Test solution—Dry crushed Maritime Pine at 110° for 3 hours. Place about 1.9 g of the crushed material, accurately weighed, in a 20-mL vial, and add 10 mL of methanol. Crimp the vial, and sonicate for 2 minutes. Heat in boiling water for 10 minutes. Cool to room temperature, allow the sediment to settle, and transfer the supernatant to a 100-mL volumetric flask, passing it through a filter having a 0.45-µm porosity. Wash the sediment two times with 10 mL of methanol, and transfer the solution into the same 100-mL volumetric flask, again passing it through a filter having a 0.45-µm porosity. Dilute with methanol to volume, and mix. Transfer 1.0 mL of that solution into a 20-mL volumetric flask, dilute with methanol to volume, and mix.
Procedure— ~~Transfer 1.0 mL of the *Test solution* and 1.0 mL of methanol to two separate 10-mL vials. To each flask add 6.0 mL of *Reagent solution A* and 0.25 mL of *Reagent solution B* to each flask.~~

■Transfer 1.0 mL of the *Standard solution,* 1.0 mL of the *Test solution,* and 1.0 mL of methanol to three separate 10-mL vials. To each vial add 6.0 mL of *Reagent solution A* and 0.25 mL of *Reagent solution B.*■2S *(USP30)*
Seal the vials with crimp caps. Mix, and heat in a water bath for 40 minutes. Quickly cool to room temperature in an ice bath. Quantitatively transfer these solutions, with the aid of *Reagent solution A,* to ~~two~~

■three■2S *(USP30)*
separate 10-mL volumetric flasks, dilute with *Reagent solution A* to volume, and mix. ~~Determine the absorbance of the solution obtained from the *Test solution* at 546 nm, using the methanol-containing solution as the blank. Calculate the percentage of total procyanidins in the portion of Maritime Pine taken by the formula:~~

~~$(2000A_U)/(36.7W)$,~~

~~in which A_U is the absorbance of the solution obtained from the *Test solution;* 36.7 is the absorptivity of the maritime pine procyanidins; and W is the weight, in g, of the Maritime Pine taken to prepare the *Test solution.*~~

■Determine the absorbance of the solutions obtained from the *Standard solution* and the *Test solution* at 551 nm, using the methanol-containing solution as the blank. Calculate the percentage of total procyanidins in the portion of Maritime Pine taken by the formula:

$$200(A_U/A_S)(C_S/W)$$

in which A_U and A_S are the absorbances of the solutions from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in µg per mL, of the *Standard solution;* and

In-Process Revision

W is the weight, in mg, of Maritime Pine powder used to prepare the *Test solution,* corrected for the water content.■2S (*USP30*)

BRIEFING

Maritime Pine Extract, *USP 29* page 2360. In order to minimize analyst-to-analyst variations, it is proposed to use USP Maritime Pine Extract RS in the determination of the test for *Content of procyanidins* instead of the absorptivity value. The wavelength of the test has been changed from 546 nm to the wavelength of maximum absorption at 551 nm. An adsorbent of chromatographic silica gel mixture has been added to *Identification* tests *B* and *C*. In addition, editorial style changes have been made.

(DSB: M. Sharaf) RTS—C44243

Change to read:

Identification—

A: Dissolve 50 mg of Extract in 6 mL of a mixture of butanol and hydrochloric acid (95 : 5). Heat in a water bath for 2 minutes: the solution turns dark red.

B: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

■*Adsorbent:* 0.25-mm layer of chromatographic silica gel mixture.■2S (*USP30*)

Test solution—Dissolve a quantity of Extract in methanol to obtain a solution having a concentration of about 25 mg per mL.

Standard solution 1—Prepare a solution of USP Maritime Pine Extract RS in methanol having a concentration of about 25 mg per mL.

Standard solution 2—~~Prepare a solution of ferulic acid in methanol having a concentration of about 1 mg per mL.~~

■Prepare a solution of ferulic acid and protocatechuic acid in methanol having a concentration of about 1 mg per mL of each.■2S (*USP30*)

Application volume: 5 µL.

Developing solvent system: a mixture of methylene chloride, methanol, glacial acetic acid, and water (80 : 15 : 2 : 2).

Spray reagent—Prepare a 5% ferric chloride solution in methanol.

Procedure—~~Proceed as directed in the chapter, except to dry the plate at 110° and to examine the plate under short-wavelength and long-wavelength UV light. The chromatogram of *Standard solution 1* exhibits bands in the middle third and upper third that correspond to protocatechuic acid and ferulic acid, respectively. Spray the plate with the *Spray reagent,* and dry at 110° for 10 minutes. The bands due to ferulic acid and protocatechuic acid turn grayish green and orange, respectively. Grayish-green bands become visible in the chromatogram of *Standard solution 1* above and below protocatechuic acid indicating the presence of caffeic acid and catechin, respectively. The chromatogram of the *Test solution* exhibits bands due to caffeic acid, protocatechuic acid, and ferulic acid that correspond in color and R_F value to those in the chromatogram of *Standard solution 1.*~~

■Proceed as directed in the chapter, except to dry the plate at 110° and to examine the plate under short-wavelength and long-wavelength UV light. The chromatograms of *Standard solution 1* and *Standard solution 2* exhibit bands in the middle third and upper third that correspond to protocatechuic acid and ferulic acid, respectively. Spray the plate with the *Spray reagent,* and heat at 115° for 15 minutes. The bands due to ferulic acid and protocatechuic acid turn grayish green. Grayish-green bands become visible in the chromatogram of *Standard solution 1* above and below protocatechuic acid indicating the presence of caffeic acid and catechin, respectively. The chromatogram of the *Test solution* exhibits bands due to catechin, protocatechuic acid, caffeic acid, and ferulic acid that correspond in color and R_F values to those in the chromatogram of *Standard solution 1* and *Standard solution 2.*■2S (*USP30*)

C: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

■*Adsorbent:* 0.25-mm layer of chromatographic silica gel mixture.■2S (*USP30*)

Test solution—Use the *Test solution* prepared as directed for *Identification* test *B.*

Standard solution—Use *Standard solution 1* prepared as directed for *Identification* test *B.*

Application volume: 5 µL.

Developing solvent system: a mixture of ethyl acetate, formic acid, and water (100 : 10 : 6).

Spray reagent: a mixture of phosphoric acid and alcohol (1 : 1), containing 1% of vanillin.

Procedure—Proceed as directed in the chapter, except to

■dry the plate with the aid of a current of air,■2S (*USP30*) spray the plate with the *Spray reagent,* and heat at ~~110° for 10 minutes.~~

■115° for 15 minutes.■2S (*USP30*) Three red bands appear in the middle third of the chromatogram of the *Standard solution* corresponding to two dimeric procyanidins and catechin. The chromatogram of the *Standard solution* also exhibits a blue band between the upper band due to upper dimeric procyanidins and the band due to catechin. The chromatogram of the *Test solution* contains bands that correspond to those found in the chromatogram of the *Standard solution.*

D: Proceed as directed in the following liquid chromatographic procedure.

Solution A—Use filtered and degassed methanol.

Solution B—Carefully weigh 1 g of phosphoric acid, and dilute with water. Transfer to a 1000-mL volumetric flask, dilute with water to volume, and mix.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (*see System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Maritime Pine Extract RS in *Solution A* to obtain a solution having a known concentration of about 2 mg per mL. Pass through a membrane having a 0.45-µm or finer porosity.

In-Process Revision

Test solution—Weigh about 20 mg of Extract. Add 10 mL of *Solution A,* and sonicate for 10 minutes. Pass through a membrane having a 0.45-µm or finer porosity, discarding the first 4 mL of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 15-cm column that contains base-deactivated packing L7, having less than 5-µm particle size. The column temperature is maintained at 40°. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	8	92	equilibration
0–40	8→34	92→66	linear gradient
40–45	34→2	66→98	linear gradient
45–50	2	98	isocratic
50–52	2→8	98→92	linear gradient
52–57	8	92	isocratic

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the chromatogram obtained is similar to the Reference Chromatogram provided with the USP Maritime Pine Extract RS; the resolution, *R,* between taxifolin and ferulic acid is not less than 3.0; and the tailing factor for taxifolin is not more than 2.0.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and ~~measure the peak areas for catechin, caffeic acid, taxifolin, and ferulic acid, identifying the peaks~~

■identify the peaks for catechin, caffeic acid, taxifolin, and ferulic acid■2S (*USP30*)
by comparison of the chromatogram of the *Standard solution* with the Reference Chromatogram: the chromatogram of the *Test solution* exhibits peaks for catechin, caffeic acid, taxifolin, and ferulic acid at the retention times corresponding to those in the chromatogram of the *Standard solution*.

MONOGRAPHS (NF)

BRIEFING

Almond Oil, *NF 24* page 3270. On the basis of data, validation, and comments received as well as on the monograph *Almond Oil, Refined* in the *European Pharmacopoeia, Fifth Edition,* page 3893, it is proposed to make significant changes to this monograph. The following changes have been proposed.

1. Revise the Definition of this article to reflect the latest classification.
2. Add a *Labeling* section to include the use of the suitable antioxidants.
3. Revise the *Packaging and storage* section.
4. Add a test for *Identification.*
5. Delete the tests for *Foreign kernel oils, Cottonseed oil, Sesame oil, Mineral oil and foreign fatty oils,* and *Foreign oils*.
6. Delete the tests for *Free fatty acid, Iodine value,* and *Saponification value*.
7. Add the test for *Fatty acid composition* as an *Identification* test.
8. Add the tests for *Acid value, Peroxide value,* and *Unsaponifiable matter.*
9. Add a test for *Sterol composition*.
10. Delete the test for *Residual solvents*.

(EM2: H. Wang) RTS—C42256

Change to read:

» Almond Oil is the

■refined■2S (*NF25*)
fixed oil obtained by expression from the kernels of varieties of ~~*Prunus amygdalus* Batsch~~

■*Prunus dulcis* (Miller) D.A. Webb■2S (*NF25*)
(Fam. Rosaceae).

■It may contain suitable antioxidants.■2S (*NF25*)

Change to read:

Packaging and storage~~— Preserve in tight containers.~~

■Preserve in tight, light-resistant, and well-filled containers. No storage requirements specified.■2S (*NF25*)

Add the following:

■**Labeling**—Label it to indicate the name and quantity of any added antioxidants.■2S (*NF25*)

Add the following:

■**Identification**—It meets the requirements of the test for *Fatty acid composition*.■2S (*NF25*)

Delete the following:

■~~**Foreign kernel oils**— Shake vigorously 2 mL with a mixture of 1 mL of fuming nitric acid and 1 mL of water for 5 minutes: the mixture is not more than slightly colored.~~■2S (*NF25*)

Delete the following:

■~~**Cottonseed oil**— Mix 5 mL in a test tube with 5 mL of a mixture of equal volumes of amyl alcohol and a 1 in 100 solution of sulfur in carbon disulfide, warm the mixture carefully until the carbon disulfide is expelled, and immerse the test tube to one third of its length in a boiling, saturated solution of sodium chloride: the mixture develops no reddish color within 2 hours.~~■2S (*NF25*)

Delete the following:

■~~**Sesame oil**— Mix 10 mL with 10 mL of hydrochloric acid, add 0.1 mL of a 1 in 50 solution of furfural in alcohol, and shake the mixture vigorously for 15 seconds: no pink to crimson color appears in the acid layer when separate layers form. Should any color appear in the acid layer, add 10 mL of water, and again shake the mixture vigorously. In the absence of sesame oil the pink color is fugitive.~~■2S (*NF25*)

Delete the following:

■~~**Mineral oil and foreign fatty oils**— Heat 10 mL on a steam bath with 15 mL of 4 N sodium hydroxide and 30 mL of alcohol in a flask that has a small, short-stem funnel inserted in the neck, and occasionally agitate the mixture until it becomes clear. Transfer the solution to a shallow dish, evaporate the alcohol on a steam bath, and mix the residue with 100 mL of water: a clear solution results (*absence of mineral oil*). Add an excess of hydrochloric acid to this solution, remove the layer of fatty acids that rises to the surface, wash it with warm water, clarify it by heating on a steam bath, and allow it to cool to 15° without stirring: the fatty acids remain clear for 30 minutes at this temperature (*absence of foreign fatty oils*).~~■2S (*NF25*)

Delete the following:

■~~**Foreign oils**— One volume of the mixed fatty acids obtained in the test for *Mineral oil and foreign fatty oils,* when mixed with 1 volume of alcohol, yields a clear solution, which at 15° does not deposit any fatty acid or become turbid upon the further addition of 1 volume of alcohol (*absence of olive, peanut, or other fixed oils*).~~■2S (*NF25*)

Delete the following:

■~~**Free fatty acids** ⟨401⟩— The free fatty acids in 10 g require for neutralization not more than 5.0 mL of 0.10 N sodium hydroxide.~~■2S (*NF25*)

Delete the following:

■~~**Iodine value** ⟨401⟩: between 95 and 105.~~■2S (*NF25*)

In-Process Revision

Delete the following:

■~~**Saponification value** ⟨401⟩: between 190 and 200.~~■2S (*NF25*)

Add the following:

■**Acid value** ⟨401⟩**:** not more than 0.5.■2S (*NF25*)

Add the following:

■**Peroxide value** ⟨401⟩**:** not more than 5.0.■2S (*NF25*)

Add the following:

■**Unsaponifiable matter** ⟨401⟩**:** not more than 0.9%.■2S (*NF25*)

Add the following:

■**Fatty acid composition**—Almond Oil exhibits the following composition profiles of fatty acids, as determined in the section *Fatty Acid Composition* under *Fats and Fixed Oils* ⟨401⟩:

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
<16	0	≤0.1
16	0	4.0–9.0
17	0	≤0.2
18	0	≤3.0
20	0	≤0.2
22	0	≤0.2
16	1	≤0.8
18	1	62.0–86.0
18	2	10.0–30.0
18	3	≤0.4
20	1	≤0.3
22	1	≤0.1

■2S (*NF25*)

Add the following:

■**Sterol composition**—

SEPARATION OF THE STEROLS FRACTION—

Reference solution A—Dissolve an accurately weighed quantity of cholesterol in chloroform to obtain a solution of 5% (w/v).

Developing solvent system: a mixture of toluene and acetone (95 : 5) or a mixture of hexane and ether (65 : 35).

Test solution A—Weigh accurately 5 g of Almond Oil into a 250-mL flask. Add 50 mL of 2 N alcoholic potassium hydroxide, and heat to gentle boiling with continuous vigorous stirring until saponification takes place (the solution becomes clear). Continue heating for a further 20 minutes, and add 50 mL of water from the top of the condenser. Cool the flask to approximately 30°. Transfer the contents of the flask to a 500-mL separating funnel with several rinses of water, amounting in all to about 50 mL. Add approximately 80 mL of ether, shake vigorously for approximately 30 seconds, and allow to settle. [NOTE—Any emulsion can be destroyed by adding small quantities of ethyl or methyl alcohol by means of a spray.] Separate the lower aqueous phase, and collect it into a second separating funnel. Perform two further extractions on the water–alcohol phase in the same way using 60 to 70 mL of ether on each occasion. Pool the ether extracts into a single separating funnel, and wash with water, 50 mL at a time, until the wash water is no longer alkaline to phenolphthalein. Dry the ether phase with anhydrous sodium sulfate, and filter on anhydrous sodium sulfate into a previously weighed 250-mL flask, washing the funnel and filter with small quantities of ether. Distill the ether down to a few mL, and bring to dryness under a slight vacuum or in a stream of nitrogen. Complete drying at 100° for approximately 15 minutes, and then weigh after cooling in a desiccator. Dissolve the unsaponifiables so obtained in chloroform to prepare a solution having a concentration of approximately 5%.

Test solution B—Treat 5 g of canola oil in the same way as prescribed for Almond Oil in *Test solution A*, beginning with "Add 50 mL of 2 N alcoholic potassium hydroxide".

Test solution C—Treat 5 g of sunflower oil in the same way as prescribed for Almond Oil in *Test solution A*, beginning with "Add 50 mL of 2 N alcoholic potassium hydroxide".

Procedure—Immerse the thin-layer chromatographic plate (see *Chromatography* ⟨621⟩), 20-cm × 20-cm silica gel on polyester with a layer thickness of 200 µm and particle size of 5–17 µm, completely in the 0.2 N alcoholic potassium hydroxide for 10 seconds, then allow to dry in a fume cupboard for 2 hours and finally place at 100° for 1 hour. [NOTE—Remove from the validated heating device, and keep the plate in a desiccator until required for use. The plates must be used within 15 days. Thin-layer chromatographic plates without requiring the preconditioning are also commercially available.] Use a separate plate for each test solution.

Place a mixture of toluene and acetone (95 : 5) or a mixture of hexane and ether (65 : 35) to a depth of approximately 1 cm. Close the chamber with the appropriate cover, and leave for at least 30 minutes. Strips of filter paper dipping into the eluent may be placed on the internal surfaces of the chamber. [NOTE—The developing mixture should be replaced for every test to ensure reproducible elution conditions.] Apply 0.3 mL of *Test solution A* approximately 2 cm from the lower edge in a streak which is as thin and as uniform as possible. In line with the streak place 2 to 3 µL of *Reference solution A* at one end of the plate. Develop the chromatograms in an equilibrated chamber with a *Developing solvent system* until the solvent front reaches approximately 1 cm from the upper edge of the plate. Remove the plate from the developing chamber, and evaporate the solvent under a current of hot air [NOTE—Avoid excessive heat.] or by leaving the plate for a short while under a hood. Spray the plate with a 0.2% alcoholic solution of 2,7-dichlorofluorescein, and examine in UV light at 254 nm [NOTE—The plates pretreated with UV indicator are also commercially available and used equivalently.] In each of the plates, mark the limits of the sterol band identified through being aligned with the stain obtained from *Reference solution A* along the edges of the fluorescence, and additionally the area of the zones 2 to 3 mm above and below the visible zones corresponding to *Reference solution A* is included. Remove the silica gel in the marked area into a filter funnel with a G3 porous septum. Add 10 mL of hot chloroform, mix carefully with the metal spatula and filter under vacuum, and collect the filtrate in the conical flask attached to the filter funnel. Wash the residue in the funnel three times with ether, about 10 mL each time, and collect the filtrate in the same flask attached to the funnel. Evaporate the filtrate to a volume of 4 to 5 mL, transfer the residual solution to a previously weighed 10-mL test tube with a tapering bottom and a sealing stopper, and evaporate to dryness by mild heating in a gentle stream of nitrogen. Make up again using a few drops of acetone, and evaporate again to dryness. Place at 105° for approximately 10 minutes, and allow to cool in a desiccator, and weigh.

Treat *Test solution B* and *Test solution C* the same way as prescribed for *Test solution A*.

DETERMINATION OF THE STEROLS—

Test solution D—To the test tube containing the sterol fraction separated from Almond Oil by thin-layer chromatography add a freshly prepared mixture of anhydrous pyridine, hexamethyldisilazane, and chlorotrimethylsilane (9 : 3 : 1) [NOTE—This reagent is also commercially available and used equivalently.] in the ratio of 50 µL for every mg of sterols, avoiding any uptake of moisture. Stopper the test tube, and shake carefully until the sterols are completely dissolved. Allow it to stand for at least 15 minutes at ambient temperature, and centrifuge for a few minutes if necessary. Use the supernatant. [NOTE—The slight opalescence which may form is normal and does not cause an anomaly. However, the formation of a white floc or the appearance of a pink color is indicative of the presence of moisture or deterioration of the reagent. If these occur the test must be repeated.]

Reference solution E—To 9 parts of the sterols separated from canola oil by thin-layer chromatography add 1 part of cholesterol. Treat the mixture in the same way as prescribed under the *Test solution D*.

Reference solution F—Treat the sterols separated from sunflower oil by thin-layer chromatography in the same way as prescribed under the *Test solution D*.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a glass or fused-silica capillary column of length 20 to 30 m, internal diameter 0.25 to 0.32 mm, entirely coated with a 0.10 to 0.30-µm layer of stationary phase G27 or G36. The injection port temperature is maintained at 280°, the detector temperature is maintained at 290°, and the column temperature is maintained at 260 ± 5°. The carrier gas is either helium with a linear velocity of 20 to 35 cm per second or hydrogen with a linear velocity of 30 to 50 cm per second. A split ratio of 1 : 50 to 1 : 100 is used. Chromatograph *Reference solution E* and *Reference solution F*, and record the peak responses as directed for *Procedure:* the retention time should be 20 ± 5 minutes for β-sitosterol, all the sterols present must be separated. [NOTE—For peak identification purposes, the chromatogram obtained with *Reference solution E* shows four principal peaks corresponding to cholesterol, brassicasterol, campesterol, and β-sitosterol; and the chromatogram obtained with *Reference solution F* shows four principal peaks corresponding to campesterol, stigmasterol, β-sitosterol and Δ7-stigmastenol. The retention times of the sterols with reference to β-sitosterol are given in *Table 1*.]

Table 1. Relative Retention Times of Sterols for Two Different Columns

Identification	G36 column	G27 column
Cholesterol	0.67	0.63
Brassicasterol	0.73	0.71
24-Methylene -cholesterol	0.82	0.80
Campesterol	0.83	0.81
Campestanol	0.85	0.82
Stigmasterol	0.88	0.87
Δ7-Campesterol	0.93	0.92
Δ5,23-Stigmasta-dienol	0.95	0.95
Clerosterol	0.96	0.96
β-Sitosterol	1.00	1.00
Sitostanol	1.02	1.02
Δ5-Avenasterol	1.03	1.03
Δ5,24-Stigmasta-dienol	1.08	1.08
Δ7-Stigmastenol	1.12	1.12
Δ7-Avenasterol	1.16	1.16

Procedure—Separately inject equal volumes (about 1 µL) of *Test solution D, Reference solution E,* and *Reference solution F* into the chromatograph, record the chromatograms, and measure the peak areas for the sterols. Calculate the percentage of each individual sterol in the sterol fraction of Almond Oil taken by the formula:

$$100(A / S)$$

in which A is the area of the peak due to the sterol component to be determined, and S is the sum of the areas of the peaks due to the components indicated in *Table 1*. Almond Oil exhibits the following composition profiles of sterols.

Component	Percentage (%)
Cholesterol	≤0.7
Brassicasterol	≤0.3
Campesterol	≤5.0
Stigmasterol	≤4.0
β-Sitosterol	73.0–87.0
Δ5-Avenasterol	≥5.0
Δ7-Stigmastenol	≤3.0
Δ7-Avenasterol	≤3.0

BRIEFING

High Fructose Corn Syrup. The proposal on page 408 of *PF* 28(2) [Mar.–Apr. 2002] is canceled and a new proposal is presented in this *PF* for this new monograph. The references to the monograph for *Corn Syrup* are deleted; and detailed procedures in the tests for *Limit of sulfur dioxide* and *Limit of lead* are provided. In addition, minor editorial changes have been made.

(EM2: H. Wang; NOM: W. Paul) RTS—C45813

Add the following:

■High Fructose Corn Syrup

» High Fructose Corn Syrup is a sweet, nutritive saccharide mixture prepared as a clear, aqueous solution from high-dextrose-equivalent corn starch hydrolysate by the partial enzymatic conversion of dextrose to fructose, using an insoluble glucose isomerase enzyme preparation that complies with 21 CFR 184.1372. It is available in two types, 42% and 55%, based on fructose content. High Fructose Corn Syrup 42% contains not less than 97.0 percent of total saccharides, expressed as a percentage of total solids, of which not less than 92.0 percent consists of monosaccharides (fructose and dextrose), including not less than 41.5 percent and not more than 44.8 percent of fructose, and not more than 8.0 percent consists of other saccharides. High Fructose Corn Syrup 55% contains not less than 95.0 percent of total saccharides, expressed as a percentage of total solids, of which not less than 95.0 percent consists of monosaccharides (fructose and dextrose), including not less than 54.5 percent and not more than 56.5 percent of fructose, and not more than 5.0 percent consists of other saccharides.

Packaging and storage—Preserve in tight containers. No storage requirement specified.

Labeling—Label it to state, as part of the official title, the nominal percentage of fructose, based on the specified minimum percentage concentration of total saccharides. Label it to indicate the presence of sulfur dioxide if the residual sulfur dioxide concentration is greater than 10 μg per g.

USP Reference standards ⟨11⟩—*USP Dextrose RS. USP Fructose RS. USP Maltose Monohydrate RS.*

Identification—Add a few drops of a solution (1 in 10) of Syrup to 5 mL of hot, alkaline cupric tartrate TS: a copious, red precipitate of cuprous oxide is formed *(distinction from sucrose).*

Microbial limits ⟨61⟩—The total aerobic microbial count does not exceed 1000 cfu per g, and the total combined molds and yeasts count does not exceed 100 cfu per g.

Residue on ignition ⟨281⟩**:** not more than 0.05%.

Heavy metals, *Method II* ⟨231⟩**:** not more than 5 µg per g, an ignition temperature of 500° being used.

Total solids—Determine the refractive index of Syrup at 20° or 45° (see *Refractive Index* ⟨831⟩). Use the table below for calculating the percentage of dry substance (percentage of total solids).

Fructose Content	% Dry Substance	Refractive Index at 20°	Refractive Index at 45°
42%	70.5	1.4632	1.4577
	71.0	1.4643	1.4589
	72.0	1.4667	1.4612
	73.0	1.4691	1.4635
55%	76.5	1.4774	1.4716
	77.0	1.4786	1.4728
	78.0	1.4811	1.4752
	79.0	1.4835	1.4776

Limit of sulfur dioxide—Transfer about 100 g of Syrup, accurately weighed, to a 250-mL conical flask, add 100 mL of water, and mix. Cool to between 5° and 10°. While stirring with a magnetic stirrer, add 10 mL of cold 1.5 N sodium hydroxide (at a temperature between 5° and 10°). Stir for an additional 20 seconds, and add 10 mL of starch indicator solution prepared as follows. Mix 10 g of soluble starch with 50 mL of cold water, transfer to 1000 mL of boiling water, stir until completely dissolved, cool, and add 1 g of salicylic acid preservative. [NOTE—Discard the solution after 1 month.] Add 10 mL of 2.0 N sulfuric acid (at a temperature between 5° and 10°), and titrate immediately with 0.005 N iodine VS until a light blue color persists for 1 minute (see *Titrimetry* ⟨541⟩). Perform a blank determination, using 200 mL of water treated similarly to the solution under test, and make any necessary correction. Each mL of 0.005 N iodine is equivalent to 0.16 mg of SO_2: not more than 30 µg per g is found.

Limit of lead—[NOTE—For the preparation of all aqueous solutions and for the rinsing of glassware before use, employ water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. For digestion, use acid-cleaned, high-density polyethylene, polypropylene, polytef, or quartz tubes. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in borosilicate glass containers. Cleanse glassware before use by soaking in warm 8 N nitric acid for 30 minutes, and rinsing with deionized water. Store final diluted solutions in acid-cleaned plastic or polytef tubes or bottles.]

Modifier solution—Prepare a solution of magnesium nitrate in water containing about 200 mg per mL. Just before use, transfer 1.0 mL of this solution to a 10-mL volumetric flask, dilute with 5% nitric acid to volume, and mix.

Standard solutions—Transfer 10.0 mL of *Lead Nitrate Stock Solution,* prepared as directed under *Heavy Metals* ⟨231⟩, to a 100-mL volumetric flask, add 40 mL of water and 5 mL of nitric acid, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to a second 100-mL volumetric flask, dilute with 5% nitric acid to volume, and mix. This solution contains 0.1 µg of lead per mL. Transfer portions of this solution to four suitable containers, and dilute quantitatively, and stepwise if necessary, with 5% nitric acid to obtain *Standard solutions* having lead concentrations of 100 ng per mL, 50 ng per mL, 25 ng per mL, and 10 ng per mL, respectively.

Test solution—[NOTE—Perform this procedure in a fume hood.] Transfer about 1.5 g of Syrup, accurately weighed, to two digestion tubes, labeled "Test solution" and "Temper-

ature monitor solution", and add 0.75 mL of nitric acid to each tube. Warm both solutions slowly to between 90° and 95° to avoid spattering. Heat until all brown vapors have dissipated and any rust-colored tint is gone from the tube labeled "Test solution" (20 to 30 minutes). Cool, add 0.5 mL of 50% hydrogen peroxide dropwise to both solutions, heat to between 90° and 95° for 5 minutes, and cool. Add a second 0.5-mL portion of 50% hydrogen peroxide dropwise to each solution, and heat to between 90° and 100° for 5 to 10 minutes until the tube labeled "Test solution" is clear. Cool, and transfer the *Test solution* to a 10-mL volumetric flask. Rinse the tube labeled "Test solution" with 5% nitric acid, add the rinsing to the volumetric flask, dilute with 5% nitric acid to volume, and mix.

Standard blank—Use 5% nitric acid.

Test blank—Transfer 1.5 g of water to a digestion tube, and proceed as directed for the *Test solution,* beginning with "add 0.75 mL of nitric acid."

Procedure—[NOTE—Use peak area measurements for all quantitations.] Add 5 µL of the *Modifier solution* to 20 µL each of the *Standard solutions,* the *Test solution,* the *Standard blank,* and the *Test blank,* and mix. Separately inject equal volumes (about 20 µL) of the *Standard solutions,* the *Test solution,* the *Standard blank,* and the *Test blank* into a suitable graphite furnace atomic absorption spectrophotometer equipped with pyrolytically coated graphite tubes and adequate means of background correction. The temperature is programmed as follows. Maintain the drying temperature of the furnace at 200° for 30 seconds after a 20-second ramp time using an argon gas flow of about 300 mL per minute; maintain the ashing temperature at 750° for 40 seconds after a 40-second ramp time using an airflow of about 300 mL per minute; cool down and purge the air from the furnace for 60 seconds using a 20° set temperature and an argon gas flow of about 300 mL per minute; and maintain the atomization temperature at 1800° for 10 seconds after a 0-second ramp time with the argon gas flow stopped. [NOTE—The temperature program may be modified to obtain optimum furnace temperatures.] Using the *Standard blank* to set the instrument to zero, determine the integrated absorbances of the *Standard solutions* at the lead emission line at 283.3 nm. Plot the integrated absorbances of the *Standard solutions* versus their contents of lead, in ng per mL, and draw the line best fitting the four points to determine the calibration curve. Similarly determine the integrated absorbances of the *Test solution* and the *Test blank* at the lead emission line at 283.3 nm. Correct the absorbance value of the *Test solution* by subtracting from it the absorbance value obtained from the *Test blank*. Calculate the concentration, in µg per g, of lead in the portion of Syrup taken by the formula:

$$0.01(C/W)$$

in which C is the concentration, in ng per mL, of lead in the *Test solution,* as determined from the calibration curve; and W is the weight, in g, of Syrup taken to prepare the *Test solution:* the limit is 0.1 µg per g.

Assay—

Mobile phase—Use filtered and degassed water.

Standard preparation—Prepare a solution in water containing a total of about 10% saccharide solids of USP Dextrose RS, USP Fructose RS, and USP Maltose Monohydrate RS, in which the USP Dextrose RS and USP Fructose RS percentage concentrations are in the same ratio as those in the *Assay preparation,* based on the labeled nominal fructose percentage for the Syrup under test. Calculate the percentage of USP Maltose Monohydrate RS by the formula:

$$100 - (F + D)$$

in which F is the labeled nominal fructose percentage for the Syrup under test; and D is the difference between the specified minimum percentage concentration of total monosaccharides for the Syrup and *F.*

Assay preparation—Dilute a known volume of Syrup, determined from the results of the test for *Total solids* and on the nominal total saccharides content, with water to a total saccharides concentration of about 10% (w/v), and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector maintained at 45° and a 7.8-mm × 30-cm column that contains packing L19. The column is maintained at a constant temperature of about 85°. The flow rate is about 0.6 mL per minute. Chromatograph the *Standard preparation,* and record the peak areas as directed for *Procedure:* the relative retention times are about 0.83, 1.0, and 1.32 for maltose, dextrose, and fructose, respectively; and the resolution, *R,* between maltose and dextrose is not less than 1.2.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of fructose and of dextrose in the portion of Syrup taken by the formula:

$$100C(V_A/V_S S_1 S_2)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Fructose RS or USP Dextrose RS in the *Standard preparation;* V_A is the volume, in mL, of the *Assay preparation;* V_S is the volume, in mL, of Syrup taken to prepare the *Assay preparation;* S_1 is the percentage of total saccharides in the *Standard preparation* (corresponding to 97 for High Fructose Corn Syrup 42% and to 95 for High Fructose Corn Syrup 55%); S_2 is the percentage of total solids in the Syrup as determined in the test for *Total solids;* and r_U and r_S are the peak areas of fructose or dextrose obtained from the *Assay preparation* and the *Standard preparation,* respectively. Calculate the percentage of other saccharides, expressed in terms of maltose, in the portion of Syrup taken by the formula:

$$C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Maltose Monohydrate RS in the *Standard preparation;* r_U is the sum of all peak areas obtained from the *Assay preparation,* except those of fructose and dextrose; and r_S is the peak area of maltose obtained from the *Standard preparation.* ■2S (*NF25*)

BRIEFING

Isomalt, *NF 24* page 3354. On the basis of comments received, it is proposed to revise *Identification* test *A* as well as the formula in the test for *Related compounds.*

(EM1: C. Sheehan) RTS—C43794

Change to read:

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture containing a fluorescent indicator having optimal intensity at 254 nm.

Test solution: 5000 µg per mL in water.

Application volume: 1 µL.

Developing solvent system: a mixture of ethyl acetate, pyridine, water, acetic acid, and propionic acid (50 : 50 : 10 : 5 : 5).

Procedure—Separately apply 1 µL each of the Standard solution and the *Test solution* to the thin-layer chromatographic plate, and thoroughly dry the starting points in warm air. Develop over 10 cm using the *Developing solvent system,* dry the plate in a current of hot air, and dip for 3 seconds in a 1 g per L solution of sodium periodate. Dip the plate for 3 seconds in a mixture of dehydrated alcohol, sulfuric acid, acetic acid, and anisaldehyde (90 : 5 : 1 : 1). Dry the plate in a current of hot air until colored spots become visible. The background color may be brightened by exposure to warm steam. Examine in daylight. ~~The chromatogram obtained from the Standard solution shows two blue-grey spots with R_F values of about 0.13 (1,6-GPS) and 0.16 (1,1-GPM). The chromatogram obtained from the *Test solution* shows principal spots similar in position and color to the chromatogram obtained from the Standard solution.~~

■The chromatograms obtained from the Standard solution and the *Test solution* show principal spot(s) similar in position and color. ■2S (*NF25*)

In-Process Revision

B: The retention times of the two principal peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Change to read:

Related compounds—

Mobile phase—Prepare as directed in the *Assay.*

Resolution solution—Dissolve accurately weighed quantities of USP Isomalt RS, USP Mannitol RS, and USP Sorbitol RS, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having known concentrations of about 20 mg per mL, 0.1 mg per mL, and 0.1 mg per mL, respectively.

Standard solution—Dissolve an accurately weighed quantity of USP Sorbitol RS and USP Mannitol RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.1 mg of each per mL.

Test solution—Use the *Assay preparation.*

Chromatographic system (see *Chromatography* ⟨621⟩)—Prepare as directed in the *Assay.* Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the typical retention time of 1,1-GPM is about 12.3 minutes; the relative retention times are about 1.2 for 1,6-GPS, about 1.6 for mannitol, about 2.0 for sorbitol, and 1.0 for 1,1-GPM; and the resolution, *R,* between 1,1-GPM and 1,6-GPS is not less than 2.0.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of mannitol or sorbitol in the portion of Isomalt taken by the formula:

$$5000C/W(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Mannitol RS or USP Sorbitol RS in the *Standard solution; W* is the weight, in mg, of Isomalt used to prepare the *Test solution;* and r_U and r_S are the individual peak responses of mannitol or sorbitol obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.5% of mannitol and not more than 0.5% of sorbitol is found. Calculate the percentage of any ~~other~~

■unknown■2S (*NF25*)
impurity in the portion of Isomalt taken by the formula:

~~$100(r_i/r_u)$~~

~~in which r_i is the peak response for each impurity, and r_u is the sum of the responses of all the peaks obtained from the *Test solution.*~~

■$5000C/W(r_i/r_S)$

in which C is the concentration, in mg per mL, of USP Sorbitol RS in the *Standard solution; W* is the weight, in mg, of Isomalt used to prepare the *Test solution;* r_i is the peak response of each unknown impurity; and r_S is the peak response of Sorbitol in the *Standard solution:*■2S (*NF25*)
not more than 0.5% of any individual impurity is found; and not more than 2.0% of total impurities, including mannitol and sorbitol, is found. Disregard any impurity peak that is less than 0.1%.

BRIEFING

Polydextrose. Because there is no existing *NF* monograph for this article, it is proposed to add a new monograph based on the Polydextrose monograph in the *Food Chemicals Codex, Fifth Edition,* pages 336–339 and also on the Polydextroses monograph in the *51st Joint FAO/WHO Expert Committee on Food Additives (JECFA),* 1998.

(EM2: H. Wang; NOM: W. Paul) RTS—C44166

Add the following:

■Polydextrose

Modified polydextrose [*68424-04-4*].

» Polydextrose is a randomly bonded polymer prepared by melting and subsequent condensation of the ingredients, which consist of approximately 90 parts dextrose, 10 parts sorbitol, and up to 1 part citric acid or 0.1 part phosphoric acid. The 1,6-glycosidic linkage predominates in the polymer but other linkages are present. It contains not less than 90.0 percent of dextrose polymer units, calculated on the anhydrous and ash-free basis. It contains small quantities of free dextrose, sorbitol, and 1,6-anhydro-D-glucose (levoglucosan), with traces of citric acid or phosphoric acid. It may be untreated, or neutralized with potassium hydroxide and decolorized and deionized for further purification. It may be partially reduced by transition metal catalytic hydrogenation in an aqueous solution.

Packaging and storage—Preserve in tight, light-resistant containers. No storage requirements specified.

USP Reference standards ⟨11⟩—*USP 1,6-Anhydro-D-glucose RS. USP Dextrose RS. USP Sorbitol RS.*

Identification—

A: To 1 drop of a solution (1 in 10), add 4 drops of 5% phenol solution, then rapidly add 15 drops of sulfuric acid TS: a deep yellow to orange color is produced.

B: With vigorous swirling, add 1 mL of acetone to 1 mL of a solution (1 in 10): the solution remains clear.

C: With vigorous swirling, add 2 mL of acetone to the solution obtained in *Identification* test *B:* a heavy, milky turbidity develops immediately.

D: To 1 mL of a solution (1 in 50), add 4 mL of alkaline cupric citrate TS. Boil vigorously for 2 to 4 minutes. Remove from heat, and allow the precipitate (if any) to settle: the supernatant is blue or blue-green.

pH ⟨791⟩**:** between 2.5 and 7.0, in a solution (1 in 10) for untreated Polydextrose; between 5.0 and 6.0, in a solution (1 in 10) for neutralized and/or decolorized Polydextrose.

Water, *Method I* ⟨921⟩**:** not more than 4.0%, anhydrous pyridine being used in place of methanol in the titration vessel.

Residue on ignition ⟨281⟩**:** not more than 0.3% for untreated Polydextrose; not more than 2.0% for neutralized and/or decolorized Polydextrose.

Limit of lead—[NOTE—Use reagent-grade chemicals with as low a lead content as is practicable, as well as high-purity water and gases. Before use in this analysis, rinse all glassware and plasticware twice with 10% nitric acid and twice with 10% hydrochloric acid, and then rinse them thoroughly with *Purified Water*.]

Matrix modifier solution—Prepare a solution in water containing 100.0 mg of dibasic ammonium phosphate per 10 mL of solution.

Lead nitrate stock solution—Dissolve 159.8 mg of lead nitrate in 100 mL of water to which has been added 1 mL of nitric acid, then dilute with water to 1000 mL. Prepare and store this solution in glass containers free from soluble lead salts.

Standard lead solution—On the day of use, dilute 10.0 mL of *Lead nitrate stock solution* with water to 100.0 mL, and mix. Each mL of *Standard lead solution* contains the equivalent of 10 µg of lead.

Standard solutions—Into five separate 100-mL volumetric flasks, pipet 0.2, 0.5, 1, 2, and 5 mL, respectively, of *Standard lead solution*, dilute with water, and mix. The *Standard solutions* contain 0.02, 0.05, 0.1, 0.2, and 0.5 µg of lead per mL, respectively.

Test solution—Transfer about 1.0 g of Polydextrose, accurately weighed and calculated on the anhydrous and ash-free basis, into a 10-mL volumetric flask, dissolve in water, dilute with water to volume, and mix.

Spiked test solution—Transfer about 1.0 g of Polydextrose, accurately weighed and calculated on the anhydrous and ash-free basis, into a 10-mL volumetric flask, and dissolve in water. Add 100 µL of the *Standard lead solution,* dilute with water to volume, and mix. This solution contains 0.1 µg of added lead per mL.

Procedure—Concomitantly determine the absorbances of 10-µL aliquots of the five *Standard solutions,* a mixture of 10 µL of the *Matrix modifier solution* and 10 µL of the *Test solution,* and a mixture of 10 µL of the *Matrix modifier solution* and 10 µL of the *Spiked test solution* at the lead emission line at 283.3 nm, with a suitable graphite furnace atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩). The spectrophotometer is equipped with a pyrolytic tube with a platform and a lead hollow-cathode lamp, using a slit width of 0.7 mm (set low) and a deuterium arc lamp for background correction. The drying temperature of the furnace is maintained at 130° for 40 seconds after a 20-second ramp time using an argon flow rate of 300 mL per minute; the ashing temperature is maintained at 800° for 40 seconds after a 20-second ramp time using an argon flow rate of 300 mL per minute; and the atomization temperature is maintained at 2400° for 6 seconds using an argon flow rate of 50 mL per minute. Clean the graphite furnace at 2600° for 5 seconds after a 1-second ramp time

In-Process Revision

using an argon flow rate of 300 mL per minute, and recharge the graphite furnace at 20° for 20 seconds after a 2-second ramp time using an argon flow rate of 300 mL per minute. Plot the absorbance of each *Standard solution,* compensated for background correction, versus its content of lead, in µg per mL, and draw the best straight line fitting the five points. From this plot, determine the concentrations, C_T and C_{ST}, in µg per mL, of lead in the *Test solution* and the *Spiked test solution*, respectively. Calculate the percentage recovery taken by the formula:

$$100[(C_{ST} - C_T)/0.1]$$

in which 0.1 is the amount of lead, in µg per mL, added to the *Spiked test solution*. Calculate the content, in µg per g, of lead in Polydextrose taken by the formula:

$$10C_T/W$$

in which W is the weight, in g, of Polydextrose taken to prepare the *Test solution:* not more than 0.5 µg of lead per g is found.

Limit of 5-hydroxymethylfurfural and related compounds—

Test solution—Transfer about 1.0 g of Polydextrose, accurately weighed and calculated on the anhydrous and ash-free basis, into a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Procedure—Determine the absorbance of the *Test solution* in a 1-cm quartz cell at 283 nm, with a suitable spectrophotometer, using water as the blank. Calculate the percentage of 5-hydroxymethylfurfural and related compounds in the Polydextrose taken by the formula:

$$100[(0.1)(126)A]/(16{,}830LW)$$

in which 0.1 is the volume, in L, of the *Test solution;* 126 is the molecular weight, in g per mol, of 5-hydromethylfurfural; A is the absorbance of the *Test solution;* 16,830 is the molar extinction coefficient, in L per mol per cm, of 5-hydromethylfurfural at a wavelength of 283 nm; L is the path length, in cm, of the spectrophotometer cell; and W is the weight, in g, of Polydextrose taken to prepare the *Test solution:* not more than 0.1% is found.

Molecular weight limit—

Mobile phase—Dissolve 35.0 g of sodium nitrate and 1.0 g of sodium azide in 100 mL of water. Dilute with water to 4 L, and mix. Pass through a 0.45-µm filter or finer porosity, and degas by applying an aspirator vacuum for 30 minutes. The resulting *Mobile phase* is 0.1 N sodium nitrate containing 0.025% sodium azide.

Standard solution—Transfer about 20 mg each of USP Dextrose RS, stachyose, and 5800-, 23,700-, and 100,000-molecular weight (MW) pullulan standards, accurately weighed, into a 10-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix. Pass through a syringe filter having a 0.45-µm or finer porosity into a suitable autosampler vial, and seal.

Test solution—Transfer about 50 mg of Polydextrose, accurately weighed, into a 10-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix. Pass through a syringe filter having a 0.45-µm or finer porosity into a suitable autosampler vial, and seal.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector set at a sensitivity of 4×10^{-6} refractive index units full scale and is maintained at a temperature of $35 \pm 0.1°$ and a 7.8-mm × 30-cm column that contains packing L25 and is maintained at a temperature of 45°. The flow rate is about 0.8 mL per minute. [NOTE—After installation of a new column, pump *Mobile phase* through the column overnight at a rate of about 0.3 mL per minute. Before calibration or analysis, increase the flow slowly over a 1-minute period to 0.8 mL per minute. Continue to pump *Mobile phase* through the column at this flow rate for at least 1 hour before the first injection. Check the flow gravimetrically, and adjust it if necessary. Reduce the flow rate to about 0.1 mL per minute when the

system is not in use.] Chromatograph replicate injections of the *Standard solution*, allowing 15 minutes between injections, and record the retention times of the components of the *Standard solution* as directed for *Procedure:* the retention times for each component determined on replicate injections agree within ±2 seconds; and dextrose and stachyose are baseline resolved from one another and from the 5800-MW pullulan standard. [NOTE—Elevated valleys are usually observed between the peaks for the three pullulan standards.]

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the retention times for the major peaks. Plot the average retention time, in seconds, of each component in the *Standard solution,* versus its molecular weight, in g per mol, of each component, draw the best cubic line fitting the five points, and calculate the correlation coefficient for the line. A suitable system is one that yields a line having a correlation coefficient of not less than 0.99. From the molecular weight distribution graph, generate a MW distribution profile of Polydextrose: no measurable peak above a molecular weight of 22,000 is found.

Limit of monomers—

Internal standard solution—Transfer about 50 mg of *n*-octadecane, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with pyridine to volume, and mix.

Standard stock solution—Dissolve accurately weighed quantities of USP Dextrose RS, USP Sorbitol RS, and USP 1,6-Anhydro-D-glucose RS in pyridine to obtain a solution having a known concentration of about 0.5 mg of dextrose, about 0.4 mg of sorbitol, and about 0.35 mg of 1,6-anhydro-D-glucose per mL.

Standard solution—Transfer 1.0 mL of *Standard stock solution* to a reaction vial equipped with a screw cap. Add 1.0 mL of *Internal standard solution* and 0.5 mL of *N*-(trimethylsilyl)imidazole to the reaction vial, seal the vial with the screw cap, and mix. Place the vial in an ultrasonic bath at 70° for 60 minutes, remove, and allow the contents to cool.

Test solution—Transfer 20 mg of Polydextrose, accurately weighed and calculated on the anhydrous and ash-free basis, into a reaction vial equipped with a screw cap. Add 1.0 mL of *Internal standard solution,* 1.0 mL of pyridine, and 0.5 mL of *N*-(trimethylsilyl)imidazole to the reaction vial, seal the vial with the screw cap, and mix. Place the vial in an ultrasonic bath at 70° for 60 minutes, remove, and allow the contents to cool.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and 2-mm × 250-cm glass column packed with 3% phase G2 on support S1AB. The detector temperature is maintained at about 230°. The column temperature is maintained at about 175°, and the injection port temperature is maintained at about 210°. Chromatograph the *Standard solution,* and record the peak response as directed for *Procedure*. [NOTE—For peak identification purposes, relative retention times are 0.3, 0.4, 0.45, 0.8, 1.0, and 1.2 for D-anhydroglucose (levoglucosan) pyranose form, D-anhydroglucose furanose form (not present in standard), *n*-octadecane, alpha-D-glucose; D-sorbitol, beta-D-glucose, respectively.]

Procedure—Separately inject equal volumes (about 3 µL) of the *Standard solution* and the *Test solution* into the chromatograph. Record the chromatograms and measure the responses for the major peaks. Calculate the percentage of each monomer in Polydextrose taken by the formula:

$$(100C / W) / (R_U / R_S)$$

in which C is the concentration, in mg per mL, of the respective monomer in the *Standard stock solution; W* is the weight, in mg, of Polydextrose taken to prepare the *Test solution;* R_U and R_S are the ratios of the peak of the respective monomer silyl derivative peak to the peak area of the internal standard peak obtained from the *Test solution* and the

Standard solution, respectively: not more than 4.0% of 1,6-anhydrous-D-glucose is found, and not more than 6.0% of dextrose and sorbitol is found. [NOTE—In the case of glucose, the peak areas for the alpha- and beta-epimers are combined, and in the case of 1,6-anhydro-D-glucose, the peak areas for the pyranose and furanose forms are combined.]

Limit of nickel—[NOTE—This test is required only for hydrogenated Polydextrose.]

Blank solution—Add 2.0 mL of a saturated solution of ammonium pyrrolidinedithiocarbamate TS, into 150.0 mL of strong acetic acid TS, and mix. Add 10.0 mL of methyl isobutyl ketone, and shake for 30 seconds. Protect from bright light. Allow the two layers to separate, and use the methyl isobutyl ketone layer.

Standard solutions—Into three identical 250-mL volumetric flasks, dissolve about 20.0 g of hydrogenated Polydextrose, accurately weighed, in strong acetic acid TS, and dilute with strong acetic acid TS to 150.0 mL. Into these three volumetric flasks, introduce respectively 0.5, 1.0, and 1.5 mL of nickel standard solution TS, and mix. To each flask, add 2.0 mL of a saturated solution of ammonium pyrrolidinedithiocarbamate TS, and 10.0 mL of methyl isobutyl ketone, and shake for 30 seconds. Protect from bright light. Allow the two layers to separate, and use the methyl isobutyl ketone layer. These *Standard solutions* are fortified with the equivalent of 0.5, 1.0, and 1.5 µg per g of nickel from the nickel standard solution TS.

Test solution—Dissolve about 20.0 g of hydrogenated Polydextrose, accurately weighed, in strong acetic acid TS, and dilute with strong acetic acid TS to 150.0 mL. Add 2.0 mL of a saturated solution of ammonium pyrrolidinedithiocarbamate TS, and 10.0 mL of methyl isobutyl ketone, and shake for 30 seconds. Protect from bright light. Allow the two layers to separate, and use the methyl isobutyl ketone layer.

Procedure—Concomitantly determine the absorbances of the *Standard solutions* and the *Test solution* at least three times each, at the wavelength of maximum absorbance at 232.0 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with an air–acetylene flame and a nickel hollow-cathode lamp using the *Blank solution* to zero the instrument. Record the average of the steady readings for each of the *Standard solutions* and the *Test solution*. Between each measurement, aspirate the *Blank solution,* and ascertain that the reading returns to its initial blank value. Plot the absorbances of the *Standard solutions* and the *Test solution* versus the added quantity of nickel. Extrapolate the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of nickel in the *Test solution*: not more than 2 µg per g is found.

Assay—

Phenol solution—Add 20 mL of water to 80 g of phenol, and mix.

Dextrose stock standard solution—Transfer 100 mg of USP Dextrose RS, accurately weighed, to a 500-mL volumetric flask, dilute with water to volume, and mix.

Standard preparations—Quantitatively dilute the *Dextrose stock standard solution* with water to obtain five *Standard preparations* containing 5, 10, 20, 40, and 50 µg of dextrose per mL, respectively.

Assay preparation—Transfer approximately 10 mg of Polydextrose, accurately weighed and calculated on the anhydrous and ash-free basis, to a 250-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Freshly pipet 2.0 mL of each of the *Standard preparations* into a separate acetone-free, 15-mL vial equipped with a screw-cap. Transfer 2.0 mL of the *Assay preparation* to a separate acetone-free, 15-mL vial equipped with a screw-cap, and transfer 2.0 mL of water to a separate acetone-free, 15-mL vial equipped with a screw-cap to provide a blank. To each vial, add 0.12 mL of the *Phenol solution,* cap the vial, and mix gently. Uncap each vial, and rapidly add 5.0 mL of sulfuric acid. Immediately recap each vial, and shake vigorously. *[Caution—Wear rubber gloves and a safety shield while adding sulfuric acid.]* Allow the

vials to stand at room temperature for 45 minutes. Concomitantly determine the absorbances of the solutions in 1-cm cells at 490 nm with a suitable spectrophotometer, using the blank to set the instrument. Prepare a standard curve by plotting the absorbances of the solutions from the *Standard preparations* versus their contents of dextrose, in µg per mL. Draw the straight line best fitting the five points, and extrapolate the line until it intercepts the absorbance axis (*y* axis). From the curve, determine the concentration C_D, in µg per mL, of dextrose in the *Assay preparation*. Calculate the percentage of dextrose polymer units in the Polydextrose taken by the formula:

$$1.05(25C_D / W_T - P_G - 1.11P_L)$$

in which 1.05 is an experimentally derived correction factor to account for the polymer (which also contains a small amount of sorbitol) not giving the exact amount of color given by an equivalent amount of glucose monomers; W_T is the weight, in mg, of the Polydextrose taken to prepare the *Assay preparation;* P_G and P_L are the percentages of dextrose and 1,6-anhydrous-D-glucose (levoglucosan) determined, respectively, in the test for *Limit of monomers;* and 1.11 is a conversion factor from 1,6-anhydrous-D-glucose, which gives an equivalent amount of color to an equivalent weight of glucose.■2S (*NF25*)

Physical Tests and Determinations

BRIEFING

⟨**621**⟩ **Chromatography,** *USP 29* page 2639, page 3595 of the *First Supplement,* the *Second Interim Revision Announcement* on page 265 of *PF* 32(2) [Mar.–Apr. 2006], and page 831 of *PF* 32(3) [May–June 2006]. On the basis of comments received, the General Chapters Expert Committee has introduced changes in the *System Suitability* section. It is proposed to eliminate the reference to chapter ⟨1226⟩ and give to the user the reponsibility of verifying the impact of the changes made on the official method.

In order to avoid unnecessary republishing of this chapter each time a chromatographic reagent is modified or new chromatographic reagents are added to the existing lists, the Expert Committee has proposed to move the lists of *Packings, Phases,* and *Supports* under *Chromatographic Reagents* to a new section called *Chromatographic Reagents* under *Reagents, Indicators, and Solutions.*

In addition, minor revisions are proposed in the sections *Introduction, Thin-Layer Chromatography,* and *Interpretation of Chromatograms.*

(GC: H. Pappa) RTS—C43823; C43930

Change to read:

INTRODUCTION

This chapter defines the terms and procedures used in chromatography and provides general information. Specific requirements for chromatographic procedures for drug substances and dosage forms, including adsorbent and developing solvents, are given in the individual monographs.

Chromatography is defined as a procedure by which solutes are separated by a dynamic differential migration process in a system consisting of two or more phases, one of which moves continuously in a given direction and in which the individual substances exhibit different mobilities by reason of differences in adsorption, partition, solubility, vapor pressure, molecular size, or ionic charge density. The individual substances thus separated can be identified or determined by analytical procedures.

The general chromatographic technique requires that a solute undergo distribution between two phases, one of them fixed (stationary phase), the other moving (mobile phase). It is the mobile phase that transfers the solute through the medium until it eventually emerges separated from other solutes that are eluted earlier or later. Generally, the solute is transported through the separation medium by means of a flowing stream of a liquid or a gaseous solvent known as the ''eluant.'' The stationary phase may act through adsorption, as in the case of adsorbents such as activated alumina and silica gel, or it may act by dissolving the solute, thus partitioning the latter between the stationary and mobile phases. In the latter process, a liquid coated onto an inert support, or chemically bonded onto silica gel, or directly onto the wall of a fused silica capillary, serves as the stationary phase. Partitioning is the predominant mechanism of separation in gas–liquid chromatography, paper chromatography, in forms of column chromatography, and in thin-layer chromatography designated as liquid-liquid ~~separation~~

■chromatography.■2S (*USP30*)

In practice, separations frequently result from a combination of adsorption and partitioning effects. Other separation principles include ion exchange, ion-pair formation, size exclusion, hydrophobic interaction, and chiral recognition.

The types of chromatography useful in qualitative and quantitative analysis that are employed in the *USP* procedures are column, gas, paper, thin-layer, (including high-performance thin-layer chromatography), and pressurized liquid chromatography (commonly called high-pressure or high-performance liquid chromatography). Paper and thin-layer chromatography are ordinarily more useful for purposes of identification because of their convenience and simplicity. Column chromatography offers a wider choice of stationary phases and is useful for the separation of individual compounds, in quantity, from mixtures. Modern high-performance thin-layer chromatography, gas chromatography, and pressurized liquid chromatography require more elaborate apparatus but usually provide high resolution and identify and quantitate very small amounts of material.

Use of Reference Substances in Identity Tests—In paper and thin-layer chromatography, the ratio of the distance (this distance being measured to the point of maximum intensity of the spot or zone) traveled on the medium by a given compound to the distance traveled by the front of the mobile phase, from the point of application of the test substance, is designated as the R_F value of the compound. The ratio between the distances traveled by a given compound and a reference substance is the R_R value. R_F values vary with the experimental conditions, and thus identification is best accomplished where an authentic specimen of the compound in question is used as a reference substance on the same chromatogram.

For this purpose, chromatograms are prepared by applying on the thin-layer adsorbent or on the paper in a straight line, parallel to the edge of the chromatographic plate or paper, solutions of the substance to be identified, the authentic specimen, and a mixture of nearly equal amounts of the substance to be identified and the authentic specimen. Each sample application contains approximately the same quantity by weight of material to be chromatographed. If the substance to be identified and the authentic specimen are identical, all chromatograms agree in color and R_F value and the mixed chromatogram yields a single spot; i.e., R_R is 1.0.

Location

■**and Identification**■2S (*USP30*)
of Components—The spots produced by paper or thin-layer chromatography may be located by: (1) direct inspection if the compounds are visible under white or either short-wavelength (254 nm) or long-wavelength (360 nm) UV light, (2) inspection in white or UV light after treatment with reagents that will make the spots visible (reagents are most conveniently applied with an atomizer), (3) use of a Geiger-Müller counter or autoradiographic techniques in the case of the presence of radioactive substances, or (4) evidence resulting from stimulation or inhibition of bacterial growth by the placing of removed portions of the adsorbent and substance on inoculated media.

In open-column chromatography, in pressurized liquid chromatography performed under conditions of constant flow rate, and in gas chromatography, the retention time, *t,* defined as the time elapsed between sample injection and appearance of the peak concentration of the eluted sample zone, may be used as a parameter of identification. Solutions of the substance to be identified or derivatives thereof, of the reference compound, and of a mixture of equal amounts of these two are chromatographed successively on the same column under the same chromatographic conditions. Only one peak should be observed for the mixture. The ratio of the retention times of the test substance, the reference compound, and a mixture of these, to the retention time of an internal standard is called the relative retention time R_R and is also used frequently as a parameter of identification.

The deviations of R_R, R_F, or t values measured for the test substance from the values obtained for the reference compound and mixture should not exceed the reliability estimates determined statistically from replicate assays of the reference compound.

Chromatographic identification by these methods under given conditions strongly indicates identity but does not constitute definitive identification. Coincidence of identity parameters under three to six different sets of chromatographic conditions (temperatures, column packings, adsorbents, eluants, developing solvents, various chemical derivatives, etc.) increases the probability that the test and reference substances are identical. However, many isomeric compounds cannot be separated. Specific and pertinent chemical, spectroscopic, or phys-

In-Process Revision

icochemical identification of the eluted component combined with chromatographic identity is the most valid criterion of identification. For this purpose, the individual components separated by chromatography may be collected for further identification.

Change to read:

THIN-LAYER CHROMATOGRAPHY

In thin-layer chromatography, the adsorbent is a relatively thin, uniform layer of dry, finely powdered material applied to a glass, plastic, or metal sheet or plate, glass plates being most commonly employed. The coated plate can be considered an ''open chromatographic column'' and the separations achieved may be based upon adsorption, partition, or a combination of both effects, depending on the particular type of stationary phase, its preparation, and its use with different solvents. Thin-layer chromatography on ion-exchange layers can be used for the fractionation of polar compounds. Presumptive identification can be effected by observation of spots or zones of identical R_F value and about equal magnitude obtained, respectively, with an unknown and a reference sample chromatographed on the same plate. A visual comparison of the size or intensity of the spots or zones may serve for semiquantitative estimation. Quantitative measurements are possible by means of densitometry (absorbance or fluorescence measurements), or the spots may be carefully removed from the plate, followed by elution with a suitable solvent and spectrophotometric measurement. For two-dimensional thin-layer chromatography, the chromatographed plate is turned at a right angle and again chromatographed, usually in another chamber equilibrated with a different solvent system.

Apparatus—Acceptable apparatus and materials for thin-layer chromatography consist of the following.

A *TLC or HPTLC plate.* The chromatography is generally carried out using *precoated plates* or *sheets* (on glass, aluminum, or polyester support) of suitable size. It may be necessary to clean the plates prior to separation. This can be done by migration of, or immersion in, an appropriate solvent. The plates may also be impregnated by procedures such as development, immersion, or spraying. At the time of use, the plates may be activated, if necessary, by heating in an oven at 120° for 20 minutes. The *stationary phase* of TLC plates has an average particle size of 10–15 µm, and that of HPTLC plates an average particle size of 5 µm. Commercial plates with a preadsorbant zone can be used if they are specified in a monograph. Sample applied to the preabsorbant region develops into sharp, narrow bands at the preabsorbant-sorbent interface. Alternatively, flat *glass plates* of convenient size, typically 20 cm × 20 cm, can be coated as described under *Preparation of Chromatographic Plates.*

A suitable *manual, semiautomatic, or automatic application device* can be used to ensure proper positioning of the plate and proper transfer of the sample, with respect to volume and position, onto the plate. Alternatively, a *template* can be used to guide in manually placing the test spots at definite intervals, to mark distances as needed, and to aid in labeling the plates. For the proper application of the solutions, *micropipets, microsyringes, or calibrated disposable capillaries* are recommended.

For ascending development, a *chromatographic chamber* made of inert, transparent material and having the following specifications is used: a flat bottom or twin trough, a tightly fitted lid, and a size suitable for the plates. For horizontal development, the chamber is provided with a reservoir for the mobile phase, and it also contains a device for directing the mobile phase to the stationary phase.

Devices for transfer of reagents onto the plate by spraying, immersion, or exposure to vapor and devices to facilitate any necessary heating for visualization of the separated spots or zones.

A *UV light source* suitable for observations under short (254 nm) and long (365 nm) wavelength UV light.

A suitable *device for documentation* of the visualized chromatographic result.

Procedure—Apply the prescribed volume of the test solution and the standard solution in sufficiently small portions to obtain circular spots of 2 to 5 mm in diameter (1 to 2 mm on HPTLC plates) or bands of 10 to 20 mm by 1 to 2 mm (5 to 10 mm by 0.5 to 1 mm on HPTLC plates) at an appropriate distance from the lower edge—during chromatography the application position must be

■at least■2S (*USP30*)
3 mm (HPTLC) ~~to~~

■or■2S (*USP30*)
5 mm (TLC) above the level of the developing solvent—and from the sides of the plate. Apply the solutions on a line parallel to the lower edge of the plate with an interval of at least 10 mm (5 mm on HPTLC plates) between the centers of spots or 4 mm (2 mm on HPTLC plates) between the edges of bands, and allow to dry.

Ascending Development—Line at least one wall of the chromatographic chamber with filter paper. Pour into the chromatographic chamber a quantity of the mobile phase sufficient for the size of the chamber to give, after impregnation of the filter paper, a level of depth appropriate to the dimension of the plate used. For saturation of the chromatographic chamber, close the lid, and allow the system to equilibrate. Unless otherwise indicated, the chromatographic separation is performed in a saturated chamber.

Place the plate in the chamber, ensuring that the plate is as vertical as possible and that the spots or bands are above the surface of the mobile phase, and close the chamber. The stationary phase faces the inside of the chamber. Remove the plate when the mobile phase has moved over the prescribed distance. Dry the plate, and visualize the chromatograms as prescribed. For two-dimensional chromatography, dry the plates after the first development, and carry out a second development in a direction perpendicular to that of the first development.

Horizontal Development—Introduce a sufficient quantity of the developing solvent into the reservoir of the chamber using a syringe or pipet. Place the plate horizontally in the chamber, connect the mobile phase direction device according to the manufacturer's instructions, and close the chamber. If prescribed, develop the plate starting simultaneously at both ends. Remove the plate when the mobile phase has moved over the distance prescribed in the monograph. Dry the plate, and visualize the chromatograms as prescribed.

For two-dimensional chromatography, dry the plates after the first development, and carry out a second development in a direction perpendicular to that of the first development.

Detection—Observe the dry plate first under short-wavelength UV light (254 nm) and then under long-wavelength UV light (365 nm) or as stated in the monograph. If further directed, spray, immerse, or expose the plate to vapors of the specified reagent, heat the plate when required, observe, and compare the test chromatogram with the standard chromatogram. Document the plate after each observation. Measure and record the distance of each spot or zone from the point of origin, and indicate for each spot or zone the wavelength under which it was observed. Determine the R_F values for the principal spots or zones (see *Glossary of Symbols*).

Quantitative Measurement—Using appropriate instrumentation, substances separated by TLC and responding to ultraviolet-visible (UV-Vis) irradiation prior to or after derivatization can be determined directly on the plate. While moving the plate or the measuring device, the plate is examined by measuring the reflectance of the incident light. Similarly, fluorescence may be measured using an appropriate optical system. Substances containing radionuclides can be quantified in three ways: (1) directly by moving the plate alongside a suitable counter or vice versa; (2) by cutting the plates into strips and measuring the radioactivity on each individual strip using a suitable counter; or (3) by scraping off the stationary phase, dissolving it in a suitable scintillation cocktail, and measuring the radioactivity using a liquid scintillation counter (see *Radioactivity* ⟨821⟩).

The apparatus for direct quantitative measurement on the plate is a densitometer that is composed of a mechanical device to move the plate or the measuring device along the *x*-axis and the *y*-axis, a recorder, a suitable integrator or a computer; and, for substances responding to UV-Vis irradiation, a photometer with a source of light, an optical device capable of generating monochromatic light, and a photo cell of adequate sensitivity, all of which are used for the measurement of reflectance. In the case where fluorescence is measured, a suitable filter is also required to prevent the light used

In-Process Revision

for excitation from reaching the photo cell while permitting the emitted light or specific portions thereof to pass. The linearity range of the counting device must be verified.

For quantitative tests, it is necessary to apply to the plate not fewer than three standard solutions of the substance to be examined, the concentrations of which span the expected value in the test solution (e.g., 80%, 100%, and 120%). Derivatize with the prescribed reagent, if necessary, and record the reflectance or fluorescence in the chromatograms obtained. Use the measured results for the calculation of the amount of substance in the test solution.

Preparation of Chromatographic Plates—

Apparatus—

Flat *glass plates* of convenient size, typically 20 cm × 20 cm.

An *aligning tray* or a flat surface upon which to align and rest the plates during the application of the adsorbent.

A *storage rack* to hold the prepared plates during drying and transportation. The rack holding the plates should be kept in a desiccator or be capable of being sealed in order to protect the plates from the environment after removal from the drying oven.

The *adsorbent* consists of finely divided adsorbent materials, normally 5 to 40 µm in diameter, suitable for chromatography. It can be applied directly to the glass plate or can be bonded to the plate by means of plaster of Paris [calcium sulfate hemihydrate (at a ratio of 5% to 15%)] or with starch paste or other binders. The plaster of Paris will not yield as hard a surface as will the starch, but it is not affected by strongly oxidizing spray reagents. The adsorbent may contain fluorescing material to aid in the visualization of spots that absorb UV light.

A *spreader,* which, when moved over the glass plate, will apply a uniform layer of adsorbent of desired thickness over the entire surface of the plate.

Procedure—[NOTE—In this procedure, use Purified Water that is obtained by distillation.] Clean the glass plates scrupulously, using an appropriate cleaning solution (see *Cleaning Glass Apparatus* ⟨1051⟩), rinsing them with copious quantities of water until the water runs off the plates without leaving any visible water or oily spots, then dry. It is important that the plates be completely free from lint and dust when the adsorbent is applied.

Arrange the plate or plates on the aligning tray, place a 5- × 20-cm plate adjacent to the front edge of the first square plate and another 5- × 20-cm plate adjacent to the rear edge of the last square, and secure all of the plates so that they will not slip during the application of the adsorbent. Position the spreader on the end plate opposite the raised end of the aligning tray. Mix 1 part of adsorbent with 2 parts of water (or in the ratio suggested by the supplier) by shaking vigorously for 30 seconds in a glass-stoppered conical flask, and transfer the slurry to the spreader. Usually 30 g of adsorbent and 60 mL of water are sufficient for five 20- × 20-cm plates. Complete the application of adsorbents using plaster of Paris binder within 2 minutes of the addition of the water, because thereafter the mixture begins to harden. Draw the spreader smoothly over the plates toward the raised end of the aligning tray, and remove the spreader when it is on the end plate next to the raised end of the aligning tray. (Wash away all traces of adsorbent from the spreader immediately after use.) Allow the plates to remain undisturbed for 5 minutes, then transfer the square plates, layer side up, to the storage rack, and dry at 105° for 30 minutes. Preferably place the rack at an angle in the drying oven to prevent the condensation of moisture on the back sides of plates in the rack. When the plates are dry, allow them to cool to room temperature, and inspect the uniformity of the distribution and the texture of the adsorbent layer; transmitted light will show uniformity of distribution, and reflected light will show uniformity of texture. Store the satisfactory plates over silica gel in a suitable chamber.

INTERPRETATION OF CHROMATOGRAMS

Figure 1 represents a typical chromatographic separation of two substances, 1 and 2, where t_1 and t_2 are the respective retention times; and h, $h/2$, and $W_{h/2}$ are the height, the half-height, and the width at half-height, respectively, for peak 1. W_1 and W_2 are the respective widths of peaks 1 and 2 at the baseline. Air peaks are a feature of gas chromatograms and correspond to the solvent front in liquid chromatography.

■The retention time of these unretained components is designated as t_{M}.■2S *(USP30)*

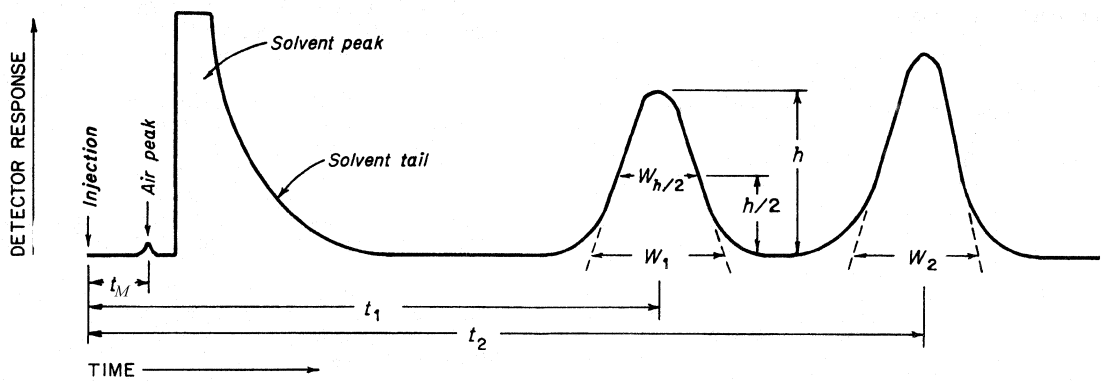

Figure 1. Chromatographic separation of two substances

Chromatographic retention times are characteristic of the compounds they represent but are not unique. Coincidence of retention times of a test and a reference substance can be used as a feature in construction of an identity profile but is insufficient on its own to establish identity. Absolute retention times of a given compound vary from one chromatogram to the next.

■Because in most procedures there is no need to identify an unretained peak, comparisons are normally made in terms of relative retention times, R_r:

$$R_r = \frac{t_2}{t_1}$$

where t_2 and t_1 are the retention times, measured from the point of injection, of the test and the reference substances, respectively, determined under identical experimental conditions on the same column.

Other procedures may identify the peak position using the relative retention, r:

$$r = \frac{t_2 - t_M}{t_1 - t_M}$$

where t_M is the retention time of a nonretained marker, which needs to be defined in the procedure.■1S (*USP29*)

The number of theoretical plates, N, is a measure of column efficiency. For Gaussian peaks, it is calculated by the equation:

■$$N = 16\left(\frac{t}{W}\right)^2$$ ■1S (*USP29*)

where t is the retention time of the substance and W is the width of the peak at its base, obtained by extrapolating the relatively straight sides of the peak to the baseline. ■■1S (*USP29*) The value of N depends upon the substance being chromatographed as well as the operating conditions such as mobile phase or carrier gas flow rates and temperature, the quality of the packing, the uniformity of the packing within the column and, for capillary columns, the thickness of the stationary phase film, and the internal diameter and length of the column.

The separation of two components in a mixture, the resolution, R, is determined by the equation:

$$R = \frac{2(t_2 - t_1)}{W_2 + W_1}$$

in which t_2 and t_1 are the retention times of the two components, and W_2 and W_1 are the corresponding widths at the bases of the peaks obtained by extrapolating the relatively straight sides of the peaks to the baseline.

Where electronic integrators are used, it may be convenient to determine the resolution, R, by the equation:

$$R = \frac{2(t_2 - t_1)}{1.70(W_{1,h/2} + W_{2,h/2})}$$

and to determine the number of theoretical plates, N, by the equation:

$$N = 5.54(t/W_{h/2})^2$$

■where $W_{h/2}$ is the peak width at half-height, obtained directly by electronic integrators.■1S (*USP29*) However, in the event of dispute, only equations based on peak width at baseline are to be used.

Peak areas and peak heights are usually proportional to the quantity of compound eluting. These are commonly measured by electronic integrators but may be determined by more classical approaches. Peak areas are generally used but may be less accurate if peak interference occurs. For manual measurements, the chart should be run faster than usual, or a comparator should be used to measure the width at half-height and the width at the base of the peak, to minimize error in these measurements. For accurate quantitative work, the components to be measured should be separated from any interfering components. Peak tailing and fronting and the measurement of peaks on solvent tails are to be avoided.

Chromatographic purity tests for drug raw materials are sometimes based on the determination of peaks due to impurities, expressed as a percentage of the area due to the drug peak. It is preferable, however, to compare impurity peaks with those in the chromatogram of a standard at a similar concentration. The standard may be the drug itself at a level corresponding to, for example, 0.5% impurity, or in the case of toxic or signal impurities, a standard of the impurity itself.

SYSTEM SUITABILITY

System suitability tests are an integral part of gas and liquid chromatographic methods. They are used to verify that the ▲detection sensitivity,▲*USP29* ●(Postponed indefinitely)●2 resolution, and reproducibility of the chromatographic system are adequate for the analysis to be done. The tests are based on the concept that the equipment, electronics, analytical operations, and samples to be analyzed constitute an integral system that can be evaluated as such.

▲The detection sensitivity is a measure used to ensure the suitability of a given chromatographic procedure for the complete detection of the impurities in the *Chromatographic purity* or *Related compounds* tests by injecting a volume of a quantitation limit solution equal to that of the *Test solution*. Unless otherwise specified in the individual monograph, the quantitation limit solution may be prepared by dissolving the drug substance Reference Standard in the same solvent as that used for the *Test solution* at a 0.05% concentration level relative to the amount of drug substance in the *Test solution* for drug substances, and a 0.1% level relative to the amount of drug substance in the *Test solution* for drug products. The signal-to-noise ratio for the drug substance peak obtained with the quantitation limit solution should be not less than 10.▲*USP29* ●(Postponed indefinitely)●2

The resolution, R, [NOTE—All terms and symbols are defined in the *Glossary of Symbols*] is a function of column efficiency, N, and is specified to ensure that closely eluting compounds are resolved from each other, to establish the general resolving power of the system, and to ensure that internal standards are resolved from the drug. Column efficiency may be specified also as a system suitability requirement, especially if there is only one peak of interest in the chromatogram; however, it is a less reliable means to ensure resolution than direct measurement. Column efficiency is a measure of peak sharpness, which is important for the detection of trace components.

In-Process Revision

Replicate injections of a standard preparation used in the assay or other standard solution are compared to ascertain whether requirements for precision are met. Unless otherwise specified in the individual monograph, data from five replicate injections of the analyte are used to calculate the relative standard deviation, S_R, if the requirement is 2.0% or less; data from six replicate injections are used if the relative standard deviation requirement is more than 2.0%.

The tailing factor, *T,* a measure of peak symmetry, is unity for perfectly symmetrical peaks and its value increases as tailing becomes more pronounced (see *Figure 2*). In some cases, values less than unity may be observed. As peak asymmetry increases, integration, and hence precision, becomes less reliable.

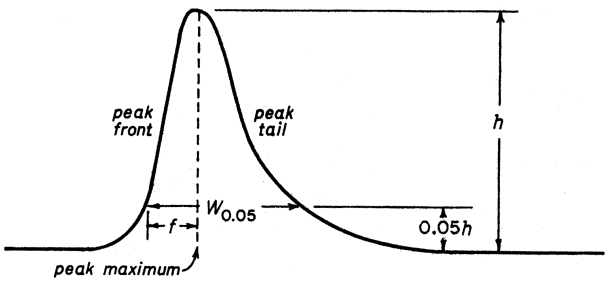

Figure 2. Asymmetrical chromatographic peak

These tests are performed by collecting data from replicate injections of standard or other solutions as specified in the individual monograph. The specification of definitive parameters in a monograph does not preclude the use of other suitable operating conditions (see *Procedures* under *Tests and Assays* in the *General Notices*). ~~Adjustments of operating conditions to meet system suitability requirements may be necessary.~~

■If adjustments of operating conditions to meet system suitability requirements are necessary, each of the following is the maximum ~~specification~~ variation that can be considered, unless otherwise directed in the monograph. Adjustments are permitted only when ~~Reference Standards~~ suitable standards (including Reference Standards) are available for all ~~analytes~~ compounds used in the suitability test and only when those standards are used to show that the adjustments have improved the quality of the chromatography in meeting system suitability requirements. Adjustments to chromatographic systems performed in order to comply with system suitability requirements are not to be made to compensate for column failure ~~or to circumvent replacing a deteriorated column~~ or system malfunction. ~~The changes described below may require additional validation data unless the user can verify the suitability of the method under the new conditions. This verification consists of assessing the analytical performance characteristics that can be affected by the change (e.g., specificity, linearity, precision, accuracy) to ensure the adequacy of the method. Multiple adjustments that may have a cumulative effect in the performance of the system are to be avoided.~~ The changes described below may require additional validation data. The user should verify the suitability of the method under the new conditions by assessing the relevant analytical performance characteristics potentially affected by the change. ~~*Tables 1* and *2* in the general information chapter *Verification of Compendial Procedures* ⟨1226⟩ provide lists of analytical performance validation characteristics that may require assessment.~~ Multiple adjustments can have a cumulative effect in the performance of the system and should be considered carefully before implementation.

pH of Mobile Phase (HPLC)—The pH of the aqueous buffer used in the preparation of the mobile phase can be adjusted to within ~~0.2~~ ±0.2 units of the value or range specified.

Concentration of Salts in Buffer (HPLC)—The concentration of the salts used in the preparation of the aqueous buffer used in the mobile phase can be adjusted to within ±10%, provided the permitted pH variation (see above) is met.

Ratio of Components in Mobile Phase (HPLC)—~~The amount of the minor~~ The following adjustment limits apply to minor components of the mobile phase (specified at 50% or less). The amount(s) of these component(s) can be adjusted by ±30% relative. ~~or ±2% absolute (i.e., in relation to the total mobile phase), whichever is larger.~~ However, the change in any component cannot exceed ±10% absolute (i.e., in relation to the total mobile phase). ~~nor can the final concentration of any component be reduced to zero.~~ Adjustment can be made to one minor component in a ternary mixture. Examples of adjustments for binary and ternary mixtures are given below.

Binary Mixtures—

SPECIFIED RATIO OF 50 : 50—Thirty percent of 50 is 15% absolute, but this exceeds the maximum permitted change of ±10% absolute in either component. Therefore, the mobile phase ratio may be adjusted only within the range of 40 : 60 to 60 : 40.

In-Process Revision

~~SPECIFIED RATIO OF 95 : 5—Thirty percent of 5 is 1.5% absolute. However, because adjustments up to ±2% absolute are allowed, the ratio may be adjusted within the range of 93 : 7 to 97 : 3.~~

SPECIFIED RATIO OF 2 : 98—Thirty percent of 2 is 0.6% absolute. ~~In this case an absolute adjustment of ±2% is not allowed because it would reduce the amount of the first component to zero.~~ Therefore the maximum allowed adjustment is within the range of 1.4 : 98.6 to 2.6 : 97.4.

Ternary Mixtures—

SPECIFIED RATIO OF 60 : 35 : 5—For the second component, 30% of 35 is 10.5% absolute, which exceeds the maximum permitted change of ±10% absolute in any component. Therefore the second component may be adjusted only within the range of 25% to 45% absolute. For the third component, 30% of 5 is 1.5% absolute. ~~Since ±2% absolute is permitted and provides more flexibility, the third component may be adjusted within the range of 3% to 7% absolute.~~ In all cases, a sufficient quantity of the first component is used to give a total of 100%. Therefore, mixture ranges of 50 : 45 : 5 to 70 : 25 : 5 or ~~58 : 35 : 7 to 62 : 35 : 3~~ 58.5 : 35 : 6.5 to 61.5 : 35 : 3.5 would meet the requirement.

~~Detector~~ Wavelength of UV-Visible Detector (HPLC)— Deviations from the wavelengths specified in the method are not permitted. The procedure specified by the detector manufacturer, or another validated procedure, is to be used to verify that error in the detector wavelength is, at most, ±3 nm.

Column Length (GC, HPLC): can be adjusted by as much as ~~70%.~~ ±70%.

Column Inner Diameter (GC, HPLC): can be adjusted by as much as ~~±25% 50%.~~ ±25% for HPLC and ±50% for GC.

Film Thickness (Capillary GC): can be adjusted by as much as –50% to 100%.

Particle Size (HPLC): can be reduced by as much as 50%.

Particle Size (GC): going from a larger to a smaller or a smaller to a larger (if it is the same "Range Ratio", which is the diameter of the largest particle divided by the diameter of the smallest particle) particle size GC mesh support is acceptable, provided the chromatography meets the requirements of the system suitability.

Flow Rate (GC, HPLC): can be adjusted by as much as ±50%.

Injection Volume (GC, HPLC): can be reduced as far as is consistent with accepted precision and detection limits. ~~It may be increased to as much as twice the volume specified, provided there are no adverse effects on factors such as baseline, peak shapes, resolution, linearity, and retention times.~~

Column Temperature (HPLC): can be adjusted by as much as ~~±20°.~~ ±10°. Column thermostating is recommended to improve control and reproducibility of retention time.

~~Column~~ Oven Temperature (GC): can be adjusted by as much as ~~±2%, in terms of absolute temperature.~~ ±10%.

Oven Temperature Program (GC)—Adjustment of temperatures is permitted as stated above. For the times specified for the temperature to be maintained or for the temperature to be changed from one value to another, an adjustment of up to ±20% is permitted.

~~**Gradient Elution (HPLC)**—The configuration of the equipment employed may significantly alter the resolution, retention time, and relative retentions described in the method. Should this occur, it may be due to excess dwell time, which is the volume between the point at which the two eluants meet and the top of the column.~~ ■2S (*USP30*)

Unless otherwise directed in the monograph, system suitability parameters are determined from the analyte peak.

■Relative retention times may be provided in monographs for informational purposes only, to aid in peak identification. There are no acceptance criteria applied to relative retention times.■2S (*USP30*)

In-Process Revision

To ascertain the effectiveness of the final operating system, it should be subjected to suitability testing. Replicate injections of the standard preparation required to demonstrate adequate system precision may be made before the injection of samples or may be interspersed among sample injections. System suitability must be demonstrated throughout the run by injection of an appropriate control preparation at appropriate intervals. The control preparation can be a standard preparation or a solution containing a known amount of analyte and any additional materials useful in the control of the analytical system, such as excipients or impurities. Whenever there is a significant change in equipment or in a critical reagent, suitability testing should be performed before the injection of samples. No sample analysis is acceptable unless the requirements of system suitability have been met. Sample analyses obtained while the system fails

■system suitability■2S *(USP30)* requirements are unacceptable.

~~L12 A strong anion exchange packing made by chemically bonding a quaternary amine to a solid silica spherical core, 30 to 50 µm in diameter.~~

~~L13 Trimethylsilane chemically bonded to porous silica particles, 3 to 10 µm in diameter.~~

~~L14 Silica gel having a chemically bonded, strongly basic quaternary ammonium anion exchange coating, 5 to 10 µm in diameter.~~

~~L15 Hexylsilane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.~~

~~L16 Dimethylsilane chemically bonded to porous silica particles, 5 to 10 µm in diameter.~~

~~L17 Strong cation exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form, 7 to 11 µm in diameter.~~

~~L18 Amino and cyano groups chemically bonded to porous silica particles, 3 to 10 µm in diameter.~~

~~L19 Strong cation exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the calcium form, about 9 µm in diameter.~~

~~L20 Dihydroxypropane groups chemically bonded to porous silica particles, 5 to 10 µm in diameter.~~

~~L21 A rigid, spherical styrene-divinylbenzene copolymer, 5 to 10 µm in diameter.~~

~~L22 A cation exchange resin made of porous polystyrene gel with sulfonic acid groups, about 10 µm in size.~~

~~L23 An anion exchange resin made of porous polymethacrylate or polyacrylate gel with quaternary ammonium groups, about 10 µm in size.~~

~~L24 A semi rigid hydrophilic gel consisting of vinyl polymers with numerous hydroxyl groups on the matrix surface, 32 to 63 µm in diameter.~~

~~■[NOTE—Available as YMC-Pack PVA-SIL manufactured by YMC Co., Ltd. and distributed by Waters Corp. (www.waters.com).]■1S *(USP29)*~~

~~L25 Packing having the capacity to separate compounds with a molecular weight range from 100–5000 (as determined by polyethylene oxide), applied to neutral, anionic, and cationic water-soluble polymers. A polymethacrylate resin base, cross-linked with polyhydroxylated ether (surface contained some residual carboxyl functional groups) was found suitable.~~

~~L26 Butyl silane chemically bonded to totally porous silica particles, ■3■1S *(USP29)* to 10 µm in diameter.~~

~~L27 Porous silica particles, 30 to 50 µm in diameter.~~

~~L28 A multifunctional support, which consists of a high purity, 100-Å, spherical silica substrate that has been bonded with anionic exchanger, amine functionality in addition to a conventional reversed phase C8 functionality.~~

~~L29 Gamma alumina, reverse phase, low carbon percentage by weight, alumina based polybutadiene spherical particles, 5 µm in diameter with a pore volume of 80 Å.~~

~~L30 Ethyl silane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.~~

~~L31 A ■hydroxide selective,■1S *(USP29)* strong anion exchange resin quaternary amine bonded on latex particles attached to a core of 8.5-µm macroporous particles having a pore size of 2000 Å and consisting of ethylvinylbenzene cross-linked with 55% divinylbenzene.~~

~~L32 A chiral ligand exchange packing L-proline copper complex covalently bonded to irregularly shaped silica particles, 5 to 10 µm in diameter.~~

~~L33 Packing having the capacity to separate dextrans by molecular size over a range of 4000 to 500,000 Da. It is spherical, silica-based, and processed to provide pH stability.~~

~~■[NOTE—Available as TSKgel G4000 SWXL from Tosoh Biosep (www.tosohbiosep.com).]■1S *(USP29)*~~

~~L34 Strong cation exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the lead form, about 9 µm in diameter.~~

L35—A zirconium stabilized spherical silica packing with a hydrophilic (diol type) molecular monolayer bonded phase having a pore size of 150 Å.

L36—A 3,5 dinitrobenzoyl derivative of L phenylglycine covalently bonded to 5-µm aminopropyl silica.

L37—Packing having the capacity to separate proteins by molecular size over a range of 2,000 to 40,000 Da. It is a polymethacrylate gel.

L38—A methacrylate-based size-exclusion packing for water-soluble samples.

L39—A hydrophilic polyhydroxymethacrylate gel of totally porous spherical resin.

L40—Cellulose tris 3,5-dimethylphenylcarbamate coated porous silica particles, 5 to 20 µm in diameter.

L41—Immobilized α_1-acid glycoprotein on spherical silica particles, 5 µm in diameter.

L42—Octylsilane and octadecylsilane groups chemically bonded to porous silica particles, 5 µm in diameter.

L43—Pentafluorophenyl groups chemically bonded to silica particles by a propyl spacer, 5 to 10 µm in diameter.

L44—A multifunctional support, which consists of a high purity, 60-Å, spherical silica substrate that has been bonded with a cationic exchanger, sulfonic acid functionality in addition to a conventional reversed-phase C8 functionality.

L45—Beta cyclodextrin bonded to porous silica particles, 5 to 10 µm in diameter.

L46—Polystyrene/divinylbenzene substrate agglomerated with quaternary amine functionalized latex beads, about 10 µm in diameter.

L47—High capacity anion exchange microporous substrate, fully functionalized with trimethlyamine groups, 8 µm in diameter.

■[NOTE—Available as CarboPac MA1 and distributed by Dionex Corp. (www.dionex.com).]■*1S (USP29)*

L48—Sulfonated, cross-linked polystyrene with an outer layer of submicron, porous, anion exchange microbeads, 15 µm in diameter.

L49—A reversed phase packing made by coating a thin layer of polybutadiene onto spherical porous zirconia particles, 3 to 10 µm in diameter.

■[NOTE—Available as Zirchrom PBD, manufactured by ZirChrom Separations, Inc., distributed by Alltech, www.Alltechweb.com.]■*1S (USP29)*

L50—Multifunction resin with reversed-phase retention and strong anion exchange functionalities. The resin consists of ethylvinylbenzene, 55% cross-linked with divinylbenzene copolymer, 3 to 15 µm in diameter, and a surface area not less than 350 m^2 per g. Substrate is coated with quaternary ammonium functionalized latex particles consisting of styrene cross-linked with divinylbenzene.

■[NOTE—Available as OmniPac PAX-500 and distributed by Dionex Corp. (www.dionex.com).]■*1S (USP29)*

L51—Amylose tris 3,5-dimethylphenylcarbamate coated, porous, spherical, silica particles, 5 to 10 µm in diameter.

■[NOTE—Available as Chiralpak AD from Chiral Technologies, Inc., (www.chiraltech.com).]■*1S (USP29)*

L52—A strong cation exchange resin made of porous silica with sulfopropyl groups, 5 to 10 µm in diameter.

■[NOTE—Available as TSK-IC-SW Cation from Tosoh Biosep (www.tosohbiosep.com).]■*1S (USP29)*

L53—Weak cation exchange resin consisting of ethylvinylbenzene, 55% cross linked with divinylbenzene copolymer, 3 to 15 µm diameter. Substrate is surface grafted with carboxylic acid and/or phosphoric acid functionalized monomers. Capacity not less than 500 µEq/column.

■[NOTE—Available as IonPac CS14 distributed by Dionex Corp. (www.dionex.com).]■*1S (USP29)*

L54—A size exclusion medium made of covalent bonding of dextran to highly cross-linked porous agarose beads, about 13 µm in diameter.

■[NOTE—Available as Superdex Peptide HR 10/30 from Amersham Pharmacia Biotech (www.amershambiosciences.com).]■*1S (USP29)*

L55—A strong cation exchange resin made of porous silica coated with polybutadiene–maleic acid copolymer, about 5 µm in diameter.

■[NOTE—Available as IC-Pak C M/D from Waters Corp. (www.waters.com).]■*1S (USP29)*

L56—Propyl silane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

■[NOTE—Available as Zorbax SB-C3 from Agilent Technologies. (www.agilent.com/chem).]■*1S (USP29)*

L57—A chiral recognition protein, ovomucoid, chemically bonded to silica particles, about 5 µm in diameter, with a pore size of 120 Å.

■[NOTE—Available as Ultron ES-OVM from Agilent Technologies (www.agilent.com/chem).]■*1S (USP29)*

L58—Strong cation exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the sodium form, about 7 to 11 µm in diameter.

■[NOTE—Available as Aminex HPX-87N from Bio-Rad Laboratories, (2000/01 catalog, #125-0143) www.bio-rad.com.]■*1S (USP29)*

L59—Packing having the capacity to separate proteins by molecular weight over the range of 10 to 500 kDa. It is spherical (10 µm), silica based, and processed to provide hydrophilic characteristics and pH stability.

■[NOTE—Available as TSKgel G3000SW Column (analytical column) and TSKgel Guard (guard column) from Tosoh Biosep (part numbers 05789 and 05371, respectively) (www.tosohbiosep.com).]■*1S (USP29)*

L60—Spherical, porous silica gel, 3 or 5 µm■10 µm or less■*1S (USP29)*, in diameter, the surface of which has been covalently modified with palmitamidopropyl■alkyl amide■*1S (USP30)*, groups and end capped.

■[NOTE—Available as Supelcosil ABZ from Supelco (http://www.sigmaaldrich.com/Brands/Supelco_Home.html).]■*1S (USP29)*

L61—A hydroxide selective strong anion exchange resin consisting of a highly cross-linked core of 13 µm microporous particles having a pore size less than 10 Å units and consisting of ethylvinylbenzene cross-linked with 55% divinylbenzene with a latex coating composed of 85 nm diameter microbeads bonded with alkanol quaternary ammonium ions (6%).

■[NOTE—Available as Ion Pac AS-11 and AG-11 from Dionex (www.dionex.com).]■*1S (USP29)*

L62—C30 silane bonded phase on a fully porous spherical silica, 3 to 15 µm in diameter.

L## (Enoxaparin Sodium, Dowex 1X8)—[To come.]

L## (Enoxaparin Sodium, Dowex 50WX2)—[To come.]

■L## (Dalteparin Sodium, anion exchange Dowex 1X8)—[To come.]

L## (Dalteparin Sodium, cation exchange Dowex 50WX2)—[To come.]■*2S (USP29)*

■L## (Glucosamine, Shodex NH2P-50)—Polyamine chemically bonded to cross-linked polyvinyl alcohol polymer, 5 µm in diameter. [NOTE—Available as Shodex NH2P-50 from Shodex (www.shodex.com).]

L## [Valganciclovir Hydrochloride, Crownpak CR(+)]—A crown ether coated on a 5 µm particle size silica gel substrate. The active site is *(S)*-18-crown-6-ether.

[NOTE—Available as Crownpak CR(+) from Daicel (www.daicel.com).]

L## (Trehalose, Sugar KS-801)—Strong cation exchange resin consisting of sulfonated cross-linked styrene divinylbenzene copolymer in the sodium form, 6 to 17 µm in diameter.

[NOTE—Available as Sugar KS-801 from Shodex (www.shodex.com).]

L## (Levalbuterol, Chirobiotic T)—Glycopeptide teicoplanin linked through multiple covalent bonds to a 100-Å units spherical silica.

[NOTE—Available as Chirobiotic T from Astec (www.asteceusa.com).]■*1S (USP30)*

Phases

G1—Dimethylpolysiloxane oil.

G2—Dimethylpolysiloxane gum.

G3—50% Phenyl 50% methylpolysiloxane.

G4—Diethylene glycol succinate polyester.

G5—3-Cyanopropylpolysiloxane.

G6—Trifluoropropylmethylpolysiloxane.

G7—50% 3-Cyanopropyl 50% phenylmethylsilicone.

G8—80% Bis(3-cyanopropyl) 20% 3-cyanopropylphenylpolysiloxane (percentages refer to molar substitution).

■■ 2S (*USP30*)

BRIEFING

⟨**660**⟩ **Containers—Glass.** It is proposed to remove the sections pertaining to glass that are currently under *Containers* ⟨661⟩ in order to create this proposed new chapter. In addition, the Type NP glass section has been deleted because it is no longer an industry practice, and a *Surface Glass Test* has been added to this new chapter to reflect a widely used test in industry. The sections pertaining to plastic will remain in general chapter ⟨661⟩. These proposed changes are intended to better organize the information on containers.

(P&S: D. Hunt) RTS—C44239

Add the following:

■⟨660⟩ CONTAINERS—GLASS

Glass containers for pharmaceutical use are intended to come into direct contact with pharmaceutical preparations. Glass used for pharmaceutical containers is either a borosilicate (neutral) glass or a soda-lime glass. Borosilicate glass

In-Process Revision

contains a significant amount of boric oxide, aluminum oxide, and alkali and/or alkaline earth oxides. Borosilicate glass has a high hydrolytic resistance due to the chemical composition of the glass itself; it is classified as Type I glass. Soda-lime glass is a silica glass containing alkali metal oxides. Soda-lime glass has a moderate hydrolytic resistance due to the chemical composition of the glass itself; it is classified as Type III glass. The inner surface of glass containers may be treated, for example, to improve hydrolytic resistance. The treatment of Type III soda-lime glass containers will raise their hydrolytic resistance from a moderate to a high level, changing the classification of the glass to Type II.

The outer surface of glass containers may be treated to reduce friction or for protection against abrasion or breakage. The treatment of the outer surface does not come into contact with the inner surface of the container. Glass may be colored to provide protection from light or may have a coating applied to the outer surface. Such containers will meet the requirements for *Light Transmission* under *Containers—Permeation* ⟨671⟩. A clear and colorless or a translucent container that is made light-resistant by means of an opaque enclosure (see *Light-Resistant Container* in *Preservation, Packaging, Storage, and Labeling* under the *General Notices*) is exempt from the requirements for *Light Transmission.*

The quality of glass containers is defined by measuring their resistance to chemical attack. In addition, containers for aqueous parenteral preparations are tested for arsenic release, and colored glass containers are tested for light transmission.

CHEMICAL RESISTANCE

The following tests are designed to determine the resistance to water attack of new (not previously used) glass containers. The degree of attack is determined by the amount of alkali released from the glass under the influence of the attacking medium under the conditions specified. This quantity of alkali is extremely small in the case of the more resistant glasses, thus calling for particular attention to all details of the tests and the use of apparatus of high quality and precision. The tests should be conducted in an area relatively free from fumes and excessive dust.

Glass Types—Glass containers suitable for packaging Pharmacopeial preparations may be classified as in *Table 1* on the basis of the tests set forth in this section. Containers of Type I borosilicate glass are generally used for preparations that are intended for parenteral administration. Containers of Type I glass, or of Type II glass (i.e., soda-lime glass that is suitably dealkalized) are usually used for packaging acidic and neutral parenteral preparations. Type I glass containers, or Type II glass containers (where stability data demonstrate their suitability), are used for alkaline parenteral preparations. Type III soda-lime glass containers usually are not used for parenteral preparations, except where suitable stability test data indicate that Type III glass is satisfactory for the parenteral preparations that are packaged therein.

Table 1. Glass Types and Test Limits

			Limits	
Type	General Description[a]	Type of Test	Size,[b] mL	mL of 0.020 N Acid
I	Highly resistant, borosilicate glass	*Powdered Glass*	All	1.0
II	Treated soda-lime glass	*Water Attack*	100 or less	0.7
			Over 100	0.2
III	Soda-lime glass	*Powdered Glass*	All	8.5

[a] The description applies to containers of this type of glass usually available.
[b] Size indicates the overflow capacity of the container.

Apparatus—

Autoclave—For these tests, use an autoclave capable of maintaining a temperature of 121 ± 2.0°, equipped with a thermometer, a pressure gauge, a vent cock, and a rack adequate to accommodate at least 12 test containers above the water level.

Mortar and Pestle—Use a hardened-steel mortar and pestle, made according to the specifications in *Figure 1*.

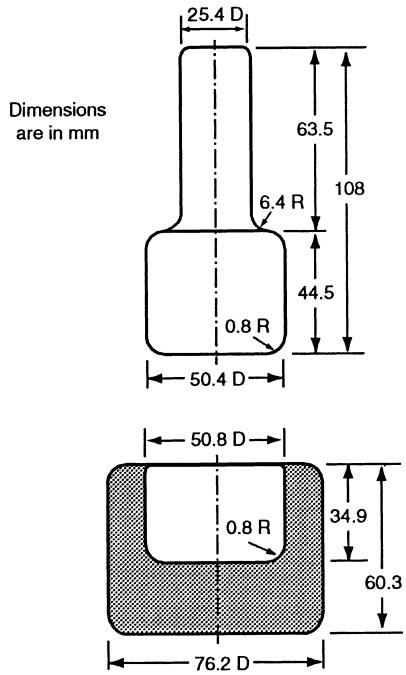

Figure 1. Special Mortar and Pestle for Pulverizing Glass[1]

Other Equipment—Also required are 20.3-cm (8-inch) sieves made of stainless steel including the Nos. 20, 40, and 50 sieves along with the pan and cover (see *Sizes of Standard Sieve Series in Range of Interest* under *Particle Size Distribution Estimation by Analytical Sieving* ⟨786⟩), 250-mL conical flasks made of resistant glass aged as specified, a 900-g (2-lb) hammer, a permanent magnet, a desiccator, and an adequate volumetric apparatus.

Reagents—

High-Purity Water—The water used in these tests has a conductivity at 25°, as measured in an in-line cell just prior to dispensing, of not greater than 0.15 µS per cm (6.67 Megohm-cm). There must also be an assurance that this water is not contaminated by copper or its products (e.g., copper pipes, stills, or receivers). The water may be prepared by passing distilled water through a deionizer cartridge packed with a mixed bed of nuclear-grade resin, then through a cellulose ester membrane having openings not exceeding 0.45 µm.[2] Do not use copper tubing. Flush the discharge lines before water is dispensed into test vessels. When the low conductivity specification can no longer be met, replace the deionizer cartridge.

Methyl Red Solution—Dissolve 24 mg of methyl red sodium in *Purified Water* to make 100 mL. If necessary, neutralize the solution with 0.02 N sodium hydroxide, or acidify it with 0.02 N sulfuric acid so that the titration of 100 mL of *High-Purity Water,* containing 5 drops of indicator, does not require more than 0.020 mL of 0.020 N sodium hydroxide to effect the color change of the indicator, which should occur at a pH of 5.6.

Powdered Glass Test

Rinse thoroughly with *Purified Water* 6 or more containers selected at random, and dry them with a current of clean, dry air. Crush the containers into fragments about 25 mm in size, divide about 100 g of the coarsely crushed glass into three approximately equal portions, and place one of the portions in the special mortar. With the pestle in place, crush the glass further by striking 3 or 4 blows with the hammer. Nest the sieves, and empty the mortar into the No. 20 sieve. Repeat the operation on each of the two remaining portions of glass, emptying the mortar each time into the No. 20 sieve. Shake the sieves for a short time, then remove the glass from the Nos. 20 and 40 sieves, and again crush and sieve as before. Repeat again this crushing and sieving operation. Empty the receiving pan, re-

[1] A suitable mortar and pestle is available (catalog No. H-17280) from Humboldt Manufacturing Co., 7300 West Agatite, Norridge, Chicago, IL 60656.

[2] A suitable nuclear-grade resin mixture of the strong acid cation exchanger in the hydrogen form and the strong base anion exchanger in the hydroxide form, with a one-to-one cation to anion equivalence ratio, is available from the Millipore Corp., Bedford, MA 01730; Barnstead Co., 225 Rivermoor St., Boston, MA 02132; Illinois Water Treatment Co., 840 Cedar St., Rockford, IL 61105; and Vaponics, Inc., 200 Cordage Park, Plymouth, MA 02360. A suitable in-line filter is available from the Millipore Corp.; Gelman Instrument Co., 600 S. Wagner Rd., Ann Arbor, MI 48106; and Schleicher and Schuell, Inc., 540 Washington St., Keene, NH 10003.

assemble the nest of sieves, and shake by mechanical means for 5 minutes or by hand for an equivalent length of time. Transfer the portion retained on the No. 50 sieve, which should weigh in excess of 10 g, to a closed container, and store in a desiccator until used for the test.

Spread the specimen on a piece of glazed paper, and pass a magnet through it to remove particles of iron that may be introduced during the crushing. Transfer the specimen to a 250-mL conical flask of resistant glass, and wash it with six 30-mL portions of acetone, swirling each time for about 30 seconds, and carefully decanting the acetone. After washing, the specimen should be free from agglomerations of glass powder, and the surface of the grains should be practically free from adhering fine particles. Dry the flask and contents for 20 minutes at 140°, transfer the grains to a weighing bottle, and cool in a desiccator. Use the test specimen within 48 hours after drying.

Procedure—Transfer 10.00 g of the prepared specimen, accurately weighed, to a 250-mL conical flask that has been digested (aged) previously with *High-Purity Water* in a bath at 90° for at least 24 hours or at 121° for 1 hour. Add 50.0 mL of *High-Purity Water* to this flask and to one similarly prepared to provide a blank. Cap all flasks with borosilicate glass beakers that previously have been treated as described for the flasks and that are of such size that the bottoms of the beakers fit snugly down on the top rims of the containers. Place the containers in the autoclave, and close it securely, leaving the vent cock open. Heat until steam issues vigorously from the vent cock, and continue heating for 10 minutes. Close the vent cock, and adjust the temperature to 121°, taking 19 to 23 minutes to reach the desired temperature. Hold the temperature at 121 ± 2.0° for 30 minutes, counting from the time this temperature is reached. Reduce the heat so that the autoclave cools and comes to atmospheric pressure in 38 to 46 minutes, being vented as necessary to prevent the formation of a vacuum. Cool the flask at once in running water, decant the water from the flask into a suitably cleansed vessel, and wash the residual powdered glass with four 15-mL portions of *High-Purity Water,* adding the decanted washings to the main portion. Add 5 drops of *Methyl Red Solution,* and titrate immediately with 0.020 N sulfuric acid. If the volume of titrating solution is expected to be less than 10 mL, use a microburet. Record the volume of 0.020 N sulfuric acid used to neutralize the extract from 10 g of the prepared specimen of glass, corrected for a blank. The volume does not exceed that indicated in *Table 2* for the type of glass concerned.

Water Attack at 121°

Rinse thoroughly 3 or more containers, selected at random, twice with *High-Purity Water.*

Procedure—Fill each container to 90% of its overflow capacity with *High-Purity Water*, and proceed as directed for *Procedure* under *Powdered Glass Test,* beginning with "Cap all flasks," except that the time of autoclaving shall be 60 minutes instead of 30 minutes, and ending with "to prevent the formation of a vacuum." Empty the contents from 1 or more containers into a 100-mL graduated cylinder, combining, in the case of smaller containers, the contents of several containers to obtain a volume of 100 mL. Place the pooled specimen in a 250-mL conical flask of resistant glass, add 5 drops of *Methyl Red Solution,* and titrate, while warm, with 0.020 N sulfuric acid. Complete the titration within 60 minutes after opening the autoclave. Record the volume of 0.020 N sulfuric acid used, corrected for a blank obtained by titrating 100 mL of *High-Purity Water* at the same temperature and with the same amount of indicator. The volume does not exceed that indicated in *Table 2* for the type of glass concerned.

Arsenic

Arsenic ⟨211⟩—Use as the *Test Preparation* 35 mL of the water from one Type I glass container or, in the case of smaller containers, 35 mL of the combined contents of several Type I glass containers, prepared as directed for *Procedure* under *Water Attack at 121°:* the limit is 0.1 µg per g.

In-Process Revision

Surface Glass Test

Determination of the Filling Volume—The filling volume is the volume to be filled with *Purified Water* in the container for the purpose of the test. For vials and bottles the filling volume is 90% of the brimful capacity. For ampules it is the volume up to the height of the shoulder.

Vials and Bottle—Select, at random, 6 containers from the sample lot, or 3 if their capacity exceeds 100 mL, and remove any dirt or debris. Weigh the empty containers with an accuracy of 0.1 g. Place the containers on a horizontal surface, and fill them with *Purified Water* to about the rim edge, avoiding overflow and introduction of air bubbles. Adjust the liquid levels to the brimful line. Weigh the filled containers to obtain the mass of the water, expressed to 2 decimal places, for containers having a nominal volume less or equal to 30 mL, and expressed to 1 decimal place for containers having a nominal volume greater than 30 mL. Calculate the mean value of the brimful capacity in mL, and multiply it by 0.9. This volume, expressed to 1 decimal place, is the filling volume for the particular container lot.

Ampules—Place at least 6 dry ampules on a flat, horizontal surface, and fill them with *Purified Water* from a buret until the water reaches point A, where the body of the ampule decreases to the shoulder of the ampule (see *Figure 2*). Read the capacities, expressed to 2 decimal places, and calculate the mean value. This volume, expressed to 1 decimal place, is the filling volume for the particular ampule lot. The filling volume may also be determined by weighing.

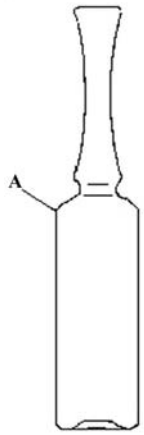

Figure 2. Filling Volumes of Ampules (up to point A)

Test—The determination is carried out on unused containers. The volumes of the test liquid necessary for the final determination are indicated in *Table 2*.

Table 2. Volume of Test Liquid and Number of Titrations

Filling Volume (mL)	Volume of Test Liquid for One Titration (mL)	Number of Titrations
Up to 3	25.0	1.0
Above 3 and up to 30	50.0	2.0
Above 30 and up to 100	100.0	2.0
Above 100	100.0	3.0

Cleaning—Remove any debris or dust. Shortly before the test, rinse each container carefully at least twice with *Purified Water,* and allow to stand. Immediately before testing, empty the containers, rinse once with *Purified Water,* then with carbon dioxide-free water, and allow to drain. Complete the cleaning procedure from the first rinsing in not less than 20 minutes and not more than 25 minutes. Heat closed ampules in a water bath or in an air-oven at about 50° for approximately 2 minutes before opening. Do not rinse before testing.

Filling and Heating—The containers are filled with carbon dioxide-free water up to the filling volume. Containers in the form of cartridges or prefilled syringes are closed in a suitable

manner with material that does not interfere with the test. Each container, including ampules, shall be loosely capped with an inert material such as a dish of neutral glass or aluminum foil previously rinsed with *Purified Water.* Place the containers on the tray of the autoclave.

Place the tray in the autoclave containing a quantity of water such that the tray remains clear of the water. Close the autoclave, and carry out the following operations:

(1) heat the autoclave to 100° and allow the steam to issue from the vent cock for 10 minutes;

(2) close the vent cock and raise the temperature from 100° to 121° at a rate of 1° per minute;

(3) maintain the temperature at 121 ± 1° for 60 ± 1 minutes;

(4) lower the temperature from 121° to 100° at a rate of 0.5° per minute, venting to prevent a vacuum;

(5) do not open the autoclave before it has cooled down to 95°;

(6) remove the containers from the autoclave using normal precautions, place them in a water bath at 80°, and run cold tap water, taking care that the water does not contact the loose foil caps to avoid contamination of the extraction solution;

(7) cooling time does not exceed 30 minutes.

The extraction solutions are analyzed by titration according to the method described below.

Method—Carry out the titration within 1 hour of removal of the containers from the autoclave.

Combine the liquids obtained from the containers, and mix. Introduce the prescribed volume indicated in *Table 3* into a conical flask. Place the same volume of carbon dioxide-free water into a second similar flask as a blank. Add 0.05 mL of *Methyl Red Solution* to each flask for each 25 mL of liquid. Titrate the blank with 0.01 M hydrochloric acid. Titrate the test liquid with the same acid until the color of the resulting solution is the same as that obtained for the blank. Subtract the value found for the blank titration from that found for the test liquid, and express the results in mL of 0.01 M hydrochloric acid per 100 mL. Express titration values of less than 1.0 mL to 2 decimal places and titration values of more than or equal to 1.0 mL to 1 decimal place.

Limits—The results, or the average of the results if more than one titration is performed, are not greater than the values stated in *Table 3.*

Table 3. Limit Values in the Test for Surface Hydrolytic Resistance

	Maximum Volume of 0.01 M HCl per 100 mL of Test Liquid (mL)	
Filling Volume (mL)	Types I and II	Type III
Up to 1	2.0	20.0
Above 1 and Up to 2	1.8	17.6
Above 2 and Up to 5	1.3	13.2

■2S (*USP30*)

BRIEFING

⟨**661**⟩ **Containers,** *USP 29* page 2655. To clarify the specialized content of this chapter, it is proposed to separate the chapter into three new chapters: sections relevant to plastics will remain in this chapter but the title will be changed to *Containers—Plastics* ⟨661⟩; sections relevant to glass will be included in a new chapter *Containers—Glass* ⟨660⟩; and those sections relative to repackaging will be included in a new chapter *Repackaging into Single-Unit Containers and Unit-Dose Containers from Nonsterile Solid and Liquid Dosage Forms* ⟨681⟩. The plastics content will also be reorganized to eliminate redundancy, and the standards and tests used to determine the functional properties of plastic containers (permeation test for polyethylene and polypropylene containers and the light transmission test) will be placed in General Chapter *Containers—Permeation* ⟨671⟩, which is being renamed *Containers—Performance Testing* ⟨671⟩.

In-Process Revision

Change to read:

⟨661⟩ CONTAINERS

■—PLASTICS■ 2S (*USP30*)

Many Pharmacopeial articles are of such nature as to require the greatest attention to the containers in which they are stored or maintained even for short periods of time. While the needs vary widely and some of them are not fully met by the containers available, objective standards are essential. It is the purpose of this chapter to provide such standards as have been developed for the materials of which pharmaceutical containers principally are made, i.e., glass and plastic.

A container intended to provide protection from light or offered as a "light resistant" container meets the requirements for *Light Transmission*, where such protection or resistance is by virtue of the specific properties of the material of which the container is composed, including any coating applied thereto. A clear and colorless or a translucent container that is made light resistant by means of an opaque enclosure (see *General Notices*) is exempt from the requirements for *Light Transmission*.

Containers composed of glass meet the requirements for *Chemical Resistance—Glass Containers*, and containers composed of plastic and intended for packaging products prepared for parenteral use meet the requirements under *Biological Tests—Plastics* and *Physicochemical Tests—Plastics*.

Where dry oral dosage forms, not meant for constitution into solution, are intended to be packaged in a container defined in the section *Polyethylene Containers*, the requirements given in that section are to be met.

Guidelines and requirements under *Repacking into Single-Unit Containers and Unit-Dose Containers for Nonsterile Solid and Liquid Dosage Forms* apply to official dosage forms that are repackaged into single-unit or unit-dose containers or mnemonic packs for dispensing pursuant to prescription.

LIGHT TRANSMISSION

Apparatus[1]**—** Use a spectrophotometer of suitable sensitivity and accuracy, adapted for measuring the amount of light transmitted by either transparent or translucent glass or plastic materials used for pharmaceutical containers. For transparent glass or plastic pharmaceutical containers, use a spectrophotometer of suitable sensitivity and accuracy for measuring and recording the amount of light transmitted. For translucent glass or plastic pharmaceutical containers, use a spectrophotometer as described above that, in addition, is capable of measuring and recording light transmitted in diffused as well as parallel rays.

Preparation of Specimen—

Glass—Break the container or cut it with a circular saw fitted with a wet abrasive wheel, such as a carborundum or a bonded diamond wheel. Select sections to represent the average wall thickness in the case of blown glass containers, and trim them as necessary to give segments of a size convenient for mounting in the spectrophotometer. After cutting, wash and dry each specimen, taking care to avoid scratching the surfaces. If the specimen is too small to cover the opening in the specimen holder, mask the uncovered portion of the opening with opaque paper or masking tape, provided that the length of the specimen is greater than that of the slit in the spectrophotometer. Immediately before mounting in the specimen holder, wipe the specimen with lens tissue. Mount the specimen with the aid of a tacky wax, or by other convenient means, taking care to avoid leaving fingerprints or other marks on the surfaces through which light must pass.

Plastic—Cut circular sections from two or more areas of the container, and wash and dry them, taking care to avoid scratching the surfaces. Mount in the apparatus as described for *GlassC*.

Procedure— Place the section in the spectrophotometer with its cylindrical axis parallel to the plane of the slit and approximately centered with respect to the slit. When properly placed, the light beam is normal to the surface of the section and reflection losses are at a minimum.

Measure the transmittance of the section with reference to air in the spectral region of interest, continuously with a recording instrument or at intervals of about 20 nm with a manual instrument, in the region of 290 to 450 nm.

Limits— The observed light transmission does not exceed the limits given in *Table 1* for containers intended for parenteral use.

Table 1. Limits for Glass Types I, II, and III and Plastic Classes I–VI

	Maximum Percentage of Light Transmission at Any Wavelength Between 290 and 450 nm	
Nominal Size (in mL)	Flame-sealed Containers	Closure-sealed Containers
1	50	25
2	45	20
5	40	15
10	35	13
20	30	12
50	15	10

NOTE—Any container of a size intermediate to those listed above exhibits a transmission not greater than that of the next larger size container listed in the table. For containers larger than 50 mL, the limits for 50 mL apply.

The observed light transmission for containers of Type NP glass and for plastic containers for products intended for oral or topical administration does not exceed 10% at any wavelength in the range from 290 to 450 nm.

CHEMICAL RESISTANCE—GLASS CONTAINERS

The following tests are designed to determine the resistance to water attack of new (not previously used) glass containers. The degree of attack is determined by the amount of alkali released from the glass under the influence of the attacking medium under the conditions specified. This quantity of alkali is extremely small in the case of the more resistant glasses, thus calling for particular attention to all details of the tests and the use of apparatus of high quality and precision. The tests should be conducted in an area relatively free from fumes and excessive dust.

Glass Types— Glass containers suitable for packaging Pharmacopeial preparations may be classified as in *Table 2* on the basis of the tests set forth in this section. Containers of Type I borosilicate glass are generally used for preparations that are intended for parenteral administration. Containers of Type I glass, or of Type II glass (i.e., soda-lime glass that is suitably dealkalized) are usually used for packaging acidic and neutral parenteral preparations. Type I glass containers, or Type II glass containers (where stability data demonstrate their suitability), are used for alkaline parenteral preparations. Type III soda-lime glass containers usually are not used for parenteral preparations, except where suitable stability test data indicate that Type III glass is satisfactory for the parenteral preparations that

[1] For further detail regarding apparatus and procedures, reference may be made to the following publications of the American Society for Testing and Materials, 100 Barr Harbor Drive, West Conshohocken, PA 19428-2959: "Standard Method of Test for Haze and Luminous Transmittance of Transparent Plastics," ASTM Designation D 1003-61; "Tentative Method of Test for Luminous Reflectance, Transmittance, and Color of Materials," ASTM E 308-66.

In-Process Revision

are packaged therein. Containers of Type NP glass are intended for packaging nonparenteral articles, i.e., those intended for oral or topical use.

Table 2. Glass Types and Test Limits

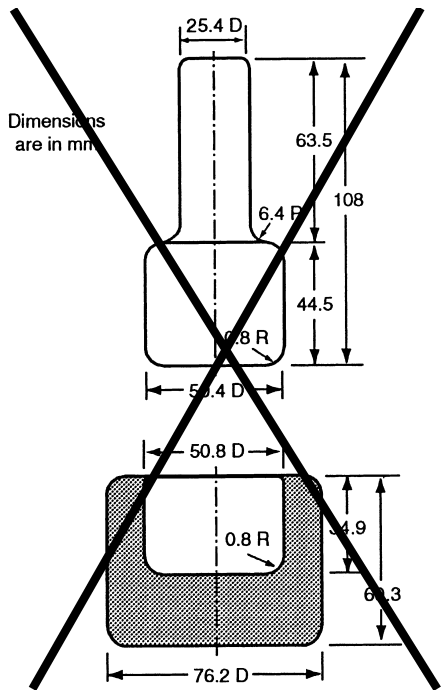
Type	General Description[1]	Type of Test	Limits: Size,[2] mL	Limits: mL of 0.020 N Acid
I	Highly resistant, borosilicate glass	*Powdered Glass*	All	1.0
II	Treated soda-lime glass		100 or less	0.7
		Water Attack	Over 100	0.2
III	Soda-lime glass	*Powdered Glass*	All	8.5
NP	General-purpose soda-lime glass	*Powdered Glass*	All	15.0

[1] The description applies to containers of this type of glass usually available.
[2] Size indicates the overflow capacity of the container.

Apparatus

Autoclave—For these tests, use an autoclave capable of maintaining a temperature of 121 ± 2.0°, equipped with a thermometer, a pressure gauge, a vent cock, and a rack adequate to accommodate at least 12 test containers above the water level.

Mortar and *Pestle*—Use a hardened steel mortar and pestle, made according to the specifications in the accompanying illustration.



Special Mortar and Pestle for Pulverizing Glass[3]

Other Equipment—Also required are 20.3-cm (8-inch) sieves made of stainless steel including the Nos. 20, 40, and 50 sieves along with the pan and cover (see *Sizes of Standard Sieve Series in Range of Interest* under *Particle-Size Distribution Estimation by Analytical Sieving* ⟨786⟩), 250-mL conical flasks made of resistant glass aged as specified, a 900-g (2-lb) hammer, a permanent magnet, a desiccator, and an adequate volumetric apparatus.

[3] A suitable mortar and pestle is available (catalog No. H 17280) from Humboldt Manufacturing Co., 7300 West Agatite, Norridge, Chicago, IL 60656.

Reagents

High-Purity Water—The water used in these tests has a conductivity at 25°, as measured in an in-line cell just prior to dispensing, of not greater than 0.15 µS per cm (6.67 Megohm-cm). There must also be an assurance that this water is not contaminated by copper or its products (e.g., copper pipes, stills, or receivers). The water may be prepared by passing distilled water through a deionizer cartridge packed with a mixed bed of nuclear-grade resin, then through a cellulose ester membrane having openings not exceeding 0.45 µm.[3] Do not use copper tubing. Flush the discharge lines before water is dispensed into test vessels. When the low-conductivity specification can no longer be met, replace the deionizer cartridge.

Methyl Red Solution—Dissolve 24 mg of methyl red sodium in *Purified Water* to make 100 mL. If necessary, neutralize the solution with 0.02 N sodium hydroxide or acidify it with 0.02 N sulfuric acid so that the titration of 100 mL of *High-Purity Water*, containing 5 drops of indicator, does not require more than 0.020 mL of 0.020 N sodium hydroxide to effect the color change of the indicator, which should occur at a pH of 5.6.

Powdered-Glass Test

Rinse thoroughly with *Purified Water* 6 or more containers selected at random, and dry them with a current of clean, dry air. Crush the containers into fragments about 25 mm in size, divide about 100 g of the coarsely crushed glass into three approximately equal portions, and place one of the portions in the special mortar. With the pestle in place, crush the glass further by striking 3 or 4 blows with the hammer. Nest the sieves, and empty the mortar into the No. 20 sieve. Repeat the operation on each of the two remaining portions of glass, emptying the mortar each time into the No. 20 sieve. Shake the sieves for a short time, then remove the glass from the Nos. 20 and 40 sieves, and again crush and sieve as before. Repeat again this crushing and sieving operation. Empty the receiving pan, reassemble the nest of sieves, and shake by mechanical means for 5 minutes or by hand for an equivalent length of time. Transfer the portion retained on the No. 50 sieve, which should weigh in excess of 10 g, to a closed container, and store in a desiccator until used for the test.

Spread the specimen on a piece of glazed paper, and pass a magnet through it to remove particles of iron that may be introduced during the crushing. Transfer the specimen to a 250-mL conical flask of resistant glass, and wash it with six 30-mL portions of acetone, swirling each time for about 30 seconds and carefully decanting the acetone. After washing, the specimen should be free from agglomerations of glass powder, and the surface of the grains should be practically free from adhering fine particles. Dry the flask and contents for 20 minutes at 140°, transfer the grains to a weighing bottle, and cool in a desiccator. Use the test specimen within 48 hours after drying.

Procedure—Transfer 10.00 g of the prepared specimen, accurately weighed, to a 250-mL conical flask that has been digested (aged) previously with *High-Purity Water* in a bath at 90° for at least 24 hours or at 121° for 1 hour. Add 50.0 mL of *High-Purity Water* to this flask and to one similarly prepared to provide a blank. Cap all flasks with borosilicate glass beakers that previously have been treated as described for the flasks and that are of such size that the bottoms of the beakers fit snugly down on the top rims of the containers. Place the containers in the autoclave, and close it securely, leaving the vent cock open. Heat until steam issues vigorously from the vent cock, and continue heating for 10 minutes. Close the vent cock, and adjust the temperature to 121°, taking 19 to 23 minutes to reach the desired temperature. Hold the temperature at 121 ± 2.0° for 30 minutes, counting from the time this temperature is reached. Reduce the heat so that the autoclave cools and comes to atmospheric pressure in 38 to 46 minutes, being vented as necessary to prevent the formation of a vacuum. Cool the flask at once in running water, decant the water from

[3] A suitable nuclear-grade resin mixture of the strong acid cation exchanger in the hydrogen form and the strong base anion exchanger in the hydroxide form, with a one-to-one cation to anion equivalence ratio, is available from the Millipore Corp., Bedford, MA 01730; Barnstead Co., 225 Rivermoor St., Boston, MA 02132; Illinois Water Treatment Co., 840 Cedar St., Rockford, IL 61105; and Vaponics, Inc., 200 Cordage Park, Plymouth, MA 02360. A suitable in-line filter is available from the Millipore Corp.; Gelman Instrument Co., 600 S. Wagner Rd., Ann Arbor, MI 48106; and Schleicher and Schuell, Inc., 540 Washington St., Keene, NH 10003.

the flask into a suitably cleansed vessel, and wash the residual powdered glass with four 15-mL portions of *High Purity Water*, adding the decanted washings to the main portion. Add 5 drops of *Methyl Red Solution*, and titrate immediately with 0.020 N sulfuric acid. If the volume of titrating solution is expected to be less than 10 mL, use a microburet. Record the volume of 0.020 N sulfuric acid used to neutralize the extract from 10 g of the prepared specimen of glass, corrected for a blank. The volume does not exceed that indicated in *Table 2* for the type of glass concerned.

Water Attack at 121°

Rinse thoroughly 3 or more containers, selected at random, twice with *High-Purity Water*.

Procedure— Fill each container to 90% of its overflow capacity with *High-Purity Water*, and proceed as directed for *Procedure* under *Powdered Glass Test*, beginning with "Cap all flasks," except that the time of autoclaving shall be 60 minutes instead of 30 minutes, and ending with "to prevent the formation of a vacuum." Empty the contents from 1 or more containers into a 100-mL graduated cylinder, combining, in the case of smaller containers, the contents of several containers to obtain a volume of 100 mL. Place the pooled specimen in a 250-mL conical flask of resistant glass, add 5 drops of *Methyl Red Solution*, and titrate, while warm, with 0.020 N sulfuric acid. Complete the titration within 60 minutes after opening the autoclave. Record the volume of 0.020 N sulfuric acid used, corrected for a blank obtained by titrating 100 mL of *High-Purity Water* at the same temperature and with the same amount of indicator. The volume does not exceed that indicated in *Table 2* for the type of glass concerned.

Arsenic

Arsenic ⟨211⟩— Use as the *Test Preparation* 35 mL of the water from one Type I glass container or, in the case of smaller containers, 35 mL of the combined contents of several Type I glass containers, prepared as directed for *Procedure* under *Water Attack at 121°*: the limit is 0.1 µg per g.

BIOLOGICAL TESTS—PLASTICS AND OTHER POLYMERS

Perform the in vitro biological tests according to the procedures set forth under *Biological Reactivity Tests, In Vitro* ⟨87⟩. Materials that meet the requirements of the in vitro tests are not required to undergo further testing. No plastic class designation is assigned to these materials. Materials that do not meet the requirements of the in vitro tests are not suitable for containers for drug products

If a plastic class designation is needed for plastics and other polymers that meet the requirements under *Biological Reactivity Tests, In Vitro* ⟨87⟩, perform the appropriate in vivo tests specified for *Classification of Plastics* under *Biological Reactivity Tests, In Vivo* ⟨88⟩.

PHSYSICOCHEMICAL TESTS—PLASTIC

The following tests, designed to determine physical and chemical properties of plastics and their extracts, are based on the extraction of the plastic material, and it is essential that the designated amount of the plastic be used. Also, the specified surface area must be available for extraction at the designated temperature.

Extracting Medium— Unless otherwise directed in a specific test below, use *Purified Water* (see monograph) as the extracting medium, maintained at a temperature of 70° during the extraction of the prepared *Sample*.

Apparatus— Use a water bath and the *Extraction Containers* as described under *Biological Reactivity Tests, In Vivo* ⟨88⟩.

Preparation of Apparatus— Proceed as directed in the first paragraph of *Preparation of Apparatus* under *Biological Reactivity Tests, In Vivo* ⟨88⟩. [NOTE—The containers and equipment need not be sterile.]

Procedure—

Preparation of Sample— From a homogeneous plastic specimen, use a portion, for each 20.0 mL of extracting medium, equivalent to 120 cm² total surface area (both sides combined), and subdivide into strips approximately 3 mm in width and as near to 5 cm in length as is practical. Transfer the subdivided *Sample* to a glass-stoppered, 250-mL graduated cylinder of Type I glass, and add about 150 mL of *Purified Water*. Agitate for about 30 seconds, drain off and discard the liquid, and repeat with a second washing.

Transfer the prepared *Sample* to a suitable extraction flask, and add the required amount of *Extracting Medium*. Extract by heating in a water bath at the temperature specified for the *Extracting Medium* for 24 hours. Cool, but not below 20°. Pipet 20 mL of the extract of the prepared *Sample* into a suitable container. Use this portion in the test for *Buffering Capacity*. Immediately decant the remaining extract into a suitably cleansed container, and seal.

Blank— Use *Purified Water* where a blank is specified in the following tests.

NONVOLATILE RESIDUE— Transfer, in suitable portions, 50.0 mL of the extract of the prepared *Sample* to a suitable, tared crucible (preferably a fused-silica crucible that has been acid-cleaned), and evaporate the volatile matter on a steam bath. Similarly evaporate 50.0 mL of the *Blank* in a second crucible. [NOTE—If an oily residue is expected, inspect the crucible repeatedly during the evaporation and drying period, and reduce the amount of heat if the oil tends to creep along the walls of the crucible.] Dry at 105° for 1 hour: the difference between the amounts obtained from the *Sample* and the *Blank* does not exceed 15 mg.

RESIDUE ON IGNITION ⟨**281**⟩— []It is not necessary to perform this test when the *Nonvolatile Residue* test result does not *Nonvolatile Residue* obtained from the *Sample* and from the *Blank*, using, if necessary, additional sulfuric acid but adding the same amount of sulfuric acid to each crucible: the difference between the amounts of residue on ignition obtained from the *Sample* and the *Blank* does not exceed 5 mg.

HEAVY METALS— Pipet 20 mL of the extract of the prepared *Sample*, filtered if necessary, into one of two matched 50-mL color-comparison tubes. Adjust with 1 N acetic acid or 6 N ammonium hydroxide to a pH between 3.0 and 4.0, using short-range pH paper as external indicator, dilute with water to about 35 mL, and mix.

Into the second color-comparison tube pipet 2 mL of *Standard Lead Solution* (see *Heavy Metals* ⟨231⟩), and add 20 mL of the *Blank*. Adjust with 1 N acetic acid or 6 N ammonium hydroxide to a pH between 3.0 and 4.0, using short-range pH paper as external indicator, dilute with water to about 35 mL, and mix. To each tube add 1.2 mL of thioacetamide-glycerin base TS and 2 mL of *pH 3.5 Acetate Buffer* (see *Heavy Metals* ⟨231⟩), dilute with water to 50 mL, and mix: any brown color produced within 10 minutes in the tube containing the extract of the prepared *Sample* does not exceed that in the tube containing the *Standard Lead Solution*, both tubes being viewed downward over a white surface (1 ppm in extract).

BUFFERING CAPACITY— Titrate the previously collected 20-mL portion of the extract of the prepared *Sample* potentiometrically to a pH of 7.0, using either 0.010 N hydrochloric acid or 0.010 N sodium hydroxide, as required. Treat a 20.0-mL portion of the *Blank* similarly: if the same titrant was required for both *Sample* and *Blank*, the difference between the two volumes is not greater than 10.0 mL; and if acid was required for either the *Sample* or the *Blank* and alkali for the other, the total of the two volumes required is not greater than 10.0 mL.

CONTAINERS FOR OPHTHALMICS—PLASTICS

Plastics for ophthalmics are composed of a mixture of homologous compounds, having a range of molecular weights. Such plastics frequently contain other substances such as residues from the polymerization process, plasticizers, stabilizers, antioxidants, pigments, and lubricants. Factors such as plastic composition, processing and cleaning procedures, contacting media, inks, adhesives, absorption, adsorption and permeability of preservatives, and conditions of storage may also affect the suitability of a plastic for a specific use.

In-Process Revision

Definition— For the purposes of this chapter, a *container* is that which holds the drug and is or may be in direct contact with the drug.

Biological Tests— Plastics and other polymers used for containers for ophthalmics meet the requirements set forth in the section *Biological Tests—Plastics and Other Polymers*.

POLYETHYLENE CONTAINERS

The standards and tests provided in this section characterize high-density and low-density polyethylene containers that are interchangeably suitable for packaging dry oral dosage forms not meant for constitution into solution.

Where stability studies have been performed to establish the expiration date of a particular dry oral dosage form not meant for constitution into solution in a container meeting the requirements set forth herein for either high- or low-density polyethylene containers, then any other polyethylene container meeting the same sections of these requirements may be similarly used to package such dosage form, provided that the appropriate stability programs are expanded to include the alternative container, in order to assure that the identity, strength, quality, and purity of the dosage form are maintained throughout the expiration period.

Both high- and low-density polyethylene are long-chain polymers synthesized under controlled conditions of heat and pressure, with the aid of catalysts from not less than 85.0% ethylene and not less than 95.0% total olefins. The other olefin ingredients most frequently used are butene, hexene, and propylene. The ingredients used to manufacture the polyethylene, and those used in the fabrication of the containers, conform to the requirements in the applicable sections of the *Code of Federal Regulations*, Title 21.

High-density polyethylene and low-density polyethylene both have an IR absorption spectrum that is distinctive for polyethylene, and each possesses characteristic thermal properties. High-density polyethylene has a density between 0.941 and 0.965 g per cm^3. Low-density polyethylene has a density between 0.850 and 0.940 g per cm^3. The permeation properties of molded polyethylene containers may be altered when re-ground polymer is incorporated, depending upon the proportion of re-ground material in the final product. Other properties that may affect the suitability of polyethylene used in containers for packaging drugs are: oxygen and moisture permeability, modulus of elasticity, melt index, environmental stress crack resistance, and degree of crystallinity after molding. The requirements in this section are to be met when dry oral dosage forms, not meant for constitution into solution, are intended to be packaged in a container defined by this section.

Multiple Internal Reflectance—

APPARATUS— Use an IR spectrophotometer capable of correcting for the blank spectrum and equipped with a multiple internal reflectance accessory and a KRS-5 internal reflection plate.[4] A KRS-5 crystal 2 mm thick having an angle of incidence of 45° provides a sufficient number of reflections.

PREPARATION OF SPECIMEN— Cut 2 flat sections representative of the average wall thickness of the container, and trim them as necessary to obtain segments that are convenient for mounting in the multiple internal reflectance accessory. Taking care to avoid scratching the surfaces, wipe the specimens with dry paper or, if necessary, clean them with a soft cloth dampened with methanol, and permit them to dry. Securely mount the specimens on both sides of the KRS-5 internal reflection plate, ensuring adequate surface contact. Prior to mounting the specimens on the plate, they may be compressed to thin uniform films by exposing them to temperatures of about 177° under high pressures (15,000 psi or more).

PROCEDURE— Place the mounted specimen sections within the multiple internal reflectance accessory, and place the assembly in the specimen beam of the IR spectrophotometer. Adjust the specimen position and mirrors within the accessory to permit maximum light transmission of the unattenuated reference beam. (For a double-beam instrument, upon completing the adjustments in the accessory, attenuate the reference beam to permit full scale deflection during the scanning of the specimen.) Determine the IR spectrum from 3500 to 600 cm^{-1}: the corrected spectrum of the specimen exhibits major absorption bands only at the same wavelengths as the spectrum of USP High-density Polyethylene RS or USP Low-density Polyethylene RS, similarly determined.

Thermal Analysis— Cut a section weighing about 12 mg, and place it in the test specimen pan. Determine the thermogram under nitrogen at temperatures between 40° and 200° at a heating rate between 2° and 10° per minute followed by cooling at a rate between 2° and 10° per minute to 40°, using equipment capable of performing the determinations described under *Thermal Analysis* ⟨891⟩.

High-Density Polyethylene— The thermogram of the specimen is similar to the thermogram of USP High-Density Polyethylene RS, similarly determined, and the temperatures of the endotherms and exotherms in the thermogram of the specimen do not differ from those of the standard by more than 6.0°.

Low-Density Polyethylene— The thermogram of the specimen is similar to the thermogram of USP Low-Density Polyethylene RS, similarly determined, and the temperatures of the endotherms and exotherms in the thermogram of the specimen do not differ from those of the standard by more than 8.0°.

Light Transmission— Polyethylene containers intended to provide protection from light meet the requirements under *Light Transmission*.

Water-Vapor Permeation— Fit the containers with impervious seals obtained by heat-sealing the bottles with an aluminum foil-polyethylene laminate or other suitable seal.[5] Test the containers as described under *Containers—Permeation* ⟨671⟩: the high-density polyethylene containers so tested meet the requirements if the moisture permeability exceeds 10 mg per day per L in not more than 1 of the 10 test containers and exceeds 25 mg per day per L in none of them. The low-density polyethylene containers so tested meet the requirements if the moisture permeability exceeds 20 mg per day per L in not more than 1 of the 10 test containers and exceeds 30 mg per day per L in none of them.

Heavy Metals and Nonvolatile Residue— Prepare extracts of specimens for these tests as directed for *Preparation of Sample* in the *Procedure* under *Physicochemical Tests—Plastics*, except that for each 20.0 mL of *Extracting Medium* the portion shall be 60 cm^2, regardless of thickness.

HEAVY METALS— Containers meet the requirements for *Heavy Metals* under *Physicochemical Tests—Plastics*.

NONVOLATILE RESIDUE— Proceed as directed for *Nonvolatile Residue* under *Physicochemical Tests—Plastics*, except that the blank shall be the same solvent used in each of the tests set forth below. The difference between the amounts obtained from the specimen and the blank does not exceed 12.0 mg when water maintained at a temperature of 70° is used as the extracting medium; does not exceed 75.0 mg when alcohol maintained at a temperature of 70° is used as the extracting medium; and does not exceed 100.0 mg for high-density polyethylene and does not exceed 350.0 mg for low-density polyethylene when hexanes maintained at a temperature of 50° are used as the extracting medium. Containers meet these requirements for *Nonvolatile Residue* for all of the above extracting media. [NOTE— When evaporating these solvents, use a current of air with the water bath; when drying the residue, use an explosion-proof oven.]

POLYETHYLENE TEREPHTHALATE BOTTLES AND POLYETHYLENE TEREPHTHALATE-G BOTTLES

The standards and tests provided in this section characterize polyethylene terephthalate (PET) and polyethylene terephthalate-G (PETG) bottles that are interchangeably suitable for packaging liquid oral dosage forms.

[4] The multiple internal reflectance accessory and KRS-5 plate are available from several sources, including Beckman Instruments, Inc., 2500 Harbor Blvd., Fullerton, CA 92634, and from Perkin-Elmer Corp., Main Ave., Norwalk, CT 06856.

[5] A suitable laminate for sealing has as the container contact layer polyethylene of not less than 0.025 mm (0.001 inch) and a second layer of aluminum foil of not less than 0.018 mm (0.0007 inch), with additional layers of suitable backing materials. A suitable seal can be obtained also by using glass plates and a sealing wax consisting of 60% of refined amorphous wax and 40% of refined crystalline paraffin wax.

Where stability studies have been performed to establish the expiration date of a particular liquid oral dosage form in a bottle meeting the requirements set forth herein for either PET or PETG bottles, any other PET or PETG bottle meeting these requirements may be similarly used to package such dosage form, provided that the appropriate stability programs are expanded to include the alternative bottle in order to assure that the identity, strength, quality, and purity of the dosage form are maintained throughout the expiration period.

The suitability of a specific PET or PETG bottle for use in the dispensing of a particular pharmaceutical liquid oral dosage form must be established by appropriate testing.

PET resins are long-chain crystalline polymers prepared by the condensation of ethylene glycol with dimethyl terephthalate or terephthalic acid. PET copolymer resins are prepared in a similar way, except that they may also contain a small amount of either isophthalic acid (not more than 3 mole percent) or 1,4-cyclohexanedimethanol (not more than 5 mole percent). Polymerization is conducted under controlled conditions of heat and vacuum, with the aid of catalysts and stabilizers.

PET copolymer resins have physical and spectral properties similar to PET and for practical purposes are treated as PET. The tests and specifications provided in this section to characterize PET resins and bottles apply also to PET copolymer resins and to bottles fabricated from them.

PET and PET copolymer resins generally exhibit a large degree of order in their molecular structure. As a result, they exhibit characteristic composition-dependent thermal behavior, including a glass transition temperature of about 76° and a melting temperature of about 250°. These resins have a distinctive IR absorption spectrum that allows them to be distinguished from other plastic materials (e.g., polycarbonate, polystyrene, polyethylene, and PETG resins). PET and PET copolymer resins have a density between 1.3 and 1.4 g per cm^3 and a minimum intrinsic viscosity of 0.7 dL per g, which corresponds to a number average molecular weight of about 23,000 daltons.

PETG resins are high molecular weight polymers prepared by the condensation of ethylene glycol with dimethyl terephthalate or terephthalic acid and 15 to 34 mole percent of 1,4-cyclohexanedimethanol. PETG resins are clear, amorphous polymers, having a glass transition temperature of about 81° and no crystalline melting point, as determined by differential scanning calorimetry. PETG resins have a distinctive IR absorption spectrum that allows them to be distinguished from other plastic materials, including PET. PETG resins have a density of approximately 1.27 g per cm^3 and a minimum intrinsic viscosity of 0.65 dL per g, which corresponds to a number average molecular weight of about 16,000 daltons.

PET and PETG resins, and other ingredients used in the fabrication of these bottles, conform to the requirements in the applicable sections of the Code of Federal Regulations, Title 21, regarding use in contact with food and alcoholic beverages. PET and PETG resins do not contain any plasticizers, processing aids, or antioxidants. Colorants, if used in the manufacture of PET and PETG bottles, do not migrate into the contained liquid.

Multiple Internal Reflectance—

APPARATUS—Use an IR spectrophotometer capable of correcting for the blank spectrum and equipped with a multiple internal reflectance accessory and a KRS-5 internal reflection plate.[6] A KRS-5 crystal having a thickness of 2 mm and an angle of incidence of 45° provides a sufficient number of reflections.

PREPARATION OF SPECIMEN—Cut 2 flat sections representative of the average wall thickness of the bottle, and trim them as necessary to obtain segments that are convenient for mounting in the multiple internal reflectance accessory. Taking care to avoid scratching the surfaces, wipe the specimens with dry paper or, if necessary, clean them with a soft cloth dampened with methanol, and permit them to dry. Securely mount the specimens on both sides of the KRS-5 internal reflection plate, ensuring adequate surface contact.

PROCEDURE—Place the mounted specimen sections within the multiple internal reflectance accessory, and place the assembly in the specimen beam of the IR spectrophotometer. Adjust the specimen position and mirrors within the accessory to permit maximum light transmission of the unattenuated beams. (For a double-beam instrument, upon completing the adjustments in the accessory, attenuate the reference beam to permit full-scale deflection during the scanning of the specimen.) Determine the IR spectrum from 4000 to 400 cm^{-1}. The corrected spectrum of the specimen exhibits major absorption bands only at the same wavelengths as the spectrum of the USP Polyethylene Terephthalate RS, or the USP Polyethylene Terephthalate G RS, similarly determined.

Thermal Analysis—Cut a section weighing about 12 mg from the bottle, and place it in the test specimen pan. Determine the thermogram under nitrogen, using the heating and cooling conditions as specified for the resin type and using equipment capable of performing the determinations as described under *Thermal Analysis* ⟨891⟩.

Polyethylene Terephthalate—Heat the specimen from room temperature to 280° at a heating rate of about 20° per minute. Hold the specimen at 280° for 1 minute. Quickly cool the specimen to room temperature, and reheat it to 280° at a heating rate of about 5° per minute. The thermogram of the specimen is similar to the thermogram of USP Polyethylene Terephthalate RS, similarly determined: the melting point (T_m) of the specimen does not differ from that of the Standard by more than 9.0°, and the glass transition temperature (T_g) of the specimen does not differ from that of the Standard by more than 4.0°.

Polyethylene Terephthalate G—Heat the specimen from room temperature to 120° at a heating rate of about 20° per minute. Hold the specimen at 120° for 1 minute. Quickly cool the specimen to room temperature, and reheat it to 120° at a heating rate of about 10° per minute. The thermogram of the specimen is similar to the thermogram of USP Polyethylene Terephthalate G RS, similarly determined: the glass transition temperature (T_g) of the specimen does not differ from that of the Standard by more than 6.0°.

Light Transmission—PET and PETG bottles intended to provide protection from light meet the requirements under *Light Transmission*.

Water Vapor Permeation—[NOTE—Throughout the following procedure, determine the weights of bottles and closures, both as tare weights and weights of filled bottles, to the nearest 0.1 mg if the bottle volume is less than 200 mL; to the nearest mg if the bottle volume is 200 mL or more but less than 1000 mL; or to the nearest centigram (10 mg) if the bottle volume is 1000 mL or more.] Select 10 bottles of a uniform size and type, clean the sealing surfaces with a lint-free cloth, and close and open each bottle 30 times. Apply the closure firmly and uniformly each time the bottle is closed. Close screw-capped bottles with a torque that is within the range of tightness specified in the table provided under *Containers—Permeation* ⟨671⟩. Weigh each empty bottle and its closure. Fill ten bottles with water at 25 ± 2° until the meniscus is tangent to the top of the bottle opening. Record the weight of each bottle and its closure, and determine the average bottle volume, in L, taken by the following formula:

$$\sum_{i=1}^{10} (W_{ci} - W_{ti})/9970,$$

where W_{ci} is the total weight, in g, of bottle I and its closure, W_{ti} is the tare weight, in g, of bottle I and its closure, and 9970 is the density of water at 25° times 10,000 (the number of bottles tested times the conversion factor for converting milliliters to liters).

Using a pipet, adjust the water level in the bottles to the fill point. Apply the closures using a torque that is within the range specified in the table provided under *Containers—Permeation* ⟨671⟩, and store the bottles at a temperature of 25 ± 2° and a relative humidity of 50 ± 2%. After 168 ± 1 hours (7 days), record the weight of the individual bottles. Return the bottles to storage for another 168 ± 1 hours. After the second 168 ± 1 hours, remove the bottles, record

[6] The multiple-internal-reflectance accessory and KRS-5 plate are available from several sources, including Beckman Instruments, Inc., 2500 Harbor Boulevard, Fullerton, CA 92634, and from Perkin-Elmer Corporation, 761 Main Ave., Norwalk, CT 06859-01560.

In-Process Revision

the weights of the individual bottles, and calculate the water vapor permeation rate, in mg per day per L, for each bottle taken by the formula:

$$(W_{Ii} - W_{Ji})/TV_a,$$

in which W_{Ii} is the weight, in mg, of bottle I at 14 days, W_{Ji} is the weight, in mg, of bottle J at 7 days, T is the test time, in days, after the 7-day equilibration period, and V_a is the average bottle volume, in L.

The bottles so tested meet the requirements and are *tight containers* if the water vapor permeation rate exceeds 100 mg per day per L in not more than 1 of the 10 test bottles and exceeds 200 mg per day per L in none of them.

Colorant Extraction— Select 3 test bottles. Cut a relatively flat portion from the side wall of one bottle, and trim it as necessary to fit the sample holder of the spectrophotometer. Obtain the visible spectrum of the side wall by scanning the portion of the visible spectrum from 350 to 700 nm. Determine, to the nearest 2 nm, the wavelength of maximum absorbance. Fill the remaining two test bottles, using 50% alcohol for PET bottles and 25% alcohol for PETG bottles. Fit the bottles with impervious seals, such as aluminum foil, and apply closures. Fill a glass bottle having the same capacity as that of the test bottles with the corresponding solvent, fit the bottle with an impervious seal, such as aluminum foil, and apply a closure. Incubate the test bottles and the glass bottle in a constant temperature room or in an oven at 49° for ten days. Remove the bottles, and allow them to equilibrate to room temperature. Concomitantly determine the absorbances of the test solutions in 5-cm cells at the wavelength of maximum absorbance (see *Spectrophotometry and Light-Scattering* ⟨851⟩), using the corresponding solvent from the glass bottle as the blank. The absorbance values so obtained are less than 0.01 for both test solutions.

Heavy Metals, Total Terephthaloyl Moieties, and Ethylene Glycol—

EXTRACTING MEDIA—

Purified Water— (see monograph).

50 Percent Alcohol— Dilute 125 mL of alcohol with water to 238 mL, and mix.

25 Percent Alcohol— Dilute 125 mL of *50 Percent Alcohol* with water to 250 mL, and mix.

n-Heptane

PROCEDURE— [NOTE—Use the *50 Percent Alcohol Extracting Medium* with PET bottles. Use the *25 Percent Alcohol Extracting Medium* with PETG bottles.]For each *Extracting Medium*, fill a sufficient number of test bottles to 90% of their nominal capacity to obtain not less than 30 mL of extract. Fill a corresponding number of glass bottles with *Purified Water Extracting Medium*, a corresponding number of glass bottles with *50 Percent Alcohol Extracting Medium* or *25 Percent Alcohol Extracting Medium*, and a corresponding number of glass bottles with *n-Heptane Extracting Medium* for use as *Extracting Media* blanks. Fit the bottles with impervious seals, such as aluminum foil, and apply closures. Incubate the test bottles and the glass bottles in a constant temperature room or in an oven at 49° for ten days. Remove the test bottles with the *Extracting Media* samples and the glass bottles with the *Extracting Media* blanks, and store them at room temperature. Do not transfer the *Extracting Media* samples to alternative storage vessels.

HEAVY METALS— Pipet 20 mL of the *Purified Water* extract of the test bottles, filtered if necessary, into one of two matched 50-mL color comparison tubes, and retain the remaining *Purified Water* extract in the test bottles for use in the test for *Ethylene Glycol*. Adjust the extract with 1 N acetic acid or 6 N ammonium hydroxide to a pH between 3.0 and 4.0, using short-range pH paper as an external indicator. Dilute with water to about 35 mL, and mix.

Into the second color comparison tube, pipet 2 mL of freshly prepared (on day of use) *Standard Lead Solution* (see *Heavy Metals* ⟨231⟩), and add 20 mL of *Purified Water*. Adjust with 1 N acetic acid or 6 N ammonium hydroxide to a pH between 3.0 and 4.0, using short-range pH paper as an external indicator. Dilute with water to about 35 mL, and mix.

To each tube add 1.2 mL of thioacetamide-glycerin base TS and 2 mL of *pH 3.5 Acetate Buffer* (see *Heavy Metals* ⟨231⟩), dilute with water to 50 mL, and mix: any color produced within 10 minutes in the tube containing the *Purified Water* extract of the test bottles does not exceed that in the tube containing the *Standard Lead Solution*, both tubes being viewed downward over a white surface (1 ppm in extract).

Total Terephthaloyl Moieties— Determine the absorbance of the *50 Percent Alcohol* or *25 Percent Alcohol* extract in a 1-cm cell at the wavelength of maximum absorbance at about 244 nm (see *Spectrophotometry and Light-Scattering* ⟨851⟩), using the corresponding *Extracting Medium* blank as the blank: the absorbance of the extract does not exceed 0.150, corresponding to not more than 1 ppm of total terephthaloyl moieties.

Determine the absorbance of the *n-Heptane* extract in a 1-cm cell at the wavelength of maximum absorbance at about 240 nm (see *Spectrophotometry and Light-Scattering* ⟨851⟩), using the *n-Heptane Extracting Medium* blank as the blank: the absorbance of the extract does not exceed 0.150, corresponding to not more than 1 ppm of total terephthaloyl moieties.

ETHYLENE GLYCOL—

Periodic Acid Solution— Dissolve 125 mg of periodic acid in 10 mL of water.

Dilute Sulfuric Acid— To 50 mL of water add slowly and with constant stirring 50 mL of sulfuric acid, and allow to cool to room temperature.

Sodium Bisulfite Solution— Dissolve 0.1 g of sodium bisulfite in 10 mL of water. Use this solution within seven days.

Disodium Chromotropate Solution— Dissolve 100 mg of disodium chromotropate in 100 mL of sulfuric acid. Protect this solution from light, and use within seven days.

Standard Solution— Dissolve an accurately weighed quantity of ethylene glycol in water, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 1 µg per mL.

Test Solution— Use the *Purified Water* extract.

Blank— Use the *Purified Water Extracting Medium* blank.

Procedure— Transfer 1.0 mL of *Standard Solution* to a 10-mL volumetric flask. Transfer 1.0 mL of *Test Solution* to a second 10-mL volumetric flask. Transfer 1.0 mL of *Purified Water Extracting Medium* blank to a third 10-mL volumetric flask. To each of the three flasks, add 100 µL of *Periodic Acid Solution*, swirl to mix, and allow to stand for 60 minutes. Add 1.0 mL of *Sodium Bisulfite Solution* to each flask, and mix. Add 100 µL of *Disodium Chromotropate Solution* to each flask, and mix. [NOTE—All solutions should be analyzed within one hour after addition of the *Disodium Chromotropate Solution*.] Cautiously add 6 mL of sulfuric acid to each flask, mix, and allow the solutions to cool to room temperature. Dilute each solution with *Dilute sulfuric acid* to volume, and mix. Concomitantly determine the absorbances of the solutions from the *Standard Solution* and the *Test Solution* in 1-cm cells at the wavelength of maximum absorbance at about 575 nm (see *Spectrophotometry and Light-Scattering* ⟨851⟩), using the solution from the *Purified Water Extracting Medium* blank as the blank: the absorbance of the solution from the *Test solution* does not exceed that of the solution from the *Standard solution*, corresponding to not more than 1 ppm of ethylene glycol.

POLYPROPYLENE CONTAINERS

The standards and tests provided in this section characterize polypropylene containers, produced from either homopolymers or copolymers, that are interchangeably suitable for packaging dry solid and liquid oral dosage forms.

Where suitable stability studies have been performed to establish the expiration date of a particular dosage form in the appropriate polypropylene container, then any other polypropylene container meeting these requirements may be similarly used to package such dosage form, provided that the appropriate stability programs are ex-

In-Process Revision

panded to include the alternative container, in order to assure that the potency, identity, strength, quality, and purity of the dosage form are maintained throughout the expiration period.

Propylene polymers are long-chain polymers synthesized from propylene or propylene and other olefins under controlled conditions of heat and pressure, with the aid of catalysts. Examples of other olefins most commonly used include ethylene and butene. The propylene polymers, the ingredients used to manufacture the propylene polymers, and the ingredients used in the fabrication of the containers conform to the applicable sections of the *Code of Federal Regulations*, Title 21.

Factors such as plastics composition, processing and cleaning procedures, contacting media, inks, adhesives, absorption, adsorption and permeability of preservatives, and conditions of storage may also affect the suitability of a plastic for a specific use. The suitability of a specific polypropylene must be established by appropriate testing.

Polypropylene has a distinctive IR spectrum and possesses characteristic thermal properties. It has a density between 0.880 and 0.913 g per cm^3. The permeation properties of molded polypropylene containers may be altered when reground polymer is incorporated, depending on the proportion of reground material in the final product. Other properties that may affect the suitability of polypropylene used in containers for packaging drugs are the following: oxygen and moisture permeability, modulus of elasticity, melt flow index, environmental stress crack resistance, and degree of crystallinity after molding. The requirements in this section are to be met when dry solid and liquid oral dosage forms are to be packaged in a container defined by this section.

Multiple Internal Reflectance—

APPARATUS—Use an IR spectrophotometer capable of correcting for the blank spectrum and equipped with a multiple internal reflectance accessory and a KRS-5 internal reflection plate. A KRS-5 crystal 2 mm thick having an angle of incidence of 45° provides a sufficient number of reflections.

PREPARATION OF SPECIMEN—Cut 2 flat sections, representative of the average wall thickness of the container, and trim them as necessary to obtain segments that are convenient for mounting in the internal reflectance accessory. Taking care to avoid scratching the surfaces, wipe the specimens with dry paper, or if necessary with a soft cloth dampened with methanol, and permit them to dry. Securely mount the specimens on both sides of the KRS-5 internal reflection plate, ensuring adequate surface contact. Prior to mounting the specimens on the plate, they may be compressed to flat uniform films by exposure to temperatures between 220° and 240°. The specimen's time/temperature history during this operation should be limited to that necessary to mold the films.

PROCEDURE—Place the mounted specimen sections within the multiple internal reflectance accessory, and place the assembly in the specimen beam of the IR spectrophotometer. Adjust the specimen position and mirrors within the accessory to permit maximum light transmission of the unattenuated reference beam. (For a double-beam instrument, upon completing the adjustment in the accessory, attenuate the reference beam to permit full-scale deflection during the scanning of the specimen.) Determine the IR spectrum from 3500 to 600 cm^{-1}. The corrected spectrum of the specimen exhibits major absorption bands only at the same wavelengths as the spectrum of the USP Reference Standard for either a polypropylene homopolymer or copolymer, similarly determined.

Thermal Analysis—Cut a section weighing about 12 mg, and place it in the test specimen pan. Intimate contact between the pan and the thermocouple is essential for reproducible results. Determine the thermogram under nitrogen at temperatures ranging from ambient to 30° above the melting point. Maintain the temperature for 10 minutes, then cool to 50° below the peak crystallization temperature at a rate of 10° to 20° per minute, using equipment capable of performing the determinations as described under *Thermal Analysis* ⟨891⟩. The thermogram of the specimen is similar to the thermogram of the appropriate USP Reference Standard for polypropylene. The temperatures of the endotherms and exotherms in the thermogram do not differ from those of the USP Reference Standard for homopolymers by more than 12.0° or from those of the USP Reference Standard for copolymers by more than 6.0°.

Light Transmission—Polypropylene containers intended to provide protection from light meet the requirements under *Light Transmission*.

Water-Vapor Permeation—Fit the containers with impervious seals obtained by heat sealing the bottles with an aluminum foil–polyethylene laminate or other suitable seal. Test the containers as described under *Containers—Permeation* ⟨671⟩. The containers meet the requirements if the moisture permeability exceeds 15 mg per day per L in not more than one of the 10 test containers and exceeds 25 mg per day per L in none of them.

Heavy Metals and Nonvolatile Residue—Prepare extracts of specimens for these tests as directed for *Procedure* under *Physicochemical Tests—Plastics*, except that for each 20 mL of *Extracting Medium* the portion shall be 60 cm^2, regardless of thickness.

HEAVY METALS—Containers meet the requirements for *Heavy Metals* under *Physicochemical Tests—Plastics*.

NONVOLATILE RESIDUE—Proceed as directed for *Nonvolatile Residue* under *Physicochemical Tests—Plastics*, except that the blank shall be the same solvent used in each of the tests set forth below. The difference between the amounts obtained from the specimen and the blank does not exceed 10.0 mg when water maintained at a temperature of 70° is used as the extracting medium, does not exceed 60.0 mg when alcohol maintained at a temperature of 70° is used as the extracting medium, and does not exceed 225.0 mg when hexanes maintained at a temperature of 50° is used as the extracting medium. Containers meet these requirements for *Nonvolatile Residue* for all of the above extracting media. [NOTE—Hexanes and alcohol are flammable. When evaporating these solvents, use a current of air with the water bath; when drying the residue, use an explosion-proof oven.]

Buffering Capacity—Prepare extracts of the specimen as described for *Procedure* under *Physicochemical Tests—Plastics*. Containers meet the requirements for *Buffering Capacity* under *Physicochemical Tests—Plastics*.

REPACKAGING INTO SINGLE-UNIT CONTAINERS AND UNIT-DOSE CONTAINERS FOR NONSTERILE SOLID AND LIQUID DOSAGE FORMS

An official dosage form is required to bear on its label an expiration date assigned for the particular formulation and package of the article. This date limits the time during which the product may be dispensed or used. Because the expiration date stated on the manufacturer's or distributor's package has been determined for the drug in that particular package and is not intended to be applicable to the product where it has been repackaged in a different container, repackaged drugs dispensed pursuant to a prescription are exempt from this expiration date labeling requirement. It is necessary, therefore, that other precautions be taken by the dispenser to preserve the strength, quality, and purity of drugs that are repackaged for ultimate distribution or sale to patients.

The following guidelines and requirements are applicable where official dosage forms are repackaged into single-unit or unit-dose containers or mnemonic packs for dispensing pursuant to prescription.

Labeling—It is the responsibility of the dispenser, taking into account the nature of the drug repackaged, any packaging and beyond-use dating information in the manufacturer's product labeling, the characteristics of the containers, and the storage conditions to which the article may be subjected, to place a suitable beyond-use date on the label. Repackaged dosage forms must bear on their labels beyond-use dates as determined from information in the product labeling. Each single-unit or unit-dose container bears a separate label, unless the device holding the unit-dose form does not allow for the removal or separation of the intact single-unit or unit-dose container therefrom.

Storage—Store the repackaged article in a humidity-controlled environment and at the temperature specified in the individual monograph or in the product labeling. Where no temperature or humidity is specified in the monograph or in the labeling of the product, controlled room temperature and a relative humidity corresponding to 75% at 23° are not to be exceeded during repackaging or storage.

A refrigerator or freezer shall not be considered to be a humidity-controlled environment, and drugs that are to be stored at a cold temperature in a refrigerator or freezer shall be placed within an outer container that meets the monograph requirements for the drug contained therein.

Reprocessing— Reprocessing of repackaged unit-dose containers (i.e., removing dosage unit from one unit-dose container and placing dosage unit into another unit-dose container) shall not be done. However, reprocessing of the secondary package (e.g., removing the blister card from the cardboard carrier and placing the blister card into another cardboard carrier) is allowed provided that the original beyond-use date is maintained.

CUSTOMIZED PATIENT MEDICATION PACKAGES

In lieu of dispensing two or more prescribed drug products in separate containers, a pharmacist may, with the consent of the patient, the patient's caregiver, or a prescriber, provide a customized patient medication package (patient med pak).[2]

A patient med pak is a package prepared by a pharmacist for a specific patient comprising a series of containers and containing two or more prescribed solid oral dosage forms. The patient med pak is so designed or each container is so labeled as to indicate the day and time, or period of time, that the contents within each container are to be taken.

It is the responsibility of the dispenser to instruct the patient or caregiver on the use of the patient med pak.

Label— The patient med pak shall bear a label stating:

(1) the name of the patient;
(2) a serial number for the patient med pak itself and a separate identifying serial number for each of the prescription orders for each of the drug products contained therein;
(3) the name, strength, physical description or identification, and total quantity of each drug product contained therein;
(4) the directions for use and cautionary statements, if any, contained in the prescription order for each drug product therein;
(5) any storage instructions or cautionary statements required by the official compendia;
(6) the name of the prescriber of each drug product;
(7) the date of preparation of the patient med pak and the beyond-use date or period of time assigned to the patient med pak (such beyond-use date or period of time shall be not longer than the shortest recommended beyond-use date for any dosage form included therein or not longer than 60 days from the date of preparation of the patient med pak and shall not exceed the shortest expiration date on the original manufacturer's bulk containers for the dosage forms included therein); alternatively, the package label shall state the date of the prescription(s) or the date of preparation of the patient med pak, provided the package is accompanied by a record indicating the start date and the beyond-use date;
(8) the name, address, and telephone number of the dispenser (and the dispenser's registration number where necessary); and
(9) any other information, statements, or warnings required for any of the drug products contained therein.

If the patient med pak allows for the removal or separation of the intact containers therefrom, each individual container shall bear a label identifying each of the drug products contained therein.

Labeling— The patient med pak shall be accompanied by a patient package insert, in the event that any medication therein is required to be dispensed with such insert as accompanying labeling. Alternatively, such required information may be incorporated into a single, overall educational insert provided by the pharmacist for the total patient med pak.

Packaging— In the absence of more stringent packaging requirements for any of the drug products contained therein, each container of the patient med pak shall comply with the moisture permeation requirements for a Class B single-unit or unit-dose container (see *Containers—Permeation* ⟨671⟩). Each container shall be either not reclosable or so designed as to show evidence of having been opened.

Guidelines— It is the responsibility of the dispenser, when preparing a patient med pak, to take into account any applicable compendial requirements or guidelines and the physical and chemical compatibility of the dosage forms placed within each container, as well as any therapeutic incompatibilities that may attend the simultaneous administration of the medications. In this regard, pharmacists are encouraged to report to USP headquarters any observed or reported incompatibilities. Once a medication has been placed in a patient med pak with another solid dosage form, it may not be returned to stock, redistributed, or resold if unused.

Recordkeeping— In addition to any individual prescription filing requirements, a record of each patient med pak shall be made and filed. Each record shall contain, as a minimum:

(1) the name and address of the patient;
(2) the serial number of the prescription order for each drug product contained therein;
(3) the name of the manufacturer or labeler and lot number for each drug product contained therein;
(4) information identifying or describing the design, characteristics, or specifications of the patient med pak sufficient to allow subsequent preparation of an identical patient med pak for the patient;
(5) the date of preparation of the patient med pak and the beyond-use date that was assigned;
(6) any special labeling instructions; and
(7) the name or initials of the pharmacist who prepared the patient med pak.

[2] It should be noted that there is no special exemption for patient med paks from the requirements of the Poison Prevention Packaging Act. Thus the patient med pak, if it does not meet child-resistant standards, shall be placed in an outer package that does comply, or the necessary consent of the purchaser or physician, to dispense in a container not intended to be child-resistant, shall be obtained.

■INTRODUCTION

It is the purpose of this chapter to provide standards for plastic materials and components used to package medical articles (pharmaceuticals, biologics, dietary supplements, and devices). Definitions that apply to this chapter are provided in the *Preservation, Packaging, Storage, and Labeling* section of the *General Notices and Requirements*. Standards and tests for the functional properties of containers and their components are provided in general chapter *Containers—Performance Testing* ⟨671⟩.

In addition to the standards provided herein, the ingredients added to the polymers, and those used in the fabrication of the containers, must conform to the requirements in the applicable sections of the *Code of Federal Regulations,* Title 21, *Indirect Food Additives,* or have been evaluated by the FDA and determined to be acceptable substances for the listed use.

Plastic articles are identified and characterized by IR spectroscopy and differential scanning calorimetry. Standards are provided in this chapter for the identification and characterization of the different types of plastic, and the test procedures are

In-Process Revision

provided at the end of the chapter. The degree of testing is based on drug contact, and the risk is based on the end use of the component.

Plastics are composed of a mixture of homologous polymers, having a range of molecular weights. Plastics may contain other substances such as residues from the polymerization process, plasticizers, stabilizers, antioxidants, pigments, and lubricants. These materials meet the requirements for food contact as provided in the *Code of Federal Regulations,* Title 21. Factors such as plastic composition, processing and cleaning procedures, surface treatment, contacting media, inks, adhesives, absorption and permeability of preservatives, and conditions of storage may also affect the suitability of a plastic for a specific use. Extraction tests are designed to characterize the extracted components and identify possible migrants. The degree or extent of testing for extractables of the component is dependent upon the intended use and the degree of risk to adversely impact the efficacy of the compendial article (drug, biologic, dietary supplement, or device). Resin-specific extraction tests are provided in this chapter for polyethylene, polypropylene, polypropylene terephthalate, and polypropylene terephthalate G. Test all other plastics as directed under *Physicochemical Tests* in the section *Test Methods.* Conduct the *Buffering Capacity* test only when the containers are intended to hold a liquid product.

Plastic components used for products of high risk, such as those intended for inhalation, parenteral preparation, and ophthalmics are tested using the *Biological Tests* in the section *Test Methods.*

Plastic containers intended for packaging products prepared for parenteral use meet the requirements under *Biological Tests* and *Physicochemical Tests* in the section *Test Methods.* Standards are also provided for polyethylene containers used to package dry oral dosage forms that are not meant for constitution into solution.

POLYETHYLENE CONTAINERS

Scope

The standards and tests provided in this section characterize containers and components produced from either low density polyethylene or high density polyethylene of either homopolymer or copolymer resin. All polyethylene components are subject to testing by IR spectroscopy and differential scanning calorimetry. Where stability studies have been performed to establish the expiration date of a particular dosage form in the appropriate polyethylene container, then any other polyethylene container meeting these requirements may be similarly used to package such a dosage form, provided that the appropriate stability programs are expanded to include the alternative container, in order to ensure that the identity, strength, quality, and purity of the dosage form are maintained throughout the expiration period.

Background

High and low density polyethylene are long-chain polymers synthesized under controlled conditions of heat and pressure, with the aid of catalysts from not less than 85.0% ethylene and not less than 95.0% total olefins. Other olefin ingredients that are most frequently used are butene, hexene, and propylene. High density polyethylene and low density polyethylene both have an IR absorption spectrum that is distinctive for polyethylene, and each possesses characteristic thermal properties. High density polyethylene has a density between 0.941 and 0.965 g per cm^3. Low density polyethylene has a density between 0.850 and 0.940 g per cm^3. Other properties that may affect the suitability of polyethylene include modulus of elasticity, melt index, environmental stress crack resistance, and degree of crystallinity after molding.

High Density Polyethylene

Infrared Spectroscopy—Proceed as directed under *Multiple Internal Reflectance* in the section *Test Methods.* The corrected spectrum of the specimen exhibits major absorption bands only at the same wavelengths as the spectrum of USP High Density Polyethylene RS.

Differential Scanning Calorimetry—Proceed as directed under *Thermal Analysis* in the section *Test Methods.* The thermogram of the specimen is similar to the thermogram of USP High Density Polyethylene RS, similarly determined, and the temperatures of the endotherms and exotherms in the thermogram of the specimen do not differ from those of the USP Reference Standard by more than 6.0°.

Heavy Metals and Nonvolatile Residue—Prepare extracts of specimens for these tests as directed for *Sample Preparation* under *Physicochemical Tests* in the section *Test Methods,* except that for each 20.0 mL of *Extracting Medium* the portion shall be 60 cm^2, regardless of thickness.

HEAVY METALS—Containers meet the requirements for *Heavy Metals* under *Physicochemical Tests* in the section *Test Methods.*

NONVOLATILE RESIDUE—Proceed as directed for *Nonvolatile Residue* under *Physicochemical Tests,* except that the *Blank* shall be the same solvent used in each of the following test conditions: the difference between the amounts obtained from the *Sample Preparation* and the *Blank* does not exceed 12.0 mg when water maintained at a temperature of 70° is used as the *Extracting Medium;* does not exceed 75.0 mg when alcohol maintained at a temperature of 70° is used as the *Extracting Medium;* and does not exceed 100.0 mg when hexanes maintained at a temperature of 50° is used as the *Extracting Medium*.

Components Used in Contact with Oral Liquids—Proceed as directed under *Buffering Capacity* under *Physicochemical Tests* in the section *Test Methods.*

Low Density Polyethylene

Infrared Spectroscopy—Proceed as directed under *Multiple Internal Reflectance* in the section *Test Methods.* The corrected spectrum of the specimen exhibits major absorption bands only at the same wavelengths as the spectrum of USP Low Density Polyethylene RS.

Differential Scanning Calorimetry—Proceed as directed under *Thermal Analysis* in the section *Test Methods.* The thermogram of the specimen is similar to the thermogram of USP Low Density Polyethylene RS, similarly determined, and the temperatures of the endotherms and exotherms in the thermogram of the specimen do not differ from those of the USP Reference Standard by more than 8.0°.

Heavy Metals and Nonvolatile Residue—Prepare extracts of specimens for these tests as directed for *Sample Preparation* under *Physicochemical Tests* in the section *Test Methods,* except that for each 20.0 mL of *Extracting Medium* the portion shall be 60 cm^2, regardless of thickness.

HEAVY METALS—Containers meet the requirements for *Heavy Metals* under *Physicochemical Tests* in the section *Test Methods*.

NONVOLATILE RESIDUE—Proceed as directed for *Nonvolatile Residue* under *Physicochemical Tests* in the section *Test Methods,* except that the *Blank* shall be the same solvent used in each of the following test conditions: the difference between the amounts obtained from the *Sample Preparation* and the *Blank* does not exceed 12.0 mg when water maintained at a temperature of 70° is used as the *Extracting Medium;* does not exceed 75.0 mg when alcohol maintained at a temperature of 70° is used as the *Extracting Medium;* and does not exceed 350.0 mg when hexanes maintained at a temperature of 50° is used as the *Extracting Medium*.

Components Used in Contact with Oral Liquids—Proceed as directed under *Buffering Capacity* under *Physicochemical Tests* in the section *Test Methods*.

In-Process Revision

POLYPROPYLENE CONTAINERS

Scope

The standards and tests provided in this section characterize polypropylene containers, produced from either homopolymers or copolymers, that are interchangeably suitable for packaging dry solid and liquid oral dosage forms. Where suitable stability studies have been performed to establish the expiration date of a particular dosage form in the appropriate polypropylene container, then any other polypropylene container meeting these requirements may be similarly used to package such a dosage form, provided that the appropriate stability programs are expanded to include the alternative container, in order to ensure that the identity, strength, quality, and purity of the dosage form are maintained throughout the expiration period.

Background

Propylene polymers are long-chain polymers synthesized from propylene or propylene and other olefins under controlled conditions of heat and pressure, with the aid of catalysts. Examples of other olefins most commonly used include ethylene and butene. The propylene polymers, the ingredients used to manufacture the propylene polymers, and the ingredients used in the fabrication of the containers conform to the applicable sections of the *Code of Federal Regulations,* Title 21.

Factors such as plastic composition, processing and cleaning procedures, contacting media, inks, adhesives, absorption, adsorption and permeability of preservatives, and conditions of storage may also affect the suitability of a plastic for a specific use. The suitability of a specific polypropylene must be established by appropriate testing.

Polypropylene has a distinctive IR spectrum and possesses characteristic thermal properties. It has a density between 0.880 and 0.913 g per cm^3. The permeation properties of molded polypropylene containers may be altered when reground polymer is incorporated, depending on the proportion of reground material in the final product. Other properties that may affect the suitability of polypropylene used in containers for packaging drugs are the following: oxygen and moisture permeability, modulus of elasticity, melt flow index, environmental stress crack resistance, and degree of crystallinity after molding. The requirements in this section are to be met when dry solid and liquid oral dosage forms are to be packaged in a container defined by this section.

Infrared Spectroscopy—Proceed as directed under *Multiple Internal Reflectance* in the section *Test Methods.* The corrected spectrum of the specimen exhibits major absorption bands only at the same wavelengths as the spectrum of the respective USP Homopolymer Polypropylene RS or USP Copolymer Polypropylene RS, similarly determined.

Differential Scanning Calorimetry—Proceed as directed under *Thermal Analysis* in the section *Test Methods.* The temperatures of the endotherms and exotherms in the thermogram do not differ from those of the USP Homopolymer Polypropylene RS by more than 12.0° or from those of the USP Copolymer Polypropylene RS by more than 6.0°.

Heavy Metals and Nonvolatile Residue—Prepare extracts of specimens for these tests as directed for *Sample Preparation* under *Physicochemical Tests* in the section *Test Methods,* except that for each 20 mL of *Extracting Medium* the portion shall be 60 cm^2, regardless of thickness.

HEAVY METALS—Containers meet the requirements for *Heavy Metals* under *Physicochemical Tests* in the section *Test Methods.*

NONVOLATILE RESIDUE—Proceed as directed for *Nonvolatile Residue* under *Physicochemical Tests* in the section *Test Methods,* except that the *Blank* shall be the same solvent used in each of the following test conditions: the difference between the amounts obtained from the *Sample Preparation* and the *Blank* does not exceed 10.0 mg when water maintained at a temperature of 70° is used as the *Extracting Medium;* does not exceed 60.0 mg when alcohol maintained at a temperature of 70° is used as the *Extracting Medium;* and does not exceed

In-Process Revision

225.0 mg when hexanes maintained at a temperature of 50° is used as the *Extracting Medium*. Containers meet these requirements for *Nonvolatile Residue* for all of the above extracting media. [NOTE—Hexanes and alcohol are flammable. When evaporating these solvents, use a current of air with the water bath; when drying the residue, use an explosion-proof oven.]

Components Used in Contact with Oral Liquids—Proceed as directed in *Buffering Capacity* under *Physicochemical Tests* in the section *Test Methods.*

POLYETHYLENE TEREPHTHALATE BOTTLES AND POLYETHYLENE TEREPHTHALATE G CONTAINERS

Scope

The standards and tests provided in this section characterize polyethylene terephthalate (PET) and polyethylene terephthalate G (PETG) bottles that are interchangeably suitable for packaging liquid oral dosage forms. Where stability studies have been performed to establish the expiration date of a particular liquid oral dosage form in a bottle meeting the requirements set forth herein for either PET or PETG bottles, any other PET or PETG bottle meeting these requirements may be similarly used to package such a dosage form, provided that the appropriate stability programs are expanded to include the alternative bottle in order to ensure that the identity, strength, quality, and purity of the dosage form are maintained throughout the expiration period. The suitability of a specific PET or PETG bottle for use in the dispensing of a particular pharmaceutical liquid oral dosage form must be established by appropriate testing.

Background

PET resins are long-chain crystalline polymers prepared by the condensation of ethylene glycol with dimethyl terephthalate or terephthalic acid. PET copolymer resins are prepared in a similar way, except that they may also contain a small amount of either isophthalic acid (not more than 3 mole percent) or 1,4-cyclohexanedimethanol (not more than 5 mole percent). Polymerization is conducted under controlled conditions of heat and vacuum, with the aid of catalysts and stabilizers.

PET copolymer resins have physical and spectral properties similar to PET and for practical purposes are treated as PET. The tests and specifications provided in this section to characterize PET resins and bottles apply also to PET copolymer resins and to bottles fabricated from them.

PET and PET copolymer resins generally exhibit a large degree of order in their molecular structure. As a result, they exhibit characteristic composition-dependent thermal behavior, including a glass transition temperature of about 76° and a melting temperature of about 250°. These resins have a distinctive IR absorption spectrum that allows them to be distinguished from other plastic materials (e.g., polycarbonate, polystyrene, polyethylene, and PETG resins). PET and PET copolymer resins have a density between 1.3 and 1.4 g per cm^3 and a minimum intrinsic viscosity of 0.7 dL per g, which corresponds to a number average molecular weight of about 23,000 Da.

PETG resins are high molecular weight polymers prepared by the condensation of ethylene glycol with dimethyl terephthalate or terephthalic acid and 15 to 34 mole percent of 1,4-cyclohexanedimethanol. PETG resins are clear, amorphous polymers, having a glass transition temperature of about 81° and no crystalline melting point, as determined by differential scanning calorimetry. PETG resins have a distinctive IR absorption spectrum that allows them to be distinguished from other plastic materials, including PET. PETG resins have a density of approximately 1.27 g per cm^3 and a minimum intrinsic viscosity of 0.65 dL per g, which corresponds to a number average molecular weight of about 16,000 Da.

PET and PETG resins, and other ingredients used in the fabrication of these bottles, conform to the requirements in the applicable sections of the *Code of Federal Regulations,* Title 21, regarding use in contact with food and alcoholic bever-

In-Process Revision

ages. PET and PETG resins do not contain any plasticizers, processing aids, or antioxidants. Colorants, if used in the manufacture of PET and PETG bottles, do not migrate into the contained liquid.

Infrared Spectroscopy—Proceed as directed under *Multiple Internal Reflectance* in the section *Test Methods.* The corrected spectrum of the specimen exhibits major absorption bands only at the same wavelengths as the spectrum of USP Polyethylene Terephthalate RS, or USP Polyethylene Terephthalate G RS, similarly determined.

Differential Scanning Calorimetry—Proceed as directed under *Thermal Analysis* in the section *Test Methods.* For polyethylene terephthalate, the thermogram of the specimen is similar to the thermogram of USP Polyethylene Terephthalate RS, similarly determined: the melting point (T_m) of the specimen does not differ from that of the USP Reference Standard by more than 9.0°, and the glass transition temperature (T_g) of the specimen does not differ from that of the USP Reference Standard by more than 4.0°. For polyethylene terephthalate G, the thermogram of the specimen is similar to the thermogram of USP Polyethylene Terephthalate G RS, similarly determined: the glass transition temperature (T_g) of the specimen does not differ from that of the USP Reference Standard by more than 6.0°.

Colorant Extraction—Select three test bottles. Cut a relatively flat portion from the side wall of one bottle, and trim it as necessary to fit the sample holder of the spectrophotometer. Obtain the visible spectrum of the side wall by scanning the portion of the visible spectrum from 350 to 700 nm. Determine, to the nearest 2 nm, the wavelength of maximum absorbance. Fill the remaining two test bottles, using 50% alcohol for PET bottles and 25% alcohol for PETG bottles. Fit the bottles with impervious seals, such as aluminum foil, and apply closures. Fill a glass bottle having the same capacity as that of the test bottles with the corresponding solvent, fit the bottle with an impervious seal, such as aluminum foil, and apply a closure. Incubate the test bottles and the glass bottle at 49° for 10 days. Remove the bottles, and allow them to equilibrate to room temperature. Concomitantly determine the absorbances of the test solutions in 5-cm cells at the wavelength of maximum absorbance (see *Spectrophotometry and Light–Scattering* ⟨851⟩), using the corresponding solvent from the glass bottle as the blank. The absorbance values so obtained are less than 0.01 for both test solutions.

Heavy Metals, Total Terephthaloyl Moieties, and Ethylene Glycol—

EXTRACTING MEDIA—

Purified Water—(see monograph).

50 Percent Alcohol—Dilute 125 mL of alcohol with water to 238 mL, and mix.

25 Percent Alcohol—Dilute 125 mL of *50 Percent Alcohol* with water to 250 mL, and mix.

n-Heptane.

GENERAL PROCEDURE—[NOTE—Use an *Extracting Medium* of *50 Percent Alcohol* for PET bottles and *25 Percent Alcohol* for PETG bottles.] For each *Extracting Medium,* fill a sufficient number of test bottles to 90% of their nominal capacity to obtain not less than 30 mL. Fill a corresponding number of glass bottles with *Purified Water,* a corresponding number of glass bottles with *50 Percent Alcohol* or *25 Percent Alcohol,* and a corresponding number of glass bottles with *n-Heptane* for use as *Extracting Media* blanks. Fit the bottles with impervious seals, such as aluminum foil, and apply closures. Incubate the test bottles and the glass bottles at 49° for 10 days. Remove the test bottles with the *Extracting Media* samples and the glass bottles with the *Extracting Media* blanks, and store them at room temperature. Do not transfer the *Extracting Media* samples to alternative storage vessels.

HEAVY METALS—Pipet 20 mL of the *Purified Water* extract of the test bottles, filtered if necessary, into one of two matched 50-mL color-comparison tubes, and retain the remaining *Purified Water* extract in the test bottles for use in the test for *Ethylene Glycol*. Adjust the extract with 1 N acetic acid or 6 N ammonium hydroxide to a pH between 3.0 and 4.0, using short-range pH paper as an external indicator. Dilute with water to about 35 mL, and mix.

Into the second color-comparison tube, pipet 2 mL of freshly prepared (on day of use) *Standard Lead Solution* (see *Heavy Metals* ⟨231⟩), and add 20 mL of *Purified Water*. Adjust with 1 N acetic acid or 6 N ammonium hydroxide to a pH between 3.0 and 4.0, using short-range pH paper as an external indicator. Dilute with water to about 35 mL, and mix.

To each tube add 1.2 mL of thioacetamide–glycerin base TS and 2 mL of *pH 3.5 Acetate Buffer* (see *Heavy Metals* ⟨231⟩), dilute with water to 50 mL, and mix: any color produced within 10 minutes in the tube containing the *Purified Water* extract of the test bottles does not exceed that in the tube containing the *Standard Lead Solution,* both tubes being viewed downward over a white surface (1 ppm in extract).

TOTAL TEREPHTHALOYL MOIETIES—Determine the absorbance of the *50 Percent Alcohol* or *25 Percent Alcohol* extract in a 1-cm cell at the wavelength of maximum absorbance at about 244 nm (see *Spectrophotometry and Light–Scattering* ⟨851⟩), using as the blank the corresponding *Extracting Medium* blank: the absorbance of the extract does not exceed 0.150, corresponding to not more than 1 ppm of total terephthaloyl moieties.

Determine the absorbance of the *n-Heptane* extract in a 1-cm cell at the wavelength of maximum absorbance at about 240 nm (see *Spectrophotometry and Light-Scattering* ⟨851⟩), using as the blank the *n-Heptane Extracting Medium:* the absorbance of the extract does not exceed 0.150, corresponding to not more than 1 ppm of total terephthaloyl moieties.

ETHYLENE GLYCOL—

Periodic Acid Solution—Dissolve 125 mg of periodic acid in 10 mL of water.

Dilute Sulfuric Acid—To 50 mL of water add slowly and with constant stirring 50 mL of sulfuric acid, and allow to cool to room temperature.

Sodium Bisulfite Solution—Dissolve 0.1 g of sodium bisulfite in 10 mL of water. Use this solution within 7 days.

Disodium Chromotropate Solution—Dissolve 100 mg of disodium chromotropate in 100 mL of sulfuric acid. Protect this solution from light, and use within 7 days.

Standard Solution—Dissolve an accurately weighed quantity of ethylene glycol in water, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 1 µg per mL.

Test Solution—Use the *Purified Water* extract.

Procedure—Transfer 1.0 mL of the *Standard Solution* to a 10-mL volumetric flask. Transfer 1.0 mL of the *Test Solution* to a second 10-mL volumetric flask. Transfer 1.0 mL of the *Purified Water Extracting Medium* to a third 10-mL volumetric flask. To each of the three flasks, add 100 µL of *Periodic Acid Solution,* swirl to mix, and allow to stand for 60 minutes. Add 1.0 mL of *Sodium Bisulfite Solution* to each flask, and mix. Add 100 µL of *Disodium Chromotropate Solution* to each flask, and mix. [NOTE—All solutions should be analyzed within 1 hour after addition of the *Disodium Chromotropate Solution*.] Cautiously add 6 mL of sulfuric acid to each flask, mix, and allow the solutions to cool to room temperature. *[Caution–Dilution of sulfuric acid produces substantial heat and can cause the solution to boil. Perform this addition carefully. Sulfur dioxide gas will be evolved. Use of a fume hood is recommended.]* Dilute each solution with *Dilute Sulfuric Acid* to volume, and mix. Concomitantly determine the absorbances of the solutions from the *Standard Solution* and the *Test Solution* in 1-cm cells at the wavelength of maximum absorbance at about 575 nm (see *Spectrophotometry and Light-Scattering* ⟨851⟩), using as the blank the solution from the *Purified Water Extracting Medium:* the absorbance of the solution from the *Test Solution* does not exceed that of the solution from the *Standard Solution,* corresponding to not more than 1 ppm of ethylene glycol.

In-Process Revision

TEST METHODS

Multiple Internal Reflectance

Apparatus—Use an IR spectrophotometer capable of correcting for the blank spectrum and equipped with a multiple internal reflectance accessory and a KRS-5 internal reflection plate.[4] A KRS-5 crystal 2-mm thick having an angle of incidence of 45° provides a sufficient number of reflections.

Specimen Preparation—Cut two flat sections representative of the average wall thickness of the container, and trim them as necessary to obtain segments that are convenient for mounting in the multiple internal reflectance accessory. Taking care to avoid scratching the surfaces, wipe the specimens with dry paper or, if necessary, clean them with a soft cloth dampened with methanol, and permit them to dry. Securely mount the specimens on both sides of the KRS-5 internal reflection plate, ensuring adequate surface contact. Prior to mounting the specimens on the plate, they may be compressed to thin uniform films by exposing them to temperatures of about 177° under high pressures (15,000 psi or more).

General Procedure—Place the mounted specimen sections within the multiple internal reflectance accessory, and place the assembly in the specimen beam of the IR spectrophotometer. Adjust the specimen position and mirrors within the accessory to permit maximum light transmission of the unattenuated reference beam. (For a double-beam instrument, upon completing the adjustments in the accessory, attenuate the reference beam to permit full-scale deflection during the scanning of the specimen.) Determine the IR spectrum from 3500 to 600 cm^{-1} for polyethylene and polypropylene and from 4000 to 400 cm^{-1} for PET and PETG.

[4] The multiple internal reflectance accessory and KRS-5 plate are available from several sources, including Beckman Instruments, Inc., 2500 Harbor Blvd., Fullerton, CA 92634, and from Perkin Elmer Corp., Main Ave., Norwalk, CT 06856.

Thermal Analysis

General Procedure—Cut a section weighing about 12 mg, and place it in the test specimen pan. [NOTE—Intimate contact between the pan and the thermocouple is essential for reproducible results.] Determine the thermogram under nitrogen, using the heating and cooling conditions as specified for the resin type and using equipment capable of performing the determinations as specified under *Thermal Analysis* ⟨891⟩.

For Polyethylene—Determine the thermogram under nitrogen at temperatures between 40° and 200° at a heating rate between 2° and 10° per minute followed by cooling at a rate between 2° and 10° per minute to 40°.

For Polypropylene—Determine the thermogram under nitrogen at temperatures ranging from ambient to 30° above the melting point. Maintain the temperature for 10 minutes, then cool to 50° below the peak crystallization temperature at a rate of 10° to 20° per minute.

For Polyethylene Terephthalate—Heat the specimen from room temperature to 280° at a heating rate of about 20° per minute. Hold the specimen at 280° for 1 minute. Quickly cool the specimen to room temperature, and reheat it to 280° at a heating rate of about 5° per minute.

For Polyethylene Terephthalate G—Heat the specimen from room temperature to 120° at a heating rate of about 20° per minute. Hold the specimen at 120° for 1 minute. Quickly cool the specimen to room temperature, and reheat it to 120° at a heating rate of about 10° per minute.

Biological Tests

The in vitro biological tests are performed according to the procedures set forth under *Biological Reactivity Test, In Vitro* ⟨87⟩. Components that meet the requirements of the in vitro tests are not required to undergo further testing. No plastic class designation is assigned to these materials. Materials that do not meet the requirements of the in vitro tests are not suitable for containers for drug products.

If a plastic class designation is needed for plastics and other polymers that meet the requirements under *Biological Reactivity Test, In Vitro* ⟨87⟩, perform the appropriate in vivo test specified for *Classification of Plastics* under *Biological Reactivity Test, In Vivo* ⟨88⟩.

Physicochemical Tests

The following tests, designed to determine physical and chemical properties of plastics and their extracts, are based on the extraction of the plastic material, and it is essential that the designated amount of the plastic be used. Also, the specified surface area must be available for extraction at the designated temperature.

Testing Parameters—

Extracting Medium—Unless otherwise directed in a specific test below, use *Purified Water* (see monograph) as the *Extracting Medium,* maintained at a temperature of 70° during the extraction of the *Sample Preparation.*

Blank—Use *Purified Water* where a blank is specified in the tests that follow.

Apparatus—Use a water bath and the *Extraction Containers* as described under *Biological Reactivity Tests, In Vivo* ⟨88⟩. Proceed as directed in the first paragraph of *Preparation of Apparatus* under *Biological Reactivity Tests, In Vivo* ⟨88⟩. [NOTE—The containers and equipment need not be sterile.]

Sample Preparation—From a homogeneous plastic specimen, use a portion, for each 20.0 mL of *Extracting Medium,* equivalent to 120 cm^2 total surface area (both sides combined), and subdivide into strips approximately 3 mm in width and as near to 5 cm in length as is practical. Transfer the subdivided sample to a glass-stoppered, 250-mL graduated cylinder of Type I glass, and add about 150 mL of *Purified Water.* Agitate for about 30 seconds, drain off and discard the liquid, and repeat with a second washing.

Sample Preparation Extract—Transfer the prepared *Sample Preparation* to a suitable extraction flask, and add the required amount of *Extracting Medium.* Extract by heating in a water bath at the temperature specified for the *Extracting Medium* for 24 hours. Cool, but not below 20°. Pipet 20 mL of the prepared extract into a suitable container. [NOTE—Use this portion in the test for *Buffering Capacity.*] Immediately decant the remaining extract into a suitably cleansed container, and seal.

Nonvolatile Residue—Transfer, in suitable portions, 50.0 mL of the *Sample Preparation Extract* to a suitable, tared crucible (preferably a fused-silica crucible that has been acid-cleaned), and evaporate the volatile matter on a steam bath. Similarly evaporate 50.0 mL of the *Blank* in a second crucible. [NOTE—If an oily residue is expected, inspect the crucible repeatedly during the evaporation and drying period, and reduce the amount of heat if the oil tends to creep along the walls of the crucible.] Dry at 105° for 1 hour: the difference between the amounts obtained from the *Sample Preparation Extract* and the *Blank* does not exceed 15 mg.

Residue on Ignition ⟨281⟩—[NOTE—It is not necessary to perform this test when the *Nonvolatile Residue* test result does not exceed 5 mg.] Proceed with the residues obtained from the *Sample Preparation Extract* and from the *Blank* in the test for *Nonvolatile Residue* above, using, if necessary, additional sulfuric acid but adding the same amount of sulfuric acid to each crucible: the difference between the amounts of residue on ignition obtained from the *Sample Preparation Extract* and the *Blank* does not exceed 5 mg.

Heavy Metals—Pipet 20 mL of the *Sample Preparation Extract,* filtered if necessary, into one of two matched 50-mL color-comparison tubes. Adjust with 1 N acetic acid or 6 N ammonium hydroxide to a pH between 3.0 and 4.0, using short-range pH paper as an external indicator, dilute with water to about 35 mL, and mix.

Into the second color-comparison tube pipet 2 mL of *Standard Lead Solution* (see *Heavy Metals* ⟨231⟩), and add 20 mL of the *Blank.* Adjust with 1 N acetic acid or 6 N ammonium hydroxide to a pH between 3.0 and 4.0, using short-range pH paper as an external indicator, dilute with water to about 35 mL, and mix. To each tube add 1.2 mL of thioacetamide–glycerin base TS and 2 mL of *pH 3.5 Acetate Buffer*

(see *Heavy Metals* ⟨231⟩), dilute with water to 50 mL, and mix: any brown color produced within 10 minutes in the tube containing the *Sample Preparation Extract* does not exceed that in the tube containing the *Standard Lead Solution,* both tubes being viewed downward over a white surface (1 ppm in extract).

Buffering Capacity—Titrate the previously collected 20-mL portion of the *Sample Preparation Extract* potentiometrically to a pH of 7.0, using either 0.010 N hydrochloric acid or 0.010 N sodium hydroxide, as required. Treat a 20.0-mL portion of the *Blank* similarly: if the same titrant was required for both the *Sample Preparation Extract* and the *Blank*, the difference between the two volumes is not greater than 10.0 mL; and if acid was required for either the *Sample Preparation Extract* or the *Blank* and alkali for the other, the total of the two volumes required is not greater than 10.0 mL.■2S (*USP30*)

BRIEFING

⟨**671**⟩ **Containers—Permeation,** *USP 29* page 2663. It has been proposed to revise the current chapter to include all standards and tests used to determine the functional properties of plastic containers. To accurately represent the new intent of this chapter, it will be renamed *Containers—Performance Testing* ⟨671⟩. The permeation test for polyethylene and polypropylene containers without closures and the light transmission test in *Containers* ⟨661⟩ will be added to the current chapter. As part of the ongoing re-evaluation of USP plastic container standards, the Packaging and Storage Expert Committee (PSEC) requested information and support from industry on the establishment of specifications and functional test procedures for plastic containers for liquids. Currently, a large number of liquid products are packaged in high density polyethylene, low density polyethylene, polypropylene terephthalate and polyethylene terephthalate (PET/PETG); however, only a permeation (liquid weight loss) test exists for PET/PETG containers. PSEC, using the performance standard used to evaluate PET/PETG containers for liquids, has developed a permeation (liquid weight loss) test intended to be used on all containers used to package liquids.

⟨671⟩ CONTAINERS—~~PERMEATION~~

■PERFORMANCE TESTING■2S (*USP30*)

~~The tests that follow are provided to determine the moisture permeability of containers utilized for drugs being dispensed on prescription. The section *Multiple Unit Containers for Capsules and Tablets* applies to multiple unit containers (see *Preservation, Packaging, Storage, and Labeling* under *General Notices and Requirements*). The section *Single Unit Containers and Unit Dose Containers for Capsules and Tablets* applies to single unit and unit dose containers (see *Single-Unit Containers and Unit-Dose Containers for Nonsterile Solid and Liquid Dosage Forms* under *Containers* ⟨661⟩). As used herein, the term "container" refers to the entire system comprising, usually, the container itself, the liner (if used), the closure in the case of multiple-unit containers, and the lidding and blister in the case of single-unit and unit-dose containers.~~

~~Where the manufacturer's unopened multiple unit, single unit, or unit dose packages are used for dispensing the drug, such containers are exempt from the requirements of this test.~~

■It is the purpose of this chapter to provide standards for the functional properties of plastic containers and their components used to package regulated articles (pharmaceuticals, biologics, dietary supplements, and devices). Definitions that apply to this chapter are provided in the *Preservation, Packaging, Storage, and Labeling* section of the *General Notices and Requirements*. The tests that follow are provided to determine the moisture permeability and light transmission of plastic containers utilized for regulated articles. The section *Multiple-Unit Containers for Capsules and Tablets* applies to multiple-unit containers. The section *Single-Unit Containers and Unit-Dose Containers for Capsules and Tablets* applies to single-unit and unit-dose containers. The section *Multiple-Unit Containers for Capsules and Tablets (Without Closure)* applies to polyethylene and polypropylene containers that have no closures. The section *Multiple-Unit and Single-Unit Containers for Liquids* applies to multiple-unit and single-unit containers.

A container intended to provide protection from light or offered as a *light-resistant* container meets the requirements for *Light Transmission*, where such protection or resistance is by virtue of the specific properties of the material of which the

In-Process Revision

container is composed, including any coating applied thereto. A clear and colorless or a translucent container that is made *light-resistant* by means of an opaque enclosure (see *General Notices and Requirements*) is exempt from the requirements for *Light Transmission*. As used herein, the term "container" refers to the entire system comprising, usually, the container itself, the liner (if used), the closure in the case of multiple-unit containers, and the lidding and blister in the case of unit-dose containers.■2S (*USP30*)

MULTIPLE-UNIT CONTAINERS FOR CAPSULES AND TABLETS

Desiccant—Place a quantity of 4- to 8-mesh, anhydrous calcium chloride[1] in a shallow container, taking care to exclude any fine powder, then dry at 110° for 1 hour, and cool in a desiccator.

Procedure—Select 12 containers of a uniform size and type, clean the sealing surfaces with a lint-free cloth, and close and open each container 30 times. Apply the closure firmly and uniformly each time the container is closed. Close screw-capped containers with a torque that is within the range of tightness specified in the accompanying table. Add *Desiccant* to 10 of the containers, designated *test containers,* filling each to within 13 mm of the closure if the container volume is 20 mL or more, or filling each to two-thirds of capacity if the container volume is less than 20 mL. If the interior of the container is more than 63 mm in depth, an inert filler or spacer may be placed in the bottom to minimize the total weight of the container and *Desiccant*; the layer of *Desiccant* in such a container shall be not less than 5 cm in depth. Close each immediately after adding *Desiccant*, applying the torque designated in the accompanying table when closing screw-capped containers. To each of the remaining 2 containers, designated *controls*, add a sufficient number of glass beads to attain a weight approximately equal to that of each of the *test containers*, and close, applying the torque designated in the accompanying table when closing screw-capped containers. Record the weight of the individual containers so prepared to the nearest 0.1 mg if the container volume is less than 20 mL; to the nearest mg if the container volume is 20 mL or more but less than 200 mL; or to the nearest centigram (10 mg) if the container volume is 200 mL or more; and store at 75 ± 3% relative humidity and a temperature of 23 ± 2°. [NOTE—A saturated system of 35 g of sodium chloride with each 100 mL of water placed in the bottom of a desiccator maintains the specified humidity. Other methods may be employed to maintain these conditions.] After 336 ± 1 hours (14 days), record the weight of the individual containers in the same manner. Completely fill 5 empty containers of the same size and type as the containers under test with water or a noncompressible, free-flowing solid such as well-tamped fine glass beads, to the level indicated by the closure surface when in place. Transfer the contents of each to a graduated cylinder, and determine the average container volume, in mL. Calculate the rate of moisture permeability, in mg per day per L, by the formula:

$$(1000 / 14V)[(T_F - T_I) - (C_F - C_I)]$$

in which V is the volume, in mL, of the container; $(T_F - T_I)$ is the difference, in mg, between the final and initial weights of each *test container;* and $(C_F - C_I)$ is the difference, in mg, between the average final and average initial weights of the 2 *controls.* For containers used for drugs being dispensed on prescription, the containers so tested are *tight containers* if not more than 1 of the 10 *test containers* exceeds 100 mg per day per L in moisture permeability, and none exceeds 200 mg per day per L.

For containers used for drugs being dispensed on prescription, the containers are *well-closed containers* if not more than 1 of the 10 *test containers* exceeds 2000 mg per day per L in moisture permeability, and none exceeds 3000 mg per day per L.

In-Process Revision

Add the following:

▪MULTIPLE-UNIT CONTAINERS FOR CAPSULES AND TABLETS (WITHOUT CLOSURE)

Polyethylene Container—Fit the containers with impervious seals obtained by heat-sealing the bottles with an aluminum foil–polyethylene laminate or other suitable seal.[2] Test the containers as specified under *Multiple-Unit Containers for Capsules and Tablets:* the high–density polyethylene containers so tested meet the requirements if the moisture permeability exceeds 10 mg per day per L in not more than 1 of the 10 test containers and exceeds 25 mg per day per L in none of them. The low–density polyethylene containers so tested meet the requirements if the moisture permeability exceeds 20 mg per day per L in not more than 1 of the 10 test containers and exceeds 30 mg per day per L in none of them.

Polypropylene Containers—Fit the containers with impervious seals obtained by heat-sealing the bottles with an aluminum foil–polyethylene laminate or other suitable seal. Test the containers as described under *Multiple-Unit Containers for Capsules and Tablets*. The containers meet the requirements if the moisture permeability exceeds 15 mg per day per L in not more than 1 of the 10 test containers and exceeds 25 mg per day per L in none of them.▪2S (*USP30*)

Add the following:

▪MULTIPLE-UNIT CONTAINERS AND UNIT-DOSE CONTAINERS FOR LIQUIDS

The standards and tests provided in this section measure the functional and performance characteristics of plastic containers used to package aqueous products by measuring the liquid water weight loss as a percent of the contents. This test can also be used to demonstrate performance or functional comparability. [NOTE—Throughout the following procedure, determine the weights of individual container–closure systems (bottle, innerseal if used, and closure) both as tare weights and fill weights, to the nearest 0.1 mg if the bottle overflow capacity is less than 200 mL; to the nearest mg if the bottle overflow capacity is 200 mL or more but less than 1000 mL; or to the nearest centigram (10 mg) if the bottle overflow capacity is 1000 mL or more.]

Procedure for Testing Unopened Market Containers (cap liner [if applicable], innerseal, and cap)—Select 10 bottles of a uniform size and type, and clean the sealing surfaces with a lint-free cloth. Fit each bottle with a closure liner (if applicable) and closure. Number each container closure system, and record the tare weight.

Remove the closures and, using a pipette, fill the bottles with water to the overflow capacity. Fit the bottles with seals and apply the closures. If using screw closures, apply a torque that is within the range specified in *Table 1,* and store the sealed containers at a temperature of 25 $\pm$ 2° and a relative humidity of 50 $\pm$ 2%. After 168 $\pm$ 1 hours (7 days), record the weight of the individual containers. Return the containers to storage for another 168 $\pm$ 1 hours. After the second 168 $\pm$ 1 hours, remove the containers, record the weights of each of the individual container systems, and calculate the water vapor permeation rate, in percent water weight loss, for each bottle taken by the formula:

$$(W_7 - W_{14})365 \times 100/(W_7 - W_T)7 = \text{Percent per year}$$

in which W_7 is the weight, in mg, of the container at 7 days; W_{14} is the weight, in mg, of the container at 14 days; W_T is the tare weight in g; and 7 is the test time, in days, after the 7-day equilibration period. The containers so tested meet the requirements and are tight containers if the percentage of water weight loss exceeds 2.5% per year in not more than 1 of the 10 test containers and exceeds 5.0% per year in none of them.

Unit-dose containers for liquids meet the requirement of a tight container if the average water weight loss is less than or equal to 2.5% (w/w) loss per year (5% at the end of 2 years).

[2] A suitable laminate for sealing has as the container layer polyethylene of not less than 0.025 mm (0.001 inch) and a second layer of aluminum foil of not less than 0.018 mm (0.0007 inch), with additional layers of suitable backing materials. A suitable seal can be obtained also by using glass plates and a sealing wax consisting of 60% of refined amorphous wax and 40% of refined crystalline paraffin wax.

Procedure for Testing Multiple-Unit Containers Under Conditions of Use—Select 10 bottles of a uniform size and type. If an innerseal is used, carefully open the individual containers and remove the innerseal from each container. Fit each bottle with a closure liner (if applicable) and closure. Number each container–closure system, and record the tare weight. Open and close the containers 30 times being careful not to lose liquid in the process. Close screw-capped bottles with a torque that is within the range of tightness provided in *Table 1,* and store the sealed containers at a temperature of 25 ± 2° and a relative humidity of 50 ± 2%. After 168 ± 1 hours (7 days), record the weight of the individual containers. Return the containers to storage for another 168 ± 1 hours. After the second 168 ± 1 hours, remove the containers, record the weights of each of the individual container systems, and calculate the water vapor permeation rate, in percent water weight loss, for each bottle taken by the formula:

$$(W_7 - W_{14})365 \times 100/(W_7 - W_T)7 = \text{Percent per year}$$

in which W_7 is the weight, in mg, of the container at 7 days; W_{14} is the weight, in mg, of the container at 14 days; W_T is the tare weight, in g; and 7 is the test time, in days, after the 7-day equilibration period. The containers so tested meet the requirements and are tight containers if the percentage of water weight loss exceeds 2.5% per year in not more than 1 of the 10 test containers and exceeds 5.0% per year in none of them.■2S (*USP30*)

Add the following:

■LIGHT TRANSMISSION TEST

Apparatus[5]—Use a spectrophotometer of suitable sensitivity and accuracy, adapted for measuring the amount of light transmitted by either transparent or translucent glass or plastic materials used for pharmaceutical containers. In addition, the spectrophotometer is capable of measuring and recording light transmitted in diffused as well as parallel rays.

Procedure—Select sections to represent the average wall thickness. Cut circular sections from two or more areas of the container and trim them as necessary to give segments of a size convenient for mounting in the spectrophotometer. After cutting, wash and dry each specimen, taking care to avoid scratching the surfaces. If the specimen is too small to cover the opening in the specimen holder, mask the uncovered portion of the opening with opaque paper or masking tape, provided that the length of the specimen is greater than that of the slit in the spectrophotometer. Immediately before mounting in the specimen holder, wipe the specimen with lens tissue. Mount the specimen with the aid of a tacky wax, or by other convenient means, taking care to avoid leaving fingerprints or other marks on the surfaces through which light must pass. Place the section in the spectrophotometer with its cylindrical axis parallel to the plane of the slit and approximately centered with respect to the slit. When properly placed, the light beam is normal to the surface of the section and reflection losses are at a minimum.

Continuously measure the transmittance of the section with reference to air in the spectral region of interest with a recording instrument or at intervals of about 20 nm with a manual instrument, in the region of 290 to 450 nm.

Limits—The observed light transmission does not exceed the limits given in *Table 2* for containers intended for parenteral use. [NOTE—Any container of a size intermediate to those

[5] For further detail regarding apparatus and procedures, reference may be made to the following publications of the American Society for Testing and Materials, 100 Barr Harbor Drive, West Conshohocken, PA 19428-2959: "Standard Method of Test for Haze and Luminous Transmittance of Transparent Plastics," ASTM Designation D-1003-61; "Tentative Method of Test for Luminous Reflectance, Transmittance, and Color of Materials," ASTM E 308-66.

In-Process Revision

listed above exhibits a transmission not greater than that of the next larger size container listed in the table. For containers larger than 50 mL, the limits for 50 mL apply.]

Table 2. Limits for Plastic Classes I–VI

Nominal Size (in mL)	Maximum Percentage of Light Transmission at Any Wavelength Between 290 and 450 nm: Closure-Sealed Containers
1	25
2	20
5	15
10	13
20	12
50	10

The observed light transmission for plastic containers for products intended for oral or topical administration does not exceed 10% at any wavelength in the range from 290 to 450 nm.■2S (*USP30*)

BRIEFING

⟨681⟩ Repackaging into Single-Unit Containers and Unit-Dose Containers for Nonsterile Solid and Liquid Dosage Forms. It is proposed to remove the sections relating to repackaging in ⟨661⟩ *Containers* and place them in this proposed new chapter. The intent of this proposed change is to make the content of ⟨661⟩ consistent with that chapter's testing requirements and thus clarify the intent of that chapter. The content removed from ⟨661⟩ was practitioner based and this is now reflected in this proposed new chapter.

(P&S: D. Hunt) RTS—C44241

Add the following:

■⟨681⟩ REPACKAGING INTO SINGLE-UNIT CONTAINERS AND UNIT-DOSE CONTAINERS FOR NONSTERILE SOLID AND LIQUID DOSAGE FORMS

An official dosage form is required to bear on its label an expiration date assigned for the particular formulation and package of the article. This date limits the time during which the product may be dispensed or used. Because the expiration date stated on the manufacturer's or distributor's package has been determined for the drug in that particular package and is not intended to be applicable to the product where it has been repackaged in a different container, repackaged drugs dispensed pursuant to a prescription are exempt from this expiration date labeling requirement. It is necessary, therefore, that other precautions be taken by the dispenser to preserve the strength, quality, and purity of drugs that are repackaged for ultimate distribution or sale to patients.

The following guidelines and requirements are applicable where official dosage forms are repackaged into single-unit or unit-dose containers or mnemonic packs for dispensing pursuant to prescription.

Labeling—It is the responsibility of the dispenser, taking into account the nature of the drug repackaged, any packaging and expiration dating information in the manufacturer's product labeling, the characteristics of the containers, and the storage conditions to which the article may be subjected, to place a suitable expiration date on the label. Repackaged dosage forms must bear on their labels expiration dates as determined from information in the product labeling. Each single-

unit or unit-dose container bears a separate label, unless the device holding the unit-dose form does not allow for the removal or separation of the intact single-unit or unit-dose container therefrom.

Storage—Store the repackaged article in a humidity-controlled environment and at the temperature specified in the individual monograph or in the product labeling. Where no temperature or humidity is specified in the monograph or in the labeling of the product, controlled room temperature and a relative humidity corresponding to 75% at 23° are not to be exceeded during repackaging or storage.

A refrigerator or freezer shall not be considered to be a humidity-controlled environment, and drugs that are to be stored at a cold temperature in a refrigerator or freezer shall be placed within an outer container that meets the monograph requirements for the drug contained therein.

Reprocessing—Reprocessing of repackaged unit-dose containers (i.e., removing dosage unit from one unit-dose container and placing dosage unit into another unit-dose container) shall not be done. However, reprocessing of the secondary package (e.g., removing the blister card from the cardboard carrier and placing the blister card into another cardboard carrier) is allowed provided that the original expiration date is maintained.

CUSTOMIZED PATIENT MEDICATION PACKAGES

In lieu of dispensing two or more prescribed drug products in separate containers, a pharmacist may, with the consent of the patient, the patient's caregiver, or a prescriber, provide a customized patient medication package (patient med pak).[1]

A patient med pak is a package prepared by a pharmacist for a specific patient comprising a series of containers and containing two or more prescribed solid oral dosage forms. The patient med pak is so designed or each container is so labeled as to indicate the day and time, or period of time, that the contents within each container are to be taken.

It is the responsibility of the dispenser to instruct the patient or caregiver on the use of the patient med pak.

Label—The patient med pak shall bear a label stating:

(1) the name of the patient;

(2) a serial number for the patient med pak itself and a separate identifying serial number for each of the prescription orders for each of the drug products contained therein;

(3) the name, strength, physical description or identification, and total quantity of each drug product contained therein;

(4) the directions for use and cautionary statements, if any, contained in the prescription order for each drug product therein;

(5) any storage instructions or cautionary statements required by the official compendia;

(6) the name of the prescriber of each drug product;

(7) the date of preparation of the patient med pak and the beyond-use date or period of time assigned to the patient med pak (such beyond-use date or period of time shall be not longer than the shortest recommended beyond-use date for any dosage form included therein or not longer than 60 days from the date of preparation of the patient med pak and shall not exceed the shortest expiration date on the original manufacturer's bulk containers for the

[1] It should be noted that there is no special exemption for patient med paks from the requirements of the Poison Prevention Packaging Act. Thus the patient med pak, if it does not meet child-resistant standards, shall be placed in an outer package that does comply, or the necessary consent of the purchaser or physician, to dispense in a container not intended to be child-resistant, shall be obtained.

dosage forms included therein); alternatively, the package label shall state the date of the prescription(s) or the date of preparation of the patient med pak, provided the package is accompanied by a record indicating the start date and the beyond-use date;

(8) the name, address, and telephone number of the dispenser (and the dispenser's registration number where necessary); and

(9) any other information, statements, or warnings required for any of the drug products contained therein.

If the patient med pak allows for the removal or separation of the intact containers therefrom, each individual container shall bear a label identifying each of the drug products contained therein.

Labeling—The patient med pak shall be accompanied by a patient package insert, in the event that any medication therein is required to be dispensed with such insert as accompanying labeling. Alternatively, such required information may be incorporated into a single, overall educational insert provided by the pharmacist for the total patient med pak.

Packaging—In the absence of more stringent packaging requirements for any of the drug products contained therein, each container of the patient med pak shall comply with the moisture permeation requirements for a Class B single-unit or unit-dose container (see *Containers—Permeation* ⟨671⟩). Each container shall be either not reclosable or so designed as to show evidence of having been opened.

Guidelines—It is the responsibility of the dispenser, when preparing a patient med pak, to take into account any applicable compendial requirements or guidelines and the physical and chemical compatibility of the dosage forms placed within each container, as well as any therapeutic incompatibilities that may attend the simultaneous administration of the medications. In this regard, pharmacists are encouraged to report to USP headquarters any observed or reported incompatibilities. Once a medication has been placed in a patient med pak with another solid dosage form, it may not be returned to stock, redistributed, or resold if unused.

Recordkeeping—In addition to any individual prescription filing requirements, a record of each patient med pak shall be made and filed. Each record shall contain, as a minimum:

(1) the name and address of the patient;

(2) the serial number of the prescription order for each drug product contained therein;

(3) the name of the manufacturer or labeler and lot number for each drug product contained therein;

(4) information identifying or describing the design, characteristics, or specifications of the patient med pak sufficient to allow subsequent preparation of an identical patient med pak for the patient;

(5) the date of preparation of the patient med pak and the beyond-use date that was assigned;

(6) any special labeling instructions; and

(7) the name or initials of the pharmacist who prepared the patient med pak.■2S (*USP30*)

In-Process Revision

BRIEFING

⟨**721**⟩ **Distilling Range,** *USP 29* page 2682. In response to comments received, the General Chapters Expert Committee proposes a conversion equation in the *Procedure* under *Method II* to correct temperature readings due to deviations from normal barometric pressure instead of the current fixed factors. Justification for this calculation is presented in a *Stimuli* article appearing elsewhere in this issue of *PF.*

(GC: A. Hernández-Cardoso) RTS—C44230

Change to read:

METHOD II

Apparatus—Use an apparatus consisting of the following parts:

Distilling Flask—A round-bottom distilling flask, of heat-resistant glass, of 200-mL capacity, and having a total length of 17 to 19 cm, and an inside neck diameter of 20 to 22 mm. Attached about midway on the neck, approximately 12 cm from the bottom of the flask, is a side-arm 10 to 12 cm long and 5 mm in internal diameter, which forms an angle of 70° to 75° with the lower portion of the neck.

Condenser—A straight glass condenser 55 to 60 cm in length with a water jacket about 40 cm in length, or a condenser of other design having equivalent condensing capacity. The lower end of the condenser may be bent to provide a delivery tube, or it may be connected to a bent adapter that serves as a delivery tube.

Insulating Boards—Two pieces of insulating board, 5 to 7 mm thick and 14 to 16 cm square, suitable for confining the heat to the lower part of the flask. Each board has a hole in its center, and the two boards differ only with respect to the diameter of the hole, i.e., the diameters are 4 cm and 10 cm, respectively. In use, the boards are placed one upon the other, and rest on a tripod or other suitable support, with the board having the larger hole on top.

Receiver—A 100-mL cylinder graduated in 1-mL subdivisions.

Thermometer—In order to avoid the necessity for an emergent stem correction, an accurately standardized, partial-immersion thermometer having the smallest practical subdivisions (not greater than 0.2°) is recommended. Suitable thermometers are available as the ASTM E-1 series ~~37C through 41C, and 102C through 107C~~ ■37° through 41°, and 102° through 107°■2S (*USP30*) (see *Thermometers* ⟨21⟩). When placed in position, the stem is located in the center of the neck, and the top of the contraction chamber (or bulb, if ~~37C or 38C~~ ■37° or 38°■2S (*USP30*) is used) is level with the bottom of the outlet to the side-arm.

Heat Source—A small Bunsen burner or an electric heater or mantle capable of adjustment comparable to that possible with a Bunsen burner.

Procedure—Assemble the apparatus, and place in the flask 100 mL of the liquid to be tested, taking care not to allow any of the liquid to enter the side-arm. Insert the thermometer, shield the entire burner and flask assembly from external air currents, and apply heat, regulating it so that between 5 and 10 minutes elapse before the first drop of distillate falls from the condenser. Continue the distillation at a rate of 4 to 5 mL of distillate per minute, collecting the distillate in the receiver. Note the temperature when the first drop of distillate falls from the condenser, and again when the last drop of liquid evaporates from the bottom of the flask or when the specified percentage has distilled over. ~~Correct the observed temperature readings for any variation in the observed ambient barometric pressure from the normal (760 mm), adding if the pressure is lower or subtracting if the pressure is higher than 760 mm, and apply the emergent stem correction where necessary. Unless otherwise specified in the individual monograph, allow 0.1° for each 2.7 mm (0.037° per mm) of variation.~~

■Unless otherwise specified in the individual monograph, report the temperatures, making corrections for barometric pressure, using the following formula:

$$t = t_0 + [(t_0 10^{-4} + 0.033)(760 - p)]$$

in which t is the corrected boiling temperature, in Celsius scale; t_0 is the measured boiling temperature, in Celsius scale; and p is the barometric pressure at the time of measurement, in mm Hg.■2S (*USP30*)

In-Process Revision

BRIEFING

〈**905**〉 **Uniformity of Dosage Units,** *USP 29* page 2780 and page 3599 of the *First Supplement*. The United States Pharmacopeia is the coordinating pharmacopeia in the efforts toward international harmonization of the specifications provided in this general test chapter. The Stage 5B text for this chapter has been signed-off by the Pharmacopeial Discussion Group members. However, subsequent revisions to the Stage 5B text are under PDG review. The national text presented herein represents a merger of the revised Stage 5B text and national USP text. It is proposed to implement this combined text via the *Sixth Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of January 1, 2007.

Major differences between this current text and the text that was published on pages 3599–3604 of the *First Supplement* are listed below.

(1) New text at the end of the opening paragraph has been added to emphasize that these uniformity of dosage units requirements are not intended to apply to suspensions, emulsions, or gels in unit-dose containers intended for topical administration.

(2) The proposed replacement of the text ''external, cutaneous'' with the text ''topical'' in item C3 under the list of dosage forms for which the *Content Uniformity* test is required is intended to clarify that not only products intended for application to skin but also products intended for application to hair, nails, etc., are included in this category.

(3) Comments were received regarding that portion of the unofficial, harmonized general chapter text that provides for the use of the *Weight Variation* test in place of the *Content Uniformity* test in cases where ''the concentration relative standard deviation (RSD) of the drug substance in the final dosage units is not more than 2%, based on process validation data and development data.'' The comments indicated that dosage unit uniformity should be independent of process validation data and product development data because these data may not always be available to regulatory agencies. The comments indicated further that the proposed wording would therefore require regulatory agencies and others that conduct dosage unit uniformity testing to obtain data from the sponsoring firm to determine whether to use a *Weight Variation* test or a *Content Uniformity* test in certain cases. Therefore, the proposed wording creates a private standard because an analyst would need information outside that provided in the *USP–NF* to conduct the compendial test. The proposed standard would allow for different standards based on proprietary data held only by the drug sponsor. USP feels that these comments merit further discussion among the PDG members. At the same time, USP is proposing revised wording in the national text published herein to address the above concerns. This proposed wording provides the option of applying the *Weight Variation* test under the 2% drug substance concentration RSD condition as an alternative test method in place of the *Content Uniformity* test. As stated in the proposed new text, where the *Weight Variation* test is used as an alternative test, the product must nevertheless comply with the official compendial test for *Content Uniformity.*

(4) Revisions proposed for the *T* value definition in *Table 2* are intended for clarity. The definition proposed herein is consistent with the approach in the current *USP* chapter where the headings (A) and (B) under the section *Criteria* refer to ''the average of the limits specified in the potency definition in the individual monograph.''

(5) Revisions proposed to the definitions of the *w* and $\overline{W}$ terms in the *Calculation of Acceptance Value* section under *Weight Variation* are intended to clarify these terms by indicating that the *w* term applies to the weights of the dosage forms obtained in the *Weight Variation* test itself, while the $\overline{W}$ term applies to the weights of the dosage forms used in the *Assay.*

Comments regarding these proposals are invited and should be submitted to William E. Brown by September 30, 2006.

(PDF: W. Brown) RTS—C45151

Change to read:

[NOTE—In this chapter, *unit* and *dosage unit* are synonymous.]

To ensure the consistency of dosage units, each unit in a batch should have a drug substance content within a narrow range around the label claim. Dosage units are defined as dosage forms containing a single dose or a part of a dose of drug substance in each unit.

•The uniformity of dosage units specification is not intended to apply to suspensions, emulsions, or gels in unit-dose containers intended for topical administration.•6

The term ''uniformity of dosage unit'' is defined as the degree of uniformity in the amount of the drug substance among dosage units. Therefore, the requirements of this chapter apply to each drug substance being comprised in dosage units containing one or more drug substances, unless otherwise specified in the individual monograph.

The uniformity of dosage units can be demonstrated by either of two methods, *Content Uniformity* or *Weight Variation* (see *Table 1*). The test for *Content Uniformity* is based on the assay of the individual content of drug substance(s) in a number of individual dosage units to determine whether the individual content is within the limits set. The *Content Uniformity* method may be applied in all cases. The test for *Content Uniformity* is required for those dosage forms described in *(C1)–(C6)* below:

(C1) coated tablets, other than film-coated tablets containing 25 mg or more of a drug substance that comprises 25% or more (by weight) of one tablet;

(C2) transdermal systems;

(C3) suspensions or emulsions or gels in ~~unit-dose~~ •single-unit•6 containers or in soft capsules that are intended for systemic administration only (not for those drug products that are intended for ~~external, cutaneous~~ •topical•6 administration);

(C4) inhalations (other than solutions for inhalation packaged in glass or plastic ampuls and intended for use in nebulizers) packaged in premetered dosage units. For inhalers and premetered dosage units labeled for use with a named inhalation device, also see *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers* 〈601〉;

(C5) solids (including sterile solids) that are packaged in single-unit containers and that contain active or inactive added substances, except that the test for *Weight Variation* may be applied in the special ~~situations~~ •cases•6 stated in ~~*(W2)* and~~ ••6 *(W3)* below; and

(C6) suppositories.

In-Process Revision

The test for *Weight Variation* is applicable for the following dosage forms:

(W1) solutions for inhalation that are packaged in glass or plastic ampuls and intended for use in nebulizers, and oral solutions packaged in unit-dose containers and into soft capsules;

(W2) solids (including sterile solids) that are packaged in single-unit containers and contain no added substances, whether active or inactive;

(W3) solids (including sterile solids) that are packaged in single-unit containers, with or without added substances, whether active or inactive, that have been prepared from true solutions and freeze-dried in the final containers and are labeled to indicate this method of preparation; and

(W4) hard capsules, uncoated tablets, or film-coated tablets, containing 25 mg or more of a drug substance comprising 25% or more, by weight, of the dosage unit or, in the case of hard capsules, the capsule contents, except that uniformity of other drug substances present in lesser proportions is demonstrated by meeting *Content Uniformity* requirements.

The test for *Content Uniformity* is required for all dosage forms not meeting the above conditions for the *Weight Variation* test. ~~Alternatively, products listed in item (W4) above that do not meet the 25 mg/25% threshold limit may be tested for uniformity of dosage units by *Weight Variation* instead of the *Content Uniformity* test if the concentration relative standard deviation (RSD) of the drug substance in the final dosage units is not more than 2%, based on process validation data and development data.~~

•Where compliance with the *Content Uniformity* test is required, then, by application of the provision for use of alternative methods provided in the *General Notices* section of this Pharmacopeia, it is possible for manufacturers to ensure this compliance by application of the *Weight Variation* test where the concentration relative standard deviation (RSD) of the drug substance in the final dosage units is not more than 2%. This RSD determination may be based on the manufacturer's process validation and product development data.•6 The concentration RSD is the RSD of the concentration per dosage unit (w/w or w/v), where concentration per dosage unit equals the assay result per dosage unit divided by the individual dosage unit weight. See the RSD formula in *Table 2*.

•Where the *Weight Variation* test is used in this way, the product must, if tested, nevertheless comply with the official compendial test for *Content Uniformity.*•6

Table 1. Application of Content Uniformity (CU) and Weight Variation (WV) Tests for Dosage Forms

Dosage Form	Type	Subtype	Dose & Ratio of Drug Substance: ≥25 mg & ≥25%	Dose & Ratio of Drug Substance: <25 mg or <25%

Change to read:

CONTENT UNIFORMITY

Select not fewer than 30 units, and proceed as follows for the dosage form designated. Where the amount of drug substance in a single dosage unit differs from that required in the *Assay,* adjust the degree of dilution of the solutions and/or the volume of aliquots so that the concentration of the drug substances in the final solution is of the same order as that obtained in the *Assay* procedure; or, in the case of a titrimetric assay, use a titrant of a different concentration, if necessary, so that an adequate volume of titrant is required (see *Titrimetry* ⟨541⟩); see also *Procedures* under *Tests and Assays* in the *General Notices and Requirements*. If any such modifications are made in the *Assay* procedure set forth in the individual monograph, make the appropriate corresponding changes in the calculation formula and titration factor.

Where a special *Procedure for content uniformity* is specified in the test for *Uniformity of dosage units* in the individual monograph, make any necessary correction of the results obtained as follows.

(1) Prepare a composite specimen of a sufficient number of dosage units to provide the amount of specimen called for in the *Assay* in the individual monograph plus the amount required for the special *Procedure for content uniformity* in the monograph by finely powdering tablets or mixing the contents of capsules or oral solutions, suspensions, emulsions, gels, or solids in single-unit containers to obtain a homogeneous mixture. If a homogeneous mixture cannot be obtained in this manner, use suitable solvents or other procedures to prepare a solution containing all of the drug substance, and use appropriate aliquot portions of this solution for the specified procedures.

(2) Assay separate, accurately measured portions of the composite specimen of capsules or tablets or suspensions or inhalations or solids in single-unit containers, both (a) as directed in the *Assay,* and (b) using the special *Procedure for content uniformity* in the monograph.

(3) Calculate the weight of drug substance equivalent to 1 average dosage unit, by (a) using the results obtained by the *Assay* procedure, and by (b) using the results obtained by the special procedure.

(4) Calculate the correction factor, *F,* by the formula:

$$F = W/P$$

in which W is the weight of drug substance equivalent to 1 average dosage unit obtained by the *Assay* procedure, and P is the weight of drug substance equivalent to 1 average dosage unit obtained by the special procedure. If

$$\frac{100|W - P|}{W}$$

is greater than 10, the use of a correction factor is not valid.

(5) The correction factor is to be applied only if F is not less than 1.030 nor greater than 1.100, or not less than 0.900 nor greater than 0.970. If F is between 0.970 and 1.030, no correction is required.

(6) If F lies between 1.030 and 1.100, or between 0.900 and 0.970, calculate the weight of drug substance in each dosage unit by multiplying each of the weights found using the special procedure by F.

Uncoated, Coated, or Molded Tablets, Capsules, Oral Solutions in ~~Single-Unit Containers, Oral Suspensions or Oral Emulsions or Oral Gels in Single-Unit Containers~~

•Unit-Dose Containers, Suspensions or Emulsions or Gels in Single-Unit Containers (that are intended for systemic administration only),•[6]
and Solids (including Sterile Solids) in Single-Unit Containers—Assay 10 units individually as directed in the *Assay* in the individual monograph, unless otherwise specified in the *Procedure for content uniformity* in the individual monograph. Calculate the acceptance value as directed below.

For oral solutions ~~, oral suspensions, oral emulsions, or oral gels in single-unit containers~~

•in unit-dose containers, and for suspensions, emulsions, or gels in single-unit containers that are intended for systemic administration only,•[6]
conduct the *Assay* on the amount of well-mixed material that drains from an individual container in not more than 5 seconds, or for highly viscous products, conduct the *Assay* on the amount of well-mixed material that is obtained by quantitatively removing the contents from an individual container, and express the results as the delivered dose.

Calculation of Acceptance Value—Calculate the acceptance value by the formula:

$$\left|M - \overline{X}\right| + ks$$

in which the terms are as defined in *Table 2*.

Table 2

Variable	Definition	Conditions	Value
$\overline{X}$	Mean of individual contents (χ_1, χ_2, … , χ_n), expressed as a percentage of the label claim		
χ_1, χ_2, … , χ_n	Individual contents of the units tested, expressed as a percentage of the label claim		
n	Sample size (number of units in a sample)		
k	Acceptability constant	If $n = 10$, then $k =$	2.4
		If $n = 30$, then $k =$	2.0
s	Sample standard deviation		$\left[\frac{\sum_{i=1}^{n}\left(\chi_i - \overline{X}\right)^2}{n-1}\right]^{\frac{1}{2}}$
RSD	Relative standard deviation (the sample standard deviation expressed as a percentage of the mean)		$\frac{100s}{\overline{X}}$
M (case 1) to be applied when $T \leq 101.5$	Reference value	If $98.5\% \leq \overline{X} \leq 101.5\%$, then	$M = \overline{X}$ $(AV = ks)$
		If $\overline{X} < 98.5\%$, then	$M = 98.5\%$ $(AV = 98.5 - \overline{X} + ks)$
		If $\overline{X} > 101.5\%$, then	$M = 101.5\%$ $(AV = \overline{X} - 101.5 + ks)$
M (case 2) to be applied when $T > 101.5$	Reference value	If $98.5 \leq \overline{X} \leq T$, then	$M = \overline{X}$ $(AV = ks)$
		If $\overline{X} < 98.5\%$, then	$M = 98.5\%$ $(AV = 98.5 - \overline{X} + ks)$
		If $\overline{X} > T$, then	$M = T\%$ $(AV = \overline{X} - T + ks)$

Table 2 *(Continued)*

Variable	Definition	Conditions	Value
Acceptance value *(AV)*			general formula: $\left\|M - \overline{X}\right\| + ks$ (Calculations are specified above for the different cases.)
L1	Maximum allowed acceptance value		*L1* = 15.0 unless otherwise specified in the individual monograph
L2	Maximum allowed range for deviation of each dosage unit tested from the calculated value of *M*	On the low side, no dosage unit result can be less than ~~(1 – *L2**0.01)*M*.~~ •$[1 – (0.01)(L2)]M$,• while on the high side no dosage unit result can be greater than ~~(1 + *L2**0.01)*M*.~~ •$[1 + (0.01)(L2)]M$• (This is based on an *L2* value of 25.0.)	*L2* = 25.0 unless otherwise specified in the individual monograph
T	Target ~~test sample amount at time of manufacture.~~ •content per dosage unit at the time of manufacture, expressed as a percentage of the label claim.• For purposes of this Pharmacopeia, unless otherwise specified in the individual monograph, *T* is ~~100.0%, and for manufacturing purposes, *T* is the manufacturer's approved target test amount value at the time of manufacture.~~ •the average of the limits specified in the potency definition in the individual monograph.•		

Suppositories, Transdermal Systems, and Inhalations Packaged in Premetered Dosage Units—[NOTE—Acceptance value calculations are not required for these dosage forms.] Assay 10 units individually as directed in the *Assay* in the individual monograph, unless otherwise specified in the *Procedure for content uniformity.*

Change to read:

WEIGHT VARIATION

Select not fewer than 30 dosage units, and proceed as follows for the dosage form designated. The result of the *Assay,* obtained as directed in the individual monograph, is designated as result *A,* expressed as % of label claim (see *Calculation of the Acceptance Value*). Assume that the concentration (weight of drug substance per weight of dosage unit) is uniform. [NOTE—Specimens other than these test units may be drawn from the same batch for assay determinations.]

Uncoated or Film-Coated Tablets—Accurately weigh 10 tablets individually. Calculate the drug substance content, expressed as % of label claim, of each tablet from the weight of the individual tablet and the result of the *Assay.* Calculate the acceptance value.

Hard Capsules—Accurately weigh 10 capsules individually, taking care to preserve the identity of each capsule. Remove the contents of each capsule by a suitable means. Accurately weigh the emptied shells individually, and calculate for each capsule the net weight of its contents by subtracting the weight of the shell from the respective gross weight. Calculate the drug substance content, expressed as % of label claim, of each capsule from the net weight of the individual capsule content and the result of the *Assay.* Calculate the acceptance value.

Soft Capsules—Accurately weigh 10 intact capsules individually to obtain their gross weights, taking care to preserve the identity of each capsule. Then cut open the capsules by means of a suitable clean, dry cutting instrument such as scissors or a sharp open blade, and remove the contents by washing with a suitable solvent. Allow the occluded solvent to evaporate from the shells at room temperature over a period of about 30 minutes, taking precautions to avoid uptake or loss of moisture. Weigh the individual shells, and calculate the net contents. Calculate the drug substance content, expressed as % of label claim, in each capsule from the net weight of product removed from the individual capsules and the result of the *Assay.* Calculate the acceptance value.

Solids (Including Sterile Solids) in Single-Unit Containers—Proceed as directed for *Hard Capsules,* treating each unit as described therein. Calculate the acceptance value.

Oral Solutions Packaged in ~~Single Unit~~

•Unit-Dose•6 Containers—Accurately weigh the amount of liquid that drains in not more than 5 seconds from each of 10 individual containers. If necessary, compute the equivalent volume after determining the density. Calculate the drug substance content, expressed as % of label claim, in the liquid drained from each unit from the net weight of the individual container content and the result of the *Assay.* Calculate the acceptance value.

Calculation of Acceptance Value—Calculate the acceptance value as shown in *Content Uniformity,* except that the individual contents of the units are replaced with the individual estimated contents defined below.

$\chi_1, \chi_2, \ldots, \chi_n$ = individual estimated contents of the units tested, where $\chi_i = w_i \times A / \overline{W}$,

$w_1, w_2, \ldots, w_n$ = individual weights of the units tested

•for weight variation,•6

A = content of drug substance (% of label claim) determined as described in the *Assay,* and

$\overline{W}$ = mean of individual weights $(w_1, w_2, \ldots, w_n)$

•of the units used in the *Assay.*•6

Solutions for Inhalation Packaged in Glass or Plastic Ampuls and Intended for Use in Nebulizers—[NOTE—Acceptance value calculations are not required for these dosage forms.] Accurately weigh 10 containers individually, taking care to preserve the identity of each container. Remove the contents of each container by a suitable means. Accurately weigh the emptied containers individually, and calculate for each container the net weight of its contents by subtracting the weight of the container from the respective gross weight. From the results of the *Assay,* obtained as directed in the individual monograph, calculate the drug substance content, expressed as % of label claim, in each of the containers.

Change to read:

CRITERIA

Apply the following criteria, unless otherwise specified in the individual monograph.

Uncoated, Coated, or Molded Tablets, Capsules, Oral Solutions in ~~Single-Unit Containers, Oral Suspensions or Oral Emulsions or Oral Gels in Single-Unit Containers~~

•Unit-Dose Containers, Suspensions or Emulsions or Gels in Single-Unit Containers (that are intended for systemic administration only),•6 and Solids (Including Sterile Solids) in Single-Unit Containers—The requirements for dosage uniformity are met if the acceptance value of the first 10 dosage units is less than or equal to *L1*%. If the acceptance value is greater than *L1*%, test the next 20 units, and

In-Process Revision

calculate the acceptance value. The requirements are met if the final acceptance value of the 30 dosage units is less than or equal to *L1*%, and no individual content of any dosage unit is less than ~~(1 – *L2**0.01)*M*~~

•[1 – (0.01)(*L2*)] $M_{•6}$
nor more than ~~(1 + *L2**0.01)*M*~~

•[1 + (0.01)(*L2*)] $M_{•6}$
as specified in the *Calculation of Acceptance Value* under *Content Uniformity* or under *Weight Variation.* Unless otherwise specified in the individual monograph, *L1* is 15.0 and *L2* is 25.0.

Suppositories—

Limit A (if the average of the limits specified in the potency definition in the individual monograph is 100.0 percent or less)—Unless otherwise specified in the individual monograph, the requirements for dosage uniformity are met if the amount of the drug substance in each of the 10 dosage units as determined from the *Content Uniformity* method lies within the range of 85.0% to 115.0% of the label claim, and the RSD is less than or equal to 6.0%.

If 1 unit is outside the range of 85.0% to 115.0% of label claim, and no unit is outside the range of 75.0% to 125.0% of label claim, or if the RSD is greater than 6.0%, or if both conditions prevail, test 20 additional units. The requirements are met if not more than 1 unit of the 30 is outside the range of 85.0% to 115.0% of label claim, and no unit is outside the range of 75.0% to 125.0% of label claim and the RSD of the 30 dosage units does not exceed 7.8%.

Limit B (if the average of the limits specified in the potency definition in the individual monograph is greater than 100.0 percent)—

(1) If the average value of the dosage units tested is 100.0 percent or less, the requirements are as in *Limit A.*
(2) If the average value of the dosage units tested is greater than or equal to the average of the limits specified in the potency definition in the individual monograph, the requirements are as specified under *Limit A,* except that the words "label claim" are replaced by the words "label claim multiplied by the average of the limits specified in the potency definition in the monograph divided by 100".
(3) If the average value of the dosage units tested is between 100 percent and the average of the limits specified in the potency definition in the individual monograph, the requirements are as specified under *Limit A,* except that the words "label claim" are replaced by the words "label claim multiplied by the average value of the dosage units tested (expressed as a percent of label claim) divided by 100".

Transdermal Systems and Inhalations Packaged in Premetered Dosage Units—

Limit A (if the average of the limits specified in the potency definition in the individual monograph is 100.0 percent or less)—Unless otherwise specified in the individual monograph, the requirements for dosage uniformity are met if the amount of the drug substance in not fewer than 9 of the 10 dosage units as determined from the *Content Uniformity* method (or, in the case of solutions for inhalation packaged in glass or plastic ampuls and intended for use in nebulizers, from either the *Content Uniformity* or the *Weight Variation* method) lies within the range of 85.0% to 115.0% of label claim, and no unit is outside the range of 75.0% to 125.0% of label claim, and the RSD of the 10 dosage units is less than or equal to 6.0%.

If 2 or 3 dosage units are outside the range of 85.0% to 115.0% of label claim, but not outside the range of 75.0% to 125.0% of label claim, or if the RSD is greater than 6.0% or if both conditions prevail, test 20 additional units. The requirements are met if not more than 3 units of the 30 are outside the range of 85.0% to 115.0% of label claim and no unit is outside the range of 75.0% to 125.0% of label claim, and the RSD of the 30 dosage units does not exceed 7.8%.

Limit B (if the average of the limits specified in the potency definition in the individual monograph is greater than 100.0 percent)—

(1) If the average value of the dosage units tested is 100.0 percent or less, the requirements are as in *Limit A.*
(2) If the average value of the dosage units tested is greater than or equal to the average of the limits specified in the potency definition in the individual monograph, the requirements are as specified under *Limit A*, except that the words "label claim" are replaced by the words "label claim multiplied by the average of the limits specified in the potency definition in the monograph divided by 100".
(3) If the average value of the dosage units tested is between 100 percent and the average of the limits specified in the potency definition in the individual monograph, the requirements are as specified under *Limit A*, except that the words "label claim" are replaced by the words "label claim multiplied by the average value of the dosage units tested (expressed as a percent of label claim) divided by 100".

GENERAL CHAPTERS

General Information

BRIEFING

⟨**1079**⟩ **Good Storage and Shipping Practices,** *USP 29* page 2915. It is proposed to revise this general chapter to include *Controlled Cold Temperature,* which was proposed to be added in the *General Notices and Requirements* on page 721 of *PF* 31(3) [May–June 2005] under *Preservation, Packaging, Storage, and Labeling* (see *Storage Temperature and Humidity*) and will become official in the *Second Supplement,* with an official date of August 1, 2006.

(P&S: D. Hunt) RTS—C45420

Change to read:

STORAGE IN WAREHOUSES, PHARMACIES, TRUCKS, SHIPPING DOCKS, AND OTHER LOCATIONS

Pharmacopeial articles are to be stored in locations that adhere to conditions established by the manufacturer. Where the desired conditions are not established, use storage conditions described in the *General Notices and Requirements* or in the applicable monograph.

Warehouses

Observation of the temperature variations in a warehouse should be made over a period of time to establish a meaningful temperature profile, including the temperature variations and conditions in the different parts of the warehouse. Such observations provide data and information as to where various products should and should not be stored.

ESTABLISHING TEMPERATURE PROFILES

Temperature profiles can be compiled by using a suitable number of thermometers or other temperature recording instruments. They should be placed throughout the warehouse in divided sections and should record the maximum and minimum temperatures during a 24-hour period for a total of three consecutive 24-hour periods. The following factors, some of which may give rise to extreme temperatures, should be considered during the process of temperature profiling: the size of the space, location of space heaters, sun-facing walls, low ceilings or roofs, and geographic location of the warehouse. Temperature profiling for warehouses already in use should be done at known times of external temperature extremes, e.g., for a period of not less than 3 hours when air temperatures are higher than 25° or less than 15°. Profiling should be conducted in both summer and winter. A mean kinetic temperature (MKT) should be obtained for any separate areas within the warehouse (see *Pharmaceutical Calculations in Prescription Compounding* ⟨1160⟩ for samples of MKT calculations). The temperature profile report should provide recommendations for the use of each area and identification of any areas that are found unsuitable for storage of Pharmacopeial articles.

CONTROLLED ROOM TEMPERATURE

■AND CONTROLLED COLD TEMPERATURE■2S (*USP30*)

The *General Notices* provide a definition for *Controlled Room Temperature*

■and *Controlled Cold Temperature.*■2S (*USP30*)
A temperature profiling study should demonstrate suitability for storing Pharmacopeial articles in areas determined to be ~~at room or controlled room temperature.~~

■at room temperature, controlled room temperature, or controlled cold temperature.■2S (*USP30*)
A suitable number of temperature and humidity recording instruments should be installed to record temperatures and to provide temperature and humidity profiles. Temperature recording should be conducted to meet the recommendations for establishing mean kinetic temperature and to comply with the warehouse's written procedures. These written procedures should have a reporting mechanism in place whereby a management tree is informed in the event that predefined high or low temperatures or humidity limits have been exceeded. Records can be reviewed as determined by the management system in accordance with established guidelines. Suitable training should be provided to persons who record temperatures, and proper quality accountability and tracking systems should be maintained.

STORAGE AT "COOL," "COLD," "REFRIGERATOR," AND "FREEZING" CONDITIONS

The *General Notices* provide definitions for cool, cold, refrigerator, and freezer temperatures. A temperature profiling study can be used to establish suitable areas for storing Pharmacopeial articles designated to be stored under these conditions. Equipment used for storing Pharmacopeial articles at these low temperatures should be qualified according to written procedures provided by the management system. Recording devices can be installed within the equipment and used to enable both air and product temperatures to be recorded at regular intervals. The number and location of monitoring devices should be determined based on the result of the temperature profile. Temperature records should be examined at least once every 24 hours or as provided in the equipment protocol. Cool or cold conditions are moisture-condensing conditions. Humidity-monitoring devices should be used in cases where the repackaged Pharmacopeial article is humidity-sensitive or labeled to avoid moisture. Additionally, there can be installed temperature-monitoring, and where necessary, humidity-monitoring alarm devices that have the capability of alerting personnel in the event that control is compromised. There should be protocols in place to address procedures for responding to failed temperature and humidity ranges both for normal working hours and outside normal working hours. Temperature and humidity should be reviewed at the times designated by the established protocol. The calibration and functioning of all temperature and humidity monitoring devices, including alarms and other associated equipment, should be checked on an annual or semiannual basis. Regular maintenance protocols should be in place for refrigeration equipment. There should be written agreements in place for all maintenance and evaluation procedures, and this may include an emergency situation protocol.

PERSONNEL TRAINING

Suitable training should be provided for personnel who handle Pharmacopeial articles with special storage temperature requirements. Personnel should know how to monitor temperatures and how to react to situations where adverse temperatures are identified. There should be written procedures in place such that the adverse temperatures are recorded and a report provided to the parties designated in the protocol.

QUALIFICATION OF "COLD" EQUIPMENT OR STORES

Only climate control equipment for which a contractor has provided documentation to assure its suitability for temperature and humidity requirements should be considered for use in cold storage. Qualification procedures on a regular basis should be independently conducted on equipment in cold stores to guarantee suitability and proper functioning. The procedure should demonstrate the temperature profile for both air and product temperatures when empty as well as when loaded. The procedure should also demonstrate the time taken for temperatures to exceed the maximum temperature in the event of a power failure. Qualification should consider thermal fluctuations that occur during stock replenishment and order removal. The results of the qualification should demonstrate the ability of the equipment to maintain the required temperature range in all areas, defining any zones which should not be used for storage such as those areas in close proximity to cooling coils, cold air streams from equipment ventilation, or doors. The variability of the system can be characterized by using the relative standard deviation. Thermal monitoring should establish that the system is rugged in that its temperature profile is consistent and reliable.

Change to read:

SPECIAL HANDLING

Certain classes of Pharmacopeial articles may require special handling. Such articles include products classified as dangerous goods under the Department of Transportation (DOT), state, local, or carrier rules; or products classified as controlled substances by the Drug Enforcement Administration (DEA) or by individual states.

Receipt of Pharmacopeial Articles

Upon arrival of Pharmacopeial articles to warehouse loading docks, premises, and other arrival areas, the Pharmacopeial articles are to be transferred to their manufacturer-designated storage environment within 2 hours of receipt. Limitation of the time spent in the uncontrolled environments of the loading dock is important to ensure that the integrity of the preparation is maintained. This is particularly important for temperature-sensitive items. The delivery document should be reviewed at receiving sites to ensure that the Pharmacopeial articles have not been subjected to any delays during shipment that could result in exposure of the article to extremes of temperature, or to any other extreme or undesirable conditions. In addition, to the extent possible, the receiving personnel should ensure that the ruggedness requirements in shipment have been met. For Pharmacopeial articles requiring extreme caution, special handling, or refrigerator temperature storage conditions, those who supply the articles (e.g., wholesalers and manufacturers) and delivery contractors should provide documented evidence to show that the required temperature range has been maintained during transportation. In the event that a deviation from the required temperature range has been observed during shipment of an article requiring such a shipping condition, the supplier or delivery contractors should document the temperature and the length of time the compendial article was not within the designated storage temperature. The pharmaceutical manufacturer may be contacted to determine the significance of unusual variances.

Distribution or Shipping Vehicles

Vehicles used for shipping or distribution of Pharmacopeial articles designated for storage at controlled room temperature

■or controlled cold temperature■2S (*USP30*)
should be suitably equipped to ensure that the temperature excursions encountered are within those allowed under the definition. ~~of controlled room temperature.~~

■■2S (*USP30*)
Steps should be taken so that extremes of temperature, whether above or below the specified temperatures, should not be encountered during delivery procedures.

Vehicle Qualification

Where practical, suitable monitoring devices, as determined by the manufacturer and vehicle supplier, should be placed in different areas of the truck to establish a temperature profile of the truck over a 24-hour period during a hot summer day, average high, and a cold winter day, average low, and during a normal or typical day. The derived temperature of the different parts of the truck may be used to determine the location on the truck where Pharmacopeial articles can be stored appropriately during shipping (see *Monitoring Devices—Time, Temperature, and Humidity* ⟨1118⟩).

Pharmaceutical Delivery Staff

As part of the contractual agreement between the delivery contractors and the manufacturers, the delivery staff should receive appropriate training to ensure that they are aware of the correct procedures to follow in maintaining products at the correct temperature. There may be written procedures that should be documented. In addition, the transportation personnel should have proper knowledge of the temperature profile of the vehicle to ensure proper placement of the Pharmacopeial articles in the vehicle. Pharmacopeial articles requiring special handling (e.g., refrigeration) or environmentally sensitive preparations should be transported in a suitably equipped vehicle to ensure that the articles are maintained at the correct temperature during distribution, shipping, and delivery and up to the point of receipt. Special arrangements should be made to inform receiving personnel, pharmacists, or other appropriate customers that the package includes articles with special storage and handling specifications and are to be transferred immediately to the appropriate storage location. The manufacturer, shipper, or delivery agency should provide appropriate evidence to show that the required temperature has been maintained throughout shipment and distribution.

Change to read:

SHIPMENT FROM MANUFACTURER TO WHOLESALER

Wholesaler

The wholesaler receiving the pharmaceutical articles should ensure that on arrival, the pharmaceutical articles are transferred to the correct environment without delay, as directed by the manufacturer, ideally within 2 hours of receipt. The wholesaler should examine the delivery documentation to ensure that the products have not been subjected to any delays during shipping and distribution that could result in products being exposed to extreme temperatures (see also the previous section, *Pharmaceutical Delivery Staff,* for staff expectations). The vehicles used for shipping of Pharmacopeial articles to the wholesaler, especially products requiring storage at low temperatures, should be suitably equipped to ensure that products are maintained at the correct temperature during shipping and distribution and up to the point of receipt. The receiving wholesaler staff should be informed

that the articles are transferred to appropriate storage locations without delays. The vehicles used for shipping of Pharmacopeial articles requiring storage ~~at room or controlled room temperatures~~

■at room temperature, controlled room temperature, or controlled cold temperature■2S (*USP30*)
should be suitably equipped to ensure that extremes of temperature, either above or below the specified temperature, do not occur during delivery procedures. Warehouse staff may receive appropriate training to ensure that the correct procedures are followed to maintain required temperature conditions (see *Pharmaceutical Delivery Staff*). Where necessary, a monitoring device for temperature and/or humidity should be used during shipping and distribution.

Compromised Temperature Conditions

A procedure should be in place in the warehouse to define the action that should be taken in the event of deviation from required storage conditions. Suitable records should be maintained to explain the reason for deviation and the resulting action that is taken. The product in question should then be placed in a quarantine status. Advice on the suitability of the product for use should be sought from the manufacturer or supplier of the product. The manufacturer's response should be documented prior to issuing the product to the customer, if that product is to be issued to the customer.

Change to read:

SHIPMENT FROM MANUFACTURER OR WHOLESALER TO PHARMACY

Pharmacy

The pharmacy receiving the pharmaceutical articles should ensure that on arrival, the pharmaceutical articles are transferred to the correct environment without delay, as directed by the manufacturer, ideally within 2 hours of receipt. The pharmacy personnel should examine the delivery documentation to ensure that the products have not been subjected to any delays during shipping and distribution, which could result in the products being exposed to extreme temperatures (see also the section, *Pharmaceutical Delivery Staff,* for staff expectations). The vehicles used for shipping of Pharmacopeial articles to the pharmacy, especially products requiring storage at low temperatures, should be suitably equipped to ensure that products are maintained at the correct temperature during shipping and distribution and up to the point of receipt. Receiving pharmacy staff should be informed that the articles are to be transferred to appropriate storage without delays. The vehicles used for shipping of Pharmacopeial articles requiring storage ~~at room or controlled room temperatures~~

■at room temperature, controlled room temperature, or controlled cold temperature■2S (*USP30*)
should be suitably equipped to ensure that extremes of temperature, either above or below the specified temperature, do not occur during delivery procedures. Pharmacy staff may receive appropriate training to ensure that the correct procedures are followed to maintain required temperature conditions (see *Pharmaceutical Delivery Staff*). Where necessary, a monitoring device for temperature and/or humidity may be used during shipping and distribution.

Compromised Temperature Conditions

The pharmacy should maintain appropriate procedures to define action that should be taken in the event of deviation from the required storage conditions. Suitable records should be maintained to explain the reason for deviation and the resulting action taken (including whether the product is issued to the patient or customer). Advice on the suitability of the product for use as an acceptable drug article should be sought from the manufacturer or supplier of the product.

Change to read:

SHIPMENT FROM PHARMACY TO PATIENT OR CUSTOMER

The pharmacy should provide an appropriate label on the package sent through air or surface routes so that the deliverer does not place the package in a mailbox exposed to extremes in temperature. In the event that no one is available to receive the package, the deliverer should return the package to the post office or service office, and store it in a cool or air-conditioned area until the patient can receive the medication. In the event that the package has not been delivered for more than 2 days, the package may be returned to the pharmacy. For temperature-sensitive articles, it is important that proper arrangements be made to protect the drug from exposure to high temperatures, or in some cases, from freezing conditions. Such arrangements may include the following: insulating the packaging, or packaging with coolant included; overnight shipping; and pre-arranged pick-up. In such cases, the pharmacy should provide on the external package a statement of an acceptable period of delay for delivery. The patient or customer should examine the delivery documentation to ensure that the package has not been subjected to any unacceptable delays during shipping and distribution. The patient or customer receiving the pharmaceutical articles, either by mail, delivery vehicle from the pharmacy, or directly from the physician or pharmacy, should be advised that upon receipt the articles are to be transferred to appropriate storage conditions without delay, as directed by the pharmacy, ideally within 2 hours of receipt. The vehicle used for air or surface shipping and distribution of pharmaceutical packages to the patient or customer, especially those requiring low temperatures, should contain the article suitably packaged in containers that maintain the desired storage conditions until the article reaches the patient or customer. The vehicles used for shipping and distribution of pharmaceutical articles to a patient or customer, especially those requiring storage ~~at room or controlled room temperatures~~

■at room temperature, controlled room temperature, or controlled cold temperature■2S (*USP30*)
should be suitably equipped during extreme temperature conditions such that the packages are not exposed to extremes of temperature either in winter or summer months. In the event that the vehicle is not adequately equipped with air conditioning or heating to protect the product, the time that the article is exposed to ambient conditions should be strictly limited, ideally not more than 2 hours. Where appropriate, a monitoring device may be used to ensure that required temperatures are maintained until the package reaches the patient or customer. If stability studies for the Pharmacopeial preparation indicate that it is particularly sensitive to environmental insults or if appropriate shipping safeguards described in this section are not feasible, then the preparation should be shipped by a different method whereby environmental control can be maintained.

Compromised Temperature Conditions

There should be appropriate procedures in the pharmacy that ships the article to the patient or customer defining the action that should be taken in the event that a patient reports that there has been a deviation from required storage conditions for an article, including any environmentally sensitive preparations, prior to the point of receipt. Advice on the suitability of the product for use should be provided to the patient or customer after the manufacturer or supplier's advice has been sought by the pharmacy. If the patient is advised to use the article, such advice should be documented and noted appropriately by the pharmacy. Otherwise, appropriate arrangements should be made to promptly replace the suspect article. For mail order items, replacement from local pharmacies may be an option to ensure an uninterrupted supply of medication.

In-Process Revision

Change to read:

STORAGE OF PHYSICIAN SAMPLES HANDLED BY SALES REPRESENTATIVES IN AUTOMOBILES

Storage of physician samples by sales representatives is regulated under 21CFR 203.34(b)(4); each manufacturer or distributor is to have appropriate policies in place to ensure that proper storage is maintained. The following suggestions may be considered in response to this need and are of interest to practitioners who may observe actual practices. Automobile trunks or passenger cabins used for the storage and distribution of physician samples should be monitored to determine the temperature profile of the trunk or passenger cabin. Suitable monitoring devices as determined by the sales representative may be placed in different areas of the trunk or passenger cabin on a hot summer and a cold winter day. Measurements should also be made during typical 24-hour periods, and the derived temperature should be used for calculation of the mean kinetic temperature at which the sample is stored (see *Pharmaceutical Calculations in Prescription Compounding* ⟨1160⟩ for examples of MKT calculations). If the Pharmacopeial article designated for storage requires storage at controlled room temperature

■or controlled cold temperature,■2S (*USP30*)
then suitable measures should be taken to maintain the sample within the allowable limits of the storage parameters. Environmentally-sensitive preparations should not be stored in automobile trunks or passenger cabins. Medications stored in automobile trunks or passenger cabins should be removed at the end of 3 days. Sales representatives should consider parking automobiles in shaded areas to avoid extreme heat during the summer and in garages to avoid freezing temperatures during the winter. The use of vouchers from the manufacturer that patients could use to obtain medication samples from participating pharmacies is an alternative way of providing drug samples.

STATEMENTS/LABELING OF THE IMMEDIATE CONTAINERS OR PACKAGE INSERT

Storage statements should be based on the stability evaluations of the Pharmacopeial drug substances and in accordance with national and international requirements.

Room Temperature Storage Statements—For products with a storage statement reading, ''Store at controlled room temperature,'' the labeling should read as follows on the package insert: ''Store at 20 °C to 25 °C (68 °F to 77 °F), excursions permitted between 15 °C and 30 °C (between 59 °F and 86 °F). Brief exposure to temperatures up to 40 °C (104 °F) may be tolerated provided the mean kinetic temperature does not exceed 25 °C (77 °F); however, such exposure should be minimized.''

On the immediate container label, the following may read for controlled room temperature (CRT): ''Store at 20 °C to 25 °C (68 °F to 77 °F), excursions permitted between 15 °C and 30 °C (between 59 °F and 86 °F).''

Cool Storage Statement—The storage statement for labeling may be as follows: ''Store in a cool place, 8 °C to 15 °C (46 °F to 59 °F).''

Refrigerator Storage Statement—The storage statement for labeling may be as follows: ''Store in a refrigerator, 2 °C to 8 °C (36 °F to 46 °F).''

■For products with a storage statement reading ''Store at controlled cold temperaure'' the labeling should read as follows on the package insert: ''Store at between 2 °C and 8 °C (36 °F and 46 °F), excursions permitted between 0 °C and 15 °C (32 °F and 59 °F). Brief exposure to temperatures up to 25 °C (77 °F) may be tolerated provided the mean kinetic temperature does not exceed 8 °C (46 °F); however, such exposure should be minimized.'' On the immediate container label, the following may read for controlled cold temperature (CCT): ''Store at between 2 °C and 8 °C (36 °F and 46 °F), excursions permitted between 0 °C and 15 °C (32 °F and 59 °F).''■2S (*USP30*)

Freezer Storage Statement—The storage statement for labeling may be as follows: ''Store in a freezer, –25 °C to –10 °C (–13 °F to 14 °F).''

See the *General Notices* for all other applicable storage conditions, such as *Storage Under Nonspecific Conditions* and store in a *Dry Place.* Additional cautionary statements to protect the Pharmacopeial drug product from extreme temperature and humidity conditions may be included on the container label and package insert, as the manufacturer desires.

BRIEFING

⟨**1120**⟩ Raman Spectrophotometry, *USP 29* page 2983. On the basis of comments received by Subcommittee G of the General Chapters Expert Committee, it is proposed to revise this general information chapter. The subcommittee asked that in addition to their revisions the chapter sponsor, as well as the National Institute of Standards and Technology (NIST) experts on Raman, also critically review and suggest revisions to the chapter. Extensive editorial revisions have also been made.

(GC: G. Ritchie) RTS—C42437

⟨1120⟩ RAMAN ~~SPECTROPHOTOMETRY~~

■SPECTROMETRY■2S (*USP30*)

~~INTRODUCTION~~

~~Raman spectroscopy shares many of the principles that apply to other spectroscopic measurements discussed in *Spectrophotometry and Light-Scattering* ⟨851⟩. Raman is a vibrational spectroscopic technique and is therefore related to IR (IR) and near-IR (NIR) spectroscopy. The Raman effect itself arises as a result of a change in the polarizability of a molecular bond and is measured as inelastically scattered radiation.~~

~~A Raman spectrum is generated by exciting the sample of interest to a virtual state with a monochromatic source, typically a laser. Light elastically scattered (no change in wavelength) is known as Rayleigh scatter and is not of analytical interest. However, if the sample relaxes to a vibrational energy level differing from the initial state, the scattered radiation is shifted in energy. The shift is commensurate with~~

In-Process Revision

the energy difference between the initial and final vibrational states. This "inelastically scattered" light is referred to as Raman scatter. Only about one in 10^8 photons incident to the sample undergoes Raman scattering. If the Raman scattered photon is of lower energy, it is referred to as Stokes scattering. If it is of higher energy, it is referred to as anti-Stokes scattering. In practice, nearly all analytically useful Raman measurements make use of Stokes-shifted Raman scatter.

The appearance of a Raman spectrum is much like an absorption Fourier transform–IR (FT–IR) spectrum. The intensities, or the number of Raman photons counted, are plotted against the shifted energies. The *x*-axis is generally labeled "Raman Shift/cm^{-1}" or "Wavenumber/cm^{-1}". The shift position is usually expressed in frequency and represents the frequency of the peak *relative* to the laser frequency. The spectrum is interpreted in the same manner as the commensurate absorption FT–IR spectrum. The positions of the shift frequencies for a given bond in an analyte are similar to their respective absorption frequencies in an IR spectrum. However, the peaks emphasized in a Raman spectrum are often de-emphasized in an IR spectrum and vice versa. This is why the two spectroscopic techniques are often said to be complementary.

Raman spectroscopy is advantageous because quick and accurate measurements can often be made without destroying the sample (solid, semi-solid, liquid, or gas) and with minimal or no sample preparation. The signal is typically in the visible or NIR range, allowing efficient coupling to fiber optics. This also means that a signal can be obtained from any medium transparent to the laser, such as glass, plastics, or samples in aqueous media. From an instrumental point of view, modern systems are easy to use, provide fast analysis times (seconds to several minutes), and are reliable. The Raman spectrum contains information on fundamental vibrational modes of the sample that can yield both sample and process understanding. Finally, the analysis modeling may be simpler than that associated with other spectroscopic techniques. (Both univariate and multivariate methods and calibrations can be used.)

In addition to normal Raman spectroscopy, there are a number of more specialized Raman techniques. These include resonance Raman (RR), surface-enhanced Raman spectroscopy (SERS), Raman optical activity (ROA), coherent anti-Stokes Raman spectroscopy (CARS), Raman gain or loss spectroscopy, and hyper-Raman spectroscopy. These techniques are not widely implemented currently, and are not addressed in this general information chapter.

QUALITATIVE AND QUANTITATIVE RAMAN MEASUREMENTS

There are two general classes of commonly performed Raman measurements: qualitative and quantitative.

Qualitative Raman Measurements

Qualitative Raman measurements yield accurate spectral information about the vibrational bands present in the sample. Because the Raman spectrum is specific for a given compound, qualitative Raman measurements may be used as a compendial ID test, as well as for structural elucidation.

Quantitative Raman Measurements

Quantitative Raman measurements follow a relationship comparable to Beer's law:

$$I_s = KLCI_o,$$

in which I_s is the peak intensity at a given wavelength, K represents instrument and sample constants, L is the path length, C is the molar concentration of a particular component in the sample, and I_o is the laser intensity. In practice, path length is more accurately described as sampling volume, which is an instrumental variable described by the focus of the laser and the collection optics. From the equation, it is apparent that peak intensity is directly correlated to concentration. It is this relationship that is the basis for the majority of quantitative Raman applications.

FACTORS AFFECTING QUANTITATION

Sample-Based Factors

The most important sample-based factors are fluorescence, sample heating, and matrix absorption. Fluorescence is typically observed as a broad sloping background underlying the Raman spectrum. The effect on quantitation is therefore that of an unstable baseline and decreased signal-to-noise ratio. The exact wavelength and intensity are dependent on the identity and concentration of the fluorescing material. Because fluorescence is generally a much more efficient process, even very minor amounts of fluorescent impurities can lead to significant Raman signal degradation. Fluorescence can be minimized by using longer wavelength excitation sources such as 785 nm or 1064 nm. However, the intensity of the Raman signal is proportional to ν^{-4}, where ν is the excitation wavelength. The optimum signal-to-noise ratio will be obtained by balancing fluorescence rejection, signal strength, and detector response.

Fluorescence in solids can also be mitigated by exposing the sample to the laser source for a period of time before measurement. This process is called photobleaching, and operates by degrading the highly absorbing species. Photobleaching is less effective in liquids, where the sample is mobile, or if the amount of fluorescent material is more than a trace.

Sample heating can cause a variety of issues, such as physical form change (melting), polymorph conversion, or sample burning. This is usually an issue for colored, highly absorbing species, or very small particles that have low heat transfer. The effects of sample heating are usually observable either as changes in the Raman spectrum over time or by visual inspection of the sample. Besides decreasing the laser flux, a variety of methods can be employed to diminish heating, such as moving the sample or laser during the measurement or improving the heat transfer of the sample with thermal contact or liquid immersion.

Absorption of the Raman signal by the matrix can also occur. This problem is more prevalent with long-wavelength FT–Raman systems where the Raman signal can overlap with a NIR overtone absorption. This effect will be dependent on the optics of the system as well as on the sample presentation. Associated with this effect is variability from scattering in solids as a result of packing and particle size differences. The magnitude of all of these effects, however, is typically less severe than in NIR because of the limited depth of penetration and the relatively narrower wavelength region sampled in Raman spectroscopy.

In-Process Revision

Sampling Factors

Quantitative Raman spectroscopy differs from many other spectroscopic techniques in that it is a single-beam measurement with no background. Careful instrument design and sampling can minimize this variation but not entirely remove it. Thus the absolute Raman signal intensity is very difficult to use for direct quantitation of an analyte. Among the potential sources of variation are changes in sample opacity, sample heterogeneity, changes in laser power at the sample, and changes in optical collection geometry or sample position. These effects can be minimized by sampling in a reproducible, representative manner.

Use of an internal reference is the most common and robust method of eliminating variations due to absolute intensity fluctuations. There are several choices for this approach. An internal standard can be deliberately added, and isolated peaks from this standard can be employed. In a solution, an isolated solvent band can be employed because the solvent will remain relatively unchanged from sample to sample. Also, in a formulation, an excipient peak can be used if it is in substantial excess compared to the analyte. The entire spectrum can also be used as a reference, with the assumption that laser and sample orientation changes will affect the entire spectrum equally.

A second important sampling-based factor to consider is spectral contamination. Raman is a weak effect that can be masked by a number of external sources. Common contamination sources include sample holder artifacts (container or substrate) and ambient light. Typically, these issues can be identified and resolved by careful experimentation.

APPARATUS

Components

All modern Raman measurements involve irradiating a sample with a laser, collecting the scattered radiation, rejecting the Rayleigh scattered light, differentiating the Raman photons by wavelength, and detecting the resulting Raman spectrum. All commercial Raman instruments therefore share the following common features to perform these functions:

1. Excitation source (laser)
2. Sampling device
3. Device to filter/reject light scattered at the laser wavelength
4. Wavelength processing unit
5. Detector and electronics

EXCITATION SOURCE (LASER)

Table 1 identifies several common lasers used for pharmaceutical applications. UV lasers have also been used for specialized applications but have various drawbacks that severely limit their utility for general analytical measurements.

Table 1. Typical Lasers Used in Pharmaceutical Applications

Laser λ, nm (nearest whole number)	Type	Typical Power at Laser	Wavelength Range, nm (Stokes Region, 100 cm^{-1} to 3000 cm^{-1} shift)	Comments
NIR Lasers				
1064	Solid state (Nd:YAG)	Up to 3W	1075–1563	Commonly used in Fourier transform instruments
785	Diode	Up to 500 mW	791–1027	Most ubiquitous dispersive Raman laser
Visible Lasers				
488–632.8	Ion gas and solid state frequency doubled lasers	Up to 1W	488–781	Fluorescence risks

~~SAMPLING DEVICE~~

~~A wide variety of sampling arrangements are possible, including direct optical interfaces, microscopes, fiber optic–based probes (either noncontact or immersion optics), and sample chambers (including specialty sample holders and automated sample changers). The sampling optics may also be designed to obtain the polarization-dependent Raman spectrum, which often contains additional information. Selection of the sampling device will often be dictated by the analyte. However, considerations such as sampling volume, speed of the measurement, laser safety, and reproducibility of sample presentation should be evaluated to optimize the sampling device for any given application.~~

~~FILTERING DEVICE~~

~~Scattered light at the laser wavelength (Rayleigh) is many orders of magnitude greater than the Raman signal and must be rejected prior to the detector. Notch filters are almost universally used for this purpose and provide excellent rejection and stability combined with small size. The traditional use of multistage monochromators for this purpose, although still viable, is now rare. In addition, various filters or physical barriers to shield the sample from external radiation sources (e.g., room lights, laser plasma lines) may be required depending on the collection geometry of the instrument.~~

~~WAVELENGTH PROCESSING UNIT~~

~~The wavelength may be processed by either dispersion or interferometry (Fourier transform). The specific benefits and drawbacks of each of the dispersive designs compared to the FT instrument are beyond the scope of this chapter. Any properly qualified instruments should be suitable for qualitative measurements. However, care must be taken when selecting an instrument for quantitative measurements, as dispersion and response linearity may not be uniform across the full spectral range (for example, when using an echelle spectrograph).~~

~~DETECTOR~~

~~The silicon-based charge-coupled device (CCD) is the most common detector for dispersive instruments. The cooled-array detector allows fast, full-spectrum measurements with low noise. It also has peak wavelength responsivity when matched to the commonly used 785-nm diode laser. Fourier transform instruments typically use single-channel germanium or indium–gallium–arsenide (InGaAs) detectors responsive in the NIR to match neodymium:yttrium–aluminum–garnet (Nd:YAG) 1064-nm excitation.~~

~~Calibration~~

~~Raman instrument calibration consists of three components: primary wavelength (*x*-axis), laser wavelength, and intensity (*y*-axis).~~

~~PRIMARY WAVELENGTH (*X*-AXIS)~~

~~In the case of FT-Raman instruments, primary wavelength-axis calibration is maintained with an internal He–Ne laser. Most dispersive instruments utilize atomic emission lamps for primary wavelength-axis calibration. In all Raman systems suitable for analytical Raman measurements, the vendor will offer a procedure of *x*-axis calibration that can be performed by the user. For dispersive-Raman instruments, a calibration based on multiple atomic emission lines is preferred. The validity of this calibration approach can be verified subsequent to laser wavelength calibration using a suitable Raman shift standard. For scanning dispersive instruments, calibration may need to be performed more frequently, and precision in both a scanning and static operation mode may need to be verified.[1]~~

~~[1] ASTM E1840-96(2002) Standard Guide for Raman Shift Standards for Spectrometer Calibration, ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA, USA 19428-2959.~~

~~LASER WAVELENGTH~~

~~Laser wavelength variation can impact both the wavelength precision and the photometric (intensity) precision of a given instrument. Even the most stable current lasers can vary slightly in their measured wavelength output. The laser wavelength must therefore be confirmed to ensure that the Raman shift positions are accurate for both FT-Raman or dispersive Raman instruments. A reference Raman shift standard material such as those outlined in ASTM E1840-96(2002)[1] or other suitably verified materials can be utilized for this purpose. [NOTE—Reliable Raman shift standard values for frequently used liquid and solid reagents, required for wavenumber calibration of Raman spectrometers, are provided in the ASTM Standard Guide cited. These values can be used in addition to the highly accurate and precise low-pressure arc-lamp emission lines that are also available for use in Raman instrument calibration.] Spectrophotometric-grade material can be purchased from appropriate suppliers for this use. Certain instruments may use an internal Raman standard separate from the primary optical path. External calibration devices exactly reproduce the optical path taken by the scattered radiation. [NOTE—When chemical standards are used, care must be taken to avoid standard contamination and to confirm standard stability.]~~

~~Unless the instrument is of a continuous calibration type, the primary wavelength-axis calibration should be performed, as per vendor procedures, just prior to measuring the laser wavelength. For external calibration, the Raman shift standard should be placed at the sample location and measured using appropriate acquisition parameters. The peak center of a strong, well-resolved band in the spectral region of interest should be evaluated. The position can be assessed manually or with a suitable, valid peak-picking algorithm. The software provided by the vendor may measure the laser wavelength and adjust the laser wavelength appropriately so that this peak is at the proper position. If the vendor does not provide this functionality, the laser wavelength should be adjusted manually.~~

~~INTENSITY (*Y*-AXIS)~~

~~Calibration of the photometric axis can be critical for successful quantitation using certain analytical methods (chemometrics) and method transfer between instruments. Both FT-Raman units and dispersive Raman units should undergo similar calibration procedures. The tolerance of photometric precision acceptable for a given measurement should be assessed during the method development stage.~~

~~To calibrate the photometric response of a Raman instrument, a broad-band emission source should be used. There are two accepted methods: *Method A*, which utilizes an NIST-traceable tungsten white light source[2] (and is applicable to all common laser excitation wavelengths listed in *Table 1*) and *Method B*, which utilizes NIST SRM 2241,[3] a doped glass fluorescence source that is currently available only for systems with 785-nm nominal excitation.~~

~~**Method A**—The NIST-traceable source should be placed at the sample location with the laser off and the response of the detector measured (using parameters appropriate for the instrument). The output for the source used for calibration should be known. The ratio of the measured response to the true response should be determined and a correction file generated. This correction should be applied to all spectra acquired with the instrument. Most manufacturers will provide both appropriate calibration sources and software for this approach. If the manufacturer does not provide a procedure or method, the user may accomplish the task using a source obtained from NIST and appropriate software. If using a manufacturer's method, attention must be paid to the calibration procedure and source validity. The user should obtain appropriate documentation from the manufacturer to ensure a qualified approach.~~

~~[2] NIST-traceable tungsten white light source statement: While the calibration of the Raman frequency (or Raman shift, cm^{-1}) axis using pure materials and an existing ASTM standard is well accepted, techniques for calibration of the Raman intensity axis are not. Intensity calibrations of Raman spectra can be accomplished with certified white light sources.~~

~~[3] NIST SRM 2241: Ray, K. G.; McCreery, R. L. Raman intensity correction standard for systems operating with 785-nm excitation. Appl. Spectrosc. 1997, 51, 108–116.~~

In-Process Revision

Method B—The NIST SRM 2241 should be placed at the sample location. With the laser on, a spectrum of the SRM should be obtained (using parameters appropriate for the instrument). The output for the source used for calibration should be known. The ratio of the measured response to the true response should be determined and a correction file generated. This correction should be applied to all spectra acquired with the instrument. Most manufacturers will provide both appropriate calibration sources and software for this approach. If the manufacturer does not provide a procedure or method, the user may accomplish the task using a source obtained from NIST and appropriate software. If using a manufacturer's method, attention must be paid to the calibration procedure and source validity. The user should obtain appropriate documentation from the manufacturer to ensure a qualified approach. [NOTE—*Method B* is currently appropriate only for a system with 785-nm laser excitation. NIST is currently producing other SRM materials that will be wavelength-specific for 1064-, 632.8-, 532-, and 514-nm excitation (and available in the 2004–2006 timeframe).]

EXTERNAL CALIBRATION

Detailed functional validation employing external reference standards is recommended to demonstrate instrumental suitability for laboratory instruments, even for instruments possessing an internal calibration approach. The use of external reference standards does not negate the need for internal quality control procedures; rather, it provides independent documentation of the fitness of the instrument to perform the specific analysis/purpose. For instruments installed in a process location or in a reactor where positioning of an external standard routinely is not possible, including those instruments possessing an internal calibration approach, periodic checking of the relative performance of an internal vs. external calibration approach should be made. The purpose of this test is to check for change in components that may not be included in the internal calibration method (process lens, fiber optic probe, etc.), e.g., photometric calibration of the optical system.

QUALIFICATION AND VERIFICATION OF RAMAN INSTRUMENTS

The suitability of a specific instrument for use in a given method is ensured by a thorough technology suitability evaluation for the application; a routine, periodic instrument operational qualification; and the more frequent performance verification (see *Definition of Terms and Symbols*). The purpose of the technology suitability evaluation is to ensure that the technology proposed is suitable for the intended application. The purpose of the instrument qualification is to ensure that the instrument to be used is suitable for its intended application and, when requalified periodically, continues to function properly over extended time periods. When the device is used for a specific qualitative or quantitative analysis, regular performance verifications are made. Because there are many different approaches to measuring Raman spectra, instrument operational qualification and performance verification often employ external standards that can be used on any instrument. As with any spectrophotometric device, a Raman instrument needs to be qualified for both wavelength (*x* axis and shift from the excitation source) and photometric (intensity axis) precision.

In performance verification, a quality of fit to an initial scan or group of scans (often referred to in nonscanning instruments as an accumulation) included in the instrumental qualification can be employed. In such analysis, it is assumed that reference standard spectra collected on a new or a newly repaired, properly operating instrument represent the best available spectra. Comparison of spectra taken over time on identical reference standards [either the original standard or identical new standards (if stability of the reference standards is a concern)] form the basis for evaluating the long-term stability of a Raman measurement system.

Frequency of Testing

Instrumental qualification is performed at designated intervals or following a repair or significant optical reconfiguration, such as a laser replacement or changing excitation wavelengths. Full instrument requalification may not be necessary when changing between sampling accessories such as a microprobe, a sample compartment, or a fixed fiber optic probe. Performance verification tests may be sufficient in these cases; instrument-specific guidance from the vendor on qualification requirements should be followed. Tests include wavelength (*x* axis and shift from the excitation source) and photometric (intensity axis) precision. Instrument qualification tests require that specific application dependent tolerances be met.

Performance verification is carried out on the instrument configured for the analytical measurements and is done more frequently than instrument qualification. Performance verification includes wavelength uncertainty and intensity scale precision. Wavelength precision and intensity scale precision tests may be needed prior to any data collection on a given day. Performance is verified by matching the current spectra to those collected during the previous instrument qualification.

Instrument Operational Qualification

It is important to note that the acceptance specifications given in both the *Instrument Operational Qualification* and *Performance Qualification* sections are applicable for general use; specifications for particular instruments and applications may vary depending on the analysis method used and the desired accuracy of the final result. ASTM standard reference materials are also specified, with the understanding that under some circumstances (specifically remote on-line applications) calibration using one of these materials may be impractical, and other suitably verified materials may be employed. At this juncture it is important to note that specific parameters such as spectrometer noise, limits of detection (LOD), limits of quantification (LOQ), and acceptable spectral bandwidth for any given application should be developed as part of the analytical method development. Specific values for tests such as spectrometer noise and bandwidth will be dependent on the instrument chosen and the purpose required. In view of this, specific instrument tests for these parameters are not dictated in this information chapter.

WAVELENGTH (*X* AXIS) PRECISION

It is important to ensure the precision of the wavelength axis via calibration to maintain the integrity of Raman peak positions. Wavelength calibration of a Raman spectrometer consists of two parts: primary wavelength axis and laser wavelength calibration. After calibrating both the primary wavelength axis and the laser wavelength, instrument wavelength uncertainty can be determined. This can be accomplished using a Raman shift standard such as the ASTM shift standards or other suitably verified material. Selection of a standard with bands present across the full Raman spectral range is recommended so that instrument wavelength uncertainty can be evaluated at multiple locations within the spectrum. The tolerance of wavelength precision that is required for a given measurement should be assessed during the method development stage. [NOTE—For scanning dispersive instruments, calibration may need to be performed more frequently, and precision in both a scanning and static operation mode may need to be verified.]

PHOTOMETRIC PRECISION

Laser variation in terms of the total emitted photons occurring between two measurements can give rise to changes in the photometric precision of the instrument. Unfortunately, it is very difficult to deconvolute changes in the photometric response associated with variations in the total emitted laser photons from the sample and sampling-induced perturbations. This is one of the reasons why absolute Raman measurements are strongly discouraged and why the photometric precision specification is set relatively loosely. The tolerance of photometric precision required for a given measurement should be assessed during the method development stage.

Performance Qualification

The objective of performance qualification is to ensure that the instrument is performing within specified limits with respect to wavelength precision, intensity axis precision, and sensitivity. In certain cases when the instrument has been set up for a specific measurement (for example, installed in a process reactor), it may no longer be possible or desirable to measure the wavelength and photometric (intensity) qualification reference standards identified above. Provided instrument operational qualification has shown that the equipment is fit for use, a single external performance verification standard can be used to reverify function on a continuing basis (for example, a routinely used process solvent signal, for both wavelength and photometric precision, following reactor cleaning). The performance verification standard should match the format of the samples in the current analysis as closely as possible and use similar spectral acquisition parameters. Quantitative measurements of an external performance verification standard spectrum checks both the wavelength (*x*-axis and laser wavelength) and the photometric (intensity) precision. Favorable comparison of a series of performance verification spectra demonstrates proper continued operation of the instrument.

WAVELENGTH PRECISION

The wavelength precision should be measured by collecting data for a single spectrum of the selected Raman shift standard for a period equal to that used in the photometric consistency test. Peak positions across the spectral range of interest are used to calculate precision. Performance is verified by matching the current peak position to those collected during the previous instrument qualification and should not vary by more than ± 0.3 cm^{-1}, although this specification may be adjusted according to the required accuracy of the measurement.

PHOTOMETRIC CONSISTENCY

The photometric consistency should be measured by collecting data for a single spectrum of a suitably verified reference standard material for a specified time. The areas of a number of bands across the spectral range of interest should be calculated using an appropriate algorithm. The most intense band area is set to an intensity of 1, and all other envelopes are normalized to this band. Performance is verified by matching the current band areas to their respective areas collected during the previous instrument qualification. The areas should vary by no more than 10%, although this specification may be adjusted according to the required accuracy of the measurement.

LASER POWER OUPUT PRECISION AND ACCURACY

This test is applicable only to Raman instruments with automatic, internal laser power meters. Instruments without laser power measurement should utilize a calibrated laser power meter from a reputable supplier. The laser output should be set on a representative output, dictated by the requirements of the analytical measurement and the laser power measured. The output should be measured and checked against the output measured at instrument qualification. The power (in milliwatts or watts) should vary by no more than 25% compared to the qualified level. If the power varies by more than this amount, the instrument should be serviced (as this variation may indicate, among other things, a gross misalignment of the system or the onset of failure of the laser).

For instruments with an automatic, internal laser power meter, the accuracy of the values generated from the internal power meter should be compared to a calibrated external laser power meter at an interval of not more than 12 months. The internally calculated value should be compared to that generated by the external power meter. Performance is verified by matching the current value to that generated during the previous instrument qualification. The manufacturer may provide software to facilitate this analysis. If the instrument design prevents the use of an external power meter, then the supplier should produce documentation to ensure the quality of the instrument and provide a recommended procedure for the above analysis to be accomplished during a scheduled service visit.

METHOD VALIDATION

Validation of Raman methods will follow the same protocols described in *Validation of Compendial Methods* ⟨1225⟩ in terms of accuracy, precision, etc. However, several of these criteria are affected by variables specific to Raman.

Fluorescence is the primary variable that can affect the suitability of a method. The presence of fluorescent impurities in samples can be quite variable and have little effect on the acceptability of a material. The method must be flexible enough to accommodate different sampling regimes that may be necessary to minimize the effects of these impurities.

Detector linearity must be confirmed over the range of possible signal levels. Fluorescence may drive the signal baseline higher than that used in the validation, in which case the fluorescence must be decreased, or the method validated to accommodate the higher fluorescence levels. This is also true for the precision, LOD, and LOQ of the method, as increased baseline noise will negatively impact all of these values. Because fluorescence may also affect quantitation due to baseline shifts, confirmation of acceptable quantitation at different levels of photobleaching, when used, should also be obtained.

The impact of the laser on the sample must be determined. Visual inspection of the sample and qualitative inspection of the Raman spectrum for measurements with differing laser powers and exposure times will confirm that the sample is not being altered (other than by photobleaching). Specific variables to confirm in the spectrum are shifts in peak position, changes in peak intensity and band width, and unexpected changes in background intensity.

Method precision must also encompass sample position. The sample presentation is a critical factor for both solids and liquids, and must be either tightly controlled or accounted for in the calibration model. Sample position sensitivity can often be minimized by appropriate sample preparation or sample holder geometry, but will vary from instrument to instrument based on excitation and collection optical configuration.

DEFINITION OF TERMS AND SYMBOLS

Calibration model is a mathematical expression that relates the response from an analytical instrument to the properties of samples.

Instrument bandwidth is a measure of the ability of a spectrometer to separate radiation of similar wavelengths.

Multiple linear regression is a calibration algorithm used to relate the response from an analytical instrument to the properties of samples. The distinguishing feature of this algorithm is the use of a limited number of independent variables. Linear least squares calculations are performed to establish a relationship between these independent variables and the properties of the samples.

Multivariate curve resolution (MCR) is a curve deconvolution technique that separates spectral components on the basis of their linear contributions to the overall spectrum.

Operational qualification is the process by which it is demonstrated and documented that the instrument performs according to specifications, and that it can perform the intended task. This process is required following any significant change such as instrument installation, relocation, major repair, etc.

Partial least squares (PLS) is a calibration algorithm used to relate instrument responses to the properties of samples. The distinguishing feature of this algorithm is that, although similar to PCR, this algorithm includes data concerning the properties of the samples used for calibration in the calculation of the factors used to describe the instrument responses.

Performance qualification is the process of using one or more well characterized and stable reference materials to verify consistent instrument performance. Qualification may employ the same or different standards for different performance characteristics.

In-Process Revision

Principal component analysis and regression (PCA and PCR) is a calibration algorithm used to relate the response from an analytical instrument to the properties of samples. This algorithm, which expresses a set of independent variables as a linear combination of factors, is a method of relating those factors to the properties of the samples for which the independent variables were obtained.

Raman spectrum[4] is a graph of the radiant energy, or number of photons, scattered by the sample through the indirect interaction between the molecular vibrations in the sample and monochromatic radiation of frequency much higher than that of the vibrations. The abscissa is usually the difference in wavenumber between the incident and scattered radiation.

(Normal) Raman scattering[4] is Raman scattering that occurs through the polarizability, not the hyper-polarizabilities, and is excited by radiation that is not in resonance with electronic transitions in the sample. The scattering, in fact, occurs through the derived polarizability tensors, i.e., through changes in the polarizability during the vibrations.

Raman wavenumber shift[4],

$$\Delta\tilde{\nu}$$

is the wavenumber of the exciting line minus the wavenumber of the scattered radiation. SI unit: m^{-1}. Common unit: cm^{-1}. = 100 m^{-1}.

$$\Delta\tilde{\nu}$$

is positive for Stokes scattering and negative for anti-Stokes scattering.

APPENDIX: CHEMOMETRIC APPLICATIONS AND MODEL BUILDING

Chemometrics can legitimately be used with Raman data to create models that can be used for qualitative and/or quantitative analysis.

Data Pretreatments

Pretreatments are mathematical manipulations of the spectra performed prior to the primary modeling step. The goal of pretreatments is to reduce the amount of irrelevant information, eliminating it from the model prior to the application of the primary technique. There are several data pretreatments that are typically used for removal of baseline anomalies. These include multiplicative scatter correction (MSC), standard normal variate (SNV), and derivatives. Pearson's method, an iterative approach to baseline decurvature, works well for the correction of some sets of data.

Library Construction and Use

Raman libraries are often used for compound identification. The test material can be tentatively known to the user or not. Libraries used for the purpose of raw material, intermediate, or formulation identity confirmation are best constructed from real production materials. This is particularly prudent in light of the fact that materials differing in crystallinity or polymorphic constitution will yield varying Raman spectra. Raman libraries purchased from a third party should be used judiciously.

Qualitative algorithms vary, and the appropriate choice is application dependent. For simple identifications, correlation algorithms often work well. These algorithms can be based on a variety of mathematical manipulations. Principal component based methods such as discriminant analysis can also be used for qualitative analysis.

Quantitative Calibration Approach

Raman spectroscopy can be used for quantitative analysis both for in-line and off-line work. There are some unique aspects concerning the use of quantitative Raman spectra that should be noted.

ALGORITHMS FOR QUANTITATION

As in the case of NIR spectroscopy (see *Near-Infrared Spectrophotometry* ⟨1119⟩), multivariate methods may be used to model Raman data. However, univariate analyses are often appropriate because of the resolution of information that Raman affords.

Both peak areas and peak heights can appropriately be used for Raman quantitation when univariate models are employed. Peaks should be reasonably well resolved when this approach is employed. As described above, peak ratios, as a rule, should be employed to account for peak intensity changes not related to the analyte. The judicious choice for a reference band is critical in such cases. Multivariate methods are also viable for Raman quantitation.

Multivariate curve resolution (MCR), which attempts to deconvolute the spectral data as a linear sum of its contributions, is a particularly effective means of dealing with Raman data that exhibit substantial change. This algorithm can potentially isolate the contribution from the analyte of interest and quantify the level of this contribution from sample to sample. The method is often employed in a non-negative mode, making the resulting factors potentially interpretable.

Principal components analysis (PCA) can be used similarly to MCR. The contribution of each component generated can be used to semiquantitatively estimate the level of the analyte. Related to PCA, principal component regression (PCR) can also be used. This provides an opportunity for reference data to be employed and is thus truly quantitative.

In many circumstances, multiple linear regression (MLR) can be very effective for Raman quantitation. MLR gives the user the capability of using denominator data points, which can be very useful for Raman data. As with other types of data, the ability to choose multiple numerators can also work synergistically in a quantitative analysis.

Partial least squares (PLS) regression remains one of the more popular choices for Raman quantitation. PLS uses the reference data to orient the factor generation. This can be very effective, especially for the quantitation of low-level analytes.

The choice of appropriate quantitation tools varies from project to project. Both pretreatment methods and quantitative algorithms should be chosen wisely according to the goals. If isolated analyte and reference bands are available, univariate models are often a good choice. If quantitative estimates are all that are necessary or the sample set is a closed set (no future predictions will be made), then MCR or PCA is a good choice. For reasonably extensive data sets with available reference data, MLR, PCR, or PLS can be used.

■INTRODUCTION

Raman spectroscopy shares many of the principles that apply to other spectroscopic measurements discussed in *Spectrophotometry and Light-Scattering* ⟨851⟩. Raman is a vibrational spectroscopic technique and is therefore related to infrared (IR) and near-infrared (NIR) spectroscopy. The Raman effect itself arises as a result of a change in the polarizability of molecular bonds during a given vibrational mode and is measured as inelastically scattered radiation.

[4] Chalmers, J., Griffiths, P., Eds. Handbook of Vibrational Spectroscopy; John Wiley & Sons, Ltd: New York, 2002.

In-Process Revision

A Raman spectrum is generated by exciting the sample of interest to a virtual state with a monochromatic source, typically a laser. Light elastically scattered (no change in wavelength) is known as Rayleigh scatter and is not of interest in Raman spectrometry, except for marking the laser wavelength. However, if the sample relaxes to a vibrational energy level that differs from the initial state, the scattered radiation is shifted in energy. This shift is commensurate with the energy difference between the initial and final vibrational states. This ''inelastically scattered'' light is referred to as Raman scatter. Only about one in 10^6–10^8 photons incident on the sample undergoes Raman scattering. Thus lasers are employed in Raman spectrometers. If the Raman-scattered photon is of lower energy, it is referred to as Stokes scattering. If it is of higher energy, it is referred to as anti-Stokes scattering. In practice, nearly all analytically useful Raman measurements make use of Stokes-shifted Raman scatter.

The appearance of a Raman spectrum is much like an infrared spectrum plotted linearly in absorbance. The intensities, or the number of Raman photons counted, are plotted against the shifted energies. The *x*-axis is generally labeled ''Raman Shift/cm^{-1}'' or ''Wavenumber/cm^{-1}''. The Raman shift is usually expressed in wavenumber and represents the difference in the absolute wavenumber of the peak and the laser wavenumber. The spectrum is interpreted in the same manner as the corresponding mid-infrared spectrum. The positions of the (Raman shifted) wavenumbers for a given vibrational mode are identical to the wavenumbers of the corresponding bands in an IR absorption spectrum. However, the stronger peaks in a Raman spectrum are often weak in an IR spectrum, and vice versa. Thus the two spectroscopic techniques are often said to be complementary.

Raman spectroscopy is advantageous because quick and accurate measurements can often be made without destroying the sample (solid, semisolid, liquid or, less frequently, gas) and with minimal or no sample preparation. The Raman spectrum contains information on fundamental vibrational modes of the sample that can yield both sample and process understanding. The signal is typically in the visible or NIR range, allowing efficient coupling to fiber optics. This also means that a signal can be obtained from any medium transparent to the laser light; examples are glass, plastics, or samples in aqueous media. In addition, because Raman spectra are ordinarily excited with visible or NIR radiation, standard glass/quartz optics may be used. From an instrumental point of view, modern systems are easy to use, provide fast analysis times (seconds to several minutes), and are reliable. However, the danger of using high-powered lasers must be recognized, especially when their wavelengths are in the NIR and, therefore, not visible to the eye. Fiber-optic probes should be used with caution and with reference to appropriate government regulations regarding lasers and laser classes.

In addition to ''normal'' Raman spectroscopy, there are several more specialized Raman techniques. These include resonance Raman (RR), surface-enhanced Raman spectroscopy (SERS), Raman optical activity (ROA), coherent anti-Stokes Raman spectroscopy (CARS), Raman gain or loss spectroscopy, and hyper-Raman spectroscopy. These techniques are not widely employed in pharmaceutical laboratories, and are not addressed in this general information chapter.

QUALITATIVE AND QUANTITATIVE RAMAN MEASUREMENTS

There are two general classes of measurements that are commonly performed by Raman spectrometry: qualitative and quantitative.

Qualitative Raman Measurements

Qualitative Raman measurements yield spectral information about the functional groups that are present in a sample. Because the Raman spectrum is specific for a given compound, qualitative Raman measurements can be used as a compendial ID test, as well as for structural elucidation.

Quantitative Raman Measurements

For instruments equipped with a detector that measures optical power (such as Fourier transform [FT]-Raman spectrometers), quantitative Raman measurements utilize the following relationship between signal, S_ν, at a given wavenumber, ν, and the concentration of an analyte, C:

$$S_\nu = K\sigma_\nu (\nu_L - \nu_\beta)^4 P_0 C$$

in which K is a constant that depends on laser beam diameter, collection optics, sample volume, and temperature; σ_ν is the Raman cross section of the particular vibrational mode; ν_L is the laser wavenumber; ν_β is the wavenumber of the vibrational mode; and P_0 is the laser power. The Raman cross section, σ_ν, is characteristic of the nature of the particular vibrational mode. The sample volume is defined by size of the focus of the laser beam at the sample, the optic being used for focusing, and the optical properties of the sample itself. Spot sizes at the sample can range from less than 1 µm for a microprobe to 6 mm for a large area sample system. For Raman spectrometers that measure the number of photons per second (such as change-coupled device [CCD]-Raman spectrometers) the corresponding equation is:

$$Si_\nu = KP\, s\nu_0(\nu_0 - \nu_i)^3$$

From the above equations, it is apparent that peak signal is directly proportional to concentration. It is this relationship that is the basis for the majority of quantitative Raman applications.

FACTORS AFFECTING QUANTIFICATION

Sample-Based Factors

The most important sample-based factors that deleteriously affect quantitative Raman spectrometry are fluorescence, sample heating, absorption by the matrix or the sample itself, and the effect of polarization. If the sample matrix includes fluorescent compounds, the measured signal will usually contain a contribution from fluorescence. Fluorescence will be observed only if the laser excitation wavelength overlaps with an absorption band of a fluorescent compound. Fluorescence is typically observed as a broad sloping background underlying the Raman spectrum. Fluorescence can cause both a baseline offset and reduced signal-to-noise ratio. The wavelength range and intensity of the fluorescence is dependent on the chemical composition of the fluorescent material. Because fluorescence is generally a much more efficient process than Raman scattering, even very minor amounts of fluorescent impurities can lead to significant degradation of the Raman signal. Fluorescence can be reduced by using longer wavelength excitation sources such as 785 nm or 1064 nm. However, it should be remembered that the strength of the Raman signal is proportional to $(\nu_L - \nu_\beta)^4$, so the advantage of using a long-wavelength excitation laser to minimize fluorescence is at least partially offset by the reduced strength of the Raman signal. The greatest signal-to-noise ratio will be obtained by balancing fluorescence rejection, signal strength, and detector response.

Fluorescence in solids can sometimes be mitigated by exposing the sample to the laser radiation for a period of time before measurement. This process is called photobleaching, and operates by degrading the highly absorbing species. Photobleaching is less effective in liquids, where the sample is mobile, or if the amount of fluorescent material is more than a trace.

Sample heating by the laser source can cause a variety of effects, such as physical form change (melting), polymorph conversion, or sample burning. The chance for sample heating is greatest when the spot size at the sample is the smallest, i.e., when a microprobe is being used. This is usually an issue for colored, highly absorbing species, or very small particles that have low heat transfer. The effects of sample heating are usually observable either as changes in the Raman spectrum over time or by visual inspection of the sample. Besides decreasing the laser flux, a variety of methods can be employed to dimin-

ish laser-induced heating, such as moving the sample or laser during the measurement or improving the heat transfer from the sample with thermal contact or liquid immersion.

Absorption of the Raman signal by the matrix or the sample itself can also occur. This problem is more prevalent with long-wavelength FT-Raman systems where the Raman signal can overlap with an NIR overtone absorption. This effect will be dependent on the optics of the system as well as on the sample presentation. Associated with this effect is variability from scattering in solids as a result of packing and particle-size differences. The magnitude of all of these effects, however, is typically less severe than in NIR because of the limited depth of penetration and the relatively narrower wavelength region sampled in Raman spectroscopy.

Finally, it should be recognized that laser radiation is polarized and the Raman spectra of crystalline materials and other oriented samples can differ significantly depending on the way that the sample is mounted. If the Raman spectrometer is capable of producing linearly polarized radiation at the sample then a polarization scrambler is recommended for routine sample analysis.

Sampling Factors

Raman spectroscopy is a zero-background technique, in that the signal at the detector is expected to be zero in the absence of a sample. This situation can be contrasted with absorption spectrometry, where the signal at the detector is at a maximum in the absence of a sample. Zero-background techniques are inherently sensitive because small changes in sample concentration lead to proportionate changes in the signal level. The instrument will also be sensitive to other sources of light that can cause sample-to-sample variations in the measured signal level. In addition, a large background signal caused by fluorescence will lead to an increased noise level (photon shot noise). Thus it may be very difficult to use the absolute Raman signal for direct determination of an analyte. Other potential sources of variation are changes in the sample opacity and heterogeneity, changes in the laser power at the sample, and changes in optical collection geometry or sample position. These effects can be minimized by sampling in a reproducible, representative manner. Careful design of the instrumentation can reduce these effects but they cannot be eliminated entirely.

Use of an internal reference standard is the most common and robust method of eliminating variations caused by absolute intensity fluctuations. There are several choices for this approach. An internal standard can be deliberately added, and isolated peaks from this standard can be employed or a band due to a moiety such as an aromatic ring, the Raman cross-section of which does not change with the way the sample is prepared, can also be used. For solution spectra, an isolated solvent band can be employed because the solvent will remain relatively unchanged from sample to sample. Also, in a formulation, an excipient peak can be used if it is in substantial excess compared to the analyte. The entire spectrum can also be used as a reference, with the assumption that laser and sample-orientation changes will affect the entire spectrum equally.

A second important sampling-based factor to consider is spectral contamination. Raman scattering is a weak effect that can be masked by a number of external sources. Common contamination sources include sample-holder artifacts (container or substrate) and ambient light. Typically, these issues can be identified and resolved by careful experimentation.

APPARATUS

Components

All modern Raman measurements involve irradiating a sample with a laser, collecting the scattered radiation, rejecting the Rayleigh-scattered light, differentiating the Raman photons by wavelength, and detecting the resulting Raman spectrum. All commercial Raman instruments therefore share the following common features to perform these functions:

1. Excitation source (laser)
2. Sampling device
3. Device to filter/reject light scattered at the laser wavelength
4. Wavelength processing unit
5. Detector and electronics

EXCITATION SOURCE (LASER)

Table 1 identifies several common lasers used for pharmaceutical applications or Raman spectrometry. UV lasers have also been used for specialized applications but have various drawbacks that limit their utility for general analytical measurements. As more applications for UV lasers are described, it is likely that they may become more common for Raman spectrometry.

Table 1. Lasers Used in Pharmaceutical Applications

Laser λ, nm (nearest whole number)	Type	Typical Power at Laser	Wavelength Range, nm (Stokes Region, 100 cm^{-1} to 3000 cm^{-1} shift)	Comments
NIR Lasers				
1064	Solid state (Nd:YAG)	Up to 3W	1075–1563	Commonly used in Fourier transform instruments
830	Diode	Up to 300 mW	827–980	Typically limited to 2000 cm^{-1}; Ramon shift because of CCD spectral response; less common than the other lasers
785	Diode	Up to 500 mW	791–1027	Most widely used dispersive Raman laser
Visible Lasers				
632.8	He–Ne	Up to 500 mW	637–781	Relatively small fluorescence risk
532	Doubled (Nd:YAG)	Up to 1W	535–632.8	High fluorescence risk
514.5	Ar+	Up to 1W	517–608	High fluorescence risk
488–632.8	Ar+	Up to 1W	490–572	High fluorescence risk

SAMPLING DEVICE

Several sampling arrangements are possible, including direct optical interfaces, microscopes, fiber optic-based probes (either noncontact or immersion optics), and sample chambers (including specialty sample holders and automated sample changers). The sampling optics can also be designed to obtain the polarization-dependent Raman spectrum, which often contains additional information. Selection of the sampling device will often be dictated by the analyte and sample. However, considerations such as sampling volume, speed of the measurement, laser safety, and reproducibility of sample presentation should be evaluated to optimize the sampling device for any given application.

FILTERING DEVICE

The intensity of scattered light at the laser wavelength (Rayleigh) is many orders of magnitude greater than the Raman signal and must be rejected prior to the detector. Notch filters are almost universally used for this purpose and provide excellent rejection and stability combined with small size. The traditional use of multistage monochromators for this purpose, although still viable, is now rare. In addition, various filters or physical barriers to shield the sample from external radiation sources (e.g., room lights, laser plasma lines) may be required depending on the collection geometry of the instrument.

WAVELENGTH PROCESSING UNIT

The wavelength scale may be encoded by either a scanning monochromator, a grating polychromator (in CCD-Raman spectrometers) or a two-beam interferometer (in FT-Raman spectrometers). A discussion of the specific benefits and drawbacks of each of the dispersive designs compared to the FT instrument is beyond the scope of this chapter. Any properly qualified instruments should be suitable for qualitative measurements. However, care must be taken when selecting an instrument for quantitative measurements, as dispersion and response linearity might not be uniform across the full spectral range.

DETECTOR

The silicon-based CCD array is the most common detector for dispersive instruments. The cooled array detector allows measurements over the spectral range from 3100 to 100 cm^{-1} Raman shift with low noise even with excitation wavelengths as long as 785 nm. It also has peak wavelength responsivity when matched to the commonly used 632.8-nm He–Ne gas laser or 785-nm diode laser. FT instruments typically use single-channel germanium or indium–gallium–arsenide (InGaAs) detectors responsive in the NIR to match neodymium-doped yttrium–aluminum–garnet (Nd:YAG) 1064-nm excitation.

Calibration

Raman instrument calibration involves three components: primary wavelength (*x*-axis), laser wavelength, and intensity (*y*-axis).

PRIMARY WAVELENGTH (*X*-AXIS)

In the case of FT-Raman instruments, primary wavelength-axis calibration is maintained, at least to a first approximation, with an internal He–Ne laser. Most dispersive instruments utilize atomic emission lamps for primary wavelength-axis calibration. In all instruments suitable for analytical Raman measurements, the vendor will offer a procedure of *x*-axis calibration that can be performed by the user. For dispersive Raman instruments, a calibration based on multiple atomic emission lines is preferred. The validity of this calibration approach can be verified subsequent to laser wavelength calibration by using a suitable Raman shift standard. For scanning

dispersive instruments, calibration might need to be performed more frequently, and precision in both a scanning and static operation mode may need to be verified.[1]

LASER WAVELENGTH

Laser wavelength variation can impact both the wavelength precision and the photometric (signal) precision of a given instrument. Even the most stable current lasers can vary slightly in their measured wavelength output. The laser wavelength must therefore be confirmed to ensure that the Raman shift positions are accurate for both FT-Raman or dispersive Raman instruments. A reference Raman shift standard material such as those outlined in ASTM E1840-96 (2002)[1] or other suitably verified materials can be utilized for this purpose. [NOTE—Reliable Raman shift standard values for frequently used liquid and solid reagents, required for wavenumber calibration of Raman spectrometers, are provided in the ASTM Standard Guide cited. These values can be used in addition to the highly accurate and precise low-pressure arc lamp emission lines that are also available for use in Raman instrument calibration.] Spectrometric grade material can be purchased from appropriate suppliers for this use. Certain instruments may use an internal Raman standard separate from the primary optical path. External calibration devices exactly reproduce the optical path taken by the scattered radiation. [NOTE—When chemical standards are used, care must be taken to avoid contamination and to confirm standard stability.]

Unless the instrument is of a continuous calibration type, the primary wavelength axis calibration should be performed, as per vendor procedures, just prior to measuring the laser wavelength. For external calibration, the Raman shift standard should be placed at the sample location and measured using appropriate acquisition parameters. The peak center of a strong, well-resolved band in the spectral region of interest should be evaluated. The position can be assessed manually or with a suitable, valid peak-picking algorithm. The software provided by the vendor might measure the laser wavelength and adjust the laser wavelength appropriately so that this peak is at the proper position. If the vendor does not provide this functionality, the laser wavelength should be adjusted manually. Depending on the type of laser, the laser wavelength can vary with temperature, current, and voltage. Wavelength tolerances can vary depending on the specific application.

SIGNAL LEVEL (*Y*-AXIS)

Calibration of the photometric axis can be critical for successful quantification by using certain analytical methods (chemometrics) and method transfer between instruments. Both FT-Raman and dispersive Raman spectrometers should undergo similar calibration procedures. The tolerance of photometric precision acceptable for a given measurement should be assessed during the method development stage.

To calibrate the photometric response of a Raman instrument, a broad-band emission source should be used. There are two accepted methods. *Method A* utilizes a tungsten white light source.[2] The output power of such sources is traceable to the National Metrology Institute (NMI). In the United Kingdom, the National Physical Laboratory also provides calibrated light bulbs. Several other vendors also provide NIST-traceable irradiance calibration standards. This method is applicable to all common laser excitation wavelengths listed in *Table 1*. In *Method B,* NIST standard reference materials (SRMs) are utilized.[3] Several doped-glass fluorescence standards are currently available.

Method A—The source should be placed at the sample location with the laser off and the response of the detector measured (using parameters appropriate for the instrument). The

[1] ASTM E1840-96 (2002) Standard Guide for Raman Shift Standards for Spectrometer Calibration, ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA, USA 19428-2959.

[2] NIST-traceable tungsten white light source statement: While the calibration of the Raman frequency (or Raman shift, cm^{-1}) axis using pure materials and an existing ASTM standard is well accepted, techniques for calibration of the Raman intensity axis are not. Intensity calibrations of Raman spectra can be accomplished with certified white light sources.

[3] NIST SRM 2241: Ray KG, McCreery RL. Raman intensity correction standard for systems operating with 785-nm excitation. Appl. Spectrosc. 1997, 51, 108–116.

output for the source used for calibration should be known. The ratio of the measured response to the true response should be determined and a correction file generated. This correction should be applied to all spectra acquired with the instrument. Most manufacturers will provide both appropriate calibration sources and software for this approach. If the manufacturer does not provide a procedure or method, the user can accomplish the task using a source obtained from NIST and appropriate software. If a manufacturer's method is used, attention must be paid to the calibration procedure and source validity. The user should obtain appropriate documentation from the manufacturer to ensure a qualified approach.

Method B—The fluorescence standard should be placed at the sample location. With the laser on, a spectrum of the SRM should be obtained (using parameters appropriate for the instrument). The output of the source used for calibration should be known. The ratio of the measured response to the true response should be determined and a correction file generated. This correction should be applied to all spectra acquired with the instrument. Most manufacturers will provide both appropriate calibration sources and software for this approach. If the manufacturer does not provide a procedure or method, the user can accomplish the task using a source obtained from NIST and appropriate software. If a manufacturer's method is used, attention must be paid to the calibration procedure and source validity. The user should obtain appropriate documentation from the manufacturer to ensure a qualified approach. [NOTE—*Method B* is currently appropriate for systems with 785-nm (SRM 2241), 532-nm (SRM 2242), and both 514.5-nm and 488-nm (SRM 2243) laser excitation. NIST is currently developing other SRMs that will be wavelength-specific for 1064-nm (SRM 2244) and 632.8-nm excitation (expected to be available in 2006).]

EXTERNAL CALIBRATION

Detailed functional validation employing external reference standards is recommended to demonstrate instrumental suitability for laboratory instruments, even for instruments that possess an internal calibration approach. The use of external reference standards does not obviate the need for internal quality control procedures; rather, it provides independent documentation of the fitness of the instrument to perform the specific analysis or purpose. For instruments installed in a process location or in a reactor where positioning of an external standard routinely is not possible, including those instruments that employ an internal calibration approach, the relative performance of an internal versus an external calibration approach should be periodically checked. The purpose of this test is to check for changes in components that might not be included in the internal calibration method (process lens, fiber-optic probe, etc.), e.g., photometric calibration of the optical system.

QUALIFICATION AND VERIFICATION OF RAMAN SPECTROMETERS

The suitability of a specific instrument for a given method is ensured by a thorough technology-suitability evaluation for the application; a routine, periodic instrument operational qualification; and the more frequent performance verification (see *Definition of Terms and Symbols*). The purpose of the technology-suitability evaluation is to ensure that the technology proposed is suitable for the intended application. The purpose of the instrument qualification is to ensure that the instrument to be used is suitable for its intended application and, when requalified periodically, continues to function properly over extended time periods. When the device is used for a specific qualitative or quantitative analysis, regular performance verifications are made. Because there are many different approaches to measuring Raman spectra, instrument operational qualification and performance verification often employ external standards that can be used on any instrument.

As with any spectrometric device, a Raman instrument needs to be qualified for both wavenumber (*x*-axis and shift from the excitation source) and photometric (signal axis) precision.

In performance verification, a quality-of-fit to an initial scan or group of scans (often referred to in nonscanning instruments as an accumulation) included in the instrumental qualification can be employed. In such an analysis, it is assumed that reference standard spectra collected on a new or a newly repaired, properly operating instrument represent the best available spectra. Comparison of spectra taken over time on identical reference standards (either the original standard or identical new standards [if stability of the reference standards is a concern]) forms the basis for evaluating the long-term stability of a Raman measurement system.

Frequency of Testing

Instrumental qualification is performed at designated intervals or following a repair or significant optical reconfiguration, such as the replacement of the laser, the detector or the notch or edge filters. Full instrument requalification might not be necessary when changing between sampling accessories such as a microprobe, a sample compartment, or a fixed fiber-optic probe. Performance verification tests may be sufficient in these cases; instrument-specific guidance from the vendor on qualification requirements should be followed. Tests include wavelength (*x*-axis and shift from the excitation source) and photometric (signal axis) precision. Instrument qualification tests require that specific application-dependent tolerances be met.

Performance verification is carried out on the instrument configured for the analytical measurements and is performed more frequently than instrument qualification. Performance verification includes measurement of the wavelength uncertainty and intensity-scale precision. Wavelength precision and intensity-scale precision tests may be needed prior to any data collection on a given day. Performance is verified by matching the current spectra to those collected during the previous instrument qualification.

Instrument Operational Qualification

It is important to note that the acceptance specifications given in both the *Instrument Operational Qualification* and *Performance Qualification* sections are applicable for general use; specifications for particular instruments and applications can vary depending on the analysis method used and the desired accuracy of the final result. ASTM standard reference materials are also specified, with the understanding that under some circumstances (specifically remote on-line applications) calibration using one of these materials may be impractical, and other suitably verified materials can be employed. At this juncture it is important to note that specific parameters such as spectrometer noise, limits of detection (LOD), limits of quantification (LOQ), and acceptable spectral bandwidth for any given application should be included as part of the analytical method development. Specific values for tests such as spectrometer noise and bandwidth will be dependent on the instrument chosen and the purpose required. As a result, specific instrument tests for these parameters are not dictated in this information chapter.

WAVELENGTH (*X*-AXIS) ACCURACY

It is important to ensure the accuracy of the wavelength axis via calibration to maintain the integrity of Raman peak positions. Wavelength calibration of a Raman spectrometer consists of two parts: primary wavelength axis and laser wavelength calibration. After both the primary wavelength axis and the laser wavelength are calibrated, instrument wavelength uncertainty can be determined. This can be accomplished using a Raman shift standard such as the ASTM shift standards or other suitably verified material. Selection of a standard with bands present across the full Raman spectral

range is recommended so that instrument wavelength uncertainty can be evaluated at multiple locations within the spectrum. The tolerance of wavelength precision that is required for a given measurement should be assessed during the method-development stage. [NOTE—For scanning dispersive instruments, calibration might need to be performed more frequently, and precision in both a scanning and static operation mode may need to be verified.]

PHOTOMETRIC PRECISION

Laser variation in terms of the total emitted photons occurring between two measurements can give rise to changes in the photometric precision of the instrument. Unfortunately, it is very difficult to separate changes in the photometric response associated with variations in the total emitted laser photons from the sample- and sampling-induced perturbations. This is one of the reasons why absolute Raman measurements are strongly discouraged and why the photometric precision specification is set relatively loosely. The tolerance of photometric precision required for a given measurement should be assessed during the method-development stage.

PERFORMANCE QUALIFICATION

The objective of performance qualification is to ensure that the instrument is performing within specified limits with respect to wavelength precision, photometric axis precision, and sensitivity. In certain cases when the instrument has been set up for a specific measurement (for example, installed in a process reactor), it might no longer be possible or desirable to measure the wavelength and photometric (signal) qualification reference standards identified above. Provided instrument operational qualification has shown that the equipment is fit for use, a single external performance verification standard can be used to reverify function on a continuing basis (for example, a routinely used process solvent signal, for both wavelength and photometric precision, following reactor cleaning). The performance verification standard should match the format of the samples in the current analysis as closely as possible and use similar spectral acquisition parameters. Quantitative measurements of an external performance verification standard spectrum check both the wavelength (*x*-axis and laser wavelength) and the photometric (signal) precision. Favorable comparison of a series of performance verification spectra demonstrates proper continued operation of the instrument.

WAVELENGTH PRECISION

The wavelength precision should be measured by collecting data for a single spectrum of the selected Raman shift standard for a period equal to that used in the photometric consistency test. When appropriate, powdered samples should be repacked between each set of measurements. Peak positions across the spectral range of interest are used to calculate precision. Performance is verified by matching the current peak positions to those collected during the previous instrument qualification and should not vary with a standard deviation of more than ± 0.3 cm^{-1}, although this specification can be adjusted according to the required accuracy of the measurement.

PHOTOMETRIC PRECISION

The photometric precision should be measured by collecting data for a single spectrum of a suitably verified reference standard material for a specified time. After suitable baseline correction, the areas of a number of bands across the spectral range of interest should be calculated by means of an appropriate algorithm. The area of the strongest band is set to 1, and all other envelopes are normalized to this band. Performance is verified by matching the current band areas to the respective areas collected during the previous instrument qualification. The areas should vary by no more than 10%, although this specification can be adjusted according to the required accuracy of the measurement.

LASER POWER OUTPUT PRECISION AND ACCURACY

This test is applicable only to Raman instruments with automatic, internal laser power meters. Instruments without laser power measurement should utilize a calibrated laser power meter from a reputable supplier. The laser output should be set to a representative output, dictated by the requirements of the analytical measurement and the laser power measured. The output should be measured and checked against the output measured at instrument qualification. The power (in milliwatts or watts) should vary by no more than 25% compared to the qualified level. If the power varies by more than this amount, the instrument should be serviced (as this variation might indicate, among other things, a gross misalignment of the system or the onset of failure of the laser).

For instruments with an automatic, internal laser power meter, the accuracy of the values generated from the internal power meter should be compared to a calibrated external laser power meter at an interval of not more than 12 months. The internally calculated value should be compared to that generated by the external power meter. Performance is verified by matching the current value to that generated during the previous instrument qualification. The manufacturer might provide software to facilitate this analysis. If the instrument design prevents the use of an external power meter, then the supplier should produce documentation to ensure the quality of the instrument and provide a recommended procedure for the above analysis to be accomplished during a scheduled service visit.

METHOD VALIDATION

Validation of Raman methods will follow the same protocols described in *Validation of Compendial Methods* ⟨1225⟩ in terms of accuracy, precision, etc. However, several of these criteria are affected by variables specific to Raman spectrometry. Fluorescence is the primary variable that can affect the suitability of a method. The presence of fluorescent impurities in samples can be quite variable and have little effect on the acceptability of a material. The method must be flexible enough to accommodate different sampling regimes that may be necessary to minimize the effects of these impurities.

Detector linearity must be confirmed over the range of possible signal levels. Fluorescence might drive both the signal baseline and the noise higher than that used in the validation, in which case the fluorescence must be decreased, or the method modified to accommodate the higher fluorescence levels. This is also true for the precision, limit of detection, and limit of quantification of the method, as increased baseline noise will negatively impact all of these values. Because fluorescence can also affect quantification caused by baseline shifts, acceptable quantification at different levels of photobleaching, when used, should also be confirmed.

The impact of the laser on the sample must be determined. Visual inspection of the sample and qualitative inspection of the Raman spectrum for measurements with differing laser powers and exposure times will confirm that the sample is not being altered (other than by photobleaching). Specific variables to confirm in the spectrum are shifts in peak position, changes in peak height and band width, and unexpected changes in background intensity.

Method precision must also encompass sample position. The sample presentation is a critical factor for both solids and liquids, and must be either tightly controlled or accounted for in the calibration model. Sample-position sensitivity can often be minimized by appropriate sample preparation or sample holder geometry, but will vary from instrument to instrument based on excitation and collection optical configuration.

DEFINITION OF TERMS AND SYMBOLS

CALIBRATION MODEL is a mathematical expression that relates the response from an analytical instrument to the properties of samples.

INSTRUMENT BANDPASS (OR RESOLUTION) is a measure of the capability of a spectrometer to separate radiation of similar wavelengths.

OPERATIONAL QUALIFICATION is the process by which it is demonstrated and documented that the instrument performs according to specifications, and that it can perform the intended task. This process is required following any significant change such as instrument installation, relocation, major repair, etc.

PERFORMANCE QUALIFICATION is the process of using one or more well-characterized and stable reference materials to verify consistent instrument performance. Qualification may employ the same or different standards for different performance characteristics.

RAMAN SPECTRA[4] are plots of the radiant energy, or number of photons, scattered by the sample through the indirect interaction between the molecular vibrations in the sample and monochromatic radiation of frequency much higher than that of the vibrations. The abscissa is usually the difference in wavenumber between the incident and scattered radiation.

(NORMAL) RAMAN SCATTERING[4] is the inelastic scattering of radiation that occurs because of changes in the polarizability, of the relevant bonds during a molecular vibration. Normal Raman spectra are excited by radiation that is not in resonance with electronic transitions in the sample.

RAMAN WAVENUMBER SHIFT[4],

$$\Delta\tilde{\nu}$$

is the wavenumber of the exciting line minus the wavenumber of the scattered radiation. SI unit: m^{-1}. Common unit: cm^{-1} = 100 m^{-1}.

$$\beta\Delta\tilde{\nu}$$

is positive for Stokes scattering and negative for anti-Stokes scattering.■2S (*USP30*)

mark rights in the brand name for the article concerned; and, finally, the manufacturer is obligated by federal law to include the established nonproprietary name in advertising and labeling.

Under the terms of the Drug Amendments of 1962 to the Federal Food, Drug, and Cosmetic Act, which became law October 10, 1962, the Secretary of Health and Human Services is authorized to designate an official name for any drug wherever deemed "necessary or desirable in the interest of usefulness and simplicity."[3]

The Commissioner of Food and Drugs and the Secretary of Health and Human Services published in the *Federal Register* regulations effective November 26, 1984, which state, in part:

"Sec. 299.4 Established names of drugs."

"(e) The Food and Drug Administration will not routinely designate official names under section 508 of the act. As a result, the established name under section 502(e) of the act will ordinarily be either the compendial name of the drug or, if there is no compendial name, the common ~~or~~

■and■2S (*USP30*)
usual name of the drug. Interested persons, in the absence of the designation by the Food and Drug Administration of an official name, may rely on as the established name for any drug the current compendial name or the USAN adopted name listed in *USAN and the USP Dictionary of Drug Names.*"[4]

It will be noted that the monographs on the biologics, which are produced under licenses issued by the Secretary of the U.S. Department of Health and Human Services, represent a special case. Although efforts continue toward achieving uniformity, there may be a difference between the respective title required by federal law and the USP title. Such differences are fewer than in past revisions of the Pharmacopeia. The USP title, where different from the FDA ~~Bureau of Biologics~~

■Center for Biologics Evaluation and Research■2S (*USP30*)
title, does not necessarily constitute a synonym for labeling purposes; the conditions of licensing the biologic concerned require that each such article be designated by the name appearing in the product license issued to the manufacturer. Where a USP title differs from the title in the federal regulations, the former has been adopted with a view to usefulness, simplicity, and conformity with the principles governing the selection of monograph titles generally.

Add the following:

■GENERAL NOMENCLATURE FORMS

Some monograph titles existing in the *USP–NF* do not conform to the formats outlined in this general information chapter. Typically, these monograph titles were adopted before the establishment of the title formats and nomenclature policies presented in this general information chapter. Such monograph titles may be subject to subsequent revision and should not be interpreted as precedents for other monograph titles.

Standardized forms of nomenclature have been devised in the interest of achieving uniformity for naming compendial articles. The general nomenclature forms that follow illustrate the terminology used throughout the official compendia for consistency in establishing titles of monographs on official pharmaceutical dosage forms and preparations. Examples are shown for the more frequently encountered categories of dosage forms.

For a variety of dosage forms, titles are in the following general form:

[DRUG][ROUTE OF ADMINISTRATION]
[DOSAGE FORM]

Examples:

Calcium Carbonate Oral Suspension
Cetylpyridinium Chloride Topical Solution
Dexamethasone Ophthalmic Suspension
Epinephrine Bitartrate Ophthalmic Solution
Isosorbide Dinitrate Sublingual Tablets
Miconazole Nitrate Topical Powder
Triple Sulfa Vaginal Cream

The term for route of administration is omitted for those dosage forms for which the route of administration is understood. The general form then becomes simply

[DRUG] [DOSAGE FORM]

Thus, capsules, tablets, and lozenges are administered via the oral route unless otherwise indicated by the title.

Examples:

Acetaminophen Capsules
Aminophylline Delayed-Release Tablets
Aspirin Extended-Release Tablets
Hexylresorcinol Lozenges
Meperidine Hydrochloride Tablets

Drugs that are injected may be administered via the intravenous, intramuscular, subcutaneous, etc., route; the route being specified in the labeling rather than in the name.

Examples:

Aurothioglucose Injectable Suspension
Epinephrine Injection
Fluorouracil Injection

[3] F.D.&C. Act, Sec. 508 [358].
[4] 53 Fed. Reg. 5369 (1988) amending 21 CFR § 299.4.

Hydrocortisone Acetate Injectable Suspension

Phytonadione Injectable Emulsion

Creams, ointments, lotions, and pastes are applied topically, unless otherwise indicated by the name.

Examples:

Benzoyl Peroxide Lotion

Betamethasone Dipropionate Cream

Estradiol Vaginal Cream

Nystatin Ointment

Zinc Oxide Paste

The term ''for'' is included in names, as appropriate, of preparations for which a solid drug substance must be dissolved or suspended in a suitable liquid to obtain a dosage form, and the general form becomes

[DRUG] FOR [ROUTE OF ADMINISTRATION][DOSAGE FORM]

Examples:

Ampicillin for Oral Suspension

Epinephrine Bitartrate for Ophthalmic Solution

Nafcillin for Injection

Spectinomycin for Injectable Suspension

In some instances, the drug is supplied in one dosage form for the preparation of the intended dosage form.

Examples:

Aspirin Effervescent Tablets for Oral Solution

Methadone Hydrochloride Tablets for Oral Suspension

Papain Tablets for Topical Solution

Systems are preparations of drugs in carrier devices that are applied topically or inserted into body cavities, from which drugs are released gradually over extended times, after which the carrier device is removed. The general form for a system is

[DRUG] [ROUTE] [SYSTEM]

Examples:

Nicotine Transdermal System

Progesterone Intrauterine Contraceptive System

The term ''Vaginal Inserts'', rather than ''Vaginal Tablets'' and ''Vaginal Capsules'', is used in the title of this type of vaginal preparation to avoid the potential for misuse of these products if only the term ''Tablets'' or ''Capsules'' were to appear in the title.

Example:

Clotrimazole Vaginal Inserts

The term ''Suppositories'' is used in the titles of preparations that are intended primarily for rectal administration. Suppositories that are intended for vaginal administration contain the term ''Vaginal Suppositories'' in the titles.

Examples:

Aspirin Suppositories

Miconazole Nitrate Vaginal Suppositories

Some drugs are available as concentrated solutions that are not intended for direct administration to humans or animals, but are to be diluted with suitable liquid vehicles to obtain the intended preparation. The general form for these preparations, which are not dosage forms, is

[DRUG][CONCENTRATE]

Examples:

Isosorbide Concentrate (used to prepare Isosorbide Oral Solution)

Glutaral Concentrate (used to prepare Glutaral Disinfectant Solution)

For products intended for parenteral administration, the use of the word ''Concentrate'' in the monograph title is restricted to one specific monograph, Potassium Chloride for Injection Concentrate. The word ''Concentrate'' should not appear in the monograph title for any other parenteral product; rather, this issue is to be addressed in the product labeling.

Some drugs are supplied as preparations that may be intermediates used for convenience in formulating finished dosage forms. The general form for such preparations, which are not finished dosage forms, is

[DRUG][PREPARATION]

Examples:

Vitamin E Preparation

Cranberry Liquid Preparation■2S (*USP30*)

Add the following:

▪SALT NOMENCLATURE POLICY

The USP follows the policy below for naming dosage form monographs:

> The term used in the title of a monograph for a dosage form formulated with a salt of an acid or base shall be the same as that used in expressing the strength of the article.
>
> Where the strength is expressed in terms of the salt, the same salt name is used in the monograph title.
>
> Where the strength is expressed in terms of the free acid or base, the same acid or base name is used in the monograph title.

With this policy, the dosage form monograph title uses the name of the molecule on which dosing and monitoring are based. Exceptions to the policy may rarely be made with suitable justification.

The application of this policy (1) is based on the strength that appears in FDA-approved labeling, (2) is intended for use in titles of monographs on dosage forms formulated from salts of organic acids and bases, (3) is not used in titles of dosage form monographs defined as containing esters, and (4) is not used in titles of drug substance monographs.

The *Salt Nomenclature Policy* is followed by USP in naming dosage forms that are newly admitted to the *United States Pharmacopeia.* Revising existing monographs on dosage forms to conform to the policy is not intended, except in cases where other revisions to the monograph would require labeling changes or where the USP Council of Experts determines that, for reasons such as safety, a nomenclature change is warranted.

When existing monographs are being revised or when new monographs that will require relabeling of the products are adopted, a delayed implementation of official dates of change of nomenclature and labeling is usually followed. Exceptions to the approach using a delayed implementation date are considered on an individual basis. For example, an earlier rather than a delayed implementation date may be considered in cases where public health and safety are an issue.■2S (*USP30*)

Add the following:

▪POLICY FOR POSTPONEMENT SCHEDULES

It is the practice of USP to postpone the official dates of nomenclature and labeling revisions for a reasonable time primarily to allow for product label changes to be made and to allow health practitioners and consumers time to become familiar with the new terminology. A postponement period of 18 months is usually applied when only one or a small number of products is affected. A postponement period of 30 months is usually applied when names or labeling of multisource products or multiproduct lines of a firm's preparations are being changed. A postponement period of 60 months is usually applied for title and labeling changes that affect excipients, because such changes would require relabeling of very large numbers of prescription-only and OTC preparations.

There may be exceptions to this postponement schedule where a shorter time is needed in order to specify nomenclature and labeling changes in cases where public health and safety are a concern.

The assignment of a postponement schedule is handled by the USP Expert Committee on Nomenclature. The postponement schedules are presented below. USP's implementation of a postponement schedule is automatic, unless an exception is sought. Exceptions to the postponement schedule are rarely made, and must have suitable justification as well as the ap-

proval of the Expert Committee on Nomenclature. Any questions or concerns regarding this postponement schedule may be addressed to the USP staff liaison assigned to the Expert Committee on Nomenclature.

18 months—Schedule for title and labeling changes for a drug product. One or few companies are involved. *Example:* Sterile [Drug] change to [Drug] for Injection.

30 months—Schedule for title and labeling changes for prescription-only and OTC products.

1. Extensive product line for a company. *Examples:* syrups and elixirs.
2. Several companies are involved. *Examples:* syrups and elixirs; lotions; sunscreens.

60 months—Schedule for title and labeling changes for excipient monographs. Ingredient names in numerous multisource products are affected.■2S (*USP30*)

BRIEFING

⟨**1150**⟩ **Pharmaceutical Stability,** *USP 29* page 2994. It is proposed to revise this general chapter to include *Controlled Cold Temperature,* which was proposed to be added in the *General Notices and Requirements* on page 721 of *PF* 31(3) [May–June 2005] under *Preservation, Packaging, Storage, and Labeling* (see *Storage Temperature and Humidity*) and will become official in the *Second Supplement* to *USP 29–NF 24* with an official date of August 1, 2006.

(P&S: D. Hunt) RTS—C45420

Change to read:

Controlled Room Temperature

▪and Controlled Cold Temperature■2S (*USP30*)

Controlled room temperature

▪and controlled cold temperature■2S (*USP30*)
(see *Storage Temperature and Humidity* in *Preservation, Packaging, Storage, and Labeling* under *General Notices and Requirements*) delineate the allowable tolerance in storage circumstances at any location in the chain of distribution (e.g., pharmacies, hospitals, and warehouses). These terminologies also allow patients or consumers to be counseled as to appropriate storage for the product. Products may be labeled either to store at controlled room temperature or to store at temperatures "up to 25°" where labeling is supported by long-term stability studies at the designated storage condition of 25°. *Controlled Room Temperature* limits the permissible excursions to those consistent with the maintenance of a mean kinetic temperature calculated to be not more than 25°.

▪Products may be labeled either to store at controlled cold temperature or to store at temperatures "up to 8°" where labeling is supported by long-term stability studies at the designated storage condition of 8°. *Controlled Cold Temperature* limits the permissible excursions to those consistent with the maintenance of a mean kinetic temperature calculated to be not more than 8°.■2S (*USP30*)
See *Mean Kinetic Temperature.* The common international guideline for long-term stability studies specifies 25 ± 2° at 60 ± 5% relative humidity. Accelerated studies are specified at 40 ± 2° and at 75 ± 5% relative humidity. Accelerated studies also allow the interpretation of data and information on short-term spikes in storage conditions in addition to the excursions allowed by controlled room temperature.

The term "room temperature" is used in different ways in different countries, and for products to be shipped outside the continental U.S. it is usually preferable for product labeling to refer to a maximum storage temperature or temperature range in degrees Celsius.

BRIEFING

⟨**1226**⟩ **Verification of Compendial Procedures,** page 555 of *PF* 31(2) [Mar.–Apr. 2005]. On the basis of numerous comments received following this general information chapter's initial publication and its presentation at the USP Annual Scientific Meeting in San Diego in September 2005, a newly proposed version is presented that attempts to incorporate these comments in order to provide general information on verifying the suitability of a compendial procedure under actual conditions of use, as stated in 21 CFR 211.194(a)(2). Requirements for compendial procedure verification are currently not addressed by regulatory authorities and standards-setting organizations; therefore the goal of this chapter is to clarify the topic and provide consistency between laboratories and regulatory agencies. This revised version provides a high-level view of the verification process. Although *Tables 1* and *2* were removed, a description of how the performance characteristics might be applied to method verification is mentioned. This would still provide the necessary guidance, while allowing the user the flexibility to determine which performance characteristics are most appropriate for the method being verified. Also included is language stating that this chapter is not intended for retroactive application to already successfully established laboratory procedures.

(GC: H. Pappa) RTS—C43714; 43045; 43047; 43068; 43100; 43101; 43141; 43164; 43180; 43287; 43314; 43315; 43316

In-Process Revision

Add the following:

■⟨1226⟩ VERIFICATION OF COMPENDIAL PROCEDURES

~~Calibration, validation, and traceability are core metrological components. The validation of analytical procedures is a standard practice in pharmaceutical analytical laboratories because it ensures the accuracy and reliability of generated data. General information chapter *Validation of Compendial Methods* ⟨1225⟩ provides guidance on characteristics that should be evaluated for various test categories and on the documentation that should accompany analytical procedures submitted for inclusion in *USP–NF*. Chapter ⟨1225⟩ does not provide guidance on verifying the suitability of compendial procedures. The intent of general information chapter ⟨1226⟩ is to provide guidance to laboratories on how to verify that a compendial procedure that is being performed for the first time will yield acceptable results utilizing the laboratories' personnel, equipment, and reagents. Verification consists of assessing selected *Analytical Performance Characteristics,* which are described in chapter ⟨1225⟩, to generate appropriate, relevant data rather than repeating the validation process.~~

~~Users of compendial analytical procedures are not required to validate these procedures when first used in their laboratories, but suitability should be established under actual conditions of use. In the United States, this requirement is established in 21 CFR 211.194(a)(2), which states that "the suitability of all testing methods used shall be verified under actual conditions of use." In cases where multiple sites or laboratories will perform the monograph test for the first time, one laboratory may verify the suitability of the procedure, and then conduct a procedure transfer to the other locations.~~

~~Microbiological procedures are not included in this chapter because they are covered in USP general chapters *Antimicrobial Effectiveness Testing* ⟨51⟩, *Microbial Limit Tests* ⟨61⟩, *Sterility Tests* ⟨71⟩, and *Validation of Microbial Recovery from Pharmacopeial Articles* ⟨1227⟩.~~

~~VERIFICATION PROCESS~~

~~Laboratory personnel should have the appropriate experience, knowledge, and training to understand and be able to perform the compendial procedure as written. An approved document should be available prior to performing the compendial procedure; this document describes the procedure to be verified, establishes the number and identity of lots or batches of articles that will be used in the verification test, details the analytical performance characteristics (see *Table 1*) to be evaluated, and specifies the range of results that will be considered acceptable. Any deviation from the recommendations in chapter ⟨1226⟩ should be justified in this documentation. Acceptance criteria should be established such that results meeting the requirements will provide confidence that the compendial procedure will perform suitably. Typically, the acceptance criteria would be more stringent than the compendial monograph specifications for the test.~~

~~Once the samples described in the verification document are analyzed, the data should be compared to the predetermined and approved acceptance criteria and the results documented. Documentation should include a summary of the analytical data, an assessment of the results and comparison to the acceptance criteria, and a conclusion as to the acceptability of the data as they relate to the ability of the laboratory analysts to successfully perform the compendial procedure in the particular laboratory. Once the results are shown to be acceptable, it can be concluded that the USP procedure will perform in the laboratory as intended.~~

~~If any of the acceptance criteria are not met, the source of the problem should be identified and corrective action, where appropriate, should be initiated (e.g., providing additional training for the laboratory analyst, or contacting USP staff for clarification of the procedure). Revisions to the verification document to include the implemented corrective actions should be made before the procedure is repeated. The initial unacceptable results, the most probable cause, and corrective actions implemented should be described in the final document.~~

If, after several attempts, the verification of the compendial procedure is not successful, and assistance from USP staff has not resolved the problem, it may be concluded that the procedure may not be suitable for use with the article being tested. It may then be necessary to develop and validate an alternate procedure and submit the data to USP with a recommendation to replace the current compendial procedure with the new procedure. In some situations it may be possible to revise the current procedure by adding the new procedure as an alternative to the current procedure.[+] The final internal verification documentation should summarize the inability to verify the compendial procedure and describe the action that was taken.

ANALYTICAL PERFORMANCE CHARACTERISTICS

The analytical performance characteristics that are typically included in the validation of procedures and that should be considered for the verification process are defined in general information chapter ⟨1225⟩.

Table 2 in chapter ⟨1225⟩ lists the analytical performance characteristics to be determined for several categories of assays to ensure that the procedure is validated. However, not all of the characteristics listed in chapter ⟨1225⟩, *Table 2,* need to be repeated for the verification of the compendial procedure in a laboratory. Depending on the type of test to be verified, different analytical performance characteristics should be studied.

Table 1 in this chapter includes examples of analytical performance characteristics that should be studied for various common analytical techniques applied to drug substances and excipients; corresponding information for dosage forms for each of the categories is presented in *Table 2* of this chapter. For several of the categories, the number of analytical performance characteristics to be studied for dosage forms is generally larger than that for excipients or drug substances because of the greater complexity of a drug product. Where the technique is not suitable for the category, no data elements are displayed in the table.

In addition to the analytical performance characteristics summarized in *Table 1,* the evaluation of other characteristics may be considered in order to provide further assurance that the procedure will continue to perform as intended when unplanned changes occur in analysts, equipment, reagent, or environmental conditions, or when deliberate adjustments are made in procedure parameters. The sensitivity of the procedure to these changes can be measured by a robustness study. An appropriate ruggedness study may be necessary if there is a possibility that the procedure will be used by more than one analyst or if the procedure is to be transferred to multiple company sites or laboratories. The design of the ruggedness study will depend on how the procedure will be used. The definition of ruggedness and robustness can be found in chapter ⟨1225⟩. Verification is not required for general tests such as residue on ignition, unless there is a reason to suspect that the compendial procedure is not appropriate for the article under test.

[+] Request for revision includes both new monograph or general chapters and suggested changes to existing monographs and general chapters. See the USP Guideline for Submitting Requests for Revision to the USP–NF.

In-Process Revision

The intent of this chapter is to provide general information to laboratories on the verification of compendial procedures that are being performed for the first time to yield acceptable results utilizing the laboratories' personnel, equipment, and reagents. This chapter is not intended for retroactive application to already successfully established laboratory procedures. The chapter *Validation of Compendial Procedures* ⟨1225⟩ provides general information on characteristics that should be evaluated for various test categories and on the documentation that should accompany analytical procedures submitted for inclusion in *USP–NF.* Verification consists of assessing selected analytical performance characteristics, such as those that are described in chapter ⟨1225⟩, to generate appropriate, relevant data rather than repeating the validation process.

Users of compendial analytical procedures are typically not required to validate these procedures when first used in their laboratories, but documented evidence of suitability should be established under actual conditions of use. In the United States, this requirement is established in 21 CFR 211.194(a)(2) of the current Good Manufacturing Practice regulations, which states that the ''suitability of all testing methods used shall be verified under actual conditions of use.''

Verification of microbiological procedures is not covered in this chapter because it is covered in USP general chapters *Antimicrobial Effectiveness* ⟨51⟩, *Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests* ⟨61⟩, *Microbiological Examination of Nonsterile Products: Tests for Specified Microorganisms* ⟨62⟩, *Sterility Tests* ⟨71⟩, and *Validation of Microbial Recovery from Pharmacopeial Articles* ⟨1227⟩.

VERIFICATION PROCESS

Laboratory personnel should have the appropriate experience, knowledge, and training to understand and be able to perform the compendial procedures as written. Acceptance criteria for verification should be established such that results meeting the requirements will provide confidence that the compendial procedure will perform suitably as intended.

If the verification of the compendial procedure is not successful, and assistance from USP staff has not resolved the problem, it may be concluded that the procedure may not be suitable for use with the article being tested in that laboratory. It may then be necessary to develop and validate an alternate procedure as allowed in the *General Notices*. The alternate procedure may be submitted to USP, along with the appropriate data, to support a proposal for inclusion or replacement of the current compendial procedure.

VERIFICATION REQUIREMENTS

Verification requirements should be based on an assessment of the complexity of both the procedure and the material to which the procedure is applied. Although complete revalidation of a compendial method is not required to verify the suitability of the method under actual conditions of use, some of the analytical performance characteristics listed in chapter ⟨1225⟩, *Table 2,* may be used for the verification process. Only those characteristics that are considered to be appropriate for the verification of the particular method need to be evaluated. This implies that a verification continuum exists in terms of which and how many analytical procedural characteristics need to be evaluated for any one USP procedure. The degree and extent of the verification process will depend on the level of training and experience of the laboratory personnel, on the type of procedure and its associated equipment or instrumentation, on the specific procedural steps, and on which article(s) are being tested.

As an example, an assessment of specificity is a key parameter in verifying that a compendial procedure is suitable for use in assaying drug substances and drug products. For instance, acceptable specificity for a chromatographic method may be verified by conformance with system suitability resolution requirements (if specified in the method). However, drug substances from different suppliers may have different

impurity profiles that are not addressed by the compendial test procedure. Similarly, the excipients in a drug product can vary widely among manufacturers and may have the potential to directly interfere with the procedure or cause the formation of impurities that are not addressed by the compendial procedure. In these cases, a more thorough assessment of specificity may be required to demonstrate suitability of the method for the particular drug substance or product. Other analytical performance characteristics such as an assessment of the limit of detection for an impurities procedure or precision for an assay procedure may be useful to demonstrate the suitability of the compendial method under actual conditions of use.

Verification is not required for common compendial test procedures that are routinely performed in a laboratory. Examples include, but are not limited to, loss on drying, residue on ignition, various wet chemical procedures such as acid value, and simple instrumental methods such as pH measurements, unless there is an indication that the compendial procedure is not appropriate for the article under test. However, for the application of already established routine procedures to compendial articles tested for the first time, it is recommended that consideration be given to any new or different sample handling or solution preparation requirements.■2S (*USP30*)

■[*109-69-3*]■1S (*USP30*)
—Clear, colorless, volatile liquid.▲*USP29*[*Caution—Highly flammable.]* Practically insoluble in water. Miscible with alcohol and with ether.

~~*Assay*~~ ~~When examined by gas–liquid chromatography, it shows a purity of not less than 98%. The following conditions have been found suitable for assaying the article: a 3-mm × 1.8-m stainless steel column packed with phase G16 on support S1. Helium, flowing at a rate of about 40 mL per minute, is the carrier gas, the detector temperature is about 310°, the injection port temperature is about 230°, and the column temperature is programmed to rise at 10° per minute from 35° to 150°. A flame ionization detector is employed.~~

~~*Boiling range* ⟨721⟩: between 76° and 80°, within a 2° range.~~

~~*Refractive index* ⟨831⟩: between 1.4015 and 1.4035 at 20°.~~

~~*Acidity* Add phenolphthalein TS to 75 mL, and titrate with 0.1 N potassium hydroxide in methanol to a faint pink color that persists, with shaking, for 1.5 seconds: not more than 0.91 mL is required (about 0.005% as HCl).~~

~~*Water* ⟨921⟩: not more than 0.02%, determined by the *Titrimetric Method*.~~

~~*Residue after evaporation* Evaporate about 60 mL (50 g), accurately weighed, in a tared platinum dish on a steam bath, and dry at 105° for 1 hour: not more than 0.005% is found.~~

■Use HPLC grade.■2S (*USP30*)

BRIEFING

Casein, Hammersten. It is proposed to add this new reagent used to prepare the *Casein substrate* in the *Assay* test in the monograph for *Papain*.

(HDQ: M. Marques) RTS—C44880

Add the following:

■**Casein, Hammersten—**[*9000-71-9*].

[NOTE—A suitable grade is available from *www.emdchemicals.com*, catalog number CX0525-1.]■2S (*USP30*)

BRIEFING

Diaveridine. It is proposed to add this new reagent used in the test for *Chromatographic purity* in the *USP* monograph for *Trimethoprim*.

(HDQ: M. Marques) RTS—C46222

Add the following:

■**Diaveridine** *(5-([3,4-Dimethoxyphenyl]methyl)-2,4-pyrimidinediamine),* $C_{13}H_{16}N_4O_2$—**260.3**[*5355-16-8*]—Use a suitable grade.■2S (*USP30*)

BRIEFING

Eriochrome Black T–Sodium Chloride Indicator. It is proposed to add this new reagent to be used in the test for *Disodium acetate* in the Adoption Stage 6 proposal for *Edetate Calcium Disodium,* which also appears in this issue of *PF*.

(HDQ: M. Marques) RTS—C45162

Add the following:

■**Eriochrome Black T–Sodium Chloride Indicator—**Mix 0.1 g of eriochrome black T and 10 g of sodium chloride, and triturate until the mixture becomes homogenous.■2S (*USP30*)

BRIEFING

1-Nonyl Alcohol, *USP 29* page 3141. To facilitate the procurement of this reagent and other reagents appearing in this issue of *PF* (see related cross-references), it is proposed to include CAS numbers and relevant synonyms, as necessary.

(HDQ: M. Marques) RTS—43575-2

Change to read:

1-Nonyl Alcohol *(1-Nonanol),* $CH_3(CH_2)_8OH$—**144.25**

■[*143-08-8*]■2S (*USP30*)

—Colorless liquid.

Assay—Use a suitable gas chromatograph equipped with a flame-ionization detector, helium being used as the carrier gas at a flow rate of about 40 mL per minute. The following conditions have been found suitable: a 3.2-mm × 1.83-m stainless steel column packed with 20% phase G16 on support S1A; the injection port, column, and detector temperatures are maintained at about 250°, 160°, and 310°, respectively. Not less than 97% of $C_9H_{20}O$ is found.

Refractive index ⟨831⟩: between 1.432 and 1.434 at 20°.

BRIEFING

Octadecyl Silane, *USP 29* page 3142—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43576-3

Change to read:

Octadecyl Silane

■—[*18623-11-5*]■2S (*USP30*)
—This reagent is formed *in situ* by reaction of the column support with a suitable silylating agent such as octadecyl trichlorosilane.

BRIEFING

Octanophenone, *USP 29* page 3142—See briefing under *1-Nonyl Alcohol.*

Change to read:

Octanophenone, $C_{14}H_{20}O$—**204.31**

■[*1674-37-9*]■2S (*USP30*)
—Colorless liquid.

Assay—

MOBILE PHASE—Prepare a filtered and degassed mixture of acetonitrile and water (7 : 3).

PROCEDURE—Inject about 20 µL into a suitable liquid chromatograph (see *Chromatography* ⟨621⟩) equipped with a 254-nm detector and a 4.6-mm × 15.0-cm column that contains packing L1. The flow rate is about 2 mL per minute. The area of the $C_{14}H_{20}O$ peak is not less than 99% of the total peak area.

Refractive index ⟨831⟩: 1.5043 at 20°.

BRIEFING

Orange G, *USP 29* page 3142—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43576-5

Change to read:

Orange G *(the sodium salt of azobenzene-betanaphthol disulfonic acid),* $C_6H_5N{:}NC_{10}H_4(OH)(SO_3Na)_2$-2,6,8—**452.37**

■[*1936-15-8*]■2S (*USP30*)
—Orange to brick-red powder or dark red crystals. Readily soluble in water, yielding an orange-yellow solution; slightly soluble in alcohol; insoluble in ether and in chloroform. The addition of tannic acid TS to its 1 in 500 solution causes no precipitation *(acid color)*. The addition of hydrochloric acid to a mixture of 500 mg of zinc dust and 10 mL of its 1 in 500 solution produces decolorization. When filtered, the colorless filtrate, on standing exposed to air, does not regain its original color *(presence of azo-group)*. When heated, orange G does not deflagrate (distinction from *nitro colors*). The addition of barium or calcium chloride TS to a concentrated solution of orange G produces a colored, crystalline precipitate. The addition of hydrochloric acid to its 1 in 500 solution produces no change; the addition of sodium hydroxide TS to a similar solution produces a yellowish red to a Bordeaux color but no precipitation. Orange G dissolves in sulfuric acid with an orange to yellowish-red color. No change in color results upon diluting the solution cautiously with water.

BRIEFING

Orcinol, *USP 29* page 3142—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43576-6

Change to read:

Orcinol *(5-Methylresorcinol),* $C_7H_8O_2 \cdot H_2O$—**142.15**

■[*6153-39-5*]■2S (*USP30*)
—White to light tan crystals.

Assay—Transfer about 60 mg, accurately weighed, to a 100-mL volumetric flask, dissolve in methanol, dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask and dilute with methanol to volume, and mix. Using a suitable spectrophotometer, 1-cm cells, and methanol as the blank, record the absorbance of the solution at the wavelength of maximum absorbance at about 273 nm. From the observed absorbance, calculate the absorptivity (see *Spectrophotometry and Light-Scattering* ⟨851⟩): the absorptivity is not less than 13.2, corresponding to not less than 98% of $C_7H_8O_2 \cdot H_2O$.

Melting range ⟨741⟩: between 58° and 61°.

(HDQ: M. Marques) RTS—43576-11

Change to read:

***Para*-aminobenzoic Acid** *(p-Aminobenzoic Acid),* $H_2NC_6H_4COOH$—**137.14**

■[*150-13-0*]■2S *(USP30)*
—White or slightly yellow ▲▲*USP29* crystals or crystalline powder, becoming discolored on exposure to air or light. One g dissolves in 170 mL of water, in 9 mL of boiling water, in 8 mL of alcohol, and in 50 mL of ether. Freely soluble in solutions of alkali hydroxides

and carbonates; soluble in warm glycerin; sparingly soluble in diluted hydrochloric acid; slightly soluble in chloroform. Store in tight, light-resistant containers.

Assay—Accurately weigh about 300 mg, previously dried at 105° for 2 hours, and transfer to a beaker or casserole. Add 5 mL of hydrochloric acid and 50 mL of water, and stir until dissolved. Cool to about 15°, add about 25 g of crushed ice, and slowly titrate with 0.1 M sodium nitrite VS until a glass rod dipped into the titrated solution produces an immediate blue ring when touched to starch iodide paper. When the titration is complete, the endpoint is reproducible after the mixture has been allowed to stand for 1 minute. Each mL of 0.1 M sodium nitrite is equivalent to 13.71 mg of $C_7H_7NO_2$. Not less than 98.5% is found.

Melting range ⟨741⟩: between 186° and 189°.

Loss on drying ⟨731⟩—Dry it at 105° for 2 hours: it loses not more than 0.2% of its weight.

Residue on ignition (Reagent test): not more than 0.1%.

BRIEFING

Paraformaldehyde, *USP 29* page 3143—See briefing under *1-Nonyl Alcohol.*

Change to read:

Paraformaldehyde, $(CH_2O)_n$

■—[*30525-89-4*]■2S (*USP30*)
—Fine, white powder. ▲*USP29*

Assay—Transfer about 1 g, accurately weighed, to a 250-mL conical flask containing 50.0 mL of 1 N sodium hydroxide VS, and mix by swirling. Immediately, and slowly, add 50 mL of hydrogen peroxide TS, previously neutralized to bromothymol blue, through a small funnel placed in the neck of the flask. After the reaction moderates, rinse the funnel and inner wall of the flask with water, allow the solution to stand for 30 minutes, add bromothymol blue TS, and titrate the excess alkali with 1 N sulfuric acid VS. Each mL of 1 N sodium hydroxide is equivalent to 30.03 mg of HCHO: not less than 95% is found.

Residue on ignition: not more than 0.1%.

Solubility in ammonia—Dissolve 5 g in 50 mL of ammonia TS: a practically clear, colorless solution results.

Reaction—Shake 1 g with 20 mL of water for about 1 minute, and filter: the filtrate is neutral to litmus.

BRIEFING

Pentadecane, *USP 29* page 3143—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43576-13

Change to read:

Change to read:

2-Phenoxyethanol, $C_6H_5OCH_2CH_2OH$—**138.16**

■[*122-99-6*]■2S *(USP30)*
—Colorless, slightly viscous liquid. Soluble in water. Miscible with alcohol, with acetone, and with glycerin. Density: about 1.107.

Assay—To 2 g, accurately weighed, add 10 mL of a freshly prepared solution made by dissolving 25 g of acetic anhydride in 100 g of anhydrous pyridine. Swirl to mix the liquids, heat on a steam bath for 45 minutes, add 10 mL of water, heat for 2 additional minutes, and cool. Add 10 mL of normal butyl alcohol, shake vigorously, add phenolphthalein TS, and titrate with 1 N sodium hydroxide VS. Perform a blank test using the same quantities of the same reagents, and in the same manner, and make any necessary correction. Each mL of 1 N sodium hydroxide is equivalent to 138.2 mg of $C_8H_{10}O_2$. Not less than 99% is found.

Phenol—Add 0.2 mL of it to 20 mL of water, mix, and to 5 mL of the mixture add 0.2 mL of Millon's reagent. Warm the solution at 60° for 90 seconds, and allow to stand: no pink or red color is produced within 1 minute.

BRIEFING

Phenyl Isocyanate, *USP 29* page 3144—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43583-3

Change to read:

Phenyl Isocyanate, C_6H_5NCO—**119.12**

■[*103-71-9*]■2S (*USP30*)
—Clear, colorless to straw-yellow liquid of medium volatility. *[Caution—Phenyl Isocyanate is a violent lacrimator, and the vapor is highly toxic. Handle with care.]*

Assay—Transfer 250 mg, accurately weighed, to a glass-stoppered, 250-mL flask. Exercise care to avoid loss by volatilization, and avoid breathing the vapor. Add 20 mL of butylamine solution (25 g of butylamine diluted to 1000 mL with dioxane previously dried over potassium hydroxide pellets), insert the stopper in the flask, and allow to stand for 15 minutes. Add a few drops of methyl red TS and 25 mL of water, and titrate the excess amine with 0.1 N sulfuric acid VS. Perform a blank titration on 20 mL of the butylamine solution (see *Residual Titrations* ⟨541⟩). Subtract the volume of 0.1 N sulfuric acid consumed in the test specimen titration from that consumed in the blank titration. Each mL of 0.1 N sulfuric acid, representing this difference, is equivalent to 11.91 mg of C_6H_5NCO: not less than 97.0% of C_6H_5NCO is found.

BRIEFING

Phthalimide, *USP 29* page 3145—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43583-15

Change to read:

Phthalimide, $C_8H_5NO_2$—**147.13**

■[*85-41-6*]■2S (*USP30*)
—White powder.

Assay—

MOBILE PHASE—Prepare a mixture of isooctane and methyl-*tert*-butyl ether (88 : 12).

PROCEDURE—Inject about 20 µL into a suitable liquid chromatograph (see *Chromatography*⟨621⟩) equipped with a 230-nm detector and a 4.6-mm × 15-cm column that contains packing L3. The flow rate is about 2 mL per minute. The area of the $C_8H_5NO_2$ peak is not less than 99% of the total peak area.

Melting range ⟨741⟩: between 233° and 235°, with decomposition.

BRIEFING

2-Picoline, *USP 29* page 3146—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43583-16

Change to read:

2-Picoline, C_6H_7N—**93.13**

■[*109-06-8*]■2S (*USP30*)
—Colorless to yellowish liquid.

Assay—Inject an appropriate specimen into a suitable gas chromatograph (see *Chromatography*⟨621⟩) equipped with a flame-ionization detector, helium being used as the carrier gas. The following conditions have been found suitable: a 2-mm × 2-m glass column packed with 20% liquid phase G16 on 80- to 100-mesh support S1C; the injection port temperature is maintained at 140°; the detector temperature is maintained at 300°; the column temperature is maintained at 90° and programmed to rise 3° per minute to 140°. The area of the C_6H_7N peak is not less than 98% of the total peak area.

Refractive index ⟨831⟩: 1.500 ± 0.002 at 20°.

BRIEFING

Picric Acid, *USP 29* page 3146—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43583-17

Change to read:

Picric Acid *(2,4,6-Trinitrophenol; Trinitrophenol),* $C_6H_2(OH)(NO_2)_3$-1,2,4,6—**229.10**

■[*88-89-1*]■2S (*USP30*)
—Use ACS reagent grade.

BRIEFING

Picrolonic Acid, *USP 29* page 3146—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43583-18

Change to read:

Picrolonic Acid *(3-Methyl-4-nitro-1-(p-nitrophenyl)-5-pyrazolone),* $C_{10}H_8N_4O_5$—**264.19**

■[*550-74-3*]■2S (*USP30*)
—Yellow to brownish-yellow, crystalline powder. Slightly soluble in water; soluble in alcohol, in chloroform, in ether, in benzene, and in solutions of alkali hydroxides.

Melting range ⟨741⟩: between 115° and 117°.

Residue on ignition (Reagent test): negligible, from 200 mg.

In-Process Revision

Sensitiveness—Dissolve 25 mg in 10 mL of warm water containing 0.1 mL of glacial acetic acid, and filter the solution, if necessary. Dissolve 100 mg of calcium chloride in 250 mL of water, and mix. Heat 1 mL of the calcium chloride solution in a test tube to about 60°, then add to it 1 mL of the picrolonic acid solution: a bulky precipitate forms in 5 minutes or less.

BRIEFING

Pipemidic Acid, *USP 29* page 3146—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43583-19

Change to read:

Pipemidic Acid *(8-Ethyl-3,8-dihydro-5-oxo-2-(1-piperazinyl)pyrido[2,3-d]-pyrimidine-6-carboxylic acid),* $C_{14}H_{17}N_5O_3$—**303.3**

■[*51940-44-4*]■2S (*USP30*)
—Use a suitable grade.

BRIEFING

Piperidine, *USP 29* page 3146—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43583-20

Change to read:

Piperidine, $C_5H_{11}N$—**85.15**

■[*110-89-4*]■2S (*USP30*)
—Colorless liquid. Miscible with water and with alcohol. Specific gravity: about 0.860.

Congealing range ⟨651⟩: between 12° and 15°.

Boiling range (Reagent test)—Not less than 95% distills between 104° and 106°.

Refractive index: about 1.454.

BRIEFING

Platinic Chloride, *USP 29* page 3146—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43593-1

Change to read:

Platinic Chloride *(Chloroplatinic Acid),* $H_2PtCl_6 \cdot 6H_2O$—**517.90**

■[*16941-12-1*]■2S (*USP30*)
—Use ACS reagent grade Chloroplatinic Acid.

BRIEFING

Polyethylene Glycol 600, *USP 29* page 3146—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43593-2

Change to read:

Polyethylene Glycol 600

■—[*25322-68-3*]■2S (*USP30*)
—A clear, practically colorless, viscous liquid condensation polymer represented by $H(OCH_2CH_2)_nOH$, in which *n* varies from 12 to 14. Its average molecular weight is about 600.

It meets the requirements of all of the tests under *Polyethylene Glycol* (*NF* monograph) except *Limit of ethylene glycol and diethylene glycol.*

BRIEFING

Polyethylene Glycol 20,000, *USP 29* page 3146—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43593-3

Change to read:

Polyethylene Glycol 20,000

■—[*25322-68-3*]■2S (*USP30*)
—Molecular weight range: 15,000–20,000. Hard, white, waxy solid, usually supplied in flake form. Soluble in water with subsequent gel formation.

Viscosity of 25% solution ⟨911⟩—Add 50.0 g of test specimen to a 250-mL wide-mouth, screw-cap jar containing 150.0 g of water. Attach the cap securely to the jar, and roll on a mechanical roller until the test specimen is completely dissolved, in 2 to 4 hours. Allow the solution to stand until all air bubbles have disappeared. Another 2 to 4 hours may be required. Adjust the temperature of the solution to 37.8 ± 0.1°, and determine the kinematic viscosity on a suitable viscosimeter of the Ubbelohde type. The viscosity is not less than 100 centistokes.

pH ⟨791⟩: between 6.5 and 8.0 in a solution (1 in 20). [NOTE—A five-fold dilution of the test solution prepared for the *Viscosity of 25% solution* test may be used.]

Residue on ignition ⟨281⟩: not more than 0.7%, the use of sulfuric acid being omitted.

BRIEFING

Polyvinyl Alcohol, *USP 29* page 3146—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43593-4

Change to read:

Polyvinyl Alcohol, $(C_2H_4O)_n$

■—[*9002-89-5*]■2S (*USP30*)
—White powder. Soluble in water; insoluble in organic solvents.

pH ⟨791⟩: between 5.0 and 8.0, in a solution (1 in 25).

Loss on drying—Dry it at 110° to constant weight: it loses not more than 5% of its weight.

Residue on ignition: not more than 0.75%.

[NOTE—Suitable grades are available as catalog number U 232, from J.T. Baker Chemical Co., www.jtbaker.com.]

BRIEFING

Potassium Acetate, *USP 29* page 3146—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43593-5

Change to read:

Potassium Acetate, $KC_2H_3O_2$—**98.14**

■[*127-08-2*]■2S (*USP30*)
—Use ACS reagent grade.

BRIEFING

Potassium Bicarbonate, *USP 29* page 3146—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43593-6

Change to read:

Potassium Bicarbonate, $KHCO_3$—**100.12**

■[*298-14-6*]■2S (*USP30*)
—Use ACS reagent grade.

BRIEFING

Potassium Biphthalate, *USP 29* page 3146—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43593-7

Change to read:

Potassium Biphthalate *(Acid Potassium Phthalate; Phthalic Acid Monopotassium Salt; Potassium Hydrogen Phthalate Acidimetric Standard),* $KHC_6H_4(COO)_2$—**204.22**

■[*877-24-7*]■2S (*USP30*)
—Use ACS reagent grade Potassium Hydrogen Phthalate, Acidimetric Standard.

BRIEFING

Potassium Bisulfate, *USP 29* page 3146—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43593-8

Change to read:

Potassium Bisulfate, $KHSO_4$—**136.17**

■[*7646-93-7*]■2S (*USP30*)
—Fused, white, deliquescent masses or granules. Very soluble in water. When ignited, it evolves SO_3 and H_2O, changing first to potassium pyrosulfate, then to sulfate.

Acidity—Dissolve 4 g, accurately weighed, in 50 mL of water, add phenolphthalein TS, and titrate with 1 N alkali: it contains between 34% and 36%, calculated as H_2SO_4.

Insoluble matter and *ammonium hydroxide precipitate*—Dissolve 10 g in 100 mL of water, add methyl red TS, render slightly alkaline with ammonia TS, boil for 1 minute, and digest on a steam bath for 1 hour. Pass through a tared filtering crucible, wash thoroughly, and dry at 105° for 2 hours: the precipitate weighs not more than 1 mg (0.01%).

For the following tests, prepare a *Test solution* as follows. Dissolve 6 g in 45 mL of water, add 2 mL of hydrochloric acid, boil gently for 10 minutes, cool, and dilute with water to 60 mL.

Heavy metals (Reagent test)—To 30 mL of *Test solution* add phenolphthalein TS, and neutralize with ammonia TS. Add 0.5 mL of glacial acetic acid, dilute with water to 40 mL, and add 10 mL of hydrogen sulfide TS: any brown color produced is not darker than that of a control containing 10 mL of *Test solution* and 0.02 mg of added Pb (0.001%).

Iron ⟨241⟩—To 5 mL of *Test solution* add 2 mL of hydrochloric acid, and dilute with water to 47 mL: the solution shows not more than 0.01 mg of Fe (0.002%).

BRIEFING

Potassium Bromate, *USP 29* page 3146—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43593-9

Change to read:

Potassium Bromate, $KBrO_3$—**167.00**

■[*7758-01-2*]■2S (*USP30*)

Change to read:

Potassium Tellurite *(Potassium Tellurate IV),* K_2TeO_3—**253.79**

■[*7790-58-1*]■2S (*USP30*)
—White, granular powder. Soluble in water. Its solution is alkaline.

Assay—Weigh accurately about 120 mg, transfer to a beaker, and dissolve in a mixture of 10 mL of nitric acid, 10 mL of sulfuric acid, and 25 mL of water. Heat to boiling, and boil until copious fumes of sulfur trioxide are evolved. Cool, cautiously add 100 mL of water, heat to boiling, add 6 g of sodium fluoride, and titrate the hot solution with 0.1 N potassium permanganate VS. Each mL of 0.1 N potassium permanganate is equivalent to 12.69 mg of K_2TeO_3. Not less than 98% is found.

Chloride (Reagent test)—One g shows not more than 0.1 mg of Cl (0.01%).

BRIEFING

Pyridoxal Hydrochloride, *USP 29* page 3148—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43597-17

Change to read:

Pyridoxal Hydrochloride, $C_8H_9NO_3 \cdot HCl$—**203.62**

■[*65-22-5*]■2S (*USP30*)
—White to slightly yellow crystals or crystalline powder. Gradually darkens on exposure to air or sunlight. One g dissolves in about 2 mL of water and in about 25 mL of alcohol. Insoluble in acetone, in chloroform, and in ether. Its solutions are acid (pH about 3).

Melting range ⟨741⟩: between 171° and 175° with some decomposition.

Residue on ignition (Reagent test): not more than 0.1%.

Loss on drying ⟨731⟩—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.

Nitrogen content (Reagent test)—Determine by the Kjeldahl method, using a test specimen previously dried at 105° for 2 hours: between 6.7% and 7.1% of N is found.

Chloride content—Accurately weigh about 500 mg, previously dried at 105° for 2 hours, and dissolve in 50 mL of water. Add 3 mL of nitric acid and 50.0 mL of 0.1 N silver nitrate VS, then add 5 mL of nitrobenzene, shake for about 2 minutes, add ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS: each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of Cl. Between 17.2% and 17.7% is found.

■[*524-36-7*]■2S (*USP30*)
—White to slightly yellow crystals or crystalline powder. Gradually darkens on exposure to air or sunlight. One g dissolves in about 1 mL of water and in about 60 mL of alcohol. Insoluble in chloroform and in ether. Its solutions are acid.

Melting range ⟨741⟩: between 225° and 230°, with some decomposition.

Residue on ignition (Reagent test): not more than 0.15%.

Loss on drying ⟨731⟩—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.

Nitrogen content (Reagent test)—Determine by the Kjeldahl method, using a test specimen previously dried at 105° for 2 hours: between 11.3% and 11.8% of N is found.

Chloride content—Determine as directed in the test for *Chloride content* under *Pyridoxal Hydrochloride:* between 29.1% and 29.6% of Cl is found.

BRIEFING

1-(2-Pyridylazo)-2-naphthol, *USP 29* page 3148—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43597-20

Change to read:

1-(2-Pyridylazo)-2-naphthol, $C_{15}H_{11}N_3O$—**249.27**

■[*85-85-8*]■2S (*USP30*)
—Stable, orange-red crystals. Soluble in alcohol and in hot solutions of dilute alkalies; slightly soluble in water.

Melting range ⟨741⟩: between 140° and 142°.

Sensitiveness—Add 0.1 mL of a 1 in 1000 solution of it in alcohol to a mixture of 10 mL of water and 1 mL of a buffer solution prepared by mixing 80 mL of 0.2 M acetic acid and 20 mL of sodium acetate solution (8.2 in 100), and mix. To this solution add 1 mL of a mixture of 1 mL of cupric sulfate TS and 2 mL of water, and mix: the color changes from yellow to red.

BRIEFING

Pyrogallol, *USP 29* page 3148—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43599-1

—Clear liquid, colorless when freshly distilled, becoming yellow in a few days. ▲▲*USP29* Specific gravity: about 0.94. Insoluble in water; soluble in alcohol, in benzene, and in ether.

Boiling range (Reagent test)—Not less than 90% distills between 128° and 132°.

BRIEFING

Pyruvic Acid, *USP 29* page 3148—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43599-3

Change to read:

Pyruvic Acid, $CH_3COCOOH$—**88.06**

■[*127-17-3*]■2S (*USP30*)
—Colorless to light yellow liquid. Miscible with water, with alcohol, and with ether.

Refractive index ⟨831⟩: about 1.43 at 20°.

Assay—Accurately weigh about 1 g, transfer to a suitable container, and add 100 mL of water. Mix, add phenolphthalein TS, and titrate with 0.5 N sodium hydroxide VS. Each mL of 0.5 N sodium hydroxide is equivalent to 44.03 mg of $CH_3COCOOH$: not less than 98% of $CH_3COCOOH$ is found.

BRIEFING

Quinhydrone, *USP 29* page 3148—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43599-4

Change to read:

Quinhydrone, $C_6H_4(OH)_2 \cdot C_6H_4O_2$—**218.21**

■[*106-34-3*]■2S (*USP30*)
—Green crystals having a metallic luster. Slightly soluble in cold water; soluble in hot water, in alcohol, and in ether.

Assay—Transfer about 450 mg, accurately weighed, to a glass-stoppered flask, add 50 mL of 1 N sulfuric acid and 3 g of potassium iodide, insert the stopper in the flask, and shake until dissolved. Titrate the liberated iodine with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Each mL of 0.1 N sodium thiosulfate is equivalent to 5.405 mg of quinone ($C_6H_4O_2$). Between 49.0% and 51.0% is found.

Alcohol-insoluble matter—Dissolve 10 g in 100 mL of hot alcohol, filter through a suitable tared crucible of fine porosity, and wash with hot alcohol until the last washing is colorless. Dry at 105°, cool in a desiccator, and weigh: the residue weighs not more than 1.0 mg (0.010%).

Residue on ignition (Reagent test): not more than 0.050%, a 2.0-g test specimen being used. Save the residue.

Sulfate—Transfer 1 g to a platinum crucible, add 10 mL of hot water and 0.5 g of sodium carbonate, evaporate to dryness, and ignite, protected from the sulfur in the flame, until the residue is nearly white. Cool, add 20 mL of water and 1 mL of 30 percent hydrogen peroxide, boil gently for a few minutes, add 2 mL of hydrochloric acid, and evaporate on a steam bath to dryness. Cool, dissolve the residue in 20 mL of water, filter, and to the filtrate add 1 mL of 1 N hydrochloric acid and 3 mL of barium chloride TS: any turbidity produced within 10 minutes does not exceed that in a control containing 0.2 mg of added SO_4 and 0.5 mg of sodium carbonate, 1 mL of 30 percent hydrogen peroxide, and 2 mL of hydrochloric acid previously evaporated on a steam bath to dryness (0.02%).

Heavy metals—To the residue retained from the test for *Residue on ignition* add 2 mL of hydrochloric acid and 0.5 mL of nitric acid, and evaporate on a steam bath to dryness. Dissolve the residue in 30 mL of hot water containing 1 mL of 1 N hydrochloric acid, cool, dilute with water to 40 mL, and mix. Dilute 20 mL of this solution (retain the rest of the solution) with water to 25 mL, adjust to a pH between 3.0 and 4.0 by the addition of 1 N acetic acid or 6 N ammonium hydroxide as necessary, dilute with water to 40 mL, and add 10 mL of freshly prepared hydrogen sulfide TS: any brown color produced does not exceed that in a control containing 0.02 mg of added Pb (0.002%).

Iron ⟨241⟩—To 10 mL of the solution retained from the test for *Heavy metals* add 2 mL of hydrochloric acid, and dilute with water to 47 mL: the solution shows not more than 0.01 mg of Fe (0.002%).

BRIEFING

Resazurin (Sodium), *USP 29* page 3149—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43599-5

Change to read:

Resazurin (Sodium), $C_{12}H_6NNaO_4$—**251.17**

■[*62758-13-8*]■2S (*USP30*)
—A brownish-purple, crystalline powder. One g dissolves in 100 mL of water, forming a deep-violet-colored solution.

Hydrogen sulfide and other compounds containing the thiol group decolorize solutions of resazurin sodium, forming dihydroresorufin. When the decolorized solution is shaken in the presence of air, a rose color develops as a result of the formation of resorufin.

BRIEFING

Rhodamine B, *USP 29* page 3149—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43599-6

Change to read:

Rhodamine B *(Tetraethylrhodamine),* $C_{28}H_{31}ClN_2O_3$—**479.01**

■[*81-88-9*]■2S (*USP30*)
—Green crystals or a reddish-violet powder. Very soluble in water, yielding a bluish-red solution that is strongly fluorescent when dilute. Very soluble in alcohol; slightly soluble in dilute acids and in alkali solutions. In strong acid solution, it forms a pink complex with antimony that is soluble in isopropyl ether.

Clarity of solution—Its solution (1 in 200) is complete and clear.

Residue on ignition (Reagent test)—Ignite 1 g with 1 mL of sulfuric acid: the residue weighs not more than 2 mg (0.2%).

BRIEFING

Rose Bengal Sodium, *USP 29* page 3149—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43599-7

Change to read:

Rose Bengal Sodium *(Disodium Salt of 4,5,6,7-Tetrachloro-2′,4′,5′,7′-tetraiodofluorescein),* $C_{20}H_2Cl_4I_4Na_2O_5$—**1017.64**

■[632-69-9]■2S (*USP30*)
—Fine, rose-colored crystals or crystalline powder. ▲▲*USP29* Soluble in water.

[NOTE—Render commercially available material suitably pure by the following treatment. Dissolve 8 g in 200 mL of water, and adjust to a pH between 10 and 11, using short-range pH indicator paper.

In-Process Revision

Add 200 mL of acetone, while stirring gently, then add dilute hydrochloric acid (1 in 10), while continuing to stir, until the pH of the solution reaches 4.0. Add 400 mL more of water, with stirring, and continue the stirring for 5 minutes. Filter the crystals on a filtering funnel, and return the crystals to the beaker used for crystallization. Recrystallize three more times in the same manner, and dry the crystals at 110° for 12 hours. Store in an amber bottle in a refrigerator at a temperature between 2° and 8°. Prepare this reagent fresh monthly.]

Chromatographic purity—Dissolve 100 mg of rose bengal sodium, prepared as described above, in 100 mL of water, and apply 10 µL of the solution on suitable chromatographic paper. Develop the chromatogram by ascending chromatography, using a mixture of 1 part of dilute alcohol (1 in 4) and 1 part of dilute stronger ammonia water (1 in 12). Examine the chromatogram in daylight and under UV light (360 nm): no colored or fluorescent spot is visible other than the rose bengal sodium spot.

[NOTE—A suitable grade is available commercially as "Silica Gel H".]

BRIEFING

Ruthenium Red, *USP 29* page 3149—See briefing under *1-Nonyl Alcohol.*

—A brownish-red to dark purple powder. Soluble in water.

BRIEFING

Safranin O, *USP 29* page 3149—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43599-8

Change to read:

Safranin O

■—[*477-73-6*]■2S (*USP30*)
—Dark red powder consisting of a mixture of 3,7-diamino-2,8-dimethyl-5-phenylphenazinium chloride, $C_{20}H_{19}ClN_4$—350.85, and 3,7-diamino-2,8-dimethyl-5-*o*-tolylphenazinium chloride, $C_{21}H_{21}ClN_4$—364.88—Sparingly soluble in 70 percent alcohol yielding a clear red solution with a yellowish-red fluorescence.

Identification—

A: To 10 mL of a 0.5% w/v solution add 5 mL of hydrochloric acid: a bluish violet solution is produced.

B: To 10 mL of a 0.5% w/v solution add 5 mL of sodium hydroxide solution (1 in 5): a brownish-red precipitate is produced.

C: To 100 mg add 5 mL of sulfuric acid: a green solution is produced, which, on dilution, changes to blue and finally to red.

Absorption characteristics—Dissolve 50 mg in 250 mL of 50 percent alcohol. Dilute 3 mL of this solution with 50 percent alcohol to 200 mL. Determine the absorbance, in a 1-cm cell, with a suitable spectrophotometer. The absorbance maximum is in the range of 530 to 533 nm; the ratio $(P - 15)/(P + 15)$ is between 1.10 and 1.32, in which P is the wavelength of maximum absorbance.

[NOTE—A suitable grade is available as catalog number 10,214-8 from Sigma-Aldrich, www.sigma-aldrich.com.]

BRIEFING

Selenious Acid *(Selenous Acid),* H_2SeO_3—**128.97**

■[*7783-00-8*]■2S (*USP30*)
—Colorless or white crystals, efflorescent in dry air and hygroscopic in moist air. Soluble in water and in alcohol.

Assay—Accurately weigh about 100 mg, transfer to a glass-stoppered flask, and dissolve in 50 mL of water. Add 10 mL of potassium iodide solution (3 in 10) and 5 mL of hydrochloric acid, mix, insert the stopper in the flask, and allow to stand for 10 minutes. Dilute with 50 mL of water, add 3 mL of starch TS, and titrate with 0.1 N sodium thiosulfate VS until the color is no longer diminished, then titrate with 0.1 N iodine VS to a blue color. Subtract the volume of 0.1 N iodine solution from the volume of 0.1 N sodium thiosulfate to give the volume of 0.1 N thiosulfate equivalent to selenious acid. Each mL of 0.1 N sodium thiosulfate is equivalent to 3.225 mg of H_2SeO_3: not less than 93% is found.

Insoluble matter—Dissolve 1 g in 5 mL of water: the solution is clear and complete.

Residue on ignition (Reagent test): not more than 1.0 mg (0.01%), from 10 g.

Selenate and *sulfate*—Dissolve 500 mg in 10 mL of water, and add 0.1 mL of hydrochloric acid and 1 mL of barium chloride TS: no turbidity or precipitate is formed within 10 minutes.

BRIEFING

Selenium, *USP 29* page 3150—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43599-11

Change to read:

Selenium, Se—**At. Wt. 78.96**

■[*7782-49-2*]■2S *(USP30)*
—Dark-red amorphous, or bluish-black, crystalline powder. Soluble in solutions of sodium and potassium hydroxides or sulfides; insoluble in water.

Residue on ignition (Reagent test)—One g yields not more than 2 mg (0.2%).

Heavy metals—To the *Residue on ignition* add 3 mL of hydrochloric acid and 2 mL of nitric acid, evaporate on a steam bath to dryness, take up the residue in a mixture of 2 mL of diluted hydrochloric acid and 50 mL of hot water, cool, filter, and wash the filter with sufficient water to make 100 mL of filtrate (*Test Solution*). To a 30-mL aliquot of the *Test Solution* add 10 mL of water and 10 mL of hydrogen sulfide TS: the color produced is not darker than that of a *Control Solution* prepared from 3 mL of *Standard Lead Solution* (see *Heavy Metals* ⟨231⟩; 0.03 mg of Pb), 0.2 mL of 1 N hydrochloric acid, 37 mL of water, and 10 mL of hydrogen sulfide TS (0.01%).

Iron ⟨241⟩—To 20 mL of the *Test Solution* prepared in the test for *Heavy metals* add 2 mL of hydrochloric acid, and dilute with water to 47 mL: the solution shows not more than 0.01 mg of Fe (0.005%).

Nitrogen—

STANDARD NITROGEN SOLUTION—Dissolve 382 mg of ammonium chloride in water to make 1 L. Each mL of this solution contains the equivalent of 0.1 mg of nitrogen (N).

PROCEDURE—Heat 1.0 g with 10 mL of sulfuric acid in a Kjeldahl flask until the test specimen is dissolved and the volume of acid is reduced to about 5 mL. Cool, cautiously dilute with 100 mL of water, render strongly alkaline with sodium hydroxide solution (3 in 10), and distill about 75 mL of the solution into 5 mL of water containing 2 drops of 1 N hydrochloric acid. Dilute the distillate with water to 250 mL. To a 50-mL aliquot of the solution add 1 mL of sodium hydroxide solution (1 in 10) and 2 mL of mercuric–potassium iodide TS: the color produced is not darker than that produced by 0.1 mL of *Standard nitrogen solution* (0.01 mg of N) treated in the same manner as the test specimen (0.005%).

Sulfur—To 1.0 g in a beaker add, successively, 5 mL of nitric acid, then 10 mL of hydrochloric acid, and evaporate on a steam bath to dryness. Add 10 mL of hydrochloric acid, and slowly evaporate again to dryness. Take up the residue in 30 mL of dilute hydrochloric acid (1 in 30), filter, and wash the filter with water to make about 100 mL of the filtrate. Heat the filtrate to boiling, and add slowly, with stirring, 5 mL of barium chloride TS. Digest on the steam bath for 4 hours. Pass through a fine-porosity filter paper, wash the precipitate until it is free from chloride, ignite, and weigh. The weight of the barium sulfate residue, multiplied by 0.1374, represents sulfur (S). Not more than 0.5 mg of S is found (0.05%).

BRIEFING

Selenomethionine, *USP 29* page 3150—See briefing under *1-Nonyl Alcohol.*

Change to read:

Selenomethionine, $C_5H_{11}NO_2Se$—**196.11**

■[*1464-42-2*]■2S *(USP30)*
—*[Caution—Handle with care, as this reagent is highly toxic.]*

Assay—Weigh accurately about 750 mg, dissolve in 100 mL of methanol, add crystal violet TS, and titrate with 0.1 N perchloric acid to a blue-green endpoint. Each mL of 0.1 N perchloric acid is equivalent to 19.61 mg of $C_5H_{11}NO_2Se$: between 97.0% and 103.0%, calculated on the as-is basis, is found.

Melting range ⟨741⟩: about 260°, with decomposition.

Nitrogen content ⟨461⟩—Determine by the Kjeldahl method: between 6.8% and 7.4%, calculated on the as-is basis, is found.

BRIEFING

Silicic Acid, *USP 29* page 3151—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43599-13

Change to read:

Silicic Acid, $SiO_2 \cdot xH_2O$—(anhydrous) **60.08**

■[*1343-98-2*]■2S *(USP30)*
—White, amorphous powder. Insoluble in water and in acids; soluble in hot solutions of strong alkalies.

Residue on ignition (Reagent test): not less than 80.0%.

Nonvolatile with hydrofluoric acid—Heat 500 mg with 1 mL of sulfuric acid and 10 mL of hydrofluoric acid in a platinum crucible to dryness, and ignite to constant weight: the weight of the residue does not exceed 1.0 mg (0.2%).

Chloride (Reagent test)—One g shows not more than 0.05 mg of Cl (0.005%).

Sulfate (Reagent test)—Boil 2 g with 20 mL of dilute hydrochloric acid (1 in 40), filter, neutralize the filtrate with ammonia TS, and dilute with water to 20.0 mL. A 10-mL aliquot of the solution shows not more than 0.1 mg of SO_4 (0.01%).

Heavy metals (Reagent test)—Boil 2.5 g with 50 mL of dilute hydrochloric acid (1 in 10) for 5 minutes, filter while hot, and evaporate the filtrate on a steam bath to dryness. Take up the residue in 20 mL of dilute hydrochloric acid (1 in 500), digest for 5 minutes, cool, add water to make 100 mL, and filter. To 40 mL of the filtrate add 10 mL of hydrogen sulfide TS: any color produced is not darker than that produced by adding 10 mL of hydrogen sulfide TS to a control containing 0.03 mg of Pb (0.003%).

Iron ⟨241⟩—To 20 mL of the filtrate obtained in the test for *Heavy metals* add 1 mL of hydrochloric acid, and dilute with water to 47 mL: the solution shows not more than 0.015 mg of Fe (0.003%).

Silver Oxide, *USP 29* page 3151—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43600-3

Change to read:

Silver Oxide, Ag_2O—**231.74**

■[*20667-12-3*]■2S (*USP30*)
—Brownish-black, heavy ▲▲*USP29* powder. Slowly decomposes on exposure to light. Absorbs carbon dioxide when moist. Practically insoluble in water; freely soluble in dilute nitric acid and in ammonia; insoluble in alcohol. Store in well-closed containers; do not expose to ammonia fumes or easily oxidizable substances.

Assay—Dissolve about 500 mg, previously dried at 120° for 3 hours and accurately weighed, in a mixture of 20 mL of water and 5 mL of nitric acid. Dilute with 100 mL of water, add 2 mL of ferric ammonium sulfate TS, and titrate with 0.1 N ammonium thiocyanate VS to a permanent reddish-brown color. Each mL of 0.1 N ammonium thiocyanate is equivalent to 11.59 mg of Ag_2O: not less than 99.7% of Ag_2O is found.

Loss on drying—Dry it at 120° for 3 hours: it loses not more than 0.25% of its weight.

Nitrate—To 500 mg add 30 mg of sodium carbonate and 2 mL of phenoldisulfonic acid TS, mix, and heat on a steam bath for 15 minutes. Cool, *cautiously* add 20 mL of water, render alkaline with ammonia TS, and dilute with water to 30 mL: any color produced by the test solution is not darker than that produced in a control containing 0.01 mg of NO_3 (0.002%).

Substances insoluble in nitric acid—Dissolve 5 g in a mixture of 5 mL of nitric acid and 10 mL of water, dilute with water to about 65 mL, and filter any undissolved residue on a tared filtering crucible (retain the filtrate for the test for *Substances not precipitated by hydrochloric acid*). Wash the crucible with water until the last washing shows no opalescence with 1 drop of hydrochloric acid, and dry at 105° to constant weight: the residue weighs not more than 1 mg (0.02%).

Substances not precipitated by hydrochloric acid—Dilute the filtrate obtained in the test for *Substances insoluble in nitric acid* with water to 250 mL, heat to boiling, and add, dropwise, sufficient hydrochloric acid to precipitate all of the silver (about 5 mL), avoiding any great excess. Cool, dilute with water to 300 mL, and allow to stand overnight. Filter, evaporate 200 mL of the filtrate in a suitable tared porcelain dish to dryness, and ignite: the residue weighs not more than 1.7 mg (0.05%).

Alkalinity—Heat 2 g with 40 mL of water on a steam bath for 15 minutes, cool, and dilute with water to 50 mL. Filter, discarding the first 10 mL of the filtrate. To 25 mL of the subsequent filtrate add 2 drops of phenolphthalein TS, and titrate with 0.02 N hydrochloric acid VS to the disappearance of any pink color: not more than 0.20 mL is required (0.016% as NaOH).

Change to read:

Sodium Arsenite, $NaAsO_2$—**129.91**

■[*7784-46-5*]■2S (*USP30*)
—White, crystalline ▲*USP29* powder. Soluble in water; slightly soluble in alcohol.

Assay—Transfer about 5.5 g, accurately weighed, to a 500-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Pipet 25 mL of this solution into a suitable container, add 50 mL of water and 5 g of dibasic sodium phosphate, swirl to dissolve, and titrate with 0.1 N iodine VS, adding 3 mL of starch TS as the endpoint is approached. Each mL of 0.1 N iodine is equivalent to 3.746 mg of As. Between 57.0% and 60.5% is found (equivalent to 98.8% to 104.9% of $NaAsO_2$).

Chloride (Reagent test)—One g shows not more than 0.10 mg of Cl (0.01%).

Heavy metals—Dissolve 200 mg in 8 mL of dilute hydrochloric acid (3 in 8), and evaporate on a steam bath to dryness. Dissolve the residue in 5 mL of dilute hydrochloric acid (2 in 5), and again evaporate to dryness. Dissolve the residue in 10 mL of water, and add 2 mL of diluted acetic acid and 10 mL of hydrogen sulfide TS. Any brown color produced is not darker than that of a control containing 0.01 mg of added Pb (0.005%).

Iron—Dissolve 1 g in 20 mL of dilute hydrochloric acid (1 in 5), and add, dropwise, a slight excess of bromine TS. Boil the solution to remove the excess bromine, cool, dilute with water to 40 mL, and add 10 mL of ammonium thiocyanate solution (3 in 10). Any red color produced is not darker than that of a control containing 0.02 mg of added Fe (0.02%).

Sulfide—Dissolve 1 g in 20 mL of water, and add 5 drops of lead acetate TS: no brown color is produced (about 0.0005%).

Sulfate (Reagent test, *Method II*)—Dissolve 5 g in 100 mL of water, add methyl orange TS, neutralize with 1 N hydrochloric acid, add 3 mL of the acid in excess, and filter: the filtrate yields not more than 3 mg of residue (0.02%).

BRIEFING

Sodium Azide, *USP 29* page 3152—See briefing under *1-Nonyl Alcohol.*

Change to read:

Sodium Azide, NaN_3—**65.01**

■[*26628-22-8*]■2S (*USP30*)
—White powder.

Assay—[Caution—Sodium azide is a potent poison. Its conjugate acid HN_3 is more toxic than hydrogen cyanide and is readily liberated from neutral aqueous solutions. Contact of NaH_3 or hydrazoic acid (HN_3)with certain metals may produce explosive salts. Work in a well-ventilated hood, and handle the sample with care.] Dissolve about 100 mg, accurately weighed, in 50 mL of water, and add 3 drops of phenolphthalein. Adjust the pH, if

In-Process Revision

necessary, to 7.0, and add 35.0 mL of 0.1 N perchloric acid. Pipet, while stirring, 2.5 mL of 1.0 M sodium nitrite into the solution, and stir for 15 seconds. Titrate rapidly to the phenolphthalein endpoint with 0.1 N sodium hydroxide. The endpoint should be reached in less than 4 minutes after addition of perchloric acid because HN_3 is readily volatile. Calculate the percentage of azide by the formula:

$$[(N_P)(V_P) - (N_S)(V_S)](65.01)(100)/2C$$

where N_P is the normality of perchloric acid solution; V_P is the volume of perchloric acid, in mL, taken; N_S is the normality of sodium hydroxide solution; V_S is the volume, in mL, of sodium hydroxide taken; 65.01 is the molecular weight of sodium azide; and C is the weight, in mg, of sodium azide. Not less than 98.5% of NaN_3 is found.

■[*7775-14-6*]■2S *(USP30)*
—White or grayish-white crystalline powder. Soluble in water; slightly soluble in alcohol. Gradually oxidizes in air, more readily when in solution, to bisulfite, acquiring an acid reaction. Is affected by light.

Assay—Accurately weigh about 1 g, dissolve it in a mixture of 10 mL of formaldehyde TS and 10 mL of water contained in a small glass-stoppered flask, and allow to stand for 30 minutes with frequent agitation. Transfer the solution to a 250-mL volumetric flask, add 150 mL of water and 3 drops of methyl orange TS, and then add, dropwise, 1 N sulfuric acid to a slightly acid reaction. Dilute with water to 250 mL, and mix. To 50.0 mL of the dilution add 2 drops of phenolphthalein TS and just sufficient 0.1 N sodium hydroxide to produce a slight, pink color, then titrate with 0.1 N iodine, adding 3 mL of starch TS as the indicator. Then discharge the blue color of the solution with 1 drop of 0.1 N sodium thiosulfate, and titrate with 0.1 N sodium hydroxide VS to a pink color: each mL of 0.1 N sodium hydroxide is equivalent to 3.482 mg of $Na_2S_2O_4$. Not less than 88% is found.

Sulfide—Add sodium hydroxide solution (1 in 10) to lead acetate TS until the precipitate dissolves. Add 5 drops of this solution to a solution of 1 g of the sodium hydrosulfite in 10 mL of water: no immediate darkening is observed.

Heavy metals—Dissolve 1 g in 10 mL of water, add 10 mL of hydrochloric acid, and evaporate on a steam bath to dryness. Dissolve the residue in 20 mL of water and 0.5 mL of diluted hydrochloric acid, filter, and add to the filtrate 10 mL of hydrogen sulfide TS: no darkening is produced. Render the solution alkaline with ammonia TS: a slight, greenish color may be produced, but not a dark or white precipitate.

Suitability for riboflavin assay—To each of 2 or more tubes add 10 mL of water and 1.0 mL of a standard riboflavin solution containing 20 µg of riboflavin in each mL, and mix. To each tube add 1.0 mL of glacial acetic acid, mix, add with mixing, 0.5 mL of potassium permanganate solution (1 in 25), and allow to stand for 2 minutes. Then to each tube add, with mixing, 0.5 mL of hydrogen peroxide TS: the permanganate color is destroyed within 10 seconds. Shake the tubes vigorously until excess oxygen is expelled. If gas bubbles

In-Process Revision

remain on the sides of tubes after foaming has ceased, remove the bubbles by tipping the tubes so that the solution flows slowly from end to end. In a suitable fluorometer, measure the fluorescence of the solution. Then add, with mixing, 8.0 mg of sodium hydrosulfite: the riboflavin is completely reduced in not more than 5 seconds.

BRIEFING

BRIEFING

Sodium Hypochlorite Solution, *USP 29* page 3154—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43601-11

Change to read:

Sodium Hypochlorite Solution

■—[*7681-52-9*]■2S (*USP30*)
—A solution of sodium hypochlorite (NaOCl) in water. Usually yellow to yellowish-green in color. Has an odor of chlorine. Is affected by light and gradually deteriorates. Store it in light-resistant containers, preferably below 25°. *[Caution—This solution is corrosive and may evolve gases that are corrosive and toxic. It is a powerful oxidant that can react violently with reducing agents. Is irritating and corrosive to skin and mucous membranes.]*

Assay—Transfer about 3 mL to a tared, glass-stoppered iodine flask, and weigh accurately. Add 50 mL of water, 2 g of potassium iodide, and 10 mL of acetic acid, insert the stopper in the flask, and allow to stand in the dark for 10 minutes. Remove the stopper, rinse the walls of the flask with a few mL of water, and titrate the liberated iodine with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is neared. Each mL of 0.1 N sodium thiosulfate consumed is equivalent to 3.723 mg of NaOCl: not less than 5.25% is found. If it is desired to calculate the percentage of available chlorine, note that each mL of 0.1 N sodium thiosulfate consumed is equivalent to 3.545 mg of available chlorine.

Calcium—Transfer 10.0 g to a 150-mL beaker, dissolve in 10 mL of water, and add 5 mL of hydrochloric acid and 2 g of potassium iodide. Heat the mixture for 5 minutes, cool, and add 2 mL of 30 percent hydrogen peroxide. Evaporate to dryness, cool, and add 2 mL of hydrochloric acid and 2 mL of 30 percent hydrogen peroxide. Rinse the inner walls of the beaker with a few mL of water, and evaporate to dryness. Take up the residue in 20 mL of water, and filter if necessary. To the filtrate add ammonium hydroxide until the solution is just alkaline, then add 4 drops of ammonium hydroxide and 5 mL of ammonium oxalate TS: any turbidity produced within 15 minutes does not exceed that in a blank containing 0.1 mg of added Ca carried through the entire procedure (0.001%).

Phosphate (Reagent test)—Transfer 2 g to a beaker, and add 5 mL of hydrochloric acid and 2 g of potassium iodide. Heat the solution for 5 minutes, and cool. Add 2 mL of 30 percent hydrogen peroxide, and evaporate the solution to dryness. Rinse the walls of the beaker with a few mL of water, and add 2 mL of hydrochloric acid and 2 mL of 30 percent hydrogen peroxide. Evaporate again to dryness: the residue shows not more than 0.01 mg of PO_4 (5 ppm).

In-Process Revision

BRIEFING

Sodium (tri) Pentacyanoamino Ferrate, *USP 29* page 3154—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43614-1

Change to read:

Sodium (tri) Pentacyanoamino Ferrate *[Trisodium Aminepentacyanoferrate (3-)],* $Na_3[Fe(CN)_5NH_3]$—**271.93**

■[*14099-05-9*]■2S (*USP30*)
—Yellow to tan powder. Soluble in water.

Solubility—Dissolve 500 mg in 50 mL of water, and allow to stand for 1 hour: the solution is clear and free from foreign matter.

Sensitivity—

1,1-DIMETHYLHYDRAZINE STANDARD SOLUTION—Place 500 mL of water in a 1-L volumetric flask, and add from a buret 1.27 mL of anhydrous 1,1-dimethylhydrazine. Dilute with water to volume, and mix. Pipet 10 mL of this solution into a 100-mL volumetric flask, and dilute with water to volume. Each mL of this solution contains the equivalent of 100 µg of 1,1-dimethylhydrazine.

BUFFER SOLUTION—Transfer 4.8 g of citric acid monohydrate to a 1-L volumetric flask, dissolve in water, add 14.6 g of sodium phosphate, swirl to dissolve, and dilute with water to volume.

TEST PREPARATION—Dissolve 100 mg of sodium (tri)pentacyanoamino ferrate in 100 mL of water.

PROCEDURE—Into each of five 25-mL volumetric flasks pipet 0 mL, 0.25 mL, 0.50 mL, 1.0 mL, and 1.5 mL, respectively, of *1,1-Dimethylhydrazine standard solution;* to each add 15 mL of *Buffer solution,* and swirl to mix. To each flask, add by pipet 2 mL of *Test preparation,* mix, dilute with *Buffer solution* to volume, and allow to stand for 1 hour. Using a suitable spectrophotometer, 1-cm cells, and the solution containing no *1,1-Dimethylhydrazine standard solution* as the blank, determine the absorbances of the remaining solutions at 500 nm. Plot the observed absorbance as the ordinate versus the concentration of standard as the abscissa on coordinate paper, and draw the curve of best fit. The plot is linear and the absorbance of the 150-µg solution is not less than 0.65.

Sodium Pyruvate, CH_3COCO_2Na—**110.04**

■[*113-24-6*]■2S (*USP30*)
—White to practically white powder or crystalline solid. Soluble in water.

Assay—Transfer about 300 mg, accurately weighed, to a high-form titration beaker, add 150 mL of glacial acetic acid, and stir until dissolved. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically, using a glass electrode and a calomel electrode modified to use 0.1 N tetramethylammonium chloride in methanol as the electrolyte. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 11.00 mg of CH_3COCO_2Na: not less than 98.0% is found.

Solubility—Dissolve 1.5 g in 25 mL of water: the solution is clear and complete.

Free acid—Dissolve 10 g in 150 mL of water, and titrate with 0.5 N sodium hydroxide VS, determining the endpoint potentiometrically: not more than 2.8 mL of 0.5 N sodium hydroxide is consumed (about 1% as $C_3H_4O_3$).

In-Process Revision

Change to read:

Sodium Selenite, Na_2SeO_3—**172.94**

■[*10102-18-8*]■2S (*USP30*)
—White, odorless, crystalline powder, usually partially hydrated. Freely soluble in water; insoluble in alcohol.

Assay—Accurately weigh about 180 mg, previously dried at 120° to constant weight, and dissolve it in 50 mL of water in a glass-stoppered flask. Add, successively, 3 g of potassium iodide and then 5 mL of hydrochloric acid, insert the stopper, and allow to stand for 10 minutes. Add 50 mL of water, 50.0 mL of 0.1 N sodium thiosulfate VS, and 3 mL of starch TS, and immediately titrate with 0.1 N iodine VS to a blue color. Perform a blank determination. The difference in volumes of 0.1 N iodine is equivalent to 4.323 mg of Na_2SeO_3. Between 98% and 101% is found.

Solubility—One g in 10 mL of water shows not more than a faint haze.

Carbonate—To 500 mg add 1 mL of water and 2 mL of diluted hydrochloric acid: no effervescence is produced.

Chloride (Reagent test)—A 500-mg portion shows not more than 0.05 mg of Cl (0.01%).

Nitrate (Reagent test)—A 200-mg portion dissolved in 3 mL of water shows not more than 0.02 mg of NO_3 (0.01%).

Selenate and *sulfate* (*as* SO_4)—To 500 mg in a small evaporating dish add 20 mg of sodium carbonate and 10 mL of hydrochloric acid. Slowly evaporate the solution on a steam bath under a hood to dryness. Wash the sides of the dish with 5 mL of hydrochloric acid, and again evaporate to dryness. Dissolve the residue in a mixture of 15 mL of hot water and 1 mL of hydrochloric acid. Proceed as directed under *Sulfate in Reagents* (Reagent test, *Method I*), beginning with "Filter the solution." The test specimen shows no more turbidity than that produced by 0.15 mg of SO_4 (0.03%).

BRIEFING

(HDQ: M. Marques) RTS—43614-14

Change to read:

Sodium Sulfate, Anhydrous, Na_2SO_4—**142.04**

■[*7757-82-6*]■2S (*USP30*)
—Use ACS reagent grade.

For use in assaying alkaloids by gas–liquid chromatography, it conforms to the following additional test.

Suitability for alkaloid assays—Transfer about 10 mg of atropine, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with alcohol to volume. Pipet 3 mL of the solution into each of two 60-mL separators, and add to each 10 mL of water, 1 mL of 1 N sodium hydroxide, and 10 mL of chloroform. Shake thoroughly, and allow the layers to separate. Filter the organic phase from one separator through phase-separating paper, previously washed with 5 mL of chloroform, supported in a funnel, and collect the filtrate in a suitable container. Add 10 mL of chloroform to the separator, shake thoroughly, and filter the organic layer through the same phase-separating paper, collecting and combining the filtrates in the same container. Designate the combined filtrates as *Solution A*. Filter the organic phase from the second separator through 30 g of the Anhydrous Sodium Sulfate, supported on a pledget of glass wool in a small funnel, and previously washed with chloroform, and collect the filtrate in a suitable container. Add 10 mL of chloroform to the separator, shake thoroughly, and filter the organic layer through the same portion of anhydrous sodium sulfate, collecting and combining the two filtrates in the same container. Designate the combined filtrates as *Solution B*. Evaporate the two solutions in vacuum to a volume of about 1 mL. Inject an accurately measured volume of *Solution A* into a suitable gas chromatograph, and record the peak height. Repeat the determination with a second accurately measured volume of *Solution A,* record the peak height, and obtain the average of the two results. In a similar manner, determine the peak height of two portions of *Solution B,* and obtain the average of the results. The average value obtained for *Solution B* is within 5.0% of the value obtained for *Solution A*.

Under typical conditions, the gas chromatograph contains a 4-mm × 1.2-m glass column packed with 3% phase G3 on packing S1A. After curing and conditioning, the column temperature is maintained at 210°, the injector port temperature at 225°, and the detector block temperature at 240° during the determinations. The carrier gas is helium, flowing at a rate of 60 mL per minute.

Change to read:

Sodium Thioglycolate *(Sodium Thioglycollate),* $HSCH_2COONa$—**114.10**

■[*367-51-1*]■2S (*USP30*)
—A white, crystalline powder. ~~having a slight, characteristic odor.~~

■■2S (*USP30*)
Very soluble in water; slightly soluble in alcohol. Is hygroscopic, and oxidizes in air. Store in tight, light-resistant containers. It should not be used if it is pale yellow or darker in color.

Assay—Accurately weigh about 250 mg, and dissolve in 50 mL of oxygen-free water. Add 5 mL of diluted hydrochloric acid, boil for 2 minutes, cool, and titrate the solution with 0.1 N iodine VS, adding 3 mL of starch TS toward the end: each mL of 0.1 N iodine is equivalent to 11.41 mg of $HSCH_2COONa$. Not less than 75% is found.

Insoluble matter—A solution of 1 g in 10 mL of water is clear, and practically complete.

Sulfide—Dissolve 500 mg in 10 mL of water in a small flask, add 2 mL of hydrochloric acid, then place a strip of filter paper, moistened with lead acetate TS, over the mouth of the flask, and bring the solution to a boil: the lead acetate paper is not darkened.

■[*112-92-5*]■2S (*USP30*)
—White flakes, granules, or crystals. Soluble in alcohol, in ether, in acetone, and in benzene; insoluble in water.

Melting range ⟨741⟩: between 56° and 58°.

Other requirements—It conforms to the tests for *Acid value, Iodine value,* and *Hydroxyl value* under *Stearyl Alcohol* (*NF* monograph).

BRIEFING

Strontium Acetate, *USP 29* page 3156—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43617-7

Change to read:

Strontium Acetate, $Sr(CH_3COO)_2 \cdot ½H_2O$—**214.72**

■[*543-94-2*]■2S (*USP30*)
—White, crystalline powder. Soluble in 3 parts of water; slightly soluble in alcohol.

Assay—Ignite about 3 g, accurately weighed, in a platinum crucible, protecting from sulfur in the flame. Cool, transfer the crucible with the residue to a beaker, and add 50 mL of water and

40.0 mL of 1 N hydrochloric acid VS. Boil gently for 30 minutes or longer, if necessary; filter; wash with hot water until the washings are neutral; add methyl red TS; and titrate the excess acid with 1 N sodium hydroxide VS. Each mL of 1 N hydrochloric acid is equivalent to 107.4 mg of $Sr(CH_3COO)_2 \cdot \frac{1}{2}H_2O$: not less than 99% is found.

Insoluble matter(Reagent test): not more than 2 mg, from 10 g (0.02%).

Free alkali or free acid—Dissolve 3 g in 30 mL of water, and add 3 drops of phenolphthalein TS: no pink color is produced. Titrate with 0.1 N sodium hydroxide VS to a pink color: not more than 0.30 mL of the 0.1 N sodium hydroxide is required.

Barium—Dissolve 1 g in 10 mL of water, and add 1 drop of glacial acetic acid and 5 drops of potassium dichromate solution (1 in 10): no turbidity is produced within 2 minutes (about 0.02%).

Calcium—Ignite 1 g until completely carbonized. Warm the residue with a mixture of 3 mL of nitric acid and 10 mL of water, filter, wash with 5 mL of water, and evaporate the filtrate on a steam bath to dryness. Powder the residue, and dry it at 120° for 3 hours. Reflux the dried powder with 15 mL of dehydrated alcohol for 10 minutes, cool in ice, and filter. Repeat the extraction with 10 mL of dehydrated alcohol. Evaporate the combined filtrates to dryness, add 0.5 mL of sulfuric acid, and ignite: the weight of the residue is not more than 10 mg (0.3% of Ca).

Chloride (Reagent test)—One g shows not more than 0.1 mg of Cl (0.01%).

Heavy metals (Reagent test): 0.001%.

Iron ⟨241⟩—Dissolve 1.0 g in 45 mL of water, and add 2 mL of hydrochloric acid: the solution shows not more than 0.01 mg of Fe (0.001%).

Alkali salts—Dissolve 2 g in 80 mL of water, heat to boiling, add an excess of ammonium carbonate TS, boil for 5 minutes, dilute with water to 100 mL, and filter. Evaporate 50 mL of the filtrate, and ignite: the residue, after correcting for the ignition residue from half the volume of the clear ammonium carbonate TS used above, is not more than 3 mg (0.3%).

Nitrate—Dissolve 1 g in 10 mL of water, add 0.10 mL of indigo carmine TS, and then add 10 mL of sulfuric acid: the blue color persists for 5 minutes (about 0.01% of NO_3).

BRIEFING

Strontium Hydroxide,*USP 29* page 3156—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43617-8

Change to read:

Strontium Hydroxide *(Strontium Hydroxide Octahydrate),* $Sr(OH)_2 \cdot 8H_2O$—**265.76**

■[*18480-07-4*]■2S (*USP30*)
—White, crystalline, free-flowing powder. Sparingly soluble in water. May absorb carbon dioxide from the air. Keep tightly closed.

Assay and *carbonate*—Accurately weigh about 5 g, dissolve in 200 mL of warm carbon dioxide-free water in a glass-stoppered, 500-mL flask, add phenolphthalein TS, and titrate with 1 N hydrochloric acid VS to determine the hydroxide alkalinity. Then add methyl orange TS, and titrate with 1 N hydrochloric acid VS. Each mL of 1 N hydrochloric acid required to reach the phenolphthalein endpoint is equivalent to 132.9 mg of $Sr(OH)_2 \cdot 8H_2O$, and each additional mL of 1 N hydrochloric acid VS required to reach the methyl orange endpoint is equivalent to 73.8 mg of $SrCO_3$. Not less than 95.0% of $Sr(OH)_2 \cdot 8H_2O$ and not more than 3.0% of $SrCO_3$ are found.

Chloride (Reagent test)—Dissolve 1.0 g in 100 mL of water, and filter if necessary: 1.0 mL of the solution shows not more than 0.01 mg of Cl (0.1%).

Calcium (Reagent test)—

TEST SOLUTION—Dissolve 5.0 g in water, and dilute with water to 100 mL.

SAMPLE SOLUTION—Dilute 10.0 mL of the *Test solution* with water to 100 mL.

CONTROL SOLUTION—To 10.0 mL of the *Test solution* add 0.50 mg of calcium ion (Ca), and dilute with water to 100 mL.

PROCEDURE—Determine the background emission at 416.7 nm: the limit is 0.1%.

Iron—Dissolve 1 g in warm water, and dilute with water to 100 mL. To 20 mL of this solution add 2 mL of hydrochloric acid and 0.1 mL of 0.1 N potassium permanganate, allow to stand for 5 minutes, and add 3 mL of ammonium thiocyanate solution (3 in 10). Any red color produced is not darker than that of a control containing 0.03 mg of added Fe (0.015%).

Heavy metals—Dissolve 2.0 g in 14 mL of dilute hydrochloric acid (1 in 6), and evaporate on a steam bath to dryness. Take up the residue in 25 mL of water, filter, and dilute with water to 100 mL *(Test solution).* To 5.0 mL of the *Test solution* add 0.02 mg of lead (Pb), and dilute with water to 30 mL, to provide the standard. For the test specimen, use 30 mL of the *Test solution.* Adjust each solution with diluted acetic acid or ammonia TS to a pH between 3.0 and 4.0 (using short-range pH paper), dilute with water to 40 mL, and add 10 mL of freshly prepared hydrogen sulfide TS: any brown color developed in the sample solution is not darker than that in the control solution (0.004%).

BRIEFING

Strychnine Sulfate, *USP 29* page 3157—See briefing under *1-Nonyl Alcohol.*

■[*85-86-9*]■2S (*USP30*)
—Red to red-brown powder. Use a suitable grade.

Assay—When tested by thin-layer chromatography (see *Chromatography* ⟨621⟩) with the use of plates coated with chromatographic silica gel mixture and a developing system consisting of a mixture of hexane and ethyl acetate (80 : 20), and examined under short-wavelength UV light, a single spot is exhibited, with trace impurities.

BRIEFING

Sudan IV, *USP 29* page 3157—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43617-11

Change to read:

Sudan IV, $C_{24}H_{20}N_4O$—**380.44**

■[*85-83-6*]■2S (*USP30*)
—Brown to reddish-brown powder.

Assay—Transfer about 25 mg, accurately weighed, to a 100-mL volumetric flask. Dissolve in chloroform, dilute with chloroform to volume, and mix. Dilute 2.0 mL of the resulting solution with chloroform to 50.0 mL. Determine the absorbance of this solution in 1-cm cells at the wavelength of maximum absorbance at about 520 nm, with a suitable spectrophotometer, using chloroform as the blank. Calculate the percentage of Sudan IV in the test specimen taken by the formula:

$$(100A) / (85C)$$

in which A is the absorbance at 520 nm and C is the concentration of the test specimen in g per L. Not less than 90% is found.

Loss on drying ⟨731⟩—Dry it at 105° for 2 hours: it loses not more than 10% of its weight.

Change to read:

Tetramethylammonium Chloride, $(CH_3)_4NCl$—**109.60**

■[*75-57-0*]■2S (*USP30*)
—Colorless crystals. Soluble in water and in alcohol; insoluble in chloroform.

Assay—Transfer about 200 mg, accurately weighed, to a beaker, add 50 mL of water and 10 mL of diluted nitric acid, swirl to dissolve the test specimen, add 50.0 mL of 0.1 N silver nitrate VS, and mix. Add 2 mL of ferric ammonium sulfate TS and 5 mL of nitrobenzene, shake, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS: each mL of 0.1 N silver nitrate is equivalent to 10.96 mg of $(CH_3)_4NCl$. Not less than 98% is found.

BRIEFING

Tetramethylammonium Hydroxide, *USP 29* page 3158—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43621-16

Change to read:

Tetramethylammonium Hydroxide, $(CH_3)_4NOH$—**91.15**

■[*75-59-2*]■2S (*USP30*)
—Available as an approximately 10% or approximately 25% aqueous solution, or as the crystalline pentahydrate. Is clear and colorless. ▲▲*USP29* Tetramethylammonium hydroxide is a stronger base than ammonia and rapidly absorbs carbon dioxide from the air. Store in tight containers.

Assay—Accurately weigh a glass-stoppered flask containing about 15 mL of water. Add a quantity of a solution of tetramethylammonium hydroxide, equivalent to about 200 mg of $(CH_3)_4NOH$, and again weigh. Add methyl red TS, and titrate the solution with 0.1 N hydrochloric acid VS: each mL of 0.1 N hydrochloric acid is equivalent to 9.115 mg of $(CH_3)_4NOH$.

Residue on evaporation—Evaporate 5 mL of solution on a steam bath, and dry at 105° for 1 hour: the weight of the residue is equivalent to not more than 0.02% of the weight of the test specimen.

Ammonia and other amines—Accurately weigh a quantity of solution, corresponding to about 300 mg of $(CH_3)_4NOH$, in a low-form weighing bottle tared with 5 mL of water. Add a slight excess of 1 N hydrochloric acid (about 4 mL), evaporate on a steam bath to dryness, and dry at 105° for 2 hours: the weight of the tetramethylammonium chloride so obtained, multiplied by 0.8317, represents the quantity, in mg, of $(CH_3)_4NOH$ in the portion of test specimen taken and corresponds to within 0.2% above or below that found in the *Assay.*

BRIEFING

Tetramethylammonium Hydroxide, Pentahydrate, *USP 29* page 3158—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43621-17

Change to read:

Tetramethylammonium Hydroxide, Pentahydrate, $(CH_3)_4NOH \cdot 5H_2O$—**181.23**

■[*10424-65-4*]■2S (*USP30*)
—White to off-white crystals. Is hygroscopic. Strong base. Keep well-closed. Soluble in water and in methanol.

Assay—Accurately weigh about 800 mg, dissolve in 100 mL of water, and titrate with 0.1 N hydrochloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N hydrochloric acid is equivalent to 18.22 mg of $(CH_3)_4NOH \cdot 5H_2O$: not less than 98% is found.

BRIEFING

Tetramethylammonium Hydroxide Solution in Methanol, *USP 29* page 3158—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43621-18

Change to read:

Tetramethylammonium Hydroxide Solution in Methanol

■—[*75-59-2*]■2S (*USP30*)
—A solution in methanol of tetramethylammonium hydroxide [$(CH_3)_4NOH$—91.15]. Is generally available in concentrations of 10% and 25%. The following specifications apply specifically to the 25% concentration; for other concentrations, appropriate adjustments in the procedures may be necessary.

Assay—Accurately weigh about 1 g of the solution, and dilute with water to about 50 mL. Add phenolphthalein TS, and titrate with 0.1 N hydrochloric acid VS to the disappearance of the pink color: each mL of 0.1 N hydrochloric acid VS is equivalent to 91.15 mg of $(CH_3)_4NOH$. Between 23% and 25% is found.

Clarity—A portion of it in a test tube is clear, or only slightly turbid, when viewed transversely.

■[*89-83-3*]■2S (*USP30*)
—Colorless, often large, crystals, or a white, crystalline powder. ▲▲*USP29* Is affected by light. Has greater density than water, but when liquefied by fusion is less dense than water. Its alcohol solutions are neutral to litmus. One g dissolves in about 1000 mL of water, in 1 mL of alcohol, in 1 mL of chloroform, in 1.5 mL of ether, and in about 2 mL of olive oil. Soluble in glacial acetic acid and in fixed or volatile oils. Store in tight, light-resistant containers.

Melting range ⟨741⟩**:** between 48° and 51°, but when melted it remains liquid at a considerably lower temperature.

Nonvolatile matter—Volatilize 2 g on a steam bath, and dry at 105° to constant weight: the residue weighs not more than 1 mg (0.05%).

Change to read:

***n*-Tricosane,** $C_{23}H_{48}$—**324.63**

■[*638-67-5*]■2S (*USP30*)
—Colorless or white, more or less translucent mass, showing a crystalline structure. ▲*USP29* Has a slightly greasy feel. Insoluble in water and in alcohol; soluble in chloroform, in ether, in volatile oils, and in most warm fixed oils; slightly soluble in dehydrated alcohol. Boils at about 380°.

Melting range ⟨741⟩**:** between 47° and 49°.

Suitability—Determine its suitability for use in the test for *Related compounds* under *Propoxyphene Hydrochloride* (*USP* monograph) as follows. Dissolve a suitable quantity in chloroform to yield a solution containing 20 µg per mL. Following the directions given in the test for *Related compounds* under *Propoxyphene Hydrochloride,* inject a suitable volume of the solution into the chromatograph, and record the chromatogram. Concomitantly record the chromatogram from the *Standard preparation* prepared as directed in the test for *Related compounds:* only one main peak is obtained from the *n*-tricosane solution, and no minor peaks are observed at, or near, the peak positions obtained for propoxyphene, acetoxy, or carbinol in the chromatogram from the *Standard preparation*.

BRIEFING

Triethylamine, *USP 29* page 3161—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43698-9

Change to read:

Triethylamine, $(C_2H_5)_3N$—**101.19**

■[*121-44-8*]■2S (*USP30*)
—Colorless liquid. ▲*USP29* Slightly soluble in water. Miscible with alcohol, with ether, and with cold water. Store in well-closed containers.

Boiling range (Reagent test): between 89° and 90°.

Absorbance—To 1 mL in a 50-mL volumetric flask add 10 mL of methanol and 1 mL of hydrochloric acid, and add chloroform to volume. The absorbance of this solution, determined at the wavelength of maximum absorbance at about 285 nm, with a suitable spectrophotometer, does not exceed 0.01. [NOTE—If the absorbance exceeds 0.01, purify the triethylamine as follows. Reflux 100 mL with 20 mL of water and 2 g of sodium hydrosulfite for not less than 8 hours, wash with water, dry by refluxing, using a Dean-Stark trap, and distill, collecting only the first 75 mL of the filtrate. Store over anhydrous sodium carbonate or anhydrous potassium carbonate.]

Change to read:

Triethylene Glycol, $C_6H_{14}O_4$—**150.17**

■[*112-27-6*]■2S (*USP30*)
—Colorless to pale yellow liquid. Is hygroscopic. Miscible with water, with alcohol, and with toluene.

Assay—Inject an appropriate test specimen into a suitable gas chromatograph equipped with a flame-ionization detector (see *Chromatography* ⟨621⟩), helium being used as the carrier gas. The following conditions have been found suitable: a 3-mm × 1.85-m stainless steel column packed with support S2; the injection port, column, and detector temperatures are maintained at 250°, 230°, and 310°, respectively. The area of the $C_6H_{14}O_4$ peak is not less than 97% of the total peak area.

Refractive index ⟨831⟩: between 1.4550 and 1.4570, at 20°.

BRIEFING

Trifluoroacetic Acid, *USP 29* page 3161—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43698-12

Change to read:

Trifluoroacetic Acid, $C_2HF_3O_2$—**114.02**

■[*76-05-1*]■2S (*USP30*)
—Colorless liquid. Miscible with ether, with acetone, with ethanol, with benzene, with carbon tetrachloride, and with hexane.

Assay—Dissolve about 300 mg, accurately weighed, in 25 mL of water and 25 mL of alcohol. Titrate with 0.1 N sodium hydroxide VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary corrections. Each mL of 0.1 N sodium hydroxide is equivalent to 11.40 mg of $C_2HF_3O_2$. Not less than 99% is found.

BRIEFING

Trifluoroacetic Anhydride, *USP 29* page 3161—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43698-14

Change to read:

Trifluoroacetic Anhydride, $(F_3CCO)_2O$—**210.03**

■[*407-25-0*]■2S (*USP30*)
—Colorless liquid. Boils between 40° and 42°. Extremely volatile. Avoid exposure to air or water.

Assay—Transfer about 0.8 g, accurately weighed, to a glass-stoppered flask containing 50 mL of methanol. Add 500 mg of phenolphthalein, and titrate with 0.1 N sodium methoxide VS to a pink endpoint. Calculate *A* by the formula:

$$V / W$$

in which *V* is the volume, in mL, of 0.1 N sodium methoxide and *W* is the weight, in mg, of test specimen. To a second glass-stoppered flask containing 50 mL of a mixture of dimethylformamide and water (1 : 1) transfer 0.4 g, accurately weighed, of the specimen under test, add 500 mg of phenolphthalein, and titrate with 0.1 N sodium hydroxide VS to a pink endpoint. Calculate *B* by the formula:

$$V^1 / W^1$$

in which V^1 is the volume, in mL, of 0.1 N sodium hydroxide and W^1 is the weight, in mg, of test specimen. Calculate the percentage of $(F_3CCO)_2O$ by the formula:

$$2100.3(B - A)$$

Not less than 97% is found. If 2*A* is greater than *B*, calculate the percentage of F_3CCOOH by the formula:

$$1140.3(2A - B)$$

BRIEFING

(HDQ: M. Marques) RTS—43703-6

Change to read:

Triphenyltetrazolium Chloride, $C_{19}H_{15}ClN_4$—**334.80**

■[*298-96-4*]■2S (*USP30*)
—White to yellowish, crystalline powder. Soluble in about 10 parts of water and of alcohol; slightly soluble in acetone; insoluble in ether. Usually contains solvent of crystallization, and when dried at 105° it melts at about 240°, with decomposition.

Solubility—Separate 100-mg portions dissolve completely in 10 mL of water and in 10 mL of alcohol, respectively, to yield solutions that are clear, or practically so.

Loss on drying ⟨731⟩—Dry it at 105° to constant weight: it loses not more than 5.0% of its weight.

Residue on ignition (Reagent test): negligible, from 100 mg.

Sensitiveness—Dissolve 10 mg in 10 mL of dehydrated alcohol (*A*). Then dissolve 10 mg of dextrose in 20 mL of dehydrated alcohol (*B*). To 0.2 mL of *B* add 1 mL of dehydrated alcohol and 0.5 mL of dilute tetramethylammonium hydroxide TS (1 volume diluted with 9 volumes of dehydrated alcohol), then add 0.2 mL of *A:* a pronounced red color develops within about 10 minutes.

In-Process Revision

BRIEFING

Tris(2-aminoethyl)amine, *USP 29* page 3162—See briefing under *1-Nonyl Alcohol.*

L-Tryptophane, $C_{11}H_{12}N_2O_2$—**204.23**

■[*73-22-3*]■2S (*USP30*)
—White or not more than slightly yellow leaflets or powder. One g dissolves in about 100 mL of water; soluble in dilute acids and in solutions of the alkali hydroxides; slightly soluble in alcohol.

Assay—Accurately weigh about 300 mg, dissolve in a mixture of 3 mL of formic acid and 50 mL of glacial acetic acid, add 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Each mL of 0.1 N perchloric acid is equivalent to 20.42 mg of $C_{11}H_{12}N_2O_2$. Between 98.0% and 102.0%, calculated on the dried basis, is found.

Specific rotation ⟨781⟩: between –30.0° and –33.0°, determined in a solution containing 1.0 g of test specimen, previously dried at 105° for 3 hours, in 100 mL.

Loss on drying ⟨731⟩—Dry it at 105° for 3 hours: it loses not more than 0.3% of its weight.

Residue on ignition (Reagent test): not more than 0.1%.

Tyrosine—Dissolve 100 mg in 3 mL of diluted sulfuric acid, add 10 mL of mercuric sulfate TS, and heat on a steam bath for 10 minutes. Filter, wash with 5 mL of mercuric sulfate TS, and add to the combined filtrate 0.5 mL of sodium nitrite solution (1 in 20): no red color is produced within 15 minutes.

BRIEFING

Tubocurarine Chloride. It is proposed to add this new reagent used in the preparation of the *Running buffer* in the *Assay* in the monograph for *Pancuronium Bromide Injection,* presented elsewhere in this *PF.*

(HDQ: M. Marques) RTS—C44876

Add the following:

■**Tubocurarine Chloride** *(7′,12′-Dihydroxy-6,6′-dimethoxy-2,2′,2′-trimethyltubocuraranium Chloride),* $C_{37}H_{42}Cl_2N_2O_6$—**681.65**[*6989-98-6*]—Use a suitable grade with an assay result between 98.0% and 102.0%.

[NOTE—A suitable grade is available from Acros Organics, catalog number 24349 at www.acros.com.]■2S (*USP30*)

Valerophenone, $C_{11}H_{14}O$—**162.23**

■[*1009-14-9*]■2S (*USP30*)
—Colorless liquid.

Assay—Inject an appropriate specimen into a suitable gas chromatograph (see *Chromatography* ⟨621⟩) equipped with a flame-ionization detector, helium being used as the carrier gas. The following conditions have been found suitable: a capillary column coated with a 1-µm layer of phase G2; the injection port temperature is maintained at 250°; the detector temperature is maintained at 300°; and the column temperature is maintained at 150° and programmed to rise 10° per minute to 300°. The area of the $C_{11}H_{14}O$ peak is not less than 98% of the total peak area.

Refractive index ⟨831⟩: 1.5149 at 20°.

Boiling range: between 105° and 107°, at a pressure of 5 mm of mercury.

BRIEFING

Vanadium Pentoxide, *USP 29* page 3163—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43703-18

Change to read:

Vanadium Pentoxide, V_2O_5—**181.88**

■[*1314-62-1*]■2S (*USP30*)
—Fine, yellow to orange-yellow powder. Soluble in concentrated acids and in alkalies; slightly soluble in water; insoluble in alcohol.

Assay—Transfer about 400 mg, accurately weighed, to a 500-mL conical flask, and add 150 mL of water and 30 mL of dilute sulfuric acid (1 in 2). Boil the solution on a hot plate for 5 minutes, add 50 mL of water, and continue boiling until a yellow solution is obtained. Transfer the hot plate and the flask to a well-ventilated hood, and bubble sulfur dioxide gas through the solution for 10 minutes, or until the solution is a clear, brilliant blue color. Rinse the gas delivery tube into the flask with a few mL of water, then bubble carbon dioxide gas through the solution for 30 minutes while continuing to boil the solution gently. Cool the solution to about 80°, and titrate with 0.1 N potassium permanganate VS to a yellow-orange endpoint. Perform a complete blank determination, and make any necessary correction. Each mL of 0.1 N potassium permanganate is equivalent to 9.095 mg of V_2O_5. Not less than 99.5% is found.

BRIEFING

Vanadyl Sulfate, *USP 29* page 3163—See briefing under *1-Nonyl Alcohol.*

(HDQ: M. Marques) RTS—43703-19

Change to read:

Vanadyl Sulfate, $VOSO_4 \cdot xH_2O$ (anhydrous)—**163.00**

■[*27774-13-6*]■2S (*USP30*)
—Blue, hygroscopic crystals. Slowly and usually incompletely soluble in water.

Assay—Accurately weigh about 400 mg of the dried test specimen obtained in the test for *Water,* and transfer with 15 to 20 mL of water into a beaker. Add 3 mL of sulfuric acid, cover the beaker with a watch glass, and heat on a steam bath until all of the specimen is dissolved. Cool, dilute with 125 mL of water, and titrate with 0.1 N potassium permanganate VS to the production of a pinkish color that persists for 1 minute: each mL of 0.1 N potassium permanganate is equivalent to 16.30 mg of $VOSO_4$. Not less than 97% is found.

Water—Dry about 1 g, accurately weighed, at 220° to constant weight: it loses not more than 50.0% of its weight.

Pentavalent vanadium—Heat 1 g, accurately weighed, with 50 mL of water and 5 mL of hydrochloric acid in a flask until dissolved. Cool, add 2 g of potassium iodide, insert the stopper, and allow to stand for 30 minutes. Add 50 mL of water, and titrate the liberated iodine with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the indicator. Correct for the volume of thiosulfate consumed by a blank. Each mL of 0.1 N thiosulfate is equivalent to 5.095 mg of vanadium (V). Not more than 0.5% is found, calculated on the dried basis.

Substances not precipitated by ammonia—Dissolve 1.0 g by heating with 20 mL of water and 2 mL of hydrochloric acid. Dilute with water to about 75 mL, and neutralize to litmus paper with ammonia TS. Transfer the solution to a cylinder, slowly add 5 mL of ammonia TS and sufficient water to make 100 mL, and allow to stand overnight. Decant 50 mL of the supernatant through a filter, add 5 drops of sulfuric acid, evaporate to dryness, and ignite: the residue weighs not more than 10 mg (2.0%).

Volumetric Solutions

BRIEFING

Volumetric Solutions, *USP 29* page 3175 and page 939 of *PF* 32(3) [May–June 2006]. Two new volumetric solutions are being proposed: *Bismuth Nitrate,* which is being added to the Stage 6 proposal for *Edetate Calcium Disodium,* which also appears in this *PF;* and *Magnesium Chloride, 0.01 M.*

(HDQ: M. Marques) RTS—C44011; C46397

Add the following:

■**Bismuth Nitrate, 0.01 mol/L**
$Bi(NO_3)_3 \cdot 5H_2O$, **485.07**

1000 mL of this solution contains 4.851 g of bismuth nitrate pentahydrate

Dissolve 4.86 g of bismuth nitrate pentahydrate in 60 mL of dilute nitric acid, add water to make 1000 mL, and standardize the solution as follows:

Accurately measure 25 mL of the prepared bismuth nitrate solution, add 50 mL of water and 1 drop of xylenol orange TS, and titrate the solution with 0.01 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the red color changes to yellow. Calculate the molarity factor.■2S (*USP30*)

Add the following:

■**Magnesium Chloride, 0.01 M**
$MgCl_2 \cdot 6H_2O$, **203.30**

2.0330 g in 1000 mL

Dissolve about 2.04 g of magnesium chloride in 1000 mL of freshly boiled and cooled water, and standardize the solution as follows.

Accurately measure 25 mL of the prepared magnesium chloride solution. Add 50 mL of water, 3 mL of ammonia–ammonium chloride buffer TS and 0.04 g of eriochrome black T–sodium chloride reagent. Titrate with 0.05 M edetate disodium VS until the red-purple color of the solution changes to blue-purple.■2S (*USP30*)

$$M = \frac{(\text{mL edetate disodium VS}) \times (\text{M edetate disodium})}{\text{mL magnesium chloride}}$$

NaOH, **40.00**

To 250 mL of alcohol add 2 mL of a 50% ~~(w/w)~~

■(w/v)■2S (*USP29*)
solution of sodium hydroxide.

Dissolve about 200 mg of benzoic acid, accurately weighed, in 10 mL of alcohol and 2 mL of water. Add 2 drops of phenolphthalein TS, and titrate with the alcoholic sodium hydroxide solution until a permanent pale pink color is produced.

$$N = \frac{\text{mg benzoic acid}}{122.1 \times \text{mL sodium hydroxide}}$$

In-Process Revision

Change to read:

Sodium Hydroxide, Normal (1 N)
NaOH, **40.00**

40.00 g in 1000 mL

Dissolve 162 g of sodium hydroxide in 150 mL of carbon dioxide-free water, cool the solution to room temperature, and filter through hardened filter paper. Transfer 54.5 mL of the clear filtrate to a tight, polyolefin container, and dilute with carbon dioxide-free water to 1000 mL.

Accurately weigh about 5 g of potassium biphthalate, previously crushed lightly and dried at 120° for 2 hours, and dissolve in 75 mL of carbon dioxide-free water. Add 2 drops of phenolphthalein TS, and titrate with the sodium hydroxide solution to the production of a permanent pink color. Each ~~204.2 mg~~ ■204.23 mg■1S (*USP30*) of potassium biphthalate is equivalent to 1 mL of 1 N sodium hydroxide.

$$N = \frac{\text{g } KHC_8H_4O_4}{0.20423 \times \text{mL NaOH solution}}$$

NOTES—(1) Solutions of alkali hydroxides absorb carbon dioxide when exposed to air. They should be preserved in bottles having well-fitted, suitable stoppers, provided with a tube filled with a mixture of sodium hydroxide and lime (soda-lime tubes) so that air entering the container must pass through this tube, which will absorb the carbon dioxide. (2) Prepare solutions of lower concentration (e.g., 0.1 N, 0.01 N) by quantitatively diluting accurately measured volumes of the 1 N solution with sufficient carbon dioxide-free water to yield the desired concentration.

Restandardize the solution frequently.

Change to read:

Sodium Thiosulfate, Tenth-Normal (0.1 N)
$Na_2S_2O_3 \cdot 5H_2O$, **248.19**

24.82 g in 1000 mL

Dissolve about 26 g of sodium thiosulfate and 200 mg of sodium carbonate in 1000 mL of recently boiled and cooled water. Standardize the solution as follows.

Accurately weigh about 210 mg of primary standard potassium dichromate, previously pulverized and dried ~~at 120° for 4 hours,~~ ■according to the instructions on its label, if necessary,■1S (*USP30*) and dissolve in 100 mL of water in a glass-stoppered, 500-mL flask. Swirl to dissolve the solid, remove the stopper, and quickly add 3 g of potassium iodide, 2 g of sodium bicarbonate, and 5 mL of hydrochloric acid. Insert the stopper gently in the flask, swirl to mix, and allow to stand in the dark for exactly 10 minutes. Rinse the stopper and the inner walls of the flask with water, and titrate the liberated iodine with the sodium thiosulfate solution until the solution is yellowish green in color. Add 3 mL of starch TS, and continue the titration until the blue color is discharged. Perform a blank determination.

Restandardize the solution as frequently as supported by laboratory stability data. In the absence of such data, restandardize the solution weekly.

$$N = \frac{\text{mg } K_2Cr_2O_7}{49.04 \times \text{mL } Na_2S_2O_3}$$

BRIEFING

Chromatographic Reagents. It is proposed to add a new section *Chromatographic Reagents* under *Reagents, Indicators, and Solutions* based on the proposal of the General Chapters Expert Committee to move the list of *Packings, Phases,* and *Supports* under *Chromatographic Reagents* from the general chapter *Chromatography* ⟨621⟩. See also briefing under *Chromatography* ⟨621⟩.

(HDQ: M. Marques)

Add the following:

■CHROMATOGRAPHIC REAGENTS

The following list of packings (L), phases (G), and supports (S) is intended to be a convenient reference for the chromatographer. [NOTE—Particle sizes given in this listing are those generally provided. Where other, usually finer, sizes are required, the individual monograph specifies the desired particle size. Within any category of packings or phases listed below, there may be a wide range of columns available. Where it is necessary to define more specifically the chromatographic conditions, the individual monograph so indicates.]

Packings

L1—Octadecyl silane chemically bonded to porous silica or ceramic micro-particles, ~~3~~ ■1.5■1S (*USP30*) to 10 µm in diameter, ■or a monolithic silica rod.■1S (*USP29*)

In-Process Revision

L2—Octadecyl silane chemically bonded to silica gel of a controlled surface porosity that has been bonded to a solid spherical core, 30 to 50 µm in diameter.

L3—Porous silica particles, 5 to 10 µm in diameter.

L4—Silica gel of controlled surface porosity bonded to a solid spherical core, 30 to 50 µm in diameter.

L5—Alumina of controlled surface porosity bonded to a solid spherical core, 30 to 50 µm in diameter.

L6—Strong cation-exchange packing–sulfonated fluorocarbon polymer coated on a solid spherical core, 30 to 50 µm in diameter.

L7—Octylsilane chemically bonded to totally porous silica particles, ~~3~~ ■1.5■1S *(USP30)* to 10 µm in diameter.

L8—An essentially monomolecular layer of aminopropylsilane chemically bonded to totally porous silica gel support, 3 to 10 µm in diameter.

L9—■■1S *(USP29)* Irregular or spherical, totally porous silica gel having a chemically bonded, strongly acidic cation-exchange coating, ■3 to 10 µm in diameter.■1S *(USP29)*

L10—Nitrile groups chemically bonded to porous silica particles, 5 to 10 µm in diameter.

L11—Phenyl groups chemically bonded to porous silica particles, ~~5~~■1.5■1S *(USP30)* to 10 µm in diameter.

L12—A strong anion-exchange packing made by chemically bonding a quaternary amine to a solid silica spherical core, 30 to 50 µm in diameter.

L13—Trimethylsilane chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L14—Silica gel having a chemically bonded, strongly basic quaternary ammonium anion-exchange coating, 5 to 10 µm in diameter.

L15—Hexylsilane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

L16—Dimethylsilane chemically bonded to porous silica particles, 5 to 10 µm in diameter.

L17—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form, 7 to 11 µm in diameter.

L18—Amino and cyano groups chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L19—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the calcium form, about 9 µm in diameter.

L20—Dihydroxypropane groups chemically bonded to porous silica particles, 5 to 10 µm in diameter.

L21—A rigid, spherical styrene-divinylbenzene copolymer, 5 to 10 µm in diameter.

L22—A cation-exchange resin made of porous polystyrene gel with sulfonic acid groups, about 10 µm in size.

L23—An anion-exchange resin made of porous polymethacrylate or polyacrylate gel with quaternary ammonium groups, about 10 µm in size.

L24—A semi-rigid hydrophilic gel consisting of vinyl polymers with numerous hydroxyl groups on the matrix surface, 32 to 63 µm in diameter.

■[NOTE—Available as YMC-Pack PVA-SIL manufactured by YMC Co., Ltd. and distributed by Waters Corp. (www.waters.com).]■1S *(USP29)*

L25—Packing having the capacity to separate compounds with a molecular weight range from 100–5000 (as determined by polyethylene oxide), applied to neutral, anionic, and cationic water-soluble polymers. A polymethacrylate resin base, cross-linked with polyhydroxylated ether (surface contained some residual carboxyl functional groups) was found suitable.

L26—Butyl silane chemically bonded to totally porous silica particles, ■3■1S *(USP29)* to 10 µm in diameter.

L27—Porous silica particles, 30 to 50 µm in diameter.

L28—A multifunctional support, which consists of a high purity, 100 Å, spherical silica substrate that has been bonded with anionic exchanger, amine functionality in addition to a conventional reversed phase C8 functionality.

L29—Gamma alumina, reverse-phase, low carbon percentage by weight, alumina-based polybutadiene spherical particles, 5 µm in diameter with a pore volume of 80 Å.

L30—Ethyl silane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

In-Process Revision

L31—A ■hydroxide-selective,■1S (*USP29*) strong anion-exchange resin-quaternary amine bonded on latex particles attached to a core of 8.5-µm macroporous particles having a pore size of 2000 Å and consisting of ethylvinylbenzene cross-linked with 55% divinylbenzene.

L32—A chiral ligand-exchange packing–L-proline copper complex covalently bonded to irregularly shaped silica particles, 5 to 10 µm in diameter.

L33—Packing having the capacity to separate dextrans by molecular size over a range of 4000 to 500,000 Da. It is spherical, silica-based, and processed to provide pH stability.

■[NOTE—Available as TSKgel G4000 SWXL from Tosoh Biosep (www.tosohbiosep.com).]■1S (*USP29*)

L34—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the lead form, about 9 µm in diameter.

L35—A zirconium-stabilized spherical silica packing with a hydrophilic (diol-type) molecular monolayer bonded phase having a pore size of 150 Å.

L36—A 3,5-dinitrobenzoyl derivative of L-phenylglycine covalently bonded to 5-µm aminopropyl silica.

L37—Packing having the capacity to separate proteins by molecular size over a range of 2,000 to 40,000 Da. It is a polymethacrylate gel.

L38—A methacrylate-based size-exclusion packing for water-soluble samples.

L39—A hydrophilic polyhydroxymethacrylate gel of totally porous spherical resin.

L40—Cellulose tris-3,5-dimethylphenylcarbamate coated porous silica particles, 5 to 20 µm in diameter.

L41—Immobilized α_1-acid glycoprotein on spherical silica particles, 5 µm in diameter.

L42—Octylsilane and octadecylsilane groups chemically bonded to porous silica particles, 5 µm in diameter.

L43—Pentafluorophenyl groups chemically bonded to silica particles by a propyl spacer, 5 to 10 µm in diameter.

L44—A multifunctional support, which consists of a high purity, 60 Å, spherical silica substrate that has been bonded with a cationic exchanger, sulfonic acid functionality in addition to a conventional reversed phase C8 functionality.

L45—Beta cyclodextrin bonded to porous silica particles, 5 to 10 µm in diameter.

L46—Polystyrene/divinylbenzene substrate agglomerated with quaternary amine functionalized latex beads, about 10 µm in diameter.

L47—High-capacity anion-exchange microporous substrate, fully functionalized with trimethlyamine groups, 8 µm in diameter.

■[NOTE—Available as CarboPac MA1 and distributed by Dionex Corp. (www.dionex.com).]■1S (*USP29*)

L48—Sulfonated, cross-linked polystyrene with an outer layer of submicron, porous, anion-exchange microbeads, 15 µm in diameter.

L49—A reversed-phase packing made by coating a thin layer of polybutadiene onto spherical porous zirconia particles, 3 to 10 µm in diameter.

■[NOTE—Available as Zirchrom PBD, manufactured by ZirChrom Separations, Inc., distributed by Alltech, www.Alltechweb.com.]■1S (*USP29*)

L50—Multifunction resin with reversed-phase retention and strong anion-exchange functionalities. The resin consists of ethylvinylbenzene, 55% cross-linked with divinylbenzene copolymer, 3 to 15 µm in diameter, and a surface area not less than 350 m^2 per g. Substrate is coated with quaternary ammonium functionalized latex particles consisting of styrene cross-linked with divinylbenzene.

■[NOTE—Available as OmniPac PAX-500 and distributed by Dionex Corp. (www.dionex.com).]■1S (*USP29*)

L51—Amylose tris-3,5-dimethylphenylcarbamate-coated, porous, spherical, silica particles, 5 to 10 µm in diameter.

■[NOTE—Available as Chiralpak AD from Chiral Technologies, Inc., (www.chiraltech.com).]■1S (*USP29*)

L52—A strong cation-exchange resin made of porous silica with sulfopropyl groups, 5 to 10 µm in diameter.

■[NOTE—Available as TSK IC SW Cation from Tosoh Biosep (www.tosohbiosep.com).]■1S *(USP29)*

L53—Weak cation-exchange resin consisting of ethylvinylbenzene, 55% cross-linked with divinylbenzene copolymer, 3 to 15 µm diameter. Substrate is surface grafted with carboxylic acid and/or phosphoric acid functionalized monomers. Capacity not less than 500 µEq/column.

■[NOTE—Available as IonPac CS14 distributed by Dionex Corp. (www.dionex.com).]■1S *(USP29)*

L54—A size exclusion medium made of covalent bonding of dextran to highly cross-linked porous agarose beads, about 13 µm in diameter.

■[NOTE—Available as Superdex Peptide HR 10/30 from Amersham Pharmacia Biotech (www.amershambiosciences.com).]■1S *(USP29)*

L55—A strong cation-exchange resin made of porous silica coated with polybutadiene–maleic acid copolymer, about 5 µm in diameter.

■[NOTE—Available as IC-Pak C M/D from Waters Corp. (www.waters.com).]■1S *(USP29)*

L56—Propyl silane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

■[NOTE—Available as Zorbax SB-C3 from Agilent Technologies. (www.agilent.com/chem).]■1S *(USP29)*

L57—A chiral-recognition protein, ovomucoid, chemically bonded to silica particles, about 5 µm in diameter, with a pore size of 120 Å.

■[NOTE—Available as Ultron ES-OVM from Agilent Technologies (www.agilent.com/chem).]■1S *(USP29)*

L58—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the sodium form, about 7 to 11 µm in diameter.

■[NOTE—Available as Aminex HPX-87N from Bio-Rad Laboratories, (2000/01 catalog, #125-0143) www.bio-rad.com.]■1S *(USP29)*

L59—Packing having the capacity to separate proteins by molecular weight over the range of 10 to 500 kDa. It is spherical (10 µm), silica-based, and processed to provide hydrophilic characteristics and pH stability.

■[NOTE—Available as TSKgel G3000SW Column (analytical column) and TSKgel Guard (guard column) from Tosoh Biosep (part numbers 05789 and 05371, respectively) (www.tosohbiosep.com).]■1S *(USP29)*

L60—Spherical, porous silica gel, ~~3 or 5 µm~~ ■10 µm or less■1S *(USP30)* in diameter, the surface of which has been covalently modified with ~~palmitamidopropyl~~ ■alkyl amide■1S *(USP30)* groups and endcapped.

■[NOTE—Available as Supelcosil ABZ from Supelco (www.sigma-aldrich.com/supelco).]■1S *(USP29)*

L61—A hydroxide selective strong anion-exchange resin consisting of a highly cross-linked core of 13 µm microporous particles having a pore size less than 10 Å units and consisting of ethylvinylbenzene cross-linked with 55% divinylbenzene with a latex coating composed of 85 nm diameter microbeads bonded with alkanol quaternary ammonium ions (6%).

■[NOTE—Available as Ion Pac AS-11 and AG-11 from Dionex (www.dionex.com).]■1S *(USP29)*

L62—C30 silane bonded phase on a fully porous spherical silica, 3 to 15 µm in diameter.

~~L## (Enoxaparin Sodium, Dowex 1X8) [To come.]~~

~~L## (Enoxaparin Sodium, Dowex 50WX2) [To come.]~~

▲L## (Dalteparin Sodium, anion-exchange Dowex 1X8)—[To come.]

L## (Dalteparin Sodium, cation-exchange Dowex 50WX2)—[To come.]▲*USP30*

■L## (Glucosamine, Shodex NH2P-50)—Polyamine chemically bonded to cross-linked polyvinyl alcohol polymer, 5 µm in diameter.

[NOTE—Available as Shodex NH2P-50 from Shodex (www.shodex.com).]

In-Process Revision

L## [Valganciclovir Hydrochloride, Crownpak CR(+)]—A crown ether coated on a 5-µm particle size silica gel substrate. The active site is *(S)*-18-crown-6-ether.

[NOTE—Available as Crownpak CR(+) from Daicel (www.daicel.com).]

L## (Trehalose, Sugar KS-801)—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the sodium form, 6 to 17 µm in diameter.

[NOTE—Available as Sugar KS-801 from Shodex (www.shodex.com).]

L## (Levalbuterol, Chirobiotic T)—Glycopeptide teicoplanin linked through multiple covalent bonds to a 100-Å units spherical silica.

[NOTE—Available as Chirobiotic T from Astec (www.astecusa.com).]■1S (*USP30*)

Phases

G1—Dimethylpolysiloxane oil.

G2—Dimethylpolysiloxane gum.

G3—50% Phenyl-50% methylpolysiloxane.

G4—Diethylene glycol succinate polyester.

G5—3-Cyanopropylpolysiloxane.

G6—Trifluoropropylmethylpolysiloxane.

G7—50% 3-Cyanopropyl-50% phenylmethylsilicone.

G8—80% Bis(3-cyanopropyl)-20% 3-cyanopropylphenylpolysiloxane (percentages refer to molar substitution).

G9—Methylvinylpolysiloxane.

G10—Polyamide formed by reacting a C_{36} dicarboxylic acid with 1,3-di-4-piperidylpropane and piperidine in the respective mole ratios of 1.00 : 0.90 : 0.20.

G11—Bis(2-ethylhexyl) sebacate polyester.

G12—Phenyldiethanolamine succinate polyester.

G13—Sorbitol.

G14—Polyethylene glycol (av. mol. wt. of 950 to 1050).

G15—Polyethylene glycol (av. mol. wt. of 3000 to 3700).

G16—Polyethylene glycol compound (av. mol. wt. about 15,000). A high molecular weight compound of polyethylene glycol with a diepoxide linker. Available commercially as Polyethylene Glycol Compound 20M, or as Carbowax 20M, from suppliers of chromatographic reagents.

G17—75% Phenyl-25% methylpolysiloxane.

G18—Polyalkylene glycol.

G19—25% Phenyl-25% cyanopropyl-50% methylsilicone.

G20—Polyethylene glycol (av. mol. wt. of 380 to 420).

G21—Neopentyl glycol succinate.

G22—Bis(2-ethylhexyl) phthalate.

G23—Polyethylene glycol adipate.

G24—Diisodecyl phthalate.

G25—Polyethylene glycol compound TPA. A high molecular weight compound of a polyethylene glycol and a diepoxide that is esterified with terephthalic acid. ■[NOTE—Available commercially as Carbowax 20M-TPA from suppliers of chromatographic reagents.]■1S (*USP29*)

G26—25% 2-Cyanoethyl-75% methylpolysiloxane.

G27—5% Phenyl-95% methylpolysiloxane.

G28—25% Phenyl-75% methylpolysiloxane.

G29—3,3′-Thiodipropionitrile.

G30—Tetraethylene glycol dimethyl ether.

G31—Nonylphenoxypoly(ethyleneoxy)ethanol (av. ethyleneoxy chain length is 30); Nonoxynol 30.

G32—20% Phenylmethyl-80% dimethylpolysiloxane.

G33—20% Carborane-80% methylsilicone.

G34—Diethylene glycol succinate polyester stabilized with phosphoric acid.

G35—A high molecular weight compound of a polyethylene glycol and a diepoxide that is esterified with nitroterephthalic acid.

G36—1% Vinyl-5% phenylmethylpolysiloxane.

G37—Polyimide.

G38—Phase G1 containing a small percentage of a tailing inhibitor.

■[NOTE—A suitable grade is available commercially as "SP2100/0.1% Carbowax 1500" from Supelco, Inc. (www.sigma-aldrich.com/supelco).]■1S (*USP29*)

G39—Polyethylene glycol (av. mol. wt. about 1500).

G40—Ethylene glycol adipate.

G41—Phenylmethyldimethylsilicone (10% phenyl-substituted).

G42—35% phenyl-65% dimethylpolysiloxane (percentages refer to molar substitution).

G43—6% cyanopropylphenyl-94% dimethylpolysiloxane (percentages refer to molar substitution).

G44—2% low molecular weight petrolatum hydrocarbon grease and 1% solution of potassium hydroxide.

G45—Divinylbenzene-ethylene glycol-dimethylacrylate.

G46—14% Cyanopropylphenyl-86% methylpolysiloxane.

G47—Polyethylene glycol (av. mol. wt. of about 8000).

G48—Highly polar, partially cross-linked cyanopolysiloxane.■■1S (*USP29*)

Supports

NOTE—Unless otherwise specified, mesh sizes of 80 to 100 or, alternatively, 100 to 120 are intended.

S1A—Siliceous earth for gas chromatography has been flux-calcined by mixing diatomite with Na_2CO_3 flux and calcining above 900°. The siliceous earth is acid-washed, then water-washed until neutral, but not base-washed. The siliceous earth may be silanized by treating with an agent such as dimethyldichlorosilane ■[NOTE—Unless otherwise specified in the individual monograph, silanized support is intended.]■1S (*USP29*) to mask surface silanol groups.

S1AB—The siliceous earth as described above is both acid- and base-washed. ■[NOTE—Unless otherwise specified in the individual monograph, silanized support is intended.]■1S (*USP29*)

S1C—A support prepared from crushed firebrick and calcined or burned with a clay binder above 900° with subsequent acid-wash. It may be silanized.

S1NS—The siliceous earth is untreated.

S2—Styrene-divinylbenzene copolymer having a nominal surface area of less than 50 m^2 per g and an average pore diameter of 0.3 to 0.4 μm.

S3—Copolymer of ethylvinylbenzene and divinylbenzene having a nominal surface area of 500 to 600 m^2 per g and an average pore diameter of 0.0075 μm.

S4—Styrene-divinylbenzene copolymer with aromatic –O and –N groups, having a nominal surface area of 400 to 600 m^2 per g and an average pore diameter of 0.0076 μm.

S5—40- to 60-mesh, high-molecular weight tetrafluoroethylene polymer.

S6—Styrene-divinylbenzene copolymer having a nominal surface area of 250 to 350 m^2 per g and an average pore diameter of 0.0091 μm.

S7—Graphitized carbon having a nominal surface area of 12 m^2 per g.

S8—Copolymer of 4-vinyl-pyridine and styrene-divinylbenzene.

S9—A porous polymer based on 2,6-diphenyl-*p*-phenylene oxide.

S10—A highly polar cross-linked copolymer of acrylonitrite and divinylbenzene.

S11—Graphitized carbon having a nominal surface area of 100 m^2 per g modified with small amounts of petrolatum and polyethylene glycol compound. ■[NOTE—Commercially available as SP1500 on Carbopack B from Supelco (www.sigma-aldrich.com/supelco).]■1S (*USP29*)

S12—Graphitized carbon having a nominal surface area of 100 m^2 per g.■2S (*USP30*)

In-Process Revision

REFERENCE TABLES

BRIEFING

Container Specifications for Capsules and Tablets, *USP 29* page 3184, page 3625 of the *First Supplement,* and page 941 of *PF* 32(3) [May–June 2006].

(HDQ) RTS—C42655; C43862; C44132; C45407; C45499; C45503

The following table is provided as a reminder for the pharmacist engaged in the typical dispensing situation who already is acquainted with the *Packaging and storage* requirements set forth in the individual monographs. It lists the capsules and tablets that are official in the *United States Pharmacopeia* and indicates the relevant tight (T), well-closed (W), and light-resistant (LR) specifications applicable to containers in which the drug that is repackaged should be dispensed.

This table is not intended to replace, nor should it be interpreted as replacing, the definitive requirements stated in the individual monographs.

Container Specifications for Capsules and Tablets

Monograph Title	*Container Specification*
Add the following:	
▲Benazepril Hydrochloride Tablets	W ▲*USP30*
Add the following:	
■Capecitabine Tablets	T ■2S *(USP30)*

▲Valsartan and Hydrochlorothiazide Tablets	~~W~~ T▲*USP30*

BRIEFING

Description and Relative Solubility of USP and NF Articles, *USP 29* page 3191, page 3625 of the *First Supplement,* page 8589 of *PF* 25(4) [July–Aug. 1999], page 1135 of *PF* 26(4) [July–Aug. 2000], page 1908 of *PF* 27(1) [Jan.–Feb. 2001], page 554 of *PF* 28(2) [Mar.–Apr. 2002], page 1953 of *PF* 28(6) [Nov.–Dec. 2002], page 266 of *PF* 29(1) [Jan.–Feb. 2003], page 812 of *PF* 29(3) [May–June 2003], page 1684 of *PF* 29(5) [Sept.–Oct. 2003], page 1405 of *PF* 30(4) [July–Aug. 2004], page 1822 of *PF* 30(5) [Sept.–Oct. 2004], page 2183 of *PF* 30(6) [Nov.–Dec. 2004], page 122 of *PF* 31(1) [Jan.–Feb. 2005], page 591 of *PF* 31(2) [Mar.–Apr. 2005], page 861 of *PF* 31(3) [May–June 2005], page 1193 of *PF* 31(4) [July–Aug. 2005], page 1491 of *PF* 31(5) [Sept.–Oct. 2005], page 1703 of *PF* 31(6) [Nov.–Dec. 2005], page 188 of *PF* 32(1) [Jan.–Feb. 2006], page 662 of *PF* 32(2) [Mar.–Apr. 2006], and page 942 of *PF* 32(3) [May–June 2006].

(HDQ) RTS—C43499; C43750; C44166; C44223; C46125

Add the following:

■**Capecitabine:** White to off-white crystalline powder. Freely soluble in methanol; soluble in acetonitrile and in ethanol; sparingly soluble in water.■2S (*USP30*)

Add the following:

■**Carvedilol:** White or nearly white, crystalline powder. Slightly soluble in alcohol; practically insoluble in water and in dilute acids.■2S (*USP30*)

Change to read:

Doxorubicin Hydrochloride: Red-orange, hygroscopic, crystalline

■or amorphous■2S (*USP30*)
powder. Soluble in water, in isotonic sodium chloride solution, and in methanol; practically insoluble in chloroform, in ether, and in other organic solvents.

Add the following:

■**Levofloxacin** (hemihydrate)**:** Pale or bright yellow crystalline powder. Freely soluble in glacial acetic acid and in chloroform; sparingly soluble in methanol; slightly soluble in ethanol; practically insoluble in ether.■2S (*USP30*)

Add the following:

■**Polydextrose:** Off-white to light tan-colored solid. Very soluble in water; slightly soluble in glycerin and in propylene glycol; insoluble in alcohol. *NF category:* Bulking agent; humectant.■2S (*NF25*)

Pending Proposals

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *Pharmacopeial Forum (PF)* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in the *USP–NF*, its *Supplements*, or an *IRA.* Those items that have not yet been adopted are marked as *Pending Proposals.*

The *Pending Proposals* list contains these items separated into the following categories: General Notices and Requirements; *USP* monographs; Dietary Supplements Monographs; General Chapters; Reference Tables; Excipients; and *NF* Monographs. Each entry in the *Pending Proposals* list contains the monograph title and the citation of the most recent publication of the monograph. When the appropriate USP Expert Committee is considering advancing to official status a pending proposal that is more than 2 years old, it is republished in *PF* for additional opportunity for public review and comment. Reprints of *PF* proposals may be purchased from USP by sending a written request for information to custsvc@usp.org.

To check the status of a *Pending Proposal,* please contact USP as directed below.

- The briefing accompanying the monograph or general chapter lists the names of the Scientific Liaisons responsible for the proposed revisions. The contact information (phone number and email) for the Scientific Liaison is available in the *Staff Directory* section of *How to Use PF*. For *USP–NF Online* subscribers, the name and contact information for the assigned Scientific Liaison is available in the *Auxiliary Information* portion of each monograph.
- Call USP at 301-816-8344 and ask to speak with the Scientific Liaison assigned to the monograph or general chapter of interest.
- Submit questions by email to stdsmonographs@usp.org. Please indicate the name of the monograph or general chapter in the subject line of the email.

Following these lists the reader will find the *Canceled Proposals* list. These are items that were published in *PF* and were pending, but have since been canceled. This list contains cumulative entries for the six issues per volume of *PF* [i.e., 32(1) through 32(6)]. Note that canceled proposals may be republished in *PF* to be considered for future adoption into the *USP–NF*.

Amantadine Hydrochloride—*Chromatographic purity*	31	5	1344

In-Process Revision

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* Vol.	No.	Page(s)
Amifostine—*Related compounds*	32	3	756
Amifostine for Injection—*Related compounds*	32	3	757
Amiloride Hydrochloride and Hydrochlorothiazide Tablets—*Dissolution*	31	4	1025
Amitriptyline Hydrochloride—*USP Reference standards, Identification, Chromatographic purity* (delete), *Related compounds* (add), *Assay*	31	6	1606
Amlodipine Besylate (new)	32	3	757
Amoxicillin Tablets—*Dissolution*	32	2	305
Amoxicillin and Clavulanate Potassium for Oral Suspension—*Water* (delete)	31	4	1026
Anecortave Acetate (new)	30	2	445
Anecortave Acetate Injectable Suspension (new)	30	2	447
Aprotinin (new)	31	3	732
Aprotinin Injection (new)	31	3	736
Aspartic Acid—*Chloride*	31	5	1345
Aspirin Boluses—*Dissolution*	31	4	1026
Atenolol—*Assay*	31	5	1345
Atracurium Besylate—*Chromatographic purity, Assay*	32	2	305
Azathioprine Oral Suspension (new)	32	1	48
Azithromycin—*Labeling, USP Reference standards, Limit of related substances*	32	2	306
Aztreonam for Injection—*Assay*	31	3	737
Baclofen Oral Solution (new)	32	1	49
Baclofen Oral Suspension (new)	32	1	51
Benazepril Hydrochloride (new)	31	4	1027
Benazepril Hydrochloride Tablets (new)	32	1	52
Benzonatate Capsules—*Dissolution* (add)	32	1	55
Betamethasone Oral Solution—*Thin-layer chromatographic identification test*	31	4	1032
Bethanechol Chloride Oral Solution (new)	32	1	55
Bethanechol Chloride Oral Suspension (new)	32	1	57
Bicalutamide (new)	31	3	738
Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Metal or Plastic Carriers (new)	30	1	63
Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions (new)	30	1	66
Biphasic Isophane Insulin Human Suspension (new)	31	4	1033
Bismuth Subsalicylate Oral Suspension (new)	31	4	1035
Bismuth Subsalicylate Tablets (new)	31	3	741
Bisoctrizole (new)	32	2	309
Bromocriptine Mesylate—*Chromatographic purity*	31	5	1346
Bromocriptine Mesylate Capsules—*Dissolution*	32	1	58
Budesonide (new)	30	6	1978
Bupropion Hydrochloride Extended-Release Tablets—*Drug release, Dissolution*	32	2	312
Buspirone Hydrochloride—*Content of chloride*	31	3	742
Butorphanol Tartrate Nasal Solution (new)	31	5	1346
Calcitonin Salmon (new)	32	3	760
Calcitonin Salmon Nasal Solution (new)	32	3	767
Calcitonin Salmon Injection (new)	30	4	1177
Calcitriol (new)	32	1	58
Calcitriol Injection (new)	32	1	61
Calcium Carbonate and Magnesia Tablets—*Title* (name change)	29	6	1852
Calcium Carbonate and Magnesia Chewable Tablets (new)	29	6	1852
Calcium Carbonate, Magnesia, and Simethicone Tablets—*Title* (name change)	29	6	1853
Calcium Carbonate, Magnesia, and Simethicone Chewable Tablets (new)	29	6	1854
Calcium Lactate—*USP Reference standards* (add), *Identification*	31	6	1608
Calcium Lactate Tablets—*Identification*	31	6	1609
Calcium Pantothenate—*USP Reference standards, Ordinary impurities*	32	1	62
Camphor—*Water*	31	3	742
Captopril Oral Solution (new)	32	1	63
Captopril Oral Suspension (new)	32	1	64
Carbamazepine—*USP Reference standards, Chromatographic purity (Related compounds), Assay*	32	1	65
Carbamazepine Tablets—*Dissolution*	31	4	1044
Carbon Dioxide—*Definition, Packaging and storage*	31	4	1045
Carboxymethylcellulose Sodium—*Heavy metals*	31	5	1349

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Carboxymethylcellulose Sodium Paste—*Heavy metals*	31	5	1349
Cefaclor Tablets (new)	32	2	314
Cefadroxil for Oral Suspension—*Dissolution* (add), *Water*	32	2	315
Cefepime Hydrochloride—*Limit of N-methylpyrrolidine, Related compounds*	32	2	316
Cefonicid for Injection—*Assay*	32	1	67
Ceftazidime—*USP Reference standards, Assay*	32	1	67
Ceftazidime Injection—*USP Reference standards*	32	1	68
Ceftazidime for Injection—*USP Reference standards*	32	1	68
Cetirizine Hydrochloride (new)	32	2	317
Chlorhexidine Gluconate Oral Rinse—*Assay*	32	3	768
Chlorhexidine Gluconate Solution—*Assay*	32	3	768
Chlorophyllin Copper Complex Sodium—*Content of total copper*	32	3	769
Chlorthalidone—*USP Reference standards, Limit of 4'-chloro-3'-sulfamoyl-2-benzophenone carboxylic acid (CCA) (Limit of chlorthalidone related compound A), Assay*	32	1	68
Cholestyramine Resin—*Dialyzable quaternary amines*	32	2	320
Cilostazol (new)	32	1	69
Cimetidine—*Identification, Chromatographic purity*	32	3	769
Cimetidine Tablets—*Dissolution*	32	1	72
Ciprofloxacin—*Chromatographic purity, Assay*	32	2	320
Ciprofloxacin and Dexamethasone Otic Suspension (new)	32	2	321
Ciprofloxacin Hydrochloride—*Chromatographic purity, Assay*	32	2	325
Ciprofloxacin Injection—*Limit of ciprofloxacin ethylenediamine analog, Assay*	32	2	326
Citalopram Tablets (new)	32	3	770
Anhydrous Citric Acid *(Harmonization), Sulfate*	31	3	749
Citric Acid Monohydrate *(Harmonization), Sulfate*	31	3	750
Citric Acid, Magnesium Oxide, and Sodium Carbonate Irrigation—*USP Reference standards, Assay for citric acid (delayed implementation to January 1, 2009)*	31	2	394
Cladribine—*Specific rotation, Water, Related compounds, Limit of residual solvents*	32	3	774
Clarithromycin Extended-Release Tablets—*Dissolution*	32	3	775
Clindamycin Hydrochloride Oral Solution—*pH*	31	5	1350
Clonazepam Oral Suspension (new)	32	1	73
Clopidogrel Bisulfate—*Related compounds, Assay*	32	1	74
Clopidogrel Tablets—*Related compounds, Assay*	32	1	76
Clotrimazole Lozenges—*Dissolution*	32	1	78
Cloxacillin Benzathine—*Assay*	31	4	1050
Cloxacillin Benzathine Intramammary Infusion—*Assay*	31	4	1051
Cyanocobalamin—*Pseudo cyanocobalamin*	31	5	1350
Cyclopropane—*Definition, Packaging and storage*	31	4	1052
Cyclosporine Capsules—*Labeling* (add), *USP Reference standards, Identification A, B, Dissolution, Droplet size* (add), *Content of alcohol* (add), *Assay*	27	4	2721
Dalteparin Sodium (new)	30	5	1598
Dantrolene Sodium (new)	32	2	327
Dantrolene Sodium for Injection (new)	32	3	779
Dapsone—*Assay*	31	3	750
Desmopressin Acetate (new)	31	4	1052
Desmopressin Injection (new)	31	4	1057
Desmopressin Nasal Spray Solution (new)	31	4	1059
Desogestrel (new)	28	6	1785
Desogestrel and Ethinyl Estradiol Tablets (new)	30	5	1604
Diazepam Extended-Release Capsules—*USP Reference standards, Assay*	32	2	330
Diclofenac Potassium (new)	31	5	1350
Diclofenac Potassium Tablets (new)	31	5	1352
Diclofenac Sodium Delayed-Release Tablets—*Identification*	31	3	751
Diclofenac Sodium Extended-Release Tablets (new)	30	2	476
Didanosine (new)	32	3	781
Didanosine for Oral Solution (new)	31	5	1357
Didanosine Tablets (new)	32	3	784
Digoxin Oral Solution—*Assay*	31	5	1361
Dihydroxyaluminum Sodium Carbonate Tablets—*Title* (name change)	29	6	1873

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Dihydroxyaluminum Sodium Carbonate Chewable Tablets (new)	29	6	1873
Diltiazem Hydrochloride Oral Solution (new)	32	1	79
Diltiazem Hydrochloride Oral Suspension (new)	32	1	80
Diphenoxylate Hydrochloride and Atropine Sulfate Oral Solution—*Identification, Assay for diphenoxylate hydrochloride* (delete), *Assay for atropine sulfate* (delete), *Assay* (add)	31	6	1612
Diphenoxylate Hydrochloride and Atropine Sulfate Tablets—*Identification, Assay for diphenoxylate hydrochloride* (delete), *Assay for atropine sulfate* (delete), *Assay* (add)	31	6	1614
Diphtheria Toxin for Schick Test (delete)	31	6	1616
Dipyridamole Oral Suspension (new)	32	1	81
Divalproex Sodium (new)	31	5	1362
Docusate Calcium—*Limit of bis(2-ethylhexyl)maleate*	31	3	752
Docusate Potassium—*Limit of bis(2-ethylhexyl)maleate*	31	3	753
Docusate Sodium—*Limit of bis(2-ethylhexyl)maleate*	31	3	753
Dolasetron Mesylate Oral Solution (new)	32	1	83
Dolasetron Mesylate Oral Suspension (new)	32	1	84
Doxazosin Mesylate (new)	29	5	1470
Doxazosin Tablets (new)	29	1	64
Doxepin Hydrochloride—*USP Reference standards, Identification, Melting range* (delete), *Chloride content* (delete), *Related compounds* (add)	32	2	330
Dronabinol—*USP Reference standards, Identification, Limit of* Δ^8*-tetrahydrocannabinol* (delete), *Related compounds* (add), *Assay*	32	1	86
Drospirenone (new)	32	3	787
Egg Phospholipids (new)	31	3	757
Enoxaparin Sodium (new)	29	6	1876
Enoxaparin Sodium Injection (new)	31	3	761
Ensulizole—*USP Reference standards, Assay*	31	6	1617
Estradiol and Norethindrone Acetate Tablets (new)	31	5	1364
Estradiol Transdermal System (new)	31	4	1063
Estradiol Vaginal Tablets (new)	31	6	1617
Conjugated Estrogens—*Definition*	30	3	840
Synthetic Conjugated Estrogens (new)	31	6	1620
Ethinyl Estradiol Tablets—*Disintegration* (delete), *Dissolution* (add), *Related compounds*	31	4	1067
Ethotoin Tablets—*USP Reference standards, Assay*	32	2	332
Ethyl Chloride—*Alcohol* (delete)	31	5	1368
Etidronate Disodium—*Limit of phosphite*	31	6	1625
Famotidine Injection (new)	32	2	333
Fenofibrate (new)	31	3	763
Fentanyl (new)	31	6	1626
Fexofenadine Hydrochloride (postponed indefinitely)	31	3	703
Fexofenadine Hydrochloride Capsules (postponed indefinitely)	31	3	705
Fexofenadine Hydrochloride Tablets (new)	30	6	1997
Fexofenadine Hydrochloride and Pseudoephedrine Hydrochloride Extended-Release Tablets (new)	31	2	403
Fluconazole—*Melting range* (delete), *Related compounds*	32	2	335
Flucytozine Oral Suspension (new)	32	1	92
Flumazenil—*USP Reference standards, Related compounds, Assay*	32	1	94
Fluorometholone Acetate (new)	31	5	1371
Fluoxetine Delayed-Release Capsules—*Chromatographic purity*	32	2	337
Flurazepam Hydrochloride—*Identification*	31	3	766
Flurbiprofen—*Identification*	31	4	1069
Fluticasone Propionate—*Chemical information, Definition, Bromofluoromethane content* (delete), *Content of acetone, Assay*	32	2	337
Fluticasone Propionate Nasal Spray (new)	32	2	339
Fluvastatin Sodium—*Packaging and storage, USP Reference standards, Identification, Chromatographic purity*	32	1	103
Fluvastatin Capsules—*USP Reference standards, Identification, Chromatographic purity*	32	1	105
Fluvoxamine Maleate—*Maleic acid* (delete), *Assay*	32	2	344
Fluvoxamine Maleate Tablets (new)	30	5	1622
Formoterol Fumarate (new)	32	1	106
Fosinopril Sodium (new)	32	3	789

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Fosinopril Sodium Tablets (new)	30	6	2004
Fosinopril Sodium and Hydrochlorothiazide Tablets (new)	30	6	2006
Gabapentin (new)	31	1	50
Ganciclovir Oral Suspension (new)	32	1	113
Gemcitabine for Injection—*USP Reference standards, Chromatographic purity*	31	6	1630
Gemcitabine Hydrochloride—*USP Reference standards*	32	1	114
Glipizide and Metformin Hydrochloride Tablets (new)	31	6	1631
Glutaral Concentrate—*Specific gravity*	31	3	766
Glyburide and Metformin Hydrochloride Tablets (new)	31	3	766
Glycopyrrolate Tablets—*Identification*	31	4	1077
Gonadorelin Acetate (new)	30	4	1250
Goserelin Acetate (new)	32	3	792
Helium—*Definition, Packaging and storage*	31	4	1077
Hepatitis B Virus Vaccine Inactivated (delete)	31	6	1641
Hydrocodone Bitartrate—*USP Reference standards* *Ordinary impurities* (delete), *Related compounds* (add)	30	5	1628
Hydrocodone Bitartrate and Homatropine Methylbromide Tablets (new)	30	3	853

Ibuprofen Oral Suspension—*USP Reference standards, Limit of ibuprofen related compound C, Assay*	32	3	796
Ibuprofen Tablets—*USP Reference standards, Limit of ibuprofen related compound C, Assay*	32	3	798
Indinavir Sulfate—*Heavy metals, Method I,* (delete), *Heavy metals* (add), *Chromatographic purity, Assay*	32	2	345
Insulin—*USP Reference standards*	31	5	1375
Insulin Human—*USP Reference standards*	31	5	1375
Sodium Iodide I 123 Capsules—*Definition*	31	6	1642
Sodium Iodide I 123 Solution—*Definition, Radionuclidic purity, Bacterial endotoxins, pH*	31	6	1642
Sodium Iodide I 131 Solution—*pH*	31	6	1643
Iodoform—*Molecular weight*	32	1	115
Irbesartan—*Limit of azide, Related compounds*	32	3	799
Irbesartan Tablets (new)	32	3	799
Irbesartan and Hydrochlorothiazide Tablets (new)	29	4	1036
Isopropyl Alcohol—*USP Reference standards* (add), *Identification*	31	5	1375
Isosorbide Dinitrate Tablets—*Dissolution, Assay*	31	5	1375
Isosorbide Dinitrate Chewable Tablets—*Assay*	31	5	1376
Isosorbide Dinitrate Extended-Release Tablets—*Assay*	31	5	1376
Isosorbide Dinitrate Sublingual Tablets—*Assay*	31	5	1377
Isosorbide Mononitrate Tablets (new)	29	5	1513
Isosorbide Mononitrate Extended-Release Tablets (new)	31	4	1082
Ivermectin—*Specific rotation, Limit of alcohol and formamide*	31	6	1645
Ketoprofen—*Assay*	31	3	772
Ketoprofen Extended-Release Capsules (new)	31	5	1378
Labetalol Hydrochloride Oral Solution (new)	32	1	116
Labetalol Hydrochloride Oral Suspension (new)	32	1	117
Lamivudine—*Assay*	32	2	346
Leflunomide (new)	31	5	1380
Leflunomide Tablets (new)	31	5	1383
Leuprolide Acetate (new)	30	3	882
Levocabastine Hydrochloride (new)	31	6	1647
Levofloxacin (new)	32	2	347
Lidocaine and Prilocaine Cream (new)	31	4	1087
Lindane—*Definition, Assay*	31	6	1648

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* Vol.	No.	Page(s)
Lipid Injectable Emulsion (new)	32	2	350
Lisinopril Tablets—*Dissolution*	31	4	1090
Loperamide Hydrochloride Oral Solution—*Assay*	32	2	353
Lovastatin—*Assay*	32	1	118
Magaldrate and Simethicone Tablets—*Title* (name change)	29	6	1918
Magaldrate and Simethicone Chewable Tablets (new)	29	6	1919
Milk of Magnesia—*Limit of calcium* (delete)	32	2	353
Magnesium Carbonate and Citric Acid for Oral Solution—*USP Reference standards* (add), *Content of anhydrous citric acid, Other requirements (delayed implementation to January 1, 2009)*	31	2	419
Magnesium Carbonate, Citric Acid, and Potassium Citrate for Oral Solution (new)	31	5	1386
Magnesium Chloride—*Identification*	31	2	420
Magnesium Citrate Oral Solution—*USP Reference standards* (add), *Assay for anhydrous citric acid (delayed implementation to January 1, 2009)*	31	2	420
Magnesium Citrate for Oral Solution—*USP Reference standards* (add), *Content of anhydrous citric acid, Other requirements (delayed implementation to January 1, 2009)*	31	2	421
Magnesium Oxide—*Labeling, Bulk density* (add)	31	4	1091
Mangafodipir Trisodium—*Limit of residual solvents*	31	6	1650
Mannitol Injection—*Labeling*	32	2	263
Megestrol Acetate Oral Suspension—*Dissolution*	31	5	1387
Meloxicam (new)	31	1	57
Metformin Hydrochloride—*Related compounds*	31	4	1092
Metformin Hydrochloride Tablets—*Identification, Related compounds*	31	4	1093
Metformin Hydrochloride Extended-Release Tablets (new)	31	3	772
Methoxyflurane—*Foreign odor* (delete)	31	5	1388
Methylcellulose Ophthalmic Solution—*Identification*	31	3	780
Methylcellulose Oral Solution—*Identification*	31	3	780
Methylcellulose Tablets—*Identification*	31	3	780
Methyldopa Oral Suspension—*USP Reference standards, Limit of methyldopa-glucose reaction product* (delete)	32	2	354
Methylprednisolone—*Chromatographic purity*	32	2	354
Metolazone Oral Suspension (new)	32	1	119
Metoprolol Tartrate Oral Solution (new)	32	1	121
Metoprolol Tartrate Oral Suspension (new)	32	1	122
Metronidazole Benzoate—*USP Reference standards, Related compounds*	31	3	781
Miconazole Nitrate Cream—*Identification*	32	1	123
Miconazole Nitrate Vaginal Suppositories—*Assay*	31	5	1389
Mirtazapine—*Heavy metals*	31	6	1650
Mitoxantrone Injection—*Packaging and storage*	32	2	355
Modafinil (new)	30	5	1634
Modafinil Tablets (new)	30	5	1636
Morantel Tartrate—*pH*	32	2	355
Morphine Sulfate Extended-Release Capsules—*Packaging and storage* (add)	32	1	124
Mupirocin Calcium (new)	31	2	430
Mupirocin Cream (new)	31	2	432
Naphazoline Hydrochloride—*Definition, Assay*	31	4	1093
Naproxen Delayed-Release Tablets—*Packaging and storage* (add)	32	1	124
Narasin Granular—*Molecular weight, Assay*	32	1	124
Narasin Premix—*Assay*	32	1	126
Nefazodone Hydrochloride (new)	32	3	802
Nefazodone Hydrochloride Tablets (new)	32	3	804
Nevirapine Tablets (new)	32	3	807
Nifedipine Extended-Release Tablets—*Drug release, Dissolution*	32	2	355
Nimodipine—*Identification, Related compounds*	32	2	360
Nitrous Oxide—*Definition, Packaging and storage, Assay*	31	4	1099
Norgestimate—*USP Reference standards, Limit of residual solvents, Chromatographic purity, Assay*	31	5	1390
Norgestimate and Ethinyl Estradiol Tablets (new)	29	1	87
Ofloxacin—*Chromatographic purity* (delete), *Related compounds* (add)	30	4	1274
Omeprazole—*Chromatographic purity*	31	4	1100

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Omeprazole Delayed-Release Capsules—*Identification, Chromatographic purity*	31	5	1392
Ondansetron Hydrochloride—*Limit of ondansetron related compound D, Assay*	32	1	126
Ondansetron Hydrochloride Oral Suspension (new)	32	1	127
Ondansetron Injection—*Chromatographic purity*	31	6	1651
Ondansetron Oral Solution—*Packaging and storage* (add), *Limit of ondansetron related compound D, Related compounds*	32	1	128
Ondansetron Orally Disintegrating Tablets (new)	31	4	1101
Orphenadrine Citrate Injection—*Assay*	31	6	1651
Oxandrolone—*Definition, USP Reference standards, Identification B, Ordinary impurities* (delete), *Related compounds* (add), *Assay*	31	1	64
Oxaprozin—*Packaging and storage* (add)	32	1	130
Oxaprozin Tablets—*Packaging and storage* (add)	32	1	130
Oxybutynin Chloride—*Related compounds*	32	3	810
Oxybutynin Chloride Extended-Release Tablets (new)	31	6	1652
Oxycodone Hydrochloride Extended-Release Tablets (new)	31	4	1104
Oxygen—*Definition, Packaging and storage*	31	4	1107
Oxygen 93 Percent—*Definition, Packaging and storage*	31	4	1107
Paclitaxel—*USP Reference standards, Related compounds*	32	2	361
Pamidronate Disodium (new)	31	4	1108
Pamidronate Disodium for Injection (new)	31	4	1111
Pancuronium Bromide (new)	32	1	130
Paricalcitol—*Identification, Chromatographic purity, Assay*	32	1	132
Paroxetine Hydrochloride—*USP Reference standards, Limit of 1-methyl-4-(p-fluorophenyl)-1,2,3,6-tetrahydropyridine, Chromatographic purity, Assay*	32	3	811
Pectin—*Identification*	31	3	783
Penicillamine Capsules—*Dissolution*	31	2	436
Pentazocine and Acetaminophen Tablets (new)	28	6	1838
Pentobarbital Sodium—*Labeling* (add), *USP Reference standards, Other requirements* (add)	31	1	73
Pentobarbital Sodium Injection—*Identification, Assay*	32	2	364
Petrolatum (new)—*Harmonization*	28	2	569
White Petrolatum (new)—*Harmonization*	28	2	570
Phenytoin Tablets—*Title* (name change)	29	6	1965
Phenytoin Chewable Tablets (new)	29	6	1965
Piperacillin and Tazobactam Injection (new)	31	2	437
Piperacillin and Tazobactam for Injection (new)	31	2	439
Piroxicam Cream (new)	32	1	134
Potassium and Sodium Bicarbonates and Citric Acid Effervescent Tablets for Oral Solution—*USP Reference standards* (add), *Assay for anhydrous citric acid (delayed implementation to January 1, 2009)*	31	2	440
Potassium Bitartrate—*Limit of ammonia*	31	3	786
Potassium Citrate Extended-Release Tablets—*USP Reference standards* (add), *Assay (delayed implementation to January 1, 2009)*	31	2	443
Potassium Citrate and Citric Acid Oral Solution—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	2	444
Potassium Iodide Oral Solution—*Definition*	31	3	786
Potassium Perchlorate—*USP Reference standards* (delete), *Assay*	32	2	364
Potassium Sodium Tartrate—*Limit of ammonia*	31	3	787
Pravastatin Sodium (new)	32	3	813
Pravastatin Sodium Tablets (new)	32	3	817
Prednicarbate (new)	31	5	1398
Prednicarbate Cream (new)	32	3	819
Prednicarbate Ointment (new)	32	3	822
Prednisolone Sodium Phosphate—*USP Reference standards, Identification*	32	2	365
Promethazine Hydrochloride—*USP Reference standards, Related substances*	32	2	365
Promethazine Hydrochloride Tablets—*USP Reference standards, Related compounds, Assay*	32	2	367
Pseudoephedrine Sulfate—*Ordinary impurities*	32	1	135
Pyridoxine Hydrochloride Injection—*Assay*	32	2	369
Quazepam Tablets—*USP Reference standards, Assay*	32	2	370
Quinapril Tablets—*Packaging and storage*	29	4	1071

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Quinidine Sulfate Oral Suspension (new)	32	1	136
Ramipril—*Definition, Assay*	31	3	787
Ranitidine Hydrochloride—*USP Reference standards, Chromatographic purity, Assay*	30	6	2033
Oral Rehydration Salts—*USP Reference standards* (add), *Identification F* (delete), *Assay for citrate (delayed implementation to January 1, 2009)*	31	5	1399
Rifampin and Isoniazid Capsules—*Dissolution*	30	2	533
Rifampin, Isoniazid, and Pyrazinamide Tablets—*Dissolution*	30	2	534
Risperidone (new)	31	6	1659
Ritonavir (new)	32	2	370
Ropivacaine Hydrochloride Injection (new)	32	2	374
Rubella and Mumps Virus Vaccine Live (delete)	31	6	1662
Saccharin Calcium (new)—*Harmonization*	31	2	607
Saccharin Sodium (new)—*Harmonization*	31	4	1225
Saquinavir Capsules—*Dissolution*	32	3	824
Saquinavir Mesylate—*Identification*	31	5	1400
Schick Test Control (delete)	31	6	1662
Senna—*Title, Definition, Packaging and storage, Labeling* (add), *USP Reference standards* (add), *Botanic characteristics, Identification, Microbial enumeration* (add) *Loss on drying* (add), *Total ash* (add), *Assay* (add)	32	1	137
Senna Pods (new)	32	1	140
Sennosides—*Definition, Packaging and storage, Residue on ignition*	32	1	141
Sevoflurane (new)	30	1	178
Simvastatin—*Identification, Chromatographic purity, Limit of lovastatin* (delete), *Assay*	32	1	141
Sodium Bicarbonate—*Normal carbonate, Limit of ammonia*	31	3	795
Sodium Bicarbonate Injection—*Packaging and storage*	31	5	1401
Sodium Chloride—*Limit of phosphates*	31	5	1401
Sodium Chloride—*Identification, Loss on drying, Limit of potassium (postponed indefinitely)*	32	2	264
Sodium Fluoride and Phosphoric Acid Topical Solution (delete)	32	3	824
Sodium Lactate Injection—*Identification B* (delete)	31	5	1402
Sodium Phosphates Rectal Solution—*Assay*	31	5	1403
Sodium Salicylate Tablets—*USP Reference standards* (add), *Dissolution*	32	3	825
Spironolactone and Hydrochlorothiazide Tablets—*Dissolution*	32	2	376
Stavudine Capsules—*Assay*	31	5	1403
Succinylcholine Chloride—*Limit of ammonium salts* (delete), *Chromatographic purity*	31	5	1404
Sulfamethazine Granulated—*Assay*	31	3	797
Sumatriptan Succinate Oral Suspension (new)	32	1	144
Talc—*Packaging and storage* (add), *Limit of iron, Limit of calcium, Limit of aluminum*	31	6	1662
Tazobactam (new)	31	4	1116
Technetium Tc 99m Fanolesomab Injection (new)—*Packaging and storage* (add)	31	5	1405
Temazepam—*Identification*	32	1	145
Terbutaline Sulfate Inhalation Aerosol—*USP Reference standards, Assay*	31	2	450
Thalidomide—*Microbial limits, Chromatographic purity*	32	1	146
Thiabendazole Tablets—*Title* (name change)	29	6	1991
Thiabendazole Chewable Tablets (new)	29	6	1991
Thimerosal—*Identification*	32	1	147
Thioridazine Hydrochloride—*Identification*	31	3	798
Tilmicosin—*Definition, Related compounds, Assay*	31	3	798
Tizanidine Tablets (new)	32	1	147
Tolazamide—*Chromatographic purity*	31	4	1118
Topiramate (new)	30	4	1307
Tramadol Hydrochloride (new)	31	2	458
Tramadol Hydrochloride Tablets (new)	31	2	462
Travoprost (new)	31	4	1119
Travoprost Ophthalmic Solution (new)	31	4	1121
Triamcinolone Acetonide—*USP Reference standards, Assay*	31	3	800
Tricitrates Oral Solution—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	2	465
Triclosan—*Assay*	32	2	377
Trimethoprim—*Packaging and storage*	31	5	1409

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Crystallized Trypsin—*Definition*	32	3	779
Tryptophan—*Chloride, Sulfate*	31	5	1410
Tylosin Tartrate (new)	31	5	1410
Ursodiol Capsules—*Dissolution*	31	3	800
Valganciclovir Hydrochloride (new)	32	2	379
Valganciclovir Tablets (new)	32	2	384
Valsartan (new)	32	1	150
Valsartan and Hydrochlorothiazide Tablets (new)	31	4	1123
Valproic Acid Injection (new)—*Title (delayed implementation to October 1, 2008)*	32	2	387
Vancomycin Hydrochloride—*USP Reference standards, Limit of monodechlorovancomycin* (add)	30	6	2055
Vasopressin—*Identification*	31	4	1127
Verapamil Hydrochloride—*USP Reference standards Identification, Chromatographic purity*	32	2	389
Verapamil Hydrochloride Injection—*USP Reference standards, Related compounds*	32	1	154
Verapamil Hydrochloride Oral Solution (new)	32	1	155
Verapamil Hydrochloride Oral Suspension (new)	32	1	156
Verapamil Hydrochloride Tablets—*USP Reference standards, Related compounds*	32	1	158
Vinorelbine Injection—*Definition, Assay*	32	3	825
Pure Steam (new)	31	2	467
Water for Hemodialysis—*Bacterial endotoxins*	31	2	468
Sterile Water for Inhalation—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add), *Oxidizable substances*	31	3	802
Sterile Water for Injection—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add), *Oxidizable substances*	31	3	803
Sterile Water for Irrigation—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add), *Oxidizable substances*	31	3	804
Sterile Purified Water—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add), *Oxidizable substances*	31	3	804
Zidovudine Tablets—*USP Reference standards, Related compounds, Assay*	32	1	158
Dietary Supplements Monographs			
Ademetionine Disulfate Tosylate (new)	31	2	469
Acesulfame Potassium—*Packaging and storage* (add), *Limit of fluoride*	31	3	811
Ethylcellulose Aqueous Dispersion—*Identification*	31	3	811
Ethylparaben—*Identification*	31	3	812
Gamma Cyclodextrin (new)	31	3	812
Ginger—*Packaging and storage, Labeling, USP Reference standards, Identification, Microbial enumeration, Alcohol-soluble extractives, Limit of shogaols, Content of gingerols and gingerdiones*	32	1	160
Powdered Ginger—*Packaging and storage, USP Reference standards*	32	1	162
Ginger Capsules—*USP Reference standards, Content of gingerols, gingerdiones, and shogaols*	32	1	163
Ginger Tincture—*USP Reference standards, Thin-layer chromatographic identification test, Microbial enumeration, Content of gingerols*	32	1	163
Ginkgo—*Definition, Packaging and storage, USP Reference standards, Thin-layer chromatographic identification test, Microbial enumeration, Content of terpene lactones*	32	1	164
Powdered Ginkgo Extract (new)	32	1	166
Ginkgo Capsules (new)	32	1	172
Ginkgo Tablets (new)	32	1	174
Lutein—*Definition, Packaging and storage, Content of total carotenoids*	31	4	1133
Lutein Preparation—*Definition, Packaging and storage, Content of total carotenoids*	31	4	1134
Tomato Extract Containing Lycopene—*Microbial enumeration, Limit of aflatoxins*	30	2	578

Pending Proposals (*continued*)

HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps **(*Stages*)**.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

MONOGRAPHS (USP)

BRIEFING

Dibasic Calcium Phosphate Dihydrate, *USP 29* page 359. The Japanese Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the *Dibasic Calcium Phosphate Dihydrate* monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the **ADOPTION STAGE 6** document, is based on the corresponding monograph for Dibasic Calcium Phosphate Dihydrate that was prepared by the Japanese Pharmacopoeia. The Japanese Pharmacopoeia draft was based in part on comments from the European Pharmacopoeia and the United States Pharmacopeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the Japanese Pharmacopoeia.

Differences between the Japanese Pharmacopoeia Adoption Stage 6 document and the current *USP* monograph for Dibasic Calcium Phosphate include the following:

1. *Definition*—The current Dibasic Calcium Phosphate monograph is proposed to be split into two separate monographs: Anhydrous Dibasic Calcium Phosphate and Dibasic Calcium Phosphate Dihydrate.
2. *Packaging and storage*—Retained as a nonharmonized attribute.
3. *Labeling*—Statement removed as it is no longer necessary with two monographs for the anhydrous and the dihydrate forms of Dibasic Calcium Phosphate.
4. *USP Reference standards*—No change.
5. *Identification*—Changed test *A* by increasing the volume of hydrochloric acid to assist in sample dissolution. Changed test *B* by decreasing the sample size and volume of nitric acid, and providing temperature and time for warming of sample.
6. *Loss on ignition*—Removed specification pertaining to anhydrous material.
7. *Carbonate*—Added statement to require carbon dioxide-free water in sample preparation.
8. *Chloride*—Changed sample size and volume of diluent to allow for complete dissolution of the sample.
9. *Sulfate*—Decreased sample size.
10. *Arsenic*—Retained as a nonharmonized attribute.
11. *Barium*—Added statement "heat to boiling".
12. *Heavy metals*—Retained as a nonharmonized attribute.
13. *Limit of acid-insoluble substances*—Added statement to indicate "heat to boiling" in preparation step. Added step to incinerate residue at 600°.
14. *Limit of fluoride*—Retained as a nonharmonized attribute.
15. *Organic volatile impurities*—Test removed from harmonization draft.
16. *Residual solvents*—Test removed from harmonization draft.
17. *Assay*—Replaced existing method with new titration assay to be consistent with JP standards.

~~anhydrous dibasic calcium phosphate ($CaHPO_4$) or of dibasic calcium phosphate dihydrate ($CaHPO_4 \cdot 2H_2O$).~~ ■2S (*USP30*)

Add the following:

■» Dibasic Calcium Phosphate Dihydrate contains two molecules of water of hydration. It contains not less than 98.0 percent and not more than 105.0 percent of dibasic calcium phosphate dihydrate ($CaHPO_4 \cdot 2H_2O$). ■2S (*USP30*)

Delete the following:

■~~**Packaging and storage** Preserve in well-closed containers.~~ ■2S (*USP30*)

Add the following:

■**Packaging and storage**—Preserve in well-closed containers. No storage requirements specified. ■2S (*USP30*)

Delete the following:

■~~**Labeling** Label it to indicate whether it is anhydrous or the dihydrate.~~ ■2S (*USP30*)

USP Reference standards ⟨11⟩—*USP Sodium Fluoride RS.*

Delete the following:

■~~**Identification**~~

~~**A:** Dissolve about 100 mg by warming with a mixture of 5 mL of 3 N hydrochloric acid and 5 mL of water, add 2.5 mL of 6 N ammonium hydroxide dropwise, with shaking, and then add 5 mL of ammonium oxalate TS: a white precipitate is formed.~~

~~**B:** To 10 mL of a warm solution (1 in 100) in a slight excess of nitric acid add 10 mL of ammonium molybdate TS: a yellow precipitate of ammonium phosphomolybdate is formed.~~ ■2S (*USP30*)

Add the following:

■**Identification—**

A: Dissolve about 100 mg by warming in 10 mL of 2 N hydrochloric acid, add 2.5 mL of ammonia TS dropwise, with shaking, and then add 5 mL of ammonium oxalate TS: a white precipitate is formed.

B:

Ammonium molybdate solution—Dissolve 21.2 g of ammonium molybdate in water to make 200 mL of solution (10%). Prepare before use.

Dissolve about 100 mg of sample in 5 mL of diluted nitric acid. Warm the solution to 70°, and add 2 mL of *Ammonium molybdate solution:* a yellow precipitate of ammonium phosphomolybdate is formed. ■2S (*USP30*)

Delete the following:

■~~**Loss on ignition** ⟨733⟩ Ignite it at 800° to 825° to constant weight: anhydrous Dibasic Calcium Phosphate loses between 6.6% and 8.5% of its weight, and the dihydrate form of Dibasic Calcium Phosphate loses between 24.5% and 26.5% of its weight.~~ ■2S (*USP30*)

Add the following:

■**Loss on ignition** ⟨733⟩—Ignite about 1 g at 800° to 825° to constant weight: the material loses between 24.5% and 26.5% of its weight. ■2S (*USP30*)

Delete the following:

■~~**Carbonate** Mix 1.0 g with 5 mL of water, and add 2 mL of hydrochloric acid: no effervescence occurs.~~ ■2S (*USP30*)

Add the following:

■**Carbonate**—Mix 1.0 g with 5 mL of carbon dioxide-free water, and immediately add 2 mL of hydrochloric acid: no effervescence occurs. ■2S (*USP30*)

Delete the following:

■~~**Chloride** ⟨221⟩ To 0.30 g add 10 mL of water and 2 mL of nitric acid, and warm gently, if necessary, until no more dissolves. Dilute to 25 mL, filter, if necessary, and add 1 mL of silver nitrate TS: the turbidity does not exceed that produced by 1.0 mL of 0.020 N hydrochloric acid (0.25%).~~ ■2S (*USP30*)

Harmonization

Add the following:

■**Chloride** ⟨221⟩—To 0.20 g add 20 mL of water and 13 mL of diluted nitric acid, and warm gently, if necessary, until no more dissolves. Dilute to 100 mL, and filter, if necessary. To 50 mL of this solution add 1 mL of silver nitrate TS: the turbidity does not exceed that produced by 0.70 mL of 0.010 N hydrochloric acid (0.25%).■2S (*USP30*)

Delete the following:

■~~**Sulfate** ⟨221⟩—Dissolve 1.0 g in the smallest possible amount of 3 N hydrochloric acid, dilute with water to 100 mL, and filter, if necessary. To 20 mL of the filtrate add 1 mL of barium chloride TS: the turbidity does not exceed that produced by 1.0 mL of 0.020 N sulfuric acid (0.5%).~■2S (*USP30*)

Add the following:

■**Sulfate** ⟨221⟩—Dissolve 0.5 g in 5 mL of water and 5 mL of diluted hydrochloric acid, dilute with water to 100 mL, and filter, if necessary. To 20 mL of the filtrate add 1 mL of diluted hydrochloric acid, and dilute with water to 50 mL. Add 1 mL of barium chloride TS: the turbidity does not exceed that produced by 1.0 mL of 0.010 N sulfuric acid (0.5%).■2S (*USP30*)

Arsenic, *Method I* ⟨211⟩—Prepare the *Test Preparation* by dissolving 1.0 g in 25 mL of 3 N hydrochloric acid, and diluting with water to 55 mL: the resulting solution meets the requirements of the test, the addition of 20 mL of 7 N sulfuric acid specified under *Procedure* being omitted. The limit is 3 µg per g.

Delete the following:

■~~**Barium**—Heat 0.50 g with 10 mL of water, and add hydrochloric acid dropwise, stirring after each addition, until no more dissolves. Filter, and to the filtrate add 2 mL of potassium sulfate TS: no turbidity is produced within 10 minutes.~■2S (*USP30*)

Add the following:

■**Barium**—Heat to boiling 0.50 g with 10 mL of water, and add 1 mL of hydrochloric acid dropwise, stirring after each addition. Allow to cool, and filter, if necessary, and to the filtrate add 2 mL of potassium sulfate TS: no turbidity is produced within 10 minutes.■2S (*USP30*)

Heavy metals, *Method I* ⟨231⟩—Warm 1.3 g with 3 mL of 3 N hydrochloric acid until no more dissolves, dilute with water to 50 mL, and filter: the limit is 0.003%.

Delete the following:

■~~**Limit of acid-insoluble substances**—Heat 5.0 g with a mixture of 40 mL of water and 10 mL of hydrochloric acid until no more dissolves, and dilute with water to 100 mL. If an insoluble residue remains, filter, wash with hot water until the last washing does not give a reaction for chloride, and dry the residue at 105° for 1 hour. The weight of the residue does not exceed 10 mg: not more than 0.2% of acid-insoluble substances is found.~■2S (*USP30*)

Add the following:

■**Limit of acid-insoluble substances**—Dissolve 5.0 g with a mixture of 40 mL of water and 10 mL of hydrochloric acid by boiling gently for 5 minutes. After cooling, collect the insoluble substance on ashless filter paper, and wash with water until the last washing does not give a reaction for chloride (no turbidity results from the addition of silver nitrate TS.) Ignite to incinerate completely the residue and ashless filter paper for assay at 600 ± 50°. The weight of the residue does not exceed 10 mg: not more than 0.2% of acid-insoluble substances is found.■2S (*USP30*)

Limit of fluoride—[NOTE—Prepare and store all solutions in plastic containers.]

Buffer solution—Dissolve 73.5 g of sodium citrate dihydrate in water to make 250 mL of solution.

Standard solution—Dissolve an accurately weighed quantity of USP Sodium Fluoride RS quantitatively in water to obtain a solution containing 1.1052 mg per mL. Transfer 20.0 mL of the resulting solution to a 100-mL volumetric flask containing 50 mL of *Buffer solution,* dilute with water to volume, and mix. Each mL of this solution contains 100 µg of fluoride ion.

Electrode system—Use a fluoride-specific, ion-indicating electrode and a silver–silver chloride reference electrode connected to a pH meter capable of measuring potentials with a minimum reproducibility of ±0.2 mV (see *pH* ⟨791⟩).

Standard response line—Transfer 50.0 mL of *Buffer solution* and 2.0 mL of hydrochloric acid to a beaker, and add water to make 100 mL. Add a plastic-coated stirring bar, insert the electrodes into the solution, stir for 15 minutes, and read the potential, in mV. Continue stirring, and at 5-minute intervals add 100 µL, 100 µL, 300 µL, and 500 µL of *Standard solution,* reading the potential 5 minutes after each addition. Plot the logarithms of the cumulative fluoride ion concentrations (0.1 µg per mL, 0.2 µg per mL, 0.5 µg per mL, and 1.0 µg per mL) versus potential, in mV.

Procedure—Transfer 2.0 g of the specimen under test to a beaker containing a plastic-coated stirring bar, add 20 mL of water and 2.0 mL of hydrochloric acid, and stir until dissolved. Add 50.0 mL of *Buffer solution* and sufficient water to make 100 mL of test solution. Rinse and dry the electrodes, insert them into the test solution, stir for 5 minutes, and read the potential, in mV. From the measured potential and the *Standard response line* determine the concentration, *C,* in µg per mL, of fluoride ion in the test solution. Calculate the percentage of fluoride in the specimen taken by multiplying *C* by 0.005: the limit is 0.005%.

Delete the following:

■~~**Organic volatile impurities,** *Method IV* ⟨467⟩**:** meets the requirements.~~■2S (*USP30*)

Delete the following:

■~~**Residual solvents** ⟨467⟩**:** meets the requirements.~~
~~(Official January 1, 2007)~~■2S (*USP30*)

Delete the following:

■~~**Assay**—Dissolve about 250 mg of Dibasic Calcium Phosphate, accurately weighed, with the aid of gentle heat if necessary, in a mixture of hydrochloric acid and water (5 : 3) contained in a 250-mL beaker equipped with a magnetic stirrer, and cautiously add 125 mL of water. With constant stirring, add, in the order named, 0.5 mL of triethanolamine, 300 mg of hydroxy naphthol blue, and, from a 50-mL buret, about 23 mL of 0.05 M edetate disodium VS. Add sodium hydroxide solution (45 in 100) until the initial red color changes to clear blue. Continue to add it dropwise until the color changes to violet, and add an additional 0.5 mL. The pH is between 12.3 and 12.5. Continue the titration dropwise with the 0.05 M edetate disodium VS to the appearance of a clear blue endpoint that persists for not less than 60 seconds. Each mL of 0.05 M edetate disodium is equivalent to 6.803 mg of $CaHPO_4$, or to 8.604 mg of $CaHPO_4 \cdot 2H_2O$.~~■2S (*USP30*)

Add the following:

■**Assay—**

Ammonia–ammonium chloride buffer, pH 10.7—Dissolve 53.5 g of ammonium chloride in water. Add 570 mL of ammonia water, stronger. Dilute with water to make 1000 mL.

Transfer about 400 mg of Dibasic Calcium Phosphate Dihydrate, accurately weighed, into a 200-mL volumetric flask. Dissolve in 12 mL of diluted hydrochloric acid with the aid of gentle heat, if necessary, and dilute with water to volume. Transfer 20.0 mL of this solution to a solution containing 25.0 mL of 0.02 M edetate disodium VS, 50 mL of water, and 5 mL of *Ammonia–ammonium chloride buffer, pH 10.7*. Add 25 mg of eriochrome black T–sodium chloride, and titrate the excess edetate disodium with 0.02 M zinc sulfate VS. Perform a blank determination in the same manner. Each mL of 0.02 M edetate disodium is equivalent to 3.442 mg of $CaHPO_4 \cdot 2H_2O$.■2S (*USP30*)

BRIEFING

Anhydrous Dibasic Calcium Phosphate, *USP 29* page 359. The Japanese Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the *Anhydrous Dibasic Calcium Phosphate* monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the **ADOPTION STAGE 6** document, is based on the corresponding monograph for Anhydrous Dibasic Calcium Phosphate that was prepared by the Japanese Pharmacopoeia. The Japanese Pharmacopoeia draft was based in part on comments from the European Pharmacopoeia and the United States Pharmacopeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the Japanese Pharmacopoeia.

Differences between the Japanese Pharmacopoeia Adoption Stage 6 document and the current *USP* monograph for Dibasic Calcium Phosphate include the following:

1. *Definition*—The current Dibasic Calcium Phosphate monograph is proposed to be split into two separate monographs: Anhydrous Dibasic Calcium Phosphate and Dibasic Calcium Phosphate Dihydrate.
2. *Packaging and storage*—Retained as a nonharmonized attribute.
3. *Labeling*—Statement removed as it is no longer necessary with two monographs for the anhydrous and the dihydrate forms of Dibasic Calcium Phosphate.
4. *USP Reference standards*—No change.
5. *Identification*—Changed test *A* by increasing the volume of hydrochloric acid to assist in sample dissolution. Changed test *B* by decreasing sample size and volume of nitric acid, and providing temperature and time for warming of sample.
6. *Loss on ignition*—Removed specification pertaining to dihydrate material.
7. *Carbonate*—Added statement to require carbon dioxide-free water in sample preparation.
8. *Chloride*—Changed sample size and volume of diluent to allow for complete dissolution of the sample.
9. *Sulfate*—Decreased sample size.
10. *Arsenic*—Retained as a nonharmonized attribute.
11. *Barium*—Added statement "heat to boiling".
12. *Heavy metals*—Retained as a nonharmonized attribute.
13. *Limit of acid-insoluble substances*—Added statement to indicate "heat to boiling" in preparation step. Added step to incinerate residue at 600°.
14. *Limit of fluoride*—Retained as a nonharmonized attribute.
15. *Organic volatile impurities*—Test removed from harmonization draft.
16. *Residual solvents*—Test removed from harmonization draft.
17. *Assay*—Replaced existing method with new titration assay to be consistent with JP standards.

■~~**Assay**—Dissolve about 250 mg of Dibasic Calcium Phosphate, accurately weighed, with the aid of gentle heat if necessary, in a mixture of hydrochloric acid and water (5 : 3) contained in a 250-mL beaker equipped with a magnetic stirrer, and cautiously add 125 mL of water. With constant stirring, add, in the order named, 0.5 mL of triethanolamine, 300 mg of hydroxy naphthol blue, and, from a 50-mL buret, about 23 mL of 0.05 M edetate disodium VS. Add sodium hydroxide solution (45 in 100) until the initial red color changes to clear blue. Continue to add it dropwise until the color changes to violet, and add an additional 0.5 mL. The pH is between 12.3 and 12.5. Continue the titration dropwise with the 0.05 M edetate disodium VS to the appearance of a clear blue endpoint that persists for not less than 60 seconds. Each mL of 0.05 M edetate disodium is equivalent to 6.803 mg of $CaHPO_4$ or to 8.604 mg of $CaHPO_4 \cdot 2H_2O$.~~■2S (*USP30*)

Add the following:

■**Assay—**

Ammonia–ammonium chloride buffer, pH 10.7—Dissolve 53.5 g of ammonium chloride in water. Add 570 mL of ammonia water, stronger. Dilute with water to make 1000 mL.

Transfer about 400 mg of Anhydrous Dibasic Calcium Phosphate, accurately weighed, into a 200-mL volumetric flask. Dissolve in 12 mL of diluted hydrochloric acid with the aid of gentle heat, if necessary, and dilute with water to volume. Transfer 20.0 mL of this solution to a solution containing 25.0 mL of 0.02 M edetate disodium VS, 50 mL of water, and 5 mL of *Ammonia–ammonium chloride buffer, pH 10.7*. Add 25 mg of eriochrome black T–sodium chloride, and titrate the excess edetate disodium with 0.02 M zinc sulfate VS. Perform a blank determination in the same manner. Each mL of 0.02 M edetate disodium is equivalent to 2.721 mg of $CaHPO_4$.■2S (*USP30*)

BRIEFING

Edetate Calcium Disodium, *USP 29* page 779. The Japanese Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the *Edetate Calcium Disodium* monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the **ADOPTION STAGE 6** document, is based on the corresponding monograph for Edetate Calcium Disodium that was prepared by the Japanese Pharmacopoeia. The Japanese Pharmacopoeia draft was based in part on comments from the European Pharmacopoeia and the United States Pharmacopeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the Japanese Pharmacopoeia.

Differences between the Japanese Pharmacopoeia **Adoption Stage 6** document and the current *USP* monograph for Edetate Calcium Disodium include the following:

(1) *Definition*—Changed to reflect new purity specifications (not less than 98.0%).
(2) *Storage*—Retained as a nonharmonized attribute.
(3) *Identification—Identification* test *A* (IR absorption) is retained as a nonharmonized attribute. Tests *B* and *C* are replaced by more definitive tests for calcium and sodium, respectively. Test *B* was updated to include experimental detail consistent with JP standards. *Identification* test *C* replaced the existing procedure with a pyroantimonate test to be consistent with JP standards.
(4) *pH*—No change.
(5) *Chloride*—New test added to reflect sign-off draft.

(6) *Magnesium-chelating substances*—Renamed as *Disodium edetate.* Changed to reflect decrease in sample concentration, and titrant changed to magnesium chloride to be consistent with JP.
(7) *Water*—Updated specification to include lower limit of 5.0% to be consistent with JP.
(8) *Heavy metals*—Retained as a nonharmonized attribute.
(9) *Limit of nitrilotriacetic acid*—Retained as a nonharmonized attribute.
(10) *Assay*—Procedure changed to harmonize with JP and EP standards. Decreased sample size to 0.5 g and increased volume of water in test solution to 200 mL. Changed titrant to bismuth nitrate and indicator to xylenol orange to eliminate use of mercuric nitrate.

Add two drops of xylenol orange TS, and titrate with 0.01 M bismuth nitrate VS until the color of the solution changes from yellow to red. Each mL of 0.01 M bismuth nitrate VS is equivalent to 3.743 mg of $C_{10}H_{12}CaN_2Na_2O_8$.■2S (*USP30*)

PHARMACOPEIAL PREVIEWS

This section contains potential revisions not yet targeted for official adoption. These may include drafts for new monographs or chapters; drafts for standards that would require new or unusual technology; drafts for which more data are required; or changes that would affect numerous monographs, thus having a broad impact on individual products. Readers should review the drafts in this section and provide comments to the appropriate staff liaison whose name is cited in the Briefing (use the *Staff Directory* to find the contact information).

Briefings Each Preview is preceded by a Briefing in the following format:

BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being used, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How To Use PF*), the name of the scientific staff liaison who handled this item, and the USP tracking correspondence number, as shown in the example below:

(DSN: L. Evans) RTS—55678-1

Symbols No symbols are used in this section, as Previews are not yet targeted for official adoption.

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of authoritative committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* and *Pharmacopeial Previews* sections. Readers interested in submitting comments should see *Instructions to Authors.*

Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP–NF* revision will be considered for publication in the *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention (USPC) and may not be published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

References—Consult a current copy of the *Pharmacopeial Forum* and the *ACS Style Guide* for assistance with reference style.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Contact Person—When submitting a manuscript, designate one author of the article as correspondent and include that author's full address, telephone number, fax number, and e-mail address.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Graphics that cannot be submitted electronically must be camera-ready, of easily reproducible quality and size, and clearly labeled. Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

Proposed Monograph for Piroxicam Topical Cream 3%

A. Ashley, K. Gilbert, C. Pilatti, H. Rowe, B. Voigt, P. White, *U.S. Pharmacopeia;* and J. Graham Nairn, *University of Toronto, Canada,* and *2000–2005 USP Compounding Expert Committee*[*]

ABSTRACT The purpose of this *Stimuli* article is to provide background information, the proposed monograph, and stability data for Piroxicam Topical Cream 3%. This monograph has been prepared under the guidance of the USP Expert Committee for Pharmaceutical Compounding.

RATIONALE

This *Stimuli* article describes a proposed pharmacopeial monograph for a topical dosage form in a gel base (*1*). A topical gel base is available at 0.5% and also as a cream base at 1% in some countries (*2*). It was deemed appropriate for compounding pharmacists to formulate this drug in a cream base in order to provide a preparation with a concentration of 3% piroxicam. This preparation would have the advantages of a cream, such as emollient and moisturizing properties, and at the same time provide a preparation with a higher concentration of the drug for therapeutic use.

INDICATIONS AND USE

Piroxicam is classified as a nonsteroidal, anti-inflammatory systemic agent (*3*). Oral administration of piroxicam is indicated mainly for its analgesic, anti-inflammatory, antipyretic properties, and the dose range is 10–30 mg/day. As a topical gel, the drug is also useful for the local treatment of a number of painful or inflammatory conditions. (*2*).

TOPICAL PREPARATIONS

Larson and Lombardino prepared piroxicam at concentrations up to 1.0% in an ointment base, and the product was shown to be a potent inhibitor of inflammation in rats (*4*). Schiantarelli et al. indicated that piroxicam 5% in an oil-in-water (o/w) emulsion base exerted anti-inflammatory action against superficial and deep-seated inflammation in laboratory animals. The anti-inflammatory effect was attributed to a fraction of the drug diffusing through the underlying nonvascular tissues or via the lymphatic system (*5*). Tsai et al. investigated the percutaneous absorption of piroxicam 3.3% from four major classes of ointment bases in rabbits. The greatest area under the curve (AUC) was obtained with an o/w base that could be enhanced by replacing the water pH 7.2 with a $NaHCO_3$ solution of pH 9.2. The enhancement was attributed to an increase in the solubility of the drug and the destructive effect on the skin. Of those bases containing water at pH 7.2, the o/w emulsion containing 5% urea gave the best results (*6*). A 1% cream was effective in a human test, but the formula was not given (*7*).

Several papers investigate or describe gel preparations (*8–17*). Beetge et al. showed that the AUC for piroxicam was higher than that for four other gel formulations of NSAIDS after transdermal application in vivo to rats, an effect that was attributed to the lipophilic character of the drug (*18*).

Additional research of topical piroxicam preparations involved a fatty alcohol propylene glycol base (*19*). The effects of a number of additives on the biological activities of piroxicam have been studied, for example lecithin in gel ointments by Natuski and Takabatake (*20*), oleic acid and dimethylsulfoxide by Hsu et al. (*21*), and pyroglutamates in ointments by Makino et al. (*22*). In vitro studies by Rafiee-Tehrani and Mehramizi showed that the release from cream formulations can be described by a diffusion mechanism and that in general a hydroalcoholic gel formulation with hydroxypropyl cellulose is a more suitable preparation of piroxicam compared with an o/w cream preparation (*23*).

Francoeur et al. showed that the penetration of piroxicam does not depend on primary absorption into the systemic circulation but instead on the arrangement of the vasculature at the site of application (*24*). Li et al. showed that most piroxicam penetrating to local deep tissues in rats can be attributed to direct penetration, and they felt that topical delivery is superior to the oral route when the target is local tissue under the skin (*25*). In pigs the local delivery of topical piroxicam is independent of systemic absorption, and the nature of cutaneous vasculature at different sites should be considered (*26*). Moore et al. (*27*) by a large meta analysis involving 86 randomized controlled trials concluded that topical nonsteroidal anti-inflammatory drugs are effective for the treatment of acute pain and chronic conditions.

Stability in Solution

Several reports discuss the stability of piroxicam in solution. Backensfeld et al. (*28*) showed that the drug was stable in a buffered solution at pH 7.4, with 101.1% remaining after 475 days at 21 °C. Chen et al. (*29*) found that piroxicam was photosensitive to sunlight but rather stable to temperature stress; unfortunately the solvent was not stated. In gel form, composition not stated, piroxicam had a shelf life of 3.39 years at 25 °C (*30*). In acid and basic solutions, a yellow color appears, and Fini et al. (*31*) indicated that this was due possibly to a change in tautomeric equilibrium with pH rather than because of the decomposition of the drug. Mito and Sekiguchi (*32*) indicated that solutions of piroxicam containing water-soluble polymers or surfactants in buffers at a pH range between

[*] Correspondence should be addressed to: Claudia Okeke, Ph.D., Associate Director, CAPS, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852-1790; tel. 301.816.8243; e-mail cco@usp.org.

6.0 and 8.0 were very stable. For example, the drug in a Tween solution at pH 8.0 at 40 °C for 6 months did not show any change in absorbance. Arrhenius parameters have been calculated by Shin et al. (*33*) for the drug in mixed aqueous propylene glycol or polyethylene glycol. Singhai et al. (*34*) found that most formulations were unaffected with respect to color stability at room temperature for 45 days. They also investigated stress conditions involving light, temperature, humidity, and shaking.

The drug in the solid state has been reported to be thermally stable in brown powder glass jars stored in the dark at 20 °C and 40 °C and did not show any decomposition after two years (*35*). The photostability of piroxicam was investigated by subjecting the drug, stored in colorless bottles, to 300–830 nm at 30 °C for 72 hours. The concentration of the drug decreased from 99.8% to 99.6% as determined by HPLC (*35*).

Formulation

The physicochemical properties of the drug relevant to formulation are the ionization constants, partition coefficient, solubility, polymorphism, and hydration. The pKa values are 1.8 and 5.1 (*36*). In addition, a pKa of 6.3 effected by the enolic hydroxyl group at C-4 in dioxane and water has been reported (*37*). The partition coefficient between *n*-octanol and an aqueous buffer pH 7.4 is 1.8. Piroxicam is insoluble in water, sparingly soluble in diisopropyl ether, and only slightly more soluble in the lower aliphatic alcohols, namely methanol, ethanol, and isopropylalcohol, and soluble in acetone 1:50 and chloroform 1:20 (*35*). It has been noted that polyethylene glycol and propylene glycol increase the solubility in water (*33*).

The 3% topical piroxicam cream formulation was selected on the basis of the research of Dallas et al. (*38*). They showed that in rabbits a 3% concentration provided considerably greater serum levels and total serum concentration compared to a 1% concentration. Although many factors must be considered when a practitioner prepares an effective topical formulation, one guide is to ensure that nearly all the drug is dissolved and at saturation. This drug, which is insoluble in water, has a pKa of 6.3 (or 5.1), and thus a number of articles have indicated the use of water at neutral or alkaline pH values to increase the solubility. If the pH of the aqueous phase is 7.2 and pH = pKa + log(salt concentration/acid concentration), then a ratio of 7.9 to 1 of salt to acid form of the drug, providing all the drug is in solution, would allow both forms to be available to penetrate the skin.

The formula discussed by Dallas et al. (*38*) is a modified *USP* hydrophilic ointment. The Dallas formula includes sodium hydroxide and contains less stearyl alcohol and parabens and more water than the *USP* formula. The 100-g preparation contains 0.0025 eq. of sodium hydroxide, which will convert most of the drug, 1 g (0.003018 eq.), to the salt form. Although the solubility of the drug in propylene glycol is not provided, it will likely increase the solubility of the piroxicam in the preparation. In a subsequent publication, Babar et al. (*39*) decreased the concentration of white petrolatum, altered the concentration of the parabens, and increased the concentration of the sodium lauryl sulfate. In a preparation containing 3% of the drug, it is likely that the drug will be beyond the solubility limit of the aqueous phase and perhaps the oil phase, thus providing a saturated product resulting in a reservoir and perhaps providing a sustained or constant release. The formulation described below is similar to Formula B investigated by Dallas et al. (*38*).

Experimental Stability Studies

The stability of piroxicam was investigated by the USP Research and Development Laboratory (RDL). Four batches of the Piroxican Topical Cream 3% of 100 g each were prepared according to the method and formula described below. A placebo was also prepared containing all the ingredients except piroxicam, in which water replaced the weight of the piroxicam. The creams were stored in plastic, resealable containers and stored in an environmental chamber maintained at 25 °C and 25% relative humidity. The creams were bright yellow, and the placebo was white.

The development of a suitable stability-indicating method for the cream was accomplished by RDL as described in Project #97-053A. Briefly, the HPLC assay involved a Hewlett Packard liquid chromatograph with a UV detector set at 254 nm and a μBondaPak C18 4.6 mm × 30 cm 10-μm analytical column. The mobile phase was a buffer consisting of 0.04 M citric acid and 0.38 M dibasic sodium phosphate solution and methanol, approximately 50:50 (v/v). The diluent was 4.5 mL hydrochloric acid diluted to 5 L with methanol. The standard preparation consisted of 5 mg of USP Piroxicam Reference Standard (RS) and 2 mL of chloroform mixed and diluted to 100 mL with diluent. The sample preparation was made by adding approximately 340 mg of cream to 4 mL of chloroform and 150 mL of diluent, and after the mixture was shaken it was diluted to 200 mL with diluent.

The creams were assayed against USP Piroxicam RS five different times during a four-month period as indicated in *Table 1,* which shows the number of days after the preparation of the cream. Each cream was assayed four times at each time period (*Table 1*). The assay of the placebo did not show peaks for piroxicam at any of the times of measurement. The average results for the first day of analysis showed an excess of piroxicam in the cream when compared with the frequently stated rubric for creams and ointments in *USP:* "It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of" active drug. One explanation for this anomaly is that the products may have been compounded with a slight overage. One might note, however, that the average range of 100.2 to 117.8 is well within the usual *USP* required range of 20%. This excursion suggests that an overage is not necessary because the active drug is quite stable. A comparison of the piroxicam concentration at day 1 with that on day 121 shows a tendency toward a small increase in the piroxicam concentration. Nevertheless there was variability in the average values as time progressed, which may have been due to the possibility that some of the piroxicam was suspended in the vehicle. In conclusion, although the analytical results were somewhat variable, the Piroxicam Topical Cream preparation appeared to be stable during four months.

PROPOSED NEW MONOGRAPH
Title: Piroxicam Topical Cream 3%

Formula

White petrolatum	25.0 g
Stearyl alcohol	15.0 g
Propylparaben	0.06 g
Methylparaben	0.15 g
Propylene glycol	12.0 g
Sodium lauryl sulfate	1.0 g
Sodium hydroxide 1 M	2.5 mL
Piroxicam	3.0 g
Purified water, a sufficient quantity to make	100.0 g

Method of Preparation

1. All the ingredients are accurately weighed.
2. All the oil-phase ingredients are placed in a separate stainless steel container and are heated to 80 ± 5 °C.
3. All the aqueous phase ingredients are placed in a separate stainless steel container and are heated to 80 ± 5 °C.
4. The aqueous phase is added to the oil phase with continuous stirring.
5. The emulsion is then cooled to about 50 °C.
6. The piroxicam is added to the sodium hydroxide solution with titration to form a suspension.
7. The warm emulsion is added to the piroxicam suspension geometrically with titration.

Packaging

Store in plastic resealable containers.

Storage

At room temperature.

Preparations for Nebulization: Characterization*

Keith Truman, *EP Inhalanda Committee* and *GlaxoSmithKline Research and Development, Ware, UK;* Steve Nichols, *EP Inhalanda Committee* and *Sanofi-Aventis, UK;* Jolyon Mitchell, *Trudell Medical International, Ontario, Canada;* Caroline Vanneste, *USP Aerosols Expert Committee* and *Health Canada, Canada;* Markus Tservistas, *PARI Aerosol Research Institute, Germany;* John Dennis, *University of Calgary, Canada*

ABSTRACT Currently, neither the *United States Pharmacopeia* nor the *European Pharmacopoeia* contains procedures to aerodynamically assess nebulization preparations. The USP Aerosols Expert Committee supports the development of tests to assess the quality of such products. This *Stimuli* article provides two tests with associated procedures. Depending on the feedback received on this *Stimuli* article, the Committee will consider including the two tests in *USP* General Chapter *Aerosols* ⟨601⟩.

INTRODUCTION

USP General Chapter *Aerosols* ⟨601⟩ does not include any information about aerodynamically assessing nebulization preparations. The *European Pharmacopoeia* monograph titled *Preparations for inhalation,* subsection on *Liquid preparations for nebulisation,* states that ''continuously operating nebulisers... allow the dose to be inhaled at an appropriate rate and particle size that ensures deposition of the preparation in the lungs.'' However, associated procedures are not provided. The European Committee for Standardisation (CEN) has worked on the assessment of the capabilities of the nebulizers themselves but has not addressed nebulization preparations.

An international group was formed in order to develop standardized procedures for testing preparations for nebulization. The proposed procedures have been tested in a number of laboratories, and a collaborative study involving the European Pharmaceutical Aerosol Group (EPAG) will take place in 2006. This study will be led by Steve Nichols at Sanofi-Aventis.

Readers are invited to comment on the applicability of the two tests described, as well as on the procedures themselves. The proposed procedures have also been presented for comment in *PharmEuropa* volume 18.2 (April 2006).

TESTS

Products used for nebulization and intended for pulmonary delivery are characterized using the following tests:

- Drug Delivery Rate and Total Drug Delivered and
- Aerodynamic Assessment of Nebulized Aerosols.

These tests standardize the approach for assessing the dose that would be delivered to a patient but are not intended to assess the nebulizer device itself. A procedure for the latter is described in a CEN Standard (*1*). The size distribution of the mass—rather than the number of droplets—is a more appropriate means to evaluate product performance because drug mass as a function of aerodynamic diameter is more indicative of therapeutic effect within the respiratory tract.

1. Drug Delivery Rate and Total Drug Delivered

These tests are performed to assess the total drug delivered to a patient and the rate of delivery to the patient using standardized conditions of volumetric flow rate. It is essential that breath-enhanced and breath-actuated nebulizers be evaluated by a breathing simulator because the output of these types of devices depends to a great extent on the inhalation flow rate. The methodology below describes the use of a standard breathing pattern defined for adults. Should a particular product for nebulization be indicated *only* for pediatric use, then pediatric breathing pattern(s) should be utilized (*2*). Breathing patterns, rather than continuous flow rates, are used in order to provide a more appropriate measure of the mass of drug that would be delivered to patients.

Drug Delivery Rate and Total Drug Delivered are appropriate characteristics because they allow the delivered mass to be characterized in a standard way regardless of the nebulizer used. Accordingly, the test methodology described below permits the mass of drug delivered in the first period (typically 1 min) to be measured (consequently giving an assessment of drug delivery *rate*) as well as capturing the total drug mass delivered.

1a. Procedure for Drug Delivery Rate and Total Drug Delivered

Breath simulator

A commercially available breath simulator (*3*) that is able to generate the breathing profile specified in *Table 1* is used for the test. The pattern is intended to simulate an adult's breathing pattern. A different breathing pattern may be used when appropriate; e.g., drug products specifically intended for use by children may be tested using a breathing pattern appropriate for a child.

Table 1. Breath simulator specification

Item	Specification
Tidal volume	500 mL
Frequency	15 cycles/min
Waveform	Sinusoidal
Inhalation:exhalation ratio	1:1

Filter system

The test uses a suitably validated low-resistance filter (*4*) that is capable of quantitatively collecting the aerosol and is suitable for ensuring recovery of the drug with an appropriate solvent. The dead volume of the filter casing should not exceed 10% of the tidal volume used in the breath simulation.

1b. Method

Attach the filter contained in filter holder (A) to the breath simulator (B) according to the scheme shown in *Figure 1*. Fill the nebulizer with the volume of the drug product specified in the patient instructions. Attach the mouthpiece of the nebulizer to the inhalation filter using a mouthpiece adapter, if required, ensuring that connections are airtight. Make sure the nebulizer is positioned in the same orientation as intended for use. This may require tilting the breath simulator and filter holder. Ensure that environmental conditions are within the limits specified in *Table 2*. Set the breath simulator to generate the specified breathing pattern.

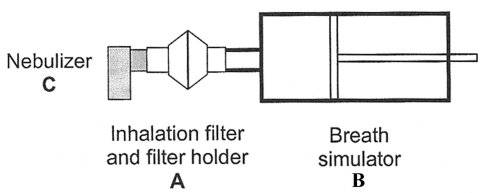

Figure 1. Experimental set-up for breath simulator testing

Table 2. Environmental conditions

Item	Specification range
Temperature	23 ± 2 °C
Pressure	86–106 kPa
Relative humidity (RH)	45%–75% RH

Start the breath simulator and then, at the beginning of an inhalation cycle, start the nebulizer. Operate the nebulizer for the defined initial time, and collect the nebulized drug aerosol on the filter during the inhalation phase of the breathing cycle. The length of the time interval ensures that sufficient drug will be deposited on the inhalation filter for quantitative analysis. A time of 60 ± 1 s typically enables direct determination of the drug delivery rate. If necessary, the length of the time interval for aerosol collection can be increased if there is insufficient drug deposition on the inhalation filter to allow quantitative analysis over the 60-s period. At the end of the initial period, stop the nebulizer, dismantle the filter holder, and recover the drug from the filter and the filter holder using a suitable solvent.

Place a fresh filter and filter holder in position, and continue until nebulization ceases. Interrupt nebulization and exchange filters if necessary to avoid filter saturation. The end of nebulization for gas-powered nebulizers is 1 min after the beginning of sputtering, and for electronic nebulizers it is at the end of operation.

Results

Using a suitable method of analysis, determine the quantity of drug mass collected on the filters during each time interval. Determine the Drug Delivery Rate by dividing the drug mass collected on the first inhalation filter by the time interval used for collection. Determine the Total Mass of Drug Delivered by summing the drug mass collected on all inhalation filters.

2. Aerodynamic Assessment of Nebulized Aerosols

Particle sizes in nebulized products should be characterized at flow rates lower than those in the range that is normally used for dry-powder and metered-dose inhalers. The CEN standard (*1*) recommends a flow rate of 15 L min^{-1} because this value represents a good approximation of the midinhalation flow rate achievable by a tidally breathing healthy adult, who typically has a 500-mL tidal volume.

Although low-angle laser light-scattering instruments (laser diffractometers) can provide rapid size-distribution measurements of nebulizer-generated aerosols, these techniques do not detect the active substance, but rather they measure the size distribution of the droplets irrespective of their content. This may not be a problem for homogeneous solutions but can result in significant error if the nebulized product is a suspension or if droplet evaporation is significant, as can be the case with certain nebulizer types. Cascade impactors enable laboratory technicians to unambiguously characterize the aerosol in terms of the mass of active substance as a function of aerodynamic diameter.

Apparatus E, the Next Generation Impactor (NGI), is a cascade impactor that has been calibrated at 15 L min^{-1} specifically to meet the recommendation of the CEN standard, and it is therefore used for this test (*5*). Researchers also recognize that controlling the evaporation of droplets produced by nebulizers may be critical to avoid bias in assessing droplet size. The method describes an approach by which evaporation is standardized by operating with air or other driving gas that is within a defined range of water vapor content. Determination of mass balance for metered-dose and dry-powder inhalers is not straightforward because in these cases the dose is captured as a continuous output, and hence this method is not included for use with nebulizers. As a part of method development, recovery experiments should be performed to validate the method.

The droplets produced by certain types of nebulizer (e.g., non–air-entrainment versions) may be more susceptible to evaporation caused by heat transfer from the impactor during the measurement process (*6*). As part of method development it is good practice to check if the nebulized aerosol is significantly affected by evaporation. Analysts can do this by comparing the size distributions of aerosols generated by an impactor operated at ambient temperature and comparing such

aerosols with those produced by a cooled impactor. If there is a significant difference, the operating conditions described in the monograph may not be suitable. In such cases, cool the impactor to between +5° and +10 °C before making further measurements of the droplet size distribution.

2a. Procedure for Aerodynamic Assessment of Fine Droplets (Particles)

Detailed descriptions of Apparatus E, the NGI, and the Induction Port are contained in the *European Pharmacopoeia,* Chapter 2.9.18, and in *USP* General Chapter ⟨601⟩ and include details of critical dimensions and the qualification process for the impactor (stage mensuration).

2b. Method Validation

Impactor stage overloading

During method development and validation, it is important to confirm that the volume of liquid sampled from the nebulizer does not overload the impactor. Visual inspection of the collection surfaces on stages collecting most of the droplets normally will reveal streaking if overloading has occurred. This phenomenon is also usually associated with an increase in the mass of drug collecting on the final stage and back-up filter. Reducing the sampling period (T_0) is the most effective way to avoid overloading in any given system, balancing overloading with analytical sensitivity.

Re-entrainment

Droplet bounce and re-entrainment are less likely with nebulizer-produced droplets than with solid particles from other types of inhaler. However, it is important to assess the need for coating as part of method development and to check if coating can be omitted if justified and authorized. When necessary to ensure efficient particle capture, coat each cup with silicone oil or similar high-viscosity liquid, typically deposited from a volatile solvent.

Impactor configuration

A back-up filter in addition to the micro-orifice collector (MOC) must be used to ensure quantitative recovery of drug from the nebulized aerosol at the specified flow rate of 15 L min^{-1}. The MOC may be removed for the purpose of nebulizer testing. However, if it is retained, the filter may be located below the MOC (internal filter option), or an external filter may be used to capture any fine droplets that pass beyond the last size-fractionating stage. The pre-separator is not used for testing nebulizer-generated aerosols (*5*).

2c. Method

Locate the test system in an environment in which the ambient air is at a temperature of 23 ± 2 °C at an RH between 45% and 75% (or cool the impactor to between 5° and 10 °C if method development has demonstrated the need to control droplet size changes caused by heat transfer from the impactor to the incoming aerosol).

Attach the induction port to the impactor, and connect the outlet of the impactor to a vacuum source that is capable of withdrawing air through the system at 15 L min^{-1} as specified in *Figure 2*. Locate a three-way gate valve between the impactor and vacuum source, and set the valve so that flow is sampled from the impactor. Insert a suitable filter (e.g., a glass fiber filter) capable of quantitatively collecting the active ingredient in either the internal or external filter holder.

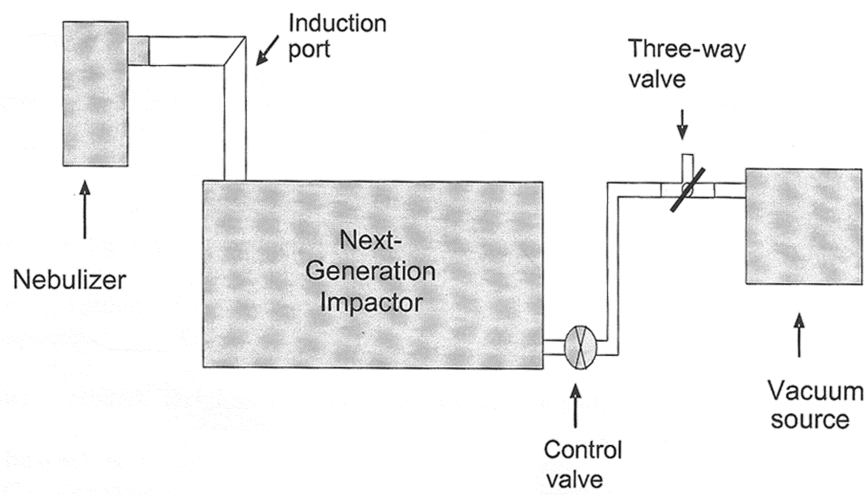

Figure 2. Apparatus E for measuring the size distribution of products for nebulization

Connect a flow meter, calibrated for the volumetric flow leaving the meter, to the induction port. Adjust the flow control valve located between the impactor and three-way valve to achieve steady flow through the system at 15 L min^{-1} (± 5%). Turn off the flow, and set the three-way valve so that flow to the vacuum source bypasses the impactor. Remove the flow meter.

Set up the nebulizer with a supply of driving gas (usually air or oxygen) at the pressure and flow rate specified by the manufacturer. Take precautions to ensure that the gas supply line does not become detached from the nebulizer when under pressure. Fill the nebulizer with the volume of the drug product as specified in the patient instructions.

Set the three-way valve so that the flow bypasses the impactor. Switch on flow from the vacuum source downstream of the impactor, and then switch on the flow of driving gas to the nebulizer at the steady predetermined value. When the flow rate is stable, attach the mouthpiece of the nebulizer to the induction port, using a mouthpiece adapter if required and ensuring that the mouthpiece is aligned on-axis with the induction port. Set the three-way valve so that the flow passes through the impactor. Sample for a predetermined time (T_0). Once determined, this time (T_0) must be defined and used in the analytical method for a particular drug product to ensure that mass fraction data for a given drug product are comparable. At the end of the sampling period, remove the nebulizer from the induction port and switch off flow from the vacuum source to the impactor. Switch off the driving gas flow to the nebulizer.

Dismantle the impactor and, using a suitable method of analysis, determine the mass of drug collected in the induction port and on each stage and on the back-up filter as described for Apparatus E in *USP* General Chapter ⟨601⟩ and in the *European Pharmacopoeia,* Chapter 2.9.18. If the MOC is retained, add the mass of drug collected in the MOC to that deposited on the back-up filter, and treat this mass as a single sample for the purpose of subsequent calculations.

Calculate the mass fraction ($F_{m,comp}$) of the drug deposited on each component of the impactor, commencing with the induction port and proceeding in order through the impactor in accordance with the relationship:

$$F_{m,comp} = \frac{m_{comp}}{M}$$

where m_{comp} refers to the mass associated with the component under evaluation and M is the total mass collected by the system.

Present $F_{m,comp}$ in order of location within the measurement equipment, beginning at the induction port and ending with the back-up filter of the impactor (see *Figure 3*). When appropriate, $F_{m,comp}$ for adjacent stages of the impactor may be combined in order to report the mass fraction collected on a group of stages as a single value.

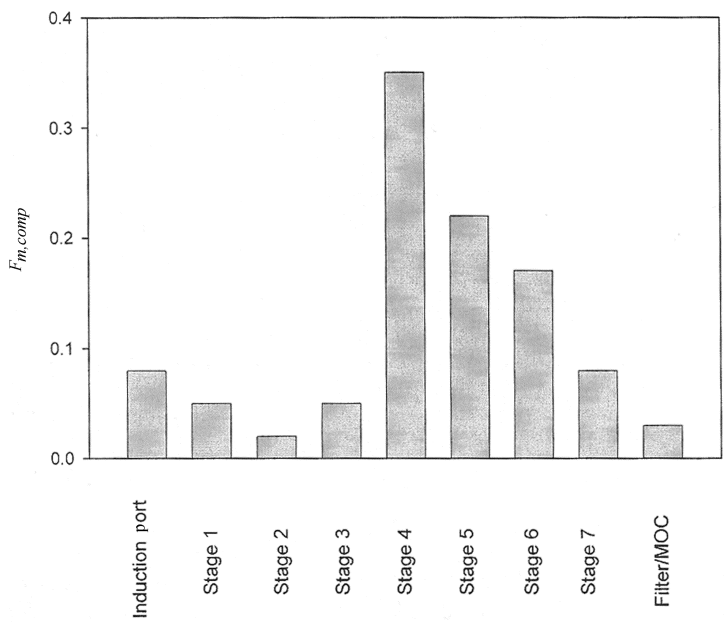

Figure 3. Example of mass fraction of droplets presented in terms of location within the sampling system

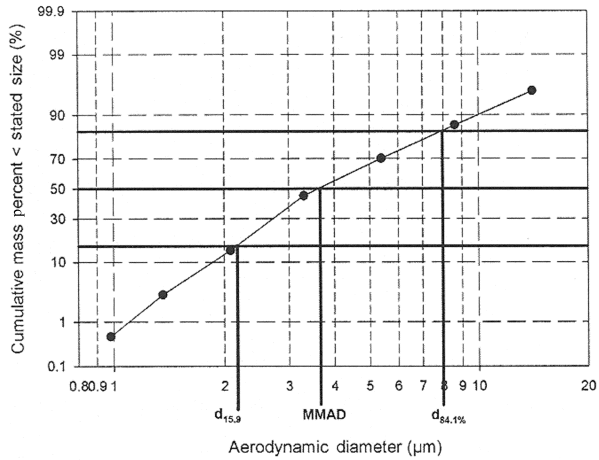

Figure 4. Cumulative mass-weighted size distribution from NGI-measured data: geometric standard deviation (GSD) = $\sqrt{(d_{84.1\%}/d_{15.9\%})}$ for a log-normal size distribution; MMAD = mass median aerodynamic diameter

Determine the cumulative mass-weighted particle-size distribution of the aerosol size-fractionated by the impactor in accordance with the procedures given in *USP* General Chapter ⟨601⟩ and in the *European Pharmacopoeia,* Chapter 2.9.18. Starting at the filter, derive a cumulative mass vs. cut-off diameter of the respective stages (see *Table 3* for the appropriate cut-off diameters at 15 L min^{-1}). Plot the cumulative fraction of active ingredient versus cut-off diameter in a suitable format, e.g., logarithmic or log-probability format (see *Figure 4*). As appropriate, use this plot to determine by interpolation the fraction either less than a given size or between an upper and lower size limit. If necessary, and when appropriate, use this plot to determine values for the mass median aerodynamic diameter and the geometric standard deviation. Suitable computational methods also may be used.

Table 3. Cut-off sizes for Apparatus E at 15 L min^{-1} (*6*)

Stage	Cut-off diameter (µm)
1	14.1
2	8.61
3	5.39
4	3.30
5	2.08
6	1.36
7	0.98

CONCLUSION

The methodology presented in this article provides a standardized approach to the assessment of products for nebulization. This methodology has not been previously described in either *USP* or *EP*. The test methodology has been assessed in a number of laboratories, and a collaborative study involving the European Pharmaceutical Aerosol Group (EPAG) will take place in 2006. The apparatus used, specifically the Next Generation Impactor, has been suitably qualified and is already described within \the two pharmacopeias. All apparatus described is commercially available.

Correction Formula for the Boiling Point Temperatures in USP General Chapter Distilling Range ⟨721⟩

Oscar A. Quattrocchi,[*] Gador S.A.; Antonio Hernández Cardoso,[†] *U.S. Pharmacopeia;* James E. DeMuth,[*] *University of Wisconsin*

ABSTRACT Boiling point is a test used by some pharmacopeias as a quality attribute, with associated test, procedure, and acceptance criteria. Because of variations in atmospheric pressure, correction to a standard pressure is performed prior to application of the standard. The current *United States Pharmacopeia (USP)* General Chapter *Distilling Range* ⟨721⟩ (*4*) uses a single correction factor for all boiling temperatures, namely 0.037 °C per mm Hg variation from standard atmospheric pressure. This value is added to or subtracted from the boiling point when it is lower or higher than 760 mm Hg, respectively. An improved approach used both in *Lange's Handbook* and adopted by the *European Pharmacopoeia (EP)* (*3*) relies on tables that relate the correction factor with temperature ranges to provide an average correction factor for a number of individual substances. Even this approach, however, is a rough approximation. We applied both the USP and EP approaches as well as two additional ones, one of which involves use of the Antoine equation, to tabulated ranges from differing sources. The general goal of this effort resulted in a single equation utilizing readily determined variables to correct observed boiling point temperature. Comments are requested on the use of this equation as a means of adjusting an observed boiling point to standard pressure.

INTRODUCTION

Boiling point is defined as the temperature at which the vapor pressure of a liquid equals the external atmospheric pressure. The standard boiling point is the temperature at which the vapor pressure of a liquid equals the standard atmospheric pressure, which is defined as 760 mm Hg or 101.325 kPa. In addition, the distillation range of a solvent is a measurement of purity and quality, which in turn can be assessed by its boiling point. Distillation is a technique used for the separation of the components of a mixture on the basis of different boiling points, whereby the mixture is heated until some of the components are vaporized. When the boiling point (or the distillation range) is determined at an atmospheric pressure that is different from standard (760 mm Hg), a correction is usually made to reflect the effect of this parameter on the vapor pressure of the liquid. Several approaches of varying degrees of complexity have been employed, and selection of a particular approach typically is related to the accuracy required in the corrected value (*1*).

When a high degree of accuracy for a prediction model is not required, simpler approaches may be used. For example, the Clausius-Clapeyron equation assumes that the change in volume upon vaporization equals the ideal gas volume of the vapor. The Clausius-Clapeyron equation is:

$$\Delta t / \Delta p \;=\; RT_b^2 / p_0 \Delta_{vap} H(T_b)$$

where $\Delta t/\Delta p$ is the temperature variation due to pressure variation, R is the molar gas constant [8.3145 joules per kelvin per mole ($J \cdot K^{-1} \cdot mol^{-1}$)], T_b is the absolute temperature for the normal boiling point, p_0 is the standard pressure, and $\Delta_{vap}H(T_b)$ is the molar enthalpy of vaporization at T_b.

However, a more accurate and therefore most widely used approach involves the application of the Antoine equation. This equation generally is accurate to 0.1–0.2 °C if the atmospheric pressure is ±10% of the standard atmospheric pressure of 760 mm Hg. The formula is:

$$\log p = A - \frac{B}{t + C}$$

Antoine's equation uses three parameters fit to experimental vapor pressures, measured over a restricted temperature range. The variables p and t refer to pressure and temperature, respectively. *A, B,* and *C* are Antoine coefficients that vary for each chemical substance and are determined experimentally. They depend on several intrinsic factors, including the molecular weight of the substance, its functional groups, and number of carbon atoms. Antoine *A, B,* and *C* values for several inorganic and organic substances can be found in *Lange's Handbook of Chemistry* (*2*).

Another approach is the use of the Dreisbach method, which is a derivation of Antoine's equation and evaluates the rate of change of the boiling point with atmospheric pressure (symbols have the same meaning as in Antoine's equation):

$dt/dp = B/[2.3026\ p\ (A - \log p)^2]$

However, this formula should not be used to correct boiling points at different atmospheric pressures because the value of dt/dp itself varies with pressure (*2*).

[*] Member, USP General Chapters Expert Committee.

EXPERIMENTAL

In an attempt to add accuracy while maintaining the simplicity of the compendial measurement, the authors studied published experimental data to establish a set of correction factors that depend on the boiling point. We compared three published data sets based on Antoine's equation. The sets were published in *Lange's Handbook of Chemistry,* the *EP,* and the *CRC Handbook of Chemistry and Physics* (*5*).

Figure 1 is an example of the data sets examined and shows the compilation of data published in *CRC* for the correction factor in two units of measurement, one used by *EP* (°C/kPa), and one used by *USP* (°C/mm Hg).

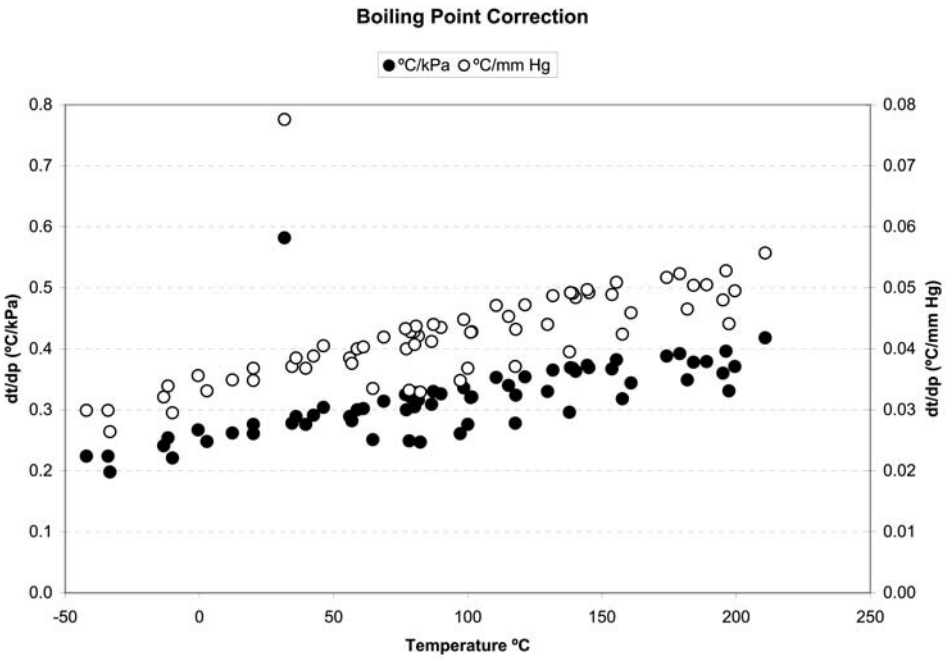

Figure 1. Correction factors for the complete set of substances disclosed in *CRC* (*5*). The out-of-trend data belong to methyl formate and could not be confirmed from the source.

The *EP* Data Set

The *EP* data set was created by the application of *EP's* correction formula:

$t_c = t_0 + k\ (101.3 - b)$

where t_c is the corrected temperature of the boiling point, t_0 is the measured temperature, k is the correction factor, and b is the atmospheric pressure expressed in kPa. The correction factor is shown in *Table 1*.

Table 1. Temperature Correction in Relation to Pressure*

Distillation Temperature	Correction Factor, k (°C/kPa)
Up to 100 °C	0.30
Above 100 up to 140 °C	0.34
Above 140 up to 190 °C	0.38
Above 190 up to 240 °C	0.41
Above 240 °C	0.45

* From *EP,* Table 2.2.11.1.

Lange's Data Set

Correction factors also are found in *Lange's* (*Table 10-10*). The correction factors are presented in narrower bands (20 °C each) and in a wider overall range (from 10 to 410 °C) than in *EP*. The correction is added to or subtracted from the experimental temperature when the atmospheric pressure is below or above the normal pressure, respectively.

The CRC Data Set

The application of the *CRC* correction factors (''Dependence of Boiling Point on Pressure,'' pp. 15–26) using the same ranges proposed by *EP* (*Tables 2–5*) give slightly different factors, as illustrated in *Figure 2*. *CRC* does not report on substances that boil above 240 °C.

Table 2. Range: up to 100 °C*

Compound	*t* °C	°C/kPa	°C/mm Hg

The Current *USP* Data Set

The current *USP* General Chapter ⟨721⟩ strategy is based on a single correction factor regardless of pressure.

Figure 2 shows the differences among the four data sets. Aside from demonstrating the difference in correction magnitudes, *Figure 2* also shows that the three approaches based on Antoine's equation give similar but not identical results. The most complete data set is represented by the Lange Data Set. These data clearly show that a linear regression would yield a simple equation resulting in a straight line as shown in *Figure 3*.

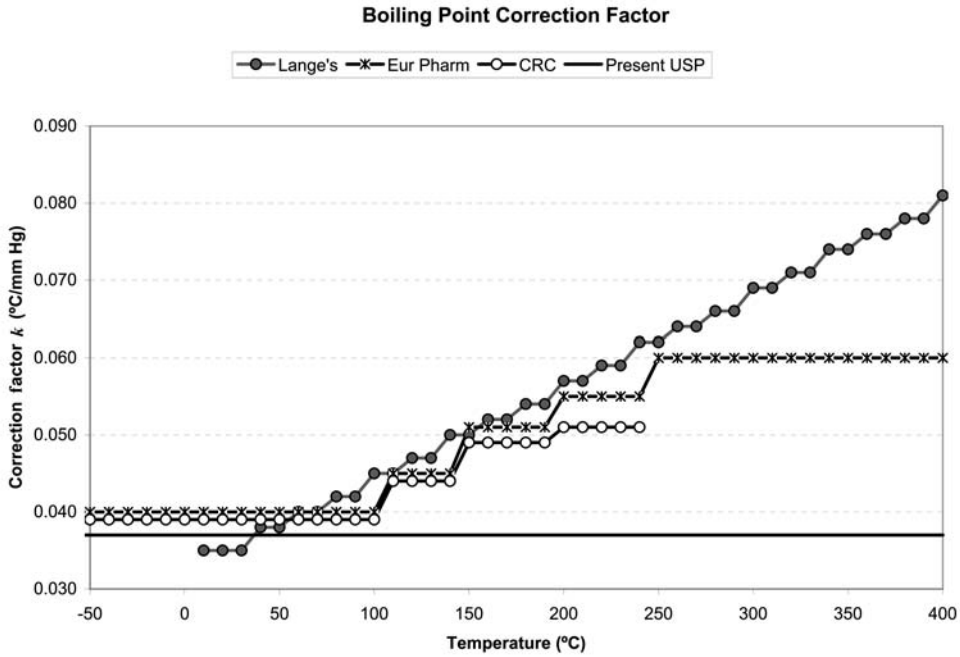

Figure 2. Comparison of correction factors as a function of temperature using *Lange's* (*2*), *EP* (*3*), *CRC (5),* and the present *USP (4)* approach. For comparison purposes, *CRC* data were ordered as in *EP* tables.

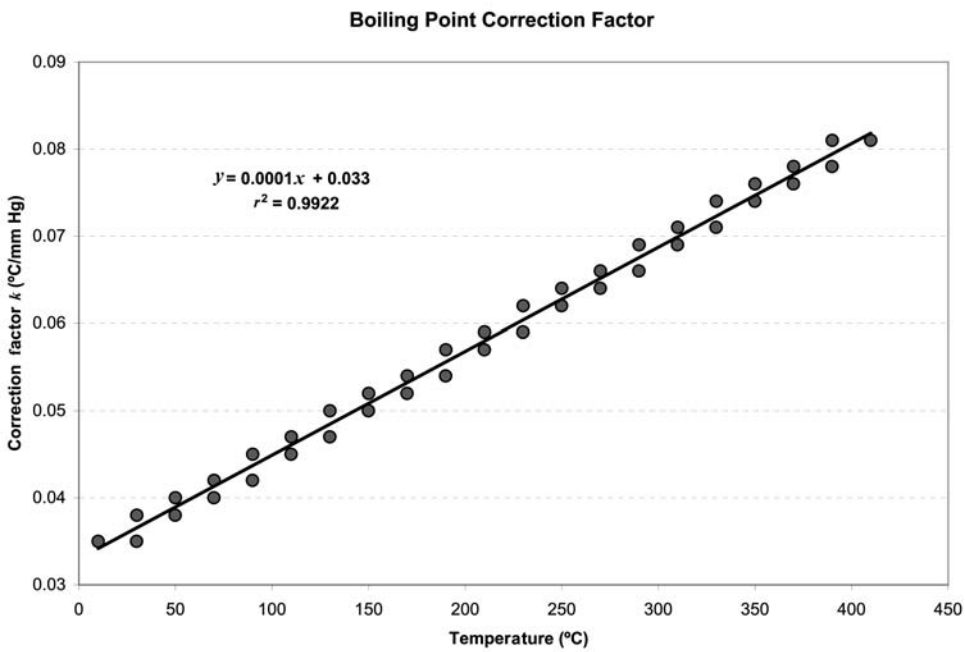

Figure 3. Linearization of *Lange's* data table based on an American Society for Testing and Materials method. The correction factor, *k* was calculated from the graph and was applied to a correction formula.

A NEW APPROACH

The general approach and equation presented in *EP* appear to give results that are similar to those from the much more complicated Lange approach. However, the use of a table to specify k is not as accurate a means to approximate the effects of pressure on the measurement. The linear regression presented in *Figure 3* yields a better way to derive the correction factor, k. Therefore, the *EP* equation, converted to mm of Hg,

$$t = t_0 + k\,(760 - p),$$

is solved using the the linear regression formula:

$$k = 0.0001t_0 + 0.033$$

to yield the final equation

$$t = t_0 + [(t_0 10^{-4} + 0.033)\,(760 - p)].$$

This formula would be used as the correction equation in *USP* ⟨721⟩, where t is the corrected boiling point temperature, t_0 is the measured boiling point temperature, and p is the atmospheric pressure at the time of measurement [NOTE—In the previous equations, k is the correction factor].

The Dreisbach method cited above also proposed a formula for the correction of the temperature but was considered of little value in *Lange's,* probably because of a lack of fit with experimental data. The formula and approach proposed here are based on experimental comparisons and thus should be applicable for correction of the boiling temperature based on the difference between atmospheric pressure and the standard pressure.

Figure 4 compares results from all four approaches. The proposed method yields a line in a central position between *EP* and *CRC* but is extended for a wider range. Its slope is slightly lower than *Lange's,* probably because the last digit of the slope was rounded to fit better with substances more polar than the nonpolar hydrocarbons used in *Lange's*.

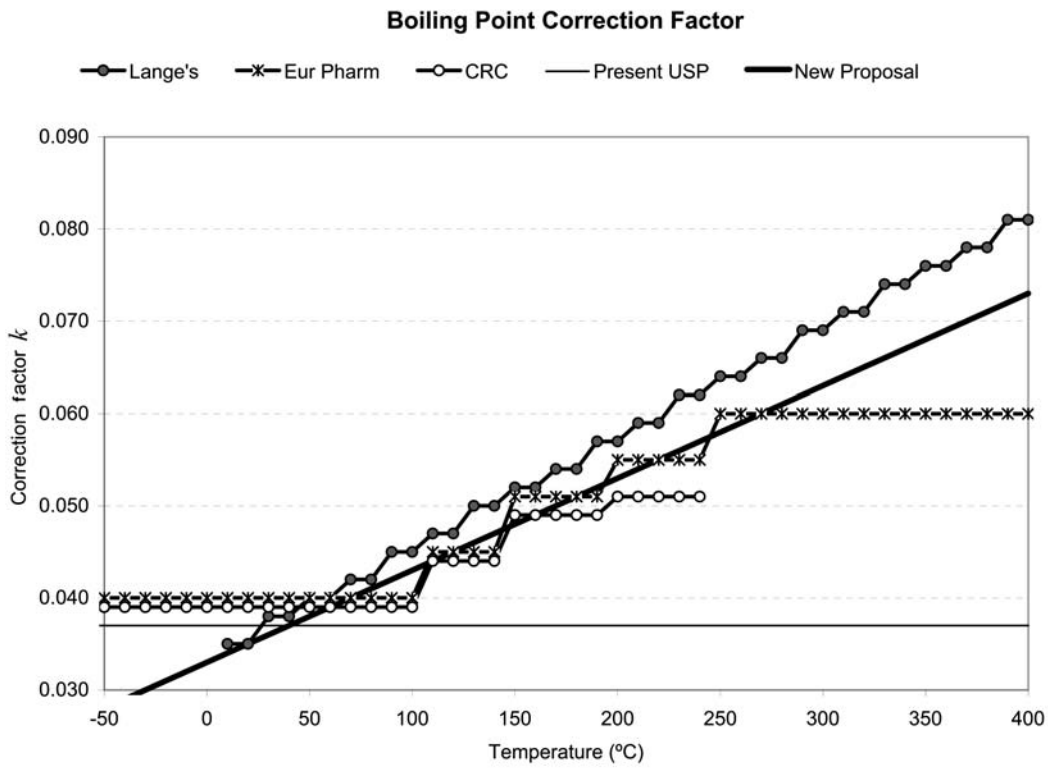

Figure 4. Comparison of the proposed approach with the correction factors as a function of temperature using *Lange's* (*2*), *EP* (*3*), *CRC* (*5*), and the current *USP* (*4*) approach.

CONCLUSION

Several approaches are used to correct the boiling point when it is measured at an atmospheric pressure different from the normal barometric pressure of 760 mm Hg. The proposed approach seems to be both accurate and simple and offers a broader application range by comparison with other methods. Comments regarding the proposed revision to *USP* General Chapter ⟨721⟩ should be sent before 16 October 2006 to Antonio Hernández Cardoso, Scientist and Latin American Specialist, Department of Standards Development, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD, 20852-1790; e-mail: ahc@usp.org.

Bioassay Glossary

Robert Singer, *PDL Biopharma;* David M. Lansky, *Lansky Consulting;* and Walter W. Hauck, *Thomas Jefferson University*[*]

ABSTRACT The United States Pharmacopeia (USP) has empanelled biological and statistical experts to develop chapters pertaining to the practice of biological assays. These include a rewrite of General Chapter *Design and Analysis of Biological Assays* ⟨111⟩ and the development of two new General Chapters, *Design of Biological Assays* ⟨1032⟩ and *Validation of Biological Assays* ⟨1033⟩. These experts have come to realize a need for clear and uniform terminology in their discussions, throughout the three chapters, and, indeed, throughout all portions of *USP–NF* that relate to biological assays. Accordingly, they have developed a glossary pertinent to biological assays. The purpose of this *Stimuli* article is to share this nascent glossary with the USP audience and to resolve and/or clarify differences in measurement terminology for well- (small molecules) and poorly characterized (biologicals and biotechnological moieties), hereafter referred to collectively as drug substances. In many cases the terms developed herein have common usages or appear elsewhere, for example in contemporary references by the International Conferences on Harmonization [ICH, for example Guideline Q2A, *Text on Validation of Analytical Procedures (1)*], Food and Drug Administration (FDA), and USP. For some of the terms in this document, the derivation may be clear. Rather than claim originality, the authors seek to associate with this work a compendial perspective that will provide clarity going forward, consistency with previous authoritative usage, and a useful focus on the bioassay context.

I. GENERAL TERMS RELATED TO BIOASSAYS

Analytical procedure—detailed description of the steps necessary to perform the assay.

Notes: 1. The description may include but is not limited to the sample, the reference standard and the reagents preparations, use of the apparatus, generation of the standard curve, use of the formulae for the calculation, etc. 2. The FDA Guidance provides a list of information that typically should be included in the description of an analytical procedure *(2)*.

Assay—analysis (as of a drug) to determine the quantity of one or more components or the presence or absence of one or more components.

Notes: 1. *Assay* often is used as a verb synonymous with *to determine,* as in, "I will assay the material for impurities." In this glossary, *assay* is a noun and is synonymous with the *analytic procedure (protocol).* 2. The phrase, "to run the assay" means to perform the analytical procedure(s) as specified.

Assay data set—the set of data used to determine a single potency or relative potency for all samples included in the bioassay.

Notes: 1. The definition of an assay data set can be subject to interpretation as necessarily a *minimal* set. It is important to understand that it may be possible to determine a potency or relative potency from a set of data but not to do this well. It is *not* the intent of this definition to mean that an assay data set is the *minimal* set of data that can be used to determine a relative potency. In practice, an assay data set should include, at least, sufficient data to assess similarity (q.v.). It also may include sufficient data to assess other assumptions. 2. It is also not an implication of this definition that assay data sets used together in determining a reportable value (q.v.) are necessarily independent from one another, although it may be desirable that they be so. When a run (q.v.) consists of multiple assay data sets, independence of assay sets within the run must be evaluated.

Bioassay, biological assay (these terms are interchangeable)—analysis (as of a drug) to quantify the biological activity(ies) of one or more components by determining its capacity for producing an expected biological activity, expressed in terms of units.

Notes: 1. Typically a bioassay involves controlled administration of the drug substance to living matter, in vivo or in vitro, followed by observation and assessment of the extent to which the expected biological activity has been manifested. 2. The description of a bioassay includes the analytic procedure, which should include the statistical design for collecting data, and the method of statistical analysis that eventually yields the estimated potency or relative potency. 3. Bioassays can be either direct or indirect.

> **Direct bioassays** measure the concentration of a substance that is required to elicit a specific response. For example, the potency of digitalis can be directly estimated from the concentration required to stop a cat's heart. In a direct assay, the response must be distinct and unambiguous. The substance must be administered in such a manner that the exact amount (threshold concentration) needed to elicit a response can be readily measured and recorded.

> **Indirect bioassays** compare the magnitude of responses for nominally equal concentrations of reference and test preparations, rather than test and reference concentrations

[*] Correspondence should be addressed to: Tina Morris, Ph.D., Director, Complex Actives Division, Department of Standards Development, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852-1790; tel. 301.816.8397; e-mail tsm@usp.org.

that are required to achieve a specified response. Most biological assays in *USP* are indirect assays that are based on either quantitative or quantal (yes/no) responses.

Potency—the specific ability or capacity of the product, as indicated by appropriate laboratory tests or by adequately controlled clinical data obtained through the administration of the product in the manner intended, to effect a given result.

Notes: 1. A wholly impotent sample has no capacity to produce the expected response, as a potent sample would. Equipotent samples produce equal responses at equal dosages. Potency is typically measured relative to a reference standard or preparation that has been assigned a single unique value (e.g., 100%) for the assay; see *relative potency.* At times, additional qualifiers are used to indicate the physical standard employed (e.g., ''international units''). 2. Some biological products have multiple uses and multiple assays. For such products there may be different reference lots that do not have consistently ordered responses across a collection of different relevant assays.

Relative potency—a measure obtained from the comparison of a test to a reference drug substance on the basis of capacity to produce the expected biological activity.

Notes: 1. A frequently invoked perspective is that relative potency is the degree to which the test preparation is diluted or concentrated relative to the standard. 2. Relative potency is unitless and is given definition, for any test material, solely in relation to the reference material and the assay.

Reportable value—the potency or relative potency estimate of record that is intended to achieve such measurement accuracy and precision as are required for use.

Notes: 1. The reportable value is the value that will be compared to a product specification. The specification may be in the *USP* monograph, or it may be set by the company, e.g., for product release. 2. The term *reportable value* is inextricably linked to the ''intended use'' of an analytical procedure. Tests are performed on samples in order to yield results that can be used to evaluate some parameter of the sample in some manner. One type of test may be configured in two different ways because the resulting data will be used for two different purposes (e.g., lot release vs. stability). The reportable value would likely be different even if the mechanics of the test itself were identical. Validation is required to support the properties of each type of reportable value. In practice there may be one physical document that is the analytical procedure used for more than one application, but each application must be detailed separately within that document. Alternatively, there may be two separate documents for the two applications. 3. When the inherent variability of a biological response, or that of the log potency, precludes a single assay data set's attaining a value sufficiently accurate and precise to meet an assay specification, the assay, or analysis data set, may consist of multiple assay data sets, as necessary. The number of assay data sets needed depends on the assay's accuracy and precision and on the intended use and hence the properties of the reported value and is influenced by factors such as the type and variability of the biological activity being studied.

Run—that performance of the analytical procedure that can be accomplished by a laboratory team in a set time with a given unique set of assay factors (e.g., standard preparations).

Notes: 1. There is no necessary relationship of *run* to *assay data set* (q.v.). The term *run* is laboratory specific; *run* relates to the physical capability of a team and its physical environment. An example of a *run* is given by one analyst's simultaneous assay of several samples in one day's bench work. During the course of a single run, it may be possible to determine multiple reportable values. Conversely, a single assay or reportable value may include data from multiple runs. 2. From a statistical viewpoint, a run is one realization of the factors associated with intermediate precision (q.v.). It is good practice to associate runs with factors that are significant sources of variation in the assay. For example, if cell passage number is an important source of variation in the assay response obtained, then each change in cell passage number initiates a new run. If the variance associated with all factors that could be assigned to runs is negligible, then the influence of runs can be ignored in the analysis and the analysis can focus on combining independent analysis data sets. 3. When a run contains multiple assays, caution is required regarding the independence of the assay results. Factors that are typically associated with runs and that cause lack of independence include cell preparations, groups of animals, analyst, day, a common preparation of reference material, and analysis with other data from the same run. Even though a strict sense of independence may be violated because some elements are shared among the assay sets within a run, the degree to which independence is compromised *may* have negligible influence on the reportable values obtained. This would need to be verified and monitored.

Similar preparations (similarity)—the property of two preparations such that each behaves as a dilution (or concentration) of the other.

Notes: 1. Similarity is fundamental to methods for determination of relative potency. Bioassay similarity requires that the reference and test samples should be sufficiently similar for legitimate calculation of relative potency. Given demonstration of similarity, a relative potency can be calculated, reported, and interpreted. Relative potency is valuable in assessing consistency and also intra- and inter-manufacturer comparability in the presence of change. In the absence of similarity, a meaningful relative potency cannot be reported or interpreted. 2. The practical *consequence* of similarity is a comparable form of dose and/or concentration–response behavior. 3. Failure to statistically demonstrate dissimilarity between a reference and a test sample does not amount to demonstration of similarity. To assess similarity it is not sufficient to fail to find evidence that a reference and a test sample are not similar.

II. TERMS RELATED TO RUNNING A BIOASSAY

Configuration, assay—the arrangement of experimental units (q.v.) by number, position, location, temporal treatment, etc. and the corresponding test, control, or reference sample dilution that will be applied to each.

Notes: 1. The assay configuration must be specified in the formalized assay protocol. 2. Assay configuration can include nested dimensions like plate design, multiple plates per day, single plates on multiple days, etc. The configuration will depend on what the variance analysis (performed during assay development) reveals regarding sources of variability on assay response.

Sample suitability—a sample is suitable (may be described as having a potency) if its response curve satisfies certain properties defined in the protocol.

Note: Most significant of these properties is that of similarity to the reference standard response curve. If this property of similarity is satisfied, then the sample is suitable for the assay and can be described via a relative potency estimate.

System suitability—the provision of assurance that the laboratory control procedure is capable of providing legitimate measurements as defined in the validation report.

Notes: 1. System suitability may be thought of as an assessment of current validity achieved at the time of assay performance. An example is provided by positive and negative controls giving values within their normal ranges, ensuring that the assay system is working properly. 2. As described in USP General Chapter *Validation of Compendial Methods* ⟨1225⟩ and ICH Q2B, system suitability testing is an integral part of many analytical procedures. The tests are based on the concept that the equipment, electronics, analytical operations, and samples to be analyzed constitute an integral system that can be evaluated as such. System suitability test parameters to be established for a particular procedure depend on the type of procedure being validated. *USP–NF* is a source of many system suitability tests.

III. TERMS RELATED TO PRECISION AND ACCURACY

Accuracy—an expression of the closeness of agreement between the value that is accepted either as a conventional true value or an accepted reference value and the value found.

Notes: 1. ICH and ISO give the same definition of accuracy. However, ISO specifically regards accuracy as having two components, bias and precision *(3)*. That is, to be accurate as used by ISO, a measurement must be both ''on target'' (have low bias) and precise. In contrast, ICH Q2A says that accuracy is sometimes termed ''trueness'' but does not define trueness. ISO defines trueness as the ''closeness of agreement between the average value obtained from a large series of test results and an accepted reference value'' and indicates that ''trueness is usually expressed in terms of bias.'' The 2001 FDA guidance on Bioanalytical Method Validation defines accuracy in terms of ''closeness of *mean* test results'' (emphasis added) and is thus consistent with the ICH usage. This glossary adopts the ICH approach. That is, it uses the term *accurate* to indicate low bias and the term *precise* to indicate low variability. 2. Considerable caution is needed when using or reading the term *accuracy*. In addition to the inconsistency between ICH and ISO, common usage is not consistent.

Error, types of—Two sources of uncertainty that affect the results of a biological assay are systematic and random error.

A **systematic error** is one that happens with similar magnitude and consistent direction repeatedly. This introduces a *bias* in the determination. Effective experimental design, including randomization and/or blocking, can reduce systematic error.

A **random error** is one whose magnitude and direction vary without pattern. Random error is an inherent variability or uncertainty of the determination. Transformation of systematic into random error will increase the robustness of a biological assay and allow a comparatively simple analysis of assay data.

Intermediate precision—expresses within-laboratory precision associated with changes in operating conditions.

Notes: 1. Factors contributing to intermediate precision involve anything that can change within a given laboratory and that may affect the assay, including different days, different analysts, different equipment, etc. Intermediate precision is thus ''intermediate'' in scope between the extremes of repeatability and reproducibility. 2. Any statement of intermediate precision should include clarification about which factors varied. For example, ''The intermediate precision associated with changing equipment and operators is . . .'' 3. There can also be value in separately identifying the precision associated with each source, e.g., interanalyst precision. This may be part of assay development and validation, when there is value in identifying which are the important contributors to intermediate precision. 4. When reporting intermediate precision, particularly for individual sources, analysts should take care to distinguish between intermediate precision variance and components of that variance. The variance includes repeatability and thus must be necessarily at least as large as the repeatability variance. A variance component, e.g., for analyst, is also a part of the intermediate precision variance for analyst, but it could be negligible and need not be larger in magnitude than the repeatability variance.

Precision—the closeness of agreement (degree of scatter) between a series of measurements obtained from multiple sampling of the same homogeneous sample under the prescribed conditions.

Notes: 1. Precision may be considered at three levels: repeatability (q.v.), intermediate precision (q.v.), and reproducibility (q.v.). 2. Precision should be investigated using homogeneous, authentic samples. However, if it is not possible to obtain a homogeneous sample, precision may be investigated using artificially prepared samples or a sample solution. 3. Precision is usually expressed as the variance, standard deviation, or coefficient of variation.

Repeatability—the expression of the precision under the same operating conditions over a short interval of time.

Notes: 1. ICH Q2A says that repeatability is also termed ''intra-assay'' precision. In the bioassay context, the better term is ''intrarun,'' and a ''short interval of time'' is meant

to connote "within-run." 2. The idea of a "short interval of time" can be problematic with bioassay. If a run takes multiple weeks and consists of a single assay set, then intrarun precision cannot be determined. Alternatively, if a run consists of two assay data sets and a run can be done in a single day, repeatability of the relative potency determination can be assessed. 3. Operating conditions will include, but not be limited to, equipment and analyst.

Reproducibility—expresses the precision between laboratories.

Notes: 1. Reproducibility includes contributions from repeatability and all factors contributing to intermediate precision as well as any additional contributions from interlaboratory differences. 2. Reproducibility will apply to collaborative studies, such as those for standardization or portability of methodology. Depending on the design of the collaborative study, it may be possible to separately describe variance components associated with intra- and interlaboratory sources of variability.

Specificity—the ability to assess unequivocally the analyte in the presence of components that may be expected to be present.

Note: Typically these components may include impurities, degradants, matrix, etc.

IV. TERMS RELATED TO CHARACTERIZATION AND VALIDATION

Detection limit—the lowest amount of analyte in a sample that can be detected but not necessarily quantified or quantified to any given level of precision and accuracy.

Linearity, bioassay—the ability (within a given range) of a bioassay to obtain log relative potencies that are directly proportional to the log relative potency of the sample.

Notes: 1. Bioassay linearity, sometimes called dilutional linearity, is demonstrated across a range of known relative potency values by considering a plot of true log potency vs. observed log potency. If that plot yields an essentially straight line with a y-intercept of 0 and a slope of 1, the assay has direct proportionality. If that plot yields an essentially straight line but either the y-intercept is not 0 or the slope is not 1 (or both), the assay has a proportional linear response. 2. To assess whether the slope is (near) 1.0 requires an a priori equivalence or indifference interval. It is not proper statistical practice to test the null hypothesis that the slope is 1.0 against the alternative that it is not 1.0 and conclude a slope of 1.0 if this is not rejected. Assay linearity is separate from consideration of the shape of the concentration–response curve. Linearity of concentration–response is *not* a requirement of assay linearity. Linearity as discussed in ICH Guideline Q2B is concentration–response linearity.

Quantitation limits—the limits of true relative potencies between which the assay has suitable precision and accuracy.

Note: This applies to assay results (log potency) rather than the reportable value.

Range—the interval between the upper and lower relative potencies for which the bioassay is demonstrated to have a suitable level of precision, accuracy, and assay linearity.

Note: This applies to assay results (log potency) rather than the reportable value.

Robustness—a measure of an analytical procedure's capacity to remain unaffected by small but deliberate variations in method parameters.

Notes: 1. Robustness is an indication of a bioassay's reliability during normal usage. For example, a cell culture assay system that is robust to the passage number of the cells would provide potency values with equivalent accuracy and precision across a consistent range of passage numbers. 2. ICH Q2B states:

> the evaluation of robustness should be considered during the development phase and depends on the type of procedure under study. It should show the reliability of an analysis with respect to deliberate variations in method parameters. If measurements are susceptible to variations in analytical conditions, the analytical conditions should be suitably controlled, or a precautionary statement should be included in the procedure. One consequence of the evaluation of robustness should be that a series of system suitability [q.v.] parameters is established to ensure that the validity of the analytical procedure is maintained whenever used.

Validation, assay—a formal, archived demonstration of the analytical capacity of an assay that provides justification for use of the assay for an intended purpose and a range of acceptable potency values.

Note: Formal validations are conducted prospectively according to a written, approved plan.

V. TERMS RELATED TO STATISTICAL DESIGN AND ANALYSIS

Blocking—the grouping of related experimental units in experimental designs.

Notes: 1. Blocking is often used to reduce the variability of a measure of interest. 2. Blocks may consist of groups of animals (a cage, a litter, or a shipment), individual 96-well plates, sections of 96-well plates, or whole 96-well plates grouped by analyst, day, or batch of cells. 3. The goal is to isolate a systemic effect, such as cage, so that it does not obscure the effects of interest.

> A **complete block design** occurs when all levels of a treatment factor (in a bioassay, the primary treatment factors are sample and concentration) can be applied to experimental units for that factor within a single block. Note that the two treatment factors, sample and concentration, may have different experimental units. For example, if the

animals within a cage are all assigned the same concentration but are assigned unique samples, then the experimental unit for concentration is cage and the experimental unit for sample is animal; cage is a blocking factor for sample.

An **incomplete block design** occurs when the number of levels of a treatment factor exceeds the number of experimental units for that factor within the block.

Confounded design—two factors are confounded if their levels vary together (they are not crossed).

Notes: 1. For example, in a bioassay validation experiment in which one analyst performs assays on a set of samples for three days using cells from one passage number, then another analyst performs assays on the same set of samples for another three days using cells from a different passage number, the passage number of the cells and the analysts are confounded. [Also note that days are nested (q.v.) within analyst and cell passage number.] When factors are confounded, one cannot tell which of the factors has caused an observed experimental difference. 2. Fractional factorial designs (q.v.), in which factors are only partially crossed, also are partially confounded. A full factorial design also can be confounded if the number of treatment combinations (sample and concentration) is greater than the block size.

Crossed (and partially crossed)—two factors are crossed (or fully crossed) if each level of each factor appears with each level of the other factor. Two factors are partially crossed when they are not fully crossed but multiple levels of one factor appear with a common level of the other factor.

Notes: 1. For example, in a bioassay in which all samples appear at all dilutions, samples and dilutions are (fully) crossed. In a bioassay validation experiment in which two of four analysts each perform assays on the same set of samples on each of six days and a different pair of analysts is used on each day, the analysts are partially crossed with days. 2. Each factor may be applied to different experimental units, and the factors may be both fully crossed and nested (q.v.), creating a split-unit or split-plot design (q.v.). 3. Experiments with factors that are partially crossed require particular care for proper analysis. 4. A randomized complete block design (RCBD) (q.v.) is a design in which the block factor (which often is treated as a random effect) is crossed with the treatment factor (which is usually treated as a fixed effect).

Experimental design—the structure of assigning treatments to experimental units.

Note: Blocking (q.v.), randomization (q.v.), replication (q.v.), and specific choice of design (to be covered in the planned General Chapter *Design of Biological Assays* ⟨1032⟩ are some aspects of experimental design. Important components of experimental design include the number of samples, the number of concentrations, and how samples and concentrations are assigned to experimental units and are grouped into blocks.

Experimental unit—the smallest unit to which a distinct level of a treatment is randomly allocated.

Notes: 1. Randomization of treatment factors to experimental units is essential in bioassays. 2. An experimental unit needs to be distinguished from a sampling unit, the smallest unit on which a distinct measurement is recorded (e.g., a well). Because the sampling unit is often smaller than the experimental unit, it is an easy mistake to treat sampling units as if they are experimental units; this mistake is called pseudoreplication (q.v.). 3. Different treatment factors can be applied to different experimental units. For example, samples may be assigned to rows on a 96-well plate while dilutions are assigned to columns on the plate. In this case, rows are the experimental units for samples, columns are the experimental units for concentrations, and wells are the experimental units for the interaction of sample and concentration.

Factor—an assay design element that may affect assay response and that varies in an experiment.

Note: In a bioassay there will be at least two treatment factors—sample and concentration.

A **fixed factor** is a factor that is deliberately set at specific levels in an experiment; inference is made only to the levels used in the experiment. In a bioassay, sample and concentration are both fixed factors.

A **random factor** is one for which its levels represent a sample of ways in which that factor might vary. In a bioassay, the test organisms, plate, and day often are considered random factors.

Factorial design—one in which there are multiple factors and the factors are partially or fully crossed.

In a **full factorial design**, each level of a factor appears with each combination of levels of all other factors. For example, if factors are sample (test and reference), concentration, and analyst, for a full factorial design each analyst must analyze all combinations of sample and concentration.

A **fractional factorial design** is one in which some factors are deliberately partially confounded with interactions associated with other combinations of factors.

Independence—For two measurements or observations A and B (raw data, assay sets, or relative potencies) to be independent, values for A must be unaffected by B's responses and vice versa.

Note: In practice this means that if two potency or relative potency measurements share a common analyst, cell preparation, incubator, group of animals, or aliquot of reference sample, then the assumption must be that they cannot be assumed to be independent. The same holds true if the two potency or relative potency measurements are estimated together from the same model or are in any way associated. In some bioassays, ongoing evidence from data can be used to show that it is reasonable to treat potency measures as independent even if they share a common level of a factor such as cell preparation.

Interaction—two factors are said to interact if the effect of one factor depends on the level of the other factor.

Level—a location on the scale of measurement of a factor.

Notes: 1. Factors have two or more distinct levels. For example, if a bioassay contains two samples, test and reference, then there are two levels for the factor sample. 2. Levels of a factor in a bioassay may be quantitative, such as concentration, or categorical, such as sample (i.e., test and reference).

Modeling, statistical—the mathematical specification of the concentration–response relationship and important sources of variation in the bioassay.

Notes: 1. Modeling includes methods to capture the dependence of the response on the samples, concentration, and groups or blocking factors in the assay configuration. 2. Modeling of bioassay data includes making many choices, some of which are driven by data. With continuous data there is a choice between linear and nonlinear models. With discrete data there is a choice among logit/log models within a larger family of generalized linear models. In limiting dilution assays there is published literature advocating Poisson models and Markov chain binomial models. One can use either fixed-effects models or mixed-effects models for bioassay data. The fixed-effects models are more widely available in software and are somewhat less demanding for statisticians to set up. On the other hand, mixed models have advantages over fixed ones. The former are more accommodating of missing data and, more importantly, can allow each block to have different slopes, asymptotes, median effective concentrations required to induce a 50% effect (EC50s), or relative potencies. Particularly when the analyst is using straight-line models fit to nonlinear responses, or in assay systems in which the concentration–response curve varies from block to block, the mixed model captures the behavior of the assay system in a much more realistic and interpretable way. 3. It is essential that any modeling approach for bioassay data use all available data simultaneously to estimate the variation (or, in a mixed model, each of several sources of variation). It may be necessary to transform the observations before this modeling; to include a variance model; or to fit a "means" model (in which there is a predicted effect for each combination of sample and concentration) to get pooled estimate(s) of variation.

Nested—a factor *A* is nested within another factor *B* if the levels of *A* are different for every level of *B*.

Notes: 1. For example, in a bioassay validation experiment two analysts may perform assays on the same set of samples on each of six days when no analyst performs the assay on more than one day (this requires 12 analysts who are qualified to perform the assay); these analysts are nested within days. 2. Nested factors have a hierarchical relationship. 3. For two factors to be nested they must satisfy the following: (a) be applied to different-sized experiment units; (b) the larger experimental unit contains more than one of the smaller experimental units; and (c) the factor applied to the smaller experimental unit is not fully crossed with the factor applied to the larger experimental unit. When conditions (a) and (b) are satisfied and the factors are partially crossed, then the experiment is partially crossed and partially nested. Experiments with this structure require particular care for proper analysis.

Parallelism (of concentration–response curves)—the concentration–response curves of the test and standard are identical in shape and differ only in a constant horizontal difference.

Notes: 1. When test and reference preparations are similar (q.v.) and assay responses are plotted against log concentrations, the resulting curve for the test preparation will be the same as that for the standard but shifted horizontally by an amount that is the logarithm of the relative potency. Because of this relationship, similarity (q.v.) is generally referred to as *parallelism*. Note that similarity is the primary concept and that parallelism is not necessary for similarity; see slope ratio models in the General Chapter *Design and Analysis of Biological Assays* ⟨111⟩, in which samples with similar concentration–response relationships have a common (or nearly common) *y*-intercept, but may differ in their slopes. 2. In practice, it is not possible to demonstrate that the shapes of two curves are exactly the same. Instead, the two curves are shown to be sufficiently similar (equivalent) in shape. Note that *similar* should be interpreted as "we have evidence that the two values are close enough" rather than "we don't have evidence that the two values are different." 3. The assessment of parallelism depends on the type of function used to fit the response curve. Parallelism for a nonlinear assay using a four-parameter logistic fit means that (a) the slopes of the rapidly changing parts of the sample and reference standard curves (that is, slope at tangent to the curve, where the first derivative is at a maximum) should be similar and (b) the upper and lower asymptotes of the response curves (plateaus) should be similar. For straight-line analysis, the slopes of the lines should be similar.

Randomization—a process of assignment of treatment to experimental units based on chance so that all equal-sized groups of units have an equal chance of receiving a given treatment.

Notes: 1. The chance mechanism may be an unbiased physical process (rolling unbiased dice, flipping coins, drawing from a well-mixed urn), random-number tables, or computer-generated randomized numbers. Care must be taken in the choice and use of method. Good practice is to use a validated computerized random-number generator. 2. The use of randomization results in systematic error becoming random error not associated with particular samples or a dilution pattern but distributed throughout the assay. In 96-well bioassays, plate effects can be substantial and cause bias or trending, particularly in assays involving long-term cell culturing or multiple addition and wash steps. In animal studies, a variety of factors associated with individual animals can influence responses. If extraneous factors that influence either plate assays or animal assays are not routinely demonstrated to have been eliminated or minimized so as to be negligible, randomization that removes the influence of the biasing factor is essential to obtain unbiased data required for the calculation of true potency. Randomization is central to the experimental design and analysis of data obtained from most biological assays.

Replication—a process in which multiple independent experimental units receive the same level of a treatment factor.

Notes: 1. The purpose of replication is to minimize the effects of uncontrollable sources of random variability. 2. Replication can occur either completely at random or across blocks. Generally, replication within blocks is pseudoreplication (see below).

> **True replicates**—samples based on independent experimental units.
>
> **Pseudoreplication** is the identification of samples from experimental units as independent and thus true replicates when they are actually not independent.

Notes: 1. Pseudoreplication results in wrong inferences and the appearance of more replicates than are actually present. 2. Pseudoreplication is dangerous because it is an easy mistake to make, it is easy to overlook, and the consequences can be serious. For example, pseudoreplicates commonly arise when analysts are making a dilution series for each sample in tubes (the dilution series can be made with serial dilutions, by single-point dilutions, or with any convenient dilution scheme). The analyst then transfers each dilution of each sample to several wells on one or more assay plates. The wells are then pseudoreplicates because they are simply aliquots of a single dilution process. 3. In general, pseudoreplication should be avoided because, unless it is properly addressed in the analysis, it leads to underestimation of replicate variance. 4. The simple way to analyze data from pseudoreplicates is to average over the pseudoreplicates (if a transformation of the observed data is used, the transformation should be applied before averaging over pseudoreplicates) before fitting any sort of concentration–response model. In many assay systems averaging over pseudoreplicates will leave the assay without any replication. A more complex way to use data containing pseudoreplicates is to use a mixed model that treats the pseudoreplicates as a separate random effect. The only case in which pseudoreplication is useful is when the pseudoreplicate (i.e., well-to-well) variation is very large compared to the variation associated with replicates and when the cost of pseudoreplicates is much lower than the cost of replicates.

Proposed Revisions to *USP* Standards for Containers—Glass

C. Jeanne Taborsky, *SciRegs International;* Edward McKinley, *Owens-Illinois;* Brian Reamer, *SciRegs International;* Michael Röβler, *Schott AG;* Desmond Hunt,* *USP;* and Claudia Okeke, *USP*

ABSTRACT All glasses do not behave identically in the presence of pharmaceutical products. For example, some drugs fail stability tests when manufacturers change Type 1 glass suppliers or Type 1 glass formulations *(Table 1)*. Neutral parenteral preparations may interact with the inner surface of glass containers. A small amount of alkali and other ions may leach into and react with the drug product, rendering it unacceptable for use. The intensity of the degradation depends on the nature of the drug product, the composition of the glass, its surface treatment, and the method of the glass manufacture. This *Stimuli* article discusses glass components, compositions, and evaluations and outlines proposed revisions to current *USP* standards to better qualify glass components for use with pharmaceutical products. Current *USP* General Chapter *Containers* ⟨661⟩ standards have been in effect without substantive revisions for an extensive period (*1*) and may benefit from comparative and cooperative international compendial revision (*2*).

INTRODUCTION

USP XII (1942) contained the first chemical specifications for glass containers for certain parenteral products (*3*). In *USP XVIII* and *NF XIII* the standards for glass were expanded, and glass was classified based on its composition and hydrolytic chemical durability (*4*), defined as the ability of glass grains to resist the release of soluble mineral substances into water under prescribed conditions of contact with water (see *Appendix: Proposed Definition*s, for further terminology and definitions) (*5, 6*). No single formula or method of manufacture is established for each type of glass. Currently in *USP* General Chapter *Containers* ⟨661⟩ the types of glass are measured by hydrolytic resistance using the powdered glass test, which measures the titration of released alkali. In this test the glass is ground, sieved, and titrated to an endpoint. Glass types are summarized in *Tables 1* and *2* below.

Until the 1970s glass was the most widely used packaging material. During this time containers were manufactured of glass or polystyrene with metal or plastic screw closures for tablets and capsules. Glass was used for vials for parenteral products, bottles for oral liquids and solids, and large bottles for intravenous solutions, blood and blood components, anticoagulants, cartridges, droppers, and ampuls. Today glass is still the primary packaging material for vials for injectable drugs and prefilled syringes. Plastics are used for most solid oral dosage forms, oral liquids, ophthalmic solutions, parenteral solutions, and ampuls in the form of nebules.

Glass has the advantage of transparency, ease of cleaning, and amenability to heat sterilization. Glass is resistant to most liquids, relatively inert, and totally impermeable to gases. Weight loss by diffusion through the container is nonexistent, although closure integrity can be an issue because of loss at the container–closure interface. Some disadvantages of using glass include its density (2.0–2.5 g/cm^2) and brittle nature. Glass requires thick container walls in order to remain durable and is therefore heavier than similar containers manufactured from plastic (*7*). Because glass containers are heavier, they are more expensive to ship. Glass also is more prone to stress cracks, breakage, and shattering into small, sharp fragments. Some glass defects are not visible until the container is filled with drug product, and over time the surface can flake into the drug.

Types of Glass

Glass as an amorphous, inorganic, super-cooled liquid has an ultra-high viscosity at room temperature (*5, 7*). Conventional inorganic glass consists of a mixture of crystalline oxides, carbonates, etc., melted by heating to a viscous liquid state. Glass consists mainly of silica dioxide, but the composition varies widely within each type. The types are based on chemical resistance (*Table 1*).

Table 1. Types of Glass in ⟨661⟩

	Type I	Type II	Type III	Type NP*
Composition	Borosilicate	Soda–lime	Soda–lime	General purpose
Reactivity	Neutral glass; high hydrolytic resistance	High hydrolytic resistance resulting from dealkalization	Average hydrolytic resistance	Potentially reactive
USP *Powdered Glass Test:* mL of 0.02 N acid	NMT† 1.0	(Water attack) NMT 0.7 or 0.2	NMT 8.5	NMT 15.0
Color	Clear amber	Clear amber	Clear amber	Assorted
Use	Most products including parenterals	Most acidic and neutral aqueous preparations including some parenterals	Nonaqueous parenterals, powders (excluding freeze-dried preparations), and nonparenterals	Nonparenterals

* NP=Nonparenteral
† NMT=Not more than

Medical glass is composed of borosilicate or soda–lime glass. The composition and relative concentration of the various elements change the properties, including melting and processing temperature. Typical proportions of atoms are provided in *Table 2*.

Table 2. Typical Composition of Medical Glass: Proportions of Atoms (*6*)

Element	Type I	Type II	Type III
Boron	6	0	0
Silica	25	24	24
Aluminum	2	1	1
Sodium	4	2	10
Calcium	0	5	5
Oxygen	63	56	60

Type I glass is composed of approximately 80% silicon dioxide and 20% boron oxide. It is preferred for sterile injectable products because of its high chemical resistance, and it is available in both amber and clear glass. Type II glass containers are fabricated of a high-grade commercial soda–lime glass, the inner glass surface of which is dealkalized by treatment, e.g., with ammonium sulfate or sulfur dioxide, followed by washing with water. This glass is suitable for most acidic and neutral aqueous preparations, including some parenteral products. Type III glass is a level above common commercial glass in resistivity to chemical attack. This glass may be suitable for some parenteral products, solids, oral liquids, and beverages.

GLASS INTERACTIONS

The quality of the contact surface of glass containers is critical to the stability of pharmaceutical products therein. Chemicals, most commonly sodium, silicon, boron, aluminum, and calcium ions, can leach or migrate from the glass to the product, causing a pH shift in unbuffered solutions. Migrants also can cause precipitation, aggregation, and degradation of product, rendering it unacceptable for use. In all types of glass, all of the ingredients have a potential to leach into the product. Neutral or acid solutions can attack the glass surface and result in ion exchange. Alkali attacks glass by dissolution. Physical attacks of the glass by the pharmaceutical product can result in sloughing or delamination, producing glass particles. Product can adsorb on the glass, and the glass can physically degrade (slough or weather). The manufacturer of the component can control the quality of the surface by controlling the composition, forming process, and secondary processes. Ultimately the packager or finished pharmaceutical product manufacturer must determine the suitability for use of the glass component in a system with a particular product (*5, 6, 7*).

INTERIOR SURFACE TREATMENTS

Several factors affect the surface quality of glass components, including composition, forming process, and secondary processing or treatments. Drug interactions with glass are due mostly to the migration or leaching of ions, e.g., sodium. Reduction of sodium atoms will increase chemical resistance to most, but not all, attacks. The sodium content of Type I borosilicate glass is inherently low, so it resists reactions with neutral and acidic drugs but may be less stable in the presence of alkaline solutions. The compatibility of any type of glass with alkaline solutions must be tested and evaluated on a case-by-case basis. Treatment of Type II glass is common to achieve chemical compatibility with pharmaceutical products. Alkali atoms can be removed from the surface of glass by several methods. Soaking or rinsing with water can remove some alkali from the immediate surface. In contact with water, elemental components that migrate are present in proportions identical to those in molded glass components. The most effective method is to treat the surface of the glass with ammonium sulfate or sulfur dioxide, which removes alkali to a deeper level below the immediate surface than does water treatment alone. Using this method during the manufacturing process at high temperatures allows other atoms to fill the voids left by the alkali and maintains the density of the glass at the inner surface. Glass for parenteral use is washed and must be presterilized before it can be used for an aseptically

filled pharmaceutical product. All washings and treatments should be documented, and their effects on the reactivity and stability of the glass component must be known (*5 ,6 ,7*).

Type I glass also is available with a silicon dioxide coating (silica) on the inner surface to reduce the risk of migration and interaction, further increasing chemical resistance. The coating forms a strong chemical bond without the use of solvents and reduces ion release from the glass by orders of magnitude. These containers are designed for packaging products of extreme sensitivity, high pH or aggressive buffer systems, complex agents, radiopharmaceuticals, or pharmaceutical products that have a tendency to adsorb to glass surfaces.

STABILITY OF GLASS CONTAINERS

The composition, manufacturing process, treatment, and storage conditions of glass components affect the stability of glass. Some typically assume that tubing glass has less physical stability because it has more heat histories, but this is a general premise that should be evaluated and tested. Type I glass is inherently the most stable. Type II components that have been sulfur treated can display stability problems because of environmental issues. Sodium sulfate on the surface can interact with surface moisture and subsequently recrystallize as a white deposit. These deposits can easily be removed by washing. Within 6 months of storage, under uncontrolled conditions, components made of other types of glass can show signs of weathering. High humidity and temperature and cycling conditions have the greatest influence because of condensation and subsequent evaporation.

SIMILARITIES AND DIFFERENCES BETWEEN PHARMACOPEIAS

The authors reviewed and compared standards for glass in *USP,* the *European Pharmacopoeia (EP),* and the *Japanese Pharmacopoeia (JP)* and are recommending only staged changes or additions that are appropriate for the improvement of *USP*'s glass standards. The first stage is to move glass standards to their own chapter, *USP* General Chapter *Containers—Glass* ⟨660⟩. The second stage is to incorporate the surface test. The third stage is to conduct studies to determine which of the tests in *USP, EU,* and *JP* should be used for the *Powdered Glass Test*.

Currently, *USP, EP,* and *JP* conduct similar *Powdered Glass Tests* but with several variations. The dissimilarities can be found in the cleaning process, the test samples, size of the sieves, acid used for titration, amount of methyl red included in the solution, and limits. The differences between tests for glass containers are summarized in *Table 3*.

Table 3. Comparison of *USP, EP,* and *JP* Tests for Glass Containers

Test	*USP 29* ⟨661⟩	*EP 5.0* Section 3.2.1	*JP XIV* GT 57

Water attack at 121°	Existing test	Test absent	Test absent

PHARMACOPEIAL CHANGES

Proposed Changes to *USP*

In order to make the container standards in *USP* clearer, the testing for glass should be moved to a separate chapter titled *USP* General Chapter *Containers—Glass* ⟨660⟩. The testing for plastic components should remain in ⟨661⟩. Compendial scientists seem to agree that the hydrolytic resistance test of the inner surface of glass containers should be added to *USP* because this test already is being conducted by many US companies and its addition to *USP* appears to be noncontroversial. *EP* also includes an *Etching Test,* which is implemented using the results of the surface test to determine if glass has been surface treated. The authors recommend that this test also be incorporated into ⟨660⟩. To the best of our knowledge, Type NP glass is no longer being used for pharmaceuticals, and thus we propose its deletion.

EP 5.0 Section 3.2.1. Glass containers for pharmaceutical use

As part of *EP*'s recent revision and update to the introduction to the general chapter, Type IV glass, which is comparable to *USP* NP, has been deleted. In addition, a new passage was added discussing possible interactions between glass components and pharmaceutical products. For the *Hydrolytic Resistance* test, which measures the alkali release of the inner surface, the exact definition for fill volume is provided. The fill volumes for cartridges and syringes have been defined, and additional set times for rinsing are stipulated (20–25 min). Recent laboratory studies have shown that the results obtained using the titrimetric or the flame atomic absorption spectrometry method are not always comparable. Both methods cannot be considered equivalent or comparable, so *EP* has recommended that the current titrimetric method be kept as the official method.

For the *Glass Grains* test, the mesh size of sieve No. 250 was changed to sieve No. 300 in accordance with ISO 720 and *USP*. The quantity of glass powder was reduced from 20 g to 10 g. The quantity of water used for extraction was reduced from 100 mL to 50 mL. The concentration of the acid used in the titration was doubled, and the limit was reduced to half the previous value. For containers produced from tubular glass, the result of the glass grains test carried out on the corresponding glass tubing is sufficient to qualify the finished molded part. Therefore it is not necessary to carry out a separate test on finished containers.

The *Glass Grains* test was renamed the *Hydrolytic Resistance of Glass Grains* and measures the durability or chemical resistance of glass particles. The sample is crushed to a defined particle size and autoclaved in water. The liquid is titrated with acid to determine the alkali content. This test is not sensitive to surface features. The effectiveness of this surface treatment cannot be sufficiently evaluated by the glass grains test.

JP

To the best of the authors' knowledge, no changes are proposed to glass testing in *JP* at this time.

CONCLUSIONS

This *Stimuli* article has examined the history of and recent progress in packaging pharmaceutical products in various types of glass. Because of advances in both materials science and analytical technologies, container components have become more amenable to precise pharmaceutical characterization, leading to a better understanding of interactions between pharmaceutical products and glass container systems. This knowledge may warrant both a separate *USP* chapter for glass containers and activities to harmonize, when possible, with other pharmacopeias to improve the precision, utility, and scope of pharmacopeial glass container testing. USP welcomes comments, which should be sent to Desmond Hunt, Ph.D., dgh@usp.org before 30 September 2006.

APPENDIX: PROPOSED DEFINITIONS

Fill Capacity—The rated fill amount or volume inside a component.
Overflow Capacity—The total volume inside a component measured to the meniscus.
Durability—The lasting physical and chemical quality of a glass surface. It is frequently evaluated after prolonged weathering or storing in terms of chemical and physical changes in the glass surface or in terms of changes to the contents of a vessel.
Finish—The material forming the opening of a container shaped to accommodate a specified closure system.
Glass—An amorphous inorganic super-cooled liquid.
Clear flint glass—Glass that is highly transparent in the visible spectrum.
Light-resistant glass—Glass that is obtained by the addition of small amounts of metal oxides, chosen according to the desired spectral absorbance.
Neutral glass—A borosilicate glass containing significant amounts of boric oxide, aluminum oxide, alkali, and/or alkaline earth oxides. Because of its composition, neutral glass has a high hydrolytic resistance and a high thermal shock resistance.
Soda–lime silica glass—A silica glass containing alkali metal oxides, mainly sodium oxide and alkaline earth oxides, mainly calcium oxide. Because of its composition, soda–lime silica glass has only a moderate hydrolytic resistance.
Haze—The degree of cloudiness in a material.
Headspace—The volume between the fill level capacity and the overflow capacity.
Stability—The ability of the material to maintain its chemical and physical properties from manufacture through the shelf life of the article.
Hermetic—A container that is impervious to air or other gases under the ordinary and customary conditions of use.

NOMENCLATURE

This section includes supplements to the latest edition of the *USP Dictionary of USAN and International Drug Names* that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

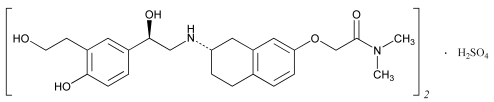
USP Dictionary of USAN and International Drug Names
2006 USP DICTIONARY SUPPLEMENT 2

IMPORTANT—Save this Supplement. This and all supplements appearing in *PF* are needed to keep the 2006 edition of the USP Dictionary (USPD) up-to-date. The cumulative contents of the supplements to the current (2005) edition will be included in the next complete edition of the Dictionary.

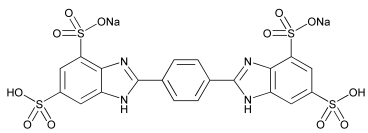
Newly Approved United States Adopted Names (USAN), Released for Publication

The following are newly established United States Adopted Names (USAN). These names will not be listed cumulatively; see preceding and succeeding numbers of *PF* for other new USAN to supplement the Dictionary main volume.

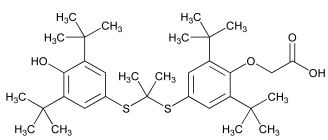
Bedoradrine Sulfate [*2006*] (bed or′ a dreen). $2C_{24}H_{32}N_2O_5.H_2O_4S$. 955.12. (1) Acetamide, *N,N*-dimethyl-2-[[(7*S*)-5,6,7,8-tetrahydro-7-[[(2*R*)-2-hydroxy-2-[4-hydroxy-3-(2-hydroxyethyl)phenyl]ethyl]amino]-2-naphthalenyl]oxy]-, sulfate; (2) Bis[2-[[(7*S*)-7-[[(2*R*)-2-hydroxy-2-[4-hydroxy-3-(2-hydroxyethyl)phenyl]ethyl]amino]-5,6,7,8-tetrahydronaphthalen-2-yl]oxy]-*N,N*-dimethylacetamide] sulfate. *CAS-194785-31-4*. *Tocolytic for the acute management of imminent pre-term birth.* (Medical Arts) ✧*KUR-1246; MN-221*



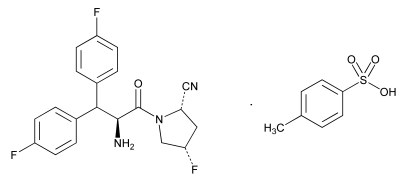
Bisdisulizole Disodium [*2006*] (bis dye su′ li zole). $C_{20}H_{12}N_4Na_2O_{12}S_4$. 674.57. (1) 1*H*-Benzimidazole-4,6-disulfonic acid, 2,2′-(1,4-phenylene)bis-, disodium salt; (2) Disodium dihydrogen 2,2′-(1,4-phenylene)bis(1*H*-benzimidazole-4,6-disulfonate). *CAS-180898-37-7*. *Sunscreen.* Neo Heliopan AP (Symrise GmbH)



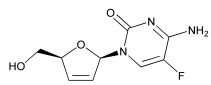
Camobucol [*2006*] (kam oh bue′ kol). $C_{33}H_{50}O_4S_2$. 574.88. (1) Acetic acid, [4-[[1-[[3,5-bis(1,1-dimethylethyl)-4-hydroxyphenyl]thio]-1-methylethyl]thio]-2,6-bis(1,1-dimethylethyl)phenoxy]-; (2) [4-[[1-[[3,5-Bis(1,1-dimethylethyl)-4-hydroxyphenyl]sulfanyl]-1-methylethyl]sulfanyl]-2,6-bis(1,1-dimethylethyl)phenoxy]acetic acid. *CAS-216167-92-9*. *Treatment of inflammatory diseases.* (AtheroGenics) ✧*AGIX-4207*



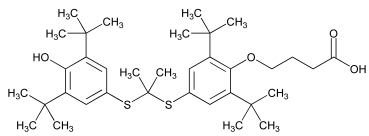
Denagliptin Tosylate [*2006*] (den a glip′ tin). $C_{20}H_{18}F_3N_3O.C_7H_8O_3S$. 545.57. [Denagliptin is INN.] (1) 2-Pyrrolidinecarbonitrile, 1-[(2*S*)-2-amino-3,3-bis(4-fluorophenyl)-1-oxopropyl]-4-fluoro-, (2*S*,4*S*)-, mono(4-methylbenzenesulfonate); (2) (2*S*,4*S*)-1-[(2*S*)-2-Amino-3,3-bis(4-fluorophenyl)propanoyl]-4-fluoropyrrolidine-2-carbonitrile 4-methylbenzenesulfonate. *CAS-811432-66-3; CAS-483369-58-0* [denagliptin]. *Treatment of Type 2 diabetes.* (GlaxoSmithKline) ✧*GW823093C*



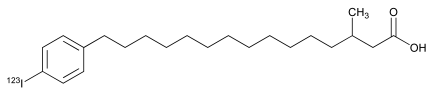
Dexelvucitabine [*2006*] (dex″ el vue sye′ ta been). $C_9H_{10}FN_3O_3$. 227.19. (1) Cytidine, 2′,3′-didehydro-2′,3′-dideoxy-5-fluoro-; (2) (+)-4-Amino-5-fluoro-1-[(2*R*,5*S*)-5-(hydroxymethyl)-2,5-dihydrofuran-2-yl]pyrimidin-2(1*H*)-one. *CAS-134379-77-4*. *Treatment of HIV-1 and HIV-2 infection.* Reverset (Incyte) ✧*INCB-8721; DPC-817; YZ-817*



Elsibucol [*2006*] (el si bue′ kol). $C_{35}H_{54}O_4S_2$. 602.93. (1) Butanoic acid, 4-[4-[[1-[[3,5-bis(1,1-dimethylethyl)-4-hydroxyphenyl]thio]-1-methylethyl]thio]-2,6-bis(1,1-dimethylethyl)phenoxy]-; (2) 4-[4-[[1-[[3,5-Bis(1,1-dimethylethyl)-4-hydroxyphenyl]sulfanyl]-1-methylethyl]sulfanyl]-2,6-bis(1,1-dimethylethyl)phenoxy]butanoic acid. *CAS-216167-95-2*. *Prevention of solid organ transplant rejection.* (AtheroGenics) ✧*AGI-1096*

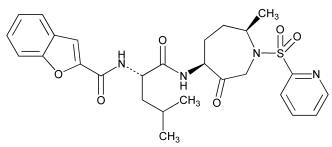


Iodofiltic Acid I 123 [*2006*] (eye oh doe fil′ tic). $C_{22}H_{35}[^{123}I]O_2$. 454.40. (1) Benzenepentadecanoic acid, 4-(iodo-^{123}I)-β-methyl-; (2) (3*RS*)-15-(4-[^{123}I]iodophenyl)-3-methylpentadecanoic acid. *CAS-123748-56-1. Metabolic imaging pharmaceutical for detection of ischemic myocardium.* Zemiva (Molecular Insight) ✧*BMIPP*



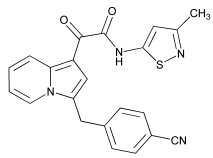
Lexatumumab [*2006*] (lex″ a too′ moo mab). $C_{6346}H_{9832}N_{1720}O_{2002}S_{42}$. (1) Immunoglobulin G1, anti-(human cytokine receptor TRAIL-R2) (human monoclonal HGS-ETR2 heavy chain), disulfide with human monoclonal HGS-ETR2 λ-chain, dimer; (2) Immunoglobulin G1, anti-(human tumor necrosis factor receptor superfamily member 10B (Death receptor 5 or TRAIL-R2)) (human monoclonal HGS-ETR2 heavy chain), disulfide with human monoclonal HGS-ETR2 λ-chain, dimer. Molecular weight is approximately 143,600 daltons. *CAS-845816-02-6. Treatment of cancer.* (Human Genome Sciences) ✧*HGS-ETR2; HGS1018*

Relacatib [*2006*] (rel′ a ka tib). $C_{27}H_{32}N_4O_6S$. 540.63. (1) 2-Benzofurancarboxamide, *N*-[(1*S*)-1-[[[(4*S*,7*R*)-hexahydro-7-methyl-3-oxo-1-(2-pyridinylsulfonyl)-1*H*-azepin-4-yl]amino]carbonyl]-3-methylbutyl]-; (2) *N*-[(1*S*)-3-Methyl-1-[[(4*S*,7*R*)-7-methyl-3-oxo-1-(pyridin-2-ylsulfonyl)hexahydro-1*H*-azepin-4-yl]carbamoyl]butyl]benzofuran-2-carboxamide; (3) *N*-[(1*S*)-3-Methyl-1-({[(4*S*,7*R*)-7-methyl-3-oxo-1-(2-pyridinylsulfonyl)hexahydro-1*H*-azepin-4-yl]amino}carbonyl)-butyl]-1-benzofuran-2-carboxamide. *CAS-362505-84-8*. INN. *Treatment of osteoporosis.* (GlaxoSmithKline) ✧*SB-462795*

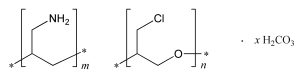


Rilonacept [*2006*] (ri lon′ a sept). $C_{9030}H_{13932}N_{2400}O_{2670}S_{74}$. (1) Interleukin 1 receptor accessory protein (human extracellular domain fragment) fusion protein with type I interleukin 1 receptor (human extracellular domain fragment) fusion protein with immunoglobulin G1 (human Fc fragment), homodimer; (2) [653-Glycine][-human interleukin-1 receptor accessory protein-(1-339)-peptide (extracellular domain fragment) fusion protein with human type I interleukin-1 receptor-(5-316)-peptide (extracellular domain fragment) fusion protein with human immunoglobulin G1-(229 *C*-terminal residues)-peptide (Fc fragment)] dimer. Molecular weight is approximately 201,210 daltons. *CAS-501081-76-1. Treatment of rheumatoid arthritis, auto-inflammatory diseases, and osteoarthritis.* (Regeneron) ✧*IL-1 Trap; Interleukin-1 Trap*

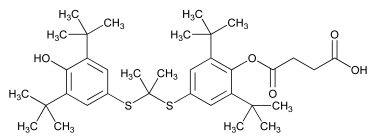
Rosabulin [*2006*] (roe″ za bue′ lin). $C_{22}H_{16}N_4O_2S$. 400.45. (1) 1-Indolizineacetamide, 3-[(4-cyanophenyl)methyl]-*N*-(3-methyl-5-isothiazolyl)-α-oxo-; (2) 2-[3-(4-Cyanobenzyl)indolizin-1-yl]-*N*-(3-methylisothiazol-5-yl)-2-oxoacetamide. *CAS-501948-05-6. Treatment of therapeutic resistant cancers.* (Synta) ✧*STA-5312*



Sevelamer Carbonate [*2006*] (se vel′ a mer). $[(C_3H_7N)_m(C_3H_5ClO)_n].xCH_2O_3$. (1) Carbonic acid, compound with (chloromethyl)oxirane polymer with 2-propen-1-amine; (2) Prop-2-en-1-amine polymer with (chloromethyl)oxirane carbonate. *CAS-845273-93-0. Control of serum phosphorus in patients with chronic kidney disease (phosphate binder).* (Genzyme) ✧*GT335-012*

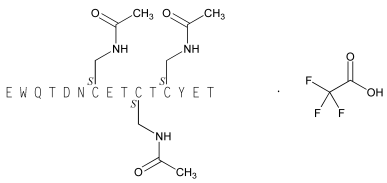


Succinobucol [*2006*] (sux in oh bue′ kol). $C_{35}H_{52}O_5S_2$. 616.91. (1) Butanedioic acid, mono[4-[[1-[[3,5-bis(1,1-dimethylethyl)-4-hydroxyphenyl]thio]-1-methylethyl]thio]-2,6-bis(1,1-dimethylethyl)phenyl] ester; (2) 4-[4-[[1-[[3,5-Bis(1,1-dimethylethyl)-4-hydroxyphenyl]sulfanyl]-1-methylethyl]sulfanyl]-2,6-bis(1,1-dimethylethyl)phenoxy]-4-oxobutanoic acid. *CAS-216167-82-7. Reduction of cardiovascular events.* (AtheroGenics) ✧*AGI-1067*



Ticilimumab [*2006*] (tis i lim′ ue mab). $C_{6500}H_{9974}N_{1726}O_{2026}S_{52}$. (1) Immunoglobulin G2, anti-(human CTLA-4 (antigen)) (human monoclonal CP-675206 clone 11.2.1 heavy chain), disulfide with human monoclonal CP-675206 clone 11.2.1 light chain, dimer; (2) Immunoglobulin G2, anti-(human Cytotoxic T-lymphocyte protein 4 (CD 152 antigen)) (human monoclonal CP-675206 clone 11.2.1 heavy chain) disulfide with human monoclonal CP-675206 clone 11.2.1 light chain, dimer. Molecular weight is approximately 150,000 daltons. *CAS-745013-59-6*. INN. *Treatment of cancer.* (Boehringer Ingelheim) ✧*CP-675,206*

Tigapotide Triflutate [*2006*] (tye″ gah poe′ tide). $C_{82}H_{119}N_{21}O_{34}S_3.C_2HF_3O_2$. 2153.16. (1) L-Threonine, L-α-glutamyl-L-tryptophyl-L-glutaminyl-L-threonyl-L-α-aspartyl-L-asparaginyl-*S*-[(acetylamino)methyl]-L-cysteinyl-L-α-glutamyl-L-threonyl-*S*-[(acetylamino)methyl]-L-cysteinyl-L-threonyl-*S*-[(acetylamino)-methyl]-L-cysteinyl-L-tyrosyl-L-α-glutamyl-, mono(trifluoroacetate); (2) L-α-Glutamyl-L-tryptophyl-L-glutaminyl-L-threonyl-L-α-aspartyl-L-asparaginyl-*S*-[(acetylamino)methyl]-L-cysteinyl-L-α-glutamyl-L-threonyl-*S*-[(acetylamino)methyl]-L-cysteinyl-L-threonyl-*S*-[(acetylamino)methyl]-L-cysteinyl-L-tyrosyl-L-α-glutamyl-L-threonine mono(trifluoroacetate). *CAS-848084-84-4*. *Treatment of metastatic hormone refractory prostate cancer.* (Procycon) ✧*PCK3145*



Vitespen [*2006*] (vi tes′ pen). $C_{3970}H_{6275}N_{1047}O_{1302}S_{21}$. (1) gp96; (2) Glucose regulated protein 94 (grp 94); (2) Endoplasmin (human tumor rejection antigen 1). Molecular weight is approximately 90,100 daltons. *CAS-492448-75-6*. *Autologous heat shock protein immuno-stimulant for the treatment of cancer.* Oncophage (Antigenics) ✧*HSPPC-96*

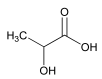
Revisions of United States Adopted Names (USAN)

The following are revisions of existing United States Adopted Names (USAN) and other names.

Lactic Acid

Add the molecular formula, molecular weight and chemical structure to read:

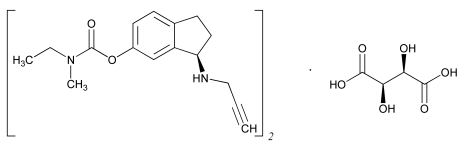
$C_3H_6O_3$. 90.08.



Ladostigil Tartrate

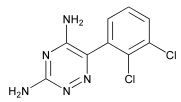
Change the chemical name and add the chemical structure to read:

(2) (3*R*)-3-(Prop-2-ynylamino)-2,3-dihydro-1*H*-inden-5-yl ethylmethylcarbamate (2*R*,3*R*)-tartrate (2:1).



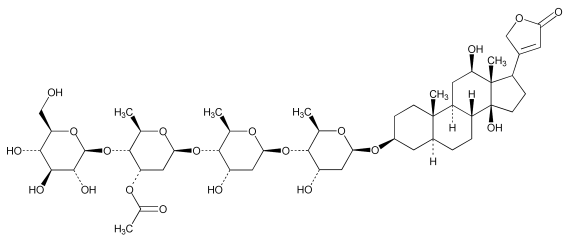
Lamotrigine

Add the chemical structure to read:



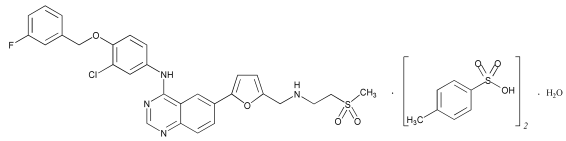
Lanatoside C

Add the chemical structure to read:



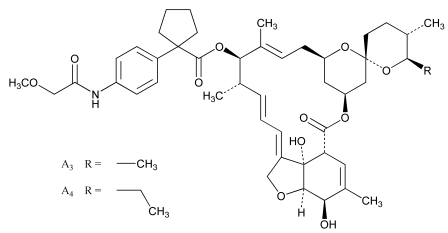
Lapatinib Ditosylate

Add the chemical structure to read:



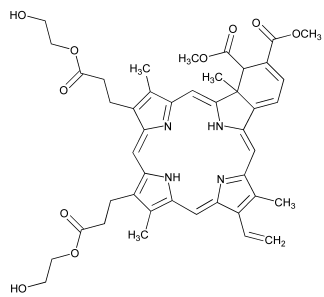
Latidectin

Add the chemical structure to read:



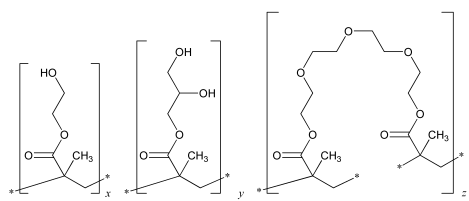
Lemuteporfin

Add the chemical structure to read:



Lenefilcon A

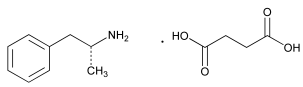
Add the chemical structure to read:



Levamfetamine Succinate

Change the chemical names and structure to read:

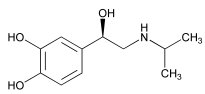
(1) Butanedioic acid, compd. with (–)-(*R*)-α-methylbenzeneethanamine (1:1); (2) (–)-(*R*)-α-Methylphenethylamine succinate (1:1).



Levisoprenaline

Change the chemical name and structure to read:

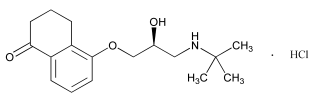
(–)-(*R*)-α-(Isopropylaminomethyl)protocatechuyl alcohol.



Levobunolol Hydrochloride

Change the chemical names and structure to read:

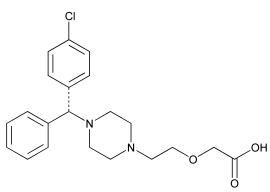
(1) 1(2*H*)-Naphthalenone, 5-[3-[(1,1-dimethylethyl)amino]-2-hydroxypropoxy]-3,4-dihydro-, hydrochloride, (–)-(*S*); (2) (–)-(*S*)-5-[3-(*tert*-Butylamino)-2-hydroxypropoxy]-3,4-dihydro-1(2*H*)-naphthalenone hydrochloride.



Levocetirizine

Change the chemical name and add the chemical structure to read:

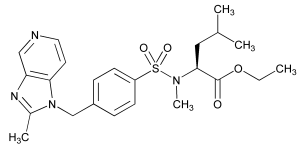
[2-[4-[(*R*)-*p*-Chloro-α-phenylbenzyl]-1-piperazinyl]ethoxy]acetic acid.



Lexipafant

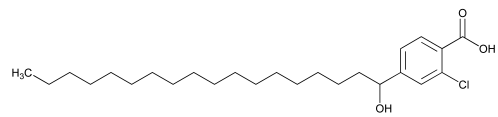
Change the chemical name and structure to read:

(1) L-Leucine, *N*-methyl-*N*-[[4-[(2-methyl-1*H*-imidazo[4,5-*c*]pyridin-1-yl)methyl]phenyl]sulfonyl]-, ethyl ester;



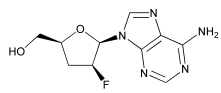
Lodelaben

Add the chemical structure to read:



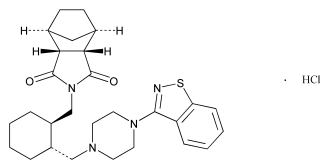
Lodenosine

Add the chemical structure to read:



Lurasidone Hydrochloride

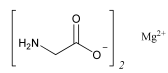
Change the chemical structure to read:



Magnesium Glycinate

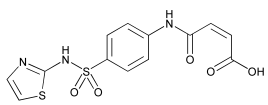
Add the CAS number and change the chemical structure to read:

CAS-14783-68-7.



Maleylsufathiazole

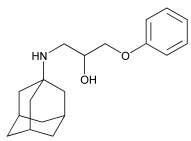
Add the chemical structure to read:



Mantabegron

Add the molecular weight and chemical structure to read:

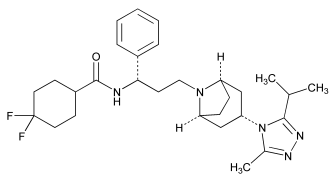
301.42.



Maraviroc

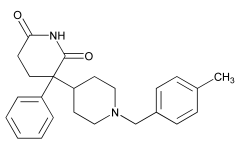
Add the molecular weight, change the chemical name, and add the chemical structure to read:

513.67. 4,4-Difluoro-*N*-[(1*S*)-3-{(1*R*,3*S*,5*S*)-3-[3-methyl-5-(propan-2-yl)-4*H*-1,2,4-triazol-4-yl]-8-azabicyclo[3.2.1]octan-8-yl}-1-phenylpropyl]cyclohexanecarboxamide.



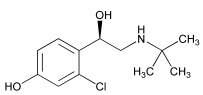
Meletimide

Change the chemical structure to read:



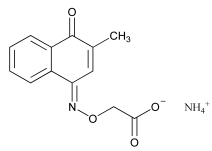
Meluadrine

Add the chemical structure to read:



Menadoxime

Add the chemical structure to read:



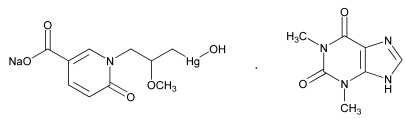
Meprochol

Add the chemical structure to read:

Meragidone Sodium

Add the chemical information and structure to read:

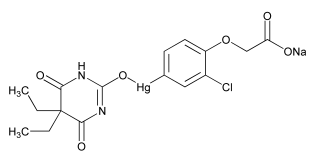
$C_{10}H_{12}HgNNaO_5 \cdot C_7H_8N_4O_2$. 629.95. (1) Mercurate(1-), (3-(5-carboxylato-1,2-dihydro-2-oxo-1-pyridinyl)-2-methoxypropyl) hydroxy-, sodium, compd. with 3,7-dihydro-1,3-dimethyl-1*H*-purine-2,6-dione; (2) Sodium (3-(5-carboxylato-2-oxopyridin-1(2*H*)-yl)-2-methoxypropyl)(hydroxy) mercury compd. with theophylline.



Merbaphen

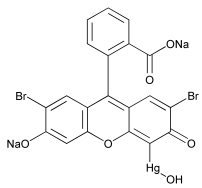
Add the chemical information and structure to read:

$C_{16}H_{16}ClHgN_2NaO_6$. 591.34. (1) Mercury(1-), (4-(carboxymethoxy)-3-chlorophenyl)(5,5-diethyl-2,4,6(1*H*,3*H*,5*H*)-pyrimidinetrionato-*O*^{2})-, monosodium salt; (2) Sodium (4-(carboxylatomethoxy)-3-chlorophenyl)(5,5-diethyl-4,6-dioxo-1,4,5,6-tetrahydropyrimidin-2-yloxy)-mercury.



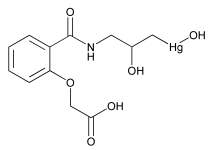
Merbromin

Add the chemical structure to read:



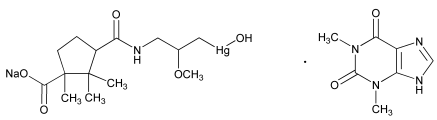
Mercuderamide

Add the chemical structure to read:



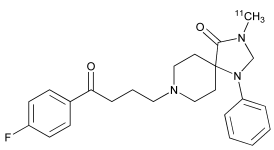
Mercurophylline

Add the chemical structure to read:



Mespiperone C 11

Add the chemical structure to read:



Synthetic Conjugated Estrogens, B

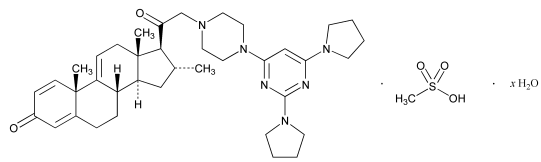
Change the chemical information to read:

Synthetic conjugated estrogens, B, contains the sodium sulfate forms of estrone, equilin, 17α-estradiol, 17α-dihydroequilin, 17β-dihydroequilin, 17α-dihydroequilenin, 17β-dihydroequilenin, equilenin, 17β-estradiol, and $\Delta^{8,9}$-dehydroestrone. The total percent label claim for the sum of estrone and equilin is 79.5%–88.0%. The individual levels for each component are the following: estrone 52.5%–61.5%, equilin 22.5%–30.5%, 17α-estradiol 2.5%–9.5%, 17α-dihydroequilin 13.5%–19.5%, 17β-dihydroequilin 0.5%–4.0%, 17α-dihydroequilenin 0.2%–3.25%, 17β-dihydroequilenin 0.2%–2.75%, equilenin 0.2%–5.5%, 17β-estradiol 0.2%–2.25%, and $\Delta^{8,9}$-dehydroestrone 0.2%–6.25%.

Tirilazad Mesylate

Change the chemical information and structure to read:

[*1993*] *Treatment of CNS trauma, stroke (lipid peroxidation inhibitor).* (Upjohn) ✧*U-74006F*



INDEX

This is a cumulative directory for the content of all issues of *PF* beginning with *PF* 32(1).

[*Note—This index covers Vol. 32 No. 1, pp. 1–224; Vol. 32 No. 2, pp. 225–704; Vol. 32 No. 3, pp. 705–987; Vol. 32 No. 4, pp. 989–1388*]

New Items at a Glance

See what's new in USP Reference Standards. For your convenient and quick reference, here's a list of Reference Standards released by USP over the past year.

This list is continuously updated with the newest Reference Standards released within the past 12 months.

Cat. No.	Description	Curr. Lot	Price
1006801	Acetone (1.5 mL/ampule; 3 ampules)	F0D028	$168
1011007	Acitretin (200 mg)	F0E266	$394
1011018	Acitretin Related Compound A (20 mg)	F0E264	$536
1011029	Acitretin Related Compound B (20 mg)	F0E265	$536
1012076	Acyclovir Related Compound A (50 mg) (AS)	F0F010	$535
1019712	Amiloride Related Compound A (30 mg) (AS)	F0E287	$526
1034909	Anecortave Acetate (200 mg)	F0E298	$168
1034910	Anecortave Acetate Related Compound A (20 mg)	F0E299	$526
1042102	L-Arabinitol (500 mg)	F0E311	$168
1065210	Berberine Chloride (50 mg)	F0E185	$281
1071202	Bicalutamide (200 mg)	F0E321	$168
1071213	Bicalutamide Related Compound A (25 mg)	F0E322	$526
1076465	Bromazepam **CIV** (100 mg) (AS)	F0F064	$224
1078201	Budesonide (200 mg)	F0E302	$168
1086301	Calcitriol (10 mg)	F0E062	$1,352
1087508	Camphor (1 g)	F0F030	$168
1496802	Parachlorophenol (500 mg)	F0E061	$168
1134346	Ciprofloxacin Related Compound A (25 mg) (AS)	F0E333	$526
1134390	Clarithromycin Identity (100 mg)	F0E141	$526
1145207	Cod Liver Oil (1 g)	F0D400	$168
1162148	Cytosine (100 mg)	F0E284	$168
1187954	2,4-Dichlorophenol (100 mg)	F0E113	$168
1241903	Erythritol (200 mg)	F0E313	$168
1249202	Escin (350 mg)	F0F088	$185
1268513	Etidronate Disodium Related Compound A (300 mg)	F0E227	$526
1270446	Fexofenadine Related Compound C (15 mg) (AS)	F0E291	$526
1273819	Flumazenil Related Compound A (20 mg)	F0E147	$675
1273820	Flumazenil Related Compound B (20 mg)	F0E148	$675
1285873	Fluticasone Propionate (100 mg)	F0F036	$832
1285884	Fluticasone Propionate Resolution Mixture (25 mg)	F0E123	$675
1285895	Fluticasone Propionate System Suitability Mixture (25 mg)	F0E122	$675
1285964	Fluvastatin Related Compound B (15 mg)	F0F017	$526
1285942	Fluvastatin for System Suitability (25 mg)	F0F016	$526
1287369	Gabapentin Related Compound E (25 mg)	F0E190	$526
1292303	Glimepiride (200 mg)	F0E228	$250
1292314	Glimepiride Related Compound A (20 mg)	F0E232	$526
1292325	Glimepiride Related Compound B (20 mg)	F0E233	$526
1292336	Glimepiride Related Compound C (20 mg)	F0E234	$526
1292347	Glimepiride Related Compound D (20 mg)	F0E235	$526
1295516	Glyburide Related Compound A (25 mg)	F0E224	$526
1313210	Hydrastine (10 mg)	F0E204	$281
1335010	Hyoscyamine Related Compound A (10 mg)	F0E250	$526
1349626	Isomalt (200 mg)	F0E263	$168
1379059	Mefloquine Hydrochloride (100 mg)	F0E165	$168
1379060	Mefloquine Related Compound A (20 mg)	F0E166	$526
1379401	Meloxicam (400 mg)	F0E158	$281
1379412	Meloxicam Related Compound A (25 mg)	F0E167	$526
1379423	Meloxicam Related Compound B (25 mg)	F0E168	$526
1379434	Meloxicam Related Compound C (30 mg)	F0E159	$526
1379445	Meloxicam Related Compound D (30 mg)	F0E160	$526
1396331	Metformin Related Compound B (25 mg)	F0F019	$526
1396342	Metformin Related Compound C (25 mg)	F0E343	$526
1424109	Methyl Alcohol (3 x 1.5 mL)	F0D015	$168
1460204	Neotame (200 mg)	F0F044	$168
1460215	Neotame Related Compound A (15 mg)	F0F045	$526
1473206	Norphenylephrine Hydrochloride (25 mg)	F0E205	$526
1478119	Ofloxacin Related Compound A (25 mg)	F0E276	$526
1478571	Ondansetron (300 mg)	F0E281	$225
1479010	Orphenadrine Related Compound A (50 mg) (AS)	F0F042	$526
1491015	Oxytetracycline Hydrochloride (200 mg) (AS)	F0E258	$168
1500353	Paroxetine System Suitability Mixture A (50 mg)	F0E150	$526
1524806	Phenol (500 mg)	F0F029	$168
1546401	Polyethylene Glycol 200 (1 g)	F0E316	$168
1546423	Polyethylene Glycol 300 (1 g)	F0E336	$168
1546445	Polyethylene Glycol 400 (1 g)	F0E344	$168
1546467	Polyethylene Glycol 600 (1 g)	F0E345	$168
1546489	Polyethylene Glycol 1000 (1 g)	F0F008	$168
1546503	Polyethylene Glycol 1500 (1 g)	F0F009	$168
1546525	Polyethylene Glycol 3000 (1 g)	F0F013	$168
1546547	Polyethylene Glycol 3350 (1 g)	F0F012	$168
1546569	Polyethylene Glycol 4000 (1 g)	F0F040	$168
1546580	Polyethylene Glycol 6000 (1 g)	F0F041	$168
1546605	Polyethylene Glycol 8000 (1 g)	F0F050	$168
1546627	Polyethylene Glycol 10000 (1 g)	F0F051	$168
1546649	Polyethylene Glycol 12000 (1 g)	F0F052	$168
1546650	Polyethylene Glycol 20000 (1 g)	F0F053	$168
1546660	Polyethylene Glycol 35000 (1 g)	F0F054	$168
1546966	Polyisobutylene (1 g)	F0E108	$168
1372402	Polyoxyl Lauryl Ether (500 mg)	F0E253	$168
1557000	Prednisolone Sodium Phosphate (100 mg)	F0E300	$168

New Items at a Glance *(Continued)*

Cat. No.	Description	Curr. Lot	Price
1598338	Ramipril Related Compound C (20 mg)	F0E157	$526
1598450	Ranitidine Resolution Mixture (20 mg)	F0E323	$1,052
1604803	Ritonavir (200 mg)	F0F049	$168
1605500	Ropivacaine Hydrochloride (200 mg)	F0E334	$168
1605512	Ropivacaine Related Compound A (25 mg)	F0E315	$526
1605523	Ropivacaine Related Compound B (50 mg)	F0E318	$526
1609013	Salicylic Acid Related Compound A (100 mg)	F0F108	$526
1612404	Sesame Oil (1 mL/ampule; 2 ampules) (AS)	F0E134	$168
1612415	Sesame Oil Related Compound A (6 mg/vial; 3 vials)	F0E131	$526
1612426	Sesame Oil Related Compound B (6 mg/vial; 3 vials)	F0E132	$526
1614363	Sodium Lauryl Sulfate (1 g) (AS)	F0D381	$168
1614670	Sodium Starch Glycolate Type B (400 mg)	F0E222	$168
1615708	Somatropin (8.63 USP Somatropin Units/vial)	F0E191	$182
1619017	Spironolactone Related Compound A (100 mg) (AS)	F0E184	$526
1642019	Sulindac Related Compound A (20 mg)	F0E314	$526
1642100	Sulisobenzone (500 mg)	F0F074	$194
1667280	Tiagabine Hydrochloride (300 mg)	F0E178	$260
1667235	Racemic Tiagabine Hydrochloride Mixture (25 mg)	F0E179	$526
1667224	Tiagabine Related Compound A (15 mg)	F0E177	$526
1667355	Tiamulin (100 mg)	F0E219	$168
1667541	Tinidazole Related Compound B (20 mg)	F0E274	$526
1672010	o-Toluenesulfonamide (200 mg)	F0E163	$263
1672020	p-Toluenesulfonamide (200 mg)	F0E162	$263
1682217	Triclosan Related Compounds Mixture A (1.2 mL/ampule; 3 ampules)	F0E292	$526
1705323	Ubidecarenone Related Compound A (15 mg)	F0E210	$526
1708718	Valproic Acid Related Compound B (50 mg) (AS)	F0E201	$526
1711428	Verapamil Related Compound D (50 mg)	F0E342	$526

New Lots in Distribution

Cat. No.	Description	Curr. Lot.	Purity Value/Conc.	Change Code*	Previous Lot/Valid Use Date	CAS No.	Price
1012076	Acyclovir Related Compound A (50 mg) (AS) (2-[(2-amino-6-oxo-1,6-dihydro-9H-purin-9-yl)-methoxy]ethyl acetate)	F0F010		1		n/f	$535
1076465	Bromazepam **CIV** (100 mg) (AS)	F0F064		1		[1812-30-2]	$224

Chromatographic Reagents Used in *USP-NF* and *Pharmacopeial Forum*

July–Aug. 2006

ALMOND OIL (DSD Mgh #1510)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(4)	G27	SPB-5	Sterol composition	0.32 mm × 30 m, 0.25 µm, manufacturer Supelco.

BISOPROLOL FUMARATE TABLETS (DSD Mgh #9794)

PF	LGS#	Reagent Brand	Type of Test	Comments
0(0)	L7	Pecosphere 3CR C8	Dissolution	4.6 mm × 33 mm, manufacturer PerkinElmer, catalog number 0250191.

CARPROFEN (DSD Mgh #13600)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(5)	L1	Zorbax ODS	Assay and Related compounds	4.6 mm × 25 cm, 5 µm, manufacturer Agilent.

CHOLINE CHLORIDE (DSD Mgh #17320)

PF	LGS#	Reagent Brand	Type of Test	Comments
0(0)	L7	Zorbax SB C8	Chromatographic purity	4.6 mm × 25 cm, manufacturer Agilent.

CISAPRIDE (DSD Mgh #17895)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(5)	L1	Hypersil BDS C-18	Related compounds	4.0 mm × 10 cm, 3 µm, manufacturer Thermo Electron.

DOXAZOSIN MESYLATE (DSD Mgh #28090)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(4)	L7	LiChrospher 60 RP-Select B	Related compounds and Chromatographic purity	4 mm × 25 cm, 5 µm, manufcturer Merck KGaA.

ETHYL ACETATE (DSD Mgh #31860)

PF	LGS#	Reagent Brand	Type of Test	Comments
0(0)	G16	DB Wax	Organic volatile impurities	0.53 mm × 10 m, 1 µm, manufacturer J&W Scientific.

FLUDARABINE PHOSPHATE INJECTION (DSD Mgh #1516)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(4)	L1	Discovery C18	Assay and Related compounds	4.6 mm × 25 cm, 5 µm, manufacturer Supelco.

FLUOXETINE ORAL SOLUTION (DSD Mgh #33785)

PF	LGS#	Reagent Brand	Type of Test	Comments
25(2)	L1	Supelcosil LC-18-DB	Chromatographic purity	4.6 mm × 25 cm, 5 µm, manufacturer Supelco.

GLUCOSAMINE AND METHYLSULFONYLMETHANE TABLETS (DSD Mgh #2188)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(4)	G2	Zebron ZB-1	Content of	Content of methylsulfonylmethane. 0.53 mm × 30 m, 5 µm, manufacturer Phenomenex.
32(4)	L1	Genesis C18	Content of	Content of glucosamine. 3.0 mm × 5 cm, 5 µm, manufacturer Grace-Jones.

HYDROMORPHONE HYDROCHLORIDE (DSD Mgh #38640)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(4)	L1	Symmetry C-18	Related compounds	3.9 mm × 15 cm, 5 µm, manufacturer Waters.

MELOXICAM ORAL SUSPENSION (DSD Mgh #2140)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(4)	L1	Kromasil C18	Assay and Chromatographic purity	4 mm × 12.5 cm, manufacturer EKA Nobel.

MELOXICAM TABLETS (DSD Mgh #48124)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(5)	L1	Kromasil C18	Assay and Related compounds	4.0 mm × 10 cm, 10 µm, manufacturer EKA Nobel.

PANTOPRAZOLE SODIUM (DSD Mgh #60470)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(5)	L1	Nova-Pak C18	Assay and Related compounds	3.9 mm × 15 cm, 4 µm, manufacturer Waters.

POLYDEXTROSE (DSD Mgh #66235)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(4)	L25	Ultrahydrogel 250	Mol. wt. distrib., Ave. mol. wt.	7.8 mm × 30 cm, 6 µm, manufacturer Waters.
32(4)	L25	Ultrahydrogel 250	Molecular size distribution	7.8 mm × 30 cm, 6 µm, manufacturer Waters.

TRANEXAMIC ACID (DSD Mgh #84413)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(5)	L1	Nucleosil C18	Assay and Related compounds	250 × 4.6 mm 5 µm, manufacturer Agilent.

TRIMIPRAMINE MALEATE (DSD Mgh #85990)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(4)	L7	Luna C8	Assay and Related compounds	4.6 mm × 25 cm, 5 µm, manufacturer Phenomenex.

Table of Contents*

PHARMACOPEIAL FORUM VOL. 32 NO. 5 SEPT.–OCT. 2006

* The *USP–NF* (*USP 30–NF 25*), the *Supplement* (*Supp*), or the *Interim Revision Announcement* (*IRA*) for which the revision proposal is targeted is shown in parentheses next to each proposed item.

THE JOURNAL OF STANDARDS DEVELOPMENT AND OFFICIAL COMPENDIA REVISION

Please address comments on *PF* content to Executive Secretariat
USP–NF, 12601 Twinbrook Pkwy.,
Rockville, MD 20852

Telephone: 1-301-816-8345
Fax: 1-301-816-8373
http://www.usp.org

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI),* in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences.*

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

Printed in USA by Port City Press, Baltimore, Maryland

ISSN: 0363-4655

Moving?
Our subscribers' records and publication labels are computer-generated. Please send your new address, and your latest label, or an exact copy of it, to: USPC, *PF* Customer Service Dept., 12601 Twinbrook Parkway, Rockville, MD 20852.
Fax: (301) 816-8148.

STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum* (*PF*), for the development of official pharmaceutical standards.

USP publishes *Pharmacopeial Forum* (*PF*) bimonthly as the working vehicle of the USP Council of Experts. *PF* provides interested parties an opportunity to review and comment as the Council of Experts develops or revises standards for the *United States Pharmacopeia* and the *National Formulary* (*USP–NF*).

PF includes the following:

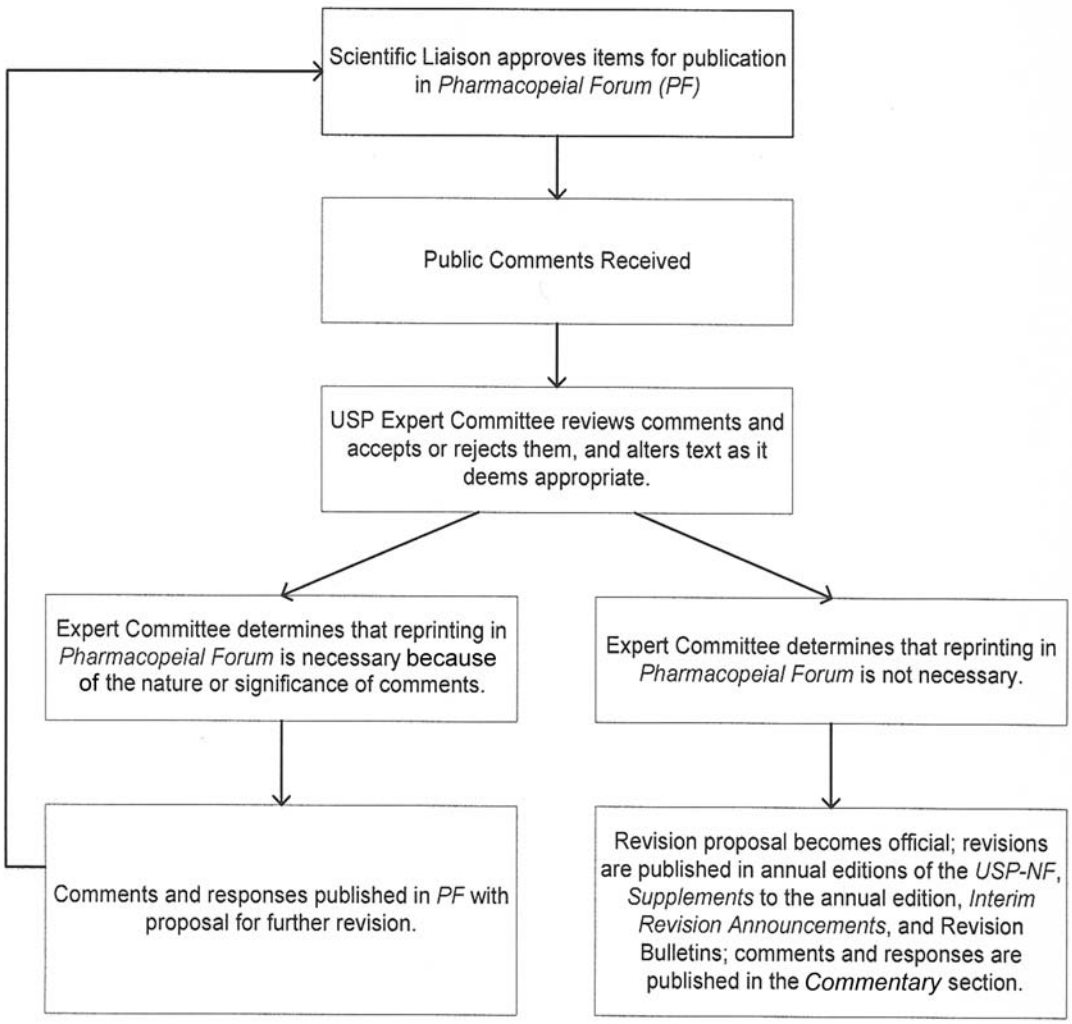
1. Potential revisions—entirely new standards, revision ideas, and drafts not yet targeted for official adoption (*Pharmacopeial Previews*)
2. Proposed revisions—new or revised standards targeted for official adoption (*In-Process Revision*)
3. Adopted revisions—new or revised standards that become official and binding before the publication of the next *USP–NF* or *Supplement* (*Interim Revision Announcement*)

USP welcomes comments and data on potential, proposed, or official standards.* Comments, along with USP's responses, will be published either in *PF Briefings*, the *Commentary* section of *PF*, the *Commentary* section of *Supplements* to *USP–NF*, or the *Commentary* section of *USP–NF*.

* If you are not immediately able to submit comments but you intend to do so, please notify USP by using the Intent to Comment form provided before the section *Chromatographic Reagents Used in USP–NF and PF*.

The chart below shows the public review and comment process and its relationship to standards development.

Public Review and Comment Process for *USP-NF* Standards Development



Questions on the process should be addressed to Director, Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: execsec@usp.org).

HOW TO USE *PF*

This section provides descriptions of the various parts of *PF*. It also includes *Committee Designations* and the *Staff Directory*.

The content of the different sections of *PF* is briefly described below. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a *Request for Revision* is available in the *Guideline for Submitting Requests for Revision to the USP–NF* on the USP website (www.usp.org/USPNF/submitMonograph/subGuide.html).

Proposed and Adopted Revisions to the *USP–NF*

Section	Content	How Readers Can Respond
Pharmacopeial Previews Early ideas for revisions	•BRIEFING: Scientific rationale for potential inclusion or change. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •Potential revisions not yet targeted for official adoption that require a longer public review and comment process because of issues such as: — the controversial nature of an item; — the application of new technologies that require further study; and — articles produced by multiple sources.	Review drafts and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview.*
In-Process Revision Revisions targeted for adoption	•BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see *Standards Development*). New or revised text is marked with symbols (■ or ● or ▲) to specify the tentative earliest date on which the revision would be officially adopted.	Review material and send comments promptly to USP staff liaison (see the *Staff Directory*). Guidelines on how to comment are found at the end of the *Policies and Announcements* section.
Harmonization Items the Pharmacopeial Discussion Group (PDG) is working to harmonize internationally	•BRIEFING: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. The stage determines whether an item appears under *Pharmacopeial Previews* or under *In-Process Revision,* both separate sections of *Harmonization.* •For *In-Process Revision,* new or revised text is marked with symbols (■) to specify the tentative, earliest date on which the revision would be officially adopted.	Review material and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview* or *In-Process Revision.*
Interim Revision Announcement Adopted standards	Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols ●.	Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance.
Pending Proposals	In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *PF* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in either the *USP–NF*, its supplements, or an *IRA*. Those items that have not yet been adopted are still pending.	Review items to track pending proposals.
Canceled Proposals	Canceled proposals are items that were published in *PF* and were pending, but have since been canceled. Note that canceled proposals may be republished to be considered in the future for adoption into the *USP–NF.*	Review items to track canceled proposals.

Other Sections

Committee Designations
Names of the committees (composed of volunteer scientific experts) that USP staff work with on the development of standards.

Staff Directory
Names of all USP scientific staff liaisons with contact information.

Policies and Announcements
- General scientific and policy issues affecting *USP–NF* standards and processes
- Update on standards-related issues being considered by USP
- Where to find summaries of meetings of the Council of Experts
- Guidelines on how to comment
- Publication and comment schedules

Stimuli to the Revision Process
- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

Nomenclature
- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the *USP Dictionary of USAN and International Drug Names*
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

Index
Cumulative directory for the content of all issues of *PF* beginning with *PF* 32(1).

Reference Standards Catalog
List of official USP Reference Standards specified in *USP–NF*, along with availability and ordering information.

Chromatographic Reagents Used in USP–NF and Pharmacopeial Forum
Update of chromatographic reagents based on the proposals published in this issue of *PF*.

POLICIES AND ANNOUNCEMENTS

This section includes information about general scientific and policy issues that may have an impact on *USP–NF* standards and processes and announcements about issues being considered by USP. This section also includes publication and comment schedules.

***USP 30–NF 25* TO BE PRINTED AS A THREE-VOLUME SET.** USP is pleased to announce that the *USP–NF* will now be printed as a three-volume set because of the increase in content which no longer fits into one volume. *USP 30–NF 25* will be the first edition to be printed as three volumes.

- Volume 1 includes Front Matter (Mission and Preface, People, Collaborators, Members, Preambles [formerly called Appendices], Admissions/Annotations, and Commentary). It also includes USP General Notices, General Chapters, Dietary Supplement Chapters, Reagents, Reference Tables, Dietary Supplement Monographs, *NF* General Notices, Excipients, and *NF* Monographs.
- Volume 2 includes *USP* monographs A–L.
- Volume 3 includes *USP* monographs M–Z.

Each volume includes the General Notices, the full Table of Contents, the General Chapters Table of Contents, and full Index. The new format will be easier to use and will allow for printing on a heavier weight of paper.

IMPLEMENTATION PERIOD EXTENDED FOR UPCOMING OFFICIAL REVISIONS TO THE *USP–NF*. To provide additional time to adopt revisions made to the compendia, USP is pleased to announce that effective beginning with the publication of *USP 30–NF 25,* implementation periods for revisions to official text in *United States Pharmacopeia–National Formulary (USP–NF)* and its *Supplements* are being extended. This change is a response to stakeholder requests (see the *Pharmacopeial Forum* [*PF* 31(2)] *Stimuli* article, ''The USP Revision Process: Recommendations for Enhancements''). As a result of this change, users will have six months from the publication date to implement new official texts as opposed to the previous 60-day period. The complete revised Publication Schedule for *USP 30–NF 25* reflecting this new 6-month implementation period is outlined below.

Publication Schedule for *USP 30–NF 25*

***USP–NF* Publication**	**Publication Date**	**Official Date**
USP–NF (Book)	November 2006	May 1, 2007
Supplement One	February 2007	August 1, 2007
Supplement Two	June 2007	December 1, 2007

Users may implement the newly official texts prior to the official date and the use becomes mandatory on the official date.

Please direct any comments or questions on this topic to Beryl Voigt, Director, Executive Secretariat (301-816-8155 or execsec@usp.org).

COORDINATION OF *PF* SUBMISSIONS AND NEW USP REFERENCE STANDARDS. USP recently announced a new process in which revisions and new monographs will not be published as official standards until the required USP Reference Standards are available for purchase [see *Policies and Announcements, PF* 32(3)]. We are pleased to announce another process change to better synchronize the availability of USP Reference Standards and the adoption of new documentary standards in the *USP–NF.* Effective March 28, 2006, any revision proposal involving the use of a first-time USP Reference Standard or new use of an existing USP Reference Standard will be scheduled for publication in the *PF* only after a suitable reference standard bulk candidate has been received by USP. The timing of this new process affects regular revisions (not new monographs/general chapters) submitted to *PF* 32(4) and all revisions and new monographs/general chapters beginning with *PF* 32(5). While we acknowledge that this may cause a brief delay in publication of some proposed revisions and new monographs, we believe this process change is a benefit to USP customers and will ultimately lead to better public standards. It is anticipated that there may be some exceptions to this new process on a case-by-case basis.

Please direct any comments or questions on this topic to Beryl Voigt, Director, Executive Secretariat (301-816-8155 or execsec@usp.org).

REVISION BULLETINS. In accordance with Section 9.01 of the Rules and Procedures of the Council of Experts, a *Revision Bulletin* is an official publication of the United States Pharmacopeia and the National Formulary. *Revision Bulletins* are posted on USP's website and sent to affected manufacturers via mail and e-mail, and are used to make revisions effective immediately when the need arises.

ALENDRONIC ACID TABLETS: NOTICE OF POSTPONEMENT. In accordance with Section 9.06(c) of the Rules and Procedures of the Council of Experts, the USP Nomenclature Expert Committee has postponed the official date of the title for this new monograph, which was published on page 64 of *USP 28–NF 23,* from July 1, 2006, to May 1, 2008. The postponement is intended to provide additional time for product label changes to be completed and for healthcare practitioners and consumers to become familiar with the terminology. Use of this title has been permitted since January 1, 2005, when the monograph first became official, but will not become mandatory until May 1, 2008, the official date of *USP 31–NF 26*.

The Salt Nomenclature Policy, on which this monograph title is based, was published for public review and comment in the July–August 2006 issue of *Pharmacopeial Forum* as part of the revised general information chapter *Nomenclature* ⟨1121⟩. The postponement is effective immediately and also appears in this *PF* in the *Fifth Interim Revision Announcement* to *USP 29–NF 24*. This postponement has been approved by

the Nomenclature Expert Committee and Chair of the Council of Experts in accordance with Section 9.06(c) of the Rules and Procedures of the Council of Experts.

Should you have any questions, please contact Dr. W. Larry Paul, Scientific Fellow and Scientific Liaison to the Nomenclature Expert Committee (301-816-8331 or wlp@usp.org).

AMIFOSTINE FOR INJECTION: NOTICE OF REVISION. In accordance with Section 9.06(c) of the Rules and Procedures of the Council of Experts, the USP Cardiovascular Expert Committee has made official the following revision to this monograph.

Delete the word ''lyophilized'' from the product Definition in the monograph.

This revision is effective immediately and also appears in the *Fifth Interim Revision Announcement* in this *PF*. This revision is intended to accommodate and provide flexibility for marketed products to be manufactured without the process of lyophilization while still meeting the product specifications.

Should you have any questions, please contact Dr. S. Ramakrishna, Scientist and Scientific Liaison to the Monograph Development—Cardiovascular Expert Committee (301-816-8349 or syk@usp.org).

IMMEDIATE IRA COMMENTARY

INDOCYANINE GREEN—As the current Definition does not adequately describe the article of commerce, the rubric is being revised from ''not less than 94.0 percent and not more than 105.0 percent of $C_{43}H_{47}N_2NaO_6S_2$, calculated on the dried basis'' to ''not less than 89.0 percent and not more than 100.0 percent of $C_{43}H_{47}N_2NaO_6S_2$, calculated on the dried basis.''

Please direct any comments or questions to Radhakrishna S. Tirumalai, Ph.D., Scientist and Scientific Liaison to the General Toxicity and Medical Device Biocompatibility Expert Committee (301-816-8339 or rst@usp.org).

NITROFURANTOIN CAPSULES—The *Nitrofurantoin Capsules* test for *Dissolution* is being revised to include an additional dissolution procedure (*Test 3*) to provide appropriate standards for an FDA-approved product.

Please direct any comments or questions to Margareth Marques, Ph.D., Senior Scientist (301-816-8106 or mrm@usp.org) or Behnam Davani, Ph.D., M.B.A., Senior Scientist (301-816-8394 or bd@usp.org).

CATALOG TO BE REMOVED FROM *PHARMACOPEIAL FORUM* PRINT PUBLICATION. Starting with *Pharmacopeial Forum* 33(1), the *USP Catalog* will no longer be included in the back of the publication. This change was made to reduce the bulk of the publication and, therefore, increase ease of handling and use.

The *USP Catalog* is still available in online and stand-alone print versions. Online bi-monthly and daily catalogs can be accessed at www.usp.org/referenceStandards/catalog.html. To receive the *USP Catalog* in print (via postal mail) along with monthly e-mail alerts that will keep you informed about new Reference Standards, availability, and current lots, send an e-mail to marketing@usp.org or call 301-816-8237.

USP ANNUAL SCIENTIFIC MEETING 2006. USP will host its third Annual Scientific Meeting, September 26–29, 2006, at the Marriott Denver City Center, Denver, Colorado. This year's topics include the following:

- Track I: Biologics and Biotechnology
- Track II: Reference Standards
- Track III: Dietary Supplements
- Track IV: Excipients
- Track V: USP—Working for You
- Track VI: Impurities in Drug Substances and Products
- One Day Track: Chromatography
- Special Topic: International Quality and Performance Topics

Many members of USP's Council of Experts' Expert Committees are presenting at the various track sessions and attending the meeting. USP anticipates that the collegial exchange of comments during session discussions and networking events will provide Expert Committees with a better understanding of the varied perspectives of USP's many audiences.

This year's Annual Scientific Meeting also will feature an expanded exhibit program and a spouse/guest program.

For more information and to register, go to www.usp.org/conferences, call 301-816-8134, or e-mail conferences@usp.org.

PHARMACOPEIAL EDUCATION COURSES. USP's Pharmacopeial Education courses offer specialized instruction for chemists, other scientists, and professionals in the pharmaceutical and allied industries. USP scientists who play a key role in establishing official USP standards teach these courses and provide expert insights on the practical applications of official test procedures and best practices in using the *USP–NF* and other USP resources. The courses also give participants an opportunity to learn how to get involved in USP's standards-setting processes and the benefits of participating in standards development. Courses offered in 2006 are listed below. For more information and to register, visit www.usp.org. To discuss how USP can bring courses to a location of your choice or design a custom course package for you, call 301-816-8237, or e-mail PharmacopeialEducation@usp.org.

Calendar of Forthcoming Pharmacopeial Education Courses as of September 1, 2006

Date	Name of Course	Location	Price
26-Sep-06	Effectively Using the *USP–NF*—Sessions I and II	Denver, CO (USP Annual Scientific Meeting)	$595
26-Sep-06	Fundamentals of Microbiological Testing	Denver, CO (USP Annual Scientific Meeting)	$595
3-4 Oct-06	Fundamentals of Dissolution—Lecture and Laboratory	North Brunswick, NJ (with Distek)	$1,695
10-11 Oct-06	Fundamentals of Dissolution—Lecture and Laboratory (in English with assistance for German)	Basel, Switzerland (with Sotax)	[1]
12-13 Oct-06	Fundamentals of Dissolution—Lecture and Laboratory (in English with assistance for French)	Basel, Switzerland (with Sotax)	[1]
18-Oct-06	Effectively Using the *USP–NF*—Sessions I and II	Brussels, Belgium	$595
19-Oct-06	Analytical Method Validation	Brussels, Belgium	$595
7-Nov-06	Analytical Method Validation	Milan, Italy	[2]
8-9 Nov-06	Fundamentals of Dissolution—Lecture and Laboratory (in English with assistance for Italian)	Milan, Italy (with Sotax)	[1]
14-15 Nov-06	Fundamentals of Dissolution—Lecture and Laboratory (in English with assistance for Italian)	Rome, Italy (with Sotax)	[1]

Fax: +41 61 316 30 11
E-mail: ap@usp.org

VISIT THE USP WEB SITE AT ⟨http://www.usp.org⟩. Various resources related to Pharmacopeial standards are presented, including highlights from *PF*.

INTERNATIONAL CORRESPONDENCE. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia, with a copy to USP, for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows:

Technical Secretariat of the European
Pharmacopoeia Commission
B.P. 907
F 67029 Strasbourg Cedex 1
France

NAKASHIMA Nobumasa
Evaluation and Licensing Division
Pharmaceutical and Medical Safety Bureau
Ministry of Health, Labour and Welfare, Japan
Tel. +81-3-3595-2431, Fax +81-3-3597-9535
E-mail: nakashima-nobumasa@mhlw.go.jp

HOW TO SUBMIT COMMENTS. The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. Submissions concerning a particular item that has appeared in an issue of *PF* should be submitted to the appropriate USP scientific staff liaison identified at the end of the *Briefing* accompanying each item. To submit comments and data to a liaison, use the e-mail address and telephone numbers listed in the *Staff Directory* included in every *PF*.

Please note that *USP–NF* is being published in an annual edition with one main book and two *Supplements* a year. In addition, the schedule provided below will repeat every year so that users will know what to expect and become familiar with the deadlines.

For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or FAX number 301-816-8373.

***PHARMACOPEIAL FORUM* PUBLIC REVIEW AND COMMENT PERIOD DEADLINES.** The full year's listing of comment period deadlines, including the targeted official publications, appears in the table below. In accordance with the Rules and Procedures of the 2005–2010 Council of Experts*, USP has implemented a 90-day comment period by providing a deadline for each issue of *PF* unless otherwise stated in the individual briefing.

Pharmacopeial Forum	Comment Deadline	Targeted Official Publication	Publication Date	Official Date
PF 32(4)	October 16, 2006	*USP 30–NF 25 2nd Supplement*	June 2007	December 2007
PF 32(5)	December 15, 2006			
PF 32(6)	February 15, 2007	*USP 31–NF 26*	November 2007	May 2008
PF 33(1)	April 16, 2007			
PF 33(2)	June 15, 2007	*USP 31–NF 26 1st Supplement*	February 2008	April 2008
PF 33(3)	August 15, 2007			
PF 33(4)	October 15, 2007	*USP 31–NF 26 2nd Supplement*	June 2008	December 2008
PF 33(5)	December 15, 2007			

All official revisions are published in the annual edition or *Supplements* to *USP–NF* (twice yearly). Between these publications, official revisions are published in *PF* in the *Interim Revision Announcement;* these revisions are also incorporated in the upcoming *Supplement.* The official publication in which an *IRA* is incorporated will depend upon publication deadlines. The 5th *IRA* and the 6th *IRA* will not appear until *Supplement 1*. See table below. The electronic version of *USP–NF* is updated as each *Supplement* becomes available and, therefore, contains all official text up to and including the contents of the latest *Supplement.* The new table below outlines the publications and their release and official dates, and the book or supplement which supersedes them.

* ***Section 9.04(b) of the Rules and Procedures of the 2005–2010 Council of Experts***
A period of at least ninety (90) days from the date of publication will be allowed for public review and comment. The time allowed for public comments shall be noted in the publication in the PF. For good cause shown, the Chairperson may alter the time specified.

Publication Schedules

Publication	Release Date	Official Date	Superseded by
4th *IRA* [*PF* 32(4)]	July 1, 2006	Aug. 1, 2006	*USP 30–NF 25*
5th *IRA* [*PF* 32(5)]	Sept. 1, 2006*	Oct. 1, 2006*	*1st Supplement*
6th *IRA* [*PF* 32(6)]	Nov. 1, 2006*	Dec. 1, 2006*	*1st Supplement*
USP 30–NF 25	Nov. 1, 2006*	May 1, 2007*	*1st Supplement*
1st *IRA* [*PF* 33(1)]	Jan. 1, 2007*	Feb. 1, 2007*	*2nd Supplement*
1st Supplement	Feb. 1, 2007*	Aug. 1, 2007*	*2nd Supplement*
2nd *IRA* [*PF* 33(2)]	Mar. 1, 2007*	Apr. 1, 2007*	*2nd Supplement*
3rd *IRA* [*PF* 33(3)]	May 1, 2007*	June 1, 2007*	*USP 31–NF 26*
2nd Supplement	June 1, 2007*	Dec. 1, 2007*	*USP 31–NF 26*
4th *IRA* [*PF* 33(4)]	July 1, 2007*	Aug. 1, 2007*	*USP 31–NF 26*
5th *IRA* [*PF* 33(5)]	Sept. 1, 2007*	Oct. 1, 2007*	*1st Supplement to USP 31–NF 26*
6th *IRA* [*PF* 33(6)]	Nov. 1, 2007*	Dec. 1, 2007*	*1st Supplement to USP 31–NF 26*
USP 31–NF 26	Nov. 1, 2007*	May 1, 2008*	*1st Supplement to USP 31–NF 26*

*Tentative

PRIORITY NEW MONOGRAPH ITEMS. USP is seeking monographs for the following drug substances and drug products that are or soon will be off patent and thus are of the highest priority. USP also is seeking monographs for the excipients listed below. Monographs are marked received upon receipt of monograph proposal. Received monographs are removed from this list upon publication in *Pharmacopeial Forum*. (This list has been updated as of July 5, 2006.) For additional information, contact Karen A. Russo, Ph.D., kar@usp.org. Monograph sponsors should consult USP's *Guideline for Submitting Requests for Revision to the USP–NF.*

Noncomplex Actives (Drug Substances)

Acarbose	Alatrofloxacin Mesylate	Alfuzosin
Allopurinol Sodium	Aminopromazine Fumarate	Aminopterin Sodium
Anagrelide Hydrochloride	Arsenic Trioxide	Azelaic Acid
Balsalazide Disodium	Bentoquatam	Bepridil Hydrochloride
Bivalirudin	Cabergoline	Calcipotriene
Calcium Trisodium Pentetate	Calfactant	Candesartan Cilexetil
Carmustine ***(Received)***	Cefdinir ***(Received)***	Cefditoren Pivoxil
Ceftibuten	Cetrorelix	Cevimeline
Chloroxine	Colfosceril	Cytarabine Liposome
Dalfopristin	Dapirazole Hydrochloride	Desirudin
Desonide ***(Received)***	Dexrazoxane	Difloxacin Hydrochloride
Docosanol	Entacapone	Epoprostenol Sodium ***(Received)***
Erythromycin Phosphate	Erythromycin Thiocyanate	Esmolol
Esomeprazole Magnesium ***(Received)***	Estazolam	Estradiol Benzoate
Estramustine Phosphate Sodium	Ethanolamine Oleate	Etomidate
Etoposide Phosphate	Exemestane	Felbamate
Flavoxate Hydrochloride	Fluoromethane F 18	Foscarnet Sodium
Fosfomycin Tromethamine	Gadobenate Dimeglumine	Gadopentetic Acid
Galantamine Hydrobromide ***(Received)***	Gallium Nitrate	Ganirelix
Glyceryl Aminobenzoate	Granisetron	Halobetasol Propionate
Haloperidol Decanoate ***(Received)***	Hydrocodone Polistirex	Ibandronate Sodium
Imipramine Pamoate	Imiquimod	Irinotecan
Isosulfan Blue	Itraconazole	Lamotrigine ***(Received)***

Noncomplex Actives (Drug Substances) *(Continued)*

Latanoprost	Lawsone	Levetriacepam
Levobetaxolol	Levomethadyl Acetate	Lomustine
Lopinavir	Metipranolol Hydrochloride	Midazolam Hydrochloride
Mifepristone	Miglitol	Misoprostol ***(Received)***
Mivacurium	Moexipril	Nalbuphine Hydrochloride
Nalmefene Hydrochloride	Nateglinide ***(Received)***	Nedocromil Sodium
Nicardipine Hydrochloride	Nilutamide	Nisoldipine
Olopatadine	Olsalazine Sodium ***(Received)***	Orbifloxacin ***(Received)***
Orlistat ***(Received)***	Oxcarbazepine ***(Received)***	Pantoprazole Sodium ***(Received)***
Pemoline	Pentamidine Isethionate	Piperonyl Butoxide
Pirbuterol Acetate	Poractant Alpha	Proguanil
Quetiapine Fumarate ***(Received)***	Rose Bengal	Salmeterol Xinafoate
Sertraline Hydrochloride ***(Received)***	Sodium Phenylbutyrate	Sterile Methotrexate Sodium
Streptozocin	Sulfacytine	Tacrolimus
Terbinafine Hydrochloride	Terconazole	Tiludronate Disodium
Tiopronin	Tranexamic Acid ***(Received)***	Trimipramine Maleate ***(Received)***
Trovafloxacin Mesylate	Voriconazole	Zinc Tridosium Pentetate

Noncomplex Actives (Drug Products)

Abacavir Sulfate, Lamivudine, and Zidovudine Tablets	Acarbose Tablets	Acetaminophen, Butalbital, Caffeine, and Codeine Phosphate Capsules
Acetaminophen, Clemastine Fumarate, and Pseudoephedrine Hydrochloride Tablets	Acetazolamide Extended-Release Capsules	Albuterol Extended-Release Tablets
Albuterol for Inhalation	Albuterol Inhalation Aerosol	Alendronate Sodium Oral Solution
Alfuzosin Tablets	Allopurinol for Injection	Alprazolam Extended-Release Tablets
Alprostadil Urethral Suppository	Aminopromazine Fumarate and Neomycin Sulfate Tablets	Aminopromazine Fumarate Injection
Aminopromazine Fumarate Tablets	Aminopterin Sodium Tablets	Amlodipine and Benazepril Hydrochloride Capsules
Amphotericin B Injection	Anagrelide Hydrochloride Capsules	Arsenic Trioxide Injection
Atovaquone and Proguanil Hydrochloride Tablets	Atovaquone Tablets	Auranofin Capsules
Azatadine Maleate and Pseudoephedrine Sulfate Extended-Release Tablets	Azelaic Acid Cream	Azithromycin for Injection
Azithromycin Tablets	Baclofen Injection	Balsalazide Disodium Capsules
Beclomethasone Dipropionate Inhalation Aerosol	Beclomethasone Dipropionate Nasal Suspension	Bentoquatam Topical Suspension
Benzocaine and Cetylpyridinium Chloride Lozenges	Benzocaine and Menthol Lotion	Benzphetamine Hydrochloride Tablets
Bepridil Tablets	Bicalutamide Tablets	Bivalirudin Injection
Brompheniramine Maleate, Dextromethorphan Hydrobromide, and Pseudoephedrine Hydrochloride Oral Solution	Budesonide Inhalation Aerosol	Bupivacaine and Lidocaine Hydrochlorides Injection
Buprenorphine Hydrochloride Injection	Butalbital and Acetaminophen Capsules	Butalbital and Acetaminophen Tablets
Calcipotriene Cream	Calcipotriene Ointment	Calcipotriene Topical Solution
		Cabergoline Tablets
Calcitriol Capsules	Calcitriol Oral Solution	Calcium Acetate Capsules
Calcium Trisodium Pentetate Injection	Calfactant Intratracheal Suspension	Carbidopa and Levodopa Extended-Release Tablets
Carbidopa and Levodopa Tablets for Oral Suspension ***(Received)***	Carbidopa, Levodopa, and Entacapone Tablets	Carmustine for Injection ***(Received)***
Carmustine Implant	Carvedilol Tablets ***(Received)***	Cefdinir Tablets
Cefditoren Pivoxil Tablets	Ceftibuten Capsules	Ceftibuten for Oral Suspension

Noncomplex Actives (Drug Products) *(Continued)*		
Ceftiofur Hydrochloride Oral Suspension	Cetirizine Hydrochloride Oral Solution	Cetirizine Hydrochloride Tablets ***(Received)***
Cetrorelix Injection	Cevimeline Hydrochloride Capsules	Chloroxine Cream
Chlorpromazine Hydrochloride Extended-Release Capsules	Choline and Magnesium Salicylates Oral Solution	Choline and Magnesium Salicylates Tablets
Choline Salicylate Oral Solution	Ciclopirox Shampoo	Ciclopirox Topical Gel
Ciclopirox Topical Solution	Cilostazol Tablets ***(Received)***	Cimetidine Oral Solution
Ciprofloxacin Hydrochloride and Hydrocortisone Otic Suspension	Ciprofloxacin Otic Solution	Citalopram Hydrobromide Oral Solution
Citric Acid, Gluconolactone, and Magnesium Carbonate Irrigation	Cladribine Injection	Clemastine Fumarate Syrup
Clobetasol Propionate Gel	Clonazepam Orally-Disintegrating Tablets	Clorazepate Dipotassium Capsules
Clorazepate Dipotassium Extended-Release Tablets	Clotrimazole and Betamethasone Dipropionate Lotion	Colestipol Hydrochloride Tablets
Colfosceril and Tyloxapol Suspension	Compound Undecylenic Acid Cream	Compound Undecylenic Acid Topical Powder
Conjugated Estrogens and Medroxyprogesterone Acetate Tablets	Cromolyn Sodium Nasal Solution	Cyclosporine Modified Capsules
Cyclosporine Modified Oral Solution	Cyclosporine Ointment	Cyclosporine Topical Solution
Cysteamine Bitartrate Capsules	Cytarabine Liposome Injection	Dalfopristin and Quinupristin Injection
		Dantrolene Sodium Oral Suspension
Dapiprazole for Ophthalmic Solution	Desirudin for Injection	Desonide Cream
Dexrazoxane for Injection	Dextroamphetamine Sulfate Extended-Release Capsules	Dextromethorphan Polistirex Extended-Release Oral Suspension
Diazepam Injectable Emulsion	Diclofenac Sodium Ophthalmic Solution	Diethylpropion Hydrochloride Extended-Release Tablets
Difenoxin and Atropine Tablets	Difloxacin Hydrochloride Tablets	Dihydroergotamine Mesylate Metered Spray
Diltiazem Malate Extended-Release Tablets	Dinoprostone Vaginal Suppositories	Diphenhydramine Hydrochloride and Acetaminophen Tablets
Divalproex Sodium Delayed-Release Capsules	Dorzolamide and Timolol Ophthalmic Solution	Dorzolamide Ophthalmic Solution
Doxacurium Chloride Injection	Doxepin Hydrochloride Cream	Doxycycline Oral Gel
Econazole Nitrate Cream	Edrophonium Chloride and Atropine Sulfate Injection	Enalapril Maleate and Diltiazem Malate Extended-Release Tablets
Enalapril Maleate and Felodipine Extended-Release Tablets	Enalaprilat Injection	Entacapone Tablets
Ephedrine Sulfate and Guaifenesin Tablets	Epoprostenol for Injection	Epoprostenol Injection
Esmolol Hydrochloride Injection	Esomeprazole Magnesium Capsules	Estazolam Tablets
Estramustine Phosphate Sodium Capsules	Ethanolamine Oleate Injection	Etidronate Disodium Injection Concentrate
Etomidate Injection	Exemestane Tablets	Famotidine Orally Disintegrating Tablets
Felbamate Oral Suspension	Felbamate Tablets	Fentanyl Lozenges
Fentanyl Transdermal System ***(Received)***	Ferrous Fumarate and Docusate Sodium Extended-Release Capsules	Flavoxate Hydrochloride Tablets
Fluconazole Injection ***(Received)***	Fluconazole Tablets	Flunisolide Inhalation Aerosol
Flunisolide Nasal Spray	Fluocinolone Acetonide Shampoo	Fluorescein Sodium Ophthalmic Solution
Fluorometholone Ointment	Fluticasone Propionate Cream ***(Received)***	Fluticasone Propionate Inhalation Powder
Fluticasone Propionate Ointment ***(Received)***	Fluticasone Propionate Pressurized Inhaler	Foscarnet Sodium Injection
Fosfomycin for Oral Solution	Gabapentin Oral Solution	Gabapentin Tablets ***(Received)***
Gadobenate Dimeglumine Injection	Galantamine Tablets ***(Received)***	Gallium Nitrate Injection
Ganciclovir Capsules	Ganirelix Acetate Injection	Gatifloxacin Injection
Gatifloxacin Tablets	Gentamicin Sulfate Oral Solution	Gentamicin Sulfate Soluble Powder
Glimepiride Tablets ***(Received)***	Glipizide Extended-Release Tablets	Granisetron Injection
Granisetron Tablets	Guaifenesin and Salts of Dextromethorphan and Pseudoephedrine Oral Solution	Guaifenesin and Pseudoephedrine Hydrochloride Extended-Release Tablets
Guanidine Hydrochloride	Guanidine Hydrochloride Tablets	Halobetasol Propionate Cream
Halobetasol Propionate Ointment	Haloperidol Decanoate Injection	Haloperidol Lactate Injection
Haloperidol Lactate Oral Concentrate	Hydralazine Hydrochloride and Hydrochlorothiazide Capsules	Hydrochlorothiazide Capsules
Hydrochlorothiazide Oral Solution Concentrate	Hydrocodone Bitartrate and Acetaminophen Oral Solution	Hydrocodone Bitartrate and Aspirin Tablets

Noncomplex Actives (Drug Products) *(Continued)*

Hydrocodone Bitartrate and Guaifenesin Oral Solution	Hydrocodone Bitartrate and Homatropine Methylbromide Syrup	Hydrocodone Bitartrate and Homatropine Methylbromide Tablets
Hydrocortisone Acetate Dental Paste	Hydrocortisone Acetate Rectal Foam Aerosol	Hydrocortisone Butyrate Lotion
Hydroflumethiazide and Reserpine Tablets	Hydromorphone Hydrochloride Oral Solution	Hydroquinone Lotion
Ibandronate Sodium Tablets	Ibuprofen Capsules	Idarubicin Hydrochloride Injection
Imipramine Pamoate Capsules	Imiquimod Topical Cream	Ipratropium Bromide Inhalation Aerosol
Ipratropium Bromide Inhalation Solution	Irinotecan Hydrochloride Injection	Isosulfan Blue Injection
Isradipine Extended-Release Tablets	Itraconazole Injection	Itraconazole Oral Solution
Ketoconazole Cream	Ketoconazole Shampoo	Ketoprofen Capsules ***(Received)***
Ketoprofen Extended-Release Capsules	Ketoprofen Tablets	Ketotifen Fumarate
Ketotifen Fumarate Ophthalmic Solution	Lactic Acid Lotion	Lamivudine Tablets
Latanoprost Ophthalmic Solution	Leucovorin Calcium for Injection	Levetriacepam Tablets
Levobetaxolol Ophthalmic Suspension	Levocabastine Ophthalmic Suspension	Levofloxacin Solution
Levomethadyl Acetate Hydrochloride Oral Concentrate	Lincomycin Hydrochloride and Spectinomycin Sulfate Soluble Powder	Liothyronine Injection
Lisinopril and Hydrochlorothiazide Tablets	Lomustine Capsules	Lopinavir and Ritonavir Solution
Lopinavir Capsules	Lopinavir Solution	Loratadine and Pseudoephedrine Sulfate Extended-Release Tablets ***(Received)***
Loratadine Orally-Disintegrating Tablets	Losartan Potassium Tablets	Mefloquine Hydrochloride Tablets
Melphalan for Injection	Mesalamine Suppositories	Mesoridazine Besylate Concentrate
Metaraminol Bitartrate Injection	Methacholine Chloride for Inhalation Solution	Methadone Hydrochloride Oral Concentrate
Methocarbamol and Aspirin Tablets	Methoxsalen Softgels	Methyclothiazide and Deserpidine Tablets
Methylphenidate Hydochloride Chewable Tablets	Metipranolol Ophthalmic Solution	Metronidazole Capsules
Metronidazole Cream	Metronidazole Extended-Release Tablets	Metronidazole Hydrochloride for Injection
Metronidazole Lotion	Miconazole Nitrate Topical Aerosol	Midazolam Hydrochloride Injection ***(Received)***
Mifepristone Tablets	Miglitol Tablets	Milrinone Injection
Misoprostol Tablets ***(Received)***	Mivacurium In Dextrose Injection	Mivacurium Injection
Moexipril Hydrochloride and Hydrochlorothiazide Tablets	Moexipril Hydrochloride Tablets	Molindone Hydrochloride Oral Solution
Morphine Sulfate for Injection Concentrate	Morphine Sulfate Oral Solution	Morphine Sulfate Oral Solution Concentrate
Morphine Sulfate Tablets	Mycophenolate Mofetil Capsules	Mycophenolate Mofetil Oral Solution
Mycophenolate Mofetil Tablets	Nalbuphine Hydrochloride Injection	Nalmefene Hydrochloride Injection
Naphazoline Hydrochloride and Pheniramine Maleate Ophthalmic Solution	Naproxen Extended-Release Tablets	Nateglinide Tablets
Nedocromil Sodium Inhalation Aerosol	Neomycin Sulfate Oral Powder	Nicardipine Hydrochloride Capsules
Nilutamide Tablets	Nimodipine Capsules	Nisoldipine Extended-Release Tablets
Nitroglycerin Solution in Acrylic Adhesive	Nizatidine Tablets	Ofloxacin in Dextrose Injection
Ofloxacin Injection	Ofloxacin Tablets ***(Received)***	Olopatadine Ophthalmic Solution
Olsalazine Sodium Capsules	Ondansetron Tablets	Orbifloxacin Tablets ***(Received)***
Orlistat Capsules ***(Received)***	Orphenadrine Citrate Extended-Release Tablets	Orphenadrine Citrate, Aspirin, and Caffeine Tablets
Oxcarbazepine Suspension	Oxcarbazepine Tablets	Oxiconazole Cream
Pantoprazole Sodium for Injection	Paroxetine Hydrochloride Extended-Release Tablets	Pemirolast Potassium Ophthalmic Solution
Pantoprazole Sodium Tablets	Paroxetine Oral Suspension	
Pemoline Tablets	Penicillin G Potassium Tablets for Oral Solution	Pentaerythritol Tetranitrate Extended-Release Capsules
Pentaerythritol Tetranitrate Extended-Release Tablets	Pentamidine Isethionate for Inhalation	Pentamidine Isethionate for Injection
Pentazocine Hydrochloride and Acetaminophen Tablets	Phendimetrazine Tartrate Extended-Release Capsules	Phenobarbital Capsules
Phentermine Resin Complex	Phentermine Resin Complex Capsules	Phenylephrine Hydrochloride and Chlorpheniramine Maleate Extended-Release Capsules

Noncomplex Actives (Drug Products) *(Continued)*		
Phenylephrine Hydrochloride, Chlorpheniramine Maleate, and Acetaminophen Extended-Release Tablets	Pilocarpine Hydrochloride Ophthalmic Gel	Pilocarpine Hydrochloride Ophthalmic Ointment
Pilocarpine Hydrochloride Tablets	Piperonyl Butoxide and Pyrethrins Aerosol Foam	Pirbuterol Acetate Inhalation Aerosol
Poractant Alpha Supension	Porfimer Sodium for Injection	Povacrylate Solution
Povacrylate-Iodine Topical Solution	Povidone-Iodine Gauze	Povidone-Iodine Swabsticks
Povidone-Iodine Topical Aerosol Foam	Povidone-Iodine Vaginal Suppositories	Pramipexole Dihydrochloride Tablets
Prazosin Hydrochloride and Polythiazide Capsules	Prednisolone Sodium Phosphate Oral Solution	Prochlorperazine Maleate Extended-Release Capsules
Progesterone Capsules	Promethazine and Phenylephrine Hydrochlorides and Codeine Phosphate Syrup	Promethazine and Phenylephrine Hydrochlorides Syrup
Promethazine Hydrochloride and Codeine Phosphate Oral Solution	Promethazine Hydrochloride and Dextromethorphan Hydrobromide Syrup	Propafenone Hydrochloride Tablets
Pseudoephedrine Hydrochloride and Brompheniramine Maleate Extended-Release Tablets	Pseudoephedrine Hydrochloride and Naproxen Sodium Extended-Release Tablets	Pseudoephedrine Hydrochloride, Chlorpheniramine Maleate, and Codeine Phosphate Oral Solution
Pseudoephedrine Hydrochloride, Guaifenesin, and Codeine Phosphate Oral Solution	Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Extended-Release Tablets	Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Oral Solution
Pseudoephedrine Sulfate, Dexbrompheniramine Maleate, and Acetaminophen Extended-Release Tablets	Quinidine Sulfate Injection	Ramipril Capsules
Ranitidine Capsules	Rauwolfia Serpentina and Endroflumethiazide Tablets	Reserpine and Polythiazide Tablets
Rimantadine Hydrochloride Oral Solution	Risperidone Oral Solution	Risperidone Orally Disintegrating Tablets
Rivastigmine Tartrate Capsules	Rocuronium Bromide Injection	Rose Bengal Ophthalmic Solution
Rivastigmine Tartrate Oral Solution	Ropinirole Hydrochloride Tablets	
Rosiglitazone Maleate Tablets	Salicylic Acid and Sulfur Cleansing Lotion	Salicylic Acid and Sulfur Lotion
Salicylic Acid and Sulfur Shampoo	Salicylic Acid Cream	Salicylic Acid Ointment
Salmeterol Inhalation Aerosol	Salmeterol Xinafoate Inhalation Powder	Scopolamine Transdermal System
Selegiline Hydrochloride Capsules	Serpacwa Topical Cream	Sertraline Hydrochloride Oral Solution
Sibutramine Hydrochloride Capsules	Sodium Bicarbonate and Sodium Citrate for Oral Solution	Sodium Bicarbonate, Sodium Citrate, and Sodium Tartrate for Oral Suspension
Sodium Chlorophyllin Copper Complex Tablets	Sodium Iodide Injection	Sodium Phenylbutyrate Oral Powder
Sodium Phenylbutyrate Tablets	Sodium Phosphates for Oral Suspension	Sodium Phosphates Tablets
Sodium Salicylate and Sulfur Shampoo	Sterile Talc Aerosol	Streptozocin for Injection
Sucralfate Oral Suspension	Sulconazole Nitrate Cream	Sulfacetamide Sodium and Fluorometholone Ophthalmic Suspension
Sulfacetamide Sodium and Prednisolone Sodium Phosphate Ophthalmic Solution	Sulfacytine Tablets	Sulfanilamide Vaginal Cream
Sulfasalazine Oral Suspension	Sulisobenzone Lotion	Sumatriptan Injection
Sumatriptan Tablets	Tacrolimus Capsules	Tacrolimus Injection
Tacrolimus Ointment	Tamsulosin Hydrochloride Capsules	Technetium Tc 99m Teboroxime Injection
Tenofovir Disoproxil Fumarate Tablets	Terbinafine Hydrochloride Cream	Terbinafine Tablets
Terbinafine Topical Solution	Terconazole Vaginal Cream	Terconazole Vaginal Suppositories
Testosterone Transdermal System	Tetracycline Hydrochloride Periodontal Fiber	Theophylline Extended-Release Tablets
Tioconazole Vaginal Ointment	Tiopronin Tablets	Tolnaftate Topical Aerosol Solution
Topiramate Capsules	Topiramate Tablets	Torsemide Injection
Torsemide Tablets ***(Received)***	Trandolapril and Verapamil Hydrochloride Extended-Release Tablets	Trandolapril Tablets
Tranexamic Acid Injection	Tranylcypromine Sulfate	Tranylcypromine Sulfate Tablets
Tretinoin Capsules	Tretinoin Microsphere Gel	Triamcinolone Acetonide Nasal Suspension
Trifluridine Ophthalmic Solution	Trimetrexate for Injection	Trimipramine Maleate Capsules
Triprolidine and Pseudoephedrine Hydrochlorides and Codeine Phosphate Syrup	Trolamine Salicylate Cream	Trolamine Salicylate Gel
Trolamine Salicylate Topical Emulsion	Trovafloxacin Injection	Trovafloxacin Mesylate for Injection
Undecylenic Acid Topical Foam Aerosol	Unoprostone Isopropyl Ophthalmic Solution	Urea Cream

Noncomplex Actives (Drug Products) *(Continued)*

Vecuronium Bromide for Injection	Venlafaxine Extended-Release Capsules ***(Received)***	Venlafaxine Tablets
Verapamil Hydrochloride Capsules	Verapamil Hydrochloride Extended-Release Capsules	Voriconazole Injection
Voriconazole Oral Suspension	Voriconazole Tablets	Yttrium Y-90 Chloride Solution
Yttrium Y-90 Glass Microspheres	Yttrium Y-90 Microspheres Injection	Zidovudine and Lamivudine Tablets ***(Received)***
Zinc Acetate Capsules	Zinc Tridosium Pentetate Injection	Ziprasidone Hydrochloride Capsules
Zoledronic Acid for Injection		

Excipients

Acetone Sodium Bisulfite	Acetylated Monoglycerides	Aconitic Acid (Achilleic Acid)
Acrylic Acid-Octyl Acrylate Copolymer	Albumin Colloidal	Aliphatic Polyesters
Allantoin-Sodium Pyrrolidone Carboxylate	Aluminum Ammonium Sulfate	Aluminum Lactate
Aluminum Oxide	Aluminum Potassium Sulfate	Aluminum Silicate
Aluminum Sodium Sulfate	Aluminum Stearate	Ammonium Bicarbonate
Ammonium Calcium Alginate	Ammonium Phosphate	Batylalcohol Monostearate
Beeswax, Synthetic	Benzododecinium Bromide	Benzyl Chloride
Benzyl Nicotinate	Beta Naphthol	Brominated Vegetable Oil
Butadiene-Styrene Rubber	Butylated Hydromethylphenol	Butylene Glycol
Butylphthalyl Butylglycolate	Calcium Acid Pyrophosphate	Calcium Alginate
Calcium Alginate and Ammonium Alginate	Calcium Bromide	Calcium Chloride Solution
Calcium Glycerophosphate ***(Received)***	Calcium Phosphate Monobasic	Calcium Propionate
Calcium Pyrophosphate	Calcium Sorbate	Calcium Stearoyl Lactylate
Caldiamide Sodium	Calteridol Calcium	Canola Oil
Capric Acid	Caprylic/Capric Diglyceryl Succinate	Carbon
Carboxymethyl Starch	Carboxymethylamylopectin Sodium	Carboxymethylcellulose Potassium
Cetostearyl Isononanoate	Chlorodifluoroethane	Cholic Acid
Cinnamaldehyde	Cocamide Diethanolamine	Cocamide Oxide
Cocoyl Caprylocaprate	Crystal Gum	Cutina
Cystine	Dammar Gum	Decanoic Acid
Decyl Oleate	Dehydroacetic Acid	Desoxycholic Acid
Dextrin Palmitate	Dextrins Modified	Diacetyl Tartaric Acid Esters of Mono- and Diglycerides
Dicetyl Phosphate	Dichlorofluoromethane	Diethyl Sebacate
Difluoroethane	Diglycol Stearate	Diisobutyl Adipate
Diisopropyl Adipate	Diisopropylbenzothiazyl-2-Sulfenamide	Dilauryl Thiodipropionate
Dimethyl Dicarbonate	Dimyristoyl Lecithin	Dimyristoyl Phosphatidylglycerol
Dipropylene Glycol	Disodium Edisylate	Disodium Guanylate
Disodium Inosinate	Disodium Monooleamide Sulfasuccinate	D-Mannose
Docusate Sodium/Sodium Benzoate	Erythorbic Acid	Erythrosine
Ethoxylated Mono- and Diglycerides	Ethoxyquin	Ethyl Hexanediol
Ethyl Linoleate	Ethyl Maltol	Ethylene Dichloride
Ethylurea	Ferric Ammonium Citrate	Ferric Citrate
Ferric Oxide, Brown	Ferric Phosphate	Ferric Pyrophosphate
Ferrous Citrate	Ferrous Glycinate	Ferrous Lactate
Fluorochlorohydrocarbons	Formic Acid	Furcelleran
Gamma-Cyclodextrin	Gentistic Acid	Geraniol
Glutamic Acid Hydrochloride	Gluten	Glycerol Ester Of Gum Rosin (Ester Gum)
Glyceryl Laurate	Glyceryl Palmitate	Glyceryl Ricinoleate
Glyceryl Tristearate	Glycine Hydrochloride	Glycofurol
Glycol Stearate	Heptafluoropropane	Heptylparaben
Hexadecyl Isostearate	Hexane	Hexanetriol(-1,2,6-)
Hydrocarbon Gel	Hydroxyethylmethylcellulose	Hydroxypropyl Beta Cyclodextrin
Hydrogenated Starch Hydrolysate	Hydroxylated Lecithin	
Indigotine	Inositol	Iron Carbonyl

Excipients *(Continued)*		
Iron Subcarbonate	Isobutylated-Isoprene Copolymer	Isooctylacrylate
Isopropyl Isostearate	Isopropyl Stearate	Isostearic Acid
Isostearyl Alcohol	Lactobionic Acid	Lactose Ferrin, Bovine
Lactylated Fatty Acid Esters of Glycerol and Propylene Glycol	Lactylic Esters of Fatty Acids	Lanolin (Wool Fat), Hydrogenated
Lanolin Alcohols, Acetylated	Lanolin Hydrous	L-Ascorbyl Stearate
Lauramine Oxide	Lauric Myristic Diethanolamide	Lauric Acid
Lauric Diethanolamide	Lavender Oil	L-Cysteine Monohydrochloride
Lecithin, Hydroxylated	L-Glutamic Acid	L-Leucine
	Linoleic Acid	
Macrogol Sorbitan Tristearate	Macrogolglycerol Cocoates	Macrogolglycerol Triisostearate
Magnesium Aluminum Silicate Hydrate	Magnesium Aspartame Dihydrate	Magnesium Aspartate
Magnesium Phosphate Tribasic	Magnesium Phosphate, Dibasic, Trihydrate	Magnesium Tartrate
Malt Syrup	Maltitol Syrup	Maltol Isobutyrate
Manganese Chloride	Manganese Citrate	Manganese Glycerophosphate
Manganese Hypophosphite	Medical Antifoam Emulsion C	Medronate Disodium
Medronic Acid	Methyl Chloride	Methylchloroisothiazolinone
Methylisothiazolinone	Microcrystalline Cellulose, Silicified ***(Received)***	Mineral Spirits
Monoisostearyl Glyceryl Ester	Monopotassium Glutamate Monohydrate	Monosodium Citrate
Mullein Leaf	Myristyl Gamma-Picolinium Chloride	Myristyl Lactate
N,N-Bis(2-Hydroxyethyl)Stearamide	*N*-Acetyl-L-Methionine	*N*-Methylpyrrolidone ***(Received)***
	Naphtha	
Non-Pareil Seeds	Nutmeg Oil	Octanoic Acid
Oxystearin	Palm Kernel Oil ***(Received)***	Palm Oil
Pentasodium Triphosphate	Pentetate Calcium Trisodium	Pentetate Pentasodium
Phenprobamate	Phenylmercuric Acetate	Phenylmercuric Nitrate
Pine Oil	Polacrilin	Polydextrose ***(Received)***
Polydextrose Solution	Polyglycerol Esters Of Fatty Acids	Polyglycerol Polyricinoleic Acid
Polyoxyethylene Castor Oil (USP has 35)	Polyoxyl Stearate (USP has 40)	Polypropylene Oleate
Polypropylene Stearyl Ether	Polysorbate 65	Polyvinyl Acetal
		Polyvinylacetal Diethylanoacetate
Polyvinylpolypyrrolidone	Polyvinylpyrrolidone Ethylcellulose	Potassium Acid Tartrate
Potassium Bromate	Potassium Carbonate Solution	Potassium Dichloroisocyanurate
Potassium Gibberellate	Potassium Glycerophospate	Potassium Iodate
Potassium Nitrite	Potassium Phosphate	Potassium Phosphate Tribasic
Potassium Polymetaphosphate	Potassium Pyrophosphate	Potassium Stearate
Potassium Sulfate	Potassium Sulfite	Potassium Tripolyphosphate
Propyl Propionate	Propylene Glycol Diacetate	Propylene Glycol Mono- and Diesters
Purified Polyoxyl 35 Castor Oil ***(Received)***	Rapeseed Oil, Hydrogenated ***(Received)***	Rapeseed Oil, Superglycerinated ***(Received)***
Rice Bran Wax	Rosin	Silicone
Sodium Acid Pyrophosphate	Sodium Aluminosilicate	Sodium Aluminum Phosphate Acidic
Sodium Aluminum Phosphate Basic	Sodium Aspartate	Sodium Bisulfate
Sodium Bisulfite	Sodium Carbonate Hydrate	Sodium Carboxymethyl Betaglucan
Sodium Caseinate	Sodium Chlorate	Sodium Citrate, Dibasic
Sodium Citrate, Monobasic	Sodium Dehydroacetate	Sodium Diacetate
Sodium Erythorbate	Sodium Ferric Pyrophosphate	Sodium Ferrocyanide
Sodium Hypophosphite	Sodium Laureth Sulfate	Sodium Lauroyl Sarcosinate
Sodium Lauryl Sulfoacetate	Sodium Magnesium Aluminosilicate	Sodium Magnesium Silicate
Sodium Malate	Sodium Metaphosphate, Insoluble	Sodium Metasilicate
Sodium Methylate	Sodium Polyphosphates Glassy	Sodium Potassium Tripolyphosphate
Sodium Pyrophosphate	Sodium Pyrrolidone Carboxylate	Sodium Sesquicarbonate
Sodium Sesquinoleate	Sodium Stearoyl Lactylate	Sodium Thiomalate
Sodium Trimetaphosphate	Sodium Trioleate	Sodium Tripolyphosphate
Soy Polysaccharides	Stannous Chloride	Stannous Tartrate

Excipients *(Continued)*

Starch, Pregelatinized Corn	Starch, Pregelatinized Tapioca	Stearalkonium Chloride
Stearyl Citrate	Stearyl Monoglyceridyl Citrate	Succinylated Monoglycerides
Sucrose Acetate Isobutyrate	Sucrose Fatty Acid Esters	Sucrose Stearate
Sugar Fruit Fine	Sulfobutyl Ether Beta Cyclodextran	Tallow
		Tallow Glycerides
Tallow Oil	Tetrafluoroethane	Thioglycerol
Thyme Oil	Tribehenin	Triceteareth-4 Phosphate
Trichloroethylene	Trimyristin	Trisodium Citrate
Trolamine Lauryl Sulfate	Vegetable Oil	Wheat Flour
Wheat Germ Oil	Wheat Gluten ***(Received)***	Whey

INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- New adopted (official) revisions to the *USP–NF* that become effective before the effective date of the next *Supplement* or that were not ready for adoption by the closing date for the upcoming *Supplement*. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.

Symbols—Interim revisions are shown with new text (if any) enclosed in circles, •new text•. Text enclosed in squares, ▪new text▪, has already been adopted in a *Supplement*. Where the symbols appear together with no enclosed text, such as •• or ▪▪, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by a number that indicates the *IRA* or *Supplement* in which the revision first appeared. For example, •2 indicates that the revision was officially adopted in the *Second Interim Revision Announcement,* and ▪2S (*USP29*) indicates that the revision was officially adopted in the *Second Supplement* to *USP 29*.

Errata—At the end of the *Interim Revision Announcement* section is a list of errata and corrections to *USP 29–NF 24*. The page number indicates where the item is found in *USP–NF*. If necessary, this list will be updated with every issue of *PF*. This information will also be cumulative in future *Supplements,* and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

FIFTH INTERIM REVISION ANNOUNCEMENT to *USP 29* and to *NF 24*

By authority of the United States Pharmacopeial Convention, Inc.
Prepared by the Council of Experts and published by the Board of Trustees

John W. Mauger, *Chair*
USP Board of Trustees

Roger L. Williams, *Executive Vice President*
and *Chairman, USP Council of Experts*

Roger L. Williams, M.D., *Chief Standards Officer, Acting*

Official October 1, 2006 **Released September 1, 2006**

All inquiries and comments regarding *USP 29* text and *NF 24* text should be addressed to the Executive Secretariat, *USP–NF*, 12601 Twinbrook Parkway, Rockville, MD 20852.

New USP Reference Standards

The following USP Reference Standards, which were not available when the associated monograph was made official, have since become available. The respective official date of each *USP 29* or *NF 24* standard, test, or assay requiring the use of the following USP Reference Standards is indicated in parentheses after the name of the Reference Standard.

USP Budesonide RS (September 1, 2006)
USP Escin RS (January 1, 2007)
USP Fluticasone Propionate RS (November 1, 2006)
USP Fluticasone Propionate Resolution Mixture RS (September 1, 2006)
USP Fluticasone Propionate System Suitability Mixture RS (September 1, 2006)
USP Fluvastatin Related Compound B RS (November 1, 2006)
USP Fluvastatin Sodium RS (March 1, 2007)
USP Hexacosanol RS (March 1, 2007)
USP Mecamylamine Related Compound A RS (March 1, 2007)
USP Polyisobutylene RS (November 1, 2006)
USP Ropivocaine Hydrochloride RS (November 1, 2006)
USP Ropivacaine Related Compound A RS (September 1, 2006)
USP Ropivacaine Related Compound B RS (September 1, 2006)
USP Saccharin Sodium RS (March 1, 2007)
USP Sulisobenzone RS (January 1, 2007)
USP Tinidazole Related Compound B RS (September 1, 2006)

Unavailable First-Time Official USP Reference Standards

The official dates of any *USP 29* or *NF 24* standards, tests, or assays requiring the use of the following new USP Reference Standards are postponed until further notice pending availability of the respective Reference Standards. This listing was updated as of July 5, 2006.

USP Albumin Human RS
USP Alteplase RS
USP Amifostine RS
USP Amifostine Thiol RS
USP Antithrombin III Human RS
USP Aprotinin RS
USP Aprotinin System Suitability RS
USP Cetrimonium Bromide RS
USP Citalopram Hydrobromide RS
USP Cladribine RS
USP Cladribine Related Compound A RS
USP Copolymer Polypropylene RS
USP Decoquinate RS
USP Cryopreserved Human Fibroblast-Derived Dermal Substitute Reference Photomicrographs RS
USP Diethylstilbestrol Diphosphate RS
USP Docosyl Ferulate RS
USP Powdered *Echinacea pallida* Extract RS
USP Eucatropine Hydrochloride RS
USP Fluvastatin Related Compound A RS
USP Gabapentin Related Compound B RS
USP Ginkgo Terpene Lactones RS
USP Powdered American Ginseng Extract RS
USP Glyceryl Monolinoleate RS
USP Glyceryl Monooleate RS
USP Gonadorelin Hydrochloride RS
USP Hemoglobin RS
USP Irbesartan RS
USP Irbesartan Related Compound A RS
USP Isosorbide Mononitrate RS
USP Isosorbide Mononitrate Related Compound A RS
USP Alpha Lipoic Acid RS
USP Maritime Pine Extract RS
USP Menotropins RS
USP Methyldopa-Glucose Reaction Product RS
USP Mibolerone RS
USP Narasin RS
USP Naratriptan Resolution Mixture RS
USP Near Infrared Calibrator RS
USP Nimodipine RS
USP Nimodipine Related Compound A RS
USP Cultured Rat Pheochromocytoma Reference Photomicrographs RS
USP Polyoxyl 10 Oleyl Ether RS
USP Potassium Perchlorate RS
USP Pyrethrum Extract RS
USP Quinapril Hydrochloride RS
USP Ramipril Related Compound B RS
USP Powdered St. John's Wort Extract RS
USP Sargramostim RS
USP Sincalide RS
USP Human Fibroblast-Derived Temporary Skin Substitute Reference Photomicrographs RS
USP Δ^8-Tetrahydrocannabinol RS
USP Δ^9-Tetrahydrocannabinol RS
USP Tizanidine Hydrochloride RS
USP Tizanidine Related Compound A RS
USP Tizanidine Related Compound B RS
USP Tizanidine Related Compound C RS
USP Valrubicin RS
USP Valrubicin Related Compound A RS
USP Vasopressin RS

NOTICE OF POSTPONEMENT

Alendronic Acid Tablets

In accordance with Section 9.06(c) of the Rules and Procedures of the Council of Experts, the USP Nomenclature Expert Committee has postponed the official date of the title for this new monograph, which was published on page 72 of *USP 29–NF 24,* from July 1, 2006, until May 1, 2008. The postponement is intended to provide additional time for product label changes to be completed and for healthcare practitioners and consumers to become familiar with the terminology. Use of this title has been permitted since January 1, 2005, when the monograph first became official, but will not become mandatory until May 1, 2008, the official date of *USP 31–NF 26.* The Salt Nomenclature Policy, on which this monograph title is based, was published for public review and comment on page 1228 of *PF* 32(4) [July–Aug. 2006] as part of the revised general information chapter *Nomenclature* ⟨1121⟩. Should you have any questions, please contact Dr. W. Larry Paul, Scientific Fellow and Scientific Liaison to the Nomenclature Expert Committee at 301-816-8331 or wlp@usp.org.

Alendronic Acid Tablets

•(Title for this new monograph—to become official May 1, 2008)•S

Amifostine

Change to read:

Related compounds—

Mobile phase—Dissolve 1.0 mL of nonafluorobutane sulfonic acid in 1200 mL of HPLC grade water, add 400 µL of trifluoroacetic acid, and adjust with triethylamine to a pH of 2.5. Prepare a degassed mixture of this solution and acetonitrile (68 : 32).

Blank solution—Use water.

Standard thiol solution—Transfer about 12.4 mg of USP Amifostine Thiol RS, accurately weighed, to a 100-mL volumetric flask. Dissolve in and dilute with water to volume, and mix. [NOTE—Inject immediately after preparation, or refrigerate until use. The solution is stable for 48 hours if maintained at about 5°.]

System suitability solution—Dissolve about 5.0 mg of USP Amifostine RS, accurately weighed, in 1 mL of *Standard thiol solution,* and mix. [NOTE—Inject immediately after preparation, or refrigerate until use. The solution is stable for 12 hours if maintained at about 5°.]

Test solution—Transfer about 50 mg of Amifostine, accurately weighed, to a 1-mL volumetric flask. Dissolve in and dilute with water to volume, and mix. [NOTE—Inject immediately after preparation, or refrigerate until use. The solution is stable for 48 hours if maintained at about 5°.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The column temperature is maintained at 30°, and the temperature of the solutions to be injected is maintained at 2° to 8°. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution* and the *Standard thiol solution,* and record the peak responses as directed for *Procedure:* the resolution between the amifostine and amifostine thiol peaks is not less than 2.0; the column efficiency calculated for the amifostine thiol peak is not less than 2300 theoretical plates; the tailing factor is not more than 4.0; the capacity factor, k', is more than 0.5; and the relative standard deviation for replicate injections is not more than 4.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard thiol solution,* the *Test solution,* and the *Blank solution* into the chromatograph, record the chromatograms, and measure the responses of all the peaks, excluding the peaks corresponding to those obtained from the *Blank solution*. Calculate the percentage of amifostine thiol in the portion of Amifostine taken by the formula:

$$\bullet(134.24/207.17)100(C/W)(r_U/r_S)_{\bullet 5}$$

in which 134.24 and 207.17 are the molecular weights of amifostine thiol and amifostine thiol dihydrochloride, respectively; C is the concentration, in mg per mL, of amifostine thiol dihydrochloride in the *Standard thiol solution; W* is the weight, in mg, of Amifostine taken to prepare the *Test solution;* and r_U and r_S are the amifostine thiol peak responses obtained from the *Test solution* and the *Standard thiol solution,* respectively. Calculate the percentage of each of the other impurities in the portion of Amifostine taken by the formula:

$$100(r_i/r_A)$$

in which r_i and r_A are the peak responses for each impurity and amifostine, respectively, obtained from the *Test solution:* not more than 0.1% of any individual impurity, excluding amifostine thiol, is found; and not more than 0.3% of total impurities, including amifostine thiol, is found.

Amifostine for Injection

Change to read:

» Amifostine for Injection is a sterile, •$_{\bullet 5}$ crystalline substance suitable for parenteral use. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of amifostine ($C_5H_{15}N_2O_3PS$).

Change to read:

Related compounds—

Mobile phase, Blank solution, and *System suitability solution* •$_{\bullet 5}$—Prepare as directed in the test for *Related compounds* under *Amifostine.*

Standard thiol solution—Transfer about 40.1 mg of USP Amifostine Thiol RS, accurately weighed, to a 50-mL volumetric flask. Dissolve in and dilute with water to volume, and mix. [NOTE—Inject immediately after preparation, or refrigerate until use. The solution is stable for 48 hours if maintained at about 5°.]

Standard disulfide solution—Transfer about 18.6 mg of USP Amifostine Disulfide RS, accurately weighed, to a 100-mL volumetric flask. Dissolve in and dilute with water to volume, and mix. [NOTE—Inject immediately after preparation, or refrigerate until use. The solution is stable for 48 hours if maintained at about 5°.]

•*Test solution*—Transfer about 50 mg of Amifostine for Injection, accurately weighed, to a 1-mL volumetric flask, dissolve in and dilute with water to volume, and mix. [NOTE—Inject immediately after preparation, or refrigerate until use. The solution is stable for 48 hours if maintained at about 5°.]•$_{\bullet 5}$

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a detector capable of recording at both 220 nm and 247 nm, and a 4.6-mm × 25-cm column that contains packing L1. The column temperature is maintained at 30°, and the temperature of solutions to be injected is maintained at between 2° and 8°. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution,* the *Standard disulfide solution,* and the *Standard thiol solution,* and record the peak responses as directed for *Procedure:* the column efficiency calculated for the amifostine thiol peak is not less than 2300 theoretical plates; the tailing factor is not more than 4.0; the capacity factor, k', is more than 0.5; and the relative standard deviation for replicate injections is not more than 4.0%. The column efficiency calculated for the amifostine disulfide peak is not less than 2000 theoretical plates; the tailing factor is not more than 4.5; the capacity factor, k', is more than 2.2; and the relative standard deviation for replicate injections is not more than 4.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard thiol solution,* the *Standard disulfide solution,* the *Test solution,* and the *Blank solution* into the chromatograph, record the chromatograms, and measure the responses of all the peaks except the peaks corresponding to those obtained from the *Blank solution.* Calculate the percentage of amifostine thiol in the portion of Amifostine for Injection taken by the formula:

$$\bullet(134.24/207.17)100(C/W)(r_U/r_S)_{\bullet 5}$$

in which 134.24 and 207.17 are the molecular weights of amifostine thiol and amifostine thiol dihydrochloride, respectively; C is the concentration, in mg per mL, of amifostine thiol dihydrochloride in the *Standard thiol solution; W* is the weight, in mg, of amifostine taken to prepare the *Test solution;* and r_U and r_S are the amifostine thiol peak responses recorded at 220 nm, obtained from the *Test solution* and the *Standard thiol solution,* respectively. Calculate the percentage of amifostine disulfide in the portion of Amifostine for Injection taken by the formula:

$$\bullet(266.47/412.31)(100C/W)(r_U/r_S)_{\bullet 5}$$

in which 266.47 and 412.31 are the molecular weights of amifostine disulfide and amifostine disulfide tetrahydrochloride, respectively; C

Interim Revision Announcement

is the concentration, in mg per mL, of USP Amifostine Disulfide RS in the *Standard disulfide solution;* and r_U and r_S are the peak responses recorded at 247 nm, obtained from the *Test solution* and the *Standard disulfide solution,* respectively: not more than 2.0% of total impurities, including amifostine thiol and amifostine disulfide, is found. Calculate the percentage of each of the other impurities in the portion of Amifostine for Injection taken by the formula:

$$100(r_i / r_A)$$

in which r_i and r_A are the peak responses for each impurity and amifostine, respectively, obtained from the *Test solution:* not more than 0.1% of any individual impurity except amifostine thiol is found.

Cladribine

Water, *Method I* ⟨921⟩**:** not more than •4.0%.•5

Clarithromycin Extended-Release Tablets

Change to read:

▲**Dissolution** ⟨711⟩—

TEST 1—▲*USP29*

Medium: 0.3 M phosphate buffer, pH 6.0 (prepared by dissolving 816.5 g of monobasic potassium phosphate and 48 g of sodium hydroxide in about 4 L of water, mixing, and diluting with water to 20 L. Adjust with either concentrated phosphoric acid or 1 N sodium hydroxide to a pH of 6.0 ± 0.05); 900 mL.

Apparatus 2: 75 rpm.

Times: 30, 45, 60, and 120 minutes.

Determine the percentages of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved using the following method.

Standard solutions—Prepare five solutions of USP Clarithromycin RS dissolved in acetonitrile and diluted in *Medium,* with known concentrations over the range of about 60 to 600 µg per mL.

Test solution—Use portions of the solution under test passed through a 35-µm polyethylene filter.

Chromatographic system—Proceed as directed in the *Assay.*

Procedure—Separately inject equal volumes (about 50 µL) of the five *Standard solutions* and the *Test solution* into the chromatograph, and measure the responses for the major peaks. Perform a linear regression analysis to generate a standard curve using the peak area of each *Standard solution* versus its concentration. Determine the amount of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved at each specified time interval, using the peak area of each *Test solution* and the linear regression statistics for the *Standard solutions.*

Tolerances—The percentages of the labeled amounts of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved at the times specified conform to the following *Acceptance Table.*

▲TEST 2—•If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.•5

Medium: 0.05 M phosphate buffer, pH 6.8 containing 0.5% of sodium lauryl sulfate; 900 mL, degassed by sonication and vacuum.

Apparatus 1: 100 rpm.

Times: 2, 12, and 24 hours.

Determine the percentages of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved using the following method.

0.067 M Phosphate buffer, pH 2.5—Dissolve 9.2 g of monobasic sodium phosphate monohydrate in about 800 mL of water. Adjust with phosphoric acid to a pH of 2.5. Dilute with water to 1000 mL.

Mobile phase—Prepare a filtered and degassed mixture of methanol and *0.067 M Phosphate buffer, pH 2.5* (65 : 35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Transfer about 56 mg of USP Clarithromycin RS, accurately weighed, to a 100-mL volumetric flask. Add 10 mL of methanol, and sonicate to dissolve. Dilute with *Medium* to volume.

Test solution—Centrifuge the solution under test at 2500 rpm for 10 minutes.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. •The column temperature is maintained at 50°.•5 Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; the column efficiency is not less than 2000; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Determine the amount, in percentage, of clarithromycin dissolved by the formula:

$$C_U = \frac{r_U \times C_S}{r_S}$$

in which C_U is the concentration, in mg per mL, of clarithromycin in the sample at each time point; r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; and C_S is the concentration, in mg per mL, of clarithromycin in the *Standard solution.*

Calculate the amount, in percentage, of clarithromycin dissolved with volume correction:

$$\bullet \frac{[\{C_n \times [900 - V_U(n-1)]\} + [\sum_{i=1}^{n-1} C_i \times V_U]] \times 100}{LC} \bullet 5$$

in which C_n is the concentration, in mg per mL, of clarithromycin in the *Test solution* at each time point; 900 is the volume, in mL, of *Medium;* V_U is the volume, in mL, of sample withdrawn at each time point; *n* is the number of time points [NOTE—The summation of the amount of clarithromycin removed at previous sampling time points is applicable only where n > 1.]; 100 is the conversion factor to percentage; and *LC* is the Tablet label claim.

Tolerances—The percentages of the labeled amounts of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
2	not more than 20%
12	between 45% and 70%
24	not less than 80%

▲*USP29*

•TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium: Acetate buffer, pH 4.75 (prepared by dissolving 3.59 g of sodium acetate trihydrate and 11.0 mL of 2 N acetic acid in 1000 mL of water, and adjusting with 2 N acetic acid to a pH of 4.75); 1000 mL.

Apparatus 1: 10 mesh; 50 rpm.

Times: 1, 2, 4, 8, and 12 hours.

Determine the percentages of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved by employing the following method.

0.067 M Phosphate buffer—Dissolve 9.12 g of monobasic potassium phosphate in 1000 mL of water, and mix.

Interim Revision Announcement

Acceptance Table

Level	Time (minutes)	Amount dissolved (individual limits)	Amount dissolved (average limits)
L_1	30	not more than 65%	—
	45	between 55% and 85%	—
	60	not less than 75%	—
	120	not less than 85%	—
L_2	30	not more than 75%	not more than 65%
	45	between 45% and 95%	between 55% and 85%
	60	not less than 65%	not less than 75%
	120	not less than 75%	not less than 85%
L_3	30	not more than 2 tablets release more than 75%, and no individual tablet releases more than 85%	not more than 65%

Mobile phase—Prepare a filtered and degassed mixture of methanol and *0.067 M Phosphate buffer* (65 : 35), mix, and adjust with phosphoric acid to a pH of 4.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Dissolve quantitatively an accurately weighed quantity of USP Clarithromycin RS in methanol, shaking and sonicating if necessary to ensure dissolution, to obtain a stock solution having a known concentration of about 625 µg of clarithromycin per mL, taking into account the stated potency, in µg per mg, of USP Clarithromycin RS.

Standard solution—Transfer 10.0 mL of the *Standard stock solution* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. This solution contains about 125 µg of clarithromycin per mL.

System suitability solution—Dissolve quantitatively an accurately weighed quantity of USP Clarithromycin Related Compound A RS in methanol to obtain a solution containing about 625 µg of clarithromycin related compound A per mL. Transfer 10 mL of this solution and 10 mL of the *Standard stock solution* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Test solution—Withdraw 10-mL of the solution under test. Transfer 3 mL to a 25-mL volumetric flask, and dilute with *Mobile phase* to volume. Pass portions of this dilution through a 0.45-µm filter. Replace 10 mL of *Medium* in each vessel.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 50°. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.75 for clarithromycin and 1.0 for clarithromycin related compound A; and the resolution, *R,* between clarithromycin and clarithromycin related compound A is not less than 2.0. Chromatograph the *Standard solution,* and record the responses as directed for *Procedure:* the column efficiency, determined from the clarithromycin peak, is not less than 750 theoretical plates; the tailing factor is not less than 0.9 and not more than 2; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Determine the amount, in percentage, of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved by the formula:

$$C_U = \frac{r_U \times C_S \times 100}{r_S \times LC}$$

in which C_U is the concentration, in mg per mL, of clarithromycin in the sample at each time point; r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; and C_S is the concentration, in mg per mL, of clarithromycin in the *Standard solution;* 100 is the conversion factor to percentage; and *LC* is the Tablet label claim in mg.

Calculate the amount, in percentage, of clarithromycin dissolved with volume correction at time points $n \geq 2$:

$$\frac{[\{C_n \times [1000]\} + [\sum_{i=1}^{n-1} C_i \times V_u]] \times 100}{LC}$$

$$C_n = \frac{r_U \times C_S}{r_S}$$

in which C_n is the concentration, in mg per mL, of clarithromycin in the *Test solution* at each time point; 900 is the volume, in mL, of *Medium;* V_U is the volume, in mL, of sample withdrawn at each time point; n is the time point (at 2 hours, n = 2), summation of the concentration of the *Test solution* from the first to the (n –1)th time point (only applicable for $n \geq 2$); 100 is the conversion factor to percentage; and *LC* is the Tablet label claim in mg.

Tolerances—The percentages of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	not more than 15%
2	between 10% and 30%
4	between 35% and 55%
8	not less than 80%
12	not less than 90%

TEST 4 —If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

Medium: phosphate buffer, pH 6.0 (prepared by dissolving 68.0 g of potassium dihydrogen phosphate and 1.8 g of sodium hydroxide in 10 L of water, and adjusting with dilute sodium hydroxide or phosphoric acid to a pH of 6.0 ± 0.1); 900 mL.

Apparatus 2: 50 rpm.

Times: 2, 4, 8, and 12 hours.

Interim Revision Announcement

Determine the percentages of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved by employing the following method.

Buffer solution—Dissolve 6.8 g of potassium dihydrogen phosphate in 1 L of water. Adjust with dilute sodium hydroxide or phosphoric acid to a pH of 4.5 ± 0.1.

Mobile phase—Prepare a filtered and degassed mixture of methanol and *Buffer solution* (64 : 36). Make adjustments if necessary (see *System suitability* under *Chromatography* ⟨621⟩).

Standard solution—Transfer about 20 mg of USP Clarithromycin RS, accurately weighed, to a 50-mL volumetric flask. Add about 30 mL of *Medium,* and sonicate until dissolved, about 10 minutes. Add 2 mL of methanol, and dilute with *Medium* to volume.

Test solution—Use the solution under test passed through a 0.45-µm suitable filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 203-nm detector and a 4.0-mm × 12.5-cm column that contains 5-µm packing L7. The flow rate is about 1.0 mL per minute. The column is maintained at 30°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Determine the amount, in percentage, of clarithromycin dissolved by the formula:

$$C_U = \frac{r_U \times C_S}{r_S}$$

in which C_U is the concentration, in mg per mL, of clarithromycin in the *Test solution* at each time point; r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; and C_S is the concentration, in mg per mL, of clarithromycin in the *Standard solution*.

Calculate the amount, in percentage, of clarithromycin dissolved at each time point by the formula:

$$\frac{C_n \times [900 - (n-1) \times V_S] + (C_1 + C_2 + ... + C_{n-1}) \times V_S \times 100}{LC}$$

in which C_n is the concentration, in mg per mL, of clarithromycin in the *Test solution* at each time point; 900 is the volume, in mL, of *Medium;* V_S is the volume, in mL, of the sample taken at each time point; and *LC* is the Tablet label claim, in mg.

Tolerances—The percentages of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
2	not more than 25%
4	between 20% and 40%
8	between 45% and 75%
12	not less than 80%

•5

Indocyanine Green

Change to read:

» Indocyanine Green contains not less than •89.0•5 percent and not more than •100.0•5 percent of $C_{43}H_{47}N_2NaO_6S_2$, calculated on the dried basis. It contains not more than 5.0 percent of sodium iodide, calculated on the dried basis.

Nefazodone Hydrochloride

Add the following:

•Related compounds—

Diluent—Prepare a solution of water and acetonitrile (50 : 50).

Solution A—Dissolve 0.77 g of ammonium acetate in about 950 mL of water. Adjust with triethylamine to a pH of 7.10 ± 0.05. Dilute with water to 1 L. Filter and degas.

Solution B—Use filtered and degassed acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Dissolve an accurately weighed amount of USP Nefazodone Hydrochloride RS in *Diluent* to obtain a solution containing 0.1 mg per mL of nefazodone hydrochloride.

Nefazodone related compound A stock solution and *Nefazodone related compound B stock solution*—Transfer about 20 mg each of USP Nefazodone Related Compound A RS and USP Nefazodone Related Compound B RS, accurately weighed, into separate 200-mL volumetric flasks. Dissolve in and dilute with *Diluent* to volume.

Resolution solution—Pipet 5.0 mL of *Nefazodone related compound A stock solution* and 5.0 mL of *Nefazodone related compound B stock solution* into a 100-mL volumetric flask. Dilute with *Standard stock solution* to volume, and mix. This solution contains about 90 µg per mL of nefazodone hydrochloride, and about 5 µg per mL each of nefazodone related compounds A and B.

Standard solution—Pipet 2.0 mL each of the *Standard stock solution, Nefazodone related compound A stock solution,* and *Nefazodone related compound B stock solution* into a 200-mL volumetric flask. Dilute with *Diluent* to volume, and mix well to obtain a final concentration of 1 µg per mL each of nefazodone hydrochloride, nefazodone related compound A, and nefazodone related compound B.

Test solution—Transfer about 100 mg of Nefazodone Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 250-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.7 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	50	50	equilibration
0–10	50→45	50→55	linear gradient
10–16	45→35	55→65	linear gradient
16–25	35	65	isocratic
25–26	35→50	65→50	linear gradient
26–35	50	50	re-equilibration

Interim Revision Announcement

Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between nefazodone related compound A and nefazodone hydrochloride is not less than 4.0, and it is not less than 1.5 between nefazodone hydrochloride and nefazodone related compound B. Chromatograph the *Standard solution,* and measure the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 5.0% for nefazodone related compound A and nefazodone related compound B. [NOTE—For identification purposes, the relative retention times are about 1.2 for nefazodone related compound A, 1.0 for nefazodone hydrochloride, and 0.94 for nefazodone related compound B.]

Procedure—Inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each nefazodone related compound in the portion of Nefazodone Hydrochloride taken by the formula:

$$100(C_S / C_T)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of the relevant USP Reference Standard in the *Standard solution;* C_T is the concentration of Nefazodone Hydrochloride, in mg per mL, in the *Test solution;* and r_U and r_S are the peak areas of the corresponding nefazodone related compound obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.2% of nefazodone related compound A is found; not more than 0.2% of nefazodone related compound B is found; not more than 0.1% of any unknown impurity is found; and not more than 0.5% of total impurities is found. [NOTE—Use the peak area for nefazodone hydrochloride in the *Standard solution* as r_S to calculate any unknown impurity.]•5

Nitrofurantoin Capsules

Interim Revision Announcement

Change to read:

Dissolution ⟨711⟩—

TEST 1 (where it is labeled as containing nitrofurantoin macrocrystals)—

Medium: pH 7.2 (±0.05) phosphate buffer; 900 mL.

Apparatus 1: 100 rpm.

Times: 1, 3, and 8 hours.

Procedure—Determine the amount of $C_8H_6N_4O_5$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 375 nm on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Nitrofurantoin RS in the same *Medium.*

Tolerances—The percentage of the labeled amount of $C_8H_6N_4O_5$ dissolved at the 1-hour point conforms to *Acceptance Table 2,* and the percentages dissolved at the 3- and 8-hour points conform to the criteria for the final test time in *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 20% and 60%
3	not less than 45%
8	not less than 60%

TEST 2 (where it is labeled as containing both nitrofurantoin macrocrystalline and monohydrate forms)—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

Acid medium: 0.01 N hydrochloric acid for 1 hour; 900 mL.

pH 7.5 Buffer medium—Prepare a pH 7.5 buffer concentrate by dissolving 62.2 g of potassium hydroxide and 129.3 g of monobasic potassium phosphate in water, dilute with water to 1 L, and mix. After 1 hour change the *Acid medium* to *pH 7.5 Buffer medium* by adding 50 mL of pH 7.5 buffer concentrate, for an additional 6 hours.

Apparatus 2: 100 rpm, with sinkers made of teflon-coated steel wire prepared by forming a coil approximately 22 mm long from a 13-cm length of 20-gauge wire (see *Figure 1*).

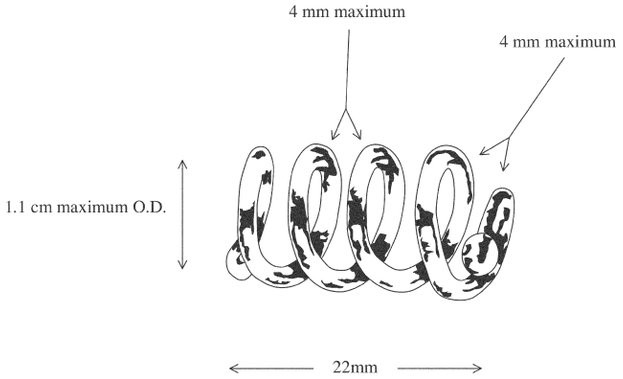

Figure 1. Sinker.

Times: 1, 3, and 7 hours.

Acid-stage standard solution—Prepare a solution of USP Nitrofurantoin RS in *Acid medium* to obtain a solution having a known concentration of about 0.025 mg per mL.

Buffer-stage standard solution—Prepare a solution of USP Nitrofurantoin RS in *pH 7.5 Buffer medium* to obtain a solution having a known concentration of about 0.075 mg per mL.

Procedure—Determine the amount of $C_8H_6N_4O_5$ dissolved from UV absorbances at the isosbestic wavelength at about 375 nm on filtered portions of each solution under test, suitably diluted, if necessary, with *Acid medium* or *pH 7.5 Buffer medium* when appropriate in comparison with the appropriate *Standard solution.*

Tolerances—The percentages of the labeled amount of $C_8H_6N_4O_5$ dissolved at the specified times conform to the accompanying *Acceptance Table.*

Time (hours)	Amount dissolved (individual)	Amount dissolved (mean)
1	between 2% and 16%	between 5% and 13%
3	between 27% and 69%	between 39% and 56%
7	not less than 68%	not less than 81%

Acceptance Table

Level	Number Tested	Criteria
L_1	12	The mean percentage of dissolved label claim lies within the range for the means at each interval and is not less than the stated amount at the final test time. All individual values lie within the ranges for the individuals at each interval and are not less than the stated amount at the final test time.
L_2	12	The mean percentage of dissolved label claim lies within the range for the means at each interval and is not less than the stated amount at the final test time. Not more than 2 of the 24 individual values lie outside the stated range for individuals at each interval, and not more than 2 of 24 are less than the stated amount at the final test time.

(Official April 1, 2006)

•TEST 3 (where it is labeled as containing both nitrofurantoin macrocrystalline and monohydrate forms)—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3.*

Acid medium, pH 7.5 Buffer medium, Apparatus 2, Times, Acid-stage standard solution, Buffer stage standard solution, and *Procedure*—Proceed as directed for *Test 2*.

Tolerances—The percentages of the labeled amount of $C_8H_6N_4O_5$ dissolved at the specified times conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved (individual)	Amount dissolved (mean)
1	between 2% and 16%	between 5% and 13%
3	between 50% and 80%	between 55% and 75%
7	not less than 85%	not less than 90%

•5

Vinorelbine Injection

Change to read:

» Vinorelbine Injection is a sterile solution of Vinorelbine Tartrate in Water for Injection. It contains not less than •90.0•5 percent and not more than •110.0•5 percent of the labeled amount of vinorelbine ($C_{45}H_{54}N_4O_8$).

Caution—Handle Vinorelbine Injection with great care because it is a potent cytotoxic agent.

Change to read:

■**Assay—**

Phosphate buffer, Mobile phase, and *System suitability solution*—Proceed as directed in the test for *Related compounds* under *Vinorelbine Tartrate*.

Standard preparation—Dissolve an accurately weighed quantity of USP Vinorelbine Tartrate RS in water to obtain a solution having a known concentration of about •0.14 mg•5 per mL.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 10 mg of vinorelbine, to a 100-mL volumetric flask, dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a diode-array detector and a 3.9-mm × 15-cm column that contains packing L1. The column temperature is maintained at 40°. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.8 for the photodegradation product, 1.0 for vinorelbine, and about 1.2 for vinorelbine related compound A; and the relative retention, α, between vinorelbine tartrate and vinorelbine related compound A is not less than 1.1.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the vinorelbine peaks, using a diode-array detector. Calculate the quantity, in mg, of vinorelbine ($C_{45}H_{54}N_4O_8$) in each mL of the Injection taken by the formula:

$$•(778.93/1079.11)C(L/D)(r_U/r_S)$$

in which 778.93 and 1079.11 are the molecular weights of vinorelbine and vinorelbine tartrate, respectively;•5 C is the concentration, in mg per mL, of USP Vinorelbine Tartrate RS in the *Standard preparation; L* is the labeled quantity, in mg, of vinorelbine in each mL of Injection taken; D is the concentration, in mg per mL, of vinorelbine in the *Assay preparation;* and r_U and r_S are the peak responses at 267 nm obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP29*)

Interim Revision Announcement

ERRATA

Following is a list of errata and corrections to *USP 29–NF 24*. The page number indicates where the item is found in *USP 29–NF 24*. If necessary, this list will be updated with every issue of *PF*. This information will also be available as a cumulative table in future *Supplements* and will appear in its corrected form in a future annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement. USP staff is available to respond to questions regarding the accuracy of a particular requirement by calling 1-800-822-USPC.

Interim Revision Announcement

IN-PROCESS REVISION

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) items that previously appeared under *Pharmacopeial Previews* and are now formally proposed as revisions, (2) proposed revisions placed directly under *In-Process Revision,* or (3) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the staff liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

BRIEFING

> **Name of Item**, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How to Use PF*), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
>
> (DSN: L. Evans) RTS—C-55678-1

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type (print edition only), as shown in the examples below:

•new text•

if slated for an *Interim Revision Announcement to USP 29–NF 24* (*IRA*);

▲new text▲*USP30*

if slated for *USP 30–NF 25*; and

■new text■

if slated for a *Supplement to USP–NF*. The same symbols *not* set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as •• or ■■ or ▲▲, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •2 indicates that the revision is proposed for the *Second Interim Revision Announcement*, ■2S (*USP 29*) indicates that the proposed revision is slated for the *Second Supplement to USP 29*, and ▲*USP30* and ▲*NF25* indicate that the revisions are proposed for *USP 30* and *NF 25*, respectively.

Official Title Changes Where the specification ***"Monograph title change"*** is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

MONOGRAPHS (USP)

BRIEFING

Acetaminophen, Chlorpheniramine Maleate, and Dextromethorphan Hydrobromide Tablets. There are two *USP* monographs that have similar titles except for the decongestant active ingredient: (1) *Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine* and (2) *Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Phenylpropanolamine.* If a product does not contain a decongestant there would not be an official *USP* monograph for that product. To correct this, a separate *USP* monograph is being proposed for Acetaminophen, Chlorpheniramine Maleate, and Dextromethorphan Hyhdrobromide Tablets based on the two aforementioned monographs, which will have a change in title to clarify that tablets must contain either pseudoephedrine or phenylpropanolamine to apply. The liquid chromatographic procedure in the *Assay for acetaminophen* is based on analysis performed with the Zorbax SB-C8 brand of L7 column. The typical retention time for acetaminophen is about 4.4 minutes. The liquid chromatographic procedure in the *Assay for chlorpheniramine maleate* is based on analysis performed with the Zorbax SB Phenyl brand of L11 column. The typical retention time for chlorpheniramine maleate is about 5.5 minutes. The liquid chromatographic procedure in the *Assay for dextromethorphan hydrobromide* is based on analysis performed with the Zorbax SB Phenyl brand of L11 column. The typical retention time for dextromethorphan is about 9.3 minutes.

(MD-CCA: C. Anthony) RTS—C46298

Add the following:

■Acetaminophen, Chlorpheniramine Maleate, and Dextromethorphan Hydrobromide Tablets

» Acetaminophen, Chlorpheniramine Maleate, and Detromethorphan Hydrobromide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ($C_8H_9NO_2$), chlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$), and dextromethorphan hydrobromide ($C_{18}H_{25}NO \cdot HBr \cdot H_2O$).

Packaging and storage—Preserve in tight containers, and store at controlled room temperature.

Labeling—The label states the name and quantity of each active ingredient and indicates its function (or purpose) in the article. When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

USP Reference standards ⟨11⟩—*USP Acetaminophen RS. USP Chlorpheniramine Maleate RS. USP Dextromethorphan Hydrobromide RS.*

Identification—

A: The chromatogram of the *Assay preparation,* obtained as directed in the *Assay for acetaminophen,* exhibits a major peak for acetaminophen, the retention time of which corresponds to that exhibited by the *Standard preparation.*

B: The chromatogram of the *Assay preparation,* obtained as directed in the *Assay for chlorpheniramine maleate,* exhibits a major peak for chlorpheniramine, the retention time of which corresponds to that exhibited by the *Standard preparation.*

C: The chromatogram of the *Assay preparation,* obtained as directed in the *Assay for dextromethorphan hydrobromide,* exhibits a major peak for dextromethorphan, the retention time of which corresponds to that exhibited by the *Standard preparation.*

Dissolution, *Procedure for a Pooled Sample* ⟨711⟩—

TEST 1—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Test solution—Mix 9.0 mL of a filtered portion of the solution under test with 1.0 mL of 1% phosphoric acid solution.

Procedure—Determine the amounts of acetaminophen, chlorpheniramine maleate, and dextromethorphan hydrobromide dissolved, employing the procedures set forth in the

In-Process Revision

Assay for acetaminophen, Assay for chlorpheniramine maleate, and *Assay for dextromethorphan hydrobromide,* respectively, making any necessary volumetric adjustments.

Tolerances—Not less than 75% *(Q)* of the labeled amounts of acetaminophen ($C_8H_9NO_2$), chlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$), and dextromethorphan hydrobromide ($C_{18}H_{25}NO \cdot HBr \cdot H_2O$) are dissolved in 45 minutes.

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

Medium: 0.1 M hydrochloric acid; 900 mL.

Apparatus, Time, Test solution, Procedure, and *Tolerances*—Proceed as directed for *Test 1.*

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3.*

Medium: pH 5.8 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

Apparatus, Time, Test solution, Procedure, and *Tolerances*—Proceed as directed for *Test 1.*

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Assay for acetaminophen—

Mobile phase—Prepare a filtered and degassed mixture of water, methanol, and glacial acetic acid (79 : 20 : 1). Make adjustments, if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer about 50 mg of USP Acetaminophen RS, accurately weighed, to a 100-mL volumetric flask. Add 4 mL of methanol, and mix until solution is complete. Dilute with 0.1% phosphoric acid to volume, and mix.

Assay preparation—Weigh and powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of acetaminophen, to a 50-mL volumetric flask. Add about 7.5 mL of methanol, and sonicate to disperse the powder. Add 0.5 mL of phosphoric acid, dilute with water to volume, mix, and filter. Transfer 25.0 mL of the filtered solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 15-cm column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor for the acetaminophen peak is not greater than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the acetaminophen peaks. Calculate the quantity, in mg, of acetaminophen ($C_8H_9NO_2$) in the portion of Tablets taken by the formula:

$$200C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation;* and r_U and r_S are the acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Assay for chlorpheniramine maleate—

Mobile phase, System suitability solutions, and *Chromatographic system*—Proceed as directed in the *Assay for pseudoephedrine hydrochloride* under *Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine.*

Standard preparation—Dissolve an accurately weighed quantity of USP Chlorpheniramine Maleate RS in water to obtain a solution having a known concentration of about 0.8 mg per mL. Quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a known concentration of about 8 µg per mL.

Assay preparation—Weigh and powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 2 mg of chlorpheniramine

maleate, to a 250-mL volumetric flask. Add about 25 mL of methanol, and sonicate to disperse the powder. Add 1 mL of phosphoric acid, dilute with water to volume, mix, and filter.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the chlorpheniramine peaks. Calculate the quantity, in mg, of chlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$) in the portion of Tablets taken by the formula:

$$250C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Chlorpheniramine Maleate RS in the *Standard preparation;* and r_U and r_S are the peak responses for chlorpheniramine obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Assay for dextromethorphan hydrobromide—

Mobile phase, System suitability solutions, and *Chromatographic system*—Proceed as directed in the *Assay for pseudoephedrine hydrochloride* under *Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine.*

Standard preparation—Dissolve an accurately weighed quantity of USP Dextromethorphan Hydrobromide RS in water to obtain a solution having a known concentration of about 0.6 mg per mL. Quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a known concentration of about 0.06 mg per mL.

Assay preparation—Weigh and powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 6 mg of dextromethorphan hydrobromide, to a 100-mL volumetric flask. Add 10 mL of methanol, and sonicate to disperse the powder. Add 0.4 mL of phosphoric acid, dilute with water to volume, mix, and filter.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for the dextromethorphan peaks. Calculate the quantity, in mg, of dextromethorphan hydrobromide ($C_{18}H_{25}NO \cdot HBr \cdot H_2O$) in the portion of Tablets taken by the formula:

$$(370.33 / 352.32)(100C)(r_U / r_S)$$

in which 370.33 and 352.32 are the molecular weights of dextromethorphan hydrobromide monohydrate and anhydrous dextromethorphan hydrobromide, respectively; C is the concentration, in mg per mL, of USP Dextromethorphan Hydrobromide RS in the *Standard preparation;* and r_U and r_S are the dextromethorphan peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP30*)

BRIEFING

Albuterol Sulfate, *USP 29* page 63. In the *Assay,* it is proposed to delete the current test and substitute a new, stability-indicating HPLC test. The new method also eliminates the need for the indicator oracet blue B, which is no longer commercially available. The new procedure is based on analyses performed with the Spherisorb CN brand of L10 column.

(AER: K. Zaidi) RTS—C44145

Change to read:

Identification—

A: *Infrared Absorption* ⟨197K⟩.
B: *Ultraviolet Absorption* ⟨197U⟩—
Solution: 80 µg per mL.
Medium: 0.1 N hydrochloric acid.
C: Shake a quantity of it, equivalent to 4 mg of albuterol, with 10 mL of water, and filter: the filtrate so obtained meets the requirements of the tests for *Sulfate* ⟨191⟩.

■**D:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*■2S (*USP30*)

In-Process Revision

Change to read:

~~**Assay**— Dissolve about 900 mg of Albuterol Sulfate, accurately weighed, in 50 mL of glacial acetic acid, add 2 drops of oracet blue B TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each 1 mL of 0.1 N perchloric acid is equivalent to 57.67 mg of $(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$.~~

■*0.05 ± 0.01 M Ammonium acetate solution*—Dissolve 3.85 g of ammonium acetate in 1000 mL of water, and mix.

Mobile phase—Prepare a degassed mixture of water, *0.05 ± 0.01 M Ammonium acetate solution,* and isopropanol [65: 30: (5 ± 1)], and adjust dropwise with acetic acid to a pH of 4.5 ± 0.3.

Standard preparation—Dissolve an accurately weighed quantity of USP Albuterol Sulfate RS in water, and dilute quantitatively with water to obtain a solution having a known concentration of about 0.6 mg per mL.

Assay preparation—Transfer about 60 mg of Albuterol Sulfate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 276-nm detector and a 5.0-mm × 20-cm column that contains packing L10. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between albuterol and 4-[2-[(1,1-dimethylethyl)amino]-1-hydroxyethyl]-2-methylphenol sulfate is not less than 1.5; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$ in the portion of Albuterol Sulfate taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Albuterol Sulfate RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP30*)

BRIEFING

Aminosalicylate Sodium Tablets, *USP 29* page 144. Because the internal standard used in the test for *Limit of m-aminophenol* is sulfanilamide and not acetaminophen, it is proposed to correct the cross reference to indicate that the *Internal standard solution* is prepared as directed in the test for *Limit of m-aminophenol* under *Aminosalicylic Acid*.

(MD-AA: B. Davani) RTS—C46431

Change to read:

Limit of *m*-aminophenol—

Mobile phase ~~and *Internal standard solution*~~

BRIEFING

Benazepril Hydrochloride, page 3713 of the *Second Supplement.* On the basis of the comments received, the following revisions are proposed:

1. The current *Test preparation* in the test for *Absorptivity* prescribes to dissolve 25 mg in 1000 mL of methanol. It is proposed to revise the *Test preparation* such that the final sample concentration is 0.025 mg per mL to avoid unnecessary consumption of the solvent.
2. In the *Chromatographic system* in the *Assay,* it is proposed to correct the guard column dimensions specified from 4.6-mm × 0.3-cm to 4.6-mm × 3-cm.
3. It is proposed to utilize the *Test solution* (from the test for *Related compounds*) in the *Assay preparation,* which will minimize the usage of the benazepril hydrochloride sample.
4. In footnote 5 under *Table 1* in the test for *Related compounds,* the nomenclature of related compound D is revised to match the procured Reference Standard bulk material.

(MD-CV: S. Ramakrishna) RTS—C47274

Change to read:

Absorptivity—

Test preparation— ~~25 mg in 1000 mL of methanol.~~

■Dissolve an accurately weighed quantity of Benazepril Hydrochloride in methanol, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.025 mg per mL.■2S (*USP30*)

Procedure—Proceed as directed under *Spectrophotometry and Light-Scattering* ⟨851⟩, and measure the absorbance at 238 nm: the absorptivity is between 21.0 and 23.2.

In-Process Revision

Change to read:

Related compounds—

TEST 1 (FOR BENAZEPRIL RELATED COMPOUND A)—

pH 6.0 Phosphate buffer—Dissolve 9.66 g of monobasic potassium phosphate and 2.68 g of dibasic sodium phosphate, heptahydrate in about 900 mL of water, and dilute with water to 1000 mL.

Mobile phase—Prepare a filtered and degassed mixture of *pH 6.0 Phosphate buffer* and methanol (80 : 20). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—Dissolve accurately weighed quantities of USP Benazepril Hydrochloride RS and USP Benazepril Related Compound A RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having known concentrations of about 1.0 mg per mL and 0.005 mg per mL, respectively.

Standard stock solution—Dissolve an accurately weighed quantity of USP Benazepril Related Compound A RS in *Mobile phase* to obtain a solution having a known concentration of about 0.05 mg per mL.

Standard solution—Dilute a suitable portion of *Standard stock solution,* accurately measured, with *Mobile phase* to obtain a solution having a known concentration of about 5 µg per mL.

Dilute standard solution—Dilute a suitable portion of *Standard stock solution,* accurately measured, with *Mobile phase* to obtain a solution having a known concentration of about 1 µg per mL.

Test solution—Transfer about 50 mg of Benazepril Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 240-nm detector and a 4.0-mm × 10-cm column that contains packing L41. The flow rate is about 0.9 mL per minute. The column temperature is maintained at 30°. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 2.3 for benazepril related compound A and 1.0 for benazepril hydrochloride; and the resolution, *R,* between benazepril hydrochloride and benazepril related compound A is not less than 2.0. Chromatograph the *Dilute standard solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio is not less than 10 : 1. Chromatograph the *Standard solution:* the relative standard deviation for replicate injections determined from the benazepril related compound A peak is not more than 10%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the area for the benazepril related compound A peak. Calculate the percentage of benazepril related compound A in the portion of Benazepril Hydrochloride taken by the formula:

$$100(C_S / C_T)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Benazepril Related Compound A RS in the *Standard solution;* C_T is the concentration, in mg per mL, of Benazepril Hydrochloride in the *Test solution;* r_U is the peak response for benazepril related compound A obtained from the *Test solution;* and r_S is the peak response for benazepril related compound A obtained from the *Standard solution:* not more than 0.1% of benazepril related compound A is found.

TEST 2 (FOR BENAZEPRIL RELATED COMPOUNDS B, C, D, E, F, AND G)—

Tetrabutylammonium bromide solution, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Dissolve accurately weighed quantities of USP Benazepril Related Compound B RS, USP Benazepril Related Compound C RS, USP Benazepril Related Compound D RS, USP Benazepril Related Compound E RS, USP Benazepril Related Compound F RS, and USP Benazepril Related Compound G RS in *Mobile phase* to obtain a solution having known concentrations of about 10 µg of each related compound per mL.

Test solution—Transfer about 50 mg of Benazepril Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Calculate the percentage of benazepril related compounds in the portion of Benazepril Hydrochloride taken by the formula:

$$100(C_S / C_T)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of the relevant USP Reference Standard in the *Standard solution;* C_T is the concentration, in mg per mL, of benazepril hydrochloride in the *Test solution;* r_U is the peak response for the relevant benazepril related compound obtained from the *Test solution;* and r_S is the peak response for the relevant benazepril related compound obtained from the *Standard solution* (see *Table 1* for values).

Table 1

Benazepril Related Compound	Relative Retention Time	Limit (%)
E[1]	0.4	0.2
F[2]	0.5	0.2
C[3]	0.6	0.3
B[4]	1.5	0.5
D[5]	1.7	0.2

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the quantity, in mg, of $C_{24}H_{28}N_2O_5 \cdot HCl$ in the portion of Benazepril Hydrochloride taken by the formula:

$$250C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Benazepril Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Bismuth Subsalicylate Tablets, page 741 of *PF* 31(3) [May–June 2005]. It is proposed to revise the *Packaging and storage* statement to be consistent with the labeling for the currently marketed product. The equation in the *Assay* is also revised to include a dilution factor.

(MD-CCA: C. Anthony) RTS—C43293

Add the following:

■Bismuth Subsalicylate Tablets

» Bismuth Subsalicylate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of bismuth subsalicylate ($C_7H_5BiO_4$).

Packaging and storage—Preserve in tight containers. ~~Store between 15° and 30°.~~ Avoid excessive heat (over 40°).

Labeling—Label chewable Tablets to indicate that they are to be chewed before swallowing.

Identification—

A: It meets the requirements of the tests for *Bismuth* ⟨191⟩.

B: After acidifying with nitric acid, it meets the requirements of the test for *Salicylate* ⟨191⟩ with ferric chloride TS.

Disintegration ⟨701⟩**:** 10 minutes. [NOTE—This test does not apply for Tablets labeled as chewable.]

Assay—

Standard preparation—Transfer about 500 mg of bismuth, accurately weighed, to a 200-mL volumetric flask, dissolve in 12 mL of nitric acid, and dilute with 0.01 N nitric acid to volume. Transfer 10.0 mL of the solution so obtained into a 500-mL volumetric flask, and dilute with 1 N nitric acid to volume to obtain a concentration of 50 µg of bismuth per mL.

Assay preparation—Transfer an accurately weighed portion of finely powdered Tablets, equivalent to about 90 mg of bismuth subsalicylate, to a 200-mL volumetric flask, add about 150 mL of 1 N nitric acid, and sonicate for 2 minutes. Dilute with 1 N nitric acid to volume. Transfer 20.0 mL of the solution so obtained to a 100-mL volumetric flask, and dilute with 1 N nitric acid to volume. Centrifuge a portion at 4500 rpm for at least 10 minutes.

Procedure—Transfer 10.0 mL, accurately measured, of the *Assay preparation* and the *Standard preparation* to separate 50.0-mL volumetric flasks. Add 10.0 mL of 10% ascorbic acid solution and 25.0 mL of 20% potassium iodide solution into each volumetric flask, and dilute with 1 N nitric acid to volume. Concomitantly determine the absorbance of the solutions at the wavelength of maximum absorbance at about 463 nm with a suitable spectrophotometer using the combined reagent solutions as the blank. Calculate the quantity, in mg, of $C_7H_5BiO_4$ in the portion of Tablets taken by the formula:

~~$(362.11/208.98)(C)(A_u / A_s)$~~

In-Process Revision

$$(362.11/208.98)(CD)(A_U/A_S)$$

in which, 362.11 and 208.98 are the molecular weights of bismuth subsalicylate and bismuth, respectively; *C* is the concentration, in ~~µg~~ mg per mL, of bismuth in the *Standard preparation; D* is the dilution factor of the *Assay preparation;* and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP30*)

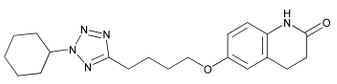
BRIEFING

Cilostazol, page 69 of *PF* 32(1) [Jan.–Feb. 2006]. On the basis of comments received, the nomenclature for the structure of cilostazol related compound C (see *Table 1*) is being revised to represent the structure as given by the innovator. The final concentration of the preparation of the *Control solution* in the test for *Chloride* is also revised.

(MD-CV: S. Ramakrishna) RTS—C47035; C47489

Add the following:

■Cilostazol



$C_{20}H_{27}N_5O_2$ 369.46

2(1*H*)-Quinolinone, 6-[4-(1-cyclohexyl-1*H*-tetrazol-5-yl)butoxy]-3,4-dihydro-.

6-[4-(1-Cyclohexyl-1*H*-tetrazol-5-yl)butoxy]-3,4-dihydrocarbostyril [*73963-72-1*].

» Cilostazol contains not less than 98.0 percent and not more than 102.0 percent of $C_{20}H_{27}N_5O_2$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers, and store at room temperature.

USP Reference standards ⟨11⟩—*USP Cilostazol RS. USP Cilostazol Related Compound A RS. USP Cilostazol Related Compound B RS. USP Cilostazol Related Compound C RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay.*

Loss on drying ⟨731⟩**—**Dry it at 110° for 3 hours: it loses not more than 0.25% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Chloride ⟨221⟩**—**

Test solution—Dissolve 0.5 g of Cilostazol in 40 mL of dimethylformamide, add 6 mL of diluted nitric acid and dimethylformamide to make 50 mL.

Control solution—To ~~25 mL~~ 0.25 mL of 0.01 M hydrochloric acid add 6 mL of diluted nitric acid and dimethylformamide to make 50 mL.

Procedure—Add 1 mL of silver nitrate TS to the *Test solution* and to the *Control solution,* mix well, and allow to stand for 5 minutes, protecting from direct sunlight. Compare the opalescence developed in both solutions against a black background by viewing downward or transversely. The opalescence developed in the *Test solution* is not more than that of the *Control solution* (0.018%).

Heavy metals, *Method II* ⟨231⟩**:** 0.001%.

Related compounds—

Diluent, Solution A, Solution B, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

In-Process Revision

Standard solution—Dissolve accurately weighed quantities of USP Cilostazol RS and USP Cilostazol Related Compound C RS in acetonitrile, with sonication if necessary, to obtain a solution having known concentrations of about 0.5 mg per mL of each component. Transfer 4 mL of this solution to a 10-mL volumetric flask, and dilute with water to volume. Further dilute this solution, stepwise if necessary, with *Diluent* to obtain a solution having known concentrations of about 0.4 µg per mL of each component.

Test solution—Transfer about 20 mg of Cilostazol, accurately weighed, to a 50-mL volumetric flask, dissolve in 20 mL of acetonitrile, with sonication if necessary. Dilute with water to volume, and mix.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of cilostazol related compound C by the formula:

$$0.1(C_S / C_T)(r_U / r_S)$$

in which C_S is the concentration, in µg per mL, of Cilostazol related compound C in the *Standard solution;* C_T is the concentration, in mg per mL, of Cilostazol in the *Test solution;* r_U is the peak response for Cilostazol related compound C obtained from the *Test solution;* and r_S is the peak response for Cilostazol related compound C obtained from the *Standard solution*. Calculate the percentage of other impurities by the formula:

$$0.1(1/F)(C_S / C_T)(r_U / r_S)$$

in which F is the relative response factor from *Table 1;* C_S is the concentration, in µg per mL, of Cilostazol in the *Standard solution;* C_T is the concentration, in mg per mL, of Cilostazol in the *Test solution;* r_U is the peak response for any other impurity obtained from the *Test solution;* and r_S is the peak response for Cilostazol obtained from the *Standard solution*.

Table 1

Name	Relative Retention Time	Relative Response Factor *(F)*	Limit (%)
Cilostazol related compound A[1]	0.2	1.7	0.1
Cilostazol related compound B[2]	0.9	0.58	0.1
Cilostazol	1.0	1.0	—
Cilostazol related compound C[3]	1.9	n/a	0.1
Any other individual impurity	—	1.0	0.1

[1] 6-Hydroxy-3,4-dihydro-1*H*-quinolin-2-one
[2] 6-[4-(1-Cyclohexyl-1*H*-tetrazol-5-yl)-butoxy]-1*H*-quinolin-2-one
[3] ~~1,6-Bis-[4-(1-cyclohexyl-1*H*-tetrazol-5-yl)-butoxy]-1*H*-quinolin-2-one~~ 1-(4-(5-Cyclohexyl-1*H*-tetrazol-1-yl)butyl)-6-(4-(1-cyclohexyl-1*H*-tetrazol-5-yl)butoxy)-3,4-dihydroquinolin-2(1*H*)-one

In addition to not exceeding the limits for impurities in *Table 1,* not more than 0.4% of total impurities is found.

Assay—

Diluent—Use a mixture of water and acetonitrile (60 : 40).

Solution A—Use a mixture of water and acetonitrile (70 : 30).

Solution B—Use a mixture of water and acetonitrile (50 : 50).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Prepare a solution in *Diluent* having known concentrations of about 0.05 mg per mL each of USP Cilostazol RS, USP Cilostazol Related Compound A RS, and USP Cilostazol Related Compound B RS.

In-Process Revision

Standard preparation—Dissolve an accurately weighed quantity of USP Cilostazol RS in acetonitrile, with sonication if necessary, to obtain a solution having a known concentration of about 1.0 mg per mL. Transfer 4 mL of this solution to a 10-mL volumetric flask, and dilute with water to volume. Further dilute this solution with *Diluent* to obtain a solution having a known concentration of about 0.04 mg per mL.

Assay preparation—Transfer about 20 mg of Cilostazol, accurately weighed, to a 50-mL volumetric flask, dissolve in 20 mL acetonitrile, sonicate if necessary, dilute with water to volume, and mix. Transfer 1 mL of this solution to a 10-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 10-cm column that contains 3.5-µm packing L7. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 40°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–6.5	100→50	0→50	linear gradient
6.5–10	50→0	50→100	linear gradient
10–20	0	100	isocratic
20–20.1	0→100	100→0	linear gradient
20.1–28	100	0	re-equilibration

Chromatograph the *System suitability solution,* identify the components using *Table 1,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between Cilostazol related compound B and Cilostazol is not less than 3.0; the tailing factor for the cilostazol peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{20}H_{27}N_5O_2$ in the portion of Cilostazol taken by the formula:

$$500C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of Cilostazol in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■2S (*USP30*)

BRIEFING

Cod Liver Oil, *USP 29* page 581. In *Identification* test *B,* it is proposed to make revisions as follows: to state the concentration of the boron trichloride–methanol solution in the *Standard solution;* to correct the catalog number for the *System suitability mixture;* to correct the names of several fatty acids appearing in the table; in the *Chromatographic system,* to describe the use of the reference chromatogram provided with USP Cod Liver Oil RS; and in the *Procedure,* to add instructions for retention times and limits for fatty acids.

(DSN: L. Evans) RTS—C43958

Change to read:

Identification—

A: *Presence of vitamin A*—To 1 mL of a 1 in 40 solution of it in chloroform, add 10 mL of antimony trichloride TS: a blue color results immediately.

B: *Fatty acid profile*—

Antioxidant solution—Dissolve an accurately weighed quantity of butylated hydroxytoluene in hexanes to obtain a solution having a concentration of 0.05 mg per mL.

Standard solution—Transfer 0.450 g of USP Cod Liver Oil RS, accurately weighed, into a 10-mL volumetric flask, and dissolve in and dilute with *Antioxidant solution* to volume. Transfer 2.0 mL of this solution into a quartz tube, and evaporate with a gentle stream of nitrogen. Add 1.5 mL of a 2% solution of sodium hydroxide in methanol, cap tightly with a polytetrafluoroethylene-lined cap, mix, and heat in a water bath for 7 minutes. Cool, add 2 mL of ~~boron trichloride–methanol solution~~ ■a solution of 120 g of boron trichloride in 1000 mL of methanol, ■2S (*USP30*) cover with nitrogen, cap tightly, mix, and heat in a water bath for 30 minutes. Cool to 40° to 50°, add 1 mL of isooctane, cap, and mix in a vortex mixer or shake vigorously for at least 30 seconds. Immediately add 5 mL of saturated sodium chloride solution, cover with nitrogen, cap, and mix in a vortex mixer or shake thoroughly for at least 15 seconds. Allow the upper layer to become clear, and transfer to a separate tube. Shake the methanol layer once

In-Process Revision

more with 1 mL of isooctane, and combine the isooctane extracts. Wash the combined extracts twice with 1 mL of water, and dry over anhydrous sodium sulfate.

System suitability mixture—Prepare a mixture containing accurately weighed and equal amounts of methyl palmitate, methyl stearate, methyl arachidate, and methyl behenate. [NOTE—A suitable mixture is available from Supelco, Bellefonte, PA, as GLC-40 cat. number ~~1985-1AMP~~

■1895-1AMP.]■2S (*USP30*)

Fatty acid	Shorthand notation	Lower limit (area %)	Upper limit (area %)
Saturated fatty acids:

■Docosahexaenoic■2S (*USP30*) acid			

Test solution—Proceed as directed for the *Standard solution,* except to use an accurately weighed quantity of Cod Liver Oil.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.25-mm × 30-m fused silica capillary column coated with a 0.25-μm film of G16. The temperature of the detector is maintained at 280° and that of the injection port at 250°. Initially the temperature of the column is equilibrated at 170°, then the temperature is increased at a rate of 1° per minute to 225°, and maintained at 225° for 20 minutes. The carrier gas is helium, with a split flow ratio of 1 : 200. Chromatograph the *Standard solution,* the *System suitability mixture,* and the *Test solution,* and record the peak responses as directed for *Procedure:*

■the chromatogram obtained from the *Standard solution* is similar to the reference chromatogram supplied with USP Cod Liver Oil RS. Identify the retention times of the relevant fatty acid methyl esters by comparing the chromatogram of the *Standard solution* with the reference chromatogram supplied with USP Cod Liver Oil RS.■2S (*USP30*)

The resolution, *R,* between the peaks in the *Standard solution* due to methyl oleate and to methyl *cis*-vaccinate is not less than 1.3, and that between methyl gadoleate and methyl gondoate is sufficient for purposes of identification and area measurement; the theoretical area percentages for methyl palmitate, methyl stearate, methyl arachidate, and methyl behenate

■in the *System suitability mixture*■2S (*USP30*) are 24.4, 24.8, 25.2, and 25.6, respectively. In a suitable instrument, the area percentages from the *System suitability mixture* are within 1% of the theoretical values. The number of fatty acid methyl ester peaks exceeding 0.05% of the total area is at least 24, and the 24 largest peaks of the methyl esters account for more than 90% of the total area. (These correspond to the following, in common elution order: 14 : 0, 15 : 0, 16 : 0, 16 : 1 n-7, 16 : 4 n-1, 18 : 0, 18 : 1 n-9, 18 : 1 n-7, 18 : 2 n-6, 18 : 3 n-3, 18 : 4 n-3, 20 : 1 n-11, 20 : 1 n-9, 20 : 1 n-7, 20 : 2 n-6, 20 : 4 n-6, 20 : 3 n-3, 20 : 4 n-3, 20 : 5 n-3, 22 : 1 n-11, 22 : 1 n-9, 21 : 5 n-3, 22 : 5 n-3, and 22 : 6 n-3.)

Procedure—Separately inject equal volumes (about 1 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses.

■Identify the retention times of the relevant fatty acid methyl esters in the *Test solution* by comparing the chromatogram of the *Test solution* with that of the *Standard solution.*■2S (*USP30*)

Calculate the area percentage for each fatty acid methyl ester taken by the formula:

$$100(r_A / r_B)$$

in which r_A is the average peak area of each individual fatty acid; and r_B is the total peak area from all peaks in the chromatogram, except the solvent front and butylated hydroxytoluene.

■The fatty acids observed in the *Test solution* should meet the limits described in the table.■2S (*USP30*)

BRIEFING

Didanosine Tablets, page 784 of *PF* 32(3) [May–June 2006]. It is proposed to add a *Dissolution* test to this new monograph. The liquid chromatographic procedure in this test was validated using the LiChrospher 60 RP-Select brand of column that contains packing L1.

(BPC: M. Marques) RTS—C46520

In-Process Revision

Add the following:

■Didanosine Tablets

» Didanosine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of didanosine ($C_{10}H_{12}N_4O_3$).

Packaging and storage—Preserve in tight containers, and store between 15° and 30°.

Labeling—Label ~~chewable~~ the Tablets to indicate that they are to be chewed before swallowing or dispersed in liquid before administration.

USP Reference standards ⟨11⟩—*USP Didanosine RS. USP Didanosine Related Compound A RS.*

Identification—

~~**A:** *Thin-Layer Chromatographic Identification Test* ⟨201⟩—~~

~~*Adsorbent*—Merck silica gel 60 with fluorescent indicator, or equivalent.~~

~~*Test solution*—Place 1 Tablet in sufficient methanol to make a 1 mg per mL solution. Stir to dissolve, and pass through a 0.45-µm filter.~~

~~*Standard solution*—Transfer 10 mg of USP Didanosine RS into a 10 mL volumetric flask. Dissolve in and dilute with methanol to volume.~~

~~*Developing solvent solution:*—A mixture of 1-butanol, methanol, ethyl acetate, and ammonium hydroxide (11 : 3 : 3 : 3).~~

~~*Procedure*—Spot 10 µL each of the *Test solution* and the *Standard solution* onto the chromatographic plate, approximately 2 cm from the bottom and 2 cm apart. Allow the plate to air-dry. Place in a chromatographic chamber, and develop, allowing the developing solution to travel at least 10 cm from the spotting line. Allow the plate to air-dry. View under shortwave light (254 nm). Didanosine appears as a blue spot.~~

~~**B:**~~ The retention time of the major peak in the chromatogram of the *Diluted assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: water; 900 mL.

Apparatus 2: 75 rpm.

Time: 30 minutes.

Determine the amount of $C_{10}H_{12}N_4O_3$ dissolved by employing the following method.

0.01 M Ammonium acetate buffer solution, Mobile phase—Proceed as directed in the *Assay.*

Standard stock solution—Transfer about 160 mg of USP Didanosine RS, accurately weighed, to a 200-mL volumetric flask. Add about 100 mL of water, shake, and sonicate for 30 seconds to dissolve. Dilute with water to volume. This solution is stable for 48 hours at 5°.

Working standard solution—Dilute the *Standard stock solution* in water to obtain a concentration of approximately *LC*/900, where *LC* is the label claim of the Tablet for didanosine.

Test solution—Pass a portion of the solution under test through a suitable filter having a porosity of 0.45 µm.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a variable wavelength detector set at 275 nm, and a 4-mm × 12.5-cm column that contains 5-µm packing L7. The flow rate is about 2 mL per minute. Chromatograph the *Working standard solution,* and record the peak responses as directed for *Procedure:* didanosine elutes at about 4.8 minutes; the column efficiency is not less than 1000 theoretical plates; the tailing factor is not more than 2; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes, equivalent to approximately 2 µg of didanosine, of the *Working standard solution* and the *Test solution* into the chromatograph, record

In-Process Revision

the chromatograms for at least 7 minutes, and measure the responses for the didanosine peaks. Calculate the percentage of $C_{10}H_{12}N_4O_3$ released by the formula:

$$\frac{r_U \times C_S \times 900 \times 100}{r_S \times LC}$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Working standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Working standard solution;* 900 is the volume, in mL, of the *Medium;* 100 is the conversion factor to percentage; and *LC* is the Tablet label claim, in mg.

Tolerances—Not less than 80% (*Q*) of the labeled amount of $C_{10}H_{12}N_4O_3$ is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Loss on drying ⟨731⟩—Dry 4 Tablets at 130° for 16 hours: they lose not more than 6% of their weight.

Related compounds—

0.01 M Ammonium acetate buffer solution—Prepare as directed in the *Assay.*

Mobile phase—Prepare a filtered and degassed mixture of *0.01 M Ammonium acetate buffer solution* and methanol (99 : 1).

Standard stock solution—Transfer 25 mg of USP Didanosine Related Compound A RS to a 200-mL volumetric flask. Dissolve in and dilute with water to volume, and mix. [NOTE—Use this solution within 48 hours of preparation.]

Standard solution—Transfer 3 mL of the *Standard stock solution* to a 250-mL volumetric flask. Dilute with water to volume, and mix. [NOTE—Use this solution within 48 hours of preparation of the *Standard stock solution*.]

Test solution—Proceed as directed for the *Assay preparation.*

Diluted test solution—Dilute the *Test solution* quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a concentration of about 0.1 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a variable wavelength detector set at 275 nm, a 4-mm × 12.5-cm column that contains 5-µm packing L7, and a matching guard column. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard solution* as directed for *Procedure:* ~~the retention time of didanosine related compound A is between 1.5 and 2.5 minutes;~~ the column efficiency is not less than 1000 theoretical plates; and the relative standard deviation for replicate injections is not more than 5.0%. [NOTE—For information purposes only, didanosine related compound A, with a retention time between 1.5 and 2.5 minutes, is hypoxanthine.]

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Diluted test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks, carrying out the chromatography for approximately 30 minutes. Calculate the percentage of didanosine related compound A in the portion of Tablets taken by the formula:

~~$100(CVDL/N)(r_U/r_S)$~~

$$100(CVD/NL)(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Didanosine Related Compound A RS in the *Standard solution; V* is the volume, in mL, of the *Test solution; D* is the dilution factor of the *Diluted test solution; N* is the number of Tablets used to prepare the *Test solution; L* is the label claim of didanosine, in mg per Tablet; and r_U and r_S are the peak responses obtained from the *Diluted test solution* and the *Standard solution,* respectively. Not more than 0.7% of didanosine related compound A is found. Calculate the percentage of any other ~~impurities~~ impurity by the formula:

In-Process Revision

$$100(r_i / r_s)$$

in which r_i is the peak response of any other individual impurity in the chromatogram of the *Diluted test solution;* and r_s is the sum of the responses of all the peaks in the chromatogram of the *Diluted test solution,* including those of didanosine and hypoxanthine: not more than 0.2% of any other individual impurity is found; and not more than 1.2% of total impurities, excluding hypoxanthine, is found.

Assay—

0.01 M Ammonium acetate buffer solution—Dissolve 1.54 g of ammonium acetate in a 2000-mL volumetric flask, dilute with water to volume, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *0.01 M Ammonium acetate buffer solution* and methanol (95 : 5). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Didanosine RS in water to obtain a solution having a known concentration of 0.1 mg per mL. [NOTE—Use this solution within 24 hours of preparation.]

Assay preparation—Transfer not fewer than 5 crushed Tablets to a 500-mL volumetric flask. Dissolve in 250 mL of water, dilute with water to volume, and shake for about 10 minutes.

Diluted assay preparation—Dilute the *Assay preparation* quantitatively, and stepwise if necessary, with water to obtain a solution containing about 0.1 mg of didanosine per mL. [NOTE—Use this solution within 72 hours of preparation; because of the buffering agents in the Tablets, the *Assay preparation* is stable longer than the *Standard preparation.*]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a variable wavelength detector set at 275 nm, a 4-mm × 12.5-cm column that contains 5-µm packing L7, and a matching guard column. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* ~~the retention time of didanosine is greater than 3.0 minutes;~~ the column efficiency is not less than 2000 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%. [NOTE—For information purposes only, the retention time of didanosine is greater than 3.0 minutes.]

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Diluted assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg per Tablet, of didanosine ($C_{10}H_{12}N_4O_3$) taken by the formula:

$$[CVD(r_U / r_S)] / N$$

in which C is the concentration, in mg per mL, of USP Didanosine RS in the *Standard preparation; V* is the volume, in mL, of the *Assay preparation; D* is the dilution factor of the *Diluted assay preparation;* r_U and r_S are the peak responses of the *Diluted assay preparation* and the *Standard preparation,* respectively; and N is the number of Tablets used to prepare the *Assay preparation.* ■2S (*USP30*)

BRIEFING

Fexofenadine Hydrochloride, *USP 29* page 905; **Fexofenadine Hydrochloride Capsules,** *USP 29* page 906. These monographs were originally slated to become official on April 1, 2005, but the official date was postponed to provide additional time to further evaluate some of the tests, procedures, and acceptance criteria provided in the proposed monographs. On the basis of comments and supporting data received from companies, it is proposed to revise the Fexofenadine Hydrochloride monograph as follows.

1. Delete the *Differential scanning calorimetry* test from *Identification* because the current acceptance criteria are specific to the anhydrous form of the drug substance. USP received comments that there are different melting ranges for the same hydrate forms. It is proposed to delete the test so that no manufacturer is excluded.
2. Revise the test for *Water* to provide separate requirements for the anhydrous and hydrate forms of the drug, and add a labeling requirement if the hydrate form is used. [NOTE—For this monograph, "hydrate" refers to a mixture of dihydrate and trihydrate forms of fexofenadine hydrochloride.]

In-Process Revision

3. Add an identification test for chloride in the *Identification* section.
4. Delete the test for *Specific surface area* because this is a manufacturer-specific property and could be an obstacle to other manufacturers entering the market.
5. Revise the acceptance criteria for the test for *Limit of fexofenadine related compound B* and the test for *Related compounds* to align with requirements for approved products.
6. Delete the retention time requirement in the test for *Limit of fexofenadine related compound B* as this is subject to wide variation.

(MD-PS: D. Bempong) RTS— C42017

Add the following:

■**Labeling—**Where it is the hydrate form, the label so indicates.■2S (*USP30*)

Change to read:

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the fexofenadine peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

~~**C:** *Differential scanning calorimetry* ⟨891⟩—Accurately weigh 2 to 6 mg of Fexofenadine Hydrochloride into an aluminum pan, and crimp the pan, using a suitable sample press. Analyze the sample from 25° to 225° at 10° per minute. The sample exhibits a single endotherm between 193° and 199°. [NOTE—The pan can be sealed hermetically, provided a pinhole is punched into the lid so that the sample can degas during heating.]~~

■**C:** Examine the precipitate formed in the *Content of chloride* test: a white precipitate is observed.■2S (*USP30*)

Change to read:

Water, *Method Ic* ⟨921⟩**:** not more than 0.5%

■for the anhydrous form; between 6.0% and 10.0% for the hydrate form. [NOTE—"Hydrate" refers to a mixture of dihydrate and trihydrate forms of fexofenadine hydrochloride.]■2S (*USP30*)

Delete the following:

~~■**Specific surface area,** *Method II* ⟨846⟩—Outgas a portion of Fexofenadine Hydrochloride, 0.2 to 0.5 g, using helium flow for 1 hour at 100° or vacuum for 1 hour at 100°. Test the sample, using gas sorption: between 2.5 and 5.0 m^2 per g is found.■2S (*USP30*)~~

Change to read:

Limit of fexofenadine related compound B—

Ammonium acetate buffer solution—Add 2.3 mL of glacial acetic acid to 2000 mL of water. Adjust with 6 N ammonium hydroxide to a pH of 4.0 ± 0.1.

Mobile phase—Prepare a filtered and degassed mixture of *Ammonium acetate buffer solution* and acetonitrile (80 : 20). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Add about 1.2 mg of USP Fexofenadine Related Compound B RS, accurately weighed, to a 5-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix. Transfer 2.0 mL of the solution so obtained into a 100-mL volumetric flask; add about 25 mg of USP Fexofenadine Hydrochloride RS, accurately weighed; dilute with *Mobile phase* to volume; and mix.

Standard solution—Dilute the *System suitability solution* quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 2.5 µg of USP Fexofenadine Hydrochloride RS per mL.

Test solution—Dissolve an accurately weighed quantity of Fexofenadine Hydrochloride in *Mobile phase* to obtain a solution having a concentration of about 0.25 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L45. The column is maintained at room temperature. The flow rate is about 0.5 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* ~~the retention time for fexofenadine is between 15 and 23 minutes;~~

■■2S (*USP30*)
the relative retention times are about 0.7 for fexofenadine related compound B and 1.0 for fexofenadine; and the resolution, *R,* between fexofenadine and fexofenadine related compound B is not less than 3.0.

Procedure—Separately inject equal volumes (about 20 µL) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of fexofenadine related compound B in the portion of Fexofenadine Hydrochloride taken by the formula:

$$100/0.8(C_S/C_T)(r_U/r_S)$$

in which 0.8 is the relative response factor for fexofenadine related compound B relative to fexofenadine; C_S is the concentration, in mg per mL, of USP Fexofenadine Hydrochloride RS in the *Standard solution;* C_T is the concentration, in mg per mL, of fexofenadine in the *Test solution;* r_U is the peak response for fexofenadine related compound B obtained from the *Test solution;* and r_S is the peak response for fexofenadine obtained from the *Standard solution:* not more than ~~0.1%~~

	Any other individual impurity			0.1
	Total impurities			0.5

$$100F(r_i / r_s)$$

in which *F* is the relative response factor for each formoterol related compound according to *Table 1*; r_i is the peak response for each formoterol related compound; and r_s is the sum of the responses for all the peaks.

Content of related compound I *(diastereoisomer)*—

Standard solution—Dissolve 10 mg of USP Formoterol Related Compound I RS in 1 mL of dimethylformamide. Add 100 µL of *N*-(trimethylsilyl)imidazole, and mix.

Test solution—Dissolve 10 mg of Formoterol Fumarate in 1 mL of dimethylformamide. Add 100 µL of *N*-(trimethylsilyl)imidazole, and mix.

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm × 30-m fused-silica capillary column coated with a 0.25-µm film of stationary phase G27, and a split injection system. The carrier gas is helium, flowing at a rate of about 2 mL per minute and a split ratio of about 75 : 1. The injection port and the detector temperatures are maintained at about 280° and 300°, respectively. The column temperature is programmed as follows. Initially the column temperature is equilibrated at 220° for 5 minutes, then the temperature is increased at a rate of 1° per minute to 250°, and maintained at 250° for 20 minutes. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between formoterol related compound I and formoterol fumarate is not less than 2.0.

Procedure—Separately inject equal volumes (about 2 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses for formoterol related compound I and formoterol fumarate. Disregard all other peaks. Calculate the percentage of formoterol related compound I in the portion of Formoterol Fumarate taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for formoterol related compound I, and r_s is the sum of the responses of both formoterol fumarate and formoterol related compound I peaks: not more than 0.3% of formoterol related compound I is found.

Assay—Transfer about 350 mg of Formoterol Fumarate, accurately weighed, to a titration vessel, dissolve in 50 mL of anhydrous acetic acid, and titrate with 0.1 M perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 M perchloric acid is equivalent to 40.24 mg of $(C_{19}H_{24}N_2O_4)_2 \cdot C_4H_4O_4$. ■2S *(USP30)*

BRIEFING

Glipizide, *USP 29* page 1002. Comments were received that the currently official HPLC method for the test for *Related compounds* does not have sufficient specificity. It is proposed to designate the currently official method as *Test 1,* and to add a new method that is able to separate glipizide related compounds A and B, as *Test 2*. It is also proposed to use this new liquid chromatographic method for the *Assay.* The procedure is based on analyses performed with the Phenomenex Curosil-PFP brand of L43 column. The typical retention time for the glipizide peak is about 21 minutes. Alternatively, Supelco Discovery HS FS brand of L43 column can be used, with the typical retention times for the glipizide peak of about 14 minutes. In addition, it is proposed to change the format of the formula in *Test 1,* as recommended in the Stimuli article *Common Pharmacopeial Calculations in USP Monographs,* published on page 626 of *PF* 31(2).

Disregard any impurity peak that is less than 0.05%. Not more than 0.5% of any individual impurity is found. ~~; and not more than 1.5% of total impurities is found.~~

■TEST 2 (limit of related compounds A, B, and C)—

0.02 M Phosphate buffer, Mobile phase, Impurity standard stock solution, System suitability solution, Sensitivity solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Impurity standard solution—Accurately transfer 5.0 mL of the *Impurity standard stock solution* into a 100-mL volumetric flask, and dilute with methanol to volume. Accurately transfer 10.0 mL of the solution obtained into another 100-mL volumetric flask containing 20 mL of acetonitrile and 60 mL of *0.02 M Phosphate buffer.* Sonicate the solution for about 5 minutes, dilute with *0.02 M Phosphate buffer* to volume, and mix. This solution contains about 0.0005 mg of each of glipizide related compounds A, B, and C per mL.

Test solution—Use *Assay preparation.*

Procedure—Separately inject equal volumes (about 10 µL) of the *Impurity standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each of the glipizide related compounds A, B, or C in the portion of Glipizide taken by the formula:

$$100(C_S/C_T)(r_U/r_S)$$

in which C_S is the concentration, in mg per mL, of the respective glipizide related compound in the *Impurity standard solution;* C_T is the concentration, in mg per mL, of Glipizide in the *Test solution;* r_U and r_S are the peak responses for the respective glipizide related compound obtained from the *Test solution* and the *Impurity standard solution,*

In-Process Revision

respectively. Not more than 0.5% of any individual impurity is found; and not more than 1.5% of total impurities is found, the results for *Test 1* and *Test 2* being combined.■2S *(USP30)*

Change to read:

~~**Assay**— [NOTE—Use low-actinic glassware in this procedure.]~~

~~*Buffer*— Dissolve 13.8 g of monobasic sodium phosphate in water, and dilute with water to 1000 mL. Adjust with 2.0 N sodium hydroxide to a pH of 6.00 ± 0.05.~~

~~*Mobile phase*— Prepare a filtered and degassed mixture of *Buffer* and methanol (55 : 45). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~

~~*Standard preparation*— Dissolve an accurately weighed quantity of USP Glipizide RS in methanol, and dilute quantitatively with methanol to obtain a solution having a known concentration of about 0.1 mg per mL. Transfer 25.0 mL of this solution to a 50-mL volumetric flask, dilute with *Buffer* to volume, and mix to obtain a solution having a known concentration of about 0.05 mg per mL.~~

~~*Assay preparation*— Transfer about 20 mg of glipizide, accurately weighed, to a 200-mL volumetric flask, and dissolve in and dilute with methanol to volume. Pipet 25 mL of this solution into a 50-mL volumetric flask, dilute with *Buffer* to volume, and mix to obtain a solution having a known concentration of about 0.05 mg per mL.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩): The liquid chromatograph is equipped with a 225-nm detector and a 15-cm × 3.9-mm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.0%.~~

~~*Procedure*— Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of glipizide ($C_{21}H_{27}N_5O_4S$) in the portion of Glipizide taken by the formula:~~

$$~~400C(r_U/r_S),~~$$

~~in which *C* is the concentration, in mg per mL, of USP Glipizide RS in the *Standard preparation,* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.~~

■[NOTE—Use low-actinic glassware for solutions containing glipizide.]

0.02 M Phosphate buffer—Dissolve 2.84 g of dibasic sodium phosphate in 1000 mL of water. Adjust with phosphoric acid to a pH of 6.00 ± 0.05.

Mobile phase—Prepare a filtered and degassed mixture of *0.02 M Phosphate buffer,* acetonitrile, and methanol (70 : 20 : 10). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Transfer accurately weighed amounts of USP Glipizide RS to a suitable volumetric flask, and dissolve in methanol with the aid of sonication for about 5 minutes to obtain a solution having a known concentration of about 1.0 mg of glipizide per mL.

Standard preparation—Accurately transfer 10.0 mL of the *Standard stock preparation* into a 100-mL volumetric flask containing 20 mL of acetonitrile and 60 mL of *0.02 M Phosphate buffer.* Sonicate the solution for about 5 minutes, dilute with *0.02 M Phosphate buffer* to volume, and mix. This solution contains about 0.1 mg of glipizide per mL.

Impurity standard stock solution—Transfer accurately weighed amounts of USP Glipizide Related Compound A RS, USP Glipizide Related Compound B RS, and USP Glipizide Related Compound C RS to a suitable volumetric flask, and dissolve in methanol with the aid of sonication for about 5 minutes to obtain a solution having known concentrations of about 0.1 mg of each of glipizide related compounds A, B, and C per mL. [NOTE—Glipizide related compound A is *N*-{2-[(4-aminosulfonyl)phenyl]ethyl}-5-methyl-pyrazinecarboxamide; glipizide related compound B is 6-methyl-*N*-[2-(4-sulfamoylphenyl)ethyl]pyrazine-2-carboxamide; and glipizide related compound C is 1-cyclohexyl-3-[[4-[2-[[(6-methylpyrazin-2-yl)carbonyl]amino]ethyl]phenyl]sulfonyl]urea.]

System suitability stock solution—Transfer an accurately weighed amount of USP Glipizide RS to a suitable volumetric flask, dissolve in methanol with the aid of sonication for about 5 minutes, and add an accurately measured volume of *Impurity standard stock solution* to obtain a solution containing about 1.0 mg of glipizide and about 0.005 mg of each of glipizide related compounds A, B, and C per mL.

System suitability solution—Accurately transfer 10.0 mL of the *System suitability stock solution* into a 100-mL volumetric flask containing 20 mL of acetonitrile and 60 mL of *0.02 M Phosphate buffer.* Sonicate the solution for about 5 minutes, dilute with *0.02 M Phosphate buffer* to volume, and mix.

Sensitivity solution—Accurately transfer 5.0 mL of the *System suitability solution* into a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Assay stock preparation—Transfer about 100 mg of Glipizide, accurately weighed, to a 100-mL volumetric flask, dissolve in about 50 mL of methanol with the aid of sonication for about 5 minutes, dilute with methanol to volume, and mix.

Assay preparation—Accurately transfer 10.0 mL of the *Assay stock preparation* into a 100-mL volumetric flask containing 20 mL of acetonitrile and 60 mL of *0.02 M Phosphate buffer.* Sonicate the solution for about 5 minutes, dilute with *0.02 M Phosphate buffer* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L43. The column temperature is maintained at 40°. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the elution order is glipizide related compound A, glipizide related compound B, glipizide, and glipizide related compound C; the resolution, *R,* between glipizide related compound A and glipizide related compound B peaks is not less than 1.8, and the resolution, *R,* between glipizide and glipizide related compound C peaks is also not less than 1.8; the tailing factor for the glipizide peak is not more than 2.0; and the relative standard deviation for 5 replicate injections is not more than 1.5% for the glipizide peak and not more than 5.0% for each of the related compounds peaks. Chromatograph the *Sensitivity solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio for each of glipizide related compound A and glipizide related compound B peaks is not less than 15.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of $C_{21}H_{27}N_5O_4S$ in the portion of Glipizide taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which C_S and C_U are the concentrations, in mg per mL, of glipizide in the *Standard preparation* and the *Assay preparation,* respectively; and r_U and r_S are the glipizide peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP30*)

BRIEFING

Hydroxyzine Hydrochloride, *USP 29* page 1089 and page 114 of *PF* 32(1) [Jan.–Feb. 2006]. It is proposed to replace the current titration assay with the HPLC method used in the test for *Chromatographic purity.* During the validation it was established that this test can be successfully done with one 25-cm long L3 column instead of the currently required two 10-cm long L3 columns, with some minor modifications. The validation work was performed using the Econosphere brand of Silica column manufactured by Alltech Associates. Hydroxyzine related compound A and hydroxyzine elute around 6.1 and 6.9 minutes, respectively. The definition has been changed to reflect the variability in the HPLC method.

BRIEFING

Meloxicam Tablets. Because there is no *USP* monograph for this dosage form, a new monograph is being proposed. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with a Kromasil C18 brand of L1 column. The typical retention time for meloxicam is about 4.0 minutes.

(MD-CCA: C. Anthony) RTS—C41830

Add the following:

■Meloxicam Tablets

» Meloxicam Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of meloxicam ($C_{14}H_{13}N_3O_4S_2$).

Packaging and storage—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards ⟨11⟩—*USP Meloxicam RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

0.1 N Methanolic sodium hydroxide—Dilute 100 mL of 1 N sodium hydroxide with methanol to 1000 mL.

Test solution—Transfer a portion of finely powdered Tablets, equivalent to about 50 mg of meloxicam, to a suitable flask. Add 5 mL of *0.1 N Methanolic sodium hydroxide,* and mix. Add 20 mL of methanol, and stir for about 15 minutes. Filter the mixture to remove insoluble material, and use the filtrate.

Standard solution—Transfer about 20 mg of USP Meloxicam RS, accurately weighed, to a 10-mL volumetric flask, dissolve in 2 mL of *0.1 N Methanolic sodium hydroxide,* dilute with methanol to volume, and mix.

Developing solvent system—Prepare a mixture of chloroform, methanol, and ammonia water (25%) (80 : 20 : 1).

Procedure—Proceed as directed in the chapter.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩**:** [To come.]

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Related compounds—

Solution A, Solution B, and *Mobile phase*—Proceed as directed in the *Assay.*

Standard solution—Use the *Standard preparation* from the *Assay.*

System sensitivity solution—Transfer 4 mL of the *Standard solution* to a 100-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 5 mL of the resulting solution to a 50-mL volumetric flask, add 5 mL of 1 N sodium hydroxide, and dilute with methanol to volume.

Test solution—Use the *Assay preparation* from the *Assay.*

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay,* except to chromatograph the *Standard solution* and the *System sensitivity solution:* the tailing factor for the meloxicam peak is not more than 2.0; the relative standard deviation for replicate injections of the *Standard solution* is not more than 2.0%; and the signal-to-noise ratio of the meloxicam peak in the chromatogram of the *System sensitivity solution* is not less than 10.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Determine the relative retention times for the impurity peaks relative to that of the meloxicam peak. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$(5000/3)(1/F)(C/W)(A/L)(r_i/r_S)$$

in which F is the relative response factor for each impurity and is equal to 2.7 for the impurity with a relative retention time of about 0.5 (meloxicam related compound B [2-amino-

In-Process Revision

5-methylthiazole]) and 1.0 for all other impurities; *C* is the concentration, in mg per mL, of USP Meloxicam RS in the *Standard solution; W* is the weight, in mg, of powdered Tablets taken to prepare the *Test solution; A* is the average weight of a Tablet; *L* is the labeled amount, in mg, of meloxicam in each Tablet; r_i is the peak response obtained for each impurity in the *Test solution;* and r_S is the peak response for meloxicam in the *Standard solution:* not more than 0.15% of meloxicam related compound B is found; not more than 0.2% of any individual unknown impurity is found; and not more than 0.5% of total impurities is found.

Assay—

Solution A—Dissolve 2.0 g of dibasic ammonium phosphate in 1 L of water, and adjust with phosphoric acid to a pH of 7.0 ± 0.1.

Solution B—Mix 650 mL of methanol and 100 mL of isopropyl alcohol.

Mobile phase—Prepare a filtered and degassed mixture of *Solution A* and *Solution B* (63 : 37). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—[NOTE—The *Standard stock preparation* is prepared so that the final concentration of meloxicam, in mg per mL, is approximately equivalent to the concentration of the *Assay stock preparation.*] Transfer a suitable quantity of USP Meloxicam RS, accurately weighed, to a 50-mL volumetric flask, dissolve in 1 mL of 1 N sodium hydroxide and 30 mL of methanol, and dilute with methanol to volume. Transfer 10 mL of the resulting solution to a 100-mL volumetric flask, add 10 mL of 1 N sodium hydroxide, and dilute with methanol to volume.

Standard preparation—Transfer 15 mL of the *Standard stock preparation* to a 25-mL volumetric flask, and dilute with water to volume.

Assay stock preparation—Transfer 10 Tablets to a 1000-mL volumetric flask, add about 100 mL of 1 N sodium hydroxide, shake to disperse the Tablets, and add 800 mL of methanol. Sonicate the solution for about 15 minutes, then stir for 30 minutes. Dilute with methanol to volume, and mix. Filter the resulting solution, and use the filtrate.

Assay preparation—Transfer 15 mL of the *Assay stock preparation* to a 25-mL volumetric flask, and dilute with water to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector, a guard column that contains packing L1, and a 4-mm × 10-cm column that contains packing L1. The flow rate is about 0.8 mL per minute. The column temperature is maintained at 40°. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor for the meloxicam peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* to the chromatograph, record the chromatograms, and measure the responses for the meloxicam peak. Calculate the quantity, in mg, of meloxicam ($C_{14}H_{13}N_3O_4S_2$) in the portion of Tablets taken by the formula:

$$5000(C/3)(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Meloxicam RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■2S (*USP30*)

In-Process Revision

BRIEFING

Naratriptan Hydrochloride, *USP 29* page 1487. It is proposed to rename the *Resolution solution* in the *Assay* to *System suitability preparation* to eliminate confusion between its use and preparation in the *Chromatographic purity* test and in the *Assay.* It is also proposed to revise the *System suitability preparation* in the *Assay* to reflect the true nature of the USP Naratriptan Resolution Mixture RS, which is a mixture of naratriptan, naratriptan related compound A, and naratriptan related compound B; and to increase the concentration of the *System suitability preparation* to enhance the ability to see the peaks due to both naratriptan related compounds A and B.

(MD-PP: R. Ravichandran) RTS—C46788

Change to read:

Assay—

0.01 M Triethylamine phosphate buffer—Dilute 0.6 mL of phosphoric acid with water to 900 mL, and adjust with triethylamine to a pH of 2.5.

Mobile phase—Prepare a filtered and degassed mixture of *0.01 M Triethylamine phosphate buffer* and isopropyl alcohol (9 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

~~*Resolution solution*—Dissolve accurately weighed quantities of USP Naratriptan Hydrochloride RS and USP Naratriptan Resolution Mixture RS in *Mobile phase* to obtain a solution having known concentrations of about 0.11 mg per mL and 0.11 µg per mL, respectively.~~

■*System suitability preparation*—Dissolve an accurately weighed quantity of USP Naratriptan Resolution Mixture RS in *Mobile phase* to obtain a solution having a concentration of about 0.7 mg per mL.■2S (*USP30*)

Standard preparation—Dissolve an accurately weighed quantity of USP Naratriptan Hydrochloride RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.11 mg per mL.

Assay preparation—Transfer about 11 mg of Naratriptan Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 282-nm detector and a 4.6-mm × 15-cm column that contains 3-µm packing L11. The column temperature is maintained at 35°. The flow rate is about 1.5 mL per minute. Chromatograph the ~~*Resolution solution,*~~

■*System suitability preparation,*■2S (*USP30*) and record the peak responses as directed for *Procedure:* ~~the relative retention times are about 0.9 for 3-(1-methylpiperidin-4-yl)-1*H*-indole (naratriptan related compound A), 1.0 for naratriptan, and 1.1 for naratriptan related compound B; and~~

■■2S (*USP30*) the resolution, *R,* between naratriptan related compound A and naraptriptan and between naratriptan related compound B and naratriptan is not less than 1.5. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 1.5%.

■[NOTE—For identification purposes, the approximate relative retention times are about 0.9 for naratriptan related compound A, 1.0 for naratriptan, and 1.1 for naratriptan related compound B.]■2S (*USP30*)

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $C_{17}H_{25}N_3O_2S \cdot HCl$ in the portion of Naratriptan Hydrochloride taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Naratriptan Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Nefazodone Hydrochloride, page 3733 of the *Second Supplement* and the *Fifth Interim Revision Announcement* in this number of *PF.* In the newly implemented test for *Related compounds,* it is proposed to combine the currently required two different stock solutions of nefazodone related compound A and nefazodone related compound B into one solution, *Impurities stock solution,* and to specify the final concentration of the components in this solution. Because of this proposed revision, the *Resolution solution* and the *Standard solution* used in the *Related compounds* test now reflect the final concentration.

(MD-PP: R. Ravichandran) RTS—C47315

Add the following:

•**Related compounds—**

Diluent—Prepare a solution of water and acetonitrile (50 : 50).

Solution A—Dissolve 0.77 g of ammonium acetate in about 950 mL of water. Adjust with triethylamine to a pH of 7.10 ± 0.05. Dilute with water to 1 L. Filter and degas.

Solution B—Use filtered and degassed acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Dissolve an accurately weighed amount of USP Nefazodone Hydrochloride RS in *Diluent* to obtain a solution containing 0.1 mg per mL of nefazodone hydrochloride.

~~*Nefazodone related compound A stock solution* and *Nefazodone related compound B stock solution*—Transfer about 20 mg of each USP Nefazodone Related Compound A RS and USP Nefazodone Related Compound B RS, accurately weighed, into separate 200-mL volumetric flasks. Dissolve in and dilute with *Diluent* to volume.~~

■*Impurities stock solution*—Dissolve accurately weighed quantities of USP Nefazodone Related Compound A RS and USP Nefazodone Related Compound B RS in *Diluent* to obtain a final solution having a known concentration of about 0.1 mg per mL of each compound.■2S (*USP30*)

Resolution solution—~~Pipet 5.0 mL of *Nefazodone related compound A stock solution* and 5.0 mL of *Nefazodone related compound B stock solution* into a 100-mL volumetric flask. Dilute with *Standard stock solution* to volume, and mix. This solution contains about 90 µg per mL of nefazodone hydrochloride, and about 5 µg per mL each of nefazodone related compound A and B.~~

In-Process Revision

■Dilute a suitable volume of the *Impurities stock solution* with the *Standard stock solution* to obtain a solution having a concentration of about 5 µg per mL each of nefazodone related compounds A and B.■2S (*USP30*)

Standard solution—~~Pipet 2.0 mL each of the *Standard stock solution, Nefazodone related compound A stock solution,* and *Nefazodone related compound B stock solution* into a 200-mL volumetric flask. Dilute with *Diluent* to volume, and mix well to obtain a final concentration of 1 µg per mL each of nefazodone hydrochloride, nefazodone related compound A, and nefazodone related compound B.~~

■Dilute accurately measured volumes of the *Impurities stock solution* and the *Standard stock solution* quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 1 µg per mL each of nefazodone hydrochloride, nefazodone related compound A, and nefazodone related compound B.■2S (*USP30*)

Test solution—Transfer about 100 mg of Nefazodone Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 250-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.7 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	50	50	equilbration
0–10	50→45	50→55	linear gradient
10–16	45→35	55→65	linear gradient
16–25	35	65	isocratic
25–26	35→50	65→50	linear gradient
26–35	50	50	re-equilbration

Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between nefazodone related compound A and nefazodone hydrochloride is not less than 4.0 and is not less than 1.5 between nefazodone hydrochloride and nefazodone related compound B. Chromatograph the *Standard solution,* and measure the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 5.0% for nefazodone related compound A and nefazodone related compound B. [NOTE—For identification purposes, the relative retention times are about 1.2 for nefazodone related compound A, 1.0 for nefazodone hydrochloride, and 0.94 for nefazodone related compound B.]

Procedure—Inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each nefazodone related compound in the portion of Nefazodone Hydrochloride taken by the formula:

$$100(C_S/C_T)(r_U/r_S)$$

in which C_S is the concentration, in mg per mL, of the relevant USP Reference Standard in the *Standard solution;* C_T is the concentration of Nefazodone Hydrochloride, in mg per mL, in the *Test solution;* and r_U and r_S are the peak areas of the corresponding nefazodone related compound obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.2% of nefazodone related compound A is found; not more than 0.2% of nefazodone related compound B is found; not more than 0.1% of any unknown impurity is found; and not more than 0.5% of total impurities is found. [NOTE—Use the peak area for nefazodone hydrochloride in the *Standard solution* as r_S to calculate any unknown impurity.]●5

BRIEFING

Ondansetron Orally Disintegrating Tablets, page 3736 of the *Second Supplement.* It is proposed to make a correction in the formula used to calculate the amount of drug dissolved in the *Dissolution* test.

(BPC: M. Marques) RTS— C40143; C41613; C44228

Change to read:

Dissolution ⟨711⟩—

Medium: 0.1 N hydrochloric acid; 500 mL, deaerated.
Apparatus 2: 50 rpm.
Time: 10 minutes.

Standard solution—Accurately weigh an amount of USP Ondansetron RS, and dilute with *Medium* to obtain a solution having a final concentration of 0.01 mg per mL for Tablets labeled to contain 4 mg, and a final concentration of 0.02 mg per mL for Tablets labeled to contain 8 mg.

Test solution—Pass a portion of the solution under test through a filter.

Procedure—Determine the amount of $C_{18}H_{19}N_3O$ dissolved by UV absorption at the wavelength of maximum absorbance at about 310 nm on portions of the *Test solution* in comparison with the *Standard solution,* using a 1-cm cell. Calculate the amount, in percentage, of ondansetron released by the formula:

$$\cancel{\frac{A_U \times W_S \times 500 \times MW_1 \times P \times 100}{A_S \times D \times L \times MW_2}}$$

■$$\frac{A_U \times W_S \times 500 \times P \times 100}{A_S \times D \times L}$$■2S (*USP30*)

in which A_U and A_S are the absorbances obtained from the *Test solution* and the *Standard solution,* respectively; W_S is the weight, in mg, of USP Ondansetron RS taken; 500 is the volume, in mL, of *Medium;* ~~*MW_1,* is the molecular weight of ondansetron (293.4); *P* is the purity, expressed in decimal, of USP Ondansetron RS;~~

■■2S (*USP30*)
100 is the conversion factor to percentage; *D* is the dilution factor of the *Standard solution;*

■and■2S (*USP30*)
L is the Tablet label claim, in mg. ~~and *MW_2* is the molecular weight of ondansetron hydrochloride dihydrate (365.9).~~

■■2S (*USP30*)
Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{18}H_{19}N_3O$ is dissolved in 10 minutes.

In-Process Revision

BRIEFING

Oxandrolone Tablets, *USP 29* page 1592 and page 3573 of the *First Supplement*. In *Dissolution Test 1* it is proposed to add instructions on how to prepare the *Working standard solution* according to the tablet label claim. In *Dissolution Test 2* it is proposed to correct the type of detector and to specify the temperatures of the column and the detector.

(BPC: M. Marques) RTS—C44276

Change to read:

Dissolution ⟨711⟩—

■TEST 1—■1S (*USP29*)

Medium: a solution of water and isopropanol (7 : 3); 500 mL.

Apparatus 2: 100 rpm.

Time: 60 minutes.

Determine the amount of $C_{19}H_{30}O_3$ dissolved by employing the following method.

Internal standard solution—Dissolve accurately weighed quantities of 17α-methyltestosterone, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a concentration of about 0.2 mg per mL (for Tablets with a 2.5-mg label claim) and about 0.8 mg per mL (for Tablets with a 10-mg label claim).

Standard solution—Dissolve an accurately weighed quantity of USP Oxandrolone RS, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a concentration of about 1 mg per mL.

Working standard solution—~~Combine 100 µL of the *Standard solution,* 400 µL of the *Internal standard solution,* and 1500 µL of acetonitrile.~~

■For Tablets labeled to contain 2.5 mg: combine 100 µL of the *Standard solution,* 400 µL of the *Internal standard solution,* and 1500 µL of acetonitrile. For Tablets labeled to contain 10 mg: combine 100 µL of the *Standard solution,* 100 µL of the *Internal standard solution,* and 1800 µL of acetonitrile.■2S (*USP30*)

Test solution—Withdraw 25 mL of the solution under test from the vessel. Pass through a 0.45-µm polytef filter. Transfer 20 mL of the filtrate to a separatory funnel, add 400 µL of the *Internal standard solution,* 40 mL of a 10% potassium chloride solution, and 8 mL of chloroform. In separate separatory funnels, prepare an extraction blank and an internal standard blank in a similar manner using 20 mL of filtered *Medium* in place of the solution under test and excluding the *Internal standard solution* from the extraction blank. Shake each funnel, and allow the layers to separate. Collect the lower chloroform layer. Repeat the extraction procedure one more time. Evaporate the solvents under a stream of nitrogen at 45° until just dry. Reconstitute the dried residue with 2 mL of acetonitrile (for Tablets with a 2.5-mg label claim) or with 8 mL of acetonitrile (for Tablets with a 10-mg label claim), and sonicate for 10 minutes.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 30-m column coated with a 0.5-µm phase G27. The carrier gas is helium, flowing at a rate of about 16.8 mL per minute. The injection port and detector temperatures are maintained at 190° and 320°, respectively. The chromatograph is programmed as follows. Upon injection, the column temperature is increased at a rate of 25° per minute to 280°, and maintained at 280° for 3 minutes. Then the column temperature is increased at a rate of 10° per minute to 320°, and maintained at 320° for 3 minutes. Chromatograph the acetonitrile, the extraction blank, and the internal standard blank, and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5. Make two injections of the *Working standard solution,* and record the peak responses. The average oxandrolone/*Internal standard solution* peak area percent comparison is between 98.0% and 102.0%. The resolution, *R,* between the oxandrolone peak and the nearest eluting peak is equal to or greater than 1.5.

Procedure—Separately inject equal volumes (0.5 µL) of the *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{19}H_{30}O_3$ released by the formula:

$$\frac{C_S \times \text{sample ratio} \times V_{UF} \times 500 \times 100}{\text{Standard ratio} \times V_{UI} \times LC}$$

in which C_S is the concentration, in mg per mL, of oxandrolone in the *Standard solution;* sample ratio is the area ratio of oxandrolone to 17α-methyltestosterone in the sample injection for each *Test solution;* V_{UF} is the final volume, in mL, of the sample after reconstitution of the dry residue; 500 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; standard ratio is the mean area ratio of oxandrolone to 17α-methyltestosterone in all injections of the *Standard solution;* V_{UI} is the initial sample volume, in mL, used in the extraction; and *LC* is the tablet label claim, in mg.

Tolerances—Not less than 75% *(Q)* of the labeled amount of oxandrolone ($C_{19}H_{30}O_3$) is dissolved in 60 minutes.

■TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

Medium: 1% polysorbate 80 in water; 500 mL, deaerated.

Apparatus 2: 100 rpm.

Time: 120 minutes.

Determine the amount of $C_{19}H_{30}O_3$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (55 : 45). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Transfer about 20 mg of USP Oxandrolone RS, accurately weighed, to a 200-mL volumetric flask. Add about 20 mL of acetonitrile, and sonicate to dissolve. Dilute with *Medium* to volume, and mix.

Working standard solution—Quantitatively dilute the *Standard stock solution* with *Medium* to obtain a solution having a final concentration of about 5 µg per mL for Tablets with a label claim of 2.5 mg, or a final concentration of about 20 µg per mL for Tablets with a label claim of 10 mg.

Test solution—Withdraw about 10 mL of the solution under test from the vessel. Centrifuge in a glass tube at 2000 rpm for 10 minutes.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a ~~reflective~~ ■refractive■2S (*USP30*) index detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1.

■The column is maintained at 30°, and the detector is maintained at 50°.■2S (*USP30*)

The flow rate is about 1.5 mL per minute. Chromatograph the *Working standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; the column efficiency is not less than 4000 theoretical plates; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{19}H_{30}O_3$ released by the formula:

$$\frac{r_U \times C_S \times D \times 500 \times 100}{r_S \times LC}$$

In-Process Revision

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Working standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Working standard solution; D* is the dilution factor of the *Test solution;* 500 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the tablet label claim, in mg.

Tolerances—Not less than 65% *(Q)* of the labeled amount of $C_{19}H_{30}O_3$ is dissolved in 120 minutes.■1S (*USP29*)

BRIEFING

Pamidronate Disodium for Injection, page 3739 of the *Second Supplement.* In the *Packaging and storage* section, it is proposed to delete the reference to Type III glass. It is also proposed to correct the limit in the test for *Bacterial endotoxins*. The revised limit is based on the maximum single dosage for the Pamidronate Disodium Injection.

(MD-GRE: E. Gonikberg; MSA: R. Tirumalai) RTS—C46748; C46749

Change to read:

Packaging and storage—Preserve in *Containers for Sterile Solids,* as described under *Injections* ⟨1⟩. ~~, preferably of Type III glass.~~

■■2S (*USP30*)
Store at controlled room temperature.

USP Endotoxin Units per mg of anhydrous pamidronate disodium.

BRIEFING

Pyrantel Pamoate, *USP 29* page 1864. In the test for *Limit of iron,* the *Test Preparation* is provided in the monograph; however, the method procedure and the *Standard Preparation* are not specified. Because this test is based on the general chapter *Iron* ⟨241⟩, it is proposed to clarify the procedure by cross referencing the test to the general chapter.

(MD-AA: B. Davani) RTS—C44729

Change to read:

Limit of iron

■⟨241⟩■2S (*USP30*)
—To the residue obtained in the test for *Residue on ignition* add 3 mL of hydrochloric acid and 2 mL of nitric acid, and evaporate on a steam bath to dryness. Dissolve the residue in 2 mL of hydrochloric acid with the aid of gentle heat. Add 18 mL of hydrochloric acid, dilute with water to 50 mL, and mix. Dilute 5 mL of this solution with water to 47 mL: the limit is 0.0075%.

BRIEFING

Sodium Bicarbonate, *USP 29* page 1970 and page 3581 of the *First Supplement*. It is proposed to address the following comments:

1. In the test for *Normal carbonate,* a solubility problem is still encountered when the test is performed without agitation, even after the temperature has been changed from 5° to 15°. It is proposed to allow a "very gentle swirling" in order to get the material into solution. This is consistent with the current industry practice and with the monograph for Sodium Bicarbonate in the *Japanese Pharmacopoeia,* XIV Edition.
2. In the test for *Limit of ammonia,* the procedure does not allow to calculate or verify the percentage of ammonia in the sample. It is proposed to delete the numeric limit in the test and merely state that the material meets the requirement of this test if no blue color develops.

(MD-GRE: E. Gonikberg) RTS—C46744

Change to read:

Normal carbonate—Add 2.0 mL of 0.10 N hydrochloric acid and 2 drops of phenolphthalein TS to 1.0 g of Sodium Bicarbonate, previously dissolved ~~without agitation~~

■with very gentle swirling■2S (*USP30*)
in 20 mL of water at a temperature not exceeding ■15°:■1S (*USP29*) the solution does not assume more than a faint pink color immediately.

Limit of ammonia—

■*Sodium hypochlorite solution*—Use a commercially available solution that contains 4.0% to 6.0% of sodium hypochlorite.

Oxidizing solution—[NOTE—Prepare on the day of use.] Prepare a mixture of alkaline sodium citrate TS and *Sodium hypochlorite solution* (4 : 1).

Diluted sodium nitroferricyanide solution—Prepare a mixture of water and sodium nitroferricyanide TS (10 : 1).

Test solution—Transfer 2.5 g of Sodium Bicarbonate to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Procedure—[NOTE—Carefully follow the order of addition stated below.] To 4.0 mL of the *Test solution,* add 0.4 mL of phenol TS, 0.4 mL of *Diluted sodium nitroferricyanide solution,* and 1.0 mL of *Oxidizing solution*. Dilute with water to 10 mL, mix, and allow to stand for 1 hour: no blue color develops. ~~(0.002%).~~

■■2S (*USP30*)
■1S (*USP29*)

BRIEFING

Sodium Fluoride, *USP 29* page 1980. It is proposed to replace the current fluoride-selective electrode procedure in the *Assay* with a simple titration procedure employed in the monograph for Sodium Fluoride in *European Pharmacopoeia* 5.5. The proposed method provides more reproducible assay results, and is also simpler and more time-efficient to perform.

(MD-GRE: E. Gonikberg) RTS—C46326

Change to read:

Assay—~~[NOTE—Store all solutions, except the *Buffer solution*, in plastic containers.]~~

~~*Buffer solution* and *Standard preparations*—Prepare as directed in the *Assay* under *Sodium Fluoride Oral Solution*.~~

~~*Assay preparation*—Transfer about 100 mg of Sodium Fluoride, accurately weighed, to a 250-mL volumetric flask. Add 50 mL of water, mix for 5 minutes, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, dilute with water to volume, and mix.~~

~~*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Sodium Fluoride Oral Solution*. Calculate the quantity, in mg, of NaF in the portion of Sodium Fluoride taken by the formula:~~

~~$(41.99/18.998)(1.25C)$,~~

~~in which 41.99 is the molecular weight of sodium fluoride; 18.998 is the atomic weight of fluorine; and *C* is the determined concentration of fluoride, in µg per mL, in the *Assay preparation*.~~

■To 80.0 mg of Sodium Fluoride add a mixture of 5 mL of acetic anhydride and 20 mL of glacial acetic acid, and heat to dissolve. Allow to cool, and add 20 mL of dioxane. Add 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 4.199 mg of NaF.■2S (*USP30*)

BRIEFING

Sodium Fluoride Oral Solution, *USP 29* page 1981. It is proposed to clarify that a suitable reference electrode could be used in the *Assay* procedure.

(MD-GRE: E. Gonikberg) RTS—C46845

Change to read:

Assay—[NOTE—Store all solutions, except the *Buffer solution,* in plastic containers.]

Buffer solution—Dissolve 57 mL of glacial acetic acid, 58 g of sodium chloride, and 4 g of (1,2-cyclohexylenedinitrilo)tetraacetic acid in 500 mL of water. Adjust with 5 N sodium hydroxide to a pH of 5.25 ± 0.25, dilute with water to 1000 mL, and mix.

Standard preparations—Quantitatively dissolve an accurately weighed quantity of USP Sodium Fluoride RS in water to obtain a solution containing 420 µg per mL. Each mL of this solution (*Standard preparation A*) contains 190 µg of fluoride ion (10^{-2} M). Transfer 25.0 mL of *Standard preparation A* to a 250-mL volumetric flask, dilute with water to volume, and mix. This solution (*Standard preparation B*) contains 19 µg of fluoride ion per mL (10^{-3} M). Transfer 25.0 mL of *Standard preparation B* to a 250-mL volumetric flask, dilute with water to volume, and mix. This solution (*Standard preparation C*) contains 1.9 µg of fluoride ion per mL (10^{-4} M).

Assay preparation—Transfer an accurately measured volume of Oral Solution, equivalent to about 10 mg of fluoride, to a 500-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Pipet 20 mL of each *Standard preparation* and of the *Assay preparation* into separate plastic beakers each containing a plastic-coated stirring bar. Pipet 20 mL of *Buffer solution* into each beaker. Concomitantly measure the potentials (see *pH* ⟨791⟩), in mV, of the solutions from the *Standard preparations* and of the solution from the *Assay preparation,* with a pH meter capable of a minimum reproducibility of ±0.2 mV and equipped with a fluoride-specific ion-indicating electrode and a ~~calomel~~

■suitable■2S (*USP30*) reference electrode. [NOTE—When taking measurements, immerse the electrodes in the solution, stir on a magnetic stirrer having an insulated top until equilibrium is attained (1 to 2 minutes), and record the potential. Rinse and dry the electrodes between measurements, taking care to avoid damaging the crystal of the specific-ion electrode.] Plot the logarithms of the fluoride-ion concentrations, in µg per mL, of the *Standard preparations* versus potential, in mV. From the measured potential of the *Assay preparation* and the standard response line, determine the concentration, *C,* in µg per mL, of fluoride ion in the *Assay preparation*. Calculate the quantity, in mg, of fluoride ion in each mL of the Oral Solution taken by the formula:

$$0.5(C/V)$$

in which *C* is the determined concentration of fluoride, in µg per mL, in the *Assay preparation;* and *V* is the volume, in mL, of Oral Solution taken. Multiply the quantity of fluoride ion by 2.21 to obtain the quantity of NaF.

In-Process Revision

BRIEFING

Streptomycin Sulfate, *USP 29* page 2008. It is proposed to correct the HPLC column designation in the *Assay* test.

(HDQ: M. Marques) RTS—C44411

Change to read:

Assay—

Mobile phase—Use 70 mM sodium hydroxide. During use, store in a plastic bottle flushed with a blanket of helium above the liquid surface. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Streptomycin Sulfate RS in water, and quantitatively dilute with water to obtain a solution having a known concentration of about 0.03 mg per mL. Sonicate for 1 minute, and mix.

Assay preparation—Transfer about 30 mg of Streptomycin Sulfate, accurately weighed, to a 100-mL volumetric flask, dilute with water to volume, sonicate for 1 minute, and mix. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask, dilute with water to volume, and mix.

System suitability solution—Heat about 10 mL of the *Standard preparation* at 75° for 1 hour. Allow to cool.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with an electrochemical detector, a gold working electrode, a pH silver–silver chloride reference electrode, a 4-mm × 5-cm guard column that contains packing ~~L48~~ ■L46,■2S (*USP30*) and a 4-mm × 25-cm analytical column that contains packing ~~L48.~~ ■L46.■2S (*USP30*) The electrochemical detector is used in the integrated amperometric mode with a range of 300 nC, an output of 1 V full scale, and a rise time of 0.5 second, positive polarity. The potential is programmed as follows.

Step	Time (seconds)	Potential (V)	Integration
1	0.00	+0.1	
2	0.20	+0.1	begins
3	0.40	+0.1	ends
4	0.41	–2.0	
5	0.42	–2.0	
6	0.43	+0.6	
7	0.44	–0.1	
8	0.50	–0.1	

The flow rate is about 0.5 mL per minute. Chromatograph the *System suitability solution*, and measure the peak areas as directed for *Procedure:* the relative retention times are about 0.5 for the main degradation product and 1.0 for streptomycin; and the resolution, *R,* between the two peaks is not less than 3. Chromatograph the *Standard preparation,* and measure the peak areas as directed for *Procedure:* the tailing factor is not more than 2; the column efficiency is not less than 1000 theoretical plates; and the relative standard deviation for replicate injections is not more than 5%. [NOTE—If variation of retention time or increase of tailing occurs, clean the columns with 0.2 M sodium hydroxide. Carefully maintain the working and reference electrodes.]

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in µg, of streptomycin ($C_{21}H_{39}N_7O_{12}$) in each mg of Streptomycin Sulfate taken by the formula:

$$1000(CP/W_U)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Streptomycin Sulfate RS in the *Standard preparation; P* is the designated streptomycin content, in µg per mg, of streptomycin ($C_{21}H_{39}N_7O_{12}$) in USP Streptomycin Sulfate RS; W_U is the weight, in mg, of Streptomycin Sulfate taken to prepare the *Assay preparation;* and r_U and r_S are the streptomycin peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Thalidomide, *USP 29* page 2106 and page 146 of *PF* 32(1) [Jan.–Feb. 2005]. On the basis of comments received, it is proposed to revise the test for *Microbial limits* by removing the requirement for the absence of *Escherichia coli* and placing it in the monograph *Thalidomide Capsules,* proposed revisions for which appear in *In-Process Revision* in this issue.

Chromatographic purity—

Solution A—Prepare a filtered and degassed mixture of water, acetonitrile, and phosphoric acid (95 : 5 : 0.1).

Solution B—Prepare a filtered and degassed mixture of water, acetonitrile, and phosphoric acid (85 : 15 : 0.1).

Diluent—Prepare a mixture of water, acetonitrile, and phosphoric acid (50 : 50 : 0.1).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Phthalic acid stock solution—Transfer about 100 mg of phthalic acid to a 100-mL volumetric flask, dissolve in a mixture of acetonitrile and water (80 : 5), and dilute with acetonitrile to volume. Mix, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a concentration of about 0.1 mg per mL.

Standard stock solution—Dissolve, with the aid of sonication, an accurately weighed quantity of USP Thalidomide RS in acetonitrile to obtain a solution having a known concentration of about 1 mg per mL.

Standard solution—Pipet 2.0 mL of *Standard stock solution* and 2.0 mL of *Phthalic acid stock solution* into a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. Pipet 10.0 mL of this solution into a 100-mL volumetric flask, add 10.0 mL of phosphoric acid solution (1 in 100), dilute with water to volume, and mix to obtain a solution having a known concentration of about 0.0002 mg of phthalic acid per mL.

Test solution—Transfer about 100 mg of Thalidomide, accurately weighed, to a 50-mL volumetric flask, and dissolve, with the aid of sonication, in 40 mL of a mixture of water, acetonitrile, and phosphoric acid (50 : 50 : 0.1). Dilute with *Diluent* to volume, and mix. Pipet 10.0 mL of this solution into a 100-mL volumetric flask, add 10.0 mL of phosphoric acid solution (1 in 100), dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 218-nm detector and a 3.9-mm × 15-cm column that contains 4-µm packing L1. The flow rate is about 2 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	100	0	equilibration
0–15	100→50	0→50	linear gradient
15–20	50→100	50→0	linear gradient
20–30	100	0	isocratic

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.35 for phthalic acid and about 1.0 for thalidomide; the tailing factor for the phthalic acid and thalidomide peaks is not more than 2.0; and the relative standard deviation for replicate injections, determined from the phthalic acid peak, is not more than 2.0%.

Procedure—Separately inject equal volumes (about 200 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Calculate the percentage of each impurity in ~~the portion of~~

▲▲*USP30*
Thalidomide ~~taken~~

▲▲*USP30*
by the formula:

$$▲50{,}000(C_P / W)(r_i / r_P)▲_{USP29}$$

in which C_P is the concentration, in mg per mL, of phthalic acid in the *Standard solution; W* is the amount, in mg, of Thalidomide taken to prepare the *Test solution;* r_i is the peak response for each impurity obtained from the *Test solution;* and r_P is the phthalic acid peak response obtained from the *Standard solution:* not more than 0.1% of any individual impurity is found; and not more than 0.3% of total impurities is found.

BRIEFING

Thalidomide Capsules, *USP 29* page 2108. On the basis of comments received, it is proposed to add requirements for *Microbial limits.*

(MD-OOD: F. Mao; MSA: R. Tirumalai) RTS—C45959

Add the following:

■**Microbial limits** ⟨61⟩—The total aerobic microbial count using the *Plate Method* is not more than 1000 cfu per g, and the total combined molds and yeasts count is not more than 100 cfu per g. It meets the requirements of the test for absence of *Escherichia coli.*■2S (*USP30*)

BRIEFING

Tiagabine Hydrochloride, *USP 29* page 2141. To eliminate possible interference by the presence of water in the test article, it is proposed to revise *Identification* test *A* to include a *Test specimen* preparation under *Infrared Absorption* ⟨197K⟩. Also, in the table of relative response factors under *Chromatographic purity,* it is proposed to clarify the terms "*x*" and "*y*" for the related compound that has a relative retention time of about 1.13.

(MD-PP: R. Ravichandran) RTS—C44408; C42389

Change to read:

Identification—

A: *Infrared Absorption* ⟨197K⟩.

■*Test specimen*—Transfer about 5 mg of Tiagabine Hydrochloride to a test tube, add 4 mL of 2-propanol, and sonicate if necessary for complete dissolution. Evaporate the solvent under inert atmosphere at 50° using a nitrogen evaporator for 2 hours.

Standard specimen—A similar preparation of USP Tiagabine Hydrochloride RS.■2S (*USP30*)

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

In-Process Revision

Change to read:

Chromatographic purity—

Solution A—Use a filtered and degassed solution of water adjusted with phosphoric acid to a pH of 2.3.

Solution B—Use filtered and degassed acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Dissolve an accurately weighed quantity of USP Tiagabine Hydrochloride RS in water to obtain a solution having a known concentration of about 1 mg per mL.

Standard solution—Dilute a portion of the *Standard stock solution* quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.001 mg per mL.

Resolution solution—Dissolve an accurately weighed quantity of USP Tiagabine Related Compound A RS in water to obtain a solution having a known concentration of about 1 mg per mL. Transfer 1.0 mL of this solution and 1.0 mL of the *Standard stock solution* to a 10-mL volumetric flask, dilute with water to volume, and mix.

Test solution—Transfer about 100 mg of Tiagabine Hydrochloride, accurately weighed, to a 100-mL volumetric flask. Dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0	75	25	equilibration
0–30	75→45	25→55	linear gradient
30–40	45→10	55→90	linear gradient
40–45	10	90	isocratic

Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between tiagabine hydrochloride and tiagabine related compound A is not less than 9.0. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Interference check—Inject water as the blank: no interfering peaks are observed.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all the peak responses. Calculate the percentage of each impurity in the portion of Tiagabine Hydrochloride taken by the formula:

$$100F(r_i/r_s)$$

in which F is the relative response factor (see the accompanying table for values) for each impurity; r_i is the peak response for each impurity obtained from the *Test solution;* and r_s is the sum of the responses of all the peaks, excluding the solvent peaks. (See the accompanying table for limits of individual impurities.) Not more than 1.0% of total impurities is found.

~~*System suitability solution*—Dissolve accurately weighed quantities of USP Vinorelbine Tartrate RS and USP Vinorelbine Related Compound A RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having known concentrations of about 1.4 mg per mL and 0.01 mg per mL, respectively. Expose a portion of this solution in a suitable xenon lamp apparatus capable of supplying a dose of 1600 KJ/m² between 310 and 800 nm at a power of 500 W/m² for about one hour, in order to generate an additional degradation product (3′,4′,7,8-tetradehydro-3,4′-dideoxy-3,6-epoxy-6,7-dihydro-C′-norvincaleukoblastine) having a relative retention time of about 0.8.~~

In-Process Revision

■*Phosphate buffer, Mobile phase, System suitability solution,* and *Chromatographic system*—Proceed as directed in the *Assay.* ■2S (*USP30*)

Standard solution—~~Dissolve an accurately weighed quantity of USP Vinorelbine Tartrate RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1.4 mg per mL.~~

■Use the *Standard preparation,* prepared as directed in the *Assay.* ■2S (*USP30*)

Diluted standard solution—Transfer 1.0 mL of the *Standard solution* to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume. Pipet 1.0 mL of this solution into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Test solution—~~Transfer about 35 mg of Vinorelbine Tartrate, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.~~

■Use the *Assay preparation.* ■2S (*USP30*)

~~*Chromatographic system* (see *Chromatography* ⟨621⟩): The liquid chromatograph is equipped with a 267-nm detector and a 3.9-mm × 15-cm column that contains 5-µm packing L1. The column temperature is maintained at 40°. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the retention time for vinorelbine is about 13.5 minutes; and the relative retention times are about 0.8 for the photodegradation product, 1.0 for vinorelbine, and 1.2 for vinorelbine related compound A. The relative retention, α, between vinorelbine tartrate and vinorelbine related compound A is not less than 1.1.~~

■ ■2S (*USP30*)

Procedure—Separately inject equal volumes (about 20 µL) of the *Test solution* and the *Diluted standard solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Record the chromatograms for three times the retention time of the vinorelbine peak. Disregard any peaks with an area less than or equal to one-half of the area of the peak obtained for vinorelbine in the *Diluted standard solution.* Calculate the percentage of each impurity in the portion of Vinorelbine Tartrate taken by the formula:

$$100(r_i/r_s)$$

in which r_i is the peak response for each impurity obtained from the *Test solution;* and r_s is the sum of the responses of all the peaks: not more than 0.3% of the photodegradation product is found; not more than 0.2% of any individual impurity or coeluted impurities comprising an individual peak is found; and not more than 0.7% of total impurities, excluding the photodegradation product, is found.

Change to read:

Assay—~~Dissolve about 350 mg of Vinorelbine Tartrate, accurately weighed, in 40.0 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically, using suitable electrodes. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N perchloric acid is equivalent to 53.96 mg of $C_{45}H_{54}N_4O_8 \cdot 2C_4H_6O_6$.~~

■*Phosphate buffer*—Dissolve 6.9 g of monobasic sodium phosphate in 900 mL of water. Adjust with phosphoric acid to a pH of 4.2, dilute with water to 1000 mL, and mix.

Mobile phase—Dissolve 1.22 g of sodium 1-decanesulfonate in 620 mL of methanol. Add 380 mL of *Phosphate buffer,* mix, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve accurately weighed quantities of USP Vinorelbine Tartrate RS and USP Vinorelbine Related Compound A RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having known concentrations of about 1.4 mg per mL and 0.01 mg per mL, respectively. Expose a portion of this solution in a suitable xenon lamp apparatus capable of supplying a dose of 1600 KJ/m^2 between 310 and 800 nm at a power of 500 W/m^2 for about 1 hour, in order to generate an additional degradation product (3′,4′,7,8-tetradehydro-3,4′-dideoxy-3,6-epoxy-6,7-dihydro-C′-norvincaleukoblastine) having a relative retention time of about 0.8.

Standard preparation—Dissolve an accurately weighed quantity of USP Vinorelbine Tartrate RS in *Mobile phase* to obtain a solution having a known concentration of about 1.4 mg per mL.

Assay preparation—Dissolve an accurately weighed quantity of Vinorelbine Tartrate in *Mobile phase* to obtain a solution having a known concentration of about 1.4 mg per mL.

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 267-nm detector and a 3.9-mm × 15-cm column that contains 5-µm packing L1. The column temperature is maintained at 40°. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention, *r,* between vinorelbine tartrate and vinorelbine related compound A is not less than 1.1. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for the replicate injections is not more than 2.0%. [NOTE—For peak identification purposes, the relative retention times are about 0.8 for the photodegradation product, 1.0 for vinorelbine, and 1.2 for vinorelbine related compound A.]

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the vinorelbine tartrate peaks. Calculate the quantity in percent of $C_{45}H_{54}N_4O_8 \cdot 2C_4H_6O_6$ in the portion of Vinorelbine Tartrate taken by the formula:

$$100(C_S/C_U)(r_U/r_S)$$

in which C_S is the concentration, in mg per mL, of USP Vinorelbine Tartrate RS in the *Standard preparation;* C_U is the concentration of Vinorelbine Tartrate in the *Assay preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S (*USP30*)

BRIEFING

Zinc Chloride Injection, *USP 29* page 2288. To be consistent with the validation data and minimize the matrix effect in the *Assay,* it is proposed to revise the sodium chloride concentration in the *Assay preparation* to match that in the *Standard preparations*.

(MD-OOD: F. Mao) RTS—C46731

Change to read:

Assay—[NOTE—The *Standard preparations* and the *Assay preparation* may be diluted quantitatively with water, if necessary, to obtain solutions of suitable concentrations adaptable to the linear or working range of the instrument.]

Sodium chloride solution—Dissolve 450 mg of sodium chloride in water, dilute with water to 500 mL, and mix.

Standard preparations—Transfer 3.11 g of zinc oxide, accurately weighed, to a 250-mL volumetric flask, add 80 mL of 1 N sulfuric acid, warm to dissolve, cool, dilute with water to volume, and mix. This stock solution contains 10.0 mg of zinc per mL. Dilute an accurately measured volume of this solution quantitatively with water to obtain a solution containing 125 µg of zinc per mL. Transfer 2.0, 3.0, and 4.0 mL, respectively, of this solution to three separate 500-mL volumetric flasks, each containing 5 mL of *Sodium chloride solution,* dilute the contents of each flask with water to volume, and mix. These *Standard preparations* contain, respectively, 0.50, 0.75, and 1.0 µg of zinc per mL.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 5 mg of zinc, to a 500-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask. From the labeled amount of sodium chloride, if any, in the Injection, calculate the amount, in mg, of sodium chloride in the 10.0-mL portion, and add sufficient *Sodium chloride solution* to bring the total sodium chloride content of the 100-mL volumetric flask to ~~9 mg~~

■0.9 mg.■2S (*USP30*)

Dilute with water to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the zinc emission line at 213.8 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with a zinc hollow-cathode lamp and an air–acetylene flame, using water as the blank. Plot the absorbances of the *Standard preparations* versus the concentration, in µg per mL, of zinc, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, in µg per mL, of zinc in the *Assay preparation.* Calculate the quantity, in mg, of zinc in each mL of Injection taken by the formula:

$$5C/V$$

in which C is the concentration, in µg per mL, of zinc in the *Assay preparation;* and V is the volume, in mL, of Injection taken.

DIETARY SUPPLEMENTS—MONOGRAPHS

BRIEFING

Minerals Capsules, *USP 29* page 2365; **Minerals Tablets,** *USP 29* page 2367; **Oil and Water-Soluble Vitamins with Minerals Capsules,** *USP 29* page 2396; **Oil and Water-Soluble Vitamins with Minerals Oral Solution,** *USP 29* page 2401; **Oil and Water-Soluble Vitamins with Minerals Tablets,** *USP 29* page 2407; **Water-Soluble Vitamins with Minerals Capsules,** *USP 29* page 2430; **Water-Soluble Vitamins with Minerals Oral Solution,** *USP 29* page 2434; **Water-Soluble Vitamins with Minerals Tablets,** *USP 29* page 2435. The current upper tolerance limit for microminerals in dosage form combinations of minerals and vitamins with minerals is 125.0 percent. This tolerance limit became official on January 1, 2004, after previously being published in *PF* 28(5) [Sept.–Oct. 2002], pages 1543–1548, where the reasons for the change were indicated and included new upper limit recommendations from the Food and Nutrition Board, Institute of Medicine (IOM). During the public comment period, no comments were received. Since becoming official, USP has received comments requesting a revision to this assay tolerance. Some of the comments suggest that because minerals are obtained from mined sources and naturally contain trace amounts of extrinsic minerals which vary greatly from batch to batch, the contribution of minute amounts of minerals from extraneous sources will result in significant overage to the trace mineral content in a formulation. On the basis of data received supporting these comments, the Dietary Supplements Non-Botanical Expert Committee approved for publication in *PF* an upper limit of not more than 160.0 percent of label claim in oral dosage form combinations of minerals and vitamins with minerals. However, the *General Notices* to the current *USP* indicate that where applicable legal requirements for dietary supplements require a minimum tolerance to be higher than the lower monograph tolerance, the upper monograph tolerance shall be increased by the corresponding amount. In this case, the minimum legal requirement of 100.0 percent, effective in the United States, is higher than the monograph lower tolerance of 90.0 percent, thus the upper tolerance contained in the monograph is increased by 10.0 percent. Due to this legal requirement, dietary supplements containing 170.0 percent of the labeled amount of microminerals would therefore be in compliance with the monograph.

MONOGRAPHS (NF)

BRIEFING

Carbomer Copolymer, *NF 24* page 3295. On the basis of comments received, it is proposed to make the following changes in the *Chromatographic system* section of the test for *Limit of ethyl acetate and cyclohexane:*

1. To change the measurement method of the flow rate of the carrier gas.
2. To delete the current statement of the relative retention times of the components and to add it to a note later in the paragraph, which also states that the relative retention times are for information purposes only (not part of the system suitability requirements).

(EM2: H. Wang) RTS—C47468

Change to read:

Limit of ethyl acetate and cyclohexane—[NOTE—This test is required only for those Carbomer Copolymers where the labeling indicates that ethyl acetate or a mixture of ethyl acetate and cyclohexane was used in the polymerization process.]

Standard stock solution—Transfer 5.0 mL of methanol to a 10-mL serum vial, insert a rubber septum, and seal with a metal cap. Add 25.0 µL of ethyl acetate and 20.0 µL of cyclohexane through the septum into the vial, and mix.

Standard solution—Transfer 20.0 mL of methanol to a 30-mL serum vial, insert a rubber septum, and seal with a metal cap. Through the rubber septum, add 10 µL of methyl ethyl ketone (internal standard) and 50.0 µL of the *Standard stock solution,* and mix to obtain a solution containing 0.225 mg of ethyl acetate and 0.156 mg of cyclohexane.

Test solution—Transfer about 50 mg of Carbomer Copolymer, accurately weighed, to a 30-mL serum vial, add 20.0 mL of methanol, insert a rubber septum, and seal with a metal cap. Through the rubber septum, add 10 µL of methyl ethyl ketone, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm × 3-m column packed with 1% liquid phase G25 on 60- to 80-mesh support S12. The carrier gas is helium, ~~flowing at a linear velocity of about 33 cm per minute~~

■flowing at a rate of about 33 mL per minute.■2S (*NF25*)
The column temperature is maintained at 115° for 4 minutes after injection, then the temperature is increased at a rate of 6° per minute to 175°, and maintained at 175° for 5 minutes. The injection port and detector temperatures are maintained at 250°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* ~~the relative retention times are about 0.7 for methyl ethyl ketone, 0.9 for ethyl acetate, and 1.0 for cyclohexane;~~

■■2S (*NF25*)
the resolution, *R,* between ethyl acetate and cyclohexane is not less than 1.0; and the relative standard deviation for replicate injections is not more than 2.5%.

■[NOTE—For information purposes only, the relative retention times are about 0.7 for methyl ethyl ketone, 0.9 for ethyl acetate, and 1.0 for cyclohexane.]■2S (*NF25*)

Procedure—Separately inject equal volumes (about 2 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentages of ethyl acetate and cyclohexane in the portion of Carbomer Copolymer taken by the formula:

$$100(W_S / W_T)(R_U / R_S)$$

in which W_S is the weight, in mg, of ethyl acetate or cyclohexane in the *Standard solution;* W_T is the weight, in mg, of Carbomer Copolymer taken to prepare the *Test solution;* and R_U and R_S are the peak area ratios of the relevant analyte peak to the methyl ethyl ketone peaks obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.5% of ethyl acetate and not more than 0.3% of cyclohexane is found.

BRIEFING

Hydroxypropyl Betadex, page 1282 of *PF* 28(4) [July–Aug. 2002]. This new monograph, which previously appeared in *Pharmacopeial Previews,* is now forwarded with the following changes based on comments received to *In-Process Revision*. In addition, editorial style changes have been made.

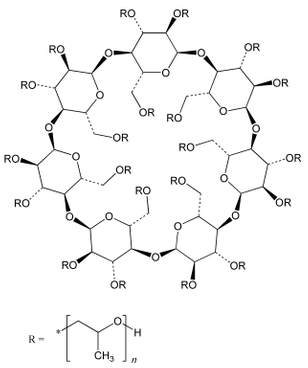
1. The chemical formula is revised and a molecular structure is added.
2. In the Definition, the term "hydroxylpropyl group" is changed to "hydroxypropyl group".
3. A storage statement is included under *Packaging and storage*.
4. The *Labeling* section is changed to include bacterial endotoxin and sterility statements.
5. The USP Reference Standard name is changed from "USP Hydroxypropyl Beta Cyclodextrin RS" to "USP Hydroxypropyl Betadex RS".
6. Clarification is provided in the *IR* Identification test.
7. The specification for the *Microbial limits* test is modified in line with the general requirement for excipients.
8. The *Heavy metals* test is changed from *Method II* to *Method I* for water-soluble material.
9. A test for *Loss on drying* is incorporated into the monograph.
10. The *Test solution* under *Conductivity* is revised to indicate "calculated on the dried basis". Clarification is provided under *Calibration*.
11. An appropriate specification is assigned in the test for *Bacterial endotoxins*. Also, clarification is provided to reflect dosage form requirements.
12. A test for *Sterility* is added to reflect dosage form requirements.
13. The procedure in the test for *Related compounds* is modified based on comments received. A *Note* has been added to indicate that the relative retention times of components are for information purposes only and not as part of the system suitability requirements.
14. For clarification, changes are added to the test for *Molar substitution*.
15. A test for *Limit of propylene oxide* is added. Propylene oxide is a toxic and hazardous substance that is used as a starting material in the manufacture of Hydroxypropyl Betadex. The column used to develop and validate the procedure is a Varian, CP-PoraPLOT Q, Chrompak No. 7550, 10 m × 0.32 mm, 10 µm film thicknes.

(EM2: H. Wang; MSA: R. Tirumalai) RTS—C44146

Add the following:

■Hydroxypropyl Betadex

~~$(C_{26}H_{70-x}O_{35})(C_3H_6O)_x$~~



$C_{42}H_{70}O_{35}(C_3H_6O)_x$ where x = ~~MS 7, MS = Molar Substitution~~ 7MS, MS being Molar Substitution

Beta cyclodextrin, 2-hydroxypropyl ether [*94035-02-6*].

» Hydroxypropyl Betadex is a partially substituted poly(hydroxypropyl) ether of Betadex. The number of ~~hydroxylpropyl~~ hydroxypropyl groups per anhydroglucose unit expressed as molar substitution (MS) is not less than 0.40 and not more than 1.50 and is within 10 percent of the value stated on the label.

Packaging and storage—Preserve in well-closed containers. ~~(Storage conditions to come.)~~ Store at room temperature.

Labeling—Label it to indicate the molar substitution (MS). ~~Where it is intended for use in parenteral dosage forms, it is so labeled.~~ Where Hydroxypropyl Betadex is intended for use in the manufacture of injectable dosage forms, it is so labeled. Where Hydroxypropyl Betadex must be subjected to further processing during the preparation of injectable dosage forms to ensure acceptable levels of bacterial endotoxins, it is so labeled. Where Hydropropyl Betadex is sterile, it is so labeled.

USP Reference standards ⟨11⟩—~~*USP Hydroxypropyl Beta Cyclodextrin RS.*~~ *USP Hydroxypropyl Betadex RS. USP Beta Cyclodextrin RS. USP Propylene Glycol RS. USP Endotoxin RS.*

Clarity of solution—Dissolve 1.0 g in 2.0 mL of water, and heat: the resulting solution is clear and remains transparent after cooling to room temperature.

Identification—

A: *Infrared Absorption* ⟨197K⟩—The spectrum obtained with Hydroxypropyl Betadex shows the same absorption bands as the spectrum acquired with USP Hydroxypropyl Betadex RS. Due to the difference in the substitution of the substance, the intensity of some absorption bands may vary.

B: It ~~complies with~~ meets the requirements of the test for *Clarity of solution*.

Microbial limits ⟨61⟩—~~It meets the requirements for absence of *Salmonella* species and *Escherichia coli*, and the total aerobic bacterial count does not exceed 1000 per g.~~ The total aerobic microbial count does not exceed 1000 cfu per g, and the total combined molds and yeasts count does not exceed 100 cfu per g.

Heavy metals, ~~*Method II*~~ *Method I* ⟨231⟩: 20 µg per g.

Loss on drying ⟨731⟩—Dry about 1 g of it at 120° for 2 hours: it loses not more than 10.0% of its weight.

Conductivity—

Test solution—Transfer about 5.0 g of Hydroxypropyl Betadex, accurately weighed and calculated on the dried basis, to a 50-mL volumetric flask, dissolve in and dilute with water ~~, which has been~~ (previously boiled and cooled to room temperature) to volume, and mix.

Apparatus—Use a conductivity meter or resistivity meter that measures the resistance of the column of liquid between the electrodes of the immersed measuring device. The apparatus is supplied with alternating current to avoid the effects of electrode polarization. It is equipped with a temperature compensation device or a precision thermometer.

In-Process Revision

Reagents—Prepare three standard solutions of potassium chloride containing 0.7455, 0.0746, and 0.0149 g, respectively, of potassium chloride per 1000.0 g of solution. ~~, using water, which has been previously boiled and cooled to room temperature, whose conductivity does not exceed 2 μS · cm^{-1}.~~ These solutions should be prepared using water, which has been previously boiled and cooled to room temperature and whose conductivity does not exceed 2 μS · cm^{-1}. The conductivity and resistivity of these three solutions at 20° are given below.

Concentration of solution in g/1000.0 g	Conductivity μS · cm^{-1}	Resistivity Ω · cm
0.7455	1330	752
0.0746	133.0	7519
0.0149	26.6	37,594

Calibration—Choose a conductivity cell that is appropriate for the conductivity of the solution to be examined. The higher the expected conductivity, the higher the cell constant that must be chosen. ~~so that the value, *R,* measured is as large as possible for the apparatus used~~ Commonly used conductivity cells have cell constants of the order of 0.1 cm^{-1}, 1 cm^{-1}, and 10 cm^{-1}. Use a Standard solution of potassium chloride that is appropriate for the measurement. The conductivity value of the Standard solution of potassium chloride should be near the expected conductivity value of the *Test solution*. Rinse the cell several times with water, which has been previously boiled and cooled to room temperature, and at least twice with the potassium chloride solution used for the determination of the cell constant of the conductivity cell. Measure the resistance of the conductivity cell using the potassium chloride solution at 20 ± 0.1°. The constant C (in cm^{-1}) of the conductivity cell is given by the expression:

$$C = R_{KCl} \times K_{KCl},$$

in which R_{KCl} is the measured resistance, expressed in megaohms; and K_{KCl} is the conductivity of the standard solution of potassium chloride used, expressed in μS · cm^{-1}. The measured constant, C, of the conductivity cell must be within 5% of the given value.

Procedure—Rinse the conductivity cell several times with water, which has been previously boiled and cooled to room temperature, and at least twice with the *Test solution*. Measure the conductivity of the *Test solution*, while gently stirring with a magnetic stirrer: the conductivity is not more than 200 μS · cm^{-1}.

Bacterial endotoxins ⟨85⟩—~~If intended for use in the manufacturing of parenteral dosage forms, it contains not more than (limit to come).~~ The level of bacterial endotoxins is such that the requirement under the relevant dosage form monograph(s) in which Hydropropyl Betadex is used can be met. Where the label states that Hydroxypropyl Betadex must be subjected to further processing during the preparation of injectable dosage forms, the level of bacterial endotoxins is such that the requirement under the relevant dosage form monograph(s) in which Hydroxypropyl Betadex is used can be met.

Sterility ⟨71⟩—Where the label states that Hydropropyl Betadex is sterile, it meets the requirements for *Sterility* ⟨71⟩ in the relevant dosage form monograph(s) in which Hydropropyl Betadex is used.

Related compounds—

Mobile phase—Use water.

Standard solution A—~~Transfer 75 mg of USP Beta Cyclodextrin RS and 125 mg of USP Propylene Glycol RS, accurately weighed, to a 5-mL volumetric flask, dissolve in and dilute with water to volume, and mix.~~ Dissolve accurately weighed quantities of USP Beta Cyclodextrin RS and USP Propylene Glycol RS in water to make a solution having a known concentration of about 15 mg per mL for beta cyclodextrin, calculated on the anhydrous basis, and about 25 mg per mL for propylene glycol.

In-Process Revision

Standard solution B—Pipet 1.0 mL of *Standard solution A* into a ~~5 mL~~ 10-mL volumetric flask, dilute with water to volume, and mix.

Test solution—Dissolve 2.50 g of Hydroxypropyl Betadex, accurately weighed and calculated on the dried basis, in water with the aid of heat. Cool, and dilute with water to 25.0 mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a differential refractometer detector and a 3.9-mm × 30-cm column and pre-column that contain packing L11 ~~and that are~~, both maintained at a temperature of 40°. The flow rate is about 1.5 mL per minute. Chromatograph *Standard solution A* and *Standard solution B*, and record the peak responses as directed for *Procedure:* ~~the retention time of propylene glycol is about 2.5 minutes, and the relative retention times with reference to that of propylene glycol are about 4.2 for betadex and about 6 for hydroxypropyl betadex;~~ the resolution, *R*, between the betadex and propylene glycol is not less than 4 for *Standard solution A*; and the relative standard deviation for replicate injections of *Standard solution B* is not more than 2.0%. [NOTE—For information purposes only, the retention time of propylene glycol is about 2.5 minutes, and the relative retention times with reference to that of propylene glycol are about 4.2 for betadex and about 6 for hydroxypropyl betadex; Hydroxypropyl Betadex elutes as a very wide peak or several peaks.]

Procedure—Separately inject equal volumes (about 20 µL) of *Standard solution B* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks, disregarding any peaks eluting before propylene glycol and after the hydroxypropyl betadex peak. The area of the betadex peak in the *Test solution* is not more than the area of the corresponding peak in the chromatogram obtained with *Standard solution B* (1.5%). The area of the propylene glycol peak in the *Test solution* is not more than the area of the corresponding peak in the chromatogram obtained with *Standard solution B* (2.5%). The area obtained from any other single impurity peak is not more than 0.1 times the area of propylene glycol in the chromatogram obtained with *Standard solution B* (0.25%). The total area obtained from all impurity peaks, excluding betadex and propylene glycol, is not more than 0.4 times the area of propylene glycol in the chromatogram obtained with *Standard solution B* (1%). Disregard any peaks that are less than 0.04 times the area of propylene glycol in the chromatogram obtained with *Standard solution B* (0.1%).

Molar substitution (see *Nuclear Magnetic Resonance* ⟨761⟩)—The molar substitution (MS) is calculated from the ratio between the signal from the three protons of the methyl group, contained ~~by~~ in the hydroxypropyl ~~function~~ functional group, and the signal from the proton attached to the carbon C_1 (glycosidic proton) of the anhydroglucose units. Use a Fourier-transform nuclear magnetic resonance (NMR) spectrometer ~~of minimum power 250 MHz~~ having a magnetic field strength of at least 6 Tesla~~, suited to perform a proton spectrum and to carry out quantitative analysis, at a temperature of at least 25°.~~ and that is capable of performing quantitative analysis using proton NMR spectroscopy at a temperature of at least 25°.

Test preparation—~~Introduce not less than the equivalent of 10.0 mg of Hydroxypropyl Betadex (dried) into a 5 mm NMR sinning tube. Add about 0.75 mL of deuterium oxide. Cap the tube, mix thoroughly, and adapt the spinner.~~ Mix not less than the equivalent of 10.0 mg of dried Hydroxypropyl Betadex with 0.75 mL of deuterium oxide thoroughly in an NMR tube. Place the tube into an NMR probe.

Procedure—~~Record the FID, with at least 8 scans, so as to obtain a spectral window comprised, at least, between 0 and 6.2 ppm, referring to the peak of exchangeable protons (solvent) at 4.8 ppm (25°). Make a zero filling of at least 3-fold in size relative to the acquisition data file, and transform the FID to the spectrum without any correction of Gaussian Broadening (GB) factor and with a Line Broadening (LB) factor up to 0.2 maximum (GB = 0 and LB ≤ 0.2). Make sure that the spectrum is phased correctly, and call the integration subroutine after phase corrections. Measure the peak areas of~~

In-Process Revision

~~the signal from the methyl of the hydroxypropyl function at 1.2 ppm (A_1), and of the signal of the glycosidic proton between 5 and 5.4 ppm (A_2), after baseline correction between 0.5 and 6.2 ppm.~~ Adjust the spectrometer settings so that a high-resolution proton NMR spectrum can be acquired that will provide quantitative data. Acquire a free induction decay (FID) with at least 8 transients using a spectral window from at least 0 to 6.2 ppm, with the solvent peak located at 4.8 ppm at 25°. Zero fill the spectrum at least 3 times, and Fourier transform the FID with no Gaussian line broadening and no more than 0.2 Hz of Lorenzian line broadening. Determine the peak areas of the doublet from the methyl protons of the hydroxypropyl functional group at 1.2 ppm (A_1) and the peak areas from the glycosidic protons, which are located between 5 and 5.4 ppm (A_2). Calculate the molar substitution by the formula:

$$A_1/(3A_2)$$

in which A_1 is the area of the methyl group of hydroxypropyl; and A_2 is the area of the glycosidic proton. The degree of substitution is the number of hydroxypropyl groups per molecule of betadex and is obtained by multiplying the MS by 7.

Limit of propylene oxide—

Ether stock solution—Add 75 µL of ether to about 30 mL of dimethylacetamide in a 50-mL volumetric flask, dilute with dimethylacetamide to volume, and mix. This solution contains about 1.0 mg per mL of ether.

Internal standard solution—Add 30 µL of *Ether stock solution* to about 70 mL of dimethylacetamide in a 100-mL volumetric flask, dilute with dimethylacetamide to volume, and mix.

Propylene oxide stock solution—[Caution—Propylene oxide is toxic and flammable. Prepare this solution in a well-ventilated fume hood.] Add about 30 mL of dimethylacetamide into a 50-mL volumetric flask. Weigh the flask and contents accurately, add 60 µL of propylene oxide (cooled in a refrigerator) into the flask with a 100-µL cooled microsyringe, weigh again, and calculate the weight of propylene oxide added, by difference. [NOTE—Propylene oxide is a gas at room temperature. It is usually stored in a lecture-type gas cylinder or small metal pressure bomb. Chill the cylinder in a refrigerator before use. Transfer about 5 mL of the liquid propylene oxide to a 100-mL beaker chilled in wet ice. Use a gas-tight syringe that has been chilled in a refrigerator.] Dilute with dimethylacetamide to volume, and mix. This solution contains about 1.0 mg per mL of propylene oxide.

Resolution solution—Add 30 µL of the *Ether stock solution* and 20 µL of *Propylene oxide stock solution* to about 70 mL of dimethylacetamide in a 100-mL volumetric flask, dilute with dimethylacetamide to volume, and mix.

Standard stock solutions—Add about 7 mL of dimethylacetamide into each of four 10-mL volumetric flasks. Transfer the following amount of *Propylene oxide stock solution* into each of the four flask using a microsyringe, with one amount per flask: 40, 100, 200, and 400 µL. Dilute with dimethylacetamide to volume, and mix. The *Standard stock solutions* contain about 4, 10, 20, and 40 µg per mL of propylene oxide, respectively.

Standard solutions—Into each of four 10-mL headspace vials, transfer 200 ± 5 mg of Hydroxypropyl Betadex, calculated on the dried basis. Pipet 1.0 mL of the *Internal standard solution* into each vial, and close the vial with septum and cap. Into each of the vials, add 10 µL of each of *Standard stock solutions* using a 10-µL syringe, respectively. Allow each vial to stand, and gently shake until the sample is dissolved. The *Standard solutions* contain, respectively, about 0.04, 0.1, 0.2, and 0.4 µg per mL of propylene oxide.

Test solution—Transfer 200 ± 5 mg of Hydroxypropyl Betadex, calculated on the dried basis, into a 10-mL headspace autosampler vial. Pipet 1.0 mL of the *Internal standard solution* into the vial, and close the vial with a septum and cap. Add 10 µL of dimethylacetamide using a 10-µL syringe. Allow the vial to stand, and gently shake until the sample is dissolved.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a balanced pressure automatic headspace sampler with a split injection mode of a ratio of 1 : 1, a flame-ionization detector and a 0.32-mm × 10-m fused-silica capillary column coated with a 10-µm layer of stationary phase S3. The column temperature is maintained at 50° for the first 10 minutes after injection, programmed to rise at a rate of 10° per minute to a temperature of 100°, maintained for 10 minutes at 100°, then is increased at a rate of 20° per minute to a temperature of 220°, and maintained at 220° for 4 minutes. The transfer line temperature is maintained at 120°. The detector temperature is maintained at 250° and the injection port temperature is maintained at 120°. The carrier gas is helium, flowing at a rate of about 2.0 mL per minute, corresponding to the linear velocity of 44 cm per second. Chromatograph the *Resolution solution,* and record the peak response as directed for *Procedure:* the resolution, *R,* between ether and propylene oxide is not less than 2.0. [NOTE—For information purposes only, the relative retention times are about 1.0 for propylene oxide and 1.3 for ether.]

Procedure—Separately place the vials containing the *Standard solutions* and the *Test solution* in the automated sampler, and start the sequence so that the vial is heated at a temperature of 100° for 30 minutes before a suitable portion of its headspace is injected into the chromatograph. Using a 2-mL gas syringe preheated in an oven at 110°, separately inject 1.0 mL of the headspace from each vial into the chromatograph. Chromatograph the *Standard solutions* and the *Test solution,* record the chromatograms, and measure the area ratios of the peak responses of propylene oxide and ether as directed for *Procedure*. Determine, based on a retention time comparison, whether propylene oxide is detected in the *Test solution*. Plot the area ratios of the peak responses of propylene oxide and ether of the *Test solution* and the *Standard solutions* versus the content, in µg, of propylene oxide in each vial, as furnished by the *Standard stock solutions,* draw the straight line best fitting the five points, and calculate the correlation coefficient for the line. [NOTE—The *Test solution* should be plotted as if it had a content of added propylene oxide equivalent to 0 µg.] A suitable system is one that yields a line having a correlation coefficient of not less than 0.99. Extrapolate the line until it meets the content axis on the negative side. The distance between this point and the intersection of the axes represents the total amount, T_U, in µg, of propylene oxide in the *Test solution*. Calculate the percentage of propylene oxide in the portion of Hydroxypropyl Betadex taken by the formula:

$$100(T_U / W)$$

in which W is the weight, in µg, of Hydroxypropyl Betadex taken to prepare the *Test solution:* the limit is 0.0001%.■2S (*NF25*)

BRIEFING

Palm Kernel Oil. Because there is no existing *NF* monograph for this article, it is proposed to add a new monograph based on the Palm Kernel Oil monograph in the *Food Chemicals Codex, Fifth Edition,* page 316 and also on the *Cottonseed Oil* monograph in *NF 24,* page 3317.

(EM2: H. Wang; NOM: W. Paul) RTS—C44796

Add the following:

■Palm Kernel Oil

Elaeis guineensis seed oil [*8023-79-8*].

» Palm Kernel Oil is the refined fixed oil obtained from the kernel of the fruit of the oil palm *Elaeis guineensis* Jacq. (Fam. Arecaceae). It may contain suitable antioxidants.

In-Process Revision

Packaging and storage—Preserve in well-closed containers. No storage requirements specified.

Labeling—Label it to indicate the name and quantity of any added antioxidants.

Identification—

A: It meets the requirements of the test for *Fatty acid composition*.

B: It meets the requirements of the test for *Melting range*.

Melting range ⟨741⟩**:** between 27° and 29°.

Acid value ⟨401⟩**:** not more than 2.0.

Peroxide value ⟨401⟩**:** not more than 10.0.

Unsaponifiable matter ⟨401⟩**:** not more than 1.5%.

Fatty acid composition—Palm Kernel Oil exhibits the following composition profile of fatty acids, as determined in the section *Fatty Acid Composition* under *Fats and Fixed Oils* ⟨401⟩:

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
6	0	≤1.5
8	0	3–5
10	0	2.5–6
12	0	40–52
14	0	14–18
16	0	7–10
18	0	1–3
20	0	≤1
16	1	≤1
18	1	11–19
18	2	0.5–4

Water, *Method I* ⟨921⟩**:** not more than 0.1%, 50 mL of chloroform being used instead of 35 to 40 mL of methanol as the solvent.

Limit of lead—[NOTE—For this test, use reagent-grade chemicals with as low a lead content as is practicable, as well as high-purity water and gases. Before use in this analysis, rinse all glassware and plasticware twice with diluted nitric acid and twice with diluted hydrochloric acid, and then rinse them thoroughly with *Purified Water*.]

Hydrogen peroxide–nitric acid solution—Dissolve equal volumes of 10% hydrogen peroxide and diluted nitric acid. [NOTE—Use caution.]

Lead nitrate stock solution—Dissolve 159.8 mg of lead nitrate in 100 mL of *Hydrogen peroxide–nitric acid solution*. Dilute with *Hydrogen peroxide–nitric acid solution* to 1000 mL, and mix. Prepare and store this solution in glass containers that are free from lead salts. Each mL of this solution contains the equivalent of 100 µg of lead.

Standard lead solution—On the day of use, dilute 10.0 mL of *Lead nitrate stock solution* with *Hydrogen peroxide–nitric acid solution* to 100.0 mL and mix. Each mL of *Standard lead solution* contains the equivalent of 10 µg of lead.

Butanol–nitric acid solution—Slowly add 50 mL of nitric acid to approximately 500 mL of butanol contained in a 1000-mL volumetric flask. Dilute with butanol to volume, and mix.

Standard solutions—Into five separate 100-mL volumetric flasks, pipet 0.2, 0.5, 1, 2, and 5 mL, respectively, of *Standard lead solution,* dilute with *Butanol–nitric acid solution* to volume, and mix. The *Standard solutions* contain, respectively, 0.02, 0.05, 0.1, 0.2, and 0.5 µg of lead per mL.

Test solution—[Caution—Perform this procedure in a fume hood, and wear safety glasses.] Transfer 1.0 g of Oil, accurately weighed, into a large test tube. Add 1 mL of nitric acid. Place the test tube in a rack in a boiling water bath. As soon as the rusty tint is gone, add 1 mL of 30 percent hydrogen peroxide dropwise to avoid a vigorous reaction, and wait for bubbles to form. Stir with an acid-washed plastic spatula if necessary. Remove the test tube from the water bath, and allow it to cool. Transfer the solution into a 10-mL volumetric flask, and dilute with *Butanol–nitric acid solution* to volume, and mix.

Tungsten solution—Transfer 0.1 g of tungstic acid and 5 g of sodium hydroxide pellets into a 50-mL plastic bottle. Add 5.0 mL of water, and mix. Heat the mixture in a hot water bath until complete solution is achieved. Cool, and store at room temperature.

Procedure—Place the graphite tube in the furnace. Inject a 20-µL aliquot of the *Tungsten solution* into the graphite tube, using an argon flow rate of 300 mL per minute. Maintain the drying temperature at 110° for 20 seconds, the ashing temperature at 700° to 900° for 20 seconds, and with the argon flow stopped, the atomization temperature at 2700° for 10 seconds; repeat this procedure once more using a second 20-µL aliquot of the *Tungsten solution*. Clean the quartz windows. [NOTE—The sample injection technique is the most crucial step in controlling the precision of the analysis; the volume of each of the *Standard solutions* and the *Test solution* must remain constant. Rinse the microliter pipet tip three times with either the *Standard solutions* or the *Test solution* before injection. Use a fresh pipet tip for each injection, and start the atomization process immediately after injecting the *Standard solutions* and the *Test solution*. Between injections, flush the graphite tube of any residual lead by purging at a high temperature as recommended by the manufacturer.]

Concomitantly determine the absorbances of the five *Standard solutions* and the *Test solution*, at the lead emission line at 283.3 nm, with a suitable graphite furnace atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with a lead hollow-cathode lamp by atomizing the equal volumes (20 µL) of the solutions with an argon flow rate of 300 mL per minute. Maintain the drying temperature of the furnace at 110° for 30 seconds after a 20-second ramp time and a 10-second hold time; the ashing temperature at 700° for 42 seconds after a 20-second ramp time and a 22-second hold time; and the atomization temperature at 2300° for 7 seconds with the argon flow stopped. Plot the absorbance of each of the *Standard solutions,* compensated for background correction, versus its content of lead, in µg per mL, and draw the best straight line fitting the five points. From this plot, determine the concentration, *C,* in µg per mL, of lead in the *Test solution*. Calculate the quantity, in µg per g, of lead in the Oil taken by the formula:

$$10C / W$$

in which W is the weight, in g, of the Oil taken to prepare the *Test solution*: not more than 0.1 µg of lead per g is found.■2S (*NF25*)

BRIEFING

Polyoxyl 10 Oleyl Ether, *NF 24* page 3400 and page 3629 of the *First Supplement.* On the basis of comments received, it is proposed to revise the specification range for average polymer length in the Definition statement. In addition, it is proposed to revise the test for *Average polymer length* to employ a quantitative analysis and to reflect current practice.

(EM2: H. Wang) RTS—C46394

Change to read:

» Polyoxyl 10 Oleyl Ether is a mixture of the monooleyl ethers of mixed polyoxyethylene diols, the average polymer length being equivalent to not less than ~~8.6~~

■9.1■2S (*NF25*)
and not more than ~~10.4~~

■10.9■2S (*NF25*)
oxyethylene units. It may contain suitable stabilizers.

Change to read:

Average polymer length—If solid material is present, place the Polyoxyl 10 Oleyl Ether in a 60° water bath overnight. Shake vigorously to eliminate any possibility of molecular weight gradients within it. Add about 1 mL of the melt to 1 mL of deuterated chloroform in a test tube, and shake the test tube until dissolution is complete. Transfer about 0.5 mL to an NMR tube, and add ~~5 drops~~

■a small amount■2S (*NF25*)
of tetramethylsilane as an internal reference standard. Cap the tube tightly, and shake thoroughly. Place the tube in the NMR spectrometer

■that is capable of performing quantitative analysis,■2S (*NF25*)

In-Process Revision

and record the NMR spectrum ~~at an appropriate RF power level and a sweep time of 250 seconds per 500 Hz (see *Qualitative Scans* under *Nuclear Magnetic Resonance* ⟨761⟩). Adjust the spectrum amplitude so that the signal at 1.1 ppm is at least 80% of full scale. Record the integral areas from 0.4 ppm to 2.35 ppm (A_1), and from 2.35 ppm to 4.9 ppm (A_2) at a sweep time of 50 seconds per 500 Hz at an integral power level such that the integral of the largest peak is at least 80% of full chart height. Do not change the power level during the sweep. Record the integral of each peak several times, and calculate the average integral area.~~

■(see *Quantitative Applications* under *Nuclear Magnetic Resonance* ⟨761⟩). Integrate the areas from 0.4 ppm to 2.35 ppm (A_1), and from 2.35 ppm to 4.9 ppm (A_2).■2S *(NF25)*

Calculate the number of oxyethylene units, n, per molecule taken by the formula:

$$n = (31A_2/A_1 - 3)/4$$

in which 31 is the total number of protons in the molecule not activated by either oxygen or a double bond, 3 is the number of oxygen-activated protons not included in the oxyethylene unit count, and 4 is the number of protons in each oxyethylene unit.

LIMIT TESTS

BRIEFING

⟨**401**⟩ **Fats and Fixed Oils,** *USP 29* page 2568 and page 3766 of the *Second Supplement.* On the basis of comments received, it is proposed to revise the test for *Acid Value (Free Fatty Acids)* to include potassium hydroxide solution as another titrant of choice and to designate the current method as *Method I;* in addition *Method II* is proposed to allow for the use of a different solvent mixture.

(EGC: H. Wang) RTS—C46732

Change to read:

ACID VALUE (FREE FATTY ACIDS)

The acidity of fats and fixed oils in this Pharmacopeia may be expressed as the number of mL of 0.1 N alkali required to neutralize the free acids in 10.0 g of substance. Acidity is frequently expressed as the Acid Value, which is the number of mg of potassium hydroxide required to neutralize the free acids in 1.0 g of the substance.

■Unless otherwise directed in the individual monograph, use *Method I.*■2S (*USP30*)

■**Method I**■2S (*USP30*)

Procedure—Unless otherwise directed, dissolve about 10.0 g of the substance, accurately weighed, in 50 mL of a mixture of equal volumes of alcohol and ether (which has been neutralized to phenolphthalein with

■0.1 N potassium hydroxide or■2S (*USP30*)
0.1 N sodium hydroxide,

■unless otherwise specified)■2S (*USP30*)
contained in a flask. If the test specimen does not dissolve in the cold solvent, connect the flask with a suitable condenser and warm slowly, with frequent shaking, until the specimen dissolves. Add 1 mL of phenolphthalein TS, and titrate with

■0.1 N potassium hydroxide VS or■2S (*USP30*)

In-Process Revision

0.1 N sodium hydroxide VS until the solution remains faintly pink after shaking for 30 seconds. Calculate either the Acid Value or the volume of 0.1 N alkali required to neutralize 10.0 g of specimen (free fatty acids), whichever is appropriate. ■Calculate the Acid Value by the formula:

$$56.1V \times N/W$$

in which ~~*V* is the volume, in mL; *N* is the normality, respectively, of the~~

■56.1 is the molecular weight of potassium hydroxide; *V* is the volume, in mL; *N* is the normality, of the potassium hydroxide solution or■2S *(USP30)*
sodium hydroxide solution; and *W* is the weight, in g, of the sample taken.■2S *(USP29)*

If the volume of

■0.1 N potassium hydroxide VS or■2S *(USP30)*
0.1 N sodium hydroxide VS required for the titration is less than 2 mL, a more dilute titrant may be used, or the sample size may be adjusted accordingly. The results may be expressed in terms of the volume of titrant used or in terms of the equivalent volume of

■0.1 N potassium hydroxide or■2S *(USP30)*
0.1 N sodium hydroxide.

If the oil has been saturated with carbon dioxide for the purpose of preservation, gently reflux the alcohol-ether solution for 10 minutes before titration. The oil may be freed from carbon dioxide also by exposing it in a shallow dish in a vacuum desiccator for 24 hours before weighing the test specimens.

■Method II

Procedure—Prepare 125 mL of a solvent mixture consisting of equal volumes of isopropyl alcohol and toluene. Before use, add 2 mL of 1% solution of phenolphthalein in isopropyl alcohol to the 125-mL mixture, and neutralize with alkali to a faint but permanent pink color. Weigh accurately the appropriate amount of well-mixed liquid sample indicated in the table below, and dissolve it in the neutralized solvent mixture. If the test specimen does not dissolve in the cold solvent, connect the flask with a suitable condenser and warm slowly, with frequent shaking, until the specimen dissolves. Shake vigorously while titrating with 0.1 N potassium hydroxide VS or 0.1 N sodium hydroxide VS to the first permanent pink of the same intensity as that of the neutralized solvent before mixture with the sample. Calculate the Acid Value as indicated in *Method I*.

Acid Value	Sample Weight (g)
0–1	20
1–4	10
4–15	2.5
15–74.9	0.5
≥75.0	0.1

■2S *(USP30)*

BRIEFING

⟨**466**⟩ **Ordinary Impurities,** *USP 29* page 2579. Impurites are closely related to integrity and safety, which are matters of principal interest for *USP*. Regulatory agencies participating in the International Conference on Harmonization (ICH) are near to concluding the process for adoption of the guidelines "*Impurities in New Drug Substances (Q3A)*" and "*Impurities in New Drug Products (Q3B)*". Revisions to incorporate the intent of ICH are proposed for the general chapter *Impurities in Official Articles* ⟨1086⟩, published elsewhere in this issue of *PF*. Revisions to this chapter are proposed to maintain consistency with the changes in ⟨1086⟩.

(GC: A. Hernandez-Cardoso) RTS—C46417

Change to read:

~~This test, where called for in the individual monograph, is provided to evaluate the impurity profile of an article. See *Chromatography* ⟨621⟩ for a general discussion of the thin-layer chromatographic technique. Unless otherwise specified in the individual monograph, use the following method.~~

■This test, where called for in the individual monograph, is provided to control ordinary impurities in official articles. Ordinary impurities are defined as those species in drug substances and/or drug products that have no significant, undesirable biological activity in the amounts present. These impurities may arise out of the synthesis, preparation, or degradation of compendial articles. Selections of tests and assays allow for anticipated amounts of impurities that are unobjectionable for the customary use of the article.■2S *(USP30)*

Add the following:

■Reporting and Specifications—The value of 2.0%, unless otherwise specified in the individual monograph, was selected as the general limit on ordinary impurities in monographs where documentation did not support adoption of other values.

In-Process Revision

Where a monograph sets limits on concomitant components and/or specified impurities/degradation products, these species are not to be included in the estimation of ordinary impurities unless so stated in the individual monograph.■2S (*USP30*)

Add the following:

■**Methodology**—Unless otherwise specified in an individual monograph, estimation of the amount and number of ordinary impurities is made by relative methods rather than by strict comparison to individual Reference Standards. Nonspecific detection of ordinary impurities is also consistent with this classification.

Typical evaluation methods used for ordinary impurities are thin-layer chromatographic (TLC) techniques. See *Chromatography* ⟨621⟩ for a general discussion of the thin-layer chromatographic technique. Tests for related substances or chromatographic purity may also be used to control the presence of ordinary impurities. Other methods (e.g., HPLC, HPTLC, etc.) may also be used with adequate justification as an alternate method.

Unless otherwise specified in the individual monograph, use the following method.■2S (*USP30*)

Change to read:

Procedure—Use a thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel mixture, and the *Eluant* specified in the monograph. Apply equal volumes (20 µL) of the *Test Solution* and *Standard Solutions* to the plate, using a stream of nitrogen to dry the spots.

Allow the chromatogram to develop in a pre-equilibrated chamber until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and air-dry. View the plate using the visualization technique(s) specified. Locate any spots other than the principal spot in the chromatogram of the *Test Solution,* and determine their relative intensities by comparison with the chromatograms of the appropriate *Standard Solutions*. ~~The total of any ordinary impurities observed does not exceed 2.0%, unless otherwise specified in the individual monograph.~~

■See discussion with regard to reporting and specifying of ordinary impurities above.■2S (*USP30*)

KEY FOR VISUALIZATION TECHNIQUES

(1) Use UV light at 254 nm and at about 366 nm.
(2) Use Iodoplatinate TS.
(3) *Solution A*—Mix 850 mg of bismuth subnitrate with 40 mL of water and 10 mL of glacial acetic acid.

Solution B—Dissolve 8 g of potassium iodide in 20 mL of water. Mix A and B together to obtain a Stock Solution which can be stored for several months in a dark bottle. Mix 10 mL of the Stock Solution with 20 mL of glacial acetic acid, and dilute with water to make 100 mL, to prepare the spray reagent.
(4) *Ninhydrin Spray*—Dissolve 200 mg of ninhydrin in 100 mL of alcohol. Heat the plate after spraying.
(5) *Acid Spray*—In an ice bath, add slowly and cautiously, with stirring, 10 mL of sulfuric acid to 90 mL of alcohol. Spray the plate, and heat until charred.
(6) *Acid–Dichromate Spray*—Add sufficient potassium dichromate to 100 mL of sulfuric acid to make a saturated solution. Spray the plate, and heat until charred.
(7) *Vanillin*—Dissolve 1 g of vanillin in 100 mL of sulfuric acid.
(8) *Chloramine T–Trichloroacetic Acid*—Mix 10 mL of a 3% aqueous solution of chloramine T with 40 mL of a 25% alcoholic solution of trichloroacetic acid. Prepare immediately before use.
(9) *Folin-C*—Add 10 g of sodium tungstate and 2.5 g of sodium molybdate to 70 mL of water, add 5 mL of 85% phosphoric acid and 10 mL of 36% hydrochloric acid, and reflux this solution for 10 hours.
(10) $KMnO_4$—Dissolve 100 mg of Potassium Permanganate in 100 mL of water.
(11) *DAB*—Mix 1 g of *p*-dimethylaminobenzaldehyde in 100 mL of 0.6 *N* hydrochloric acid.
(12) *DAC*—Mix 100 mg of *p*-dimethylaminocinnamaldehyde in 100 mL of 1 *N* hydrochloric acid.
(13) *Ferricyanide*—Mix equal volumes of a 1% ferric chloride solution and a 1% potassium ferricyanide solution. Use immediately.
(14) *Fast Blue B*—Reagent A—Dissolve 500 mg of Fast Blue B Salt in 100 mL of water.
Reagent B—0.1 N sodium hydroxide.
Spray first with A, then with B.
(15) *Alkaline Ferric Cyanide*—Dilute 1.5 mL of a 1% potassium ferricyanide solution with water to 20 mL, and add 10 mL of 15% sodium hydroxide solution.
(16) *Iodine Spray*—Prepare a 0.5% solution of iodine in chloroform.
(17) Expose the plate for 10 minutes to iodine vapors in a pre-equilibrated closed chamber, on the bottom of which there are iodine crystals.
(18) *Solution A*—Dissolve 0.5 g of potassium iodide in 50 mL of water.
Solution B—Prepare a solution of 0.5 g of soluble starch in 50 mL of hot water.
Just prior to use, mix equal volumes of *Solution A* and *Solution B*.
(19) *PTSS*—Dissolve 20 g of *p*-toluenesulfonic acid in 100 mL of alcohol, spray the plate, dry for 15 minutes at 110°, and view under UV light at 366 nm.
(20) *o-Tolidine Spray*—Dissolve 160 mg of *o*-tolidine in 30 mL of glacial acetic acid, dilute with water to make 500 mL, add 1 g of potassium iodide, and mix until the potassium iodide has dissolved.
(21) Mix 3 mL of chloroplatinic acid solution (1 in 10) with 97 mL of water, followed by the addition of 100 mL of potassium iodide solution (6 in 100) to prepare the spray reagent.
(22) *Iodine–Methanol Spray*—Prepare a mixture of iodine TS and methanol (1 : 1).

BRIEFING

⟨**467**⟩**Residual Solvents,** page 3774 of the *Second Supplement* and page 1011 of *PF* 32(4) [July–Aug. 2006] under *Policies and Announcements*. It was announced in *PF* 32(4) that the new implementation date for this requirement is July 1, 2007. Also, the announcement reflects that the0 implementation date for the change in the title of this general chapter has been modified to July 1, 2007. On the basis of the general concern presented by the industry in stakeholders forums and on comments received regarding several differences between the USP text and ICH Q3C guidelines, this general chapter is being proposed for revision. The changes are intended to

consider and correct many of those differences, harmonizing to the extent possible with the ICH document. Comments received indicate that some problems may exist in performing the analytical procedures for water-insoluble articles. In light of that, it was decided to delete the analytical procedures and allow users to use other validated procedures. In order to correct this deficiency, users are encouraged to send to USP alternative general procedures useful for testing residual solvents Class 1 and Class 2 in water-insoluble articles.

(GC: H. Pappa) RTS—C44705

⟨467⟩ RESIDUAL SOLVENTS

(Chapter under this new title—to become official July 1, 2007)
(Current chapter title is** ⟨467⟩ Organic Volatile Impurities**)

Change to read:

▪INTRODUCTION

This general chapter applies to existing drug substances, excipients, and medicinal products whether or not they are the subject of a monograph of the Pharmacopeia. All substances and products are to be tested for the content of solvents likely to be present in a substance or product.

Where the limits to be applied comply with those given below, tests for residual solvents are not generally mentioned in specific monographs because the solvents employed may vary from one manufacturer to another.

Where a quantitative determination of a residual solvent is carried out and a test for loss on drying is not carried out, the content of residual solvent is taken into account for calculation of the assay content of the article.

The objective of this general chapter is to provide acceptable amounts of residual solvents in pharmaceuticals for the safety of the patient. The general chapter recommends the use of less toxic solvents and describes levels considered to be toxicologically acceptable for some residual solvents.▪2S (*USP30*)

For pharmacopeial purposes, residual solvents in pharmaceuticals are defined as organic volatile chemicals that are used or produced in the manufacture of drug substances or excipients, or in the preparation of drug products. The residual solvents are not completely removed by practical manufacturing techniques. Appropriate selection of the solvent for the synthesis of a drug substance or an excipient may enhance the yield, or determine characteristics such as crystal form, purity, and solubility. Therefore, the solvent may sometimes be a critical element in the synthetic process. This general chapter does not address solvents deliberately used as excipients nor does it address solvates. However, the content of solvents in such products should be evaluated and justified.

Because residual solvents do not provide therapeutic benefit, they should be removed, to the extent possible, to meet ingredient and product specifications, good manufacturing practices, or other quality-based requirements. Drug products should contain no higher levels of residual solvents than can be supported by safety data. ~~Solvents~~

▪Some solvents▪2S (*USP30*)
that are known to cause unacceptable toxicities (Class 1, *Table 1*) should be avoided in the production of drug substances, excipients, or drug products unless their use can be strongly justified in a risk-benefit assessment. ~~Solvents~~

▪Some solvents▪2S (*USP30*)
associated with less severe toxicity (Class 2, *Table 2*) should be limited in order to protect patients from potential adverse effects. Ideally, less toxic solvents (Class 3, *Table 3*) should be used where practical. The complete list of solvents included in this general chapter is given in *Appendix 1*. These tables and the list are not exhaustive. ~~Where other solvents have been used, based on approval by the competent regulatory authority, such solvents may be added to the tables and list.~~

▪For the purposes of this Pharmacopeia, when a manufacturer has received approval from a competent regulatory authority for the use of a new solvent not currently listed in this general chapter, it is the responsibility of that manufacturer to notify the USP regarding the identity of this solvent, the approved residual solvent limit in the article, and the appropriate test procedure for this residual solvent in the article. The USP will then address this topic in the individual monograph. When a new solvent has been approved through the ICH process, this new solvent will be added to the appropriate list in this general chapter. At that time consideration will be given for removal of the specific solvent test requirement in the individual monograph.▪2S (*USP30*)

Testing of drug substances, excipients, and drug products for residual solvents should be performed when production or purification processes are known to result in the presence of such residual solvents. It is only necessary to test for residual solvents that are used or produced in the manufacture or purification ~~processes~~

▪of drug substances, excipients, or drug products.▪2S (*USP30*)

Although manufacturers may choose to test the drug product, a cumulative procedure may be used to calculate the residual solvent levels in the

▪drug▪2S (*USP30*)
product from the levels in ~~its ingredients~~

▪the ingredients used to produce the drug product.▪2S (*USP30*)
If the calculation results in a level equal to or below that ~~recommended~~

▪provided▪2S (*USP30*)
in this general chapter, no testing of the drug product for residual solvents ~~needs to~~

▪need▪2S (*USP30*)
be considered. If, however, the calculated ~~levels are~~

▪level is▪2S (*USP30*)
above the recommended level, the drug product should be tested to ascertain whether the formulation process has reduced the relevant solvent ~~levels to within acceptable amounts~~

In-Process Revision

■level to within the acceptable amount.■2S (*USP30*)
A drug product should also be tested if a residual solvent is used during its manufacture.

■For the purposes of this Pharmacopeia, when a manufacturer has received approval from a competent regulatory authority for a higher level of residual solvent, it is the responsibility of that manufacturer to notify the USP regarding the identity of this solvent and the approved residual solvent limit in the article. The USP will then address this topic in the individual monograph.■2S (*USP30*)

See *Appendix 2* for additional background information related to residual solvents.

Change to read:

CLASSIFICATION OF RESIDUAL SOLVENTS BY RISK ASSESSMENT

The term "tolerable daily intake" (TDI) is used by the International Program on Chemical Safety (IPCS) to describe exposure limits of toxic chemicals and the term "acceptable daily intake" (ADI) is used by the World Health Organization (WHO) and other national and international health authorities and institutes. The term "permitted daily exposure" (PDE) is defined as a pharmaceutically acceptable intake of residual solvents to avoid confusion of differing values for ADIs of the same substance.

Residual solvents ~~specified~~

■assessed■2S (*USP30*)
in this general chapter are listed in *Appendix 1* by common names and structures. They were evaluated for their possible risk to human health and placed into one of three classes as follows:

Class 1	~~Residual Solvents: Solvents to be Avoided~~
■Residual Solvents■2S (*USP30*)	■Solvents to be avoided■2S (*USP30*) Known human carcinogens Strongly suspected human carcinogens Environmental hazards
Class 2	~~Residual Solvents: Solvents to be Limited~~
■Residual Solvents■2S (*USP30*)	■Solvents to be limited■2S (*USP30*) Nongenotoxic animal carcinogens or possible causative agents of other irreversible toxicity, such as neurotoxicity or teratogenicity. Solvents suspected of other significant but reversible toxicities.
Class 3	~~Residual Solvents: Solvents with Low Toxic Potential~~
■Residual Solvents■2S (*USP30*)	■Solvents with low toxic potential■2S (*USP30*) Solvents with low toxic potential to humans; no health-based exposure limit is needed. [NOTE—Class 3 residual solvents ~~may have PDEs of up to~~ ■have PDEs of■2S (*USP30*) 50 mg or more per day.]*

* For residual solvents with PDEs of more than 50 mg per day, see the discussion in the section *Class 3* under *Limits of Residual Solvents*.

Change to read:

~~PROCEDURES~~

■METHODS■2S (*USP30*)

FOR ESTABLISHING EXPOSURE LIMITS

The ~~procedure~~ ■method■2S (*USP30*)
used to establish permitted daily exposures for residual solvents is presented in *Appendix 3*.

Change to read:

OPTIONS FOR ~~DETERMINING LEVELS~~

■DESCRIBING LIMITS■2S (*USP30*)

OF CLASS 2 RESIDUAL SOLVENTS

Two options are available ~~to determine levels of~~ ■when setting limits for■2S (*USP30*)
Class 2 residual solvents.

Option 1

The concentration limits in ppm stated in *Table 2* are used. They were calculated using equation (1) below by assuming a product weight of 10 g administered daily.

$$\text{Concentration (ppm)} = \frac{1000 \times \text{PDE}}{\text{dose}} \quad (1)$$

Here, PDE is given in terms of mg per day, and dose is given in g per day.

These limits are considered acceptable for all drug substances, excipients, and drug products. Therefore, this option may be applied if the daily dose is not known or fixed. If all drug substances and excipients in a formulation meet the limits given in *Option 1,* these components may be used in any proportion. No further calculation is necessary provided the daily dose does not exceed 10 g. Products that are administered in doses greater than 10 g per day are to be considered under *Option 2.*

Option 2

It is not necessary for each component of the drug product to comply with the limits given in *Option 1.* The PDE in terms of mg per day as stated in *Table 2* can be used with the known maximum daily dose and equation (1) above to determine the concentration of residual solvent allowed in a drug product. Such limits are considered acceptable

In-Process Revision

provided that it has been demonstrated that the residual solvent has been reduced to the practical minimum. The limits should be realistic in relation to analytical precision, manufacturing capability, and reasonable variation in the manufacturing process. The limits should also reflect contemporary manufacturing standards.

Option 2 may be applied by adding the amounts of a residual solvent present in each of the components of the drug product. The sum of the amounts of solvent per day should be less than that given by the PDE.

Consider an example of the application of *Option 1* and *Option 2* to acetonitrile concentration in a drug product. The permitted daily exposure to acetonitrile is 4.1 mg per day; thus, the *Option 1* limit is 410 ppm. The maximum administered daily weight of a drug product is 5.0 g, and the drug product contains two excipients. The composition of the drug product and the calculated maximum content of residual acetonitrile are given in the following table.

Component	Amount in Formulation (g)	Acetonitrile Content (ppm)	Daily Exposure (mg)
Drug substance	0.3	800	0.24
Excipient 1	0.9	400	0.36
Excipient 2	3.8	800	3.04
Drug product	5.0	728	3.64

Excipient l meets the *Option 1* limit, but the drug substance, excipient 2, and drug product do not meet the *Option 1* limit. Nevertheless, the drug product meets the *Option 2* limit of 4.1 mg per day and thus conforms to the acceptance criteria in this general chapter.

Consider another example using acetonitrile as the residual solvent. The maximum administered daily weight of a drug product is 5.0 g, and the drug product contains two excipients. The composition of the drug product and the calculated maximum content of residual acetonitrile are given in the following table.

Component	Amount in Formulation (g)	Acetonitrile Content (ppm)	Daily Exposure (mg)
Drug substance	0.3	800	0.24
Excipient 1	0.9	2000	1.80
Excipient 2	3.8	800	3.04
Drug product	5.0	1016	5.08

In this example, the drug product meets neither the *Option 1* nor the *Option 2* limit

■according to this summation.■2S (*USP30*)
The manufacturer could test the drug product to determine if the formulation process reduced the level of acetonitrile. If the level of acetonitrile was not reduced to the allowed limit during formulation, the ~~product fails the requirements of the test.~~

■manufacturer of the drug product should take other steps to reduce the amount of acetonitrile in the drug product, unless the manufacturer has received approval from a competent regulatory authority for such a higher level of residual solvent. If this is the case, it is the responsibility of that manufacturer to notify the USP regarding the identity of this solvent and the approved residual solvent limit in the article. The USP will then address this topic in the individual monograph.■2S (*USP30*)

Add the following:

■ANALYTICAL PROCEDURES

Residual solvents are typically determined using chromatographic techniques such as gas chromatography. The procedures described in the *Identification, Control, and Quantification of Residual Solvents* section of this general chapter are to be applied wherever possible. Otherwise, manufacturers may select the most appropriate validated analytical procedure for a particular application. However, Pharmacopeial standards and procedures are interrelated; therefore, where a difference appears or in the event of dispute, only the results obtained by the procedures given in this general chapter are conclusive (see *General Notices*). If only Class 3 solvents are present, a nonspecific method such as loss on drying may be used.

All methods for residual solvents should be appropriately validated as specified under *Validation of Compendial Procedures* ⟨1225⟩.■2S (*USP30*)

Add the following:

■REPORTING LEVELS OF RESIDUAL SOLVENTS

Manufacturers of pharmaceutical products need certain information about the content of residual solvents in drug substances or excipients in order to meet the criteria of this general chapter. The following statements are given as acceptable examples of the information that could be provided from a supplier of drug substances or excipients to a pharmaceutical manufacturer. The supplier might choose one of the following as appropriate:

- Only Class 3 solvents are likely to be present. Loss on drying is less than 0.5%.
- Only Class 2 solvents X, Y, ... are likely to be present. All are below the Option 1 limit. (Here the supplier would name the Class 2 solvents represented by X, Y, ...)

In-Process Revision

- Only Class 2 solvents X, Y, ... and Class 3 solvents are likely to be present. Residual Class 2 solvents are below the Option 1 limit and residual Class 3 solvents are below 0.5%.

The phrase "likely to be present" as used in the above examples refers to the solvent used or produced in the final manufacturing step and to solvents that are used or produced in earlier manufacturing steps and not removed consistently by a validated process.

If Class 1 solvents are likely to be present, they should be identified and quantified. If solvents of Class 2 or 3 are present at greater than their Option 1 limits or 0.5%, respectively, they should be identified and quantified.■2S (*USP30*)

Change to read:

LIMITS OF RESIDUAL SOLVENTS

Ethylene Oxide

[NOTE—The test for ethylene oxide is conducted only where specified in the individual monograph.] The standard solution parameters and the procedure for determination are described in the individual monograph. Unless otherwise specified in the individual monograph, the limit is 10 µg per g.

Class 1

■(solvents to be avoided)■2S (*USP30*)

Class 1 residual solvents *(Table 1)* should not be employed in the manufacture of drug substances, excipients, and drug products because of the unacceptable toxicities or deleterious environmental effects of these residual solvents. However, if their use in order to produce a medicinal product

■with a significant therapeutic advance■2S (*USP30*)
is unavoidable, their levels should be restricted as shown in *Table 1,* unless otherwise stated in the individual monograph. The solvent 1,1,1-trichloroethane is included in *Table 1* because it is an environmental hazard. The stated limit of 1500 ppm is based on

■a review of■2S (*USP30*)
safety data.

When Class 1 residual solvents are used or produced in the manufacture or purification of a drug substance, excipient, or drug product, these solvents should be identified and quantified. The procedures described in the *Identification, Control, and Quantification of Residual Solvents* section of this general chapter are to be applied wherever possible. Otherwise an appropriate validated procedure is to be employed. ~~Such procedure shall be submitted to the USP for evaluation.~~

■■2S (*USP30*)

Table 1. Class 1 Residual Solvents

■(solvents that should be avoided)■2S (*USP30*)

Solvent	Concentration Limit (ppm)	Concern
Benzene	2	Carcinogen
Carbon tetrachloride	4	Toxic and environmental hazard
1,2-Dichloroethane	5	Toxic
1,1-Dichloroethene	8	Toxic
1,1,1-Trichloroethane	1500	Environmental hazard

Class 2

Class 2 residual solvents *(Table 2)* should be limited in drug substances, excipients, and drug products because of the inherent toxicities of the residual solvents. PDEs are given to the nearest 0.1 mg per day, and concentrations are given to the nearest 10 ppm. The stated values do not reflect the necessary analytical precision of the determination procedure. Precision should be determined as part of the procedure validation.

If Class 2 residual solvents are present at greater than their *Option 1* limits, they should be identified and quantified. The procedures described in the *Identification, Control, and Quantification of Residual Solvents* section of this general chapter are to be applied wherever possible. Otherwise an appropriate validated procedure is to be employed. ~~Such procedure shall be submitted to the USP for evaluation~~

■■2S (*USP30*)

[NOTE—The following Class 2 residual solvents are not readily detected by the headspace injection conditions described in the *Identification, Control, and Quantification of Residual Solvents* section of this general chapter: formamide, 2-ethoxyethanol,2-methoxyethanol, ethylene glycol, *N*-methylpyrrolidone, and sulfolane. Other appropriate validated procedures are to be employed for the quantification of these residual solvents. Such procedures shall be submitted to the USP for review and possible inclusion in the relevant individual monograph.]

Table 2. Class 2 Residual Solvents

Solvent	PDE (mg/day)	Concentration Limit (ppm)
Acetonitrile	4.1	410
Chlorobenzene	3.6	360
Chloroform	0.6	60
Cyclohexane	38.8	3880
1,2-Dichloroethene	18.7	1870
1,2-Dimethoxyethane	1.0	100
N,N-Dimethylacetamide	10.9	1090
N,N-Dimethylformamide	8.8	880
1,4-Dioxane	3.8	380
2-Ethoxyethanol	1.6	160
Ethylene glycol	6.2	620
Formamide	2.2	220
Hexane	2.9	290
Methanol	30.0	3000
2-Methoxyethanol	0.5	50
Methylbutylketone	0.5	50
Methylcyclohexane	11.8	1180
Methylene chloride	6.0	600
N-Methylpyrrolidone	5.3	530
Nitromethane	0.5	50
Pyridine	2.0	200
Sulfolane	1.6	160
Tetrahydrofuran	7.2	720
Tetralin	1.0	100
Toluene	8.9	890

In-Process Revision

Table 2. Class 2 Residual Solvents *(Continued)*

Solvent	PDE (mg/day)	Concentration Limit (ppm)
Trichloroethylene	0.8	80
Xylene*	21.7	2170

* Usually 60% *m*-xylene, 14% *p*-xylene, 9% *o*-xylene with 17% ethyl benzene

Class 3

Class 3 residual solvents *(Table 3)* may be regarded as less toxic and of lower risk to human health than Class 1 and Class 2 residual solvents. Class 3 includes no solvent known as a human health hazard at levels normally accepted in pharmaceuticals. However, there are no long-term toxicity or carcinogenicity studies for many of the residual solvents in Class 3. Available data indicate that they are less toxic in acute or short-term studies and negative in genotoxicity studies.

~~Unless otherwise stated in the individual monograph, Class 3 residual solvents are limited to not more than 50 mg per day (corresponding to 5000 ppm or 0.5% under *Option 1*).~~

■It is considered that amounts of these residual solvents of 50 mg per day or less (corresponding to 5000 ppm or 0.5% under *Option 1*) would be acceptable without justification. Higher amounts may also be acceptable provided they are realistic in relation to manufacturing capability and good manufacturing practice. For the purposes of this Pharmacopeia, when a manufacturer has received approval from a competent regulatory authority for such a higher level of residual solvent, it is the responsibility of that manufacturer to notify the USP regarding the identity of this solvent and the approved residual solvent limit in the article. The USP will then address this topic in the individual monograph.■2S (*USP30*)

If a Class 3 solvent limit in an individual monograph is greater than 50 mg per day, that residual solvent should be identified and quantified. The procedures described in the *Identification, Control, and Quantification of Residual Solvents* section of this general chapter, with appropriate modifications to the standard solutions, are to be applied wherever possible. Otherwise an appropriate validated procedure is to be employed. ~~Such procedure shall be submitted to the USP for evaluation. USP Reference Standards, where available, should be used in these procedures.~~

■■2S (*USP30*)

Table 3. Class 3 Residual Solvents
(limited by GMP or other quality-based requirements in drug substances, excipients, and drug products)

Acetic acid	Heptane
Acetone	Isobutyl acetate
Anisole	Isopropyl acetate
1-Butanol	Methyl acetate
2-Butanol	3-Methyl-1-butanol
Butyl acetate	Methylethylketone
tert-Butylmethyl ether	Methylisobutylketone
Cumene	2-Methyl-l-propanol
Dimethyl sulfoxide	Pentane
Ethanol	1-Pentanol
Ethyl acetate	1-Propanol
Ethyl ether	2-Propanol
Ethyl formate	Propyl acetate
Formic acid	

Other Residual Solvents

The residual solvents listed in *Table 4* may also be of interest to manufacturers of drug substances, excipients, or drug products. However, no adequate toxicological data on which to base a PDE was found.

Table 4. Other Residual Solvents
(for which no adequate toxicological data was found)

1,1-Diethoxypropane	Methyl isopropyl ketone
1,1-Dimethoxymethane	Methyltetrahydrofuran
2,2-Dimethoxypropane	Solvent hexane
Isooctane	Trichloroacetic acid
Isopropyl ether	Trifluoroacetic acid

Change to read:

IDENTIFICATION, CONTROL, AND QUANTIFICATION OF RESIDUAL SOLVENTS

■Whenever possible, the substance under test needs to be dissolved to release the residual solvent. As the USP deals with drug products, as well as with active ingredients and excipients, it may be acceptable that in cases, some of the components of the formulation will not dissolve completely. In those cases, the drug product may first need to be pulverized into a fine powder so that any residual solvent that may be present can be released. This operation should be as fast as possible to prevent the loss of volatile solvents during the procedure.■2S (*USP30*)

[NOTE—The organic-free water specified in the following procedures produces no significantly interfering peaks when chromatographed.]

Class 1 and Class 2 Residual Solvents

~~WATER-SOLUBLE ARTICLES~~

■The following *Procedures* demonstrated that they were appropriate for water-soluble articles. For water-insoluble articles, perform the appropriate modifications to the standard solutions and chromatographic parameters. Otherwise, an appropriate validated procedure is to be employed.■2S (*USP30*)

Procedure A—

Class 1 Standard Stock Solution—Transfer 1.0 mL of USP Class 1 Residual Solvents Mixture RS to a 100-mL volumetric flask, add 9 mL of dimethyl sulfoxide, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to a 10-mL volumetric flask, dilute with water to volume, and mix.

Class 1 Standard Solution—Transfer 1.0 mL of *Class 1 Standard Stock Solution* to an appropriate headspace vial, add 5.0 mL of water, apply the stopper, cap, and mix.

Class 2 Standard Stock Solutions—Transfer 1.0 mL of USP Residual Solvents Class 2—Mixture A RS to a 100-mL volumetric flask, dilute with water to volume, and mix. This is *Class 2 Standard Stock Solution A.* Transfer 1.0 mL of USP Residual Solvents Class 2—Mixture B RS to a 100-mL volumetric flask, dilute with water to volume, and mix. This is *Class 2 Standard Stock Solution B.*

Class 2 Mixture A Standard Solution—Transfer 1.0 mL of *Class 2 Standard Stock Solution A* to an appropriate headspace vial, add 5.0 mL of water, apply the stopper, cap, and mix.

Class 2 Mixture B Standard Solution—Transfer 5.0 mL of *Class 2 Standard Stock Solution B* to an appropriate headspace vial, add 1.0 mL of water, apply the stopper, cap, and mix.

Test Stock Solution—Transfer about 250 mg of the article under test, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Test Solution—Transfer 5.0 mL of *Test Stock Solution* to an appropriate headspace vial, add 1.0 mL of water, apply the stopper, cap, and mix.

Class 1 System Suitability Solution—Transfer 1.0 mL of *Class 1 Standard Stock Solution* to an appropriate headspace vial, add 5.0 mL of *Test Stock Solution,* apply the stopper, cap, and mix.

Chromatographic System (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm × 30-m fused-silica column coated with a 1.8-µm layer of phase G43 or a 0.53-mm × 30-m wide-bore column coated with a 3.0-µm layer of phase G43. The carrier gas is nitrogen or helium with a linear velocity of about 35 cm per second, and a split ratio of 1 : 5. The column temperature is maintained at 40° for 20 minutes, then raised at a rate of 10° per minute to 240°, and maintained at 240° for 20 minutes. The injection port and detector temperatures are maintained at 140° and 250°, respectively. Chromatograph the *Class 1 Standard Solution, Class 1 System Suitability Solution,* and *Class 2 Mixture A Standard Solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio of 1,1,1-trichloroethane in the *Class 1 Standard Solution* is not less than 5; the signal-to-noise ratio of each peak in the *Class 1 System Suitability Solution* is not less than 3; and the resolution, *R,* between acetonitrile and methylene chloride in the *Class 2 Mixture A Standard Solution* is not less than 1.0.

Procedure—Separately inject (following one of the headspace operating parameter sets described in the table below) equal volumes of headspace (about 1.0 mL) of the *Class 1 Standard Solution, Class 2 Mixture A Standard Solution, Class 2 Mixture B Standard Solution,* and the *Test Solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. ~~If a peak response of any peak in the *Test Solution* is greater than or equal to a corresponding peak in either the *Class 1 Standard Solution* or either of the two *Class 2 Mixture Standard Solutions,* proceed to *Procedure B* to verify the identity of the peak; otherwise the article meets the requirements of this test.~~

■If a peak response of any peak, other than a peak for 1,1,1-trichloroethane, in the *Test Solution* is greater than or equal to a corresponding peak in either the *Class 1 Standard Solution* or either of the two *Class 2 Mixture Standard Solutions*, or a peak response of 1,1,1-trichloroethane is greater than or equal to 150 times the peak response corresponding to 1,1,1-trichloroethane in the *Class 1 Standard Solution*, proceed to *Procedure B* to verify the identity of the peak; otherwise the article meets the requirements of this test.■2S (*USP30*)

Table 5. Headspace Operating Parameters

	Headspace Operating Parameter Sets		
	1	2	3
Equilibration temperature (°)	80	105	80
Equilibration time (min.)	60	45	45
Transfer-line temperature (°)	85	110	105
Carrier gas: nitrogen or helium at an appropriate pressure			
Pressurization time (s)	30	30	30
Injection volume (mL)	1	1	1

Procedure B—

Class 1 Standard Stock Solution, Class 1 Standard Solution, Class 2 Standard Stock Solutions, Class 2 Mixture A Standard Solution, Class 2 Mixture B Standard Solution, Test Stock Solution, Test Solution, and *Class 1 System Suitability Solution*—Prepare as directed for *Procedure A.*

Class 2 System Suitability Solution—Transfer 1.0 mL of USP Residual Solvent Class 2—Acetonitrile RS and 1.0 mL of USP Residual Solvent Class 2—Trichloroethylene RS to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to an appropriate headspace vial, add 5.0 mL of water, apply the stopper, cap, and mix.

Chromatographic System (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm × 30-m fused-silica column coated with a 0.25-µm layer of phase G16, or a 0.53-mm × 30-m wide-bore column coated with a 0.25-µm layer of phase G16. The carrier gas is nitrogen or helium with a linear velocity of about 35 cm per second and a split ratio of 1 : 5. The column temperature is maintained at 50° for 20 minutes, then raised at a rate of 6° per minute to 165°, and maintained at 165° for 20 minutes. The injection port and detector temperatures are maintained at 140° and 250°, respectively. Chromatograph the *Class 1 Standard Solution,* the *Class 1 System Suitability Solution,* and the *Class 2 System Suitability Solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio of benzene in the *Class 1 Standard Solution* is not less than 5; the signal-to-noise ratio of each peak in the *Class 1 System Suitability Solution* is not less than 3; and the resolution, *R,* between acetonitrile and trichloroethylene in the *Class 2 System Suitability Solution* is not less than 1.0.

In-Process Revision

Procedure—Separately inject (following one of the headspace operating parameter sets described in *Table 5*) equal volumes of headspace (about 1.0 mL) of the *Class 1 Standard Solution,* the *Class 2 Mixture A Standard Solution,* the *Class 2 Mixture B Standard Solution,* and the *Test Solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. If the peak response(s) in the *Test Solution* of the peak(s) identified in *Procedure A* is/are greater than or equal to a corresponding peak(s) in either the *Class 1 Standard Solution* or either of the two *Class 2 Mixture Standard Solutions,* proceed to *Procedure C* to quantify the peak(s); otherwise the article meets the requirements of this test.

Procedure C—

Class 1 Standard Stock Solution, Class 1 Standard Solution, Class 2 Standard Stock Solution A, Class 2 Mixture A Standard Solution, Test Stock Solution, Test Solution, and *Class 1 System Suitability Solution*—Prepare as directed for *Procedure A.*

Standard Solution—~~[NOTE—Prepare a separate *Standard Solution* for each peak identified and verified by *Procedures A* and *B.*]~~

■[NOTE—Prepare a separate *Standard Solution* for each peak identified and verified by *Procedures A* and *B.* For the Class 1 solvents other than 1,1,1-trichloroethane, prepare the first dilution as directed for the first dilution under *Class 1 Standard Stock Solution* in *Procedure A.*]■2S (*USP30*)
Transfer an accurately measured volume of each individual USP Reference Standard corresponding to each residual solvent peak identified and verified by *Procedures A* and *B* to a suitable container, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a final concentration of 1/20 of the value stated in *Table 1* or *2* (under *Concentration Limit*). Transfer 1.0 mL of this solution to an appropriate headspace vial, add 5.0 mL of water, apply the stopper, cap, and mix.

Spiked Test Solution—[NOTE—Prepare a separate *Spiked Test Solution* for each peak identified and verified by *Procedures A* and *B.*] Transfer 5.0 mL of *Test Stock Solution* to an appropriate headspace vial, add 1.0 mL of the *Standard Solution,* apply the stopper, cap, and mix.

Chromatographic System (see *Chromatography* ⟨621⟩)—[NOTE—If the results of the chromatography from *Procedure A* are found to be inferior to those found with *Procedure B,* the *Chromatographic System* from *Procedure B* may be substituted.] The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm × 30-m fused-silica column coated with a 1.8-µm layer of phase G43 or a 0.53-mm × 30-m wide-bore column coated with a 3.0-µm layer of phase G43. The carrier gas is nitrogen or helium with a linear velocity of about 35 cm per second, and a split ratio of 1 : 5. The column temperature is maintained at 40° for 20 minutes, then raised at a rate of 10° per minute to 240°, and maintained at 240° for 20 minutes. The injection port and detector temperatures are maintained at 140° and 250°, respectively. Chromatograph the *Class 1 Standard Solution,* the *Class 1 System Suitability Solution,* and the *Class 2 Mixture A Standard Solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio of 1,1,1-trichloroethane in the *Class 1 Standard Solution* is not less than 5; the signal-to-noise ratio of each peak in the *Class 1 System Suitability Solution* is not less than 3; and the resolution, *R,* between acetonitrile and methylene chloride in the *Class 2 Mixture A Standard Solution* is not less than 1.0.

Procedure—Separately inject (following one of the headspace operating parameters described in *Table 5*) equal volumes of headspace (about 1.0 mL) of the *Standard Solution,* the *Test Solution,* and the *Spiked Test Solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in ppm, of each residual solvent found in the article under test by the formula:

$$5(C/W)[r_U/(r_{ST} - r_U)]$$

in which C is the concentration, in ppm, of the appropriate USP Reference Standard in the *Standard Solution; W* is the weight, in g, of the article under test taken to prepare the *Test Stock Solution;* and r_U and r_{ST} are the peak responses of each residual solvent obtained from the *Test Solution* and the *Spiked Test Solution,* respectively.

GLOSSARY

■*Acceptable daily intake (ADI):* The maximum acceptable intake of toxic chemicals per day. This term is used by the World Health Organization (WHO).■2S (*USP30*)

Genotoxic carcinogens: Carcinogens that produce cancer by affecting genes or chromosomes.

Lowest-observed-effect level (LOEL): The lowest dose of a substance in a study or group of studies that produces biologically significant increases in frequency or severity of any effects in exposed humans or animals.

Modifying factor: A factor determined by professional judgment of a toxicologist and applied to bioassay data so that the data can be safely related to humans.

Neurotoxicity: The ability of a substance to cause adverse effects on the nervous system.

No-observed-effect level (NOEL): The highest dose of a substance at which there are no biologically significant increases in frequency or severity of any effects in exposed humans or animals.

Permitted daily exposure (PDE): The maximum acceptable intake per day of a residual solvent in pharmaceutical products.

Reversible toxicity: The occurrence of harmful effects that are caused by a substance and that disappear after exposure to the substance ends.

Strongly suspected human carcinogen: A substance for which there is no epidemiological evidence of carcinogenesis but for which there are positive genotoxicity data and clear evidence of carcinogenesis in rodents.

Teratogenicity: The occurrence of structural malformations in a developing fetus when a substance is administered during pregnancy.

■*Tolerable daily intake (TDI):*Tolerable daily exposure to toxic chemicals. Term used by the International Program on Chemical Safety (IPCS).■2S (*USP30*)

GENERAL CHAPTERS

General Information

BRIEFING

⟨**1005**⟩ **Acoustic Emission.** A new general information chapter for acoustic emission is being proposed. The technique of acoustic emission is based on the detection and analysis of sound produced by a process or system. In terms of pharmaceutical applications, the dependence of the acoustic emission measurement on physical properties such as particle size, mechanical strength, and cohesivity of solid materials allows the technique to be used for the control and endpoint detection of processes such as high shear granulation, fluid bed drying, milling, and micronization. This chapter provides general information on this technique, which may have application in certain cases as a manufacturing real-time control technique.

Add the following:

■⟨1005⟩ACOUSTIC EMISSION

INTRODUCTION

Ultrasound techniques can be categorized as two distinct types: acoustic emission (passive mode) and ultrasound spectroscopy (active mode). Both of these techniques have many applications.

The technique of acoustic emission is based on the detection and analysis of sound produced by a process or system. This is essentially equivalent to listening to sounds produced by a process or system, although the sounds are often well above the frequencies that can be detected by the human ear. Generally, frequencies up to about 15 kHz are audible.

In the case of ultrasound spectroscopy, the instrument is designed to generate ultrasound waves across a defined frequency range. These waves travel through the sample and are measured using a receiver. An analogy can be drawn with UV-visible or IR spectroscopy in that the detected ultrasound spectrum reflects changes in velocity or sound attenuation due to the interaction with a sample across a range of frequencies. However, as the scope of this chapter is limited to acoustic emission, ultrasound spectroscopy will not be discussed any further.

Acoustic emission is well-known in the study of fracture mechanics and therefore is used extensively by material scientists. It is also widely used as a nondestructive testing technique and is applied routinely for the inspection of aircraft wings, pressure vessels, and load-bearing structures and components. Acoustic emission is also used in the engineering industry for the monitoring of machine tool wear.

In terms of pharmaceutical applications, the dependence of the acoustic emission measurement on physical properties such as particle size, mechanical strength, and cohesivity of solid materials allows the technique to be used for the control and endpoint detection of processes such as high shear granulation, fluid bed drying, milling, and micronization.

General Principles

Acoustic emissions can propagate by a number of modes. In solids, compressional and shear or transverse modes are important. Compressional modes have the highest velocity and thus reach the acoustic detector (or transducer) first. However, in most process applications of acoustic emission, there are many sources—each producing short bursts of energy—and, consequently, the different modes cannot easily be resolved. The detected signal, for example on the wall of a vessel, is a complex mixture of many overlapping waveforms resulting from many sources and many propagation modes.

At interfaces, depending on the relative acoustic impedance of the two materials, much of the energy is reflected back towards the source. In a fluidized bed, for example, acoustic emissions will only be detected from particles directly impacting the walls of the bed close to the transducer.

A convenient method of studying acoustic emission from processes is to use the "average signal level". A root mean square-to-direct current (RMS-to-DC) converter may be used

to convert the amplitude-modulated (AM) carrier into a more slowly varying DC signal. This is referred to as the average signal level (ASL). The ASL can then be digitally sampled (typically at a sampling frequency of about 50 Hz) and stored electronically for further signal processing.

The simplest way of studying the acoustic data is to examine changes in the ASL. However, other information can be derived from examining the power spectrum of the ASL. The power spectrum is calculated by performing a Fast Fourier Transform (FFT) on the digitized raw data record. Power spectra may be averaged to produce a reliable estimate of power spectral density or to give a ''fingerprint'' of a particular process regime. Interpretation of the power spectrum is complicated by the fact that the acoustic signal originating in the system is distorted by several factors including transmission, reflection, and signal transfer characteristics.

The shape of the power spectrum of the ASL record is a function of the process dynamics. Periodic processes (e.g., mechanical stirring or periodic bubbling of a fluidized bed) show high power at certain discrete frequencies. Random processes show either flicker type properties, where power is inversely proportional to frequency, or white noise type properties in which power is independent of frequency. The amplitude of the power spectrum is also affected by the energy of the acoustic emissions produced by the process. For example, if hard material is being processed, the acoustic emission produced by particle impact will be greater than that produced by soft material.

INSTRUMENTATION

Generally, piezoelectric sensors are used to detect and quantify the acoustic signals produced by a process. Sensors with different resonant frequencies are often used (e.g., 70 and 190 kHz, although higher frequencies may be more appropriate at smaller scales of operation), incorporating various bandpasses. As sound (ultrasound) of the appropriate frequency range reaches these sensors, an electrical signal is generated, the amplitude of which is directly proportional to the energy (amplitude) of the incident sound waves.

These signals are processed through the following:

(1) a pre-amplifier (which incorporates signal filtering),
(2) an RMS-to-DC converter,
(3) a variable gain amplifier, and
(4) a PC-based data acquisition board.

The controlling software is also incorporated into the PC.

Acoustic emission equipment generally allows several sensors to be used simultaneously by incorporating multiple electronic channels into a single instrument.

Signal Processing

The signal from a resonant transducer resembles an AM radio signal. At the resonance frequency of the transducer, the signal consists of a carrier wave that is modulated in amplitude by the process. An RMS-to-DC converter is used to demodulate the signal. The output of this device is the modulation signal or envelope.

The envelope is digitally resampled at a frequency appropriate for the process. For example, 50 Hz is a typical digital sampling rate for a fluid bed drier or high shear granulator.

Qualification and Verification of Acoustic Emission Instruments

A system suitability approach should be taken around instrument performance, establishing optimum measurement configuration, then comparing the instrument performance to the values obtained during routine use to those obtained during installation qualification (IQ).

This approach effectively addresses the issues related to sampling because, unlike other on-line analytical systems, the transducers can be optimally positioned and attached to receive the maximum signal without vessel modification.

Sample rates need to comply with the Nyquist sampling theorem, which states that a signal must be sampled at a rate that is twice the highest frequency component in the signal. A low-pass filter should be used to remove the frequency components greater than half the sampling frequency (Nyquist frequency). Failure to comply with this criterion will result in aliasing.

Owing to the nature of the piezoelectric transducers and because resonant frequencies are natural properties of the crystals, it is not necessary to test the variation (reproducibility) or drift in the frequency domain. If other types of transducers are used, this may be necessary. Any gross change in the frequency domain will be recorded as a drop in the signal intensity at the resonant frequency, and therefore is covered by the signal intensity tests.

The two main areas for instrument performance verification are signal intensity and timings. Any change in the signal intensity will affect the raw signal and the ASL and, therefore, will also affect the power spectrum. Changes in signal intensity can occur as a result of changes in the process (e.g., variation in hardness or moisture in the particles impacting the vessel wall) or changes in the acoustic conduit from the process to transducer.

Reproducibility of the acoustic conduit should be tested using a second transducer to input a pulse or "ping" at the resonant frequency of the receiving sensor. This reproducibility value represents the noise of the signal and can be used in calculations of limit of detection (LOD) and limit of quantitation (LOQ), where LOD is defined as three times the noise of the signal and LOQ is ten times the noise of the signal. The noise value should be calculated from twenty sequential ASL values acquired at the sampling frequency used for normal operation. This test should be repeated in reverse in order to establish that statistically similar intensity values can be obtained on both channels.

Short term reproducibility allows the calculation of noise. However, it does not give a measure of integrity of acoustic conduit over time or, more specifically, changes caused by the process (e.g., variations in adhesive properties with process changes such as heating/cooling). The noise test should be repeated while executing the normal processing parameters (using an empty vessel) and the drift in the ASL should be calculated. This drift will underlay any trend plots (ASL against time), but will not impact chemometric models based purely on endpoint determination. For trend plots, it should be shown that drift is not statistically significant; otherwise, drift correction will need to be applied. Values for noise, drift, and absolute ASL should be recorded and logged, and the tests re-executed if changes are made to the processing equipment or to the acoustic emission system. If no changes are made, then the tests should be re-executed every month. In this way the quality of the acoustic conduit can be shown to be intact and any changes to the signal intensity isolated and attributed to the process itself.

During routine use, it is recommended that the noise test be executed (as above) before each process run, and that signal intensity and noise be calculated. These values should be logged and compared to those generated both during previous use and during installation. Impact of the deviation from previous values will be a function of the prediction model and should be addressed by method validation.

The noise data (from above) can also be used to calculate the time of flight of the pulse. If the pulse activation and signal reception are synchronized, the time taken for the pulse to transmit across the vessel can be measured. This is a good indication of the measurement electronics as well as the overall condition of the acoustic conduit. However, this test should be regarded as a measure of "system" condition and needs to be executed only if changes have been made to the process equipment or the acoustic emission system, or every 6 months. Correlation of the measured timings with the historical ones should be statistically valid. If not, it is an indicator that the acoustic emission system may need requalification by the instrument manufacturer or supplier, or that there are changes in the acoustic conduit.

All these tests require the use of a pulse generated electrically. Failure in any of the above tests could be attributed to the signal generation itself. It is recommended that the electrical pulse generation system be requalified and certified against National Institute of Standards and Technology (NIST) traceable standards every 12 months.

FACTORS AFFECTING MEASUREMENT

The following factors can affect the acoustic data obtained and should be considered when installing an acoustic emission system.

1. As with any other type of sensor, acoustic emission sensors can fail with time or as a result of physical damage. It is important to check the sensor function as part of routine maintenance of the instrument. If multiple sensors are installed on the same vessel, an active signal can be generated from one sensor and this can be used to check the detection on another sensor. This exercise will ensure that the sensors are detecting the acoustic signals generated by the process. A statistically valid ''minimum acceptable acoustic signal'' for the sensor(s) should also be determined and monitored at the start, middle, and end of a process to ensure the performance of the sensor(s) during a process run. This may be established from the routine maintenance signal experiments or based on historical data for the sensors.
2. Sensors are typically installed on the outer wall of the process vessel. Several types of adhesives (temporary or permanent) can be used to attach the sensor to the vessel wall. Through repeated cleaning and vessel movement, it is possible for the bonding between the sensor and vessel to be compromised. Checking the integrity of the installation should be part of routine maintenance. Similar to item *1* above, an active signal can be used to ensure proper bonding between sensor and vessel.
3. The use of high frequencies significantly reduces the contribution of mechanical noise to the acoustic signal detected, especially at smaller scales of operation, although it does not eliminate it completely. Testing the effect of various motor settings, for example, can determine if the acoustic signal detected is a function of mechanical noise. If the effect is significant, using higher frequencies may be necessary. Awareness of the contribution of the mechanical noise, no matter how small, is an important consideration as the motors age or are replaced.
4. Because the sensors are often placed on the outer vessel wall, wall thickness can affect the quality of the signal detected. If the vessel is jacketed, the amplitude of the acoustic signal may be reduced. Adding more sensors on the vessel can improve signal quality. Alternatively, an increase in signal may be obtained by positioning sensor(s) at a location where contact exists between the inner and outer walls, essentially providing a waveguide between the sensor and sound source. Waveguides may also be incorporated into the design of manufacturing equipment to enable utilization of acoustic emission monitoring. Appropriate validation is required to ensure that this does not adversely affect the performance of equipment.
5. During operation, the acoustic signal collected is a summation of various events occurring within the process. For example, the acoustic signal generated as particles hit the wall in a granulator is a function of both the material properties of the granules (i.e., density, size, and porosity), the process-related properties (i.e., force of impact, frequency of impact, and amount of material), and environmental factors (i.e., temperature and humidity). Therefore, significant changes to any of these parameters can affect the acoustic signal and the quality of the ensuing prediction.

The acoustic emission data collected is vessel/equipment specific. It is not advisable to apply a model generated on one piece of equipment to another because the acoustic information can differ as a result of the issues discussed in items *3, 4,* and *5* above.

DATA ANALYSIS

Acoustic emission from granulators and fluid bed driers is known as continuous acoustic emission. Continuous acoustic emission is aphasic (i.e., there are no starts or stops to the signal). This means that it is unnecessary to use signal processing techniques that preserve phase. Power spectral analysis is a useful technique in processing acoustic emission signals. The information in the power spectra, unlike the raw acoustic emission signals, is coherent in the short term, allowing signal averaging to be performed. This provides a better estimate of power spectral density than that provided by a single power spectrum.

To detect endpoints in batch processes (e.g., granulation or drying endpoint), a qualitative multivariate model is appropriate (e.g., PCA or SIMCA). The following sequence of operations is performed:

(1) Training/Calibration—Acoustic emission spectra that are representative of the endpoint condition are obtained.

(2) Modeling—A multivariate model describing the distribution of acoustic emission signals at the endpoint condition is created.

(3) Prediction—Acoustic emission spectra are compared with the model. The fit to the model (usually expressed in terms of a number of standard deviations) is monitored. As the system approaches the endpoint, the fit improves and completion of the process is established once the model fits predefined criteria.

The prediction model is generated from acoustic emission spectra obtained from the process operating under normal conditions. Upsets (e.g., unwanted agglomeration in coaters) are detected by observing statistically valid deviations from the model.

Adaptive modeling has also been proposed for upset detection. This involves generating multivariate models continuously as the acoustic emission signals are acquired. Unusual deviation of the acoustic emission signal indicates the occurrence of a process upset. The advantage of adaptive modeling is that it is not necessary to perform a separate calibration step.

GLOSSARY

Acoustic Emission Transducer—A solid state device usually incorporating a piezoelectric element to convert the acoustic emission wave to an electrical signal.

Acoustic Impedance—Acoustic impedance (Z) is defined as $Z = \rho v$ (where ρ is density and v is the sound velocity). It is an important quantity and gives the proportion of sound energy transmitted from one medium to another and the amount of energy reflected at the interface.

Adaptive Modeling—A method that predicts the state of a process without the use of a previously generated model (i.e., there is no prior training or calibration step).

Aliasing—Spurious low frequency components, appearing in the signal, that are really frequencies above the Nyquist frequency.

Amplitude—The magnitude or strength of a varying waveform.

Average Signal Level (ASL)—A measure of the average power in an acoustic emission signal.

Band-Pass—The range of frequencies within which a component operates.

Compressional Mode—A longitudinal mode of acoustic transmission encountered in solids, liquids, and gases.

Continuous Acoustic Emission—Acoustic emission signals that cannot be separated in time and are typical of pharmaceutical processes such as granulation and fluid bed drying.

Flicker Type Properties—A type of signal associated with many natural processes. The characteristics of flicker noise are that the power of the noise is directly proportional to the signal and has approximately a $1/f$ (f = frequency) spectral density distribution.

Gain—The amplification factor for a component usually expressed in terms of decibels (dB).

Gain in dB = $20 \log_{10} (\text{Voltage}_{out} \text{Voltage}_{in})$.

Piezoelectric—A material which generates an electric field when compressed. Piezoelectric materials are used in the construction of acoustic emission sensors. A common material is PZT (lead zirconium titanate).

Power Spectrum—A power spectrum of a signal is a representation of the signal power as a function of frequency. A power spectrum is calculated from the time domain signal by means of the Fast Fourier Transform (FFT) algorithm. It is useful to study acoustic emission signals in the frequency or spectral domain, as the spectrum is often characteristic of the mechanism. Improvements in signal-to-noise ratio can be obtained by averaging a number of power spectra, as they are coherent.

Power Spectral Density—The measure of acoustic emission power in each resolution element of the power spectrum.

Resonant Frequency—The frequency at which an acoustic emission sensor is most sensitive. Resonant acoustic emission sensors have a clearly defined resonant frequency, but are usually sensitive to other frequencies.

RMS-to-DC Converter—An electronic device that converts an alternating signal to a voltage level proportional to the average power in the signal.

Shear Mode—A transverse mode of acoustic transmission, encountered only in solids.

Signal Filtering—Filtering a signal means attenuating frequencies outside a prescribed range. In acoustic emission work, band-pass filtering is used to improve the signal-to-noise ratio by attenuating noise outside the bandwidth of the sensor. Low pass filtering is used to remove frequencies higher than the Nyquist frequency in order to prevent aliasing.

Transverse Mode—A mode of wave propagation where the displacement of the material is perpendicular to the direction of propagation. These modes are only encountered in solid materials.

White Noise—The characteristic of white noise is a power spectrum of uniform spectral density and is associated with purely random processes.■2S (*USP30*)

BRIEFING

⟨**1086**⟩ **Impurities in Official Articles,** *USP 29* page 2920. Impurites are closely related to integrity and safety, which are matters of principal interest for USP. Regulatory agencies participating in the International Conference on Harmonization (ICH) are near to concluding the process for adoption of the guidelines "*Impurities in New Drug Substances (Q3A)*" and "*Impurities in New Drug Products (Q3B)*". Although this chapter deals with impurities in official articles, as opposed to new drugs, revisions are proposed in order to integrate the intent of the ICH regarding impurities.

(GC: A. Hernandez-Cardoso) RTS—C46417

Change to read:

▪INTRODUCTION

This general information chapter covers impurities or degradation products in drug substances and degradation products in drug products. Impurities or degradation products in drug substances can arise during the manufacturing process or during storage of the drug substance. The degradation products in drug products can arise from drug substances or reaction products of the drug substance with an excipient or an immediate container–closure system. Biological, biotechnological, and radiopharmaceutical products are not covered in this chapter.■2S (*USP30*)

Concepts about purity change with time and are inseparable from developments in analytical chemistry. If a material previously considered to be pure can be resolved into more than one component, that material can be redefined into new terms of purity and impurity. Inorganic, organic, biochemical, isomeric, or polymeric components can all be considered impurities. Microbiological species or strains are sometimes described in similar terms of resolving into more than one component.

Communications about

▪impurities or degradation products in■2S (*USP30*) compendial articles may be improved by including in this Pharmacopeia the definitions of terms and the contexts in which these terms are used. (See *Definitions* below.) There has been much activity and discussion in recent years about term definition. Certain industry-wide concerns about terminology and context deserve widespread publication and ready retrievability and are included here. ~~(See *Industrial Concepts* below.)~~

usually cite one of three types of purity tests: (1) a chromatographic purity test coupled with a nonspecific assay; (2) a chromatographic purity-indicating method that serves as the assay; or (3) a specific test and limit for a known impurity, an approach that usually requires a Reference Standard for that impurity. Modern separation methods clearly play a dominant role in scientific research today because these methods simultaneously separate and measure components and fulfill the analytical ideal of making measurements only on purified specimens. Nevertheless, the more classical methods based on titrimetry, colorimetry, spectrophotometry, single or multiple partitions, or changes in physical constants (or any other tests or assays) lose none of their previous validities. The *purity profile* of a specimen that is constructed from the results of experiments using a number of analytical methods is the ultimate goal.
Purity or impurity measurements ~~on finished preparations~~

■Pharmaceutical manufacturers interact with regulatory agencies in developing new drug substances and new drug products, and cooperate with the compendia in writing official monographs for the compendial articles the manufacturers produce. Establishment of impurity limits in drug substances and drug products should proceed on a rational basis so that everyone involved in the development and approval phases can carry on their work in a predictable manner. Although drug development in the United States is the primary focus of this section of the chapter, the subject also has broad applicability across national boundaries.

Manufacturers share with regulatory agencies and with the compendia the goal of making available to the public high-quality products that are both safe and efficacious. This goal continues to be achieved through rational approaches to the complex process of drug development. Tests used at all stages of drug development and marketing should not be interpreted individually but as a whole. Controls on raw materials and on manufacturing as well as those on drug substances, along with toxicological and clinical studies performed, ensure the safety and efficacy of drug products. It is more rational to identify impurities or degradation products and to set limits based on the factors detailed here, relying on the scientific judgments of manufacturers, the compendia, and regulators to arrive at sets of acceptable limits for identified and unidentified impurities or degradation products.

Limits are set for impurity levels or degradation products as one of the steps in ensuring the identity, strength, quality, and chemical purity of drug substances or drug products. The ultimate goal is to produce a final drug product of high quality that is safe and efficacious and remains so throughout its shelf life. The setting of limits for impurities or degradation products in drug substances is a complex process that considers a number of factors:

(1) the toxicology of a drug substance containing typical levels of impurities and/or the toxicology of impurities relative to a drug substance;
(2) the route of administration, e.g., oral, topical, parenteral, or intrathecal;
(3) the daily dose, i.e., frequency and amount (micrograms or grams) administered of a drug substance;
(4) the target population (age and disease state), e.g., neonates, children, or senior citizens;
(5) the pharmacology of an impurity, when appropriate;
(6) the source of a drug substance, e.g., synthetic, natural product, or biotechnology;

In-Process Revision

(7) the duration of therapy, i.e., administration over a long period (treatment of chronic conditions) versus administration intended for a short duration (treatment of acute conditions); and

(8) the capability of a manufacturer to produce consistently high-quality material.

Concepts for setting impurity or degradation product limits in drug substances are chemistry and safety concerns. Limits for organic and inorganic impurities and residual solvents should be established for drug substances. The basic tenet for setting limits is that levels of impurities or degradation products in a drug substance must be controlled to ensure its safety and quality throughout its development to use in a drug product.

For drug products the concept for setting degradation product limits are based on sound scientific rationale of the degradation pathways, manufacturing process, and stability studies conducted at the recommended storage conditions. A rationale should be provided for exclusion of those impurities that are not degradation products (e.g., process impurities from drug substance and impurities arising from excipients).

For drug substances and drug products, limits are appropriately set no higher than the level that can be justified (e.g., safety data, literature references, etc.) and no lower than the level achievable by the manufacturing process and analytical capability. Where there is no safety concern, limits should be based on (a) data generated on actual batches of the drug substance or drug product, allowing sufficient latitude to deal with normal process and analytical variation, and (b) stability characteristics.

Documented evidence that the analytical procedure used to evaluate impurities or degradation products is validated and suitable for the detection and quantitation of impurities or degradation products should be established.

The setting of limits on impurities or degradation products is an evolutionary process, beginning in the United States before an investigational new drug (IND) is filed and continuing until well after the approval of a new drug application (NDA). Therefore, it is appropriate to address different stages in drug development as separate issues. There are three points in the drug development process where the setting of limits may be significantly different: (1) at the initial IND application, (2) at the filing of the NDA, and (3) after NDA approval. The filing of an abbreviated new drug application (ANDA) is another activity in which limits are set on impurities or degradation products. Since the approach may vary from that of filing an NDA, it is addressed as a separate issue. The underlying assumption is that the analytical methods used to evaluate impurities or degradation products are suitable for their intended purpose at each stage in the development.■2S (*USP30*)

~~DEFINITIONS~~

~~Foreign Substances~~

~~Foreign substances, which are introduced by contamination or adulteration, are not consequences of the synthesis or preparation of compendial articles and thus cannot be anticipated when monograph tests and assays are selected. The presence of objectionable foreign substances not revealed by monograph tests and assays constitutes a variance from the official standard. Examples of foreign substances include ephedrine in Ipecac or a pesticide in an oral liquid analgesic. Allowance is made in this Pharmacopeia for the detection of foreign substances by unofficial methods. (See *Foreign Substances and Impurities,* in the section *Tests and Assays,* under *General Notices and Requirements*.)~~

~~Residual Solvents~~

~~Residual solvents are defined as organic volatile chemicals that are used or produced in the manufacture of drug substances or excipients, or in the preparation of drug products. The solvents are not completely removed by practical manufacturing techniques. Appropriate selection of the solvent for the synthesis of a drug substance may enhance the yield or determine characteristics such as crystal form, purity, and solubility and, as such, may be a critical parameter in the synthetic process. Because there is no therapeutic benefit from residual solvents, they should be removed to the extent possible to meet product specifications, good manufacturing practices, or other quality based requirements. Drug products should contain no higher levels of residual solvents than can be supported by safety data. A classification of residual solvents by risk assessment is presented in the *Residual Solvents Limits* section of *Organic Volatile Impurities* ⟨467⟩. Class 1 solvents should be avoided in the production of drug substances, excipients, or drug products unless their use can be strongly justified in a risk-benefit assessment.~~

~~Toxic Impurities~~

~~Toxic impurities have significant undesirable biological activity, even as minor components, and require individual identification and quantitation by specific tests. These impurities may arise out of the synthesis, preparation, or degradation of compendial articles. Based on validation data, individualized tests and specifications are selected. These feature comparison to a Reference Standard of the~~

impurity, if available. It is incumbent on the manufacturer to provide data that would support the classification of such impurities as toxic impurities.

Concomitant Components

Concomitant components are characteristic of many bulk pharmaceutical chemicals and are not considered to be impurities in the Pharmacopeial sense. Limits on contents, or specified ranges, or defined mixtures are set forth for concomitant components in this Pharmacopeia. Examples of concomitant components are geometric and optical isomers (or racemates) and antibiotics that are mixtures. Any component that can be considered a toxic impurity because of significant undesirable biological effect is not considered to be a concomitant component.

Signal Impurities

Signal impurities are distinct from ordinary impurities in that they require individual identification and quantitation by specific tests. Based on validation data, individualized tests and specifications are selected. These feature a comparison to a reference standard of the impurity, if available.

Signal impurities may include some process related impurities or degradation products that provide key information about the process, such as diazotizable substances in thiazides. It is incumbent on the manufacturer to provide data that would support the classification of such impurities as signal impurities rather than ordinary impurities.

Ordinary Impurities

Ordinary impurities are those species in bulk pharmaceutical chemicals that are innocuous by virtue of having no significant, undesirable biological activity in the amounts present. These impurities may arise out of the synthesis, preparation, or degradation of compendial articles. Selections of tests and assays allow for anticipated amounts of impurities that are unobjectionable for the customary use of the article. The presence of ordinary impurities is controlled in monographs in this Pharmacopeia by including tests for *Ordinary Impurities* ⟨466⟩. Tests for *related substances* or *chromatographic purity* may also control the presence of ordinary impurities.

Unless otherwise specified in an individual monograph, estimation of the amount and number of ordinary impurities is made by relative methods rather than by strict comparison to individual Reference Standards. Nonspecific detection of ordinary impurities is also consistent with this classification.

The value of 2.0% was selected as the general limit on ordinary impurities in monographs where documentation did not support adoption of other values. This value represents the maximum allowable impact from this source of variation, when taken with the variation allowed by the composite of other Pharmacopeial tests and assays for both the bulk pharmaceutical chemical and the preparations.

Where a monograph sets limits on concomitant components, signal impurities, and/or toxic impurities, these species are not to be included in the estimation of ordinary impurities unless so stated in the individual monograph.

Related Substances

Related substances are structurally related to a drug substance. These substances may be identified or unidentified degradation products or impurities arising from a manufacturing process or during storage of a material.

Process Contaminants

Process contaminants are identified or unidentified substances (excluding related substances and water), including reagents, inorganics (e.g., heavy metals, chloride, or sulfate), raw materials, and solvents. These substances may be introduced during manufacturing or handling procedures.

INDUSTRIAL CONCEPTS

Pharmaceutical manufacturers interact with regulatory agencies in developing new drug substances and new drug products, and cooperate with the compendia in writing official monographs for the compendial articles the manufacturers produce. Establishment of impurity limits in drug substances should proceed on a rational basis so that everyone involved in the development and approval phases can carry on their work in a predictable fashion. Although drug development in the United States is the primary focus of this section of the chapter, the subject also has broad applicability across national boundaries.

Manufacturers share with regulatory agencies and with the compendia the goal of making available to the public high-quality products that are both safe and efficacious. This goal continues to be achieved through rational approaches to the complex process of drug development. Tests used at all stages of drug development and marketing should not be interpreted individually but as a whole. Controls on raw materials and on manufacturing as well as those on drug substances, along with toxicological and clinical studies performed, ensure the safety and efficacy of drug products. It has been suggested that impurities should be identified when they exceed some set amount, e.g., 0.1, 0.3, or 0.5%. It is more rational to identify impurities and to set limits based on the factors detailed here, relying on the scientific judgments of manufacturers, the compendia, and regulators to arrive at sets of acceptable limits for identified and unidentified impurities.

Limits are set for impurity levels as one of the steps in ensuring the identity, strength, quality, and chemical purity of drug substances. The ultimate goal is to produce a final drug product of high quality and at a reasonable cost that is safe and efficacious and remains so throughout its shelf life. The setting of limits for impurities in bulk drug substances is a complex process that considers a number of factors:

(1) the toxicology of a drug substance containing typical levels of impurities and/or the toxicology of impurities relative to a drug substance;

(2) the route of administration, e.g., oral, topical, parenteral, or intratheceal;

(3) the daily dose, i.e., frequency and amount (micrograms or grams) administered of a drug substance;

(4) the target population (age and disease state), e.g., neonates, children, or senior citizens;

(5) the pharmacology of an impurity, when appropriate;

(6) the source of a drug substance, e.g., synthetic, natural product, or biotechnology;

(7) the duration of therapy, i.e., administration over a long period (treatment of chronic conditions) versus administration intended for a short duration (treatment of acute conditions); and

(8) the capability of a manufacturer to produce high-quality material at a reasonable cost to consumers.

Concepts for setting impurity limits in bulk drug substances are the concerns of the regulatory and compendial agencies as well as the pharmaceutical industry. The basic tenet for setting limits is that levels of impurities in a drug substance must be controlled to ensure its safety and quality throughout its development into and use as a drug product. The concepts are derived from issues and experiences with drug substances from traditional sources and technologies. Issues arising from biotechnologically produced drug substances, e.g., recombinant DNA and hybridomas, are still being defined and so are not necessarily covered by these concepts. However, the concepts can serve as a general foundation to address specific issues arising from biotechnology.

The setting of limits on impurities in drug substances is an evolutionary process, beginning in the United States before an investigational new drug (IND) is filed and continuing until well after the approval of a new drug application (NDA). Therefore, it is appropriate to address different stages in drug development as separate issues.

In-Process Revision

~~There are three points in the drug development process where the setting of limits may be significantly different: (1) at the initial IND application, (2) at the filing of the NDA, and (3) after NDA approval. The filing of an abbreviated new drug application (ANDA) is another activity in which limits are set on impurities. Since the approach may vary from that of filing an NDA, it is addressed as a separate issue. The underlying assumption is that the analytical methods used to evaluate impurities in a drug substance are suitable for their intended purpose at each stage in the development.~~

~~An impurity is any component of a drug substance (excluding water) that is not the chemical entity defined as the drug substance. The impurity profile of a drug substance is a description of the impurities present in a typical lot of a drug substance produced by a given manufacturing process. The description includes the identity or some qualitative analytical designation (if unidentified), the range of each impurity observed, and the classification of each identified impurity.~~

~~Following are two more terms that enlarge upon those given under *Definitions*.~~

~~*Related Substances*—Related substances are structurally related to a drug substance. These substances may be identified or unidentified degradation products or impurities arising from a manufacturing process or during storage of a material.~~

~~*Process Contaminants*—Process contaminants are identified or unidentified substances (excluding related substances and water), including reagents, inorganics (e.g., heavy metals, chloride, or sulfate), raw materials, and solvents. These substances may be introduced during manufacturing or handling procedures.~~

~~INITIAL IND FILING~~

~~At the initial IND filing, the chemical nature of a bulk substance has generally been defined. The manufacturing process normally is in an early stage of development, and materials may be produced on a laboratory scale. Usually few batches have been made and, therefore, little historical data are available. The reference materials of a drug substance may be relatively impure. Limits for the purity of a drug substance are set to indicate drug quality. The setting of limits on related substances and process contaminants can be characterized as follows.~~

~~(1) Limits are set on total impurities, and an upper limit may be set on any single impurity. The limit for total impurities should maintain, if possible, a nominal composition material balance.~~

~~(2) Impurity profiles are documented. These are profiles of the lots of drug substances used in clinical studies and in toxicological studies that establish the safety of drug substances. The lots used in these studies should be typical products of the manufacturing process in use at that time.~~

~~(3) Limits for residual solvents are based on the known toxicology of the solvents and on the manufacturing capabilities and dosing regimens.~~

~~(4) General inorganic contaminants are monitored by appropriate tests such as a heavy metals limit test and/or a test for residue on ignition. Traditional compendial limits are applied unless otherwise indicated. Specific metal contaminants that appear during manufacturing should be monitored by appropriate analytical techniques, and limits should be set based on the toxicological properties of these metals.~~

~~(5) Appropriate limits are set for impurities known to be toxic.~~

~~(6) If appropriate, enantiomeric purity is controlled.~~

~~Although water is not classified as an impurity, limits for water content may be needed to ensure the stability or ease of processing a drug substance.~~

~~NDA FILING~~

~~During the IND phases of drug development, the manufacturing process for a drug substance may undergo a number of revisions. Generally, the scale will have changed from laboratory size and will approach or reach full production batch size. A number of batches will normally have been produced, and a historical data base of the results of testing for impurities will exist. When significant changes in a manufacturing process are made, the impurity profile should be reviewed to determine if the toxicological studies are still supportive.~~

~~At the NDA stage a reference standard of defined purity is available, analytical methods have been validated, impurity and degradation profiles are known, and enantiomeric purity has been evaluated. The setting of limits on related substances and process contaminants can be characterized as follows.~~

~~(1) Consistency of the impurity profile of a drug substance has been established.~~

~~(2) IND limits for total and individual impurities (identified and unidentified) are reviewed and adjusted based on manufacturing experience and toxicological data.~~

~~(3) Impurities present in significant amounts are identified and individual limits are set. However, it is not always possible to identify and/or prepare authentic substances for impurities. The labile nature of some impurities precludes this possibility. Limits may be set on these substances based on comparison of lots produced and used in toxicological and clinical studies.~~

~~(4) The impurity profiles of the lots designated for marketing should not be significantly different from those of the lot(s) used for toxicological and clinical studies.~~

~~(5) The composition material balance should be used, if possible, to evaluate the adequacy of the controls.~~

~~(6) Limits for residual solvents are based on the known toxicology of the solvents and on the manufacturing capabilities and dosing regimens.~~

~~(7) Limits are set for inorganic contaminants by appropriate tests such as a heavy metals limit test and/or by a test for residue on ignition. Traditional compendial limits are applied unless otherwise indicated. Based on toxicological properties, limits may be set for specific metal contaminants that appear during manufacturing.~~

~~POST-NDA APPROVAL~~

~~After approval and marketing of a pharmaceutical product, significant changes may be made in manufacturing the bulk drug substance. There may be technological, ecological, economic, or safety reasons for these changes. If they occur, the Pharmacopeial and NDA impurity limits and rationale should be reviewed; the limits should be revised when indicated to ensure similar or improved quality of the drug substance.~~

~~ANDA FILING~~

~~The drug substance for a pharmaceutical product eligible for ANDA status normally is an official article and should be well characterized analytically. Drug substances are typically available from multiple sources, and each source may have a different manufacturing process. Therefore, it is essential that the dosage form manufacturer evaluate each supplier's drug substance impurity profiles. Limits can then be set based on the more detailed concepts described for NDA filing, including review of compendial monographs for appropriateness.~~

▪INITIAL IND FILING

Drug Substances—At the initial IND filing, the chemical nature of a drug substance has generally been defined. The manufacturing process normally is in an early stage of development, and materials may be produced on a laboratory scale. Usually few batches have been made and, therefore, little historical data are available. The reference materials of a drug substance may be relatively impure. Limits for the purity of

In-Process Revision

a drug substance are set to indicate drug quality. The setting of limits on related substances and process contaminants can be characterized as follows.

(1) Limits are set on total impurities, and an upper limit may be set on any single impurity. The limit for total impurities should maintain, if possible, a nominal composition material balance.
(2) Impurity profiles are documented. These are profiles of the lots of drug substances used in clinical studies and in toxicological studies that establish the safety of drug substances. The lots used in these studies should be typical products of the manufacturing process in use at that time.
(3) Limits for residual solvents are based on the known toxicology of the solvents and on the manufacturing capabilities and dosing regimens.
(4) General inorganic impurities are monitored by appropriate tests such as a heavy metals limit test and/or a test for residue on ignition. Traditional compendial limits are applied unless otherwise indicated. Specific residual metals that appear during manufacturing should be monitored by appropriate analytical techniques, and limits should be set based on the toxicological properties of these metals.
(5) Appropriate limits are set for impurities known to be toxic.
(6) If appropriate, enantiomeric purity is controlled.

Although water is not classified as an impurity, limits for water content may be needed to ensure the stability or ease of processing a drug substance.

Drug Product—At the initial IND filing, the dosage form of a drug product has been identified, which is appropriate for early clinical studies (and may or may not be representative of the drug product that will eventually be marketed). Usually, few batches have been made and, therefore, little historical data are available.

(1) Qualitative and quantitative limits on degradation products may not be established at this point due to the limited data available. Typically, degradation products will be monitored as part of the stability evaluation of the drug product.
(2) Dating for use of a drug product in clinical studies will be related to the ongoing stabilty data, which are generated. If the data indicate the presence of degradation products, dating and storage conditions are controlled to ensure any degradation products are controlled within industry accepted limits or within limits established through safety assessment studies.
(3) Limits for residual solvents, if appropriate, are based on the known toxicology of the solvents and on the manufacturing capabilities and dosing regimens. When amendments to the IND are filed, limits for impurities in drug substance and degradation products in drug substance or drug product may be updated based on additional data as they become available.

NDA FILING

Drug Substances—During the IND phases of drug development, the manufacturing process for a drug substance may undergo a number of revisions. Generally, the scale will have changed from laboratory size and will approach or reach full production batch size. A number of batches will normally have been produced, and a historical data base of the results of testing for impurities will exist. When significant changes in a manufacturing process are made, the impurity profile should be reviewed to determine if the toxicological studies are still supportive.

At the NDA stage a reference standard of defined purity is available, analytical methods have been validated, impurity and degradation profiles are known, and enantiomeric purity has been evaluated. The setting of limits on related substances and process contaminants can be characterized as follows.

(1) Consistency of the impurity profile of a drug substance has been established.

(2) IND limits for total and individual impurities (identified and unidentified) are reviewed and adjusted based on manufacturing experience and toxicological data.

(3) Impurities present in significant amounts are identified and individual limits are set. However, it is not always possible to identify or prepare authentic substances for impurities. The labile nature of some impurities precludes this possibility. Limits may be set on these substances based on comparison of lots produced and used in toxicological and clinical studies.

(4) The impurity profiles of the lots designated for marketing should not be uniquely different from those of the lot(s) used for toxicological and clinical studies.

(5) The composition material balance should be used, if possible, to evaluate the adequacy of the controls.

(6) Limits for residual solvents are based on the known toxicology of the solvents and on the manufacturing capabilities and dosing regimens.

(7) Limits are set for inorganic impurities by appropriate tests such as a heavy metals limit test and/or by a test for residue on ignition. Traditional compendial limits are applied unless otherwise indicated. Based on toxicological properties, limits may be set for specific residual metals that appear during manufacturing.

Drug Product—Similarly, for the drug product, the dosage form may change, the number or scale of batches may increase and more stability data will have become available. Methods will have been validated.

(1) IND limits for total and individual degradation products (identified and unidentified) are reviewed and adjusted based on manufacturing experience, stability data and toxicological data.

(2) Degradation products present in significant amounts are identified and individual limits are set. However, it is not always possible to identify or prepare authentic substances for degradation products.

(3) The degradation product profiles of the lots designated for marketing should not be uniquely different from those of the lot(s) used for toxicological and clinical studies.

(4) The mass balance should be used, if possible, to evaluate the adequacy of the controls.

(5) Limits for residual solvents, if appropriate, are based on the known toxicology of the solvents and on the manufacturing capabilities and dosing regimens.

POST NDA APPROVAL

After approval and marketing of a pharmaceutical product, significant changes may be made in manufacturing the drug substance. There may be technological, ecological, economic, or safety reasons for these changes. If they occur, the Pharmacopeial and NDA impurity and degradation product limits and rationale should be reviewed; the limits should be revised when indicated to ensure similar or improved quality of the drug substance or drug product.

ANDA FILING

The drug substance for a pharmaceutical product eligible for ANDA status is frequently an official article and should be well characterized analytically. Drug substances are typically available from multiple sources, and each source may have a different manufacturing process. Therefore, it is essential that the dosage form manufacturer evaluate each supplier's drug substance impurity or degradation profiles. Limits can then be set based on the more detailed concepts described for NDA filing, including review of compendial monographs for appropriateness.

DEFINITIONS

Concomitant Components—Concomitant components are characteristic of many drug substances and are not considered to be impurities in the Pharmacopeial sense. Limits on contents, or specified ranges, or defined mixtures are set forth for concomitant components in this Pharmacopeia. Examples of concomitant components are geometric and optical isomers (or racemates) and antibiotics that are mixtures. Any component that can be considered a toxic impurity because of significant undesirable biological effect is not considered to be a concomitant component.

Foreign Substances (Extraneous Contaminants)—Foreign substances (extraneous contaminants), which are introduced by contamination or adulteration, are not consequences of the synthesis or preparation of compendial articles and thus cannot be anticipated when monograph tests and assays are selected. The presence of objectionable foreign substances not revealed by monograph tests and assays constitutes a variance from the official standard. Examples of foreign substances include ephedrine in Ipecac or a pesticide in an oral liquid analgesic. Allowance is made in this Pharmacopeia for the detection of foreign substances by unofficial methods. (See *Foreign Substances and Impurities* in the section *Tests and Assays* under *General Notices and Requirements.*)

Identified Impurities and Identified Degradation Products—Impurities or degradation products for which structural characterizations have been achieved.

Inorganic Impurities—Inorganic impurities can result from the manufacturing process (e.g., residual metals, inorganic salts, filter aids, etc.). Inorganic impurities are typically controlled by tests such as *Heavy Metals* ⟨231⟩ and *Residue On Ignition* ⟨281⟩.

Ordinary Impurities—Some monographs make reference to ordinary impurities and for more details see *Ordinary Impurities* ⟨466⟩.

Process Contaminants—Process contaminants are identified or unidentified substances (excluding related substances and water), including reagents, catalysts, other inorganic impurities (e.g., heavy metals, chloride, or sulfate); and may also include foreign substances (extraneous contaminants). These contaminants may be introduced during manufacturing or handling procedures.

Related Substances—Related substances are structurally related to a drug substance. These substances may be (a) identified or unidentified impurities arising from synthesis manufacturing process such as intermediates or by-products and do not increase on storage or (b) identified or unidentified degradation products that result from drug substance or drug product manufacturing processes or arise during storage of a material.

Residual Solvents—Refer to *Residual Solvents* ⟨467⟩.

Specified Impurities and Specified Degradation Products—Previously referred to as Signal Impurities, specified impurities or specified degradation products are impurities or degradation products that are individually listed and limited with specific acceptance criteria in individual monographs as applicable. Specified impurities or specified degradation products can be identified or unidentified.

Toxic Impurities—Toxic impurities have significant undesirable biological activity, even as minor components, and require individual identification and quantitation by specific tests. These impurities may arise out of the synthesis, preparation, or degradation of compendial articles. Based on validation data, individualized tests and specifications are selected. These feature comparison to a Reference Standard of the impurity, if available. It is incumbent on the manufacturer to provide data that would support the classification of such impurities as toxic impurities.

Unidentified Impurities and Unidentified Degradation Products—Impurities or degradation products for which structural characterizations have not been achieved and that are identified solely by qualitative analytical properties (e.g., chromatographic retention times).

Unspecified Impurities and Unspecified Degradation Products—Impurities or degradation products that are limited by general acceptance criteria but not individually listed with their own specific acceptance criteria in individual monographs.■2S (*USP30*)

BRIEFING

⟨1163⟩ Quality Assurance in Pharmaceutical Compounding. This proposed new general information chapter is intended to provide guidance on developing a good quality assurance program in compounding. This chapter references other USP compounding-related chapters, such as *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩, *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩, and *Good Compounding Practices* ⟨1075⟩. The chapter discusses integral components involved in developing a good quality assurance program, which include standard operating procedures, documentation, verification, and testing. The testing components recommend that a compounder understand the basics in pharmaceutical and microbiological analysis. Also included are testing methods which describe the types of analysis for various dosage forms and the types of equipment required to perform the analysis. Please submit comments and suggestions to Dr. Christina Lee at CHL@usp.org.

■⟨1163⟩ QUALITY ASSURANCE IN PHARMACEUTICAL COMPOUNDING

INTRODUCTION

A quality assurance program is a system of steps and actions taken to ensure the maintenance of proper standards in compounded preparations, including good documentation of the compounding activities. Although there are numerous *USP* general chapters that may apply to compounding, the need for a quality assurance system is well documented in USP chapters (see *Compounding Controls* under *Good Compounding Practices* ⟨1075⟩; *Quality Control* and *Verification* under *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩; and *The Quality Assurance Program* under *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩). A quality assurance program for compounding should include at least four separate but integrated components: (1) Standard Operating Procedures, (2) Documentation, (3) Verification, and (4) Testing.

STANDARD OPERATING PROCEDURES

Standard Operating Procedures (SOPs) for pharmaceutical compounding are documents that describe how to perform routine and expected tasks in the compounding environment, including formulation development, purchasing, compounding, testing, maintenance, materials handling and storage, quality assurance, labeling, beyond-use dating, cleaning, safety, and dispensing. SOPs are itemized instructions that describe how a task will be performed, who will do it, why it is done, and any limits.

SOPs must be reviewed regularly and updated as necessary. The SOP should be specific to each device, process, and decision used in compounding. Properly maintained and implemented SOPs should result in quality preparations and fewer compounding errors.

DOCUMENTATION

The purpose of the documentation is to provide a permanent record of all aspects of each compounding operation. Two essential compounding documents, the formulation record and the compounding record, are described in *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩. The compounding record is completed during the compounding process for the preparation being made.

In addition, many SOPs require specific cross-referenced data collection forms (e.g., air temperature and humidity records and balance maintenance and calibration records). Data collection forms required by SOPs are completed during routine tasks directed by the SOPs and may provide blank spaces for data, including logbook entries, data printouts, and reports.

VERIFICATION

Verification involves assurance and documentation that a process, procedure, or piece of equipment is functioning properly and producing the expected results. *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩ states: "The act of verification of a compounding procedure involves checking to ensure that calculations, weighing and measuring, order of mixing, and compounding techniques were appropriate and accurately performed." Verification may require outside laboratory testing. Equipment verification methods are sometimes available from manufacturers of the specific equipment or can be developed in-house. The responsibility for assuring that equipment performance is verified resides with compounding personnel, but may be performed by contractors.

TESTING

A quality assurance program should include testing of finished compounded preparations. It is important for the compounder to have a basic understanding of pharmaceutical analysis to ensure that valid results are obtained when tests are being conducted, whether they are done in-house or outsourced. While it is not practical to test every compounded preparation, it is incumbent on the compounder to know (1) when to test, (2) what to test, (3) what method(s) to use, (4) how to interpret the results, (5) the limits of the test, and (6) the importance of testing in the overall quality program in the compounding facility.

The goal in testing is to produce results as accurately, efficiently and quickly as possible. Any testing method used should have accuracy, speed, reproducibility, and specificity. No single testing method is suited for all drugs. There are a number of factors that determine the validity and reliability of results.

Compounding facilities have two options when testing is required. Some testing methods can easily be performed in-house, but some may need to be outsourced to a contract laboratory. Relatively basic testing methods that can be conducted in-house with proper training and a modest investment in instrumentation include weight and volumetric measurements, pH, density/specific gravity, refractive index, and UV and visible spectroscopy (see *Weights and Balances* ⟨41⟩, *Volumetric Apparatus* ⟨31⟩, *Prescription Balances and Volumetric Apparatus* ⟨1176⟩, *pH* ⟨791⟩, *Specific Gravity* ⟨841⟩, *Refractive Index* ⟨831⟩, and *Spectrophotometry and Light-Scattering* ⟨851⟩). Testing methods often outsourced to a contract laboratory include chromatography (high-pressure liquid chromatography (HPLC) and gas chromatography (GC), see *Chromatography* ⟨621⟩), mass spectroscopy (MS) (see *Mass Spectrometry* ⟨736⟩), hyphenated methods (HPLC-MS and GC-MS), UV and visible spectroscopy (see *Spectrophotometry and Light-Scattering* ⟨851⟩), and other sophisticated methods.

If testing is done in-house, appropriate equipment must be obtained, validated either by the manufacturer or by the compounder upon purchase, maintained, calibrated, and used properly. If testing is outsourced, the compounder needs to determine what to outsource and how to select a laboratory, and should develop ongoing relationships with the laboratories chosen. Contract laboratories should follow USP general chapter standards, as appropriate.

Selection of a Testing Method—One general consideration in testing method selection is the type of information that is needed, such as quantitative (potency, concentration), semi-quantitative (where a tolerance level is involved, as in endotoxin levels), or qualitative (presence/absence type of testing, including substance identification, sterility). Another consideration involves the physical and chemical characteristics of the analyte, including solubility, partition coefficient, dissociation constant (pKa), volatility, binding, and the quantity present.

The degree of quantitative measurement and specificity must be considered in the validation process. The typical analytical characteristics used in method validation include accuracy, precision, specificity, detection limit, quantitation limit,

linearity, range, and ruggedness (see *Validation of Compendial Procedures* ⟨1225⟩). Generally, the greater the level of accuracy, precision, or specificity required, the more sophisticated and expensive the testing methods needed. The methods used are also governed by the types of instrumentation available and the standards available for comparison.

Pharmaceutical analysis decisions include not only method selection but also administrative and economic factors, obtaining a representative sample, storage/shipping of the sample, sample preparation for analysis, the actual analysis, data acquisition, data treatment, and interpretation.

Factors Involved in Methods Selection—The testing method selected depends upon a number of factors, including sample requirements, sample handling/preparation/purification requirements, type of data needed, and levels of specificity and accuracy required.

Sampling Requirements—Prior to collecting samples for testing, the following factors should be considered: the number of samples needed, appropriate methods of obtaining representative samples, the physical state of the samples (solid, liquid, or gas), the type of container required for collection and storage, and possible shipping requirements or restrictions. Storage requirements for samples must be specified, such as type of container, temperature, humidity, and light protection (see *General Notices and Requirements*).

The effect of any substances in the formulation that may interfere or alter the results must be known beforehand. When sending a preparation to a contract laboratory, the compounder should provide the complete formulation so the laboratory can quickly determine if there may be any interfering substances.

Controlled drug substances, dangerous or hazardous chemicals, flammable or caustic substances, and refrigerated or frozen preparations require special handling during shipping.

Data Interpretation Requirements—The collection of raw data from the testing process must be completed accurately. One must ensure that appropriate and valid descriptive statistics are used to analyze the data, and that the operating parameters of the analytical instruments are well established. Reference values, if available, should be provided with the analytical results. A description of the analytical controls used by the laboratory is important for documentation, as well as the source of reference standards used to establish standard curves.

Personnel Requirements and Considerations—If testing is done in-house, personnel involved in this activity must be appropriately trained and evaluated with documentation of the training and evaluation. If testing is outsourced, the compounder must be assured of the credentials, proper training, and continuing competency activities of the personnel in the contract laboratory. The external laboratory should comply with Good Laboratory Practices (see *Good Laboratory Practice for Nonclinical Laboratory Studies,* 21 CFR Part 58 FDA's Good Laboratory Practices www.labcompliance.com/documents/FDA/FDA-GLP/21CFR58.pdf) and Good Compounding Practices (see *Good Compounding Practices* ⟨1075⟩). It is preferable that they be registered with the Food and Drug Administration (FDA). Also, it may be advantageous if the contract laboratory performs testing for pharmaceutical companies.

Testing Methods—Testing methods can be generally divided into physical testing methods, methods that interact with electromagnetic radiation, conductometric techniques, immunoassay methods, separation techniques, and others, as detailed in *Table 1*.

Table 1. Classification of Analytical and Microbiological Methods

Physical Testing Procedures	Interaction of Electromagnetic Radiation	Conductance Methods	Immunoassay	Separation Techniques	Others	Microbiological Methods
Weight	UV/Visible spectroscopy	pH	Radioimmunoassay	High-Performance Liquid Chromatography (HPLC)	Osmolality	Sterility Testing
Volumetric	IR spectroscopy	Ion selective electrodes	Enzyme Multiplied Immunoassay Technique(EMIT)	Gas Chromatography(GC)	—	Endotoxin Testing
Melting point	Fluorescence/Phosphorescence spectroscopy	Polarography	Enzyme Linked Immu noSorbent Assay (ELISA)	Thin-Layer Chromatog raphy (TLC)	—	Preservative Effectiveness Testing
Freezing point	Raman spectroscopy	—	Fluorescent Immunoas say (FIA)	Paper Chromatography (PC)	—	—
Boiling point	X-ray spectroscopy	—	—	Column Chromatogra phy (CC)	—	—
Density	Flame emission and Atomic absorption spectroscopy	—	—	—	—	—
Refractive index	Polarimetry	—	—	—	—	—
Optical rotation (Polarimetry)	Refractometry	—	—	—	—	—
Thermal analysis	Interferometry	—	—	—	—	—
Color change	—	—	—	—	—	—
Precipitate formation	—	—	—	—	—	—
Viscosity change	—	—	—	—	—	—

Table 1. Classification of Analytical and Microbiological Methods *(Continued)*

Physical Testing Procedures	Interaction of Electromagnetic Radiation	Conductance Methods	Immunoassay	Separation Techniques	Others	Microbiological Methods
Particle size	—	—	—	—	—	—
Light scattering	—	—	—	—	—	—
Zeta potential	—	—	—	—	—	—
Light obscuration	—	—	—	—	—	—
Microscopic examination	—	—	—	—	—	—

Nonspecific methods include melting, freezing and boiling points, density, refractive index, polarimetry, UV/visible spectroscopy, and pH. Methods that are somewhat more specific include IR spectroscopy, mass spectroscopy, ion selective electrodes, immunoassay methods, and chromatographic methods (HPLC and GC). Suggested testing methods for different dosage forms are shown in *Table 2*. It is the responsibility of the compounder to implement a program using selected methods for the preparations compounded in the facility.

Table 2. Suggested Analytical Methods for Various Dosage Forms, Depending Upon the Active Drug

	Analytical Method												
Dosage Form	Wt	Vol	pH	Osm	RI	Sp Gr	MP	UV/ Vis	HPLC	GC	IR	Sterile	En- do
Bulk substances	—	—	*	—	*	—	*	*	*	*	*	—	—
Powders	*	—	—	—	—	—	—	—	*	*	—	—	—
Capsules	*	—	—	—	—	—	—	—	*	*	—	—	—
Tablets	*	—	—	—	—	—	—	—	*	*	—	—	—
Lozenges	*	—	—	—	—	—	—	—	*	*	—	—	—
Suppositories	*	—	—	—	—	*	*	—	*	*	—	—	—
Sticks	*	—	—	—	—	*	*	—	*	*	—	—	—
Solutions	*	*	*	*	*	*	—	*	*	*	—	—	—
Suspensions	*	*	*	—	—	*	—	—	*	*	—	—	—
Emulsions	*	*	*	—	—	*	—	—	*	*	—	—	—
Semisolids	*	—	—	—	—	*	*	—	*	*	—	—	—
Gels	*	*	*	—	*	*	—	—	*	*	—	—	—
Ophthalmics, Otics, and Nasals	*	*	*	*	*	*	—	*	*	*	—	*	—
Inhalations	*	*	*	*	*	—	—	*	*	*	—	*	—
Injections	*	*	*	*	*	*	—	*	*	*	—	*	*
Sterile implant gels	*	*	*	*	*	*	—	*	*	*	*	*	*
Sterile implant solids	*	*	—	—	—	—	*	*	*	*	*	*	*

Methods that can be routinely used for testing incoming bulk materials, whether active or excipients, include melting, freezing and boiling points, density, refractive index, UV/Visible spectroscopy, IR spectroscopy, polarimetry, pH, and the separation methods. Final products may generally require a method such as HPLC or GC.

MICROBIOLOGICAL TESTING

Microbiological testing for pharmacy compounding includes sterility and endotoxin testing. Preservative effectiveness may also be considered.

Sterility Testing—Sterility tests can be conducted using commercial kits or by developing and validating USP sterility testing protocols, which are more detailed than the commercial sterility-testing kits. Standards and procedures are explained in *Sterility Tests* ⟨71⟩.

Endotoxin Testing—Endotoxin tests can be conducted using commercially available kits or by purchasing the components separately. Endotoxin testing endpoints can be difficult to interpret and in-house testing should only be done after obtaining training and experience. See *Bacterial Endotoxins Test* ⟨85⟩.

SUMMARY

A sound quality assurance program is important in a compounding pharmacy. It includes detailed SOPs, documentation, verification, and analytical and microbiological testing as appropriate. Analytical and microbiological testing will no doubt become a more important part of pharmaceutical compounding as the public and regulatory agencies demand more documentation on the quality of compounded preparations. Compounders must decide on the types of testing and degree of testing that will be a part of their quality assurance program. A decision must also be made on whether to do testing in-house or outsource it to a contract laboratory. It may be practical for larger compounding facilities to have their own analytical and/or microbiological testing laboratory, analytical chemist, or microbiologist to provide rapid turnaround of testing results.

Analytical and microbiological testing should only be performed by those who are trained and experienced, and who can demonstrate validated performance of their operations.■2S (*USP30*)

BRIEFING

⟨**1178**⟩ **Good Repackaging Practices,** *USP 29* page 3023. This proposed revised general information chapter is intended to provide repackagers with the guidance and references needed to apply good repackaging practices for oral solid drug products. The following proposed changes were based on discussions held by the Packaging and Storage Expert Committee:

1. The sections on *Facilities, Acquisition Process, Repackaging Process, Labeling, Minimum Requirements,* and *Shipping and Distribution* were omitted.
2. References to applicable FDA regulations and *USP* chapters were added to the chapter.
3. The definition of *Beyond-Use-Date* (BUD) was omitted, and its use removed from all text.
4. The definitions for *Repackager, Contract Repackager,* and *Equivalent Container–Closure System* were rewritten.

Other changes were made to clarify the content of the chapter and improve its readability.

(P&S: D. Hunt) RTS—C47502

⟨1178⟩ GOOD REPACKAGING PRACTICES

Change to read:

~~This chapter is intended to provide guidance to those engaged in repackaging of drug products in accordance with 21 CFR 10.90. A pharmacist who repackages under the state law needs to apply (1) the principal information provided in the USP general information chapter *Packaging Practice—Repackaging a Single Solid Oral Drug Product Into a Unit-Dose Container* ⟨1146⟩ and (2) other beyond-use date references in the *Expiration Date and Beyond-Use Date* section under *General Notices and Requirements*.~~

~~This chapter provides information to any person who removes drugs from their original manufacturer's container and repacks them into a different container–closure system for resale or for distribution to hospitals or other pharmacies. It does not apply to repackaging of any *radioactive* drug products, including oral solids.~~

~~A repackager referred to here may also be a contract packager or a contract repackager. The words "repackager" and "repacker" are the same in this text and may be used interchangeably. These functions are beyond the regular practice of a pharmacist. A repackager is required to register with the FDA and comply with current Good Manufacturing Practices (cGMPs) regulations in 21 CFR 210 and 211.~~

~~A repackager is expected to meet the requirements of packaging practice under 21 CFR 210 through 226. Because the packaging practice relates to packaging, processing, or holding a drug product intended for administration to humans or animals, the repackager is expected to comply with regulations such as those relating to the sections pertaining to quality control, personnel qualifications, building and facilities, equipment, production and process controls, packaging and labeling controls, laboratory controls, master production record, batch records and reprints, distribution records, storage control records, and complaint files.~~

~~DEFINITIONS~~

~~For the purposes of this chapter, repackager, contract packager, and contract repackager are defined as follows.~~

In-Process Revision

A REPACKAGER is one who purchases and removes a drug product from the manufacturer's market container or bulk dosage container and places the product into a different container for distribution for human or animal use. A repackager may or may not take ownership from the manufacturer. A repackager is engaged in the repackaging of drugs (see also *Packaging Practice—Repackaging a Single Solid Oral Drug Product Into a Unit-Dose Container* ⟨1146⟩ for more definitions of a repackager).

A CONTRACT PACKAGER is one who is contracted by original drug manufacturers to package or repackage their product into a single- or multi-unit container chosen by the manufacturer. These containers should meet all the applicable requirements in this chapter, pertinent sections in general test chapters *Containers* ⟨661⟩ and *Containers—Permeation* ⟨671⟩, and comply with 21 CFR food additive requirements.

AN EQUIVALENT CONTAINER–CLOSURE SYSTEM refers to a container–closure system that yields the same, or better, moisture vapor transmission rate (MVTR), oxygen transmission, and light transmission as the original market container. These values may be determined by the repackager, or they may be obtained from the container–closure vendor for the specific container–closure system under consideration.

BEYOND USE DATE (BUD) AND DISCARD AFTER DATE are equivalent and are assigned using the criteria stated in the relevant section below.

EXPIRATION DATE is determined using stability studies and is not the same as beyond use date or discard after date.

FACILITIES

The facility in which repackaging is practiced should be operated in conformity with cGMPs. The environmental conditions during the packaging and storage operation of the drug product should comply with the *controlled room temperature* (see *General Notices*), storage in a *dry place*, and other requirements as directed by the manufacturer or supplier, especially if the drug requires storage at special temperature and humidity conditions (see *Good Storage and Shipping Practices* ⟨1079⟩).

ACQUISITION PROCESS

The repackager is expected to perform appropriate analytical testing for all pertinent specifications, such as identity and strength of each active ingredient, and any other finished product tests to establish valid analytical data. The repackager is expected to maintain records of such analyses on a batch-by-batch basis for the repackaged product that is either transferred to the repackager by the manufacturer or independently maintained by the repackager.

"Bulk" in this text refers to the quantity of either drug product or dosage form. The following criteria should be considered by the repackager upon receipt of bulk prior to repackaging.

(a) The bulk article should be distributed to the repackager by the manufacturer in accordance with all regulatory requirements and accompanied by appropriate labeling and a valid expiration date. The repackager should also receive Material Safety Data Sheets (MSDS), Certificates of Analysis, and sample market labeling, including inserts from the drug product manufacturer.

(b) The bulk article should be received intact and undamaged and in properly labeled containers with the Certificate of Analysis.

(c) The bulk article should undergo definitive organoleptic evaluations to confirm its identity (e.g., physical appearance, marking, color, and odor) and to confirm the labeling as described by the manufacturer.

(d) Records should be maintained to verify the identity and quantity of each shipment received and to verify the lot number and bar coded information for each article of the bulk shipment received. This record should also include the name of the manufacturer or supplier and its lot numbers and the date of receipt.

(e) The repackager should store and maintain the bulk under storage conditions specified by the manufacturer, and/or as directed under *Controlled Room Temperature* (see *General Notices*).

REPACKAGING PROCESS

The following criteria should be observed.

(a) The repackaging operations should be conducted under conditions that meet specified storage temperature definitions (see *General Notices*). Conditions of operation include maintenance of *controlled room temperature* in the area where the repackaging operation is conducted or other conditions as instructed by the manufacturer.

(b) The manufacturer should include, in the package insert or in other appropriate literature supplied to the repackager, the following information about the packaging: materials of construction of the market package, its MVTR (see *Containers—Permeation* ⟨671⟩), as well as oxygen transmission and light transmission characteristics in order to enable the repackager to properly select an equivalent container–closure system. If the repackager does not use a container–closure system equivalent to the manufacturer's market package, then the repackager must generate stability data for the drug product in the new container–closure system to justify the expiration date assigned.

(c) The repackaging containers are labeled with the same labeling information as the market label that is used by the manufacturer. The conditions on the labeling should meet those required under 21 CFR 201, 211.122, 211.125, and 211.130.

(d) Written procedures should be maintained to ensure that correct labels, labeling, and packaging materials are used for drug products.

(e) All requirements for repackaging of bulk products should meet 21 CFR 211.

(f) The packaging materials should comply with 21 CFR food additives regulations and all applicable requirements in USP general chapters ⟨661⟩, ⟨671⟩, and ⟨1146⟩.

LABELING

A repackager should provide appropriate labeling of the product identical to the manufacturer's approved market container. All repackaged products should be labeled with an appropriate BUD in the absence of stability data, or with an expiration date in cases where suitable stability studies, determined in CFR 211.166 (for recommended conditions see *International Conference on Harmonization ICH Q1A Stability Testing of New Drug Substances and Products*), have been performed on the product using the repackager's container. The expiration date will ensure that the products meet applicable standards of identity, strength, quality, and purity at the time of use.

EXPIRATION DATE/BEYOND USE DATE

Expiration Date

Stability studies are performed on the drug product in the original manufacturer's containers to establish an expiration date. When a drug is repackaged into a different container, the product's expiration date is altered or interrupted.

(a) The repackager may perform stability studies on the repackaged products to establish an expiration date for the product based on scientific evaluation of the drug product in the container–closure system in which it is to be marketed.

(b) A repackager may use the manufacturer's original expiration date without additional stability testing if the drug product is repackaged into an equivalent container–closure system that is at least as protective as, or more protective than, the original system and complies with criteria established for equivalency. Establishment of system equivalency means (1) that the requirements of USP general test chapters ⟨661⟩ and ⟨671⟩ are met and (2) that the specifications such as light transmission, seals, or desiccants associated with the original container–closure system, or special protective materials in which the drug product is marketed, are the same. Comparison of container–closure systems may be done through stress testing of the product after storage under exaggerated conditions of temperature and humidity. If the repackager does not use a container–closure system equivalent to the manu-

In-Process Revision

facturer's market package, then the repackager must generate stability data for the drug product in the new container–closure system to justify the expiration date or BUD assigned.

(c) A repackager should not use the equivalency container–closure system criteria to repackage drug products where such products have been identified by the manufacturer to have stability problems or if the manufacturer specifically states that the product should not be repackaged using the equivalency container–closure system criteria. For example, "This product is labile (e.g., moisture sensitive) and therefore should be dispensed only in the original manufacturer's container". In this case, a repackager needs to demonstrate the stability of the drug product in the repackager's container–closure system.

(d) Establishing the expiration date in the case listed in ô) is applicable for unit-dose containers, multiple-unit containers, and unit-of-use container types.

Beyond-Use Date or Discard-After Date

In the absence of stability data, where a repackager repackages a product into a unit-dose or multiple-unit container without conducting appropriate stability studies to support expiration dates used, the period of use of the product is limited by the BUD for the repackaged product, which must be less than the expiration date.

UNIT-DOSE PACKAGING

For unit-dose packaging, the following criteria should be considered.

(1) The original bulk container of the drug product to be used for repackaging has not been previously opened.

(2) The contents of the original bulk drug product to be repackaged are repackaged at one time.

(3) The unit-dose container meets USP general test chapter ⟨671⟩ testing requirements for either Class A or Class B containers.

(4) The unit-dose container meets or exceeds the manufacturer's specification for light resistance.

(5) The conditions of storage meet the storage specifications provided in the *General Notices* and as described in the labeling by the manufacturer of the bulk product. Where no specific storage conditions are specified, the product should be maintained at *controlled room temperature* and in a *dry place* during repackaging.

(6) The BUD used for the repackaged product does not exceed 6 months from the date of repackaging.

(7) The BUD does not exceed the manufacturer's expiration date.

(8) The BUD does not exceed 25% of the time between the date of repackaging and the expiration date shown on the manufacturer's bulk article container of the drug being repackaged.

(9) Documentation should be in place to show that the preceding criteria (items 1–8) are met. Documentation to show the type of packaging material used and the testing for these materials is also kept on file.

(10) The repackager may not repackage if the manufacturer specifically states "Do not repackage." HOwever, the repackager may affix the repackager's labeling if it is in accordance with FDA requirements and in agreement with the manufacturer of the drug product.

(11) The repackager may not use the expiration date and BUD interchangeably because they imply the presence or absence of stability testing, respectively.

MULTIPLE-UNIT PACKAGING

The *General Notices* define multiple-unit packaging as a package that contains more than one single dosage unit. For multiple unit packaging, the following criteria should be considered in assigning a BUD.

(1) The original bulk container of drug product to be used for repackaging has not been previously opened.

(2) The contents of the original bulk drug product to be packaged are repackaged at one time.

(3) The conditions of storage meet the storage specifications in the *General Notices* and as described in the labeling of the manufacturer's bulk product. Where no specific storage conditions are specified, the product should be maintained at *controlled room temperature* and in a *dry place* during repackaging.

(4) The type of container used for repackaging should be the same type used by the manufacturer as the market container, and the product container should comply with the requirements for containers as directed under *Containers* ⟨661⟩ and *Containers—Permeation* ⟨671⟩, as well as the requirements of 21 CFR for food additives, or the container should be composed of an approved food contact substance. For example, if the manufacturer packages in glass, the repackager should repackage in glass of the same type used by the manufacturer or in chemical resistant glass containers.

(5) Where the original container is a material other than glass or high density polyethylene (HDPE), the repackager may use a container demonstrated to be equivalent to, or exceed, the protective properties of the manufacturer's multiple-unit market container when performing the applicable tests as described in USP general test chapters ⟨661⟩ and ⟨671⟩.

(6) Where the original container is polyethylene, the repackager may repackage in a chemical resistant glass container or a polyethylene container. These containers should meet the appropriate tests and specifications in 21 CFR and USP general test chapters ⟨661⟩ and ⟨671⟩.

(7) The container meets or exceeds the test results of the manufacturer's multiple-unit market container for light transmission.

(8) The container meets or exceeds the manufacturer's container in special protective features: methods used to prevent leaching of container materials or the use of desiccants to maintain low moisture content. [NOTE—Desiccants should always be packaged on top of the drug product.]

(9) The container meets or exceeds the manufacturer's container test results for "tight" as provided in USP general test chapters ⟨661⟩ and ⟨671⟩.

(10) For all products, if the repackager uses a container that is equivalent in MVTR to the manufacturer's container or one that has a higher barrier, then the BUD should be 12 months or the manufacturer's expiration date, whichever is less. (See *Packaging Practice—Repackaging a Single Solid Oral Drug Product Into a Unit-Dose Container* ⟨1146⟩ for a description of low- and high-barrier packaging.)

(11) The repackager may not repackage the original bulk container of the drug product if the manufacturer specifically states "Do not repackage." However, the repackager may affix the repackager's labeling if this is in accordance with FDA requirements or the specifications of the drug product manufacturer.

MINIMUM REQUIREMENTS

The following represents the minimum requirements a repackager must meet in order to engage in repackaging drugs from their original manufacturer's container.

(a) A repackager is expected to comply with cGMPs and 21 CFR 211.170(b) for retained samples of repackaged drug products. Any alteration or manipulation of the repackaging process should be documented in accordance with the requirements in 21 CFR 211.

(b) A repackager is expected to repack penicillins, or products such as penicillins, in facilities separate from those facilities used for drug products as described in 21 CFR 211.42 and 21 CFR 211.46.

SHIPPING AND DISTRIBUTION

For products identified by the manufacturer as moisture- and temperature-sensitive, the repackager must follow the specifications provided by the manufacturer during repackaging, shipping, and distribution.

~~(a) A repackager may not repackage a moisture- and temperature-sensitive product if the manufacturer so instructs, except if the repackager is only altering the labeling in accordance with FDA requirements.~~
~~(b) The repackaging container should show the equivalent of, or be better in protective properties than, the manufacturer's original container. For moisture-sensitive products, a higher-barrier container should be used for repackaging.~~
~~(c) The repackager should have proper documentation in place to show the equivalency in protection of the container used.~~
~~(d) The storage and handling of the drug product should meet the conditions specifically instructed by the manufacturer of the product.~~
~~(e) The repackager should label the container "Contains moisture-sensitive product."~~
~~For all other products, the repackager should follow the same guidelines provided in *Good Storage and Shipping Practices* ⟨1079⟩ that are applicable to a manufacturer.~~

▪INTRODUCTION

This chapter is intended to provide guidance to those engaged in repackaging of oral solid drug products; and the chapter provides information to any person who removes drugs from their original container–closure system (new primary package) and repackages them into a different container–closure system for sale and/or for distribution.

This chapter does not apply to pharmacists engaged in dispensing prescription drugs in accordance with state practice of pharmacy. The pharmacist needs to apply

(1) the principal information provided in the USP general information chapter *Packaging Practice—Repackaging a Single Solid Oral Drug Product Into a Unit-Dose Container* ⟨1146⟩ and

(2) other beyond-use date references in the subsection *Expiration Date and Beyond-Use Date* in the *Labeling* section under *General Notices and Requirements*.

DEFINITIONS

The section *Preservation, Packaging, Storage, and Labeling* under *General Notices and Requirements* provides definitions related to repackaging. For the purposes of this chapter, a repackager, a contract packager, and an equivalent container–closure system are defined as follows:

1. **Repackager—**A repackager is an establishment that repackages drugs and sends them to a second location in anticipation of a need. Repackaging firms repackage preparations for distribution (e.g., for resale to distributors, hospitals, or other pharmacies), a function that is beyond the regular practice of a pharmacy. Distribution is not patient-specific in that there are no prescriptions. Unlike dispensers, repackaging firms are required to register with the FDA and to comply with the Current Good Manufacturing Practice Regulations in 21 CFR 210 and 211.
2. **Contract Packager—**A contract packager is an establishment that is contracted to package or repackage a drug product into a single- or multi-unit container. These containers should meet all of the applicable requirements in this chapter. A contract packager does not take ownership from the manufacturer and generally receives the assigned expiration date from the contractor.
3. **Equivalent Container–Closure System—**This term refers to a container–closure system that is at least as protective or more protective than the original container–closure system in terms of moisture vapor transmission rate (MVTR), oxygen transmission, light transmission, and compatibility of the container–closure system with the drug product. System equivalency extends to any special protective materials, such as for light transmission, seals, or desiccants associated with the original container–closure system. These values may be determined by the repackager, or they may be obtained from the container–closure vendor for the specific container–closure system under consideration.

ESTABLISHING EXPIRATION DATE

In the absence of stability data, the following criteria should be considered by repackagers when assigning an expiration date.

In-Process Revision

Unit-Dose Packaging

1. The original container–closure system of the drug product to be used for repackaging must be received un-opened and show no outward signs of having been previously opened.
2. The unit-dose container–closure system must meet the testing requirements under *Containers—Performance Testing* ⟨671⟩ for either *Class A* or *Class B* containers.
3. The contents of the original bulk drug product to be repackaged are repackaged at one time unless the repackager has data and/or other scientific information from literature sources demonstrating that the drug product is not sensitive to exposure to moisture, oxygen, or light.
4. The unit-dose container–closure system must meet or exceed the original container's specification for light resistance.
5. The conditions of storage must meet the storage specifications provided in the *USP General Notices* and as described in the labeling of the original container–closure system received for repackaging. Where no specific storage conditions are specified, the product must be maintained at controlled room temperature and in a dry place during the repackaging process, including storage.
6. The expiration dating period used for the repackaged product does not exceed (1) 6 months from the date of repackaging; or (2) the manufacturer's expiration date; or (3) 25% of the time between the date of repackaging and the expiration date shown on the manufacturer's bulk article container of the drug being repackaged, whichever is earlier.
7. Nitroglycerin Sublingual Tablets or any other drug product known to have stability problems should not be repackaged. This would include any drug known to be oxygen-sensitive or one that exhibits extreme moisture or light sensitivity. In deciding whether a particular drug product is suitable for repackaging, the repackager should take into consideration any available information from the manufacturer, published literature, the USP, and the FDA.
8. Documentation must be maintained to demonstrate that the preceding criteria are met.
9. Documentation must be maintained that specifies the container–closure packaging material used in repackaging operations.

Multiple-Unit Packaging

1. A repackager may use the manufacturer's original expiration date without additional stability testing if the drug product is repackaged into an equivalent container–closure system that is at least as protective as, or more protective than, the original system and complies with criteria established for equivalency.
2. The original container–closure system of the drug product to be used for repackaging must be received un-opened and shows no outward signs of having been previously opened.
3. The contents of the original bulk drug product to be repackaged are repackaged at one time unless the repackager has data and/or other scientific information from literature sources demonstrating that the drug product is not sensitive to exposure to moisture, oxygen, or light.
4. The conditions of storage meet the storage specifications in the *General Notices* and as described in the labeling of the original container–closure system received for repackaging. When no specific storage conditions are specified, the product should be maintained at controlled room temperature and in a dry place during repackaging operations.
5. The type of container–closure system used for repackaging must be at least as protective or more protective than the original container–closure system in terms of moisture vapor transmission rate (MVTR), oxygen transmission,

light transmission, and compatibility of the container–closure system with the drug product. System equivalency extends to any special protective materials, such as for light transmission, seals, or desiccants associated with the original container–closure system.

6. The container–closure system must meet or exceed the original container–closure system's results for light transmission.
7. Nitroglycerin Sublingual Tablets or any other drug product known to have stability problems should not be repackaged. This would include any drug known to be oxygen-sensitive or one that exhibits extreme moisture or light sensitivity. In deciding whether a particular drug product is suitable for repackaging, the repackager should take into consideration any available information from the manufacturer, published literature, the USP, and the FDA.
8. Documentation must be maintained to demonstrate that the preceding criteria are met.
9. Documentation must be maintained that specifies the container–closure packaging material used in repackaging operations.

BRIEFING

⟨**1231**⟩ **Water for Pharmaceutical Purposes,** *USP 29* page 3056. This informational chapter, which became official in the *Second Supplement* to *USP 28,* has a discussion of *Pure Steam* as a "USP monograph to come"; however, the *Pure Steam* monograph became official April 1, 2006 in the *First Supplement* to *USP 29*. In order to better align the ⟨1231⟩ discussion of Pure Steam with the wording and intended uses of this new official article, the Pharmaceutical Waters Expert Committee is proposing the following changes to that section. Please direct comments to Gary Ritchie, liaison to the Pharmaceutical Waters Expert Committee.

In-Process Revision

Change to read:

TYPES OF WATER

There are many different grades of water used for pharmaceutical purposes. Several are described in *USP* monographs that specify uses, acceptable methods of preparation, and quality attributes. These waters can be divided into two general types: bulk waters, which are typically produced on site where they are used; and packaged waters, which are produced, packaged, and sterilized to preserve microbial quality throughout their packaged shelf life. There are several specialized types of packaged waters, differing in their designated applications, packaging limitations, and other quality attributes.

There are also other types of water for which there are no monographs. These are all bulk waters, with names given for descriptive purposes only. Many of these waters are used in specific analytical methods. The associated text may not specify or imply certain quality attributes or modes of preparation. These nonmonographed waters may not necessarily adhere strictly to the stated or implied modes of preparation or attributes. Waters produced by other means or controlled by other test attributes may equally satisfy the intended uses for these waters. It is the user's responsibility to ensure that such waters, even if produced and controlled exactly as stated, be suitable for their intended use. Wherever the term "water" is used within this compendia without other descriptive adjectives or clauses, the intent is that water of no less purity than *Purified Water* be used.

What follows is a brief description of the various types of pharmaceutical waters and their significant uses or attributes. *Figure 1* may also be helpful in understanding some of the various types of waters.

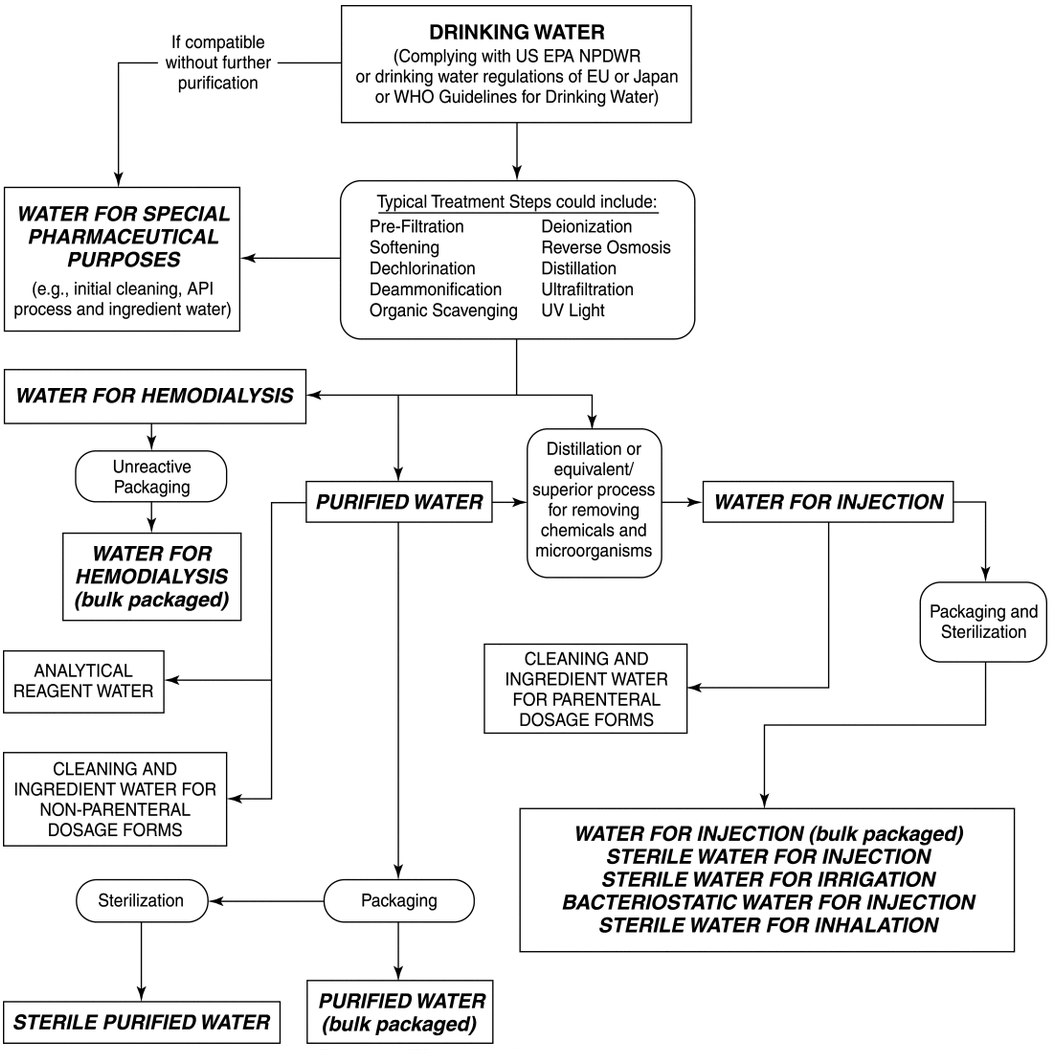

Figure 1. Water for pharmaceutical purposes.

Bulk Monographed Waters and Steam

The following waters are typically produced in large volume by a multiple-unit operation water system and distributed by a piping system for use at the same site. These particular pharmaceutical waters must meet the quality attributes as specified in the related monographs.

Purified Water—*Purified Water* (see *USP* monograph) is used as an excipient in the production of nonparenteral preparations and in other pharmaceutical applications, such as cleaning of certain equipment and nonparenteral product-contact components. Unless otherwise specified, *Purified Water* is also to be used for all tests and assays for which water is indicated (see *General Notices and Requirements*). *Purified Water* is also referenced throughout the *USP–NF*. Regardless of the font and letter case used in its spelling, water complying with the *Purified Water* monograph is intended. *Purified Water* must meet the requirements for ionic and organic chemical purity and must be protected from microbial contamination. The minimal quality of source or feed water for the production of *Purified Water* is Drinking Water. This source water may be purified using unit operations that include deionization, distillation, ion exchange, reverse os-

mosis, filtration, or other suitable purification procedures. Purified water systems must be validated to reliably and consistently produce and distribute water of acceptable chemical and microbiological quality. Purified water systems that function under ambient conditions are particularly susceptible to the establishment of tenacious biofilms of microorganisms, which can be the source of undesirable levels of viable microorganisms or endotoxins in the effluent water. These systems require frequent sanitization and microbiological monitoring to ensure water of appropriate microbiological quality at the points of use.

The *Purified Water* monograph also allows bulk packaging for commercial use elsewhere. When this is done, the required specifications are those of the packaged water *Sterile Purified Water*, except for *Sterility* and *Labeling*. There is a potential for microbial contamination and other quality changes of this bulk packaged non-sterile water to occur. Therefore, this form of *Purified Water* should be prepared and stored in such a fashion that limits microbial growth and/or simply used in a timely fashion before microbial proliferation renders it unsuitable for its intended use. Also depending on the material used for packaging, there could be extractable compounds leaching into the water from the packaging. Though this article may meet its required chemical attributes, such extractables may render the water an inappropriate choice for some applications. It is the user's responsibilitiy to assure fitness for use of this packaged article when used in manufacturing, clinical, or analytical applications where the pure bulk form of the water is indicated.

Water for Injection—*Water for Injection* (see *USP* monograph) is used as an excipient in the production of parenteral and other preparations where product endotoxin content must be controlled, and in other pharmaceutical applications, such as cleaning of certain equipment and parenteral product-contact components. The minimum quality of source or feed water for the generation of *Water for Injection* is Drinking Water as defined by the U.S. EPA, EU, Japan, or the WHO. This source water may be pre-treated to render it suitable for subsequent distillation (or whatever other validated process is used according to the monograph). The finished water must meet all of the chemical requirements for *Purified Water* as well as an additional bacterial endotoxin specification. Since endotoxins are produced by the kinds of microorganisms that are prone to inhabit water, the equipment and procedures used by the system to purify, store, and distribute *Water for Injection* must be designed to minimize or prevent microbial contamination as well as remove incoming endotoxin from the starting water. *Water for Injection* systems must be validated to reliably and consistently produce and distribute this quality of water.

The *Water for Injection* monograph also allows it to be packed in bulk for commercial use. Required specifications include the test for *Bacterial endotoxins,* and those of the packaged water *Sterile Purified Water,* except for *Labeling*. Bulk packaged *Water for Injection* is required to be sterile, thus eliminating microbial contamination quality changes. However, packaging extractables may render this water an inappropriate choice for some applications. It is the user's responsibility to ensure fitness for use of this packaged article when used in manufacturing, clinical, or analytical applications where the purer bulk form of the water is indicated.

Water for Hemodialysis—*Water for Hemodialysis* (see *USP* monograph) is used for hemodialysis applications, primarily the dilution of hemodialysis concentrate solutions. It is produced and used on-site and is made from EPA Drinking Water which has been further purified to reduce chemical and microbiological components. It may be packaged and stored in unreactive containers that preclude bacterial entry. The term "unreactive containers" implies that the container, especially its water contact surfaces, are not changed in any way by the water, such as by leaching of container-related compounds into the water or by any chemical reaction or corrosion caused by the water. The water contains no added antimicrobials and is not intended for injection. Its attributes include specifications for *Water conductivity, Total organic* carbon (or oxidizable substances), *Microbial limits,* and *Bacterial endotoxins.* The water conductivity and total organic carbon attributes are identical to those established for *Purified Water* and *Water for Injection;* however, instead of total organic carbon, the organic content may alternatively be measured by the test for *Oxidizable substances*. The *Microbial limits* attribute for this water is unique among the "bulk" water monographs, but is justified on the basis of this water's specific application that has microbial content requirements related to its safe use. The *Bacterial endotoxins* attribute is likewise established at a level related to its safe use.

~~**Pure Steam**—*Pure Steam* is intended for use in steam sterilizing porous loads and equipment and in other processes such as cleaning where condensate would directly contact official articles, containers for these articles, process surfaces that would in turn contact these articles, or materials which are used in analyzing such articles. *Pure Steam* may be used for air humidification in controlled manufacturing areas where official articles or article-contact surfaces are exposed to the resulting conditioned air. The primary intent of using this quality of steam is to ensure that official articles or article-contact surfaces exposed to it are not contaminated by residues within the steam. *Pure Steam* is prepared from suitably pretreated source water, analogous to the pretreatment used for *Purified Water* or *Water for Injection,* vaporized with a suitable mist elimination, and distributed under pressure. The sources of undesirable contaminants within Pure Steam could be derived from entrained source water droplets, anti corrosion steam additives, or particulate matter from the steam production and distribution system itself; therefore, the attributes in the monograph should preclude most of the contaminants that could arise from these sources.~~

■*Pure Steam* (see *USP* monograph) is also sometimes referred to as "clean steam". It is used where the steam or its condensate would directly contact official articles or article-contact surfaces such as during their preparation, sterilization, or cleaning where no subsequent processing step is used to remove any codeposited impurity residues. These *Pure Steam* applications include but are not limited to porous load sterilization processes, to product or cleaning solutions heated by direct steam injection, or in humidification of processes where steam injection is used to control the humidity inside processing vessels where the official articles or their in-process forms are exposed. The primary intent of using this quality of steam is to ensure that official articles or article-contact surfaces exposed to it are not contaminated by residues within the steam.

Pure Steam is prepared from suitably pretreated source water, analogously to either the pretreatment used for *Purified Water* or *Water for Injection*. The water is vaporized with suitable mist elimination, and distributed under pressure. The sources of undesirable contaminants within *Pure Steam* could arise from entrained source water droplets, anti-corrosion steam additives, or residues from the steam production and distribution system itself. The attributes in the *Pure Steam* monograph should detect most of the contaminants that could arise from these sources. If the official article exposed to potential *Pure Steam* residues is intended for parenteral use or

In-Process Revision

other applications where the pyrogenic content must be controlled, the *Pure Steam* must additionally meet the specification for *Bacterial Endotoxins* ⟨85⟩.■2S (*USP30*)

These purity attributes are measured on the condensate of the article, rather than the article itself. This, of course, imparts great importance to the cleanliness of the *Pure Steam* condensate generation and collection process because it must not adversely impact the quality of the resulting condensed fluid.

Other steam attributes not detailed in the monograph, in particular, the presence of even small quantities of noncondenseable gases or the existence of a superheated or dry state, may also be important for applications such as sterilization. The large release of energy (latent heat of condensation) as water changes from the gaseous to the liquid state is the key to steam's sterilization efficacy and its efficiency, in general, as a heat transfer agent. If this phase change (condensation) is not allowed to happen because the steam is extremely hot and in a persistent super heated, dry state, then its usefulness could be seriously compromised. Noncondensable gases in steam tend to stratify or collect in certain areas of a steam sterilization chamber or its load. These surfaces would thereby be at least partially insulated from the steam condensation phenomenon, preventing them from experiencing the full energy of the sterilizing conditions. Therefore, control of these kinds of steam attributes, in addition to its chemical purity, may also be important for certain *Pure Steam* applications. However, because these additional attributes are use-specific, they are not mentioned in the *Pure Steam* monograph.

~~Note that less pure plant steam may be used for steam sterilization of nonporous loads, general cleaning and sterilization of nonproduct contact equipment and analytical materials, humidification of air in nonmanufacturing areas, where used as a nonproduct contact heat exchange medium, and in all compatible applications involved in bulk pharmaceutical chemical and API manufacture.~~

■Note that less pure "plant steam" may be used for steam sterilization of nonproduct contact nonporous loads, for general cleaning of nonproduct contact equipment, as a nonproduct contact heat exchange medium, and in all compatible applications involved in bulk pharmaceutical chemical and API manufacture.■2S (*USP30*)

Packaged Monographed Waters

The following monographed waters are packaged forms of either *Purified Water* or *Water for Injection* that have been sterilized to preserve their microbiological properties. These waters may have specific intended uses as indicated by their names and may also have restrictions on packaging configurations related to those uses. In general, these packaged waters may be used in lieu of the bulk form of water from which they were derived. However, the user should take into consideration that the packaging and sterilization processes used for the articles may leach materials from the packaging material into the water over its shelf life, rendering it less pure than the original water placed into the package. The chemical attributes of these waters are still defined primarily by the wet chemistry methods and specifications similar to those formerly used for the bulk pharmaceutical waters prior to their replacement with water conductivity and total organic carbon (TOC). It is the user's responsibility to ensure fitness for use of this article when used in manufacturing, clinical, or analytical applications where the purer bulk form of the water is indicated.

Sterile Purified Water—*Sterile Purified Water* (see *USP* monograph) is *Purified Water*, packaged and rendered sterile. It is used in the preparation of nonparenteral compendial dosage forms or in analytical applications requiring *Purified Water* where access to a validated *Purified Water* system is not practical, where only a relatively small quantity is needed, where sterile *Purified Water* is required, or where bulk packaged *Purified Water* is not suitably microbiologically controlled.

Sterile Water for Injection —*Sterile Water for Injection* (see *USP* monograph) is *Water for Injection* packaged and rendered sterile. It is used for extemporaneous prescription compounding and as a sterile diluent for parenteral products. It may also be used for other applications where bulk *Water for Injection* or *Purified Water* is indicated but where assess to a validated water system is either not practical or where only a relatively small quantity is needed. *Sterile Water for Injection* is packaged in single-dose containers not larger than 1 L in size.

Bacteriostatic Water for Injection —*Bacteriostatic Water for Injection* (see *USP* monograph) is sterile *Water for Injection* to which has been added one or more suitable antimicrobial preservatives. It is intended to be used as a diluent in the preparation of parenteral products, most typically for multi-dose products that require repeated content withdrawals. It may be packaged in single-dose or multiple-dose containers not larger than 30 mL.

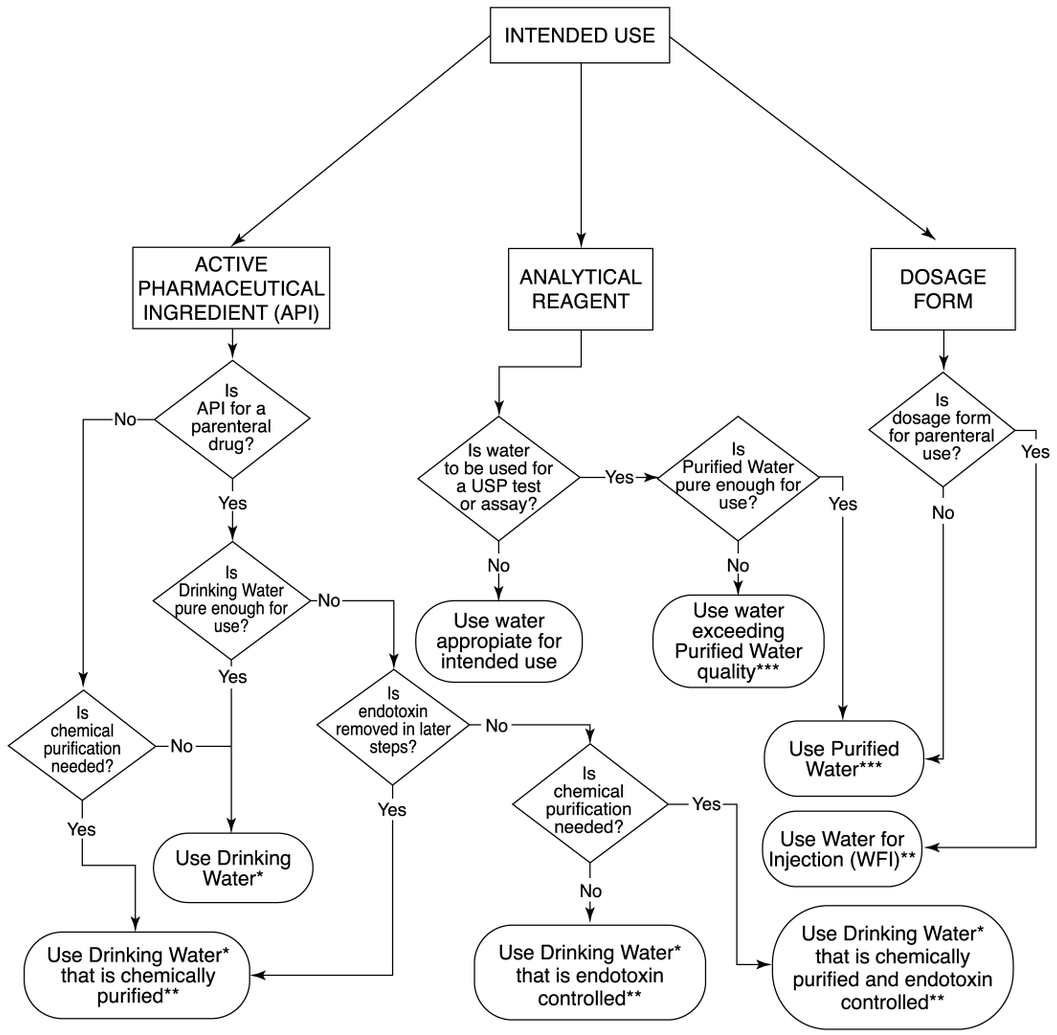
Sterile Water for Irrigation—*Sterile Water for Irrigation* (see *USP* monograph) is *Water for Injection* packaged and sterilized in single-dose containers of larger than 1 L in size that allows rapid delivery of its contents. It need not meet the requirement under small-volume injections in the general test chapter *Particulate Matter in Injections* ⟨788⟩. It may also be used in other applications, which do not have particulate matter specifications, where bulk *Water for Injection* or *Purified Water* is indicated but where access to a validated water system is not practical or where somewhat larger quantities than are provided as *Sterile Water for Injection* are needed.

Sterile Water for Inhalation—*Sterile Water for Inhalation* (see *USP* monograph) is *Water for Injection* that is packaged and rendered sterile and is intended for use in inhalators and in the preparation of inhalation solutions. It carries a less stringent specification for bacterial endotoxins than *Sterile Water for Injection*, and therefore, is not suitable for parenteral applications.

Nonmonographed Manufacturing Waters

In addition to the bulk monographed waters described above, nonmonographed waters can also be used in pharmaceutical processing steps such as cleaning, synthetic steps or as a starting material for further purification. The following is a description of several of these nonmonographed waters as cited in various locations within this compendia.

Drinking Water—This type of water can be referred to as Potable Water (meaning drinkable or fit to drink), National Primary Drinking Water, Primary Drinking Water, or National Drinking Water. Except where a singular drinking water specification is stated (such as the NPDWR [U.S. Environmental Protection Agency's National Primary Drinking Water Regulations as cited in 40 CFR Part 141]), this water must comply with the quality attributes of either the NPDWR, or the drinking water regulations of the European Union or Japan, or the WHO Drinking Water Guidelines. It may be derived from a variety of sources including a public water utility, a private water supply (e.g., a well), or a combination of these sources. Drinking Water may be used in the early stages of cleaning pharmaceutical manufacturing equipment and product-contact components. Drinking Water is also the minimum quality of water that should be used for the preparation of official substances and other bulk pharmaceutical ingredients. Where compatible with the processes, the allowed contaminant levels in Drinking Water are generally considered safe for use for official substances and other drug substances. Where required by the processing of the materials to achieve their required final purity, higher qualities of water may be needed for these manufacturing steps, perhaps even as pure as *Water for Injection* or *Purified Water*. Such higher purity waters, however, might require only selected attributes to be of higher purity than Drinking Water (see *Figure 2* below). Drinking Water is the prescribed source or feed water for the production of bulk monographed pharmaceutical waters. The use of Drinking Water specifications establishes a reasonable set of maximum allowable levels of chemical and microbiological contaminants with which a water purification system will be challenged. As seasonal variations in the quality attributes of the Drinking Water supply can occur, due consideration to its synthetic and cleaning uses must be given. The processing steps in the production of pharmaceutical waters must be designed to accommodate this variability.



* Drinking Water is water complying with US EPA NPDWR or drinking water regulations of EU or Japan or WHO drinking water guidelines.

** Water for sterile API's or dosage forms must first be rendered sterile if there is not a subsequent sterilization step in the process where used.

*** See guidance in this chapter where waters other than Purified Water are required by some USP tests and assays.

Note: All water systems should be validated with whatever microbial control is needed to suit the intended purposes of the water.

Figure 2. Selection of water for pharmaceutical purposes.

Hot Purified Water—This water is used in the preparation instructions for *USP–NF* articles and is clearly intended to be *Purified Water* that has been heated to an unspecified temperature in order to enhance solubilization of other ingredients. There is no upper temperature limit for the water (other than being less than 100°), but for each monograph there is an implied lower limit below which the desired solubilization effect would not occur.

Nonmonographed Analytical Waters

Both *General Notices and Requirements* and the introductory section to *Reagents, Indicators, and Solutions* clearly state that where the term ''water,'' without qualification or other specification, is indicated for use in analyses, the quality of water shall be *Purified Water*. However, numerous such qualifications do exist. Some of these qualifications involve methods of preparation, ranging from specifying the primary purification step to specifying additional purification. Other qualifications call for specific attributes to be met that might otherwise interfere with analytical processes. In most of these latter cases, the required attribute is not specifically tested. Rather, a further ''purification process'' is specified that ostensibly allows the water to adequately meet this required attribute.

However, preparation instructions for many reagents were carried forward from the innovator's laboratories to the originally introduced monograph for a particular *USP–NF* article or general test chapter. The quality of the reagent water described in these tests may reflect the water quality designation of the innovator's laboratory. These spe-

cific water designations may have originated without the innovator's awareness of the requirement for *Purified Water* in *USP–NF* tests. Regardless of the original reason for the creation of these numerous special analytical waters, it is possible that the attributes of these special waters could now be met by the basic preparation steps and current specifications of *Purified Water*. In some cases, however, some of the cited post-processing steps are still necessary to reliably achieve the required attributes.

Users are not obligated to employ specific and perhaps archaically generated forms of analytical water where alternatives with equal or better quality, availability, or analytical performance may exist. The consistency and reliability for producing these alternative analytical waters should be verified as producing the desired attributes. In addition, any alternative analytical water must be evaluated on an application-by-application basis by the user to ensure its suitability. Following is a summary of the various types of nonmonographed analytical waters that are cited in the *USP–NF.*

Distilled Water—This water is produced by vaporizing liquid water and condensing it in a purer state. It is used primarily as a solvent for reagent preparation, but it is also specified in the execution of other aspects of tests, such as for rinsing an analyte, transferring a test material as a slurry, as a calibration standard or analytical blank, and for test apparatus cleaning. It is also cited as the starting water to be used for making *High Purity Water.* Because none of the cited uses of this water imply a need for a particular purity attribute that can only be derived by distillation, water meeting the requirements for *Purified Water* derived by other means of purification could be equally suitable where *Distilled Water* is specified.

Freshly Distilled Water—Also called "recently distilled water", it is produced in a similar fashion to *Distilled Water* and should be used shortly after its generation. This implies the need to avoid endotoxin contamination as well as any other adventitious forms of contamination from the air or containers that could arise with prolonged storage. It is used for preparing solutions for subcutaneous test animal injections as well as for a reagent solvent in tests for which there appears to be no particularly high water purity needed that could be ascribable to being "freshly distilled". In the "test-animal" use, the term "freshly distilled" and its testing use imply a chemical, endotoxin, and microbiological purity that could be equally satisfied by *Water for Injection* (though no reference is made to these chemical, endotoxin, or microbial attributes or specific protection from recontamination). For nonanimal uses, water meeting the requirements for *Purified Water* derived by other means of purification and/or storage periods could be equally suitable where "recently distilled water" or *Freshly Distilled Water* is specified.

Deionized Water—This water is produced by an ion-exchange process in which the contaminating ions are replaced with either H^+ or OH^- ions. Similarly to *Distilled Water, Deionized Water* is used primarily as a solvent for reagent preparation, but it is also specified in the execution of other aspects of tests, such as for transferring an analyte within a test procedure, as a calibration standard or analytical blank, and for test apparatus cleaning. Also, none of the cited uses of this water imply any needed purity attribute that can only be achieved by deionization. Therefore, water meeting the requirements for *Purified Water* that is derived by other means of purification could be equally suitable where *Deionized Water* is specified.

Freshly Deionized Water—This water is prepared in a similar fashion to *Deionized Water,* though as the name suggests, it is to be used shortly after its production. This implies the need to avoid any adventitious contamination that could occur upon storage. This water is indicated for use as a reagent solvent as well as for cleaning. Due to the nature of the testing, *Purified Water* could be a reasonable alternative for these applications.

Deionized Distilled Water—This water is produced by deionizing (see *Deionized Water*) *Distilled Water.* This water is used as a reagent in a liquid chromatography test that requires a high purity. Because of the importance of this high purity, water that barely meets the requirements for *Purified Water* may not be acceptable. *High Purity Water* (see below) could be a reasonable alternative for this water.

Filtered Distilled or Deionized Water—This water is essentially *Purified Water* produced by distillation or deionization that has been filtered through a 1.2-µm rated membrane. This water is used in particulate matter testing where the presence of particles in the water could bias the test results (see *Particulate Matter in Injections* ⟨788⟩). Because the chemical water purity needed for this test could also be afforded by water purification processes other than distillation or deionization, filtered water meeting the requirements for *Purified Water,* but produced by means other than distillation or deionization could be equally suitable.

Filtered Water—This water is *Purified Water* that has been filtered to remove particles that could interfere with the analysis where the water is used. Where used for preparing samples for particulate matter testing (see *Particulate Matter in Injections* ⟨788⟩), though unspecified in monographs, water filtration should be through a 1.2-µm filter to be consistent with the general test chapter. Where used as a chromatography reagent, monograph-specified filter ratings range from 0.5 µm to unspecified.

High Purity Water—The preparation of this water is defined in *Containers* ⟨661⟩. It is water that is prepared by deionizing previously distilled water, and then filtering it through a 0.45-µm rated membrane. This water must have an in-line conductivity of not greater than 0.15 µS/cm (6.67 Megohm-cm) at 25°. For the sake of purity comparison, the analogous Stage 1 and 2 conductivity requirements for *Purified Water* at the same temperature are 1.3 µS/cm and 2.1 µS/cm, respectively. The preparation specified in *Containers* ⟨661⟩ uses materials that are highly efficient deionizers and that do not contribute copper ions or organics to the water, assuring a very high quality water. If the water of this purity contacts the atmosphere even briefly as it is being used or drawn from its purification system, its conductivity will immediately degrade, by as much as about 1.0 µS/cm, as atmospheric carbon dioxide dissolves in the water and equilibrates to bicarbonate ions. Therefore, if the analytical use requires that water purity remains as high as possible, its use should be protected from atmospheric exposure. This water is used as a reagent, as a solvent for reagent preparation, and for test apparatus cleaning where less pure waters would not perform acceptably. However, if a user's routinely available purified water is filtered and meets or exceeds the conductivity specifications of *High Purity Water,* it could be used in lieu of *High Purity Water.*

Ammonia-Free Water—Functionally, this water must have a negligible ammonia concentration to avoid interference in tests sensitive to ammonia. It has been equated with *High Purity Water* that has a significantly tighter Stage 1 conductivity specification than *Purified Water* because of the latter's allowance for a minimal level of ammonium among other ions. However, if the user's *Purified Water* were filtered and met or exceeded the conductivity specifications of *High Purity Water,* it would contain negligible ammonia or other ions and could be used in lieu of *High Purity Water.*

Carbon Dioxide-Free Water—The introductory portion of the *Reagents, Indicators, and Solutions* section defines this water as *Purified Water* that has been vigorously boiled for at least 5 minutes, then cooled and protected from absorption of atmospheric carbon dioxide. Because the absorption of carbon dioxide tends to drive down the water pH, most of the uses of Carbon Dioxide-Free Water are either associated as a solvent in pH-related or pH- sensitive determinations or as a solvent in carbonate-sensitive reagents or determinations. Another use of this water is for certain optical rotation and color and clarity of solution tests. Though it is possible that this water is indicated for these tests simply because of its purity, it is also possible that the pH effects of carbon dioxide containing water could interfere with the results of these tests. A third plausible reason that this water is indicated is that outgassing air bubbles might interfere with these photometric-type tests. The boiled water preparation approach will also greatly reduced the concentrations of many other dissolved gases along with carbon dioxide. Therefore, in some of the applications for *Carbon Dioxide-Free Water,* it could be the inadvertent deaeration effect that actually renders this water suitable. In addition to boiling, deionization is perhaps an even more efficient process for removing dissolved carbon dioxide (by drawing the dissolved gas equilibrium toward the ionized state with subsequent removal by the ion-exchange resins). If the starting *Purified Water* is prepared by an efficient deionization process and protected after deionization from exposure to atmospheric air, water that is carbon dioxide-free can be effectively made without the application of heat. However this deionization process does not deaerate the water, so if *Purified Water* prepared by deionization is considered as a substitute water in a test requiring Carbon Dioxide-Free Water, the user must verify that it is not actually water akin to *Deaerated Water* (discussed below) that is needed for the test. As indicated in the *High Purity Water,* even brief contact with the atmosphere can allow small amounts of carbon diox-

ide to dissolve, ionize, and significantly degrade the conductivity and lower the pH. If the analytical use requires the water to remain as pH-neutral and as carbon dioxide-free as possible, even the analysis should be protected from atmospheric exposure. However, in most applications, atmospheric exposure during testing does not significantly affect its suitability in the test.

Ammonia- and Carbon Dioxide-Free Water—As implied by the name, this water should be prepared by approaches compatible with those mentioned for both *Ammonia-Free Water* and *Carbon Dioxide-Free Water.* Because the carbon dioxide-free attribute requires post-production protection from the atmosphere, it is appropriate to first render the water ammonia-free using the *High Purity Water* process followed by the boiling and carbon dioxide-protected cooling process. The *High Purity Water* deionization process for creating *Ammonia-Free Water* will also remove the ions generated from dissolved carbon dioxide and ultimately, by forced equilibration to the ionized state, all the dissolved carbon dioxide. Therefore, depending on its use, an acceptable procedure for making *Ammonia- and Carbon Dioxide-Free Water* could be to transfer and collect *High Purity Water* in a carbon dioxide intrusion-protected container.

Deaerated Water—This water is *Purified Water* that has been treated to reduce the content of dissolved air by "suitable means". In the *Reagents* section, approaches for boiling, cooling (similar to *Carbon Dioxide-Free Water* but without the atmospheric carbon dioxide protection), and sonication are given as applicable for test uses other than dissolution and drug release testing. Though *Deaerated Water* is not mentioned by name in *Dissolution* ⟨711⟩*,* suggested methods for deaerating dissolution media (which may be water) include warming to 41°, vacuum filtering through a 0.45-µm rated membrane, and vigorously stirring the filtrate while maintaining the vacuum. This chapter specifically indicates that other validated approaches may be used. In other monographs that also do not mention *Deaerated Water* by name, degassing of water and other reagents is accomplished by sparging with helium. *Deaerated Water* is used in both dissolution testing as well as liquid chromatography applications where outgassing could either interfere with the analysis itself or cause erroneous results due to inaccurate volumetric withdrawals. Applications where ambient temperature water is used for reagent preparation, but the tests are performed at elevated temperatures, are candidates for outgassing effects. If outgassing could interfere with test performance, including, chromatographic flow, colorimetric, or photometric measurements, or volumetric accuracy, then *Deaerated Water* should probably be used, whether called for in the analysis or not. The above deaeration approaches might not render the water "gas-free". At best, they reduce the dissolved gas concentrations so that outgassing caused by temperature changes is not likely.

Recently Boiled Water—This water may include recently or freshly boiled water (with or without mention of cooling in the title), but cooling prior to use is clearly intended. Occasionally it is necessary to use when hot. *Recently Boiled Water* is specified because it is used in a pH-related test or carbonate-sensitive reagent, in an oxygen-sensitive test or reagent, or in a test where outgassing could interfere with the analysis, such as specific gravity or an appearance test.

Oxygen-Free Water—The preparation of this water is not specifically described in the compendia. Neither is there an oxygen specification or analysis mentioned. However, all uses involve analyses of materials that could be sensitive to oxidation by atmospheric oxygen. Procedures for the removal of dissolved oxygen from solvents, though not necessarily water, are mentioned in *Polarography* ⟨801⟩ and *Spectrophotometry and Light-Scattering* ⟨851⟩. These procedures involve simple sparging of the liquid with an inert gas such as nitrogen or helium followed by inert gas blanketing to prevent oxygen reabsorption. The sparging times cited range from 5 to 15 minutes to an unspecified period. Some *Purified Water* and *Water for Injection* systems produce water that is maintained in a hot state and that is inert gas blanketed during its preparation and storage and distribution. Though oxygen is poorly soluble in hot water, such water may not be oxygen-free. Whatever procedure used for removing oxygen should be verified as reliably producing water that is fit for use.

LAL Reagent Water—This water is also referred to as endotoxin-free water. This is usually *Water for Injection,* which may have been sterilized. It is free from a level of endotoxin that would yield any detectable reaction or interference with the Limulus amebocyte lysate reagent used in the *Bacterial Endotoxins Test* ⟨85⟩.

Organic-Free Water—This water is defined by *Organic Volatile Impurities* ⟨467⟩ as producing no significantly interfering gas chromatography peaks. Referenced monographs specify using this water as the solvent for standard and test solution preparation for the *Organic volatile impurities* test

Lead-Free Water—This water is used as a transferring diluent for an analyte in a *Lead* ⟨251⟩ test. Though no specific instructions are given for its preparation, it must not contain any detectable lead. *Purified Water* should be a suitable substitute for this water.

Chloride-Free Water—This water is specified as the solvent for use in an assay that contains a reactant that precipitates in the presence of chloride. Though no specific preparation instructions are given for this water, its rather obvious attribute is having a very low chloride level in order to be unreactive with this chloride sensitive reactant. *Purified Water* could be used for this water but should be tested to assure it is unreactive.

Hot Water—The uses of this water include solvents for achieving or enhancing reagent solubilization, restoring the original volume of boiled or hot solutions, rinsing insoluble analytes free of hot water soluble impurities, solvents for reagent recrystallization, apparatus cleaning, and as a solubility attribute for various *USP–NF* articles. In only one monograph is the temperature of "hot" water specified; so in all the other cases, the water temperature is less important, but should be high enough to achieve the desirable effect. In all cases, the chemical quality of the water is implied to be that of *Purified Water.*

REAGENTS, INDICATORS, AND SOLUTIONS

Reagent Specifications

BRIEFING

***N,N*-Dimethylacetamide,** *USP 29* page 3126 and page 656 of *PF* 32(2) [Mar.–Apr. 2006]. It is proposed to update the specifications for this reagent to reflect the products currently available on the market.

(HDQ: M. Marques) RTS—47676

Change to read:

***N,N*-Dimethylacetamide,** C_4H_9NO—**87.12**

■[*127-19-5*]■1S (*USP30*)
—Clear, colorless liquid. Miscible with water and with many organic solvents.

~~*Assay*~~ ~~When examined by gas–liquid chromatography, with the use of suitable apparatus and conditions, it shows a purity of not less than 99%.~~

~~*Distilling range*~~ ~~⟨721⟩: between 164.5° and 167.5°.~~

~~*Residue on evaporation*~~ ~~Evaporate 215 mL on a steam bath, and dry at 105° for 1 hour: the residue weighs not more than 2 mg (0.001%).~~

~~*pH of 20% solution*~~ ~~Weigh 20 g of it into a 100-mL volumetric flask, and dilute with carbon dioxide–free water to volume: the solution shows a pH between 4.0 and 7.0.~~

~~*Ultraviolet absorbance*~~ ~~Determine its absorbance throughout the range 270 to 400 nm, using a 1-cm cell, a suitable spectrophotometer, and water to set the instrument: the absorbance does not exceed 1.00 at 270 nm, 0.30 at 280 nm, 0.15 at 290 nm, 0.05 at 310 nm, 0.03 at 320 nm, and 0.01 at 360 to 400 nm.~~

~~*Water, Method I*~~ ~~⟨921⟩: not more than 0.05%.~~

■Use a suitable HPLC or spectroscopic grade.■2S (*USP30*)

BRIEFING

2,4-Dinitrophenylhydrazine, *USP 29* page 3128 and page 901 of *PF* 32(3) [May–June 2006]. It is proposed to update the information regarding this reagent to reflect the products currently available on the market.

(HDQ: M. Marques) RTS—C47532

Change to read:

2,4-Dinitrophenylhydrazine, $2,4\text{-}C_6H_3(NO_2)_2NHNH_2$—**198.14**

■[*119-26-6*]■2S (*USP30*)
—Orange-red crystals, which under the microscope appear individually to be lemon-yellow, lath-like needles. Very slightly soluble in water; slightly soluble in alcohol; moderately soluble in dilute inorganic acids.

~~*Melting range*~~ ~~⟨741⟩: between 197° and 200°.~~

~~*Solubility in sulfuric acid*~~ ~~Dissolve 500 mg in a mixture of 25 mL of sulfuric acid and 25 mL of water: the solution is clear or not more than slightly turbid.~~

~~*Residue on ignition*~~ ~~(Reagent test): negligible, from 500 mg.~~

■Use a suitable grade with a content of not less than 97%.■2S (*USP30*)

BRIEFING

Hydrogen Peroxide, 10 Percent. It is proposed to add this new reagent used in the test for *Limit of lead* in the proposed new monograph for *Palm Kernel Oil,* also appearing in this issue of *PF.*

(HDQ: M. Marques) RTS—C47603

Add the following:

■**Hydrogen Peroxide, 10 Percent,** H_2O_2—**34.01**—Dilute 30 mL of 30 percent hydrogen peroxide with water to 100 mL.■2S (*USP30*)

In-Process Revision

BRIEFING

4-Hydroxyisophthalic Acid, *USP 29* page 3134 and page 917 of *PF* 32(3) [May–June 2006]. It is proposed to delete this reagent. It is currently available as USP Salicylic Acid Related Compound B RS.

(HDQ: M. Marques) RTS—C47634

Delete the following:

~~■**4-Hydroxyisophthalic Acid,** $C_8H_8O_4$—**182.13**~~

~~■[*636-46-4*]■1S (*USP30*)~~
~~—Colorless branched needles. Freely soluble in alcohol and in ether.~~
~~*Melting range* ⟨741⟩: between 308° and 310°, with decomposition at 314° to 315°.~~■2S (*USP30*)

BRIEFING

Methyl Green, *USP 29* page 3138. It is proposed to update the information regarding this reagent.

(HDQ: M. Marques) RTS—C47613

Change to read:

Methyl Green,

■*(Methyl Green Zinc Chloride Double Salt; Ethyl Green Zinc Chloride Double Salt; C.I. 42590),*■2S (*USP30*)
~~$C_{28}H_{33}N_3BrCl \cdot ZnCl_2$—**653.24**~~

■$C_{27}H_{35}Cl_2N_3 \cdot ZnCl_2$—**608.78**■2S (*USP30*)
[*7114-03-6*]—Use a suitable grade

■for microscopy.■2S (*USP30*)

BRIEFING

Methyl Iodide, *USP 29* page 3138 and page 929 of *PF* 32(3) [May–June 2006]. It is proposed to update the specifications for this reagent to reflect the products currently available on the market.

(HDQ: M. Marques) RTS—C47646

Change to read:

Methyl Iodide
■(Iodomethane),■2S (*USP30*)
CH_3I—**141.94**

■[*74-88-4*]■2S (*USP30*)
—Colorless, heavy, transparent liquid. Slightly soluble in water. Miscible with alcohol, with ether, and with solvent hexane. Turns brown on exposure to light as a result of liberation of iodine.

~~*Assay*—Add 1 mL to a 100-mL volumetric flask tared with 10 mL of alcohol. Weigh again, add alcohol to volume, and mix. Pipet 20 mL into a glass-stoppered flask, and add 50.0 mL of 0.1 N silver nitrate VS and 2 mL of nitric acid. Insert the stopper immediately, shake frequently during 2 hours, and allow to stand in the dark overnight. Shake again for 2 hours, then add 50 mL of water and 3 mL of ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS. Each mL of 0.1 N silver nitrate is equivalent to 14.19 mg of CH_3I: not less than 98.5% is found.~~

~~*Boiling range* (Reagent test)—Distill 50 mL into a chilled, partly closed receiver: not less than 48 mL distills between 41.5° and 43°.~~

~~*Density:*—between 2.270 and 2.285.~~

~~*Residue on evaporation*—Evaporate 4 mL (10 g) on a steam bath, and dry the residue at 105° for 1 hour: the residue weighs not more than 1 mg (0.01%).~~

~~*Acidity*—Shake 3 mL with 5 mL of water for 30 seconds, and immediately draw off the lower layer: the aqueous layer is neutral to litmus, and when 1 mL of silver nitrate TS is added, it shows not more than a slight opalescence.~~

■Use a suitable grade with a content of not less than 99%.■2S (*USP30*)

In-Process Revision

BRIEFING

***n*-Octadecane.** This proposed reagent is used to prepare the *Internal standard solution* in the test for *Limit of monomers* under *Polydextrose,* a new monograph proposed in *PF* 32(4) [July–Aug. 2006].

(HDQ: M. Marques) RTS—C44166

Add the following:

■***n*-Octadecane,** $CH_3(CH_2)_{16}CH_3$—**254.49**[*593-45-3*]—Use a gas chromatographic standard with a content of not less than 99.5%.■2S (*USP30*)

BRIEFING

Sodium Citrate Dihydrate. It is proposed to add this new reagent.

(HDQ: M. Marques) RTS—C46393

Add the following:

■**Sodium Citrate Dihydrate** *(2-Hydroxy-1,2,3-propanetricarboxylic Acid, Trisodium Salt, Dihydrate),* $Na_3C_6H_5O_7 \cdot 2H_2O$—**294.10**[*6132-04-3*]—Use ACS reagent grade.■2S (*USP30*)

BRIEFING

Pullulan Standards. These proposed reagents are used to prepare the *Standard solution* in the test for *Molecular weight limit* under *Polydextrose,* a new monograph proposed on page 1155 of *PF* 32(4) [July–Aug. 2006].

(HDQ: M. Marques) RTS—C44166

Add the following:

■**5,800, 23,700, and 100,000 Molecular Weight (MW) Pullulan Standards** (a commercial Pullulan Standard set contains standards having several molecular weights: 5,800; 12,000; 24,000; 48,000; 100,000; 186,000; 380,000; and 750,000)—[*9057-02-7*]—Use a suitable grade. Each individual Pullulan Standard with a different molecular weight, such as 5,800, 24,000, or 100,000, is equivalently used.

[NOTE—The standard set is available from Polymer Laboratories (www.polymerlabs.com), Sigma-Aldrich (www.sigma-aldrich.com), and Waters (www.waters.com).]■2S (*USP30*)

BRIEFING

Stachyose Hydrate. It is proposed to add this new reagent used in the test for *Molecular weight limit* under *Polydextrose,* a proposed new monograph appearing on page 1155 of *PF* 32(4) [July–Aug. 2006].

(HDQ:M. Marques) RTS—C44166

Add the following:

■**Stachyose Hydrate,** $C_{24}H_{42}O_{21} \cdot xH_2O$—**666.58** [*10094-58-3*]—Use a suitable grade.■2S (*USP30*)

BRIEFING

Tungstic Acid. It is proposed to add this new reagent used in the test for *Limit of lead* in the monograph for *Palm Kernel Oil,* also appearing in this issue of *PF*.

(HDQ: M. Marques) RTS—C47595

Add the following:

■**Tungstic Acid,** H_2WO_4—**249.85**[*7783-03-1*]—Use a suitable grade with a content of not less than 99%.■2S (*USP30*)

Indicator and Test Papers

BRIEFING

Methyl Green–Iodomercurate Paper. It is proposed to add this new indicator paper used in *Identification* test *B* in the monograph for *Cetrimonium Bromide*.

(HDQ: M. Marques) RTS—C47614

Add the following:

■**Methyl Green–Iodomercurate Paper—**Immerse thin strips of suitable filter paper in a 40 g per L solution of methyl green, and allow to air-dry. Immerse the strips for 1 hour in a solution containing 140 g per L of potassium iodide and 200 g per L of mercuric iodide. Wash with water until the washings are practically colorless, and allow to air-dry. Store protected from light, and use within 48 hours.■2S (*USP30*)

Test Solutions

BRIEFING

Test Solutions, *USP 29* page 3168 and page 3812 of the *Second Supplement.* It is proposed to add two test solutions: Acetic Acid, Strong, TS; and Ammonium Pyrrolidinedithiocarbamate, Saturated, TS. These test solutions are used in the test for *Limit of nickel* in the proposed new monograph *Polydextrose,* which appears elsewhere in this issue of *PF*.

(HDQ: M. Marques) RTS—C44166

Add the following:

■**Acetic Acid, Strong, TS**—Add 300.0 mL of glacial acetic acid, and dilute with water to 1000 mL. This solution contains about 30% (v/v) of CH_3COOH and has a concentration of about 5 N.■2S (*USP30*)

Add the following:

■**Ammonium Pyrrolidinedithiocarbamate, Saturated, TS**—Add about 10 g of ammonium pyrrolidinedithiocarbamate to a 1000-mL volumetric flask, and dilute with water to volume.■2S (*USP30*)

REFERENCE TABLES

BRIEFING

Container Specifications for Capsules and Tablets, *USP 29* page 3184, page 3813 of the *Second Supplement,* and page 1299 of *PF* 32(4) [July–Aug. 2006].

(HDQ) RTS—C41830; C46298

The following table is provided as a reminder for the pharmacist engaged in the typical dispensing situation who already is acquainted with the *Packaging and storage* requirements set forth in the individual monographs. It lists the capsules and tablets that are official in the *United States Pharmacopeia* and indicates the relevant tight (T), well-closed (W), and light-resistant (LR) specifications applicable to containers in which the drug that is repackaged should be dispensed.

This table is not intended to replace, nor should it be interpreted as replacing, the definitive requirements stated in the individual monographs.

BRIEFING

Description and Relative Solubility of USP and NF Articles, *USP 29* page 3191, page 3813 of the *Second Supplement,* page 8589 of *PF* 25(4) [July–Aug. 1999], page 1135 of *PF* 26(4) [July–Aug. 2000], page 1908 of *PF* 27(1) [Jan.–Feb. 2001], page 554 of *PF* 28(2) [Mar.–Apr. 2002], page 1953 of *PF* 28(6) [Nov.–Dec. 2002], page 266 of *PF* 29(1) [Jan.–Feb. 2003], page 1405 of *PF* 30(4) [July–Aug. 2004], page 1822 of *PF* 30(5) [Sept.–Oct. 2004], page 2183 of *PF* 30(6) [Nov.–Dec. 2004], page 122 of *PF* 31(1) [Jan.–Feb. 2005], page 591 of *PF* 31(2) [Mar.–Apr. 2005], page 861 of *PF* 31(3) [May–June 2005], page 1193 of *PF* 31(4) [July–Aug. 2005], page 1491 of *PF* 31(5) [Sept.–Oct. 2005], page 1703 of *PF* 31(6) [Nov.–Dec. 2005], page 188 of *PF* 32(1) [Jan.–Feb. 2006], page 662 of *PF* 32(2) [Mar.–Apr. 2006], page 942 of *PF* 32(3) [May–June 2006], and page 1301 of *PF* 32(4) [July–Aug. 2006].

(HDQ) RTS—C43595; C44146; C44408; C44796

Add the following:

■**Cetirizine Hydrochloride:** White or almost white powder. Freely soluble in water; insoluble in acetone and in methylene chloride.■2S (*USP30*)

Add the following:

■**Hydroxypropyl Betadex:** White or almost white, amorphous or crystalline powder. Freely soluble in water and in propylene glycol. *NF category:* Sequestering agent.■2S (*NF25*)

Add the following:

■**Palm Kernel Oil:** White to yellowish, fatty solid. Insoluble in water. *NF category:* Coating agent; emulsifying and/or solubilizing agent.■2S (*NF25*)

Change to read:

Tiagabine Hydrochloride: White to off-white powder.

■Freely soluble in methanol and in alcohol; soluble in isopropanol;■2S (*USP30*)
very slightly soluble in chloroform; sparingly soluble in water; practically insoluble in *n*-heptane.

Pending Proposals

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *Pharmacopeial Forum (PF)* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in the *USP–NF*, its *Supplements*, or an *IRA.* Those items that have not yet been adopted are marked as *Pending Proposals.*

The *Pending Proposals* list contains these items separated into the following categories: General Notices and Requirements; *USP* monographs; Dietary Supplements Monographs; General Chapters; Reference Tables; Excipients; and *NF* Monographs. Each entry in the *Pending Proposals* list contains the monograph title and the citation of the most recent publication of the monograph. When the appropriate USP Expert Committee is considering advancing to official status a pending proposal that is more than 2 years old, it is republished in *PF* for additional opportunity for public review and comment. Reprints of *PF* proposals may be purchased from USP by sending a written request for information to custsvc@usp.org.

To check the status of a *Pending Proposal,* please contact USP as directed below.

- The briefing accompanying the monograph or general chapter lists the names of the Scientific Liaisons responsible for the proposed revisions. The contact information (phone number and email) for the Scientific Liaison is available in the *Staff Directory* section of *How to Use PF*. For *USP–NF Online* subscribers, the name and contact information for the assigned Scientific Liaison is available in the *Auxiliary Information* portion of each monograph.
- Call USP at 301-816-8344 and ask to speak with the Scientific Liaison assigned to the monograph or general chapter of interest.
- Submit questions by email to stdsmonographs@usp.org. Please indicate the name of the monograph or general chapter in the subject line of the email.

Following these lists the reader will find the *Canceled Proposals* list. These are items that were published in *PF* and were pending, but have since been canceled. This list contains cumulative entries for the six issues per volume of *PF* [i.e., 32(1) through 32(6)]. Note that canceled proposals may be republished in *PF* to be considered for future adoption into the *USP–NF.*

Alumina, Magnesia, and Simethicone Tablets—*Title* (name change)	29	6	1841
Alumina, Magnesia, and Simethicone Chewable Tablets (new)	29	6	1842
Aluminum Sulfate and Calcium Acetate Powder for Topical Solution (new)	32	3	755
Amifostine—*Related compounds*	32	3	756
Amifostine for Injection—*Related compounds*	32	3	757

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Amitriptyline Hydrochloride—*USP Reference standards, Identification, Chromatographic purity* (delete), *Related compounds* (add), *Assay*	31	6	1606
Amlodipine Besylate (new)	32	3	757
Anecortave Acetate (new)	30	2	445
Anecortave Acetate Injectable Suspension (new)	30	2	447
Aprotinin (new)	31	3	732
Aprotinin Injection (new)	31	3	736
Atracurium Besylate—*Chromatographic purity, Assay*	32	2	305
Azathioprine Oral Suspension (new)	32	1	48
Azithromycin—*Labeling, USP Reference standards, Limit of related substances*	32	2	306
Aztreonam for Injection—*Assay*	31	3	737
Baclofen Oral Solution (new)	32	1	49
Baclofen Oral Suspension (new)	32	1	51
Bemotrizinol (new)	32	4	1044
Benazepril Hydrochloride Tablets (new)	32	1	52
Benzonatate Capsules—*Dissolution* (add)	32	1	55
Bethanechol Chloride Oral Solution (new)	32	1	55
Bethanechol Chloride Oral Suspension (new)	32	1	57
Bicalutamide (new)	31	3	738
Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Metal or Plastic Carriers (new)	30	1	63
Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions (new)	30	1	66
Biphasic Isophane Insulin Human Suspension (new)	31	4	1033
Bismuth Subsalicylate Oral Suspension (new)	31	4	1035
Bismuth Subsalicylate Tablets (new)	31	3	741
Bisoctrizole (new)	32	2	309
Bromocriptine Mesylate Capsules—*Dissolution*	32	1	58
Budesonide (new)	30	6	1978
Bupropion Hydrochloride Extended-Release Tablets—*Drug release, Dissolution*	32	4	1047
Buspirone Hydrochloride—*Content of chloride*	31	3	742
Butorphanol Tartrate Nasal Solution (new)	32	4	1049
Calcitonin Salmon (new)	32	3	760
Calcitonin Salmon Nasal Solution (new)	32	3	767
Calcitonin Salmon Injection (new)	30	4	1177
Calcitriol (new)	32	1	58
Calcitriol Injection (new)	32	1	61
Calcium Carbonate and Magnesia Tablets—*Title* (name change)	29	6	1852
Calcium Carbonate and Magnesia Chewable Tablets (new)	29	6	1852
Calcium Carbonate, Magnesia, and Simethicone Tablets—*Title* (name change)	29	6	1853
Calcium Carbonate, Magnesia, and Simethicone Chewable Tablets (new)	29	6	1854
Calcium Lactate—*USP Reference standards* (add), *Identification*	31	6	1608
Calcium Lactate Tablets—*Identification*	31	6	1609
Calcium Pantothenate—*USP Reference standards, Ordinary impurities*	32	1	62
Dibasic Calcium Phosphate Dihydrate (harmonization)	32	4	1329
Anhydrous Dibasic Calcium Phosphate (harmonization)	32	4	1332
Camphor—*Water*	31	3	742
Capecitabine (new)	32	4	1052
Capecitabine Tablets (new)	32	4	1054
Captopril Oral Solution (new)	32	1	63
Captopril Oral Suspension (new)	32	1	64
Carbamazepine—*USP Reference standards, Chromatographic purity (Related compounds), Assay*	32	1	65
Carbon Dioxide—*Definition, Packaging and storage*	31	4	1045
Carboxymethylcellulose Sodium—*Heavy metals*	31	5	1349
Carboxymethylcellulose Sodium Paste—*Heavy metals*	31	5	1349
Carvedilol (new)	32	4	1057
Cefaclor Tablets (new)	32	2	314
Cefadroxil for Oral Suspension—*Dissolution* (add)	32	2	315
Cefepime Hydrochloride—*Limit of N-methylpyrrolidine, Related compounds*	32	2	316
Cefonicid for Injection—*Assay*	32	1	67
Ceftazidime—*USP Reference standards, Assay*	32	1	67
Ceftazidime Injection—*USP Reference standards*	32	1	68
Ceftazidime for Injection—*USP Reference standards*	32	1	68

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Cetirizine Hydrochloride (new)	32	2	317
Chlorhexidine Gluconate Oral Rinse—*Assay*	32	3	768
Chlorhexidine Gluconate Solution—*Assay*	32	3	768
Chlorophyllin Copper Complex Sodium—*Content of total copper*	32	3	769
Chlorthalidone—*USP Reference standards, Limit of 4'-chloro-3'-sulfamoyl-2-benzophenone carboxylic acid (CCA) (Limit of chlorthalidone related compound A), Assay*	32	1	68
Cholestyramine Resin—*Dialyzable quaternary amines*	32	2	320
Cilostazol (new)	32	1	69
Cimetidine—*Identification, Chromatographic purity*	32	3	769
Cimetidine Tablets—*Dissolution*	32	1	72
Ciprofloxacin—*Chromatographic purity, Assay*	32	2	320
Ciprofloxacin and Dexamethasone Otic Suspension (new)	32	2	321
Ciprofloxacin Hydrochloride—*Chromatographic purity, Assay*	32	2	325
Ciprofloxacin Injection—*Bacterial endotoxins, Limit of ciprofloxacin ethylenediamine analog, Assay*	32	4	1059
Citalopram Hydrobromide—*Labeling* (add), *USP Reference standards, Related compounds*	32	4	1060
Citalopram Tablets—*Identification* (add), *Related compounds, Assay*	32	3	770
Anhydrous Citric Acid *(Harmonization), Sulfate*	31	3	749
Citric Acid Monohydrate *(Harmonization), Sulfate*	31	3	750
Citric Acid, Magnesium Oxide, and Sodium Carbonate Irrigation—*USP Reference standards, Assay for citric acid (delayed implementation to January 1, 2009)*	31	2	394
Cladribine—*Specific rotation, Water, Related compounds, Limit of residual solvents*	32	3	774
Clarithromycin Extended-Release Tablets—*Dissolution*	32	3	775
Clonazepam Oral Suspension (new)	32	1	73
Clopidogrel Bisulfate—*Related compounds, Assay*	32	1	74
Clopidogrel Tablets—*Related compounds, Assay*	32	1	76
Clotrimazole Lozenges—*Dissolution*	32	1	78
Cyclopropane—*Definition, Packaging and storage*	31	4	1052
Cyclosporine Capsules—*Labeling* (add), *USP Reference standards, Identification A, B, Dissolution, Droplet size* (add), *Content of alcohol* (add), *Assay*	27	4	2721
Dalteparin Sodium (new)	30	5	1598
Dantrolene Sodium (new)	32	2	327
Dantrolene Sodium Capsules (new)	32	4	1063
Dantrolene Sodium for Injection (new)	32	3	779
Dapsone—*Assay*	31	3	750
Desmopressin Acetate (new)	31	4	1052
Desmopressin Injection (new)	31	4	1057
Desmopressin Nasal Spray Solution (new)	31	4	1059
Desogestrel (new)	28	6	1785
Desogestrel and Ethinyl Estradiol Tablets (new)	30	5	1604
Diazepam Extended-Release Capsules—*USP Reference standards, Assay*	32	2	330
Diclofenac Potassium (new)	31	5	1350
Diclofenac Potassium Tablets (new)	31	5	1352
Diclofenac Sodium Delayed-Release Tablets—*Identification*	31	3	751
Diclofenac Sodium Extended-Release Tablets (new)	30	2	476
Didanosine (new)	32	3	781
Didanosine for Oral Solution (new)	31	5	1357
Didanosine Tablets (new)	32	3	784
Dihydroxyaluminum Sodium Carbonate Tablets—*Title* (name change)	29	6	1873
Dihydroxyaluminum Sodium Carbonate Chewable Tablets (new)	29	6	1873
Diltiazem Hydrochloride Oral Solution (new)	32	1	79
Diltiazem Hydrochloride Oral Suspension (new)	32	1	80
Diphenoxylate Hydrochloride and Atropine Sulfate Oral Solution—*Identification, Assay for diphenoxylate hydrochloride* (delete), *Assay for atropine sulfate* (delete), *Assay* (add)	31	6	1612
Diphenoxylate Hydrochloride and Atropine Sulfate Tablets—*Identification, Assay for diphenoxylate hydrochloride* (delete), *Assay for atropine sulfate* (delete), *Assay* (add)	31	6	1614

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Diphtheria Toxin for Schick Test (delete)	31	6	1616
Dipyridamole Oral Suspension (new)	32	1	81
Divalproex Sodium (new)	31	5	1362
Dolasetron Mesylate Oral Solution (new)	32	1	83
Dolasetron Mesylate Oral Suspension (new)	32	1	84
Doxazosin Mesylate (new)	32	4	1066
Doxazosin Tablets (new)	29	1	64
Doxepin Hydrochloride—*USP Reference standards, Identification, Melting range* (delete), *Chloride content* (delete), *Related compounds* (add)	32	2	330
Dronabinol—*USP Reference standards, Identification, Limit of* Δ^8*-tetrahydrocannabinol* (delete), *Related compounds* (add), *Assay*	32	1	86
Drospirenone (new)	32	3	787
Edetate Calcium Disodium (harmonization)	32	4	1335
Edetate Disodium—*Assay*	32	4	1070
Edetate Disodium Injection—*Assay*	32	4	1071
Egg Phospholipids (new)	31	3	757
Enoxaparin Sodium (new)	29	6	1876
Enoxaparin Sodium Injection (new)	31	3	761
Ensulizole—*Assay*	31	6	1617
Estradiol and Norethindrone Acetate Tablets (new)	31	5	1364
Estradiol Transdermal System (new)	31	4	1063
Estradiol Vaginal Inserts (new)	32	4	1071
Conjugated Estrogens—*Definition*	30	3	840
Conjugated Estrogens Tablets—*Dissolution*	32	4	1074
Synthetic Conjugated Estrogens (new)	31	6	1620
Ethotoin Tablets—*USP Reference standards, Assay*	32	2	332
Etidronate Disodium—*Limit of phosphite*	31	6	1625
Famotidine Injection (new)	32	2	333
Fenofibrate (new)	31	3	763
Fentanyl (new)	31	6	1626
Fexofenadine Hydrochloride (postponed indefinitely)	31	3	703
Fexofenadine Hydrochloride Capsules (postponed indefinitely)	31	3	705
Fexofenadine Hydrochloride Tablets (new)	30	6	1997
Fexofenadine Hydrochloride and Pseudoephedrine Hydrochloride Extended-Release Tablets (new)	31	2	403
Fluconazole—*Related compounds*	32	2	335
Flucytozine Oral Suspension (new)	32	1	92
Flumazenil—*USP Reference standards, Related compounds, Assay*	32	1	94
Fluorometholone Acetate (new)	31	5	1371
Flurazepam Hydrochloride—*Identification*	31	3	766
Fluticasone Propionate—*Definition, Bromofluoromethane content* (delete)	32	2	337
Fluticasone Propionate Nasal Spray (new)	32	2	339
Fluvastatin Sodium—*Packaging and storage, USP Reference standards, Identification, Chromatographic purity*	32	1	103
Fluvastatin Capsules—*USP Reference standards, Identification, Chromatographic purity*	32	1	105
Fluvoxamine Maleate—*Maleic acid* (delete), *Assay*	32	2	344
Fluvoxamine Maleate Tablets (new)	30	5	1622
Formoterol Fumarate (new)	32	1	106
Fosinopril Sodium (new)	32	3	789
Fosinopril Sodium Tablets (new)	30	6	2004
Fosinopril Sodium and Hydrochlorothiazide Tablets (new)	30	6	2006
Gabapentin (new)	31	1	50
Ganciclovir Oral Suspension (new)	32	1	113
Gemcitabine for Injection—*USP Reference standards, Chromatographic purity*	31	6	1630
Gemcitabine Hydrochloride—*USP Reference standards*	32	1	114
Glipizide and Metformin Hydrochloride Tablets (new)	32	4	1076
Glutaral Concentrate—*Specific gravity*	31	3	766
Glyburide Tablets—*Labeling* (add), *Dissolution* (add)	32	4	1080
Glyburide and Metformin Hydrochloride Tablets (new)	31	3	766
Gonadorelin Acetate (new)	30	4	1250
Goserelin Acetate (new)	32	3	792
Helium—*Definition, Packaging and storage*	31	4	1077
Hepatitis B Virus Vaccine Inactivated (delete)	31	6	1641

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Hydrocodone Bitartrate—*USP Reference standards* *Ordinary impurities* (delete), *Related compounds* (add)	30	5	1628
Hydrocodone Bitartrate and Homatropine Methylbromide Tablets (new)	30	3	853
Hydrocortisone Tablets—*USP Reference standards, Uniformity of dosage units, Assay*	32	4	1083
Hydroxyzine Hydrochloride—*USP Reference standards, Chromatographic purity*	32	1	114
Hypromellose Ophthalmic Solution—*Assay*	32	4	1084
Ibuprofen—*USP Reference standards, Limit of ibuprofen related compound C, Assay*	32	3	796
Ibuprofen Oral Suspension—*USP Reference standards, Limit of ibuprofen related compound C, Assay*	32	3	796
Ibuprofen Tablets—*USP Reference standards, Limit of ibuprofen related compound C, Assay*	32	3	798
Indinavir Sulfate—*Heavy metals, Method I,* (delete), *Heavy metals* (add), *Chromatographic purity, Assay*	32	2	345
Sodium Iodide I 123 Capsules—*Definition*	31	6	1642
Sodium Iodide I 123 Solution—*Definition, Radionuclidic purity, Bacterial endotoxins, pH*	31	6	1642
Sodium Iodide I 131 Solution—*pH*	31	6	1643
Iodoform—*Molecular weight*	32	1	115
Irbesartan—*Limit of azide, Related compounds, Assay*	32	4	1084
Irbesartan Tablets (new)	32	3	799
Irbesartan and Hydrochlorothiazide Tablets (new)	29	4	1036
Isosorbide Mononitrate Tablets (new)	29	5	1513
Isosorbide Mononitrate Extended-Release Tablets (new)	31	4	1082
Ivermectin—*Specific rotation, Limit of alcohol and formamide*	31	6	1645
Ketoprofen—*Assay*	31	3	772
Ketoprofen Extended-Release Capsules (new)	31	5	1378
Labetalol Hydrochloride Oral Solution (new)	32	1	116
Labetalol Hydrochloride Oral Suspension (new)	32	1	117
Lamivudine—*Assay*	32	2	346
Leflunomide (new)	31	5	1380
Leflunomide Tablets (new)	31	5	1383
Leuprolide Acetate (new)	30	3	882
Levocabastine Hydrochloride (new)	31	6	1647
Levodopa—*Related compounds*	32	4	1085
Levofloxacin (new)	32	2	347
Lidocaine and Prilocaine Cream (new)	31	4	1087
Lindane—*Definition, Assay*	31	6	1648
Lipid Injectable Emulsion (new)	32	2	350
Lisinopril Tablets—*Assay*	32	4	1086
Loperamide Hydrochloride Oral Solution—*Assay*	32	2	353
Lovastatin—*Assay*	32	1	118
Magaldrate and Simethicone Tablets—*Title* (name change)	29	6	1918
Magaldrate and Simethicone Chewable Tablets (new)	29	6	1919
Milk of Magnesia—*Limit of calcium* (delete)	32	2	353
Magnesium Carbonate and Citric Acid for Oral Solution—*USP Reference standards* (add), *Content of anhydrous citric acid, Other requirements (delayed implementation to January 1, 2009)*	31	2	419
Magnesium Chloride—*Identification*	31	2	420
Magnesium Citrate Oral Solution—*USP Reference standards* (add), *Assay for anhydrous citric acid (delayed implementation to January 1, 2009)*	31	2	420
Magnesium Citrate for Oral Solution—*USP Reference standards* (add), *Content of anhydrous citric acid, Other requirements (delayed implementation to January 1, 2009)*	31	2	421
Magnesium Hydroxide—*Lead* (delete), *Limit of lead* (add)	32	4	1087
Magnesium Hydroxide Paste—*Definition, Soluble alkalies, Limit of lead* (add)	32	4	1088
Mangafodipir Trisodium—*Limit of residual solvents*	31	6	1650
Mannitol Injection—*Labeling*	32	2	263
Meloxicam (new)	31	1	57
Metformin Hydrochloride Extended-Release Tablets (new)	31	3	772
Methylcellulose Ophthalmic Solution—*Identification*	31	3	780

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Methylcellulose Oral Solution—*Identification*	31	3	780
Methylcellulose Tablets—*Identification*	31	3	780
Methyldopa Oral Suspension—*USP Reference standards, Limit of methyldopa-glucose reaction product* (delete)	32	2	354
Methylprednisolone—*Chromatographic purity*	32	2	354
Metolazone Oral Suspension (new)	32	1	119
Metoprolol Tartrate—*Chromatographic purity*	32	4	1089
Metoprolol Tartrate Oral Solution (new)	32	1	121
Metoprolol Tartrate Oral Suspension (new)	32	1	122
Metronidazole Benzoate—*USP Reference standards, Related compounds*	31	3	781
Miconazole Nitrate Cream—*Identification*	32	1	123
Mirtazapine—*Heavy metals*	31	6	1650
Mitoxantrone Injection—*Packaging and storage*	32	2	355
Modafinil (new)	30	5	1634
Modafinil Tablets (new)	30	5	1636
Morantel Tartrate—*pH*	32	2	355
Morphine Sulfate Extended-Release Capsules—*Packaging and storage* (add)	32	1	124
Mupirocin Calcium (new)	31	2	430
Mupirocin Cream (new)	31	2	432
Naphazoline Hydrochloride—*Definition, Assay*	31	4	1093
Naproxen Delayed-Release Tablets—*Packaging and storage*	32	1	124
Narasin Granular—*Molecular weight, Assay*	32	1	124
Narasin Premix—*Assay*	32	1	126
Nefazodone Hydrochloride (new)	32	3	802
Nefazodone Hydrochloride Tablets (new)	32	3	804
Netilmicin Sulfate—*Definition, Assay*	32	4	1089
Nevirapine Oral Suspension (new)	32	4	1090
Nevirapine Tablets (new)	32	3	807
Nimodipine—*Identification, Related compounds*	32	2	360
Nitrous Oxide—*Definition, Packaging and storage, Assay*	31	4	1099
Norgestimate—*USP Reference standards, Chromatographic purity*	32	4	1094
Norgestimate and Ethinyl Estradiol Tablets (new)	29	1	87
Ofloxacin—*Chromatographic purity* (delete), *Related compounds* (add)	30	4	1274
Ondansetron Hydrochloride—*Limit of ondansetron related compound D, Assay*	32	1	126
Ondansetron Hydrochloride Oral Suspension (new)	32	1	127
Ondansetron Injection—*Chromatographic purity*	32	4	1096
Ondansetron Oral Solution—*Packaging and storage* (add), *Limit of ondansetron related compound D, Related compounds*	32	1	128
Orphenadrine Citrate Injection—*Assay*	31	6	1651
Oxandrolone—*Ordinary impurities* (delete), *Related compounds* (add)	31	1	64
Oxaprozin—*Packaging and storage* (add)	32	1	130
Oxaprozin Tablets—*Packaging and storage* (add)	32	1	130
Oxybutynin Chloride—*Related compounds*	32	3	810
Oxybutynin Chloride Extended-Release Tablets (new)	31	6	1652
Oxycodone Hydrochloride Extended-Release Tablets (new)	31	4	1104
Oxygen—*Definition, Packaging and storage*	31	4	1107
Oxygen 93 Percent—*Definition, Packaging and storage*	31	4	1107
Paclitaxel—*USP Reference standards, Related compounds*	32	2	361
Pancuronium Bromide Injection (new)	32	4	1097
Paricalcitol—*Identification, Chromatographic purity, Assay*	32	1	132
Paroxetine Hydrochloride—*Assay*	32	3	811
Pectin—*Identification*	31	3	783
Penicillamine Capsules—*Dissolution*	31	2	436
Pentazocine and Acetaminophen Tablets (new)	28	6	1838
Pentobarbital Sodium—*Labeling* (add), *USP Reference standards, Other requirements* (add)	31	1	73
Pentobarbital Sodium Injection—*Identification, Assay*	32	2	364
Permethrin (new)	32	4	1100
Permethrin Cream (new)	32	4	1102
Petrolatum (new)—*Harmonization*	28	2	569
White Petrolatum (new)—*Harmonization*	28	2	570
Phenytoin Tablets—*Title* (name change)	29	6	1965
Phenytoin Chewable Tablets (new)	29	6	1965
Piperacillin and Tazobactam Injection (new)	31	2	437

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Piperacillin and Tazobactam for Injection (new)	31	2	439
Piroxicam Cream (new)	32	1	134
PEG 3350 and Electrolytes for Oral Solution—*Title, Definition, Assay for potassium and sodium*	32	4	1104
Potassium and Sodium Bicarbonates and Citric Acid Effervescent Tablets for Oral Solution—*USP Reference standards* (add), *Assay for anhydrous citric acid (delayed implementation to January 1, 2009)*	31	2	440
Potassium Bitartrate—*Limit of ammonia*	31	3	786
Potassium Citrate Extended-Release Tablets—*USP Reference standards* (add), *Assay (delayed implementation to January 1, 2009)*	31	2	443
Potassium Citrate and Citric Acid Oral Solution—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	2	444
Potassium Iodide Oral Solution—*Definition*	31	3	786
Potassium Perchlorate—*USP Reference standards* (delete), *Assay*	32	2	364
Potassium Sodium Tartrate—*Limit of ammonia*	31	3	787
Pravastatin Sodium (new)	32	3	813
Pravastatin Sodium Tablets (new)	32	3	817
Prednicarbate Cream (new)	32	3	819
Prednicarbate Ointment (new)	32	3	822
Prednisolone Sodium Phosphate—*USP Reference standards, Identification*	32	2	365
Promethazine Hydrochloride—*USP Reference standards, Related compounds*	32	4	1105
Promethazine Hydrochloride Tablets—*USP Reference standards, Related compounds, Assay*	32	4	1107
Pseudoephedrine Sulfate—*Ordinary impurities*	32	1	135
Pyridoxine Hydrochloride Injection—*Assay*	32	2	369
Quazepam Tablets—*USP Reference standards, Assay*	32	2	370
Quinapril Tablets—*Packaging and storage*	29	4	1071
Quinidine Sulfate Oral Suspension (new)	32	1	136
Ramipril—*Definition, Assay*	31	3	787
Oral Rehydration Salts—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	5	1399
Rifampin and Isoniazid Capsules—*Dissolution*	30	2	533
Rifampin, Isoniazid, and Pyrazinamide Tablets—*Dissolution*	30	2	534
Risperidone (new)	31	6	1659
Risperidone Tablets (new)	32	4	1109
Ritonavir—*Identification, X-ray diffraction* (add), *Related compounds*	32	4	1113
Ropivacaine Hydrochloride Injection (new)	32	2	374
Rubella and Mumps Virus Vaccine Live (delete)	31	6	1662
Saccharin Calcium—*Identification*	32	4	1114
Saccharin Sodium—*Identification*	32	4	1114
Saquinavir Capsules—*Dissolution*	32	3	824
Schick Test Control (delete)	31	6	1662
Senna—*Title, Definition, Packaging and storage, Labeling* (add), *USP Reference standards* (add), *Botanic characteristics, Identification, Microbial enumeration* (add) *Loss on drying* (add), *Total ash* (add), *Assay* (add)	32	1	137
Senna Pods (new)	32	1	140
Sennosides—*Definition, Packaging and storage, Residue on ignition*	32	1	141
Sevoflurane (new)	30	1	178
Simvastatin—*Identification, Chromatographic purity, Limit of lovastatin* (delete), *Assay*	32	1	141
Sodium Bicarbonate—*Normal carbonate, Limit of ammonia*	31	3	795
Sodium Chloride—*Limit of phosphates*	31	5	1401
Sodium Chloride—*Identification, Loss on drying, Limit of potassium (postponed indefinitely)*	32	2	264
Sodium Fluoride and Phosphoric Acid Topical Solution (delete)	32	3	824
Spironolactone and Hydrochlorothiazide Tablets—*Dissolution*	32	2	376
Sulfamethazine Granulated—*Assay*	31	3	797
Sumatriptan Succinate Oral Suspension (new)	32	1	144
Talc—*Packaging and storage* (add), *Limit of iron, Limit of calcium, Limit of aluminum*	31	6	1662

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Tazobactam (new)	31	4	1116
Temazepam—*Identification*	32	1	145
Terbutaline Sulfate Inhalation Aerosol—*USP Reference standards, Assay*	31	2	450
Thalidomide—*Microbial limits, Chromatographic purity*	32	1	146
Thiabendazole Tablets—*Title* (name change)	29	6	1991
Thiabendazole Chewable Tablets (new)	29	6	1991
Thimerosal—*Identification*	32	1	147
Thioridazine Hydrochloride—*Identification*	31	3	798
Tiamulin Fumarate—*Chemical name, Definition, Melting temperature, Chromatographic purity*	32	4	1115
Tilmicosin—*Definition, Related compounds, Assay*	31	3	798
Tizanidine Tablets (new)	32	1	147
Topiramate (new)	30	4	1307
Tramadol Hydrochloride (new)	31	2	458
Tramadol Hydrochloride Tablets (new)	31	2	462
Travoprost (new)	32	4	1115
Travoprost Ophthalmic Solution (new)	32	4	1118
Triamcinolone Acetonide—*USP Reference standards, Assay*	31	3	800
Triamcinolone Diacetate—*Definition, Identification*	32	4	1120
Tricitrates Oral Solution—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	2	465
Triclosan—*Assay*	32	2	377
Crystallized Trypsin—*Definition*	32	3	779
Ursodiol Capsules—*Dissolution*	31	3	800
Valganciclovir Hydrochloride (new)	32	2	379
Valganciclovir Tablets (new)	32	2	384
Valsartan (new)	32	1	150
Valsartan and Hydrochlorothiazide Tablets (new)	31	4	1123
Valproic Acid Injection (new)—*Title (delayed implementation to October 1, 2008)*	32	2	387
Vancomycin Hydrochloride—*USP Reference standards, Limit of monodechlorovancomycin* (add)	30	6	2055
Vasopressin—*Identification*	31	4	1127
Verapamil Hydrochloride—*USP Reference standards Identification, Chromatographic purity*	32	2	389
Verapamil Hydrochloride Injection—*USP Reference standards, Related compounds*	32	1	154
Verapamil Hydrochloride Oral Solution (new)	32	1	155
Verapamil Hydrochloride Oral Suspension (new)	32	1	156
Verapamil Hydrochloride Tablets—*USP Reference standards, Related compounds*	32	1	158
Vinorelbine Injection—*Definition, Assay*	32	3	825
Pure Steam (new)	31	2	467
Water for Hemodialysis—*Bacterial endotoxins*	31	2	468
Sterile Water for Inhalation—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add)	31	3	802
Sterile Water for Injection—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add)	31	3	803
Sterile Water for Irrigation—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add)	31	3	804
Sterile Purified Water—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add)	31	3	804
Zidovudine Tablets—*USP Reference standards, Related compounds, Assay*	32	1	158
<u>*Dietary Supplements Monographs*</u>			
Ademetionine Disulfate Tosylate (new)	31	2	469
Acesulfame Potassium—*Packaging and storage* (add), *Limit of fluoride*	31	3	811
Cat's Claw (new)	32	4	1120
Powdered Cat's Claw (new)	32	4	1124
Powdered Cat's Claw Extract (new)	32	4	1124
Cat's Claw Capsules (new)	32	4	1126
Cat's Claw Tablets (new)	32	4	1127
Black Cohosh (new)	32	4	1128
Powdered Black Cohosh (new)	32	4	1132

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Powdered Black Cohosh Extract (new)	32	4	1133
Black Cohosh Fluidextract (new)	32	4	1134
Black Cohosh Tablets (new)	32	4	1135
Ginger—*Packaging and storage, Labeling, USP Reference standards, Identification, Microbial enumeration, Alcohol-soluble extractives, Limit of shogaols, Content of gingerols and gingerdiones*	32	1	160
Powdered Ginger—*Packaging and storage, USP Reference standards*	32	1	162
Ginger Capsules—*USP Reference standards, Content of gingerols, gingerdiones, and shogaols*	32	1	163
Ginger Tincture—*USP Reference standards, Thin-layer chromatographic identification test, Microbial enumeration, Content of gingerols*	32	1	163
Ginkgo—*Definition, Packaging and storage, USP Reference standards, Thin-layer chromatographic identification test, Microbial enumeration, Content of terpene lactones*	32	1	164
Powdered Ginkgo Extract (new)	32	1	166
Ginkgo Capsules (new)	32	1	172
Ginkgo Tablets (new)	32	1	174
Glucosamine Tablets—*Disintegration and dissolution*	32	4	1137
Glucosamine and Methylsulfonylmethane Tablets (new)	32	4	1137
Glucosamine, Chondroitin Sulfate Sodium and Methylsulfonylmethane Tablets (new)	32	4	1138
Tomato Extract Containing Lycopene—*Microbial enumeration, Limit of aflatoxins*	30	2	578
Maleic Acid—*Identification*	31	3	815
Maltose—*Water*	31	3	815
Maritime Pine—*Identification, Content of procyanidins*	32	4	1140
Maritime Pine Extract—*Identification, microbial enumeration, Content of procyanidins*	32	4	1142
Methylsulfonylmethane (new)	32	3	826
Methylsulfonylmethane Tablets (new)	32	3	827
Fish Oil Containing Omega-3 Acids (new)	31	2	474
Fish Oil Containing Omega-3 Acids Capsules (new)	31	2	481
Olive Oil—*Definition, Labeling* (add), *Teaseed oil*	31	3	815
Phenoxyethanol—*Chromatographic purity, Assay*	31	3	816
Polyethylene Glycol (new)—*Harmonization*	31	3	897
Polyoxyl 10 Oleyl Ether—*Free ethylene oxide*	31	3	816
Polyoxyl 20 Oleyl Cetostearyl Ether—*Free ethylene oxide*	31	3	817
Sodium Benzoate—*USP Reference standards* (add), *Identification*	31	3	818
Sucrose (new)—*Harmonization*	31	3	902
Sugar Spheres—*Identification, Specific rotation*	31	3	819
Tagatose (new)	31	3	819
Thymol—*USP Reference standards* (add), *Identification*	31	3	821
Ubidecarenone—*USP Reference standards, Assay*	31	1	86
Ubidecarenone Capsules—*USP Reference standards, Assay*	31	1	86
Valerian—*Packaging and storage, Extractable matter, Microbial enumeration*	32	2	394
Powdered Valerian—*Packaging and storage, Labeling, Botanic characteristics*	32	2	395
Valerian Tablets—*Packaging and storage, USP Reference standards*	32	2	395
Xanthan Gum—*Assay*	31	3	821
USP General Test Chapters			
⟨1⟩ Injections—*Labels and Labeling, Packaging*	32	2	402
⟨1⟩ Injections—*Packaging—Printing on Ferrules and Cap Overseals (delayed implementation to February 1, 2009)*	32	2	406

In-Process Revision

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*

HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps **(*Stages*)**.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

MONOGRAPHS (USP)

BRIEFING

Hypromellose. The Japanese Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Hypromellose monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the **ADOPTION STAGE 6** document, is based on the corresponding monograph for Hypromellose that was prepared by the Japanese Pharmacopoeia. The Japanese Pharmacopoeia draft was based in part on comments from the European Pharmacopoeia and the United States Pharmacopeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the Japanese Pharmacopoeia.

Differences between the Japanese Pharmacopoeia Adoption Stage 6 document and the current USP monograph for Hypromellose include the following:

1. *Definition*—Provided formula weight information for methoxyl and hydroxypropoxyl groups for consistency with harmonization draft.
2. *Packaging and storage*—Retained as a nonharmonized attribute
3. *Labeling*—Added a statement to specifiy viscosity in mPa · s.
4. *Identification*—**Test A:** Modified to be an aggregation test only. Eliminated reaction with sodium hydroxide or hydrochloric acid. **Test B:** Modified cooling temperature to 10° and adjusted wording of acceptance criteria to be consistent with harmonized draft. **Test C:** Added new test in accordance with harmonized draft. **Test D:** Adjusted wording of acceptance criteria (former Test C) to be consistent with harmonized draft. **Test E:** Added new test to reflect harmonized draft.
5. *Viscosity*—Two separate methods are added with different measurement procedures. The choice of which is to be performed is dependent on the reported viscosity result.
6. *pH*—New method added to reflect harmonized draft.
7. *Heavy metals*—Changed from *Method II* to *Method III* to reflect harmonized draft.
8. *Loss on drying*—Reduced sample size to 1 g to reflect harmonized draft.
9. *Residue on ignition*—Specification changed to a maximum of 1.5% on all grades of Hypromellose.
10. *Organic volatile impurities*—No change.
11. *Assay*—Replaced existing method with new GC assay to be consistent with JP standards.

Change to read:

» Hypromellose ~~is a propylene glycol ether of methylcellulose. When dried at 105° for 2 hours, it contains methoxy (–OCH_3–) and hydroxypropoxy (–$OCH_2CHOHCH_3$–)~~

■is a methyl and hydroxypropyl mixed ether of cellulose. It contains, calculated on the dried basis, methoxy (–OCH_3: 31.03) and hydroxypropoxy (–OC_3H_6OH: 75.09)■2S (*USP30*) groups conforming to the limits for the types of Hypromellose (hydroxypropyl methylcellulose) set forth in the accompanying table.

	Methoxy (percent)		Hydroxypropoxy (percent)	
Substitution Type	Min.	Max.	Min.	Max.
1828	16.5	20.0	23.0	32.0
2208	19.0	24.0	4.0	12.0
2906	27.0	30.0	4.0	7.5
2910	28.0	30.0	7.0	12.0

No change:

Packaging and storage—Preserve in well-closed containers. No storage requirements specified.

Change to read:

Labeling—Label it to indicate its substitution type and its ~~viscosity type [viscosity of a solution (1 in 50)].~~

■nominal viscosity value in milli-Pascal per second (mPa · s).■2S (*USP30*)

Change to read:

Identification—

A: Gently add 1 g of Hypromellose to the top of 100 mL of water in a beaker, and allow to disperse over the surface, tapping the top of the container to ensure an even dispersion of the substance. Allow the beaker to stand ~~until the substance becomes transparent and mucilaginous (about 5 hours), and then swirl the beaker to wet the remaining substance. Add a stirring bar, and stir until solution is complete: the mixture remains stable when an equal volume of 1 N sodium hydroxide or 1 N hydrochloric acid is added.~~

■for 1 to 2 minutes; the powdered material aggregates on the surface.■2S (*USP30*)

B: Add 1 g of Hypromellose to 100 mL of boiling water, and stir the mixture ~~a slurry is formed, but the powdered material does not dissolve. Cool the slurry to 20°, and stir: the resulting liquid is a clear or opalescent mucilaginous colloidal mixture.~~

■using a magnetic stirrer with a bar that is 25 mm long: a slurry is formed, but the powdered material does not dissolve. Cool the slurry to 10°, and stir using a magnetic stirrer: the resulting liquid is a clear or slightly turbid solution with thickness dependent on the viscosity grade.■2S (*USP30*)

~~**C:** Pour a few mL of the mixture prepared for *Identification* test *B* onto a glass plate, and allow the water to evaporate: a thin, self-sustaining film results.~~

■**C:**

Sulfuric acid, 90%—Carefully add 9 mL of sulfuric acid to 1 mL of water. To 0.1 mL of the solution prepared for *Identification* test *B,* add 9 mL of *Sulfuric acid, 90%,* and shake. Heat in a water bath for exactly 3 minutes, immediately cool in an ice bath, and add carefully 0.6 mL of ninhydrin TS. Shake, and allow to stand at 25°: a red color develops at first that changes to purple within 100 minutes.

D: Pour 2 to 3 mL of the solution prepared for *Identification* test *B* onto a glass slide as a thin film, and allow the water to evaporate: a coherent, clear film forms on the glass slide.

E: Add exactly 50 mL of the solution prepared in *Identification* test *B* to exactly 50 mL of water in a beaker. Insert a thermometer into the solution. Stir the solution on a magnetic stirrer/hot plate, and begin heating at a rate of 2 to 5° per minute. Determine the temperature at which a turbidity increase begins to occur and designate this temperature as the flocculation temperature: the flocculation temperature is higher than 50°.■2S (*USP30*)

Change to read:

Viscosity ⟨911⟩—~~Place a quantity, accurately weighed and equivalent to 2 g of solids on the dried basis, in a tared, wide-mouth, 250-mL centrifuge bottle, and add 98 g of water previously heated to 80° to 90°. Stir with a propeller-type stirrer for 10 minutes, place the bottle in an ice bath, continue the stirring, and allow to remain in the ice bath for 40 minutes to ensure that hydration and solution are complete. Adjust the weight of the solution to 100 g, if necessary, and centrifuge the solution to expel any entrapped air. Adjust the temperature of the solution to 20 ± 0.1°, and determine the viscosity in a suitable viscosimeter of the Ubbelohde type as directed for *Procedure for Cellulose Derivatives* under *Viscosity* ⟨911⟩. Its apparent viscosity is not less than 80.0% and not more than 120.0% of that stated on the label for viscosity types of 100 centipoises or less, and not less than 75.0% and not more than 140.0% of that stated on the label for viscosity types higher than 100 centipoises.~~

■FOR HYPROMELLOSE SAMPLES HAVING A VISCOSITY TYPE OF LESS THAN 600MPA · S—Transfer an accurately weighed quantity of Hypromellose, equivalent to 4 g of solids, calculated on the dried basis, to a tared, wide-mouth centrifuge bottle. Add hot water to obtain a total weight of the sample and water of 200.0 g. Capping the bottle, stir by mechanical means at 400 ± 50 rpm for 10 to 20 minutes until the particles are thoroughly dispersed and wetted out. Scrape down the walls of the bottle with a spatula, if necessary, to ensure that there is no undissolved material on the sides of the bottle, and continue the stirring in a cooling water bath equilibrated at a temperature below 10° for another 20 to 40 minutes. Adjust the solution weight, if necessary, to 200.0 g using cold water. Centrifuge the solution to expel any entrapped air. If any foam is present, remove with a spatula. Determine the viscosity in a suitable viscosimeter of the Ubbelohde type as directed for *Procedure for Cellulose Derivatives* under *Viscosity* ⟨911⟩: the viscosity is not less than 80% and not more than 120% of that stated on the label.

FOR HYPROMELLOSE SAMPLES HAVING A VISCOSITY TYPE OF 600MPA · S OR HIGHER—Transfer an accurately weighed quantity of Hypromellose, equivalent to 10 g of solids, calculated on the dried basis, to a tared, wide-mouth centrifuge bottle, and add hot water to obtain a total weight of the sample and

water of 500.0 g. Capping the bottle, stir by mechanical means at 400 ± 50 rpm for 10 to 20 minutes until the particles are thoroughly dispersed and wetted out. Scrape down the walls of the bottle with a spatula, if necessary, to ensure that there is no undissolved material on the sides of the bottle, and continue the stirring in a cooling water bath equilibrated at a temperature below 10° for another 20 to 40 minutes. Adjust the solution weight if necessary to 200.0 g using cold water. Centrifuge the solution, if necessary, to expel any entrapped air. If any foam is present, remove with a spatula. Equip a suitable single cylinder type rotational viscosimeter (Brookfield type LV Model, or equivalent), and determine the viscosity of this solution at 20 ± 0.1° under the following operating conditions specified in the table below.

Labeled Viscosity* (mPa · s)	Rotor No.	Revolution (rpm)	Calculation Multiplier
600 or more and less than 1400	3	60	20
1400 or more and less than 3500	3	12	100
3500 or more and less than 9500	4	60	100
9500 or more and less than 99,500	4	6	1000
99,500 or more	4	3	2000

* NOTE: The Labeled Viscosity is based on the manufacture's specifications.

Allow the spindle to rotate for 2 minutes before taking the measurement. Allow a rest period of 2 minutes between subsequent measurements. Repeat the operation twice to rotate the spindle as specified above, and average the three readings: the viscosity is not less than 75% and not more than 140% of that stated on the label.■2S (*USP30*)

Add the following:

■**pH** ⟨791⟩**:** between 5.0 and 8.0 measured on the solution prepared in the test for *Viscosity* at a temperature of 20 ± 2°. Read the indicated pH value after the probe has been immersed for 5 ± 0.5 minutes.■2S (*USP30*)

Change to read:

Heavy metals, ~~*Method II* ⟨231⟩.~~

■*Method III* ⟨231⟩:■2S (*USP30*)

~~0.001%, 1 mL of hydroxylamine hydrochloride solution (1 in 5) being added to the solution of the residue.~~

■not more than 20 ppm.■2S (*USP30*)

Change to read:

Loss on drying ⟨731⟩~~— Dry it at 105° for 2 hours:~~

■Dry 1.0 g at 105° for 1 hour:■2S (*USP30*)
it loses not more than 5.0% of its weight.

Change to read:

Residue on ignition ⟨281⟩: ~~not more than 1.5% for Hypromellose having a labeled viscosity of greater than 50 centipoises, not more than 3% for Hypromellose having a labeled viscosity of 50 centipoises or less, and not more than 5% for Hypromellose 1828 of all labeled viscosities.~~

■not more than 1.5% on a 1.0-g sample.■2S (*USP30*)

No change:

Organic volatile impurities, *Method IV* ⟨467⟩: meets the requirements.

Change to read:

Assay—[*Caution—Hydriodic acid and its reaction byproducts are highly toxic. Perform all steps of the Assay preparation and the Standard preparation in a properly functioning hood. Specific safety practices to be followed are to be identified to the analyst performing this test.]*

■*Apparatus*—For the reaction vial, use a 5-mL pressure-tight serum vial, 50 mm in height, 20 mm in outside diameter, and 13 mm in inside diameter at the mouth. The vial is equipped with a pressure-tight septum having a polytetrafluoroethylene-faced butyl rubber and an air-tight seal using an aluminum crimp or any sealing system that provides a sufficient air-tightness. Use a heater having a heating module that has a square-shape aluminum block with holes 20 mm in diameter and 32 mm in depth, into which the reaction vial fits. The heating module is also

equipped with a magnetic stirrer capable of mixing the contents of the vial, or use a reciprocal shaker that performs a reciprocating motion of approximately 100 times per minute.■2S (*USP30*)

Hydriodic acid—Use a reagent having ~~a specific gravity of at least 1.69, equivalent to 55% HI.~~

■a typical concentration of HI about 57%.■2S (*USP30*)

Internal standard solution—Transfer about ~~2.5 g of toluene,~~

■3 g of *n*-octane,■2S (*USP30*) accurately weighed, to a 100-mL volumetric flask containing 10 mL of *o*-xylene, dilute with *o*-xylene to volume, and mix.

Standard preparation—Into a suitable serum vial weigh ~~about 135 mg of adipic acid and 4.0 mL of *Hydriodic acid*~~, pipet 4 mL of *Internal standard solution* into the vial, and close the vial securely with a suitable septum stopper. ~~Weigh the vial and contents accurately, add 30 µL of isopropyl iodide through the septum with a syringe, again weigh, and calculate the weight of isopropyl iodide added, by difference. Add 90 µL of methyl iodide similarly, again weigh, and calculate the weight of methyl iodide added, by difference. Shake, and allow the layers to separate.~~

■between 60 and 100 mg of adipic acid and add 2.0 mL of *Hydriodic acid* and 2.0 mL of *Internal standard solution* into the vial. Close the vial securely with a suitable septum stopper. Weigh the vial and contents accurately, add between 15 µL to 22 µL of isopropyl iodide through the septum with a syringe, weigh again, and calculate the weight of isopropyl iodide added, by difference. Add 45 µL of methyl iodide similarly, weigh again, and calculate the weight of methyl iodide added, by difference. Shake the reaction vial well, and allow the layers to separate. Use the upper layer as the *Standard preparation*.■2S (*USP30*)

Assay preparation—Transfer about 0.065 g of dried Hypromellose, accurately weighed, to a 5-mL thick-walled reaction vial equipped with a pressure-tight septum-type closure, add ~~an amount of adipic acid equal to the weight of the test specimen,~~

■between 60 and 100 mg of adipic acid,■2S (*USP30*) and pipet 2.0 mL of *Internal standard solution* into the vial. Cautiously pipet 2.0 mL of *Hydriodic acid* into the mixture, immediately cap the vial tightly, and weigh accurately. ~~Mix the contents of the vial continuously, while heating at 150° for 60 minutes. Allow the vial to cool for about 45 minutes, and again weigh. If the weight loss is greater than 10 mg, discard the mixture, and prepare another *Assay preparation*.~~

■Using the magnetic stirrer equipped in the heating module, or using a reciprocal shaker, mix the contents of the vial continuously, heating and maintaining the temperature of the contents at 130 ± 2° for 60 minutes. If a reciprocal shaker or magnetic stirrer cannot be used, shake the vial well by hand at 5-minute intervals during the initial 30 minutes of the heating time. Allow the vial to cool, and weigh accurately. If the weight loss is greater than or equal to 0.50% of the contents or there is evidence of a leak, discard the mixture, and prepare another *Assay preparation*.■2S (*USP30*)

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a thermal conductivity detector ~~and a 4-mm × 1.8-m glass column packed with 20% liquid phase G28 on 100- to 120-mesh support S1C that is not silanized. Helium is used as the carrier gas and the temperature of the column is maintained at 130°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0, 2.2, 3.6, and 8.0 for methyl iodide, isopropyl iodide, toluene, and *o*-xylene, respectively; and the resolution, *R*, between toluene and isopropyl iodide is not less than 2.0.~~

■or hydrogen flame-ionization detector and a 3- to 4-mm × 1.8- to 3-m glass column packed with 20% liquid phase G28 on 100- to 120-mesh support S1C that is not silanized. Helium is used as the carrier gas for use with the thermal conductivity detector; helium or nitrogen can be used for the hydrogen flame-ionization detector. The temperature of the column is maintained at 100°. Chromatograph the *Standard preparation,* and adjust the flow rate so that the retention time of the internal standard is about 10 minutes. Use a column giving well resolved peaks of methyl iodide, isopropyl iodide, and the internal standard in this order.■2S (*USP30*)

~~*Calibration*—Inject about 2 µL of the upper layer of the *Standard preparation* into the gas chromatograph, and record the chromatogram. Calculate the relative response factor, F_M, of equal weights of toluene and methyl iodide taken by the formula:~~

$$Q_M / R_{SM}$$

~~in which Q_M is the quantity ratio of methyl iodide to toluene in the *Standard preparation*, and R_{SM} is the peak area ratio of methyl iodide to toluene obtained from the *Standard preparation*. Similarly, calculate the relative response factor, F_I, of equal weights of toluene and isopropyl iodide taken by the formula:~~

$$Q_I / R_{SI}$$

~~in which Q_I is the quantity ratio of isopropyl iodide to toluene in the *Standard preparation*, and R_{SI} is the peak area ratio of isopropyl iodide to toluene obtained from the *Standard preparation*.~~

■■2S (*USP30*)

~~*Procedure*—Inject about 2 µL of the upper layer of the *Assay preparation* into the gas chromatograph, and record the chromatogram. Calculate the percentage of methoxy ($-OCH_3$) in the Hypromellose taken by the formula:~~

$$2(31/142)F_M R_{UM}(W_S/W_U)$$

~~in which 31/142 is the ratio of the formula weights of methoxy and methyl iodide; F_M is defined under *Calibration*; R_{UM} is the ratio of the area of the methyl iodide peak to that of the toluene peak obtained from the *Assay preparation*; W_S is the weight, in g, of toluene in the *Internal standard solution*; and W_U is the weight, in g, of Hypromellose taken for the *Assay*. Similarly, calculate the percentage of hydroxypropoxy ($-OCH_2CHOHCH_3$) in the Hypromellose taken by the formula:~~

$$2(75/170)F_I R_{UI}(W_S/W_U)$$

~~in which 75/170 is the ratio of the formula weights of hydroxypropoxy and isopropyl iodide; F_I is defined under *Calibration*; R_{UI} is the ratio of the area of the isopropyl iodide peak to that of the toluene~~

Harmonization

~~peak obtained from the *Assay preparation;* W_T is the weight, in g, of toluene in the *Internal standard solution;* and W_L is the weight, in g, of Hypromellose taken for the *Assay.*~~

■Separately inject about 1 to 2 µL of the upper layer of the *Standard preparation* and the *Assay preparation* into the gas chromatograph, and record the chromatograms. Calculate the following.

$$Q_{Ta}$$

which is the ratio of the peak areas of methyl iodide to *n*-octane in the *Assay preparation;*

$$Q_{Tb}$$

which is the ratio of the peak areas of isopropyl iodide to *n*-octane in the *Assay preparation;*

$$Q_{Sa}$$

which is the ratio of the peak areas of methyl iodide to *n*-octane in the *Standard preparation;* and

$$Q_{Sb}$$

which is the ratio of the peak areas of isopropyl iodide to *n*-octane in the *Standard preparation.* Calculate the percentage of methoxy ($-OCH_3$) in the Hypromellose taken by the formula:

$$21.864(Q_{Ta} / Q_{Sa})(W_{Sa} / W_U)$$

in which W_{Sa} is the weight, in mg, of methyl iodide in the *Standard preparation;* and W_U is the weight, in mg, of Hypromellose, calculated on the dried basis, taken for the *Assay preparation*. Similarly, calculate the percentage of hydroxypropoxy ($-OC_3H_6OH$) in the Hypromellose taken by the formula:

$$44.17(Q_{Tb} / Q_{Sb})(W_{Sb} / W_U)$$

in which W_{Sb} is the weight, in mg, of isopropyl iodide in the *Standard preparation;* and W_U is the weight, in mg, of Hypromellose, calculated on the dried basis, taken for the *Assay preparation*.■2S (*USP30*)

Harmonization

PHARMACOPEIAL PREVIEWS

This section contains potential revisions not yet targeted for official adoption. These may include drafts for new monographs or chapters; drafts for standards that would require new or unusual technology; drafts for which more data are required; or changes that would affect numerous monographs, thus having a broad impact on individual products. Readers should review the drafts in this section and provide comments to the appropriate staff liaison whose name is cited in the Briefing (use the *Staff Directory* to find the contact information).

Briefings Each Preview is preceded by a Briefing in the following format:

BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being used, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How To Use PF*), the name of the scientific staff liaison who handled this item, and the USP tracking correspondence number, as shown in the example below:

(DSN: L. Evans) RTS—55678-1

Symbols No symbols are used in this section, as Previews are not yet targeted for official adoption.

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of authoritative committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* and *Pharmacopeial Previews* sections. Readers interested in submitting comments should see *Instructions to Authors.*

Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP–NF* revision will be considered for publication in the *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention (USPC) and may not be published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

References—Consult a current copy of the *Pharmacopeial Forum* and the *ACS Style Guide* for assistance with reference style.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Contact Person—When submitting a manuscript, designate one author of the article as correspondent and include that author's full address, telephone number, fax number, and e-mail address.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Graphics that cannot be submitted electronically must be camera-ready, of easily reproducible quality and size, and clearly labeled. Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

USP Advisory Panel on the *USP* Performance Test for Topical and Transdermal Dosage Forms

Vinod P. Shah,* Co-chair and Clarence T. Ueda, Co-chair, *USP Advisory Panel on Topical and Transdermal Dosage Forms Testing*

ABSTRACT The mission of the US Pharmacopeia (USP) is to promote public health and benefit practitioners and patients by disseminating authoritative standards and information developed by its volunteers for medicines, other health care technologies, and related practices used to maintain and improve health and promote optimal health care delivery. USP publishes the *United States Pharmacopeia (USP)* and *National Formulary (NF),* which contain monographs and associated information for more than 4000 medicines, dietary supplements, and other health care products. Standards in a pharmacopeial monograph include introductory statements (definition, description, and packaging and storage statements), followed by a specification (tests, procedures, and acceptance criteria). A key test in the drug product monograph is the USP performance test, a specific (not universal) test (*1*).

INTRODUCTION

This and a following *Stimuli* article provide information about an ongoing set of activities intended to expand on the USP performance test. The activities are proceeding in Advisory Panels originally formed in connection with the Council of Experts Biopharmaceutics Expert Committee during the 2000–2005 cycle. With adjustments in membership, these Advisory Panels will continue during the 2005–2010 cycle.

BACKGROUND

Following regulatory documentation of bioavailability (BA) and/or bioequivalence (BE) and market access, the performance test becomes the sole means of directly monitoring the ongoing performance of a dosage form or drug product that may be marketed for many years. The test may be either a private (application) performance test, usually based on USP General Chapters or the USP performance test in a dosage form monograph in *USP–NF*. For this reason, the work of the Advisory Panels and that of the Biopharmaceutics Expert Committee are especially important to the public health.

USP publishes monographs for both ingredients and products, including pharmaceutical dosage forms (drug products). A key test in the product monograph for nonsolution dosage forms is the USP performance test, which assesses release of the drug in vitro. Under appropriate circumstances, the USP performance test links to BA and BE studies that are subject to regulatory review. Without this linkage, the USP performance test should be viewed solely as a quality control test. For orally administered drug products, procedures and acceptance criteria for the USP performance test appear in General Chapters*Disintegration* ⟨701⟩, *Dissolution* ⟨711⟩, and *Drug Release* ⟨724⟩. Individual product monographs may then refer to these General Chapters with suitable Drug Release adjustments in the procedure to account for a specified dosage form.

In November 2002 USP formed an Ad Hoc Committee composed of members with expertise in pharmaceutical dosage forms, biopharmaceutics, and nomenclature, who worked with the Pharmaceutical Dosage Forms Expert Committee to develop a pharmaceutical dosage forms taxonomy scheme and related glossary. The taxonomy scheme and glossary were published as a *Stimuli* article in *Pharmacopeial Forum (2)*. The taxonomy scheme is tiered: The first grouping arranges dosage forms according to five routes of administration; the second grouping aligns them by dosage form type and physical properties (e.g., solid, semi-solid, liquid, gas, or aerosol; and the third groups them according to the release pattern of the active pharmaceutic ingredient and performance characteristics of the dosage form. According to this scheme, any dosage form for any drug substance can be unambiguously identified by a combination of taxonomic terms from each tier, taking the form:
[drug substance] [route of administration] [physical state] [release pattern]

The USP Biopharmaceutics Expert Committee is responsible for reviewing the performance test requirement for all oral dosage forms. Following publication of the taxonomy *Stimuli* article, it became possible for USP to better consider dosage form specifications and to focus on improving and/or expanding the USP Performance test for dosage forms grouped by route of administration and other factors. This consideration began in the 2000–2005 cycle with creation of four additional Advisory Panels in connection with the USP Council of Experts Biopharmaceutics Expert Committee. In total, this has resulted in five routes of dosage forms, with associated Advisory Panels:

- Oral
- Parenteral
- Inhalation/Aerosol
- Topical/Dermal
- Mucosal.

The current membership of the Topical/Dermal Advisory Panel appears in the Appendix to this *Stimuli* article. According to USP's rules and procedures, the chair of the panel must be a member of the Biopharmaceutics Expert Committee.

* Correspondence should be addressed to: Vinod P. Shah, PhD, USP Scientific Liaison, 12601 Twinbrook Parkway, Rockville, MD 20852-1790; tel. 301.816.8208; e-mail vps@usp.org.

DISCUSSSION

USP recognizes that the task of the Advisory Panels and of the Biopharmaceutics Expert Committee in improving and expanding on the USP performance test for drug products by route of administration is not simple. Although the performance test, in both its public and private presentations, has been of considerable value in ensuring the quality and performance of dosage forms/products in the US and other markets, the general approach requires continued careful scientific study, deliberation, and adjustment as needed (*3*). Further, it must be viewed in the context of national and international advances in regulatory control, not only in terms of development of information in support of a regulatory filing (e.g., the product development report and quality by design approaches), but also in terms of postapproval change and ongoing adherence to current Good Manufacturing Practices (e.g., process analytical technology) even in the absence of change.

Because the number and types of dosage forms are rapidly evolving, the task of developing a valid specification, including a USP performance test, in applicable private or public approaches becomes even more daunting. Although the outcome of the deliberations of the Advisory Panels and Biopharmaceutics Expert Committee remain to be fully defined, USP envisions perhaps one or more General Chapters for each route of administration, for which there are now two [*Injections* ⟨1⟩ and *Aerosols, Nasal Sprays, Metered-dose Inhalers, and Dry-powder Inhalers* ⟨601⟩], coupled with corresponding General Chapters providing information about the applicable performance test(s). A manufacturer could then use these General Chapters in the development and postapproval process, if present, to establish the private or public test, procedure, and acceptance criteria—as is done now for nonsolution orally administered dosage forms using ⟨701⟩, ⟨711⟩, and ⟨724⟩.

USP ADVISORY PANEL ON TOPICAL–TRANSDERMAL DOSAGE FORM PERFORMANCE

An accompanying *Stimuli* article has been prepared by the USP Advisory Panel on Topical–Transdermal Dosage Form Performance, which held its first meeting on December 17, 2004. This meeting included discussions about regulatory and compendial goals in setting specifications for the performance of topical and transdermal drug products. The discussions included the scientific principles undergirding the performance test. Also discussed were the following relevant workshop reports:

- Assessment of value and applications of in vitro testing of topical dermatological drug products (*4*).
- Scale-up of adhesive transdermal drug delivery systems (*5*).
- FIP/AAPS Guidelines to dissolution/in vitro release testing of novel/special dosage forms (*6*).

Key Advisory Panel suggestions included:

- Identify and define essential product characteristics critical to product performance.
- Review and evaluate tests used by manufacturers of topical and transdermal dosage forms.
- Identify and assess apparatus utilized for in vitro drug release testing.
- Investigate linking in vitro drug release results to in vivo drug performance (e.g., activity) when applicable or as appropriate.

The Advisory Panel has prepared this and the following *Stimuli* articles as a means of soliciting public input and ensuring transparency about its deliberations.

SUMMARY

The USP performance test is an important tool among the tests, procedures, and acceptance criteria that form the dosage form/product specification. USP's Biopharmaceutics Expert Committee considers and evaluates USP performance tests for oral dosage forms. USP has created additional Advisory Panels to investigate application of the USP performance test to dosage forms grouped by four specified routes of administration. All Advisory Panels will work at the direction of the Biopharmaceutics Expert Committee. The following *Stimuli* article is one of several planned to ensure that USP maintains the highest scientific and public health approaches to compendial tests to ensure the safety, quality, and efficacy of compendial articles.

APPENDIX

The Advisory Panel members for the USP Performance Test on Topical and Transdermal Dosage Forms are: Clarence T. Ueda (Co-Chair), Vinod P. Shah (Co-Chair and USP Scientific Liaison), Kris Derdzinski, Gary Ewing, Gordon Flynn, Howard Maibach, Margareth Marques, Steve Shaw, Kailas Thakker, and Avi Yacobi.

Performance Test for Topical and Transdermal Dosage Forms

The Advisory Panel for the USP Performance Test on Topical and Transdermal Dosage Forms: Clarence T. Ueda (Co-Chair), Vinod P. Shah (Co-Chair and USP Scientific Liaison),* Kris Derdzinski, Gary Ewing, Gordon Flynn, Howard Maibach, Margareth Marques (USP Scientific Liaison), Steve Shaw, Kailas Thakker, and Avi Yacobi

ABSTRACT The physical characteristics of dosage forms administered via the skin vary widely, and therefore, the in vitro release test for these products also will be significantly different and may require different types of apparatus. Currently, reasonably well described product performance tests for topically applied dosage forms exist for semisolids and transdermal systems (patches) alone. This *Stimuli* article outlines the scientific rationale for the in vitro release test for semisolid and transdermal patch topical dosage forms. It also presents a list of commonly employed product quality tests conducted during manufacturing, together with a discussion about additional performance tests that will help ensure product quality.

INTRODUCTION

Two classes of drug products are administered via the skin.

- Topical drug products are applied to the skin for local action, for dermatological diseases, or to alleviate dermatological symptoms. In general, these products are not intended to produce systemic effects. Common drug products in this category include creams, gels, solutions, suspensions, lotions, foams, sprays, and ointments. Creams, ointments, and gels generally are referred to as semisolid dosage forms.
- Transdermal drug products are applied to the skin for systemic effects. In this case, the drug penetrates the skin, is absorbed by the blood vasculature, and is taken up by the general circulation. These products generally are referred to as self-adhering transdermal drug delivery systems (TDS) or transdermal patches.

Two categories of tests are performed with drug products:

1. Product quality tests are intended to assess attributes such as assay, content uniformity, pH, minimum fill, and microbial limits and are part of the compendial monograph.
2. Product performance tests are designed to assess product performance and in many cases relate to drug release from the dosage form.

Although the former attributes *may* affect drug product performance, the product performance test is conducted to assess the release characteristics of the finished product.

For the pharmacological activity of a drug product to occur after application to the skin, the first step is the release of drug from the formulation onto the skin surface. For this reason, a performance test must be able to determine drug release from the formulation to ensure product performance.

TOPICAL DOSAGE FORMS

Topical dosage forms include solutions (for which release testing is not indicated), suspensions, emulsions (e.g., lotions), semisolids (e.g., collodions, foams, ointments, pastes, creams, and gels), solids (e.g., powders, aerosols, and patches [see TDS below]), and sprays. The 2005 *USP–NF* includes 5 emulsions, 22 lotions, 3 collodions, 1 foam, 116 ointments, 7 pastes, 75 creams, and 29 gels.

Table 1 shows typical product quality tests associated with *USP* topical dosage form monographs. In addition to these product quality tests, manufacturers may perform additional testing before product is released to the market: e.g., for creams they also may test for product description, impurities and degradation products, dose uniformity, preservative content, extractables, alcohol content, rheological properties, specific gravity, water content, and solid-state form. Many of these tests may not appear in the public monograph but are part of the private (application) standard. Some manufacturers also carry out product performance (in vitro drug release) tests.

Table 1. Topical Dosage Forms and Associated Product Quality Tests

Topical Dosage Form	Product Quality Tests
Aerosol (solid)	Assay, identification, content of ..., limits of ..., particle size
Collodion	Assay, identification, contents of ..., pH, limits of ..., + specific gravity
Cream	Assay, identification, content of ..., microbial limits, pH, minimum fill, related compounds, viscosity, homogeneity, concentration/content uniformity, phase separation.
Emulsion	Assay, identification, content of ..., microbial limits, pH, limits of ..., defoaming activity, heavy metals, phase volume (?)
Foam	Assay, identification, pH + additional tests from industry, if any
Gel	Assay, identification, content of ..., microbial limits, pH, limit of ..., minimum fill, acid-neutralizing capacity, arsenic, chloride, sulfate
Lotion	Assay, identification, content of ..., microbial limits, pH, limits of ..., minimum fill, related compounds

Table 1. Topical Dosage Forms and Associated Product Quality Tests *(Continued)*

Topical Dosage Form	Product Quality Tests
Ointment	Assay, identification, content of ..., microbial limits, pH, limit of ..., minimum fill, concentration/content uniformity, water content
Ophthalmic ointment	Assay, identification, content of ..., pH, limit of ..., minimum fill, particle size, metal particles, osmolality, sterility, water content
Paste	Assay, identification, content of ..., microbial limits, pH, limits of ..., minimum fill, carbonate and acid-insoluble matter, consistency, heavy metals, loss on drying, soluble alkalies, soluble salts
Powder	Assay, identification, content of ..., limits of ..., particle size (?)
Solution	Assay, identification, content of ..., microbial limits, pH, limits of ..., +
Sprays	See solutions
Suspension	Assay, identification, content of ..., microbial limits, pH, limits of ..., particle size, +

Scientific Rationale for Release Rate Determination from Semisolid Dosage Forms

Current *USP* monographs for semisolid dosage forms do not contain a release test. However, the FDA/AAPS workshop, "Assessment of Value and Applications of In Vitro Testing of Topical Dermatological Drug Products" (*1*), concluded that:

- In vitro release testing is based on sound scientific principles. The procedure is rugged and reproducible, and the release rate is a distinguishing property of the formulation (i.e., semisolid drug release during in vitro testing is proportional to the square root of time, $\sqrt{t}$).
- In vitro release testing can serve as a research tool in the course of developing formulations.
- The use of in vitro release tests to demonstrate product sameness for the purposes of SUPAC-SS is acceptable.
- A release test is neither a surrogate test for bioavailability nor for bioequivalence and should be used only as supporting evidence in such evaluations.
- In vitro release testing should not be used for comparing fundamentally different formulations (e.g., ointments vs. creams).
- In vitro release generally is formulation dependent and therefore should not be used to compare similar formulations from different manufacturers (which would be analogous to comparing different manufacturers' solid oral extended-release preparations that display different release profiles but are bioequivalent).
- A change in the in vitro release rate may be indicative of a change in the clinical performance of the dosage form in question.

Release testing can, in principle, provide useful information about the physical attributes (solubility, microscopic viscosity, emulsion state, particle size, etc.) of semisolid dosage forms. A simple, reproducible drug release test that employs a vertical diffusion cell system has been developed for these dosage forms (*2*). In the test, a thick layer of the test semisolid is placed in contact with a reservoir. Diffusion of the drug out of the semisolid into the receptor medium ensues. In most instances, diffusive communication between the delivery system and the reservoir takes place through an inert support membrane. The membrane keeps the product and the receptor medium physically separate and distinct. Membranes are chosen to offer the least possible diffusional resistance and must not be rate controlling.

The system's configuration is such that after a short lag period, release of drug from the dosage form is kinetically describable by diffusion of a chemical out of a "semi-infinite medium" into a "sink." Regardless of whether the releasing system is a solution or a suspension, the momentary release rate tracks the depth of penetration of the forming gradient within the semisolid. Beginning at the moment when the receding boundary layer's diffusional resistance assumes dominance of the kinetics of release, the amount of the drug released, *M,* becomes proportional to $\sqrt{t}$ with the momentary rate of release, *dM/dt,* becoming proportional to $1/\sqrt{t}$. These quantitative dependencies of release are well characterized and established for solution and suspension systems.

The first 30% of release rate from a solution is describable by the following mathematical relationship.

$$M = 2 \cdot C_o \sqrt{\frac{D \cdot t}{\pi}} \qquad [1]$$

where A plot of M vs. $\sqrt{t}$ will be linear with a slope of

$$2 \cdot C_o \sqrt{\frac{D}{\pi}} \cdot$$

M = amount of drug released into the sink per cm^2
C_o = drug concentration in releasing matrix
D = drug diffusion coefficient through the matrix
t = time.

For suspensions, the release rate can be described by the following equation:

$$M = \sqrt{2 \cdot D_m \cdot C_s \left(Q - \frac{C_s}{2} \right) t} \quad [2]$$

where

C_s = drug solubility in the releasing matrix
D_m = drug diffusion coefficient in the semisolid matrix
Q = total amount of the drug in solution and suspended in the matrix.

When $Q >> C_s$, Eq. 2 simplifies to Eq. 3:

$$M = \sqrt{2 \cdot Q \cdot D_m \cdot C_s \cdot t} \quad [3]$$

A plot of M vs. $\sqrt{t}$ will be linear with a slope of $\sqrt{2QD_mC_S}$. During the release rate experiments, every attempt should be made to keep the composition of the formulation intact during the releasing period.

A. Vertical Diffusion Cell System Methodology

Typically, 200–400 mg of an ointment, cream, or gel is spread evenly over a suitable synthetic, inert support membrane, and the thickness of the applied layer per cm^2 is measured. The membrane, with its application side up, is placed in a vertical diffusion cell (typically of 15-mm diameter orifice), e.g., a Franz cell. The release rate experiment is carried out at 32 °C, except in the case of vaginal creams when the temperature should be 37 °C. Sampling usually is performed over 4–5 hours, and sample volume is replaced with fresh receptor medium. To achieve sink condition, the receptor medium must have a high capacity to dissolve or carry away the drug, and the receptor medium should not exceed 10% of C_s at the end of the test.

Several collaborative studies have been carried out with different types of semisolid dosage forms (creams, ointments, and gels) to evaluate within-laboratory and between-laboratory reproducibility using the vertical diffusion cell system. The results of the study are published as a *Stimuli* article immediately following the present *Stimuli* article in this issue of *PF*.

B. Alternative Methodology Using a Modified Semisolid Holding Cell System

In vitro release test procedures using modified semisolid holding cell systems, e.g., the Enhancer Cell, also have been reported (*3, 4*). With these systems the semisolid dosage form is placed in an inert holding cell, and the entire assembly is placed in a dissolution vessel and stirred by paddles. Only limited information about these systems is available, and more data, e.g., validation and reproducibility studies, are needed.

General comments about Methods A and B

Studies comparing drug release between the vertical diffusion cell system and the semisolid holding cell system have been reported in the literature (*4*). The principle of drug release with the two types of systems is the same. However, because the setups of the two diffusion cell systems are significantly different, results obtained with one system will not necessarily match those from the other system. This is to be expected because the mass of sample and the diffusion surface in the two systems are different.

Product Performance Test for Topical Semisolids

The release rate is a property of the dosage form. The in vitro release test method using the vertical diffusion cell has been found to be rugged and reproducible (*1*). This test has been utilized in FDA's Scale-Up and Post-Approval Guidance for Nonsterile Semisolid Dosage Forms (*5*) to lower regulatory burdens. In vitro release is based on sound scientific principles and can be used to ensure product sameness between prechange and postchange dosage forms. A statistical 90% confidence interval (CI) criterion has been developed to compare the release rate between approved and postapproval changes in dosage forms. The release rate of postchange dosage forms must be within a 90% CI of the original approved prechange dosage form.

TDS (TRANSDERMAL PATCHES)

TDS have different release mechanisms due to differences in their composition and fabrication. TDS systems can be categorized as 1) liquid form–fill–seal systems, 2) peripheral adhesive systems, or 3) solid matrix systems. The latter two categories include the subcategories of monolithic, matrix, multilaminate, and drug-in-adhesive systems (6). Recent advances in the design of novel TDS employ novel physicochemical principles for control or enhancement of drug delivery such as iontophoresis, heat-assisted drug delivery, and others.

In all of the three principal TDS categories, the drug substance is in solution or suspension. A number of factors can influence drug release and the performance of TDS dosage forms. These include changes in formulation composition involving adhesives, solvents, viscosity-modifying agents, enhancers, and changes in the semipermeable film or laminate.

The 2005 *USP–NF* includes only two TDS monographs even though many more have been approved by FDA and are marketed in the US. *USP* monographs include the following product quality test requirements for TDS dosage forms: assay, identification, drug release, related compounds, uniformity of dosage units, residual solvents, and microbial limits.

Manufacturers may also perform additional testing for transdermal patches, including appearance, assay for potency of critical excipient(s), related compounds (degradants), residual monomers, adhesion to release liner and standard substrates, peel, shear, tack, liner functionality, pouch (container) integrity, patch integrity (vacuum, pressure, and seal), dimensions, and system functionality tests.

The performance test for TDS should include in vitro drug release, especially testing for dose dumping, adhesion tests (for release liner and/or standard substrates), and, if appropriate, system functionality testing to ensure product performance.

Product Performance Test for TDS

In vitro drug release testing is commonly used to characterize TDS and is a basic quality control tool. USP has established three different in vitro drug release test procedures for these products: 1) the paddle over disk method (Apparatus 5), 2) the cylinder method (Apparatus 6), and 3) the reciprocating holder method (Apparatus 7).

The paddle over disk method (Apparatus 5) is the simplest procedure and is highly reproducible. However, it is not applicable to all marketed transdermal systems due to variations in sizes and shapes of the systems. Experimental evidence indicates that the same release profile is obtained when the results are compared using Apparatus 5 and 6 or Apparatus 5 and 7 (*7, 8*). The reciprocating holder method (Apparatus 7) permits different designs of sample holders to be used for TDS. The disk holder, the angled disk holder, and the reciprocating cylinder holder are used most commonly. Typically, the in vitro release test should be conducted for a period sufficient to exceed 100% of the total amount of drug delivered in vivo, and a minimum of three to four test points should be used to characterize the drug release profile.

Adhesion to the target site is another critical performance characteristic of TDS. Therefore, minimum adhesion force to release the liner should be tested, and an adhesion test using a standard substrate is recommended. For some novel TDS products, appropriate system functionality tests assessing crucial physicochemical attributes also may be required.

SUMMARY

USP encourages further investigations of performance tests that will yield increasing quality for the types of dosage forms discussed in this *Stimuli* article. USP believes that product performance tests will enhance assurance of the continuing strength, quality, and purity of both topical and TDS dosage forms that may be marketed many years without a requirement for redocumentation of bioavailability and bioequivalence. Depending on deliberations of the Topical–Transdermal Advisory Panel and its discussions with the Biopharmaceutics Expert Committee, USP believes that at least two new General Chapters may result: 1) a General Chapter analogous to ⟨1⟩ and ⟨601⟩ discussing topical–transdermal dosage forms, as well as a new General Chapter that describes general approaches for product performance tests for these types of dosage forms.

In Vitro Release: Collaborative Study Using the Vertical Diffusion Cell

Vinod P. Shah, *USP;*[*] Steven W. Shaw, *Hanson Research, Inc.;* Donna D. Norton, *Hanson Research, Inc.;* Jerry Elkins, *Hanson Research, Inc.;* and Royal Hanson, *Hanson Research, Inc.* Contributors: Gang Deng, *USP;* Joseph Eaton, *USP;* Joanne Hajoway, *FDA;* Shaoyong Nie, *Taro Pharmaceuticals;* and Jixing Wang, *Taro Pharmaceuticals*

ABSTRACT Since the inception of in vitro release testing for semisolid dosage forms using diffusion cell testing, a variety of diffusion cell styles and designs have been used. The Vertical Diffusion Cell (VDC) or "Franz Cell" has emerged as the most optimum for testing the in vitro release of topical dosage forms (*1, 2*). The VDC design incorporates a donor compartment at the top of the assembly and a receptor compartment below. These two compartments are separated by a membrane. This membrane is not intended to be a barrier but an avenue through which drug diffusion takes place. The membrane is also intended to be a support for the test product, ensuring that the product remains in place with constant and consistent contact with the receptor media. This purpose of this *Stimuli* article is to summarize the status of collaborative studies to date and to indicate next steps for a USP Performance test for semisolid dosage forms.

INTRODUCTION

In 1997 FDA released the SUPAC-SS Guideline (*3*). This guideline recommends in vitro diffusion cell testing for semisolid dosage forms when manufacturing or material changes were made to an approved topical dosage form. If any of a variety of changes occurs, the SUPAC-SS Guideline requires an in vitro release test comparing the product prior and subsequent to the change to assess similarity in performance.

As with all test methods it is important to demonstrate robustness. To understand the robustness and reproducibility of the in vitro test using the VDC, the USP Biopharmaceutics Expert Committee requested additional information in the form of a collaborative study. This study was conducted using four laboratory sites and four topical products: Hydrocortisone Cream, Betamethasone Dipropionate Cream, Betamethasone Dipropionate Gel, and Betamethasone Dipropionate Ointment.

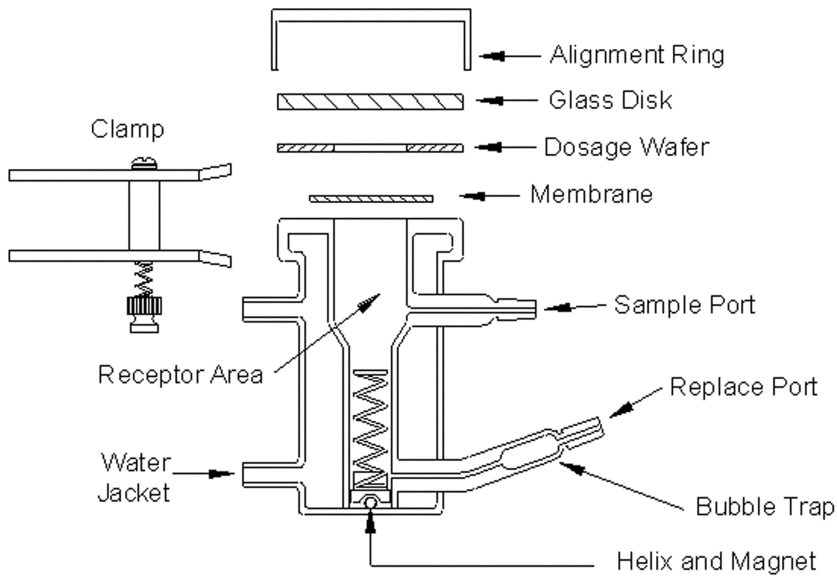

Figure 1. Vertical diffusion cell

The VDC used for this collaborative study is illustrated in *Figure 1*. This type of cell is commonly used for testing the in vitro release rate of topical drug products such as creams, gels, and ointments. The cell is made from clear glass and uses a clamp to secure the donor side of the cell to the receptor side. The clamp also ensures that all of the components and the membrane remain in place during the test. A glass disk is used to support the dosage wafer and to facilitate viewing of the donor material during the test. The cell is temperature controlled via the water jacket ports using a bath circulator. The alignment ring ensures that the positions between the donor and receptor orifices are accurately aligned. The sampling and replace ports have Luer connections that facilitate the collection of sample and media replacement. In addition, a bubble trap is incorporated into the replace port to seize any bubbles

that may be inadvertently introduced by the sampling process. A magnetic stirrer is used to turn the helix and magnet, mixing the receptor media to maintain a homogeneous mixture.

IN VITRO RELEASE COLLABORATIVE STUDY PHASE I

Collaborators

- C1: Hanson Research
- C2: FDA
- C3: USP
- C4: Taro Pharmaceuticals

Products Studied

- Hydrocortisone Cream 1%, Pharmacia, Lot 03JDM, expiration date (exp.) 10-2004
- Betamethasone Dipropionate Cream 0.05%, Taro, Lot 26057, exp. 07-2005
- Betamethasone Dipropionate Gel 0.05%, Schering, Lot 2RFH104, exp. 10-2005
- Betamethasone Dipropionate Ointment 0.05%, Warrick, Lot 1HYA301, exp. 10-2005.

Each of these products was tested by C1 prior to beginning Collaborative Phase 1 of the study.

Criteria for Product Selection

Semisolid dosage forms (creams, ointments, and gels) containing the same active ingredient were selected for ease of operating the analytical procedure and HPLC system and at the same time providing the information that the procedure is workable for all types of topical dosage forms.

Objectives

The objective for this phase of the study was for each collaborator to conduct the specified test one time for each product. Testing was accomplished manually, and all test data were calculated following the SUPAC-SS Guideline. The results were calculated using in vitro release data of C1 as the ''Reference'' data and using the in vitro release data of other collaborators as the ''Test'' data. The results from this study were presented to the USP Biopharmaceutics Expert Committee on 25 May 2004.

Test Method

During the test of the Betamethasone Cream and Gel, the synthetic membrane was saturated in a 15% solution of Ethomeen in isopropyl myristate (IPM) for 30 minutes and placed on the dosage wafer (*2*). During the test of the Betamethasone Ointment, the synthetic membrane was saturated in IPM for 30 minutes and placed on the dosage wafer. In either case, the dosage wafer was inverted and then filled with the test product. This (approximately) 300-mg dose is defined as an infinite dose for these tests. The dosage wafer was then placed on a cell filled with receptor media which had come to temperature (32 °C). The glass disk, alignment ring, and clamp were applied to the cell and the stirring initiated, constituting time zero for the test.

Sample time points were at 1, 2, 3, 4, and 6 hours. The VDC was equipped with a check valve attached to the replace port and a sampling port canula (both not shown in figure) to aid in the manual sampling process (*4*). The purpose of the check valve is to allow replacement solution to be introduced into the VDC without allowing media to flow back out once the syringe is removed. The sampling process introduces approximately 1 mL of replacement media through the check valve and into the replace port, concurrently pushing sample out of the sampling port for collection. Half of this 1-mL sample was used for rinsing the sample port and canula, and the other half was collected for HPLC analysis. The sampling process was accomplished with the stirring device off.

Role of In Vitro Release Rate of Hydrocortisone Cream

The results from Hydrocortisone Cream were used to check the performance of the operating system. This included set-up of the equipment, preparation of the samples by the analyst, sample collection, and analysis. The in vitro release rate data from collaborators C2, C3, and C4 were compared with the release rate data from C1, the reference laboratory. The release rate data from C2, C3, and C4 collaborators were within a 90% confidence interval (CI) of C1 data, verifying the performance of the other systems.

Sample Analysis

Table 1. Chromatographic Conditions for Analysis Using Reversed-phase HPLC

	Hydrocortisone Cream	Betamethasone Dipropionate Creams, Gels, and Ointments
Wavelength	242 nm	239 nm
Flow Rate	1.0 mL/min	1.5 mL/min
Injection Volume	10 µL	50 µL
Runtime	10 min	10 min
Column	50 mm × 3.9 mm Symmetry C-18, 5 µm	300 mm × 3.9 mm µBondapak C-18
Mobile Phase	20:80::ACN*:H_2O	60:40::ACN:H_2O

* ACN=acetonitrile

Data Calculations

The peak area data from each sampling time point was used to calculate the amount released (µg/cm^2) into each VDC and then plotted against the square root of time. The slope of the line (release rate) was calculated using linear regression. These slopes (one for each VDC) were then compared to another set of test slopes to obtain a pass or fail as described by the SUPACC-SS Guideline using a 90% CI (*3*).

Results from Collaborative Study Phase I

Table 2. Pass–fail results from C2, C3, and C4

Collaborator	Hydrocortisone Cream	Betamethasone Dipropionate Cream	Betamethasone Dipropionate Gel	Betamethasone Dipropionate Ointment
C2	Pass	Fail	Pass	Fail
C3	Pass	Fail	Pass	Pass
C4	Pass	Pass	Pass	Fail

- Within-lab reproducibility: 11 of 13 runs pass 90% CI limits (SUPAC-SS)
- Between-lab reproducibility: 8 of 12 runs pass 90% CI limits (SUPAC-SS).

Conclusions from Collaborative Study Phase I

After reviewing and discussing the results from the first phase, the Biopharmaceutics Expert Committee agreed that the failures and inconsistent results possibly were associated with variations among the laboratories in performing the methods and protocols. The Expert Committee also concluded that the best way to better understand the variability would be to repeat the study. Beforehand, however, the Expert Committee recommended that training should be conducted to ensure that all collaborators had a complete understanding of the methods and protocols. This training was carried out in April 2005, when each participating laboratory sent two analysts for one day of training.

IN VITRO RELEASE COLLABORATIVE STUDY PHASE II

For this phase of the collaborative study, testing levels were increased from one test per product to three tests per product for a total of 18 cells tested per product per laboratory. Procedures like those described in Collaborative Study Phase 1 were used.

Collaborators

Collaborators were the same laboratories as in the Collaborative Study Phase I, although only analyst "C" conducted tests in both Phase I and Phase II.

Products Studied

- Hydrocortisone Cream 1%, Pharmacia, Lot 20KJM, exp. 10-2005
- Betamethasone Dipropionate Cream 0.05%, Taro, Lot 31119, exp. 09-2006
- Betamethasone Dipropionate Gel 0.05%, Taro, Lot 4B055, exp. 09-2005
- Betamethasone Dipropionate Ointment 0.05%, Alpharma, Lot 310046, exp. 10-2005.

Although the same types of products were used for Collaborative Study Phase II, new lots/manufacturers were needed. These new products were all tested by C1 prior to training and beginning the second phase of the study as also was the case during the first phase of the study. This initial testing by C1 ensured that consistent SUPAC-SS results were attainable for these products and that the methods and protocols were still valid. As in the first phase, sampling was performed manually.

For this part of the collaborative study, C1 ran at least three tests for each product using 12 VDCs with Groups A and B consisting of six cells each. Each of the other collaborators tested each product three times with a single set of six cells. As in the previous testing phase, C1's first test was used as the "Reference," and the other collaborators' data were used as the "Test" set. In addition, each collaborator's first test was also used as the "Reference" against which subsequent tests were then evaluated (see results in the following tables). For convenience, the tables use the following abbreviations:

- Hydrocortisone Cream=HCC
- Bethamethasone Dipropionate Cream=BDC
- Bethamethasone Dipropionate Gel=BDG
- Bethamethasone Dipropionate Ointment=BDO

Not all tests were completed by C2; tests not completed are shown as blank.

The following tables are an overview of the results from Collaborative Study Phase II. Each table represents one of the products tested, the results from all four collaborators, and pass–fail notations. In addition, test slope averages and % RSD also are listed for each of the tests, along with an identification of the analyst who conducted that specific test.

All collaborators' tests were evaluated two different ways—against the preparatory tests performed by C1, and within their own laboratories all subsequent tests were compared to the first test. The results from C4's HCC test reveal a point of interest: Tests one and three failed, but test two passed the SUPAC-SS requirements when compared with C1. Although two of these tests failed against C1, all of C4's tests passed when the results were evaluated against all tests within their laboratory.

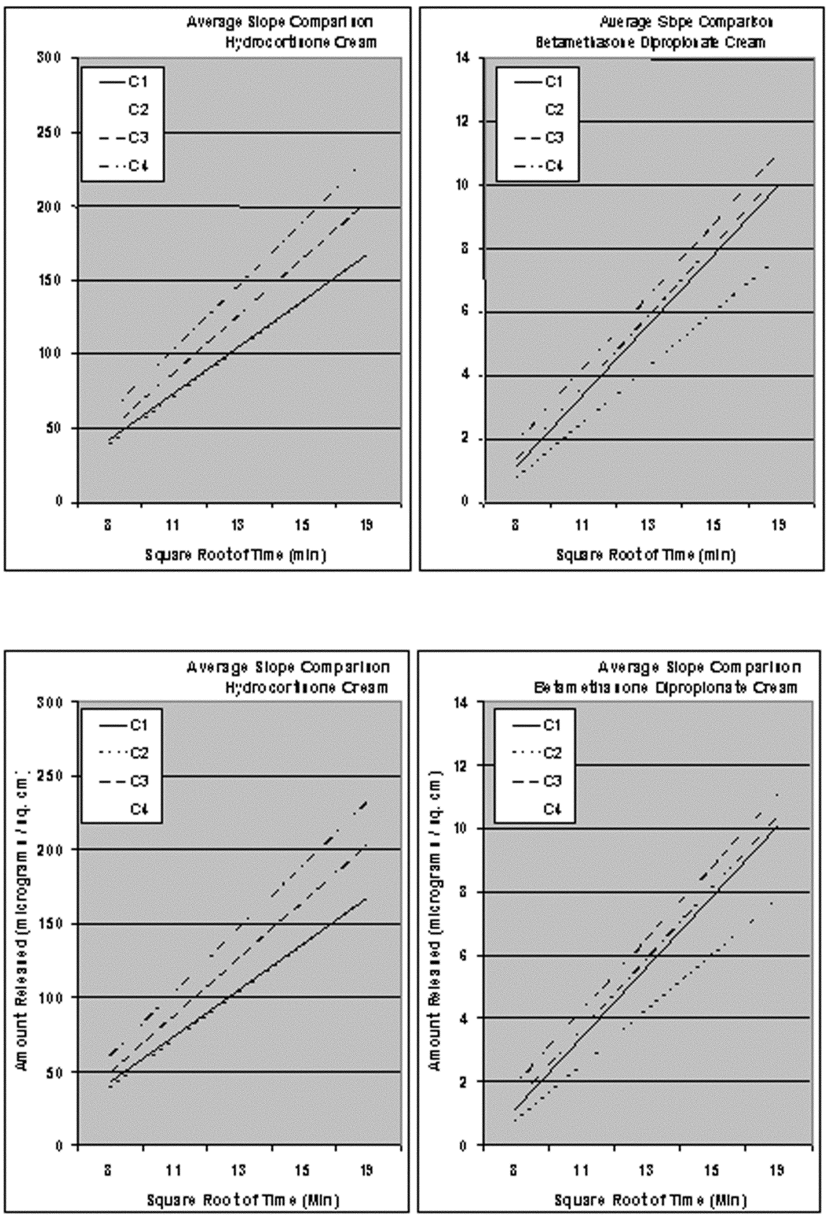

Figure 2. The graphs show the slope average for all tests reported by each laboratory

In summary:

- 17 runs pass 90% CI limits
- BDO 12 of 12 runs pass 90% CI limits.

- Between-lab reproducibility:
  - HCC 11 of 14 runs pass 90% CI limits
  - BDC 14 of 15 runs pass 90% CI limits
  - BDG 16 of 17 runs pass 90% CI limits
  - BDO 12 of 12 runs pass 90% CI limits.

Conclusions from Collaborative Study Phase II

The test results from Collaborative Study Phase II demonstrate improvement by comparison with those from Study Phase I. All tests from Study Phase II passed SUPAC-SS requirements within a single laboratory and with an analyst who attended training. Thus the improved results for Phase II suggest that training was a key component in ensuring analysts' understanding of the method steps and procedures. This study also shows that the test is robust and repeatable even when one evaluates results both from different laboratories and analysts.

The most consistent and repeatable results were obtained when one analyst ran the test. Further improvement also occurred when the test was conducted with a group of 12 VDCs simultaneously. To ensure the most accurate results, testing should be conducted with as few variables as possible, including the time between tests when using only one group of samples.

Automation

The manual method described here is an emulation of the automated process, which further enhances this type of test method. A manual sampling procedure may be easily migrated to an automated sampling system, allowing pharmaceutical

companies options for their diffusion test requirements. Manual sampling may be used as well to validate automated methods (*4*).

NEXT STEPS

- Specifications should be established to ensure control and consistency of the test apparatus.
- Method development guidelines also should be elaborated and published to aid analysts in the start-up and maintenance of this test procedure.
- Expert practitioners should work together to publish a simple method for performance verification that can be used to ensure an analyst's comprehensive understanding of the methods and procedures.
- Hydrocortisone Cream 1% (Pharmacia) can be used as a performance verification test product. Appropriate in vitro release rate parameters should be disseminated.

NOMENCLATURE

This section includes supplements to the latest edition of the *USP Dictionary of USAN and International Drug Names* that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

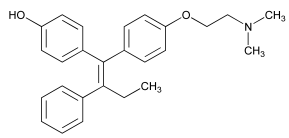
USP Dictionary of USAN and International Drug Names
2006 USP DICTIONARY SUPPLEMENT 3

IMPORTANT—Save this Supplement. This and all supplements appearing in *PF* are needed to keep the 2006 edition of the USP Dictionary (USPD) up-to-date. The cumulative contents of the supplements to the current (2006) edition will be included in the next complete edition of the Dictionary.

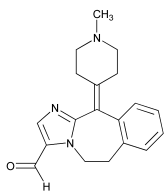
Newly Approved United States Adopted Names (USAN), Released for Publication

The following are newly established United States Adopted Names (USAN). These names will not be listed cumulatively; see preceding and succeeding numbers of *PF* for other new USAN to supplement the Dictionary main volume.

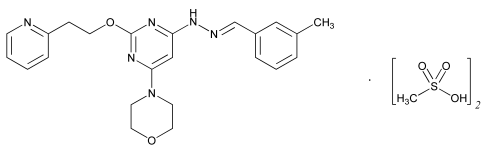
Afimoxifene [*2006*] (a fim ox′ i feen). $C_{26}H_{29}NO_2$. 387.51. (1) Phenol, 4-[1-[4-[2-(dimethylamino)ethoxy]phenyl]-2-phenyl-1-butenyl]-; (2) 4-[1-[4-[2-(Dimethylamino)ethoxy]phenyl]-2-phenylbut-1-enyl]phenol. *CAS-68392-35-8*. *Local treatment of estrogen dependent conditions of the breast.* TamoGel (Ascend Therapeutics) ✧*4-OHT*



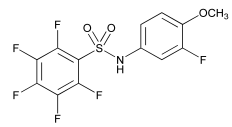
Alcaftadine [*2006*] (al kaf′ ta deen). $C_{19}H_{21}N_3O$. 307.39. (1) 5*H*-Imidazo[2,1-*b*][3]benzazepine-3-carboxaldehyde, 6,11-dihydro-11-(1-methyl-4-piperidinylidene)-; (2) 11-(1-Methylpiperidin-4-ylidene)-6,11-dihydro-5*H*-imidazolo[2,1-*b*][3]benzazepine-3-carbaldehyde; (3) 4-(1-Methyl-piperidin-4-ylidene)-9,10-dihydro-4*H*-3,10a-diaza-benzo[f]azulene-1-carbaldehyde. *CAS-147084-10-4*. INN. *Antiallergic, histaminic H-1 receptor antagonist, anti-inflammatory.* (Janssen Cilag) ✧*R 89674*



Apilimod Mesylate [*2006*] (a pil i mod). $C_{23}H_{26}N_6O_2 \cdot 2CH_4O_3S$. 610.70. (1) Benzaldehyde, 3-methyl-, [6-(4-morpholinyl)-2-[2-(2-pyridinyl)ethoxy]-4-pyrimidinyl]hydrazone mesylate; (2) *N*-(3-Methylbensylidene) *N*-[6-morpholin-4-yl-2(2-pyridin-2-yl-ethoxy)-pyrimidin-4-yl]-hydrazine bismesylate. *CAS-870087-36-8*. *Treatment of inflammatory diseases* (*inhibits production of IL-12*). (Synta) ✧*STA-5326 mesylate*

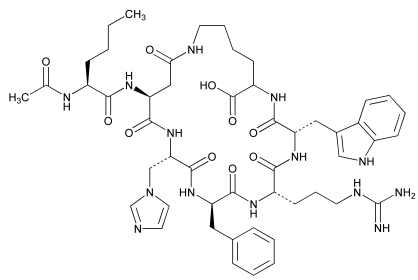


Batabulin [*2006*] (ba′′ ta bue′ lin). $C_{13}H_7F_6NO_3S$. 371.25. (1) Benzenesulfonamide, 2,3,4,5,6-pentafluoro-*N*-(3-fluoro-4-methoxyphenyl)-; (2) 2,3,4,5,6-Pentafluoro-*N*-(3-fluoro-4-methoxyphenyl)benzenesulfonamide. *CAS-195533-53-0*. *Treatment of various advanced refractory cancers* (*binds to* β-*tubulin*). (Tularik) ✧*T138067; T67; TL 057*

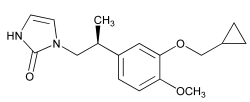


Bavituximab [[*2006*] (bav i tux′ i mab). $C_{6446}H_{9946}N_{1702}O_{2042}S_{32}$. Immunoglobulin G1, anti-(phosphatidylserine)(human-mouse monoclonal ch3G4 heavy chain), disulfide with human-mouse monoclonal ch3G4 κ-chain, dimer. Molecular weight is approximately 145,300 daltons. *CAS-648904-28-3*. *Anti-cancer and anti-viral.* (Peregrine)

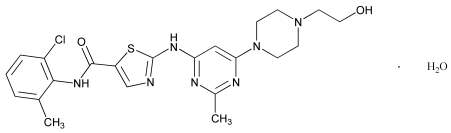
Bremelanotide [*2006*] (bre′′ mel an′ oh tide). $C_{50}H_{68}N_{14}O_{10}$. 1025.16. (1) L-Lysine, *N*-acetyl-L-norleucyl-L-α-aspartyl-L-histidyl-D-phenylalanyl-L-arginyl-L-tryptophyl-, (2→7)-lactam; (2) *N*-Acetyl-L-2-aminohexanoyl-L-α-aspartyl-L-histidyl-D-phenylalanyl-L-arginyl-L-tryptophyl-L-lysine-(2→7)-lactam. *CAS-189691-06-3*. *Treatment of sexual dysfunction* (*melanocortin receptor agonist*). (Palatin) ✧*PT-141*



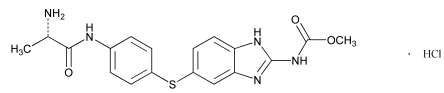
Catramilast [*2006*] (ka tra′ mi last). $C_{17}H_{22}N_2O_3$. 302.37. (1) 2*H*-Imidazol-2-one, 1-[2-[3-(cyclopropylmethoxy)-4-methoxyphenyl]propyl]-1,3-dihydro-, (*S*)-; (2) 1-[(2*S*)-2-[3-(Cyclopropylmethoxy)-4-methoxyphenyl]propyl]-1,3-dihydro-2*H*-imidazol-2-one. *CAS-183659-72-5*. *Treatment of atopic dermatitis.* (Barrier) ✧*R115500*



Dasatinib [*2005*] (da sa′ ti nib). $C_{22}H_{26}ClN_7O_2S \cdot H_2O$. 506.02. (1) 5-Thiazolecarboxamide-*N*-(2-chloro-6-methylphenyl)-2-[[6-[4-(2-hydroxyethyl)-1-piperazinyl]-2-methyl-4-pyrimidinyl]amino]-, monohydrate; (2) *N*-(2-Chloro-6-methylphenyl)-2-[[6-[4-(2-hydroxyethyl)piperazin-1-yl]-2-methylpyrimidin-4-yl]amino]thiazole-5-carboxamide hydrate. *CAS-863127-77-9*. INN. *Anticancer.* (Bristol-Myers Squibb) ✧*BMS-354825-03*



Denibulin Hydrochloride [*2006*] (den i bue′ lin). $C_{18}H_{19}N_5O_3S \cdot HCl$. 421.90. (1) Carbamic acid, [5-[[4-[[(2*S*)-2-amino-1-oxopropyl]amino]phenyl]thio]-1*H*-benzimidazol-2-yl]-, methyl ester, monohydrochloride; (2) Methyl [5-[[4-[[(2*S*)-2-aminopropanoyl]amino]phenyl]sulfanyl]-1*H*-benzimidazol-2-yl]carbamate monohydrochloride. *CAS-779356-64-8*. *Treatment of solid tumors.* (Medical Arts) ✧*MN-029*



Fispemifene [*2006*] (fis pem′ i feen). $C_{26}H_{27}ClO_3$. 422.94. (1) Ethanol, 2-[2-[4-[(1*Z*)-4-chloro-1,2-diphenyl-1-butenyl]phenoxy]ethoxy]-; (2) 2-[2-[4-[(1*Z*)-4-Chloro-1,2-diphenylbut-1-enyl]phenoxy]ethoxy]ethanol.*CAS-341524-89-8*. Vapitadine Dihydrochloride [*2006*] (va pi′ ta deen). $C_{17}H_{20}N_4O \cdot 2HCl$. 369.29. (1) Spiro[11*H*-imidazo[2,1-*b*][3]benzazepine-11,4′-piperidine]-3-carboxamide, 5,6-dihydro-, dihydrochloride; (2) 5,6-Dihydrospiro[11*H*-imidazo[2,1-*b*][3]benzazepine-11,4′-piperidine]-3-carboxamide dihydrochloride. *CAS-279253-83-7*. *Treatment of atopic dermatitis.* (Barrier) ✧*R129160*

Veliflapon [*2006*] (vel″ i flap′ on). $C_{23}H_{23}NO_3$. 361.43. (1) Benzeneacetic acid, α-cyclopentyl-4-(2-quinolinylmethoxy)-, (α*R*)-; (2) (+)-(*R*)-Cyclopentyl-2-[4-(quinolin-2-ylmethoxy)phenyl]acetic acid. *CAS-128253-31-6*. *Prevention of acute cardiovascular events.* (Debio Recherche Pharmaceutique, Switzerland) ✧*DG-031; Bay x 1005*

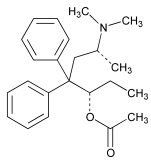
Nomenclature

Revisions of United States Adopted Names (USAN)

The following are revisions of existing United States Adopted Names (USAN) and other names.

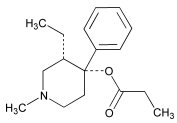
Alphacetylmethadol

Change the chemical structure to read:



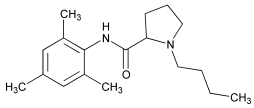
Alphameprodine

Change the chemical structure to read:



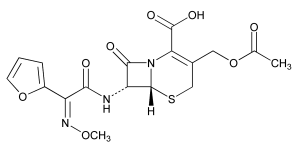
Bumecaine

Change the chemical structure to read:



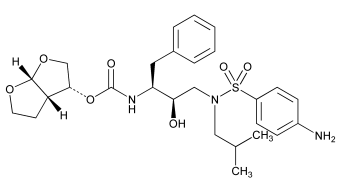
Cefuracetime

Change the chemical structure to read:



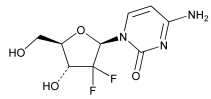
Darunavir

Change the chemical structure to read:



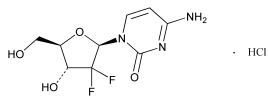
Gemcitabine

Change the chemical structure to read:



Gemcitabine Hydrochloride

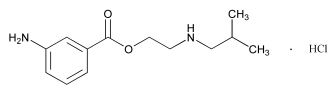
Change the chemical structure to read:



Metabutethamine Hydrochloride

Add the chemical information and structure to read:

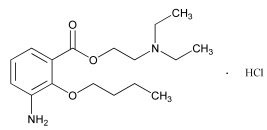
$C_{13}H_{20}N_2O_2 \cdot HCl$. 272.77. 2-(Isobutylamino)ethanol *m*-aminobenzoate, hydrochloride.



Metabutoxycaine Hydrochloride

Add the chemical information and structure to read:

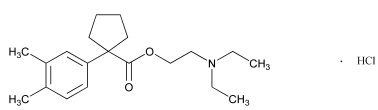
$C_{17}H_{28}N_2O_2 \cdot HCl$. 344.88. 2-(Diethylamino)ethyl 3-amino-2-butoxybenzoate hydrochloride.



Metcaraphen Hydrochloride

Add the chemical information and structure to read:

$C_{20}H_{31}NO_2 \cdot HCl$. 353.93. (1) Cyclopentanecarboxylic acid, 1-(3,4-xylyl)-, 2-(diethylamino)ethyl ester, hydrochloride; (2) 2-(Diethylamino)ethyl 1-(3,4-dimethylphenyl)cyclopentanecarboxylate hydrochloride.



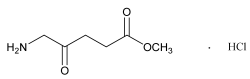
Methacholine Bromide

Add the chemical information to read:

$C_8H_{18}BrNO_2$. 240.14.

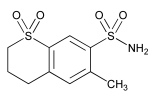
Methyl Aminolevulinate Hydrochloride

Add the chemical structure to read:



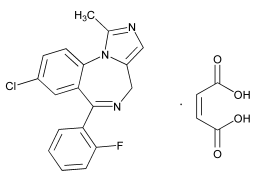
Meticrane

Add the chemical structure to read:



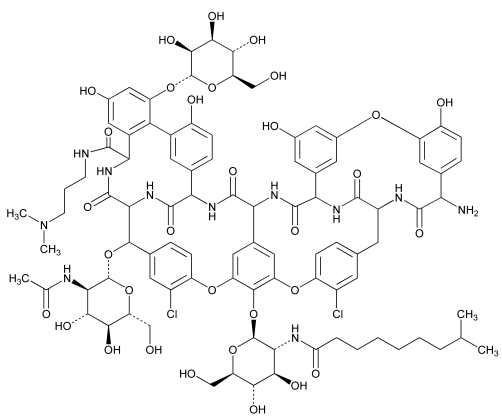
Midazolam Maleate

Change the chemical structure to read:



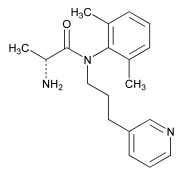
Mideplanin

Add the chemical structure to read:



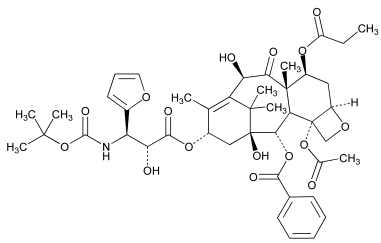
Milacainide

Add the chemical structure to read:



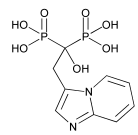
Milataxel

Add the chemical structure to read:



Minodronic Acid

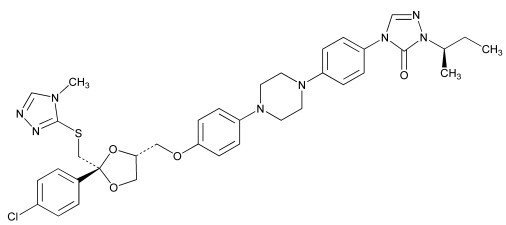
Add the chemical structure to read:



Mitratapide

Add the molecular weight and change the chemical structure to read:

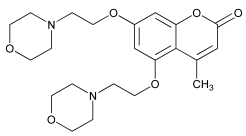
717.28.



Moxicoumone

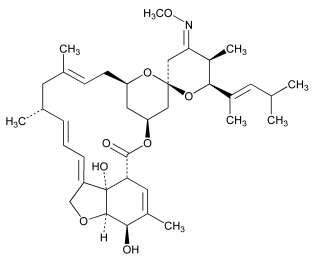
Change the chemical name and structure to read:

4-Methyl-5,7-bis(2-morpholinoethoxy)coumarin.



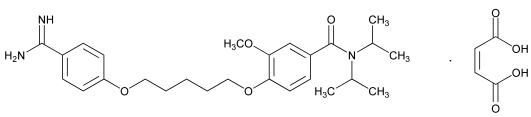
Moxidectin

Change the chemical structure to read:



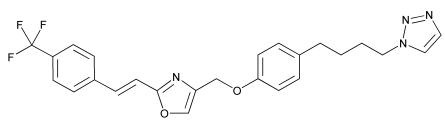
Moxilubant Maleate

Add the chemical structure to read:



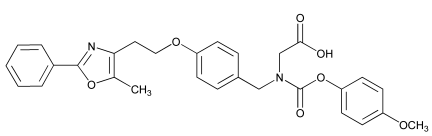
Mubritinib

Add the chemical structure to read:



Muraglitazar

Add the chemical structure to read:



Myristic Acid

Add the chemical structure to read:

Myristyl Alcohol

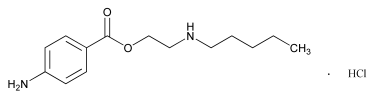
Add the chemical information and structure to read:

$C_{14}H_{30}O$. 214.39. Tetradecanol. *CAS-112-72-1.*

Naepaine Hydrochloride

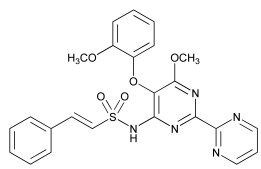
Add the chemical information and structure to read:

$C_{14}H_{22}N_2O_2 \cdot HCl$. 286.80. (1) Benzoic acid, *p*-amino-, 2-(pentylamino)ethyl ester, hydrochloride; (2) 2-(pentylamino)ethyl 4-aminobenzoate.



Nebentan

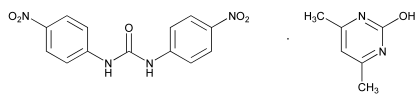
Add the chemical structure to read:



Nicarbazin

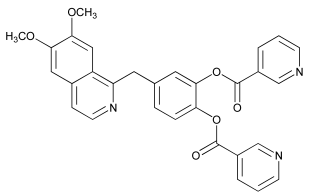
Change the chemical information and add the structure to read:

$C_{13}H_{10}N_4O_5 \cdot C_6H_8N_2O$. 1,3-Bis(4-nitrophenyl)urea complex with 4,6-dimethylpyrimidin-2-ol.



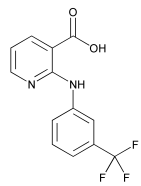
Niceverine

Change the chemical structure to read:



Niflumic Acid

Add the chemical structure to read:



Proposed and Recommended International Nonproprietary Names

International Nonproprietary Names (INN) are devised by the World Health Organization (WHO).

Under its charter, the WHO is empowered simply to *recommend* specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as *proposals* (''Proposed International Nonproprietary Names''). A period of four months from the date of publication in *WHO Drug Information* is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested parties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event that no objection is received, the WHO proceeds with listing and publishing the names so devised as *recommendations* (''Recommended International Nonproprietary Names''), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

Recommended International Nonproprietary Names

The following 52 nonproprietary names have been selected by the World Health Organization (WHO) as Recommended International Nonproprietary Names. This list, with chemical names or descriptions and the molecular formulae, appears in *WHO Drug Information,* Vol. 20, No. 1, 2006.

Recommended INN	Recommended INN	Recommended INN	Recommended INN
Apixaban	Ispronicline	Peforelin	Tasidotin
Apratastat	Istaroxime	Plerixafor	Tasquinimod
Arasertaconazole	Lecozotan	Plitidepsin	Terutroban
Bapineuzumab	Levolansoprazole	Pradefovir	Tesetaxel
Brivaracetam	Manitimus	Radequinil	Tretazicar
Caricotamide	Mapatumumab	Rimacalib	Udenafil
Catumaxomab	Nebicapone	Rivanicline	Valategrast
Dapiclermin	Nerispirdine	Rivenprost	Valopicitabine
Dexlansoprazole	Ofatumumab	Satavaptan	Volociximab
Dianicline	Olmesartan	Seletracetam	Yttrium (^{90}Y) Tacatuzumab Tetraxetan
Ecallantide	Padoporfin	Sipoglitazar	Zabofloxacin
Ertumaxomab	Pagibaximab	Sunitinib	Zalutumumab
Esmirtazapine	Paliroden	Surinabant	
Fosfluridine Tidoxil

PHARMACOPEIAL FORUM VOL. 32 NO. 6 NOV.–DEC. 2006

* The *USP–NF* (*USP 31–NF 26*), the *Supplement* (*Supp*), or the *Interim Revision Announcement* (*IRA*) for which the revision proposal is targeted is shown in parentheses next to each proposed item.

THE JOURNAL OF STANDARDS DEVELOPMENT AND OFFICIAL COMPENDIA REVISION

Please address comments on *PF* content to Executive Secretariat
USP–NF, 12601 Twinbrook Pkwy.,
Rockville, MD 20852

Telephone: 1-301-816-8345
Fax: 1-301-816-8373
http://www.usp.org

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI),* in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences.*

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

Printed in USA by Port City Press, Baltimore, Maryland

ISSN: 0363-4655

Moving?
Our subscribers' records and publication labels are computer-generated. Please send your new address, and your latest label, or an exact copy of it, to: USPC, *PF* Customer Service Dept., 12601 Twinbrook Parkway, Rockville, MD 20852.
Fax: (301) 816-8148.

STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum* (*PF*), for the development of official pharmaceutical standards.

USP publishes *Pharmacopeial Forum* (*PF*) bimonthly as the working vehicle of the USP Council of Experts. *PF* provides interested parties an opportunity to review and comment as the Council of Experts develops or revises standards for the *United States Pharmacopeia* and the *National Formulary* (*USP–NF*).

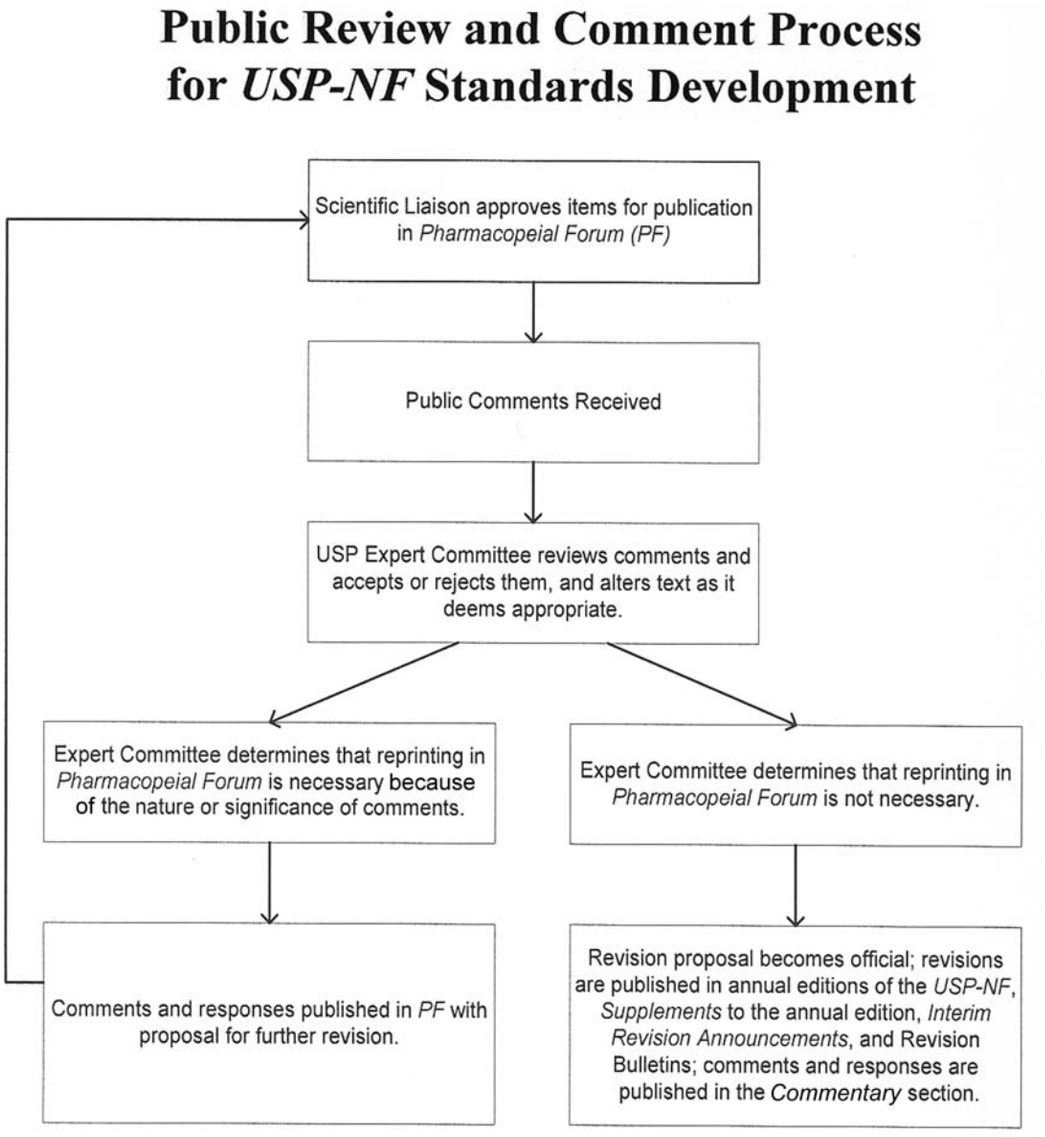
PF includes the following:

1. Potential revisions—entirely new standards, revision ideas, and drafts not yet targeted for official adoption (*Pharmacopeial Previews*)
2. Proposed revisions—new or revised standards targeted for official adoption (*In-Process Revision*)
3. Adopted revisions—new or revised standards that become official and binding before the publication of the next *USP–NF* or *Supplement* (*Interim Revision Announcement*)

USP welcomes comments and data on potential, proposed, or official standards.* Comments, along with USP's responses, will be published either in *PF Briefings*, the *Commentary* section of *PF*, the *Commentary* section of *Supplements* to *USP–NF*, or the *Commentary* section of *USP–NF*.

* If you are not immediately able to submit comments but you intend to do so, please notify USP by using the Intent to Comment form provided before the section *Chromatographic Reagents Used in USP–NF and PF*.

The chart below shows the public review and comment process and its relationship to standards development.



Questions on the process should be addressed to Director, Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: execsec@usp.org).

HOW TO USE *PF*

This section provides descriptions of the various parts of *PF*. It also includes *Committee Designations* and the *Staff Directory.*

The content of the different sections of *PF* is briefly described below. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a *Request for Revision* is available in the *Guideline for Submitting Requests for Revision to the USP–NF* on the USP website (www.usp.org/USPNF/submitMonograph/subGuide.html).

Proposed and Adopted Revisions to the *USP–NF*

Section	Content	How Readers Can Respond
Pharmacopeial Previews Early ideas for revisions	•BRIEFING: Scientific rationale for potential inclusion or change. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •Potential revisions not yet targeted for official adoption that require a longer public review and comment process because of issues such as: — the controversial nature of an item; — the application of new technologies that require further study; and — articles produced by multiple sources.	Review drafts and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview.*
In-Process Revision Revisions targeted for adoption	•BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see *Standards Development*). New or revised text is marked with symbols (■ or ● or ▲) to specify the tentative earliest date on which the revision would be officially adopted.	Review material and send comments promptly to USP staff liaison (see the *Staff Directory*). Guidelines on how to comment are found at the end of the *Policies and Announcements* section.
Harmonization Items the Pharmacopeial Discussion Group (PDG) is working to harmonize internationally	•BRIEFING: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. The stage determines whether an item appears under *Pharmacopeial Previews* or under *In-Process Revision,* both separate sections of *Harmonization.* •For *In-Process Revision,* new or revised text is marked with symbols (■) to specify the tentative, earliest date on which the revision would be officially adopted.	Review material and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview* or *In-Process Revision.*
Interim Revision Announcement Adopted standards	Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols ●.	Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance.
Pending Proposals	In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *PF* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in either the *USP–NF*, its supplements, or an *IRA*. Those items that have not yet been adopted are still pending.	Review items to track pending proposals.
Canceled Proposals	Canceled proposals are items that were published in *PF* and were pending, but have since been canceled. Note that canceled proposals may be republished to be considered in the future for adoption into the *USP–NF.*	Review items to track canceled proposals.

Other Sections

Committee Designations
Names of the committees (composed of volunteer scientific experts) that USP staff work with on the development of standards.

Staff Directory
Names of all USP scientific staff liaisons with contact information.

Policies and Announcements
- General scientific and policy issues affecting *USP–NF* standards and processes
- Update on standards-related issues being considered by USP
- Where to find summaries of meetings of the Council of Experts
- Guidelines on how to comment
- Publication and comment schedules

Stimuli to the Revision Process
- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

Nomenclature
- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the *USP Dictionary of USAN and International Drug Names*
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

Index
Cumulative directory for the content of all issues of *PF* beginning with *PF* 32(1).

Reference Standards Catalog
List of official USP Reference Standards specified in *USP–NF*, along with availability and ordering information.

Chromatographic Reagents Used in USP–NF and Pharmacopeial Forum
Update of chromatographic reagents based on the proposals published in this issue of *PF*.

POLICIES AND ANNOUNCEMENTS

This section includes information about general scientific and policy issues that may have an impact on *USP–NF* standards and processes and announcements about issues being considered by USP. This section also includes publication and comment schedules.

USP TO PUBLISH FOOD CHEMICALS CODEX. The U.S. Pharmacopeia (USP) will assume responsibility for publishing and distributing future editions of the *Food Chemicals Codex,* a compendium of standards that promotes the quality and safety of food additives such as preservatives, flavoring, coloring, and nutrients.

First published in 1966, the *Food Chemicals Codex* is cited in U.S. law and widely used for industry self-regulation and regulatory oversight by the Food and Drug Administration. The *Food Chemicals Codex,* currently in its fifth edition, has been an activity of the Food and Nutrition Board of the Institute of Medicine, with monographs developed by the voluntary experts of the Committee on Food Chemicals Codex.

USP anticipates publishing the sixth edition in the summer of 2007. Until publication of the sixth edition, the *Food Chemicals Codex: Fifth Edition* and its first supplement will continue to be the authoritative source, available through the National Academies Press at www.nap.edu or via electronic subscription at http://www.knovel.com.

The process for establishing standards for the *Food Chemicals Codex* will mirror that used for the *United States Pharmacopeia* and *National Formulary (USP–NF).* This process includes publication of proposed standards for public review and comment, and decision-making by the Expert Committees of the USP Council of Experts, a distinguished body of voluntary experts who are responsible for USP's scientific determinations and standards-setting.

For more information, contact Catherine Sheehan, Director, Excipients (301-816-8262 or cxs@usp.org).

USP PARTNERS WITH THE INDIAN PHARMACOPOEIA. On August 1, 2006, the Indian Pharmacopoeia Commission (IPC) and USP signed a Memorandum of Understanding (MoU) to promote greater cooperation through the exchange of information and to increase awareness of the importance of the quality and safety of medicines. The signing ceremony took place at the Nirman Bhavan, Ministry of Health and Family Welfare in New Delhi. The MoU provides for IPC and USP collaboration on regional scientific conferences, seminars, training, and workshops. It will also facilitate communication and activity to obtain the necessary information and chemicals to develop monographs and reference standards of mutual interest, and promote collaboration on testing for reference standards. The MoU is another example of USP's commitment to working with partners in India. The IPC is a member organization of the USP Convention.

IN MEMORIAM.

William W. Wright, Ph.D.

It is with great sorrow that USP reports the passing of a pharmacopeial legend, Dr. William Wynn Wright, on July 15, 2006.

For those of us who were privileged to know and work closely with Dr. Wright, his death also represents the passing of an era. He was an internationally recognized expert in antibiotics and was instrumental in the transfer of antibiotic standards from FDA to USP. Following a career of 33 years at the Food and Drug Administration, during which he advanced to become deputy director of the Office of Pharmaceutical Research and Testing overseeing certification of antibiotics and insulin, Dr. Wright served for over 25 years at USP as the Scientific Liaison for the Antibiotics and Chemistry Subcommittee/ Pharmaceutical Analysis 7 Expert Committee. He also served as a U.S. representative and an expert on pharmaceutical sciences for the World Health Organization for 30 years. In 2004, he was recognized by two associations in India for his contributions and services to the field of pharmaceutical analytical chemistry.

Many were impressed by his vast knowledge of antibiotic drugs and compendial standards, but they were even more impressed by his refined and courteous manner of personal conduct. He always made time to help others, and many within USP remember him as a mentor and friend. He talked with pride about his children, grandchildren and great-grandchildren and spoke fondly of his wife, Tess, and their life together.

Dr. Wright's charm and graciousness to all will be a legacy forever. Knowing him enriched all of our lives.

USP RULES AND PROCEDURES OF THE COUNCIL OF EXPERTS REVISED, REFLECTING CHANGES TO THE STANDARDS-SETTING PROCESS. The 2005–2010 USP Council of Experts has voted to approve changes to the *Rules and Procedures of the 2005–2010 Council of Experts,* which were originally adopted on a provisional basis in April 2005. Pursuant to USP's Bylaws, the revised Rules and Procedures were made available to USP's Convention membership for comment, reviewed and approved by USP's Board of Trustees and formally adopted by the Council of Experts. The effective date for these changes was September 1, 2006.

While the revised *Rules and Procedures* and details about the changes are posted on USP's website (http://www.usp.org/USPNF/notices/), the following summarizes those changes:

- A strengthened ability for Expert Committees to make final decisions on standards without multiple resubmissions to *PF*.
- An increased responsibility by USP to respond to public comments, both to the commenter and in the *USP–NF* or *Supplement*.
- The ability for increased use of the USP website for the standards-setting process.
- Provisions for Information Expert Committees, which were previously omitted due to the delay in electing Information Expert Committee chairs and members.
- Provisions for several new USP initiatives, including Standards for Articles Legally Marketed Outside the U.S. (SALMOUS), Standards for Articles Pending FDA Approval (SAPFA), and *USP–NF* translations.
- Provisions to enable a third classification of observers, FDA Observers, to participate in USP Expert Committee meetings.
- Miscellaneous clarifications/corrections.

Please direct any comments or questions on this topic to Susan de Mars, Chief Legal Officer (301-816-8296 or sdm@usp.org).

USP DISCONTINUES USE OF INTENT TO COMMENT FORM. Beginning with the next issue of *Pharmacopeial Forum,* the Intent to Comment form will no longer exist. Previously, the comment period for each issue of *PF* was 60 days. In 2005, the comment period was increased to 90 days. With this expansion in the comment period, it was no longer viewed as necessary or appropriate to allow further extensions of time to comment through the Intent to Comment form. In order for a comment on a proposed revision to be considered by the Expert Committee in determining whether and how a proposed revision should proceed, it must be received within the 90-day comment period.

Please direct any comments or questions on this topic to Beryl Voigt, Director, Executive Secretariat (301-816-8155 or execsec@usp.org).

IMPLEMENTATION PERIOD FOR UPCOMING OFFICIAL REVISIONS TO THE *USP–NF* EXTENDED. To provide additional time to adopt revisions made to the compendia, USP is pleased to announce that effective beginning with the publication of *USP 30–NF 25,* implementation periods for revisions to official text in *United States Pharmacopeia–National Formulary (USP–NF)* and its *Supplements* are being extended. This change responds to stakeholder requests (see the *Pharmacopeial Forum (PF)* 31(2) *Stimuli* article, "The USP Revision Process: Recommendations for Enhancements"). As a result of this change, users will have six months from the publication date to implement new official texts as opposed to the previous 60-day period. *USP 29–NF 24* remains official until May 1, 2007. The complete revised Publication Schedule for *USP 30–NF 25* reflecting this new six-month implementation period is outlined below.

Publication Schedule for *USP 30–NF 25*

***USP–NF* Publication**	**Publication Date**	**Official Date**
USP–NF (Book)	November 2006	May 1, 2007
Supplement One	February 2007	August 1, 2007
Supplement Two	June 2007	December 1, 2007

Users may implement the newly official texts prior to the official date and the use becomes mandatory on the official date.

Please direct any comments or questions on this topic to Beryl Voigt, Director, Executive Secretariat (301-816-8155 or execsec@usp.org).

ERRATA FOR SPANISH EDITION OF *USP–NF* TO APPEAR ON WEBSITE. A Spanish version of the list of errata and corrections to the *Spanish Edition* of the *USP–NF* is available on the USP Spanish website. The errata are presented as a cumulative table and, if necessary, will be updated concurrently with every issue of *PF*. This information will also be published in each *Supplement* of the *Spanish Edition* of *USP–NF* and will appear in its corrected form in a future annual edition of these compendia. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

CATALOG TO BE REMOVED FROM *PHARMACOPEIAL FORUM* PRINT PUBLICATION. Starting with *Pharmacopeial Forum (PF)* 33(1), the *USP Catalog* will no longer be included in the back of the publication. This change was made to reduce the bulk of the publication and, therefore, increase ease of handling and use.

The *USP Catalog* is still available in online and stand-alone print versions. Online bi-monthly and daily catalogs can be accessed at www.usp.org/referenceStandards/catalog.html. To receive the *USP Catalog* in print (via postal mail) along with monthly e-mail alerts that will keep you informed about new Reference Standards, availability, and current lots, send an e-mail to marketing@usp.org or call 301-816-8237.

STIMULI ARTICLES TO BE POSTED ON USP'S WEBSITE. Starting in January 2007, the *Stimuli* articles that are published in *Pharmacopeial Forum* will be simultaneously published on USP's website. Look for them at www.usp.org. For more information, please contact Stefan Schuber, Ph.D., Director, Scientific Reports (301-816-8551 or sps@usp.org).

PHARMACOPEIAL EDUCATION COURSES. USP's Pharmacopeial Education courses offer specialized instruction for chemists, other scientists, and professionals in the pharmaceutical and allied industries. USP scientists, who play a key role in establishing official USP standards, teach these courses and provide expert insights on the practical applications of official test procedures and best practices in using the *USP–NF* and other USP resources. The courses also give participants an opportunity to learn how to get involved in USP's standards-setting processes and the benefits of participating in standards development. Courses offered in 2006 are listed below. For more information and to register, visit www.usp.org/goto/pe. To discuss how USP can bring courses to a location of your choice, call 301-816-8589, or e-mail PharmacopeialEducation@usp.org.

Calendar of Forthcoming Pharmacopeial Education Courses as of September 1, 2006

Date	Name of Course	Location	Price
The Americas			
16-Nov-06	Introduction to HPCL	Raleigh, NC	$450
30-Nov-06	Effectively Using the USP–NF—Sessions I & II	San Francisco, CA	$595
6-Dec-06	Effectively Using the USP–NF—Sessions I & II	Cambridge, MA	$595
7-Dec-06	Analytical Method Validation	Dallas, TX	$595
Europe/ Middle East/ Africa/ India			
7-Nov-06	Analytical Method Validation	Milan, Italy (with Nova Chimica)	[2]
8-9 Nov-06	Fundamentals of Dissolution—Lecture and Laboratory (in English with assistance for Italian)	Milan, Italy (with Sotax)	[1]
14-15 Nov-06	Fundamentals of Dissolution—Lecture and Laboratory (in English with assistance for Italian)	Rome, Italy (with Sotax)	[1]

[1] Registration handled by:

VISIT THE USP WEB SITE AT ⟨http://www.usp.org⟩. Various resources related to Pharmacopeial standards are presented, including highlights from *PF*.

INTERNATIONAL CORRESPONDENCE. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia, with a copy to USP, for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows:

Technical Secretariat of the European
Pharmacopoeia Commission
B.P. 907
F 67029 Strasbourg Cedex 1
France

NAKASHIMA Nobumasa
Evaluation and Licensing Division
Pharmaceutical and Medical Safety Bureau
Ministry of Health, Labour and Welfare, Japan
Tel. +81-3-3595-2431, Fax +81-3-3597-9535
E-mail: nakashima-nobumasa@mhlw.go.jp

HOW TO SUBMIT COMMENTS. The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. Submissions concerning a particular item that has appeared in an issue of *PF* should be submitted to the appropriate USP scientific staff liaison identified at the end of the *Briefing* accompanying each item. To submit comments and data to a liaison, use the e-mail address and telephone numbers listed in the *Staff Directory* included in every *PF*.

Please note that *USP–NF* is being published in an annual edition with one main book and two *Supplements* a year. In addition, the schedule provided below will repeat every year so that users will know what to expect and become familiar with the deadlines.

For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or FAX number 301-816-8373.

***PHARMACOPEIAL FORUM* PUBLIC REVIEW AND COMMENT PERIOD DEADLINES.** The full year's listing of comment period deadlines and the targeted official publications appears below. In accordance with the Rules and Procedures of the 2005–2010 Council of Experts, USP has implemented a 90-day comment period by providing a deadline for each issue of *PF* unless otherwise stated in the individual briefing. As previously indicated, due to the comment deadlines extension, the Intent to Comment form will no longer be used and will be removed from *PF*.

The listing of comment period deadlines and the targeted official publications appears below.

Pharmacopeial Forum	Comment Deadline	Targeted Official Publication	Publication Date	Official Date
PF 32(4)	October 16, 2006	*USP 30–NF 25 2nd Supplement*	June 2007	December 2007
PF 32(5)	December 15, 2006			
PF 32(6)	February 15, 2007	*USP 31–NF 26*	November 2007	May 2008
PF 33(1)	April 16, 2007			
PF 33(2)	June 15, 2007	*USP 31–NF 26 1st Supplement*	February 2008	August 2008
PF 33(3)	August 15, 2007			
PF 33(4)	October 15, 2007	*USP 31–NF 26 2nd Supplement*	June 2008	December 2008
PF 33(5)	December 15, 2007			

All official revisions are published in the annual edition or *Supplements* to *USP–NF* (twice yearly). Between these publications, official revisions are published in *PF* in the *Interim Revision Announcement;* these revisions are also incorporated in the upcoming *Supplement.* The official publication in which an *IRA* is incorporated will depend upon publication deadlines. The 5th *IRA* and the 6th *IRA* will not appear until *Supplement 1*. See table below. The electronic version of *USP–NF* is updated as each *Supplement* becomes available and, therefore, contains all official text up to and including the contents of the latest *Supplement.* The new table below outlines the publications and their release and official dates, and the book or supplement which supersedes them.

Publication Schedules

Publication	Release Date	Official Date	Superseded by
4th *IRA* [*PF* 32(4)]	July 1, 2006	Aug. 1, 2006	*USP 30–NF 25*
5th *IRA* [*PF* 32(5)]	Sept. 1, 2006*	Oct. 1, 2006*	*1st Supplement*
6th *IRA* [*PF* 32(6)]	Nov. 1, 2006*	Dec. 1, 2006*	*1st Supplement*
USP 30–NF 25	Nov. 1, 2006*	May 1, 2007*	*1st Supplement*
IRA [*PF* 33(1)]	Jan. 1, 2007*	Feb. 1, 2007*	*2nd Supplement*
1st Supplement	Feb. 1, 2007*	Aug. 1, 2007*	*2nd Supplement*
IRA [*PF* 33(2)]	Mar. 1, 2007*	Apr. 1, 2007*	*2nd Supplement*
IRA [*PF* 33(3)]	May 1, 2007*	June 1, 2007*	*USP 31–NF 26*
2nd Supplement	June 1, 2007*	Dec. 1, 2007*	*USP 31–NF 26*
IRA [*PF* 33(4)]	July 1, 2007*	Aug. 1, 2007*	*USP 31–NF 26*
IRA [*PF* 33(5)]	Sept. 1, 2007*	Oct. 1, 2007*	*1st Supplement to USP 31– NF 26*
IRA [*PF* 33(6)]	Nov. 1, 2007*	Dec. 1, 2007*	*1st Supplement to USP 31– NF 26*
USP 31–NF 26	Nov. 1, 2007*	May 1, 2008*	*1st Supplement to USP 31– NF 26*

* Tentative

PRIORITY NEW MONOGRAPH ITEMS. USP is seeking monographs for the following drug substances and drug products that are or soon will be off patent and thus are of the highest priority. USP also is seeking monographs for the excipients listed below. Monographs are marked received upon receipt of monograph proposal. Received monographs are removed from this list upon publication in *Pharmacopeial Forum.* (This list has been updated as of September 1, 2006.) For additional information, contact Karen A. Russo, Ph.D., kar@usp.org. Monograph sponsors should consult USP's *Guideline for Submitting Requests for Revision to the USP–NF.*

Noncomplex Actives (Drug Substances)

Acarbose	Alatrofloxacin Mesylate	Alfuzosin
Allopurinol Sodium	Aminopromazine Fumarate	Aminopterin Sodium
Anagrelide Hydrochloride	Arsenic Trioxide	Azelaic Acid
Balsalazide Disodium	Bentoquatam	Bepridil Hydrochloride
Bivalirudin	Cabergoline	Calcipotriene
Calcium Trisodium Pentetate	Calfactant	Candesartan Cilexetil
Carmustine ***(Received)***	Cefdinir ***(Received)***	Cefditoren Pivoxil
Ceftibuten	Cetrorelix	Cevimeline
Chloroxine	Colfosceril	Cytarabine Liposome
Dalfopristin	Dapirazole Hydrochloride	Desirudin
Desonide ***(Received)***	Dexrazoxane	Difloxacin Hydrochloride
Docosanol	Entacapone	Epoprostenol Sodium ***(Received)***
Erythromycin Phosphate	Erythromycin Thiocyanate	Esmolol
Esomeprazole Magnesium ***(Received)***	Estazolam	Estradiol Benzoate ***(Received)***
Estramustine Phosphate Sodium	Ethanolamine Oleate	Etomidate ***(Received)***
Etoposide Phosphate	Exemestane	Felbamate
Flavoxate Hydrochloride	Fluoromethane F 18	Foscarnet Sodium ***(Received)***
Fosfomycin Tromethamine ***(Received)***	Gadobenate Dimeglumine	Gadopentetic Acid
Galantamine Hydrobromide ***(Received)***	Gallium Nitrate	Ganirelix
Glyceryl Aminobenzoate	Granisetron	Halobetasol Propionate ***(Received)***
Haloperidol Decanoate ***(Received)***	Hydrocodone Polistirex	Ibandronate Sodium
Imipramine Pamoate	Imiquimod	Irinotecan
Isosulfan Blue	Itraconazole ***(Received)***	Lamotrigine ***(Received)***
Latanoprost	Lawsone	Levetriacepam
Levobetaxolol	Levomethadyl Acetate	Lomustine
Lopinavir	Metipranolol Hydrochloride	Midazolam Hydrochloride
Mifepristone ***(Received)***	Miglitol	Misoprostol ***(Received)***
Mivacurium	Moexipril	Nalbuphine Hydrochloride
Nalmefene Hydrochloride	Nateglinide ***(Received)***	Nedocromil Sodium
Nicardipine Hydrochloride	Nilutamide	Nisoldipine
Olopatadine	Olsalazine Sodium ***(Received)***	Orbifloxacin ***(Received)***
Orlistat ***(Received)***	Oxcarbazepine ***(Received)***	Pantoprazole Sodium ***(Received)***
Pemoline	Pentamidine Isethionate ***(Received)***	Piperonyl Butoxide
Pirbuterol Acetate	Poractant Alpha	Proguanil
Quetiapine Fumarate ***(Received)***	Rose Bengal	Salmeterol Xinafoate
Sertraline Hydrochloride ***(Received)***	Sodium Phenylbutyrate	Sterile Methotrexate Sodium
Streptozocin	Sulfacytine	Tacrolimus
Terbinafine Hydrochloride ***(Received)***	Terconazole ***(Received)***	Tiludronate Disodium
Tiopronin	Tranexamic Acid ***(Received)***	Trimipramine Maleate ***(Received)***
Trovafloxacin Mesylate	Voriconazole	Zinc Tridosium Pentetate

Noncomplex Actives (Drug Products)

Abacavir Sulfate, Lamivudine, and Zidovudine Tablets	Acarbose Tablets	Acetaminophen, Butalbital, Caffeine, and Codeine Phosphate Capsules
Acetaminophen, Clemastine Fumarate, and Pseudoephedrine Hydrochloride Tablets	Acetazolamide Extended-Release Capsules	Albuterol Extended-Release Tablets
Albuterol for Inhalation	Albuterol Inhalation Aerosol	Alendronate Sodium Oral Solution
Alfuzosin Tablets	Allopurinol for Injection	Alprazolam Extended-Release Tablets
Alprostadil Urethral Suppository	Aminopromazine Fumarate and Neomycin Sulfate Tablets	Aminopromazine Fumarate Injection
Aminopromazine Fumarate Tablets	Aminopterin Sodium Tablets	Amlodipine and Benazepril Hydrochloride Capsules

Noncomplex Actives (Drug Products) *(Continued)*		
Amphotericin B Injection	Anagrelide Hydrochloride Capsules	Arsenic Trioxide Injection
Atovaquone and Proguanil Hydrochloride Tablets	Atovaquone Tablets	Auranofin Capsules
Azatadine Maleate and Pseudoephedrine Sulfate Extended-Release Tablets	Azelaic Acid Cream	Azithromycin for Injection ***(Received)***
Azithromycin Tablets	Baclofen Injection	Balsalazide Disodium Capsules
Beclomethasone Dipropionate Inhalation Aerosol	Beclomethasone Dipropionate Nasal Suspension	Bentoquatam Topical Suspension
Benzocaine and Cetylpyridinium Chloride Lozenges	Benzocaine and Menthol Lotion	Benzphetamine Hydrochloride Tablets
Bepridil Tablets	Bicalutamide Tablets	Bivalirudin Injection
Brompheniramine Maleate, Dextromethorphan Hydrobromide, and Pseudoephedrine Hydrochloride Oral Solution	Budesonide Inhalation Aerosol	Bupivacaine and Lidocaine Hydrochlorides Injection
Buprenorphine Hydrochloride Injection	Butalbital and Acetaminophen Capsules	Butalbital and Acetaminophen Tablets
Calcipotriene Cream	Calcipotriene Ointment	Calcipotriene Topical Solution
Cabergoline Tablets	Calcitriol Capsules	Calcitriol Oral Solution
Calcium Acetate Capsules	Calcium Trisodium Pentetate Injection	Calfactant Intratracheal Suspension
Carbidopa and Levodopa Extended-Release Tablets ***(Received)***	Carbidopa and Levodopa Tablets for Oral Suspension ***(Received)***	Carbidopa, Levodopa, and Entacapone Tablets
Carmustine for Injection ***(Received)***	Carmustine Implant	Carvedilol Tablets ***(Received)***
Cefdinir Tablets	Cefditoren Pivoxil Tablets	Ceftibuten Capsules
Ceftibuten for Oral Suspension	Ceftiofur Hydrochloride Oral Suspension	Cetirizine Hydrochloride Oral Solution
Cetirizine Hydrochloride Tablets ***(Received)***	Cetrorelix Injection	Cevimeline Hydrochloride Capsules
Chloroxine Cream	Chlorpromazine Hydrochloride Extended-Release Capsules	Choline and Magnesium Salicylates Oral Solution
Choline and Magnesium Salicylates Tablets	Choline Salicylate Oral Solution ***(Received)***	Ciclopirox Shampoo
Ciclopirox Topical Gel	Ciclopirox Topical Solution	Cilostazol Tablets ***(Received)***
Cimetidine Oral Solution	Ciprofloxacin Hydrochloride and Hydrocortisone Otic Suspension	Ciprofloxacin Otic Solution
Citalopram Hydrobromide Oral Solution	Citric Acid, Gluconolactone, and Magnesium Carbonate Irrigation	Cladribine Injection
Clemastine Fumarate Syrup	Clobetasol Propionate Gel	Clonazepam Orally-Disintegrating Tablets
Clorazepate Dipotassium Capsules	Clorazepate Dipotassium Extended-Release Tablets	Clotrimazole and Betamethasone Dipropionate Lotion
Colestipol Hydrochloride Tablets	Colfosceril and Tyloxapol Suspension	Compound Undecylenic Acid Cream
Compound Undecylenic Acid Topical Powder	Conjugated Estrogens and Medroxyprogesterone Acetate Tablets	Cromolyn Sodium Nasal Solution
Cyclosporine Modified Capsules	Cyclosporine Modified Oral Solution	Cyclosporine Ointment
Cyclosporine Topical Solution	Cysteamine Bitartrate Capsules	Cytarabine Liposome Injection
Dalfopristin and Quinupristin Injection	Dantrolene Sodium Oral Suspension	Dapiprazole for Ophthalmic Solution
Desirudin for Injection	Desonide Cream	Dexrazoxane for Injection
Dextroamphetamine Sulfate Extended-Release Capsules	Dextromethorphan Polistirex Extended-Release Oral Suspension	Diazepam Injectable Emulsion
Diclofenac Sodium Ophthalmic Solution	Diethylpropion Hydrochloride Extended-Release Tablets	Difenoxin and Atropine Tablets
Difloxacin Hydrochloride Tablets	Dihydroergotamine Mesylate Metered Spray	Diltiazem Malate Extended-Release Tablets
Dinoprostone Vaginal Suppositories	Diphenhydramine Hydrochloride and Acetaminophen Tablets	Divalproex Sodium Delayed-Release Capsules
Dorzolamide and Timolol Ophthalmic Solution	Dorzolamide Ophthalmic Solution	Doxacurium Chloride Injection
Doxepin Hydrochloride Cream	Doxycycline Oral Gel	Econazole Nitrate Cream
Edrophonium Chloride and Atropine Sulfate Injection	Enalapril Maleate and Diltiazem Malate Extended-Release Tablets	Enalapril Maleate and Felodipine Extended-Release Tablets
Enalaprilat Injection	Entacapone Tablets	Ephedrine Sulfate and Guaifenesin Tablets
Epoprostenol for Injection	Epoprostenol Injection	Esmolol Hydrochloride Injection
Esomeprazole Magnesium Capsules	Estazolam Tablets	Estramustine Phosphate Sodium Capsules
Ethanolamine Oleate Injection	Etidronate Disodium Injection Concentrate	Etomidate Injection

Noncomplex Actives (Drug Products) *(Continued)*

Exemestane Tablets	Famotidine Orally Disintegrating Tablets	Felbamate Oral Suspension
Felbamate Tablets	Fentanyl Lozenges	Fentanyl Transdermal System ***(Received)***
Ferrous Fumarate and Docusate Sodium Extended-Release Capsules	Flavoxate Hydrochloride Tablets	Fluconazole Injection ***(Received)***
Fluconazole Tablets	Flunisolide Inhalation Aerosol	Flunisolide Nasal Spray
Fluocinolone Acetonide Shampoo	Fluorescein Sodium Ophthalmic Solution	Fluorometholone Ointment
Fluticasone Propionate Cream ***(Received)***	Fluticasone Propionate Inhalation Powder	Fluticasone Propionate Ointment ***(Received)***
Fluticasone Propionate Pressurized Inhaler	Foscarnet Sodium Injection	Fosfomycin for Oral Solution
Gabapentin Oral Solution	Gabapentin Tablets ***(Received)***	Gadobenate Dimeglumine Injection
Galantamine Tablets ***(Received)***	Gallium Nitrate Injection	Ganciclovir Capsules
Ganirelix Acetate Injection	Gatifloxacin Injection	Gatifloxacin Tablets
Gentamicin Sulfate Oral Solution	Gentamicin Sulfate Soluble Powder	Glimepiride Tablets ***(Received)***
Glipizide Extended-Release Tablets	Granisetron Injection	Granisetron Tablets
Guaifenesin and Salts of Dextromethorphan and Pseudoephedrine Oral Solution	Guaifenesin and Pseudoephedrine Hydrochloride Extended-Release Tablets	Guanidine Hydrochloride
Guanidine Hydrochloride Tablets	Halobetasol Propionate Cream	Halobetasol Propionate Ointment
Haloperidol Decanoate Injection	Haloperidol Lactate Injection	Haloperidol Lactate Oral Concentrate
Hydralazine Hydrochloride and Hydrochlorothiazide Capsules	Hydrochlorothiazide Capsules	Hydrochlorothiazide Oral Solution Concentrate
Hydrocodone Bitartrate and Acetaminophen Oral Solution	Hydrocodone Bitartrate and Aspirin Tablets	Hydrocodone Bitartrate and Guaifenesin Oral Solution
Hydrocodone Bitartrate and Homatropine Methylbromide Syrup	Hydrocodone Bitartrate and Homatropine Methylbromide Tablets	Hydrocortisone Acetate Dental Paste
Hydrocortisone Acetate Rectal Foam Aerosol	Hydrocortisone Butyrate Lotion	Hydroflumethiazide and Reserpine Tablets
Hydromorphone Hydrochloride Oral Solution ***(Received)***	Hydroquinone Lotion	Ibandronate Sodium Tablets
Ibuprofen Capsules	Idarubicin Hydrochloride Injection	Imipramine Pamoate Capsules
Imiquimod Topical Cream	Ipratropium Bromide Inhalation Aerosol	Ipratropium Bromide Inhalation Solution
Irinotecan Hydrochloride Injection	Isosulfan Blue Injection	Isradipine Extended-Release Tablets
Itraconazole Injection	Itraconazole Oral Solution	Ketoconazole Cream
Ketoconazole Shampoo	Ketoprofen Capsules ***(Received)***	Ketoprofen Extended-Release Capsules
Ketoprofen Tablets	Ketotifen Fumarate	Ketotifen Fumarate Ophthalmic Solution
Lactic Acid Lotion	Lamivudine Tablets ***(Received)***	Latanoprost Ophthalmic Solution
Leucovorin Calcium for Injection	Levetriacepam Tablets	Levobetaxolol Ophthalmic Suspension
Levocabastine Ophthalmic Suspension	Levofloxacin Solution	Levomethadyl Acetate Hydrochloride Oral Concentrate
Lincomycin Hydrochloride and Spectinomycin Sulfate Soluble Powder	Liothyronine Injection	Lisinopril and Hydrochlorothiazide Tablets ***(Received)***
Lomustine Capsules	Lopinavir and Ritonavir Solution	Lopinavir Capsules
Lopinavir Solution	Loratadine and Pseudoephedrine Sulfate Extended-Release Tablets ***(Received)***	Loratadine Orally-Disintegrating Tablets
Losartan Potassium Tablets	Mefloquine Hydrochloride Tablets	Melphalan for Injection
Mesalamine Suppositories	Mesoridazine Besylate Concentrate	Metaraminol Bitartrate Injection
Methacholine Chloride for Inhalation Solution	Methadone Hydrochloride Oral Concentrate	Methocarbamol and Aspirin Tablets
Methoxsalen Softgels	Methyclothiazide and Deserpidine Tablets	Methylphenidate Hydochloride Chewable Tablets
Metipranolol Ophthalmic Solution	Metronidazole Capsules	Metronidazole Cream
Metronidazole Extended-Release Tablets	Metronidazole Hydrochloride for Injection	Metronidazole Lotion
Miconazole Nitrate Topical Aerosol	Midazolam Injection ***(Received)***	Mifepristone Tablets
Miglitol Tablets	Milrinone Injection	Misoprostol Tablets ***(Received)***
Mivacurium In Dextrose Injection	Mivacurium Injection	Moexipril Hydrochloride and Hydrochlorothiazide Tablets
Moexipril Hydrochloride Tablets	Molindone Hydrochloride Oral Solution	Morphine Sulfate for Injection Concentrate
Morphine Sulfate Oral Solution	Morphine Sulfate Oral Solution Concentrate	Morphine Sulfate Tablets

Noncomplex Actives (Drug Products) *(Continued)*		
Mycophenolate Mofetil Capsules	Mycophenolate Mofetil Oral Solution	Mycophenolate Mofetil Tablets
Nalbuphine Hydrochloride Injection	Nalmefene Hydrochloride Injection	Naphazoline Hydrochloride and Pheniramine Maleate Ophthalmic Solution
Naproxen Extended-Release Tablets	Nateglinide Tablets	Nedocromil Sodium Inhalation Aerosol
Neomycin Sulfate Oral Powder	Nicardipine Hydrochloride Capsules	Nilutamide Tablets
Nimodipine Capsules	Nisoldipine Extended-Release Tablets	Nitroglycerin Solution in Acrylic Adhesive
Nizatidine Tablets	Ofloxacin in Dextrose Injection	Ofloxacin Injection
Ofloxacin Tablets ***(Received)***	Olopatadine Ophthalmic Solution	Olsalazine Sodium Capsules
Ondansetron Tablets	Orbifloxacin Tablets ***(Received)***	Orlistat Capsules ***(Received)***
Orphenadrine Citrate Extended-Release Tablets	Orphenadrine Citrate, Aspirin, and Caffeine Tablets	Oxcarbazepine Suspension
Oxcarbazepine Tablets	Oxiconazole Cream	Pantoprazole Sodium for Injection
Pantoprazole Sodium Tablets	Paroxetine Hydrochloride Extended-Release Tablets	Paroxetine Oral Suspension
Pemirolast Potassium Ophthalmic Solution	Pemoline Tablets	Penicillin G Potassium Tablets for Oral Solution
Pentaerythritol Tetranitrate Extended-Release Capsules	Pentaerythritol Tetranitrate Extended-Release Tablets	Pentamidine Isethionate for Inhalation
Pentamidine Isethionate for Injection	Pentazocine Hydrochloride and Acetaminophen Tablets	Phendimetrazine Tartrate Extended-Release Capsules
Phenobarbital Capsules	Phentermine Resin Complex	Phentermine Resin Complex Capsules
Phenylephrine Hydrochloride and Chlorpheniramine Maleate Extended-Release Capsules	Phenylephrine Hydrochloride, Chlorpheniramine Maleate, and Acetaminophen Extended-Release Tablets	Pilocarpine Hydrochloride Ophthalmic Gel
Pilocarpine Hydrochloride Ophthalmic Ointment	Pilocarpine Hydrochloride Tablets	Piperonyl Butoxide and Pyrethrins Aerosol Foam
Pirbuterol Acetate Inhalation Aerosol	Poractant Alpha Supension	Porfimer Sodium for Injection
Povacrylate Solution	Povacrylate-Iodine Topical Solution	Povidone-Iodine Gauze
Povidone-Iodine Swabsticks	Povidone-Iodine Topical Aerosol Foam	Povidone-Iodine Vaginal Suppositories
Pramipexole Dihydrochloride Tablets	Prazosin Hydrochloride and Polythiazide Capsules	Prednisolone Sodium Phosphate Oral Solution
Prochlorperazine Maleate Extended-Release Capsules	Progesterone Capsules	Promethazine and Phenylephrine Hydrochlorides and Codeine Phosphate Syrup
Promethazine and Phenylephrine Hydrochlorides Syrup	Promethazine Hydrochloride and Codeine Phosphate Oral Solution	Promethazine Hydrochloride and Dextromethorphan Hydrobromide Syrup
Propafenone Hydrochloride Tablets	Pseudoephedrine Hydrochloride and Brompheniramine Maleate Extended-Release Tablets	Pseudoephedrine Hydrochloride and Naproxen Sodium Extended-Release Tablets
Pseudoephedrine Hydrochloride, Chlorpheniramine Maleate, and Codeine Phosphate Oral Solution	Pseudoephedrine Hydrochloride, Guaifenesin, and Codeine Phosphate Oral Solution	Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Extended-Release Tablets
Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Oral Solution	Pseudoephedrine Sulfate, Dexbrompheniramine Maleate, and Acetaminophen Extended-Release Tablets	Pseudoephedrine Sulfate, Dexbrompheniramine Maleate, and Acetaminophen Extended-Release Tablets
Quinidine Sulfate Injection	Ramipril Capsules	Ranitidine Capsules
Rauwolfia Serpentina and Endroflumethiazide Tablets	Reserpine and Polythiazide Tablets	Rimantadine Hydrochloride Oral Solution
Risperidone Oral Solution	Risperidone Orally Disintegrating Tablets	Rivastigmine Tartrate Capsules
Rivastigmine Tartrate Oral Solution	Rocuronium Bromide Injection	Ropinirole Hydrochloride Tablets
Rose Bengal Ophthalmic Solution	Rosiglitazone Maleate Tablets	Salicylic Acid and Sulfur Cleansing Lotion
Salicylic Acid and Sulfur Lotion	Salicylic Acid and Sulfur Shampoo	Salicylic Acid Cream
Salicylic Acid Ointment	Salmeterol Inhalation Aerosol	Salmeterol Xinafoate Inhalation Powder
Scopolamine Transdermal System	Selegiline Hydrochloride Capsules	Serpacwa Topical Cream
Sertraline Hydrochloride Oral Solution	Sibutramine Hydrochloride Capsules	Sodium Bicarbonate and Sodium Citrate for Oral Solution
Sodium Bicarbonate, Sodium Citrate, and Sodium Tartrate for Oral Suspension	Sodium Chlorophyllin Copper Complex Tablets	Sodium Iodide Injection
Sodium Phenylbutyrate Oral Powder	Sodium Phenylbutyrate Tablets	Sodium Phosphates for Oral Suspension
Sodium Phosphates Tablets	Sodium Salicylate and Sulfur Shampoo	Sterile Talc Aerosol
Streptozocin for Injection	Sucralfate Oral Suspension	Sulconazole Nitrate Cream

Noncomplex Actives (Drug Products) *(Continued)*

Sulfacetamide Sodium and Fluorometholone Ophthalmic Suspension	Sulfacetamide Sodium and Prednisolone Sodium Phosphate Ophthalmic Solution	Sulfacytine Tablets
Sulfanilamide Vaginal Cream	Sulfasalazine Oral Suspension	Sulisobenzone Lotion
Sumatriptan Injection	Sumatriptan Tablets	Tacrolimus Capsules
Tacrolimus Injection	Tacrolimus Ointment	Tamsulosin Hydrochloride Capsules ***(Received)***
Technetium Tc 99m Teboroxime Injection	Tenofovir Disoproxil Fumarate Tablets	Terbinafine Hydrochloride Cream
Terbinafine Tablets	Terbinafine Topical Solution	Terconazole Vaginal Cream
Terconazole Vaginal Suppositories	Testosterone Transdermal System	Tetracycline Hydrochloride Periodontal Fiber
Theophylline Extended-Release Tablets	Tioconazole Vaginal Ointment	Tiopronin Tablets
Tolnaftate Topical Aerosol Solution	Topiramate Capsules ***(Received)***	Topiramate Tablets
Torsemide Injection	Torsemide Tablets ***(Received)***	Trandolapril and Verapamil Hydrochloride Extended-Release Tablets
Trandolapril Tablets	Tranexamic Acid Injection	Tranylcypromine Sulfate
Tranylcypromine Sulfate Tablets	Tretinoin Capsules	Tretinoin Microsphere Gel
Triamcinolone Acetonide Nasal Suspension	Trifluridine Ophthalmic Solution	Trimetrexate for Injection
Trimipramine Maleate Capsules	Triprolidine and Pseudoephedrine Hydrochlorides and Codeine Phosphate Syrup	Trolamine Salicylate Cream
Trolamine Salicylate Gel	Trolamine Salicylate Topical Emulsion	Trovafloxacin Injection
Trovafloxacin Mesylate for Injection	Undecylenic Acid Topical Foam Aerosol	Unoprostone Isopropyl Ophthalmic Solution
Urea Cream	Vecuronium Bromide for Injection	Venlafaxine Extended-Release Capsules ***(Received)***
Venlafaxine Tablets	Verapamil Hydrochloride Capsules	Verapamil Hydrochloride Extended-Release Capsules
Voriconazole Injection	Voriconazole Oral Suspension	Voriconazole Tablets
Yttrium Y-90 Chloride Solution	Yttrium Y-90 Glass Microspheres	Yttrium Y-90 Microspheres Injection
Zidovudine and Lamivudine Tablets ***(Received)***	Zinc Acetate Capsules	Zinc Tridosium Pentetate Injection
Ziprasidone Hydrochloride Capsules	Zoledronic Acid for Injection	

Excipients

Acetone Sodium Bisulfite	Acetylated Monoglycerides	Aconitic Acid (Achilleic Acid)
Acrylic Acid-Octyl Acrylate Copolymer	Albumin Colloidal	Aliphatic Polyesters
Allantoin-Sodium Pyrrolidone Carboxylate	Aluminum Ammonium Sulfate	Aluminum Lactate
Aluminum Oxide	Aluminum Potassium Sulfate	Aluminum Silicate
Aluminum Sodium Sulfate	Aluminum Stearate	Ammonium Bicarbonate
Ammonium Calcium Alginate	Ammonium Phosphate	Batylalcohol Monostearate
Beeswax, Synthetic	Benzododecinium Bromide	Benzyl Chloride
Benzyl Nicotinate	Beta Naphthol	Brominated Vegetable Oil
Butadiene-Styrene Rubber	Butylated Hydromethylphenol	Butylene Glycol
Butylphthalyl Butylglycolate	Calcium Acid Pyrophosphate	Calcium Alginate
Calcium Alginate and Ammonium Alginate	Calcium Bromide	Calcium Chloride Solution
Calcium Glycerophosphate ***(Received)***	Calcium Phosphate Monobasic	Calcium Propionate
Calcium Pyrophosphate	Calcium Sorbate	Calcium Stearoyl Lactylate
Caldiamide Sodium	Calteridol Calcium	Canola Oil
Capric Acid	Caprylic/Capric Diglyceryl Succinate	Carbon
Carboxymethyl Starch	Carboxymethylamylopectin Sodium	Carboxymethylcellulose Potassium
Cetostearyl Isononanoate	Chlorodifluoroethane	Cholic Acid
Cinnamaldehyde	Cocamide Diethanolamine	Cocamide Oxide
Cocoyl Caprylocaprate	Crystal Gum	Cutina
Cystine	Dammar Gum	Decanoic Acid
Decyl Oleate	Dehydroacetic Acid	Desoxycholic Acid
Dextrin Palmitate	Dextrins Modified	Diacetyl Tartaric Acid Esters of Mono- and Diglycerides

Excipients *(Continued)*		
Dicetyl Phosphate	Dichlorofluoromethane	Diethyl Sebacate
Difluoroethane	Diglycol Stearate	Diisobutyl Adipate
Diisopropyl Adipate	Diisopropylbenzothiazyl-2-Sulfenamide	Dilauryl Thiodipropionate
Dimethyl Dicarbonate	Dimyristoyl Lecithin	Dimyristoyl Phosphatidylglycerol
Dipropylene Glycol	Disodium Edisylate	Disodium Guanylate
Disodium Inosinate	Disodium Monooleamide Sulfasuccinate	D-Mannose
Docusate Sodium/Sodium Benzoate	Erythorbic Acid	Erythrosine
Ethoxylated Mono- and Diglycerides	Ethoxyquin	Ethyl Hexanediol
Ethyl Linoleate	Ethyl Maltol	Ethylene Dichloride
Ethylurea	Ferric Ammonium Citrate	Ferric Citrate
Ferric Oxide, Brown	Ferric Phosphate	Ferric Pyrophosphate
Ferrous Citrate	Ferrous Glycinate	Ferrous Lactate
Fluorochlorohydrocarbons	Formic Acid	Furcelleran
Gamma-Cyclodextrin	Gentistic Acid	Geraniol
Glutamic Acid Hydrochloride	Gluten	Glycerol Ester Of Gum Rosin (Ester Gum)
Glyceryl Laurate	Glyceryl Palmitate	Glyceryl Ricinoleate
Glyceryl Tristearate	Glycine Hydrochloride	Glycofurol
Glycol Stearate	Heptafluoropropane	Heptylparaben
Hexadecyl Isostearate	Hexane	Hexanetriol(-1,2,6-)
Hydrocarbon Gel	Hydrogenated Starch Hydrolysate	Hydroxyethylmethylcellulose
Hydroxylated Lecithin	Hydroxypropyl Beta Cyclodextrin	Indigotine
Inositol	Iron Carbonyl	Iron Subcarbonate
Isobutylated-Isoprene Copolymer	Isooctylacrylate	Isopropyl Isostearate
Isopropyl Stearate	Isostearic Acid	Isostearyl Alcohol
Lactobionic Acid	Lactose Ferrin, Bovine	Lactylated Fatty Acid Esters of Glycerol and Propylene Glycol
Lactylic Esters of Fatty Acids	Lanolin (Wool Fat), Hydrogenated	Lanolin Alcohols, Acetylated
Lanolin Hydrous	L-Ascorbyl Stearate	Lauramine Oxide
Lauric Myristic Diethanolamide	Lauric Acid	Lauric Diethanolamide
Lavender Oil	L-Cysteine Monohydrochloride	Lecithin, Hydroxylated
L-Glutamic Acid	Linoleic Acid	L-Leucine
Macrogol Sorbitan Tristearate	Macrogolglycerol Cocoates	Macrogolglycerol Triisostearate
Magnesium Aluminum Silicate Hydrate	Magnesium Aspartame Dihydrate	Magnesium Aspartate
Magnesium Phosphate Tribasic	Magnesium Phosphate, Dibasic, Trihydrate	Magnesium Tartrate
Malt Syrup	Maltitol Syrup	Maltol Isobutyrate
Manganese Chloride	Manganese Citrate	Manganese Glycerophosphate
Manganese Hypophosphite	Medical Antifoam Emulsion C	Medronate Disodium
Medronic Acid	Methyl Chloride	Methylchloroisothiazolinone
Methylisothiazolinone	Microcrystalline Cellulose, Silicified ***(Received)***	Mineral Spirits
Monoisostearyl Glyceryl Ester	Monopotassium Glutamate Monohydrate	Monosodium Citrate
Mullein Leaf	Myristyl Gamma-Picolinium Chloride	Myristyl Lactate
N,N-Bis(2-Hydroxyethyl)Stearamide	*N*-Acetyl-L-Methionine	Naphtha
N-Methylpyrrolidone ***(Received)***	Non-Pareil Seeds	Nutmeg Oil
Octanoic Acid	Oxystearin	Palm Kernel Oil ***(Received)***
Palm Oil	Pentasodium Triphosphate	Pentetate Calcium Trisodium
Pentetate Pentasodium	Phenprobamate	Phenylmercuric Acetate
Phenylmercuric Nitrate	Pine Oil	Polacrilin
Polydextrose ***(Received)***	Polydextrose Solution	Polyglycerol Esters of Fatty Acids
Polyglycerol Polyricinoleic Acid	Polyoxyethylene Castor Oil (USP has 35)	Polyoxyl Stearate (USP has 40)
Polypropylene Oleate	Polypropylene Stearyl Ether	Polysorbate 65
Polyvinylacetal	Polyvinylacetal Diethylanoacetate	Polyvinylpolypyrrolidone
Polyvinylpyrrolidone Ethylcellulose	Potassium Acid Tartrate	Potassium Bromate
Potassium Carbonate Solution	Potassium Dichloroisocyanurate	Potassium Gibberellate
Potassium Glycerophospate	Potassium Iodate	Potassium Nitrite
Potassium Phosphate	Potassium Phosphate Tribasic	Potassium Polymetaphosphate
Potassium Pyrophosphate	Potassium Stearate	Potassium Sulfate

Excipients *(Continued)*

Potassium Sulfite	Potassium Tripolyphosphate	Propyl Propionate
Propylene Glycol Diacetate	Propylene Glycol Mono- and Diesters	Purified Polyoxyl 35 Castor Oil ***(Received)***
Rapeseed Oil, Hydrogenated ***(Received)***	Rapeseed Oil, Superglycerinated ***(Received)***	Rice Bran Wax
Rosin	Silicone	Sodium Acid Pyrophosphate
Sodium Aluminosilicate	Sodium Aluminum Phosphate Acidic	Sodium Aluminum Phosphate Basic
Sodium Aspartate	Sodium Bisulfate	Sodium Bisulfite
Sodium Carbonate Hydrate	Sodium Carboxymethyl Betaglucan	Sodium Caseinate
Sodium Chlorate	Sodium Citrate, Dibasic	Sodium Citrate, Monobasic
Sodium Dehydroacetate	Sodium Diacetate	Sodium Erythorbate
Sodium Ferric Pyrophosphate	Sodium Ferrocyanide	Sodium Hypophosphite
Sodium Laureth Sulfate	Sodium Lauroyl Sarcosinate	Sodium Lauryl Sulfoacetate
Sodium Magnesium Aluminosilicate	Sodium Magnesium Silicate	Sodium Malate
Sodium Metaphosphate, Insoluble	Sodium Metasilicate	Sodium Methylate
Sodium Polyphosphates Glassy	Sodium Potassium Tripolyphosphate	Sodium Pyrophosphate
Sodium Pyrrolidone Carboxylate	Sodium Sesquicarbonate	Sodium Sesquinoleate
Sodium Stearoyl Lactylate	Sodium Thiomalate	Sodium Trimetaphosphate
Sodium Trioleate	Sodium Tripolyphosphate	Soy Polysaccharides
Stannous Chloride	Stannous Tartrate	Starch, Pregelatinized Corn
Starch, Pregelatinized Tapioca	Stearalkonium Chloride	Stearyl Citrate
Stearyl Monoglyceridyl Citrate	Succinylated Monoglycerides	Sucrose Acetate Isobutyrate
Sucrose Fatty Acid Esters	Sucrose Stearate	Sugar Fruit Fine
Sulfobutyl Ether Beta Cyclodextran	Tallow	Tallow Glycerides
Tallow Oil	Tetrafluoroethane	Thioglycerol
Thyme Oil	Tribehenin	Tricetearet-4 Phosphate
Trichloroethylene	Trimyristin	Trisodium Citrate
Trolamine Lauryl Sulfate	Vegetable Oil	Wheat Flour
Wheat Germ Oil	Wheat Gluten ***(Received)***	Whey

INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- New adopted (official) revisions to the *USP–NF* that become effective before the effective date of the next *Supplement* or that were not ready for adoption by the closing date for the upcoming *Supplement*. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.

Symbols—Interim revisions are shown with new text (if any) enclosed in circles, •new text•. Text enclosed in squares, ▪new text▪, has already been adopted in a *Supplement*. Where the symbols appear together with no enclosed text, such as •• or ▪▪, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by a number that indicates the *IRA* or *Supplement* in which the revision first appeared. For example, •2 indicates that the revision was officially adopted in the *Second Interim Revision Announcement,* and ▪2S (*USP29*) indicates that the revision was officially adopted in the *Second Supplement* to *USP 29*.

Errata—At the end of the *Interim Revision Announcement* section is a list of errata and corrections to *USP 29–NF 24*. The page number indicates where the item is found in *USP–NF*. If necessary, this list will be updated with every issue of *PF*. This information will also be cumulative in future *Supplements,* and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

SIXTH INTERIM REVISION ANNOUNCEMENT to *USP 29* and to *NF 24*

By authority of the United States Pharmacopeial Convention, Inc.
Prepared by the Council of Experts and published by the Board of Trustees

John W. Mauger, *Chair*
USP Board of Trustees

Roger L. Williams, *Executive Vice President*
and *Chairman, USP Council of Experts*

Roger L. Williams, M.D., *Chief Standards Officer, Acting*

Official December 1, 2006 **Released November 1, 2006**

All inquiries and comments regarding *USP 29* text and *NF 24* text should be addressed to the Executive Secretariat, *USP–NF*, 12601 Twinbrook Parkway, Rockville, MD 20852.

New USP Reference Standards

The following USP Reference Standards, which were not available when the associated monograph was made official, have since become available. The respective official date of each *USP 29* or *NF 24* standard, test, or assay requiring the use of the following USP Reference Standards is indicated in parentheses after the name of the Reference Standard.

USP Citalopram Hydrobromide RS (May 1, 2007)
USP Escin RS (January 1, 2007)
USP Fluticasone Propionate RS (November 1, 2006)
USP Fluvastatin Related Compound B RS (November 1, 2006)
USP Fluvastatin Sodium RS (March 1, 2007)
USP Hexacosanol RS (March 1, 2007)
USP Mecamylamine Related Compound A RS (March 1, 2007)
USP Naratriptan Resolution Mixture RS (May 1, 2007)
USP Cultured Rat Pheochromocytoma Reference Photomicrographs RS (May 1, 2007)
USP Polyisobutylene RS (November 1, 2006)
USP Ramipril Related Compound B RS (May 1, 2007)
USP Ropivocaine Hydrochloride RS (November 1, 2006)
USP Saccharin Sodium RS (March 1, 2007)
USP Sulisobenzone RS (January 1, 2007)

Unavailable First-Time Official USP Reference Standards

The official dates of any *USP 29* or *NF 24* standards, tests, or assays requiring the use of the following new USP Reference Standards are postponed until further notice pending availability of the respective Reference Standards. This listing was updated as of September 1, 2006.

USP Albumin Human RS
USP Alteplase RS
USP Amifostine RS
USP Amifostine Thiol RS
USP Antithrombin III Human RS
USP Aprotinin RS
USP Aprotinin System Suitability RS
USP Cetrimonium Bromide RS
USP Cladribine RS
USP Cladribine Related Compound A RS
USP Copolymer Polypropylene RS
USP Decoquinate RS
USP Cryopreserved Human Fibroblast-Derived Dermal Substitute Reference Photomicrographs RS
USP Diethylstilbestrol Diphosphate RS
USP Docosyl Ferulate RS
USP Powdered *Echinacea pallida* Extract RS
USP Eucatropine Hydrochloride RS
USP Fluvastatin Related Compound A RS
USP Gabapentin Related Compound B RS
USP Ginkgo Terpene Lactones RS
USP Powdered American Ginseng Extract RS
USP Glyceryl Monolinoleate RS
USP Glyceryl Monooleate RS
USP Gonadorelin Hydrochloride RS
USP Hemoglobin RS
USP Irbesartan RS
USP Irbesartan Related Compound A RS
USP Isosorbide Mononitrate RS
USP Isosorbide Mononitrate Related Compound A RS
USP Alpha Lipoic Acid RS
USP Maritime Pine Extract RS
USP Menotropins RS
USP Methyldopa-Glucose Reaction Product RS
USP Mibolerone RS
USP Narasin RS
USP Near Infrared Calibrator RS
USP Nimodipine RS
USP Nimodipine Related Compound A RS
USP Polyoxyl 10 Oleyl Ether RS
USP Potassium Perchlorate RS
USP Pyrethrum Extract RS
USP Quinapril Hydrochloride RS
USP Powdered St. John's Wort Extract RS
USP Sargramostim RS
USP Sincalide RS
USP Human Fibroblast-Derived Temporary Skin Substitute Reference Photomicrographs RS
USP Δ^8-Tetrahydrocannabinol RS
USP Δ^9-Tetrahydrocannabinol RS
USP Tizanidine Hydrochloride RS
USP Tizanidine Related Compound A RS
USP Tizanidine Related Compound B RS
USP Tizanidine Related Compound C RS
USP Valrubicin RS
USP Valrubicin Related Compound A RS
USP Vasopressin RS

GENERAL CHAPTERS

General Tests and Assays

Physical Tests and Determinations

⟨905⟩ UNIFORMITY OF DOSAGE UNITS

Change to read:

[NOTE—In this chapter, *unit* and *dosage unit* are synonymous.]

To ensure the consistency of dosage units, each unit in a batch should have a drug substance content within a narrow range around the label claim. Dosage units are defined as dosage forms containing a single dose or a part of a dose of drug substance in each unit. •The uniformity of dosage units specification is not intended to apply to suspensions, emulsions, or gels in unit-dose containers intended for topical administration.•6

The term "uniformity of dosage unit" is defined as the degree of uniformity in the amount of the drug substance among dosage units. Therefore, the requirements of this chapter apply to each drug substance being comprised in dosage units containing one or more drug substances, unless otherwise specified in the individual monograph.

The uniformity of dosage units can be demonstrated by either of two methods, *Content Uniformity* or *Weight Variation* (see *Table 1*). The test for *Content Uniformity* is based on the assay of the individual content of drug substance(s) in a number of individual dosage units to determine whether the individual content is within the limits set. The *Content Uniformity* method may be applied in all cases. The test for *Content Uniformity* is required for those dosage forms described in *(C1)–(C6)* below:

(C1) coated tablets, other than film-coated tablets containing 25 mg or more of a drug substance that comprises 25% or more (by weight) of one tablet;

(C2) transdermal systems;

(C3) suspensions or emulsions or gels in •single-unit•6 containers or in soft capsules that are intended for systemic administration only (not for those drug products that are intended for •topical•6 administration);

(C4) inhalations (other than solutions for inhalation packaged in glass or plastic ampuls and intended for use in nebulizers) packaged in premetered dosage units. For inhalers and premetered dosage units labeled for use with a named inhalation device, also see *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers* ⟨601⟩;

(C5) solids (including sterile solids) that are packaged in single-unit containers and that contain active or inactive added substances, except that the test for *Weight Variation* may be applied in the special •cases•6 stated in ••6 *(W3)* below; and

(C6) suppositories.

The test for *Weight Variation* is applicable for the following dosage forms:

(W1) solutions for inhalation that are packaged in glass or plastic ampuls and intended for use in nebulizers, and oral solutions packaged in unit-dose containers and into soft capsules;

(W2) solids (including sterile solids) that are packaged in single-unit containers and contain no added substances, whether active or inactive;

(W3) solids (including sterile solids) that are packaged in single-unit containers, with or without added substances, whether active or inactive, that have been prepared from true solutions and freeze-dried in the final containers and are labeled to indicate this method of preparation; and

(W4) hard capsules, uncoated tablets, or film-coated tablets, containing 25 mg or more of a drug substance comprising 25% or more, by weight, of the dosage unit or, in the case of hard capsules, the capsule contents, except that uniformity of other drug substances present in lesser proportions is demonstrated by meeting *Content Uniformity* requirements.

The test for *Content Uniformity* is required for all dosage forms not meeting the above conditions for the *Weight Variation* test. •Where compliance with the *Content Uniformity* test is required, then, by application of the provision for use of alternative methods provided in the *General Notices* section of this Pharmacopeia, it is possible for manufacturers to ensure this compliance by application of the *Weight Variation* test where the concentration relative standard deviation (RSD) of the drug substance in the final dosage units is not more than 2%. This RSD determination may be based on the manufacturer's process validation and product development data.•6 The concentration RSD is the RSD of the concentration per dosage unit (w/w or w/v), where concentration per dosage unit equals the assay result per dosage unit divided by the individual dosage unit weight. See the RSD formula in *Table 2*. •Where the *Weight Variation* test is used in this way, the product must, if tested, nevertheless comply with the official compendial test for *Content Uniformity.*•6

Table 1. Application of Content Uniformity (CU) and Weight Variation (WV) Tests for Dosage Forms

Dosage Form	Type	Subtype	Dose & Ratio of Drug Substance	
			≥25 mg & ≥25%	<25 mg or <25%
Tablets	Uncoated		WV	CU
	Coated	Film	WV	CU
		Others	CU	CU
Capsules	Hard		WV	CU
	Soft	Suspension, emulsion, or gel	CU	CU
		Solutions	WV	WV

Interim Revision Announcement

Change to read:

CONTENT UNIFORMITY

Select not fewer than 30 units, and proceed as follows for the dosage form designated. Where the amount of drug substance in a single dosage unit differs from that required in the *Assay,* adjust the degree of dilution of the solutions and/or the volume of aliquots so that the concentration of the drug substances in the final solution is of the same order as that obtained in the *Assay* procedure; or, in the case of a titrimetric assay, use a titrant of a different concentration, if necessary, so that an adequate volume of titrant is required (see *Titrimetry* ⟨541⟩); see also *Procedures* under *Tests and Assays* in the *General Notices and Requirements*. If any such modifications are made in the *Assay* procedure set forth in the individual monograph, make the appropriate corresponding changes in the calculation formula and titration factor.

Where a special *Procedure for content uniformity* is specified in the test for *Uniformity of dosage units* in the individual monograph, make any necessary correction of the results obtained as follows.

(1) Prepare a composite specimen of a sufficient number of dosage units to provide the amount of specimen called for in the *Assay* in the individual monograph plus the amount required for the special *Procedure for content uniformity* in the monograph by finely powdering tablets or mixing the contents of capsules or oral solutions, suspensions, emulsions, gels, or solids in single-unit containers to obtain a homogeneous mixture. If a homogeneous mixture cannot be obtained in this manner, use suitable solvents or other procedures to prepare a solution containing all of the drug substance, and use appropriate aliquot portions of this solution for the specified procedures.

(2) Assay separate, accurately measured portions of the composite specimen of capsules or tablets or suspensions or inhalations or solids in single-unit containers, both (a) as directed in the *Assay,* and (b) using the special *Procedure for content uniformity* in the monograph.

(3) Calculate the weight of drug substance equivalent to 1 average dosage unit, by (a) using the results obtained by the *Assay* procedure, and by (b) using the results obtained by the special procedure.

(4) Calculate the correction factor, *F,* by the formula:

$$F = W/P$$

in which W is the weight of drug substance equivalent to 1 average dosage unit obtained by the *Assay* procedure, and P is the weight of drug substance equivalent to 1 average dosage unit obtained by the special procedure. If

$$\frac{100|W - P|}{W}$$

is greater than 10, the use of a correction factor is not valid.

(5) The correction factor is to be applied only if F is not less than 1.030 nor greater than 1.100, or not less than 0.900 nor greater than 0.970. If F is between 0.970 and 1.030, no correction is required.

(6) If F lies between 1.030 and 1.100, or between 0.900 and 0.970, calculate the weight of drug substance in each dosage unit by multiplying each of the weights found using the special procedure by F.

Uncoated, Coated, or Molded Tablets, Capsules, Oral Solutions in •Unit-Dose Containers, Suspensions or Emulsions or Gels in Single-Unit Containers (that are intended for systemic administration only),•6 and Solids (including Sterile Solids) in Single-Unit Containers—Assay 10 units individually as directed in the *Assay* in the individual monograph, unless otherwise specified in the *Procedure for content uniformity* in the individual monograph. Calculate the acceptance value as directed below.

For oral solutions •in unit-dose containers, and for suspensions, emulsions, or gels in single-unit containers that are intended for systemic administration only,•6 conduct the *Assay* on the amount of well-mixed material that drains from an individual container in not more than 5 seconds, or for highly viscous products, conduct the *Assay* on the amount of well-mixed material that is obtained by quantitatively removing the contents from an individual container, and express the results as the delivered dose.

Calculation of Acceptance Value—Calculate the acceptance value by the formula:

$$\left|M - \overline{X}\right| + ks$$

in which the terms are as defined in *Table 2*.

Table 2

Variable	Definition	Conditions	Value
$\overline{X}$	Mean of individual contents (χ_1, χ_2, … , χ_n), expressed as a percentage of the label claim		
χ_1, χ_2, … , χ_n	Individual contents of the units tested, expressed as a percentage of the label claim		
n	Sample size (number of units in a sample)		
k	Acceptability constant	If n = 10, then k =	2.4
		If n = 30, then k =	2.0
s	Sample standard deviation		$\left[\frac{\sum_{i=1}^{n}\left(\chi_i-\overline{X}\right)^2}{n-1}\right]^{\frac{1}{2}}$
RSD	Relative standard deviation (the sample standard deviation expressed as a percentage of the mean)		$\frac{100s}{\overline{X}}$
M (case 1) to be applied when $T \leq 101.5$	Reference value	If 98.5% $\leq \overline{X} \leq$ 101.5%, then	$M = \overline{X}$ $(AV = ks)$
		If $\overline{X}$ < 98.5%, then	M = 98.5% $(AV = 98.5 - \overline{X} + ks)$
		If $\overline{X}$ > 101.5%, then	M = 101.5% $(AV = \overline{X} - 101.5 + ks)$
M (case 2) to be applied when $T > 101.5$	Reference value	If 98.5 $\leq \overline{X} \leq T$, then	$M = \overline{X}$ $(AV = ks)$
		If $\overline{X}$ < 98.5%, then	M = 98.5% $(AV = 98.5 - \overline{X} + ks)$
		If $\overline{X} > T$, then	$M = T\%$ $(AV = \overline{X} - T + ks)$

Table 2 *(Continued)*

Variable	Definition	Conditions	Value
Acceptance value *(AV)*			general formula: $\left\|M - \overline{X}\right\| + ks$ (Calculations are specified above for the different cases.)
L1	Maximum allowed acceptance value		*L1* = 15.0 unless otherwise specified in the individual monograph
L2	Maximum allowed range for deviation of each dosage unit tested from the calculated value of *M*	On the low side, no dosage unit result can be less than •[1 – (0.01)(*L2*)]*M*,•6 while on the high side no dosage unit result can be greater than •[1 + (0.01)(*L2*)]M•6 (This is based on an *L2* value of 25.0.)	*L2* = 25.0 unless otherwise specified in the individual monograph
T	Target •content per dosage unit at the time of manufacture, expressed as a percentage of the label claim.•6 For purposes of this Pharmacopeia, unless otherwise specified in the individual monograph, *T* is •the average of the limits specified in the potency definition in the individual monograph.•6		

Suppositories, Transdermal Systems, and Inhalations Packaged in Premetered Dosage Units—[NOTE—Acceptance value calculations are not required for these dosage forms.] Assay 10 units individually as directed in the *Assay* in the individual monograph, unless otherwise specified in the *Procedure for content uniformity.*

Change to read:

WEIGHT VARIATION

Select not fewer than 30 dosage units, and proceed as follows for the dosage form designated. The result of the *Assay,* obtained as directed in the individual monograph, is designated as result *A,* expressed as % of label claim (see *Calculation of the Acceptance Value*). Assume that the concentration (weight of drug substance per weight of dosage unit) is uniform. [NOTE—Specimens other than these test units may be drawn from the same batch for assay determinations.]

Uncoated or Film-Coated Tablets—Accurately weigh 10 tablets individually. Calculate the drug substance content, expressed as % of label claim, of each tablet from the weight of the individual tablet and the result of the *Assay.* Calculate the acceptance value.

Hard Capsules—Accurately weigh 10 capsules individually, taking care to preserve the identity of each capsule. Remove the contents of each capsule by a suitable means. Accurately weigh the emptied shells individually, and calculate for each capsule the net weight of its contents by subtracting the weight of the shell from the respective gross weight. Calculate the drug substance content, expressed as % of label claim, of each capsule from the net weight of the individual capsule content and the result of the *Assay.* Calculate the acceptance value.

Soft Capsules—Accurately weigh 10 intact capsules individually to obtain their gross weights, taking care to preserve the identity of each capsule. Then cut open the capsules by means of a suitable clean, dry cutting instrument such as scissors or a sharp open blade, and remove the contents by washing with a suitable solvent. Allow the occluded solvent to evaporate from the shells at room temperature over a period of about 30 minutes, taking precautions to avoid uptake or loss of moisture. Weigh the individual shells, and calculate the net contents. Calculate the drug substance content, expressed as % of label claim, in each capsule from the net weight of product removed from the individual capsules and the result of the *Assay.* Calculate the acceptance value.

Solids (including Sterile Solids) in Single-Unit Containers—Proceed as directed for *Hard Capsules,* treating each unit as described therein. Calculate the acceptance value.

Oral Solutions Packaged in •Unit-Dose$_{•6}$ Containers—Accurately weigh the amount of liquid that drains in not more than 5 seconds from each of 10 individual containers. If necessary, compute the equivalent volume after determining the density. Calculate the drug substance content, expressed as % of label claim, in the liquid drained from each unit from the net weight of the individual container content and the result of the *Assay.* Calculate the acceptance value.

Calculation of Acceptance Value—Calculate the acceptance value as shown in *Content Uniformity,* except that the individual contents of the units are replaced with the individual estimated contents defined below.

$\chi_1, \chi_2, \ldots, \chi_n$ = individual estimated contents of the units tested, where $\chi_i = w_i \times A / \overline{W}$,

$w_1, w_2, \ldots, w_n$ = individual weights of the units tested •for weight variation,$_{•6}$

A = content of drug substance (% of label claim) determined as described in the *Assay,* and

$\overline{W}$ = mean of individual weights $(w_1, w_2, \ldots, w_n)$ •of the units used in the *Assay.*$_{•6}$

Solutions for Inhalation Packaged in Glass or Plastic Ampuls and Intended for Use in Nebulizers—[NOTE—Acceptance value calculations are not required for these dosage forms.] Accurately weigh 10 containers individually, taking care to preserve the identity of each container. Remove the contents of each container by a suitable means. Accurately weigh the emptied containers individually, and calculate for each container the net weight of its contents by subtracting the weight of the container from the respective gross weight. From the results of the *Assay,* obtained as directed in the individual monograph, calculate the drug substance content, expressed as % of label claim, in each of the containers.

Change to read:

CRITERIA

Apply the following criteria, unless otherwise specified in the individual monograph.

Uncoated, Coated, or Molded Tablets, Capsules, Oral Solutions in •Unit-Dose Containers, Suspensions or Emulsions or Gels in Single-Unit Containers (that are intended for systemic administration only),$_{•6}$ and Solids (including Sterile Solids) in Single-Unit Containers—The requirements for dosage uniformity are met if the acceptance value of the first 10 dosage units is less than or equal to *L1*%. If the acceptance value is greater than *L1*%, test the next 20 units, and calculate the acceptance value. The requirements are met if the final acceptance value of the 30 dosage units is less than or equal to *L1*%, and no individual content of any dosage unit is less than •$[1 - (0.01)(L2)]\,M_{•6}$ nor more than •$[1 + (0.01)(L2)]\,M_{•6}$ as specified in the *Calculation of Acceptance Value* under *Content Uniformity* or under *Weight Variation.* Unless otherwise specified in the individual monograph, *L1* is 15.0 and *L2* is 25.0.

Suppositories—

Limit A (if the average of the limits specified in the potency definition in the individual monograph is 100.0 percent or less)—Unless otherwise specified in the individual monograph, the requirements for dosage uniformity are met if the amount of the drug substance in each of the 10 dosage units as determined from the *Content Uniformity* method lies within the range of 85.0% to 115.0% of the label claim, and the RSD is less than or equal to 6.0%.

If 1 unit is outside the range of 85.0% to 115.0% of label claim, and no unit is outside the range of 75.0% to 125.0% of label claim, or if the RSD is greater than 6.0%, or if both conditions prevail, test 20 additional units. The requirements are met if not more than 1 unit of the 30 is outside the range of 85.0% to 115.0% of label claim, and no unit is outside the range of 75.0% to 125.0% of label claim and the RSD of the 30 dosage units does not exceed 7.8%.

Limit B (if the average of the limits specified in the potency definition in the individual monograph is greater than 100.0 percent)—

(1) If the average value of the dosage units tested is 100.0 percent or less, the requirements are as in *Limit A.*

Interim Revision Announcement

(2) If the average value of the dosage units tested is greater than or equal to the average of the limits specified in the potency definition in the individual monograph, the requirements are as specified under *Limit A,* except that the words ''label claim'' are replaced by the words ''label claim multiplied by the average of the limits specified in the potency definition in the monograph divided by 100''.

(3) If the average value of the dosage units tested is between 100 percent and the average of the limits specified in the potency definition in the individual monograph, the requirements are as specified under *Limit A,* except that the words ''label claim'' are replaced by the words ''label claim multiplied by the average value of the dosage units tested (expressed as a percent of label claim) divided by 100''.

Transdermal Systems and Inhalations Packaged in Premetered Dosage Units—

Limit A (if the average of the limits specified in the potency definition in the individual monograph is 100.0 percent or less)—Unless otherwise specified in the individual monograph, the requirements for dosage uniformity are met if the amount of the drug substance in not fewer than 9 of the 10 dosage units as determined from the *Content Uniformity* method (or, in the case of solutions for inhalation packaged in glass or plastic ampuls and intended for use in nebulizers, from either the *Content Uniformity* or the *Weight Variation* method) lies within the range of 85.0% to 115.0% of label claim, and no unit is outside the range of 75.0% to 125.0% of label claim, and the RSD of the 10 dosage units is less than or equal to 6.0%.

If 2 or 3 dosage units are outside the range of 85.0% to 115.0% of label claim, but not outside the range of 75.0% to 125.0% of label claim, or if the RSD is greater than 6.0% or if both conditions prevail, test 20 additional units. The requirements are met if not more than 3 units of the 30 are outside the range of 85.0% to 115.0% of label claim and no unit is outside the range of 75.0% to 125.0% of label claim, and the RSD of the 30 dosage units does not exceed 7.8%.

Limit B (if the average of the limits specified in the potency definition in the individual monograph is greater than 100.0 percent)—

(1) If the average value of the dosage units tested is 100.0 percent or less, the requirements are as in *Limit A.*

(2) If the average value of the dosage units tested is greater than or equal to the average of the limits specified in the potency definition in the individual monograph, the requirements are as specified under *Limit A*, except that the words ''label claim'' are replaced by the words ''label claim multiplied by the average of the limits specified in the potency definition in the monograph divided by 100''.

(3) If the average value of the dosage units tested is between 100 percent and the average of the limits specified in the potency definition in the individual monograph, the requirements are as specified under *Limit A*, except that the words ''label claim'' are replaced by the words ''label claim multiplied by the average value of the dosage units tested (expressed as a percent of label claim) divided by 100''.

ERRATA

Following is a list of errata and corrections to *USP 29–NF 24*. The page number indicates where the item is found in *USP 29–NF 24*. If necessary, this list will be updated with every issue of *PF*. This information will also be available as a cumulative table in future *Supplements* and will appear in its corrected form in a future annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement. USP staff is available to respond to questions regarding the accuracy of a particular requirement by calling 1-800-822-USPC.

Page	Title	Section	Description
1892	*Ranitidine Injection*	*Chromatographic purity*	Line 8 under *Procedure*: Change ''Perform the chromatography as described in *Chromatographic purity* under *Ranitidine Hydrochloride.*'' to: Allow the spots to dry, and develop the chromatograms in a solvent system consisting of a mixture of ethyl acetate, isopropyl alcohol, ammonium hydroxide, and water (25 : 15 : 5 : 1) until the solvent front has moved not less than 15 cm from the origin. Remove the plate from the developing chamber, mark the solvent front, and allow to air-dry. Expose the plate to iodine vapors in a closed chamber until the chromatogram is fully revealed.
		Assay	Delete the single subsection beginning with ''*Mobile phase, Standard preparation, System suitability solution,* and *Chromatographic system*''. Replace with: *Mobile phase*—Prepare a filtered and degassed mixture of methanol and 0.1 M aqueous ammonium acetate (85:15). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩). *Standard preparation*—Dissolve an accurately weighed quantity of USP Ranitidine Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 0.112 mg (equivalent to 0.100 mg of ranitidine base) per mL. *System suitability solution*—Dissolve accurately weighed quantities of USP Ranitidine Hydrochloride RS and USP Ranitidine Related Compound C RS in *Mobile phase* to obtain a solution having known concentrations of about 0.112 mg per mL and 0.01 mg per mL, respectively. *Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 322-nm detector and a 4.6-mm × 20- to 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure:* the resolution, *R,* between ranitidine hydrochloride and *N*-[2-[[[5-[(dimethylamino)methyl]-2-furanyl]methyl]-sulfinyl]ethyl]-*N′*-methyl-2-nitro-1,1-ethenediamine (ranitidine related compound C) is not less than 1.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the tailing factor for the ranitidine hydrochloride peak is not more than 2.0; the column efficiency determined from the ranitidine hydrochloride peak is not less than 700 theoretical plates; and the relative standard deviation for replicate injections is not more than 2%.
1892	*Ranitidine Oral Solution*	*Chromatographic purity*	Line 8 under *Procedure*: Change ''Perform the chromatography as described in *Chromatographic purity* under *Ranitidine Hydrochloride.*'' to: Allow the spots to dry, and develop the chromatograms in a solvent system consisting of a mixture of ethyl acetate, isopropyl alcohol, ammonium hydroxide, and water (25 : 15 : 5 : 1) until the solvent front has moved not less than 15 cm from the origin. Remove the plate from the developing chamber, mark the solvent front, and allow to air-dry. Expose the plate to iodine vapors in a closed chamber until the chromatogram is fully revealed.
		Assay	Line 3 under *Mobile phase, Standard preparation, System suitability solution,* and *Chromatographic system:* Change the reference to ''*Ranitidine Hydrochloride*'' to: *Ranitidine Injection*

Interim Revision Announcement

Page	Title	Section	Description
1893	*Ranitidine Tablets*	*Assay*	Line 3 under *Mobile phase, Standard preparation, System suitability solution,* and *Chromatographic system:* Change the reference to "*Ranitidine Hydrochloride*" to: *Ranitidine Injection*
1894	*Ranitidine in Sodium Chloride Injection*	*Chromatographic purity*	Line 8 under *Procedure*: Change "Perform the chromatography as described in *Chromatographic purity* under *Ranitidine Hydrochloride.*" to: Allow the spots to dry, and develop the chromatograms in a solvent system consisting of a mixture of ethyl acetate, isopropyl alcohol, ammonium hydroxide, and water (25 : 15 : 5 : 1) until the solvent front has moved not less than 15 cm from the origin. Remove the plate from the developing chamber, mark the solvent front, and allow to air-dry. Expose the plate to iodine vapors in a closed chamber until the chromatogram is fully revealed.
		Assay	Line 3 under *Mobile phase, Standard preparation, System suitability solution,* and *Chromatographic system:* Change the reference to "*Ranitidine Hydrochloride*" to: *Ranitidine Injection*
2013	*Succinylcholine Chloride for Injection*	*Other requirements*	Line 3 under *Mobile phase, Standard preparation, System suitability solution,* and *Chromatographic system:* Delete reference to "*Limit of ammonium salt*"
First Supplement			
3592	⟨121⟩ *Insulin Assays*	*Rabbit Blood Sugar Method—Quantitative*	Under *Calculations,* lines 7 and 8 of the third paragraph: Change "Standard dilution" and "Assay dilution" to: Standard solution and Assay solution
			Line 6 under *Appendix:* Change the formula $$(L,U)=\frac{M'\pm\frac{t}{T_b}\sqrt{(1-g)S_N^2+(M')S_D^2}}{1-g}$$ to: $$(L,U)=\frac{M'\pm\frac{t}{T_b}\sqrt{(1-g)S_N^2+(M')^2S_D}}{1-g}$$

Interim Revision Announcement

Interim Revision Announcement

IN-PROCESS REVISION

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) items that previously appeared under *Pharmacopeial Previews* and are now formally proposed as revisions, (2) proposed revisions placed directly under *In-Process Revision,* or (3) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the staff liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

BRIEFING

> **Name of Item**, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How to Use PF*), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
>
> (DSN: L. Evans) RTS—C-55678-1

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type (print edition only), as shown in the examples below:

•new text•

if slated for an *Interim Revision Announcement to USP 29–NF 24* (*IRA*);

▲new text▲*USP30*

if slated for *USP 30–NF 25*; and

■new text■

if slated for a *Supplement to USP–NF*. The same symbols *not* set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as •• or ■■ or ▲▲, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •2 indicates that the revision is proposed for the *Second Interim Revision Announcement*, ■2S (*USP 29*) indicates that the proposed revision is slated for the *Second Supplement to USP 29*, and ▲*USP30* and ▲*NF25* indicate that the revisions are proposed for *USP 30* and *NF 25*, respectively.

Official Title Changes Where the specification ***"Monograph title change"*** is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

MONOGRAPHS (USP)

BRIEFING

Acetaminophen Extended-Release Tablets, *USP 29* page 22 and page 1161 of *PF* 30(4) [July–Aug. 2004]. It is proposed to add a *Dissolution Test 2* to this monograph because FDA recently approved a new generic version of this product. Also, in *Dissolution Test 1* it is proposed to change the wavelength in the quantitation step from 243 nm to 280 nm because a more linear relationship is obtained at this wavelength. In the absence of any significant adverse comment, it is proposed to implement the inclusion of *Dissolution Test 2* via the *Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of April 1, 2007.

(BPC: M. Marques) RTS—C43633

Add the following:

▲**Packaging and storage—**Preserve in tight containers.▲*USP30*

Change to read:

Labeling—Where the Tablets are gelatin-coated, the label so states.

•When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.•2

Change to read:

Dissolution ⟨711⟩—

TEST 1—
Medium: simulated gastric fluid TS (without enzyme); 900 mL.
Apparatus 2: 50 rpm.
Times: 15 minutes, 1 hour, and 3 hours.
Procedure—Determine the amount of $C_8H_9NO_2$ dissolved from UV absorbances at ~~243 nm,~~

•280 nm,•2
using a filtered portion of the solution under test in comparison with a Standard solution having a known concentration of USP Acetaminophen RS in the same *Medium.*
Tolerances—The percentages of the labeled amount of $C_8H_9NO_2$ dissolved at the times specified conform to *Acceptance Table 2*.

Time	Amount dissolved
15 minutes	between 45% and 65%
1 hour	between 60% and 85%
3 hours	not less than 85%

•TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium, Apparatus, and *Procedure*—Proceed as directed for *Test 1*.

Tolerances—The percentages of the labeled amount of $C_8H_9NO_2$ dissolved at the times specified conform to *Acceptance Table 2*.

Time	Amount dissolved
15 minutes	between 40% and 60%
1 hour	between 55% and 75%
3 hours	not less than 80%

•2

BRIEFING

Bisoprolol Fumarate Tablets, *USP 29* page 293. It is proposed to add a *Dissolution Test 2* because FDA recently approved a new generic version of this product. In the absence of negative comments, it is proposed to implement this inclusion via the *Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of February 1, 2007. Also, it is proposed to correct the dimensions of the column used in the chromatographic procedure in the *Dissolution* test to be in accordance with the validation documentation.

(BPC: M. Marques) RTS—C48402

Add the following:

•**Labeling—**When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.•1

Change to read:

Dissolution ⟨711⟩—

•TEST 1—•1
Medium: water; 900 mL.
Apparatus 2: 75 rpm.
Time: 20 minutes.
Determine the amount of $(C_{18}H_{31}NO_4)_2 \cdot C_4H_4O_4$ dissolved by employing the following method.
Diluent—Prepare a mixture of methanol, water, triethylamine, and phosphoric acid (160 : 35 : 5 : 2.5).
Mobile phase—Mix 20 mL of triethylamine with 1000 mL of water and 680 mL of methanol, adjust with phosphoric acid to a pH of 4.0 ± 0.1, and mix.
Standard stock solution—Quantitatively dissolve an accurately weighed quantity of USP Bisoprolol Fumarate RS in water to obtain a solution having a known concentration of about twice the concentration of bisoprolol fumarate in the *Test solution.*
Standard solution—Dilute an accurately measured volume of *Standard stock solution* with an equal accurately measured volume of *Diluent.*

In-Process Revision

Test solution—Withdraw a portion of the solution under test, filter, dilute with an equal volume of *Diluent,* and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 227-nm detector and a ~~3.9-mm × 30-cm~~ •4.6-mm × 33-cm•[1] column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas for bisoprolol. Calculate the quantity, in mg, of bisoprolol fumarate $[(C_{18}H_{31}NO_4)_2 \cdot C_4H_4O_4]$ dissolved.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $(C_{18}H_{31}NO_4)_2 \cdot C_4H_4O_4$ is dissolved in 20 minutes.

•TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: 0.5 M sodium chloride; 900 mL.

Apparatus 2: 75 rpm.

Time: 20 minutes.

Determine the amount of $(C_{18}H_{31}NO_4)_2 \cdot C_4H_4O_4$ dissolved by employing the chromatographic method described in *Test 1*.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $(C_{18}H_{31}NO_4)_2 \cdot C_4H_4O_4$ is dissolved in 20 minutes.•[1]

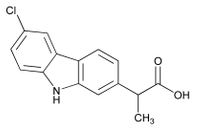
BRIEFING

Carprofen. Because there is no existing *USP* monograph for this drug substance, a new monograph is being proposed. The test for *Limit of acetone and methylene chloride* uses a GC method in which the chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 30-m capillary column coated with 3.0-µm G43 stationary phase. USP has received information indicating that the Agilent DB-624 brand of G43 column is suitable. The test for *Related compounds* and the *Assay* are HPLC methods validated with the Zorbax C18 brand of 4.6-mm × 25-cm column that contains 5-µm packing L1. Interested parties are invited to submit comments.

(VET: I. DeVeau) RTS—C44282

Add the following:

▲Carprofen



$C_{15}H_{12}ClNO_2$ 273.71

9*H*-Carbazole-2-acetic acid, 6-chloro-α-methyl-, (±)-.

(±)-6-Chloro-α-methylcarbazole-2-acetic acid [*53716-49-7*].

» Carprofen contains not less than 98.0 percent and not more than 102.0 percent of $C_{15}H_{12}ClNO_2$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

Labeling—Label it to indicate that it is intended for veterinary use only.

USP Reference standards ⟨11⟩—*USP Carprofen RS. USP Carprofen Related Compound A RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Loss on drying ⟨731⟩—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩**:** 0.002%.

In-Process Revision

Limit of acetone and methylene chloride—

Standard solution—Transfer about 5.0 g of acetone and 0.6 g of methylene chloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *N*,*N*-dimethylacetamide to volume, and mix. Pipet 1 mL of this solution into a 100-mL volumetric flask, dissolve in and dilute with *N*,*N*-dimethylacetamide to volume, and mix.

Test solution—Transfer about 500 mg of Carprofen, accurately weighed, to a 5-mL volumetric flask, dissolve in and dilute with *N,N*-dimethylacetamide to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 30-m capillary column coated with 3.0-µm G43 stationary phase. The carrier gas is nitrogen, flowing at a rate of about 4.9 mL per minute. The split flow ratio is about 10 : 1. Initially the column temperature is maintained at 80° for 4 minutes, then is increased at a rate of 30° per minute to a temperature of 190°, and maintained at 190° for at least 3 minutes. The injection port temperature is maintained at 210°, and the detector temperature is maintained at 220°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* acetone elutes before methylene chloride; the resolution, *R,* between them is not less than 1.5; and the relative standard deviation for replicate injections, determined from the peak responses of acetone, is not more than 10.0%.

Procedure—Separately inject equal volumes (about 1 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all the peak responses. Calculate the percentage of each residual solvent in the portion of Carprofen taken by the formula:

$$0.5(C_S / W)(r_U / r_S)$$

in which C_S is the concentration, in µg per mL, of the individual residual solvent in the *Standard solution; W* is the weight, in mg, of Carprofen taken to prepare the *Test solution;* r_U is the peak response of the individual residual solvent in the *Test solution;* and r_S is the peak response of the individual residual solvent in the *Standard solution:* not more than 5000 ppm of acetone is found; and not more than 600 ppm of methylene chloride is found.

Related compounds—

Mobile phase and *Chromatographic system*—Proceed as directed in the *Assay.*

Test solution—Use the *Assay preparation*.

Procedure—Inject about 10 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the responses for all the peaks. Calculate the percentage of each related compound in the portion of Carprofen taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the response of each individual peak other than the major peak of carprofen; and r_s is the sum of the peak responses: not more than 0.5% of each individual known related compound is found (see the relative retention times of these compounds in the table below); not more than 0.1% of each individual unknown related compound is found; and not more than 1.0% of total related compounds is found.

Known Related Compound	Approximate Relative Retention Time
Carprofen related compound A (carbazole)	0.9
2-[1,1-dimethoxy-2-hydroxypropyl]-6-chlorocarbazole	1.3
2-[2-chloropropionyl]-6-chloro-9-acetylcarbazole	3.3

Assay—

Mobile phase—Prepare a mixture of acetonitrile, water, methanol, and glacial acetic acid (40 : 35 : 25 : 0.2).

In-Process Revision

Carprofen related compound A solution—[NOTE—Use low-actinic glassware.] Prepare a solution of USP Carprofen Related Compound A RS, accurately weighed, in *Mobile phase,* containing about 16 µg per mL, sonicating if necessary.

Standard preparation—[NOTE—Use low-actinic glassware.] Prepare a solution of USP Carprofen RS, accurately weighed, in *Mobile phase,* containing about 160 µg per mL, sonicating if necessary.

System suitability solution—[NOTE—Use low-actinic glassware.] Transfer 10 mL of the *Carprofen related compound A solution* and 10 mL of the *Standard preparation* into a 100-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

Assay preparation—[NOTE—Use low-actinic glassware.] Dissolve an accurately weighed quantity of Carprofen in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 160 µg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 239-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between carprofen and carprofen related compound A is not less than 2.0; the column efficiency for the carprofen peak is not less than 5000 theoretical plates; the tailing factor for the carprofen peak is not more than 2.0; and the relative standard deviation for replicate injections of carprofen is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the percentage of $C_{15}H_{12}ClNO_2$ in the portion of Carprofen taken by the formula:

$$100P(C_S / C_U)(R_U / R_S)$$

in which P is the purity, in µg per mg, of USP Carprofen RS; C_S and C_U are the concentrations, in µg per mL, of the *Standard preparation* and the *Assay preparation,* respectively; and R_U and R_S are the ratios of the carprofen peak response to the internal standard peak response obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP31*

BRIEFING

Carprofen Tablets. Because there is no existing *USP* monograph for this drug substance, a new monograph is being proposed. The tests for *Uniformity of dosage units* and *Related compounds* and the *Assay* use HPLC methods validated with the Phenomenex Prodigy C8 brand of 4.6-mm × 15-cm column that contains 5-µm packing L7. Interested parties are invited to submit comments.

(VET: I. DeVeau; BPC: M. Marques) RTS—C44780

Add the following:

▲Carprofen Tablets

» Carprofen Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of carprofen ($C_{15}H_{12}ClNO_2$).

In-Process Revision

Packaging and storage—Preserve in tight containers.

USP Reference standards ⟨11⟩—*USP Carprofen RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩—

Reference specimen—Mix about 2 mg of USP Carprofen RS with 200 mg of potassium bromide, and grind thoroughly for 10 to 15 minutes. Compress the mixture into a clear pellet. Record the IR spectrum of the pellet immediately after preparation.

Test specimen—Grind into powder not fewer than 4 Tablets. Transfer the powder, equivalent to about 100 mg of carprofen, to a 125-mL separatory funnel. Add 30 mL of water and 3 drops of hydrochloric acid, and shake for about 5 minutes. Add about 30 mL of methylene chloride, and shake for another 5 minutes. Allow the phases to separate. Carefully drain and collect the lower methylene chloride layer through anhydrous sodium sulfate that is placed on a cotton pledget into a suitable container. Evaporate the methylene chloride on a steam bath with the aid of a stream of nitrogen to dryness. Dry the residue in vacuum at 60° for about 30 minutes. Mix about 2 mg of the dried residue with 200 mg of potassium bromide, and grind thoroughly for 10 to 15 minutes. Compress the mixture into a clear pellet. Record the IR spectrum of the carprofen sample pellet immediately after preparation.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—[NOTE—Use low-actinic volumetric flasks, dissolution vessels, and evaporation covers.]

Medium: 0.05 M phosphate buffer, pH 7.5 (prepared by dissolving 6.8 g of monobasic potassium phosphate in 600 mL of water, mixing, adding 18 mL of 2 N sodium hydroxide, mixing, diluting with water to 1000 mL, and adjusting with 0.2 N sodium hydroxide or 0.2 N hydrochloric acid to a pH of 7.50 ± 0.05); 900 mL, degassed.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Determine the amount of $C_{15}H_{12}ClNO_2$ dissolved by employing the following method.

Standard solution—

FOR TABLETS LABELED TO CONTAIN 25 MG—Transfer about 25 mg of USP Carprofen RS, accurately weighed, to a 900-mL volumetric flask. Slowly add 10 mL of methanol. Dilute with *Medium* to volume, and mix.

FOR TABLETS LABELED TO CONTAIN 75 MG—Transfer about 75 mg of USP Carprofen RS, accurately weighed, to a 900-mL volumetric flask. Slowly add 30 mL of methanol. Dilute with *Medium* to volume, and mix.

FOR TABLETS LABELED TO CONTAIN 100 MG—Transfer about 100 mg of USP Carprofen RS, accurately weighed, to a 900-mL volumetric flask. Slowly add 40 mL of methanol. Dilute with *Medium* to volume, and mix.

Test solution—Pass a portion of the solution under test through a suitable 0.45-µm filter.

System suitability solution—Determine the absorbance of the *Standard solution,* as directed for *Procedure,* five times: the relative standard deviation is not more than 2.0%.

Procedure—Determine the amount of $C_{15}H_{12}ClNO_2$ dissolved by measuring the absorbance of the *Test solution* in comparison with the appropriate *Standard solution* at the wavelength of maximum absorbance at about 300 nm, using a 0.5-cm cell for Tablets labeled to contain 25 mg, a 0.2-cm cell for Tablets labeled to contain 75 mg, and a 0.1-cm cell for Tablets labeled to contain 100 mg. Use *Medium* as the blank. Calculate the percentage of $C_{15}H_{12}ClNO_2$ dissolved by the formula:

$$\frac{A_U \times W_S \times 100}{A_S \times LC}$$

In-Process Revision

in which A_U and A_S are the absorbances obtained from the *Test solution* and the *Standard solution,* respectively; W_S is the weight, in mg, of USP Carprofen RS used to prepare the *Standard solution;* 100 is the conversion factor to percentage; and *LC* is the Tablet label claim, in mg.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{15}H_{12}ClNO_2$ is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements for *Content Uniformity.*

Procedure for content uniformity—[NOTE—Use low-actinic glassware.]

Mobile phase and *Chromatographic system*—Prepare as directed in the *Assay.*

Standard solution—Prepare as directed for the *Standard preparation* in the *Assay.*

Test solution—Transfer 10 Tablets individually to 10 separate volumetric flasks of a suitable calibrated volume such that an interim concentration of 0.5 mg per mL of *Mobile phase* can be prepared. To each flask, add *Mobile phase* to 80% of the calibrated volume, sonicate for 10 minutes, then stir for 10 minutes. Sonicate again for 10 minutes, and stir for another 10 minutes or until the Tablets are completely disintegrated. Cool to room temperature, dilute with *Mobile phase* to volume to obtain an interim concentration of 0.5 mg of carprofen per mL, and mix. Quantitatively transfer 5.0 mL of the individual solutions to 10 separate 50.0-mL volumetric flasks, dilute with *Mobile phase* to volume, and mix. Pass the solution through a polyvinylidenefluoride (PVDF) filter having a 0.45-µm or finer porosity, discarding the first 5 mL of the filtrate. The final concentration is about 0.05 mg of carprofen per mL.

Procedure—Proceed as directed for *Procedure* in the *Assay.* Calculate the percentage of the labeled content of $C_{15}H_{12}ClNO_2$ in the portion of Tablets taken by the formula:

$$100(C_S/(C_U)(r_U/r_S)$$

in which the terms are as defined therein.

Chromatographic purity—

Mobile phase—Proceed as directed in the *Assay.*

Standard solution—[NOTE—Use low-actinic glassware.] Dissolve an accurately weighed quantity of USP Carprofen RS in *Mobile phase* to obtain a solution having a known concentration of 0.05 µg of carprofen per mL.

Sensitivity solution—[NOTE—Use low-actinic glassware.] Quantitatively dilute the *Standard solution* with *Mobile phase* to obtain a solution containing about 0.005 µg of carprofen per mL.

Test solution—Use the *Assay preparation.*

Blank solution—Transfer an accurately weighed portion of the Tablet base, equivalent to the weight of 1 Tablet, to a volumetric flask of the same calibrated volume as that used to prepare the *Test solution*. To each flask add *Mobile phase* to 80% of the calibrated volume. Sonicate for 10 minutes, then stir for 10 minutes. Sonicate again for 10 minutes, and stir for another 10 minutes. Cool to room temperature, dilute with *Mobile phase* to volume, and mix. Quantitatively transfer 5.0 mL of the solution to a 50.0 mL-volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass the solution through a PVDF filter having a 0.45-µm or finer porosity, discarding the first 5 mL of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L7. The flow rate is about 1.0 mL per minute. Wash the column after each series of analyses with a mixture of acetonitrile and water (20 : 80) for 30 minutes; gradually change the composition of acetonitrile and water to 80 : 20 over 10 minutes; continue to wash at 80 : 20 for 30 minutes; gradually change the composition to 50 : 50 over 10 minutes; and continue to wash at 50 : 50 for another 30 minutes. Chromatograph the *Standard solution,* the *Sensitivity solution,* and the *Test solution,* and record the peak responses as directed for *Procedure:* for the *Standard solution,* the column efficiency is not less than 4000 theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation

for replicate injections is not more than 2.0%; for the *Sensitivity solution,* the carprofen peak should be defined and integratable; for the *Test solution,* the resolution, *R,* between carprofen and the nearest impurity peak is not less than 2.0. After every six injections of any solution, inject a *Standard solution* in duplicate. The ratio of the average response of the duplicate injections to that obtained from the initial five replicate injections is 0.95 to 1.05.

Procedure—Inject a volume (about 50 µL) of the *Standard solution,* the *Test solution,* and the *Blank solution* into the chromatograph, record the chromatograms, and measure all the peak areas. Calculate the percentage of carprofen-related compounds in the portion of Tablets taken by the formula:

$$0.1(C_S / C_U)(r_i / r_S)$$

in which C_S is the concentration, in mg per mL, of carprofen in the *Standard solution;* C_U is the concentration, in mg per mL, of carprofen in the *Test solution;* r_i is the peak area of any peak other than carprofen obtained from the *Test solution;* and r_S is the peak area of carprofen obtained from the *Standard solution:* not more than 0.5% of any single impurity is found; and the sum of all impurities is not more than 2.0%. Disregard any peak also observed in the *Blank solution.*

Assay—

Mobile phase—Mix 500 mL of acetonitrile, 500 mL of water, and 1 mL of phosphoric acid. Degas before using. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—[NOTE—Use low-actinic glassware.] Dissolve an accurately weighed quantity of USP Carprofen RS in *Mobile phase* to obtain a solution having a known concentration of about 0.05 mg per mL.

Assay preparation—[NOTE—Use low-actinic glassware.] Accurately weigh 20 Tablets, and calculate the average Tablet weight. Grind the Tablets into uniform powder. Transfer three accurately weighed portions of the powder, each equivalent to the weight of one Tablet, into three volumetric flasks of a suitable calibrated volume such that an interim concentration of 0.5 mg per mL of *Mobile phase* can be prepared. To each flask add *Mobile phase* to 80% of the calibrated volume, sonicate for 10 minutes, then stir for 10 minutes. Sonicate again for 10 minutes, and stir for another 10 minutes. Cool to room temperature, dilute with *Mobile phase* to volume to obtain an interim concentration of 0.5 mg of carprofen per mL, and mix. Quantitatively transfer 5.0 mL of the solution to a 50.0-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass the solution through a PVDF filter having a 0.45-µm or finer porosity, discarding the first 5 mL of the filtrate. The final concentration is about 0.05 mg of carprofen per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm × 15-cm column that contains packing L7. The flow rate is about 1.0 mL per minute. Wash the column after each series of analyses with a mixture of acetonitrile and water (20 : 80) for 30 minutes; gradually change the composition of acetonitrile and water to 80 : 20 over 10 minutes; continue to wash at 80 : 20 for 30 minutes; gradually change the composition to 50 : 50 over 10 minutes; and continue to wash at 50 : 50 for another 30 minutes. Chromatograph the *Standard preparation,* and record the peak areas as directed for *Procedure:* the column efficiency for carprofen is not less than 4000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for five replicate injections is not more than 2.0%. Inject the *Standard preparation* in duplicate after every 12 injections or fewer of any other solution. The ratio of the average area of the duplicate injections to that obtained from the initial five replicate injections is 0.95 to 1.05.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into

In-Process Revision

the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of the labeled content of carprofen ($C_{15}H_{12}ClNO_2$) in the portion of Tablets taken by the formula:

$$100(C_S / C_U)(R_U / R_S)$$

in which C_S and C_U are the concentrations, in mg per mL, of USP Carprofen RS in the *Standard preparation* and carprofen in the *Assay preparation,* respectively; and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP31*

BRIEFING

Diltiazem Hydrochloride Extended-Release Capsules, *USP 29* page 715. It is proposed to add a *Dissolution Test 15* because FDA recently approved a new generic version of this product. In the absence of any negative comments, it is proposed to implement the inclusion of the *Dissolution Test 15* via the *Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of February 1, 2007.

(BPC: M. Marques) RTS—C42282; C45348

Change to read:

Dissolution ⟨711⟩—

FOR PRODUCTS LABELED FOR DOSING EVERY 12 HOURS—

TEST 1—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1.* Proceed as directed for *Extended-Release Dosage Forms.*

Medium: water; 900 mL.

Apparatus 2: 100 rpm.

Times: 3, 9, and 12 hours.

Procedure—Determine the amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 237 nm on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Diltiazem Hydrochloride RS in the same *Medium.*

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to the *Acceptance Table* given.

Acceptance Table

Level	Number Tested	Criteria
L_1	6	No individual value lies outside each of the stated ranges, and no individual value is less than the stated amount at the final test time.
L_2	6	The average value of the 12 units ($L_1 + L_2$) lies within each of the stated ranges and is not less than the stated amount at the final test time. At 3 hours none of the units is outside the range of 10% to 35% of labeled content; at 9 hours none of the units is outside the range of 45% to 95% of labeled content; and at 12 hours none of the units is less than 65% of labeled content at the final test time.
L_3	12	The average value of the 24 units ($L_1 + L_2 + L_3$) lies within each of the stated ranges and is not less than the stated amount at the final test time. At 3 hours not more than 2 of the 24 units are outside the range of 10% to 35% of labeled content, and these two units must be within the range of 5% to 45% of labeled content; at 9 hours not more than 2 of 24 of the units are outside the range of 45% to 95% of labeled content, and these two units must be within the range of 35% to 100% of labeled content; at 12 hours not more than 2 of the 24 units are less than 65% of labeled content at the final test time, and these two units cannot be less than 60% of labeled content at the final test time.

TEST 4—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4.*

Medium, Apparatus, and *Procedure*—Proceed as directed under *Test 1.*

Times: 4, 8, 12, and 24 hours.

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
4	between 10% and 25%
8	between 35% and 60%
12	between 55% and 80%
24	not less than 80%

TEST 5—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5.*

Medium: 0.05 M phosphate buffer, pH 7.2; 900 mL.

Apparatus 2: 50 rpm.

Procedure—Proceed as directed under *Test 1.*

Times: 1, 3, and 8 hours.

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
1	not more than 15%
3	between 45% and 70%
8	not less than 80%

TEST 10—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 10.*

Medium: 0.05 M phosphate buffer, pH 6.5; 900 mL. Prepare the buffer employing the following method. Dissolve 7.1 g of anhydrous dibasic sodium phosphate in 1000 mL of water, and adjust with phosphoric acid to a pH of 6.5.

Apparatus 1: 100 rpm.

Procedure—Proceed as directed under *Test 1.*

Times: 1, 6, 9, and 24 hours.

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
1	not more than 10%
6	between 10% and 30%
9	between 34% and 60%
24	not less than 80%

FOR PRODUCTS LABELED FOR DOSING EVERY 24 HOURS—

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

Medium, Apparatus, and *Procedure*—Proceed as directed under *Test 1.*

Times: 1, 4, 10, and 15 hours.

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
1	between 5% and 20%
4	between 30% and 50%
10	between 70% and 90%
15	not less than 80%

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3.*

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 2: 100 rpm.

Times: 6, 12, 18, 24, and 30 hours.

Procedure—Determine the amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 237 nm on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Diltiazem Hydrochloride RS in the same *Medium.*

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
6	between 20% and 45%
12	between 25% and 50%
18	between 35% and 70%
24	not less than 70%
30	not less than 85%

TEST 6—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 6.*

Medium and *Procedure*—Proceed as directed under *Test 1.*

Apparatus 1: 100 rpm.

Times: 2, 4, 8, 12, and 16 hours.

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
2	not more than 25%
4	between 25% and 50%
8	between 60% and 85%
12	not less than 70%
16	not less than 80%

TEST 7—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 7.*

Medium: pH 4.2 acetate buffer; 900 mL. Prepare the buffer by employing the following method. Transfer 115 mL of acetic acid to a 10-L volumetric flask, dilute with water to volume, and mix *(Solution A)*. Transfer 165.4 g of anhydrous sodium acetate to a 10-L volumetric flask, dilute with water to volume, and mix *(Solution B)*. Mix 4410 mL of *Solution A* with 1590 mL of *Solution B*. Adjust, if necessary, with the addition of *Solution A* or *Solution B* to a pH of 4.2 ± 0.05.

Apparatus 2: 100 rpm.

Times: 1, 4, 10, and 15 hours.

Procedure—Determine the amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 237 nm on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Diltiazem Hydrochloride RS in the same *Medium.*

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
1	not more than 10%
4	between 15% and 35%
10	between 65% and 85%
15	not less than 80%

TEST 8—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 8.*

Medium, Apparatus, and *Procedure*—Proceed as directed under *Test 1.*

Times: 1, 4, 10, and 15 hours.

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
1	between 5% and 20%
4	between 30% and 50%
10	between 60% and 90%
15	not less than 80%

TEST 9—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 9.*

NOTE—Perform the test separately in each of the two media.

Medium 1: 0.1 N hydrochloric acid; 900 mL.

Medium 2: simulated intestinal fluid TS, prepared without enzyme and adjusted to a pH of 7.5 ± 0.1; 900 mL.

Apparatus 2: 75 rpm.

Time for Medium 1: 2 hours.

Times for Medium 2: 2, 12, 18, and 24 hours.

Procedure—Determine the amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 237 nm on filtered portions of the solution under test, suitably diluted with the appropriate *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Diltiazem Hydrochloride RS in the same *Medium.*

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved (*Medium 1*)	Amount dissolved (*Medium 2*)
2	between 0% and 5%	between 20% and 45%
12		between 35% and 55%
18		not less than 60%
24		not less than 80%

In-Process Revision

TEST 11—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 11.*

Medium, Apparatus, and *Procedure*—Proceed as directed under *Test 3.*

Times: 1, 6, 12, and 18 hours.

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
1	not more than 10%
6	between 30% and 40%
12	between 36% and 58%
18	not less than 85%

TEST 12—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 12.* Proceed as directed for *Extended-Release Dosage Forms.*

Medium and *Procedure*—Proceed as directed under *Test 1.*

Apparatus 1: 100 rpm.

Times: 2, 8, 14, and 24 hours.

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
2	not more than 20%
8	between 30% and 55%
14	not less than 65%
24	not less than 80%

TEST 13—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 13.* Proceed as directed for *Extended-Release Dosage Forms.*

Medium and *Procedure*—Proceed as directed under *Test 1.*

Apparatus 1: 100 rpm.

Times: 2, 8, 14, and 24 hours.

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
2	not more than 20%
8	between 30% and 55%
14	between 60% and 80%
24	not less than 80%

TEST 14—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 14.* Proceed as directed for *Extended-Release Dosage Forms.*

Medium, Apparatus, Times, and *Procedure*—Proceed as directed under *Test 3.*

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
6	between 20% and 45%
12	between 25% and 50%
18	between 35% and 70%
24	not less than 70%
30	not less than 80%

•TEST 15—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 15.* Proceed as directed for *Extended-Release Dosage Forms.*

Medium: 0.05 M phosphate buffer, pH 7.5; 900 mL.

Apparatus 2: 75 rpm.

Times: 2, 4, 8, 12, and 16 hours.

Procedure—Proceed as directed for *Test 1.*

Tolerances—The percentages of the labeled amount of $C_{22}H_{26}N_2O_4S \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved

BRIEFING

Divalproex Sodium, page 1362 of *PF* 31(5) [Sept.–Oct. 2005]. On the basis of comments received, it is proposed to revise this proposed new monograph. The specific changes include the following:

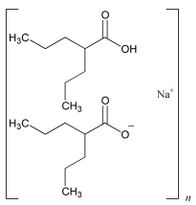
1. To eliminate the confusion of monomer vs. oligomer, reference to the chemical abstract number has been deleted. Also, the molecular weight has been designated to indicate the repeating unit.
2. The Definition has been modified to indicate that the content is calculated as available valproic acid. The need for content calculation on the "anhydrous basis" has been removed to reflect approved marketed product. Appropriate changes have been made in the *Assay* to reflect this.
3. The *Diluent* has been replaced with *Mobile phase* in the *Assay* to eliminate the problems caused by the presence of sodium lauryl sulfate.
4. *Stock solution A* and *Stock solution B* have been renamed as *Standard stock preparation* and *Impurity stock preparation,* respectively. A separate *System suitability preparation* has been introduced.
5. 2-Propanol has been replaced with acetonitrile as the solvent in the *Impurity stock preparation.*
6. The test for *Residual solvents* is no longer necessary because it is covered under the *General Notices.*

(MD-PP: R. Ravichandran) RTS—C44120

In-Process Revision

Add the following:

▲Divalproex Sodium



$(C_{16}H_{31}NaO_4)_n$, in which $n \geq 1$. Repeating unit molecular weight, 310.41

Pentanoic acid, 2-propyl-, sodium salt (2 : 1).

Sodium hydrogen bis(2-propylvalerate) ~~oligomer~~ [~~76584-70-8~~].

» ~~Divalproex Sodium contains not less than 98.0 percent and not more than 102.0 percent of $(C_{16}H_{31}NaO_4)_n$, calculated on the anhydrous basis.~~ Divalproex Sodium contains not less than 98.0 percent and not more than 102.0 percent of available valproic acid ($C_8H_{16}O_2$).

Packaging and storage—Preserve in tight containers. Store at room temperature.

USP Reference standards ⟨11⟩—*USP Divalproex Sodium RS. USP Valproic Acid RS. USP Valproic Acid Related Compound A RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: Ignite about 100 mg: the residue meets the requirements of the tests for *Sodium* ⟨191⟩.

Water, *Method I* ⟨921⟩**:** not more than 1.0%, determined on 3.0 g.

Heavy metals, *Method II* ⟨231⟩**:** 0.002%.

~~**Residual solvents** ⟨467⟩**:** meets the requirements.~~

Assay—

Buffer—Dissolve 3.5 g of monobasic sodium phosphate monohydrate in 900 mL of water. Adjust with phosphoric acid to a pH of 3.5. Dilute with water to 1 L.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer* and acetonitrile (1 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

~~*Diluent*—Prepare a 0.5% solution of sodium dodecyl sulfate in water.~~

~~*Stock solution A*—Transfer an accurately weighed amount of USP Valproic Acid RS to a suitable volumetric flask, first dissolve in methanol, using 10% of the final volume, then dilute with *Diluent* to volume, and mix to obtain a solution having a known concentration of about 5.0 mg per mL.~~

Standard stock preparation—Transfer an accurately weighed amount of USP Valproic Acid RS to a suitable volumetric flask, and dissolve in *Mobile phase* to obtain a solution having a known concentration of about 5.0 mg per mL.

~~*Stock solution B*—Dissolve an accurately weighed amount of USP Valproic Acid Related Compound A RS in 2-propanol to obtain a solution having a known concentration of about 0.5 mg per mL.~~

Impurity stock preparation—Dissolve an accurately weighed amount of USP Valproic Acid Related Compound A RS in acetonitrile to obtain a solution having a known concentration of about 0.5 mg per mL of valproic acid related compound A.

~~*Standard preparation*—Accurately transfer 20 mL of *Stock solution A* and 1 mL of *Stock solution B* into a 100 mL volumetric flask, and dilute with *Mobile phase* to obtain a solution having 1.0 mg per mL of valproic acid and 0.005 mg per mL of valproic acid related compound A.~~

System suitability preparation—Accurately transfer 10 mL of *Standard stock preparation* and 1 mL of *Impurity stock preparation* to a 100-mL volumetric flask, and dilute with

In-Process Revision

Mobile phase to obtain a solution having concentrations of 0.5 mg per mL of valproic acid and 0.005 mg per mL of valproic acid related compound A.

Standard preparation—Dilute quantitatively the *Standard stock preparation* with *Mobile phase* to obtain a solution having a known concentration of about 0.5 mg per mL of valproic acid.

Assay preparation—~~Transfer about 50 mg of Divalproex Sodium, accurately weighed, to a 100-mL volumetric flask; dissolve in 10 mL of methanol; and dilute with *Diluent* to volume. This solution has a concentration of about 0.5 mg per mL ofdivalproex sodium.~~ Transfer about 50 mg of Divalproex Sodium, accurately weighed, to a 100-mL volumetric flask, and dissolve in and dilute with *Mobile phase* to volume. This solution has a concentration of about 0.5 mg per mL of divalproex sodium.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the ~~*Standard preparation,*~~ *System suitability preparation,* and record the peak responses as directed for *Procedure:* the relative retention time for valproic acid related compound A is about 0.69, and that for valproic acid is 1.0; the resolution, *R,* between valproic acid related compound A and valproic acid is not less than 5.0; for the valproic acid peak, ~~the column efficiency is not less than 5000 theoretical plates;~~ the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about ~~15 µL~~ 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of ~~($C_{16}H_{24}NaO_4$),~~ available valproic acid ($C_8H_{16}O_2$) in the portion of Divalproex Sodium taken by the formula:

$$100(C_S / C_U)(r_U / r_S)(310.41/144.21)(½)$$

in which C_S is the concentration, in mg per mL, of valproic acid in the *Standard preparation;* C_U is the concentration of Divalproex Sodium, in mg per mL, in the *Assay preparation;* r_U and r_S are the peak areas for valproic acid obtained from the *Assay preparation* and the *Standard preparation;* 310.41 and 144.21 are the molecular weights for divalproex sodium repeating unit and valproic acid, respectively; and 2 is the number of moles of valproic acid per mole of divalproex sodium repeating unit.▲*USP31*

BRIEFING

Ensulizole, *USP 29* page 802, page 3719 of the *Second Supplement*, and page 1617 of *PF* 31(6) [Nov.–Dec. 2005]. It is proposed to correct the formula for the *Assay* calculation.

(HDQ: M. Marques) RTS—C47639

Change to read:

Assay—Transfer about 1200 mg of Ensulizole, accurately weighed, to a 300-mL iodine flask, and dissolve by stirring in 25 mL of 0.5 N sodium hydroxide. Add phenolphthalein TS, and titrate the excess with 0.5 N hydrochloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.5 N sodium hydroxide is equivalent to 137.15 mg of $C_{13}H_{10}N_2O_3S$. Calculate the percentage of $C_{13}H_{10}N_2O_3S$ in the portion of Ensulizole taken by the formula:

~~$$\frac{[(V_{NaOH} \times T_{NaOH}) - (V_{HCl} \times T_{HCl})] \times 0.5 \times 274.30 \times 100}{W \times LOD \times 10}$$~~

▲$$\frac{[(V_{NaOH} \times T_{NaOH}) - (V_{HCl} \times T_{HCl})] \times 0.5 \times 274.30 \times 100}{W \times (1 - LOD) \times 10}$$ ▲*USP30*

▲$$\frac{N_{HCl} \times (V_B - V_A) \times 274.30 \times 100}{W \times (1 - LOD)}$$ ▲*USP31*

~~in which V_{NaOH} is the volume, in mL, of 0.5 N sodium hydroxide added; T_{NaOH} is the titer of the 0.5 N sodium hydroxide; V_{HCl} is the volume, in mL, of 0.5 N hydrochloric acid used; T_{HCl} is the titer of 0.5 N hydrochloric acid; W is the weight, in g, of Ensulizole taken;~~

In-Process Revision

~~★100 is the percentage conversion factor;▲USP30 *LOD* and is the percentage of loss on drying, as determined in the test for *Loss on drying*.~~

▲in which N_{HCl} is the actual normality of 0.5 N hydrochloric acid; V_B is the volume, in mL, of 0.5 N hydrochloric acid used in the titration of the blank; V_A is the volume, in mL, of 0.5 N hydrochloric acid used in the titration of the sample; W is the weight, in mg, of ensulizole taken, and LOD is the percentage of loss on drying expressed as a decimal fraction, as determined in the test for *Loss on drying*.▲USP31

BRIEFING

Esterified Estrogens, *USP 29* page 852. Because USP has received comments that Esterified Estrogens do not contain 17α-dihydroequilin, it is proposed to revise the *Identification* test, the test for *Free steroids,* and the *Assay* to remove all requirements for and references to 17α-dihydroequilin. In the absence of any significant adverse comments, it is proposed to implement this revision via an *Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of April 1, 2007.

(MD-PS: D. Bempong) RTS—C46968

Change to read:

Identification— ~~It responds to *Identification* test *A* under *Conjugated Estrogens*.~~

•The chromatogram of the *Assay preparation* exhibits distinctive peaks for estrone and equilin at relative retention times corresponding to those exhibited in the chromatogram of the *Standard preparation,* as obtained in the *Assay*.•2

Change to read:

Free steroids— ~~Proceed with Esterified Estrogens as directed in the test for *Limit of estrone, equilin, and 17α-dihydroequilin* (free steroids) under *Conjugated Estrogens*. The limit is 3.0% of free steroids.~~

•*pH 5.2 Acetate buffer, Stock solution, Internal standard solution, and System suitability solution*—Proceed as directed in the *Assay.*

Free steroids standard solution—Dilute the *Stock solution* tenfold. Pipet 1.0 mL of the resulting solution and 1.0 mL of the *Internal standard solution* into a suitable centrifuge tube fitted with a tight screw cap or stopper. Proceed as directed for *Standard preparation* in the *Assay*, beginning with "Evaporate the mixture".

Test solution—Proceed as directed for *Assay preparation* in the *Assay,* with the following exceptions: do not add the sulfatase enzyme preparation, and transfer 6.0 mL instead of 3.0 mL of the filtrate to the centrifuge tube. Prepare a reagent blank in the same manner.

Chromatographic system—Proceed as directed in the *Assay,* with the additional requirement that the relative standard deviation for the ratio of the peak response of estrone to that of the internal standard in the *Free steroids standard solution,* for not less than two replicate injections, is not greater than 5.5%.

Procedure—Separately inject equal volumes (about 1 µL) of the *Free steroids standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the following ratio:

$$R_U / R_S$$

in which R_U is the ratio of the combined peak areas of equilin and estrone relative to the area of the internal standard in the *Test solution,* corrected for any reagent blank peaks; and R_S is the ratio of the peak area of estrone to that of the internal standard obtained from the *Free steroids standard solution:* the ratio is not more than 1.5 (3.0% of free steroids).•2

Change to read:

Assay—

~~*Internal standard solution, Stock solution, Acetate buffer, pH 5.2, System suitability solution, Standard preparation,* and *Chromatographic system*— Proceed as directed in the *Assay* under *Conjugated Estrogens*.~~

•*pH 5.2 Acetate buffer*—Mix 79 mL of sodium acetate TS with 21 mL of 1 N acetic acid, dilute with water to 500 mL, and mix. If necessary, adjust with the 1 N acetic acid or sodium acetate TS to a pH of 5.2 ± 0.1.

In-Process Revision

Stock solution—Dissolve accurately weighed quantities of USP Equilin RS and USP Estrone RS in alcohol, and dilute quantitatively, and stepwise if necessary, to obtain a solution having known concentrations of about 70 µg per mL and 160 µg per mL, respectively.

Internal standard solution—Prepare a solution of 3-*O*-methylestrone in methanol containing about 150 µg per mL.

System suitability solution—Dissolve a quantity of USP Estradiol RS (17β-estradiol) in alcohol to obtain a solution containing about 2 µg per mL. Pipet 1.0 mL of this solution, 1.0 mL of *Stock solution,* and 1.0 mL of *Internal standard solution* into a centrifuge tube fitted with a tight screw cap or stopper. Proceed as directed for *Standard preparation,* beginning with "Evaporate the mixture".

Standard preparation—Pipet 1.0 mL of *Stock solution* and 1.0 mL of *Internal standard solution* into a suitable centrifuge tube fitted with a tight screw cap or stopper. Evaporate the mixture with the aid of a stream of nitrogen to dryness, maintaining the temperature below 50°. To the dry residue add 15 µL of dried pyridine and 65 µL of bis(trimethylsilyl)-trifluoroacetamide containing 1% trimethylchlorosilane. Immediately cover the tube tightly, mix, and allow to stand for 15 minutes. Add 0.5 mL of toluene, and mix.•2

Assay preparation— ~~Using an accurately weighed quantity of Esterified Estrogens, equivalent to about 2 mg of total esterified estrogens, proceed as directed for *Assay preparation* in the *Assay* under *Conjugated Estrogens*.~~

•Transfer an accurately weighed quantity of Esterified Estrogens, equivalent to about 2 mg of total esterified estrogens, to a 50-mL centrifuge tube fitted with a polytef-lined screw cap and containing 15 mL of *pH 5.2 Acetate buffer* and 1 g of barium chloride. Cap the tube tightly, and shake for 30 minutes. If necessary, adjust the solution with 1 N acetic acid or sodium acetate TS to a pH of 5.0 ± 0.5. Place in a sonic bath for 30 seconds, then shake for an additional 30 minutes. Add a suitable sulfatase enzyme preparation equivalent to 2500 Units, and shake for 20 minutes in a water bath maintained at 50°. Add 15.0 mL of ethylene dichloride to the warm mixture, cap the tube again, and shake by mechanical means for 15 minutes. Centrifuge for 10 minutes or until the lower layer is clear. Transfer as much of the organic phase as possible, and dry by passing it rapidly through a filter consisting of a pledget of dry glass wool and about 5 g of anhydrous sodium sulfate in a small funnel. Protect from loss by evaporation. Transfer 3.0 mL of the solution to a suitable centrifuge tube fitted with a tight screw cap or stopper, and add 1.0 mL of *Internal standard solution.* Proceed as directed for *Standard preparation,* beginning with "Evaporate the mixture".

Chromatographic system (See *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector maintained at a temperature of 260° and contains a 0.25-mm × 15-m fused silica capillary column bonded with a 0.25-µm layer of phase G19, and a split injection system. The carrier gas is hydrogen flowing at a rate of 2 mL per minute, and the split flow rate is 40 to 60 mL per minute. The column temperature is maintained at 220°, and the injection port temperature is maintained at 260°. Adjust the operating conditions as necessary to maintain the elution time of the 3-*O*-methylestrone peak at between 17 and 25 minutes. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure*: the relative retention times are about 0.29, 0.80, 0.87, and 1.00 for 17-estradiol, estrone, equilin, and 3-*O*-methylestrone, respectively; the resolution, *R,* between estrone and equilin is not less than 1.2; the tailing factor for the estrone peak is not more than 1.3; and the relative standard deviation of the estrone peak ratios, for not fewer than four injections of the *Standard preparation,* is not greater than 2.0%.•2

Procedure— ~~Proceed as directed in the *Assay* under *Conjugated Estrogens*.~~

•Separately inject equal volumes (about 1 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks.•2

Calculate the quantity, in mg, of each sodium estrogen sulfate (equilin and estrone) in the portion of Esterified Estrogens taken by the formula:

$$(0.005)(F)C_i(R_U/R_S)$$

in which F is the conversion factor of free estrogen to the conjugate sodium salt (1.380 for equilin and 1.377 for estrone); C_i is the concentration, in µg per mL, of USP Equilin RS or USP Estrone RS, as appropriate, in the ~~alcohol solution;~~

In-Process Revision

•*Standard solution;*•2
and R_U and R_S are the ratios of the estrone or equilin peak areas to the 3-*O*-methylestrone peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Esterified Estrogens Tablets, *USP 29* page 853. Because USP has received comments that Esterified Estrogens do not contain 17α-dihydroequilin, it is proposed to revise the *Assay* to remove all requirements for and references to 17α-dihydroequilin by replacing the cross-reference to *Conjugated Estrogens* in the *Assay* with a cross-reference to *Esterified Estrogens.* It is also proposed to delete USP Testosterone RS from the *USP Reference standards* section because this Reference Standard is not used in any test in the monograph. In the absence of any significant adverse comments, it is proposed to implement this revision via an *Interim Revision Announcement* pertaining to *USP 29–NF 24,* with the official date of April 1, 2007.

Dissolution ⟨711⟩—
Medium: pH 4.5, 0.1 M phosphate buffer; prepared by dissolving 13.6 g of monobasic potassium phosphate in 1 L of water; 900 mL.
Apparatus 2: 50 rpm.
Time: 30 minutes.
~~*Procedure*—Determine the amount of $C_8H_{15}N_7O_2S_3$ dissolved from UV absorption at the wavelength of maximum absorbance at about 265 nm, using filtered portions of the solution under test, suitably diluted with *Medium* if necessary, in comparison with a Standard solution having a known concentration of USP Famotidine RS in the same *Medium.*~~

▲Determine the amount of $C_8H_{15}N_7O_2S_3$ dissolved employing one of the following methods.

SPECTROPHOTOMETRIC METHOD—Determine the amount of $C_8H_{15}N_7O_2S_3$ dissolved from UV absorption at the wavelength of maximum absorbance at about 265 nm, using filtered portions of the solution under test, suitably diluted with *Medium* if necessary, in comparison with a Standard solution having a known concentration of USP Famotidine RS in the same *Medium.*

CHROMATOGRAPHIC METHOD—

Buffer solution and *Mobile phase*—Proceed as directed in the *Assay.*

Standard solution—Dissolve an accurately weighed quantity of USP Famotidine RS in *Medium* to obtain a solution having a known concentration of about 0.14 mg per mL. Dilute this solution with *Medium* to obtain a solution containing *L*/900 mg per mL, *L* being the famotidine tablet label claim, in mg.

Test solution—Use filtered portions of the solution under test.

Chromatographic system—Proceed as directed in the *Assay.* Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the capacity factor, *k′*, is greater than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the

In-Process Revision

peak responses. Calculate the amount of $C_8H_{15}N_7O_2S_3$ dissolved by the formula:

$$\frac{r_U \times C_S \times 900 \times 100}{r_S \times LC}$$

in which r_U and r_S are the peak responses for the *Standard solution* and the *Test solution,* respectively; C_S is the concentration, in mg per mL, of the *Standard solution;* 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the tablet label claim, in mg.▲*USP31*

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_8H_{15}N_7O_2S_3$ is dissolved in 30 minutes.

▲FOR TABLETS LABELED AS CHEWABLE—Proceed as directed for either of the methods specified above, except for the following:

Time: 45 minutes.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_8H_{15}N_7O_2S_3$ is dissolved in 45 minutes.▲*USP31*

BRIEFING

Finasteride Tablets, *USP 29* page 908. It is proposed to update the system suitability requirements in the *Dissolution* test to reflect the validation report.

(BPC: M. Marques) RTS—C43215

Change to read:

Dissolution ⟨711⟩—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

FOR PRODUCTS LABELED AS 5-MG TABLETS—

Time: 45 minutes.

Determine the amount of $C_{23}H_{36}N_2O_2$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (29 : 21). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluting solution—Prepare a solution of acetonitrile and water (7 : 3).

Standard solution—Dissolve an accurately weighed quantity of USP Finasteride RS in *Diluting solution,* and dilute quantitatively, and stepwise if necessary, with *Diluting solution* to obtain a solution having a known concentration approximately equivalent to the sample under test.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 5-cm column that contains packing L1. The column temperature is maintained at 45°. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the capacity factor, *k′*, is not less than 2.0; the column efficiency is ~~not less~~

▲greater▲*USP31*
than 1000 theoretical plates; the tailing factor is ~~not more than 2.0;~~

▲less than 2;▲*USP31*
and the relative standard deviation for replicate injections is ~~not more~~

▲less▲*USP31*
than 2.0%.

Procedure—Separately inject equal volumes (about 200 µL) of the solution under test and the *Standard solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity of $C_{23}H_{36}N_2O_2$ dissolved.

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{23}H_{36}N_2O_2$ is dissolved in 45 minutes.

FOR PRODUCTS LABELED AS 1-MG TABLETS—

Time: 30 minutes.

Mobile phase—Prepare a degassed mixture of acetonitrile and water (11 : 9). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluting solution—Prepare a solution of water and acetonitrile (7 : 3).

Standard solution—Dissolve an accurately weighed quantity of USP Finasteride RS in *Diluting solution,* to obtain a solution having a known concentration of 0.1 mg per mL. Dilute this solution quantitatively, and stepwise if necessary, in 0.5% sodium lauryl sulfate to obtain a solution containing 0.001 mg of finasteride per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L11. The column temperature is maintained at 45°. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 5000 theoretical plates; the tailing factor is not more than ~~2.0;~~

▲2;▲*USP31*
and the relative standard deviation for replicate injections is not more than ~~2.0%~~

▲2%.▲*USP31*

Procedure—Separately inject equal volumes (about 100 µL) of the solution under test and the *Standard solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity of finasteride ($C_{23}H_{36}N_2O_2$) dissolved.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{23}H_{36}N_2O_2$ is dissolved in 30 minutes.

In-Process Revision

BRIEFING

Fluvastatin Sodium, *USP 29* page 961 and page 103 of *PF* 32(1) [Jan.–Feb. 2006]. The previously proposed replacement of the test for *Water* with the test for *Loss on drying* is now canceled.

It is proposed to add hydrated forms of Fluvastatin Sodium to the monograph. This proposal is consistent with the policy relating to inclusion of different degrees of hydration which was approved by the Council of Experts Executive Committee in January 2005 and published in *PF* 31(3), page 690, under *Policies and Announcements*. As per this policy, this proposal may become official "... only when the FDA has approved, or has not given any indication that it will not approve, a new drug application for a drug product with a different polymorphic form of the active ingredient than the form used to manufacture the reference listed drug."

The test for *Water* is revised to provide a separate requirement for the hydrated forms of the drug and to add a *Note* to clarify that for this monograph, the term "hydrated form" covers several known forms of Fluvastatin Sodium that are not stoichiometric hydrates. The actual range for the *Water* content for each hydrated form, included in the manufacturer's specifications, may be tighter than the one proposed in the monograph.

It is also proposed to add a *Labeling* requirement. In addition, *Identification* test *A* is revised to add a detailed procedure for a polymorphic equalization.

Interested parties are encouraged to submit their comments to the MD-GRE Expert Committee.

BRIEFING

Fluvoxamine Maleate Tablets, page 3568 of the *First Supplement* and page 1622 of *PF* 30(5) [Sept.–Oct. 2004]. In the *Procedure* section of the *Dissolution* test, it is proposed to add a statement allowing corrections, as needed, to eliminate the effect of interference caused by excipients.

(BPC: M. Marques) RTS—C48262

Change to read:

Dissolution ⟨711⟩—

Medium: water; 900 mL, degassed.
Apparatus 2: 50 rpm.
Time: 30 minutes.
Procedure—Determine the amount of $C_{15}H_{21}F_3N_2O_2 \cdot C_4H_4O_4$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 246 nm on portions of the solution under test centrifuged at 2000 rpm for 10 minutes, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Fluvoxamine Maleate RS in the same *Medium*.

▲When there are known interferences due to excipients, excipient interference corrections may be applied, as necessary.▲*USP31*
Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{15}H_{21}F_3N_2O_2 \cdot C_4H_4O_4$ is dissolved in 30 minutes.

Add the following:

■**Related compounds—**

Buffer solution, Mobile phase, Resolution solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Identification solution—Dissolve a quantity of maleic acid in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a concentration of about 0.35 mg per mL.

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Test solution—Use the *Assay stock preparation,* prepared as directed in the *Assay.*

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution,* the *Test solution,* and the *Identification solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of impurities in the portion of Tablets taken by the formula:

$$100(C/D)F(r_i/r_S)$$

in which C is the concentration, in mg per mL, of USP Fluvoxamine Maleate RS in the *Standard solution; D* is the expected concentration, in mg per mL, of fluvoxamine maleate taking into account the labeled amount and the amount of sample taken to prepare the *Test solution; F* is the response factor of each impurity as given in *Table 1;* r_i is the individual peak area of each impurity in the *Test solution;* and r_S is the peak area of fluvoxamine maleate in the *Standard solution.* The limits of impurities are specified in *Table 1.* [NOTE—Disregard any peak due to maleic acid or to the reagent blank.]

TEST 2—

Mobile phase—Prepare a degassed mixture of acetonitrile, water, and phosphoric acid (4000 : 15 : 2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Resolution solution—Transfer about 1 mg each of USP Fosinopril Sodium RS, USP Fosinopril Related Compound C RS, and USP Fosinopril Related Compound D RS to a 100-mL volumetric flask. Dissolve in and dilute with the *Standard solution* to volume, and mix.

Test solution—Use the *Assay preparation.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 25-cm column that contains packing L12. The column temperature is maintained at 45°. The flow rate is about 0.9 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between fosinopril sodium and fosinopril related compound C is not less than 1.5.

Procedure—Inject about 20 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak areas, carrying out the chromatography to two times the retention time of the fosinopril sodium peak. Calculate the percentages of fosinopril related compound C and fosinopril related compound D only by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response of fosinopril related compound C or fosinopril related compound D; and r_s is the sum of the responses of all the peaks.

TEST 3—

0.2% Phosphoric acid solution—Prepare a 1 in 500 solution of phosphoric acid.

Mobile phase—Prepare a degassed mixture of acetonitrile and *0.2% Phosphoric acid solution* (560 : 440). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—Transfer about 1 mg each of USP Fosinopril Sodium RS, USP Fosinopril Related Compound E RS, and USP Fosinopril Related Compound F RS to a 100-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix.

Test solution—Transfer about 10 mg of Fosinopril Sodium, accurately weighed, to a 50-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 205-nm detector and a 4.6-mm × 25-cm column that contains packing L11. The column temperature is maintained at 45°. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between fosinopril related compound F and fosinopril sodium is not less than 1.5, and the resolution between fosinopril related compound E and fosinopril related compound F is not less than 1.5.

Procedure—Inject about 20 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak areas, carrying out the chromatography to four times the retention time of the fosinopril sodium peak. Calculate the percentages of fosinopril related compound E and fosinopril related compound F only, ~~by~~ using the formula below:

$$100(r_i / r_s)$$

in which r_i is the peak response of fosinopril related compound E or fosinopril related compound F; and r_s is the sum of the responses of all the peaks. In addition to not exceeding the limits for impurities in *Table 1,* not more than 0.1% of any other individual impurity is found (calculated as directed for the *Procedure* in *Test 1*); and not more than 1.5% of total impurities is found.

~~**Organic volatile impurities,** *Method I* **Residual solvents** ⟨467⟩**:** meets the requirements.~~

Assay—

Mobile phase—Prepare a degassed mixture of acetonitrile, water, and phosphoric acid (2000 : 10 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Transfer about 10 mg of USP Fosinopril Sodium RS, and about 1 mg each of USP Fosinopril Related Compound A RS and USP Fosinopril Related Compound B RS to a 100-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix.

Standard preparation—Dissolve an accurately weighed quantity of USP Fosinopril Sodium RS in *Mobile phase* to obtain a solution having a known concentration of about 0.10 mg per mL.

Assay preparation—Transfer about 25 mg of Fosinopril Sodium, accurately weighed, to a 250-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 214-nm detector and a 3.9-mm × 15-cm column that contains packing L3. The column temperature is maintained at 33°. The flow rate is about 1.2 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between fosinopril related compound B and fosinopril sodium is not less than 2.0; and the relative standard deviation of the fosinopril sodium peak response for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in mg, of $C_{30}H_{45}NNaO_7P$ in the portion of Fosinopril Sodium taken by the formula:

$$250C_S(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Fosinopril Sodium RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ■1S (*USP30*)

In-Process Revision

BRIEFING

Gabapentin, page 3569 of the *First Supplement* and page 50 of *PF* 31(1) [Jan.–Feb. 2005]. On the basis of comments received, it is proposed to make the following changes in the test for *Related compounds*.

1. It is proposed to delete *Test 2* because it monitors only gabapentin related compound A and *Test 1, Method 1* also monitors this related compound.
2. *Test 1, Method 1* is renamed as *Limit of early eluting impurities,* and *Test 1, Method 2* is renamed as *Limit of late eluting impurities.*
3. The *System suitability solution* in the current *Assay* is moved to *Limit of early eluting impurities* because the criteria are more relevant for this test.
4. In the *Procedure,* the limit of total impurities is revised to reflect the currently approved products on the market.

In addition, the proposed *Labeling* section is deleted, based on the changes made in the test for *Related compounds*. The test for *Limit of chloride* is also deleted because it does not provide any specific value-added information related to the quality of the drug substance.

(MD-PP: R. Ravichandran) RTS—C47073

~~**Labeling**—Label it to indicate with which impurity tests the article complies.~~

Delete the following:

▲~~**Limit of chloride**—Transfer about 1500 mg of Gabapentin, accurately weighed, to a 100-mL beaker, and dissolve in 50 mL of a mixture of water, methanol, and acetic acid (60 : 39 : 1). Titrate with 0.01 N silver nitrate VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary corrections (see *Titrimetry* ⟨541⟩). Each mL of 0.01 N silver nitrate is equivalent to 0.3545 mg of chloride: not more than 0.01% is found.~~▲*USP31*

Add the following:

▲**Related compounds**—~~[NOTE—Perform all related impurity tests unless the manufacturer has assurance, based on knowledge of the manufacturing process, that one of the tests is not relevant to the manufacturer's material.]~~

~~TEST 1, METHOD 1~~ LIMIT OF EARLY ELUTING IMPURITIES—

Diluent, Buffer solution, Mobile phase, ~~*Impurities solution, System suitability solution,*~~ and *Chromatographic system*—Proceed as directed in the *Assay.*

Impurities solution—Dissolve suitable quantities of USP Gabapentin RS, USP Gabapentin Related Compound A RS, and USP Gabapentin Related Compound B RS in methanol to obtain a solution containing about 1.4 mg per mL and 0.84 mg per mL, respectively.

System suitability solution—Dissolve a suitable quantity of USP Gabapentin RS in *Diluent,* and add an appropriate volume of *Impurities solution* to obtain a solution containing about 14.0 mg per mL, 0.014 mg per mL, and 0.0084 mg per mL of USP Gabapentin RS, USP Gabapentin Related Compound A RS, and USP Gabapentin Related Compound B RS, respectively.

Test solution—Use the *Assay preparation*.

Standard solution—~~Use the *Standard preparation,* prepared as directed in the *Assay.*~~ Dissolve a suitable quantity of USP Gabapentin Related Compound E RS in *Diluent* to obtain a solution having a known concentration of 8.4 µg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—Prepare as directed in the *Assay.* Chromatograph the *System suitability solution* (about 20 µL), and record the peak responses as directed for *Procedure:* identify the major peaks using the relative retention times given in *Table 1:* the resolution, *R,* between gabapentin related compound A and gabapentin related compound B is not less than 2.3; and the relative standard deviation for gabapentin is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of any impurity in the portion of Gabapentin taken by the formula:

$$\sim\sim 2500F(C/W)(r_i/r_S)\sim\sim$$

$$100(1/F)C_S/C_T)(r_i/r_S)$$

~~in which *F* is the relative response factor of the impurity according the table below; *C* is the concentration, in mg per mL, of USP Gabapentin Related Compound E RS in the *Standard solution; W* is the weight, in mg, of Gabapentin, on an anhydrous basis, used to prepare the *Test solution;*~~ in

In-Process Revision

which F is the relative response factor of the impurity (relative to gabapentin related compound E) according to *Table 1;* C_S is the concentration, in mg per mL, of USP Gabapentin Related Compound E RS in the *Standard solution;* C_T is the concentration of Gabapentin, in mg per mL, in the *Test solution;* r_i is the peak area for any impurity in the *Test solution;* and r_S is the peak area for gabapentin related compound E in the *Standard solution:* the impurities meet the requirements given in ~~table~~ *Table 1*.~~.~~

~~Compound Name~~	~~Relative Response Factor~~	~~Limit (%)~~
~~Gabapentin related compound A~~	~~1.0~~	~~0.10~~
~~Gabapentin related compound B~~	~~1.0~~	~~0.06~~
~~Gabapentin related compound E~~	~~1.0~~	~~0.10~~
~~Individual unknown impurity~~	~~0.025~~	~~0.10~~

~~TEST 1, METHOD 2~~ LIMIT OF LATE ELUTING IMPURITIES—

Diluent—Dissolve 2.32 g of ammonium phosphate monobasic in 1000 mL of water. Adjust with phosphoric acid to a pH of 2.0.

Buffer solution—Proceed as directed in the *Assay.*

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution,* ~~methanol, and acetontrile (35 : 30 : 30)~~ acetonitrile, and methanol (35 : 35 : 30). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Gabapentin Related Compound D RS in a small amount of methanol, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.0028 mg per mL.

Test solution—Use the *Assay preparation.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. The column temperature is maintained at 40°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 13,600 theoretical plates for the gabapentin related compound D peak; and the relative standard deviation for replicate injections is not more than 7.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. [NOTE—Disregard all the peaks having relative retention times of 0.35 or less relative to

Table 1

Compound Name	Relative Retention Time[1] (approximate)	Relative Response Factor[2]	Limit (%)
Gabapentin related compound E	2.9	1.0	0.10
Gabapentin related compound A	3.5	5.3	0.1
Gabapentin related compound B	3.8	0.35	0.06
Individual unknown impurity	—	0.41	0.10

[1] The relative retention times are calculated based on the retention time of gabapentin. [NOTE—This information is for identification purposes only.]
[2] The relative response factors are calculated based on the response of gabapentin related compound E due to the low absorptivity of gabapentin at the monitoring wavelength (215 nm).

In-Process Revision

gabapentin related compound D as these are quantified in the test for *Related compounds*.] Calculate the percentage of any impurity in the portion of Gabapentin taken by the formula:

~~$2500(C/W)(r_i/r_s)$,~~

$$100(1/F)(C_S/C_T)(r_i/r_S)$$

~~in which *C* is the concentration, in mg per mL, of USP Gabapentin Related Compound D RS in the *Standard solution; W* is the weight, in mg, of Gabapentin, on the anhydrous basis, used to prepare the *Test solution;* r_i is the peak area for any impurity in the *Test solution;* and r_s is the peak area for gabapentin related compound D in the *Standard solution:* not more than 0.02% of gabapentin related compound D is found; not more than 0.10% of any other impurity is found; and not more than 0.35% of total impurities is found (including the impurities quantified in *Test 1* and *Test 2*) [NOTE—Disregard all the peaks having relative retention times of 0.35 or less.]~~ in which F is the relative response factor of the impurity (relative to gabapentin related compound D) which is 1.0 for gabapentin related compound D and 0.025 for all other impurities, respectively; C_S is the concentration, in mg per mL, of USP Gabapentin Related Compound D RS in the *Standard solution;* C_T is the concentration of Gabapentin, in mg per mL, in the *Test solution;* r_i is the peak area for any impurity in the *Test solution;* and r_S is the peak area for gabapentin related compound D in the *Standard solution:* not more than 0.10% of any impurity is found, and not more than 0.5% of total impurities (including the impurities quantified in *Limit of early eluting impurities*) is found.

~~TEST 2—~~

~~*Diluent*—Dissolve 1.2 g of monobasic potassium phosphate in 1000 mL of water, and adjust with 5 N potassium hydroxide to a pH of 6.9.~~

~~*Blank solution*—Use the *Diluent.*~~

~~*Solution A*—Dissolve 1.2 g of monobasic potassium phosphate in 940 mL of water, and adjust with 5 N potassium hydroxide to a pH of 6.9, add 60 mL of acetonitrile, mix, filter, and degas.~~

~~*Solution B*—Dissolve 1.2 g of monobasic potassium phosphate in 700 mL of water, adjust with 5 N potassium hydroxide to a pH of 6.9, add 300 mL of acetonitrile, mix, filter, and degas.~~

~~*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~

~~*Standard solution*—Dissolve accurately weighed quantities of USP Gabapentin RS and USP Gabapentin Related Compound A RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.04 mg per mL.~~

~~*Test solution*—Transfer about 500 mg of Gabapentin, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The flow rate is about 1.3 mL per minute. The chromatograph is programmed as follows. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 4.8 for gabapentin related compound A and 1.0 for gabapentin; and the relative standard deviation for replicate injections in both peaks is not more than 10.0%.~~

~~Time (minutes)~~	~~*Solution A* (%)~~	~~*Solution B* (%)~~	~~Elution~~
~~0~~	~~100~~	~~0~~	~~equilibration~~
~~0–7~~	~~100~~	~~0~~	~~isocratic~~
~~7–45~~	~~100→0~~	~~0→100~~	~~linear gradient~~

In-Process Revision

BRIEFING

Gabapentin Capsules. A monograph for Gabapentin Capsules had been proposed in *PF* 28(2) [Mar.–Apr. 2002] but was recently canceled. A new monograph is now being proposed for this dosage form. The liquid chromatographic procedures in the tests for *Related compounds* and *Dissolution* and in the *Assay* are based on analyses performed with the Spherisorb S5 brand of L7 column. In the test for *Related compounds,* a gradient elution method is used in which the typical retention time for gabapentin related compund A is 33 minutes. In the *Assay,* an isocratic method is used in which the typical retention time for gabapentin is 6 minutes.

(MD-PP: R. Ravichandran; BPC: M. Marques) RTS—C44434

Add the following:

▲Gabapentin Capsules

» Gabapentin Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of gabapentin ($C_9H_{17}NO_2$).

Packaging and storage—Preserve in well-closed containers. Store at conrolled room temperature.

USP Reference standards ⟨11⟩—*USP Gabapentin RS. USP Gabapentin Related Compund A RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

Test specimen—Empty the contents of not fewer than 10 Capsules, and grind to a fine powder. Use an amount of the powder, equivalent to 2 mg of gabapentin, and 200 mg of potassium bromide.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩**—**

Medium: 0.06 N hydrochloric acid (prepared by adding 51 mL of hydrochloric acid to 10 L of water); 900 mL.

Apparatus 2: 50 rpm.

Time: 20 minutes.

Determine the amount of gabapentin ($C_9H_{17}NO_2$) dissolved by employing the following method.

Mobile phase—Proceed as directed in the *Assay.*

Standard stock solution—Transfer about 111 mg of USP Gabapentin RS, accurately weighed, to a 100-mL volumetric flask, and dissolve in and dilute with *Medium* to volume.

Working standard solution—

FOR CAPSULES LABELED TO CONTAIN 100 MG—Transfer 10.0 mL of the *Standard stock solution* to a 100-mL volumetric flask, and dilute with *Medium* to volume.

FOR CAPSULES LABELED TO CONTAIN 300 MG—Transfer 30.0 mL of *Standard stock solution* to a 100-mL volumetric flask, and dilute with *Medium* to volume.

FOR CAPSULES LABELED TO CONTAIN 400 MG—Transfer 20.0 mL of the *Standard stock solution* to a 50-mL volumetric flask, and dilute with *Medium* to volume.

Test solution—Pass a portion of the solution under test through a suitable 0.45-µm filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay,* except to use the *Working standard solution*.

Procedure—Separately inject equal volumes (about 100 µL) of the appropriate *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the amount of gabapentin ($C_9H_{17}NO_2$) dissolved by the formula:

$$\frac{r_U \times C_S \times 900 \times 100}{r_S \times LC}$$

in which r_U and r_S are the peak responses for the *Working standard solution* and the *Test solution,* respectively; C_S is the concentration, in mg per mL, of the *Working standard solution*; 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the Capsule label claim in mg.

In-Process Revision

Tolerances—Not less than 80% *(Q)* of the labeled amount of gabapentin ($C_9H_{17}NO_2$) is dissolved in 20 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Related compounds—

Diluent—Prepare as directed in the *Assay.*

Solution A—Dissolve 1.2 g of monobasic potassium phosphate in 940 mL of water. Adjust with 5 N potassium hydroxide to a pH of 6.9, add 60 mL of acetonitrile, and stir. Filter, and degas.

Solution B—Dissolve 1.2 g of monobasic potassium phosphate in 700 mL of water. Adjust with 5 N potassium hydroxide to a pH of 6.9, add 300 mL of acetonitrile, and stir. Filter, and degas.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve accurately weighed quantities of USP Gabapentin RS and USP Gabapentin Related Compound A RS in *Diluent* to obtain a solution having a known concentration of about 0.04 mg of each per mL.

Test solution—Weigh and finely powder not fewer than 20 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about 500 mg of gabapentin, to a suitable volumetric flask, and dissolve the contents in *Diluent* with sonication, if necessary, for about 30 seconds. Dilute with *Diluent* to volume, and mix to obtain a final solution having a known concentration of about 20 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0.0–4.0	100	0	isocratic
4.0–45.0	100→0	0→100	linear gradient
45.0–45.1	0→100	100→0	linear gradient
45.1–50.0	100	0	re-equilibration

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor for the gabapentin peak is not more than 2.0; and the relative standard deviation for replicate injections for both gabapentin and gabapentin related compound A is not more than 5.0%.

Procedure—Separately inject a volume (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of gabapentin related compound A in the portion of Capsules taken by the formula:

$$100(C_S/C_T)(r_U/r_S)$$

in which C_S is the concentration, in mg per mL, of USP Gabapentin Related Compound A RS in the *Standard solution;* C_T is the concentration, in mg per mL, of gabapentin in the *Test solution;* and r_U and r_S are the individual peak responses for gabapentin related compound A obtained from the *Test solution* and *Standard solution,* respectively: not more than 0.4% of gabapentin related compound A is found. Calculate the percentage of any other unspecified impurity using the formula:

$$100(C_S/C_T)(r_i/r_S)$$

in which C_S and C_T are the concentrations, in mg per mL, of gabapentin in the *Standard solution* and the *Test solution,* respectively; r_i is the response for each unspecified impurity in the *Test solution;* and r_S is the peak response for gabapentin

In-Process Revision

in the *Standard solution:* not more than 0.1% of any indivdiual unspecified impurity is found, and not more than 1.0% of total impurities is found.

Assay—

Diluent—Dissolve 1.2 g of monobasic potassium phosphate in 1 L of water. Adjust with 5 N potassium hydroxide to a pH of 6.9.

Mobile phase—Dissolve 1.2 g of monobasic potassium phosphate in 940 mL of water. Adjust with 5 N potassium hydroxide to a pH of 6.9, add 60 mL of acetonitrile, and stir. Filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Gabapentin RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 4.0 mg per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of gabapentin, to a suitable volumetric flask, and dissolve the contents in *Diluent* with sonication, if necessary, for about 60 seconds. Dilute with *Diluent* to volume, and mix to obtain a final solution having a known concentration of about 4.0 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 7,000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the gabapentin peak. Calculate the percentage of gabapentin ($C_9H_{17}NO_2$) in the portion of Capsules taken by the formula:

$$100(C_S/C_U)(r_U/r_S)$$

in which C_S and C_U are the concentrations, in mg per mL, of gabapentin in the *Standard preparation* and *Assay preparation,* respectively; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP31*

BRIEFING

Gabapentin Tablets. Because there is no existing *USP* monograph for this dosage form, a new monograph is being proposed. The liquid chromatographic procedures in the tests for *Related compounds* and *Dissolution* and in the *Assay* are based on analyses performed with the Spherisorb S5 brand of L7 column. In the test for *Related compounds,* a gradient elution method is used in which the typical retention time for gabapentin related compound A is 33 minutes. In the *Assay,* an isocratic method is used in which the typical retention time for gabapentin is 6 minutes.

(MD-PP: R. Ravichandran; BPC: M. Marques) RTS—C44435

Add the following:

▲Gabapentin Tablets

» Gabapentin Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of gabapentin ($C_9H_{17}NO_2$).

Packaging and storage—Preserve in well-closed containers. Store at controlled room temperature.

In-Process Revision

USP Reference standards ⟨11⟩—*USP Gabapentin RS. USP Gabapentin Related Compund A RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

Test specimen—Grind at least 20 Tablets to a fine powder. Use an amount of powder, equivalent to about 2 mg of gabapentin, and about 200 mg of dry potassium bromide.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: 0.06 N hydrochloric acid (prepared by adding 51 mL of hydrochloric acid to 10 L of water); 900 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Determine the amount of gabapentin ($C_9H_{17}NO_2$) dissolved by the following method.

Mobile phase—Proceed as directed in the *Assay.*

Standard stock solution—Transfer about 111 mg of USP Gabapentin RS, accurately weighed, to a 50-mL volumetric flask, and dissolve in and dilute with *Medium* to volume.

Working standard solutions—Dilute aliquots of the *Standard stock solution* with *Medium* to obtain solutions having the following concentrations: 110 µg per mL for Tablets labeled to contain 100 mg; 330 µg per mL for Tablets labeled to contain 300 mg; 440 µg per mL for Tablets labeled to contain 400 mg; 660 µg per mL for Tablets labeled to contain 600 mg; and 880 µg per mL for Tablets labeled to contain 800 mg.

Test solution—Pass a portion of the solution under test through a suitable 0.45-µm filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay,* except to use the *Working standard solutions*: the column efficency is not less than 5000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 3%.

Procedure—Separately inject equal volumes (about 100 µL for the Tablets labeled to contain 100, 300, or 400 mg; and about 50 µL for Tablets labeled to contain 600 or 800 mg) of the appropriate *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the amount of gabapentin ($C_9H_{17}NO_2$) dissolved by the formula:

$$\frac{r_U \times C_S \times 900 \times 100}{r_S \times LC}$$

in which r_U and r_S are the peak responses for the *Working standard solution* and the *Test solution,* respectively; C_S is the concentration, in mg per mL, of the *Working standard solution;* 900 is the volume, in mL, of *Medium*; 100 is the conversion factor to percentage; and *LC* is the Tablet label claim in mg.

Tolerances—Not less than 80% *(Q)* of the labeled amount of gabapentin ($C_9H_{17}NO_2$) is dissolved in 45 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Related compounds—

Diluent—Prepare as directed in the *Assay.*

Solution A—Dissolve 1.2 g of monobasic potassium phosphate in 940 mL of water, Adjust with 5 N potassium hydroxide to a pH of 6.9, add 60 mL of acetonitrile, and stir. Filter, and degas.

Solution B—Dissolve 1.2 g of monobasic potassium phosphate in 700 mL of water, adjust with 5 N potassium hydroxide to a pH of 6.9, add 300 mL of acetonitrile, and stir. Filter, and degas.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

In-Process Revision

Standard solution—Dissolve accurately weighed quantities of USP Gabapentin RS and USP Gabapentin Related Compound A RS in *Diluent* to obtain a solution having a known concentration of about 0.04 mg of each per mL.

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 500 mg of gabapentin, to a suitable volumetric flask, and dissolve the contents in *Diluent* with sonication, if necessary, for about 30 seconds. Dilute with *Diluent* to volume, and mix to obtain a final solution having a known concentration of about 20 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0.0–4.0	100	0	isocratic
4.0–45.0	100→0	0→100	linear gradient
45.0–45.1	0→100	100→0	linear gradient
45.1–50.0	100	0	re-equilibration

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor for the gabapentin peak is not more than 2.0; and the relative standard deviation for replicate injections for both gabapentin and gabapentin related compound A is not more than 5.0%.

Procedure—Separately inject a volume (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of gabapentin related compound A in the portion of Tablets taken by the formula:

$$100(C_S / C_T)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Gabapentin Related Compound A RS in the *Standard solution;* C_T is the concentration, in mg per mL, of gabapentin in the *Test solution;* and r_U and r_S are the individual peak responses for gabapentin related compound A obtained from the *Test solution* and *Standard solution,* respectively: not more than 0.4% of gabapentin related compound A is found. Calculate the percentage of any other unspecified impurity using the formula:

$$100(C_S / C_T)(r_i / r_S)$$

in which C_S and C_T are the concentrations, in mg per mL, of gabapentin in the *Standard solution* and *Test solution,* respectively; r_i is the response for each unspecified impurity in the *Test solution;* and r_S is the peak response for gabapentin in the *Standard solution:* not more than 0.1% of any indivdiual unspecified impurity is found; and not more than 1.0% of total impurities is found.

Assay—

Diluent—Dissolve 1.2 g of monobasic potassium phosphate in 1 L of water. Adjust with 5 N potassium hydroxide to a pH of 6.9.

Mobile phase—Dissolve 1.2 g of monobasic potassium phosphate in 940 mL of water. Adjust with 5 N potassium hydroxide to a pH of 6.9, add 60 mL of acetonitrile, and stir. Filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Gabapentin RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 4.0 mg per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of gabapentin, to a suitable volumetric flask, and dissolve the contents in *Diluent* with sonication, if necessary, for about 60 seconds. Dilute with *Diluent* to volume, and mix to obtain a final solution having a known concentration of about 4.0 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 7,000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0 %.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the gabapentin peak. Calculate the percentage of gabapentin ($C_9H_{17}NO_2$) in the portion of Tablets taken by the formula:

$$100(C_S/C_U)(r_U/r_S)$$

in which C_S and C_U are the concentrations, in mg per mL, of gabapentin in the *Standard preparation* and the *Assay preparation,* respectively; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP31*

Add the following:

▲**Uniformity of dosage units** ⟨905⟩: meets the requirements.▲*USP31*

BRIEFING

Indium In 111 Chloride Solution, *USP 29* page 1119. On the basis of comments received, it is proposed to revise the *Radiochemical purity* section to replace the descending paper chromatography method with an ITLC method using SG glass microfiber strips.

(RMI: A. Wilk) RTS—C41565

Change to read:

Radiochemical purity~~— Dispense about 50 µL of Solution into 1 mL of 0.04 M hydrochloric acid, taking care to use polypropylene tips prewashed in 0.04 M hydrochloric acid for all dispensings. Draw a line approximately 10 cm from one end of a Whatman No. 1 paper strip (5 × 25 cm). Using dispensers with polypropylene tips prewashed in 0.04 M hydrochloric acid, spot 10 µL of 0.5 N sodium carbonate at the start position followed by 2 µL of the test specimen. Allow the strip to air-dry, place in a chromatography jar, and elute downwards using 1 M sodium chloride as the eluent. The indium chloride will remain at the origin. After allowing the strip to air-dry, interpret the chromatogram using an appropriate scanner, and determine the percentage of radiochemical purity of the test specimen. Not less than 95% indium is present as ionic In.~~

▲*Adsorbent:* instant thin-layer chromatography (ITLC) strips (2.5 cm × 10 cm).[1]

Test solution—Dispense about 50 µL of Solution into 1 mL of 0.05 M hydrochloric acid, taking care to use polypropylene tips prewashed in 0.05 M hydrochloric acid for all dispensings.

Application volume: 2 µL. The amount of ^{111}In spotted should be between 0.5 and 30 µCi as of the day of the test.

Developing solvent system: a mixture of a 1 in 10 solution of ammonium acetate and methanol (1 : 1).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. Examine the plate with an appropriate scanner, and determine the percentage of radiochemical purity of the *Test solution.* The indium chloride will remain at the origin. Not less than 95% of indium is present as ionic indium.▲*USP31*

BRIEFING

Diluted Isosorbide Mononitrate, *USP 29* page 1205 and page 3727 of the *Second Supplement.* It is proposed to use USP Diluted Isosorbide Mononitrate Related Compound A RS instead of the previously proposed reference standard, USP Isosorbide Mononitrate Related Compound A RS. The currently proposed reference standard is a dry mixture of an active component and a suitable excipient.

(MD-CV: S. Ramakrishna) RTS—C49076

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water and methanol (95 : 5). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Transfer an accurately weighed quantity of USP ■Diluted■2S *(USP29)* Isosorbide Mononitrate RS to a suitable volumetric flask, dissolve in water, add a volume of methanol equivalent to 4% of the flask volume, and dilute with water to volume to obtain a solution having a known concentration of about 2.0 mg ■of isosorbide mononitrate■2S *(USP29)* per mL.

Isosorbide mononitrate related compound A standard preparation—Dissolve an accurately weighed quantity of USP

▲Diluted▲*USP31*
Isosorbide Mononitrate Related Compound A RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 1.0 mg of

▲isosorbide mononitrate related compound A▲*USP31*
per mL. Quantitatively dilute a portion of this solution with water to obtain a solution having a known concentration of about 0.05 mg per mL.

Resolution solution—Transfer 10.0 mL of *Isosorbide mononitrate related compound A standard preparation,* 1.0 mL of the *Standard preparation,* and 4.0 mL of methanol to a 100-mL volumetric flask, and dilute with water to volume. Filter a portion of the solution, discarding the first few mL of the filtrate.

Assay preparation—Transfer ■an accurately weighed amount of Diluted Isosorbide Mononitrate, equivalent to 100 mg of isosorbide mononitrate,■2S *(USP29)* to a 50-mL volumetric flask, dissolve in about 25 mL of water, add 2 mL of methanol, dilute with water to volume, and mix. Filter a portion of the solution, discarding the first few mL of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4-mm × 12.5-cm column that contains packing L1. The flow rate is about 1.5 mL per minute, increasing to 3.0 mL per minute at about 8.5 minutes to ensure that the isosorbide mononitrate peak has completely eluted. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.8 for isosorbide mononitrate related compound A, 1.0 for isosorbide mononitrate, and 4.1 for isosorbide dinitrate; and the resolution, *R,* between isosorbide mononitrate related compound A and isosorbide mononitrate is not less than 2.0. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the isosorbide mononitrate peaks. Calculate the quantity, in mg, of isosorbide mononitrate ($C_6H_9NO_6$) in the portion of Diluted Isosorbide Mononitrate taken by the formula:

$$\blacksquare CV(r_U / r_S)_{\blacksquare 2S\ (USP29)}$$

in which C is the concentration, in mg per mL, of isosorbide mononitrate in the *Standard preparation;* $\blacksquare V$ is the volume, in mL, of the *Assay preparation;* $\blacksquare_{2S\ (USP29)}$ and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Isosorbide Mononitrate Tablets, page 1513 of *PF* 29(5) [Sept.–Oct. 2003]—See briefing under *Isosorbide Mononitrate Extended-Release Tablets*.

(MD-CV: S. Ramakrishna) RTS—C49075

Add the following:

■Isosorbide Mononitrate Tablets

» Isosorbide Mononitrate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of isosorbide mononitrate ($C_6H_9NO_6$).

Packaging and storage—Preserve in tight containers. Store at a temperature between 20° and 30°.

Change to read:

USP Reference standards ⟨11⟩—*USP Isosorbide RS.* ▲[NOTE—The following Reference Standards are dry mixtures of an active component and suitable excipients to permit safe handling. in which C is the concentration, in mg per mL, of isosorbide mononitrate in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■1S (*USP30*)

In-Process Revision

BRIEFING

Isosorbide Mononitrate Extended-Release Tablets, page 1082 of *PF* 31(4) [July–August 2005]. It is proposed to use USP Diluted Isosorbide Mononitrate RS instead of the previously proposed Reference Standard, USP Isosorbide Mononitrate RS. A *Note* is also added to the *USP Reference standards* section to identify the Reference Standards that are dry mixtures of an active component and a suitable excipient. It is proposed to update the *Tolerances* in *Dissolution Test 1* to be in accordance with those approved by FDA. Also, *Dissolution Test 2* and *Dissolution Test 3* are being added. The chromatographic method in *Dissolution Test 2* was developed with a MicroBondpak C18 brand of L1 column. With this column the retention time of isosorbide mononitrate is between 4.5 and 6.5 minutes. The chromatographic procedure in *Dissolution Test 3* was developed using a Supelcosil LC brand of L1 column. An alternative column is the Kromasil C18 brand. With either of these two columns the retention time of isosorbide mononitrate is about 4.5 minutes.

~~**Drug release** ⟨724⟩ **—** [To come.]~~

Dissolution ⟨711⟩—

TEST 1—

Medium: water; 900 mL.

Apparatus 2: 50 rpm. The Tablets are placed in a metal helix, prepared by winding 10 inches of a 0.8-mm stainless steel wire around a 9/32-inch shaft and pulling the coils to form a helix 1 inch long.

Times: 1, 2, 4, 8, and 12 hours.

Determine the amount of $C_6H_9NO_6$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water and methanol (7 : 3). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

In-Process Revision

Standard solution—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Mononitrate RS in *Medium,* and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration of about 0.06 mg of isosorbide mononitrate per mL.

Test solution—Use portions of the solution under test passed through a 0.45-µm nylon filter, discarding the first 4 to 6 mL of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution,* and record the chromatogram as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Determine the amount, in mg, of isosorbide mononitrate dissolved at each interval by the formula:

$$\frac{r_U \times C_S \times V}{r_S}$$

in which r_U and r_S are the peak responses for the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Standard solution;* and V is the volume, in mL, of *Medium* in the vessel at each time point.

Calculate the amount, in mg, of isosorbide mononitrate removed by sampling at the previous time points by the formula:

$$\sum AD \times \frac{V_S}{V}$$

in which AD is the amount, in mg, of isosorbide mononitrate dissolved at each time point; V_S is the volume, in mL, of the sample taken; and V is the volume, in mL, of *Medium* in the vessel at each time point.

Calculate the percentage of isosorbide mononitrate dissolved at each time point by the formula:

$$\frac{(AD + AR) \times 100}{LC}$$

in which AD is the amount, in mg, of isosorbide mononitrate dissolved at a given time point; AR is the amount, in mg, of isosorbide mononitrate removed at the previous time point; 100 is the conversion factor to percentage; and LC is the Tablet label claim, in mg.

Tolerances—The percentages of the labeled amount of $C_6H_9NO_6$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between ~~12% and 32%~~ 15% and 35%
2	between ~~23% and 43%~~ 28% and 48%
4	between ~~39% and 59%~~ 43% and 68%
8	between 65% and ~~85%~~ 90%
12	not less than 80%

TEST 2—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

Medium: Simulated gastric fluid (without enzymes); 500 mL.

Apparatus 2: 50 rpm.

Times: 1, 2, 6, and 12 hours.

Determine the amount of $C_6H_9NO_6$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water and methanol (3 : 2). Make adjustments if necessary (see *System suitability* under *Chromatography* ⟨621⟩).

In-Process Revision

Standard stock solution—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Mononitrate RS in *Medium,* and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration of about 1.2 mg of isosorbide mononitrate per mL.

Working standard solution—Dilute the *Standard stock solution* with *Medium* to obtain a final concentration of 60 µg per mL for Tablets labeled to contain 30 mg and a final concentration of 120 µg per mL for Tablets labeled to contain 60 mg.

Test solution—Use portions of the solution under test passed through a suitable 0.45-µm filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains 10-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Working standard solution,* and record the chromatogram as directed for *Procedure:* the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%

Procedure—Separately inject equal volumes (about 20 µL) of the appropriate *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the concentration (C_i), in mg per mL, of isosorbide mononitrate removed at each time point by the formula:

$$C_i = \frac{r_{U(i)}}{r_S} \times C_S$$

in which $r_{U(i)}$ is the peak response for the *Test solution* at time point *i;* r_S is the peak response for the *Working standard solution;* and C_S is the concentration, in mg per mL, of the *Working standard solution*. Calculate the total amount, in percentage, of drug release at each time point *i* by the formula:

$$\{C_i \times [V_0 - ((i-1)V_t)] + (\sum_{j=1}^{i-1} C_j V_t)\} \times \frac{100}{LC}$$

in which C_i is the concentration, in mg per mL, of drug removed at time point *i;* V_0 is the initial volume, in mL, of *Medium;* V_t is the volume, in mL, of sample removed at each sampling time, C_j is the concentration, in mg per mL, of drug released at time *j;* V_t is the volume, in mL, removed at each sampling time *t*; 100 is the conversion factor to percentage; and *LC* is the Tablet label claim, in mg.

Tolerances—The percentages of the labeled amount of $C_6H_9NO_6$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	30-mg Tablet, Amount dissolved	60-mg Tablet, Amount dissolved
1	between 25% and 40%	between 25% and 45%
2	between 35% and 60%	between 35% and 60%
6	between 72% and 90%	between 72% and 90%
12	not less than 80%	not less than 80%

TEST 3—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 3*.

Medium: Simulated gastric fluid (without enzymes); 500 mL.

Apparatus 2: 50 rpm.

Times: 1, 2, 6, and 12 hours.

Determine the amount of $C_6H_9NO_6$ dissolved by employing the following method.

Buffer solution—Transfer 15.4 g of ammonium acetate and 11.5 mL of acetic acid to a 1-L volumetric flask containing about 500 mL of water. Adjust with acetic acid to a pH of 4.7. Dilute with water to volume.

Standard stock solution—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Mononitrate RS in *Medium,* and dilute quantitatively, and stepwise if necessary,

with *Medium* to obtain a solution having a known concentration of about 0.12 mg of isosorbide mononitrate per mL.

Working standard solution—For Tablets labeled to contain 60 mg, use the *Standard stock solution* with no further dilution. For Tablets labeled to contain 30 mg, transfer 25.0 mL of the *Standard stock solution* to a 50-mL volumetric flask. Dilute with *Medium* to volume.

Test solution—Use portions of the solution under test passed through a suitable 0.45-µm filter.

Mobile phase—Prepare a filtered and degassed mixture of water, methanol, and *Buffer solution* (6 : 3 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Working standard solution,* and record the chromatogram as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the appropriate *Working standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the concentration (C_i), in mg per mL, of isosorbide mononitrate removed at each time point by the formula:

$$C_i = \frac{r_{U(i)}}{r_S} \times C_S$$

in which $r_{U(i)}$ is the peak response for the *Test solution* at time point *i;* r_S is the peak response for the *Working standard solution;* and C_S is the concentration, in mg per mL, of the *Working standard solution*. Calculate the total amount, in percentage, of drug release at each time point *i* by the formula:

$$\{C_i \times [V_0 - ((i-1)V_t)] + (\sum_{j=1}^{i-1} C_j V_t)\} \times \frac{100}{LC}$$

in which C_i is the concentration, in mg per mL, of drug removed at time point *i;* V_0 is the initial volume, in mL, of *Medium;* V_t is the volume, in mL, of sample removed at each sampling time; C_j is the concentration, in mg per mL, of drug released at time *j;* V_t is the volume, in mL, removed at each sampling time *t;* 100 is the conversion factor to percentage; and *LC* is the Tablet label claim, in mg.

Tolerances—The percentages of the labeled amount of isosorbide mononitrate dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 20% and 40%
2	between 30% and 50%
6	between 70% and 90%
12	not less than 85%

Uniformity of dosage units ⟨905⟩**:** meet the requirements for *Content Uniformity.* Proceed as directed in the *Assay,* except to use 1 Tablet instead of the portion of powdered Tablets used in the *Assay preparation.*

~~**Water,** *Method I* ⟨921⟩**:** not more than 5.0%.~~

~~*Test solution*—Weigh and finely powder 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to one Tablet, accurately weighed, to a suitable container. Add 5.0 mL of methanol, shake for 45 minutes, and then centrifuge at about 4000 rpm for 10 minutes. Use 0.25 mL of the resulting supernatant, correcting for the blank.~~

Related compounds—

TEST 1—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

In-Process Revision

Standard solution 1—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 0.0125 mg of isosorbide per mL.

Standard solution 2—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 0.025 mg of isosorbide per mL.

Standard solution 3—Weigh accurately a quantity of USP Isosorbide RS, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 0.05 mg of isosorbide per mL.

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of isosorbide mononitrate, to a suitable flask containing 20.0 mL of acetonitrile. Sonicate for 10 minutes and then centrifuge. Use the supernatant.

Application volume: 20 µL.

Developing solvent system: a mixture of toluene, ethyl acetate, and isopropyl alcohol (53 : 32 : 15).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. After developing, dry the plate with warm air for about 10 minutes, dip the plate in a solution prepared by dissolving 1.25 g of potassium permanganate and 10.0 g of sodium hydroxide in 500 mL of water (prepared fresh for each plate), and heat at 105° for 5 minutes. Any spot in the chromatogram obtained from the *Test solution* and corresponding to the R_F value of the spots obtained from the *Standard solutions* is not more intense than the spot in the chromatogram obtained from *Standard solution 3:* not more than 1% of any individual impurity is found. [NOTE—The R_F values of isosorbide and isosorbide mononitrate are about 0.2 and 0.6, respectively.] If the spot in the chromatogram obtained from the *Test solution* is nearly as intense as the spot obtained from *Standard solution 3,* further dilute the *Test solution* with acetonitrile (1 : 1), repeat the test, and compare the intensity of the isosorbide spot in the diluted *Test solution* with the intensity of the spots obtained from the *Standard solutions,* correcting the percentage level for the additional dilution of the *Test solution.*

TEST 2—

Mobile phase—Prepare a filtered and degassed mixture of water and methanol (75 : 25). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Isosorbide mononitrate related compound A standard stock solution—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Mononitrate Related Compound A RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.3 mg of isosorbide mononitrate related compound A per mL.

Isosorbide dinitrate standard stock solution—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Dinitrate RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.15 mg of isosorbide dinitrate per mL.

Standard stock solution—Transfer 2.0 mL of *Isosorbide mononitrate related compound A standard stock solution* and 4.0 mL of *Isosorbide dinitrate standard stock solution* to a 100-mL volumetric flask. Dilute with water to volume, and mix.

~~*Standard*~~ *Resolution solution*—Transfer ~~about 24 mg~~ a quantity of USP Diluted Isosorbide Mononitrate RS, ~~accurately weighed~~ equivalent to about 24 mg of isosorbide mononitrate, to a 100-mL volumetric flask, add 10.0 mL of *Standard stock solution,* add 20 mL of methanol, and dilute with water to volume.

~~*Resolution*~~ *Standard solution*—Transfer 10.0 mL of *Standard stock solution* and 20 mL of methanol to a 100-mL volumetric flask. Dilute with water to volume, and mix.

In-Process Revision

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 60 mg of isosorbide mononitrate, to a 50-mL volumetric flask, add 40 mL of methanol, and sonicate for about 30 minutes with cooling. Warm to ambient temperature, dilute with methanol to volume, and mix. Centrifuge at about 3000 rpm for 10 minutes. Quantitatively dilute the supernatant with water (10 in 50). Pass a portion of this solution through a filter having a 0.45-µm or finer porosity, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between isosorbide mononitrate related compound A and isosorbide mononitrate is not less than 1.0. [NOTE—The relative retention times are about 0.9 for isosorbide mononitrate related compound A, 1.0 for isosorbide mononitrate, and 5.6 for isosorbide dinitrate.] Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 10% for the isosorbide mononitrate related compound A and isosorbide dinitrate peaks.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of isosorbide mononitrate related compound A and isosorbide dinitrate in the portion of Tablets taken by the formula:

$$25(C/W)(r_U / r_S)$$

in which C is the concentration, in µg per mL, of the appropriate Standard, USP Diluted Isosorbide Mononitrate Related Compound A RS or USP Diluted Isosorbide Dinitrate RS, in the *Standard solution; W* is the weight, in mg, of isosorbide mononitrate in the sample used to prepare the *Test solution;* and r_U and r_S are the peak areas of the corresponding component obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.25% of isosorbide mononitrate related compound A is found, and not more than 0.25% of isosorbide dinitrate is found. Calculate the percentage of each other impurity (other than isosorbide mononitrate related compound A or isosorbide dinitrate) in the portion of Tablets taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak area for each other impurity obtained from the *Test solution;* and r_s is the sum of the areas of all the peaks: not more than 0.25% of total other impurities is found, and not more than 0.5% of total impurities is found, including isosorbide mononitrate related compound A and isosorbide dinitrate.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water and methanol (8 : 2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Isosorbide mononitrate related compound A standard preparation—Dissolve an accurately weighed quantity of USP Diluted Isosorbide Mononitrate Related Compound A RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.15 mg of isosorbide mononitrate related compound A per mL.

Resolution solution—Transfer a quantity of USP Diluted Isosorbide Mononitrate RS, accurately weighed and equivalent to about 30 mg of isosorbide mononitrate, to a 250-mL volumetric flask. Dissolve in water, add 10.0 mL of *Isosorbide mononitrate related compound A standard preparation,* add 50 mL of methanol, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a concentration of about 0.12 mg of isosorbide mononitrate per mL and about 0.006 mg of isosorbide mononitrate related compound A per mL.

In-Process Revision

Standard preparation—Transfer a quantity of USP Diluted Isosorbide Mononitrate RS, accurately weighed, to a suitable volumetric flask. Dissolve in water, add a portion of methanol equivalent to about 20% of the flask volume, and dilute with water to volume to obtain a solution having a known concentration of about 0.12 mg of isosorbide mononitrate per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 60 mg of isosorbide mononitrate, to a 100-mL volumetric flask, add 50 mL of methanol, and sonicate for about 30 minutes with cooling. Warm to ambient temperature, dilute with methanol to volume, and mix. Centrifuge at about 3000 rpm for 10 minutes. Quantitatively dilute the supernatant with water (10 in 50). Pass a portion of this solution through a filter having a 0.45-µm or finer porosity, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4-mm × 12.5-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between isosorbide mononitrate related compound A and isosorbide mononitrate is not less than 1.5. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5, and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about ~~50 µL)~~ 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of isosorbide mononitrate ($C_6H_9NO_6$) in the portion of Tablets taken by the formula:

$$500C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of isosorbide mononitrate in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP31*

BRIEFING

Lactulose Concentrate, *USP 29* page 1224. On the basis of comments received, it is proposed to revise the *Procedure* in the test for *Related compounds* to add a *Table* with the names and relative retention times of the related compounds. The test for *Related compounds* and the *Assay* are also being revised to clarify the numeric coefficients in the formulas.

BRIEFING

Lansoprazole, *USP 29* page 1229. On the basis of information received, it is proposed to make the following changes:

1. Add the chemical names of impurities B and C to *Table 1* in the *Chromatographic purity* test.
2. Add a "disregard" limit of 0.05% to the *Chromatographic purity* test.
3. To increase the stability of the solutions in the *Chromatographic purity* test, it is proposed to use a basic *Diluent,* instead of the currently used *Diluent* with pH 7.0.
4. To further increase the stability of the solutions, it is proposed to specify the use of a cooled autosampler. A *Note* is added that the lansoprazole solutions are stable for about 24 hours at 5°.
5. Report the limit of the *Water* and *Residue on ignition* tests rounded off to one decimal place. The MD-GRE Expert Committee is aware that the water, when present even in small amounts, may affect the stability of Lansoprazole, and encourages interested manufacturers to submit stability data for lots with differing initial levels of water.
6. Change the acceptance criteria in the *Definition* from "not less than 99.0 percent and not more than 101.0 percent" to "not less than 98.0 percent and not more than 102.0 percent", which are typical for chromatographic assay procedures. On the basis of comments received, the relative standard deviation in the *Assay* is also revised.
7. The relative response factors under *Chromatographic purity* are revised to implement a uniform and consistent approach as proposed in the *Stimuli* article, *The Use of Relative Response Factors to Determine Impurities,* published on page 960 of *PF* 31(3) [May–June 2005].
8. Change the format of the formulas under *Chromatographic purity* and *Assay,* as recommended in the *Stimuli* article, *Common Pharmacopeial Calculations in USP Monographs,* published on page 626 of *PF* 31(2) [Mar.–Apr. 2005].

▲[NOTE—Store and inject the lansoprazole solutions at or below 5° using a cooled autosampler. The solutions are stable for about 24 hours when stored at 5°.]▲*USP31*

Solution A: water.

Solution B—Prepare a filtered and degassed mixture of acetonitrile, water, and triethylamine (160 : 40 : 1). Adjust with phosphoric acid to a pH of 7.0.

Diluent—~~Prepare a mixture of *Solution A* and *Solution B* (9 : 1).~~

▲Prepare a mixture of 0.1 N sodium hydroxide solution and methanol (75 : 25).▲*USP31*

Blank solution—Prepare a mixture of *Diluent* and methanol (9 : 1).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—~~[NOTE—Prepare immediately before using.]~~

▲
▲*USP31*
Dissolve 5 mg each of USP Lansoprazole RS and USP Lansoprazole Related Compound A RS in 200 mL of methanol. Pipet 1 mL of this solution into a 10-mL volumetric flask, dilute with *Diluent* to volume, and mix.

System suitability solution—Dissolve a suitable quantity of USP Lansoprazole Related Compound A RS in methanol, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.025 mg per mL. Pipet 1 mL of this solution into a 10-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Standard solution—~~[NOTE—Inject within 10 minutes of preparation.]~~

▲
▲*USP31*
Dissolve an accurately weighed quantity of USP Lansoprazole RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 25 µg per mL. Pipet 1 mL of this solution into a 10-mL volumetric flask, dilute with *Diluent* to volume, and mix. The final concentration of the *Standard solution* is about 2.5 µg per mL.

Test solution—~~[NOTE—Inject within 10 minutes of preparation.]~~

▲
▲*USP31*
Transfer about 125 mg of Lansoprazole, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Pipet 1 mL of this solution into a 10-mL volumetric flask, and dilute with *Diluent* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 285-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 0.8 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–40	90→20	10→80	linear gradient
40–50	20	80	isocratic
50–51	20→90	80→10	linear gradient
51–60	90	10	isocratic

Chromatograph the *Resolution solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between lansoprazole and lansoprazole related compound A is not less than 6. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 3%.

Procedure—Separately inject equal volumes (about 40 µL) of the *Blank solution,* the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and identify the lansoprazole peak and the peaks due to the impurities listed in *Table 1*. Measure the areas for the major peaks, excluding the peaks obtained from the *Blank solution.* Calculate the percentage of each impurity in the portion of Lansoprazole taken by the formula:

~~$50(CF/W)(r_i/r_s)$~~

▲$100 \times 0.001(1/F)(C_S/C_T)(r_i/r_S)$▲*USP31*

in which F is the relative response factor for each impurity peak (see *Table 1* for values); ~~*C* is the concentration, in µg per mL, of USP Lansoprazole RS in the *Standard solution; W* is the weight, in mg, of Lansoprazole taken for the Test solution;~~

▲0.001 is the conversion factor from µg per mL to mg per mL; C_S is the concentration, in µg per mL, of USP Lansoprazole RS in the *Standard solution;* C_T is the concentration, in mg per mL, of Lansoprazole in the *Test solution;*▲*USP31*

r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the peak response for lansoprazole obtained from the *Standard solution:* In addition to not exceeding the limits for impurities in *Table 1,* not more than 0.6% of total impurities is found.

▲Disregard any peak below 0.05%.▲*USP31*

Change to read:

Assay—

Diluent—Prepare a mixture of water, acetonitrile, and triethylamine (60 : 40 : 1), and adjust with phosphoric acid to a pH of 10.0.

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and triethylamine (60 : 40 : 1). Adjust with phosphoric acid to a pH of 7.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—Dissolve suitable quantities of USP Lansoprazole RS and USP Lansoprazole Related Compound A RS in *Diluent* to obtain a solution containing about 0.1 mg of each per mL.

Internal standard solution—Dissolve an accurately weighed quantity of 4′-ethoxyacetophenone in *Diluent* to obtain a solution having a known concentration of about 2.5 mg per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Lansoprazole RS in *Internal standard solution* to obtain a solution having a known concentration of about 5.0 mg per mL. Transfer 1.0 mL of this solution to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Assay preparation—Transfer about 50 mg of Lansoprazole, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Internal standard solution* to volume, and mix. Transfer 1.0 mL of this solution to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 285-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure:* the resolution, *R,* between lansoprazole and lansoprazole related

BRIEFING

Leflunomide Tablets, page 1383 of *PF* 31(5) [Sept.–Oct. 2005]. It is proposed to add a *Dissolution* test to this monograph. The chromatographic procedure in this test was validated using the Hypersil BDS C18 brand of L1 column. The retention time for the leflunomide peak is about 5 minutes.

(BPC: M. Marques) RTS—C43057; C44097

Add the following:

▲Leflunomide Tablets

» Leflunomide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of leflunomide ($C_{12}H_9F_3N_2O_2$).

Packaging and storage—Preserve in tight, light- and humidity-resistant containers.

In-Process Revision

USP Reference standards ⟨11⟩—*USP Leflunomide RS. USP Leflunomide Related Compound A RS. USP Leflunomide Related Compound B RS. USP Leflunomide Related Compound C RS.*

Identification—

A: *Ultraviolet Absorption* ⟨197U⟩—

Spectral range: 220 to 360 nm.

Solution: 0.01 mg per mL.

Medium: methanol.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩ ~~[To come.]~~

Medium: For Tablets labeled to contain 10 mg or 20 mg: water, 1000 mL, deaerated. For Tablets labeled to contain 100 mg: water containing 0.6 % of polyoxyethylene lauryl ether; 1000 mL, deaerated.

Apparatus 2: 100 rpm.

Time: 30 minutes.

Determine the amount of $C_{12}H_9F_3N_2O_2$ dissolved employing one of the following methods.

SPECTROPHOTOMETRIC METHOD—

Procedure—Determine the amount of $C_{12}H_9F_3N_2O_2$ dissolved from ultraviolet absorbances at the wavelength of maximum absorbance at about 262 nm on portions of the solution under test passed through a suitable 0.45-µm filter, suitably diluted with *Medium* if necessary, in comparison with a Standard solution having a known concentration of USP Leflunomide RS in the same *Medium*. [NOTE—A volume of methanol not exceeding 2% of the final volume of the Standard solution may be used to dissolve leflunomide.]

CHROMATOGRAPHIC METHOD—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (1 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Transfer about 22 mg of USP Leflunomide RS, accurately weighed, to a 100-mL volumetric flask. Add 40 mL of acetonitrile, and sonicate until dissolved. Add about 40 mL of water, and cool to room temperature. Dilute with water to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, and dilute with water to volume.

Test solution—Use portions of the solution under test passed through a suitable 0.45-µm filter.

Chromatographic system—The liquid chromatograph is equipped with a 260-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 40 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the amount of leflunomide ($C_{12}H_9F_3N_2O_2$) dissolved by the formula:

$$\frac{r_U \times C_S \times 1000 \times 100}{r_S \times LC}$$

in which r_U and r_S are the peak responses for the *Standard solution* and the *Test solution,* respectively; C_S is the concentration, in mg per mL, of the *Standard solution;* 1000 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the Tablet label claim, in mg.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{12}H_9F_3N_2O_2$ is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

Mobile phase, Standard preparation, System suitability preparations, and *Chromatographic system*—Prepare as directed in the *Assay.*

In-Process Revision

Test solution—Transfer 1 Tablet to a suitable volumetric flask, and prepare a solution having a concentration of about 1 mg of leflunomide per mL. Add *Mobile phase* 50% by volume, and shake to disintegrate the Tablet. After the Tablet is completely disintegrated, add acetonitrile 20% by volume, dilute with *Mobile phase* to volume, and shake again. Pass through a membrane filter.

Procedure—Proceed as directed in the *Assay,* except to use the *Test solution* instead of the *Assay preparation.*

Water, *Method Ic* ⟨921⟩**:** not more than 9.0%.

Related compounds—

Mobile phase, System suitability preparations, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution and *Test solution*—Prepare as directed for *Standard preparation* and *Assay preparation,* respectively, in the *Assay.*

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each individual impurity in the portion of Tablets taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response of each individual impurity in the chromatogram obtained from the *Test solution;* and r_s is the sum of all the related compounds and the leflunomide peak responses in the chromatogram obtained from the *Test solution:* not more than 0.1% of leflunomide related compound A is found; not more than 3.5% of leflunomide related compound B is found; not more than 0.1% of any other individual impurity is found; and not more than 4.0% of total impurities is found.

Assay—

Mobile phase—Prepare a mixture of water, acetonitrile, and triethylamine (65 : 35 : 05), filter, and degas. Adjust with phosphoric acid to a pH of 4.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Leflunomide RS in a minimum volume of acetonitrile, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1 mg per mL.

System suitability preparation 1—Transfer 20.0 mg of USP Leflunomide Related Compound A RS, accurately weighed, to a 20-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

System suitability preparation 2—Transfer 100.0 mg of USP Leflunomide Related Compound B RS and 10.0 mg of USP Leflunomide Related Compound C RS, each accurately weighed, to a 100-mL volumetric flask. Add 1 mL of *System suitability preparation 1,* 5 mL of acetonitrile, and 80 mL of *Mobile phase,* and shake by mechanical means for 10 minutes. Dilute with *Mobile phase* to volume, and mix.

System suitability preparation 3—Transfer about 100.0 mg of USP Leflunomide RS, accurately weighed, to a 100-mL volumetric flask. Dissolve in 2 mL of acetonitrile, add 1 mL of *System suitability preparation 2* and 80 mL of *Mobile phase,* and shake by mechanical means for 10 minutes. Dilute with *Mobile phase* to volume, and mix.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of leflunomide, to a 100.0-mL volumetric flask. Add 20 mL of acetonitrile, dilute with *Mobile phase* to volume, and shake by mechanical means for 10 minutes. Pass through a membrane filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.0-mm × 12.5-cm column containing packing L1. The flow rate is about 1 mL per minute. Chromatograph *System suitability preparation 3* and the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative retention times for leflunomide related compound A, leflunomide related compound B, leflunomide related compound C, and leflunomide are about 0.4, 0.2, 0.9, and 1.0, respectively; the resolution, *R,* between leflunomide related compound C and leflunomide is not less than 1.5; the tailing factor for leflunomide is not more than 3.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of leflunomide ($C_{12}H_9F_3N_2O_2$) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Leflunomide RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP31*

BRIEFING

Loratadine and Pseudoephedrine Sulfate Extended-Release Tablets. Because there is no existing *USP* monograph for this dosage form, a new monograph is being proposed. The reverse-phase HPLC method used in the test for *Loratadine chromatographic purity* and in the *Assay for loratadine* was validated using the Inertsil ODS(3) brand of L1 column. Loratadine elutes at approximately 6.5 minutes. The normal-phase HPLC method used in the test for *Pseudoephedrine sulfate chromatographic purity* and in the *Assay for pseudoephedrine sulfate* was validated using the Prodigy Silica brand of L3 column. Pseudoephedrine sulfate elutes at approximately 6.8 minutes.

(MD-PS: D. Bempong) RTS—C41808

Add the following:

▲Loratadine and Pseudoephedrine Sulfate Extended-Release Tablets

» Loratadine and Pseudoephedrine Sulfate Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of loratadine ($C_{22}H_{23}ClN_2O_2$) and pseudoephedrine sulfate [$(C_{10}H_{15}NO)_2 \cdot H_2SO_4$].

Packaging and storage—Preserve in light-resistant containers in a dry place. Store between 2° and 25°.

USP Reference standards ⟨11⟩—*USP Loratadine RS. USP Pseudoephedrine Sulfate RS.*

Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay for loratadine*.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay for pseudoephedrine sulfate*.

In-Process Revision

Dissolution ⟨711⟩—[To come.]

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Loss on drying ⟨731⟩**—**Dry about 5 g of finely ground Tablets, accurately weighed, at 105° for 2 hours: it loses not more than 3.0% of its weight.

Loratadine chromatographic purity—

Buffer solution and *Mobile phase*—Proceed as directed in the *Assay for loratadine*.

Standard solution—Dissolve an accurately weighed quantity of USP Loratadine RS in *Mobile phase,* and dilute quantitatively and stepwise, if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.25 µg per mL.

Sensitivity test solution—Transfer 5 mL of the *Standard solution* into a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

Test solution—Prepare as directed for *Assay preparation* in the *Assay for loratadine,* except instead of passing the final solution through a suitable filter, centrifuge the solution at a speed of at least 3000 rpm for about 10 minutes. Use the supernatant.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that containing 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 3000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%. Chromatograph the *Sensitivity test solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio is not less than 10.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and record the peak responses. Calculate the percentage of individual impurities in the portion of Tablets taken by the formula:

$$0.1(D/F)(C/W)(r_i/r_S)$$

in which D is the dilution factor used in the preparation of the *Test solution; F* is the relative response factor (equal to 0.63 for the impurity with a relative retention time of about 0.5 and 1.0 for all other impurity peaks [NOTE—The impurity with a relative retention time of about 0.5 is 8-chloro-5,6-dihydro-11*H*-benzo[5,6]cyclohepta[l,2-*b*]pyridin-11-one.]); C is the concentration, in µg per mL, of USP Loratadine RS in the *Standard solution; W* is the weight, in mg, of loratadine in the portion of powdered Tablets taken to prepare the *Test solution;* r_i is the peak response obtained for each individual unknown impurity in the *Test solution;* and r_S is the peak response for loratadine obtained from the *Standard solution:* not more than 0.2% of the impurity with a relative retention time of about 0.5 is found; not more than 0.2% of any other impurity is found; and not more than 0.3% of total impurities is found. [NOTE—Disregard peaks due to pseudoephedrine sulfate and peaks due to excipients.]

Pseudoephedrine sulfate chromatographic purity—

Ammonium acetate solution and *Mobile phase*—Proceed as directed in the *Assay for pseudoephedrine sulfate*.

Standard solution—Dissolve an accurately weighed quantity of USP Pseudoephedrine Sulfate RS in *Mobile phase,* and dilute quantitatively and stepwise, if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 9.6 µg per mL.

Sensitivity test solution—Transfer 5 mL of *Standard solution* into a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

In-Process Revision

Test solution—Accurately weigh and finely powder at least 20 Tablets, and transfer a portion of the powdered Tablets, equivalent to 480 mg of pseudoephedrine, into a 50-mL volumetric flask. Add 40 mL of methanol, and stir vigorously for 30 minutes or longer, if necessary, until the powder is finely dispersed. Dilute with methanol to volume, and mix. Transfer 2 mL of the resulting suspension into a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Centrifuge the solution in a plastic centrifuge tube at a speed of at least 3000 rpm for about 10 minutes. Use the supernatant.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 10-µm packing L3. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 1000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 3.0%. Chromatograph the *Sensitivity test solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio is not less than 10.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and record the peak responses. Calculate the percentage of individual impurities in the portion of Tablets taken by the formula:

$$0.1D(C/W)(r_i / r_S)$$

in which D is the dilution factor used in the preparation of the *Test solution;* C is the concentration, in µg per mL, of USP Pseudoephedrine Sulfate RS in the *Standard solution;* W is the weight, in mg, of pseudoephedrine sulfate in the portion of powdered Tablets taken to prepare the *Test solution;* r_i is the peak response obtained for each individual impurity in the *Test solution;* and r_S is the peak response obtained for pseudoephedrine sulfate in the *Standard solution:* not more than 0.1% of ephedrine sulfate (with a relative retention time of 0.78) is found; not more than 0.2% of any individual unknown impurity is found; and not more than 0.5% of total impurities is found. [NOTE—Disregard peaks due to loratadine and peaks due to excipients.]

Assay for loratadine—

Buffer solution—Dissolve 2.72 g of monobasic potassium phosphate in 1 L of water, and adjust with 5 N sodium hydroxide to a pH of 6.50 ± 0.05.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and *Buffer solution* (70 : 30). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Loratadine RS in *Mobile phase,* and dilute quantitatively and stepwise, if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.05 mg per mL.

Assay preparation—Crush a number of Tablets, equivalent to 100 mg of loratadine, and accurately transfer the crushed Tablets into a 1000-mL volumetric flask. Add 800 mL of methanol, and stir vigorously for 30 minutes or longer, if necessary, until the Tablets are completely disintegrated and the powder is finely dispersed. Dilute with methanol to volume, and mix. Transfer 5 mL of the resulting suspension into a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass the solution through a suitable filter, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 3000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the loratadine peak. Calculate the quantity, in mg, of loratadine ($C_{22}H_{23}ClN_2O_2$) in the portion of Tablets taken by the formula:

$$DC(r_U / r_S)$$

in which D is the dilution factor, in mL, for the *Assay preparation;* C is the concentration, in mg per mL, of USP Loratadine RS in the *Standard preparation,* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Assay for pseudoephedrine sulfate—

Ammonium acetate solution—Dissolve 4 g of ammonium acetate in 1000 mL of water.

Mobile phase—Prepare a filtered and degassed mixture of dehydrated alcohol and *Ammonium acetate solution* (85 : 15). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Pseudoephedrine Sulfate RS in *Mobile phase,* and dilute quantitatively and stepwise, if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1.2 mg per mL.

Assay preparation—Crush a number of Tablets, equivalent to 2.4 g of pseudoephedrine sulfate, and accurately transfer the crushed Tablets into a 1000-mL volumetric flask. Add 80 mL of methanol, and stir vigorously for 30 minutes or longer, if necessary, until the Tablets are completely disintegrated and the powder is finely dispersed. Dilute with methanol to volume, and stir for an additional 10 minutes. Transfer 5 mL of the resulting suspension into a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass the solution through a suitable filter, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 10-µm packing L3. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 1000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the pseudoephedrine sulfate peak. Calculate the quantity, in mg, of pseudoephedrine sulfate $[(C_{10}H_{15}NO)_2 \cdot H_2SO_4]$ in the portion of Tablets taken by the formula:

$$DC(r_U / r_S)$$

in which D is the dilution factor, in mL, for the *Assay preparation;* C is the concentration, in mg per mL, of USP Pseudoephedrine Sulfate RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP31*

In-Process Revision

BRIEFING

Magnesium Carbonate, *USP 29* page 1292; **Magnesium Chloride,** *USP 29* page 1294; **Magnesium Oxide,** *USP 29* page 1299 and page 3730 of the *Second Supplement*. Comments were received that the use of an air–acetylene flame in the test for *Limit of calcium* could lead to an underestimation of calcium content in magnesium products. Calcium may form refractory compounds that do not completely decompose at the temperatures achieved by an air–acetylene flame. To address this problem, it is proposed to use a nitrous oxide–acetylene flame which has a higher temperature. Additionally, it is proposed to modify the standard curve, add a *Note* to clarify the use of commercially available atomic absorption standard solutions for calcium, and to add a formula for the final calculation. It is also proposed to add formulas to clarify correction for the content of calcium and other calculations in the *Assay.*

(MD-GRE: E. Gonikberg) RTS—C44339

Change to read:

Limit of calcium—

▲[NOTE—A commercially available atomic absorption standard solution for calcium may be used where preparation of a calcium standard stock solution is described below. Concentrations of the *Standard preparations* and the *Test preparation* may be modified to fit the linear or working range of the instrument.]▲*USP31*

Dilute hydrochloric acid—Dilute 100 mL of hydrochloric acid with water to 1000 mL.

Lanthanum solution—To 58.65 g of lanthanum oxide add 400 mL of water, and add, gradually with stirring, 250 mL of hydrochloric acid. Stir until dissolved, dilute with water to 1000 mL, and mix.

Standard preparations—Transfer 249.7 mg of calcium carbonate, previously dried at 300° for 3 hours and cooled in a desiccator for 2 hours, to a 100-mL volumetric flask, dissolve in a minimum amount of hydrochloric acid, dilute with water to volume, and mix. Transfer

▲1.0,▲*USP31*
5.0, 10.0, and 15.0 mL of this stock solution to separate 1000-mL volumetric flasks, each containing 20 mL of *Lanthanum solution* and 40 mL of *Dilute hydrochloric acid,* add water to volume, and mix. These *Standard preparations* contain

▲1.0,▲*USP31*
5.0, 10.0, and 15.0 µg of calcium in each mL, respectively.

Blank solution—Transfer 4 mL of *Lanthanum solution* and 10 mL of *Dilute hydrochloric acid* to a 200-mL volumetric flask, dilute with water to volume, and mix.

Test preparation—Transfer 250 mg of Magnesium Carbonate to a beaker, add 30 mL of *Dilute hydrochloric acid,* and stir until dissolved, heating if necessary. Transfer the solution so obtained to a 200-mL volumetric flask containing 4 mL of *Lanthanum solution,* dilute with water to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Standard preparations* and the *Test preparation* at the calcium emission line at 422.7 nm with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with a calcium hollow-cathode lamp and ~~an air–acetylene~~

▲a nitrous oxide–acetylene▲*USP31*
flame, using the *Blank solution* as the blank. ~~Plot the absorbances of the *Standard preparations* versus their concentrations of calcium, in µg per mL, and draw a straight line through the three points. From the line so obtained and the absorbance of the *Test preparation,* determine the concentration, in µg per mL, of calcium in the *Test preparation*. Calculate the percentage of calcium in the specimen by multiplying this value by 0.08:~~

▲Determine the concentration, C, in µg per mL, of calcium in the *Test preparation* using the calibration graph. Calculate the content of calcium, in percentage, in the portion of Magnesium Carbonate taken by the formula:

$$100(0.001CV/W)$$

in which C is as defined above; the multiplier of 0.001 is for conversion of µg per mL to mg per mL; V is the volume, in mL, of the *Test preparation;* and W is the amount of Magnesium Carbonate, in mg, taken to prepare the *Test preparation:*▲*USP31*
the limit is 0.45%.

Change to read:

Assay—Dissolve about 1 g of Magnesium Carbonate, accurately weighed, in 30.0 mL of 1 N sulfuric acid VS, add methyl orange TS, and titrate the excess acid with 1 N sodium hydroxide VS. ~~From the volume of 1 N sulfuric acid consumed, deduct the volume of 1 N sulfuric acid corresponding to the content of calcium in the weight of Magnesium Carbonate taken for the assay. The difference is the volume of 1 N sulfuric acid equivalent to the magnesium oxide present. Each mL of 1 N sulfuric acid is equivalent to 20.15 mg of MgO and to 20.04 mg of Ca.~~

▲Record the volume, V_A, in mL, of 1 N sodium hydroxide consumed. Perform the blank determination, and record the volume, V_B, in mL, of 1 N sodium hydroxide consumed. Calculate the volume, V_S, of 1 N sulfuric acid, in mL, consumed by the sample, by the formula:

$$(V_B - V_A) \times N_{NaOH}$$

in which N_{NaOH} is the exact normality of the sodium hydroxide solution. Calculate the volume of 1 N sulfuric acid, V_{Ca}, in mL, consumed by calcium which is present in the Magnesium Carbonate taken for the *Assay,* by the formula:

$$(W \times L_{Ca})/(100 \times 20.04)$$

In-Process Revision

in which W is the weight, in mg, of Magnesium Carbonate taken; L_{Ca} is the content of calcium, in percentage, as determined in the test for *Limit of calcium;* and 20.04 is the weight, in mg, of Ca that is equivalent to each mL of 1 N sulfuric acid.

Calculate the percentage of MgO in the portion of Magnesium Carbonate taken by the formula:

$$100(V_S - V_{Ca}) \times 20.15/W$$

in which 20.15 is the weight, in mg, of MgO that is equivalent to each mL of 1 N sulfuric acid; and the other terms are as defined above.▲*USP31*

BRIEFING

Meloxicam Oral Suspension. Because there is no existing *USP* monograph for this article, a new monograph is being proposed. The liquid chromatographic procedures in the *Assay* and in the test for *Chromatographic purity* are based on analyses performed with the Kromasil brand of L1 column. The typical retention time for meloxicam is 10.5 minutes.

(MD-CCA: C. Anthony; MSA: R. Tirumalai; BPC: M. Marques) RTS—C44069

Add the following:

▲Meloxicam Oral Suspension

» Meloxicam Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of meloxicam ($C_{14}H_{13}N_3O_4S_2$).

Packaging and storage—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards ⟨11⟩—*USP Meloxicam RS. USP Meloxicam Related Compound B RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Transfer a volume of Oral Suspension, equivalent to about 2.5 mg of meloxicam, to a 10-mL volumetric flask. Dilute with acetone to volume, and mix for 10 minutes. If necessary, pass through fluted filter paper.

In-Process Revision

Standard solution: 0.25 mg per mL, prepared by dissolving USP Meloxicam RS in 1 mL of water and diluting with acetone to volume.

Developing solvent solution: a mixture of chloroform, methanol, and ammonium hydroxide (80 : 20 : 1)

Procedure—Proceed as directed in the chapter. After removing the plate from the chamber and drying, examine the chromatograms under UV light at 254-nm: the R_F value (approximately 0.45) of the principal dark spot obtained from the *Test solution* corresponds to that obtained from the *Standard solution.*

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

pH ⟨791⟩**:** between 3.5 and 4.5.

Viscosity ⟨911⟩—Determine using a shear rate programmable rotational viscometer: between 40 and 100 centipoises, determined at 20°.

Dissolution ⟨711⟩—

Medium: pH 7.5 phosphate buffer; 900 mL.

Apparatus 2: 25 rpm.

Time: 15 minutes.

Determine the amount of $C_{14}H_{13}N_3O_4S_2$ dissolved by employing the following method.

Standard solution—Transfer about 20.83 mg of USP Meloxicam RS, accurately weighed, into a 100-mL volumetric flask. Dissolve in 5 mL of methanol and 1 mL of 0.1 M sodium hydroxide, and dilute with *Medium* to volume. Dilute with *Medium* to a final concentration of about 8.3 µg per mL of meloxicam.

Test solution—Shake each sample for 15 minutes. Weigh six portions, equivalent to 7.5 mg of the Oral Suspension, into separate tared 10-mL beakers, and record each weight. Introduce each of the samples to the middle of the dissolution vessels, and rinse each beaker with about 20 mL of the *Medium* withdrawn from the vessel. Carefully lower the paddle to the appropriate height and start the rotation. After completion of the dissolution, pass a 20-mL aliquot through a nylon filter having a 0.45-µm porosity, discarding the first 3 mL of the filtrate.

Procedure—Determine the amount of $C_{14}H_{13}N_3O_4S_2$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 362 nm on the *Test solution* in comparison with the *Standard solution,* using *Medium* as the blank. Calculate the percentage of $C_{14}H_{13}N_3O_4S_2$ released by the formula:

$$\frac{A_U \times C_S \times 900 \times d \times 100}{A_S \times W_U \times LC}$$

in which A_U and A_S are the absorbances obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Standard solution; d* is the density, in g per mL, of the Oral Suspension; W_U is the weight, in mg, of the Oral Suspension taken; 900 is the volume, in mL of the *Medium;* 100 is the conversion factor to percentage; and *LC* is the label claim, in mg per mL.

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{14}H_{13}N_3O_4S_2$ is dissolved in 15 minutes.

Microbial limits ⟨61⟩—The total aerobic microbial count does not exceed 100 cfu per g or 100 cfu per mL. The total yeasts and molds count does not exceed 50 cfu per g or 50 cfu per mL. It meets the requirements of the test for the absence of *Escherichia coli.*

Chromatographic purity—

Buffer, Mobile phase, and *Diluent*—Proceed as directed in the *Assay.*

Related compound standard stock solution—Proceed as directed for *Related compound standard stock preparation* in the *Assay.*

Sensitivity solution—Dilute the *Related compound standard stock solution* with *Diluent* to a final concentration of about 0.08 µg per mL.

In-Process Revision

Related compound standard solution—Dilute *Related compound standard stock preparation* with *Diluent* to a final concentration of about 0.5 µg per mL.

Test solution—Proceed as directed for *Assay preparation* in the *Assay.*

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay.* Chromatograph the *Sensitivity solution* (about 10 µL), and record the peak responses as directed for *Procedure* at 260 nm: the relative standard deviation of three replicate injections is not more than 10% for meloxicam related compound B. Chromatograph the *Related compound standard solution* (about 10 µL), and record the peak responses as directed for *Procedure* at 260 nm: the tailing factor for meloxicam related compound B is not more than 2.0.

Procedure—Separately inject equal volumes (about 10 µL) of the *Related compound standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and record the peak areas at 260 nm and 360 nm. The run time is about 20 minutes or two times the retention time of meloxicam. Calculate the percentage of meloxicam related compound B in the portion of Oral Suspension taken by the formula:

$$(5000/L)(C/V)(r_U/r_S)$$

in which L is the label claim, in mg per mL; C is the concentration, in mg per mL, of USP Meloxicam Related Compound B RS in the *Related compound standard solution;* V is the volume, in mL, of Oral Suspension taken to prepare the *Test solution;* r_U is the peak area obtained for meloxicam related compound B in the *Test solution* at 260 nm; and r_S is the peak area for meloxicam related compound B in the *Related compound standard solution* at 260 nm. Calculate the percentage of each unknown degradation product in the portion of Oral Suspension taken by the formula:

$$100(r_i/r_s)$$

in which r_i is the area of any unknown degradant at 360 nm; r_s is the sum of areas of meloxicam and all impurities in the *Test solution* at 360 nm. Not more than 0.15% of meloxicam related compound B is found; not more than 0.2% of any individual unknown degradation product is found; and not more than 0.5% of total degradation products is found.

Assay—

Buffer—Dissolve 2 g of monohydrate citric acid and 2 g of boric acid in 1000 mL of water, and adjust with dihydrate trisodium citrate to a pH of 2.9.

Mobile phase—Mix 565 mL of *Buffer,* 260 mL of methanol, and 200 mL of acetonitrile. Degas the solution, and then dissolve 200 mg of sodium dodecyl sulfate in 1000 mL of the resulting solution.

Diluent—Dissolve 3 g of boric acid and 1.5 g of dihydrate trisodium citrate in 1000 mL of water, and adjust with 2 M sodium hydroxide to a pH of 8.3. Mix 420 mL of the resulting buffer with 420 mL of methanol and 160 mL of acetonitrile.

Standard stock preparation—Transfer about 67 mg of USP Meloxicam RS, accurately weighed, into a 100-mL volumetric flask. Add 3.0 mL of dimethylformamide. Swirl the flask, and allow to stand for about 5 minutes. Add 15 mL of methanol. Dilute with *Diluent* to just below volume. Sonicate for 30 minutes, and mix until dissolved. Cool to room temperature. Dilute with *Diluent* to volume.

Standard preparation—Dilute *Standard stock preparation* with *Diluent* to a final concentration of about 0.27 mg per mL.

Related compound standard stock preparation—Transfer about 21 mg of USP Meloxicam Related Compound B RS, accurately weighed, into a 100-mL volumetric flask. Add 3.0 mL of dimethylformamide, 15 mL of methanol, and about 60 mL of *Diluent.* Sonicate, and mix until dissolved. Cool to room temperature. Dilute with *Diluent* to volume. Dilute further with *Diluent* to a concentration of about 8.4 µg per mL.

System suitability solution—Transfer a volume of Oral Suspension, equivalent to about 15 mg of meloxicam, accurately weighed, to a 50-mL volumetric flask. Add 3.0 mL of *Related compound standard stock preparation.* Add 3.0 mL of dimethylformamide. Swirl the flask, and allow to stand for about 5 minutes. Add 15 mL of methanol. Dilute with *Diluent* to just below volume. Sonicate for 30 minutes, mixing the flask vigorously about every 5 minutes. Cool to room temperature. Dilute with *Diluent* to volume. Mix, and allow particulates to settle. Pass through a 0.45-µm membrane filter with a fiberglass prefilter.

Assay preparation—Transfer an accurately meaured volume of Oral Suspension, equivalent to about 15 mg of meloxicam, to a 50-mL volumetric flask. Add 3.0 mL of dimethylformamide. Swirl the flask, and allow to stand for about 5 minutes. Add 15 mL of methanol. Dilute with *Diluent* to just below volume. Sonicate for 30 minutes, mixing the flask vigorously about every 5 minutes. Cool to room temperature. Dilute with *Diluent* to volume. Mix, and allow particulates to settle. Pass through a 0.45-µm membrane filter with a fiberglass prefilter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a programmable dual wavelength detector, a single wavelength detector in series, or a photodiode array detector capable of detecting wavelengths from 190 nm to 400 nm, or equivalent, and a 4-mm × 12.5-cm analytical column that contains 5-µm packing L1. The column temperature is maintained at 40°. The flow rate is about 1.0 mL per minute. The run time is about 20 minutes or two times the retention time of meloxicam. Chromatograph the *System suitability solution* (about 10 µL), and record the peak responses as directed for *Procedure* at 360 nm and 260 nm: at 360 nm the resolution, *R,* between meloxicam and any other adjacent peak is not less than 1.5. The tailing factor for the meloxicam peak is not more than 2.0. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure* at 360 nm: the relative standard deviation for replicate injections of the *Standard preparation* is not more than 1.5%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and record the peak areas at 360 nm. Calculate the amount of meloxicam ($C_{14}H_{13}N_3O_4S_2$), in mg per mL, in the portion of Oral Suspension taken by the formula:

$$50(C/V)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Meloxicam RS in the *Standard preparation; V* is the volume, in mL, of Oral Suspension taken to prepare the *Assay preparation;* r_U is the peak area obtained for meloxicam in the *Assay preparation* at 360 nm; and r_S is the peak area for meloxicam in the *Standard solution* at 360 nm.▲*USP31*

BRIEFING

Meropenem for Injection, *USP 29* page 1351. It is proposed to clarify the dilution scheme for *Assay preparation 2* in the *Assay.*

(MD-ANT: B. Gilbert) RTS—C46973

Change to read:

Assay—

Mobile phase—Dilute 15 mL of tetrabutylammonium hydroxide solution (25% in water) with water to 750 mL. Adjust with dilute phosphoric acid (1 in 10) to a pH of 7.5 ± 0.1. Add 150 mL of acetonitrile and 100 mL of methanol, mix, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed portion of USP Meropenem RS quantitatively in *Mobile phase* to obtain a solution having a known concentration of about 0.11 mg per mL. This solution contains the equivalent of about 0.1 mg of meropenem per mL. [NOTE—Immediately after preparation, store this solution in a refrigerator and use within 24 hours.]

Assay preparation 1 (where it is represented as being a single-dose container)—Constitute a container of Meropenem for Injection with a volume of water, accurately measured, corresponding to the amount of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and transfer to a 100-mL volumetric flask. Dilute with water

In-Process Revision

to volume, and mix. Dilute an accurately measured volume of this stock solution quantitatively with *Mobile phase* to obtain a solution having a concentration of about 0.1 mg of meropenem per mL. Hold this *Assay preparation 1* for 2 hours at 25 ± 1° before testing.

Assay preparation 2 (where the label states the quantity of meropenem in a given volume of constituted solution)—Constitute a container of Meropenem for Injection with a volume of water, accurately measured, corresponding to the amount of solvent specified in the labeling. Transfer an accurately measured volume of the constituted solution, equivalent to about 100 mg of meropenem to a 100-mL volumetric flask,

▲and dilute with water to volume.▲*USP31*
Transfer 5.0 mL of this stock solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Hold this *Assay preparation 2* for 2 hours at 25 ± 1° before testing.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 300-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. Adjust the flow rate to obtain a retention time for meropenem of about 6 to 8 minutes. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 2500 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of *Standard preparation, Assay preparation 1,* and *Assay preparation 2* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of meropenem ($C_{17}H_{25}N_3O_5S$) withdrawn from the container or in the portion of constituted solution taken by the formula:

$$100(L/D)(CP)(r_U/r_S)$$

in which L is the labeled quantity, in mg, of meropenem in the container or in the volume of constituted solution taken; D is the concentration, in mg per mL, of meropenem in *Assay preparation 1* or *Assay preparation 2*, based on the labeled quantity in the container or in the portion of constituted solution taken, respectively; C is the concentration, in mg per mL, of USP Meropenem RS in the *Standard preparation,* calculated on the anhydrous basis; P is the stated percentage, on the anhydrous basis, of meropenem in USP Meropenem RS; and r_U and r_S are the peak responses of meropenem obtained from *Assay preparation 1* or *Assay preparation 2*, as appropriate, and the *Standard preparation,* respectively.

BRIEFING

Metformin Hydrochloride Tablets, *USP 29* page 1365 and page 3732 of the *Second Supplement.* It is proposed to add *Dissolution Test 3* to this monograph because FDA approved a new generic version of this product. The chromatographic procedure in this test was validated using the Prodigy C18 brand of L1 column. The retention time of the metformin peak is about 13 minutes. A suitable alternative column is the Aqua C18 brand. In the absence of any significant adverse comments, it is proposed to implement this revision via the *Interim Revision Announcement* pertaining to *USP 29–NF 24,* with an official date of April 1, 2007.

(BPC: M. Marques) RTS—C43191

Change to read:

Dissolution ⟨711⟩—

TEST 1—
Medium: pH 6.8 phosphate buffer; 1000 mL.
Apparatus 1: 100 rpm.
Time: 45 minutes.
Procedure—Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 233 nm on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium.*
Tolerances—Not less than 70% *(Q)* of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ is dissolved in 45 minutes.

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

FOR PRODUCTS LABELED TO CONTAIN 500 MG OF METFORMIN—
Medium: pH 6.8 phosphate buffer; 1000 mL.
Apparatus 2: 50 rpm.
Time: 30 minutes.
Procedure—Proceed as directed for *Test 1.*
Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ is dissolved in 30 minutes.

FOR PRODUCTS LABELED TO CONTAIN 850 MG OR 1000 MG OF METFORMIN—
Medium: pH 6.8 phosphate buffer; 1000 mL.
Apparatus 2: 75 rpm.
Time: 30 minutes.
Procedure—Proceed as directed for *Test 1.*
Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ is dissolved in 30 minutes.

•TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3.*

Medium: pH 6.8 phosphate buffer; 1000 mL.

Apparatus 1: 100 rpm.

Time: 60 minutes.

Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by employing the following method.

0.05 M Sodium phosphate with 1-pentanesulfonic acid solution—Dissolve 1.38 g of monobasic sodium phosphate in about 1800 mL of water. Add 3.484 g of 1-pentanesulfonic acid sodium salt, and mix. Adjust with diluted phosphoric acid to a pH of 3.00 ± 0.05. Add water to make 2000 mL, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *0.05 M Sodium phosphate with 1-pentanesulfonic acid solution* and acetonitrile (19 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Transfer about 25 mg, accurately weighed, of USP Metformin Hydrochloride RS to a 100-mL volumetric flask, and add about 50 mL of *Medium*. Sonicate until dissolved, and dilute with *Medium* to volume.

In-Process Revision

Standard solution—Transfer 10.0 mL of the *Standard stock solution* to a 50-mL volumetric flask, and dilute with *Medium* to volume.

Test solution—Withdraw a portion of the solution under test, and pass through a 0.45-µm nylon filter. Dilute with *Medium,* if necessary, to obtain a concentration similar to that of the *Standard solution*.

Chromatographic system—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph replicate injections of the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; the column efficiency is not less than 1500 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 40 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of metformin released by the formula:

$$\frac{r_U \times C_S \times 900 \times 100}{r_S \times D \times LC}$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of metformin in the *Standard solution;* 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; D is the dilution factor of the *Test solution;* and *LC* is the Tablet label claim, in mg.

Tolerances—Not less than 70% *(Q)* of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ is dissolved in 60 minutes.•2

In-Process Revision

BRIEFING

Metformin Hydrochloride Extended-Release Tablets, page 772 of *PF* 31(3) [May–June 2005].

1. On the basis of comments received, the limit of total impurities under the *Chromatographic purity* test is changed from "not more than 0.5%" to "not more than 0.6%". This limit is representative of marketed products.
2. Small variations in the acetonitrile content or differences in the performances of chromatographic columns may result in poor separation of metformin impurities from the analyte. To address this issue, it is proposed to add a *Note* to indicate that the composition of the *Mobile phase* may be changed to 95 : 5, if necessary, to improve the separation.
3. It is proposed to add *Test 7* and *Test 8* to the *Dissolution* tests in this monograph.

(MD-GRE: E. Gonikberg; BPC: M. Marques) RTS—C44063; C43520; C45557; C45559; C45557

Add the following:

▲Metformin Hydrochloride Extended-Release Tablets

» Metformin Hydrochloride Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$).

Packaging and storage—Preserve in well-closed, light-resistant containers, and store at controlled room temperature.

Labeling—When more than one *Dissolution Test* is given, the labeling states the *Dissolution Test* used only if *Test 1* is not used.

USP Reference standards ⟨11⟩—*USP Metformin Hydrochloride RS. USP Metformin Related Compound B RS. USP Metformin Related Compound C RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—

TEST 1—

Medium: pH 6.8 phosphate buffer prepared by dissolving 6.8 g of monobasic potassium phosphate in 1000 mL of water and adjusting with 0.2 N sodium hydroxide to a pH of 6.8 ± 0.1; 1000 mL.

Apparatus 2: 100 rpm, for Tablets labeled to contain 500 mg.

Apparatus 1: 100 rpm, for Tablets labeled to contain 750 mg.

Times: 1, 3, and 10 hours.

Procedure—Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by UV absorption at the wavelength of maximum absorbance at about 232 nm on portions of the solution under test passed through a 0.45-µm hydrophilic polyethylene filter, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium*. Calculate the amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), in percentage, released at each time point by the formula:

$$\frac{[C \times (A_U / A_S) \times (V - V_S) + (C_{60} \times V_S) + (C_{180} \times V_S)] \times 100}{L}$$

in which C is the concentration, in mg per mL, of the Standard solution; A_U and A_S are the absorbances of the solution under test and the Standard solution, respectively; V is the initial volume, in mL, of *Medium* in the vessel; V_S is the volume, in mL, withdrawn from the vessel for previous samplings; C_{60} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 1 hour; C_{180} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 3 hours; 100 is the conversion factor to percentage; and L is the Tablet label claim, in mg.

Tolerances—The percentages of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	500-mg Tablet, Amount dissolved	750-mg Tablet, Amount dissolved
1	between 20% and 40%	between 22% and 42%
3	between 45% and 65%	between 49% and 69%
10	not less than 85%	not less than 85%

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

Medium: Prepare as directed for *Medium* in *Test 1;* 1000 mL.

Apparatus 2: 100 rpm.

Times: 1, 2, 6, and 10 hours.

Procedure—Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by UV absorption at the wavelength of maximum absorbance at about 232 nm on portions of the solution under test passed through a 0.45-µm polyethylene filter, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium*. Calculate the content of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), C_t, in mg per mL, in the *Medium* at each time point, *t,* by the formula:

$$\frac{A_U \times C_s \times D_U}{A_s}$$

in which A_U and A_S are the absorbances of the solution under test and the Standard solution, respectively; C_S is the concentration of metformin hydrochloride, in mg per mL, in the Standard solution; and D_U is the dilution factor of the solution under test. Calculate the percentage of metformin

hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved at each time point by the following formulas:

Percentage dissolved at the first time point (1 hour):

$$\frac{C_1 \times 1000 \times 100}{L}$$

in which C_1 is the content of metformin hydrochloride, in mg per mL, in the *Medium* at the first time interval; 1000 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and L is the Tablet label claim, in mg.

Percentage dissolved at the second time point (2 hours):

$$\frac{C_2 \times (1000 - SV_1) + C_1 \times SV_1 \times 100}{L}$$

in which C_2 is the content of metformin hydrochloride, in mg per mL, in the *Medium* at the second time interval; 1000 is the volume, in mL, of *Medium;* SV_1 is the volume, in mL, of the sample withdrawn at 1 hour; C_1 is the content of metformin hydrochloride, in mg per mL, in the *Medium* at 1 hour; 100 is the conversion factor to percentage; and L is the Tablet label claim, in mg.

Percentage dissolved at the *n*th time point:

$$\frac{C_n \times [1000 - (n-1)SV] + (C_1 + C_2 + ... + C_{n-1}) \times SV \times 100}{L}$$

in which C_n is the content of metformin hydrochloride, in mg per mL, in the *Medium* at the *n*th time interval; n is the time interval of interest; SV is the volume, in mL, of sample withdrawn at each time interval; C_1, C_2, C_3, ... C_{n-1} is the content of metformin hydrochloride, in mg per mL, in the *Medium* at each time interval; 100 is the conversion factor to percentage; and L is the Tablet label claim, in mg.

Tolerances—The percentages of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 20% and 40%
2	between 35% and 55%
6	between 65% and 85%
10	not less than 85%

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium, Apparatus, and *Procedure*—Proceed as directed for *Test 1*.

Times: 1, 2, 5, and 12 hours for Tablets labeled to contain 500 mg; and 1, 3, and 10 hours for Tablets labeled to contain 750 mg.

Procedure—Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by UV absorption at the wavelength of maximum absorbance at about 232 nm on portions of the solution under test passed through a 0.45-µm hydrophilic polyethylene filter, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium*. Calculate the amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), in percentage, released at each time point by the formula:

$$\frac{[C \times (A_U / A_S) \times (V - V_S) + (C_{60} \times V_S) + (C_{120} \times V_S) + (C_{300} \times V_S)] \times 100}{L}$$

in which C is the concentration, in mg per mL, of the Standard solution; A_U and A_S are the absorbances of the solution under test and the Standard solution, respectively; V is the initial volume, in mL, of *Medium* in the vessel; V_S is the volume, in mL, withdrawn from the vessel for previous samplings; C_{60} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 1

In-Process Revision

hour; C_{120} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 2 hours; C_{300} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 5 hours; 100 is the conversion factor to percentage; and L is the Tablet label claim, in mg.

Tolerances—The percentages of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

FOR TABLETS LABELED TO CONTAIN 500 MG

Time (hours)	Amount dissolved
1	between 20% and 40%
2	between 35% and 55%
5	between 60% and 80%
12	not less than 85%

FOR TABLETS LABELED TO CONTAIN 750 MG

Time (hours)	Amount dissolved
1	between 22% and 42%
3	between 49% and 69%
10	not less than 85%

TEST 4—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

Medium: Prepare as directed for *Medium* in *Test 1;* 1000 mL.

Apparatus 2: 100 rpm.

Times: 1, 3, 6, and 10 hours.

Procedure—Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by UV absorption at the wavelength of maximum absorbance at about 250 nm (shoulder) on portions of the solution under test passed through a 0.45-µm polyethylene filter, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium*. Calculate the content of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), C_t, in mg per mL, in the *Medium* at each time point, *t,* by the formulas specified in *Test 2*.

Tolerances—The percentages of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 20% and 40%
3	between 45% and 65%
6	between 65% and 85%
10	not less than 85%

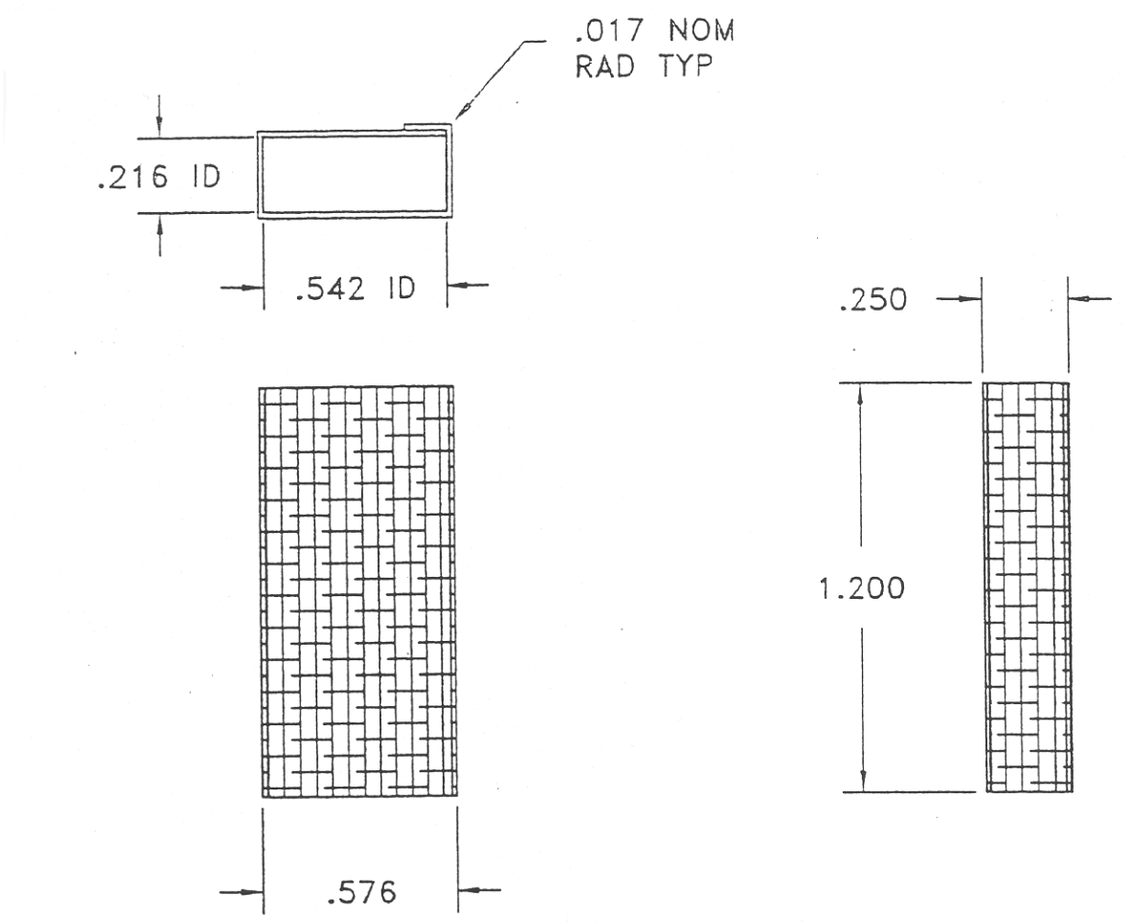
TEST 5—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5*.

Medium: pH 6.8 phosphate buffer prepared by dissolving 6.8 g of monobasic potassium phosphate in 1000 mL of water and adjusting with 0.2 N sodium hydroxide to a pH of 6.8 ± 0.1; 900 mL, deaerated.

Apparatus 1: 100 rpm, with the vertical holder described below.

Times: 2, 8, and 16 hours.

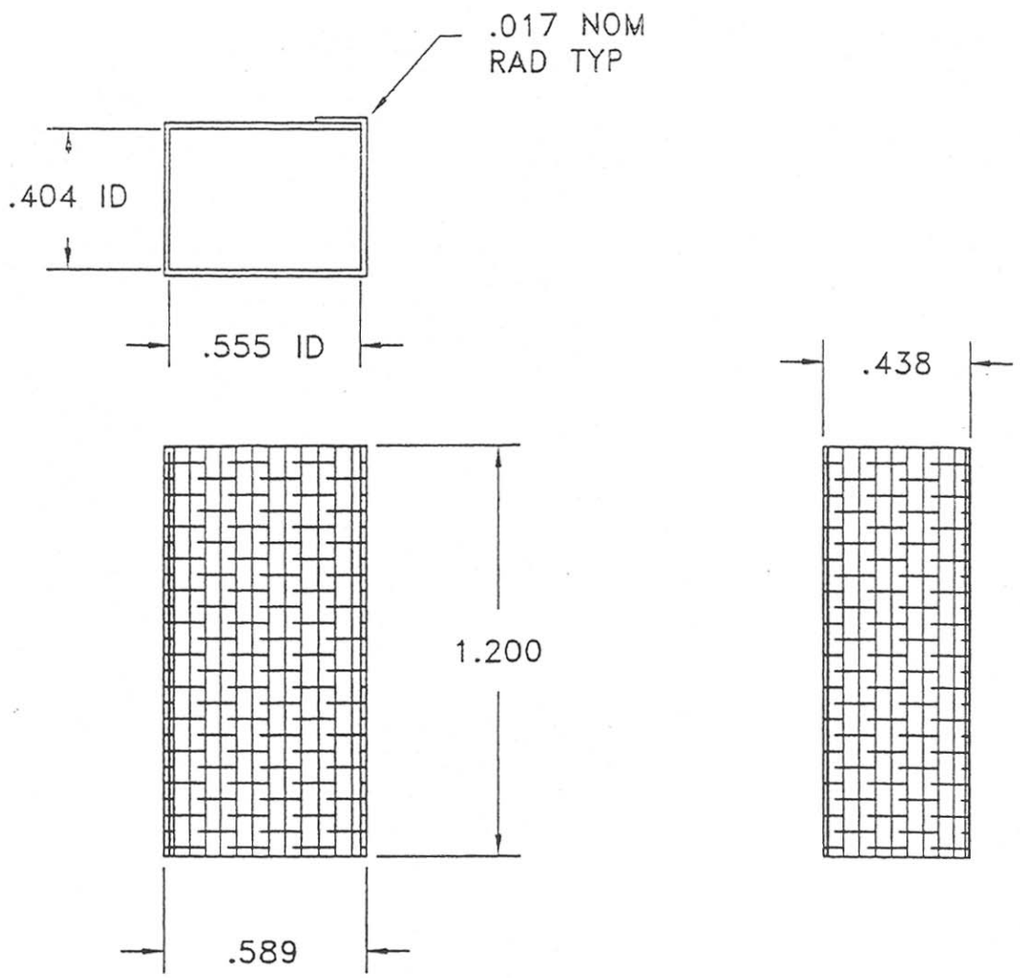
Procedure—Place a vertical sample holder into each basket (see *Figures 1* and *2*). Place one Tablet inside the sample holder, making sure that the Tablets are vertical at the bottom of the baskets. Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by UV absorption at the wavelength of maximum absorbance at about 250 nm on portions of the solution under test passed through a 0.45-µm polyethylene filter, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium*. Calculate the content of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), C_t, in mg per mL, in the *Medium* at each time point, *t,* by the formulas specified in *Test 2*.



NOTES:

1. MATERIAL: 316SS OR EQUIVALENT .017 WIRE VERTICAL MEAS SQUARE WEAVE WITH .039 SQUARE OPENINGS.
2. ALL DIMENSIONS ARE IN INCHES. TOLERANCES TO BE +/-.010

Figure 1



NOTES:

1. MATERIAL: OR EQUIVALENT .017 WIRE VERTICAL MEAS SQUARE WEAVE WITH .039 SQUARE OPENINGS.
2. ALL DIMENSIONS ARE IN INCHES. TOLERANCES TO BE +/-.010

Figure 2

Tolerances—The percentages of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	500-mg Tablet, Amount dissolved	1000-mg Tablet, Amount dissolved
2	not more than 30%	not more than 30%
8	between 60% and 85%	between 65% and 90%
16	not less than 90%	not less than 90%

TEST 6—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 6.*

Medium: pH 6.8 phosphate buffer prepared by dissolving 6.8 g of monobasic potassium phosphate in 1000 mL of water and adjusting with 0.2 N sodium hydroxide to a pH of 6.8 ± 0.05; 1000 mL, deaerated.

Apparatus 2: 100 rpm, with USP sinker, if necessary.

Procedure—Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by UV absorption at the wavelength of maximum absorbance at about 233 nm on portions of the solution under test passed through a 0.45-µm hydrophilic polyethylene filter, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium*. Calculate the amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), in percentage, released at each time point by the formula:

$$\frac{[C \times (A_U / A_S) \times (V - V_S) + (C_{60} \times V_S) + (C_{180} \times V_S) + (C_{600} \times V_S)] \times 100}{L}$$

in which C is the concentration, in mg per mL, of the Standard solution; A_U and A_S are the absorbances of the solution under test and the Standard solution, respectively; V is the initial volume, in mL, of *Medium* in the vessel; V_S is the volume, in mL, withdrawn from the vessel for previous samplings; C_{60} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 1 hour; C_{180} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 3 hours; C_{600} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 10 hours; 100 is the conversion factor to percentage; and L is the Tablet label claim, in mg.

Tolerances—The percentages of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	500-mg Tablet, Amount dissolved	750-mg Tablet, Amount dissolved
1	between 20% and 40%	between 20% and 40%
3	between 45% and 65%	between 45% and 65%
10	not less than 85%	not less than 85%

TEST 7—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 7.*

Medium—Prepare as directed for *Medium* in *Test 1;* 1000 mL.

Apparatus 2: 50 rpm, with USP sinker, for Tablets labeled to contain 500 mg.

Apparatus 1: 100 rpm, for Tablets labeled to contain 750 mg.

Times: 1, 3, and 10 hours.

Procedure—Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by UV absorption at the wavelength of maximum absorbance at about 232 nm on portions of the solution under test passed through a suitable 0.45-µm filter, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium*. Calculate the amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), in percentage, released at each time point by the formula:

$$\frac{[C \times (A_U / A_S) \times (V - V_S) + (C_{60} \times V_S) + (C_{180} \times V_S) + (C_{600} \times V_S)] \times 100}{L}$$

In-Process Revision

in which C is the concentration, in mg per mL, of the Standard solution; A_U and A_S are the absorbances of the solution under test and the Standard solution, respectively; V is the initial volume, in mL, of *Medium* in the vessel; V_S is the volume, in mL, withdrawn from the vessel for previous samplings; C_{60} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 1 hour; C_{180} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 3 hours; C_{600} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 10 hours; 100 is the conversion factor to percentage; and L is the Tablet label claim, in mg.

Tolerances—The percentages of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	500-mg Tablet, Amount dissolved	750-mg Tablet, Amount dissolved
1	between 20% and 40%	between 20% and 40%
3	between 45% and 65%	between 40% and 60%
10	not less than 85%	not less than 80%

TEST 8—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 8.*

Medium—Prepare as directed for *Medium* in *Test 1;* 1000 mL.

Apparatus 2: 100 rpm, with sinker, for Tablets labeled to contain 500 mg.

Apparatus 1: 100 rpm, for Tablets labeled to contain 750 mg.

Times: 1, 2, 6, and 10 hours

Procedure—Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by UV absorption at the wavelength of maximum absorbance at about 232 nm on portions of the solution under test passed through a suitable 0.45-µm filter, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium*. Calculate the amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), in percentage, released at each time point by the formula (1):

in which C is the concentration, in mg per mL, of the Standard solution; A_U and A_S are the absorbances of the solution under test and the Standard solution, respectively; V is the initial volume, in mL, of *Medium* in the vessel; V_S is the volume, in mL, withdrawn from the vessel for previous samplings; C_{60} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 1 hour; C_{120} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 2 hours; C_{360} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 6 hours; C_{600} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 10 hours; 100 is the conversion factor to percentage; and L is the tablet label claim, in mg.

Tolerances—The percentages of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	500-mg Tablet, Amount dissolved	750-mg Tablet, Amount dissolved
1	between 20% and 40%	between 20% and 40%
2	between 30% and 50%	between 35% and 55%
6	between 65% and 85%	between 75% and 95%
10	not less than 85%	not less than 85%

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Chromatographic purity—

Mobile phase and *Chromatographic system*—Prepare as directed in the *Assay.*

$$\frac{[C \times (A_U / A_S) \times (V - V_S) + (C_{60} \times V_S) + (C_{120} \times V_S) + (C_{360} \times V_S) + (C_{600} \times V_S)] \times 100}{L} \qquad (1)$$

In-Process Revision

Test solution—Use the *Assay preparation,* prepared as directed in the *Assay.*

Procedure—Inject a volume (about 10 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each impurity, and r_s is the sum of the responses of all the peaks: not more than 0.1% of any individual impurity is found, and not more than ~~0.5%~~ 0.6% of total impurities is found. Disregard any peak less than 0.05%, and disregard any peak observed in the blank.

Assay—

Buffer solution—Transfer 1.0 g each of sodium heptanesulfonate and sodium chloride to a 2000-mL volumetric flask, add 1800 mL of water, and mix. Adjust with 0.06 M phosphoric acid to a pH of 3.85, and dilute with water to volume.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (90 : 10). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩). [NOTE—To improve the separation, the composition may be changed to 95 : 5, if necessary.]

Diluent—Use a 1.25% solution of acetonitrile in water.

Standard preparation—Dissolve an accurately weighed quantity of USP Metformin Hydrochloride RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about (*L*/4000) mg per mL, where *L* is the labeled quantity, in mg, of metformin hydrochloride in each Tablet.

System suitability preparation—Dissolve suitable quantities of USP Metformin Related Compound B RS and USP Metformin Related Compound C RS in *Diluent* to obtain a solution containing about 12.5 µg of each per mL. Pipet 0.5 mL of this solution into a 50-mL volumetric flask, and dilute with the *Standard preparation* to volume.

Assay stock preparation—Weigh and finely powder not fewer than 10 Tablets. Transfer an accurately weighed portion of the powder, equivalent to the average Tablet weight, to a homogenization vessel, and accurately add 500 mL of 10% acetonitrile solution. Alternately, homogenize and allow to soak until the sample is fully homogenized.

Assay preparation—Pass a portion of the *Assay stock preparation* through a filter having a 0.45-µm porosity, discarding the first 3 mL of filtrate. Transfer 25 mL of the filtrate to a 200-mL volumetric flask, and dilute with water to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 218-nm detector and a 3.9-mm × 30-cm column that contains 10-µm packing L1. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 30°. Chromatograph the *System suitability preparation,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.86 for metformin related compound B, 1.0 for metformin, and about 2.1 to 2.3 for metformin related compound C [NOTE—This impurity can have a variable retention time; the composition of the *Mobile phase* may be changed to 95 : 5, if metformin related compound C elutes at a relative retention time of less than 2.1.]; the resolution, *R,* between peaks due to metformin related compound B and metformin is not less than 1.5; the tailing factor for the metformin peak is not less than 0.8 and not more than 2.0; and the relative standard deviation for replicate injections is not more than 1.5% for the metformin peak and not more than 10% for each of the peaks due to metformin related compound B and metformin related compound C.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, carrying out the run until after the elution locus of metformin related compound C; record the

In-Process Revision

chromatograms; and measure the responses for the major peaks. Calculate the quantity, in mg per Tablet, of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) by the formula:

$$C(V/W)TD(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Metformin Hydrochloride RS in the *Standard preparation; V* is the volume, in mL, of the *Assay stock preparation; W* is the weight, in mg, of sample used to prepare the *Assay stock preparation; T* is the average Tablet weight, in mg; D is the dilution factor of the *Assay preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP31*

BRIEFING

Morantel Tartrate, *USP 29* page 1455 and page 355 of *PF* 32(2) [Mar.–Apr. 2006]. On the basis of comments received, the following changes are proposed. In the Definition, it is proposed to decrease the lower limit of the allowed percentage range. In the *Related compounds* test, in the *Chromatographic system,* it is proposed to add relative rention times for morantel and two of its isomers; in the *Procedure,* it is proposed to add a specific limit for the 4-methyl isomer impurity of morantel tartrate (1-methyl-2-[(*E*)-2-(4-methylthiophen-2-yl)ethenyl]-1,4,5,6 tetrahydropyrimidine). These changes also result in a lower allowable limit in the *Assay.* Interested parties are encouraged to submit comments.

(VET: I. DeVeau) RTS—C46101

Change to read:

» Morantel Tartrate contains not less than ~~98.5~~ ▲96.4▲*USP31* percent and not more than 101.5 percent of $C_{12}H_{16}N_2S \cdot C_4H_6O_6$, calculated on the dried basis.

Change to read:

pH ⟨791⟩**:** between 2.8 and ~~3.2~~ ■3.9.■1S (*USP30*)

Solution—Dissolve and dilute 0.25 g to 25.0 mL of it in carbon dioxide-free water.

Change to read:

Related compounds—[NOTE—Conduct this test without exposure to daylight, and with the minimum necessary exposure to artificial light.]

Mobile phase—Mix 3.5 mL of triethylamine and 850 mL of water. Adjust with phosphoric acid to a pH of 2.5. Add 50 mL of tetrahydrofuran and 100 mL of methanol, and mix.

Tartrate solution—Prepare a solution containing about 0.15 mg of tartaric acid per mL in *Mobile phase*.

Standard solution 1—Dissolve an accurately weighed quantity of USP Morantel Tartrate RS in *Mobile phase* to obtain a solution having a known concentration of about 5.0 µg per mL.

Standard solution 2—Dilute 2.0 mL of *Standard solution 1* to 100.0 mL with *Mobile phase*.

System suitability solution—Expose 10 mL of *Standard solution 1* to daylight for 15 minutes before injection.

Test solution—Dissolve an accurately weighed quantity of Morantel Tartrate in *Mobile phase* to obtain a solution having a concentration of about 0.5 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 226-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 0.75 mL per minute. Chromatograph the *Tartrate solution, Standard solution 1,* and the *System suitability solution,* and record the peak areas as directed for *Procedure:* using the *System suitability solution,* the resolution, *R,* between morantel and its preceding peak (*(Z)*-isomer) is not less than 2.

▲The relative retention times are about 0.8, 1.0, and 1.2 for the morantel *(Z)*-isomer, morantel, and the morantel 4-methyl isomer (1-methyl-2-[(*E*)-2-(4-methylthiophen-2-yl)ethenyl]-1,4,5,6 tetrahydropyrimidine), respectively.▲*USP31*

Procedure—Separately inject equal volumes (about 20 µL) of the *Tartrate solution, Standard solution 1, Standard solution 2,* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Disregarding the tartrate peak and any peak in the chromatogram of the *Test solution* less than the area of the principal peak in the chromatogram of *Standard solution 2,* calculate the area percentage of each impurity, relative to morantel, in the portion of Morantel Tartrate taken by the formula:

$$100(C_S/C_U)(r_i/r_S)$$

in which C_S and C_U are the concentrations of morantel tartrate, in mg per mL, of *Standard solution 1* and the *Test solution,* respectively; and r_i and r_S are the peak areas of each individual impurity and morantel obtained from the *Test solution* and *Standard solution 1,* respectively: ~~not more than 0.5% of any individual impurity is found, and not more than 1% of total impurities is found.~~

▲not more than 3% of the morantel 4-methyl isomer is found; not more than 0.5% of any other individual impurity is found; and not more than 1% of total other individual impurities is found.▲*USP31*

In-Process Revision

BRIEFING

Norethindrone Tablets, *USP 29* page 1553. It is proposed to replace the *Disintegration* test with a *Dissolution* test for each product approved for the U.S. market. The chromatographic procedure in *Dissolution Test 1* was validated using an Ultrasphere C8 brand of L7 column. The chromatographic procedure in *Dissolution Test 2* was validated using a Pecosphere ODS brand of L1 column. An alternative L1 column for this procedure is 1B-Sil.

▲**Dissolution** ⟨711⟩**—**

TEST 1—

Medium: 0.09% sodium lauryl sulfate in 0.1 N hydrochloric acid; 500 mL, deaerated.

Apparatus 2: 75 rpm.

Time: 30 minutes.

Determine the amount of $C_{20}H_{26}O_2$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (3 : 2). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Transfer about 35 mg, accurately weighed, of USP Norethindrone RS to a 500-mL volumetric flask. Add approximately 100 mL of methanol, and sonicate until completely dissolved. Cool to room temperature. Dilute with methanol to volume, and mix well. Transfer 2.0 mL of this solution to a 200-mL volumetric flask. Dilute with *Medium* to volume, and mix well.

Test solution—Pass the solution under test through a suitable 0.45-µm filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 3.0%.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of norethindrone dissolved by the formula:

$$\frac{r_U \times C_S \times 500 \times 100}{r_S \times LC}$$

in which r_U and r_S are the peak responses for the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of norethindrone in the *Standard solution;* 500 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the Tablet label claim, in mg.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{20}H_{26}O_2$ is dissolved in 30 minutes.

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: 0.09% sodium lauryl sulfate in 0.1 N hydrochloric acid; 900 mL, deaerated.

Apparatus 2: 75 rpm.

Time: 45 minutes.

Determine the amount of $C_{20}H_{26}O_2$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of 0.02 M phosphate buffer pH 6.0 and acetonitrile (65 : 35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

In-Process Revision

Standard solution—Transfer about 14 mg, accurately weighed, of USP Norethindrone RS to a 100-mL volumetric flask. Dilute with methanol to volume, and mix. Transfer 20.0 mL of this solution to a 100-mL volumetric flask. Dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to a 200-mL volumetric flask. Dilute with *Medium* to volume, and mix.

Test solution—Pass the solution under test through a suitable 0.45-µm filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 200-nm detector and a 4.6-mm × 10-cm column that contains 3-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 3.0%.

Procedure—Proceed as directed for *Test 1*. Calculate the percentage of norethindrone dissolved by the formula:

$$\frac{r_U \times C_S \times 900 \times 100}{r_S \times LC}$$

in which r_U and r_S are the peak responses for the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of norethindrone in the *Standard solution;* 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the Tablet label claim, in mg.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{20}H_{26}O_2$ is dissolved in 45 minutes.▲*USP31*

BRIEFING

Ofloxacin Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with the 3-µm Hypersil BDS C18 brand of L1 column. In the test for *Related compounds,* typical retention times for impurity A and impurity B are about 4 minutes and 28 minutes, respectively. In the *Assay,* the typical retention time for ofloxacin is about 7 minutes.

(MD-AA: B. Davani; BPC: M. Marques) RTS—C42637

Add the following:

▲Ofloxacin Tablets

» Ofloxacin Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ofloxacin ($C_{18}H_{20}FN_3O_4$).

Packaging and storage—Preserve in well-closed containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Ofloxacin RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩**—**[To come.]

Uniformity of dosage units ⟨905⟩**:** meet the requirements for *Content Uniformity.*

Related compounds—

Phosphate buffer—Dissolve 2.72 g of monobasic potassium phosphate in 1000 mL of water. Adjust with diluted phosphoric acid to a pH of 3.3 ± 0.1.

Solution A—Prepare a filtered and degassed mixture of *Phosphate buffer* and acetonitrile (88 : 12).

Solution B—Prepare a filtered and degassed mixture of acetonitrile and *Phosphate buffer* (60 : 40).

In-Process Revision

Mobile phase—Use variable mixtures of *Solution A* and *Solution B,* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Ofloxacin RS in methanol, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 4 µg per mL.

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of ofloxacin, to a 100-mL volumetric flask, add 70 mL of methanol, and sonicate for about 20 minutes. Dilute with methanol to volume, and mix. Pass a portion of this solution through a filter having a 0.45-µm or finer porosity, discarding the first 5 mL. Use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 294-nm detector and a 4.6-mm × 10-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–8	100	0	isocratic
8–25	100→40	0→60	linear gradient
25–26	40→100	60→0	linear gradient
26–40	100	0	isocratic

Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(1/F)(r_U/r_S)(C_S/C_U)$$

in which F is the relative response factor for each impurity; r_U is the peak response of the impurity obtained from the *Test solution;* r_S is the peak response of ofloxacin obtained from the *Standard solution;* C_S is the concentration, in mg per mL, of USP Ofloxacin RS in the *Standard solution;* and C_U is the concentration, in mg per mL, of ofloxacin in the *Test solution,* based on the label claim. The impurity limits meet the requirements specified in *Table 1*.

Assay—

Buffer solution—Dissolve 2.72 g of monobasic potassium phosphate in 1000 mL of water, and adjust with diluted phosphoric acid to a pH of 3.3 ± 0.1.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (88 : 12). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent 1—Prepare a mixture of methanol and glacial acetic acid (75 : 25).

Diluent 2—Prepare a mixture of water and acetonitrile (90 : 10).

Standard preparation—Dissolve an accurately weighed quantity of USP Ofloxacin RS in *Diluent 1* to obtain a solution having a known concentration of about 1 mg per mL, and dilute quantitatively, and stepwise if necessary, with *Diluent 2* to obtain a solution having a known concentration of about 20 µg per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of ofloxacin, to a 100-mL volumetric flask, add 70 mL of *Diluent 1,* and sonicate for

In-Process Revision

Table 1

Name	Relative Retention Time	Relative Response Factor	Limit (%)
Impurity A (2,3-dihydro-3-methyl-10-(4-methyl-1-piperazinyl)-7-oxo-7*H*-pyrido [1,2,3-de]-1,4-benzoxazine-6-carboxylic acid)	0.5	1	0.3
Impurity B (9,10-difluoro-3-methyl-7-oxo-2,3-dihydro-7*H*-pyrido[1,2,3-de]-1,4-benzoxazine-6-carboxylic acid)	3.6	0.22	0.3
Any other impurity	—	1	0.2
All impurities	—	—	1.0

about 20 minutes. Dilute with *Diluent 1* to volume, and mix. Pass a portion of this solution through a filter having a 0.45-µm or finer porosity, and collect the filtrate. Dilute 2.0 mL of the filtrate with *Diluent 2* to 100 mL, and mix well.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 294-nm detector and 4.6-mm × 10-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of ofloxacin ($C_{18}H_{20}FN_3O_4$) in the portion of Tablets taken by the formula:

$$5000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Ofloxacin RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP31*

BRIEFING

Orlistat Capsules. Because there is no *USP* monograph for this dosage form, a new monograph is being proposed. The liquid chromatographic procedures in the tests for *Dissolution* and *Related compounds* and in the *Assay* are based on analyses performed with the Nova-Pak C18 brand of L1 column. The typical retention time is about 10.2 minutes for orlisat.

(MD-CCA: C. Anthony; BPC: M. Marques) RTS—C44029

Add the following:

▲Orlistat Capsules

» Orlistat Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of orlistat ($C_{29}H_{53}NO_5$).

Packaging and storage—Preserve in tight containers, and store at 25°, excursions permitted between 15° and 30°.

USP Reference standards ⟨11⟩—*USP Orlistat RS. USP Orlistat Related Compound D RS.*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

In-Process Revision

Dissolution ⟨711⟩—

Medium: 3% sodium lauryl sulfate and 0.5% sodium chloride in water. To each 10 L of this solution, add 1 to 2 drops of *n*-octanol, and adjust with phosphoric acid to a pH of 6.0 ± 0.2; 900 mL.

Apparatus 2: 75 rpm, with a coil sinker.

Time: 45 minutes.

Determine the amount of $C_{29}H_{53}NO_5$ dissolved by employing the following method.

Mobile phase—Proceed as directed in the *Assay.*

Standard solution—Transfer about 13 mg of USP Orlistat RS, accurately weighed, to a 100-mL volumetric flask, dissolve in 2 mL of acetonitrile, dilute with *Medium* to volume, and mix.

Test solution—Pass the solution under test through a suitable 0.2-µm filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay,* except to use a flow rate of about 2.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Proceed as directed for *Procedure* in the *Assay.* Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the amount of orlistat ($C_{29}H_{53}NO_5$) dissolved by the formula:

$$\frac{r_U \times C_S \times 900 \times 100}{r_S \times LC}$$

in which r_U and r_S are the peak responses for the *Test solution* and *Standard solution,* respectively; C_S is the concentration, in mg per mL, of orlistat in the *Standard solution;* 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the Capsule label claim, in mg.

Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{29}H_{53}NO_5$ is dissolved in 45 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Related compounds—

Mobile phase—Proceed as directed in the *Assay.*

System suitability solution—Transfer about 5 mg of USP Orlistat Related Compound D RS to a 200-mL volumetric flask, and dissolve in and dilute with *Mobile phase* to volume. Transfer 1 mL of this solution to a 50-mL volumetric flask, and dilute with *Standard solution* to volume.

Standard solution—Proceed as directed for *Standard preparation* in the *Assay.*

Test solution—Proceed as directed for *Assay preparation* in the *Assay.*

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay,* except to chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between USP Orlistat RS and USP Orlistat Related Compound D RS is not less than 1.4; and the relative standard deviation for replicate injections calculated for the orlistat peak is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of each impurity in the portion of Capsules taken by the formula:

$$20{,}000(C/FW)(r_i/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Orlistat RS in the *Standard solution; W* is the weight, in mg, of orlistat in the powder sample used to prepare the *Test solution; F* is the relative response factor (see *Table 1* for values); r_i is the peak response obtained for the individual impurity in the *Test solution;* and r_S is the peak height for orlistat in the *Standard solution.* The limits of impurities are specified in *Table 1*.

In-Process Revision

Table 1

Compound	Relative Retention Time	Relative Response Factor (*F*)	Limit (%, w/w)
(2*S*,3*R*,5*S*)-5-[*(S)*-2-Formylamino-4-methyl-pentanoyl-oxy]-2-hexyl-3-hydroxyhexadecanoic acid	0.45	0.92	1.5

Individual identified impurity	—	—	0.3
Individual unidentified impurity	—	1.0	0.2
Total impurities	—	—	3.0

Assay—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, water, and phosphoric acid (860 : 140 : 0.05). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Orlistat RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.6 mg per mL.

Assay preparation—Transfer the contents of not fewer than 10 Capsules into a suitable container, weigh, and mix. Transfer an accurately weighed portion of the powder, equivalent to about 120 mg of orlistat into a 200-mL volumetric flask. Add 140 mL of *Mobile phase,* and sonicate for about 1 minute. Shake the resulting solution mechanically for about 15 minutes, and dilute with *Mobile phase* to volume. Pass a portion of this solution through a filter having a 0.45-µm or finer porosity, discarding the first few mL of the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 195-nm detector and a 3.9-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the orlistat peaks. Calculate the quantity, in mg, of orlistat ($C_{29}H_{53}NO_5$) in the portion of Capsules taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Orlistat RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP31*

In-Process Revision

BRIEFING

Oxybutynin Chloride Extended-Release Tablets, page 1652 of *PF* 31(6) [Nov.–Dec. 2005]. In the test for *Drug release,* it is proposed to revise the specifications for *Apparatus 7* to include the temperature at which the test should be run.

(BPC: M. Marques) RTS—C48590

Add the following:

▲Oxybutynin Chloride Extended-Release Tablets

» Oxybutynin Chloride Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of oxybutynin chloride ($C_{22}H_{31}NO_3 \cdot HCl$).

Packaging and storage—Preserve in tight containers. Store at ~~25°, excursions permitted between 15° and 30°~~ controlled room temperature.

USP Reference standards ⟨11⟩—*USP Oxybutynin Chloride RS. USP Oxybutynin Related Compound A RS.*

Identification—

A: *Infrared Absorption* ⟨197⟩—

Test specimen—Add a quantity of finely powdered Tablets, equivalent to about 15 mg of oxybutynin chloride, to 5 mL of water per Tablet. Mix for 1 minute. Adjust with 0.1 N sodium hydroxide to a pH between 7 and 8. Extract the solution twice with 10 mL of ether. Combine the extracts, evaporate the ether, and dry under vacuum over silica gel for at least 30 minutes. Redissolve the dried residue in a small amount of acetone, transfer the solution to an IR salt plate, and evaporate to cast a thin film.

Standard specimen—Dissolve 15 mg of USP Oxybutynin Chloride RS in 5 mL of water. Proceed as directed for the *Test specimen,* beginning with "Adjust with".

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Change to read:

Drug release ⟨724⟩—

Medium: simulated gastric fluid without enzymes; 50 mL.

Apparatus 7: 30 cycles per minute; 2- to 3-cm amplitude, ▲at 37.0 ± 0.5°.▲*USP31*

Times: 4, 10, and 24 hours.

Determine the amount of $C_{22}H_{31}NO_3 \cdot HCl$ dissolved by employing the following method.

0.035 M Phosphate buffer, pH 2.2—Dissolve about 4.83 g of monobasic sodium phosphate in 1000 mL of water, add 2.3 mL of triethylamine, and adjust with phosphoric acid to a pH of 2.2 ± 0.2.

Acidified water—To 1 L of water add phosphoric acid dropwise to a pH of 3.5, and mix well.

Standard stock solutions—Dissolve accurately weighed quantities of USP Oxybutynin RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain solutions having known concentrations of about 250, 300, and 350 µg per mL.

Standard solutions—Prepare a series of dilutions of the *Standard stock solutions* in acidified water having final concentrations similar to those expected in the *Test solution.*

Test solution—Use portions of the solution under test. If the solution is cloudy, centrifuge at 2000 rpm for 10 minutes, and use the supernatant.

Mobile phase—Prepare a suitable filtered and degassed mixture of *0.035 M Phosphate buffer, pH 2.2* and acetonitrile (65 : 35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Use a medium range *Standard solution* of USP Oxybutynin Chloride RS.

In-Process Revision

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 5-cm column that contains packing L11. The flow rate is about 1.5 mL per minute. The column temperature is maintained at about 35°. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the tailing factor is greater than 0.5 and less than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solutions* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Construct a calibration curve by plotting the peak response versus concentration of the *Standard solutions.* A weighing factor, $1/x$, is applied to the regression line of the calibration curve to enhance the accuracy of the low standard concentrations. Determine the amount of $C_{22}H_{31}NO_3 \cdot HCl$ dissolved in each interval from a linear regression analysis of the calibration curve.

Tolerances—The percentages of the labeled amount of $C_{22}H_{31}NO_3 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 1.*

FOR TABLETS LABELED TO CONTAIN 5 MG OR 10 MG OF OXYBUTYNIN CHLORIDE:

Time (hours)	Amount dissolved
4	not more than 20%
10	between 34.5% and 59.5%
24	not less than 75%

FOR TABLETS LABELED TO CONTAIN 15 MG OF OXYBUTYNIN CHLORIDE:

Time (hours)	Amount dissolved
4	not more than 20%
10	between 34.5% and 59.5%
24	not less than 75%

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Related compounds—

Mobile phase, Diluent, Preparation medium, Impurity stock solution, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Impurity standard solution—Dilute the *Impurity stock solution* with *Diluent* to obtain a solution having a known concentration of about 1 µg of oxybutynin related compound A per mL. [NOTE—Oxybutynin related compound A is phenylcyclohexylglycolic acid.]

Test solution—Use the *Assay preparation*.

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains packing L11. The flow rate is about 1.5 mL per minute. Chromatograph the *Impurity standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is greater than 0.75 and not more than 2.5 for the phenylcyclohexylglycolic acid peak. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.0 for oxybutynin and about 1.6 for phenylcyclohexylglycolic acid; the resolution, *R,* between oxybutynin and phenylcyclohexylglycolic acid is not less than 1.5; and the relative standard deviation of peak area responses for six replicate injections of *System suitability solution* is not more than 3% for each compound.~~

Procedure—Separately inject equal volumes (about 50 µL) of the *Impurity standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$C(r_U / r_S)$$

in which C is the concentration, in µg per mL, of oxybutynin related compound A in the *Impurity standard solution;* and r_U and r_S are the peak responses for each impurity obtained from the *Test solution* and the *Impurity standard solution,*

In-Process Revision

respectively. Disregard any peak less than 0.1%: not more than 1% of oxybutynin related compound A is found, and not more than 2% of total impurities is found.

Assay—

Mobile phase—Prepare a mixture of water, acetonitrile, and triethylamine (65 : 35 : 0.15). Adjust with phosphoric acid to a pH of 3.9, degas, and filter.

Diluent—Use water adjusted with phosphoric acid to a pH of 3.5.

Preparation medium—Prepare a solution of methanol and acetonitrile (1 : 1).

Impurity stock solution—Dissolve an accurately weighed quantity of USP Oxybutynin Related Compound A RS in acetonitrile to obtain a solution having a known concentration of about 0.11 mg per mL.

Standard stock preparation—Dissolve an accurately weighed quantity of USP Oxybutynin Chloride RS in acetonitrile to obtain a solution having a known concentration of about 0.37 mg per mL.

System suitability solution—Transfer 10 mL of the *Standard stock preparation* and 1 mL of the *Impurity stock solution* into a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Standard preparation—Dilute the *Standard stock preparation* with *Diluent* to obtain a solution having a known concentration of about 0.1 mg per mL.

Assay preparation—

FOR TABLETS THAT CONTAIN 5 MG OF OXYBUTYNIN CHLORIDE—Place 10 Tablets in a 500-mL volumetric flask, add 150 mL of *Preparation medium,* and stir ~~overnight~~ for at least 4 hours or until dissolved. Dilute with *Diluent* to volume. Mix thoroughly, centrifuge, and use the clear supernatant.

FOR TABLETS THAT CONTAIN 10 MG OF OXYBUTYNIN CHLORIDE OR MORE—Place 10 Tablets in a 1000-mL volumetric flask, add 300 mL of *Preparation medium,* and stir ~~overnight~~ for at least 4 hours or until dissolved. Dilute with *Diluent* to volume. If necessary, make a further dilution with *Diluent* to obtain a solution having a final concentration equivalent to 0.1 mg per mL of oxybutynin chloride. Mix thoroughly, centrifuge, and use the clear supernatant.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains packing L11. The flow rate is about 1.5 mL per minute. ~~Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is greater than 0.75 and not more than 2.5.~~ Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 1.0 for oxybutynin and about 1.6 for oxybutynin related compound A; the resolution, *R,* between oxybutynin and oxybutynin related compound A is not less than 1.5; the tailing factor is greater than 0.75 and not more than 2.5 for each peak; and the relative standard deviation of peak area responses for six replicate injections is not more than 3% for each compound.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of oxybutynin chloride ($C_{22}H_{31}NO_3 \cdot HCl$) in the portion of Tablets taken by the formula:

$$CVD(r_U / r_S)$$

in which C is the concentration, in mg per mL, of oxybutynin chloride in the *Standard preparation; V* is the volume, in mL, of the *Assay preparation; D* is the dilution factor; and r_U and r_S are the peak area responses obtained from the *Assay preparation* and the *Standard preparation,* respectively. ▲*USP30*

In-Process Revision

BRIEFING

Oxycodone Hydrochloride Extended-Release Tablets, page 1104 of *PF* 31(4) [July–Aug. 2005]. It is proposed to add two *Dissolution* tests to this monograph. The chromatographic procedure in *Dissolution Test 1* was validated using the Microbondapak C18 brand of L1 column.

(BPC: M. Marques) RTS—C44026; C43993; C48625

Add the following:

▲Oxycodone Hydrochloride Extended-Release Tablets

» Oxycodone Hydrochloride Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$).

Packaging and storage—Preserve in tight, light-resistant containers, and store at controlled room temperature.

Labeling—When more than one *Dissolution Test* is given, the labeling states the *Dissolution Test* used only if *Test 1* is not used.

USP Reference standards ⟨11⟩—*USP Oxycodone RS. USP Oxycodone Related Compound A RS.*

Identification—

A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—Transfer a portion of powdered Tablets, equivalent to about 5 mg of oxycodone hydrochloride, to a suitable screw-capped tube, add 5 mL of chloroform, sonicate for about 30 seconds, shake for several minutes, and centrifuge. Use the clear supernatant.

Standard solution: 0.9 mg of USP Oxycodone RS per mL of chloroform.

Application volume: 20 µL.

Developing solvent solution: a mixture of acetone, toluene, ether, and ammonium hydroxide (6 : 4 : 1 : 0.3).

Procedure—Proceed as directed in the chapter. Spray with iodoplatinate TS: the R_F value, color, and size of the principal spot obtained from the *Test solution* correspond to those obtained from the *Standard solution;* and no other spot is observed.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

~~**Drug release** ⟨724⟩ — [To come.]~~

Dissolution ⟨711⟩—

TEST 1—

Medium: Simulated gastric fluid (without enzymes); 900 mL.

Apparatus 1: 100 rpm.

Times: 1, 2, 4, 6, and 8 hours, for Tablets labeled to contain 10 mg, 20 mg, or 40 mg; 1, 2, 4, and 6 hours, for Tablets labeled to contain 80 mg.

Determine the amount of oxycodone ($C_{18}H_{21}NO_4$) dissolved by employing the following method.

Standard stock solution—For Tablets labeled to contain 10 mg, transfer about 39.8 mg of USP Oxycodone RS, accurately weighed, into a 100-mL volumetric flask, dissolve in and dilute with *Medium* to volume. For Tablets labeled to contain 20 mg, 40 mg, or 80 mg, transfer about 39.8 mg of USP Oxycodone RS, accurately weighed, into a 50-mL volumetric flask, dissolve in and dilute with *Medium* to volume.

Working standard solution—Dilute the *Standard stock solution* with *Medium* to obtain solutions containing *L*/900 mg per mL, with *L* being the oxycodone Tablet label claim, in mg.

Procedure—Determine the amount of oxycodone ($C_{18}H_{21}NO_4$) dissolved from UV absorption at a wavelength of about 226 nm (shoulder), using filtered portions of the solution under test, suitably diluted with *Medium,* if

necessary, in comparison with the appropriate *Working standard solution*. Use *Medium* as the blank, and a 1.0-cm cell for Tablets labeled to contain 10 mg, 20 mg, or 40 mg; and a 0.5-cm cell for Tablets labeled to contain 80 mg. For Tablets labeled to contain 10 mg, 20 mg, or 40 mg, calculate the amount of oxycodone ($C_{18}H_{21}NO_4$) dissolved by the formula (1), in which C is the concentration, in mg per mL, of the appropriate *Working standard solution;* A_U and A_S are the absorbances of the solution under test and of the appropriate *Working standard solution,* respectively; V is the initial volume, in mL, of *Medium* in the vessel; V_S is the volume, in mL, withdrawn from the vessel for previous samplings; C_1 is the concentration, in mg per mL, of oxycodone in the *Medium* determined at 1 hour; C_2 is the concentration, in mg per mL, of oxycodone in the *Medium* determined at 2 hours; C_4 is the concentration, in mg per mL, of oxycodone in the *Medium* determined at 4 hours; C_6 is the concentration, in mg per mL, of oxycodone in the *Medium* determined at 6 hours; C_8 is the concentration, in mg per mL, of oxycodone in the *Medium* determined at 8 hours; 100 is the conversion factor to percentage; and L is the Tablet label claim, in mg.

For Tablets labeled to contain 80 mg, calculate the amount of oxycodone ($C_{18}H_{21}NO_4$) dissolved by the formula (2), in which C is the concentration, in mg per mL, of the appropriate *Working standard solution;* A_U and A_S are the absorbances of the solution under test and of the appropriate *Working standard solution,* respectively; V is the initial volume, in mL, of *Medium* in the vessel; V_S is the volume, in mL, withdrawn from the vessel for previous samplings; C_1 is the concentration, in mg per mL, of oxycodone in the *Medium* determined at 1 hour; C_2 is the concentration, in mg per mL, of oxycodone in the *Medium* determined at 2 hours; C_4 is the concentration, in mg per mL, of oxycodone in the *Medium* determined at 4 hours; C_6 is the concentration, in mg per mL, of oxycodone in the *Medium* determined at 6 hours; 100 is the conversion factor to percentage; and L is the Tablet label claim, in mg.

Tolerances—The percentages of the labeled amount of oxycodone ($C_{18}H_{21}NO_4$) dissolved at the times specified conform to *Acceptance Table 2*.

FOR TABLETS LABELED TO CONTAIN 10 MG, 20 MG, OR 40 MG:

Time (hours)	Amount dissolved
1	between 20% and 40%
2	between 35% and 55%
4	between 55% and 75%
6	between 70% and 90%
8	not less than 80%

FOR TABLETS LABELED TO CONTAIN 80 MG:

Time (hours)	Amount dissolved
1	between 25% and 45%
2	between 45% and 65%
4	between 65% and 85%
6	not less than 80%

TEST 2—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

Medium: Simulated gastric fluid (without enzymes); 900 mL.

$$\frac{[C\times(A_U/A_S)\times(V-V_S)+(C_1\times V_S)+(C_2\times V_S)+(C_4\times V_S)+(C_6\times V_S)+(C_8\times V_S)]\times 100}{L} \quad (1)$$

$$\frac{[C\times(A_U/A_S)\times(V-V_S)+(C_1\times V_S)+(C_2\times V_S)+(C_4\times V_S)+(C_6\times V_S)]\times 100}{L} \quad (2)$$

In-Process Revision

Apparatus 1: 100 rpm.

Times: 1, 4, and 12 hours.

Determine the amount of oxycodone ($C_{18}H_{21}NO_4$) dissolved by employing the following method.

0.85% Phosphoric acid—Dilute 10 mL of phosphoric acid with water to 1 L.

Standard stock solution—Prepare a solution of USP Oxycodone RS in *0.85% Phosphoric acid* containing about 0.9 mg per mL.

Working standard solution—Dilute the *Standard stock solution,* quantitatively and stepwise, with *Medium* to obtain a solution having a concentration of about 40% of the Tablet label claim. [NOTE—This solution is stable for two weeks at room tempeature.]

Test solution—Pass the solution under test through a suitable 0.45-µm filter.

Mobile phase—Weigh 23.1 g of monobasic potassium phosphate into a 4-L flask, and dissolve with 3400 mL of water. Add 4 mL of triethylamine and adjust with *0.85% Phosphoric acid* to a pH of 3.0 ± 0.1. Add 600 mL of methanol and 20 mL of *tert*-butyl methyl ether, and mix well. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 3.9-mm × 30-cm column that contains 10-µm packing L1 and that is maintained at a temperature of 60°. The flow rate is about 1.0 mL per minute. Chromatograph the *Working standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.5 and not less than 0.75; the capacity factor is not less than 0.5; and the relative standard deviation for replicate injections is not more than 2%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak reponses. Calculate the amount of oxycodone ($C_{18}H_{21}NO_4$) dissolved by the formula (3), in which C is the concentration, in mg per mL, of the appropriate *Working standard solution;* r_U and r_S are the peak responses of the solution under test and of the appropriate *Working standard solution,* respectively; V is the initial volume, in mL, of *Medium* in the vessel under test; V_S is the volume, in mL, withdrawn from the vessel for previous samplings; C_1 is the concentration, in mg per mL, of oxycodone in the *Medium* determined at 1 hour; C_4 is the concentration, in mg per mL, of oxycodone in the *Medium* determined at 4 hours; C_{12} is the concentration, in mg per mL, of oxycodone in the *Medium* determined at 12 hours; 100 is the conversion factor to percentage; and L is the Tablet label claim, in mg.

Tolerances—The percentages of the labeled amount of oxycodone ($C_{18}H_{21}NO_4$) dissolved at the times specified conform to *Acceptance Table 2*.

FOR TABLETS LABELED TO CONTAIN 10 MG:

Time (hours)	Amount dissolved
1	between 29% and 49%
4	between 58% and 78%
12	not less than 85%

FOR TABLETS LABELED TO CONTAIN 20 MG:

Time (hours)	Amount dissolved
1	between 33% and 53%
4	between 63% and 83%
12	not less than 85%

$$\frac{[C \times (r_U / r_S) \times (V - V_S) + (C_1 \times V_S) + (C_4 \times V_S) + (C_{12} \times V_S)] \times 100}{L} \quad (3)$$

In-Process Revision

FOR TABLETS LABELED TO CONTAIN 40 MG:

Time (hours)	Amount dissolved
1	between 37% and 57%
4	between 68% and 88%
12	not less than 85%

FOR TABLETS LABELED TO CONTAIN 80 MG:

Time (hours)	Amount dissolved
1	between 31% and 51%
4	between 61% and 81%
12	not less than 85%

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Related compounds—

Buffer solution—Dissolve 1.5 g of sodium heptanesulfonate in 810 mL of water. Mix with 10 mL of glacial acetic acid, adjust with 5 N sodium hydroxide solution to a pH of 3.50 ± 0.05, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (82 : 18). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve accurately weighed quantities of USP Oxycodone RS and USP Oxycodone Related Compound A RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a concentration of about 1.8 µg per mL of USP Oxycodone RS and about 1.8 µg per mL of USP Oxycodone Related Compound A RS.

Standard solution—Dissolve an accurately weighed quantity of USP Oxycodone RS in *Mobile phase,* and dilute quantitatively and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1.8 µg per mL.

Sensitivity test solution—Transfer 5 mL of the *Standard solution* into a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to 40 mg of oxycodone hydrochloride, to a 100-mL volumetric flask, add about 20 mL of a solvent consisting of methanol and acetonitrile (50 : 50), sonicate for about 10 minutes, and stir for 20 minutes. Dilute with *Buffer solution* to volume, and mix. Pass a portion of this solution through a suitable filter, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The column is maintained at a temperature of 50°, and the flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure*: the resolution, *R*, between oxycodone related compound A and oxycodone is not less than 2.0. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 1000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%. Chromatograph the *Sensitivity test solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio is not less than 10.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$10(C/W)(1/F)(r_i/r_S)$$

in which C is the concentration, in µg per mL, of USP Oxycodone RS in the *Standard solution; W* is the weight, in mg, of oxycodone hydrochloride in the powdered Tablets taken to prepare the *Test solution; F* is the relative response factor (see

In-Process Revision

Table 1 for values); r_i is the peak response obtained for each individual impurity in the *Test solution;* and r_S is the peak response for oxycodone in the *Standard solution*.

Assay—

Buffer solution—Dissolve 1.5 g of sodium heptanesulfonate in 740 mL of water. Mix with 10 mL of glacial acetic acid, adjust with 5 N sodium hydroxide solution to a pH of 3.50 ± 0.05, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (75 : 25). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Oxycodone RS in *Mobile phase,* and dilute quantitatively and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.036 mg per mL.

Assay stock preparation—Transfer 10 Tablets into an appropriate volumetric flask, add a volume of a mixture of methanol and acetonitrile (50 : 50) equivalent to 50% of the volumetric flask volume, sonicate for about 10 minutes, and stir for about 20 minutes. Dilute with *Buffer solution* to volume, and mix.

Assay preparation—Transfer a volume of the *Assay stock preparation,* equivalent to 4 mg of oxycodone hydrochloride, into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass a portion of the solution through a suitable filter, and use the filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 4000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the oxycodone peak. Calculate the quantity, in mg, of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$) in the portion of Tablets taken by the formula:

$$(351.82/315.37)CD(r_U / r_S)$$

Table 1

Name	Relative Retention Time	Relative Response Factor	Limit (w/w, %)
Oxycodone	1.00	—	—
7,8 Dihydro-14-hydroxycodeine (DHC)	about 0.6	0.64	0.5
14-Hydroxycodeine (HC) (Oxycodone related compound A)	about 1.2	0.78	0.5
Individual unknown impurity	—	—	0.5
Total impurities	—	—	2.0

in which 351.82 and 315.37 are the molecular weights of oxycodone hydrochloride and oxycodone base, respectively; *C* is the concentration, in mg per mL, of USP Oxycodone RS in the *Standard preparation; D* is the dilution factor, in mL, for the *Assay preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP31*

BRIEFING

Oxytocin Injection, *USP 29* page 1623. It is proposed to make several revisions in the monograph to facillitate the use of this product in countries throughout the world. In the Definition, the *Assay* limits are changed to not less than 80.0 percent and not more than 120.0 percent. The *Packaging and storage* conditions are changed to allow for plastic containers and the explicit temperature requirements for storage are removed from the section.

(BB PP: L. Callahan) RTS—C46027

Change to read:

» Oxytocin Injection is a sterile solution of Oxytocin in a suitable diluent. Each mL of Oxytocin Injection possesses an oxytocic activity of not less than ~~90.0~~

▲80.0▲*USP31*
percent and not more than ~~110.0~~

▲120.0▲*USP31*
percent of that stated on the label in USP Oxytocin Units.

Change to read:

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I glass

▲or in suitable plastic containers.▲*USP31*
~~Store between 2° and 8°.~~

BRIEFING

Phenoxybenzamine Hydrochloride Capsules, *USP 29* page 1704. The current *USP* test methods for Phenoxybenzamine Hydrochloride Capsules are nonstability-indicating and do not include a test for related compounds suitable for quantitating the impurities (degradants) in the finished products. It is therefore proposed to incorporate validated test methods in the tests for *Uniformity of dosage units* and *Related compounds* and in the *Assay,* as approved by FDA. These tests employ an HPLC method using the Waters YMC brand of column that contains 5-µm packing L7. The typical retention time for phenoxybenzamine hydrochloride is about 8 minutes.

(MD-CV: S. Ramakrishna) RTS—C42617

Change to read:

Uniformity of dosage units ⟨905⟩: meet the requirements.

▲PROCEDURE FOR CONTENT UNIFORMITY—

Buffer solution, Mobile phase, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Proceed as directed for *Standard preparation* in the *Assay.*

Test solution—Carefully open 10 Capsules and transfer each immediately into separate 50-mL volumetric flasks, including the capsule shells. Dissolve the capsule fill powder in approximately 30 mL of acetonitrile, and sonicate for 15 minutes with occasional stirring [NOTE—The capsule shell does not dissolve.]. Cool, dilute with acetonitrile to volume, mix, and pass through a 0.45-µm membrane filter, discarding the first 1.5 mL of the filtrate. Use the subsequent filtrate as the *Test solution*.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of phenoxybenzamine hydrochloride in the Capsules taken by the formula:

$$(TC/D)(r_U/r_S)$$

in which *T* is the labeled quantity, in mg, of phenoxybenzamine hydrochloride in the Capsules taken; *C* is the concentration, in mg per mL, of USP Phenoxybenzamine

In-Process Revision

Hydrochloride RS in the *Standard solution; D* is the concentration, in mg per mL, of phenoxybenzamine hydrochloride in the *Test solution,* based on the labeled quantity per Capsule and the extent of dilution; and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively.▲*USP31*

Add the following:

▲Related compounds—

Buffer solution, Mobile phase, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Proceed as directed for *Standard preparation* in the *Assay.*

Test solution—Use the *Assay preparation*.

Procedure—Proceed as directed in the *Assay.* Calculate the percentage of each individual impurity by the formula:

$$(100 / F)(C_S / C_T)(r_U / r_S)$$

in which F is the relative response factor, which is 1.1 for the known degradant phenoxybenzamine tertiary amine and 1 for all other individual impurities; C_S is the concentration, in µg per mL, of USP Phenoxybenzamine Hydrochloride RS in the *Standard solution;* C_T is the concentration, in mg per mL, of phenoxybenzamine in the *Test solution;* r_U is the peak response for the individual impurity obtained from the *Test solution;* and r_S is the peak response for phenoxybenzamine obtained from the *Standard solution*. Not more than 0.5% of phenoxybenzamine tertiary amine is found; not more than 0.1% of any other specified or unspecified individual impurity (degradant) is found; and not more than 0.5% total of all the specified and unspecified impurities is found.▲*USP31*

Change to read:

~~**Assay**— Remove, as completely as possible, the contents of not fewer than 20 Capsules, and weigh. Transfer an accurately weighed portion of the mixed powder, equivalent to about 50 mg of phenoxybenzamine hydrochloride, to a 50-mL volumetric flask, add about 25 mL of a 1 in 1000 solution of hydrochloric acid in alcohol, and shake. Add the alcoholic hydrochloric acid to volume, mix, and filter, discarding the first 10 mL of the filtrate. Transfer 15.0 mL of the subsequent filtrate to a 100-mL volumetric flask, dilute with the alcoholic hydrochloric acid to volume, and mix. Concomitantly determine the absorbances of this solution and of a Standard solution of USP Phenoxybenzamine Hydrochloride RS in the same medium having a known concentration of about 150 µg per mL in 1-cm cells at the wavelength of maximum absorbance at about 275 nm, with a suitable spectrophotometer, using a 1 in 1000 solution of hydrochloric acid in alcohol as the blank. Calculate the quantity, in mg, of $C_{18}H_{22}ClNO \cdot HCl$ in the portion of Capsules taken by the formula:~~

~~$$0.333C(A_U / A_S),$$~~

~~in which C is the concentration, in µg per mL, of USP Phenoxybenzamine Hydrochloride RS in the Standard solution, and A_U and A_S are the absorbances of the solution from the Capsules and the Standard solution, respectively.~~

▲*Buffer solution*—Dissolve 1.1 g of anhydrous monobasic sodium phosphate in 500 mL of water. Adjust with concentrated phosphoric acid to a pH of 3.0.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (55 : 45).

Standard preparation—Prepare a solution of USP Phenoxybenzamine Hydrochloride RS in acetonitrile having a known concentration of 0.02 mg per mL. Sonicate for 5 minutes to mix well.

System suitability solution—Prepare a solution of 0.5 mL of 0.1 N sodium hydroxide and 10 mL of the *Standard preparation* taken in a vial. [NOTE—Basic solutions of phenoxybenzamine hydrochloride will produce the known degradant tertiary amine phenoxybenzamine and an unknown related substance. Severe degradation of the drug substance will be observed if the solution is allowed to stand for more than 1 hour.]

Assay preparation—Remove, as completely as possible, the contents of not fewer than 20 Capsules, and weigh. Transfer an accurately weighed portion of the mixed powder, equivalent to about 10 mg of phenoxybenzamine hydrochloride, to a 50-mL volumetric flask. Add about 40 mL of acetonitrile, and sonicate for 15 minutes with occasional swirling. Cool, and dilute with acetonitrile to volume. Allow the sample to stand undisturbed for 30 minutes such that the undissolved material settles to the bottom. Transfer the top clear solution into HPLC vials, and use as the *Assay preparation*.

Chromatographic system—The liquid chromatograph is equipped with a 268-nm detector and a 4.6-mm × 150-cm column that contains packing L7. The flow rate is about 1.0

mL per minute. The column is maintained at ambient temperatures. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution *R,* between the phenoxybenzamine hydrochloride and the nearest peak is not less than 4. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for an average of five injections determined from the phenoxybenzamine hydrochloride peak is not more than 2%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of phenoxybenzamine hydrochloride ($C_{18}H_{22}ClNO \cdot HCl$) in the portion of Capsules taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Phenoxybenzamine Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP31*

BRIEFING

Racepinephrine Hydrochloride, *USP 29* page 1889. It is proposed to revise the current tests for *Identification,* which consist of two similar UV tests, to provide the correct tests for UV absorption and chloride, as published in *USP 22*.

(MD-PS: D. Bempong) RTS—C46958

Change to read:

Identification—

A: ~~The UV absorption spectrum of a 1 in 20,000 solution exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Epinephrine Bitartrate RS, concomitantly measured.~~

▲*Ultraviolet Absorption* ⟨197U⟩—

Solution: 50 µg per mL. [NOTE—Use USP Epinephrine Bitartrate RS in the preparation of the Standard solution.]

Medium: water.▲*USP31*

B: ~~*Ultraviolet Absorption* ⟨197U⟩—~~
~~*Solution:* 50 µg per mL.~~
~~*Medium:* water.~~

▲A solution (1 in 100) meets the requirements of the tests for *Chloride* ⟨191⟩.▲*USP31*

BRIEFING

Ranitidine Hydrochloride, *USP 29* page 1891 and page 3742 of the *Second Supplement*. It is proposed to revise the *Table* in the test for *Chromatographic purity* to add the chemical names of the impurities. It is also proposed to clarify numeric coefficients in the formulas in the test for *Chromatographic purity* and in the *Assay.*

(MD-GRE: E. Gonikberg) RTS—C48771

Assay—

■*Phosphate buffer*—Place approximately 1900 mL of water in a 2.0-L volumetric flask, accurately add 6.8 mL of phosphoric acid, and mix. Accurately add 8.6 mL of 50% sodium hydroxide solution, and dilute with water to volume. If necessary, adjust with 50% sodium hydroxide solution or phosphoric acid to a pH of 7.1, and filter.

Solution A—Prepare a mixture of *Phosphate buffer* and acetonitrile (98 : 2).

Solution B—Prepare a mixture of *Phosphate buffer* and acetonitrile (78 : 22).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent—Use *Solution A*.

Standard preparation—Dissolve an accurately weighed quantity of USP Ranitidine Hydrochloride RS in *Diluent* to obtain a solution having a known concentration of about 0.125 mg of ranitidine hydrochloride per mL.

Resolution solution—Transfer about 1.3 mg of USP Ranitidine Resolution Mixture RS to a 10-mL volumetric flask, and dissolve in and dilute with *Diluent* to volume. [NOTE—USP Ranitidine Resolution Mixture RS contains ranitidine hydrochloride and four related impurities: ranitidine amino alcohol hemifumarate, ranitidine diamine hemifumarate, ranitidine *N*-oxide, and ranitidine complex nitroacetamide.]

Assay preparation—Transfer about 25 mg of Ranitidine Hydrochloride, accurately weighed, to a 200-mL volumetric flask. Dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 10-cm column containing 3.5-µm packing L1 that is stable from pH 1 to 12. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 35°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–10	100→0	0→100	linear gradient
10–15	0	100	isocratic
15–16	0→100	100→0	linear gradient
16–20	100	0	re-equilibration

Chromatograph the *Resolution solution,* and identify the peaks using the table of impurities and degradation products (found above): the resolution, *R,* between the peaks for ranitidine *N*-oxide and ranitidine complex nitroacetamide is not less than 1.5. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the ~~quantity, in mg,~~

▲percentage▲*USP31* of $C_{13}H_{22}N_4O_3S \cdot HCl$ in the portion of Ranitidine Hydrochloride taken by the formula:

~~$200C(r_U/r_S)$~~

$$\blacktriangle 100(C_S/C_U)(r_U/r_S)\blacktriangle_{USP31}$$

in which ~~*C* is the concentration, in mg per mL, of USP Ranitidine Hydrochloride RS in the *Standard preparation;*~~

▲C_S and C_U are the concentrations, in mg per mL, of ranitidine hydrochloride in the *Standard preparation* and the *Assay preparation,* respectively;▲*USP31* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.■2S *(USP29)*

BRIEFING

Succinylcholine Chloride, *USP 29* page 2011 and page 3746 of the *Second Supplement.* On the basis of comments received, it is proposed to clarify that in *Test 2 (Limit of choline)* in the *Chromatographic purity* section, water is used as the regenerant in the chemical suppression device.

(MD-PS: D. Bempong) RTS—C46974

Change to read:

Chromatographic purity—

TEST 1—

Buffer solution—Prepare a solution in water containing 3.85 g per L of 1-pentanesulfonic acid, 2.9 g per L of sodium chloride, and 1% (v/v) of 1 N sulfuric acid.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (95 : 5).

System suitability solution—Dissolve accurately weighed quantities of citric acid and succinic acid in *Mobile phase* to obtain a solution containing about 0.5 mg of each per mL.

Standard solution—Dissolve an accurately weighed quantity of USP Succinylmonocholine Chloride RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.05 mg per mL.

Test solution—Transfer about 100 mg of Succinylcholine Chloride, accurately weighed, to a 10-mL volumetric flask, and dissolve in and dilute with *Mobile phase* to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The chromatograph is equipped with a 214-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Samples are maintained at a temperature of about 4° during the analysis. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* ■the resolution, *R,* between citric acid and succinic acid is not less than 2.9. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 3.0%.■2S *(USP29)*

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Begin integration after the edetate disodium peak, if present (retention time is about 3.5 minutes). ■The relative retention times are about 0.22 for succinic acid, 0.32 for the doublet of peaks quantitated as a single component, 0.49 for succinylmonocholine chloride, and 1.0 for succinylcholine chloride.■2S *(USP29)* Calculate the percentage of each impurity in the portion of Succinylcholine Chloride taken by the formula:

$$10C(r_i/r_S)F$$

in which C is the concentration, in mg per mL, of USP Succinylmonocholine Chloride RS in the *Standard solution;* r_i is the peak area for each impurity obtained from the *Test solution;* r_S is the succinylmonocholine chloride peak area obtained from the *Standard solution;* and F is the response factor (0.63 for succinic acid): not more than 0.1% of succinic acid is found; not more than 0.4% of the doublet of peaks quantitated as a single component is found; not more than 0.4% of succinylmonocholine chloride is found; and not more than 0.2% of any other individual impurity is found.

TEST 2 (LIMIT OF CHOLINE)—

Solution A—Prepare a solution in water containing 5% (v/v) of acetonitrile and 5% (w/v) of 0.1 M 1-hexanesulfonic acid.

Solution B—Prepare a solution of acetonitrile and water (1 : 1).

Mobile phase—Use variable amounts of *Solution A* and *Solution B* as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Dissolve an accurately weighed quantity of USP Choline Chloride RS and sodium chloride in water; and dilute quantitatively, and stepwise if necessary, with water to obtain a solution containing 0.05 mg per mL and ▲0.01▲*USP29* mg per mL, respectively.

Standard stock solution—Dissolve an accurately weighed quantity of USP Choline Chloride RS in water; and dilute quantitatively, and stepwise if necessary, with water to obtain a solution containing 0.5 mg per mL.

Standard solution—Dilute 1 mL of the *Standard stock solution* with water to 50 mL.

Test solution—Transfer about 50 mg of Succinylcholine Chloride, accurately weighed, to a 25-mL flask, and dissolve in and dilute with water to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The ion chromatograph is equipped with a suitable device for chemical suppression, a conductivity detector at 30 µS, and a 4.6-mm × 25-cm column that contains 5-µm packing L1. ~~The eluant flow is about 1 mL per minute, and uses a suitable regenerant flow rate at 50 mA output.~~

▲The eluent flow rate is about 1 mL per minute, and uses deionized water at a flow rate of 5–10 mL per minute as the regenerant for the chemical suppressor and a suppressor current setting of 50 mA.▲*USP31*

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–15	100	0	isocratic
15–16	100→0	0→100	linear gradient
16–25	0	100	isocratic
25–27	0→100	100→0	linear gradient
27–40	100	0	isocratic

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between sodium and choline is not less than 2.0; and the relative standard deviation for replicate injections is not more than 3.0%.

In-Process Revision

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of choline in the portion of Succinylcholine Chloride taken by the formula:

$$37.5C(r_C / r_S)$$

in which C is the concentration, in mg per mL, of USP Choline Chloride RS in the *Standard solution;* and r_C and r_S are the choline peak areas obtained from the *Test solution* and the *Standard solution,* respectively: not more than 0.3% of choline is found; ▲and ▲*USP29* not more than 1.5% of total impurities is found, the results for *Test 1* and *Test 2* being added.

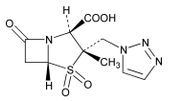
BRIEFING

Tazobactam, page 1116 of *PF* 31(4) [July–Aug. 2005]. On the basis of comments received, it is proposed to (1) add the specifications for the test for *Bacterial endotoxins,* (2) correct the limits in the test for *Specific rotation,* (3) include a limit for unspecified impurities in the test for *Related compounds,* and (4) clarify the sample treatment in the test for *Related compounds* and in the *Assay.*

(MD-ANT: B. Gilbert) RTS—C44171

Add the following:

▲Tazobactam



$C_{10}H_{12}N_4O_5S$ 300.29

4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 3-methyl-7-oxo-3-(1*H*-1,2,3-triazol-1-ylmethyl)-, 4,4-dioxide, [2*S*-(2α,3β,5α)]-.

(2*S*,3*S*,5*R*)-3-Methyl-7-oxo-3-(1*H*-1,2,3-triazol-1-ylmethyl)-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 4,4-dioxide [*89786-04-9*].

» Tazobactam contains not less than 98.0 percent and not more than 102.0 percent of $C_{10}H_{12}N_4O_5S$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers. Store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Endotoxin RS. USP Tazobactam RS. USP Tazobactam Related Compound A RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩, on an undried specimen.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Bacterial endotoxins ⟨85⟩**—**The level of Bacterial Endotoxins are such that the requirements under the relevant dosage form monograph(s) in which Tazobactam is used can be met.

Specific rotation ⟨781S⟩**:** ~~between +60° and +167° (t = 20°).~~ between 160° and 167° (t = 20°).

Test solution: 10 mg per mL, in dimethylformamide.

Microbial limits ⟨61⟩**—**The total aerobic microbial count does not exceed 1000 cfu per g, and the total combined molds and yeasts count does not exceed 100 cfu per g.

pH ⟨791⟩**:** between 1.8 and 2.8, in a solution containing 2.5 mg per mL.

Water, *Method I* ⟨921⟩**:** not more than 0.6%.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Heavy metals, *Method II* ⟨231⟩**:** 0.002%.

Related compounds—

Mobile phase, L-Phenylalanine solution, System suitability solution, and *Chromatographic system*—Prepare as directed in the *Assay.*

Blank—Use water.

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Test solution—Use the *Assay preparation.*

In-Process Revision

Procedure—Cool and maintain the *Standard solution,* the *System suitability solution,* the *Blank,* and the *Test solution* at 3° until injection. [NOTE—If an autosampler is used, replace the plastic tubing connected to the injection needle with a stainless steel assembly, and maintain at 3°. If a chilled autosampler is not used, then these solutions should be injected immediately after preparation.] Separately inject equal volumes (about 20 µL) of the *Standard solution*, the *System suitability solution,* the *Blank,* and the *Test solution* into the chromatograph; record the chromatograms; and measure the area responses for the peaks. Calculate the percentage of each related substance in the portion of Tazobactam taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the response for each related compound in the chromatogram obtained from the *Test solution,* and r_s is the sum of the peak responses of all the peaks in the chromatogram obtained from the *Test solution:* not more than 1.0% of tazobactam related compound A is found; not more than 0.1% of any other individual impurity is found; and the sum of all impurities found, other than tazobactam related compound A, is not greater than 0.3%. [NOTE—Ignore any peaks in the chromatogram of the *Test solution* that correspond to any peaks in the chromatogram of the *Blank*.]

Organic volatile impurities, *Method IV* ⟨467⟩**:** meets the requirements.

Assay—

Mobile phase—Dissolve 1.32 g of dibasic ammonium phosphate in 750 mL of water. Adjust with 5% (v/v) phosphoric acid to a pH of 2.5, dilute with water to 1000 mL, and mix. Add 30 mL of acetonitrile, mix, and pass through a filter having a 0.2-µm porosity. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve accurately weighed quantities of USP Tazobactam RS and USP Tazobactam Related Compound A RS in water to obtain a solution having known concentrations of about 0.5 mg per mL and 0.08 mg per mL, respectively.

L-Phenylalanine solution—Prepare an aqueous solution of L-phenylalanine containing 0.8 mg per mL.

System suitability solution—Pipet 1.0 mL of *L-Phenylalanine solution* and 5.0 mL of the *Standard preparation* into a 50-mL volumetric flask. Dilute with water to volume, and mix. [NOTE—Maintain this solution at 3° until injection. Prepare fresh daily.]

Assay preparation—Transfer about 25 mg of Tazobactam, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph 20 µL of the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between tazobactam and L-phenylalanine is not less than 6.0; the tailing factor is not more than 1.8; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Cool and maintain the *Standard preparation*, the *System suitability solution*, and the *Assay preparation* at 3° until injection. [NOTE—If an autosampler is used, replace the plastic tubing connected to the injection needle with a stainless steel assembly, and maintain at 3°. If a chilled autosampler is not used, then these solutions should be injected immediately after preparation.] Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{10}H_{12}N_4O_5S$ in the portion of Tazobactam taken by the formula:

In-Process Revision

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Tazobactam RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP31*

BRIEFING

Tizanidine Hydrochloride, *USP 29* page 2157 and page 746 of the *Third Interim Revision Announcement* pertaining to *USP 29–NF 24.* The following changes are proposed

1. Eliminate the redundant *Content of chloride* test because the purity range required for this test is wider than the criteria in the HPLC assay.
2. Include an identification test for chloride counter ion per *Indentification Tests–General* ⟨191⟩.
3. Revise the relative response factors under the test for *Related compounds* to implement a uniform and consistent approach, as proposed in the Stimuli article, *The Use of Relative Response Factors to Determine Impurities,* published on page 960 of *PF* 31(3) [May–June 2005]. The calculations are also revised in both the *Assay* and in the *Related compounds* tests.
4. Revise the system suitability criteria in the *Assay* on the basis of the data obtained during the collaborative laboratory work performed for Reference Standard Development.

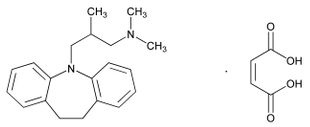
BRIEFING

Trimipramine Maleate. Because there is no existing *USP* monograph for this active drug substance, a new monograph, based on validated methods of analysis, is being proposed. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed using the Phenomenex Luna C8 brand of L7 column. The typical retention time for trimipramine is about 15.5 minutes.

(MD-PP: R. Ravichandran) RTS—C44141

Add the following:

▲Trimipramine Maleate



$C_{20}H_{26}N_2 \cdot C_4H_4O_4$ 410.51

5*H*-Dibenz[*b,f*]azepine-5-propanamine, 10,11-dihydro-*N,N,β*-trimethyl-, *(Z)*-2-butenedioate (1 : 1).

5-[3-(Dimethylamino)-2-methylpropyl]-10,11-dihydro-5*H*-dibenz[*b,f*]azepine maleate (1 : 1) [*521-78-8*].

» Trimipramine Maleate contains not less than 98.0 percent and not more than 102.0 percent of $C_{20}H_{26}N_2 \cdot C_4H_4O_4$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers, and store at room temperature.

USP Reference standards ⟨11⟩—*USP Iminodibenzyl RS. USP Imipramine Hydrochloride RS. USP Trimipramine Maleate RS. USP Trimipramine Related Compound A RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Loss on drying ⟨731⟩**—**Dry it at 105° to constant weight: it loses not more than 0.50% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.10%.

Heavy metals, *Method II* ⟨231⟩: 0.002%.

Related compounds—

Mobile phase and *Standard stock preparation*—Prepare as directed in the *Assay.*

Impurity stock solution—Dissolve accurately weighed quantities of USP Imipramine Hydrochloride RS and USP Iminodibenzyl RS in a suitable volume of *Mobile phase* to obtain a solution having a known concentration of about 50 µg per mL of iminodibenzyl and 56.5 µg per mL of imipramine hydrochloride.

Trimipramine related compound A solution—Dissolve a suitable quantity of USP Trimipramine Related Compound A RS in *Mobile phase* to obtain a solution having a concentration of about 50 µg per mL.

Trimipramine stock solution—Quantitatively dilute the *Standard stock preparation* with *Mobile phase* to obtain a solution having a known concentration of about 70 µg per mL of trimipramine maleate.

System suitability solution—Transfer about 7 mg of USP Trimipramine Maleate RS to a 10-mL volumetric flask, dissolve in a small amount of *Mobile phase,* add 0.1 mL each of the *Impurity stock solution* and the *Trimipramine related compound A solution,* and dilute with *Mobile phase* to volume.

Standard solution—Transfer 5.0 mL each of the *Impurity stock solution* and the *Trimipramine stock solution* with *Mobile phase* to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume. Dilute the resulting solution quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a final solution having a known concentration of about 0.5 µg per mL each of iminodibenzyl, imipramine (free

In-Process Revision

base), and trimipramine (free base). [NOTE—This solution is stable for one day at room temperature. The concentration of imipramine (free base), in µg per mL, can be calculated using the molecular weights of imipramine (282.41) and imipramine hydrochloride (318.88). The concentration of trimipramine (free base), in µg per mL, can be calculated using the molecular weights of trimipramine (294.43) and trimipramine maleate (410.51).]

Test solution—Use the *Assay stock preparation*.

Chromatographic system—Prepare as directed in the *Assay*. Chromatograph about 10 µL of the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between imipramine and trimipramine related compound A is not less than 1.5. [NOTE—For identification purposes, the approximate relative retention times of the specified impurities are given in *Table 1*.]

Procedure—Separately inject about 10 µL of the *Standard solution* and the *Test solution* into the chromatograph, and record the chromatogram for three times the retention time for trimipramine. Identify the components based on their relative retention times in *Table 1*. Measure the peak areas of all the peaks in the *Test solution*. Calculate the percentage of imipramine and iminodibenzyl in the portion of Trimipramine Maleate taken by the formula:

$$100(C_S / C_T)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of any given impurity (free base) in the *Standard solution;* C_T is the concentration of Trimipramine Maleate, in mg per mL, in the *Test solution;* r_U is the individual peak response of the given impurity obtained from the *Test solution;* and r_S is the corresponding response for the same impurity obtained from the *Standard solution*. Calculate the percentage of trimipramine related compound A in the portion of Trimipramine Maleate taken by the formula:

$$100(1/3.6)(C_S / C_T)(r_U / r_S)$$

in which 3.6 is the relative response factor for trimipramine related compound A; C_S is the concentration, in mg per mL, of trimipramine (free base) in the *Standard solution;* C_T is the concentration of Trimipramine Maleate, in mg per mL, in the *Test solution;* r_U is the peak response for trimipramine related compound A obtained from the *Test solution;* and r_S is the peak response of trimipramine obtained from the *Standard solution*. Calculate the percentage of each unknown impurity in the portion of Trimipramine Maleate taken by the formula:

$$100(C_S / C_T)(r_i / r_S)$$

in which C_S is the concentration, in mg per mL, of trimipramine (free base) in the *Standard solution;* C_T is the concentration of Trimipramine Maleate, in mg per mL, in the *Test solution;* r_i is the individual peak response of the given impurity obtained from the *Test solution;* and r_S is the response for trimipramine obtained from the *Standard solution:* the limits of the related compounds are given in *Table 1*. [NOTE—Disregard any peak due to the maleate counterion eluting at a relative retention time of about 0.13.]

Table 1

Peak Identification	Approximate Relative Retention Time (RRT)	Limit % (w/w)
Iminodibenzyl	0.49	NMT 0.20
Imipramine	0.72	NMT 0.20
Trimipramine related compound A	0.80	NMT 0.10
Any other individual impurity	—	NMT 0.10
Total impurites	—	NMT 0.50

In-Process Revision

Assay—

Buffer solution—Dissolve about 1.4 g of anhydrous dibasic sodium phosphate in 1 L of water. Adjust with phosphoric acid to a pH of 7.7.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, methanol, and *Buffer solution* (18 : 12 : 10). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Dissolve an accurately weighed quantity of USP Trimipramine Maleate RS in a suitable volume of *Mobile phase* to obtain a solution having a known concentration of about 0.7 mg per mL.

Standard preparation—Transfer 3 mL of the *Standard stock preparation* to a 10-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a final solution having a known concentration of about 0.21 mg per mL of trimipramine maleate.

Assay stock preparation—Dissolve an accurately weighed quantity of Trimipramine Maleate in a suitable volume of *Mobile phase* to obtain a solution having a known concentration of about 0.7 mg per mL.

Assay preparation—Transfer 3 mL of the *Assay stock preparation* to a 10-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a final solution having a known concentration of about 0.21 mg per mL of trimipramine maleate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 30°. Chromatograph about 20 µL of the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor for the trimipramine maleate peak is not more than 2.0; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms for up to 1.5 times the retention time of trimipramine maleate, and measure the responses for the trimipramine maleate peak. Calculate the percentage of $C_{20}H_{26}N_2 \cdot C_4H_4O_4$, in the portion of Trimipramine Maleate taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Trimipramine Maleate RS in the *Standard preparation;* C_U is the concentration, in mg per mL, of Trimipramine Maleate in the *Assay preparation;* and r_U and r_S are the trimipramine peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP31*

BRIEFING

Tyrosine, *USP 29* page 2228. Comments were received indicating that dissolution of the sample cannot be achieved under current conditions described in the test for *Sulfate*. On the basis of supporting data received, it is proposed to change the *Note* to indicate that diluted hydrochloric acid may be required to dissolve the test specimen.

(DSN: L. Evans) RTS—C36717

Change to read:

Sulfate ⟨221⟩—A solution containing 1.2 g shows no more sulfate than corresponds to 0.50 mL of 0.020 N sulfuric acid (0.04%). [NOTE—If necessary, dissolve the test specimen by ~~heating to near boiling and adding 1 mL of 3 *N*~~

▲adding 6 mL of diluted▲*USP31*
hydrochloric acid.]

In-Process Revision

BRIEFING

Verapamil Hydrochloride Injection, *USP 29* page 2245 and page 154 of *PF* 32(1) [Jan.–Feb. 2006]; **Verapamil Hydrochloride Tablets,** *USP 29* page 2246 and page 158 of *PF* 32(1) [Jan.–Feb. 2006]. The current official test for *Related compounds* refers to the Verapamil Hydrochloride drug substance monograph for the preparation of the *Aqueous solvent mixture, Mobile phase, System suitability solution,* and *Chromatographic system*. This revision incorporates the following changes because the drug substance monograph has been proposed for revision (see page 389 of *PF* 32(2) [Mar.–Apr. 2006]).

1. The test for *Related compounds* is revised to include methods for the preparation of *Aqueous solvent mixture, Mobile phase, System suitability solution,* and *Chromatographic system*.
2. The *Procedure* in the test for *Related compounds* is revised to specify the impurities under the term *C* in the equation.
3. The *USP Reference standards* section is also revised to include USP Verapamil Related Compound B RS.

Record the chromatograms, and measure the responses for all of the major peaks. Calculate the quantity, in mg, of verapamil hydrochloride ($C_{27}H_{38}N_2O_4 \cdot HCl$) in the portion of Tablets taken by the formula:

$$25C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Verapamil Hydrochloride RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

DIETARY SUPPLEMENTS—MONOGRAPHS

BRIEFING

Alpha Lipoic Acid Capsules. *USP 29* page 2352. On the basis of comments received, the solvent composition used in the *Standard solution, Test solution 1,* and *Test solution 2* in the test for the *Content of alpha lipoic acid* is being revised. A binary solvent system composed of equal amounts of acetonitrile and water will be used as the diluent throughout the preparation of each of the mentioned solutions.

(DSN: L. Evans) RTS—C48869

Change to read:

Content of alpha lipoic acid—

Mobile phase—Prepare a filtered and degassed mixture of 0.025 M phosphoric acid and acetonitrile (62 : 38).

Standard solution—Dissolve an accurately weighed quantity of USP Alpha Lipoic Acid RS in acetonitrile

▲and water (1 : 1),▲*USP31*
and dilute quantitatively, and stepwise if necessary, with acetonitrile

▲and water (1 : 1)▲*USP31*
to obtain a solution having a known concentration of 0.05 mg per mL.

Test solution 1 (for hard gelatin capsules)—Empty and mix thoroughly the contents of not fewer than 20 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of alpha lipoic acid, to a suitable container, add about 70 mL of a mixture of acetonitrile and water (1 : 1), and shake for 45 minutes by mechanical means. Transfer to a 100-mL volumetric flask, dilute with the mixture of acetonitrile and water (1 : 1) to volume, mix, and filter a portion of this preparation, discarding the first 5 mL of the filtrate. Transfer 5.0 mL of the remaining filtrate to a 100-mL volumetric flask, dilute with ~~water~~

▲acetonitrile and water (1 : 1)▲*USP31*
to volume, and mix.

Test solution 2 (for soft gelatin capsules)—Using a suitable cutting instrument, open an accurately counted number of Capsules equivalent to about 500 mg of alpha lipoic acid. Transfer the contents and the shells to a suitable container with stopper, add 500.0 mL of a mixture of acetonitrile and water (1 : 1), and shake for 45 minutes by mechanical means. Filter a portion of this preparation, discarding the first 5 mL of the filtrate. Transfer 5.0 mL of the remaining filtrate to a 100-mL volumetric flask, dilute with ~~water~~

▲acetonitrile and water (1 : 1)▲*USP31*
to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 220-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for alpha lipoic acid is not more than 1.2; the efficiency of the column is not less than 1300 theoretical plates; and the relative standard deviation for replicate injections is not more than 1.0%.

In-Process Revision

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the appropriate *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of alpha lipoic acid in the portion of hard gel Capsules taken by the formula:

$$2000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Alpha Lipoic Acid RS in the *Standard solution;* and r_U and r_S are the peak responses of alpha lipoic acid obtained from *Test solution 1* and the *Standard solution,* respectively. Calculate the quantity, in mg, of alpha lipoic acid in each soft gel Capsule taken by the formula:

$$10{,}000(C/N)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Alpha Lipoic Acid RS in the *Standard solution; N* is the number of capsules taken; and r_U and r_S are the peak responses of alpha lipoic acid obtained from *Test solution 2* and the *Standard solution*, respectively.

BRIEFING

Calcium Glycerophosphate. Because there is no existing *USP* monograph for this dietary supplement, a new monograph, based on validated procedures, is being proposed.

(DSN: L. Evans) RTS—C46401

Add the following:

▲Calcium Glycerophosphate

$C_3H_7CaO_6P$ 210.14

1,2,3-Propanetriol, mono(dihydrogen phosphate) calcium salt (1 : 1).

Calcium glycerophosphate. [*27214-00-2*].

» Calcium Glycerophosphate is a mixture, in variable proportions, of calcium *(RS)*-2,3-dihydroxypropyl phosphate and calcium 2-hydroxy-1-(hydroxymethyl)ethyl phosphate, which may be hydrated. Calcium Glycerophosphate contains not less than 18.6 percent and not more than 19.4 percent of calcium (Ca), calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers, and store at controlled room temperature.

Appearance of solution—

Opalescent suspension—Dissolve 1 g of hydrazine sulfate in sufficient water to produce 100 mL, and allow to stand for 4 to 6 hours. Add 25 mL of this solution to a solution containing 2.5 g of methenamine in 25 mL of water, mix well, and allow to stand for 24 hours.

Primary reference suspension—Dilute 15.0 mL of the *Opalescent suspension* with water to 1000.0 mL. [NOTE—This suspension is freshly prepared, and may be stored for at most 24 hours.]

Reference suspension—To 30 mL of the *Opalescent suspension,* add 70 mL of water, and mix. [NOTE—Shake before using.]

Test solution—Dissolve 1.5 g at room temperature in carbon dioxide-free water, and dilute with the same solvent to 150 mL.

Procedure—Compare the opalescence of equal volumes of the *Test solution* and the *Reference suspension*. The *Test solution* is not more opalescent than the *Reference suspension*.

Identification—

A: Ignite 0.1 g in a crucible. Take up the residue with 5 mL of nitric acid, heat on a water bath for 1 minute, and filter. Mix 1 mL of the filtrate with 2 mL of ammonium molybdate TS: a yellow color develops.

B: Dissolve about 20 mg of the substance being examined in 5 mL of 5 M acetic acid, and add 0.5 mL of potassium ferrocyanide solution (53 g in 1000 mL). The resulting solution remains clear. To the clear solution, add about 50 mg of ammonium chloride: a white crystalline precipitate is produced.

Acidity or alkalinity—Dissolve 1 g in water, and dilute with the same solvent to 100 mL. Add 0.1 mL of 1.0% (w/v) phenolphthalein solution. Not more than 0.5 mL of 0.1 M sodium hydroxide or 0.1 M hydrochloric acid is required to change the color of the indicator.

Citric acid—

Mercury (II) sulfate solution—Dissolve 1 g of mercuric oxide in a mixture of water and sulfuric acid (5 : 1).

Procedure—Mix 5 g with 20 mL of carbon dioxide-free water, and filter. To the filtrate, add 0.15 mL of sulfuric acid, and filter. To the filtrate, add 5 mL of *Mercury (II) sulfate solution,* and heat to boiling. Add 0.5 mL of 0.2 M potassium permanganate, and heat to boiling. No precipitate is formed.

Loss on drying ⟨731⟩**—**Dry it at 150° for 4 hours: it loses not more than 12.0% of its weight.

Glycerol and alcohol-soluble substances—Mix 1 g with 25 mL of alcohol, and shake for 1 minute. Filter, evaporate the filtrate to dryness on a water bath, and dry the residue at 70° for 1 hour. The residue weighs not more than 5 mg (0.5%).

Lead ⟨251⟩**:** not more than 4 µg per g.

Iron ⟨241⟩**—**

Standard solution—Dilute 1 volume of *Standard Iron Solution,* prepared as directed under *Iron* ⟨241⟩, with water to 10 volumes (1 ppm).

Procedure—Dissolve 0.20 g in 10 mL of water. Add 2 mL of a 20% (w/v) solution of citric acid to 0.1 mL of thioglycolic acid, mix, make alkaline with 10 M ammonia, dilute with water to 20 mL, and allow to stand for 5 minutes. Any pink color produced is not more intense than that obtained by treating 4 mL of the *Standard solution* in the same manner.

Heavy metals, *Method I* ⟨231⟩**:** 20 µg per g.

Limit of chloride—

Chloride standard solution—Dissolve an accurately weighed quantity of sodium chloride in water to obtain a solution having a concentration of about 0.824 mg per mL. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

Test solution—Dissolve 0.125 g in a 10-mL mixture of water and 5 M acetic acid (8 : 2), and dilute with water to 15 mL.

Procedure—To the *Test solution,* add 1 mL of 2 M nitric acid, then add the resulting solution to 1 mL of a silver nitrate solution (17 g in 1000 mL), and allow to stand for 5 minutes protected from light. To 10 mL of the *Chloride standard solution,* add 5 mL of water and 1 mL of 2 M nitric acid. To this solution, add 1 mL of silver nitrate solution (17 g in 1000 mL), and allow to stand for 5 minutes protected from light. When viewed against a dark background, the *Test solution* is not more turbid than the *Chloride standard solution:* not more than 400 ppm.

Limit of sulfate—

Sulfate standard solution—Dissolve an accurately weighed quantity of potassium sulfate in water to obtain a solution having a concentration of about 1.81 mg per mL. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

Test solution—Use the *Test solution* prepared as directed in the test for *Appearance of solution*.

Procedure—To 15 mL of the *Sulfate standard solution,* add 0.5 mL of 5 M acetic acid and 1 mL of barium chloride solution (250 g in 1000 mL). Repeat, using 15 mL of the *Test solution*. Allow the solutions to stand for 5 minutes protected from light. When viewed against a dark background, the *Test solution* is not more turbid than the *Sulfate standard solution:* not more than 0.2%.

Limit of arsenic—

Arsenic trioxide stock solution—In a 250-mL volumetric flask, dissolve 330 mg of arsenic trioxide in 5 mL of 2 N sodium hydroxide, and dilute with water to volume. Transfer 1 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

Arsenic standard solution—Transfer 1 mL of the *Arsenic trioxide stock solution* to a 10-mL volumetric flask, dilute with water to volume, and mix.

Tin (II) chloride solution—Transfer 1 mL of the *Arsenic trioxide stock solution* to a 10-mL volumetric flask, dilute with water to volume, and mix.

Test solution—In a 25-mL volumetric flask, dissolve 330 mg of Calcium Glycerophosphate in water, dilute with water to volume, and mix.

Apparatus—Prepare a 100-mL side-arm conical flask containing a magnetic stirring bar. Attach to the conical flask a ground–glass stopper through which passes a 20-cm long glass tube with an internal diameter of 5 mm. The lower end of the tube is inside the conical flask and has been drawn to a tip with an internal diameter of 1 mm. About 15 mm from the tip, and at least 3 mm below the lower surface of the stopper, is an orifice about 3 mm in diameter. The upper end of the tube has a flat ground surface at a right angle to the axis of the tube. A second glass tube of the same internal diameter and 30 mm long, with a similar flat ground surface, is placed in contact with the ground surface of the first tube and is held in position by a clamp and springs. Into the lower tube insert about 55 mg of loosely packed lead acetate cotton. Between the flat surfaces of the tubes place a disk of mercuric bromide paper.

Procedure—Before placing the tube assembly into the flask transfer the *Test solution* to the flask, and add 15.0 mL of hydrochloric acid, 0.1 mL of *Tin (II) chloride solution,* and 5 mL of potassium iodide TS. Allow to stand for 15 minutes, and add 5 g of activated zinc. Assemble the apparatus immediately, and immerse the flask in a water bath at a temperature such that a uniform evolution of gas is maintained. After not less than 2 hours examine the stain produced on the mercuric bromide paper. Perform the same procedure using the *Arsenic standard solution*. The stain produced on the mercuric bromide paper by the *Test solution* is not more intense than that produced by the *Arsenic standard solution* (1 ppm).

Limit of phosphates—

Sulfomolybdic solution—Dissolve with heating 2.5 g of ammonium molybdate in 20 mL of water. Dilute 28 mL of sulfuric acid in 50 mL of water, and cool. Mix the two solutions, and dilute with water to 100 mL.

Tin (II) chloride solution—Heat 20 g of tin with 85 mL of hydrochloric acid until no more hydrogen is released. Allow to cool. Dilute 1 volume of this solution with 10 volumes of dilute hydrochloric acid (20 g of hydrochloric acid in 100 mL of water).

Phosphate standard stock solution—Dissolve an accurately weighed quantity of monobasic potassium phosphate in water to obtain a solution having a concentration of about 1.43 mg per mL. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

Phosphate standard solution—Transfer 50.0 mL of the *Phosphate standard stock solution* to a 100-mL volumetric flask, dilute with water to volume, and mix.

Test solution—Transfer 2.5 mL of the *Test solution* from the test for *Appearance of solution* to a 100-mL volumetric flask, dilute with water to volume, and mix.

Procedure—To 100 mL of the *Test solution,* add 4 mL of *Sulfomolybdic solution,* mix, and add 0.1 mL of *Tin (II) chloride solution*. To 100 mL of the *Phosphate standard solution,* add 4 mL of *Sulfomolybdic solution,* mix, and add 0.1 mL of *Tin (II) chloride solution*. Allow the preparations to stand for 10 minutes, then examine 20 mL of each preparation. Any color produced by the *Test solution* is not more intense than that produced by the *Phosphate standard solution* (400 ppm).

Assay—Dissolve about 200 mg of Calcium Glycerophosphate, accurately weighed, in 300 mL of water. Add 6 mL of 10 M sodium hydroxide and about 15 mg of calconecarboxylic acid triturate, and titrate with 0.1 M edetate disodium VS until the solution is a distinct blue color. Each mL of 0.1 M edetate disodium is equivalent to 4.008 mg of calcium (Ca). ▲*USP31*

BRIEFING

Excipients, USP and NF Excipients, Listed by Category, *NF 24* page 3257, page 3816 of the *Second Supplement,* and page 1478 of *PF* 32(5) [Sept.–Oct. 2006]. It is proposed to add *Fully Hydrogenated Rapeseed Oil* to the *Coating Agent* and *Stiffening Agent* categories and *Superglycerinated Fully Hydrogenated Rapeseed Oil* to the *Coating Agent, Emulsifying and/or Solubilizing Agent,* and *Stiffening Agent* categories to complement the proposed new monographs for *Fully Hydrogenated Rapeseed Oil* and *Superglycerinated Fully Hydrogenated Rapeseed Oil,* respectively, which appear elsewhere in this issue of *PF.*

MONOGRAPHS (NF)

BRIEFING

Oleic Acid, *NF 24* page 3382. It is proposed to add a spectrophotometric *Identification* test employing *Infrared Absorption* ⟨197F⟩. It is also proposed to add a *USP Reference standards* section to include USP Oleic Acid RS, to be used to perform the IR absorption test.

(EM1: C. Sheehan) RTS—C49130

Add the following:

▲**USP Reference standards** ⟨11⟩—*USP Oleic Acid RS.*▲*NF26*

Add the following:

▲**Identification—**

Infrared Absorption ⟨197F⟩, on undried specimen.▲*NF26*

BRIEFING

Fully Hydrogenated Rapeseed Oil. Because there is no existing *NF* monograph for this excipient, it is proposed to add a new monograph, based on the monograph *Rapeseed Oil, Fully Hydrogenated,* in the *Food Chemicals Codex, Fifth Edition,* page 382, and on the monograph *Hydrogenated Cottonseed Oil, NF 24* page 3318.

(EM2: H. Wang; NOM: W. Paul) RTS—C44784

Add the following:

▲Fully Hydrogenated Rapeseed Oil

Fully hydrogenated rapeseed oil [*84681-71-0*].

» Fully Hydrogenated Rapeseed Oil is the product obtained by refining and hydrogenating oil obtained from the seeds of *Brassica napus* and *Brassica campestris* (Fam. Cruciferae). The product is a mixture of triglycerides in which the fatty acid composition is a mixture of saturated fatty acids.

Packaging and storage—Preserve in tight, light-resistant containers. No storage requirements specified.

Identification—It meets the requirements of the test for *Fatty acid composition*.

Acid value ⟨401⟩**:** not more than 6.0.

Iodine value ⟨401⟩**:** not more than 4.

Peroxide value ⟨401⟩**:** not more than 2.0.

Unsaponifiable matter ⟨401⟩**:** not more than 1.5%.

Fatty acid composition—Fully Hydrogenated Rapeseed Oil exhibits the following fatty acid composition profile, as determined in the section *Fatty Acid Composition* under *Fats and Fixed Oils* ⟨401⟩:

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
14	0	< 1.0
16	0	3–5
18	0	38–42
20	0	8–10
22	0	42–50
24	0	1.0–2.0
18	1	≤ 1.0
18	2	< 1.0
20	1	< 1.0
22*	1	≤ 1.0

* Erucic acid.

Residue on ignition ⟨281⟩**:** when a 5-g sample of Fully Hydrogenated Rapeseed Oil is ignited at an ignition temperature of 800 ± 25°, not more than 0.5%.

Heavy metals, *Method II* ⟨231⟩**:** 0.001%.

Limit of erucic acid: not more than 1.0%, as determined in the test for *Fatty acid composition*.

Alkaline impurities—Prepare a mixture of 2.0 g of Fully Hydrogenated Rapeseed Oil, 1.5 mL of alcohol, and 3.0 mL of toluene. Dissolve by gentle heating. Add 0.05 mL of bromophenol blue TS, and titrate with 0.01 N hydrochloric acid to a yellow endpoint: not more than 0.4 mL of 0.01 N hydrochloric acid is required.

Limit of nickel—

Test solution—Weigh 5.0 g of Fully Hydrogenated Rapeseed Oil into a previously tared platinum or silica crucible. Cautiously heat the substance, and introduce into it a wick formed from twisted ashless filter paper. Ignite the wick. When the substance ignites, stop heating. After combustion, ignite in a muffle furnace at about 600°. Continue the incineration until white ash is obtained. After cooling, transfer the residue, with the aid of two 2-mL portions of diluted hydrochloric acid, to a 25-mL volumetric flask, add 0.3 mL of nitric acid, and dilute with water to volume.

Nickel standard solution—Immediately before use, dilute 10 mL of nickel standard solution TS with water to 500 mL. This solution contains the equivalent of 0.2 µg of nickel per mL.

In-Process Revision

Standard solutions—Into three identical 10-mL volumetric flasks, introduce respectively 1.0, 2.0, and 4.0 mL of *Nickel standard solution*. To each flask, add a 2.0-mL portion of the *Test solution,* and dilute with water to volume.

Procedure—Concomitantly determine the absorbances of the *Standard solutions* and the *Test solution* at least three times each, at the wavelength of maximum absorbance at 232.0 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with a graphite furnace and a nickel hollow-cathode lamp. Record the average of the steady readings for each of the *Standard solutions* and the *Test solution.* Plot the absorbances of the *Standard solutions* and the *Test solution* versus the added quantity of nickel. [NOTE—The *Test solution* should be plotted as if it had a content of added nickel equivalent to 0 µg.] Extrapolate the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of nickel, *C,* in µg per mL, in the *Test solution.* Calculate the content of nickel in the portion of Fully Hydrogenated Rapeseed Oil taken by the formula:

$$25C / W$$

in which *W* is the weight, in g, of Fully Hydrogenated Rapeseed Oil taken to prepare the *Test solution*: not more than 1 µg per g is found.▲*NF26*

BRIEFING

Superglycerinated Fully Hydrogenated Rapeseed Oil. Because there is no existing *NF* monograph for this excipient, it is proposed to add a new monograph, based on the monograph *Rapeseed Oil, Superglycerinated,* in the *Food Chemicals Codex, Fifth Edition,* page 382, and on the monograph *Hydrogenated Cottonseed Oil, NF 24* page 3318.

(EM2: H. Wang; NOM: W. Paul) RTS—C44797

Add the following:

▲Superglycerinated Fully Hydrogenated Rapeseed Oil

Superglycerinated fully hydrogenated rapeseed oil.

» Superglycerinated Fully Hydrogenated Rapeseed Oil is the product obtained by refining, hydrogenating, and glycerinating oil obtained from the seeds of *Brassica napus* and *Brassica campestris* (Fam. Cruciferae). The product is a mixture of mono-, di-, and triglycerides, with triglycerides as a minor component.

Packaging and storage—Preserve in tight, light-resistant containers. No storage requirements specified.

Labeling—Label it to indicate the *Hydroxyl value* and the *Content of 1-monoglycerides.*

Identification—It meets the requirements of the test for *Fatty acid composition*.

Acid value ⟨401⟩**:** not more than 6.0.

Iodine value ⟨401⟩**:** not more than 4.

Hydroxyl value ⟨401⟩**:** not less than 90.0% and not more than 110.0% of that indicated on the label.

Peroxide value ⟨401⟩**:** not more than 2.0.

Unsaponifiable matter ⟨401⟩**:** not more than 1.5%.

Fatty acid composition—Superglycerinated Fully Hydrogenated Rapeseed Oil exhibits the following fatty acid composition profile, as determined in the section *Fatty Acid Composition* under *Fats and Fixed Oils* ⟨401⟩:

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
14	0	<1.0
16	0	3–5
18	0	38–42
20	0	8–10
22	0	42–50
24	0	1.0–2.0
18	1	≤ 1.0
18	2	<1.0
20	1	<1.0
22*	1	≤ 1.0

* Erucic acid.

Residue on ignition ⟨281⟩**:** when a 5-g sample of Superglycerinated Fully Hydrogenated Rapeseed Oil is ignited at an ignition temperature of $800 \pm 25^{\circ}$, not more than 0.5%.

Heavy metals, *Method II* ⟨231⟩**:** 0.001%.

Limit of erucic acid: not more than 1.0%, as determined in the test for *Fatty acid composition*.

Content of 1-monoglycerides—

Periodic acid solution—Dissolve 5.4 g of periodic acid in 100 mL of water, add 1900 mL of glacial acetic acid, and mix. Preserve in a light-resistant, glass-stoppered bottle.

Chloroform—Use chloroform that meets the following test. Add 50.0 mL of *Periodic acid solution* to each of three 500-mL flasks. Add 50 mL of chloroform and 10 mL of water to two of the flasks, and add 50 mL of water to the third flask. Add 20 mL of potassium iodide TS to each flask, mix gently, and continue as directed in the *Procedure,* beginning with "and allow to stand at least 1 minute, but no longer than 5 minutes, before titrating". The difference between the volume of 0.1 N sodium thiosulfate VS required in the titrations with and without the chloroform is not greater than 0.5 mL.

Test solution—Melt Superglycerinated Fully Hydrogenated Rapeseed Oil at a temperature not higher than 10° above its melting point, and mix thoroughly. Transfer an accurately weighed quantity of it, equivalent to about 150 mg of 1-monoglycerides, to a 100-mL beaker, dissolve in 25 mL of *Chloroform,* and mix.

In-Process Revision

Procedure—Transfer the *Test solution,* with the aid of an additional 25 mL of *Chloroform,* to a separator. Wash the beaker with 25 mL of water, and add the washing to the separator. Close the separator tightly with a stopper, shake vigorously for 30 to 60 seconds, and allow the layers to separate. [NOTE—Add 1 to 2 mL of glacial acetic acid to break emulsions due to the presence of soap.] Collect the aqueous layer in a 500-mL glass-stoppered Erlenmeyer flask, and again extract the chloroform solution in the separator with two 25-mL portions of water. Retain the combined aqueous extracts, which will be used in the test for *Limit of free glycerin.* Transfer the chloroform layer to a 500-mL glass-stoppered Erlenmeyer flask, and add 50.0 mL of *Periodic acid solution* to this flask and to each of two blank flasks containing a mixture of 50 mL of *Chloroform* and 10 mL of water. Swirl the flasks during the addition of *Periodic acid solution,* and allow to stand for at least 30 minutes, but no longer than 90 minutes. To each flask, add 20 mL of potassium iodide TS, and allow to stand at least 1 minute, but no longer than 5 minutes, before titrating. Add 100 mL of water, and titrate with 0.1 N sodium thiosulfate VS, using a magnetic stirrer to keep the solution thoroughly mixed, to the disappearance of the brown iodine color. Add 2 mL of starch TS, and continue the titration to the disappearance of the blue color. Calculate the percentage of 1-monoglycerides in the Superglycerinated Fully Hydrogenated Rapeseed Oil taken by the formula:

$$17.9(V_B - V_S)N/W$$

in which 17.9 is the molecular weight of glyceryl monostearate divided by 20; V_B is the volume, in mL, of sodium thiosulfate VS consumed in the blank determination; V_S is the volume, in mL, of sodium thiosulfate VS required in the titration of the Superglycerinated Fully Hydrogenated Rapeseed Oil; N is the normality, in mol per L, of the sodium thiosulfate VS; and W is the weight, in g, of the Superglycerinated Fully Hydrogenated Rapeseed Oil taken to prepare the *Test solution*: not less than 90.0% and not more than 110.0% of that indicated on the label is found.

Limit of free glycerin—

Periodic acid solution and *Chloroform*—Prepare as directed in the test for *Content of 1-monoglycerides.*

Test solution—Use the combined aqueous extracts obtained as directed in the test for *Content of 1-monoglycerides.*

Procedure—Transfer 50.0 mL of *Periodic acid solution* each to two flasks: a 500-mL glass-stoppered Erlenmeyer flask containing the *Test solution* and a 500-mL glass-stoppered Erlenmeyer blank flask containing 75 mL of water. Continue as directed for *Procedure* in the test for *Content of 1-monoglycerides,* beginning with "Swirl the flasks during the addition of *Periodic acid solution,* and allow to stand for at least 30 minutes, but no longer than 90 minutes". Calculate the percentage of free glycerin in the Superglycerinated Fully Hydrogenated Rapeseed Oil taken by the formula:

$$2.3(V_B - V_S)N/W$$

in which 2.3 is the molecular weight of glycerin divided by 40; V_B is the volume, in mL, of sodium thiosulfate VS consumed in the blank determination; V_S is the volume, in mL, of sodium thiosulfate VS required in the titration of the Superglycerinated Fully Hydrogenated Rapeseed Oil; N is the normality, in mol per L, of the sodium thiosulfate VS; and W is the weight, in g, of the Superglycerinated Fully Hydrogenated Rapeseed Oil taken to prepare the *Test solution* as directed in the test for *Content of 1-monoglycerides:* not more than 1% is found.

Limit of nickel—

Test solution—Weigh 5.0 g of Superglycerinated Fully Hydrogenated Rapeseed Oil into a previously tared platinum or silica crucible. Cautiously heat the substance, and introduce into it a wick formed from twisted ashless filter paper. Ignite the wick. When the substance ignites, stop heating. After combustion, ignite in a muffle furnace at about 600°. Continue the incineration until white ash is obtained. After cooling, transfer the residue, with the aid of two 2-mL portions of diluted hydrochloric acid, to a 25-mL volumetric flask, add 0.3 mL of nitric acid, and dilute with water to volume.

Nickel standard solution—Immediately before use, dilute 10 mL of nickel standard solution TS with water to 500 mL. This solution contains the equivalent of 0.2 µg of nickel per mL.

Standard solutions—Into three identical 10-mL volumetric flasks, introduce respectively 1.0, 2.0, and 4.0 mL of *Nickel standard solution*. To each flask, add a 2.0-mL portion of the *Test solution,* and dilute with water to volume.

Procedure—Concomitantly determine the absorbances of the *Standard solutions* and the *Test solution* at least three times each, at the wavelength of maximum absorbance at 232.0 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) equipped with a graphite furnace and a nickel hollow-cathode lamp. Record the average of the steady readings for each of the *Standard solutions* and the *Test solution.* Plot the absorbances of the *Test solution* and the *Standard solutions* versus the added quantity of nickel. [NOTE—The *Test solution* should be plotted as if it had a content of added nickel equivalent to 0 µg.] Extrapolate the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of nickel, C, in µg per mL, in the *Test solution*. Calculate the content of nickel in the portion of Superglycerinated Fully Hydrogenated Rapeseed Oil taken by the formula:

$$25C / W$$

in which W is the weight, in g, of Superglycerinated Fully Hydrogenated Rapeseed Oil taken to prepare the *Test solution*: not more than 1 µg per g is found. ▲*NF26*

BRIEFING

Sodium Tartrate, *NF 24* page 3429. On the basis of comments received, it is proposed to delete the test for *Limit of oxalate*.

(EM1: C. Sheehan) RTS—C49010

Delete the following:

▲~~**Limit of oxalate**—Dissolve 1.0 g of Sodium Tartrate in 10 mL of water, then add 5 drops of diluted acetic acid and 2 mL of calcium chloride TS: no turbidity develops within 1 hour. Not more than 0.1% is found.~~ ▲*NF26*

In-Process Revision

BRIEFING

Stearyl Alcohol, *NF 24* page 3441. On the basis of comments received, it is proposed to revise the system suitability requirements for determining %RSD for the *Chromatographic system* in the *Assay.*

(EM1: C. Sheehan) RTS—C49015

Change to read:

Assay—

System suitability solution—Dissolve accurately weighed quantities of USP Stearyl Alcohol RS and USP Cetyl Alcohol RS in dehydrated alcohol to obtain a solution containing about 9 mg per mL and 1 mg per mL, respectively.

Assay preparation—Dissolve 100 mg of Stearyl Alcohol in 10.0 mL of dehydrated alcohol, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 3-mm × 2-m column packed with 10% liquid phase G2 on support S1A. The carrier gas is helium. The temperature of the column is maintained at about 205°, the injection port temperature is maintained at about 275°, and the detector temperature is maintained at about 250°. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between cetyl alcohol and stearyl alcohol is not less than 4.0; and the relative standard deviation for replicate injections,

▲calculated with the area ratio of stearyl alcohol to cetyl alcohol,▲*NF26*
is not more than 1.5%.

Procedure—Inject about 2 µL of the *Assay preparation* into the chromatograph, record the chromatogram, and measure the areas for the major peaks. Calculate the percentage of $C_{18}H_{38}O$ in the portion of Stearyl Alcohol taken by the formula:

$$100(r_U / r_s)$$

in which r_U is the peak area for stearyl alcohol obtained from the *Assay preparation;* and r_s is the sum of the areas of all the peaks except the solvent peak.

BRIEFING

Succinic Acid, *NF 24* page 3442. Because of problems reported with the use of hexane in the *Identification* test, it is proposed to replace the solvent with ethyl ether.

(EM1: C. Sheehan) RTS—C49105

Change to read:

Identification—Place a drop of a saturated solution of the sample in a micro-test tube, and add a drop of ammonium chloride solution (0.5 in 100) and several mg of zinc powder. Cover the mouth of the tube with a disk of filter paper moistened with a solution in ~~hexane~~

▲ethyl ether▲*NF26*
containing *p*-dimethylaminobenzaldehyde (5 in 100) and trichloroacetic acid (20 in 100). Heat with a small flame for about 1 minute: a pink to red-violet stain appears on the paper.

BRIEFING

Sugar Spheres, *NF 24* page 3445 and page 3633 of the *First Supplement.* It is proposed to delete the reference to *Method I* of the general chapter *Particle Size Distribution Estimation by Analytical Sieving* ⟨786⟩. *Method I,* a dry sieving method, and *Method II,* a wet sieving method, were removed from the harmonized chapter. The chapter now directs that particle size distribution be estimated as described under *Dry Sieving Method* unless otherwise specified in the individual monograph.

(EM1: C. Sheehan) RTS—C49109

Change to read:

Particle size ~~*Method I*~~

▲▲*NF26*
⟨786⟩: not less than 90% of it passes the coarser sieve size stated in the labeling; all of it passes the next coarser sieve size listed in *Table 1* of the general chapter. Not more than 10% passes the finer sieve size stated in the labeling.

Apparatus for Tests and Assays

BRIEFING

〈**31**〉 **Volumetric Apparatus,** *USP 29* page 2497. It is proposed to align the capacity tolerances for volumetric flasks with the most recent ASTM standards. Accordingly, it is also proposed to update the references in footnote 1. In addition, corrections are made to values in the *Burets* table.

(GC: H. Pappa) RTS—48636

Change to read:

Standards of Accuracy—The capacity tolerances for volumetric flasks, transfer pipets, and burets are those accepted by the National Institute of Standards and Technology (Class A),[1] as indicated in the accompanying tables. Use Class A volumetric apparatus unless otherwise specified in the individual monograph. For plastic volumetric apparatus, the accepted capacity tolerances are Class B.[2]

The capacity tolerances for measuring (i.e., "graduated") pipets of up to and including 10-mL capacity are somewhat larger than those for the corresponding sizes of transfer pipets, namely 10, 20, and 30 µL for the 2-, 5-, and 10-mL sizes, respectively.

Transfer and measuring pipets calibrated "to deliver" should be drained in a vertical position and then touched against the wall of the receiving vessel to drain the tips. Volume readings on burets should be estimated to the nearest 0.01 mL for 25- and 50-mL burets, and to the nearest 0.005 mL for 5- and 10-mL burets. Pipets calibrated "to contain" are called for in special cases, generally for measuring viscous fluids like syrups; however, a volumetric flask may be substituted for a "to contain" pipet. In such cases, the pipet or flask should be washed clean, after draining, and the washings added to the measured portion.

BRIEFING

〈**41**〉 **Weights and Balances,** *USP 29* page 2499 and page 514 of *PF* 32(2) [Mar.–Apr. 2006]. On the basis of comments received, it is proposed to revise the chapter to further discuss the three requirements for assessing control of the analytical balance. It is also proposed, in the *Repeatability* section, to modify the formula for estimating *s* when its value is zero, as recommended in NISTIR 6919. In addition, editorial changes have been made.

(GC: H. Pappa) RTS—C46517; C47507; C50641

Change to read:

▲INTRODUCTION▲*USP31*

~~The intent of this section is to bring the requirements for weights into conformity with American National Standard ANSI/ASTM E617, “Laboratory Weights and Precision Mass Standards.” This standard is incorporated by reference and should be consulted for full descriptions and information on the tolerances and construction of weights.[+]~~

▲▲*USP31*

Pharmacopeial tests and assays require balances that vary in capacity, sensitivity, and reproducibility.

▲Measurement uncertainty from the balance is only one contributor to overall weighing errors. Other contributors to weighing errors include changes in water content of samples during weighing and errors due to a static charge on the sample. This chapter addresses the control of the analytical balance for routine operation.▲*USP31*

Unless otherwise specified, when substances are to be “accurately weighed” for *Assay,* the weighing is to be performed with a weighing device whose measurement uncertainty ~~(random plus systematic error) does not exceed 0.1% of the reading. Measurement uncertainty is satisfactory if three times the standard deviation of not less than ten replicate weighings divided by the amount weighed, does not exceed 0.001. Unless otherwise specified, for titrimetric limits tests, the weighing shall be performed to provide the number of significant figures in the weight of the analyte that corresponds to the number of significant figures in the concentration of the titrant.~~

~~Assessment of measurement uncertainty is typically done prior to the balance being placed in operation (e.g., during IQ/OQ/PQ) and periodically thereafter. Two steps are performed in measuring uncertainty: (1) measurement of repeatability and (2) verification of accuracy against certified weights.~~

~~The class designations below are in order of increasing tolerances.~~

~~Class 1.1 weights are used for calibration of low-capacity, high-sensitivity balances. They are available in various denominations from 1 to 500 mg. The tolerance for any denomination in this class is 5 µg. They are recommended for calibration of balances using optical or electrical methods for accurately weighing quantities below 20 mg.~~

~~Class 1 weights are designated as high-precision standards for calibration. They may be used for weighing accurately quantities below 20 mg. (For weights of 10 g or less, the requirements of class 1 are met by *USP XXI* class M.)~~

~~[+] Copies of ASTM Standard E 617-81 (Reapproved 1985) may be obtained from the American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103.~~

In-Process Revision

~~Class 2 weights are used as working standards for calibration, built-in weights for analytical balances, and laboratory weights for routine analytical work. (The requirements of class 2 are met by *USP XXI* class S.)[2]~~

~~Class 3 and class 4 weights are used with moderate precision laboratory balances. (Class 3 requirements are met by *USP XXI* class S 1; class 4 requirements are met by *USP XXI* class P.)[2]~~

~~A weight class is chosen so that the tolerance of the weights used does not exceed 0.1% of the amount weighed. Generally, class 2 may be used for quantities greater than 20 mg, class 3 for quantities of greater than 50 mg, and class 4 for quantities of greater than 100 mg. Weights should be calibrated periodically, preferably against an absolute standard weight.~~

▲does not exceed 0.1% of the reading. There are three requirements for control of the analytical balance: assessment of measurement uncertainty (represented mainly by the repeatability of the measurement), verification of accuracy, and a calibration check. The first two requirements are typically performed prior to placing the balance in operation (e.g., during IQ/OQ/PQ) and periodically thereafter. The calibration check is typically performed each day or prior to each series of weighings.▲*USP31*

Add the following:

▲REPEATABILITY

Assessment of repeatability may be performed using either *Method A* or *Method B*.

Method A—In this method, repeatability is determined at the lower end of the desired operating range (i.e., the range of weights for which the balance has been qualified to meet the requirements of this chapter). The measurement of repeatability using this method is satisfactory if two times the standard deviation of not less than 10 replicate weighings divided by the amount weighed does not exceed 0.001, as shown in the formula:

$$2s/w \leq 0.001$$

in which s is the standard deviation of not less than 10 replicate weighings; and w is the nominal mass, in mg, of the weight used.

Method B—This method may be used to determine the low end of the operating range (e.g., minimum weight). Minimum weight can be derived from the following formula:*

$$(2/U_{rel})s$$

in which U_{rel} represents the uncertainty factor of 0.001; and s is the standard deviation, in mg, of not less than 10 replicate measurements of a mass near the low end of the operating range. Because of scale resolution, it is possible to make measurements in which every one results in the same value. A true scale standard deviation of zero is not statistically possible, although the standard deviation may be less than one display increment d. In this situation, the standard deviation of the scale can be estimated as

~~$$s = \frac{d}{\sqrt{3}} = 0.577d$$~~

$$s = \frac{d}{2\sqrt{3}} = 0.29d$$ ▲*USP 31*

Add the following:

▲VERIFICATION OF ACCURACY

Using multiple weights of suitable accuracy as described in the table *Weights Used for Calibration Check of Balances,* the measured weight is within 0.1% of the certified value over the operating range of the balance. The operating range refers to the range used for performing the assay, and not necessarily to the operating range for other weighing operations.

~~[2] Note that the designations S and P no longer designate weight classes but rather weight grades, that is, design limitations such as range of density of materials, surface area, surface finish, corrosion resistance, and hardness.~~

* Derived from the expanded uncertainty equation in NISTIR 6919, *Recommended Guide for Determining and Reporting Uncertainties for Balances and Scales,* January 2002.

In-Process Revision

Weights Used for Calibration Check of Balances

▲*USP31*

Add the following:

▲CALIBRATION CHECK

Analytical balances vary greatly in the features they offer to ensure that the balance is maintained in a calibrated state. A calibration check to ensure that the balance is in a calibrated state is performed each day or before each series of weighings. Typically, the calibration check uses internal or external weights to verify that the balance is still in a calibrated state.▲*USP31*

Add the following:

▲⟨1058⟩ ANALYTICAL INSTRUMENT QUALIFICATION

INTRODUCTION

A large variety of laboratory instruments and ~~tools~~ equipment, ranging from simple nitrogen evaporators to complex multiple-function technologies (see *Instrument Categories*), are used in the pharmaceutical industry to acquire data to help ensure that products are suitable for their intended use. ~~and that they do not pose high safety risks. The~~ An analyst's objective is to consistently obtain reliable and valid data suitable for the intended purpose. Depending on the applications, users validate their procedures, ~~and perform system suitability tests and in process quality control checks check samples~~ calibrate their instruments, and perform additional instrument checks, such as system suitability tests and analysis of in-process quality control check samples to help ensure that the acquired data are reliable. ~~These activities help enhance the quality of data, and there are specific guidances and procedures for performing these activities.~~ With the increasing sophistication and automation of analytical instruments, an increasing demand has been placed on users to qualify their instruments.

Unlike method validation and system suitability activities, analytical instrument qualification (AIQ) currently has no specific guidance or procedures. Competing opinions ~~abound~~ exist regarding instrument qualification and validation procedures and the roles and responsibilities of those who perform them. Consequently, various approaches have been used for instrument qualification, approaches that require varying amounts of resources and generate widely differing amounts of documentation. This chapter provides a scientific approach to AIQ and considers AIQ as one of the major components required for generating reliable and consistent data. ~~Note that a risk-based approach may be used to provide flexibility in the qualification process, depending on the complexity and intended use of the instrumentation.~~ Note that the amount of rigor applied to the qualification process will depend on the complexity and intended use of the instrumentation. ~~This chapter provides an efficient science- and risk-based process for AIQ.~~ This approach emphasizes AIQ's place in the overall process of obtaining reliable data from analytical instruments. ~~The approach provided in this chapter focuses on scientific value rather than on producing documents.~~

Validation versus Qualification

~~Because there is ambiguity in the use of the terms "validation" and "qualification", in this chapter the term "validation" will be is used for processes, and software, including~~

In-Process Revision

~~analytical procedures and software procedures, and the term "qualification" will be is used for instruments.~~ In this chapter, the term validation is used for manufacturing processes, analytical procedures, and software procedures and the term qualification is used for instruments. Thus, the phrase "analytical instrument qualification" (AIQ) is used for the process of ensuring that an instrument is suitable for its intended application. ~~The term "validation" is reserved for processes including analytical procedures and software procedures.~~

COMPONENTS OF DATA QUALITY

There are four critical components involved in the generation of reliable and consistent data (quality data). *Figure 1* shows these components as layered activities within a quality triangle. Each layer adds to the overall quality. Analytical instrument qualification forms the ~~base~~ basis for generating quality data. The other components essential for generating quality data are analytical method validation, system suitability tests, and quality control ~~checks~~ check samples. These quality components are described below.

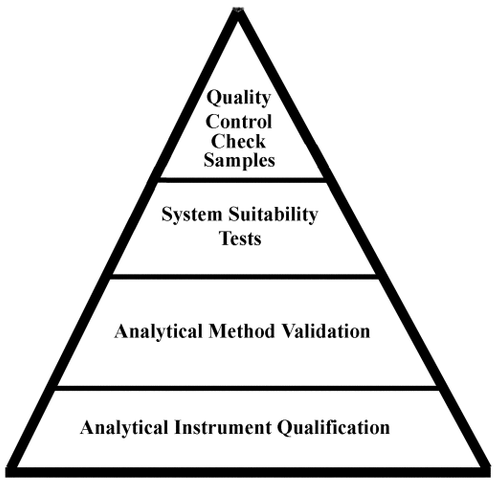

Figure 1. Components of data quality.

Analytical Instrument Qualification

AIQ is the collection of documented evidence that an instrument performs suitably for its intended purpose. ~~and that it is properly maintained and calibrated.~~ Use of a qualified instrument in analyses contributes to confidence in the ~~veracity~~ validity of generated data.

Analytical Method Validation

Analytical method validation is the collection of documented evidence that an analytical procedure ~~does what it purports to do and addresses the required attributes of the procedure~~ is suitable for its intended use. Use of a validated procedure with qualified analytical instruments provides confidence that the procedure will generate test data of acceptable quality. ~~Users of compendial procedures perform validation using the criteria provided in general information chapter *Validation of Compendial Methods* ⟨1225⟩.~~ Additional guidance on validation of compendial procedures may be found in the general information chapter *Validation of Compendial Procedures* ⟨1225⟩.

System Suitability Tests

System suitability tests verify that the system will perform ~~according to~~ in accordance with ~~the analyst's expectations and according to~~ the criteria set forth in the procedure. These tests are performed along with the sample analyses to ensure that the system's performance is acceptable at the time of the test. USP general chapter *Chromatography* ⟨621⟩ presents a more detailed discussion of system suitability tests as related to chromatographic systems.

Quality Control ~~Checks~~ Check Samples

Most analyses are performed on instruments ~~calibrated or~~ standardized using reference materials ~~or~~ and/or calibration standards. ~~The calibration or standardization process uses a single- or multiple-point calibration, depending on the instru-~~

~~ment and the intended application. The calibration or standardization of an instrument during analysis ensures that the instrument response correlates with the known quantity or quality of the calibration standard or reference material. In addition to calibration or standardization, some~~ Some analyses also require the inclusion of quality control check samples to provide an in-process or ongoing assurance of the test's suitable performance.

~~The extent of system suitability tests and/or quality control checks check samples varies for different analyses, depending on their intended use.~~ The extent of system suitability and/or quality control check sample testing needed to demonstrate a continuing state of control may vary depending on the complexity or difficulty of the analysis. ~~Chemical analyses, which are largely subject to Good Manufacturing Practices (GMP) regulations and require tighter precision and accuracy, may require more system suitability tests than bioanalytical work, which is largely subject to Good Laboratory Practice (GLP) regulations. Bioanalytical work requires sensitive, specific, broad range analysis and therefore is generally performed with more quality control checks during sample analysis.~~ Generally, chemical analyses exhibit tighter precision and accuracy than bioanalytical work, and for these analyses system suitability tests are often more appropriate. Due to the inherent variability, bioanalytical analyses are generally performed with more quality control checks during sample analysis. Control check samples are also appropriate when high-variability tests or instruments ~~(i.e., those with a relative standard deviation [RSD] higher than 5%)~~ are considered. Other use-specific considerations may also determine the extent of system suitability tests or quality-control-check sample analysis. Whatever the case, the sum total of such controls provides an important step in delivering quality data for the intended purpose.

In summary, analytical instrument qualification and analytical method validation ensure the quality of analysis *before* conducting the tests. System suitability tests and quality control checks ensure the quality of analytical results *immediately before* or *during* sample analysis.

ANALYTICAL INSTRUMENT QUALIFICATION PROCESS

The following sections address in detail the AIQ process. The other three components of building quality into analytical-data—analytical method validation, system suitability tests, and quality control ~~checks~~ check samples—are not within the scope of this chapter.

Qualification Phases

Instrument qualification is not a single continuous process, but instead results from several discrete activities. For convenience, these activities can be grouped into four phases: design qualification (DQ), installation qualification (IQ), operational qualification (OQ), and performance qualification (PQ).

~~Some of these qualification terms have their roots in manufacturing process validation. Note, however, that adoption of process validation terms does not imply that all process validation activities are necessary for AIQ. Also, some AIQ activities cover more than one qualification phase and could arguably be performed within any of the phases. It is important that the required AIQ activities be performed; however, within which qualification phase an activity is performed or reported is not as important. *Table 1* accommodates these overlapping activities by letting users perform them under one or another phase as necessary. The user should describe where the activity is performed and reported.~~ Some AIQ activities cover more than one qualification phase and could potentially be performed during any of the phases (see *Table 1*). However, in many instances there is need for specific order to the AIQ activities; for example, installation qualification must occur first in order to initiate other qualification activities. The AIQ activities will be defined and documented.

In-Process Revision

Table 1. Timing, Applicability, and Activities for Each Phase of Analytical Instrument Qualification*

Design Qualification	Installation Qualification		Operational Qualification		Performance Qualification
		Timing and applicability			
Prior to purchase of a new ~~type~~ model of instrument	At installation of each instrument (new, old, or existing unqualified)		After installation or major repair of each instrument		Periodically at specified intervals for each instrument
		Activities			
Assurance of ~~vendor's~~ manufacturer's DQ	System description	⇆	Fixed parameters		Preventive maintenance and repairs
Assurance of adequate support availability from manufacturer	Instrument delivery				~~SOPs for~~ Establish practices to address operation, calibration, maintenance, and change control
Instrument's fitness for use in laboratory	Utilities/facility	⇆	Environment		
	Network and data storage	⇆	Secure data storage, backup, and archive		
	Assembly and installation				
	Installation verification	⇆	Instrument function tests	⇆	Performance checks

* Activities under each phase are usually performed as given in the table. However, in some cases, it may be more appropriate to perform or combine a given activity with another phase. Such activities spanning more than one qualification phase are shown as connected by double arrows. If an activity listed under a given phase is performed under another phase, it is not necessary to repeat the activity under the phase where the activity is listed. Performing the activity is far more important than the phase under which the activity is performed.

DESIGN QUALIFICATION

Design qualification (DQ) is the documented collection of activities that define the functional and operational specifications of the instrument, based on the intended purpose. Design qualification (DQ) may not only be performed by the instrument developer or manufacturer ~~Because the instrument design is already in place for commercial off-the-shelf (COTS) systems, users do not need to repeat all aspects of DQ. However, users should ensure that COTS instruments are suitable for their intended applications meet all necessary user requirements and that the manufacturer has adopted a quality system for developing, manufacturing, and testing. Users should also establish that manufacturers and vendors adequately support installation, service, and training. Methods for ascertaining the manufacturer's design qualification and an instrument's suitability for its intended use depend on the nature of the instrument, the complexity of the proposed application, and the extent of the user's previous interaction with the manufacturer. Vendor audits or required vendor supplied documentation may satisfy part of the DQ requirements. The required scope~~

~~and comprehensiveness of the audits and documentation vary with users' familiarity with the instrument and their previous interactions with the vendor should be based on the risk the instrument will impose on operations.~~

~~Informal processes also form an important part of DQ. Informal personal communications and networking with peers at technical or user group meetings significantly inform users about the suitability of instrument design for various applications and the quality of vendor support services. Informal site visits to other users' and vendors' facilities to obtain data on representative samples that used the specified instrument are another good source of information about suitability for intended use. In many instances an assessment of the quality of vendor support, gleaned from informal discussions with peer users, significantly influences instrument selection~~ but also may be performed by the user. The manufacturer is responsible for robust design and maintaining information describing how the analytical instrument is manufactured (design specifications, functional requirements, etc.) and tested before shipment to users. The user should ensure that commercial off-the-shelf (COTS) instruments are suitable for their intended application and that the manufacturer has adopted a quality system that provides for reliable equipment. Users should also determine the manufacturer's capability for support installation, services, and training. This determination might be aided by the user's previous interaction with the manufacturer.

INSTALLATION QUALIFICATION

~~Installation qualification (IQ) is the documented collection of activities necessary for installing an instrument in the user's environment.~~ Installation qualification (IQ) is the documented collection of activities necessary to establish that an instrument is delivered as designed and specified, and is properly installed in the selected environment, and that this environment is suitable for the ~~intended purpose~~ instrument. IQ applies to an instrument that is new or was pre-owned, or to any instrument that exists on site but has not been previously qualified. Relevant parts of IQ would also apply to a qualified instrument that has been ~~packed and~~ transported to another location or is being reinstalled for other reasons, such as prolonged storage. The activities and documentation typically associated with IQ are as follows.

System Description—Provide a description of the instrument or the collection of instrument components, including its manufacturer, model, serial number, software version, and location. Use drawings and flow charts where appropriate.

Instrument Delivery—Ensure that the instrument, software, manuals, supplies, and any other accessories arrive as specified with the instrument as the purchase order specifies and that they are undamaged. For a pre-owned or existing instrument, manuals and documentation should be obtained.

Utilities/Facility/Environment—Verify that the installation site satisfactorily meets ~~vendor specified~~ manufacturer-specified environmental requirements. ~~A commonsense judgment for the environment suffices: one need not measure the exact voltage for a standard voltage instrument or the exact humidity reading for an instrument that will operate at ambient conditions.~~

Network and Data Storage—Some analytical systems require users to provide network connections and data storage capabilities at the installation site. When required, connect the instrument to the network, and check its functionality.

Assembly and Installation—Assemble and install the instrument, and perform any preliminary diagnostics and testing. Assembly and installation ~~of complex instruments are best~~ may be done by the manufacturer, vendor, specialized engineers, or qualified in-house personnel. ~~whereas users can assemble and install simple ones. For complex instruments, vendor established~~ Manufacturer-established installation tests and guides provide a valuable baseline reference for determining instrument acceptance. Any abnormal event observed during assembly and installation merits documenting. ~~If the pre-owned, unqualified existing instrument or transported instrument requires assembly and installation, perform the tasks as~~

In-Process Revision

~~specified above, then perform the installation verification procedure, described below.~~ Installation packages purchased from the manufacturer or the vendor may, however, need to be supplemented with user-specific criteria.

Installation Verification—Perform the initial diagnostics and testing of the instrument after installation. ~~On obtaining acceptable results, the user and, when present, the installing engineer should confirm that the installation was successful before proceeding with the next qualification phase.~~ Before proceeding to the next qualification phase, confirm that the IQ has been successfully completed.

OPERATIONAL QUALIFICATION

After a successful IQ, the instrument is ready for OQ testing. Operational qualification (OQ) is the documented collection of activities necessary to demonstrate that an instrument will function according to its operational specification in the selected environment. The OQ phase may consist of these test parameters.

Fixed Parameters—These tests measure the instrument's nonchanging parameters such as length, height, weight, voltage inputs, acceptable pressures, and loads. If the ~~vendor supplied~~ manufacturer-supplied specifications for these parameters satisfy the user, the test requirements may be waived. However, if the user wants to confirm the parameters, testing can be performed at the user's site. Fixed parameters do not change over the life of the instrument, and therefore never need redetermination. [NOTE—These tests could also be performed during the IQ phase (see *Table 1*); if so, fixed parameters need not be redetermined as part of OQ testing.]

Secure Data Storage, Backup, and Archiving—When ~~required~~ applicable, test secure data handling such as storage, backup, and archiving at the user's site according to written procedures.

Instrument Function Tests—~~Important instrument~~ Instrument functions should be tested to verify that the instrument operates as intended by the manufacturer. ~~and required by the user. The user should select~~ The user may select additional ~~important~~ instrument parameters for testing according to the instrument's intended use. ~~Vendor supplied~~ Manufacturer-supplied information is useful in identifying specifications for these parameters. Tests should be designed to evaluate the identified parameters. Users, or their qualified designees, should perform these tests to verify that the instrument meets ~~vendor~~ manufacturer ~~and user specifications~~ specifications in the user's environment.

The extent of OQ testing that an instrument undergoes depends on its intended applications. Therefore, no specific OQ tests for any instrument or application are offered in this chapter. ~~Nevertheless, as a guide to the types of tests possible during OQ, consider the following, which apply to an HPLC unit:~~

- ~~pump flow rate~~
- ~~gradient linearity~~
- ~~detector wavelength accuracy~~
- ~~detector linearity~~
- ~~column oven temperature~~
- ~~injector precision and accuracy~~
- ~~peak retention time precision~~

Routine analytical tests do not constitute OQ testing. OQ tests are specifically designed to verify the instrument's operation according to specifications in the user's environment, and repeating the testing at regular intervals may not be required. However, when the instrument undergoes major repairs or modifications, relevant OQ and/or PQ tests should be repeated to verify whether the instrument continues to operate satisfactorily. ~~Relevant OQ tests should also be repeated for an instrument that has been transported to another location, although a move within the laboratory, or from one room to another, that does not disturb instrument operation may not require requalification.~~ If an instrument is moved to another location an assessment should be made of what if any OQ test should be repeated.

OQ tests can be modular or holistic. Modular testing of individual components of a system may facilitate interchanging of such components without requalification. ~~and should be performed whenever possible.~~ Holistic tests, which involve the entire system, are also acceptable. ~~in lieu of modular testing. Having successfully completed OQ testing, the instrument is qualified for use in regulated samples analysis.~~

Operational Verification—Before proceeding to the next qualification phase, confirm that OQ has been successfully completed.

PERFORMANCE QUALIFICATION

Performance qualification (PQ) is the documented collection of activities necessary to demonstrate that an instrument consistently performs according to the specifications defined by the user, and is appropriate for the intended use. After IQ and OQ have been performed, the instrument's continued suitability for its intended use is demonstrated through performance qualification. The PQ phase may include the following parameters.

Performance Checks—Set up a test or series of tests to verify the acceptable performance of the instrument for its intended use. PQ tests are usually based on the instrument's typical on-site applications ~~Some~~ and may consist of analyzing known components or standards. The tests should be based on good science and reflect the general intended use of the instrument. ~~These~~ Some system suitability tests or quality control checks that are performed concurrently with the test samples can be used to demonstrate that the instrument is performing suitably. PQ tests may resemble those performed during OQ, but the specifications for their results can be set differently if required. ~~PQ tests should be performed routinely on a working instrument, not only on a new instrument at installation. Therefore, PQ specifications can be slightly less rigorous than OQ specifications.~~ Nevertheless, user specifications for PQ tests should ~~evince~~ demonstrate trouble-free instrument operation for the intended applications. ~~PQ tests should be performed independently of the routine analytical testing performed on the instrument.~~ As is the case with OQ testing, PQ tests can be modular or holistic. However, because many modules within a system interact, holistic tests generally prove to be more effective because they evaluate the entire system, not simply the system's individual modules.

Testing frequency depends on the ruggedness of the instrument and the criticality of the tests performed. Testing may be unscheduled—for example, each time the instrument is used. It may also be scheduled for regular intervals, such as weekly or monthly. Experience with the instrument can influence this decision. ~~Generally, the same PQ tests are repeated~~ It may be useful to repeat the same PQ tests each time the instrument is used so that a history of the instrument's performance can be compiled. Alternatively, the instrument may be incorporated into an integrated support system to assure that it remains continually qualified. Some system suitability tests or quality control checks that are performed concurrently with the test samples also imply that the instrument is performing suitably. ~~However, although system suitability tests can supplement periodic PQ tests, they cannot replace them.~~

Preventive Maintenance and Repairs—When an instrument fails to meet PQ test specifications, it requires maintenance or repair. A periodic preventive maintenance may also be recommended for many instruments. The relevant PQ test(s) should be repeated after the needed maintenance or repair to ensure that the instrument remains qualified.

~~**Standard Operating Procedure[s]**~~ **Practices for Operation, Calibration, ~~and~~ Maintenance, and Change Control**—Establish ~~standard operating procedures~~ practices to maintain and calibrate the instrument. ~~Use a logbook, binder, or electronic record to document each~~ Each maintenance and calibration activity should be documented.

In-Process Revision

ROLES AND RESPONSIBILITIES

Users

Users are ultimately responsible for instrument operations and data quality. The user's group encompasses analysts, their supervisors, and organization management. Users should be adequately trained in the instrument's use, and their training records should be maintained as required by the regulations.

Users should also be responsible for qualifying their instruments because their training and expertise in the use of instruments make them the best-qualified group to design the instrument test(s) and specification(s) necessary for successful AIQ. Consultants, equipment manufacturer or vendors, validation specialists, and quality assurance (QA) personnel can advise and assist as needed, but the final responsibility for qualifying instruments lies with the users. The users must also maintain the instrument in a qualified state by routinely performing PQ.

Quality ~~Assurance~~ Unit

The ~~QA role~~ role of the Quality Unit in AIQ remains the same as for any other regulated ~~study~~ activity. ~~QA~~ Quality personnel should understand the instrument qualification process, and they should learn about the instrument's application by working with the users. Finally, they should review the AIQ process to determine whether it meets regulatory requirements and ~~they should make certain that the users attest to the scientific validity of the process~~ the intended use of the equipment supported by scientifically valid and documented data.

Manufacturers

Manufacturers and developers are responsible for DQ when designing the instrument. They are also responsible for validation of relevant processes used in manufacturing and assembly of the hardware and for software associated with the instrument (see also *Software Validation*). Manufacturers and developers are also responsible for writing stand-alone software for analytical work in a documented quality manner and for the validation of this software. Manufacturers should test the assembled instruments before shipping them to users.

Manufacturers and vendors should make available to users a summary of their validation efforts and the results of final instrument and software tests, and they should provide the critical functional test scripts that can be used to qualify the instrument and software at the user site. For instance, manufacturers and vendors can provide a large database and scripts for functional testing of the network's bandwidth for laboratory information management system (LIMS) software.

Finally, it is desirable that manufacturers and vendors should notify all known users about hardware or software defects discovered after a product's release; offer user training, service, repair, and installation support; and invite user audits as necessary.

SOFTWARE VALIDATION

Software used for analytical work can be classified into three categories: firmware; instrument control, data acquisition, and processing software; and stand-alone software. Although software validation is not the primary focus of this chapter, the following sections describe in which cases this activity is under the scope of the analytical instrument qualification.

Firmware

Computerized analytical instruments contain integrated chips with low-level software (firmware). Such instruments will not function without properly operating firmware, and users generally cannot alter firmware design or function. Firmware is therefore considered a component of the instrument itself. Indeed, the qualification of hardware is not possible without operating it via its firmware. Thus, when the hardware (that is, the analytical instrument) is qualified at the user's site,

the integrated firmware is also essentially qualified. No separate on-site qualification of the firmware is needed. Any changes made to firmware versions should be tracked through change control of the instrument (see *Change Control,* below).

Instrument Control, Data Acquisition, and Processing Software

Software for instrument control, data acquisition, and processing for many of today's computerized instruments is loaded on a computer connected to the instrument. Operation of the instrument is then controlled via the software, leaving fewer operating controls on the instrument. Also, the software is needed for data acquisition and postacquisition calculations. Thus, both hardware and software, their functions inextricably intertwined, are critical to providing analytical results.

The manufacturer should perform DQ, validate this software, and provide users with a summary of validation. At the user site, holistic qualification, which involves the entire instrument and software system, is more efficient than modular validation of the software alone. Thus, the user qualifies the instrument control, data acquisition, and processing software by qualifying the instrument according to the AIQ process.

Stand-Alone Software

An authoritative guide for validating stand-alone software, such as LIMS, is available.[1] The validation process is administered by the software developer, who also specifies the development model appropriate for the software. Validation takes place in a series of activities planned and executed through various stages of the development cycle.

The software validation guide cited in the previous paragraphs indicates that user-site testing is an essential part of the software development cycle. Note, however, that user-site testing, though essential, is only part of the validation process for stand-alone software and does not constitute complete validation. Refer to the software validation guide for activities that must be performed at the user site for testing stand-alone software used in analytical work.

CHANGE CONTROL

Changes to ~~the instrument and~~ instruments, including software, become inevitable as manufacturers add new features and correct known defects. However, implementing all such changes may not always benefit users. Users should therefore adopt changes they deem useful or necessary and should also assess the effects of changes to determine what, if any, requalification is required. The change control process enables them to do this.

Change control follows the DQ/IQ/OQ/PQ classification process. For DQ, evaluate the changed parameters, and determine whether need for the change warrants implementing it. If implementation of the change is needed, install the changes to the system during IQ. Evaluate which of the existing OQ and PQ tests need revision, deletion, or addition as a result of the installed change. Where the change calls for additions, deletions, or revisions to the OQ or PQ tests, follow the procedure outlined below.

Operational Qualification—Revise OQ tests as necessitated by the change. Perform ~~the revised OQ testing. If the OQ did not need revision, repeat only~~ the relevant tests affected by the change. This ensures the instrument's effective operation after the change is installed.

Performance Qualification—Revise PQ tests as necessitated by the change. Perform the PQ testing after installation of the change if similar testing is not already performed during OQ. In the future, perform the revised PQ testing.

[1] *General Principles of Software Validation: Final Guidance for Industry and FDA Staff,* U.S. Department of Health and Human Services, Food and Drug Administration, Rockville, MD, January 11, 2002. http://www.fda.gov/cdrh/comp/guidance/938.html (accessed September 2004).

For changes to firmware and to software for instrument control, data acquisition, and processing, change control is performed through DQ/IQ/OQ/PQ of the affected instrument. Change control for stand-alone software requires user-site testing of changed functionality.

AIQ DOCUMENTATION

~~Two types of documents result from AIQ: static and dynamic.~~

~~Static Documents~~

~~Static documents are obtained during the DQ, IQ, and OQ phases and should be kept in a "Qualification" binder retained in an accessible manner.~~ Documents obtained during instrument qualification should be retained in an accessible manner. Where multiple instruments of one kind exist, documents common to all instruments ~~should go into one binder or section,~~ and documents specific to an instrument ~~should go into that instrument's binder or section~~ may be stored separately. During change control, additional documents ~~can be placed with~~ may supplement ~~the static ones~~ those obtained during the qualification process, and both sets of documents should ~~be removed~~ be retained. When necessary, such documents may be archived.

~~Dynamic Documents~~

~~Dynamic documents are generated during the OQ and PQ phases when the instrument is maintained or tested for performance. Arranged in a binder or logbook, they provide a running record for the instruments and should be kept with them. These documents ay should also be archived as necessary.~~ These documents provide a running record for the instruments and should be stored and maintained in a suitable manner which allows for appropriate protection and access.

INSTRUMENT CATEGORIES

Modern laboratories typically include a suite of ~~tools~~ instruments and equipment varying from simple nitrogen evaporators to complex automated instruments. Therefore, applying a single set of principles to qualifying such dissimilar instruments would be scientifically inappropriate. Users are most capable of establishing the level of qualification needed for an instrument. On the basis of the level needed, it is convenient to categorize instruments into three groups: A, B, and C, as defined below. Examples of instruments in each group are provided. Note that the list of instruments provided here is for illustration only and is not meant to be exhaustive. It does not provide the exact category for an instrument at a user site. That category should be determined by users for their specific instruments or applications.

The exact grouping of an instrument must be determined by users for their specific requirements. Depending on individual user requirements, the same instrument may appropriately fall into one group for one user and another group for another user. Therefore, a careful selection of groups by users is highly encouraged.

Group A

Conformance of Group A ~~instruments to user requirements is determined by visual observation. Since requirements are often straightforward, documentation of requirements may not be required. No independent qualification process is required.~~ equipment may not require formal qualification. ~~Examples of instruments in this group are nitrogen evaporators, magnetic stirrers, vortex mixers, mortar and pestle sets, water baths, and glass pipets.~~ Examples of equipment in this group are nitrogen evaporators, magnetic stirrers, vortex mixers, and pipets.

Group B

Conformance of Group B instruments to user requirements is determined according to an instrument's standard operating procedures. ~~Conformity assessments are generally unambiguous.~~ Installation of Group B instruments is relatively simple, and ~~causes of their failure are readily discernible by simple observation~~ conformity assessments are generally unambiguous. Examples of instruments in this group are balances, incubators, ~~IR spectrometers,~~ melting point apparatus, muffle furnaces, light microscopes, pH meters, variable pipets, refractometers, refrigerator-freezers, thermocouples, thermometers, titrators, ovens, water baths, and viscosimeters.

Group C

Conformance of Group C instruments to user requirements is complex and highly method-specific; conformity bounds are determined by the application. Installing these instruments can be a complicated undertaking and may require the assistance of specialists. A full qualification process, as outlined in this document, should apply to these instruments. Examples of instruments in this group include the following:

- atomic absorption spectrometers
- differential scanning calorimeters
- dissolution apparatus
- electron microscopes
- flame absorption spectrometers
- high-pressure liquid chromatographs
- mass spectrometers
- microplate readers
- thermal gravimetric analyzers
- X-ray fluorescence spectrometers
- X-ray powder diffractometers
- densitometers
- diode-array detectors
- elemental analyzers
- gas chromatographs
- IR spectrometers
- near IR spectrometers
- Raman spectrometers
- UV/Vis spectrometers
- inductively coupled argon–plasma emission spectrometers

~~Again, it must be emphasized that the placement of these instruments in the given three groups is for illustrative purposes only. The exact grouping of an instrument must be determined by users for their specific requirements. Depending on individual user requirements, the same instrument may appropriately fall into one group for one user and another group for another user. Therefore, a careful selection of groups by users is highly encouraged.~~

~~CONCLUSION~~

~~The purpose of the use of analytical instruments is to generate reliable data. Analytical instrument qualification helps fulfill this purpose. No authoritative guide existed that considered the risk of instrument nonperformance and combined that risk with users' scientific knowledge and ability to use the instrument to deliver reliable and consistent data. In the absence of such a guide, the qualification of analytical instruments became a subjective and often fruitless document-generating exercise.~~

~~This chapter is based on the outcome of a user workshop-conference on the subject and provides an efficient science- and risk-based process for AIQ. This approach emphasizes AIQ's place in the overall process of obtaining reliable data from analytical instruments. The process provided in this chapter focuses on scientific value rather than on producing documents. Implementing such a process should increase efficiency and remove ambiguous or varying interpretations by different groups.~~▲*USP31*

In-Process Revision

DIETARY SUPPLEMENTS

General Chapters—General Information

BRIEFING

⟨2040⟩ Disintegration and Dissolution of Dietary Supplements, *USP 29* page 3089 and page 184 of *PF* 32(1) [Jan.–Feb. 2006]. On the basis of comments received, it is proposed to revise this general information chapter to include dietary supplements other than vitamin–mineral dosage forms and botanicals, which currently are not covered. A brief introduction is provided to explain the purpose of the chapter and define categories of dietary supplements. In the *Disintegration* section, *Apparatus B* specifications are revised, a general procedure for disintegration is provided, and testing times are made consistent for the same dietary supplement dosage forms, regardless of their categories. Sections relating to capsules are now referred to as *Hard Shell Capsules* or *Soft Shell Capsules,* encompassing capsules made from gelatin and nongelatin materials. In the *Dissolution* section, the provision of general chapter *Disintegration* ⟨701⟩ allowing the use of enzymes for hard or soft gelatin capsules and gelatin-coated tablets is adopted. *Notes* are added to explain dissolution conditions for articles containing folic acid and for index vitamins and index minerals. Procedures for dissolution testing of dietary supplements other than vitamin–mineral and botanical dosage forms are now provided. The DS-BA Expert Committee decided to present this proposal in *In-Process Revision* and encourages interested parties to submit their comments and pertinent data.

(DS-BA: D. Cairatti; G. Giancaspro) RTS—C47711

Add the following:

▲INTRODUCTION

This general chapter is provided to determine compliance with the disintegration and dissolution standards for dietary supplements where stated in the individual monographs.

For the purposes of this chapter, dietary supplement dosage forms have been divided into three categories: *Vitamin–Mineral, Botanical,* and *Dietary Supplements Other Than Vitamin–Mineral and Botanical.Vitamin–Mineral Dosage Forms* include articles prepared with vitamins, minerals, or combinations of these dietary ingredients (e.g., USP dietary supplements *Classes I* to *VI* described below); *Botanical Dosage Forms* comprise formulations containing ingredients of botanical origin, including plant materials and extracts; and *Dietary Supplements Other Than Vitamin–Mineral and Botanical Dosage Forms* encompass dietary supplements formulated with lawfully recognized dietary ingredients which are different from those pertaining to the two foregoing categories (e.g., amino acids, chondroitin, and glucosamine.)

Where a dietary supplement represents a combination of the categories mentioned above, and there is a difference between the requirements for the individual categories, the more stringent requirement applies.

Dissolution testing as described in this chapter is a quality-control tool to enable the performance of dietary supplements to be routinely assessed.▲*USP31*

Change to read:

DISINTEGRATION

~~This test is provided to determine compliance with the limits on *Disintegration* stated below or in the individual class monographs on dietary supplements, including botanical dosage forms. This test applies to uncoated and plain coated tablets and to hard gelatin and soft gelatin capsules. It does not apply to tablets or capsules designed to liberate vitamin or mineral content over an extended period or where the label states that the dosage form is to be chewed. Determine the type of units under test from the labeling and from observation, and apply the appropriate procedure to 6 or more dosage units.~~

~~For the purposes of this test, disintegration does not imply complete solution of the unit or even of its active constituent. Complete disintegration is defined as that state in which any residue of the unit, except fragments of insoluble coating or capsule shell remaining on the screen of the test apparatus, is a soft mass having no palpably firm core.~~

▲This test is provided to determine whether dietary supplement tablets or capsules disintegrate within the prescribed time when placed in a liquid medium at the experimental conditions presented below. Compliance with the limits on *Disintegration* stated in the individual monographs for dietary supplements is required except where the label states that the products are intended for use as troches, are to be chewed, or are designed as extended-release dosage forms. Dietary

In-Process Revision

supplements claiming to be extended-release dosage forms must comply with standards other than disintegration to verify that the release of the dietary ingredients from the dosage form is for a defined period of time. Dietary supplements claiming to be extended-release dosage forms shall not be labeled as in compliance with USP unless a USP monograph exists for such product. Determine the type of units under test from the labeling and from observation, and apply the appropriate procedure to 6 or more units.

For purposes of this test, disintegration does not imply complete solution of the unit or even of its active constituent. Complete disintegration is defined as that state in which any residue of the unit, except fragments of insoluble coating or capsule shell, remaining on the screen of the test apparatus or adhering to the lower surface of the disk, if used, is a soft mass having no palpably firm core.▲*USP31*

Apparatus

Apparatus A—Use the *Apparatus* described under *Disintegration* ⟨701⟩ for tablets or capsules that are not greater than 18-mm long. For larger tablets or capsules, use *Apparatus B.*

Apparatus B—The apparatus[1] consists of a basket-rack assembly, a 1000-mL, low-form beaker for the immersion fluid, a thermostatic arrangement for heating the fluid between 35° and 39°, and a device for raising and lowering the basket in the immersion fluid at a constant frequency rate between 29 and 32 cycles per minute through a distance of not less than ~~5.3 cm~~

▲53 mm▲*USP31*
and not more than ~~5.7 cm~~

▲57 mm.▲*USP31*
The volume of the fluid in the vessel is such that at the highest point of the upward stroke the wire mesh remains at least ~~2.5 cm~~

▲15 mm▲*USP31*
below the surface of the fluid and descends to not less than ~~2.5 cm~~

▲25 mm▲*USP31*
from the bottom of the vessel on the downward stroke.

▲At no time should the top of the basket-rack assembly become submerged.▲*USP31*
The time required for the upward stroke is equal to the time required for the downward stroke, and the change in stroke direction is a smooth transition rather than an abrupt reversal of motion. The basket-rack assembly moves vertically along its axis. There is no appreciable horizontal motion or movement of the axis from the vertical.

Basket-Rack Assembly—The basket-rack assembly consists of three open-ended transparent tubes, each ~~7.95 ± 0.05 cm~~

▲77.5 ± 2.5 mm▲*USP31*
long and having an inside diameter of ~~approximately 33.3mm~~

▲32.0 to 34.6 mm▲*USP31*
and a wall ~~approximately 2.4 mm~~

▲2.0 to 3.0 mm▲*USP31*
thick; the tubes are held in a vertical position by two plastic plates, each about ~~9.7 cm~~

▲97 mm▲*USP31*
in diameter and ~~9.5 mm~~

▲7.5 to 10.5 mm▲*USP31*
in thickness, with three holes, each about ~~39 mm~~

▲33 to 34 mm▲*USP31*
in diameter, equidistant from the center of the plate and equally spaced from one another. Attached to the under surface of the lower plate is 10-mesh No. 23 (0.025-inch) W. and M. gauge woven stainless-steel wire cloth having a plain square weave. The parts of the apparatus are assembled and rigidly held by means of three bolts passing through the two plastic plates. A suitable means is provided to suspend the basket-rack assembly from the raising and lowering device using a point on its axis.

The design of the basket-rack assembly may be varied somewhat provided the specifications for the glass tubes and the screen mesh size are maintained.

Disks—Each tube is provided with a perforated cylindrical disk 15.3- ± 0.15-mm thick and 31.4 ± 0.13 mm in diameter. The disk is made of a suitable, transparent plastic material having a specific gravity of between 1.18 and 1.20. Seven ~~3.2 mm~~

▲3.15- ± 0.1-mm▲*USP31*
holes extend between the ends of the cylinder, one of the holes being through the cylinder axis and the others parallel with it equally spaced on a ~~6 mm~~

▲4.2- ± 0.1-mm▲*USP31*
radius from it. All surfaces of the disk are smooth.

▲[2]▲*USP31*

~~Procedure~~

~~VITAMIN–MINERAL DOSAGE FORMS~~

~~**Uncoated Tablets and Film-Coated Tablets**—Place 1 tablet in each of the tubes of the basket, add a disk to each tube, and operate the apparatus, using water maintained at 37 ± 2° as the immersion fluid. At the end of 30 minutes, lift the basket from the fluid, and observe the tablets: all of the tablets disintegrate completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.~~

~~**Plain-Coated Tablets (Other Than Film-Coated Tablets)**—Place 1 tablet in each of the tubes of the basket and, if the tablet has a soluble external coating, immerse the basket in water at room temperature for 5 minutes. Then add a disk to each tube, and operate the apparatus, using water maintained at 37 ± 2° as the immersion fluid. After 45 minutes of operation in water, lift the basket from the fluid, and observe the tablets: all of the tablets have disintegrated completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.~~

~~**Hard Gelatin Capsules**—Apply the test for *Uncoated Tablets,* using 0.05 M acetate buffer, prepared by mixing 2.99 g of sodium acetate trihydrate and 1.66 mL of glacial acetic acid with water to obtain~~

[1] An apparatus and disks meeting these specifications are available from ~~Van-Kel Technology Group~~ ▲Varian Inc.,▲*USP31* 13000 Weston Parkway, Cary, NC 27513, or from laboratory supply houses.

[2] The use of automatic detection employing modified disks is permitted where the use of disks is specified or allowed. Such disks must comply with the requirements for density and dimensions given in this chapter.

In-Process Revision

~~1000 mL of solution having a pH of 4.50 ± 0.05, maintained at 37 ± 2° as the immersion fluid. At the end of 45 minutes, lift the basket from the fluid, and observe the capsules: all of the capsules disintegrate except for fragments from the capsule shell. If 1 or 2 capsules fail to disintegrate completely, repeat the test on 12 additional capsules: not fewer than 16 of the total of 18 capsules tested disintegrate completely.~~

~~**Soft Gelatin Capsules**—Proceed as directed under *Hard Gelatin Capsules*.~~

~~BOTANICAL DOSAGE FORMS~~

~~**Uncoated Tablets and Film-Coated Tablets**—[NOTE—Omit the use of disks unless otherwise specified in the individual monograph.] Place 1 tablet in each of the tubes of the basket, and operate the apparatus, using water maintained at 37 ± 2° as the immersion fluid. At the end of 20 minutes, lift the basket from the fluid, and observe the tablets: all of the tablets disintegrate completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.~~

~~**Plain-Coated Tablets (other than Film-Coated Tablets)**—[NOTE—Omit the use of disks, unless otherwise specified in the individual monograph.] Place 1 tablet in each of the tubes of the basket and, if the tablet has a soluble external coating, immerse the basket in water at room temperature for 5 minutes. Operate the apparatus using water maintained at 37 ± 2° as the immersion fluid. After 20 minutes of operation in water, lift the basket from the fluid, and observe the tablets: all of the tablets have disintegrated completely. If 1 or 2 of the tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.~~

~~**Delayed-Release (Enteric-Coated) Tablets**—Place 1 tablet in each of the six tubes of the basket, and if the tablet has a soluble external coating, immerse the basket in water at room temperature for 5 minutes. Then operate the apparatus using simulated gastric fluid TS maintained at 37 ± 2° as the immersion fluid. After 1 hour of operation in simulated gastric fluid TS, lift the basket from the fluid, and observe the tablets: the tablets show no evidence of disintegration, cracking, or softening. Operate the apparatus, using simulated intestinal fluid TS, maintained at 37 ± 2° as the immersion fluid, for the time specified in the monograph. Lift the basket from the fluid, and observe the tablets: all of the tablets disintegrate completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.~~

~~**Hard Gelatin Capsules**—Apply the test for *Uncoated Tablets*, using 0.05 M acetate buffer, prepared by mixing 2.99 g of sodium acetate trihydrate and 1.66 mL of glacial acetic acid with water to obtain 1000 mL of solution having a pH of 4.50 ± 0.05, maintained at 37 ± 2° as the immersion fluid. At the end of 20 minutes, lift the basket from the fluid, and observe the capsules: all of the capsules disintegrate except for fragments from the capsule shell. If 1 or 2 capsules fail to disintegrate completely, repeat the test on 12 additional capsules: not fewer than 16 of the total of 18 capsules tested disintegrate completely.~~

~~**Soft Gelatin Capsules**—Proceed as directed under *Hard Gelatin Capsules*.~~

~~★*Rupture Test for Soft Gelatin Capsules* ▲USP30~~

▲Procedure

Uncoated Tablets—Place 1 tablet in each of the tubes of the basket and, if prescribed, add a disk to each tube. Operate the apparatus, using water or the specified medium as the immersion fluid, maintained at 37 ± 2°. At the end of 30 minutes, lift the basket from the fluid, and observe the tablets: all of the tablets disintegrate completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets. The requirement is met if not fewer than 16 of the total of 18 tablets tested disintegrate completely.

Plain Coated Tablets—Place 1 tablet in each of the tubes of the basket and, if the tablet has a soluble external sugar coating, immerse the basket in water at room temperature for 5 minutes. Then, if prescribed, add a disk to each tube, and operate the apparatus, using water or the specified medium as the immersion fluid, maintained at 37 ± 2°. At the end of 30 minutes, lift the basket from the fluid, and observe the tablets: all of the tablets disintegrate completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets. The requirement is met if not fewer than 16 of the total of 18 tablets tested disintegrate completely.

Delayed-Release (Enteric-Coated) Tablets—Place 1 tablet in each of the six tubes of the basket, and if the tablet has a soluble external sugar coating, immerse the basket in water at room temperature for 5 minutes. Then operate the apparatus using simulated gastric fluid TS maintained at 37 ± 2° as the immersion fluid. After 1 hour of operation in simulated gastric fluid TS, lift the basket from the fluid, and observe the tablets: the tablets show no evidence of disintegration, cracking, or softening. Operate the apparatus, using simulated intestinal fluid TS, maintained at 37 ± 2°, as the immersion fluid for the time specified in the monograph. Lift the basket from the fluid, and observe the tablets: all of the tablets disintegrate completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.

Buccal Tablets—Apply the test for *Uncoated Tablets*. After 4 hours, lift the basket from the fluid, and observe the tablets: all of the tablets disintegrate completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.

Sublingual Tablets—Apply the test for *Uncoated Tablets*. At the end of the time limit specified in the individual monograph, all of the tablets disintegrate completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.

Hard Shell Capsules—Apply the test for *Uncoated Tablets,* using as the immersion fluid, maintained at 37 ± 2°, a 0.05 M acetate buffer prepared by mixing 2.99 g of sodium acetate trihydrate and 1.66 mL of glacial acetic acid with water to obtain a 1000-mL solution having a pH of 4.50 ± 0.05. Attach a removable wire cloth, as described under *Basket-Rack Assembly,* to the surface of the upper plate of the basket-rack assembly. At the end of 30 minutes, lift the basket from the fluid, and observe the capsules: all of the capsules disintegrate except for fragments from the capsule shell. If 1 or 2 capsules fail to disintegrate completely, repeat the test on 12 additional capsules: not fewer than 16 of the total of 18 capsules tested disintegrate completely.

Soft Shell Capsules—Proceed as directed under *Rupture Test for Soft Shell Capsules.*

Use of Disks—

VITAMIN–MINERAL DOSAGE FORMS—Add a disk to each tube unless otherwise specified in the individual monograph.

BOTANICAL DOSAGE FORMS—Omit the use of disks unless otherwise specified in the individual monograph.

DIETARY SUPPLEMENTS OTHER THAN VITAMIN–MINERAL AND BOTANICAL DOSAGE FORMS—Omit the use of disks unless otherwise specified in the individual monograph.

NOTE—The use of disks for enteric-coated tablets is not permitted.▲*USP31*

Change to read:

▲~~RUPTURE TEST FOR SOFT GELATIN CAPSULES~~

▲RUPTURE TEST FOR SOFT SHELL CAPSULES▲*USP31*

Medium: water; 500 mL.

Apparatus—Use *Apparatus 2* as described under *Dissolution* ⟨711⟩, operating at 50 rpm.

Time: 15 minutes.

Procedure—Place 1 capsule in each vessel, and allow the capsule to sink to the bottom of the vessel before starting rotation of the blade. Observe the capsules, and record the time taken for each capsule shell to rupture.

Tolerances—The requirements are met if all of the capsules tested rupture in not more than 15 minutes. If 1 or 2 of the capsules rupture in more than 15 but not more than 30 minutes, repeat the test on 12 additional capsules: not more than 2 of the total of 18 capsules tested rupture in more than 15 but not more than 30 minutes.▲*USP30*

Change to read:

DISSOLUTION

▲This test is provided to determine compliance with the *Dissolution* requirements where stated in the individual monograph for dietary supplements, except where the label states that tablets are to be chewed.

See *Dissolution* ⟨711⟩ for description of apparatus used, *Apparatus Suitability Test,* and other related information. Of the types of apparatus described in ⟨711⟩, use the one specified in the individual monograph.

For hard or soft gelatin capsules and gelatin-coated tablets that do not conform to the dissolution specification, repeat the test as follows. Where water or a medium with a pH of less than 6.8 is specified as the *Medium* in the individual mono-

In-Process Revision

graph, the same *Medium* specified may be used with the addition of purified pepsin that results in an activity of 750,000 Units or less per 1000 mL. For media with a pH of 6.8 or greater, pancreatin can be added to produce not more than 1750 USP Units of protease activity per 1000 mL.

This nonspecific dissolution is intended to be diagnostic of known technological problems that may arise as a result of coatings, lubricants, disintegrants, and other substances inherent in the manufacturing process. For dosage forms containing botanical extracts, this dissolution measurement allows an assessment of the extent of decomposition of the extract to polymeric or other nondissoluble compounds that may have been produced by excessive drying or other manipulations involved in the manufacture of botanical extracts. The operative assumption inherent in this procedure is that if the index or marker compound(s) or the extract is demonstrated to have dissolved within the time frame and under conditions specified, the dosage form does not suffer from any of the above formulation or manufacturing related problems.▲*USP31*

Vitamin–Mineral Dosage Forms

~~This test is provided to determine compliance with the dissolution requirements where stated in the individual class monographs for a tablet or capsule dosage form, except where the label states that the tablets are to be chewed. It does not apply to tablets or capsules designed to release vitamin or mineral content over a delayed or extended period of time. Soft gelatin capsule preparations of dietary supplements meet the requirements for *Disintegration.*~~

All dietary supplements belonging to USP *Classes II* to *VI,* prepared as tablets or capsules, are subject to the dissolution test and criteria described in this chapter for folic acid (if present) and for index vitamins and index minerals. This test is ~~also required if the product labeling includes a health claim concerning~~

▲required because of the importance of▲*USP31*
the relationship between folate deficiency and the risk of neural tube defects. The accompanying table lists the dissolution requirements for the individual USP classes of dietary supplements. *Class I* dietary supplements are combinations of oil-soluble vitamins ~~which are exempt from dissolution requirements;~~

▲for which dissolution standards are not established; ▲*USP31*
hence, dissolution requirements do not apply to the oil-soluble vitamins contained in formulations belonging to *Class IV* or *Class V.*

▲Vitamin–mineral combinations that may not be strictly covered by USP *Classes I* to *VI* are subject to the dissolution test and criteria specified in the individual monographs.▲*USP31*

Dietary Supplements—Vitamin–Mineral Dosage Forms

USP Class	Combination of Vitamins or Minerals Present	Dissolution Requirement
I	Oil-Soluble Vitamins	not applicable
II	Water-Soluble Vitamins	one index vitamin; folic acid (if present)
III	Water-Soluble Vitamins with Minerals	one index vitamin and one index element; folic acid (if present)
IV	Oil- and Water-Soluble Vitamins	one index water-soluble vitamin; folic acid (if present)
V	Oil- and Water-Soluble Vitamins with Minerals	one index water-soluble vitamin and one index element; folic acid (if present)
VI	Minerals	one index element

Unless otherwise stated in the individual monograph, test 6 dosage units for dissolution as directed under *Dissolution* ⟨711⟩.

DISSOLUTION CONDITIONS FOR FOLIC ACID

NOTE—Perform this test under ~~subdued light~~

▲light conditions that minimize photo degradation.▲*USP31*

Medium: water; 900 mL. If the units tested do not meet the requirements for dissolution in water, test 6 additional dosage units for dissolution in a medium of 900 mL of 0.05 M pH 6.0 citrate buffer solution, prepared by mixing 9.5 mL of 0.1 M citric acid monohydrate and 40.5 mL of 0.1 M sodium citrate dihydrate in a 100-mL volumetric flask, diluting with water to volume, mixing, and adjusting to a pH of 6.0 by using either 0.1 M hydrochloric acid or 0.1 M sodium hydroxide solution.
Apparatus 1: 100 rpm, for capsules.
Apparatus 2: 75 rpm, for tablets.
Time: 1 hour.

▲NOTE—Compliance with the dissolution requirements for folic acid does not exempt the product from dissolution testing of the pertinent index vitamin or the corresponding index mineral.▲*USP31*

DISSOLUTION CONDITIONS FOR INDEX VITAMINS AND INDEX MINERALS

Medium: 0.1 N hydrochloric acid; 900 mL.
Apparatus 1: 100 rpm, for capsules.
Apparatus 2: 75 rpm, for tablets.
Time: 1 hour.
For formulations containing 25 mg or more of the index vitamin, riboflavin, use the following conditions:
Medium: 0.1 N hydrochloric acid; 1800 mL.
Apparatus 1: 100 rpm, for capsules.
Apparatus 2: 75 rpm, for tablets.
Time: 1 hour.

In-Process Revision

▲NOTE—Compliance with dissolution requirements for the pertinent index vitamin or index mineral does not exempt the product from dissolution testing of folic acid, if present.▲*USP31*

SELECTION OF INDEX VITAMINS AND INDEX ELEMENTS

Compliance with the dissolution requirements for dietary supplements representing combinations of water-soluble vitamins (*Water-Soluble Vitamins Capsules* and *Water-Soluble Vitamins Tablets*) and combinations of oil- and water-soluble vitamins (*Oil- and Water-Soluble Vitamins Capsules* and *Oil- and Water-Soluble Vitamins Tablets*) is determined by measuring the dissolution of a single index vitamin from the water-soluble vitamins present. Riboflavin is the index vitamin when present in the formulation. For formulations that do not contain riboflavin, pyridoxine is the index vitamin. If neither riboflavin nor pyridoxine is present in the formulation, the index vitamin is niacinamide (or niacin), and in the absence of niacinamide (or niacin), the index vitamin is thiamine. If none of the above four water-soluble vitamins is present in the formulation, the index vitamin is ascorbic acid.

Compliance with the dissolution requirements for dietary supplements representing combinations of minerals (*Minerals Capsules* and *Minerals Tablets*) is determined by measuring the dissolution of only one index element. Iron is the index element when present in the formulation. For formulations that do not contain iron, the index element is calcium. If neither iron nor calcium is present, the index element is zinc, and in the absence of all three of these elements, magnesium is the index element.

Compliance with dissolution requirements for dietary supplements representing combinations of water-soluble vitamins and minerals (*Water-Soluble Vitamins with Minerals Capsules* and *Water-Soluble Vitamins with Minerals Tablets*) and combinations of oil- and water-soluble vitamins and minerals (*Oil- and Water-Soluble Vitamins with Minerals Capsules* and *Oil- and Water-Soluble Vitamins with Minerals Tablets*) is determined by measuring the dissolution of one index water-soluble vitamin and one index element, designated according to the respective hierarchies described above.

PROCEDURES

In the following procedures, combine equal volumes of the filtered solutions of the 6 individual specimens withdrawn, and determine the amount of folic acid or the index vitamin or element dissolved, based on the average of 6 units tested. Make any necessary modifications including concentration of the analyte in the volume of test solution taken. Use the *Medium* for preparation of the Standard solution and dilution, if necessary, of the test solution.

Folic Acid—Determine the amount of $C_{19}H_{19}N_7O_6$ dissolved by employing the procedure set forth in the *Assay for folic acid* under *Oil- and Water-Soluble Vitamins with Minerals Tablets*, in comparison with a Standard solution having a known concentration of USP Folic Acid RS in the same *Medium*.

Niacin or Niacinamide, Pyridoxine, Riboflavin, and Thiamine—Determine the amount of the designated index vitamin dissolved by employing the procedure set forth in the *Assay for niacin or niacinamide, pyridoxine, riboflavin, and thiamine* under *Water-Soluble Vitamins Tablets.*

Ascorbic Acid—Determine the amount of $C_6H_8O_6$ dissolved by adding 10 mL of 1.0 N sulfuric acid and 3 mL of starch TS to 100.0 mL of test solution, and titrating immediately with 0.01 N iodine VS. Perform a blank determination, and make any necessary correction.

Iron, Calcium, Magnesium, and Zinc—Determine the amount of the designated index element dissolved by employing the procedure set forth in the appropriate *Assay* under *Minerals Capsules*.

TOLERANCES

The requirements are met if not less than 75% of the labeled content of folic acid and not less than 75% of the labeled content of the index vitamin or the index element from the units tested is dissolved in 1 hour.

Botanical Dosage Forms

~~This test is provided to determine compliance with the dissolution requirements where stated in the individual monograph for a tablet or capsule dosage form. See *Dissolution* ⟨711⟩ for description of apparatus used, *Apparatus Suitability Test,* and other related information. Of the types of apparatus described in ⟨711⟩, use the one specified in the individual monograph. Where the label states that an article is enteric-coated, and a dissolution or disintegration test that does not specifically state that it is to be applied to enteric-coated articles is included in the individual monograph, the test for *Delayed-Release Articles* under *Drug Release* ⟨724⟩ is applied, unless otherwise specified in the individual monograph. Compliance with dissolution requirements is determined by testing 6 dosage units individually, or testing 2 or more counted number of dosage units in each vessel, and measuring the dissolution of one or more index/marker compound(s) or the extract specified in the individual monograph. This nonspecific dissolution is intended to be diagnostic of known technological problems that may arise due to coatings, lubricants, disintegrants, and other substances inherent in the manufacturing process. Further, this dissolution measurement allows an assessment of the extent of decomposition of the extract to polymeric or other nondissoluble compounds that may have been produced by excessive drying or other manipulations involved in the manufacture of botanical extracts. The operative assumption inherent in this procedure is that if the index or marker compound(s) or the extract is demonstrated to have dissolved within the time frame and under conditions specified, the dosage form does not suffer from any of the above formulation or manufacturing related problems.~~

▲Compliance with dissolution requirements necessitates the testing of 6 dosage units individually, or testing 2 or more dosage units in each of the 6 vessels of the dissolution apparatus, and measuring the dissolution of one or more index/marker compound(s) or the extract specified in the individual monograph.▲*USP31*

PROCEDURES

Combine equal volumes of the filtered solutions of the 6 or more individual specimens withdrawn, and use the pooled sample as the test solution. Determine the average amount of index or marker compound(s) or the extract dissolved in the pooled sample by the *Procedure* specified in the individual monograph. Make any necessary modifications, including concentration of the analyte in the volume of the test solution taken. Use the *Medium* for preparation of the Standard solution and dilution, if necessary, of the test solution.

In-Process Revision

INTERPRETATION

Pooled Sample—Unless otherwise specified in the individual monograph, the requirements are met if the quantities of the index or marker compound(s) or the extract dissolved from the pooled sample conform to the accompanying acceptance table. The quantity, *Q*, is the amount of dissolved index or marker compound(s) or the extract specified in the individual monograph, expressed as a percentage of the labeled content. The 5%, 15%, and 25% values in the acceptance table are percentages of the labeled content so that these values and *Q* are in the same terms.

Acceptance Table for a Pooled Sample

Stage	Number Tested	Acceptance Criteria
S_1	6	Average amount dissolved is not less than Q + 10%
S_2	6	Average amount dissolved (S_1 + S_2) is equal to or greater than Q + 5%
S_3	12	Average amount dissolved (S_1 + S_2 + S_3) is equal to or greater than Q

▲Dietary Supplements Other Than Vitamin–Mineral and Botanical Dosage Forms

Unless otherwise stated in the individual monographs for dietary supplement dosage forms in this category, compliance requires the testing of 6 individual units, measuring the dissolution of the dietary ingredient as the average of the 6 units tested.

PROCEDURES

Combine equal volumes of the filtered solutions of the 6 specimens withdrawn, and use the pooled sample as the test solution. Determine the average amount of dietary ingredient dissolved in the pooled sample by the *Procedure* specified in the individual monograph. Make any necessary modifications, including concentration of the analyte in the volume of the test solution taken. Use the *Medium* for preparation of the Standard solution and for dilution, if necessary, of the test solution.

TOLERANCES

Because of the diversity of chemical characteristics and solubilities of dietary ingredients pertaining to this category, general tolerances cannot be established. See individual monographs for *Tolerances*.▲*USP31*

Change to read:

Tetrabutylammonium Iodide, $(C_4H_9)_4NI$—**369.37**

■[*311-28-4*]■2S (*USP30*)

—White, shiny, crystalline flakes. Soluble in alcohol and in ether; slightly soluble in water.

~~*Assay*—Dissolve 200 mg, accurately weighed, in 40 mL of boiling water with vigorous stirring, and cool to room temperature. Stir the solution by mechanical means, add 5 mL of 2 N nitric acid, and titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically, using a glass-silver electrode system and adding the titrant in 0.1 mL increments as the endpoint is approached. Perform a complete blank determination, and make any necessary correction. Each mL of 0.1 N silver nitrate is equivalent to 36.94 mg of $(C_4H_9)_4NI$. not less than 99.0% is found.~~

~~*Melting range* ⟨741⟩: between 146° and 147°.~~

▲Use a suitable grade with a content of not less than 99%.▲*USP31*

Test Solutions

BRIEFING

Test Solutions, *USP 29* page 3168, page 3812 of the *Second Supplement,* and page 1538 of *PF* 32(5) [Sept.–Oct.. 2006]. It is proposed to delete one test solution, *Dicyclohexylamine Acetate,* which is not used in any *USP–NF* monograph.

(HDQ: M. Marques) RTS—C48135

Add the following:

■**Acetic Acid, Strong, TS**—Add 300.0 mL of glacial acetic acid, and dilute with water to 1000 mL. This solution contains about 30% (v/v) of CH_3COOH and has a concentration of about 5 N.■2S (*USP30*)

In-Process Revision

Add the following:

■**Ammonium Pyrrolidinedithiocarbamate, Saturated, TS**—Add about 10 g of ammonium pyrrolidinedithiocarbamate to a 1000-mL volumetric flask, and dilute with water to volume.■2S (*USP30*)

Delete the following:

~~★**Dicyclohexylamine Acetate TS**—Dissolve 50 g of dicyclohexylamine in 150 mL of acetone, cool in an ice bath, and add, with stirring, a solution consisting of 18 mL of glacial acetic acid in 150 mL of acetone. Recrystallize the precipitate that forms, by heating the mixture to boiling and allowing it to cool in an ice bath, then collect the crystals on a filtering funnel, wash with a small volume of acetone, and air-dry. Dissolve 300 mg of the dicyclohexylamine acetate so obtained in 200 mL of a mixture of 6 volumes of chloroform and 4 volumes of water saturated ether. Use immediately.★(*USP21*)~~

Volumetric Solutions

BRIEFING

Volumetric Solutions, *USP 29* page 3175, page 3812 of the *Second Supplement,* and page 1292 of *PF* 32(4) [July–Aug. 2006]. For *Mercuric Nitrate, Tenth-Molar (0.1 M),* it is proposed to correct the formula used to calculate molarity. For *Sodium Tetraphenylboron, Fiftieth-Molar (0.02M),* it is proposed to add the formula for calculating molarity.

(HDQ: M. Marques) RTS—C47709; C47698

Add the following:

■**Bismuth Nitrate, 0.01 mol/L**

$Bi(NO_3)_3 \cdot 5H_2O$, **485.07**

1000 mL of this solution contains 4.851 g of bismuth nitrate pentahydrate

Dissolve 4.86 g of bismuth nitrate pentahydrate in 60 mL of dilute nitric acid, add water to make 1000 mL, and standardize the solution as follows.

Accurately measure 25 mL of the prepared bismuth nitrate solution, add 50 mL of water and 1 drop of xylenol orange TS, and titrate the solution with 0.01 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the red color changes to yellow. Calculate the molarity factor.■2S (*USP30*)

Add the following:

■**Magnesium Chloride, 0.01 M**

$MgCl_2 \cdot 6H_2O$, **203.30**

2.0330 g in 1000 mL

Dissolve about 2.04 g of magnesium chloride in 1000 mL of freshly boiled and cooled water, and standardize the solution as follows.

Accurately measure 25 mL of the prepared magnesium chloride solution. Add 50 mL of water, 3 mL of ammonia–ammonium chloride buffer TS and 0.04 g of eriochrome black T–sodium chloride reagent. Titrate with 0.05 M edetate disodium VS until the red-purple color of the solution changes to blue-purple.

$$M = \frac{(\text{mL edetate disodium VS}) \times (\text{M edetate disodium})}{\text{mL magnesium chloride}}$$ ■2S (*USP30*)

Change to read:

Mercuric Nitrate, Tenth-Molar (0.1 M)

$Hg(NO_3)_2$, **324.60**

32.46 g in 1000 mL

Dissolve about 35 g of mercuric nitrate in a mixture of 5 mL of nitric acid and 500 mL of water, and dilute with water to 1000 mL. Standardize the solution as follows.

In-Process Revision

Transfer an accurately measured volume of about 20 mL of the solution to a conical flask, and add 2 mL of nitric acid and 2 mL of ferric ammonium sulfate TS. Cool to below 20°, and titrate with 0.1 N ammonium thiocyanate VS to the first appearance of a permanent brownish color.

~~$$M = \frac{\text{mL } NH_4SCN \times \text{N } NH_4SCN}{\text{mL } Hg(NO_3)_2}$$~~

▲$$M = \frac{\text{mL } NH_4SCN \times \text{N } NH_4SCN}{\text{mL } Hg(NO_3)_2 \times 2}$$ ▲*USP 31*

Change to read:

Potassium Hydroxide, Normal (1 N)

KOH, **56.11**

56.11 g in 1000 mL

Dissolve 68 g of potassium hydroxide in about 950 mL of water. Add a freshly prepared saturated solution of barium hydroxide until no more precipitate forms. Shake the mixture thoroughly, and allow it to stand overnight in a stoppered bottle. Decant the clear liquid, or filter the solution in a tight, polyolefin bottle, and standardize by the procedure set forth for *Sodium Hydroxide, Normal (1 N)*.

~~$$N = \frac{\text{g } KHC_8H_4O_4}{0.20423 \times \text{mL NaOH}}$$~~

■$$N = \frac{\text{g } KHC_8H_4O_4}{0.20423 \times \text{mL KOH}}$$ ■1S (*USP30*)

Change to read:

Sodium Hydroxide, Normal (1 N)

NaOH, **40.00**

40.00 g in 1000 mL

Dissolve 162 g of sodium hydroxide in 150 mL of carbon dioxide-free water, cool the solution to room temperature, and filter through hardened filter paper. Transfer 54.5 mL of the clear filtrate to a tight, polyolefin container, and dilute with carbon dioxide-free water to 1000 mL.

Accurately weigh about 5 g of potassium biphthalate, previously crushed lightly and dried at 120° for 2 hours, and dissolve in 75 mL of carbon dioxide-free water. Add 2 drops of phenolphthalein TS, and titrate with the sodium hydroxide solution to the production of a permanent pink color. Each ~~204.2 mg~~ ■204.23 mg■1S (*USP30*) of potassium biphthalate is equivalent to 1 mL of 1 N sodium hydroxide.

$$N = \frac{\text{g } KHC_8H_4O_4}{0.20423 \times \text{mL NaOH solution}}$$

NOTES—(1) Solutions of alkali hydroxides absorb carbon dioxide when exposed to air. They should be preserved in bottles having well-fitted, suitable stoppers, provided with a tube filled with a mixture of sodium hydroxide and lime (soda-lime tubes) so that air entering the container must pass through this tube, which will absorb the carbon dioxide. (2) Prepare solutions of lower concentration (e.g., 0.1 N, 0.01 N) by quantitatively diluting accurately measured volumes of the 1 N solution with sufficient carbon dioxide-free water to yield the desired concentration.

Restandardize the solution frequently.

Change to read:

Sodium Hydroxide, Alcoholic, Tenth-Normal (0.1 N)

NaOH, **40.00**

To 250 mL of alcohol add 2 mL of a 50% ~~(w/w)~~

■(w/v)■2S *(USP29)*
solution of sodium hydroxide.

Dissolve about 200 mg of benzoic acid, accurately weighed, in 10 mL of alcohol and 2 mL of water. Add 2 drops of phenolphthalein TS, and titrate with the alcoholic sodium hydroxide solution until a permanent pale pink color is produced.

$$N = \frac{\text{mg benzoic acid}}{122.1 \times \text{mL sodium hydroxide}}$$

Change to read:

Sodium Tetraphenylboron, Fiftieth-Molar (0.02 M)

$NaB(C_6H_5)_4$, **342.22**

6.845 g in 1000 mL

Dissolve an amount of sodium tetraphenylboron, equivalent to 6.845 g of $NaB(C_6H_5)_4$, in water to make 1000 mL, and standardize the solution as follows.

Pipet two 75-mL portions of the solution into separate beakers, and to each add 1 mL of acetic acid and 25 mL of water. To each beaker add, slowly and with constant stirring, 25 mL of potassium biphthalate solution (1 in 20), and allow to stand for 2 hours. Filter one of the mixtures through a filtering crucible, and wash the precipitate with cold water. Transfer the precipitate to a container, add 50 mL of water, shake intermittently for 30 minutes, filter, and use the filtrate as the saturated potassium tetraphenylborate solution in the following standardization procedure. Filter the second mixture through a tared filtering crucible, and wash the precipitate with three 5-mL portions of saturated potassium tetraphenylborate solution. Dry the precipitate at 105° for 1 hour. Each g of potassium tetraphenylborate is equivalent to 955.1 mg of sodium tetraphenylboron.

$$\text{▲}M = \frac{gKTPB \times 0.9551 \times 0.075}{342.22}\text{▲}_{USP\ 31}$$

NOTE—Prepare this solution just before use.

Change to read:

Sodium Thiosulfate, Tenth-Normal (0.1 N)

$Na_2S_2O_3 \cdot 5H_2O$, **248.19**

24.82 g in 1000 mL

Dissolve about 26 g of sodium thiosulfate and 200 mg of sodium carbonate in 1000 mL of recently boiled and cooled water. Standardize the solution as follows.

Accurately weigh about 210 mg of primary standard potassium dichromate, previously pulverized and dried ~~at 120° for 4 hours,~~
■according to the instructions on its label, if necessary,■1S *(USP30)*
and dissolve in 100 mL of water in a glass-stoppered, 500-mL flask. Swirl to dissolve the solid, remove the stopper, and quickly add 3 g of potassium iodide, 2 g of sodium bicarbonate, and 5 mL of hydrochloric acid. Insert the stopper gently in the flask, swirl to mix, and allow to stand in the dark for exactly 10 minutes. Rinse the stopper and the inner walls of the flask with water, and titrate the liberated iodine with the sodium thiosulfate solution until the solution is yellowish green in color. Add 3 mL of starch TS, and continue the titration until the blue color is discharged. Perform a blank determination.

Restandardize the solution as frequently as supported by laboratory stability data. In the absence of such data, restandardize the solution weekly.

$$N = \frac{\text{mg } K_2Cr_2O_7}{49.04 \times \text{mL } Na_2S_2O_3}$$

REFERENCE TABLES

BRIEFING

Container Specifications for Capsules and Tablets, *USP 29* page 3184, page 3813 of the *Second Supplement,* and page 1539 of *PF* 32(5) [Sept.–Oct. 2006].

(HDQ) RTS—C41808; C42512; C42637; C44029; C44435; C44780

The following table is provided as a reminder for the pharmacist engaged in the typical dispensing situation who already is acquainted with the *Packaging and storage* requirements set forth in the individual monographs. It lists the capsules and tablets that are official in the *United States Pharmacopeia* and indicates the relevant tight (T), well-closed (W), and light-resistant (LR) specifications applicable to containers in which the drug that is repackaged should be dispensed.

This table is not intended to replace, nor should it be interpreted as replacing, the definitive requirements stated in the individual monographs.

Container Specifications for Capsules and Tablets

Monograph Title	*Container Specification*
Add the following:	
■Acetaminophen, Chlorpheniramine, and Dextromethorphan Tablets	$T_{■2S\ (USP30)}$
Add the following:	
▲Benazepril Hydrochloride Tablets	$W_{▲USP30}$
Add the following:	
■Capecitabine Tablets	$T_{■2S\ (USP30)}$

Add the following:

▲**Carprofen:** White crystalline powder. Freely soluble in ether, in acetone, in ethyl acetate, and in sodium hydroxide TS or sodium carbonate TS; practically insoluble in water.▲*USP31*

Change to read:

Meropenem: Colorless to white crystals. Soluble in dimethylformamide and in 5% ~~monobasic~~

▲dibasic▲*USP31*
potassium phosphate solution; sparingly soluble in water

▲and in 5% monobasic potassium phosphate solution;▲*USP31*
very slightly soluble in alcohol; practically insoluble in acetone and in ether.

Add the following:

▲**Fully Hydrogenated Rapeseed Oil:** White, waxy solid. Insoluble in water and in alcohol. *NF category:* Coating agent; stiffening agent.▲*NF26*

Add the following:

▲**Superglycerinated Fully Hydrogenated Rapeseed Oil:** White solid. Insoluble in water and in alcohol. *NF category:* Coating agent; emulsifying and/or solubilizing agent; stiffening agent.▲*NF26*

Add the following:

▲**Trimipramine Maleate:** White to almost white crystalline powder. Slightly soluble in water and in alcohol.▲*USP31*

Pending Proposals

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *Pharmacopeial Forum (PF)* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in the *USP–NF*, its *Supplements*, or an *IRA.* Those items that have not yet been adopted are marked as *Pending Proposals.*

The *Pending Proposals* list contains these items separated into the following categories: General Notices and Requirements; *USP* monographs; Dietary Supplements Monographs; General Chapters; Reference Tables; Excipients; and *NF* Monographs. Each entry in the *Pending Proposals* list contains the monograph title and the citation of the most recent publication of the monograph. When the appropriate USP Expert Committee is considering advancing to official status a pending proposal that is more than 2 years old, it is republished in *PF* for additional opportunity for public review and comment. Reprints of *PF* proposals may be purchased from USP by sending a written request for information to custsvc@usp.org.

To check the status of a *Pending Proposal,* please contact USP as directed below.

- The briefing accompanying the monograph or general chapter lists the names of the Scientific Liaisons responsible for the proposed revisions. The contact information (phone number and email) for the Scientific Liaison is available in the *Staff Directory* section of *How to Use PF*. For *USP–NF Online* subscribers, the name and contact information for the assigned Scientific Liaison is available in the *Auxiliary Information* portion of each monograph.
- Call USP at 301-816-8344 and ask to speak with the Scientific Liaison assigned to the monograph or general chapter of interest.
- Submit questions by email to stdsmonographs@usp.org. Please indicate the name of the monograph or general chapter in the subject line of the email.

Following these lists the reader will find the *Canceled Proposals* list. These are items that were published in *PF* and were pending, but have since been canceled. This list contains cumulative entries for the six issues per volume of *PF* [i.e., 32(1) through 32(6)]. Note that canceled proposals may be republished in *PF* to be considered for future adoption into the *USP–NF.*

Cholestyramine Resin—*Dialyzable quaternary amines*	32	2	320
Cilostazol (new)	32	5	1441
Cimetidine—*Identification, Chromatographic purity*	32	3	769
Cimetidine Tablets—*Dissolution*	32	1	72
Ciprofloxacin—*Chromatographic purity, Assay*	32	2	320
Ciprofloxacin and Dexamethasone Otic Suspension (new)	32	2	321
Ciprofloxacin Hydrochloride—*Chromatographic purity, Assay*	32	2	325
Ciprofloxacin Injection—*Bacterial endotoxins, Limit of ciprofloxacin ethylenediamine analog, Assay*	32	4	1059
Citalopram Hydrobromide—*Labeling* (add), *USP Reference standards, Related compounds*	32	4	1060
Citalopram Tablets—*Identification* (add), *Related compounds, Assay*	32	3	770
Anhydrous Citric Acid *(Harmonization), Sulfate*	31	3	749
Citric Acid Monohydrate *(Harmonization), Sulfate*	31	3	750
Citric Acid, Magnesium Oxide, and Sodium Carbonate Irrigation—*USP Reference standards, Assay for citric acid (delayed implementation to January 1, 2009)*	31	2	394
Cladribine—*Specific rotation, Related compounds, Limit of residual solvents*	32	3	774
Clonazepam Oral Suspension (new)	32	1	73
Clopidogrel Bisulfate—*Related compounds, Assay*	32	1	74
Clopidogrel Tablets—*Related compounds, Assay*	32	1	76
Clotrimazole Lozenges—*Dissolution*	32	1	78
Cod Liver Oil—*Identification*	32	5	1443
Cyclopropane—*Definition, Packaging and storage*	31	4	1052
Cyclosporine Capsules—*Labeling* (add), *USP Reference standards, Identification A, B, Dissolution, Droplet size* (add), *Content of alcohol* (add), *Assay*	27	4	2721
Dalteparin Sodium (new)	30	5	1598
Dantrolene Sodium (new)	32	2	327
Dantrolene Sodium Capsules (new)	32	4	1063
Dantrolene Sodium for Injection (new)	32	3	779
Dapsone—*Assay*	31	3	750
Desmopressin Acetate (new)	31	4	1052
Desmopressin Injection (new)	31	4	1057
Desmopressin Nasal Spray Solution (new)	31	4	1059
Desogestrel (new)	28	6	1785
Desogestrel and Ethinyl Estradiol Tablets (new)	30	5	1604
Diazepam Extended-Release Capsules—*USP Reference standards, Assay*	32	2	330
Diclofenac Potassium (new)	31	5	1350
Diclofenac Potassium Tablets (new)	31	5	1352
Diclofenac Sodium Delayed-Release Tablets—*Identification*	31	3	751
Diclofenac Sodium Extended-Release Tablets (new)	30	2	476
Didanosine (new)	32	3	781
Didanosine for Oral Solution (new)	31	5	1357
Didanosine Tablets (new)	32	5	1444
Dihydroxyaluminum Sodium Carbonate Tablets—*Title* (name change)	29	6	1873
Dihydroxyaluminum Sodium Carbonate Chewable Tablets (new)	29	6	1873
Diltiazem Hydrochloride Oral Solution (new)	32	1	79
Diltiazem Hydrochloride Oral Suspension (new)	32	1	80

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Diphenoxylate Hydrochloride and Atropine Sulfate Oral Solution—*Identification, Assay for diphenoxylate hydrochloride* (delete), *Assay for atropine sulfate* (delete), *Assay* (add)	31	6	1612
Diphenoxylate Hydrochloride and Atropine Sulfate Tablets—*Identification, Assay for diphenoxylate hydrochloride* (delete), *Assay for atropine sulfate* (delete), *Assay* (add)	31	6	1614
Diphtheria Toxin for Schick Test (delete)	31	6	1616
Dipyridamole Oral Suspension (new)	32	1	81
Divalproex Sodium (new)	31	5	1362
Dolasetron Mesylate Oral Solution (new)	32	1	83
Dolasetron Mesylate Oral Suspension (new)	32	1	84
Doxazosin Mesylate (new)	32	4	1066
Doxazosin Tablets (new)	29	1	64
Doxepin Hydrochloride—*USP Reference standards, Identification, Melting range* (delete), *Chloride content* (delete), *Related compounds* (add)	32	2	330
Dronabinol—*USP Reference standards, Identification, Limit of* Δ^8*-tetrahydrocannabinol* (delete), *Related compounds* (add), *Assay*	32	1	86
Drospirenone (new)	32	3	787
Edetate Calcium Disodium—*Harmonization*	32	4	1335
Edetate Disodium—*Assay*	32	4	1070
Edetate Disodium Injection—*Assay*	32	4	1071
Egg Phospholipids (new)	31	3	757
Enoxaparin Sodium (new)	29	6	1876
Enoxaparin Sodium Injection (new)	31	3	761
Ensulizole—*Assay*	31	6	1617
Estradiol and Norethindrone Acetate Tablets (new)	31	5	1364
Estradiol Transdermal System (new)	31	4	1063
Estradiol Vaginal Inserts (new)	32	4	1071
Conjugated Estrogens—*Definition*	30	3	840
Conjugated Estrogens Tablets—*Dissolution*	32	4	1074
Synthetic Conjugated Estrogens (new)	31	6	1620
Ethotoin Tablets—*USP Reference standards, Assay*	32	2	332
Etidronate Disodium—*Limit of phosphite*	31	6	1625
Famotidine Injection (new)	32	2	333
Fenofibrate (new)	31	3	763
Fentanyl (new)	31	6	1626
Fexofenadine Hydrochloride (postponed indefinitely)—*Labeling* (add), *Identification, Water, Specific surface area* (delete), *Limit of fexofenadine related compound B, Related compounds*	32	5	1447
Fexofenadine Hydrochloride Capsules (postponed indefinitely)—*Water, Related compounds*	32	5	1449
Fexofenadine Hydrochloride Tablets (new)	30	6	1997
Fexofenadine Hydrochloride and Pseudoephedrine Hydrochloride Extended-Release Tablets (new)	31	2	403
Fluconazole—*Related compounds*	32	2	335
Flucytozine Oral Suspension (new)	32	1	92
Flumazenil—*USP Reference standards, Related compounds, Assay*	32	1	94
Fluorometholone Acetate (new)	31	5	1371
Flurazepam Hydrochloride—*Identification*	31	3	766
Fluticasone Propionate—*Definition, Bromofluoromethane content* (delete)	32	2	337
Fluticasone Propionate Nasal Spray (new)	32	2	339
Fluvastatin Sodium—*Packaging and storage, USP Reference standards, Identification, Chromatographic purity*	32	1	103
Fluvastatin Capsules—*USP Reference standards, Identification, Chromatographic purity*	32	1	105
Fluvoxamine Maleate—*Definition, Maleic acid* (delete), *Assay*	32	5	1449
Fluvoxamine Maleate Tablets (new)	30	5	1622
Formoterol Fumarate (new)	32	5	1450
Fosinopril Sodium (new)	32	3	789
Fosinopril Sodium Tablets (new)	30	6	2004
Fosinopril Sodium and Hydrochlorothiazide Tablets (new)	30	6	2006
Gabapentin (new)	31	1	50
Ganciclovir Oral Suspension (new)	32	1	113
Gemcitabine for Injection—*USP Reference standards, Chromatographic purity*	31	6	1630

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Gemcitabine Hydrochloride—*USP Reference standards*	32	1	114
Glipizide—*USP Reference standards, Related compounds, Assay*	32	5	1453
Glipizide and Metformin Hydrochloride Tablets (new)	32	4	1076
Glutaral Concentrate—*Specific gravity*	31	3	766
Glyburide Tablets—*Labeling* (add), *Dissolution* (add)	32	4	1080
Glyburide and Metformin Hydrochloride Tablets (new)	31	3	766
Gonadorelin Acetate (new)	30	4	1250
Goserelin Acetate (new)	32	3	792
Helium—*Definition, Packaging and storage*	31	4	1077
Hepatitis B Virus Vaccine Inactivated (delete)	31	6	1641
Hydrocodone Bitartrate—*USP Reference standards Ordinary impurities* (delete), *Related compounds* (add)	30	5	1628
Hydrocodone Bitartrate and Homatropine Methylbromide Tablets (new)	30	3	853
Hydrocortisone Tablets—*USP Reference standards, Uniformity of dosage units, Assay*	32	4	1083
Hydroxyzine Hydrochloride—*Definition, USP Reference standards, Chromatographic purity, Assay*	32	5	1456
Hypromellose—*Harmonization*	32	5	1573
Hypromellose Ophthalmic Solution—*Assay*	32	4	1084
Ibuprofen—*USP Reference standards, Limit of ibuprofen related compound C, Assay*	32	3	796
Ibuprofen Oral Suspension—*USP Reference standards, Limit of ibuprofen related compound C, Assay*	32	3	796
Ibuprofen Tablets—*USP Reference standards, Limit of ibuprofen related compound C, Assay*	32	3	798
Indinavir Sulfate—*Heavy metals, Method I,* (delete), *Heavy metals* (add), *Chromatographic purity, Assay*	32	2	345
Sodium Iodide I 123 Capsules—*Definition*	31	6	1642
Sodium Iodide I 123 Solution—*Definition, Radionuclidic purity, Bacterial endotoxins, pH*	31	6	1642
Sodium Iodide I 131 Solution—*pH*	31	6	1643
Iodoform—*Molecular weight*	32	1	115
Irbesartan—*Limit of azide, Related compounds, Assay*	32	4	1084
Irbesartan Tablets (new)	32	3	799
Irbesartan and Hydrochlorothiazide Tablets (new)	29	4	1036
Isosorbide Mononitrate Tablets (new)	29	5	1513
Isosorbide Mononitrate Extended-Release Tablets (new)	31	4	1082
Ivermectin—*Specific rotation, Limit of alcohol and formamide*	31	6	1645
Ketoprofen—*Assay*	31	3	772
Ketoprofen Extended-Release Capsules (new)	31	5	1378
Labetalol Hydrochloride Oral Solution (new)	32	1	116
Labetalol Hydrochloride Oral Suspension (new)	32	1	117
Lamivudine—*Assay*	32	2	346
Leflunomide (new)	31	5	1380
Leflunomide Tablets (new)	31	5	1383
Leuprolide Acetate (new)	30	3	882
Levocabastine Hydrochloride (new)	31	6	1647
Levodopa—*Related compounds*	32	4	1085
Levofloxacin (new)	32	2	347
Lidocaine and Prilocaine Cream (new)	31	4	1087
Lindane—*Definition, Assay*	31	6	1648
Lipid Injectable Emulsion (new)	32	2	350
Lisinopril Tablets—*Assay*	32	4	1086
Loperamide Hydrochloride Oral Solution—*Assay*	32	2	353
Lovastatin—*Assay*	32	1	118
Lovastatin Tablets—*Identification, Dissolution, Assay*	32	5	1458
Magaldrate and Simethicone Tablets—*Title* (name change)	29	6	1918
Magaldrate and Simethicone Chewable Tablets (new)	29	6	1919
Milk of Magnesia—*Limit of calcium* (delete)	32	2	353
Magnesium Carbonate and Citric Acid for Oral Solution—*USP Reference standards* (add), *Content of anhydrous citric acid, Other requirements (delayed implementation to January 1, 2009)*	31	2	419
Magnesium Chloride—*Identification*	31	2	420

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Magnesium Citrate Oral Solution—*USP Reference standards* (add), *Assay for anhydrous citric acid (delayed implementation to January 1, 2009)*	31	2	420
Magnesium Citrate for Oral Solution—*USP Reference standards* (add), *Content of anhydrous citric acid, Other requirements (delayed implementation to January 1, 2009)*	31	2	421
Magnesium Hydroxide—*Lead* (delete), *Limit of lead* (add)	32	4	1087
Magnesium Hydroxide Paste—*Definition, Soluble alkalies, Limit of lead* (add)	32	4	1088
Mangafodipir Trisodium—*Limit of residual solvents*	31	6	1650
Mannitol Injection—*Labeling*	32	2	263
Meloxicam (new)	31	1	57
Meloxicam Tablets (new)	32	5	1460
Metformin Hydrochloride Extended-Release Tablets (new)	31	3	772
Methylcellulose Ophthalmic Solution—*Identification*	31	3	780
Methylcellulose Oral Solution—*Identification*	31	3	780
Methylcellulose Tablets—*Identification*	31	3	780
Methyldopa Oral Suspension—*USP Reference standards, Limit of methyldopa-glucose reaction product* (delete)	32	2	354
Methylprednisolone—*Chromatographic purity*	32	2	354
Metolazone Oral Suspension (new)	32	1	119
Metoprolol Tartrate—*Chromatographic purity*	32	4	1089
Metoprolol Tartrate Oral Solution (new)	32	1	121
Metoprolol Tartrate Oral Suspension (new)	32	1	122
Metronidazole Benzoate—*USP Reference standards, Related compounds*	31	3	781
Miconazole Nitrate Cream—*Identification*	32	1	123
Mirtazapine—*Heavy metals*	31	6	1650
Mitoxantrone Injection—*Packaging and storage*	32	2	355
Modafinil (new)	30	5	1634
Modafinil Tablets (new)	30	5	1636
Morantel Tartrate—*pH*	32	2	355
Morphine Sulfate Extended-Release Capsules—*Packaging and storage* (add)	32	1	124
Mupirocin Calcium (new)	31	2	430
Mupirocin Cream (new)	31	2	432
Naphazoline Hydrochloride—*Definition, Assay*	31	4	1093
Naproxen Delayed-Release Tablets—*Packaging and storage*	32	1	124
Narasin Granular—*Molecular weight, Assay*	32	1	124
Narasin Premix—*Assay*	32	1	126
Naratriptan Hydrochloride—*Assay*	32	5	1462
Nefazodone Hydrochloride—*Related compounds*	32	5	1462
Nefazodone Hydrochloride Tablets (new)	32	3	804
Netilmicin Sulfate—*Definition, Assay*	32	4	1089
Nevirapine Oral Suspension (new)	32	4	1090
Nevirapine Tablets (new)	32	3	807
Nimodipine—*Identification, Related compounds*	32	2	360
Nitrous Oxide—*Definition, Packaging and storage, Assay*	31	4	1099
Norgestimate—*USP Reference standards, Chromatographic purity*	32	4	1094
Norgestimate and Ethinyl Estradiol Tablets (new)	29	1	87
Ofloxacin—*Chromatographic purity* (delete), *Related compounds* (add)	30	4	1274
Ondansetron Hydrochloride—*Limit of ondansetron related compound D, Assay*	32	1	126
Ondansetron Hydrochloride Oral Suspension (new)	32	1	127
Ondansetron Injection—*Chromatographic purity*	32	4	1096
Ondansetron Oral Solution—*Packaging and storage* (add), *Limit of ondansetron related compound D, Related compounds*	32	1	128
Ondansetron Orally Disintegrating Tablets—*Dissolution*	32	5	1463
Orphenadrine Citrate Injection—*Assay*	31	6	1651
Oxandrolone—*Ordinary impurities* (delete), *Related compounds* (add)	31	1	64
Oxandrolone Tablets—*Dissolution*	32	5	1464
Oxaprozin—*Packaging and storage* (add)	32	1	130
Oxaprozin Tablets—*Packaging and storage* (add)	32	1	130
Oxybutynin Chloride—*Related compounds*	32	3	810
Oxybutynin Chloride Extended-Release Tablets (new)	31	6	1652

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Oxycodone Hydrochloride Extended-Release Tablets (new)	31	4	1104
Oxygen—*Definition, Packaging and storage*	31	4	1107
Oxygen 93 Percent—*Definition, Packaging and storage*	31	4	1107
Paclitaxel—*USP Reference standards, Related compounds*	32	2	361
Pamidronate Disodium for Injection—*Packaging and storage, Bacterial endotoxins*	32	5	1465
Pancuronium Bromide Injection (new)	32	4	1097
Paricalcitol—*Identification, Chromatographic purity, Assay*	32	1	132
Paroxetine Hydrochloride—*Assay*	32	3	811
Pectin—*Identification*	31	3	783
Penicillamine Capsules—*Dissolution*	31	2	436
Pentazocine and Acetaminophen Tablets (new)	28	6	1838
Pentobarbital Sodium—*Labeling* (add), *USP Reference standards, Other requirements* (add)	31	1	73
Pentobarbital Sodium Injection—*Identification, Assay*	32	2	364
Permethrin (new)	32	4	1100
Permethrin Cream (new)	32	4	1102
Petrolatum (new)—*Harmonization*	28	2	569
White Petrolatum (new)—*Harmonization*	28	2	570
Phenytoin Tablets—*Title* (name change)	29	6	1965
Phenytoin Chewable Tablets (new)	29	6	1965
Piperacillin and Tazobactam Injection (new)	31	2	437
Piperacillin and Tazobactam for Injection (new)	31	2	439
Piroxicam Cream (new)	32	1	134
PEG 3350 and Electrolytes for Oral Solution—*Title, Definition, Assay for potassium and sodium*	32	4	1104
Potassium and Sodium Bicarbonates and Citric Acid Effervescent Tablets for Oral Solution—*USP Reference standards* (add), *Assay for anhydrous citric acid (delayed implementation to January 1, 2009)*	31	2	440
Potassium Bitartrate—*Limit of ammonia*	31	3	786
Potassium Citrate Extended-Release Tablets—*USP Reference standards* (add), *Assay (delayed implementation to January 1, 2009)*	31	2	443
Potassium Citrate and Citric Acid Oral Solution—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	2	444
Potassium Iodide Oral Solution—*Definition*	31	3	786
Potassium Perchlorate—*USP Reference standards* (delete), *Assay*	32	2	364
Potassium Sodium Tartrate—*Limit of ammonia*	31	3	787
Pravastatin Sodium (new)	32	3	813
Pravastatin Sodium Tablets (new)	32	3	817
Prednicarbate Cream (new)	32	3	819
Prednicarbate Ointment (new)	32	3	822
Prednisolone Sodium Phosphate—*USP Reference standards, Identification*	32	2	365
Promethazine Hydrochloride—*USP Reference standards, Related compounds*	32	4	1105
Promethazine Hydrochloride Tablets—*USP Reference standards, Related compounds, Assay*	32	4	1107
Pseudoephedrine Sulfate—*Ordinary impurities*	32	1	135
Pyrantel Pamoate—*Limit of iron*	32	5	1465
Pyridoxine Hydrochloride Injection—*Assay*	32	2	369
Quazepam Tablets—*USP Reference standards, Assay*	32	2	370
Quinapril Tablets—*Packaging and storage*	29	4	1071
Quinidine Sulfate Oral Suspension (new)	32	1	136
Ramipril—*Definition, Assay*	31	3	787
Oral Rehydration Salts—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	5	1399
Rifampin and Isoniazid Capsules—*Dissolution*	30	2	533
Rifampin, Isoniazid, and Pyrazinamide Tablets—*Dissolution*	30	2	534
Risperidone (new)	31	6	1659
Risperidone Tablets (new)	32	4	1109
Ritonavir—*Identification, X-ray diffraction* (add), *Related compounds*	32	4	1113
Ropivacaine Hydrochloride Injection (new)	32	2	374
Rubella and Mumps Virus Vaccine Live (delete)	31	6	1662
Saccharin Calcium—*Identification*	32	4	1114

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Saccharin Sodium—*Identification*	32	4	1114
Saquinavir Capsules—*Dissolution*	32	3	824
Schick Test Control (delete)	31	6	1662
Senna—*Title, Definition, Packaging and storage, Labeling* (add), *USP Reference standards* (add), *Botanic characteristics, Identification, Microbial enumeration* (add) *Loss on drying* (add), *Total ash* (add), *Assay* (add)	32	1	137
Senna Pods (new)	32	1	140
Sennosides—*Definition, Packaging and storage, Residue on ignition*	32	1	141
Sevoflurane (new)	30	1	178
Simvastatin—*Identification, Chromatographic purity, Limit of lovastatin* (delete), *Assay*	32	1	141
Sodium Bicarbonate—*Normal carbonate, Limit of ammonia*	32	5	1465
Sodium Chloride—*Limit of phosphates*	31	5	1401
Sodium Chloride—*Identification, Loss on drying, Limit of potassium (postponed indefinitely)*	32	2	264
Sodium Fluoride—*Assay*	32	5	1466
Sodium Fluoride Oral Solution—*Assay*	32	5	1466
Sodium Fluoride and Phosphoric Acid Topical Solution (delete)	32	3	824
Spironolactone and Hydrochlorothiazide Tablets—*Dissolution*	32	2	376
Streptomycin Sulfate—*Assay*	32	5	1467
Sulfamethazine Granulated—*Assay*	31	3	797
Sumatriptan Succinate Oral Suspension (new)	32	1	144
Talc—*Packaging and storage* (add), *Limit of iron, Limit of calcium, Limit of aluminum*	31	6	1662
Tazobactam (new)	31	4	1116
Temazepam—*Identification*	32	1	145
Terbutaline Sulfate Inhalation Aerosol—*USP Reference standards, Assay*	31	2	450
Thalidomide—*Microbial limits, Chromatographic purity*	32	5	1467
Thalidomide Capsules—*Microbial limits* (add)	32	5	1468
Thiabendazole Tablets—*Title* (name change)	29	6	1991
Thiabendazole Chewable Tablets (new)	29	6	1991
Thimerosal—*Identification*	32	1	147
Thioridazine Hydrochloride—*Identification*	31	3	798
Tiagabine Hydrochloride—*Identification, Chromatographic purity*	32	5	1468
Tiamulin Fumarate—*Chemical name, Definition, Melting temperature, Chromatographic purity*	32	4	1115
Tilmicosin—*Definition, Related compounds, Assay*	31	3	798
Tizanidine Tablets (new)	32	1	147
Topiramate (new)	30	4	1307
Tramadol Hydrochloride (new)	31	2	458
Tramadol Hydrochloride Tablets (new)	31	2	462
Travoprost (new)	32	4	1115
Travoprost Ophthalmic Solution (new)	32	4	1118
Triamcinolone Acetonide—*USP Reference standards, Assay*	31	3	800
Triamcinolone Diacetate—*Definition, Identification*	32	4	1120
Tricitrates Oral Solution—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	2	465
Triclosan—*Assay*	32	2	377
Crystallized Trypsin—*Definition*	32	3	779
Ursodiol Capsules—*Dissolution*	31	3	800
Valganciclovir Hydrochloride (new)	32	2	379
Valganciclovir Tablets (new)	32	2	384
Valsartan (new)	32	1	150
Valsartan and Hydrochlorothiazide Tablets (new)	31	4	1123
Valproic Acid Injection (new)—*Title (delayed implementation to October 1, 2008)*	32	2	387
Vancomycin Hydrochloride—*USP Reference standards, Limit of monodechlorovancomycin* (add)	30	6	2055
Vasopressin—*Identification*	31	4	1127
Verapamil Hydrochloride—*USP Reference standards Identification, Chromatographic purity*	32	2	389
Verapamil Hydrochloride Injection—*USP Reference standards, Related compounds*	32	1	154
Verapamil Hydrochloride Oral Solution (new)	32	1	155
Verapamil Hydrochloride Oral Suspension (new)	32	1	156

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Vinblastine Sulfate—*USP Reference standards*	32	5	1470
Vinblastine Sulfate for Injection—*USP Reference standards*	32	5	1470
Vincristine Sulfate—*USP Reference standards*	32	5	1470
Vincristine Sulfate Injection—*USP Reference standards*	32	5	1470
Vincristine Sulfate for Injection—*USP Reference standards*	32	5	1470
Vinorelbine Injection—*Related compounds, Assay*	32	5	1471
Vinorelbine Tartrate—*Related compounds, Assay*	32	5	1471
Pure Steam (new)	31	2	467
Water for Hemodialysis—*Bacterial endotoxins*	31	2	468
Sterile Water for Inhalation—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add)	31	3	802
Sterile Water for Injection—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add)	31	3	803
Sterile Water for Irrigation—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add)	31	3	804
Sterile Purified Water—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add)	31	3	804
Zidovudine Tablets—*USP Reference standards, Related compounds, Assay*	32	1	158
Zinc Chloride Injection—*Assay*	32	5	1473
<u>*Dietary Supplements Monographs*</u>			
Ademetionine Disulfate Tosylate (new)	31	2	469
Acesulfame Potassium—*Packaging and storage* (add), *Limit of fluoride*	31	3	811
Cat's Claw (new)	32	4	1120
Powdered Cat's Claw (new)	32	4	1124
Powdered Cat's Claw Extract (new)	32	4	1124
Cat's Claw Capsules (new)	32	4	1126
Cat's Claw Tablets (new)	32	4	1127
Black Cohosh (new)	32	4	1128
Powdered Black Cohosh (new)	32	4	1132
Powdered Black Cohosh Extract (new)	32	4	1133
Black Cohosh Fluidextract (new)	32	4	1134
Black Cohosh Tablets (new)	32	4	1135
Ginger—*Packaging and storage, Labeling, USP Reference standards, Identification, Microbial enumeration, Alcohol-soluble extractives, Limit of shogaols, Content of gingerols and gingerdiones*	32	1	160
Powdered Ginger—*Packaging and storage, USP Reference standards*	32	1	162
Ginger Capsules—*USP Reference standards, Content of gingerols, gingerdiones, and shogaols*	32	1	163
Ginger Tincture—*USP Reference standards, Thin-layer chromatographic identification test, Microbial enumeration, Content of gingerols*	32	1	163
Ginkgo—*Definition, Packaging and storage, USP Reference standards, Thin-layer chromatographic identification test, Microbial enumeration, Content of terpene lactones*	32	1	164
Powdered Ginkgo Extract (new)	32	1	166
Ginkgo Capsules (new)	32	1	172
Ginkgo Tablets (new)	32	1	174
Glucosamine Tablets—*Disintegration and dissolution*	32	4	1137
Glucosamine and Methylsulfonylmethane Tablets (new)	32	4	1137
Glucosamine, Chondroitin Sulfate Sodium and Methylsulfonylmethane Tablets (new)	32	4	1138
Tomato Extract Containing Lycopene—*Microbial enumeration, Limit of aflatoxins*	30	2	578
Maleic Acid—*Identification*	31	3	815
Maltose—*Water*	31	3	815
Maritime Pine—*Identification, Content of procyanidins*	32	4	1140
Maritime Pine Extract—*Identification, microbial enumeration, Content of procyanidins*	32	4	1142
Methylsulfonylmethane (new)	32	3	826
Methylsulfonylmethane Tablets (new)	32	3	827
Minerals Capsules—*Definition*	32	5	1474
Minerals Tablets—*Definition*	32	5	1474

Pending Proposals (*continued*)

HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps **(*Stages*)**.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

MONOGRAPHS (NF)

Readers are requested to review the proposal carefully and to send comments to USP.

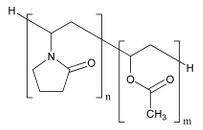
(EM2: K. Moore) RTS—C44007

BRIEFING

Copovidone. The Japanese Pharmacopoeia is the coordinating pharmacopoeia for the international harmonization of the compendial standards for the *Copovidone* monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the **OFFICIAL INQUIRY STAGE 4** document, is based in part on comments from the Japanese Pharmacopoeia and the European Pharmacopoeia in response to the Harmonization Stage 4 draft prepared by the Japanese Pharmacopoeia. Differences between the **OFFICIAL INQUIRY STAGE 4** document and the current *NF* monograph (see *NF 24* page 3316) include the following:

1. *Definition*—Nitrogen and vinyl acetate acceptance criteria are added. The K-value range is removed but indicated in the test for *K-value.*
2. *Description*—Consistent with Stage 4 document.
3. *Packaging and storage*—No change. The *USP* text is retained as a nonharmonized attribute.
4. *Labeling*—No change.
5. *Clarity and color of solution*—No change.
6. *Identification A*—A drying step added to infrared absorption ID; *Identification B*— A wet chemistry ID (colorimetric test with iodine TS) retained as a nonharmonized attribute.
7. *pH*—Added.
8. *Loss on drying*—No change.
9. *Residue on ignition*—No change.
10. *Limit of aldehydes*—A change in the use of reagents: pyrophosphate buffer instead of potassium phosphate buffer; additional details to sample preparation were also added.
11. *Limit of hydrazine*—Differences in preparation of the *Test solution* (no pH adjustment required) and new developing solution for evaluation by TLC (methanol/water) are added.
12. *Limit of peroxides*—No change.
13. *Limit of monomers*—The titration method is replaced with a new HPLC method consistent with the *Povidone* monograph.
14. *Nitrogen*—Modifications were made to the experimental procedure. Different reagents are used in the digestion procedure.
15. *K-value*—No change.
16. *Assay*—The test was formerly known as *Content of copolymerized vinyl acetate.* The calculation is modified to eliminate reference to the *Saponification Value* calculation in the *USP* general test chapter *Fats and Fixed Oils* ⟨401⟩.

Copovidone



$(C_6H_9NO)_n + (C_4H_6O_2)_m$

$(C_6H_9NO: \quad 111.14)_n + (C_4H_6O_2: \quad 86.09)_m$

Copolymer of 1-ethenylpyrrolidin-2-one and ethenyl acetate.

(Poly[(2-oxopyrrolidin-1-yl)ethylene-co-(1-acetoxyethylene)]) [*25086-89-9*].

» Copovidone is a copolymer of 1-vinyl-2-pyrrolidone and vinyl acetate in the mass proportion of 3 : 2. It contains not less than 7.0% and not more than 8.0% of nitrogen (N:14.01) and not less than 35.3% and not more than 42.0% of vinyl acetate ($C_4H_6O_2$:86.09), calculated on the dried basis.

Packaging and storage—Preserve in tight containers. No storage requirements specified.

Labeling—Label it to indicate its nominal K-value.

USP Reference standards ⟨11⟩—*USP Copovidone RS.*

Clarity and color of solution—Dissolve 1.0 g in 10 mL of water: the solution is clear or slightly opalescent and colorless to pale yellow or pale red.

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: To 5 mL of a solution (1 in 50) add a few drops of iodine TS: a deep red color is produced.

pH ⟨791⟩ **:** between 3.0 and 7.0, in a solution (1 in 10).

Loss on drying ⟨731⟩**—**Dry 0.5 g at 105° for 3 hours: it loses not more than 5.0% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Limit of aldehydes—

pH 9.0 Pyrophosphate buffer, 0.05 M—Transfer 8.7 g of monobasic potassium pyrophosphate to a 500-mL volumetric flask, and dissolve in 400 mL of water. Adjust, if necessary, with 1 N potassium hydroxide to a pH of 9.0, dilute with water to volume, and mix.

Blank solution—Use water.

Standard solution—Dissolve 0.140 g of acetaldehyde ammonia trimer trihydrate in 200.0 mL of water, and mix. Pipet 1.0 mL of this solution into a 100-mL volumetric flask, dilute with *pH 9.0 Pyrophosphate buffer, 0.05 M* to volume, and mix.

Test solution—Transfer about 1 g of Copovidone, accurately weighed, to a 100-mL volumetric flask, dissolve in 50 mL of *pH 9.0 Pyrophosphate buffer, 0.05 M,* dilute with *pH 9.0 Pyrophosphate buffer, 0.05 M* to volume, and mix. Insert a stopper into the flask, heat at 60° for 1 hour, and cool to room temperature.

Procedure—Pipet 0.5 mL each of the *Standard solution,* the *Test solution,* and the *Blank solution* into separate 1-cm cells. Add 2.5 mL of *pH 9.0 Pyrophosphate buffer, 0.05 M* and 0.2 mL of β-nicotinamide adenine dinucleotide TS to each cell. Mix by inversion, and stopper tightly. Allow to stand for 2 to 3 minutes at 22 ± 2°, and perform the test with these solutions with a suitable spectrophotometer, using water as the control solution. Determine the absorbances of the solutions at a wavelength of 340 nm. Add 0.05 mL of aldehyde dehydrogenase TS to each cell. Mix by inversion, and stopper tightly. Allow to stand for 5 minutes at 22 ± 2°. Determine the absorbances of the solutions at a wavelength of 340 nm. Calculate the percentage of aldehydes, expressed as acetaldehyde, in the portion of Copovidone taken by the formula:

$$10(C/W)\left[\frac{(A_{U2}-A_{U1})-(A_{B2}-A_{B1})}{(A_{S2}-A_{S1})-(A_{B2}-A_{B1})}\right]$$

in which C is the concentration, in mg per mL, of acetaldehyde in the *Standard solution,* calculated from the weight of the acetaldehyde ammonia trimer trihydrate with the factor 0.72; W is the weight, in g, calculated on the dried basis, of Copovidone taken to prepare the *Test solution;* A_{U1}, A_{S1}, and A_{B1} are the absorbances of the solutions obtained from the *Test solution,* the *Standard solution,* and the *Blank solution,* respectively, before the addition of the β-nicotinamide adenine dinucleotide TS; and A_{U2}, A_{S2}, and A_{B2} are the absorbances of the solutions obtained from the *Test solution,* the *Standard solution,* and the *Blank solution,* respectively, after addition of the aldehyde dehydrogenase TS: not more than 0.05% is found.

Limit of hydrazine—

Standard solution—Dissolve 0.09 g of salicylaldazine in toluene to make exactly 100 mL. Pipet 1 mL of this solution into a 100-mL volumetric flask, dilute with toluene to volume, and mix. Dissolve an accurately weighed quantity of salicylaldazine in toluene, and dilute quantitatively, and stepwise if necessary, with toluene to obtain a solution having a known concentration of 9 µg per mL.

Test solution—Transfer the equivalent of 2.5 g of dried Copovidone, accurately weighed, to a 50-mL centrifuge tube, add 25 mL of water, and mix to dissolve. Add 500 µL of a 1 in 20 solution of salicylaldehyde in methanol, stir, and warm in a water bath at 60° for 15 minutes. Allow to cool, add 2.0 mL of toluene, stopper tightly, shake vigorously for 2 minutes, and centrifuge. Use the clear upper toluene layer as the *Test solution.*

Procedure—Separately apply 10 µL of the *Test solution* and the *Standard solution* to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩) coated with a 0.25-mm layer of dimethylsilanized silica gel mixture with fluorescent indicator for thin-layer chromatography. Develop the chromatogram in a solvent system consisting of a mixture of methanol and water (2 : 1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and air-dry the plate. Locate the spot on the plate by examination under UV light at a wavelength of 365 nm: salicylaldazine appears as a fluorescent spot having an R_F value about 0.3, and the fluorescence of any salicylaldazine spot from the *Test solution* is not more intense than that produced by the spot obtained from the *Standard solution:* not more than 1 ppm is found.

Limit of peroxides—

Copovidone solution—Transfer the equivalent of 4.0 g of dried Copovidone, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Test solution—Transfer 25.0 mL of *Copovidone solution* to a 50-mL beaker, add 2 mL of titanium trichloride–sulfuric acid TS, and mix. Allow to stand for 30 minutes at room temperature.

Blank solution—Transfer 25.0 mL of *Copovidone solution* to a 50-mL beaker, add 2 mL of 13% sulfuric acid, and mix.

Procedure—Determine the absorbance of the *Test solution* in a 1-cm cell at the wavelength of maximum absorbance at about 405 nm, with a suitable spectrophotometer, using the *Blank solution* as the blank: the absorbance is not more than 0.35 (corresponding to not more than 0.04%, expressed as hydrogen peroxide).

Limit of monomers (1-vinyl-2-pyrrolidone, vinyl acetate, and 2-pyrrolidone)—

Solution A—Prepare a mixture of water, acetonitrile, and methanol [90 : 5 : 5 (v/v/v)].

Solution B—Prepare a mixture of water, acetonitrile, and methanol [50 : 45 : 5 (v/v/v)].

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system* (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Separately dissolve 50 mg of 1-vinyl-2-pyrrolidone, 50 mg of vinyl acetate, and 300 mg of 2-pyrrolidone in methanol to make exactly 100 mL. Pipet 1 mL of this solution, add *Solution A* to make exactly 100 mL, and mix. Pipet 5 mL of this solution, add *Solution A* to make exactly 100 mL, and use this solution as the *Standard solution*.

Test solution—Dissolve about 250 mg of Copovidone, accurately weighed, into a 10-mL volumetric flask, add 1 mL of methanol, mix ultrasonically, dilute with water to volume, and mix. If necessary, filter this solution to remove undissolved particles.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 205-nm detector, a 235-nm detector, and a 4-mm × 25-mm guard column attached to a 4-mm × 25-cm analytical column that contains packing L7 with a 5-µm particle size. The column temperature is maintained at 30°. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–2	100	0	isocratic
2–26	100→80	0→20	linear gradient
26–27	80→0	20→100	linear gradient
27–36	0	100	isocratic
36–38	0→100	100→0	linear gradient

Chromatograph the *Standard solution,* and record the peak areas as directed for *Procedure:* the resolution, *R,* between the 2-pyrrolidone, vinyl acetate, and 1-vinyl-2-pyrrolidone peaks is not less than 2.0; and the relative standard deviation for replicate injections of each analyte is not more than 2.0%.

[NOTE—According to the above operating conditions, the order of elution is 2-pyrrolidone, vinyl acetate, and 1-vinyl-2-pyrrolidone. After each injection with the *Test solution,* wash away the polymeric material of Copovidone from the guard column by passing the *Mobile phase* through the column backwards for about 30 minutes at the same flow rate applied in the test.]

Procedure—Separately inject equal volumes (about 10 µL) of the *Test solution* and the *Standard solution,* and determine the peak areas of 1-vinyl-2-pyrrolidone, vinyl acetate, and 2-pyrrolidone. Calculate the content of 1-vinyl-2-pyrrolidone, vinyl acetate, and 2-pyrrolidone in Copovidone taken by the following formulas:

Content (ppm) of 1-vinyl-2-pyrrolidone

$$(A_{TA}/A_{SA}) \times 2.5/W$$

Content (ppm) of vinyl acetate

$$(A_{TB}/A_{SB}) \times 2.5/W$$

Content (%) of 2-pyrrolidone

$$(A_{TC}/A_{SC}) \times (15/W) \times 10^{-4}$$

in which W is the weight, in g, of Copovidone, calculated on the dried basis; A_{TA}, A_{TB}, and A_{TC} are the absorbances of the solutions of 1-vinyl-2-pyrrolidone, vinyl acetate, and 2-pyrrolidone, respectively, obtained from the *Test solution;* A_{SA}, A_{SB}, and A_{SC} are the absorbances of the solutions of 1-vinyl-2-pyrrolidone, vinyl acetate, and 2-pyrrolidone, respectively, obtained from the *Standard solution:* not more than 10 ppm of 1-vinyl-2-pyrrolidone is found, not more than 10 ppm vinyl acetate is found, and not more than 0.5% of 2-pyrrolidone is found.

Nitrogen, *Method II* ⟨461⟩—Proceed as directed in the chapter using an accurately weighed quantity of about 0.1 g of Copovidone except for the following: use 5 g of a powdered mixture of potassium sulfate, cupric sulfate, and titanium dioxide (33 : 1 : 1) instead of potassium sulfate and cupric sulfate (10 : 1); omit the use of hydrogen peroxide; and heat until the solution has a clear, yellow-green color and the sides of the flask are free from carbonaceous material. Then heat for a further 45 minutes; add 20 mL of water, instead of 70 mL, after the second heating; and use bromocresol green–methyl red TS instead of methyl red–methylene blue TS. Titrate the distillate with 0.05 N sulfuric acid VS until the color of the solution changes from green through pale grayish blue to pale grayish red-purple: each mL of 0.5 N sulfuric acid VS is equivalent to 0.7004 mg of nitrogen.

K-value—Transfer an accurately weighed quantity of undried Copovidone, equivalent to about 1.0 g on the dried basis, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Allow to stand for 1 hour. Determine the viscosity, using a capillary-tube viscosimeter of the Ubbelohde type (see *Viscosity* ⟨911⟩), of this solution at 25 ± 0.2°. Calculate the K-value of Copovidone by the formula:

$$\frac{1.5\log\eta - 1}{0.15 + 0.003w} + \frac{\sqrt{300w\log\eta + (w + 1.5w\log\eta)^2}}{0.15w + 0.003w^2}$$

in which w is the weight, in g, on the dried basis, of the specimen tested in each 100.0 mL of solution; and η is the kinematic viscosity of the test solution relative to that of water: the K-value is not less than 90.0% and not more than 110.0% of the nominal K-value stated on the label.

Assay—Weigh accurately about 2 g of Copovidone into a 250-mL borosilicate glass flask, add exactly 25 mL of 0.5 N alcoholic potassium hydroxide VS and a few glass beads, and heat under reflux for 30 minutes. Add 1 mL of phenolphthalein TS, and titrate the excess 0.5 N alcoholic potassium hydroxide immediately (while still hot) with 0.5 N hydrochloric acid VS. Perform a blank determination under the

same conditions (see *Residual Titrations* under *Titrimetry* ⟨541⟩). Calculate the percentage of copolymerized vinyl acetate in the Copovidone taken by the formula:

$$0.1 \times \frac{86.09}{56.11} \times \frac{28.05(n_2 - n_1)}{w}$$

in which w is the weight, in g, of Copovidone, calculated on the dried basis; n_2 is the volume, in mL, of 0.5 N hydrochloric acid VS consumed for the blank determination; and n_1 is the volume, in mL, of 0.5 N hydrochloric acid VS consumed for the sample determination.

BRIEFING

Anhydrous Lactose, *NF 25* page 3357. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Anhydrous Lactose monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the **ADOPTION STAGE 6** document, is based on the corresponding monograph for Anhydrous Lactose that was prepared by USP. The USP draft was based in part on comments from EP and JP in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by USP.

Differences between the USP Adoption Stage 6 document and the current *NF* monograph for Anhydrous Lactose include the following:

1. *Definition*—Provided additional detail to maintain consistency with harmonized text.
2. *Packaging and storage*—Removed from *Other requirements* section. Added detail to maintain consistency with the harmonized text. No storage requirements specified.
3. *Labeling*—Removed from *Other requirements* section. Added detail to maintain consistency with the harmonized text.
4. *USP Reference standards*—No change.
5. *Clarity and color of solution*—Removed from *Other requirements* section. Added detail to maintain consistency with the harmonized text.
6. *Identification*—Test *A* is retained as a nonharmonized attribute. Tests *B* and *C* are retained as specific local attributes.
7. *Specific rotation*—Removed from *Other requirements* section. Added detail to maintain consistency with the harmonized text.
8. *Microbial limits*—Removed from *Other requirements* section. Added detail to maintain consistency with the harmonized text.
9. *Acidity or alkalinity*—Removed from *Other requirements* section. Added detail to maintain consistency with the harmonized text.
10. *Loss on drying*—No change.
11. *Water*—No change.
12. *Residue on ignition*—Removed from *Other requirements* section. Added detail to maintain consistency with the harmonized text.
13. *Heavy metals*—Retained as a nonharmonized attribute.
14. *Protein and light-absorbing impurities*—Removed from *Other requirements* section. Added detail to maintain consistency with the harmonized text.
15. *Content of alpha and beta anomers*—No change.

(DSN: K. Moore) RTS—C43927

No change:

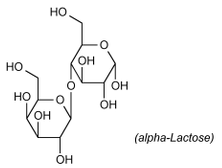
Anhydrous Lactose

Add the following:

Attribute	JP	EP	USP
Definition	+	+	+
Clarity and color of solution	+	+	+
Specific rotation	+	+	+
Acidity or alkalinity	+	+	+
Loss on drying	–	+	+
Water	+	+	+
Content of alpha and beta anomers	+	+	+
Residue on ignition	+	+	+
Protein and light-absorbing impurities	+	+	+

Legend: + will adopt and implement; – will not stipulate.
Nonharmonized attributes: Characters, Labeling, Microbial limits, Heavy metals, Packaging and storage, Identification (IR).
Specific local attributes: Identification B and C (USP), Particle size distribution (USP), Particle size distribution EP (FRC).

No change:



(alpha-Lactose)

Change to read:

» ~~Anhydrous Lactose is primarily beta lactose or a mixture of alpha and beta lactose.~~

Harmonization

▲Anhydrous Lactose is *O*-β-D-galactopyranosyl-(1→4)-β-D-glucopyranose (β-lactose) or a mixture of *O*-β-D-galactopyranosyl-(1→4)-β-D-glucopyranose and *O*-β-D-galactopyranosyl-(1→4)-α-D-glucopyranose (α-lactose).▲*NF26*

Add the following:

▲**Packaging and storage**—Preserve in tight containers.▲*NF26*

Change to read:

Labeling—Where the labeling indicates the relative quantities of alpha and beta lactose, determine compliance using *Content of alpha and beta anomers*.

▲Where the labeling states the particle size distribution, it also indicates the d_{10}, d_{50}, and d_{90} values and the range for each.▲*NF26*

No change:

USP Reference standards ⟨11⟩—*USP Dextrose RS. USP Fructose RS. USP Anhydrous Lactose RS. USP Sucrose RS.*

Add the following:

▲**Clarity and color of solution**—A solution of 1 g in 10 mL of boiling water is clear and nearly colorless. Determine the absorbance of this solution at a wavelength of 400 nm. The absorbance divided by the path length, in cm, is not more than 0.04.▲*NF26*

No change:

Identification—
A: *Infrared Absorption* ⟨197K⟩.
B: Proceed as directed in *Identification* test *B* under *Lactose Monohydrate,* except to use USP Anhydrous Lactose RS instead of USP Lactose Monohydrate RS in *Standard solution A* and *B* and to use Anhydrous Lactose in the *Test solution*.
C: Proceed as directed in *Identification* test *C* under *Lactose Monohydrate*.

Add the following:

▲**Specific rotation** ⟨781⟩—Dissolve 10 g by heating in 80 mL of water to 50°. Allow to cool, and add 0.2 mL of 6 N ammonium hydroxide. Allow to stand for 30 minutes, and dilute with water to 100 mL: the specific rotation, calculated on the anhydrous basis, determined at 20°, is between +54.4° and +55.9°.▲*NF26*

Add the following:

▲**Microbial limits** ⟨61⟩—The total aerobic microbial count does not exceed 100 cfu per g, the total combined molds and yeasts count does not exceed 50 cfu per g, and it meets the requirements of the test for absence of *Escherichia coli*.▲*NF26*

Add the following:

▲**Acidity or alkalinity**—Dissolve 6 g by heating in 25 mL of carbon dioxide-free water, cool, and add 0.3 mL of phenolphthalein TS: the solution is colorless, and not more than 0.4 mL of 0.1 N sodium hydroxide is required to produce a red color.▲*NF26*

No change:

Loss on drying ⟨731⟩—Dry it at 80° for 2 hours: it loses not more than 0.5% of its weight.

No change:

Water, *Method I* ⟨921⟩: not more than 1.0%, determined on a preparation containing anhydrous lactose in a mixture of methanol and formamide (2 : 1).

Add the following:

▲**Residue on ignition** ⟨281⟩: not more than 0.1%, determined on a specimen ignited at a temperature of 600 ± 50°.▲*NF26*

No change:

Heavy metals, *Method II* ⟨231⟩: 5 µg per g.

Add the following:

▲**Protein and light-absorbing impurities** ⟨851⟩—Measure the light absorption of a 1% (w/v) solution in the range of 210 nm to 300 nm. The absorbance divided by the path length, in cm, is not more than 0.25 in the range of 210 nm to 220 nm and is not more than 0.07 in the range of 270 nm to 300 nm.▲*NF26*

No change:

Content of alpha and beta anomers—
Silylation reagent—Prepare a mixture of pyridine and trimethylsilylimidazole (72 : 28).
Resolution mixture—Prepare a mixture of alpha lactose monohydrate and beta lactose having an anomeric ratio of about 1 : 1 based on the labeled anomeric contents of the alpha lactose monohydrate and the beta lactose.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 4-mm × 0.9-m glass column packed with 3% liquid phase G19 on support S1A. The column temperature is maintained at about 215°, and the injection port and the detector temperatures are maintained at about 275°. The carrier gas is helium, flowing at a rate of about 40 mL per minute.

Derivatization procedure—Transfer about 1 mg of Anhydrous Lactose to a 5-mL reaction vial equipped with a screw cap, add 0.45 mL of dimethyl sulfoxide, seal the vial tightly with a screw cap, and mix on a vortex mixer to dissolve. Add 1.8 mL of *Silylation reagent,* seal the vial tightly with a screw cap, and mix gently. Transfer about 1 mg of *Resolution mixture* to a second 5-mL reaction vial equipped with a screw cap, add 0.45 mL of dimethyl sulfoxide, seal the vial tightly with a screw cap, and mix on a vortex mixer to dissolve. Add 1.8 mL of *Silylation reagent,* seal the vial tightly with a screw cap, and mix gently. Maintain both vials at room temperature for 20 minutes before using.

Procedure—Inject a 2.0-µL portion of the derivatized *Resolution mixture* into the chromatograph, and record the areas for the major peaks: the relative retention times are about 0.7 for the silyl derivative of alpha lactose and 1.0 for the silyl derivative of beta lactose; and the resolution, *R,* between the two peaks is not less than 3.0. Similarly inject a 2.0-µL portion of the derivatized Anhydrous Lactose into the chromatograph, and record the areas for the major peaks. Determine the percentage of alpha anomer in the portion of Anhydrous Lactose taken by the formula:

$$100r_a / (r_a + r_b)$$

in which r_a is the response of the alpha anomer silyl derivative peak, and r_b is the response of the beta anomer silyl derivative peak. Determine the percentage of beta anomer in the portion of Anhydrous Lactose taken by the formula:

$$100r_b / (r_a + r_b)$$

in which the terms are as defined above.

Delete the following:

~~***Other requirements**—It meets the requirements for *Packaging and storage*, *Labeling*, *Clarity and color of solution*, *Specific rotation* ⟨781⟩, *Microbial limits* ⟨61⟩, *Acidity or alkalinity, Residue on ignition* ⟨281⟩, and *Protein and light-absorbing impurities* under *Lactose Monohydrate*.~~ ▲*NF26*

PHARMACOPEIAL PREVIEWS

This section contains potential revisions not yet targeted for official adoption. These may include drafts for new monographs or chapters; drafts for standards that would require new or unusual technology; drafts for which more data are required; or changes that would affect numerous monographs, thus having a broad impact on individual products. Readers should review the drafts in this section and provide comments to the appropriate staff liaison whose name is cited in the Briefing (use the *Staff Directory* to find the contact information).

Briefings Each Preview is preceded by a Briefing in the following format:

BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being used, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How To Use PF*), the name of the scientific staff liaison who handled this item, and the USP tracking correspondence number, as shown in the example below:

(DSN: L. Evans) RTS—55678-1

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of authoritative committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* and *Pharmacopeial Previews* sections. Readers interested in submitting comments should see *Instructions to Authors.*

Pharmacopeial Forum
Vol. 32(6) [Nov.–Dec. 2006]

Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP–NF* revision will be considered for publication in the *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention (USPC) and may not be published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

References—Consult a current copy of the *Pharmacopeial Forum* and the *ACS Style Guide* for assistance with reference style.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Contact Person—When submitting a manuscript, designate one author of the article as correspondent and include that author's full address, telephone number, fax number, and e-mail address.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Graphics that cannot be submitted electronically must be camera-ready, of easily reproducible quality and size, and clearly labeled. Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

Comparative Study of the Chromatographic and Bioassay Procedure for the Determination of Vasopressin Potency*

Hullahalli R. Prasanna,[1] Joseph P. Hanig,[2] and Karl P. Flora[1,3*]

ABSTRACT Vasopressin is a bioactive peptide hormone available as two chemically distinct forms: lysine vasopressin, an antidiuretic, and arginine vasopressin, an antidiuretic and neurotransmitter. Lysine forms are commercially available in intravenous and nasal spray preparations. Previously the *United States Pharmacopeia* (*USP*) measured vasopressin potency by monitoring blood pressure in rats following intravenous administration of the drug. In *USP 29* (with an effective date of January 1, 2007), *USP* subsequently replaced this bioassay with a high-performance liquid chromatographic (HPLC) procedure. We have compared two commercially marketed vasopressin formulations, injection and nasal spray, by the current HPLC and former bioassay procedures. The results indicate a good correlation between the two procedures. HPLC analysis of the nasal spray samples revealed the presence of significant amounts of methyl- and propylparabens that were present in these preparations as excipients.

INTRODUCTION

Vasopressin and oxytocin are bioactive peptide hormones of significant clinical importance (*1*). Vasopressin is present as two chemically distinct forms: lysine vasopressin, a known antidiuretic, and arginine vasopressin, a compound with antidiuretic as well as neurotransmitter activity (*2*). The lysine vasopressin forms are commercially available in the U.S. The vasopressin peptide hormones are synthesized in the hypothalamus and paraventricular nucleus of primates (*3*) and are transported to the posterior pituitary for storage and eventual release. Vasopressin is released as a response to hypo-osmolality, hypovolemia, hypotension, emotional stress, change from prone or sitting to upright posture, and by many pharmacological agents (*4*). For pharmaceutical use, vasopressin as the lysine form is prepared by chemical synthesis. It was previously isolated from the pituitary of domestic animals. Several investigators have developed chromatographic procedures for both qualitative and quantitative evaluation of vasopressin and oxytocin (*5–9*). Based on this work, USP replaced the bioassay procedure with a high-performance liquid chromatography (HPLC) procedure that appeared in *USP 29* with an official date of January 1, 2007. Despite this advance, results are still expressed in units because the physical standard for the new procedure remains a World Health Organization (WHO) standard with assigned value expressed in IU/mL. USP intends to replace this standard with a fully characterized official USP Reference Standard so that results can be expressed in terms of mass. In the case of oxytocin, excellent correlation between chromatographic and bioassay methods has been observed for the determination of potency (*8*). This report presents the results of our comparisons between the current *USP* HPLC procedure for the determination of vasopressin potency and the previous bioassay procedure (*10*) for two different formulations (injectable and nasal spray) of commercially marketed lysine vasopressin. Evaluation of the HPLC method suggests a possible modification of the recent *USP* monograph.

MATERIALS AND METHODS

Chromatographic apparatus

The HPLC system used was a Hewlett-Packard model 1050 quaternary pump, a model 1050 autosampler, and a model 1050 diode array or variable wavelength ultraviolet detector. The data collected were processed using Chemstation software (Hewlett-Packard, Avondale, PA).

Reagents and supplies

The following reagents and solvents were obtained from the suppliers indicated and were used as received: acetonitrile (HPLC grade), methanol (HPLC grade) and glacial acetic acid (reagent grade) (J.T.Baker, Phillipsburg, NJ); dibasic ammonium phosphate (LR grade, Fisher Scientific, Fair Lawn NJ); sodium acetate, methyl- and propylparaben (Aldrich Chemical, Milwaukee, WI); absolute ethyl alcohol (Pharma Products, Bayonne, NJ); and chlorobutanol (Sigma Chemical, St. Louis, MO). Deionized water (NANOpure, Branstead/Thermolyne Corp., Dubuque, IA) was used in the preparation of reagents and the mobile phase. The lysine vasopressin products were collected as routine post-marketing surveillance samples from individual companies. Vasopressin samples analyzed were of two formulation types, injection and nasal spray. Sample diluent was prepared by dissolving 5.0 g of chlorobutanol in 5.0 mL of glacial acetic acid, 5.0 g of ethyl alcohol, 1.1 g of sodium acetate, and 1000 mL of water and thoroughly mixed. This diluent was used to dissolve arginine- or lysine-containing reference standards obtained from WHO. Standard solutions were prepared by adding 1.0 mL of sample diluent to a glass ampoule containing a freeze-dried plug of vasopressin WHO standard (arginine or lysine) to give a final vasopressin concentration of 7.7 International Units (IU)/mL (arginine form) or 8.2 IU/mL (lysine form). Dilutions were made to ob-

tain two other standard concentrations. These concentrations were based on the potencies assigned to the standard materials supplied by WHO. Samples and standards prepared in this manner were suitable for direct injection into the HPLC system. The paraben standards were dissolved in methanol at 1 mg/mL and were diluted with the vasopressin diluent to concentrations suitable for the assay.

Chromatography

Chromatographic assay of Vasopressin as the lysine form was accomplished on a stainless steel column (4.6 mm × 25 cm) containing USP-designated packing L1 (Spherisorb ODS, 5 µm, Beckman Instruments, Inc., Fullerton, CA). The composition of the isocratic mobile phase consisted of 870 mL of 0.05 M ammonium phosphate buffer, pH 3.0, and 130 mL of acetonitrile. The two solutions were individually filtered using 0.45-µm nylon membrane filter and then mixed. Each sample was chromatographed for 90 min at a flow rate of 1.0 mL/min. Detection was accomplished using ultraviolet (UV) at 220 nm with both a variable wavelength and diode array detectors. Diode array UV scans were run and recorded on the components observed in the injected samples. The flow rate was chosen to yield the approximate retention times for vasopressin described in the *USP* monograph (*10*). All separations were accomplished at ambient temperature. The injection volume was 20 µL for all samples and standards.

Bioassay procedure

The rat blood pressure bioassay required for the determination of the potencies of vasopressin was preformed as described in the *USP* monograph (*10*).

RESULTS AND DISCUSSION

Chromatographic techniques of sufficient accuracy, selectivity, precision, and sensitivity have recently been described for quantifying biologically active peptides, including oxytocin and vasopressin. When methods of potency determination for biologically active molecules are replaced by physicochemical procedures, it is important to establish a correlation between the old and the new procedures. The excellent correlation between the chromatographic and the bioassay determinations of potency of oxytocin (*8, 9*) suggested that a correlation for vasopressin could also be established.

Establishment of an HPLC method with a known correlation to the bioassay procedure would facilitate the determination of the potency and purity of commercially marketed products. The observations also could be helpful in evaluating the need for testing in animals to determine the potency of the samples. A chromatographic method may allow the estimation of both process and product impurities and excipients, which would not be possible in the bioassay. Recognizing these possibilities, we evaluated the current *USP* chromatographic analysis and compared it to the bioassay procedure using several commercially marketed samples of vasopressin.

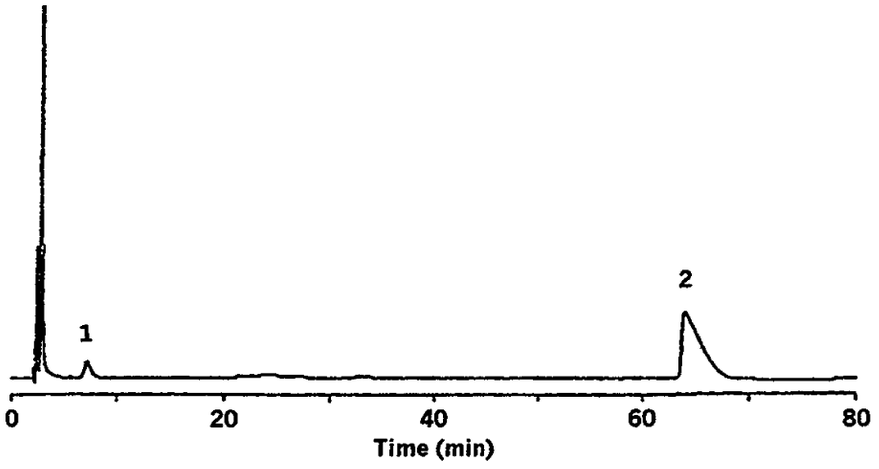

Figure 1. Typical Chromatographic profile of WHO arginine vasopressin standard. Peak 1 = vasopressin; peak 2 = chlorobutanol.

Figure 1 depicts a typical chromatographic profile of the WHO arginine vasopressin standard. In this run 2.0 IU/μL was injected, and experimental conditions were *USP* monograph procedures as described in the Methods section. Although *USP* recommends a 60-min run for each sample for complete elution, under our experimental conditions chlorobutanol, which is contained in the sample diluent, elutes between 65 and 68 min. Therefore, to avoid contamination of subsequent vasopressin samples a run time of 90 min was chosen. The system suitability criteria specified in the monograph were easily met: Resolution between vasopressin and the nearest peak was not less than 1.5 (ratio), and the relative standard deviation (for both retention time as well as peak area) for 10 replicate injections was not more than 2%. Precision data for vasopressin peak area and retention time are presented in *Table 1*.

Table 1. Precision of HPLC vasopressin assay[1]

Retention time (min) (Mean ±RSD[2])	Peak area (Mean ±RSD)
5.5 ±09.004 (<0.1%)	317 ±2.96 (<1.0%)

[1] Ten 20-μL replicates of WHO argenine vasopressin standard (0.164 IU/20 μL) were analyzed separately for 90 min by HPLC.
[2] Relative standard deviation.

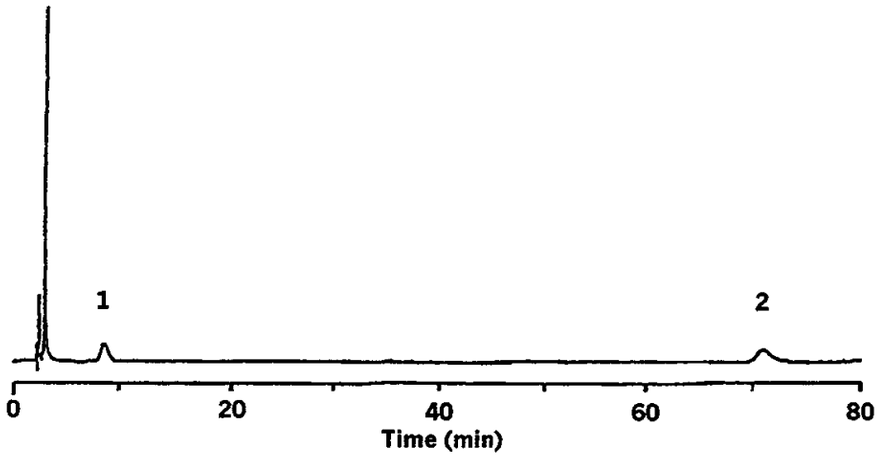

Figure 2. Chromatogram of a commercially marketed injectable sample of vasopressin. Peak 1 = vasopressin; peak 2 = chlorobutanol.

Figure 2 shows a chromatogram of a commercially marketed injectable sample of lysine vasopressin. The sample was diluted with diluent (~ 2.0 units/mL), and 20 μL of the diluted sample was injected. Experimental conditions were *USP* monograph procedures as described in the Methods section. The position of the vasopressin peak agrees well with that of the one noted for the WHO standard. For the assay of the marketed samples of the nasal spray (lysine vasopressin) the appropriate lysine-containing WHO reference standard was used. The *USP* procedure applied here did not chromatographically resolve the arginine and lysine vasopressin standard when mixed in equal amounts. An examination of the chromatograms for the nasal spray product reveals a distinct additional peak eluting at about 37–39 minutes in addition to the expected vasopressin and chlorobutanol peaks (*Figure 3*). In this experiment 20 μL of the sample was injected. Experimental conditions were *USP* monograph procedures as described in the Methods section.

Pharmacopeial Forum
Vol. 32(6) [Nov.–Dec. 2006]

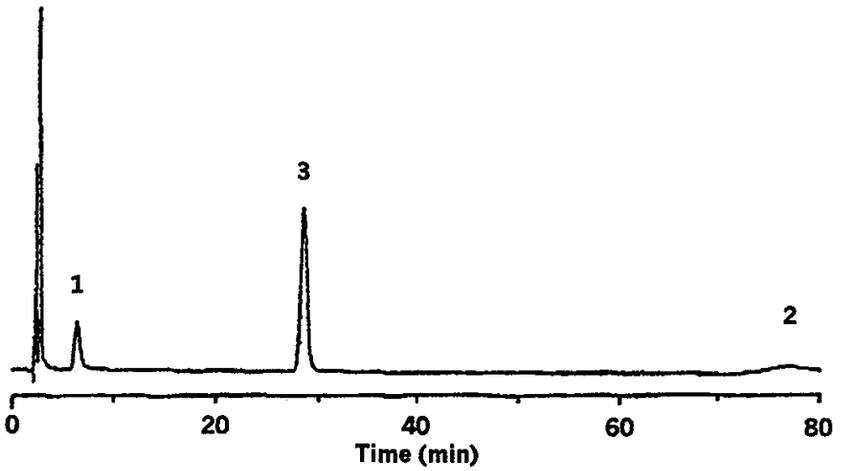

Figure 3. Chromatogram of a commercially marketed sample of vasopressin nasal spray. Peak 1 = vasopressin; peak 2 = chlorobutanol; peak 3 = methylparaben.

At the detection wavelength specified in the *USP* monograph, the area of this peak was severalfold that of the parent vasopressin peak. The package insert for the commercially marketed nasal spray preparation indicates the presence of unspecified amounts of methyl- and propylparaben (methyl or propyl esters of 4-hydroxybenzoic acid) added as preservatives along with chlorobutanol, in addition to other excipients. Authentic samples of methyl- and propylparaben were chromatographed under the same chromatographic conditions to ascertain their elution characteristics. The results indicate that methylparaben elutes at an elution volume consistent with the additional peak observed in the commercial nasal spray samples. When nasal spray samples were spiked with authentic methylparaben, the peaks coeluted. Also, diode array ultraviolet scans of the additional peak observed in the nasal spray and the peak observed with authentic methylparaben produced similar ultraviolet spectra.

However, under the *USP* HPLC assay conditions propylparaben did not elute. In order to confirm the presence of propylparaben in the marketed nasal spray product, the acetonitrile content in the mobile phase was increased to 25%, and 40 µL of the diluted sample was injected (see Methods section). *Figure 4* shows the assay of the marketed nasal spray formulation under these conditions.

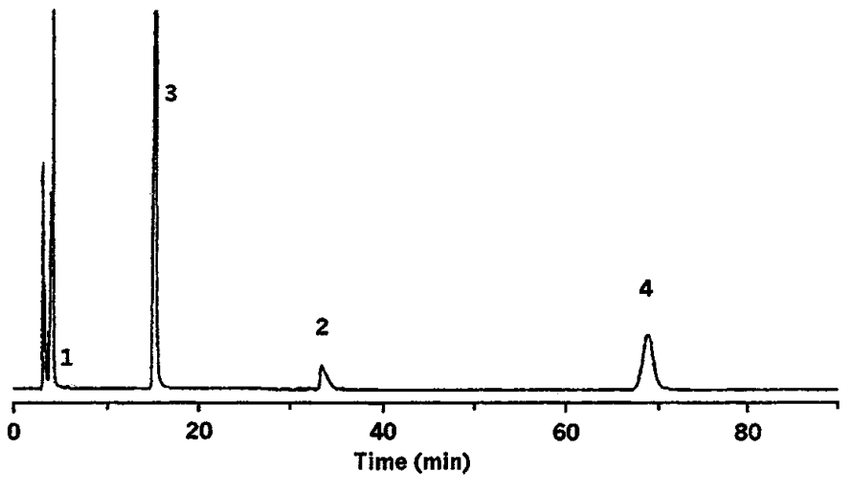

Figure 4. Chromatogram of a commercial sample of vasopressin nasal spray. Peak 1 = vasopressin; peak 2 = chlorobutanol; peak 3 = methylparaben; peak 4 = propylparaben.

An additional peak eluting later than the characteristically tailing peak for chlorobutanol is observed. Diode array scans of the peaks labeled in *Figure 4* are consistent with methyl- and propylparaben. To further confirm the identity of these peaks, we spiked samples of nasal spray formulation with authentic samples of suitable amounts of both methyl- and propylparabens. The chromatographic profile observed in *Figure 5* indicates the coelution of methyl- and propylparaben with the additional peaks observed in the nasal spray product. The mobile phase contained 25% acetonitrile (see the Methods section), and 40 µL of the diluted sample was injected.

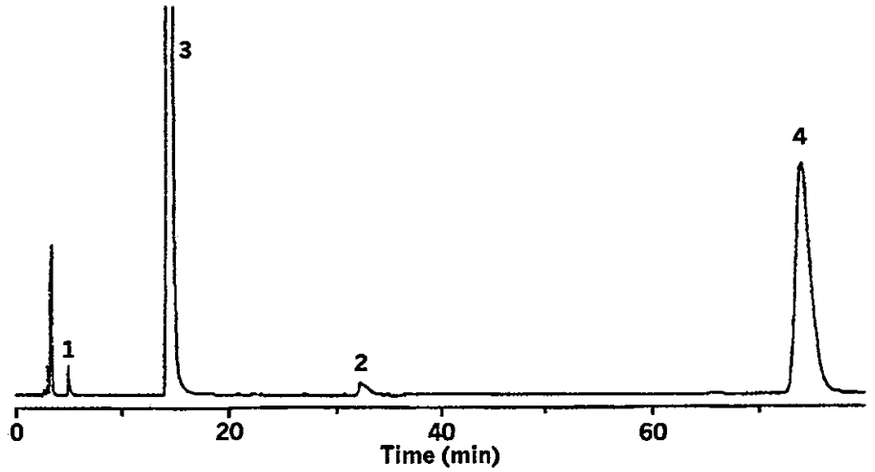

Figure 5. Chromatogram of a commercial sample of vasopressin nasal spray spiked with 50 µg each of methyl- and propylparaben. Peak 1 = vasopressin; peak 2 = chlorobutanol; peak 3 = methylparaben; peak 4 = propylparaben.

The chromatographic identification of the preservatives methyl- and propylparabens in the samples is noteworthy and could be of potential clinical significance. Studies reported elsewhere indicate that parabens can alter the balance of estrogens in animals and humans. The estrogenic aspect of parabens is suspected to increase the risk of breast cancer in humans (*11, 12*). Therefore the identification and quantitation of parabens present as excipients in the commercial nasal spray products in vasopressin samples would be helpful in assessing the quality of the vasopressin samples.

The results obtained from the comparative study undertaken between the chromatographic and bio-identity procedure of commercially marketed samples of vasopressin are presented in *Table 2.*

Table 2. Comparison of HPLC and Bioidentity Methods for the Evaluation of Potency of Vasopressin

	Activity/mL (IU/mL)			Percent of Labeled Content	
		HPLC[†]			
Formulation[*]	Labeled	Mean ±SD	Bioassay	Bioassay	HPLC
Injectable 1	20	22.3 ±0.25	20.37	102	112
Injectable 2	20	23.6 ±0.56	22.00	110	118
Injectable 3	20	18.7 ±0.22	21.30	107	94
Nasal Spray 1	50	47.9 ±1.79	47.20	94	96
Nasal spray 2	50	47.9 ±1.80	51.4	103	96
Nasal Spray 3	50	51.5 ±1.26	NA[‡]	NA	103

[*] Three separate samples of injectable and nasal spray variety obtained from three different manufacturers were used in the analysis.
[†] Vasopressin was measured in triplicate by HPLC and in duplicate for the bioassay.
[‡] NA = Not Analyzed.

When the results are expressed as a percent of the labeled potency, four of six samples meet the newly specified *USP* limits of 90–110% for vasopressin potency as determined by the HPLC assay, whereas all the results of the biological procedure were within the established range (85–120%). These results establish a good correlation measured by both procedures.

SUMMARY

This report demonstrates a good correlation between the chromatographic and bioassay methods for the evaluation of potency of lysine vasopressin in commercially marketed samples. The chromatographic method easily meets the specified system suitability criteria for both retention time and the peak area. The method was robust for potency determination and showed acceptable precision. However, the monograph notes that small changes in the mobile phase composition could result in significant changes in the elution volume of vasopressin. This is perhaps understated because elution volumes were sensitive to different batches of mobile phase prepared in exactly the same way. A similar elution time for vasopressin could be ensured only by using the same batch of mobile phase (*Table 1*). Therefore, large batches of mobile phase may be prepared to cover the analysis of a given set of samples.

The elution of methylparaben in the commercial nasal spray preparation is of some concern because it is not addressed or acknowledged in the *USP* monograph. Perhaps of greater concern is the apparent nonelution of the highly UV-absorbing propylparaben. In our application of the *USP* system propylparaben did not appear to elute either within the 90-min run time or as much as 90 min later. It is not known if this would be the case with other L1 columns. The modification proposed in this study, such as increasing the of time of running the chromotograph (90 min as opposed to 60 min) and additionally a change in the strength of acetonitrile to 25% in the mobile phase demonstrates that both parabens may be eluted, but under these conditions vasopressin elutes with other components of the sample diluent. A possible solution would be to run the system isocratically until after the elution of vasopressin and then to apply a gradient to elute chlorobutanol and the parabens. However, given the sensitivity of the elution of vasopressin to small changes in the mobile phase, significant reequilibration times after the gradient may be required, and this feature will also avoid elution of propylparabens in subsequent injections as a residual component of previous operations.

The results observed in this study indicate that the HPLC method is suitable for the assay of vasopressin in marketed formulations of both injectable and nasal spray varieties. In the revised monograph *USP* should include these features of the assay, identifying the excipient peaks in the nasal spray product, along with a method for detecting them as outlined in this study. We note that USP is working to advance an official USP Reference Standard for both lysine and arginine vasopressin with content (purity) expressed in terms of mass. This will allow a full transition to a standards-based as opposed to a procedures-based approach, with results expressed in terms of mass instead of units.

Determination of Signal-to-Noise Ratio in the Establishment of Quantitation Limit Requirements for Chromatographic Methods in *USP* Monographs—Approaches for Calculation and Implementation

Thomas J. DiFeo, Ph.D.,[*] Oscar A. Quattrocchi, M.S.,[*] Horacio Pappa,[†] Ph.D., *USP*

ABSTRACT USP has postponed indefinitely implementation of the requirements of the text pertaining to detection sensitivity in General Chapter *Chromatography, System Suitability* ⟨621⟩ (*1*). Although the central issue pertains to the impact of the proposal on older procedures that were not initially developed to meet proposed quantitation limit requirements, a more fundamental issue pertains to the appropriate calculation of quantitation limits and the application of such requirements in the monographs. The USP Expert Committee on General Chapters has discussed the issue and proposes to approach the topic first with a test case to gather public feedback about implementing signal-to-noise requirements for chromatographic monographs. This *Stimuli* article outlines the fundamental principles of calculating quantitation limits and considers the current requirements of the *European Pharmacopoeia* and the *Japanese Pharmacopoeia*. The article provides a suggested approach for determining the quantitation limit for monographs and also proposes a process to implement Quantitation Limit Requirements in current and new monographs.

INTRODUCTION

Proposals to establish Quantitation Limits requirements for *USP* monographs were originally published in *Pharmacopeial Forum* in 2004 (*2*). The proposal included a *Quantitation Limit Solution* at a 0.05% concentration level relative to the amount of drug substance in the *Test Preparation* for drug substance and a 0.1% level relative to the amount of drug substance in the *Test Preparation* for the drug product. The proposed requirement was that the signal-to-noise (S/N) ratio for the drug substance peak obtained with the *Quantitation Limit Solution* should not be less than 10. The purpose of the requirement was to ensure that appropriate quantitation limits could be met for calculating impurity levels in the drug substance and drug product *Test Preparations*. Recently, USP has postponed indefinitely the implementation of the requirements of the text pertaining to quantitation limits in General Chapter *Chromatography, System Suitability* ⟨621⟩. This *Stimuli* article explores the calculation of detection sensitivity and approaches to calculate quantitation limits in current and new monographs.

TERMINOLOGY

The draft USP proposal for the addition of detection sensitivity requirements relates to those monographs that have chromatographic-related specifications. The logic behind the requirement is to ensure that the procedure provides adequate quantitation capability to accurately quantify organic impurities (related compounds). The provision for such calculations as part of system suitability ensures that related compounds of interest can be quantified accurately each time the procedure is implemented in a laboratory. The literature is replete with discussions of detection limits, including discussions of limits of quantitation and limits of detection (*3*–*7*). USP had originally proposed the terminology *detection sensitivity* in considerations of quantitation limits. The term *sensitivity* is normally reserved for the slope of the calibration curve (*8*), and the term *detection* usually refers to detectability of peaks rather than the ability to accurately quantify them. In order to avoid confusion of terms, we suggest that the *USP*-proposed terminology of "detection sensitivity" be changed to "quantitation limit requirements" because the proposed measurement examines the limit of quantitation for the procedure.

THEORETICAL BACKGROUND

Although the purpose of this brief article is not to discuss the myriad treatments of detection limits, it is helpful to briefly review some approaches to gain an appreciation of the subject.

The detector output signal from HPLC experiment is the sum of the signal due to the presence of the analyte plus any signal due to the instrument background or blank contribution (*5*):

$$O_{total} = O_{analyte} + O_{blank} \qquad (1)$$

where O is the signal output of the measurement.

Equation 1 can be rewritten as:

$$O_{total} = (bC_x) + a_L + O_{blank} \qquad (2)$$

when expressed in terms of concentration (where b is given by the slope of the response of the analyte of interest, the sensitivity), C_X is the concentration of the analyte, and a_L is a constant relating the linear function of signal and analyte concentration). The analyte signal is given then as:

$$O_{analyte} = bC_x + a_L \qquad (3)$$

At the quantitative concentration limit (assuming for ease of argument that $a_L = 0$), then:

$$O_{total} = bC_x + 0 + O_{blank} \qquad (4)$$

$$O_{total} = bC_x + O_{blank} \qquad (5)$$

[*] Member USP General Chapters Expert Committee

[†] Correspondence should be addressed to: Horacio Pappa, Ph.D., Senior Scientist and Latin American Specialist, 12601 Twinbrook Parkway, Rockville, MD, 20852–1790; e-mail: HP@usp.org.

or:

$$C_x = [O_{total} - O_{blank}]/\, b \qquad (6)$$

At the limit of quantitation, $C_x = C_{limit}$.

Then:

$$C_{limit} = (O_{total} - O_{blank})/\, b \qquad (7)$$

or:

$$O_{total} - O_{blank} = C_{limit}\, b. \qquad (8)$$

The blank signal has associated with it the variability σ and is estimated by the measured standard deviation s from a sample population.

The determination limit (*9*) is given by:

$$O_{total} - O_{blank} = C_{limit}\, b = Ks \qquad (9)$$

where $(O_{total} - O_{blank})$ is the true value of the net signal, and K is a constant determined by the level of acceptable risk, typically set at $K = 10$ for quantitative analysis.

$$C_{limit}\, b = Ks = 10s \qquad (10)$$

$$C_{limit} = (10s)/(b) \qquad (11)$$

CURRENT COMPENDIAL PERSPECTIVES

The *Japanese Pharmacopoeia* does not require measurement of the limit of quantitation on a routine basis for its monographs, although the quantitation limit is given as described in equation 11 in *General Information Chapter for Validation of Analytical Procedures* (*10*).

The *European Pharmacopoeia* (*EP*) requires S/N (*11*) measurements for minor components in some of its product monographs. The *Chromatographic Separation Techniques* chapter of *EP* defines the S/N ratio as:

$$S/N = (2H)/h \qquad (12)$$

where H is the height of the peak of interest and h is the range of the background noise. The value of the *S/N* ratio requirement is monograph dependent and is listed specifically for each monograph. *EP* considers "the background noise in a chromatogram obtained after injection or application of a blank, observed over a distance equal to 20 times the width at half-height of the peak in the chromatogram obtained with the prescribed reference solution and, if possible, situated equally around the place where this peak would be found." The expression "if possible" serves to emphasize the importance of good science in selecting the appropriate portion of the baseline that best represents the baseline noise where the peak of interest elutes. The analyst may begin with a consideration of *EP*'s suggestions and then make appropriate adjustments based on scientific merits.

The *USP* chapter on *Validation of Compendial Methods* ⟨1225⟩ (*12*) indicates that a typically acceptable ratio is 10:1 for the quantitation limit. Other references indicate that this is a generally acceptable level or define the limit as 10 times the standard deviation of the lowest detectable signal (*13, 14*).

SELECTION OF CALCULATION APPROACH

The situations shown in equations 11 and 12 are only two examples of calculation approaches for determination of quantitation limits. The first approach involves the measurement of the standard deviation of the noise, and several injections are required. In the second approach, that of *EP,* the sensitivity determination may be based on as few as one or two injections. Although more accurate analysis can be performed using elaborate statistical analysis, the potential need to perform this calculation on a routine basis requires a practical and simple approach. Other approaches also exist: the measurement of the peak-to-peak noise as described by IUPAC (8), ASTM (*15*), Dolan (*16*), Hinshaw (*17*), the root-mean-square noise (*16*), and the statistical approach described by Miller and Miller (*18*). Whereas the scientific merits of these other approaches are clear, the advantages of harmonization of compendial chapters between *USP* and *EP,* as well as the simplicity of the *EP* approach prevailed in the final analysis.

In addition, with the advent of software programs that enable automatic calculation of quantitation limits, flexibility should be provided to allow such advances. As *EP* indicates in section 2.2.46, "With some equipment, certain parameters, such as the signal-to-noise ratio, can be calculated using software provided by the manufacturer. It is the responsibility of the user to ensure that the calculation methods used in the software are compatible with the requirements of the *European Pharmacopoeia*. If not, the necessary corrections must be made."

Finally, the purpose of the quantitation limits solutions is to ensure that adequate S/N levels exist to ensure analysts' ability to accurately quantitate low-level impurities as described in various monographs. Multiple approaches are possible, but a simple approach is preferred in order to promote harmonized approaches. Arguments can be made that *EP*'s is not the most technically robust approach, but its simplicity, acceptable precision, and the positive outcomes of compendial harmonization lend support to this approach.

IMPLEMENTATION

To resolve the issue, we propose to introduce a *Quantitation Limit Solution* as part of the system suitability test in those chromatographic procedures pertaining to the USP *Impurities* test procedure. The *Quantitation Limit Solution* is a solution of the drug substance generally at a 0.05% concentration level relative to the concentration of the *Test Preparation* for drug substances and generally a 0.1% level relative to the amount of drug substance in the *Test Preparation* for drug products. The *Quantitation Limit Solution* concentration level depends on the quantitation requirements of the procedure. The system is considered suitable for the analysis if the signal-to-noise (S/N) ratio for the drug substance peak obtained with the *Quantitation Limit Solution* is not less than 10. The addition of a *Quantitation Limit Solution* to a monograph ensures that accurate quantitation of related substances can be made at the procedure's specified quantitation level. Implementation of *Quantitation Limit Solution* in current monographs, however, is not practical without additional development and validation of current methods. In fact, it may not be sufficient only to demonstrate the validity of a method at a single working sample concentration. In order to circumvent sensitivity issues

caused by differences in detector sensitivities between laboratories, analysts may need to validate a larger linear concentration range for the active component in order to allow assay concentration changes to meet *Quantitation Limit Solution* requirements that depend on detector sensitivity. For example, instead of giving a simple target concentration for the preparation of the sample solution, it may be helpful to provide a range of concentrations in which the procedure has been demonstrated to be accurate, linear, and precise. To ensure that the instrument is operating in the linear range of the test method, a second sample solution at 50% of the working sample concentration could be tested at the time the procedure is run to ensure a linear response when the higher range of the assay concentration target is used in order to meet the *Quantitation Limit Solution* requirements.

Future monographs should include *Quantitation Limit Solution* as part of the validated method. The validation should include the components discussed above.

CONCLUSION

The inclusion of a *Quantitation Limit Solution* in monographs that require impurity determination should become a standard practice for *USP* monographs that include an impurity limit requirement. The general requirement should be included in ⟨621⟩ and should apply to monographs in which the application of a *Quantitation Limit Solution* has been validated. None of the various approaches to calculating the S/N ratio has overriding advantages from a scientific perspective, and hence the choice with *EP* of a harmonized approach presents advantages in the global pharmaceutical environment. Additional suggestions for validation of methods that include a *Quantitation Limit Solution* may be included in ⟨1225⟩ based on public feedback.

Monograph Redesign Proposal

Todd L. Cecil, *USP*[*]

ABSTRACT This *Stimuli* article presents proposed style, format, and content changes to the *USP–NF* monograph. This article seeks input from readers of *Pharmacopeial Forum* and *USP–NF*.

INTRODUCTION

During the USP Annual Scientific Meeting in September 2005 in San Diego, attendees discussed changes to *USP–NF* to enhance usability. The discussion emphasized the need for changes in monograph style, format, and content. Subsequently, USP staff prepared a new monograph template based on this discussion and presented it to members of the *USP* Council of Experts. With this further input, the template was refined. Presented herewith are *USP* official monographs for Acepromazine Maleate and Acebutolol Hydrochloride Capsules using the new template. Comments will be accepted through February 1, 2007.

STYLE

Concise wording

Despite USP's goal of unambiguous, clear, and concise statements in its publications, the style of writing in *USP–NF* has increasingly relied on extensive descriptions of test procedures and other requirements. The proposed presentation reduces the number of words for these descriptions. Also, procedures would be moved to General Chapters when feasible.

Cross-references

Common tests, procedures, and acceptance criteria in the drug substance and corresponding dosage monograph(s) will be repeated to avoid cross-referencing.

Sections

The International Conference on Harmonization (ICH) Q6A and B guidances categorized tests in a specification into Universal (Description, Identification, Impurities, and Assay) and Specific tests. The proposed template follows this categorization. Similarly, in accordance with ICH, the template provides an Impurity test(s), with procedures for organic, inorganic, and residual solvent impurities. The terms *related compound, chromatographic purity, ordinary impurities,* and the like are eliminated. The proposed template aligns acceptance criteria with the corresponding test; e.g., the Assay test acceptance criteria are moved to the Assay test part of the template. The monograph's Description section in the proposed template includes information described in ICH Q6A as well as information from the Description and Solubility section of *USP–NF*. As before, the latter is informational only and is not intended to be enforced.

Solutions

When possible, the description of the solutions is shortened to include the analyte, solvent, and concentration in SI units. When solvents are complex mixtures, additional description of component solutions is included. Preparation details are excluded. This change allows greater flexibility to the analyst in preparing solution volumes that are appropriate to the task.

PROPOSED CHANGES TO FORMAT

USP traditionally uses combinations of fonts, italics and boldface, and capitalization–lower case to present information. This complexity is often lost on users and only makes the text hard to read and understand. In the proposed template, these combinations are reduced or eliminated. Instead, the proposed template uses a sans serif font that is designed to signal information locus without the need to read entire passages. The template also relies on indenting, including hanging indents with boldface headers, to aid in location of information. The outcome is closer to an outline than a text. Larger type size with more white space is also used to aid comprehension. Although they are not shown in the draft monographs included in this article, lines (rules) may be used to demarcate the beginning and end of a monograph and also to identify commentary within a monograph.

PROPOSED CHANGES TO CONTENT

Content changes are kept to a minimum, but the proposed presentation eliminates calculations. Although discussion of this possibility is underway, comments are solicited now and are expected to be useful.

SUMMARY

Based on comments about this *Stimuli* article and further deliberations, conversion to the new presentation may occur in *USP 32–NF 27* in 2009.

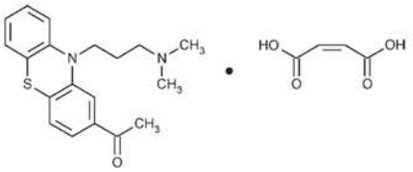
Stimuli to the Revision Process

DRAFT MONOGRAPHS

Acepromazine Maleate



DESCRIPTION

$C_{19}H_{22}N_2OS \cdot C_4H_4O_4$ 442.53

Ethanone, 1-[10-[3-(dimethylamino)propyl]-10*H*-phenothiazin-2-yl]-, (*Z*)-2-butenedioate (1:1).

10-[3-(Dimethylamino)propyl]phenothiazin-2-yl methyl ketone maleate (1:1) [3598-37-6].

IDENTIFICATION

A: *Infrared Absorption* ⟨197K⟩

B: The retention time of the major peak in the chromatogram of the Assay Test solution corresponds to that in the chromatogram of the Assay Standard solution, as obtained in the Assay.

IMPURITIES

Residue on ignition ⟨281⟩: not more than 0.2%

Specified and Unspecified Impurities

[NOTE—Conduct this test without exposure to daylight, and with the minimum necessary exposure to artificial light.]

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Test solution: 20.0 mg/mL acepromazine maleate in methanol and diethylamine (19:1)

Standard solution: 0.1 mg/mL acepromazine maleate in methanol and diethylamine (19:1)

Application volume: 10 µL

Developing solvent system: *n*-heptane, isobutyl alcohol, and diethylamine (75:17:8)

Detection/visualization: short-wavelength UV light

Impurities Acceptance Criteria—No spot, except for the principal spot and origin, is not more intense than the spot in the chromatogram obtained from Standard solution (0.5%).

ASSAY

Solvent A: triethylamine and water (6:700), adjusted to pH 2.5 with phosphoric acid

Mobile phase: Solvent A and acetonitrile (70:30) Make adjustments, if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution: 1 mg/mL USP Acepromazine Maleate RS in 0.05 *N* hydrochloric acid

Standard solution: 0.1 mg/mL of USP Acepromazine Maleate RS: from a 1 to 10 dilution of Standard stock solution with water

Test stock solution: 1 mg/mL acepromazine maleate in 0.05 *N* hydrochloric acid

Test solution: 0.1 mg/mL acepromazine maleate: from a 1 to 10 dilution of Test stock solution with water

Chromatographic system—
Mode: liquid chromatography
Detector: 280 nm
Column: 4-mm × 15-cm: 5-µm L7 packing
Flow rate: about 1 mL/minute
Injection size: about 10 µL

System Suitability—
Sample—Standard Solution
Suitability Acceptance Criteria—
column efficiency: NLT 1500 theoretical plates
relative standard deviation of acepromazine maleate: NMT 2.0%
tailing factor: NMT 2.5

Assay Acceptance Criteria—Acepromazine Maleate contains not less than 98.0% and not more than 101.0% of $C_{19}H_{22}N_2OS \cdot C_4H_4O_4$, calculated on the anhydrous basis.

SPECIFIC TESTS

Melting range ⟨741⟩: between 136° and 139°

pH ⟨791⟩: between 4.0 and 5.5, in a 10 mg/mL solution

Water, *Method I* ⟨921⟩: NMT 1.0%

ADDITIONAL REQUIREMENTS

Packaging and storage—Preserve in well-closed containers, protected from light. Store at room temperature.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards ⟨11⟩:
USP Acepromazine Maleate RS

Acepromazine Maleate Tablets

Acepromazine Maleate Tablets contains acepromazine maleate.

[NOTE—Throughout the following procedures, protect test or assay specimens, the Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

IDENTIFICATION

A: *Infrared Absorption* ⟨197K⟩

Test sample—To a quantity of powdered Tablets equivalent to about 20 mg of acepromazine maleate, add 2 mL of water and 3 mL of 2 N sodium hydroxide, and extract with two 5-mL portions of cyclohexane. Combine the cyclohexane extracts and evaporate to dryness under vacuum, using gentle heat, if necessary.

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

ASSAY

Solvent 1—Add 6 mL of triethylamine to 700 mL of water and adjust with phosphoric acid to a pH of 2.5.

Mobile phase: Solvent 1 and acetonitrile (70:30) Make adjustments, if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock solution: 1 mg/mL of USP Acepromazine Maleate RS in 0.05N hydrochloric acid

Standard solution: Dilute 5 mL of Standard Stock solution with water to 50 mL

Test solution—Transfer not fewer than 10 Tablets, accurately counted, to a 200-mL volumetric flask. Add about 100 mL of 0.05 N hydrochloric acid, and sonicate for about 10 minutes. Shake by mechanical means for about 30 minutes, dilute with 0.05 N hydrochloric acid to volume, and mix. Quantitatively dilute an accurately measured volume of this solution with water to obtain a solution containing about 0.1 mg of acepromazine maleate per mL. Pass a portion of this solution through a filter having a 0.5-µm or finer porosity, and use the filtrate as the Assay preparation.

Chromatographic system—
Mode: liquid chromatography
Detector: UV 280 nm
Column: 4-mm × 15-cm column that contains packing L7
Flow rate: about 1 mL/min
Injection size: about 10 µL

System Suitability—
Sample—Standard Solution
Suitability Acceptance Criteria—
column efficiency: NLT 1500 theoretical plates
relative standard deviation: NMT 2.0%
tailing factor: NMT 2.5

Calculate the quantity, in mg, of acepromazine maleate ($C_{19}H_{22}N_2OS{\cdot}C_4H_4O_4$) in each Tablet taken by the formula:

$$(LC/D)(r_U / r_S)$$

in which L is the labeled quantity, in mg, of acepromazine maleate in each Tablet; C is the concentration, in mg per mL, of USP Acepromazine Maleate RS in the Standard preparation; D is the concentration, in mg per mL, of acepromazine maleate in the Assay preparation, based on the labeled quantity per Tablet, the number of Tablets taken, and the extent of dilution; and r_U and r_S are the acepromazine peak responses obtained from the Assay preparation and the Standard preparation, respectively.

Assay Acceptance Criteria—Acepromazine Maleate Tablets contains not less than 90.0% and not more than 110.0% of $C_{19}H_{22}N_2OS{\cdot}\ C_4H_4O_4$.

ADDITIONAL REQUIREMENTS

Packaging and storage—Preserve in tight, light-resistant containers and store at controlled room temperature.

Labeling—Label the Tablets to indicate that they are for veterinary use only.

USP Reference standards ⟨11⟩:
USP Acepromazine Maleate RS

NOMENCLATURE

This section includes supplements to the latest edition of the *USP Dictionary of USAN and International Drug Names* that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

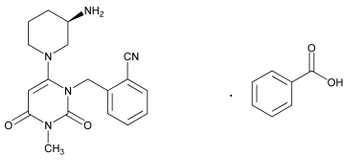
USP Dictionary of USAN and International Drug Names
2006 USP DICTIONARY SUPPLEMENT 4

IMPORTANT—Save this Supplement. This and all supplements appearing in *PF* are needed to keep the 2006 edition of the USP Dictionary (USPD) up-to-date. The cumulative contents of the supplements to the current (2006) edition will be included in the next complete edition of the Dictionary.

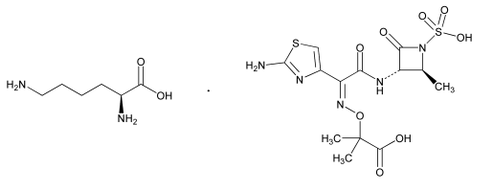
Newly Approved United States Adopted Names (USAN), Released for Publication

The following are newly established United States Adopted Names (USAN). These names will not be listed cumulatively; see preceding and succeeding numbers of *PF* for other new USAN to supplement the Dictionary main volume.

Alogliptin Benzoate [*2006*] (al″ oh glip′ tin). $C_{18}H_{21}N_5O_2 \cdot C_7H_6O_2$. 461.51. (1) Benzonitrile, 2-[[6-[(3*R*)-3-amino-1-piperidinyl]-3,4-dihydro-3-methyl-2,4-dioxo-1(2*H*)-pyrimidinyl]methyl]-, monobenzoate; (2) 6-[(3*R*)-3-Aminopiperidin-1-yl]-1-(2-cyanobenzyl)-3-methylpyrimidin-2,4(1*H*,3*H*)-dione monobenzoate; (3) 2-[[6-[(3*R*)-3-Amino-1-piperidinyl]-3,4-dihydro-3-methyl-2,4-dioxo-1(2*H*)-pyrimidinyl]methyl]benzonitrile monobenzoate. *CAS-850649-62-6*. *Treatment of type 2 diabetes.* (Takeda) ✧*SYR-322*



Aztreonam Lysine [*2005*] (az′ tree oh nam lye′ seen). $C_{13}H_{17}N_5O_8S_2 \cdot C_6H_{14}N_2O_2$. 581.62. (1) L-Lysine, mono[2-[[(*Z*)-[1-(2-amino-4-thiazolyl)-2-[[(2*S*,3*S*)-2-methyl-4-oxo-1-sulfo-3-azetidinyl]amino]-2-oxoethylidene]amino]oxy]-2-methylpropanoate]; (2) L-Lysine, mono[2-[[(*Z*)-[1-(2-aminothiazol-4-yl)-2-[[2*S*,3*S*)-2-methyl-4-oxo-1-sulfoazetidin-3-yl]amino]-2-oxoethylidene]amino]oxy]-2-methylpropanoate. *CAS-827611-49-4*. *Antimicrobial.* Cayston (Corus) ✧*Corus1020*



Balamapimod [*2006*] (bal a map′ i mod). $C_{30}H_{32}ClN_7OS$. 574.14. (1) 3-Quinolinecarbonitrile, 4-[[3-chloro-4-[(1-methyl-1*H*-imidazol-2-yl)thio]phenyl]amino]-6-methoxy-7-[4-(1-pyrrolidinyl)-1-piperidinyl]-; (2) 4-[[3-Chloro-4-[(1-methyl-1*H*-imidazol-2-yl)sulfanyl]phenyl]amino]-6-methoxy-7-[4-(pyrrolidin-1-yl)piperidin-1-yl]quinoline-3-carbonitrile. *CAS-863029-99-6*. *Oncology.* (Wyeth) ✧*MKI-833*

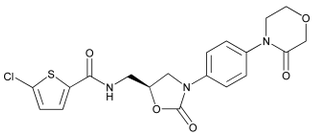
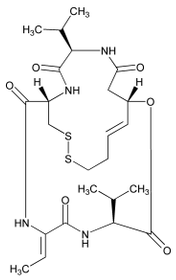
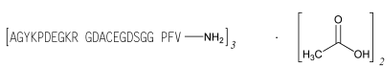
Rivaroxaban [*2006*] (ri va rox′ a ban). $C_{19}H_{18}ClN_3O_5S$. 435.88. (1) 2-Thiophenecarboxamide, 5-chloro-*N*-[[(5*S*)-2-oxo-3-[4-(3-oxo-4-morpholinyl)phenyl]-5-oxazolidinyl]methyl]-; (2) 5-Chloro-*N*-({(5*S*)-2-oxo-3-[4-(3-oxomorpholin-4-yl)phenyl]-1,3-oxazolidin-5-yl}methyl)thiophene-2-carboxamide. *CAS-366789-02-8*. INN. *Prophylaxis of venous thromboembolism.* (Bayer HealthCare) ✧*BAY 59-7939*



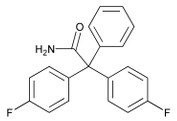
Romidepsin [*2006*] (Roe″ mi dep′ sin). $C_{24}H_{36}N_4O_6S_2$. 540.70. (1) Cyclo[(2*Z*)-2-amino-2-butenoyl-L-valyl-(3*S*,4*E*)-3-hydroxy-7-mercapto-4-heptenoyl-D-valyl-D-cysteinyl], cyclic (3→5)-disulfide; (2) (1*S*,4*S*,7*Z*,10*S*,16*E*,21*R*)-7-Ethylidene-4,21-bis(1-methylethyl)-2-oxa-12,13-dithia-5,8,20,23-tetraazabicyclo[8.7.6]tricos-16-ene-3,6,9,19,22-pentone. *CAS-128517-07-7*. INN. *Antitumor/anticancer drug.* Chromadax (Gloucester) ✧*FR901228; FK228*



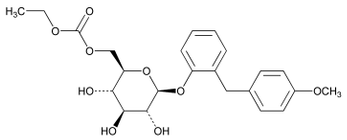
Rusalatide Acetate [*2006*] (roo sal′ a tide). $(C_{97}H_{147}N_{29}O_{35}S)_3.(C_2H_4O_2)_2$. 7054.00. (1) L-Valinamide, L-alanylglycyl-L-tyrosyl-L-lysyl-L-prolyl-L-α-aspartyl-L-α-glutamylglycyl-L-lysyl-L-arginylglycyl-L-α-aspartyl-L-alanyl-L-cysteinyl-L-α-glutamylglycyl-L-α-aspartyl-L-serylglycylglycyl-L-prolyl-L-phenylalanyl-, acetate (3:2) (salt); (2) L-Alanylglycyl-L-tyrosyl-L-lysyl-L-prolyl-L-α-aspartyl-L-α-glutamylglycyl-L-lysyl-L-arginylglycyl-L-α-aspartyl-L-alanyl-L-cysteinyl-L-α-glutamylglycyl-L-α-aspartyl-L-serylglycylglycyl-L-prolyl-L-phenylalanyl-L-valinamide, acetate (3:2) salt. *CAS-875455-82-6*. *Promotes healing of bone, skin wounds, cartilage, cardiovascular tissue and ligaments/tendons.* Chrysalin (OrthoLogic) ✧*TP 508; TRAP-508*



Senicapoc [*2006*] (sen″ i kay′ pok). $C_{20}H_{15}F_2NO$. 323.34. (1) Benzeneacetamide, 4-fluoro-α-(4-fluorophenyl)-α-phenyl-; (2) 2,2-Bis(4-fluorophenyl)-2-phenylacetamide. *CAS-289656-45-7*. *Treatment of disorders mediated by a calcium activated intermediate conductance potassium ion channel antagonist.* (Icagen); (McNeil-PPC) ✧*ICA-17043*

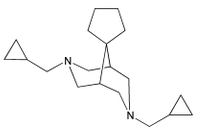


Sergliflozin [*2006*] (ser″ gli floe′ zin). $C_{23}H_{28}O_9$. 448.46. (1) β-D-Glucopyranoside, 2-[(4-methoxyphenyl)methyl]phenyl, 6-(ethyl carbonate); (2) 2-(4-Methoxybenzyl)phenyl 6-*O*-(ethoxycarbonyl)-β-D-glucopyranoside. *CAS-408504-26-7*. *Treatment of type 2 diabetes.* (GlaxoSmithKline) ✧*GW869682X*

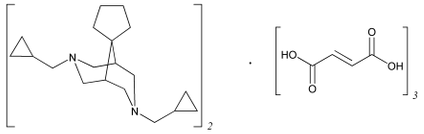


Sipuleucel-T [*2005*] (sye″ pul oo′ sel). Product is a specific active immunotherapeutic composed of antigen-loaded autologous antigen presenting cells designed to stimulate a T cell immune response specific for the tumor-associated antigen prostatic acid phosphatase (PAP). *Treatment of prostate cancer.* Provenge (Dendreon) ✧*APC8015*

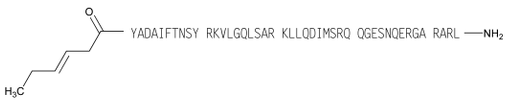
Tedisamil [*2005*] (te dis′ a mil). $C_{19}H_{32}N_2$. 288.47. (1) Spiro[cyclopentane-1,9′-[3,7]diazabicyclo[3.3.1]nonane], 3′,7′-bis(cyclopropylmethyl)-; (2) 3′,7′-Bis(cyclopropylmethyl) spiro[cyclopentane-1,9′-[3,7]diazabicyclo[3.3.1]nonane]. *CAS-90961-53-8*. INN. *Antiarrhythmic agent (K⁺channel blocker)*. (Solvay Pharmaceuticals) ✧*KC8857*



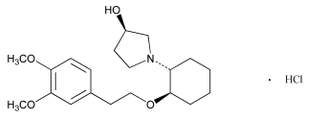
Tedisamil Sesquifumarate [*2005*] (ted″ i′ sam il ses″ kwi fue′ ma rate). $2C_{19}H_{32}N_2 \cdot 3C_4H_4O_4$. 925.16. (1) Spiro[cyclopentane-1,9′-[3,7]diazabicyclo[3.3.1]nonane], 3′,7′-bis(cyclopropylmethyl)-, (2*E*)-2-butenedioate (2:3); (2) Bis[3′,7′-bis(cyclopropylmethyl)-spiro[cyclopentane-1,9′-[3,7]diazabicyclo[3.3.1]nonane]] dihydrogen tris[(2*E*-but-2-enedioate]. *CAS-150501-62-5*. *Antiarrhythmic agent (K⁺ channel blocker);* (Solvay Pharmaceuticals) ✧*KC8857*



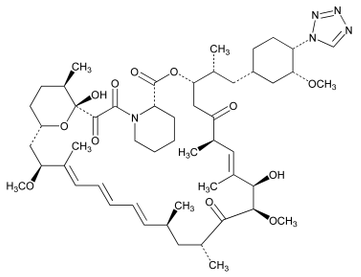
Tesamorelin [*2006*] (tes″ a moe rel′ in). $C_{221}H_{366}N_{72}O_{67}S$. 5135.78. (1) L-Leucinamide, *N*-[(3*E*)-1-oxo-3-hexenyl]-L-tyrosyl-L-alanyl-L-α-aspartyl-L-alanyl-L-isoleucyl-L-phenylalanyl-L-threonyl-L-asparaginyl-L-seryl-L-tyrosyl-L-arginyl-L-lysyl-L-valyl-L-leucylglycyl-L-glutaminyl-L-leucyl-L-seryl-L-alanyl-L-arginyl-L-lysyl-L-leucyl-L-leucyl-L-glutaminyl-L-α-aspartyl-L-isoleucyl-L-methionyl-L-seryl-L-arginyl-L-glutaminyl-L-glutaminylglycyl-L-α-glutamyl-L-seryl-L-asparaginyl-L-glutaminyl-L-α-glutamyl-L-arginylglycyl-L-alanyl-L-arginyl-L-alanyl-L-arginyl-; (2) (3*E*)-Hex-3-enoylsomatoliberin (human). *CAS-218949-48-5*. *Reduction of visceral adipose tissue in patients receiving antiretroviral therapy.* (Theratechnologies) ✧*TH9507*



Vernakalant Hydrochloride [*2006*] (ver nayk′ a lant). $C_{20}H_{31}NO_4 \cdot HCl$. 385.93. (1) 3-Pyrrolidinol, 1-[(1*R*,2*R*)-2-[2-(3,4-dimethoxyphenyl)ethoxy]cyclohexyl]-, hydrochloride, (3*R*)-; (2) (3*R*)-1-[(1*R*,2*R*)-2-[2-(3,4-dimethoxyphenyl)ethoxy]cyclohexyl]pyrrolidin-3-ol hydrochloride. *CAS-748810-28-8*. *Treatment of patients with atrial fibrillation and atrial flutter.* (Astellas); (Cardiome) ✧*RSD1235*



Zotarolimus [*2005*] (zoe ta roe′ li mus). $C_{52}H_{79}N_5O_{12}$. 966.21. (1) Rapamycin, 42-deoxy-42-(1*H*-tetrazol-1-yl)-, (42*S*)-; (2) (1*R*, 9*S*, 12*S*,15*R*,16*E*,18*R*,19*R*,21*R*,23*S*,24*E*,26*E*,28*E*,30*S*,32*S*, 35*R*)-1,18-Dihydroxy-19,30-dimethoxy-12-[(1*R*)-2-[(1*S*,3*R*,4*S*)-3-methoxy-4-(1*H*-tetrazol-1-yl)cyclohexyl]-1-methylethyl]-15,17,21,23,29,35-hexamethyl-11,36-dioxa-4-azatricyclo[30.3.1.$0^{4,9}$]hexatriaconta-16,24,26,28-tetraene-2,3,10,14,20-pentone. *CAS-221877-54-9*. INN. *Drug component of phosphorycholine polymer coated drug-eluting stent currently under evaluation for the prevention of coronary restenosis following stent replacement.* (Abbott) ✧*ABT-578*



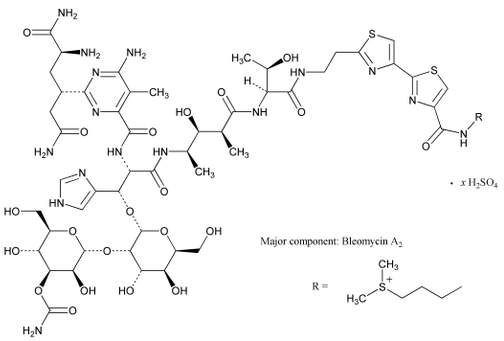
Nomenclature

Revisions of United States Adopted Names (USAN)

The following are revisions of existing United States Adopted Names (USAN) and other names.

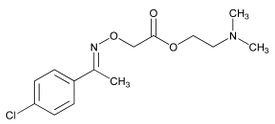
Bleomycin Sulfate

Change the chemical structure to read:



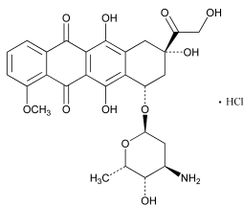
Cloximate

Change the chemical structure to read:



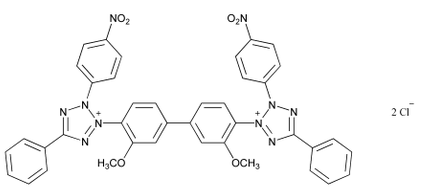
Epirubicin Hydrochloride

Change the chemical structure to read:



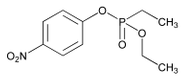
Nitroblue Tetrazolium Chloride

Add the chemical structure to read:



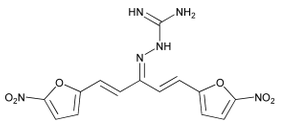
***p*-Nitrophenyl-*O*-ethyl Ethylphosphonate**

Add the chemical structure to read:



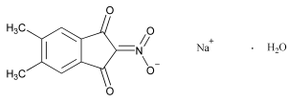
Nitrovin

Add the chemical structure to read:



Nivimedone Sodium

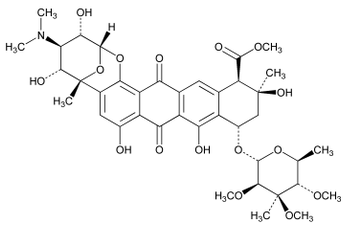
Add the chemical structure to read:



Nogalamycin

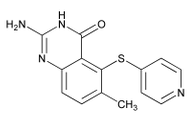
Change the molecular formula and weight and the chemical structure to read:

$C_{39}H_{49}NO_{16}$. 787.80.



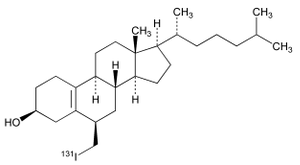
Nolatrexed

Add the chemical structure to read:



Norcholestenol Iodomethyl

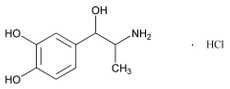
Add the chemical structure to read:



Nordefrin Hydrochloride

Add the chemical information and structure to read:

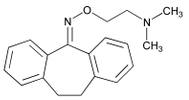
$C_9H_{13}NO_3 \cdot HCl$. 219.67.
(±)-α-(1-Aminoethyl)-3,4-dihydroxybenzyl alcohol hydrochloride.



Noxiptiline

Change the chemical name and structure to read:

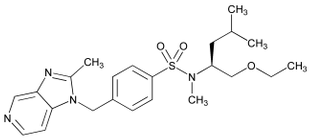
10,11-Dihydro-5*H*-dibenzo[*a,d*]cyclohepten-5-one *O*-[(2-dimethylamino)ethyl]oxime.



Nupafant

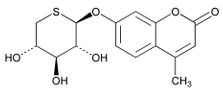
Change the chemical name and structure to read:

N-[(*S*)-1-(Ethoxymethyl)-3-methylbutyl]-*N*-methyl-α-(2-methyl-1*H*-imidazo[4,5-*c*]pyridin-1-yl)-*p*-toluenesulfonamide.



Odiparcil

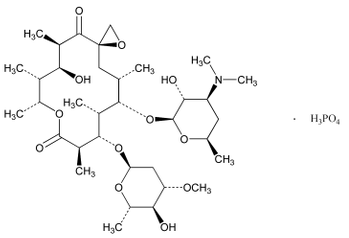
Add the chemical structure to read:



Oleandomycin Phosphate

Add the CAS numbers and change the chemical structure to read:

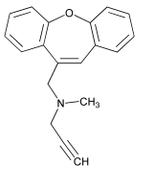
CAS-7060-74-4; CAS-3922-90-5 [oleandomycin].



Omigapil

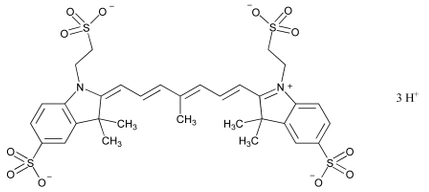
Change the chemical name and add the chemical structure to read:

N-(Dibenzo[*b,f*]oxepin-10-ylmethyl)-*N*-methylprop-2-yn-1-amine.



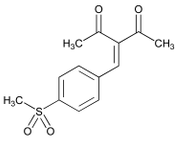
Omocianine

Add the chemical structure to read:



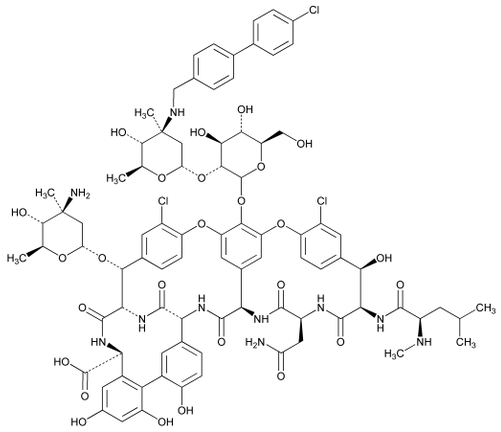
Orazipone

Add the chemical structure to read:



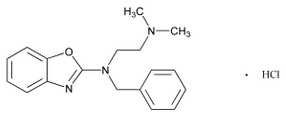
Oritavancin

Change the chemical structure to read:



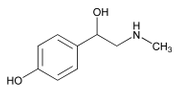
Oxadimedine Hydrochloride

Change the chemical structure to read:



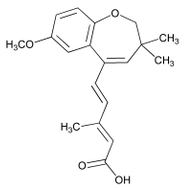
Oxedrine

Add the chemical structure to read:



Oxeglitazar

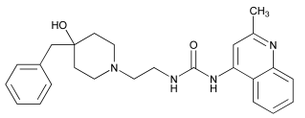
Add the chemical structure to read:



Palosuran

Add the molecular weight and the chemical structure to read:

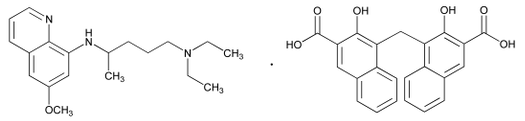
418.53



Pamaquine Naphthoate

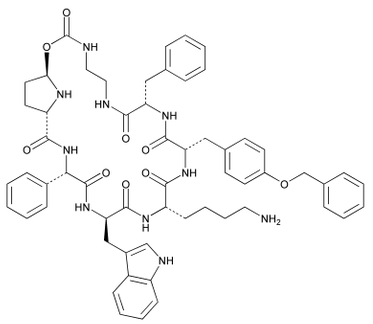
Add the chemical names and change the chemical structure to read:

(1) Quinoline, 6-methoxy-8-(1-methyl-4-diethylamino)butylamino, methylene-bis-β-hydroxynaphthoate; (2) N^1,N^1-Diethyl-N^4-(6-methoxyquinolin-8-yl)pentane-1,4-diamine pamoate.



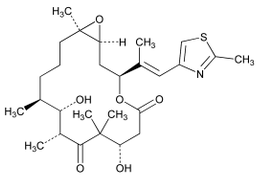
Pasireotide

Add the chemical structure to read:



Patupilone

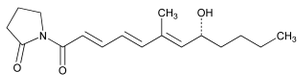
Add the chemical structure to read:



Pecilocin

Add the chemical information and change the chemical structure to read:

$C_{17}H_{25}NO_3$. 291.39. 2-Pyrrolidinone, 1-(8-hydroxy-6-methyl-2,4,6-dodecatrienoyl)-, (*E,E,E*)-(*R*)-.



Pegademase Bovine

Delete the chemical structure

Pegaspargase

Delete the chemical structure

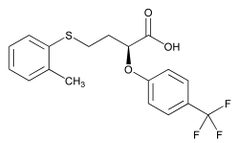
Pegoterate

Delete the chemical structure

Pemaglitazar

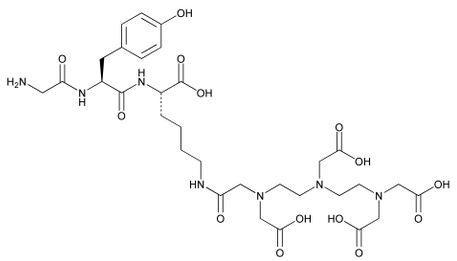
Change the chemical name and add the chemical structure to read:

(2*S*)-4-[(2-Methylphenyl)sulfanyl]-2-[4-(trifluoromethyl)phenoxy]butanoic acid.



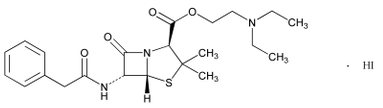
Pendetide

Add the chemical structure to read:



Penethamate Hydriodide

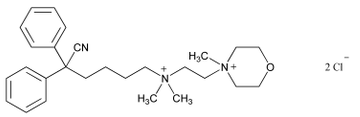
Add the chemical structure to read:



Pentacynium Chloride

Change the chemical name and add the chemical structure to read:

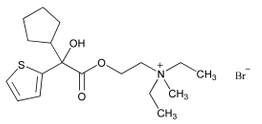
N-[*N*′-(5-Cyano-5,5-diphenylpentyl)-*N*′-dimethylammoniummethyl]-*N*-methylmorpholinium dichloride.



Penthienate Bromide

Add the chemical information and structure to read:

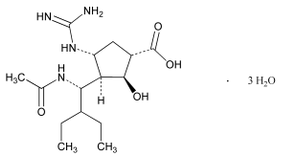
$C_{18}H_{30}BrNO_3S$. 420.40. (1) Diethyl(2-hydroxyethyl)methylammonium bromide α-cyclopentyl-2-thiopheneglycolate; (2) 2-(2-Cyclopentyl-2-hydroxy-2-(thiophen-2-yl)acetoxy)-*N,N*-diethyl-*N*-methylethanaminium bromide.



Peramivir

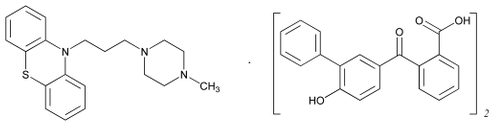
Change the chemical information and structure to read:

$C_{15}H_{28}N_4O_4 \cdot 3H_2O$. (1*S*,2*S*,3*R*,4*R*)-3-[(1*S*)-1-Acetylamino-2-ethylbutyl]-4-[(aminoiminomethyl)amino]-2-hydroxycyclopentanecarboxylic acid.



Perazine Fendizoate

Add the chemical structure to read:



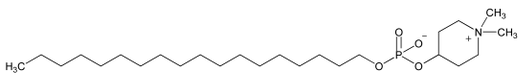
Perflisobutane

Add the chemical structure to read:

Perifosine

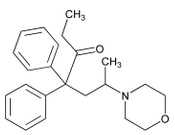
Change the chemical name and add the chemical structure to read:

1,1-Dimethylpiperidinium-4-yl octadecyl phosphate, inner salt.



Phenaxodone

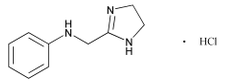
Add the chemical structure to read:



Phenamazoline Hydrochloride

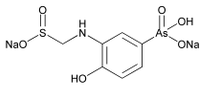
Add the chemical name and change the chemical structure to read:

N-((4,5-Dihydro-1*H*-imidazol-2-yl)methyl)aniline hydrochloride.



Phenarsone Sulfoxylate

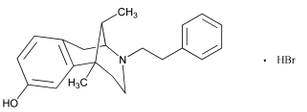
Add the chemical structure to read:



Phenazocine Hydrobromide

Add the chemical information and change the chemical structure to read:

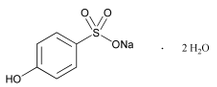
$C_{22}H_{27}NO \cdot HBr$. 402.37. 2′-Hydroxy-5,9-dimethyl-2-phenethyl-6,7-benzomorphan.



Phenolsulphonate Sodium

Add the chemical information and structure to read:

$C_6H_5NaO_4S \cdot 2H_2O$. 232.19. Sodium 4-hydroxybenzenesulfonate, dihydrate. *CAS-10580-19-5*.



Proposed and Recommended International Nonproprietary Names

International Nonproprietary Names (INN) are devised by the World Health Organization (WHO).

Under its charter, the WHO is empowered simply to *recommend* specific actions or procedures to its Member States. This limitation is incorporated into the WHO program concerned with the selection of international nonproprietary names for pharmaceutical substances, in that the WHO first publishes the selected names as *proposals* (''Proposed International Nonproprietary Names''). A period of four months from the date of publication in *WHO Drug Information* is allowed for entering comments on, or objections to, any proposal on the part of Member States or other interested parties. In general, an objection reflects a belief that the proposal concerned is confusingly close to (i.e., conflicts with) a name already in use, perhaps in only a restricted area in which the party has a proprietary interest in the form of trademark rights. In the event that no objection is received, the WHO proceeds with listing and publishing the names so devised as *recommendations* (''Recommended International Nonproprietary Names''), which many Member States then recognize as the sole or preferred nonproprietary name for use within their respective territories.

Proposed International Nonproprietary Names

The following 68 names have been selected by the World Health Organization (WHO) as Proposed International Nonproprietary Names. This list, with chemical names or descriptions and the molecular formulae, appears in *WHO Drug Information,* Vol. 20, No. 2, 2006.

Any comments or formal objections to the proposed names should be addressed to Helene Biernacki, Research Associate, USAN Council, American Medical Association, 515 North State Street, Chicago, Illinois 60610.

Proposed INN	Therapeutic Indication
Abagovomab	*Immunological agent, Antineoplastic*
Iodofiltic Acid (^{123}I)	*Radiopharmaceutical*
Aclidinium Bromide	*Muscarinic receptor antagonist*
Afimoxifene	*Anti-estrogen*
Aflibercept	*Angiogenesis inhibitor*
Aleglitazar	*Antidiabetic*
Alferminogene Tadenovec	*Gene therapy product—stimulates angiogenesis*
Apilimod	*Immunomodulator*
Apricitabine	*Antiviral*
Atacicept	*Immunomodulator*
Azilsartan	*Angiotensin II receptor antagonist*
Bavituximab	*Antineoplastic*
Bedoradrine	*β_2-adrenoceptor agonist*
Beperminogene Perplasmid	*Gene therapy product—stimulates angiogenesis for tissue repair*
Beroctocog Alfa	*Blood coagulation factor*
Bremelanotide	*Melanocortin receptor agonist*
Bucelipase Alfa	*Enzyme*
Camobucol	*Anti-inflammatory*
Capadenoson	*Adenosine A_1 receptor agonist*
Catramilast	*Phosphodiesterase IV inhibitor*
Cediranib	*Angiogenesis inhibitor*
Denibulin	*Antineoplastic*
Dexelvucitabine	*Antiviral*
Efungumab	*Immunomodulator*
Elacytarabine	*Antineoplastic*
Elocalcitol	*Vitamin D analogue*
Elsibucol	*Anti-inflammatory*
Epoetin Theta	*Anti-anaemic*
Ferroquine	*Antimalarial*
Fluticasone Furoate	*Steroidal anti-inflammatory*
Fosalvudine Tidoxil	*Antiviral*
Gamithromycin	*Antibiotic (veterinary use)*
Ilepatril	*Antihypertensive*
Imisopasem Manganese	*Anti-inflammatory*
Inakalant	*Anti-arrhythmic*
Lapaquistat	*Squalene synthase inhibitor*
Levonadifloxacin	*Antibacterial*
Lexatumumab	*Antineoplastic*
Lificiguat	*Guanylate cyclase activator*
Lobeglitazone	*Antidiabetic*
Lorcaserin	*Serotonin receptor agonist*
Mifamurtide	*Antineoplastic*
Migalastat	*Alpha-galactosidase A enzyme inhibitor*
Mirodenafil	*Vasodilator*
Motavizumab	*Immunomodulator*
Naproxcinod	*Anti-inflammatory*
Omtriptolide	*Antineoplastic*
Pafuramidine	*Antiparasitic*
Piraxostat	*Xanthine oxydase inhibitor*
Pramiconazole	*Antifungal*
Prinaberel	*Beta estrogen receptor agonist*
Rilonacept	*Immunomodulator*
Rosabulin	*Antineoplastic*
Sagopilone	*Antineoplastic*
Sodelglitazar	*Antidiabetic*
Sofigatran	*Thrombin inhibitor*
Succinobucol	*Anti-inflammatory*
Taribavirin	*Antiviral*
Tezampanel	*AMPA/KA glutamate receptor antagonist*
Ticagrelor	*Platelet aggregation inhibitor*
Tigapotide	*Antineoplastic*
Tipelukast	*Leukotriene receptor antagonist*
Tomopenem	*Antibiotic*
Tylvalosin	*Antibiotic*
Vabicaserin	*Serotonin receptors agonist, antipsychotic*
Vapitadine	*Tricyclic histamine H_1 receptor antagonist*
Veliflapon	*5-Lipoxygenase activating protein (FLAP) antagonist*
Volinanserin	*Serotonin receptor antagonist*

Recommended International Nonproprietary Names

The following 74 nonproprietary names have been selected by the World Health Organization (WHO) as Recommended International Nonproprietary Names. This list, with chemical names or descriptions and the molecular formulae, appears in *WHO Drug Information,* Vol. 20, No. 3, 2006.

Recommended INN	Recommended INN	Recommended INN	Recommended INN
Alcaftadine	Dilopetine	Mavacoxib	Sitagliptin
Amibegron	Disomotide	Nilotinib	Sontuzumab
Antithrombin Alfa	Dutacatib	Nimotuzumab	Sotirimod
Apadenoson	Eltrombopag	Obatoclax	Stamulumab
Aplaviroc	Eprodisate	Ocrelizumab	Tadocizumab
Avosentan	Fimasartan	Oglemilast	Talotrexin
Axitinib	Fosaprepitant	Olaparib	Telaprevir
Bosutinib	Fospropofol	Orvepitant	Tiplasinin
Brecanavir	Gabapentin Enacarbil	Ovemotide	Tramiprosate
Capeserod	Goxalapladib	Ozarelix	Transferrin Aldifitox
Casopitant	Incyclinide	Paquinimod	Tucotuzumab Celmoleukin
Celivarone	Indantadol	Parogrelil	Velafermin
Cevoglitazar	Ipilimumab	Pazopanib	Verpasep Caltespen
Darapladib	Iratumumab	Relacatib	Vicriviroc
Dasatinib	Larotaxel	Rilapladib	Vorinostat
Denagliptin	Lisdexamfetamine	Rolipoltide	Zibotentan
Denosumab	Lodenafil Carbonate	Romidepsin	Zotarolimus
Dexamethasone Cipecilate	Masilukast	Rotigaptide	
Diaplasinin		Sapacitabine	
		Simotaxel	

INDEX

This is a cumulative directory for the content of all issues of *PF* beginning with *PF* 32(1).

[*Note—This index covers Vol. 32 No. 1, pp. 1–224; Vol. 32 No. 2, pp. 225–704; Vol. 32 No. 3, pp. 705–987; Vol. 32 No. 4, pp. 989–1388; Vol. 32 No. 5, pp. 1389–1617; Vol. 32 No. 6, pp. 1619–1891*]
