Assay preparation—Transfer about 100 mg of Clopidogrel Bisulfate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Pipet 5.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains packing L57. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.8 and 1.2 for enantiomers of clopidogrel related compound B, respectively, and 1.0 for clopidogrel; and the resolution, *R,* between clopidogrel and the first enantiomer of clopidogrel related compound B is ~~not less~~

▲greater▲*USP30*
than 2.5. Chromatograph the *Standard preparation:* the relative standard deviation for replicate injections determined from clopidogrel bisulfate is not more than 1.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Calculate the quantity, in mg, of $C_{16}H_{16}ClNO_2S \cdot H_2SO_4$ in the portion of Clopidogrel taken by the formula:

$$1000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Clopidogrel Bisulfate RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Clopidogrel Tablets, *USP 29* page 562. On the basis of comments received, it is proposed to revise the test for *Related compounds* to change the limit of clopidogrel related compound A to 1.2%, the limit of clopidogrel related compound C to 1.5%, and the limit of total impurities to 2.5%. These limits are appropriate for marketed products through their shelf life. In the absence of any significant adverse comments, it is proposed to implement this revision via the *Third Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of June 1, 2006.

See also the briefing under *Clopidogrel Bisulfate*.

Change to read:

▲**Dissolution** ⟨711⟩—

Medium: 0.1 N hydrochloric acid; 500 mL, deaerated.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Determine the amount of $C_{22}H_{17}ClN_2$ dissolved by employing the following method.

25 mM Phosphate buffer—Dissolve 4.4 g of dibasic potassium phosphate in 1000 mL of water.

100 mM Phosphate buffer—Dissolve 17.4 g of dibasic potassium phosphate in 1000 mL of water.

Diluent—Prepare a filtered and degassed mixture of methanol and *100 mM Phosphate buffer* (60 : 40).

Mobile phase—Prepare a filtered and degassed mixture of methanol and *25 mM Phosphate buffer* (4 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Clotrimazole RS, and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a concentration of about 0.02 mg per mL.

Working standard solution—Transfer 5.0 mL of the *Standard solution* to a 25-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Test solution—Withdraw 25 mL of the solution under test from the vessel. Pass through a 0.45-µm polyvinylidene difluoride filter, discarding the first 10 mL of the filtrate. Transfer 5.0 mL of the filtrate to a 25-mL volumetric flask. Dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 3.9-mm × 7.5-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Working standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in percentage, of $C_{22}H_{17}ClN_2$ released by the formula:

$$\frac{r_U \times C_S \times 500 \times D \times 100}{r_s \times LC}$$

in which r_U and r_S are the peak responses for the *Test solution* and the *Working standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Working standard solution;* 500 is the volume, in mL, of *Medium; D* is the dilution factor of the ~~*Working standard solution;*~~ ▲*Test solution;*▲*USP30* 100 is the conversion factor to percentage; and *LC* is the label claim, in mg.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{22}H_{17}ClN_2$ is dissolved in 45 minutes.▲*USP29*

BRIEFING

Diltiazem Hydrochloride Oral Solution—See briefing under *Acetazolamide Oral Solution.*

(CRX: C. Okeke) RTS—42993-5

Add the following:

▲Diltiazem Hydrochloride Oral Solution

» Diltiazem Hydrochloride Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of diltiazem hydrochloride ($C_{22}H_{26}N_2O_4S \cdot HCl$). Prepare Diltiazem Hydrochloride Oral Solution, 12 mg per mL, as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩. See also *Diltiazem Hydrochloride Oral Suspension*):

Diltiazem Hydrochloride powder . .	1.2 g
Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

Dissolve Diltiazem Hydrochloride powder in about 10 mL of Cherry Syrup in a mortar, and mix to a uniform paste. Add the Cherry Syrup in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough Cherry Syrup to bring to final volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature, or in a cold place.

Labeling—Label it to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Diltiazem Hydrochloride RS.*

pH ⟨791⟩**:** between 3.1 and 3.9.

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Buffer solution—Dissolve 1.16 g of *d*-10-camphorsulfonic acid in 1000 mL of 0.1 M sodium acetate, adjust this solution by the addition of 0.1 N sodium hydroxide to a pH of 6.2, and mix.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, methanol, and *Buffer solution* (2 : 1 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve USP Diltiazem Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of 120 µg per mL.

Assay preparation—Agitate the container of Oral Solution for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At time of analysis remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample solution to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the

peak responses as directed for *Procedure:* the retention time is about 9.6 minutes, and the relative standard deviation for replicate injections is not more than 1.3%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of diltiazem hydrochloride ($C_{22}H_{26}N_2O_4S \cdot HCl$) in the volume of Oral Solution taken by the formula:

$$100(C/V)(r_U / r_S)$$

in which C is the concentration, in µg per mL, of USP Diltiazem Hydrochloride RS in the *Standard preparation; V* is the volume, in mL, of Oral Solution taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Diltiazem Hydrochloride Oral Suspension, page 928 of *PF* 31(3) [May–June 2005]—See briefing under *Acetazolamide Oral Suspension.*

(CRX: C. Okeke) RTS—43131-10

In-Process Revision

Add the following:

▲Diltiazem Hydrochloride Oral Suspension

» Diltiazem Hydrochloride Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of diltiazem hydrochloride ($C_{22}H_{26}N_2O_4S \cdot HCl$). Prepare Diltiazem Hydrochloride Oral Suspension 12 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩. See also *Diltiazem Hydrochloride Oral Solution*):

Diltiazem Hydrochloride	1.2 g
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free), and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

NOTE—~~If Cherry Syrup, *NF* is used, it becomes a solution.~~ If Tablets are used instead of bulk powder, the preparation becomes a suspension and should be labeled as such.

If using Tablets, comminute the Tablets to a fine powder in a suitable mortar, or add Diltiazem Hydrochloride powder to the mortar. Add approximately 10 mL of the Vehicle, and mix to a uniform paste. Add the Vehicle to the mortar in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough Vehicle to bring to final volume.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken, and to state the beyond-use date.

USP Reference standards ⟨11⟩—*USP Diltiazem Hydrochloride RS.*

pH ⟨791⟩**:** between 3.8 and 4.6 (Vehicle for Oral Solution and Vehicle for Oral Suspension), and between 3.1 and 3.9 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Buffer solution—Dissolve 1.16 g of *d*-10-camphorsulfonic acid in 1000 mL of 0.1 M sodium acetate, adjust this solution by the addition of 0.1 N sodium hydroxide to a pH of 6.2, and mix.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, methanol, and *Buffer solution* (2 : 1 : 1). Make adjustments if necessary (see *System suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve USP Diltiazem Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of 120 µg per mL.

Assay preparation—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample solution into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the 100 µg per mL *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 9.6 minutes, and the relative standard deviation for replicate injections is not more than 1.3%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of diltiazem hydrochloride ($C_{22}H_{26}N_2O_4S \cdot HCl$) in the volume of Oral Suspension taken by the formula:

$$100(C/V)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Diltiazem Hydrochloride RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Dipyridamole Oral Suspension, page 930 of *PF* 31(3) [May–June 2005]—See briefing under *Acetazolamide Oral Suspension.*

(CRX: C. Okeke) RTS—43131-11

Add the following:

▲Dipyridamole Oral Suspension

» Dipyridamole Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dipyridamole ($C_{24}H_{40}N_8O_4$). Prepare Dipyridamole Oral Sus-

In-Process Revision

pension 10 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Dipyridamole	1 g
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free), and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

NOTE—~~If Cherry Syrup, *NF* is used, it becomes a solution.~~ If Tablets are used instead of bulk powder, the preparation becomes a suspension and should be labeled as such.

If using Tablets, place the Dipyridamole Tablets in a suitable mortar, and comminute to a fine powder, or add Dipyridamole powder to the mortar. Add about 20 mL of Vehicle, and mix to a uniform paste. Add the Vehicle in small portions, and mix well after each addition. Transfer, stepwise and quantitatively, to a graduated or calibrated bottle. Add the Vehicle in portions to rinse the mortar, add sufficient Vehicle to bring to final volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Dipyridamole RS.*

pH ⟨791⟩**:** between 3.9 and 4.7 (Vehicle for Oral Solution and Vehicle for Oral Suspension), and between 3.0 and 3.8 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Mobile phase—Dissolve 250 mg of dibasic sodium phosphate in 250 mL of water, and adjust with dilute phosphoric acid (1 in 3) to a pH of 4.6. Add 750 mL of methanol, mix, pass through a 0.5-µm membrane filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve USP Dipyridamole RS in *Mobile phase* to obtain a suspension having a known concentration of 100 µg per mL.

Assay preparation—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 288-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.3 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 7.3 minutes, and the relative standard deviation for replicate injections is not more than 2.3%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and

In-Process Revision

measure the responses for the major peaks. Calculate the quantity, in mg, of dipyridamole ($C_{24}H_{40}N_8O_4$) in the volume of Oral Suspension taken by the formula:

$$100(C / V)(r_U / r_S)$$

in which C is the concentration, in µg per mL, of USP Dipyridamole RS in the *Standard preparation;* V is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Dolasetron Mesylate Oral Solution—See briefing under *Acetazolamide Oral Solution.*

(CRX: C. Okeke) RTS—42993-7

Add the following:

▲Dolasetron Mesylate Oral Solution

» Dolasetron Mesylate Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dolasetron mesylate ($C_{19}H_{20}N_2O_3 \cdot CH_4O_3S$). Prepare Dolasetron Mesylate Oral Solution 10 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩. See also *Dolasetron Mesylate Oral Suspension*):

Dolasetron Mesylate powder	1 g
Strawberry Syrup, *NF,* a sufficient quantity to make	100 mL

Dissolve Dolasetron Mesylate powder in about 15 mL of Strawberry Syrup in a mortar, and mix to a uniform paste. Add the Strawberry Syrup in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough Strawberry Syrup to bring to final volume and mix.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature, or in a cold place.

Labeling—Label it to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Dolasetron Mesylate RS.*

pH ⟨791⟩**:** between 3.6 and 4.6.

Beyond-use date: 90 days after the day on which it was compounded.

Assay—

Buffer—Prepare a solution of 0.05 M ammonium acetate adjusted with diluted ammonium hydroxide to a pH of 7.5.

Mobile phase—Prepare a filtered and degassed solution of *Buffer* and acetonitrile (76 : 24). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

In-Process Revision

Sample diluent—Prepare a solution of water and acetonitrile (76 : 24).

Standard stock preparation—Dissolve USP Dolasetron Mesylate RS in *Sample diluent* to obtain a solution having a known concentration of about 500 µg per mL.

Standard preparation—Transfer 2 mL of *Standard stock preparation* to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume. Transfer 10 mL of this prepared solution to another 100-mL volumetric flask, and dilute with *Mobile phase* to obtain a solution having a known concentration of about 10 µg per mL.

Assay preparation—Transfer 0.1 mL of Oral Solution by micropipet to a 100-mL volumetric flask, and dilute with *Sample diluent* to obtain a 10 µg per mL concentration. Shake each sample thoroughly by hand for about 15 seconds, centrifuge at 1000 rpm for about 2 minutes, and assay the supernatant.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 15-cm analytical column that contains 3-µm packing L10, and is maintained at a temperature of 30°. The flow rate is about 0.8 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 6.9 minutes, and the relative standard deviation for replicate injections is not more than 1.4%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of dolasetron mesylate ($C_{19}H_{20}N_2O_3 \cdot CH_4O_3S$) in the volume of Oral Solution taken by the formula:

$$1000(C/V)(r_U / r_S)$$

in which C is the concentration, in µg per mL, of USP Dolasetron Mesylate RS in the *Standard preparation; V* is the volume, in mL, of Oral Solution taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Dolasetron Mesylate Oral Suspension, page 931 of *PF* 31(3) [May–June 2005]—See briefing under *Acetazolamide Oral Suspension.*

(CRX: C. Okeke) RTS—43131-12

Add the following:

▲Dolasetron Mesylate Oral Suspension

» Dolasetron Mesylate Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dolasetron mesylate ($C_{19}H_{20}N_2O_3 \cdot CH_4O_3S$). Prepare Dolasetron Mesylate Oral Suspension 10 mg per mL

In-Process Revision

as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩. See also *Dolasetron Mesylate Oral Solution*):

Dolasetron Mesylate	1 g
Vehicle: a mixture of Vehicle for Oral Suspension, *NF,* and Vehicle for Oral Solution, Sugar-Free, *NF* (1 : 1), or Strawberry Syrup, *NF,* ~~and Vehicle for Oral Suspension,~~ a sufficient quantity to make	100 mL

NOTE— ~~If Strawberry Syrup, *NF* is used, it becomes a solution.~~ If Tablets are used instead of bulk powder, the preparation becomes a suspension and should be labeled as such.

If using Tablets, comminute into a fine powder in a suitable mortar or add Dolasetron Mesylate powder. Mix separately Vehicle for Oral Suspension and Vehicle for Oral Solution, Sugar-Free, and stir vigorously; or mix with Strawberry Syrup. Add about 15 mL of the mixture to the powder and triturate well to a uniform paste. Transfer mortar contents, stepwise and quantitatively, to a calibrated bottle, and rinse the mortar with about 15 mL of the Vehicle. Repeat the previous step as necessary to bring to final volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store at room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken before use, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Dolasetron Mesylate RS.*

pH ⟨791⟩**:** between 3.6 and 4.6.

Beyond-use date: 90 days after the day on which it was compounded.

Assay—

Buffer—Prepare a solution of 0.05 M ammonium acetate adjusted with diluted ammonium hydroxide to a pH of 7.5.

Mobile phase—Prepare a filtered and degassed solution of *Buffer* and acetonitrile (76 : 24). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Sample diluent—Prepare a solution of water and acetonitrile (76 : 24).

Standard stock preparation—Dissolve an accurately weighed quantity of USP Dolasetron Mesylate RS in *Sample diluent* to obtain a solution having a known concentration of about 500 µg per mL.

Standard preparation—Transfer 2 mL of *Standard stock preparation* to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume. Transfer 10 mL of this prepared solution to another 100-mL volumetric flask, and dilute with *Mobile phase* to obtain a solution having a known concentration of about 10 µg per mL.

Assay preparation—Transfer 1.0 mL of Oral Suspension by pipet to a 100-mL volumetric flask, and dilute with *Sample diluent* to obtain a 10 µg per mL concentration. Shake each sample thoroughly by hand for about 15 seconds, centrifuge at 1000 rpm for about 2 minutes, and assay the supernatant.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 15-cm analytical column that contains 5-µm packing L10, and is maintained at a temperature of 30°. The flow rate is about 0.8 mL per minute. Chromatograph the *Standard preparation,* and record the peak re-

sponses as directed for *Procedure:* the retention time is about 6.9 minutes, and the relative standard deviation for replicate injections is not more than 1.4%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of dolasetron mesylate ($C_{19}H_{20}N_2O_3 \cdot CH_4O_3S$) in the volume of Oral Suspension taken by the formula:

$$1000(C/V)(r_U / r_S)$$

in which C is the concentration, in µg per mL, of USP Dolasetron Mesylate RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Dronabinol, *USP 29* page 769. In the *USP Reference standards* section, it is proposed to delete USP Δ^8-Tetrahydrocannabinol RS and to add USP Exo-tetrahydrocannabinol RS. It is also proposed to develop the necessary USP Reference standards as solutions in methanol, having a concentration of about 1 mg per mL. In addition, it is proposed to make minor revisions in *Identification* tests *A* and *B.* Finally, it is proposed to replace the test for *Limit of* Δ^8*-tetrahydrocannabinol* with a test for *Related compounds,* and to establish limits for individual specified impurities.

A new liquid chromatographic procedure, which provides better separation of impurities, is proposed both for the test for *Related compounds* and for the *Assay.* This procedure is based on analyses performed with the YMC J-Sphere ODS-H80 brand of L1 column. The typical retention time for the Δ^9-tetrahydrocannabinol peak is about 21 minutes.

The procedure was validated with the column temperature maintained at 20°. Manufacturers who can demonstrate equivalency at a higher temperature are encouraged to submit data to the Expert Committee.

(MD-GRE: E. Gonikberg) RTS—41820-1

Change to read:

USP Reference standards ⟨11⟩—

▲*USP Exo-tetrahydrocannabinol RS.*▲*USP30*
USP Δ^9*-Tetrahydrocannabinol RS.* ~~*USP* Δ^8*-Tetrahydrocannabinol RS.*~~

▲▲*USP30*

Change to read:

Identification—

A: The retention time of the major peak ~~(other than that due to the internal standard)~~

▲▲*USP30*
in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation,* as obtained in the *Assay.*

B: ~~[NOTE—Since the visualizing agent used in this test is specific for phenols, solution preparations containing diphenyl phthalate and/or sesame oil may be used without interference.]~~

▲▲*USP30*
Visualizing agent—Transfer about 100 mg of Fast Blue B salt to a suitable flask containing about 100 mL of methanol, stir for about 5 minutes, and allow to settle. Decant the clear liquid into the sprayer reservoir. [NOTE—Prepare fresh daily.]

Identification solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Test solution—Use the *Assay preparation.*

Procedure—Apply separately 10 µL each of the *Identification solution* and the *Test solution* to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the plate in a chromatographic chamber that has been equilibrated (for about 2 minutes) with vapors from a solvent mixture of *n*-hexane and methylene chloride (1 : 1) until the solvent front has moved about 10 cm. Remove the plate from the developing chamber, quickly mark the solvent front, and allow the plate to dry at room temperature for about 5 minutes. Spray the plate with the *Visualizing agent* until it is uniformly damp (not saturated). Heat the plate at about 80° until the spots are developed: the color and R_F value of the spots from the *Test solution* correspond to those obtained from the *Identification solution*.

~~*System suitability solution*—Mix accurately measured volumes of USP Δ⁹-Tetrahydrocannabinol RS and USP Δ⁸-Tetrahydrocannabinol RS in dehydrated alcohol to obtain a solution having a known concentration of about 0.5 mg per mL of each component.~~

~~*Standard preparation*—Dissolve an accurately measured volume of USP Δ⁹-Tetrahydrocannabinol RS in dehydrated alcohol to obtain a solution having a known concentration of about 0.2 mg per mL.~~

~~*Assay preparation*—Transfer about 20 mg of Dronabinol, accurately weighed, to a 100-mL volumetric flask, dissolve in dehydrated alcohol, dilute with dehydrated alcohol to volume, and mix.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 228-nm detector, a 4.6- × 30-mm guard column that contains 5-µm packing L1, and a 4.6-mm × 15-cm analytical column that contains 3-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for Δ⁹-tetrahydrocannabinol and 1.14 for Δ⁸-tetrahydrocannabinol; the resolution, *R,* between dronabinol and Δ⁹-tetrahydrocannabinol is not less than 2.0; and the tailing factor of the Δ⁹-tetrahydrocannabinol peak is not more than 2.0. Chromatograph the *Standard prep-*~~

~~*aration,* and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not greater than 2.0%.~~

~~*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for all of the peaks. Calculate the quantity, in mg, of $C_{21}H_{30}O_2$ in the portion of Dronabinol taken by the formula:~~

~~$$100C(r_U/r_S),$$~~

~~in which *C* is the concentration, in mg per mL, of USP Δ⁹-Tetrahydrocannabinol RS in the *Standard preparation;* and r_U and r_S are the dronabinol peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.~~

▲*Mobile phase*—Prepare a filtered and degassed mixture of methanol, water, tetrahydrofuran, and acetonitrile (45 : 25 : 20 : 10), making adjustments, if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Transfer accurately measured volumes of USP Δ⁹-Tetrahydrocannabinol RS and USP Exo-tetrahydrocannabinol RS to a suitable volumetric flask, and dilute with dehydrated alcohol to prepare a solution that contains about 200 µg of Δ⁹-tetrahydrocannabinol and about 10 µg of exo-tetrahydrocannabinol per mL.

Standard preparation—Quantitatively dilute an accurately measured volume of USP Δ⁹-Tetrahydrocannabinol RS with dehydrated alcohol to obtain a solution having a known concentration of about 0.2 mg per mL.

Sensitivity standard preparation—Quantitatively dilute an accurately measured volume of the *Standard preparation* with dehydrated alcohol to obtain a solution having a concentration of about 0.2 µg per mL.

Assay preparation—Transfer about 20 mg of Dronabinol, accurately weighed, to a 100-mL volumetric flask, dissolve in dehydrated alcohol, dilute with dehydrated alcohol to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 228-nm detector and a 4.6-mm × 15-cm analytical column that contains 4-µm packing L1. The flow rate is about 1 mL per minute. The column temperature is maintained at 20°. Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between Δ⁹-tetrahydrocannabinol and exo-tetrahydrocannabinol is not less than 1.5; and the tailing factor of Δ⁹-tetrahydrocannabinol is not more than 2.0. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not greater than 2.0%. Chromatograph the *Sensitivity standard preparation,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio is not less than 10.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for all of the peaks. Calculate the quantity, in mg, of $C_{21}H_{30}O_2$ in the portion of Dronabinol taken by the formula:

$$CV(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of Δ⁹-tetrahydrocannabinol in the *Standard preparation; V* is the volume, in mL, of the *Assay preparation;* and r_U and r_S are the Δ⁹-tetrahydrocannabinol peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

In-Process Revision

BRIEFING

Felodipine Extended-Release Tablets, *USP 29* page 885. It is proposed to add *Dissolution Test 2* because FDA recently approved a generic version of this product. The chromatographic procedure in this test was validated using the Hypersil BDS brand of L1 column. In the absence of any adverse comments, it is proposed to implement this revision via the *Third Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of June 1, 2006.

(BPC: M. Marques) RTS—42719-1

Add the following:

•**Labeling**—When more than one test for *Dissolution* is given, the *Labeling* section states the test for *Dissolution* used only if *Test 1* is not used.•

Change to read:

Dissolution ⟨711⟩—

•TEST 1—•

Medium: pH 6.5 phosphate buffer with 1% sodium lauryl sulfate; 500 mL. (*Medium* is prepared as follows. Transfer 206 mL of 1 M monobasic sodium phosphate monohydrate, 196 mL of 0.5 M dibasic sodium phosphate anhydrous, and 50.0 g of sodium lauryl sulfate to a 5000-mL volumetric flask. Add approximately 4000 mL of water, and mix well. If necessary, adjust with 1 N sodium hydroxide to a pH of 6.5. Dilute with water to volume, and mix well.)

Apparatus 2: 50 rpm.

Times: 2, 6, and 10 hours.

Buffer solution—Prepare as directed in the *Assay.*

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, *Buffer solution,* and methanol (2.5 : 2 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Dissolve an accurately weighed quantity of USP Felodipine RS in alcohol to obtain a solution having a known concentration of 0.25 mg per mL.

Standard solution—Dilute an accurately measured volume of the *Standard stock solution* quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration of USP Felodipine RS equivalent to the concentration that would result from about 60% dissolution of a single Tablet in 500 mL of *Medium.*

Test solution—Place each Tablet in a specially made quadrangular basket of stainless steel wire gauze, soldered in one of its upper, narrow sides to the end of a steel rod (see *Figure 1*). Place the tablet cover in the horizontal diagonal of the basket. Put the rod assembly up through the cover of the dissolution vessel, and fix it by means of two teflon nuts, 3.2 cm from the center of the vessel, or by any other appropriate means. Adjust the lower edge of the bottom of the basket to approximately 1 cm above the top of the paddle blade (see *Figure 2*). Orient the large side of the basket tangentially to the flow stream with the Tablet standing on its edge. Pass a 10-mL portion of the solution under test, obtained at each time interval, through a suitable filter.

Chromatographic system—Proceed as directed in the *Assay.*

Procedure—Separately inject equal volumes (100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of felodipine ($C_{18}H_{19}Cl_2NO_4$) dissolved in the *Medium* by the formula:

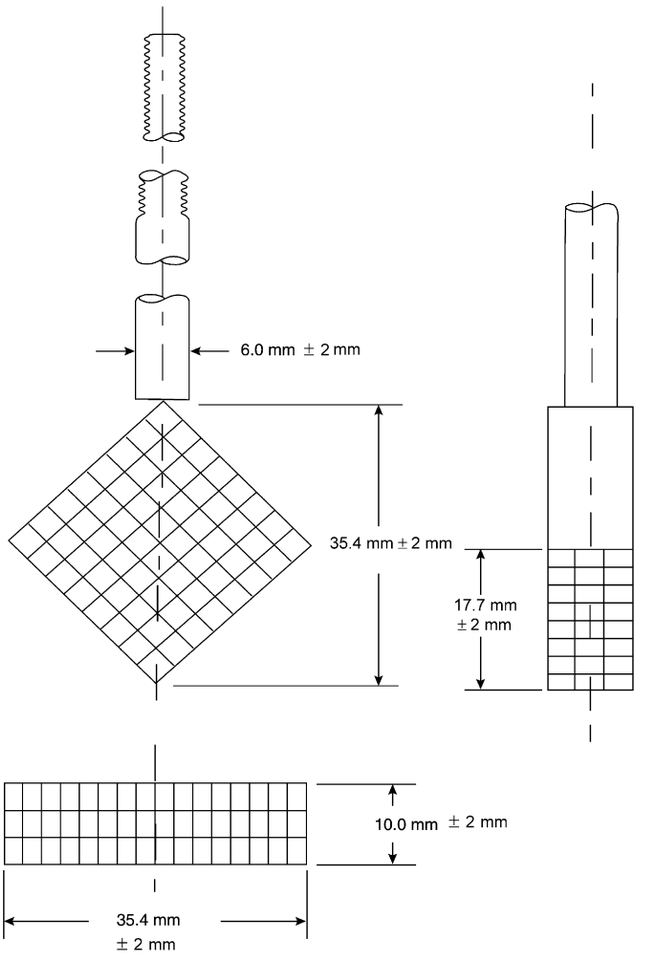
$$CD(r_U / r_S),$$

in which C is the concentration, in mg per mL, of USP Felodipine RS in the *Standard solution; D* is the dilution factor used in preparing the *Test solution;* and r_U and r_S are the felodipine peak areas obtained from the *Test solution* and the *Standard solution,* respectively.

Tolerances—The percentages of the labeled amount of $C_{18}H_{19}Cl_2NO_4$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
2	between 10% and 30%
6	between 42% and 68%
10	not less than 75%

In-Process Revision



NOTES

1. Rod and Basket with a Tablet cover placed in the horizontal diagonal of the basket.
2. Basket and Tablet cover material; stainless steel.
3. Basket gauze wire size: 8 mesh.

Figure 1. Stationary Tablet Basket

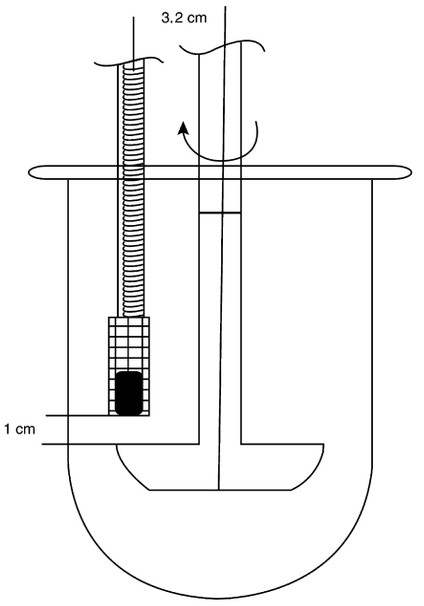


Figure 2. Drug Release Stationary Tablet Basket Configuration Diagram

(Official April 1, 2006)

•TEST 2—

Medium: 1% (w/v) polysorbate 80 in water; 500 mL.

Apparatus 1: 100 rpm.

Times: 1, 4, and 8 hours.

Determine the amount of $C_{18}H_{19}Cl_2NO_4$ dissolved by employing the following method.

Buffer solution—Transfer 6.9 g, accurately weighed, of monobasic sodium phosphate into a 1-L volumetric flask containing about 400 mL of water. Add 8.0 mL of 1 M phosphoric acid, dilute with water to volume, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution,* acetonitrile, and methanol (2 : 2 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Transfer 40 mg, accurately weighed, of USP Felodipine RS into a 200-mL volumetric flask, add about 200 mL of methanol. Sonicate for 2 minutes, cool, dilute with methanol to volume, and mix.

Standard working solutions—Transfer the appropriate volume of *Standard stock solution* into a suitable volumetric flask according to the following table.

Tablet Label Claim (mg)	Volume Transferred (mL)	Volumetric Flask (mL)
10	10	100
5	5	100
2.5	2.5	100

Dilute with *Medium* to volume, and mix.

Test solution—Pass a portion of the solution under test through a suitable 0.45-µm filter. Replace the withdrawn amount with *Medium.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard working solution* and record the peak responses as directed for *Procedure:* the capacity factor (k') is not less than 5, the column efficiency (N) is not less than 1500 theoretical plates, the tailing factor is not more than 1.5, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard working solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of felodipine ($C_{18}H_{19}Cl_2NO_4$) dissolved by the formula:

$$C_U = \frac{r_U \times C_S}{r_S}$$

in which C_U is the concentration, in mg per mL, of felodipine in the sample at each time point; r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard working solution,* respectively; and C_S is the concentration, in mg per mL, of felodipine in the *Standard working solution.*

Calculate the amount, in percentage, of felodipine ($C_{18}H_{19}Cl_2NO_4$) dissolved, with volume correction, by the formula:

$$\left[\frac{r_U \times D_S \times P \times 100}{r_S \times D_U \times 100 \times LC}\right] + \sum_{i=1}^{n-1} \frac{V}{900} \times C_U$$

$$\frac{\left[\left\{C_N \times \left[500 - V_U(n-1)\right]\right\} + \left[\sum_{i=1}^{n-1} C_i \times V_U\right]\right] \times 100}{LC}$$

in which C_N is the concentration, in mg per mL, of felodipine in the *Test solution* at each time point; 500 is the volume, in mL, of *Medium;* V_U is the volume, in mL, of sample withdrawn at each time point; n is the time point (at 4 hours, n + 1), summation of the concentration of the *Test solution* from the first to the $(n-1)^{th}$ time point (only applicable for $n = 2$); 100 is the conversion factor to percentage; and LC is the tablet label claim, in mg.

Tolerances—The percentages of the labeled amount of felodipine dissolved at the times specified conform to *Acceptance Table 1.*

Time (hours)	Amount dissolved
1	between 5% and 30%
4	between 45% and 70%
8	not less than 80%

●[3]

BRIEFING

Flucytosine Oral Suspension, page 933 of *PF* 31(3) [May–June 2005]—See briefing under *Acetazolamide Oral Suspension.*

(CRX: C. Okeke) RTS—43131-13

Add the following:

▲Flucytosine Oral Suspension

» Flucytosine Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of flucytosine ($C_4H_4FN_3O$). Prepare Flucytosine Oral Suspension 10 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Flucytosine	1.0 g
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free), and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

NOTE— ~~If Cherry Syrup, *NF* is used, it becomes a solution.~~ If Capsules are used instead of bulk powder, the preparation becomes a suspension and should be labeled as such.

If using Flucytosine Capsules, empty the appropriate amount into a suitable mortar, or add Flucytosine powder to the mortar. Add about 10 mL of the Vehicle, and mix to a uniform paste. Add the

In-Process Revision

Vehicle in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough Vehicle to bring to final volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store in a cold place.

Labeling—Label it to state that it is to be well shaken, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Flucytosine RS.*

pH ⟨791⟩**:** between 4.0 and 4.8 (Vehicle for Oral Solution and Vehicle for Oral Suspension) and between 3.2 and 4.0 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Buffer—Dissolve 1g of ammonium acetate and 1 mL of diisopropylamine in 1 L of water, and adjust with glacial acetic acid to a pH of 7.5.

Mobile phase—Prepare a filtered and degassed solution of methanol and *Buffer* (1 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Flucytosine RS in *Mobile phase,* and dilute quantitatively with *Mobile phase* to obtain a solution having a known concentration of about 50 µg per mL.

Assay preparation—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 0.5 mL of the sample into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6- × 200-mm analytical column that contains 5-µm packing L3. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 3 minutes, and the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of flucytosine ($C_4H_4FN_3O$) in the volume of Oral Suspension taken by the formula:

$$200(C/V)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Flucytosine RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

In-Process Revision

BRIEFING

Flumazenil, *USP 29* page 919 and page 1628 of *PF* 31(6) [Nov.–Dec. 2005]. It is proposed to rename *N,N*-dimethylformamide diethyl acetal as USP Flumazenil Related Compound C RS and to revise *Related compounds Test 1* to specify the use of USP Flumazenil Related Compound C RS.

(MD-PP: R. Ravichandran) RTS—43561-1

Related compounds—

TEST 1—

Ninhydrin solution—Dissolve 0.5 g of ninhydrin in 90 mL of alcohol, and add 10 mL of glacial acetic acid.

Diluent—Prepare a mixture of alcohol and chloroform (1 : 1).

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture (see *Chromatography* ⟨621⟩).

Test solution—Transfer about 250 mg of Flumazenil, accurately weighed, to a 5-mL volumetric flask. Dissolve in and dilute with *Diluent* to volume, and mix.

Standard solution 1—Prepare a solution of USP Flumazenil RS and ~~*N,N*-dimethylformamide diethyl acetal~~

▲USP Flumazenil Related Compound C RS▲*USP30* in *Diluent* having known concentrations of about 0.5 mg per mL and about 0.6 µL per mL, respectively.

Standard solution 2—Dilute 2.0 mL of *Standard solution 1* with *Diluent* to 10.0 mL.

Application volume: 10 µL.

Developing solvent system: a mixture of chloroform, glacial acetic acid, alcohol, and water (75 : 15 : 7.5 : 2.5).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. Dry the plate for 10 minutes in a current of cold air, and view under short-wavelength UV light. Spray the plate with *Ninhydrin solution,* and heat at 105° for 15 minutes. The R_F values of analytes are as follows.

Compound	R_F	Detection
Flumazenil	about 0.8	UV
~~*N,N*-Dimethylformamide diethyl acetal~~	about 0.04	Ninhydrin
▲Flumazenil related compound C▲*USP30*	Any spot at an R_F value corresponding to ~~*N,N*-dimethylformamide diethyl acetal~~	

▲flumazenil related compound C▲*USP30* in the chromatogram obtained from the *Test solution* is not more intense than the corresponding spot in the chromatogram obtained from *Standard solution 2:* not more than 0.2% is found.

TEST 2—

Diluted phosphoric acid, pH 2.0, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution— ~~Dissolve an accurately weighed quantity of USP Flumazenil RS in *Mobile phase,* and dilute quantitatively,~~

▲Dilute the *Standard preparation* quantitatively,▲*USP30* and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1 µg per mL of flumazenil.

Test solution— ~~Transfer about 25.0 mg of Flumazenil, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.~~

▲Use the *Assay preparation.*▲*USP30*

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for at least three times the retention time of the flumazenil peak, and measure the areas for the major peaks. Calculate the percentage of any impurity in the portion of Flumazenil taken by the formula:

~~$2500(C/W)(1/F)(r_i/r_s)$,~~

▲$100(C_S/C_U)(r_i/r_S)(1/F)$▲*USP30*

~~in which *C* is the concentration, in mg per mL, of USP Flumazenil RS in the *Standard solution; F* is the relative response factor according to the *Table* below; *W* is the weight, in mg, of Flumazenil, on the dried basis, used to prepare the *Test solution; r_i,* is the peak area for any impurity in the *Test solution;* and r_s is the peak area for flumazenil in the *Standard solution:* the impurities meet the requirements given in the *Table* below.~~

▲in which C_S and C_U are the concentrations, in mg per mL, of flumazenil in the *Standard solution* and the *Test solution,* respectively; r_i is the peak area for any impurity in the *Test solution;* r_S is the peak area for flumazenil in the *Standard solution;* and *F* is the relative response factor for each of the known impurities relative to flumazenil. [NOTE—*F* values are given for all the impurities, along with the corresponding limits, in the *Table* below.]▲*USP30*

Identification—

A: *Infrared Absorption* ⟨197M⟩—

Test specimen—Transfer about 30 g of Nasal Spray equally into two 50-mL centrifuge tubes. Add 10 mL of water to each tube, insert the stopper, and shake the tubes vigorously for 2 minutes. Centrifuge at 3500 rpm for 10 minutes, and discard the supernatant. Add 10 mL of water to each tube, insert the stopper, and shake the tubes vigorously for 2 minutes. Centrifuge at 3500 rpm for 10 minutes, and discard the supernatant. Add 10 mL of water to each tube, insert the stopper, and shake the tubes vigorously for 2 minutes. Centrifuge at 3500 rpm for 10 minutes, and discard the supernatant. To one tube add 10 mL of methanol. Shake to disperse the residue, and transfer to the other tube. Shake this tube for 1 minute. Centrifuge at 3500 rpm for 10 minutes. Decant the supernatant into an agate mortar. Evaporate the methanol either by carefully blowing dry with compressed air or nitrogen, or by allowing the methanol to evaporate naturally. If using an air or nitrogen line, use a suitable in-line filter to avoid contamination. Allow the residue to dry overnight in a desiccator over silica gel.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Microbial limits ⟨61⟩—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa.* The total aerobic microbial count does not exceed 100 cfu per g, and the total combined molds and yeasts count does not exceed 50 cfu per g.

BRIEFING

Fluticasone Propionate Nasal Spray, page 1071 of *PF* 31(4) [July–Aug. 2005]. It is proposed to revise the tests for *Delivered dose uniformity* (within container) and *Delivered dose uniformity* (within batch) to delete the unnecessary container weight measurements specified for the *Test solution.* The typical retention time for fluticasone propionate in the *Assay* is about 7 minutes.

(AER: K. Zaidi) RTS— 43696-1

Add the following:

▲Fluticasone Propionate Nasal Spray

» Fluticasone Propionate Nasal Spray is a white opaque suspension of fluticasone propionate in water. It is supplied in a form suitable for nasal administration. It contains not less than 95.0 percent and not more than 115.0 percent of the labeled amount of fluticasone propionate ($C_{25}H_{31}F_3O_5S$).

Packaging and storage—Preserve in tight, light-resistant containers, and store between 4° and 30°.

pH ⟨791⟩**:** between 5.0 and 7.0.

Particle size—Remove the pump system after shaking the test bottle to ensure product uniformity. Transfer 1 drop of the Nasal Spray onto a clean microscope slide. Examine 10 random fields of view on the slide using 400 × magnification. Record the number of individual particles that are less than 5 µm in diameter: not less than 98% by number. Record the number of the individual particles that are greater than 5 µm in diameter but less than 15 µm in diameter: not more than 1.8% by number. Record the number of the individual particles that are greater than 15 µm in diameter: not more than 0.2% by number.

Foreign particulates—Shake the required number of bottles to ensure uniformity. Remove the pump system carefully to minimize contamination of the sample. Collect about 100 g of Nasal Spray, and pass it through a wetted 250-µm screen. Rinse each bottle with a portion of water equal to twice the volume of each bottle. Pass the rinse through the 250-µm screen. Visually observe the screen and filtrate for any foreign particulates. Also examine the screen under a microscope using transmitted light: free from any visible foreign particulates greater than 250 µm.

Delivered dose uniformity (within container)—

Diluent, 0.01 M Monobasic ammonium phosphate buffer, pH 3.5, Mobile phase, and *Chromatographic system*—Prepare as directed in the *Assay.*

Resolution solution—Dissolve an accurately weighed quantity of USP Fluticasone Propionate RS and USP Fluticasone Propionate Related Compound D RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 4 µg per mL of each.

Standard solution—Dissolve an accurately weighed quantity of USP Fluticasone Propionate RS in *Diluent* to obtain a solution having a known concentration of about 4 µg per mL.

Test solution—Wipe clean the pump. ~~and record the weight of the bottle prior to actuation.~~ Shake the bottle for 30 seconds, and mechanically prime the bottle. Hold a 25-mL volumetric flask in an inverted position, and discharge the first two actuations (1 dose) into the flask. Turn the flask to the upright position immediately after each actuation. Insert the stopper into the flask after the collection of two actuations. ~~Weigh the bottle after sample collection.~~ Discharge actuations 3 to 48 (50-spray pack) or 3 to 118 (120-spray pack) to waste. Wipe clean the bottle, and ~~record the weight of the bottle. Collect~~ collect the last two actuations (49 and 50 or 119 and 120) into a second 25-mL volumetric flask. Turn the flask to the upright position immediately after each actuation, ~~Insert the stopper into the flask,~~ and insert the stopper into the flask. ~~and record the weight of the bottle.~~ Add 20 mL of the *Diluent* to each flask, and shake well for 10 minutes to disperse the suspension. Dilute with *Diluent* to volume, and mix thoroughly. Allow the flask to stand until the excipients have settled. Transfer a portion of the clear supernatant to an HPLC vial and inject. Repeat this procedure with 4 additional bottles.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in µg, of $C_{25}H_{31}F_3O_5S$ per dose taken by the formula:

$$CV(r_U / r_S)$$

in which C is the concentration of USP Fluticasone Propionate RS, in µg per mL, in the *Standard solution; V* is the total volume of *Test solution,* in mL; and r_U and r_S are the

peak responses obtained from the *Test solution* and the *Standard solution,* respectively. The mean dose delivered from 10 doses is within 85% to 115% of label claim. Not more than 1 dose is outside 80% to 120% of label claim. No doses are outside 75% to 125% of label claim. Test an additional 10 bottles if 2 or 3 doses are outside ±20% of label claim. The mean dose delivered from ~~30~~ 20 doses should be within 85% to 115% of the label claim. Not more than 3 doses are outside 80% to 120% of label claim. No doses are outside 75% to 125% of label claim.

Delivered dose uniformity (within batch)—

Diluent, 0.01 M Monobasic ammonium phosphate buffer, pH 3.5, Mobile phase, and *Chromatographic system*—Prepare as directed in the *Assay.*

Resolution solution—Prepare as directed in the test for *Delivered dose uniformity* (within container).

Standard solution—Prepare as directed in the test for *Delivered dose uniformity* (within container).

Test solution—Wipe clean the pump. ~~and record the weight of the bottle prior to actuation.~~ Shake the bottle for 30 seconds, and mechanically prime the bottle. Hold a 25-mL volumetric flask in an inverted position, and discharge the first two actuations into the flask. Turn the flask to the upright position immediately after each actuation. Insert the stopper into the flask after the collection of two actuations (1 dose). Repeat this procedure with 9 additional bottles.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in µg, of $C_{25}H_{31}F_3O_5S$ per dose taken by the formula:

$$CV(r_U / r_S)$$

in which C is the concentration of USP Fluticasone Propionate RS, in µg per mL, in the *Standard solution; V* is the total volume of *Test solution,* in mL; and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively. The mean dose delivered from 10 doses is within 85% to 115% of label claim. Not more than 1 dose is outside 80% to 120% of label claim. No doses are outside 75% to 125% of label claim. Test an additional 20 bottles if 2 or 3 doses are outside ±20% of label claim. The mean dose delivered from the two actuations at the beginning of the 30 bottles (30 doses) is within 85% to 115% of the label claim. Not more than 3 doses are outside 80% to 120% of label claim. No doses are outside 75% to 125% of label claim.

Related compounds—

Solution A—Prepare a mixture of methanol and acetonitrile (77 : 23).

0.01 M Monobasic ammonium phosphate buffer—Dissolve 1.15 g of monobasic ammonium phosphate in 1000 mL of water, adjust with phosphoric acid to a pH of 3.4 ± 0.1, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *Solution A* and *0.01 M Monobasic ammonium phosphate buffer* (60 : 40). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of acetonitrile and 0.001 M hydrochloric acid (60 : 40).

Control solution—Prepare a solution in a mixture of *Diluent* and water (4 : 1) containing about 0.5 mg per mL of USP Phenylethyl Alcohol RS and 0.08 mg per mL of benzalkonium chloride.

System suitability solution—Dissolve an accurately weighed quantity of USP Fluticasone Propionate RS, USP Fluticasone Related Compound D RS, USP Fluticasone Propionate Related Compound F RS, and USP Phenylethyl Alcohol RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a

known concentration of about 100 µg per mL, 1.0 µg per mL, 1.0 µg per mL, and 500 µg per mL of each Reference Standard, respectively.

Test solution—Transfer accurately about 1.0 g of the Nasal Spray to a 5-mL volumetric flask, dissolve in and dilute with *Diluent* to volume. Shake the flask vigorously to dissolve. Pass through a 0.5-µm porosity filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 239-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. The column is maintained at a temperature of 40°. Chromatograph the *System suitability solution,* and measure the peak responses as directed for *Procedure:* the resolution, *R,* between fluticasone propionate related compound F and phenylethyl alcohol is not less than 1.5; the resolution, *R,* between fluticasone propionate related compound D and fluticasone propionate is not less than 2; and the relative retention times and limits are as provided in *Table 1.*

Procedure—Separately inject a volume (about 50 µL) of the *System suitability solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Nasal Spray taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each impurity, and r_s is the sum of the responses of all the peaks, excluding the peaks obtained from the *Control solution.*

Table 1

Compound	Approximate Relative Retention Time	Limit (%)
S-Fluoromethyl 17α-acetyloxy-6α,9α-difluoro-11β-hydroxy-16α-methyl-3-oxo-androsta-1,4-diene-17β-carbothioate/ *S*-Fluoromethyl 9α-fluoro-11β-hydroxy-16α-methyl-3,6-dioxo-17α-propionyloxyandrosta-1,4-diene-17β-carbothioate	0.7	0.3
Fluticasone propionate related compound D	1.1	0.3
6α,9α-Difluoro-11β,17α-dihydroxy-16α-methyl-3-oxo-androsta-1,4-diene-17β-carboxylic acid 6α,9α-difluoro-17β-(fluoromethylthio) carbonyl-11β-hydroxy-16α-methyl-3-oxo-androsta-1,4-dien-17α-yl ester	2.1	0.3
Unknown impurities	—	0.2
Total	—	1.5

Content of phenylethyl alcohol—

Diluent, Mobile phase, Resolution solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Dissolve an accurately weighed quantity of USP Phenylethyl Alcohol RS in *Diluent* to obtain a solution having a known concentration of about 50 µg per mL.

Test solution—Use the *Assay preparation.*

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg per g, of phenylethyl alcohol in the portion of Nasal Spray taken by the formula:

$$50(C/W_U)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of the USP Phenylethyl Alcohol RS in the *Standard solution;* W_U is the weight, in g, of the Nasal Spray taken to prepare the *Test solution;* and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively. For 50 sprays: not less than 1.75 mg per g and not more than 2.63 mg per g. For 120 sprays: not less than 1.88 mg per g and not more than 2.63 mg per g.

Content of benzalkonium chloride—

Citric acid buffer solution—Dissolve 50 g of citric acid in 200 mL of water. Adjust the solution with 2 N sodium hydroxide to a pH of 3.5 ± 0.05.

Docusate sodium titrant—Dissolve 0.22 g of docusate sodium in 100 mL of warm water, and dilute with water to make 1000 mL.

Eosin Y indicator—Dissolve about 25 mg of eosin Y in 50 mL of acetone. Add 450 mL of chloroform and 5.0 ± 0.5 g of citric acid. Shake thoroughly until no discoloration occurs. Filter the mixture to remove any undissolved citric acid. Store in an amber bottle.

Benzalkonium chloride standard stock solution—Use 50% (w/v) solution of benzalkonium chloride.*

Benzalkonium chloride standard solution—Transfer accurately about 0.4 g of *Benzalkonium chloride standard stock solution* to a 1000-mL volumetric flask. Dilute with water to volume, and mix. Sonicate for 5 minutes to dissolve.

Procedure—Pipet 10 mL of *Benzalkonium chloride standard solution* into a 250-mL glass-stoppered flask containing 40 mL of water, 5 mL of *Eosin Y indicator,* and 2 mL of *Citric acid buffer solution.* Insert the stopper into the flask, and shake the mixture, releasing any build-up of pressure. Titrate with *Docusate sodium titrant* with vigorous shaking to a point when pink coloration is discharged from the chloroform layer. Perform a blank determination, substituting 10 mL of water for the *Benzalkonium chloride standard solution,* and make any necessary correction (see *Titrimetry* ⟨541⟩). Calculate the titer value of the *Docusate sodium titrant,* in µg of benzalkonium chloride per mL of *Docusate sodium titrant,* by the formula:

$$W_B/V_D$$

in which W_B is the weight, in µg, of benzalkonium chloride titrated; and V_D is the volume, in mL, of *Ducosate sodium titrant.* Transfer accurately about 10 g of Nasal Spray into a 250-mL glass-stoppered flask containing 40 mL of water, 5 mL of *Eosin Y indicator,* and 2 mL of *Citric acid buffer solution.* Repeat the procedure as given above for *Benzalkonium chloride standard solution.* To clarify the endpoint, place the flask in an ultrasonic bath for 1 to 2 minutes to separate the chloroform layer from the aqueous phase. Per-

In-Process Revision

* A suitable grade is available from Merck, Germany (www.merck.com).

form a blank determination. Calculate the concentration of benzalkonium chloride, in µg per g, in the portion of Nasal Spray taken by the formula:

$$TV/W$$

in which T is the titer value of *Ducosate sodium titrant; V* is the volume, in mL, of the *Docusate sodium titrant* used in the titration of the Nasal Spray; and W is the weight, in g, of the portion of Nasal Spray taken: not less than 160 µg per g and not more than 210 µg per g.

Assay—

Diluent—Prepare a mixture of acetonitrile and 0.001 M hydrochloric acid (60 : 40).

0.01 M Monobasic ammonium phosphate buffer, pH 3.5—Dissolve 1.15 g of monobasic ammonium phosphate in 1000 mL of water, adjust with phosphoric acid to a pH of 3.5 ± 0.05, and mix.

Mobile phase—Prepare a filtered and degassed mixture of methanol, *0.01 M Monobasic ammonium phosphate buffer, pH 3.5,* and acetonitrile (50 : 35 : 15). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—Dissolve accurately weighed quantities of USP Phenylethyl Alcohol RS, USP Fluticasone Propionate RS, and USP Fluticasone Propionate Related Compound D RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having known concentrations of about 50 µg per mL, 10 µg per mL, and 1 µg per mL, respectively.

Standard preparation—Dissolve an accurately weighed quantity of the USP Fluticasone Propionate RS in *Diluent* to obtain a solution having a known concentration of about 10 µg per mL.

Assay preparation—Transfer accurately about 1.0 g of the Nasal Spray to a 50-mL volumetric flask, add about 40 mL of *Diluent,* and sonicate the flask for 10 minutes. Dilute with *Diluent* to volume, and shake. Allow to stand for about 10 minutes until the supernatant is a clear solution. Inject the clear supernatant into the chromatograph.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 4.6-mm × 25-cm column that contains 5-µm packing L1, and a programmable variable wavelength detector capable of monitoring at 210 nm and 239 nm. The flow rate is about 1.5 mL per minute. The column is maintained at a temperature of 40°. Chromatograph the *Resolution solution* and the *Standard preparation,* record the peak areas at 210 nm for 5 minutes, and then change the wavelength to 239 nm and record the peak areas: the relative retention times are about 0.42 for phenylethyl alcohol, 1.0 for fluticasone propionate, and 1.10 for fluticasone propionate related compound D; the resolution, R, between fluticasone propionate and fluticasone propionate related compound D is not less than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of fluticasone propionate ($C_{25}H_{31}F_3O_5S$) in the portion of Nasal Spray taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration of USP Fluticasone Propionate RS, in mg per mL, in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ▲*USP30*

In-Process Revision

BRIEFING

Fluvastatin Sodium, *USP 29* page 961; **Fluvastatin Capsules,** *USP 29* page 962. Previously proposed changes (see pages 43 and 47 of *PF* 31(1) [Jan.–Feb. 2005]) in the composition of the USP Fluvastatin for System Suitability RS, as well as the resulting changes in the *System suitability solution* in the test for *Chromatographic purity,* are now being canceled. The following changes are proposed:

1. Because the USP was unable to establish a USP Fluvastatin Related Compound A RS, it is proposed to revise the monographs to exclude the use of this Reference Standard. This revision necessitates changes in the *System suitability solution* in the test for *Chromatographic purity.*
2. Delete *Identification* test *B* (UV absorption). Two remaining *Identification* tests, employing *Infrared Absorption* ⟨197K⟩ and *Sodium* ⟨191⟩, are sufficient for identifying the material.
3. The *Relative Response Factors* under *Chromatographic purity* are revised to implement a uniform and consistent approach as proposed in the *Stimuli* article, *The Use of Relative Response Factors to Determine Impurities,* published on page 960 of *PF* 31(3) [May–June 2005]. The new *F* values are recalculated from the unrounded values provided by the monograph sponsor.
4. Chemical names for related impurities are added to *Table 1* in the *Chromatographic purity* test.
5. Revise the *Packaging and storage* statement to indicate storage at a temperature not exceeding 40°.
6. Replace the test for *Water* with the test for *Loss on drying*.

~~*System suitability stock solution*—Prepare a solution in methanol containing about 0.1 mg of USP Fluvastatin Related Compound A RS per mL.~~

▲▲*USP30*
System suitability solution—~~Transfer about 50 mg of USP Fluvastatin for System Suitability RS, accurately weighed, to a 100-mL volumetric flask, and dissolve in 35 mL of methanol. Add 5.0 mL of *System suitability stock solution* into the flask, dilute with *Diluent* to volume, and mix. [NOTE—The *System suitability stock solution* and the *System suitability solution* are stable for up to 6 months if stored in a refrigerator.]~~

▲Use the *System suitability preparation,* prepared as directed in the *Assay.*▲*USP30*

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay.*

Chromatographic system—Proceed as directed in the *Assay,* except use the liquid chromatograph equipped with either a programmable variable wavelength detector or two separate detectors capable of monitoring at 305 nm and at 365 nm. Chromatograph the *System suitability solution,* and record the peak responses at 305 nm as directed for *Procedure.* Identify the peaks corresponding to fluvastatin

▲and▲*USP30*
fluvastatin anti-isomer. ~~, and fluvastatin hydroxydiene~~

▲▲*USP30*
Chromatograph the *System suitability solution,* and record the peak responses at 305 nm as directed for *Procedure:* the resolution, *R,* between fluvastatin anti-isomer and fluvastatin is not less than 1.4; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms at 305 nm and 365 nm, identify the impurities listed in *Table 1,* and measure the peak responses. [NOTE—3-Hydroxy-5-keto fluvastatin is monitored using a wavelength of 365 nm, and all other compounds are monitored at 305 nm.] Calculate the percentage of each impurity, except for 3-hydroxy-5-keto fluvastatin, in the portion of Capsules taken by the formula:

~~$100F(411.48/433.45)(C_S/C_T)(r_{i(305)}/r_{S(305)})$~~

▲$100(1/F)(411.48/433.45)(C_S/C_T)(r_{i(305)}/r_{S(305)})$▲*USP30*

in which F is the relative response factor as listed in *Table 1* [NOTE—Use F equal to 1.0 for unknown impurities]; 411.48 and 433.45 are the molecular weights of fluvastatin and fluvastatin sodium, respectively; C_S is the concentration, in mg per mL, of USP Fluvastatin Sodium RS in the *Standard solution;* C_T is the concentration, in mg per mL, of fluvastatin in the *Test solution,* based on the label claim; $r_{i\,(305)}$ is the peak response at 305 nm for each impurity obtained from the *Test solution;* and $r_{S\,(305)}$ is the peak response at 305 nm for the fluvastatin peak, obtained from the *Standard solution*.

Calculate the percentage of 3-hydroxy-5-keto fluvastatin in the portion of Capsules taken by the formula:

~~$100F(411.48/433.45)(C_S/C_T)(r_{i(365)}/r_{S(365)})$~~

▲$100(1/F)(411.48/433.45)(C_S/C_T)(r_{i(365)}/r_{S(365)})$▲*USP30*

in which F, C_S, and C_T are as defined above; $r_{i\,(365)}$ is the peak response at 365 nm for 3-hydroxy-5-keto fluvastatin, obtained from the *Test solution;* and $r_{S\,(365)}$ is the peak response at 365 nm for the fluvastatin peak, obtained from the *Standard solution.* In addition to not exceeding the limits for each impurity in *Table 1,* not more than 0.5% of any unknown impurity is found; not more than 1.5% of total unknown impurities is found; and not more than 4.0% of total impurities is found.

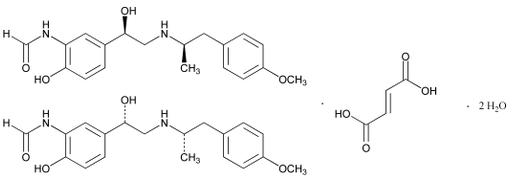
BRIEFING

Formoterol Fumarate. Because there is no existing *USP* monograph for this drug substance, the following new monograph is being proposed. The liquid chromatographic procedure in the test for *Related compounds* is based on analyses performed with the Zorbax SB brand of L7. The typical retention time for formoterol fumarate is about 12 minutes. The gas chromatographic procedure in the test for *Content of related compound I (diastereoisomer)* is based on the analyses performed with apHera brand of L1 column.

(AER: K. Zaidi) RTS—40261-1; 43069-1; 43069-2

Add the following:

▲Formoterol Fumarate



$(C_{19}H_{24}N_2O_4)_2 \cdot C_4H_4O_4$ 804.88

(±)-2′-Hydroxy-5′-[*(R*)*-1-hydroxy-2-[[*(R*)-p*-methoxy-α-methylphenethyl]amino]ethyl]formanilide fumarate (2 : 1) (salt) [*43229-80-7*].

» Formoterol Fumarate contains not less than 98.0 percent and not more than 102.0 percent of $(C_{19}H_{24}N_2O_4)_2 \cdot C_4H_4O_4$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed, light-resistant containers.

USP Reference standards ⟨11⟩—*USP Formoterol Fumarate RS. USP Formoterol Fumarate System Suitability Mixture RS. USP Formoterol Related Compound I RS.*

Identification, *Infrared Absorption* ⟨197K⟩**.**

pH ⟨791⟩**:** between 5.5 and 6.5, in a solution in water containing 1 mg per mL.

Water, *Method I* ⟨921⟩**:** not more than 5.0%.

In-Process Revision

Specific rotation ⟨781S⟩**:** between –0.10° and +0.10°.

Test solution: 10 mg per mL, in methanol.

Residue on ignition ⟨281⟩**:** not more than 0.1%, determined on 1 g.

Heavy metals, *Method II* ⟨231⟩**:** not more than 0.002%.

Residual solvents ⟨467⟩**:** meets the requirements.

Related compounds—

Solution A—Dissolve 3.73 g of sodium dihydrogen phosphate monohydrate and 0.35 g of phosphoric acid in water, dilute with water to 1000 mL, and mix. The pH of this solution is 3.1 ± 0.1.

Solution B—Use acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Solution C—Transfer 6.10 g of sodium dihydrogen phosphate monohydrate and 1.03 g of disodium hydrogen phosphate dihydrate to a 1000-mL volumetric flask, add 500 mL of water, and dissolve. Dilute with water to volume, and mix. The pH is 6.0 ± 0.1.

Diluent—Prepare a filtered and degassed mixture of *Solution C* and acetonitrile (84 : 16, v/v).

System suitability solution—Transfer about 5 mg of USP Formoterol Fumarate System Suitability Mixture RS (containing formoterol related compounds A, B, C, D, E, F, G, and H), accurately weighed, to a 25-mL volumetric flask, add 10 mL of *Diluent,* and sonicate to dissolve. Dilute with *Diluent* to volume, and mix.

Test solution—Transfer about 20.0 mg of Formoterol Fumarate, accurately weighed, to a 100-mL volumetric flask, add 50 mL of *Diluent,* and sonicate to dissolve. Dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 15-cm column that contains packing L7. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	84	16	equilibration
0–10	84	16	isocratic
10–37	84→30	16→70	linear gradient
37–40	30→84	70→16	linear gradient
40–55	84	16	isocratic

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between formoterol related compound G and formoterol related compound A is not less than 1.5; the peak-to-valley ratio (H_P / H_V) of formoterol related compound C and formoterol fumarate is not less than 2.5, where H_P is the height above the baseline of the peak due to formoterol related compound C and H_V is the height above the baseline of the lowest point of the curve separating this peak from the peak due to formoterol fumarate; and the relative retention times and limits are as provided in *Table 1* below.

Table 1

Related Compound	Related Compound Chemical Name	Relative Retention Time	Relative Response Factor (*F*)	Limit (%)
G	(2*RS*)-1-(4-methoxyphenyl)propan-2-amine	0.4	1.00	0.1
A	1-(3-amino-4-hydroxyphenyl)-2-[[2-(4-methoxyphenyl)-1-methylethyl]amino]ethanol	0.5	1.75	0.3
B	*N*-[2-hydroxy-5-[(1*RS*)-1-hydroxy-2-[[2-(4-methoxyphenyl)ethyl]amino]ethyl]phenyl]formamide	0.7	1.00	0.2
C	*N*-[2-hydroxy-5-[1-hydroxy-2-[[2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]-acetamide	1.2	1.00	0.2
D	*N*-[2-hydroxy-5-[1-hydroxy-2-[methyl[2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]-formamide	1.3	1.00	0.2
E	*N*-[2-hydroxy-5-[1-hydroxy-2-[[2-(4-methoxy-3-methylphenyl)-1-methylethyl]amino]ethyl]-phenyl]formamide	1.8	1.00	0.1
F	*N*-[2-hydroxy-5-[1-[[2-hydroxy-5-[1-hydroxy-2-[[2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]amino]-2-[[2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]-phenyl]formamide	2.0	1.00	0.2
H	*N*-[5-[(1*RS*)-2-[benzyl[(1*RS*)-2-(4-methoxyphenyl)-1-methylethyl]amino]-1-hydroxyethyl]-2-hydroxyphenyl]formamide (monobenzyl-analogue)	2.2	1.00	0.1
	Any other individual impurity			0.1
	Total impurities			0.5

In-Process Revision

Procedure—Separately inject equal volumes (about 20 µL) of the *System suitability solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Disregard any peak representing less than 0.05%. Calculate the percentage of each formoterol related compound in the portion of Formoterol Fumarate taken by the formula:

$$100F(r_i / r_s)$$

in which F is the relative response factor for each formoterol related compound according to *Table 1;* r_i is the peak response for each formoterol related compound; and r_s is the sum of the responses for all the peaks.

Content of related compound I *(diastereoisomer)*—

Standard solution—Dissolve 10 mg of USP Formoterol Related Compound I RS in 1 mL of dimethylformamide. Add 100 µL of *N*-(trimethylsilyl)imidazole, and mix.

Test solution—Dissolve 10 mg of Formoterol Fumarate in 1 mL of dimethylformamide. Add 100 µL of *N*-(trimethylsilyl)imidazole, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm × 30-m fused-silica capillary column coated with a 0.25-µm film of stationary phase G27, and a split injection system. The carrier gas is helium, flowing at a rate of about 2 mL per minute and a split ratio of about 75 : 1. The injection port and the detector temperatures are maintained at about 280° and 300°, respectively. The column temperature is programmed as follows. Initially the column temperature is equilibrated at 220° for 5 minutes, then the temperature is increased at a rate of 1° per minute to 250°, and maintained at 250° for 20 minutes. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between formoterol related compound I and formoterol fumarate is not less than 2.0.

Procedure—Separately inject equal volumes (about 2 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses for formoterol related compound I and formoterol fumarate. Disregard all other peaks. Calculate the percentage of formoterol related compound I in the portion of Formoterol Fumarate taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for formoterol related compound I, and r_s is the sum of the responses of both formoterol fumarate and formoterol related compound I peaks: not more than 0.3% of formoterol related compound I is found.

Assay—Transfer about 350 mg of Formoterol Fumarate, accurately weighed, to a titration vessel, dissolve in 50 mL of anhydrous acetic acid, and titrate with 0.1 M perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 M perchloric acid is equivalent to 40.24 mg of $(C_{19}H_{24}N_2O_4)_2 \cdot C_4H_4O_4$. ▲*USP30*

In-Process Revision

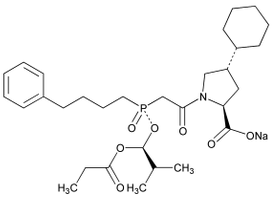
BRIEFING

Fosinopril Sodium, page 2001 of *PF* 30(6) [Nov.–Dec. 2004]. On the basis of comments received, this new monograph is being revised. The method for determination in the test for *Water* is being corrected as well as the chemical name of fosinopril related compound E in the table under *Related compounds.* The compositions of the *Resolution solutions* used in the test for *Related compounds* and in the *Assay* are also being corrected.

(MD-CV: A. Wilk) RTS—42492-1

Add the following:

▲Fosinopril Sodium



$C_{30}H_{45}NNaO_7P$ 585.64

L-Proline, 4-cyclohexyl-1-[[[2-methyl-1-(1-oxopropoxy)-propoxy](4-phenylbutyl)phosphinyl]acetyl]-, sodium salt, [1[*S*(R*)*],2α,4β]-.

(4*S*)-4-Cyclohexyl-1-[*(R)*-[*(S)*-1-hydroxy-2-methylpropoxy](4-phenylbutyl)phosphinyl]acetyl-L-proline propionate (ester), sodium salt [*88889-14-9*].

» Fosinopril Sodium contains not less than 97.5 percent and not more than 102.0 percent of $C_{30}H_{45}NNaO_7P$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight containers, and store at controlled room temperature.

[3] Mixture of (4*S*)-4-Cyclohexyl-1-[*(S)*-[*(S)*-1-hydroxy-2-methylpropoxy](4-phenylbutyl)phosphinyl]acetyl-L-proline propionate (ester), sodium salt and (4*S*)-4-Cyclohexyl-1-[[*(R)*-[*(R)*-1-hydroxy-2-methylpropoxy](4-phenylbutyl)phosphinyl]acetyl-L-proline propionate (ester), sodium salt
[4] (4*R*)-4-Cyclohexyl-1-[*(R)*-[*(S)*-1-hydroxy-2-methylpropoxy](4-phenylbutyl)phosphinyl]acetyl-L-proline propionate (ester), sodium salt
[5] (4*S*)-4-~~Cyclohexyl~~ Phenyl-1-[*(R)*-[*(S)*-1-hydroxy-2-methylpropoxy](4-phenylbutyl)phosphinyl]acetyl-L-proline propionate (ester), sodium salt
[6] (4*S*)-4-Cyclohexyl-1-[*(R)*-[*(S)*-1-hydroxy-ethoxy](4-phenylbutyl)phosphinyl]acetyl-L-proline propionate (ester)

TEST 2—

Mobile phase—Prepare a degassed mixture of acetonitrile, water, and phosphoric acid (4000 : 15 : 2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Test solution—Use the *Assay preparation.*

Resolution solution—Transfer about 1 mg each of USP Fosinopril Sodium RS, USP Fosinopril Related Compound C RS, and USP Fosinopril Related Compound D RS to a 100-mL volumetric flask. Dissolve in and dilute with the *Standard solution* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 25-cm column that contains packing L12. The column temperature is maintained at 45°. The flow rate is about 0.9 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the fosinopril sodium and the fosinopril related compound C peaks is not less than 1.5.

Procedure—Inject about 20 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak areas, carrying out the chromatography to two times the retention time of the fosinopril sodium peak. Calculate the percentages of fosinopril related compounds C and D only by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak of fosinopril related compound C or D, and r_s is the sum of the responses of all the peaks.

TEST 3—

0.2% Phosphoric acid solution—Prepare a 1 in 500 solution of phosphoric acid.

Mobile phase—Prepare a degassed mixture of acetonitrile and *0.2% Phosphoric acid solution* (560 : 440). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—Transfer about 1 mg each of USP Fosinopril Sodium RS, USP Fosinopril Related Compound E RS, and USP Fosinopril Related Compound F RS to a 100-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix.

Test solution—Transfer about 10 mg of Fosinopril Sodium, accurately weighed, to a 50-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 205-nm detector and a 4.6-mm × 25-cm column that contains packing L11. The column temperature is maintained at 45°. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the fosinopril related compound F and the fosinopril sodium peaks is not less than 1.5.

Procedure—Inject about 20 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak areas, carrying out the chromatography to four times the retention time of the fosinopril sodium peak. Calculate the percentages of fosinopril related compounds E and F only by the formula:

$$100(r_i / r_s)$$

in which r_i is the response of the peak of fosinopril related compound E or F, and r_s is the sum of the responses of all the peaks. In addition to not exceeding the limits for impurities in *Table 1,* not more than 0.1% of any other individual impurity is found, and not more than 1.5% of total impurities is found.

~~**Organic volatile impurities,** *Method I*~~ **Residual solvents** ⟨467⟩**:** meets the requirements.

Assay—

Mobile phase—Prepare a degassed mixture of acetonitrile, water, and phosphoric acid (2000 : 10 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—Transfer about 10 mg of USP Fosinopril Sodium RS, and about 1 mg each of USP Fosinopril Related Compound A RS and USP Fosinopril Related Compound B RS to a 100-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix.

Standard preparation—Dissolve an accurately weighed quantity of USP Fosinopril Sodium RS in *Mobile phase* to obtain a solution having a known concentration of about 0.10 mg per mL.

Assay preparation—Transfer about 25 mg of Fosinopril Sodium, accurately weighed, to a 250-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 214-nm detector and a 3.9-mm × 15-cm column that contains packing L3. The column temperature is maintained at 33°. The flow rate is about 1.2 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the fosinopril related compound B and the fosinopril sodium peaks is not less than 2.0; and the relative standard deviation of the fosinopril sodium peak response for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for the major peaks. Calculate the amount, in mg, of $C_{30}H_{45}NNaO_7P$ in the portion of Fosinopril Sodium taken by the formula:

$$250C_S(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Fosinopril Sodium RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard prepapration,* respectively.▲*USP30*

In-Process Revision

BRIEFING

Ganciclovir Oral Solution, page 934 of *PF* 31(3) [May–June 2005]—See briefing under *Acetazolamide Oral Suspension.* Also, the title of the monograph is being changed to Ganciclovir Oral Suspension.

(CRX: C. Okeke) RTS—43131-14

Add the following:

▲Ganciclovir Oral ~~Solution~~ Suspension

» Ganciclovir Oral ~~Solution~~ Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ganciclovir ($C_9H_{13}N_5O_4$). Prepare Ganciclovir Oral ~~Solution,~~ Suspension 100 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Ganciclovir	10 g
~~Vehicle for Oral Solution, *NF* (regular or sugar-free)~~ Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free), and Vehicle for Oral Suspension, *NF* (3 : 1), a sufficient quantity to make . . .	100 mL

If using Capsules, empty the contents of the Capsules into a suitable mortar, or add Ganciclovir powder to the mortar. Add sufficient Vehicle to wet the powder, and work to a smooth paste. Add additional Vehicle to about half the final volume, and transfer the contents of the mortar to a calibrated bottle. Using additional Vehicle, rinse out the mortar, and transfer the contents, stepwise and quantitatively, to bring to final volume, and mix well.

Caution—Avoid skin contact or inhalation of ganciclovir by using protective gloves and a fume hood or surgical mask.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature.

Labeling—Label it to state that it is to be well shaken before use, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Ganciclovir RS.*

pH ⟨791⟩**:** between 4.0 and 5.0.

Beyond-use date: 90 days after the day on which it was compounded.

Assay—

25 mM Monobasic sodium phosphate buffer—Prepare a 25 mM monobasic sodium phosphate solution, and adjust with phosphoric acid to a pH of 2.5.

Mobile phase—Prepare a solution of *25 mM Monobasic sodium phosphate buffer* and acetonitrile (97.5 : 2.5). Filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Sample diluent—Prepare a solution of water, acetonitrile, and methanol (80 : 15 : 5).

Internal standard solution—Prepare a 4 mg per mL aqueous solution of hypoxanthine.

Standard stock preparation—Dissolve an accurately weighed quantity of USP Ganciclovir RS in water to obtain a concentration of about 1.0 mg per mL.

Standard preparation—Transfer an appropriate volume of *Standard stock preparation* to a suitable container, and add an appropriate volume of *Internal standard solution* to obtain a solution having known concentrations of 6 µg per mL and 4 µg per mL, respectively.

Assay preparation—Transfer about 1 mL of Oral ~~Solution~~ Suspension from each bottle to a plastic weighing cup, and weigh to determine density. [NOTE—The exact volume of Oral ~~Solution~~ Suspension taken from each bottle is calculated by the suspension density.] Transfer the suspension to a 100-mL volumetric flask, and add about 50 mL of water. Place the volumetric flask on a mechanical shaker for 30 minutes, and then dilute with water to volume. Transfer 0.6 mL from this solution and 1 mL of the *Internal standard solution* to a 100-mL volumetric flask, and dilute with water to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 10-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are 1.0 for ganciclovir and 0.75 for hypoxanthine; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of ganciclovir ($C_9H_{13}N_5O_4$) in the volume of Oral ~~Solution~~ Suspension taken by the formula:

$$100(C/V)(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Ganciclovir RS in the *Standard preparation; V* is the volume, in mL, of ~~solution~~ Oral Suspension taken; and R_U and R_S are the peak response ratios of the analyte peak to the internal standard peak obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Gemcitabine Hydrochloride, *USP 29* page 990. Because USP Cytosine RS is used in the test for *Chromatographic purity,* it is proposed to add it to the *USP Reference standards* section.

USP Endotoxin RS. USP Gemcitabine Hydrochloride RS.

BRIEFING

Hydroxyzine Hydrochloride, *USP 29* page 1089. USP *p*-Chlorobenzhydrylpiperazine RS has been renamed in the USP Reference Standard Catalog as USP Hydroxyzine Related Compound A RS. It is proposed to revise the monograph to reflect this name change.

(MD-PP: R. Ravichandran) RTS—43699-1

Change to read:

USP Reference standards ⟨11⟩~~— *USP p-Chlorobenzhydrylpiperazine RS.*~~

Change to read:

Chromatographic purity—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and 0.12 N sulfuric acid (90 : 10). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Quantitatively dissolve an accurately weighed quantity of USP Hydroxyzine Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 1.8 µg per mL.

Resolution solution—Dissolve suitable quantities of USP Hydroxyzine Hydrochloride RS and ~~USP *p*-Chlorobenzhydrylpiperazine RS~~

▲USP Hydroxyzine Related Compound A RS▲*USP30*
in *Mobile phase* to obtain a solution containing 3.6 µg of each per mL.

Test solution—Transfer an accurately weighed quantity of Hydroxyzine Hydrochloride to a suitable volumetric flask, dissolve in and dilute with *Mobile phase* to volume to obtain a solution containing a concentration of about 0.6 mg of specimen per mL, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector, and two series-coupled 3-mm × 10-cm columns that contain packing L3. The flow rate is about 0.4 mL per minute. Chromatograph the *Resolution solution* and the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the ~~*p*-chlorobenzhydrylpiperazine~~

▲hydroxyzine related compound A▲*USP30*
and hydroxyzine peaks is not less than 1.2, and the relative standard deviation for replicate injections of the *Standard solution* is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for a total time of not less than 1.8 times the retention time of the hydroxyzine peak, and measure the response for each peak, except for the main hydroxyzine peak in the chromatogram obtained from the *Test solution*. Calculate the apparent percentage of each impurity in the specimen taken by the formula:

$$0.1(C_S / C_U)(r_U / r_S)$$

in which C_S is the concentration, in µg per mL, of USP Hydroxyzine Hydrochloride RS in the *Standard solution;* C_U is the concentration, in mg per mL, of specimen in the *Test solution;* r_U is the peak response of a given impurity in the chromatogram obtained from the *Test solution;* and r_S is the peak response of hydroxyzine in the chromatogram obtained from the *Standard solution:* not more than 0.3% of any impurity is found, and the sum of all impurities found is not greater than 1.5%.

BRIEFING

Iodoform, *USP 29* page 1156. It is proposed to revise the molecular weight of iodoform. The revised value is consistent with that in the *2005 USP Dictionary* and other sources.

(MD-AA: B. Davani) RTS—43193-1

Change to read:

Triiodomethane

▲393.73▲*USP30*
[*75-47-8*].

BRIEFING

Irbesartan, *USP 29* page 1177. It is proposed to correct the column designation used in the test for *Limit of azide.* The test was validated with the IonPac AS10 brand of L31 column.

(BPC: M. Marques) RTS—43230-1

Change to read:

Limit of azide—

Mobile phase—Prepare a filtered and degassed 0.1 N sodium hydroxide solution (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Transfer about 25 mg of sodium azide, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Pipet 250 µL of this solution into a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. This solution contains about 0.312 µg of sodium azide per mL.

Test solution—Transfer about 100 mg of Irbesartan, accurately weighed, to a 5-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a conductimetric detector and a 4.0-mm × 25-cm column that contains packing ~~L46~~

▲L31.▲*USP30*
The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio for the azide peak is not less than 10.

Procedure—Separately inject equal volumes (about 200 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas for azide. Calculate the amount of azide, in ppm, in the portion of Irbesartan taken by the formula:

$$1000(C_S / C_T)(42.02/65.01)(r_U / r_S)$$

in which C_S is the concentration, in µg per mL, of sodium azide in the *Standard solution;* C_T is the concentration, in mg per mL, of Irbesartan in the *Test solution;* r_U is the peak area for azide obtained from the *Test solution;* and r_S is the peak area for azide obtained from the *Standard solution:* not more than 10 ppm of azide is found.

BRIEFING

Labetalol Hydrochloride Oral Solution—See briefing under *Acetazolamide Oral Solution.*

(CRX: C. Okeke) RTS—42993-9

Add the following:

▲Labetalol Hydrochloride Oral Solution

» Labetalol Hydrochloride Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of labetalol hydrochloride ($C_{19}H_{24}N_2O_3 \cdot HCl$). Prepare Labetalol Hydrochloride Oral Solution 40 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩. See also *Labetalol Hydrochloride Oral Suspension*):

Labetalol Hydrochloride powder . . .	4 g
Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

Dissolve Labetalol Hydrochloride powder in about 20 mL of Cherry Syrup in a mortar, and mix to a uniform paste. Add the Cherry Syrup in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough Cherry Syrup to bring to final volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature, or in a cold place.

Labeling—Label it to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Labetalol Hydrochloride RS.*

pH ⟨791⟩**:** between 3.0 and 4.0.

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a suitable filtered and degassed mixture of 0.1 M monobasic sodium phosphate and methanol (65 : 35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve USP Labetalol Hydrochloride RS in water to obtain a solution having a known concentration of 400 µg per mL.

Assay preparation—Agitate the container of Oral Solution for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix on a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.3 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 7.5 minutes, and the relative standard deviation for replicate injections is not more than 1.6%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of labetalol hydrochloride ($C_{19}H_{24}N_2O_3 \cdot HCl$) in the volume of Oral Solution taken by the formula:

$$100(C/V)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Labetalol Hydrochloride RS in the *Standard preparation; V* is the volume, in mL, of Oral Solution taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Labetalol Hydrochloride Oral Suspension, page 937 of *PF* 31(3) [May–June 2005]—See briefing under *Acetazolamide Oral Suspension.*

(CRX: C. Okeke) RTS—43131-16

Add the following:

▲Labetalol Hydrochloride Oral Suspension

» Labetalol Hydrochloride Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of labetalol hydrochloride ($C_{19}H_{24}N_2O_3 \cdot HCl$). Prepare Labetalol Hydrochloride Oral Suspension 40 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩. See also *Labetalol Hydrochloride Oral Solution*):

Labetalol Hydrochloride	4 g
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free), and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

NOTE—~~If Cherry Syrup, *NF* is used, it becomes a solution.~~ If Tablets are used instead of bulk powder, the preparation becomes a suspension and should be labeled as such.

If using Tablets, place the Labetalol Hydrochloride Tablets in a suitable mortar. Comminute the Tablets to a fine powder or add Labetalol Hydrochloride powder. Add about 20 mL of the Vehicle, and mix to a uniform paste. Add the Vehicle in small portions almost to volume. Transfer the contents of the mortar, stepwise and quantitatively, to

In-Process Revision

a calibrated bottle. Add the Vehicle in portions to rinse the mortar, combine with the final preparation to final volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken, and to state the beyond-use date.

USP Reference standards ⟨11⟩—*USP Labetalol Hydrochloride RS.*

pH ⟨791⟩**:** between 4.0 and 5.0 (Vehicle for Oral Solution and Vehicle for Oral Suspension), and between 3.0 and 4.0 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a suitable filtered and degassed mixture of 0.1 M monobasic sodium phosphate and methanol (65 : 35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve USP Labetolol Hydrochloride RS in water to obtain a solution having a known concentration of 400 µg per mL.

Assay preparation—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.3 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 7.5 minutes, and the relative standard deviation for replicate injections is not more than 1.6%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of labetalol hydrochloride ($C_{19}H_{24}N_2O_3 \cdot HCl$) in the volume of Oral Suspension taken by the formula:

$$100(C/V)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Labetalol RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Lovastatin, *USP 29* page 1281. In the *Assay,* it is proposed to clarify the preparation of the *Mobile phase.*

(MD-GRE: E. Gonikberg) RTS—43273-1

Change to read:

Assay—

▲*Dilute phosphoric acid*—Transfer 1 mL of phosphoric acid to a 1-L volumetric flask, and dilute with water to volume.▲*USP30*

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and ~~0.1% phosphoric acid solution (65 : 35).~~

In-Process Revision

▲*Dilute phosphoric acid* (65 : 35).▲*USP30*
Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Lovastatin RS in acetonitrile to obtain a solution having a known concentration of about 0.3 mg per mL.

Assay preparation—Transfer about 30 mg of Lovastatin, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 238-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 1.4, and the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{24}H_{36}O_5$ in the portion of Lovastatin taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Lovastatin RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Mebendazole Oral Suspension, *USP 29* page 1316. USP acknowledges that Mebendazole Oral Suspension is approved in several countries for human use. It is proposed to change the specified labeling requirements so that manufacturers can use the USP Mebendazole Oral Suspension monograph for these drug products.

(VET: I. DeVeau) RTS—43400-2

Change to read:

Labeling—~~Label~~

▲For products marketed in the United States, label▲*USP30* it to indicate that it is for veterinary use only.

BRIEFING

Metolazone Oral Suspension, page 940 of *PF* 31(3) [May–June 2005]—See briefing under *Acetazolamide Oral Suspension.*

(CRX: C. Okeke) RTS—43131-17

Add the following:

▲Metolazone Oral Suspension

» Metolazone Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of metolazone ($C_{16}H_{16}ClN_3O_3S$). Prepare Metolazone Oral Suspension 1 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Metolazone	100 mg
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free), and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

NOTE—~~If Cherry Syrup, *NF* is used, it becomes a solution.~~ If Tablets are used instead of bulk powder, the preparation becomes a suspension and should be labeled as such.

If using Tablets, place the Metolazone Tablets in a suitable mortar, and comminute to a fine powder, or add Metolazone powder to the mortar. Add

In-Process Revision

about 20 mL of the Vehicle, and mix to a uniform paste. Add the Vehicle in small portions, and transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add sufficient Vehicle in portions to rinse the mortar, add sufficient Vehicle to final volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken, and to state the beyond-use date.

USP Reference standards ⟨11⟩—*USP Metolazone RS.*

pH ⟨791⟩**:** between 3.6 and 4.6 (Vehicle for Oral Solution and Vehicle for Oral Suspension) and between 2.5 and 3.3 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a suitable filtered and degassed mixture of 700 mL of methanol, 300 mL of 1.5 g ammonium acetate, and 1 mL of diisopropylamine. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve USP Metolazone RS in water to obtain a solution having a known concentration of 1.0 µg per mL.

Assay preparation—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample into a 1000-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 20-cm analytical column that contains 5-µm packing L3. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time for metolazone is about 6.0 minutes, and the relative standard deviation for replicate injections is not more than 2.2%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of metolazone ($C_{16}H_{16}ClN_3O_3S$) in the volume of Oral Suspension taken by the formula:

$$1000(C/V)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Metolazone RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

In-Process Revision

BRIEFING

Metoprolol Tartrate Oral Solution—See briefing under *Acetazolamide Oral Solution.*

(CRX: C. Okeke) RTS—42993-10

Add the following:

▲Metoprolol Tartrate Oral Solution

» Metoprolol Tartrate Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of metoprolol tartrate [$(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6$]. Prepare Metoprolol Tartrate Oral Solution 10 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩. See also *Metoprolol Tartrate Oral Suspension*):

Metoprolol Tartrate powder	1 g
Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

Dissolve Metoprolol Tartrate powder in Cherry Syrup in a mortar, and mix to a uniform paste. Add the Cherry Syrup in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough Cherry Syrup to bring to final volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature, or under refrigeration.

Labeling—Label it to state that it is to be well shaken, and to state the beyond-use date.

USP Reference standards ⟨11⟩—*USP Metoprolol Tartrate RS.*

pH ⟨791⟩**:** between 3.0 and 3.8.

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a suitable filtered and degassed solution by dissolving 961 mg of 1-pentanesulfonic acid sodium salt, monohydrate, and 82 mg of anhydrous sodium acetate in a mixture of 550 mL of methanol, 470 mL of water, and 0.57 mL of glacial acetic acid. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve USP Metoprolol Tartrate RS in water to obtain a solution having a known concentration of 100 µg per mL.

Assay preparation—Agitate the container of Oral Solution for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix on a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time

for metoprolol tartrate is about 7.3 minutes; and the relative standard deviation for replicate injections is not more than 1.3%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of metoprolol tartrate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6]$ in the volume of Oral Solution taken by the formula:

$$100(C/V)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Metoprolol Tartrate RS in the *Standard preparation; V* is the volume, in mL, of Oral Solution taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

Add the following:

▲Metoprolol Tartrate Oral Suspension

» Metoprolol Tartrate Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of Metoprolol Tartrate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6)]$. Prepare Metoprolol Tartrate Oral Suspension 10 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩. See also *Metoprolol Tartrate Oral Solution*):

Metoprolol Tartrate	1 g
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free), and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

NOTE— ~~If Cherry Syrup, *NF* is used, it becomes a solution.~~ If Tablets are used instead of bulk powder, the preparation becomes a suspension and should be labeled as such.

If using Tablets, place the Metoprolol Tartrate Tablets in a suitable mortar, and comminute the Tablets, or add Metoprolol Tartrate powder. Add the Vehicle in small portions, and mix well. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add the Vehicle in portions to rinse the mortar. Add to the preparation to final volume, and mix well.

In-Process Revision

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature, or under refrigeration.

Labeling—Label it to state that it is to be well shaken, and to state the beyond-use date.

USP Reference standards ⟨11⟩—*USP Metoprolol Tartrate RS.*

pH ⟨791⟩**:** between 3.6 and 4.6 (Vehicle for Oral Solution and Vehicle for Oral Suspension) and between 3.0 and 3.8 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a suitable filtered and degassed solution by dissolving 961 mg of 1-pentanesulfonic acid sodium salt, monohydrate, and 82 mg of anhydrous sodium acetate in a mixture of 550 mL of methanol, 470 mL of water, and 0.57 mL of glacial acetic acid. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve USP Metoprolol Tartrate RS in water to obtain a solution having a known concentration of 100 µg per mL.

Assay preparation—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample solution into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time for metoprolol tartrate is about 7.3 minutes; and the relative standard deviation for replicate injections is not more than 1.3%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of metoprolol tartrate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6]$ in the volume of Oral Suspension taken by the formula:

$$100(C/V)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Metoprolol Tartrate RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Miconazole Nitrate Cream, *USP 29* page 1435. It is proposed to replace the present *Identification* test with one that contains HPLC retention time agreement between the major peak in the *Assay preparation* and in the *Standard preparation*. The stock solution used in the current *Identification* test is based on the previous GC assay for this monograph published in *USP 27*. This proposed revision eliminates the need for extensive sample preparation, including the use of chloroform. The proposed revision is also consistent with current pharmaceutical industry practice.

(MD-AA: B. Davani) RTS—43705-1

In-Process Revision

Change to read:

Identification~~— Place about 25 mL of the stock solution, prepared as directed in the *Assay*, in a 50-mL beaker, and evaporate on a steam bath with the aid of a current of filtered air to dryness. Dry the residue at 105° for 10 minutes: the IR absorption spectrum of a potassium bromide dispersion of it so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Miconazole Nitrate RS~~

▲The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*▲*USP30*

BRIEFING

Morphine Sulfate Extended-Release Capsules, *USP 29* page 1459 and page 1822 of *PF* 28(6) [Nov.–Dec. 2002]. On the basis of comments received, additional information has been included in the proposed *Packaging and storage* section of the monograph.

(MD-CCA: C. Anthony; D. Hunt) RTS—43626-1

Add the following:

▲**Packaging and storage**—Preserve in tight, ~~containers~~ light-resistant containers, and store at controlled room temperature.▲*USP30*

BRIEFING

Naproxen Delayed-Release Tablets, *USP 29* page 1484 and page 1264 of *PF* 30(4) [July–Aug. 2004]. On the basis of comments received, it is proposed to add a *Packaging and storage* statement.

(MD-CCA: C. Anthony; P&S: D. Hunt) RTS—43632-1

Add the following:

▲**Packaging and storage**—Preserve in well-closed containers, and store at controlled room temperature.▲*USP30*

BRIEFING

Narasin Granular, *USP 29* page 1486; **Narasin Premix,** *USP 29* page 1487. On the basis of comments received regarding the potency of the candidate narasin reference standard, it is proposed to change the values of the specified biopotency conversion factors in the *Assay.* Additional changes are being made for clarification.

Assay—

Diluent—Prepare a mixture of methanol and water (9 : 1).

Mobile phase—Prepare a degassed mixture of methanol, water, and glacial acetic acid (94 : 6 : 0.1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Neutralized methanol—Add 1 g of sodium bicarbonate to 4 L of methanol, mix, and filter.

Derivatizing reagent—Dissolve 30 g of vanillin in a mixture of methanol and sulfuric acid (950 : 20) in a container protected from light. *[Caution—To avoid splattering, add the sulfuric acid carefully and slowly with a pipet; do not pour. Allow the mixture of methanol and sulfuric acid to cool before adding the vanillin.]* Do not filter.

Resolution solution—Prepare a solution in *Neutralized methanol* containing about 3 mg of USP Narasin RS and 1 mg of USP Monensin Sodium RS per mL. Transfer 2 mL of this solution to a 200-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Standard preparations—Dissolve an accurately weighed quantity of USP Narasin RS in *Neutralized methanol* to obtain a solution having a known concentration of about 1 mg per mL. Transfer 1.0 mL of this stock solution to a 200-mL volumetric flask, and transfer 2.0 mL and 4.0 mL of the stock solution to two separate 100-mL volumetric flasks, dilute each with *Diluent* to volume, and mix. These solutions contain about 5, 20, and 40 µg of USP Narasin RS per mL. Using the designated percentage of narasin A in the USP Narasin RS, calculate the exact narasin A concentration, in µg per mL, in each of the *Standard preparations.*

Assay preparation—Transfer about 5 g of Narasin Granular, accurately weighed, to a suitable container, add 200.0 mL of *Diluent,* and shake by mechanical means for 1 hour. Allow the solids to settle, and quantitatively dilute an accurately measured volume of the supernatant with *Diluent* to obtain a solution containing about 20 µg of narasin per mL. Pass a portion of this solution through a filter having a 0.5-µm or finer porosity, and use the filtrate as the *Assay preparation*.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 4.6-mm × 25-cm column that contains packing L1. The column outlet is attached to a tee, the opposing arm is attached to a tube from which is pumped the *Derivatizing reagent,* and the outlet is connected to a 2-mL postcolumn reaction coil maintained at 98°. The outlet of the reaction coil is connected to a detector set at 520 nm. The *Mobile phase* and the *Derivatizing reagent* flow at the rate of about 0.7 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.7 for monensin B, 0.75 for monensin A, 1.0 for narasin A, and 1.1 for narasin D + I; and the resolution, *R,* between the monensin B peak and the monensin A peak is not less than 1.25, and between the monensin A peak and the narasin A peak not less than 3.5. Chromatograph the *Standard preparations,* and record the peak responses as directed for *Procedure:* the tailing factor for the narasin A peak is not more than 1.4 when calculated by the formula:

$$W_{0.1} / 2f$$

in which $W_{0.1}$ is the width of the peak at 10% of peak height; and f is the distance from the peak maximum to the leading edge of the peak, the distance being measured at a point on the baseline at which 10% peak height is reached. The relative standard deviation for replicate injections is not more than 10%. [NOTE—After use, flush the system with methanol.]

Procedure—Separately inject equal volumes (about 200 µL) of the *Standard preparations* and the *Assay preparation* into the chromatograph, and measure the areas of the peak responses for the narasin A and narasin D + I peaks ▲[NOTE—Narasin D and narasin I will co-elute under this chromatographic system.]▲*USP30*

Plot the three narasin peak responses in the chromatograms obtained from the *Standard preparations* versus the concentration, in µg per mL, of narasin A, and draw the straight line best fitting the three plotted points. From the graph so obtained, and the narasin A peak response in the chromatogram obtained from the *Assay preparation,* determine the concentration, C_A, in µg per mL, of narasin A in the *Assay preparation.* From the same graph and the narasin D + I peak response in the chromatogram obtained from the *Assay preparation,* determine the concentration, C_{D+I}, in µg per mL, of narasin D + I in the *Assay preparation.* Calculate the biopotency, in mg per g, in the portion of Narasin Granular taken by the formula:

~~$(C_A + C_{D+I}F)(VE/M)$~~

▲$(0.001)(C_AF_A + C_{D+I}F_{D+I})(VE/M)$▲*USP30*

in which ~~*F* is the biopotency conversion factor for narasin D + I~~ ▲F_A is 1.077 representing the biopotency conversion factor for narasin A; F_{D+I} is the biopotency conversion factor for narasin D + I;▲*USP30*

V is the extraction volume, in mL; E is the dilution factor used in diluting the extract to the final estimated concentration of 20 µg per mL; and M is the weight, in g, of Narasin Granular taken to prepare the *Assay preparation.* Calculate the bioconversion factor, ~~*F*~~ ▲F_{D+I},▲*USP30* for narasin D + I by the formula:

~~$(1.402D + 0.0111I)/(D + I)$~~

▲$(1.510D + 0.012I)/(D + I)$▲*USP30*

in which D and I are the specified percentages of narasin D and narasin I, respectively, in USP Narasin RS; ~~1.402~~ ▲1.510▲*USP30* is the factor for converting narasin D to narasin D biopotency; and ~~0.0111~~ ▲0.012▲*USP30* is the factor for converting narasin I to narasin I biopotency.

In-Process Revision

BRIEFING

Narasin Premix, *USP 29* page 1487—See briefing under *Narasin Granular.*

(VET: I. DeVeau) RTS—43506-1

Change to read:

Assay—

Diluent, Mobile phase, Neutralized methanol, Derivatizing reagent, Resolution solution, Standard preparations, and *Chromatographic system*—Proceed as directed in the *Assay* under *Narasin Granular.*

Assay preparation—Transfer about 5 g of Narasin Premix, accurately weighed, to a suitable container, add 200.0 mL of *Diluent,* and shake by mechanical means for 1 hour. Allow the solids to settle, and quantitatively dilute an accurately measured volume of the supernatant with *Diluent* to obtain a solution containing about 20 µg of narasin per mL. Pass a portion of this solution through a filter having a 0.5-µm or finer porosity, and use the filtrate as the *Assay preparation*.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Narasin Granular*. Calculate the biopotency, in mg per g, in the portion of Narasin Premix taken by the formula:

~~$(C_A F_A + C_{D+I} F)(VE/M)$~~

$$\blacktriangle(0.001)(C_A F_A + C_{D+I} F_{D+I})(VE/M)_{\blacktriangle USP30}$$

in which *M* is the weight, in g, of Narasin Premix taken to prepare the *Assay preparation;* and the other terms are as defined therein.

BRIEFING

Ondansetron Hydrochloride, *USP 29* page 1582. The test for *Limit of ondansetron related compound D* and the *Assay* use a 20-cm long L10 column, as well as the test for *Chromatographic purity, Method II* by cross reference. Because the 20-cm column is not commercially available, it is proposed to change the column length to 25 cm.

(MD-PP: R. Ravichandran) RTS—43547-1

Change to read:

Limit of ondansetron related compound D—

Mobile phase—Prepare a filtered and degassed mixture of 0.02 M monobasic potassium phosphate (previously adjusted with 1 M sodium hydroxide to a pH of 5.4) and acetonitrile (80 : 20). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Ondansetron Related Compound D RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.4 µg per mL.

System suitability solution—Dissolve suitable quantities of USP Ondansetron Related Compound D RS and USP Ondansetron Related Compound C RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a concentration of about 0.6 µg per mL and 1 µg per mL, respectively.

Test solution—Transfer about 50 mg of Ondansetron Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 328-nm detector and a 4.6-mm × ~~20-cm~~ ▲25-cm▲*USP30* column that contains packing L10. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.8 for ondansetron related compound C and 1.0 for ondansetron related compound D; and the resolution, *R,* between ondansetron related compound C and ondansetron related compound D is not less than 1.5. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency determined from the analyte peak is not less than 400 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of ondansetron related compound D in the portion of Ondansetron Hydrochloride taken by the formula:

$$10{,}000(C/W)(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Ondansetron Related Compound D RS in the *Standard solution; W* is the weight, in mg, of Ondansetron Hydrochloride taken to prepare the *Test solution;* and r_U and r_S are the peak areas obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.10% is found.

Change to read:

Assay—

Mobile phase—Prepare a filtered and degassed mixture of 0.02 M monobasic sodium phosphate (previously adjusted with 1 M sodium hydroxide to a pH of 5.4) and acetonitrile (50 : 50). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Ondansetron Hydrochloride RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 90 µg per mL.

In-Process Revision

System suitability solution—Dissolve suitable quantities of USP Ondansetron Hydrochloride RS and USP Ondansetron Related Compound A RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution containing about 90 µg per mL and 20 µg per mL, respectively.

Assay preparation—Transfer about 45 mg of Ondansetron Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Pipet 5.0 mL of this solution into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 216-nm detector and a 4.6-mm × ~~20-cm~~ ▲25-cm▲*USP30* column that contains packing L10. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.0 for ondansetron and 1.1 for ondansetron related compound A; and the resolution, *R,* between ondansetron related compound A and ondansetron is not less than 1.5. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{18}H_{19}N_3O \cdot HCl$ in the portion of Ondansetron Hydrochloride taken by the formula:

$$500C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Ondansetron Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Ondansetron Hydrochloride Oral Suspension, page 944 of *PF* 31(3) [May–June 2005]—See briefing under *Acetazolamide Oral Suspension.*

(CRX: C. Okeke) RTS—43131-20

Add the following:

▲Ondansetron Hydrochloride Oral Suspension

» Ondansetron Hydrochloride Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ondansetron hydrochloride ($C_{18}H_{19}N_3O \cdot HCl \cdot 2H_2O$). Prepare Ondansetron Hydrochloride Oral Suspension 0.8 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Ondansetron Hydrochloride	80 mg
Vehicle: a mixture of Vehicle for Oral Suspension, *NF,* Vehicle for Oral Solution, *NF* (regular or sugar-free) (1 : 1), or Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

NOTE— ~~If Cherry Syrup, *NF* is used, it becomes a solution.~~ If Tablets are used instead of bulk powder, the preparation becomes a suspension and should be labeled as such.

If using Tablets, place the Tablets in a suitable glass mortar, and comminute well, or add Ondansetron Hydrochloride powder. Add the mixed Vehicle ~~for Oral Suspension~~ in 5-mL portions, and mix well. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add the mixed Vehicle ~~for Oral Suspension~~ in small portions to rinse the mortar, add to the preparation

In-Process Revision

to final volume, and mix well. If using Cherry Syrup, repeat as above, replacing the mixed Vehicle ~~for Oral Suspension~~ with Cherry Syrup.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken before use, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Ondansetron Hydrochloride RS.*

pH ⟨791⟩**:** between 3.6 and 4.6 (Vehicle for Oral Solution and Vehicle for Oral Suspension), and between 3.0 and 4.0 (Cherry Syrup).

Beyond-use date: 42 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a filtered and degassed solution of 43 mM monobasic potassium phosphate buffer adjusted with a mixture of 1 N sodium hydroxide and acetonitrile (85 : 15) to a pH of 5.4. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Ondansetron Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 4 µg per mL.

Assay preparation—After each amber plastic vial containing Oral Suspension that is stored at 4° is brought to room temperature, pipet 500 µL of Oral Suspension from each bottle into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume. Pass through a 0.45-µm filter, and keep frozen at –70° until assayed.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 216-nm detector, a 3.9-mm × 20-mm guard column that contains 4-µm packing L10, and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L10. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 30 minutes for ondansetron hydrochloride; and the relative standard deviation for replicate injections is not more than 1.6%.

Procedure—Separately inject equal volumes (about 80 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of ondansetron hydrochloride ($C_{18}H_{19}N_3O \cdot HCl \cdot 2H_2O$) in the volume of Oral Suspension taken by the formula:

$$200(C/V)(r_U / r_S)$$

in which C is the concentration, in µg per mL, of USP Ondansetron Hydrochloride RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Ondansetron Oral Solution, *USP 29* page 1585 and page 905 of *PF* 30(3) [May–June 2004]. It is proposed to revise the column length in the test for *Limit of related compound D* from 30 cm to 25 cm because the 30-cm column is no longer available. The analysis can be performed with the L10 type Spherisorb brand CN column. It is also proposed to correct the calculation of impurities using relative response factors (RRF) in the test for *Related compounds* and to add a table with information regarding impurities.

(MD-PP: R. Ravichandran) RTS—43208-1

In-Process Revision

Add the following:

■**Packaging and storage**—Preserve in well-closed, light-resistant containers.■2S *(USP29)*

Change to read:

Limit of ondansetron related compound D—

Mobile phase—Proceed as directed in the test for *Limit of ondansetron related compound D* under *Ondansetron Hydrochloride*.

System suitability solution—Dissolve suitable quantities of USP Ondansetron Related Compound D RS and USP Ondansetron Related Compound C RS in *Mobile phase;* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution containing about 0.5 µg per mL and 2 µg per mL, respectively.

Standard solution—Dissolve an accurately weighed quantity of USP Ondansetron Related Compound D RS in *Mobile phase;* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.5 µg per mL.

Test solution—Quantitatively dilute, if necessary, an accurately measured volume of Oral Solution with *Mobile phase* to obtain a solution containing about 0.8 mg of ondansetron per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 328-nm detector and a 4.6-mm × ~~30-cm~~

▲25-cm▲*USP30*
column that contains packing L10. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between ondansetron related compound D and ondansetron related compound C is not less than 2.0; the tailing factor for ondansetron related compound D is not more than 2.0; and the relative standard deviation for replicate injections is not more than 4.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of ondansetron related compound D in the volume of Oral Solution taken by the formula:

$$100D(C_S/C_A)(r_U/r_S)$$

in which D is the dilution factor for the Oral Solution in the *Test solution;* C_S is the concentration, in µg per mL, of USP Ondansetron Related Compound D RS in the *Standard solution;* C_A is the concentration, in µg per mL, of ondansetron in the Oral Solution, as determined in the *Assay;* and r_U and r_S are the peak responses of ondansetron related compound D obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.1% is found.

BRIEFING

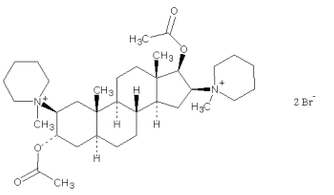
Pancuronium Bromide. Because there is no existing *USP* monograph for this drug substance, a new monograph is being proposed.

(MD-PS: D. Bempong) RTS—41982-1

Add the following:

▲Pancuronium Bromide



$C_{35}H_{60}Br_2N_2O_4$ 732.67

Piperidinium, 1,1′-[(2*β*,3α,5α,16*β*,17*β*)-3,17-bis(acetyloxy)androstane-2,16-diyl]bis[1-methyl]-, dibromide.

1,1′-(3α,17*β*-Dihydroxy-5α-androstan-2*β*,16*β*-ylene)bis[1-methylpiperidinium] dibromide diacetate.

2*β*,16*β*-Dipiperidino-5α-androstane-3α,17*β*-diol diacetate dimethobromide [*15500-66-0*].

» Pancuronium Bromide contains not less than 98.0 percent and not more than 102.0 percent of $C_{35}H_{60}Br_2N_2O_4$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight containers, protected from light and moisture. Store between 15° and 25°.

USP Reference standards ⟨11⟩—*USP Pancuronium Bromide RS. USP Vecuronium Bromide RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The R_F value of the principal spot in the chromatogram of the *Test solution* corresponds to that of the chromatogram of *Standard solution 2,* as obtained in the test for *Related compounds.*

C: A solution (1 in 10) meets the requirements of the tests for *Bromide* ⟨191⟩.

In-Process Revision

Clarity of solution—

Hydrazine sulfate solution—Transfer 1.0 g of hydrazine sulfate to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Allow to stand for 4 to 6 hours before use.

Methenamine solution—Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension—[NOTE—This suspension is stable for two months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.] Transfer 25.0 mL of *Hydrazine sulfate solution* to the *Methenamine solution* in the 100-mL glass-stoppered flask. Mix, and allow to stand for 24 hours.

Opalescence standard—[NOTE—This suspension should not be used beyond 24 hours after preparation.] Transfer 15.0 mL of the *Primary opalescent suspension* to a 1000-mL volumetric flask, dilute with water to volume, and mix.

Reference suspensions—Transfer 5.0 mL of the *Opalescence standard* to a 100-mL volumetric flask, dilute with water to volume, and mix to obtain *Reference suspension A*. Transfer 10.0 mL of the *Opalescence standard* to a second 100-mL volumetric flask, dilute with water to volume, and mix to obtain *Reference suspension B*.

Test solution—Dissolve 50 mg of Pancuronium Bromide in about 20 mL of water, dilute with water to 25 mL, and mix.

Procedure—Transfer a sufficient portion of the *Test solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 to 25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Reference suspension A, Reference suspension B,* and water to separate matching test tubes. Compare the *Test solution, Reference suspension A, Reference suspension B,* and water in diffused daylight, viewing vertically against a black background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). [NOTE—The diffusion of light must be such that *Reference suspension A* can readily be distinguished from water, and *Reference suspension B* can readily be distinguished from *Reference suspension A*.] The *Test solution* shows the same or more clarity than *Reference suspension A*.

Color of solution—

Standard stock solution—Prepare a solution of ferric chloride CS, cobaltous chloride CS, cupric sulfate CS, and a 10 g per L hydrochloric acid solution (3 : 3 : 2.4 : 1.6).

Standard solution—[NOTE—Prepare this solution just before use.] Transfer 1 mL of *Standard stock solution* to a 100-mL volumetric flask, dilute with hydrochloric acid (10 g per L) solution to volume, and mix.

Test solution—Use the *Test solution* prepared as directed in the test for *Clarity of solution*.

Procedure—Transfer a sufficient portion of the *Test solution* to a test tube of colorless, transparent, neutral glass with a flat base and an external diameter of 15 to 25 mm to obtain a depth of 40 mm. Similarly transfer a portion of the *Standard solution* and water to separate matching test tubes. Compare the *Test solution,* (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩): the *Test solution* is not more intensely colored than the *Standard solution* or water.

Specific rotation ⟨781S⟩**:** between +39° and +43°.

Test solution: 30 mg per mL, in water.

Water, *Method I* ⟨921⟩**:** not more than 8.0%.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Related compounds—

Adsorbent: 0.2-mm layer of chromatographic silica gel mixture.

In-Process Revision

Test solution—Prepare a solution of Pancuronium Bromide in methylene chloride containing 10 mg per mL.

Diluted test solution—Dilute 1.0 mL of the *Test solution* with methylene chloride to 50 mL, and mix. Dilute 1.0 mL of the resulting solution with methylene chloride to 20 mL, and mix.

Standard solution 1—Prepare a solution in methylene chloride containing 0.1 mg of USP Vecuronium Bromide RS and 10 mg of USP Pancuronium Bromide RS per mL.

Standard solution 2—Prepare a solution of USP Pancuronium Bromide RS in methylene chloride containing 10 mg per mL.

Developing solvent system: a mixture of isopropyl alcohol, acetonitrile, and a 400 g per L solution of sodium iodide (85 : 10 : 5).

Procedure—Apply separate 5-µL portions of the *Test solution, Diluted test solution, Standard solution 1,* and *Standard solution 2* to a suitable thin-layer chromatographic plate (see *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩). Spray the plate with a 20 g per L solution of sodium nitrate, and allow to dry for 5 minutes. Spray the plate with Dragendorff's TS, and cover the plate with a transparent glass cover. Any spot in the chromatogram obtained from the *Test solution* due to vecuronium bromide is not more intense than the corresponding spot in the chromatogram obtained from *Standard solution 1:* equivalent to not more than 1.0% of vecuronium bromide. Any other spot in the chromatogram obtained from the *Test solution,* except for the principal spot and any spot due to vecuronium bromide, is not more intense than the spot in the chromatogram obtained from the *Diluted test solution:* equivalent to not more than 0.1% of any individual impurity. In a valid test, the chromatogram obtained from *Standard solution 1* shows two clearly separated spots. The R_F values for pancuronium bromide and vancuronium bromide are about 0.5 and 0.64, respectively.

Assay—Transfer about 200 mg of Pancuronium Bromide, accurately weighed, to a 100-mL beaker, and dissolve by stirring in 50 mL of acetic anhydride. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N perchloric acid is equivalent to 36.63 mg of $C_{35}H_{60}Br_2N_2O_4$. ▲*USP30*

BRIEFING

Paricalcitol, *USP 29* page 1640. On the basis of comments received, it is proposed to revise *Identification* test *B* by replacing the test for *Ultraviolet Absorption* ⟨197U⟩ with HPLC retention time agreement of the major peak in the *Assay preparation* and the *Standard preparation.* The proposed revision is consistent with current pharmaceutical industry practice. In the test for *Chromatographic purity* and in the *Assay,* it is proposed to specify the final concentrations of the solutions, and to change the format of the formulas, as recommended in the *Stimuli* article, "Common Pharmacopeial Calculations in USP Monographs," published on page 626 of *PF* 31(2) [Mar.–Apr. 2005]. Finally, in the test for *Chromatographic purity* and the *Assay,* it is proposed to add a *Note* to use low-actinic glassware.

(MD-GRE: E. Gonikberg) RTS—43700-1

In-Process Revision

Change to read:

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: ~~—*Ultraviolet Absorption* ⟨197U⟩~~

~~*Solution:* 5 µg per mL.~~

~~*Medium:* dehydrated alcohol.~~

~~*Ratios:* A_{242}/A_{264}, between 0.80 and 0.86; and A_{264}/A_{244}, between 0.63 and 0.69.~~

▲The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.* ▲*USP30*

Change to read:

Chromatographic purity—

▲[NOTE—Use low-actinic glassware to prepare solutions of Paricalcitol.]▲*USP30*

Diluent—Prepare a mixture of water and dehydrated alcohol (1 : 1).

Butylparaben solution—Transfer about 25 mg of butylparaben to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Solution A—Use filtered and degassed water.

Solution B—Use filtered and degassed acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B,* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dilute USP Paricalcitol Solution RS in *Diluent* to a known concentration of about 0.1 µg of paricalcitol per mL.

Control standard solution—Transfer 3.0 mL of the *Standard solution* to a 10.0-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Test stock solution—~~Transfer about 10 mg of Paricalcitol, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with dehydrated alcohol to volume, and mix.~~

▲Prepare a solution of Paricalcitol in dehydrated alcohol, having a known concentration of about 200 µg per mL.▲*USP30*

Resolution solution—Transfer 1 mL of the *Butylparaben solution* and 1 mL of the *Test stock solution* to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. Transfer 1 mL of this solution to a 10-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Test solution—Prepare a mixture of the *Test stock solution* and water (1 : 1).

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 252-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 2 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–10	95	5	isocratic
10–30	95→45	5→55	linear gradient
30–40	45	55	isocratic
40–45	45→0	55→100	linear gradient
45–50	0	100	isocratic

Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between paricalcitol and butylparaben is not less than 12.0. Chromatograph the *Standard solution* and the *Control standard solution,* and record the peak responses as directed for *Procedure:* the area ratio for the paricalcitol peak from the *Standard solution* to that from the *Control standard solution* is between 1.8 and 4.0; and the relative standard deviation for replicate injections of the *Standard solution* is not more than 10.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Diluent,* the *Standard solution,* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses, disregarding any peaks corresponding to those obtained from the *Diluent.* Calculate the percentage of each impurity in the portion of Paricalcitol taken by the formula:

~~$10(C/W)(r_i/r_s)$~~

~~in which C is the concentration, in µg per mL, of USP Paricalcitol RS in the *Standard solution; W* is the weight, in mg, of Paricalcitol taken to prepare the *Test stock solution;*~~

▲$100(C_S / C_U)(r_i / r_S)$

in which C_S and C_U are the concentrations, in µg per mL, of paricalcitol in the *Standard solution* and the *Test solution,* respectively;▲*USP30*
r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the paricalcitol peak response obtained from the *Standard solution:* not more than 0.1% of any individual impurity is found; and not more than 0.5% of total impurities is found.

BRIEFING

Piroxicam Cream. Because there is no existing *USP* monograph for this dosage form, a new monograph is being proposed.

(CRX: C. Okeke) RTS—43150-2

In-Process Revision

Add the following:

▲Piroxicam Cream

» Piroxicam Cream contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of piroxicam ($C_{15}H_{13}N_3O_4S$). Prepare Piroxicam Cream as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

White Petrolatum	25 g
Stearyl Alcohol	15 g
Propylparaben	0.06 g
Methylparaben	0.15 g
Propylene Glycol	12.0 g
Sodium Lauryl Sulfate	1 g
Sodium Hydroxide 1 M	2.5 mL
Piroxicam	3 g
Purified Water, a sufficient quantity to make	100 g

In an appropriate container (final weight tared), mix the White Petrolatum and Stearyl Alcohol together, and heat to 80 ± 5° to form a clear oil phase. In a separate container, mix the Propylparaben, Methylparaben, Propylene Glycol, Sodium Lauryl Sulfate, and about 30 mL of Purified Water together, and heat to 80 ± 5° to form a clear aqueous phase. Add the aqueous phase to the oil phase with continuous stirring, and allow it to cool to 50° to form an emulsion. In a mortar, triturate the Piroxicam with the Sodium Hydroxide to form a suspension. Using additional water to rinse out the mortar, add the Piroxicam suspension to the previously prepared emulsion, transferring the suspension stepwise and quantitatively to the emulsion. Add sufficient Purified Water with stirring to bring to final weight. Package and label.

Packaging and storage—Preserve in a tight, light-resistant plastic resealable container, and store at controlled room temperature.

Labeling—Label it to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Piroxicam RS.*

Beyond-use date: 90 days at room temperature after the day on which it was compounded.

Assay—

Buffer solution—Dissolve 5.4 g of citric acid and 10.8 g of dibasic sodium phosphate in 2 L of Purified Water, and pass through a 0.45-µm filter.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and methanol (1 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent: 0.01 N methanolic hydrochloric acid, made by diluting 0.9 mL of hydrochloric acid with methanol to a volume of 1 L.

Standard preparation—Dissolve an accurately weighed quantity of USP Piroxicam RS in 2 mL of chloroform, and dilute with *Diluent* to obtain a solution having a known concentration of about 50 µg per mL.

Assay preparation—Add about 340 mg of Piroxicam Cream to 4 mL of chloroform and 150 mL of *Diluent.* Shake the mixture on a wrist action shaker for 15 minutes, and dilute with *Diluent* to 200 mL. Pass the solution through a 0.45-µm filter, and discard the first 5 mL of the filtrate.

Blank—Prepare as directed for the *Assay preparation,* without adding Piroxicam. Use Purified Water to offset the difference in weight between the *Blank* and the *Assay preparation.* Pass the solution through a 0.45-µm filter, and discard the first 5 mL of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector, a 4.6-mm × 30-cm analytical column that contains 10-µm packing L1, and a 4.6-mm × 2-cm guard column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 7 minutes, and the relative standard deviation for replicate injections is not more than 2.8%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation,* the *Assay preparation,* and the *Blank* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of piroxicam ($C_{15}H_{13}N_3O_4S$) in each mL of Piroxicam Cream taken by the formula:

$$200(C/V)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Piroxicam RS in the *Standard preparation; V* is the volume, in mL, of liquid taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Pseudoephedrine Sulfate, *USP 29* page 1861. It is proposed to use iodine vapors instead of iodine spray as a visualizing agent in the test for *Ordinary impurities.*

(MD-CCA: C. Anthony) RTS—43723-1

In-Process Revision

Change to read:

Ordinary impurities ⟨466⟩—
Test solution: alcohol.
Standard solution: alcohol.
Eluant: a mixture of alcohol, glacial acetic acid, and water (10 : 3 : 1).
Visualization: ~~16~~

▲Expose the plate for 24 hours to iodine vapors in a pre-equilibrated closed chamber, on the bottom of which there are iodine crystals.▲*USP30*

BRIEFING

Quinidine Sulfate Oral Suspension, page 946 of *PF* 31(3) [May–June 2005]—See briefing under *Acetazolamide Oral Suspension.*

(CRX: C. Okeke) RTS—43131-21

Add the following:

▲Quinidine Sulfate Oral Suspension

» Quinidine Sulfate Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of quinidine sulfate $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O]$. Prepare Quinidine Sulfate Oral Suspension 10 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Quinidine Sulfate	1 g
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free), and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

NOTE— ~~If Cherry Syrup, *NF* is used, it becomes a solution.~~ If Tablets are used instead of bulk powder, the preparation becomes a suspension and should be labeled as such.

If using Quinidine Sulfate Tablets, place in a suitable mortar, and comminute into a fine powder, or add Quinidine Sulfate powder to the mortar. Add about 15 mL of the Vehicle, and mix to a uniform paste. Add the Vehicle in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to the calibrated bottle. Add sufficient Vehicle to volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store at room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken before use, and to state the beyond-use date.

USP Reference standards ⟨11⟩—*USP Quinindine Sulfate RS.*

In-Process Revision

pH ⟨791⟩**:** between 3.4 and 4.4 (Vehicle for Oral Solution and Vehicle for Oral Suspension), and between 3.2 and 4.0 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Methanesulfonic acid solution—Add 35.0 mL of methanesulfonic acid to 20.0 mL of glacial acetic acid, dilute with water to 500 mL, and mix.

Diethylamine solution—Dissolve 10.0 mL of diethylamine in water to obtain 100 mL of solution.

Mobile phase—Prepare a suitable filtered and degassed solution of water, acetonitrile, *Methanesulfonic acid solution,* and *Diethylamine solution* (80 : 20 : 2 : 2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve USP Quinidine Sulfate RS in *Mobile phase* to obtain a solution having a known concentration of about 100 µg per mL.

Assay preparation—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix on a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample solution into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 235-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the 100 µg per mL *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time for quinidine sulfate is about 8.5 minutes, and the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of quinidine sulfate $[(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O]$ in the volume of Oral Suspension taken by the formula:

$$100(C / V)(r_U / r_S)$$

in which C is the concentration, in µg per mL, of USP Quinidine Sulfate RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Senna, *USP 29* page 1959. A new monograph, *Senna Pods,* is proposed elsewhere in this issue of *PF*. Accordingly, changes in the Title and Definition of this monograph are proposed to indicate that the plant part contained in this article is the leaflet. A limit for the minimum content of sennosides is proposed. Also, the following proposals are presented: under *Packaging and storage,* storage conditions are defined; a *Labeling* section is added; a USP Reference Standard is added because of the addition of the *Assay;* limits for *Loss on drying, Total ash,* and *Microbial enumeration* are added; and an *Assay,* which is harmonized with other Pharmacopeias, is proposed.

(DSB: M. Sharaf) RTS—43697-1

Senna

▲Leaf▲*USP30*

Change to read:

» Senna

▲Leaf▲*USP30*
consists of the dried leaflet of *Senna alexandrina* Mill also known as *Cassia acutifolia* Delile (Alexandrian senna) or *C. angustifolia* Vahl (Tinnevelly senna) (Fam. Fabaceae). Senna Leaf contains not less than 2.5 percent of anthraquinone glucosides, calculated as sennosides, on the dried basis.

Change to read:

Packaging and storage—Preserve against attack by insects and rodents (see *Vegetable and Animal Drugs—Preservation* in the *General Notices*).

▲Store protected from light and moisture, at room temperature.▲*USP30*

Add the following:

▲**Labeling**—The label states the Latin binomial and, following the official name, the part of the plant contained in the article.▲*USP30*

Add the following:

▲**USP Reference standards** ⟨11⟩—*USP Sennosides RS.*▲*USP30*

Change to read:

Botanic characteristics—

Unground Alexandrian ~~Senna~~

▲*senna leaf*▲*USP30*
—Inequilaterally lanceolate or lance-ovate leaflets, frequently broken; from 1.5 cm to 3.5 cm in length and from 5 mm to 10 mm in width, unequal at the base, with very short, stout petiolules. The leaflets are acutely cuspidate, entire, brittle, and subcoriaceous, with short and somewhat appressed hairs, few on the upper surface, more numerous on the lower surface, where they occur spreading on the midrib, especially on its lower part. The color is weak yellow to light grayish-green to pale olive. The odor is characteristic.

Unground Tinnevelly ~~Senna~~

▲*senna leaf*▲*USP30*
—Usually unbroken leaflets, from 2 cm to 5 cm in length and from 6 mm to 15 mm in width; acute at the apex; and slightly hairy. The color of the leaves is weak yellow to pale olive.

Histology—Senna

▲leaf▲*USP30*
shows polygonal epidermal cells with straight walls and frequently containing mucilage; numerous, broadly elliptical stomata mostly from 20 to 35 µm in length, usually bordered by two neighbor-cells with their long axes parallel to that of the stoma, and rarely, though more frequently in ~~Alexandria Senna,~~

▲Alexandrian senna leaf,▲*USP30*
a third epidermal cell at the end of the stoma. The hairs are nonglandular, one-celled, conical, often curved, with thick papillose walls, from 100 to 350 µm in length. Palisade cells in a single layer underlie both surfaces except in the midrib region where they occur only beneath the upper epidermis. A meristele occurs in the midrib composed of several radially arranged fibrovascular bundles, the latter separated by narrow vascular rays and supported above and below by arcs of lignified pericyclic fibers. Calcium oxalate occurs in rosette aggregates in the spongy parenchyma and in six- to eight-sided prisms in the crystal fibers, which lie on the outer surface of each group of pericyclic fibers.

~~Powdered Senna~~

▲*Powdered senna leaf*▲*USP30*
—Dusky greenish-yellow to light olive-brown, displaying fragments of veins bearing lignified vessels, tracheids, and crystal fibers, isolated hairs, masses of palisade and spongy parenchyma, fragments of epidermis with stomata, free calcium oxalate rosette aggregates, and prisms from 10 to 20 µm in length. In powdered ~~Alexandrian senna,~~

▲Alexandrian senna leaf,▲*USP30*
the hairs are more numerous than in powdered ~~Tinnevelly senna~~

▲Tinnevelly senna leaf.▲*USP30*

Change to read:

Identification—Mix 500 mg

▲of finely powdered Senna Leaf▲*USP30*
with 10 mL of a 1 in 10 solution of potassium hydroxide in alcohol, boil for about 2 minutes, dilute with 10 mL of water, and filter. Acidify the filtrate with hydrochloric acid, shake it with ether, remove the ether layer, and shake it with 5 mL of 6 N ammonium hydroxide: the latter is colored orange or bluish-red.

Add the following:

▲**Microbial enumeration** ⟨2021⟩—The total bacterial count does not exceed 10^5 cfu per g, the total combined molds and yeasts count does not exceed 10^3 cfu per g, the bile-tolerant Gram-negative bacteria does not exceed 10^3 cfu per g, and it meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.▲*USP30*

In-Process Revision

Add the following:

▲**Loss on drying** ⟨731⟩—Dry 1.0 g of finely powdered Senna Leaf at 105° for 2 hours: it loses not more than 12.0% of its weight.▲*USP30*

Add the following:

▲**Total ash** ⟨561⟩: not more than 12.0%.▲*USP30*

Add the following:

▲**Assay—**[NOTE—Conduct all sample preparations with minimal exposure to subdued light, and use low-actinic glassware to protect solutions from light.]

Ferric chloride solution—Dissolve 10.5 g of ferric chloride in 100 mL of water.

Methanolic magnesium acetate solution—Dissolve 5.0 g of magnesium acetate in 1 L of methanol.

Sodium bicarbonate solution—Dissolve 5.0 g of sodium bicarbonate in 1 L of water.

Standard preparation—Dissolve accurately weighed quantities of USP Sennosides RS in *Sodium bicarbonate solution* to obtain a solution having a known concentration of about 0.13 mg per mL.

Assay preparation—Weigh and pulverize about 10 g of Senna Leaf. Transfer about 0.15 g, accurately weighed, to a 100-mL round-bottom flask, add 30 mL of water, mix, weigh, attach a condenser, and reflux in a water bath for 15 minutes. Cool to room temperature, weigh, and adjust to the original weight with water. Centrifuge, and transfer 20.0 mL of the supernatant to a 150-mL separatory funnel. Add 0.1 mL of diluted hydrochloric acid, and shake with three quantities, each of 15 mL, of chloroform. Allow to separate, and discard the chloroform layer after each addition. Add about 0.1 g of sodium bicarbonate, shake for 3 minutes, and centrifuge. Use the supernatant as the *Assay preparation.*

Procedure—Transfer 10.0 mL each of the *Standard preparation* and the *Assay preparation* to separate 100-mL round-bottom flasks equipped with condensers, add 20 mL of *Ferric chloride solution,* and mix. Reflux in a water bath for 20 minutes. Add 1 mL of hydrochloric acid, and reflux for an additional 20 minutes, with frequent shaking, to dissolve the precipitates. Cool to room temperature, transfer the mixtures to separate 100-mL separatory funnels, and shake with three quantities, each of 25 mL, of ether previously used to rinse the flasks. Combine the ether extracts, mix, and wash with two quantities, each of 15 mL, of water. Tranfer the ether layers to separate 100-mL volumetric flasks, dilute with ether to volume, and mix. Evaporate 10.0 mL of the ether extracts to dryness, and dissolve the residue in 10.0 mL of *Methanolic magnesium acetate solution*. Determine the absorbance of the resulting solution from the *Standard preparation* and the *Assay preparation* at 515 nm, with a suitable spectrophotometer fitted with matched quartz cells, using methanol as the blank. Calculate the percentage of sennosides in the Senna Leaf by the formula:

$$3000(A_U / A_S)(C_S / W)$$

in which A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation,* respectively; C_S is the concentration, in mg per mL, of sennosides in the *Standard preparation;* and W is the weight, in mg, of powdered Senna Leaf used.▲*USP30*

BRIEFING

Senna Pods. A new monograph for Senna pods is proposed. The pericarp of the pods is used as the source of sennosides. This new monograph is based on the *Senna* (leaflets) monograph in *USP 29* page 1959 and is harmonized with other Pharmacopeias. Proposed revisions to the *Senna (leaf)* monograph are also appearing in this number of *PF*.

(DSB: M. Sharaf) RTS—43728-1

Add the following:

▲Senna Pods

» Senna Pods are the dried ripe fruits of *Senna alexandrina* Mill also known as *Cassia acutifolia* Delile (Alexandrian senna) or *C. angustifolia* Vahl (Tinnevelly senna) (Fam. Fabaceae). Senna Pods contain not less than 3.4 percent (Alexandrian senna) and not less than 2.2 percent (Tinnevelly senna), of anthraquinone glucosides, calculated as sennosides, on the dried basis.

Packaging and storage—Preserve against attack by insects and rodents (see *Vegetable and Animal Drugs—Preservation* in the *General Notices*). Store protected from light and moisture, at room temperature.

Labeling—The label states the Latin binomial and, following the official name, the part of the plant contained in the article.

USP Reference standards ⟨11⟩**—***USP Sennosides RS.*

Botanic characteristics—

Unground Alexandrian senna pods—Occur as flattened, reniform, membranous, leathery pods; green to greenish-brown with brown patches at the positions corresponding to the seeds; from 40 to 50 mm in length and at least 20 mm wide; at one end is a stylar point and at the other a short stalk. The pods contain six or seven flattened and obovate seeds, green to pale brown, with a continuous network of prominent ridges on the testa.

Unground Tinnevelly senna pods—Occur as flattened, slightly reniform, membranous, leathery pods; brown to yellowish-brown with brown patches at the positions corresponding to the seeds; slightly longer but narrower than Alexandrian senna pods, from 35 to 60 mm in length and 14 to 18 mm wide; at one end is a stylar point and at the other a short stalk. The pods contain five to eight flattened and obovate seeds, green to pale brown, with incomplete, wavy, transverse ridges on the testa.

Histology—Senna pods show epicarp with very thick cuticulized polygonal cells, occasional anomocytic or paracytic stomata, and very few nonglandular, one-celled, conical, often curved hairs, with thick papillose walls, from 100 to 350 µm in length; mesocarp consists of parenchymatous tissue containing a layer of calcium oxalate prisms and vascular bundles partially enclosed by fibers; endocarp with two crossed layers of fibers; seeds with a subepidermal layer of palisade cells with thick outer walls and endosperm of polyhedral cells with mucilaginous walls.

Powdered senna pods—Brown powder displaying polygonal cells with occasional small numbers of nonglandular hairs and anomocytic or paracytic stomata, fibers in two crossed layers accompanied by a crystal sheath of calcium oxalate prisms, isolated hairs, masses of palisade cells of the seeds, clusters, and prisms of calcium oxalate.

Identification—Proceed as directed in the *Identification* test under *Senna Leaf,* except to use 500 mg of finely powdered Senna Pods.

In-Process Revision

Microbial enumeration ⟨2021⟩—The total bacterial count does not exceed 10^5 cfu per g, the total combined molds and yeasts count does not exceed 10^3 cfu per g, the bile-tolerant Gram-negative bacteria does not exceed 10^3 cfu per g, and it meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli.*

Loss on drying ⟨731⟩—Dry 1.0 g of finely powdered Senna Pods at 105° for 2 hours: it loses not more than 12.0% of its weight.

Foreign organic matter ⟨561⟩: not more than 1.0%.

Total ash ⟨561⟩: not more than 9.0%.

Acid-insoluble ash ⟨561⟩: not more than 2.0%.

Assay—Proceed as directed in the *Assay* under *Senna Leaf,* using 0.15 g of finely powdered Senna Pods to prepare the *Assay preparation.*▲*USP30*

BRIEFING

Sennosides, *USP 29* page 1959. On the basis of comments received, the following revisions are proposed: changes in the Definition; senna pods as a source of sennosides are included; under *Packaging and storage,* storage conditions are defined; and in the section *Residue on ignition,* it is proposed to change the temperature back to the original conditions specified in *USP 26* of 800° because USP received reports of out-of-specification results for USP-grade sennosides using the 600° temperature indicated in the harmonized general chapter, *Residue on Ignition* ⟨281⟩. See also the proposed title change for *Senna* and the new proposed monograph *Senna Pods,* published elsewhere in this number of *PF.*

BRIEFING

Simvastatin, *USP 29* page 1964 and page 792 of *PF* 31(3) [May–June 2005]. It is proposed to clarify the preparation of *Solution A* and *Solution B* used in the test for *Chromatographic purity* and in the *Assay.* It is also proposed to add a *Note* regarding the stability of the Simvastatin solutions. In addition, minor editorial style changes have been made.

(MD-GRE: E. Gonikberg) RTS—43269-1

In-Process Revision

Change to read:

Identification—

A: *Infrared Absorption* ⟨197M⟩.
B: ~~*Ultraviolet Absorption* ⟨197U⟩~~
~~*Solution:* 10 µg per mL.~~
~~*Medium:* acetonitrile.~~

▲The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*▲*USP30*

Change to read:

Chromatographic purity—

▲[NOTE—The Simvastatin solutions are stable for up to 3 days when stored at 4°. Without refrigeration, they should be injected immediately after preparation.]▲*USP30*

~~*Diluting solution*—Prepare a solution of butylated hydroxytoluene in acetonitrile containing 0.5 mg per mL.~~

~~*Standard solutions*—Dissolve an accurately weighed quantity of USP Simvastatin RS in *Diluting solution* to obtain *Standard solution A* having a known concentration of about 0.2 mg per mL. Transfer 4.0, 2.0, and 1.0 mL of *Standard solution A* to separate 10-mL volumetric flasks, and dilute with *Diluting solution* to volume to obtain *Standard solutions B*, *C*, and *D*, respectively.~~

~~*Test solution*—Dissolve an accurately weighed quantity of simvastatin in *Diluting solution* to obtain a solution having a concentration of about 20 mg per mL.~~

~~*Procedure*—Separately apply 4 µL portions of each of the *Standard solutions* and the *Test solution* to a thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of silica gel mixture, previously washed with methanol and air-dried. Dry the spots with the aid of a stream of nitrogen. Position the plate in a chromatographic chamber previously equilibrated with a solvent system consisting of a mixture of cyclohexane, chloroform, and isopropyl alcohol (5 : 2 : 1) containing 0.5 mg of butylated hydroxytoluene per mL, and develop the chromatogram until the solvent front has moved about three-quarters of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate under a stream of nitrogen. Spray the plate with a mixture of methanol and sulfuric acid (8 : 2), heat at 110° for 30 minutes, and immediately examine the plate: no secondary spot in the chromatogram of the *Test solution* is greater in size or intensity than the principal spot from *Standard solution B* (0.4%), and the sum of all such secondary spots obtained from the *Test solution* is not greater than 1.0%.~~

▲*Mobile phase, Diluent,* and *Chromatographic system*—Proceed as directed in the *Assay.*

Test solution—Use the *Assay preparation*.

Procedure—Inject about 5 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the areas for all the peaks. Calculate the percentage of each impurity in the portion of Simvastatin taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak area for each impurity; and r_s is the sum of the areas of all the peaks. Not more than 1.0% of the sum of lovastatin and epilovastatin is found. [NOTE—If present, lovastatin and epilovastatin may not be completely resolved by the method. These peaks, appearing at a relative retention time of 0.6, are integrated together to determine conformance.] Not more than 0.4% of any individual impurity other than lovastatin and epilovastatin is found; and not more than 1.0% of total impurities other than lovastatin and epilovastatin is found.▲*USP30*

Delete the following:

▲~~**Limit of lovastatin**—From the chromatograms of the *Assay preparation* and the *Standard preparation*, obtained as directed in the *Assay*, calculate the percentage of lovastatin in the portion of Simvastatin taken by the formula:~~

~~$$10{,}000(C/W)(r_u/r_s),$$~~

~~in which *C* is the concentration, in mg per mL, of USP Lovastatin RS in the *Standard preparation*; *W* is the weight, in mg, of Simvastatin taken for the *Assay preparation*; and r_u and r_s are the lovastatin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively: not more than 1% is found.~~▲*USP30*

Change to read:

Assay—

▲[NOTE—The Simvastatin solutions are stable for up to 3 days when stored at 4°. Without refrigeration, they should be injected immediately after preparation.]▲*USP30*

~~*Mobile phase*—Prepare a filtered and degassed mixture of acetonitrile and dilute phosphoric acid (1 in 1000) (50 : 50). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~

~~*Diluting solution*—Prepare a mixture of acetonitrile and 0.01 M monobasic potassium phosphate (60 : 40), filter, and adjust with phosphoric acid to a pH of 4.0.~~

~~*Standard preparation*—Dissolve accurately weighed quantities of USP Simvastatin RS and USP Lovastatin RS in *Diluting solution*, and dilute quantitatively, and stepwise if necessary, to obtain a solution having known concentrations of about 0.3 mg per mL of USP Simvastatin RS and 0.003 mg per mL of USP Lovastatin RS.~~

In-Process Revision

~~*Assay preparation*—Transfer about 30 mg of Simvastatin, accurately weighed, to a 100-mL volumetric flask, and dissolve in and dilute with *Diluting solution* to volume.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 238-nm detector and a 4.6- × 33-mm column that contains packing L1. The flow rate is about 3.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.65 for lovastatin and 1.0 for simvastatin, the resolution, *R*, between simvastatin and lovastatin is not less than 3.0, the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 1.0%.~~

~~*Procedure*—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas of the responses for the major peaks. Calculate the quantity, in mg, of $C_{25}H_{38}O_5$ in the portion of Simvastatin taken by the formula:~~

~~$$100C(r_u/r_s)$$~~

~~in which *C* is the concentration, in mg per mL, of USP Simvastatin RS in the *Standard preparation*, and r_u and r_s are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.~~

▲*Dilute phosphoric acid*—Transfer 1 mL of phosphoric acid to a 1-L volumetric flask, and dilute with water to volume.

Solution A—Prepare a mixture of acetonitrile and ~~0.1% phosphoric acid in water (1 : 1).~~ *Dilute phosphoric acid* (50 : 50).

Solution B—~~Prepare a 0.1% solution of phosphoric acid in acetonitrile.~~ Transfer 1 mL of phosphoric acid to a 1-L volumetric flask, and dilute with acetonitrile to volume.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B,* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Buffer solution—Prepare a solution containing 1.4 g of monobasic potassium phosphate per L, and adjust with phosphoric acid to a pH of 4.0.

Diluent—Prepare a mixture of acetonitrile and *Buffer solution* (3 : 2).

System suitability preparation—Dissolve accurately weighed quantities of USP Simvastatin RS and USP Lovastatin RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having known concentrations of about 1.5 mg per mL of USP Simvastatin RS and 0.015 mg per mL of USP Lovastatin RS.

Standard preparation—Dissolve an accurately weighed quantity of USP Simvastatin RS in *Diluent* to obtain a solution having a known concentration of about 1.5 mg per mL.

Assay preparation—Transfer about 75 mg of Simvastatin, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩—The liquid chromatograph is equipped with a 238-nm detector and a 4.6- × 33-mm column that contains packing L1. The flow rate is about 3.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–4.5	100	0	isocratic
4.5–4.6	100→95	0→5	linear gradient
4.6–8.0	95→25	5→75	linear gradient
8.0–11.5	25	75	isocratic
11.5–11.6	25→100	75→0	linear gradient
11.6–13	100	0	re-equilibration

Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.60 for lovastatin and 1.0 for simvastatin; and the resolution, *R,* between simvastatin and lovastatin is greater than 3. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure

the areas for the major peaks. Calculate the quantity, in mg, of $C_{25}H_{38}O_5$ in the portion of Simvastatin taken by the formula:

$$VC(r_U / r_S)$$

in which V is the volume, in mL, of the *Assay preparation;* C is the concentration, in mg per mL, of USP Simvastatin RS in the *Standard preparation;* and r_U and r_S are the responses of the simvastatin peak obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Sumatriptan Succinate Oral Suspension, page 947 of *PF* 31(3) [May–June 2005]—See briefing under *Acetazolamide Oral Suspension*.

(CRX: C. Okeke) RTS—43131-22

Add the following:

▲Sumatriptan Succinate Oral Suspension

» Sumatriptan Succinate Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of sumatriptan succinate ($C_{14}H_{21}N_3O_2S \cdot C_4H_6O_4$). Prepare Sumatriptan Succinate Oral Suspension 5 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Sumatriptan Succinate	500 mg
Vehicle: a mixture of Vehicle for Oral Suspension, *NF,* and Vehicle for Oral Solution (regular or sugar-free), *NF* (1 : 1), a sufficient quantity to make . . .	~~25 mL~~ 100 mL

If using Tablets, comminute into a fine powder using a suitable mortar, or add Sumatriptan Succinate powder to the mortar. Add about 25 mL of ~~the~~ Vehicle ~~for Oral Suspension~~ in ~~5 mL~~ portions, mixing thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add sufficient Vehicle ~~for Oral Solution~~ to bring to final volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store at a controlled room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken before use, and to state the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Sumatriptan Succinate RS.*

pH ⟨791⟩**:** between 3.6 and 4.6.

Beyond-use date: 14 days after the day on which it was compounded.

In-Process Revision

Assay—

Mobile phase—Prepare a solution of 0.01 M dibutylamine in 0.025 M aqueous monobasic sodium phosphate dihydrate and acetonitrile (75 : 25). Adjust *Mobile phase* with 1 N sodium hydroxide to a pH of 8.0, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Internal standard solution—Dissolve an accurately weighed quantity of *N*-hydroxymethylsumatriptan succinate in *Mobile phase* to obtain a known concentration of about 3.0 mg per mL.

Standard stock preparation—Dissolve an accurately weighed quantity of USP Sumatriptan Succinate RS in *Mobile phase* to obtain a known concentration of about 4.0 mg per mL.

Standard preparation—Dilute the *Standard stock preparation* with *Mobile phase* to obtain a solution having a known concentration of about 120 µg per mL. Each solution contains 30 µg per mL of *Internal standard solution.*

Assay preparation—Transfer about 1 mL of Oral Suspension from each bottle to a suitable container, and dilute with 0.1 M hydrochloric acid to obtain a concentration of about 0.15 mg per mL. Pass the solution through a 0.22-µm syringe filter into a 0.3-mL polypropylene sample vial for assay.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 282-nm detector and a 4.6-mm × 10-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention times for sumatriptan and *N*-hydroxymethylsumatriptan are 11 and 14 minutes, respectively; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of sumatriptan succinate ($C_{14}H_{21}N_3O_2S \cdot C_4H_6O_4$) in the volume of Oral Suspension taken by the formula:

$$100(C/V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Sumatriptan Succinate RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ▲*USP30*

BRIEFING

Temazepam, *USP 29* page 2077. It is proposed to simplify *Identification* test *A* because drying of the test article is no longer required. This is in accordance with General Chapter *Spectrophotometric Identification Tests* ⟨197⟩. It is also proposed to delete the redundant *Identification* test *B* pertaining to UV identification. *Identification* test *C* is to be renamed *Identification* test *B*.

precipitate is formed.

BRIEFING

Tizanidine Tablets, page 456 of *PF* 31(2) [Mar.–Apr. 2005]. It is proposed to add a test for *Dissolution* to this proposed new monograph. Minor editorial revisions are also being made.

(BPC: M. Marques) RTS—40316-4

Add the following:

▲Tizanidine Tablets

» Tizanidine Tablets contain Tizanidine Hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of tizanidine ($C_9H_8ClN_5S$).

Packaging and storage—Preserve in tight containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Tizanidine Hydrochloride RS. USP Tizanidine Related Compound A RS. USP Tizanidine Related Compound B RS. USP Tizanidine Related Compound C RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩**—**

Medium: 0.1 N hydrochloric acid; 500 mL, degassed.

Apparatus 1: 100 rpm.

Time: 45 minutes.

Determine the amount of tizanidine hydrochloride ($C_9H_8ClN_5S \cdot HCl$) dissolved by employing the following method.

Phosphoric acid solution, Buffer solution, and *Mobile phase*—Proceed as directed in the *Assay.*

Standard stock solution—Dissolve an accurately weighed quantity of USP Tizanidine Hydrochloride RS, and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a concentration of about 201 µg per mL.

Working standard solution—For Tablets labeled to contain 2 mg, transfer 4.0 mL of the *Standard stock solution* to a 200-mL volumetric flask, dilute with *Medium* to volume, and mix. For Tablets labeled to contain 4 mg, transfer 4.0 mL of the *Standard stock solution* to a 100-mL volumetric flask, dilute with *Medium* to volume, and mix.

Test solution—Withdraw 10 mL of the solution under test. Pass through a suitable 0.45-µm filter, discarding the first 5 mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. The column

In-Process Revision

temperature is maintained at 50°. Chromatograph the *Working standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 2000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in percentage, of $C_9H_8ClN_5S \cdot HCl$ dissolved by the formula:

$$\frac{r_U \times C_S \times 500 \times 100}{r_S \times LC} \times \frac{253.71}{290.17}$$

in which r_U and r_S are the peak responses for the *Test solution* and the *Working standard solution,* respectively; C_S is the concentration, in µg per mL, of the *Working standard solution;* 500 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; *LC* is the Tablet label claim, in mg; 253.71 is the molecular weight of tizanidine; and 290.17 is the molecular weight of tizanidine hydrochloride.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_9H_8ClN_5S \cdot HCl$ is dissolved in 45 minutes.

Related compounds—

Phosphoric acid solution, Buffer solution, Mobile phase, Tizanidine related compound A solution, Tizanidine related compound B solution, Tizanidine related compound C solution, Resolution solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Prepare as directed for the *Standard preparation* in the *Assay.*

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg of tizanidine, to a 100-mL volumetric flask, add about 50 mL of *Buffer solution,* sonicate for about 15 minutes with occasional shaking, and shake by mechanical means for 15 minutes. Add 20 mL of acetonitrile, and mix. Allow to cool, dilute with *Buffer solution* to volume, and mix. Centrifuge a portion of this solution at 2000 rpm or higher for 10 minutes. Pass a portion of this solution through a filter having a 45-µm or finer porosity, and use the filtrate.

Procedure—Inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major analyte peaks, disregarding the peaks due to the solvent. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$(253.71/290.17)10{,}000(C/W)(A/D)F(r_i / r_S)$$

in which 253.71 and 290.17 are the molecular weights of tizanidine and tizanidine hydrochloride, respectively; *C* is the concentration, in mg per mL, of USP Tizanidine Hydrochloride RS in the *Standard solution; A* is the average weight, in mg, of each Tablet; *D* is the labeled dose, in

In-Process Revision

mg, of tizanidine per Tablet; *W* is the weight, in mg, of sample taken to prepare the *Test solution; F* is the relative response factor and is given in *Table 1; r_i* is the peak area for each impurity obtained from the *Test solution;* and r_S is the peak area of tizanidine in the *Standard solution*. The limits for the impurities are specified in *Table 1.*

Table 1

Compound Name	Relative Retention Time	Relative Response Factor	Limit (%)
Tizanidine related compound C	about 0.8	1.0	0.2
Tizanidine	1.0	—	—
Tizanidine related compound B	about 1.4	0.9	0.2
Tizanidine Related compound A	about 10.2	0.9	0.2
Individual unknown	—	1.0	0.2
Total	—	—	0.5

Assay—

Phosphoric acid solution—Dilute 6 mL of phosphoric acid with water to make 50 mL of solution.

Buffer solution—Dissolve about 3.5 g of sodium 1-pentanesulfonate in 1000 mL of water. Adjust with *Phosphoric acid solution* or 1 N sodium hydroxide to a pH of 3.0 ± 0.05.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (80 : 20). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Tizanidine related compound A solution—Dissolve an accurately weighed quantity of USP Tizanidine Related Compound A RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.1 mg per mL.

Tizanidine related compound B solution—Dissolve an accurately weighed quantity of USP Tizanidine Related Compound B RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.1 mg per mL.

Tizanidine related compound C solution—Dissolve an accurately weighed quantity of USP Tizanidine Related Compound C RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.1 mg per mL.

Resolution solution—Transfer about 23 mg of USP Tizanidine Hydrochloride RS to a 100-mL volumetric flask, add 20 mL of *Mobile phase* and 10 mL each of *Tizanidine related compound A solution, Tizanidine related compound B solution,* and *Tizanidine related compound C solution.* Sonicate to dissolve the USP Tizanidine Hydrochloride RS, and dilute with *Mobile phase* to volume.

Standard preparation—Dissolve an accurately weighed quantity of USP Tizanidine Hydrochloride RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.046 mg per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg of tizanidine, to a 500-mL volumetric flask, add about 250 mL of *Buffer solution,* sonicate for about 15 minutes with occasional shaking,

and shake by mechanical means for 15 minutes. Add 100 mL of acetonitrile, and mix. Allow to cool, dilute with *Buffer solution* to volume, and mix. Centrifuge a portion of this solution at 2000 rpm or higher for 10 minutes. Pass a portion of this solution through a filter having a 45-µm or finer porosity, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 50°. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the relative retention times are given in *Table 1;* the resolution, *R,* between tizanidine and tizanidine related compound C is not less than 4.0, and the resolution, *R,* between tizanidine and tizanidine related compound B is not less than 4.0. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 5000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of tizanidine ($C_9H_8ClN_5S$) in the portion of Tablets taken by the formula:

$$(253.71/290.17)500C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Tizanidine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively. ▲*USP30*

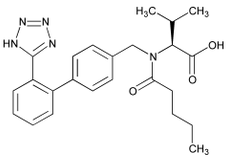
BRIEFING

Valsartan, page 1996 of *PF* 29(6) [Nov.–Dec. 2003]. This new *USP* monograph is presented again with additional changes. On the basis of comments received, it is proposed to remove the requirement for a 4-cm cell in the test for *Absorbance* and to revise the preparation of the *Standard solution* and the *System suitability solution* in *Test 1* under *Related compounds*.

(MD-CV: D. Bempong) RTS—43409-1

Add the following:

▲Valsartan



$C_{24}H_{29}N_5O_3$ ~~435.53~~ 435.52

L-Valine, *N*-(1-oxopentyl)-*N*-[[2′-(1*H*-tetrazol-5-yl)[1,1′-biphenyl]-4-yl]methyl]-.

N-[*p*-(*o*-1*H*-Tetrazol-5-ylphenyl)benzyl]-*N*-valeryl-L-valine [*137862-53-4*].

» Valsartan contains not less than 98.0 percent and not more than 102.0 percent of $C_{24}H_{29}N_5O_3$, calculated on the anhydrous basis.

Packaging and storage—Preserve in ~~well-closed containers~~ tight containers, and store at 25°, excursions permitted between 15° and 30°. Protect from moisture and heat.

USP Reference standards ⟨11⟩—*USP Valsartan RS. USP Valsartan Related Compound A RS. USP Valsartan Related Compound B RS. USP Valsartan Related Compound C RS.*

In-Process Revision

Identification—

A: *Infrared Absorption* ⟨197M⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Absorbance: ~~not more than 0.070~~ 0.07, ~~determined at 420 nm, in a 4-cm cell, on a solution prepared by dissolving 1 g in 20 mL of methanol.~~ Prepare a 1 in 20 solution in methanol and determine the absorbance at 420 nm. The absorbance divided by the path length is not more than 0.02.

~~**Specific rotation** ⟨781S⟩**:** between −64° and −69° at 20°.~~

~~*Test solution:* 10 mg per mL, in methanol.~~

Water, *Method I* ⟨921⟩**:** not more than 2.0%.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩**:** 0.001%.

Related compounds—

TEST 1 (LIMIT OF VALSARTAN RELATED COMPOUND A)—

~~*0.07 M Phosphate buffer solution*~~ ~~Dissolve 10.99 g of dibasic sodium phosphate and 3.81 g of monobasic potassium phosphate in water, dilute with water to 1000 mL, and mix.~~

Mobile phase—Prepare a ~~filtered and degassed~~ mixture of ~~*0.07 M Phosphate buffer solution* and isopropyl alcohol (98 : 2)~~ *n*-hexane, 2-propanol, and trifluoroacetic acid (85 : 15 : 0.1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

~~*Standard stock solution* Pipet 5.0 mL of *System suitability solution* into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Dissolve an accurately weighed quantity of USP Valsartan Related Compound A RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.003 mg of valsartan related compound A per mL. Transfer about 5 mg of USP Valsartan Related Compound A RS, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.~~

Standard solution— ~~Transfer 1.0 mL of *Standard stock solution* into a 10-mL volumetric flask, dilute with *Mobile phase,* and mix. Transfer 1.0 mL of this solution into a 10-mL volumetric flask, dilute with *Mobile phase,* and mix.~~ Dissolve an accurately weighed quantity of USP Valsartan Related Compound A RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.01 mg per mL.

System suitability solution— ~~Transfer about 30 mg of USP Valsartan Related Compound A, accurately weighed, to a 100-mL volumetric flask, and dissolve in and dilute with *Mobile phase* to volume. Pipet 5.0 mL of this solution into a 50-mL volumetric flask, and dilute with *Mobile phase* to volume (*Solution 1*). Transfer about 15 mg of USP Valsartan RS, accurately weighed, to a 100-mL volumetric flask, and dissolve in *Mobile phase*. Add, by pipetting, 10.0 mL of *Solution 1* to the same flask, dilute with *Mobile phase* to volume, and mix. Dissolve accurately weighed quantities of USP Valsartan RS and USP Valsartan Related Compound A RS in *Mobile phase,* serially diluting, if necessary, to obtain a solution having a known concentration of about 0.15 mg of valsartan per mL and about 0.003 mg of valsartan related compound A per mL. Transfer about 1 mg of Valsartan, accurately weighed, to a 20-mL 25-mL volumetric flask, add 10 mL of the *Standard stock solution,* and dissolve in and dilute with *Mobile phase* to volume.~~ Dissolve accurately weighed quantities of USP Valsartan RS and USP Valsartan Related Compound A RS in *Mobile phase* to obtain a solution having known concentrations of about 0.04 mg per mL each of valsartan and valsartan related compound A.

In-Process Revision

Test solution— ~~Transfer about 100 mg of Valsartan, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Pipet 5.0 mL of this solution into a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.~~ Transfer about 50 mg of Valsartan, accurately weighed, to a 50-mL volumetric flask, add about 40 mL of *Mobile phase,* and sonicate for 5 minutes. Dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)— The liquid chromatograph is equipped with a ~~227-nm 220-nm~~ 230-nm detector and a ~~4.0-mm × 10-cm~~ 4.6-mm × 25-cm column that contains 5-µm packing ~~L41~~ L40. The flow rate is about 0.8 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* ~~the relative retention times are 0.60 for valsartan related compound A and 1.0 for valsartan; the ratio of the height between the baseline and the lowest point between the valsartan and valsartan related compound A peaks to the height of the valsartan related compound A peak is not more than 0.4. and~~ the resolution, *R,* between valsartan related compound A and valsartan is not less than 2.0; ~~Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:*~~ and the relative standard deviation, determined from the valsartan related compound A peak, for replicate injections is not more than ~~15.0%~~ 5%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the ~~heights~~ areas for the major peaks. Calculate the percentage of valsartan related compound A in the portion of Valsartan taken by the formula:

~~$100(r_u/r_s),$~~

~~in which r_u and r_s are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively: not more than 1.5% is found.~~

$$100(C_S/C_U)(r_U/r_S)$$

in which C_S is the concentration, in mg per mL, of USP Valsartan Related Compound A RS in the *Standard solution;* C_U is the concentration, in mg per mL, of valsartan in the *Test solution;* and r_U and r_S are the peak responses for valsartan related compound A obtained from the *Test solution* and *Standard solution,* respectively: not more than ~~1.5%~~ 1.0% is found.

TEST 2 (LIMIT OF VALSARTAN RELATED COMPOUND B, VALSARTAN RELATED COMPOUND C, AND OTHER RELATED COMPOUNDS)—

~~*Diluent* and~~ *Mobile phase*—Proceed as directed in the *Assay.*

~~*Standard stock solution A*— Dissolve an accurately weighed quantity of USP Valsartan RS in *Mobile phase* to obtain a solution having a known concentration of about 5 mg per mL.~~

~~*Standard stock solution B*— Dissolve an accurately weighed quantity of USP Valsartan Related Compound B RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.05 mg per mL.~~

In-Process Revision

~~*Standard stock solution C*—Dissolve an accurately weighed quantity of USP Valsartan Related Compound C RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.025 mg per mL.~~

Resolution solution—~~Pipet 10.0 mL of *Standard stock solution A,* 5.0 mL of *Standard stock solution B,* and 2.0 mL of *Standard stock solution C* into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.~~ Dissolve accurately weighed quantities of USP Valsartan RS, USP Valsartan Related Compound B RS, and USP Valsartan Related Compound C RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having known concentrations of about ~~0.5 mg~~ 0.001 mg of valsartan per mL, ~~0.0025 mg~~ 0.001 mg of valsartan related compound B per mL, and ~~0.0005 mg~~ 0.001 mg of valsartan related compound C per mL.

Standard solution—~~Dilute an accurately measured volume of *Standard stock solution A* quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.0005 mg per mL.~~ Dissolve an accurately weighed quantity of USP Valsartan RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about ~~0.0005 mg~~ 0.001 mg of valsartan per mL.

Test solution—Transfer about 50 mg of Valsartan, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—Prepare as directed in the *Assay,* except to use a 225-nm detector. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* ~~the relative retention times are 0.73 for valsartan related compound B, 1.0 for valsartan, and 3.8 for valsartan related compound C;~~ the resolution, *R,* between valsartan related compound B and valsartan is not less than 1.8; the relative standard deviation, determined from the valsartan related compound B peaks, for replicate injections is not more than ~~5.0%~~ 10.0%; and the relative standard deviation, determined from the valsartan peaks, for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Resolution solution, Standard solution,* and *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of ~~each impurity~~ valsartan related compound B and valsartan related compound C in the portion of Valsartan taken by the formula:

~~$$100(Dr_i / r_s),$$~~

~~in which *D* is the factor due to the extent of dilution and is equal to 2.5 for valsartan related compound B, 0.5 for valsartan related compound C, and 0.05 for all other impurities; r_i is the peak response for each impurity obtained from the *Test solution;* and r_s is the peak response for valsartan related compound B or valsartan related compound C obtained from the *Resolution solution* or the valsartan peak response obtained from the *Standard solution,* as appropriate:~~

$$100(C_S / C_U)(r_i / r_S)$$

in which C_S is the concentration, in mg per mL, of the appropriate USP Valsartan Related Compound RS in the *Resolution solution;* C_U is the concentration, in mg per mL, of valsartan in the *Test solution;* r_i is the peak response for the impurity obtained from the *Test solution;* and r_S is the peak response for the appropriate valsartan related compound ob-

tained from the *Resolution solution.* Calculate the percentage of each other impurity in the portion of Valsartan taken by the formula:

$$100(C_S / C_U)(r_i / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Valsartan RS in the *Standard solution;* r_S is the peak response for valsartan obtained from the *Standard solution;* and the other terms are as defined above: not more than ~~0.5%~~ 0.2% of valsartan related compound B is found; not more than 0.1% of valsartan related compound C is found; not more than 0.1% of any other individual impurity, excluding valsartan related compound A, is found; ~~and not more than 0.5% of total impurities is found.~~ and not more than 0.3% of total impurities, excluding valsartan related compound A, is found.

Assay—

~~*Diluent*—Prepare a mixture of acetonitrile and water (1 : 1).~~

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and glacial acetic acid (500 : 500 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Valsartan RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about ~~0.05 mg~~ 0.5 mg per mL.

Assay preparation—Transfer about 50 mg of Valsartan, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. ~~Pipet 10.0 mL of this solution into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.~~

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a ~~230-nm 248-nm~~ 273-nm detector and a 3.0-mm × 12.5-cm column that contains 5-µm packing L1. The flow rate is about 0.4 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* ~~the tailing factor is between 0.8 and 1.5; and~~ the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $C_{24}H_{29}N_5O_3$ in the portion of Valsartan taken by the formula:

~~$1000C(r_U / r_S)$,~~

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Valsartan RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Verapamil Hydrochloride Injection, *USP 29* page 2245; **Verapamil Hydrochloride Tablets,** *USP 29* page 2246. It is proposed to provide USP Reference Standards for the two related compounds in these monographs: 3,4-dimethoxybenzaldehyde and 3,4-dimethoxybenzyl alcohol are used in the preparation of the *Standard solution* in the test for *Related compounds.*

Change to read:

Related compounds—

Aqueous solvent mixture, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed for *Chromatographic purity* under *Verapamil Hydrochloride.*

Standard solution—Dissolve accurately weighed quantities of USP Verapamil Hydrochloride RS, USP Verapamil Related Compound A RS, ~~3,4-dimethoxybenzaldehyde, and 3,4-dimethoxybenzyl alcohol~~

▲USP Verapamil Related Compound E RS, and USP Verapamil Related Compound F RS▲USP30
in *Mobile phase* to obtain a solution having known concentrations of about 2.5 mg of USP Verapamil Hydrochloride RS per mL and 0.0075 mg each of USP Verapamil Related Compound A RS, ~~3,4-dimethoxybenzaldehyde, and 3,4-dimethoxybenzyl alcohol~~

▲USP Verapamil Related Compound E RS, and USP Verapamil Related Compound F RS▲USP30
per mL.

Test solution—Use the *Assay preparation*.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, and allow the *Test solution* to elute for not less than four times the retention time for verapamil hydrochloride. Record the chromatograms, and measure all of the peak responses. The retention times are about 0.4 for ~~3,4-dimethoxybenzyl alcohol~~

▲verapamil related compound F,▲USP30
0.5 for verapamil related compound A, 0.7 for ~~3,4-dimethoxybenzaldehyde~~

▲verapamil related compound E,▲USP30
and 1.0 for verapamil. Calculate the quantity, in mg, of each individual impurity in each mL of the Injection taken by the formula:

$$C(L/D)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of the appropriate impurity in the *Standard solution; L* is the labeled quantity, in mg per mL, of verapamil hydrochloride in the Injection; D is the concentration, in mg per mL, of verapamil hydrochloride in the *Test solution*, on the basis of the labeled quantity in each mL and the extent of dilution; and r_U and r_S are the peak responses of the appropriate impurity in the *Test solution* and the *Standard solution*, respectively: not more than 0.3% of any specified impurity is found, and the sum of all impurities is not greater than 1.0%.

BRIEFING

Verapamil Hydrochloride Oral Solution—See briefing under *Acetazolamide Oral Solution.*

(CRX: C. Okeke) RTS—42993-13

Add the following:

▲Verapamil Hydrochloride Oral Solution

» Verapamil Hydrochloride Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of verapamil hydrochloride ($C_{27}H_{38}N_2O_4 \cdot HCl$). Prepare Verapamil Hydrochloride Oral Solution 50 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩. See also *Verapamil Hydrochloride Oral Suspension*):

Verapamil Hydrochloride powder . .	5 g
Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

Dissolve Verapamil Hydrochloride powder in about 40 mL of Cherry Syrup in a mortar, and mix to a uniform paste. Add the Cherry Syrup in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough Cherry Syrup to bring to final volume, and mix well.

In-Process Revision

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature or in a cold place.

Labeling—Label it to indicate the beyond-use date.

USP Reference standards ⟨11⟩**—***USP Verapamil Hydrochloride RS.*

pH ⟨791⟩**:** between 3.0 and 3.8.

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Sodium acetate solution—Dissolve an accurately weighed quantity of sodium acetate in acetic acid having a concentration of 33 mL per L to obtain a solution having a 0.01 M sodium acetate concentration.

Mobile phase—Prepare a mixture of *Sodium acetate solution,* acetonitrile, and 2-aminoheptane (50 : 50 : 0.5), filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Verapamil Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 500 µg per mL.

Assay preparation—Agitate containers of Oral Solution for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix on a vortex mixer for 30 seconds. Pipet 1.0 mL into a 10-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 278-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 0.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time for verapamil hydrochloride is about 4.8 minutes, and the relative standard deviation for replicate injections is not more than 0.7%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of verapamil hydrochloride ($C_{27}H_{38}N_2O_4 \cdot HCl$) in the volume of Oral Solution taken by the formula:

$$100(C/V)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Verapamil Hydrochloride RS in the *Standard preparation; V* is the volume, in mL, of Oral Solution taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

BRIEFING

Verapamil Hydrochloride Oral Suspension, page 949 of *PF* 31(3) [May–June 2005]—See briefing under *Acetazolamide Oral Suspension.*

(CRX: C. Okeke) RTS—43131-23

In-Process Revision

Add the following:

▲Verapamil Hydrochloride Oral Suspension

» Verapamil Hydrochloride Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of verapamil hydrochloride ($C_{27}H_{38}N_2O_4 \cdot HCl$). Prepare Verapamil Hydrochloride Oral Suspension 50 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩. See also *Verapamil Hydrochloride Oral Solution*):

Verapamil Hydrochloride	5 g
Vehicle: a mixture of Vehicle for Oral Solution, *NF* (regular or sugar-free), and Vehicle for Oral Suspension, *NF* (1 : 1), or Cherry Syrup, *NF,* a sufficient quantity to make	100 mL

NOTE—~~If Cherry Syrup, *NF* is used, it becomes a solution.~~ If Tablets are used instead of bulk powder, the preparation becomes a suspension and should be labeled as such.If using Verapamil Hydrochloride Tablets, comminute to a fine powder using a suitable mortar, or add Verapamil Hydrochloride powder. Add about 40 mL of the Vehicle in small portions, and mix to obtain a uniform paste. Transfer the mortar contents, stepwise and quantitatively, to a calibrated bottle. Add the Vehicle in portions to rinse the mortar, add sufficient Vehicle to final volume, and mix well.

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature, or in a cold place.

Labeling—Label it to state that it is to be well shaken before use, and to state the beyond-use date.

USP Reference standards ⟨11⟩—*USP Verapamil Hydrochloride RS.*

pH ⟨791⟩**:** between 3.8 and 4.8 (Vehicle for Oral Solution and Vehicle for Oral Suspension), and between 3.0 and 3.8 (Cherry Syrup).

Beyond-use date: 60 days after the day on which it was compounded.

Assay—

Mobile phase—Prepare a suitable filtered and degassed mixture of 0.01 M sodium acetate with a mixture of acetic acid having a concentration of 33 mL per L, acetonitrile, and 2-aminoheptane (50 : 50 : 0.5). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve USP Verapamil Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of 500 µg per mL.

Assay preparation—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, store in a clear glass vial at –70° until analyzed. At time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix on a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample solution into a 10-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 278-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 0.5 mL per minute. Chromatograph the *Standard preparation,* and record the

peak responses as directed for *Procedure:* the retention time for verapamil hydrochloride is about 4.8 minutes, and the relative standard deviation for replicate injections is not more than 0.7%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of verapamil hydrochloride ($C_{27}H_{38}N_2O_4 \cdot HCl$) in the volume of Oral Suspension taken by the formula:

$$100(C/V)(r_U / r_S)$$

in which C is the concentration, in µg per mL, of USP Verapamil Hydrochloride RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP30*

and 1.0 for verapamil.] Calculate the quantity, in mg, of each individual impurity in each mL of the portion of Tablets taken by the formula:

$$25C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of the appropriate impurity in the *Standard solution;* and r_U and r_S are the peak responses of the appropriate impurity obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.3% of any specified impurity is found; and the sum of all impurities is not more than 1.0%.

BRIEFING

Zidovudine Tablets, *USP 29* page 2284. It is proposed to clarify the impurity levels in the test for *Related compounds* to be consistent with the terminology preferred in drug product application approvals and in the ICH Q3B (R) guideline. This proposed revision is intended to eliminate the possibility that a specified impurity controlled at levels higher than the present limit of 0.2% might be unintentionally restricted to the lower limit due to the way the limit is worded in the current monograph. In addition, the relative

In-Process Revision

response factor in the formula in the test for *Related compounds* has been reformatted in accordance with the recent USP policy as published on page 691 of *PF* 31(3) [May–June 2005].

Assay—

Mobile phase—Dissolve 3.0 g of sodium acetate and 1.3 g of sodium 1-octanesulfonate in 900 mL of water. Add 90 mL of methanol and 40 mL of acetonitrile, and mix. Adjust with glacial acetic acid to a pH of 5.3, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

▲*Zidovudine related compound B standard stock solution*—Dissolve an accurately weighed quantity of USP Zidovudine Related Compound B RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.1 mg per mL.

Zidovudine related compound C standard stock solution—Dissolve by sonicating for about 15 minutes, an accurately weighed quantity of USP Zidovudine Related Compound C RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.2 mg per mL.▲*USP30*

Standard preparation—~~Dissolve an accurately weighed quantity of USP Zidovudine RS in a volume of methanol, equivalent to not more than 1.2% of the total flask volume, dilute with water to volume, and mix to obtain a final solution having a known concentration of about 0.12 mg per mL.~~

▲Transfer about 30 mg of USP Zidovudine RS, accurately weighed, to a 250-mL volumetric flask, and dissolve in 3.0 mL of methanol. Add 2.5 mL of *Zidovudine related compound B standard stock solution,* 5.0 mL of *Zidovudine related compound C standard stock solution,* and dilute with water to volume. This solution contains zidovudine, zidovudine related compound B, and zidovudine related compound C at concentrations of about 0.12 mg per mL, 0.001 mg per mL, and 0.004 mg per mL, respectively.▲*USP30*

Assay preparation—Transfer a counted number of Tablets, equivalent to 1500 mg of zidovudine, to a 500-mL volumetric flask. Add about 50 mL of water, and shake by mechanical means for 30 minutes to disperse the Tablets. Add about 150 mL of methanol, and sonicate for 10 minutes. Dilute with water to volume, and mix. Pipet 4.0 mL into a 100-mL volumetric flask, and dilute with water to volume. Mix, and pass a portion of the solution through a suitable nylon filter, discarding the first 2 mL of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 265-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.3 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:*

▲the relative retention times are about 0.17 for zidovudine related compound C (thymine), 1.0 for zidovudine, and 1.2 for zidovudine related compound B;▲*USP30*
the resolution, *R,* between zidovudine and ~~a peak having a relative retention time of about 1.2~~

▲zidovudine related compound B▲*USP30*

is not less than 2.5; the tailing factor for the zidovudine peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of zidovudine ($C_{10}H_{13}N_5O_4$) in each Tablet taken by the formula:

$$12{,}500(C/N)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Zidovudine RS in the *Standard preparation; N* is the number of Tablets taken for the *Assay preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

DIETARY SUPPLEMENTS—MONOGRAPHS

BRIEFING

Ginger, *USP 29* page 2331; **Powdered Ginger,** *USP 29* page 2332; **Ginger Capsules,** *USP 29* page 2333; **Ginger Tincture,** *USP 29* page 2333. Proposed revisions that affect this monograph and may affect its dosage forms include the following: adding a storage temperature to the *Packaging and storage* section; adding a new USP Reference Standard, which by cross reference is used in the *Identification, Alcohol soluble extractives,* and *Limit of shogaols* tests; making the microbial limits consistent with those in *Microbial Attributes of Nonsterile Nutritional and Dietary Supplements* ⟨2023⟩; and revising the *System suitability solution* and relevant subsections in the test for *Content of gingerols and gingerdiones* to include the new USP Reference Standard, USP Ginger Constituent Mixture RS. Minor editorial changes have also been made.

Identification—

A: Pulverize about 5 g of Ginger. To about 1 g of the pulverized Ginger add 5 mL of dilute acetic acid, prepared by diluting 1 part of glacial acetic acid with 1 part of water, and shake for 15 minutes. Filter, and add a few drops of ammonium oxalate TS to the filtrate: not more than a slight turbidity is produced.

B: Dissolve about 50 mg of the residue obtained in the test for *Alcohol-soluble extractives* in 25 mL of water, and extract this solution with two 15-mL portions of ether. Combine the ether extracts, and evaporate in a porcelain dish. To the residue so obtained, add 5 mL of sulfuric acid solution (7.5 in 10.0) and about 5 mg of vanillin. Allow to stand for 15 minutes, and add an equal volume of water: the solution turns azure blue.

C: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—
Adsorbent: 0.50-mm layer of chromatographic silica gel mixture.

Test solution—Pulverize about 5 g of Ginger. Transfer about 0.2 g of pulverized sample to a test tube, add 5 mL of methanol, shake for 30 minutes, and centrifuge. Apply the supernatant to the plate.

~~*Standard solution*~~

▲*Standard solution 1*—▲*USP30*

Thin-layer chromatographic identification test ⟨201⟩

TEST FOR FLAVONOIDS—
Test solution—Transfer 0.2 g of finely powdered Ginkgo to a test tube, add 10 mL of methanol, and heat on a water bath at 65° for 10 minutes. Shake the mixture frequently during the heating. Allow to cool to room temperature, filter, concentrate the filtrate on a hot water bath at 60° to half its volume, and cool.
Standard solution: a solution of USP Rutin RS and ~~chlorogenic acid~~

▲USP Chlorogenic Acid RS▲*USP30*
in methanol containing about 0.6 mg per mL and 0.2 mg per mL, respectively.
Developing solvent system: a mixture of ethyl acetate, water, anhydrous formic acid, and glacial acetic acid (67.5 : 17.5 : 7.5 : 7.5).
Spray reagent 1: a solution of diphenyl boryloxyethylamine in methanol containing 10 mg per mL.
Spray reagent 2: a solution of polyethylene glycol 400 in alcohol containing 50 mg per mL.

In-Process Revision

Procedure— Apply separately, as bands, 20 µL each of the *Test solution* and the *Standard solution* to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of chromatographic silica gel, and allow the bands to dry. Develop the chromatograms in the *Developing solvent system* until the solvent front has moved about 10 cm from the origin. Remove the plate from the chromatographic chamber, and dry it in a circulating air oven at 100° to 105°. Immediately spray the hot plate with *Spray reagent 1,* and then spray with *Spray reagent 2.* Allow the plate to cool for 30 minutes, and examine it under long-wavelength UV light. The chromatogram of the *Standard solution* shows in its middle part, with increasing R_F values, the yellowish-brown fluorescent zone due to rutin and a light blue fluorescent zone due to chlorogenic acid. The presence of flavonol glycosides in the *Test solution* is shown by three yellowish-brown to green fluorescent zones, and slightly above a blue to green fluorescent zone below the zone due to rutin, a light blue fluorescent zone appears in the same location as that due to chlorogenic acid, as well as two greenish-brown to yellow fluorescent zones, located above. Other, less intense zones may be seen in the chromatogram of the *Test solution*.

TEST FOR TERPENE LACTONES—

Adsorbent: a 0.50-mm layer of chromatographic silica gel.

Test solution—Transfer 0.8 g of the dried test specimen retained from the test for *Loss on drying* to a suitable flask fitted with a reflux condenser, add 5 mL of a mixture of methanol and water (1 in 10), and heat under reflux for 15 minutes. While still hot, filter the contents of the flask with the aid of a vacuum. Rinse the flask and the test specimen with 2 mL of a mixture of methanol and water (2 in 100), and transfer the rinsings to the filter with the aid of a vacuum. Return the powdered Ginkgo to the flask, add 4 mL of a mixture of methanol and water (1 in 10), and repeat the extraction. After filtration, wash the residue of powdered Ginkgo twice with 1.5 mL of a mixture of methanol and water (2 in 100). Combine the filtrates, and transfer the combined filtrates (about 12 mL) to a solid-phase extraction column containing L1 packing with a sorbent mass-to-column volume ratio of 1000 mg per 3 mL or equivalent. [NOTE—Initially pass 10 mL of methanol and then 10 mL of a mixture of methanol and water (2 in 100) through the column to condition it. Do not allow the column to dry.] Collect the eluate at the rate of 1 drop per second. Evaporate the eluate to dryness, and dissolve the residue in 2 mL of methanol.

Developing solvent system: a mixture of ethyl acetate and methyl acetate (1 : 1).

Procedure—Prepare a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with *Adsorbent* as follows. Immerse the plate for 20 seconds in a solution of sodium acetate in methanol containing 1 g per 10 mL. Allow the excess coating liquid to drip from the plate, and dry in a forced-air oven at 70° for 30 minutes. Cool in a desiccator. Separately apply several 10-µL spots of the test solution to the impregnated plate, and allow the spots to air-dry. Develop the plate in the *Developing solvent system* in a chromatographic chamber without filter paper attached to the walls until the solvent front travels about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and dry in an oven at 105° for 15 minutes. Spray the plate with acetic anhydride, and heat in an oven at 140° for 25 minutes. Cool, and examine the plate under short- and long-wavelength UV light. [NOTE—The compounds present in high concentrations may be visible in daylight as light brown spots.] The presence of terpene lactones in the test solution is shown by the following spots detected in the chromatogram at both the short and long wavelengths: bilobalide (R_F about 0.75), ginkgolide A (R_F about 0.68), ginkgolide B (R_F about 0.52), ginkgolide J (R_F about 0.39), and ginkgolide C (R_F about 0.27). Other spots of varying intensities also may be seen.

Procedure—Separately inject equal volumes (about 15 µL) of each of the *Standard solutions* and the *Test solution* into the chromatograph, record the chromatograms, and identify the peaks of the relevant analytes in the chromatogram of the *Standard solution* by comparison with the Reference Chromatogram. Measure the areas of the analyte peaks. Plot the logarithms of the relevant peak responses versus logarithms of concentrations, in mg per mL, of each analyte obtained from the *Standard solutions*, and determine the regression line using a least-squares analysis. The correlation coefficient for the regression line is not less than 0.995. From the graphs so obtained, determine the concentration, *C*, in mg per mL, of the relevant analyte in the *Test solution*. Separately calculate the percentages of bilobalide ($C_{15}H_{18}O_8$), ginkgolide A ($C_{20}H_{24}O_9$), ginkgolide B ($C_{20}H_{24}O_{10}$), ▲and▲*USP30* ginkgolide C ($C_{20}H_{24}O_{11}$)~~, and ginkgolide J ($C_{20}H_{24}O_{10}$)~~ ▲▲*USP30* in the portion of Ginkgo taken by the formula:

$$1000(C/W)$$

in which *W* is the weight, in mg, of Ginkgo taken to prepare the *Test solution.* Calculate the total percentage of terpene lactones in the portion of Ginkgo taken by adding the percentages calculated for each analyte.

* Suitable commercially available material is Extrelut® NT 20 from E Merck Science.

BRIEFING

Powdered Ginkgo Extract, page 2233 of *PF* 27(2) [Mar.–Apr. 2001]; **Gingko Capsules,** page 2238 of *PF* 27(2) [Mar.–Apr. 2001]; **Gingko Tablets,** page 2240 of *PF* 27(2) [Mar.–Apr. 2001]. In accordance with the recommendations of the USP AMB Expert Committee, it is proposed to add a limit for *Microbial enumeration.* It is also proposed to add storage conditions to *Packing and storage,* to add an *Identification* test *B,* and to revise the test for *Limit of ginkgolic acids* as follows: decrease the concentration of the *Standard solution* to correspond to the expected *Test solution* concentration; use a shorter column with smaller particle size (Zorbax XBD-C8, 4.6 mm × 5.0 cm, 3.5 µm) to increase the peak efficiency; shorten the *Mobile phase* gradient proportionally to the column length, which leads to a shorter run time; replace trifluoroacetic acid with phosphoric acid in preparation of *Solution A* and *Solution B* to decrease baseline noise; change the extraction solvent used in preparation of the *Test solution* from 100% methanol to a mixture of methanol and water (8 : 2) to reduce the solvent effect; and increase the injection volume in the *Procedure* to increase peak height. Also, in the *Chromatographic system* section, it is proposed to increase the column temperature to 35° and to add a *Note* recommending washing of the column if peak shape deterioration is observed with multiple injections. In the test for *Content of terpene lactones* it is proposed to add a clean-up step in the

In-Process Revision

preparation of the *Test solution* to remove interferences due to other components in the extract. In addition, other revisions have been proposed, and editorial style changes have been made.

(DSB: M. Sharaf) RTS—43433-1

Add the following:

▲Powdered Ginkgo Extract

» Powdered Ginkgo Extract is prepared from dried and comminuted leaves of Ginkgo extracted with an acetone–water mixture or other suitable solvents. The ratio of the crude plant material to Powdered Extract is between 35 : 1 and 67 : 1. It contains not less than 22.0 percent and not more than 27.0 percent of ~~flavonoids, calculated as flavonol glycosides, with a mean molecular weight of 756.7, calculated as the sum of quercetin, kaempferol, and isorhamnetin glycosides.~~ flavonoids, calculated as flavonol glycosides, with a mean molecular mass of 756.7. It contains not less than ~~5.4 6.0~~ 5.4 percent and not more than ~~6.6~~ 12.0 percent of terpene lactones, consisting of between ~~2.6 2.9~~ 2.6 percent and ~~3.2~~ 5.8 percent of bilobalide ($C_{15}H_{18}O_8$) and between ~~2.8 3.0~~ 2.8 percent and ~~3.4~~ 6.2 percent of ginkgolide A ($C_{20}H_{24}O_9$), ginkgolide B ($C_{20}H_{24}O_{10}$), ~~and~~ and ginkgolide C ($C_{20}H_{24}O_{11}$).~~, and ginkgolide J ($C_{20}H_{24}O_{10}$).~~

Packaging and storage—Preserve in tight, light-resistant containers, protected from moisture, and store at controlled room temperature.

Labeling—The label states the Latin binomial ~~name~~ and, following the official name, the part of the plant from which the article was prepared. The label also indicates the content of flavonol glycosides and of terpene lactones, the extracting solvent used for preparation, and the ratio of the starting crude plant material to the Powdered Extract.

USP Reference standards ⟨11⟩— *USP Chlorogenic Acid RS. USP Ginkgo Terpene Lactones RS. USP Ginkgolic Acids RS.* ~~*USP Isorhamnetin RS. USP Kaempferol RS.*~~ *USP Quercetin RS. USP Rutin RS.*

~~**Thin-layer chromatographic identification test —**~~**Identification—**

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Adsorbent: 0.5-mm layer of chromatographic silica gel mixture.

Test solution—Dissolve about 50 mg of Powdered Extract, accurately weighed, in 10 mL of a mixture of methanol and water (8 : 2). Apply 20 µL.

Standard solution—Prepare a solution of USP Rutin RS and ~~chlorogenic acid~~ USP Chlorogenic Acid RS in methanol containing 0.3 mg per mL and 0.1 mg per mL, respectively. Apply 10 µL.

Developing solvent system: a mixture of ethyl acetate, water, glacial acetic acid, and anhydrous formic acid (67.5 : 17.5 : 7.5 : 7.5).

Spray reagent 1—Prepare a solution of 2-aminoethyl diphenylborinate in methanol containing 10 mg per mL.

Spray reagent 2—Prepare a solution of polyethylene glycol 4000 in methanol containing 50 mg per mL.

Procedure—Proceed as directed in the chapter, except to dry the plate between 100° and 105°, spray with *Spray reagent 1* while the plate is still warm, and then spray with *Spray reagent 2*. After about 30 minutes, examine the plate under UV light at 365 nm: the chromatogram of the *Stan-*

In-Process Revision

dard solution exhibits a yellow-brown fluorescent zone due to rutin in the lower section and a light blue fluorescent zone due to chlorogenic acid in the middle section. The chromatogram of the *Test solution* exhibits three yellow-brown to greenish fluorescent zones at R_F values below that for the rutin zone in the chromatogram of the *Standard solution;* a green-blue fluorescent zone at an R_F value just above that for the rutin zone in the chromatogram of the *Standard solution;* an intense, light blue fluorescent zone at an R_F value about equal to that of the chlorogenic acid zone in the chromatogram of the *Standard solution;* and two yellow-brown to greenish fluorescent zones in the upper third of the plate. Other, less intense zones may be observed in the chromatogram of the *Test solution.*

B: Proceed as directed in the test for *Content of flavonol glycosides:* the retention times of the peaks for quercetin, isorhamnetin, and kaempferol in the chromatogram of the *Test solution* correspond to those in the chromatogram of the *Standard solution;* the peak for kaempferol is between 0.8 and 1.2 times the size of the quercetin peak; and the peak for isorhamnetin is not less than 0.1 times the size of the quercetin peak.

Microbial enumeration ⟨2021⟩—It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli.* The total aerobic bacterial count does not exceed 10^4 cfu per g, and the total combined molds and yeasts count does not exceed 10^3 cfu per g.

Loss on drying ⟨731⟩—Dry about 1.0 g of Powdered Extract, accurately weighed, at 105° for 2 hours: it loses not more than 5.0% of its weight.

Pesticide residues ⟨561⟩: meets the requirements.

Limit of ginkgolic acids—

Solution A—~~Prepare a mixture of water, acetonitrile, and phosphoric acid (70 : 30 : 0.3), and trifluoroacetic acid (1000 : 1).~~ Prepare a solution of 0.01% phosphoric acid in water.

Solution B—~~Prepare a mixture of acetonitrile and phosphoric acid (100 : 0.3), trifluoroacetic acid (1000 : 1).~~ Prepare a solution of 0.01% phosphoric acid in acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Ginkgolic Acids RS in methanol, and dilute quantitatively, and stepwise if necessary, with ~~methanol~~ water to obtain a solution having a known concentration of about ~~2.5 µg/0.5 µg~~ 0.25 µg per mL of ginkgolic acids.

Test solution—Transfer about ~~1.0 g~~ 0.5 g of Powdered Extract, accurately weighed, to a ~~suitable beaker, add 10 mL of water, and stir the mixture for 5 minutes. Quantitatively transfer the mixture to a separatory funnel, and rinse the beaker with 5 mL of water, adding the washings to the separatory funnel. Extract with four 10-mL portions of ethyl acetate. Combine the extracts, wash with two 5-mL portions of water, and discard the aqueous layer. Filter the organic phase, and evaporate to dryness in vacuum, on a water bath maintained at 50°. Dissolve the residue in 2.0 mL of methanol.~~ 10-mL volumetric flask, add ~~5~~ 8 mL of methanol to dissolve, and dilute with ~~methanol~~ water to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a ~~310-nm~~ 210-nm detector and a ~~4.0-mm × 12.5-cm~~ 4.6-mm × ~~25-cm~~ 5-cm column that contains base-deactivated packing ~~L1.~~ L7.

In-Process Revision

The column temperature is maintained at 35°. The flow rate is about ~~1.2~~ 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
~~0~~	~~100~~	~~0~~	~~equilibration~~
~~0–20~~	~~100→0~~	~~0→100~~	~~linear gradient~~

~~35–36~~	~~0→100~~	~~100→0~~	~~linear gradient~~
~~36–41~~	~~100~~	~~0~~	~~isocratic~~
~~0–30~~ 0–6	25→10	75→90	linear gradient
~~30–35~~ 6–7	10	90	isocratic
~~35–36~~ 7–8	10→25	90→75	linear gradient
~~36–45~~ 8–10	25	75	isocratic

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* ~~the retention times of peaks for ginkgolic acids are about 30 and 32 minutes;~~ the chromatogram obtained is similar to the Reference Chromatogram provided with USP Ginkgolic Acids RS; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than ~~3.0%~~ 2.0%.[NOTE—If deterioration of peak shapes is observed, wash the column using a mixture of methanol and water (9 : 1) for 30 minutes.]

Procedure—Separately inject equal volumes (about ~~200 µL 50 µL~~ 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, identify the peaks of the relevant analytes by comparison with the Reference Chromatogram, and measure the areas for the major peaks. ~~the sum of the peak areas due to ginkgolic acids obtained from the *Test solution* is not more than that obtained from the *Standard solution* (5 µg per g).~~ Calculate the concentration, in µg per g, of each ginkgolic acid in the portion of Powdered Extract taken by the formula:

$$10P(C/W)(r_U / r_S)$$

in which P is the content, in µg per g, of the relevant ginkgolic acid in USP Ginkgolic Acids RS; C is the concentration, in mg per mL, of USP Ginkgolic Acids RS in the *Standard solution; W* is the weight, in mg, of Powdered Extract taken to prepare the *Test solution;* and r_U and r_S are the peak areas for the relevant analyte obtained from the *Test solution* and the *Standard solution*, respectively. Calculate the total amount of ginkgolic acids by adding the individual contents: the limit is 5 µg per g.

Content of flavonol glycosides—

~~*Hydrochloric acid solution*—Transfer 16.0 mL of hydrochloric acid to a 100-mL volumetric flask, dilute with water to volume, and mix.~~

~~*Mobile phase*—Prepare a mixture of citric acid solution (0.6 in 100), acetonitrile, and isopropyl alcohol (100 : 47 : 5). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~

~~*Standard solution*—Dissolve an accurately weighed quantity of USP Quercetin RS in a mixture of methanol, *Hydrochloric acid solution*, and water (6 : 3 : 1) to obtain a solution having a known concentration of about 0.2 mg per mL.~~

~~*Test solution*—Transfer about 200 mg of Powdered Extract, accurately weighed, to a 50-mL volumetric flask, add 20 mL of methanol, and shake well to dissolve. Add 15 mL of *Hydrochloric acid solution* and 5 mL of water, dilute with methanol to volume, and mix. Transfer 10.0 mL of this solution to a 10-mL amber glass flask, seal the flask with a rubber seal and an aluminum cap, and heat in a hot water bath for 25 minutes. Cool the flask to room temperature.~~

In-Process Revision

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 370-nm detector and a 4.0-mm × 12.5-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%. Chromatograph the *Test solution*, and record the peak responses as directed for *Procedure:* the relative retention times for the flavonol glycosides of interest are about 1.0 for quercetin, 1.58 for kaempferol, and 1.7 for isorhamnetin. [NOTE—Isorhamnetin sometimes co-elutes with kaempferol.]~~

~~*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of flavonol glycosides, as *3-O*-(*2-O*-[*6-O*-(*p*-hydroxy-*trans*-cinnamoyl-RS-*β*-D-glucosyl]-α-L-rhamnosyl)-quercetin with a mean molecular weight of 756.7, in the portion of Powdered Extract taken by the formula:~~

$$2.51 \times 50CP(r_U/r_S)$$

~~in which 2.51 is the mean molecular weight conversion factor; *C* is the concentration, in mg per mL, of USP Quercetin RS in the *Standard solution; P* is the designated purity, in percentage, of USP Quercetin RS; r_U is the sum of the peak areas for quercetin, kaempferol, and isorhamnetin obtained from the chromatogram of the *Test solution;* and r_S is the peak area for quercetin obtained from the chromatogram of the *Standard solution*.~~

Extraction solvent, Mobile phase, and *Chromatographic system*—Proceed as directed in the test for *Content of flavonol glycosides* under *Ginkgo*.

Standard solutions—Transfer accurately weighed quantities of USP Quercetin RS, kaempferol, and isorhamnetin to separate volumetric flasks, dissolve each in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain *Standard solutions 1*, *2*, and *3* having known concentrations of 0.125 mg per mL, 0.125 mg per mL, and 0.03 mg per mL, respectively.

Test solution—Transfer about 0.300 g of Powdered Extract, accurately weighed, to a 250-mL flask fitted with a reflux condenser. Add 78 mL of *Extraction solvent*, and reflux on a hot water bath for 135 minutes. [NOTE—The solution will turn deep red. The color of the solution is not a definitive indication of reaction completeness.] Allow to cool at room temperature. Transfer to a 100-mL volumetric flask, add water to volume, and mix.

Procedure—Proceed as directed in the test for *Content of flavonol glycosides* under *Ginkgo*. Calculate the percentage of each flavonol glycoside in the portion of Powdered Extract taken by the formula:

~~$10M(C/W)(r_U/r_S)$~~

$$10(2.51)(C/W)(r_U/r_S)$$

in which *W* is the weight, in g, of Powdered Extract taken to prepare the *Test solution;* and the other terms are as defined therein. Calculate the total percentage of flavonol glycosides by adding the individual percentages calculated.

Content of terpene lactones—

~~*Buffer solution*—Dissolve 1.19 g of dibasic sodium phosphate and 8.25 g of monobasic potassium phosphate in 1000 mL of water, and adjust to a pH of about 5.8.~~

~~*Mobile phase*—Prepare a mixture of water, methanol, and tetrahydrofuran (70 : 20 : 10). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~

In-Process Revision

~~*Standard solution*—Dilute benzyl alcohol with *Mobile phase* to obtain a solution having a known concentration of about 0.3 mg per mL.~~

~~*Test solution*—Transfer about 120 mg of Powdered Extract, accurately weighed, to a 25-mL beaker, add 10 mL of *Buffer solution*, and dissolve by stirring. Quantitatively transfer the solution to a 30- × 150-mm glass chromatographic tube filled with 15 g of chromatographic siliceous earth. Rinse the beaker with two 5-mL portions of *Buffer solution*, and transfer the washings to the column. Allow the *Buffer solution* to drain off the column. After 15 minutes elute the column with 100 mL of ethyl acetate, collect the ethyl acetate solution, and evaporate to dryness under vacuum, on a water bath maintained at 50°. Remove the last traces of the solvent with the aid of a current of air at room temperature. Dissolve the residue in 2.5 mL of *Mobile phase*.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector, maintained at a temperature of 35°, and a 4.0-mm × 25-cm column that contains packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution* and the *Test solution*, and record the chromatograms as directed for *Procedure*: the retention time for benzyl alcohol is between 5 and 12 minutes; the relative retention times are about 1.0 for benzyl alcohol, 1.1 for ginkgolide C, 1.3 for bilobalide, 1.6 for ginkgolide A, and 2.2 for ginkgolide B; and the relative standard deviation for replicate injections is not more than 2.0%.~~

~~*Procedure*—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Separately calculate the quantities, in mg, of bilobalide ($C_{15}H_{18}O_8$), ginkgolide A ($C_{20}H_{24}O_9$), ginkgolide B ($C_{20}H_{24}O_{10}$), and ginkgolide C ($C_{20}H_{24}O_{11}$) in the portion of Powdered Extract taken by the formula:~~

~~$$2.5FCP(r_u/r_s)$$~~

~~in which F is the response factor for the relevant analyte (namely, 1.20 for bilobalide, 1.22 for ginkgolide A, 1.19 for ginkgolide B, and 1.27 for ginkgolide C, relative to 1.0 for benzyl alcohol); C is the concentration, in mg per mL, of benzyl alcohol in the *Standard solution*; P is the designated purity, in percentage, of benzyl alcohol used in the *Standard solution*; r_u is the peak area for the corresponding analyte obtained from the *Test solution*; and r_s is the peak area for benzyl alcohol obtained from the *Standard solution*. Calculate the content of total terpene lactones, in mg, in the portion of Powdered Extract taken by adding all of the quantities calculated for individual analytes.~~

~~*Solvent,*~~ *Solution A, Solution B, Mobile phase, Standard solutions, Buffer solution, Diluent,* and *Chromatographic system*—Proceed as directed in the test for *Content of terpene lactones* under *Ginkgo*.

Test solution—~~Transfer 400 mg of Powdered Extract, accurately weighed, to a round-bottom 50-mL volumetric flask, add 40.0 mL of *Solvent*, sonicate in a bath at 60° for 20 for a few minutes, allow to cool, dilute with *Solvent* to volume, and filter through a membrane having a 0.45 µm or finer porosity.~~ Transfer about 120 mg of Powdered Extract, accurately weighed, to a 25-mL beaker, and proceed as directed for *Test solution* in the test for *Content of terpene lactones* under *Ginkgo,* starting with "add 10 mL of *Buffer solution*", except to dissolve the residue in 20.0 mL of *Diluent.*

Procedure—Proceed as directed in the test for *Content of terpene lactones* under *Ginkgo*. ~~except that the correlation coefficient for the regression line is not less than 0.999.~~ Se-

In-Process Revision

parately calculate the percentages of bilobalide ($C_{15}H_{18}O_8$), ginkgolide A ($C_{20}H_{24}O_9$), ginkgolide B ($C_{20}H_{24}O_{10}$), and ginkgolide C ($C_{20}H_{24}O_{11}$) ~~and ginkgolide J ($C_{20}H_{24}O_{10}$)~~ in the portion of Powdered Extract taken by the formula:

~~4000(*C/W*)~~

~~5000(*C/W*)~~

2000(*C/W*)

in which *C* is the concentration, in mg per mL, of the relevant analyte in the *Test solution;* and *W* is the weight, in mg, of Powdered Extract taken to prepare the *Test solution.* Calculate the total percentage of terpene lactones in the portion of Powdered Extract taken by adding the percentages calculated for each analyte.

Other requirements—It meets the requirements for *Residue on Evaporation, Residual Solvents,* and *Heavy Metals* under *Botanical Extracts* ⟨565⟩.▲*USP30*

BRIEFING

Ginkgo Capsules, page 2238 of *PF* 27(2) [Mar.–Apr. 2001]. It is proposed to add storage conditions to *Packaging and storage.* In the test for *Disintegration and Dissolution,* it is proposed to change the index component used in the *Procedure* from ginkgolide A to ginkgolide B, to correspond to the component used in the *Ginkgo Tablets* monograph and because ginkgolide B is less polar than ginkgolide A. See also briefing under *Powdered Ginkgo Extract.*

(DSB: M. Sharaf) RTS—43478-1

Add the following:

▲Ginkgo Capsules

» Ginkgo Capsules are prepared with Powdered Ginkgo Extract and contain, in the labeled amount of Powdered Extract, not less than ~~20.0~~ 22.0 percent and not more than ~~30.0~~ 27.0 percent of flavonol glycosides and not less than 5.4 percent and not more than ~~13.2~~ 12.0 percent of terpene lactones, calculated as the sum of bilobalide ($C_{15}H_{18}O_8$), ginkgolide A ($C_{20}H_{24}O_9$), ginkgolide B ($C_{20}H_{24}O_{10}$), and ginkgolide C ($C_{20}H_{24}O_{11}$). ~~and ginkgolide J ($C_{20}H_{24}O_{10}$).~~

Packaging and storage—Preserve in tight, light-resistant containers, and store at room temperature.

Labeling—The label states the Latin binomial ~~name~~ and, following the official name, the article used to prepare the Capsules. Label the Capsules to indicate the amount, in mg, of Powdered Ginkgo Extract per Capsule.

USP Reference standards ⟨11⟩—*USP Ginkgo Terpene Lactones RS.* ~~*USP Isorhamnetin RS. USP Kaempferol RS.*~~ *USP Quercetin RS.* ~~*USP Rutin RS.*~~

Identification—

A: ~~The retention times of the peaks for quercetin, isorhamnetin, and kaempferol in the chromatogram of the *Test solution* correspond to those in the chromatogram of the appropriate *Standard solution,* as obtained in the test for *Content of flavonol glycosides.*~~ It meets the requirements of *Identification* test *B* under *Powdered Ginkgo Extract.*

In-Process Revision

B: The retention times of the peaks for bilobalide, ginkgolide A, ginkgolide B, and ginkgolide C in the chromatogram of the *Test solution* correspond to those in the chromatogram of the *Standard solutions,* as obtained in the test for *Content of terpene lactones.*

Disintegration and dissolution ⟨2040⟩**:** meet the requirements for *Dissolution.*

Medium: 0.1 N hydrochloric acid; 500 mL.

Apparatus 2: 75 rpm.

Time: 45 minutes.

Standard solutions—Proceed as directed in the test for *Content of terpene lactones* under *Ginkgo*.

Test solution—Combine 25-mL portions of the solution under test from each one of the six dissolution vessels in a separation funnel. Extract with four 50-mL portions of ethyl acetate. Combine the extracts, and evaporate in vacuum to dryness. Dissolve the residue with sonication in 5.0 mL of a mixture of water and methanol ~~(7 : 3)~~ (1 : 1).

Procedure—Proceed as directed in the test for *Content of terpene lactones* to determine the concentration, *C*, in mg per mL, of ginkgolide ~~A~~ B in the *Test solution.* Calculate the percentage of ginkgolide ~~A~~ B dissolved by the formula:

$$5000C/3G$$

in which *C* is as obtained above; and *G* is the content, in mg per Capsule, of ginkgolide ~~A~~ B as determined in the test for *Content of terpene lactones.*

Tolerances—Not less than 75% of the content of ginkgolide ~~A~~ B is dissolved in 45 minutes.

Weight variation ⟨2091⟩**:** meet the requirements.

Content of flavonol glycosides—

Mobile phase and *Chromatographic system*—Proceed as directed in the test for *Content of flavonol glycosides* under *Ginkgo*.

Standard solutions—Proceed as directed in the test for *Content of flavonol glycosides* under *Ginkgo,* except to obtain solutions having known concentrations of 0.2 mg per mL, 0.2 mg per mL, and 0.05 mg per mL, respectively.

Test solution—Weigh and finely powder the contents of not fewer than 20 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about 48 mg of flavonol glycosides, to a 50-mL volumetric flask. Add 20 mL of methanol, and sonicate for about 3 minutes. Add 20 mL of 1.5 N hydrochloric acid, and sonicate again for about 10 minutes. Allow to cool to room temperature, and dilute with methanol to volume. Centrifuge, and transfer a portion of the clear supernatant to a rubber-capped, low-actinic glass vial. Heat in a steam bath for 25 minutes, and cool to room temperature in an ice bath.

Procedure—Separately inject equal volumes (about 10 µL) of each of the *Standard solutions* and the *Test solution* into the chromatograph; record the chromatograms; identify the peaks for quercetin, kaempferol, and isorhamnetin by comparison with the chromatogram obtained from the corresponding *Standard solution;* and measure the responses for those peaks. Separately calculate the quantities, in mg, of quercetin, kaempferol, and isorhamnetin glycosides in the portion of Capsules taken by the formula:

~~$50CM(r_U/r_S)$~~

$$50(2.51)C(r_U/r_S)$$

in which 2.51 is the mean molecular mass factor to convert each analyte into a flavonol glycoside with a mean molecular mass of 756.7; *C* is the concentration, in mg per mL, of ~~the relevant~~ USP ~~Reference Standard~~ Quercetin RS in ~~each~~ *Standard solution 1;* ~~*M* is the factor to convert each analyte into its respective glycoside and it is 2.504 for quercetin,~~

In-Process Revision

~~2.588 for kaempferol, and 2.437 for isorhamnetin; r_U and r_S are~~ r_U is the peak response for the relevant analytes obtained from the *Test solution;* and r_S is the peak response of USP Quercetin RS in ~~the corresponding~~ *Standard solution 1.* ~~, respectively~~.

Content of terpene lactones—

Solution A, Solution B, Mobile phase, Standard solutions, Buffer solution, Diluent, Solvent, and *Chromatographic system*—Proceed as directed in the test for *Content of terpene lactones* under *Ginkgo*.

Test solution—Weigh and finely powder the contents of not fewer than 20 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about ~~18 mg of terpene lactones, to a 50-mL volumetric flask, add about 40 mL of methanol, and sonicate for about 15 minutes. Allow to cool to room temperature, dilute with methanol to volume, mix, and centrifuge.~~ 120 mg of ginkgo extract, to a 30-mL tube with screw cap and PTFE gasket, and proceed as directed in the *Test solution* in the test for *Content of terpene lactones* under *Ginkgo,* starting with "Add 10.0 mL of *Solvent*", except to dissolve the final residue in 20.0 mL of *Diluent*.

Procedure—Proceed as directed in the test for *Content of terpene lactones* under *Ginkgo*. Separately calculate the quantities, in mg, of bilobalide ($C_{15}H_{18}O_8$), ginkgolide A ($C_{20}H_{24}O_9$), ginkgolide B ($C_{20}H_{24}O_{10}$), and ginkgolide C ($C_{20}H_{24}O_{11}$)~~, and ginkgolide J ($C_{20}H_{24}O_{10}$)~~ in the portion of Capsules taken by the formula:

$$\frac{\text{~~50}C\text{~~}}{20C}$$

in which C is as defined therein. Calculate the total quantity, in mg, of terpene lactones in the portion of Capsules taken by adding the individual quantities calculated.▲*USP30*

BRIEFING

Ginkgo Tablets, page 2240 of *PF* 27(2) [Mar.–Apr. 2001]. It is proposed to add storage conditions in *Packaging and storage.* In the test for *Content of terpene lactones,* it is proposed to revise the preparation of the *Test solution* and also to revise the formula used for the calculation in the *Procedure*. See also briefing under *Powdered Gingko Extract.*

(DSB: M. Sharaf) RTS—43478-2

Add the following:

▲Ginkgo Tablets

» Ginkgo Tablets are prepared from Powdered Ginkgo Extract and contain, in the labeled amount of Powdered Extract, not less than ~~90.0 20.0~~ 22.0 percent and not more than ~~110.0 30.0~~ 27.0 percent ~~of the labeled amount~~ of flavonol glycosides and not less than ~~90.0~~ 5.4 percent and not more than ~~110.0 13.2~~ 12.0 percent ~~of the labeled amount~~ of terpene lactones, consisting of bilobalide ($C_{15}H_{18}O_8$), ginkgolide A ($C_{20}H_{24}O_9$), ginkgolide B ($C_{20}H_{24}O_{10}$), ~~and~~ and ginkgolide C ($C_{20}H_{24}O_{11}$). ~~, and ginkgolide J ($C_{20}H_{24}O_{10}$).~~

Packaging and storage—Preserve in tight, light-resistant containers, and store at room temperature.

Labeling—The label states the Latin binomial ~~name,~~ and following the official name, the article used to prepare the Tablets. Label the Tablets to indicate the ~~amount,~~ content, in mg, of ~~total flavonol glycosides and total terpene lactones per Tablet.~~ Powdered Ginkgo Extract per Tablet.

In-Process Revision

USP Reference standards ⟨11⟩—~~*USP Powdered Ginkgo Extract RS.*~~ *USP Ginkgo Terpene Lactones RS.* ~~*USP Isorhamnetin RS. USP Kaempferol RS.*~~ *USP Quercetin RS.*

Identification—

A: ~~The retention times of the peaks for quercetin, isorhamnetin, and kaempferol in the chromatogram of the *Test solution* correspond to those in the chromatogram of the appropriate *Standard solution*, as obtained in the test for *Content of flavonol glycosides.*~~ It meets the requirements of *Identification* test *B* under *Powdered Ginkgo Extract*.

B: The retention times of the peaks for bilobalide, ginkgolide A, ginkgolide B, and ginkgolide C in the chromatogram of the *Test solution* correspond to those in the chromatogram of the *Standard solutions,* as obtained in the test for *Content of terpene lactones.*

Disintegration and dissolution ⟨2040⟩: meet the requirements for *Dissolution.*

Medium: 0.1 N hydrochloric acid; 500 mL.

Apparatus 2: 75 rpm.

Time: 45 minutes.

Standard solutions—Proceed as directed in the test for *Content of terpene lactones* under *Ginkgo.*

Test solution—Combine 25-mL portions of the solution under test from each one of the six dissolution vessels in a separation funnel. Extract with four 50-mL portions of ethyl acetate. Combine the extracts, and evaporate in vacuum to dryness. Dissolve the residue with sonication in 5.0 mL of a mixture of water and methanol ~~(7 : 3)~~ (1 : 1).

Procedure—Proceed as directed in the test for *Content of terpene lactones* to determine the concentration, *C*, in mg per mL, of ginkgolide B in the *Test solution.* Calculate the percentage of ginkgolide B dissolved by the formula:

$$5000C/3G$$

in which *C* is as obtained above; and *G* is the content, in mg per Tablet, of ginkgolide B as determined in the test for *Content of terpene lactones.*

Tolerances—Not less than 75% of the content of ginkgolide B is dissolved in 45 minutes.

Weight variation ⟨2091⟩: meet the requirements.

Content of flavonol glycosides—

Mobile phase—Proceed as directed in the test for *Content of flavonol glycosides* under *Ginkgo.*

Solvent—Transfer 20 mL of 1.5 N hydrochloric acid to a 50-mL volumetric flask, dilute with methanol to volume, and mix.

Standard solutions—~~Dissolve an accurately weighed quantity of USP Powdered Ginkgo Extract RS in *Solvent* to obtain a solution having a known concentration of about 1 mg of flavonol glycosides per mL. Transfer a portion of this solution to a rubber-capped, low-actinic glass vial, heat in a steam bath for 25 minutes, and then cool to room temperature in an ice bath.~~ Proceed as directed for *Standard solutions* in the test for *Content of flavonol glycosides* under *Ginkgo,* except to obtain solutions having known concentrations of 0.2 mg per mL, 0.2 mg per mL, and 0.05 mg per mL, respectively.

Test solution—Weigh and ~~using a mortar and pestle,~~ finely powder not fewer than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 50 mg of flavonol glycosides, to a 50-mL volumetric flask.

Add 20 mL of methanol, and sonicate for about 3 minutes. Add 20 mL of 1.5 N hydrochloric acid, and sonicate again for about 10 minutes. Allow to cool to room temperature, and dilute with methanol to volume. Centrifuge, and transfer a portion of the clear supernatant to a rubber-capped, low-actinic glass vial. Heat in a steam bath for 25 minutes, and cool to room temperature in an ice bath.

Chromatographic system—Prepare as directed in the test for *Content of flavonol glycosides* under *Ginkgo*. ~~Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure:* the chromatogram obtained from the *Standard solution* is similar to the Reference Chromatogram for flavonol glycosides provided with USP Powdered Ginkgo Extract RS.~~

Procedure—Separately inject equal volumes (about 10 µL) of each of the *Standard solutions* and the *Test solution* into the chromatograph, record the chromatograms, identify the peaks for quercetin, isorhamnetin, and kaempferol by comparison with the chromatogram obtained from the corresponding *Standard solution*, and measure the responses for those peaks. Separately calculate the quantities, in mg, of quercetin, isorhamnetin, and kaempferol glycosides in the portion of Tablets taken by the formula:

~~$0.5CP(r_U/r_S)$~~

~~$50CM(r_U/r_S)$~~

$$50(2.51)C(r_U/r_S)$$

in which 2.51 is the mean molecular mass factor to convert each analyte into a flavonol glycoside with a mean molecular mass of 756.7; C is the concentration, in mg per mL, of ~~USP Powdered Ginkgo Extract RS the relevant~~ USP ~~Reference Standard~~ Quercetin RS in ~~each~~ *Standard solution 1;* ~~P is the designated percentage of the relevant glycoside in USP Powdered Ginkgo Extract RS; M is the factor to convert each analyte into its respective glycoside and it is 2.504 for quercetin, 2.588 for kaempferol, and 2.437 for isorhamnetin;~~ r_U ~~and r_S are~~ is the peak response for the relevant analytes obtained from the *Test solution;* and r_S is the peak response of USP Quercetin RS in ~~corresponding~~ *Standard solution 1.* ~~respectively.~~ Calculate the total quantity, in mg, of flavonol glycosides in the portion of Tablets taken by adding the individual quantities calculated.

Content of terpene lactones—

~~*Buffer solution*—Dissolve 1.19 g of dibasic sodium phosphate and 8.25 g of monobasic potassium phosphate in 1000 mL of water, and adjust to a pH of about 5.8.~~

~~*Mobile phase*—Prepare a mixture of water, methanol, and tetrahydrofuran (70 : 20 : 10). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~

~~*Standard solution*—Dissolve an accurately weighed quantity of USP Powdered Ginkgo Extract RS in *Buffer solution* to obtain a solution having a known concentration of about 0.4 mg of terpene lactones per mL. Transfer 20.0 mL of this solution to a 30 × 150 mm glass chromatographic tube filled with 15 g of chromatographic siliceous earth. Allow the *Buffer solution* to drain off the column. After 15 minutes elute the column with 100 mL of ethyl acetate, collect the eluate, and evaporate to dryness in vacuum on a water bath maintained at 50°. Remove the last traces of solvent with the aid of a current of air at room temperature. Dissolve the residue in 2.5 mL of *Mobile phase*.~~

Solvent, Buffer solution, Diluent, Solution A, Solution B, Mobile phase, Standard solutions, and *Chromatographic system*—Proceed as directed in the test for *Content of terpene lactones* under *Ginkgo.*

In-Process Revision

Test solution—Weigh and finely powder~~, using a mortar and pestle,~~ not fewer than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about ~~18 mg of terpene lactones, to a 50-mL volumetric flask, add about 35 mL of *Buffer solution*, 40 mL of *Solvent*, and sonicate for about 15 minutes with occasional shaking. Allow to cool to room temperature, and dilute with *Buffer solution* *Solvent* to volume, and mix, and centrifuge. Use the supernatant as the *Test solution*. and transfer 20.0 mL of the clear supernatant to a 30- × 150-mm glass chromatographic tube filled with 15 g of chromatographic siliceous earth. Proceed as directed for the *Standard solution,* beginning with "Allow the *Buffer solution* to drain off...".~~ 120 mg of ginkgo extract, to a 30-mL tube with a cap and PTFE gasket, and proceed as directed in the *Test solution* in the test for *Content of terpene lactones* under *Ginkgo,* starting with ''Add 10.0 mL of Solvent,'' except to dissolve the final residue in 20.0 mL of *Diluent*.

~~*Chromatographic system* (see *Chromatography* ⟨621⟩) — The liquid chromatograph is equipped with a refractive index detector and a 4.0-mm × 25-cm column that contains packing L7. The column temperature is maintained at 35°. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution* and the *Test solution*, and record the chromatograms as directed for *Procedure*: the relative standard deviation for replicate injections of bilobalide is not more than 2.0%; and the chromatogram obtained from the *Standard solution* is similar to the Reference Chromatogram for terpene lactones provided with USP Powdered Ginkgo Extract RS.~~

Procedure— ~~Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution*, record the chromatograms, and measure the areas of the major peaks.~~ Proceed as directed for *Content of terpene lactones* under *Ginkgo*. Separately calculate the quantities, in mg, of bilobalide ($C_{15}H_{18}O_8$), ginkgolide A ($C_{20}H_{24}O_9$), ginkgolide B ($C_{20}H_{24}O_{10}$), ~~and~~ and ginkgolide C ($C_{20}H_{24}O_{11}$)~~, and ginkgolide J ($C_{20}H_{24}O_{10}$)~~ in the portion of Tablets taken by the formula:

~~$0.025CP(r_U/r_S)$,~~

~~$50C$~~

$20C$

in which C is as ~~the concentration, in mg per mL, of USP Powdered Ginkgo Extract RS in the *Standard solution; P* is the designated percentage of the relevant analyte in USP Powdered Ginkgo Extract RS; and r_U and r_S are the areas for the relevant peaks obtained from the *Test solution* and the *Standard solution*, respectively~~ defined therein. Calculate the total quantity, in mg, of terpene lactones in the portion of Tablets taken by adding the individual quantities calculated. ▲*USP30*

MONOGRAPHS (NF)

BRIEFING

Acetyltributyl Citrate, *NF 24* page 3266; **Acetyltriethyl Citrate,** *NF 24* page 3266; **Tributyl Citrate,** *NF 24* page 3450; **Triethyl Citrate,** *NF 24* page 3451. On the basis of several comments received, it is proposed to revert to the previous assay method requiring the use of an on-column temperature programmable injector. The current method employs the use of a split injection system, and reports have indicated that this system fails to separate acetyl-

tributyl citrate, tributyl citrate, triethyl citrate, and acetyltriethyl citrate peaks. In addition, minor editorial style changes have been made.

(EM1: C. Sheehan) RTS—43050-1

Change to read:

Assay—

System suitability solution—Prepare a solution in toluene containing about 30 mg each of USP Acetyltributyl Citrate RS and USP Tributyl Citrate RS per mL.

Assay preparation—Transfer about 300 mg of Acetyltributyl Citrate, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with toluene to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with

▲an on-column, temperature-programmable injector,▲*NF25* a flame-ionization detector maintained at about 275°, ~~a split injection system with a split ratio of about 30 : 1,~~

▲▲*NF25* and a 0.32-mm × 30-m column bonded with a 0.5-µm layer of phase G42. The column temperature is programmed as follows. Initially the temperature of the column is maintained at about 80° for 0.5 minute, then increased at a rate of 20° per minute to about 220°, and maintained at about 220° for 10 minutes. The injection port temperature is ~~maintained at about 85°.~~

▲programmed as follows. Initially the temperature is maintained at about 85° for 0.5 minute, then increased at a rate of 20° per minute to about 225°, and maintained at about 225° for 10 minutes.▲*NF25*

The carrier gas is helium, flowing at a rate of about 2.3 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.9 for tributyl citrate and 1.0 for acetyltributyl citrate; the resolution, *R,* between tributyl citrate and acetyltributyl citrate is not less than 1.5; and the relative standard deviation for replicate injections is not more than 2.0% determined from both the tributyl citrate and acetyltributyl citrate peaks, based on area percent calculation.

Procedure—Inject 1 µL of the *Assay preparation* into the chromatograph, record the chromatogram, and measure all of the peak areas, excluding the solvent peak. Calculate the percentage of $C_{20}H_{34}O_8$ in the portion of Acetyltributyl Citrate taken by the formula:

$$100(A/B)$$

in which *A* is the acetyltributyl citrate peak area response; and *B* is the sum of the area responses of all the peaks.

BRIEFING

Acetyltriethyl Citrate, *NF 24* page 3266—See briefing under *Acetyltributyl Citrate*.

BRIEFING

Strawberry Syrup. Because there is no existing *NF* monograph for this syrup, the following new monograph is proposed.

(CRX: C. Okeke) RTS—43128-1

Add the following:

▲Strawberry Syrup

» Prepare Strawberry Syrup as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Strawberry juice	475 mL
Sucrose	800 g
Alcohol	20 mL
Purified Water, a sufficient quantity to make	1000 mL

Dissolve Sucrose in Strawberry juice by gently heating on a steam bath, cool, and remove the foam and floating solids. Add Alcohol and sufficient Purified Water to make 1000 mL, and mix.

Packaging and storage—Preserve in tight, light-resistant containers, and prevent exposure to excessive heat.

Labeling—The label states the Latin binomial name and, following the official name, the part of the plant source from which the article was derived.

Alcohol content, *Method I* ⟨611⟩**:** between 1.0% and 2.0% of C_2H_5OH is found.▲*NF25*

BRIEFING

Tributyl Citrate, *NF 24* page 3450—See briefing under *Acetyltributyl Citrate*.

(EM1: C. Sheehan) RTS—43050-3

In-Process Revision

Change to read:

Chemical Tests and Assays

LIMIT TESTS

BRIEFING

⟨**231**⟩ **Heavy Metals,** *USP 29* page 2556 and page 1435 of *PF* 31(5) [Sept.–Oct. 2005]. On the basis of comments received, *Method II* is being revised to add a *Blank Preparation* and to address issues related to sample size and pH adjustment. The *Standard Preparation* has also been revised to ensure that the *Standard Preparation, Test Preparation,* and *Blank Preparation* are treated the same way for valid comparison.

(GC: K. Zaidi) RTS—43620-1

Change to read:

METHOD II

NOTE—This method does not recover mercury.

▲**Blank Preparation—**Prepare as directed under *Standard Preparation,* using 2 mL of water instead of the *Standard Lead Solution.*▲*USP30*

pH 3.5 Acetate Buffer—Prepare as directed under *Method I.*

Standard Preparation— ~~Pipet 4 mL of the *Standard Lead Solution* into a suitable test tube, and add 10 mL of 6 N hydrochloric acid.~~

▲Pipet 2 mL of the *Standard Lead Solution* into a suitable crucible and evaporate on a steam bath to dryness. Add sufficient sulfuric acid to wet the surface, and carefully ignite at low temperature until thoroughly charred. (The crucible may be loosely covered with a suitable lid during the charring.) Add 2 mL of nitric acid and 5 drops of sulfuric acid, and heat cautiously until white fumes no longer are evolved.

In-Process Revision

Ignite, preferably in a muffle furnace, at 500° to 600°, until the carbon is completely burned off (no longer than 2 hours). If carbon remains, allow the residue to cool, add a few drops of sulfuric acid, evaporate, and ignite again. Cool, add 5 mL of 6 N hydrochloric acid, cover, and digest on a steam bath for 10 minutes. Cool, and quantitatively transfer the solution to a test tube. Rinse the crucible with a second 5-mL portion of 6 N hydrochloric acid, and transfer the rinsing to the test tube.▲*USP30*

Test Preparation—Use a quantity, in g, of the substance to be tested as calculated by the formula:

~~4.0/(1000*L*)~~

▲2.0/(1000*L*)▲*USP30*

in which *L* is the *Heavy metals* limit, as a percentage.

▲[NOTE—If the sample is liquid, first evaporate to dryness on a steam bath.]▲*USP30*
Transfer the weighed quantity of the substance to a suitable crucible, add sufficient sulfuric acid to wet the substance, and carefully ignite at a low temperature until thoroughly charred. (The crucible may be loosely covered with a suitable lid during the charring.) Add to the carbonized mass 2 mL of nitric acid and 5 drops of sulfuric acid, and heat cautiously until white fumes no longer are evolved. Ignite, preferably in a muffle furnace, at 500° to 600°, until the carbon is completely burned off (no longer than 2 hours). If carbon remains, allow the residue to cool, add a few drops of sulfuric acid, evaporate, and ignite again. Cool, add 5 mL of 6 N hydrochloric acid, cover, and digest on a steam bath for 10 minutes. Cool, and quantitatively transfer the solution to a test tube

▲or a beaker.▲*USP30*
Rinse the crucible with a second 5-mL portion of 6 N hydrochloric acid, and transfer the rinsing to the test tube

▲or a beaker.▲*USP30*

~~**Monitor Preparation**—Pipet 4 mL of the *Standard Lead Solution* into a crucible identical to that used for the *Test Preparation* and containing a quantity of the substance under test that is equal to 10% of the amount required for the *Test Preparation*. Evaporate on a steam bath to dryness. Ignite at the same time, in the same muffle furnace, and under the same conditions used for the *Test Preparation*. Cool, add 5 mL of 6 N hydrochloric acid, cover, and digest on a steam bath for 10 minutes. Cool, and quantitatively transfer to a test tube. Rinse the crucible with a second 5-mL portion of 6 N hydrochloric acid, and transfer the rinsing to the test tube.~~

■■2S (*USP29*)

Procedure—

▲[NOTE—When adjusting the pH, a water bath can be used to keep the preparations near room temperature. Stir well during pH adjustment.]▲*USP30*
Adjust the solution in each of the tubes containing the *Standard Preparation*

Cool, and adjust with glacial acetic acid, added dropwise, to a pH of 8, then add 0.5 mL in excess. Using a pH meter, ~~or short range pH indicator paper as external indicator, check the pH,and adjust,~~

■check and adjust the pH,■2S (*USP29*)
if necessary, with

▲glacial acetic acid,▲*USP30*
1 N acetic acid, or 6 N ammonium hydroxide to a pH between 3.0 and 4.0. Filter, if necessary, washing the filter with a few mL of water, into a 50-mL color-comparison tube, and then dilute with water to 40 mL. Add 2 mL of *pH 3.5 Acetate Buffer,* then add 1.2 mL of thioacetamide–glycerin base TS, dilute with water to 50 mL, mix, allow to stand for 2 minutes, and view downward over a white surface*: the color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation.*

▲[NOTE—If the color of the solution from the *Standard Preparation* is not distinguishable from the *Blank Preparation,* the *Test Preparation* is not evaluated.]▲*USP30*
~~and the color of the solution from the *Monitor Preparation* is equal to or darker than that of the solution from the *Standard Preparation*. [NOTE—If the color of the solution from the *Monitor Preparation* is lighter than that of the solution from the *Standard Preparation,* proceed as directed for *Method III* for the substance being tested.]~~

■■2S (*USP29*)

* In those countries or jurisdictions where thioacetamide cannot be used, add 10 mL of freshly prepared hydrogen sulfide TS to each of the tubes, mix, allow to stand for 5 minutes, and view downward over a white surface.

DIETARY SUPPLEMENTS

General Chapters—General Information

BRIEFING

⟨2040⟩ Disintegration and Dissolution of Dietary Supplements, *USP 29* page 3089. This revision of general chapter ⟨2040⟩, which previously appeared in *Pharmacopeial Previews* on page 1673 of *PF* 28(5) [Sept.–Oct. 2002], is now forwarded to *In-Process Revision.* Having received no comments regarding this proposal to use a *Rupture* test in lieu of a *Disintegration* test for soft gelatin capsules, the text is published here with minor editorial changes. The previewed revision was based on comments stating that performance characteristics for dietary supplements in soft gelatin capsules are not appropriately measured by the *Disintegration* test. This problem seems to be worse for some preparations containing botanical extracts, where the gelatin cross-linking process is reported to be exacerbated over time. Complete disintegration of the gelatin mass formed from placing the capsule in a disintegration medium requires a significantly longer time than that for other dosage forms. Although the gelatin capsule may rupture and release its contents, the gelatin shell requires a longer period of time to disintegrate. Therefore, a *Disintegration* test for soft gelatin capsules would be measuring the disintegration of gelatin which may not be representative of the availability of the dietary ingredient. For these reasons, in several monographs, USP has adopted a *Rupture* test in lieu of a test for *Disintegration*. A *Rupture* test seems to be a more appropriate test for soft gelatin capsules filled with liquids. The DS-BA Expert Committee decided to move this proposal forward to *In-Process Revision* and encourages interested parties to submit their comments and pertinent data.

(DS-BA: D. Cairatti) RTS—43551-1

In-Process Revision

Change to read:

DISINTEGRATION

This test is provided to determine compliance with the limits on *Disintegration* stated below or in the individual class monographs on dietary supplements, including botanical dosage forms. This test applies to uncoated and plain coated tablets and to hard gelatin and soft gelatin capsules. It does not apply to tablets or capsules designed to liberate vitamin or mineral content over an extended period or where the label states that the dosage form is to be chewed. Determine the type of units under test from the labeling and from observation, and apply the appropriate procedure to 6 or more dosage units.

For the purposes of this test, disintegration does not imply complete solution of the unit or even of its active constituent. Complete disintegration is defined as that state in which any residue of the unit, except fragments of insoluble coating or capsule shell remaining on the screen of the test apparatus, is a soft mass having no palpably firm core.

Apparatus

Apparatus A—Use the *Apparatus* described under *Disintegration* ⟨701⟩ for tablets or capsules that are not greater than 18-mm long. For larger tablets or capsules, use *Apparatus B.*

Apparatus B—The apparatus* consists of a basket-rack assembly, a 1000-mL, low-form beaker for the immersion fluid, a thermostatic arrangement for heating the fluid between 35° and 39°, and a device for raising and lowering the basket in the immersion fluid at a constant frequency rate between 29 and 32 cycles per minute through a distance of not less than 5.3 cm and not more than 5.7 cm. The volume of the fluid in the vessel is such that at the highest point of the upward stroke the wire mesh remains at least 2.5 cm below the surface of the fluid and descends to not less than 2.5 cm from the bottom of the vessel on the downward stroke. The time required for the upward stroke is equal to the time required for the downward stroke, and the change in stroke direction is a smooth transition rather than an abrupt reversal of motion. The basket-rack assembly moves vertically along its axis. There is no appreciable horizontal motion or movement of the axis from the vertical.

Basket-Rack Assembly—The basket-rack assembly consists of three open-ended transparent tubes, each 7.95- ± 0.05-cm long and having an inside diameter of approximately 33.3 mm and a wall approximately 2.4 mm thick; the tubes are held in a vertical position by two plastic plates, each about 9.7 cm in diameter and 9.5 mm in thickness, with three holes, each about 39 mm in diameter, equidistant from the center of the plate and equally spaced from one another. Attached to the under surface of the lower plate is 10-mesh No. 23 (0.025-inch) W. and M. gauge woven stainless-steel wire cloth having a plain square weave. The parts of the apparatus are assembled and rigidly held by means of three bolts passing through the two plastic plates. A suitable means is provided to suspend the basket-rack assembly from the raising and lowering device using a point on its axis.

The design of the basket-rack assembly may be varied somewhat provided the specifications for the glass tubes and the screen mesh size are maintained.

Disks—Each tube is provided with a perforated cylindrical disk 15.3- ± 0.15-mm thick and 31.4 ± 0.13 mm in diameter. The disk is made of a suitable, transparent plastic material having a specific gravity of between 1.18 and 1.20. Seven 3.2-mm holes extend between the ends of the cylinder, one of the holes being through the cylinder axis and the others parallel with it equally spaced on a 6-mm radius from it. All surfaces of the disk are smooth.

Procedure

VITAMIN–MINERAL DOSAGE FORMS

Uncoated Tablets and Film-Coated Tablets—Place 1 tablet in each of the tubes of the basket, add a disk to each tube, and operate the apparatus, using water maintained at 37 ± 2° as the immersion fluid. At the end of 30 minutes, lift the basket from the fluid, and observe the tablets: all of the tablets disintegrate completely. If 1 or

* An apparatus and disks meeting these specifications are available from VanKel Technology Group, 13000 Weston Parkway, Cary, NC 27513, or from laboratory supply houses.

2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.

Plain Coated Tablets (Other Than Film-Coated Tablets)—Place 1 tablet in each of the tubes of the basket and, if the tablet has a soluble external coating, immerse the basket in water at room temperature for 5 minutes. Then add a disk to each tube, and operate the apparatus, using water maintained at 37 ± 2° as the immersion fluid. After 45 minutes of operation in water, lift the basket from the fluid, and observe the tablets: all of the tablets have disintegrated completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.

Hard Gelatin Capsules—Apply the test for *Uncoated Tablets,* using 0.05 M acetate buffer, prepared by mixing 2.99 g of sodium acetate trihydrate and 1.66 mL of glacial acetic acid with water to obtain 1000 mL of solution having a pH of 4.50 ± 0.05, maintained at 37 ± 2° as the immersion fluid. At the end of 45 minutes, lift the basket from the fluid, and observe the capsules: all of the capsules disintegrate except for fragments from the capsule shell. If 1 or 2 capsules fail to disintegrate completely, repeat the test on 12 additional capsules: not fewer than 16 of the total of 18 capsules tested disintegrate completely.

Soft Gelatin Capsules—Proceed as directed under ~~*Hard Gelatin Capsules.*~~

▲*Rupture Test for Soft Gelatin Capsules.*▲*USP30*

BOTANICAL DOSAGE FORMS

Uncoated Tablets and Film-Coated Tablets—[NOTE—Omit the use of disks unless otherwise specified in the individual monograph.] Place 1 tablet in each of the tubes of the basket, and operate the apparatus, using water maintained at 37 ± 2° as the immersion fluid. At the end of 20 minutes, lift the basket from the fluid, and observe the tablets: all of the tablets disintegrate completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.

Plain Coated Tablets (other than Film-Coated Tablets)—[NOTE—Omit the use of disks, unless otherwise specified in the individual monograph.] Place 1 tablet in each of the tubes of the basket and, if the tablet has a soluble external coating, immerse the basket in water at room temperature for 5 minutes. Operate the apparatus using water maintained at 37 ± 2° as the immersion fluid. After 20 minutes of operation in water, lift the basket from the fluid, and observe the tablets: all of the tablets have disintegrated completely. If 1 or 2 of the tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.

Delayed-Release (Enteric-Coated) Tablets—Place 1 tablet in each of the six tubes of the basket, and if the tablet has a soluble external coating, immerse the basket in water at room temperature for 5 minutes. Then operate the apparatus using simulated gastric fluid TS maintained at 37 ± 2° as the immersion fluid. After 1 hour of operation in simulated gastric fluid TS, lift the basket from the fluid, and observe the tablets: the tablets show no evidence of disintegration, cracking, or softening. Operate the apparatus, using simulated intestinal fluid TS, maintained at 37 ± 2° as the immersion fluid, for the time specified in the monograph. Lift the basket from the fluid, and observe the tablets: all of the tablets disintegrate completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.

Hard Gelatin Capsules—Apply the test for *Uncoated Tablets*, using 0.05 M acetate buffer, prepared by mixing 2.99 g of sodium acetate trihydrate and 1.66 mL of glacial acetic acid with water to obtain 1000 mL of solution having a pH of 4.50 ± 0.05, maintained at 37 ± 2° as the immersion fluid. At the end of 20 minutes, lift the basket from the fluid, and observe the capsules: all of the capsules disintegrate except for fragments from the capsule shell. If 1 or 2 capsules fail to disintegrate completely, repeat the test on 12 additional capsules: not fewer than 16 of the total of 18 capsules tested disintegrate completely.

Soft Gelatin Capsules—Proceed as directed under ~~*Hard Gelatin Capsules.*~~

▲*Rupture Test for Soft Gelatin Capsules.*▲*USP30*

Add the following:

▲RUPTURE TEST FOR SOFT GELATIN CAPSULES

Medium: water; 500 mL.

Apparatus—Use *Apparatus 2* as described under *Dissolution* ⟨711⟩, operating at 50 rpm.

Time: 15 minutes.

Procedure—Place 1 capsule in each vessel, and allow the capsule to sink to the bottom of the vessel before starting rotation of the blade. Observe the capsules, and record the time taken for each capsule shell to rupture.

Tolerances—The requirements are met if all of the capsules tested rupture in not more than 15 minutes. If 1 or 2 of the capsules rupture in more than 15 but not more than 30 minutes, repeat the test on 12 additional capsules: not more than 2 of the total of 18 capsules tested rupture in more than 15 but not more than 30 minutes.▲*USP30*

REFERENCE TABLES

BRIEFING

Container Specifications for Capsules and Tablets, *USP 29* page 3164 and page 1702 of *PF* 31(6) [Nov.–Dec. 2005].

(HDQ) RTS—43361-1

The following table is provided as a reminder for the pharmacist engaged in the typical dispensing situation who already is acquainted with the *Packaging and storage* requirements set forth in the individual monographs. It lists the capsules and tablets that are official in the *United States Pharmacopeia* and indicates the relevant tight (T), well-closed (W), and light-resistant (LR) specifications applicable to containers in which the drug that is repackaged should be dispensed.

This table is not intended to replace, nor should it be interpreted as replacing, the definitive requirements stated in the individual monographs.

Container Specifications for Capsules and Tablets

Monograph Title	*Container Specification*
Add the following:	
▲Benazepril Hydrochloride Tablets	W ▲*USP30*
Add the following:	
■Citalopram ~~Hydrobromide~~ Tablets	W ■1S (*USP29*)
Add the following:	
■Black Cohosh Tablets	T, LR ■1S (*USP29*)
Add the following:	
■Desogestrel and Ethinyl Estradiol Tablets	W ■1S (*USP29*)
Add the following:	
■Diclofenac Potassium Tablets	T, LR ■2S (*USP29*)
Add the following:	
■Didanosine Tablets	T ■2S (*USP29*)
Add the following:	
▲Estradiol Vaginal Tablets	T ▲*USP30*

Container Specifications for Capsules and Tablets *(Continued)*

Monograph Title	*Container Specification*
Add the following:	
■Estradiol and Norethindrone Acetate Tablets	W ■1S (*USP29*)
Add the following:	
■Fexofenadine Hydrochloride Tablets	W ■1S (*USP29*)
Add the following:	
■Fosinopril Sodium Tablets	T ■1S (*USP29*)
Add the following:	
■Fosinopril Sodium and Hydrochlorothiazide Tablets	T ■1S (*USP29*)
Add the following:	
■Ginkgo Capsules	T, LR ■1S (*USP29*)
Add the following:	
■Ginkgo Tablets	T, LR ■1S (*USP29*)
Change to read:	
Asian Ginseng Capsules	T~~, LR~~ ■ ■1S (*USP29*)
Add the following:	
▲Glipizide and Metformin Hydrochloride Tablets	W ▲*USP30*
Add the following:	
■Glyburide and Metformin Hydrochloride Tablets	T, LR ■1S (*USP29*)
Add the following:	
■Irbesartan Tablets	W ■1S (*USP29*)
Add the following:	
■Irbesartan and Hydrochlorothiazide Tablets	W ■1S (*USP29*)

Container Specifications for Capsules and Tablets *(Continued)*

Monograph Title	*Container Specification*
Add the following:	
■Isosorbide Mononitrate Tablets	T■1S (*USP29*)
Add the following:	
■Isosorbide Mononitrate Tablets, Extended-Release	T■1S (*USP29*)
Add the following:	
■Ketoprofen Capsules, Extended-Release	T■2S (*USP29*)
Add the following:	
■Metformin Hydrochloride Tablets, Extended-Release	W, LR■1S (*USP29*)
Add the following:	
■Modafinil Tablets	T■1S (*USP29*)
Add the following:	
■Nefazodone Hydrochloride Tablets	T■2S (*USP29*)
Add the following:	
■Norgestimate and Ethinyl Estradiol Tablets	W■1S (*USP29*)
Add the following:	
■Oxycodone Hydrochloride Tablets, Extended-Release	T, LR■2S (*USP29*)
Add the following:	
■Quinapril Tablets	W■1S (*USP29*)
Add the following:	
■Tizanidine Tablets	T■1S (*USP29*)

Container Specifications for Capsules and Tablets *(Continued)*

Monograph Title	*Container Specification*
Add the following:	
■Valerian Capsules	T, LR■1S (*USP29*)
Add the following:	
■Valsartan and Hydrochlorothiazide Tablets	W■1S (*USP29*)

BRIEFING

Description and Relative Solubility of USP and NF Articles, *USP 29* page 3191, page 8589 of *PF* 25(4) [July–Aug. 1999], page 9254 of *PF* 25(6) [Nov.–Dec. 1999], page 1953 of *PF* 28(6) [Nov.–Dec. 2002], page 266 of *PF* 29(1) [Jan.–Feb. 2003], page 812 of *PF* 29(3) [May–June 2003], page 1262 of *PF* 29(4) [July–Aug. 2003], page 1684 of *PF* 29(5) [Sept.–Oct. 2003], page 2057 of *PF* 29(6) [Nov.–Dec. 2003], page 1405 of *PF* 30(4) [July–Aug. 2004], page 1822 of *PF* 30(5) [Sept.–Oct. 2004], page 122 of *PF* 31(1) [Jan.–Feb. 2005], page 591 of *PF* 31(2) [Mar.–Apr. 2005], page 861 of *PF* 31(3) [May–June 2005], page 1193 of *PF* 31(4) [July–Aug. 2005], page 1491 of *PF* 31(5) [Sept.–Oct. 2005], and page 1703 of *PF* 31(6) [Nov.–Dec. 2005].

(HDQ) RTS—41820-3; 41982-3; 42064-2; 43069-3; 43535-1

Add the following:

▲**Cilostazol:** White to off-white crystals. Freely soluble in chloroform; slightly soluble in methanol and in ethanol; practically insoluble in water.▲*USP30*

In-Process Revision

Add the following:

▲**Dronabinol:** Light yellow resinous oil that is sticky at room temperature and hardens upon refrigeration. Insoluble in water.▲*USP30*

Add the following:

▲**Formoterol Fumarate Dihydrate:** White or almost white or slightly yellow powder. Freely soluble in dimethyl sulfoxide and in acetic acid; soluble in methanol; slightly soluble in water and in 2-propanol; practically insoluble in acetonitrile and in diethyl ether.▲*USP30*

Add the following:

▲**Mono- and Di-glycerides:** Vary in consistency from yellow liquids, through ivory-colored plastics, to ivory white-colored solids (bead or flake forms). Insoluble in water, but soluble in alcohol, in ethyl acetate, in chloroform, and in other chlorinated hydrocarbons. *NF category:* Emulsifying and/or solubilizing agent.▲*NF25*

Add the following:

▲**Pancuronium Bromide:** White, yellowish-white, or slightly pink crystalline powder, hygroscopic. Freely soluble in water, in methylene chloride, and in alcohol.▲*USP30*

Pending Proposals

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *Pharmacopeial Forum (PF)* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in the *USP–NF*, its *Supplements*, or an *IRA.* Those items that have not yet been adopted are marked as *Pending Proposals.*

The *Pending Proposals* list contains these items separated into the following categories: General Notices and Requirements; *USP* monographs; Dietary Supplements Monographs; General Chapters; Reference Tables; Excipients; and *NF* Monographs. Each entry in the *Pending Proposals* list contains the monograph title and the citation of the most recent publication of the monograph. When the appropriate USP Expert Committee is considering advancing to official status a pending proposal that is more than 2 years old, it is republished in *PF* for additional opportunity for public review and comment. Reprints of *PF* proposals may be purchased from USP by sending a written request for information to custsvc@usp.org.

To check the status of a *Pending Proposal,* please contact USP as directed below.

- The briefing accompanying the monograph or general chapter lists the names of the Scientific Liaisons responsible for the proposed revisions. The contact information (phone number and email) for the Scientific Liaison is available in the *Staff Directory* section of *How to Use PF.* For *USP–NF Online* subscribers, the name and contact information for the assigned Scientific Liaison is available in the *Auxiliary Information* portion of each monograph.
- Call USP at 301-816-8344 and ask to speak with the Scientific Liaison assigned to the monograph or general chapter of interest.
- Submit questions by email to stdsmonographs@usp.org. Please indicate the name of the monograph or general chapter in the subject line of the email.

Following these lists the reader will find the *Canceled Proposals* list. These are items that were published in *PF* and were pending, but have since been canceled. This list contains cumulative entries for the six issues per volume of *PF* [i.e., 31(1) through 31(6)]. Note that canceled proposals may be republished in *PF* to be considered for future adoption into the *USP–NF.*

Norgestimate—*USP Reference standards, Limit of residual solvents, Chromatographic purity, Assay*	31	5	1390
Norgestimate and Ethinyl Estradiol Tablets (new)	29	1	87
Ofloxacin—*Chromatographic purity* (delete), *Related compounds* (add)	30	4	1274
Omeprazole—*Chromatographic purity*	31	4	1100

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Omeprazole Delayed-Release Capsules—*Identification, Chromatographic purity*	31	5	1392
Ondansetron Injection—*Chromatographic purity*	31	6	1651
Ondansetron Oral Solution—*Packaging and storage*	30	3	905
Ondansetron Orally Disintegrating Tablets (new)	31	4	1101
Orphenadrine Citrate Injection—*Assay*	31	6	1651
Oxandrolone—*Definition, USP Reference standards, Identification B, Ordinary impurities* (delete), *Related compounds* (add), *Assay*	31	1	64
Oxaprozin—*Packaging and storage*	29	4	1059
Oxaprozin Tablets—*Packaging and storage*	29	4	1061
Oxybutynin Chloride Extended-Release Tablets (new)	31	6	1652
Oxycodone Hydrochloride Extended-Release Tablets (new)	31	4	1104
Oxygen—*Definition, Packaging and storage*	31	4	1107
Oxygen 93 Percent—*Definition, Packaging and storage*	31	4	1107
Pamidronate Disodium (new)	31	4	1108
Pamidronate Disodium for Injection (new)	31	4	1111
Pectin—*Identification*	31	3	783
Penicillamine Capsules—*Dissolution*	31	2	436
Pentazocine and Acetaminophen Tablets (new)	28	6	1838
Pentobarbital Sodium—*Labeling* (add), *USP Reference standards, Other requirements* (add)	31	1	73
Petrolatum (new)—*Harmonization*	28	2	569
White Petrolatum (new)—*Harmonization*	28	2	570
Phenytoin Tablets—*Title* (name change)	29	6	1965
Phenytoin Chewable Tablets (new)	29	6	1965
Piperacillin and Tazobactam Injection (new)	31	2	437
Piperacillin and Tazobactam for Injection (new)	31	2	439
PEG 3350 and Electrolytes for Oral Solution—*Title* (name change—*delayed implementation to February 1, 2009*), *Definition, Assay for potassium and sodium*	31	5	1393
Potassium and Sodium Bicarbonates and Citric Acid Effervescent Tablets for Oral Solution—*USP Reference standards* (add), *Assay for anhydrous citric acid (delayed implementation to January 1, 2009)*	31	2	440
Potassium Bitartrate—*Limit of ammonia*	31	3	786
Potassium Citrate Extended-Release Tablets—*USP Reference standards* (add), *Assay (delayed implementation to January 1, 2009)*	31	2	443
Potassium Citrate and Citric Acid Oral Solution—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	2	444
Potassium Iodide Oral Solution—*Definition*	31	3	786
Potassium Sodium Tartrate—*Limit of ammonia*	31	3	787
Pravastatin Sodium (new)	31	5	1394
Prednicarbate (new)	31	5	1398
Prednicarbate Cream (new)	31	6	1655
Prednicarbate Ointment (new)	31	6	1657
Quinapril Tablets—*Packaging and storage*	29	4	1071
Ramipril—*Definition, Assay*	31	3	787
Ranitidine Hydrochloride—*USP Reference standards, Chromatographic purity, Assay*	30	6	2033
Oral Rehydration Salts—*USP Reference standards* (add), *Identification F* (delete), *Assay for citrate (delayed implementation to January 1, 2009)*	31	5	1399
Rifampin and Isoniazid Capsules—*Dissolution*	30	2	533
Rifampin, Isoniazid, and Pyrazinamide Tablets—*Dissolution*	30	2	534
Risperidone (new)	31	6	1659
Ritonavir (new)	31	3	788
Rubella and Mumps Virus Vaccine Live (delete)	31	6	1662
Saccharin Calcium (new)—*Harmonization*	31	2	607

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Saccharin Sodium (new)—*Harmonization*	31	4	1225
Saquinavir Mesylate—*Identification*	31	5	1400
Schick Test Control (delete)	31	6	1662
Sevoflurane (new)	30	1	178
Simvastatin—*Identification, Chromatographic purity, Limit of lovastatin* (delete), *Assay*	31	3	792
Sodium Bicarbonate—*Normal carbonate, Limit of ammonia*	31	3	795
Sodium Bicarbonate Injection—*Packaging and storage*	31	5	1401
Sodium Chloride—*Identification, Loss on drying, Limit of phosphates, Limit of potassium*	31	5	1401
Sodium Citrate and Citric Acid Oral Solution—*USP Reference standards* (add), *Assay for sodium citrate (delayed implementation to April 1, 2009)*	31	3	797
Sodium Lactate Injection—*Identification B* (delete)	31	5	1402
Sodium Phosphates Rectal Solution—*Assay*	31	5	1403
Sodium Salicylate Tablets—*USP Reference standards* (add)	31	4	1116
Sorbitol Solution—*Microbial limits* (add)	29	4	1078
Stavudine Capsules—*Assay*	31	5	1403
Succinylcholine Chloride—*Limit of ammonium salts* (delete), *Chromatographic purity*	31	5	1404
Sulfamethazine Granulated—*Assay*	31	3	797
Talc—*Packaging and storage* (new), *Limit of iron, Limit of calcium, Limit of aluminum*	31	6	1662
Tazobactam (new)	31	4	1116
Technetium Tc 99m Fanolesomab Injection (new)—*Packaging and storage* (add)	31	5	1405
Terbutaline Sulfate Inhalation Aerosol—*USP Reference standards, Assay*	31	2	450
Thiabendazole Tablets—*Title* (name change)	29	6	1991
Thiabendazole Chewable Tablets (new)	29	6	1991
Thioridazine Hydrochloride—*Identification*	31	3	798
Tilmicosin—*Definition, Related compounds, Assay*	31	3	798
Titanium Dioxide—*Definition, Packaging and storage, Labeling, Loss on ignition, Water-soluble substances, Acid-soluble substances, Limit of lead* (add), *Limit of antimony* (add), *Limit of mercury* (add), *Organic volatile impurities* (delete), *Assay*	30	4	1301
Tizanidine Tablets (new)	31	2	456
Tolazamide—*Chromatographic purity*	31	4	1118
Topiramate (new)	30	4	1307
Tramadol Hydrochloride (new)	31	2	458
Tramadol Hydrochloride Tablets (new)	31	2	462
Travoprost (new)	31	4	1119
Travoprost Ophthalmic Solution (new)	31	4	1121
Triamcinolone Acetonide—*USP Reference standards, Assay*	31	3	800
Tricitrates Oral Solution—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	2	465
Triclosan—*USP Reference standards; Limit of monochlorophenols and 2,4-dichlorophenol; Limit of 1,3,7-trichlorodibenzo-p-dioxin, 2,8-dichlorodibenzo-p-dioxin, 2,8-dichlorodibenzofuran, and 2,4,8-trichlorodibenzofuran; Assay*	31	5	1408
Trimethoprim—*Packaging and storage*	31	5	1409
Tryptophan—*Chloride, Sulfate*	31	5	1410
Tylosin Tartrate (new)	31	5	1410
Ursodiol Capsules—*Dissolution*	31	3	800
Valsartan (new)	29	6	1996
Valsartan and Hydrochlorothiazide Tablets (new)	31	4	1123
Valproic Acid Injection (new)—*Title (delayed implementation to October 1, 2007)*	31	5	1412
Vancomycin Hydrochloride—*USP Reference standards, Limit of monodechlorovancomycin* (add)	30	6	2055

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Vasopressin—*Identification*	31	4	1127
Pure Steam (new)	31	2	467
Water for Hemodialysis—*Bacterial endotoxins*	31	2	468
Sterile Water for Inhalation—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add), *Oxidizable substances*	31	3	802
Sterile Water for Injection—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add), *Oxidizable substances*	31	3	803
Sterile Water for Irrigation—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add), *Oxidizable substances*	31	3	804
Sterile Purified Water—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add), *Oxidizable substances*	31	3	804
Dietary Supplements Monographs			
Ademetionine Disulfate Tosylate (new)	31	2	469
Acesulfame Potassium—*Packaging and storage* (add), *Limit of fluoride*	31	3	811
Black Cohosh (new)	28	5	1455
Powdered Black Cohosh (new)	28	5	1460
Powdered Black Cohosh Extract (new)	28	5	1461
Black Cohosh Tablets (new)	28	5	1462
Ethylcellulose Aqueous Dispersion—*Identification*	31	3	811
Ethylparaben—*Identification*	31	3	812
Gamma Cyclodextrin (new)	31	3	812
Powdered Ginkgo Extract (new)	27	2	2233
Lutein—*Definition, Packaging and storage, Identification, Zeaxanthin and other related compounds, Content of lutein, Content of total carotenoids*	31	4	1133
Lutein Preparation—*Definition, Packaging and storage, Identification, Zeaxanthin and other related compounds, Content of lutein, Content of total carotenoids*	31	4	1134
Tomato Extract Containing Lycopene—*Microbial enumeration, Limit of aflatoxins*	30	2	578
Maleic Acid—*Identification*	31	3	815
Maltose—*Water*	31	3	815
Fish Oil Containing Omega-3 Acids (new)	31	2	474
Fish Oil Containing Omega-3 Acids Capsules (new)	31	2	481
Olive Oil—*Definition, Labeling* (add), *Teaseed oil*	31	3	815
Phenoxyethanol—*Chromatographic purity, Assay*	31	3	816
Polyethylene Glycol (new)—*Harmonization*	31	3	897
Polyoxyl 10 Oleyl Ether—*Free ethylene oxide*	31	3	816
Polyoxyl 20 Oleyl Cetostearyl Ether—*Free ethylene oxide*	31	3	817
Pygeum Extract—*Packaging and storage*	30	3	956
Sodium Benzoate—*USP Reference standards* (add), *Identification*	31	3	818
Sucrose (new)—*Harmonization*	31	3	902
Sugar Spheres—*Identification, Specific rotation*	31	3	819
Tagatose (new)	31	3	819
Thymol—*USP Reference standards* (add), *Identification*	31	3	821
Ubidecarenone—*USP Reference standards, Assay*	31	1	86
Ubidecarenone Capsules—*USP Reference standards, Assay*	31	1	86
Xanthan Gum—*Assay*	31	3	821
USP General Test Chapters			
⟨1⟩ Injections—*Labels and Labeling, Packaging*	31	5	1428

HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps **(*Stages*)**.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

Harmonization

PHARMACOPEIAL PREVIEWS

This section contains potential revisions not yet targeted for official adoption. These may include drafts for new monographs or chapters; drafts for standards that would require new or unusual technology; drafts for which more data are required; or changes that would affect numerous monographs, thus having a broad impact on individual products. Readers should review the drafts in this section and provide comments to the appropriate staff liaison whose name is cited in the Briefing (use the *Staff Directory* to find the contact information).

Briefings Each Preview is preceded by a Briefing in the following format:

BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being used, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How To Use PF*), the name of the scientific staff liaison who handled this item, and the USP tracking correspondence number, as shown in the example below:

(DSN: L. Evans) RTS—55678-1

Symbols No symbols are used in this section, as Previews are not yet targeted for official adoption.

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of authoritative committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* and *Pharmacopeial Previews* sections. Readers interested in submitting comments should see *Instructions to Authors.*

Pharmacopeial Forum
Vol. 32(1) [Jan.–Feb. 2006]

Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP–NF* revision will be considered for publication in the *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention (USPC) and may not be published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

References—Consult a current copy of the *Pharmacopeial Forum* and the *ACS Style Guide* for assistance with reference style.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Contact Person—When submitting a manuscript, designate one author of the article as correspondent and include that author's full address, telephone number, fax number, and e-mail address.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Graphics that cannot be submitted electronically must be camera-ready, of easily reproducible quality and size, and clearly labeled. Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

Pharmacopeial Forum
Executive Secretariat, USP

Rockville, MD 20852

NOMENCLATURE

This section includes supplements to the latest edition of the *USP Dictionary of USAN and International Drug Names* that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

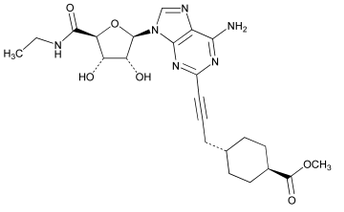
USP Dictionary of USAN and International Drug Names
2005 USP DICTIONARY SUPPLEMENT 5

IMPORTANT—Save this Supplement. This and all supplements appearing in *PF* are needed to keep the 2005 edition of the USP Dictionary (USPD) up-to-date. The cumulative contents of the supplements to the current (2005) edition will be included in the next complete edition of the Dictionary.

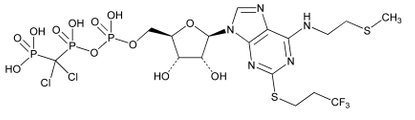
Newly Approved United States Adopted Names (USAN), Released for Publication

The following are newly established United States Adopted Names (USAN). These names will not be listed cumulatively; see preceding and succeeding numbers of *PF* for other new USAN to supplement the Dictionary main volume.

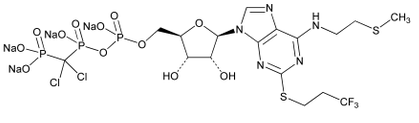
Apadenoson [*2005*] (a pa den′ oh son). $C_{23}H_{30}N_6O_6$. 486.50. (1) Cyclohexanecarboxylic acid, 4-[3-[6-amino-9-(*N*-ethyl-β-D-ribofuranuronamidosyl)-9*H*-purin-2-yl]-2-propynyl]-, methyl ester, *trans*-; (2) Methyl *trans*-4-[3-[6-amino-9-(*N*-ethyl-β-D-ribofuranosyluronamide)-9*H*-purin-2-yl]prop-2-ynyl]cyclohexanecarboxylate. *CAS-250386-15-3*. *Adjunct to nuclear myocardial perfusion imaging in patients unable to exercise adequately.* (Bristol-Myers Squibb) ✧*BMS068645*



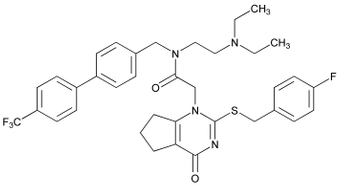
Cangrelor [*2005*] (kan′ grel or). $C_{17}H_{25}Cl_2F_3N_5O_{12}P_3S_2$. 776.36. (1) 5′-Adenylic acid, *N*-[2-(methylthio)ethyl]-2-[(3,3,3-trifluoropropyl)thio]-, monoanhydride with (dichloromethylene)bis[phosphonic acid]; (2) (Dichloromethylene)diphosphonic *N*-[2-(methylsulfanyl)ethyl]-2-[(3,3,3-trifluoropropyl)sulfanyl-5′-adenylic monoanhydride. *CAS-163706-06-7*. INN; BAN. *Anti-platelet agent.* (Medical Arts) ✧*AR-C69931XX*



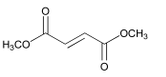
Cangrelor Tetrasodium [*2005*] (kan′ grel or). $C_{17}H_{21}Cl_2F_3N_5Na_4O_{12}P_3S_2$. 864.30. (1) 5′-Adenylic acid, *N*-[2-(methylthio)ethyl]-2-[(3,3,3-trifluoropropyl)thio]-, monoanhydride with (dichloromethylene)bis[phosphonic acid], tetrasodium salt; (2) *N*-[2-(Methylthio)ethyl]-2-[(3,3,3-trifluoropropyl)thio]-5′-adenylic acid, monoanhydride with (dichloromethylene)diphosphonic acid tetrasodium salt. *CAS-163706-36-3*. *Antiplatelet agent.* (Medical Arts) ✧*AR-C69931MX*



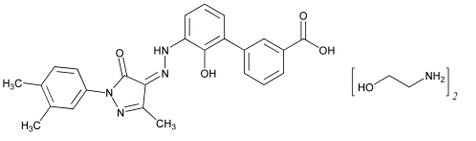
Darapladib [*2005*] (dar ap′ la lib). $C_{36}H_{38}F_4N_4O_2S$. 666.80. (1) 1*H*-Cyclopentapyrimidine-1-acetamide, *N*-[2-(diethylamino)ethyl]-2-[[(4-fluorophenyl)methyl]thio]-4,5,6,7-tetrahydro-4-oxo-*N*-[[4′-(trifluoromethyl)[1,1′-biphenyl]-4-yl]-methyl]-; (2) *N*-[2-(Diethylamino)ethyl]-2-[2-[(4-fluorobenzyl)sulfanyl]-4-oxo-4,5,6,7-tetrahydro-1*H*-cyclopentapyrimidin-1-yl]-*N*-[[4′-(trifluoromethyl)biphenyl-4-yl]-methyl]acetamide. *CAS-356057-34-6*. *Treatment of atherosclerosis.* (GlaxoSmithKline) ✧*SB-480848*



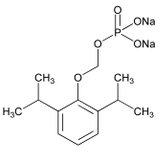
Dimethyl Fumarate [*2005*] (dye meth′ il fue′ ma rate). $C_6H_8O_4$. 144.10. (1) 2-Butenedioic acid, (2*E*)-, dimethyl ester; (2) Dimethyl (2*E*)-but-2-enedioate. *CAS-624-49-7*. *Immunomodulator.* (Biogen Idec) ✧*AZL O 211089*



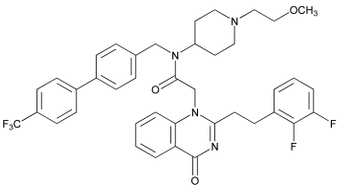
Eltrombopag Olamine [*2005*] (el trom′ boe pag). $C_{25}H_{22}N_4O_4 \cdot 2(C_2H_7NO)$. 564.60. (1) [1,1′-Biphenyl]-3-carboxylic acid, 3′-[(2*Z*)-[1-(3,4-dimethylphenyl)-1,5-dihydro-3-methyl-5-oxo-4*H*-pyrazol-4-ylidene]hydrazino]-2′-hydroxy-, compound with 2-aminoethanol (1:2); (2) 3′-[(2*Z*)-2-[1-(3,4-Dimethylphenyl)-3-methyl-5-oxo-1,5-dihydro-4*H*-pyrazol-4-ylidene]diazanyl]-2′-hydroxybiphenyl-3-carboxylic acid compound with 2-aminoethanol (1:2). *CAS-496775-62-3*. *Treatment of chemotherapy-induced thrombocytopenia and treatment of immune thrombocytopenic purpura.* (GlaxoSmithKline) ✧*SB-497115-GR*



Fospropofol Disodium [*2005*] (fos proe poe′ fol). $C_{13}H_{19}Na_2O_5P$. 332.20. (1) Methanol, [2,6-bis(1-methylethyl)phenoxy]-, dihydrogen phosphate, disodium salt; (2) [2,6-Bis(1-methylethyl)phenoxy]methyl disodium phosphate; (3) 2,6-Diisopropylphenoxymethyl phosphate, disodium salt. *CAS-258516-87-9*. *Procedural sedation.* Aquavan (Guilford)

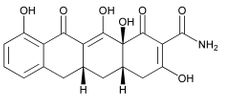


Goxalapladib [*2005*] (gox a lap′ la dib). $C_{40}H_{39}F_5N_4O_3$. 718.80. (1) 1,8-Naphthyridine-1(4*H*)-acetamide, 2-[2-(2,3-difluorophenyl)ethyl]-*N*-[1-(2-methoxyethyl)-4-piperidinyl]-4-oxo-*N*-[[4′-(trifluoromethyl)[1,1′-biphenyl]-4-yl]methyl]-; (2) 2-[2-[2-(2,3-Difluorophenyl)ethyl]-4-oxo-1,8-naphthyridin-1(4*H*)-yl]-*N*-[1-(2-methoxyethyl)piperidin-4-yl]-*N*-[[4′-(trifluoromethyl)biphenyl-4-yl]methyl]acetamide; (3) 2-{2-[2-(2,3-Difluorophenyl)ethyl]-4-oxo-1,8-naphthyridin-1(4*H*)-yl}-*N*-{1-(2-methoxyethyl)piperidin-4-yl]-*N*-[[4′-(trifluoromethyl)-1,1′-biphenyl-4-yl]methyl}acetamide. *CAS-412950-27-7*. *Treatment of atherosclerosis.* (GlaxoSmithKline)



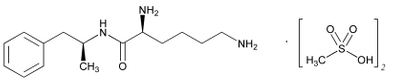
Inalimarev (CEA, MUC-1, Vaccinia virus) [*2005*] (in a lim′ a rev). PANVAC-V. The genome size is approximately 290,000 ± 50,000. *CAS-685563-13-7*. *Treatment of pancreatic cancer, CEA-bearing tumors.* Panvac (Therion Biologics)

Incyclinide [*2005*] (in sye′ kli nide). $C_{19}H_{17}NO_7$. 371.30. (1) 2-Naphthacenecarboxamide, 1,4,4a,5,5a,6,11,12a-octahydro-3,10,12,12a-tetrahydroxy-1,11-dioxo-, (4a*S*,5a*R*,12a*S*)-; (2) (4a*S*,5a*R*,12a*S*)-3,10,12,12a-Tetrahydroxy-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide. *CAS-15866-90-7*. *Treatment of acne, rosacea, and acute respiratory distress syndrome.* Metastat (CollaGenex) ✧*COL-3*

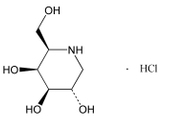


Iratumumab [*2005*] (ir″ a toom′ ue mab). Immunoglobulin G1, anti-(human CD30 (antigen)) (human monoclonal MDX-060 heavy chain), disulfide with human monoclonal MDX-060 light chain, dimer. Molecular weight is approximately 170,000 daltons. *CAS-640735-09-7*. *Oncological diseases; treatment of relapsed or refractory CD30 positive lymphoma including Hodgkin's Disease.* (Medarex) ✧*MDX-060*

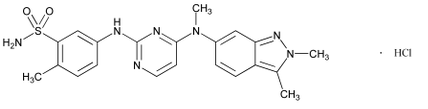
Lisdexamfetamine Dimesylate [*2005*] (lis dex″ am fet′ a meen). $C_{15}H_{25}N_3O \cdot (CH_4O_3S)_2$. 455.60. (1) Hexanamide, 2,6-diamino-*N*-[(1*S*)-1-methyl-2-phenylethyl]-, (2S)-, dimethanesulfonate; (2) (2S)-2,6-Diamino-*N*-[(1*S*)-1-methyl-2-phenylethyl]hexanamide dimethanesulfonate. *CAS-608137-33-3*. *Treatment of attention deficit hyperactivity disorder (ADHD).* (New River) ✧*NRP104*



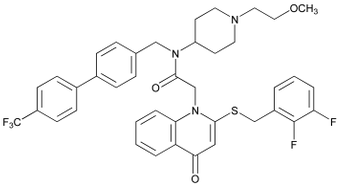
Migalastat Hydrochloride [*2005*] (mi gal′ a stat). $C_6H_{13}NO_4 \cdot HCl$. 199.63. (1) 3,4,5-Piperidinetriol, 2-(hydroxymethyl)-, hydrochloride, (2*R*,3*S*,4*R*,5*S*)-; (2) (+)-(2*R*,3*S*,4*R*,5*S*)-2-(Hydroxymethyl)piperidine-3,4,5-triol hydrochloride; (3) 1,5-Dideoxy-1,5-imino-D-galactitol hydrochloride. *CAS-75172-81-5*. *Treatment of Fabry disease.* (Amicus Therapeutics)



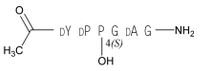
Pazopanib Hydrochloride [*2005*] (paz oh′ pa nib). $C_{21}H_{23}N_7O_2S \cdot HCl$. 474.00. (1) Benzenesulfonamide, 5-[[4-[(2,3-dimethyl-2*H*-indazol-6-yl)methylamino]-2-pyrimidinyl]amino]-2-methyl-, monohydrochloride; (2) 5-[[4-[(2,3-Dimethyl-2*H*-indazol-6-yl)methylamino]pyrimidin-2-yl]amino]-2-methylbenzenesulfonamide monohydrochloride. *CAS-635702-64-6*. *Antineoplastic agent, a potent and selective inhibitor of VEGFR-1, -2, and -3 tyrosine kinases, blocking angiogenesis.* (GlaxoSmithKline) ✧*GW786034B*



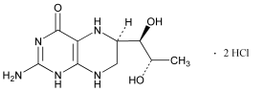
Rilapladib [*2005*] (ri lap′ la dib). $C_{40}H_{39}F_5N_3O_3S$. 735.80. (1) 1(4*H*)-Quinolineacetamide, 2-[[(2,3-difluorophenyl)-methyl]thio]-*N*-[1-(2-methoxyethyl)-4-piperidinyl]-4-oxo-*N*-[[4′-(trifluoromethyl)[1,1′-biphenyl]-4-yl]methyl]-; (2) 2-[2-[(2,3-Difluorobenzyl)sulfanyl]-4-oxoquinolin-1(4*H*)-yl]-*N*-[1-(2-methoxyethyl)piperidin-4-yl]-*N*-[[4′-(trifluoromethyl)-biphenyl-4-yl]methyl]acetamide.*CAS-412950-08-4*. *Treatment of atherosclerosis.* (GlaxoSmithKline) ✧*SB-659032*



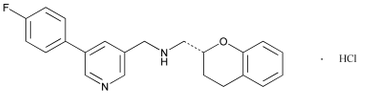
Rotigaptide [*2005*] (roe ti gap′ tide). $C_{28}H_{39}N_7O_9$. 617.70. (1) Glycinamide, *N*-acetyl-D-tyrosyl-D-prolyl-(4*S*)-4-hydroxy-D-prolylglycyl-D-alanyl-; (2) *N*-Acetyl-D-tyrosyl-D-prolyl-(4*S*)-4-hydroxy-D-prolylglycyl-D-alanylglycinamide. *CAS-355151-12-1. Treatment of ventricular tachycardia or ventricular fibrillation.* (Wyeth/Zealand) ✧*GAP (Wyeth); ZP-123 (Zealand)*



Sapropterin Dihydrochloride [*2005*] (sap″ roe ter′ in). $C_9H_{15}N_5O_3 \cdot 2HCl$. 314.20. [Sapropterin is INN.] (1) 4(1*H*)-Pteridinone, 2-amino-6-[(1*R*,2*S*)-1,2-dihydroxypropyl]-5,6,7,8-tetrahydro-, dihydrochloride, (6*R*)-; (2) (6*R*)-2-Amino-6-[(1*R*,2*S*)-1,2-dihydroxypropyl]-5,6,7,8-tetrahydro-4(1*H*)-pteridinone dihydrochloride. *CAS-69056-38-8; CAS-62989-33-7* [sapropterin]. *Treatment of mild-to-moderate phenylketonuria (PKU).* (BioMarin) ✧*T1401 (BioMarin); SUN-0588 (Shiratori)*

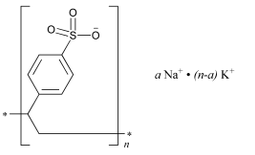


Sarizotan Hydrochloride [*2005*] (sar i zoe′ tan). $C_{22}H_{21}FN_2O \cdot HCl$. 384.90. [Sarizotan is INN.] (1) 3-Pyridinemethanamine, *N*-[[(2*R*)-3,4-dihydro-2*H*-1-benzopyran-2-yl]methyl]-5-(4-fluorophenyl)-, monohydrochloride; (2) (–)-*N*-[[(2*R*)-3,4-Dihydro-2*H*-1-benzopyran-2-yl)methyl]-5-(4-fluorophenyl)pyridine-3-yl]methanamine monohydrochloride. *CAS-195068-07-6; CAS-177975-08-5* [sarizotan]. *Treatment-associated dyskinesia in Parkinson's disease.* (EMD) ✧*EMD 128130*

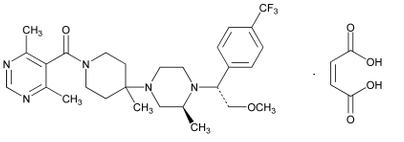


Stamulumab [*2005*] (sta mul′ ue mab). Immunoglobulin G1, anti-(human growth differentiation factor 8) (human MYO-029 heavy chain), disulfide with human MYO-029 λ-chain, dimer. *CAS-705287-60-1. Treatment of muscular dystrophy and age-related sarcopenia or frailty.* (Wyeth) ✧*MYO-029*

Tolevamer Potassium Sodium [*2005*] (tol ev′ am er). $(C_8H_7O_3S)_n \cdot K_{(n-a)} \cdot Na_a$. (1) Benzenesulfonic acid, 4-ethenyl-, potassium salt, polymer with sodium 4-ethenylbenzenesulfonate; (2) Poly[1-(4-sulfophenyl)ethylene], potassium sodium salt. Molecular weight is greater than 400,000 daltons. *CAS-81998-90-5. Treatment of Clostridium difficle associated diarrhea.* (Genzyme) ✧*GT267-004*



Vicriviroc Maleate [*2005*] (vi″ kri vir′ ok). $C_{28}H_{38}F_3N_5O_2 \cdot C_4H_4O_4$. 649.70. (1) Piperidine, 1-[(4,6-dimethyl-5-pyrimidinyl)-carbonyl]-4-[(3*S*)-4-[(1*R*)-2-methoxy-1-[4-(trifluoromethyl)-phenyl]ethyl]-3-methyl-1-piperazinyl]-4-methyl-, (2*Z*)-2-butenedioate (1:1); (2) 1-[(4,6-Dimethylpyrimidin-5-yl)carbonyl]-4-[(3*S*)-4-[(1*R*)-2-methoxy-1-[4-(trifluoromethyl)phenyl]ethyl]-3-methylpiperazin-1-yl]-4-methylpiperidine (2*Z*)-but-2-enedioate. *CAS-599179-03-0. Antiviral, CCR5 antagonist, treatment of autoimmune conditions.* (Schering-Plough Research) ✧*SCH 417690*



Proposed and Recommended International Nonproprietary Names

International Nonproprietary Names (INN) are devised by the World Health Organization (WHO).

Under its charter, the WHO is empowered simply to *recommend* specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as *proposals* (''Proposed International Nonproprietary Names''). A period of four months from the date of publication in *WHO Drug Information* is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested parties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event that no objection is received, the WHO proceeds with listing and publishing the names so devised as *recommendations* (''Recommended International Nonproprietary Names''), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

Recommended International Nonproprietary Names

The following 58 nonproprietary names have been selected by the World Health Organization (WHO) as Recommended International Nonproprietary Names. This list, with chemical names or descriptions and the molecular formulae, appears in *WHO Drug Information,* Vol. 19, No. 3, 2005.

Recommended INN	Recommended INN	Recommended INN	Recommended INN
Ancriviroc	Deferitrin	Inotuzumab Ozogamicin	Raxibacumab
Aplindore	Delmitide	Isalmadol	Rimeporide
Atilmotin	Deutolperisone	Ispinesib	Salclobuzic Acid
Avanafil	Efipladib	Levotofisopam	Saxagliptin
Balicatib	Elomotecan	Linaprazan	Seliciclib
Becatecarin	Embeconazole	Morphine Glucuronide	Sugammadex
Becocalcidiol	Epoetin Zeta	Naveglitazar	Talabostat
Bemotrizinol	Eritoran	Omocianine	Talactoferrin Alfa
Besilesomab	Etalocib	Peliglitazar	Talaglumetad
Bisoctrizole	Farampator	Pemaglitazar	Tanogitran
Canfosfamide	Forodesine	Perflisobutane	Tefibazumab
Ceftobiprole	Galsulfase	Piclozotan	Temsirolimus
Ceftobiprole Medocaril	Glucarpidase	Pralatrexate	Tetomilast
Cintredekin Besudotox	Iboctadekin	Radotermin	Thrombomodulin Alfa
Davasaicin	Icomucret

PHARMACOPEIAL FORUM VOL. 32 NO. 2 **MAR.–APR. 2006**

* The *USP–NF* (*USP 30–NF 25*), the *Supplement* (*Supp*), or the *Interim Revision Announcement* (*IRA*) for which the revision proposal is targeted is shown in parentheses next to each proposed item.

THE JOURNAL OF STANDARDS DEVELOPMENT AND OFFICIAL COMPENDIA REVISION

Please address comments on *PF* content to Executive Secretariat
USP–NF, 12601 Twinbrook Pkwy.
Rockville, MD 20852

Telephone: 1-301-816-8345
Fax: 1-301-816-8373
http://www.usp.org

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI),* in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences.*

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

ISSN: 0363-4655

Printed in USA by Port City Press, Baltimore, Maryland

STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum* (*PF*), for the development of official pharmaceutical standards.

USP publishes *Pharmacopeial Forum* (*PF*) bimonthly as the working vehicle of the USP Council of Experts. *PF* provides interested parties an opportunity to review and comment as the Council of Experts develops or revises standards for the *United States Pharmacopeia* and the *National Formulary* (*USP–NF*).

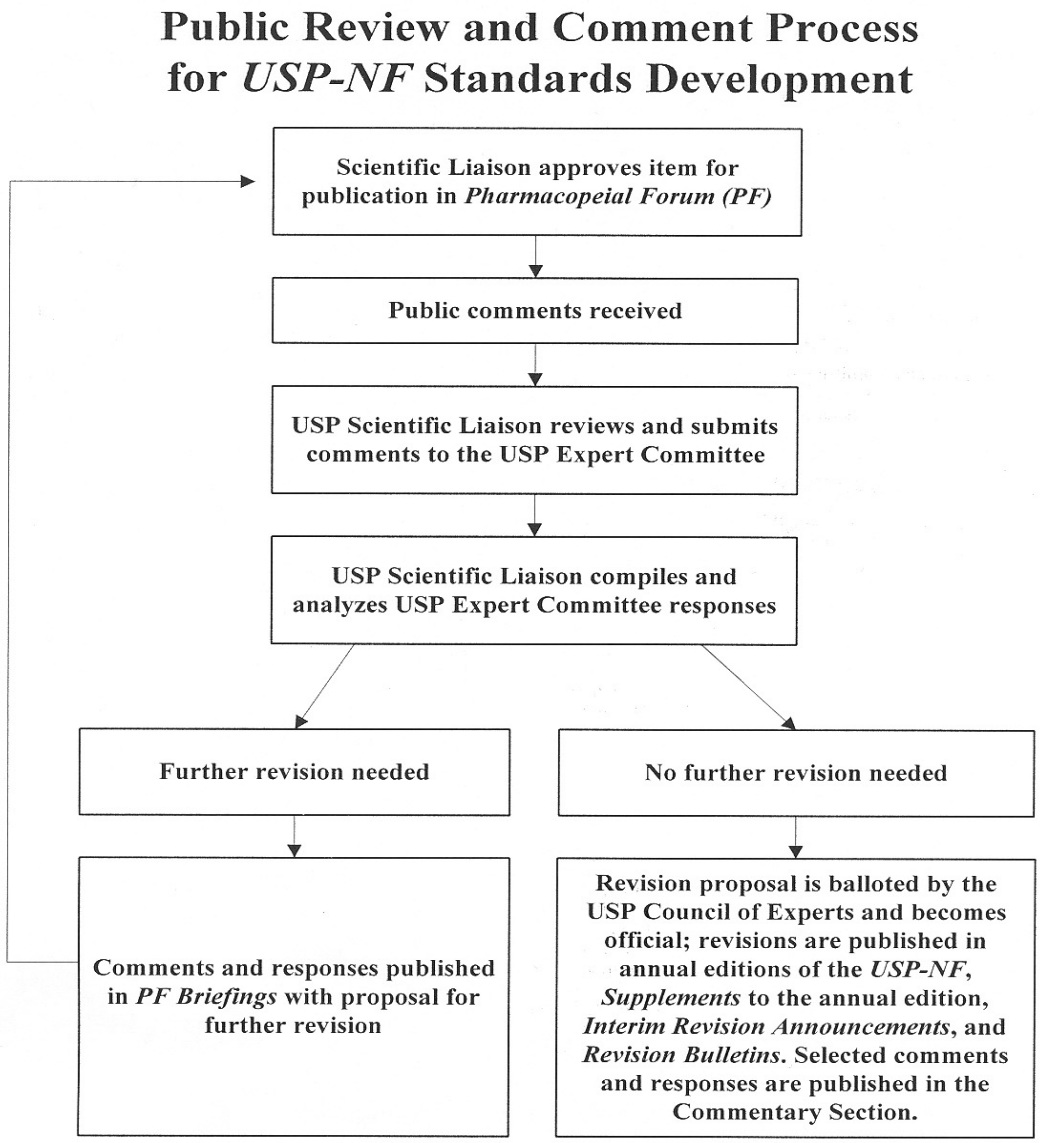
PF includes the following:

1. Potential revisions—entirely new standards, revision ideas, and drafts not yet targeted for official adoption (*Pharmacopeial Previews*)
2. Proposed revisions—new or revised standards targeted for official adoption (*In-Process Revision*)
3. Adopted revisions—new or revised standards that become official and binding before the publication of the next *USP–NF* or *Supplement* (*Interim Revision Announcement*)

USP welcomes comments and data on potential, proposed, or official standards.* Comments, along with USP's responses, will be published either in *PF Briefings*, the *Commentary* section of *PF*, the *Commentary* section of *Supplements* to *USP–NF*, or the *Commentary* section of *USP–NF*.

* If you are not immediately able to submit comments but you intend to do so, please notify USP by using the Intent to Comment form provided before the section *Chromatographic Reagents Used in USP–NF and PF*.

The chart below shows the public review and comment process and its relationship to standards development.



Questions on the process should be addressed to Director, Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: execsec@usp.org).

HOW TO USE *PF*

This section provides descriptions of the various parts of *PF*. It also includes *Committee Designations* and the *Staff Directory*.

The content of the different sections of *PF* is briefly described below. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a *Request for Revision* is available in the *Guideline for Submitting Requests for Revision to the USP–NF* on the USP website (www.usp.org/USPNF/submitMonograph/subGuide.html).

Proposed and Adopted Revisions to the *USP–NF*

Section	Content	How Readers Can Respond
Pharmacopeial Previews Early ideas for revisions	•BRIEFING: Scientific rationale for potential inclusion or change. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •Potential revisions not yet targeted for official adoption that require a longer public review and comment process because of issues such as: — the controversial nature of an item; — the application of new technologies that require further study; and — articles produced by multiple sources.	Review drafts and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview.*
In-Process Revision Revisions targeted for adoption	•BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see *Standards Development*). New or revised text is marked with symbols (■■ or ●● or ▲▲) to specify the tentative earliest date on which the revision would be officially adopted.	Review material and send comments promptly to USP staff liaison (see the *Staff Directory*). Guidelines on how to comment are found at the end of the *Policies and Announcements* section.
Harmonization Items the Pharmacopeial Discussion Group (PDG) is working to harmonize internationally	•BRIEFING: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. The stage determines whether an item appears under *Pharmacopeial Previews* or under *In-Process Revision,* both separate sections of *Harmonization.* •For *In-Process Revision,* new or revised text is marked with symbols (■■) to specify the tentative, earliest date on which the revision would be officially adopted.	Review material and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview* or *In-Process Revision.*
Interim Revision Announcement Adopted standards	Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols ●●.	Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance.
Pending Proposals	In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *PF* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in either the *USP–NF*, its supplements, or an *IRA*. Those items that have not yet been adopted are still pending.	Review items to track pending proposals.
Canceled Proposals	Canceled proposals are items that were published in *PF* and were pending, but have since been canceled. Note that canceled proposals may be republished to be considered in the future for adoption into the *USP–NF.*	Review items to track canceled proposals.

Other Sections

Committee Designations
Names of the committees (composed of volunteer scientific experts) that USP staff work with on the development of standards.

Staff Directory
Names of all USP scientific staff liaisons with contact information.

Policies and Announcements
- General scientific and policy issues affecting *USP–NF* standards and processes
- Update on standards-related issues being considered by USP
- Where to find summaries of meetings of the Council of Experts
- Guidelines on how to comment
- Publication and comment schedules

Stimuli to the Revision Process
- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

Nomenclature
- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the *USP Dictionary of USAN and International Drug Names*
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

Index
Cumulative directory for the content of all issues of *PF* beginning with *PF* 32(1).

Reference Standards Catalog
List of official USP Reference Standards specified in *USP–NF*, along with availability and ordering information.

Chromatographic Reagents Used in USP–NF and Pharmacopeial Forum
Update of chromatographic reagents based on the proposals published in this issue of *PF*.

EXPERT COMMITTEE DESIGNATIONS*

2005–2010

AER	Aerosols

POLICIES AND ANNOUNCEMENTS

This section includes information about general scientific and policy issues that may have an impact on *USP–NF* standards and processes and announcements about issues being considered by USP. This section also includes publication and comment schedules.

***PF ONLINE* LAUNCHES NEW "MY *PF*" PRODUCT ENHANCEMENT.** Beginning in March 2006, *PF Online* subscriptions will include ''My *PF*''—a value-added enhancement that allows users to save searches and bookmarks. This new option is FREE to *PF Online* subscribers and is provided in addition to standard Web-based features, including current issue search, advanced search, browse, print, and copy-paste. With ''My *PF,*'' *PF Online* users can perform the following functions:

- Set up searches for specific *USP–NF* monographs or general chapters to find out if any recent changes have occurred in areas that impact their work.
- Run historical searches to track the progression of changes and chart comparisons. *PF Online* provides access to back issues, beginning with 2002.
- Bookmark monographs for easy access in the future.
- Bookmark frequently accessed information such as comment deadlines and liaison contact information.
- Find out if a new Reference Standard has been released by creating a search and run each time a new *PF Online* edition becomes available.

For subscription information and additional details about *PF Online,* please visit http://www.usp.org/products/PF/ or contact USP Customer Service at 1-800-227-8772 or +1-301-881-0666.

NOTICE OF CORRECTION TO *HELIUM, NITROUS OXIDE, NITROGEN,* AND *NITROGEN 97 PERCENT* MONOGRAPHS. Because the revisions to these monographs, which were published in the *First Supplement* to *USP 28–NF 23* have been postponed indefinitely, *USP 29–NF 24* by default should have shown the *Identification* and *Assay* tests as they originally appeared in the *USP 28–NF 23* on pages 939, 1388, 3041, and 3041, respectively. Instead, these sections of the monographs were printed in error without the original text. See the USP website www.usp.org/USPNF/notices/ for the original text.

Should you have any questions, please contact Kahkashan Zaidi, Ph.D., Senior Scientist, General Policies and Requirements Division (301-816-8269 or kxz@usp.org).

GENERAL CHAPTERS ⟨1⟩ AND ⟨905⟩ POSTPONEMENTS—CLARIFICATION. Two postponements that appeared in the *Fifth IRA* and *Sixth IRA,* respectively for ⟨1⟩ *Injections* and ⟨905⟩ *Uniformity of Dosage Units* do not appear as postponed in the *USP 29–NF 24*. This is due to USP's publication schedule, which slates the *Fifth IRA* and *Sixth IRA* for the *First Supplement* to *USP 29–NF 24,* rather than to the book. The *First Supplement* is scheduled to be published on February 15, 2006, and become official on April 1, 2006. The complete publication schedule appears in this section of *PF*.

For General Chapter ⟨1⟩ *Injections,* USP has postponed the text for *Printing on Ferrules and Cap Overseals* that was to become official on October 1, 2005, as stated in *USP 28–NF 23*. The reason for the postponement is that the Parenteral Products—Industrial, Nomenclature, and Safe Medication Use Expert Committees have approved a revision of this section that also appears in *Pharmacopeial Forum* 31(5), with an implementation date of February 1, 2009.

For General Chapter ⟨905⟩ *Uniformity of Dosage Units,* USP has postponed the official date from April 1, 2006 to January 1, 2007, to provide additional time for the Pharmacopeial Discussion Group to evaluate comments received concerning this revision.

Further information about these postponements is available on USP's website (www.usp.org). If you have any questions, please contact Beryl Voigt, Director, Executive Secretariat (301-816-8155 or bev@usp.org).

USP ISSUES NOTICE OF RETRACTION FOR RESIDUAL SOLVENTS. Please note the following retraction notice that has been included on page 14 of the *USP 29–NF 24*.

"*Residual Solvents* ⟨467⟩: *meet the requirements." is hereby withdrawn from all monographs in the USP and the NF. This retraction is made to allow the USP Council of Experts further time to evaluate the most appropriate manner to implement the Residual Solvents test. The General Notices statement concerning the application of Residual Solvents to all monographs is unaffected by this retraction.*

This notice also serves as an additional request for comments on this issue from all users of the USP. Please forward your comments to:

Todd Cecil, Ph.D.
Vice President
Department of Standards Development
USP
12601 Twinbrook Parkway
Rockville, MD 20852

Comments must be received by June 1, 2006 to ensure consideration.

EXPERT COMMITTEE SUMMARIES AVAILABLE ON THE USP WEBSITE. Summaries of the first meetings of the cycle for the 2005–2010 Standards Expert Committees are now posted and available at http://www.usp.org/USPNF/meetingSummaries/.

USP SEEKS SUBMISSION OF PROPOSALS FOR STABILITY-INDICATING ASSAY PROCEDURES FOR STEROIDS. The assay procedures for steroids in many *USP–NF* monographs are not stability indicating. In an effort to update the monographs, the Monograph Development—Pulmonary and Steroids Expert Committee is seeking submission of proposals for stability-indicating assay procedures for steroids, preferably HPLC- or GC-based, for inclusion in the following *USP–NF* monographs to replace the current procedures that are not stability indicating. The submissions should include data and other information recommended in the *USP Guideline for Submitting Requests for Revision to the USP–NF* at http://www.usp.org/pdf/EN/USPNF/revisionGuide.pdf. Each submission should include analytical validation data, data demonstrating that the procedure is stability indicating, and results of analysis from three commercial batches. Please submit proposals for steroid assay procedures for the following *USP–NF* monographs to Daniel Bempong, Ph.D., or contact him for the details at 301-816-8143 or dkb@usp.org.

Drug Substance:

Clocortolone Pivalate
Danazol
Desoxycorticosterone Acetate
Estriol
Fludrocortisone Acetate
Flumethasone Pivalate
Hydrocortisone Sodium Phosphate
Hydrocortisone Sodium Succinate
Hydroxyprogesterone Caproate
Levonorgestrel
Meprednisone
Mestranol
Methylprednisolone Sodium Succinate
Nandrolone Phenpropionate
Norethindrone
Norethindrone Acetate
Norethynodrel
Norgestrel
Oxandrolone
Oxymetholone
Paramethasone Acetate
Prednisolone Hemisuccinate
Prednisolone Sodium Phosphate
Testosterone
Testosterone Enanthate
Testosterone Propionate

Dosage Form:

Betamethasone Oral Solution
Clocortolone Pivalate Cream
Desoxycorticosterone Acetate Injection
Desoxycorticosterone Acetate Pellets
Dexamethasone Gel
Dexamethasone Sodium Inhalation Aerosol
Dexamethasone Tablets
Dexamethasone Topical Aerosol
Estradiol Injectable Suspension
Estradiol Tablets
Estrone Injection
Flumethasone Pivalate Cream
Hydrocortisone Acetate Injectable Suspension
Hydrocortisone Acetate Ophthalmic Ointment
Hydrocortisone Acetate Ophthalmic Suspension
Hydrocortisone Injectable Suspension
Hydrocortisone Sodium Phosphate Injection
Hydroxyprogesterone Caproate Injection
Methylprednisolone Acetate Cream
Methyltestosterone Capsules
Methyltestosterone Tablets
Nandrolone Phenpropionate Injection
Norethindrone Acetate Tablets
Norethindrone Acetate and Ethinyl Estradiol Tablets (assay for both steroids)
Norethindrone Tablets
Norgestrel Tablets
Oxymetholone Tablets
Paramethasone Acetate Tablets
Penicillin G Procaine, Dihydrostreptomycin Sulfate, and Prednisolone Injectable Suspension (assay for Prednisolone)
Neomycin Sulfate, Sulfacetamide Sodium, and Prednisolone Acetate Ophthalmic Ointment (assay for Prednisolone Acetate)
Prednisolone Sodium Phosphate Injection
Prednisolone Sodium Phosphate Ophthalmic Solution
Neomycin Sulfate and Prednisolone Sodium Phosphate Ophthalmic Ointment (assay for Prednisolone Sodium Phosphate)
Prednisolone Sodium Succinate for Injection
Prednisolone Cream
Progesterone Intrauterine Contraceptive System
Testosterone Enanthate Injection
Testosterone Injectable Suspension
Testosterone Propionate

PHARMACOPEIAL EDUCATION COURSES. USP's Pharmacopeial Education courses offer specialized instruction for chemists, other scientists, and professionals in the pharmaceutical and allied industries. USP scientists who play a key role in establishing official USP standards teach these courses and provide expert insights on the practical applications of official test procedures and best practices in using the *USP–NF* and other USP resources. The courses also give participants an opportunity to learn how to get involved in USP's standards-setting processes and the benefits of participating in standards development. Courses offered in 2006 are listed below. For more information and to register, visit www.usp.org. To discuss how USP can bring courses to a location of your choice or design a custom course package for you, call 301-816-8237, or e-mail PharmacopeialEducation@usp.org.

2006 Calendar of Pharmacopeial Education Courses

Date	Name of Course	Location	Price
18-Jan-06	Effectively Using the *USP–NF*	California State University—Fullerton, CA	$595
24-25 Jan-06	Fundamentals of Dissolution—Lecture & Lab	North Brunswick, NJ	$1,500
14-Feb-06	Effectively Using the *USP–NF*	Basel, Switzerland	$595
15-Feb-06	Analytical Method Validation	Basel, Switzerland	$595
23-Feb-06	Effectively Using the *USP–NF*	North Carolina State University—Raleigh, NC	$595
29-Mar-06	Basic Statistics and their Practical Applications to the *USP–NF*	New Jersey, hosted by NJPQCA	$595
19-Apr-06	Effectively Using the *USP–NF*—Session I	USP Headquarters, Rockville, MD	$895
20-Apr-06	Effectively Using the *USP–NF*—Session II	USP Headquarters, Rockville, MD	$895 ($1,695 both days)

VISIT THE USP WEB SITE AT ⟨http://www.usp.org⟩. Various resources related to Pharmacopeial standards are presented, including highlights from *PF*.

INTERNATIONAL CORRESPONDENCE. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia, with a copy to USP, for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows:

Technical Secretariat of the European
Pharmacopoeia Commission
B.P. 907
F 67029 Strasbourg Cedex 1
France

NAKASHIMA Nobumasa
Evaluation and Licensing Division
Pharmaceutical and Medical Safety Bureau
Ministry of Health, Labour and Welfare, Japan
Tel. +81-3-3595-2431, Fax +81-3-3597-9535
E-mail: nakashima-nobumasa@mhlw.go.jp

HOW TO SUBMIT COMMENTS. The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. Submissions concerning a particular item that has appeared in an issue of *PF* should be submitted to the appropriate USP scientific staff liaison identified at the end of the *Briefing* accompanying each item. To submit comments and data to a liaison, use the e-mail address and telephone numbers listed in the *Staff Directory* included in every *PF*.

Please note that *USP–NF* is being published in an annual edition with one main book and two *Supplements* a year. In addition, the schedule provided below will repeat every year so that users will know what to expect and become familiar with the deadlines.

In the future, USP anticipates including the comment submission deadline in each briefing of every revision proposal when it is published for public review and comment.

For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or FAX number 301-816-8373.

NEW *PHARMACOPEIAL FORUM* PUBLIC REVIEW AND COMMENT PERIOD DEADLINES. The full year's listing of comment period deadlines and the targeted official publications appear below. In accordance with the Rules and Procedures of the 2005–2010 Council of Experts*, USP is implementing the 90-day comment period by providing a deadline for each issue of *PF* unless otherwise stated in the individual briefing. Note that *PF* 31(6) and *PF* 32(1) have a combined comment deadline (April 17, 2006) due to the omission of the comment deadline dates in *PF* 31(6). Individual comment deadlines begin with *PF* 32(2) [Mar.–Apr. 2006].

* ***Section 9.04(b) of the Rules and Procedures of the 2005–2010 Council of Experts***
A period of at least ninety (90) days from the date of publication will be allowed for public review and comment. The time allowed for public comments shall be noted in the publication in the PF. For good cause shown, the Chairperson may alter the time specified.

The listing of comment period deadlines and the targeted official publications appear below.

Pharmacopeial Forum	Comment Deadline	Targeted Official Publication	Publication Date	Official Date
PF 31(6)	April 17, 2006	*USP 30–NF 25*	November 2006	January 2007
PF 32(1)	April 17, 2006			
PF 32(2)	June 15, 2006	*USP 30–NF 25 1st Supplement*	February 2007	April 2007
PF 32(3)	August 15, 2006			
PF 32(4)	October 16, 2006	*USP 30–NF 25 2nd Supplement*	June 2007	August 2007
PF 32(5)	December 15, 2006			
PF 32(6)	February 15, 2007	*USP 31–NF 26*	November 2007	January 2008
PF 33(1)	April 16, 2007			
PF 33(2)	June 15, 2007	*USP 31–NF 26 1st Supplement*	February 2008	April 2008

All official revisions are published in the annual edition or *Supplements* to *USP–NF* (twice yearly). Between these publications, official revisions are published in *PF* in the *Interim Revision Announcement;* these revisions are also incorporated in the upcoming *Supplement.* The official publication in which an *IRA* is incorporated will depend upon publication deadlines. The 5th *IRA* and the 6th *IRA* will not appear until *Supplement 1*. See table below. The electronic version of *USP–NF* is updated as each *Supplement* becomes available and, therefore, contains all official text up to and including the contents of the latest *Supplement.* The new table below outlines the publications and their release and official dates, and the book or supplement which supersedes them.

Publication Schedules

Publication	Release Date	Official Date	Superseded by
USP 29–NF 24	Nov. 1, 2005	Jan. 1, 2006	*1st Supplement*
1st Supplement	Feb. 1, 2006	Apr. 1, 2006	*2nd Supplement*
1st *IRA* [*PF* 32(1)]	Jan. 1, 2006	Feb. 1, 2006	*2nd Supplement*
2nd *IRA* [*PF* 32(2)]	Mar. 1, 2006	Apr. 1, 2006	*2nd Supplement*
3rd *IRA* [*PF* 32(3)]	May 1, 2006*	June 1, 2006*	*USP 30–NF 25*
2nd Supplement	June 1, 2006*	Aug. 1, 2006*	*USP 30–NF 25*
4th *IRA* [*PF* 32(4)]	July 1, 2006*	Aug. 1, 2006*	*USP 30–NF 25*
5th *IRA* [*PF* 32(5)]	Sept. 1, 2006*	Oct. 1, 2006*	*1st Supplement USP 30–NF25*
6th *IRA* [*PF* 32(6)]	Nov. 1, 2006*	Dec. 1, 2006*	*1st Supplement USP 30–NF25*
USP 30–NF 25	Nov. 1, 2006*	Jan. 1, 2007*	

*Tentative

CALL FOR HIGH PRIORITY MONOGRAPHS FOR DRUG SUBSTANCES AND PRODUCTS AND EXCIPIENTS. USP is seeking monographs for the following drug substances and drug products that are or soon will be off patent and thus are of the highest priority. USP also is seeking monographs for the excipients listed below. Monographs are marked received upon receipt of a monograph proposal. Received monographs are removed from this list upon publication in *Pharmacopeial Forum.* (This list has been updated as of December 15, 2005). This list is also available on the USP website at http://www.usp.org/USPNF/submitMonograph/newMon.html. For further information, contact Karen Russo, Ph.D., kar@usp.org. Monograph sponsors should consult the *USP Guideline for Submitting Requests for Revision to the USP–NF* at http://www.usp.org/pdf/EN/USPNF/revisionGuide.pdf.

Noncomplex Actives (Drug Substances)

Acarbose	Alatrofloxacin Mesylate	Alfuzosin
Allopurinol Sodium	Aminopromazine Fumarate	Aminopterin Sodium
Amlodipine Besylate ***(Received)***	Anagrelide Hydrochloride ***(Received)***	Arsenic Trioxide
Azelaic Acid	Balsalazide Disodium	Bentoquatam
Bepridil Hydrochloride	Bivalirudin	Cabergoline
Calcipotriene	Calcium Trisodium Pentetate	Calfactant
Candesartan Cilexetil	Carmustine	Carvedilol
Cefdinir	Cefditoren Pivoxil	Ceftibuten
Cetirizine Hydrochloride ***(Received)***	Cetrorelix	Cevimeline
Chloroxine	Colfosceril	Cytarabine Liposome
Dalfopristin	Dantrolene Sodium ***(Received)***	Dapirazole Hydrochloride
Desirudin	Dexrazoxane	Difloxacin Hydrochloride
Docosanol	Entacapone	Epoprostenol
Erythromycin Phosphate	Erythromycin Thiocyanate	Esomeprazole Magnesium
Esmolol	Estazolam	Estramustine Phosphate Sodium
Estradiol Benzoate	Ethanolamine Oleate	Etomidate
Etoposide Phosphate	Exemestane	Felbamate
Fluoromethane F 18	Foscarnet Sodium	Fosfomycin Tromethamine
Gadobenate Dimeglumine	Galantamine Hydrobromide	Gadopentetic Acid
Gallium Nitrate	Ganirelix	Glyceryl Aminobenzoate
Granisetron	Halobetasol Propionate	Haloperidol Decanoate ***(Received)***
Hydrocodone Polistirex	Ibandronate Sodium	Imipramine Pamoate
Imiquimod	Irinotecan	Isosulfan Blue
Itraconazole	Lamotrigine ***(Received)***	Latanoprost
Lawsone	Levetriacepam	Levobetaxolol
Levofloxacin ***(Received)***	Levomethadyl Acetate	Lomustine
Lopinavir	Metipranolol Hydrochloride	Midazolam Hydrochloride
Miglitol	Mifepristone	Misoprostol ***(Received)***
Mivacurium	Moexipril	Nalbuphine Hydrochloride
Nalmefene Hydrochloride	Nateglinide	Nedocromil
Nicardipine Hydrochloride	Nilutamide	Nisoldipine
Olopatadine	Olsalazine Sodium	Orbifloxacin
Orlistat ***(Received)***	Oxcarbazepine ***(Received)***	Pantoprazole Sodium
Pemoline	Pentamidine Isethionate	Piperonyl Butoxide
Pirbuterol Acetate	Poractant Alpha	Proguanil
Quetiapine Fumarate	Rose Bengal	Salmeterol Xinafoate
Sertraline Hydrochloride	Sodium Phenylbutyrate	Simethicone Powder
Sterile Methotrexate Sodium	Streptozocin	Sulfacytine
Tacrolimus	Terbinafine Hydrochloride	Terconazole
Tiludronate Disodium	Tiopronin	Tranexamic Acid
Trimipramine Maleate	Trovafloxacin Mesylate	Voriconazole
Zinc Tridosium Pentetate		

Noncomplex Actives (Drug Products)

Abacavir Sulfate, Lamivudine, and Zidovudine Tablets	Acarbose Tablets	Acetaminophen, Butalbital, Caffeine, and Codeine Phosphate Capsules
Acetaminophen, Clemastine Fumarate and Pseudoephedrine Hydrochloride Tablets	Acetazolamide Extended-Release Capsules	Albuterol Extended-Release Tablets
Albuterol for Inhalation	Albuterol Inhalation Aerosol	Alendronate Sodium Oral Solution
Alfuzosin Tablets	Allopurinol for Injection	Alprazolam Extended-Release Tablets
Alprostadil Urethral Supository	Aminopromazine Fumarate and Neomycin Sulfate Tablets	Aminopromazine Fumarate Injection
Aminopromazine Fumarate Tablets	Amlodipine and Benazepril Hydrochloride Capsules	Aminopterin Sodium Tablets
Amphotericin B Injection	Anagrelide Hydrochloride Capsules	Arsenic Trioxide Injection
Atovaquone and Proguanil Hydrochloride Tablets	Atovaquone Tablets	Auranofin Capsules
Azatadine Maleate and Pseudoephedrine Sulfate Extended-Release Tablets	Azelaic Acid Cream	Azithromycin for Injection
Azithromycin Tablets	Baclofen Injection	Balsalazide Disodium Capsules
Beclomethasone Dipropionate Inhalation Aerosol	Beclomethasone Dipropionate Metered-Dose Nasal Suspension	Bentoquatam Topical Suspension
Benzocaine and Cetylpyridinium Chloride Lozenges	Benzocaine and Menthol Lotion	Benzphetamine Hydrochloride Tablets
Bepridil Tablets	Bicalutamide Tablets	Brompheniramine Maleate, Dextromethorphan Hydrobromide and Pseudoephedrine HCl Oral Solution
Bivalirudin Injection	Budesonide Metered-Dose Inhalation Aerosol	Budesonide Inhalation Aerosol
Bupivacaine and Lidocaine Hydrochlorides Injection	Buprenorphine Hydrochloride Injection	Butalbital and Acetaminophen Capsules
Butalbital and Acetaminophen Tablets	Calcipotriene Topical Solution Cabergoline Tablets	Calcipotriene Cream
Calcipotriene Ointment	Calcitriol Capsules	Calcitriol Oral Solution
Calcium Acetate Capsules	Calfactant Intratracheal Suspension	Calcium Trisodium Pentetate Injection
Carbidopa and Levodopa Extended-Release Tablets	Carbidopa and Levodopa Tablets for Oral Suspension	Carbidopa, Levidopa, and Entacapone Tablets
Carmustine Implant	Carmustine for Injection	Carvedilol Tablets
Cefditoren Pivoxil Tablets	Cefdinir Tablets	Ceftibuten Capsules
Ceftibuten for Oral Suspension	Cetirizine Hydrochloride Oral Solution	Ceftiofur Hydrochloride Oral Suspension
Cetrorelix Injection	Cetirizine Hydrochloride Tablets	Cevimeline Hydrochloride Capsules
Choline and Magnesium Salicylates Oral Solution	Chloroxine Cream	Chlorpromazine Hydrochloride Extended-Release Capsules
Ciclopirox Shampoo	Choline and Magnesium Salicylates Tablets	Choline Salicylate Oral Solution
Ciclopirox Topical Gel	Ciclopirox Topical Solution	Ciprofloxacin Hydrochloride and Hydrocortisone Otic Suspension
Cilostazol Tablets ***(Received)***	Cimetidine Oral Solution	Citalopram Hydrobromide Oral Solution
Ciprofloxacin Otic Solution	Cladribine Injection	Citric Acid, Gluconolactone, and Magnesium Carbonate Irrigation
Clonazepam Orally-Disintegrating Tablets	Clemastine Fumarate Syrup	Clobetasol Propionate Gel
Clotrimazole and Betamethasone Dipropionate Lotion	Clorazepate Dipotassium Capsules	Clorazepate Dipotassium Extended-Release Tablets
Colfosceril and Tyloxapol Suspension	Colestipol Hydrochloride Tablets	Conjugated Estrogens and Medroxyprogesterone Acetate Tablets
Compound Undecylenic Acid Cream	Compound Undecylenic Acid Topical Powder	Cyclosporine Modified Oral Solution
Cromolyn Sodium Metered-Dose Nasal Solution	Cyclosporine Modified Capsules	Cysteamine Bitartrate Capsules
Cyclosporine Ointment	Cyclosporine Topical Solution	Cytarabine Liposome Injection
Dantrolene Sodium Capsules ***(Received)***	Dalfopristin and Quinupristin Injection	Dapiprazole for Ophthalmic Solution
Dantrolene Sodium for Injection ***(Received)***	Dantrolene Sodium Oral Suspension	Desirudin for Injection

Noncomplex Actives (Drug Products) *(Continued)*

Desonide ***(Received)***	Desonide Cream	Dexrazoxane for Injection
Dextroamphetamine Sulfate Extended-Release Capsules	Dextromethorphan Polistirex Extended-Release Oral Suspension	Diazepam Injectable
Diclofenac Sodium Ophthalmic Solution	Didanosine Chewable Tablets ***(Received)***	Diethylpropion Hydrochloride Extended-Release Tablets
Difenoxin and Atropine Tablets	Difloxacin Hydrochloride Tablets	Dihydroergotamine Mesylate Metered Spray
Diltiazem Malate Extended-Release Tablets	Dinoprostone Vaginal Suppositories	Diphenhydramine Hydrochloride and Acetaminophen Tablets
Divalproex Sodium Delayed-Release Capsules	Dorzolamide and Timolol Ophthalmic Solution	Dorzolamide Ophthalmic Solution
Doxacurium Chloride Injection	Doxepin Hydrochloride Cream	Doxycycline Oral Gel
Econazole Nitrate Cream	Edrophonium Chloride and Atropine Sulfate Injection	Enalaprilat Injection
Enalapril Maleate and Diltiazem Malate Extended-Release Tablets	Enalapril Maleate and Felodipine Extended-Release Tablets	Entacapone Tablets
Ephedrine Sulfate and Guaifenesin Tablets	Epoprostenol for Injection	Epoprostenol Injection
Esmolol Hydrochloride Injection	Esomeprazole Magnesium Capsules	Estazolam Tablets
Estramustine Phosphate Sodium Capsules	Ethanolamine Oleate Injection	Etomidate Injection
Etidronate Disodium Injection Concentrate	Exemestane Tablets	Famotidine Injection ***(Received)***
Famotidine Orally Disintegrating Tablets	Felbamate Oral Suspension	Felbamate Tablets
Fentanyl Lozenges	Fentanyl Transdermal System	Ferrous Fumarate and Docusate Sodium Extended-Release Capsules
Flavoxate Hydrochloride	Flavoxate Hydrochloride Tablets	Fluconazole Injection
Flunisolide Nasal Spray	Fluconazole Tablets	Flunisolide Inhalation Aerosol
Fluocinolone Acetonide Shampoo	Fluorescein Sodium Ophthalmic Solution	Fluticasone Propionate Inhalation Powder
Fluorometholone Ointment	Fluticasone Propionate Cream ***(Received)***	Fluticasone Propionate Ointment ***(Received)***
Fluticasone Propionate Pressurized Inhaler	Foscarnet Sodium Injection	Fosfomycin for Oral Solution
Gabapentin Oral Solution	Gabapentin Tablets	Gadobenate Dimeglumine Injection
Gallium Nitrate Injection	Galantamine Hydrobromide Tablets	Ganirelix Acetate Injection
Ganciclovir Capsules	Gentamicin Sulfate Oral Solution	Gatifloxacin Injection
Gatifloxacin Tablets	Glipizide Extended-Release Tablets	Gentamicin Sulfate Soluble Powder
Glimepiride Tablets	Granisetron Tablets	Granisetron Injection
Guaifenesin and Pseudoephedrine Hydrochloride Extended-Release Tablets	Guaifenesin and Salts of Dextromethorphan and Pseudoephedrine Oral Solution	Guanidine Hydrochloride
Guanidine Hydrochloride Tablets	Halobetasol Propionate Ointment	Halobetasol Propionate Cream
Haloperidol Decanoate Injection	Haloperidol Lactate Injection	Haloperidol Lactate Oral Concentrate
Hydrochlorothiazide Oral Solution Concentrate	Hydrocodone Bitartrate and Acetaminophen Oral Solution	Hydralazine Hydrochloride and Hydrochlorothiazide Capsules
Hydrocodone Bitartrate and Homatropine Methylbromide Syrup	Hydrochlorothiazide Capsules	Hydrocodone Bitartrate and Guaifenesin Oral Solution
Hydrocodone Bitartrate and Aspirin Tablets	Hydrocortisone Butyrate Lotion	Hydrocodone Bitartrate and Homatropine Methylbromide Tablets
Hydrocortisone Acetate Rectal Foam Aerosol	Hydroquinone Lotion	Hydrocortisone Acetate Dental Paste
Hydroflumethiazide and Reserpine Tablets	Hydromorphone Hydrochloride Oral Solution	Ibuprofen Capsules
Ibandronate Sodium Tablets	Idarubicin Hydrochloride Injection	Imipramine Pamoate Capsules
Imiquimod Topical Cream	Ipratropium Bromide Inhalation Aerosol	Ipratropium Bromide Inhalation Solution
Irinotecan Hydrochloride Injection	Isosulfan Blue Injection	Isradipine Extended-Release Tablets
Itraconazole Injection	Itraconazole Oral Solution	Ketoconazole Cream
Ketoconazole Shampoo	Ketoprofen Capsules	Ketoprofen Extended-Release Capsules
Ketotifen Fumarate	Ketotifen Fumarate Ophthalmic Solution	Ketoprofen Tablets
Lactic Acid Lotion	Lamivudine Tablets	Latanoprost Ophthalmic Solution
Levetriacepam Tablets	Levobetaxolol Ophthalmic Suspension	Levocabastine Ophthalmic Suspension
Leucovorin Calcium for Injection	Levomethadyl Acetate Hydrochloride Oral Concentrate	Levofloxacin Solution
Lincomycin Hydrochloride and Spectinomycin Sulfate Soluble Powder	Liothyronine Injection	Lisinopril and Hydrochlorothiazide Tablets

Noncomplex Actives (Drug Products) *(Continued)*

Lomustine Capsules	Lopinavir Capsules	Lopinavir Solution
Lopinavir and Ritonavir Solution	Loratadine and Pseudoephedrine Sulfate Extended-Release Tablets ***(Received)***	Loratadine Orally-Disintegrating Tablets
Losartan Potassium Tablets	Mesalamine Suppositories	Methacholine Chloride for Inhalation Solution
Mesoridazine Besylate Concentrate	Mefloquine Hydrochloride Tablets	Methoxsalen Softgels
Methadone Hydrochloride Oral Concentrate	Melphalan for Injection	Metaraminol Bitartrate Injection
Methyclothiazide and Deserpidine Tablets	Methocarbamol and Aspirin Tablets	Metipranolol Ophthalmic Solution
Metronidazole Cream	Metronidazole Lotion	Metronidazole Extended-Release Tablets
Methylphenidate Hydochloride Chewable Tablets	Metronidazole Capsules	Midazolam Hydrochloride Injection
Metronidazole Hydrochloride for Injection	Miconazole Nitrate Topical Aerosol	Mifepristone Tablets
Miglitol Tablets	Milrinone Injection	Misoprostol Dispersion ***(Received)***
Misoprostol Tablets ***(Received)***	Mivacurium in Dextrose Injection	Mivacurium Injection
Moexipril Hydrochloride and Hydrochlorothiazide Tablets	Moexipril Hydrochloride Tablets	Molindone Hydrochloride Oral Solution
Morphine Sulfate for Injection Concentrate	Morphine Sulfate Oral Solution	Morphine Sulfate Oral Solution Concentrate
Morphine Sulfate Tablets	Mycophenolate Mofetil Tablets	Mycophenolate Mofetil Oral Solution
Mycophenolate Mofetil Capsules	Nalbuphine Hydrochloride Injection	Naproxen Extended-Release Tablets
Naphazoline Hydrochloride and Pheniramine Maleate Ophthalmic Solution	Naphazoline Hydrochloride and Pheniramine Maleate Ophthalmic Solution	Nalmefene Hydrochloride Injection
Nateglinide Tablets	Nedocromil Sodium Inhalation Aerosol	Neomycin Sulfate Oral Powder
Nevirapine Oral Suspension ***(Received)***	Nevirapine Tablets ***(Received)***	Nicardipine Hydrochloride Capsules
Nilutamide Tablets	Nimodipine Capsules	Nisoldipine Extended-Release Tablets
Nitroglycerin Solution In Acrylic Adhesive	Nizatidine Tablets	Ofloxacin Injection
Ofloxacin In Dextrose Injection	Ofloxacin Tablet ***(Received)***	Olopatadine Ophthalmic Solution
Olsalazine Sodium Capsules	Ondansetron Oral Solution	Ondansetron Tablets
Orbifloxacin Tablets	Orlistat Capsules ***(Received)***	Orphenadrine Citrate, Aspirin, and Caffeine Tablets
Orphenadrine Citrate Extended Release Tablets	Oxcarbazepine Suspension	Oxcarbazepine Tablets
Oxiconazole Cream	Pancuronium Bromide Injection ***(Received)***	Pantoprazole Sodium Tablets
Pantoprazole Sodium for Injection	Paroxetine Hydrochloride Extended-Release Tablets	Paroxetine Oral Suspension
Pemirolast Potassium Ophthalmic Solution	Pemoline Tablets	Penicillin G Potassium Tablets for Oral Solution
Pentaerythritol Tetranitrate Extended-Release Capsules	Pentaerythritol Tetranitrate Extended-Release Tablets	Pentamidine Isethionate for Inhalation
Pentamidine Isethionate for Injection	Pentazocine Hydrochloride and Acetaminophen Tablets	Permethrin Cream ***(Received)***
Phendimetrazine Tartrate Extended-Release Capsules	Phenobarbital Capsules	Phentermine Resin Complex
Phenylephrine Hydrochloride and Chlorpheniramine Maleate Extended-Release Capsules	Phenylephrine Hydrochloride, Chlor pheniramine Maleate, and Acetaminophen Extended-Release Tablets	Phentermine Resin Complex Capsules
Phosphate Oral Solution	Pilocarpine Hydrochloride Ophthalmic Gel	Pilocarpine Hydrochloride Ophthalmic Ointment
Pilocarpine Hydrochloride Tablets	Piperonyl Butoxide and Pyrethrins Aerosol Foam	Pirbuterol Acetate Inhalation Aerosol
Povacrylate Solution	Poractant Alpha Supension	Porfimer Sodium for Injection
Povacrylate-Iodine Topical Solution	Povidone-Iodine Gauze	Povidone-Iodine Swabsticks
Povidone-Iodine Topical Aerosol Foam	Povidone-Iodine Vaginal Suppositories	Pramipexole Dihydrochloride Tablets
Prazosin Hydrochloride and Polythiazide Capsules	Prednisolone Sodium Phosphate Oral Solution	Prochlorperazine Maleate Extended-Release Capsules

Noncomplex Actives (Drug Products) *(Continued)*

Progesterone Capsules	Promethazine Hydrochloride and Codeine Phosphate Oral Solution	Promethazine Hydrochloride and Dextromethorphan Hydrobromide Syrup
Promethazine and Phenylephrine Hydrochlorides and Codeine Phosphate Syrup	Promethazine and Phenylephrine Hydrochlorides Syrup	Propafenone Hydrochloride Tablets
Pseudoephedrine Hydrochloride and Brompheniramine Maleate Extended-Release Tablets	Pseudoephedrine Hydrochloride and Naproxen Sodium Extended-Release Tablets	Pseudoephedrine Hydrochloride, Chlorpheniramine Maleate, and Codeine Phosphate Oral Solution
Pseudoephedrine Hydrochloride, Guaifenesin, and Codeine Phosphate Oral Solution	Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Extended-Release Tablets	Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Oral Solution
Pseudoephedrine Sulfate, Dexbrompheniramine Maleate, and Acetaminophen Extended-Release Tablets	Pyrilamine Maleate Injection	Quinidine Sulfate Injection
		Ramipril Capsules
Ranitidine Capsules	Rauwolfia Serpentina and Endroflumethiazide Tablets	Reserpine and Polythiazide Tablets
Rimantadine Hydrochloride Oral Solution	Risperidone Oral Solution	Risperidone Orally Disintegrating Tablets
Risperidone Tablets	Rivastigmine Tartrate Capsules	Rivastigmine Tartrate Oral Solution
Rocuronium Bromide Injection	Ropinirole Hydrochloride Tablets	Rose Bengal Ophthalmic Solution
Rosiglitazone Maleate Tablets	Salicylic Acid and Sulfur Cleansing Lotion	Salicylic Acid and Sulfur Lotion
Salicylic Acid and Sulfur Shampoo	Salicylic Acid Cream	Salicylic Acid Ointment
Salmeterol Inhalation Aerosol	Salmeterol Xinafoate Inhalation Powder	Scopolamine Transdermal System
Selegiline Hydrochloride Capsules	Serpacwa Topical Cream	Sertraline Hydrochloride Oral Solution
Sibutramine Hydrochloride Capsules	Sodium Bicarbonate and Sodium Citrate for Oral Solution	Sodium Bicarbonate, Sodium Citrate, and Sodium Tartrate for Oral Suspension
Sodium Chlorophyllin Copper Complex Tablets	Sodium Iodide Injection	Sodium Phenylbutyrate Oral Powder
Sodium Phenylbutyrate Tablets	Sodium Phosphates for Oral Suspension	Sodium Phosphates Tablets
Sodium Salicylate and Sulfur Shampoo	Sterile Talc Aerosol	Streptozocin for Injection
Sucralfate Oral Suspension	Sulconazole Nitrate Cream	Sulfacetamide Sodium and Prednisolone Sodium Phosphate Ophthalmic Solution
Sulfacetamide Sodium and Fluorometholone Ophthalmic Suspension	Sulfacytine Tablets	Sulfanilamide Vaginal Cream
Sulfasalazine Oral Suspension	Sumatriptan Tablets	Sulisobenzone Lotion
Sumatriptan Injection	Tacrolimus Capsules	Tacrolimus Ointment
Tacrolimus Injection	Tamsulosin Hydrochloride Capsules	Technetium Tc 99M Teboroxime Injection
Tenofovir Disoproxil Fumarate Tablets	Terbinafine Hydrochloride Cream	Terbinafine Tablets
Terbinafine Topical Solution	Terconazole Vaginal Cream	Terconazole Vaginal Suppositories
Testosterone Transdermal System	Tetracycline Hydrochloride Periodontal Fiber	Theophylline Extended-Release Tablets
Tioconazole Vaginal Ointment	Tiopronin Tablets	Tolnaftate Topical Aerosol Solution
Topiramate Capsules	Topiramate Tablets	Torsemide Injection
Torsemide Tablets	Trandolapril and Verapamil Hydrochloride Extended-Release Tablets	Trandolapril Tablets
Tranexamic Acid Injection	Tranylcypromine Sulfate	Tranylcypromine Sulfate Tablets
Tretinoin Capsules	Tretinoin Microsphere Gel	Triamcinolone Acetonide Metered-Dose Nasal Suspension
Trifluridine Ophthalmic Solution	Trimetrexate for Injection	Trimipramine Maleate Capsules
Triprolidine and Pseudoephedrine Hydrochlorides and Codeine Phosphate Syrup	Trolamine Salicylate Cream	Trolamine Salicylate Gel
Trolamine Salicylate Topical Emulsion	Trovafloxacin Injection	Trovafloxacin Mesylate for Injection
Undecylenic Acid Topical Foam Aerosol	Unoprostone Isopropyl Ophthalmic Solution	Urea Cream
Vecuronium Bromide for Injection	Venlafaxine Extended-Release Capsules	Venlafaxine Tablets
Verapamil Hydrochloride Capsules	Verapamil Hydrochloride Extended-Release Capsules	Voriconazole Injection
Voriconazole Oral Suspension	Voriconazole Tablets	Yttrium Y-90 Chloride Solution
Yttrium Y-90 Glass Microspheres	Yttrium Y-90 Microspheres Injection	Ziprasidone Hydrochloride Capsules
Zidovudine and Lamivudine Tablets	Zinc Acetate Capsules	Zoledronic Acid for Injection
Zinc Tridosium Pentetate Injection		

Excipients

Acetone Sodium Bisulfite	Acetylated Monoglycerides	*N*-Acetyl-L- Methionine
Aconitic Acid (Achilleic Acid)	Acrylic Acid-Octyl Acrylate Copolymer	Albumin Colloidal
Aliphatic Polyesters	Aluminum Ammonium Sulfate	Aluminum Hydroxide
Aluminum Lactate	Aluminum Oxide	Aluminum Ammonium Sulfate
Aluminum Potassium Sulfate	Aluminum Silicate	Aluminum Sodium Sulfate
Aluminum Stearate	Allantoin-Sodium Pyrrolidone Carboxylate	Ammonium Bicarbonate
Ammonium Calcium Alginate	Ammonium Phosphate	L-Ascorbyl Stearate
L-Asparagine	Batylalcohol Monostearate	Beeswax, Synthetic
Benzododecinium Bromide	Benzyl Chloride	Benzyl Nicotinate
Brominated Vegetable Oil	Butadiene-Styrene Rubber	Beta Naphthol
Butylene Glycol	Butylphthalyl Butylglycolate	Butylated Hydromethylphenol
Calcium Alginate	Calcium Alginate and Ammonium Alginate	Calcium Acid Pyrophosphate
Calcium Chloride Solution	Calcium Glycerophosphate ***(Received)***	Calcium Bromide
Calcium Phospahte Dibasic, Monohydrate	Calcium Phosphate Monobasic	Calcium Phosphate Dibasic, Anhydrous
Calcium Pyrophosphate	Calcium Sorbate	Calcium Propionate
Calcium Sulfate Dihydrate	Calcium Sulfate, Anhydrous	Calcium Stearoyl Lactylate
Calteridol Calcium	Canola Oil	Caldiamide Sodium
Caprylic/Capric Diglyceril Succinate	Carbon	Capric Acid
Carboxymethylamylopectin Sodium	Carboxymethylcellulose Potassium	Carboxymethyl Starch
Cetostearyl Isononanoate	Cholic Acid	Cinnamaldehyde
Chlorodifluoroethane	Cocamide Diethanolamine	Cocamide Oxide
Coconut Oil Hydrogenated ***(Received)***	Cocoyl Caprylocaprate	Coconut Oil
Crystal Gum	Cutina	Copper Sulfate
L-Cysteine Monohydrochloride	Dammar Gum	Cystine
Decanoic Acid	Decyl Oleate	Dehydroacetic Acid
Desoxycholic Acid	Dextrin Palmitate	Dextrins Modified
Diacetyl Tartaric Acid Esters Of Mono- and Diglycerides	Dicetyl Phosphate	Dichlorofluoromethane
Diethylene Glycol Monopalmitostearate	Diethyl Sebacate	Difluoroethane
Diglycol Stearate	Diisobutyl Adipate	Diisopropyl Adipate
Diisopropylbenzothiazyl-2-Sulfenamide	Dilauryl Thiodipropionate	Dimethyl Dicarbonate
Dimyristoyl Lecithin	Dimyristoyl Phosphatidylglycerol	Dioctyl Sodium Sulfosuccinate
Dipropylene Glycol	Disodium Edisylate	Disodium Guanylate
Disodium Inosinate	Disodium Monooleamide Sulfasuccinate	Docusate Sodium/Sodium Benzoate
Erythorbic Acid	Erythrosine	Ethoxylated Mono- and Diglycerides
Ethoxyquin	Ethyl Hexanediol	Ethyl Linoleate
Ethyl Maltol	Ethylene Dichloride	Ethylene Glycol Monopalmitostearate
Ethylurea	Ferric Ammonium Citrate	Ferric Citrate
Ferric Oxide, Brown	Ferric Phosphate	Ferric Pyrophosphate
Ferrous Citrate	Ferrous Glycinate	Ferrous Lactate
Fluorochlorohydrocarbons	Formic Acid	Furcelleran
Gamma-Cyclodextrin	Gentistic Acid	Geraniol
L-Glutamic Acid	Glutamic Acid Hydrochloride	Gluten
Glycerol Ester of Gum Rosin (Ester Gum)	Glyceryl Laurate	Glyceryl Palmitate
Glyceryl Ricinoleate	Glyceryl Tristearate	Glycine Hydrochloride
Glycofurol	Glycol Stearate	Heptafluoropropane
Heptylparaben	Hexadecyl Isostearate	Hexane
Hexanetriol(-1,2,6-)	Hydrocarbon Gel	Hydrogenated Starch Hydrolysate
Hydroxyethylmethylcellulose	Hydroxylated Lecithin	Hydroxypropyl Beta Cyclodextrin
Indigotine	Inositol	Iron Carbonyl
Iron Subcarbonate	Isobutylated-Isoprene Copolymer	Isooctylacrylate
Isopropyl Isostearate	Isopropyl Stearate	Isostearic Acid
Isostearyl Alcohol	Lactobionic Acid	Lactose Ferrin, Bovine
Lactylated Fatty Acid Esters of Glycerol and Propylene Glycol	Lactylic Esters of Fatty Acids	Lanolin Anhydrous
Lanolin Alcohols, Acetylated	Lanolin (Wool Fat), Hydrogenated	Lanolin Hydrous
Lauramine Oxide	Lauric Acid	Lauric Diethanolamide

Excipients *(Continued)*

Lauric Myristic Diethanolamide	Lavender Oil	Lecithin, Hydroxylated
L-Leucine	Linoleic Acid	Macrogol Lauryl Ether
Macrogol Oleate	Macrogol Sorbitan Tristearate	Macrogol Stearyl Ether
Macrogolglycerol Cocoates	Macrogolglycerol Triisostearate	Magnesium Aluminum Silicate Hydrate
Magnesium Aspartate	Magnesium Aspartame Dihydrate	Magnesium Phosphate, Diabasic, Trihydrate
Magnesium Phosphate Tribasic	Magnesium Tartrate	Maltitol Syrup
Maltol Isobutyrate	Malt Syrup	Manganese Chloride
Manganese Citrate	Manganese Glycerophosphate	Manganese Hypophosphite
D-Mannose	Medical Antifoam Emulsion C	Medronate Disodium
Medronic Acid	Methyl Chloride	Methylchloroisothiazolinone
Methyl Hydroxyethyl Cellulose	Methylisothiazolinone	*N*-Methylpyrrolidone ***(Received)***
Microcrystalline Cellulose, Silicified ***(Received)***	Mineral Spirits	Monoisostearyl Glyceryl Ester
Monopotassium Glutamate Monohydrate	Monosodium Citrate	Mullein Leaf
Myristyl Gamma-Picolinium Chloride	Myristyl Lactate	*N,N*-Bis(2-Hydroxyethyl) Stearamide
Naphtha	Non-Pareil Seeds	Nutmeg Oil
Octanoic Acid	Oxystearin	Palm Kernel Oil
Palm Oil	Pentasodium Triphosphate	Pentetate Calcium Trisodium
Pentetate Pentasodium	Phenprobamate	Phenylmercuric Acetate
Phenylmercuric Nitrate	Pine Oil	Polacrilin
Polyacrylate Dispersion 30 Percent ***(Received)***	Polydextrose	Polydextrose Solution
Polyglycerol Esters of Fatty Acids	Polyglycerol Polyricinoleic Acid	Polyoxyethylene Castor Oil (USP has 35)
Polyoxyl Stearate (USP has 40)	Polypropylene Oleate	Polyvinyl Acetate ***(Received)***
Polyvinylacetal	Polyvinylacetal Diethylanoacetate	Polyvinylpolypyrrolidone
Polypropylene Stearyl Ether	Polyvinylpyrrolidone Ethylcellulose	Polysorbate 65

Potasssium Iodate	Potassium Nitrite	Potassium Phosphate
Potassium Phosphate Tribasic	Potassium Polymetaphosphate	Potassium Pyrophosphate
Potassium Stearate	Potassium Sulfate	Potassium Sulfite
Potassium Tripolyphosphate	Propylene Glycol Diacetate	Propylene Glycol Mono- and Diesters
Propyl Propionate	Purified Polyoxyl 35 Castor Oil ***(Received)***	Rapeseed Oil, Hydrogenated
Rapeseed Oil, Superglycerinated	Rice Bran Wax	Rosin
Silicone	Sodium Acid Pyrophosphate	Sodium Aluminosilicate
Sodium Aluminum Phosphate Acidic	Sodium Aluminum Phosphate Basic	Sodium Aspartate
Sodium Bisulfate	Sodium Bisulfite	Sodium Carbonate Hydrate
Sodium Carboxymethyl Betaglucan	Sodium Caseinate	Sodium Chlorate
Sodium Citrate, Dibasic	Sodium Citrate, Monobasic	Sodium Dehydroacetate
Sodium Diacetate	Sodium Erythorbate	Sodium Ferric Pyrophosphate
Sodium Ferrocyanide	Sodium Hypophosphite	Sodium Laureth Sulfate
Sodium Lauroyl Sarcosinate	Sodium Lauryl Sulfoacetate	Sodium Magnesium Aluminosilicate
Sodium Magnesium Silicate	Sodium Malate	Sodium Metaphosphate, Insoluble
Sodium Metasilicate	Sodium Methylate	Sodium Polyphosphates Glassy
Sodium Potassium Tripolyphosphate	Sodium Pyrophosphate	Sodium Pyrrolidone Carboxylate
Sodium Sesquicarbonate	Sodium Sesquinoleate	Sodium Stearoyl Lactylate
Sodium Thiomalate	Sodium Trimetaphosphate	Sodium Trioleate
Sodium Tripolyphosphate	Soy Polysaccharides	Stannous Chloride
Stannous Tartrate	Starch, Pregelatinized Corn	Starch, Pregelatinized Tapioca
Stearalkonium Chloride	Stearyl Citrate	Stearyl Monoglyceridyl Citrate
Succinylated Monoglycerides	Sucrose Acetate Isobutyrate	Sucrose Fatty Acid Esters
Sucrose Stearate	Sucrose Syrup	Sugar Fruit Fine
Sulfobutyl Ether Beta Cyclodextran	Tallow	Tallow Glycerides
Tallow Oil	Tetrafluoroethane	Thioglycerol
Thyme Oil	Tribehenin	Tricetеareth-4 Phosphate

Excipients *(Continued)*

Trichloroethylene	Trimyristin	Trisidium Citrate
Trolamine Lauryl Sulfate	Vegetable Oil	Wheat Flour
Wheat Gluten	Wheat Germ Oil	Whey

INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- New adopted (official) revisions to the *USP–NF* that become effective before the effective date of the next *Supplement* or that were not ready for adoption by the closing date for the upcoming *Supplement*. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.

Symbols—Interim revisions are shown with new text (if any) enclosed in circles, •new text•. Text enclosed in squares, ■new text■, has already been adopted in a *Supplement*. Where the symbols appear together with no enclosed text, such as •• or ■■, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by a number that indicates the *IRA* or *Supplement* in which the revision first appeared. For example, •2 indicates that the revision was officially adopted in the *Second Interim Revision Announcement*, and ■2S (*USP29*) indicates that the revision was officially adopted in the *Second Supplement* to *USP 29*.

Errata—At the end of the *Interim Revision Announcement* section is a list of errata and corrections to *USP 29–NF 24*. The page number indicates where the item is found in *USP–NF*. If necessary, this list will be updated with every issue of *PF*. This information will also be cumulative in the next available *Supplement*, and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

SECOND INTERIM REVISION ANNOUNCEMENT to *USP 29* and to *NF 24*

By authority of the United States Pharmacopeial Convention, Inc.
Prepared by the Council of Experts and published by the Board of Trustees

John W. Mauger, *Chair*
USP Board of Trustees

Roger L. Williams, *Executive Vice President*
and *Chairman, USP Council of Experts*

Roger L. Williams, M.D. *Chief Standards Officer, Acting*

Official April 1, 2006 **Released March 1, 2006**

All inquiries and comments regarding *USP 29* text and *NF 24* text should be addressed to the Executive Secretariat, *USP–NF*, 12601 Twinbrook Parkway, Rockville, MD 20852.

New USP Reference Standards

The following USP Reference Standards, which were not available when the associated monograph was made official, have since become available. The respective official date of each *USP 29* or *NF 24* standard, test, or assay requiring the use of the following USP Reference Standards is indicated in parentheses after the name of the Reference Standard.

USP Berberine Chloride (May 1, 2006)
USP Budesonide RS (September 1, 2006)
USP Clopidogrel Bisulfate RS (March 1, 2006)
USP Clopidogrel Bisulfate Related Compound A RS (March 1, 2006)
USP Clopidogrel Bisulfate Related Compound B RS (March 1, 2006)
USP Clopidogrel Bisulfate Related Compound C RS (March 1, 2006)
USP Fluticasone Propionate Resolution Mixture RS (September 1, 2006)
USP Fluticasone Propionate System Suitability Mixture RS (September 1, 2006)
USP Hydrastine RS (May 1, 2006)
USP Insulin Lispro RS (March 1, 2006)
USP Mefloquine Hydrochloride RS (May 1, 2006)
USP Mefloquine Related Compound A RS (May 1, 2006)
USP Norphenylephrine Hydrochloride RS (May 1, 2006)
USP Ondansetron RS (May 1, 2006)
USP Polyoxyl 20 Cetostearyl Ether RS (March 1, 2006)
USP Polyoxyl 20 Stearyl Ether RS (March 1, 2006)
USP Ropivacaine Related Compound A RS (September 1, 2006)
USP Ropivacaine Related Compound B RS (September 1, 2006)
USP Somatropin RS (May 1, 2006)
USP Tiagabine Related Compound A RS (May 1, 2006)
USP Racemic Tiagabine Hydrochloride Mixture RS (May 1, 2006)
USP Tiagabine Hydrochloride RS (May 1, 2006)
USP Tinidazole Related Compound B RS (September 1, 2006)

Unavailable First-Time Official USP Reference Standards

The official dates of any *USP 29* or *NF 24* standards, tests, or assays requiring the use of the following new USP Reference Standards are postponed until further notice pending availability of the respective Reference Standards. This listing was updated as of January 5, 2006.

USP Albumin Human RS
USP Alteplase RS
USP Amifostine RS
USP Amifostine Thiol RS
USP Antithrombin III Human RS
USP Aprotinin RS
USP Aprotinin System Suitability RS
USP Cetrimonium Bromide RS
USP Citalopram Hydrobromide RS
USP Cladribine RS
USP Cladribine Related Compound A RS
USP Copolymer Polypropylene RS
USP Decoquinate RS
USP Cryopreserved Human Fibroblast-Derived Dermal Substitute Reference Photomicrographs RS
USP Diethylstilbestrol Diphosphate RS
USP Docosyl Ferulate RS
USP Powdered *Echinacea pallida* Extract RS
USP Escin RS
USP Eucatropine Hydrochloride RS
USP Fludeoxyglucose Related Compound B RS
USP Fluticasone Propionate RS
USP Fluvastatin Sodium RS
USP Fluvastatin Related Compound A RS
USP Fluvastatin Related Compound B RS
USP Ginkgo Terpene Lactones RS
USP Powdered American Ginseng Extract RS
USP Glyceryl Distearate RS
USP Glyceryl Monolinoleate RS
USP Glyceryl Monooleate RS
USP Gonadorelin Hydrochloride RS
USP Hemoglobin RS
USP Hexacosanol RS
USP Irbesartan RS
USP Irbesartan Related Compound A RS
USP Isosorbide Mononitrate RS
USP Isosorbide Mononitrate Related Compound A RS
USP Lamivudine Resolution Mixture B RS
USP Alpha Lipoic Acid RS
USP Maritime Pine Extract RS
USP Mecamylamine Related Compound A RS
USP Menotropins RS
USP Methyldopa-Glucose Reaction Product RS
USP Mibolerone RS
USP Narasin RS
USP Naratriptan Resolution Mixture RS
USP Near Infrared Calibrator
USP Nimodipine RS
USP Nimodipine Related Compound A RS
USP Paricalcitol Solution RS
USP Cultured Rat Pheochromocytoma Reference Photomicrographs RS
USP Polyisobutylene RS
USP Polyoxyl 10 Oleyl Ether RS
USP Potassium Perchlorate RS
USP Pygeum Extract RS
USP Pyrethrum Extract RS
USP Quinapril Hydrochloride RS
USP Ramipril Related Compound B RS
USP Ropivacaine Hydrochloride RS
USP Powdered St John's Wort Extract RS
USP Sargramostim RS
USP Sincalide RS
USP Human Fibroblast-Derived Temporary Skin Substitute Reference Photomicrographs RS
USP Sulisobenzone RS
USP Δ^8-Tetrahydrocannabinol RS
USP Δ^9-Tetrahydrocannabinol RS
USP Powdered Valerian RS
USP Valrubicin RS
USP Valrubicin Related Compound A RS
USP Vasopressin RS

NOTICE OF POSTPONEMENT

Mannitol Injection Monograph

In accordance with Section 9.06c of the Rules and Procedures of the Council of Experts, the Nomenclature Expert Committee has postponed the official date of the new *Labeling* requirement for the *Mannitol Injection* monograph from January 1, 2006 to August 1, 2007. This requirement currently appears in *USP 29–NF 24* on page 1311.

The text of the postponed *Labeling* requirement states: ''The label also states that it should be warmed before use to dissolve any crystals that may have formed.''

The postponement is to provide additional time for manufacturers to meet the new *Labeling* standard. The text of the new *Labeling* standard is not being changed, only its implementation date.

Should you have any questions, please contact W. Larry Paul, Ph.D., Scientific Fellow and Scientific Liaison to the Nomenclature Expert Committee (301-816-8331 or wlp@usp.org).

Mannitol Injection

Change to read:

Labeling—The label states the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per mL. ▲The label also states that it should be warmed before use to dissolve any crystals that may have formed.▲*USP29*

Interim Revision Announcement

NOTICE OF POSTPONEMENT

Identification, Loss on drying, and *Limit of potassium* tests under *Sodium Chloride* (*First Supplement* to *USP 29–NF 24,* page 3582)

USP has **postponed indefinitely** the official date of the revisions to the *Identification, Loss on drying,* and *Limit of potassium* tests under the *Sodium Chloride* monograph, which is published on page 3582 of the *First Supplement* to *USP 29–NF 24.* This postponement applies to the official date of the changes, April 1, 2006. The monograph remains official as it appears on page 1975 of *USP 29.* This postponement is intended to give the industry more time to comment on the proposed changes.

If you have any questions or concerns, please contact Kevin Moore, Ph.D., Scientist, DSD, and scientific liaison to the Pharmacopeial Discussion Group (301-816-8369 or ktm@usp.org).

Sodium Chloride

Change to read:

Identification—

•**A:** Dissolve in 2 mL of water a quantity of the substance to be examined equivalent to about 2 mg of chloride (Cl^-). Acidify with diluted nitric acid, and add 0.4 mL of a silver nitrate solution containing about 42.5 g per L. Shake, and allow to stand. A curdled, white precipitate is formed. Centrifuge, and wash the precipitate with three quantities, each 1 mL, of water. Carry out this operation rapidly in subdued light, disregarding the fact that the supernatant may not become perfectly clear. Suspend the precipitate in 2 mL of water, and add 1.5 mL of ammonium hydroxide. The precipitate dissolves easily with the possible exception of a few large particles that dissolve slowly.

B: Introduce into a test tube a quantity of the substance to be examined equivalent to about 15 mg of chloride (Cl^-). Add 0.2 g of potassium dichromate and 1 mL of sulfuric acid. Place a filter-paper strip impregnated with 0.1 mL of *Diphenylcarbazide solution,* prepared below, over the opening of the test tube. The paper turns violet-red. The impregnated paper must not come into contact with the potassium dichromate.

Diphenylcarbazide solution—Dissolve 0.2 g of diphenylcarbazide in 10 mL of glacial acetic acid, and dilute with alcohol to 100 mL. Prepare immediately before use.

C: Dissolve 0.1 g of the substance to be examined in 2 mL of water. Add 2 mL of a 150 g per L solution of potassium carbonate, and heat to boiling. No precipitate is formed. Add 4 mL of *Potassium pyroantimonate solution,* prepared below, and heat to boiling. Allow to cool in ice water, and if necessary rub the inside of the test tube with a glass rod. A dense white precipitate is formed.

Potassium pyroantimonate solution—Dissolve 2 g of potassium pyroantimonate in 95 mL of hot water. Cool quickly and add a solution containing 2.5 g of potassium hydroxide in 50 mL of water and 1 mL of sodium hydroxide solution containing 8.5 g of sodium hydroxide in 100 mL of water. Allow to stand for 24 hours, filter, and dilute with water to 150 mL.

D: Dissolve a quantity of the substance to be examined equivalent to about 2 mg of sodium (Na^+) in 0.5 mL of water. Add 1.5 mL of *Methoxyphenylacetic reagent,* prepared below, and cool in ice water for 30 minutes. A voluminous, white, crystalline precipitate is formed. Place in water at 20°, and stir for 5 minutes. The precipitate does not disappear. Add 1 mL of ammonia TS. The precipitate dissolves completely. Add 1 mL of ammonium carbonate solution (158 g per L). No precipitate is formed.

Methoxyphenylacetic reagent—Dissolve 2.7 g of methoxyphenylacetic acid in 6 mL of 10% tetramethylammonium hydroxide solution in methanol, and add 20 mL of alcohol. Store in a polyethylene container.

(Postponed indefinitely)•2

Change to read:

Loss on drying ⟨731⟩**—**Dry the test material at 105° for 2 hours: it loses not more than 0.5% of its weight, determined on •about 1.000 g of sample.

(Postponed indefinitely)•2

Change to read:

Limit of potassium (where it is labeled as intended for use in the manufacture of injectable dosage forms, peritoneal dialysis solutions, hemodialysis solutions, or hemofiltration solutions)—

Test solution—Transfer 1.00 g of Sodium Chloride to a 100-mL volumetric flask, add water and swirl to dissolve, dilute with water to volume, and mix.

Standard solution—[NOTE—The *Standard solution* and the *Test solution* may be modified, if necessary, to obtain solutions of suitable concentrations adaptable to the linear or working range of the instrument.] Dissolve 1.144 g of potassium chloride, previously dried at 105° for 3 hours, in water, dilute with water to 1000 mL, and mix. This solution contains the equivalent of 600 µg of potassium per mL. Dilute as required to obtain not fewer than three solutions at concentrations that span the expected value in the *Test solution*.

Procedure—Using atomic •emission•2 spectrophotometry (see *Spectrophotometry and Light-Scattering* ⟨851⟩), measure, at least three times, the emission intensity of the *Test solution* and the *Standard solution* using an air–acetylene flame and a wavelength of 766.5 nm. Prepare a calibration curve from the mean of the readings obtained with the *Standard solution,* and determine the concentration of potassium in the *Test solution.* The limit is 0.05%.

•(Postponed indefinitely)•2

Interim Revision Announcement

NOTICE OF POSTPONEMENT

⟨621⟩ *Chromatography*

General Chapter ⟨621⟩ *System Suitability (USP 29–NF 24,* page 2647)

USP has **postponed indefinitely** the implementation of the requirement of the text pertaining to detection sensitivity under *System Suitability* that is published on page 2647 of *USP 29–NF 24* and slated to become official on June 1, 2006. On the basis of comments received, the General Chapters Expert Committee has decided that additional time is necessary to review the impact of this proposal, specifically on older methods that were not developed to meet this requirement. The postponement will give the Expert Committee time to define a better strategy to implement this requirement. Should you have any questions, please contact Horacio Pappa, Ph.D., Senior Scientist, General Policies and Requirements Division, and Scientific Liaison to the General Chapters Expert Committee (301-816-8319 or hp@usp.org).

⟨621⟩ CHROMATOGRAPHY

Change to read:

SYSTEM SUITABILITY

System suitability tests are an integral part of gas and liquid chromatographic methods. They are used to verify that the ▲detection sensitivity,▲*USP29* ●(Postponed indefinitely)●2 resolution, and reproducibility of the chromatographic system are adequate for the analysis to be done. The tests are based on the concept that the equipment, electronics, analytical operations, and samples to be analyzed constitute an integral system that can be evaluated as such.

▲The detection sensitivity is a measure used to ensure the suitability of a given chromatographic procedure for the complete detection of the impurities in the *Chromatographic purity* or *Related compounds* tests by injecting a volume of a quantitation limit solution equal to that of the *Test solution*. Unless otherwise specified in the individual monograph, the quantitation limit solution may be prepared by dissolving the drug substance Reference Standard in the same solvent as that used for the *Test solution* at a 0.05% concentration level relative to the amount of drug substance in the *Test solution* for drug substances, and a 0.1% level relative to the amount of drug substance in the *Test solution* for drug products. The signal-to-noise ratio for the drug substance peak obtained with the quantitation limit solution should be not less than 10.▲*USP29* ●(Postponed indefinitely)●2

The resolution, *R*, [NOTE—All terms and symbols are defined in the *Glossary of Symbols*] is a function of column efficiency, *N,* and is specified to ensure that closely eluting compounds are resolved from each other, to establish the general resolving power of the system, and to ensure that internal standards are resolved from the drug. Column efficiency may be specified also as a system suitability requirement, especially if there is only one peak of interest in the chromatogram; however, it is a less reliable means to ensure resolution than direct measurement. Column efficiency is a measure of peak sharpness, which is important for the detection of trace components.

Replicate injections of a standard preparation used in the assay or other standard solution are compared to ascertain whether requirements for precision are met. Unless otherwise specified in the individual monograph, data from five replicate injections of the analyte are used to calculate the relative standard deviation, S_R, if the requirement is 2.0% or less; data from six replicate injections are used if the relative standard deviation requirement is more than 2.0%.

The tailing factor, *T,* a measure of peak symmetry, is unity for perfectly symmetrical peaks and its value increases as tailing becomes more pronounced (see *Figure 2*). In some cases, values less than unity may be observed. As peak asymmetry increases, integration, and hence precision, becomes less reliable.

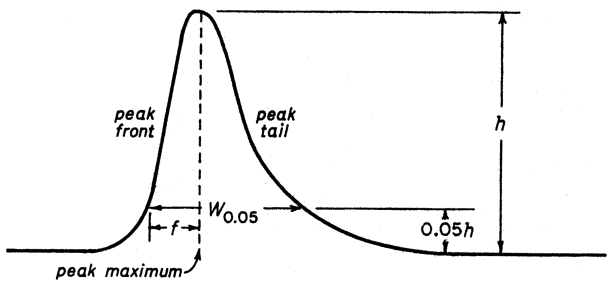

Figure 2. Asymmetrical chromatographic peak

These tests are performed by collecting data from replicate injections of standard or other solutions as specified in the individual monograph. The specification of definitive parameters in a monograph does not preclude the use of other suitable operating conditions (see *Procedures* under *Tests and Assays* in the *General Notices*). Adjustments of operating conditions to meet system suitability requirements may be necessary.

Unless otherwise directed in the monograph, system suitability parameters are determined from the analyte peak.

To ascertain the effectiveness of the final operating system, it should be subjected to suitability testing. Replicate injections of the standard preparation required to demonstrate adequate system precision may be made before the injection of samples or may be interspersed among sample injections. System suitability must be demonstrated throughout the run by injection of an appropriate control preparation at appropriate intervals. The control preparation can be a standard preparation or a solution containing a known amount of analyte and any additional materials useful in the control of the analytical system, such as excipients or impurities. Whenever there is a significant change in equipment or in a critical reagent, suitability testing should be performed before the injection of samples. No sample analysis is acceptable unless the requirements of system suitability have been met. Sample analyses obtained while the system fails requirements are unacceptable.

MONOGRAPHS (USP)

Glucagon

Change to read:

Assay—[NOTE—All buffers have a final pH of 7.4, unless otherwise indicated. •The concentration range of the *Standard preparations* and the *Assay preparations* may be modified to fall within the linear range of the *Assay.* The calculations should be adjusted accordingly. Alternatively, full curve analysis using validated nonlinear statistical methods can be used, provided that parallelism is demonstrated when comparing the responses of the *Standard preparations* and the *Assay preparations*.]•2

HEPATOCYTE PREPARATION—

Calcium-free perfusion buffer with dextrose—Prepare a solution containing, in each L, 7.92 g of sodium chloride, 0.35 g of potassium chloride, 1.80 g of dextrose, 0.19 g of edetic acid, and 2.38 g of *N*-2-hydroxyethylpiperazine-*N*′-2-ethanesulfonic acid. Oxygenate prior to circulation.

Collagenase buffer—Prepare a solution containing, in each L, 3.62 g of sodium chloride, 23.83 g of *N*-2-hydroxyethylpiperazine-*N*′-2-ethanesulfonic acid, 0.35 g of potassium chloride, 0.52 g of calcium chloride, and 1.8 g of dextrose. Adjust to a pH of 7.6, and oxygenate. Immediately before perfusion, dissolve a quantity of collagenase in this solution to obtain a concentration of 0.02% to 0.05%.

Wash buffer—Prepare a solution containing, in each L, 7.92 g of sodium chloride, 0.35 g of potassium chloride, 0.19 g of edetic acid, 2.38 g of *N*-2-hydroxyethylpiperazine-*N*′-2-ethanesulfonic acid, 0.22 g of calcium chloride, and 0.12 g of magnesium sulfate.

Incubation buffer—Prepare a solution containing, in each L, 6.19 g of sodium chloride, 0.35 g of potassium chloride, 0.22 g of calcium chloride, 0.12 g of magnesium sulfate, 0.16 g of monobasic potassium phosphate, 11.915 g of *N*-2-hydroxyethylpiperazine-*N*′-2-ethanesulfonic acid, and 1% bovine serum albumin (BSA). Adjust to a pH of 7.5.

Test animals—Male Sprague-Dawley rats are maintained on a standard rat chow diet and freely given water. On the morning of the test, select a healthy rat weighing approximately 300 g, and administer 100 Units of Heparin Sodium subcutaneously.

Procedure—[NOTE—Conduct this procedure in the morning to ensure that the rat has optimal glycogen in its liver.] Anesthetize the rat with an appropriate anesthetic. Open the abdominal cavity, and isolate the portal vein. Insert an angiocatheter connected to a perfusion pump, and tie into the portal vein at the general location of the lienal branch. Start the perfusion (25 mL per minute) in situ with *Calcium-free perfusion buffer with dextrose,* equilibrated with oxygen, at a temperature of 37°. As the liver enlarges, cut the inferior vena cava to allow pressure equilibrium. [NOTE—About 300 mL of the perfusate is needed to clear the liver of red blood cells at a flow rate of 30 to 60 mL per minute.] Then circulate *Collagenase buffer* at a flow rate of 30 to 60 mL per minute for about 10 minutes. The exact concentration of collagenase (within the range of 0.02% to 0.05%) is determined empirically for each lot of enzyme. The concentration of collagenase is that necessary to consistently cause a breakdown of the liver about 10 minutes after initial entry of the *Collagenase buffer* into the liver. When the liver significantly increases in size, changes color and consistency, and starts to leak perfusate out of the lobes, change the system to the oxygenated prewarmed *Wash buffer.* About 100 mL of *Wash buffer* is needed to wash the liver of collagenase at a flow rate of 25 mL per minute. Surgically remove the liver from the animal and place in a prewarmed tray containing oxygenated *Wash buffer* (37°). Gently comb the liver with a stainless steel, fine-toothed comb to free the hepatocytes. Wash the hepatocytes with *Wash buffer,* and filter through cheesecloth (or a 150-µm mesh polyethylene net) into a plastic beaker. Centrifuge the cell suspension for about 2 minutes at about 25 × *g* to form a loosely packed pellet. Discard the supernatant, and resuspend the pellet in *Wash buffer.* Repeat the washing procedure twice for a total of three washes. Resuspend the final pellet in 100 to 200 mL of *Incubation buffer,* depending on cell yield. [NOTE—If the *Assay* procedure is interrupted, cool the cells by collecting the cells in a beaker placed in ice. The cells are washed with ice-cold *Wash buffer,* and stored on ice until ready for use. At that point the cells are pelleted once more, and resuspended in ice-cold *Incubation buffer.*]

Suitability—The concentrations of cells may vary due to the collagenase activity and the viability of the hepatocytes. To check cell viability and to determine viable cell concentration, dilute duplicate 100-µL aliquots of cell suspension with 400 µL of *Wash buffer* and 500 µL of isotonic 0.4% trypan blue. The aliquots are counted in a hemocytometer. The cells are suspended in *Incubation buffer* to obtain a viable cell concentration of not less than 3×10^6 per mL. Count several distinct fields. [NOTE—Viable cells are those cells that exclude the trypan blue.]

NEGATIVE CONTROL SOLUTION—Prepare a solution containing 0.5% BSA in sterile water.

INCUBATION FLASKS—Use 25-mL conical flasks, the bottoms of which have been heated and pushed inward to form a conically raised center.

STANDARD PREPARATIONS—In duplicate, dissolve a suitable quantity of USP Glucagon RS, accurately measured, in 0.01 N hydrochloric acid or other suitable diluent to obtain a solution containing 1.0 USP Glucagon Unit per mL. All dilutions thereafter are made using 0.5% BSA (w/v) in water. Accurately dilute measured volumes of each solution with *Negative control solution* to obtain five concentrations—200, 100, 50, 25, and 12.5 micro-Units per mL—of each solution *(Standard preparations).* Pipet 0.2 mL of each *Standard preparation* into separate *Incubation flasks.* Pipet 0.2 mL of *Negative control solution* into each of two flasks *(Negative control solutions 1* and *2).* Then add the hepatocytes into each of the 12 flasks.

ASSAY PREPARATIONS—Using accurately weighed quantities of Glucagon, proceed as directed for *Standard preparations.*

D-GLUCOSE DETERMINATION—

Standard stock solution—Transfer 2.0 g of USP Dextrose RS, accurately weighed, to a 200-mL volumetric flask, and dissolve in and dilute with saturated benzoic acid solution to volume.

Standard solutions—Transfer suitable quantities of *Standard stock solution* to three flasks, and dilute with saturated benzoic acid solution to obtain solutions having known concentrations of 0.5, 1.0, and 1.5 times the typical sample glucose concentration.

Potassium ferrocyanide solution—Dissolve 1.25 g of trihydrate potassium ferrocyanide in 125 mL of *Sterile Water for Injection*.

System suitability—Analyze the *Potassium ferrocyanide solution,* the *Standard solutions,* and five replicates of the middle *Standard solution.* Prepare a standard curve using the *Standard solutions* as directed for *Procedure:* the relative standard deviation of the standard curve is not more than 2.0%; the response of the *Potassium ferrocyanide solution* is not more than 30 mg per L; and the relative standard deviation is not more than 2.0% for the replicate analyses of the middle *Standard solution.*

PROCEDURE—Dispense 5 mL of *Hepatocyte preparation* into the special incubation flasks in sequence from high glucagon concentration to low glucagon concentration, alternating the *Standard preparations* with the *Assay preparations.* The flasks are swirled in an orbiting water bath at 125 rpm at 30° for approximately 30 to 60 minutes. [NOTE—The exact incubation time must be determined to optimize the signal-to-noise ratio.] Following incubation, place 0.5- to 1.0-mL aliquots, in duplicate, from each incubation flask into labeled tubes, and centrifuge at 12,500 × *g.* Determine the percentage of glucose concentration in each flask's supernatant.

To conform to the linear range of the instrument being used, it may be necessary to adjust by dilution each of the preparations. Use a glucose analyzer that has demonstrated appropriate specificity, accuracy, precision, and linear response over the range of concentrations being determined. [NOTE—A suitable analyzer may

Interim Revision Announcement

use an immobilized, oxidase-enzyme membrane or jacket-generating hydrogen peroxide, which is then detected at the electrode.] Perform the glucose analysis in the following sequence: *Negative control solution 1, Standard preparations, Assay preparations,* and *Negative control solution 2.* Determine the percentage of glucose against the *Negative control solution* for each preparation.

CALCULATIONS—

Linearity test—Use an analysis of variance (ANOVA) with one sample assayed against a standard, and using two replicates each, construct a table (see *Table 1*). Compare the value of the ratio $MSNL/MSRES_1$ to a critical value obtained from a table for an F distribution with $m-2$ and $3m-3$ degrees of freedom, where m is the number of dose levels for each preparation. If the ratio $MSNL/MSRES_1$ does not indicate the presence of significant nonlinearity (ratio value is lower than the critical value), then proceed to the test for parallelism. If the ratio exceeds the critical value (significance level of •0.025),•2 the nonlinearity is statistically significant and the test is repeated, discarding the results from either the highest or lowest dose of both the *Standard preparations* and the *Assay preparations* (four dose levels). If the ratio $MSNL/MSRES_1$ does not indicate the presence of significant nonlinearity, then proceed to the test for parallelism.

Parallelism test—Compare the ratio $MSNP/MSRES_2$ to a critical value obtained from an F distribution having 1 and $4m-5$ degrees of freedom. If the ratio $MSNP/MSRES_2$ does not indicate the presence of significant nonparallelism, then the assay is considered valid. Use the appropriate dose levels for the estimation of the relative potency.

Relative potency—Calculate the relative potency, *R,* of the *Assay preparations* as compared with the *Standard preparations* as follows.

(1) X_j is defined as the $\log_{10}$ of the j^{th} dose of the *Standard preparations* or the *Assay preparations.* The glucagon dose varies from 12.5 to 200×10^{-6} USP Glucagon Units per mL. For ease in the subsequent calculations, these doses are respectively represented by 1 through 5, as shown in the table below.

j	1	2	3	4	5
Dose	12.5	25	50	100	200
X_j	1.10	1.40	1.70	2.00	2.30

(2) To differentiate between the *Standard preparations* and the *Assay preparations* in the calculations, the subscript i will be used, with $i = 1$ to designate the *Standard preparations* and $i = 2$ to designate the *Assay preparations.* Y_{ijk} will denote the glucose concentration associated with the k^{th} replicate of the j^{th} dose of the i^{th} preparation. For example, Y_{1jk} is the glucose concentration associated with the k^{th} replicate of the j^{th} dose of the appropriate *Standard preparation;* Y_{11k} is the glucose concentration associated with the k^{th} replicate of dose 1 of the *Standard preparation;* and Y_{21k} is the glucose concentration associated with the k^{th} replicate of dose 1 of the *Assay preparation.* Dose 1 represents a glucose dose of 12.5×10^{-6} USP Glucagon Units per mL. Finally, Y_{132} represents the glucose concentration associated with the 2nd replicate of dose 3 for the *Standard preparation.*

(3) Y_S and Y_t denote the average glucose concentrations for the *Standard preparations* and the *Assay preparations,* respectively.

(4) Calculate the least-squares slope estimate, *b,* for a linear regression relating the Y_{ijk}'s to the X_j's as follows: $b = S_{xy}/S_{xx}$, with S_{xy} and S_{xx} calculated using the equations in *Table 2*.

(5) The log potency, *M,* is calculated using $M = -1[(Y_S - Y_t)/b]$.

(6) R = antilog *(M).*

(7) Calculate the confidence limits (upper and lower) for the relative potency, *R,* using the value $s^2 = MSRES_3$ (see *Table 1* and *Table 2*) as follows. Obtain t from a table for a t distribution having $4m-4$ degrees of freedom. For the 95% limits, the t values can be obtained from *Table 9* under *Design and Analysis of Biological Assays* ⟨111⟩.

NOTE—For confidence limits having other probability levels (i.e., $100(1-a)$ %), the right tail t critical value having $a/2$ area to its right is used.

$$\text{Calculate } g = t^2 S^2 / b^2 S_{xx}$$

$$\text{and } F = (ts/b)\sqrt{(1/m)(1-g) + (M^2/S_{xx})}$$

and calculate

$$M_L = (M - F)/(1 - g)$$

and

$$M_U = (M + F)/(1 - g)$$

where M is the log potency and M_L and M_U are the log potency lower and upper confidence limits. The lower and upper confidence limits for the relative potency, *R,* are given by

$$RL = \text{antilog } (M_L)$$

$$RU = \text{antilog } (M_U)$$

It meets the requirements if the potency is between 0.8 and 1.25 USP Glucagon Units per mg, and the confidence interval width at $P = 0.95$ does not exceed 45% of the computed potency. Repeat the assay if the confidence interval width exceeds 45% of the computed potency.

Table 1. ANOVA for the Rat Hepatocyte Assay for Glucagon

Source	Degrees of Freedom	SS (Sum of Squares)	MS (Mean Square)
Preparations	1	SSPREP	MSPREP
Replicates	1	SSREP	MSREP
Linear Slope	1	SSLIN	MSLIN
$Residual_3$	$4m-4$	$SSRES_3$	$MSRES_3$
Nonparallelism	1	SSNP	MSNP
$Residual_2$	$4m-5$	$SSRES_2$	$MSRES_2$
Nonlinearity	$m-2$	SSNL	MSNL
$Residual_1$	$3m-3$	$SSRES_1$	$MSRES_1$
TOTAL	$4m-1$	SST	

NOTES—This analysis pertains to one sample assayed against a standard, using two replicates each.

The number of dose levels for each preparation is denoted by m. *Table 2* gives the equations for calculating the SS terms.

In each row of the ANOVA table, the MS is obtained by dividing the SS term by the degrees of freedom.

Table 2. Equations for Calculating the Sums of Squares in the Analysis of Variance*

$$Y_{i..} = \sum_{jk} \sum y_{ijk}$$

$$Y_{.j.} = \sum_{ik} \sum y_{ijk}$$

$$Y_{..k} = \sum_{ij} \sum y_{ijk}$$

$$CF = \frac{\left(\sum_{ijk} \sum\sum y_{ijk}\right)^2}{4m}$$

$$S^S_{xy} = \sum_{jk} \sum x_j y_{ijk} - \frac{\left(\sum_j x_j\right)(Y_{1..})}{m}$$

$$S^T_{xy} = \sum_{jk} \sum x_j y_{2jk} - \frac{\left(\sum_j x_j\right)(Y_{2..})}{m}$$

$$S_{xy} = S^S_{xy} + S^T_{xy}$$

$$S^S_{xx} = 2 \sum_j x_j^2 - \frac{2\left(\sum_j x_j\right)^2}{m}$$

$$S^T_{xx} = S^S_{xx}$$

$$S_{xx} = S^S_{xx} + S^T_{xx}$$

$$SSPREP = \frac{\sum_i Y^2_{i..}}{2m} - CF$$

$$SSREP = \frac{\sum_k Y^2_{..k}}{2m} - CF$$

$$SSLIN = \frac{\left(S_{xy}\right)^2}{S_{xx}}$$

$$SST = \sum_{i\,j\,k} \sum\sum y^2_{ijk} - CF$$

$$SSRES_3 = SST - SSPREP - SSREP - SSLIN$$

$$SSNP = \frac{\left(S^S_{xy}\right)^2}{S^S_{xx}} + \frac{\left(S^T_{xy}\right)^2}{S^T_{xx}} - SSLIN$$

$$SSRES_2 = SSRES_3 - SSNP$$

$$SSNL = \frac{\sum_j Y^2_{.j.}}{4} - SSLIN - CF$$

$$SSRES_1 = SSRES_2 - SSNL$$

Related compounds—

TEST 1—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Standard solution 1—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with absolute alcohol to obtain a solution having a known concentration of about 0.0125 mg of isosorbide per mL.

Interim Revision Announcement

Standard solution 2—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with absolute alcohol to obtain a solution having a known concentration of about 0.025 mg of isosorbide per mL.

Standard solution 3—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with absolute alcohol to obtain a solution having a known concentration of about 0.05 mg of isosorbide per mL.

Test solution—Transfer a portion of Diluted Isosorbide Mononitrate, equivalent to about 200 mg of isosorbide mononitrate, accurately weighed, to a suitable container, add 20.0 mL of absolute alcohol, sonicate for 10 minutes, and then centrifuge. Use the supernatant.

Application volume: 20 µL.

Developing solvent system: a mixture of absolute alcohol and toluene (8 : 2).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. After developing, dry the plate with warm air for about 10 minutes, dip the plate in a solution prepared by dissolving 1.25 g of potassium permanganate and 10.0 g of sodium hydroxide in 500 mL of water (prepared fresh for each plate), and heat at 105° for 5 minutes. Any spot in the chromatogram obtained from the *Test solution* and corresponding to the R_F value of the spots obtained from the *Standard solutions* is not more intense than the spot in the chromatogram obtained from *Standard solution 3:* not more than 0.5% of any individual impurity is found. If the spot in the chromatogram obtained from the *Test solution* is nearly as intense as the spot obtained from *Standard solution 3,* further dilute the *Test solution* (1 : 1) with absolute alcohol, repeat the test, and compare the intensity of the isosorbide spot in the diluted *Test solution* with the intensity of the spots obtained from the *Standard solutions,* correcting the percent level for the additional dilution of the *Test solution.*

TEST 2—

Mobile phase, Resolution solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Isosorbide mononitrate related compound A standard solution—Prepare as directed for *Isosorbide mononitrate related compound A standard preparation* in the *Assay.*

Isosorbide dinitrate standard stock solution—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Dinitrate RS in methanol, sonicate and warm if necessary, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.125 mg of isosorbide dinitrate per mL.

Standard solution—Transfer a quantity of USP •Diluted$_{•2}$ Isosorbide Mononitrate RS, accurately weighed, to a suitable volumetric flask. Dissolve in water, quantitatively add a volume of *Isosorbide mononitrate related compound A standard solution* and a volume of *Isosorbide dinitrate standard stock solution,* and dilute with water to volume to obtain a solution having a known concentration of about 2.0 mg of •isosorbide mononitrate$_{•2}$ per mL, 0.005 mg of isosorbide mononitrate related compound A per mL, and 0.005 mg of isosorbide dinitrate per mL. Filter a portion of the solution, discarding the first few mL of the filtrate.

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay.*

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of isosorbide mononitrate related compound A and isosorbide dinitrate relative to the amount of isosorbide mononitrate in the portion of Diluted Isosorbide Mononitrate taken by the formula:

$$•100(CV/W)(r_U/r_S)_{•2}$$

in which C is the concentration, in mg per mL, of •isosorbide mononitrate related compound A or isosorbide dinitrate, as appropriate,$_{•2}$ in the *Standard solution; W* is the •amount, in mg, of isosorbide mononitrate in the portion$_{•2}$ of Diluted Isosorbide Mononitrate used to prepare the *Test solution;* •based on the label claim; V is the volume, in mL, of the *Test solution;*$_{•2}$ and r_U and r_S are the peak areas of the corresponding components obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.25% of isosorbide mononitrate related compound A is found; and not more than 0.25% of isosorbide dinitrate is found. Calculate the percentage of each other impurity (other than isosorbide mononitrate related compound A or isosorbide dinitrate) in the portion of Diluted Isosorbide Mononitrate taken by the formula:

$$100(r_i/r_s)$$

in which r_i is the peak area for each other impurity obtained from the *Test solution;* and r_s is the sum of the areas of all the peaks: not more than 0.5% of total impurities is found, including isosorbide mononitrate related compound A and isosorbide dinitrate; and not more than 0.5% of total impurities is found, the results for *Test 1* and *Test 2* being considered.

Change to read:

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water and methanol (95 : 5). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer an accurately weighed quantity of USP •Diluted$_{•2}$ Isosorbide Mononitrate RS to a suitable volumetric flask, dissolve in water, add a volume of methanol equivalent to 4% of the flask volume, and dilute with water to volume to obtain a solution having a known concentration of about 2.0 mg •of isosorbide mononitrate$_{•2}$ per mL.

Isosorbide mononitrate related compound A standard preparation—Dissolve an accurately weighed quantity of USP Isosorbide Mononitrate Related Compound A RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 1.0 mg per mL. Quantitatively dilute a portion of this solution with water to obtain a solution having a known concentration of about 0.05 mg per mL.

Resolution solution—Transfer 10.0 mL of *Isosorbide mononitrate related compound A standard preparation,* 1.0 mL of *Standard preparation,* and 4.0 mL of methanol to a 100-mL volumetric flask, and dilute with water to volume. Filter a portion of the solution, discarding the first few mL of the filtrate.

Assay preparation—Transfer •an accurately weighed amount of Diluted Isosorbide Mononitrate, equivalent to 100 mg of isosorbide mononitrate,$_{•2}$ to a 50-mL volumetric flask, dissolve in about 25 mL of water, add 2 mL of methanol, dilute with water to volume, and mix. Filter a portion of the solution, discarding the first few mL of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4-mm × 12.5-cm column that contains packing L1. The flow rate is about 1.5 mL per minute, increasing to 3.0 mL per minute at about 8.5 minutes to ensure that the isosorbide mononitrate peak has completely eluted. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.8 for isosorbide mononitrate related compound A, 1.0 for isosorbide mononitrate, and 4.1 for isosorbide dinitrate; and the resolution, *R,* between isosorbide mononitrate related compound A and isosorbide mononitrate is not less than 2.0. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the isosorbide mononitrate peaks. Calculate the quantity, in mg, of isosorbide mononitrate ($C_6H_9NO_6$) in the portion of Diluted Isosorbide Mononitrate taken by the formula:

$$•CV(r_U/r_S)_{•2}$$

in which C is the concentration, in mg per mL, of isosorbide mononitrate in the *Standard preparation;* •V is the volume, in mL, of the *Assay preparation;*$_{•2}$ and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.

⟨467⟩ ORGANIC VOLATILE IMPURITIES

(Current title—not to change until January 1, 2007)
(Chapter title change—to become official January 1, 2007)
See ⟨467⟩ Residual Solvents

Change to read:

••2

For pharmacopeial purposes, residual solvents in pharmaceuticals are defined as organic volatile chemicals that are used or produced in the manufacture of drug substances or excipients, or in the preparation of drug products. The residual solvents are not completely removed by practical manufacturing techniques. Appropriate selection of the solvent for the synthesis of a drug substance or an excipient may enhance the yield, or determine characteristics such as crystal form, purity, and solubility. Therefore, the solvent may sometimes be a critical element in the synthetic process. This General Chapter does not address solvents deliberately used as excipients nor does it address solvates. However, the content of solvents in such products should be evaluated and justified.

Because residual solvents do not provide therapeutic benefit, they should be removed, to the extent possible, to meet ingredient and product specifications, good manufacturing practices, or other quality-based requirements. Drug products should contain no higher levels of residual solvents than can be supported by safety data. Solvents that are known to cause unacceptable toxicities (Class 1, *Table 1*) should be avoided in the production of drug substances, excipients, or drug products unless their use can be strongly justified in a risk-benefit assessment. Solvents associated with less severe toxicity (Class 2, *Table 2*) should be limited in order to protect patients from potential adverse effects. Ideally, less toxic solvents (Class 3, *Table 3*) should be used where practical. The complete list of solvents included in this General Chapter is given in *Appendix 1*. These tables and the list are not exhaustive. Where other solvents have been used, based on approval by the competent regulatory authority, such solvents may be added to the tables and list.

Testing of drug substances, excipients, and drug products for residual solvents should be performed when production or purification processes are known to result in the presence of such residual solvents. It is only necessary to test for residual solvents that are used or produced in the manufacture or purification processes.

Although manufacturers may choose to test the drug product, a cumulative procedure may be used to calculate the residual solvent levels in the product from the levels in its ingredients. If the calculation results in a level equal to or below that recommended in this General Chapter, no testing of the drug product for residual solvents needs to be considered. If, however, the calculated levels are above the recommended level, the drug product should be tested to ascertain whether the formulation process has reduced the relevant solvent levels to within acceptable amounts. A drug product should also be tested if a residual solvent is used during its manufacture.

See *Appendix 2* for additional background information related to residual solvents.

LIMITS OF RESIDUAL SOLVENTS

Ethylene Oxide

[NOTE—The test for ethylene oxide is conducted only where specified in the individual monograph.] The standard solution parameters and the procedure for determination are described in the individual monograph. Unless otherwise specified in the individual monograph, the limit is 10 μg per g.

Class 1

Class 1 residual solvents *(Table 1)* should not be employed in the manufacture of drug substances, excipients, and drug products because of the unacceptable toxicities or deleterious environmental effects of these residual solvents. However, if •their use in order to produce a medicinal product is unavoidable,•2 their levels should be restricted as shown in *Table 1,* unless otherwise stated in the individual monograph. The solvent 1,1,1-trichloroethane is included in *Table 1* because it is an environmental hazard. The stated limit of 1500 ppm is based on safety data.

When Class 1 residual solvents are used •or produced in the manufacture or purification of a drug substance, excipient, or drug product, these solvents should be identified and quantified. The procedures described in the *Identification, Control, and Quantification of Residual Solvents* section of this General Chapter are to be applied wherever possible.•2 Otherwise an appropriate validated procedure is to be employed. Such procedure shall be submitted to the USP for •evaluation.•2

Table 1. Class 1 Residual Solvents

Solvent	Concentration Limit (ppm)	Concern
Benzene	2	Carcinogen
Carbon tetrachloride	4	Toxic and environmental hazard
1,2-Dichloroethane	5	Toxic
1,1-Dichloroethene	8	Toxic
1,1,1-Trichloroethane	1500	Environmental hazard

Interim Revision Announcement

Class 2

Class 2 residual solvents *(Table 2)* should be limited in drug substances, excipients, and drug products because of the inherent toxicities of the residual solvents. PDEs are given to the nearest 0.1 mg per day, and concentrations are given to the nearest 10 ppm. The stated values do not reflect the necessary analytical precision of the determination procedure. Precision should be determined as part of the procedure validation.

If Class 2 residual solvents are present at greater than their *Option 1* limits, they should be identified and quantified. The procedures described in the *Identification, Control, and Quantification of Residual Solvents* section of this General Chapter are to be applied wherever possible. Otherwise an appropriate validated procedure is to be employed. Such procedure shall be submitted to the USP for •evaluation.•2

[NOTE—The following Class 2 residual solvents are not readily detected by the headspace injection conditions described in the *Identification, Control, and Quantification of Residual Solvents* section of this General Chapter: formamide, 2-ethoxyethanol, 2-methoxyethanol, ethylene glycol, *N*-methylpyrrolidone, and sulfolane. Other appropriate validated procedures are to be employed for the •quantification•2 of these residual solvents. Such procedures shall be submitted to the USP for •review and possible•2 inclusion in the relevant individual monograph.]

Table 2. Class 2 Residual Solvents

Solvent	PDE (mg/day)	Concentration Limit (ppm)
Acetonitrile	4.1	410
Chlorobenzene	3.6	360
Chloroform	0.6	60
Cyclohexane	38.8	3880
1,2-Dichloroethene	18.7	1870
1,2-Dimethoxyethane	1.0	100
N,N-Dimethylacetamide	10.9	1090
N,N-Dimethylformamide	8.8	880
1,4-Dioxane	3.8	380
2-Ethoxyethanol	1.6	160
Ethylene glycol	6.2	620
Formamide	2.2	220
Hexane	2.9	290
Methanol	30.0	3000
2-Methoxyethanol	0.5	50
Methylbutylketone	0.5	50
Methylcyclohexane	11.8	1180
Methylene chloride	6.0	600
N-Methylpyrrolidone	5.3	530
Nitromethane	0.5	50
Pyridine	2.0	200
Sulfolane	1.6	160
Tetrahydrofuran	7.2	720
Tetralin	1.0	100
Toluene	8.9	890
•Trichloroethylene•2	0.8	80
Xylene*	21.7	2170

* Usually 60% *m*-xylene, 14% *p*-xylene, 9% *o*-xylene with 17% ethyl benzene

Class 3

Class 3 residual solvents *(Table 3)* may be regarded as less toxic and of lower risk to human health than Class 1 and Class 2 residual solvents. Class 3 includes no solvent known as a human health hazard at levels normally accepted in pharmaceuticals. However, there are no long-term toxicity or carcinogenicity studies for many of the residual solvents in Class 3. Available data indicate that they are less toxic in acute or short-term studies and negative in genotoxicity studies.

Unless otherwise stated in the individual monograph, Class 3 residual solvents are limited to not more than 50 mg per day (corresponding to 5000 ppm or 0.5% under *Option 1*). If a Class 3 solvent limit in an individual monograph is greater than 50 mg per day, that residual solvent should be identified and quantified. The procedures described in the *Identification, Control, and Quantification of Residual Solvents* section of this General Chapter, •with appropriate modifications to the standard solutions,•2 are to be applied wherever possible. Otherwise an appropriate validated procedure is to be employed. Such procedure shall be submitted to the USP for •evaluation. USP Reference Standards, where available, should be used in these procedures.•2

Table 3. Class 3 Residual Solvents
(limited by GMP or other quality-based requirements in drug substances, excipients, and drug products)

Acetic acid	Heptane
Acetone	Isobutyl acetate
Anisole	Isopropyl acetate
1-Butanol	Methyl acetate
2-Butanol	3-Methyl-1-butanol
Butyl acetate	Methylethylketone
tert-Butylmethyl ether	Methylisobutylketone
Cumene	2-Methyl-l-propanol
Dimethyl sulfoxide	Pentane
Ethanol	1-Pentanol
Ethyl acetate	1-Propanol
Ethyl ether	2-Propanol
Ethyl formate	Propyl acetate
Formic acid	

Other Residual Solvents

The residual solvents listed in *Table 4* may also be of interest to manufacturers of drug substances, excipients, or drug products. However, no adequate toxicological data on which to base a PDE was found. ••2

Table 4. Other Residual Solvents
(for which no adequate toxicological data was found)

1,1-Diethoxypropane	Methyl isopropyl ketone
1,1-Dimethoxymethane	Methyltetrahydrofuran
2,2-Dimethoxypropane	Solvent hexane
Isooctane	Trichloroacetic acid
Isopropyl ether	Trifluoroacetic acid

IDENTIFICATION, CONTROL, AND QUANTIFICATION OF RESIDUAL SOLVENTS

[NOTE—The organic-free water specified in the following procedures produces no significantly interfering peaks when chromatographed.]

Class 1 and Class 2 Residual Solvents

WATER-SOLUBLE ARTICLES

Procedure A—

Class 1 Standard Stock Solution—Transfer 1.0 mL of USP Class 1 Residual Solvents Mixture RS to a 100-mL volumetric flask, add 9 mL of dimethyl sulfoxide, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to a 10-mL volumetric flask, dilute with water to volume, and mix.

Class 1 Standard Solution—Transfer 1.0 mL of *Class 1 Standard Stock Solution* to an appropriate headspace vial, add 5.0 mL of water, apply the stopper, cap, and mix.

•*Class 2 Standard Stock Solutions*—Transfer 1.0 mL of USP Residual Solvents Class 2—Mixture A RS to a 100-mL volumetric flask, dilute with water to volume, and mix. This is *Class 2 Standard Stock Solution A.* Transfer 1.0 mL of USP Residual Solvents Class 2—Mixture B RS to a 100-mL volumetric flask, dilute with water to volume, and mix. This is *Class 2 Standard Stock Solution B.*

Class 2 Mixture A Standard Solution—Transfer 1.0 mL of *Class 2 Standard Stock Solution A* to an appropriate headspace vial, add 5.0 mL of water, apply the stopper, cap, and mix.

Class 2 Mixture B Standard Solution—Transfer 5.0 mL of *Class 2 Standard Stock Solution B* to an appropriate headspace vial, add 1.0 mL of water, apply the stopper, cap, and mix.•2

Test Stock Solution—Transfer about 250 mg of the article under test, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Test Solution—Transfer 5.0 mL of *Test Stock Solution* to an appropriate headspace vial, add 1.0 mL of water, apply the stopper, cap, and mix.

Class 1 System Suitability Solution—Transfer 1.0 mL of *Class 1 Standard Stock Solution* to an appropriate headspace vial, add 5.0 mL of *Test Stock Solution,* apply the stopper, cap, and mix.

Chromatographic System (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm × 30-m fused-silica column coated with a 1.8-µm layer of phase G43 or a 0.53-mm × 30-m wide-bore column coated with a 3.0-µm layer of phase G43. The carrier gas is nitrogen or helium with a linear velocity of about 35 cm per second, and a split ratio of 1 : 5. The column temperature is maintained at 40° for 20 minutes, then raised at a rate of 10° per minute to 240°, and maintained at 240° for 20 minutes. The injection port and detector temperatures are maintained at 140° and 250°, respectively. Chromatograph the *Class 1 Standard Solution, Class 1 System Suitability Solution,* and *Class 2* •*Mixture A*•2 *Standard Solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio of 1,1,1-trichloroethane in the *Class 1 Standard Solution* is not less than 5; the signal-to-noise ratio of each peak in the *Class 1 System Suitability Solution* is not less than 3; and the resolution, *R,* between acetonitrile and methylene chloride in the *Class 2* •*Mixture A*•2 *Standard Solution* is not less than 1.0.

Procedure—Separately inject (following one of the headspace operating parameter sets described in the table below) equal volumes of headspace (about 1.0 mL) of the *Class 1 Standard Solution,* •*Class 2 Mixture A Standard Solution, Class 2 Mixture B Standard Solution,*•2 and the *Test Solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. If a peak response of any peak in the *Test Solution* is greater than or equal to a corresponding peak in either the *Class 1 Standard Solution* or •either of the two *Class 2 Mixture Standard Solutions,*•2 proceed to *Procedure B* to verify the identity of the peak; otherwise the article meets the requirements of this test.

Table 5. Headspace Operating Parameters

	Headspace Operating Parameter Sets		
	1	2	3
Equilibration temperature (°)	80	105	80
Equilibration time (min.)	60	45	45
Transfer-line temperature (°)	85	110	105
Carrier gas: nitrogen or helium at an appropriate pressure			
Pressurization time (s)	30	30	30
Injection volume (mL)	1	1	1

•*Class 2 System Suitability Solution*—Transfer 1.0 mL of USP Residual Solvent Class 2—Acetonitrile RS and 1.0 mL of USP Residual Solvent Class 2—Trichloroethylene RS to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to an appropriate headspace vial, add 5.0 mL of water, apply the stopper, cap, and mix.•2

Chromatographic System (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm × 30-m fused-silica column coated with a 0.25-µm layer of phase G16, or a 0.53-mm × 30-m wide-bore column coated with a 0.25-µm layer of phase G16. The carrier gas is nitrogen or helium with a linear velocity of about 35 cm per second and a split ratio of 1 : 5. The column temperature is maintained at 50° for 20 minutes, then raised at a rate of 6° per minute to 165°, and maintained at 165° for 20 minutes. The injection port and detector temperatures are maintained at 140° and 250°, respectively. Chromatograph the *Class 1 Standard Solution,* the *Class 1 System Suitability Solution,* and the *Class 2* •*System Suitability*•2 *Solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio of benzene in the *Class 1 Standard Solution* is not less than 5; the signal-to-noise ratio of each peak in the *Class 1 System Suitability Solution* is not less than 3; •and•2 the resolution, *R,* between acetonitrile and trichloroethylene in the *Class 2* •*System Suitability*•2 *Solution* is not less than 1.0.

Procedure—Separately inject (following one of the headspace operating parameter sets described in *Table 5*) equal volumes of headspace (about 1.0 mL) of the *Class 1 Standard Solution,* the *Class 2* •*Mixture A*•2 *Standard Solution,* •the *Class 2 Mixture B Standard Solution,*•2 and the *Test Solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. If the peak response(s) in the *Test Solution* of the peak(s) identified in *Procedure A* is/are greater than or equal to a corresponding peak(s) in either the *Class 1 Standard Solution* or •either of•2 the •two•2 *Class 2* •*Mixture*•2 *Standard* •*Solutions,*•2 proceed to *Procedure C* to quantify the •peak(s);•2 otherwise the article meets the requirements of this test.

Procedure C—

•*Class 1 Standard Stock Solution,*•2 *Class 1 Standard Solution,* •*Class 2 Standard Stock Solution A,*•2 *Class 2* •*Mixture A*•2 *Standard Solution, Test Stock Solution, Test Solution,* and *Class 1 System Suitability Solution*—Prepare as directed for *Procedure A.*

Standard Solution—•[NOTE—Prepare a separate *Standard Solution* for each peak identified and verified by *Procedures A* and *B.*]•2 Transfer an accurately measured volume of •each individual•2 USP Reference Standard •corresponding to•2 each •residual solvent•2 peak identified and verified by *Procedures A* and *B* to a suitable container, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a final concentration of •1/20•2 of the value stated in *Table 1* or *2* (under *Concentration Limit*). Transfer •1.0 mL•2 of this solution to an appropriate headspace vial, add •5.0 mL•2 of water, apply the stopper, cap, and mix.

•*Spiked Test Solution*—[NOTE—Prepare a separate *Spiked Test Solution* for each peak identified and verified by *Procedures A* and *B.*] Transfer 5.0 mL of *Test Stock Solution* to an appropriate headspace vial, add 1.0 mL of the *Standard Solution,* apply the stopper, cap, and mix.•2

Chromatographic System (see *Chromatography* ⟨621⟩)—[NOTE—If the results of the chromatography from *Procedure A* are found to be inferior to those found with *Procedure B,* the *Chromatographic System* from *Procedure B* may be substituted.] The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm × 30-m fused-silica column coated with a 1.8-µm layer of phase G43 or a 0.53-mm × 30-m wide-bore column coated with a 3.0-µm layer of phase G43. The carrier gas is nitrogen or helium with a linear velocity of about 35 cm per second, and a split ratio of 1 : 5. The column temperature is maintained at 40° for 20 minutes, then raised at a rate of 10° per minute to 240°, and maintained at 240° for 20 minutes. The injection port and detector temperatures are maintained at 140° and 250°, respectively. Chromatograph the *Class 1 Standard Solution,* the *Class 1 System Suitability Solution,* and the *Class 2* •*Mixture A*•2 *Standard Solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio of 1,1,1-trichloroethane in the *Class 1 Standard Solution* is not less than 5; the signal-to-noise ratio of each peak in the

Interim Revision Announcement

Class 1 System Suitability Solution is not less than 3; and the resolution, *R,* between acetonitrile and methylene chloride in the *Class 2* •*Mixture A*$_{•2}$ *Standard Solution* is not less than 1.0.

Procedure—Separately inject (following one of the headspace operating parameters described in *Table 5*) equal volumes of headspace (about 1.0 mL) of the *Standard Solution,* •the$_{•2}$ *Test Solution,* •and the *Spiked Test Solution*$_{•2}$ into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in ppm, of each residual solvent found in the article under test by the formula:

$$•5(C/W)[r_U/(r_{ST} - r_U)]_{•2}$$

in which C is the concentration, in ppm, of the appropriate USP Reference Standard in the *Standard Solution; W* is the weight, in g, of the article under test taken to prepare the *Test Stock Solution;* and r_U and $•r_{ST•2}$ are the peak responses of each residual solvent obtained from the *Test Solution* and the •*Spiked Test*$_{•2}$ *Solution,* respectively.

WATER-INSOLUBLE ARTICLES

Procedure A—

Class 1 Standard Stock Solution, Class 1 Standard Solution, Class 1 System Suitability Solution, Class 2 Standard Stock Solution •*A, Class 2 Standard Stock Solution B, Class 2 Mixture A Standard Solution, Class 2 Mixture B Standard Solution,*$_{•2}$and *Chromatographic System*—Proceed as directed for *Procedure A* under *Water-Soluble Articles.*

•*Class 2 Standard Stock Solution C*—Transfer 1.0 mL of USP Residual Solvents Class 2—Mixture C RS to a 100-mL volumetric flask, dilute with 1,3-dimethyl-2-imidazolidinone to volume, and mix.

Class 2 Mixture C Standard Solution—[NOTE—This solution is used for the identification and quantification of dimethylformamide and/or *N,N*-dimethylacetamide in the article under test.] Transfer 1.0 mL of *Class 2 Standard Stock Solution C* to an appropriate headspace vial, add 5.0 mL of 1,3-dimethyl-2-imidazolidinone, apply the stopper, cap, and mix.$_{•2}$

Test Stock Solution—Transfer about 250 mg of the article under test, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with dimethylformamide to volume, and mix.

Test Solution 1—Transfer 5.0 mL of *Test Stock Solution* to an appropriate headspace vial, add 1.0 mL of dimethylformamide, apply the stopper, cap, and mix.

Test Solution 2—•[NOTE—This solution is used for the identification of dimethylformamide and/or *N,N*-dimethylacetamide in the article under test.]$_{•2}$ Transfer about 250 mg of the article under test, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with 1,3-dimethyl-2-imidazolidinone to volume, and mix. Transfer 5.0 mL of this solution to an appropriate headspace vial, add 1.0 mL of 1,3-dimethyl-2-imidazolidinone, apply the stopper, cap, and mix.

Procedure—Separately inject (following one of the headspace operating parameters described in *Table 5*) equal volumes of headspace (about 1.0 mL) of the *Class 1 Standard Solution,* •*Class 2 Mixture A Standard Solution, Class 2 Mixture B Standard Solution, Class 2 Mixture C Standard Solution,*$_{•2}$ *Test Solution 1,* and *Test Solution 2* •(if applicable)$_{•2}$ into the chromatograph, record the chromatograms, and measure the responses for the major peaks. If a peak response of any peak in *Test Solution 1* is greater than or equal to a corresponding peak in either the *Class 1 Standard Solution* or •any of the three *Class 2 Mixture Standard Solutions,*$_{•2}$ proceed to *Procedure B* to verify the identity of the peak; otherwise the article meets the requirements of this test. If the peak response for dimethylformamide or *N,N*-dimethylacetamide in *Test Solution 2* is greater than or equal to the corresponding peak in the *Class 2* •*Mixture C*$_{•2}$ *Standard Solution,* proceed to *Procedure B* to verify the identity of the peak; otherwise the article meets the requirements of this test.

Procedure B—

Class 1 Standard Stock Solution, Class 1 Standard Solution, •*Class 1 System Suitability Solution, Class 2 Standard Stock Solution A, Class 2 Standard Stock Solution B, Class 2 Mixture A Standard Solution,* and *Class 2 Mixture B Standard Solution*—$_{•2}$Prepare as directed for *Procedure A* under *Water-Soluble Articles.*

•*Class 2 Standard Stock Solution C, Class 2 Mixture C Standard Solution,*$_{•2}$ *Test Stock Solution, Test Solution 1,* and *Test Solution 2*—Proceed as directed for *Procedure A.*

•*Class 2 System Suitability Solution* and$_{•2}$ *Chromatographic System*—Proceed as directed for *Procedure B* under *Water-Soluble Articles.*

Procedure—Separately inject (following one of the headspace operating parameters described in *Table 5*) equal volumes of headspace (about 1.0 mL) of the *Class 1 Standard Solution,* •*Class 2 Mixture A Standard Solution, Class 2 Mixture B Standard Solution, Class 2 Mixture C Standard Solution,*$_{•2}$ *Test Solution 1,* and/or *Test Solution 2* •(if applicable)$_{•2}$ into the chromatograph, record the chromatograms, and measure the responses for the major peaks. If the peak response(s) in *Test Solution 1* of the peak(s) identified in *Procedure A* is/are greater than or equal to a corresponding peak(s) in either the *Class 1 Standard Solution* or •any of$_{•2}$ the •three *Class 2 Mixture Standard Solutions,*$_{•2}$ proceed to *Procedure C* to quantify the •peak(s);$_{•2}$ otherwise the article meets the requirements of this test. If the peak response for dimethylformamide or *N,N*-dimethylacetamide in *Test Solution 2* is greater than or equal to the corresponding peak in the *Class 2* •*Mixture C*$_{•2}$ *Standard Solution,* proceed to *Procedure C* to quantify the peak; otherwise the article meets the requirements of this test.

Procedure C—

•*Class 1 Standard Stock Solution,*$_{•2}$ *Class 1 Standard Solution, Class 1 System Suitability Solution,* •*Class 2 Standard Stock Solution A,*$_{•2}$ and *Class 2* •*Mixture A*$_{•2}$ *Standard Solution*—Proceed as directed for *Procedure A* under *Water-Soluble Articles.*

•*Standard Solution 1*—[NOTE—Prepare a separate *Standard Solution* for each peak identified and verified by *Procedures A* and *B.*] Transfer an accurately measured volume of each individual USP Reference Standard corresponding to each residual solvent peak identified and verified by *Procedures A* and *B* to a suitable container, and dilute quantitatively, and stepwise if necessary, with dimethylformamide to obtain a solution having a final concentration of 1/20 of the value stated in *Table 1* or *Table 2* (under *Concentration Limit*). Transfer 1.0 mL of this solution to an appropriate headspace vial, add 5.0 mL of dimethylformamide, apply the stopper, cap, and mix.

Standard Solution 2—[NOTE—This solution is used for the quantification of dimethylformamide and/or *N,N*-dimethylacetamide in the article under test.] Transfer an accurately measured volume of USP Residual Solvent Class 2—*N,N*-Dimethylformamide RS and/or an accurately measured volume of USP Residual Solvent Class 2—*N,N*-Dimethylacetamide RS to a suitable container; and dilute quantitatively, and stepwise if necessary, with 1,3-dimethyl-2-imidazolidinone to obtain a solution having a final concentration of 1/20 of the value stated in *Table 2* (under *Concentration Limit*). Transfer 1.0 mL of this solution to an appropriate headspace vial, add 5.0 mL of 1,3-dimethyl-2-imidazolidinone, apply the stopper, cap, and mix.$_{•2}$

Test Stock Solution, Test Solution 1, and *Test Solution 2*—Proceed as directed for *Procedure A.*

•*Spiked Test Solution 1*—[NOTE—Prepare a separate *Spiked Test Solution* for each peak identified and verified by *Procedures A* and *B.*] Transfer 5.0 mL of *Test Stock Solution* to an appropriate headspace vial, add 1.0 mL of *Standard Solution 1,* apply the stopper, cap, and mix.

Spiked Test Solution 2—[NOTE—Prepare a separate *Spiked Test Solution* for each peak identified and verified by *Procedures A* and *B.*] Transfer 5.0 mL of *Test Solution 2* to an appropriate headspace vial, add 1.0 mL of *Standard Solution 2,* apply the stopper, cap, and mix.$_{•2}$

•$_{•2}$ *Chromatographic System*—Proceed as directed for *Procedure C* under *Water-Soluble Articles.*

Procedure—Separately inject (following one of the headspace operating parameters described in *Table 5*) equal volumes of headspace (about 1.0 mL) of the *Standard Solution, Test Solution 1* and/or *Test Solution 2,* •and *Spiked Test Solution 1* and/or *Spiked Test Solution 2*•2 into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in ppm, of each residual solvent found in the article under test by the formula:

$$•5(C/W)[r_U/(r_{ST} - r_U)]•2$$

in which C is the concentration, in ppm, of the appropriate USP Reference Standard in the *Standard Solution; W* is the weight, in g, of the article under test taken to prepare the *Test Stock Solution;* and r_U and $•r_{ST}•2$ are the peak responses of each residual solvent obtained from *Test Solution 1* or *Test Solution 2* and •*Spiked Test Solution 1* or *Spiked Test Solution 2,*•2 respectively.

Class 3 Residual Solvents

If only Class 3 solvents are present, the level of residual solvents is to be determined as directed under *Loss on Drying* ⟨731⟩. If the loss on drying value is greater than 0.5%, a water determination should be performed on the test sample as directed under *Water Determination* ⟨921⟩. Determine the water by *Method Ia*, unless otherwise specified in the individual monograph. If a Class 3 solvent limit in an individual monograph is greater than 50 mg per day (corresponding to 5000 ppm or 0.5% under *Option 1*), that residual solvent should be identified and quantified, and the procedures as described above, •with appropriate modifications to the standard solutions,•2 are to be applied wherever possible. Otherwise an appropriate validated procedure is to be employed. Such procedure shall be submitted to the USP for •evaluation. USP Reference Standards, where available, should be used in these procedures.•2 A flow diagram for the application of residual solvent limit tests is shown in *Figure 1*.

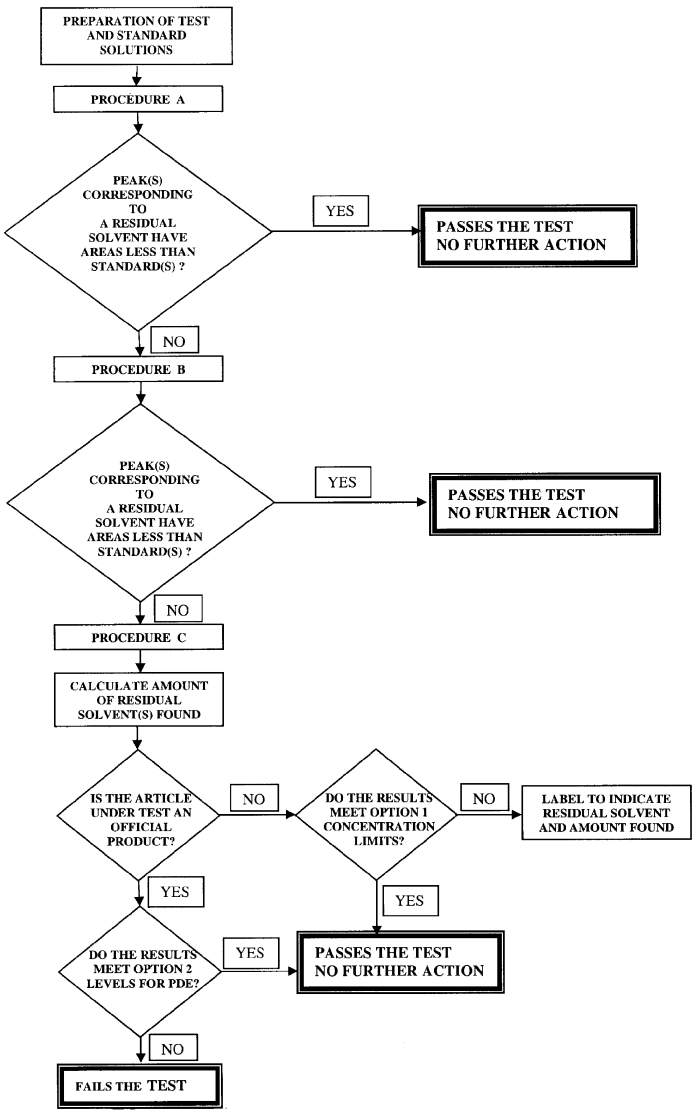

Figure 1. Diagram relating to the identification of residual solvents and the application of limit tests.

APPENDIX 1. LIST OF RESIDUAL SOLVENTS INCLUDED IN THIS GENERAL CHAPTER

Solvent	Other Names	Structure	Class
Acetic acid	Ethanoic acid	CH_3COOH	Class 3
Acetone	2-Propanone Propan-2-one	CH_3COCH_3	Class 3
Acetonitrile		CH_3CN	Class 2
Anisole	Methoxybenzene		Class 3
Benzene	Benzol		Class 1
1-Butanol	*n*-Butyl alcohol Butan-1-ol	$CH_3(CH_2)_3OH$	Class 3
2-Butanol	*sec*-Butyl alcohol Butan-2-ol	$CH_3CH_2CH(OH)CH_3$	Class 3
Butyl acetate	Acetic acid butyl ester	$CH_3COO(CH_2)_3CH_3$	Class 3
tert-Butylmethyl ether	2-Methoxy-2-methylpropane	$(CH_3)_3COCH_3$	Class 3
Carbon tetrachloride	Tetrachloromethane	CCl_4	Class 1
Chlorobenzene			Class 2
Chloroform	Trichloromethane	$CHCl_3$	Class 2
Cumene	Isopropylbenzene (1-Methylethyl)benzene		Class 3
Cyclohexane	Hexamethylene		Class 2
1,2-Dichloroethane	*sym*-Dichloroethane Ethylene dichloride Ethylene chloride	CH_2ClCH_2Cl	Class 1
1,1-Dichloroethene	1,1-Dichloroethylene Vinylidene chloride	$H_2C{=}CCl_2$	Class 1
1,2-Dichloroethene	1,2-Dichloroethylene Acetylene dichloride	$ClHC{=}CHCl$	Class 2
1,2-Dimethoxyethane	Ethyleneglycol dimethyl ether Monoglyme Dimethyl cellosolve	$H_3COCH_2CH_2OCH_3$	Class 2
N,*N*-Dimethylacetamide	DMA	$CH_3CON(CH_3)_2$	Class 2
N,*N*-Dimethylformamide	DMF	$HCON(CH_3)_2$	Class 2
Dimethyl sulfoxide	Methylsulfinylmethane Methyl sulfoxide DMSO	$(CH_3)_2SO$	Class 3
1,4-Dioxane	*p*-Dioxane [1,4]Dioxane		Class 2
Ethanol	Ethyl alcohol	CH_3CH_2OH	Class 3
2-Ethoxyethanol	Cellosolve	$CH_3CH_2OCH_2CH_2OH$	Class 2
Ethyl acetate	Acetic acid ethyl ester	$CH_3COOCH_2CH_3$	Class 3
Ethylene glycol	1,2-Dihydroxyethane 1,2-Ethanediol	$HOCH_2CH_2OH$	Class 2
Ethyl ether	Diethyl ether Ethoxyethane 1,1′-Oxybisethane	$CH_3CH_2OCH_2CH_3$	Class 3
Ethyl formate	Formic acid ethyl ester	$HCOOCH_2CH_3$	Class 3
Formamide	Methanamide	$HCONH_2$	Class 2
Formic acid		$HCOOH$	Class 3
Heptane	*n*-Heptane	$CH_3(CH_2)_5CH_3$	Class 3
Hexane	*n*-Hexane	$CH_3(CH_2)_4CH_3$	Class 2

Interim Revision Announcement

APPENDIX 1. LIST OF RESIDUAL SOLVENTS INCLUDED IN THIS GENERAL CHAPTER *(Continued)*

Solvent	Other Names	Structure	Class
Isobutyl acetate	Acetic acid isobutyl ester	$CH_3COOCH_2CH(CH_3)_2$	Class 3
Isopropyl acetate	Acetic acid isopropyl ester	$CH_3COOCH(CH_3)_2$	Class 3
Methanol	Methyl alcohol	CH_3OH	Class 2
2-Methoxyethanol	Methyl cellosolve	$CH_3OCH_2CH_2OH$	Class 2
Methyl acetate	Acetic acid methyl ester	CH_3COOCH_3	Class 3
3-Methyl-1-butanol	Isoamyl alcohol Isopentyl alcohol 3-Methylbutan-1-ol	$(CH_3)_2CHCH_2CH_2OH$	Class 3
Methylbutylketone	2-Hexanone Hexan-2-one	$CH_3(CH_2)_3COCH_3$	Class 2
Methylcyclohexane	Cyclohexylmethane		Class 2
Methylene chloride	Dichloromethane	CH_2Cl_2	Class 2
Methylethylketone	2-Butanone MEK Butan-2-one	$CH_3CH_2COCH_3$	Class 3
Methyl isobutyl ketone	4-Methylpentan-2-one 4-Methyl-2-pentanone MIBK	$CH_3COCH_2CH(CH_3)_2$	Class 3
2-Methyl-1-propanol	Isobutyl alcohol 2-Methylpropan-1-ol	$(CH_3)_2CHCH_2OH$	Class 3
N-Methylpyrrolidone	1-Methylpyrrolidin-2-one 1-Methyl-2-pyrrolidinone		Class 2
Nitromethane		CH_3NO_2	Class 2
Pentane	*n*-Pentane	$CH_3(CH_2)_3CH_3$	Class 3
1-Pentanol	Amyl alcohol Pentan-1-ol Pentyl alcohol	$CH_3(CH_2)_3CH_2OH$	Class 3
1-Propanol	Propan-1-ol Propyl alcohol	$CH_3CH_2CH_2OH$	Class 3
2-Propanol	Propan-2-ol Isopropyl alcohol	$(CH_3)_2CHOH$	Class 3
Propyl acetate	Acetic acid propyl ester	$CH_3COOCH_2CH_2CH_3$	Class 3
Pyridine			Class 2
Sulfolane	Tetrahydrothiophene 1,1-dioxide		Class 2
Tetrahydrofuran	Tetramethylene oxide Oxacyclopentane		Class 2
Tetralin	1,2,3,4-Tetrahydronaphthalene		Class 2
Toluene	Methylbenzene		Class 2
1,1,1-Trichloroethane	Methylchloroform	CH_3CCl_3	Class 1

•⟨467⟩ RESIDUAL SOLVENTS

(Chapter under this new title—to become official January 1, 2007)

(Current chapter title is ⟨467⟩ Organic Volatile Impurities)

For pharmacopeial purposes, residual solvents in pharmaceuticals are defined as organic volatile chemicals that are used or produced in the manufacture of drug substances or excipients, or in the preparation of drug products. The residual solvents are not completely removed by practical manufacturing techniques. Appropriate selection of the solvent for the synthesis of a drug substance or an excipient may enhance the yield, or determine characteristics such as crystal form, purity, and solubility. Therefore, the solvent may sometimes be a critical element in the synthetic process. This General Chapter does not address solvents deliberately used as excipients nor does it address solvates. However, the content of solvents in such products should be evaluated and justified.

Because residual solvents do not provide therapeutic benefit, they should be removed, to the extent possible, to meet ingredient and product specifications, good manufacturing practices, or other quality-based requirements. Drug products should contain no higher levels of residual solvents than can be supported by safety data. Solvents that are known to cause unacceptable toxicities (Class 1, *Table 1*) should be avoided in the production of drug substances, excipients, or drug products unless their use can be strongly justified in a risk-benefit assessment. Solvents associated with less severe toxicity (Class 2, *Table 2*) should be limited in order to protect patients from potential adverse effects. Ideally, less toxic solvents (Class 3, *Table 3*) should be used where practical. The complete list of solvents included in this General Chapter is given in *Appendix 1*. These tables and the list are not exhaustive. Where other solvents have been used, based on approval by the competent regulatory authority, such solvents may be added to the tables and list.

Testing of drug substances, excipients, and drug products for residual solvents should be performed when production or purification processes are known to result in the presence of such residual solvents. It is only necessary to test for residual solvents that are used or produced in the manufacture or purification processes.

Although manufacturers may choose to test the drug product, a cumulative procedure may be used to calculate the residual solvent levels in the product from the levels in its ingredients. If the calculation results in a level equal to or below that recommended in this General Chapter, no testing of the drug product for residual solvents needs to be considered. If, however, the calculated levels are above the recommended level, the drug product should be tested to ascertain whether the formulation process has reduced the relevant solvent levels to within acceptable amounts. A drug product should also be tested if a residual solvent is used during its manufacture.

See *Appendix 2* for additional background information related to residual solvents.

CLASSIFICATION OF RESIDUAL SOLVENTS BY RISK ASSESSMENT

The term "tolerable daily intake" (TDI) is used by the International Program on Chemical Safety (IPCS) to describe exposure limits of toxic chemicals and the term "acceptable daily intake" (ADI) is used by the World Health Organization (WHO) and other national and international health authorities and institutes. The term "permitted daily exposure" (PDE) is defined as a pharmaceutically acceptable intake of residual solvents to avoid confusion of differing values for ADIs of the same substance.

Residual solvents specified in this General Chapter are listed in *Appendix 1* by common names and structures. They were evaluated for their possible risk to human health and placed into one of three classes as follows:

Class 1	Residual Solvents: Solvents to be Avoided Known human carcinogens Strongly suspected human carcinogens Environmental hazards
Class 2	Residual Solvents: Solvents to be Limited Nongenotoxic animal carcinogens or possible causative agents of other irreversible toxicity, such as neurotoxicity or teratogenicity. Solvents suspected of other significant but reversible toxicities.
Class 3	Residual Solvents: Solvents with Low Toxic Potential Solvents with low toxic potential to humans; no health-based exposure limit is needed. [NOTE—Class 3 residual solvents may have PDEs of up to 50 mg or more per day.]*

* For residual solvents with PDEs of more than 50 mg per day, see the discussion in the section *Class 3* under *Limits of Residual Solvents*.

PROCEDURES FOR ESTABLISHING EXPOSURE LIMITS

The procedure used to establish permitted daily exposures for residual solvents is presented in *Appendix 3*.

OPTIONS FOR DETERMINING LEVELS OF CLASS 2 RESIDUAL SOLVENTS

Two options are available to determine levels of Class 2 residual solvents.

Interim Revision Announcement

Option 1

The concentration limits in ppm stated in *Table 2* are used. They were calculated using equation (1) below by assuming a product weight of 10 g administered daily.

$$\text{Concentration (ppm)} = \frac{1000 \times \text{PDE}}{\text{dose}} \quad (1)$$

Here, PDE is given in terms of mg per day, and dose is given in g per day.

These limits are considered acceptable for all drug substances, excipients, and drug products. Therefore, this option may be applied if the daily dose is not known or fixed. If all drug substances and excipients in a formulation meet the limits given in *Option 1,* these components may be used in any proportion. No further calculation is necessary provided the daily dose does not exceed 10 g. Products that are administered in doses greater than 10 g per day are to be considered under *Option 2.*

Option 2

It is not necessary for each component of the drug product to comply with the limits given in *Option 1.* The PDE in terms of mg per day as stated in *Table 2* can be used with the known maximum daily dose and equation (1) above to determine the concentration of residual solvent allowed in a drug product. Such limits are considered acceptable provided that it has been demonstrated that the residual solvent has been reduced to the practical minimum. The limits should be realistic in relation to analytical precision, manufacturing capability, and reasonable variation in the manufacturing process. The limits should also reflect contemporary manufacturing standards.

Option 2 may be applied by adding the amounts of a residual solvent present in each of the components of the drug product. The sum of the amounts of solvent per day should be less than that given by the PDE.

Consider an example of the application of *Option 1* and *Option 2* to acetonitrile concentration in a drug product. The permitted daily exposure to acetonitrile is 4.1 mg per day; thus, the *Option 1* limit is 410 ppm. The maximum administered daily weight of a drug product is 5.0 g, and the drug product contains two excipients. The composition of the drug product and the calculated maximum content of residual acetonitrile are given in the following table.

Component	Amount in Formulation (g)	Acetonitrile Content (ppm)	Daily Exposure (mg)
Drug substance	0.3	800	0.24
Excipient 1	0.9	400	0.36
Excipient 2	3.8	800	3.04
Drug product	5.0	728	3.64

Excipient l meets the *Option 1* limit, but the drug substance, excipient 2, and drug product do not meet the *Option 1* limit. Nevertheless, the drug product meets the *Option 2* limit of 4.1 mg per day and thus conforms to the acceptance criteria in this General Chapter.

Consider another example using acetonitrile as the residual solvent. The maximum administered daily weight of a drug product is 5.0 g, and the drug product contains two excipients. The composition of the drug product and the calculated maximum content of residual acetonitrile are given in the following table.

Component	Amount in Formulation (g)	Acetonitrile Content (ppm)	Daily Exposure (mg)
Drug substance	0.3	800	0.24
Excipient 1	0.9	2000	1.80
Excipient 2	3.8	800	3.04
Drug product	5.0	1016	5.08

In this example, the drug product meets neither the *Option 1* nor the *Option 2* limit. The manufacturer could test the drug product to determine if the formulation process reduced the level of acetonitrile. If the level of acetonitrile was not reduced to the allowed limit during formulation, the product fails the requirements of the test.

LIMITS OF RESIDUAL SOLVENTS

Ethylene Oxide

[NOTE—The test for ethylene oxide is conducted only where specified in the individual monograph.] The standard solution parameters and the procedure for determination are described in the individual monograph. Unless otherwise specified in the individual monograph, the limit is 10 µg per g.

Class 1

Class 1 residual solvents *(Table 1)* should not be employed in the manufacture of drug substances, excipients, and drug products because of the unacceptable toxicities or deleterious environmental effects of these residual solvents. However, if their use in order to produce a medicinal product is unavoidable, their levels should be restricted as shown in *Table 1,* unless otherwise stated in the individual monograph. The solvent 1,1,1-trichloroethane is included in *Table 1* because it is an environmental hazard. The stated limit of 1500 ppm is based on safety data.

When Class 1 residual solvents are used or produced in the manufacture or purification of a drug substance, excipient, or drug product, these solvents should be identified and quantified. The procedures described in the *Identification, Control, and Quantification of Residual Solvents* section of this General Chapter are to be applied wherever possible. Otherwise an appropriate validated procedure is to be employed. Such procedure shall be submitted to the USP for evaluation.

Table 1. Class 1 Residual Solvents

Solvent	Concentration Limit (ppm)	Concern
Benzene	2	Carcinogen
Carbon tetrachloride	4	Toxic and environmental hazard
1,2-Dichloroethane	5	Toxic
1,1-Dichloroethene	8	Toxic
1,1,1-Trichloroethane	1500	Environmental hazard

Class 2

Class 2 residual solvents *(Table 2)* should be limited in drug substances, excipients, and drug products because of the inherent toxicities of the residual solvents. PDEs are given to the nearest 0.1 mg per day, and concentrations are given to the nearest 10 ppm. The stated values do not reflect the necessary analytical precision of the determination procedure. Precision should be determined as part of the procedure validation.

If Class 2 residual solvents are present at greater than their *Option 1* limits, they should be identified and quantified. The procedures described in the *Identification, Control, and Quantification of Residual Solvents* section of this General Chapter are to be applied wherever possible. Otherwise an appropriate validated procedure is to be employed. Such procedure shall be submitted to the USP for evaluation.

[NOTE—The following Class 2 residual solvents are not readily detected by the headspace injection conditions described in the *Identification, Control, and Quantification of Residual Solvents* section of this General Chapter: formamide, 2-ethoxyethanol, 2-methoxyethanol, ethylene glycol, *N*-methylpyrrolidone, and sulfolane. Other ap-

propriate validated procedures are to be employed for the quantification of these residual solvents. Such procedures shall be submitted to the USP for review and possible inclusion in the relevant individual monograph.

Table 2. Class 2 Residual Solvents

Solvent	PDE (mg/day)	Concentration Limit (ppm)
Acetonitrile	4.1	410
Chlorobenzene	3.6	360
Chloroform	0.6	60
Cyclohexane	38.8	3880
1,2-Dichloroethene	18.7	1870
1,2-Dimethoxyethane	1.0	100
N,N-Dimethylacetamide	10.9	1090
N,N-Dimethylformamide	8.8	880
1,4-Dioxane	3.8	380
2-Ethoxyethanol	1.6	160
Ethylene glycol	6.2	620
Formamide	2.2	220
Hexane	2.9	290
Methanol	30.0	3000
2-Methoxyethanol	0.5	50
Methylbutylketone	0.5	50
Methylcyclohexane	11.8	1180
Methylene chloride	6.0	600
N-Methylpyrrolidone	5.3	530
Nitromethane	0.5	50
Pyridine	2.0	200
Sulfolane	1.6	160
Tetrahydrofuran	7.2	720
Tetralin	1.0	100
Toluene	8.9	890
Trichloroethylene	0.8	80
Xylene*	21.7	2170

* Usually 60% *m*-xylene, 14% *p*-xylene, 9% *o*-xylene with 17% ethyl benzene

Class 3

Class 3 residual solvents *(Table 3)* may be regarded as less toxic and of lower risk to human health than Class 1 and Class 2 residual solvents. Class 3 includes no solvent known as a human health hazard at levels normally accepted in pharmaceuticals. However, there are no long-term toxicity or carcinogenicity studies for many of the residual solvents in Class 3. Available data indicate that they are less toxic in acute or short-term studies and negative in genotoxicity studies.

Unless otherwise stated in the individual monograph, Class 3 residual solvents are limited to not more than 50 mg per day (corresponding to 5000 ppm or 0.5% under *Option 1*). If a Class 3 solvent limit in an individual monograph is greater than 50 mg per day, that residual solvent should be identified and quantified. The procedures described in the *Identification, Control, and Quantification of Residual Solvents* section of this General Chapter, with appropriate modifications to the standard solutions, are to be applied wherever possible. Otherwise an appropriate validated procedure is to be employed. Such procedure shall be submitted to the USP for evaluation. USP Reference Standards, where available, should be used in these procedures.

Table 3. Class 3 Residual Solvents
(limited by GMP or other quality-based requirements in drug substances, excipients, and drug products)

Acetic acid	Heptane
Acetone	Isobutyl acetate
Anisole	Isopropyl acetate
1-Butanol	Methyl acetate
2-Butanol	3-Methyl-1-butanol
Butyl acetate	Methylethylketone
tert-Butylmethyl ether	Methylisobutylketone
Cumene	2-Methyl-l-propanol
Dimethyl sulfoxide	Pentane
Ethanol	1-Pentanol
Ethyl acetate	1-Propanol
Ethyl ether	2-Propanol
Ethyl formate	Propyl acetate
Formic acid	

Other Residual Solvents

The residual solvents listed in *Table 4* may also be of interest to manufacturers of drug substances, excipients, or drug products. However, no adequate toxicological data on which to base a PDE was found.

Table 4. Other Residual Solvents
(for which no adequate toxicological data was found)

1,1-Diethoxypropane	Methyl isopropyl ketone
1,1-Dimethoxymethane	Methyltetrahydrofuran
2,2-Dimethoxypropane	Solvent hexane
Isooctane	Trichloroacetic acid
Isopropyl ether	Trifluoroacetic acid

IDENTIFICATION, CONTROL, AND QUANTIFICATION OF RESIDUAL SOLVENTS

[NOTE—The organic-free water specified in the following procedures produces no significantly interfering peaks when chromatographed.]

Class 1 and Class 2 Residual Solvents

WATER-SOLUBLE ARTICLES

Procedure A—

Class 1 Standard Stock Solution—Transfer 1.0 mL of USP Class 1 Residual Solvents Mixture RS to a 100-mL volumetric flask, add 9 mL of dimethyl sulfoxide, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to a 10-mL volumetric flask, dilute with water to volume, and mix.

Class 1 Standard Solution—Transfer 1.0 mL of *Class 1 Standard Stock Solution* to an appropriate headspace vial, add 5.0 mL of water, apply the stopper, cap, and mix.

Class 2 Standard Stock Solutions—Transfer 1.0 mL of USP Residual Solvents Class 2—Mixture A RS to a 100-mL volumetric flask, dilute with water to volume, and mix. This is *Class 2 Standard Stock Solution A.* Transfer 1.0 mL of USP Residual Solvents Class 2—Mixture B RS to a 100-mL volumetric flask, dilute with water to volume, and mix. This is *Class 2 Standard Stock Solution B.*

Class 2 Mixture A Standard Solution—Transfer 1.0 mL of *Class 2 Standard Stock Solution A* to an appropriate headspace vial, add 5.0 mL of water, apply the stopper, cap, and mix.

Class 2 Mixture B Standard Solution—Transfer 5.0 mL of *Class 2 Standard Stock Solution B* to an appropriate headspace vial, add 1.0 mL of water, apply the stopper, cap, and mix.

Test Stock Solution—Transfer about 250 mg of the article under test, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Test Solution—Transfer 5.0 mL of *Test Stock Solution* to an appropriate headspace vial, add 1.0 mL of water, apply the stopper, cap, and mix.

Class 1 System Suitability Solution—Transfer 1.0 mL of *Class 1 Standard Stock Solution* to an appropriate headspace vial, add 5.0 mL of *Test Stock Solution,* apply the stopper, cap, and mix.

Chromatographic System (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm × 30-m fused-silica column coated with a 1.8-µm layer of phase G43 or a 0.53-mm × 30-m wide-bore column coated with a 3.0-µm layer of phase G43. The carrier gas is nitrogen or helium with a linear velocity of about 35 cm per second, and a split ratio of 1 : 5. The column temperature is maintained at 40° for 20 minutes, then raised at a rate of 10° per minute to 240°, and maintained at 240° for 20 minutes. The injection port and detector temperatures are maintained at 140° and 250°, respectively. Chromatograph the *Class 1 Standard Solution, Class 1 System Suitability Solution,* and *Class 2 Mixture A Standard Solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio of 1,1,1-trichloroethane in the *Class 1 Standard Solution* is not less than 5; the signal-to-noise ratio of each peak in the *Class 1 System Suitability Solution* is not less than 3; and the resolution, *R,* between acetonitrile and methylene chloride in the *Class 2 Mixture A Standard Solution* is not less than 1.0.

Procedure—Separately inject (following one of the headspace operating parameter sets described in the table below) equal volumes of headspace (about 1.0 mL) of the *Class 1 Standard Solution, Class 2 Mixture A Standard Solution, Class 2 Mixture B Standard Solution,* and the *Test Solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. If a peak response of any peak in the *Test Solution* is greater than or equal to a corresponding peak in either the *Class 1 Standard Solution* or either of the two *Class 2 Mixture Standard Solutions,* proceed to *Procedure B* to verify the identity of the peak; otherwise the article meets the requirements of this test.

Table 5. Headspace Operating Parameters

	Headspace Operating Parameter Sets		
	1	2	3
Equilibration temperature (°)	80	105	80
Equilibration time (min.)	60	45	45
Transfer-line temperature (°)	85	110	105
Carrier gas: nitrogen or helium at an appropriate pressure			
Pressurization time (s)	30	30	30
Injection volume (mL)	1	1	1

Procedure B—

Class 1 Standard Stock Solution, Class 1 Standard Solution, Class 2 Standard Stock Solutions, Class 2 Mixture A Standard Solution, Class 2 Mixture B Standard Solution, Test Stock Solution, Test Solution, and *Class 1 System Suitability Solution*—Prepare as directed for *Procedure A.*

Class 2 System Suitability Solution—Transfer 1.0 mL of USP Residual Solvent Class 2—Acetonitrile RS and 1.0 mL of USP Residual Solvent Class 2—Trichloroethylene RS to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to an appropriate headspace vial, add 5.0 mL of water, apply the stopper, cap, and mix.

Chromatographic System (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm × 30-m fused-silica column coated with a 0.25-µm layer of phase G16, or a 0.53-mm × 30-m wide-bore column coated with a 0.25-µm layer of phase G16. The carrier gas is nitrogen or helium with a linear velocity of about 35 cm per second and a split ratio of 1 : 5. The column temperature is maintained at 50° for 20 minutes, then raised at a rate of 6° per minute to 165°, and maintained at 165° for 20 minutes. The injection port and detector temperatures are maintained at 140° and 250°, respectively. Chromatograph the *Class 1 Standard Solution,* the *Class 1 System Suitability Solution,* and the *Class 2 System Suitability Solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio of benzene in the *Class 1 Standard Solution* is not less than 5; the signal-to-noise ratio of each peak in the *Class 1 System Suitability Solution* is not less than 3; and the resolution, *R,* between acetonitrile and trichloroethylene in the *Class 2 System Suitability Solution* is not less than 1.0.

Procedure—Separately inject (following one of the headspace operating parameter sets described in *Table 5*) equal volumes of headspace (about 1.0 mL) of the *Class 1 Standard Solution,* the *Class 2 Mixture A Standard Solution,* the *Class 2 Mixture B Standard Solution,* and the *Test Solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. If the peak response(s) in the *Test Solution* of the peak(s) identified in *Procedure A* is/are greater than or equal to a corresponding peak(s) in either the *Class 1 Standard Solution* or either of the two *Class 2 Mixture Standard Solutions,* proceed to *Procedure C* to quantify the peak(s); otherwise the article meets the requirements of this test.

Procedure C—

Class 1 Standard Stock Solution, Class 1 Standard Solution, Class 2 Standard Stock Solution A, Class 2 Mixture A Standard Solution, Test Stock Solution, Test Solution, and *Class 1 System Suitability Solution*—Prepare as directed for *Procedure A.*

Standard Solution—[NOTE—Prepare a separate *Standard Solution* for each peak identified and verified by *Procedures A* and *B.*] Transfer an accurately measured volume of each individual USP Reference Standard corresponding to each residual solvent peak identified and verified by *Procedures A* and *B* to a suitable container, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a final concentration of 1/20 of the value stated in *Table 1* or *2* (under *Concentration Limit*). Transfer 1.0 mL of this solution to an appropriate headspace vial, add 5.0 mL of water, apply the stopper, cap, and mix.

Spiked Test Solution—[NOTE—Prepare a separate *Spiked Test Solution* for each peak identified and verified by *Procedures A* and *B.*] Transfer 5.0 mL of *Test Stock Solution* to an appropriate headspace vial, add 1.0 mL of the *Standard Solution,* apply the stopper, cap, and mix.

Chromatographic System (see *Chromatography* ⟨621⟩)—[NOTE—If the results of the chromatography from *Procedure A* are found to be inferior to those found with *Procedure B,* the *Chromatographic System* from *Procedure B* may be substituted.] The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm × 30-m fused-silica column coated with a 1.8-µm layer of phase G43 or a 0.53-mm × 30-m wide-bore column coated with a 3.0-µm layer of phase G43. The carrier gas is nitrogen or helium with a linear velocity of about 35 cm per second, and a split ratio of 1 : 5. The column temperature is maintained at 40° for 20 minutes, then raised at a rate of 10° per minute to 240°, and maintained at 240° for 20 minutes. The injection port and detector temperatures are maintained at 140° and 250°, respectively. Chromatograph the *Class 1 Standard Solution,* the *Class 1 System Suitability Solution,* and the *Class 2 Mixture A Standard Solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio of 1,1,1-trichloroethane in the *Class 1 Standard Solution* is not less than 5; the signal-to-noise ratio of each peak in the *Class 1 System Suitability Solution* is not less than 3; and the resolution, *R,* between acetonitrile and methylene chloride in the *Class 2 Mixture A Standard Solution* is not less than 1.0.

Procedure—Separately inject (following one of the headspace operating parameters described in *Table 5*) equal volumes of headspace (about 1.0 mL) of the *Standard Solution,* the *Test Solution,* and the *Spiked Test Solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in ppm, of each residual solvent found in the article under test by the formula:

$$5(C/W)[r_U/(r_{ST} - r_U)]$$

in which C is the concentration, in ppm, of the appropriate USP Reference Standard in the *Standard Solution; W* is the weight, in g, of the article under test taken to prepare the *Test Stock Solution;* and r_U and r_{ST} are the peak responses of each residual solvent obtained from the *Test Solution* and the *Spiked Test Solution,* respectively.

Interim Revision Announcement

WATER-INSOLUBLE ARTICLES

Procedure A—

Class 1 Standard Stock Solution, Class 1 Standard Solution, Class 1 System Suitability Solution, Class 2 Standard Stock Solution A, Class 2 Standard Stock Solution B, Class 2 Mixture A Standard Solution, Class 2 Mixture B Standard Solution, and *Chromatographic System*—Proceed as directed for *Procedure A* under *Water-Soluble Articles.*

Class 2 Standard Stock Solution C—Transfer 1.0 mL of USP Residual Solvents Class 2—Mixture C RS to a 100-mL volumetric flask, dilute with 1,3-dimethyl-2-imidazolidinone to volume, and mix.

Class 2 Mixture C Standard Solution—[NOTE—This solution is used for the identification and quantification of dimethylformamide and/or *N,N*-dimethylacetamide in the article under test.] Transfer 1.0 mL of *Class 2 Standard Stock Solution C* to an appropriate headspace vial, add 5.0 mL of 1,3-dimethyl-2-imidazolidinone, apply the stopper, cap, and mix.

Test Stock Solution—Transfer about 250 mg of the article under test, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with dimethylformamide to volume, and mix.

Test Solution 1—Transfer 5.0 mL of *Test Stock Solution* to an appropriate headspace vial, add 1.0 mL of dimethylformamide, apply the stopper, cap, and mix.

Test Solution 2—[NOTE—This solution is used for the identification of dimethylformamide and/or *N,N*-dimethylacetamide in the article under test.] Transfer about 250 mg of the article under test, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with 1,3-dimethyl-2-imidazolidinone to volume, and mix. Transfer 5.0 mL of this solution to an appropriate headspace vial, add 1.0 mL of 1,3-dimethyl-2-imidazolidinone, apply the stopper, cap, and mix.

Procedure—Separately inject (following one of the headspace operating parameters described in *Table 5*) equal volumes of headspace (about 1.0 mL) of the *Class 1 Standard Solution, Class 2 Mixture A Standard Solution, Class 2 Mixture B Standard Solution, Class 2 Mixture C Standard Solution, Test Solution 1,* and *Test Solution 2* (if applicable) into the chromatograph, record the chromatograms, and measure the responses for the major peaks. If a peak response of any peak in *Test Solution 1* is greater than or equal to a corresponding peak in either the *Class 1 Standard Solution* or any of the three *Class 2 Mixture Standard Solutions,* proceed to *Procedure B* to verify the identity of the peak; otherwise the article meets the requirements of this test. If the peak response for dimethylformamide or *N,N*-dimethylacetamide in *Test Solution 2* is greater than or equal to the corresponding peak in the *Class 2 Mixture C Standard Solution,* proceed to *Procedure B* to verify the identity of the peak; otherwise the article meets the requirements of this test.

Procedure B—

Class 1 Standard Stock Solution, Class 1 Standard Solution, Class 1 System Suitability Solution, Class 2 Standard Stock Solution A, Class 2 Standard Stock Solution B, Class 2 Mixture A Standard Solution, and *Class 2 Mixture B Standard Solution*—Prepare as directed for *Procedure A* under *Water-Soluble Articles.*

Class 2 Standard Stock Solution C, Class 2 Mixture C Standard Solution, Test Stock Solution, Test Solution 1, and *Test Solution 2*—Proceed as directed for *Procedure A.*

Class 2 System Suitability Solution and *Chromatographic System*—Proceed as directed for *Procedure B* under *Water-Soluble Articles.*

Procedure—Separately inject (following one of the headspace operating parameters described in *Table 5*) equal volumes of headspace (about 1.0 mL) of the *Class 1 Standard Solution, Class 2 Mixture A Standard Solution, Class 2 Mixture B Standard Solution, Class 2 Mixture C Standard Solution, Test Solution 1,* and/or *Test Solution 2* (if applicable) into the chromatograph, record the chromatograms, and measure the responses for the major peaks. If the peak response(s) in *Test Solution 1* of the peak(s) identified in *Procedure A* is/are greater than or equal to a corresponding peak(s) in either the *Class 1 Standard Solution* or any of the three *Class 2 Mixture Standard Solutions,* proceed to *Procedure C* to quantify the peak(s); otherwise the article meets the requirements of this test. If the peak response for dimethylformamide or *N,N*-dimethylacetamide in *Test Solution 2* is greater than or equal to the corresponding peak in the *Class 2 Mixture Standard Solution, C* proceed to *Procedure C* to quantify the peak; otherwise the article meets the requirements of this test.

Procedure C—

Class 1 Standard Stock Solution, Class 1 Standard Solution, Class 1 System Suitability Solution, Class 2 Standard Stock Solution A, and *Class 2 Mixture A Standard Solution*—Proceed as directed for *Procedure A* under *Water-Soluble Articles.*

Standard Solution 1—[NOTE—Prepare a separate *Standard Solution* for each peak identified and verified by *Procedures A* and *B.*] Transfer an accurately measured volume of each individual USP Reference Standard corresponding to each residual solvent peak identified and verified by *Procedures A* and *B* to a suitable container, and dilute quantitatively, and stepwise if necessary, with dimethylformamide to obtain a solution having a final concentration of 1/20 of the value stated in *Table 1* or *Table 2* (under *Concentration Limit*). Transfer 1.0 mL of this solution to an appropriate headspace vial, add 5.0 mL of dimethylformamide, apply the stopper, cap, and mix.

Standard Solution 2—[NOTE—This solution is used for the quantification of dimethylformamide and/or *N,N*-dimethylacetamide in the article under test.] Transfer an accurately measured volume of USP Residual Solvent Class 2—*N,N*-Dimethylformamide RS and/or an accurately measured volume of USP Residual Solvent Class 2—*N,N*-Dimethylacetamide RS to a suitable container; and dilute quantitatively, and stepwise if necessary, with 1,3-dimethyl-2-imidazolidinone to obtain a solution having a final concentration of 1/20 of the value stated in *Table 2* (under *Concentration Limit*). Transfer 1.0 mL of this solution to an appropriate headspace vial, add 5.0 mL of 1,3-dimethyl-2-imidazolidinone, apply the stopper, cap, and mix.

Test Stock Solution, Test Solution 1, and *Test Solution 2*—Proceed as directed for *Procedure A.*

Spiked Test Solution 1—[NOTE—Prepare a separate *Spiked Test Solution* for each peak identified and verified by *Procedures A* and *B.*] Transfer 5.0 mL of *Test Stock Solution* to an appropriate headspace vial, add 1.0 mL of *Standard Solution 1,* apply the stopper, cap, and mix.

Spiked Test Solution 2—[NOTE—Prepare a separate *Spiked Test Solution* for each peak identified and verified by *Procedures A* and *B.*] Transfer 5.0 mL of *Test Solution 2* to an appropriate headspace vial, add 1.0 mL of *Standard Solution 2,* apply the stopper, cap, and mix.

Chromatographic System—Proceed as directed for *Procedure C* under *Water-Soluble Articles.*

Procedure—Separately inject (following one of the headspace operating parameters described in *Table 5*) equal volumes of headspace (about 1.0 mL) of the *Standard Solution, Test Solution 1* and/or *Test Solution 2,* and *Spiked Test Solution 1* and/or *Spiked Test Solution 2* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in ppm, of each residual solvent found in the article under test by the formula:

$$5(C/W)[r_U/(r_{ST} - r_U)]$$

in which C is the concentration, in ppm, of the appropriate USP Reference Standard in the *Standard Solution; W* is the weight, in g, of the article under test taken to prepare the *Test Stock Solution;* and r_U and r_{ST} are the peak responses of each residual solvent obtained from *Test Solution 1* or *Test Solution 2* and *Spiked Test Solution 1* or *Spiked Test Solution 2,* respectively.

Class 3 Residual Solvents

If only Class 3 solvents are present, the level of residual solvents is to be determined as directed under *Loss on Drying* ⟨731⟩. If the loss on drying value is greater than 0.5%, a water determination should be performed on the test sample as directed under *Water Determination* ⟨921⟩. Determine the water by *Method Ia*, unless otherwise specified in the individual monograph. If a Class 3 solvent limit in an individual monograph is greater than 50 mg per day (corresponding to 5000 ppm or 0.5% under *Option 1*), that residual solvent should be identified and quantified, and the procedures as described above, with ap-

propriate modifications to the standard solutions, are to be applied wherever possible. Otherwise an appropriate validated procedure is to be employed. Such procedure shall be submitted to the USP for evaluation. USP Reference Standards, where available, should be used in these procedures. A flow diagram for the application of residual solvent limit tests is shown in *Figure 1*.

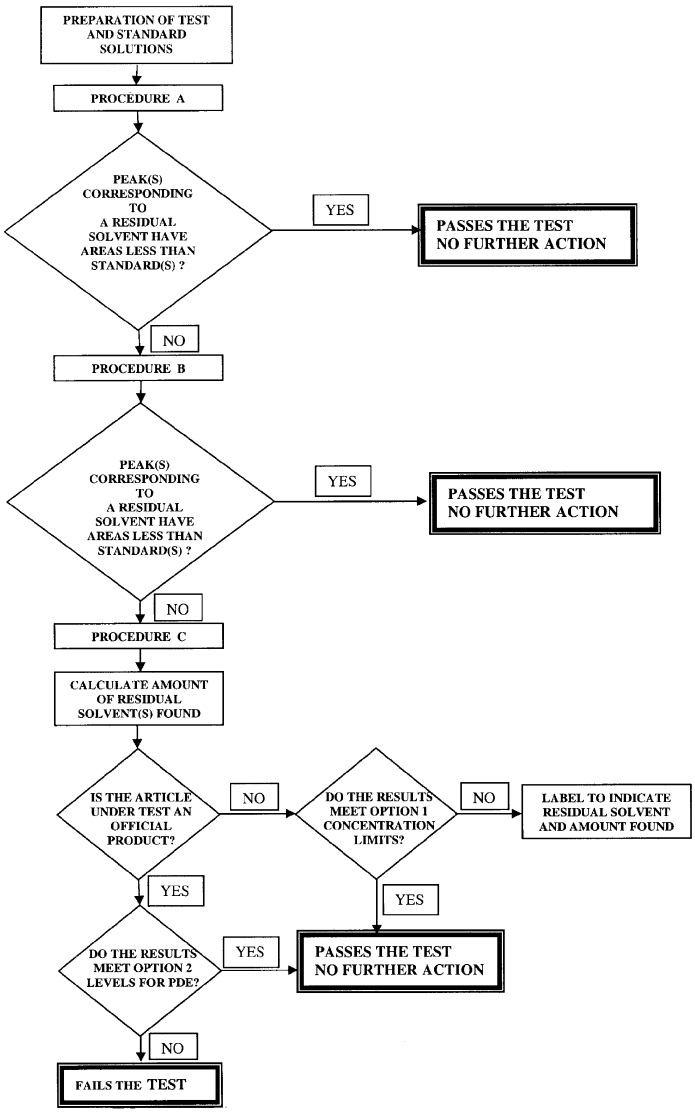

Figure 1. Diagram relating to the identification of residual solvents and the application of limit tests.

GLOSSARY

Genotoxic carcinogens: Carcinogens that produce cancer by affecting genes or chromosomes.

Lowest-observed-effect level (LOEL): The lowest dose of a substance in a study or group of studies that produces biologically significant increases in frequency or severity of any effects in exposed humans or animals.

Modifying factor: A factor determined by professional judgment of a toxicologist and applied to bioassay data so that the data can be safely related to humans.

Neurotoxicity: The ability of a substance to cause adverse effects on the nervous system.

No-observed-effect level (NOEL): The highest dose of a substance at which there are no biologically significant increases in frequency or severity of any effects in exposed humans or animals.

Permitted daily exposure (PDE): The maximum acceptable intake per day of a residual solvent in pharmaceutical products.

Reversible toxicity: The occurrence of harmful effects that are caused by a substance and that disappear after exposure to the substance ends.

Strongly suspected human carcinogen: A substance for which there is no epidemiological evidence of carcinogenesis but for which there are positive genotoxicity data and clear evidence of carcinogenesis in rodents.

Teratogenicity: The occurrence of structural malformations in a developing fetus when a substance is administered during pregnancy.

APPENDIX 1. LIST OF RESIDUAL SOLVENTS INCLUDED IN THIS GENERAL CHAPTER

Solvent	Other Names	Structure	Class
Acetic acid	Ethanoic acid	CH_3COOH	Class 3
Acetone	2-Propanone Propan-2-one	CH_3COCH_3	Class 3
Acetonitrile		CH_3CN	Class 2
Anisole	Methoxybenzene		Class 3
Benzene	Benzol		Class 1
1-Butanol	*n*-Butyl alcohol Butan-1-ol	$CH_3(CH_2)_3OH$	Class 3
2-Butanol	*sec*-Butyl alcohol Butan-2-ol	$CH_3CH_2CH(OH)CH_3$	Class 3
Butyl acetate	Acetic acid butyl ester	$CH_3COO(CH_2)_3CH_3$	Class 3
tert-Butylmethyl ether	2-Methoxy-2-methylpropane	$(CH_3)_3COCH_3$	Class 3
Carbon tetrachloride	Tetrachloromethane	CCl_4	Class 1
Chlorobenzene			Class 2
Chloroform	Trichloromethane	$CHCl_3$	Class 2
Cumene	Isopropylbenzene (1-Methylethyl)benzene		Class 3
Cyclohexane	Hexamethylene		Class 2
1,2-Dichloroethane	*sym*-Dichloroethane Ethylene dichloride Ethylene chloride	CH_2ClCH_2Cl	Class 1
1,1-Dichloroethene	1,1-Dichloroethylene Vinylidene chloride	$H_2C{=}CCl_2$	Class 1
1,2-Dichloroethene	1,2-Dichloroethylene Acetylene dichloride	$ClHC{=}CHCl$	Class 2
1,2-Dimethoxyethane	Ethyleneglycol dimethyl ether Monoglyme Dimethyl cellosolve	$H_3COCH_2CH_2OCH_3$	Class 2
N,*N*-Dimethylacetamide	DMA	$CH_3CON(CH_3)_2$	Class 2
N,*N*-Dimethylformamide	DMF	$HCON(CH_3)_2$	Class 2
Dimethyl sulfoxide	Methylsulfinylmethane Methyl sulfoxide DMSO	$(CH_3)_2SO$	Class 3
1,4-Dioxane	*p*-Dioxane [1,4]Dioxane		Class 2
Ethanol	Ethyl alcohol	CH_3CH_2OH	Class 3
2-Ethoxyethanol	Cellosolve	$CH_3CH_2OCH_2CH_2OH$	Class 2
Ethyl acetate	Acetic acid ethyl ester	$CH_3COOCH_2CH_3$	Class 3
Ethylene glycol	1,2-Dihydroxyethane 1,2-Ethanediol	$HOCH_2CH_2OH$	Class 2
Ethyl ether	Diethyl ether Ethoxyethane 1,1′-Oxybisethane	$CH_3CH_2OCH_2CH_3$	Class 3
Ethyl formate	Formic acid ethyl ester	$HCOOCH_2CH_3$	Class 3
Formamide	Methanamide	$HCONH_2$	Class 2
Formic acid		$HCOOH$	Class 3
Heptane	*n*-Heptane	$CH_3(CH_2)_5CH_3$	Class 3
Hexane	*n*-Hexane	$CH_3(CH_2)_4CH_3$	Class 2
Isobutyl acetate	Acetic acid isobutyl ester	$CH_3COOCH_2CH(CH_3)_2$	Class 3
Isopropyl acetate	Acetic acid isopropyl ester	$CH_3COOCH(CH_3)_2$	Class 3

Interim Revision Announcement

APPENDIX 1. LIST OF RESIDUAL SOLVENTS INCLUDED IN THIS GENERAL CHAPTER *(Continued)*

Solvent	Other Names	Structure	Class
Methanol	Methyl alcohol	CH_3OH	Class 2
2-Methoxyethanol	Methyl cellosolve	$CH_3OCH_2CH_2OH$	Class 2
Methyl acetate	Acetic acid methyl ester	CH_3COOCH_3	Class 3
3-Methyl-1-butanol	Isoamyl alcohol Isopentyl alcohol 3-Methylbutan-1-ol	$(CH_3)_2CHCH_2CH_2OH$	Class 3
Methylbutylketone	2-Hexanone Hexan-2-one	$CH_3(CH_2)_3COCH_3$	Class 2
Methylcyclohexane	Cyclohexylmethane		Class 2
Methylene chloride	Dichloromethane	CH_2Cl_2	Class 2
Methylethylketone	2-Butanone MEK Butan-2-one	$CH_3CH_2COCH_3$	Class 3
Methyl isobutyl ketone	4-Methylpentan-2-one 4-Methyl-2-pentanone MIBK	$CH_3COCH_2CH(CH_3)_2$	Class 3
2-Methyl-1-propanol	Isobutyl alcohol 2-Methylpropan-1-ol	$(CH_3)_2CHCH_2OH$	Class 3
N-Methylpyrrolidone	1-Methylpyrrolidin-2-one 1-Methyl-2-pyrrolidinone		Class 2
Nitromethane		CH_3NO_2	Class 2
Pentane	*n*-Pentane	$CH_3(CH_2)_3CH_3$	Class 3
1-Pentanol	Amyl alcohol Pentan-1-ol Pentyl alcohol	$CH_3(CH_2)_3CH_2OH$	Class 3
1-Propanol	Propan-1-ol Propyl alcohol	$CH_3CH_2CH_2OH$	Class 3
2-Propanol	Propan-2-ol Isopropyl alcohol	$(CH_3)_2CHOH$	Class 3
Propyl acetate	Acetic acid propyl ester	$CH_3COOCH_2CH_2CH_3$	Class 3
Pyridine			Class 2
Sulfolane	Tetrahydrothiophene 1,1-dioxide		Class 2
Tetrahydrofuran	Tetramethylene oxide Oxacyclopentane		Class 2
Tetralin	1,2,3,4-Tetrahydronaphthalene		Class 2
Toluene	Methylbenzene		Class 2
1,1,1-Trichloroethane	Methylchloroform	CH_3CCl_3	Class 1
Trichloroethylene	1,1,2-Trichloroethene	$HClC{=}CCl_2$	Class 2
Xylene*	Dimethybenzene Xylol		Class 2

* Usually 60% *m*-xylene, 14% *p*-xylene, 9% *o*-xylene with 17% ethyl benzene.

Interim Revision Announcement

APPENDIX 2. ADDITIONAL BACKGROUND

A2.1. Environmental Regulation of Organic Volatile Solvents

Several of the residual solvents frequently used in the production of pharmaceuticals are listed as toxic chemicals in Environmental Health Criteria (EHC) monographs and in the Integrated Risk Information System (IRIS). The objectives of such groups as the International Programme on Chemical Safety (IPCS), the United States Environmental Protection Agency (EPA), and the United States Food and Drug Administration (FDA) include the determination of acceptable exposure levels. The goal is maintenance of environmental integrity and protection of human health against the possible deleterious effects of chemicals resulting from long-term environmental exposure. The procedures involved in the estimation of maximum safe exposure limits are usually based on long-term studies. When long-term study data are unavailable, shorter term study data can be used with modification of the approach, such as use of larger safety factors. The approach described therein relates primarily to long-term or lifetime exposure of the general population in the ambient environment (i.e., ambient air, food, drinking water, and other media).

A2.2. Residual Solvents in Pharmaceuticals

Exposure limits in this General Chapter are established by referring to methodologies and toxicity data described in EHC and IRIS monographs. However, the following specific assumptions about residual solvents to be used in the synthesis and formulation of pharmaceutical products should be taken into account in establishing exposure limits.

1. Patients (not the general population) use pharmaceuticals to treat their diseases or for prophylaxis to prevent infection or disease.
2. The assumption of lifetime patient exposure is not necessary for most pharmaceutical products but may be appropriate as a working hypothesis to reduce risk to human health.
3. Residual solvents are unavoidable components in pharmaceutical production and will often be a part of medicinal products.
4. Residual solvents should not exceed recommended levels except in exceptional circumstances.
5. Data from toxicological studies that are used to determine acceptable levels for residual solvents should have been generated using appropriate protocols such as those described, for example, by the Organization for Economic Cooperation and Development (OECD), EPA, and the FDA Red Book.

APPENDIX 3. PROCEDURES FOR ESTABLISHING EXPOSURE LIMITS

The Gaylor-Kodell method of risk assessment (Gaylor, D. W. and Kodell, R. L. Linear Interpolation Algorithm for Low Dose Assessment of Toxic Substance. *Journal of Environmental Pathology and Toxicology,* 4 : 305, 1980) is appropriate for Class 1 carcinogenic solvents. Only in cases where reliable carcinogenicity data are available should extrapolation by the use of mathematical models be applied to setting exposure limits. Exposure limits for Class 1 residual solvents could be determined with the use of a large safety factor (i.e., 10,000 to 100,000) with respect to the no-observed-effect level (NOEL). Detection and quantification of these residual solvents should be performed by state-of-the-art analytical techniques.

Acceptable exposure levels in this General Chapter for Class 2 residual solvents were established by calculation of PDE values according to the procedures for setting exposure limits in pharmaceuticals (page 5748 of *PF* 15(6) [Nov.–Dec. 1989]), and the method adopted by IPCS for Assessing Human Health Risk of Chemicals (*Environmental Health Criteria 170,* WHO, 1994). These procedures are similar to those used by the U.S. EPA (IRIS) and the U.S. FDA *(Red Book)* and others. The method is outlined here to give a better understanding of the origin of the PDE values. It is not necessary to perform these calculations in order to use the PDE values presented in *Table 2* of this document.

PDE is derived from the no-observed-effect level (NOEL), or the lowest-observed effect level (LOEL), in the most relevant animal study as follows:

$$\text{PDE} = \frac{\text{NOEL} \times \text{Weight Adjustment}}{\text{F1} \times \text{F2} \times \text{F3} \times \text{F4} \times \text{F5}} \quad (1)$$

The PDE is derived preferably from a NOEL. If no NOEL is obtained, the LOEL may be used. Modifying factors proposed here, for relating the data to humans, are the same kind of "uncertainty factors" used in Environmental Health Criteria (*Environmental Health Criteria 170,* WHO, Geneva, 1994) and "modifying factors" or "safety factors" in *Pharmacopeial Forum.* The assumption of 100 percent systemic exposure is used in all calculations regardless of route of administration.

The modifying factors are as follows:

F1 = A factor to account for extrapolation between species
- F1 = 2 for extrapolation from dogs to humans
- F1 = 2.5 for extrapolation from rabbits to humans
- F1 = 3 for extrapolation from monkeys to humans
- F1 = 5 for extrapolation from rats to humans
- F1 = 10 for extrapolation from other animals to humans
- F1 = 12 for extrapolation from mice to humans

F1 takes into account the comparative surface area to body weight ratios for the species concerned and for man. Surface area (S) is calculated as:

$$S = kM^{0.67}, \quad (2)$$

in which M = body weight, and the constant k has been taken to be 10. The body weights used in the equation are those shown below in *Table A3.-1*.

F2 = A factor of 10 to account for variability between individuals. A factor of 10 is generally given for all organic solvents, and 10 is used consistently in this General Chapter.

F3 = A variable factor to account for toxicity studies of short-term exposure.
- F3 = 1 for studies that last at least one half-lifetime (1 year for rodents or rabbits; 7 years for cats, dogs, and monkeys).
- F3 = 1 for reproductive studies in which the whole period of organogenesis is covered.
- F3 = 2 for a 6-month study in rodents, or a 3.5-year study in nonrodents.
- F3 = 5 for a 3-month study in rodents, or a 2-year study in nonrodents.
- F3 = 10 for studies of a shorter duration.

In all cases, the higher factor has been used for study durations between the time points (e.g., a factor of 2 for a 9-month rodent study).

F4 = A factor that may be applied in cases of severe toxicity, e.g., nongenotoxic carcinogenicity, neurotoxicity, or teratogenicity. In studies of reproductive toxicity, the following factors are used:
- F4 = 1 for fetal toxicity associated with maternal toxicity
- F4 = 5 for fetal toxicity without maternal toxicity
- F4 = 5 for a teratogenic effect with maternal toxicity
- F4 = 10 for a teratogenic effect without maternal toxicity

F5 = A variable factor that may be applied if the no-effect level was not established.

When only a LOEL is available, a factor of up to 10 can be used depending on the severity of the toxicity. The weight adjustment assumes an arbitrary adult human body weight for either sex of 50 kilograms (kg). This relatively low weight provides an additional safety

Interim Revision Announcement

factor against the standard weights of 60 kg or 70 kg that are often used in this type of calculation. It is recognized that some adult patients weigh less than 50 kg; these patients are considered to be accommodated by the built-in safety factors used to determine a PDE. If the solvent was present in a formulation specifically intended for pediatric use, an adjustment for a lower body weight would be appropriate.

As an example of the application of this equation, consider a toxicity study of acetonitrile in mice that is summarized in *Pharmeuropa,* Vol. 9, No. 1, Supplement, April 1997, page S24. The NOEL is calculated to be 50.7 mg kg^{-1} day^{-1}. The PDE for acetonitrile in this study is calculated as follows:

$$\text{PDE} = \frac{50.7\ \text{mg kg}^{-1}\ \text{day}^{-1} \times\ 50\ \text{kg}}{12\times10\times5\times1\times1} = 4.22\ \text{mg day}^{-1}$$

In this example,

F1 = 12 to account for the extrapolation from mice to humans
F2 = 10 to account for differences between individual humans
F3 = 5 because the duration of the study was only 13 weeks
F4 = 1 because no severe toxicity was encountered
F5 = 1 because the no-effect level was determined

A3.-1. - Values Used in the Calculations in This Document

Rat body weight	425 g
Pregnant rat body weight	330 g
Mouse body weight	28 g
Pregnant mouse body weight	30g
Guinea-pig body weight	500 g
Rhesus monkey body weight	2.5 kg
Rabbit body weight (pregnant or not)	4 kg
Beagle dog body weight	11.5 kg
Rat respiratory volume	290 L/day
Mouse respiratory volume	43 L/day
Rabbit respiratory volume	1440 L/day
Guinea-pig respiratory volume	430 L day
Human respiratory volume	28,800 L/day
Dog respiratory volume	9000 L/day
Monkey respiratory volume	1150 L/day
Mouse water consumption	5 mL/day
Rat water consumption	30 mL/day
Rat food consumption	30 g/day

The equation for an ideal gas, $PV = nRT$, is used to convert concentrations of gases used in inhalation studies from units of ppm to units of mg/L or mg/m^3. Consider as an example the rat reproductive toxicity study by inhalation of carbon tetrachloride (molecular weight 153.84) summarized in *Pharmeuropa,* Vol. 9, No. 1, Supplement, April 1997, page S9.

$$\frac{n}{V} = \frac{P}{RT} = \frac{300\times10^{-6}\ \text{atm}\times153\ 840\ \text{mg mol}^{-1}}{0.082\ \text{L at mK}^{-1}\ \text{mol}^{-1}\times298\ \text{K}} = \frac{46.15\ \text{mg}}{24.45\ \text{L}} = 1.89\ \text{mg/L}$$

The relationship 1000 L = 1 m^3 is used to convert to mg/ m^3.●2

Physical Tests and Determinations

⟨711⟩ DISSOLUTION

Change to read:

This general chapter is harmonized with the corresponding texts of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia.*●●2 These pharmacopeias have undertaken not to make any unilateral change to this harmonized chapter.

Portions of the present general chapter text that are national USP text, and therefore not part of the harmonized text, are marked with symbols (◆◆) to specify this fact.

This test is provided to determine compliance with the dissolution requirements ◆where stated in the individual monograph◆ for dosage forms administered orally. In this general chapter, a dosage unit is defined as 1 tablet or 1 capsule or the amount specified. ◆Of the types of apparatus described herein, use the one specified in the individual monograph. Where the label states that an article is enteric-coated, and where a dissolution or disintegration test that does not specifically state that it is to be applied to delayed-release articles is included in the individual monograph, the procedure and interpretation given for *Delayed-Release Dosage Forms* is applied unless otherwise specified in the individual monograph. For hard or soft gelatin capsules and gelatin-coated tablets that do not conform to the *Dissolution* specification, repeat the test as follows. Where water or a medium with a pH of less than 6.8 is specified as the *Medium* in the individual monograph, the same *Medium* specified may be used with the addition of purified pepsin that results in an activity of 750,000 Units or less per 1000 mL. For media with a pH of 6.8 or greater, pancreatin can be added to produce not more than 1750 USP Units of protease activity per 1000 mL.

USP Reference Standards ⟨11⟩—*USP Chlorpheniramine Maleate Extended-Release Tablets RS (Drug Release Calibrator, Single Unit). USP Prednisone Tablets RS (Dissolution Calibrator, Disintegrating). USP Salicylic Acid Tablets RS. (Dissolution Calibrator, Nondisintegrating).*◆

PROCEDURE

Apparatus 1 and Apparatus 2

IMMEDIATE-RELEASE DOSAGE FORMS

Place the stated volume of the *Dissolution Medium* (±1%) in the vessel of the specified apparatus ◆given in the individual monograph◆, assemble the apparatus, equilibrate the *Dissolution Medium* to 37 ± 0.5°, and remove the thermometer. Place 1 dosage unit in the apparatus, taking care to exclude air bubbles from the surface of the dosage unit, and immediately operate the apparatus at the specified rate ◆given in the individual monograph◆. Within the time interval specified, or at each of the times stated, withdraw a specimen from a zone midway between the surface of the *Dissolution Medium* and the top of the rotating basket or blade, not less than 1 cm from the vessel wall. [NOTE—Where multiple sampling times are specified, replace the aliquots withdrawn for analysis with equal volumes of fresh *Dissolution Medium* at 37° or, where it can be shown that replacement

Interim Revision Announcement

of the medium is not necessary, correct for the volume change in the calculation. Keep the vessel covered for the duration of the test, and verify the temperature of the mixture under test at suitable times.] Perform the analysis ◆as directed in the individual monograph◆ using a suitable assay method.[3] Repeat the test with additional dosage form units.

If automated equipment is used for sampling or the apparatus is otherwise modified, verification that the modified apparatus will produce results equivalent to those obtained with the standard apparatus described in this general chapter is necessary.

Dissolution Medium—A suitable dissolution medium is used. Use the solvent specified ◆in the individual monograph◆. The volume specified refers to measurements made between 20° and 25°. If the *Dissolution Medium* is a buffered solution, adjust the solution so that its pH is within 0.05 unit of the specified pH ◆given in the individual monograph◆. [NOTE—Dissolved gases can cause bubbles to form, which may change the results of the test. If dissolved gases influence the dissolution results, dissolved gases should be removed prior to testing.[4]]

Time—Where a single time specification is given, the test may be concluded in a shorter period if the requirement for minimum amount dissolved is met. Specimens are to be withdrawn only at the stated times within a tolerance of ±2%.

●◆**Procedure for a Pooled Sample for Immediate-Release Dosage Forms**—Use this procedure where *Procedure for a Pooled Sample* is specified in the individual monograph. Proceed as directed in *Procedure* for *Apparatus 1 and Apparatus 2* in *Immediate-Release Dosage Forms.* Combine equal volumes of the filtered solutions of the six or twelve individual specimens withdrawn, and use the pooled sample as the test specimen. Determine the average amount of the active ingredient dissolved in the pooled sample.◆●[2]

EXTENDED-RELEASE DOSAGE FORMS

Proceed as directed for *Immediate-Release Dosage Forms.*

Dissolution Medium—Proceed as directed for *Immediate-Release Dosage Forms.*

Time—The test-time points, generally three, are expressed in hours.

DELAYED-RELEASE DOSAGE FORMS

NOT ACCEPTED BY THE JAPANESE PHARMACOPOEIA

Use *Method A* or *Method B* and the apparatus specified ◆in the individual monograph◆. All test times stated are to be observed within a tolerance of ±2%, unless otherwise specified.

Method A—

Procedure ◆(unless otherwise directed in the individual monograph)◆—

ACID STAGE—Place 750 mL of 0.1 N hydrochloric acid in the vessel, and assemble the apparatus. Allow the medium to equilibrate to a temperature of 37 ± 0.5°. Place 1 dosage unit in the apparatus, cover the vessel, and operate the apparatus at the specified rate ◆given in the monograph◆.

After 2 hours of operation in 0.1 N hydrochloric acid, withdraw an aliquot of the fluid, and proceed immediately as directed under *Buffer Stage*.

Perform an analysis of the aliquot using a suitable assay method. ◆The procedure is specified in the individual monograph.◆

BUFFER STAGE—[NOTE—Complete the operations of adding the buffer and adjusting the pH within 5 minutes.]

With the apparatus operating at the rate specified ◆in the monograph◆, add to the fluid in the vessel 250 mL of 0.20 M tribasic sodium phosphate that has been equilibrated to 37 ± 0.5°. Adjust, if necessary, with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of 6.8 ± 0.05. Continue to operate the apparatus for 45 minutes, or for the specified time ◆given in the individual monograph◆. At the end of the time period, withdraw an aliquot of the fluid, and perform the analysis using a suitable assay method. ◆The procedure is specified in the individual monograph. The test may be concluded in a shorter time period than that specified for the *Buffer Stage* if the requirement for the minimum amount dissolved is met at an earlier time.◆

Method B—

Procedure ◆(unless otherwise directed in the individual monograph)◆—

ACID STAGE—Place 1000 mL of 0.1 N hydrochloric acid in the vessel, and assemble the apparatus. Allow the medium to equilibrate to a temperature of 37 ± 0.5°. Place 1 dosage unit in the apparatus, cover the vessel, and operate the apparatus at the rate specified ◆in the monograph◆. After 2 hours of operation in 0.1 N hydrochloric acid, withdraw an aliquot of the fluid, and proceed immediately as directed under *Buffer Stage*.

Perform an analysis of the aliquot using a suitable assay method. ◆The procedure is specified in the individual monograph.◆

BUFFER STAGE—[NOTE—For this stage of the procedure, use buffer that previously has been equilibrated to a temperature of 37 ± 0.5°.] Drain the acid from the vessel, and add to the vessel 1000 mL of pH 6.8 phosphate buffer, prepared by mixing 0.1 N hydrochloric acid with 0.20 M tribasic sodium phosphate (3 : 1) and adjusting, if necessary, with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of 6.8 ± 0.05. [NOTE—This may also be accomplished by removing from the apparatus the vessel containing the acid and replacing it with another vessel containing the buffer and transferring the dosage unit to the vessel containing the buffer.]

Continue to operate the apparatus for 45 minutes, or for the specified time ◆given in the individual monograph◆. At the end of the time period, withdraw an aliquot of the fluid, and perform the analysis using a suitable assay method. ◆The procedure is specified in the individual monograph. The test may be concluded in a shorter time period than that specified for the *Buffer Stage* if the requirement for minimum amount dissolved is met at an earlier time.◆

Apparatus 3 (Reciprocating Cylinder)

NOT ACCEPTED BY THE JAPANESE PHARMACOPOEIA

IMMEDIATE-RELEASE DOSAGE FORMS

Place the stated volume of the *Dissolution Medium* in each vessel of the apparatus, assemble the apparatus, equilibrate the *Dissolution Medium* to 37 ± 0.5°, and remove the thermometer. Place 1 dosage-form unit in each of the six reciprocating cylinders, taking care to exclude air bubbles from the surface of each dosage unit, and immediately operate the apparatus as specified ◆in the individual monograph◆. During the upward and downward stroke, the reciprocating cylinder moves through a total distance of 9.9 to 10.1 cm. Within the time interval specified, or at each of the times stated, raise the reciprocating cylinders and withdraw a portion of the solution under test from a zone midway between the surface of the *Dissolution Medium* and the bottom of each vessel. Perform the analysis as directed ◆in the individual monograph◆. If necessary, repeat the test with additional dosage-form units.

Dissolution Medium—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

Time—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

[3] Test specimens are filtered immediately upon sampling unless filtration is demonstrated to be unnecessary. Use an inert filter that does not cause adsorption of the active ingredient or contain extractable substances that would interfere with the analysis.

[4] One method of deaeration is as follows: Heat the medium, while stirring gently, to about 41°, immediately filter under vacuum using a filter having a porosity of 0.45 µm or less, with vigorous stirring, and continue stirring under vacuum for about 5 minutes. Other validated deaeration techniques for removal of dissolved gases may be used.

EXTENDED-RELEASE DOSAGE FORMS

Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 3*.

Dissolution Medium—Proceed as directed for *Extended-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

Time—Proceed as directed for *Extended-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

DELAYED-RELEASE DOSAGE FORMS

Proceed as described for *Delayed-Release Dosage Forms, Method B* under *Apparatus 1 and Apparatus 2* using one row of vessels for the acid stage media and the following row of vessels for the buffer stage media and using the volume of medium specified (usually 300 mL).

Time—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

Apparatus 4 (Flow-Through Cell)

IMMEDIATE-RELEASE DOSAGE FORMS

Place the glass beads into the cell specified ◆in the monograph◆. Place 1 dosage unit on top of the beads or, if specified ◆in the monograph◆, on a wire carrier. Assemble the filter head, and fix the parts together by means of a suitable clamping device. Introduce by the pump the *Dissolution Medium* warmed to 37 ± 0.5° through the bottom of the cell to obtain the flow rate specified ◆in the individual monograph◆ and measured with an accuracy of 5%. Collect the eluate by fractions at each of the times stated. Perform the analysis as directed ◆in the individual monograph◆. Repeat the test with additional dosage-form units.

Dissolution Medium—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

Time—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

EXTENDED-RELEASE DOSAGE FORMS

Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 4.*

Dissolution Medium—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 4*.

Time—Proceed as directed for *Immediate-Release Dosage Forms* under *Apparatus 4.*

DELAYED-RELEASE DOSAGE FORMS

Proceed as directed for *Delayed-Release Dosage Forms* under *Apparatus 1 and Apparatus 2,* using the specified media.

Time—Proceed as directed for *Delayed-Release Dosage Forms* under *Apparatus 1 and Apparatus 2*.

Change to read:

INTERPRETATION

Immediate-Release Dosage Forms

Unless otherwise specified ◆in the individual monograph◆, the requirements are met if the quantities of active ingredient dissolved from the dosage units tested conform to *Acceptance Table 1*. Continue testing through the three stages unless the results conform at either S_1 or S_2. The quantity, Q, is the amount of dissolved active ingredient ◆specified in the individual monograph◆, expressed as a percentage of the labeled content of the dosage unit; the 5%, 15%, and 25% values in *Acceptance Table 1* are percentages of the labeled content so that these values and Q are in the same terms.

Acceptance Table 1

Stage	Number Tested	Acceptance Criteria
S_1	6	Each unit is not less than Q + 5%.
S_2	6	Average of 12 units (S_1 + S_2) is equal to or greater than Q, and no unit is less than Q – 15%.
S_3	12	Average of 24 units (S_1 + S_2 + S_3) is equal to or greater than Q, not more than 2 units are less than Q – 15%, and no unit is less than Q – 25%.

●◆**Immediate-Release Dosage Forms Pooled Sample**—Unless otherwise specified in the individual monograph, the requirements are met if the quantities of active ingredient dissolved from the pooled sample conform to the accompanying *Acceptance Table for a Pooled Sample.* Continue testing through the three stages unless the results conform at either S_1 or S_2. The quantity, Q, is the amount of dissolved active ingredient specified in the individual monograph, expressed as a percentage of the labeled content.

Acceptance Table for a Pooled Sample

Stage	Number Tested	Acceptance Criteria
S_1	6	Average amount dissolved is not less than Q + 10%.
S_2	6	Average amount dissolved (S_1 + S_2) is equal to or greater than Q + 5%.
S_3	12	Average amount dissolved (S_1 + S_2 + S_3) is equal to or greater than Q.

◆●[2]

Extended-Release Dosage Forms

Unless otherwise specified ◆in the individual monograph◆, the requirements are met if the quantities of active ingredient dissolved from the dosage units tested conform to *Acceptance Table 2*. Continue testing through the three levels unless the results conform at either L_1 or L_2. Limits on the amounts of active ingredient dissolved are expressed in terms of the percentage of labeled content. The limits embrace each value of Q_i, the amount dissolved at each specified

Interim Revision Announcement

fractional dosing interval. Where more than one range is specified ◆in the individual monograph◆, the acceptance criteria apply individually to each range.

Acceptance Table 2

Level	Number Tested	Criteria
L_1	6	No individual value lies outside each of the stated ranges and no individual value is less than the stated amount at the final test time.
L_2	6	The average value of the 12 units ($L_1 + L_2$) lies within each of the stated ranges and is not less than the stated amount at the final test time; none is more than 10% of labeled content outside each of the stated ranges; and none is more than 10% of labeled content below the stated amount at the final test time.
L_3	12	The average value of the 24 units ($L_1 + L_2 + L_3$) lies within each of the stated ranges, and is not less than the stated amount at the final test time; not more than 2 of the 24 units are more than 10% of labeled content outside each of the stated ranges; not more than 2 of the 24 units are more than 10% of labeled content below the stated amount at the final test time; and none of the units is more than 20% of labeled content outside each of the stated ranges or more than 20% of labeled content below the stated amount at the final test time.

Delayed-Release Dosage Forms

NOT ACCEPTED BY THE JAPANESE PHARMACOPOEIA.

Acid Stage—Unless otherwise specified ◆in the individual monograph◆, the requirements of this portion of the test are met if the quantities, based on the percentage of the labeled content, of active ingredient dissolved from the units tested conform to *Acceptance Table 3*. Continue testing through all levels unless the results of both acid and buffer stages conform at an earlier level.

Acceptance Table 3

Level	Number Tested	Criteria
A_1	6	No individual value exceeds 10% dissolved.
A_2	6	Average of the 12 units ($A_1 + A_2$) is not more than 10% dissolved, and no individual unit is greater than 25% dissolved.
A_3	12	Average of the 24 units ($A_1 + A_2 + A_3$) is not more than 10% dissolved, and no individual unit is greater than 25% dissolved.

Buffer Stage—Unless otherwise specified ◆in the individual monograph◆, the requirements are met if the quantities of active ingredient dissolved from the units tested conform to *Acceptance Table 4*. Continue testing through the three levels unless the results of both stages conform at an earlier level. The value of Q in *Acceptance Table 4* is 75% dissolved unless otherwise specified ◆in the individual monograph◆. The quantity, Q,◆specified in the individual monograph◆ is the total amount of active ingredient dissolved in both the *Acid* and *Buffer Stages*, expressed as a percentage of the labeled content. The 5%, 15%, and 25% values in *Acceptance Table 4* are percentages of the labeled content so that these values and Q are in the same terms.

Acceptance Table 4

Level	Number Tested	Criteria
B_1	6	Each unit is not less than Q + 5%.
B_2	6	Average of 12 units ($B_1 + B_2$) is equal to or greater than Q, and no unit is less than Q – 15%.
B_3	12	Average of 24 units ($B_1 + B_2 + B_3$) is equal to or greater than Q, not more than 2 units are less than Q – 15%, and no unit is less than Q – 25%.

GENERAL CHAPTERS

General Information

⟨1216⟩ TABLET FRIABILITY

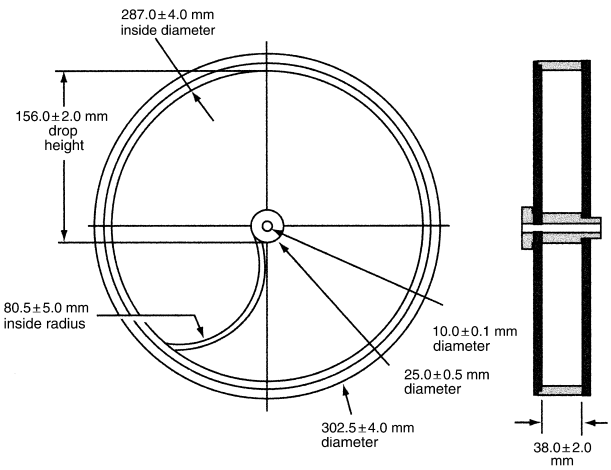
Change to read:

•This general information chapter has been harmonized with the corresponding texts of the *European Pharmacopoeia* and the *Japanese Pharmacopoeia*. The harmonized texts of these three pharmacopeias are therefore interchangeable, and the methods of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia* may be used for demonstration of compliance instead of the present *United States Pharmacopeia* general information chapter method. These pharmacopeias have undertaken not to make any unilateral change to this harmonized chapter.•2

This chapter provides guidelines for the friability determination of compressed, uncoated tablets. The test procedure presented in this chapter is generally applicable to most compressed tablets. Measurement of tablet friability supplements other physical strength measurements, such as tablet •breaking force.•2

Use a drum,* with an internal diameter between 283 and 291 mm and a depth between 36 and 40 mm, of transparent synthetic polymer with polished internal surfaces, and ••2 subject to •minimum•2 static build-up (see figure for a typical apparatus). One side of the drum is removable. The tablets are tumbled at each turn of the drum by a curved projection with an inside radius between 75.5 and 85.5 mm that extends from the middle of the drum to the outer wall. •The outer diameter of the central ring is between 24.5 and 25.5 mm.•2 The drum is attached to the horizontal axis of a device that rotates at 25 ± 1 rpm. Thus, at each turn the tablets roll or slide and fall onto the drum wall or onto each other.

* The apparatus meeting these specifications is available from laboratory supply houses such as VanKel Technology Group, 13000 Weston Parkway, Cary, NC 27513, or from Erweka Instruments, Inc., 56 Quirk Road, Milford, CT 06460.



Tablet Friability Apparatus

For tablets with a unit •weight•2 equal to or less than 650 mg, take a sample of whole tablets corresponding •as near as possible•2 to 6.5 g. For tablets with a unit •weight•2 of more than 650 mg, take a sample of 10 whole tablets. The tablets should be carefully dedusted prior to testing. Accurately weigh the tablet sample, and place the tablets in the drum. Rotate the drum 100 times, and remove the tablets. Remove any loose dust from the tablets as before, and accurately weigh.

Generally, the test is run once. If obviously cracked, cleaved, or broken tablets are present in the tablet sample after tumbling, the sample fails the test. If the results are •difficult to interpret•2 or if the weight loss is greater than the targeted value, the test should be repeated twice and the mean of the three tests determined. A maximum mean weight loss from the three samples of not more than 1.0% is considered acceptable for most products.

If tablet size or shape causes irregular tumbling, adjust the drum base so that the base forms an angle of about 10° with the •horizontal•2 and the tablets no longer bind together when lying next to each other, which prevents them from falling freely.

Effervescent tablets and chewable tablets may have different specifications as far as friability is concerned. In the case of hygroscopic tablets, an appropriate humidity-controlled environment is required for testing.

Drums with dual scooping projections, or an apparatus with more than one drum, for the running of multiple samples at one time, are also permitted.

•(Official August 1, 2006)•2

Interim Revision Announcement

ERRATA

Following is a list of errata and corrections to *USP 29–NF 24*. The page number indicates where the item is found in *USP 29–NF 24*. If necessary, this list will be updated with every issue of *PF*. This information will also be available as a cumulative table in the next available *Supplement* and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement. USP staff are available to respond to questions regarding the accuracy of a particular requirement by calling 1-800-822-USPC.

Page	Title	Section	Description
294	*Bisoprolol Fumarate and Hydrochlorothiazide Tablets*	*Assay*	Line 2 under *Diluent:* Change "a mixture of water and acetonitrile." to: a mixture of water and acetonitrile (1:1).
1045	*Helium*	*USP Reference standards*	There is no USP Reference Standard for this monograph. Therefore, text in this section that appears in *USP 29–NF 24* and is marked "Postponed indefinitely" should be disregarded.
		Assay	The *Assay* was postponed indefinitely in the *USP 29–NF 24* official text, leaving the *Assay* in *USP 28–NF 23* as official text. In addition to the *USP 29–NF 24* text, the following official *USP 28–NF 23* text should also be included: Introduce a specimen of Helium into a gas chromatograph by means of a gas sampling valve. Select the operating conditions of the gas chromatograph such that the standard peak signal resulting from the following procedure corresponds to not less than 70% of the full-scale reading. Preferably, use an apparatus corresponding to the general type in which the column is 6 m in length and 4 mm in inside diameter and is packed with porous polymer beads, which permits complete separation of nitrogen and oxygen from Helium, although the nitrogen and oxygen may not be separated from each other. Use industrial grade helium (99.99%) as the carrier gas, with a thermal-conductivity detector, and control the column temperature: the peak response produced by the assay specimen exhibits a retention time corresponding to that produced by an air-helium certified standard (see under *Reagents* in the section *Reagents, Indicators, and Solutions*), and indicates not more than 1.0% of air when compared to the peak response of the air-helium certified standard, and not less than 99.0%, by volume, of He.

ERRATA *(Continued)*

Page	Title	Section	Description
1547	*Nitrous Oxide*	*USP Reference standards*	There is no USP Reference Standard for this monograph. Therefore, text in this section that appears in *USP 29–NF 24* and is marked "Postponed indefinitely" should be disregarded.
		Identification	The *Identification* test was postponed indefinitely in the *USP 29–NF 24* official text, leaving the *Identification* test in *USP 28–NF 23* as official text. In addition to the *USP 29–NF 24* text the following official *USP 28–NF 23* text should also be included: **A:** With the container temperatures the same and maintained between 15° and 25°, concomitantly read the pressure of the Nitrous Oxide container and of a container of nitrous oxide certified standard (see under *Reagents* in the section *Reagents, Indicators, and Solutions*). [NOTE—Do not use the nitrous oxide certified standard if it has been depleted to less than half of its full capacity.] The pressure of the Nitrous Oxide container is within 50 psi of that of the nitrous oxide certified standard. **B:** Pass 100 ± 5 mL released from the vapor phase of the contents of the Nitrous Oxide container through a carbon dioxide detector tube at the rate specified for the tube: no color change is observed *(distinction from carbon dioxide)*. **C:** Collect about 100 mL of the gas under test in a 100-mL tube fitted at the top with a stopcock. Open the stopcock, and quickly add a freshly prepared solution of 500 mg of pyrogallol in 2 mL of water and a freshly prepared solution of 12 g of potassium hydroxide in 8 mL of water. Immediately close the stopcock, and mix: the gas is not absorbed, and the solution does not become brown *(distinction from oxygen)*.
		Assay	The *Assay* was postponed indefinitely in the *USP 29–NF 24* official text, leaving the *Assay* in *USP 28–NF 23* as official text. In addition to the *USP 29–NF 24* text the following official *USP 28–NF 23* text should also be included: Introduce a specimen of Nitrous Oxide taken from the liquid phase, as directed in the test for *Nitrogen dioxide,* into a gas chromatograph by means of a gas-sampling valve. Select the operating conditions of the gas chromatograph such that the peak response resulting from the following procedure corresponds to not less than 70% of the full-scale reading. Preferably, use an apparatus corresponding to the general type in which the column is 6 m in length and 4 mm in inside diameter and is packed with porous polymer beads, which permits complete separation of N_2 and O_2 from N_2O, although the N_2 and O_2 may not be separated from each other. Use industrial grade helium (99.99%) as the carrier gas, with a thermal-conductivity detector, and control the column temperature: the peak response produced by the assay specimen exhibits a retention time corresponding to that produced by an air-helium certified standard (see under *Reagents* in the section *Reagents, Indicators, and Solutions*), and is equivalent to not more than 1.0% of air when compared to the peak response of the air-helium certified standard, indicating not less than 99.0%, by volume, of N_2O.
2567	⟨381⟩ *Elastomeric Closures for Injections*	*Physicochemical Test Procedures*	Line 5 under *Procedure:* Change "121 ± 0.5°" to: 121 ± 2°
3273	*Ammonium Sulfate*	*Microbial limits*	Lines 1 through 3: Change "The total aerobic microbial count does not exceed 1000 cfu per g, and the total combined molds and yeasts count does not exceed 1000 cfu per g." to: The total aerobic microbial count does not exceed 1000 cfu per g, and the total combined molds and yeasts count does not exceed 10 cfu per g.

In addition to the *USP 29–NF 24* text the following official *USP 28–NF 23* text should also be included: The flame of a burning wood splinter is extinguished when inserted into a test tube filled with Nitrogen. [NOTE—Exercise caution.]
		Assay	The *Assay* was postponed indefinitely in the *USP 29–NF 24* official text, leaving the *Assay* test in *USP 28–NF 23* as official text. In addition to the *USP 29–NF 24* text the following official *USP 28–NF 23* text should also be included: Introduce a specimen of Nitrogen into a gas chromatograph by means of a gas sampling valve. Select the operating conditions of the gas chromatograph such that the standard peak signal resulting from the following procedure corresponds to not less than 70% of the full-scale reading. Preferably, use an apparatus corresponding to the general type in which the column is 3 m in length and 4 mm in inside diameter and is packed with a molecular sieve prepared from a synthetic alkali-metal aluminosilicate capable of absorbing molecules having diameters of up to 0.5 nm, which permit complete separation of oxygen from nitrogen. Use industrial grade helium (99.99%) as the carrier gas, with a thermal-conductivity detector, and control the column temperature: the peak response produced by the assay specimen exhibits a retention time corresponding to that produced by an oxygen-helium certified standard (see under *Reagents* in the section *Reagents, Indicators, and Solutions*), and is equivalent to not more than 1.0% of oxygen when compared to the peak response of the oxygen-helium certified standard, indicating not less than 99.0%, by volume, of N_2.
3381	*Nitrogen 97 Percent*	*USP Reference standards*	There is no USP Reference Standard for this monograph. Therefore, text in this section that appears in *USP 29–NF 24* and is marked ''Postponed indefinitely'' should be disregarded.
		Identification	The *Identification* test was postponed indefinitely in the *USP 29–NF 24* official text, leaving the *Identification* test in *USP 28–NF 23* as official text. In addition to the *USP 29–NF 24* text the following official *USP 28–NF 23* text should also be included: The flame of a burning wood splinter is extinguished when inserted into a test tube filled with Nitrogen 97 Percent. [NOTE—Exercise caution.]
		Assay	The *Assay* was postponed indefinitely in the *USP 29–NF 24* official text, leaving the *Assay* in *USP 28–NF 23* as official text. In addition to the *USP 29–NF 24* text the following official *USP 28–NF 23* text should also be included: Proceed with Nitrogen 97 Percent as directed in the *Assay* for *Nitrogen*. The peak response produced by the assay specimen exhibits a retention time corresponding to that produced by an oxygen-helium certified standard (see under *Reagents* in the section *Reagents, Indicators, and Solutions*) and is equivalent to not more than 3.0% of oxygen when compared to the peak response of the oxygen-helium certified standard, indicating not less than 97.0%, by volume, of N_2.

Interim Revision Announcement

IN-PROCESS REVISION

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) items that previously appeared under *Pharmacopeial Previews* and are now formally proposed as revisions, (2) proposed revisions placed directly under *In-Process Revision,* or (3) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the staff liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

BRIEFING

> **Name of Item**, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How to Use PF*), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
>
> (DSN: L. Evans) RTS—55678-1

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type, as shown in the examples below:

•new text•

if slated for an *Interim Revision Announcement to USP 29–NF 24* (*IRA*);

▲new text▲*USP30*

if slated for *USP 30–NF 25*; and

■new text■

if slated for a *Supplement to USP–NF*. The same symbols *not* set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as •• or ■■ or ▲▲, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •2 indicates that the revision is proposed for the *Second Interim Revision Announcement*, ■2S (*USP 29*) indicates that the proposed revision is slated for the *Second Supplement to USP 29*, and ▲*USP30* and ▲*NF25* indicate that the revisions are proposed for *USP 30* and *NF 25*, respectively.

Official Title Changes Where the specification ***"Monograph title change"*** is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

In-Process Revision

In-Process Revision

MONOGRAPHS (USP)

BRIEFING

Allopurinol, *USP 29* page 75. On the basis of comments received, it is proposed to cancel the revision proposal previously published on page 1386 of *PF* 28(5) [Sept.–Oct. 2002], and to make the following changes:

1. Replace the current thin-layer chromatographic procedure in the test for *Chromatographic purity* with a new single chromatographic procedure for the test for *Related compounds*. The proposed procedure is based on analyses performed with the 5-µm Zorbax Eclipse XDB C18 brand of L1 column. The typical retention time for allopurinol is about 4.6 minutes.
2. Resubmit the previously proposed stability-indicating liquid chromatographic procedure for the *Assay* with minor changes. It is based on analyses performed with the 5-µm Hypersil-ODS brand of L1 column. The typical retention time for allopurinol is about 6.1 minutes.
3. Change the acceptance criteria in the Definition from "not less than 98.0 percent and not more than 101.0 percent" to "not less than 98.0 percent and not more than 102.0 percent," which are typical for chromatographic procedures.
4. Indicate storage at room temperature under the *Packaging and storage* section.

(MD-GRE: E. Gonikberg) RTS—41003-1

USP Reference standards ⟨11⟩**—***USP Allopurinol RS. USP Allopurinol Related Compound A RS.*

■*USP Allopurinol Related Compound B RS. USP Allopurinol Related Compound C RS. USP Allopurinol Related Compound D RS. USP Allopurinol Related Compound E RS. USP Allopurinol Related Compound F RS.*■1S (*USP30*)

Delete the following:

■~~**Chromatographic purity**~~

~~*Adsorbent:* 0.1-mm layer of chromatographic cellulose containing a fluorescent indicator.~~

~~*Test solution*—Dissolve 250 mg of Allopurinol in a mixture of 6 N ammonium hydroxide and 1 N sodium hydroxide (9 : 1) to make 10.0 mL, and mix.~~

~~*Standard solution*—Dissolve a suitable quantity of USP Allopurinol Related Compound A RS in 6 N ammonium hydroxide to obtain a solution having a known concentration of 50 µg per mL.~~

~~*Application volume:* 10 µL.~~

~~*Developing solvent system*—Shake 200 mL of butyl alcohol and 200 mL of 6 N ammonium hydroxide, discard the lower layer, and add 20 mL of butyl alcohol to the top layer.~~

~~*Procedure*—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. Develop the chromatogram until the solvent front is 1 cm from the top of the plate, air-dry, and examine under UV light. Any spot in the chromatogram obtained from the *Test solution*, except for the principal spot, is not more intense than the spot in the chromatogram obtained from the *Standard solution*: not more than 0.2% of any individual impurity is found.~~■1S (*USP30*)

Add the following:

■**Related compounds—**[NOTE—Store and inject the *Standard solution* and the *Test solution* at 8°, using a cooled autosampler.]

Solution A—Dissolve 1.25 g of monobasic potassium phosphate in 1000 mL of water, filter, and degas.

Solution B—Use methanol.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of *Solution A* and *Solution B* (90 : 10).

Standard stock solution—Accurately weigh about 5 mg of each of USP Allopurinol RS, USP Allopurinol Related Compound A RS, USP Allopurinol Related Compound B RS, USP Allopurinol Related Compound C RS, USP Allopurinol Related Compound D RS, USP Allopurinol Related Compound E RS, and USP Allopurinol Related Compound F RS, and transfer to a 100-mL volumetric flask. Add 2.0 mL of 0.1 N sodium hydroxide to dissolve, promptly sonicate with swirling for not more than 1 minute, add 80 mL of *Diluent,* and sonicate for an additional 5 minutes. Dilute with *Diluent* to volume. [NOTE—This solution is stable for 48 hours when stored at 8°.]

Standard solution—Quantitatively dilute an accurately measured volume of the *Standard stock solution* with *Diluent* to obtain a solution having known concentrations of about 0.5 µg of allopurinol and about 0.5 µg of each of allopurinol related compounds A, B C, D, E, and F per mL.

Test solution—Transfer about 25 mg of Allopurinol, accurately weighed, to a 100-mL volumetric flask, add 5.0 mL of 0.1 N sodium hydroxide to dissolve, promptly sonicate with swirling for not more than 1 minute, add 80 mL of *Diluent,* and sonicate for an additional 5 minutes. Dilute with *Diluent* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The column temperature is maintained at 30°. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–30	90→70	10→30	linear gradient
30–35	70	30	isocratic
35–36	70→90	30→10	linear gradient
36–46	90	10	re-equilibration

Chromatograph the *Standard solution,* identify the peaks (see *Table 1*), and record the peak responses as directed for *Procedure:* the resolution, *R,* between allopurinol related compounds C and B is not less than 0.8; and the tailing factor for the allopurinol peak is not more than 1.5.

Procedure—Separately inject equal volumes (about 40 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and identify the allopurinol peak and the peaks due to impurities listed in *Table 1.*

Table 1

Name	Relative Retention Time	Limit (%)
Allopurinol related compound A[1]	0.62	0.2
Allopurinol related compound C[3]	0.79	0.2
Allopurinol related compound B[2]	0.81	0.2
Allopurinol	1.0	—
Allopurinol related compound D[4]	4.4	0.2
Allopurinol related compound E[5]	4.8	0.2
Allopurinol related compound F[6]	6.5	0.2

[1] 3-Amino-1*H*-pyrazole-4-carboxamide
[2] 5-(Formylamino)-1*H*-pyrazole-4-carboxamide
[3] 5-(4*H*-1,2,4-Triazol-4-yl)-1*H*-pyrazole-4-carboxamide
[4] Ethyl-5-amino-1*H*-pyrazole-4-carboxylate
[5] Ethyl-5-(formylamino)-1*H*-pyrazole-4-carboxylate
[6] Ethyl-(E/Z)-3-(2-carbethoxy-2-cyanoethenyl)amino-1*H*-pyrazole-4-carboxylate

Calculate the percentage of each impurity in the portion of Allopurinol taken by the formula:

$$10(C/W)(r_i/r_S)$$

in which C is the concentration, in µg per mL, of each individual impurity in the *Standard solution; W* is the weight, in mg, of Allopurinol taken to prepare the *Test solution;* and r_i and r_S are the peak responses for each individual impurity obtained from the *Test solution* and the *Standard solution*, respectively. [NOTE—For unspecified impurities, r_S is the peak response for the allopurinol peak obtained from the *Standard solution.*] In addition to not exceeding the limits for each impurity in *Table 1*, not more than 0.1% of any individual unspecified impurity is found; and not more than 1.0% of total impurities is found.■1S *(USP30)*

In-Process Revision

Change to read:

Assay—~~Dissolve about 100 mg of Allopurinol, accurately weighed, in 30 mL of dimethylformamide, warming if necessary. Titrate with 0.1 N tetrabutylammonium hydroxide VS, determining the endpoint potentiometrically, using a calomel-glass electrode system and taking the necessary precautions to prevent the absorption of atmospheric carbon dioxide. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N tetrabutylammonium hydroxide is equivalent to 13.61 mg of $C_5H_4N_4O$.~~

■[NOTE—Store and inject the *System suitability solution,* the *Standard preparation,* and the *Assay preparation* at 8°, using a cooled autosampler.]

Mobile phase—Dissolve 1.25 g of monobasic potassium phosphate in 1000 mL of water, filter, and degas.

System suitability solution—Transfer accurately weighed quantities of USP Allopurinol RS, USP Allopurinol Related Compound B RS, and USP Allopurinol Related Compound C RS, each to a suitable volumetric flask, dissolve in a small volume of 0.1 N sodium hydroxide, and immediately and quantitatively dilute with *Mobile phase* to obtain solutions having known concentrations of about 0.05 mg per mL. Transfer 1.0 mL of each of these three solutions to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Standard preparation—Dissolve an accurately weighed quantity of USP Allopurinol RS in a small volume of 0.1 N sodium hydroxide, and immediately and quantitatively dilute with *Mobile phase* to obtain a solution having a known concentration of about 0.5 mg per mL. Quantitatively dilute an accurately measured volume of this solution with *Mobile phase* to obtain a solution having a known concentration of about 0.08 mg of allopurinol per mL.

Assay preparation—Transfer about 50 mg of Allopurinol, accurately weighed, to a 100-mL volumetric flask, dissolve in 5.0 mL of 0.1 N sodium hydroxide, immediately dilute with *Mobile phase* to volume, and mix. Quantitatively dilute an accurately measured volume of this solution with *Mobile phase* to obtain a solution having a known concentration of about 0.08 mg of allopurinol per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.8 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between allopurinol related compound B and allopurinol related compound C is not less than 1.1, and that between allopurinol related compound C and allopurinol is not less than 6.0. [NOTE—For the purpose of identification, the relative retention times are about 0.7 for allopurinol related compound B, 0.8 for allopurinol related compound C, and 1.0 for allopurinol.] Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_5H_4N_4O$ in the portion of Allopurinol taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which C_U and C_S are the concentrations, in mg per mL, of allopurinol in the *Assay preparation* and the *Standard preparation,* respectively; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■IS (*USP30*)

In-Process Revision

BRIEFING

Amoxicillin Tablets, *USP 29* page 160. It is proposed to include separate requirements for each strength of chewable tablets in the *Dissolution* test. In the absence of any significant adverse comments, it is proposed to implement this revision via the *Fourth Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of August 1, 2006.

(BPC: M. Marques) RTS—43832-1; 43833-1

Change to read:

Dissolution ⟨711⟩—

Medium: water; 900 mL.
Apparatus 2: 75 rpm.
Time: 30 minutes.

Determine the amount of $C_{16}H_{19}N_3O_5S$ dissolved by employing the following method.

pH 5.0 Buffer—Dissolve 27.2 g of monobasic potassium phosphate in 3 L of water, adjust with a 45% (w/w) solution of potassium hydroxide to a pH of 5.0 ± 0.1, dilute with water to obtain 4 L of solution, and mix.

Mobile phase—Prepare a mixture of *pH 5.0 Buffer* and acetonitrile (3900 : 100), and pass through a filter having a 0.5-µm or finer porosity. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Amoxicillin RS in *pH 5.0 Buffer* to obtain a solution having a known concentration of about 0.05 mg per mL. Use this solution within 6 hours.

Test solution—Pass a portion of the solution under test through a filter having a 0.5-µm or finer porosity. Quantitatively dilute an accurately measured volume of the filtrate with water to obtain a solution having an estimated concentration of about 0.045 mg of amoxicillin per mL. Use this solution within 6 hours.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector, a 3.9-mm × 30-cm analytical column that contains packing L1, and a 2-mm × 2-cm guard column that contains packing L2. The analytical column is maintained at a constant temperature of about 40 ± 1°. The flow rate is about 0.7 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the capacity factor, *k′,* is between 1.1 and 2.8; the column efficiency is not less than 1700 theoretical plates; the tailing factor is not more than 2.5; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of amoxicillin ($C_{16}H_{19}N_3O_5S$) dissolved by the formula:

$$0.9DCP(r_U/r_S)$$

in which *D* is the dilution factor used in preparing the *Test solution; C* is the concentration, in mg per mL, of USP Amoxicillin RS in the *Standard solution; P* is the stated content, in µg of amoxicillin ($C_{16}H_{19}N_3O_5S$) per mg, of USP Amoxicillin RS; and r_U and r_S are the amoxicillin peak responses obtained from the *Test solution* and the *Standard solution,* respectively.

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{16}H_{19}N_3O_5S$ is dissolved in 30 minutes.

FOR PRODUCTS LABELED AS CHEWABLE TABLETS—Proceed as directed above.

•FOR CHEWABLE TABLETS LABELED TO CONTAIN 200 MG OR 400 MG:•4

Time: 20 minutes.

Tolerances—Not less than 70% *(Q)* of the labeled amount of $C_{16}H_{19}N_3O_5S$ is dissolved in 20 minutes.

•FOR CHEWABLE TABLETS LABELED TO CONTAIN 125 MG OR 250 MG:

Time: 90 minutes.

Tolerances—Not less than 70% *(Q)* of the labeled amount of $C_{16}H_{19}N_3O_5S$ is dissolved in 90 minutes.•4

FOR VETERINARY PRODUCTS—Proceed as directed above, except to use *Apparatus 2* at 100 rpm.

BRIEFING

Atracurium Besylate, *USP 29* page 216. It is proposed to include an identified impurity, laudanosine, along with appropriate acceptance criteria to the test for *Chromatographic purity.* Laudanosine elutes at an approximate relative retention time of about 0.3 and is quantified using a response factor of 1.9 relative to atracurium besylate. Additionally, in the test for *Chromatographic purity* and in the *Assay,* the relative retention time information, which is currently listed along with system suitability criteria, has been moved to a *Note,* which clearly indicates that it is intended for identification purposes only.

(MD-PP: R. Ravichandran) RTS—43921-1

Change to read:

Chromatographic purity—

Buffer solution, Solution A, Solution B, and *Mobile phase*—Proceed as directed in the *Assay.*

Standard solution—Transfer 1.0 mL of the *Standard preparation,* prepared as directed in the *Assay,* to a 100-mL volumetric flask, dilute with *Solution A* to volume, and mix.

Test solution—Use the *Assay preparation.*

Chromatographic system (see *Chromatography* ⟨621⟩)—Prepare as directed in the *Assay.* Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the responses of the *cis-cis* isomers from not fewer than two injections do not differ by more than 10%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all of the peak responses, except the three main isomeric peaks. Calculate the percentage of each impurity in the portion of Atracurium Besylate taken by the formula:

~~$10{,}000C/W)(r_i/r_s)$~~

$$\blacksquare 10{,}000(1/F)(C/W)(r_i/r_S)_{\blacksquare 1S\ (USP30)}$$

in which

■*F* is the relative response factor of the impurity peak, which is 1.9 for laudanosine and 1.0 for all other unidentified impurities;■1S *(USP30)*

In-Process Revision

C is the concentration, in mg per mL, of the *cis-cis* isomer in the *Standard solution; W* is the weight, in mg, of Atracurium Besylate taken to prepare the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the peak response for the *cis-cis* isomer obtained from the *Standard solution:* ~~not more than 1.5% of any individual impurity is found,~~

■not more than 0.5% of laudanosine is found, not more than 1.0% of any other individual impurity is found,■1S (*USP30*) and not more than 3.5% of total impurities is found.

■[NOTE—For identification purposes, the relative retention time for laudanosine is about 0.3.]■1S (*USP30*)

Change to read:

Assay—

Buffer solution—Transfer about 10.2 g of monobasic potassium phosphate to a 1000-mL volumetric flask, and dissolve in about 950 mL of water. While stirring, adjust with phosphoric acid to a pH of 3.1, dilute with water to volume, and mix.

Solution A—Prepare a mixture of *Buffer solution,* acetonitrile, and methanol (75 : 20 : 5).

Solution B—Prepare a mixture of *Buffer solution,* methanol, and acetonitrile (50 : 30 : 20).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Atracurium Besylate RS in *Solution A* to obtain a solution having a known concentration of about 1.0 mg per mL.

Assay preparation—Transfer about 100 mg of Atracurium Besylate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Solution A* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 25-cm column that contains base-deactivated packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	80	20	equilibration
0–5	80	20	isocratic
5–15	80→40	20→60	linear gradient
15–25	40	60	isocratic
25–30	40→0	60→100	linear gradient

Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* ~~the relative retention times are about 0.8, 0.9, and 1.0 for the *trans-trans* isomer, the *cis-trans* isomer, and the *cis-cis* isomer, respectively;~~

■■1S (*USP30*) the resolution, *R,* between the *trans-trans* isomer and the *cis-trans* isomer and between the *cis-trans* isomer and the *cis-cis* isomer is not less than 1.1; and the relative standard deviation for replicate injections is not more than 2.0%.

■[NOTE—For identification purposes, the relative retention times are about 0.8, 0.9, and 1.0 for the *trans-trans* isomer, the *cis-trans* isomer, and the *cis-cis* isomer, respectively.]■1S (*USP30*)

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the three isomeric peaks. Calculate the quantity, in mg, of $C_{65}H_{82}N_2O_{18}S_2$ in the portion of Atracurium Besylate taken by the formula:

$$100C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Atracurium Besylate RS in the *Standard preparation;* and r_U and r_S are the sums of the peak responses for the *trans-trans* isomer, the *trans-cis* isomer, and the *cis-cis* isomer obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Azithromycin, *USP 29* page 227. It is proposed to revise the test for *Limit of related substances* to include an alternative procedure *(Test 2)* to accommodate a different synthesis route for the azithromycin drug substance. The reverse-phase HPLC procedure was validated using a Kromasil KR 100 brand of L1 column; azithromycin elutes at approximately 14 minutes on this system. It is proposed to add USP Azithromycin Identity RS and USP Azithromycin-*N*-oxide RS to support the proposed procedure in *Test 2* and to add a *Labeling* statement to reflect the proposed addition of another test.

(MD-ANT: B. Gilbert) RTS—42419-1; 42816-1; 42817-1

Change to read:

Labeling—Label it to indicate whether it is the monohydrate or the dihydrate. Where the quantity of azithromycin is indicated in the labeling of any preparation containing Azithromycin, this shall be understood to be in terms of anhydrous azithromycin ($C_{38}H_{72}N_2O_{12}$).

■The labeling states with which *Limit of related substances* test the article complies if a test other than *Test 1* is used.■1S (*USP30*)

In-Process Revision

TEST 1—■1S *(USP30)*
[NOTE—Use water that has a resistivity of not less than 18 Mohm-cm.]

Mobile phase—Proceed as directed in the *Assay.*

pH 7.5 Potassium phosphate buffer—Transfer 2.7 g of monobasic potassium phosphate to a 1000-mL volumetric flask. Dilute with water to volume, and mix. Adjust with 10 N potassium hydroxide to a pH of 7.5 ± 0.1.

Dilution solution—Prepare a mixture of *pH 7.5 Potassium phosphate buffer* and acetonitrile (750 : 250).

Standard stock solution—Quantitatively dissolve accurately weighed quantities of USP Desosaminylazithromycin RS, USP *N*-Demethylazithromycin RS, and USP Azithromycin RS with acetonitrile to obtain a solution having known concentrations of about 45 µg per mL, 105 µg per mL, and 160 µg per mL, respectively.

Standard solution—Transfer 4.0 mL of the *Standard stock solution* to a 200-mL volumetric flask, dilute with *Dilution solution* to volume, and mix. This solution contains known concentrations of USP Desosaminylazithromycin RS, USP *N*-Demethylazithromycin RS, and USP Azithromycin RS of about 0.9 µg per mL, 2.1 µg per mL, and 3.2 µg per mL, respectively.

Test solution—Transfer about 33 mg of Azithromycin, accurately weighed, to a 100-mL volumetric flask, add 5 mL of acetonitrile, and sonicate for about 20 seconds to dissolve. Dilute with *Dilution solution* to volume, and mix. [NOTE—Use this solution within 6 hours.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with an amperometric electrochemical detector with dual glassy carbon electrodes operated in the oxidative screen mode with electrode 1 set at +0.70 ± 0.05 V and electrode 2 set at +0.85 ± 0.05 V , and the background current optimized to 95 ± 25 nanoamperes, a 4.6-mm × 5-cm guard column that contains 5-µm packing L29, and a 4.6-mm × 15-cm analytical column that contains 5-µm packing L29 or 3-µm packing L49 without the guard column. [NOTE—In general, maintain electrode 1 at 0.12 V less than electrode 2, and maintain the electrodes at a constant temperature of about 26°.] The flow rate is about 0.4 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 1500 theoretical plates for the azithromycin peak; the tailing factor for each of these compounds is not more than 1.5; and the relative standard deviation for replicate injections is not more than 5% for each of these compounds. [NOTE—For the purpose of identification, the relative retention times are about 0.38 for desosaminylazithromycin, 0.54 for *N*-demethylazithromycin, and 1.0 for azithromycin]

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, using an elution period for the *Test solution* that is 3.3 times the elution time of the azithromycin peak in the chromatogram of the *Standard solution,* and measure the areas for all of the peaks. Calculate the percentages of desosaminylazithromycin and *N*-demethylazithromycin in the Azithromycin taken by the formula:

$$0.1(CP/W)(r_i/r_S)$$

in which C is the concentration, in µg per mL, of the appropriate USP Reference Standard in the *Standard solution; P* is the designated potency, in percentage, of the relevant USP Reference Standard; W is the weight, in mg, of Azithromycin taken to prepare the *Test solution;* and r_i and r_S are the peak area responses for the relevant analyte in the chromatograms obtained from the *Test solution* and the *Standard solution*, respectively. Calculate the percentages of other related substances in the Azithromycin taken by the formula:

$$0.01(CP/W)(r_i/r_S)$$

in which C is the concentration, in µg per mL, of USP Azithromycin RS in the *Standard solution; P* is the designated purity, in µg per mg, of USP Azithromycin RS; W is the weight, in mg, of Azithromycin taken to prepare the *Test solution;* r_i is the peak area response for an individual related substance peak in the chromatogram obtained from the *Test solution;* and r_S is the peak area response for the azithromycin peak in the chromatogram obtained from the *Standard solution*. Not more than 0.3% of desosaminylazithromycin, 0.7% of *N*-demethylazithromycin, and 1.0% of any other individual related substance is found; and the sum of all related substances is not more than 3.0%.

■TEST 2—

Phosphate buffer solution—Dissolve about 8.7 g of dibasic potassium phosphate in 1 L of water, adjust with 20% phosphoric acid to a pH of 8.2, and mix.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and *Phosphate buffer solution* (6 : 4). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution 1—Dissolve an accurately weighed quantity of USP Azithromycin RS in *Mobile phase,* and quantitatively dilute to obtain a solution having a known concentration of about 35 µg per mL.

Standard solution 2—Prepare a solution in *Mobile phase* containing about 7 mg of USP Azithromycin Identity RS per mL.

Standard solution 3—Prepare a solution in *Mobile phase* containing about 14 µg of USP Azithromycin-*N*-oxide RS per mL.

Test solution—Transfer about 70.0 mg of Azithromycin, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

System suitability solution—Prepare a solution in *Mobile phase* containing about 0.07 mg of USP Azaerythromycin A RS and 7 mg of USP Azithromycin RS per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 0.9 mL per minute. The column temperature is maintained at 30°. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between azaerythromycin A and azithromycin is not less than 8.0;

and the tailing factor for the azithromycin peak is not more than 2.5. [NOTE—For the purpose of identification, the relative retention times are about 0.47 for azaerythromycin A and 1.00 for azithromycin.]

Procedure—Separately inject equal volumes (about 50 µL) of *Standard solution 1, Standard solution 2, Standard solution 3, Test solution,* and *Mobile phase* into the chromatograph, record the chromatograms, identify the peaks in the chromatogram of the *Test solution* by comparison with the chromatograms obtained from *Standard solution 2* and *Standard solution 3,* and measure the peak area responses. Disregard any peak due to the solvent front and any peak corresponding to those obtained from the *Mobile phase*. Calculate the percentage of each impurity in the portion of Azithromycin taken by the formula:

$$(CP/W)(1/F)(r_i/r_S)$$

in which C is the concentration, in mg per mL, of USP Azithromycin RS in *Standard solution 1; P* is the designated purity, in µg per mg, of USP Azithromycin RS; W is the weight, in mg, of Azithromycin taken to prepare the *Test solution; F* is the relative response factor (see *Table 1*); r_i is the peak area response for each impurity obtained from the *Test solution;* and r_S is the peak area response for azithromycin obtained from *Standard solution 1*. The impurities meet the limits specified in *Table 1*.

Table 1

Compound	Relative Retention Time	Relative Response Factor	Limit (w/w, %)
Azithromycin-*N*-oxide	0.20	0.45	0.40
3′-(*N,N*-didemethyl)-3′-*N*-formyl-azithromycin	0.26	1.8	0.30
3′-*N*-demethyl-3′-*N*-formylazithromycin (rotamer 1)	0.34	4.1	0.15
3′-*N*-demethyl-3′-*N*-formylazithromycin (rotamer 2)	0.37	4.1	0.15
6-Demethylazithromycin (azaerythromycin A)	0.47	0.67	0.50
3′-De(dimethylamino)-3′-oxoazithromycin	0.80	1.9	0.25
2-Desethyl-2-propylazithromycin	1.52	1.0	0.50
3-Deoxyazithromycin (azithromycin B)	1.60	1.0	0.50
3′-*N*-demethyl-3′-*N*-[(4-methylphenyl)sulfonyl]azithromycin	2.14	7.0	0.50
Individual unknown impurity	—	1.0	0.20
Total impurities	—	—	2.0

■1S (*USP30*)

In-Process Revision

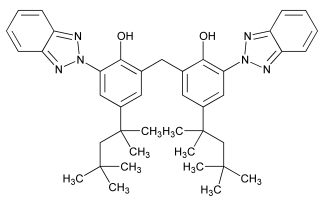
BRIEFING

Bisoctrizole. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on validated methods, is being proposed. The liquid chromatographic procedures in the tests for *Related compounds* and *Limit of bisoctrizole related compound A and the bisoctrizole isomer* and the *Assay* are based on analyses performed with a Nucleosil brand of L1 column. The typical retention time for bisoctrizole is about 24 minutes.

(MD-OOD: C. Anthony; NOM: L. Paul) RTS—41734-1

Add the following:

■Bisoctrizole



$C_{41}H_{50}N_6O_2$ 658.90

Phenol, 2,2′-methylenebis[6-(2*H*-benzotriazol-2-yl)-4-(1,1,3,3-tetramethylbutyl)]-.

2,2′-Methylenebis[6-(2*H*-benzotriazol-2-yl)-4-(1,1,3,3-tetramethylbutyl)phenol] [*103597-45-1*].

» Bisoctrizole contains not less than 96.0 percent and not more than 102.0 percent of $C_{41}H_{50}N_6O_2$, calculated on the as-is basis.

Packaging and storage—Preserve in well-closed containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩**—***USP Bisoctrizole RS. USP Bisoctrizole Related Compound A RS. USP Bisoctrizole Resolution Mixture RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Heavy metals, *Method II* ⟨231⟩**:** 0.002%.

Limit of bisoctrizole related compound A and the bisoctrizole isomer—

Diluent, Solution A, Solution B, and *Mobile phase*—Proceed as directed in the *Assay.*

Standard stock solution A—Dissolve an accurately weighed quantity of USP Bisoctrizole RS in tetrahydrofuran to obtain a solution having a known concentration of about 0.65 mg per mL.

Standard stock solution B—Dissolve an accurately weighed quantity of USP Bisoctrizole Related Compound A RS in tetrahydrofuran to obtain a solution having a known concentration of about 0.40 mg per mL.

Standard solution—Quantitatively transfer 5 mL of *Standard stock solution A* and 1.0 mL of *Standard stock solution B* to a 100-mL volumetric flask. Add 60 mL of tetrahydrofuran, and dilute with *Diluent* to volume.

Test solution—Proceed as directed for *Assay preparation.*

Chromatographic system—Proceed as directed in the *Assay.* Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure*: the resolution, *R,* between bisoctrizole and the bisoctrizole isomer is not less than 1.5. [NOTE—For identification purposes, the relative retention times are about 0.42 for bisoctrizole related compound A and about 1.1 for the bisoctrizole isomer.]

Procedure—Inject a volume (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of bisoctrizole related compound A taken by the formula:

$$10{,}000(C/W)(r_U/r_S)$$

In-Process Revision

in which C is the concentration, in mg per mL, of USP Bisoctrizole Related Compound A RS; W is the weight, in mg, of Bisoctrizole taken; r_U is the peak response for bisoctrizole related compound A in the *Test solution;* and r_S is the peak response for bisoctrizole related compound A in the *Standard solution:* not more than 0.5% of bisoctrizole related compound A is found. Calculate the percentage of the bisoctrizole isomer taken by the formula:

$$10{,}000(C/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Bisoctrizole RS; W is the weight, in mg, of Bisoctrizole taken; r_U is the peak response for the bisoctrizole isomer in the *Test solution;* and r_S is the peak response for bisoctrizole in the *Standard solution:* not more than 4.0% of the bisoctrizole isomer is found.

Related compounds—

Diluent, Solution A, Solution B, Mobile phase, and *Chromatographic system*—Proceed as directed in the *Assay.*

Test solution—Proceed as directed for the *Assay preparation.*

Procedure—Inject a volume (about 10 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure all the peak responses. Calculate the percentage of each impurity in the portion of Bisoctrizole taken by the formula:

$$100(r_i/r_s)$$

in which r_i is the peak response for each individual impurity, and r_s is the sum of the responses of all the peaks: not more than 0.1% of any individual impurity, excluding bisoctrizole related compound A and the bisoctrizole isomer, is found. Not more than 4.0% of total impurities, including bisoctrizole related compound A, and the bisoctrizole isomer, determined in the test for *Limit of bisoctrizole related compound A and the bisoctrizole isomer,* is found.

Limit of residual solvents—

Standard addition solution—Transfer 21 mg of methanol, 42 mg of 2-propanol, and 104 mg of xylene to a 100-mL volumetric flask, dilute with 1,2,4-trichlorobenzene to volume, and mix. Pipet 4.0 mL of this solution into a 25-mL volumetric flask, dilute with 1,2,4-trichlorobenzene to volume, and mix.

Standard solution 1—Transfer 3 mL of *Standard addition solution* to a 20-mL headspace vial.

Standard solution 2—In a 20-mL headspace vial, dissolve 1000 mg of bisoctrizole, accurately weighed, in 3 mL of *Standard addition solution.* [NOTE—The 3 mL of *Standard addition* solution contains about 100 µg of methanol, 200 µg of 2-propanol, and 500 µg of xylene.]

Test solution—In a 20-mL headspace vial, dissolve 1000 mg of Bisoctrizole, accurately weighed, in 3 mL of 1,2,4-trichlorobenzene.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a headspace injector and a flame-ionization detector, and contains a 0.32-mm × 30-m column coated with a 5-µm film of liquid phase G27. The carrier gas is helium, flowing at a rate of 1.5 mL per minute. The split ratio is (2 : 1). Vials containing *Standard solution 1, Standard solution 2,* and the *Test solution* are equilibrated for 60 minutes at 95° in the headspace sampler. The chromatograph is programmed as follows. Initially the temperature of the column is maintained at 40° for 5 minutes, then the temperature is increased at a rate of 12° per minute to 250° and held at 250° for 5 minutes. The injection port temperature and the detector temperature are maintained at 250°. Chromatograph *Standard solution 1,* and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 10.0% for each of the three solvents.

Procedure—Separately inject equal volumes (about 1 mL) of the gaseous headspace of *Standard solution 2* and the *Test solution* into the chromatograph, record the chromatograms,

and measure the responses for the major peaks. Calculate the content of methanol, 2-propanol, and xylene, in ppm, in the portion of Bisoctrizole taken by the formula:

$$C[r_U/(r_S - r_U)]$$

in which C is the concentration, in µg, of solvent per mL of *Standard solution 1;* r_U is the peak response of the individual solvent in the *Test solution;* and r_S is the peak response of the individual solvent in *Standard solution 2:* not more than 1000 ppm of 2-propanol, 3000 ppm of methanol, and 1000 ppm of xylene is found. [NOTE—For identification purposes, the relative retention times are about 0.44 for 2-propanol and about 0.25 for methanol. The peak area of xylene is the sum of the peak areas for the individual *o*-, *m*-, and *p*-xylene isomers and ethylbenzene. For identification purposes, the relative retention times for the *o-, m-,* and *p*-xylene isomers and ethylbenzene are about 1.03, 1.0, 1.0, and 0.99, respectively.]

Assay—

Diluent—Prepare a mixture containing tetrahydrofuran and a 0.2% (w/v) aqueous solution of 1-pentane sulfonic acid sodium salt (60 : 40).

Solution A—Prepare a filtered and degassed solution containing 0.4 g of 1-pentane sulfonic acid sodium salt, 800 mL of methanol, 200 mL of water, and 0.5 mL of phosphoric acid.

Solution B—Prepare a filtered and degassed solution containing 0.4 g of 1-pentane sulfonic acid sodium salt, 1000 mL of methanol, and 0.5 mL of phosphoric acid.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve an accurately weighed quantity of USP Bisoctrizole Resolution Mixture RS in tetrahydrofuran, and dilute quantitatively with *Diluent* to obtain a solution having a known concentration of about 0.8 mg per mL of bisoctrizole.

Standard preparation—Transfer about 80 mg of USP Bisoctrizole RS, accurately weighed, to a 100-mL volumetric flask. Dissolve in 60 mL of tetrahydrofuran, dilute with *Diluent* to volume, and mix.

Assay preparation—Transfer about 80 mg of Bisoctrizole, accurately weighed, to a 100-mL volumetric flask. Dissolve in 60 mL of tetrahydrofuran, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 346-nm detector and a 3.0-mm × 25-cm column that contains packing L1. The flow rate is about 0.8 mL per minute. The column temperature is maintained at 40°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–1	70	30	isocratic
1–11	70→3	30→97	linear gradient
11–27	3	97	isocratic
27–28	3→70	97→30	linear gradient

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.0 for bisoctrizole and 1.1 for the bisoctrizole isomer; the resolution, *R,* between bisoctrizole and the bisoctrizole isomer is not less than 1.5; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure

the responses for the major peaks. Calculate the quantity, in mg, of $C_{41}H_{50}N_6O_2$ in the portion of Bisoctrizole taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Bisoctrizole RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP30*)

BRIEFING

Bupropion Hydrochloride Extended-Release Tablets, *USP 29* page 322. It is proposed to include the instructions on how to prepare the *Medium* in *Test 2* under *Drug release* and *Dissolution*. Also, in both sections, it is proposed to add a new test for the product with a dosing every 24 hours and to categorize the tests according to the dosing interval, 12 hours or 24 hours.

Drug release ⟨724⟩—

■FOR PRODUCTS LABELED FOR DOSING EVERY 12 HOURS—■1S (*USP30*)

TEST 1—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Times: 1, 4, and 8 hours.

Procedure—Determine the amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 298 nm, using a 1.0-cm cell, on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Bupropion Hydrochloride RS in the same *Medium.*

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 1*.

Time (hours)	Amount dissolved
1	between 25% and 45%
4	between 60% and 85%
8	not less than 80%

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 2.*

Medium: 0.1 N hydrochloric acid, pH 1.5

■(prepared by transferring about 50 mL of concentrated hydrochloric acid to 6000 mL of water, adding about 18 g of sodium hydroxide, mixing, and adjusting with either diluted sodium hydroxide or hydrochloric acid to a pH of 1.5 ± 0.05.);■1S (*USP30*)

900 mL,

■deaerated.■1S (*USP30*)

Apparatus 1: 50 rpm.

Times: 1, 2, 4, and 6 hours.

Determine the percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved by employing the following method.

Buffer solution—Dissolve 3.45 g of monobasic sodium phosphate monohydrate in 996 mL of water, add 4.0 mL of triethylamine, and mix. Adjust with phosphoric acid to a pH of 2.80 ± 0.05.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and methanol (65 : 35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Bupropion Hydrochloride RS in *Medium,* and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration similar to the one expected in the *Test solution.*

Test solution—Use portions of the solution under test, and pass through a 0.45-µm nylon filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 298-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 2000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of bupropion hydrochloride dissolved at each time point.

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 1*.

Time (hours)	Amount dissolved
1	between 25% and 50%
2	between 40% and 65%
4	between 65% and 90%
6	not less than 80%

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 3.*

Medium, Apparatus, and *Procedure*—Proceed as directed for *Test 1,* except to use the wavelength at about 250 nm.

Times: 1, 2, 4, and 6 hours.

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 1*.

Time (hours)	Amount dissolved
1	between 30% and 55%
2	between 50% and 75%
4	between 70% and 90%
6	not less than 80%

Time: 2, 4, 8, and 16 hours.

Procedure—Determine the amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 252 nm, using a 1.0-cm cell, on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Bupropion Hydrochloride RS in the same *Medium.*

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
2	not more than 20%
4	between 20% and 45%
8	between 65% and 85%
16	not less than 80%

■1S (*USP30*)

(Official April 1, 2006)

In-Process Revision

BRIEFING

Cefaclor Tablets, page 1858 of *PF* 29(6) [Nov.–Dec. 2003]. It is proposed to add a *Dissolution* test to this monograph.

(BPC: M. Marques) RTS—44015-1

Add the following:

■Cefaclor Tablets

» Cefaclor Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of cefaclor ($C_{15}H_{14}ClN_3O_4S$).

Packaging and storage—Preserve in tight containers. Store at 25°, excursions permitted between 15° and 30°.

Labeling—Label chewable Tablets to include the word "chewable" in juxtaposition to the official name. The labeling indicates that chewable Tablets are to be chewed before being swallowed.

USP Reference standards ⟨11⟩—*USP Cefaclor RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Procedure—Determine the amount of cefaclor dissolved by employing UV absorption at the wavelength of maximum absorbance at about 264 nm on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Cefaclor RS in the same *Medium*. Calculate the amount of cefaclor dissolved by the formula:

$$\frac{A_U \times C_S \times 900 \times 100}{A_S \times D \times LC}$$

in which A_U and A_S are the absorbances obtained from the solution under test and the Standard solution, respectively; C_S is the concentration, in mg per mL, of the Standard solution; 900 is the volume, in mL, of *Medium*; 100 is the conversion factor to percentage; D is the dilution factor of the solution under test; and LC is the tablet label claim in mg.

Tolerances—Not less than 80% *(Q)* of the labeled amount of cefaclor is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Water, *Method I* ⟨921⟩**:** not more than 5.0%.

Related compounds—

Solvent, Blank solution, Solution A, Solution B, Mobile phase, Standard solution, System suitability solution, and *Chromatographic system*—Proceed as directed for *Related compounds* under *Cefaclor.*

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the composite, equivalent to about 50 mg of cefaclor, to a 10-mL volumetric flask. Dissolve in *Solvent,* using brief sonication, if necessary, to dissolve. Avoid heating. Dilute with *Solvent* to volume, mix, and filter. [NOTE—Use this *Test solution* within 3 hours if stored at room temperature, or within 20 hours when stored under refrigeration.]

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak area responses for all the peaks. Calculate the quantity, in mg, of each related compound in the portion of Tablets taken by the formula:

$$0.01CP(r_i/r_S)$$

in which the terms are as defined for *Related compounds* under *Cefaclor*. Not more than 1.0% of any individual cefaclor related compound is found; and the sum of all cefaclor related compounds found is not more than 3.0%, not including the contribution of any peak that gives a result of less than 0.1%.

Assay—

Mobile phase, Standard preparation, Resolution solution, and *Chromatographic system*—Proceed as directed in the *Assay* under *Cefaclor.*

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 75 mg of cefaclor, to a 250-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Sonicate, if necessary, to dissolve the cefaclor. Filter to obtain a clear solution.

Procedure—Proceed as directed in the *Assay* under *Cefaclor*. Calculate the quantity, in mg, of cefaclor ($C_{15}H_{14}ClN_3O_4S$) in the portion of Tablets taken by the formula:

$$5W_S(P/1000)(r_U/r_S)$$

in which the terms are as defined therein.■1S (*USP30*)

BRIEFING

Cefadroxil for Oral Suspension, *USP 29* page 404 and page 1045 of *PF* 31(4) [July–Aug. 2005]. It is proposed to add a test for *Dissolution* to this monograph.

(BPC: M. Marques) RTS—42555-1

Add the following:

■**Dissolution** ⟨711⟩—

Medium: water; 900 mL.

Apparatus 2: 25 rpm.

Time: 30 minutes.

Procedure—Accurately weigh 5.0 mL of the constituted Oral Suspension, and transfer to the dissolution vessel. Determine the amount of cefadroxil dissolved by employing UV absorption at the wavelength of maximum absorbance at about 263 nm on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison

with a Standard solution having a known concentration of USP Cefadroxil RS in the same *Medium*. Calculate the amount of cefadroxil dissolved by the formula:

$$\frac{A_U \times C_S \times 900 \times 100}{A_S \times W \times D \times LC}$$

in which A_U and A_S are the absorbances obtained from the solution under test and the Standard solution, respectively; C_S is the concentration, in mg per mL, of the Standard solution; 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; W is the weight, in mg, of the 5 mL of constituted Oral Suspension taken; D is the dilution factor of the solution under test; and LC is the label claim, in mg per 5 mL.

Tolerances—Not less than 75% (Q) of the labeled amount of cefadroxil is dissolved in 30 minutes.■1S (*USP30*)

Change to read:

Water, *Method I* ⟨921⟩**:** not more than 2.0%,

■except where it is labeled as containing 100 mg of cefadroxil per mL after constitution, the limit is not more than 3.0%.■2S (*USP29*)

BRIEFING

Cefepime Hydrochloride, *USP 29* page 409. On the basis of comments from industry indicating difficulties in meeting the system suitability requirements for the tests for *Limit of N-methylpyrrolidine* and *Related compounds,* it is proposed to make revisions that will improve the performance of these tests.

(MD-ANT: B. Gilbert) RTS—43166-1; 43168-1; 43169-1

Change to read:

Limit of *N*-methylpyrrolidine—

Mobile phase—Prepare a filtered and degassed mixture of 0.01 N nitric acid and acetonitrile (100 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

■*Column rinse solution*—Transfer 1.9 mL of nitric acid to a 1-L volumetric flask, add 10 mL of acetonitrile, and mix. Dilute with water to volume, and mix.■1S (*USP30*)

Standard solution—Transfer about 0.16 mL of *N*-methylpyrrolidine, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Transfer 4.0 mL of this solution to a 100-mL volumetric flask, dilute with 0.01 N nitric acid to volume, and mix. This solution contains about 0.05 mg of *N*-methylpyrrolidine per mL.

Test solution—Transfer about 100 mg of Cefepime Hydrochloride, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with 0.01 N nitric acid to volume, and mix. [NOTE—Use this solution within 30 minutes.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a conductivity detector and a 4.6-mm × 5-cm column that contains 5-µm packing L52

■and a 4.4-mm × 5-cm guard column, placed between the pump and the injector, that contains packing L17.■1S (*USP30*) The flow rate is about 1 mL per minute.

■The typical background conductance is about 3500 µS.■1S (*USP30*)

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the retention time of *N*-methylpyrrolidine is not less than 8 minutes, and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses for *N*-methylpyrrolidine. Calculate the percentage of *N*-methylpyrrolidine in the portion of Cefepime Hydrochloride taken by the formula:

$$1000(C/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of *N*-methylpyrrolidine in the *Standard solution; W* is the quantity, in mg, of Cefepime Hydrochloride taken to prepare the *Test solution;* and r_U and r_S are the *N*-methylpyrrolidine peak responses obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.3% is found.

■[NOTE—Cefepime from the *Test solution* elutes as a broad peak at about 55 minutes. To minimize equilibration time at the start of the next day, it is recommended that the detector be turned on the night before and that *Mobile phase* be pumped through the system overnight at a flow rate of 0.2 mL per minute. After every third sample injection, it is recommended that the chromatograph be flushed with *Column rinse solution* for 60 minutes at a flow rate of 1 mL per minute to remove cefepime from the column; and that the system then be switched back to *Mobile phase* at a flow rate of 1 mL per minute for reequilibration.]■1S (*USP30*)

Change to read:

Related compounds—

Potassium phosphate solution—Dissolve 0.68 g of monobasic potassium phosphate in 1000 mL of water.

In-Process Revision

Solution A—Prepare a mixture of *Potassium phosphate solution* and acetonitrile (9 : 1). ~~Adjust with a potassium hydroxide solution (2 in 100) to a pH of 5.0, filter, and degas.~~

■Adjust with potassium hydroxide or phosphoric acid to a pH of 5.0, filter, and degas.■1S (*USP30*)

Solution B—Prepare a mixture of *Potassium phosphate solution* and acetonitrile (1 : 1). ~~Adjust with a potassium hydroxide solution (2 in 100) to a pH of 5.0, filter, and degas.~~

■Adjust with potassium hydroxide or phosphoric acid to a pH of 5.0, filter, and degas.■1S (*USP30*)

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Prepare a solution of USP Cefepime Hydrochloride System Suitability RS in *Solution A* containing about 1.4 mg per mL.

Test solution—Transfer about 70 mg of Cefepime Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Solution A* to volume, sonicate, and mix. [NOTE—Inject this solution immediately, or store in a refrigerator and inject within 12 hours.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–10	100	0	isocratic
10–30	100→50	0→50	linear gradient
30–35	50	50	isocratic
35–36	50→100	50→0	linear gradient

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* ~~the relative retention times are about 2.7 for cefepime related compound A, 4.3 for cefepime related compound B, and 1.0 for cefepime; and~~

■■1S (*USP30*)
the resolution, *R,* between cefepime and cefepime related compound A is not less than 5, and that between cefepime related compound A and cefepime related compound B is not less than 10. Chromatograph the *Test solution,* and record the peak responses as directed for *Procedure:* the capacity factor, *k′,* is more than 0.6; the column efficiency is not less than 4000 theoretical plates; and the tailing factor is not more than ~~1.1~~

■1.5. [NOTE—For the purpose of identification, the relative retention times are about 1.0 for cefepime, 2.7 for cefepime related compound A, and about 4.3 for cefepime related compound B.]■1S (*USP30*)

Procedure—Inject a volume (about 10 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Cefepime Hydrochloride taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each impurity; and r_s is the sum of the responses for all the peaks: not more than 0.3% of cefepime related compound A is found; not more than 0.2% of cefepime related compound B is found; and not more than 0.1% of any other impurity is found.

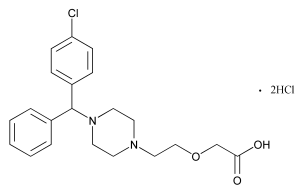
BRIEFING

Cetirizine Hydrochloride. Because there is no existing *USP* monograph for this drug substance, a new monograph is being proposed. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with the Hypersil Silica brand of L3 column. The typical retention time for cetirizine is about 10 minutes.

(MD-PS: D. Bempong) RTS—43595-1; 43753-1

Add the following:

■Cetirizine Hydrochloride



$C_{21}H_{25}ClN_2O_3 \cdot 2HCl$ 461.81

(±)-[2-[4-[(4-Chlorophenyl)phenylmethyl]-1-piperazinyl]ethoxy]acetic acid, dihydrochloride.

(±)-[2-[4-(*p*-Chloro-α-phenylbenzyl)-1-piperazinyl]ethoxy]acetic acid, dihydrochloride. [*83881-52-1*].

» Cetirizine Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of $C_{21}H_{25}ClN_2O_3 \cdot 2HCl$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers, protected from light and moisture. Store at room temperature.

USP Reference standards ⟨11⟩—*USP Cetirizine Hydrochloride RS. USP Cetirizine Related Compound A RS.*

Color of solution ⟨631⟩—

Reference solution—Mix 2.5 mL of *Matching Fluid G* and 97.5 mL of dilute hydrochloric acid (10 g per L).

Test solution—Transfer 500 mg of Cetirizine Hydrochloride to a 10-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

In-Process Revision

Procedure—Proceed as directed under *Color and Achromicity* ⟨631⟩: the *Test solution* is not more intensely colored than the *Reference solution*.

Clarity of solution—[NOTE—The *Test solution* is to be compared to *Reference suspension A* in diffused daylight 5 minutes after preparation of *Reference suspension A*.]

Hydrazine sulfate solution—Transfer 1.0 g of hydrazine sulfate to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Allow to stand for 4 to 6 hours before use.

Methenamine solution—Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension—Transfer 25.0 mL of *Hydrazine sulfate solution* to the *Methenamine solution* in the 100-mL glass-stoppered flask. Mix, and allow to stand for 24 hours. [NOTE—This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.]

Opalescence standard—Transfer 15.0 mL of the *Primary opalescent suspension* to a 1000-mL volumetric flask, dilute with water to volume, and mix. [NOTE—This suspension should not be used beyond 24 hours after preparation.]

Reference suspension A—Transfer 5.0 mL of the *Opalescence standard* to a 100-mL volumetric flask, dilute with water to volume, and mix.

Test solution—Prepare as directed under *Color of solution*.

Procedure—Transfer a sufficient portion of the *Test solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15 to 25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Reference suspension A* and water to separate matching test tubes. Compare the *Test solution, Reference suspension A,* and water in diffused daylight, viewing vertically against a black background (see *Visual Comparison* under *Spectrophotometry and Light-Scattering* ⟨851⟩). [NOTE—The diffusion of light must be such that *Reference suspension A* can readily be distinguished from water.] The clarity of the *Test solution* is not more than that of *Reference suspension A*.

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: It meets the requirements of the test for *Chloride* ⟨191⟩.

pH ⟨791⟩**:** between 1.2 and 1.8, in an aqueous solution 1 in 20.

Loss on drying ⟨731⟩—Dry it at 105° to constant weight: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Heavy metals, *Method I* ⟨231⟩**:** not more than 0.001%.

Related compounds—

Mobile phase—Proceed as directed in the *Assay.*

System suitability solution—Dissolve an accurately weighed quantity of USP Cetirizine Hydrochloride RS and USP Cetirizine Related Compound A RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having concentrations of about 4 µg per mL of USP Cetirizine Hydrochloride RS and about 4 µg per mL of USP Cetirizine Related Compound A RS.

Standard solution—Dissolve an accurately weighed quantity of USP Cetirizine Hydrochloride RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.5 µg per mL.

Test solution—Prepare as directed for the *Assay preparation* in the *Assay.*

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay.* Chromatograph the *System suitability solution* and record the peak responses as directed for *Procedure:* the resolution, *R,* between cetirizine related compound A and cetirizine is not less than 2.0; and the tailing factor for the cetirizine peak is not more than 2.0. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

In-Process Revision

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. [NOTE—Record the chromatogram of the *Test solution* for a period of time equivalent to 3 times the retention time of cetirizine.] Calculate the percentage of each related compound in the portion of Cetirizine Hydrochloride taken by the formula:

$$0.1C_S / C_U(1/F)(r_i / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Cetirizine Hydrochloride RS in the *Standard solution;* C_U is the concentration, in mg per mL, of Cetirizine Hydrochloride in the *Test solution;* F is the relative response factor as indicated in *Table 1;* r_i is the peak response of each impurity obtained from the *Test solution;* and r_S is the peak response of of cetirizine obtained from the *Standard solution.* The limits of impurities are as specified in *Table 1*.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, water, and 1 M sulfuric acid (93 : 6.6 : 0.4). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Cetirizine Hydrochloride RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.5 mg per mL.

Assay preparation—Transfer about 50 mg of Cetirizine Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L3. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as

Table 1

Compound Name	Approximate Relative Retention Time	Relative Response Factor (*F*)	Limit (%)
4-CBH[1]	0.3	1.4	0.1
Dimer[2]	0.5	1.8	0.1
2-Chlorocetirizine[3]	0.85	0.49	0.1
Cetirizine related compound A[4]	0.9	0.95	0.1
Cetirizine	1.0	—	—
Deschlorocetirizine[5]	1.4	0.45	0.1
CBHP[6]	1.45	1.6	0.1
Individual unknown	—	1.0	0.1
Total	—	—	0.3

[1] 4-Chlorobenzhydrol
[2] 1,4-Bis[(4-chlorophenyl)phenylmethyl]piperazine
[3] (RS)-2-[2-[4-[(2-Chlorophenyl)phenylmethyl]piperazin-1-yl]ethoxy]acetic acid
[4] (RS)-2-[2-[4-[(4-Chlorophenyl)phenylmethyl]piperazin-1-yl]ethoxy]acetic acid, ethyl ester (Cetirizine Ethyl Ester)
[5] (RS)-2-[2-[4-(Diphenylmethyl]piperazin-1-yl]ethoxy]acetic acid
[6] (RS)-1-[(4-Chlorophenyl)phenylmethyl]piperazine

directed for *Procedure:* the tailing factor for the cetirizine peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the cetirizine peaks. Calculate the quantity, in mg, of $C_{21}H_{25}ClN_2O_3 \cdot 2HCl$ in the portion of Cetirizine Hydrochloride taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cetirizine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP30*)

BRIEFING

Cholestyramine Resin, *USP 29* page 503. It is proposed to update the information regarding suitable cellulose dialysis tubing in the footnote under the test for *Dialyzable quaternary amines,* and provide a clarification regarding its molecular weight.

(MD-GRE: E. Gonikberg) RTS—44050-1

In-Process Revision

Change to read:

Dialyzable quaternary amines—

pH 9.2 Buffer—Transfer 3.80 g of sodium borate decahydrate to a 1000-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Bromothymol blue solution—Transfer 150 mg of bromothymol blue and 405 mg of sodium carbonate to a 100-mL volumetric flask, dilute with water to volume, and mix.

Standard solution—Take 1 mL of 60% benzyltrimethylammonium chloride solution, accurately pipeted, and dilute quantitatively, and stepwise, with water to obtain a stock solution having a concentration of 0.2 ± 0.01 mg per mL [NOTE—Prepare this solution fresh]. Cut a 20- to 25-cm piece of cellulose dialysis tubing* having a molecular weight cut-off ~~of 6,000 to 14,000~~

■that falls within the 6,000 to 14,000 range■1S (*USP30*) and a dry flat width of 5 to 9 cm, and place it in water to hydrate until pliable, appropriately sealing one end. Pipet 5 mL of the stock solution into the tubing, add 5 mL of water, appropriately seal the open end, place the tube in a suitable vessel containing 100 mL of water so that it is completely immersed in the water, and stir the fluid for 16 hours to effect dialysis.

Test solution—Cut a 20- to 25-cm piece of cellulose dialysis tubing* having a molecular weight cut-off ~~of 6,000 to 14,000~~

■that falls within the 6,000 to 14,000 range■1S (*USP30*) and a dry flat width of 5 to 9 cm, and place it in water to hydrate until pliable, appropriately sealing one end. Weigh 2 ± 0.01 g of Cholestyramine Resin, and carefully transfer the specimen into the tubing, taking care to ensure that none adheres to the upper walls of the tubing. Add 10 mL of water to the contents of the tube, appropriately seal the open end, and place the tube in a suitable vessel containing 100 mL of water so that it is completely immersed in the water. Stir the fluid for 16 hours to effect dialysis.

Procedure—Pipet the following into each of three separators: separator 1: 5 mL of *Standard solution,* 5 mL of *pH 9.2 Buffer,* 1 mL of *Bromothymol blue solution,* and 10 mL of chloroform; separator 2: 5 mL of *Test solution,* 5 mL of *pH 9.2 Buffer,* 1 mL of *Bromothymol blue solution,* and 10 mL of chloroform; separator 3: 5 mL of water, 5 mL of *pH 9.2 Buffer,* 1 mL of *Bromothymol blue solution,* and 10 mL of chloroform. Shake each separator, vigorously, for 1 minute, allow the phases to separate until the chloroform phase is clear, and collect the chloroform extracts in separate 25-mL volumetric flasks. Repeat the extraction process with a second 10-mL portion of chloroform, and combine with the previous extracts. Dilute each solution with chloroform to volume, if necessary, and mix. Concomitantly determine the absorbances of the *Test solution* and the *Standard solution* at the wavelength of maximum absorbance at about 420 nm, with a suitable spectrophotometer, using the solution from separator 3 as the blank: the absorbance of the *Test solution* does not exceed that of the *Standard solution* (0.05% as benzyltrimethylammonium chloride).

BRIEFING

Ciprofloxacin, *USP 29* page 516; **Ciprofloxacin Hydrochloride,** *USP 29* page 517. On the basis of supporting data and comments received, it is proposed to make several changes as follows:

1. Omit the reference to the *Standard preparation* in the *Chromatographic purity* test, because it is not used in this test.
2. In the *Assay,* change the *Resolution solution* to a more appropriate set of concentrations, approximately 0.5% w/w relative to Ciprofloxacin, for examining system suitability, because these concentrations more closely approximate the limit of analog in ciprofloxacin.
3. In the *Assay,* change the column dimensions for the *Chromatographic system* to reflect the column used for the procedure.

* ~~A suitable tubing is Visking No. C65, available from Union Carbide Corp., Films Packaging Div., 6733 West 65th St., Chicago, IL 60638, or Spectrapor 1, available from various laboratory supply houses, or equivalent.~~

■A suitable tubing is Spectra/Por 1, Item # 132 665, available from Spectrum Laboratories, Inc. (www.spectrapor.com), or equivalent.■1S (*USP30*)

4. In the *Procedure* in the *Assay,* make the tailing factor for the ciprofloxacin peak more restrictive. Additionally, include the relative retention times for the system suitability criteria as a *Note* for the purpose of identification rather than for the system suitability requirement. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 25-cm Prodigy ODS-3 (Phenomenax) brand of L1 column. Typical retention times are about 7.8 minutes for ciprofloxacin and about 5.5 minutes for ciprofloxacin ethylenediamine analog.

(MD-AA: B. Davani) RTS—44060-1

Change to read:

Chromatographic purity—

Mobile phase, ~~*Standard preparation,*~~

■■1S (*USP30*)
Resolution solution, Assay preparation, and *Chromatographic system*—Prepare as directed in the *Assay.*

Procedure—Proceed as directed for *Procedure* in the *Assay.* Calculate the percentage of each impurity peak in the chromatogram obtained from the *Assay preparation* taken by the formula:

$$100r_i / r_t$$

in which r_i is the response of each impurity peak; and r_t is the sum of the responses of all the peaks: not more than 0.2% of ciprofloxacin ethylenediamine analog or any other individual impurity peak is found; and the sum of all the impurity peaks is not more than 0.5%.

Change to read:

Assay—

Mobile phase—Prepare a filtered and degassed mixture of 0.025 M phosphoric acid, previously adjusted with triethylamine to a pH of 3.0 ± 0.1, and acetonitrile (87 : 13). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer about 12.5 mg of USP Ciprofloxacin RS, accurately weighed, to a 25-mL volumetric flask. Add 0.1 mL of 7% phosphoric acid, dilute with *Mobile phase* to volume, and mix.

Resolution solution—~~Dissolve a quantity of USP Ciprofloxacin Ethylenediamine Analog RS in the *Standard preparation* to obtain a solution containing about 0.5 mg per mL.~~

■Prepare a 0.025 mg per mL solution of USP Ciprofloxacin Ethylenediamine Analog RS in *Mobile phase.* Transfer 1.0 mL of this solution to a 10-mL volumetric flask, dilute with *Standard preparation* to volume, and mix.■1S (*USP30*)

Assay preparation—Transfer about 25 mg of Ciprofloxacin, accurately weighed, to a 50-mL volumetric flask. Add 0.2 mL of 7% phosphoric acid, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 278-nm detector and a ~~4-mm × 25-cm~~

■4.6-mm × 25-cm■1S (*USP30*)
column that contains packing L1 and is maintained at a temperature of 30 ± 1°. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution,* and record the responses as directed for *Procedure:* ~~the retention time for ciprofloxacin is between 6.4 and 10.8 minutes; the relative retention times are about 0.7 for ciprofloxacin ethylenediamine analog and 1.0 for ciprofloxacin; and~~

■■1S (*USP30*)
the resolution, *R,* between ciprofloxacin ethylenediamine analog and ciprofloxacin is not less than 6. Chromatograph the *Standard preparation,* and record the responses as directed for *Procedure:* the column efficiency, determined from the ciprofloxacin peak, is not less than 2500 theoretical plates; the tailing factor for the ciprofloxacin peak is not more than ~~4.0;~~

■2.5;■1S (*USP30*)
and the relative standard deviation for replicate injections is not more than 1.5%.

■[NOTE—For the purpose of identification, the relative retention times are about 0.7 for ciprofloxacin ethylenediamine analog and 1.0 for ciprofloxacin.]■1S (*USP30*)

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $C_{17}H_{18}FN_3O_3$ in the portion of Ciprofloxacin taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Ciprofloxacin RS in the *Standard preparation;* and r_U and r_S are the ciprofloxacin peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Ciprofloxacin and Dexamethasone Otic Suspension. Because there is no existing *USP* monograph for this dosage form, a new monograph based on submitted data is being proposed. The liquid chromatographic procedures in the tests for related compounds and in the assay for each are based on the Symmetry brand of L1 column. The typical retention time for ciprofloxacin formamide is from 3 to 4 minutes, and for ciprofloxacin and dexamethasone is from 8 to 10 minutes.

(MD-AA: B. Davani) RTS—43139-1

Add the following:

■Ciprofloxacin and Dexamethasone Otic Suspension

» Ciprofloxacin and Dexamethasone Otic Suspension is a sterile aqueous suspension containing ciprofloxacin hydrochloride and dexamethasone. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of

ciprofloxacin ($C_{17}H_{18}FN_3O_3$), and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dexamethasone ($C_{22}H_{29}FO_5$).

Packaging and storage—Preserve in tight containers, protected from light. Avoid freezing.

USP Reference standards ⟨11⟩—*USP Ciprofloxacin Ethylenediamine Analog RS. USP Ciprofloxacin Formamide RS. USP Ciprofloxacin Hydrochloride RS. USP Dexamethasone RS. USP Dexamethasone Acetate RS.*

Identification—

A: The chromatogram of the *Assay preparation,* obtained as directed in the *Assay for ciprofloxacin,* exhibits a major peak for ciprofloxacin, the retention time of which corresponds to that obtained in the chromatogram of the *Standard preparation,* obtained as directed in the *Assay for ciprofloxacin*.

B: The chromatogram of the *Assay preparation,* obtained as directed in the *Assay for dexamethasone,* exhibits a major peak for dexamethasone, the retention time of which corresponds to that obtained in the chromatogram of the *Standard preparation,* obtained as directed in the *Assay for dexamethasone*.

Sterility ⟨71⟩—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

pH ⟨791⟩**:** between 3.8 and 4.8.

Particle size—

Carrier fluid—Heat Purified Water to a temperature of 40° to 50°, add 100 mg of dexamethasone per L while stirring, cool to room temperature while stirring, pass through a 0.2-μm filter, and store in a clean, covered container.

Test preparation—Dilute a volume of about 10 μL of Otic Suspension with *Carrier fluid* to 25 mL.

Procedure—(see *Light Obscuration Particle Count Test* under *Particulate Matter in Injections* ⟨788⟩). Analyze the *Test preparation* using an electronic, liquid-borne particle counting system that employs a light obscuration sensor with a suitable sample feeding device. Not less than 99.5% of the particles are $\leq$25 μm, not less than 99.95% are $\leq$50 μm, and not less than 99.995% are $\leq$100 μm.

Osmolality ⟨785⟩**:** between 270 and 330 mOsmol per kg.

Limit of ciprofloxacin formamide—

Buffer—Add 6.0 mL of phosphoric acid to 2.0 L of water. Adjust with 50% sodium hydroxide to a pH of 3.0.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer* and acetonitrile (73 : 27). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Transfer about 25 mg of USP Ciprofloxacin Formamide RS, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume. Transfer 3.0 mL of this solution to a 50-mL volumetric flask and dilute with *Mobile phase* to volume to obtain a solution having a known concentration of about 0.015 mg per mL.

System suitability solution—Transfer about 2.5 mg of USP Dexamethasone RS and about 2.5 mg of USP Ciprofloxacin Formamide RS to a 100-mL volumetric flask. Dissolve in 15 mL of methanol, then dilute with *Mobile phase* to volume.

Test solution—Transfer an accurately weighed portion of freshly mixed Otic Suspension, equivalent to about 6 mg of ciprofloxacin, to a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm × 15-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the column efficiency for ciprofloxacin formamide is not less than 2000 theoretical plates; the resolution, *R,* between ciprofloxacin formamide and dexamethasone is not less than 8; and the tailing factor for ciprofloxacin formamide is not more than 2.0. The relative standard deviation for replicate injections of the *Standard solution* is not more than 2.0%.

In-Process Revision

Procedure— Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the peaks at the retention time of ciprofloxacin formamide. Calculate the percentage of ciprofloxacin formamide in the portion of the Otic Suspension taken by the formula:

$$10(C/VL)(r_U/r_S)100$$

in which C is the concentration, in mg per mL, of USP Ciprofloxacin Formamide RS in the *Standard solution; V* is the volume, in mL, of Otic Suspension taken; L is the labeled amount, in mg per mL, of ciprofloxacin; and r_U and r_S are the ciprofloxacin formamide peak responses obtained from the *Test solution* and the *Standard solution,* respectively. Ciprofloxacin formamide is not more than 0.5% of the labeled amount of ciprofloxacin.

Ciprofloxacin related compounds—

Procedure—From the chromatogram of the *Assay preparation,* obtained as directed in the *Assay for ciprofloxacin,* measure the responses for the ciprofloxacin ethylenediamine analog and the other minor peaks. Calculate the percentage of each related compound in the portion of Otic Suspension taken by the formula:

$$25(C/V)(r_U/r_S)100/FL$$

in which C is the concentration, in mg per mL, of USP Ciprofloxacin Hydrochloride RS in the *Dilute standard preparation,* calculated on the anhydrous basis; V is the volume, in mL, of Otic Suspension taken; r_U and r_S are the related compound peak responses obtained from the *Assay preparation* and the ciprofloxacin peak response obtained from the *Dilute standard preparation,* respectively; F is the relative response factor (1.3 for ciprofloxacin ethylenediamine analog and 1.0 assumed for all other degradation products); and L is the labeled amount, in mg per mL, of ciprofloxacin. The ciprofloxacin ethylenediamine analog is not more than 0.4% of the labeled amount of ciprofloxacin. No other single related compound is greater than 0.2%, and the sum of all related compounds found is not more than 0.8%.

Dexamethasone related compounds—

Procedure—From the chromatogram of the *Assay preparation,* obtained as directed in the *Assay for dexamethasone,* measure the responses for the 21-dehydro-17-deoxy related compound, the 20-carboxy-17-desoxy related compound, and other minor peaks. Calculate the percentage of each related compound in the portion of the Otic Suspension taken by the formula:

$$10(C/VL)(r_U/r_S)100$$

in which C is the concentration, in mg per mL, of USP Dexamethasone RS in the *Dilute standard preparation; V* is the volume, in mL, of Otic Suspension taken; L is the labeled amount, in mg per mL, of dexamethasone; and r_U and r_S are the related compound peak responses obtained from the *Assay preparation* and the dexamethasone peak response obtained from the *Dilute standard preparation,* respectively. The 21-dehydro-17-deoxy related compound is not more than 0.6%, the 20-carboxy-17-desoxy related compound is not more than 2.6%, no other related compound is greater than 0.3%, and the sum of all related compounds found is not more than 3.0%. [NOTE—Identification of known related compounds is accomplished by measuring relative retention times versus dexamethasone. The relative retention times are about 1.4 to 1.6 for the 21-dehydro-17-deoxy related compound and about 2.8 to 3.2 for the 20-carboxy-17-desoxy related compound.]

Assay for ciprofloxacin—

Buffer—Add 6.0 mL of phosphoric acid and 8 g of diethylamine phosphate to 2.0 L of water. Adjust with 50% sodium hydroxide to a pH of 3.0.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer* and acetonitrile (89 : 11). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Accurately weigh about 37 mg of USP Ciprofloxacin Hydrochloride RS into a 25-mL volumetric flask, dissolve in and dilute with 0.1 N hydrochloric acid to volume. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume to obtain a solution having a known concentration of about 0.13 mg of ciprofloxacin per mL.

Dilute standard preparation—Transfer 2.0 mL of the *Standard preparation* to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution having a known concentration of about 0.0025 mg of ciprofloxacin per mL.

System suitability solution—Weigh about 1 mg of USP Ciprofloxacin Hydrochloride RS and 1 mg of USP Ciprofloxacin Ethylenediamine Analog RS into a 25-mL volumetric flask, and dilute with *Mobile phase* to volume. Transfer 2.0 mL of this solution to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

Assay preparation—Transfer an accurately weighed portion of freshly mixed Otic Suspension, equivalent to about 3 mg of ciprofloxacin, to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm × 15-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between ciprofloxacin and the ciprofloxacin ethylenediamine analog is not less than 3.0; the column efficiency for ciprofloxacin is not less than 2500 theoretical plates; and the tailing factor for ciprofloxacin is not more than 2.0. The relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%; and the relative standard deviation for replicate injections of the *Dilute standard preparation* is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of ciprofloxacin ($C_{17}H_{18}FN_3O_3$) in each mL of the Otic Suspension taken by the formula:

$$(331.34/367.81)(25C/V)(r_U/r_S)$$

in which 331.34 and 367.81 are the molecular weights of ciprofloxacin and anhydrous ciprofloxacin hydrochloride, respectively; C is the concentration, in mg per mL, of USP Ciprofloxacin Hydrochloride RS in the *Standard preparation,* calculated on the anhydrous basis; V is the volume, in mL, of Otic Suspension taken; and r_U and r_S are the ciprofloxacin peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Assay for dexamethasone—

Buffer and *Mobile phase*—Prepare as directed under *Limit of ciprofloxacin formamide.*

Standard preparation—Transfer about 50 mg of USP Dexamethasone RS, accurately weighed, to a 25-mL volumetric flask, dilute with acetonitrile to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. This solution contains about 0.2 mg of USP Dexamethasone RS per mL.

Dilute standard preparation—Transfer 2.0 mL of the *Standard preparation* to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. This solution contains about 0.004 mg of USP Dexamethasone RS per mL.

System suitability solution—Transfer about 2 mg of USP Dexamethasone RS and about 2 mg of USP Dexamethasone Acetate RS to a 10-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Assay preparation—Transfer an accurately weighed portion of freshly mixed Otic Suspension, equivalent to about 2 mg of dexamethasone, to a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 15-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the column efficiency for dexamethasone is not less than 2000 theoretical plates; the resolution, *R,* between dexamethasone and dexamethasone acetate is not less than 12; the tailing factor for dexamethasone is not more than 2.0; the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%; and the relative standard deviation for replicate injections of the *Dilute standard preparation* is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of dexamethasone ($C_{22}H_{29}FO_5$) in each mL of the Otic Suspension taken by the formula:

$$10(C/V)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Dexamethasone RS in the *Standard preparation; V* is the volume, in mL, of Otic Suspension taken; and r_U and r_S are the dexamethasone peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP30*)

BRIEFING

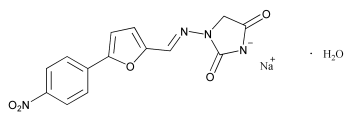
Dantrolene Sodium. Because there is no existing *USP* monograph for this drug substance, a new monograph is being proposed. The liquid chromatographic procedures in the tests for *Related compounds* and *Limit of dantrolene related compound A* and in the *Assay* are based on analyses performed with the Waters Symmetry C18 brand of L1 column. In the test for *Related compounds* and in the *Assay,* the typical retention time for dantrolene is about 10 minutes. In the test for *Limit of dantrolene related compound A,* the typical retention time for dantrolene related compound A is about 3.8 minutes, and dantrolene elutes at void volume at about 1.5 minutes.

(MD-PP: R. Ravichandran) RTS—42654-1

Add the following:

■Dantrolene Sodium



$C_{14}H_9N_4NaO_5 \cdot 3½H_2O$ 399.29

2,4-Imidazolidinedione, 1-[[[5-(4-nitrophenyl)-2-furanyl]-methylene]amino]-, sodium salt, hydrate (2 : 7).

1-[[5-(*p*-Nitrophenyl)furfurylidene]amino]hydantoin sodium salt hydrate [*24868-20-0*].

» Dantrolene Sodium contains not less than 90.0 percent and not more than 96.0 percent of $C_{14}H_{10}N_4O_5$, the free acid form of Dantrolene Sodium, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight, light-resistant containers. Store at room temperature.

USP Reference standards ⟨11⟩—*USP Dantrolene RS. USP Dantrolene Related Compound A RS. USP Dantrolene Related Compound B RS. USP Dantrolene Related Compound C RS. USP Dantrolene Sodium RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

C: Ignite about 200 mg: the residue meets the requirements of the flame test for *Sodium* ⟨191⟩.

Water, *Method Ia* ⟨921⟩**:** between 14.5% and 17.0%.

Heavy metals, *Method II* ⟨231⟩**:** 0.002%.

Limit of dantrolene related compound A—

Test stock solution—Prepare as directed for the *Assay stock preparation* as directed in the *Assay.*

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (80 : 20). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩.

Standard solution—Dissolve an accurately weighed quantity of *USP Dantrolene Related Compound A RS* and *USP Dantrolene Sodium RS* in dimethylformamide to obtain a solution having known concentrations of 17.5 µg per mL of dantrolene related compound A and 50 µg per mL of dantrolene sodium. Dilute with acetonitrile to obtain a solution having concentrations of about 0.35 µg per mL of dantrolene related compound A and 1 µg per mL of dantrolene sodium.

Test solution—Dilute the *Test stock solution* with acetonitrile to obtain a solution having a concentration of about 0.175 mg per mL of dantrolene sodium.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 365-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*. The tailing fator for dantrolene related compound A is not more than 1.5; and the relative standard deviation for replicate injections is not more than 5% for dantrolene related compound A. [NOTE—The dantrolene peak elutes at void volume at approximately 1.5 minutes.]

Procedure—Inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution,* record the chromatograms, and measure the response for the dantrolene related compound A peak. Calculate the percentage of dantrolene related compound A in the portion of Dantrolene Sodium taken by the formula:

$$100(r_U / r_S)(C_S / C_T)$$

in which r_U and r_S are the peak responses of dantrolene related compound A obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of dantrolene related compound A in the *Standard solution;* and C_T is the concentration, in mg per mL, of dantrolene sodium in the *Test solution:* not more than 0.15% of dantrolene related compound A is found.

Related compounds—

Mobile phase, System suitability stock solution B, Diluent, and *Chromatographic system*—Prepare as directed in the *Assay.*

Standard solution—Dilute quantitatively the *System suitability stock solution B* with *Diluent* to obtain a solution having a known concentration of 0.25 µg per mL each of dantrolene related compound B and dantrolene related compound C.

Test solution—Use the *Assay preparation.*

Procedure—Inject equal volumes (about 20 µL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each of the relevant dantrolene related compounds in the portion of Dantrolene Sodium taken by the formula:

$$100(C_S / C_T)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of dantrolene related compound B or dantrolene related compound C in the *Standard solution;* C_T is the concentration, in mg per mL, of dantrolene sodium in the *Test solution;* r_U is the individual peak response for dantrolene related compound B or dantrolene related compound C obtained from the *Test solution;* and r_S is the response of the corresponding peak

obtained from the *Standard solution.* Not more than 0.50% of dantrolene related compound B is found; and not more than 0.30% of dantrolene related compound C is found.

Assay—

Buffer—Dissolve 3.85 g of ammonium acetate in 1.0 L of water, and adjust with glacial acetic acid to a pH of 4.5 ± 0.1.

Diluent—Prepare a mixture of water and acetonitrile (50 : 50).

Solution A—Prepare a filtered and degassed mixture of water, *Buffer,* and acetonitrile (70 : 20 : 10).

Solution B—Prepare a filtered and degassed mixture of acetonitrile and *Buffer* (80 : 20).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability stock solution A—Transfer 62.5 mg of *USP Dantrolene Sodium RS,* accurately weighed, into a 50-mL volumetric flask, and dissolve in 2.5 mL of dimethylformamide. Add 2.5 mL of glacial acetic acid, and dilute with acetone to volume to obtain a solution having a known concentration of about 1.25 mg per mL of dantrolene sodium.

System suitability stock solution B—Transfer 6.3 mg each of USP Dantrolene Related Compound B RS and USP Dantrolene Related Compound C RS, accurately weighed, into a 50-mL volumetric flask, and dissolve in 2.5 mL of dimethylformamide. Add 2.5 mL of glacial acetic acid, and dilute with acetone to volume to obtain a solution having known concentrations of about 0.125 mg per mL each of dantrolene related compound B and dantrolene related compound C.

System suitability solution—Quantitatively dilute suitable volumes of *System suitability stock preparation A* and *System suitability stock preparation B* with *Diluent* to obtain a solution having concentrations of about 0.125 mg per mL of dantrolene sodium and 2.5 µg per mL each of dantrolene related compound B and dantrolene related compound C.

Standard stock preparation—Transfer 50 mg of USP Dantrolene RS, accurately weighed, into a 50-mL volumetric flask, and dissolve in 2.5 mL of dimethylformamide. Add 2.5 ml of glacial acetic acid, and dilute with acetone to volume to obtain a solution having a known concentration of about 1.0 mg per mL of dantrolene.

Standard preparation—Dilute the *Standard stock preparation* with *Diluent* to obtain a solution having a known concentration of about 0.1 mg per mL of dantrolene.

Assay stock preparation—Transfer an accurately weighed quantity of dantrolene sodium into a 100-mL volumetric flask, and dissolve in 5mL of dimethylformamide. Add 5 mL of glacial acetic acid, and dilute with acetone to volume to obtain a solution having a concentration of about 1.25 mg per mL of dantrolene sodium.

Assay preparation—Dilute the *Assay stock preparation* with *Diluent* to obtain a solution having a concentration of about 0.125 mg per mL of dantrolene sodium.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 365-nm detector and a 4.6-mm × 15-cm column that contains 5-µm L1 packing. The flow rate is about 2.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solvent A* (%)	*Solvent B* (%)	Elution
0–10	90→60	10→40	linear gradient
10–20	60→10	40→90	linear gradient
20–25	10	90	isocratic
25–25.1	10→90	90→10	linear gradient
25.1–35	90	10	re-equilibration

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure*. The resolution, *R,* between dantrolene and dantrolene related compound C is not less than 8. Chromatograph the *Standard preparation,* and

record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 1.0%. [NOTE—For the purpose of identification, the approximate relative retention times are 0.68 for dantrolene related compound B, 1.24 for dantrolene related compound C, and 1.0 for dantrolene.]

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the dantrolene peaks. Calculate the percentage of dantrolene ($C_{14}H_{10}N_4O_5$) in the portion of Dantrolene Sodium taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of dantrolene in the *Standard preparation;* C_U is the concentration, in mg per mL, of dantrolene sodium in the *Assay preparation;* and r_U and r_S are the peak responses for dantrolene obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP30*)

BRIEFING

Diazepam Extended-Release Capsules, *USP 29* page 674. It is proposed to require the use of USP Ethylparaben RS for the preparation of the *Internal standard solution.* The current monograph does not contain any specific system suitability criteria; this proposal introduces two system suitability criteria. It is also proposed to clarify that the relative retention times are intended for identification only.

Change to read:

Assay—

Mobile phase and *Chromatographic system*—Prepare as directed in the *Assay* under *Diazepam*.

Internal standard solution—~~Transfer about 300 mg of ethylparaben to a 200-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix.~~

■Dissolve an accurately weighed quantity of USP Ethylparaben RS in methanol to obtain a solution having a known concentration of about 1.5 mg per mL.■1S (*USP30*)

Standard preparation—Dissolve an accurately weighed quantity of USP Diazepam RS in methanol, quantitatively dilute with methanol to obtain a solution having a known concentration of about 1 mg per mL, and mix. Transfer 15.0 mL of this solution and 5.0 mL of *Internal standard solution* to a 100-mL volumetric flask, dilute with methanol to volume, and mix.

Assay preparation—Weigh and mix the contents of not fewer than 20 Capsules. Transfer an accurately weighed portion of the mixture, equivalent to about 15 mg of diazepam, to a 100-mL volumetric flask. Add 5.0 mL of *Internal standard solution* and about 45 mL of methanol. Shake by mechanical means for 30 minutes, dilute with methanol to volume, and mix. Centrifuge about 30 mL of this solution for 5 minutes, and filter.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. ~~The relative retention times are about 0.5 for ethylparaben and 1.0 for diazepam.~~

■The tailing factor for diazepam is not more than 2.0; and the relative standard deviation for the diazepam peak for replicate injections is not more than 2.0%. [NOTE—For the purpose of identifcation, the relative retention times are about 0.5 for ethylparaben and 1.0 for diazepam.]■1S (*USP30*)

Calculate the quantity, in mg, of diazepam ($C_{16}H_{13}ClN_2O$) in the portion of Capsules taken by the formula:

$$100C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Diazepam RS in the *Standard preparation;* and R_U and R_S are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Doxepin Hydrochloride, *USP 29* page 758. It is proposed to add a test for *Related compounds* based on an isocratic reverse phase HPLC methodology. The method was validated using a Phenomenx brand of Luna C18(2) column. The typical retention times for doxepin and doxepinone are about 20 and 9.5 minutes, respectively. It is also proposed to make the following changes:

1. Replace the UV *Identification* test with an HPLC test based on a comparison of the retention times of the drug substance and the Reference Standard.

In-Process Revision

2. Delete the test for *Chloride content,* and add a qualitative *Identification* test for chloride.
3. Delete the *Melting range* test.

(MD-PP: R. Ravichandran) RTS—42805-1

Delete the following:

■~~**Chloride content**—Dissolve about 100 mg, accurately weighed, in a mixture of 100 mL of water and 100 mL of alcohol. Titrate with 0.05 N silver nitrate VS, determining the endpoint potentiometrically using a silver silver sulfide sensing electrode and a double junction reference electrode containing potassium nitrate filling solution in the outer jacket and a standard filling solution in the inner jacket. Each mL of 0.05 N silver nitrate is equivalent to 1.773 mg of chloride. Not less than 10.9% and not more than 11.6% of chloride is found.~~■1S (*USP30*)

Add the following:

■**Related compounds—**

Diluted phosphoric acid—Prepare a mixture of water and phosphoric acid (10 : 1), and mix well.

Buffer—Dissolve 1.42 g of dibasic sodium phosphate in 1 L of water, adjust with *Diluted phosphoric acid* to a pH of 7.7, and mix.

Mobile phase—Prepare a filtered and degassed mixture of methanol, *Buffer,* and acetonitrile (50 : 30 : 20). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of *Mobile phase* and 2 N sodium hydroxide (1000 : 2).

Standard solution—Dissolve accurately weighed quantities of USP Doxepin Hydrochloride RS, USP Doxepin Related Compound A RS, USP Doxepin Related Compound B RS, and USP Doxepin Related Compound C RS in *Diluent* to obtain a solution having a known concentration of about 0.001 mg of each per mL. [NOTE—Sonication for about 1 minute may be used to aid the initial dissolution of the compounds.]

Test solution—Dissolve an accurately weighed quantity of Doxepin Hydrochloride in *Diluent* to obtain a final solution having a known concentration of about 1 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. The column temperature is maintained at 30°. Chromatograph about 20 µL of the *Standard solution,* and record the peak areas as directed for *Procedure:* the resolution, *R,* between doxepin related compound A and doxepin related compound C is not less than 1.5; the resolution between doxepin related compound C and doxepin related compound B is not less than 1.5; and the S/N ratio for all the peaks is not less than 10. [NOTE—Use the approximate relative retention times given in *Table 1* for the purpose of peak identification.]

Name	Relative Retention Time (RRT)	Limit (%)
Doxepin related compound A	0.48	0.10
Doxepin related compound C	0.55	0.20
Doxepin related compound B	0.63	0.10
Doxepin hydrochloride	1.0	—
Unknown impurity	—	0.10 each

Procedure—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatogram for up to 2.2 times the retention time of doxepin, and measure the peak responses. Calculate the percentage of each individual doxepin related compound in the portion of Doxepin Hydrochloride taken by the formula:

$$100(r_U / r_S)(C_S / C_T)$$

in which r_U is the individual peak response for each doxepin related compound obtained from the *Test solution;* r_S is the response of the corresponding peak in the *Standard solution;* C_S is the concentration, in mg per mL, of each doxepin related compound in the *Standard solution;* and C_T is the concentration, in mg per mL, of Doxepin Hydrochloride in the *Test solution*. The related substance limits are listed in *Table 1*. [NOTE—Discard any peak with a relative retention time less than 0.25.] Use the response of the doxepin peak obtained from the *Standard solution* and the concentration of doxepin hydrochloride in the *Standard solution* to calculate the percentage of unknown individual impurities.■1S (*USP30*)

BRIEFING

Ethotoin Tablets, *USP 29* page 870. In the *Assay,* it is proposed to use a mixture of acidified water and acetonitrile as the *Diluent* instead of the *Mobile phase* in the preparation of the *Internal standard solution* to enhance the stability of the *Standard preparation* and the *Assay preparation*. It is also proposed to revise the *USP Reference standards* section to include USP Ethylparaben RS in the preparation of the *Internal standard solution*.

(MD-PP: R. Ravichandran) RTS—40023-1

Change to read:

Change to read:

Assay—

■*Diluent*—Prepare a mixture of water, acetonitrile, and phosphoric acid (750 : 250 : 1).■1S (*USP30*)

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (3 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Internal standard solution—Prepare a solution of ~~ethylparaben~~ ■USP Ethylparaben RS■1S (*USP30*) in ~~*Mobile phase*~~ ■*Diluent*■1S (*USP30*) having a concentration of 0.02 mg per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Ethotoin RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1.0 mg per mL. ~~To 5.0 mL of this solution add 5.0 mL of *Internal standard solution,* and mix.~~

■Immediately transfer 5 mL of this solution and 5 mL of the *Internal standard solution* to a suitable container, and mix well.■1S (*USP30*)

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of ethotoin, to a 100-mL volumetric flask. Add 75 mL of *Mobile phase,* shake vigorously for 60 minutes, dilute with *Mobile phase* to volume, mix, and ■immediately■1S (*USP30*) filter. ~~To 5.0 mL of the filtrate add 5.0 mL of the *Internal standard solution,* and mix.~~

■Without delay, transfer 5 mL of the filtrate and 5 mL of the *Internal standard solution* to a suitable container, and mix.■1S (*USP30*)

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the analyte and internal standard peaks is not less than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

In-Process Revision

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. ~~The relative retention times are about 0.5 for ethotoin and 1.0 for ethylparaben.~~

■[NOTE—For the purpose of identification, the relative retention times are about 0.5 for ethotoin and 1.0 for ethylparaben.]■1S *(USP30)*

Calculate the quantity, in mg, of $C_{11}H_{12}N_2O_2$ in the portion of Tablets taken by the formula:

$$200C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Ethotoin RS in the *Standard preparation;* and R_U and R_S are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Famotidine Injection. Because there is no existing *USP* monograph for this dosage form, a new monograph, based on validated methods of analysis, is being proposed. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with the Ultrasphere Silica brand of L3 column. The typical retention time reported for famotidine is about 8 minutes.

(MD-GRE: E. Gonikberg; MSA: R. Tirumalai) RTS—43694-1

Add the following:

■Famotidine Injection

» Famotidine Injection is a sterile, concentrated solution of famotidine. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of famotidine ($C_8H_{15}N_7O_2S_3$). It may contain suitable preservatives.

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I glass. Store in a refrigerator.

Labeling—It meets the requirements for *Labeling* under *Injections* ⟨1⟩. Label it to indicate that the Injection is to be diluted with a suitable parenteral vehicle prior to administration. Label it to indicate the name and the quantity of any added preservative.

USP Reference standards ⟨11⟩**—***USP Benzyl Alcohol RS. USP Endotoxin RS. USP Famotidine RS.*

Identification—The retention time of the famotidine peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Bacterial endotoxins ⟨85⟩**—**It contains not more than 16.67 USP Endotoxin Units per mg of famotidine.

Sterility ⟨71⟩**:** meets the requirements.

pH ⟨791⟩**:** between 5.0 and 5.6.

Particulate matter ⟨788⟩**:** meets the requirements for small-volume injections.

Related compounds—

Buffer solution, Mobile phase, and *Diluent*—Proceed as directed in the *Assay.*

Test solution—Use the *Assay preparation* prepared as directed in the *Assay.*

System suitability stock solution—Proceed as directed in the test for *Content of benzyl alcohol.*

System suitability solution—

IF BENZYL ALCOHOL IS PRESENT—Proceed as directed in the test for *Content of benzyl alcohol.*

IF BENZYL ALCOHOL IS NOT PRESENT—Transfer 25 mL of *System suitability stock solution* to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—Prepare as directed in the *Assay.* Chromatograph the *System suitability solution,* identify the famotidine peak and other peaks based on the relative retention times listed in *Table 1*, and record the peak responses as directed for *Procedure:* the

resolution, *R,* between adjacent peaks of impurity B, impurity C, famotidine, and impurity D is not less than 1.3 for each pair of peaks.

Table 1

Name	Approximate Relative Retention Time
Benzyl alcohol (if present)	0.4
Impurity B[1]	0.7
Impurity C[2]	0.8
Famotidine	1.0
Impurity D[3]	1.3

[1] 3-[2-(Diaminomethyleneamino)-1,3-thiazol-4-ylmethylthio]-propanoic acid
[2] 3-[2-(Diaminomethyleneamino)-1,3-thiazol-4-ylmethylthio]-*N*-sulfamoyl-propanamide
[3] 3-[2-(Diaminomethyleneamino)-1,3-thiazol-4-ylmethylthio]-propanamide

Procedure—Inject about 30 µL of the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of the total of impurities B, C, and D in the portion of the Injection taken by the formula:

$$100(r_U / r_T)$$

in which r_U is the sum of the areas of peaks for impurities B, C, and D obtained from the *Test solution;* and r_T is the sum of the peak areas for famotidine, impurity B, impurity C, and impurity D obtained from the *Test solution*: not more than 5.0% of total impurities is found.

Content of benzyl alcohol *(if present)*—

Buffer solution, Mobile phase, and *Diluent*—Proceed as directed in the *Assay.*

Test solution—Use the *Assay preparation* prepared as directed in the *Assay.*

System suitability stock solution—Transfer approximately 10 mg of USP Famotidine RS to a 50-mL volumetric flask, and add 1 mL of 0.1 N hydrochloric acid. Heat at 80° for 30 minutes. Allow to cool, add 2 mL of 0.1 N sodium hydroxide, and heat at 80° for an additional 30 minutes. Allow to cool, and neutralize by adding 1 mL of 0.1 N hydrochloric acid. Dilute with *Diluent* to volume, and mix (*Solution A*). Transfer about 5 mg of USP Famotidine RS to a separate 50-mL volumetric flask, add 8 mL of methanol, and sonicate to dissolve. Add 10 mL of *Solution A,* dilute with *Diluent* to volume, and mix.

System suitability solution—Transfer 25 mL of *System suitability stock solution* to a 50-mL volumetric flask. Add 1 drop (approximately 20 mg) of USP Benzyl Alcohol RS, dilute with *Diluent* to volume, and mix.

Standard solution—Dissolve accurately weighed quantities of USP Famotidine RS and USP Benzyl Alcohol RS in *Diluent* to obtain a solution having known concentrations of about 0.1 mg of famotidine per mL and about 0.09 mg of benzyl alcohol per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—Prepare as directed in the *Assay.* Chromatograph the *System suitability solution,* identify the components based on their relative retention times listed in *Table 1*, and record the peak responses as directed for *Procedure:* the benzyl alcohol peak is resolved from the solvent front, and the resolution, *R,* between adjacent peaks of benzyl alcohol and famotidine impurity B is not less than 1.3. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is less than 2.0% for each peak.

Procedure—Separately inject equal volumes (about 30 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of benzyl alcohol in each mL of the Injection by the formula:

$$D(C/V)(r_U / r_S)$$

in which *D* is the volume, in mL, of the *Test solution; C* is the concentration, in mg per mL, of benzyl alcohol in the *Standard solution; V* is the volume, in mL, of the Injection taken to prepare the *Test solution;* and r_U and r_S are the peak

areas for benzyl alcohol obtained from the *Test solution* and the *Standard solution,* respectively: the content of benzyl alcohol is between 90.0% and 110.0% of the labeled amount.

Other requirements—It meets the requirements for *Volume in Container* under *Injections* ⟨1⟩.

Assay—

Buffer solution—Dissolve 13.8 g of monobasic sodium phosphate in water, and dilute with water to 1 L.

Mobile phase—Prepare a mixture of water, methanol, and *Buffer solution* (32 : 5 : 3), and adjust with 1 N sodium hydroxide to a pH of 5.3.

Diluent—Dissolve 1.36 g of monobasic potassium phosphate in 800 mL of water, adjust with 1 N sodium hydroxide to a pH of 7.0, and dilute with water to 1 L.

Standard preparation—

IF BENZYL ALCOHOL IS PRESENT—Dissolve accurately weighed quantities of USP Famotidine RS and USP Benzyl Alcohol RS in *Diluent* to obtain a solution having known concentrations of about 0.1 mg of famotidine per mL and about 0.09 mg of benzyl alcohol per mL.

IF BENZYL ALCOHOL IS NOT PRESENT—Dissolve an accurately weighed quantity of USP Famotidine RS in *Diluent* to obtain a solution having a known concentration of about 0.1 mg of famotidine per mL.

Assay preparation—Transfer an accurately measured volume of Famotidine Injection, equivalent to about 20 mg of famotidine based on the label claim, to a 200-mL volumetric flask, and dilute with *Diluent* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L3. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections for the famotidine peak is less than 2.0%.

Procedure—Separately inject equal volumes (about 30 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of famotidine ($C_8H_{15}N_7O_2S_3$) in each mL of the Injection by the formula:

$$D(C/V)(r_U/r_S)$$

in which D is the volume, in mL, of the *Assay preparation; C* is the concentration, in mg per mL, of famotidine in the *Standard preparation; V* is the volume, in mL, of the Injection taken to prepare the *Assay preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S *(USP30)*

BRIEFING

Fluconazole, *USP 29* page 911 and page 1368 of *PF* 31(5) [Sept.–Oct. 2005]. It is proposed to revise the limits for total unknown impurities and total impurities in *Test 1* under *Related compounds* to correspond to those in the NDA submission. On the basis of the new information received, it is also proposed to revise the relative retention times of impurities in *Test 2* under *Related compounds.*

TEST 1—▲*USP29*

Mobile phase—Prepare a mixture of water and acetonitrile (80 : 20).

System suitability solution—Use the *Standard solution*.

Standard solution—Transfer accurately weighed quantities of USP Fluconazole RS, USP Fluconazole Related Compound A RS, USP Fluconazole Related Compound B RS, and USP Fluconazole Related Compound C RS to a suitable volumetric flask, dissolve in acetonitrile, dilute quantitatively, and stepwise if necessary, with *Mobile phase* to volume, and mix to obtain a solution having known concentrations of 10 µg of each per mL.

In-Process Revision

Test solution—Transfer about 30 mg of Fluconazole, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 260-nm detector and a 4.6-mm × 15-cm column that contains 3.5-µm packing L1. The flow rate is about 0.5 mL per minute. The column temperature is maintained at 40°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* typical retention times are about 4.9 minutes for fluconazole related compound A, 8.0 minutes for fluconazole related compound B, 8.5 minutes for fluconazole related compound C, and 9.9 minutes for fluconazole; the resolution, *R,* between fluconazole related compound B and fluconazole related compound C is not less than 1.5; and the relative standard deviation of each peak for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of fluconazole related compound A, fluconazole related compound B, fluconazole related compound C, and any other impurities in the portion of Fluconazole taken by the formula:

$$1000(C/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Fluconazole Related Compound A RS, USP Fluconazole Related Compound B RS, USP Fluconazole Related Compound C RS, or USP Fluconazole RS, respectively, in the *Standard solution; W* is the weight, in mg, of Fluconazole taken to prepare the *Test solution;* r_U is the peak response obtained from the *Test solution;* and r_S is the average peak response of fluconazole related compound A, fluconazole related compound B, fluconazole related compound C, or fluconazole obtained from replicate injections of the *Standard solution:* ▲not more than 1.0% of any impurity with a relative retention time (RRT) of about 0.6 is found; not more than 0.2% of fluconazole related compound A or fluconazole related compound C is found; not more than 0.1% of fluconazole related compound B is found; not more than 0.1% of any other individual impurity is found; not more than ~~0.2%~~

■0.3%■1S (*USP30*)

■unknown■1S (*USP30*)
impurities is found; and not more than ~~1.2%~~

■1.5%■1S (*USP30*)
of total impurities is found.

TEST 2—

Acetate buffer—Prepare a 0.04 M anhydrous sodium acetate solution, adjust with 1 N acetic acid to a pH of 5.0, and mix.

Solution A: filtered and degassed *Acetate buffer*.

Solution B: acetonitrile.

Solution C: methanol.

Mobile phase—Use variable mixtures of *Solution A, Solution B,* and *Solution C* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of *Acetate buffer* and methanol (84 : 16).

Standard solution—Dissolve an accurately weighed quantity of USP Fluconazole RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.01 mg per mL.

System suitability solution—Dissolve suitable quantities of USP Fluconazole RS and USP Desacetyl Diltiazem Hydrochloride RS in *Diluent.* Dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution containing about 0.02 mg per mL and 0.006 mg per mL, respectively.

Test solution—Transfer about 200 mg of Fluconazole, accurately weighed, to a 100-mL volumetric flask, and dissolve in and dilute with *Diluent* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 261-nm detector and a 4.0-mm × 10-cm column that contains packing L1. The flow rate is 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	*Solution C* (%)	Elution
0–10	80	5	15	isocratic
10–20	80→30	5→55	15	linear gradient (*A* and *B*)
20–23	30	55	15	isocratic
23–25	30→80	55→5	15	reset composition
25–30	80	5	15	re-equilibration

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are 1.0 for fluconazole and about 1.2 for desacetyl hydrochloride; the resolution, *R,* between fluconazole and desacetyl diltiazem hydrochloride is not less than 10.0; the column efficiency for fluconazole is not less than 30,000 theoretical plates; and the tailing factor, *T,* is not more than 1.4. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is less than 5.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Fluconazole taken by the formula:

$$10{,}000(r_i/r_S)(C/W)(1/F)$$

in which r_i is the peak response of each impurity obtained from the *Test solution;* r_S is the peak response of fluconazole obtained from the *Standard solution; C* is the concentration, in mg per mL, of USP Fluconazole RS in the *Standard solution; W* is the weight, in mg, of Fluconazole taken to prepare the *Test solution;* and *F* is the relative response factor as determined from the following table.

Relative Response Factor *(F)*	Relative Retention Time (RRT)
0.72	0.17–0.37
0.85	~~1.20–1.32~~
	■0.48–0.60■1S (*USP30*)
1.21	~~0.48–0.60~~
	■0.67–0.79■1S (*USP30*)
0.96	1.14–1.18
0.97	~~0.67–0.79~~
	■1.20–1.32■1S (*USP30*)
1.0	all other peaks

Not more than 0.1% of any individual impurity is found; and not more than 0.5% of total impurities is found.

TEST 3—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Test solution—Dissolve an accurately weighed quantity of Fluconazole in methanol to obtain a solution containing approximately 50 mg per mL.

Standard solutions—Dissolve an accurately weighed quantity of USP Fluconazole RS in methanol to obtain *Standard solution A* having a known concentration of about 1 mg per mL (2.0%). Quantitatively dilute portions of this solution with methanol to obtain *Standard solution B* and *Standard solution C* having known concentrations of about 0.1 mg per mL (0.2%) and 0.05 mg per mL (0.1%), respectively.

Developing solvent system—Prepare a mixture of chloroform, methanol, and ammonium hydroxide (80 : 20 : 1).

Application volume: 10 µL.

Spray reagent A—Dissolve about 170 mg of silver nitrate in 100 mL of water.

Spray reagent B (Potassium iodoplatinate solution)—Dissolve about 375 mg of chloroplatinic acid in 5 mL of 1 N hydrochloric acid. Dissolve about 5 g of potassium iodide in 50 mL of water, and

In-Process Revision

store in a light-resistant container. Prepare a mixture of water, the potassium iodide solution, and the chloroplatinic acid solution (20 : 9 : 1).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. Spray the dry plate with *Spray reagent A,* and expose the plate to 365-nm UV light for 10 to 20 minutes. Dry the plate for 20 minutes between 80° and 90°, then spray the plate with *Spray reagent B*. Allow the plate to dry. Examine the plate and compare the intensities of any secondary spots observed in the chromatogram of the *Test solution* with those of the principal spots in the chromatograms of the *Standard solutions:* no spot from the chromatogram of the *Test solution* with an R_F value of between 0.10 to 0.25 and 0.27 to 0.41 is larger or more intense than that obtained from *Standard solution B* (0.2%).▲*USP29*

BRIEFING

Fluoxetine Delayed-Release Capsules, *USP 29* page 942. It is proposed to revise the *Detector sensitivity solution* preparation to ensure that the solution will have adequate concentration to meet the signal-to-noise ratio requirement specified in the monograph. It is proposed to implement this revision via the *Fourth Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of August 1, 2006.

(MD-PP: R. Ravichandran) RTS—44019-1

Change to read:

Chromatographic purity—

Ion-pair solution—Dissolve about 6.5 g of sodium 1-octanesulfonate and 2.9 g of anhydrous sodium acetate in 1 L of water, and adjust with glacial acetic acid to a pH of 5.0.

Mobile phase—Prepare a filtered and degassed mixture of *Ion-pair solution* and acetonitrile (58 : 42). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Degraded fluoxetine solution—Dissolve a quantity of USP Fluoxetine Hydrochloride RS in 1.0 N sulfuric acid to obtain a solution containing about 2.2 mg per mL. Heat to 85° for 3 hours, and cool to room temperature.

Fluoxetine related compound solution—Dissolve a quantity of USP Fluoxetine Related Compound C RS in *Mobile phase* to obtain a solution containing about 0.5 mg per mL.

System suitability solution—Transfer about 13.5 mg of USP Fluoxetine Hydrochloride RS to a 100-mL volumetric flask, add 2 mL of *Degraded fluoxetine solution* and 2 mL of *Fluoxetine related compound solution,* and dissolve in and dilute with *Mobile phase* to volume. Transfer 10.0 mL of this solution to a 250-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Detector sensitivity solution—~~Transfer 1 mL of the *System suitability solution* to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.~~

•Transfer 2 mL of the *System suitability solution* to a 25-mL volumetric flask, and dilute with *Mobile phase* to volume.•[4]

Test solution—Weigh and finely powder not fewer than 20 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of fluoxetine, to a 250-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Filter before injection.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 15-cm column that contains 3.5-µm packing L7. The column temperature is maintained at 30°. The flow rate is about 1 mL per minute. Inject the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.49 for α,α,α-trifluoro-*p*-cresol, 0.70 for fluoxetine related compound C, and 1.0 for fluoxetine; the resolution, *R,* between α,α,α-trifluoro-*p*-cresol and fluoxetine related compound C is not less than 2.0; and the resolution, *R,* between fluoxetine related compound C and fluoxetine is not less than 6.0. Chromatograph the *Detector sensitivity solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio for the fluoxetine peak is not less than 10.

Procedure—Inject a volume (about 50 µL) of the *Test solution* into the chromatograph, record the chromatogram for at least three times the retention time of the fluoxetine peak, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Capsules taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each impurity, and r_s is the sum of the responses of all the peaks: not more than 0.2% of any individual impurity is found, and not more than 0.7% of total impurities is found.

BRIEFING

Fluticasone Propionate, *USP 29* page 960 and page 95 of *PF* 32(1) [Jan.–Feb. 2006]. On the basis of comments received, it is proposed to revise the upper limit for the drug substance in the Definition. The test for *Bromofluoromethane content* has also been deleted due to the unavailabilty of this reagent.

In-Process Revision

BRIEFING

Fluticasone Propionate Nasal Spray, page 97 of *PF* 32(1) [Jan.–Feb. 2006]. It is proposed to revise the tests for *Delivered dose uniformity* (within container) to specify correct concentrations of the components of the *Resolution solution.*

(AER: K. Zaidi) RTS—44076-1

Add the following:

■Fluticasone Propionate Nasal Spray

» Fluticasone Propionate Nasal Spray is a white, opaque suspension of fluticasone propionate in water. It is supplied in a form suitable for nasal administration. It contains not less than 95.0 percent and not more than 115.0 percent of the labeled amount of fluticasone propionate ($C_{25}H_{31}F_3O_5S$).

Packaging and storage—Preserve in tight, light-resistant containers. Store between 4° and 30°.

USP Reference standards ⟨11⟩**—***USP Fluticasone Propionate RS. USP Fluticasone Propionate Related Compound D RS. USP Fluticasone Propionate Related Compound F RS. USP Phenylethyl Alcohol RS.*

Identification—

A: *Infrared Absorption* ⟨197M⟩—

Test specimen—Transfer about 30 g of Nasal Spray equally into two 50-mL centrifuge tubes. Add 10 mL of water to each tube, insert the stopper, and shake vigorously for 2 minutes. Centrifuge at 3500 rpm for 10 minutes, and discard the supernatant. Add 10 mL of water to each tube, insert the stopper, and shake vigorously for 2 minutes. Centrifuge at 3500 rpm for 10 minutes, and discard the supernatant. Add 10 mL of water to each tube, insert the stopper, and shake vigorously for 2 minutes. Centrifuge at 3500 rpm for 10 minutes, and discard the supernatant. To one tube add 10 mL of methanol. Shake to disperse the residue, and transfer to the other tube. Shake the other tube for 1 minute. Centrifuge at 3500 rpm for 10 minutes. Decant the supernatant into an agate mortar. Evaporate the methanol either by carefully blowing dry with compressed air or nitrogen, or by allowing the methanol to evaporate naturally. If using an air or nitrogen line, use a suitable in-line filter to avoid contamination. Allow the residue to dry overnight in a desiccator over silica gel.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Microbial limits ⟨61⟩—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa.* The total aerobic microbial count does not exceed 100 cfu per g, and the total combined molds and yeasts count does not exceed 50 cfu per g.

pH ⟨791⟩**:** between 5.0 and 7.0.

Particle size—Remove the pump system after shaking the test bottle to ensure product uniformity. Transfer 1 drop of the Nasal Spray onto a clean microscope slide. Examine 10 random fields of view on the slide using 400 × magnification. Record the number of individual particles that are less than 5 µm in diameter: not less than 98% by number. Record the number of individual particles that are greater than 5 µm in diameter but less than 15 µm in diameter: not more than 1.8% by number. Record the number of individual particles that are greater than 15 µm in diameter: not more than 0.2% by number.

Foreign particulates—Shake the required number of bottles to ensure uniformity. Remove the pump system carefully to minimize contamination of the sample. Collect about 100 g of Nasal Spray, and pass it through a wetted 250-µm screen. Rinse each bottle with a portion of water equal to twice the volume of each bottle. Pass the rinse through the 250-µm screen. Visually observe the screen and filtrate for any foreign

particulates. Also examine the screen under a microscope using transmitted light: free from any visible foreign particulates greater than 250 µm.

Delivered dose uniformity (within container)—

Diluent, 0.01 M Monobasic ammonium phosphate buffer, Mobile phase, and *Chromatographic system*—Prepare as directed in the *Assay.*

Resolution solution—Dissolve an accurately weighed quantity of USP Fluticasone Propionate RS and USP Fluticasone Propionate Related Compound D RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution ~~having a known concentration of about 4 µg per mL of each~~ containing 4 µg per mL of USP Fluticasone Propionate RS and 0.4 µg per mL of USP Fluticasone Propionate Related Compound D RS.

Standard solution—Dissolve an accurately weighed quantity of USP Fluticasone Propionate RS in *Diluent* to obtain a solution having a known concentration of about 4 µg per mL.

Test solution—Wipe the pump clean. ~~and record the weight of the bottle prior to actuation.~~ Shake the bottle for 30 seconds, and mechanically prime the bottle. Hold a 25-mL volumetric flask in an inverted position, and discharge the first two actuations (1 dose) into the flask. Turn the flask to the upright position immediately after each actuation. Insert the stopper into the flask after collecting two actuations. ~~Weigh the bottle after sample collection.~~ Discharge actuations 3 to 48 (50-spray pack) or 3 to 118 (120-spray pack) to waste. Wipe the bottle clean, and ~~record the weight of the bottle. Collect~~ collect the last two actuations (49 and 50 or 119 and 120) in a second 25-mL volumetric flask. Turn the flask to the upright position immediately after each actuation, ~~Insert the stopper into the flask,~~ and insert the stopper into the flask. ~~and record the weight of the bottle.~~ Add 20 mL of the *Diluent* to each flask, and shake well for 10 minutes to disperse the suspension. Dilute with *Diluent* to volume, and mix thoroughly. Allow the flask to stand until the excipients have settled. Transfer a portion of the clear supernatant to an HPLC vial, and inject. Repeat this procedure with 4 additional bottles.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in µg, of $C_{25}H_{31}F_3O_5S$ per dose taken by the formula:

$$CV(r_U / r_S)$$

in which C is the concentration of USP Fluticasone Propionate RS, in µg per mL, in the *Standard solution; V* is the total volume of *Test solution,* in mL; and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively. The mean dose delivered from 10 doses is within 85% to 115% of the label claim. Not more than 1 dose is outside 80% to 120% of the label claim. No doses are outside 75% to 125% of the label claim. Test an additional 10 bottles if 2 or 3 doses are outside $\pm$20% of the label claim. The mean dose delivered from ~~30~~ 20 doses should be within 85% to 115% of the label claim. Not more than 3 doses are outside 80% to 120% of the label claim. No doses are outside 75% to 125% of the label claim.

Delivered dose uniformity (within batch)—

Diluent, 0.01 M Monobasic ammonium phosphate buffer, Mobile phase, and *Chromatographic system*—Prepare as directed in the *Assay.*

Resolution solution—Prepare as directed in the test for *Delivered dose uniformity* (within container).

Standard solution—Prepare as directed in the test for *Delivered dose uniformity* (within container).

Test solution—Wipe the pump clean. ~~and record the weight of the bottle prior to actuation.~~ Shake the bottle for 30 seconds, and mechanically prime the bottle. Hold a 25-mL volumetric flask in an inverted position, and discharge the first two actuations into the flask. Turn the flask to the upright

In-Process Revision

position immediately after each actuation. Insert the stopper into the flask after collecting two actuations (1 dose). Repeat this procedure with 9 additional bottles.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in µg, of $C_{25}H_{31}F_3O_5S$ per dose taken by the formula:

$$CV(r_U / r_S)$$

in which C is the concentration of USP Fluticasone Propionate RS, in µg per mL, in the *Standard solution; V* is the total volume of *Test solution,* in mL; and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively. The mean dose delivered from 10 doses is within 85% to 115% of the label claim. Not more than 1 dose is outside 80% to 120% of the label claim. No doses are outside 75% to 125% of the label claim. Test an additional 20 bottles if 2 or 3 doses are outside ±20% of the label claim. The mean dose delivered from the two actuations at the beginning of the 30 bottles (30 doses) is within 85% to 115% of the label claim. Not more than 3 doses are outside 80% to 120% of the label claim. No doses are outside 75% to 125% of the label claim.

Related compounds—

Solution A—Prepare a mixture of methanol and acetonitrile (77 : 23).

0.01 M Monobasic ammonium phosphate buffer—Dissolve 1.15 g of monobasic ammonium phosphate in 1000 mL of water, adjust with phosphoric acid to a pH of 3.4 ± 0.1, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *Solution A* and *0.01 M Monobasic ammonium phosphate buffer* (60 : 40). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Prepare a mixture of acetonitrile and 0.001 M hydrochloric acid (60 : 40).

Control solution—Prepare a solution in a mixture of *Diluent* and water (4 : 1) containing about 0.5 mg per mL of USP Phenylethyl Alcohol RS and 0.08 mg per mL of benzalkonium chloride.

System suitability solution—Dissolve an accurately weighed quantity of USP Fluticasone Propionate RS, USP Fluticasone Related Compound D RS, USP Fluticasone Propionate Related Compound F RS, and USP Phenylethyl Alcohol RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 100 µg per mL, 1.0 µg per mL, 1.0 µg per mL, and 500 µg per mL of each Reference Standard, respectively.

Test solution—Transfer accurately about 1.0 g of the Nasal Spray to a 5-mL volumetric flask, dissolve in and dilute with *Diluent* to volume. Shake the flask vigorously to dissolve. Pass through a 0.5-µm porosity filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 239-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. The column is maintained at a temperature of 40°. Chromatograph the *System suitability solution,* and measure the peak responses as directed for *Procedure:* the resolution, *R,* between fluticasone propionate related compound F and phenylethyl alcohol is not less than 1.5; the resolution, *R,* between fluticasone propionate related compound D and fluticasone propionate is not less than 2; and the relative retention times and limits are as provided in *Table 1.*

Procedure—Separately inject a volume (about 50 µL) of the *System suitability solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Nasal Spray taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each impurity, and r_s is the sum of the responses of all the peaks, excluding the peaks obtained from the *Control solution.*

Content of phenylethyl alcohol—

Diluent, Mobile phase, Resolution solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Dissolve an accurately weighed quantity of USP Phenylethyl Alcohol RS in *Diluent* to obtain a solution having a known concentration of about 50 µg per mL.

Test solution—Use the *Assay preparation.*

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg per g, of phenylethyl alcohol in the portion of Nasal Spray taken by the formula:

$$50(C/W_U)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of the USP Phenylethyl Alcohol RS in the *Standard solution;* W_U is the weight, in g, of the Nasal Spray taken to prepare the *Test solution;* and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively. For 50 sprays: not less than 1.75 mg per g and not more than 2.63 mg per g. For 120 sprays: not less than 1.88 mg per g and not more than 2.63 mg per g.

Content of benzalkonium chloride—

Citric acid buffer solution—Dissolve 50 g of citric acid in 200 mL of water. Adjust the solution with 2 N sodium hydroxide to a pH of 3.5 ± 0.05.

Docusate sodium titrant—Dissolve 0.22 g of docusate sodium in 100 mL of warm water, and dilute with water to make 1000 mL.

Eosin Y indicator—Dissolve about 25 mg of eosin Y in 50 mL of acetone. Add 450 mL of chloroform and 5.0 ± 0.5 g of citric acid. Shake thoroughly until no discoloration occurs. Filter the mixture to remove any undissolved citric acid. Store in an amber bottle.

Table 1

Compound	Approximate Relative Retention Time	Limit (%)
S-Fluoromethyl 17α-acetyloxy-6α,9α-difluoro-11β-hydroxy-16α-methyl-3-oxoandrosta-1,4-diene-17β-carbothioate/ *S*-Fluoromethyl 9α-fluoro-11β-hydroxy-16α-methyl-3,6-dioxo-17α-propionyloxyandrosta-1,4-diene-17β-carbothioate	0.7	0.3
Fluticasone propionate related compound D	1.1	0.3
6α,9α-Difluoro-11β,17α-dihydroxy-16α-methyl-3-oxoandrosta-1,4-diene-17β-carboxylic acid 6α,9α-difluoro-17β-(fluoromethylthio)carbonyl-11β-hydroxy-16α-methyl-3-oxoandrosta-1,4-dien-17α-yl ester	2.1	0.3
Unknown impurities	—	0.2
Total	—	1.5

Benzalkonium chloride standard stock solution—Use 50% (w/v) solution of benzalkonium chloride.*

Benzalkonium chloride standard solution—Transfer accurately about 0.4 g of *Benzalkonium chloride standard stock solution* to a 1000-mL volumetric flask. Dilute with water to volume, and mix. Sonicate for 5 minutes to dissolve.

Procedure—Pipet 10 mL of *Benzalkonium chloride standard solution* into a 250-mL glass-stoppered flask containing 40 mL of water, 5 mL of *Eosin Y indicator,* and 2 mL of *Citric acid buffer solution.* Insert the stopper into the flask, and shake, releasing any build-up of pressure. Titrate with *Docusate sodium titrant* with vigorous shaking to a point when pink coloration is discharged from the chloroform layer. Perform a blank determination, substituting 10 mL of water for the *Benzalkonium chloride standard solution,* and make any necessary correction (see *Titrimetry* ⟨541⟩). Calculate the titer value of the *Docusate sodium titrant,* in µg of benzalkonium chloride per mL of *Docusate sodium titrant,* by the formula:

$$W_B / V_D$$

in which W_B is the weight, in µg, of benzalkonium chloride titrated; and V_D is the volume, in mL, of *Ducosate sodium titrant.* Transfer accurately about 10 g of Nasal Spray into a 250-mL glass-stoppered flask containing 40 mL of water, 5 mL of *Eosin Y indicator,* and 2 mL of *Citric acid buffer solution.* Repeat the procedure as given above for *Benzalkonium chloride standard solution.* To clarify the endpoint, place the flask in an ultrasonic bath for 1 to 2 minutes to separate the chloroform layer from the aqueous phase. Perform a blank determination. Calculate the concentration of benzalkonium chloride, in µg per g, in the portion of Nasal Spray taken by the formula:

$$TV/W$$

in which T is the titer value of *Ducosate sodium titrant; V* is the volume, in mL, of the *Docusate sodium titrant* used in the titration of the Nasal Spray; and W is the weight, in g, of the portion of Nasal Spray taken: not less than 160 µg per g and not more than 210 µg per g.

Assay—

Diluent—Prepare a mixture of acetonitrile and 0.001 M hydrochloric acid (60 : 40).

0.01 M Monobasic ammonium phosphate buffer—Dissolve 1.15 g of monobasic ammonium phosphate in 1000 mL of water, adjust with phosphoric acid to a pH of 3.5 ± 0.05, and mix.

Mobile phase—Prepare a filtered and degassed mixture of methanol, *0.01 M Monobasic ammonium phosphate buffer,* and acetonitrile (50 : 35 : 15). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—Dissolve accurately weighed quantities of USP Phenylethyl Alcohol RS, USP Fluticasone Propionate RS, and USP Fluticasone Propionate Related Compound D RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having known concentrations of about 50 µg per mL, 10 µg per mL, and 1 µg per mL, respectively.

Standard preparation—Dissolve an accurately weighed quantity of USP Fluticasone Propionate RS in *Diluent* to obtain a solution having a known concentration of about 10 µg per mL.

Assay preparation—Transfer accurately about 1.0 g of the Nasal Spray to a 50-mL volumetric flask, add about 40 mL of *Diluent,* and sonicate the flask for 10 minutes. Dilute with *Diluent* to volume, and shake. Allow to stand for about 10 minutes until the supernatant is a clear solution. Inject the clear supernatant into the chromatograph.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 4.6-mm × 25-cm column that contains 5-µm packing L1, and a programmable variable wavelength detector capable of monitoring at 210 nm and 239 nm. The flow rate is about

* A suitable grade is available from Merck, Germany (www.merck.-com).

1.5 mL per minute. The column is maintained at a temperature of 40°. Chromatograph the *Resolution solution* and the *Standard preparation,* record the peak areas at 210 nm for 5 minutes, then change the wavelength to 239 nm and record the peak areas: the relative retention times are about 0.42 for phenylethyl alcohol, 1.0 for fluticasone propionate, and 1.10 for fluticasone propionate related compound D; the resolution, *R,* between fluticasone propionate and fluticasone propionate related compound D is not less than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of fluticasone propionate ($C_{25}H_{31}F_3O_5S$) in the portion of Nasal Spray taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration of USP Fluticasone Propionate RS, in mg per mL, in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■1S (*USP30*)

BRIEFING

Fluvoxamine Maleate, *USP 29* page 964. On the basis of comments received, it is proposed to delete the redundant *Maleic acid* content test performed by nonaqueous titration. The *Maleic acid* content requirement as stated in the monograph is inconsistent and larger than the range stated in the Definition. Also, a *Note* has been added to clarify the purpose of including relative retention times in *Table 1*, which is included in the *Related compounds* test (see page 965 of *USP 29*).

(MD-PP: R. Ravichandran) RTS—43037-1

Delete the following:

~~■**Maleic acid**—Transfer about 800.0 mg of Fluvoxamine Maleate, accurately weighed, to a 250-mL conical flask containing 50 mL of water. Titrate with 0.1 N sodium hydroxide VS, using 0.5 mL of phenolphthalein TS as the indicator. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N sodium hydroxide VS is equivalent to 5.805 mg of maleic acid ($C_4H_4O_4$). Between 26.0% and 27.5% of maleic acid is found.~~ ■1S (*USP30*)

Change to read:

Assay—

Buffer solution—Dissolve about 5 g of 1-pentanesulfonic acid sodium salt and 0.7 g of monobasic potassium phosphate in 620 mL of water. Adjust with phosphoric acid to a pH of 3.00 ± 0.05.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (62 : 38). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—Transfer about 6 mg of Fluvoxamine Maleate to a 50-mL volumetric flask. Heat the sample at 120° for 10 minutes. Cool down to room temperature, and add 3.0 mL of 0.1 N hydrochloric acid. Heat the solution in a water bath for 10 minutes. Cool down to room temperature, add 50 mg of Fluvoxamine Maleate, and dissolve in 25 mL of *Mobile phase.* Dilute with *Mobile phase* to volume, and mix.

Standard preparation—Dissolve an accurately weighed quantity of USP Fluvoxamine Maleate RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.05 mg per mL.

Assay stock preparation—Transfer an accurately weighed quantity of about 50 mg of Fluvoxamine Maleate to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Assay preparation—Transfer 5.0 mL of the *Assay stock preparation* to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 234-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 1.7 mL per minute. The column temperature is maintained at 40°. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* ~~the relative retention times are about 0.2 for maleic acid, 0.5 for 5-methoxy-1-[4-(trifluoromethyl)phenyl]-1-pentanone (*E*)-*O*-[2-[(2-succinyl)amino]ethyl]oxime, 0.8 for the *Z*-isomer, and 1.0 for fluvoxamine maleate;~~

■ ■1S (*USP30*)
the resolution, *R,* between the *Z*-isomer and fluvoxamine maleate is not less than 3.0 and not less than 5.0 between 5-methoxy-1-[4-(trifluoromethyl)phenyl]-1-pentanone-(*E*)-*O*-[2-[(2-succinyl)amino]ethyl]oxime and the *Z*-isomer. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 5000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

■[NOTE—For the purpose of peak identification, the approximate relative retention times are given in *Table 1.*] ■1S (*USP30*)

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the

In-Process Revision

responses for the fluvoxamine maleate peaks. Calculate the quantity, in mg, of $C_{15}H_{21}F_3N_2O_2 \cdot C_4H_4O_4$ in the portion of Fluvoxamine Maleate taken by the formula:

$$1000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Fluvoxamine Maleate RS in the *Standard preparation;* and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Indinavir Sulfate, *USP 29* page 1118. On the basis of new information and supporting data received, three revisions have been proposed: (1) It is proposed to modify the procedure in the test for *Heavy metals* ⟨231⟩, because there is a matrix effect on *Method 1* for this drug substance. This proposed revision is consistent with the New Drug Application (NDA) submission. The revision also attempts to harmonize the texts of this procedure found in *USP* and in the *European Pharmacopoeia.* (2) In the test for *Chromatographic purity,* it is proposed to move *Table 1* from the *Chromatographic system* section to the *Procedure* section. The rationale is that, although *Table 1* lists five related compounds, with corresponding relative retention times based on the indinavir peak at about 21 to 26 minutes, the *System suitability solution* does not contain all these components. The related compounds shown in the table are for information and not part of the system suitability requirement. (3) In the *Assay,* it is proposed to revise the pH range for the *Dibutyl ammonium phosphate buffer* used in the preparation of the *Mobile phase.*

(MD-AA: B. Davani) RTS—43721-1

Delete the following:

■~~**Heavy metals,** *Method 1* ⟨231⟩: 0.001%.~~ ■1S (*USP30*)

Add the following:

■**Heavy metals** ⟨231⟩—

Standard solution—Into a 50-mL color-comparison tube, pipet 2 mL of *Standard Lead Solution* (10 µg per mL), and dilute with water to 25 mL. Using a pH meter or short-range pH indicator paper as an external indicator, adjust with 1 N acetic acid or 6 N ammonium hydroxide to a pH between 3.0 and 4.0, dilute with water to 40 mL, and mix.

Test solution—In a 50-mL color-comparison tube, dissolve 2.0 g of Indinavir Sulfate in 25 mL of water. Using a pH meter or a suitable short-range pH indicator paper as an external indicator, adjust with 1 N acetic acid or 6 N ammonium hydroxide to a pH between 3.0 and 4.0, dilute with water to 40 mL, and mix.

Blank solution—To a 50-mL color-comparison tube, add 25 mL of water. Using a pH meter or a suitable short-range pH indicator paper as an external indicator, adjust with 1 N acetic acid or 6 N ammonium hydroxide to a pH between 3.0 and 4.0, dilute with water to 40 mL, and mix.

Procedure—To each tube, add 10 mL of hydrogen sulfide TS, mix, allow to stand for 5 minutes, and view downward over a white surface: the color of the *Test solution* is not darker than that of the *Standard solution*. The intensity of the color of the *Blank solution* is less than or equal to the intensity of that of the *Test solution.* ■1S (*USP30*)

Heavy metals, *Method II* ⟨231⟩**:** 0.001%.

Related compounds—[NOTE—Solutions of Levofloxacin are not stable in light; use amber bottles.]

Solution A, Solution B, Mobile phase, and *System suitability preparation*—Prepare as directed in the *Assay.*

Levofloxacin stock solution—Dissolve an accurately weighed quantity of about 10 mg of USP Levofloxacin RS in 2 mL of acetonitrile, sonicate, and quantitatively dilute with water to 25 mL. Transfer 5 mL of this solution to a 100-mL volumetric flask, dilute with a mixture of acetonitrile and water (1 : 10) to volume, and mix.

Levofloxacin related compound B stock solution—Dissolve an accurately weighed quantity of about 10 mg of USP Levofloxacin Related Compound B RS in methanol, sonicate, and quantitatively dilute with methanol to 50 mL. Transfer 2 mL of this solution to a 10-mL volumetric flask, dilute with methanol to volume, and mix.

Standard solution—Transfer 2 mL each of *Levofloxacin stock solution* and *Levofloxacin related compound B stock solution* into the same 100-mL volumetric flask, dilute with a

mixture of acetonitrile and water (1 : 10) to volume, and mix.

Test solution—Transfer about 10 mg of Levofloxacin, accurately weighed, to a 25-mL volumetric flask, dissolve in 2 mL of acetonitrile, sonicate, dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay,* except to program the chromatograph as follows in *Table 1*.

Table 1

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibrium
0–5	100	0	isocratic
5–10	100→82	0→18	linear gradient
10–15	82→40	18→60	linear gradient
15–30	40	60	isocratic
30–30.1	40→100	60→0	step gradient
30.1–38	100	0	re-equilibration

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of levofloxacin related compound B in the portion of Levofloxacin taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Levofloxacin Related Compound B RS in the *Standard solution;* C_U is the concentration, in mg per mL, of Levofloxacin in the *Test solution;* r_U is the peak response for levofloxacin related compound B obtained from the *Test solution;* and r_S is the peak response for levofloxacin obtained from the *Standard solution*. Calculate the percentage of other levofloxacin related compounds or impurities in the portion of Levofloxacin taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Levofloxacin RS in the *Standard solution;* C_U is the concentration, in mg per mL, of Levofloxacin in the *Test solution;* r_U is the peak response for levofloxacin related compound obtained from the *Test solution;* and r_S is the peak response for levofloxacin obtained from the *Standard solution*. The limits of related compounds or impurities meet the requirements specified in *Table 2.*

Table 2

Related Compound/ Impurity	Relative Retention Time	Limit (%)
A	0.9	0.20
B	2.9	0.13
Any other impurity	—	0.1
Total impurities	—	0.50

Enantiomeric purity—

Buffer solution—Dissolve 1.32 g of D-phenylamine and 0.75 g of copper(II)sulfate pentahydrate in about 500 mL of water, dilute with water to 1000 mL, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and methanol (85 : 15). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve in and dilute accurately weighed quantities of USP Ofloxacin RS and USP Levofloxacin RS with water to obtain a solution having a final concentration of about 0.01 mg of each per mL.

In-Process Revision

Test solution—Transfer about 20 mg of Levofloxacin, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Transfer 2 mL into a 10-mL volumetric flask, dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 294-nm detector and 4.6-mm × 15-cm column that contains 3.5-µm packing L1. The flow rate is about 0.7 mL per minute. The column temperature is maintained at 40°. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between D-ofloxacin and levofloxacin is not less than 2.0. [NOTE—The relative retention times are about 0.91 for D-ofloxacin and 1.0 for levofloxacin.]

Procedure—Inject about 10 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the areas for all the peaks. Calculate the percentage of D-ofloxacin in the portion of Levofloxacin taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the response for each impurity; and r_s is the sum of the responses of all the peaks: not more than 1.0% of D-ofloxacin is found.

Assay—

Buffer solution—Dissolve 3.08 g of ammonium acetate and 8.43 g of sodium perchlorate monohydrate in about 500 mL of water, and dilute with water to 1000 mL. Adjust with phosphoric acid to a pH of 2.2, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Solution A—Prepare a mixture of *Buffer solution* and acetonitrile (84 : 16).

Solution B—Prepare a mixture of *Buffer solution,* acetonitrile, and methanol (50 : 30 : 20).

Solution C—Transfer about 10 mg of USP Levofloxacin RS to a 25-mL volumetric flask, dissolve in 2 mL of acetonitrile, dilute with water to volume, and mix.

Solution D—Transfer about 5.0 mg of USP Levofloxacin Related Compound A RS to a 100-mL volumetric flask, dissolve in and dilute with 0.2% ammonium hydroxide in methanol to volume, and mix.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system* (see *Table 3*).

Table 3

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibration
0–5	100	0	isocratic
5–10	100→82	0→18	linear gradient
10–15	82→40	18→60	linear gradient
15–15.1	40→100	60→0	step gradient
15.1–20	40→100	60→0	re-equilibration

System suitability preparation—Transfer 5 mL of *Solution C* and 2 mL of *Solution D* to a 20-mL volumetric flask, dilute with water to volume, and mix.

Standard preparation—Dissolve an accurately weighed quantity of USP Levofloxacin RS in 2 mL of acetonitrile, sonicate, and dilute quantitatively, and stepwise if necessary, with a mixture of acetonitrile and water (1 : 10) to obtain a solution having a known concentration of about 0.02 mg per mL.

Assay preparation—Dissolve an accurately weighed quantity of Levofloxacin in 2 mL of acetonitrile, sonicate, and dilute quantitatively, and stepwise if necessary, with a mixture of acetonitrile and water (1 : 10) to obtain a solution having a known concentration of about 0.02 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and 4.0-mm × 15-cm column that contains 3.0-µm packing

L1. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 38°. The chromatograph is programmed as shown in *Table 3.* Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between levofloxacin related compound A and levofloxacin is not less than 3.0; and the relative standard deviation for replicate injections for levofloxacin is not more than 2.0%. [NOTE—The relative retention times are about 0.9 for levofloxacin related compound A and 1.0 for levofloxacin.]

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{18}H_{20}FN_3O_4$ in the portion of Levofloxacin taken by the formula:

$$500C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Levofloxacin RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■1S (*USP30*)

BRIEFING

Lipid Injectable Emulsion, page 416 of *PF* 31(2) [Mar.–Apr. 2005]. It is proposed to revise the lower limit of the concentration range of phospholipids in the Definition to reflect FDA-approved product specifications. Secondly, as the fatty acid composition of a given emulsion may vary, especially in oil mixtures, the test for *Fatty acid composition* has been revised to identify the individual profiles of each oil prior to emulsification. Finally, the mean droplet diameter has been changed to a universal limit of less than 500 nm, or 0.5 µm, as detailed in *Globule Size Distribution in Lipid Injectable Emulsions* ⟨729⟩ on page 1451 of *PF* 31(5) [Sept.–Oct. 2005].

(PPI: J. Kelly) RTS—43584-1

In-Process Revision

Add the following:

■Lipid Injectable Emulsion

» ~~Lipid Injectable Emulsion is a sterile 10 percent, 20 percent, or 30 percent w/v oil in water emulsion in a vehicle containing glycerol in Water for Injection. The oils are Soybean Oil, Safflower Oil, Olive Oil, Medium Chain Triglycerides, or other suitable nutritional oils, or a mixture of these oils. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of the oil. It contains no antimicrobial agents. It contains Egg Phospholipids as an emulsifying agent.~~ Lipid Injectable Emulsion used in total parenteral nutrition is a sterile 10 ~~percent~~ (0.10 g per mL), 20 ~~percent~~ (0.20 g per mL), or 30 percent (0.30 g per mL) w/v emulsion in a vehicle. The vehicle contains 2.25 percent to 2.5 percent w/v Glycerin and ~~0.6 percent~~ 0.74 percent to 1.8 percent w/v parenteral Egg Phospholipids in Water for Injection. The principal oil used is Soybean Oil, which provides an ample supply of the essential fatty acids: linoleic acid and linolenic acid. Other oils, such as Safflower Oil, Medium-Chain Triglycerides, Olive Oil, Fish Oil, ~~Containing Omega-3 Acids,~~ or other suitable oils, can be mixed with Soybean Oil. Hence, Soybean Oil can be the only oil or be part of a mixture ~~containing~~ of these other oils. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of the oils. It contains no antimicrobial agents. The final products are terminally sterilized.

Packaging and storage—~~Preserve in a single-dose, glass container or glass *Pharmacy Bulk Package* (see *Injections* ⟨1⟩). Use elastomeric closures that are compatible with both the oil and water phases of the Emulsion. Store at controlled room temperature, and protect from freezing.~~ Preserve in a single-dose, Type I or Type II glass container or glass *Pharmacy bulk package* (see *Injections* ⟨1⟩). Use elastomeric closures that are compatible with both the oil and water phases of the Emulsion. Store at a temperature not below 4° (protect from freezing) or above 30° (protect from excessive heat).

Labeling—The label states the identity and the quantities of the specific oils in the Emulsion. The label states the total ~~osmolal~~ osmolar concentration (or osmolarity) in ~~mOsmol~~ mOsm per ~~kg.~~ L. The labeling provides the following information: do not use if there is evidence of excessive creaming or aggregation, if excessive free oil droplets are visible, or if there ~~are other forms of phase separation indicating that the stability of the product has been compromised.~~ are other indications of compromised integrity, such as microbial growth, present in the product.

USP Reference standards ⟨11⟩—*USP Endotoxin RS. USP Particle Count RS.*

Fatty acid composition—Transfer a volume of the Emulsion, equivalent to about 200 mg of lipids, to a stoppered extraction vessel, add 10 mL of ether, and mix. Add 5 g of anhydrous sodium sulfate, mix, and allow the mixture to stand until separation of the layers is complete. Wet the packing of a chromatographic silica cartridge with a few mL of ether, transfer about 5 mL of the ether layer from the extraction vessel to the column reservoir, and elute at a rate of between 5 and 10 drops per minute into a suitable vessel. Evaporate the ether from the eluant, and dissolve the residue in 5.0 mL of toluene. Transfer 1.0 mL of the toluene solution to a reaction vial, and add 0.4 mL of (*m*-trifluoromethylphenyl) trimethylammonium hydroxide in methanol. Cover, mix, and allow to stand for 30 minutes. Inject about 1 µL of this solution into a ~~gas ionization detector and~~ gas chromatograph equipped with a 0.53-mm × 50-m wide-bore, fused-silica capillary column coated with a 2.0-µm thickness of liquid phase G16 and maintained at a temperature of 200°. Helium is used as the carrier gas at a flow rate of about 10 mL per minute. Measure the ~~five~~ main peak areas of the methyl esters of the fatty acids. ~~The order of elution is palmitate, stearate, oleate, linoleate, and linolenate: their~~ The relative peak areas expressed as a percentage of the ~~five~~ main peaks are in the known ranges for the ~~oils or mixtures of oils~~ oil (e.g., Soybean Oil, USP; Safflower Oil, USP) as specified on the label. For oil mixtures, analysis of each oil should be performed to identify known peaks prior to emulsification as specified on the label.

Bacterial endotoxins ⟨85⟩—It contains not more than 0.5 USP Endotoxin Unit per mL.

pH ⟨791⟩**:** between 6.0 and 9.0.

Globule size limits—Lipid Injectable Emulsion meets the requirements of the limits specified in both *Method I* and *Method II* as directed under *Globule Size Distribution in Lipid Injectable Emulsions* ⟨729⟩.

Limit of oil droplet mean diameters (See *Method I—Light Scattering Method* under *Globule Size Distribution in Lipid Injectable Emulsions* ⟨729⟩)—Using the method of light scattering, determine the mean droplet diameter (MDD): the sample meets the requirements. The intensity-weighted mean droplet diameter (MDD) for Lipid Injectable Emulsion must be ≤500 nm, or 0.5 µm, irrespective of the concentration of the dispersed lipid phase.

Limit of large globule volume-diameter (See *Method II—Light Obscuration or Extinction Method* under *Globule Size Distribution in Lipid Injectable Emulsions* ⟨729⟩)—Using the method of light obscuration, determine the size distribution of globules in the large-diameter tail of the dispersion (detection threshold ≥2.0 µm). Calculate the volume-weighted mass of lipid in the form of globules with diameters in excess of 5.0

μm per 100 mL of Emulsion. This mass does not exceed 0.05% of the dispersed phase that is ≥5.0 μm from the nominal lipid concentration stated on the label.

~~**Particulate matter** ⟨788⟩: meets the requirements for *Large Volume Injections* for single dose infusion.~~

Limit of free fatty acid—

Solvent—Prepare a mixture of heptane, isopropanol, and water (400 : 400 : 200) in a separatory funnel. Allow the phases to separate, and discard the lower phase. Filter the upper phase (heptane solution) through 40 g of anhydrous sodium sulfate. Store in a tightly-capped glass container, and use within 1 week.

Chromatographic column—Prepare a slurry of heptane and chromatographic silica gel having an average pore size of 6 nm, and activate at a temperature of 110° for not less than 1 hour prior to use. Transfer the slurry to a 2.3-cm chromatographic tube (see *Column Chromatography* under *Chromatography* ⟨621⟩), and pack to a bed height of between 5 cm and 6 cm. Wash the column with about 40 mL of heptane, and drain the heptane through the column to a level of about 0.5 cm above the silica gel bed.

Procedure—Transfer 20.0 mL of the Emulsion to a flask, freeze, and lyophilize. Dissolve the residue in ~~3 mL~~ 30 mL of *Solvent,* and transfer the solution to the column. Rinse the flask with three 30-mL portions of *Solvent,* and transfer the washings to the column, allowing each rinsing to drain to the top of the column bed before applying the next rinse. Collect a total of 120 mL of effluent. Add 10 drops of phenolphthalein TS to the effluent, bubble nitrogen through the solution, and titrate with 0.02 N alcoholic potassium hydroxide VS until the solution remains pale pink after mixing for 10 seconds. Titrate a blank using 120 mL of *Solvent.* Calculate the quantity, in mEq, of free fatty acids in the portion of Emulsion taken by the formula:

$$(V_U - V_B)N / 20C$$

in which V_U is the volume, in mL, of 0.02 N alcoholic potassium hydroxide consumed by the eluant; V_B is the volume, in mL, of 0.02 N alcoholic potassium hydroxide consumed by the blank; N is the normality of the 0.02 N alcoholic potassium hydroxide; and C is the labeled concentration, in g per mL, of the ~~sum of the individual~~ oils in the Emulsion: not more than 0.07 mEq of free fatty acids per ~~mL~~ g of Emulsion is found.

Other requirements—It meets the requirements under *Injections* ⟨1⟩.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of isopropanol, ethyl acetate, and glacial acetic acid (179 : 20 : 1).

Standard preparation—Dissolve an accurately weighed portion of Soybean Oil (or other relevant oils used in the Emulsion) in *Mobile phase* to obtain a solution having a known concentration of about 8 mg per mL.

Assay preparation—Transfer an accurately measured portion of Emulsion, equivalent to about 800 mg of oil, ~~to a suitable container, and freeze dry. Dissolve the residue in *Mobile phase,* and quantitatively transfer~~ to a 100-mL volumetric flask with the aid of additional portions of *Mobile phase.* Dilute with *Mobile phase* to volume, and mix to obtain a solution containing about 8 mg of oil per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector and a ~~4.6-mm~~ 4.1-mm × 25-cm column that contains packing L21. The flow rate is about 1 mL per minute, adjusted so that the peak due to oil elutes at about 6.5 minutes. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the capacity factor, k', is not less than 1.0; the tailing factor for the oil peak is not more than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%.

In-Process Revision

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of oil in the portion of Emulsion taken by the formula:

$$100C(r_U / r_S)$$

~~in which *C* is the concentration, in mg per mL, of Soybean Oil in the *Standard preparation;* and r_u and r_s are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.~~ in which *C* is the concentration, in mg per mL, of Soybean Oil or other relevant oils used in the Emulsion in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP30*)

BRIEFING

Loperamide Hydrochloride Oral Solution, *USP 29* page 1269. On the basis of comments received, it is proposed to provide additional information for the preparation of the *Standard preparation* in the *Assay.*

(MD-GRE: E. Gonikberg) RTS—44051-1

Change to read:

Assay—

Buffer solution—Transfer 3.0 g of monobasic potassium phosphate to a 1-L volumetric flask, dissolve in and dilute with water to volume, and mix.

Mobile phase—Prepare a mixture of *Buffer solution* and acetonitrile (63 : 37), and adjust with 0.9 M phosphoric acid to a pH of 3.0. Mix, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation— ~~Dissolve an accurately weighed quantity of USP Loperamide Hydrochloride RS in methanol, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 10 µg per mL.~~

■Dissolve an accurately weighed quantity of USP Loperamide Hydrochloride RS in methanol to obtain a solution having a known concentration of about 2 mg per mL. Quantitatively dilute this solution with water to obtain a solution having a known concentration of about 0.1 mg per mL. Further dilute this solution with *Mobile phase* to obtain a solution having a known concentration of about 10 µg of loperamide hydrochloride per mL.■1S (*USP30*)

Assay preparation—Transfer an accurately measured volume of Oral Solution, equivalent to about 1.0 mg of loperamide hydrochloride, to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume, mix, and filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 214-nm detector and a 4.0-mm × 8.0-cm column that contains 5-µm packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak areas as directed for *Procedure:* the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of loperamide hydrochloride ($C_{29}H_{33}ClN_2O_2 \cdot HCl$) in each mL of Oral Solution taken by the formula:

$$100(C/V)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Loperamide Hydrochloride RS in the *Standard preparation; V* is the volume of Oral Solution taken to prepare the *Assay preparation;* and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Milk of Magnesia, *USP 29* page 1291. It is proposed to delete the test for *Limit of calcium* because this test is also required for raw materials used in the preparation of *Milk of Magnesia* and, therefore, provides assurance of the quality of the material.

(MD-GRE: E. Gonikberg) RTS—44052-1

Delete the following:

■~~**Limit of calcium—**~~

~~*Dilute hydrochloric acid, Lanthanum solution, Standard preparations,* and *Blank solution*—Proceed as directed in the test for *Limit of calcium* under *Magnesium Carbonate*.~~

~~*Test preparation*—Transfer the equivalent of 1.4 g of regular-strength Milk of Magnesia to a beaker, add 60 mL of *Dilute hydrochloric acid*, and stir until dissolved, heating if necessary. Transfer the solution so obtained to a 200-mL volumetric flask containing 4 mL of *Lanthanum solution*, dilute with water to volume, and mix.~~

~~*Procedure*—Proceed as directed in the test for *Limit of calcium* under *Magnesium Carbonate*. Calculate the percentage of calcium in the Milk of Magnesia taken by multiplying the concentration, in µg per mL, of calcium found in the *Test preparation* by 0.014: the limit is 0.07%.~~■1S (*USP30*)

In-Process Revision

BRIEFING

Methyldopa Oral Suspension, *USP 29* page 1396. It is proposed to delete the test for *Limit of methyldopa-glucose reaction product* because the required USP Reference Standard for this test is not available.

(MD-CV: S. Ramakrishna) RTS—44024-1

Change to read:

USP Reference standards ⟨11⟩—*USP Methyldopa RS.* ~~*USP Methyldopa-glucose Reaction Product RS.*~~

■■1S (*USP30*)

Delete the following:

■~~**Limit of methyldopa-glucose reaction product** [TO BE DETERMINED IF SUCROSE IS PRESENT]~~

~~*Mobile phase*—Prepare as directed in the *Assay.*~~

~~*Solution A*—Dissolve a suitable, accurately weighed quantity of USP Methyldopa-glucose Reaction Product RS in 0.1 N sulfuric acid to obtain a solution having a known concentration of about 0.45 mg per mL.~~

~~*Standard solution*—Transfer about 25 mg of USP Methyldopa RS, accurately weighed, to a 25-mL volumetric flask, add 1.0 mL of *Solution A*, dilute with 0.1 N sulfuric acid to volume, and mix. The *Standard solution* has a known concentration of about 18 µg of USP Methyldopa-glucose Reaction Product RS per mL.~~

~~*Test solution*—Prepare as directed for *Assay preparation* in the *Assay.*~~

~~*Chromatographic system*—Use the system described under *Chromatographic system* in the *Assay.* The relative retention times for methyldopa and methyldopa-glucose reaction product are about 1.0 and 0.8, respectively. Chromatograph three replicate injections of the *Standard solution:* the resolution factor, *R,* between methyldopa and methyldopa-glucose reaction product is not less than 2.0. The relative standard deviations for three replicate injections of the *Standard solution* are not more than 2.0% and 3.0% for methyldopa and methyldopa-glucose reaction product, respectively.~~

~~*Procedure*—Proceed as directed for *Procedure* in the *Assay.* Calculate the quantity, in µg, of methyldopa equivalent to the methyldopa-glucose reaction product in each mL of the Oral Suspension taken by the formula:~~

~~$$(211.22/373.35)(250)(CD/W)(r_u/r_s)$$~~

~~in which 211.22 and 373.35 are the molecular weights of anhydrous methyldopa and methyldopa-glucose reaction product, respectively; *C* is the concentration, in µg per mL, of USP Methyldopa-glucose Reaction Product RS in the *Standard solution;* r_u and r_s are the peak responses of the methyldopa-glucose reaction product obtained from the *Test solution* and the *Standard solution,* respectively; and the other terms are as defined therein. The limit is 10.0%, based on the methyldopa content of the Oral Suspension as determined in the *Assay.*~~■1S (*USP30*)

BRIEFING

Methylprednisolone, *USP 29* page 1406. It is proposed to revise the test for *Chromatographic purity* to correct the formula provided in the *Procedure.*

(MD-PS: D. Bempong) RTS—43741-1

Change to read:

Chromatographic purity—

Mobile phase—Prepare a filtered and degassed mixture of water, tetrahydrofuran, dimethylsulfoxide, and butanol (149 : 40 : 10 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluting solution—Prepare a filtered mixture of water, tetrahydrofuran, and glacial acetic acid (72 : 25 : 3).

Standard solution—Dissolve an accurately weighed quantity of USP Methylprednisolone RS in *Diluting solution.* Dilute quantitatively, and stepwise if necessary, with *Diluting solution* to obtain a solution having a known concentration of about 0.01 mg per mL.

Test solution—Transfer about 25 mg of Methylprednisolone, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Diluting solution* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 20-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 800 theoretical plates; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—~~Inject a volume (about 10 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak responses. Calculate the amount of each impurity in the portion of Methylprednisolone taken by the formula:~~

~~$$20C(r_i/r_s),$$~~

~~in which *C* is the concentration, in mg per mL, of USP Methylprednisolone RS in the *Standard solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_s is the peak response obtained in the *Standard solution;*~~

■Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Methylprednisolone taken by the formula:

$$25 \times 100(C/W)(r_i/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Methylprednisolone RS in the *Standard solution; W* is the weight, in mg, of the sample taken to prepare the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the peak response for methylprednisolone in the *Standard solution:*■1S (*USP30*)
not more than 1.0% of any individual impurity is found, and not more than 2.0% of total impurities is found.

In-Process Revision

BRIEFING

Mitoxantrone Injection, *USP 29* page 1447. To better represent currently marketed products, it is proposed to revise the *Packaging and storage* statement to include multiple-dose containers.

Change to read:

Packaging and storage—Preserve in single-dose

■or in multiple-dose■1S (*USP30*) containers, preferably of Type I glass.

BRIEFING

Morantel Tartrate, *USP 29* page 1455. On the basis of comments received, it is proposed to raise the upper limit of the *pH* from 3.2 to 3.9. Interested parties are encouraged to submit comments.

(VET: I. DeVeau) RTS—43546-1

Change to read:

pH ⟨791⟩**:** between 2.8 and ~~3.2~~

■3.9.■1S (*USP30*)
Solution—Dissolve and dilute 0.25 g to 25.0 mL in carbon dioxide-free water.

BRIEFING

Nifedipine Extended-Release Tablets, *USP 29* page 1531. It is proposed to add an identical *Test 5* to both the currently official *Drug release* section and to the delayed implementation date *Dissolution* section of this monograph because FDA recently approved a new generic version of this product. In the absence of any negative comments, it is proposed to implement this revision via the *Fourth Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of August 1, 2006.

(BPC: M. Marques) RTS—44118-1

Change to read:

Drug release ⟨724⟩—

TEST 1—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 1.*

Medium: water; 50 mL.

Apparatus 7: 15 to 30 cycles per minute. Do not use the reciprocating disk, but use a 25-cm plexiglas rod, the perimeter of the Tablets being affixed to the rod with a water-insoluble glue. The solution containers are 25-mm test tubes, 150 to 200 mm in length, and the water bath is maintained at 37 ± 0.5°. At the end of each specified test interval, the systems are transferred to the next row of new test tubes containing 50 mL of fresh *Medium*.

Times: 4, 8, 12, 16, 20, and 24 hours.

Diluting solution: a mixture of methanol and water (1 : 1).

Standard solutions—Transfer about 50 mg of USP Nifedipine RS, accurately weighed, to a 100-mL volumetric flask, dissolve in 50 mL of methanol, dilute with water to volume, and mix to obtain a Standard stock solution. Quantitatively dilute this Standard stock solution with *Diluting solution* to obtain solutions having suitable known concentrations.

Test solution—Use portions of the solution under test, passed through a 0.4-µm filter, suitably diluted with methanol, and stepwise, if necessary, with *Diluting solution* to obtain a final mixture consisting of equal parts of methanol and water.

Procedure—Determine the amount of $C_{17}H_{18}N_2O_6$ released in the *Test solution* at each 4-hour interval by employing UV absorption at the wavelength of maximum absorbance at about 338 nm, in 0.5-cm cells. [NOTE—For the 4-hour time period, determine the absorbance at 456 nm, and use this determination to correct for excipient interference.]

Tolerances—The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$), released in vivo and dissolved at the times specified, conform to *Acceptance Table 1*.

Time (hours)	Amount dissolved*
4	between 5% and 17%
8	—
12	between 43% and 80%
16	—
20	—
24	not less than 80%

* The amount dissolved is expressed in terms of the labeled tablet strength rather than in terms of the labeled total contents.

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 2.*

Buffer concentrate—Transfer 330.9 g of dibasic sodium phosphate and 38 g of citric acid to a 1-L volumetric flask, add water to dissolve, add 10 mL of phosphoric acid, dilute with water to volume, and mix.

Medium—Mix 125.0 mL of *Buffer concentrate* and 1 L of 10% sodium lauryl sulfate solution, and dilute to 10 L. Adjust if necessary to a pH of 6.8; 900 mL.

Apparatus 2: 50 rpm, with sinkers (see *Figure 1*).

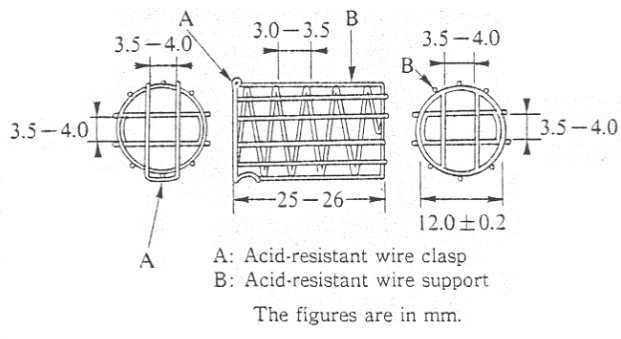

Figure 1 (printed with permission of the Japanese Pharmacopoeia)

Times: 3, 6, and 12 hours.

Determine the amount of nifedipine ($C_{17}H_{18}N_2O_6$) dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (70 : 30). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Nifedipine RS in methanol to obtain a solution having a known concentration of about 1.11 mg per mL. Dilute quantitatively and stepwise with *Medium* to obtain a solution having a known concentration of 0.1 mg per mL.

Chromatographic system—The liquid chromatograph is equipped with a 350-nm detector and a 4.0-mm × 125-mm column that contains 3-µm packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at about 40°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 2000 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of filtered portions of the *Standard solution* and the solution under test into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Determine the amount of nifedipine ($C_{17}H_{18}N_2O_6$) dissolved.

Tolerances—The percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$) released in vivo and dissolved at the times specified conform to *Acceptance Table 1*.

Time (hours)	Amount dissolved
3	between 10% and 30%
6	between 40% and 65%
12	not less than 80%

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 3*.

FOR TABLETS LABELED TO CONTAIN 30 MG OF NIFEDIPINE—

Phase 1:

Medium: 0.05 M phosphate buffer, pH 7.5; 900 mL.

Apparatus 2: 100 rpm.

Time: 1 hour.

Standard solution—Prepare a solution in *Medium* having an accurately known concentration of about 0.034 mg of USP Nifedipine RS per mL. If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.

Procedure—[NOTE—After the run, take the Tablet out of the dissolution vessel, adapt a sinker to it, and transfer the Tablet with the sinker to the dissolution vessel containing the *Medium* for *Phase 2*.] Determine the amount of $C_{17}H_{18}N_2O_6$ released in *Phase 1* from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the *Standard solution*, using the *Medium* as the blank.

Phase 2:

Medium: 0.5% sodium lauryl sulfate in simulated gastric fluid without enzyme, pH 1.2; 900 mL.

Apparatus 2: 100 rpm.

Times: 1, 4, 8, and 12 hours.

Standard solution—Prepare a solution in *Medium* having an accurately known concentration of about 0.034 mg of USP Nifedipine RS per mL. If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.

Procedure—Determine the amount of $C_{17}H_{18}N_2O_6$ released in *Phase 2* from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the *Standard solution*, using *Medium* as the blank.

Tolerances—The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$), released in vivo and dissolved at the times specified, conform to *Acceptance Table 1*.

Time (hours)	Amount dissolved*
1	not more than 30%
4	between 30% and 55%
8	not less than 60%
12	not less than 80%

* For each dosage unit, add the amount dissolved in phosphate buffer, pH 7.5 from *Phase 1* to the amount dissolved at each time point in *Phase 2*.

FOR TABLETS LABELED TO CONTAIN 60 MG OF NIFEDIPINE—

Phase 1:

Medium: 0.05 M phosphate buffer, pH 7.5; 900 mL.

Apparatus 2: 100 rpm.

Time: 25 minutes.

Standard solution—Prepare a solution in *Medium* having an accurately known concentration of about 0.067 mg of USP Nifedipine RS per mL. If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.

Procedure—[NOTE—After the run, take the Tablet out of the dissolution vessel, adapt a sinker to it, and transfer the Tablet with the sinker to the dissolution vessel containing the *Medium* for *Phase 2*.] Determine the amount of $C_{17}H_{18}N_2O_6$ released in *Phase 1* from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the *Standard solution*, using the *Medium* as the blank.

Phase 2:

Medium: 0.5% sodium lauryl sulfate in simulated gastric fluid without enzyme, pH 1.2; 900 mL.

Apparatus 2: 100 rpm.

Times: 1, 4, 8, and 12 hours.

Standard solution—Prepare a solution in *Medium* having an accurately known concentration of about 0.067 mg of USP Nifedipine RS per mL. If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.

Procedure—Determine the amount of $C_{17}H_{18}N_2O_6$ released in *Phase 2* from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the *Standard solution*, using *Medium* as the blank.

Tolerances—The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$), released in vivo and dissolved at the times specified, conform to *Acceptance Table 1*.

Time (hours)	Amount dissolved*
1	not more than 30%
4	between 40% and 70%
8	not less than 70%
12	not less than 80%

* For each dosage unit, add the amount dissolved in phosphate buffer, pH 7.5 from *Phase 1* to the amount dissolved at each time point in *Phase 2*.

TEST 4—If the product complies with this test, the labeling indicates that the product meets USP *Drug Release Test 4*.

Medium: 0.5% sodium lauryl sulfate in simulated gastric fluid without enzyme, pH 1.2; 900 mL.

Apparatus 2: 100 rpm.

Times: 1, 4, and 12 hours.

Standard solution—Prepare a solution in *Medium* having an accurately known concentration of about 0.067 mg of USP Nifedipine RS per mL for Tablets labeled to contain 60 mg, and of about 0.034 mg of USP Nifedipine RS per mL for Tablets labeled to contain 30 mg. If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.

In-Process Revision

Procedure—Determine the amount of $C_{17}H_{18}N_2O_6$ released from UV absorbances at the wavelength of maximum absorbance at about 238 nm using filtered portions of the solution under test, in comparison with the *Standard solution*, using the *Medium* as the blank.

Tolerances—The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$), released at the times specified, conform to *Acceptance Table 1*.

FOR TABLETS LABELED TO CONTAIN 30 MG OF NIFEDIPINE

Time (hours)	Amount dissolved
1	between 12% and 35%
4	between 44% and 67%
12	not less than 80%

FOR TABLETS LABELED TO CONTAIN 60 MG OF NIFEDIPINE

Time (hours)	Amount dissolved
1	between 10% and 30%
4	between 40% and 63%
12	not less than 80%

•TEST 5—If the product complies with this test, the labeling indicates that the product meets USP *Drug Release Test 5*.

Medium: water; 50 mL.

Apparatus 7—Use a 25-cm plexiglas rod, the perimeter of the Tablets being affixed to the rod with a water-insoluble glue; 30 dips per minute. The solution containers are 25-mm test tubes, 150 to 200 mm in length, and the water bath is maintained at 37 $\pm$0.5°.

Time: 4, 12, and 24 hours.

Diluting solution 1—Prepare a mixture of methanol and acetonitrile (1 : 1).

Diluting solution 2—Prepare a mixture of *Diluting solution 1* and water (1 : 1).

Standard solutions—Transfer about 50 mg of USP Nifedipine RS, accurately weighed, to a 100-mL volumetric flask, dissolve in 50 mL of *Diluting solution 1,* dilute with water to volume, and mix. Quantitatively dilute this solution with *Diluting solution 2* to obtain solutions having known concentrations of 0.01 mg per mL, 0.05 mg per mL, and 0.20 mg per mL that are used at 4, 12, and 24 hours sampling, respectively.

Procedure—[NOTE—For the 4-hour time period, filter the solution under test, and determine the absorbance at 456 nm. Use this absorbance value to correct for excipient interference at the other time points.] Determine the amount of nifedipine released at each interval by employing UV absorption at the wavelength of maximum absorbance at about 338 nm on portions of the solution under test passed through a suitable 0.45-µm filter, suitably diluted, if necessary, with *Diluting solution 1* and water to obtain a final mixture of water, methanol, and acetonitrile (2 : 1 : 1), in comparison with the appropriate *Standard solution,* using 0.5-cm cells, and *Diluting solution 2* as the blank.

Tolerances—The cumulative percentages of the labeled amount of nifedipine, released in vivo and dissolved at the times specified, conform to *Acceptance Table 1*.

Time (hours)	Amount dissolved
4	not more than 14%
12	between 39% and 75%
24	not less than 75%

BRIEFING

Nimodipine, *USP 29* page 1535. It is proposed to revise the test for *Related compounds* to simplify the procedures for preparing Standard solutions and to correct the formula provided in the *Procedure.* An incorrect reference provided in *Identification* test *B* has also been corrected.

(MD-CV: D. Bempong) RTS—43759-1; 43760-1; 43760-2; 43793-1; 43793-2

Change to read:

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of *Standard solution 1,* as obtained in the test for ~~*Chromatographic purity.*~~

■*Related compounds.*■1S *(USP30)*

Change to read:

Related compounds—

Mobile phase—Prepare a filtered and degassed mixture of water, methanol, and tetrahydrofuran (3 : 1 : 1).

Standard solution 1—~~Transfer about 40 mg of USP Nimodipine RS, accurately weighed, to a 25-mL volumetric flask, dissolve in 2.5 mL of tetrahydrofuran, dilute with *Mobile phase* to volume, and mix. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 2.0 mL of this second solution to a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.~~

■Transfer an accurately weighed quantity of USP Nimodipine RS to a suitable volumetric flask, dissolve in a volume of tetrahydrofuran equivalent to about 10% of the volume of the volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution containing about 1.6 mg per mL. Dilute an aliquot of this solution with *Mobile phase* to obtain a solution having a known concentration of about 3.2 µg per mL.■1S *(USP30)*

Standard solution 2—~~Transfer about 20.0 mg of USP Nimodipine Related Compound A RS, accurately weighed, to a 25-mL volumetric flask, dissolve in 2.5 mL of tetrahydrofuran, dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.~~

■Transfer accurately weighed quantities of USP Nimodipine RS and USP Nimodipine Related Compound A RS to a suitable volumetric flask, dissolve in a volume of tetrahydrofuran equivalent to about 10% of the volume of the volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution containing 0.8 mg per mL each of USP Nimodipine RS and USP Nimodipine Related Compound A RS. Dilute an aliquot of this solution with *Mobile phase* to obtain a solution having a known concentration of about 1.6 µg per mL each of USP Nimodipine RS and USP Nimodipine Related Compound A RS.■1S *(USP30)*

~~*Standard solution 3*—Transfer 2.5 mL of *Standard solution 1* to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.~~

~~*Standard solution 4*—Transfer 1.0 mL of *Standard solution 2* and 1.0 mL of *Standard solution 3* to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.~~

■■1S *(USP30)*

Test solution—Transfer about 40 mg of Nimodipine, accurately weighed, to a 25-mL volumetric flask, dissolve in 2.5 mL of tetrahydrofuran, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 235-nm detector and a 4.6-mm × 12.5-cm column that contains packing L1. The flow rate is about 2 mL per minute. The column temperature is maintained at 40°. Chromatograph ~~*Standard solution 4,*~~

■*Standard solution 2,*■1S *(USP30)* and record the peak responses as directed for *Procedure:* ~~the relative retention times are about 0.9 for nimodipine related compound A and 1.0 for nimodipine;~~

■■1S *(USP30)* the resolution, *R,* between nimodipine related compound A and nimodipine is not less than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

■[NOTE—For the purpose of identification, the relative retention times are about 0.9 for nimodipine related compound A and 1.0 for nimodipine.]■1S *(USP30)*

Procedure—Separately inject equal volumes (about 20 µL) of *Standard solution 1,*~~*Standard solution 4,*~~

BRIEFING

Paclitaxel, *USP 29* page 1624. It is proposed to revise the test for *Related compounds* to add *Test 3* for materials produced by fermentation. *Test 3* will require the new USP Paclitaxel Impurity Mixture RS. The liquid chromatographic procedure in this test is based on analyses performed with the YMC-Pack ODS-A brand of L1 column. The typical retention time for Paclitaxel is about 27 minutes.

(MD-OOD: F. Mao) RTS—43952-1

Change to read:

Related compounds—

TEST 1 (FOR MATERIAL LABELED AS ISOLATED FROM NATURAL SOURCES)—If the material complies with this test, the labeling indicates that it meets USP *Related compounds Test 1.*

Diluent—Prepare as directed in the *Assay.*

Solution A—Prepare filtered and degassed acetonitrile.

Solution B—Prepare filtered and degassed water.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve accurately weighed quantities of USP Paclitaxel Related Compound A RS and USP Paclitaxel Related Compound B RS in methanol to obtain a solution having known concentrations of about 10 µg of each per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Standard solution—Dissolve, with the aid of sonication, an accurately weighed quantity of USP Paclitaxel RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 5 µg per mL.

Test solution—Use the *Assay preparation.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 227-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L43. The flow rate is about 2.6 mL per minute. The column temperature is maintained at 30°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–35	35	65	isocratic
35–60	35→80	65→20	linear gradient
60–70	80→35	20→65	linear gradient
70–80	35	65	isocratic

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.78 for paclitaxel related compound A and 0.86 for paclitaxel related compound B (relative to the retention time for paclitaxel obtained from the *Test solution*); and the resolution, *R,* between paclitaxel related compound A and paclitaxel related compound B is not less than 1.0. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

In-Process Revision

Procedure—Inject a volume (about 15 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the areas for the major peaks. Calculate the percentage of each impurity in the portion of Paclitaxel taken by the formula:

$$100(Fr_i / r_U)$$

in which F is the relative response factor for each impurity peak (see *Table 1* for values); r_i is the peak area for each individual impurity; and r_U is the peak area for paclitaxel.

Table 1

Relative Retention Time	Relative Response Factor *(F)*	Name	Limit (%)
0.24	1.29	Baccatin III	0.2
0.53	1.00	10-Deacetylpaclitaxel	0.5
0.57	1.00	7-Xylosylpaclitaxel	0.2
0.78	1.26	Cephalomannine (paclitaxel related compound A)	a_1[1]
0.78	1.26	2″,3″-Dihydrocephalomannine	a_2[1]
0.86	1.00	10-Deacetyl-7-epipaclitaxel (paclitaxel related compound B)	0.5
1.10	1.00	Benzyl analog[3]	b_1[2]
1.10	1.00	3″,4″-Dehydropaclitaxel C	b_2[2]
1.40	1.00	7-Epicephalomannine	0.3
1.85	1.00	7-Epipaclitaxel	0.5

[1] Resolution may be incomplete for these peaks, depending upon the relative amounts present; the sum of a_1 and a_2 is not more than 0.5%.
[2] Resolution may be incomplete for these peaks, depending upon the relative amounts present; the sum of b_1 and b_2 is not more than 0.5%.
[3] The following chemical name is assigned to the related compound Benzyl analog: Baccatin III 13-ester with (2*R*,3*S*)-2-hydroxy-3-phenyl-3-(2-phenylacetylamino)propanoic acid.

In addition to not exceeding the limits for paclitaxel related impurities in *Table 1,* not more than 0.1% of any other single impurity is found; and not more than 2.0% of total impurities is found.

TEST 2 (FOR MATERIAL LABELED AS PRODUCED BY A SEMISYNTHETIC PROCESS)—If the material complies with this test, the labeling indicates that it meets USP *Related compounds Test 2.*

Diluent—Use acetonitrile.

Solution A—Use a filtered and degassed mixture of water and acetonitrile (3 : 2).

Solution B—Use filtered and degassed acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve accurately weighed quantities of USP Paclitaxel RS and USP Paclitaxel Related Compound B RS in *Diluent,* shaking and sonicating if necessary, to obtain a solution having known concentrations of about 0.96 mg and 0.008 mg per mL, respectively.

Test solution—Transfer about 10 mg of Paclitaxel, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, shaking and sonicating if necessary, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 227-nm detector and a 4.6-mm × 15-cm column that contains 3-µm packing L1. The flow rate is about 1.2 mL per minute. The column temperature is maintained at 35°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–20	100	0	isocratic
20–60	100→10	0→90	linear gradient
60–62	10→100	90→0	linear gradient
62–70	100	0	isocratic

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.94 for paclitaxel related compound B and 1.0 for paclitaxel; the resolution, *R,* between paclitaxel related compound B and paclitaxel is not less than 1.2; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 15 µL) of the *Diluent* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Disregard any peaks due to the *Diluent.* Calculate the percentage of each impurity in the portion of Paclitaxel taken by the formula:

$$100(Fr_i / r_s)$$

in which F is the relative response factor for each impurity (see *Table 2* for values); r_i is the peak area for each impurity obtained from the *Test solution;* and r_s is the sum of the areas of all the peaks obtained from the *Test solution.*

Table 2

Relative Retention Time	Relative Response Factor *(F)*	Name	Limit (%)
0.11	1.24	10-Deacetylbaccatin III	0.1
0.20	1.29	Baccatin III	0.2
0.42	1.39	Photodegradant[2]	0.1
0.47	1.00	10-Deacetylpaclitaxel	0.5
0.80	1.00	2-Debenzoylpaclitaxel-2-pentenoate	0.7
0.92[1]	1.00	Oxetane ring opened, acetyl and benzoyl[2]	x_1
0.92[1]	1.00	10-Acetoacetylpaclitaxel	x_2
0.94[1]	1.00	10-Deacetyl-7-epipaclitaxel (paclitaxel related compound B)	x_3
1.37	1.00	7-Epipaclitaxel	0.4
1.45	1.00	10,13-Bissidechainpaclitaxel[2]	0.5
1.54	1.00	7-Acetylpaclitaxel	0.6
1.80	1.75	13-Tes-baccatin III	0.1
2.14	1.00	7-Tes-paclitaxel	0.3

[1] Resolution may be incomplete for these peaks, depending upon the relative amounts present; the sum of x_1, x_2, and x_3 is not more than 0.4%.
[2] The following chemical names are assigned to the related compounds Photodegradant; Oxetane ring opened, acetyl and benzoyl; and 10,13-Bissidechainpaclitaxel:

Photodegradant
(1*R*,2*R*,4*S*,5*S*,7*R*,10*S*,11*R*,12*S*,13*S*,15*S*,16*S*)-2,10-diacetyloxy-5,13-dihydroxy-4,16,17,17-tetramethyl-8-oxa-3-oxo-12-phenylcarbonyloxypentacyclo[11.3.1.$0^{1,11}$.$0^{4,11}$.$0^{7,10}$]heptadec-15-yl
(2*R*,3*S*)-2-hydroxy-3-phenyl-3-(phenylcarbonylamino)propanoate

Oxetane ring opened, acetyl and benzoyl migrated
(1*S*,2*S*,3*R*,4*S*,5*S*,7*S*,8*S*,10*R*,13*S*)-5,10-diacetyloxy-1,2,4,7-tetrahydroxy-8,12,15,15-tetramethyl-9-oxo-4-(phenylcarbonyloxymethyl)tricyclo[9.3.1.$0^{3,8}$]pentadec-11-en-13-yl
(2*R*,3*S*)-2-hydroxy-3-phenyl-3-(phenylcarbonylamino)propanoate

10,13-Bissidechainpaclitaxel
Baccatin III 13-ester with (2*R*,3*S*)-2-hydroxy-3-phenyl-3-(phenylcarbonylamino)propanoic acid, 10-ester with (2*S*,3*S*)-2-hydroxy-3-phenyl-3-(phenylcarbonylamino)propanoic acid

In addition to not exceeding the limits for paclitaxel related impurities in *Table 2,* not more than 0.1% of any other single impurity is found; and not more than 2.0% of total impurities is found.

■TEST 3 (FOR MATERIAL LABELED AS PRODUCED BY A PLANT CELL FERMENTATION PROCESS)—If the material complies with this test, the labeling indicates that it meets USP *Related compounds Test 3.*

Solution A—Prepare a filtered and degassed mixture of water and acetonitrile (3 : 2).

Solution B—Prepare filtered and degassed acetonitrile.

In-Process Revision

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve USP Paclitaxel Impurity Mixture RS in acetonitrile, sonicating if necessary, to obtain a solution having a known concentration of about 1 mg per mL.

Standard solution—Dissolve an accurately weighed quantity of USP Paclitaxel RS in acetonitrile, sonicating if necessary, to obtain a solution having a known concentration of about 1 mg per mL.

Test solution—Transfer about 10 mg of Paclitaxel, accurately weighed, to a 10-mL volumetric flask. Dissolve in and dilute with acetonitrile to volume, sonicating if necessary, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 227-nm detector and a 4.6-mm × 15-cm column that contains 3-µm packing L1. The flow rate is about 1.2 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–28	100	0	isocratic
28–33	100→98	0→2	linear gradient
33–58	98→10	2→90	linear gradient
58–60	10	90	isocratic
60–63	10→100	90→0	linear gradient
63–70	100	0	isocratic

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between paclitaxel and benzyl analog is not less than 1.8. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%. [NOTE—For the purpose of peak identification, the approximate relative retention times are given in *Table 3*. The relative retention times are measured versus Paclitaxel.]

Table 3

Name	Relative Retention Time	Limit (%)
Propyl analog[1]	0.54	0.2
Cephalomannine (Paclitaxel related compound A)	0.76	0.5
sec-Butyl analog[2]	0.81	0.2
n-Butyl analog[3]	0.89	0.1
Benzyl analog	1.10	0.4
Baccatin VI	1.23	0.2
Pentyl analog[4]	1.31	0.2
7-Epipaclitaxel	1.51	0.4

[1] The following chemical name is assigned to the related compound Propyl analog: Baccatin III 13-ester with (2*R*,3*S*)-2-hydroxy-3-(propanoylamino)propanoic acid.
[2] The following chemical name is assigned to the related compound *sec*-Butyl analog: Baccatin III 13-ester with (2*R*,3*S*)-2-hydroxy-3-(2-methylbutanoylamino)-3-phenylpropanoic acid.
[3] The following chemical name is assigned to the related compound *n*-Butyl analog: Baccatin III 13-ester with (2*S*,3*S*)-3-(butanoylamino)-2-hydroxy-3-phenylpropanoic acid.
[4] The following chemical name is assigned to the related compound Pentyl analog: Baccatin III 13-ester with (2*R*,3*S*)-2-hydroxy-3-(pentanoylamino)-3-phenylpropanoic acid.

Procedure—Inject a volume (about 12 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the areas for all the peaks. Calculate the percentage of each impurity in the portion of Paclitaxel taken by the formula:

$$100(r_i / r_U)$$

in which r_i is the response of each individual impurity; and r_U is the sum of the areas of all the peaks obtained from the *Test solution*. In addition to not exceeding the limits for Paclitaxel

related impurities in *Table 3,* not more than 0.1% of any other single impurity is found; and not more than 2.0% of total impurities is found.■1S (*USP30*)

BRIEFING

Pentobarbital Sodium Injection, *USP 29* page 1680. It is proposed to replace the nonspecific gravimetric assay with a specific stability-indicating HPLC assay. The method is based on the HPLC method used for the Pentobarbital and Pentobarbital Sodium monographs. The method was verified using the Phenomenex Gemini C18 brand of L1 column. The typical retention time for pentobarbital is about 12 minutes. Consequently, the *Identification* test has been revised to use retention time by HPLC.

(MD-PP: R. Ravichandran) RTS—44094-1

Change to read:

Identification— ~~The residue obtained in the *Assay* responds to *Identification* test *A* under *Pentobarbital Sodium*.~~

■The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*■1S (*USP30*)

Change to read:

Assay— ~~Pipet a volume of Injection, equivalent to about 500 mg of pentobarbital sodium, into a separator, and dilute with water to about 15 mL. To the solution add 2 mL of hydrochloric acid, shake, and completely extract the liberated pentobarbital with 25-mL portions of chloroform. Test for completeness of extraction by extracting with an additional 10-mL portion of chloroform and evaporating the solvent: not more than 0.5 mg of residue remains. Filter each extract through a pledget of chloroform-washed cotton, or other suitable filter, into a tared beaker, and finally wash the separator and the filter with several small portions of chloroform. Evaporate the combined filtrate and washings on a steam bath with the aid of a current of air, add 10 mL of ether, again evaporate, dry the residue at 105° for 2 hours, cool, and weigh. The weight of the residue, multiplied by 1.097, represents the weight of pentobarbital sodium ($C_{11}H_{17}N_2NaO_3$).~~

■*Mobile phase, Standard preparation,* and *Chromatographic system*—Proceed as directed in the *Assay* under *Pentobarbital.*

Assay preparation—Quantitatively dilute a suitable volume of Pentobarbital Sodium Injection with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{11}H_{17}N_2NaO_3$ in the portion of Pentobarbital Sodium Injection taken by the formula:

$$100(248.25/226.27)(C_S/C_U)(r_U/r_S)$$

in which 248.25 and 226.27 are the molecular weights of pentobarbital sodium and pentobarbital, respectively; C_S is the concentration, in mg per mL, of USP Pentobarbital RS in the *Standard preparation;* C_U is the final concentration, in mg per mL, of the *Assay preparation;* and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP30*)

BRIEFING

Potassium Perchlorate, *USP 29* page 1775. Because of the low-volume production of this article and the low cost of a high-quality ACS reagent, it is proposed to remove the requirement for USP Potassium Perchlorate RS and use the reagent instead. The proposed changes appear in the *USP Reference standards* section and the *Assay.* It is also proposed to make appropriate related changes in the general chapter *USP Reference Standards* ⟨11⟩ and in the *Reagents* section of *USP–NF.*

~~wavelength UV light: the R_F value of the principal spot obtained from the *Test preparation* corresponds to that from the *Standard preparation*. Estimate the concentration of any other spots observed in the lane for the *Test preparation* by comparison with the *Standard dilutions:* the sum of the impurities is not greater than 2.0%, and no single impurity is greater than 1.0%.~~

▪*Buffer solution*—Dissolve 1.35 g of monobasic potassium phosphate in 500 mL of water, and adjust with triethylamine to a pH of 7.0 ± 0.5.

Mobile phase—Prepare a mixture containing 450 mL of *Buffer solution,* 350 mL of acetonitrile, and 200 mL of methanol. Pass the mixture through a 0.45-µm membrane filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve suitable quantities of USP Promethazine Hydrochloride RS and USP Promethazine Related Compound A RS in *Mobile phase,* and dilute quantitatively with *Mobile phase,* to obtain a solution having known concentrations of about 1.0 µg per mL and 0.4 µg per mL, respectively.

Test solution—Transfer 20 mg of Promethazine Hydrochloride, accurately weighed, to a 100-mL volumetric flask, add about 50 mL of *Mobile phase,* and shake to dissolve. Dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.2 mL per minute. The column temperature is maintained at 25°, and the samples are maintained at about 4° in a refrigerated autosampler. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between promethazine related compound A and promethazine is not less than 2.0; and the relative standard deviation for replicate injections, calculated for promethazine, is not more than 5.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, and allow the *Test solution* to elute for not less than two times the retention time of promethazine. Record the chromatograms, and measure the peak responses. Calculate the percentage of promethazine related compound A in the portion of Promethazine Hydrochloride taken by the formula:

$$100(C_S / C_U)(r_A / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Promethazine Related Compound A RS in the *Standard solution;* C_U is the concentration of Promethazine Hydrochloride, in mg per mL, in the *Test solution;* r_A is the peak response for promethazine related compound A obtained from the *Test solution;* and r_S is the peak response for promethazine related compound A obtained from the *Standard solution*. Calculate the percentage of any other impurity in the portion of Promethazine Hydrochloride taken by the formula:

$$100(1/F)(C_S / C_U)(r_i / r_S)$$

in which F is the relative response factor (see accompanying table for values) for each impurity; C_S is the concentration, in mg per mL, of USP Promethazine Hydrochloride RS in the *Standard solution;* C_U is the concentration of Promethazine Hydrochloride, in mg per mL, in the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the peak response for promethazine obtained from the *Standard solution*. The limits are as specified in the accompanying table.

In-Process Revision

Compound Name	Relative Retention Time	Relative Response Factor (*F*)	Limit (w/w, %)
Promethazine sulfoxide[1]	about 0.13	0.23	0.2
Promethazine related compound A (phenothiazine)	about 0.8	—	0.2
Promethazine hydrochloride	1.0	—	—
Isopromethazine hydrochloride[2]	about 1.6	1.0	0.5
Individual unknown impurity	—	1.0	0.10
Total impurities	—	—	1.0

[1] (2*RS*)-*N,N*-dimethyl-1-(10*H*-phenothiazin-10-yl)propan-2-amine *S*-oxide.

■1S (*USP30*)

BRIEFING

Promethazine Hydrochloride Tablets, *USP* 29 page 1826. It is proposed to replace the UV spectrophotometric method in the *Assay* with a stability-indicating liquid chromatographic (LC) method. It is also proposed to add a test for *Related compounds* that is based on this LC method and to add a USP Reference Standard for use in this test. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with the 5-µm Luna C18(2) brand of L1 column. The typical retention time for promethazine is 20 minutes. In addition, minor editorial style changes have been made.

NOTE—Throughout the following procedures, protect

■from light■1S (*USP30*)
the test or assay specimens, the Reference ~~Standard~~

■Standards,■1S (*USP30*)
and solutions containing them by conducting the procedures without delay, and under subdued light or using low-actinic glassware.

Add the following:

■Related compounds—

Buffer solution and *Mobile phase*—Proceed as directed in the *Assay.*

Standard solution—Dissolve suitable quantities of USP Promethazine Hydrochloride RS and USP Promethazine Related Compound A RS in *Mobile phase,* and dilute with *Mobile phase* to obtain a solution having known concentrations of about 1.0 µg per mL and 0.4 µg per mL, respectively.

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of powder, equivalent to about 20 mg of promethazine hydrochloride, to a 100-mL volumetric flask, and add about 50 mL of *Mobile phase*. Sonicate for about 1 minute, and shake by mechanical means for 5 minutes. Cool to room temperature, dilute with *Mobile phase* to volume, mix, and pass through a 0.45-µm nylon filter, discarding the first 10 mL of filtrate.

Chromatographic system—Proceed as directed in the *Assay.* Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between promethazine related compound A and promethazine is not less than 2.0; and the relative standard deviation for replicate injections, calculated for promethazine, is not more than 5.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, and allow the *Test solution* to elute for not less than two times the retention time of promethazine.

Record the chromatograms, and measure the peak responses. Calculate the percentage of promethazine related compound A in the portion of Tablets taken by the formula:

$$100(C_S / C_U)(r_A / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Promethazine Related Compound A RS in the *Standard solution;* C_U is the concentration of promethazine hydrochloride (based on the label claim), in mg per mL, in the *Test solution;* r_A is the peak response of promethazine related compound A obtained from the *Test solution;* and r_S is the peak response of promethazine related compound A obtained from the *Standard solution.* Calculate the percentage of any other impurity in the portion of Tablets taken by the formula:

$$100(1/F)(C_S/C_U)(r_i / r_S)$$

in which F is the relative response factor (see accompanying table for values) for each impurity; C_S is the concentration, in mg per mL, of USP Promethazine Hydrochloride RS in the *Standard solution;* C_U is the concentration of promethazine hydrochloride (based on the label claim), in mg per mL, in the *Test solution;* r_i is the peak response of each impurity obtained from the *Test solution;* and r_S is the peak response of promethazine obtained from the *Standard solution.* The limits are as specified in the accompanying table.

Assay—

~~*Buffered palladium chloride solution*~~ ~~Transfer 500 mg of palladium chloride to a 250-mL beaker, add 5 mL of hydrochloric acid, and warm on a steam bath. Add 200 mL of hot water in small quantities while stirring until solution is complete. Cool, dilute with water to 500 mL, and mix. Transfer 25 mL of this solution to a 500-mL volumetric flask. Add 50 mL of 1 N sodium acetate and 48 mL of 1 N hydrochloric acid, dilute with water to volume, and mix.~~

~~*Standard preparation*~~ ~~Transfer about 31 mg of USP Promethazine Hydrochloride RS, accurately weighed, to a low-actinic 250-mL volumetric flask. Dissolve in 0.1 N hydrochloric acid, dilute with 0.1 N hydrochloric acid to volume, and mix.~~

~~*Assay preparation*~~ ~~Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 6.25 mg of promethazine hydrochloride, to a low-actinic 125-mL separator. Add 20 mL of saturated potassium chloride solution, 10 mL of 1 N sodium hydroxide, and 10 mL of methanol, and extract the promethazine with three 20-mL portions of *n* heptane. Filter the heptane extracts through anhydrous sodium sulfate and collect them in a low-actinic 125-mL separator. Extract the promethazine from the *n* heptane solution with three 15-mL portions of 0.1 N hydrochloric acid, collect the acid extracts in a low-actinic 50-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix.~~

~~*Procedure*~~ ~~Into separate test tubes, pipet 2-mL portions of the *Standard preparation,* the *Assay preparation,* and 0.1 N hydrochloric acid to provide a blank. Add 3.0 mL of *Buffered palladium chloride solution* to each tube, and mix. Concomitantly determine the absorbances of the solutions at the wavelength of maximum absorbance at about 470 nm, using a suitable spectrophotometer, and using the blank in the reference cell. Calculate the quantity, in mg, of promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$) in the portion of Tablets taken by the formula:~~

~~$$50C(A_U / A_S)$$~~

~~in which C is the concentration, in mg per mL, of USP Promethazine Hydrochloride RS in the *Standard preparation;* and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation,* respectively.~~

Compound Name	Relative Retention Time	Relative Response Factor (F)	Limit (w/w, %)

In-Process Revision

■*Buffer solution*—Dissolve 1.35 g of potassium phosphate monobasic in 500 mL of water, and adjust with triethylamine to a pH of 7.0 ± 0.5.

Mobile phase—Mix 450 mL of *Buffer solution,* 350 mL of acetonitrile, and 200 mL of methanol. Pass through a 0.45-µm membrane filter, and degas. Make adjustments if necessary (see *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Promethazine Hydrochloride RS in *Mobile phase,* and dilute with *Mobile phase* to obtain a solution having a known concentration of about 4 µg per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of powder, equivalent to about 50 mg of promethazine hydrochloride, to a 250-mL volumetric flask, and add about 100 mL of *Mobile phase*. Sonicate for 30 minutes with intermittent shaking, and shake by mechanical means for an additional 30 minutes. Dilute with *Mobile phase* to volume, mix, and pass through a 0.45-µm nylon filter, discarding the first 10 mL of filtrate. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.2 mL per minute. The column temperature is maintained at 25°, and the samples are maintained at 4° in a refrigerated autosampler. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses of the promethazine peaks. Calculate the quantity, in mg, of promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$) in the portion of Tablets taken by the formula:

$$(250)50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Promethazine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP30*)

BRIEFING

Pyridoxine Hydrochloride Injection, *USP 29* page 1870. On the basis of comments received, it is proposed to revise the *Procedure,* subsection *(a),* in the *Assay* to extend the time period just prior to determining the absorbance of the *Standard preparation* and the *Assay preparation.* The additional time allows for the maximum formation of the derivative that results from the coupling reaction between pyridoxine and 2,6-dichloroquinine, thus decreasing the variability of the results.

(DSN: L. Evans) RTS—40767-1

Change to read:

Assay—

Ammonium chloride–ammonium hydroxide buffer—Dissolve 16 g of ammonium chloride in 70 mL of water, add 16 mL of ammonium hydroxide, dilute with water to 100 mL, mix, and filter.

Chlorimide solution—Dissolve 40 mg of 2,6-dichloroquinone-chlorimide in 100 mL of isopropyl alcohol. Store the solution in a refrigerator, and use within 1 month. Do not use the solution if it has become pink.

Standard stock solution—Dissolve a suitable quantity of USP Pyridoxine Hydrochloride RS, accurately weighed, in 0.1 N hydrochloric acid, quantitatively dilute with the same solvent to obtain a solution having a known concentration of about 0.1 mg per mL, and mix. Keep the solution in an amber bottle, in a cool place.

Standard preparation—In a 100-mL volumetric flask dilute 10.0 mL of *Standard stock solution* with water to volume, and mix. Prepare this solution daily as needed.

Assay preparation—Dilute an accurately measured volume of Injection, equivalent to about 100 mg of pyridoxine hydrochloride, quantitatively and stepwise with water to a concentration of about 10 µg of pyridoxine hydrochloride per mL.

Procedure—

(a) Pipet 5 mL of the clear *Assay preparation* into a flask, add 25.0 mL of isopropyl alcohol, and mix. Pipet 5 mL of the isopropyl alcohol dilution into a glass-stoppered, 25-mL graduated cylinder or test tube; and add in succession, mixing after each addition, 1.0 mL of *Ammonium chloride–ammonium hydroxide buffer,* 1.0 mL of sodium acetate solution (1 in 5), and 1.0 mL of water. Cool to about 25°, then add 1.0 mL of *Chlorimide solution,* and shake vigorously for 10 seconds, accurately timed. ~~Sixty~~

■Ninety■1S *(USP30)* seconds, accurately timed, after the addition of the *Chlorimide solution,* determine the absorbance at the wavelength of maximum absorbance at about 650 nm, with a suitable spectrophotometer, using water as the blank. [NOTE—Make the reading promptly to avoid errors due to fading of the color.] Designate the absorbance as A_U.

(b) Repeat procedure *(a),* but substitute 1.0 mL of boric acid solution (1 in 20) for the 1.0 mL of water. Designate the absorbance as A_U'.

(c) Repeat procedure *(a),* but substitute 5.0 mL of the *Standard preparation* for the 5.0 mL of the *Assay preparation.* Designate the absorbance as A_S.

(d) Repeat procedure *(c),* but substitute 1.0 mL of boric acid solution (1 in 20) for the 1.0 mL of water. Designate the absorbance as A_S'.

Calculate the quantity, in mg, of Pyridoxine Hydrochloride ($C_8H_{11}NO_3 \cdot HCl$) in each mL of the Injection taken by the formula:

$$10(C/V)(A_U - A_U')/(A_S - A_S')$$

in which C is the concentration, in µg per mL, of USP Pyridoxine Hydrochloride RS in the *Standard preparation; V* is the volume, in mL, of Injection taken; and the other terms are as defined above.

BRIEFING

Quazepam Tablets, *USP 29* page 1875. It is proposed to require the use of USP Ethylparaben RS for the preparation of the *Internal standard solution*. It is also proposed to clarify that the relative retention times are intended for identification only.

(MD-PP: R. Ravichandran) RTS—44082-1

USP Quazepam RS. USP Quazepam Related Compound A RS.

Change to read:

Assay—

Mobile phase—Prepare a filtered and degassed mixture of methanol and water (7 : 3). Make adjustments, if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Internal standard solution—Dissolve an accurately weighed quantity of ~~ethylparaben~~ ■USP Ethylparaben RS■1S *(USP30)* in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution containing about 0.19 mg per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Quazepam RS in *Internal standard solution,* and dilute quantitatively, and stepwise if necessary, with *Internal standard solution* to obtain a solution having a known concentration of about 1.5 mg of quazepam per mL.

Assay preparation—Weigh and finely powder not fewer than 10 Tablets. Transfer an accurately weighed portion of powder, equivalent to about 15 mg of quazepam, to a 50-mL screw-capped centrifuge tube. Add 10.0 mL of *Internal standard solution,* and centrifuge for 30 minutes.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* ~~the relative retention times are about 0.4 for ethylparaben and 1.0 for quazepam,~~

■■1S *(USP30)* the resolution, *R,* between ethylparaben and quazepam is not less than 5.5; and the relative standard deviation for replicate injections is not more than 2.0%.

■[NOTE—For identification purposes, the relative retention times are about 0.4 for ethylparaben and 1.0 for quazepam.]■1S *(USP30)*

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of quazepam ($C_{17}H_{11}ClF_4N_2S$) in the portion of Tablets taken by the formula:

$$10C(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Quazepam RS in the *Standard preparation;* and R_U and R_S are the ratios of the peak response of quazepam to that of ethylparaben obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Ritonavir, page 788 of *PF* 31(3) [May–June 2005]. It is proposed to change the method for *Identification* test *A* from ⟨197S⟩ to ⟨197⟩, because ⟨197S⟩ signifies that a solution is examined in 0.1-mm cells, whereas no cell was used in the IR procedure. Additionally, a change is proposed for the *Chromatographic system* section of the *Related compounds* test to clarify the peak-to-valley ratio for the system suitability requirement. Minor editorial changes have also been made.

(MD-AA: B. Davani) RTS—43853-1

In-Process Revision

the first *Standard solution* injection, is between 0.8 and 1.2; and the relative standard deviation of the peak area response of the main component peak, for replicate injections of the *Standard solution,* is not more than 3.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Diluent, Ritonavir identity standard solution, Standard solution,* and *Test solution* into the chromatograph, record the chromatograms, and measure the peak area responses. Calculate the percentage of each impurity in the portion of Ritonavir taken by the formula:

$$0.0025(W_S / W_T)\ (R_T / R_S)(1/F)P$$

in which W_S is the the weight, in mg, of USP Ritonavir RS taken to prepare the *Standard solution;* W_T is the weight, in mg, of Ritonavir taken to prepare the *Test solution;* R_T is the area of the impurity peak obtained from the *Test solution;* R_S is the average peak area of ritonavir obtained from the the six injections of the *Standard solution;* F is the response factor for the impurity (see values in *Table 1*); and P is the purity, in percentage, of USP Ritonavir RS taken to prepare the *Standard solution.* Not more than 0.3% of impurity E and O is found; not more than 0.2% of impurity T is found; not more than 0.1% of any other impurity is found; and not more than 1.0% of total impurities is found.

Assay—

Monobasic potassium phosphate solution (0.03 M)—Dissolve about 8.2 g of monobasic potassium phosphate in 2.0 L of water. Mix well, and pass through a nylon membrane filter having a 0.45-µm porosity.

Diluent—Prepare a mixture of *Monobasic potassium phosphate solution (0.03M)* and acetonitrile (1 : 1). Mix well, and pass through a nylon membrane filter having a 0.45-µm porosity.

Solution A—Prepare a mixture of the filtered *Monobasic potassium phosphate solution (0.03 M),* acetonitrile, tetrahydrofuran (inhibitor-free), and *n*-butanol (69 : 18 : 8 : 5).

Solution B—Prepare a mixture of acetonitrile, the filtered *Monobasic potassium phosphate solution (0.03 M)*, tetrahydrofuran (inhibitor-free), and *n*-butanol (47 : 40 : 8 : 5).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩). [NOTE—Because of the high dependence of retention time and selectivity on the *Mobile phase* composition, the volumes should be accurately measured. Excessive or continued helium sparging must be avoided. Store the *Mobile phase* in a tightly sealed container when not in use.]

Standard stock preparation—Transfer about 100 mg of USP Ritonavir RS, accurately weighed, to a 50-mL volumetric flask. Dissolve in and dilute with *Diluent* to volume, and mix. [NOTE—This solution may be kept for 5 days if refrigerated.]

Intermediate standard preparation—Transfer 5.0 mL of the *Standard stock preparation* to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Standard preparation—Transfer 25.0 mL of the *Intermediate standard preparation* to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Assay preparation—Transfer 5.0 mL of the *Test solution,* prepared as directed in the test for *Related compounds,* to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix. Dilute 25.0 mL of this solution with *Diluent* to 100 mL, and mix.

Chromatographic system—Proceed as directed in the test for *Related compounds.* The run time for the *Standard preparation* and *Assay preparation* is 40 minutes. Chromatograph the *Standard preparation,* and record the responses as directed for *Procedure:* the capacity factor, k', using the main component peak of the first *Standard preparation* injection, is not less than 13; the column efficiency, using the main component peak of the first *Standard preparation* injection, is not less than 5000

theoretical plates; the tailing factor, using the main component peak of the first *Standard preparation* injection, is between 0.8 and 1.2; and the relative standard deviation of the peak area response of the main component peak, for replicate injections of the *Standard preparation,* is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak area responses. Calculate the percentage, on the as-is basis, of $C_{37}H_{48}N_6O_5S_2$ in the portion of Ritonavir taken by the formula:

$$0.5(W_S / W_T)(r_T / r_S)P$$

in which W_S is the weight, in mg, of USP Ritonavir RS taken to prepare the *Standard preparation;* W_T is the weight, in mg, of Ritonavir taken to prepare the *Assay preparation;* r_T is the peak area of the impurity obtained from the chromatogram of the *Assay preparation;* r_S is the average peak area of ritonavir obtained from the chromatograms of the five injections of the *Standard preparation;* and P is the purity, in percentage, of USP Ritonavir RS taken to prepare the *Standard preparation.*

Calculate the percentage, on the anhydrous basis, of $C_{37}H_{48}N_6O_5S_2$ in the portion of Ritonavir taken by the formula:

$$100A/(100 - B)$$

in which A is the percentage of $C_{37}H_{48}N_6O_5S_2$ on the as-is basis, as calculated above, and B is the percentage of water content.■1S (*USP29*)

In-Process Revision

BRIEFING

Ropivacaine Hydrochloride Injection. Because there is no existing *USP* monograph for this dosage form, a new monograph is being proposed. The HPLC procedure used in the test for *Limit of 2,6-dimethylaniline* is based on analysis performed with an XTerra MS C18 brand of L1 column, and related compound A and ropivacaine elute at approximately 1.4 minutes and 2.5 minutes, respectively. The HPLC procedure used in the test for *Enantiomeric purity* is based on analysis performed with a Chiral-AGP brand of L41 column, and the typical retention times are approximately 9 minutes and 12 minutes for related compound B (*R* enantiomer) and ropivacaine (*S* enantiomer), respectively. The HPLC procedure used in the *Assay* is based on analysis performed with a µBondapak C18 brand of L1 column, and the typical retention time for ropivacaine is approximately 4 minutes.

(MD-PS: D. Bempong) RTS—42217-1

Add the following:

■Ropivacaine Hydrochloride Injection

» Ropivacaine Hydrochloride Injection is a sterile solution of Ropivacaine Hydrochloride in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ropivacaine hydrochloride ($C_{17}H_{26}N_2O \cdot HCl$).

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type 1 glass or of suitable plastic.

USP Reference standards ⟨11⟩—*USP Endotoxin RS. USP Ropivacaine Hydrochloride RS. USP Ropivacaine Related Compound A RS. USP Ropivacaine Related Compound B RS.*

Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

B: The retention time of the major peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *System suitability solution,* as obtained in the test for *Enantiomeric purity.*

Bacterial endotoxins ⟨85⟩—It contains not more than 60 USP Endotoxin Units per g of ropivacaine hydrochloride.

Particulate matter ⟨788⟩**:** meets the requirements for small-volume injections.

Sterility ⟨71⟩—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

pH ⟨791⟩**:** between 4.0 and 6.0.

Limit of 2,6-dimethylaniline (ropivacaine related compound A, base)—

pH 8.0 Buffer solution—Prepare as directed in the *Assay.*

Mobile phase—Prepare as directed in the *Assay.*

Standard solution—Prepare as directed for *Standard preparation* in the *Assay.*

Test solution—Dilute accurately the Injection with *Mobile phase* to a concentration of 2.0 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 240-nm detector and a 3.9-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between ropivacaine related compound A and ropivacaine is not less than 5; and the signal-to-noise ratio for ropivacaine related compound A is not less than 10.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of ropivacaine related compound A base in the portion of Ropivacaine Hydrochloride taken by the formula:

$$0.1(121.18/157.64)C_S/C_T(r_i/r_S)$$

in which 121.18 is the molecular weight of ropivacaine related compound A base (2,6-dimethylaniline); 157.64 is the molecular weight of USP Ropivacaine Related Compound A RS; C_S is the concentration, in µg per mL, of ropivacaine related compound A in the *Standard solution;* C_T is the concentration, in mg per mL, of ropivacaine hydrochloride in the *Test solution;* and r_i and r_S are the ropivacaine related compound A peak areas obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.01% of ropivacaine related compound A base is found.

Enantiomeric purity—

pH 7.2 Buffer solution—Transfer 7.5 mL of 1 M sodium phosphate monobasic solution and 28.5 mL of 0.5 M sodium phosphate dibasic dihydrate solution into a 1-L volumetric flask, and dilute with water to volume. Adjust the resulting solution to a pH of 7.2, if necessary.

Mobile phase—Transfer 35 mL of isopropyl alcohol into a 500-mL volumetric flask, dilute with *pH 7.2 Buffer solution* to volume, mix, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve suitable quantities of USP Ropivacaine Hydrochloride RS and USP Ropivacaine Related Compound B RS in water, and dilute quantitatively, and stepwise, with water to obtain a solution containing about 75 µg per mL and 0.75 µg per mL, respectively.

Test solution—Dilute the Injection with *Mobile phase* to a concentration of about 75 µg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4-mm × 10-cm column that contains packing L41. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between ropivacaine related compound B (*R* enantiomer) and ropivacaine (*S* enantiomer) is not less than 1.5. [NOTE—For the purpose of identification, the relative retention times are about 0.75 for ropivacaine related compound B and 1.0 for ropivacaine.]

Procedure—Inject about 20 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of ropivacaine related compound B (*R* enantiomer) in the portion of ropivacaine hydrochloride taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response of ropivacaine related compound B (*R* enantiomer); and r_s is the sum of the peak responses of ropivacaine (*S* enantiomer) and ropivacaine related compound B (*R* enantiomer) obtained from the *Test solution:* not more than 2.0% of ropivacaine related compound B (*R* enantiomer) is found.

Other requirements—It meets the requirements under *Injections* ⟨1⟩.

Assay—

pH 8.0 Buffer solution—Transfer 1.3 mL of 1 M sodium phosphate monobasic solution and 32.5 mL of 0.5 M sodium phosphate dibasic dihydrate solution to a 1-L volumetric flask. Dilute with water to volume, and mix. Adjust the resulting solution to a pH of 8.0, if necessary.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and *pH 8.0 Buffer solution* (60 : 40). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve accurately weighed quantities of USP Ropivacaine Hydrochloride RS and USP Ropivacaine Related Compound A RS in *Mobile phase,* and dilute quantitatively, and stepwise, with *Mobile phase* to obtain a solution having known concentrations of about 0.25 mg per mL of USP Ropivacaine Hydrochloride RS and about 0.26 µg per mL of USP Ropivacaine Related Compound A RS.

Assay preparation—Dilute accurately the Injection with *Mobile phase* to a concentration of about 0.25 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 240-nm detector and a 3.9-mm × 15-cm column that contains 5- or 10-µm packing L1. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections, calculated for the ropivacaine peak, is not more than 1.0%; and the resolution, *R,* between ropivacaine related compound A and ropivacaine is not less than 5.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of ropivacaine hydrochloride ($C_{17}H_{26}N_2O \cdot HCl$) in each mL of Injection taken by the formula:

$$C(D / V)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Ropivacaine Hydrochloride RS in the *Standard preparation; D* is the dilution factor for the *Assay preparation; V* is the volume of Injection taken, in mL; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S *(USP30)*

BRIEFING

Spironolactone and Hydrochlorothiazide Tablets, *USP 29* page 2001. It is proposed to modify the chromatographic procedure used in the test for *Dissolution.* Using the current chromatographic procedure, sodium lauryl sulfate coelutes with hydrochlorothiazide. The gradient HPLC method being proposed provides a better separation betweeen sodium lauryl sulfate, spironolactone, and hydrochlorothiazide. The new chromatographic method was developed and validated using a Luna C18 brand of L1 packing.

(BPC: M. Marques) RTS—43904-1

In-Process Revision

Change to read:

Dissolution ⟨711⟩—

Medium: 0.1 N hydrochloric acid containing 0.1% sodium lauryl sulfate; 900 mL.

Apparatus 2: 75 rpm.

Time: 60 minutes.

Determine the amounts of Spironolactone and Hydrochlorothiazide dissolved using the following method.

Standard solution—Prepare a solution of USP Spironolactone RS and USP Hydrochlorothiazide RS in a mixture of methanol and *Medium* (1 : 1) having accurately known concentrations of about 0.0125 mg of each per mL.

Test solution—Transfer a 5.0-mL portion of the solution under test to a 10-mL volumetric flask, dilute with methanol to volume, and mix.

~~*Mobile phase, Chromatographic system,* and *Procedure*—Proceed as directed in the *Assay.*~~

■*Solution A*—Use acetonitrile.

Solution B—Transfer about 4.5 g of monobasic potassium phosphate to a 1-L volumetric flask containing about 500 mL of water. Dissolve in and dilute with water to volume, and mix.

Mobile phase—Use variable amounts of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	25	75	equilibration
0–10	25→75	75→25	linear gradient
10–18	75	25	isocratic
18–25	75→25	25→75	linear gradient

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between hydrochlorothiazide and spironolactone is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Proceed as directed in the *Assay,* injecting 20 µL of each solution.■1S (*USP30*)

Tolerances—Not less than 75% *(Q)* of each of the labeled amounts of $C_{24}H_{32}O_4S$ and $C_7H_8ClN_3O_4S_2$ is dissolved in 60 minutes.

BRIEFING

Triclosan, *USP 29* page 2197 and page 1408 of *PF* 31(5) [Sept.–Oct. 2005]. On the basis of the supporting data, in the *Assay* it is proposed to revise the concentration of the *Standard preparation* to be consistent with the concentration of the *Assay preparation.*

Limit of monochlorophenols and 2,4-dichlorophenol—

Phosphate buffer—Transfer about 1.38 g of anhydrous monobasic sodium phosphate and about 1.42 g of dibasic sodium phosphate to a 1-L volumetric flask, dissolve in and dilute with water to volume, and mix.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and *Phosphate buffer* (1 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Quantitatively dissolve accurately weighed quantities of ~~4-chlorophenol and 2,4-dichlorophenol~~

■USP Parachlorophenol RS and USP 2,4-Dichlorophenol RS■1S (*USP29*)
in acetonitrile, dilute with an equal volume of water, and mix. Transfer a portion of this solution to a suitable container, and dilute quantitatively, and stepwise if necessary, with a mixture of acetonitrile and water (1 : 1) to obtain a solution having known concentrations of about 0.5 µg of ~~4-chlorophenol~~

■parachlorophenol■1S (*USP29*)
and 0.1 µg of 2,4-dichlorophenol per mL.

Test solution—Transfer about 250 mg of Triclosan, accurately weighed, to a 25-mL low-actinic volumetric flask, dissolve in 20 mL of acetonitrile, dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a coulometric electrochemical detector with electrode 1 set at 0.45 V and electrode 2 set at 0.75 V, both having a positive (oxidative) polarity, and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 9.0% for 2,4-dichlorophenol.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. The peak responses for ~~4-chlorophenol~~

■parachlorophenol■1S (*USP29*)
and 2,4-dichlorophenol in the chromatogram of the *Test solution* are not greater than the corresponding peaks in the chromatogram of the *Standard solution*.

In-Process Revision

Change to read:

Limit of 1,3,7-trichlorodibenzo-*p*-dioxin, 2,8-dichlorodibenzo-*p*-dioxin, 2,8-dichlorodibenzofuran, and 2,4,8-trichlorodibenzofuran—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, water, and glacial acetic acid (70 : 30 : 0.1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

~~*Standard solution*—Transfer accurately weighed quantities of 2,8-dichlorodibenzofuran, and 2,4,8-trichlorodibenzofuran to a volumetric flask, add accurately measured volumes of 1,3,7-trichlorodibenzo-*p*-dioxin and 2,8-dichlorodibenzo-*p*-dioxin, and dissolve in methanol. Dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having concentrations of about 0.5, 1.0, 0.5, and 1.0 µg per mL, respectively.~~

■■1S (*USP29*)
Test solution—Transfer about 2.0 g of Triclosan, accurately weighed, to a screw-capped centrifuge tube, add 5 mL of 2 N potassium hydroxide, and shake for 10 minutes to dissolve. Add 3 mL of *n*-hexane, shake for 10 minutes, and allow the phases to separate. Transfer the organic layer to a suitable container, add another 3 mL of *n*-hexane to the aqueous layer, shake for 10 minutes, and allow the phases to separate. Transfer the organic layer to the previous extract, discard the aqueous layer, add 3 mL of 2 N potassium hydroxide to the combined organic layers, shake for 10 minutes, and allow the phases to separate. Discard the aqueous layer, add another 3 mL of 2 N potassium hydroxide to the combined organic layers, shake for 10 minutes, and allow the phases to separate. Transfer the organic layer to a suitable container, and evaporate with the aid of a stream of nitrogen to dryness. Dissolve the residue in 1.0 mL of methanol, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the ~~*Standard solution,*~~

■USP Triclosan Related Compounds Mixture A RS,■1S (*USP29*) and record the peak responses as directed for *Procedure:* the relative retention times are about 0.59 for 2,8-dichlorodibenzofuran, 0.71 for 2,8-dichlorodibenzo-*p*-dioxin, 0.88 for 2,4,8-trichlorodibenzofuran, and 1.0 for 1,3,7-trichlorodibenzo-*p*-dioxin; and the relative standard deviation for replicate injections is not more than 15.0%, determined from the 2,8-dichlorodibenzo-*p*-dioxin peak.

Procedure—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. ~~The peak responses for 2,8-dichlorodibenzofuran, 2,8-dichlorodibenzo-*p*-dioxin, 2,4,8-trichlorodibenzofuran, and 1,3,7-trichlorodibenzo-*p*-dioxin obtained from the *Test solution* are not greater than the corresponding peaks obtained from the *Standard solution*~~

■Calculate the concentration of each analyte in the portion of Triclosan taken by the formula:

$$(C/W)(r_i / r_S)$$

in which C is the concentration, in µg per mL, of the respective analyte in the USP Triclosan Related Compounds Mixture A RS; W is the weight, in g, of Triclosan taken; and r_i and r_S are the peak responses for the respective analyte obtained from the *Test solution* and the USP Triclosan Related Compounds Mixture A RS, respectively: not more than 0.25 ppm of 2,8-dichlorodibenzofuran is found; not more than 0.5 ppm of 2,4,8-trichlorodibenzofuran is found; not more than 0.25 ppm of 1,3,7-trichlorodibenzo-*p*-dioxin is found; and not more than 0.5 ppm of 2,8-dichlorodibenzo-*p*-dioxin is found.■1S (*USP29*)

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 15-m capillary column with phase G3. The carrier gas is helium maintained at about 6 psi. The injection port temperature is maintained at 34° and is increased rapidly to 200° immediately after the injection, the column temperature is maintained at 34°, and the detector temperature is maintained at 260°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about ~~0.5~~

■2.0■1S (*USP30*) µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, increase the column temperature by 20° per minute to 140°, then increase the column temperature by 4° per minute to 240°, maintain this temperature for not less than 5 minutes, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{12}H_7Cl_3O_2$ in the portion of Triclosan taken by the formula:

~~$10C(r_U / r_S)$~~

■$100C(r_U / r_S)$■1S (*USP30*)

in which C is the concentration, in mg per mL, of USP Triclosan RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

In-Process Revision

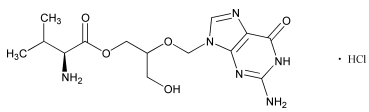
BRIEFING

Valganciclovir Hydrochloride; Valganciclovir Tablets. Because there are no existing *USP* monographs for this drug substance and dosage form, new monographs based on submitted data are being proposed. The gas chromatographic procedure in the test for the *Limit of isopropyl alcohol* is based on analyses performed with the DB624, 3.0-µm brand of G43 column. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with the Zorbax SB, 3.5-µm brand of L1 column. The liquid chromatographic procedure in the test for *Enantiomeric purity of valganciclovir* is based on analyses performed with the Daicel Crownpak CR(+), 5-µm brand of L## (see *Chromatography* ⟨621⟩) column.

(MD-AA: B. Davani) RTS—43282-1

Add the following:

■Valganciclovir Hydrochloride



$C_{14}H_{22}N_6O_5 \cdot HCl$ 390.82

L-Valine, ester with 9-[[2-hydroxy-1-(hydroxymethyl)ethoxy]methyl]guanine, monohydrochloride.

L-Valine, 2-[(2-amino-1,6-dihydro-6-oxo-9*H*-purin-9-yl)methoxy]-3-hydroxypropyl ester, monohydrochloride [*175865-59-5*].

» Valganciclovir Hydrochloride contains not less than 97.0 percent and not more than 102.0 percent of $C_{14}H_{22}N_6O_5 \cdot HCl$, calculated on the anhydrous and solvent-free basis.

Packaging and storage—Preserve in tight containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards ⟨11⟩**—***USP Valganciclovir Hydrochloride RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: *Ultraviolet Absorption* ⟨197U⟩.

Solution: 10 µg per mL.

Medium: methanol.

C: A solution in water (1 in 20) meets the requirements of the tests for *Chloride* ⟨191⟩.

Water, *Method I* ⟨921⟩**:** not more than 8.0%, a 100-mg specimen being used.

Residue on ignition ⟨281⟩**:** not more than 0.10%, a 1-g specimen being used.

Heavy metals, *Method I* ⟨231⟩**:** 0.002%.

Limit of isopropyl alcohol—

Internal standard solution—Transfer 100 µL of 1,4-dioxane to a 100-mL volumetric flask, dilute with dimethylformamide to volume, and mix.

Standard stock solution—Transfer 1.0 mL of isopropyl alcohol and 0.1 mL of toluene to a 100-mL volumetric flask, dilute with dimethylformamide to volume, and mix. [NOTE—Toluene is used to verify the system suitability.]

Standard solution—Transfer 2.0 mL of the *Internal standard solution* to a vial. Add 100 µL of *Standard stock solution* to the *Internal standard solution,* and mix.

System suitability solution—Use the *Standard solution.*

Test solution—Transfer between 90 mg to 100 mg of Valganciclovir Hydrochloride, accurately weighed, to a vial. Add 2.0 mL, accurately measured, of *Internal standard solution,* and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 30-m capillary column coated with a 3.0-µm phase G43. The carrier gas is helium, flowing at a rate of about 10.5 mL per minute, and the split ratio is (1 : 15). The chromatograph is programmed as follows. Initially the column temperature is maintained at 40° for 10 minutes, and then the temperature is increased at a rate of 25° per minute to 240°. [NOTE—Condition the column at 240° after each injection for approximately 15 minutes.] The

In-Process Revision

injection port temperature is maintained at about 250°, and the detector temperature is maintained at about 300°. Chromatograph the *System suitability solution* as directed for *Procedure:* the resolution, *R,* between 1,4-dioxane and toluene is not less than 8; the column efficiency, using the 1,4-dioxane peak, is not less than 6000 theoretical plates; and the relative standard deviation of the response area ratios of the isopropyl alcohol peak to the 1,4-dioxane peak for replicate injections is not more than 15%.

Procedure—Separately inject equal volumes (about 0.5 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentages of isopropyl alcohol in the portion of Valganciclovir Hydrochloride taken by the formula:

$$100(VC/W)(R_U/R_S)$$

in which V is the volume, in mL, of the *Test solution; C* is the concentration, in mg per mL, of isopropyl alcohol in the *Standard solution; W* is the weight, in mg, of Valganciclovir Hydrochloride taken; and R_U and R_S are the peak area ratios of isopropyl alcohol to the internal standard obtained from the *Test solution* and the *Standard solution,* respectively: not more than 1.0% of isopropyl alcohol is found.

Related compounds—

TEST 1—

Solution A—Use *0.01 M Monobasic ammonium phosphate,* prepare as directed in the *Assay.*

Solution B—Use methanol.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system* (see *Table 1*). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Prepare as directed in the *Assay.*

Test solution—Use the *Assay preparation*.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The chromatograph is programmed as shown in *Table 1.*

Table 1

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–5	92	8	isocratic
5–15	92→80	8→20	linear gradient
15–30	80→30	20→70	linear gradient

[NOTE—Equilibrate the column with starting *Mobile phase* for at least 15 minutes between injections.] The column temperature is maintained at 25°, and the flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the first peak of valganciclovir and the methoxymethylguanine peak is not less than 1.0, and the resolution, *R,* between the two peaks for valganciclovir (*R* and *S* esters of L-valine) is not less than 3.0; the column efficiency determined using the second peak of valganciclovir is not less than 8000 theoretical plates; and the tailing factor for the second peak of valganciclovir is not more than 1.4. [NOTE—The typical retention time for the second peak of valganciclovir is between 5 and 8.5 minutes.]

Procedure—Inject about 20 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. The approximate relative retention times for each individual impurity are listed in *Table 3*. Calculate the percentage of each impurity in the portion of Valganciclovir Hydrochloride taken by the formula:

$$100(r_i/F_i)/(\Sigma r_i/F_i)$$

in which the r_i is the area response for each impurity, and F_i is the relative response factor for each individual component listed in *Table 3*: The impurities meet the requirements as specified in *Table 3*.

TEST 2—

Solution A—Dilute 2.5 mL of triethylamine with water to 1000 mL, and adjust with trifluoroacetic acid to a pH of 3.0 ± 0.05. Pass this solution through a filter having a 0.45-µm porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Solution B—Use methanol.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system* (see *Table 2*). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Prepare as directed in the *Assay.*

Test solution—Use the *Assay preparation*.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The chromatograph is programmed as follows in *Table 2.*

Table 2

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–10	93	7	isocratic
10–20	93→70	7→30	linear gradient

[NOTE—Equilibrate the column with starting *Mobile phase* for at least 15 minutes between injections.] The column temperature is maintained at 30°, and the flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the two peaks for valganciclovir (*R* and *S* esters of L-valine) is not less than 1.3; the column efficiency determined using the second peak of valganciclovir is not less than 8000 theoretical plates; and the tailing factor for the second peak of valganciclovir is not more than 1.2. [NOTE—The typical retention time for the second peak of valganciclovir is between 6 and 9 minutes.]

Procedure—Inject about 20 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of ganciclovir mono-*N*-methyl valinate impurity in the portion of Valganciclovir Hydrochloride taken by the formula:

$$100(r_i / F_i)/(\Sigma r_i / F_i)$$

in which R_i is the sum of the area responses of ganciclovir mono-*N*-methyl valinate impurity (diastereomers); and F_i is the relative response factor for this impurity and valganciclovir as given in *Table 3*. The impurity limits meet the requirements specified in *Table 3*.

Diastereomer ratio—Using the chromatogram for *Test 1* in the test for *Related compounds,* calculate the percentage of valganciclovir (*R* and *S* esters of L-valine) by the following formulas:

$$100[r_A (r_A + r_B)]$$

$$100[r_B (r_A + r_B)]$$

in which r_A and r_B are the peak responses for valganciclovir (*R* and *S* esters of L-valine), respectively. The diastereomer ratio is (45 : 55) to (55 : 45).

Enantiomeric purity of valganciclovir—

Mobile phase—Dissolve 16.2 g of perchloric acid in 1000 mL of water, and mix. Pass this solution through a filter having a 0.5-µm or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Transfer about 5 mg of USP Valganciclovir Hydrochloride RS and 0.5 mg of D-valine esters to a 25-mL volumetric flask, dissolve in and dilute with 0.001 N hydrochloric acid to volume, and mix.

Table 3

Component	Common Name	Test Number	Relative Retention Time	Relative Response Factor	Maximum Limit (%)
Valganciclovir	Valganciclov	1, 2	1.00	1.00	—
A[a]	Ganciclovir	1	0.42	1.4	1.5

Other identified impurity	—	1	—	1.0	0.1 individual; 0.25 total
Unidentified impurity	—	1 and 2	—	1.0	0.1 individual; 0.25 total
Total of all impurities	—	1 and 2	—	—	3.0

[a] Specified impurity
[b] Reported as the sum of diastereomers

In-Process Revision

Test solution—Transfer about 10 mg of Valganciclovir Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with 0.001 N hydrochloric acid to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.0-mm × 15-cm column that contains packing L## (see *Chromatography* ⟨621⟩). The column temperature is maintained at ambient temperature, and the flow rate is about 0.8 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the second peak of the D-valine ester pair and the first peak of the valganciclovir pair is not less than 3.5; and the column efficiency determined using the second peak of valganciclovir is not less than 1800 theoretical plates.

Procedure—Inject about 20 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the enantiomeric purity, in percent, by the following formula:

$$100[r_S / (r_S + r_{IM})]$$

in which r_S is the sum of the peak responses of valganciclovir (*R* and *S* esters of L-valine) and r_{IM} is the sum of the peak responses of the enantiomeric impurities (*R* and *S* esters of D-valine), respectively. The enantiomeric purity is not less than 97.0%.

Assay—

0.10 M Monobasic ammonium phosphate solution—Dissolve 11.5 g of monobasic ammonium phosphate in about 900 mL of water, adjust with phosphoric acid (85%) to a pH of 2.8 ± 0.2, dilute with water to obtain 1000 mL of solution, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *0.10 M Monobasic ammonium phosphate* and methanol (92 : 8). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Transfer about 10 mg of USP Valganciclovir Hydrochloride RS and 0.5 mg of methoxymethylguanine to a 50-mL volumetric flask, dissolve in and dilute with 0.001 N hydrochloric acid to volume, and mix.

Standard preparation—Dissolve an accurately weighed quantity of USP Valganciclovir Hydrochloride RS in 0.001 N hydrochloric acid, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.2 mg per mL.

Assay preparation—Dissolve an accurately weighed quantity of Valganciclovir Hydrochloride in 0.001 N hydrochloric acid, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a concentration of about 0.2 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The column temperature is maintained at 25°, and the flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* meets the system suitability requirements as specified for *Test 1* in the test for *Related compounds.* Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation of the correction factor (C_F) for replicate injections is not more than 1.0%. [NOTE—C_F is calculated as directed below in the *Procedure*.]

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage, on the anhydrous and solvent-free basis, of $C_{14}H_{22}N_6O_5 \cdot HCl$ in the portion of Valganciclovir Hydrochloride taken by the formula:

$$100[(r_U / W_U)(C_F)(100) / (100 - S_U)]$$

in which r_U is the peak response (sum of two peaks for valganciclovir diastereomers) obtained from the *Assay preparation;* W_U is the weight, in mg, of Valganciclovir Hydrochloride in the *Assay preparation;* C_F is the correction factor; and S_U is the total percent of solvent and water in the test sample.

The C_F is calculated using the following formula:

$$(W_S / R_S)(100 - S_S/100)$$

in which W_S is the weight, in mg, of USP Valganciclovir Hydrochloride RS in the *Standard preparation;* R_S is the area response (sum of two peaks for valganciclovir diastereomers) obtained from the *Standard preparation;* and S_S is the total percent of solvent and water in USP Valganciclovir Hydrochloride RS. ■1S (*USP30*)

BRIEFING

Valganciclovir Tablets—See briefing under *Valganciclovir Hydrochloride*. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with the Zorbax SB-Phenyl 3.5-µm brand of L11 column.

(MD-AA: B. Davani; BPC: M. Marques) RTS—43284-1

In-Process Revision

Add the following:

■Valganciclovir Tablets

» Valganciclovir Tablets contain not less than 93.0 percent and not more than 110.0 percent of the labeled amount of valganciclovir ($C_{14}H_{22}N_6O_5$).

Packaging and storage—Preserve in tight containers. Store at 25°C, excursions permitted between 15° and 30°.

USP Reference standards ⟨11⟩—*USP Valganciclovir Hydrochloride RS.*

Identification—

A: *Ultraviolet Absorption* ⟨197U⟩—

Spectral range: 200–350 nm.

Solution: 10 µg per mL.

Medium: 0.001M hydrochloric acid.

B: The retention time of the diastereomeric peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation,* as obtained in the Assay.

Dissolution ⟨711⟩—

Medium: 0.1 N hydrochloric acid; 900 mL, deaerated.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Standard solution—Expose the USP Valganciclovir RS to ambient conditions overnight, and determine the water content prior to use. Accurately weigh an amount equivalent to approximately 100 mg of valganciclovir free base, transfer to a 20-mL volumetric flask, dilute with *Medium* to volume, and mix.

Working standard solution—Transfer 5.0 mL of the *Standard solution* to a 50-mL volumetric flask, dilute with *Medium* to volume, and mix well. Pass a portion of this solution through a 10-µm polyethylene filter, discarding the first 2 mL.

Test solution—Pass 10 mL of the solution under test through a 10-µm polyethylene filter, discarding the first 2 mL.

Procedure—Determine the amount of $C_{14}H_{22}N_6O_5$ dissolved by UV absorption at the wavelength of maximum absorbance at about 254 nm on portions of the *Test solution,* suitably diluted with *Medium,* if necessary, in comparison

with the *Working standard solution,* using a 0.02-cm quartz cell. Calculate the weight of valganciclovir free base by the formula:

$$W_S\left(\frac{100 - W_C}{100}\right) \times 0.91 \times P$$

in which W_S is the weight, in mg, of USP Valganciclovir RS taken to prepare the *Standard solution;* W_C is the water content of the USP Valganciclovir RS; 0.91 is the conversion factor from valganciclovir hydrochloride to valganciclovir free base; and P is the purity, in decimals, of the USP Valganciclovir RS. Calculate the amount, in percentage, of valganciclovir released by the formula:

$$\frac{A_U \times C_S \times 900 \times 100}{A_S \times LC}$$

in which A_U and A_S are the absorbances obtained from the *Test solution* and *Working standard solution,* respectively; C_S is the concentration, in mg per mL, of valganciclovir free base in the *Working standard solution;* 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the Tablet label claim, in mg.

Tolerances: Not less than 80% (Q) of the labeled amount of valganciclovir is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩: meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

Mobile phase, Diluent, Resolution Solution, and *Chromatographic System*—Proceed as directed in the *Assay.*

Standard solution—Prepare as directed for *Standard preparation* in the *Assay.*

Test solution—Transfer 1 Tablet to a 100-mL volumetric flask, add about 80 mL of *Diluent,* and sonicate until the Tablet is fully disintegrated. Dilute with *Diluent* to volume, mix, and allow the solution to settle. Pipet 3.0 mL of the top portion of the resulting solution into a 200-mL volumetric flask, dilute with *Diluent* to volume, and mix. Pass a portion of the solution through a filter having a 0.45-µm or finer porosity, and use the filtrate, discarding the initial 2 mL.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of valganciclovir ($C_{14}H_{22}N_6O_5$) in the Tablet taken by the formula:

$$W_S(r_U/r_S)(0.91)(100 - S_S/100)(D_U/D_S)$$

in which W_S is the weight, in mg, of USP Valganciclovir Hydrochloride RS taken to prepare the *Standard solution;* r_U and r_S are the sum of the peak responses of valganciclovir obtained from the *Test solution* and the *Standard solution,* respectively; 0.91 is the conversion factor for valganciclovir hydrochloride to valganciclovir free base; S_S is the percent of water in the USP Valganciclovir Hydrochloride RS; and D_U and D_S are the dilution factors of the *Test solution* and *Standard solution,* respectively.

Related compounds—

Mobile phase, Diluent, Resolution Solution, and *Chromatographic System*—Proceed as directed in the *Assay.*

Standard Solution—Use the *Standard preparation* in the *Assay.*

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 450 mg of valganciclovir, to a 1000-mL volumetric flask, add about 800 mL of *Diluent,* and sonicate until the Tablet is fully disintegrated. Dilute with *Diluent* to volume, and mix. Pass a portion of this solution through a filter having a 0.45-µm or finer porosity, and use the filtrate, discarding the initial 2 mL.

Procedure—Inject a volume (about 50 µL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak responses. Calculate the percentage of ganciclovir and guanine in the portion of Tablets taken by the formula:

$$W_S(r_U/r_S)(0.91)(1/FL)(100 - S_S/100)(D_U/D_S)(W_A/W_U)(100)$$

in which W_S is the weight, in mg, of USP Valganciclovir Hydrochloride RS taken to prepare the *Standard solution;* r_U is the guanine or ganciclovir peak response obtained from the *Test solution;* r_S is the sum of the peak responses of the valganciclovir diastereomers obtained from the *Standard solution;* 0.91 is the conversion factor for valganciclovir hydrochloride to valganciclovir free base; F is the relative response factor, 1.9 and 1.4, for guanine and ganciclovir, respectively; L is the labeled amount, in mg, of valganciclovir in each Tablet; S_S is the percent of water in the USP Valganciclovir Hydrochloride RS; D_U and D_S are the dilution factors of the *Test solution* and *Standard solution,* respectively; W_A is the average weight, in mg, of a Tablet; and W_U is the weight, in mg, of the powdered Tablet taken to prepare the *Test solution.* Not more than 2.0% of ganciclovir and not more than 1.0% of guanine are found.

Calculate the individual unidentified and identified impurities listed in *Table 1* using the formula:

$$100(r_i/r_s)$$

in which r_i is the peak response for each impurity/degradant, and r_s is the sum of the responses of all the peaks: not more than 0.2% of each unidentified individual impurity is found; not more than 0.5 % of total unidentified impurity/degradant is found; and not more than 3.5% of total impurities including all the degradation products is found.

Table 1:

Name	Component	Approximate Relative Retention time
Guanine	Degradant	0.51
Ganciclovir	Degradant	0.66
Valganciclovir 1	Active	1.00
Valganciclovir 2	Active	1.07
Ganciclovir-mono-*N*-methyl valinate 1	Impurity	1.21
Ganciclovir-mono-*N*-methyl valinate 2	Impurity	1.30
Methoxymethylguanine	Impurity	1.45
Isovalganciclovir 1	Impurity	1.55
Isovalganciclovir 2	Impurity	1.61
Ganciclovir Divalinate	Impurity	2.13
Monoacetoxyganciclovir	Impurity	2.31
Isomonochloroganciclovir	Impurity	2.52
Homologue 1	Impurity	2.69
Homologue 2	Impurity	2.77

Assay—

Solution A—Dilute 2.5 mL of triethylamine with water to 1000 mL, and adjust with trifluoroacetic acid to a pH of 3.0 ± 0.05.

Solution B—Use methanol.

Mobile phase—Prepare a filtered and degassed mixture of *Solution A* and *Solution B* (93 : 7). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Dilute 1.0 mL of 1 M hydrochloric acid with water to 1.0 L, and mix.

Resolution solution—Dissolve suitable quantities of ganciclovir mono-*N*-methylvaline and USP Valganciclovir Hydrochloride RS in *Diluent* to obtain a solution containing about 0.1 µg per mL and 78 µg per mL, respectively.

Standard stock preparation—Dissolve an accurately weighed quantity of USP Valganciclovir Hydrochloride RS, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.3 mg per mL.

Standard preparation—Pipet 6.0 mL of *Standard stock preparation* into a 20-mL volumetric flask. Dilute with *Diluent* to volume, and mix well. Pass a portion of the solution through a filter having a 0.45-µm or finer porosity, and use the filtrate, discarding the initial 2 mL.

Assay preparation—Transfer five Tablets into a 500–mL volumetric flask, add about 300 mL of *Diluent,* and shake well until the Tablets are fully disintegrated. Dilute with *Diluent* to volume, mix, and allow the solution to settle. Transfer 3.0 mL of the supernatant into a 200-mL volumetric flask, and dilute with *Diluent* to volume. Pass a portion of this solution through a filter having a 0.45-µm or finer porosity, and use the filtrate, discarding the initial 2 mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains packing L11. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 30°. Chromatograph the *Resolution solution* as directed for *Procedure:* the resolution, *R,* between the second diastereomeric valganciclovir peak and the first ganciclovir mono-*N*-methylvaline peak is not less than 2. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency for the second diastereomeric valganciclovir peak is not less than 3000 theoretical plates; the tailing factor for the second diastereomeric valganciclovir peak is not more than 3; and the relative standard deviation for the total areas for the two valganciclovir peaks for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of valganciclovir ($C_{14}H_{22}N_6O_5$) in the portion of Tablets taken by the formula:

$$W_S(r_U / r_S)(0.91)(100 - S_S/100)(D_U / D_S)$$

in which W_S is the weight, in mg, of USP Valganciclovir Hydrochloride RS taken to prepare the *Standard preparation;* r_U and r_S are the sum of the peak responses for the valganciclovir diastereomers obtained from the *Assay preparation* and the *Standard preparation,* respectively; 0.91 is the conversion factor for valganciclovir hydrochloride to valganciclovir free base; S_S is the percent of water in the USP Valganciclovir Hydrochloride RS; and D_U and D_S are the dilution factors of the *Assay preparation* and *Standard preparation,* respectively.■1S (*USP30*)

BRIEFING

Valproic Acid Injection, page 1412 of *PF* 31(5) [Sept.–Oct. 2005]. To allow additional time for public review and comment, the adoption of this monograph has been postponed from the *First Supplement* to *USP 29–NF 24* to the *First Supplement* to *USP 30–NF 25*. The official date for the previously proposed monograph title, *Valproic Acid Injection,* has likewise been postponed from October 1, 2007, to October 1, 2008. The use of this title will be permitted as of April 1, 2007, but it will not become mandatory until October 1, 2008. The 18-month extension is intended to allow for product label changes to be made and for health practitioners and consumers to become familiar with the terminology.

(NOM: L. Paul) RTS—44110-1

Add the following:

■Valproic Acid Injection

(Title for this new monograph—to become official October 1, 2008)

» Valproic Acid Injection is a sterile aqueous solution of sodium valproate, formed from the interaction of Valproic Acid and Sodium Hydroxide, in Water for Injection, and one or more suitable buffering or sequestering agents. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of valproic acid ($C_8H_{16}O_2$). Valproic Acid Injection contains no antimicrobial agents.

Packaging and storage—Preserve in single-dose *Containers for Injection* as described under *Injections* ⟨1⟩, preferably of Type I glass. Store at controlled room temperature, excursions allowed between 15° and 30°.

Labeling—Label it to state the name and quantity of any buffering or sequestering agent used.

USP Reference standards ⟨11⟩—*USP Endotoxin RS. USP Valproic Acid RS.*

Identification—

A: The relative retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

B: It meets the requirements of the tests for *Sodium* ⟨191⟩.

Bacterial endotoxins ⟨85⟩—It contains not more than 23 USP Endotoxin Units per mL of Injection.

Sterility ⟨71⟩—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product To Be Examined.*

pH ⟨791⟩**:** between 7.0 and 9.0.

Particulate matter ⟨788⟩—It meets the requirements for small-volume injections.

Other requirements—It meets the requirements under *Injections* ⟨1⟩.

Assay—

Internal standard solution—Dissolve a quantity of biphenyl in methylene chloride to obtain a solution containing 5 mg per mL.

Standard stock preparation—Prepare a solution of USP Valproic Acid RS in *Internal standard solution* having a concentration of about 8 mg per mL.

Standard preparation—Transfer 5.0 mL of *Standard stock preparation* into a 50-mL volumetric flask, and dilute with methylene chloride to volume.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to 400 mg of valproic acid, into a suitable container; add about 20 mL of 5% (v/v) hydrochloric acid; shake by mechanical means for 2 minutes; add 50.0 mL of *Internal standard solution;* and shake by mechanical means for 1 hour. Allow the phase to separate (approximately 1 hour). The bottom organic layer remains cloudy, and at times a slight emulsion may persist. If an emulsion forms, break it up by stirring it with a glass rod. Pipet 5 mL of the extract from the bottom organic layer into a 50-mL volumetric flask, and dilute with methylene chloride.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm × 1.8-m glass column packed with 10% phase G34 on 80- to 100-mesh support S1A. The column temperature is maintained at about 155°, the injection port temperature is maintained at about 275°, and the detector block temperature is maintained at about 300°. Dry helium is used as the carrier gas, at a flow rate of about 20 mL per minute. Chromatograph the *Standard preparation* as directed for *Procedure:* the resolution, *R,* between the valproic acid

In-Process Revision

and biphenyl peaks is not less than 3.0; and the relative standard deviation of the peak area ratios for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 2 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak areas for the valproic acid and biphenyl peaks. Calculate the quantity, in mg, of valproic acid in the volume of Injection taken by the formula:

$$C(R_U / R_S)\, D$$

in which C is the concentration, in mg per mL, of USP Valproic Acid RS in the *Standard preparation;* R_U and R_S are the peak area ratios obtained from the *Assay preparation* and the *Standard preparation,* respectively; and D is the appropriate dilution factor used to prepare the *Assay preparation.* ■1S (*USP30*)

BRIEFING

Verapamil Hydrochloride, *USP 29* page 2244. It is proposed to revise the test for *Chromatographic purity,* because the current method is not intended to test for verapamil related compound D, and it cannot be eluted out of the column using the existing method. The proposed revision is based on a modification of the procedure described in the monograph in the *European Pharmacopoeia* 5.2. The liquid chromatographic procedure uses a Supelco Discovery RP amide column packed with end-capped palmitamidopropyl silyl silica gel of 5-µm particle size. The *USP Reference standards* section and *Identification* test *B* are also revised accordingly.

(MD-CV: S. Ramakrishna) RTS—44077-1

Change to read:

USP Reference standards ⟨11⟩—*USP Verapamil Hydrochloride RS. USP Verapamil Related Compound B RS.*

■*USP Verapamil Related Compound D RS.* ■1S (*USP30*)

Change to read:

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak for verapamil in the chromatogram of the ~~*Test preparation*~~

■*Test solution* ■1S (*USP30*)
corresponds to that in the chromatogram of ~~*Standard preparation B,*~~

■the *Standard solution,* ■1S (*USP30*)
as obtained in the test for *Chromatographic purity.*

C: It responds to the tests for *Chloride* ⟨191⟩.

Change to read:

Chromatographic purity—

~~*Aqueous solvent mixture*—Prepare a 0.015 N sodium acetate solution containing about 33 mL of glacial acetic acid per L.~~

~~*Mobile phase*—Prepare a filtered and degassed mixture of *Aqueous solvent mixture,* acetonitrile, and 2-aminoheptane (70 : 30 : 0.5). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~

~~*Standard preparations*—Dissolve an accurately weighed quantity of USP Verapamil Hydrochloride RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain *Standard preparation A* and *Standard preparation B* having known concentrations of about 5.6 and 9.4 µg per mL, respectively.~~

~~*Test preparation*—Prepare a solution of Verapamil Hydrochloride in *Mobile phase* having a known concentration of about 1.9 mg per mL.~~

~~*System suitability solution*—Dissolve suitable quantities of USP Verapamil Hydrochloride RS and USP Verapamil Related Compound B RS in *Mobile phase* to obtain a *System suitability solution* having known concentrations of about 1.9 and 1.5 mg, respectively, in each mL.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩): The liquid chromatograph is equipped with a 278-nm detector and a 4.6-mm × 12.5- to 15-cm column that contains packing L1. The flow rate is about 0.9 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.88 for verapamil related compound B and 1.0 for verapamil; the resolution, *R,* between the verapamil related compound B and verapamil peaks is not less than 1.5, and the relative standard deviation for replicate injections is not more than 2.0%.~~

~~*Procedure*—Separately inject equal volumes (about 10 µL) of *Standard preparations A* and *B* and the *Test preparation* into the chromatograph, and allow the *Test preparation* to elute for not less than four times the retention time for verapamil. Record the chromatograms, and measure all the peak responses. The sum of the peak responses, other than that of verapamil, from the *Test preparation* is not greater than the verapamil peak response obtained from *Standard preparation B* (0.5%); and no single peak response is greater than that of the verapamil peak response obtained from *Standard preparation A* (0.3%).~~

■*Buffer solution*—Dissolve 6.97 g of dibasic potassium phosphate in 1 L of water, and adjust with phosphoric acid to a pH of 7.2.

Solution A—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (63 : 37).

Solution B—Prepare a filtered and degassed mixture of acetonitrile and *Buffer solution* (67 : 33).

In-Process Revision

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve an accurately weighed quantity of USP Verapamil Hydrochloride RS, USP Verapamil Related Compound B RS, and USP Verapamil Related Compound D RS in *Solution A* to obtain a solution having known concentrations of about 0.025 mg per mL each of verapamil hydrochloride, verapamil related compound B, and verapamil related compound D.

Standard solution—Transfer about 25 mg of USP Verapamil Hydrochloride RS, accurately weighed, to a 10-mL volumetric flask, dilute with *Solution A* to volume, and mix. Quantitatively dilute further with *Solution A* to obtain a final concentration of 2.5 µg per mL.

Test solution—Transfer about 25 mg of Verapamil Hydrochloride, accurately weighed, to a 10-mL volumetric flask, dilute with *Solution A* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 278-nm detector and a 4.6-mm × 25-cm column containing packing L60 (see *Chromatography* ⟨621⟩). The flow rate is about 1.5 mL per minute. Initially equilibrate the column for about 60 minutes with *Solution A.* The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–9	100→70	0→30	linear gradient
9–18	70→0	30→100	linear gradient
18–50	0	100	isocratic
50–51	0→100	100→0	linear gradient
51–61	100	0	equilibration

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the peaks for verapamil related compound B and verapamil is not less than 5.0; and verapamil related compound D elutes out from the column.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all the peak responses. Calculate the percentage of each impurity in the portion of Verapamil Hydrochloride taken by the formula:

$$100(C_S/C_U)(r_i/r_S)$$

in which C_S is the concentration, in mg per mL, of USP Verapamil Hydrochloride RS in the *Standard solution;* C_U is the concentration, in mg per mL, of Verapamil Hydrochloride in the *Test solution;* r_i is the peak response for each individual impurity obtained from the *Test solution;* and r_S is the peak response of verapamil hydrochloride obtained from the *Standard solution:* not more than 0.1% of verapamil related compound B, not more than 0.1% of verapamil related compound D, not more than 0.1% of any other individual impurity, and not more than 0.3% of total impurities is found. [NOTE—Disregard any impurity less than 0.01%.]■1S *(USP30)*

BRIEFING

Excipients, USP and NF Excipients, Listed by Category, *NF 24* page 3257 and page 1664 of *PF* 31(6) [Nov.–Dec. 2005]. It is proposed to add *Coconut Oil* to the *Coating Agent* and *Emulsifying and/or Solubilizing Agent* categories and *Polyvinyl Acetate* to the *Coating Agent, Desiccant,* and *Tablet Binder* categories to complement the proposed new monographs for *Coconut Oil* and *Polyvinyl Acetate,* respectively, which appear elsewhere in this issue of *PF.*

DIETARY SUPPLEMENTS—MONOGRAPHS

BRIEFING

Valerian, *USP 29* page 2384. The USP Powdered Valerian RS is proposed for deletion from the *USP Reference standards* section because of the unavailability of this Reference Standard. Affected also is *Identification* test *B,* which uses this Reference Standard, and the accompanying *Notes* in *Identification* test *A.* In the absence of any significant adverse comment, it is proposed to implement the above revisions via the *Third Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of June 1, 2006.

In the *Packaging and storage* section, it is proposed to include a storage temperature. In the test for *Extractable matter,* changes are proposed to simplify the procedure: alcohol 70 percent is used instead of a mixture of 12 g of alcohol and 8 g of water, and measurements of the liquids are in volume instead of by weight. In the section *Microbial enumeration,* revisions to change the limits are proposed to be consistent with those in *USP* General Chapter *Microbiological Attributes of Nonsterile Nutritional and Dietary Supplements* ⟨2023⟩.

(DSB: M. Sharaf) RTS—44023-1; 43959-1

Packaging and storage—Store in tight containers, protected from light and moisture,

■and store at room temperature.■1S *(USP30)*

Change to read:

USP Reference standards ⟨11⟩—~~*USP Powdered Valerian RS.*~~

••3
USP Valerenic Acid RS.

Change to read:

Identification—

A: Transfer about 0.2 g of freshly powdered Valerian to a test tube, add 5 mL of methylene chloride, shake several times, and allow to stand for 5 minutes. Filter, wash the filter with 2 mL of methylene chloride, and combine the filtrate and washings in one container. Heat the combined filtrate and washings on a water bath for the minimum time required to evaporate the solvent, and dissolve the residue in 0.2 mL of methylene chloride. ~~[NOTE—Retain a portion of this solution for use in *Identification* test *B.*]~~

••3

To about 0.1 mL of this solution, add 3 mL of a mixture of equal volumes of glacial acetic acid and 25% hydrochloric acid, and shake several times: a blue color develops within 15 minutes.

~~**B:** *Thin-Layer Chromatographic Identification Test* ⟨201⟩—~~
~~*Adsorbent:* 0.50-mm layer of chromatographic silica gel.~~
~~*Test solution:* solution reserved from *Identification* test *A.*~~
~~*Standard solution:* prepared similarly to the *Test solution* except to begin with 0.2 g of USP Powdered Valerian RS.~~
~~*Application volume:* duplicate 20-µL portions, applied as 20-mm × 3-mm bands.~~
~~*Developing solvent system*—Develop the plates twice in a mixture of toluene and ethyl acetate (75 : 25), each time allowing the solvent front to ascend 10 cm above the line of application. Remove the plate from the developing chamber, mark the solvent front, and allow the plate to air-dry. Spray the plate with a mixture of hydrochloric acid and acetic acid (8 : 2), and heat at 110° for 10 minutes. Remove the plate from the oven, cool, and visually examine the plate: the chromatogram of each solution shows a blue-to-blue-black zone due to valtrate and isovaltrate at an R_F value of about 0.75; a light brown to dark brown zone due to didrovaltrate at an R_F value of about 0.65; and a blue-to-blue-black zone due to acevaltrate at an R_F value of about 0.55.~~

•••3
~~*C:*~~

•**B:**•3
The retention time of the valerenic acid peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *Standard solution,* as obtained in the test for *Content of valerenic acid.*

Change to read:

In-Process Revision

BRIEFING

Powdered Valerian, *USP 29* page 2385. In the section for *Packaging and storage,* it is proposed to include a storage temperature. In the section for *Botanic characteristics,* an editorial correction is made.

It is proposed to delete the USP Powdered Valerian RS from the *USP Reference standards* section because this Reference Standard is unavailable. In the absence of any significant adverse comment, it is proposed to implement this revision via the *Third Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of June 1, 2006.

MONOGRAPHS (NF)

BRIEFING

Alfadex, *NF 24* page 3268. It is proposed to make the following revisions to this monograph: add a *Packaging and storage* section; replace the test for *Loss on drying* with a *Water* test that will affect how to prepare the *Test solutions* in the tests for *Reducing sugars* and *Light-absorbing impurities* and the preparation of the *Standard preparation,* the *System suitability preparation,* and the *Assay stock preparation* in the *Assay;* also in the *Assay,* revise the *Chromatographic system* to exclude the relative retention times for alfadex, betadex, and gamma cyclodextrin from the suitability parameters but add the data for identification purposes in a *Note;* add a filtration step to the *Test solution* in the test for *Light-absorbing impurities;* and delete the tests for *Organic volatile impurities* and *Residual solvents.*

(EM2: H. Wang) RTS—43989-1

Change to read:

» Alfadex is composed of six alpha-(1-4) linked D-glucopyranosyl units. It contains not less than 98.0 percent and not more than 101.0 percent of $(C_6H_{10}O_5)_6$, calculated on the ~~dried~~

■anhydrous■1S (*NF25*)
basis.

Add the following:

■**Packaging and storage**—Preserve in tight containers. No storage requirements specified.■1S (*NF25*)

Delete the following:

■~~**Loss on drying** ⟨731⟩—Dry 1.0 g of it at 120° for 2 hours: it loses not more than 10.0% of its weight.~~■1S (*NF25*)

Add the following:

■**Water,** *Method I* ⟨921⟩**:** not more than 11.0%.■1S (*NF25*)

Change to read:

Reducing sugars—

Cupric solution—Dissolve 15 g of cupric sulfate in water to make 100 mL.

Tartrate solution—Dissolve 2.5 g of anhydrous sodium carbonate, 2.5 g of potassium sodium tartrate, 2.0 g of sodium bicarbonate, and 20 g of anhydrous sodium sulfate in water to make 100 mL.

Cupric–tartaric solution—Immediately before use, mix 1 part of *Cupric solution* with 25 parts of *Tartrate solution.*

Ammonium molybdate reagent—Mix 10 mL of a solution of disodium arsenate (6 in 100), 50 mL of a solution of ammonium molybdate (1 in 10), and 90 mL of diluted sulfuric acid, and dilute with water to 200 mL.

Test solution—Transfer about 1.0 g of Alfadex, accurately weighed,

■and calculated on the anhydrous basis,■1S (*NF25*)
to a 100-mL volumetric flask, dissolve in and dilute with water that has been previously boiled and cooled to room temperature, to volume, and mix. To 1 mL of this solution add 1 mL of *Cupric–tartaric solution.* Heat on a water bath for 10 minutes, then cool to room temperature. Add 10 mL of *Ammonium molybdate reagent,* and allow to stand for 15 minutes.

Standard solution—Prepare as directed for the *Test solution,* at the same time, except to use 1 mL of a solution containing 20 mg of glucose per L.

Procedure—Concomitantly measure the absorbance of the *Test solution* and the *Standard solution* at the wavelength of maximum absorbance at 740 nm relative to that of water, with a suitable spectrophotometer. The absorbance of the *Test solution* is not greater than that of the *Standard solution* (0.2%).

Change to read:

Light-absorbing impurities—

Test solution—Transfer about 1.0 g of Alfadex, accurately weighed,

■and calculated on the anhydrous basis,■1S (*NF25*)
to a 100-mL volumetric flask, dissolve in and dilute with water, which has been previously boiled and cooled to room temperature, to volume, ~~and mix~~

■mix, and pass through a 0.2-µm filter.■1S (*NF25*)

Procedure—Determine the absorbance of the *Test solution* in a 1-cm cell with a suitable spectrophotometer, after correcting for the blank: between 230 nm and 350 nm, the absorbance is not greater than 0.10; and between 350 nm and 750 nm, the absorbance is not greater than 0.05.

Delete the following:

■~~**Organic volatile impurities,** *Method IV* ⟨467⟩**:** meets the requirements.~~■1S (*NF25*)

Delete the following:

■~~**Residual solvents** ⟨467⟩**:** meets the requirements.~~

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water and methanol (90 : 10). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—~~Transfer 25 mg of USP Alpha Cyclodextrin RS, accurately weighed, to a 25-mL volumetric flask, and dissolve in and dilute with water to volume.~~

■Dissolve an accurately weighed quantity of USP Alpha Cyclodextrin RS in water to obtain a solution having a known concentration of about 1.0 mg per mL, calculated on the anhydrous basis.■1S (*NF25*)

System suitability preparation—~~Transfer 25 mg of USP Beta Cyclodextrin RS, 25 mg of USP Gamma Cyclodextrin RS, and 50 mg of USP Alpha Cyclodextrin RS, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with water to volume, and mix.~~

■Dissolve accurately weighed quantities of USP Alpha Cyclodextrin RS, USP Beta Cyclodextrin RS, and USP Gamma Cyclodextrin RS in water to obtain a solution having known concentrations of about 1.0 mg per mL for USP Alpha Cyclodextrin RS, calculated on the anhydrous basis, about 0.5 mg of each per mL for USP Beta Cyclodextrin RS and USP Gamma Cyclodextrin RS, each calculated on the anhydrous basis.■1S (*NF25*)

Assay stock preparation—Transfer 250 mg of Alfadex, accurately weighed,

■and calculated on the anhydrous basis,■1S (*NF25*)
to a 25-mL volumetric flask, and dissolve in water with the aid of heat. Cool, and dilute with water to volume.

Assay preparation—Transfer 5.0 mL of the *Assay stock preparation* to a 50-mL volumetric flask, and dilute with water to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector and a 4.6-mm × 25-cm column that contains ~~10 µm~~

■5-µm■1S (*NF25*)
packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability preparation,* and record the chromatograms for about 3.5 times the retention time of alpha

In-Process Revision

cyclodextrin. Record the peak responses as directed for *Procedure:* ~~the retention time of alpha cyclodextrin is about 4.5 minutes; the relative retention times are about 1.0 for alpha cyclodextrin, about 2.2 for beta cyclodextrin, and about 0.7 for gamma cyclodextrin;~~

■■1S (*NF25*)
the resolution, *R,* between the gamma cyclodextrin and alpha cyclodextrin peaks is not less than 1.5; and for the alpha cyclodextrin peak, the relative standard deviation for replicate injections is not more than 2.0%.

■[NOTE—For the purpose of identification, the relative retention times are about 1.0 for alpha cyclodextrin, about 2.2 for beta cyclodextrin, and about 0.7 for gamma cyclodextrin.]■1S (*NF25*)

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $(C_6H_{10}O_5)_6$ in the portion of Alfadex taken by the formula:

~~$2500(C/W)(R_U/R_S)$~~

■$2500(C/W)(r_U/r_S)$■1S (*NF25*)

in which *C* is the concentration, in mg per mL, of alpha cyclodextrin in the *Standard preparation;* ~~calculated on the dried basis, as determined from the concentration of USP Alpha Cyclodextrin RS corrected for the declared moisture content;~~

■■1S (*NF25*)
W is the weight, in mg, of alpha cyclodextrin taken to prepare the *Assay stock preparation;* and ~~R_U and R_S~~

■r_U and r_S■1S (*NF25*)
are the peak responses of the alpha cyclodextrin peak obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Coconut Oil. Because there is no existing *NF* monograph for this article, it is proposed to add a new monograph based on the *Coconut Oil, Refined* monograph in the *European Pharmacopoeia, Fifth Edition,* page 1339; and the *Coconut Oil (Unhydrogenated)* monograph in the *Food Chemicals Codex, Fifth Edition,* page 119.

(EM2: H. Wang; NOM: L. Paul) RTS—43401-1

Add the following:

■Coconut Oil

Coconut oil.

Coconut oil [*8001-31-8*].

» Coconut oil is the refined fixed oil obtained from the seeds of *Cocos nucifera* Linné (Fam. Palmae).

Packaging and storage—Preserve in tight, light-resistant, well-filled containers. No storage requirement specified.

Identification—It meets the requirements of the test for *Fatty acid composition*.

Melting range ⟨741⟩**:** between 23° and 26°.

Acid value ⟨401⟩**:** not more than 0.5, determined on 20.0 g.

Peroxide value ⟨401⟩**:** not more than 5.0.

Unsaponifiable matter ⟨401⟩**:** not more than 1.0%.

Fatty acid composition—Coconut Oil exhibits the following composition profile of fatty acids, as determined in the section *Fatty Acid Composition* under *Fats and Fixed Oils* ⟨401⟩:

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
6	0	≤1.5
8	0	5.0–11.0
10	0	4.0–9.0
12	0	40.0–50.0
14	0	15.0–20.0
16	0	7.0–12.0
18	0	1.5–5.0
20	0	≤0.2
16	1	≤1.0
18	1	4.0–10.0
18	2	1.0–3.0
18	3	≤0.2
20	1	≤0.2

Water, *Method I* ⟨921⟩**:** not more than 0.1%, 50 mL of chloroform being used as the solvent instead of 35 to 40 mL of methanol.

Arsenic, *Method II* ⟨211⟩**:** not more than 0.5 µg per g.

Alkaline impurities—Mix 10 mL of freshly distilled acetone and 0.3 mL of water, and add 0.05 mL of bromophenol blue TS. Neutralize the solution if necessary with 0.01 N hydrochloric acid or 0.01 N sodium hydroxide. Add 10 mL of Coconut Oil, shake, and allow to stand. Titrate with 0.01 N hydrochloric acid VS to change the color of the upper layer to yellow: not more than 0.1 mL of 0.01 N hydrochloric acid VS is required.■1S (*NF25*)

BRIEFING

Polyethylene Oxide, *NF 24* page 3398. On the basis of data, validation, and comments received, it is proposed to make the following changes:

1. Add "No storage requirements specified" to the test for *Packaging and storage.*
2. Add two new Reference Standards to the *USP Reference standards* section.
3. Add the phrase "using a suitable viscometer with appropriate validation" to the viscosity test under *Identification.* A rotational viscometer is suggested in this test by some manufacturers.
4. Replace the test for *Heavy metals, Method II* ⟨231⟩ with an ICP–AES method.
5. In the test for *Limit of free ethylene oxide,* the *Test preparation* response in the plot is included and the best straight line is drawn to include all five points.
6. Delete the tests for *Residual solvents* and *Organic volatile impurities.*

Add the following:

■**Heavy metals—**

Multi-element standard stock solution—Pipet 1.0 mL of USP Multi-Metal Elements RS into a 10-mL volumetric flask, add 0.1 mL of nitric acid, dilute with water to volume, and mix. This solution contains 10 µg of each metal element per mL.

Tin standard stock solution—Pipet 0.5 mL of USP Tin RS into a 25-mL volumetric flask, add 13 mL of hydrochloric acid, dilute with water to volume, and mix. This solution contains 20 µg of tin per mL.

Standard stock solution—Transfer 1.0 mL of *Multi-element standard stock solution* and 0.5 mL of *Tin standard stock solution* to a 20-mL volumetric flask, add 0.5 mL of nitric acid, dilute with water to volume, and mix. This solution contains 0.5 µg of each metal element per mL.

Standard solutions—Transfer 0 mL, 1 mL, 2 mL, and 5 mL of *Standard stock solution* to separate 25-mL volumetric flasks, add 1 mL of sulfuric acid and 5 mL of nitric acid to each flask, dilute the contents of each flask with water to volume, and mix. These solutions contain about 0 µg, 0.02 µg, 0.04 µg, and 0.1 µg of each metal element per mL, respectively.

Test solution—[Caution—When using high-pressure-resistant digestion vessels and microwave laboratory equipment, the safety precautions and operating instructions given by the manufacturers must be followed.] Transfer 0.5 g of Polyethylene Oxide, accurately weighed, to

In-Process Revision

a dry high-pressure-resistant digestion vessel (fluoropolymer or quartz glass), and add 1 mL of sulfuric acid and 5 mL of nitric acid to the vessel. Digest Polyethylene Oxide in the microwave digestion equipment using the following time program: 10% power at 65 W for 5 minutes; 15% power at 95 W for 5 minutes; 20% power at 130 W for 5 minutes; and 25% power at 160 W for 5 minutes. After completing the digestion, allow the vessel to cool to room temperature. Open the vessel, transfer the solution to a 25-mL volumetric flask by rinsing the digestion vessel with water, dilute with water to volume, and mix.

Procedure—The inductively coupled plasma–atomic emission spectrometer (ICP–AES) is set up for Cd, Co, Cr, Cu, Mn, Mo, Ni, Pb, Sb, and Sn at the wavelengths of 226.5 nm, 228.6 nm, 267.7 nm, 324.8 nm, 257.6 nm, 202.0 nm, 231.6 nm, 220.4 nm, 217.6 nm, and 190.0 nm, respectively. The radio frequency (RF) power is 1.35 kW, the argon torch flow is about 14 L per minute, the argon auxiliary flow is about 0.5 L per minute, the argon nebulizer gas pressure is about 26 psi, and the integration time is about 25 seconds. Concomitantly analyze the *Standard solutions* and the *Test solution* by introducing the solutions into the ICP–AES and recording the reading of each metal element. Plot the absorbances of the *Standard solutions* versus concentration, in µg per mL, of each metal element, and draw the straight line best fitting the four plotted points. From the graph so obtained, determine the concentration, *C,* in µg per mL, of each metal element in the *Test solution*. Calculate the quantity, in µg, of each metal element in the portion of Polyethylene Oxide taken by the formula:

$$25C/W$$

in which *W* is the weight, in g, of Polyethylene Oxide taken to prepare the *Test solution*: not more than 1 µg per g is found.■1S (*NF25*)

Change to read:

Limit of free ethylene oxide—

Standard stock solution—[Caution—Ethylene oxide is toxic and flammable. Prepare solutions of it in a well-ventilated fume hood.] Using the special handling described in the following, complete the preparation. Ethylene oxide is a gas at room temperature. It is usually stored in a lecture-type gas cylinder or small metal pressure bomb. Chill the cylinder in a refrigerator before use. Transfer about 5 mL of the liquid ethylene oxide to a cold, 10-mL serum vial. Seal the vial, and store in a refrigerator. Transfer about 40 g of acetone, accurately weighed, to a tared 50-mL serum vial that is capable of being tightly sealed with a polytef-lined septum and a metallic crimp cap. Seal the vial, and accurately weigh it. Using a gas-tight gas chromatographic syringe that has been chilled in a refrigerator, transfer about 60 µL of the liquefied ethylene oxide to the same vial. Weigh the vial, and determine the amount added by weight difference. This solution contains about 1 µg of ethylene oxide per µL. [NOTE—This solution may be kept for 1 week in the crimp-sealed serum vial, stored in a freezer.]

Standard preparations—To four separate, tared 50-mL serum vials that are capable of being tightly sealed with polytef-lined septa and metallic crimp caps, transfer 1.0 g of the Polyethylene Oxide under test. Seal the vials. To the separate vials, transfer 2.0 µL, 4.0 µL, 6.0 µL, and 8.0 µL of the *Standard stock solution*, and mix. These vials contain about 2 µg, 4 µg, 6 µg, and 8 µg of ethylene oxide, respectively, from the *Standard stock solution*. Heat the vials at 100° for 30 minutes, and cool to room temperature.

Test preparation—Transfer about 1 g of the Polyethylene Oxide under test, accurately weighed, to a tared 50-mL serum vial that is capable of being tightly sealed with a polytef-lined septum and a metallic crimp cap. Weigh the vial, and determine the amount of Polyethylene Oxide added by weight difference. Seal the vial, heat at 100° for 30 minutes, and cool to room temperature.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.53-mm × 10-m capillary column bonded with a 20-µm layer of phase G45, and a split injection system. The carrier gas is helium, flowing at a rate of about 15 mL per minute. The makeup gas is also helium, with a split flow rate of about 15 mL per minute. The injection port and detector temperatures are maintained at about 200° and 250°, respectively. The column temperature is maintained at about 70° for 5 minutes after injection, then programmed to increase at a rate of 10° per minute to about 200° and to maintain this temperature for 5 minutes. Inject 300 µL of the gaseous headspace from the vial of *Standard preparation* that contains about 6 µg of ethylene oxide from the *Standard stock solution* into the gas chromatograph, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 5%.

■[NOTE—Multiple vials are prepared for replicate injections.]■1S (*NF25*)

Procedure—[NOTE—A headspace apparatus that automatically transfers the measured amount of gaseous headspace may be used to perform the injections.] Using a gas-tight syringe, separately inject equal volumes (about 300 µL) of the gaseous headspace of each of the *Standard preparations* and the *Test preparation* into the gas chromatograph, record the chromatograms, and measure the areas of the peak responses. Determine by a retention time comparison whether ethylene oxide is detected in the *Test preparation*. Plot the responses of

■the *Test preparation* and■1S (*NF25*)
the *Standard preparations* versus the content, in µg, of ethylene oxide in each vial, as furnished by the *Standard stock solution;* draw the straight line best fitting the ~~four~~

■five■1S (*NF25*)
points; and calculate the correlation coefficient for the line.

■[NOTE—The content of ethylene oxide, as furnished by the *Standard stock solution,* is 0 µg in the *Test preparation*.]■1S (*NF25*)

In-Process Revision

A suitable system is one that yields a line having a correlation coefficient of not less than 0.99. Extrapolate the line until it intercepts the content axis on the negative side. From the intercept, determine the total amount, T_U, in µg, of ethylene oxide in the *Test preparation*. Calculate the percentage of ethylene oxide in the portion of Polyethylene Oxide taken by the formula:

$$100(T_U / W)$$

in which W is the weight, in µg, of Polyethylene Oxide taken to prepare the *Test preparation:* the limit is 0.001%.

Delete the following:

~~(Official January 1, 2007)~~■1S (*NF25*)

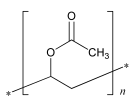
BRIEFING

Polyvinyl Acetate. Because there is no existing *NF* monograph for this article, a new monograph, based on the *Poly(vinyl acetate)* monograph in the *European Pharmacopoeia, Fifth Edition,* page 2271; the *Polyvinyl Acetate* monograph in the *Food Chemicals Codex, Fifth Edition,* page 349; and the *Polyvinyl Acetate* monograph in the *Japanese Pharmaceutical Excipients Directory 1996,* page 398, is being proposed.

(EM2: H. Wang; NOM: L. Paul) RTS—43513-1

Add the following:

■Polyvinyl Acetate



$(C_4H_6O_2)_n$

Vinyl acetate homopolymer.

Vinyl acetate resin [*9003-20-7*].

» Polyvinyl acetate is a thermoplastic polymer, represented by the formula:

$$(C_4H_6O_2)_n$$

in which the value of n lies between approximately 100 and 17,000.

Packaging and storage—Preserve in well-closed containers. No storage requirement specified.

Labeling—Label it to indicate its viscosity value.

USP Reference standards ⟨11⟩—*USP Polyvinyl Acetate RS. USP Vinyl Acetate RS.*

Identification—

A: Dissolve about 100 mg in 2.5 mL of acetone, place two drops on a potassium bromide plate, and dry to evaporate the solvent: the IR absorption spectrum of polyvinyl acetate exhibits maxima corresponding to the same wavelengths as that of a similar preparation of USP Polyvinyl Acetate RS, treated in the same manner.

B: Saponify 0.5 g in a mixture of 25.0 mL of 0.5 N alcoholic potassium hydroxide and 25.0 mL of water. The solution so obtained meets the requirements of the tests for *Acetate* ⟨191⟩.

Viscosity—Suspend 50.0 g in 100 mL of ethyl acetate in a borosilicate glass flask with a ground-glass neck. Heat under a reflux condenser with constant stirring for 30 minutes. Allow to cool. Pass through a tared sintered glass filter (No. 16), wash the residue with 50.0 mL of ethyl acetate, and pour the filtrate into a 250-mL graduated flask. Dilute with ethyl acetate to 250 mL. Resume stirring to obtain a homogenous solution of 20% (w/v) polyvinyl acetate in ethyl acetate. Determine the viscosity of this solution immediately at 20 ± 0.1° by using a rolling ball viscosimeter: between 85% and 115% of the value stated on the label is found.

Loss on drying ⟨731⟩—Dry 1.0 g at 100° to 105°, to constant weight: it loses not more than 1.0% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Acid value ⟨401⟩**:** not more than 2.0, determined on 5.0 g dissolved in 50.0 mL of alcohol by shaking for 3 hours.

Ester value ⟨401⟩—Saponify 0.5 g in a mixture of 25.0 mL of 0.5 N alcoholic potassium hydroxide VS and 25.0 mL of water. Proceed as directed under *Saponification Value* ⟨401⟩, beginning with "Heat the flask on a steam bath". The ester value, calculated from the *Saponification Value* and the *Acid Value,* is between 615 and 675.

Heavy metals, *Method II* ⟨231⟩**:** not more than 0.001%.

Residual peroxides—Place 0.85 g in a borosilicate glass flask with a ground-glass neck. Add 10.0 mL of ethyl acetate, and heat under a reflux condenser with constant agitation. Allow to cool. Replace the air in the container with oxygen-free nitrogen, and add a solution of 1.0 mL of glacial acetic acid and 0.5 g of sodium iodide in 40.0 mL of water. Shake thoroughly, and allow to stand protected from light for 20 minutes. Titrate with 0.005 N sodium thiosulfate VS until the yellow color is discharged. Carry out a blank titration. The difference between the titration volumes is not greater than 1.0 mL; and not more than 100 ppm, calculated as hydrogen peroxide, is found.

Free vinyl acetate—

Standard stock solution—Transfer 15.0 mL of dimethylformamide to a 20-mL vial, add 45.0 µL of USP Vinyl Acetate RS and 50.0 µL of butyraldehyde, and dilute with dimethylformamide to volume. Dilute 1.0 mL of the solution with dimethylformamide to 10 mL.

Standard solution—Transfer about 0.2 g of Polyvinyl Acetate, accurately weighed, to a 20-mL vial, and add 1.0 mL of the *Standard stock solution*. Close the vial, and secure it with a stopper. Swirl, avoiding contact between the stopper and the liquid.

Test solution—Transfer about 0.2 g of Polyvinyl Acetate, accurately weighed, to a 20-mL vial, and add 1.0 mL of dimethylformamide. Close the vial, and secure it with a stopper. Swirl, avoiding contact between the stopper and the liquid.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.32-mm × 25-m fused-silica capillary column coated with a 0.32-µm layer of stationary phase G36. Use static headspace conditions with an equilibration temperature of 60°, an equilibration time of 20 minutes, and a transfer line temperature of 120°, with nitrogen as the carrier gas. The injection port temperature is maintained at 120°, the detector temperature is maintained at 180°, and the column temperature is maintained at 155°. Nitrogen is used as the carrier gas, flowing at a rate of about 20 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between vinyl acetate and butyraldehyde is not less than 2.0; and the signal-to-noise ratio for vinyl acetate is not less than 5.

Procedure—Separately inject equal volumes (about 1.6 mL) of the gaseous phase of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of vinyl acetate in the portion of Polyvinyl Acetate taken by the formula:

$$(0.931 V r_u) / [2000(W_u r_s - W_s r_u)]$$

in which 0.931 is the density, in g per mL, of vinyl acetate; V is the volume, in µL, of vinyl acetate used to prepare the *Standard stock solution;* W_u and W_s are the weights, in g, of Polyvinyl Acetate used to prepare the *Test solution* and the *Standard solution,* respectively; and r_s and r_u are the vinyl acetate peak responses obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.3% of vinyl acetate is found. ■1S (*NF25*)

BRIEFING

Tribasic Sodium Phosphate, *NF 24* page 3425. On the basis of comments received, it is proposed to revise the test for *Loss on ignition* to indicate that the calculation is performed with respect to the weight of the material before it is dried.

(EM1: C. Sheehan) RTS—44045-1

Change to read:

Loss on ignition ⟨733⟩~~—Dry a portion at 100° for 5 hours. Ignite about 2 g, accurately weighed, of the dried sample at about 800° for 30 minutes: calculated on the dried basis,~~

■Weigh accurately about 2 g, dry at 110° for 5 hours, then ignite at about 800° for 30 minutes:■1S (*NF25*)
the anhydrous form loses not more than 2.0% of its weight, the monohydrate loses between 8.0% and 11.0% of its weight, and the dodecahydrate loses between 45.0% and 57.0% of its weight.

GENERAL CHAPTERS

General Tests and Assays

General Requirements for Tests and Assays

BRIEFING

⟨**1**⟩ **Injections,** *USP 29* page 2455, the *Sixth Interim Revision Announcement* on page 1599 of *PF* 31(6) [Nov.–Dec. 2005], and page 1428 of *PF* 31(5) [Sept.–Oct. 2005]. The The U.S. Food and Drug Administration (FDA) is amending its regulations to change the labeling requirements for aluminum in large- and small-volume parenterals and pharmacy bulk packages used in total parenteral nutrition (TPN). The Parenteral Products—Industrial (PPI) Expert Committee has decided to adopt these labeling requirements to comply with the Code of Federal Regulations (21 CFR 201.323). However, there are some inconsistencies between the proposed USP aluminum labeling section and the Code of Federal Regulations (21 CFR 201.323). Therefore, the committee proposes, in the *Labels and Labeling* section of this chapter, to revise the subsection *Aluminum in Large-Volume Injections, Small-Volume Injections, and Pharmacy Bulk Packages PBPs) Used in Total Parenteral Nutrition (TPN) Therapy* to make the section consistent with the CFR content; this includes changes on aluminum content labeling, changing the term ''injections'' to ''parenterals'', and changing the terms ''SVI[s]'' and ''LVI[s]'' to ''SVP[s]'' and ''LVP[s]''. Additionally, the committee proposes a revised text for *Packaging and Storage* in the *Packaging* section that describes which large-volume parenterals (LVPs) are exempt from the 1-L restriction.

(PPI: J. Kelly) RTS—42879-1; 43505-1

Change to read:

LABELS AND LABELING

Labeling

NOTE—See definitions of ''label'' and ''labeling'' in *Labeling* in the section *Preservation, Packaging, Storage, and Labeling* of the *General Notices and Requirements.*

The label states the name of the preparation; in the case of a liquid preparation, the percentage content of drug or amount of drug in a specified volume; in the case of a dry preparation, the amount of *active* ingredient; the route of administration; a statement of storage conditions and an expiration date; the name and place of business of the manufacturer, packer, or distributor; and an identifying lot number. The lot number is capable of yielding the complete manufacturing history of the specific package, including all manufacturing, filling, sterilizing, and labeling operations.

Where the individual monograph permits varying concentrations of active ingredients in the large-volume parenteral, the concentration of each ingredient named in the official title is stated as if part of the official title, e.g., Dextrose Injection 5%, or Dextrose (5%) and Sodium Chloride (0.2%) Injection.

The labeling includes the following information if the complete formula is not specified in the individual monograph: (1) In the case of a liquid preparation, the percentage content of each ingredient or the amount of each ingredient in a specified volume, except that ingredients added to adjust to a given pH or to make the solution isotonic may be declared by name and a statement of their effect; and (2) in the case of a dry preparation or other preparation to which a diluent is intended to be added before use, the amount of each ingredient, the composition of recommended diluent(s) [the name(s) alone, if the formula is specified in the individual monograph], the amount to be used to attain a specific concentration of active ingredient and the final volume of solution so obtained, a brief description of the physical appearance of the constituted solution, directions for proper storage of the constituted solution, and an expiration date limiting the period during which the constituted solution may be expected to have the required or labeled potency if it has been stored as directed.

Containers for Injections that are intended for use as dialysis, hemofiltration, or irrigation solutions and that contain a volume of more than 1 L are labeled to indicate that the contents are not intended for use by intravenous infusion.

Injections intended for veterinary use are labeled to that effect.

The container is so labeled that a sufficient area of the container remains uncovered for its full length or circumference to permit inspection of the contents.

■STRENGTH AND TOTAL VOLUME FOR SINGLE- AND MULTIPLE-DOSE INJECTABLE DRUG PRODUCTS

For single-dose and multiple-dose injectable drug products, the strength per total volume should be the primary and prominent expression on the principal display panel of the label, followed in close proximity by strength per mL enclosed by parentheses. For containers holding a volume of less than 1

In-Process Revision

mL, the strength per fraction of a mL should be the only expression of strength. Strength per single mL should be expressed as mg/mL, not mg/1 mL.

The following formats are acceptable for contents of greater than 1 mL:

Total strength/total volume: 500 mg/10 mL

Strength/mL: (50 mg/mL)

or

Total strength/total volume: 25,000 Units/5 mL

Strength/mL: (5,000 Units/mL)

The following format is acceptable for contents of less than 1 mL: 12.5 mg/0.625 mL

There are, however, some exceptions to expressing strength per total volume. In certain cases, the primary and prominent expression of the total drug content per container would not be effective in preventing medication errors (e.g., insulin). An example is the use of lidocaine or other similar drugs used as a local anesthetic where the product is ordered and administered by percentage (e.g., 1%, 2%) or a local anesthetic in combination with epinephrine that is expressed as a ratio (e.g., 1 : 100,000). In such cases, the total strength should be expressed: for example, 1% (100 mg/10 mL). Dry solids, which need to be reconstituted, should follow the same format, with the exception that only the total strength of the drug should be listed, not the strength/total volume or strength/mL.■2S (*USP29*)

(Official February 1, 2009)

~~▲Aluminum in Large-Volume Injections (LVIs), Small-Volume Injections (SVIs), and Pharmacy Bulk Packages (PBPs) Used in Total Parenteral Nutrition (TPN) Therapy~~

■Aluminum in Large-Volume Parenterals (LVPs), Small-Volume Parenterals (SVPs), and Pharmacy Bulk Packages (PBPs) Used in Total Parenteral Nutrition (TPN) Therapy■1S (*USP30*)

~~(a) The aluminum content of LVIs used in TPN therapy must not exceed 25 µg per L).~~

~~(b) The package insert of LVIs used in TPN therapy must state that the drug product contains no more than 25µg of aluminum per L. This information must be contained in the "Precautions" section of the labeling of all LVIs used in TPN therapy.~~

~~(c) If the maximum amount of aluminum in SVIs and PBPs is 25µg or less, instead of stating the act amount of aluminum that each may contain, as in paragraph (d), the immediate container label for SVIs and PBPs used in the preparation or in the administration of TPN injections (with exceptions as noted below) and injectable emulsions may state: "Contains no more than 25µg/L of aluminum."If the SVI or PBP is a lyophilizsed powder, the immediate container label may state the following; if the SVI or PBP is a lyophilized powder used in the preparation of TPN injections and injectable emulsions, the immediate container label must state the following: "When reconstituted in accordance with the package insert instructions, the concentration of aluminum will be no more tha 25 µg/L."~~

~~(d) The maximum level of aluminum at expiry must be stated on the immediate container label of all SVIs and PBPs used in the preparation or the administration of TPN injectionsand injectable emulsions. The aluminum content must be stated as follows: "Contains no more than __ µg/L of aluminum". This maximum amount of aluminum be stated as the highest one of the following three levels:~~

■(a) The aluminum content of LVPs used in TPN therapy must not exceed 25 µg per L (µg/L).

(b) The package insert of LVPs used in TPN therapy must state that the drug product contains no more than 25 µg of aluminum per L. This information must be contained in the "Precautions" section of the labeling of all LVPs used in TPN therapy.

(c) If the maximum amount of aluminum in SVPs and PBPs is 25 µg per L (µg/L) or less, instead of stating the exact amount of aluminum that each contains, as in paragraph (d), the immediate container label for SVPs and PBPs used in the preparation of TPN parenterals (with exceptions as noted below) may state: "Contains no more than 25 µg/L of aluminum". If the SVP or PBP is a lyophilized powder, the immediate container label may state the following: "When reconstituted in accordance with the package insert instructions, the concentration of aluminum will be no more than 25 µg/L".

(d) The maximum level of aluminum at expiry must be stated on the immediate container label of all SVPs and PBPs used in the preparation of TPN parenterals and injectable emulsions. The aluminum content must be stated as follows: "Contains no more than __ µg/L of aluminum". The immediate container label of all SVPs and PBPs that are lyophilized powder used in the preparation of TPN solutions must contain the following statement: "When reconstituted in accordance with the package insert in-

structions, the concentration of aluminum will be no more than __ µg/L." This maximum amount of aluminum must be stated as the highest one of the following three levels:■1S (*USP30*)

(1) The highest level for the batches produced during the last three years
(2) The highest level for the latest five batches
(3) The maximum level in terms of historical levels, but only until completion of production of the first five batches after ~~the effective date of~~

■July 26, 2004.■1S (*USP30*)

The package insert for all LVPs, SVPs, and PBPs used in the preparation ~~or administration~~

■■1S (*USP30*)

of TPN products must contain a warning statement. This warning must be contained in the "Warning" section of the labeling and must state the following: "WARNING: This product contains aluminum that may be toxic. Aluminum may reach toxic levels with prolonged parenteral administration if kidney function is impaired. Premature neonates are particularly at risk because their kidneys are immature, and they require large amounts of calcium and phosphate solutions that contain aluminum. Research indicates that patients with impaired kidney function, including premature neonates, who receive parenteral levels of aluminum at greater than 4 to 5 µg per kg per day accumulate aluminum at levels associated with central nervous system and bone toxicity. Tissue loading may occur at even lower rates of administration of TPN products." ~~and of the lock flush solutions used in their administration.~~▲*USP29*

PACKAGING

Containers for Injections

Containers, including the closures, for preparations for injections do not interact physically or chemically with the preparations in any manner to alter the strength, quality, or purity beyond the official requirements under the ordinary or customary conditions of handling, shipment, storage, sale, and use. The container is made of material that permits inspection of the contents. The type of glass preferable for each parenteral preparation is usually stated in the individual monograph. Unless otherwise specified in the individual monograph, plastic containers may be used for packaging injections (see *Containers* ⟨661⟩).

For definitions of single-dose and multiple-dose containers, see *Containers* in the *General Notices and Requirements.* Containers meet the requirements under *Containers* ⟨661⟩.

Containers are closed or sealed in such a manner as to prevent contamination or loss of contents. Validation of container integrity must demonstrate no penetration of microbial contamination or chemical or physical impurities. In addition, the solutes and the vehicle must maintain their specified total and relative quantities or concentrations when exposed to anticipated extreme conditions of manufacturing and processing, and storage, shipment, and distribution. Closures for multiple-dose containers permit the withdrawal of the contents without removal or destruction of the closure. The closure permits penetration by a needle and, upon withdrawal of the needle, closes at once, protecting the container against contamination. Validation of the multiple-dose container integrity must include verification that such a package prevents microbial contamination or loss of product contents under anticipated conditions of multiple entry and use.

Piggyback containers are usually intravenous infusion containers used to administer a second infusion through a connector of some type or an injection port on the administration set of the first fluid, thereby avoiding the need for another injection site on the patient's body. Piggyback containers are also known as secondary infusion containers.

Potassium Chloride for Injection Concentrate

The use of a black closure system on a vial (e.g., a black flip-off button and a black ferrule to hold the elastomeric closure) or the use of a black band or series of bands above the constriction on an ampul is prohibited, except for *Potassium Chloride for Injection Concentrate.*

Neuromuscular Blocking and Paralyzing Agents

All injectable preparations of neuromuscular blocking agents and paralyzing agents must be packaged in vials with a cautionary statement printed on the ferrules or cap overseals. Both the container cap ferrule and the cap overseal must bear in black or white print (whichever provides the greatest color contrast with the ferrule or cap color) the words: "Warning: Paralyzing Agent" or "Paralyzing Agent" (depending on the size of the closure system). Alternatively, the overseal may be transparent and without words, allowing for visualization of the warning labeling on the closure ferrule.

Containers for Sterile Solids

Containers, including the closures, for dry solids intended for parenteral use do not interact physically or chemically with the preparation in any manner to alter the strength, quality, or purity beyond the official requirements under the ordinary or customary conditions of handling, shipment, storage, sale, and use.

A container for a sterile solid permits the addition of a suitable solvent and withdrawal of portions of the resulting solution or suspension in such manner that the sterility of the product is maintained.

Where the *Assay* in a monograph provides a procedure for the *Assay preparation,* in which the total withdrawable contents are to be withdrawn from a single-dose container with a hypodermic needle and syringe, the contents are to be withdrawn as completely as possible into a dry hypodermic syringe of a rated capacity not exceeding three times the volume to be withdrawn and fitted with a 21-gauge needle not less than 2.5 cm (1 inch) in length, with care being taken to expel any air bubbles, and discharged into a container for dilution and assay.

Volume in Container

Each container of an injection is filled with sufficient excess of the labeled "size" or that volume which is to be withdrawn. See *Injections* under *Pharmaceutical Dosage Forms* ⟨1151⟩.

DETERMINATION OF VOLUME OF INJECTION IN CONTAINERS

Select one or more containers if the volume of the container is 10 mL or more, three or more if the volume is more than 3 mL and less than 10 mL, or five or more if the volume is 3 mL or less. Individually take up the contents of each container selected into a dry hypodermic syringe of a rated capacity not exceeding three times the volume to be measured and fitted with a 21-gauge needle not less than 2.5 cm (1 inch) in length. Expel any air bubbles from the syringe and needle, and then discharge the contents of the syringe, without emptying the needle, into a standardized, dry cylinder (graduated to contain rather than to deliver the designated volumes) of such size that the volume to be measured occupies at least 40% of the cylinder's rated volume. Alternatively, the contents of the syringe may be discharged into a dry, tared beaker, the volume, in mL, being calculated as the weight, in g, of Injection taken divided by its density. •For containers with a nominal volume of 2 mL or less, the contents of a sufficient number of containers may be pooled to obtain the volume required for the measurement, provided that a separate, dry syringe assembly is used

In-Process Revision

for each container.•6 The content of containers holding 10 mL or more may be determined by means of opening them and emptying the contents directly into the graduated cylinder or tared beaker.

The volume is not less than the labeled volume in the case of containers examined individually or, in the case of 1- and 2-mL containers, is not less than the sum of the labeled volumes of the containers taken collectively.

For Injections in multiple-dose containers labeled to yield a specific number of doses of a stated volume, proceed as directed in the foregoing, using the same number of separate syringes as the number of doses specified. The volume is such that each syringe delivers not less than the stated dose.

For Injections containing oil, warm the containers, if necessary, and thoroughly shake them immediately before removing the contents. •Cool to between 20° and 25°•6 before measuring the volume.

For Injections in cartridges or prefilled syringes, assemble the container with any required accessories such as a needle or plunger. Following the same procedure as above, and without emptying the needle, transfer the entire contents of each container to a dry, tared beaker by slowly and constantly depressing the plunger. Weigh, and calculate the volume as described above. The volume of each container is not less than the labeled volume.

For large-volume intravenous solutions, select 1 container, and transfer the contents into a dry measuring cylinder of such size that the volume to be measured occupies at least 40% of its rated volume. The volume is not less than the labeled volume.

Printing on Ferrules and Cap Overseals

Only cautionary statements are to be printed on the ferrules and cap overseals of vials containing an injectable drug product. A cautionary statement is one intended to prevent an imminent life-threatening situation if the injectable drug is used inappropriately. Examples of such statements are the following: ''Warning'', ''Dilute Before Using'', ''Paralyzing Agent'', ''I.M. Use Only'', ''Chemotherapy'', etc.

The printing must be in contrasting color and conspicuous under ordinary conditions of use. The cautionary statement may be printed solely on the ferrule, provided the cap overseal is constructed so as to allow the cautionary statement below to be readily legible.

•(Postponed indefinitely)•5

~~Printing on Ferrules and Cap Overseals~~

▪Labeling on Ferrules and Cap Overseals▪2S (*USP29*)

~~(Official October 1, 2005)~~

▪Only cautionary statements are to appear on the top (circle) surface of the ferrule or cap overseal of a vial containing an injectable product. A cautionary statement is one intended to prevent an imminent life-threatening situation if the injectable drug is used inappropriately. Examples of such statements include but are not limited to the following: ''Warning'', ''Dilute Before Using'', ''Paralyzing Agent'', ''I.M. Use Only'', and ''Chemotherapy''.

The text must be in contrasting color and conspicuous under ordinary conditions of use. The cautionary statement may appear solely on the ferrule, provided the cap overseal is constructed so as to allow the cautionary statement beneath the cap to be readily legible.

Identifying numbers or letters, such as code numbers, lot numbers, etc., may appear on the side (skirt) surface of the ferrule on vials containing injectable products. The appearance of such identifying data on the skirt surface of the ferrule, placed where it does not detract from, or interfere with, the cautionary statement on the top surface, should be considered to be a beneficial attribute of the in-process quality control of a product throughout the manufacturing process. Any anti-counterfeiting scheme must not detract from or interfere with the cautionary statements.

Under no circumstances will advertising such as company names, logos, or product names be permitted to appear on the top (circle) surface of any ferrule or cap overseal.▪2S (*USP29*)

(Official February 1, 2009)

Packaging and Storage

The volume of injection in single-dose containers provides the amount specified for parenteral administration at one time and in no case is more than sufficient to permit the withdrawal and administration of 1 L.

Preparations intended for intraspinal, intracisternal, or peridural administration are packaged only in single-dose containers.

Unless otherwise specified in the individual monograph, a multiple-dose container contains a volume of Injection sufficient to permit the withdrawal of not more than 30 mL.

~~Injections packaged for use as irrigation solutions, for hemofiltration or dialysis, or for parenteral nutrition are exempt from the 1-L restriction of the foregoing requirements relating to packaging.~~

~~Containers for Injections packaged for use as hemofiltration or irrigation solutions may be designed to empty rapidly and may contain a volume of more than 1 L.~~

▪The following Injections are exempt from the 1-L restriction of the foregoing requirements relating to packaging:

1. Injections packaged for extravascular use as irrigation solutions or peritoneal dialysis solutions
2. Injections packaged for intravascular use as parenteral nutrition or as replacement or substitution fluid to be administered continuously during hemofiltration

In-Process Revision

Injections packaged for intravascular use that may be used for intermittent, continuous, or bolus replacement fluid administration during hemodialysis or other procedures, unless excepted above, must conform to the 1-L restriction.■1S (*USP30*)

Injections labeled for veterinary use are exempt from packaging and storage requirements concerning the limitation to single-dose containers and the limitation on the volume of multiple-dose containers.

Change to read:

PACKAGING

Containers for Injections

Containers, including the closures, for preparations for injections do not interact physically or chemically with the preparations in any manner to alter the strength, quality, or purity beyond the official requirements under the ordinary or customary conditions of handling, shipment, storage, sale, and use. The container is made of material that permits inspection of the contents. The type of glass preferable for each parenteral preparation is usually stated in the individual monograph. Unless otherwise specified in the individual monograph, plastic containers may be used for packaging injections (see *Containers* ⟨661⟩).

For definitions of single-dose and multiple-dose containers, see *Containers* in the *General Notices and Requirements.* Containers meet the requirements under *Containers* ⟨661⟩.

Containers are closed or sealed in such a manner as to prevent contamination or loss of contents. Validation of container integrity must demonstrate no penetration of microbial contamination or chemical or physical impurities. In addition, the solutes and the vehicle must maintain their specified total and relative quantities or concentrations when exposed to anticipated extreme conditions of manufacturing and processing, and storage, shipment, and distribution. Closures for multiple-dose containers permit the withdrawal of the contents without removal or destruction of the closure. The closure permits penetration by a needle and, upon withdrawal of the needle, closes at once, protecting the container against contamination. Validation of the multiple-dose container integrity must include verification that such a package prevents microbial contamination or loss of product contents under anticipated conditions of multiple entry and use.

Piggyback containers are usually intravenous infusion containers used to administer a second infusion through a connector of some type or an injection port on the administration set of the first fluid, thereby avoiding the need for another injection site on the patient's body. Piggyback containers are also known as secondary infusion containers.

Potassium Chloride for Injection Concentrate

The use of a black closure system on a vial (e.g., a black flip-off button and a black ferrule to hold the elastomeric closure) or the use of a black band or series of bands above the constriction on an ampul is prohibited, except for *Potassium Chloride for Injection Concentrate.*

Neuromuscular Blocking and Paralyzing Agents

All injectable preparations of neuromuscular blocking agents and paralyzing agents must be packaged in vials with a cautionary statement printed on the ferrules or cap overseals. Both the container cap ferrule and the cap overseal must bear in black or white print (whichever provides the greatest color contrast with the ferrule or cap color) the words: "Warning: Paralyzing Agent" or "Paralyzing Agent" (depending on the size of the closure system). Alternatively, the overseal may be transparent and without words, allowing for visualization of the warning labeling on the closure ferrule.

Containers for Sterile Solids

Containers, including the closures, for dry solids intended for parenteral use do not interact physically or chemically with the preparation in any manner to alter the strength, quality, or purity beyond the official requirements under the ordinary or customary conditions of handling, shipment, storage, sale, and use.

A container for a sterile solid permits the addition of a suitable solvent and withdrawal of portions of the resulting solution or suspension in such manner that the sterility of the product is maintained.

Where the *Assay* in a monograph provides a procedure for the *Assay preparation,* in which the total withdrawable contents are to be withdrawn from a single-dose container with a hypodermic needle and syringe, the contents are to be withdrawn as completely as possible into a dry hypodermic syringe of a rated capacity not exceeding three times the volume to be withdrawn and fitted with a 21-gauge needle not less than 2.5 cm (1 inch) in length, with care being taken to expel any air bubbles, and discharged into a container for dilution and assay.

Packaging and Storage

The volume of injection in single-dose containers provides the amount specified for parenteral administration at one time and in no case is more than sufficient to permit the withdrawal and administration of 1 L.

Preparations intended for intraspinal, intracisternal, or peridural administration are packaged only in single-dose containers.

Unless otherwise specified in the individual monograph, a multiple-dose container contains a volume of Injection sufficient to permit the withdrawal of not more than 30 mL.

~~Injections packaged for use as irrigation solutions, for hemofiltration or dialysis, or for parenteral nutrition are exempt from the 1-L restriction of the foregoing requirements relating to packaging.~~

~~Containers for Injections packaged for use as hemofiltration or irrigation solutions may be designed to empty rapidly and may contain a volume of more than 1 L.~~

▪The following injections are exempt from the 1-L restriction of the foregoing requirements relating to packaging:

1. injections packaged for extravascular use as irrigation solutions or peritoneal dialysis solutions
2. injections packaged for intravascular use as parenteral nutrition or as replacement or substitution fluid to be administered continuously during hemofiltration

Injections packaged for intravascular use that may be used for intermittent, continuous, or bolus replacement fluid administration during hemodialysis or other procedures unless excepted above must conform to the 1-L restriction.▪1S (*USP30*)

Injections labeled for veterinary use are exempt from packaging and storage requirements concerning the limitation to single-dose containers and the limitation on the volume of multiple-dose containers.

BRIEFING

〈**11**〉 **USP Reference Standards,** *USP 29* page 2458, page 1101 of *PF* 26(4) [July–Aug. 2000], page 1832 of *PF* 27(1) [Jan.–Feb. 2001], page 433 of *PF* 28(2) [Mar.–Apr. 2002], page 840 of *PF* 28(3) [May–June 2002], page 1468 of *PF* 28(5) [Sept.–Oct. 2002], page 710 of *PF* 29(3) [May–June 2003], page 1601 of *PF* 29(5) [Sept.–Oct. 2003], page 2022 of *PF* 29(6) [Nov.–Dec. 2003], page 613 of *PF* 30(2) [Mar.–Apr. 2004], page 1338 of *PF* 30(4) [July–Aug. 2004], page 1674 of *PF* 30(5) [Sept.–Oct. 2004], page 2092 of *PF* 30(6) [Nov.–Dec. 2004], page 99 of *PF* 31(1) [Jan.–Feb. 2005], page 507 of *PF* 31(2) [Mar.–Apr. 2005], page 822 of *PF* 31(3) [May–June 2005], page 1154 of *PF* 31(4) [July–Aug. 2005], page 1433 of *PF* 31(5) [Sept.–Oct. 2005], page 1680 of *PF* 31(6) [Nov.–Dec. 2005], and page 181 of *PF* 32(1) [Jan.–Feb. 2006].

The changes proposed in the structure and content of the chapter are intended to provide a more comprehensive description of the USP Reference Standards program, to reflect the changes since the last major revisions, to illustrate the complexity and diversity of the collection, to present the steps in the establishment of a Reference Standard and the rationale behind the assignment of a labeled value, and to describe the proper use of the Reference Standards.

It is also proposed to remove the directions for use, handling, and storage from the list of *USP Reference Standards Specified in USP and NF Monographs and General Chapters* in the last section of this General Chapter. These directions are lot-specific. Additional information gathered from the continuous process of evaluation of USP candidates and Reference Standards often prompts changes in the storage and/or handling of USP Reference Standards. The delay between the release of a new lot of Reference Standard (labeled with the new directions) and the publication of a new edition of the Book or of a Supplement including the revised directions creates confusion for the customers. From now on, the directions for storage, handling, and use will be provided **only** on the label of the Reference Standard and on the USP Certificates displayed on the USP website.

(HDQ) RTS—41003-2; 42805-2; 42817-2; 43513-1; 43715-1; 43952-2; 44112-1

Change to read:

~~USP Reference Standards are established and released under the authority of the USPC Board of Trustees upon recommendation of the USP Reference Standards Committee, which passes on the selection and suitability of each lot. The critical characteristics of each lot of specimen selected for the standard are usually determined independently in three or more laboratories. The USP Reference Standards Laboratory (see *Preface*) and the FDA laboratories participate in testing almost all new Standards and replacements for existing Standards. In addition, laboratories throughout the nation, both academic and industrial, participate in the testing.~~

~~Reference Standards are specifically required in many Pharmacopeial assays and tests and are provided solely for such use; suitability for other nonofficial application(s) rests with the purchaser. Originally introduced for the biological assays of *USP X*, reference standards are now required for numerous other procedures as well. This reflects the extensive use of modern chromatographic and spectrophotometric methods, which require measurements relative to a reference standard to attain accurate and reproducible results.~~

~~USP Reference Standards are substances selected for their high purity, critical characteristics, and suitability for the intended purpose. Heterogeneous substances, of natural origin, also are designated "Reference Standards" where needed. Usually these are the counterparts of international standards.~~

~~Antibiotic reference standards distributed by the USPC have been designated by the FDA as identical to FDA working standards under the FDA procedures. USPC distributes both U.S. Reference Standards and USP Reference Standards for antibiotic substances. This difference in labeling the Standards is in effect only temporarily, and eventually all vials will bear the same title. Where a USP Reference Standard is called for, the corresponding substance labeled as a "U.S. Reference Standard" may be used, and vice versa.~~

~~Reference Standards currently labeled as "NF Reference Standards" will eventually all be designated and labeled as "USP Reference Standards" pursuant to the consolidation of USP and NF within the USPC as of January 2, 1975. Meanwhile, where a USP Reference Standard is called for, the corresponding substance labeled as an "NF Reference Standard" may be used.~~

■USP Reference Standards are highly characterized specimens of drug substances, excipients, reportable impurities, degradation products, compendial reagents, and performance calibrators.

They are explicitly required in many Pharmacopeial assays and tests and are provided solely for such use. Suitability for use in nonofficial application(s) should be validated by the purchaser.■1S (*USP30*)

Delete the following:

■~~Authentic Visual Reference~~

~~Unlike chemical reference standards, Authentic Visual References (AVRs) are not used in chemical analysis. Instead, the AVRs are visual images used by analysts to compare certain test articles to ensure that they meet compendial requirements and are incorporated by reference into the monograph. Approval of AVRs for use in a monograph is the decision of the Expert Committee that approves the specific monograph.~~■1S (*USP30*)

Delete the following:

■~~Other Reference Substances~~

~~As a service, the USPC tests and distributes additional authenticated substances not currently required as USP or NF Reference Standards. These also are provided under the supervision of the USP Reference Standards Committee. These additional substances fall into three groups: (1) former USP and NF Reference Standards, not required in the current *USP* or *NF* but for which sufficient demand remains; (2) FCC Reference Standards, specified in the current edition of the Food Chemicals Codex; and (3) Authentic Substances (AS), which are highly purified samples of chemicals, including substances of abuse, that are collaboratively tested and made available as a service primarily to analytical, clinical, pharmaceutical, and research laboratories.~~

~~The distribution of controlled substances is subject to the regulations and licensing provisions of the Drug Enforcement Administration of the Department of Justice.~~

~~As an additional service, the USPC distributes several non-commercial reagents required in certain *USP* monographs. These reagents are specially prepared for their intended use and will be distributed by USPC only until they become commercially available.~~

~~A program to provide international biological standards and chemical reference substances is maintained by the World Health Organization, an agency of the United Nations. The WHO program is concerned with reference materials for antibiotics, biologicals, and chemotherapeutic agents. As a rule, an International Standard for a material of natural origin is discontinued once the substance responsible for its characteristic activity has been isolated, identified, and prepared in such form that it can be completely characterized by chemical and physical means. The USP Reference Standards Committee collaborates closely with the WHO in order to minimize unavoidable differences in the actual units of potency, and in some cases to share in the preparation of a reference standard. Since some USP Reference Standards are standardized in terms of the corresponding International Standards, the relevant USP Units and the International Units of potency are generally identical.~~■1S (*USP30*)

Delete the following:

■~~CURRENT LOTS~~

~~It is the responsibility of each analyst to ascertain that his particular supply of USP Reference Standard is current. Only sufficient quantity for immediate use should be purchased, and long-term storage should be avoided.~~

~~To ensure ready access to the latest information, the USPC publishes the Official Catalog of Reference Standards and Authentic Substances, and the lot designations, bimonthly in *Pharmacopeial Forum*.~~[♣] ~~This system offers more positive control and flexibility in responding to revisions in Reference Standard usage than would ex-~~

[♣] ~~For nonsubscribers, the most recent Official Catalog is available from: U.S. Pharmacopeial Convention, Inc., Reference Standards Order Department, 12601 Twinbrook Parkway, Rockville, MD 20852. Telephone 1-301-881-0666. FAX 1-301-816-8148. Toll free telephone 1-800-227-USPC or access the Catalog on USP's web site www.usp.org/dsd/refstd.~~

In-Process Revision

~~piration dates. The Catalog in the most recent *Pharmacopeial Forum* identifies items that are official in the USP Reference Standards collection at the time of publication.~~

~~Two columns appear in the Catalog to identify the current official lots. One column identifies the official lot currently being shipped by USPC. In some cases, the previous lot may still be considered official. If so, it is identified in the second column. Ordinarily the previous lot is carried in official status for about one year after the current lot entered distribution unless, because of a change in monograph requirements or stability limitations, the previous lot is found to be no longer suitable.~~

~~PROPER USE OF USP REFERENCE STANDARDS~~

~~Unless a Reference Standard label states a specific potency or content, the Reference Standard is taken as being 100.0% pure for compendial purposes. The suitability of a USP Reference Standard for noncompendial application is left up to the user.~~

~~To serve its intended purpose, each USP Reference Standard must be properly stored, handled, and used. Generally, Reference Standards should be stored in their original stoppered containers away from heat and protected from light. Avoid humid storage areas in particular. Where special storage conditions are necessary, directions are given on the label.~~

~~Neither Reference Standards nor Authentic Substances are intended for use as drugs or as medical devices.~~

~~Many Pharmacopeial tests and assays are based on comparison of a test specimen with a USP Reference Standard. In such cases, measurements are made on preparations of both the test specimen and the Reference Standard. Where it is directed that a Standard solution or a *Standard preparation* be prepared for a quantitative determination by stepwise dilution or otherwise, it is intended that the Reference Standard substance shall be accurately weighed (see *Weights and Balances* ⟨41⟩ and *Volumetric Apparatus* ⟨31⟩). Due account should also be taken of the relatively large errors associated with weighing small masses (see also *Dilution* under *Tests and Assays* in the *General Notices and Requirements*).~~

~~Assay and test results are determined on the basis of comparisons of the specimen under test with a USP Reference Standard that has been freed from or corrected for volatile residues or water content as instructed on the label. Where special drying requirements for Reference Standards are found in specific sections of *USP* or *NF* monographs, those supersede the usual instructions (see *Procedures* under *Tests and Assays* in the *General Notices and Requirements*). Where a USP Reference Standard is required to be dried before using, transfer an amount, sufficient after drying, to a clean and dry vessel. Do not use the original container as the drying vessel, and do not dry a specimen repeatedly at temperatures above 25°. Where the titrimetric determination of water is required at the time a Reference Standard is to be used, proceed as directed for *Method I* under *Water-Determination* ⟨921⟩. Instrumental or microanalytical methods are acceptable for this purpose. When using typical amounts, about 50 mg, of the Reference Standard, titrate with a fourfold dilution of the *Reagent*.~~

~~The *USP Reference standards* section of an individual *USP* or *NF* monograph or general chapter names each USP Reference Standard required for assay and test procedures and refers to this chapter for additional information and instructions. The list that follows presents the instructions for the proper use and storage of each required USP Reference Standard. These instructions are to be the same as those appearing on the corresponding USP Reference Standard label. Where, in an isolated instance, the specific label instruction differs from the text in the following list, the instruction on the label of the item from the current lot takes precedence. A situation may be infrequently encountered where it is necessary, on scientific grounds, to effect immediately a change in the instructions. This change can be made easily on the label of the Reference Standard, whereas the formal process for revising the compendial text requires more time. Thus, it is especially important to refer to the current Supplement to *USP* and to *NF* for official revisions to the following list.~~ ■1S (*USP30*)

Add the following:

▪AUTHORITY FOR ESTABLISHMENT AND RELEASE

USP Reference Standards are established and released under the authority of the USPC Board of Trustees upon recommendation of the USP Reference Standards Expert Committee, which approves each lot as being suitable for use in its compendial applications. For some Reference Standards a preliminary review and approval is sought from other Expert Committees of the Council of Experts.

The distribution of controlled substances is subject to the regulations and licensing provisions of the Drug Enforcement Administration of the Department of Justice.

Industry Advisory Panels and other expert groups (such as Project Teams) may be assembled to advise USP on various aspects of the Reference Standards Program. ■1S (*USP30*)

Add the following:

▪HISTORY

Future availability of the first USP Reference Standards was announced in 1926 (*USP X*) "... in order to facilitate the adoption of the biological assay standards of the Pharmacopoeia, and to provide a greater degree of uniformity in their application." The list of USP Reference Standards that in 1936 comprised 6 items has grown to almost 1650 in 2004, and the collection has tracked the progress in pharmaceutical sciences: The first vitamins (Cod Liver Oil) and the first enzyme (Pepsin) in 1936; the first sulfonamide (Sulfanilamide) and the first hormones (Insulin; Posterior Pituitary) in 1942; the first performance standards (Melting Point Standards) in 1947; the first penicillin (Penicillin G Sodium) in 1950; the first recombinant-DNA technology protein (Insulin Human) in 1985, etc.

The continuous increase in the number of USP Reference Standards (over 100 new standards are being developed yearly) reflects not only the increase in the number of monographs and General Chapters, but also the development and extensive

use of modern analytical methodology (such as chromatography, spectrophotometry, biological and biochemical assays, etc.) which require measurements relative to a reference standard.■1S (*USP30*)

Add the following:

▪NOMENCLATURE

Standards designated as USP Reference Standards (USP RS) are, with a few exceptions, required for use in compendial monographs or General Chapters. The exceptions include current lots of USP and NF Reference Standards for which uses are no longer specified in the current *USP* or *NF* but for which sufficient demand remains (upon depletion of the current lots, future lots will be designated as Authentic Substances), Reference Standards specified in the current edition of the *Food Chemicals Codex* (labeled with an additional designation "FCC"), and Fluoride Dentifrices (evaluated and distributed by agreement with the FDA and the Cosmetics, Fragrances and Toiletries Association). Occasionally, a USP Reference Standard required in a monograph or General Chapter proposed in *Pharmacopeial Forum* may be released in advance of the official date of the proposed *PF* revision.

Reference Standards currently labeled as "NF Reference Standards" will eventually all be designated and labeled as "USP Reference Standards" pursuant to the consolidation of *USP* and *NF* within the USPC as of January 2, 1975. Meanwhile, where a USP Reference Standard is called for, the corresponding substance labeled as an "NF Reference Standard" may be used.

As a service, the USPC tests and distributes additional Authentic Substances (designated by AS) not currently required as USP or NF Reference Standards. These also are provided under the supervision of the USP Reference Standards Committee. They are highly characterized samples of chemicals, including substances of abuse, which are collaboratively tested and made available as a service primarily to analytical, clinical, pharmaceutical, and research laboratories. Such materials may be used for identification, method development, evaluation of method performance, or other applications as found suitable and validated by the user.

Authentic Visual References

Unlike chemical reference standards, Authentic Visual References (AVRs) are not used in chemical analyses. Instead, the AVRs are visual images used by analysts to compare certain test articles to ensure that they meet compendial requirements and are incorporated by reference into the monograph. Approval of AVRs for use in a monograph is the decision of the Expert Committee that approves the specific monograph.■1S (*USP30*)

Add the following:

▪DIVERSITY AND IMPLICATIONS

The USP Reference Standards collection is very diverse in terms of appearance, chemical structure, composition, and uses. This diversity has significant implications for the way the materials are tested, packaged, stored, and utilized.

The USP Reference Standards may be crystalline or amorphous powders, volatile or viscous liquids, solutions or suspensions, gels or pastes, plastic sheets, etc. In chemical structure they vary from simple inorganic salts to proteins produced by recombinant DNA technology. Some are highly-purified single components, while others are complex mixtures (in most cases extracted from plant or animal sources).■1S (*USP30*)

Add the following:

▪USES OF USP REFERENCE STANDARDS

The official uses of USP Reference Standards are specified in the compendial monographs and in General Chapters and they include the following:

- quantitative uses in assays for drug substances and formulations, limit tests, or blanks and controls
- qualitative uses, such as identification tests, system suitability tests, chromatographic peak markers, etc.
- performance standards and calibrators, such as dissolution calibrators, melting point standards, the particle count set, etc.

As discussed under *Nomenclature,* USP also establishes and distributes standards without compendial applications.

The most frequent applications of USP Reference Standards (USP RS) are in chromatographic and spectroscopic methodologies. However, they are also widely used in biological and biochemical applications, such as microbial assays for antibiotics, enzymatic reactions, cell-culture tests, whole-animal tests; in thermal analysis for polymers; and in titration, etc. Some of the most frequently used USP RS are those utilized in General Chapters tests such as *Dissolution* ⟨711⟩, *Bacterial Endotoxins Test* ⟨85⟩, *Total Organic Carbon* ⟨643⟩, and *Particulate Matter in Injections* ⟨788⟩.■1S (*USP30*)

Add the following:

▪STEPS IN ESTABLISHING A USP REFERENCE STANDARD

The establishment of a new USP Reference Standard is triggered by the proposal of a new monograph or of a revision of an existing monograph by the inclusion of a test requiring a new USP RS. The need for a new lot of an existing USP Reference Standard is identified when its inventory reaches a preestablished threshold. The new lot is designated as a "replacement lot" if a new bulk material is to be procured or as a "continuation lot" if the candidate material is another portion of the bulk used for the existing official lot.

USP scientists generate a set of documents including procurement specifications and a testing protocol. A bulk material is obtained, generally from a major manufacturer of the article. The material is tested and characterized in an inter-laboratory collaborative study organized according to the protocol designed at USP Headquarters. The results are evaluated by USP Staff, additional testing or investigations are performed when necessary, and a report is compiled and presented for review and approval to the USP Reference Standards Expert Committee. After approval the material is subdivided (if not packaged prior to the collaborative study), labeled, quality checks are performed, and the standard is made available for distribution. If a candidate material is found to be unsuitable by USP scientific staff or by the Reference Standards Committee, a new bulk is procured and tested.■1S (*USP30*)

Add the following:

▪COLLABORATIVE STUDY FOR THE EVALUATION OF A USP RS CANDIDATE MATERIAL

The goals of the evaluation study are to confirm the identity and assess the purity of the material, to determine its suitability for use in the official applications, to provide the user with all the necessary information and directions for use, and to acquire time-zero information for future continued-suitability-for-use studies.

USP scientists design a detailed testing protocol that includes the following elements: types of tests, number of tests, number of collaborators, number of replicates, and references to the procedures to be used.

The following factors are considered when designing the study protocol: the compendial status of the standard, its official uses, the history of the standard, its composition and complexity, the characteristics of the methodology, and the availability of material and of competent laboratories.

The testing protocol may comprise visual and microscopic evaluation; identification tests (more elaborate for first-time standards); determination of physical–chemical constants (e.g., melting range, specific rotation, refractive index, specific gravity, etc); chromatographic and electrophoretic purity tests; inorganic contaminants determination; volatile tests (water, solvents); functional group analysis (such as titrations, UV ab-

sorptivity, elemental analysis); thermal analysis; and assays against another well-characterized standard (a previous lot, an international standard, etc). Specialized testing is implemented where appropriate, such as for dissolution calibrators and the particle count set, for standards that define an attribute (negative and positive bioreaction, ion-exchange capacity, permeability diameter), and for biological standards that define a Unit of activity (heparin, endotoxin, enzymes, complex antibiotics). Vapor sorption analysis may also be performed to assist in determining packaging and storage conditions, and directions for use. For lyophilized single-use USP RS, acceptable vial content reproducibility and stability of the lyophilized form are demonstrated.

The number of collaborators is generally not less than three (two outside of USP); but it can increase significantly, especially when the methodology is complex or does not have a high level of precision or when potential users express an interest in participating in the evaluation of the candidate. (Participation in all evaluation studies is open to all competent, interested parties.) Where appropriate, statistical control is exercised in the design of the evaluation study and in the analysis of the results. The USP Reference Standards Laboratory and the FDA laboratories participate in almost all evaluation studies. Other collaborators include Health Canada, the USP Research and Development Laboratory, and industrial and academic laboratories from the United States and from abroad.■1S (*USP30*)

Add the following:

▪BIOLOGICAL REFERENCE STANDARDS

The World Health Organization, an agency of the United Nations, manages a program providing International Standards for biological materials.

USP collaborates closely with the WHO in the harmonization of analytical methodology, in the definition of the units of potency, and in some cases to share in the preparation of a reference standard. In many cases the USP Units and the International Units of potency are identical.■1S (*USP30*)

Add the following:

▪SUITABILITY FOR USE AND PURITY ASSIGNMENT

The data collected in the collaborative evaluation study are analyzed to determine whether the material is suitable for its monograph-designated use. Characterization data and results must be considered as a whole when evaluating suitability for intended use, assignment strategy, and assigned value. For Reference Standards used in quantitative applications, this includes the determination of a calculation value to be used in the compendial utilization of the standard.

The method of choice in computing the assigned value is a mass balance analysis using independently determined components such as moisture, solvent residues, inorganic residues, chromatographic impurities, and ion content. The assay results against a previous lot or against another validated standard and the results of the functional group analysis are for confirmatory purposes only. Exceptions to the mass balance approach include many biological Reference Standards, especially those which define the Unit of activity.

The number of significant figures in the labeled calculation value is a function of the use of the standard and the number of significant figures in the acceptance range or limit. Generally, Reference Standards used in assays are labeled with three significant figures and standards used in limit tests with two significant figures. Reference Standards having multiple applications in different methodologies may require separate assay-specific assignments.

The assigned value is labeled without any associated uncertainty. However, for calibration standards, the labeled value is a range, determined by a statistical analysis of the results.

Previous approaches used a purity threshold above which the content was no longer labeled, and the analyst was directed to use a default value of 100.0%. This approach is no longer in use, but older lots of standards have not been re-labeled, and users should continue to apply the default 100.0% value for compendial quantitative applications.

For antibiotics, the designation "µg/mg" is sometimes used as a unit of biological activity, and values greater than 1000 µg/mg may be assigned to some of these standards. This can happen when the first standard is assigned a value higher than its actual purity and subsequent standards of higher purity are defined relative to the previous lot. A relatively overstated assigned value can also result when less selective separation techniques are replaced with more selective modern methodologies. As a result, the original content might have been assumed to be higher than the actual level.

No value is assigned to standards having only qualitative applications.

A report compiling the results of the evaluation study and including the proposed label text is submitted for review and approval to the USP Reference Standards Expert Committee.■1S (*USP30*)

Add the following:

▪LABEL TEXT

The label text is designed to provide the user with all the information needed for the correct storage and usage of the Reference Standard in monograph application(s). The label includes directions for use, safety warnings, required information for controlled substances, and a calculation value for standards with quantitative applications. For calibrators, acceptance ranges are provided. Where necessary, USP Reference Standards are accompanied by additional documentation, such as Technical Sheets or Typical Chromatograms. USP does not provide Certificates of Analysis, because all the information that the user needs for the official applications of the standard is provided in the label text and, where necessary, in the additional documentation provided.

Directions for use are lot-specific, and they take precedence over any other indication in the compendium.

Material Safety Data Sheets are generated for every standard that USP distributes. They are available on the USP website.■1S (*USP30*)

Add the following:

▪USP REFERENCE STANDARDS EXPERT COMMITTEE

The USP Reference Standards Expert Committee comprises professionals from industry, government agencies and academia from the United States and abroad. It is organized in groups and may be assisted in the review of the evaluation studies by an Industry Advisory Panel. The approval of the evaluation report has to be unanimous.■1S (*USP30*)

Add the following:

▪PACKAGING

The USP Reference Standard production process operates under a registered ISO 9001:2000 Quality System and appropriate cGMP principles.

USP Reference Standards are packaged in individual units designed to maintain the integrity of the contained Reference Standard material. The packaging and storage conditions for USP Reference Standards provide protection for all materials even though the material may not need such exceptional protection due to its inherent stability. The most common packaging configurations are vials for solid materials and ampuls for liquids. The packaging environment is determined by the sensitivity of the material to light, oxidation, or atmospheric humidity, and by its toxicity. Where appropriate, containers are filled in a glove box under inert gas and in conditions of controlled low residual humidity. (The need to store such standards under inert gas protection is indicated on the label.)

They may also be sealed in a foil bag as an added protective barrier. Ampuls are filled and sealed on an automated device and are typically purged with an inert gas. The most common ampul sizes are 2 mL and 5 mL. Vials may be filled by manual, semi-automated, or fully automated operations. Vials may be of different sizes depending upon the amount of material. The amount of material per individual container depends on the compendial application of the standard and is generally sufficient for several replicates. Larger amounts are provided when additional experiments are required (such as a titrimetric determination of the water content at the time of use). In general, Reference Standard containers are slightly over-filled so that the user can retrieve the labeled, nominal amount of material. Vials are closed with Teflon-lined stoppers and secured with aluminum crimps and a USP-logo tamper-evident seal. Lots using prior vial closure configurations may still be in distribution.

Various considerations may determine the need to provide the standard in single-use containers, mainly for materials with significant handling issues or for those that are available only in small amounts. Such single-use containers are generally filled by lyophilization, and their content is labeled in mass or activity Units per container. If so labeled, the content of the container is to be reconstituted in its entirety without any additional weighing. Instructions for reconstitution are given either on the label or in the monographs where the standard is being used.■1S (*USP30*)

Add the following:

▪IMPURITY REFERENCE STANDARDS

The topic of impurities is addressed in several sections of USP, such as *General Notices,* General Chapters such as *Ordinary Impurities* ⟨466⟩, *Impurities in Official Articles* ⟨1086⟩, etc. In addition, most of the monographs for drug substances and many of those for formulations include specific tests for the identification or quantitation of impurities. Such tests generally require an official Reference Standard. The development of these impurity Reference Standards is one of the reasons for the continuous accelerated growth of the USP Reference Standards.

In many cases, the materials for impurity Reference Standards are expensive and difficult to procure. Only a limited amount of material may be available—procurement might require custom synthesis—and it may be of lesser quality than the Reference Standard for the official article, requiring purification. The limited amount of material available can affect the testing protocol and the packaging. Impurity Reference Standards might be available as purified single-component materials, solutions, or solid dispersions, or mixtures of more than one impurity. Other options include samples of the official article with a labeled content of impurity(ies), the in-situ generation of the impurity from the official article by a validated specified procedure, the use of relative chromatographic mobilities and relative response factors, or of theoretical values such as UV absorptivities at selective wavelengths.

In earlier editions of the compendium, the impurities were designated by their chemical names. For ease of indexing and searching, these have been gradually replaced with the designation "X Related Compound Y RS," where X is the name of the official article and Y is a sequential alphabetical letter. Reference Standard impurity mixtures might be designated by their use, such as "X System Suitability RS". The conventional names and the chemical names are cross-referenced in the final section of this chapter and in a special section of the Official USP Reference Standards Catalog.■1S (*USP30*)

Add the following:

▪CONTINUED SUITABILITY FOR USE PROGRAM

To ensure that the Reference Standards maintain the properties determined at the initial evaluation, USP maintains a Continued Suitability for Use Program. The retesting intervals and protocols are a function of the uses and properties of the standard and of the information available about its stability. Ab-

In-Process Revision

breviated protocols use the stability-indicating methodology employed in the initial characterization of the material to confirm the consistency of attributes such as appearance, chromatographic purity, or volatiles content.■1S (*USP30*)

Add the following:

▪PROPER USE

Neither the Reference Standards nor the Authentic Substances are intended for use as drugs or as medical devices.

USP Reference Standards do not carry an expiration date as long as they are in distribution. A lot of USP RS may be used in its official applications as long as it is listed as ''Current Lot'' in the current (most recent) Official USP Reference Standards Catalog. Upon depletion, the lot is designated in the catalog as ''Previous Lot'' and a ''Valid Use Date'' is assigned. USP publishes the Official Catalog of Reference Standards (which also includes Authentic Substances) bimonthly both as a separate brochure and in *Pharmacopeial Forum**. An updated version of the catalog can be found on the USP website at www.usp.org. It is the responsibility of the user to ascertain that a particular supply of USP Reference Standard has official status either as a ''Current Lot'' or as a ''Previous Lot'' within the valid use date.

Many Pharmacopeial tests and assays are based on comparison of a test specimen with a USP Reference Standard. In such cases, measurements are made on preparations of both the test specimen and the Reference Standard. Where it is directed that a Standard solution or a Standard preparation be prepared for a quantitative determination by stepwise dilution or otherwise, it is intended that the Reference Standard substance shall be accurately weighed (see *Weights and Balances* ⟨41⟩ and *Volumetric Apparatus* ⟨31⟩). Due account should also be taken of the relatively large errors associated with weighing small masses (see also *Dilution* under *Tests and Assays* in the *General Notices and Requirements*).

The label text provides the user with directions on the proper use of a Reference Standard. The directions include one of the following options. A Reference Standard may be used as follows:

- As-is, i.e., without any prior treatment or correction for volatiles. This is the preferred option, and it is selected whenever validated data show that the volatiles content is constant over time.
- Immediately after a prior drying under stated conditions. Drying should not be performed in the original container. A portion of the material should be transferred to a separate drying vessel.
- With a correction for the water content or the loss on drying determined on a separate portion of material. Where the titrimetric determination of water is required at the time a Reference Standard is to be used, proceed as directed for *Method I* under *Water Determination* ⟨921⟩. Instrumental or microanalytical methods are acceptable for this purpose. When using typical amounts (about 50 mg of the Reference Standard), titrate with a two- to five-fold dilution of the reagent.

Whenever the labeled directions for use require a preliminary drying or a correction for volatiles, it should be performed ''at the time'' of use. Further experimental details should be controlled by the user's Standard Operating Procedures and good laboratory practices.■1S (*USP30*)

Add the following:

▪STORAGE

To serve its intended purpose, each USP Reference Standard must be properly stored, handled, and used. Generally, Reference Standards should be stored in their original stoppered containers away from heat and protected from light.

* For nonsubscribers, the most recent Official Catalog is available from: U.S. Pharmacopeial Convention, Inc., Reference Standards Order Department, 12601 Twinbrook Parkway, Rockville, MD 20852. Telephone 1-301-881-0666. FAX 1-301-816-8148. Toll-free telephone 1-800-227-USPC or access the Catalog on USP's website www.usp.org/dsd/refstd.

Avoid humid storage areas in particular. Where special storage conditions are necessary, directions are given on the label.■1S (*USP30*)

Add the following:

▪RELATIONSHIPS WITH OTHER STANDARDS-SETTING ORGANIZATIONS

USP maintains continuous contact with other organizations that establish Reference Materials for compendial and other purposes, such as the European and the Japanese Pharmacopoeias (through the Pharmacopeial Discussion Group), the World Health Organization, the National Institute for Science and Technology, the Reference Materials Committee of ISO (REMCO), etc.

The specific nature of pharmacopeial reference substances has been officially recognized by ISO-REMCO in the introduction of the ISO Guide 34—General requirements for the competence of reference material producers—(Second Edition 2000): ''Pharmacopoeial standards and substances are established and distributed by pharmacopoeial authorities following the general principle of this guide. It should be noted, however, that a different approach is used by the pharmacopoeial authorities to give the user the information provided by certificate of analysis and the expiration dates. Also, the uncertainty of their assigned values is not stated since it is negligible in relation to the defined limits of the method-specific assays of the pharmacopoeias for which they are used.''

The *USP Reference standards* section of an individual *USP* or *NF* monograph or general chapter names each USP Reference Standard required for assay and test procedures and refers to this chapter for additional information and instructions. It is especially important to refer to the current Supplement to *USP* and to *NF* for official revisions listed in the following section.■1S (*USP30*)

Change to read:

USP REFERENCE STANDARDS SPECIFIED IN USP AND NF MONOGRAPHS AND GENERAL CHAPTERS

NOTE—Consult the latest Supplement or *Interim Revision Announcement* pertaining to *USP* and to *NF* for revisions, additions, or deletions.

Revisions, additions, and deletions of individual USP Reference Standards are listed cumulatively in each Supplement to *USP–NF*. As a consequence, therefore, it is necessary to consult only ~~*USP 29–NF 24*~~

▪the current edition of *USP–NF* ■1S (*USP30*) and the latest Supplement for the complete list of USP Reference Standards currently specified in *USP–NF* monographs and general chapters. The list provides up-to-date and complete names and applicable chemical information ~~, and handling instructions~~

▪■1S (*USP30*) for the USP Reference Standards that are in distribution as of the official date of that Supplement.

Revisions of this chapter are implemented continuously via the *Interim Revision Announcements* that are published in *Pharmacopeial Forum*. Those interim revisions of USP Reference Standards are cumulatively included in the next *USP–NF* Supplement.

The alphabetical list that follows constitutes an index of all revisions to this chapter. Thus, it is unnecessary to name repetitively the revised Reference Standards in the general index to the Supplement.

In the list that follows, chemical names are given for many substances (e.g., related compounds) that are not *USP* or *NF* monograph articles. Following the name of such a chemical substance RS, the empirical formula and molecular weight, separated by the ✧ symbol, may be given in parentheses if those data are available.

Apparatus for Tests and Assays

BRIEFING

〈**41**〉 **Weights and Balances,** *USP 29* page 2499. On the basis of comments received, the Expert Committee for General Chapters is canceling the previous proposal for this general chapter published on page 508 of *PF* 31(2) [Mar.–Apr. 2005]. The following new version is proposed for public comment. In this draft, uncertainty is determined through repeatability and accuracy.

(GC: H. Pappa) RTS—42800-1

Change to read:

INTRODUCTION

~~The intent of this section is to bring the requirements for weights into conformity with American National Standard ANSI/ASTM E617, "Laboratory Weights and Precision Mass Standards." This standard is incorporated by reference and should be consulted for full descriptions and information on the tolerances and construction of weights.[1]~~

■■1S (*USP30*)
Pharmacopeial tests and assays require balances that vary in capacity, sensitivity, and reproducibility.

■Measurement uncertainty from the balance is only one contributor to overall weighing errors. Other contributors to weighing errors include changes in water content of samples during weighing and errors due to a static charge on the sample. This chapter addresses the control of the analytical balance for routine operation.■1S (*USP30*)
Unless otherwise specified, when substances are to be "accurately weighed" for *Assay,* the weighing is to be performed with a weighing device whose measurement uncertainty ~~(random plus systematic error)~~

■■1S (*USP30*)
does not exceed 0.1% of the reading. ~~Measurement uncertainty is satisfactory if three times the standard deviation of not less than ten replicate weighings divided by the amount weighed, does not exceed 0.001. Unless otherwise specified, for titrimetric limits tests, the weighing shall be performed to provide the number of significant figures in the weight of the analyte that corresponds to the number of significant figures in the concentration of the titrant.~~

■Assessment of measurement uncertainty is typically done prior to the balance being placed in operation (e.g., during IQ/OQ/PQ) and periodically thereafter. Two steps are performed in measuring uncertainty: (1) measurement of repeatability and (2) verification of accuracy against certified weights.

Repeatability

Assessment of repeatability may be performed with either *Method A* or *Method B*.

Method A—In this method repeatability is determined at the lower end of the desired operating range (i.e., the range of weights for which the balance has been qualified to meet the requirements of this chapter). The measurement of repeatability using this method is satisfactory if two times the standard deviation of not less than 10 replicate weighings divided by the amount weighed does not exceed 0.001:

$$2s/w < 0.001$$

in which s is the standard deviation of not less than 10 replicate weighings; and w is the nominal mass, in mg, of the weight used.

~~[1] Copies of ASTM Standard E 617-81 (Reapproved 1985) may be obtained from the American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103.~~

In-Process Revision

Method B—This method may be used to determine the low end of the operating range (e.g., minimum weight). Minimum weight can be derived from the following formula:*

$$(2/U_{rel})s$$

in which U_{rel} represents the uncertainty factor of 0.001; and s is the standard deviation, in mg, of not less than 10 replicate measurements of a mass near the low end of the operating range. Due to scale resolution, it is possible to make measurements with every measurement resulting in the same value. A true scale standard deviation of zero is not statistically possible, though the standard deviation may be less than one display increment d. In this situation, the standard deviation of the scale can be estimated as:

$$s = \frac{d}{\sqrt{3}} = 0.577d$$

Verification of Accuracy

Using multiple weights of suitable accuracy as described in the table *Weights Used for Calibration Check of Balances,* the measured weight is within 0.1% of the certified value over the operating range of the balance. The operating range refers to the range used for performing the assay, and not necessarily the operating range for other weighing operations.

Weights Used for Calibration Check of Balances

Application	Appropriate Class of Weight	Lowest Weight with a Tolerance Within 0.1%*
Calibration of the weights used for other applications or other specialized applications	OIML Classes E1, E2, and ASTM Class 0 (Note: Special control of humidity and temperature is needed.)	OIML E1, 5 mg OIML E2, 10 mg ASTM Class 0, 5 mg
Routine analytical work using microbalances	ASTM Classes 1, 2	ASTM Class 1, 10 mg ASTM Class 2, 20 mg
Routine analytical work using 4–5 place analytical balances	ASTM Classes 3, 4 OIML Classes F1, F2	ASTM Class 3, 50 mg ASTM Class 4, 100 mg OIML Class F1, 50 mg OIML Class F2, 200 mg

* ASTM standard E617 may be obtained from ASTM, 100 Barr Harbor Drive, West Conshohocken, PA 19428. OIML R111 may be obtained from OIML, 11 Rue Targot-75009, Paris, France.

■1S (*USP30*)

~~The class designations below are in order of increasing tolerances.~~

~~Class 1.1 weights are used for calibration of low capacity, high-sensitivity balances. They are available in various denominations from 1 to 500 mg. The tolerance for any denomination in this class is 5 µg. They are recommended for calibration of balances using optical or electrical methods for accurately weighing quantities below 20 mg.~~

~~Class 1 weights are designated as high precision standards for calibration. They may be used for weighing accurately quantities below 20 mg. (For weights of 10 g or less, the requirements of class 1 are met by *USP XXI* class M.)~~

~~Class 2 weights are used as working standards for calibration, built in weights for analytical balances, and laboratory weights for routine analytical work. (The requirements of class 2 are met by *USP XXI* class S.)[2]~~

~~Class 3 and class 4 weights are used with moderate precision laboratory balances. (Class 3 requirements are met by *USP XXI* class S-1; class 4 requirements are met by *USP XXI* class P.)[2]~~

~~A weight class is chosen so that the tolerance of the weights used does not exceed 0.1% of the amount weighed. Generally, class 2 may be used for quantities greater than 20 mg, class 3 for quantities of~~

* Derived from expanded uncertainty equation in NISTIR 6919, *Recommended Guide for Determining and Reporting Uncertainties for Balances and Scales, January 2002.*

~~[2] Note that the designations S and P no longer designate weight classes but rather weight grades, that is, design limitations such as range of density of materials, surface area, surface finish, corrosion resistance, and hardness.~~

In-Process Revision

~~greater than 50 mg, and class 4 for quantities of greater than 100 mg. Weights should be calibrated periodically, preferably against an absolute standard weight.~~

■Daily or Time of Use Balance Checks

Analytical balances vary greatly in the features they offer to assure that the balance is maintained in a calibrated state. A calibration check to assure that the balance is in a calibrated state is performed each day or prior to each series of weighings. Typically, the calibration check uses internal or external weights to verify that the balance is still in a calibrated state.■1S (*USP30*)

Chemical Tests and Assays

OTHER TESTS AND ASSAYS

BRIEFING

⟨**311**⟩ **Alginates Assay,** *USP 29* page 2562. On the basis of comments received, it is proposed to revise the *System Suitability* section to revert to the acceptance range of 24.2% to 25.7% for carbon dioxide, the range in the assay that was previously official through *USP 27.* In addition, in the same section, it is proposed to clarify the requirements for the blank determination.

(EGC: C. Sheehan) RTS—44044-1

Change to read:

SYSTEM SUITABILITY

Using D-glucuronolactone as the standard, proceed as directed for *Procedure,* but do not perform preboiling steps. The system is suitable if the following criteria are met: (1) a blank determination results in a net titration value, *C,* between 0.02 and 0.06 mEq, ~~of 0.1 N hydrochloric acid,~~

■■1S (*USP30*)
calculated as follows:

$$A_b - B_b$$

in which A_b is the number of mEq of 0.25 N sodium hydroxide in the 25 mL used, and B_b is the number of mEq of 0.1 N hydrochloric acid used in the blank titration; and (2) the percentage of carbon dioxide, CO_2, obtained from the standard is between ~~24.7% and 25.3%.~~

■24.2% and 25.7%.■1S (*USP30*)

GENERAL CHAPTERS

General Information

BRIEFING

⟨**1047**⟩ **Biotechnology-Derived Articles—Tests,** *USP 29* page 2858. This general information chapter contains the following six sections: *Amino Acid Analysis, Capillary Electrophoresis, Isoelectric Focusing, Peptide Mapping, Polyacrylamide Gel Electrophoresis,* and *Total Protein Assay.* The entire chapter is harmonized with the *Japanese* and *European Pharmacopoeias*. However, the other pharmacopeias divide the listed sections into separate general chapters. For the purpose of having a parallel organization of the harmonized documents, it is proposed to divide and replace the current chapter with the following six general information chapters: *Biotechnology-Derived Articles—Amino Acid Analysis* ⟨1052⟩*, Biotechnology-Derived Articles—Capillary Electrophoresis* ⟨1053⟩*, Biotechnology-Derived Articles—Isoelectric Focusing* ⟨1054⟩*, Biotechnology-Derived Articles—Peptide Mapping* ⟨1055⟩*, Biotechnology-Derived Articles—Polyacrylamide Electrophoresis* ⟨1056⟩, and *Biotechnology-Derived Articles—Total Protein Assay* ⟨1057⟩. Interested parties are invited to submit comments.

■⟨~~1047~~⟩ ~~BIOTECHNOLOGY DERIVED ARTICLES—TESTS~~

~~The emergence of drug macromolecules obtained through biotechnological processes has led to a set of specialized tests and assays to determine quality, identity, purity, and potency of these articles in addition to the methods traditionally used for other drug products. These specialized tests that are presented below are *Amino Acid Analysis, Capillary Electrophoresis, Isoelectric Focusing, Peptide Mapping, Polyacrylamide Gel Electrophoresis,* and *Total Protein Assay*.~~

~~AMINO ACID ANALYSIS~~

~~Amino acid analysis refers to the methodology used to determine the amino acid composition or content of proteins, peptides, and other pharmaceutical preparations. Proteins and peptides are macromolecules consisting of covalently bonded amino acid residues organized as a linear polymer. The sequence of the amino acids in a protein or peptide determines the properties of the molecule. Proteins are con-~~

In-Process Revision

sidered large molecules that commonly exist as folded structures with a specific conformation, while peptides are smaller and may consist of only a few amino acids. Amino acid analysis can be used to quantify protein and peptides, to determine the identity of proteins or peptides based on their amino acid composition, to support protein and peptide structure analysis, to evaluate fragmentation strategies for peptide mapping, and to detect atypical amino acids that might be present in a protein or peptide. It is necessary to hydrolyze a protein/peptide to its individual amino acid constituents before amino acid analysis. Following protein/peptide hydrolysis, the amino acid analysis procedure can be the same as that practiced for free amino acids in other pharmaceutical preparations. The amino acid constituents of the test sample are typically derivatized for analysis.

Apparatus

Methods used for amino acid analysis are usually based on a chromatographic separation of the amino acids present in the test sample. Current techniques take advantage of the automated chromatographic instrumentation designed for analytical methodologies. An amino acid analysis instrument will typically be a low-pressure or high-pressure liquid chromatograph capable of generating mobile phase gradients that separate the amino acid analytes on a chromatographic column. The instrument must have postcolumn derivatization capability, unless the sample is analyzed using precolumn derivatization. The detector is usually a UV-visible or fluorescence detector depending on the derivatization method used. A recording device (e.g., integrator) is used for transforming the analog signal from the detector and for quantitation. It is preferred that instrumentation be dedicated particularly for amino acid analysis.

General Precautions

Background contamination is always a concern for the analyst in performing amino acid analysis. High purity reagents are necessary (e.g., low purity hydrochloric acid can contribute to glycine contamination). Analytical reagents are changed routinely every few weeks using only high pressure liquid chromatography (HPLC) grade solvents. Potential microbial contamination and foreign material that might be present in the solvents are reduced by filtering solvents before use, keeping solvent reservoirs covered, and not placing amino acid analysis instrumentation in direct sunlight.

Laboratory practices can determine the quality of the amino acid analysis. Place the instrumentation in a low traffic area of the laboratory. Keep the laboratory clean. Clean and calibrate pipets according to a maintenance schedule. Keep pipet tips in a covered box; the analysts may not handle pipet tips with their hands. The analysts may wear powder free latex or equivalent gloves. Limit the number of times a test sample vial is opened and closed because dust can contribute to elevated levels of glycine, serine, and alanine.

A well-maintained instrument is necessary for acceptable amino acid analysis results. If the instrument is used on a routine basis, it is to be checked daily for leaks, detector and lamp stability, and the ability of the column to maintain resolution of the individual amino acids. Clean or replace all instrument filters and other maintenance items on a routine schedule.

Reference Standard Material

Acceptable amino acid standards are commercially available[*] for amino acid analysis and typically consist of an aqueous mixture of amino acids. When determining amino acid composition, protein or peptide standards are analyzed with the test material as a control to demonstrate the integrity of the entire procedure. Highly purified bovine serum albumin has been used as a protein standard for this purpose.

[*] Suitable standards are available from NIST (Gaithersburg, MD), Beckman Instruments (Fullerton, CA), Sigma Chemical (St. Louis, MO), Pierce (Rockford, IL), or Hewlett Packard.

Calibration of Instrumentation

Calibration of amino acid analysis instrumentation typically involves analyzing the amino acid standard, which consists of a mixture of amino acids at a number of concentrations, to determine the response factor and range of analysis for each amino acid. The concentration of each amino acid in the standard is known. In the calibration procedure, the analyst dilutes the amino acid standard to several different analyte levels within the expected linear range of the amino acid analysis technique. Then, replicates at each of the different analyte levels can be analyzed. Peak areas obtained for each amino acid are plotted versus the known concentration for each of the amino acids in the standard dilution. These results will allow the analyst to determine the range of amino acid concentrations where the peak area of a given amino acid is an approximately linear function of the amino acid concentration. It is important that the analyst prepare the samples for amino acid analysis so that they are within the analytical limits (e.g., linear working range) of the technique employed in order to obtain accurate and repeatable results.

Four to six amino acid standard levels are analyzed to determine a response factor for each amino acid. The response factor is calculated as the average peak area or peak height per nmol of amino acid present in the standard. A calibration file consisting of the response factor for each amino acid is prepared and is used to calculate the concentration of each amino acid present in the test sample. This calculation involves dividing the peak area corresponding to a given amino acid by the response factor for that amino acid to give the nmol of the amino acid. For routine analysis, a single-point calibration may be sufficient; however, the calibration file is updated frequently and tested by the analysis of analytical controls to ensure its integrity.

Repeatability

Consistent high quality amino acid analysis results from an analytical laboratory require attention to the repeatability of the assay. During analysis of the chromatographic separation of the amino acids or their derivatives, numerous peaks can be observed on the chromatogram that corresponds to the amino acids. The large number of peaks makes it necessary to have an amino acid analysis system that can repeatedly identify the peaks based on retention time and integrate the peak areas for quantitation. A typical repeatability evaluation involves preparing a standard amino acid solution and analyzing many replicates (i.e., six analyses or more) of the same standard solution. The relative standard deviation (RSD) is determined for the retention time and integrated peak area of each amino acid. An evaluation of the repeatability is expanded to include multiple assays conducted over several days by different analysts. Multiple assays include the preparation of standard dilutions from starting materials to determine the variation due to sample handling. Often, the amino acid composition of a standard protein (e.g., bovine serum albumin) is analyzed as part of the repeatability evaluation. By evaluating the replicate variation (i.e., RSD), the laboratory can establish analytical limits to ensure that the analyses from the laboratory are under control. It is desirable to establish the lowest practical variation limits to ensure the best results. Areas to focus on to lower the variability of the amino acid analysis include sample preparation, high background spectral interference due to quality of reagents and/or laboratory practices, instrument performance and maintenance, data analysis and interpretation, and analyst performance and habits. All parameters involved are fully investigated in the scope of the validation work.

Sample Preparation

Accurate results from amino acid analysis require purified protein and peptide samples. Buffer components (e.g., salts, urea, detergents) can interfere with the amino acid analysis and are removed from the sample before analysis. Methods that utilize postcolumn derivatization of the amino acids are generally not affected by buffer components to the extent seen with precolumn derivatization methods. It is desirable to limit the number of sample manipulations to reduce potential background contamination, to improve analyte recovery, and to reduce labor. Common techniques used to remove buffer components from protein samples include the following methods: (1) injecting the protein sample onto a reverse-phase HPLC system, removing

In-Process Revision

the protein with a volatile solvent containing a sufficient organic component, and drying the sample in a vacuum centrifuge; (2) dialysis against a volatile buffer or water; (3) centrifugal ultrafiltration for buffer replacement with a volatile buffer or water; (4) precipitating the protein from the buffer using an organic solvent (e.g., acetone); and (5) gel filtration.

Internal Standards

It is recommended that an internal standard be used to monitor physical and chemical losses and variations during amino acid analysis. An accurately known amount of internal standard can be added to a protein solution prior to hydrolysis. The recovery of the internal standard gives the general recovery of the amino acids from the protein solution. Free amino acids, however, do not behave in the same way as protein-bound amino acids during hydrolysis because their rates of release or destruction are variable. Therefore, the use of an internal standard to correct for losses during hydrolysis may give unreliable results. It will be necessary to take this particular point into consideration when interpreting the results. Internal standards can also be added to the mixture of amino acids after hydrolysis to correct for differences in sample application and changes in reagent stability and flow rates. Ideally, an internal standard is an unnaturally occurring primary amino acid that is commercially available and inexpensive. It should also be stable during hydrolysis, its response factor should be linear with concentration, and it needs to elute with a unique retention time without overlapping other amino acids. Commonly used amino acid standards include norleucine, nitrotyrosine, and ⍺ aminobutyric acid.

Protein Hydrolysis

Hydrolysis of protein and peptide samples is necessary for amino acid analysis of these molecules. The glassware used for hydrolysis must be very clean to avoid erroneous results. Glove powders and fingerprints on hydrolysis tubes may cause contamination. To clean glass hydrolysis tubes, boil tubes for 1 hour in 1 N hydrochloric acid or soak tubes in concentrated nitric acid or in a mixture of concentrated hydrochloric acid and concentrated nitric acid (1 : 1). Clean hydrolysis tubes are rinsed with high purity water followed by a rinse with HPLC grade methanol, dried overnight in an oven, and stored covered until use. Alternatively, pyrolysis of clean glassware at 500° for 4 hours may also be used to eliminate contamination from hydrolysis tubes. Adequate disposable laboratory material can also be used.

Acid hydrolysis is the most common method for hydrolyzing a protein sample before amino acid analysis. The acid hydrolysis technique can contribute to the variation of the analysis due to complete or partial destruction of several amino acids. Tryptophan is destroyed; serine and threonine are partially destroyed; methionine might undergo oxidation; and cysteine is typically recovered as cystine (but cystine recovery is usually poor because of partial destruction or reduction to cysteine). Application of adequate vacuum (less than 200 µm of mercury or 26.7 Pa) or introduction of an inert gas (argon) in the headspace of the reaction vessel can reduce the level of oxidative destruction. In peptide bonds involving isoleucine and valine, the amido bonds of Ile-Ile, Val-Val, Ile-Val, and Val-Ile are partially cleaved; and asparagine and glutamine are deamidated, resulting in aspartic acid and glutamic acid, respectively. The loss of tryptophan, asparagine, and glutamine during an acid hydrolysis limits quantitation to 17 amino acids. Some of the hydrolysis techniques described are used to address these concerns. Some of the hydrolysis techniques described (i.e., *Methods 4–11*) may cause modifications to other amino acids. Therefore, the benefits of using a given hydrolysis technique are weighed against the concerns with the technique and are tested adequately before employing a method other than acid hydrolysis.

A time-course study (i.e., amino acid analysis at acid hydrolysis times of 24, 48, and 72 hours) is often employed to analyze the starting concentration of amino acids that are partially destroyed or slow to cleave. By plotting the observed concentration of labile amino acids (i.e., serine and threonine) versus hydrolysis time, the line can be extrapolated to the origin to determine the starting concentration of these amino acids. Time-course hydrolysis studies are also used with amino acids that are slow to cleave (e.g., isoleucine and valine). During the hydrolysis time course, the analyst will observe a plateau in these residues. The level of this plateau is taken as the residue concentration. If the hydrolysis time is too long, the residue concentration of the sample will begin to decrease, indicating destruction by the hydrolysis conditions.

An acceptable alternative to the time-course study is to subject an amino acid calibration standard to the same hydrolysis conditions as the test sample. The amino acid in free form may not completely represent the rate of destruction of labile amino acids within a peptide or protein during the hydrolysis. This is especially true for peptide bonds that are slow to cleave (e.g., Ile-Val bonds). However, this technique will allow the analyst to account for some residue destruction. Microwave acid hydrolysis has been used and is rapid but it requires special equipment as well as special precautions. The optimal conditions for microwave hydrolysis must be investigated for each individual protein/peptide sample. The microwave hydrolysis technique typically requires only a few minutes, but even a deviation of 1 minute may give inadequate results (e.g., incomplete hydrolysis or destruction of labile amino acids). Complete proteolysis, using a mixture of proteases, has been used but can be complicated, requires the proper controls, and is typically more applicable to peptides than proteins. [NOTE—During initial analyses of an unknown protein, experiments with various hydrolysis time and temperature conditions are conducted to determine the optimal conditions.]

METHOD 1

Acid hydrolysis using hydrochloric acid containing phenol is the most common procedure used for protein/peptide hydrolysis preceding amino acid analysis. The addition of phenol to the reaction prevents the halogenation of tyrosine.

Hydrolysis Solution: 6 N hydrochloric acid containing 0.1% to 1.0% of phenol.

Procedure—

Liquid Phase Hydrolysis—Place the protein or peptide sample in a hydrolysis tube, and dry. [NOTE—The sample is dried so that water in the sample will not dilute the acid used for the hydrolysis.] Add 200 µL of *Hydrolysis Solution* per 500 µg of lyophilized protein. Freeze the sample tube in a dry ice-acetone bath, and flame seal in vacuum. Samples are typically hydrolyzed at 110° for 24 hours in vacuum or inert atmosphere to prevent oxidation. Longer hydrolysis times (e.g., 48 and 72 hours) are investigated if there is a concern that the protein is not completely hydrolyzed.

Vapor Phase Hydrolysis—This is one of the most common acid hydrolysis procedures, and it is preferred for microanalysis when only small amounts of the sample are available. Contamination of the sample from the acid reagent is also minimized by using vapor phase hydrolysis. Place vials containing the dried samples in a vessel that contains an appropriate amount of *Hydrolysis Solution*. The *Hydrolysis Solution* does not come in contact with the test sample. Apply an inert atmosphere or vacuum (less than 200 µm of mercury or 26.7 Pa) to the headspace of the vessel, and heat to about 110° for a 24-hour hydrolysis time. Acid vapor hydrolyzes the dried sample. Any condensation of the acid in the sample vials is minimized. After hydrolysis, dry the test sample in vacuum to remove any residual acid.

METHOD 2

Tryptophan oxidation during hydrolysis is decreased by using mercaptoethanesulfonic acid (MESA) as the reducing acid.

Hydrolysis Solution: 2.5 M MESA solution.

Vapor Phase Hydrolysis—About 1 to 100 µg of the protein/peptide under test is dried in a hydrolysis tube. The hydrolysis tube is placed in a larger tube with about 200 µL of the *Hydrolysis Solution*. The larger tube is sealed in vacuum (about 50 µm of mercury or 6.7 Pa) to vaporize the *Hydrolysis Solution*. The hydrolysis tube is heated to between 170° to 185° for about 12.5 minutes. After hydrolysis, the hydrolysis tube is dried in vacuum for 15 minutes to remove the residual acid.

In-Process Revision

~~METHOD 3~~

~~Tryptophan oxidation during hydrolysis is prevented by using thioglycolic acid (TGA) as the reducing acid.~~

~~**Hydrolysis Solution:**—a solution containing 7 M hydrochloric acid, 10% of trifluoroacetic acid, 20% of thioglycolic acid, and 1% of phenol.~~

~~**Vapor Phase Hydrolysis**—About 10 to 50 µg of the protein/peptide under test is dried in a sample tube. The sample tube is placed in a larger tube with about 200 µL of the *Hydrolysis Solution*. The larger tube is sealed in vacuum (about 50 µm of mercury or 6.7 Pa) to vaporize the TGA. The sample tube is heated to 166° for about 15 to 30 minutes. After hydrolysis, the sample tube is dried in vacuum for 5 minutes to remove the residual acid. Recovery of tryptophan by this method may be dependent on the amount of sample present.~~

~~METHOD 4~~

~~Cysteine-cystine and methionine oxidation is performed with performic acid before the protein hydrolysis.~~

~~**Oxidation Solution**—The performic acid is prepared fresh by mixing formic acid and 30 percent hydrogen peroxide (9 : 1), and incubated at room temperature for 1 hour.~~

~~**Procedure**—The protein/peptide sample is dissolved in 20 µL of formic acid, and heated at 50° for 5 minutes; then 100 µL of the *Oxidation Solution* is added. In this reaction, cysteine is converted to cysteic acid and methionine is converted to methionine sulfone. The oxidation is allowed to proceed for 10 to 30 minutes. The excess reagent is removed from the sample in a vacuum centrifuge. This technique may cause modifications to tyrosine residues in the presence of halides. The oxidized protein can then be acid hydrolyzed using *Method 1* or *Method 2*.~~

~~METHOD 5~~

~~Cysteine-cystine oxidation is accomplished during the liquid phase hydrolysis with sodium azide.~~

~~**Hydrolysis Solution:**—6 N hydrochloric acid containing 0.2% of phenol, to which sodium azide is added to obtain a final concentration of 0.2% (w/v). The added phenol prevents halogenation of tyrosine.~~

~~**Liquid Phase Hydrolysis**—The protein/peptide hydrolysis is conducted at about 110° for 24 hours. During the hydrolysis, the cysteine-cystine present in the sample is converted to cysteic acid by the sodium azide present in the *Hydrolysis Solution*. This technique allows better tyrosine recovery than *Method 4*, but it is not quantitative for methionine. Methionine is converted to a mixture of the parent methionine and its two oxidative products, methionine sulfoxide and methionine sulfone.~~

~~METHOD 6~~

~~Cysteine-cystine oxidation is accomplished with dimethyl sulfoxide (DMSO).~~

~~**Hydrolysis Solution:**—6 N hydrochloric acid containing 0.1% to 1.0% of phenol, to which DMSO is added to obtain a final concentration of 2% (v/v).~~

~~**Vapor Phase Hydrolysis**—The protein/peptide hydrolysis is conducted at about 110° for 24 hours. During the hydrolysis, the cysteine-cystine present in the sample is converted to cysteic acid by the DMSO present in the *Hydrolysis Solution*. As an approach to limit variability and compensate for partial destruction, it is recommended to evaluate the cysteic acid recovery from oxidative hydrolyses of standard proteins containing 1 to 8 mol of cysteine. The response factors from protein/peptide hydrolysates are typically about 30% lower than those for nonhydrolyzed cysteic acid standards. Because histidine, methionine, tyrosine, and tryptophan are also modified, a complete compositional analysis is not obtained with this technique.~~

~~METHOD 7~~

~~Cysteine-cystine reduction and alkylation is accomplished by a vapor phase pyridylethylation reaction.~~

~~**Reducing Solution**—Transfer 83.3 µL of pyridine, 16.7 µL of 4-vinylpyridine, 16.7 µL of tributylphosphine, and 83.3 µL of water to a suitable container, and mix.~~

~~**Procedure**—Add the protein/peptide (between 1 and 100 µg) to a hydrolysis tube, and place in a larger tube. Transfer the *Reducing Solution* to the large tube, seal in vacuum (about 50 µm of mercury or 6.7 Pa), and incubate at about 100° for 5 minutes. Then remove the inner hydrolysis tube, and dry it in a vacuum desiccator for 15 minutes to remove residual reagents. The pyridylethylated protein/peptide can then be acid hydrolyzed using previously described procedures. The pyridylethylation reaction is performed simultaneously with a protein standard sample containing 1 to 8 mol of cysteine to improve accuracy in the pyridylethyl-cysteine recovery. Longer incubation times for the pyridylethylation reaction can cause modifications to the α-amino-terminal group and the ε-amino group of lysine in the protein.~~

~~METHOD 8~~

~~Cysteine-cystine reduction and alkylation is accomplished by a liquid phase pyridylethylation reaction.~~

~~**Stock Solutions**—Prepare and filter three solutions: 1 M Tris hydrochloride (pH 8.5) containing 4 mM edetate disodium (*Stock Solution 1*), 8 M guanidine hydrochloride (*Stock Solution 2*), and 10% of 2-mercaptoethanol in water (*Stock Solution 3*).~~

~~**Reducing Solution**—Prepare a mixture of *Stock Solution 2* and *Stock Solution 1* (3 : 1) to obtain a buffered solution of 6 M guanidine hydrochloride in 0.25 M Tris hydrochloride.~~

~~**Procedure**—Dissolve about 10 µg of the test sample in 50 µL of the *Reducing Solution*, and add about 2.5 µL of *Stock Solution 3*. Store under nitrogen or argon for 2 hours at room temperature in the dark. To achieve the pyridylethylation reaction, add about 2 µL of 4-vinylpyridine to the protein solution, and incubate for an additional 2 hours at room temperature in the dark. The protein/peptide is desalted by collecting the protein/peptide fraction from a reverse-phase HPLC separation. The collected sample can be dried in a vacuum centrifuge before acid hydrolysis.~~

~~METHOD 9~~

~~Cysteine-cystine reduction and alkylation is accomplished by a liquid phase carboxymethylation reaction.~~

~~**Stock Solutions**—Prepare as directed for *Method 8*.~~

~~**Carboxymethylation Solution**—Prepare a solution containing 100 mg of iodoacetamide per mL of alcohol.~~

~~**Buffer Solution**—Use the *Reducing Solution,* prepared as directed for *Method 8*.~~

~~**Procedure**—Dissolve the test sample in 50 µL of the *Buffer Solution,* and add about 2.5 µL of *Stock Solution 3*. Store under nitrogen or argon for 2 hours at room temperature in the dark. Add the *Carboxymethylation Solution* in a 1.5-fold ratio per total theoretical content of thiols, and incubate for an additional 30 minutes at room temperature in the dark. [NOTE—If the thiol content of the protein is unknown, then add 5 µL of 100 mM iodoacetamide for every 20 nmol of protein present.] The reaction is stopped by adding excess of 2-mercaptoethanol. The protein/peptide is desalted by collecting the protein/peptide fraction from a reverse-phase HPLC separation. The collected sample can be dried in a vacuum centrifuge before acid hydrolysis. The *S*-carboxyamidomethylcysteine formed will be converted to *S*-carboxymethyl cysteine during acid hydrolysis.~~

METHOD 10

Cysteine-cystine is reacted with dithiodiglycolic acid or dithiodipropionic acid to produce a mixed disulfide. [NOTE—The choice of dithiodiglycolic acid or dithiodipropionic acid depends on the required resolution of the amino acid analysis method.]

Reducing Solution: a solution containing 10 mg of dithiodiglycolic acid (or dithiodipropionic acid) per mL of 0.2 M sodium hydroxide.

Procedure—Transfer about 20 µg of the test sample to a hydrolysis tube, and add 5 µL of the *Reducing Solution*. Add 10 µL of isopropyl alcohol, and then remove all of the sample liquid by vacuum centrifugation. The sample is then hydrolyzed using *Method 1*. This method has the advantage that other amino acid residues are not derivatized by side reactions, and the sample does not need to be desalted prior to hydrolysis.

METHOD 11

Asparagine and glutamine are converted to aspartic acid and glutamic acid, respectively, during acid hydrolysis. Asparagine and aspartic acid residues are added and represented by *Asx*, while glutamine and glutamic acid residues are added and represented by *Glx*. Proteins/peptides can be reacted with bis(1,1 trifluoroacetoxy)iodobenzene (BTI) to convert the asparagine and glutamine residues to diaminopropionic acid and diaminobutyric acid residues, respectively, upon acid hydrolysis. These conversions allow the analyst to determine the asparagine and glutamine content of a protein/peptide in the presence of aspartic acid and glutamic acid residues.

Reducing Solutions—Prepare and filter three solutions: a solution of 10 mM trifluoroacetic acid (*Solution 1*), a solution of 5 M guanidine hydrochloride and 10 mM trifluoroacetic acid (*Solution 2*), and a freshly prepared solution of dimethylformamide containing 36 mg of BTI per mL (*Solution 3*).

Procedure—In a clean hydrolysis tube, transfer about 200 µg of the test sample, and add 2 mL of *Solution 1* or *Solution 2* and 2 mL of *Solution 3*. Seal the hydrolysis tube in vacuum. Heat the sample at 60° for 4 hours in the dark. The sample is then dialyzed with water to remove the excess reagents. Extract the dialyzed sample three times with equal volumes of *n*-butyl acetate, and then lyophilize. The protein can then be acid hydrolyzed using previously described procedures. The α,β-diaminopropionic and α,γ-diaminobutyric acid residues do not typically resolve from the lysine residues upon ion-exchange chromatography based on amino acid analysis. Therefore, when using ion-exchange as the mode of amino acid separation, the asparagine and glutamine contents are the quantitative difference in the aspartic acid and glutamic acid assayed contents with un-derivatized and BTI-derivatized acid hydrolysis. [NOTE—The threonine, methionine, cysteine, tyrosine, and histidine assayed content can be altered by BTI derivatization; a hydrolysis without BTI will have to be performed if the analyst is interested in the protein/peptide content of these other amino acid residues.]

Methodologies of Amino Acid Analysis

Many amino acid analysis techniques exist, and the choice of any one technique often depends on the sensitivity required from the assay. In general, about one half of the amino acid analysis techniques employed rely on the separation of the free amino acids by ion-exchange chromatography followed by postcolumn derivatization (e.g., with ninhydrin or *o*-phthalaldehyde). Postcolumn detection techniques can be used with samples that contain small amounts of buffer components, such as salts and urea, and generally require between 5 and 10 µg of protein sample per analysis. The remaining amino acid techniques typically involve precolumn derivatization of the free amino acids (e.g., phenyl isothiocyanate; 6-aminoquinolyl-*N*-hydroxysuccinimidyl carbonate; (dimethylamino)azobenzenesulfonyl chloride; 9-fluorenyl methylchloroformate; and 7-fluoro-4-nitrobenzo-2-oxa-1,3-diazole) followed by reverse-phase HPLC. Precolumn derivatization techniques are very sensitive and usually require between 0.5 and 1.0 µg of protein sample per analysis but may be influenced by buffer salts in the samples. Precolumn derivatization techniques may also result in multiple derivatives of a given amino acid, which complicates the result interpretation. Postcolumn derivatization techniques are generally influenced less by performance variation of the assay than precolumn derivatization techniques.

The following *Methods* may be used for quantitative amino acid analysis. Instruments and reagents for these procedures are available commercially. Furthermore, many modifications of these methodologies exist with different reagent preparations, reaction procedures, chromatographic systems, etc. Specific parameters may vary according to the exact equipment and procedure used. Many laboratories will utilize more than one amino acid analysis technique to exploit the advantages offered by each. In each of these *Methods*, the analog signal is visualized by means of a data acquisition system, and the peak areas are integrated for quantification purposes.

METHOD 1—POSTCOLUMN NINHYDRIN DETECTION

Ion-exchange chromatography with postcolumn ninhydrin detection is one of the most common methods employed for quantitative amino acid analysis. As a rule, a Li-based cation-exchange system is employed for the analysis of the more complex physiological samples, and the faster Na-based cation-exchange system is used for the more simplistic amino acid mixtures obtained with protein hydrolysates (typically containing 17 amino acid components). Separation of the amino acids on an ion-exchange column is accomplished through a combination of changes in pH and cation strength. A temperature gradient is often employed to enhance separation.

When the amino acid reacts with ninhydrin, the reactant has characteristic purple or yellow color. Amino acids, except imino acids, give a purple color, and show maximum absorption at 570 nm. The imino acids, such as proline, give a yellow color, and show maximum absorption at 440 nm. The postcolumn reaction between ninhydrin and amino acid eluted from the column is monitored at 440 nm and 570 nm, and the chromatogram obtained is used for the determination of amino acid composition.

The detection limit is considered to be 10 pmol for most of the amino acid derivatives, but 50 pmol for proline. Response linearity is obtained in the range of 20 to 500 pmol with correlation coefficients exceeding 0.999. To obtain good compositional data, samples larger than 1 µg before hydrolysis are best suited for this amino acid analysis of protein/peptide.

One method for postcolumn ninhydrin detection is shown below. Many other methods are also available, with instruments and reagents available commercially.

Mobile Phase Preparation—

Solution A—Transfer about 1.7 g of anhydrous sodium citrate and 1.5 mL of hydrochloric acid to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Adjust, if necessary, with hydrochloric acid to a pH of 3.0.

Solution B—Transfer about 1.7 g of anhydrous sodium citrate and 0.7 mL of hydrochloric acid to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Adjust, if necessary, with hydrochloric acid to a pH of 4.3.

Solution C—Prepare a solution containing 5% of sodium chloride, 1.9% of anhydrous sodium citrate, and 0.1% of phenol in water, and adjust to a pH of 6.

Column Regeneration Solution—Prepare a solution containing 0.8% of sodium hydroxide in water, and adjust to a pH of 13.

Mobile Phase—Use variable mixtures of *Solution A*, *Solution B*, and *Solution C* as directed for *Chromatographic system*.

Postcolumn Reagent—Transfer about 18 g of ninhydrin and 0.7 g of hydrindantin to 900 mL of a solution containing 76.7% of dimethyl sulfoxide, 0.7% of dihydrate lithium acetate, and 0.1% of acetic acid, and mix for at least 3 hours under inert gas, such as nitrogen. [NOTE—This reagent is stable for 30 days if kept between 2° and 8° under inert gas.]

Buffer Solution—Prepare a solution containing 2% of anhydrous sodium citrate, 1% of hydrochloric acid, 0.5% of thiodiglycol, and 0.1% of benzoic acid in water, and adjust to a pH of 2.

Chromatographic System—The liquid chromatograph is equipped with a detector with appropriate interference filters at 440, 570, or 690 nm and a 4.0-mm × 120-mm column that contains 7.5-µm sulfonated styrene-divinylbenzene copolymer packing. The flow rate is about 14 mL per hour. The system is programmed as fol-

In-Process Revision

lows. Initially equilibrate the column with *Solution A;* at 25 minutes, the composition of the *Mobile Phase* is changed to 100% *Solution B;* and at 37 minutes, the composition is changed to 100% *Solution C*. At 75 minutes into the run, the last amino acid has been eluted from the column, and the column is regenerated with *Column Regeneration Solution* for 1 minute. The column is then equilibrated with *Solution A* for 11 minutes before the next injection. The column temperature is programmed as follows. The initial temperature is 48°; after 11.5 minutes, the temperature is increased to 65° at a rate of 3° per minute; at about 35 minutes, the temperature is increased to 77° at a rate of 3° per minute; and finally at about 52 minutes, the temperature is decreased to 48° at a rate of 3° per minute.

Procedure and **Posteolumn Reaction**— Reconstitute the lyophilized protein/peptide hydrolysate in the *Buffer Solution,* inject an appropriate amount into the chromatograph, and proceed as directed for *Chromatographic System.* As the amino acids are eluted from the column, they are mixed with the *Posteolumn Reagent,* which is delivered at a flow rate of 7 mL per hour, through a tee. After mixing, the column effluent and the *Posteolumn Reagent* pass through a tubular reactor at a temperature of 135°, where a characteristic purple or yellow color is developed. From the reactor, the liquid passes through a colorimeter with a 12-mm flow-through cuvette. The light emerging from the cuvette is split into three beams for analysis by the detector with interference filters at 440, 570, or 690 nm. The 690-nm signal may be electronically subtracted from the other signals for improved signal-to-noise ratios. The 440-nm (imino acids) and the 570-nm (amino acids) signals may be added in order to simplify data handling.

METHOD 2—POSTCOLUMN OPA FLUOROMETRIC DERIVATIZATION

Ion-exchange chromatography with posteolumn *o*-phthalaldehyde (OPA) fluorometric detection is used. The procedure employs an ion-exchange column for separation of free amino acids followed by post-column oxidation with sodium hypochlorite and derivatization using OPA and *N*-acetyl-L-cysteine. The sodium hypochlorite oxidation step allows secondary amines, such as proline, to react with the OPA reagent.

OPA reacts with primary amines in the presence of thiol compound to form highly fluorescent isoindole products. This reaction is utilized for the posteolumn derivatization in analysis of amino acids by ion-exchange chromatography. The rule of the separation is the same as *Method I.* Instruments and reagents for this form of amino acid analysis are available commercially. Many modifications of this method exist.

Although OPA does not react with secondary amines (imino acids, such as proline) to form fluorescent substances, the oxidation with sodium hypochlorite allows secondary amines to react with OPA. The procedure employs a strongly acidic cation exchange column for separation of free amino acids followed by posteolumn oxidation with sodium hypochlorite and posteolumn derivatization using OPA and thiol compound, such as *N*-acetyl-L-cysteine and 2-mercaptoethanol. The derivatization of primary amino acids are not noticeably affected by the continuous supply of sodium hypochlorite.

Separation of the amino acids on an ion exchange column is accomplished through a combination of changes of pH and cation strength. After posteolumn derivatization of eluted amino acids with OPA, the reactant passes through the fluorometric detector. Fluorescence intensity of OPA-derivatized amino acids are monitored with an excitation wavelength of 348 nm and an emission wavelength of 450 nm.

The detection limit is considered to be a few tens of picomole level for most of the amino acid derivatives. Response linearity is obtained in the range of a few picomole level to a few tens of nanomole level. To obtain good compositional data, a sample greater than 500 ng before hydrolysis is best suited for the amino acid analysis of protein/peptide.

One method of posteolumn OPA fluorometric detection is shown below.

Mobile Phase Preparation—

Solution A— Prepare a solution of sodium hydroxide, citric acid, and alcohol in HPLC grade water having a 0.2 N sodium concentration and containing 7% of alcohol (w/v), adjusted to a pH of 3.2.

Solution B— Prepare a solution of sodium hydroxide and citric acid in HPLC grade water having a 0.6 N sodium concentration, adjusted to a pH of 10.0.

Solution C:— 0.2 N sodium hydroxide.

Mobile Phase— Use variable mixtures of *Solution A*, *Solution B,* and *Solution C* as directed for *Chromatographic System*.

Posteolumn Reagent Preparation—

Alkaline Buffer— Prepare a solution containing 384 mM sodium carbonate, 216 mM boric acid, and 108 mM potassium sulfate, and adjust to a pH of 10.0.

Hypochlorite Reagent— To 1 L of *Alkaline Buffer,* add 0.4 mL of sodium hypochlorite solution (10% chlorine concentration). [NOTE—The hypochlorite solution is stable for 2 weeks.]

OPA Reagent— Transfer 2 g of *N*-acetyl-L-cysteine and 1.6 g of OPA to a 15-mL volumetric flask, dissolve in and dilute with alcohol to volume, and mix. Transfer this solution and 4 mL of 10% aqueous polyethylene (23) lauryl ether[a] to a 1-liter volumetric flask, dilute with 980 mL of *Alkaline Buffer,* and mix.

Chromatographic System— The liquid chromatograph is equipped with a fluorometric detector set to an excitation wavelength of 348 nm and an emission wavelength of 450 nm and a 4.0-mm × 150-mm column that contains 7.5-µm packing L17. The flow rate is about 0.3 mL per minute, and the column temperature is set at 50°. The system is programmed as follows. The column is equilibrated with *Solution A;* over the next 20 minutes, the composition of the *Mobile Phase* is changed linearly to 85% *Solution A* and 15% *Solution B;* then there is a step change to 40% *Solution A* and 60% *Solution B;* over the next 18 minutes, the composition is changed linearly to 100% *Solution B* and held for 7 minutes; then there is a step change to 100% *Solution C,* and this is held for 6 minutes; then there is a step change to *Solution A,* and this composition is maintained for the next 8 minutes.

Procedure and Posteolumn Reaction— Inject about 1.0 nmol of each amino acid under test into the chromatograph, and proceed as directed for *Chromatographic System*. As the effluent leaves the column, it is mixed with the *Hypochlorite Reagent*. The mixture passes through the first posteolumn reactor which consists of stainless steel 0.5-mm × 2-m tubing. A second posteolumn reactor of similar design is placed immediately downstream from the first posteolumn reactor and is used for the OPA posteolumn reaction. The flow rates for both the *Hypochlorite Reagent* and the *OPA Reagent* are 0.2 mL per minute, resulting in a total flow rate (i.e., *Hypochlorite Reagent*, *OPA Reagent,* and column effluent) of 0.7 mL per minute exiting from the posteolumn reactors. Posteolumn reactions are conducted at 55°. This results in a residence time of about 33 seconds in the OPA posteolumn reactor. After posteolumn derivatization, the column effluent passes through the fluorometric detector.

METHOD 3—PRECOLUMN DETERMINATION

Precolumn derivatization of amino acids with phenylisothiocyanate (PITC) followed by reverse phase HPLC separation with UV detection is used.

PITC reacts with amino acids to form phenylthiocarbamyl (PTC) derivatives which can be detected with high sensitivity at 254 nm. Therefore, precolumn derivatization of amino acids with PITC followed by a reverse phase HPLC separation with UV detection is used to analyze the amino acid composition.

After the reagent is removed under vacuum, the derivatized amino acids can be stored dry and frozen for several weeks with no significant degradation. If the solution for injection is kept cold, no noticeable loss in chromatographic response occurs after three days.

Separation of the PTC-amino acids on a reverse phase HPLC with ODS column is accomplished through a combination of changes in concentrations of acetonitrile and buffer ionic strength. PTC-amino acids eluted from the column are monitored at 254 nm.

The detection limit is considered to be 1 pmol for most of the amino acid derivatives. Response linearity is obtained in the range of 20 to 500 pmol with correlation coefficients exceeding 0.999. To obtain

[a] A suitable grade is available commercially as "Palladium Catalyst, Type I (5% Palladium on Caleium Carbonate)," from Engelhard Industries, Inc., fax number (864) 885-1375.

good compositional data, a sample larger than 500 ng of protein/peptide before hydrolysis is best suited for this amino analysis of proteins/peptides.

One method of precolumn PITC derivatization is described below.

Mobile Phase Preparation

Solution A: 0.05 M ammonium acetate, adjusted with phosphoric acid to a pH of 6.8.

Solution B: Prepare 0.1 M ammonium acetate, adjust with phosphoric acid to a pH of 6.8, and then prepare a mixture of this solution and acetonitrile (1 : 1).

Solution C: a mixture of acetonitrile and water (70 : 30).

Mobile Phase: Use variable mixtures of *Solution A, Solution B,* and *Solution C* as directed for *Chromatographic System*.

Derivatization Reagent Preparation

Coupling Buffer: a mixture of acetonitrile, pyridine, triethylamine, and water (10 : 5 : 2 : 3).

Sample Solvent: a mixture of water and acetonitrile (7 : 2).

Sample Derivatization Procedure Dissolve the lyophilized test sample in 100 µL of the *Coupling Buffer,* and then dry in a vacuum centrifuge to remove any hydrochloride if a protein hydrolysis step was used. Dissolve the test sample in 100 µL of *Coupling Buffer*, add 5 µL of PITC, and incubate at room temperature for 5 minutes. The test sample is again dried in a vacuum centrifuge, and is dissolved in 250 µL of *Sample Solvent*.

Chromatographic System The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 250-mm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute, and the column temperature is maintained at 52°. The system is programmed as follows. The column is equilibrated with *Solution A;* over the next 15 minutes, the composition of the *Mobile Phase* is changed linearly to 85% *Solution A* and 15% *Solution B;* over the next 15 minutes, the composition is changed linearly to 50% *Solution A* and 50% *Solution B;* then there is a step change to 100% *Solution C,* and this is held for 10 minutes; then there is a step change to 100% *Solution A,* and the column is allowed to equilibrate before the next injection.

Procedure Inject about 1.0 nmol of each PITC-amino acid under test (10 µL sample in *Sample Solvent*) into the chromatograph, and proceed as directed for *Chromatographic System*.

METHOD 4—PRECOLUMN AQC DERIVATIZATION

Precolumn derivatization of amino acids with 6-aminoquinolyl-*N*-hydroxysuccinimidyl carbamate (AQC) followed by reverse-phase HPLC separation with fluorometric detection is used.

AQC reacts with amino acids to form stable, fluorescent unsymmetric urea derivatives (AQC-amino acids) which are readily amenable to analysis by reverse-phase HPLC. Therefore, precolumn derivatization of amino acids with AQC followed by reverse-phase HPLC separation is used to analyze the amino acid composition.

Separation of the AQC-amino acids on an ODS column is accomplished through a combination of changes in the concentrations of acetonitrile and salt. Selective fluorescence detection of the derivatives with an excitation wavelength at 250 nm and an emission wavelength at 395 nm allows for the direct injection of the reaction mixture with no significant interference from the only major fluorescent reagent by-product, 6-aminoquinoline. Excess reagent is rapidly hydrolyzed ($t_{1/2}$ < 15 seconds) to yield 6-aminoquinoline *N*-hydroxysuccinimide and carbon dioxide, and after 1 minute no further derivatization can take place.

Peak areas for AQC-amino acids are essentially unchanged for at least 1 week at room temperature, and the derivatives have more than sufficient stability to allow for overnight automated chromatographic analysis.

The detection limit is considered to be ranging from about 40 fmol to 320 fmol for each amino acid, except for Cys. The detection limit for Cys is approximately 800 fmol. Response linearity is obtained in the range of 2.5 µM to 200 µM with correlation coefficients exceeding 0.999. Good compositional data can be obtained from the analysis of derivatized protein hydrolysates containing as little as 30 ng of protein/peptide.

One method of precolumn AQC derivatization is shown below.

Mobile Phase Preparation

Solution A: Prepare a solution having a composition of 140 mM sodium acetate and 17 mM triethylamine, and adjust with phosphoric acid to a pH of 5.02.

Solution B: a mixture of acetonitrile and water (60 : 40).

Mobile Phase: Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic System*.

Sample Derivatization Procedure Dissolve about 2 µg of the test sample in 20 µL of 15 mM hydrochloric acid, and dilute with 0.2 M borate buffer (pH 8.8) to 80 µL. The derivatization is initiated by the addition of 20 µL of 10 mM AQC in acetonitrile, and allowed to proceed for 10 minutes at room temperature.

Chromatographic System The liquid chromatograph is equipped with a fluorometric detector set at an excitation wavelength of 250 nm and an emission wavelength of 395 nm and a 3.9-mm × 150-mm column that contains 4-µm packing L1. The flow rate is about 1 mL per minute, and the column temperature is maintained at 37°. The system is programmed as follows. The column is equilibrated with *Solution A;* over the next 0.5 minute, the composition of the *Mobile Phase* is changed linearly to 98% *Solution A* and 2% *Solution B;* then over the next 14.5 minutes to 93% *Solution A* and 7% *Solution B;* then over the next 4 minutes to 87% *Solution A* and 13% *Solution B;* over the next 14 minutes to 68% *Solution A* and 32% *Solution B;* then there is a step change to 100% *Solution B* for a 5-minute wash; over the next 10 minutes, there is a step change to 100% *Solution A;* and the column is allowed to equilibrate before the next injection.

Procedure Inject about 0.05 nmol of each AQC-amino acid under test into the chromatograph, and proceed as directed for *Chromatographic System*.

METHOD 5—PRECOLUMN OPA DERIVATIZATION

Precolumn derivatization of amino acids with OPA followed by reverse-phase HPLC separation with fluorometric detection is used. This technique does not detect amino acids that exist as secondary amines (e.g., proline).

OPA in conjunction with a thiol reagent reacts with primary amine groups to form highly fluorescent isoindole products. 2-Mercaptoethanol and 3-mercaptopropionic acid can be used as thiol. OPA itself does not fluoresce and consequently produces no interfering peaks. In addition, its solubility and stability in aqueous solution, along with the rapid kinetics for the reactions, make it amenable to automated derivatization and analysis using an autosampler to mix the sample with the reagent. However, lack of reactivity with secondary amino acids has been a predominant drawback. This method does not detect amino acids that exist as secondary amines (e.g., proline). To compensate for this drawback, this technique may be combined with another technique described in *Method 7* or *Method 8*.

Precolumn derivatization of amino acids with OPA is followed by reverse-phase HPLC separation. Because of the instability of the OPA-amino acid derivative, HPLC separation and analysis are performed immediately following derivatization. The liquid chromatograph is equipped with a fluorometric detector for the detection of derivatized amino acids. Fluorescence intensity of the OPA-derivatized amino acids are monitored with an excitation wavelength of 348 nm and an emission wavelength of 450 nm.

The detection limits as low as 50 fmol via fluorescence have been reported, although the practical limit of analysis remains at 1 pmol. One method of precolumn OPA derivatization is shown below.

Mobile Phase Preparation

Solution A: a mixture of 100 mM sodium acetate (pH 7.2), methanol, and tetrahydrofuran (900 : 95 : 5).

Solution B: methanol.

Mobile Phase: Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic System*.

Derivatization Reagent Dissolve 50 mg of OPA in 1.25 mL of methanol (protein sequencing grade). Add 50 µL of 2-mercaptoethanol and 11.2 mL of 0.4 M sodium borate (pH 9.5), and mix. [NOTE—This reagent is stable for 1 week.]

In-Process Revision

Sample Derivatization Procedure— Transfer about 5 µL of the test sample to an appropriate container, add 5 µL of the *Derivatization Reagent*, and mix. After 1 minute, add not less than 20 µL of 0.1 M sodium acetate (pH 7.0). Use 20 µL of this solution for analysis. [NOTE—Use of an internal standard (e.g., norleucine) is recommended for quantitative analysis because of potential reagent volume variations in the sample derivatization. The sample derivatization is performed in an automated on-line fashion. Because of the instability of the OPA-amino acid derivative, HPLC separation and analysis are performed immediately following derivatization.]

Chromatographic System— The liquid chromatograph is equipped with a fluorometric detector set at an excitation wavelength of 348 nm and an emission wavelength of 450 nm and a 4.6-mm × 75-mm column that contains 3-µm packing L3. The flow rate is about 1.7 mL per minute, and the column temperature is maintained at 37°. The system is programmed as follows. The column is equilibrated with 92% *Solution A* and 8% *Solution B;* over the next 2 minutes, the composition of the *Mobile Phase* is changed to 83% *Solution A* and 17% *Solution B,* and held for an additional 3 minutes; then changed to 54% *Solution A* and 46% *Solution B* over the next 5 minutes, and held for an additional 2 minutes; then changed to 34% *Solution A* and 66% *Solution B* over the next 2 minutes, and held for 1 minute; then over the next 0.3 minute changed to 20% *Solution A* and 80% *Solution B*, and held for an additional 2.6 minutes; and then finally over 0.6 minute changed to 92% *Solution A* and 8% *Solution B,* and held for an additional 0.6 minute.

Procedure— Inject about 0.02 nmol of each OPA-amino acid under test into the chromatograph, and proceed as directed for *Chromatographic System.*

METHOD 6—POSTCOLUMN DABS-CL DERIVATIZATION

Precolumn derivatization of amino acids with (dimethylamino)azobenzenesulfonyl chloride (DABS-Cl) followed by reverse-phase HPLC separation with visible-light detection is used.

DABS-Cl is a chromophoric reagent employed for the labeling of amino acids. Amino acids labeled with DABS-Cl (DABS-amino acids) are highly stable and show the maximum absorption at 436 nm.

DABS-amino acids, all 19 naturally occurring amino acids derivatives, can be separated on an ODS column of a reverse-phase HPLC by employing gradient systems consisting of acetonitrile and aqueous buffer mixture. Separated DABS-amino acids eluted from the column are detected at 436 nm in the visible region.

This method can analyze the imino acids, such as proline, together with the amino acids, at the same degree of sensitivity. DABS-Cl derivatization method permits the simultaneous quantification of tryptophan residues by previous hydrolysis of the protein/peptide with sulfonic acids, such as mercaptoethanesulfonic acid, *p*-toluenesulfonic acid, or methanesulfonic acid, described for *Method 2* in *Protein Hydrolysis* under *Amino Acid Analysis.* The other acid-labile residues, asparagine and glutamine, can also be analyzed by previous conversion into diaminopropionic acid and diaminobutyric acid, respectively, by treatment of protein/peptide with BTI, described for *Method 11* in *Protein Hydrolysis* under *Amino Acid Analysis.*

The non-proteinogenic amino acid, norleucine, cannot be used as an internal standard in this method as this compound is eluted in a chromatographic region crowded with peaks of primary amino acids. Nitrotyrosine can be used as an internal standard because it is eluted in a clean region.

The detection limit of DABS-amino acid is about 1 pmol. As little as 2 to 5 pmol of an individual DABS-amino acid can be quantitatively analyzed with reliability, and only 10 ng to 30 ng of the dabsylated protein hydrolysate is required for each analysis.

One method for precolumn DABS-Cl derivatization is shown below.

Mobile Phase Preparation—

Solution A:— 25 mM sodium acetate (pH 6.5) containing 4% of dimethylformamide.

Solution B:— acetonitrile.

Mobile Phase— Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic System.*

Derivatization Reagent Preparation—

Sample Buffer:— 50 mM sodium bicarbonate, adjusted to a pH of 8.1.

Derivatization Reagent— Dissolve 1.3 mg of DABS-Cl in 1 mL of acetonitrile. [NOTE—This reagent is prepared fresh shortly before the derivatization step.]

Sample Dilution Buffer— Prepare a mixture of 50 mM sodium phosphate (pH 7.0) and alcohol (1 : 1).

Sample Derivatization Procedure— Dissolve the test sample in 20 µL of *Sample Buffer*, add 40 µL of *Derivatization Reagent*, and mix. The sample container is sealed with a silicon rubber stopper, and heated to 70° for 10 minutes. During the sample heating, the mixture will become completely soluble. After the derivatization, dilute the test sample with an appropriate quantity of the *Sample Dilution Buffer.*

Chromatographic System— The liquid chromatograph is equipped with a 436-nm detector and a 4.6-mm × 250-mm column that contains packing L1. The flow rate is about 1 mL per minute, and the column temperature is maintained at 40°. The system is programmed as follows. The column is equilibrated with 85% *Solution A* and 15% *Solution B;* over the next 20 minutes, the composition of the *Mobile Phase* is changed to 60% *Solution A* and 40% *Solution B;* over the next 12 minutes, the composition is changed to 30% *Solution A* and 70% *Solution B,* and held for an additional 2 minutes.

Procedure— Inject about 0.05 nmol of the DABS-amino acids into the chromatograph, and proceed as directed for *Chromatographic System.*

METHOD 7—PRECOLUMN FMOC-CL DERIVATIZATION

Precolumn derivatization of amino acids with 9-fluorenylmethyl chloroformate (FMOC-Cl) followed by reverse-phase HPLC separation with fluorometric detection is used.

FMOC-Cl reacts with both primary and secondary amino acids to form highly fluorescent products. The reaction of FMOC-Cl with amino acid proceeds under mild conditions, in aqueous solution, and is completed in 30 seconds. The derivatives are stable, with only the histidine derivative showing any breakdown. Although FMOC-Cl is fluorescent itself, the reagent excess and fluorescent side products can be eliminated without loss of FMOC-amino acids.

FMOC-amino acids are separated by reverse-phase HPLC using an ODS column. The separation is carried out by gradient elution varied linearly from a mixture of acetic acid–buffer, methanol, and acetonitrile (50 : 40 : 10) to a mixture of acetonitrile and acetic acid–buffer (50 : 50), and 20 amino acid derivatives that are separated in 20 minutes. Each derivative eluted from the column is monitored by a fluorometric detector set at an excitation wavelength of 260 nm and an emission wavelength of 313 nm.

The detection limit is in the low fmol range. A linearity range of 0.1 µM to 50 µM is obtained for most amino acids.

One method for precolumn FMOC-Cl derivatization is shown below.

Mobile Phase Preparation—

Acetic Acid Buffer— Transfer 3 mL of glacial acetic acid and 1 mL of triethylamine to a 1-liter volumetric flask, and dilute with HPLC grade water to volume. Adjust with sodium hydroxide to a pH of 4.20.

Solution A:— a mixture of *Acetic Acid Buffer,* methanol, and acetonitrile (50 : 40 : 10).

Solution B:— a mixture of acetonitrile and *Acetic Acid Buffer* (50 : 50).

Mobile Phase— Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic System.*

Derivatization Reagent Preparation—

Borate Buffer— Prepare a 1 M boric acid solution, and adjust with sodium hydroxide to a pH of 6.2.

FMOC-Cl Reagent— Dissolve 155 mg of 9-fluorenylmethyl chloroformate in 40 mL of acetone, and mix.

In-Process Revision

Sample Derivatization Procedure— To 0.4 mL of the test sample add 0.1 mL of *Borate Buffer* and 0.5 mL of *FMOC-Cl Reagent*. After about 40 seconds, extract the mixture with 2 mL of pentane, and then extract again with fresh pentane. The aqueous solution with amino acid derivatives is then ready for injection.

Chromatographic System— The liquid chromatograph is equipped with a fluorometric detector set at an excitation wavelength of 260 nm and an emission wavelength of 313 nm and a 4.6-mm × 125-mm column that contains 3-µm packing L1. The flow rate is about 1.3 mL per minute. The system is programmed as follows. The column is equilibrated with *Solution A*, and this composition is maintained for 3 minutes; over the next 9 minutes, it is changed to 100% *Solution B;* then over the next 0.5 minute, the flow rate is increased to 2 mL per minute, and held until the final FMOC-amino acid is eluted from the column. The total run time is about 20 minutes.

Procedure— Inject not less than 0.01 nmol of each FMOC-amino acid under test into the chromatograph, and proceed as directed for *Chromatographic System*. The FMOC-histidine derivative will generally give a lower response than the other derivatives.

METHOD 8—PRECOLUMN NBD-F DERIVATIZATION

Precolumn derivatization of amino acids with 7-fluoro-4-nitrobenzo-2-oxa-1,3-diazole (NBD-F) followed by reverse-phase HPLC separation with fluorometric detection is used.

7-Fluoro-4-nitrobenzo-2-oxa-1,3-diazole (NBD-F) reacts with both primary and secondary amino acids to form highly fluorescent products. Amino acids are derivatized with NBD-F by heating to 60° for 5 minutes.

NBD-amino acid derivatives are separated on an ODS column of reverse-phase HPLC by employing a gradient elution system consisting of acetonitrile and aqueous buffer mixture, and 17 amino acid derivatives that are separated in 35 minutes. *E*-aminocaproic acid can be used as an internal standard because it is eluted in a clean chromatographic region. Each derivative eluted from the column is monitored by a fluorometric detector set at an excitation wavelength of 480 nm and an emission wavelength of 530 nm.

The sensitivity of this method is almost the same as that for the precolumn OPA derivatization method (*Method 5*), excluding proline to which OPA is not reactive and might be advantageous for NBD-F against OPA.

The detection limit for each amino acid is about 10 fmol. Profile analysis was achieved for about 1.5 mg of protein hydrolysates in the final precolumn labeling reaction mixture for HPLC.

One method for precolumn NBD-F derivatization is shown below.

Mobile Phase Preparation—

Solution A:— a solution of 10mM sodium citrate containing 75 mM sodium perchlorate, adjusted with hydrochloric acid to a pH of 6.2.

Solution B:— a mixture of acetonitrile and water (50 : 50).

Derivatization Reagent Preparation—

Sample Buffer:— a 0.1 M boric acid solution, adjusted with sodium hydroxide to a pH of 9.2.

Derivatization Reagent— Dissolve 5 mg of NBD-F in 1.0 mL of alcohol, and mix.

Sample Derivatization Procedure— Dissolve the test sample in 20 µL of *Sample Buffer*, add 10 µL of *Derivatization Reagent*, and mix. The sample container is heated at 60° for 5 minutes. After the derivatization, dilute the test sample with 300 µL of *Solution A*.

Chromatographic System— The liquid chromatograph is equipped with a fluorometric detector set at an excitation wavelength of 480 nm and an emission wavelength of 530 nm and a 4.6-mm × 150-mm column that contains 5-µm particle size ODS silica packing. The flow rate is about 1.0 mL per minute, and the column temperature is maintained at 40°. The system is programmed as follows. The column is equilibrated with 94% *Solution A* and 6% *Solution B;* over the next 16 minutes, the composition is changed linearly to 63% *Solution A* and 37% *Solution B;* over the next 5 minutes, the composition is changed linearly to 62% *Solution A* and 38% *Solution B;* over the next 9 minutes, the composition is changed linearly to 100% *Solution B*, and held for an additional 5 minutes; then finally over 2 minutes, the composition is changed linearly to 94% *Solution A* and 6% *Solution B;* and then the column is allowed to equilibrate before the next injection.

Procedure— Inject about 15 pmol of each NBD-amino acid under test into the chromatograph, and proceed as directed for *Chromatographic System*.

Data Calculation and Analysis

When determining the amino acid content of a protein/peptide hydrolysate, it should be noted that the acid hydrolysis step destroys tryptophan and cysteine. Serine and threonine are partially destroyed by acid hydrolysis, while isoleucine and valine residues may be only partially cleaved. Methionine can undergo oxidation during acid hydrolysis, and some amino acids (e.g., glycine and serine) are common contaminants. Application of adequate vacuum (less than 200 um µm of mercury or 26.7 Pa) or introduction of inert gas (argon) in the headspace of the reaction vessel during vapor phase hydrolysis can reduce the level of oxidative destruction. Therefore, the quantitative results obtained for cysteine, tryptophan, threonine, isoleucine, valine, methionine, glycine, and serine from a protein/peptide hydrolysate may be variable and may warrant further investigation and consideration.

CALCULATIONS

Amino-Acid Mole Percent— This is the number of specific amino acid residues per 100 residues in a protein. This result may be useful for evaluating amino acid analysis data when the molecular weight of the protein/peptide under investigation is unknown. This information can be used to corroborate the identity of a protein and has other applications. Carefully identify and integrate the peaks obtained as directed for each *Procedure*. Calculate the mole percent for each amino acid present in the test sample by the formula:

$$100r_i/r,$$

in which r_i is the peak response, in nmol, of the amino acid under test, and r is the sum of peak responses, in nmol, for all amino acids present in the test sample. Comparison of the mole percent of the amino acids under test to data from known proteins can help establish or corroborate the identity of the sample protein.

Unknown Protein Samples— This data analysis technique can be used to estimate the protein concentration of an unknown protein sample using the amino acid analysis data. Calculate the mass, in µg, of each recovered amino acid by the formula:

$$mM_w/1000$$

in which m is the recovered quantity, in nmol, of the amino acid under test; and M_w is the average molecular weight, in mg, for that amino acid, corrected for the weight of the water molecule that was eliminated during peptide bond formation. The sum of the masses of the recovered amino acids will give an estimate of the total mass of the protein analyzed after appropriate correction for partially and completely destroyed amino acids. If the molecular weight of the unknown protein is available (i.e., by SDS-PAGE analysis or mass spectroscopy), the amino acid composition of the unknown protein can be predicted. Calculate the number of residues of each amino acid by the formula:

$$m/(1000M/M_w)$$

in which m is the recovered quantity, in nmol, of the amino acid under test; M is the total mass, in µg, of the protein; and M_w is the molecular weight, in mg, of the unknown protein.

Known Protein Samples— This data analysis technique can be used to investigate the amino acid composition and protein concentration of a protein sample of known molecular weight and amino acid composition using the amino acid analysis data. When the composition of the protein being analyzed is known, one can exploit the fact that some amino acids are recovered well, while other amino acid recoveries may be compromised because of complete or partial destruction (e.g., tryptophan, cysteine, threonine, serine, methionine), incomplete bond cleavage (i.e., for isoleucine and valine), and free amino acid contamination (i.e., by glycine and serine).

In-Process Revision

Because those amino acids that are recovered best represent the protein, these amino acids are chosen to quantify the amount of protein. Well recovered amino acids are, typically, aspartate asparagine, glutamate glutamine, alanine, leucine, phenylalanine, lysine, and arginine. This list can be modified based on experience with one's own analysis system. Divide the quantity, in nmol, of each of the well-recovered amino acids by the expected number of residues for that amino acid to obtain the protein content based on each well recovered amino acid. Average the protein content results calculated. The protein content determined for each of the well-recovered amino acids should be evenly distributed about the mean. Discard protein content values for those amino acids that have an unacceptable deviation from the mean. Typically, a greater than 5% variation from the mean is considered unacceptable, but this is arbitrary. Recalculate the mean protein content from the remaining values to obtain the protein content of the sample. Divide the content of each amino acid by the calculated mean protein content to determine the amino acid composition of the sample by analysis.

Calculate the relative compositional error, in percentage, by the formula:

$$100m/m_s$$

in which m is the experimentally determined quantity, in nmol per amino acid residue, of the amino acid under test; and m_s is the known residue value for that amino acid. The average relative compositional error is the average of the absolute values of the relative compositional errors of the individual amino acids, typically excluding tryptophan and cysteine from this calculation. The average relative compositional error can provide important information on the stability of analysis run over time. The agreement in the amino acid composition between the protein sample and the known composition can be used to corroborate the identity and purity of the protein in the sample.

CAPILLARY ELECTROPHORESIS

Capillary electrophoresis is a physical method of analysis based on the migration, inside a capillary, of charged analytes dissolved in an electrolyte solution, under the influence of a direct-current electric field. In this section we are describing four capillary electrophoresis methods, *Free-Solution Capillary Electrophoresis, Capillary Gel Electrophoresis, Capillary Isoelectric Focusing,* and *Micelle Electrokinetic Chromatography.*

General Principle

The migration velocity of the analyte under an electric field of intensity, E, is determined by the electrophoretic mobility of the analyte and the electroosmotic mobility of the buffer inside the capillary. The electrophoretic mobility of a solute (μ_{ep}) depends on the characteristics of the solute (electrical charge, molecular size, and shape) and the characteristics of the buffer in which the migration takes place (type and ionic strength of the electrolyte, pH, viscosity, and additives). The electrophoretic velocity (V_{ep}) of a solute, assuming a spherical shape, is as follows:

$$V_{ep} = \mu_{ep} E = \left(\frac{q}{6\pi\eta r}\right)\left(\frac{V}{L}\right),$$

in which q is the effective charge of the particle; η is the viscosity of the buffer; r is the size of the solute ion; V is the applied voltage; and L is the total length of the capillary.

When an electric field is applied through the capillary filled with buffer, a flow of solvent is generated inside the capillary called electroosmotic flow. Its velocity depends on the electroosmotic mobility (μ_{eo}) which in turn depends on the charge density on the capillary internal wall and the buffer characteristics. The electroosmotic velocity (V_{eo}) is as follows:

$$V_{eo} = \mu_{eo} E = \left(\frac{\varepsilon\zeta}{\eta}\right)\left(\frac{V}{L}\right),$$

in which ε is the dielectric constant of the buffer; ζ is the zeta potential of the capillary surface; and the other terms are as defined above.

The electrophoretic and electroosmotic mobilities of the analyte may act in the same direction or in opposite directions, depending on the charge (positive or negative) of the solute, and the velocity of the solute (v) is as follows:

$$V = V_{ep} \pm V_{eo}.$$

The sum or the difference between the two velocities (V_{ep} and V_{eo}) is used depending on whether the mobilities act in the same or opposite directions. Under conditions with a fast V_{eo}, with respect to the V_{ep} of the solutes, both negative and positive charged analytes can be separated in the same run. The time (t) taken by the solute to migrate the distance (l) from the injection end of the capillary to the detection point (capillary effective length) is as follows:

$$t = \frac{l}{V_{ep} \pm V_{eo}} = \frac{l(L)}{V(\mu_{ep} \pm \mu_{eo})},$$

in which the other terms are as defined above.

In general, the fused-silica capillaries used in electrophoresis bear negative charges on the inner wall, producing electroosmotic flow towards the cathode. The electroosmotic flow has to remain constant from run to run to obtain good reproducibility in the migration velocity of the solutes. For some applications, it might be necessary to reduce or suppress the electroosmotic flow by modifying the inner wall of the capillary or by changing the pH of the buffer solution.

When the sample is introduced in the capillary, each analyte ion of the sample migrates within the background electrolyte as an independent zone according to its electrophoretic mobility. The spreading of each solute band (zone dispersion) results from a different phenomena. Under ideal conditions, the sole contribution to the solute zone broadening is molecular diffusion of the solute along the capillary (longitudinal diffusion). In this case, the efficiency of the zone is expressed as the number of theoretical plates (N), as follows:

$$N = \frac{(\mu_{ep} \pm \mu_{eo})(Vl)}{2DL},$$

in which D is the molecular diffusion of the solute in the buffer; and the other terms are as defined above.

From a practical point of view, other phenomena such as heat dissipation, sample adsorption onto the capillary wall, mismatched conductivity between sample and buffer, length of the injection plug, detector cell size, and unleveled buffer reservoirs can also significantly contribute to band dispersion. Separation between two bands (expressed by the resolution, R_s) can be achieved by modification of the

In-Process Revision

electrophoretic mobility of the analytes, by the electroosmotic mobility induced by capillary, and by increasing the efficiency for the band of each analyte as follows:

$$R_S = \frac{\sqrt{N}(\mu_{epa} - \mu_{epa})}{4(\mu_{ep} \pm \mu_{eo})},$$

in which μ_{epa} and μ_{epa} are the electrophoretic mobilities of the two compounds to be separated; $\bar{\mu}_{ep}$ is the average electrophoretic mobility of the two solutes calculated as:

$$\bar{\mu}_{ep} = \tfrac{1}{2}(\mu_{epa} - \mu_{epa}),$$

and the other terms are as defined above.

Apparatus

An apparatus for capillary electrophoresis is composed of a high voltage controllable power supply; two buffer reservoirs held at the same level and containing specified anodic and cathodic solutions; two electrodes assemblies (cathode and anode) immersed in the buffer reservoirs and connected to the power supply; a separation capillary usually made of fused silica, with sometimes an optical viewing window aligned with detector, depending on the detector, with the ends of the capillary placed in the buffer reservoirs and the capillary being filled with a solution specified in a given monograph; a suitable injection system; a detector capable of monitoring the amount of substance of interest passing through a segment of the separation capillary at a given time, generally based on absorption spectrophotometry (UV and visible), fluorimetry, conductimetric, amperometric, or mass spectrometric detection, depending on the specific applications, or even indirect detection to detect non-UV absorbing and nonfluorescent compounds; and a thermostatic system capable of maintaining the temperature inside the capillary.

The method of injection of samples and its automation is critical for precise quantitative analysis. Methods of injection include gravity, pressure or vacuum, or electrokinetic injection. The amount of each sample component introduced electrokinetically depends on its electrophoretic mobility, thus possibly biasing the results.

It is expected that the capillary, the buffer solutions, the preconditioning method, the sample solution, and the migration conditions will be specified in the individual monograph. The electrolytic solution employed may be filtered to remove particles and degassed to avoid bubble formation that could interfere with the detection system. To achieve reproducible migration time of the solutes, if would be necessary to develop, for each analytical method, a rigorous rinsing routine after each injection.

Free Solution Capillary Electrophoresis

In free solution capillary electrophoresis, analytes are separated in a capillary containing only buffer without any anticonvective medium. In this technique, separation takes place because the different components of the sample migrate as discrete bands with different velocities. The velocity of each band depends on the electrophoretic mobility of the solute and the electroosmotic flow on the capillary. Coated capillaries, with reduced electroosmotic flow, can be used to increase the separation capacity of those substances absorbing on fused silica surfaces.

This mode of capillary electrophoresis is appropriate for the analysis of small (MW < 2000) and large molecules (2000 < MW < 100,000). Due to the high efficiency achieved, molecules having only minute differences in their charge-to-mass ratio can be separated. This method also allows the separation of chiral compounds by adding chiral selectors to the separation buffer. The optimization of the separations requires consideration of a number of instrumental and electrolytic solution parameters.

INSTRUMENTAL PARAMETERS

Voltage — The separation time is universally proportional to applied voltage. However, an increase in the voltage used can cause excessive heat production, giving rise to temperature and viscosity gradients in the buffer inside the capillary, which causes band broadening and decreases resolution.

Temperature — The main effect of temperature is observed on buffer viscosity and electrical conductivity, thus affecting migration velocity. In some cases, an increase in capillary temperature can cause a conformational change of some proteins, modifying their migration time and the efficiency of the separation.

Capillary — The length and internal diameter of the capillary affects the analysis time, the efficiency of separations, and the load capacity. Increasing both effective length and total length can decrease the electric fields, at a constant voltage, which will increase migration time. For a given buffer and electric field, heat dissipation (thus sample band broadening) depends on the internal diameter of the capillary. The latter also affects the detection limit, depending on the sample volume injected into the capillary and the detection system used.

The adsorption of sample components on the capillary wall limits efficiency; therefore, methods to avoid these interactions should be considered in the development of a separation method. This is critical in samples containing proteins. Strategies have been devised to avoid adsorption of proteins on the capillary wall. These strategies include both the use of extreme pH and the absorption of positively charged buffer additives that only require modification of the buffer composition. Other strategies include the coating of the internal wall of the capillary with a polymer covalently bonded to the silica that prevents interaction between the proteins and the negatively charged silica surface. Capillaries with coatings consisting of neutral hydrophilic, cationic, and anionic polymers are commercially available.

ELECTROLYTIC SOLUTION PARAMETERS

Buffer Type and Concentrations — Suitable buffers for capillary electrophoresis have an appropriate buffer capacity in the pH range of choice and low mobility to minimize current generation.

To minimize peak shape distortion, it is important to match buffer ion mobility to solute mobility, whenever possible. The type of sample solvent used is important to achieve on-column sample focusing which increases separation efficiency and improves detection. Also, an increase in buffer concentration at a given pH will decrease electroosmotic flow and solute velocity.

Buffer pH — The pH of the buffer can affect separation by modifying the charge of the analyte or other additives and by changing the electroosmotic flow. For protein and peptide separation, a change in the pH of the buffer from above the isoelectric point to below the isoelectric point changes the net charge of the solute from negative to positive. An increase in the buffer pH generally increases the electroosmotic flow.

Organic Solvents — Organic modifiers, such as methanol, acetonitrile, and others, are added to the aqueous buffer to increase the solubility of the solute or other additives and/or to affect the ionization degree of the sample components. The addition of these organic modifiers to the buffer generally causes a decrease in the electroosmotic flow.

Additives for Chiral Separations — To separate optical isomers, a chiral selector is added to the separation buffer. The most commonly used chiral selectors are cyclodextrins, although in some cases crown ethers, certain polysaccharides, or even proteins can be used. Because chiral recognition is governed by the different interactions between the chiral selector and each of the enantiomers, the resolution achieved for the chiral compounds depends largely on the type of chiral selector used. While developing a given separation it may be useful to test cyclodextrins having a different cavity size (α, β, or Γ-cyclodextrin) or modified cyclodextrins with neutral (methyl, ethyl, hydroxyalkyl, etc.) or ionizable (aminomethyl, carboxymethyl, sulfobutylether, etc.) moities. The resolution of chiral separations is also controlled by the concentration of the chiral selector, the composition

In-Process Revision

and pH of the buffer, and the separation temperature. Organic additives, such as methanol or urea, can also affect the resolution of separation.

Capillary Gel Electrophoresis

Separation takes place inside a capillary filled with a polymer acting as a molecular sieve. The smaller components in the sample move faster along the capillary than the larger ones. This method can be used for separation of biopolymers proteins, and DNA fragments, according to their molecular mass.

CHARACTERISTICS OF CHEMICAL AND PHYSICAL GELS

Chemical Gels—Chemical gels are prepared inside the capillary by reaction of monomers. One example of such a gel is a cross-linked polyacrylamide. This type of gel is bonded to the fused silica wall and cannot be removed without destroying the capillary. For protein analysis, the separation buffer usually contains sodium dodecyl sulfate and the sample is denatured by heating in a mixture of sodium dodecyl sulfate and 2-mercaptoethanol or dithiothreitol before injection. Optimization of separation in a cross-linked gel is obtained by modifying the separation buffer (see *Free-Solution Capillary Electrophoresis*) and by controlling the gel porosity during the gel preparation. For a cross-linked polyacrylamide gel, the porosity can be modified by changing the concentration of acrylamide and/or the ratio of the cross-linker. As a rule, a decrease in the porosity of the gel leads to a decrease in the mobility of the solutes. Due to the rigidity of this type of gel, only electrokinetic injection can be used.

Physical Gels—Physical gels are hydrophilic polymers (i.e., linear polyacrylamide, cellulose derivatives, dextran, etc.) which can be dissolved in aqueous separation buffers, giving rise to a separation medium that also acts as a molecular sieve. These polymeric separation media are easier to prepare than cross-linked polymers. They can be prepared in a vial and filled by pressure in a wall-coated capillary with no electroosmotic flow. Replacing the gel before every injection generally improves the separation reproducibility. The porosity of the physical gels can be increased by using polymers of higher molecular weight (at a given polymer concentration) or by decreasing the polymer concentration (for a given polymer molecular weight). A decrease in gel porosity leads to a decrease in the mobility of the solute for the same buffer. Both hydrodynamic and electromigration injection techniques can be used, since the dissolution of these polymers in the buffer gives low-viscosity solutions.

Capillary Isoelectric Focusing

The molecules migrate under the influence of the electric field, so long as they are charged, in a pH gradient generated by ampholytes having pI values in a wide range (poly-aminocarboxylic acids) dissolved in the separation buffer. The three basic steps in capillary isoelectric focusing are loading, focusing, and mobilization.

Loading—

Loading in One Step—The sample is mixed with ampholytes and introduced into the capillary by pressure or vacuum.

Sequential Loading—A leading buffer, then the ampholytes, then the sample mixed with ampholytes, again ampholytes alone, and finally the terminating buffer are introduced into the capillary. The volume of the sample must be small enough so as to not modify the pH gradient.

Focusing—When the voltage is applied, ampholytes migrate toward the cathode or the anode according to their net charge, creating the pH gradient from anode (lower pH) to cathode (higher pH). The components to be separated migrate until they reach a pH corresponding to their isoelectric point and the current drops to very low values.

Mobilization—The bands of separated components migrate past the detector by one of the three following methods.

Method 1—During *Focusing*, under the influence of the electroosmotic flow when this flow is small enough to allow the focusing of the components.

Method 2—By application of positive pressure after *Focusing*.

Method 3—After *Focusing*, by adding salts in the cathode reservoir or the anode reservoir (depending on the direction chosen for mobilization), in order to alter the pH in the capillary when the voltage is applied. As the pH is changed, the proteins and ampholytes are mobilized in the direction of the reservoir which contains added salts and pass the detector.

The separation achieved is expressed as ΔpI and depends on the pH gradient (dpH), the number of ampholytes having different pI values, the diffusion coefficient (D), the intensity of the electric field (E), and the variation of the electrophoretic mobility of the analyte with the pH, and is as follows:

$$\Delta pI = 3\sqrt{\frac{D(dpH/dx)}{E(-d\mu/dpH)}},$$

in which dpH/dx is the pH gradient; and $d\mu/dpH$ is the variation of the solution mobility with the pH in the region close to the pI.

Optimization Parameters—The major parameters that need to be considered in the development of separations are voltage, capillary, and solutes.

Voltage—Use of high fields from 300 V/cm to 1,000 V/cm during *Focusing*.

Capillary—Depending on the *Mobilization* strategy selected (see above), the electroosmotic flow must be reduced or suppressed. Coated capillaries tend to reduce the electroosmotic flow.

Solutions—The anode buffer reservoir is filled with a solution of a lower pH than the pI of the most acidic ampholyte and the cathode reservoir is filled with a solution with a higher pH than the pI of the most basic ampholyte. Phosphoric acid for the anode and sodium hydroxide for the cathode are frequently used.

Addition of a polymer, like methylcellulose, in the ampholyte solution tends to suppress convective forces (if any) and electroosmotic flow by increasing the viscosity. Commercial ampholytes covering many pH ranges are available and may also be mixed to obtain an expanded pH range. Broad pH ranges are used to estimate the isoelectric point whereas narrower ranges are employed to improve accuracy. Calibration can be made by correlating migration time with the isoelectric point of a series of standard protein markers. During *Focusing*, precipitation of proteins at their isoelectric point can be prevented, if necessary, using buffer additives such as glycerol, surfactants, urea, or Zwitterionic buffers. However, depending on the concentration, urea can denature proteins.

Micellar Electrokinetic Chromatography (MEKC)

Separation takes place in an electrolytic solution which contains a surfactant, generally ionic, at a concentration above the critical micellar concentration. The solute molecules are distributed between the aqueous buffer and the pseudo-stationary phase composed by the micelles according to the solute's partition coefficient. The technique can be considered as a hybrid of electrophoresis and chromatography. It is an electrophoretic technique that can be used for the separation of both neutral and charged solutes maintaining the efficiency, speed, and instrumental suitability of capillary electrophoresis. One of the most widely used surfactants is sodium dodecyl sulfate, although other anionic and cationic surfactants, such as cetyl trimethyl ammonium salts, have also been used.

At neutral and alkaline pH, a strong electroosmotic flow is generated and moves the separation buffer ions in the direction of the cathode. If sodium dodecyl sulfate is used as surfactant, the electrophoretic migration of the anionic micelle is in the opposite direction, toward the anode. As a result, the overall micelle migration velocity is slowed compared to the bulk flow of the electrolytic solution. In the case of neutral solutes, since the analyte can partition between the micelle and the aqueous buffer and has no electrophoretic mobility, the analyte migration velocity will only depend on the partition coefficient between the micelle and the aqueous buffer. In the electropherotogram, the peak corresponding to each uncharged solute is always between that of the electroosmotic flow marker and that of the micelle, and the time elapsed between these two peaks is called the separation window. For electrically charged solutes, the migration

In-Process Revision

velocity depends on both the partition coefficient of the solute between the micelle and the aqueous buffer and on the electrophoretic mobility of the solute in the absence of micelles.

The separation mechanism is essentially chromatographic, and migration of the solute and resolution can be expressed in terms of the capacity factor of the solute (K'), which is the ratio between the total number of moles of solute in the micelle to those in the mobile phase. For a neutral compound, K' is as follows:

$$K' = \frac{t_r - t_o}{t_o(1 - t_r/t_m)} = K\left(\frac{V_S}{V_M}\right),$$

in which t_r is the migration time of the solute; t_o is the analysis time of the unretained solute obtained by injecting an electroosmotic flow marker which does not enter the micelle (i.e., methanol); t_m is the micelle migration time measured by injecting a micelle marker, such as Sudan III, which migrates continuously associated in the micelle; K is the partition coefficient of the solute; V_S is the volume of the micelles phase; and V_M is the volume of the mobile phase.

The resolution between two closely migrating compounds (R_S) is as follows:

$$R_S = \left(\frac{\sqrt{N}}{4}\right)\left(\frac{\alpha - 1}{\alpha}\right)\left(\frac{K'_b}{K'_b}\right)\left(\frac{1 - (t_o/t_m)}{1 + (t_o/t_m)K'_a}\right),$$

in which N is the number of theoretical plates for one of the compounds; α is the selectivity obtained; K'_a and K'_b are capacity factors for both components; and the other terms are as defined above.

Similar, but not identical, equations give K' and R_S values for electrically charged compounds.

Optimization Parameters — The main parameters to be considered in the development of separations by MEKC are instrumental and electrolytic solution parameters.

INSTRUMENTAL PARAMETERS

Voltage — Separation time is inversely proportional to applied voltage. An increase in voltage can cause excessive heat production that gives rise to temperature gradients and viscosity gradients of the buffer in the cross section of the capillary. This effect can be significant with high conductivity buffers, such as those containing micelles. Poor heat dissipation causes band broadening and decreases resolution.

Temperature — Variations in capillary temperature affect the partition coefficient of the solute between the buffer and the micelle, the critical micelle concentration, and the viscosity of the buffer. These parameters contribute to the migration time of the solutes.

Capillary — Length and internal diameter contribute to analysis time and efficiency of separations. Increasing both effective length and total length can decrease the electrical fields, working at constant voltage, and will increase migration time and improve the separation efficiency. The internal diameter controls heat dissipation, at a given buffer and electrical field, and provides a broadening of the sample band.

ELECTROLYTIC SOLUTION PARAMETERS

Surfactant Type and Concentration — The type of surfactant, as the stationary phase in chromatography, affects the resolution since it modifies separation selectively. The log K' of a neutral compound increases linearly with the concentration of detergent in the mobile phase. Resolution in MEKC reaches a maximum when K' approaches the value of

$$\sqrt{t_m t_{mc}},$$

modifying the concentration of surfactant in the mobile phase changes the resolution.

Buffer pH — pH does not modify the partition coefficient of non-ionized solutes, but it can modify the electroosmotic flow in uncoated capillaries. A decrease in the buffer pH decreases the electroosmotic flow and therefore increases the resolution of the neutral solutes, giving rise to longer analysis time.

Organic Solvents — To improve separation of hydrophobic compounds, organic modifiers (methanol, propanol, acetonitrile, etc.) can be added to the separation electrolytic solution. The addition of these modifiers generally decreases migration time and selectivity of the separation. The addition of organic modifiers affects micelle formation, thus a given surfactant concentration can be used only with a certain percentage of organic modifier before the micellezation equilibrium is eliminated or adversely affected, resulting in the absence of micelles and therefore the absence of the partition mechanism of MEKC. The elimination of micelles in the presence of a high content of organic solvent does not always mean that the separation will no longer be possible, since in some cases, the hydrophobic interaction between the ionic surfactant monomer and the neutral solutes form solvophobic complexes that can be separated electrophoretically.

Additives for Chiral Separations — A chiral selector is included in the micellar system, either covalently bound to the surfactant or added to the micellar separation electrolyte. Micelles which have a moiety with chiral discrimination properties include salts, *N*-dodecanoyl L-anine acids, bile salts, etc. Chiral resolution can also be achieved using chiral discriminators, such as cyclodextrins added to the electrolytic solutions which contain micellized achiral surfactants.

Other Additives — Selectivity can be modified by adding chemicals to the buffer. Addition of several types of cyclodextrins to the buffer are also used to reduce the interaction of hydrophobic solutes with the micelle, increasing the selectivity for this type of compound. The addition of substances able to modify solute-micelle interactions by adsorption on the latter, has been used to improve the selectivity of the separations in MEKC. These additives may consist of a second surfactant (ionic or non-ionic) which gives rise to mixed micelles, metallic cations which dissolve in the micelle, and give co-ordination complexes with the solutes.

QUANTITATIVE ANALYSIS

Peak areas must be divided by the corresponding migration time to give the corrected area in order to compensate for the shift in migration time from run to run, thus reducing the variation of the response. It will also compensate for the different responses of sample constituents with different migration times. Where an internal standard is used, check that no peak of the substance to be examined is masked by that of the internal standard.

Calculations — From the values obtained, calculate the content of a component or components being determined. When indicated, the percentage of one (or more) components of the sample to be examined is calculated by determining the areas of the peak(s) as a percentage of the total corrected areas of all the peaks, excluding those due to solvents or any added reagents. The use of an automatic integration system (integrator or data acquisition and processing system) is recommended.

Capillary Electrophoresis System Suitability

The choice of suitability parameters to be used will depend on the type of capillary electrophoresis that is performed. These parameters are the capacity factor (K') used only for *Micelles Electrokinetic Chromatography*, the number of theoretical plates (n), the symmetry factor (A_s), and the resolution (R_s). Note that in previous sections, the

In-Process Revision

theoretical expression for n and R_s have been described, but more practical equations that allow for the determination of these suitability parameters using the electropherotograms are described below.

The number of theoretical plates (n) may be calculated from the formula:

$$n = 5.54\,(t/b_{0.5})^2,$$

in which t is the distance, in mm, along the baseline between the point of injection and the perpendicular dropped from the maximum of the peak in question; and $b_{0.5}$ is the peak width, in mm, at half height.

The resolution (R_s) may be calculated from the formula:

$$R_s = 1.18(t_{s2} - t_{s1})/b_{0.5,2} - b_{0.5,1}),$$

in which t_{s1} and t_{s2} are the distances, in mm, along the baseline, between the point of injection and the perpendicular dropped from the maxima of two adjacent peaks ($t_{s2} > t_{s1}$); and $b_{0.5,1}$ and $b_{0.5,2}$ are the peak widths, in mm, at half height.

The resolution (R_s) may be also calculated by measuring the height of the valley (c) between two partly resolved peaks in a standard preparation, the height of the smaller peak (d), and by specifying $(c/d) \leq x$, in which x is the limit indicated in the individual monograph.

The symmetry factor of a peak (A_s) may be calculated using the formula:

$$A_s = b_{0.05}/2A,$$

in which $b_{0.05}$ is the width of the peak at one-twentieth of the peak height; and A is the distance between the perpendicular dropped from the peak maximum and the leading edge of the peak at one-twentieth of the peak height.

Other system suitability parameters include tests for area repeatability (i.e., standard deviation of areas or of area/migration time) and tests for migration time repeatability (i.e., standard deviation of migration time). For migration time repeatability, it will be necessary to provide for a test to measure the suitability of the capillary washing procedures. To avoid the lack of repeatability of the migration time, an alternative practice is to use a migration time relative to an internal standard.

A test for the verification of the signal-to-noise ratio for a standard preparation or the determination of the limit of quantitation is a useful system suitability parameter. The detection limit and quantitation limit correspond to a signal-to-noise ratio greater than 3 and 10, respectively. The signal-to-noise ratio (S/N) is calculated as follows:

$$S/N = 2H/h_n,$$

in which H is the height of the peak corresponding to the component concerned in the electropherotogram obtained with the specified reference solution; and h_n is the absolute value of the largest noise fluctuation from the baseline in an electropherotogram obtained after injection of a blank and observed over a distance equal to twenty times the width at the half-height of the peak in the electropherotogram obtained with the reference solution, and situated equally around the place where this peak would be found.

ISOELECTRIC FOCUSING

Isoelectric focusing (IEF) is a method of electrophoresis that separates proteins according to their isoelectric points. Separation is carried out in a slab of polyacrylamide or agarose gel that contains a mixture of amphoteric electrolytes (ampholytes). When subjected to an electrical field, the ampholytes migrate in the gel to create a pH gradient. In some cases, gels containing an immobilized pH gradient, prepared by incorporating weak acids and bases to specific regions of the gel network during the preparation of the gel, are used. When the applied proteins reach the gel fraction that has a pH that is the same as their isoelectric point, their charge is neutralized and migration ceases. Gradients can be made over various ranges of pH, according to the mixture of ampholytes chosen.

General Principles

When a protein is at the position of its isoelectric point, it has no net charge and cannot be moved in a gel matrix by the electric field. It may, however, move from that position by diffusion. The pH gradient forces a protein to remain in its isoelectric point position, thus concentrating it; this concentration effect is called "focusing". Increasing the applied voltage or reducing the sample load results in improved resolution of bands. The applied voltage is limited by the heat generated because the heat must be dissipated. The use of thin gels and an efficient cooling plate controlled by a thermostatic circulator prevents the burning of the gel while allowing sharp focusing. The separation is estimated by determining the minimum pI difference, which is necessary to separate two neighboring bands, as follows:

$$\Delta pI = 3\sqrt{\frac{D(dpH/dx)}{E(-d\mu/dpH)}},$$

in which D is the diffusion coefficient of the protein; dpH/dx is the pH gradient; E is the intensity of the electric field, in volts per centimeter; and $-d\mu/dpH$ is the variation of the solute mobility with the pH in the region close to the pI. Since D and $-d\mu/dpH$ for a given protein cannot be altered, the separation can be improved by using a narrower pH range and by increasing the intensity of the electric field.

From an operational point, special attention must be paid to sample characteristics and/or preparation. Salt in a sample can be problematic and it is best to prepare the sample, if possible, in deionized water or 2% ampholytes using dialysis or gel filtration if necessary. Potentials of 2500 volts have been used and are considered optimal under a given set of conditions. Up to 30 watts of constant power can be applied and will generally give complete separation in 1.5 to 3.0 hours. The time required for completion of focusing in thin layer polyacrylamide gels is determined by placing a colored protein (e.g., hemoglobin) at different positions on the gel surface and by applying the electric field: the steady state is reached when all applications give an identical band pattern. In some procedures the completion of the focusing is indicated by the time elapsed after the sample application.

Resolution between protein bands on an IEF gel prepared with carrier ampholytes can be quite good. Better resolution may be achieved by using immobilized pH gradients where the buffering species, which are analogous to carrier ampholytes, are copolymerized within the gel matrix. Proteins exhibiting pIs differing by as little as 0.02 pH units may be resolved using a gel prepared with carrier ampholytes, while immobilized pH gradients can resolve protein differing by approximately 0.001 pH units.

The IEF gel can be used as an identity test when migration on the gel is compared to a standard preparation and IEF calibration proteins, the IEF gel can be used as a limit test when the density of a band on IEF is compared subjectively with the density of bands appearing in a standard preparation, or it can be used as a semi-quantitative test when the density is measured using a densitometer or similar instrumentation to determine the relative concentration of protein in the bands.

Apparatus

An apparatus for isoelectric focusing consists of a controllable direct current generator, of stabilized output; a rigid plastic isoelectric focusing chamber that contains a cooled plate of suitable material to support the gel; and a plastic cover with platinum electrodes that are connected to the gel by means of paper wicks of suitable width, length, and thickness, impregnated with solutions of anodic and cathodic electrolytes.

In-Process Revision

Procedure

Unless otherwise indicated in a given monograph, the following procedure in thick polyacrylamide slab gels is to be used.

Preparation of the Gels—

Assembly—Composed of a glass plate (A) on which a polyester film (B) is placed to facilitate handling of the gel, one or more spacers (C), a second glass plate (D), and clamps to hold the structure together (see *Figure 1*).

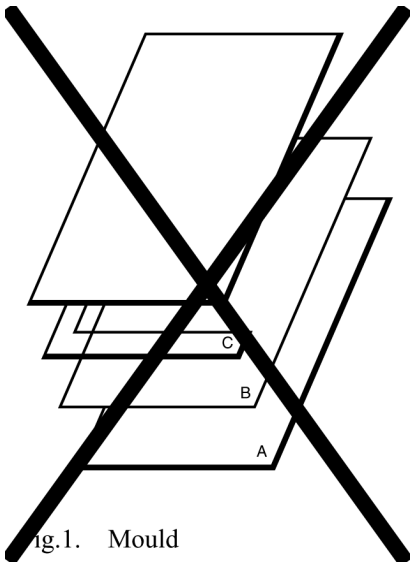

Fig.1. Mould

7.5% Polyacrylamide Gel—Dissolve 29.1 g of acrylamide and 0.9 g of methylenebisacrylamide in 100 mL of water. To 2.5 volumes of this solution, add the mixture of ampholytes specified in the individual monograph, and make up to 10 volumes with water. Mix carefully, and degas the solution.

Preparation of the Assembly—Place the polyester film on the lower glass plate, apply the spacer, place the second glass plate, and fit the clamps. Before use, place the mixture on a magnetic stirrer, and add 0.25 volumes of a 10% solution of ammonium persulfate and 0.25 volumes of tetramethylenediamine. Immediately fill the space between the glass plates of the assembly with the gel.

Fixing Solution for Isoelectric Focusing Polyacrylamide Gel—Mix 35 g of sulfosalicylic acid and 100 g of trichloroacetic acid in 1000 mL of water.

Coomassie Staining Solution and *Destaining Solution*—Use the same solutions indicated in *Polyacrylamide Gel Electrophoresis*.

Procedure—Dismantle the assembly, and using the polyester film, transfer the gel onto the cooled support wetted with a few milliliters of a suitable liquid, taking care to avoid forming air bubbles. Prepare the test solutions and reference solutions as specified in the individual monograph. Place strips of paper for sample application, about 10 mm × 5 mm in size, on the gel, and impregnate each with the prescribed amount of the test and reference solutions. If the protein concentration of the solution is too low, several strips may be superimposed (up to four). Also apply the prescribed quantity of a solution of proteins with known isoelectric points as pH markers to calibrate the gel. In some procedures, the gel has pre-cast slots where a solution of the sample is applied instead of using impregnated paper strips. Cut two strips of paper to the length of the gel, and impregnate them with the electrolyte solutions: acid for the anode and alkaline for the cathode. The compositions of the anode and cathode solutions are given in the individual monograph. Apply these paper wicks to each side of the gel several millimeters from the edge. Fit the cover so that the electrodes are in contact with the wicks (with respect to the anodic and cathodic poles). Proceed with the isoelectric focusing by applying the electrical parameters described in the individual monograph. Switch off the current when the migration of the mixture of standard proteins has stabilized. Using forceps, remove the sample application strips and the two electrode wicks. Immerse the gel in *Fixing Solution for Isoelectric Focusing Polyacrylamide Gel*. Incubate with gentle shaking at room temperature for 30 minutes. Drain off the solution, and add 200 mL of *Destaining Solution*. Incubate with shaking for 1 hour. Drain the gel, add *Coomassie Staining Solution*. Incubate for 30 minutes. Destain the gel by passive diffusion with *Destaining Solution* until the bands are well visualized against a clear background. Locate the position and intensity of the bands in the electropherogram as prescribed in the individual monograph.

Alternative Procedure—When a monograph references the general method for isoelectric focusing above, variations in methodology or procedure may be used, subject to validation. These variations include the use of commercially available pre-cast gels; the use of immobilized pH gradients; the use of rod gels; and the use of cassettes of different dimensions, including ultra-thin (0.2 mm) gels; the variations in the sample application procedure, including different sample volumes or the use of sample application masks or wicks other than paper; the use of alternate running conditions, including variations in the electric field depending on gel dimensions and equipment, and the use of fixed migration times rather than subjective interpretation of band stability; the inclusion of a pre-focusing step; the use of automated instrumentation; and the use of agarose gels.

Validation of Procedure

Where alternative methods to the general method are employed, they must be validated. The following criteria may be used to validate the separation: the formation of a stable pH gradient of desired characteristics, evaluated using colored pH markers of known isoelectric points; the comparison with electropherogram provided with the chemical reference substance for the preparation to be examined; and any other validation criteria as prescribed in the individual monograph.

Specified Variations to the General Method

Variations to the general method required for the analysis of specific substances may be specified in detail in individual monographs. Variations may include the addition of urea in the running gel (3 M concentration is often satisfactory to keep protein in solution but up to 8 M can be used). Some proteins precipitate at their isoelectric point. In this case, urea is included in the gel formulation to keep the protein in solution. If urea is used, only fresh solutions should be used to prevent carbamylation of the protein. Other variations include the use of alternative staining methods and the use of gel additives such as nonionic detergents (e.g., octylglucoside) or zwitterionic detergents (e.g., CHAPS or CHAPSO) to prevent proteins from aggregating or precipitating.

NOTE—The following are general precautionary items that can be used to improve the method. Samples can be applied to any area on the gel, but in general, they should be applied to areas where they are expected to focus. To protect the proteins from extreme pH environments, samples should not be applied close to either electrode. During method development, the analyst can try applying the protein in three positions on the gel (i.e., middle and both ends); the pattern of a protein applied at opposite ends of the gel may not be identical. A phenomenon known as cathodic drift, where the pH gradient decays over time, may occur if a gel is focused too long. Although not well understood, electroendoosmosis and absorption of carbon dioxide may be factors that lead to cathodic drift. Cathodic drift is observed as focused protein migrating off the cathode end of the gel. Immobilized pH gradients may be used to address this problem. Efficient cooling (approximately 4°) of the bed that the gel lies on during focusing is important. High field strengths used during isoelectric focusing can lead to overheating and affect the quality of the focused gel.

PEPTIDE MAPPING

Purpose and Scope

Peptide mapping is an identity test for proteins, especially those obtained by r-DNA technology. It involves the chemical or enzymatic treatment of a protein resulting in the formation of peptide fragments followed by separation and identification of the resultant fragments in

a reproducible manner. It is a powerful test that is capable of identifying single amino acid changes resulting from events such as errors in the reading of complementary DNA (cDNA) sequences or point mutations. Peptide mapping is a comparative procedure because the information obtained, compared to a reference standard or reference material similarly treated, confirms the primary structure of the protein, is capable of detecting whether alterations in structure have occurred, and demonstrates process consistency and genetic stability. Each protein presents unique characteristics which must be well understood so that the scientific and analytical approaches permit validated development of a peptide map that provides sufficient specificity.

This section provides detailed assistance in the application of peptide mapping and its validation to characterize the desired protein product, to evaluate the stability of the expression construct of cells used for recombinant DNA products, to evaluate the consistency of the overall process, and to assess product stability, as well as to ensure the identity of the protein product, or to detect the presence of protein variant. The validation scheme presented differentiates between qualification of the method at an early stage in the regulatory process, Investigational New Drug (IND) level, and full validation in support of New Drug Application (NDA), Product License Application (PLA), or Marketing Authorization Application (MAA). The validation concepts described are consistent with the general information chapter *Validation of Compendial Methods* ⟨1225⟩ and with the International Conference on Harmonization (ICH) document on *Analytical Methods Validation*.

The Peptide Map

Peptide mapping is not a general method, but involves developing specific maps for each unique protein. Although the technology is evolving rapidly, there are certain methods that are generally accepted. Variations of these methods will be indicated, when appropriate, in specific monographs.

A peptide map may be viewed as a fingerprint of a protein and is the end product of several chemical processes that provide a comprehensive understanding of the protein being analyzed. Four major steps are necessary for the development of the procedure: isolation and purification of the protein, if the protein is part of a formulation; selective cleavage of the peptide bonds; chromatographic separation of the peptides; and analysis and identification of the peptides. A test sample is digested and assayed in parallel with a reference standard or reference material. Complete cleavage is more likely to occur when enzymes such as endoproteases (e.g., trypsin) are used instead of chemical cleavage reagents. A map should contain enough peptides to be meaningful. On the other hand, if there are too many fragments, the map might lose its specificity because many proteins will then have the same profiles.

ISOLATION AND PURIFICATION

Isolation and purification are necessary for analysis of bulk drugs or dosage forms containing interfering excipients and carrier proteins and, when required, will be specified in the monograph. Quantitative recovery of protein from the dosage form should be validated.

SELECTIVE CLEAVAGE OF PEPTIDE BONDS

The selection of the approach used for the cleavage of peptide bonds will depend on the protein under test. This selection process involves determination of the type of cleavage to be employed—enzymatic or chemical—and the type of cleavage agent within the chosen category. Several cleavage agents and their specificity are shown in *Table 1*. This list is not all-inclusive and will be expanded as other cleavage agents are identified.

Table 1. Examples of Cleaving Agents

Type	Agent	Specificity
Enzymatic	Trypsin (EC 3.4.21.4)	*C* terminal side of Arg and Lys
	Chymotrypsin (EC 3.4.21.1)	*C* terminal side of hydrophobic residues (e.g., Leu, Met, Ala, aromatics)
	Pepsin (EC 3.4.23.1)	Nonspecific digest
	Lysyl endopeptidase (Lys-C Endopeptidase) (EC 3.4.21.50)	*C* terminal side of Lys
	Glutamyl endopeptidase (from *S. aureus* strain V8) (EC 3.4.21.19)	*C* terminal side of Glu and Asp
	Peptidyl-Asp metaplo-endopeptidase (Endoproteinase Asp-N) (EC 3.4.24.33)	*N* terminal side of Asp
	(Clostripain) (EC 3.4.28.8)	*C* terminal side of Arg
Chemical	Cyanogen bromide	*C* terminal side of Met
	2-Nitro-5-thio-cyano- benzoic acid	*N* terminal side of Cys
	O-Iodosobenzoic acid	*C* terminal side of Trp and Tyr
	Dilute acid	Asp and Pro
	BNPS-skatole	Trp

Pretreatment of Sample—Depending on the size or the configuration of the protein, different approaches in the pretreatment of samples can be used. For monoclonal antibodies, the heavy and light chains will need to be separated before mapping. If trypsin is used as a cleavage agent for proteins with a molecular mass greater than 100,000 Da, lysine residues must be protected by citraconylation or maleylation; otherwise, too many peptides will be generated.

Pretreatment of the Cleavage Agent—Pretreatment of cleavage agents—especially enzymatic agents—might be necessary for purification purposes to ensure reproducibility of the map. For example, trypsin used as a cleavage agent will have to be treated with tosyl-L-phenylalanine chloromethyl ketone to inactivate chymotrypsin. Other methods, such as purification of trypsin by HPLC or immobilization of enzyme on a gel support, have been successfully used when only a small amount of protein is available.

Pretreatment of the Protein—Under certain conditions, it might be necessary to concentrate the sample or to separate the protein from added substances and stabilizers used in the formulation of the product, if these interfere with the mapping procedure. Physical procedures used for pretreatment can include ultrafiltration, column chromatography, and lyophilization.

Other pretreatments, such as the addition of chaotropic agents (e.g., urea), can be used to unfold the protein prior to mapping. To allow the enzyme to have full access to cleavage sites and permit some unfolding of the protein, it is often necessary to reduce and alkylate the disulfide bonds prior to digestion.

Digestion with trypsin can introduce ambiguities in the tryptic map due to side reactions occurring during the digestion reaction, such as nonspecific cleavage, deamidation, disulfide isomerization, oxidation of methionine residues, or formation of pyroglutamic groups created

In-Process Revision

from the deamidation of glutamine at the *N* terminal side of a peptide. Furthermore, peaks may be produced by autohydrolysis of trypsin. Their intensities depend on the ratio of trypsin to protein. To avoid autohydrolysis, solutions of proteases may be prepared at a pH that is not optimal (e.g., at pH 5 for trypsin), which would mean that the enzyme would not become active until diluted with the digest buffer.

Establishment of Optimal Digestion Conditions— Factors that affect the completeness and effectiveness of digestion of proteins are those that could affect any chemical or enzymatic reactions.

pH— The pH of the digestion mixture is empirically determined to ensure the optimization of the performance of the given cleavage agent. For example, when using cyanogen bromide as a cleavage agent, a highly acidic environment (e.g., pH 2, formic acid) is necessary; however, when using trypsin as a cleavage agent, a slightly alkaline environment (pH 8) is optimal. As a general rule, the pH of the reaction milieu should not alter the chemical integrity of the protein during the digestion and should not change during the course of the fragmentation reaction.

Temperature— A temperature between 25° and 37° is adequate for most digestions. The temperature used is intended to minimize chemical side reactions. The type of protein under test will dictate the temperature of the reaction milieu, because some proteins are more susceptible to denaturation as the temperature of the reaction increases. For example, digestion of recombinant bovine somatropin is conducted at 4°, because at higher temperatures it will precipitate during digestion.

Time— If a sufficient amount of sample is available, a time course study is considered in order to determine the optimum time to obtain a reproducible map and avoid incomplete digestion. Time of digestion varies from 2 to 30 hours. The reaction is stopped by the addition of an acid that does not interfere in the tryptic map, or by freezing.

Amount of Cleavage Agent— Although excessive amounts of cleavage agent are used to accomplish a reasonably rapid digestion time (i.e., 6 to 20 hours), the amount of cleavage agent is minimized to avoid its contribution to the chromatographic map pattern. A protein to protease ratio between 20 : 1 and 200 : 1 is generally used. It is recommended that the cleavage agent can be added in two or more stages to optimize cleavage. Nonetheless, the final reaction volume remains small enough to facilitate the next step in peptide mapping—the separation step. To sort out digestion artifacts that might be interfering with the subsequent analysis, a blank determination is performed, using a digestion control with all the reagents, except the test protein.

CHROMATOGRAPHIC SEPARATION

Many techniques are used to separate peptides for mapping. The selection of a technique depends on the protein being mapped. Techniques that have been successfully used for separation of peptides are shown in *Table 2*.

Table 2. Techniques Used for the Separation of Peptides

Reverse-Phase High-Performance Liquid Chromatography (RP-HPLC)
Ion-Exchange Chromatography (IEC)
Hydrophobic Interaction Chromatography (HIC)
Polyacrylamide-Gel Electrophoresis (PAGE), nondenaturating
Sodium Dodecyl Sulfate-Polyacrylamide Gel Electrophoresis (SDS-PAGE)
Capillary Electrophoresis (CE)
Paper Chromatography
High-Voltage Paper Electrophoresis (HVPE)

In this section, a most widely used reverse-phase HPLC (RP-HPLC) method is described as one of the procedures of chromatographic separation.

The purity of solvents and mobile phases is a critical factor in HPLC separation. HPLC-grade solvents and water that are commercially available are recommended for RP-HPLC. Dissolved gases present a problem in gradient systems where the solubility of the gas in a solvent may be less in a mixture than in a single solvent. Vacuum degassing and agitation by sonication are often used as useful degassing procedures. The solid particles in the solvents are drawn into the HPLC system, they can damage the sealing of pump valves or clog the top of the chromatographic column. Both pre- and post-pump filtration is also recommended.

Chromatographic Column— The selection of a chromatographic column is empirically determined for each protein. Columns with 100Å or 300Å pore size with silica support can give optimal separation. For smaller peptides, octylsilane chemically bonded to totally porous silica articles, 3 to 10 µm in diameter (L7) and octadecylsilane chemically bonded to porous silica or ceramic microparticles, 3 to 10 µm in diameter (L1) column packings are more efficient than the butyl silane chemically bonded to totally porous silica particles, 5 to 10 µm in diameter (L26) packing.

Solvent— The most commonly used solvent is water with acetonitrile as the organic modifier to which less than 0.1% of trifluoroacetic acid is added. If necessary, add isopropyl alcohol or *n*-propyl alcohol to solubilize the digest components, provided that the addition does not unduly increase the viscosity of the components.

Mobile Phase— Buffered mobile phases containing phosphate are used to provide some flexibility in the selection of pH conditions, since shifts of pH in the 3.0 to 5.0 range enhance the separation of peptides containing acidic residues (e.g., glutamic and aspartic acids). Sodium or potassium phosphates, ammonium acetate, phosphoric acid, and a pH between 2 and 7 (or higher for polymer based supports) have also been used with acetonitrile gradients. Acetonitrile containing trifluoroacetic acid is also used quite often.

Gradient Selection— Gradients can be linear, nonlinear, or include step functions. A shallow gradient is recommended in order to separate complex mixtures. Gradients are optimized to provide clear resolution of one or two peaks that will become "marker" peaks for the test.

Isocratic Selection— Isocratic HPLC systems using a single mobile phase are used on the basis of their convenience of use and improved detector responses. Optimal composition of a mobile phase to obtain clear resolution of each peak is sometimes difficult to establish. Mobile phases for which slight changes in component ratios or in pH significantly affect retention times of peaks in peptide maps should not be used in isocratic HPLC systems.

Other Parameters— Temperature control of the column is usually necessary to achieve good reproducibility. The flow rates for the mobile phases range from 0.1 to 2.0 mL per minute, and the detection of peptides is performed with a UV detector at 200 to 230 nm. Other methods of detection have been used (e.g., postcolumn derivatization), but they are not as robust or as versatile as UV detection.

System Suitability— The section *System Suitability* under *Chromatography* ⟨621⟩ provides an experimental means for measuring the overall performance of the test method. The acceptance criteria for system suitability depend on the identification of critical test parameters that affect data interpretation and acceptance. These critical parameters are also criteria that monitor peptide digestion and peptide analysis. An indicator that the desired digestion endpoint was achieved is the comparison with a reference standard or reference material, which is treated exactly as the article under test. The use of a USP Reference Standard in parallel with the protein under test is critical in the development and establishment of system suitability limits. In addition, a specimen chromatogram should be included with the USP Reference Standard or reference material for comparison purposes. Other indicators may include visual inspection of protein or peptide solubility, the absence of intact protein, or measurement of responses of a digestion dependent peptide. The critical system suitability parameters for peptide analysis will depend on the particular mode of peptide separation and detection, and on the data analysis requirements.

When peptide mapping is used as an identification test, the system suitability requirements for the identified peptides covers selectivity and precision. In this case, as well as when identification of variant proteins is done, the identification of the primary structure of the peptide fragments in the peptide map provides both a verification of the known primary structure and the identification of protein variants by comparison with the peptide map of the USP Reference Standard or reference material for the specified protein. The use of a digested USP Reference Standard or reference material for a given protein in the determination of peptide resolution is the method of choice. For an analysis of a variant protein, a characterized mixture of a variant

In-Process Revision

and a reference standard can be used, especially if the variant peptide is located in a less resolved region of the map. The index of pattern consistency can be simply the number of major peptides detected. Peptide pattern consistency can be best defined by the resolution of peptide peaks. Chromatographic parameters—such as peak to peak resolution, maximum peak width, peak tailing factors, and column efficiency—may be used to define peptide resolution. Depending on the protein under test and the method of separation used, single peptide or multiple peptide resolution requirements may be necessary.

The replicate analysis of the digest of the USP Reference Standard or reference material for the protein under test yields measures of precision and quantitative recovery. Recovery of the identified peptides is generally ascertained by the use of internal or external peptide standards. The precision is expressed as the relative standard deviation (RSD). Differences in the recovery and precision of the identified peptides are expected; therefore, the system suitability limits will have to be established for both the recovery and the precision of the identified peptides. These limits are unique for a given protein and will be specified in the individual monograph.

Visual comparison of the relative retention times, the peak responses, the number of peaks, and the overall elution pattern is completed initially. It is then complemented and supported by mathematical analysis of the peak response ratios and by the chromatographic profile of a 1 : 1 (v/v) mixture of sample and USP Reference Standard or reference material digest. If all peaks in the sample digest and in the USP Reference Standard or reference material digest have the same relative retention times and peak response ratios, then the identity of the sample under test is confirmed.

If peaks that initially eluted with significantly different relative retention times are then observed as single peaks in the 1 : 1 mixture, the initial difference would be an indication of system variability. However, if separate peaks are observed in the 1 : 1 mixture, this would be evidence of the nonequivalence of the peptides in each peak. If a peak in the 1 : 1 mixture is significantly broader than the corresponding peak in the sample and USP Reference Standard or reference material digest, it may indicate the presence of different peptides. The use of computer-aided pattern recognition software for the analysis of peptide mapping data has been proposed and applied, but issues related to the validation of the computer software preclude its use in a compendial test in the near future. Other automated approaches have been used that employ mathematical formulas, models, and pattern recognition. Such approaches, for example, the automated identification of compounds by IR spectroscopy and the application of diode-array UV spectral analysis for identification of peptides, have been proposed. These methods have limitations due to inadequate resolutions, co-elution of fragments, or absolute peak response differences between USP Reference Standard or reference material and sample fragments.

The numerical comparison of the retention times and peak areas or peak heights can be done for a selected group of relevant peaks that have been correctly identified in the peptide maps. Peak areas can be calculated using one peak showing relatively small variation as an internal reference, keeping in mind that peak area integration is sensitive to baseline variation and likely to introduce error in the analysis. Alternatively, the percentage of each peptide peak height relative to the sum of all peak heights can be calculated for the sample under test. The percentage is then compared to that of the corresponding peak of the USP Reference Standard or reference material. The possibility of autohydrolysis of trypsin is monitored by producing a blank peptide map that is the peptide map obtained when a blank solution is treated with trypsin.

The minimum requirement for the qualification of peptide mapping is an approved test procedure that includes system suitability as a test control. In general, for an IND, qualification of peptide mapping for a protein is sufficient. As the regulatory approval process for the protein progresses, additional qualifications of the test can include a partial validation of the analytical procedure to provide assurance that the method will perform as intended in the development of a peptide map for the specified protein.

ANALYSIS AND IDENTIFICATION OF PEPTIDES

This section gives guidance on the use of peptide mapping during development in support of regulatory applications.

The use of a peptide map as a qualitative tool does not require the complete characterization of the individual peptide peaks. However, validation of peptide mapping in support of regulatory applications requires rigorous characterization of each of the individual peaks in the peptide map. Methods to characterize peaks range from *N* terminal sequencing of each peak followed by amino acid analysis to the use of mass spectroscopy (MS).

For characterization purposes, when *N* terminal sequencing and amino acids analysis are used, the analytical separation is scaled up. Since scale-up might affect the resolution of peptide peaks, it is necessary, using empirical data, to assure that there is no loss of resolution due to scale up. Eluates corresponding to specific peptide peaks are collected, vacuum concentrated, and chromatographed again, if necessary. Amino acid analysis of fragments may be limited by the peptide size. If the *N* terminus is blocked, it may need to be cleared before sequencing. *C* terminal sequencing of proteins in combination with carboxypeptidase and MALDITOF MS can also be used for characterization purposes.

The use of MS for characterization of peptide fragments is by direct infusion of isolated peptides or by the use of on-line LC-MS for structure analysis. In general, it includes electrospray and matrix-assisted laser desorption ionization coupled to time of flight analyzer (MALDITOF) as well as fast atom bombardment (FAB). Tandem MS has also been used to sequence a modified protein and to determine the type of amino acid modification that has occurred. The comparison of mass spectra of the digests before and after reduction provides a method to assign the disulfide bonds to the various sulfhydryl containing peptides.

If regions of the primary structure are not clearly demonstrated by the peptide map, it might be necessary to develop a secondary peptide map. The goal of a validated method of characterization of a protein through peptide mapping is to reconcile and account for at least 95% of the theoretical composition of the protein structure.

The Use of Peptide Mapping for Genetic Stability Evaluation

A validated peptide map can be used to assess the integrity of the predicted primary sequence of a protein product (i.e., its genetic stability). It can also be used to determine lot-to-lot consistency of the biotechnology-derived product process. Furthermore, the performance of the protein expression of the production system is best assessed by peptide mapping of the expressed protein. Peptide maps of protein produced at various times of the protein expression process, including a point well beyond the normal protein expression time, compared with those of a USP Reference Standard or reference material, will evaluate the genetic stability of the expression system as a function of time.

Variant protein sequences can arise from a genetic variation at the DNA level (point mutation) or as an error in the translation process. A validated peptide map is the best approach to the detection of protein variants. However, the limitations of the peptide mapping itself must be taken into consideration. The detection of a structured variant is possible only if the corresponding peptide variant is easily isolated and characterized. To establish genetic stability will require the use of a battery of biochemical methods, provided that the variants have properties different from those of the "normal" protein.

Validation

CRITICAL FACTORS

Validation of peptide mapping requires that a protocol be designed, outlining in detail the experiment to be conducted and the criteria for acceptance of the map. Criteria for acceptance of mapping include detection limit, specificity, linearity, range, accuracy, precision, and reagent stability. Reproducibility of the peptide map is a critical element in the utilization of such a map as an identity test and for confirming genetic stability. Those technical aspects of peptide mapping that influence the reproducibility of the map will be discussed.

The setting of limits, with respect to quantification (peak area or height) and identification (retention times) for the selected group of relevant peaks is based on empirical observations. These limits detect significant differences between the sample and USP Reference Standard or reference material within a series of analyses.

Another critical issue is the recovery of peptides and its impact on peak area determination and reproducibility and on the establishment of acceptance criteria. The recovery criteria address all aspects of test methodology, from digestion to chromatographic conditions. Determination of peptide recovery includes quantitative amino acid analysis, spike addition, radiolabeling, and UV summation. An overall recovery of about 80% is considered satisfactory. Recovery of individual peptides is more problematic and is handled on a case-by-case basis. The critical factors considered in the validation of a peptide map are as follows.

Written Test Procedures—These procedures include a detailed description of the analytical method in which reagents, equipment, sample preparation, method of analysis, and analysis of the data are defined.

Validation Protocol—A protocol is prepared that contains a procedure for test validation.

Acceptance Criteria—The criteria can be minimal at the early stages, but need to be better defined as validation studies progress.

Reporting of Results—Results from the validation study are documented with respect to the analytical parameters listed in the validation protocol.

Revalidation of the Test Procedure—If the method used requires alteration that could affect the analytical parameter previously assessed in the validation of the procedure, the test procedure must be revalidated. Significant changes in the processing of the article, in laboratories performing the analysis, in formulation of the bulk or the finished products, and in any other significant parameter will require revalidation of the methods.

REQUIREMENTS

Precision—

Intratest Precision—This is a measure of the reproducibility of peptide mapping. The two critical steps in peptide mapping are fragmentation (i.e., digestion) and separation of peptides. An acceptable precision occurs where the absolute retention times and the relative peak areas are constant from run to run, and the average variation in retention time is small relative to that of a selected internal reference peak. The reproducibility of the map can be enhanced if a temperature-controlled column oven is used, if an extensive equilibration of the system is performed prior to the start of the test, if a blank (control digest mixture without protein) is run first to minimize "first-run effects," and if a USP Reference Standard or a reference material digest is interspersed periodically with test samples to evaluate chromatographic drift.

The criteria for validation of the fragmentation step are similar to those described below for separation of peptides, but they are met for consecutive tests of a series of separately prepared digests of the protein under test.

The criteria for validation of the separation of peptides step include the following:

1. The average standard deviation of the absolute retention times of all major peaks for a set of consecutive tests of the same digest does not exceed a specified acceptance criterion.
2. The average standard deviation of absolute peak area for all fully resolved major peaks does not exceed a specified percentage.

Intertest Precision—This is a measure of the reproducibility of the peptide mapping when the test is performed on different days, by different analysts, in different laboratories, with reagents or enzymes from different suppliers or different lots from the same supplier, with different instruments, on columns of different makes or columns of the same make from different lots, and on individual columns of the same make from the same lot. Although it would be desirable, from a scientific perspective, to validate all of these variables in terms of their impacts on precision, a practical approach is to validate the test using those variables most likely to be encountered under operational conditions. Additional variables can be included when needed.

The experimental design allows the analyst to make comparisons using peak retention times and areas that are expressed relative to a highly reproducible internal reference peak within the same chromatogram. The relative peak area is expressed as the ratio of the peak area to that of the internal reference peak. The relative retention time can be expressed as the difference between the absolute retention time and that of the reference peak. The use of relative values eliminates the need to make separate corrections for differences due to injector-to-injector volumes, units of measure for peak areas, column dimensions, and instrument dead volumes. The variability in the retention times and peak areas for the *Intertest Precision* experiments is expected to be slightly higher than the variability observed for *Intratest Precision*.

Robustness—Factors such as composition of the *Mobile Phase*, protease quality or chemical reagent purity, column variation and age, and digest stability are likely to affect the overall performance of the test and its reproducibility. Tolerances for each of the key parameters are evaluated and baseline limits established in case the test is used for routine lot release purposes.

Mobile Phase—The composition of the *Mobile Phase* is optimized to obtain the maximum resolution of peptides throughout the elution profile. A balance between optimal resolution and overall reproducibility is desired. A lower pH might improve peak separation but might shorten the life of the column, resulting in lack of reproducibility. Peptide maps at a pH above and below the pH of the procedure are compared to the peptide map obtained at the pH of the procedure and checked for significant differences; they are also reviewed with respect to the acceptance criteria established in the validation protocol.

Protease Quality or Chemical Reagent Purity—A sample of the USP Reference Standard or reference material for the protein under test is prepared and digested with different lots of cleavage agent. The chromatograms for each digest are compared in terms of peak areas, shape, and number. The same procedure can be applied to other critical chemicals or pretreatment procedures used during sample preparation, such as reducing and carboxymethylation reagents.

Column Considerations—Column-to-column variability, even within a single lot, can affect the performance of the column in the development of peptide maps. Column size may also lead to significant differences. A USP Reference Standard or reference material of the protein under test is digested and the digest is chromatographed on different lots of column from a single manufacturer. The maps are then evaluated in terms of the overall elution profile, retention times, selectivity resolution, and recovery. To evaluate the overall lifetime of the column in terms of robustness, perform a peptide mapping test on different columns and vary significantly the number of injections (e.g., from 10 injections to 250 injections). The resulting maps can then be compared for significant differences in peak broadening, peak area, and overall resolution. As a column ages, an increase in back pressure might be observed that might affect the peptide maps.

A sensible precaution in the use of peptide mapping columns is to select alternative columns in case the original columns become unavailable or are discontinued. Perform a peptide mapping test using equivalent columns from different manufacturers, and examine the maps. Differences in particle shape and size, pore size and volume, carbon load, and end-capping can lead to significant differences in retention times, elution profile selectivity, resolution, and recovery. Slight modifications in the gradient profile may be required to achieve equivalency of mapping when using columns from different manufacturers. [NOTE—The equivalency between instrumentation used for the validation of the test and for routine quality control testing should be considered. It might be preferable to use the same HPLC system for all applications. Otherwise, equivalency of the systems is determined, which may require some changes in the chromatographic test conditions.]

Digest Stability—The length of time a digest can be kept before it is chromatographed, as well as the conditions under which the digest is stored before chromatography, is assessed. Several aliquots from a single digest are stored at different storage conditions and chromatographed. These maps are then evaluated for significant differences.

Reproducibility—Determination of various parameters indicated above is repeated using the same USP Reference Standard or reference material and test sample in at least two different laboratories by two analysts equipped with similar HPLC systems. The generated peptide maps are evaluated for significant differences.

In-Process Revision

~~POLYACRYLAMIDE GEL ELECTROPHORESIS~~

~~Polyacrylamide gel electrophoresis (PAGE) is used for the qualitative characterization of proteins in biological preparations, for control of purity, and for quantitative determinations. This procedure is limited to the analysis of proteins with a weight range of 14,000 to 100,000 Da. It is possible to extend the weight range of an electrophoresis gel by various techniques (e.g., gradient gels or particular buffer systems), but such techniques will not be discussed in this chapter. Analytical gel electrophoresis is an appropriate method with which to identify and to assess the homogeneity of proteins in drug substances. These methods are routinely used for the estimation of protein subunit molecular weights and for the determination of the subunit compositions of purified proteins.~~

~~Ready-to-use gels and reagents are commercially available and can be used instead of those described in this chapter, provided that they give equivalent results and that they meet the validation requirements.~~

~~General Principle of Electrophoresis~~

~~Under the influence of an electrical field, charged particles migrate in the direction of the electrode bearing the opposite polarity. In gel electrophoresis, the movements of the particles are retarded by interactions with the surrounding gel matrix, which acts as a molecular sieve. The opposing interactions of the electrical force and molecular sieving result in differential migration rates according to sizes, shapes, and charges of particles. Because of their different physicochemical properties, different macromolecules of a mixture will migrate at different speeds during electrophoresis and thus will be separated into discrete fractions. Electrophoretic separations can be conducted in systems without support phases (e.g., free solution separation in capillary electrophoresis) and in stabilizing media, such as thin-layer plates, films, or gels.~~

~~Characteristics of Polyacrylamide Gels for Protein Electrophoresis~~

~~The sieving properties of polyacrylamide gels are established by the three-dimensional network of fibers and pores that is formed as the bifunctional bisacrylamide cross-links adjacent to polyacrylamide chains. Polymerization is catalyzed by a free-radical generating system composed of ammonium persulfate and *N*,*N*,*N*′,*N*′-tetramethylethylenediamine (TEMED).~~

~~As the acrylamide concentration of a gel increases, its effective pore size decreases. The effective pore size of a gel is operationally defined by its sieving properties, that is, by the resistance it imparts to the migration of macromolecules. There are limits to the acrylamide concentrations that can be used. At high acrylamide concentrations, gels break much more easily and are difficult to handle. As the pore size of a gel decreases, the migration rate of a protein through the gel decreases. By adjusting the pore size of a gel, through manipulating the acrylamide concentration, the resolution of the method can be optimized for a given protein product. Thus, a given gel is physically characterized by its respective composition of acrylamide and bisacrylamide.~~

~~In addition to the composition of the gel, the state of the protein is an important component to the electrophoretic mobility. In the case of proteins, the electrophoretic mobility is dependent on the pK value of the charged groups and the size of the molecule. It is influenced by the type, the concentration, and pH of the buffer, by the temperature and the field strength, and by the nature of the support material.~~

~~Denaturation with Sodium Dodecyl Sulfate~~

~~Denaturing PAGE using sodium dodecyl sulfate (SDS) is the most common mode of electrophoresis used in assessing the pharmaceutical quality of protein products. Typically, analytical electrophoresis of proteins is carried out under conditions that ensure dissociation of the proteins into their individual polypeptide subunits and that minimize aggregation of these subunits. The strongly anionic detergent SDS is used in combination with heat to dissociate the proteins before they are loaded on the gel. The denatured polypeptides bind SDS, become negatively charged, and exhibit a consistent charge-to-weight ratio regardless of protein type. Because the amount of SDS bound is almost always proportional to the molecular weight of the polypeptide and is typically independent of its sequence, SDS-polypeptide complexes migrate through polyacrylamide gels in reasonable accordance with the size of the polypeptide.~~

~~The electrophoretic mobilities of the resultant detergent-polypeptide complexes all assume the same functional relationship to the molecular weights of polypeptides. Migration of SDS derivatives is toward the anode in a predictable manner, with low molecular weight complexes migrating faster than larger ones. This means that the molecular weight of a protein can be estimated from its relative mobility in calibrated SDS-PAGE and that a single band in such a gel is a criterion of purity.~~

~~Modifications to the polypeptide backbone, such as *N*- or *O*-linked glycosylation, however, have a significant impact on the apparent molecular weight of a protein. This is due to SDS not binding to a carbohydrate moiety in a manner similar to the polypeptide. Thus, a consistent charge-to-weight ratio is not maintained. The apparent molecular weight of proteins having undergone post-translational modifications is not a true reflection of the weight of the polypeptide chain.~~

~~REDUCING CONDITIONS~~

~~Polypeptide subunits and their three-dimensional structure can be maintained in proteins by the presence of disulfide bonds. A goal of SDS-PAGE analysis under reducing conditions is to disrupt this structure by reducing disulfide bonds. Complete denaturation and dissociation of proteins by treatment with 2-mercaptoethanol or dithiothreitol (DTT) will result in unfolding of the polypeptide backbone and subsequent complexation with SDS. Under these conditions, the molecular weight of the polypeptide subunits can be calculated by linear regression in the presence of suitable molecular weight standards.~~

~~NONREDUCING CONDITIONS~~

~~For some analyses, complete dissociation of protein to peptide subunits is not desirable. In the absence of treatment with reducing agents, disulfide covalent bonds remain intact, preserving the oligomeric form of the protein. Oligomeric SDS-protein complexes migrate more slowly than their SDS-polypeptide subunits. In addition, nonreduced proteins may not be completely saturated with SDS and, hence, may not bind the detergent in a constant weight ratio. This makes molecular weight determinations of these molecules less straightforward than analyses of fully denatured polypeptides, because it is necessary that both standards and unknown proteins be in similar configurations for valid comparisons. However, the staining of a single band in such a gel is a criterion of purity.~~

~~CHARACTERISTICS OF A DISCONTINUOUS BUFFER SYSTEM~~

~~The most popular electrophoretic method for the characterization of a complex mixture of proteins involves the use of a discontinuous buffer system consisting of two contiguous, but distinct, gels: a resolving or separating (lower) gel and a stacking (upper) gel. The two gels are cast with different porosities, pHs, and ionic strengths. In addition, different mobile ions are used in the gel and electrode buffers. The buffer discontinuity concentrates large volumes of sample in the stacking gel, resulting in improved resolution. When power is applied, a voltage drop develops across the sample solution that drives the proteins into the stacking gel. Glycinate ions from the electrode buffer follow the proteins into the stacking gel. A moving boundary region is rapidly formed with the highly mobile chloride ions in the front and the relatively slow glycinate ions in the rear. A localized~~

high-voltage gradient forms between the leading and trailing ion fronts, causing the SDS-protein complexes to form into a thin zone (stack) and migrate between the chloride and glycinate phases. Within a broad limit, regardless of the height of the applied sample, all SDS-proteins condense into a very narrow region and enter the resolving gel as a well-defined, thin zone of high protein density. The large-pore stacking gel does not retard the migration of most proteins and serves mainly as an anticonvective medium. At the interface between the stacking and resolving gels, the proteins experience a sharp retardation due to the restrictive pore size of the resolving gel. Once in the resolving gel, proteins continue to be slowed by the sieving of the matrix. The glycinate ions overtake the proteins, which then move in a space of uniform pH formed by the TRIS and glycine. Molecular sieving causes the SDS-polypeptide complexes to separate on the basis of their molecular weights.

PREPARATION OF GELS

In a discontinuous buffer SDS-polyacrylamide gel, it is important to pour the resolving gel, let the gel set, and then pour the stacking gel because the composition of acrylamide-bisacrylamide, buffer, and pH are different.

Gel Stock Solutions—

30% Acrylamide-Bisacrylamide Solution—Prepare a solution containing 290 g of acrylamide and 10 g of methylene bisacrylamide per L of warm water, and filter. [NOTE—Acrylamide and methylene bisacrylamide are slowly converted during storage to acrylic acid and bisacrylic acid, respectively. This deamidation reaction is catalyzed by light and alkali. The pH of the solution must be 7.0 or lower. Store the solution in dark bottles at room temperature. Fresh solutions are prepared every month.]

Ammonium Persulfate Solution—Prepare a small quantity of solution having a concentration of 100 g of ammonium persulfate per L, and store at 4°. [NOTE—Ammonium persulfate provides the free radicals that drive polymerization of acrylamide and bisacrylamide. Ammonium persulfate decomposes slowly; therefore, prepare fresh solutions weekly.]

TEMED—Use an electrophoresis-grade reagent. [NOTE—*TEMED* accelerates the polymerization of acrylamide and bisacrylamide by catalyzing the formation of free radicals from ammonium persulfate. Because *TEMED* works only as a free base, polymerization is inhibited at low pH.]

SDS Solution—Use an electrophoresis-grade reagent. Prepare a solution having a concentration of about 100 g of SDS per L, and store at room temperature.

1.5 M Buffer Solution—Transfer about 90.8 g of tris(hydroxymethyl)aminomethane (TRIS) to a 500-mL flask, dissolve in 400 mL of water, adjust with hydrochloric acid to a pH of 8.8, dilute with water to volume, and mix.

1 M Buffer Solution—Transfer about 60.6 g of TRIS to a 500-mL flask, add 400 mL of water, adjust with hydrochloric acid to a pH of 6.8, dilute with water to volume, and mix.

Plate Preparation—Clean two glass plates (10 cm × 8 cm), the polytef comb, the two spacers, and the silicone rubber tubing (0.6 mm × 35 cm) with mild detergent, rinse thoroughly with water, and blot dry.

Lubricate the spacers and the tubing with nonsilicone grease. Apply the spacers along each of the two short sides of the glass plate 2 mm away from the edges and 2 mm away from the long side corresponding to the bottom of the gel.

Begin to lay the tubing on the glass plate by using one spacer as a guide. Carefully twist the tubing at the bottom of the spacer, and follow the long side of the glass plate. While holding the tubing with one finger along the long side, twist the tubing again, and lay it on the second short side of the glass plate, using the spacer as a guide.

Place the second glass plate in perfect alignment, and hold the mold together by hand pressure. Apply two clamps on each of the two short sides of the mold. Carefully apply four clamps on the longer side of the gel mold, thus forming the bottom of the gel mold. Verify that the tubing is running along the edge of the glass plates and has not been extruded while placing the clamps. The gel mold is now ready for pouring the gel.

Resolving Gel—In a conical flask, prepare the appropriate volume of solution containing the desired concentration of acrylamide as directed in *Table 3*. Mix the components in the order shown. Before adding the *Ammonium Persulfate Solution* and the *TEMED*, pour the solution in a disposable filtration unit equipped with a nitrocellulose filter having a 0.45-µm porosity, and apply vacuum. Allow the solution to degas by swirling the filtration unit, and disconnect the vacuum when no more bubbles are formed in the solution. Add appropriate amounts of *Ammonium Persulfate Solution* and *TEMED*, as directed in *Table 3*, swirl, and pour immediately into the gap between the two glass plates of the mold. Leave sufficient space for the stacking gel (the length of the teeth of the comb plus 1 cm). Using a pipet, carefully overlay the solution with water-saturated isobutyl alcohol. Leave the gel in a vertical position at room temperature for polymerization.

15% Acrylamide								
Water	1.1	2.3	3.4	4.6	5.7	6.9	9.2	11.5
30% Acrylamide-Bisacrylamide Solution	2.5	5.0	7.5	10.0	12.5	15.0	20.0	25.0
1.5 M Buffer Solution	1.3	2.5	3.8	5.0	6.3	7.5	10.0	12.5
SDS Solution	0.05	0.1	0.15	0.2	0.25	0.3	0.4	0.5
Ammonium Persulfate Solution	0.05	0.1	0.15	0.2	0.25	0.3	0.4	0.5
TEMED	0.002	0.004	0.006	0.008	0.01	0.012	0.016	0.02

After polymerization is complete (about 30 minutes later), pour off the overlay, and wash the top of the gel several times with water to remove the isobutyl alcohol overlay and any unpolymerized acrylamide. Drain as much fluid as possible from the top of the gel, and then remove any remaining water with the edge of a paper towel.

Stacking Gel—In a conical flask, prepare the appropriate volume of solution containing the desired concentration of acrylamide, as directed in *Table 4*. Mix the components in the order shown. Before adding the *Ammonium Persulfate Solution* and the *TEMED*, pour the solution into a disposable filtration unit equipped with a nitrocellulose filter having a 0.45 µm porosity, and apply vacuum. Allow the solution to degas by swirling the filtration unit, and disconnect the vacuum when no more bubbles are formed in the solution. Add appropriate amounts of *Ammonium Persulfate Solution* and *TEMED* as directed in *Table 4*, swirl, and pour immediately into the gap between the two glass plates of the mold directly onto the surface of the polymerized Resolving Gel. Immediately insert a clean polytef comb into the stacking gel solution, being careful to avoid trapping air bubbles. Add more stacking gel solution to fill the spaces of the comb completely. Leave the gel in a vertical position, and allow to polymerize at room temperature. After polymerization is complete (about 30 minutes later), carefully remove the polytef comb, and proceed as directed below.

Table 4. Preparation of Stacking Gel

Solution Components	Component Volumes (mL) per Gel Mold Volume Below

ELECTROPHORETIC SEPARATION

Sample Buffer 1—Dissolve 1.89 g of TRIS, 5.0 g of SDS, 50 mg bromophenol blue, and 25.0 mL glycerol in 100 mL of water. Adjust with hydrochloric acid to a pH of 6.8, and dilute with water to 125 mL. Before use, dilute with an equal volume of water or sample, and mix.

Sample Buffer 2 (for reducing conditions)—Prepare as directed under *Sample Buffer 1* except to add 12.5 mL of 2-mercaptoethanol before adjusting the pH. Alternatively, prepare as directed for *Sample Buffer 1* except to start with about 1.93 g of TRIS and add a suitable quantity of DTT to obtain a final 100 µM DTT concentration.

Running Buffer—Dissolve 151.4 g of TRIS, 721.0 g of aminoacetic acid, and 50.0 g of SDS in water, dilute with water to 5000 mL, and mix to obtain a stock solution. Immediately before use, dilute this stock solution with water to 10 times its volume, mix, and adjust to a pH between 8.1 and 8.8.

Procedure—Rinse the wells immediately with water or with the *Running Buffer* to remove any unpolymerized acrylamide. (If necessary, straighten the teeth of the *Stacking Gel* with a blunt hypodermic needle attached to a syringe.) Remove the clamps on one short side, carefully pull out the tubing, and replace the clamps. Proceed similarly on the other short side. Remove the tubing from the bottom part of the gel.

Mount the completed gel in the electrophoresis apparatus. Add the electrophoresis buffers to the top and bottom reservoirs. Remove any bubbles that become trapped at the bottom of the gel between the glass plates. [NOTES—This is best done with a bent hypodermic needle attached to a syringe. Never pre-run the gel before loading the samples, because this will destroy the discontinuity of the buffer systems. Before loading the sample, carefully rinse the slot with *Running Buffer*.]

Prepare the test and standard solutions in the recommended *Sample Buffer*, and treat as directed in the individual monograph. Apply the appropriate volume of each solution to the *Stacking Gel* wells.

Start the electrophoresis using the conditions recommended by the manufacturer of the equipment. Electrophoresis running time and current or voltage may need to be varied in order to achieve optimum separation. Check that the dye front is moving into the resolving gel. When the dye has reached the bottom of the gel, stop the electrophoresis. Remove the gel assembly from the apparatus, and separate the glass plates. Remove the spacers, cut off and discard the *Stacking Gel,* and immediately proceed with staining.

DETECTION OF PROTEINS IN GELS

Coomassie staining is the most common protein staining method with a detection level in the order of 1 to 10 µg of protein per band. Silver staining is the most sensitive method for staining proteins in gels, as a band containing 10 to 100 ng can be detected, but the method is more cumbersome and less rugged. All of the steps in gel staining are performed at room temperature with gentle agitation (e.g., on a rocking platform shaker, or equivalent). Gloves must be worn when staining the gels to prevent fingerprint residue staining.

Reagents—

Coomassie Staining Solution—Prepare a solution of Coomassie brilliant blue R-250 having a concentration of 1.25 g per L in a mixture of water, methanol, and glacial acetic acid (5 : 4 : 1). Filter, and store at room temperature.

Destaining Solution—Prepare a mixture of water, methanol, and glacial acetic acid (5 : 4 : 1).

Fixing Solution 1—Prepare a mixture of water, methanol, and trichloroacetic acid (5 : 4 : 1).

Fixing Solution 2—Transfer 250 mL of methanol to a 500-mL volumetric flask, add 0.27 mL of formaldehyde, dilute with water to volume, and mix.

Silver Nitrate Reagent—To a mixture of 40 mL of 1 M sodium hydroxide and 3 mL of ammonium hydroxide, add, dropwise, 8 mL of a 200 g per L solution of silver nitrate with stirring; dilute to 200 mL with water, and mix.

Developing Solution—Transfer 2.5 mL of a citric acid solution (2 in 100) and 0.27 mL of formaldehyde to a 500.0-mL volumetric flask, dilute with water to volume, and mix.

Stopping Solution—Prepare a 10% (v/v) solution of acetic acid.

Coomassie Staining—Immerse the gel in an excess of *Coomassie Staining Solution,* and incubate for at least 1 hour. Remove the *Coomassie Staining Solution.* Destain the gel with an excess of *Destaining Solution.* Change the *Destaining Solution* several times, until the stained protein bands are clearly distinguishable on a clear background. The more thoroughly the gel is destained, the smaller the amount of protein that can be detected. Destaining can be accelerated by including a few g of anion-exchange resin or a small sponge in the *Destaining Solution.* [NOTE—The acid-alcohol solutions used in this procedure do not completely fix proteins in the gel. This can lead to losses of some low-molecular-weight proteins during the staining and destaining of thin gels. Permanent fixation is obtainable by incubating the gel in *Fixing Solution 1* for 1 hour before it is immersed in the *Coomassie Staining Solution.*]

Silver Staining—Immerse the gel in an excess of *Fixing Solution 2,* and incubate for 1 hour. Remove *Fixing Solution 2,* add fresh *Fixing Solution 2,* and incubate for at least 1 hour, or overnight if convenient. Discard *Fixing Solution 2,* and wash the gel in an excess of water for 1 hour. Soak the gel for 15 minutes in a 1% solution of glutaraldehyde (v/v). Wash the gel twice, for 15 minutes each time, with an excess of water. Soak the gel in fresh *Silver Nitrate Reagent* for 15 minutes, in darkness. Wash the gel three times, for 5 minutes each time, with an excess of water. Immerse the gel for about 1 minute in *Developing Solution* until satisfactory staining has been obtained. Stop the development by incubation in the *Stopping Solution* for 15 minutes, then rinse the gel with water, and proceed with drying as indicated below.

DRYING OF GELS

For Coomassie staining, after the destaining step, incubate the gel in a glycerol solution (1 in 10) for at least 2 hours. For silver staining, add to the final rinsing step a 5-minute incubation in a glycerol solution (1 in 50).

Immerse two sheets of porous cellophane in water, and incubate for 5 to 10 minutes. Place one of the sheets on a drying frame. Carefully lift the gel and place it on the cellophane sheet. Remove any trapped air bubbles, and pour a few mL of water around the edges of the gel. Place the second sheet on top, and remove any trapped air bubbles. Complete the assembly of the drying frame. Place in a drying oven, leave at room temperature until dry, or use a commercial gel dryer.

MOLECULAR WEIGHT DETERMINATION

Molecular weights of proteins are determined by comparison of their mobilities with those of several marker proteins of known molecular weight. Mixtures of proteins with precisely known molecular weights blended for uniform staining are available for calibrating gels. They are available in various molecular weight ranges. Concentrated stock solutions of proteins of known molecular weight are diluted in a sample buffer and loaded on the same gel as the protein sample to be tested.

Immediately after the gel has been run, the position of the bromophenol blue tracking dye is marked to identify the leading edge of the electrophoretic ion front. This can be done by cutting notches in the edges of the gel or by inserting a needle soaked in india ink into the gel at the dye front. After staining, measure the migration distances of each protein band (markers and unknowns) from the top of the *Resolving Gel.* Divide the migration distance of each protein by the distance traveled by the tracking dye. The normalized migration distances so obtained are called the relative mobilities of the proteins (relative to the dye front) and conventionally denoted as R_m. Construct a (semilogarithmic) plot of the logarithm of the molecular weights (M_w) of the protein standards as functions of the R_m values. [NOTE—The graphs are slightly sigmoid.] From the graph so obtained, estimate the unknown molecular weights by linear regression analysis or interpolation, as long as unknown samples are positioned along the linear part of the graph.

If the proteins of the molecular weight marker are not distributed along 80% of the length of the gel and over the required separation range (i.e., the range covering the product and its dimer or the products and its related impurities), and the separation obtained for the relevant protein bands does not show a linear relationship between the logarithm of the molecular weight and the R_m, then the test is not valid.

QUANTIFICATION OF IMPURITIES

Where the impurity limit is specified in the individual monograph, a reference solution corresponding to that level of impurity is prepared by diluting the test solution. For example, where the limit is 5.0%, a reference solution is a 1 in 20 dilution of the test solution. No impurity—any band other than the main band—in the electropherogram obtained from the test solution is more intense than the main band obtained with the reference solution.

Under validated conditions and when using the Coomassie staining procedure, impurities may be quantified by normalization to the main band using an integrating densitometer. In this case, the responses must be validated for linearity.

TOTAL PROTEIN ASSAY

The following procedures are provided as illustrations of the determination of total protein content in pharmacopeial preparations. Other techniques, such as HPLC, are also acceptable if total protein recovery is demonstrated. Many of the total protein assay methods described below can be performed successfully using kits from commercial sources. [NOTE—Where water is required, use distilled water.]

In-Process Revision

Method 1

Protein in solution absorbs UV light at a wavelength of 280 nm, due to the presence of aromatic amino acids, mainly tyrosine and tryptophan. This property is the basis of this method. Protein determination at 280 nm is mainly a function of the tyrosine and tryptophan content of the protein. If the buffer used to dissolve the protein has a high absorbance relative to that of water, there is an interfering substance in the buffer. This interference can be compensated for when the spectrophotometer is adjusted to zero buffer absorbance. If the interference results in a large absorbance that challenges the limit of sensitivity of the spectrophotometer, the results may be compromised. Furthermore, at low concentrations protein can be absorbed onto the cuvette, thereby reducing the content in solution. This can be prevented by preparing samples at higher concentrations or by using a nonionic detergent in the preparation. [NOTE—Keep the *Test Solution*, the *Standard Solution*, and the buffer at the same temperature during testing.]

Test Solution— Dissolve a suitable quantity of the protein under test in the appropriate buffer to obtain a solution having a concentration of 0.2 to 2 mg per mL.

Standard Solution— Unless otherwise specified in the individual monograph prepare a solution of USP Reference Standard or reference material for the protein under test in the same buffer and at the same concentration as the *Test Solution*.

Procedure— Concomitantly determine the absorbances of the *Standard Solution* and the *Test Solution* in quartz cells at a wavelength of 280 nm, with a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩), using the buffer as the blank. To obtain accurate results, the response should be linear in the range of protein concentrations to be assayed.

Light-Scattering— The accuracy of the UV spectroscopic determination of protein can be decreased by the scattering of light by the test specimen. If the proteins in solution exist as particles comparable in size to the wavelength of the measuring light (250 to 300 nm), scattering of the light beam results in an apparent increase in absorbance of the test specimen. To calculate the absorbance at 280 nm due to light scattering, determine the absorbances of the *Test Solution* at wavelengths of 320, 325, 330, 335, 340, 345, and 350 nm. Using the linear regression method, plot the log of the observed absorbance versus the log of the wavelength, and determine the standard curve best fitting the plotted points. From the graph so obtained, extrapolate the absorbance value due to light scattering at 280 nm. Subtract the absorbance from light-scattering from the total absorbance at 280 nm to obtain the absorbance value of the protein in solution. Filtration with a filter having a 0.2-µm porosity or clarification by centrifugation may be performed to reduce the effect of light scattering, especially if the solution is noticeably turbid.

Calculations— Calculate the concentration, C_u, of protein in the test specimen by the formula:

$$C_u(A_u/A_s),$$

in which C_s is the concentration of the *Standard Solution;* and A_u and A_s are the corrected absorbances of the *Test Solution* and the *Standard Solution,* respectively (see *Spectrophotometry and Light-Scattering* ⟨851⟩).

Method 2

This method, commonly referred to as the Lowry assay, is based on the reduction by protein of the phosphomolybdic-tungstic mixed acid chromogen in the Folin-Ciocalteu's phenol reagent, resulting in an absorbance maximum at 750 nm. The Folin-Ciocalteu's phenol reagent reacts primarily with tyrosine residues in the protein, which can lead to variation in the response of the assay to different proteins. Because the method is sensitive to interfering substances, a procedure for precipitation of the protein from the test specimen may be used. Where separation of interfering substances from the protein in the test specimen is necessary, proceed as directed below for *Interfering Substances* prior to preparation of the *Test Solution*. The effect of interfering substances can be minimized by dilution, provided the concentration of the protein under test remains sufficient for accurate measurement.

Standard Solutions— Unless otherwise specified in the individual monograph, dissolve the USP Reference Standard or reference material for the protein under test in the buffer used to prepare the *Test Solution*. Dilute portions of this solution with the same buffer to obtain not fewer than five *Standard Solutions* having concentrations between 5 and 100 µg of protein per mL, the concentrations being evenly spaced.

Test Solution— Dissolve a suitable quantity of the protein under test in the appropriate buffer to obtain a solution having a concentration within the range of the concentrations of the *Standard Solutions*. An appropriate buffer will produce a pH in the range of 10.0 to 10.5.

Blank— Use the buffer used for the *Test Solution* and the *Standard Solutions*.

Reagents and **Solutions**—

Copper Sulfate Reagent— Dissolve 100 mg of cupric sulfate and 200 mg of sodium tartrate in water, dilute with water to 50 mL, and mix. Dissolve 10 g of sodium carbonate in water to a final volume of 50 mL, and mix. Slowly pour the sodium carbonate solution into the copper sulfate solution with mixing. Prepare this solution fresh daily.

SDS Solution— Dissolve 5 g of sodium dodecyl sulfate in water, and dilute with water to 100 mL.

Sodium Hydroxide Solution— Dissolve 3.2 g of sodium hydroxide in water, dilute with water to 100 mL, and mix.

Alkaline Copper Reagent— Prepare a mixture of *Copper Sulfate Reagent*, *SDS Solution*, and *Sodium Hydroxide Solution* (1 : 2 : 1). This reagent may be stored at room temperature for up to 2 weeks.

Diluted Folin-Ciocalteu's Phenol Reagent— Mix 10 mL of Folin-Ciocalteu's phenol TS with 50 mL of water. Store in an amber bottle, at room temperature.

Procedure— To 1 mL of each *Standard Solution*, the *Test Solution*, and the *Blank*, add 1 mL of *Alkaline Copper Reagent*, and mix. Allow to stand at room temperature for 10 minutes. Add 0.5 mL of the *Diluted Folin-Ciocalteu's Phenol Reagent* to each solution, mix each tube immediately, and allow to stand at room temperature for 30 minutes. Determine the absorbances of the solutions from the *Standard Solutions* and the *Test Solution* at the wavelength of maximum absorbance at 750 nm, with a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩), using the solution from the *Blank* to set the instrument to zero.

Calculations— [NOTE—The relationship of absorbance to protein concentration is nonlinear; however, if the standard curve concentration range is sufficiently small, it will approach linearity.] Using the linear regression method, plot the absorbances of the solutions from the *Standard Solutions* versus the protein concentrations, and determine the standard curve best fitting the plotted points. From the standard curve so obtained and the absorbance of the *Test Solution*, determine the concentration of protein in the *Test Solution*.

INTERFERING SUBSTANCES

In the following procedure, deoxycholate-trichloroacetic acid is added to a test specimen to remove interfering substances by precipitation of proteins before testing. This technique also can be used to concentrate proteins from a dilute solution.

Sodium Deoxycholate Reagent— Prepare a solution of sodium deoxycholate in water having a concentration of 150 mg in 100 mL.

Trichloroacetic Acid Reagent— Prepare a solution of trichloroacetic acid in water having a concentration of 72 g in 100 mL.

Procedure— Add 0.1 mL of *Sodium Deoxycholate Reagent* to 1 mL of a solution of the protein under test. Mix on a vortex mixer, and allow to stand at room temperature for 10 minutes. Add 0.1 mL of *Trichloroacetic Acid Reagent*, and mix on a vortex mixer. Centrifuge at 3000 × *g* for 30 minutes, decant the liquid, and remove any residual liquid with a pipet. Redissolve the protein pellet in 1 mL of *Alkaline Copper Reagent*. Proceed as directed for the *Test Solution*.

NOTE—Color development reaches a maximum in 20 to 30 minutes during incubation at room temperature, after which there is a gradual loss of color. Most interfering substances cause a lower color yield;

In-Process Revision

however, some detergents cause a slight increase in color. A high salt concentration may cause a precipitate to form. Because different protein species may give different color response intensities, the standard protein and test protein should be the same.

Method 3

This method, commonly referred to as the Bradford assay, is based on the absorption shift from 470 nm to 595 nm observed when the brilliant blue G dye binds to protein. The brilliant blue G dye binds most readily to arginyl and lysyl residues in the protein, which can lead to variation in the response of the assay to different proteins.

Standard Solutions—Unless otherwise specified in the individual monograph, dissolve the USP Reference Standard or reference material for the protein under test in the buffer used to prepare the *Test Solution*. Dilute portions of this solution with the same buffer to obtain not fewer than five *Standard Solutions* having concentrations between 100 µg and 1 mg of protein per mL, the concentrations being evenly spaced.

Test Solution—Dissolve a suitable quantity of the protein under test in the appropriate buffer to obtain a solution having a concentration within the range of the concentrations of the *Standard Solutions*.

Blank—Use the buffer used to prepare the *Test Solution* and the *Standard Solutions*.

Coomassie Reagent—Dissolve 100 mg of brilliant blue G[3] in 50 mL of alcohol. [NOTE—Not all dyes have the same brilliant blue G content, and different products may give different results.] Add 100 mL of phosphoric acid, dilute with water to 1 L, and mix. Pass the solution through filter paper (Whatman No. 1 or equivalent), and store the filtered reagent in an amber bottle at room temperature. [NOTE—Slow precipitation of the dye will occur during storage of the reagent. Filter the reagent before use.]

Procedure—Add 5 mL of the *Coomassie Reagent* to 100 µL of each *Standard Solution*, the *Test Solution*, and the *Blank*, and mix by inversion. Avoid foaming, which will lead to poor reproducibility. Determine the absorbances of the solutions from the *Standard Solutions* and the *Test Solution* at 595 nm, with a suitable spectrophotometer (see *Spectrophotometry and Light Scattering* ⟨851⟩), using the *Blank* to set the instrument to zero. [NOTE—Do not use quartz (silica) spectrophotometer cells: the dye binds to this material. Because different protein species may give different color response intensities, the standard protein and test protein should be the same.]

There are relatively few interfering substances, but detergents and ampholytes in the test specimen should be avoided. Highly alkaline specimens may interfere with the acidic reagent.

Calculations—[NOTE—The relationship of absorbance to protein concentration is nonlinear; however, if the standard curve concentration range is sufficiently small, it will approach linearity.] Using the linear regression method, plot the absorbances of the solutions from the *Standard Solutions* versus the protein concentrations, and determine the standard curve best fitting the plotted points. From the standard curve so obtained and the absorbance of the *Test Solution*, determine the concentration of protein in the *Test Solution*.

Method 4

This method, commonly referred to as the bicinchoninic acid or BCA assay, is based on reduction of the cupric (Cu^{2+}) ion to cuprous (Cu^{1+}) ion by protein. The bicinchoninic acid reagent is used to detect the cuprous ion. The method has few interfering substances. When interfering substances are present, their effect may be minimized by dilution, provided that the concentration of the protein under test remains sufficient for accurate measurement.

Standard Solutions—Unless otherwise specified in the individual monograph, dissolve the USP Reference Standard or reference material for the protein under test in the buffer used to prepare the *Test Solution*. Dilute portions of this solution with the same buffer to obtain not fewer than five *Standard Solutions* having concentrations between 10 and 1200 µg of protein per mL, the concentrations being evenly spaced.

Test Solution—Dissolve a suitable quantity of the protein under test in the appropriate buffer to obtain a solution having a concentration within the range of the concentrations of the *Standard Solutions*.

Blank—Use the buffer used to prepare the *Test Solution* and the *Standard Solutions*.

Reagents—

BCA Reagent—Dissolve about 10 g of bicinchoninic acid, 20 g of sodium carbonate monohydrate, 1.6 g of sodium tartrate, 4 g of sodium hydroxide, and 9.5 g of sodium bicarbonate in water. Adjust, if necessary, with sodium hydroxide or sodium bicarbonate to a pH of 11.25. Dilute with water to 1 L, and mix.

Copper Sulfate Reagent—Dissolve about 2 g of cupric sulfate in water to a final volume of 50 mL.

Copper-BCA Reagent—Mix 1 mL of *Copper Sulfate Reagent* and 50 mL of *BCA Reagent*.

Procedure—Mix 0.1 mL of each *Standard Solution*, the *Test Solution*, and the *Blank* with 2 mL of the *Copper-BCA Reagent*. Incubate the solutions at 37° for 30 minutes, note the time, and allow to come to room temperature. Within 60 minutes following the incubation time, determine the absorbances of the solutions from the *Standard Solutions* and the *Test Solution* in quartz cells at 562 nm, with a suitable spectrophotometer (see *Spectrophotometry and Light Scattering* ⟨851⟩), using the *Blank* to set the instrument to zero. After the solutions are cooled to room temperature, the color intensity continues to increase gradually. If substances that will cause interference in the test are present, proceed as directed for *Interfering Substances* under *Method 2*. Because different protein species may give different color response intensities, the standard protein and test protein should be the same.

Calculations—[NOTE—The relationship of absorbance to protein concentration is nonlinear; however, if the standard curve concentration range is sufficiently small, it will approach linearity.] Using the linear regression method, plot the absorbances of the solutions from the *Standard Solutions* versus the protein concentrations, and determine the standard curve best fitting the plotted points. From the standard curve so obtained and the absorbance of the *Test Solution*, determine the concentration of protein in the *Test Solution*.

Method 5

This method, commonly referred to as the Biuret assay, is based on the interaction of cupric (Cu^{2+}) ion with protein in an alkaline solution and the resultant development of absorbance at 545 nm.

Standard Solutions—Unless otherwise specified in the individual monograph, prepare a solution of Albumin Human for which the protein content has been previously determined by nitrogen analysis (using the nitrogen-to-protein conversion factor of 6.25) or of the USP Reference Standard or reference material for the protein under test in sodium chloride solution (9 in 1000). Dilute portions of this solution with sodium chloride solution (9 in 1000) to obtain not fewer than three *Standard Solutions* having concentrations between 0.5 and 10 mg per mL, the concentrations being evenly spaced. [NOTE—Low responses may be observed if the sample under test has significantly different level of proline than that of Albumin Human. A different standard protein may be employed in such cases.]

Test Solution—Prepare a solution of the test protein in sodium chloride solution (9 in 1000) having a concentration within the range of the concentrations of the *Standard Solutions*.

Blank—Use sodium chloride solution (9 in 1000).

Biuret Reagent—Dissolve about 3.46 g of cupric sulfate in 10 mL of hot water, and allow to cool (*Solution 1*). Dissolve about 34.6 g of sodium citrate dihydrate and 20.0 g of sodium carbonate in 80 mL of hot water, and allow to cool (*Solution 2*). Mix *Solution 1* and *Solution 2*, and dilute with water to 200 mL. This *Biuret Reagent* is stable at room temperature for 6 months. Do not use the reagent if it develops turbidity or contains any precipitate.

Procedure—To one volume of a solution of the *Test Solution* add an equal volume of sodium hydroxide solution (6 in 100), and mix. Immediately add a volume of *Biuret Reagent* equivalent to 0.4 vol-

[3] Dye purity is important in the reagent preparation. It is intended to propose a reagent footnote to indicate that Serva Blue G (Crescent Chemical Company, Hauppauge, NY) is an acceptable grade.

In-Process Revision

ume of the *Test Solution*, and mix. Allow to stand at a temperature between 15° and 25° for not less than 15 minutes. Within 90 minutes after the addition of the *Biuret Reagent,* determine the absorbances of the *Standard Solutions* and the solution from the *Test Solution* at the wavelength of maximum absorbance at 545 nm, with a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩), using the *Blank* to set the instrument to zero. [NOTE—Any solution that develops turbidity or a precipitate is not acceptable for calculation of protein concentration.]

Calculations—Using the least-squares linear regression method, plot the absorbances of the *Standard Solutions* versus the protein concentrations, determine the standard curve best fitting the plotted points, and calculate the correlation coefficient for the line. [NOTE—Within the given range of the standards, the relationship of absorbance to protein concentration is approximately linear.] A suitable system is one that yields a line having a correlation coefficient of not less than 0.99. From the standard curve and the absorbance of the *Test Solution,* determine the concentration of protein in the test specimen, making any necessary correction.

Interfering Substances—To minimize the effect of interfering substances, the protein can be precipitated from the initial test specimen as follows. Add 0.1 volume of 50 percent trichloroacetic acid to 1 volume of a solution of the test specimen, withdraw the supernatant layer, and dissolve the precipitate in a small volume of 0.5 N sodium hydroxide. Use the solution so obtained to prepare the *Test Solution.*

Comments—This test shows minimal difference between equivalent IgG and albumin samples. Addition of the sodium hydroxide and the *Biuret Reagent* as a combined reagent, insufficient mixing after the addition of the sodium hydroxide, or an extended time between the addition of the sodium hydroxide solution and the addition of the *Biuret Reagent* will give IgG samples a higher response than albumin samples. The trichloroacetic acid method used to minimize the effects of interfering substances can also be used to determine the protein content in test specimens at concentrations below 500 µg per mL.

Method 6

This fluorometric method is based on the derivatization of the protein with *o*-phthalaldehyde (OPA), which reacts with the primary amines of the protein (i.e., NH_2- terminal amino acid and the ε-amino group of the lysine residues). The sensitivity of the test can be increased by hydrolyzing the protein before testing. Hydrolysis makes the α-amino group of the constituent amino acids of the protein available for reaction with the *o*-phthalaldehyde reagent. The method requires very small quantities of the protein.

Primary amines, such as tris(hydroxymethyl)aminomethane and amino acid buffers, react with *o*-phthalaldehyde and must be avoided or removed. Ammonia at high concentrations will react with *o*-phthalaldehyde as well. The fluorescence obtained when amine reacts with *o*-phthalaldehyde can be unstable. The use of automated procedures to standardize this procedure may improve the accuracy and precision of the test.

Standard Solutions—Unless otherwise specified in the individual monograph, dissolve the USP Reference Standard or reference material for the protein under test in the buffer used to prepare the *Test Solution.* Dilute portions of this solution with the same buffer to obtain not fewer than five *Standard Solutions* having concentrations between 10 and 200 µg of protein per mL, the concentrations being evenly spaced.

Test Solution—Dissolve a suitable quantity of the protein under test in the appropriate buffer to obtain a solution having a concentration within the range of the concentrations of the *Standard Solutions.*

Blank—Use the buffer used to prepare the *Test Solution* and the *Standard Solutions.*

Reagents—

Borate Buffer—Dissolve about 61.83 g of boric acid in water, and adjust with potassium hydroxide to a pH of 10.4. Dilute with water to 1 L, and mix.

Stock OPA Reagent—Dissolve about 120 mg of *o*-phthalaldehyde in 1.5 mL of methanol, add 100 mL of *Borate Buffer*, and mix. Add 0.6 mL of polyoxyethylene (23) lauryl ether, and mix. This solution is stable at room temperature for at least 3 weeks.

OPA Reagent—To 5 mL of *Stock OPA Reagent* add 15 µL of 2-mercaptoethanol. Prepare at least 30 minutes prior to use. This reagent is stable for one day.

Procedure—Adjust each of the *Standard Solutions* and the *Test Solution* to a pH between 8 and 10.5. Mix 10 µL of the *Test Solution* and each of the *Standard Solutions* with 100 µL of *OPA Reagent,* and allow to stand at room temperature for 15 minutes. Add 3 mL of 0.5 N sodium hydroxide, and mix. Using a suitable fluorometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩), determine the fluorescent intensities of solutions from the *Standard Solutions* and the *Test Solution* at an excitation wavelength of 340 nm and an emission wavelength between 440 and 455 nm. [NOTE—The fluorescence of an individual specimen is read only once because irradiation decreases the fluorescent intensity.]

Calculations—The relationship of fluorescence to protein concentration is linear. Using the linear regression method, plot the fluorescent intensities of the solutions from the *Standard Solutions* versus the protein concentrations, and determine the standard curve best fitting the plotted points. From the standard curve so obtained and the fluorescent intensity of the *Test Solution,* determine the concentration of protein in the test specimen.

Method 7

This method is based on nitrogen analysis as a means of protein determination. Interference caused by the presence of other nitrogen-containing substances in the test specimen can affect the determination of protein by this method. Nitrogen analysis techniques destroy the protein under test but are not limited to protein presentation in an aqueous environment.

Procedure 1—Determine the nitrogen content of the protein under test as directed under *Nitrogen Determination* ⟨461⟩. Commercial instrumentation is available for the Kjeldahl nitrogen assay.

Procedure 2—Commercial instrumentation is available for nitrogen analysis. Most nitrogen analysis instruments use pyrolysis (i.e., combustion of the sample in oxygen at temperatures approaching 1000°), which produces nitric oxide (NO) and similar oxides of nitrogen (NO_x) from the nitrogen present in the test protein. Some instruments convert the nitric oxides to nitrogen gas, which is quantified with a thermal conductivity detector. Other instruments mix nitric oxide (NO) with ozone (O_3) to produce excited nitrogen dioxide (NO_2), which emits light when it decays and can be quantified with a chemiluminescence detector. A protein reference material or reference standard that is relatively pure and is similar in composition to the test proteins is used to optimize the injection and pyrolysis parameters and to evaluate consistency in the analysis.

Calculations—The protein concentration is calculated by dividing the nitrogen content of the sample by the known nitrogen content of the protein. The known nitrogen content of the protein can be determined from the chemical composition of the protein or by comparison with the nitrogen content of the USP Reference Standard or reference material. ■1S (*USP30*)

■⟨1052⟩ BIOTECHNOLOGY-DERIVED ARTICLES—AMINO ACID ANALYSIS

This chapter provides guidance and procedures used for characterization of biotechnology-derived articles by amino acid analysis. This chapter is harmonized with the corresponding chapter in *JP* and *EP*. Other characterization tests, also harmonized, are shown in *Biotechnology-Derived Articles—Capillary Electrophoresis* ⟨1053⟩, *Biotechnology-Derived Articles—Isoelectric Focusing* ⟨1054⟩, *Biotechnology-Derived Articles—Peptide Mapping* ⟨1055⟩, *Biotechnology-Derived Articles—Polyacrylamide Gel Electrophoresis* ⟨1056⟩, and *Biotechnology-Derived Articles—Total Protein Assay* ⟨1057⟩.

INTRODUCTION

Amino acid analysis refers to the methodology used to determine the amino acid composition or content of proteins, peptides, and other pharmaceutical preparations. Proteins and peptides are macromolecules consisting of covalently bonded amino acid residues organized as a linear polymer. The sequence of the amino acids in a protein or peptide determines the properties of the molecule. Proteins are considered large molecules that commonly exist as folded structures with a specific conformation, while peptides are smaller and may consist of only a few amino acids. Amino acid analysis can be used to quantify protein and peptides, to determine the identity of proteins or peptides based on their amino acid composition, to support protein and peptide structure analysis, to evaluate fragmentation strategies for peptide mapping, and to detect atypical amino acids that might be present in a protein or peptide. It is necessary to hydrolyze a protein/peptide to its individual amino acid constituents before amino acid analysis. Following protein/peptide hydrolysis, the amino acid analysis procedure can be the same as that practiced for free amino acids in other pharmaceutical preparations. The amino acid constituents of the test sample are typically derivatized for analysis.

APPARATUS

Methods used for amino acid analysis are usually based on a chromatographic separation of the amino acids present in the test sample. Current techniques take advantage of the automated chromatographic instrumentation designed for analytical methodologies. An amino acid analysis instrument will typically be a low-pressure or high-pressure liquid chromatograph capable of generating mobile phase gradients that separate the amino acid analytes on a chromatographic column. The instrument must have postcolumn derivatization capability, unless the sample is analyzed using precolumn derivatization. The detector is usually a UV-visible or fluorescence detector depending on the derivatization method used. A recording device (e.g., integrator) is used for transforming the analog signal from the detector and for quantitation. It is preferred that instrumentation be dedicated particularly for amino acid analysis.

GENERAL PRECAUTIONS

Background contamination is always a concern for the analyst in performing amino acid analysis. High-purity reagents are necessary (e.g., low-purity hydrochloric acid can contribute to glycine contamination). Analytical reagents are changed routinely every few weeks using only high-pressure liquid chromatography (HPLC) grade solvents. Potential microbial contamination and foreign material that might be present in

the solvents are reduced by filtering solvents before use, keeping solvent reservoirs covered, and not placing amino acid analysis instrumentation in direct sunlight.

Laboratory practices can determine the quality of the amino acid analysis. Place the instrumentation in a low traffic area of the laboratory. Keep the laboratory clean. Clean and calibrate pipets according to a maintenance schedule. Keep pipet tips in a covered box; the analysts may not handle pipet tips with their hands. The analysts may wear powder-free latex or equivalent gloves. Limit the number of times a test sample vial is opened and closed because dust can contribute to elevated levels of glycine, serine, and alanine.

A well-maintained instrument is necessary for acceptable amino acid analysis results. If the instrument is used on a routine basis, it is to be checked daily for leaks, detector and lamp stability, and the ability of the column to maintain resolution of the individual amino acids. Clean or replace all instrument filters and other maintenance items on a routine schedule.

REFERENCE STANDARD MATERIAL

Acceptable amino acid standards are commercially available* for amino acid analysis and typically consist of an aqueous mixture of amino acids. When determining amino acid composition, protein or peptide standards are analyzed with the test material as a control to demonstrate the integrity of the entire procedure. Highly purified bovine serum albumin has been used as a protein standard for this purpose.

CALIBRATION OF INSTRUMENTATION

Calibration of amino acid analysis instrumentation typically involves analyzing the amino acid standard, which consists of a mixture of amino acids at a number of concentrations, to determine the response factor and range of analysis for each amino acid. The concentration of each amino acid in the standard is known. In the calibration procedure, the analyst dilutes the amino acid standard to several different analyte levels within the expected linear range of the amino acid analysis technique. Then, replicates at each of the different analyte levels can be analyzed. Peak areas obtained for each amino acid are plotted versus the known concentration for each of the amino acids in the standard dilution. These results will allow the analyst to determine the range of amino acid concentrations where the peak area of a given amino acid is an approximately linear function of the amino acid concentration. It is important that the analyst prepare the samples for amino acid analysis so that they are within the analytical limits (e.g., linear working range) of the technique employed in order to obtain accurate and repeatable results.

Four to six amino acid standard levels are analyzed to determine a response factor for each amino acid. The response factor is calculated as the average peak area or peak height per nmol of amino acid present in the standard. A calibration file consisting of the response factor for each amino acid is prepared and is used to calculate the concentration of each amino acid present in the test sample. This calculation involves dividing the peak area corresponding to a given amino acid by the response factor for that amino acid to give the nmol of the amino acid. For routine analysis, a single-point calibration may be sufficient; however, the calibration file is updated frequently and tested by the analysis of analytical controls to ensure its integrity.

REPEATABILITY

Consistent high quality amino acid analysis results from an analytical laboratory require attention to the repeatability of the assay. During analysis of the chromatographic separation of the amino acids or their derivatives, numerous peaks can be observed on the chromatogram that corresponds to the amino acids. The large number of peaks makes it necessary to have an amino acid analysis system that can repeatedly identify the peaks based on retention time and integrate the peak areas for quantitation. A typical repeatability evaluation involves pre-

* Suitable standards may be obtained from NIST (Gaithersburg, MD), Beckman Instruments (Fullerton, CA), Sigma Chemical (St. Louis, MO), Pierce (Rockford, IL), or Agilent (Palo Alto, CA).

paring a standard amino acid solution and analyzing many replicates (i.e., six analyses or more) of the same standard solution. The relative standard deviation (RSD) is determined for the retention time and integrated peak area of each amino acid. An evaluation of the repeatability is expanded to include multiple assays conducted over several days by different analysts. Multiple assays include the preparation of standard dilutions from starting materials to determine the variation due to sample handling. Often, the amino acid composition of a standard protein (e.g., bovine serum albumin) is analyzed as part of the repeatability evaluation. By evaluating the replicate variation (i.e., RSD), the laboratory can establish analytical limits to ensure that the analyses from the laboratory are under control. It is desirable to establish the lowest practical variation limits to ensure the best results. Areas to focus on to lower the variability of the amino acid analysis include sample preparation, high background spectral interference due to the quality of reagents and/or to laboratory practices, instrument performance and maintenance, data analysis and interpretation, and analyst performance and habits. All parameters involved are fully investigated in the scope of the validation work.

SAMPLE PREPARATION

Accurate results from amino acid analysis require purified protein and peptide samples. Buffer components (e.g., salts, urea, detergents) can interfere with the amino acid analysis and are removed from the sample before analysis. Methods that utilize postcolumn derivatization of the amino acids are generally not affected by buffer components to the extent seen with precolumn derivatization methods. It is desirable to limit the number of sample manipulations to reduce potential background contamination, to improve analyte recovery, and to reduce labor. Common techniques used to remove buffer components from protein samples include the following methods: (1) injecting the protein sample onto a reverse-phase HPLC system, removing the protein with a volatile solvent containing a sufficient organic component, and drying the sample in a vacuum centrifuge; (2) dialysis against a volatile buffer or water; (3) centrifugal ultrafiltration for buffer replacement with a volatile buffer or water; (4) precipitating the protein from the buffer using an organic solvent (e.g., acetone); and (5) gel filtration.

INTERNAL STANDARDS

It is recommended that an internal standard be used to monitor physical and chemical losses and variations during amino acid analysis. An accurately known amount of internal standard can be added to a protein solution prior to hydrolysis. The recovery of the internal standard gives the general recovery of the amino acids from the protein solution. Free amino acids, however, do not behave in the same way as protein-bound amino acids during hydrolysis because their rates of release or destruction are variable. Therefore, the use of an internal standard to correct for losses during hydrolysis may give unreliable results. It will be necessary to take this particular point into consideration when interpreting the results. Internal standards can also be added to the mixture of amino acids after hydrolysis to correct for differences in sample application and changes in reagent stability and flow rates. Ideally, an internal standard is an unnaturally occurring primary amino acid that is commercially available and inexpensive. It should also be stable during hydrolysis, its response factor should be linear with concentration, and it needs to elute with a unique retention time without overlapping other amino acids. Commonly used amino acid standards include norleucine, nitrotyrosine, and α-aminobutyric acid.

PROTEIN HYDROLYSIS

Hydrolysis of protein and peptide samples is necessary for amino acid analysis of these molecules. The glassware used for hydrolysis must be very clean to avoid erroneous results. Glove powders and fingerprints on hydrolysis tubes may cause contamination. To clean glass hydrolysis tubes, boil tubes for

1 hour in 1 N hydrochloric acid or soak tubes in concentrated nitric acid or in a mixture of concentrated hydrochloric acid and concentrated nitric acid (1 : 1). Clean hydrolysis tubes are rinsed with high-purity water followed by a rinse with HPLC grade methanol, dried overnight in an oven, and stored covered until use. Alternatively, pyrolysis of clean glassware at 500° for 4 hours may be used to eliminate contamination from hydrolysis tubes. Adequate disposable laboratory material can also be used.

Acid hydrolysis is the most common method for hydrolyzing a protein sample before amino acid analysis. The acid hydrolysis technique can contribute to the variation of the analysis due to complete or partial destruction of several amino acids. Tryptophan is destroyed; serine and threonine are partially destroyed; methionine might undergo oxidation; and cysteine is typically recovered as cystine (but cystine recovery is usually poor because of partial destruction or reduction to cysteine). Application of adequate vacuum (less than 200 µm of mercury or 26.7 Pa) or introduction of an inert gas (argon) in the headspace of the reaction vessel can reduce the level of oxidative destruction. In peptide bonds involving isoleucine and valine, the amido bonds of Ile-Ile, Val-Val, Ile-Val, and Val-Ile are partially cleaved; and asparagine and glutamine are deamidated, resulting in aspartic acid and glutamic acid, respectively. The loss of tryptophan, asparagine, and glutamine during an acid hydrolysis limits quantitation to 17 amino acids. Some of the hydrolysis techniques described are used to address these concerns. Some of the hydrolysis techniques described (i.e., *Methods 4–11*) may cause modifications to other amino acids. Therefore, the benefits of using a given hydrolysis technique are weighed against the concerns with the technique and are tested adequately before employing a method other than acid hydrolysis.

A time-course study (i.e., amino acid analysis at acid hydrolysis times of 24, 48, and 72 hours) is often employed to analyze the starting concentration of amino acids that are partially destroyed or slow to cleave. By plotting the observed concentration of labile amino acids (i.e., serine and threonine) versus hydrolysis time, the line can be extrapolated to the origin to determine the starting concentration of these amino acids. Time-course hydrolysis studies are also used with amino acids that are slow to cleave (e.g., isoleucine and valine). During the hydrolysis time course, the analyst will observe a plateau in these residues. The level of this plateau is taken as the residue concentration. If the hydrolysis time is too long, the residue concentration of the sample will begin to decrease, indicating destruction by the hydrolysis conditions.

An acceptable alternative to the time-course study is to subject an amino acid calibration standard to the same hydrolysis conditions as the test sample. The amino acid in free form may not completely represent the rate of destruction of labile amino acids within a peptide or protein during the hydrolysis. This is especially true for peptide bonds that are slow to cleave (e.g., Ile-Val bonds). However, this technique will allow the analyst to account for some residue destruction. Microwave acid hydrolysis has been used and is rapid but it requires special equipment as well as special precautions. The optimal conditions for microwave hydrolysis must be investigated for each individual protein/peptide sample. The microwave hydrolysis technique typically requires only a few minutes, but even a deviation of 1 minute may give inadequate results (e.g., incomplete hydrolysis or destruction of labile amino acids). Complete proteolysis, using a mixture of proteases, has been used but can be complicated, requires the proper controls, and is typically more applicable to peptides than proteins. [NOTE—During initial analyses of an unknown protein, experiments with various hydrolysis time and temperature conditions are conducted to determine the optimal conditions.]

Method 1

Acid hydrolysis using hydrochloric acid containing phenol is the most common procedure used for protein/peptide hydrolysis preceding amino acid analysis. The addition of phenol to the reaction prevents the halogenation of tyrosine.

Hydrolysis Solution: 6 N hydrochloric acid containing 0.1% to 1.0% of phenol.

Procedure—

Liquid Phase Hydrolysis—Place the protein or peptide sample in a hydrolysis tube, and dry. [NOTE—The sample is dried so that water in the sample will not dilute the acid used for the hydrolysis.] Add 200 µL of *Hydrolysis Solution* per 500 µg of lyophilized protein. Freeze the sample tube in a dry ice–acetone bath, and flame seal in vacuum. Samples are typically hydrolyzed at 110° for 24 hours in vacuum or inert atmosphere to prevent oxidation. Longer hydrolysis times (e.g., 48 and 72 hours) are investigated if there is a concern that the protein is not completely hydrolyzed.

Vapor Phase Hydrolysis—This is one of the most common acid hydrolysis procedures, and it is preferred for microanalysis when only small amounts of the sample are available. Contamination of the sample from the acid reagent is also minimized by using vapor phase hydrolysis. Place vials containing the dried samples in a vessel that contains an appropriate amount of *Hydrolysis Solution.* The *Hydrolysis Solution* does not come in contact with the test sample. Apply an inert atmosphere or vacuum (less than 200 µm of mercury or 26.7 Pa) to the headspace of the vessel, and heat to about 110° for a 24-hour hydrolysis time. Acid vapor hydrolyzes the dried sample. Any condensation of the acid in the sample vials is minimized. After hydrolysis, dry the test sample in vacuum to remove any residual acid.

Method 2

Tryptophan oxidation during hydrolysis is decreased by using mercaptoethanesulfonic acid (MESA) as the reducing acid.

Hydrolysis Solution: 2.5 M MESA solution.

Vapor Phase Hydrolysis—About 1 to 100 µg of the protein/peptide under test is dried in a hydrolysis tube. The hydrolysis tube is placed in a larger tube with about 200 µL of the *Hydrolysis Solution.* The larger tube is sealed in vacuum (about 50 µm of mercury or 6.7 Pa) to vaporize the *Hydrolysis Solution*. The hydrolysis tube is heated to between 170° to 185° for about 12.5 minutes. After hydrolysis, the hydrolysis tube is dried in vacuum for 15 minutes to remove the residual acid.

Method 3

Tryptophan oxidation during hydrolysis is prevented by using thioglycolic acid (TGA) as the reducing acid.

Hydrolysis Solution: a solution containing 7 M hydrochloric acid, 10% of trifluoroacetic acid, 20% of thioglycolic acid, and 1% of phenol.

Vapor Phase Hydrolysis—About 10 to 50 µg of the protein/peptide under test is dried in a sample tube. The sample tube is placed in a larger tube with about 200 µL of the *Hydrolysis Solution*. The larger tube is sealed in vacuum (about 50 µm of mercury or 6.7 Pa) to vaporize the TGA. The sample tube is heated to 166° for about 15 to 30 minutes. After hydrolysis, the sample tube is dried in vacuum for 5 minutes to remove the residual acid. Recovery of tryptophan by this method may be dependent on the amount of sample present.

Method 4

Cysteine-cystine and methionine oxidation is performed with performic acid before the protein hydrolysis.

Oxidation Solution—The performic acid is prepared fresh by mixing formic acid and 30 percent hydrogen peroxide (9 : 1), and incubating at room temperature for 1 hour.

Procedure—The protein/peptide sample is dissolved in 20 µL of formic acid, and heated at 50° for 5 minutes; then 100 µL of the *Oxidation Solution* is added. In this reaction, cysteine is converted to cysteic acid and methionine is converted to methionine sulfone. The oxidation is allowed to proceed for 10 to 30 minutes. The excess reagent is removed from the sample in a vacuum centrifuge. This technique may cause modifications to tyrosine residues in the presence of halides. The oxidized protein can then be acid hydrolyzed using *Method 1* or *Method 2*.

Method 5

Cysteine-cystine oxidation is accomplished during the liquid phase hydrolysis with sodium azide.

Hydrolysis Solution: 6 N hydrochloric acid containing 0.2% of phenol, to which sodium azide is added to obtain a final concentration of 0.2% (w/v). The added phenol prevents halogenation of tyrosine.

Liquid Phase Hydrolysis—The protein/peptide hydrolysis is conducted at about 110° for 24 hours. During the hydrolysis, the cysteine-cystine present in the sample is converted to cysteic acid by the sodium azide present in the *Hydrolysis Solution*. This technique allows better tyrosine recovery than *Method 4,* but it is not quantitative for methionine. Methionine is converted to a mixture of the parent methionine and its two oxidative products, methionine sulfoxide and methionine sulfone.

Method 6

Cysteine-cystine oxidation is accomplished with dimethyl sulfoxide (DMSO).

Hydrolysis Solution: 6 N hydrochloric acid containing 0.1% to 1.0% of phenol, to which DMSO is added to obtain a final concentration of 2% (v/v).

Vapor Phase Hydrolysis—The protein/peptide hydrolysis is conducted at about 110° for 24 hours. During the hydrolysis, the cysteine-cystine present in the sample is converted to cysteic acid by the DMSO present in the *Hydrolysis Solution*. As an approach to limit variability and to compensate for partial destruction, it is recommended to evaluate the cysteic acid recovery from oxidative hydrolyses of standard proteins containing 1 to 8 mol of cysteine. The response factors from protein/peptide hydrolysates are typically about 30% lower than those for nonhydrolyzed cysteic acid standards. Because histidine, methionine, tyrosine, and tryptophan are also modified, a complete compositional analysis is not obtained with this technique.

Method 7

Cysteine-cystine reduction and alkylation is accomplished by a vapor phase pyridylethylation reaction.

Reducing Solution—Transfer 83.3 µL of pyridine, 16.7 µL of 4-vinylpyridine, 16.7 µL of tributylphosphine, and 83.3 µL of water to a suitable container, and mix.

Procedure—Add the protein/peptide (between 1 and 100 µg) to a hydrolysis tube, and place in a larger tube. Transfer the *Reducing Solution* to the large tube, seal in vacuum (about 50 µm of mercury or 6.7 Pa), and incubate at about 100° for 5 minutes. Then remove the inner hydrolysis tube, and dry it in a vacuum desiccator for 15 minutes to remove residual reagents. The pyridylethylated protein/peptide can then be acid hydrolyzed using previously described procedures. The pyridylethylation reaction is performed simultaneously with a protein standard sample containing 1 to 8 mol of cysteine to improve accuracy in the pyridylethyl-cysteine recovery. Longer incubation times for the pyridylethylation reaction can cause modifications to the α-amino terminal group and the ϵ-amino group of lysine in the protein.

Method 8

Cysteine-cystine reduction and alkylation is accomplished by a liquid phase pyridylethylation reaction.

Stock Solutions—Prepare and filter three solutions: 1 M Tris hydrochloride (pH 8.5) containing 4 mM edetate disodium (*Stock Solution 1*), 8 M guanidine hydrochloride (*Stock Solution 2*), and 10% of 2-mercaptoethanol in water (*Stock Solution 3*).

Reducing Solution—Prepare a mixture of *Stock Solution 2* and *Stock Solution 1* (3 : 1) to obtain a buffered solution of 6 M guanidine hydrochloride in 0.25 M Tris hydrochloride.

Procedure—Dissolve about 10 µg of the test sample in 50 µL of the *Reducing Solution*, and add about 2.5 µL of *Stock Solution 3*. Store under nitrogen or argon for 2 hours at room temperature in the dark. To achieve the pyridylethylation reac-

tion, add about 2 µL of 4-vinylpyridine to the protein solution, and incubate for an additional 2 hours at room temperature in the dark. The protein/peptide is desalted by collecting the protein/peptide fraction from a reverse-phase HPLC separation. The collected sample can be dried in a vacuum centrifuge before acid hydrolysis.

Method 9

Cysteine-cystine reduction and alkylation is accomplished by a liquid phase carboxymethylation reaction.

Stock Solutions—Prepare as directed for *Method 8*.

Carboxymethylation Solution—Prepare a solution containing 100 mg of iodoacetamide per mL of alcohol.

Buffer Solution—Use the *Reducing Solution,* prepared as directed for *Method 8*.

Procedure—Dissolve the test sample in 50 µL of the *Buffer Solution*, and add about 2.5 µL of *Stock Solution 3*. Store under nitrogen or argon for 2 hours at room temperature in the dark. Add the *Carboxymethylation Solution* in a 1.5 fold ratio per total theoretical content of thiols, and incubate for an additional 30 minutes at room temperature in the dark. [NOTE—If the thiol content of the protein is unknown, then add 5 µL of 100 mM iodoacetamide for every 20 nmol of protein present.] The reaction is stopped by adding excess of 2-mercaptoethanol. The protein/peptide is desalted by collecting the protein/peptide fraction from a reverse-phase HPLC separation. The collected sample can be dried in a vacuum centrifuge before acid hydrolysis. The *S*-carboxyamidomethylcysteine formed will be converted to *S*-carboxymethyl-cysteine during acid hydrolysis.

Method 10

Cysteine-cystine is reacted with dithiodiglycolic acid or dithiodipropionic acid to produce a mixed disulfide. [NOTE—The choice of dithiodiglycolic acid or dithiodipropionic acid depends on the required resolution of the amino acid analysis method.]

Reducing Solution: a solution containing 10 mg of dithiodiglycolic acid (or dithiodipropionic acid) per mL of 0.2 M sodium hydroxide.

Procedure—Transfer about 20 µg of the test sample to a hydrolysis tube, and add 5 µL of the *Reducing Solution*. Add 10 µL of isopropyl alcohol, and then remove all of the sample liquid by vacuum centrifugation. The sample is then hydrolyzed using *Method 1*. This method has the advantage that other amino acid residues are not derivatized by side reactions, and the sample does not need to be desalted prior to hydrolysis.

Method 11

Asparagine and glutamine are converted to aspartic acid and glutamic acid, respectively, during acid hydrolysis. Asparagine and aspartic acid residues are added and represented by *Asx,* while glutamine and glutamic acid residues are added and represented by *Glx*. Proteins/peptides can be reacted with bis(1,1-trifluoroacetoxy)iodobenzene (BTI) to convert the asparagine and glutamine residues to diaminopropionic acid and diaminobutyric acid residues, respectively, upon acid hydrolysis. These conversions allow the analyst to determine the asparagine and glutamine content of a protein/peptide in the presence of aspartic acid and glutamic acid residues.

Reducing Solutions—Prepare and filter three solutions: a solution of 10 mM trifluoroacetic acid (*Solution 1*), a solution of 5 M guanidine hydrochloride and 10 mM trifluoroacetic acid (*Solution 2*), and a freshly prepared solution of dimethylformamide containing 36 mg of BTI per mL (*Solution 3*).

Procedure—In a clean hydrolysis tube, transfer about 200 µg of the test sample, and add 2 mL of *Solution 1* or *Solution 2* and 2 mL of *Solution 3*. Seal the hydrolysis tube in vacuum. Heat the sample at 60° for 4 hours in the dark. The sample is then dialyzed with water to remove the excess reagents. Extract the dialyzed sample three times with equal volumes of *n*-butyl acetate, and then lyophilize. The protein can then be acid hydrolyzed using previously described procedures. The

α-, β-diaminopropionic and α-, γ-diaminobutyric acid residues do not typically resolve from the lysine residues upon ion-exchange chromatography based on amino acid analysis. Therefore, when using ion-exchange as the mode of amino acid separation, the asparagine and glutamine contents are the quantitative difference in the aspartic acid and glutamic acid assayed contents with un-derivatized and BTI-derivatized acid hydrolysis. [NOTE—The threonine, methionine, cysteine, tyrosine, and histidine assayed content can be altered by BTI derivatization; a hydrolysis without BTI will have to be performed if the analyst is interested in the protein/peptide content of these other amino acid residues.]

METHODOLOGIES OF AMINO ACID ANALYSIS

Many amino acid analysis techniques exist, and the choice of any one technique often depends on the sensitivity required from the assay. In general, about one-half of the amino acid analysis techniques employed rely on the separation of the free amino acids by ion-exchange chromatography followed by postcolumn derivatization (e.g., with ninhydrin or *o*-phthalaldehyde). Postcolumn detection techniques can be used with samples that contain small amounts of buffer components, such as salts and urea, and generally require between 5 and 10 µg of protein sample per analysis. The remaining amino acid techniques typically involve precolumn derivatization of the free amino acids (e.g., phenyl isothiocyanate; 6-aminoquinolyl-*N*-hydroxysuccinimidyl carbonate; (dimethylamino)azobenzenesulfonyl chloride; 9-fluorenyl-methylchloroformate; and 7-fluoro-4-nitrobenzo-2-oxa-1,3-diazole) followed by reverse-phase HPLC. Precolumn derivatization techniques are very sensitive and usually require between 0.5 and 1.0 µg of protein sample per analysis but may be influenced by buffer salts in the samples. Precolumn derivatization techniques may also result in multiple derivatives of a given amino acid, which complicates the result interpretation. Postcolumn derivatization techniques are generally influenced less by performance variation of the assay than precolumn derivatization techniques.

The following *Methods* may be used for quantitative amino acid analysis. Instruments and reagents for these procedures are available commercially. Furthermore, many modifications of these methodologies exist with different reagent preparations, reaction procedures, chromatographic systems, etc. Specific parameters may vary according to the exact equipment and procedure used. Many laboratories will utilize more than one amino acid analysis technique to exploit the advantages offered by each. In each of these *Methods*, the analog signal is visualized by means of a data acquisition system, and the peak areas are integrated for quantification purposes.

Method 1—Postcolumn Ninhydrin Detection

Ion-exchange chromatography with postcolumn ninhydrin detection is one of the most common methods employed for quantitative amino acid analysis. As a rule, a Li-based cation-exchange system is employed for the analysis of the more complex physiological samples, and the faster Na-based cation-exchange system is used for the more simplistic amino acid mixtures obtained with protein hydrolysates (typically containing 17 amino acid components). Separation of the amino acids on an ion-exchange column is accomplished through a combination of changes in pH and cation strength. A temperature gradient is often employed to enhance separation.

When the amino acid reacts with ninhydrin, the reactant has characteristic purple or yellow color. Amino acids, except imino acids, give a purple color, and show maximum absorption at 570 nm. The imino acids, such as proline, give a yellow color, and show maximum absorption at 440 nm. The postcolumn reaction between ninhydrin and amino acid eluted from the column is monitored at 440 nm and 570 nm, and the chromatogram obtained is used for the determination of amino acid composition.

The detection limit is considered to be 10 pmol for most of the amino acid derivatives, but 50 pmol for proline. Response linearity is obtained in the range of 20 to 500 pmol with correlation coefficients exceeding 0.999. To obtain good compositional data, samples larger than 1 µg before hydrolysis are best suited for this amino acid analysis of protein/peptide.

One method for postcolumn ninhydrin detection is shown below. Many other methods are also available, with instruments and reagents available commercially.

Mobile Phase Preparation—

Solution A—Transfer about 1.7 g of anhydrous sodium citrate and 1.5 mL of hydrochloric acid to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Adjust, if necessary, with hydrochloric acid to a pH of 3.0.

Solution B—Transfer about 1.7 g of anhydrous sodium citrate and 0.7 mL of hydrochloric acid to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Adjust, if necessary, with hydrochloric acid to a pH of 4.3.

Solution C—Prepare a solution containing 5% of sodium chloride, 1.9% of anhydrous sodium citrate, and 0.1% of phenol in water, and adjust to a pH of 6.

Column Regeneration Solution—Prepare a solution containing 0.8% of sodium hydroxide in water, and adjust to a pH of 13.

Mobile Phase—Use variable mixtures of *Solution A, Solution B,* and *Solution C* as directed for *Chromatographic system*.

Postcolumn Reagent—Transfer about 18 g of ninhydrin and 0.7 g of hydrindantin to 900 mL of a solution containing 76.7% of dimethyl sulfoxide, 0.7% of dihydrate lithium acetate, and 0.1% of acetic acid, and mix for at least 3 hours under inert gas, such as nitrogen. [NOTE—This reagent is stable for 30 days if kept between 2° and 8° under inert gas.]

Buffer Solution—Prepare a solution containing 2% of anhydrous sodium citrate, 1% of hydrochloric acid, 0.5% of thiodiglycol, and 0.1% of benzoic acid in water, and adjust to a pH of 2.

Chromatographic System—The liquid chromatograph is equipped with a detector with appropriate interference filters at 440, 570, or 690 nm and a 4.0-mm × 120-mm column that contains 7.5-µm sulfonated styrene-divinylbenzene copolymer packing. The flow rate is about 14 mL per hour. The system is programmed as follows. Initially equilibrate the column with *Solution A;* at 25 minutes, the composition of the *Mobile Phase* is changed to 100% *Solution B;* and at 37 minutes, the composition is changed to 100% *Solution C.* At 75 minutes into the run, the last amino acid has been eluted from the column, and the column is regenerated with *Column Regeneration Solution* for 1 minute. The column is then equilibrated with *Solution A* for 11 minutes before the next injection. The column temperature is programmed as follows. The initial temperature is 48°; after 11.5 minutes, the temperature is increased to 65° at a rate of 3° per minute; at about 35 minutes, the temperature is increased to 77° at a rate of 3° per minute; and finally at about 52 minutes, the temperature is decreased to 48° at a rate of 3° per minute.

Procedure and Postcolumn Reaction—Reconstitute the lyophilized protein/peptide hydrolysate in the *Buffer Solution,* inject an appropriate amount into the chromatograph, and proceed as directed for *Chromatographic System.* As the amino acids are eluted from the column, they are mixed with the *Postcolumn Reagent*, which is delivered at a flow rate of 7 mL per hour, through a tee. After mixing, the column effluent and the *Postcolumn Reagent* pass through a tubular reactor at a temperature of 135°, where a characteristic purple or yellow color is developed. From the reactor, the liquid passes through a colorimeter with a 12-mm flow-through cuvette. The light emerging from the cuvette is split into three beams for analysis by the detector with interference filters at 440, 570, or 690 nm. The 690-nm signal may be electronically subtracted from the other signals for improved signal-to-noise ratios. The 440-nm (imino acids) and the 570-nm (amino acids) signals may be added in order to simplify data handling.

Method 2—Postcolumn OPA Fluorometric Derivatization

Ion-exchange chromatography with postcolumn *o*-phthalaldehyde (OPA) fluorometric detection is used. The procedure employs an ion-exchange column for separation of free amino acids followed by postcolumn oxidation with sodium hypochlorite and derivatization using OPA and *N*-acetyl-L-cysteine. The sodium hypochlorite oxidation step allows secondary amines, such as proline, to react with the OPA reagent.

OPA reacts with primary amines in the presence of thiol compound to form highly fluorescent isoindole products. This reaction is utilized for the postcolumn derivatization in analysis of amino acids by ion-exchange chromatography. The rule of the separation is the same as *Method I.* Instruments and reagents for this form of amino acid analysis are available commercially. Many modifications of this method exist.

Although OPA does not react with secondary amines (imino acids, such as proline) to form fluorescent substances, the oxidation with sodium hypochlorite allows secondary amines to react with OPA. The procedure employs a strongly acidic cation-exchange column for separation of free amino acids followed by postcolumn oxidation with sodium hypochlorite and postcolumn derivatization using OPA and thiol compound, such as *N*-acetyl-L-cysteine and 2-mercaptoethanol. The derivatization of primary amino acids are not noticeably affected by the continuous supply of sodium hypochlorite.

Separation of the amino acids on an ion-exchange column is accomplished through a combination of changes of pH and cation strength. After postcolumn derivatization of eluted amino acids with OPA, the reactant passes through the fluorometric detector. Fluorescence intensity of OPA-derivatized amino acids are monitored with an excitation wavelength of 348 nm and an emission wavelength of 450 nm.

The detection limit is considered to be a few tens of pmol level for most of the amino acid derivatives. Response linearity is obtained in the range of a few pmol level to a few tens of nmol level. To obtain good compositional data, a sample greater than 500 ng before hydrolysis is best suited for the amino acid analysis of protein/peptide.

One method of postcolumn OPA fluorometric detection is shown below.

Mobile Phase Preparation—

Solution A—Prepare a solution of sodium hydroxide, citric acid, and alcohol in HPLC grade water having a 0.2 N sodium concentration and containing 7% of alcohol (w/v), adjusted to a pH of 3.2.

Solution B—Prepare a solution of sodium hydroxide and citric acid in HPLC grade water having a 0.6 N sodium concentration, adjusted to a pH of 10.0.

Solution C: 0.2 N sodium hydroxide.

Mobile Phase—Use variable mixtures of *Solution A,* Solution B, and *Solution C* as directed for *Chromatographic System*.

Postcolumn Reagent Preparation—

Alkaline Buffer—Prepare a solution containing 384 mM sodium carbonate, 216 mM boric acid, and 108 mM potassium sulfate, and adjust to a pH of 10.0.

Hypochlorite Reagent—To 1 L of *Alkaline Buffer,* add 0.4 mL of sodium hypochlorite solution (10% chlorine concentration). [NOTE—The hypochlorite solution is stable for 2 weeks.]

OPA Reagent—Transfer 2 g of *N*-acetyl-L-cysteine and 1.6 g of OPA to a 15-mL volumetric flask, dissolve in and dilute with alcohol to volume, and mix. Transfer this solution and 4 mL of 10% aqueous polyethylene (23) lauryl ether to a 1-L volumetric flask, dilute with 980 mL of *Alkaline Buffer*, and mix.

Chromatographic System—The liquid chromatograph is equipped with a fluorometric detector set to an excitation wavelength of 348 nm and an emission wavelength of 450 nm and a 4.0-mm × 150-mm column that contains 7.5-µm packing L17. The flow rate is about 0.3 mL per minute, and the column temperature is set at 50°. The system is programmed as follows. The column is equilibrated with *Solution A;* over the next 20 minutes, the composition of the *Mobile Phase* is changed linearly to 85% *Solution A* and 15% *Solution B;* then there is a step change to 40% *Solution A* and 60% *So-*

lution B; over the next 18 minutes, the composition is changed linearly to 100% *Solution B* and held for 7 minutes; then there is a step change to 100% *Solution C,* and this is held for 6 minutes; then there is a step change to *Solution A,* and this composition is maintained for the next 8 minutes.

Procedure and Postcolumn Reaction—Inject about 1.0 nmol of each amino acid under test into the chromatograph, and proceed as directed for *Chromatographic System*. As the effluent leaves the column, it is mixed with the *Hypochlorite Reagent*. The mixture passes through the first postcolumn reactor which consists of stainless steel 0.5-mm × 2-m tubing. A second postcolumn reactor of similar design is placed immediately downstream from the first postcolumn reactor and is used for the OPA postcolumn reaction. The flow rates for both the *Hypochlorite Reagent* and the *OPA Reagent* are 0.2 mL per minute, resulting in a total flow rate (i.e., *Hypochlorite Reagent*, *OPA Reagent,* and column effluent) of 0.7 mL per minute exiting from the postcolumn reactors. Postcolumn reactions are conducted at 55°. This results in a residence time of about 33 seconds in the OPA postcolumn reactor. After postcolumn derivatization, the column effluent passes through the fluorometric detector.

Method 3—Precolumn Determination

Precolumn derivatization of amino acids with phenylisothiocyanate (PITC) followed by reverse-phase HPLC separation with UV detection is used.

PITC reacts with amino acids to form phenylthiocarbamyl (PTC) derivatives, which can be detected with high sensitivity at 254 nm. Therefore, precolumn derivatization of amino acids with PITC followed by a reverse-phase HPLC separation with UV detection is used to analyze the amino acid composition.

After the reagent is removed under vacuum, the derivatized amino acids can be stored dry and frozen for several weeks with no significant degradation. If the solution for injection is kept cold, no noticeable loss in chromatographic response occurs after three days.

Separation of the PTC-amino acids on a reverse-phase HPLC with ODS column is accomplished through a combination of changes in concentrations of acetonitrile and buffer ionic strength. PTC-amino acids eluted from the column are monitored at 254 nm.

The detection limit is considered to be 1 pmol for most of the amino acid derivatives. Response linearity is obtained in the range of 20 to 500 pmol with correlation coefficients exceeding 0.999. To obtain good compositional data, a sample larger than 500 ng of protein/peptide before hydrolysis is best suited for this amino analysis of proteins/peptides.

One method of precolumn PITC derivatization is described below.

Mobile Phase Preparation—

Solution A: 0.05 M ammonium acetate, adjusted with phosphoric acid to a pH of 6.8.

Solution B—Prepare 0.1 M ammonium acetate, adjust with phosphoric acid to a pH of 6.8, and then prepare a mixture of this solution and acetonitrile (1 : 1).

Solution C: a mixture of acetonitrile and water (70 : 30).

Mobile Phase—Use variable mixtures of *Solution A, Solution B,* and *Solution C* as directed for *Chromatographic System*.

Derivatization Reagent Preparation—

Coupling Buffer: a mixture of acetonitrile, pyridine, triethylamine, and water (10 : 5 : 2 : 3).

Sample Solvent: a mixture of water and acetonitrile (7 : 2).

Sample Derivatization Procedure—Dissolve the lyophilized test sample in 100 µL of the *Coupling Buffer,* and then dry in a vacuum centrifuge to remove any hydrochloride if a protein hydrolysis step was used. Dissolve the test sample in 100 µL of *Coupling Buffer,* add 5 µL of PITC, and incubate at room temperature for 5 minutes. The test sample is again dried in a vacuum centrifuge, and is dissolved in 250 µL of *Sample Solvent*.

Chromatographic System—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 250-mm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute, and the column temperature is maintained at 52°. The system is programmed as follows. The column is equilibrated with *Solution A;* over the next 15 minutes, the composition of the *Mobile Phase* is changed linearly to 85% *Solution A* and 15% *Solution B;* over the next 15 minutes, the composition is changed linearly to 50% *Solution A* and 50% *Solution B;* then there is a step change to 100% *Solution C,* and this is held for 10 minutes; then there is a step change to 100% *Solution A,* and the column is allowed to equilibrate before the next injection.

Procedure—Inject about 1.0 nmol of each PITC-amino acid under test (10-µL sample in *Sample Solvent*) into the chromatograph, and proceed as directed for *Chromatographic System*.

Method 4—Precolumn AQC Derivatization

Precolumn derivatization of amino acids with 6-aminoquinolyl-*N*-hydroxysuccinimidyl carbamate (AQC) followed by reverse-phase HPLC separation with fluorometric detection is used.

AQC reacts with amino acids to form stable, fluorescent unsymmetric urea derivatives (AQC-amino acids) which are readily amenable to analysis by reverse-phase HPLC. Therefore, precolumn derivatization of amino acids with AQC followed by reverse-phase HPLC separation is used to analyze the amino acid composition.

Separation of the AQC-amino acids on an ODS column is accomplished through a combination of changes in the concentrations of acetonitrile and salt. Selective fluorescence detection of the derivatives with an excitation wavelength at 250 nm and an emission wavelength at 395 nm allows for the direct injection of the reaction mixture with no significant interference from the only major fluorescent reagent byproduct, 6-aminoquinoline. Excess reagent is rapidly hydrolyzed ($t_{1/2} < 15$ seconds) to yield 6-aminoquinoline-*N*-hydroxysuccinimide and carbon dioxide, and after 1 minute no further derivatization can take place.

Peak areas for AQC-amino acids are essentially unchanged for at least 1 week at room temperature, and the derivatives have more than sufficient stability to allow for overnight automated chromatographic analysis.

The detection limit is considered to be ranging from about 40 fmol to 320 fmol for each amino acid, except for Cys. The detection limit for Cys is approximately 800 fmol. Response linearity is obtained in the range of 2.5 µM to 200 µM with correlation coefficients exceeding 0.999. Good compositional data can be obtained from the analysis of derivatized protein hydrolysates containing as little as 30 ng of protein/peptide.

One method of precolumn AQC derivatization is shown below.

Mobile Phase Preparation—

Solution A—Prepare a solution having a composition of 140 mM sodium acetate and 17 mM triethylamine, and adjust with phosphoric acid to a pH of 5.02.

Solution B: a mixture of acetonitrile and water (60 : 40).

Mobile Phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic System*.

Sample Derivatization Procedure—Dissolve about 2 µg of the test sample in 20 µL of 15 mM hydrochloric acid, and dilute with 0.2 M borate buffer (pH 8.8) to 80 µL. The derivatization is initiated by the addition of 20 µL of 10 mM AQC in acetonitrile, and allowed to proceed for 10 minutes at room temperature.

Chromatographic System—The liquid chromatograph is equipped with a fluorometric detector set at an excitation wavelength of 250 nm and an emission wavelength of 395 nm and a 3.9-mm × 150-mm column that contains 4-µm packing L1. The flow rate is about 1 mL per minute, and the column temperature is maintained at 37°. The system is programmed as follows. The column is equilibrated with *Solution A;* over the next 0.5 minute, the composition of the *Mobile Phase* is changed linearly to 98% *Solution A* and 2% *Solution*

B; then over the next 14.5 minutes to 93% *Solution A* and 7% *Solution B;* then over the next 4 minutes to 87% *Solution A* and 13% *Solution B;* over the next 14 minutes to 68% *Solution A* and 32% *Solution B;* then there is a step change to 100% *Solution B* for a 5-minute wash; over the next 10 minutes, there is a step change to 100% *Solution A;* and the column is allowed to equilibrate before the next injection.

Procedure—Inject about 0.05 nmol of each AQC-amino acid under test into the chromatograph, and proceed as directed for *Chromatographic System.*

Method 5—Precolumn OPA Derivatization

Precolumn derivatization of amino acids with OPA followed by reverse-phase HPLC separation with fluorometric detection is used. This technique does not detect amino acids that exist as secondary amines (e.g., proline).

OPA in conjunction with a thiol reagent reacts with primary amine groups to form highly fluorescent isoindole products. 2-Mercaptoethanol and 3-mercaptopropionic acid can be used as thiol. OPA itself does not fluoresce and consequently produces no interfering peaks. In addition, its solubility and stability in aqueous solution, along with the rapid kinetics for the reactions, make it amenable to automated derivatization and analysis using an autosampler to mix the sample with the reagent. However, lack of reactivity with secondary amino acids has been a predominant drawback. This method does not detect amino acids that exist as secondary amines (e.g., proline). To compensate for this drawback, this technique may be combined with another technique described in *Method 7* or *Method 8.*

Precolumn derivatization of amino acids with OPA is followed by reverse-phase HPLC separation. Because of the instability of the OPA-amino acid derivative, HPLC separation and analysis are performed immediately following derivatization. The liquid chromatograph is equipped with a fluorometric detector for the detection of derivatized amino acids. Fluorescence intensity of the OPA-derivatized amino acids are monitored with an excitation wavelength of 348 nm and an emission wavelength of 450 nm.

The detection limits as low as 50 fmol via fluorescence have been reported, although the practical limit of analysis remains at 1 pmol. One method of precolumn OPA derivatization is shown below.

Mobile Phase Preparation—

Solution A: a mixture of 100 mM sodium acetate (pH 7.2), methanol, and tetrahydrofuran (900 : 95 : 5).

Solution B: methanol.

Mobile Phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic System*.

Derivatization Reagent—Dissolve 50 mg of OPA in 1.25 mL of methanol (protein sequencing grade). Add 50 µL of 2-mercaptoethanol and 11.2 mL of 0.4 M sodium borate (pH 9.5), and mix. [NOTE—This reagent is stable for 1 week.]

Sample Derivatization Procedure—Transfer about 5 µL of the test sample to an appropriate container, add 5 µL of the *Derivatization Reagent,* and mix. After 1 minute, add not less than 20 µL of 0.1 M sodium acetate (pH 7.0). Use 20 µL of this solution for analysis. [NOTE—Use of an internal standard (e.g., norleucine) is recommended for quantitative analysis because of potential reagent volume variations in the sample derivatization. The sample derivatization is performed in an automated on-line fashion. Because of the instability of the OPA-amino acid derivative, HPLC separation and analysis are performed immediately following derivatization.]

Chromatographic System—The liquid chromatograph is equipped with a fluorometric detector set at an excitation wavelength of 348 nm and an emission wavelength of 450 nm and a 4.6-mm × 75-mm column that contains 3-µm packing L3. The flow rate is about 1.7 mL per minute, and the column temperature is maintained at 37°. The system is programmed as follows. The column is equilibrated with 92% *Solution A* and 8% *Solution B;* over the next 2 minutes, the composition of the *Mobile Phase* is changed to 83% *Solu-*

tion A and 17% *Solution B,* and held for an additional 3 minutes; then changed to 54% *Solution A* and 46% *Solution B* over the next 5 minutes, and held for an additional 2 minutes; then changed to 34% *Solution A* and 66% *Solution B* over the next 2 minutes, and held for 1 minute; then over the next 0.3 minute changed to 20% *Solution A* and 80% *Solution B,* and held for an additional 2.6 minutes; and then finally over 0.6 minute changed to 92% *Solution A* and 8% *Solution B,* and held for an additional 0.6 minute.

Procedure—Inject about 0.02 nmol of each OPA-amino acid under test into the chromatograph, and proceed as directed for *Chromatographic System.*

Method 6—Postcolumn DABS-Cl Derivatization

Precolumn derivatization of amino acids with (dimethylamino)azobenzenesulfonyl chloride (DABS-Cl) followed by reverse-phase HPLC separation with visible light detection is used.

DABS-Cl is a chromophoric reagent employed for the labeling of amino acids. Amino acids labeled with DABS-Cl (DABS-amino acids) are highly stable and show the maximum absorption at 436 nm.

DABS-amino acids, all 19 naturally occurring amino acids derivatives, can be separated on an ODS column of a reverse-phase HPLC by employing gradient systems consisting of acetonitrile and aqueous buffer mixture. Separated DABS-amino acids eluted from the column are detected at 436 nm in the visible region.

This method can analyze the imino acids, such as proline, together with the amino acids, at the same degree of sensitivity. DABS-Cl derivatization method permits the simultaneous quantification of tryptophan residues by previous hydrolysis of the protein/peptide with sulfonic acids, such as mercaptoethanesulfonic acid, *p*-toluenesulfonic acid, or methanesulfonic acid, described for *Method 2* in *Protein Hydrolysis* under *Amino Acid Analysis.* The other acid-labile residues, asparagine and glutamine, can also be analyzed by previous conversion into diaminopropionic acid and diaminobutyric acid, respectively, by treatment of protein/peptide with BTI, described for *Method 11* in *Protein Hydrolysis* under *Amino Acid Analysis.*

The nonproteinogenic amino acid, norleucine, cannot be used as an internal standard in this method as this compound is eluted in a chromatographic region crowded with peaks of primary amino acids. Nitrotyrosine can be used as an internal standard because it is eluted in a clean region.

The detection limit of DABS-amino acid is about 1 pmol. As little as 2 to 5 pmol of an individual DABS-amino acid can be quantitatively analyzed with reliability, and only 10 ng to 30 ng of the dabsylated protein hydrolysate is required for each analysis.

One method for precolumn DABS-Cl derivatization is shown below.

Mobile Phase Preparation—

Solution A: 25 mM sodium acetate (pH 6.5) containing 4% of dimethylformamide.

Solution B: acetonitrile.

Mobile Phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic System*.

Derivatization Reagent Preparation—

Sample Buffer: 50 mM sodium bicarbonate, adjusted to a pH of 8.1.

Derivatization Reagent—Dissolve 1.3 mg of DABS-Cl in 1 mL of acetonitrile. [NOTE—This reagent is prepared fresh shortly before the derivatization step.]

Sample Dilution Buffer—Prepare a mixture of 50 mM sodium phosphate (pH 7.0) and alcohol (1 : 1).

Sample Derivatization Procedure—Dissolve the test sample in 20 µL of *Sample Buffer*, add 40 µL of *Derivatization Reagent*, and mix. The sample container is sealed with a silicon-rubber stopper, and heated to 70° for 10 minutes. During the sample heating, the mixture will become completely soluble. After the derivatization, dilute the test sample with an appropriate quantity of the *Sample Dilution Buffer.*

Chromatographic System—The liquid chromatograph is equipped with a 436-nm detector and a 4.6-mm × 250-mm column that contains packing L1. The flow rate is about 1 mL per minute, and the column temperature is maintained at 40°. The system is programmed as follows. The column is equilibrated with 85% *Solution A* and 15% *Solution B;* over the next 20 minutes, the composition of the *Mobile Phase* is changed to 60% *Solution A* and 40% *Solution B;* over the next 12 minutes, the composition is changed to 30% *Solution A* and 70% *Solution B*, and held for an additional 2 minutes.

Procedure—Inject about 0.05 nmol of the DABS-amino acids into the chromatograph, and proceed as directed for *Chromatographic System.*

Method 7—Precolumn FMOC-Cl Derivatization

Precolumn derivatization of amino acids with 9-fluorenylmethyl chloroformate (FMOC-Cl) followed by reverse-phase HPLC separation with fluorometric detection is used.

FMOC-Cl reacts with both primary and secondary amino acids to form highly fluorescent products. The reaction of FMOC-Cl with amino acid proceeds under mild conditions, in aqueous solution, and is completed in 30 seconds. The derivatives are stable, with only the histidine derivative showing any breakdown. Although FMOC-Cl is fluorescent itself, the reagent excess and fluorescent side-products can be eliminated without loss of FMOC-amino acids.

FMOC-amino acids are separated by reverse-phase HPLC using an ODS column. The separation is carried out by gradient elution varied linearly from a mixture of acetic acid buffer, methanol, and acetonitrile (50 : 40 : 10) to a mixture of acetonitrile and acetic acid buffer (50 : 50), and 20 amino acid derivatives that are separated in 20 minutes. Each derivative eluted from the column is monitored by a fluorometric detector set at an excitation wavelength of 260 nm and an emission wavelength of 313 nm.

The detection limit is in the low fmol range. A linearity range of 0.1 μM to 50 μM is obtained for most amino acids.

One method for precolumn FMOC-Cl derivatization is shown below.

Mobile Phase Preparation—

Acetic Acid Buffer—Transfer 3 mL of glacial acetic acid and 1 mL of triethylamine to a 1-L volumetric flask, and dilute with HPLC grade water to volume. Adjust with sodium hydroxide to a pH of 4.20.

Solution A: a mixture of *Acetic Acid Buffer,* methanol, and acetonitrile (50 : 40 : 10).

Solution B: a mixture of acetonitrile and *Acetic Acid Buffer* (50 : 50).

Mobile Phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic System*.

Derivatization Reagent Preparation—

Borate Buffer—Prepare a 1 M boric acid solution, and adjust with sodium hydroxide to a pH of 6.2.

FMOC-Cl Reagent—Dissolve 155 mg of 9-fluorenylmethyl chloroformate in 40 mL of acetone, and mix.

Sample Derivatization Procedure—To 0.4 mL of the test sample add 0.1 mL of *Borate Buffer* and 0.5 mL of *FMOC-Cl Reagent*. After about 40 seconds, extract the mixture with 2 mL of pentane, and then extract again with fresh pentane. The aqueous solution with amino acid derivatives is then ready for injection.

Chromatographic System—The liquid chromatograph is equipped with a fluorometric detector set at an excitation wavelength of 260 nm and an emission wavelength of 313 nm and a 4.6-mm × 125-mm column that contains 3-μm packing L1. The flow rate is about 1.3 mL per minute. The system is programmed as follows. The column is equilibrated with *Solution A,* and this composition is maintained for 3 minutes; over the next 9 minutes, it is changed to 100% *Solution B;* then over the next 0.5 minute, the flow rate is increased to 2 mL per minute, and held until the final FMOC-amino acid is eluted from the column. The total run time is about 20 minutes.

Procedure—Inject not less than 0.01 nmol of each FMOC-amino acid under test into the chromatograph, and proceed as directed for *Chromatographic System*. The FMOC-histidine derivative will generally give a lower response than the other derivatives.

Method 8—Precolumn NBD-F Derivatization

Precolumn derivatization of amino acids with 7-fluoro-4-nitrobenzo-2-oxa-1,3-diazole (NBD-F) followed by reverse-phase HPLC separation with fluorometric detection is used.

7-Fluoro-4-nitrobenzo-2-oxa-1,3-diazole (NBD-F) reacts with both primary and secondary amino acids to form highly fluorescent products. Amino acids are derivatized with NBD-F by heating to 60° for 5 minutes.

NBD-amino acid derivatives are separated on an ODS column of reverse-phase HPLC by employing a gradient elution system consisting of acetonitrile and aqueous buffer mixture, and 17 amino acid derivatives that are separated in 35 minutes. *E*-aminocaproic acid can be used as an internal standard because it is eluted in a clean chromatographic region. Each derivative eluted from the column is monitored by a fluorometric detector set at an excitation wavelength of 480 nm and an emission wavelength of 530 nm.

The sensitivity of this method is almost the same as that for the precolumn OPA derivatization method (*Method 5*), excluding proline to which OPA is not reactive and might be advantageous for NBD-F against OPA.

The detection limit for each amino acid is about 10 fmol. Profile analysis was achieved for about 1.5 mg of protein hydrolysates in the final precolumn labeling reaction mixture for HPLC.

One method for precolumn NBD-F derivatization is shown below.

Mobile Phase Preparation—

Solution A: a solution of 10mM sodium citrate containing 75 mM sodium perchlorate, adjusted with hydrochloric acid to a pH of 6.2.

Solution B: a mixture of acetonitrile and water (50 : 50).

Derivatization Reagent Preparation—

Sample Buffer: a 0.1 M boric acid solution, adjusted with sodium hydroxide to a pH of 9.2.

Derivatization Reagent—Dissolve 5 mg of NBD-F in 1.0 mL of alcohol, and mix.

Sample Derivatization Procedure—Dissolve the test sample in 20 µL of *Sample buffer,* add 10 µL of *Derivatization Reagent,* and mix. The sample container is heated at 60° for 5 minutes. After the derivatization, dilute the test sample with 300 µL of *Solution A.*

Chromatographic System—The liquid chromatograph is equipped with a fluorometric detector set at an excitation wavelength of 480 nm and an emission wavelength of 530 nm and a 4.6-mm × 150-mm column that contains 5-µm particle size ODS silica packing. The flow rate is about 1.0 mL per minute, and the column temperature is maintained at 40°. The system is programmed as follows. The column is equilibrated with 94% *Solution A* and 6% *Solution B;* over the next 16 minutes, the composition is changed linearly to 63% *Solution A* and 37% *Solution B;* over the next 5 minutes, the composition is changed linearly to 62% *Solution A* and 38% *Solution B;* over the next 9 minutes, the composition is changed linearly to 100% *Solution B*, and held for an additional 5 minutes; then finally over 2 minutes, the composition is changed linearly to 94% *Solution A* and 6% *Solution B;* and then the column is allowed to equilibrate before the next injection.

Procedure—Inject about 15 pmol of each NBD-amino acid under test into the chromatograph, and proceed as directed for *Chromatographic System.*

DATA CALCULATION AND ANALYSIS

When determining the amino acid content of a protein/peptide hydrolysate, it should be noted that the acid hydrolysis step destroys tryptophan and cysteine. Serine and threonine are partially destroyed by acid hydrolysis, while isoleucine and valine residues may be only partially cleaved. Methionine can undergo oxidation during acid hydrolysis, and some amino acids (e.g., glycine and serine) are common contaminants. Application of adequate vacuum (less than 200 um µm of mercury or 26.7 Pa) or introduction of inert gas (argon) in the headspace of the reaction vessel during vapor phase hydrolysis can reduce the level of oxidative destruction. Therefore, the quantitative results obtained for cysteine, tryptophan, threonine, isoleucine, valine, methionine, glycine, and serine from a protein/peptide hydrolysate may be variable and may warrant further investigation and consideration.

Calculations

Amino Acid Mole Percent—This is the number of specific amino acid residues per 100 residues in a protein. This result may be useful for evaluating amino acid analysis data when the molecular weight of the protein/peptide under investigation is unknown. This information can be used to corroborate the identity of a protein and has other applications. Carefully identify and integrate the peaks obtained as directed for each *Procedure*. Calculate the mole percent for each amino acid present in the test sample by the formula:

$$100r_U / r$$

in which r_U is the peak response, in nmol, of the amino acid under test; and r is the sum of peak responses, in nmol, for all amino acids present in the test sample. Comparison of the mole percent of the amino acids under test to data from known proteins can help establish or corroborate the identity of the sample protein.

Unknown Protein Samples—This data analysis technique can be used to estimate the protein concentration of an unknown protein sample using the amino acid analysis data. Calculate the mass, in µg, of each recovered amino acid by the formula:

$$mM_W/1000$$

in which m is the recovered quantity, in nmol, of the amino acid under test; and M_W is the average molecular weight, in mg, for that amino acid, corrected for the weight of the water molecule that was eliminated during peptide bond formation. The sum of the masses of the recovered amino acids will give an estimate of the total mass of the protein analyzed after appropriate correction for partially and completely destroyed amino acids. If the molecular weight of the unknown protein is available (i.e., by SDS-PAGE analysis or mass spectroscopy), the amino acid composition of the unknown protein can be predicted. Calculate the number of residues of each amino acid by the formula:

$$m/(1000M/M_{WT})$$

in which m is the recovered quantity, in nmol, of the amino acid under test; M is the total mass, in µg, of the protein; and M_{WT} is the molecular weight, in mg, of the unknown protein.

Known Protein Samples—This data analysis technique can be used to investigate the amino acid composition and protein concentration of a protein sample of known molecular weight and amino acid composition using the amino acid analysis data. When the composition of the protein being analyzed is known, one can exploit the fact that some amino acids are recovered well, while other amino acid recoveries may be compromised because of complete or partial destruction (e.g., tryptophan, cysteine, threonine, serine, methionine), incomplete bond cleavage (i.e., for isoleucine and valine), and free amino acid contamination (i.e., by glycine and serine).

Because those amino acids that are recovered best represent the protein, these amino acids are chosen to quantify the amount of protein. Well-recovered amino acids are, typically, aspartate-asparagine, glutamate-glutamine, alanine, leucine, phenylalanine, lysine, and arginine. This list can be modified based on experience with one's own analysis system. Divide the quantity, in nmol, of each of the well-recovered amino acids by the expected number of residues for that amino acid to obtain the protein content based on each well-recovered amino acid. Average the protein content results calculated. The protein content determined for each of the well-recovered amino acids should be evenly distributed about the mean. Discard protein content values for those amino acids that have an unacceptable deviation from the mean. Typically, a greater than 5% variation from the mean is considered unacceptable, but this is arbitrary. Recalculate the mean protein content from the remaining values to obtain the protein content of the sample. Divide the content of each amino acid by the calculated mean protein content to determine the amino acid composition of the sample by analysis.

Calculate the relative compositional error, in percentage, by the formula:

$$100m / m_S$$

in which m is the experimentally determined quantity, in nmol per amino acid residue, of the amino acid under test; and m_S is the known residue value for that amino acid. The average relative compositional error is the average of the absolute values of the relative compositional errors of the individual amino acids, typically excluding tryptophan and cysteine from this calculation. The average relative compositional error can provide important information on the stability of analysis run over time. The agreement in the amino acid composition between the protein sample and the known composition can be used to corroborate the identity and purity of the protein in the sample.■ IS (*USP30*)

■⟨1053⟩ BIOTECHNOLOGY-DERIVED ARTICLES—CAPILLARY ELECTROPHORESIS

This chapter provides guidance and procedures used for characterization of biotechnology-derived articles by capillary electrophoresis. This chapter is harmonized with the corresponding chapter in *JP* and *EP*. Other characterization tests, also harmonized, are shown in *Biotechnology-Derived Articles—Amino Acid Analysis* ⟨1052⟩, *Biotechnology-Derived Articles—Isoelectric Focusing* ⟨1054⟩, *Biotechnology-Derived Articles—Peptide Mapping* ⟨1055⟩, *Biotechnology-Derived Articles—Polyacrylamide Gel Electrophoresis* ⟨1056⟩, and *Biotechnology-Derived Articles—Total Protein Assay* ⟨1057⟩.

INTRODUCTION

Capillary electrophoresis is a physical method of analysis based on the migration, inside a capillary, of charged analytes dissolved in an electrolyte solution under the influence of a direct-current electric field. In this section we are describing four capillary electrophoresis methods: *Free Solution Capillary Electrophoresis, Capillary Gel Electrophoresis, Capillary Isoelectric Focusing,* and *Micellar Electrokinetic Chromatography.*

In-Process Revision

GENERAL PRINCIPLE

The migration velocity of the analyte under an electric field of intensity *(E)* is determined by the electrophoretic mobility of the analyte and the electroosmotic mobility of the buffer inside the capillary. The electrophoretic mobility of a solute *(μ_{ep})* depends on the characteristics of the solute (electrical charge, molecular size, and shape) and the characteristics of the buffer in which the migration takes place (type and ionic strength of the electrolyte, pH, viscosity, and additives). The electrophoretic velocity *(V_{ep})* of a solute, assuming a spherical shape, is as follows:

$$V_{ep} = \mu_{ep}E = \left(\frac{q}{6\pi\eta r}\right)\left(\frac{V}{L}\right)$$

in which q is the effective charge of the particle; η is the viscosity of the buffer; r is the size of the solute ion; V is the applied voltage; and L is the total length of the capillary.

When an electric field is applied through the capillary filled with buffer, a flow of solvent, called electroosmotic flow, is generated inside the capillary. Its velocity depends on the electroosmotic mobility *(μ_{eo}),* which in turn depends on the charge density on the capillary internal wall and the buffer characteristics. The electroosmotic velocity *(V_{eo})* is as follows:

$$V_{eo} = \mu_{eo}E = \left(\frac{\varepsilon\zeta}{\eta}\right)\left(\frac{V}{L}\right)$$

in which ϵ is the dielectric constant of the buffer; ζ is the zeta potential of the capillary surface; and the other terms are as defined above.

The electrophoretic and electroosmotic mobilities of the analyte may act in the same direction or in opposite directions, depending on the charge (positive or negative) of the solute, and the velocity of the solute *(v)* is as follows:

$$V = V_{ep} \pm V_{eo}$$

The sum or the difference between the two velocities (V_{ep} and V_{eo}) is used depending on whether the mobilities act in the same or opposite directions. Under conditions with a fast V_{eo}, with respect to the V_{ep} of the solutes, both negative and positive charged analytes can be separated in the same run. The time *(t)* taken by the solute to migrate the distance *(l)* from the injection end of the capillary to the detection point (capillary effective length) is as follows:

$$t = \frac{l}{V_{ep} \pm V_{eo}} = \frac{l(L)}{V(\mu_{ep} \pm \mu_{eo})}$$

in which the other terms are as defined above.

In general, the fused-silica capillaries used in electrophoresis bear negative charges on the inner wall, producing electroosmotic flow towards the cathode. The electroosmotic flow has to remain constant from run to run to obtain good reproducibility in the migration velocity of the solutes. For some applications, it might be necessary to reduce or suppress the electroosmotic flow by modifying the inner wall of the capillary or by changing the pH of the buffer solution.

When the sample is introduced in the capillary, each analyte ion of the sample migrates within the background electrolyte as an independent zone according to its electrophoretic mobility. The spreading of each solute band (zone dispersion) results from a different phenomena. Under ideal conditions, the sole contribution to the solute-zone broadening is molecular diffu-

sion of the solute along the capillary (longitudinal diffusion). In this case, the efficiency of the zone is expressed as the number of theoretical plates *(N),* as follows:

$$N = \frac{(\mu_{ep} \pm \mu_{eo})(Vl)}{2DL}$$

in which D is the molecular diffusion of the solute in the buffer; and the other terms are as defined above.

From a practical point of view, other phenomena, such as heat dissipation, sample adsorption onto the capillary wall, mismatched conductivity between sample and buffer, length of the injection plug, detector cell size, and unleveled buffer reservoirs, can also significantly contribute to band dispersion. Separation between two bands (expressed by the resolution, R_S) can be achieved by modification of the electrophoretic mobility of the analytes, by the electroosmotic mobility induced by capillary, and by increasing the efficiency for the band of each analyte as follows:

$$R_S = \frac{\sqrt{N}(\mu_{epb} - \mu_{epa})}{4(\mu_{ep} \pm \mu_{eo})}$$

in which μ_{epa} and μ_{epb} are the electrophoretic mobilities of the two compounds to be separated; $\overline{\mu}_{ep}$ is the average electrophoretic mobility of the two solutes calculated as:

$$\overline{\mu}_{ep} = ½ (\mu_{epb} + \mu_{epa})$$

and the other terms are as defined above.

APPARATUS

An apparatus for capillary electrophoresis is composed of a high voltage controllable power supply; two buffer reservoirs held at the same level and containing specified anodic and cathodic solutions; two electrodes assemblies (cathode and anode) immersed in the buffer reservoirs and connected to the power supply; a separation capillary usually made of fused-silica, sometimes with an optical viewing window aligned with the detector, depending on the detector, with the ends of the capillary placed in the buffer reservoirs and the capillary being filled with a solution specified in a given monograph; a suitable injection system; a detector capable of monitoring the amount of substance of interest passing through a segment of the separation capillary at a given time, generally based on absorption spectrophotometry (UV and visible), fluorimetry, conductimetric, amperometric, or mass spectrometric detection, depending on the specific applications, or even indirect detection to detect non-UV-absorbing and nonfluorescent compounds; and a thermostatic system capable of maintaining the temperature inside the capillary.

The method of injection of samples and its automation is critical for precise quantitative analysis. Methods of injection include gravity, pressure or vacuum, or electrokinetic injection. The amount of each sample component introduced electrokinetically depends on its electrophoretic mobility, thus possibly biasing the results.

It is expected that the capillary, the buffer solutions, the preconditioning method, the sample solution, and the migration conditions will be specified in the individual monograph. The electrolytic solution employed may be filtered to remove particles and degassed to avoid bubble formation that could interfere with the detection system. To achieve reproducible migration time of the solutes, it would be necessary to develop, for each analytical method, a rigorous rinsing routine after each injection.

FREE SOLUTION CAPILLARY ELECTROPHORESIS

In free solution capillary electrophoresis, analytes are separated in a capillary containing only buffer without any anticonvective medium. In this technique, separation takes place because the different components of the sample migrate as discrete bands with different velocities. The velocity of each band depends on the electrophoretic mobility of the solute and the

electroosmotic flow on the capillary. Coated capillaries, with reduced electroosmotic flow, can be used to increase the separation capacity of those substances absorbing on fused-silica surfaces.

This mode of capillary electrophoresis is appropriate for the analysis of small (MW < 2000) and large (2000 < MW < 100,000) molecules. Due to the high efficiency achieved, molecules having only minute differences in their charge-to-mass ratio can be separated. This method also allows the separation of chiral compounds by adding chiral selectors to the separation buffer. The optimization of the separations requires consideration of a number of instrumental and electrolytic solution parameters.

Instrumental Parameters

Voltage—The separation time is universally proportional to applied voltage. However, an increase in the voltage used can cause excessive heat production, giving rise to temperature and viscosity gradients in the buffer inside the capillary, which causes band broadening and decreases resolution.

Temperature—The main effect of temperature is observed on buffer viscosity and electrical conductivity, thus affecting migration velocity. In some cases, an increase in capillary temperature can cause a conformational change of some proteins, modifying their migration time and the efficiency of the separation.

Capillary—The length and internal diameter of the capillary affects the analysis time, the efficiency of separations, and the load capacity. Increasing both effective length and total length can decrease the electric fields, at a constant voltage, which will increase migration time. For a given buffer and electric field, heat dissipation (thus, sample band broadening) depends on the internal diameter of the capillary. The latter also affects the detection limit, depending on the sample volume injected into the capillary and the detection system used.

The adsorption of sample components on the capillary wall limits efficiency; therefore, methods to avoid these interactions should be considered in the development of a separation method. This is critical in samples containing proteins. Strategies have been devised to avoid adsorption of proteins on the capillary wall. These strategies include both the use of extreme pH and the absorption of positively charged buffer additives that only require modification of the buffer composition. Other strategies include the coating of the internal wall of the capillary with a polymer covalently bonded to the silica that prevents interaction between the proteins and the negatively charged silica surface. Capillaries with coatings consisting of neutral-hydrophilic, cationic, and anionic polymers are commercially available.

Electrolytic Solution Parameters

Buffer Type and Concentrations—Suitable buffers for capillary electrophoresis have an appropriate buffer capacity in the pH range of choice and low mobility to minimize current generation.

To minimize peak shape distortion, it is important to match buffer–ion mobility to solute mobility whenever possible. The type of sample solvent used is important to achieve on-column sample focusing, which increases separation efficiency and improves detection. Also, an increase in buffer concentration at a given pH will decrease electroosmotic flow and solute velocity.

Buffer pH—The pH of the buffer can affect separation by modifying the charge of the analyte or other additives and by changing the electroosmotic flow. For protein and peptide separation, a change in the pH of the buffer from above the isoelectric point to below the isoelectric point changes the net charge of the solute from negative to positive. An increase in the buffer pH generally increases the electroosmotic flow.

Organic Solvents—Organic modifiers, such as methanol, acetonitrile, and others, are added to the aqueous buffer to increase the solubility of the solute or other additives and/or to

affect the ionization degree of the sample components. The addition of these organic modifiers to the buffer generally causes a decrease in the electroosmotic flow.

Additives for Chiral Separations—To separate optical isomers, a chiral selector is added to the separation buffer. The most commonly used chiral selectors are cyclodextrins, although in some cases crown ethers, certain polysaccharides, or even proteins can be used. Because chiral recognition is governed by the different interactions between the chiral selector and each of the enantiomers, the resolution achieved for the chiral compounds depends largely on the type of chiral selector used. While developing a given separation it may be useful to test cyclodextrins having a different cavity size (α-, *β*-, or Γ-cyclodextrin) or modified cyclodextrins with neutral (methyl, ethyl, hydroxyalkyl, etc.) or ionizable (aminomethyl, carboxymethyl, sulfobutylether, etc.) moities. The resolution of chiral separations is also controlled by the concentration of the chiral selector, the composition and pH of the buffer, and the separation temperature. Organic additives, such as methanol or urea, can also affect the resolution of separation.

CAPILLARY GEL ELECTROPHORESIS

Separation takes place inside a capillary filled with a polymer acting as a molecular sieve. The smaller components in the sample move faster along the capillary than the larger ones. This method can be used for separation of biopolymers-proteins and DNA fragments, according to their molecular mass.

Characteristics of Chemical and Physical Gels

Chemical Gels—Chemical gels are prepared inside the capillary by reaction of monomers. One example of such a gel is a cross-linked polyacrylamide. This type of gel is bonded to the fused-silica wall and cannot be removed without destroying the capillary. For protein analysis, the separation buffer usually contains sodium dodecyl sulfate, and the sample is denatured by heating in a mixture of sodium dodecyl sulfate and 2-mercaptoethanol or dithiothreitol before injection. Optimization of separation in a cross-linked gel is obtained by modifying the separation buffer (see *Free Solution Capillary Electrophoresis*) and by controlling the gel porosity during the gel preparation. For a cross-linked polyacrylamide gel, the porosity can be modified by changing the concentration of acrylamide and/or the ratio of the cross-linker. As a rule, a decrease in the porosity of the gel leads to a decrease in the mobility of the solutes. Due to the rigidity of this type of gel, only electrokinetic injection can be used.

Physical Gels—Physical gels are hydrophilic polymers (i.e., linear polyacrylamide, cellulose derivatives, dextran, etc.) which can be dissolved in aqueous separation buffers, giving rise to a separation medium that also acts as a molecular sieve. These polymeric separation media are easier to prepare than cross-linked polymers. They can be prepared in a vial and filled by pressure in a wall-coated capillary with no electroosmotic flow. Replacing the gel before every injection generally improves the separation reproducibility. The porosity of the physical gels can be increased by using polymers of higher molecular weight (at a given polymer concentration) or by decreasing the polymer concentration (for a given polymer molecular weight). A decrease in gel porosity leads to a decrease in the mobility of the solute for the same buffer. Both hydrodynamic and electromigration injection techniques can be used because the dissolution of these polymers in the buffer gives low viscosity solutions.

CAPILLARY ISOELECTRIC FOCUSING

The molecules migrate under the influence of the electric field, so long as they are charged, in a pH gradient generated by ampholytes having *pI* values in a wide range (poly-amino-carboxylic acids) dissolved in the separation buffer. The three basic steps in capillary isoelectric focusing are loading, focusing, and mobilization.

Loading—

Loading in One Step—The sample is mixed with ampholytes and introduced into the capillary by pressure or vacuum.

Sequential Loading—A leading buffer, then the ampholytes, then the sample mixed with ampholytes, again ampholytes alone, and finally the terminating buffer are introduced into the capillary. The volume of the sample must be small enough so as to not modify the pH gradient.

Focusing—When the voltage is applied, ampholytes migrate toward the cathode or the anode according to their net charge, creating the pH gradient from anode (lower pH) to cathode (higher pH). The components to be separated migrate until they reach a pH corresponding to their isoelectric point, and the current drops to very low values.

Mobilization—The bands of separated components migrate past the detector by one of the three following methods.

Method 1—During *Focusing,* under the influence of the electroosmotic flow when this flow is small enough to allow the focusing of the components.

Method 2—By application of positive pressure after *Focusing.*

Method 3—After *Focusing,* by adding salts in the cathode reservoir or the anode reservoir, depending on the direction chosen for mobilization, in order to alter the pH in the capillary when the voltage is applied. As the pH is changed, the proteins and ampholytes are mobilized in the direction of the reservoir, which contains added salts and pass the detector.

The separation achieved is expressed as ΔpI and depends on the pH gradient *(dpH),* the number of ampholytes having different *pI* values, the diffusion coefficient *(D),* the intensity of the electric field *(E),* and the variation of the electrophoretic mobility of the analyte with the pH, and is as follows:

$$\Delta pI = 3\sqrt{\frac{D(dpH/dx)}{E(-d\mu/dpH)}}$$

in which dpH/dx is the pH gradient; and $-d\mu/dpH$ is the variation of the solution mobility with the pH in the region close to the *pI.*

Optimization Parameters—The major parameters that need to be considered in the development of separations are voltage, capillary, and solutes.

Voltage: use of high fields from 300 V/cm to 1,000 V/cm during *Focusing.*

Capillary—Depending on the *Mobilization* strategy selected (see above), the electroosmotic flow must be reduced or suppressed. Coated capillaries tend to reduce the electroosmotic flow.

Solutions—The anode buffer reservoir is filled with a solution of a lower pH than the *pI* of the most acidic ampholyte, and the cathode reservoir is filled with a solution with a higher pH than the *pI* of the most basic ampholyte. Phosphoric acid for the anode and sodium hydroxide for the cathode are frequently used.

Addition of a polymer, like methylcellulose, in the ampholyte solution tends to suppress convective forces (if any) and electroosmotic flow by increasing the viscosity. Commercial ampholytes covering many pH ranges are available and may also be mixed to obtain an expanded pH range. Broad pH ranges are used to estimate the isoelectric point, whereas narrower ranges are employed to improve accuracy. Calibration can be made by correlating migration time with the isoelectric point of a series of standard protein markers. During *Focusing,* precipitation of proteins at their isoelectric point can be prevented, if necessary, using buffer additives such as glycerol, surfactants, urea, or Zwitterionic buffers. However, depending on the concentration, urea can denature proteins.

MICELLAR ELECTROKINETIC CHROMATOGRAPHY (MEKC)

Separation takes place in an electrolytic solution that contains a surfactant, generally ionic, at a concentration above the critical micellar concentration. The solute molecules are distributed between the aqueous buffer and the pseudo-stationary phase composed by the micelles according to the solute's partition coefficient. The technique can be considered as a hy-

brid of electrophoresis and chromatography. It is an electrophoretic technique that can be used for the separation of both neutral and charged solutes maintaining the efficiency, speed, and instrumental suitability of capillary electrophoresis. One of the most widely used surfactants is sodium dodecyl sulfate, although other anionic and cationic surfactants, such as cetyl trimethyl ammonium salts, have also been used.

At neutral and alkaline pH, a strong electroosmotic flow is generated and moves the separation buffer ions in the direction of the cathode. If sodium dodecyl sulfate is used as surfactant, the electrophoretic migration of the anionic micelle is in the opposite direction, toward the anode. As a result, the overall micelle migration velocity is slowed compared to the bulk flow of the electrolytic solution. In the case of neutral solutes, because the analyte can partition between the micelle and the aqueous buffer and has no electrophoretic mobility, the analyte migration velocity will only depend on the partition coefficient between the micelle and the aqueous buffer. In the electropho-retogram, the peak corresponding to each uncharged solute is always between that of the electroosmotic flow marker and that of the micelle; and the time elapsed between these two peaks is called the separation window. For electrically charged solutes, the migration velocity depends on both the partition coefficient of the solute between the micelle and the aqueous buffer and on the electrophoretic mobility of the solute in the absence of micelles.

The separation mechanism is essentially chromatographic, and migration of the solute and resolution can be expressed in terms of the capacity factor of the solute *(K′),* which is the ratio between the total number of moles of solute in the micelle to those in the mobile phase. For a neutral compound, K' is as follows:

$$K' = \frac{t_r - t_0}{t_0(1 - t_r/t_m)} = K\left(\frac{V_S}{V_M}\right)$$

in which t_r is the migration time of the solute; t_0 is the analysis time of the unretained solute obtained by injecting an electroosmotic flow marker that does not enter the micelle (i.e., methanol); t_m is the micelle migration time measured by injecting a micelle marker, such as Sudan III, which migrates continuously associated in the micelle; K is the partition coefficient of the solute; V_S is the volume of the micelles phase; and V_M is the volume of the mobile phase.

The resolution between two closely-migrating compounds *(R_S)* is as follows:

$$R_S = \frac{\sqrt{N}}{4} \times \frac{\alpha - 1}{\alpha} \times \frac{k_b}{k_b + 1} \times \frac{1 - \left(\frac{t_0}{t_m}\right)}{1 + k_a \times \left(\frac{t_0}{t_m}\right)}$$

in which N is the number of theoretical plates for one of the compounds; α is the selectivity obtained; k_a and k_b are retention factors for both components, respectively *($k_b > k_a$);* and the other terms are as defined above.

Similar, but not identical, equations give k and R_S values for electrically charged compounds.

Optimization Parameters

The main parameters to be considered in the development of separations by MEKC are instrumental and electrolytic solution parameters.

Instrumental Parameters—

Voltage—Separation time is inversely proportional to applied voltage. An increase in voltage can cause excessive heat production that gives rise to temperature gradients and viscosity gradients of the buffer in the cross section of the capillary. This effect can be significant with high conductivity buffers, such as those containing micelles. Poor heat dissipation causes band broadening and decreases resolution.

In-Process Revision

Temperature—Variations in capillary temperature affect the partition coefficient of the solute between the buffer and the micelle, the critical micelle concentration, and the viscosity of the buffer. These parameters contribute to the migration time of the solutes.

Capillary—Length and internal diameter contribute to analysis time and efficiency of separations. Increasing both effective length and total length can decrease the electrical fields, working at constant voltage, and will increase migration time and improve the separation efficiency. The internal diameter controls heat dissipation, at a given buffer and electrical field, and provides a broadening of the sample band.

Electrolytic Solution Parameters—

Surfactant Type and Concentration—The type of surfactant, as the stationary phase in chromatography, affects the resolution because it modifies separation selectively. The log K' of a neutral compound increases linearly with the concentration of detergent in the mobile phase. When K' approaches the value of

$$\sqrt{t_m / t_a}$$

resolution in MEKC reaches a maximum. Modifying the concentration of surfactant in the mobile phase changes the resolution.

Buffer pH—pH does not modify the partition coefficient of non-ionized solutes, but it can modify the electroosmotic flow in uncoated capillaries. A decrease in the buffer pH decreases the electroosmotic flow and, therefore, increases the resolution of the neutral solutes, giving rise to longer analysis time.

Organic Solvents—To improve separation of hydrophobic compounds, organic modifiers (methanol, propanol, acetonitrile, etc.) can be added to the separation electrolytic solution. The addition of these modifiers generally decreases migration time and selectivity of the separation. The addition of organic modifiers affects micelle formation, thus, a given surfactant concentration can be used only with a certain percentage of organic modifier before the micellezation equilibrium is eliminated or adversely affected, resulting in the absence of micelles and, therefore, the absence of the partition mechanism of MEKC. The elimination of micelles in the presence of a high content of organic solvent does not always mean that the separation will no longer be possible, because, in some cases, the hydrophobic interaction between the ionic surfactant monomer and the neutral solutes form solvophobic complexes that can be separated electrophoretically.

Additives for Chiral Separations—A chiral selector is included in the micellar system, either covalently bound to the surfactant or added to the micellar separation electrolyte. Micelles that have a moiety with chiral discrimination properties include salts, *N*-dodecanoyl-L-amino acids, bile salts, etc. Chiral resolution can also be achieved using chiral discriminators, such as cyclodextrins, added to the electrolytic solutions that contain micelliced achiral surfactants.

Other Additives—Selectivity can be modified by adding chemicals to the buffer. Addition of several types of cyclodextrins to the buffer is also used to reduce the interaction of hydrophobic solutes with the micelle, increasing the selectivity for this type of compound. The addition of substances able to modify solute-micelle interactions by adsorption on the latter has been used to improve the selectivity of the separations in MEKC. These additives may consist of a second surfactant (ionic or non-ionic), which gives rise to mixed micelles, metallic cations that dissolve in the micelle and give co-ordination complexes with the solutes.

Quantitative Analysis

Peak areas must be divided by the corresponding migration time to give the corrected area in order to compensate for the shift in migration time from run to run, thus reducing the variation of the response. Dividing the peak areas by migration time will also compensate for the different responses of sam-

ple constituents with different migration times. Where an internal standard is used, check that no peak of the substance to be examined is masked by that of the internal standard.

Calculations—From the values obtained, calculate the content of a component or components being determined. When indicated, the percentage of one (or more) components of the sample to be examined is calculated by determining the areas of the peak(s) as a percentage of the total corrected areas of all the peaks, excluding those due to solvents or any added reagents. The use of an automatic integration system (integrator or data acquisition and processing system) is recommended.

CAPILLARY ELECTROPHORESIS SYSTEM SUITABILITY

The choice of suitability parameters to be used will depend on the type of capillary electrophoresis that is performed. These parameters are the capacity factor *(K′)* used only for *Micellar Electrokinetic Chromatography,* the number of theoretical plates *(n),* the symmetry factor *(A_S),* and the resolution *(R_S)*. Note that in previous sections, the theoretical expressions for n and R_s have been described, but more practical equations that allow for the determination of these suitability parameters using the electrophoretograms are described below.

The number of theoretical plates *(n)* may be calculated from the formula:

$$n = 5.54\ (t/b_{0.5})^2$$

in which t is the distance, in mm, along the baseline between the point of injection and the perpendicular dropped from the maximum of the peak in question; and $b_{0.5}$ is the peak width, in mm, at half-height.

The resolution *(R_S)* may be calculated from the formula:

$$R_S = 1.18(t_b - t_a/b_{0.5b}\ \ b_{0.5a})$$

in which t_b and t_a are the distances, in mm, along the baseline between the point of injection and the perpendicular dropped from the maxima of two adjacent peaks *($t_b > t_a$);* and $b_{0.5b}$ and $b_{0.5a}$ are the peak widths, in mm, at half-height.

The resolution *(R_S)* may also be calculated by measuring the height of the valley *(c)* between two partly resolved peaks in a standard preparation, the height of the smaller peak *(d),* and by specifying *$(c/d) \leq x$,* in which x is the limit indicated in the individual monograph.

The symmetry factor of a peak *(A_S)* may be calculated using the formula:

$$A_S = b_{0.05}/2A$$

in which $b_{0.05}$ is the width of the peak at one-twentieth of the peak height; and A is the distance between the perpendicular dropped from the peak maximum and the leading edge of the peak at one-twentieth of the peak height.

Other system suitability parameters include tests for area repeatability (i.e., standard deviation of areas or of area/migration time) and tests for migration time repeatability (i.e., standard deviation of migration time). For migration time repeatability, it will be necessary to provide for a test to measure the suitability of the capillary washing procedures. To avoid the lack of repeatability of the migration time, an alternative practice is to use a migration time relative to an internal standard.

A test for the verification of the signal-to-noise ratio for a standard preparation or the determination of the limit of quantitation is a useful system suitability parameter. The detection limit and quantitation limit correspond to a signal-to-noise ratio greater than 3 and 10, respectively. The signal-to-noise ratio *(S/N)* is calculated as follows:

$$S/N = 2H/h_n$$

in which H is the height of the peak corresponding to the component concerned in the electrophoretogram obtained with the specified reference solution; and h_n is the absolute value of the

largest noise fluctuation from the baseline in an electrophoretogram obtained after injection of a blank and observed over a distance equal to twenty times the width at the half-height of the peak in the electrophoretogram obtained with the reference solution, and situated equally around the place where this peak would be found.■1S *(USP30)*

■⟨1054⟩ BIOTECHNOLOGY-DERIVED ARTICLES—ISOELECTRIC FOCUSING

This chapter provides guidance and procedures used for the characterization of biotechnology-derived articles by isoelectric focusing. This chapter is harmonized with the corresponding chapters in *JP* and *EP*. Other characterization tests, also harmonized, are shown in the USP general information chapters *Biotechnology-Derived Articles—Amino Acid Analysis* ⟨1052⟩, *Biotechnology-Derived Articles—Capillary Electrophoresis* ⟨1053⟩, *Biotechnology-Derived Articles—Peptide Mapping* ⟨1055⟩, *Biotechnology-Derived Articles—Polyacrylamide Gel Electrophoresis* ⟨1056⟩, and *Biotechnology-Derived Articles—Total Protein Assay* ⟨1057⟩.

INTRODUCTION

Isoelectric focusing (IEF) is a method of electrophoresis that separates proteins according to their isoelectric points. Separation is carried out in a slab of polyacrylamide or agarose gel that contains a mixture of amphoteric electrolytes (ampholytes). When subjected to an electrical field, the ampholytes migrate in the gel to create a pH gradient. In some cases, gels containing an immobilized pH gradient, prepared by incorporating weak acids and bases to specific regions of the gel network during the preparation of the gel, are used. When the applied proteins reach the gel fraction that has a pH that is the same as their isoelectric point, their charge is neutralized and migration ceases. Gradients can be made over various ranges of pH, according to the mixture of ampholytes chosen.

GENERAL PRINCIPLES

When a protein is at the position of its isoelectric point, it has no net charge and cannot be moved in a gel matrix by the electric field. It may, however, move from that position by diffusion. The pH gradient forces a protein to remain in its isoelectric point position, thus concentrating it; this concentration effect is called "focusing". Increasing the applied voltage or reducing the sample load results in improved resolution of bands. The applied voltage is limited by the heat generated because the heat must be dissipated. The use of thin gels and an efficient cooling plate controlled by a thermostatic circulator prevents the burning of the gel while allowing sharp focusing. The separation is estimated by determining the minimum pI difference, which is necessary to separate two neighboring bands, as follows:

$$\Delta pI = 3\sqrt{\frac{D(dpH/dx)}{E(-d\mu/dpH)}}$$

in which D is the diffusion coefficient of the protein; dpH/dx is the pH gradient; E is the intensity of the electric field, in volts per centimeter; and $-d\mu/dpH$ is the variation of the solute mobility with the pH in the region close to the pI. Because D and $-d\mu/dpH$ for a given protein cannot be altered, the separation can be improved by using a narrower pH range and by increasing the intensity of the electric field.

In-Process Revision

From an operational point, special attention must be paid to sample characteristics and/or preparation. Salt in a sample can be problematic, and it is best to prepare the sample, if possible, in deionized water or 2% ampholytes using dialysis or gel filtration if necessary. Potentials of 2500 volts have been used and are considered optimal under a given set of conditions. Up to 30 watts of constant power can be applied and will generally give complete separation in 1.5 to 3.0 hours. The time required for completion of focusing in thin-layer polyacrylamide gels is determined by placing a colored protein (e.g., hemoglobin) at different positions on the gel surface and by applying the electric field: the steady state is reached when all applications give an identical band pattern. In some procedures the completion of the focusing is indicated by the time elapsed after the sample application.

Resolution between protein bands on an IEF gel prepared with carrier ampholytes can be quite good. Better resolution may be achieved by using immobilized pH gradients where the buffering species, which are analogous to carrier ampholytes, are copolymerized within the gel matrix. Proteins exhibiting pI values differing by as little as 0.02 pH units may be resolved using a gel prepared with carrier ampholytes, whereas immobilized pH gradients can resolve protein differing by approximately 0.001 pH units.

The IEF gel can be used as an identity test when migration on the gel is compared to a standard preparation and IEF calibration proteins; the IEF gel can be used as a limit test when the density of a band on IEF is compared subjectively with the density of bands appearing in a standard preparation, or it can be used as a semiquantitative test when the density is measured using a densitometer or similar instrumentation to determine the relative concentration of protein in the bands.

APPARATUS

An apparatus for isoelectric focusing consists of a controllable direct current generator, of stabilized output; a rigid plastic isoelectric focusing chamber that contains a cooled plate of suitable material to support the gel; and a plastic cover with platinum electrodes that are connected to the gel by means of paper wicks of suitable width, length, and thickness, impregnated with solutions of anodic and cathodic electrolytes.

PROCEDURE

Unless otherwise indicated in a given monograph, the following procedure in thick polyacrylamide slab gels is to be used.

Preparation of the Gels

Assembly—Composed of a glass plate (A) on which a polyester film (B) is placed to facilitate handling of the gel, one or more spacers (C), a second glass plate (D), and clamps to hold the structure together (see *Figure 1*).

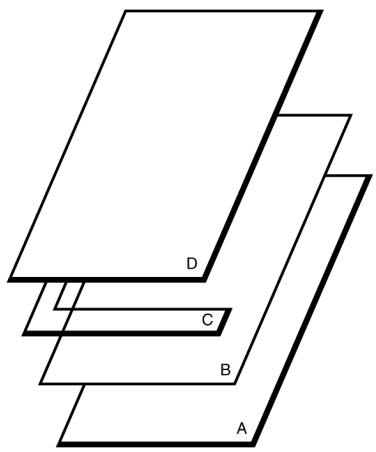

Figure 1. Mould

7.5% Polyacrylamide Gel—Dissolve 29.1 g of acrylamide and 0.9 g of methylenebisacrylamide in 100 mL of water. To 2.5 volumes of this solution, add the mixture of ampholytes specified in the individual monograph, and dilute up to 10 volumes with water. Mix carefully, and degas the solution.

Preparation of the Assembly—Place the polyester film on the lower glass plate, apply the spacer, place the second glass plate, and fit the clamps. Before use, place the mixture on a

magnetic stirrer, and add 0.25 volumes of a 10% solution of ammonium persulfate and 0.25 volumes of tetramethylenediamine. Immediately fill the space between the glass plates of the assembly with the gel.

Fixing Solution for Isoelectric Focusing Polyacrylamide Gel—Mix 35 g of sulfosalicylic acid and 100 g of trichloroacetic acid in 1000 mL of water.

Coomassie Staining Solution and *Destaining Solution*—Use the same solutions indicated in general information chapter *Biotechnology-Derived Articles—Polyacrylamide Gel Electrophoresis* ⟨1056⟩.

Procedure—Dismantle the assembly, and using the polyester film, transfer the gel onto the cooled support wetted with a few mL of a suitable liquid, taking care to avoid forming air bubbles. Prepare the test solutions and reference solutions as specified in the individual monograph. Place strips of paper for sample application, about 10 mm × 5 mm in size, on the gel, and impregnate each with the prescribed amount of the test and reference solutions. If the protein concentration of the solution is too low, several strips may be superimposed (up to four). Also apply the prescribed quantity of a solution of proteins with known isoelectric points as pH markers to calibrate the gel. In some procedures, the gel has precast slots where a solution of the sample is applied instead of using impregnated paper strips. Cut two strips of paper to the length of the gel, and impregnate them with the electrolyte solutions: acid for the anode and alkaline for the cathode. The compositions of the anode and cathode solutions are given in the individual monograph. Apply these paper wicks to each side of the gel several mm from the edge. Fit the cover so that the electrodes are in contact with the wicks (with respect to the anodic and cathodic poles). Proceed with the isoelectric focusing by applying the electrical parameters described in the individual monograph. Switch off the current when the migration of the mixture of standard proteins has stabilized. Using forceps, remove the sample application strips and the two electrode wicks. Immerse the gel in *Fixing Solution for Isoelectric Focusing Polyacrylamide Gel.* Incubate with gentle shaking at room temperature for 30 minutes. Drain off the solution, and add 200 mL of *Destaining Solution.* Incubate with shaking for 1 hour. Drain the gel, and add *Coomassie Staining Solution.* Incubate for 30 minutes. Destain the gel by passive diffusion with *Destaining Solution* until the bands are well visualized against a clear background. Locate the position and intensity of the bands in the electropherogram, as prescribed in the individual monograph.

Alternative Procedure—When a monograph references the general method for isoelectric focusing above, variations in methodology or procedure may be used, subject to validation. These variations include the use of commercially available precast gels; the use of immobilized pH gradients; the use of rod gels, and the use of cassettes of different dimensions, including ultrathin (0.2 mm) gels; variations in the sample application procedure, including different sample volumes or the use of sample application masks or wicks other than paper; the use of alternate running conditions, including variations in the electric field depending on gel dimensions and equipment, and the use of fixed migration times rather than subjective interpretation of band stability; the inclusion of a prefocusing step; the use of automated instrumentation; and the use of agarose gels.

Validation of Procedure

Where alternative methods to the general method are employed, they must be validated. The following criteria may be used to validate the separation: formation of a stable pH gradient of desired characteristics, evaluated using colored pH markers of known isoelectric points; comparison with the electropherogram provided with the chemical reference substance for the preparation to be examined; and any other validation criteria as prescribed in the individual monograph.

SPECIFIED VARIATIONS TO THE GENERAL METHOD

Variations to the general method required for the analysis of specific substances may be specified in detail in individual monographs. Variations may include the addition of urea in the running gel (a 3 M concentration is often satisfactory to keep the protein in solution, but up to 8 M can be used). Some proteins precipitate at their isoelectric point. In this case, urea is included in the gel formulation to keep the protein in solution. If urea is used, only fresh solutions should be used to prevent carbamylation of the protein. Other variations include the use of alternative staining methods and the use of gel additives such as nonionic detergents (e.g., octylglucoside) or zwitterionic detergents (e.g., CHAPS or CHAPSO) to prevent proteins from aggregating or precipitating.

NOTE—The following are general precautionary items that can be used to improve the method.

- Samples can be applied to any area on the gel, but in general, they should be applied to areas where they are expected to focus. To protect the proteins from extreme pH environments, samples should not be applied close to either electrode. During method development, the analyst can try applying the protein in three positions on the gel (i.e., middle and both ends); the pattern of a protein applied at opposite ends of the gel may not be identical.
- A phenomenon known as cathodic drift, where the pH gradient decays over time, may occur if a gel is focused too long. Although not well understood, electroendoosmosis and absorption of carbon dioxide may be factors that lead to cathodic drift. Cathodic drift is observed as focused protein migrating off the cathode end of the gel. Immobilized pH gradients may be used to address this problem.
- Efficient cooling (approximately 4°) of the bed that the gel lies on during focusing is important. High field strengths used during isoelectric focusing can lead to overheating and affect the quality of the focused gel.■1S (*USP30*)

■⟨1055⟩ BIOTECHNOLOGY-DERIVED ARTICLES—PEPTIDE MAPPING

This chapter provides guidance and procedures used for characterization of biotechnology-derived articles by peptide mapping. This chapter is harmonized with the corresponding chapter in *JP* and *EP*. Other characterization tests, also harmonized, are shown in *Biotechnology-Derived Articles—Amino Acid Analysis* ⟨1052⟩, *Biotechnology-Derived Articles—Capillary Electrophoresis* ⟨1053⟩, *Biotechnology-Derived Articles—Isoelectric Focusing* ⟨1054⟩, *Biotechnology-Derived Articles—Polyacrylamide Gel Electrophoresis* ⟨1056⟩, and *Biotechnology-Derived Articles—Total Protein Assay* ⟨1057⟩.

INTRODUCTION

Purpose and Scope

Peptide mapping is an identity test for proteins, especially those obtained by rDNA technology. It involves the chemical or enzymatic treatment of a protein, resulting in the formation of peptide fragments, followed by separation and identification of the resultant fragments in a reproducible manner. It is a powerful test that is capable of identifying single amino acid changes resulting from events such as errors in the reading of complementary DNA (cDNA) sequences or point mutations. Peptide mapping is a comparative procedure because the information obtained, compared to a reference standard or reference material similarly treated, confirms the primary structure of the protein, is capable of detecting whether alterations in

In-Process Revision

structure have occurred, and demonstrates process consistency and genetic stability. Each protein presents unique characteristics that must be well understood so that the scientific and analytical approaches permit validated development of a peptide map that provides sufficient specificity.

This section provides detailed assistance in the application of peptide mapping and its validation to characterize the desired protein product, to evaluate the stability of the expression construct of cells used for recombinant DNA products, to evaluate the consistency of the overall process, and to assess product stability, as well as to ensure the identity of the protein product or to detect the presence of protein variant. The validation scheme presented differentiates between qualification of the method at an early stage in the regulatory process, the Investigational New Drug (IND) level, and full validation in support of New Drug Application (NDA), Product License Application (PLA), or Marketing Authorization Application (MAA). The validation concepts described are consistent with the general information chapter *Validation of Compendial Procedures* ⟨1225⟩ and with the International Conference on Harmonization (ICH) document on *Analytical Methods Validation*.

The Peptide Map

Peptide mapping is not a general method, but involves developing specific maps for each unique protein. Although the technology is evolving rapidly, there are certain methods that are generally accepted. Variations of these methods will be indicated, when appropriate, in specific monographs.

A peptide map may be viewed as a fingerprint of a protein and is the end product of several chemical processes that provide a comprehensive understanding of the protein being analyzed. Four major steps are necessary for the development of the procedure: isolation and purification of the protein, if the protein is part of a formulation; selective cleavage of the peptide bonds; chromatographic separation of the peptides; and analysis and identification of the peptides. A test sample is digested and assayed in parallel with a reference standard or reference material. Complete cleavage is more likely to occur when enzymes such as endoproteases (e.g., trypsin) are used instead of chemical cleavage reagents. A map should contain enough peptides to be meaningful. On the other hand, if there are too many fragments, the map might lose its specificity because many proteins will then have the same profiles.

ISOLATION AND PURIFICATION

Isolation and purification are necessary for analysis of bulk drugs or dosage forms containing interfering excipients and carrier proteins and, when required, will be specified in the monograph. Quantitative recovery of protein from the dosage form should be validated.

SELECTIVE CLEAVAGE OF PEPTIDE BONDS

The selection of the approach used for the cleavage of peptide bonds will depend on the protein under test. This selection process involves determination of the type of cleavage to be employed—enzymatic or chemical—and the type of cleavage agent within the chosen category. Several cleavage agents and their specificity are shown in *Table 1*. This list is not all-inclusive and will be expanded as other cleavage agents are identified.

Table 1. Examples of Cleavage Agents

Type	Agent	Specificity
Enzymatic	Trypsin (EC 3.4.21.4)	*C*-terminal side of Arg and Lys
	Chymrotrypsin (EC 3.4.21.1)	*C*-terminal side of hydrophobic residues (e.g., Leu, Met, Ala, aromatics)
	Pepsin (EC 3.4.23.1)	Nonspecific digest
	Lysyl endopeptidase (Lys-C Endopeptidase) (EC 3.4.21.50)	*C*-terminal side of Lys
	Glutamyl endopeptidase (from *S. aureus* stain V8) (EC 3.4.21.19)	*C*-terminal side of Glu and Asp
	Peptidyl-Asp metaplo-endopeptidase (Endoproteinase Asp-N) (EC 3.4.24.33)	*N*-terminal side of Asp
	(Clostripain) (EC 3.4.28.8)	*C*-terminal side of Arg
Chemical	Cyanogen bromide	*C*-terminal side of Met
	2-Nitro-5-thio-cyano- benzoic acid	*N*-terminal side of Cys
	O-Iodosobenzoic acid	*C*-terminal side of Trp and Tyr
	Dilute acid	Asp and Pro
	BNPS-skatole	Trp

Pretreatment of Sample—Depending on the size or the configuration of the protein, different approaches in the pretreatment of samples can be used. For monoclonal antibodies, the heavy and light chains will need to be separated before mapping. If trypsin is used as a cleavage agent for proteins with a molecular mass greater than 100,000 Da, lysine residues must be protected by citraconylation or maleylation; otherwise, too many peptides will be generated.

Pretreatment of the Cleavage Agent—Pretreatment of cleavage agents—especially enzymatic agents—might be necessary for purification purposes to ensure reproducibility of the map. For example, trypsin used as a cleavage agent will have to be treated with tosyl-L-phenylalanine chloromethyl ketone to inactivate chymotrypsin. Other methods, such as purification of trypsin by HPLC or immobilization of enzyme on a gel support, have been successfully used when only a small amount of protein is available.

Pretreatment of the Protein— It might be necessary under certain conditions to concentrate the sample, or to separate the protein from added substances and stabilizers used in the formulation of the product if these interfere with the mapping procedure. Physical procedures used for pretreatment can include ultrafiltration, column chromatography, and lyophilization.

Other pretreatments such as the addition of chaotropic agents (e.g., urea) can be used to unfold the protein prior to mapping. It is often necessary to reduce and alkylate the disulfide bonds prior to digestion in order to allow the enzyme to have full access to cleavage sites and permit some unfolding of the protein.

Digestion with trypsin can introduce ambiguities in the tryptic map as a result of side reactions occurring during the digestion reaction, such as nonspecific cleavage, deamidation, disulfide isomerization, oxidation of methionine residues, or formation of pyroglutamic groups created from the deamidation of glutamine at the *N*-terminal side of a peptide. Furthermore, peaks may be produced by autohydrolysis of trypsin. Their intensities depend on the ratio of trypsin to protein. To avoid autohydrolysis, solutions of proteases may be prepared at a pH that is not optimal (e.g., at pH 5 for trypsin), which would mean that the enzyme would not become active until diluted with the digest buffer.

Establishment of Optimal Digestion Conditions—Factors that affect the completeness and effectiveness of digestion of proteins are those that could affect any chemical or enzymatic reactions.

pH—The digestion mixture pH is empirically determined to ensure the optimal performance of the given cleavage agent. For example, a highly acidic environment (e.g., pH 2, formic acid) is necessary when using cyanogen bromide as a cleavage agent; however, a slightly alkaline environment (pH 8) is optimal when using trypsin as a cleavage agent. As a general rule, the pH of the reaction milieu should not alter the chemical integrity of the protein during the digestion and should not change during the course of the fragmentation reaction.

Temperature—A temperature between 25° and 37° is adequate for most digestions. The temperature used is intended to minimize chemical side reactions. The type of protein under test will dictate the temperature of the reaction milieu because some proteins are more susceptible to denaturation as the temperature of the reaction increases. For example, digestion of recombinant bovine somatropin is conducted at 4° because at higher temperatures it will precipitate during digestion.

Time—If a sufficient amount of sample is available, a time course study is considered in order to determine the optimum time to obtain a reproducible map and avoid incomplete digestion. Time of digestion varies from 2 to 30 hours. The reaction is stopped by the addition of an acid that does not interfere with the tryptic map, or by freezing.

Amount of Cleavage Agent—Although excessive amounts of cleavage agent are used to accomplish a reasonably rapid digestion time (i.e., 6 to 20 hours), the amount of cleavage agent is minimized to avoid its contribution to the chromatographic map pattern. A protein-to-protease ratio between 20 : 1 and 200 : 1 is generally used. It is recommended that the cleavage agent be added in two or more stages to optimize cleavage. Nonetheless, the final reaction volume remains small enough to facilitate the next step in peptide mapping—the separation step. To sort out digestion artifacts that might be interfering with the subsequent analysis, a blank determination is performed using a digestion control with all the reagents except the test protein.

CHROMATOGRAPHIC SEPARATION

Many techniques are used to separate peptides for mapping. The selection of a technique depends on the protein being mapped. Techniques that have been successfully used for the separation of peptides are shown in *Table 2*.

Table 2. Techniques Used for the Separation of Peptides

Reverse-Phase High-Performance Liquid Chromatography (RP-HPLC)
Ion-Exchange Chromatography (IEC)
Hydrophobic Interaction Chromatography (HIC)
Polyacrylamide Gel Electrophoresis (PAGE), nondenaturating
Sodium Dodecyl Sulfate Polyacrylamide Gel Electrophoresis (SDS-PAGE)
Capillary Electrophoresis (CE)
Paper Chromatography
High-Voltage Paper Electrophoresis (HVPE)

In-Process Revision

In this section, a most widely used reverse-phase HPLC (RP-HPLC) method is described as one of the procedures of chromatographic separation.

The purity of solvents and mobile phases is a critical factor in HPLC separation. HPLC-grade solvents and water that are commercially available are recommended for RP-HPLC. Dissolved gases present a problem in gradient systems where the solubility of the gas in a solvent may be less in a mixture than in a single solvent. Vacuum degassing and agitation by sonication are often used as useful degassing procedures. The solid particles in the solvents are drawn into the HPLC system, they can damage the sealing of pump valves or clog the top of the chromatographic column. Both pre- and post-pump filtration is also recommended.

Chromatographic Column—The selection of a chromatographic column is empirically determined for each protein. Columns with 100 Å or 300 Å pore size and silica support can give optimal separation. For smaller peptides, column packings of octylsilane chemically bonded to totally porous silica articles 3 to 10 µm in diameter (L7) and of octadecylsilane chemically bonded to porous silica or ceramic microparticles 3 to 10 µm in diameter (L1) are more efficient than the butyl silane chemically bonded to totally porous silica particles 5 to 10 µm in diameter (L26).

Solvent—The most commonly used solvent is water with acetonitrile as the organic modifier to which less than 0.1% of trifluoroacetic acid is added. If necessary, add isopropyl alcohol or *n*-propyl alcohol to solubilize the digest components, provided that the addition does not unduly increase the viscosity of the components.

Mobile Phase—Buffered mobile phases containing phosphate are used to provide some flexibility in the selection of pH conditions, since shifts of pH in the 3.0 to 5.0 range enhance the separation of peptides containing acidic residues (e.g., glutamic and aspartic acids). Sodium or potassium phosphates, ammonium acetate, and phosphoric acid, with a pH between 2 and 7 (or higher for polymer-based supports), have also been used with acetonitrile gradients. Acetonitrile-containing trifluoroacetic acid is also used quite often.

Gradient Selection—Gradients can be linear, nonlinear, or include step functions. A shallow gradient is recommended in order to separate complex mixtures. Gradients are optimized to provide clear resolution of one or two peaks that will become "marker" peaks for the test.

Isocratic Selection—Isocratic HPLC systems using a single mobile phase are used on the basis of their convenience of use and improved detector responses. Optimal composition of a mobile phase to obtain clear resolution of each peak is sometimes difficult to establish. Mobile phases for which slight changes in component ratios or in pH significantly affect retention times of peaks in peptide maps should not be used in isocratic HPLC systems.

Other Parameters—Temperature control of the column is usually necessary to achieve good reproducibility. The flow rates for the mobile phases range from 0.1 to 2.0 mL per minute, and the detection of peptides is performed with a UV detector at 200 to 230 nm. Other methods of detection have been used (e.g., postcolumn derivatization), but they are not as robust or as versatile as UV detection.

System Suitability—The section *System Suitability* under *Chromatography* ⟨621⟩ provides an experimental means for measuring the overall performance of the test method. The acceptance criteria for system suitability depend on the identification of critical test parameters that affect data interpretation and acceptance. These critical parameters are also criteria that monitor peptide digestion and peptide analysis. An indicator that the desired digestion endpoint was achieved is the comparison with a reference standard or reference material, which is treated exactly as the article under test. The use of a USP Reference Standard in parallel with the protein under test is critical in the development and establishment of system suitability limits. In addition, a specimen chromatogram should be included with the USP Reference Standard or reference material for comparison purposes. Other indicators may include vi-

sual inspection of protein or peptide solubility, the absence of intact protein, or measurement of responses of a digestion-dependent peptide. The critical system suitability parameters for peptide analysis will depend on the particular mode of peptide separation and detection, and on the data analysis requirements.

When peptide mapping is used as an identification test, the system suitability requirements for the identified peptides cover selectivity and precision. In this case, as well as when identification of variant proteins is done, the identification of the primary structure of the peptide fragments in the peptide map provides both a verification of the known primary structure and the identification of protein variants by comparison with the peptide map of the USP Reference Standard or reference material for the specified protein. The use of a digested USP Reference Standard or reference material for a given protein in the determination of peptide resolution is the method of choice. For an analysis of a variant protein, a characterized mixture of a variant and a reference standard can be used, especially if the variant peptide is located in a less-resolved region of the map. The index of pattern consistency can be simply the number of major peptides detected. Peptide pattern consistency can be best defined by the resolution of peptide peaks. Chromatographic parameters—such as peak-to-peak resolution, maximum peak width, peak tailing factors, and column efficiency—may be used to define peptide resolution. Depending on the protein under test and the method of separation used, single peptide or multiple peptide resolution requirements may be necessary.

The replicate analysis of the digest of the USP Reference Standard or reference material for the protein under test yields measures of precision and quantitative recovery. Recovery of the identified peptides is generally ascertained by the use of internal or external peptide standards. The precision is expressed as the relative standard deviation (RSD). Differences in the recovery and precision of the identified peptides are expected; therefore, the system suitability limits will have to be established for both the recovery and the precision of the identified peptides. These limits are unique for a given protein and will be specified in the individual monograph.

Visual comparison of the relative retention times, the peak responses, the number of peaks, and the overall elution pattern is completed initially. It is then complemented and supported by mathematical analysis of the peak response ratios and by the chromatographic profile of a 1 : 1 (v/v) mixture of sample and USP Reference Standard or reference material digest. If all peaks in the sample digest and in the USP Reference Standard or reference material digest have the same relative retention times and peak response ratios, then the identity of the sample under test is confirmed.

If peaks that initially eluted with significantly different relative retention times are then observed as single peaks in the 1 : 1 mixture, the initial difference would be an indication of system variability. However, if separate peaks are observed in the 1 : 1 mixture, this would be evidence of the nonequivalence of the peptides in each peak. If a peak in the 1 : 1 mixture is significantly broader than the corresponding peak in the sample and USP Reference Standard or reference material digest, it may indicate the presence of different peptides. The use of computer-aided pattern recognition software for the analysis of peptide mapping data has been proposed and applied, but issues related to the validation of the computer software preclude its use in a compendial test in the near future. Other automated approaches have been used that employ mathematical formulas, models, and pattern recognition. Such approaches, for example, the automated identification of compounds by IR spectroscopy and the application of diode-array UV spectral analysis for identification of peptides, have been proposed. These methods have limitations due to inadequate resolutions, co-elution of fragments, or absolute peak response differences between USP Reference Standard or reference material and sample fragments.

The numerical comparison of the retention times and peak areas or peak heights can be done for a selected group of relevant peaks that have been correctly identified in the peptide

maps. Peak areas can be calculated using one peak showing relatively small variation as an internal reference, keeping in mind that peak area integration is sensitive to baseline variation and likely to introduce error in the analysis. Alternatively, the percentage of each peptide peak height relative to the sum of all peak heights can be calculated for the sample under test. The percentage is then compared to that of the corresponding peak of the USP Reference Standard or reference material. The possibility of autohydrolysis of trypsin is monitored by producing a blank peptide map that is the peptide map obtained when a blank solution is treated with trypsin.

The minimum requirement for the qualification of peptide mapping is an approved test procedure that includes system suitability as a test control. In general, for an IND, qualification of peptide mapping for a protein is sufficient. As the regulatory approval process for the protein progresses, additional qualifications of the test can include a partial validation of the analytical procedure to provide assurance that the method will perform as intended in the development of a peptide map for the specified protein.

ANALYSIS AND IDENTIFICATION OF PEPTIDES

This section gives guidance on the use of peptide mapping during development in support of regulatory applications.

The use of a peptide map as a qualitative tool does not require the complete characterization of the individual peptide peaks. However, validation of peptide mapping in support of regulatory applications requires rigorous characterization of each of the individual peaks in the peptide map. Methods to characterize peaks range from *N*-terminal sequencing of each peak followed by amino acid analysis to the use of mass spectroscopy (MS).

For characterization purposes, when *N*-terminal sequencing and amino acids analysis are used, the analytical separation is scaled up. Because scale-up might affect the resolution of peptide peaks, it is necessary, using empirical data, to assure that there is no loss of resolution due to scale-up. Eluates corresponding to specific peptide peaks are collected, vacuum-concentrated, and chromatographed again, if necessary. Amino acid analysis of fragments may be limited by the peptide size. If the *N*-terminus is blocked, it may need to be cleared before sequencing. *C*-terminal sequencing of proteins in combination with carboxypeptidase and MALDITOF-MS can also be used for characterization purposes.

The use of MS for characterization of peptide fragments is by direct infusion of isolated peptides or by the use of on-line LC-MS for structure analysis. In general, it includes electrospray and matrix-assisted laser desorption ionization coupled to time-of-flight analyzer (MALDITOF) as well as fast atom bombardment (FAB). Tandem MS has also been used to sequence a modified protein and to determine the type of amino acid modification that has occurred. The comparison of mass spectra of the digests before and after reduction provides a method to assign the disulfide bonds to the various sulfhydryl-containing peptides.

If regions of the primary structure are not clearly demonstrated by the peptide map, it might be necessary to develop a secondary peptide map. The goal of a validated method of characterization of a protein through peptide mapping is to reconcile and account for at least 95% of the theoretical composition of the protein structure.

The Use of Peptide Mapping for Genetic Stability Evaluation

A validated peptide map can be used to assess the integrity of the predicted primary sequence of a protein product (i.e., its genetic stability). It can also be used to determine lot-to-lot consistency of the biotechnology-derived product process. Furthermore, the performance of the protein expression of the production system is best assessed by peptide mapping of the expressed protein. Peptide maps of protein produced at various times of the protein expression process, including a point well beyond the normal protein expression time, compared with those of a USP Reference Standard or reference material, will evaluate the genetic stability of the expression system as a function of time.

Variant protein sequences can arise from a genetic variation at the DNA level (point mutation) or as an error in the translation process. A validated peptide map is the best approach to the detection of protein variants. However, the limitations of the peptide mapping itself must be taken into consideration. The detection of a structured variant is possible only if the corresponding peptide variant is easily isolated and characterized. To establish genetic stability will require the use of a battery of biochemical methods, provided that the variants have properties different from those of the ''normal'' protein.

Validation

CRITICAL FACTORS

Validation of peptide mapping requires that a protocol be designed, outlining in detail the experiment to be conducted and the criteria for acceptance of the map. Criteria for acceptance of mapping include detection limit, specificity, linearity, range, accuracy, precision, and reagent stability. Reproducibility of the peptide map is a critical element in the utilization of such a map as an identity test and for confirming genetic stability. Those technical aspects of peptide mapping that influence the reproducibility of the map will be discussed.

The setting of limits, with respect to quantification (peak area or height) and identification (retention times) for the selected group of relevant peaks is based on empirical observations. These limits detect significant differences between the sample and USP Reference Standard or reference material within a series of analyses.

Another critical issue is the recovery of peptides and its impact on peak area determination and reproducibility and on the establishment of acceptance criteria. The recovery criteria address all aspects of test methodology, from digestion to chromatographic conditions. Determination of peptide recovery includes quantitative amino acid analysis, spike addition, radiolabeling, and UV summation. An overall recovery of about 80% is considered satisfactory. Recovery of individual peptides is more problematic and is handled on a case-by-case basis. The critical factors considered in the validation of a peptide map are as follows.

Written Test Procedures—These procedures include a detailed description of the analytical method in which reagents, equipment, sample preparation, method of analysis, and analysis of the data are defined.

Validation Protocol—A protocol is prepared that contains a procedure for test validation.

Acceptance Criteria—The criteria can be minimal at the early stages, but need to be better defined as validation studies progress.

Reporting of Results—Results from the validation study are documented with respect to the analytical parameters listed in the validation protocol.

Revalidation of the Test Procedure—If the method used requires alteration that could affect the analytical parameter previously assessed in the validation of the procedure, the test procedure must be revalidated. Significant changes in the processing of the article, in laboratories performing the analysis, in formulation of the bulk or the finished products, and in any other significant parameter will require revalidation of the methods.

REQUIREMENTS

Precision—

Intratest Precision—This is a measure of the reproducibility of peptide mapping. The two critical steps in peptide mapping are fragmentation (i.e., digestion) and separation of peptides. An acceptable precision occurs where the absolute retention times and the relative peak areas are constant from run to run, and the average variation in retention time is small relative to that of a selected internal reference peak. The reproducibility of the map can be enhanced if a temperature-controlled column oven is used, if an extensive equilibration of the system is performed prior to the start of the test, if a blank (control digest mixture without protein) is run first to minimize ''first

run effects," and if a USP Reference Standard or a reference material digest is interspersed periodically with test samples to evaluate chromatographic drift.

The criteria for validation of the fragmentation step are similar to those described below for separation of peptides, but they are met for consecutive tests of a series of separately prepared digests of the protein under test.

The criteria for validation of the separation of peptides step include the following:

1. The average standard deviation of the absolute retention times of all major peaks for a set of consecutive tests of the same digest does not exceed a specified acceptance criterion.

2. The average standard deviation of absolute peak area for all fully resolved major peaks does not exceed a specified percentage.

Intertest Precision—This is a measure of the reproducibility of the peptide mapping when the test is performed on different days, by different analysts, in different laboratories, with reagents or enzymes from different suppliers or different lots from the same supplier, with different instruments, on columns of different makes or columns of the same make from different lots, and on individual columns of the same make from the same lot. Although it would be desirable, from a scientific perspective, to validate all of these variables in terms of their impacts on precision, a practical approach is to validate the test using those variables most likely to be encountered under operational conditions. Additional variables can be included when needed.

The experimental design allows the analyst to make comparisons using peak retention times and areas that are expressed relative to a highly reproducible internal reference peak within the same chromatogram. The relative peak area is expressed as the ratio of the peak area to that of the internal reference peak. The relative retention time can be expressed as the difference between the absolute retention time and that of the reference peak. The use of relative values eliminates the need to make separate corrections for differences due to injector-to-injector volumes, units of measure for peak areas, column dimensions, and instrument dead volumes. The variability in the retention times and peak areas for the *Intertest Precision* experiments is expected to be slightly higher than the variability observed for *Intratest Precision*.

Robustness—Factors such as composition of the *Mobile Phase*, protease quality or chemical reagent purity, column variation and age, and digest stability are likely to affect the overall performance of the test and its reproducibility. Tolerances for each of the key parameters are evaluated and baseline limits established in case the test is used for routine lot release purposes.

Mobile Phase—The composition of the *Mobile Phase* is optimized to obtain the maximum resolution of peptides throughout the elution profile. A balance between optimal resolution and overall reproducibility is desired. A lower pH might improve peak separation but might shorten the life of the column, resulting in lack of reproducibility. Peptide maps at a pH above and below the pH of the procedure are compared to the peptide map obtained at the pH of the procedure and checked for significant differences; they are also reviewed with respect to the acceptance criteria established in the validation protocol.

Protease Quality or Chemical Reagent Purity—A sample of the USP Reference Standard or reference material for the protein under test is prepared and digested with different lots of cleavage agent. The chromatograms for each digest are compared in terms of peak areas, shape, and number. The same procedure can be applied to other critical chemicals or pretreatment procedures used during sample preparation, such as reducing and carboxymethylation reagents.

Column Considerations—Column-to-column variability, even within a single lot, can affect the performance of the column in the development of peptide maps. Column size may also lead to significant differences. A USP Reference Standard or reference material of the protein under test is digested and the digest is chromatographed on different lots of column from

a single manufacturer. The maps are then evaluated in terms of the overall elution profile, retention times, selectivity resolution, and recovery. To evaluate the overall lifetime of the column in terms of robustness, perform a peptide mapping test on different columns and vary significantly the number of injections (e.g., from 10 injections to 250 injections). The resulting maps can then be compared for significant differences in peak broadening, peak area, and overall resolution. As a column ages, an increase in back pressure might be observed that might affect the peptide maps.

A sensible precaution in the use of peptide mapping columns is to select alternative columns in case the original columns become unavailable or are discontinued. Perform a peptide mapping test using equivalent columns from different manufacturers, and examine the maps. Differences in particle shape and size, pore size and volume, carbon load, and endcapping can lead to significant differences in retention times, elution profile selectivity, resolution, and recovery. Slight modifications in the gradient profile may be required to achieve equivalency of mapping when using columns from different manufacturers. [NOTE—The equivalency between instrumentation used for the validation of the test and for routine quality control testing should be considered. It might be preferable to use the same HPLC system for all applications. Otherwise, equivalency of the systems is determined, which may require some changes in the chromatographic test conditions.]

Digest Stability—The length of time a digest can be kept before it is chromatographed, as well as the conditions under which the digest is stored before chromatography, is assessed. Several aliquots from a single digest are stored at different storage conditions and chromatographed. These maps are then evaluated for significant differences.

Reproducibility—Determination of various parameters indicated above is repeated using the same USP Reference Standard or reference material and test sample in at least two different laboratories by two analysts equipped with similar HPLC systems. The generated peptide maps are evaluated for significant differences.■1S (*USP30*)

■⟨1056⟩ BIOTECHNOLOGY-DERIVED ARTICLES—POLYACRYLAMIDE GEL ELECTROPHORESIS

This chapter provides guidance and procedures used for characterization of biotechnology-derived articles by polyacrylamide gel electrophoresis. This chapter is harmonized with the corresponding chapter in *JP* and *EP*. Other characterization tests, also harmonized, are shown in *Biotechnology-Derived Articles—Amino Acid Analysis* ⟨1052⟩, *Biotechnology-Derived Articles—Capillary Electrophoresis* ⟨1053⟩, *Biotechnology-Derived Articles—Isoelectric Focusing* ⟨1054⟩, *Biotechnology-Derived Articles—Peptide Mapping* ⟨1055⟩, and *Biotechnology-Derived Articles—Total Protein Assay* ⟨1057⟩.

INTRODUCTION

Polyacrylamide gel electrophoresis (PAGE) is used for the qualitative characterization of proteins in biological preparations, for control of purity, and for quantitative determinations. This procedure is limited to the analysis of proteins with a weight range of 14,000 to 100,000 Da. It is possible to extend the weight range of an electrophoresis gel by various techniques (e.g., gradient gels or particular buffer systems), but

In-Process Revision

such techniques are not discussed in this chapter. Analytical gel electrophoresis is an appropriate method with which to identify and to assess the homogeneity of proteins in drug substances. These methods are routinely used for the estimation of protein subunit molecular weights and for the determination of the subunit compositions of purified proteins.

Ready-to-use gels and reagents are commercially available and can be used instead of those described in this chapter, provided that they give equivalent results and that they meet the validation requirements.

GENERAL PRINCIPLE OF ELECTROPHORESIS

Under the influence of an electrical field, charged particles migrate in the direction of the electrode bearing the opposite polarity. In gel electrophoresis, the movements of the particles are retarded by interactions with the surrounding gel matrix, which acts as a molecular sieve. The opposing interactions of the electrical force and molecular sieving result in differential migration rates according to the sizes, shapes, and charges of particles. Because of their different physicochemical properties, different macromolecules of a mixture migrate at different speeds during electrophoresis and thus are separated into discrete fractions. Electrophoretic separations can be conducted in systems without support phases (e.g., free solution separation in capillary electrophoresis) and in stabilizing media, such as thin-layer plates, films, or gels.

CHARACTERISTICS OF POLYACRYLAMIDE GELS FOR PROTEIN ELECTROPHORESIS

The sieving properties of polyacrylamide gels are established by the three-dimensional network of fibers and pores that is formed as the bifunctional bisacrylamide cross-links adjacent to polyacrylamide chains. Polymerization is catalyzed by a free-radical-generating system composed of ammonium persulfate and *N,N,N′, N′*-tetramethylethylenediamine (TEMED).

As the acrylamide concentration of a gel increases, its effective pore size decreases. The effective pore size of a gel is operationally defined by its sieving properties, that is, by the resistance it imparts to the migration of macromolecules. There are limits to the acrylamide concentrations that can be used. At high acrylamide concentrations, gels break much more easily and are difficult to handle. As the pore size of a gel decreases, the migration rate of a protein through the gel decreases. By adjusting the pore size of a gel, through manipulating the acrylamide concentration, the resolution of the method can be optimized for a given protein product. Thus, a given gel is physically characterized by its respective composition of acrylamide and bisacrylamide.

In addition to the composition of the gel, the state of the protein is an important component of electrophoretic mobility. In the case of proteins, electrophoretic mobility is dependent on the pK value of the charged groups and the size of the molecule. It is influenced by the type, the concentration, and the pH of the buffer; by the temperature and the field strength; and by the nature of the support material.

Denaturation with Sodium Dodecyl Sulfate

Denaturing PAGE using sodium dodecyl sulfate (SDS) is the most common mode of electrophoresis used in assessing the pharmaceutical quality of protein products. Typically, analytical electrophoresis of proteins is carried out under conditions that ensure dissociation of the proteins into their individual polypeptide subunits and that minimize aggregation of these subunits. The strongly anionic detergent SDS is used in combination with heat to dissociate the proteins before they are loaded on the gel. The denatured polypeptides bind SDS, become negatively charged, and exhibit a consistent charge-to-weight ratio regardless of protein type. Because the amount of SDS bound is almost always proportional to the molecular weight of the polypeptide and is typically independent of its

sequence, SDS–polypeptide complexes migrate through polyacrylamide gels in reasonable accordance with the size of the polypeptide.

The electrophoretic mobilities of the resultant detergent–polypeptide complexes all assume the same functional relationship to the molecular weights of the polypeptides. Migration of SDS derivatives is toward the anode in a predictable manner, with low molecular weight complexes migrating faster than larger ones. This means that the molecular weight of a protein can be estimated from its relative mobility in calibrated SDS PAGE and that a single band in such a gel is a criterion of purity.

Modifications to the polypeptide backbone, such as *N*- or *O*-linked glycosylation, however, have a significant impact on the apparent molecular weight of a protein. This is due to the fact that SDS does not bind to a carbohydrate moiety in a manner similar to that of the polypeptide. Thus, a consistent charge-to-weight ratio is not maintained. The apparent molecular weight of proteins having undergone post-translational modifications is not a true reflection of the weight of the polypeptide chain.

Reducing Conditions

Polypeptide subunits and their three-dimensional structure can be maintained in proteins by the presence of disulfide bonds. A goal of SDS PAGE analysis under reducing conditions is to disrupt this structure by reducing disulfide bonds. Complete denaturation and dissociation of proteins by treatment with 2-mercaptoethanol or dithiothreitol (DTT) will result in the unfolding of the polypeptide backbone and subsequent complexation with SDS. Under these conditions, the molecular weight of the polypeptide subunits can be calculated by linear regression in the presence of suitable molecular weight standards.

Nonreducing Conditions

For some analyses, complete dissociation of protein to peptide subunits is not desirable. In the absence of treatment with reducing agents, disulfide covalent bonds remain intact, preserving the oligomeric form of the protein. Oligomeric SDS–protein complexes migrate more slowly than their SDS–polypeptide subunits. In addition, nonreduced proteins may not be completely saturated with SDS and hence may not bind the detergent in a constant weight ratio. This makes molecular weight determinations of these molecules less straightforward than analyses of fully denatured polypeptides, because, for valid comparisons, it is necessary that both standards and unknown proteins be in similar configurations. However, the staining of a single band in such a gel is a criterion of purity.

Characteristics of a Discontinuous Buffer System

The most popular electrophoretic method for the characterization of a complex mixture of proteins involves the use of a discontinuous buffer system consisting of two contiguous, but distinct, gels: a resolving or separating (lower) gel and a stacking (upper) gel. The two gels are cast with different porosities, pHs, and ionic strengths. In addition, different mobile ions are used in the gel and electrode buffers. The buffer discontinuity concentrates large volumes of sample in the stacking gel, resulting in improved resolution. When power is applied, a voltage drop develops across the sample solution that drives the proteins into the stacking gel. Glycinate ions from the electrode buffer follow the proteins into the stacking gel. A moving boundary region is rapidly formed with the highly mobile chloride ions in the front and the relatively slow glycinate ions in the rear. A localized high-voltage gradient forms between the leading and trailing ion fronts, causing the SDS–protein complexes to form into a thin zone (stack) and migrate between the chloride and glycinate phases. Within a broad limit, regardless of the height of the applied sample, all SDS proteins

condense into a very narrow region and enter the resolving gel as a well-defined, thin zone of high protein density. The large-pore stacking gel does not retard the migration of most proteins and serves mainly as an anticonvective medium. At the interface between the stacking and resolving gels, the proteins experience a sharp retardation due to the restrictive pore size of the resolving gel. Once in the resolving gel, proteins continue to be slowed by the sieving of the matrix. The glycinate ions overtake the proteins, which then move in a space of uniform pH formed by tris(hydroxymethyl)aminomethane (Tris) and glycine. Molecular sieving causes the SDS–polypeptide complexes to separate on the basis of their molecular weights.

Preparation of Gels

In a discontinuous buffer SDS–polyacrylamide gel, it is important to pour the resolving gel, let the gel set, and then pour the stacking gel, because the composition of acrylamide–bisacrylamide, buffer, and pH are different.

Gel Stock Solutions—

30% Acrylamide–Bisacrylamide Solution—Prepare a solution containing 290 g of acrylamide and 10 g of methylene bisacrylamide per L of warm water, and filter. [NOTE—Acrylamide and methylene bisacrylamide are slowly converted during storage to acrylic acid and bisacrylic acid, respectively. This deamidation reaction is catalyzed by light and alkali. The pH of the solution must be 7.0 or lower. Store the solution in dark bottles at room temperature. Fresh solutions are prepared every month.]

Ammonium Persulfate Solution—Prepare a small quantity of solution having a concentration of 100 g of ammonium persulfate per L, and store at 4°. [NOTE—Ammonium persulfate provides the free radicals that drive polymerization of acrylamide and bisacrylamide. Ammonium persulfate decomposes slowly; therefore, prepare fresh solutions weekly.]

TEMED—Use an electrophoresis-grade reagent. [NOTE—*TEMED* accelerates the polymerization of acrylamide and bisacrylamide by catalyzing the formation of free radicals from ammonium persulfate. Because *TEMED* works only as a free base, polymerization is inhibited at low pH.]

SDS Solution—Use an electrophoresis-grade reagent. Prepare a solution having a concentration of about 100 g of SDS per L, and store at room temperature.

1.5 M Buffer Solution—Transfer about 90.8 g of Tris to a 500-mL flask, dissolve in 400 mL of water, adjust with hydrochloric acid to a pH of 8.8, dilute with water to volume, and mix.

1 M Buffer Solution—Transfer about 60.6 g of Tris to a 500-mL flask, add 400 mL of water, adjust with hydrochloric acid to a pH of 6.8, dilute with water to volume, and mix.

Plate Preparation—Clean two glass plates (10 cm × 8 cm), the polytef comb, the two spacers, and the silicone rubber tubing (0.6 mm × 35 cm) with mild detergent, rinse thoroughly with water, and blot dry.

Lubricate the spacers and the tubing with nonsilicone grease. Apply the spacers along each of the two short sides of the glass plate 2 mm away from the edges and 2 mm away from the long side corresponding to the bottom of the gel.

Begin to lay the tubing on the glass plate by using one spacer as a guide. Carefully twist the tubing at the bottom of the spacer, and follow the long side of the glass plate. While holding the tubing with one finger along the long side, twist the tubing again, and lay it on the second short side of the glass plate, using the spacer as a guide.

Place the second glass plate in perfect alignment with the first, and hold the gel mold together by hand pressure. Apply two clamps on each of the two short sides of the mold. Carefully apply four clamps on the longer side of the mold, thus forming the bottom of the mold. Verify that the tubing is running along the edge of the glass plates and has not been extruded while placing the clamps. The mold is now ready for the pouring of the gel.

Resolving Gel—In a conical flask, prepare the appropriate volume of solution, containing the desired concentration of acrylamide, as shown in *Table 1*. Mix the components in the order shown. Before adding the *Ammonium Persulfate Solution* and the *TEMED,* pour the solution into a disposable filtration unit equipped with a nitrocellulose filter having a 0.45-µm porosity, and apply vacuum. Allow the solution to degas by swirling the filtration unit, and disconnect the vacuum when no more bubbles are formed in the solution. Add appropriate amounts of *Ammonium Persulfate Solution* and *TEMED,* as shown in *Table 1;* swirl; and pour immediately into the gap between the two glass plates of the mold. Leave sufficient space for the stacking gel (the length of the teeth of the comb plus 1 cm). Using a pipet, carefully overlay the solution with water-saturated isobutyl alcohol. Leave the gel in a vertical position at room temperature for polymerization.
