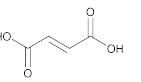
Fumaric Acid, *NF* 27 page 1238. It is proposed to replace the existing non-specific *Identification* test in this monograph with a spectrophotometric *Identification* test employing *Infrared Absorption* ⟨197A⟩.

(EM1: R. Lafaver.) RTS—C72964

Fumaric Acid



$C_4H_4O_4$ 116.07
2-Butenedioic acid, *E-*;
Fumaric acid [110-17-8].

DEFINITION
Fumaric Acid contains NLT 99.5% and NMT 100.5% of $C_4H_4O_4$, calculated on the anhydrous basis.

In-Process Revision

BRIEFING

Propylene Glycol Dilaurate, *NF 27* page 1326. On the basis of comments and data received, it is proposed to make the following changes:

1. Add the chemical structure and formula, molecular weight, and CAS number to the monograph.
2. Revise the alternate chemical names given for Propylene Glycol Dilaurate to indicate the correct chemical composition.
3. Add the application amount of the *Sample solution* and add Propylene Glycol Dilaurate to the *Sample solution* under *Identification* test *A*.
4. Add the *Standard solution* under *Identification* test *A*.
5. Revise the nomenclature of the sample under *Analysis* in the *Assay* to reflect Propylene Glycol Dilaurate.

Interested parties are encouraged to comment on the proposal.

(EM1: R. Lafaver. NOM: A. Wilk.) RTS—C70579

GENERAL CHAPTERS

General Tests and Assays

General Requirements for Tests and Assays

BRIEFING

⟨**1**⟩ **Injections,** *USP 32* page 31 and page 1020 of *PF* 34(4) [July–Aug. 2008]. As a result of comments received and discussions by the Parenteral Products—Industrial Expert Committee, additions to the *Foreign and Particulate Matter* section have been proposed, specifying requirements for types of injection products in relation to the *USP* general test chapter *Particulate Matter in Injections* ⟨788⟩.

(PPI: D. Hunt) RTS—C70804

Change to read:

INGREDIENTS

Vehicles and Added Substances

Aqueous Vehicles—The vehicles for aqueous Injections meet the requirements of the *Pyrogen Test* ⟨151⟩ or the *Bacterial Endotoxins Test* ⟨85⟩, whichever is specified. *Water for Injection* generally is used as the vehicle, unless otherwise specified in the individual monograph. Sodium chloride may be added in amounts sufficient to render the resulting solution isotonic; and *Sodium Chloride Injection,* or *Ringer's Injection,* may be used in whole or in part instead of *Water for Injection,* unless otherwise specified in the individual monograph. For conditions applying to other adjuvants, see *Added Substances* in this chapter.

Other Vehicles—Fixed oils used as vehicles for nonaqueous Injections are of vegetable origin, are odorless or nearly so, and have no odor suggesting rancidity. They meet the requirements of the test for *Solid paraffin* under *Mineral Oil,* the cooling bath being maintained at 10°, have a *Saponification Value* between 185 and 200 (see *Fats and Fixed Oils* ⟨401⟩), have an *Iodine Value* between 79 and 141 (see *Fats and Fixed Oils* ⟨401⟩), and meet the requirements of the following tests.

~~*Unsaponifiable Matter*—Reflux on a steam bath 10 mL of the oil with 15 mL of sodium hydroxide solution (1 in 6) and 30 mL of alcohol, with occasional shaking until the mixture becomes clear. Transfer the solution to a shallow dish, evaporate the alcohol on a steam bath, and mix the residue with 100 mL of water: a clear solution results.~~

~~*Free Fatty Acids*—The free fatty acids in 10 g of oil require for neutralization not more than 2.0 mL of 0.020 N sodium hydroxide (see *Fats and Fixed Oils* ⟨401⟩).~~

■*Unsaponifiable Matter* (see *Fats and Fixed Oils* ⟨401⟩): not more than 1.5%.

Acid Value (see *Fats and Fixed Oils* ⟨401⟩): not more than 0.2.

Peroxide Value (see *Fats and Fixed Oils* ⟨401⟩): not more than 5.0.

Water, Method I ⟨921⟩: not more than 0.1%, using 50 mL of chloroform instead of 35 to 40 mL of methanol as the solvent.

Limit of Copper, Iron, Lead, and Nickel—Proceed as directed in the section *Trace Metals* under *Fats and Fixed Oils* ⟨401⟩. Not more than 1 ppm of copper is found; not more than 1 ppm of iron is found; not more than 1 ppm of lead is found; and not more than 1 ppm of nickel is found.■*2S (USP32)*

Synthetic mono- or diglycerides of fatty acids may be used as vehicles, provided they are liquid, remain clear when cooled to 10°, and have an *Iodine Value* of not more than 140 (see *Fats and Fixed Oils* ⟨401⟩).

These and other nonaqueous vehicles may be used, provided they are safe in the volume of Injection administered, and also provided they do not interfere with the therapeutic efficacy of the preparation or with its response to prescribed assays and tests.

Added Substances—Suitable substances may be added to preparations intended for injection to increase stability or usefulness, unless proscribed in the individual monograph, provided they are harmless in the amounts administered and do not interfere with the therapeutic efficacy or with the responses to the specified assays and tests. No coloring agent may be added, solely for the purpose of coloring the finished preparation, to a solution intended for parenteral administration (see also *Added Substances* under *General Notices* and *Antimicrobial Effectiveness Testing* ⟨51⟩).

Observe special care in the choice and use of added substances in preparations for injection that are administered in a volume exceeding 5 mL. The following maximum limits prevail unless otherwise directed: for agents containing mercury and the cationic, surface-active compounds, 0.01%; for chlorobutanol, cresol, phenol, and similar types of substances, 0.5%; and for sulfur dioxide, or an equivalent amount of the sulfite, bisulfite, or metabisulfite of potassium or sodium, 0.2%.

A suitable substance or mixture of substances to prevent the growth of microorganisms must be added to preparations intended for injection that are packaged in multiple-dose containers, regardless of the method of sterilization employed, unless one of the following conditions prevails: (1) there are different directions in the individual monograph; (2) the substance contains a radionuclide with a physical half-life of less than 24 hours; and (3) the active ingredients are themselves antimicrobial. Such substances are used in concentrations that will prevent the growth of or kill micro-organisms in the preparations for injection. Such substances also meet the requirements of *Antimicrobial Effectiveness Testing* ⟨51⟩ and *Antimicrobial Agents—Content* ⟨341⟩. Sterilization processes are employed even though such substances are used (see also *Sterilization and Sterility Assurance of Compendial Articles* ⟨1211⟩). The air

In-Process Revision

in the container may be evacuated or be displaced by a chemically inert gas. Where specified in a monograph, information regarding sensitivity of the article to oxygen is to be provided in the labeling.

Change to read:

FOREIGN AND PARTICULATE MATTER

All articles intended for parenteral administration shall be prepared in a manner designed to exclude particulate matter as defined in *Particulate Matter in Injections* ⟨788⟩ and other foreign matter. Each final container of all parenteral preparations shall be inspected to the extent possible for the presence of observable foreign and particulate matter (hereafter termed ''visible particulates'') in its contents. The inspection process shall be designed and qualified to ensure that every lot of all parenteral preparations is essentially free from visible particulates. Qualification of the inspection process shall be performed with reference to particulates in the visible range of a type that might emanate from the manufacturing or filling process. Every container whose contents shows evidence of visible particulates shall be rejected. The inspection for visible particulates may take place when inspecting for other critical defects, such as cracked or defective containers or seals, or when characterizing the appearance of a lyophilized product.

Where the nature of the contents or the container-closure system permits only limited capability for the inspection of the total contents, the 100% inspection of a lot shall be supplemented with the inspection of constituted (e.g., dried) or withdrawn (e.g., dark amber container) contents of a sample of containers from the lot.

All large-volume Injections for single-dose infusion and small-volume Injections are subject to the light obscuration or microscopic procedures and limits for subvisible particulate matter set forth in *Particulate Matter in Injections* ⟨788⟩, unless otherwise specified in the individual monograph. An article packaged as both a large-volume and a small-volume Injection meets the requirements set forth for small-volume Injections where the container is labeled as containing 100 mL or less, if the individual monograph states a test for *Particulate Matter in Injections* ⟨788⟩; it meets the requirements set forth for large-volume Injections for single-dose infusion where the container is labeled as containing more than 100 mL. ~~Injections administered exclusively by the intramuscular or subcutaneous route or packaged and labeled for use as irrigating solutions are exempt from requirements for *Particulate Matter in Injections* ⟨788⟩.~~

■Solutions for injection administered by the intramuscular or subcutaneous route must meet the requirements of *Particulate Matter in Injections* ⟨788⟩. Parenterals packaged and labeled exclusively for use as irrigating solutions are exempt from the requirements of *Particulate Matter in Injections* ⟨788⟩. Radiopharmaceutical preparations are exempt from the requirements of *Particulate Matter in Injections* ⟨788⟩. Parenteral products for which the labeling specifies the use of a final filter prior to administration are exempt from the requirements of *Particulate Matter in Injections* ⟨788⟩, provided that scientific data are available to justify this exemption.■1S (*USP33*)

BRIEFING

⟨3⟩ Topical and Transdermal Drug Products—Product Quality Tests. Two new *USP* general chapters on Topical and Transdermal Drug Products address the quality and performance aspects of topical dermal pharmaceutical dosage forms. The general chapters are *Topical and Transdermal Drug Products—Product Quality Tests* ⟨3⟩, which covers the basic quality control tests for these dosage forms, and *Topical and Transdermal Drug Products—Product Performance Tests* ⟨725⟩, which covers the apparatus and procedures used to evaluate the in vitro drug release. Comments and suggestions regarding these two general chapters should be sent to Margareth Marques at MRM@usp.org no later than July 31, 2009. USP is planning a workshop on these general chapters and the comments and suggestions received.

■⟨3⟩ TOPICAL AND TRANSDERMAL DRUG PRODUCTS—PRODUCT QUALITY TESTS

i. **Introduction**

ii. **Glossary of Terms**

iii. **Product Quality Tests for All Topically Applied Drug Products**

  a. **Product Quality Tests for Topical Drug Products Intended for Local Action**

  b. **Product Quality Tests for Transdermal Drug Products**

iv. **Product Performance Test for Topical Drug Products**

v. **In Vitro Drug Release from Semisolid Dosage Forms**

  a. **Theory**

  b. **Application of In Vitro Drug Release**

I. INTRODUCTION

Drug products topically administered via the skin fall into two general categories: those applied to achieve local action and those to achieve systemic effects. Local ac-

In-Process Revision

tion can occur at or on the surface of the skin (the stratum corneum) and also in the epidermis and/or dermis. Locally acting drug products include creams, gels, ointments, pastes, suspensions, lotions, foams, sprays, aerosols, and solutions. Creams, ointments, and gels are generally referred to as semisolid dosage forms. Drug products applied to the skin to achieve systemic effects are referred to as self-adhering transdermal patches or transdermal drug delivery systems (TDS).

Quality tests with procedures and acceptable criteria for both types of topically administered drug products can be divided into those that assess general quality attributes and those that assess performance. The former include identification, assay (strength), content uniformity, pH, microbial limits, and minimum fill. The latter assess drug release from the finished dosage form. For locally acting topical drug products, a product performance test exists only for semisolid formulations. TDS are physical devices that are applied to the skin and vary in their composition and method of fabrication. They release their active ingredients by different mechanisms. Several product performance tests are available to assess in vitro drug release from TDS. Performance tests considered for topically applied products may also be applicable to drug products of similar composition when administered by other routes of administration, e.g., ophthalmic drug products.

II. GLOSSARY OF TERMS

Definitions of topical drug products, brief information about their manufacture, and a glossary of dosage form names can be found in the general information chapter *Pharmaceutical Dosage Forms* ⟨1151⟩.

Absorption Bases—This class of bases may be divided into two groups: bases that permit the incorporation of aqueous solutions with the formation of a water-in-oil emulsion (e.g., *Hydrophilic Petrolatum* and *Lanolin*, both *USP*), and water-in-oil emulsions that permit the incorporation of additional quantities of aqueous solutions (e.g., *Lanolin*, *USP*). Absorption bases also are useful as emollients.

Choice of Base—The choice of an ointment base depends on many factors, such as the action desired, the nature of the medicament to be incorporated and its bioavailability and stability, and the requisite shelf life of the finished product. In some cases, it is necessary to use a base that is less than ideal in order to achieve the stability required. Drugs that hydrolyze rapidly, for example, are more stable in hydrocarbon bases than in bases that contain water, even though they may be more effective in the latter.

Collodion—Collodion (pyroxylin solution; see *USP* monograph *Collodion*) is a solution of nitrocellulose in ether and acetone, sometimes with the addition of alcohol. As the volatile solvents evaporate, a dry celluloid-like film is left on the skin. Because the medicinal use of a collodion depends on the formation of a protective film, the film should be durable, tenacious in adherence, flexible, and occlusive.

Creams—Creams are semisolid dosage forms that contain one or more drug substances dissolved or dispersed in a suitable base. This term traditionally has been applied to semisolids that possess a relatively soft, spreadable consistency formulated as either water-in-oil or oil-in-water emulsions. However, more recently the term has been restricted to products consisting of oil-in-water emulsions or aqueous microcrystalline dispersions of long-chain fatty acids or alcohols that are water washable and more cosmetically and aesthetically acceptable.

Emulsions—Emulsions are viscid multiphase systems in which one or more liquids are dispersed throughout another immiscible liquid in the form of small droplets. When oil is the dispersed phase and an aqueous solution is the continuous phase, the system is designated an oil-in-water emulsion. Conversely, when water or an aque-

ous solution is the dispersed phase and oil or oleaginous material is the continuous phase, the system is designated a water-in-oil emulsion. Emulsions are stabilized by emulsifying agents that prevent coalescence, the merging of small droplets into larger droplets and, ultimately, into a single separated phase. Emulsifying agents (surfactants) act by concentrating at the interface between the immiscible liquids, thereby providing a physical barrier that reduces the tendency for coalescence. Surfactants also reduce the interfacial tension between the phases, facilitating the formation of small droplets upon mixing. The term emulsion is not used if a more specific term is applicable, e.g., cream or ointment.

Foams—Foams are emulsified systems packaged in pressurized containers or special dispensing devices that contain dispersed gas bubbles, usually in a liquid continuous phase, that when dispensed have a fluffy, semisolid consistency.

Gels—Gels (sometimes called jellies) are semisolid systems that consist of either suspensions composed of small inorganic particles or large organic molecules interpenetrated by a liquid. When the gel mass consists of a network of small discrete particles, the gel is classified as a two-phase system (e.g., *Aluminum Hydroxide Gel*, *USP*). In a two-phase system, if the particle size of the dispersed phase is relatively large, the gel mass is sometimes referred to as a magma (e.g., *Bentonite Magma*, *NF*). Both gels and magmas may be thixotropic, forming semisolids after standing and becoming liquid when agitated. They should be shaken before use to ensure homogeneity and should be labeled to that effect (see *Topical Suspensions*, below). Single-phase gels consist of organic macromolecules uniformly distributed throughout a liquid with no apparent boundary between the dispersed macromolecule and liquid.

Hydrocarbon Bases—Hydrocarbon bases, known also as oleaginous ointment bases, are represented by *White Petrolatum* and *White Ointment* (both *USP*). Only small amounts of an aqueous component can be incorporated into these bases. Hydrocarbon bases keep medicaments in prolonged contact with the skin and act as occlusive dressings. These bases are used chiefly for their emollient effects and are difficult to wash off. They do not ''dry out'' or change noticeably on aging.

Lotions—Although the term lotion may be applied to a solution, lotions usually are fluid, somewhat viscid emulsion dosage forms for external application to the skin. Lotions share many characteristics with creams. See *Creams, Topical Solutions,* and *Topical Suspensions*, herein.

Ointments—Ointments are semisolids intended for external application to the skin or mucous membranes. They usually contain less than 20% water and volatiles and more than 50% hydrocarbons, waxes, or polyols as the vehicle. Ointment bases recognized for use as vehicles fall into four general classes: hydrocarbon bases, absorption bases, water-removable bases, and water-soluble bases. Each therapeutic ointment possesses as its base one of these four general classes.

Ophthalmic Ointments—Ophthalmic ointments are semisolids for application to the eye. Special precautions must be taken in the preparation of ophthalmic ointments. They are manufactured from sterilized ingredients under rigidly aseptic conditions, must meet the requirements under *Sterility Tests* ⟨71⟩, and must be free of large particles. The medicinal agent is added to the ointment base either as a solution or as a micronized powder.

Pastes—Pastes are semisolid dosage forms that contain a high percentage (often $\geq$ 50%) of finely dispersed solids with a stiff consistency and intended for topical application. One class is made from a single-phase aqueous gel (e.g., *Carboxymethylcellulose Sodium Paste*, *USP*). The other class, the fatty pastes (e.g., *Zinc Oxide Paste*, *USP*),

consists of thick, stiff ointments that do not ordinarily flow at body temperature and therefore serve as protective coatings over the areas to which they are applied.

Powders—Powders are solids or mixture of solids in a dry, finely divided state for external (or internal) use.

Sprays—Sprays are products formed by the generation of droplets of solution containing dissolved drug for application to the skin or mucous membranes. The droplets may be formed in a variety of ways but generally result when a liquid is forced through a specially designed nozzle assembly. One example of a spray dosage form is a metered-dose topical transdermal spray that delivers a precisely controlled quantity of solution or suspension on each activation.

Transdermal Delivery Systems (TDS)—TDS are self-contained, discrete dosage forms that, when applied to intact skin, are designed to deliver the drug(s) through the skin to the systemic circulation. Systems typically comprise an outer covering (barrier), a drug reservoir that may have a drug release-controlling membrane, a contact adhesive applied to some or all parts of the system and the system/skin interface, and a protective liner that is removed before the patient applies the system. The dose of these systems is defined in terms of the release rate of the drug(s) from the system and surface area of the patch and is expressed as mass per unit time for a given surface area. With these drug products, the skin typically is the rate-controlling membrane for the drug input into the body. The total duration of drug release from the system and system surface area also may be stated.

TDS work by diffusion: the drug diffuses from the drug reservoir, directly or through the rate-controlling membrane and/or contact adhesive if present, and then through the skin into the general circulation. Typically, modified-release systems are designed to provide drug delivery at a constant rate so that a true steady-state blood concentration is achieved and maintained until the system is removed. Following removal of the system, blood concentration declines at a rate consistent with the pharmacokinetics of the drug.

Topical Aerosols—Topical aerosols are products that are packaged under pressure. The active ingredients are released in the form of fine liquid droplets or fine powder particles upon activation of an appropriate valve system. A special form is a metered-dose aerosol that delivers an exact volume (dose) per each actuation.

Topical Solutions—Topical solutions are liquid preparations that usually are aqueous but often contain other solvents such as alcohol and polyols that contain one or more dissolved chemical substances intended for topical application to the skin or, as in the case of *Lidocaine Oral Topical Solution*, *USP*, to the oral mucosal surface.

Topical Suspensions—Topical suspensions are liquid preparations that contain solid particles dispersed in a liquid vehicle intended for application to the skin. Some suspensions labeled as lotions fall into this category.

Water-removable Bases—Water-removable bases are oil-in-water emulsions (e.g., *Hydrophilic Ointment*, *USP*) and are more correctly called creams (see *Creams*, above). They also are described as ''water-washable'' because they may be readily washed from the skin or clothing with water, an attribute that makes them more acceptable for cosmetic purposes. Some medicaments may be more effective in these bases than in hydrocarbon bases. Other advantages of the water-removable bases are that they can be diluted with water and that they favor the absorption of serous discharges in dermatological conditions.

Water-soluble Bases—This group of so-called ''greaseless ointment bases'' comprises water-soluble constituents. *Polyethylene Glycol Ointment*, *NF*, is the only pharmacopeial preparation in this group. Bases of this type offer many of the advantages of the water-removable bases and, in addition, contain no water-insoluble

substances such as petrolatum, anhydrous lanolin, or waxes. They are more correctly called gels (see *Gels*, above).

III. PRODUCT QUALITY TESTS FOR ALL TOPICALLY APPLIED DRUG PRODUCTS

Universal tests are listed below and should be applied to all topically applied drug products.

Description—A qualitative description of the dosage form should be provided. The acceptance criteria should include the final acceptable appearance. If color changes during storage, a quantitative procedure may be appropriate. It specifies the content or the label claim of the article.

Identification—Identification tests are discussed in *Procedures* under *Tests and Assays* in the *General Notices and Requirements*. Identification tests should establish the identity of the drug or drugs present in the article and should discriminate between compounds of closely related structure that are likely to be present. Identity tests should be specific for the drug substances. The most conclusive test for identity is the infrared absorption spectrum (see *Spectrophotometry and Light-Scattering* ⟨851⟩ and *Spectrophotometric Identification Tests* ⟨197⟩). If no suitable infrared spectrum can be obtained, other analytical techniques can be used. Near infrared (NIR) or Raman spectrophotometric methods also could be acceptable for the sole identification of the drug product formulation (see *Near-infrared Spectrophotometry* ⟨1119⟩ and *Raman Spectroscopy* ⟨1120⟩). Identification solely by a single chromatographic retention time is not regarded as specific. However, the use of two chromatographic procedures for which the separation is based on different principles or a combination of tests in a single procedure can be acceptable. See *Chromatography* ⟨621⟩ and *Thin-layer Chromatographic Identification Test* ⟨201⟩.

Assay—A specific and stability-indicating test should be used to determine the strength (content) of the drug product. See *Antibiotics—Microbial Assays* ⟨81⟩, *Chromatography* ⟨621⟩, or *Assay for Steroids* ⟨351⟩. In cases when the use of a nonspecific assay is justified (e.g., *Titrimetry* ⟨541⟩), other supporting analytical procedures should be used to achieve overall specificity. A specific procedure should be used when there is evidence of excipient interference with the nonspecific assay.

Impurities—Process impurities, synthetic by-products, and other inorganic and organic impurities may be present in the drug substance and excipients used in the manufacture of the drug product. These impurities are controlled by the drug substance and excipients monographs. Organic impurities arising from the degradation of the drug substance and those arising during the manufacturing process of the drug product should be monitored.

In addition to the universal tests listed above, the following specific tests may be considered on a case-by-case basis.

Physicochemical Properties—These are properties such as *pH* ⟨791⟩, *Viscosity* ⟨911⟩, and *Specific Gravity* ⟨841⟩.

Uniformity of Dosage Units—This test is applicable for TDS and for dosage forms packaged in single-unit containers. It includes both the mass of the dosage form and the content of the active substance in the dosage form. The test can be performed by either content uniformity or weight variation (see *Uniformity of Dosage Units* ⟨905⟩).

Water Content—A test for water content should be included when appropriate (see *Water Determination* ⟨921⟩).

Microbial Limits—The type of microbial test(s) and acceptance criteria should be based on the nature of the drug substance, method of manufacture, and the intended use of the drug product. See *Microbiological Ex-*

amination of Nonsterile Products: Microbial Enumeration Tests ⟨61⟩ and *Microbiological Examination of Nonsterile Products: Tests for Specified Microorganisms* ⟨62⟩).

Antimicrobial Preservative Content—Acceptance criteria for preservative content in multidose products should be established. They should be based on the levels of antimicrobial preservative necessary to maintain the product's microbiological quality at all stages throughout its proposed usage and shelf life (see *Antimicrobial Effectiveness Testing* ⟨51⟩).

Antioxidant Preservative Content—If antioxidant preservatives are present in the drug product, tests of their content normally should be determined.

Sterility—Depending on the use of the dosage form (e.g., ophthalmic preparations), sterility of the product should be demonstrated as appropriate (see *Sterility Tests* ⟨71⟩).

III. a. PRODUCT QUALITY TESTS FOR TOPICAL DRUG PRODUCTS INTENDED FOR LOCAL ACTION

Additional tests for locally acting topical dosage forms are provided in this section. Some of these may also be used for some nitroglycerin semisolids.

Viscosity—Rheological properties such as viscosity of semisolid dosage forms can influence their drug delivery. Viscosity may directly influence the diffusion rate of a drug at the microstructural level. Yet semisolid drug products with comparatively high viscosity still can exhibit high diffusion rates when compared to semisolid products of comparatively lower viscosity. These observations emphasize the importance of rheologic properties of semisolid dosage forms, specifically viscosity, on drug product performance.

Depending on its viscosity, the rheological behavior of a semisolid drug product may affect its application to treatment site(s) and consistency of treatment and thus the delivered dose. Therefore, maintaining reproducibility of a product's flow behavior at the time of release is an important product manufacturing control that manufacturers should use to maintain and demonstrate batch-to-batch consistency. Most semisolid dosage forms, when sheared, exhibit non-Newtonian behavior. Structures formed within semisolid drug products during manufacturing can show a wide range of behaviors, including shear thinning viscosity, thixotropy, and structural damage that may be irreversible or only partially reversible. In addition, the viscosity of a semisolid dosage form is highly influenced by factors such as the inherent physical structure of the product, product sampling technique, sample temperature for viscosity testing, container size and shape, and specific methodology employed in the measurement of viscosity.

A variety of methods can be used to characterize the consistency of semisolid dosage forms, including penetrometry, viscometry, and rheometry. With all methods significant attention is warranted to the shear history of the sample. For semisolids, viscometer geometries typically fall into the following categories: concentric cylinders, cone-plates, and spindles. Concentric cylinders and spindles typically are used for more fluid, flowable semisolid dosage forms. Cone-plate geometries are more typically used when the sample size is small or the test samples are more viscous and less flowable.

When contemplating what viscosity parameter(s) to test, one must consider the properties of the semisolid drug product both ''at rest'' (in its container) and as it is sheared during application. The rheological properties of the drug product at rest can influence the product's shelf life, and its properties under extensive shear can influence its spreadability and, therefore, its application rate that will affect the safety and efficacy of the drug product. Further, although it is necessary to precisely control the temperature of the test sample during the viscosity measurement, one should link the specific choice

of the temperature to the intended use of the drug product (e.g., skin temperature for external application effects).

Because semisolid dosage forms frequently display non-Newtonian flow properties, formulators should give close attention to the shear history of the sample being tested, such as the shear applied during the filling operation, shear applied dispensing the product from its container, and shear when introducing the sample into the viscometer. The point of reemphasizing this aspect is that considerable variability and many failures to meet specifications can be directly attributed to a lack of attention to this detail rather than a change of viscosity (or flow properties) of the drug product.

Tube (Content) Uniformity—Tube uniformity is the degree of uniformity of the amount of active drug substance among containers, i.e., tubes containing multiple doses of the semisolid topical product. The uniformity of dosage is demonstrated by assay of top, middle, and bottom samples (typically 0.25–1.0 g) obtained from a tube cut open to withdraw respective samples for drug assay.

Various topical semisolid products may show some physical separation at accelerated storage temperatures because emulsions, creams, and topical lotions are prone to mild separation due to the nature of the vehicle.

The following procedure should be followed for testing tube uniformity of semisolid topical dosage forms:

1. Carefully remove or cut off the bottom tube seal and make a vertical cut up the face of the tube. Then carefully cut the tube around the upper rim and pry open the two ''flaps'' to expose the semisolid.
2. At the batch release and/or designated stability time point remove and test 0.25- to 1.0-g samples from the top, middle, and bottom of a tube. If assay values for those tests are within 90.0%–110.0% of the labeled amount of active drug, and the relative standard deviation (RSD) is not more than 6%, then the results are acceptable.
3. If at least one value of the testing described above is outside 90.0%–110.0% of the labeled amount of drug and none is outside 85.0%–115.0% and/or the RSD is more than 6%, then test an additional three randomly sampled tubes using top, middle, and bottom samples as described. Not more than 3 of the 12 determinations should be outside the range of 90%–110.0% of the labeled amount of drug, none should be outside 85.0%–115.0%, and the RSD should not be not more than 7%.
4. For very small tubes (e.g., 5 g or less), test only top and bottom samples, and all values should be within the range of 90.0%–110.0% of the labeled amount of drug.

pH—When applicable, semisolid drug products should be tested for pH at the time of batch release and designated stability test time points for batch-to-batch monitoring. Because most semisolid dosage forms contain very limited quantities of water or aqueous phase, pH measurements may be warranted only as a quality control measure, as appropriate.

Particle Size—Particle size of the active drug substance in semisolid dosage forms is determined and controlled at the formulation development stage. When applicable, semisolid drug products should be tested for any change in the particle size or habit of the active drug substance at the time of batch release and designated stability test time points (for batch-to-batch monitoring) that could compromise the integrity and/or performance of the drug product, as appropriate.

Ophthalmic Dosage Forms—Ophthalmic dosage forms must meet the requirements of *Sterility Tests* ⟨71⟩. If the specific ingredients used in the formulation do not lend themselves to routine sterilization techniques, ingredients that meet the sterility requirements described under *Sterility Tests* ⟨71⟩, along with aseptic manufacture, may be employed. Ophthalmic ointments must contain a suitable substance or mixture of sub-

stances to prevent growth of, or to destroy, microorganisms accidentally introduced when the container is opened during use, unless otherwise directed in the individual monograph or unless the formula itself is bacteriostatic (see *Added Substances* under *Ophthalmic Ointments* ⟨771⟩). The finished ointment must be free from large particles and must meet the requirements for *Leakage* and for *Metal Particles* in *Ophthalmic Ointments* ⟨771⟩. The immediate containers for ophthalmic ointments shall be sterile at the time of filling and closing. It is mandatory that the immediate containers for ophthalmic ointments be sealed and tamper-proof so that sterility is assured at time of first use.

III. b. PRODUCT QUALITY TESTS FOR TRANSDERMAL DRUG PRODUCTS

The product quality tests for TDS drug products include assay, content uniformity, homogeneity, and adhesive.

Uniformity of Dosage Units—This test is applicable for TDS and for dosage forms that are packaged in single-unit containers. It includes both the mass of the dosage form and the content of the active substance in the dosage form. It can be done by either content uniformity or weight variation (see *Uniformity of Dosage Units* ⟨905⟩).

Assay of excipient(s) critical to the performance of the product should be considered; e.g., residual solvent content can affect certain patches.

Adhesive Test—Three types of adhesive tests generally are performed to ensure the performance of the TDS dosage forms. These are the peel adhesion test, tack test, and shear strength test. The peel adhesion test measures the force required to peel away a transdermal patch attached to a stainless steel test panel substrate at panel angles of 90° or 180° following a dwell time of 1 minute and peel rate of 300 mm/minute.

The tack test is used to measure the tack adhesive properties of TDS dosage forms. With this test a probe touches the adhesive surface with light pressure, and the force required to break the adhesion after a brief period of contact is measured.

The shear strength or creep compliance test is a measure of the cohesive strength of TDS dosage forms. Two types of shear testing are performed: dynamic and static. During dynamic testing the TDS is pulled from the test panel at a constant rate. With the static test the TDS is subjected to a shearing force by means of a suspended weight.

Leak Test—A test that is discriminating and capable of detecting sudden drug release, such as leakage, from the TDS should be performed. Although form, fill, and seal TDS are more likely to display leak problems, all TDS should be checked for sudden drug release (dose dumping) during release testing of the dosage form.

IV. PRODUCT PERFORMANCE TEST FOR TOPICAL DRUG PRODUCTS

A performance test for topical drug products must have the ability to measure drug release from the finished dosage form. It must be reproducible and reliable, and although it is not a measure of bioavailability, the performance test must be capable of detecting changes in drug release characteristics from the finished product. The latter have the potential to alter the biological performance of the drug in the dosage form. Those changes may be related to active or inactive/inert ingredients in the formulation, physical or chemical attributes of the finished formulation, manufacturing variables, shipping and storage effects, aging effects, and other formulation factors critical to the quality characteristics of the finished drug product. Product performance tests can serve many useful purposes in product development and in post-approval drug product monitoring. They provide assurance of equivalent performance for products that

have undergone postapproval raw material changes, relocation or change in manufacturing site, and other changes as detailed in the FDA's Guidance for Industry SUPAC-SS: *Nonsterile Semisolid Dosage Forms; Scale-Up and Postapproval Changes: Chemistry, Manufacturing, and Controls; In Vitro Release Testing and In Vivo Bioequivalence Documentation* (May 1997) (available at www.fda.gov/cder/guidance/1447fnl.pdf). In this general chapter, a USP performance test for semi-solid dosage forms to support batch release is considered. Details of the procedure are provided in the general chapter *Topical and Transdermal Drug Products—Product Performance Tests* ⟨*725*⟩ (proposed).

V. IN VITRO DRUG RELEASE FROM SEMISOLID DOSAGE FORMS

V. a. THEORY

The vertical diffusion cell (VDC) system is a simple, reliable, and reproducible means of measuring drug release from semisolid dosage forms. A thick layer (200–400 mg) of the test semisolid is placed in contact with a reservoir. Diffusive communication between the delivery system and the reservoir takes place through an inert, highly permeable support membrane. The membrane keeps the product and the receptor medium separate and distinct. Membranes are chosen to offer the least possible diffusional resistance and not to be rate controlling. Samples are withdrawn from the reservoir at various times. In most cases, a 5- to 6-hour time period is all that is needed to characterize drug release from a semisolid, and when this is the case samples usually are withdrawn hourly.

After a short lag period, release of drug from the semisolid dosage form in the VDC system is kinetically describable by diffusion of a chemical out of a semi-infinite medium into a sink. The momentary release rate tracks the depth of penetration of the forming gradient within the semisolid. Beginning at the moment when the receding boundary layer's diffusional resistance assumes dominance of the kinetics of release, the amount of the drug released, *M*, becomes proportional to $\sqrt{t}$ (where $\sqrt{t}$ = time) for solution, suspension, or emulsion semisolid systems alike. The momentary rate of release, *dM/dt*, becomes proportional to $1/\sqrt{t}$, which reflects the slowing of drug release with the passage of time. The reservoir is kept large so that drug release is into a medium that remains highly dilute over the entire course of the experiment relative to the concentration of drug dissolved in the semisolid. In this circumstance drug release is said to take place into a diffusional sink.

When a drug is totally in solution within the dosage form, the amount of drug released as a function of time can be described by:

$$M = 2 \cdot Co\sqrt{D \cdot t} / \pi$$

where:

M = amount of drug released into the sink per cm^2

Co = drug concentration in releasing matrix

D = drug diffusion coefficient through the matrix.

A plot of *M* vs $\sqrt{t}$ will be linear with a slope of

$$2 \cdot Co\sqrt{D} / \pi$$

Equation 2 describes drug release when the drug is in the form of a suspension within the dosage form:

$$M = \sqrt{2 \cdot Dm \cdot Cs(Q - Cs/2)t}$$

where:

Dm = drug diffusion coefficient in the semisolid matrix

Cs = drug solubility in the releasing matrix

In-Process Revision

Q = total amount of the drug in solution and suspended in the matrix.

When $Q >> Cs$, Equation 2 simplifies to Equation 3.

$$M = \sqrt{2 \cdot Q \cdot Dm \cdot Cs \cdot t}$$

A plot of M vs $\sqrt{t}$ will be linear with a slope of $\sqrt{2QDmCs}$.

Coarse particles may dissolve so slowly that the moving boundary layer recedes to some extent behind the particles. That situation introduces noticeable curvature in the *t* plot because of a particle size effect. During release rate experiments, every attempt should be made to keep the composition of the formulation intact during the releasing period.

V. b. APPLICATION OF DRUG RELEASE

Drug release results can be utilized for purposes such as ensuring product sameness after SUPAC-SS-related changes or successive batch release comparisons. This is illustrated by the following example in which the initial drug batch is referred to as Reference Batch (R) and the changed or subsequent batch is referred to as Test Batch (T). The individual amount released from R is plotted vs time, and the resulting slope is determined. These are the reference slopes (RS). The process is repeated to determine the test slopes (TS).

The T/R ratios are calculated for each Test to Reference Slope. This is facilitated if one creates a table where the TS are listed down the left side of the table and the RS are listed across the top of the table. The T/R ratios are then calculated and entered in the body of the table.

After the T/R ratios have been calculated they are ordered from lowest to highest. The 8th and 29th T/R ratios are extracted and converted to percent (multiply by 100). To pass the first stage these ratios must fall within the range of 75%–133.33%.

If the results do not meet this criterion, the SUPAC-SS Guidance requires that four more tests of six cells each should be run, resulting in 12 additional slopes per product tested. The T/R ratios are calculated for all 18 slopes per product tested. All 324 individual T/R ratios are calculated and ordered lowest to highest. The 110th and the 215th ratios are evaluated against the specification of 75%–133.33%.

Third stage testing is not suggested.

Change to read:

INTRODUCTION

Elastomeric closures for containers used in the types of preparations defined in the general test chapter *Injections* 〈1〉 are made of materials obtained by vulcanization (cross-linking) polymerization, polyaddition, or polycondensation of macromolecular organic substances (elastomers). Closure formulations contain natural or synthetic elastomers and inorganic and organic additives to aid or control vulcanization, impart physical and chemical properties or color, or stabilize the closure formulation.

•This chapter applies to closures used for long-term storage of preparations defined in the general test chapter *Injections* 〈1〉. Such closures are typically used as part of a vial, bottle, or pre-fill syringe package system.• (RB 1-May-2009)

This chapter applies to closures formulated with natural or synthetic elastomeric substances. This chapter does not apply to closures made from silicone elastomer; however, it does apply to closures treated with silicone (e.g., Dimethicone, *NF*). When performing the tests in this chapter, it is not required that closures be treated with silicone, although there is no restriction prohibiting the use of siliconized closures.

•This chapter also applies to closures coated with other lubricious materials (e.g., materials chemically or mechanically bonded to the closure) that are not intended to, and in fact do not provide, a barrier to the base elastomer. When performing the tests, closures with lubricious nonbarrier coatings are to be tested in their coated state.

The following comments relate solely to closures laminated or coated with materials intended to provide, or in fact function as, a barrier to the base elastomer (e.g., PTFE or lacquer coatings). It is not permissible to use a barrier material in an attempt to change a closure that does not meet compendial requirements to one that does conform. Therefore, all *Physicochemical Tests* apply to the base formula of such closures, as well as to the coated or laminated closure. To obtain *Physicochemical Tests* results, the tests are to be performed on uncoated or nonlaminated closures of the same elastomeric compound, as well as to the laminated or coated closure. The *Functionality Tests* apply to and are to be performed using the laminated or coated elastomeric closure. *Biological Tests* apply to the lamination or coating material, as well as to the base formula. *Biological Tests* may be performed on the laminated or coated closure, or they may be performed on the laminate/coating material and the uncoated or nonlaminated closures of the same elastomeric compound. In the latter case, the results are to be reported separately. The base formula used for physicochemical or biological tests intended to support the compendial compliance of a barrier-coated closure should be similar to the corresponding coated closure in configuration and size.

For all *Elastomeric Closures for Injection* 〈381〉 tests performed on any closure type, it is important to document the closure being tested, including a full description of the elastomer, and any lubrication, coating, laminations, or treatments applied.• (RB 1-May-2009)

This chapter states test limits for Type I and Type II elastomeric closures. Type I closures are those used for aqueous preparations. Type II closures are typically intended for nonaqueous preparations and are those which, having properties optimized for special uses, may not meet all requirements listed for Type I closures because of physical configuration, material of construction, or both. If a closure fails to meet one or more of the Type I test requirements, but still meets the Type II requirements for the test(s), the closure is assigned a final classification of Type II.

▪All elastomeric closures suitable for use with injectable preparations must comply with either Type I or Type II test limits. However, this specification is not intended to serve as the sole evaluation criteria for the selection of such closures.▪1S (*USP33*)

~~This chapter is intended as an initial screen to identify elastomeric closures that might be appropriate for use with injectable preparations on the basis of their biological compatibility~~

▪It is appropriate to use this chapter when identifying elastomeric closures that might be acceptable for use with injectable preparations on the basis of their biological reactivity,▪1S (*USP33*)
their aqueous extract physicochemical properties, and their functionality. ~~All elastomeric closures suitable for use with injectable preparations comply with either Type I or Type II test~~

In-Process Revision

~~limits. However, this specification is not intended to serve as the sole evaluation criteria for the selection of such closures.~~

■1S (*USP33*)
The following closure evaluation requirements are beyond the scope of this chapter:
— The establishment of closure identification tests and specifications
— The verification of closure–product physicochemical compatibility
— The identification and safety determination of closure leachables found in the packaged product
— The verification of packaged product closure functionality under actual storage and use conditions

The manufacturer of the injectable product (the end user) must obtain from the closure supplier an assurance that the composition of the closure does not vary and that it is the same as that of the closure used during compatibility testing. When the supplier informs the end user of changes in the composition, compatibility testing must be repeated, totally or partly, depending on the nature of the changes. Closures must be properly stored, cleaned for removal of environmental contaminants and endotoxins, and sterilized prior to use in packaging injectable products.

Physical Tests and Determinations

BRIEFING

⟨725⟩ Topical and Transdermal Drug Products—Product Performance Tests. Two new *USP* general chapters on Topical and Transdermal Drug Products address the quality and performance aspects of topical dermal pharmaceutical dosage forms. The general chapters are *Topical and Transdermal Drug Products—Product Quality Tests* ⟨3⟩, which covers the basic quality control tests for these dosage forms and *Topical and Transdermal Drug Products—Product Performance Tests* ⟨725⟩, which covers the apparatus and procedures to be used to evaluate the in vitro drug release. The HPLC procedure for the hydrocortisone analysis was validated using a Symmetry C18 brand of packing L1. Comments and suggestions regarding these two general chapters should be sent to Margareth Marques at MRM@usp.org no later than July 31, 2009. USP is planning a workshop on these general chapters and the comments and suggestions received.

(BPC: M. Marques.) RTS—C71037

Add the following:

■⟨725⟩ TOPICAL AND TRANSDERMAL DRUG PRODUCTS—PRODUCT PERFORMANCE TESTS

i. **Introduction**

  c. **Apparatus 7—Reciprocating Holder Method**
iv. **Product Quality Tests**

I. INTRODUCTION

A performance test for topical drug products must be able to measure drug release from the finished dosage form. It must be reproducible and reliable, and although it is not a measure of bioavailability, the performance test must be capable of detecting changes in the finished product's drug release characteristics that have the potential to alter the biological performance of the drug in the dosage form. This product performance test is provided to determine compliance with drug release requirements where specified in individual monographs.

II. PERFORMANCE TEST FOR TOPICAL (SEMISOLID) DRUG PRODUCTS—IN VITRO DRUG RELEASE USING THE VERTICAL DIFFUSION CELL

The vertical diffusion cell (VDC) system is a simple, reliable, and reproducible means of measuring drug release from semisolid (cream, ointment, and gel) dosage forms. Typically, 200–400 mg of a cream, ointment, or gel is spread evenly over a suitable synthetic, inert support membrane. The membrane, with its application side up, is placed in a VDC (typically a 15-mm diameter orifice), e.g., a Franz cell. Diffusive communication between the delivery system and the reservoir takes place through an inert, highly permeable support membrane. The membrane keeps the product and the receptor medium separate and distinct. Membranes are chosen to offer the least possible diffusional resistance and not to be rate controlling. The release rate experiment is carried out at $32 \pm 1^{\circ}$, except in the case of vaginal creams when the temperature should be $37 \pm 1^{\circ}$. Sampling generally is performed during 4–5 h, and the volume withdrawn is replaced with fresh receptor medium. To achieve sink condition, the receptor medium must have a high capacity to dissolve or carry away the drug, and the receptor media should not exceed 10% of the concentration of the standard at the end of the test. The test is done with groups of six cells. Results from 12 cells—two runs of 6 cells—are used to document the release rate.

II. a. Apparatus

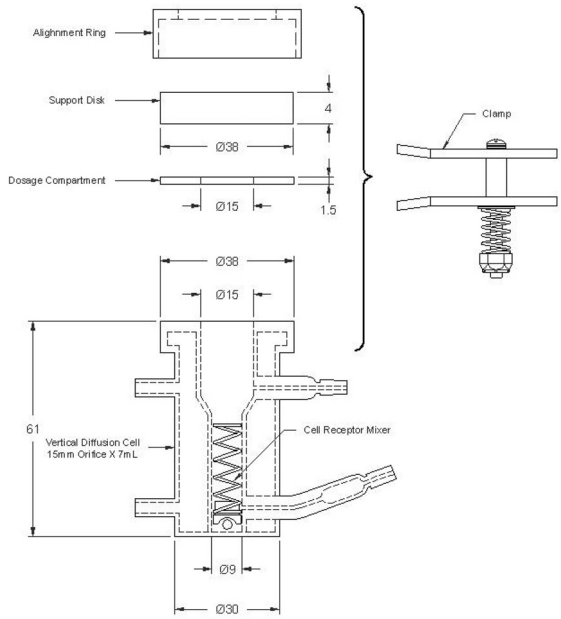

Fig. 1. Vertical Diffusion Cell.
(All measurements are expressed in mm unless noted otherwise.)

The VDC assembly consists of two chambers (a donor chamber and a receptor chamber), separated by a donor compartment and held together by a clamp (see *Figure 1*). This type of cell is commonly used for testing the in vitro release rate of topical drug products such as creams, gels, and ointments. Alternative diffusion cells that conform to the same general design and size can be used.

The VDC body normally is made from borosilicate glass, although different materials may be used to manufacture the body and other parts of the VDC assembly. None of the materials should react with or absorb the test product or samples.

In the donor compartment, the semisolid dosage form sample sits on a synthetic membrane within the cavity of the dosage compartment that is covered with a glass disk.

The diameters of the orifices of the donor chamber and the dosage compartment, which defines the dosage delivery area for the test, should be sized within ±5% of the specified diameter. The receptor chamber orifice should never be smaller than the orifice of the donor chamber and should be fabricated to the same size as the donor chamber orifice. The design of the VDC should facilitate proper alignment of the dosage compartment and receptor orifices.

The thickness of the dosage compartment normally is 1.5 mm. This thickness should be sized within ± 10% of the specified thickness.

The cell body should be manufactured consistently, with uniform height and geometry. Cells should appear the same, and their internal receptor volumes should fall within ±5% of their specified volume.

Volume—Before conducting testing, determine the true volume of each receptor chamber in the VDC. The volume of each VDC should be determined with the internal stirring device in place.

Temperature—The temperature of the receptor media during the test should remain within ±1.0° of the target temperature (typically 32°).

Speed—The rotational speed tolerance is ±10% from the target speed (normally 600–800 rpm). The speed selected should ensure adequate mixing of the receptor media during the test.

Sampling Time—Samples should be taken at the specified times within a tolerance of ±2% or ±2 minutes, whichever is greatest.

Qualification—The qualification of the apparatus is demonstrated by verifying the test temperature and speed requirements are met, along with a performance verification test (PVT). The PVT is passed if two tests of six cells comply with FDA's requirements of a 90% confidence interval (see FDA *Guidance for Industry: Nonsterile Semisolid Dosage Forms; Scale-Up and Postapproval Changes: Chemistry, Manufacturing, and Controls; In Vitro Release Testing and In Vivo Bioequivalence Documentation,* May 1997, available at www.fda.gov/cder.guidance/1447fnl.pdf). The PVT is performed by one analyst testing the specified reference standard in duplicate. The first test with six cells is performed and is defined as the reference. The second test of six cells is defined as the test. The PVT is passed if the second test passes the 90% confidence interval with reference to the first reference test.

Procedure—Unless otherwise specified in the individual monograph, degas the medium using an appropriate technique. With the stirring device in place, fill the VDC with the specified media and allow time for it to come to a temperature of 32°. If necessary, saturate the membrane in the specified media (generally receptor media) for 30 minutes. Place the membrane on the dosage compartment and invert. Apply the material that will be tested into the cavity of the dosage compartment, and spread the material out to fill the entire cavity of the dosage compartment.

Assemble each of the prepared dosage compartments to each VDC with the membrane down and in contact with the receptor media. During this application it is important to ensure that there are no bubbles under the membrane. When all dosage compartments and the remaining components are in place, turn on the stirring device, which constitutes time zero.

Follow the specified sampling procedure, and collect an aliquot from each VDC for analysis. Ensure that during the sampling process bubbles are not introduced into the cell. Exercise care during sampling and replenishment of the medium in order not to introduce bubbles.

With some cells it is acceptable to have up to three bubbles under the membrane if the bubbles are less than 1 mm in diameter. With some cells, bubbles may be removed from the receptor chamber during the test by tipping the cell as long as this process is required only one time per position.

II. b. Calculation of Rate (Flux) and Amount of Drug Released

Creams and ointments are considered extended-release preparations. Their drug release largely depends on the formulation and method of preparation. The release rate of a given drug product from different manufacturers is likely to be different. It is assumed that the drug release of the product is linked to the clinical batch.

Unless otherwise specified in the individual monograph, the release requirements are met if the following have been achieved.

The amount released (μg/cm²) at a given time (t_1, t_2, etc.) is calculated for each sample as follows:

$$\text{Amount Released } t_1 = A_U / A_S \cdot C_S \cdot 1{,}000 \cdot V_C / A_O$$

$$\text{Amount Released } t_2 = A_U / A_S \cdot C_S \cdot 1{,}000 \cdot V_C / A_O + (AR_{t1} \cdot V_S / V_C)$$

where

A_U = area of the current sample

$$\text{Amount Released } t_n = \frac{A_U}{A_S} \cdot C_S \cdot 1000 \cdot \frac{V_C}{A_O} + \sum_{i=1}^{n-1} \left(AR_{t_{n-1}} \cdot \frac{V_S}{V_C} \right)$$

A_S = average area of the standard

C_S = concentration of the standard (mg/mL)

V_C = volume of the diffusion cell (mL)

A_O = area of the orifice (cm²)

AR = amount released (μg/cm²)

V_S = volume of the sample aliquot (mL).

For each cell the individual amount released is plotted vs time, and the slope of the resulting line (rate of drug release, flux) is determined. The average of 6 + 6 slopes represents the drug release of the dosage form and serves as the standard for the drug product.

II. c. Performance Verification Test of VDC Systems using the USP Hydrocortisone Cream Reference Standard

Materials and Equipment—USP Hydrocortisone Cream RS; 25-mm, 0.45-μm hydrophilic polysulfone membrane filters (*1*); vacuum filtration apparatus consisting of a filter holder with a medium or fine-porosity sintered glass holder base, funnel with a 250-mL capacity, and magnetic stirrer; small and smooth jeweler's forceps; depression porcelain color plate; diffusion cell system with six diffusion cells and temperature control circulator; and sampling syringe or device and collection vials.

Procedure

Receptor Medium—Mix 60 mL of Alcohol with 140 mL of water to prepare a 30% alcoholic media. Degas the media by filtering through a 47-mm, 0.45-μm membrane by vacuum filtration. Assemble the filtration apparatus placing a magnetic stir bar (approximately 1 in. × 0.25 in.) in the receiving flask. Place the apparatus on a magnetic stirring plate, and spin the bar at a moderate rate. Apply vacuum and pass the media through the filter while stirring. After all media have passed through the filter, continue stirring while maintaining a vacuum for 2 minutes. Applying vacuum and stirring beyond 2 minutes may change the composition of the water-alcohol media. Care should be taken to ensure that the period of time that the media is under vacuum after the filtration is complete is limited to 2 minutes.

Immediately transfer the degassed receptor medium to a suitable receptor medium bottle and stopper. Place the receptor medium bottle in the jacketed beaker and allow the media to equilibrate for 30 minutes before use.

Preparation of Apparatus

Set the circulating bath to a temperature (typically 32.5°) that will maintain the temperature in the diffusion cells at 32° during the test. Place the appropriate magnetic stirrer in each diffusion cell. Allow the system to equilibrate for at least 30 minutes before beginning the test.

Membrane Preparation

Thirty minutes before use, prepare at least seven membranes. Using a Pasteur pipette, apply receptor medium to the surface of each membrane until covered. Allow the membranes to equilibrate for 30 minutes to saturate the membranes.

Sample Preparation

Carefully lift one membrane at its very edge with jeweler's forceps. Place the membrane on a paper tissue and blot any extreme excess solution (a slight excess solution is desired). Carefully place the membrane in the center of the dosage compartment. Place the dosage compartment, with the membrane centered on the underside, onto a tissue and press down on the compartment. Apply an appropriate amount of USP Hydrocortisone Cream RS (between 200 and 400 mg) on top of the membrane and inside of the dosage compartment cavity. Use a spatula to carefully smooth the material over the membrane, filling the entire cavity of the dosage compartment. Wipe any excess material from the surface of the dosage compartment. Repeat for a total of six sample preparations.

Performing the Test

Fill the diffusion cells with receptor media, and allow time to equilibrate to 32°. Ensure that the stirrers are not rotating and that there is a positive meniscus covering the complete top of each diffusion cell. Place the glass disk on top of the dosage compartment against the sample. Place the dosage compartment/glass disk assembly on the top of the diffusion cell, avoiding bubbles. Inspect under the membrane for bubbles. Assemble the cell. Repeat for each cell. Begin the test according to the following test parameters: temperature: 32°; stir speed: 600–800 rpm; total test time: 6 hours; sampling times: 1, 2, 3, 4, and 6 hours.

Sampling Procedure

At each of the stated sampling times, collect a sample from each cell as follows: stop the stirrer 30 seconds before sampling. Repeat sampling procedure for each cell in order from 1 to 6. Replace the medium. After the sixth cell has been sampled, resume the stirrer rotation.

High-Performance Liquid Chromatography (HPLC) Hydrocortisone Analysis

USP Hydrocortisone RS; acetonitrile; water; alcohol, 95%; 47-mm, 0.45-μm polysulfone membrane filters; 50 mm × 3.9 mm, 5-μm packing L1.

Procedure

Mobile Phase Preparation

Prepare and degas a sufficient volume of mobile phase to complete the analysis of the samples collected. For each 1 L of mobile phase mix 200 mL of acetonitrile with

800 mL of water. If necessary, adjust the mobile phase composition to achieve an approximate retention time of 7 minutes for the hydrocortisone peak.

Standard Preparation

Prepare a stock standard solution at a concentration of approximately 0.20 mg/mL of USP Hydrocortisone RS in alcohol. For example, a solution of 20 mg of hydrocortisone in 100 mL of alcohol is suggested. Prepare a working standard solution by making a 5-fold dilution of the stock standard in a solution of 30 : 70 alcohol:water mixture. For example, dilute 2 mL to 10 mL.

Chromatographic Conditions

Wavelength—242 nm; flow rate: 1 mL/min; injection volume: 10 μL; run time: 10 minutes; column: 5 cm × 3.9 mm, 5-μm packing L1; mobile phase: 20 : 80 acetonitrile:water. Begin the analysis by making five replicate injections of the working hydrocortisone standard solution for system suitability.

System Suitability Requirements—Relative standard deviation: < 2%; tailing factor: NMT 1.5. Make single injections of each of the samples obtained during the in vitro release testing. Bracket injections of samples with single standard injections after the analysis of the 2-, 4-, and 6-hour samples. Calculate the results as specified.

III. PERFORMANCE TESTS FOR TRANSDERMAL DRUG PRODUCTS

As with topical drug products, a performance test for transdermal drug products also must have the ability to measure drug release from the finished dosage form, must be reproducible and reliable, and must be capable of detecting changes in the finished product's drug release characteristics that have the potential to alter the desired pharmacologic effect(s) of the active ingredient. Such changes could be related to active or inactive/inert ingredients in the formulation or physical dosage form, physical or chemical attributes of the finished preparation, manufacturing variables, shipping and storage, age, and other characteristics that are critical to quality.

When based on sound scientific principles, product performance tests can be used for pre- and postmanufacturing purposes such as during the product research and development phase, basic quality control, demonstration of product similarity, or demonstration of compliance with FDA Guidelines (e.g., approval and postapproval changes in the dosage form).

In vitro drug release testing of transdermal patches can be carried out using USP Apparatus 5, Apparatus 6, or Apparatus 7. In general, researchers have found that Apparatus 5, the modified paddle method, is simpler and is applicable to most types, sizes, and shapes of transdermal delivery systems. At this time, no PVT Reference Standard exists for Apparatus 5, 6, or 7.

III. a. Apparatus 5 (Paddle Over Disk Method)

Apparatus—Use the paddle and vessel assembly from *Apparatus 2* as described in *Dissolution* ⟨711⟩, with the addition of a stainless steel disk assembly (*2*) designed for holding the transdermal system at the bottom of the vessel. Other appropriate devices may be used, provided they do not absorb, react with, or interfere with the specimen being tested (*3*). The temperature should be maintained at 32 ± 0.5°. During the test maintain a distance of 25 ± 2 mm between the paddle blade and the surface of the disk assembly. The vessel may be covered during the test to minimize evaporation. The disk assembly for holding the transdermal system is designed to minimize any dead volume between the disk assembly and the bottom of the vessel. The disk assembly holds the

system flat and is positioned so that the release surface is parallel with the bottom of the paddle blade (see *Figure 2*).

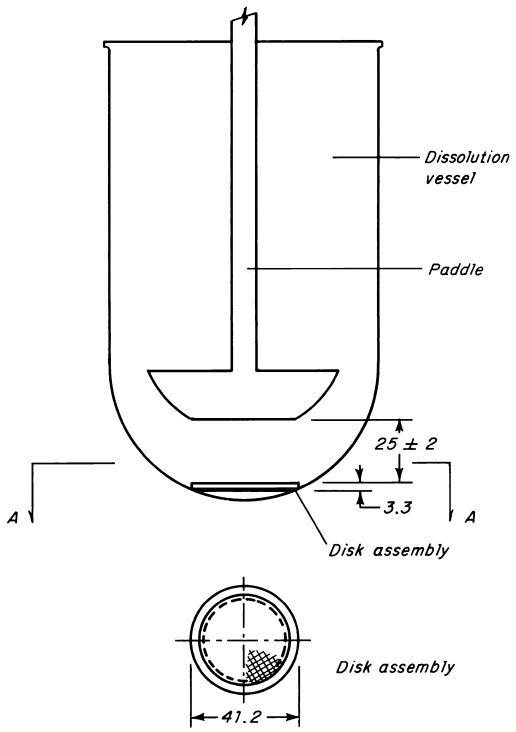

Fig. 2. Paddle over Disk.
(All measurements are expressed in mm unless noted otherwise.)

Performance Verification Test and Dissolution Medium—Proceed as directed for *Apparatus 2* in *Dissolution* ⟨711⟩.

Procedure—Place the stated volume of the *Dissolution Medium* in the vessel, assemble the apparatus without the disk assembly, and equilibrate the medium to 32 ± 0.5°. Apply the transdermal system to the disk assembly, ensuring that the release surface of the system is as flat as possible. The system may be attached to the disk by applying a suitable adhesive to the disk assembly. Dry for 1 minute. Press the system, release surface side up, onto the adhesive-coated side of the disk assembly. If a membrane[3] is used to support the system, it should be applied in such a way that no air bubbles occur between the membrane and the release surface. Place the disk assembly flat at the bottom of the vessel with the release surface facing up and parallel to the edge of the paddle blade and surface of the *Dissolution Medium*. The bottom edge of the paddle should be 25 ± 2 mm from the surface of the disk assembly. Immediately start operation of the apparatus at the rate specified in the monograph. At each sampling time interval, withdraw a specimen from a zone midway between the surface of the *Dissolution Medium* and the top of the blade, not less than 1 cm from the vessel wall. Perform the analysis on each sampled aliquot as directed in the individual monograph, correcting for any volume losses, as necessary. Repeat the test with additional transdermal systems.

Sampling Time—The test time points, generally three, are expressed in hours. Specimens should be withdrawn within a tolerance of ±15 minutes or ±2% of the stated time; select the tolerance that results in the narrowest time interval.

In Vitro Release Criteria—Unless otherwise specified in the individual monograph, the requirements are met if the quantities of active ingredient released from the system conform to *Acceptance Table 1* for transdermal drug delivery systems. Continue testing through the three levels unless the results conform at either L_1 or L_2.

Acceptance Table 1

Level	Number Tested	Criteria
L_1	6	No individual value lies outside the stated range.
L_2	6	The average value of the 12 units ($L_1 + L_2$) lies within the stated range. No individual value is outside the stated range by more than 10% of the average of the stated range.
L_3	12	The average value of the 24 units ($L_1 + L_2 + L_3$) lies within the stated range. Not more than 2 of the 24 units are outside the stated range by more than 10% of the average of the stated range, and none of the units is outside the stated range by more than 20% of the average of the stated range.

III. b. Apparatus *6* (Rotating Cylinder Method)

Apparatus—Use the vessel assembly from *Apparatus 1* as described in *Dissolution* ⟨711⟩, but replace the basket and shaft with a stainless steel cylinder stirring element and maintain the temperature at 32 ± 0.5° during the test. The shaft and cylinder components of the stirring element are fabricated from stainless steel to the specifications shown in *Figure 3*. The dosage unit is placed on the cylinder at the beginning of each test. The distance between the inside bottom of the vessel and the cylinder is maintained at 25 ± 2 mm during the test.

Dissolution Medium—Use the medium specified in the individual monograph (see *Dissolution* ⟨711⟩).

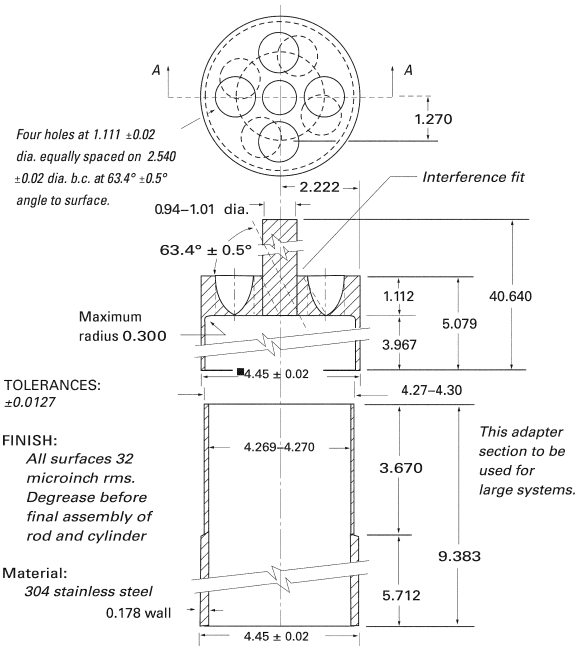

Fig. 3. Cylinder Stirring Element (*5*).
(All measurements are expressed in cm unless noted otherwise.)

Procedure—Place the stated volume of the *Dissolution Medium* in the vessel of the apparatus specified in the individual monograph, assemble the apparatus, and equilibrate the *Dissolution Medium* to 32 ± 0.5°. Unless otherwise directed in the individual monograph, prepare the test system before the test as follows: remove

In-Process Revision

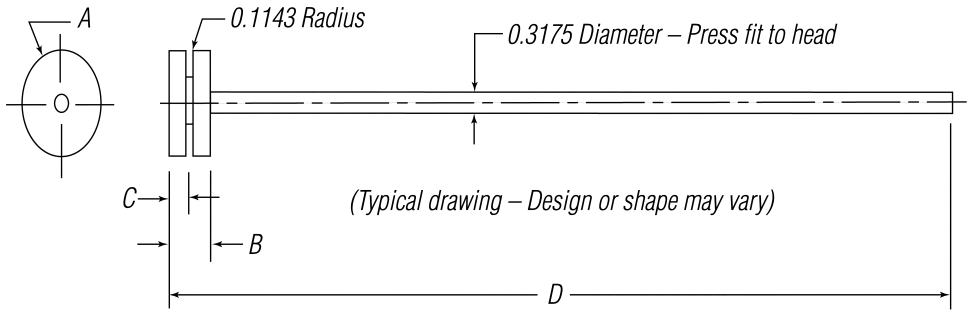
the protective liner from the system, and place the adhesive side on a piece of Cuprophan (*4*) membrane that is not less than 1 cm larger on all sides than the system. Place the system, Cuprophan-covered side down, on a clean surface, and apply a suitable adhesive (*6*) to the exposed Cuprophan borders. If necessary, apply additional adhesive to the back of the system. Dry for 1 minute. Carefully apply the adhesive-coated side of the system to the exterior of the cylinder so that the long axis of the system fits around the circumference of the cylinder. Press the Cuprophan covering to remove trapped air bubbles. Place the cylinder in the apparatus, and immediately rotate at the rate specified in the individual monograph. Within the time interval specified, or at each of the times stated, withdraw a quantity of *Dissolution Medium* for analysis from a zone midway between the surface of the *Dissolution Medium* and the top of the rotating cylinder, not less than 1 cm from the vessel wall. Perform the analysis as directed in the individual monograph, correcting for any volume losses as necessary. Repeat the test with additional transdermal drug delivery systems.

Sampling Time—Proceed as directed for *Apparatus 5 (Paddle Over Disk Method)*.

In Vitro Release Criteria—Unless otherwise specified in the individual monograph, the requirements are met if the quantities of active ingredient released from the system conform to *Acceptance Table 1* for transdermal drug delivery systems. Continue testing through the three levels unless the results conform at either L_1 or L_2.

III. c. Apparatus 7 (Reciprocating Holder Method)

Apparatus—The assembly consists of a set of volumetrically calibrated or tared solution containers made of glass or other suitable inert material, a motor and drive assembly to reciprocate the system vertically and to index the system horizontally to a different row of vessels automatically if desired, and a set of suitable sample holders (see *Figure 4* (*7*) and *Figures 5a* and *5b*). The solution containers are partially immersed in a suitable water bath of any convenient size that permits maintaining the temperature, *T*, inside the containers at $32 \pm 0.5^\circ$ or within the allowable range, as specified in the individual monograph, during the test. No part of the assembly, including the environment in which the assembly is placed, should contribute motion, agitation, or vibration beyond that due to the smooth, vertically reciprocating sample holder. An apparatus that permits observation of the system and holder during the test is preferable. Use the size container and sample holder specified in the individual monograph.



Dimensions are in centimeters

	HEAD				ROD		O-RING

[c] SS/P=Either stainless steel or Plexiglas.

Fig. 4. Reciprocating Disk Sample Holder (*7*).

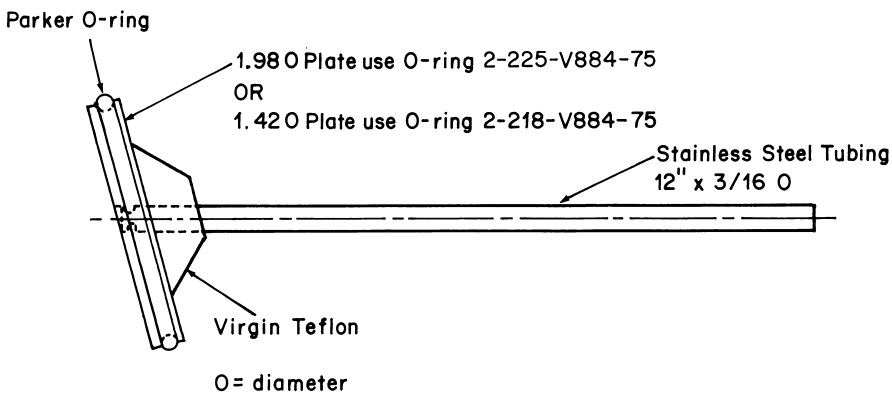

Fig. 5a. Transdermal System Holder—Angled Disk.

In-Process Revision

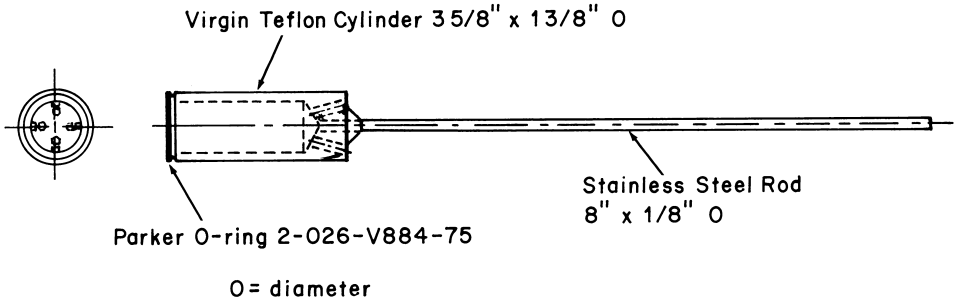

Fig. 5b. Transdermal System Holder—Cylinder

Preparation A—Attach the system to be tested to a suitable sample holder with 2-cyano acrylate glue.

Preparation B—Press the system onto a dry, unused piece of Cuprophan (*4*), nylon netting, or equivalent with the adhesive side against the selected substrate, taking care to eliminate air bubbles between the substrate and the release surface. Attach the system to a suitably sized sample holder with a suitable O-ring so that the back of the system is adjacent to and centered on the bottom of the disk-shaped sample holder or centered around the circumference of the cylindrical-shaped sample holder. Trim the excess substrate with a sharp blade.

Preparation C—Attach the system to a suitable holder as described in the individual monograph.

Dissolution Medium—Use the *Dissolution Medium* specified in the individual monograph (see *Dissolution* ⟨711⟩).

Procedure—Suspend each sample holder from a vertically reciprocating shaker so that each system is continuously immersed in an accurately measured volume of *Dissolution Medium* within a calibrated container pre-equilibrated to temperature, *T*. Reciprocate at a frequency of about 30 cycles/minute with an amplitude of about 2 cm, or as specified in the individual monograph, for the specified time in the medium specified for each time point. Remove the solution containers from the bath, cool to room temperature, and add sufficient solution (water in most cases) to correct for evaporative losses. Perform the analysis as directed in the individual monograph. Repeat the test with additional drug delivery systems as required in the individual monograph.

Sampling Time—Proceed as directed for *Apparatus 5 (Paddle Over Disk Method)*.

In Vitro Release Criteria—Dug release should be measured at least at three time points: the first time point around 1 hour, second around 50% of total drug release, and third around 85% drug release. Unless otherwise specified in the individual monograph, the requirements are met if the quantities of the active ingredients released from the system conform to *Acceptance Table 1* in *Drug Release* ⟨724⟩ for transdermal drug delivery systems, or as specified in the individual monograph. Continue testing through the three levels unless the results conform at either L_1 or L_2.

IV. PRODUCT QUALITY TESTS

General product quality tests that are part of the compendial monograph such as identification, assay, content uniformity (uniformity of dosage units), impurities, pH, water content, and microbial limits; specific tests such as viscosity, tube (content) uniformity, and particle size for topical drug products; and adhesive and leak tests for transdermal drug products should be performed. For details of drug product quality tests for topical and transdermal dosage forms, see the general chapter *Topical and Transdermal Drug Products—Product Quality Tests* ⟨3⟩.

BRIEFING

⟨729⟩ Globule Size Distribution in Lipid Injectable Emulsions, *USP 32* page 283, and page 341 of *PF* 34(2) [Mar.–Apr. 2008]. On the basis of comments received and discussions by the Parenteral Products—Industrial Expert Committee, the following changes to the section *Method II—Measurement of Large Globule Content by Light Obscuration or Extinction Method* are being proposed:

1. The requirement for degassing water by sonication is removed from the *Water* section.
2. The *System Suitability* section is revised to clarify its intent, as well to as to make it consistent with other USP particle-counting chapters.
3. The *Standard Preparation* section is revised to clarify the replicate requirements, the definition of acceptable error, and the frequency of testing.
4. The 25-μm standard sample testing requirement is being deleted from the *Standard Preparation* section.

(PPI: D. Hunt) RTS—C66264

Change to read:

METHOD II—MEASUREMENT OF LARGE GLOBULE CONTENT BY LIGHT OBSCURATION OR EXTINCTION METHOD

For determination of the extent of the large-diameter droplet tail (>5 μm) of lipid injectable emulsions, a light obscuration (LO) or light extinction (LE) method that employs a single-particle (globule) optical sizing (SPOS) technique is used. During application of the LE/SPOS technique, passage of a droplet through a thin optical sensing zone results in blockage of a portion of the incident light beam, causing a momentary decrease in the light intensity reaching the "extinction" detector. The magnitude of this decrease in the signal is ideally proportional to the cross-sectional area of the droplet (assumed smaller than the sensing zone thickness), i.e., to the square of the droplet diameter. During optimization of the LE/SPOS instrument for a given emulsion sample, a series of dilutions should be tested to achieve ~~an acceptably low coefficient of variation (i.e., <10%)~~

■consistency■1S (*USP33*)
between samples. The goal is to identify a standard range of dilutions that yield consistent data and are most applicable to the formulation tested. Ideally, when comparing different emulsions, the same approximate number of globules are sized each time, and once a standard is achieved, it should be incorporated into the routine sampling plan for validation testing. As long as the fat globule concentration is below the "coincidence limit" of the sensor (determined by the flow cell and optical design), only one globule at most will pass through the sensing zone at any given time, allowing it to be counted and accurately sized (with less than 1% coincidence events). Both the coincidence limit and the optimal flow rate must be known for the LE/SPOS sensor used. Furthermore, it is prudent to perform the large-diameter measurements at a reduced emulsion concentration such that the measurable droplet concentration ~~(i.e, >1.8 μm)~~

■at threshold of detection (e.g., >1.8 μm) to an upper limit (e.g., 50 μm)■1S (*USP33*)
is only approximately one-third of the nominal coincidence limit for the sensor used. The resulting single pulse heights are converted to droplet diameters using a standard calibration curve previously constructed from NIST-traceable monosized polystyrene microspheres of known diameters. For additional guidance in the use of the light obscuration methodology, see the general chapter *Particulate Matter in Injections* ⟨788⟩.

Apparatus—A suitable light obscuration instrument with or without the capability of automatic sample dilution and controlled by a personal computer (PC) is used for the measurement. The number- and volume-weighted particle size distribution data are reported, provided it is clearly stated which values are given and that the necessary parameter values required for all necessary calculations are also given.

Water—Pass distilled water through a filter having a 0.2-μm porosity~~, and degas by sonication,~~

■■1S (*USP33*)
or use *Sterile Water for Injection* stored in a glass container.

Standard Preparation—To a pre-established volume of *Water* add an appropriate amount of concentrated suspension, containing NIST-traceable polystyrene latex standard particles

In-Process Revision

or other suitable microspheres. Gently mix the fluids to achieve a homogeneous suspension. If the light obscuration instrument is equipped with an automatic dilution system, the starting concentrated sample can be analyzed by injection directly into the instrument via a syringe or Teflon sample line. Further dilution of the sample then occurs automatically to optimize the particle concentration for analysis. Alternatively, the sample would require greater manual dilution with water (typically by at least a factor of 10 over the first dilution). The resulting diluted sample is then instilled in an appropriate, clean container, such as a sterile Type I glass container, before being passed through the sensor. In either case the final particle concentration is caused to lie below the coincidence limit of the sensor. The sizing and counting accuracy of the light obscuration instrument should be obtained using ~~three different size standards of approximately 5 μm, 10 μm, and 25 μm (triplicate analyses per size). The corresponding results for the mean diameter should coincide with the expected values, within 10% acceptable error. In addition, the number of particle counts obtained per unit volume of diluted sample suspension should also agree, within 10% acceptable error, with the concentration values certified in the documentation provided with each NIST traceable size standard.~~

■two different size standards of approximately 5 μm and 10 μm (triplicate analyses per size). For the standards after system calibration, set the instrument threshold of detection at 1.8 μm, extended to an upper limit of 50 μm. The corresponding results for the mean diameter should coincide with the expected values, within 10% of the relative standard deviation and 90%–110% size accuracy. In addition, the number of particle counts obtained per mL should also agree within ± 10% with the concentration values certified in the documentation provided with each NIST-traceable size standard.■1S (*USP33*)

Test Preparation—To a pre-established volume of *Water* add an appropriate volume of sample from the lipid injectable emulsion

■(triplicate analyses per sample).■1S (*USP33*)
Gently mix the fluids to achieve a homogeneous suspension. The diluted emulsion will be slightly turbid in appearance. If the light obscuration instrument is equipped with an automatic dilution system, the starting concentrated sample can be analyzed by injection directly into the instrument via a syringe or nonreactive* Teflon sample line. Further dilution then occurs automatically to optimize the droplet/globule concentration for analysis. Alternatively, the sample would require greater manual dilution with water (typically by at least a factor of 10 over the first dilution). The resulting diluted sample is then instilled in an appropriate, clean container such as a sterile Type I glass container. In either case the final droplet/globule concentration is caused to lie below the coincidence limit of the sensor.

System Suitability— ~~Using the *Standard Preparation*, measure the number-weighted particle diameter and the corresponding standard deviation. The system is suitable once the sample has equilibrated and the results have stabilized and triplicate mean number-weighted particle diameter measurements are obtained within 10% of each other. The measured coefficient of variation (CV) for the number-weighted particle size distribution should not deviate by more than 25% from the CV value stipulated for the NIST traceable standard. The latter value is usually very small, assuming nearly uniform size standard particles. Therefore, in practice the measured CV value is usually considerably larger than this ideal value, being dictated instead by the resolution of the LE/SPOS sensor. The resolution of the sensor should be sufficiently good that the measured CV value does not exceed 15% of the mean diameter of the NIST traceable standard. A larger CV value indicates that the latex microspheres are not suitable as a standard because they either inherently lack uniformity or have become agglomerated to an unacceptable extent. In this case, another standard latex suspension must be selected and tested.~~

■Perform prior to the test procedure, using the *Standard Preparation* of a 5- and 10-μm NIST traceable particle. Measure in triplicate the number-weighted particle diameter and the counts/mL of the standard. The system is suitable when the triplicate mean number-weighted particle diameter measurements are within 10% of the target value, both in terms of repeatability (CV) and closeness to the certified size on the label of the NIST traceable standard.■1S (*USP33*)

Procedure and Interpretation—If the light obscuration instrument is equipped with an automatic dilution system, use a disposable syringe or Teflon sample line to load the *Standard Preparation* or *Test Preparation.* If no automatic dilution system is used, transfer the sample to an appropriate large-volume, clean container such as a sterile Type I glass vessel containing an appropriate volume of *Water.* Allow the sample and *Water* to mix thoroughly to achieve a homogeneous suspension. Set the instrument threshold of detection at 1.8 μm, extended to an upper limit of 50 μm, and ~~employ measurement times of 120, 180, and 240 seconds for each run of each replicate of the sample (*n* = 3 runs per sample).~~

■vary the concentration and/or data collection times such that there is at least a factor of two in the difference of the total number of globules that measure > 5 μm between at least two sample runs. In any case, the number of globules that measure > 5 μm should be large enough so that it represents an adequate number of globules that are statistically representative of the large-diameter tail population of the native emulsion.■1S (*USP33*)
~~As long as the three~~

~~■■1S (*USP32*)~~

~~measurements of the volume-weighted percentage of fat greater than 5 μm (PFAT5) for each sample fall within 10% of each other (irrespective of run-time), the results for the *Test Preparation* are acceptable. Values exceeding this reproducibility tolerance suggest either that the sample is unstable or that the dilution has not been optimized.~~

■■1S (*USP33*)

* Polyvinyl chloride (PVC) with diethylhexylphthalate (DEHP) has been shown to induce breakdown of lipid injectable emulsions (Drug Product Problem Reporting System. USP File Access No. 11173, May 15, 1991).

The volume-weighted, large-diameter fat globule limits of the dispersed phase, expressed as the percentage of fat residing in globules larger than 5 μm (PFAT5) for a given lipid injectable emulsion ~~must be less than~~

~~■are not to exceed■1S (USP32)~~

■must not exceed■1S (*USP33*) 0.05%.

BRIEFING

⟨**788**⟩ **Particulate Matter in Injections,** *USP 32* page 310. As a result of comments received and discussions by the Parenteral Products—Industrial Expert Committee, the following additions are being proposed:

1. Solutions for injection administered by the intramuscular or subcutaneous route must meet the requirements of *Particulate Matter In Injections* ⟨788⟩.
2. Radiopharmaceutical preparations are exempt from the requirements of *Particulate Matter In Injections* ⟨788⟩.
3. Parenteral products for which the labeling specifies use of a final filter prior to administration are exempt from the requirements of *Particulate Matter In Injections* ⟨788⟩, provided that scientific data are available to justify this exemption.
4. Parenterals packaged and labeled exclusively for use as irrigating solutions are exempt from the requirements of *Particulate Matter In Injections* ⟨788⟩.

(PPI: D. Hunt.) RTS—C63370

Change to read:

This general chapter is harmonized with the corresponding texts of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia.* These pharmacopeias have undertaken not to make any unilateral change to this harmonized chapter. Portions of the present general chapter text that are national USP text, and therefore not part of the harmonized text, are marked with symbols (◆◆) to specify this fact.

Particulate matter in injections and parenteral infusions consists of mobile undissolved particles, other than gas bubbles, unintentionally present in the solutions.

■◆As stated in *Injections* ⟨1⟩, solutions for injection administered by the intramuscular or subcutaneous route must meet the requirements of *Particulate Matter in Injections* ⟨788⟩. Parenterals packaged and labeled exclusively for use as irrigating solutions are exempt from the requirements of *Particulate Matter in Injections* ⟨788⟩. Radiopharmaceutical preparations are exempt from the requirements of *Particulate Matter in Injections* ⟨788⟩. Parenteral products for which the labeling specifies use of a final filter prior to administration are exempt from the requirements of *Particulate Matter in Injections* ⟨788⟩, provided that scientific data are available to justify this exemption.◆■1S (*USP33*)

For the determination of particulate matter, two procedures, *Method 1 (Light Obscuration Particle Count Test)* and *Method 2 (Microscopic Particle Count Test),* are specified hereinafter. When examining injections and parenteral infusions for subvisible particles, *Method 1* is preferably applied. However, it may be necessary to test some preparations by the *Light Obscuration Particle Count Test* followed by the *Microscopic Particle Count Test* to reach a conclusion on conformance to the requirements.

Not all parenteral preparations can be examined for subvisible particles by one or both of these methods. When *Method 1* is not applicable, e.g., in the case of preparations having reduced clarity or increased viscosity, the test should be carried out according to *Method 2*. Emulsions, colloids, and liposomal preparations are examples. Similarly, products that produce air or gas bubbles when drawn into the sensor may also require microscopic particle count testing. If the viscosity of the preparation to be tested is sufficiently high so as to preclude its examination by either test method, a quantitative dilution with an appropriate diluent may be made to decrease viscosity, as necessary, to allow the analysis to be performed.

The results obtained in examining a discrete unit or group of units for particulate matter cannot be extrapolated with certainty to other units that remain untested. Thus, statistically sound sampling plans must be developed if valid inferences are to be drawn from observed data to characterize the level of particulate matter in a large group of units.

GENERAL CHAPTERS

General Information

BRIEFING

⟨**1024** ⟩ **Bovine Serum.** Because of extensive changes in the previously proposed chapter (see page 776 of *PF* 34(3) [May–June 2008]), that proposal is canceled, and a new draft is proposed for this general information chapter.

(BB CGT: F. Atouf.) RTS—C69217

In-Process Revision

Add the following:

■⟨1024⟩ BOVINE SERUM

INTRODUCTION

Bovine serum is the liquid fraction of clotted blood, obtained from an ox (*Bos taurus,* among others), that has been depleted of cells, fibrin, and clotting factors. Since the advent of modern cell culture, manufacturers of biological products have used bovine serum extensively as a cell culture growth supplement. Its rich nutritional composition of proteins, growth factors, hormones, amino acids, vitamins, sugars, lipids, trace elements, and other components supports a broad range of cell culture applications in research and commercial manufacture of vaccines, natural source and recombinant biologics (hereafter biologics), engineered tissues, and other emerging cell-based therapeutic products intended for human or veterinary use. The predominant type of serum used in research applications is Fetal Bovine Serum (FBS). Calf serum (from newborn and older animals) is used much less frequently, but because of its lower cost it may be widely used in commercial manufacturing.

As is the case with other animal-derived products, bovine serum carries a potential risk of introducing extraneous agents into cell culture. Serum manufacturers and regulators must adopt rigorous sourcing and testing procedures and strict processing and production guidelines to ensure the quality of bovine serum.

The objective of increasing the quality and safety of biologics produced with bovine serum, coupled with attempts to mitigate regulatory burden, have caused developers to investigate alternatives to serum supplementation, resulting in application-specific serum-free medium formulations. Although it is recognized that bovine serum should be avoided when there is an option to use serum-free medium, there are cases where this is technically impossible or impractical.

This chapter describes issues related to sourcing, production, and characterization of bovine serum to ensure its safe use. A list of relevant regulatory and guidance documents is presented in *Appendix 1.* Serum manufacturers and serum end users (manufacturers of biological products) should consider and apply as needed the controls and procedures outlined in this chapter to ensure the safe use of bovine serum components in research and pharmaceutical manufacturing.

Types of Bovine Serum

- FBS is obtained from the fetuses of healthy, prepartum bovine dams that had been deemed fit for human consumption through ante- and postmortem inspection by licensed veterinarians. It is collected in government-inspected and -registered slaughterhouses.
- Newborn calf serum (also known as newborn bovine serum) is obtained in government-inspected and -registered slaughterhouses from animals aged less than 20 days.
- Calf serum is obtained in government-inspected and -registered slaughterhouses from animals aged between 20 days and 12 months.
- Donor bovine serum (also known as donor calf serum) is obtained by the repeated bleeding of donor animals from controlled government-inspected and -registered donor herds. The animals are 12–36 months old.
- Adult bovine serum is obtained in government inspected and -registered slaughterhouses from cattle older than 12 months that are declared fit for human consumption.

BOVINE SERUM: HISTORY AND TYPES OF USE

History of Bovine Serum Use

Animal serum and other complex biological materials have been employed in the cultivation of mammalian cells for approximately 100 years. Several factors led to the wide adoption of bovine serum as a standard tissue culture supplement. In comparison to serum from other animal species (horse, goat), bovine serum is easily sourced, and thereby more affordable. Many investigators choose to use fetal serum in their experimental systems because of concerns associated with antibodies present in newborn and adult serum that could cross-react with cells in culture and cause cell lysis through complement-mediated pathways. To eliminate that concern, heat was introduced to inactivate complement that was potentially present in the serum. Studies of FBS undertaken in the 1950s on the cultivation of low-density human cells to elucidate mechanisms of cell growth found that (1) the albumin component may serve as a carrier of essential small molecules; (2) fetuin, a glycoprotein present at high levels in the alpha globulin fraction, facilitates cell attachment and stretching; and (3) fetuin markedly inhibits trypsin, and this antiproteolytic activity may play a role in the ability of fetuin to stimulate cell growth.

In the 1960s and 1970s, serum supplementation of tissue culture media became the norm, thus facilitating biomedical research as well as the first large-scale vaccine manufacturing processes. Serum supplementation reduced the requirement for optimizing medium formulations for different cell types. FBS was shown to provide a variety of polypeptide growth factors. Albumin promoted cell growth presumably because of its abilities to function as a carrier protein for small molecules or lipids, to bind metal ions, to serve as a pH buffer, and to protect cells against shear. Similar functions were found for other serum components such as transferrin, hormones, and other serum-derived attachment factors such as fibronectin, vitronectin, and laminin.

Uses of Bovine Serum

Serum is a complex mixture of macromolecules that is required for cell growth and virus production, and its use as a raw material presents a number of challenges. These include its batch-to-batch composition and the risk of contamination by adventitious agents. The development of serum-free media has replaced serum in some new biotechnology manufacturing applications, but many cell lines used in manufacturing have not been adapted to these serum-free media. Regulatory constraints and scientific challenges generally make it impractical to alter existing manufacturing processes in which serum is used as a raw material.

FBS sometimes is required in cell and tissue bioprocessing, which often involves the cultivation of cells from tissue explants and biopsies. Some bioprocesses may also require the maintenance of specific cellular characteristics during cultivation. FBS often appears to facilitate such procedures and may affect the biological behavior of fastidious cell types. FBS has been shown to affect the transcription of developmentally important genes, apoptosis, and apoptosis-related gene expression, and to provide neuroprotective and antioxidative factors, all of which may be beneficial to the survival and development of cells in culture. Therefore, FBS will continue to play an important role as a cell culture supplement for production of cell- and tissue-based therapies.

In most viral vaccine manufacturing processes the media used for cell culture expansion and virus infection/production are supplemented with different types of serum at different concentrations. In these processes, bovine serum helps generate a mass of cells in an optimal physiological state for efficient viral replication.

BOVINE SERUM HARVESTING AND PRODUCTION

Blood Collection

For all types of bovine sera, blood should be collected in government-inspected and -registered premises (slaughterhouses, abattoirs, and donor farms). Blood should be collected by trained operators following the written procedures approved by the serum manufacturer and using either single-use disposable collection devices or reusable collection equipment for which cleaning procedures have been validated.

DONOR BOVINE SERUM

For each lot of serum from donor animals, serum manufacturers should ensure traceability to the donor herd of origin via production records and animal health and origin certificates. Donor animals are subjected to regular veterinary inspections and are bled multiple times following established procedures. Animals introduced into the herd should be traceable by source, breeding, and rearing history. Collectors should introduce new animals into the herd following specified and approved procedures that include prepurchase animal inspection and testing, proper transportation, a quarantine period, veterinary examination and testing during the quarantine period, and animal release criteria from quarantine to serum production. The collectors should not vaccinate donor animals for bovine viral diarrhea (BVD). Collectors should test animals for any agent and antibody from which the herd is claimed to be free.

NEWBORN CALF SERUM, CALF SERUM, AND ADULT BOVINE SERUM

Certificates of animal health and origin and/or serum production records should ensure that serum manufacturers can trace bovine serum derived from slaughtered animals back to the abattoir. Serum manufacturers should require abattoirs to maintain documentation of the origin of animals for slaughter. Blood should be collected from animals that have been slaughtered, for human consumption, in abattoirs inspected by the competent authority of the country of origin. Inspectors should routinely inspect animals both antemortem and postmortem to check for the clinical appearance of infections and parasitic diseases and other animal health-related problems or conditions. The animals must be free of clinical evidence of infectious diseases at the time of slaughter. Blood collection procedures must be in place to prevent cross-contamination with other tissues and body fluids and the surrounding environment. The standard procedure of slaughter consists of an approved method of animal stunning followed by exsanguination.

FETAL BOVINE SERUM

FBS product specifications and test procedures are presented in the proposed general chapter *Bovine Serum—Quality Attributes and Functionality Tests* ⟨90⟩. Serum manufacturers should collect fetal bovine blood from bovine fetuses whose dams have been slaughtered. The dams must have been deemed fit for human consumption and must have been slaughtered in abattoirs that were inspected by the competent authority of the country of origin. Inspectors should examine all animals both antemortem and postmortem to check for the clinical appearance of infections and parasitic diseases and other animal health-related problems or conditions. The animals must be free of clinical evidence of infectious diseases at the time of slaughter. The uterus is removed and transported to a dedicated space for fetal bovine blood harvest, where blood collection personnel evaluate the fetus for signs of fetal death, including bloating, skin discoloration, odor, deformation, and hair sloughing. Collectors also should check the amniotic fluid for

color, quantity, and clarity. Serum manufacturers should collect blood from acceptable fetuses by cardiac puncture into a closed collection system using an aseptic technique. Manufacturers should have in place procedures that will prevent cross-contamination with other fetal tissues and bodily fluids and the surrounding environment.

Serum Harvesting and Processing

Trained personnel should perform serum separation (harvesting) and further processing activities following written and approved procedures. Serum is first separated and pooled, followed by filtration and filling into sterile containers. If the serum is subjected to one or more virus inactivation treatments in the production process, serum manufacturers should validate the virus inactivation processes against a range of relevant viruses. It is recommended that bovine viral diarrhea virus (BVDV) be included in any virus validation study because it is ubiquitous.

SERUM SEPARATION AND HARVESTING

Bovine blood should be processed and serum separated (harvested) in such a way as to minimize bacterial and mycoplasmal contamination, which in turn minimizes endotoxin levels in serum product. Gentle, quick blood processing helps to minimize hemolysis, further enhancing the quality of the serum product. After collection, blood is first allowed to clot for a specified period of time and under controlled conditions, then centrifuged in a refrigerated centrifuge. Serum is then removed from the clot, typically by centrifugation; pooled and mixed in a pooling vessel; transferred to labeled containers; and frozen, unless it is filter-sterilized immediately. Serum manufacturers should describe each process step and carry out serum processing activities, including sample collection and in-process quality control testing, following the manufacturer's approved procedures.

POOLING BEFORE FILTRATION

Because limited amounts of blood can be collected from individual animals, serum manufacturers pool the raw serum from many animals in order to create commercial-sized lots. Serum is pooled, after raw serum thawing and before filtration, in a pooling vessel and mixed at a controlled mixing rate and temperature. Pools or lots of donor bovine serum may consist of many separate collections from individual members of the herd. Lots of FBS may consist of pooled serum from thousands of animals. Serum manufacturers should describe each prefiltration pooling process step and should carry out serum thawing, prefiltration pooling, and mixing activities following the manufacturer's approved procedures.

FILTRATION

Pooled serum is mixed and sterile-filtered through filters of pore size 0.2 μm or smaller, depending on the intended application. Filtration processes should be validated. Triple filtration using filters of pore size 0.1 μm has been shown to result in a high degree of mycoplasma removal. Although filtration may remove some large viruses and viral aggregates from the serum, generally viruses cannot be completely eliminated in this manner. Furthermore, the filters are not known to eliminate the causative agent of bovine spongiform encephalopathy (BSE). Following filtration, serum manufacturers fill filtered serum into sterile containers by aseptic processing in a suitably controlled environment. Serum manufacturers should describe each filtration process step and should perform serum filtration, filling, and sample collection activities following the manufacturer's approved procedures.

IRRADIATION

Serum treatment by gamma irradiation is very common and one of the most effective methods of virus inactivation. The most frequently used minimum dose is 25 kilograys (kGy). Some countries specify higher dose requirements (>30 kGy) for imported serum. Gamma irradiation may inactivate viruses, mycoplasma, and bacteria, but serum end users should ensure that the gamma irradiation process does not negatively affect their specific applications. Irradiation may have adverse effects on serum quality, and these adverse effects tend to increase with higher doses.

Validation of gamma irradiation has two aspects: (1) dose delivery in a defined load configuration and (2) inactivation capacity. Critical irradiation process parameters include product (serum) temperature, packaging size and configuration, dosimeter distribution, and defined minimum/maximum dose received. Dosimeters should be used to monitor the established high-dose and low-dose positions in each irradiation run. If the serum manufacturer makes inactivation claims, these should be supported by the manufacturer's own well-designed viral inactivation studies.

ULTRAVIOLET (UV) TREATMENT

Serum manufacturers may use UV treatment to inactivate viruses, mycoplasma, and bacteria, but manufacturers must validate the process to demonstrate its efficacy. In addition, manufacturers must be aware that UV treatment may have an adverse effect on serum quality and accordingly should consider the effects of UV treatment for each application, as should serum end users.

HEAT INACTIVATION

Heat inactivation involves elevating the temperature of the serum to $>56^{\circ}$ for at least 30 minutes to inactivate complement. Heat inactivation may also inactivate viruses, mycoplasma, and bacteria; but it may have an adverse affect on serum quality, and manufacturers must validate the procedure's suitability for specific applications. Heat inactivation provides significantly less assurance of virus inactivation than does irradiation.

VIRAL CLEARANCE STUDIES

Viral Safety Evaluation of Biotechnology Products Derived from Cell Lines of Human or Animal Origin ⟨1050⟩ and other regulatory documents give guidance about conducting viral clearance studies that help validate removal/inactivation processes. Serum manufacturers should also perform formal spiking studies with relevant and representative (model) viruses, and should test and compare inactivated spiked serum samples, negative controls, and positive controls.

CHARCOAL STRIPPING

Some serum manufacturers use charcoal/dextran treatment to reduce the levels of hormones in serum.

DIALYSIS

Some manufacturers use dialysis or dialfiltration to remove low molecular weight components from serum.

CLEANING AND STERILITY OF EQUIPMENT

Stainless steel systems and tubing used in the manufacture of bovine serum must be cleaned and sterilized to prevent cross-contamination and growth of adventitious agents. Serum manufacturers must validate their clean-

ing processes for removing and inactivating agents of concern. Thereafter, manufacturers should implement process controls that routinely verify cleaning cycles. Steam sterilization-in-place is a common and effective sterilization technique. Serum manufacturers that use this technology must validate steam cycles to demonstrate their uniformity and ability to destroy heat-resistant bacterial spores. Alternatively, manufacturers can use sterile disposable systems that do not require cleaning validation.

Quality Control

TRACEABILITY

Abattoir Collection

Materials collected in the U.S. should originate from U.S. Department of Agriculture (USDA)-registered facilities. Serum manufacturers should maintain documentation that traces a given serum sub-lot to the abattoir where it was collected. Slaughterhouses maintain records of animal source. General industry practice is to keep this information as part of the Device Master Record. General record-keeping requirements at USDA-licensed abattoir facilities are outlined in 9 Code of Federal Regulations (CFR) 320.

Materials collected from countries approved by the USDA for importation of bovine products into the U.S. should meet the requirements of the competent authority of the country of origin. In addition, serum manufacturers should keep USDA-required safety testing records of imported materials (if applicable) as part of their Device History Record.

Serum manufacturers should consult 9 CFR 309 and 9 CFR 310 about requirements for inspection of animals for various diseases pre- and postslaughter. These requirements are recommended for materials collected outside the U.S.

Donor Herd Collection

Serum manufacturers should maintain traceability to the donor animal farm where blood was collected from donor animals. In most cases, manufacturers individually identify farm animals and keep records for bleed and processing dates, making it possible to trace blood collection to an individual animal. A licensed veterinarian or a designee under the guidance of a veterinarian should inspect animals regularly and should certify that the animals are free of disease and fit for human consumption, consistent with 9 CFR 309.

PRODUCT STORAGE AND STABILITY

Serum should be stored in the frozen state at –10° or below. Serum is frozen as quickly as possible to preserve product quality and is stored under controlled storage conditions. Serum manufacturers should establish serum product stability in support of a proposed expiration date. Typical expiration dating for bovine serum is 5 years from the date of filtration and filling. Use of any type of bovine serum beyond the stated expiration date depends on the application, and the serum user must establish the product's continued suitability for use.

Labeling

Finished product labels must contain the following information: product description, lot number, storage conditions, name and address of manufacturer, and a statement indicating the intended use. Materials intended for research purposes are exempt from labeling regulations (21 CFR 801). Typically, serum manufacturers supply a lot-specific Certificate of Analysis (COA) that is classified as part of the product's labeling. See COA requirements in the following section.

Certification/Documentation

CERTIFICATE OF ANALYSIS

The COA should provide information about a specific lot of serum, including tests performed and test results (according to the serum manufacturer's specifications for release), as well as critical labeling identifiers such as lot number, catalog number, description of type of bovine serum, country of origin, and either or both dates of manufacture and expiration. This document is distinct from the certificate of health issued by the competent authority of the country of origin.

CERTIFICATE OF ORIGIN AND CERTIFICATION OF ANIMAL STATE OF HEALTH

The Certificate of Origin establishes the country in which the bovine blood was collected and veterinary certification of the health of the animals pre- and postcollection (9 CFR 327.4).

IMPORT/EXPORT DOCUMENTS

Import/export documents contain formal certification of animal disease status of the country of origin and negotiated/agreed certification statements. These vary from country to country. Each country defines import/export requirements in order to control introduction of exotic animal diseases and their economic impact as well as product safety assessments (risk vs. research, diagnostic, and/or therapeutic benefits).

PRODUCTION REPORTS

Production reports typically are batch records that document the raw materials in identifiable and traceable ways, production methods (centrifugation or filtration) used in manufacturing, equipment and facility cleaning, quality control testing, and personnel performing required activities. Raw material with Certificates of Origin or serum production records facilitates traceability to the source of the blood that was used to create the serum. When serum is used as a raw material for further manufacturing, process documentation also helps demonstrate controlled manufacture of the bovine serum.

BSE RISK ASSESSMENT

Despite the low risk potential of transmissible spongiform encephalopathies (TSEs) in bovine serum, various U.S. and international regulatory agencies have developed guidance to help manage and further reduce the potential risks of transmission. In the absence of appropriate test methods of detecting the infectious agent in fluids such as blood, the consensus recommendation from various regulatory agencies is to adopt good risk assessment strategies. This section of the chapter provides some background information on the disease and current methods of detection; it also highlights risk assessment and risk reduction strategies to potentially prevent transmission of the disease through the use of serum in the manufacturing of medicinal products.

Description of the Disease

TSEs are transmissible animal and human diseases that are characterized by degeneration of the brain, associated with severe neurological signs and symptoms. Since the outbreaks of TSE in cattle, termed BSE, which were transmitted to other species, public health officials have been concerned about the risk of TSE infection, including the possibility of TSE transmission by the use of therapeutic products manufactured using bovine serum. In cattle infected with BSE, lower titers have been found in the cerebrospinal fluid, lung, lymph tissue, spleen, kidney, liver, and ileum. Studies have shown that transfusion of blood from sheep infected with either BSE or scrapie but without evident disease can infect naive sheep. Although the

risk of cross-contamination is always present, to date no studies have shown that blood can transmit disease from cattle with BSE. Embryos from BSE-affected cattle have not transmitted diseases to mice. Calves born of dams that received embryos from BSE-affected cattle have survived for up to 7 years, and examination of the brains of both the unaffected dams and their offspring revealed no spongiform encephalopathy.

Detection Strategies

No currently available procedures have been validated as being sufficiently sensitive for routine antemortem screening of asymptomatic animals, although analytical methods are under development for detection and quantitation from low-infectivity materials such as blood. The classic diagnostic test for TSEs is postmortem histological examination of brain tissue to confirm characteristic vacuolar degeneration. Other testing options include immunohistochemical tests that can confirm the presence of PrPSc, the abnormal disease-specific conformation of prion-related protein (PrP), in the vacuolated regions of the brain; and immunochemical tests such as Western blots and enzyme-linked immunosorbent assays that can detect PrPSc in tissues with high or moderately high titers. These tests typically take less time to perform than histological examination (6–8 hours vs. weeks, respectively) and can be partially or fully automated. Although most of these are postmortem tests, studies have demonstrated the feasibility of premortem testing of lymphoid tissue samples from the tonsils or from the third eyelid of infected animals. Immunochemical tests require extensive sample collection and preparation and can be cost prohibitive for routine testing and monitoring the disease state of large herds. Diagnostic strategies must consider the sensitivity of testing in certain tissues as well as the test's ability to detect infectivity in animals before the development of clinical signs of disease. Negative results do not ensure the absence of infectivity. Detection of infectivity is possible if suspect tissue is inoculated into experimental animals intracranially where the causative agent can amplify. This approach for detection of low infectivity can take months to years to yield a positive result.

Risk Assessment and Risk Reduction Strategies

Serum manufacturers should employ risk reduction strategies to eliminate the danger of cross-contamination of fetal blood with other tissues, including appropriate sourcing of animal-derived articles and using practices that have been shown to eliminate or minimize the risk of transmitting TSE, via either foods or health care products. Serum end users should perform a risk assessment of their sourcing strategy that takes into account the amount of bovine serum used in their application and should conduct supplier audits to ensure traceability of sourcing, handling, and appropriate quality control systems.

SOURCE AND AGE OF ANIMALS

Serum manufacturers should monitor the traceability of each lot of serum to ensure the qualification of bovine serum, as described previously in the two sections *Serum Harvesting and Processing* and *Quality Control*. In addition to traceability, careful selection of source materials is the most important criterion for the safety of medicinal products. Certification of the origin must be available from the supplier, and manufacturers should keep this information on file. The U.S. Food and Drug Administration (FDA) recommendations prohibit the use in FDA-regulated products (except gelatin) of any bovine-derived materials that originate from countries that report indigenous cases of BSE. The current proposed rule qualifies FBS as an unlikely source of BSE infectious material, because current evidence suggests that cow-to-calf transmission of BSE is unlikely. The proposed rule also states that prohib-

ited cattle materials do not include materials sourced from fetal calves of cows that were inspected and passed, as long as the materials were obtained by procedures that can prevent contamination with specified risk materials. For veterinary biologics, current regulations enforced by the USDA's Center for Veterinary Biologics (CVB) indicate that ingredients of animal origin should be sourced from countries with no or low BSE risk, as defined by the U.S. National Center for Import and Export and 9 CFR 94.18.

The most satisfactory sources of materials are from countries with the following:

- No reported cases of indigenous BSE
- Compulsory notification of positive tests
- Compulsory clinical and laboratory verification of suspected cases
- Prohibition of the use in ruminant feed of meat and bone meal containing any ruminant protein
- No importation of cattle from countries where a high incidence of BSE has occurred
- No importation of progeny of affected females

BSE infectivity may increase with animal age. Although bovine serum is considered a low-risk material for TSE transmission, some end users consider it prudent to source serum from dams below a set maximum age. If manufacturers cannot determine the date of the dam's birth, they should consider both the implementation date of the feed ban in the country of origin and the incubation period of BSE in order to determine the safety of the source. A ruminant feed ban was imposed in the United Kingdom in July of 1988. These considerations are lot specific, so audits of the raw material supplier should include a review of records.

PRODUCTION PROCESS

End user manufacturing systems should be in place for monitoring the production process and for batch delineation (definition of batch, separation of batches, and cleaning between batches). Of primary importance is control of the potential for cross-contamination with possible infectious material. Because of the documented resistance of TSE agents to most inactivation procedures, controlled sourcing is the most important criterion in achieving acceptable product safety.

Whenever possible, manufacturers should identify steps that theoretically or demonstratively remove or inactivate agents during the manufacture of the material. Manufacturers should continue their investigations into removal and inactivation methods to identify steps/processes that will help ensure the removal or inactivation of TSE agents. Manufacturers should design production processes using available methods that have the greatest likelihood of inactivating or removing TSE agents. For example, prolonged exposure of tissues to high moist heat and high pH inactivates the BSE agent. Such treatments, however, are inappropriate for the extraction of many other types of bovine-derived articles, such as serum, because these treatments lead to the destruction of the material. Conventional chemical and biochemical extraction and isolation procedures may be sufficient to remove the infectious agent. Similar techniques may be effective for other bovine-derived articles. Further research will help to develop an understanding of the most appropriate methodology for validation studies. Issues to consider during validation of a process for removal of TSE agents include the following:

- The nature of the spiked material and its relevance to the natural situation
- Design of the study (including scale-down approaches)

- Method of detecting the agent (in vitro or in vivo assay) after spiking and after the treatment
- Characterization and standardization of reference materials for spiking
- Data treatment and analysis (see *Design and Analysis of Biological Assays* ⟨111⟩)

Because no studies have successfully validated analytical methods for the detection of small amounts of the TSE agent, TSE clearance validation studies typically employ the intracranial injection of in-process material into rodents for amplification and detection of potential residual infectivity.

TESTING AND CONTROL OF ADVENTITIOUS AGENTS

Introduction

Rigorous testing procedures, strict processing and production guidelines, and appropriate risk assessments help ensure the safety of the different types of bovine serum. This section discusses specific tests that can detect and control adventitious agents.

Adventitious Agents Testing

The adventitious agents testing required for the evaluation of master seeds, master cells, and bulk and final products is described in 9 CFR 113.53 and by directives from the European Agency for the Evaluation of Medicinal Products (EMEA) (EMEA/CVMP/743/00 and EMEA/CPMP/BWP/1793/02). The testing methods outlined in these documents can detect a wide range of bovine microbial agents in serum products. These testing methods meet the requirements for most of the world's regulatory agencies. Serum manufacturers should test a representative sample of each batch of serum to determine the presence of adventitious agents. Testing is performed after filtration but before any further processing that is intended to inactivate or remove viruses.

Filtration with multiple 100-nm (0.1-μm) pore size filters, gamma irradiation (> 25 kGy while frozen), and chemical treatment (e.g., with betapropiolactone) are accepted methods of removing or inactivating viruses and mycoplasmas, and serum manufacturers routinely use these tools in both production and testing facilities. These treatments do not remove antibodies that may interfere with some applications. Additionally, the treatments do not ensure complete viral removal or inactivation, but can significantly reduce the risk of viral activity. The testing series to screen bovine serum for the absence of adventitious agents typically includes the following:

- Bacterial and fungal sterility testing as described in 9 CFR 113.26
- Mycoplasma testing as described in 9 CFR 113.28
- Viral testing as described in 9 CFR 113.53

The procedures described in *Sterility Tests* ⟨71⟩ confirm the absence of bacterial and fungal infection. For viruses, only cultivation using suitable substrate cells can indicate viral infectivity and replication. Those who use serum for research or production should test the serum for the absence of adventitious agents in a manner that is consistent with the product's intended application, bearing in mind that testing indicates only presence or absence of adventitious agents within the limits of the test procedures used.

Mycoplasma Testing

Mycoplasma contamination in tissue culture can arise from many animal origin sources, including serum, but more commonly it results from cross-contamination of infected cultures. Mycoplasmas are particularly insidious contaminants in cell culture because they

- cannot be visualized by light microscopy, even at high density ($>10^7$ colony-forming units/mL);
- cause no observable change in turbidity or pH of the culture fluid;
- cannot routinely be removed by single sterilizing filters, although removal can be obtained through a triple series of 0.1-μm filters;
- are unaffected by traditional antibiotics used in cell culture; and
- exert an extremely wide variety of adverse effects in tissue culture.

Classical mycoplasma detection is accomplished by direct sample inoculation in broth and/or agar and cultivation for a period of 28 days, with periodic observation and subculturing. This method is typically supplemented by fluorescent deoxyribonucleic acid (DNA) detection assay. Not all mycoplasma species can be cultivated, which explains the utility of supplemental fluorescent DNA detection assay. The sensitive and highly reliable direct cultivation test requires anaerobic and aerobic incubations for 3 weeks, which is a serious limitation in certain applications where quick results are required. The fluorescent DNA assay also is reliable but can yield equivocal results because it requires skilled staff to analyze a sample. It requires approximately 1 hour to complete.

In addition to the methods described previously, more recent detection procedures include luminescent and polymerase chain reaction (PCR) assay procedures. *Nucleic Acid-Based Techniques—Amplification* ⟨1127⟩ describes the general principles of PCR assays. The sensitive 20-minute luminescent assay measures a specific enzyme activity of mollicutes that converts adenosine diphosphate to adenosine triphosphate via a luciferase/luciferin reaction. Results are unequivocal and semiquantitative. PCR methods are quick and sensitive and display with good reliability, but occasional false positive results are a source of concern with commercial testing service labs. PCR may detect mycoplasmal DNA fragments that are non-infectious.

Viral Testing

The virus testing procedures for serum products are outlined in 9 CFR 113.52 and 9 CFR 113.53. In addition, there are other documents that may include equivalent or relevant testing such the EMEA/CVMP/743/00-Rev.2 from the Committee for Veterinary Medicinal Products (CVMP) *Revised Guideline on Requirements and Controls Applied to Bovine Serum Used in the Production of Immunological Veterinary Medicinal Products* and EMEA/CPMP/BWP/1793/02 from the Committee for Proprietary Medicinal Products (CPMP) *Note for Guidance on the Use of Bovine Serum in the Manufacture of Human Biological Medicinal Products*. Serum manufacturers should perform virus testing in compliance with this regulation, using at least two different and sensitive detector cell lines, one of which should be of bovine origin. The tests include cultivation of detector cells in cell culture media supplemented with 15% test serum for at least 21 days. Cells are subcultured at least twice during this period, usually 7 and 14 days post inoculation. At the conclusion of the last subculture (after a total of at least 21 days of incubation), cells are examined for general signs of virus amplification. The following end points are used for general virus detection: microscopic cell examination for cytopathogenic agents such as infectious bovine rhinotracheitis virus, cell staining and microscopic examination for inclusion bodies, and hemadsorbtion test to detect hemadsorbing agents such as PI-3. In addition to this series of testing and at the conclusion of the last subculture (after a total of at least 21 days of incubation), cells are stained with specific fluorescent antibody against the following specific viral agents:

- BVDV

- Bovine parvovirus
- Bovine adenovirus
- Bluetongue virus
- Bovine respiratory syncytial virus
- Reovirus
- Rabies virus

In addition to the viruses listed above, other viruses can be causative agents of disease and may require testing in various bovine serum applications. The serum end user is responsible for determining whether full 9 CFR testing is sufficient, and if other specific viral agents should be tested for. Examples of specific viruses not covered by the current virus testing guide may include akabane, bovine herpesvirus 1 (BHV-1), Parainvluenza-3 virus (PI-3), bovine leukemia, bovine rotavirus, bovine circovirus, bovine polyomavirus, coronavirus, torovirus, bovine enterovirus, bovine astrovirus, foot-and-mouth disease virus (FMDV), and rinderpest. *Appendix 2* provides a general description of some of these viruses as well as the ones for which testing is required. A serum end user's thorough risk analysis should determine the scope of testing and serum treatment options.

Risk Assessment and Detection Strategies

Serum manufacturers and serum end users should carry out a comprehensive, science-based risk assessment (e.g. Failure Modes and Effects Analysis) in order to better understand the safety profile of the serum product. The following risk assessment elements can be taken into consideration, but other elements can be included as appropriate: country of origin, region of the country, animal disease status of the country/region of origin, animal age, blood collection process, animal stunning method and exsanguination method, serum manufacturing process, type of production quality system, production in-process controls, final product testing, virus inactivation, equipment segregation, equipment cleaning procedure, personnel training, serum use/application, pharmaceutical product type, and intended use.

The species barrier provides a degree of protection against infection by some animal etiologic agents. This barrier is not an alternative to proactively ensuring that pharmaceutical products are manufactured only from raw materials of animal origin that have undetectable levels of adventitious agents. Inoculation of viable organisms into a nonhost species carries a risk that the organisms could cross the species barrier. An appropriate test regimen of serum material should therefore include examination for potential contaminants associated with the species of origin and the species of intent. Serum treatments to inactivate viral agents are a factor in establishing the appropriate test regimen for a particular material. Lowest risk of contamination is associated with biological materials that are terminally sterilized.

Zero risk is neither possible nor reasonable. The serum manufacturers should fully describe specific testing regimens in the product specifications, and these will vary depending on the type and source of the serum. Therefore, the guidelines for screening described in this chapter are examples only, and screening for all viruses listed may not be required for a particular material. Some manufacturers may perform certain tests on the finished product or on in-process materials rather than on individual component(s). Manufacturers must also evaluate the dilution effect in relation to the limit of detection of the test procedure. Interference with growth or neutralization of viral activity by serum may be an indication of a specific antibody or certain nonspecific factors in serum masking the viral agent. It is recommended that serum manufacturers consider this possibility when determining an adequate level of treatment in their viral inactivation studies or in virus testing applications.

Serum manufacturers should confirm that the species of origin is bovine to ensure that no other nonbovine agents may be present. Manufacturers should perform extraneous virus testing in appropriate cell cultures (see *Virology Test Methods* ⟨1237⟩ for appropriate cell line choices dependent on assay and targeted agent). If necessary, seroconversion studies should be conducted in susceptible animal species using a host species immune antibody response as the method of detection. Studies should use this procedure following an inactivation step to detect whether the virus was present before the virus inactivation process.

Serum manufacturing processes should be conducted in a consistent manner, following the established manufacturing procedures, with adequate quality systems built into the production process. Furthermore, equipment segregation (by species of origin), equipment and facility cleaning procedures, and personnel training are important elements in the risk assessment of the process.

Safety Considerations

End users of donor bovine serum may require serum that does not have detectable antibodies against BVDV or other specific agents so that the users can propagate cell cultures used in vaccine production, diagnostic testing, and test kit preparation, especially for the maintenance of master seed and master cell stocks. More than 40 cell types are available for the production of veterinary biologicals, but fewer than 10 media types are available for their propagation. Some researchers have proposed serum-free media as an alternative in propagating certain cells and viruses; but this means adapting culture procedures, which may alter the cells and change production results. If new or different sera are imported into the U.S., serum end users will require confirmation of source, species, and documentation of the origin of the sera in countries that are free of FMD and rinderpest.

CHARACTERIZATION OF BOVINE SERUM

Introduction

In the absence of end product-specific requirements, each lot of FBS should be tested to confirm that the serum meets the requirements of the proposed general chapter *Bovine Serum—Quality Attributes and Functionality Tests* ⟨90⟩. For all other types of bovine sera, this section describes several key procedures for characterization. These procedures are not mandatory but are guidelines that manufacturers may consider for their individual applications. The table in the *Hemoglobin* section shows samples of specifications for the different types of bovine sera.

Species Identification

Both inter- and intraspecies identification assays should be performed on bovine sera to confirm species identity and the integrity of the serum products, and to ensure that nonbovine agents are not present. The most commonly used assay for the identification of bovine species identity is based on the electrophoretic profile of specific serum proteins. With electrophoresis, the serum proteins usually separate into as many as six fractions: albumin, alpha 1, alpha 2, beta 1, beta 2, and gamma globulins.

Other procedures used for bovine speciation include radial immunodiffusion (RID) and the double diffusion Ouchterlony method. These procedures allow either qualitative or quantitative measurements of the immunoglobulin G levels in serum. The RID method is based on the diffusion of an antigen from a circular well into a homogeneous gel that contains specific antiserum for each particular antigen. A circle of precipitated antigen

and antibody forms and continues to grow until it reaches equilibrium. The diameters of the rings are a function of antigen concentration. The Ouchterlony method is a double gel diffusion test wherein antigen and antibody diffuse toward each other in a semisolid medium to a point in the medium where optimum concentration of each is reached, forming a precipitate. The Ouchterlony plates contain cylindrical wells—a central 8-mm diameter antigen well, surrounded by six 3-mm antisera wells—which make possible the simultaneous monitoring of multiple antigen–antibody systems and the identification of particular antigens in a preparation. The proposed general chapter *Bovine Serum—Quality Attributes and Functionality Tests* ⟨90⟩ describes the accepted procedure.

Hemoglobin

Hemoglobin is a multi-subunit protein that forms an unstable reversible bond with oxygen in the red blood cells. The oxygen-loaded form is called oxyhemoglobin and is bright red. The oxygen-unloaded form is called deoxyhemoglobin and is purple-blue. Oxyhemoglobin is the predominant form in red blood cells.

Low hemoglobin content in sera is widely accepted as a good general indication of rapid and careful processing of blood that will be used for serum. Red blood cells are fragile and rupture easily, releasing hemoglobin into the serum. Rough handling of the harvested blood, poor temperature control, or delayed processing elevates hemoglobin content in serum. Acceptable levels of hemoglobin may vary with intended application. The hemoglobin levels are measured using spectrophotometric procedures (see *Spectrophotometry and Light-Scattering* ⟨851⟩) as described in the proposed general chapter *Bovine Serum—Quality Attributes and Functionality Tests* ⟨90⟩.

Chemical Profile

The testing of components such as cholesterol, alpha globulin, beta globulin, gamma globulin, albumin, creatinine, bilirubin, glucose, alanine aminotransferase, aspartate aminotransferase, phosphorus, potassium, calcium, and sodium usually is not considered a criterion for bovine serum lot release. Some manufacturers do not perform the tests on a routine basis but only as auxiliary tests. In some instances hospital clinical laboratories may run the tests. The levels of these chemicals in serum are important to end users and may also be used to assess lot-to-lot variability.

	FBS	Newborn Calf Serum	Calf Serum	Donor Bovine Serum	Adult Bovine Serum
Sterility test	No growth detected	No growth detected	No growth detected	No growth detected	No growth detected
Mycoplasma	Not detected	Not detected	Not detected	Not detected	Not detected
Virus testing	Not detected	Not detected	Not detected	Not detected	Not detected
Hemoglobin (mg/dL)	<30	<30	<30	<30	<30
Total protein (g/dL)	3.0–4.5	3.5–6.0	5.0–8.0	5.0–8.0	6.0–10.0
pH	7.00–8.00	7.00–8.00	7.00–8.00	7.00–8.00	7.00–8.00
Osmolality (mOsmol/Kg)	280–360	240–340	240–340	240–340	240–340

Endotoxin Levels

Although high endotoxin levels are not suitable for applications involving injectables, acceptable levels in bovine sera vary depending on the intended application. Some manufacturers may overlook the importance of low endotoxin levels in bovine sera used in cell culture applications. Endotoxin influences more than 30 biological activities. Some of these are macrophage activation, mitogenic stimulation, and induction of interferon and colony-stimulating factor (for some applications, these may be positive activities). Endotoxin can also lead to cytotoxicity by initiating complement activation. The most commonly used methods for endotoxin detection are the semiquantitative gel clot Limulus amebocyte lysate procedure and the quantitative kinetic chromogenic method described in *Bacterial Endotoxins Test* ⟨85⟩. For both the gel clot and the kinetic chromogenic assays, valid endotoxin assays require appropriate treatment by heat or dilution in order to avoid adverse effects of interfering substances in serum. Researchers should include a positive product control in each assay to confirm that any interference has been overcome by the heat or dilution treatment.

Osmolality

The osmolality test is designed to evaluate the electrolyte concentration in bovine serum. Chemicals that affect serum osmolality include sodium, chloride, bicarbonate, potassium, proteins, and glucose. Serum manufacturers should measure the osmolality of each serum batch to verify compliance with product specifications, using equipment calibrated with standards that are traceable to the National Institute of Standards and Technology. *Osmolality and Osmolarity* ⟨785⟩ describes how osmolality is determined by freezing-point depression of the bovine serum solution. Scientists use at least two standards to calibrate the instrument. The osmolality of each sample is calculated and related to the serum water content and is expressed as mOsmol/kg H_2O.

Total Protein Level

The total protein level in serum is measured to verify animal age and compliance with product specifications. *Biotechnology-Derived Articles—Total Protein Assay* ⟨1057⟩ describes two procedures, the Biuret and Bradford methods, for determining protein concentration. The acceptable level of protein in serum should be assessed by the end user based on the intended application.

Cell Growth Properties

Each lot of serum should be tested for its ability to support in vitro growth of specific cell lines. Bovine sera are highly variable, and different lots may yield different results. Because of this variability, end users should characterize and standardize the cell lines that they will use for this type of testing. End users should design cell growth procedures that will help them check the efficacy of bovine serum in promoting cell growth. Serum manufacturers will benefit from monitoring growth promotion over several generations of subcultures to detect any evidence of cytotoxicity or changes in cell morphology. Different serum manufacturers use different cell types, and the growth studies and cell lines used by serum manufacturers also may differ from those applied by serum end users. When serum manufacturers evaluate the growth properties of a specific cell line in response to a specific lot of serum, they should take into account plating efficiency and/or growth promotion or some other functionality tests that qualify the serum lot for its intended use.

Plating efficiency at low cell density is a preferred method for analyzing the proliferative capacity and survival of single cells under optimal growth conditions. This procedure can reveal differences in the growth rate within the population and is capable of distinguishing between changes in growth rate (colony size) and cell survival (colony number). The growth kinetic is another important aspect in the design of cell-based experiments. Determining the growth curve of each cell line helps define optimal culture conditions, because variation in serum and other growth additives may influence growth parameters, which may affect the experimental outcome.

In the absence of specific tests designed for their particular products, serum users can refer to the functionality tests described in the proposed general chapter *Bovine Serum—Quality Attributes and Functionality Tests* ⟨90⟩ to determine whether a lot of serum is suitable for their application. This chapter provides guidance about how to perform growth promotion and plating efficiency tests.

In Vitro Cytotoxicity

Serum manufacturers should use an appropriate cell line for testing each lot of serum, and should perform growth studies through several subcultured generations to ensure that the serum has no cytotoxic effect on the cells. The choice of cell line depends on the intended use of serum. The cell growth and cytotoxicity assays should be performed on the final batch of serum after any viral inactivation step or any further processing.

CONCLUSION

Bovine serum is likely to remain an important component in the manufacture of many biologics, particularly those relying on cell culture. As with similar materials, bovine serum displays inherently variable quality. As a result, serum end users must establish suitable tests, procedures, and acceptance criteria for introduction of materials into a particular application process that uses serum. This may mean screening multiple lots of bovine serum to determine which lots meet the specification (see the section *Characterization of Bovine Serum*).

Manufacturers of therapeutic products using bovine serum are responsible for ensuring and documenting its quality and its impact on the quality, safety, and efficacy of the final product. In addition, it is important to ensure that each lot of serum performs in an equivalent manner during manufacturing. Serum can also interfere with final product purification; therefore it is important to understand the effect of bovine serum on the manufacturing process in order to understand the effect that various processes might have on the final product. Finally, risks can also be mitigated through the design of processes to include steps to adequately remove the bovine material through dilution, separation, or inactivation as well as the development of analytical assays to assess the bovine-derived residual content during processes and in the final therapeutic product. A number of sensitive assays can provide a quantitative means of detecting bovine material at picogram levels.

APPENDIX 1

Bovine sera and serum-related products used in the manufacture of biological products are regulated in the context of *Requirements for Ingredients of Animal Origin Used for the Production of Biologics*, 9 CFR 113.53. Currently, individual serum manufacturers perform detection studies to identify contaminating viruses. Because of the potential international market for serum, serum manufacturers need to be mindful of other regulatory requirements. Manufacturers can use the documents listed here as guidance for screening bovine sera for contamination by adventitious agents. Because of the risk carried by animal-derived serum products, serum manufacturers and end users should ensure that the country of origin of

the material complies with applicable regulatory requirements. Although no cell performance assays currently demonstrate lack of BSE in serum, serum manufacturers must comply with the regulatory requirements of countries where the serum is marketed to ensure a minimal risk of infection with BSE/TSE.

Beyond relevant *USP* chapters referenced in this chapter, the following list of documents includes regulatory documents as well as best practices in product and process development, manufacturing, quality control, and quality assurance.

APPENDIX 2

Following is a general description of viruses that manufacturers can consider when testing bovine serum for the absence of adventitious agents. The list is intended

only to provide general information. The list of required testing is described in this chapter in the section *Viral Testing*.

Akabane—An insect-transmitted virus that causes congenital abnormalities of the central nervous system in ruminants. Disease due to *Akabane* virus has been recognized in Australia, Israel, Japan, and Korea. Antibodies to it have been found in a number of countries in Southeast Asia, the Middle East, and Africa. The disease affects fetuses of cattle, sheep, and goats. Asymptomatic infection has been demonstrated serologically in horses, buffalo, and deer (but not in humans or pigs) in endemic areas.

Bluetongue—An infectious, noncontagious arthropod-borne viral disease primarily of domestic and wild ruminants. Infection with bluetongue virus is common worldwide but is usually subclinical or mild. *Bluetongue* virus is the type-species of the genus *Orbivirus* in the family Reoviridae. Worldwide, 24 serotypes have been identified, although not all serotypes exist in any one geographic area: e.g., only 5 serotypes (2, 10, 11, 13, and 17) have been reported in the U.S. Distribution throughout the world parallels the spatial and temporal distribution of vector species of *Culicoides* biting midges, which are the only significant natural transmitters of the virus.

Bovine adenovirus—Associated with a wide spectrum of diseases. *Bovine adenovirus* type 3 is the serotype most often associated with bovine respiratory disease. *Bovine adenoviruses* are DNA viruses that have been separated into two genera, the *Mastadenovirus,* or *mammalian adenoviruses,* and the *Aviadenovirus,* or *avian adenoviruses.* Within the genus *Mastadenovirus* are numerous species specific serotypes, nine of which have been identified in cattle. *Epitheliotrophic adenoviruses* have also been isolated from ruminants, and usually are clinically unapparent. Clinical disease is dictated by various factors, including the strain of virus, concurrent infection, stress, environmental conditions, and management practices.

Bovine herpesvirus 1 (BHV-1)—Associated with several diseases in cattle, including infectious bovine rhinotracheitis, infectious pustular vulvovaginitis, balanoposthitis, conjunctivitis, abortion, encephalomyelitis, and mastitis. BHV-1 infections are widespread in the cattle population. In feedlot cattle the respiratory form is most common.

Bovine leukemia—An exogenous C-type oncovirus in the family Retroviridae. Bovine leukemia is a viral disease of adult cattle characterized by neoplasia of lymphocytes and lymph nodes. Infection occurs by iatrogenic transfer of infected lymphocytes and is followed by a permanent antibody response. The prevalence of infection in a herd may be high, but only a few animals develop fatal lymphosarcoma. Infection is spread by contact with contaminated blood from an infected animal.

Bovine reovirus—Double-stranded ribonucleic acid (RNA) (dsRNA) viruses with nonenveloped spherical virions 60–80 nm in diameter. They cause bovine respiratory diseases.

Bovine respiratory syncytial virus (BRSV)—An RNA virus classified as a pneumovirus in the Paramyxovirus family. This virus was named for its characteristic cytopathic effect—the formation of syncytial cells. In addition to cattle, sheep and goats can also be infected by respiratory syncytial viruses. Human respiratory syncytial virus (HRSV) is an important respiratory pathogen in infants and young children. HRSV has antigenic subtypes, and preliminary evidence suggests the existence of antigenic subtypes of BRSV. BRSV is distributed worldwide, and the virus is indigenous in the cattle population. BRSV infections associated with respiratory disease occur predominantly in young beef and dairy cattle.

Bovine rotavirus—A dsRNA spherical virion 60–80 nm in diameter without an envelope. It is the most common viral cause of diarrhea in calves and lambs.

Bovine viral diarrhea virus (BVDV)—An RNA virus classified as a *Pestivirus* in the family Flaviviridae. BVDV can cross the placenta and appears to be capable of inducing immunosuppression, which allows the development of secondary bacterial pneumonia. BVDV has been reported to be the virus most frequently associated with multiple viral infections of the respiratory tract of calves.

Foot-and-mouth disease (FMD)—A highly infectious viral disease of cattle, pigs, sheep, goats, buffalo, and artiodactyl wildlife species. In a susceptible population, morbidity approaches 100%. The disease is rarely fatal except in young animals. FMD is caused by an *Aphthovirus* of the family Picornaviridae. Seven immunologically distinct serotypes are known, and within each serotype exist a large number of strains that exhibit a spectrum of antigenic characteristics.

Parainfluenza-3 virus (PI-3)—An RNA virus classified in the Paramyxovirus family. Although PI-3 is capable of causing disease, the virus usually is associated with mild to subclinical infection. The most important role of PI-3 is to serve as an initiator that can lead to the development of secondary bacterial pneumonia. Infections caused by PI-3 are common in cattle.

Parvovirus—A relatively heat-stabile single-stranded DNA virus approximately 20 nm in diameter that has been recovered from cattle but under natural conditions is not known to cause disease.

Rabies—An acute viral encephalomyelitis that principally affects carnivores and bats, although it can affect any mammal. Rabies is caused by *Lyssaviruses* in the Rhabdovirus family. Although they are usually confined to one major reservoir species in a given geographic area, spillover to other species is common.

Rinderpest—A *Morbillivirus,* closely related to the viruses that cause canine distemper and measles. Strains may vary markedly in host range and virulence. Sera from recovered or vaccinated cattle cross-react with all strains in neutralization tests, but minor antigenic differences have been demonstrated. The virus is fragile and becomes rapidly inactivated by heat and light but remains viable for long periods in chilled or frozen tissues. Rinderpest is endemic in many countries in Asia and Africa. Historically, the virus has been widely distributed throughout Europe and Africa but to date has not established itself in North America, Central America, the Caribbean Islands, South America, Australia, or New Zealand. Rinderpest is included in the WHO's Office International des Epizooties list of communicable diseases that have the potential for very serious and rapid spread, irrespective of national borders; which are of serious socioeconomic or public health consequence; and which are of major importance in the international trade of livestock and livestock products.■1S (*USP33*)

REAGENTS, INDICATORS, AND SOLUTIONS

Reagent Specifications

BRIEFING

***t*-Butylthiol.** It is proposed to add this new reagent used in the *Content of Alliin* test in the monograph for *Garlic*.

(HDQ: M. Marques.) RTS—C73260

Add the following:

■***t*-Butylthiol** (*tert-Butylthiol; tert-Butyl Mercaptan; 2-Methyl-2-propanethiol; TBM*), $(CH_3)_3CSH$—**90.19** [*75-66-1*]—Use a suitable grade with a content of NLT 98.0%.

[NOTE— A suitable grade is available as catalog number 20230 at www.sigma-aldrich.com.]■1S *(USP33)*

BRIEFING

Cobalt Nitrate, *USP 32* page 816. It is proposed to correct the CAS number for this reagent.

(HDQ: M. Marques.) RTS—C73254

Change to read:

Cobalt Nitrate, $Co(NO_3)_2 \cdot 6H_2O$—**291.03** ~~[*10141-05-6*]~~

■[*10026-22-9*]■1S *(USP33)*
—Use ACS reagent grade.

BRIEFING

Diaveridine, *USP 32* page 818. It is proposed to include information about a possible supplier of this reagent.

(HDQ: M. Marques.) RTS—73261

Diaveridine *(5-([3,4-Dimethoxyphenyl]methyl)-2,4-pyrimidinediamine),* $C_{13}H_{16}N_4O_2$—**260.3** [*5355-16-8*]—Use a suitable grade.

■[NOTE—A suitable grade is available as catalog number 46174 from www.sigma-aldrich.com.]■1S *(USP33)*

BRIEFING

***p*-Naphtholbenzein,** *USP 32* page 834. It is proposed to correct the CAS number for this reagent.

(HDQ: M. Marques.) RTS—C73222

Change to read:

***p*-Naphtholbenzein,** $C_{27}H_{18}O_2$—**374.43** ~~[*6948-88-5*]~~

■[*145-50-6*]■1S *(USP33)*
—Red-brown powder. Use a suitable grade.

BRIEFING

Sodium Biphenyl, *USP 32* page 847 and page 178 of *PF* 35(1) [Jan.–Feb. 2009]. It is proposed to add information about other possible suppliers of this reagent.

(HDQ: M. Marques.) RTS—C73178

Change to read:

Sodium Biphenyl, $C_{12}H_9Na$—**176.19**~~—Supplied as a solution (10 percent to 30 percent, w/w) in a mixture of dimethoxyethane and toluene or xylene. The solution is a viscous, dark green liquid. [NOTE—The solution deteriorates at a rate of about 10% per month. Use only freshly prepared solution.]~~

▲Available as a solution in 2-ethoxyethyl ether,▲*USP33*

■or in 1,2-dimethoxyethane (diethylene glycol diether).■1S *(USP33)*

Activity—Place 20 mL of dry toluene in a titration flask equipped with a magnetic stirring bar and a stopper having a hole through which the delivery tip of a weight buret may be inserted. Add a quantity of sodium biphenyl sufficient to produce a blue color in the mixture, and titrate with amyl alcohol, contained in a weight buret, to the disappearance of the blue color. (Disregard the amounts of sodium biphenyl and amyl alcohol used in this adjustment.) Weigh accurately the weight buret containing the amyl alcohol. Transfer the contents of a vial of well-mixed test specimen to the titration flask, and titrate quickly with the amyl alcohol to the

disappearance of the blue color. Weigh the buret to determine the weight of amyl alcohol consumed, and calculate the activity, in mEq per vial, by the formula:

$$11.25W$$

in which *W* is the weight of amyl alcohol consumed. Not less than 10% activity is found.

Iodine content—Add 10 mL to 5 mL of toluene contained in a 125-mL separator fitted with a suitable inert plastic stopcock, and shake vigorously for 2 minutes. Extract gently with three 10-mL portions of dilute phosphoric acid (1 in 3), combining the lower phases in a 125-mL iodine flask. Add sodium hypochlorite TS, dropwise, to the combined extracts until the solution turns brown, then add 0.5 mL in excess. Shake intermittently for 3 minutes, add 5 mL of freshly prepared, saturated phenol solution, mix, and allow to stand for 1 minute, accurately timed. Add 1 g of potassium iodide, shake for 30 seconds, add 3 mL of starch TS, and titrate with 0.1 N sodium thiosulfate VS: not more than 0.1 mL of 0.1 N sodium thiosulfate is consumed.

▲[NOTE—A suitable grade is available as catalog number 277134 from www.sigma-aldrich.com▲*USP33*

■or as catalog number 54101 from www.gfschemicals.com.]■1S *(USP33)*

BRIEFING

Stannous Chloride, *USP 32* page 851. It is proposed to correct the CAS number of this reagent.

(HDQ: M. Marques.) RTS—C73278

Change to read:

Stannous Chloride, $SnCl_2 \cdot 2H_2O$—**225.65** ~~[7772-99-8]~~

■[*10025-69-1*]■1S *(USP33)*
—Use ACS reagent grade.

BRIEFING

Sulfuric Acid, Nitrogen Free. It is proposed to add this new reagent used in the test for *Limit of Nitrate* in the monograph for *Calcium Acetate*.

(HDQ: M. Marques.) RTS—C73250

Add the following:

■**Sulfuric Acid, Nitrogen Free,** H_2SO_4—**98.08**

[*7664-93-9*]—Use a suitable grade.

[NOTE—A suitable grade is available as Sulfuric Acid, Ultrex II, catalog number 6902-05 from www.mallbaker.com.]■1S *(USP33)*

Test Solutions

BRIEFING

Dibasic Sodium Phosphate TS, *USP 32* page 869. It is proposed to make some editorial changes in the entry for this *Test Solution*.

(HDQ: M. Marques.) RTS—C73221

Change to read:

Dibasic Sodium Phosphate TS—Dissolve 12 g of ~~clear crystals of~~

■■1S *(USP33)*
dibasic sodium phosphate in water to 100 mL.

BRIEFING

Description and Relative Solubility of USP and NF Articles, *USP 32* page 890, page 266 of *PF* 29(1) [Jan.–Feb. 2003], page 591 of *PF* 31(2) [Mar.–Apr. 2005], page 1053 of *PF* 33(5) [Sept.–Oct. 2007], page 450 of *PF* 34(2) [Mar.–Apr. 2008], page 817 of *PF* 34(3) [May–June 2008], page 1046 of *PF* 34(4) [July–Aug. 2008], page 1322 of *PF* 34(5) [Sept.–Oct. 2008], page 1565 of *PF* 34(6) [Nov.–Dec. 2008], page 188 of *PF* 35(1) [Jan.–Feb. 2009], and page 464 of *PF* 34(2) [Mar.–Apr. 2009].

(HDQ) RTS—C44129; C44603; C44606; C49314; C49319; C52047; C57726; C62481; C62812; C68834

Add the following:

■**Articaine Hydrochloride:** White or almost white, crystalline powder. Freely soluble in water and in alcohol.■1S (*USP33*)

Add the following:

■**Carmustine:** Light yellow powder. Freely soluble in ether.■1S (*USP33*)

Add the following:

■**Misoprostol:** Clear, colorless or light yellow viscous liquid. Very slightly soluble in water.■1S (*USP33*)

Add the following:

■**Olopatadine Hydrochloride:** White crystalline powder. Very soluble in formic acid; sparingly soluble in water; very slightly soluble in dehydrated alcohol.■1S (*USP33*)

Add the following:

■**Pentamidine Isethionate:** White or almost white powder or colorless crystals, hygroscopic. Freely soluble in water; sparingly soluble in alcohol; practically insoluble in methylene chloride.■1S (*USP33*)

Add the following:

■**Telmisartan:** White or slightly yellowish, crystalline powder. Sparingly soluble in methylene chloride; slightly soluble in methanol; practically insoluble in water. It dissolves in 1 M sodium hydroxide.■1S (*USP33*)

Add the following:

■**Ticlopidine:** White or almost white crystalline powder. Sparingly soluble in water and in alcohol; very slightly soluble in ethyl acetate.■1S (*USP33*)

Change to read:

Tretinoin: Yellow to light-orange, crystalline powder. Slightly soluble in alcohol, ~~and in chloroform.~~ ■in chloroform, and in methanol;■1S (*USP33*) insoluble in water.

Add the following:

■**Valacyclovir Hydrochloride:** White to off-white powder. Soluble in water; insoluble in dichloromethane.■1S (*USP33*)

Add the following:

■**Ziprasidone Hydrochloride:** White to slightly pink powder. Very soluble in methanol; slightly soluble in isopropyl alcohol, and in hot tetrahydrofuran; practically insoluble in water.■1S (*USP33*)

In-Process Revision

Pending Proposals

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *Pharmacopeial Forum (PF)* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in the *USP–NF,* its *Supplements,* or an *IRA.* Those items that have not yet been adopted are marked as *Pending Proposals.*

The *Pending Proposals* list contains these items separated into the following categories: General Notices and Requirements; *USP* monographs; Dietary Supplements Monographs; General Chapters; Reagents; Indicators; and Solutions; Reference Tables; Excipients; and *NF* Monographs. Each entry in the *Pending Proposals* list contains the monograph title and the citation of the most recent publication of the monograph. Reprints of *PF* proposals may be purchased from USP by sending a written request for information to custsvc@usp.org.

To check the status of a *Pending Proposal,* please contact USP as directed below.

- The briefing accompanying the monograph or general chapter lists the names of the Scientific Liaisons responsible for the proposed revisions. The contact information (phone number and email) for the Scientific Liaison is available in the *Staff Directory* section of *How to Use PF.* For *USP–NF Online* subscribers, the name and contact information for the assigned Scientific Liaison is available in the *Auxiliary Information* portion of each monograph.
- Call USP at 301-816-8344 and ask to speak with the Scientific Liaison assigned to the monograph or general chapter of interest.
- Submit questions by email to stdsmonographs@usp.org. Please indicate the name of the monograph or general chapter in the subject line of the email.

Following these lists the reader will find the *Canceled Proposals* list. These are items that were published in *PF* and were pending, but have since been canceled. This list contains cumulative entries for the six issues per volume of *PF* [i.e., 35(1) through 35(6)]. Note that canceled proposals may be republished in *PF* to be considered for future adoption into the *USP–NF.*

Gabapentin Tablets—*Labeling* (add), *Dissolution*	34	4	934
Galantamine Tablets—*Labeling* (add), *Dissolution*	34	6	1452
Glimepiride Tablets—*Dissolution*	33	3	411
Glutaral Concentrate—*Specific gravity*	31	3	766
Glyburide Tablets—*Dissolution*	33	4	651
Glyburide and Metformin Hydrochloride Tablets—*Identification A*	34	5	1163
Goserelin Acetate (new)	32	3	792
Granisetron Hydrochloride Injection (new)	34	4	935
Granisetron Hydrochloride Oral Suspension (new)	34	6	1454
Granisetron Hydrochloride Tablets (new)	34	4	937
Halazone—*Readily carbonizable substances*	34	5	1163
Haloperidol Decanoate (new)	34	3	614
Heparin Sodium (entire monograph revised)	35	2	257
Heparin Sodium Injection (entire monograph revised)	35	2	266
Hydroxychloroquine Sulfate Tablets—*Identification*	34	4	940
Hydroxyzine Pamoate—*Identification, Residue on ignition, Heavy metals, Pamoic acid content* (delete), *Assay*	34	2	271
Hydroxyzine Pamoate Capsules—*Identification, Assay*	34	2	272
Hydroxyzine Pamoate Oral Suspension—*Identification, Assay*	34	2	273
Ibuprofen—*Chromatographic purity*	34	4	941
Ibuprofen Tablets—*Limit of ibuprofen related compound C*	34	4	941
Imipramine Hydrochloride—*Melting range* (delete)	34	5	1164
Biphasic Isophane Insulin Human Suspension (new)	31	4	1033
Human Insulin Isophane Suspension and Human Insulin Injection—*Soluble insulin human content*	34	4	941
Irbesartan—*Limit of azide*	34	5	1164
Isotretinoin Capsules—*Labeling* (add), *Chromatographic purity, Assay*	34	4	942
Itraconazole (new)	34	4	947
Ivermectin and Pyrantel Pamoate Tablets (new)	34	2	277
Ketoprofen—*USP Reference standards, Chromatographic purity*	34	3	617
Ketoprofen Extended-Release Capsules (new)	34	4	951
Lactic Acid—*Readily carbonizable substances*	34	5	1164
Lamivudine and Zidovudine Tablets (new)	35	2	277
Lamotrigine (new)	34	3	617
Levonorgestrel—*USP Reference standards, Chromatographic purity, Assay*	34	3	620
Levorphanol Tartrate—*Assay*	34	2	280
Levothyroxine Sodium Oral Powder—*Identification* (add)	34	4	954
Levothyroxine Sodium Tablets—*Definition, Identification*	34	4	954
Lindane—*Assay*	34	2	280
Liothyronine Sodium Tablets—*Identification*	34	4	955
Liotrix Tablets—*Identification*	34	4	955
Lipid Injectable Emulsion—*Definition, Limit of free fatty acids*	34	3	621
Lisinopril Tablets—*Dissolution*	34	4	956
Lisinopril and Hydrochlorothiazide Tablets (new)	34	4	956
Loratadine Orally Disintegrating Tablets (new)	34	3	624
Loratadine and Pseudoephedrine Sulfate Extended-Release Tablets (new)	32	6	1715
Losartan Potassium—*Limit of cyclohexane and isopropyl alcohol* (delete)	34	3	626
Losartan Potassium Tablets (new)	34	5	1164
Losartan Potassium and Hydrochlorothiazide Tablets (new)	34	6	1455
Mafenide Acetate Cream—*Identification*	34	2	280
Mafenide Acetate for Topical Solution—*Content of acetic acid*	34	3	627
Magnesium Carbonate and Citric Acid for Oral Solution—*USP Reference standards* (add), *Content of anhydrous citric acid, Other requirements (delayed implementation to January 1, 2009)*	31	2	419
Magnesium Citrate Oral Solution—*USP Reference standards* (add), *Assay for anhydrous citric acid (delayed implementation to January 1, 2009)*	31	2	420
Magnesium Citrate for Oral Solution—*USP Reference standards* (add), *Content of anhydrous citric acid, Other requirements (delayed implementation to January 1, 2009)*	31	2	421
Mannitol—*Harmonization*	34	6	1588
Mannitol Injection—*Labeling*	32	2	263

Pending Proposals (*continued*)

Psyllium Husk—*Impurities—Heavy Metals* (add), *Procedure 3* (add)	35	2	304
Pyrantel Pamoate—*USP Reference standards, Related compounds*	34	6	1482
Quinapril Tablets—*Related compounds*	34	5	1182
Ramipril—*Definition, Assay*	31	3	787
Ranitidine Hydrochloride—*Chromatograpic purity, Assay*	34	2	299
Oral Rehydration Salts—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	5	1399
Repaglinide Tablets—*Loss on Drying* (delete)	35	2	306
Risedronate Sodium (new)	34	5	1183
Risedronate Sodium Tablets (new)	34	5	1186
Ritonavir—*Identification*	35	1	95
Rocuronium Bromide (new)	34	3	648
Salmeterol Xinafoate (new)	35	2	307
Salsalate Tablets—*Assay*	33	6	1211
Secobarbital Sodium—*Chemical structure, Definition, Identification, Related compounds* (add), *Isomer content* (delete), *Assay*	34	4	984
Sennosides—*Content of Sennosides A and B* (add), *USP Reference Standards* (add)	35	2	308
Sertraline Hydrochloride (new)	34	5	1189
Sibutramine Hydrochloride (new)	34	4	986
Simethicone Emulsion—*Assay*	34	3	652
Simethicone Tablets—*Disintegration*	34	3	652
Sodium Chloride—*Identification, Loss on drying, Limit of potassium (postponed indefinitely)*	32	2	264
Sodium Fluoride—*Assay*	34	3	653
Sodium Sulfate—*Assay*	34	5	1192
Soybean Oil—*CAS number* (add), *Labeling, Identification* (add), *Specific gravity* (delete), *Refractive index* (delete), *Heavy metals, Free fatty acids* (delete), *Acid value* (add), *Fatty acid composition, Iodine value* (delete), *Saponification value* (delete), *Cottonseed oil* (delete), *Peroxide value, Water* (add), *Alkaline impurities* (add), *Sterol composition* (add), *Other requirements* (add)	34	4	989
Spectinomycin for Injectable Suspension—*Identification* (add), *Other requirements*	34	5	1193
Stavudine—*Specific rotation*	34	3	653
Streptomycin Injection—*Identification* (add), *Other requirements*	34	5	1193
Sucralfate—*Identification*	33	2	254
Sulfadoxine—*Identification, Assay*	34	2	300
Sulfadoxine and Pyrimethamine Tablets—*Assay*	34	2	301
Sulfamethazine Granulated—*Assay*	31	3	797
Sulfasalazine—*Identification*	34	3	653
Sulfazalazine Tablets—*Identification*	34	3	653
Sulfinpyrazone—*Solubility in acetone* (delete), *Solubility in 0.50 N sodium hydroxide* (delete)	34	6	1483
Tacrolimus (new)	35	2	310
Tacrolimus Capsules (new)	35	2	312
Tamsulosin Hydrochloride Capsules (new)	34	5	1193
Tazobactam—*Identification, Specific rotation, Related compounds, Organic volatile impurities* (delete), *Assay*	34	2	302
Terbinafine Hydrochloride—*Melting range*	34	5	1197
Terbinafine Oral Suspension (new)	35	1	96
Terbutaline Oral Suspension (new)	35	1	97
Terbutaline Sulfate Inhalation Aerosol—*USP Reference standards, Assay*	31	2	450
Terconazole (new)	34	4	991
Thiabendazole Chewable Tablets (new)	29	6	1991
Thimerosal—*Readily carbonizable substances*	34	5	1197
Thioguanine—*USP Reference standards, Identification, Limit of guanine*	34	2	305
Thioridazine Hydrochloride—*Identification*	31	3	798
Tiagabine Hydrochloride—*Chromatographic purity*	34	2	306
Tiagabine Hydrochloride Oral Suspension (new)	35	1	98
Tilmicosin—*Definition, Related compounds, Assay*	31	3	798
Tobramycin Inhalation Solution—*Identification* (add), *Osmolarity, Chromatographic purity, Other requirements* (delete), *Assay*	34	2	307
Topiramate Tablets (new)	34	5	1197
Tramadol Hydrochloride (new)	34	5	1200

STAGE 4 HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization consists of several steps (***Stages 1*** through ***7***, as defined below). Stage 4 drafts are available for comments. Below are descriptions of the developmental Stages as defined by the United States Pharmacopeia, the European Pharmacopoeia, and the Japanese Pharmacopoeia.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF,* this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

MONOGRAPHS (NF)

BRIEFING

Crospovidone. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Crospovidone monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the revised OFFICIAL INQUIRY STAGE 4 document, is based in part on comments from the Japanese Pharmacopoeia and the United States Pharmacopeia. Differences between this OFFICIAL INQUIRY STAGE 4 document and the current USP monograph include the following.

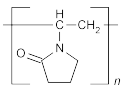
1. *Definition*. Amended to include Type A or Type B, determined by particle size.
2. *Identification*. New test added to distinguish between Type A and Type B using wet sieving.
3. *Residue on Ignition*. New specification proposed (NMT 0.1%).
4. *Peroxides*. New test proposed by EP.
5. *Vinylpyrrolidone*. Replaced titration assay with more sensitive HPLC assay, consistent with other Povidone monographs.
6. *Loss on Drying*. New test to replace *Water Determination*.
7. *Labeling*. Included requirement to label Type A or Type B.

The LC procedure performed for the *Vinylpyrrolidone* test is based on analyses performed by the Nucleosil 120-5 brand of precolumn and Aquasil brand of column containing packing L1.

(EM2: K. Moore.) RTS—C47365

Add the following:

Crospovidone



$(C_6H_9NO)_n$ $(111.1)_n$

1-Ethenyl-2-pyrrolidinone homopolymer;
1-Vinyl-2-pyrrolidinone homopolymer [9003-39-8].

DEFINITION

Crospovidone is the cross-linked homopolymer of 1-ethenylpyrrolidin-2-one. Content: 11.0%–12.8% of nitrogen (N; A_r 14.01) (dried substance). Two types of crospovidone are available, depending on the particle size: Type A and Type B.

IDENTIFICATION

- **A.** Suspend 1 g in 10 mL of water, add 0.1 mL of 0.1 N iodine, and shake for 30 s. Add 1 mL of starch TS, and shake: no blue color develops within 30 s.
- **B.** To 10 mL of water, add 0.1 g and shake. A suspension is formed and no clear solution is obtained within 15 min.
- **C. PROCEDURE**

Analysis: [NOTE—The analytical sieves must be clean and dry. To this purpose the sieves are washed in hot water and allowed to dry overnight in a drying cabinet at 105 °C.] Place 20 g calculated on the dried substance in a 1000-mL conical flask, add 500 mL of water, and shake the suspension for 30 min. Pour the suspension through a 63-µm analytical sieve, previously tared, and rinse the sieve with water until the filtrate is clear. Dry the sieve and sample residue at 105 °C for 5 h in a drying cabinet without circulating air. Cool in a desiccator for 30 min, and weigh. Calculate the sieving residue fraction of sample particles having a diameter of more than 63 µm, in percentage, using the following expression:

$$\text{Result} = (m_1 - m_3 \times 100)/(m_2)$$

m_1 = mass of the sieve and sample residue, after drying for 5 h (g)
m_3 = mass of the sieve (g)
m_2 = initial mass of the sample, calculated on a dried basis (g)

Acceptance criteria: If the sieving residue fraction is more than 15%, the substance is classified as Type A; if the sieving residue fraction is NMT 15%, the substance is classified as Type B.

ASSAY

- **PROCEDURE**

Analysis: Place 0.100 g in a combustion flask and add 5 g of a mixture of 1 g of cupric sulfate, 1 g of titanium dioxide, 33 g of potassium sulfate, and 3 glass beads. Wash any adhering particles from the neck into the flask with a small quantity of water. Add 7 mL of sulfuric acid, allowing it to run down the inside wall of the flask. Gradually heat the flask until the solution has a clear, yellowish-green colour, and the inside wall of the flask is free from carbonized material, and then heat for a further 45 min. After cooling, cautiously add 20 mL of water, and connect the flask to the distillation apparatus previously washed by passing steam through it. To the absorption flask add 30 mL of a 40 g/L solution of boric acid, 3 drops of bromocresol green–methyl red solution TS, and sufficient water to immerse the lower end of the condenser tube. Add 30 mL of a solution of strong sodium hydroxide solution through a funnel, cautiously rinse the funnel with 10 mL of water, immediately close the clamp attached to the rubber tube, then start the distillation with steam to obtain 80–100 mL of distillate. Remove the absorption flask from the lower end of the condenser tube, rinsing the end part with a small quantity of water, and titrate the distillate with 0.025 M sulfuric acid until the color of the solution changes from green through pale greyish-blue to pale greyish red-purple. Carry out a blank determination and make any necessary correction. 1 mL of 0.025 M sulfuric acid is equivalent to 0.700 mg of N.
Acceptance criteria: 11.0%–12.8%

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION ⟨281⟩:** NMT 0.1%, a 1-g specimen being used

Organic Impurities

- **PROCEDURE 1: PEROXIDES**

Sample suspension A: [NOTE—Use for Type A.] 40 mg/mL in water. To 25 mL of this suspension add 2 mL of titanium trichloride–sulfuric acid TS. Allow to stand for 30 min and filter.
Sample suspension B: [NOTE—Use for Type B.] 16 mg/mL in water. To 25 mL of this suspension add 2 mL of titanium trichloride–sulfuric acid TS. Allow to stand for 30 min and filter.
Compensation liquid A: [NOTE—Use for Type A.] 40 mg/mL in water. Filter, take 25 mL, and add 2 mL of a 13% solution of sulfuric acid.
Compensation liquid B: [NOTE—Use for Type B.] 16 mg/mL in water. Filter, take 25 mL, and add 2 mL of a 13% solution of sulfuric acid.

Analysis: Measure the absorbance of the filtrate at 405 nm against the appropriate compensation liquid.
Acceptance criteria: NMT 0.35. For Type A, this corresponds to NMT 400 ppm expressed as H_2O_2; For Type B, this corresponds to NMT 1000 ppm expressed as H_2O_2.

- **PROCEDURE 2: VINYLPYRROLIDINONE**

Mobile phase: 1:9 Acetonitrile:water
Sample solution: 25 mg/mL suspension in methanol. Shake for 60 min. Leave the bulk to settle, and pass through a 0.2-µm filter.
Reference stock solution A: 5 µg/mL of vinylpyrrolidinone in methanol
Reference stock solution B: 100 µg/mL of vinylpyrrolidinone and 5 mg/mL of vinyl acetate in methanol
Reference solution A: A 1 in 20 solution of *Reference stock solution A* with *Mobile phase*
Reference solution B: A 1 in 100 solution of *Reference stock solution B* with *Mobile phase*
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV
Detection wavelength: 235 nm
Precolumn[1]: L1, 4-mm × 2.5-cm, 5 µm
Column[2]: L1, 4-mm × 25-cm, 5 µm
Temperature: 40°
Flow rate: 1 mL/min
Injection size: 50 µL. After each injection of the *Sample solution*, wash the precolumn by passing the *Mobile phase* backwards, at the same flow rate as applied in the test, for 30 min.
System suitability
Samples: *Reference solution A* and *Reference solution B*
Suitability requirements
Resolution: NLT 2.0 between vinylpyrrolidone and vinyl acetate, *Reference solution B*
Relative standard deviation: NMT 2.0% on 6 injections of *Reference solution A*
Analysis
Sample: *Sample solution*
Acceptance criteria: The area of the peak in the *Sample solution* is NMT the area of the principal peak in the chromatogram obtained with *Reference solution A.* NMT 10 ppm.

SPECIFIC TESTS

- **LOSS ON DRYING** ⟨**731**⟩**:** Dry 0.500 g at 105° to constant weight.

Acceptance criteria: NMT 5.0% of its weight

- **WATER–SOLUBLE SUBSTANCES**

Analysis: Transfer 25.0 g of Crospovidone to a 400-mL beaker, add 200 mL of water, and stir on a magnetic stirrer, using a 5-cm stirring bar, for 1 h. Transfer to a 250-mL volumetric flask with the aid of 25 mL of water. Add water to volume. Allow the bulk of the solids to settle. Pass 100 mL of the relatively clear supernatant through a membrane filter having a 0.45-µm porosity, protected against clogging by superimposing a membrane filter having a 3-µm porosity. While filtering, stir the solution above the filter manually or with a mechanical stirrer, taking care not to physically damage the membrane filter. Transfer 50.0 mL of the clear filtrate to a tared 100-mL beaker, evaporate to dryness, and dry at 110° for 3 h.
Acceptance criteria: The weight of the residue does not exceed 75 mg (1.5%).

ADDITIONAL REQUIREMENTS

- **LABELING:** The label states the type (Type A or Type B).

[1]Nucleosil 120-5 C18 from Macherey & Nagel is sufficient.
[2]Aquasil C18 from ThermoHypersil is sufficient.

BRIEFING

Hydroxypropyl Cellulose. The United States Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Hydroxypropyl Cellulose monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the revised **OFFICIAL INQUIRY STAGE 4** document, is based in part on comments from the Japanese Pharmacopoeia and the European Pharmacopeia, in response to the **OFFICIAL INQUIRY STAGE 4** draft, prepared by the United States Pharmacopoeia, and published in *PF* 30(1) [Jan.–Feb. 2004]. Differences between this **OFFICIAL INQUIRY STAGE 4** document and the previous draft include a new assay method, where a determination of the molar substitution has been added based on extensive validation work and comparative studies with the existing titration method. This assay applies the general principle for determination of alkoxy groups in substituted celluloses (Zeissel-reaction followed by gas chromatography) which has been presented by the Japanese Pharmaceutical Excipients Council (JPEC) for Hydroxypropylcellulose and Hydroxypropylcellulose, Low Substituted. This method replaces the existing titration method which required the highly toxic reagent chromic acid.

(EM2: K. Moore.) RTS—C51136

Add the following:

Hydroxypropyl Cellulose

Cellulose, 2-hydroxypropyl ether [9004-64-21].

DEFINITION
Hydroxypropyl Cellulose is a partially substituted poly(hydroxypropyl) ether of cellulose. It contains NLT 53.4% and NMT 80.5% of hydroxypropoxy groups, calculated on the dried basis. It may contain suitable anticaking agents.

IDENTIFICATION

- **A. INFRARED ABSORPTION** ⟨**197**⟩
- **B. PROCEDURE**

Sample solution: 10 mg/mL Hydroxypropyl Cellulose
Analysis: Transfer 10 mL of *Sample solution* to a suitable container. Heat the solution to 45°.
Acceptance criteria: The solution becomes cloudy or a flocculent precipitate is formed, and the turbidity or precipitate disappears on cooling.

- **C. PROCEDURE**

Sample solution: 1 mL of *Sample solution* from *Identification* test *B*
Analysis: Transfer the *Sample solution* to a glass plate, and allow the water to evaporate.
Acceptance criteria: A thin, self-sustaining film is formed.

ASSAY
[NOTE—Determination of hydroxypropoxy groups in Hydroxypropyl Cellulose]

- **PROCEDURE**

Internal standard solution: Methylcyclohexane in *o*-xylene (1 in 50)
Standard solution: Add 60 mg of adipic acid, 2.0 mL of *Internal standard solution*, and 1.0 mL of hydroiodic acid, stopper the vial tightly, and weigh. Add 25 µL of isopropyl iodide for assay, and again weigh. Shake the reaction vial for 30 s, and use the upper layer of the content as the *Standard solution*.

Sample solution: Weigh 30 mg of hydroxypropyl cellulose previously dried, transfer to the reaction vial, add 60 mg of adipic acid, 2.0 mL of *Internal standard solution*, and 1.0 mL of hydroiodic acid, stopper the vial tightly, and weigh. Shake the vial for 30 s, heat at 115° in a heater capable of maintaining the inside temperature within ±1° for 70 min with continuous shaking. Allow the vial to cool, and weigh. If the loss is less than 5 mg, use the upper layer of the mixture as the *Sample solution*.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: GC
Detector: Flame ionization
Column: Fused silica, 0.53-mm × 30-m; bonded with 3-µm layer of G1. [NOTE—Use a guard column if necessary.]
Temperature: See the Temperature Program Table below.

Temperature Program Table

	Time (min)	Temperature (°)
Detector		280
Column	0	40
	3	40
	9	100
	12	250
	15	250
Injection port		180

Flow rate: Adjust the flow rate so the retention time of the internal standard is about 8 min.
Carrier gas: Helium
Split ratio: 1:50
Injection size: 1 µL

System suitability
Sample: *Standard solution*
Suitability requirements
Resolution: NLT 2 between isopropyl iodide and methylcyclohexane
Relative standard deviation: NMT 2.0% based on 6 injections

Analysis
Sample: *Sample solution*
[NOTE—Measure all of the peak areas, excluding the solvent peak.]
Calculate the relative response factor (RRF) from the following expression:

$$\text{Result} = (A_1 \times W_1 \times C)/(A_2 \times 100)$$

A_1 = peak area of the internal standard peak from the *Standard solution*
W_1 = weight of isopropyl iodide in the *Standard solution* (mg)
C = percentage content of isopropyl iodide from the certificate of the manufacturer
A_2 = peak area of the isopropyl iodide peak from the *Standard solution*

Calculate the percentage content (w/w) of the hydroxypropoxy group in the portion of Hydroxypropyl Cellulose taken:

$$\text{Result} = (F \times A_3 \times \text{RRF} \times M_1 \times 100)/(A_4 \times W_2 \times M_2)$$

F = correction factor, 1.1 [NOTE—The correction factor is used to correlate the accuracy of the method with historical values for the previous titration assay. This value was determined based on data from the validation robustness studies.]
A_3 = peak area of isopropyl iodide peak from the *Sample solution*
RRF = relative response factor calculated from above
M_1 = molar mass of hydroxypropoxy group, 75.1
A_4 = peak area of the internal standard peak from the *Sample solution*
W_2 = weight of the sample in the *Sample solution* (mg)
M_2 = molar mass of isopropyl iodide, 170.0

Acceptance criteria: 53.4%–80.5%

BRIEFING

Hydroxypropyl Cellulose, Low Substituted. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Hydroxypropyl Cellulose, Low Substituted monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the revised **OFFICIAL INQUIRY STAGE 4** document, is based in part on comments from the Japanese Pharmacopoeia and the European Pharmacopoeia, in response to the **OFFICIAL INQUIRY STAGE 4** draft, prepared by the United States Pharmacopeia, and published on page 339 of *PF* 30(1) [Jan.–Feb. 2004]. Differences between this **OFFICIAL INQUIRY STAGE 4** document and the previous draft include a new assay method, in which a determination of the molar substitution has been added, based on extensive validation work and comparative studies with the existing titration method. This assay applies the general principle for determination of alkoxy groups in substituted celluloses (Zeissel-reaction followed by gas chromatography), which has been presented by the Japanese Pharmaceutical Excipients Council (JPEC) for Hydroxypropylcellulose and Hydroxypropylcellulose, Low Substituted. This method replaces the existing gas chromatography method to align with the new method proposed for Hydroxypropyl Cellulose.

(EM2: K. Moore.) RTS—C72689

Add the following:

Hydroxypropyl Cellulose, Low Substituted

Cellulose, 2-hydroxypropyl ether [9004-64-21].

DEFINITION

Hydroxypropyl Cellulose, Low Substituted is a low-substituted poly(hydroxypropyl) ether of cellulose. It contains NLT 5.0% and NMT 16.0% of hydroxypropoxy groups, calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION ⟨197⟩**
- **B. PROCEDURE**

Sample solution: 10 mg/mL Hydroxypropyl Cellulose, Low Substituted. Add 1 g of sodium hydroxide, and shake until it becomes homogeneous.

Analysis: Transfer 5 mL of *Sample solution* to a suitable container, add 10 mL of a mixture of acetone and methanol (4:1), and shake.

Acceptance criteria: A white, flocculent precipitate is formed.

ASSAY

[NOTE—Determination of hydroxypropoxy groups in Hydroxypropyl Cellulose, Low Substituted]

- **PROCEDURE**

Internal standard solution: Methylcyclohexane in *o*-xylene (1 in 50)

Sample solution: Weigh accurately 30 mg of previously dried Hydroxypropyl Cellulose, Low Substituted, transfer to the reaction vial, add 60 mg of adipic acid, 2.0 mL of *Internal standard solution*, and 1.0 mL of hydroiodic acid, stopper the vial tightly, and weigh accurately. Shake the vial for 30 s, and heat at 115° in a heater capable of maintaining the inside temperature within ± 1° for 70 min with continuous shaking. Allow the vial to cool, and weigh accurately. If the loss is less than 5 mg, use the upper layer of the mixture as the *Sample solution*.

Standard solution: Add 60 mg of adipic acid, 2.0 mL of *Internal standard solution*, and 1.0 mL of hydroiodic acid, stopper the vial tightly, and weigh accurately. Add 25 µL of isopropyl iodide for assay, and again weigh accurately. Shake the reaction vial for 30 s, and use the upper layer of the content as the *Standard solution*.

Physical Tests and Determinations

BRIEFING

⟨696⟩ Characterization of Crystallinity Determination by Solution Calorimetry. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for general chapter ⟨696⟩ *Characterization of Crystallinity Determination by Solution Calorimetry,* as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following document, which represents the revised **OFFICIAL INQUIRY STAGE 4** document, is based in part on comments from the Japanese Pharmacopoeia and the United States Pharmacopeia. Readers are urged to review these proposals carefully and to respond to USP no later than July 31, 2009.

(GC: K. Zaidi; K. Moore) RTS—C70392

Add the following:

⟨696⟩ CHARACTERIZATION OF CRYSTALLINITY DETERMINATION BY SOLUTION CALORIMETRY

INTRODUCTION—THE CONCEPT OF CRYSTALLINITY

For the purpose of this chapter, crystalline material, partially crystalline material, and amorphous material are considered as solids.

The perfectly ordered crystal lattice with every molecule in its expected lattice position is an ideal that is seldom, if ever, achieved. The other extreme is the amorphous state, in which a solid contains the maximum possible density of imperfections (defects of various dimensionalities), such that all long-range order is lost while only the short-range order, imposed by its nearest neighbors, remains. Real crystals lie somewhere between these two extremes. A crystal's position on a scale bounded by these two extremes is termed *crystallinity.*

All real crystals, even in the pure state, possess some lattice imperfections or defects, which increase both the energy (enthalpy under conditions of constant atmospheric pressure) and the disorder (expressed as the entropy) of the crystal lattice. A crystal with a relatively small density of imperfections is said to be highly crystalline and to possess a high crystallinity. By contrast, a particle with a relatively high density of imperfections is said to be partially amorphous and to possess a low crystallinity. A totally amorphous particle corresponds to zero crystallinity. Amorphous particles may contain somewhat ordered domains that can act as nuclei for crystallization; such so-called amorphous particles are said to possess a low-level but finite crystallinity.

In reality, a powder probably contains particles with different degrees of crystallinity, just as it may contain particles with different sizes and shapes. The lower the crystallinity of a particle, the greater its enthalpy and entropy. The increase in enthalpy is never totally compensated by the increase in entropy; instead, the Gibbs free energy, which reflects the balance between them, actually increases. Hence, the lower the crystallinity of a particle, and consequently the greater its amorphous character, the greater its apparent intrinsic solubility, dissolution rate, and reactivity, but the lower its stability. Because of the great relevance of these properties, crystallinity is also an important property and requires measurement by a suitable method.

In the following chapter, the crystallinity or the content of amorphous parts of a powder are measured by calorimetric methods such as microcalorimetry or solution calorimetry, although other methods could be used (e.g., see general chapter ⟨941⟩ *Characterization of Crystalline and Partially Crystalline Solids by X-Ray Powder Diffraction*).

Many substances are capable of crystallizing in more than one type of crystal lattice, which is known as polymorphism. If water or a solvent is incorporated in the crystal lattice the crystals are termed hydrates or solvates. Because of the different crystal packaging, and/or molecular conformation and lattice energy, they usually exhibit different physical properties. The control of the crystal form has, therefore, to be taken into account for the characterization of crystallinity.

DETERMINING AMORPHOUS CONTENT BY MICROCALORIMETRY

Most chemical, physical, and biological processes are associated with the exchange of heat. Microcalorimetry is a highly sensitive technique to monitor and quantify both exothermic (heat producing) and endothermic (heat absorbing) changes associated with those processes. The technique allows to determine the rate and extent of chemical reactions, changes of phase, or changes of structure.

Thermal events producing only a fraction of a microwatt can be observed using microcalorimetry. This means that temperature differences less than 10^{-6} K must be detectable. Microcalorimetry typically uses the heat flow (heat leakage) principle, where the heat produced (or absorbed) in a thermally defined vessel flows away (or into) in an effort to re-establish thermal equilibrium with its surroundings. Exceptional thermal stability with its surrounding has to be achieved either by a heat sink or an electronically regulated surrounding.

Heat energy from an active sample in the reaction vessel is channeled typically through Peltier elements; they act as thermoelectric generators using the Seebeck effect. The heat energy is converted into a voltage signal proportional to the heat flow.

Results are typically presented as a measure of the thermal energy produced per unit of time (Watt) as a function of time.

Apparatus

Microcalorimeters are typically designed as twin systems with a measuring vessel and a reference vessel. Vessels are typically made of glass or stainless steel. For certain applications specially designed vessels which allow the addition of a gas, a liquid, or a solid material may be used.

Calibration

The microcalorimeter is calibrated for heat flow (energy per time unit) using either a calibrated external or internal electrical heat source or a suitable standard reaction.

Sensitivity

The sensitivity of the microcalorimetric method can be assessed based on the stability of the instrument baseline noise or by an appropriate standard sample analyzed according to the corresponding method.

Procedure

Weigh in a suitable vessel an appropriate quantity of the substance to be examined. The substance can be a solid, a liquid, or a semi-solid. Close the vessel carefully, to avoid any evaporation of solvents, and place the vessel in the sample holder. If appropriate, allow the vessel to equilibrate at the temperature of the measurement before placing it in the measuring position.

Begin the analysis and record the heat flow, with the time on the abscissa and the heat flow on the ordinate (specify the direction of exothermic or endothermic heat flow).

Applications of Microcalorimetry

Detection and quantification of amorphous content in powders—The ability to detect and to quantify the amount of amorphous material within a highly crystalline substance is of great importance during the development and subsequent manufacture of a preparation. Because the amorphous state is metastable with respect to the crystalline state, recrystallization is likely to occur. The measurement of the heat of recrystallization enables the amorphous content to be determined by the area of the recrystallization peak. By relating the output from the microcalorimeter for a sample to that obtained from an amorphous standard, it is possible to quantify the amorphous content of the sample. The range of amorphous content covered by this method depends on the individual substance to be tested, in favorable cases limits of detection below 1% can be reached.

Recrystallization can be initiated by subjecting the sample to higher relative humidity or an atmosphere containing organic vapor. The sample is typically placed in an ampul which also contains a small test tube containing a saturated salt solution or an organic solvent (pure or saturated with salt) or a solvent mixture.

The heat of recrystallization is typically measured using a fixed sample mass placed in a glass or steel vessel. The test tube containing a saturated salt solution or an organic solvent is chosen large enough to allow a full saturation of the atmosphere above the sample. The mass of the sample and the nature of the vapor atmosphere above the sample is chosen so that recrystallization occurs in such a way that a distinct peak is observed, clearly separated from initial thermal events caused by introduction of the sample.

The conditions under which the transition of the amorphous phase to a thermodynamically more stable crystalline state occurs will have a significant impact on the time of recrystallization. In particular, physical mixtures of purely amorphous and crystalline material will behave differently from a partially crystalline material. These effects have to be considered when developing a method.

A typical response for the recrystallization of a partially amorphous material is shown in *Figure 1*. The first part of the curve represents a clear response caused by different processes taking place simultaneously, such as the absorption of water vapor into the amorphous parts of the powder by the generation of water vapor from the test tube. After this initial response there is a large exothermic response caused by the recrystallization of the amorphous material. Also included, but not seen, is the expulsion of excess water from the recrystallized parts. Thus, the area under this exothermic recrystallization response is proportional to the heat of recrystallization.

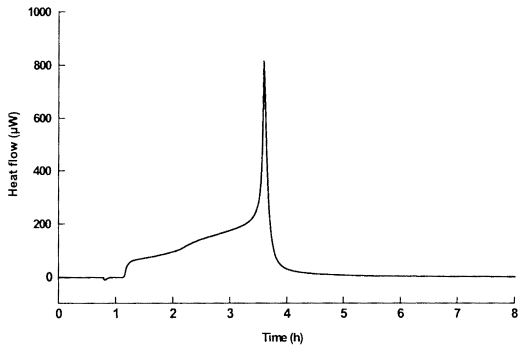

Figure 1. Typical microcalorimetric output of heat flow (in uW) as a function of time (in hours) for partially amorphous lactose at 25 degrees and 57% relative humidity.

DETERMINING CRYSTALLINITY BY SOLUTION CALORIMETRY

Solution calorimetry provides a means of determining enthalpy of solution (i.e., heat of solution under constant atmospheric pressure) of a substance. Enthalpy of solution is defined as the enthalpy of the substance dissolved in the solution to a defined concentration minus the enthalpy of the original substance. The solvent for the dissolution process must be such that the mass of solid

dissolves within a time frame that matches the response time of the calorimeter, as discussed below. The enthalpy of solution is proportional to the amount of solid being dissolved. This amount may be defined as one mole for molar enthalpy or as one gram for specific enthalpy. If the substance is pure and if its molecular mass is known, the molar enthalpy is preferred, otherwise the specific enthalpy must be used. The enthalpy of solution is weakly dependent on both the temperature, which is usually 25.0°, and the final concentration of the dissolved solute.

The crystallinity of the sample under study is given by the enthalpy of solution of the sample ΔH^s_x, minus the enthalpy of solution of the chosen reference standard of the same substance, ΔH^s_R, when determined under the same conditions. Because the reference standard is usually chosen for its perceived high crystallinity, its enthalpy of solution usually is algebraically greater (more endothermic or less exothermic) than that of the sample under study in the same solvent. Consequently, the crystallinity so determined is a negative quantity with the international system units, kJ/mol or J/g (J/kg is avoided because of its unwieldiness and potential for error). The preference for a negative value with respect to a highly crystalline reference standard recognizes the fact that most samples have a lower crystallinity than this reference standard.

A number of substances, including some purified by freeze-drying, may be available in an amorphous form but not in a crystalline form. With such substances, an amorphous form, prepared according to a standard procedure, may be used as the reference standard. The enthalpy of solution may then be algebraically smaller than that of the chosen amorphous reference standard, in which case the crystallinity, as defined above, has a positive value.

The use of a single reference standard for each substance provides a single crystallinity scale, expressed in terms of energy, for each substance and recognizes that each active substance or excipient has unique properties. Furthermore, the crystallinity can be recalculated (if the original reference standard is later replaced by a more crystalline or more amorphous reference standard) because enthalpies of solution are additive quantities according to Hess's Law of constant heat summation.

Because the enthalpy of solution depends not only on the crystallinity of the solid but also on the various other solute–solute interactions and on the solute–solvent and solvent–solvent interactions, a zero value for the enthalpy of solution does not necessarily indicate zero crystallinity of the solid solute, nor does a measurable response necessarily confirm some degree of crystallinity.

It is sometimes preferred to express the crystallinity, P_c, of a substance on a percentage scale. This procedure requires two reference standards, namely a highly crystalline sample assuming 100% crystallinity and having a measured enthalpy of solution of ΔH^s_c, and an essentially amorphous sample assuming 0% crystallinity and having a measured enthalpy of solution of ΔH^s_a. From these values and from the measured enthalpy, ΔH^s_s, of solution of the solid under study, the percentage crystallinity of the solid, P_c, may be calculated as follows:

$$P_c\,(\%) = 100(\Delta H^s_s - \Delta H^s_a)/(\Delta H^s_c - \Delta H^s_a)$$

Clearly, crystallinity expressed on a percentage scale depends on three, not two, measured values and the enthalpies of solution may be replaced by other corresponding physical quantities that depend on crystallinity. The value of the percentage crystallinity of a sample, however, depends not only on the nature and method of preparation of the two reference standards, but also on the choice of the physical quantity that is measured.

The enthalpy of solution is measured either by an isoperibol (constant perimeter, i.e., jacket) solution calorimeter or by an isothermal (constant temperature) solution calorimeter. At least three measurements are made with

each sample until the measured values of the heat of solution do not differ by more than 5%. The mean of these three values is then calculated.

Isoperibol Solution Calorimetry

In the isoperibol solution calorimeter, the heat change during the solution process causes a corresponding change in temperature of the solvent–solute system (i.e., solution). This temperature change is measured by a temperature sensor, which is wired to an electrical circuit that records an electrical signal corresponding to the temperature change. Typically, this temperature change in an electronic form is measured at precisely defined time intervals to produce temperature–time data that are collected, analyzed by a computer, and then plotted. A blank run without addition of the solid solute to the solvent normally shows no discernible change in the slope of the temperature–time plot.

For isoperibol solution calorimeters, response is relatively rapid, but any heat losses to or heat gains from the bath reduce the accuracy and contribute to noise. Therefore, isoperibol solution calorimeters are more advantageous than isothermal solution calorimeters when the solution process is relatively fast. For all measurements of enthalpy of solution using isoperibol solution calorimeters, the choice of solvent and solid is critical. The nature and mass of the solvent and the mass of sample allow the total heat change, corresponding to total dissolution of the solid, to proceed to completion within 10 minutes under vigorous stirring at a constant rotational speed within the range of 400 to 600 revolutions per minute. The rotational speed is checked with a stroboscope.

Isothermal Solution Calorimetry

In the isothermal (constant temperature) solution calorimeter, the heat change during the solution process is compensated for by an equal but opposite energy change, such that the temperature of the solvent–solute system (i.e., solution) remains constant. This equal but opposite energy change is measured and, when its sign is reversed, provides the enthalpy of solution. For isothermal calorimeters, response is relatively slow, but the compensation process eliminates the effects of heat losses to or heat gains from the bath. Therefore, isothermal calorimeters are more advantageous than isoperibol calorimetry when the solution process is relatively slow.

Solution Calorimeter Calibration

To ensure the accuracy of the calorimeter, chemical calibrations must be performed daily. For an endothermic solution process, the calibration of the calorimeter is checked by measuring the heat absorbed during the dissolution of potassium chloride in distilled water at 298.15 K (25.0°). The established enthalpy change in this endothermic process is 235.5 J/g (17.56 kJ/mol). For an exothermic solution process, the calorimeter is checked by measuring the heat evolved during the dissolution of 5 g per L of tromethamine [*tris*(hydroxymethyl) aminomethane, THAM] in a 0.1 mol/L aqueous hydrochloric acid solution at 298.15 K (25.0°). The established heat for the aforementioned process is –246.0 J/g (–29.80 kJ/mol).

The effective heat capacity of the calorimeter cell and its contents is determined for every calorimeter run. This determination is accomplished by electrical heating of the contents of the calorimeter cell. The effective heat capacity is determined according to one of two protocols—either by making one determination after ampul breakage or by making one determination before and a second determination after ampul breakage and then averaging the two results. The accuracy and reliability of the electrical heating are established by the accuracy and reliability of the aforementioned chemical calibrations.

Sample Handling

The stability of solids decreases with decreasing crystallinity. In particular, solids of low crystallinity, especially amorphous solids, tend to sorb water vapor from the atmosphere, leading to crystallization and a corresponding gain in crystallinity. For these reasons, anhydrous samples whose crystallinity is to be determined must be stored at zero humidity in sealed chambers containing a desiccant, preferably containing an indicator of effectiveness. If crystallinity–humidity studies are to be carried out, the sample is stored in a sealed chamber containing a saturated salt solution to provide a defined relative humidity at $25.0 \pm 0.1^{\circ}$.

STAGE 6 HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization consists of several steps (***Stages 1*** through ***7***, as defined below). This section includes Stage 6 adopted text which is provided for information. USP cannot incorporate public comments at Stage 6 without consulting PDG partners. Below are descriptions of the developmental Stages as defined by the United States Pharmacopeia, the European Pharmacopoeia, and the Japanese Pharmacopoeia.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

MONOGRAPHS (USP)

BRIEFING

Methylcellulose. The Japanese Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Methylcellulose monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the **ADOPTION STAGE 6** document, is based on the corresponding monograph for Methylcellulose that was prepared by the Japanese Pharmacopoeia. The Japanese Pharmacopoeia draft was based in part on comments from the European Pharmacopoeia and the United States Pharmacopeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the Japanese Pharmacopoeia. Differences between the Japanese Pharmacopoeia Adoption Stage 6 document and the current USP monograph for Methylcellulose include the following.

1. *Definition*. Changed from NLT 27.5% and NMT 31.5% of methoxy to NLT 26.0% and NMT 33.0% of methoxy groups. Drying time changed from 2 h to 1 h.
2. *Identification*. Replaced three existing methods with five new methods.
3. *Assay*. Aligned method with current PDG harmonized monograph for Hypromellose.
4. *Heavy Metals*. Aligned method with current PDG harmonized monograph for Hypromellose.
5. *Loss on Drying*. Changed time from 2 h to 1 h to align with PDG proposal.
6. *pH*. New method proposed by PDG.
7. *Viscosity*. Aligned method with current PDG harmonized monograph for Hypromellose.
8. *Packaging and Storage*. No change.
9. *Labeling*. Added statement to include units of measurement (mPa · s).

In EP, Viscosity and Assay will be dealt with in the non-mandatory Functionality-Related Characteristics section. The assay limits will not be included in the Definition (EP).
Nonharmonized attributes: Packaging and storage
Specific local attributes: Appearance of solution (EP), Description (JP), Limit of glyoxal (EP).

Cellulose, methyl ether;
Cellulose methyl ether [9004-67-5].

DEFINITION

Methylcellulose is a methyl ether of cellulose. When dried at 105° for 1 h, it contains NLT 26.0% and NMT 33.0% of methoxy (OCH_3) groups.

IDENTIFICATION

- **A. PROCEDURE**
  Analysis: Evenly distribute 1.0 g onto the surface of 100 mL of water in a beaker, tapping the top of the beaker gently if necessary to ensure a uniform layer on the surface, and allow to stand for 1–2 min.
  Acceptance criteria: The powdered material aggregates on the surface.
- **B. PROCEDURE**
  Analysis: Evenly distribute 1.0 g into 100 mL of boiling water, and stir the mixture using a magnetic stirrer with a 25-mm long bar: a slurry is formed and the particles do not dissolve. Allow the slurry to cool to 5° and stir using a magnetic stirrer.
  Acceptance criteria: A clear or slightly turbid solution occurs with its thickness dependent on the viscosity grade.
- **C. PROCEDURE**
  Analysis: To 0.1 mL of the sample solution obtained in *Identification* test *B* add 9 mL of diluted sulfuric acid (9 in 10), shake, heat in a water bath for exactly 3 min, immediately cool in an ice bath, add carefully 0.6 mL of ninhydrin TS, shake, and allow to stand at 25°.
  Acceptance criteria: A red color develops immediately, and it does not change to purple within 100 min.
- **D. PROCEDURE**
  Analysis: Add 2–3 mL of the solution obtained in *Identification* test *B* onto a glass slide as a thin film and allow the water to evaporate.
  Acceptance criteria: A coherent, clear film forms on the glass slide.
- **E. PROCEDURE**
  Analysis: Add exactly 50 mL of the sample solution obtained in *Identification* test *A* to exactly 50 mL of water in a beaker. Insert a thermometer into the solution. Stir the solution on a magnetic stirrer/hot plate and begin heating at a rate of 2°/min to 5°/min. Determine the temperature at which a turbidity increase begins to occur and designate the temperature as the flocculation temperature.
  Acceptance criteria: The flocculation temperature is higher than 50°.

ASSAY

- **PROCEDURE**
  [**CAUTION—**Perform all steps involving *Hydriodic acid* carefully, in a well-ventilated hood. Use goggles, acid-resistant gloves, and other appropriate safety equipment. Be exceedingly careful when handling the hot vials, because they are under pressure. In the event of hydriodic exposure, wash with copious amounts of water, and seek medical attention at once.]
  Apparatus
  Reaction vial: A 5-mL pressure-tight serum vial, 20 mm in outside diameter, 50 mm in height, and 20 mm in outside diameter and 13 mm in inside diameter at the mouth,

Stage 6 Harmonization

equipped with a pressure-tight septum having a polytetrafluoroethylene-faced butyl rubber, and air-tight sealing by an aluminum crimp or another sealing system providing a sufficient air-tightness.

Heater: A heating module with a square-shaped aluminum block having holes 20 mm in diameter and 32 mm in depth, so that the reaction vial fits. Capable of mixing the contents of the vial using a magnetic stirrer equipped in the heating module or using a reciprocal shaker which performs a reciprocating motion approximately 100 times/min.

Hydriodic acid: Use a reagent having a specific gravity of at least 1.69, equivalent to 55%–57% HI.

Internal standard solution: 30 mg/mL of *n*-octane in *o*-xylene

Standard solution: Into a suitable serum vial, weigh 60–100 mg of adipic acid, add 2.0 mL of *Hydriodic acid,* then pipet 2.0 mL of *Internal standard solution* into the vial, and close the vial securely with a suitable septum stopper. Weigh the vial and contents, add 45 µL of methyl iodide with a syringe through the septum, weigh again, and calculate the weight of methyl iodide added, by difference. Shake, and allow the layers to separate. Use the upper layer as the *Standard solution*.

Sample solution: Transfer 0.065 g of Methylcellulose to a 5-mL thick-walled reaction vial equipped with a pressure-tight septum closure, add 60–100 mg of adipic acid, and pipet 2.0 mL of *Internal standard solution* into the vial. Cautiously pipet 2.0 mL of *Hydriodic acid* into the mixture, immediately secure the closure, and weigh it. Using a magnetic stirrer equipped in the heating module, or using a reciprocal shaker, mix the contents of the vial continuously for 60 min while heating the block so that the temperature of the contents is maintained at 130 ± 2°. If a reciprocal shaker or magnetic stirrer cannot be used, shake the vial well by hand at 5-min intervals during the initial 30 min of the heating time. Allow the vial to cool, and again weigh. If the weight loss is less than 0.50% of the contents and there is no evidence of a leak, use the upper layer of the mixture as the *Sample solution*.

Chromatographic system

Mode: GC

Detector: Thermal conductivity or hydrogen flame ionization

Column: 1.8 to 3 m × 3 to 4-mm column packed with 10%–20% liquid phase G1, 125–150 µm in diameter on 100- to 120-mesh support S1A

Column temperature: 100°

Carrier gas: Helium for the thermal conductivity detector, and helium or nitrogen for the hydrogen flame ionization detector

Flow rate: Adjust so that the retention time of the internal standard is about 10 min.

Injection size: 1 or 2 µL

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of methoxy in the Methylcellulose taken:

$$\text{Result} = 21.864 \times (Q_T/Q_S) \times (W_S/W)$$

21.864 = ratio of the formula weights of methoxy to methyl iodide times 100%

Q_T = ratio of the peak area of methyl iodide to that of internal standard in the *Sample solution*

Q_S = ratio of the peak area of methyl iodide to that of internal standard in the *Standard solution*

W_S = weight of methyl iodide in the *Standard solution* (mg)

W = weight of Methylcellulose calculated on the dried basis taken for the *Assay* (mg)

Acceptance criteria: 26.0%–33.0%

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION ⟨281⟩:** NMT 1.5%
- **HEAVY METALS,** *Method III* ⟨**231**⟩**:** For the *Standard Preparation*, add the *Standard Lead Solution* prior to digestion. Omit the *Monitor Preparation*.

Acceptance criteria: The color of the test solution is not darker than that of the control solution (NMT 20 ppm).

SPECIFIC TESTS

- **LOSS ON DRYING ⟨731⟩:** Dry a sample at 105° for 1 h: it loses NMT 5.0% of its weight.
- **pH:** Measure the pH of the solution prepared in the test for *Viscosity* at 20 ± 2°. Read the indicated pH value after the probe has been immersed for 5 ± 0.5 min.

Acceptance criteria: 5.0–8.0

- **VISCOSITY ⟨911⟩**

[NOTE—The density is 1.00 g/mL, so there is no necessity for determining the density at every measurement in the case of having the confirmation data.]

Method 1: This method is applied to samples with a viscosity of less than 600 mPa · s. Weigh a quantity of Methylcellulose, equivalent to 4.000 g, calculated on the dried basis, transfer into a wide mouth bottle, and add hot water to obtain the total weight of the sample and water of 200.0 g. Capping the bottle, stir by mechanical means at 400 ± 50 rpm for 10 or 20 min until particles are thoroughly dispersed and wetted out. Scrape down the walls of the bottle with a spatula if necessary, to ensure that there is no undissolved material on the sides of the bottle, and continue the stirring in a cooling water bath equilibrated at a temperature below 5° for another 20–40 min. Adjust the solution weight if necessary to 200.0 g using cold water. Centrifuge the solution if necessary to expel any entrapped air bubbles. Using a spatula remove any foam, if present. Perform the test with this solution at 20 ± 0.1° to obtain the kinematic viscosity, ν. Separately, determine the density, ρ, of the solution, and calculate the viscosity, η, as $\eta = \rho\nu$.

Method 2: This method is applied to samples with a viscosity of 600 mPa · s or higher. Weigh a quantity of Methylcellulose, equivalent to 10.00 g, calculated on the dried basis, transfer into a wide mouth bottle, and add hot water to obtain the total weight of the sample and water of 500.0 g. Capping the bottle, stir by mechanical means at 400 ± 50 rpm for 10–20 min until particles are thoroughly dispersed and wetted out. Scrape down the walls of the bottle with a spatula if necessary, to ensure that there is no undissolved material on the sides of the bottle, and continue the stirring in a cooling water bath equilibrated at a temperature below 5° for another 20–40 min. Adjust the solution weight if necessary to 500.0 g using cold water. Centrifuge the solution if necessary to expel any entrapped air bubbles. Using a spatula remove any foam, if present. Determine the viscosity of this solution at 20 ± 0.1° using a single cylinder type rotational viscometer.

Apparatus: Brookfield type LV model or equivalent. Rotor No., revolution, and calculation multiplier: apply the conditions specified in the following table.

Labeled Viscosity[a] (mPa·s)	Rotor No.	Revolution (rpm)	Calculation Multiplier
600 or more and less than 1400	3	60	20
1400 or more and less than 3500	3	12	100
3500 or more and less than 9500	4	60	100
9500 or more and less than 99,500	4	6	1000
99,500 or more	4	3	2000

[a]The labeled viscosity is based on the manufacturer's specifications.

Operation of apparatus: Allow the spindle to rotate for 2 min before taking the measurement. Allow a rest period of 2 min between subsequent measurements. Repeat the operation to rotate the spindle specified above twice and average the three readings.

Acceptance criteria: 80.0%–120.0% of that stated on the label for viscosity types less than 600 mPa · s, and 75.0%–140.0% of that stated on the label for viscosity types 600 mPa · s or higher

ADDITIONAL REQUIREMENTS

- **✦PACKAGING AND STORAGE:** Preserve in well-closed containers.✦
- **LABELING:** Label it to indicate its nominal viscosity type [viscosity of a solution (1 in 50)] in milli-Pascal second (mPa · s).▲*USP33*

MONOGRAPHS (NF)

BRIEFING

Benzyl Alcohol. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Benzyl Alcohol monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the **ADOPTION STAGE 6** document, includes a minor change to *Procedure: Benzaldehyde and Other Related Substances* (previously labeled *Related compounds*). The procedure has been changed to address the instance in which the substance contains peaks that overlap with peaks due to ethylbenzene or dicyclohexyl. Instruction has been added to correct for this additional peak when calculating the sum, disregard any limit that is 0.01 times the area of ethylbenzene.

C_7H_8O 108.1
Phenylmethanol [100-51-6].

DEFINITION

Benzyl Alcohol contains NLT 98.0% and NMT the equivalent of 100.5% of phenylmethanol (C_7H_8O).

IDENTIFICATION

- **INFRARED ABSORPTION ⟨197F⟩:** On undried specimen

ASSAY

- **PROCEDURE**

Phenolphthalein solution: Dissolve 0.1 g of phenolphthalein in 80 mL of ethanol (96%), and dilute with water to 100.0 mL. To test for sensitivity, add 100 mL of carbon dioxide-free water to 0.1 mL of the *Phenolphthalein solution*. The solution is colorless. NMT 0.2 mL of 0.02 M sodium hydroxide is required to change the color to pink.

Sample: 0.900 g

Analysis: To the *Sample*, add 15 mL of a freshly prepared mixture of pyridine and acetic anhydride (7:1), and boil under a reflux condenser on a water bath for 30 min. Cool, and add 25 mL of water. Using 0.25 mL of *Phenolphthalein solution* as the indicator, titrate with 1 M sodium hydroxide VS. Carry out a blank titration. Calculate the percentage content of C_7H_8O from the formula:

$$\text{Result} = 10.81 \times (n_2 - n_1)/m$$

n_2 = amount of 1 M sodium hydroxide used for the sample (mL)
n_1 = amount of 1 M sodium hydroxide used for the blank (mL)
m = amount of sample taken (g)

Acceptance criteria: 98.0%–100.5%

IMPURITIES

Inorganic Impurities

- **FATS AND FIXED OILS,** *Peroxide Value* ⟨**401**⟩**:** NMT 5
- **RESIDUE ON EVAPORATION**

Analysis: After ensuring that the Benzyl Alcohol complies with the test for *Fats and Fixed Oils, Peroxide Value*, evaporate 10.0 g to dryness in a tared quartz or porcelain crucible or platinum dish on a hot plate at a temperature not exceeding 200°. Ensure that the Benzyl Alcohol does not boil during evaporation. Dry the residue on the hot plate for 1 h, and allow to cool in a desiccator.

Acceptance criteria: The residue weighs NMT 5 mg, corresponding to NMT 0.05%.

Organic Impurities

- **PROCEDURE: BENZALDEHYDE AND OTHER RELATED SUBSTANCES**

Sample solution: Use the Benzyl Alcohol specimen under examination.

Standard solution A: Dissolve 0.100 g of ethylbenzene in 10.0 mL of the *Sample solution*. Dilute 2.0 mL of this solution to 20.0 mL with the *Sample solution*.

Standard solution B: Dissolve 2.000 g of dicyclohexyl in 10.0 mL of the *Sample solution*. Dilute 2.0 mL of this solution to 20.0 mL with the *Sample solution*.

Reference solution A: (for use in nonparenteral applications) Dissolve 0.750 g of benzaldehyde and 0.500 g of cyclohexylmethanol in the *Sample solution*, and dilute to 25.0 mL with the *Sample solution*. Add 1.0 mL of this solution to a mixture of 2.0 mL of *Standard solution A* and 3.0 mL of *Standard solution B*, and dilute with the *Sample solution* to 20.0 mL.

Reference solution B: (for use in parenteral applications) Dissolve 0.250 g of benzaldehyde and 0.500 g of cyclohexylmethanol in the *Sample solution*, and dilute to 25.0 mL

Stage 6 Harmonization

with the *Sample solution*. Add 1.0 mL of this solution to a mixture of 2.0 mL of *Standard solution A* and 2.0 mL of *Standard solution B*, and dilute with the *Sample solution* to 20.0 mL.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Carrier: Helium, chromatography grade

Carrier linear velocity: 25 cm/s, at 50°

Detector temperature: 310°

Column: 30-m × 0.32-mm, 0.5-µm film thickness, G16.

Column temperature

Time (min)	Temperature (°)
0	50
34	220
69	220

Injection port temperature: 200°

System suitability

Sample: For nonparenteral applications, use *Reference solution A*. For parenteral applications, use *Reference solution B*. [NOTE—The retention time of benzyl alcohol is about 26 min. The relative retention times for ethylbenzene, dicyclohexyl, benzaldehyde, cyclohexylmethanol and benzyl alcohol are about 0.28, 0.59, 0.68, 0.71, 1.0, respectively.]

Injection volume: 0.1 µL without air plug

Suitability requirements

Sensitivity: Adjust the sensitivity of the detector so that the height of the peak due to ethylbenzene is NLT 30% of the full scale of the recorder.

Resolution: NLT 3.0 between the peaks corresponding to benzaldehyde and cyclohexylmethanol

Analysis

Samples: *Sample solution* and *Reference solution A* for non-parenteral applications and *Reference solution B* for parenteral applications

Acceptance criteria: (non-parenteral applications)

If any peaks are present in the chromatogram obtained with the *Sample solution* that have the same retention times as the peaks due to ethyl benzene and dicyclohexyl, subtract the areas of any such peaks from the peak areas at these retention times in the chromatograms of *Reference solution A* or *Reference solution B* (corrected peak areas of ethylbenzene and dicyclohexyl). Any such peaks in the *Sample solution* should be included in the assessments for the total of other peaks.

In the chromatogram obtained with the *Sample solution*, the area of any peak corresponding to benzaldehyde is not greater than the difference between the area of the peak due to benzaldehyde in the chromatogram obtained with *Reference solution A* (0.15%) and the area of the peak due to benzaldehyde in the chromatogram obtained with the *Sample solution*.

In the chromatogram obtained with the *Sample solution*, the area of any peak corresponding to cyclohexylmethanol is not greater than the difference between the area of the peak due to cyclohexylmethanol in the chromatogram obtained with *Reference solution A* (0.10%) and the area of the peak due to cyclohexylmethanol in the chromatogram obtained with the *Sample solution*.

In the chromatogram obtained with the *Sample solution*, the sum of the areas of any peak with a relative retention time less than that of benzyl alcohol and apart from the peaks due to benzaldehyde and cyclohexylmethanol is not greater than four times the area of ethylbenzene in *Reference solution A*, corrected if necessary as described above (0.04%).

In the chromatogram obtained with the *Sample solution*, the sum of the areas of any peak with a relative retention time greater than that of benzyl alcohol is not greater than the area of dicyclohexyl in *Reference solution A*, corrected if necessary as described above (0.3%).

Disregard any peak with an area less than 0.01 times that of the peak due to ethylbenzene in the chromatogram of *Reference solution A*, corrected if necessary as described above.

Acceptance criteria: (parenteral applications)

If any peaks are present in the chromatogram obtained with the *Sample solution* that have the same retention times as the peaks due to ethyl benzene and dicyclohexyl, subtract the areas of any such peaks from the peak areas at these retention times in the chromatograms of *Reference solution A* or *Reference solution B* (corrected peak areas of ethylbenzene and dicyclohexyl). Any such peaks in the *Sample solution* should be included in the assessments for the total of other peaks.

In the chromatogram obtained with the *Sample solution*, the area of any peak corresponding to benzaldehyde is not greater than the difference between the area of the peak due to benzaldehyde in the chromatogram obtained with *Reference solution B* (0.05%) and the area of the peak due to benzaldehyde in the chromatogram obtained with the *Sample solution*.

In the chromatogram obtained with the *Sample solution*, the area of any peak corresponding to cyclohexylmethanol is not greater than the difference between the area of the peak due to cyclohexylmethanol in the chromatogram obtained with *Reference solution B* (0.10%) and the area of the peak due to cyclohexylmethanol in the chromatogram obtained with the *Sample solution*.

In the chromatogram obtained with the *Sample solution*, the sum of the areas of any peak with a relative retention time less than that of benzyl alcohol and apart from the peaks due to benzaldehyde and cyclohexylmethanol is not greater than two times the area of ethylbenzene in *Reference solution B*, corrected if necessary as described above (0.02%).

In the chromatogram obtained with the *Sample solution*, the sum of the areas of any peak with a relative retention time greater than that of benzyl alcohol is not greater than the area of dicyclohexyl in *Reference solution B*, corrected if necessary as described above (0.2%).

Disregard any peak with an area less than 0.01 times that of the peak due to ethylbenzene in the chromatogram of *Reference solution B*, corrected if necessary as described above.

SPECIFIC TESTS

- **ACIDITY**

Phenolphthalein solution: Prepare as directed in the *Assay*.

Analysis: To 10 mL of Benzyl Alcohol add 10 mL of ethanol (96%) and 1 mL of *Phenolphthalein solution*.

Acceptance criteria: NMT 1 mL of 0.1 M sodium hydroxide is required to change the color of the indicator to pink.

- **+CLARITY OF SOLUTION:** [NOTE—The *Sample solution* is to be compared to *Reference suspension 1* in diffused daylight 5 min after preparation of *Reference suspension 1*.]

Hydrazine solution: Transfer 1.0 g of hydrazine sulfate to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Allow to stand 4–6 h before use.

Methenamine solution: Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension: [NOTE—This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.]

Transfer 25.0 mL of *Hydrazine solution* to the *Methenamine solution* in the 100-mL glass-stoppered flask. Mix, and allow to stand for 24 h.

Opalescence standard: [NOTE—This suspension should not be used beyond 24 h after preparation.]

Transfer 15.0 mL of the *Primary opalescent suspension* to a 1000-mL volumetric flask, dilute with water to volume, and mix.

Reference suspension 1: Transfer 5.0 mL of the *Opalescence standard* to a 100-mL volumetric flask, and dilute with water to volume.

Reference suspension 2: Transfer 10.0 mL of the *Opalescence standard* to a second 100-mL volumetric flask, and dilute with water to volume.
Sample solution: Dissolve 2.0 g of Benzyl Alcohol in 60 mL of water.
Analysis: Transfer a sufficient portion of the *Sample solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm, to obtain a depth of 40 mm. Similarly transfer portions of *Reference suspension 1*, *Reference suspension 2*, and water to separate matching test tubes. Compare the *Sample solution*, *Reference suspension 1*, *Reference suspension 2*, and water in diffused daylight, viewing vertically against a black background (see *Spectrophotometry and Light-Scattering* ⟨851⟩, *Visual Comparison*). [NOTE—The diffusion of light must be such that *Reference suspension 1* can readily be distinguished from water, and that *Reference suspension 2* can readily be distinguished from *Reference suspension 1*.]
Acceptance criteria: The *Sample solution* shows the same clarity as that of water, or its opalescence is not more pronounced than that of *Reference suspension 1*.✦

- ✦**COLOR OF SOLUTION**
  Sample solution: Use the *Sample solution* prepared in the test for *Clarity of Solution*.
  Analysis: Transfer a sufficient portion of the *Sample solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm, to obtain a depth of 40 mm. Similarly transfer a portion of water to a separate matching test tube. Compare the color of the *Sample solution* with that of water in diffused daylight, viewing vertically against a white background (see *Spectrophotometry and Light-Scattering* ⟨851⟩, *Visual Comparison*).
  Acceptance criteria: The *Sample solution* has the color of water.✦
- **REFRACTIVE INDEX ⟨831⟩:** 1.538 to 1.541 at 20°

ADDITIONAL REQUIREMENTS

- ✦**LABELING:** Where Benzyl Alcohol is intended for use in the manufacture of parenteral applications, it is so labeled.✦
- ✦**PACKAGING AND STORAGE:** Preserve in tight containers, protected from light.✦
- ✦**USP REFERENCE STANDARDS**
  USP Benzyl Alcohol RS✦▲*NF28*

BRIEFING

Corn Starch. The United States Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Corn Starch monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the **ADOPTION STAGE 6** document, is based on the corresponding monograph for Corn Starch that was revised based on a request from the Japanese Pharmacopoeia. Differences between the **ADOPTION STAGE 6** document and the current USP monograph for Corn Starch include the following: the sentence under *Identification* test *A* "Between crossed nicol prisms" is changed to "Between orthogonally oriented polarizing plates or prisms."

Nonharmonized attributes: Characters, *Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests,* and *Tests for Specified Microorganisms*, *Labeling*, and *Packing and Storage* (USP)
Specific local attributes: Foreign matter (EP)
Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference materials and reagent specifications.

DEFINITION
Corn Starch consists of the starch granules separated from the mature grain of corn [*Zea mays* Linnè (Fam. Gramineae)].

IDENTIFICATION

- **A. PROCEDURE:** Examine under a microscope, using NLT 20× magnification and using a mixture of glycerin and water (1:1) as a mounting agent.
  Acceptance criteria: It appears either as angular polyhedral granules of irregular sizes with diameters ranging from 2–23 µm, or as rounded or spheroidal granules of irregular sizes with diameters ranging from 25–35 µm. The central hilum consists of a distinct cavity or two- to five-rayed cleft, and there are no concentric striations. Between orthogonally oriented polarizing plates or prisms, the starch granules show a distinct black cross intersecting at the hilum.
- **B. PROCEDURE**
  Sample solution: 20 mg/mL in water
  Analysis: Boil for 1 min, and cool.
  Acceptance criteria: A thin, cloudy mucilage is formed.
- **C. PROCEDURE**
  Sample solution: 1 mL of the mucilage obtained in *Identification* test *B*
  Analysis: Add 0.05 mL of iodine and potassium iodide TS 2 to the *Sample solution*.
  Acceptance criteria: An orange-red to dark blue color is produced, which disappears upon heating.

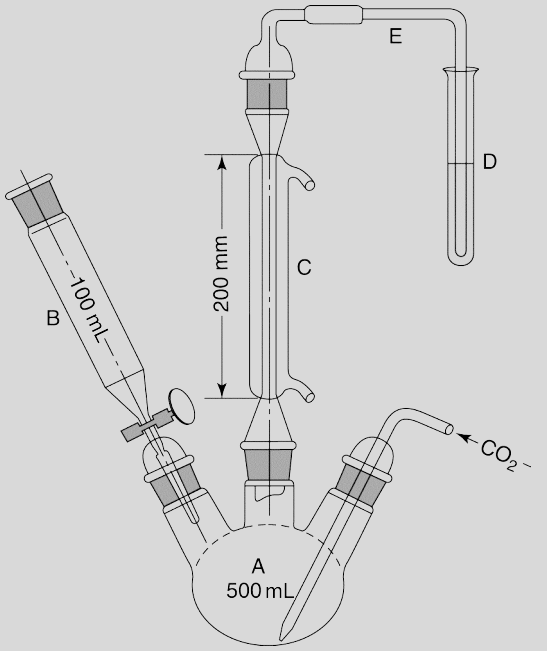
IMPURITIES
Inorganic Impurities

- **RESIDUE ON IGNITION ⟨281⟩:** NMT 0.6%, determined on a 1.0-g sample
- **LIMIT OF IRON**
  Sample solution: Shake 1.5 g of Corn Starch with 15 mL of 2 N hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube, add 2 mL of citric acid solution (2 in 10), and 0.1 mL of thioglycolic acid. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, and dilute with water to 20 mL.
  Standard iron stock solution A: Equivalent to 10 µg/mL of iron prepared as directed under *Iron* ⟨241⟩

Standard iron stock solution B: 1 µg/mL of iron from *Standard iron stock solution A* in water
[NOTE—Prepare immediately before use.]
Standard iron solution: Transfer 10 mL of *Standard iron stock solution B* to a test tube, and add 2 mL of citric acid solution (2 in 10), and 0.1 mL of thioglycolic acid. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, and dilute with water to 20 mL.
Acceptance criteria: After 5 min, any pink color in the *Sample solution* is not more intense than that in the *Standard iron solution*, corresponding to a limit of 10 ppm of iron.

- **LIMIT OF SULFUR DIOXIDE**

Carbon dioxide: Use carbon dioxide, with a flow regulator that will maintain a flow of 100 ± 10 mL/min.
Bromophenol blue indicator solution: 0.2 mg/mL of bromophenol blue in dilute alcohol. Filter if necessary.
Hydrogen peroxide solution: Dilute 30% hydrogen peroxide with water to obtain a 3% solution. Just before use, add 3 drops of *Bromophenol blue indicator solution*, and neutralize to a violet-blue endpoint with 0.01 N sodium hydroxide. Do not exceed the endpoint.
Apparatus: *Figure 1.*



In this test, the sulfur dioxide is released from the sample in a boiling acid medium and is removed by a stream of carbon dioxide. The separated gas is collected in a dilute hydrogen peroxide solution where the sulfur dioxide is oxidized to sulfuric acid and titrated with standard alkali. The apparatus consists essentially of a 500-mL three-neck, round-bottom boiling flask, a separatory funnel having a capacity of 100 mL or greater, a gas inlet tube of sufficient length to permit introduction of the carbon dioxide within 2.5 cm of the bottom of the boiling flask, a reflux condenser having a jacket length of 200 mm, and a delivery tube connecting the upper end of the reflux condenser to the bottom of a receiving test tube. Apply a thin film of stopcock grease to the sealing surfaces of all of the joints except the joint between the separatory funnel and the boiling flask, and clamp the joints to ensure tightness.
Analysis: Add 150 mL of water to the boiling flask. Close the stopcock of the separatory funnel, and begin the flow of carbon dioxide at a rate of 100 ± 5 mL/min through the *Apparatus*. Start the condenser coolant flow. Add 10 mL of *Hydrogen peroxide solution* to a receiving test tube. After 15 min, without interrupting the flow of carbon dioxide, remove the separatory funnel from the boiling flask, and transfer 25.0 g of Corn Starch into the boiling flask with the aid of 100 mL of water. Apply stopcock grease to the outer joint of the separatory funnel, and replace the separatory funnel in the boiling flask. Close the stopcock of the separatory funnel, and add 80 mL of 2 N hydrochloric acid to the separatory funnel. Open the stopcock of the separatory funnel to permit the hydrochloric acid solution to flow into the boiling flask, guarding against the escape of sulfur dioxide into the separatory funnel by closing the stopcock before the last few mL of hydrochloric acid drain out. Boil the mixture for 1 h. Remove the receiving test tube, and transfer its contents to a 200-mL wide-necked, conical flask. Rinse the receiving test tube with a small portion of water, add the rinsing to the 200-mL conical flask, and mix. Heat on a water bath for 15 min, and allow to cool.
Add 0.1 mL of *Bromophenol blue indicator solution*, and titrate the contents with 0.1 N sodium hydroxide VS until the color changes from yellow to violet-blue. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩).
Calculate the content, in ppm, of sulfur dioxide in the *Sample solution* taken:

$$\text{Result} = 1000\,(32.03)\,VN/W$$

32.03 = milliequivalent weight of sulfur dioxide
V = volume of titrant consumed (mL)
N = normality of the titrant
W = weight of the *Sample solution* (g)
Acceptance criteria: NMT 50 ppm

- **LIMIT OF OXIDIZING SUBSTANCES**

Sample solution: Transfer 4.0 g to a glass-stoppered, 125-mL conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 min. Transfer to a glass-stoppered, 50-mL centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, 125-mL conical flask. Add 1 mL of glacial acetic acid and 0.5–1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25–30 min in the dark. Add 1 mL of starch TS.
Analysis: Titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch–iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate is equivalent to 34 µg of oxidant, calculated as hydrogen peroxide.
Acceptance criteria: NMT 1.4 mL of 0.002 N sodium thiosulfate is required (20 ppm, calculated as H_2O_2).

SPECIFIC TESTS

- ✦**MICROBIOLOGICAL EXAMINATION OF NONSTERILE PRODUCTS: MICROBIAL ENUMERATION TESTS** ⟨**61**⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨**62**⟩**:** The total aerobic microbial count does not exceed 1000 cfu/g; the total combined molds and yeasts count does not exceed 100 cfu/g, and it meets the requirements of the test for the absence of *Escherichia coli*. Where it is intended for use in preparing Absorbable Dusting Powder, it also meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.✦
- **LOSS ON DRYING** ⟨**731**⟩**:** Dry 1 g, at 130° for 90 min: it loses NMT 15.0% of its weight.
- **pH** ⟨**791**⟩**:** 4.0–7.0

Sample solution: Prepare a slurry by weighing 5.0 g of Corn Starch, transferring to a suitable nonmetallic container, and adding 25.0 mL of freshly boiled and cooled water.
Analysis: Agitate continuously at a moderate rate for 1 min. Stop the agitation, and allow to stand for 15 min. Determine the pH to the nearest 0.1 unit.

ADDITIONAL REQUIREMENTS

- ✦**PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.✦
- ✦**LABELING:** Where Corn Starch is intended for use in preparing Absorbable Dusting Powder, it is so labeled, and the label states that it must be subjected to further processing during the preparation of Absorbable Dusting Powder.✦▲*NF28*

BRIEFING

DEFINITION
Potato Starch is obtained from the tuber of *Solanum tuberosum L.*

IDENTIFICATION
- **A. PROCEDURE:** Examine under a microscope using a mixture of equal volumes of glycerol and water.
  Acceptance criteria: It presents granules, either irregularly shaped, ovoid or pear-shaped, usually 30–100 µm in size but occasionally exceeding 100 µm, or rounded, 10–35 µm in size. There are occasional compound granules having two to four components. The ovoid and pear-shaped granules have an eccentric hilum and the rounded granules acentric or slightly eccentric hilum. All granules show clearly visible concentric striations. Between orthogonally oriented polarizing plates or prisms, the granules show a distinct black cross intersecting at the hilum.
- **B. PROCEDURE**
  Sample solution: 20 mg/mL in water
  Analysis: Boil for 1 min, and cool.

BRIEFING

Rice Starch. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for this monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the ADOPTION STAGE 6 document, is based on the Official Inquiry Stage 4 document, which appeared in PF 30(2). The text presented is similar to the harmonization draft for Corn Starch that appears in this issue of *Pharmacopeial Forum*, with one difference: the pH range, which is 5.0–8.0. Because there is no existing monograph for this excipient, a new monograph based on the ADOPTION STAGE 6 document is proposed.

DEFINITION
Rice Starch is obtained from the caryopsis of *Oryza sativa L.*

IDENTIFICATION
- **A. PROCEDURE**
  Analysis: Examine under a microscope, using NLT 20x magnification and using a mixture of glycerin and water (1:1) as a mounting agent.
  Acceptance criteria: It appears either as angular polyhedral granules of irregular sizes with diameters ranging from 2 µm to 23 µm, or as rounded or spheroidal granules of irregular sizes with diameters ranging from 25 µm to 35 µm. The central hilum consists of a distinct cavity or two- to five-rayed cleft, and there are no concentric striations. Between orthogonally oriented polarizing plates or prisms, the starch granules show a distinct black cross intersecting at the hilum.
- **B. PROCEDURE**
  Sample solution: 20 mg/mL in water
  Analysis: Boil for 1 min, and cool.
  Acceptance criteria: A thin, cloudy mucilage is formed.
- **C. PROCEDURE**
  Sample solution: 1 mL of the mucilage obtained in *Identification* test *B*
  Analysis: Add 0.05 mL of iodine and potassium iodide TS 2 to the *Sample solution*.
  Acceptance criteria: An orange-red to dark blue color is produced, which disappears upon heating.

IMPURITIES
Inorganic Impurities
- **RESIDUE ON IGNITION ⟨281⟩:** NMT 0.6%, determined on a 1.0-g sample
- **LIMIT OF IRON**
  Sample solution: Shake 1.5 g of Rice Starch with 15 mL of 2 N hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube, and add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, and dilute with water to 20 mL.
  Standard iron stock solution A: Equivalent to 10 µg/mL of iron prepared as directed under *Iron* ⟨241⟩
  Standard iron stock solution B: 1 µg/mL of iron from *Standard iron stock solution A* in water
  [NOTE—Prepare immediately before use.]
  Standard iron solution: Transfer 10 mL of *Standard iron stock solution B* to a test tube, and add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, and dilute with water to 20 mL.
  Acceptance criteria: After 5 min, any pink color in the *Sample solution* is not more intense than that in the *Standard iron solution*, corresponding to a limit of 10 ppm of iron.
- **LIMIT OF SULFUR DIOXIDE**
  Carbon dioxide: Use carbon dioxide, with a flow regulator that will maintain a flow of 100 ± 10 mL/min.
  Bromophenol blue indicator solution: 0.2 mg/mL of bromophenol blue in dilute alcohol. Filter if necessary.
  Hydrogen peroxide solution: Dilute 30% hydrogen peroxide with water to obtain a 3% solution. Just before use, add 3 drops of *Bromophenol blue indicator solution*, and neutralize to a violet-blue endpoint with 0.01 N sodium hydroxide. Do not exceed the endpoint.
  Apparatus: *Figure 1.*

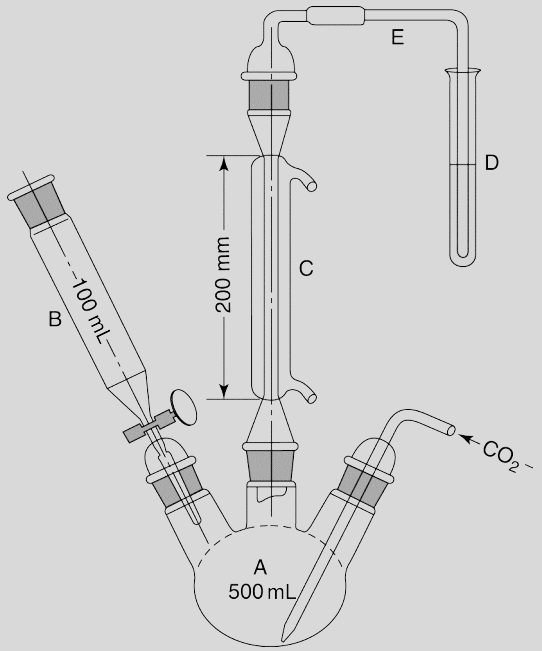

Figure 1

In this test, the sulfur dioxide is released from the sample in a boiling acid medium and is removed by a stream of carbon dioxide. The separated gas is collected in a dilute hydrogen peroxide solution where the sulfur dioxide is oxidized to sulfuric acid and titrated with standard alkali. The apparatus consists essentially of a 500-mL three-neck, round-bottom boiling flask, a separatory funnel having a capacity of 100 mL or greater, a gas inlet tube of sufficient length to permit introduction of the carbon dioxide within 2.5 cm of the bottom of the boiling flask, a reflux condenser having a jacket length of 200 mm, and a delivery tube connecting the upper end of the reflux condenser to the bottom of a receiving test tube. Apply a thin film of stopcock grease to the sealing surfaces of all of the joints except the joint between the separatory funnel and the boiling flask, and clamp the joints to ensure tightness.

Analysis
Add 150 mL of water to the boiling flask. Close the stopcock of the separatory funnel, and begin the flow of carbon dioxide at a rate of 100 ± 5 mL/min through the *Apparatus*. Start the condenser coolant flow. Add 10 mL of *Hydrogen peroxide solution* to a receiving test tube. After 15 min, without interrupting the flow of carbon dioxide, remove the separatory funnel from the boiling flask, and transfer 25.0 g of Rice Starch into the boiling flask with the aid of 100 mL of water. Apply stopcock grease to the outer joint of the separatory funnel, and replace the separatory funnel in the boiling flask. Close the stopcock of the separatory funnel, and add 80 mL of 2 N hydrochloric acid to the separatory

funnel. Open the stopcock of the separatory funnel to permit the hydrochloric acid solution to flow into the boiling flask, guarding against the escape of sulfur dioxide into the separatory funnel by closing the stopcock before the last few mL of hydrochloric acid drain out. Boil the mixture for 1 h. Remove the receiving test tube, and transfer its contents to a 200-mL wide-necked, conical flask. Rinse the receiving test tube with a small portion of water, add the rinsing to the 200-mL conical flask, and mix. Heat on a water bath for 15 min, and allow to cool.

Add 0.1 mL of *Bromophenol blue indicator solution*, and titrate the contents with 0.1 N sodium hydroxide VS until the color changes from yellow to violet-blue. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩).

Calculate the content, in ppm, of sulfur dioxide in the sample solution taken:

$$\text{Result} = 1000\ (32.03)\ VN/W$$

32.03 = milliequivalent weight of sulfur dioxide
V = volume of titrant consumed (mL)
N = normality of the titrant
W = weight of the sample solution (g)

Acceptance criteria: NMT 50 ppm

- **LIMIT OF OXIDIZING SUBSTANCES**

Sample solution: Transfer 4.0 g to a glass-stoppered, 125-mL conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 min. Transfer to a glass-stoppered, 50-mL centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, 125-mL conical flask. Add 1 mL of glacial acetic acid and 0.5–1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25–30 min in the dark. Add 1 mL of starch TS.

Analysis: Titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch–iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate is equivalent to 34 µg of oxidant, calculated as hydrogen peroxide.

Acceptance criteria: NMT 1.4 mL of 0.002 N sodium thiosulfate is required (20 ppm, calculated as H_2O_2).

SPECIFIC TESTS

- **✦MICROBIAL ENUMERATION TESTS ⟨61⟩** and **TESTS FOR SPECIFIED MICROORGANISMS ⟨62⟩ :** The total aerobic microbial count does not exceed 1000 cfu/g, the total combined molds and yeasts count does not exceed 100 cfu/g, and it meets the requirements of the test for the absence of *Escherichia coli*.✦
- **LOSS ON DRYING ⟨731⟩:** Dry 1 g at 130° for 90 min: it loses NMT 15.0% of its weight.
- **pH ⟨791⟩:** 5.0–8.0

Sample solution: Prepare a slurry by weighing 5.0 g of Rice Starch, transferring to a suitable nonmetallic container, and adding 25.0 mL of freshly boiled and cooled water.

Analysis: Agitate continuously at a moderate rate for 1 min. Stop the agitation, and allow to stand for 15 min. Determine the pH to the nearest 0.1 unit.

ADDITIONAL REQUIREMENTS

- **✦PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.✦▲*NF28*

BRIEFING

Wheat Starch. The Japanese Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Wheat Starch monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the **ADOPTION STAGE 6** document, is based on the corresponding monograph for Wheat Starch that was revised based on a request from the Japanese Pharmacopoeia. Differences between the **ADOPTION STAGE 6** document and the current USP monograph for Wheat Starch include the following: under *Identification* test *A*, "Between crossed nicol prisms" is changed to "Between orthogonally-oriented polarizing plates or prisms."

(EM2: K. Moore.) RTS—C50840

Reagents and Reference materials: Each pharmacopeia will adapt the text to take account of local reference materials and reagent specifications.

DEFINITION

Wheat starch is obtained from the caryopsis of *Triticum aestivum L.* (*T. vulgare* Vill.).

IDENTIFICATION

- **A. PROCEDURE**

Analysis: Examine under a microscope using equal volumes of glycerol and water.

Acceptance criteria: It presents large and small granules, and, very rarely, intermediate sizes. The large granules, usually 10–60 µm in diameter, are discoid or, more rarely, reniform when seen face-on. The central hilum and striations are invisible or barely visible, and the granules sometimes show cracks on the edges. Seen in profile, the granules are elliptical and fusiform and the hilum appears as a slit along the main axis. The small granules, rounded or polyhedral, are 2–10 µm in diameter. Between orthogonally-oriented polarizing plates or prisms, the granules show a distinct black cross intersecting at the hilum.

- **B. PROCEDURE**

Sample solution: 20 mg/mL in water
Analysis: Boil for 1 min, and cool.
Acceptance criteria: A thin, cloudy mucilage is formed.

- **C. PROCEDURE**

Sample solution: 1 mL of the mucilage obtained in *Identification* test *B*
Analysis: Add 0.05 mL of iodine and potassium iodide TS 2 to the *Sample solution*.

Acceptance criteria: An orange-red to dark blue color is produced, which disappears upon heating.

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION ⟨281⟩:** NMT 0.6%, determined on a 1.0-g sample
- **LIMIT OF IRON**

  Sample solution: Shake 1.5 g of Wheat Starch with 15 mL of 2 N hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube, add 2 mL of citric acid solution (2 in 10), and 0.1 mL of thioglycolic acid. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, and dilute with water to 20 mL.

  Standard iron stock solution A: Equivalent to 10 µg/mL of iron prepared as directed under *Iron* ⟨241⟩

  Standard iron stock solution B: 1 µg/mL of iron from *Standard iron stock solution A* in water
  [NOTE—Prepare immediately before use.]

  Standard iron solution: Transfer 10 mL of *Standard iron stock solution B* to a test tube, and add 2 mL of citric acid solution (2 in 10), and 0.1 mL of thioglycolic acid. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, and dilute with water to 20 mL.

  Acceptance criteria: After 5 min, any pink color in the *Sample solution* is not more intense than that in the *Standard iron solution*, corresponding to a limit of 10 ppm of iron.
- **LIMIT OF SULFUR DIOXIDE**

  Carbon dioxide: Use carbon dioxide, with a flow regulator that will maintain a flow of 100 ± 10 mL/min.

  Bromophenol blue indicator solution: 0.2 mg/mL of bromophenol blue in dilute alcohol. Filter if necessary.

  Hydrogen peroxide solution: Dilute 30% hydrogen peroxide with water to obtain a 3% solution. Just before use, add 3 drops of *Bromophenol blue indicator solution*, and neutralize to a violet-blue endpoint with 0.01 N sodium hydroxide. Do not exceed the endpoint.

  Apparatus: *Figure 1.*

  In this test, the sulfur dioxide is released from the sample in a boiling acid medium and is removed by a stream of carbon dioxide. The separated gas is collected in a dilute hydrogen peroxide solution where the sulfur dioxide is oxidized to sulfuric acid and titrated with standard alkali. The apparatus consists essentially of a 500-mL three-neck, round-bottom boiling flask, a separatory funnel having a capacity of 100 mL or greater, a gas inlet tube of sufficient length to permit introduction of the carbon dioxide within 2.5 cm of the bottom of the boiling flask, a reflux condenser having a jacket length of 200 mm, and a delivery tube connecting the upper end of the reflux condenser to the bottom of a receiving test tube. Apply a thin film of stopcock grease to the sealing surfaces of all of the joints except the joint between the separatory funnel and the boiling flask, and clamp the joints to ensure tightness.

  Analysis: Add 150 mL of water to the boiling flask. Close the stopcock of the separatory funnel, and begin the flow of carbon dioxide at a rate of 100 ± 5 mL/min through the *Apparatus*. Start the condenser coolant flow. Add 10 mL of *Hydrogen peroxide solution* to a receiving test tube. After 15 min, without interrupting the flow of carbon dioxide, remove the separatory funnel from the boiling flask, and transfer 25.0 g of Wheat Starch into the boiling flask with the aid of 100 mL of water. Apply stopcock grease to the outer joint of the separatory funnel, and replace the separatory funnel in the boiling flask. Close the stopcock of the separatory funnel, and add 80 mL of 2 N hydrochloric acid to the separatory funnel. Open the stopcock of the separatory funnel to permit the hydrochloric acid solution to flow into the boiling flask, guarding against the escape of sulfur dioxide into the separatory funnel by closing the stopcock before the last few mL of hydrochloric acid drain out. Boil the mixture for 1 h. Remove the receiving test tube, and transfer its contents to a 200-mL wide-necked, conical flask. Rinse the receiving test tube with a small portion of water, add the rinsing to the 200-mL conical flask, and mix. Heat on a water bath for 15 min, and allow to cool. Add 0.1 mL of *Bromophenol blue indicator solution*, and titrate the contents with 0.1 N sodium hydroxide VS until the color changes from yellow to violet-blue. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩).

  Calculate the content, in ppm, of sulfur dioxide in the sample solution taken:

$$\text{Result} = 1000\ (32.03)\ VN/W$$

  32.03 = milliequivalent weight of sulfur dioxide
  V = volume of titrant consumed (mL)
  N = normality of the titrant
  W = weight of the sample solution (g)

  Acceptance criteria: NMT 50 ppm
- **LIMIT OF OXIDIZING SUBSTANCES**

  Sample solution: Transfer 4.0 g to a glass-stoppered, 125-mL conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 min. Transfer to a glass-stoppered, 50-mL centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, 125-mL conical flask. Add 1 mL of glacial acetic acid and 0.5 g to 1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25–30 min in the dark. Add 1 mL of starch TS.

  Analysis: Titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch–iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate is equivalent to 34 µg of oxidant, calculated as hydrogen peroxide.

  Acceptance criteria: NMT 1.4 mL of 0.002 N sodium thiosulfate is required (20 ppm, calculated as H_2O_2).

SPECIFIC TESTS

- **•MICROBIAL ENUMERATION TESTS ⟨61⟩ and TESTS FOR SPECIFIED MICROORGANISMS ⟨62⟩:** The total aerobic microbial count does not exceed 1000 cfu/g; the total combined molds and yeasts count does not exceed 100 cfu/g, and it meets the requirements of the test for the absence of *Escherichia coli*.•
- **LOSS ON DRYING ⟨731⟩:** Dry 1 g at 130° for 90 min: it loses NMT 15.0% of its weight.
- **pH ⟨791⟩**

  Sample solution: Prepare a slurry by weighing 5.0 g of Wheat Starch, transferring to a suitable nonmetallic container, and adding 25.0 mL of freshly boiled and cooled water.

  Analysis: Agitate continuously at a moderate rate for 1 min. Stop the agitation, and allow to stand for 15 min. Determine the pH to the nearest 0.1 unit.

Acceptance criteria: 4.5–7.0

SPECIFIC TESTS

- **TOTAL PROTEIN**

Analysis: Weigh 6.0 g of sample containing 2 mg of nitrogen, transfer to a combustion flask, add 4 g of a powdered mixture consisting of 100 g of potassium sulfate, 5 g of cupric sulfate, and 2.5 g of selenium, and add three glass beads. Wash any adhering particles from the neck into the flask with 5 mL of sulfuric acid, allowing it to run down the sides of the flask, and mix the contents by rotation. Close the mouth of the flask loosely, for example by means of a glass bulb with a short stem, to avoid excessive loss of sulfuric acid. Heat gradually at first, then increase the temperature until there is vigorous boiling with condensation of sulfuric acid in the neck of the flask; precautions should be taken to prevent the upper part of the flask from becoming overheated. Continue the heating for 30 min, unless otherwise prescribed. Cool, dissolve the solid material by cautiously adding to the mixture 25 mL of water, cool again, and place in a steam distillation apparatus. Add 30 mL of sodium hydroxide solution (42 in 100), and distill immediately by passing steam through the mixture. Collect 40 mL of distillate in 20.0 mL of 0.01 N hydrochloric acid and enough water to cover the tip of the condenser. Toward the end of the distillation, lower the receiver so that the tip of the condenser is above the surface of the acid. Take precautions to prevent any water on the outer surface of the condenser from reaching the contents of the receiver. Titrate the distillate with 0.01 N sodium hydroxide, using methyl purple TS as the indicator (n_1 mL of 0.01 N sodium hydroxide). Repeat the test using 50 mg of glucose in place of the substance to be examined (n_2 mL of 0.01 N sodium hydroxide).

$$\text{Content of nitrogen} = [0.01401\ (n_2 - n_1)]/m$$

m = amount of test substance weighed (g)

Acceptance criteria: NMT 0.3% (corresponding to 0.048% N_2, conversion factor: 6.25)

Biological Tests and Assays

BRIEFING

〈 **85**〉 **Bacterial Endotoxins Test,** *USP 32* page 93. The signed-off PDG harmonization Stage 6 document is presented for information purposes only and not for comments.

(MSA 05: R.Tirumalai) RTS—C71157

Change to read:

〈85〉 BACTERIAL ENDOTOXINS TEST

◆Portions of this general chapter have been harmonized with the corresponding texts of the European Pharmacopeia and/or the Japanese Pharmacopeia. Those portions that are not harmonized are marked with symbols (◆ ◆) to specify this fact.◆

This chapter provides a test to detect or quantify bacterial endotoxins that may be present in or on the sample of the article(s) to which the test is applied. It uses Limulus Amebocyte Lysate (LAL) obtained from the aqueous extracts of circulating amebocytes of horseshoe crab (*Limulus polyphemus* or *Tachypleus tridentatus*) which has been prepared and characterized for use as an LAL Reagent.◆[1]◆

There are two types of techniques for this test: the gel-clot techniques, which are based on gel formation, and the photometric techniques. The latter include a turbidimetric method, which is based on the development of turbidity after cleavage of an endogenous substrate, and a chromogenic method, which is based on the development of color after cleavage of a synthetic peptide-chromogen complex. Proceed by any one of these techniques, unless otherwise indicated in the monograph. In case of dispute, the final decision is based on the gel-clot techniques, unless otherwise indicated in the monograph.

In the gel-clot techniques, the reaction endpoint is determined from dilutions of the material under test in direct comparison with parallel dilutions of a reference endotoxin, and quantities of endotoxin are expressed in USP Endotoxin Units (USP EU). [NOTE—One USP EU is equal to one IU of endotoxin.]

Because LAL Reagents have been formulated to be used also for turbidimetric or colorimetric tests, such tests may be used to comply with the requirements. These tests require the establishment of a standard regression curve; the endotoxin content of the test material is determined by interpolation from the curve. The procedures include incubation for a preselected time of reacting endotoxin and control solutions with LAL Reagent and reading of the spectrophotometric light absorbance at suitable wavelengths. In the endpoint turbidimetric procedure the reading is made immediately at the end of the incubation period. In the endpoint colorimetric procedure the reaction is arrested at the end of the preselected time by the addition of an enzyme reaction-terminating agent prior to the readings. In the turbidimetric and colorimetric kinetic assays the absorbance is measured throughout the reaction period and rate values are determined from those readings.

APPARATUS AND GLASSWARE

Depyrogenate all glassware and other heat-stable materials in a hot-air oven using a validated process.◆[2]◆ Commonly used minimum time and temperature settings are 30 minutes at 250°. If employing plastic apparatus, such as microplates and pipet tips for automatic pipetters, use only that which has been shown to be free of detectable endotoxin and not to interfere with the test. [NOTE—In this chapter, the term "tube" includes any other receptacle such as a micro-titer well.]

PREPARATION OF THE STANDARD ENDOTOXIN STOCK SOLUTION AND STANDARD SOLUTIONS

The USP Endotoxin RS has a defined potency of 10,000 USP Endotoxin Units (EU) per vial. Constitute the entire contents of 1 vial of the RSE with 5 mL of LAL Reagent Water◆[3]◆, mix intermittently for 30 minutes, using a vortex mixer, and use this concentrate for making appropriate serial dilutions. Preserve the concentrate in a refrigerator for making subsequent dilutions for not more than 14 days. Mix vigorously, using a vortex mixer, for not less than 3 minutes before use. Mix each dilution for not less than 30 seconds before proceeding to make the next dilution. Do not store dilutions, because of loss of activity by adsorption, in the absence of supporting data to the contrary.

Preparatory Testing

Use an LAL Reagent of confirmed label sensitivity.

The validity of test results for bacterial endotoxins requires an adequate demonstration that specimens of the article or of solutions, washings, or extracts thereof to which the test is to be applied do not of themselves inhibit or enhance the reaction or otherwise interfere with the test. Validation is accomplished by performing the inhibition or enhancement test described under each of the three techniques indicated. Appropriate negative controls are included. Validation must be repeated if the LAL Reagent source or the method of manufacture or formulation of the article is changed.

Preparation of Sample Solutions

Prepare sample solutions by dissolving or diluting drugs or extracting medical devices using LAL Reagent Water. Some substances or preparations may be more appropriately dissolved, diluted, or extracted in other aqueous solutions. If necessary, adjust the pH of the solution (or dilution thereof) to be examined so that the pH of the mixture of the LAL Reagent and sam-

◆[1] LAL Reagent reacts with some β glucans in addition to endotoxins. Some preparations that are treated will not react with β glucans and must be used for samples that contain glucans.◆

◆[2] For a validity test of the procedure for inactivating endotoxins, see Dry-Heat Sterilization under Sterilization and Sterility Assurance of Compendial Articles 1211. Use an LAL Reagent having a sensitivity of not less than 0.15 Endotoxin Unit per mL.◆

◆[3] Sterile Water for Injection or other water that shows no reaction with the specific LAL Reagent with which it is to be used, at the limit of sensitivity of such reagent.◆

ple falls within the pH range specified by the LAL Reagent manufacturer. This usually applies to a product with a pH in the range of 6.0 to 8.0. The pH may be adjusted using an acid, base, or suitable buffer as recommended by the LAL Reagent manufacturer. Acids and bases may be prepared from concentrates or solids with LAL Reagent Water in containers free of detectable endotoxin. Buffers must be validated to be free of detectable endotoxin and interfering factors.

DETERMINATION OF MAXIMUM VALID DILUTION (MVD)

The Maximum Valid Dilution is the maximum allowable dilution of a specimen at which the endotoxin limit can be determined. It applies to injections or to solutions for parenteral administration in the form constituted or diluted for administration, or, where applicable, to the amount of drug by weight if the volume of the dosage form for administration could be varied. The general equation to determine MVD is:

$$MVD = (\text{Endotoxin limit} \times \text{Concentration of sample solution}) / (\lambda)$$

where the concentration of sample solution and λ are as defined below. Where the endotoxin limit concentration is specified in the individual monograph in terms of volume (in EU per mL), divide the limit by λ, which is the labeled sensitivity (in EU per mL) of the LAL Reagent, to obtain the MVD factor. Where the endotoxin limit concentration is specified in the individual monograph in terms of weight or Units of active drug (in EU per mg or in EU per Unit), multiply the limit by the concentration (in mg per mL or in Units per mL) of the drug in the solution tested or of the drug constituted according to the label instructions, whichever is applicable, and divide the product of the multiplication by λ, to obtain the MVD factor. The MVD factor so obtained is the limit dilution factor for the preparation for the test to be valid.

ESTABLISHMENT OF ENDOTOXIN LIMITS

The endotoxin limit for parenteral drugs, defined on the basis of dose, is equal to K/M,◆[4]◆ where K is the threshold human pyrogenic dose of endotoxin per kg of body weight, and M is equal to the maximum recommended human dose of product per kg of body weight in a single hour period.

The endotoxin limit for parenteral drugs is specified in individual monographs in units such as EU/mL, EU/mg, or EU/Unit of biological activity.

GEL-CLOT TECHNIQUES

The gel-clot techniques detect or quantify endotoxins based on clotting of the LAL Reagent in the presence of endotoxin. The concentration of endotoxin required to cause the lysate to clot under standard conditions is the labeled sensitivity of the LAL Reagent. To ensure both the precision and validity of the test, tests for confirming the labeled LAL Reagent sensitivity and for interfering factors are described under *Preparatory Testing for the Gel-Clot Techniques*.

Preparatory Testing for the Gel-Clot Techniques

Test for Confirmation of Labeled LAL Reagent Sensitivity— Confirm the labeled sensitivity using at least 1 vial of the LAL Reagent lot. Prepare a series of two-fold dilutions of the USP Endotoxin RS in LAL Reagent Water to give concentrations of 2λ, λ, 0.5λ, and 0.25λ, where λ is as defined above. Perform the test on the four standard concentrations in quadruplicate and include negative controls. The test for confirmation of lysate sensitivity is to be carried out when a new batch of LAL Reagent is used or when there is any change in the experimental conditions that may affect the outcome of the test.

Mix a volume of the LAL Reagent with an equal volume (such as 0.1 mL aliquots) of one of the *Standard Endotoxin Solutions* in each test tube. When single test vials or ampuls containing lyophilized LAL Reagent are used, add solutions directly to the vial or ampul. Incubate the reaction mixture for a constant period according to directions of the LAL reagent manufacturer (usually at 37 ± 1° for 60 ± 2 minutes), avoiding vibration. To test the integrity of the gel, take each tube in turn directly from the incubator and invert it through about 180° in one smooth motion. If a firm gel has formed that remains in place upon inversion, record the result as positive. A result is negative if an intact gel is not formed. The test is not valid unless the lowest concentration of the standard solutions shows a negative result in all replicate tests.

The endpoint is the last positive test in the series of decreasing concentrations of endotoxin. Calculate the mean value of the logarithms of the endpoint concentration and then the antilogarithm of the mean value using the following equation:

$$\text{Geometric Mean Endpoint Concentration} = \text{antilog}\,(\Sigma e/f)$$

where Σe is the sum of the log endpoint concentrations of the dilution series used, and f is the number of replicate test tubes. The geometric mean endpoint concentration is the measured sensitivity of the LAL Reagent (in EU/mL). If this is not less than 0.5λ and not more than 2λ, the labeled sensitivity is confirmed and is used in tests performed with this lysate.

Interfering Factors Test for the Gel-Clot Techniques— Prepare solutions A, B, C, and D as shown in *Table 1*, and perform the inhibition/enhancement test on the *Sample Solutions* at a dilution less than the MVD, not containing any detectable endotoxins, following the procedure in the *Test for Confirmation of Labeled LAL Reagent Sensitivity* above. The geometric mean endpoint concentrations of Solutions B and C are determined using the equation in that test.

◆[4] K is 5 USP EU/kg for any route of administration other than intrathecal (for which K is 0.2 USP EU/kg body weight). For radiopharmaceutical products not administered intrathecally the endotoxin limit is calculated as 175/V, where V is the maximum recommended dose in mL. For intrathecally administered radiopharmaceuticals, the endotoxin limit is obtained by the formula 14/V. For formulations (usually anticancer products) administered on a per square meter of body surface, the formula is K/M, where K = 5 EU/kg and M is the (maximum dose/m2/hour × 1.80 m2)/70 Kg.◆

Table 1. Preparation of Solutions for the Inhibition/Enhancement Test for Gel-Clot Techniques

Solution	Endotoxin Concentration/Solution to which Endotoxin is Added	Diluent	Dilution Factor	Initial Endotoxin Concentration	Number of Replicates
A[a]	none/sample solution	—	—	—	4
B[b]	2λ/sample solution	sample solution	1	2λ	4
			2	1λ	4
			4	0.5λ	4
			8	0.25λ	4
C[c]	2λ/LAL Reagent Water	LAL Reagent Water	1	2λ	2
			2	1λ	2
			4	0.5λ	2
			8	0.25λ	2
D[d]	none/LAL Reagent Water	—	—	—	2

[a] Solution A: a *Sample Solution* of the preparation under test that is free of detectable endotoxins.
[b] Solution B: test for interference.
[c] Solution C: control for labeled LAL Reagent sensitivity.
[d] Solution D: negative control of LAL Reagent Water.

This test must be repeated when any condition that is likely to influence the test results changes. The test is not valid unless Solutions A and D show no reaction and the result of Solution C confirms the labeled sensitivity.

If the sensitivity of the lysate determined in the presence of the sample solution under test of Solution B is not less than 0.5λ and not greater than 2λ, the sample solution does not contain factors that interfere under the experimental conditions used. Otherwise, the sample solution to be examined interferes with the test.

If the sample under test does not comply with the test at a dilution less than the MVD, repeat the test using a greater dilution, not exceeding the MVD. The use of a more sensitive lysate permits a greater dilution of the sample to be examined and this may contribute to the elimination of interference.

Interference may be overcome by suitable treatment, such as filtration, neutralization, dialysis, or heating. To establish that the chosen treatment effectively eliminates interference without loss of endotoxins, perform the assay described below using the preparation to be examined to which USP Endotoxin RS has been added and which has been subjected to the selected treatment.

Gel-Clot Limit Test

This test is used when a monograph contains a requirement for endotoxin limits.

Procedure— Prepare Solutions A, B, C, and D as shown in *Table 2*, and perform the test on these solutions following the procedure in the *Test for Confirmation of Labeled LAL Reagent Sensitivity* under *Preparatory Testing for the Gel-Clot Techniques*.

Table 2. Preparation of Solutions for the Gel-Clot Limit Test

Solution[a]	Endotoxin Concentration/Solution to which Endotoxin is Added	Number of Replicates
A	none/diluted *Sample Solution*	2
B	2λ/diluted *Sample Solution*	2

Table 2. Preparation of Solutions for the Gel-Clot Limit Test *(Continued)*

Solution[a]	Endotoxin Concentration/Solution to which Endotoxin is Added	Number of Replicates
C	2λ/LAL Reagent Water	2
D	none/LAL Reagent Water	2

[a] Prepare Solution A and positive product control Solution B using a dilution not greater than the MVD and treatments as directed in the *Interfering Factors Test for the Gel-Clot Techniques* under *Preparatory Testing for the Gel-Clot Techniques*. Positive control Solutions B and C contain the standard endotoxin preparation at a concentration corresponding to twice the labeled LAL Reagent sensitivity. The negative control Solution D is LAL Reagent Water.

Interpretation— The test is not valid unless both replicates of positive control Solutions B and C are positive and those of negative control Solution D are negative. The preparation under test complies with the test when a negative result is found for both tubes containing Solution A. The preparation under test does not comply with the test when a positive result is found for both tubes containing Solution A.

Repeat the test when a positive result is found for 1 tube containing Solution A and a negative result for the other one. The preparation under test complies with the test when a negative result is found for both tubes containing Solution A in the repeat result. If the test is positive for the preparation under test at a dilution less than the MVD, the test may be repeated at a dilution not greater than the MVD.

Gel-Clot Assay

This assay quantifies bacterial endotoxins in sample solutions by titration to an endpoint.

Procedure— Prepare Solutions A, B, C, and D as shown in *Table 3*, and test these solutions by following the procedure in the Test for Confirmation of Labeled LAL Reagent Sensitivity under *Preparatory Testing for the Gel-Clot Techniques*.

Table 3. Preparation of Solutions for the Gel-Clot Assay

Solution	Endotoxin Concentration/ Solution to which Endotoxin is Added	Diluent	Dilution Factor	Initial Endotoxin Concentration	Number of Replicates
A[a]	none/sample solution	sample solution	1	—	2
			2	—	2
			4	—	2
			8	—	2
B[b]	2λ/sample solution	—	1	2λ	2

Table 3. Preparation of Solutions for the Gel-Clot Assay *(Continued)*

Solution	Endotoxin Concentration/ Solution to which Endotoxin is Added	Diluent	Dilution Factor	Initial Endotoxin Concentration	Number of Replicates
C[c]	2λ/LAL Reagent Water		1	2λ	2
			2	1λ	2
			4	0.5λ	2
			8	0.25λ	2
D[d]	none/LAL Reagent Water	—	—	—	2

[a] Solution A: a sample solution under test at the dilution, not to exceed the MVD, with which the *Interfering Factors Test for the Gel-Clot Techniques* was completed. Subsequent dilution of the sample solution must not exceed the MVD. Use LAL Reagent Water to make dilution series of four tubes containing the sample solution under test at concentrations of *Interfering Factors Test for the Gel-Clot Techniques* was completed. Other dilutions 1, , , and $\frac{1}{8}$ relative to the dilution with which the may be used as appropriate.

[b] Solution B: Solution A containing standard endotoxin at a concentration of 2λ (positive product control).

[c] Solution C: two series of 4 tubes of LAL Reagent Water containing the standardendotoxin at a concentration of 2λ, λ, 0.5λ, and 0.25λ, respectively.

[d] Solution D: LAL Reagent Water (negative control).

Calculation and Interpretation The test is not valid unless the following conditions are met: (1) both replicates of negative control Solution D are negative; (2) both replicates of positive product control Solution B are positive; and (3) the geometric mean endpoint concentration of Solution C is in the range of 0.5λ to 2λ.

To determine the endotoxin concentration of Solution A, calculate the endpoint concentration for each replicate series of dilutions by multiplying each endpoint dilution factor by λ. The endotoxin concentration in the sample is the geometric mean endpoint concentration of the replicates (see the formula given *Test for Confirmation of Labeled LAL Reagent Sensitivity* in the under *Preparatory Testing for the Gel-Clot Techniques*). If the test is conducted with a diluted *Sample Solution*, calculate the concentration of endotoxin in the original *Sample Solution* by multiplying by the dilution factor. If none of the dilutions of the *Sample Solution* is positive in a valid assay, report the endotoxin concentration as less than λ (if the diluted sample was tested, less than λ times the lowest dilution factor of the sample.) If all dilutions are positive, the endotoxin concentration is reported as equal to or greater than the greatest dilution factor multiplied by λ (e.g., initial dilution factor times 8 times λ in *Table 3*).

The articlemeets the requirements of the test if the concentration of endotoxin is less than that specified in the individual monograph.

PHOTOMETRIC TECHNIQUES

The turbidimetric method measures increases in turbidity. Depending on the test principle used, this technique is classified as either endpoint turbidimetric or kinetic turbidimetric. The endpoint turbidimetric technique is based on the quantitative relationship between the concentration of endotoxins and the turbidity (absorbance or transmission) of the reaction mixture at the end of an incubation period. The kinetic turbidimetric technique is a method to measure either the onset time needed to reach a predetermined absorbance of the reaction mixture or the rate of turbidity development.

The chromogenic method measures the chromophore released from a suitable chromogenic peptide by the reaction of endotoxins with the LAL Reagent. Depending on the test principle employed, this technique is classified as either endpoint chromogenic or kinetic chromogenic. The endpoint chromogenic technique is based on the quantitative relationship between the concentration of endotoxins and the release of chromophore at the end of an incubation period. The kinetic chromogenic technique is a method to measure either the onset time needed to reach a predetermined absorbance of the reaction mixture or the rate of color development

All photometric tests are carried out at the incubation temperature recommended by the LAL Reagent manufacturer, which is usually 37 ± 1°.

Preparatory Testing for the Photometric Techniques

To ensure the precision or validity of the turbidimetric and chromogenic techniques, preparatory tests are conducted to verify that the criteria for the standard curve are valid and that the sample solution does not inhibit or enhance the reaction. Revalidation for the test method is required when conditions that are likely to influence the test result change.

Verification of Criteria for the Standard Curve Using the Standard Endotoxin Solution, prepare at least three endotoxin concentrations to generate the standard curve. Perform the test using at least three replicates of each standard endotoxin concentration according to the manufacturer's instructions for the LAL Reagent (with regard to volume ratios, incubation time, temperature, pH, etc.). If the desired range in the kinetic methods is greater than two logs, additional standards should be included to bracket each log increase within the range of the standard curve. The absolute value of the correlation coefficient, $|r|$, must be greater than or equal to 0.980 for the range of endotoxin concentrations indicated by the manufacturer of the LAL Reagent.

Interfering Factors Test for the Photometric Techniques Select an endotoxin concentration at or near the middle of the endotoxin standard curve. Prepare Solutions A, B, C, and D as shown in *Table 4*. Perform the test on Solutions A, B, C, and D at least in duplicate following the instructions for the LAL Reagent used (with regard to volume of sample and LAL Reagent, volume ratio of sample to LAL Reagent, incubation time, etc.)

Table 4. Preparation of Solutions for the Inhibition/Enhancement Test for Photometric Techniques

Solution	Endotoxin Concentration	Solution to which Endotoxin is Added	Number of Replicates
A[a]	none	sample solution	not less than 2
B[b]	middle concentration of the standard curve	sample solution	not less than 2

Table 4. Preparation of Solutions for the Inhibition/Enhancement Test for Photometric Techniques *(Continued)*

Solution	Endotoxin Concentration	Solution to which Endotoxin is Added	Number of Replicates
C[c]	at least 3 concentrations (lowest concentration is designated λ.)	LAL Reagent Water	each not less than 2
D[d]	none	LAL Reagent Water	not less than 2

[a] Solution A: the sample solution may be diluted not to exceed MVD.
[b] Solution B: the preparation under test at the same dilution as Solution A, containing added endotoxin at a concentration equal to or near the middle of the standard curve.
[c] Solution C: the standard endotoxin at the concentrations used in the validationof the method described in *Verification of Criteria for the Standard Curve* under *Preparatory Testing for the Photometric Techniques (positive control series)*.
[d] Solution D: LAL Reagent Water(negative control).

Calculate the mean recovery of the added endotoxin by subtracting the mean endotoxin concentration in the solution, (if any) from that containing the added endotoxin. In order to be considered free of interfering factors under the conditions of the test, the measured concentration of the endotoxin added to the sample solution must be within 50% to 200% of the known added endotoxin concentration after subtraction of any endotoxin detected in the solution without added endotoxin.

When the endotoxin recovery is out of the specified ranges, the interfering factors must be removed as described in the *Interfering Factors Test for the Gel-Clot Techniques* under *Preparatory Testing for the Gel-Clot Techniques*. Repeating the *Interfering Factors Test for the Gel-Clot Techniques* validates the treatment.

Procedure for the Photometric Techniques

Follow the procedure described in the *Interfering Factors Test for the Photometric Techniques* under *Preparatory Testing for the Photometric Techniques*.

Calculation for the Photometric Techniques

Calculate the endotoxin concentration of each of the replicates of test Solution A using the standard curve generated by positive control series C. The test is not valid unless the following conditions are met: (1) the results of control series C comply with the requirements for validation defined under *Verification of Criteria for the Standard Curve* under *Preparatory Testing for the Photometric Techniques;* (2) the endotoxin recovery, calculated from the concentration found in Solution B after subtracting the endotoxin concentration found in Solution A is within 50 to 200%; and (3) the result of negative control series D does not exceed the limit of the blank value required in the description of the LAL Reagent used.

Interpretation of Results from the Photometric Techniques

In photometric assays, the preparation under test complies with the test if the mean endotoxin concentration of the replicates of Solution A, after correction for dilution and concentration, is less than the endotoxin limit for the product.

▲◆Portions of this general chapter have been harmonized with the corresponding texts of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia*. Those portions that are not harmonized are marked with symbols (◆◆) to specify this fact.◆

The Bacterial Endotoxins Test (BET) is a test to detect or quantify endotoxins from Gram-negative bacteria using amoebocyte lysate from the horseshoe crab (*Limulus polyphemus* or *Tachypleus tridentatus*).

There are three techniques for this test: the gel-clot technique, which is based on gel formation; the turbidimetric technique, based on the development of turbidity after cleavage of an endogenous substrate; and the chromogenic technique, based on the development of color after cleavage of a synthetic peptide-chromogen complex. Proceed by any of the three techniques for the test. In the event of doubt or dispute, the final decision is made based upon the gel-clot technique unless otherwise indicated in the monograph for the product being tested. The test is carried out in a manner that avoids endotoxin contamination.

APPARATUS

Depyrogenate all glassware and other heat-stable materials in a hot air oven using a validated process. ◆[1]◆ A commonly used minimum time and temperature is 30 minutes at 250°. If employing plastic apparatus, such as microplates and pipet tips for automatic pipetters, use apparatus that is shown to be free of detectable endotoxin and does not interfere in the test. [NOTE—In this chapter, the term ''tube'' includes any other receptacle such as a microtiter well.]

◆[1] For a validity test of the procedure for inactivating endotoxins, see *Dry-Heat Sterilization*under *Sterilization and Sterility Assurance of Compendial Articles* ⟨1211⟩. Use *Lysate TS* having a sensitivity of not less than 0.15 Endotoxin Unit per mL.◆

REAGENTS AND TEST SOLUTIONS

Amoebocyte Lysate—A lyophilized product obtained from the lysate of amoebocytes (white blood cells) from the horseshoe crab (*Limulus polyphemus* or *Tachypleus tridentatus*). This reagent refers only to a product manufactured in accordance with the regulations of the competent authority. [NOTE—*Amoebocyte Lysate* reacts to some β-glucans in addition to endotoxins. *Amoebocyte Lysate* preparations that do not react to glucans are available: they are prepared by removing the G factor reacting to glucans from *Amoebocyte Lysate* or by inhibiting the G factor reacting system of *Amoebocyte Lysate* and may be used for endotoxin testing in the presence of glucans.]

Water for Bacterial Endotoxins Test (BET)—Use *Water for Injection* or water produced by other procedures that shows no reaction with the lysate employed, at the detection limit of the reagent.

Lysate TS—Dissolve *Amoebocyte Lysate* in *Water for BET*, or in a buffer recommended by the lysate manufacturer, by gentle stirring. Store the reconstituted lysate, refrigerated or frozen, according to the specifications of the manufacturer.

PREPARATION OF SOLUTIONS

Standard Endotoxin Stock Solution—A *Standard Endotoxin Stock Solution* is prepared from a USP Endotoxin Reference Standard that has been calibrated to the current WHO International Standard for Endotoxin. Follow the specifications in the package leaflet and on the label for preparation and storage of the *Standard Endotoxin Stock Solution*. Endotoxin is expressed in Endotoxin Units (EU). [NOTE—One USP Endotoxin Unit (EU) is equal to one International Unit (IU) of endotoxin.]

Standard Endotoxin Solutions—After mixing the *Standard Endotoxin Stock Solution* vigorously, prepare appropriate serial dilutions of *Standard Endotoxin Solution*, using *Water for BET*. Use dilutions as soon as possible to avoid loss of activity by adsorption.

Sample Solutions—Prepare the *Sample Solutions* by dissolving or diluting drugs, or taking washes from medical devices using *Water for BET*. Some substances or preparations may be more appropriately dissolved, diluted, or extracted in other aqueous solutions. If necessary, adjust the pH of the solution to be examined (or dilution thereof) so that the pH of the mixture of the lysate and *Sample Solution* falls within the pH range specified by the lysate manufacturer, usually 6.0 to 8.0. The pH may be adjusted by use of an acid, base, or suitable buffer as recommended by the lysate manufacturer. Acids and bases may be prepared from concentrates or solids with *Water for BET* in containers free of detectable endotoxin. Buffers must be validated to be free of detectable endotoxin and interfering factors.

DETERMINATION OF MAXIMUM VALID DILUTION (MVD)

The Maximum Valid Dilution is the maximum allowable dilution of a specimen at which the endotoxin limit can be determined. Determine the MVD from the following equation:

$$\text{MVD} = (\text{Endotoxin Limit} \times \text{Concentration of } \textit{Sample Solution}) / (\lambda)$$

Endotoxin Limit—The endotoxin limit for parenteral drugs, defined on the basis of dose, equals K/M[◆2◆], where K is a threshold pyrogenic dose of endotoxin per kg of body weight , and M is equal to the maximum recommended bolus dose of product per kg of body weight. When the product is to be injected at frequent intervals or infused continuously, M is the maximum total dose administered in a single hour period. The endotoxin limit for parenteral drugs is specified in the individual monograph in units such as EU/mL, EU/mg, EU/Unit of biological activity, etc.

Concentration of Sample Solution—

mg/mL: in the case of endotoxin limit specified by weight (EU/mg);

Units/mL: in the case of endotoxin limit specified by unit of biological activity (EU/Unit);

mL/mL: when the endotoxin limit is specified by volume (EU/mL).

λ: the labeled sensitivity in the *Gel-Clot Technique* (EU/mL) or the lowest concentration used in the standard regression curve for the *Turbidimetric Technique* or *Chromogenic Technique*.

GEL-CLOT TECHNIQUE

The Gel-Clot Technique is for detecting or quantifying endotoxins based on clotting of the lysate reagent in the presence of endotoxin. The minimum concentration of endotoxin required to cause the lysate to clot under standard conditions is the labeled sensitivity of the lysate reagent. To ensure both the precision and validity of the test, perform the tests for confirming the labeled lysate sensitivity and for interfering factors as described under *Preparatory Testing*.

Preparatory Testing

Test for Confirmation of Labeled Lysate Sensitivity—Confirm in four replicates the labeled sensitivity, λ, expressed in EU/mL of the lysate prior to use in the test. The test for confirmation of lysate sensitivity is to be carried out when a new batch of lysate is used or when there is any change in the test conditions that may affect the outcome of the test. Prepare standard solutions having at least four concentrations equivalent to 2λ, λ, 0.5λ, and 0.25λ by diluting the USP Endotoxin RS with *Water for BET*.

Mix a volume of the *Lysate TS* with an equal volume (such as 0.1-mL aliquots) of one of the *Standard Endotoxin Solutions* in each test tube. When single test vials or ampuls containing lyophilized lysate are used, add solutions directly to the vial or ampul. Incubate the reaction mixture for a constant period according to the directions of the lysate manufacturer (usually at 37 ± 1° for 60 ± 2 minutes), avoiding vibration. To test the integrity of the gel, take each tube in turn directly from the incubator and invert it through about 180° in one smooth motion. If a firm gel has formed that remains in place upon inversion, record the result as positive. A result is negative if an intact gel is not formed. The test is considered valid when the lowest concentration of the standard solutions shows a negative result in all replicate tests.

The endpoint is the smallest concentration in the series of decreasing concentrations of standard endotoxin that clots the lysate. Determine the geometric mean endpoint by calculating the mean of the logarithms of the endpoint concentrations of the four replicate series and then taking the antilogarithm of the mean value, as indicated in the following formula:

$$\text{Geometric Mean Endpoint Concentration} = \text{antilog}\left(\frac{\Sigma e}{f}\right)$$

[◆2] *K* is 5 USP-EU/kg for any route of administration other than intrathecal (for which *K* is 0.2 USP-EU/kg body weight). For radiopharmaceutical products not administered intrathecally, the endotoxin limit is calculated as $175/V$, where V is the maximum recommended dose in mL. For intrathecally administered radiopharmaceuticals, the endotoxin limit is obtained by the formula $14/V$. For formulations (usually anticancer products) administered on a per square meter of body surface, the formula is K/M, where K = 5 EU/kg and M is the (maximum dose/m^2/hour × 1.80 m^2)/70 Kg. ◆

where Σe is the sum of the log endpoint concentrations of the dilution series used, and f is the number of replicate test tubes. The geometric mean endpoint concentration is the measured sensitivity of the lysate (in EU/mL). If this is not less than 0.5λ and not more than 2λ, the labeled sensitivity is confirmed and is used in tests performed with this lysate.

Test for Interfering Factors—Usually prepare solutions (A–D) as shown in *Table 1*, and perform the inhibition/enhancement test on the *Sample Solutions* at a dilution less than the MVD, not containing any detectable endotoxins, operating as described for *Test for Confirmation of Labeled Lysate Sensitivity.* The geometric mean endpoint concentrations of Solutions B and C are determined using the formula described in the *Test for Confirmation of Labeled Lysate Sensitivity.*

The test is considered valid when all replicates of *Solutions A* and *D* show no reaction and the result of *Solution C* confirms the labeled sensitivity.

If the sensitivity of the lysate determined in the presence of *Solution B* is not less than 0.5λ and not greater than 2λ, the *Sample Solution* does not contain factors that interfere under the experimental conditions used. Otherwise, the *Sample Solution* to be examined interferes with the test.

If the sample under test does not comply with the test at a dilution less than the MVD, repeat the test using a greater dilution, not exceeding the MVD. The use of a more sensitive lysate permits a greater dilution of the sample to be examined and this may contribute to the elimination of interference.

Interference may be overcome by suitable treatment, such as filtration, neutralization, dialysis, or heating. To establish that the chosen treatment effectively eliminates interference without loss of endotoxins, perform the assay described above using the preparation to be examined to which USP Endotoxin RS has been added and which has then been submitted to the chosen treatment.

Table 1. Preparation of Solutions for the Inhibition/Enhancement Test for Gel-Clot Techniques

Solution	Endotoxin Concentration/ Solution to which Endotoxin is Added	Diluent	Dilution Factor	Endotoxin Concentration	Number of Replicates
A[a]	none/*Sample Solution*	—	—	—	4
B[b]	2λ/*Sample Solution*	*Sample Solution*	1	2λ	4
			2	1λ	4
			4	0.5λ	4
			8	0.25λ	4
C[c]	2λ/*Water for BET*	*Water for BET*	1	2λ	2
			2	1λ	2
			4	0.5λ	2
			8	0.25λ	2
D[d]	none/*Water for BET*	—	—	—	2

[a] Solution A: a *Sample Solution* of the preparation under test that is free of detectable endotoxins.
[b] Solution B: test for interference.
[c] Solution C: control for labeled lysate sensitivity.
[d] Solution D: negative control of *Water for BET*

Limit Test

Procedure—Prepare *Solutions A, B, C,* and *D* as shown in *Table 2*, and perform the test on these solutions following the procedure for *Test for Confirmation of Labeled Lysate Sensitivity* under *Preparatory Testing.*

Table 2. Preparation of Solutions for the Gel-Clot Limit Test

Solution*	Endotoxin Concentration/Solution to which Endotoxin is Added	Number of Replicates
A	none/diluted *Sample Solution*	2
B	2λ/diluted *Sample Solution*	2
C	2λ/*Water for BET*	2
D	none/*Water for BET*	2

* Prepare *Solution A* and the positive product control *Solution B* using a dilution not greater than the MVD and treatments as for the *Test for Interfering Factors* under *Preparatory Testing*. The positive control *Solutions B* and *C* contain the *Standard Endotoxin Solution* at a concentration corresponding to twice the labeled lysate sensitivity. The negative control *Solution D* consists of *Water for BET.*

Interpretation—The test is considered valid when both replicates of *Solution B* and *C* are positive and those of *Solution D* are negative. When a negative result is found for both replicates of *Solution A,* the preparation under test complies with the test. When a positive result is found for both replicates of *Solution A,* the preparation under test does not comply with the test.

When a positive result is found for one replicate of *Solution A* and a negative result is found for the other, repeat the test. In the repeat test, the preparation under test complies with the test if a negative result is found for both replicates of *Solution A.* The preparation does not comply with the test if a positive result is found for one or both replicates of *Solution A.* However, if the preparation does not comply with the test at a dilution less than the MVD, the test may be repeated using a greater dilution, not exceeding the MVD.

Quantitative Test

Procedure—The test quantifies bacterial endotoxins in *Sample Solutions* by titration to an endpoint. Prepare *Solutions A, B, C,* and *D* as shown in *Table 3*, and test these solutions by following the procedure in the *Test for Confirmation of Labeled Lysate Sensitivity* under *Preparatory Testing.*

Table 3. Preparation of Solutions for the Gel-Clot Assay

Solution	Endotoxin Concentration/ Solution to which Endotoxin is Added	Diluent	Dilution Factor	Endotoxin Concentration	Number of Replicates
A[a]	none/*Sample Solution*	*Water for BET*	1	—	2
			2	—	2
			4	—	2
			8	—	2
B[b]	2λ/*Sample Solution*	—	1	2λ	2

Table 3. Preparation of Solutions for the Gel-Clot Assay *(Continued)*

Solution	Endotoxin Concentration/ Solution to which Endotoxin is Added	Diluent	Dilution Factor	Endotoxin Concentration	Number of Replicates
C[c]	2λ/*Water for BET*	*Water for BET*	1	2λ	2
			2	1λ	2
			4	0.5λ	2
			8	0.25λ	2
D[d]	none/*Water for BET*	—	—	—	2

[a] Solution A: *Sample Solution* under test at the dilution, not to exceed the MVD, with which the *Test for Interfering Factors* was completed. Subsequent dilution of the *Sample Solution* must not exceed the MVD. Use *Water for BET* to make a dilution series of four tubes containing the *Sample Solution* under test at concentrations of 1, , , and $\frac{1}{8}$ relative to the concentration used in the *Test for Interfering Factors* . Other dilutions up to the MVD may be used as appropriate.
[b] Solution B: *Solution A* containing Standard endotoxin at a concentration of 2λ (positive product control).
[c] Solution C: Two replicates of four tubes of *Water for BET* containing the standard endotoxin at a concentration of 2λ, λ, 0.5λ, and 0.25λ, respectively.
[d] Solution D: *Water for BET* (negative control).

Calculation and Interpretation—The test is considered valid when the following three conditions are met: (1) Both replicates of negative control *Solution D* are negative; (2) Both replicates of positive product control *Solution B* are positive; and (3) The geometric mean endpoint concentration of *Solution C* is in the range of 0.5λ to 2λ.

To determine the endotoxin concentration of *Solution A,* calculate the endpoint concentration for each replicate by multiplying each endpoint dilution factor by λ. The endotoxin concentration in the *Sample Solution* is the endpoint concentration of the replicates. If the test is conducted with a diluted *Sample Solution,* calculate the concentration of endotoxin in the original *Sample Solution* by multiplying by the dilution factor. If none of the dilutions of the *Sample Solution* is positive in a valid assay, report the endotoxin concentration as less than λ (if the diluted sample was tested, report as less than λ times the lowest dilution factor of the sample.) If all dilutions are positive, the endotoxin concentration is reported as equal to or greater than the greatest dilution factor multiplied by λ (e.g., initial dilution factor times 8 times λ in *Table 3*).

The preparation under test meets the requirements of the test if the concentration of endotoxin in both replicates is less than that specified in the individual monograph.

PHOTOMETRIC QUANTITATIVE TECHNIQUES

Turbidimetric Technique

This technique is a photometric assay measuring increases in reactant turbidity. On the basis of the particular assay principle employed, this technique may be classified as either an endpoint-turbidimetric assay or a kinetic-turbidimetric assay. The endpoint-turbidimetric assay is based on the quantitative relationship between the concentration of endotoxins and the turbidity (absorbance or transmission) of the reaction mixture at the end of an incubation period. The kinetic-turbidimetric assay is a method to measure either the time (onset time) needed to reach a predetermined absorbance or trans-

mission of the reaction mixture, or the rate of turbidity development. The test is carried out at the incubation temperature recommended by the lysate manufacturer (which is usually $37 \pm 1^{\circ}$).

Chromogenic Technique

This technique is an assay to measure the chromophore released from a suitable chromogenic peptide by the reaction of endotoxins with lysate. On the basis of the particular assay principle employed, this technique may be classified as either an endpoint-chromogenic assay or a kinetic-chromogenic assay. The endpoint-chromogenic assay is based on the quantitative relationship between the concentration of endotoxins and the release of chromophore at the end of an incubation period. The kinetic-chromogenic assay is a method to measure either the time (onset time) needed to reach a predetermined absorbance of the reaction mixture, or the rate of color development. The test is carried out at the incubation temperature recommended by the lysate manufacturer (which is usually $37 \pm 1^{\circ}$).

Preparatory Testing

To assure the precision or validity of the turbidimetric and chromogenic techniques, preparatory tests are conducted to verify that the criteria for the standard curve are valid and that the sample solution does not interfere with the test. Validation for the test method is required when conditions that are likely to influence the test result change.

Assurance of Criteria for the Standard Curve— The test must be carried out for each lot of lysate reagent. Using the *Standard Endotoxin Solution,* prepare at least three endotoxin concentrations within the range indicated by the lysate manufacturer to generate the standard curve. Perform the assay using at least three replicates of each standard endotoxin concentration according to the manufacturer's instructions for the lysate (volume ratios, incubation time, temperature, pH etc.). If the desired range is greater than two logs in the kinetic methods, additional standards should be included to bracket each log increase in the range of the standard curve. The absolute value of the correlation coefficient, *r,* must be greater than or equal to 0.980, for the range of endotoxin concentrations set up.

Test for Interfering Factors—Select an endotoxin concentration at or near the middle of the endotoxin standard curve. Prepare *Solutions A, B, C,* and *D* as shown in *Table 4*. Perform the test on *Solutions A, B, C,* and *D* at least in duplicate according to the instructions for the lysate employed, for example, concerning volume of *Sample Solution* and *Lysate TS,* volume ratio of *Sample Solution* to *Lysate TS,* incubation time, etc.

Table 4. Preparation of Solutions for the Inhibition/Enhancement Test for Photometric Techniques

Solution	Endotoxin Concentration	Solution to which Endotoxin is Added	Number of Replicates
A[a]	none	*Sample Solution*	not less than 2
B[b]	middle concentration of the standard curve	*Sample Solution*	not less than 2

Table 4. Preparation of Solutions for the Inhibition/Enhancement Test for Photometric Techniques *(Continued)*

Solution	Endotoxin Concentration	Solution to which Endotoxin is Added	Number of Replicates
C[c]	at least 3 concentrations (lowest concentration is designated λ)	*Water for BET*	each not less than 2
D[d]	none	*Water for BET*	not less than 2

[a] Solution A: The sample solution may be diluted not to exceed MVD.
[b] Solution B: The preparation under test at the same dilution as *Solution A,* containing added endotoxin at a concentration equal to or near the middle of the standard curve.
[c] Solution C: The standard endotoxin at the concentrations used in the validation of the method described for *Assurance of Criteria for the Standard Curve* under *Preparatory Testing* (positive controls).
[d] Solution D: *Water for BET* (negative control).

The test is considered valid when the following conditions are met.

1. The absolute value of the correlation coefficient of the standard curve generated using *Solution C* is greater than or equal to 0.980.

2. The result with *Solution D* does not exceed the limit of the blank value required in the description of the lysate reagent employed, or it is less than the endotoxin detection limit of the lysate reagent employed.

Calculate the mean recovery of the added endotoxin by subtracting the mean endotoxin concentration in the solution, if any (*Solution A,Table 4*), from that containing the added endotoxin (*Solution B,Table 4*). In order to be considered free of factors that interfere with the assay under the conditions of the test, the measured concentration of the endotoxin added to the sample solution must be within 50% to 200% of the known added endotoxin concentration after subtraction of any endotoxin detected in the solution without added endotoxin.

When the endotoxin recovery is out of the specified range, the *Sample Solution* under test is considered to contain interfering factors. Then, repeat the test using a greater dilution, not exceeding the MVD. Furthermore, interference of the *Sample Solution* or diluted *Sample Solution* not to exceed the MVD may be eliminated by suitable validated treatment, such as filtration, neutralization, dialysis, or heat treatment.To establish that the treatment chosen effectively eliminates interference without loss of endotoxins, perform the assay described above using the preparation to be examined to which Standard Endotoxin has been added and which has then been submitted to the chosen treatment.

Test Procedure

Follow the procedure described for *Test for Interfering Factors* under *Preparatory Testing.*

Calculation

Calculate the endotoxin concentration of each of the replicates of *Solution A* using the standard curve generated by the positive control *Solution C.* The test is considered valid when the following three requirements are met.

1. The results of the control *Solution C* comply with the requirements for validation defined for *Assurance of Criteria for the Standard Curve* under *Preparatory Testing*.

2. The endotoxin recovery, calculated from the concentration found in *Solution B* after subtracting the concentration of endotoxin found in *Solution A,* is within the range of 50% to 200%.

3. The result of the negative control *Solution D* does not exceed the limit of the blank value required in the description of the lysate employed, or it is less than the endotoxin detection limit of the lysate reagent employed.

Interpretation

In photometric assays, the preparation under test complies with the test if the mean endotoxin concentration of the replicates of *Solution A,* after correction for dilution and concentration, is less than the endotoxin limit for the product.▲*USP33*

OTHER TESTS AND ASSAYS

BRIEFING

⟨429⟩ Light Diffraction Measurement of Particle Size. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the general chapter *Light Diffraction Measurement of Particle Size*, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following document, which represents the revised **ADOPTION STAGE 6** document, is based in part on comments from the Japanese Pharmacopoeia and the United States Pharmacopeia.

Add the following:

▲⟨429⟩ LIGHT DIFFRACTION MEASUREMENT OF PARTICLE SIZE

INTRODUCTION

The method is based on the ISO standards 13320-1(1999) and 9276-1(1998).

This general chapter has been harmonized with the corresponding texts of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia.*

The laser light diffraction technique used for the determination of particle-size distribution is based on the analysis of the diffraction pattern produced when particles are exposed to a beam of monochromatic light. Historically, the early laser diffraction instruments only used scattering at small angles. However, the technique has since been broadened to include laser light scattering in a wider angular range and application of the Mie theory, in addition to the Fraunhofer approximation and anomalous diffraction.

The technique cannot distinguish between scattering by single particles and scattering by clusters of primary particles, i.e., by agglomerates or aggregates. As most particulate samples contain agglomerates or aggregates and as the focus of interest is generally on the size distribution of primary particles, the clusters are usually dispersed into primary particles before measurement.

For nonspherical particles, an equivalent sphere-size distribution is obtained because the technique assumes spherical particles in its optical model. The resulting particle-size distribution may differ from those obtained by methods based on other physical principles (e.g., sedimentation, sieving).

This chapter provides guidance for the measurement of size distributions of particles in different dispersed systems (e.g., powders, sprays, aerosols, suspensions, emulsions, and gas bubbles in liquids), through analysis of their angular light-scattering patterns. It does not address specific requirements of particle-size measurement of specific products.

PRINCIPLE

A representative sample, dispersed at an adequate concentration in a suitable liquid or gas, is passed through a beam of monochromatic light, usually a laser. The light

scattered by the particles at various angles is measured by a multi-element detector. Numerical values representing the scattering pattern are then recorded for subsequent analysis. These scattering pattern values are then transformed, using an appropriate optical model and mathematical procedure, to yield the proportion of total volume to a discrete number of size classes, forming a volumetric particle-size distribution.

INSTRUMENT

The instrument is located in an environment where it is not affected by electrical noise, mechanical vibrations, temperature fluctuations, humidity, or direct bright light.

An example of a setup of a laser light diffraction instrument is given in *Figure 1.* Other equipment may be used.

The instrument comprises a laser light source, beam processing optics, a sample measurement region (or cell), a Fourier lens, and a multi-element detector for measuring the scattered light pattern. A data system is also required for deconvolution of the scattering data into a volumetric size distribution and associated data analysis and reporting.

The particles can enter the laser beam in two positions. In the conventional case the particles enter the parallel beam before the collecting lens and within its working distance. In so-called reversed Fourier optics the particles enter behind the collecting lens and thus in a converging beam. The advantage of the conventional setup is that a reasonable path length for the sample is allowed within the working distance of the lens. The second setup allows only small path lengths but enables measurement of scattered light at larger angles, which is useful when submicron particles are present.

The interaction of the incident light beam and the ensemble of dispersed particles results in a scattering pattern with different light intensities at various angles. The total angular intensity distribution, consisting of both direct and scattered light, is then focused onto a multi-element detector by a lens or a series of lenses. These lenses create a scattering pattern that, within limits, does not depend on the location of the particles in the light beam. Hence, the continuous angular intensity distribution is converted into a discrete spatial intensity distribution on a set of detector elements.

Figure 1. Example of a set-up of a laser light diffraction instrument.

It is assumed that the measured scattering pattern of the particle ensemble is identical to the sum of the patterns from all individual single scattering particles presented in random relative positions. Note that only a limited angular range of scattered light is collected by the lens(es) and, therefore, by the detector.

DEVELOPMENT OF THE METHOD

The measurement of particle size by laser diffraction can give reproducible data, even in the submicron region, provided the instrument used and the sample tested are carefully controlled to limit variability of the test conditions (e.g., dispersion medium, method of preparation of the sample dispersion).

Traditionally, the measurement of particle size using laser diffraction has been limited to particles in the range of approximately 0.1 μm to 3 mm. Because of recent advances in lens and equipment design, newer instruments are routinely capable of exceeding this range. With the validation report, the user demonstrates the applicability of the method for its intended use.

Sampling

The sampling technique must be adequate to obtain a representative sample of a suitable volume for the particle-size measurement. Sample splitting techniques such as rotating riffler or the cone and quartering method may be applied.

Evaluation of the Dispersion Procedure

The sample to be analyzed is inspected, visually or with the aid of a microscope, to estimate its size range and particle shape. The dispersion procedure must be adjusted to the purpose of the measurement. The purpose may be such that it is preferable to deagglomerate clusters into primary particles as far as possible, or it may be desirable to retain clusters as intact as possible. In this sense, the particles of interest may be either primary particles or clusters.

For the development of a method, it is highly advisable to check that comminution of the particles does not occur and, conversely, that dispersion of particles or clusters is satisfactory. This can usually be done by changing the dispersing energy and monitoring the change of the particle-size distribution. The measured size distribution must not change significantly when the sample is well dispersed and the particles are neither fragile nor soluble. Moreover, if the manufacturing process (e.g., crystallization, milling) of the material has changed, the applicability of the method must be verified (e.g., by microscopic comparison).

Sprays, aerosols, and gas bubbles in a liquid should be measured directly, provided that their concentration is adequate, because sampling or dilution generally alters the particle-size distribution.

In other cases (such as emulsions, pastes, and powders), representative samples may be dispersed in suitable liquids. Dispersing aids (wetting agents, stabilizers) and/or mechanical forces (e.g., agitation, sonication) are often applied for deagglomeration or deaggregation of clusters and stabilization of the dispersion. For these liquid dispersions, a recirculating system consisting of an optical measuring cell, a dispersion bath usually equipped with stirrer and ultrasonic elements, a pump, and tubing is most commonly used. Nonrecirculating, stirred cells are useful when only small amounts of a sample are available or when special dispersion liquids are used.

Dry powders can also be converted into aerosols through the use of suitable dry powder dispersers that apply mechanical force for deagglomeration or deaggregation. Generally, the dispersers use the energy of compressed gas or the differential pressure of a vacuum to disperse the particles to an aerosol that is blown through

the measuring zone, usually into the inlet of a vacuum unit that collects the particles. However, for free-flowing, coarser particles or granules, the effect of gravity may be sufficient to disperse the particles adequately.

If the maximum particle size of the sample exceeds the measuring range of the instrument, the material that is too coarse can be removed by sieving, and the mass and percentage of removed material are reported. However, after presieving, note that the sample is no longer representative, unless proven otherwise.

Optimization of the Liquid Dispersion

Liquids, surfactants, and dispersing aids used to disperse powders must

— be transparent at the laser wavelength and practically free from air bubbles or particles;
— have a refractive index that differs from that of the test material;
— be a nonsolvent of the test material (pure liquid or prefiltered, saturated solution);
— not alter the size of the test materials (e.g., by solubility, solubility enhancement, or recrystallization effects);
— favor easy formation and stability of the dispersion;
— be compatible with the materials used in the instrument (such as O-rings, gaskets, tubing, etc.); and
— possess a suitable viscosity to facilitate recirculation, stirring, and filtration.

Surfactants and/or dispersing aids are often used to wet the particles and to stabilize the dispersion. For weak acids and weak bases, buffering of the dispersing medium at low or high pH, respectively, can assist in identifying a suitable dispersant.

A preliminary check of the dispersion quality can be performed by visual or microscopic inspection. It is also possible to take fractional samples out of a well-mixed stock dispersion. Such stock dispersions are formed by adding a liquid to the sample while mixing it with, for example, a glass rod, a spatula or a vortex mixer. Care must be taken to ensure the transfer of a representative sample and that settling of larger particles does not occur. Therefore, a sample paste is prepared or sampling is carried out quickly from a suspension maintained under agitation.

Optimization of the Gas Dispersion

For sprays and dry powder dispersions, a compressed gas free from oil, water, and particles may be used. To remove such materials from the compressed gas, a dryer with a filter can be used. Any vacuum unit should be located away from the measurement zone, so that its output does not disturb the measurement.

Determination of the Concentration Range

In order to produce an acceptable signal-to-noise ratio in the detector, the particle concentration in the dispersion must exceed a minimum level. Likewise, it must be below a maximum level in order to avoid multiple scattering. The concentration range is influenced by the width of the laser beam, the path length of the measurement zone, the optical properties of the particles, and the sensitivity of the detector elements.

In view of the above, measurements must be performed at different particle concentrations to determine the appropriate concentration range for any typical sample of material. [NOTE—In different instruments, particle concentrations are usually represented by differently scaled and differently named numbers, e.g., obscuration, optical concentration, proportional number of total mass.]

Determination of the Measuring Time

The time of measurement, the reading time of the detector, and the acquisition frequency is determined experimentally in accordance with the required precision. Generally, the time for measurement permits a large number of detector scans or sweeps at short time intervals.

Selection of an Appropriate Optical Model

Most instruments use either the Fraunhofer or the Mie theory, though other approximation theories are sometimes applied for calculation of the scattering matrix. The choice of the theoretical model depends on the intended application and the different assumptions (size, absorbance, refractive index, roughness, crystal orientation, mixture, etc.) made for the test material. If the refractive index values (real and imaginary parts for the used wavelength) are not exactly known, then the Fraunhofer approximation or the Mie theory with a realistic estimate of the refractive index can be used. The former has the advantages that it is simple and it does not need refractive index values; the latter usually provides less-biased particle-size distributions for small particles. For instance, if the Fraunhofer model is used for samples containing an appreciable amount of small, transparent particles, a significantly larger amount of small particles may be calculated. In order to obtain traceable results, it is essential to document the refractive index values used, because small differences in the values assumed for the real and imaginary part of the complex refractive index may cause significant differences in the resulting particle-size distributions. Small values of the imaginary part of the refractive index (about 0.01–0.1 i) are often applied to allow the correction of the absorbance for the surface roughness of the particles. It should be noted, in general, that the optical properties of the substance to be tested, as well as the structure (e.g., shape, surface roughness, and porosity) bear upon the final result.

Validation

Typically, the validity of a procedure may be assessed by the evaluation of its specificity, linearity, range, accuracy, precision, and robustness. In particle-size analysis by laser light diffraction, specificity as defined by ICH is not applicable as it is not possible to discriminate different components into a sample, nor is it possible to discriminate between agglomerates from dispersed particles unless properly complemented by microscopic techniques. Exploring a linear relationship between concentration and response, or a mathematical model for interpolation, is not applicable to this procedure. Rather than evaluating linearity, this method requires the definition of a concentration range within which the result of the measurements does not vary significantly. Concentrations below that range produce an error due to a poor signal-to-noise ratio, while concentrations above that range produce an error due to multiple scattering. The range depends mostly on the instrument hardware. Accuracy should be confirmed through an appropriate instrument qualification and comparison with microscopy, while precision may be assessed by means of a repeatability determination.

The attainable repeatability of the method mainly depends on the characteristics of the material (milled/not milled, robust/fragile, width of its size distribution, etc.), whereas the required repeatability depends on the purpose of the measurement. Mandatory limits cannot be specified in this chapter, as repeatabilities (different sample preparations) may vary appreciably from one substance to another. However, it is good practice to aim at acceptance criteria for repeatability such as % RSD $\leq$ 10% [n = 6] for any central value of the distribution (e.g., for x_{50}). Values at the sides of the distribution

(e.g., x_{10} and x_{90}) are oriented towards less stringent acceptance criteria such as % RSD$\leq$ 15% [n = 6]. Below 10 μm, these values must be doubled. Robustness may be tested during the selection and optimization of the dispersion media and forces. The change of the dispersing energy may be monitored by the change in the particle-size distribution.

MEASUREMENT

Precautions

The instructions given in the instrument manual are followed:

— never look into the direct path of the laser beam or its reflections;

— earth all instrument components to prevent ignition of solvents or dust explosions;

— check the instrument set-up (e.g., warm-up, required measuring range and lens, appropriate working distance, position of the detector, no direct bright daylight); and

— in the case of wet dispersions, avoid air bubbles, evaporation of liquid, schlieren or other inhomogeneities in the dispersion; similarly, avoid improper mass-flow from the disperser or turbulent airflow in the case of dry dispersions; such effects can cause erroneous particle-size distributions.

Measurement of the Light Scattering of Dispersed Sample(s)

After proper alignment of the optical part of the instrument, a blank measurement of the particle-free dispersion medium must be performed using the same method as that used for the measurement of the sample. The background signal must be below an appropriate threshold. The detector data are saved in order to subtract them later from the data obtained with the sample. The sample dispersion is measured according to the developed method.

For each detector element, an average signal is calculated, sometimes together with its standard deviation. The magnitude of the signal from each detector element depends upon the detection area, the light intensity, and the quantum efficiency. The coordinates (size and position) of the detector elements together with the focal distance of the lens determine the range of scattering angles for each element. Most instruments also measure the intensity of the central (unscattered) laser beam. The ratio of the intensity of a dispersed sample to that in its absence (the blank measurement) indicates the proportion of scattered light and hence the particle concentration.

Conversion of Scattering Pattern Into Particle-Size Distribution

This deconvolution step is the inverse of the calculation of a scattering pattern for a given particle-size distribution. The assumption of spherical particle shape is particularly important as most algorithms use the mathematical solution for scattering from spherical particles. Furthermore, the measured data always contain some random and systematic errors, which may vitiate the size distributions. Several mathematical procedures have been developed for use in the available instruments. They contain some weighting of deviations between measured and calculated scattering patterns (e.g., least squares), some constraints (e.g., non-negativity for amounts of particles), and/or some smoothing of the size distribution curve.

The algorithms used are specific to each make and model of equipment, and are proprietary. The differences in the algorithms between different instruments may give rise to differences in the calculated particle-size distributions.

Replicates

The number of replicate measurements (with individual sample preparations) to be performed, depends on the required measurement precision. It is recommended to set this number in a substance-specific method.

REPORTING RESULTS

The particle-size distribution data are usually reported as cumulative undersize distribution and/or as density distribution by volume. The symbol x is used to denote the particle size, which in turn is defined as the diameter of a volume-equivalent sphere. Q3(x) denotes the volume fraction undersize at the particle size x. In a graphical representation, x is plotted on the abscissa and the dependent variable Q3 on the ordinate. Most common characteristic values are calculated from the particle-size distribution by interpolation. The particle sizes at the undersize values of 10%, 50%, and 90% (denoted as x_{10}, x_{50}, and x_{90}, respectively) are frequently used. x_{50} is also known as the median particle size. It is recognized that the symbol d is also widely used to designate the particle size, thus the symbol x may be replaced by d.

Moreover, sufficient information must be documented about the sample, the sample preparation, the dispersion conditions, and the cell type. Because the results depend on the particular instrument, data analysis program, and optical model used, these details must also be documented.

CONTROL OF THE INSTRUMENT PERFORMANCE

Use the instrument according to the manufacturer's instructions and carry out the prescribed qualifications at an appropriate frequency, according to the use of the instrument and substances to be tested.

Calibration

Laser diffraction systems, although assuming idealized properties of the particles, are based on first principles of laser light scattering. Thus, calibration in the strict sense is not required. However, it is still necessary to confirm that the instrument is operating correctly. This can be undertaken using any certified reference material that is acceptable in industrial practice. The entire measurement procedure is examined, including sample collection, sample dispersion, sample transport through the measuring zone, measurement, and the deconvolution procedure. It is essential that the total operational procedure is fully described.

The preferred certified reference materials consist of spherical particles of a known distribution. They must be certified as to the mass-percentage size distribution by an absolute technique, if available, and used in conjunction with an agreed, detailed operation procedure. It is essential that the real and imaginary parts of the complex refractive index of the material are indicated if the Mie theory is applied in data analysis. The representation of the particle-size distribution by volume will equal that of the distribution by mass, provided that the density of the particles is the same for all size fractions.

The response of a laser diffraction instrument meets the requirements if the mean value of x_{50} from at least three independent measurements does not deviate by more than 3% from the certified range of values of the certified reference material. The mean values for x_{10} and x_{90} must not deviate by more than 5% from the certified range of values. Below 10 μm, these values must be doubled.

Although the use of materials consisting of spherical particles is preferable, nonspherical particles may also be employed. Preferably, these particles have certified or typical values from laser diffraction analysis performed according to an agreed, detailed operating procedure. The use of reference values from methods other than laser diffraction may cause a significant bias. The reason for this bias is that the different principles inherent in the various methods may lead to different sphere-equivalent diameters for the same nonspherical particle.

Although the use of certified reference materials is preferred, other well-defined reference materials may also be employed. They consist of substances of typical composition and particle-size distribution for a specified class of substances. Their particle-size distribution has proven to be stable over time. The results must comply with previously determined data, with the same precision and bias as for the certified reference material.

Qualification of the System

In addition to the calibration, the performance of the instrument must be qualified at regular time intervals or as frequently as appropriate. This can be undertaken using any suitable reference material as mentioned in the previous paragraph.

The qualification of the system is based on the concept that the equipment, electronics, software, and analytical operations constitute an integral system, which can be evaluated as an entity. Thus the entire measurement procedure is examined, including sample collection, sample dispersion, sample transport through the measuring zone, and the measurement and deconvolution procedure. It is essential that the total operational procedure is fully described.

In general, unless otherwise specified in the individual monograph, the response of a laser diffraction instrument is considered to meet the requirements if the x_{50} value does not deviate by more than 10% from the range of values of the reference material. If optionally the values at the sides of the distribution are evaluated (e.g., x_{10} and x_{90}), then these values must not deviate by more than 15% from the certified range of values. Below 10 μm, these values must be doubled.

NOTE—For calibration of the instrument, stricter requirements are laid down in the paragraph on *Calibration*.▲*USP33*

Physical Tests and Determinations

BRIEFING

⟨616⟩ Bulk Density and Tapped Density of Powders. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Bulk and Tapped Density general chapter, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following general chapter, which represents the **ADOPTION STAGE 6** document, is based on comments from the United States Pharmacopeia and the Japanese Pharmacopoeia. A new section, which includes descriptions for *Measurement in a Vessel* has been added.

(EGC: K. Moore.) RTS—C55768

Add the following:

▲⟨616⟩ BULK DENSITY AND TAPPED DENSITY OF POWDERS

BULK DENSITY

This general chapter has been harmonized with the corresponding texts of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia*. ◆The portion that is not harmonized is marked with symbols (◆◆) to specify this fact.◆

The bulk density of a powder is the ratio of the mass of an untapped powder sample and its volume including the contribution of the interparticulate void volume. Hence, the bulk density depends on both the density of powder particles and the spatial arrangement of particles in the powder bed. The bulk density is expressed in grams per mL (g/mL) although the international unit is kilogram per cubic meter (1 g/mL = 1000 kg/m^3) because the measurements are made using cylinders. It may also be expressed in grams per cubic centimeter (g/cm^3). The bulking properties of a powder are dependent upon the preparation, treatment, and storage of the sample, i.e., how it was handled. The particles can be packed to have a range of bulk densities; however, the slightest disturbance of the powder bed may result in a changed bulk density. Thus, the bulk density of a powder is often very difficult to measure with good reproducibility and, in reporting the results, it is essential to specifiy how the determination was made. The bulk density of a powder is determined by measuring the volume of a known weight of powder sample, that may have been passed through a screen, into a graduated cylinder (*Method I*), or by measuring the mass of a known volume of powder that has been passed through a volumeter into a cup (*Method II*) or a measuring vessel (*Method III*).

Method I and *Method III* are favored.

Method I—Measurement in a Graduated Cylinder

Procedure—Pass a quantity of material sufficient to complete the test through a sieve with apertures greater than or equal to 1.0 mm, if necessary, to break up agglomerates that may have formed during storage; this must be done gently to avoid changing the nature of the material. Into a dry graduated 250-mL cylinder (readable to 2 mL) introduce, without compacting, approximately 100 g of test sample, *M*, weighed with 0.1% accuracy. Carefully level the powder without compacting, if necessary, and read the unsettled apparent volume (V_0) to the nearest graduated unit. Calculate the bulk density in g/mL by the formula m/V_0. Generally, replicate determinations are desirable for the determination of this property. If the powder density is too low or too high, such that the test sample has an untapped apparent volume of either more than 250 mL or less than 150 mL, it is not possible to use 100 g of powder sample. Therefore, a different amount of powder has to be selected as the test sample, such that its untapped apparent volume is 150 mL to 250 mL (apparent volume greater than or equal

to 60% of the total volume of the cylinder); the weight of the test sample is specified in the expression of results. For test samples having an apparent volume between 50 mL and 100 mL, a 100-mL cylinder readable to 1 mL can be used; the volume of the cylinder is specified in the expression of results.

Method II—Measurement in a Volumeter

Apparatus—The apparatus (*Figure 1*) consists of a top funnel fitted with a 1.0-mm screen[1]. The funnel is mounted over a baffle box containing four glass baffle plates over which the powder slides and bounces as it passes. At the bottom of the baffle box is a funnel that collects the powder and allows it to pour into a cup of specified capacity mounted directly below it. The cup may be cylindrical (25.00 $\pm$ 0.05 mL volume with an inside diameter of 30.00 $\pm$ 2.00 mm) or a square (16.39 $\pm$ 0.2 mL volume with inside dimensions of 25.4 $\pm$ 0.076 mm).

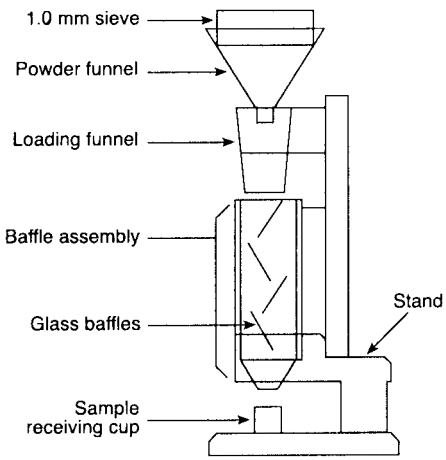

Figure 1.

Procedure—Allow an excess of powder to flow through the apparatus into the sample receiving cup until it overflows, using a minimum of 25 cm^3 of powder with the square cup and 35 cm^3 of powder with the cylindrical cup. Carefully scrape excess powder from the top of the cup by smoothly moving the edge of the blade of a spatula perpendicular to and in contact with the top surface of the cup, taking care to keep the spatula perpendicular to prevent packing or removal of powder from the cup. Remove any material from the sides of the cup, and determine the weight, *M,* of the powder to the nearest 0.1%. Calculate the bulk density, in g per mL, by the formula:

$$(M) / (V_0)$$

in which V_0 is the volume, in mL, of the cup. Record the average of three determinations using three different powder samples.

Method III—Measurement in a Vessel

Apparatus—The apparatus consists of a 100-mL cylindrical vessel of stainless steel with dimensions as specified in *Figure 2*.

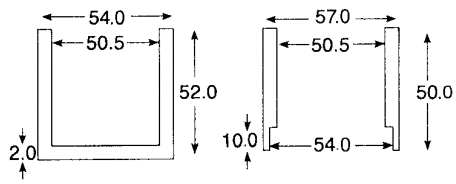

Figure 2.

Procedure—Pass a quantity of powder sufficient to complete the test through a 1.0-mm sieve, if necessary, to break up agglomerates that may have formed during storage, and allow the obtained sample to flow freely into the measuring vessel until it overflows. Carefully scrape the excess powder from the top of the vessel as described for *Method II*. Determine the weight (M_0) of the powder to the nearest 0.1% by subtraction of the previously determined mass of the empty measuring ves-

[1] The apparatus (the Scott Volumeter) conforms to the dimensions in ASTM 329 90.

sel. Calculate the bulk density (g/mL) by the formula $M_0/100$, and record the average of three determinations using three different powder samples.

TAPPED DENSITY

The tapped density is an increased bulk density attained after mechanically tapping a container containing the powder sample. Tapped density is obtained by mechanically tapping a graduated measuring cylinder or vessel containing a powder sample. After observing the initial powder volume or weight, the measuring cylinder or vessel is mechanically tapped, and volume or weight readings are taken until little further volume or weight change is observed. The mechanical tapping is achieved by raising the cylinder or vessel and allowing it to drop under its own weight a specified distance by either of three methods as described below. Devices that rotate the cylinder or vessel during tapping may be preferred to minimize any possible separation of the mass during tapping down.

Method I

Apparatus—The apparatus (*Figure 3*) consists of the following:

- A 250-mL graduated cylinder (readable to 2 mL with a mass of 220 $\pm$ 44 g
- A settling apparatus capable of producing, in 1 minute, either nominally 250 $\pm$ 15 taps from a height of 3 $\pm$ 0.2 mm, or nominally 300 $\pm$ 15 taps from a height of 14 $\pm$ 2 mm. The support for the graduated cylinder, with its holder, has a mass of 450 $\pm$ 10 g.

Procedure—Proceed as described above for the determination of the bulk volume (V_0). Secure the cylinder in the holder. Carry out 10, 500, and 1250 taps on the same powder sample and read the corresponding volumes V_{10}, V_{500}, and V_{1250} to the nearest graduated unit. If the difference between V_{500} and V_{1250} is less than 2 mL, V_{1250} is the tapped volume. If the difference between V_{500} and V_{1250} exceeds 2 mL, repeat in increments such as 1250 taps, until the difference between succeeding measurements is less than 2 mL. Fewer taps may be appropriate for some powders, when validated. Calculate the tapped density (g/mL) using the formula m/V_F in which V_F is the final tapped volume. Generally, replicate determinations are desirable for the determination of this property. Specify the drop height with the results. If it is not possible to use a 100-g test sample, use a reduced amount and a suitable 100-mL graduated cylinder (readable to 1 mL) weighing 130 $\pm$ 16 g and mounted on a holder weighing 240 $\pm$ 12 g. The modified test conditions are specified in the expression of the results.

Method II

Apparatus and **Procedure—**Proceed as directed under *Method I* except that the mechanical tester provides a fixed drop of 3 $\pm$ 0.2 mm at a nominal rate of 250 taps per minute.

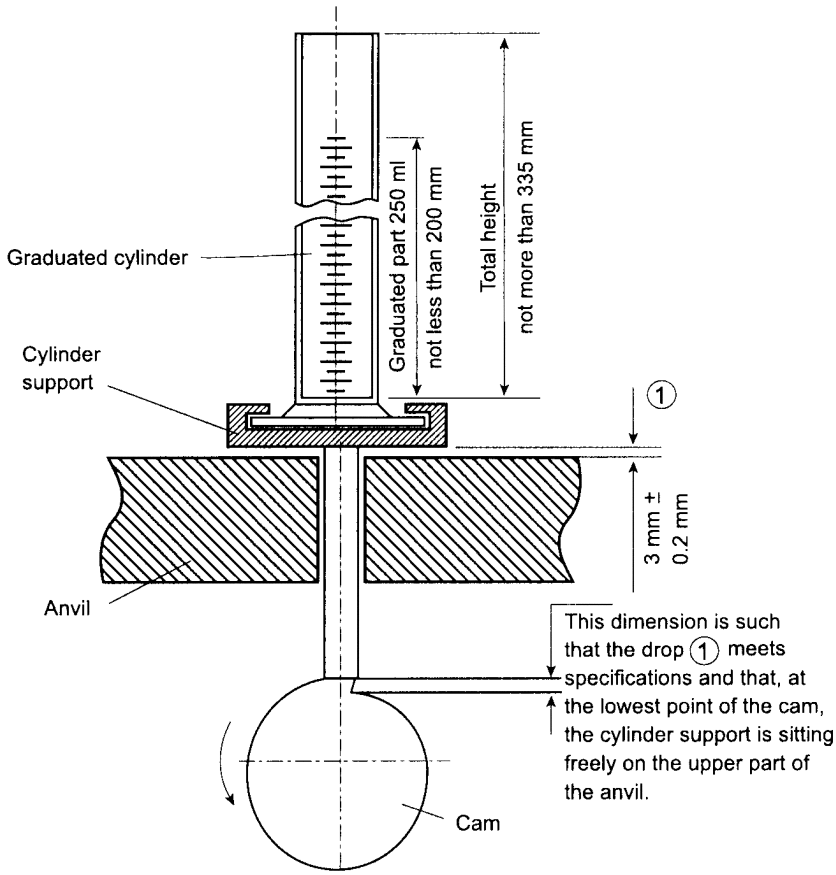

Figure 3.

Method III

Apparatus and **Procedure—**Proceed as directed in *Method III—Measurement in a Vessel* for measuring bulk density using the measuring vessel equipped with the cap shown in *Figure 2*. The measuring vessel with the cap is lifted 50–60 times per minute by the use of a suitable tapped density tester. Carry out 200 taps, remove the cap, and carefully scrape excess powder from the top of the measuring vessel as described in *Method III—Measurement in a Vessel* for measuring the bulk density. Repeat the procedure using 400 taps. If the difference between the two masses obtained after 200 and 400 taps exceeds 2%, carry out a test using 200 additional taps until the difference between succeeding measurements is less than 2%. Calculate the tapped density (g/mL) using the formula $M_F / 100$ where M_F is the mass of powder in the measuring vessel. Record the average of three determinations using three different powder samples.

MEASURES OF POWDER COMPRESSIBILITY

Because the interparticulate interactions influencing the bulking properties of a powder are also the interactions that interfere with powder flow, a comparison of the bulk and tapped densities can give a measure of the relative importance of these interactions in a given powder. Such a comparison is often used as an index of the ability of the powder to flow, for example the *Compressibility Index* or the *Hausner Ratio* as described below.

The *Compressibility Index* and *Hausner Ratio* are measures of the propensity of a powder to be compressed as described above. As such, they are measures of the powder's ability to settle, and they permit an assessment

of the relative importance of interparticulate interactions. In a free-flowing powder, such interactions are less significant, and the bulk and tapped densities will be closer in value. For poorer flowing materials, there are frequently greater interparticle interactions, and a greater difference between the bulk and tapped densities will be observed. These differences are reflected in the *Compressibility Index* and the *Hausner Ratio.*

Compressibility Index—Calculate by the formula:

$$100(V_0 - V_f)/V_0$$

V_0 = unsettled apparent volume

V_F = final tapped volume

Hausner Ratio—

$$V_0 / V_F$$

Depending on the material, the compressibility index can be determined using V_{10} instead of V_0. ◆[NOTE—If V_{10} is used, it will be clearly stated in the results.]◆▲*USP33*

BRIEFING

〈**711**〉 **Dissolution,** *USP 32* page 268 and page 1243 of *PF* 34(5) [Sept.–Oct. 2008]. The *Apparatus* section of this general test chapter is proposed for revision as a result of comments received on the **ADOPTION STAGE 6** harmonization text. As a result of comments received from the ICH Regulatory Acceptance of Analytical Procedures and Acceptance Criteria evaluation of the dissolution chapters in the *European Pharmacopoeia*, the *Japanese Pharmacopoeia*, and the *United States Pharmacopeia*, the description of the pump used in *Apparatus 4* is revised to include a pump that produces no pulsation.

(BPC: W. Brown) RTS—C69683

Change to read:

APPARATUS

Apparatus 1 (Basket Apparatus)

The assembly consists of the following: a vessel, which may be covered, made of glass or other inert, transparent material[1]; a motor; a metallic drive shaft; and a cylindrical basket. The vessel is partially immersed in a suitable water bath of any convenient size or heated by a suitable device such as a heating jacket. The water bath or heating device permits holding the temperature inside the vessel at 37 ± 0.5° during the test and keeping the bath fluid in constant, smooth motion. No part of the assembly, including the environment in which the assembly is placed, contributes significant motion, agitation, or vibration beyond that due to the smoothly rotating stirring element. An apparatus that permits observation of the specimen and stirring element during the test is preferable. The vessel is cylindrical, with a hemispherical bottom and ◆with one of the following dimensions and capacities: for a nominal◆ capacity of 1 L, the height is 160 mm to 210 mm and its inside diameter is 98 mm to 106 mm; ◆for a nominal capacity of 2 L, the height is 280 mm to 300 mm and its inside diameter is 98 mm to 106 mm; and for a nominal capacity of 4 L, the height is 280 mm to 300 mm and its inside diameter is 145 mm to 155 mm◆. Its sides are flanged at the top. A fitted cover may be used to retard evaporation.[2] The shaft is positioned so that its axis is not more than 2 mm at any point from the vertical axis of the vessel and rotates smoothly and without significant wobble that could affect the results. A speed-regulating device is used that allows the shaft rotation speed to be selected and maintained at the specified rate ◆given in the individual monograph,◆ within ± 4%.

Shaft and basket components of the stirring element are fabricated of stainless steel, type 316, or other inert material, to the specifications shown in *Figure 1.* A basket having a gold coating of about 0.0001 inch (2.5 μm) thick may be used. A dosage unit is placed in a dry basket at the beginning of each test. The distance between the inside bottom of the vessel and the bottom of the basket is maintained at 25 ± 2 mm during the test.

[1] The materials should not sorb, react, or interfere with the specimen being tested.

[2] If a cover is used, it provides sufficient openings to allow ready insertion of the thermometer and withdrawal of specimens.

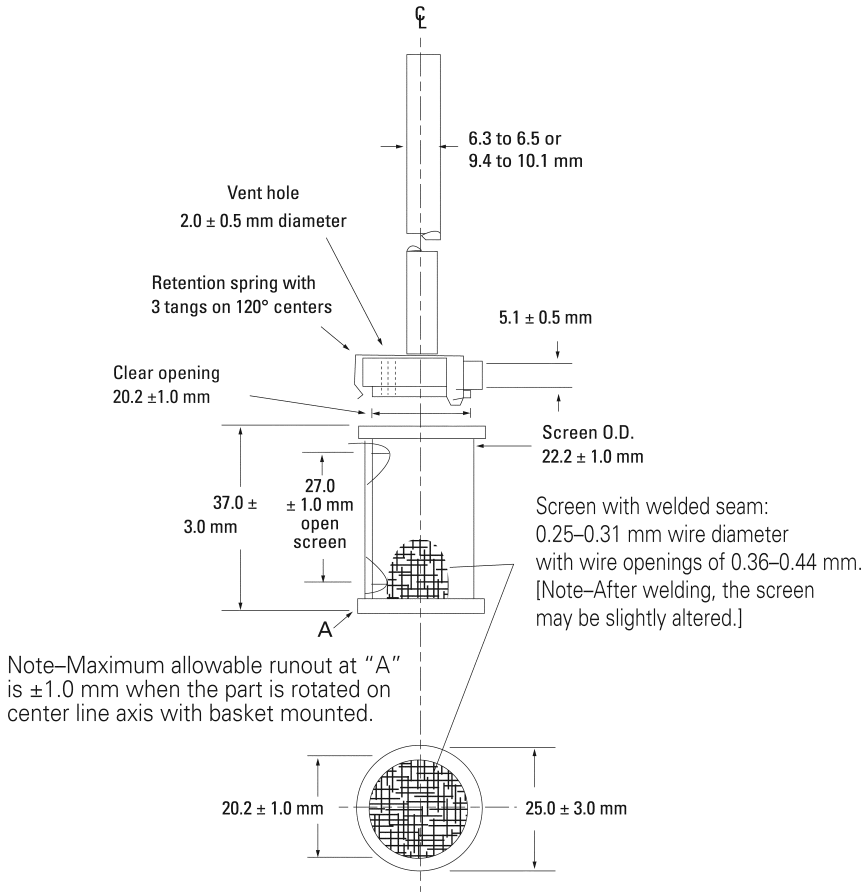

Figure 1. Basket Stirring Element

Apparatus 2 (Paddle Apparatus)

Use the assembly from *Apparatus 1*, except that a paddle formed from a blade and a shaft is used as the stirring element. The shaft is positioned so that its axis is not more than 2 mm from the vertical axis of the vessel at any point and rotates smoothly without significant wobble that could affect the results. The vertical center line of the blade passes through the axis of the shaft so that the bottom of the blade is flush with the bottom of the shaft. The paddle conforms to the specifications shown in *Figure 2*. The distance of 25 ± 2 mm between the bottom of the blade and the inside bottom of the vessel is maintained during the test. The metallic or suitably inert, rigid blade and shaft comprise a single entity. A suitable two-part detachable design may be used provided the assembly remains firmly engaged during the test. The paddle blade and shaft may be coated with a suitable coating so as to make them inert. The dosage unit is allowed to sink to the bottom of the vessel before rotation of the blade is started. A small, loose piece of nonreactive material, such as not more than a few turns of wire helix, may be attached to dosage units that would otherwise float. An alternative sinker device is shown in *Figure 2a.* Other validated sinker devices may be used.

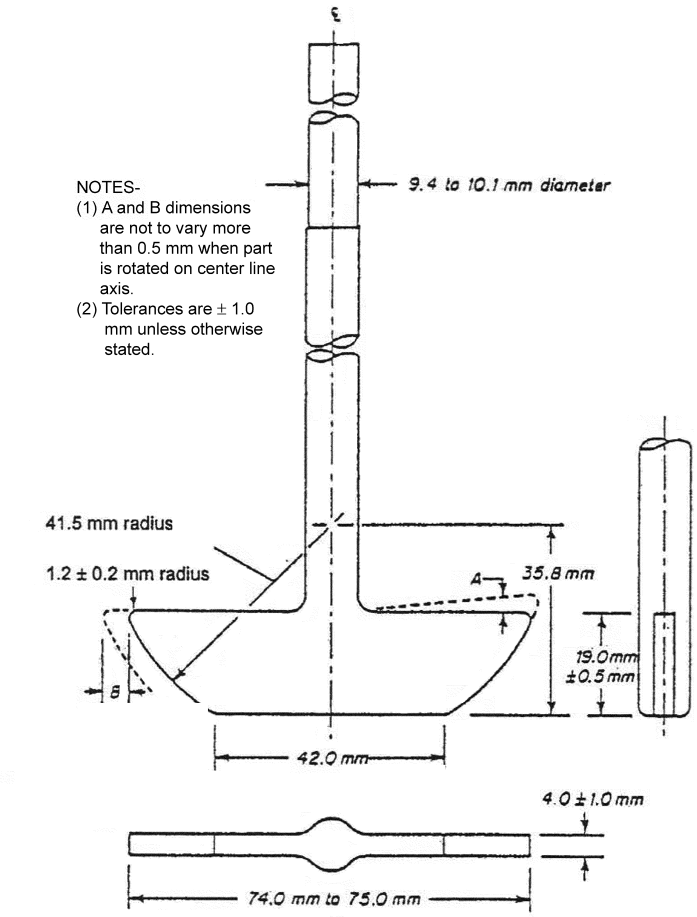

Figure 2. Paddle Stirring Element

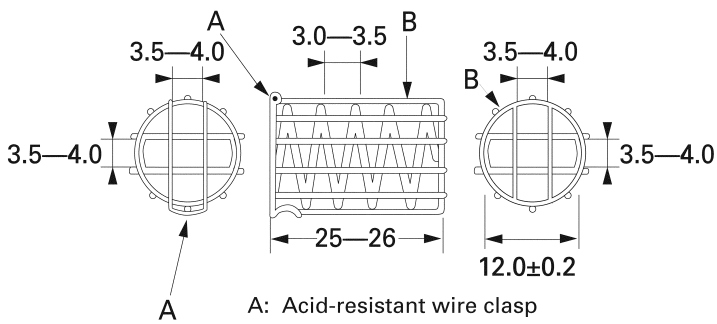

Figure 2a. Alternative sinker. All dimensions are expressed in mm.

Apparatus 3 (Reciprocating Cylinder)

NOT ACCEPTED BY THE JAPANESE PHARMACOPOEIA

The assembly consists of a set of cylindrical, flat-bottomed glass vessels; a set of glass reciprocating cylinders; inert fittings (stainless steel type 316 or other suitable material), and screens that are made of suitable nonsorbing and nonreactive material and that are designed to fit the tops and bottoms of the reciprocating cylinders; and a motor and drive assembly to reciprocate the cylinders vertically inside the vessels and, if desired, index the reciprocating cylinders horizontally to a different row of vessels. The vessels are partially immersed in a suitable water bath of any convenient size that permits holding the temperature at 37 ± 0.5° during the test. No part of the assembly, including the environment in which the assembly is placed, contributes significant motion, agitation, or vibration beyond that due to the smooth, vertically reciprocating cylinder. A device is used that allows the reciprocation rate to be selected and maintained at the specified dip rate ◆given in the individual monograph◆ within ± 5%. An apparatus that permits observation of the specimens and reciprocating cylinders is preferable. The vessels are provided with an evaporation cap that remains in place for the duration of the test. The components conform to the dimensions shown in *Figure 3* unless otherwise specified ◆in the individual monograph◆.

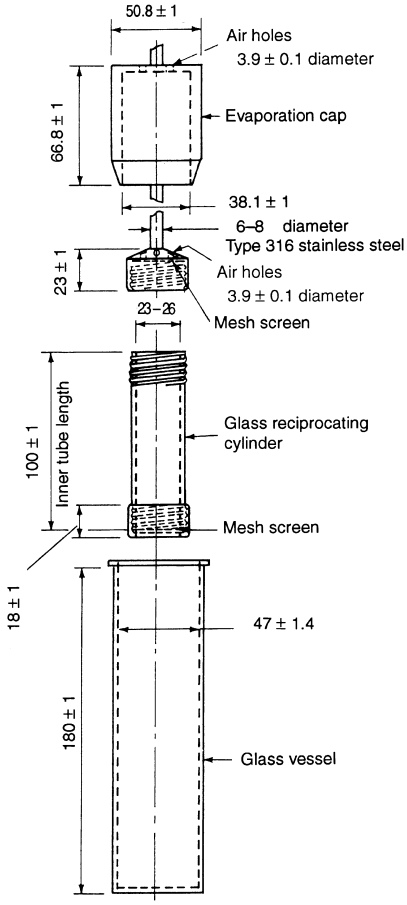

Figure 3. Apparatus 3 (reciprocating cylinder)

Apparatus 4 (Flow-Through Cell)

The assembly consists of a reservoir and a pump for the *Dissolution Medium;* a flow-through cell; and a water bath that maintains the *Dissolution Medium* at 37 ± 0.5°. Use the specified cell size ◆as given in the individual monograph◆.

The pump forces the *Dissolution Medium* upwards through the flow-through cell. The pump has a delivery range between 240 and 960 mL per hour, with standard flow rates of 4, 8, and 16 mL per minute. It must deliver a constant flow (±5% of the nominal flow rate); the flow profile is sinusoidal with a pulsation of 120 ± 10 pulses per minute.

▲A pump without pulsation may also be used. Dissolution test procedures using a flow-through cell must be characterized with respect to rate and any pulsation.▲*USP33*

The flow-through cell (see *Figures 4* and *5*), of transparent and inert material, is mounted vertically with a filter system (specified in the individual monograph) that prevents escape of undissolved particles from the top of the cell; standard cell diameters are 12 and 22.6 mm; the bottom cone is usually filled with small glass beads of about 1-mm diameter with one bead of about 5 mm positioned at the apex to protect the fluid entry tube; and a tablet holder (see *Figures 4* and *5*) is available for positioning of special dosage forms, for example, inlay tablets. The cell is immersed in a water bath, and the temperature is maintained at 37 ± 0.5°.

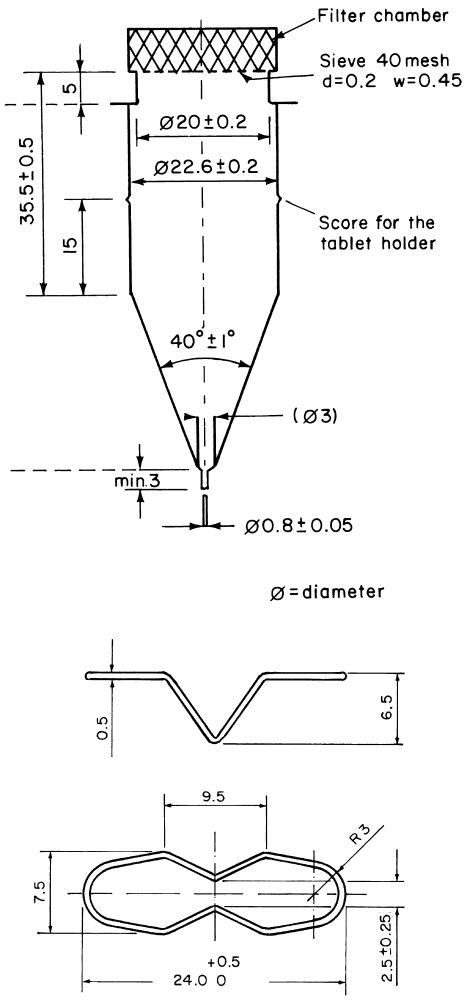

Figure 4. Apparutus 4, large cell for tablets and capsules (top), tablet holder for the large cell (bottom). (All measurements are expressed in mm unless noted otherwise.)

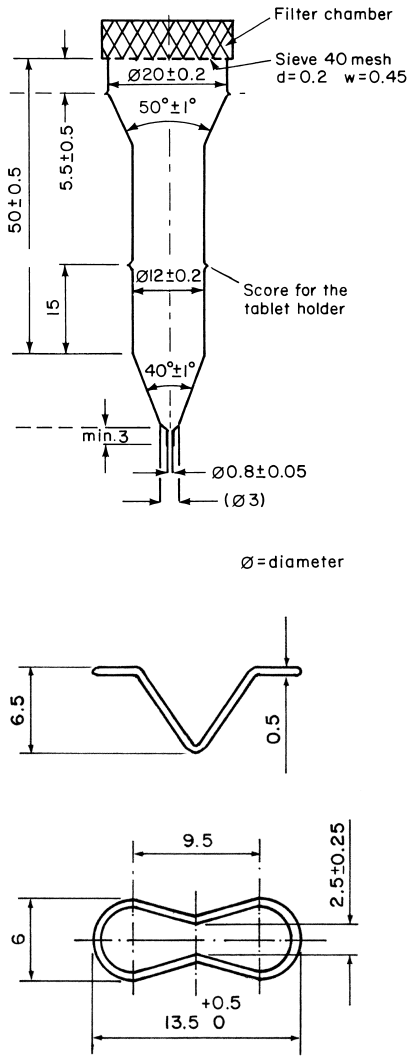

Figure 5. Apparatus 4, small cell for tablets and capsules (top), tablet holder for the small cell (bottom). (All measurements are expressed in mm unless noted otherwise.)

The apparatus uses a clamp mechanism and two O-rings to assemble the cell. The pump is separated from the dissolution unit in order to shield the latter against any vibrations originating from the pump. The position of the pump should not be on a level higher than the reservoir flasks. Tube connections are as short as possible. Use suitably inert tubing, such as polytef, with about 1.6-mm inner diameter and chemically inert flanged-end connections.

APPARATUS SUITABILITY

The determination of suitability of a test assembly to perform dissolution testing must include conformance to the dimensions and tolerances of the apparatus as given above. In addition, critical test parameters that have to be monitored periodically during use include volume and temperature of the *Dissolution Medium,* rotation speed *(Apparatus 1* and *Apparatus 2),* dip rate *(Apparatus 3),* and flow rate of medium *(Apparatus 4).*

Determine the acceptable performance of the dissolution test assembly periodically. ◆The suitability for the individual apparatus is demonstrated by the *Performance Verification Test*.

Performance Verification Test, Apparatus 1 and 2— Individually test 1 tablet of the USP Prednisone Tablets RS and 1 tablet of USP Salicylic Acid Tablets RS, according to the operating conditions specified. The apparatus is suitable if the results obtained are within the acceptable range stated in the certificate for that Reference Standard tablet in the apparatus tested.

Performance Verification Test, Apparatus 3—Individually test 1 tablet of the USP Chlorpheniramine Maleate Extended-Release Tablets RS according to the operating conditions specified. The apparatus is suitable if the results obtained are within the acceptable range stated in the certificate.

Performance Verification Test, Apparatus 4—[To come.]◆

BRIEFING

〈**905**〉 **Uniformity of Dosage Units,** *USP* 32 page 382 and page 1290 of *PF* 34(5) [Sept.–Oct. 2008]. This general test chapter is revised to reduce the quantity of national, *USP*-specific text and more completely represent the harmonized text agreed upon by the Pharmacopeial Discussion Group. The texts of this chapter as presented in the *European Pharmacopoeia*, the *Japanese Pharmacopoeia*, and the *USP* are undergoing evaluation by ICH for Regulatory Approval of Analytical Procedures and Acceptance Criteria. Communications received from the European Pharmacopoeia Commission Secretariat recommended the reduction in *USP*-specific national text to assist the ICH evaluation and approval. USP determined that the changes would not only enhance conformance with the harmonized text but reduce redundant verbiage.

Changes to the *USP* text include the following:

1. Reduction in the number of references to the specific monograph and instead merely citing the specification. In the *USP*, the specification is found in the monograph and thus additional wording to that effect is seen as redundant.
2. Elimination of the evaluation of a special procedure and replacement with harmonized text that refers in more general terms to the possible need to apply a correction factor where differences are observed between the results of the assay and the special procedure for content uniformity.
3. Simplification of the list of dosage forms presented in *Table 1*. This change is also made to the procedures and *Criteria* sections for *Content Uniformity* and *Weight Variation* test sections. The national text procedures and criteria for suppositories, transdermal systems, inhalations packaged in premetered dosage units, and solutions for inhalation packaged in glass or plastic ampuls and intended for use in nebulizers are thereby revised.

(PDF: W. Brown.) RTS—C71696

Change to read:

■This general chapter is harmonized with the corresponding texts of the *European Pharmacopoeia* and the *Japanese Pharmacopoeia*. Portions of the general chapter text that are national *USP* text, and are not part of the harmonized text, are marked with symbols (◆▲) to specify this fact.■2S (*USP32*)

◆[NOTE—In this chapter, *unit* and *dosage unit* are synonymous.]◆

To ensure the consistency of dosage units, each unit in a batch should have a drug substance content within a narrow range around the label claim. Dosage units are defined as dosage forms containing a single dose or a part of a dose of drug substance in each unit. The uniformity of dosage units specification is not intended to apply to suspensions, emulsions, or gels in unit-dose containers intended for ~~◆topical.◆~~

▲external, cutaneous▲*USP33*
administration.

The term ''uniformity of dosage unit'' is defined as the degree of uniformity in the amount of the drug substance among dosage units. Therefore, the requirements of this chapter apply to each drug substance being comprised in dosage units containing one or more drug substances, unless otherwise specified ~~◆in the individual monograph.◆~~

▲elsewhere in this pharmacopeia.▲*USP33*

The uniformity of dosage units can be demonstrated by either of two methods, *Content Uniformity* or ◆*Weight*◆*Variation* (see *Table 1*). The test for *Content Uniformity*

▲of preparations presented in dosage units▲*USP33*
is based on the assay of the individual content of drug substance(s) in a number of ~~◆individual◆~~

▲
▲*USP33*
dosage units to determine whether the individual content is within the limits set. The *Content Uniformity* method may be applied in all cases. ~~◆The test for *Content Uniformity* is required for those dosage forms described in *(C1)–(C6)* below:~~

~~(C1) coated tablets, other than film-coated tablets containing 25 mg or more of a drug substance that comprises 25% or more (by weight) of one tablet;~~
~~(C2) transdermal systems;~~
~~(C3) suspensions or emulsions or gels in single-unit containers or in soft capsules that are intended for systemic administration only (not for those drug products that are intended for topical administration);~~
~~(C4) inhalations (other than solutions for inhalation packaged in glass or plastic ampuls and intended for use in nebulizers) packaged in premetered dosage units. For inhalers and premetered dosage units labeled for use with a named inhalation device, also see *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry-Powder Inhalers* 〈601〉;~~
~~(C5) solids (including sterile solids) that are packaged in single-unit containers and that contain active or inactive added substances, except that the test for *Weight Variation* may be applied in the special cases stated in *(W3)* below; and~~
~~(C6) suppositories.◆~~

▲
▲*USP33*

The test for ◆*Weight*◆*Variation* is applicable for the following dosage forms:

(W1) ~~◆solutions for inhalation that are packaged in glass or plastic ampuls and intended for use in nebulizers, and oral◆~~ Solutions ~~◆packaged◆~~

▲enclosed▲*USP33*
in unit-dose containers and into soft capsules;

(W2) solids (including

▲powders, granules, and▲*USP33*
sterile solids) that are packaged in single-unit containers and contain no ~~added substances, whether active or inactive~~

▲active or inactive added substances;▲*USP33*

(W3) solids (including sterile solids) that are packaged in single-unit containers, with or without ~~added substances, whether active or inactive,~~

▲active or inactive added substances,▲*USP33* that have been prepared from true solutions and freeze-dried in the final containers and are labeled to indicate this method of preparation; and

(W4) hard capsules, uncoated tablets, or film-coated tablets, containing 25 mg or more of a drug substance comprising 25% or more, by weight, of the dosage unit or, in the case of hard capsules, the capsule contents, except that uniformity of other drug substances present in lesser proportions is demonstrated by meeting *Content Uniformity* requirements.

The test for *Content Uniformity* is required for all dosage forms not meeting the above conditions for the ◆*Weight Variation* test. ◆Where compliance with the *Content Uniformity* test is required, then, by application of the provision for use of alternative methods provided in the *General Notices* section of this *Pharmacopeia*, it is possible for manufacturers to ensure this compliance by application of the *Weight Variation* test where the concentration relative standard deviation (RSD) of the drug substance in the final dosage units is not more than 2%. This RSD determination may be based on the manufacturer's process validation and product development data.◆ The concentration RSD is the RSD of the concentration per dosage unit (w/w or w/v), where concentration per dosage unit equals the assay result per dosage unit divided by the individual dosage unit weight. See the RSD formula in *Table 2*. ◆Where the *Weight Variation* test is used in this way, the product must, if tested, nevertheless comply with the official compendial test for *Content Uniformity.*◆

Change to read:

CONTENT UNIFORMITY

Select not fewer than 30 units, and proceed as follows for the dosage form designated. ◆~~Where the amount of drug substance in a single dosage unit differs from that required in the *Assay*, adjust the degree of dilution of the solutions and/or the volume of aliquots so that the concentration of the drug substances in the final solution is of the same order as that obtained in the *Assay* procedure; or, in the case of a titrimetric assay, use a titrant of a different concentration, if necessary, so that an adequate volume of titrant is required (see *Titrimetry* ⟨541⟩); see also *Procedures* under *Tests and Assays* in the *General Notices and Requirements*. If any such modifications are made in the *Assay* procedure set forth in the individual monograph, make the appropriate corresponding changes in the calculation formula and titration factor.~~

~~Where a special *Procedure for content uniformity* is specified in the test for *Uniformity of dosage units* in the individual monograph, make any necessary correction of the results obtained as follows.~~

~~(1) Prepare a composite specimen of a sufficient number of dosage units to provide the amount of specimen called for in the *Assay* in the individual monograph plus the amount required for the special *Procedure for content uniformity* in the monograph by finely powdering tablets or mixing the contents of capsules or oral solutions, suspensions,~~

Table 1. Application of Content Uniformity (CU) and Weight Variation (WV) Tests for Dosage Forms

Dosage Form	Type	Subtype	Dose & Ratio of Drug Substance	
			≥25 mg &≥25%	<25 mg or<25%
Tablets	Uncoated		WV	CU

◆~~Suppositories~~◆			◆~~CU~~◆	◆~~CU~~◆ ▲▲*USP33*
Others			CU	CU

~~emulsions, gels, or solids in single-unit containers to obtain a homogeneous mixture. If a homogeneous mixture cannot be obtained in this manner, use suitable solvents or other procedures to prepare a solution containing all of the drug substance, and use appropriate aliquot portions of this solution for the specified procedures.~~

~~(2) Assay separate, accurately measured portions of the composite specimen of capsules or tablets or suspensions or inhalations or solids in single-unit containers, both (a) as directed in the *Assay*, and (b) using the special *Procedure for content uniformity* in the monograph.~~

~~(3) Calculate the weight of drug substance equivalent to 1 average dosage unit, by (a) using the results obtained by the *Assay* procedure, and by (b) using the results obtained by the special procedure.~~

~~(4) Calculate the correction factor, *F*, by the formula:~~

~~$$F = W/P$$~~

~~in which *W* is the weight of drug substance equivalent to 1 average dosage unit obtained by the *Assay* procedure, and *P* is the weight of drug substance equivalent to 1 average dosage unit obtained by the special procedure. If~~

~~$$\frac{100|W - P|}{W}$$~~

~~is greater than 10, the use of a correction factor is not valid.~~

~~(5) The correction factor is to be applied only if *F* is not less than 1.030 nor greater than 1.100, or not less than 0.900 nor greater than 0.970. If *F* is between 0.970 and 1.030, no correction is required.~~

~~(6) If *F* lies between 1.030 and 1.100, or between 0.900 and 0.970, calculate the weight of drug substance in each dosage unit by multiplying each of the weights found using the special procedure by *F*.~~

▲Where different procedures are used for assay of the preparation and for the content uniformity test, it may be necessary to establish a correction factor to be applied to the results of the latter.▲*USP33*

■is removed from an individual container in conditions of normal use, and express the results as delivered dose.■2S *(USP32)*
~~or for highly viscous products, conduct the *Assay* on the amount of well-mixed material that is obtained by quantitatively removing the contents from an individual container, and express the results as the delivered dose.~~

▲▲*USP33*

■Calculate the acceptance value (see *Table 2*).■2S *(USP32)*

Calculation of Acceptance Value—Calculate the acceptance value by the formula:

$$\left|M - \overline{X}\right| + ks$$

in which the terms are as defined in *Table 2*.

Table 2

Variable	Definition	Conditions	Value
$\overline{X}$	Mean of individual contents ($\chi_1, \chi_2, \ldots, \chi_n$), expressed as a percentage of the label claim		
$\chi_1, \chi_2, \ldots, \chi_n$	Individual contents of the units tested, expressed as a percentage of the label claim		
n	Sample size (number of units in a sample)		
k	Acceptability constant	If *n* = 10, then *k* =	2.4
		If *n* = 30, then *k* =	2.0
s	Sample standard deviation		$\left[\frac{\sum_{i=1}^{n}\left(\chi_i-\overline{X}\right)^2}{n-1}\right]^{\frac{1}{2}}$
RSD	Relative standard deviation (the sample standard deviation expressed as a percentage of the mean)		$\frac{100s}{\overline{X}}$
M (case 1) to be applied when $T \leq 101.5$	Reference value	If $98.5\% \leq \overline{X} \leq 101.5\%$, then	$M = \overline{X}$ *(AV = ks)*
		If $\overline{X} < 98.5\%$, then	*M* = 98.5% *(AV = 98.5 − $\overline{X}$ + ks)*
		If $\overline{X} > 101.5\%$, then	*M* = 101.5% *(AV = $\overline{X}$ − 101.5 + ks)*
M (case 2) to be applied when $T > 101.5$	Reference value	If $98.5 \leq \overline{X} \leq T$, then	$M = \overline{X}$ *(AV = ks)*
		If $\overline{X} < 98.5\%$, then	*M* = 98.5% *(AV = 98.5 − $\overline{X}$ + ks)*
		If $\overline{X} > T$, then	*M* = *T*% *(AV = $\overline{X}$ − T + ks)*
Acceptance value *(AV)*			general formula: $\left\lvert M-\overline{X}\right\rvert + ks$ (Calculations are specified above for the different cases.)
L1	Maximum allowed acceptance value		*L1* = 15.0 unless otherwise specified~~ in the individual monograph.~~ ▲▲*USP33*

Table 2 *(Continued)*

Variable	Definition	Conditions	Value
L2	Maximum allowed range for deviation of each dosage unit tested from the calculated value of *M*	On the low side, no dosage unit result can be less than [1 – (0.01)(*L2*)]*M,* while on the high side no dosage unit result can be greater than [1 + (0.01)(*L2*)]*M.* (This is based on an *L2* value of 25.0.)	*L2* = 25.0 unless otherwise specified ◆~~in the individual monograph,~~◆ ▲▲*USP33*
T	Target content per dosage unit at the time of manufacture, expressed as a percentage of the label claim. For purposes of this Pharmacopeia, unless otherwise ~~specified in the individual monograph, *T* is the average of the limits specified in the potency definition in the individual monograph.~~■stated in the individual monograph, *T* is 100.0%, and for manufacturing purposes, *T* is the manufacturer's approved target test amount value at the time of manufacture.■2S *(USP32)*		

~~**Suppositories, Transdermal Systems, and Inhalations Packaged in Premetered Dosage Units**~~ ~~[NOTE—Acceptance value calculations are not required for these dosage forms.] Assay 10 units individually as directed in the *Assay* in the individual monograph, unless otherwise specified in the *Procedure for content uniformity*.~~

▲⟨941⟩ CHARACTERIZATION OF CRYSTALLINE AND PARTIALLY CRYSTALLINE SOLIDS BY X-RAY POWDER DIFFRACTION (XRPD)

INTRODUCTION

Every crystalline phase of a given substance produces a characteristic X-ray diffraction pattern. Diffraction patterns can be obtained from a randomly oriented crystalline powder composed of crystallites or crystal fragments of finite size. Essentially three types of information can be derived from a powder diffraction pattern: the angular position of diffraction lines (depending on geometry and size of the unit cell), the intensities of diffraction lines (depending mainly on atom type and arrangement, and particle orientation within the sample), and diffraction line profiles (depending on instrumental resolution, crystallite size, strain, and specimen thickness).

Experiments giving angular positions and intensities of lines can be used for applications such as qualitative phase analysis (e.g., identification of crystalline phases) and quantitative phase analysis of crystalline materials. An estimate of the amorphous and crystalline fractions[1] can also be made.

The X-ray powder diffraction (XRPD) method provides an advantage over other means of analysis in that it is usually nondestructive in nature (to ensure a randomly oriented sample, specimen preparation is usually limited to grinding). XRPD investigations can also be carried out under *in situ* conditions on specimens exposed to non-ambient conditions such as low or high temperature and humidity.

PRINCIPLES

X-ray diffraction results from the interaction between X-rays and electron clouds of atoms. Depending on atomic arrangement, interferences arise from the scattered X-rays. These interferences are constructive when the path difference between two diffracted X-ray waves differs by an integral number of wavelengths. This selective condition is described by the Bragg equation, also called Bragg's law (see *Figure 1*).

$$2d_{hkl}\sin\theta_{hkl} = n\lambda$$

[1] There are many other applications of the X-ray powder diffraction technique that can be applied to crystalline pharmaceutical substances, such as determination of crystal structures, refinement of crystal structures, determination of the crystallographic purity of crystalline phases, and characterization of crystallographic texture. These applications are not described in this chapter.

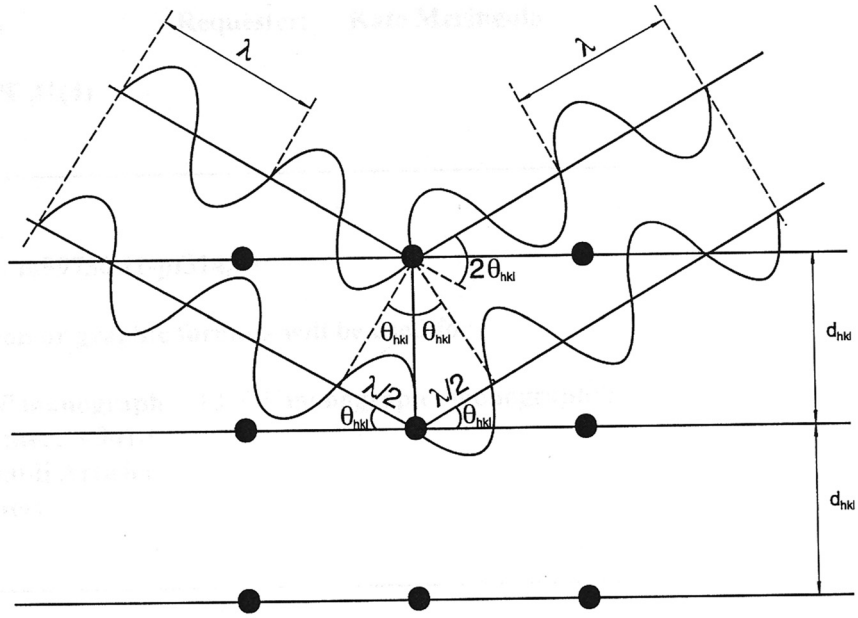

Figure 1. Diffraction of X-rays by a crystal according to Bragg's Law.

The wavelength, λ, of the X-rays is of the same order of magnitude as the distance between successive crystal lattice planes, or d_{hkl} (also called *d*-spacings). θ_{hkl} is the angle between the incident ray and the family of lattice planes, and sin θ_{hkl} is inversely proportional to the distance between successive crystal planes or *d*-spacings.

The direction and spacing of the planes with reference to the unit cell axes are defined by the Miller indices {*hkl*}. These indices are the reciprocals, reduced to the next-lower integer, of the intercepts that a plane makes with the unit cell axes. The unit cell dimensions are given by the spacings *a*, *b,* and *c,* and the angles between them α, β, and γ.

The interplanar spacing for a specified set of parallel *hkl* planes is denoted by d_{hkl}. Each such family of planes may show higher orders of diffraction where the *d* values for the related families of planes *nh, nk, nl* are diminished by the factor 1/*n* (*n* being an integer: 2, 3, 4, etc.).

Every set of planes throughout a crystal has a corresponding Bragg diffraction angle, θ_{hkl}, associated with it (for a specific λ).

A powder specimen is assumed to be polycrystalline so that at any angle θ_{hkl} there are always crystallites in an orientation allowing diffraction according to Bragg's law.[2] For a given X-ray wavelength, the positions of the diffraction peaks (also referred to as ''lines'', ''reflections'', or ''Bragg reflections'') are characteristic of the crystal lattice (*d*-spacings), their theoretical intensities depend on the crystallographic unit cell content (nature and positions of atoms), and the line profiles depend on the perfection and extent of the crystal lattice. Under these conditions, the diffraction peak has a finite intensity arising from atomic arrangement, type of atoms, thermal motion, and structural imperfections, as well as from instrument characteristics.

The intensity is dependent upon many factors such as structure factor, temperature factor, crystallinity, polarization factor, multiplicity, and Lorentz factor.

[2] An ideal powder for diffraction experiments consists of a large number of small, randomly oriented spherical crystallites (coherently diffracting crystalline domains). If this number is sufficiently large, there are always enough crystallites in any diffracting orientation to give reproducible diffraction patterns.

The main characteristics of diffraction line profiles are 2θ position, peak height, peak area, and shape (characterized by, e.g., peak width, or asymmetry, analytical function, and empirical representation). An example of the type of powder patterns obtained for five different solid phases of a substance are shown in *Figure 2.*

In addition to the diffraction peaks, an X-ray diffraction experiment also generates a more or less uniform background, upon which the peaks are superimposed. Besides specimen preparation, other factors contribute to the background—for example, sample holder, diffuse scattering from air and equipment, and other instrumental parameters such as detector noise and general radiation from the X-ray tube. The peak-to-background ratio can be increased by minimizing background and by choosing prolonged exposure times.

INSTRUMENT

Instrument Setup

X-ray diffraction experiments are usually performed using powder diffractometers or powder cameras.

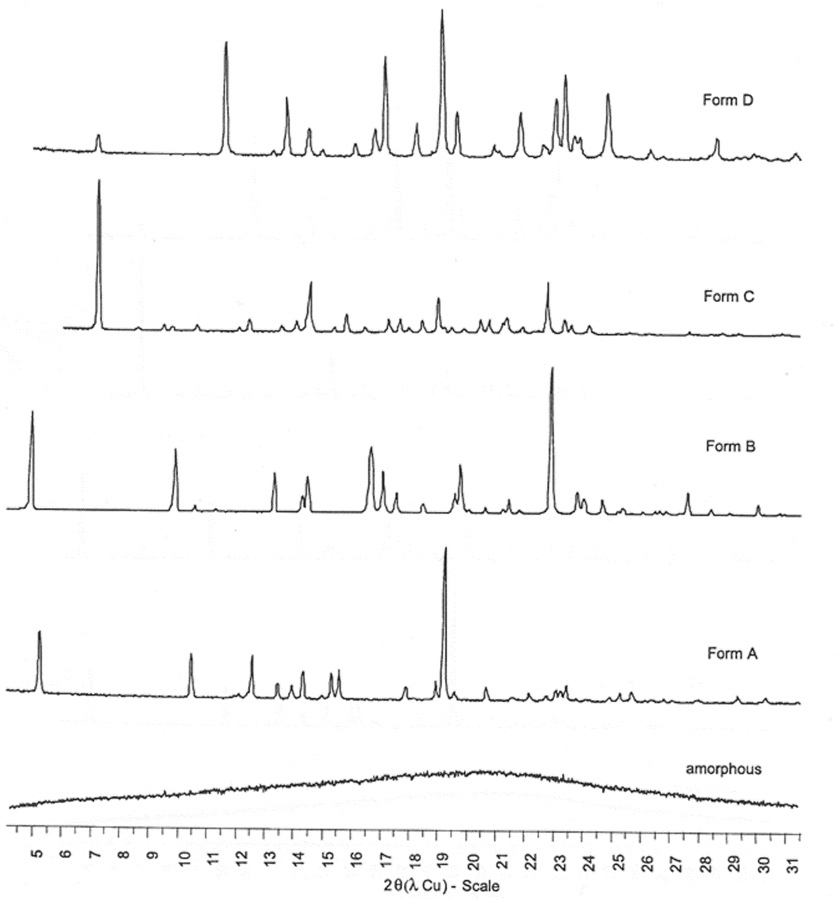

Figure 2. X-ray powder diffraction patterns collected for five different solid phases of a substance (the intensities are normalized).

A powder diffractometer generally comprises five main parts: an X-ray source; the incident beam optics, which may perform monochromatization, filtering, collimation, and/or focusing of the beam; a goniometer; the diffraction beam optics, which may include monochromatization, filtering, collimation, and focusing or parallelizing of beam; and a detector. Data collection and data processing systems are also required and are generally included in current diffraction measurement equipment.

Depending on the type of analysis to be performed (phase identification, quantitative analysis, lattice parameters determination, etc.), different XRPD instrument configurations and performance levels are required. The simplest instruments used to measure powder patterns are powder cameras. Replacement of photographic film as the detection method by photon detectors has led to the design of diffractometers in which the geometric arrangement of the optics is not truly focusing, but parafocusing, such as in Bragg-Brentano geometry. The Bragg-Brentano parafocusing configuration is currently the most widely used and is therefore briefly described here.

A given instrument may provide a horizontal or vertical $\theta/2\theta$ geometry or a vertical θ/θ geometry. For both geometries, the incident X-ray beam forms an angle θ with the specimen surface plane, and the diffracted X-ray beam forms an angle 2θ with the direction of the incident X-ray beam (an angle θ with the specimen surface plane). The basic geometric arrangement is represented in *Figure 3*. The divergent beam of radiation from the X-ray tube (the so-called primary beam) passes through the parallel plate collimators and a divergence slit assembly and illuminates the flat surface of the specimen. All the rays diffracted by suitably oriented crystallites in the specimen at an angle 2θ converge to a line at the receiving slit. A second set of parallel plate collimators and a scatter slit may be placed either behind or before the receiving slit. The axes of the line focus and of the receiving slit are at equal distances from the axis of the goniometer. The X-ray quanta are counted by a radiation detector, usually a scintillation counter, a sealed-gas proportional counter, or a position-sensitive solid-state detector such as an imaging plate or CCD detector. The receiving slit assembly and the detector are coupled together and move tangentially to the focusing circle. For $\theta/2\theta$ scans, the goniometer rotates the specimen around the same axis as that of the detector, but at half the rotational speed, in a $\theta/2\theta$ motion. The surface of the specimen thus remains tangential to the focusing circle. The parallel plate collimator limits the axial divergence of the beam and hence partially controls the shape of the diffracted line profile.

Figure 3. Geometric arrangement of the Bragg-Brentano parafocusing geometry.

A diffractometer may also be used in transmission mode. The advantage with this technology is to lessen the effects due to preferred orientation. A capillary of about 0.5–2 mm thickness can also be used for small sample amounts.

X-Ray Radiation

In the laboratory, X-rays are obtained by bombarding a metal anode with electrons emitted by the thermionic effect and accelerated in a strong electric field (using a high-voltage generator). Most of the kinetic energy of the electrons is converted to heat, which limits the power of the tubes and requires efficient anode cooling. A 20- to 30-fold increase in brilliance can be obtained by using rotating anodes and by using X-ray optics. Alternatively, X-ray photons may be produced in a large-scale facility (synchrotron).

The spectrum emitted by an X-ray tube operating at sufficient voltage consists of a continuous background of polychromatic radiation and additional characteristic radiation that depends on the type of anode. Only this characteristic radiation is used in X-ray diffraction experiments. The principal radiation sources used for X-ray diffraction are vacuum tubes using copper, molybdenum, iron, cobalt, or chromium as anodes; copper, molybdenum, or cobalt X-rays are employed most commonly for organic substances (the use of a cobalt anode can especially be preferred to separate distinct X-ray lines). The choice of radiation to be used depends on the absorption characteristics of the specimen and possible fluorescence by atoms present in the specimen. The wavelengths used in powder diffraction generally correspond to the K_α radiation from the anode. Consequently, it is advantageous to make the X-ray beam ''monochromatic'' by eliminating all the other components of the emission spectrum. This can be partly achieved using K_β filters—that is, metal filters selected as having an absorption edge between the K_α and K_β wavelengths emitted by the tube. Such a filter is usually inserted between the X-ray tube and the specimen. Another more commonly used way to obtain a monochromatic X-ray beam is via a large monochroma-

tor crystal (usually referred to as a ''monochromator''). This crystal is placed before or behind the specimen and diffracts the different characteristic peaks of the X-ray beam (i.e., K_α and K_β) at different angles so that only one of them may be selected to enter into the detector. It is even possible to separate $K_{\alpha 1}$ and $K_{\alpha 2}$ radiations by using a specialized monochromator. Unfortunately, the gain in getting a monochromatic beam by using a filter or a monochromator is counteracted by a loss in intensity. Another way of separating K_α and K_β wavelengths is by using curved X-ray mirrors that can simultaneously monochromate and focus or parallelize the X-ray beam.

RADIATION PROTECTION

Exposure of any part of the human body to X-rays can be injurious to health. It is therefore essential that whenever X-ray equipment is used, adequate precautions be taken to protect the operator and any other person in the vicinity. Recommended practice for radiation protection as well as limits for the levels of X-radiation exposure are those established by national legislation in each country. If there are no official regulations or recommendations in a country, the latest recommendations of the International Commission on Radiological Protection should be applied.

SPECIMEN PREPARATION AND MOUNTING

The preparation of the powdered material and the mounting of the specimen in a suitable holder are critical steps in many analytical methods, particularly for X-ray powder diffraction analysis, since they can greatly affect the quality of the data to be collected.[3] The main sources of errors due to specimen preparation and mounting are briefly discussed in the following section for instruments in Bragg-Brentano parafocusing geometry.

[3] Similarly, changes in the specimen can occur during data collection in the case of a nonequilibrium specimen (temperature, humidity).

Specimen Preparation

In general, the morphology of many crystalline particles tends to give a specimen that exhibits some degree of preferred orientation in the specimen holder. This is particularly evident for needle-like or platelike crystals when size reduction yields finer needles or platelets. Preferred orientation in the specimen influences the intensities of various reflections so that some are more intense and others less intense, compared to what would be expected from a completely random specimen. Several techniques can be employed to improve randomness in the orientation of crystallites (and therefore to minimize preferred orientation), but further reduction of particle size is often the best and simplest approach. The optimum number of crystallites depends on the diffractometer geometry, the required resolution, and the specimen attenuation of the X-ray beam. In some cases, particle sizes as large as 50 μm will provide satisfactory results in phase identification. However, excessive milling (crystallite sizes less than approximately 0.5 μm) may cause line broadening and significant changes to the sample itself, such as

- specimen contamination by particles abraded from the milling instruments (mortar, pestle, balls, etc.),
- reduced degree of crystallinity,
- solid-state transition to another polymorph,
- chemical decomposition,
- introduction of internal stress, and
- solid-state reactions.

Therefore, it is advisable to compare the diffraction pattern of the nonground specimen with that corresponding to a specimen of smaller particle size (e.g., a milled specimen). If the X-ray powder diffraction pattern obtained is of adequate quality considering its intended use, then grinding may not be required.

It should be noted that if a sample contains more than one phase and if sieving is used to isolate particles to a specific size, the initial composition may be altered.

SPECIMEN MOUNTING

EFFECT OF SPECIMEN DISPLACEMENT

A specimen surface that is offset by D with reference to the diffractometer rotation axis causes systematic errors that are very difficult to avoid entirely; for the reflection mode, this results in absolute $D \cdot \cos\theta$ shifts[4] in 2θ positions (typically of the order of 0.01° in 2θ at low angles

$$[\cos\theta \simeq 1]$$

for a displacement $D = 15$ μm) and asymmetric broadening of the profile toward low 2θ values. Use of an appropriate internal standard allows the detection and correction of this effect simultaneously with that arising from specimen transparency. This effect is by far the largest source of errors in data collected on well-aligned diffractometers.

EFFECT OF SPECIMEN THICKNESS AND TRANSPARENCY

When the XRPD method in reflection mode is applied, it is often preferable to work with specimens of ''infinite thickness''. To minimize the transparency effect, it is advisable to use a nondiffracting substrate (zero background holder)—for example, a plate of single crystalline silicon cut parallel to the 510 lattice planes.[5] One advantage of the transmission mode is that problems with sample height and specimen transparency are less important.

The use of an appropriate internal standard allows the detection and correction of this effect simultaneously with that arising from specimen displacement.

CONTROL OF THE INSTRUMENT PERFORMANCE

The goniometer and the corresponding incident and diffracted X-ray beam optics have many mechanical parts that need adjustment. The degree of alignment or misalignment directly influences the quality of the results of an XRPD investigation. Therefore, the different components of the diffractometer must be carefully adjusted (optical and mechanical systems, etc.) to adequately minimize systematic errors, while optimizing the intensities received by the detector. The search for maximum intensity and maximum resolution is always antagonistic when aligning a diffractometer. Hence, the best compromise must be sought while performing the alignment procedure. There are many different configurations, and each supplier's equipment requires specific alignment procedures. The overall diffractometer performance must be tested and monitored periodically, using suitable certified reference materials. Depending on the type of analysis, other well-defined reference materials may also be employed, although the use of certified reference materials is preferred.

QUALITATIVE PHASE ANALYSIS (IDENTIFICATION OF PHASES)

The identification of the phase composition of an unknown sample by XRPD is usually based on the visual or computer-assisted comparison of a portion of its X-ray powder pattern to the experimental or calculated pattern of a reference material. Ideally, these reference patterns are collected on well-characterized single-phase

[4] Note that a goniometer zero alignment shift would result in a constant shift on all observed 2θ-line positions; in other words, the whole diffraction pattern is, in this case, translated by an offset of Z° in 2θ.

[5] In the case of a thin specimen with low attenuation, accurate measurements of line positions can be made with focusing diffractometer configurations in either transmission or reflection geometry. Accurate measurements of line positions on specimens with low attenuation are preferably made using diffractometers with parallel beam optics. This helps to reduce the effects of specimen thickness.

specimens. This approach makes it possible in most cases to identify a crystalline substance by its 2θ-diffraction angles or *d*-spacings and by its relative intensities. The computer-aided comparison of the diffraction pattern of the unknown sample to the comparison data can be based on either a more or less extended 2θ range of the whole diffraction pattern or on a set of reduced data derived from the pattern. For example, the list of *d*-spacings and normalized intensities, I_{norm}, a so-called (d, I_{norm}) list extracted from the pattern, is the crystallographic fingerprint of the material and can be compared to (d, I_{norm}) lists of single-phase samples compiled in databases.

For most organic crystals, when using Cu K_α radiation, it is appropriate to record the diffraction pattern in a 2θ-range from as near 0° as possible to at least 40°. The agreement in the 2θ-diffraction angles between specimen and reference is within 0.2° for the same crystal form, while relative intensities between specimen and reference may vary considerably due to preferred orientation effects. By their very nature, variable hydrates and solvates are recognized to have varying unit cell dimensions, and as such, shifting occurs in peak positions of the measured XRPD patterns for these materials. In these unique materials, variance in 2-θ positions of greater than 0.2° is not unexpected. As such, peak position variances such as 0.2° are not applicable to these materials. For other types of samples (e.g., inorganic salts), it may be necessary to extend the 2θ region scanned to well beyond 40°. It is generally sufficient to scan past the 10 strongest reflections identified in single-phase X-ray powder diffraction database files.

It is sometimes difficult or even impossible to identify phases in the following cases:

- noncrystallized or amorphous substances,
- the components to be identified are present in low mass fractions of the analyte amounts (generally less than 10% *m/m*),
- pronounced preferred orientation effects,
- the phase has not been filed in the database used,
- the formation of solid solutions,
- the presence of disordered structures that alter the unit cell,
- the specimen comprises too many phases,
- the presence of lattice deformations,
- the structural similarity of different phases.

QUANTITATIVE PHASE ANALYSIS

If the sample under investigation is a mixture of two or more known phases, of which not more than one is amorphous, the percentage (by volume or by mass) of each crystalline phase and of the amorphous phase can in many cases be determined. Quantitative phase analysis can be based on the integrated intensities, on the peak heights of several individual diffraction lines,[6] or on the full pattern. These integrated intensities, peak heights, or full-pattern data points are compared to the corresponding values of reference materials. These reference materials must be single phase or a mixture of known phases. The difficulties encountered during quantitative analysis are due to specimen preparation (the accuracy and precision of the results require, in particular, homogeneity of all phases and a suitable particle size distribution in each phase) and to matrix effects.

In favorable cases, amounts of crystalline phases as small as 10% may be determined in solid matrices.

[6] If the crystal structures of all components are known, the Rietveld method can be used to quantify them with good accuracy. If the crystal structures of the components are not known, the Pawley method or the partial least-squares (PLS) method can be used.

Polymorphic Samples

For a sample composed of two polymorphic phases *a* and *b*, the following expression may be used to quantify the fraction F_α of phase *a*:

$$F_\alpha = \frac{1}{1+\mathrm{K}(I_b / I_\alpha)}$$

The fraction is derived by measuring the intensity ratio between the two phases, knowing the value of the constant K. K is the ratio of the absolute intensities of the two pure polymorphic phases I_{oa} / I_{ob}. Its value can be determined by measuring standard samples.

Methods Using a Standard

The most commonly used methods for quantitative analysis are

- the external standard method,
- the internal standard method, and
- the spiking method (also often called the standard addition method).

The external standard method is the most general method and consists of comparing the X-ray diffraction pattern of the mixture, or the respective line intensities, with those measured in a reference mixture or with the theoretical intensities of a structural model, if it is fully known.

To limit errors due to matrix effects, an internal reference material can be used that has a crystallite size and X-ray absorption coefficient comparable to those of the components of the sample and with a diffraction pattern that does not overlap at all that of the sample to be analyzed. A known quantity of this reference material is added to the sample to be analyzed and to each of the reference mixtures. Under these conditions, a linear relationship between line intensity and concentration exists. This application, called the internal standard method, requires precise measurement of diffraction intensities.

In the spiking method (or standard addition method), some of the pure phase *a* is added to the mixture containing the unknown concentration of *a*. Multiple additions are made to prepare an intensity-versus-concentration plot in which the negative *x*-intercept is the concentration of the phase *a* in the original sample.

ESTIMATE OF THE AMORPHOUS AND CRYSTALLINE FRACTIONS

In a mixture of crystalline and amorphous phases, the crystalline and amorphous fractions can be estimated in several ways. The choice of the method used depends on the nature of the sample:

- If the sample consists of crystalline fractions and an amorphous fraction of different chemical compositions, the amounts of each of the individual crystalline phases may be estimated using appropriate standard substances, as described above. The amorphous fraction is then deduced indirectly by subtraction.

- If the sample consists of one amorphous and one crystalline fraction, either as a 1-phase or a 2-phase mixture, with the same elemental composition, the amount of the crystalline phase (the ''degree of crystallinity'') can be estimated by measuring three areas of the diffractogram:

  A = total area of the peaks arising from diffraction from the crystalline fraction of the sample,

  B = total area below area A,

  C = background area (due to air scattering, fluorescence, equipment, etc).

When these areas have been measured, the degree of crystallinity can be roughly estimated as:

$$\% \text{ crystallinity} = 100A/(A + B - C)$$

It is noteworthy that this method does not yield an absolute degree of crystallinity values and hence is generally used for comparative purposes only. More sophisticated methods are also available, such as the Ruland method.

SINGLE CRYSTAL STRUCTURE

In general, the determination of crystal structures is performed from X-ray diffraction data obtained using single crystals. However, crystal structure analysis of organic crystals is a challenging task, since the lattice parameters are comparatively large, the symmetry is low, and the scattering properties are normally very low. For any given crystalline form of a substance, the knowledge of the crystal structure allows for calculating the corresponding XRPD pattern, thereby providing a preferred orientation-free reference XRPD pattern, which may be used for phase identification.▲USP33

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of Expert Committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues.

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* section. Readers interested in submitting comments should see *Instructions to Authors.*

INSTRUCTIONS TO AUTHORS

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP–NF* revision will be considered for publication in *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously in any language or medium and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication they will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention (USPC) and may not be subsequently published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

Style and Usage—*Stimuli*articles generally follow the current *Chicago Manual of Style*except in scientific usage (numbers, abbreviations, etc.). For the latter, authors should use the current *AMA Manual of Style* or the current *ACS Style Guide*. Authors may usefully consult a current copy of *Pharmacopeial Forum*.

References—Consult the current *AMA Manual of Style*, which is generally consistent with the National Library of Medicine's *Recommended Formats for Bibliographic Citation*. A current copy of *Pharmacopeial Forum* will offer examples of reference formats.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Contact Person—USP will designate a Scientific Liaison in the Documentary Standards Division as the corresponding author. This ensures that USP receives all comments generated by the *Stimuli* article. Authors should contact the Scientific Liaison if they would like to receive copies of comments generated by their *Stimuli* articles.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

Drug Product Performance and Interchangeability of Multisource Drug Substances and Drug Products

Leon Shargel, PhD, *Applied Biopharmaceutics*[a]

ABSTRACT Multisource drug products may contain drug substances and drug products that meet *USP–NF* monograph standards of strength, quality, purity, and identity. Pharmaceutical equivalence per se does not ensure equivalent drug product performance as demonstrated by bioequivalence, nor does it ensure therapeutic equivalence. This *Stimuli* article examines pharmaceutical equivalence and suggests that multisource drug products that meet *USP* monograph requirements may not be pharmaceutical equivalents and/or may not have the same drug product performance.

INTRODUCTION

Multisource drug products are products marketed by more than one manufacturer that contain the same active pharmaceutical ingredient (API) or drug substance in the same dosage form and are given by the same route of administration. Many of these multisource drug products contain drug substances that meet *USP–NF* monograph standards of strength, quality, purity, and identity. However, drug substances and drug products that solely meet the same *USP–NF* monograph standards should not be considered automatically as interchangeable products. The objective of this *Stimuli* article is to provide an understanding of interchangeability and substitutability of drug substances and drug products that meet *USP–NF* monographs.

Pharmaceutical equivalents are drug products that contain the same active ingredient(s), are of the same dosage form, are administered by the same route, and are identical in strength or concentration. Pharmaceutically equivalent drug products are formulated to contain the same amount of active ingredient in the same dosage form and to meet the same or compendial or other applicable standards (i.e., strength, quality, purity, and identity), but they may differ in characteristics such as shape, scoring configuration, release mechanisms, packaging, excipients (including colors, flavors, and preservatives), expiration time, and, within certain limits, labeling.

Multisource drug products that meet *USP–NF* monographs may not be pharmaceutical equivalents and/or may not have the same drug product performance. Designation of multisource drug products for interchangeability (substitution) generally is a matter of governmental (regulatory) approval. Regulatory approval for interchangeable multisource generic drug products is not identical in all countries. The US Food and Drug Administration (FDA) has very strict rules for the approval and marketing of generic drug products. These regulations must be considered during the development of both branded and generic drug products. Drug product performance also must be considered if any changes occur in the finished dosage form, including scale up, site changes, process changes, or other modifications that could have an effect on the drug product. Only multisource drug products that are pharmaceutical equivalents, bioequivalent, and therapeutic equivalents that have been approved by the appropriate regulatory agency (e.g., FDA), may be marketed as interchangeable. *USP* General Information Chapter *In Vivo Bioequivalence Guidances* ⟨1090⟩ discusses the basis for therapeutic equivalence.

USP–NF contains science-based standards for drugs, biologics, dietary supplements, and excipients used in dosage forms and products. A *USP–NF* monograph for an official substance or preparation includes applicable standards of strength, quality, purity, and identity, including also the article's definition, packaging, storage, and other requirements and specifications. The specification consists of a series of universal (description, identification, impurities, and assay) and specific tests, one or more analytical procedures for each test, and acceptance criteria.

Ingredients are defined as either drug substances or excipients. An excipient is any component, other than the active substance(s), intentionally added to the formulation of a dosage form. Excipients are not necessarily inert and may affect the performance of the finished dosage form (drug product). Quality standards are important attributes that must be built into the drug product. Products that meet *USP–NF* standards are accepted globally as articles with an assurance of high quality.

In addition to meeting *USP–NF* quality standards, multisource drug products must meet certain in vivo and/or in vitro performance standards to be considered therapeutically equivalent and interchangeable (see *USP* General Information Chapter ⟨1090⟩. Drug product performance may be defined as the release of the active pharmaceutical ingredient (API) from the drug product dosage form, leading to systemic availability of the API necessary to achieve a desired therapeutic response.

[a] Correspondence should be addressed to: Darrell R. Abernethy, MD, PhD, Chief Science Officer, US Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852-1790; tel. 301.816.8184; e-mail dra@usp.org.

The number of multisource drug products now available on the open market and on the Internet has greatly increased and has caused some confusion among pharmacy practitioners regarding their quality, performance, and interchangeability. This chapter provides a framework for comparing drug substances and drug products in terms of equivalence and substitutability.

MULTISOURCE DRUG SUBSTANCES

Pharmaceutical Equivalence

Pharmaceutical equivalence of drug substances and drug products is determined by the relevant regulatory agencies who review the manufacturer's submission that contains experimental evidence that the drug substances meet quality standards and perform similarly as measured by bioequivalence or other tests. Pharmaceutical equivalence, by itself, does not ensure bioequivalence or therapeutic equivalence.

Due to patents and different approaches in chemical or biological synthesis, the drug substance may differ in various physicochemical properties. Depending on the synthetic route and method of purification, some drugs can exist in polymorphic forms. A manufacturer may obtain a patent for a specific crystalline form of the drug substance. An alternative manufacturer of this drug substance may use a different synthetic route and method of purification, resulting in a crystalline form that is different from the patented form. Because these two drug substances have different crystalline forms, they are not identical. In another case, the hydrous form of a drug substance is not considered chemically identical to its anhydrous form. In both of these cases, the two drug substances (e.g., crystalline vs noncrystalline or hydrous vs anhydrous) may be considered pharmaceutical equivalents if their in vivo performances are equivalent.

Various factors can affect the performance of a drug substance in the finished drug product. These factors include:

- Physicochemical attributes of the drug substance
- Differences in excipients in the formulation
- Differences in the manufacturing process.

Physicochemical Attributes

As noted, drug substances can differ in polymorphic forms including hydrous and anhydrous forms, various crystalline forms, or an amorphous form. Hydrous, anhydrous, amorphous, and different crystalline forms may dissolve at different rates, and therefore, the rate of absorption from the same dosage form (e.g., oral tablet) may be different. For example, crystalline structures are more rigid and thermodynamically stable compared to amorphous forms that dissolve more quickly. Particle size and the particle size distribution of the drug may also affect the rate of dissolution. Although mean particle size may be similar, a particle size distribution that contains a larger number of very fine (smaller) particles may dissolve more quickly and may be systemically absorbed more quickly than the same drug substance whose particle size distribution contains a greater number of larger particles.

Differences in Excipients in the Formulation

The World Health Organization (WHO) states that ''pharmaceutical equivalence does not necessarily imply bioequivalence and therapeutic equivalence, as differences in the excipients and/or the manufacturing process can lead to differences in product performance'' (*1*). However, amorphous and crystalline drug substances can be bioequivalent when manufactured in the same dosage form (e.g., oral tablet) if a manufacturer uses different excipients and manufacturing processes that produce bioequivalence in vivo.

Pharmaceutical Alternatives

Pharmaceutical alternatives are defined in General Information Chapter ⟨1090⟩. FDA considers pharmaceutical alternatives as drug products that contain the same therapeutic moiety but are different salts, esters, or complexes of that moiety or are different dosage forms or strengths.

WHO considers pharmaceutical alternatives as products that contain the same molar amount of the same active pharmaceutical moiety(s) but differ in dosage form (e.g., tablets vs capsules), and/or chemical form (e.g., different salts or esters). Pharmaceutical alternatives deliver the same active moiety by the same route of administration but are otherwise not pharmaceutically equivalent. They may or may not be bioequivalent or therapeutically equivalent with the comparator product.

Different Salt Forms

Salt forms of drugs such as hydrochloride, phosphate, sulfate, potassium, and sodium, among others, are ionizable substances that have different ionization equilibrium between salt form and non-ionized form. Additionally, different salt forms of the same drug may have different aqueous solubility and may dissolve at different rates. For example, tetracycline phosphate or tetracycline hydrochloride equivalent to 250 mg tetracycline base are considered pharmaceutical alternatives. Sometimes pharmaceutical manufacturers can use different excipients and manufacturing processes to produce pharmaceutical alternatives that may be bioequivalent in vivo and therapeutically equivalent to the reference drug product.

Esters and Prodrugs

Esters of the active pharmaceutical ingredient essentially are prodrugs. Esters of fatty acids such as stearates and palmitates have been used. Generally, the ester prodrug is inactive and must be hydrolyzed to the parent drug to exert its pharmacodynamic activity. Hydrolysis can proceed by enzymatic pathways via esterases in the tissues or plasma or by nonenzymatic means such as acid hydrolysis in the stomach. Esters can be absorbed both as the prodrug and as the parent drug, and the distribution of the intact prodrug may differ from the distribution of

the parent drug. Therefore, prodrugs are considered to be different drugs compared to the parent active drug substance.

EXCIPIENTS

A pharmaceutical dosage form typically consists of both active ingredient(s) and excipients. Excipients, which may have no pharmacodynamic activity, play a critical role in manufacturing, stability, and performance (*2*). Some excipients are manufactured to comply with compendial standards. However, the performance of the finished dosage form depends extensively on the physical and chemical properties of the excipients as well as the physical and chemical properties of the drug substance and the method of manufacture.

INTERCHANGEABILITY OF MULTISOURCE DRUG PRODUCTS

The interchangeability of multisource generic drug products is a major concern for physicians, pharmacists, and others who prescribe, dispense, purchase, or pay/reimburse for drugs. Because the formulation and method of manufacture of the drug product can affect its bioavailability and stability, the multisource generic drug manufacturer must demonstrate that the generic drug product is bioequivalent and therapeutically equivalent to the reference listed drug.

Manufacturing Process

Quality cannot be tested into drug products. Quality should be built in or should be designed and confirmed by testing. With a greater understanding of the drug product and its manufacturing process, regulatory agencies and pharmaceutical manufacturers are developing a systematic approach to achieve quality and drug product performance (*3*).

As discussed in ICH Q8(R1), manufacturing should be based on sound scientific principles. Pharmaceutical development should include, at a minimum, the following elements:

- Defining the target product profile as it relates to quality, safety, and efficacy considering, e.g., the route of administration, dosage form, bioavailability, dosage, and stability
- Identifying critical quality attributes (CQAs) of the drug product so that those product characteristics that have an impact on product quality can be studied and controlled
- Determining the quality attributes of the drug substance and excipients and selecting the type and amount of excipients to deliver drug product of the desired quality
- Selecting an appropriate manufacturing process
- Identifying a control strategy.

An enhanced quality by design (QbD) approach to product development additionally would include the following elements:

- A systematic evaluation, understanding, and refining of the formulation and manufacturing process, including:
  - — Identifying by, e.g., prior knowledge, experimentation, and risk assessment, the material attributes and process parameters that can have an effect on product CQAs
  - — Determining the functional relationships that link material attributes and process parameters to product CQAs
- Using the enhanced process understanding in combination with quality risk management to establish an appropriate control strategy that can include a proposal for design space(s) and/or real-time release.

Scale-up and Postapproval Changes

Scale-up and Postapproval Changes (SUPAC) relate to change(s) in a formulation after market approval (*4*, *5*). These may include a change in (1) the components or composition, (2) the site of manufacture, (3) the scale-up/scale-down of manufacture, and/or (4) the manufacturing (process and equipment) of a modified-release solid oral dosage form during the postapproval period.

Any scale-up and postapproval change can potentially affect the performance of the finished drug product. Moreover, changes in the manufacture of drug substance or excipients have the potential to change the performance of the finished dosage form. FDA SUPAC guidances define (1) levels of change, (2) recommended chemistry, manufacturing, and controls (CMC) tests for each level of change, (3) recommended in vitro dissolution tests and/or in vivo bioequivalence tests for each level of change, and (4) documentation that should support the change. The possibility that a change may affect the safety and performance of the drug product is tabulated by levels of change (*Table 1*).

Table 1: Levels of Change and Their Impact on Drug Product Performance

Change Level	Example	Comment
Level 1	Deletion or partial deletion of an ingredient to affect the color or flavor of the drug product.	Level 1 changes are those that are unlikely to have any detectable impact on formulation quality and performance.
Level 2	Quantitative change in excipients greater than that allowed in a Level 1 change.	Level 2 changes are those that could have a significant impact on formulation quality and performance.
Level 3	Qualitative change in excipients.	Level 3 changes are those that are likely to have a significant impact on formulation quality and performance. A Level 3 change may require in vivo bioequivalence testing.

The manufacturer must provide evidence that the performance of the product is not impaired because of the change.

Generic Substitution and Interchangeability of Multisource Drug Products

Generic substitution is the process of dispensing a different brand or an unbranded therapeutically equivalent drug product in place of the prescribed drug product. The substituted drug product must be approved by the regulatory agency as a therapeutic equivalent. FDA lists therapeutic equivalents in the *Orange Book* (discussed below). In most cases, generic substitution does not require permission from the prescriber if the drug product has been approved by FDA and is listed as a therapeutic equivalent.

Therapeutic Equivalents

Drug products are considered to be *therapeutic equivalents* only if they are pharmaceutical equivalents and if they can be expected to have the same clinical effect and safety profile when administered to patients under the conditions specified in the labeling. FDA classifies as therapeutically equivalent those products that meet the following general criteria:

- they are approved as safe and effective
- they are pharmaceutical equivalents because they
  - contain identical amounts of the same active drug ingredient in the same dosage form and route of administration, and
  - meet compendial or other applicable standards of strength, quality, purity, and identity
- they are bioequivalent because
  - they do not present a known or potential bioequivalence problem, and they meet an acceptable in vitro standard, or
  - if they do present a known or potential problem, they are shown to meet an appropriate bioequivalence standard
- they are adequately labeled
- they are manufactured in compliance with cGMP regulations.

WHO and certain countries may have different definitions of therapeutic equivalence. Drug products that are approved for marketing as therapeutically equivalent can be substituted with the full expectation that the substituted product will produce the same clinical effect and safety profile as the prescribed product.

Orange Book

FDA publishes *Approved Drug Products with Therapeutic Equivalence Evaluations,* also known as the *Orange Book* (www.fda.gov/cder/ob/default.htm; accessed 8 December 2008). The *Orange Book* identifies drug products approved under the 1938 Federal Food, Drug, and Cosmetic Act by FDA on the basis of safety and effectiveness and contains therapeutic equivalence evaluations for approved multisource prescription drug products. It does not include drugs approved under the Public Health Service Act (biologics), pre-1938 drugs, or drugs approved by FDA only on the basis of safety (those covered by the so-called ongoing DESI review). *Orange Book* evaluations serve as public information and advice to health agencies, prescribers, and pharmacists to promote public education in the area of drug product selection and to foster containment of health care costs.

Therapeutic Equivalence Evaluations Codes

The coding system for therapeutic equivalence evaluations in the *Orange Book* (http://www.fda.gov/cder/ob/docs/preface/ecpreface.htm#Therapeutic%20Equivalence%20Evaluations%20Codes; accessed 8 December 2008) is constructed to allow users to determine quickly whether FDA has evaluated a particular approved product as therapeutically equivalent to other pharmaceutically equivalent products (first letter) and to provide additional information about the basis of FDA's evaluations (second letter). With few exceptions, the therapeutic equivalence evaluation date is the same as the approval date.

The two basic categories into which multisource drugs have been placed are indicated by the first letter:

- Drug products that FDA considers to be therapeutically equivalent to other pharmaceutically equivalent products. These are drug products for which there are no known or suspected bioequivalence problems. These are designated AA, AN, AO, AP, or AT, depending on the dosage form
- Actual or potential bioequivalence problems have been resolved with adequate in vivo and/or in vitro evidence supporting bioequivalence. These are designated AB.

FDA at this time considers some drug products not to be therapeutically equivalent to other pharmaceutically equivalent products, i.e., drug products for which actual or potential bioequivalence problems have not been resolved by adequate evidence of bioequivalence. Often the problem is with specific dosage forms rather than with the active ingredients. These are designated BC, BD, BE, BN, BP, BR, BS, BT, BX, or B*. The *Orange Book* should be consulted for a complete listing of therapeutically equivalent drug products.

Reference Listed Drug

The reference listed drug (RLD) is identified by FDA as the drug product on which an applicant relies when seeking approval of an Abbreviated New Drug Application (ANDA). The RLD generally is the brand-name drug that has been approved on the basis of a full New Drug Application (NDA) with substantial evidence of safety and efficacy. FDA designates a single reference listed drug as the standard to which all generic versions must be shown to be bioequivalent. FDA hopes to avoid possible significant variations among generic drugs and their brand-name counterparts. Such variations could result if generic drugs were compared to different RLDs.

Pharmaceutically Equivalent Drug Products

Drug products are considered pharmaceutical equivalents (i.e., are listed in the *Orange Book*) if they contain the same active ingredient(s), are of the same dosage form, are administered by the same route of administration, and are identical in strength or concentration (e.g., chlordiazepoxide hydrochloride, 5-mg capsules). Pharmaceutically equivalent drug products are formulated to contain the same amount of active ingredient in the same dosage form and to meet the same or compendial or other applicable standards (i.e., strength, quality, purity, and identity), but they may differ in characteristics such as shape, scoring configuration, release mechanisms, packaging, excipients (including colors, flavors, and preservatives), expiration time, and, within certain limits, labeling.

Pharmaceutically equivalent or pharmaceutically alternative products may or may not be therapeutically equivalent. Multisource pharmaceutical products that are therapeutically equivalent are interchangeable. An interchangeable pharmaceutical product is one that is therapeutically equivalent to a comparator product and can be interchanged with the comparator in clinical practice.

Pharmaceutical Alternatives

Pharmaceutical alternatives are drug products that contain the same therapeutic moiety but are different salts, esters, or complexes of that moiety or are different dosage forms or strengths (e.g., tetracycline hydrochloride, 250-mg capsules vs tetracycline phosphate complex, 250-mg capsules; quinidine sulfate, 200-mg tablets vs quinidine sulfate, 200-mg capsules). Different dosage forms and strengths within a single manufacturer's product line are thus pharmaceutical alternatives, as are extended-release products when compared with immediate-release or standard-release formulations of the same active ingredient.

Capsules vs Tablets

The bioavailability of the same drug substance from a tablet compared to another tablet may demonstrate bioequivalence. However, FDA currently considers a tablet and capsule containing the same active ingredient in the same dosage strength as pharmaceutical alternatives, and the two dosage forms cannot be interchanged. In contrast, several countries have concluded that bioequivalent capsules and tablets containing the same active ingredient in the same dosage strength are therapeutic equivalents and therefore can be interchanged.

Pharmaceutical Substitution

Pharmaceutical substitution is the process of dispensing a pharmaceutical alternative for the prescribed drug product. This occurs, for example, if ampicillin suspension is dispensed in place of ampicillin capsules or if tetracycline hydrochloride is dispensed in place of tetracycline phosphate. Pharmaceutical substitution generally requires the physician's approval.

Therapeutic Alternatives

Therapeutic alternatives are drug products that contain different active ingredients and are indicated for the same therapeutic or clinical objectives. Active ingredients in therapeutic alternatives are from the same pharmacologic class and are expected to have the same therapeutic effect when administered to patients for identical indications. In such cases, for example, ibuprofen may be given instead of naproxen, and cimetidine may be given instead of ranitidine.

Therapeutic Substitution

Therapeutic substitution is the process of dispensing a therapeutic alternative in place of the prescribed drug product. For example, amoxicillin may be dispensed instead of ampicillin for the treatment of a Staphylococcus infection, or ibuprofen may be dispensed instead of naproxen for the treatment of pain. Therapeutic substitution also can occur when one NDA-approved drug is substituted for the same drug that has been approved by a different NDA, e.g., the substitution of Nicoderm (nicotine transdermal system) for Nicotrol (nicotine transdermal system).

Because these drug products are not therapeutic equivalents as defined above, they may not be marketed or labeled as interchangeable. Generally, the prescriber must be notified before a substitution is performed. However, in certain institutions such as in a hospital or nursing facility, a formulary may list drug products that can be interchanged without the need to contact the physician. In this case, a pharmacy and therapeutics committee has reviewed the products in the formulary and has listed those products that can be substituted.

CONCLUSIONS

USP–NF contains science-based standards for drugs, biologics, dietary supplements, and excipients used in dosage forms and products. A *USP–NF* monograph for an official substance or preparation includes applicable standards of strength, quality, purity, and identity, including the article's definition, and packaging, storage, and other requirements and specifications. Multisource drug products may contain drug substances and drug products that meet *USP–NF* monograph standards of strength, quality, purity, and identity. Pharmaceutical equivalence per se does not ensure equivalent drug product performance as demonstrated by bioequivalence, nor does it ensure therapeutic equivalence. The approval of interchangeability of multisource, generic drug products depends on the review of an appropriate application (e.g., an ANDA) by an appropriate regulatory agency such as FDA.

Topical and Transdermal Drug Products

The Topical/Transdermal Ad Hoc Advisory Panel for the USP Performance Tests of Topical and Transdermal Dosage Forms: Clarence T. Ueda (Chair), Vinod P. Shah (USP Scientific Liaison), Kris Derdzinski, Gary Ewing, Gordon Flynn, Howard Maibach, Margareth Marques (USP Scientific Liaison),[a] Howard Rytting,[b] Steve Shaw, Kailas Thakker, and Avi Yacobi.

ABSTRACT This *Stimuli* article provides general information about the test methods that should be employed to ensure the quality and performance of topical and transdermal drug products. The term *topical drug products* refers to all formulations applied to the skin except transdermal delivery systems (TDS) or transdermal patches that will be addressed separately.

INTRODUCTION

Drug products topically administered via the skin fall into two general categories, those applied for local action and those for systemic effects. Local actions include those at or on the surface of the skin, those that exert their actions on the stratum corneum, and those that modulate the function of the epidermis and/or the dermis. Common products in the former category include creams, gels, ointments, pastes, suspensions, lotions, foams, sprays, aerosols, and solutions. Creams, ointments, and gels generally are referred to as semisolid dosage forms. The most common drug products applied to the skin for systemic effects are referred to as self-adhering transdermal drug delivery systems (TDS) or transdermal patches.

Two categories of tests, product quality tests and product performance tests, are performed with drug products to provide assurances of batch-to-batch quality, reproducibility, reliability, and performance. Product quality tests are performed to assess attributes such as assay, identification, content uniformity, pH, microbial limits, and minimum fill and are part of the compendial monograph. Product performance tests are conducted to assess drug release from the finished dosage form.

This *Stimuli* article provides general information about the test methods that should be employed to ensure the quality and performance of topical and transdermal drug products. The term *topical drug products* refers to all formulations applied to the skin except transdermal delivery systems (TDS) or transdermal patches that will be addressed separately.

Topical dosage forms include solutions (for which release testing is not indicated), collodion, suspensions, emulsions (e.g., lotions), semisolids (e.g., foams, ointments, pastes, creams, and gels), solids (e.g., powders and aerosols), and sprays. The physical characteristics of these dosage forms vary widely.

Therefore, the in vitro release test for those products also may differ significantly and may require different types of apparatus. At present, a product performance test exists only for semisolid formulations, specifically creams, ointments, and gels. That test employs the vertical diffusion cell (VDC) system. The VDC system is simple to operate and yields reliable and reproducible results when employed by properly trained laboratory personnel.

TDS or transdermal patches are physical devices applied to the skin and vary in their composition and method of fabrication. Therefore, they release their active ingredients by different mechanisms.

GLOSSARY OF TERMS

Definitions of topical drug products, some aspects related to the manufacture of these products, and a glossary of dosage form names commonly used can be found in General Information Chapter *Pharmaceutical Dosage Forms* ⟨1151⟩.

Collodion

Collodion (pyroxylin solution; see *USP* monograph), is a solution of nitrocellulose in ether and acetone, sometimes with the addition of alcohol. As the volatile solvents evaporate, a dry celluloid-like film is left on the skin. Because the medicinal use of a collodion depends on the formation of a protective film, the film should be durable, tenacious in adherence, flexible, and occlusive.

Creams

Creams are semisolid dosage forms that contain one or more drug substances dissolved or dispersed in a suitable base. This term traditionally has been applied to semisolids that possess a relatively soft, spreadable consistency formulated as either water-in-oil or oil-in-water emulsions. However, more recently the term has been restricted to products consisting of oil-in-water emulsions or aqueous microcrystalline dispersions of long-chain fatty acids or alcohols that are water washable and more cosmetically and aesthetically acceptable.

[b] Deceased.

Emulsions

Emulsions are viscid, multiphase systems in which one or more liquids are dispersed throughout another immiscible liquid in the form of small droplets. When oil is the dispersed phase and an aqueous solution is the continuous phase, the system is designated as an oil-in-water emulsion. Conversely, when water or an aqueous solution is the dispersed phase and oil or oleaginous material is the continuous phase, the system is designated as a water-in-oil emulsion. Emulsions are stabilized by emulsifying agents that prevent coalescence, the merging of small droplets into larger droplets, and, ultimately, into a single separated phase. Emulsifying agents (surfactants) act by concentrating at the interface between the immiscible liquids, thereby providing a physical barrier that reduces the tendency for coalescence. Surfactants also reduce the interfacial tension between the phases, facilitating the formation of small droplets upon mixing. The term emulsion is not used if a more specific term is applicable, e.g., cream or ointment.

Foams

Foams are emulsified systems packaged in pressurized containers or special dispensing devices that contain dispersed gas bubbles, usually in a liquid continuous phase, that when dispensed has a fluffy, semisolid consistency.

Gels

Gels (sometimes called Jellies) are semisolid systems consisting of either suspensions composed of small inorganic particles or large organic molecules interpenetrated by a liquid. When the gel mass consists of a network of small discrete particles, the gel is classified as a two-phase system (e.g., Aluminum Hydroxide Gel, *USP*). In a two-phase system if the particle size of the dispersed phase is relatively large, the gel mass is sometimes referred to as a magma (e.g., Bentonite Magma, *NF*). Both gels and magmas may be thixotropic, forming semisolids after standing and becoming liquid when agitated. They should be shaken before use to ensure homogeneity and should be labeled to that effect (see Topical Suspensions, below). Single-phase gels consist of organic macromolecules uniformly distributed throughout a liquid with no apparent boundary between the dispersed macromolecule and liquid.

Lotions

Although the term lotion may be applied to a solution, lotions usually are fluid, somewhat viscid emulsion dosage forms for external application to the skin. Lotions share many characteristics with creams. See Creams, Topical Solutions, and Topical Suspensions, herein.

Ointments

Ointments are semisolids intended for external application to the skin or mucous membranes. They usually contain less than 20% water and volatiles and more than 50% hydrocarbons, waxes, or polyols as the vehicle. Ointment bases recognized for use as vehicles fall into four general classes: hydrocarbon bases, absorption bases, water-removable bases, and water-soluble bases. Each therapeutic ointment possesses as its base one of these four general classes.

***Hydrocarbon Bases*—**Hydrocarbon bases, known also as ''oleaginous ointment bases,'' are represented by White Petrolatum and White Ointment (both *USP*). Only small amounts of an aqueous component can be incorporated into these bases. Hydrocarbon bases serve to keep medicaments in prolonged contact with the skin and act as occlusive dressings. These bases are used chiefly for their emollient effects and are difficult to wash off. They do not ''dry out'' or change noticeably on aging.

***Absorption Bases*—**This class of bases may be divided into two groups: the first consists of bases that permit the incorporation of aqueous solutions with the formation of a water-in-oil emulsion (e.g., Hydrophilic Petrolatum and Lanolin, both *USP*), and the second group consists of water-in-oil emulsions that permit the incorporation of additional quantities of aqueous solutions (Lanolin, *USP*). Absorption bases also are useful as emollients.

***Water-removable Bases*—**Water-removable bases are oil-in-water emulsions (e.g., Hydrophilic Ointment, *USP*), and are more correctly called ''creams'' (see Creams, above). They also are described as ''water-washable'' because they may be readily washed from the skin or clothing with water, an attribute that makes them more acceptable for cosmetic purposes. Some medicaments may be more effective in these bases than in hydrocarbon bases. Other advantages of the water-removable bases are that they may be diluted with water and that they favor the absorption of serous discharges in dermatological conditions.

***Water-soluble Bases*—**This group of so-called ''greaseless ointment bases'' comprises water-soluble constituents. Polyethylene Glycol Ointment, *NF* is the only pharmacopeial preparation in this group. Bases of this type offer many of the advantages of the water-removable bases and, in addition, contain no water-insoluble substances such as petrolatum, anhydrous lanolin, or waxes. They are more correctly called Gels (see Gels, above).

***Choice of Base*—**The choice of an ointment base depends on many factors, such as the action desired, the nature of the medicament to be incorporated and its bioavailability and stability, and the requisite shelf life of the finished product. In some cases, it is necessary to use a base that is less than ideal in order to achieve the stability required. Drugs that hydrolyze rapidly, for example, are more stable in hydrocarbon bases than in bases that contain water, even though they may be more effective in the latter.

Ophthalmic Ointments

Ophthalmic ointments are semisolids for application to the eye. Special precautions must be taken in the preparation of ophthalmic ointments. They are manufactured from sterilized ingredients under rigidly aseptic conditions, must meet the requirements under *Sterility Tests* ⟨71⟩, and must be free of large particles. The medicinal agent is added to the ointment base either as a solution or as a micronized powder.

Pastes

Pastes are semisolid dosage forms that contain a high percentage (often $\geq$ 50%) of finely dispersed solids with a stiff consistency intended for topical application. One class is made from a single-phase aqueous gel (e.g., Carboxymethylcellulose Sodium Paste, *USP*). The other class, the fatty pastes (e.g., Zinc Oxide Paste, *USP*), consists of thick, stiff ointments that do not ordinarily flow at body temperature and therefore serve as protective coatings over the areas to which they are applied.

Powders

Powders are solids or mixture of solids in a dry, finely divided state for external (or internal) use.

Sprays

Sprays are products formed by the generation of droplets of solution containing dissolved drug for application to the skin or mucous membranes. The droplets may be formed in a variety of ways but generally result from forcing the liquid through a specially designed nozzle assembly. One example of a spray dosage form is a metered-dose topical transdermal spray that delivers a precisely controlled quantity of solution or suspension on each activation.

Topical Aerosols

Topical aerosols are products that are packaged under pressure. The active ingredients are released in the form of fine liquid droplets or fine powder particles upon activation of an appropriate valve system. A special form is a metered-dose aerosol that delivers an exact volume (dose) per each actuation.

Topical Solutions

Topical solutions are liquid preparations, that usually are aqueous but often contain other solvents such as alcohol and polyols that contain one or more dissolved chemical substances intended for topical application to the skin, or, as in the case of Lidocaine Oral Topical Solution *USP*, to the oral mucosal surface.

Topical Suspensions

Topical suspensions are liquid preparations that contain solid particles dispersed in a liquid vehicle intended for application to the skin. Some suspensions labeled as ''Lotions'' fall into this category.

Transdermal Delivery Systems

Transdermal delivery systems (TDS) are self-contained, discrete dosage forms that, when applied to intact skin, are designed to deliver the drug(s) through the skin to the systemic circulation. Systems typically comprise an outer covering (barrier), a drug reservoir that may have a drug release–controlling membrane, a contact adhesive applied to some or all parts of the system and the system/skin interface, and a protective liner that is removed before the patient applies the system. The dose of these systems is defined in terms of the release rate of the drug(s) from the system and surface area of the patch and is expressed as mass per unit time for a given surface area. With these drug products, the skin typically is the rate-controlling membrane for the drug input into the body. The total duration of drug release from the system and system surface area may also be stated.

TDS work by diffusion: The drug diffuses from the drug reservoir, directly or through the rate-controlling membrane and/or contact adhesive if present, and then through the skin into the general circulation. Typically, modified-release systems are designed to provide drug delivery at a constant rate so that a true steady-state blood concentration is achieved and maintained until the system is removed. Following removal of the system, blood concentration declines at a rate consistent with the pharmacokinetics of the drug.

PRODUCT QUALITY TESTS—GENERAL

The International Conference on Harmonization (ICH) Guidance Q6A (available at www.ich.org) recommends specifications (tests, procedures, and acceptance criteria) to ensure that commercialized drug products are safe and effective at release and during shelf life. Tests that are universally applied to ensure safety and efficacy include description, identification, assay, and impurities.

Description—A qualitative description of the dosage form should be provided. The acceptance criteria should include the final acceptable appearance. If color changes during storage, a quantitative procedure may be appropriate. It specifies the content or the label claim of the article.

Identification—Identification tests are discussed in *Procedures* under *Tests and Assays* in the *General Notices and Requirements*. Identification tests should establish the identity of the drug or drugs present in the article and should discriminate between compounds of closely related structure that are likely to be present. Identity tests should be specific for the drug substances. The most conclusive test for identity is the infrared absorption spectrum (see *Spectrophotometry and Light-scattering* ⟨851⟩

and *Spectrophotometric Identification Tests* ⟨197⟩). If no suitable infrared spectrum can be obtained, other analytical techniques can be used. Near infrared (NIR) or Raman spectrophotometric methods also could be acceptable as the sole identification method of the drug product formulation (see *Near-infrared Spectrophotometry* ⟨1119⟩ and *Raman Spectroscopy* ⟨1120⟩). Identification solely by a single chromatographic retention time is not regarded as specific. However, the use of two chromatographic procedures for which the separation is based on different principles or a combination of tests in a single procedure can be acceptable. See *Chromatography* ⟨621⟩ and *Thin-layer Chromatographic Identification* ⟨201⟩.

***Assay*—**A specific and stability-indicating test should be used to determine the strength (content) of the drug product. See *Antibiotics—Microbial Assays* ⟨81⟩, ⟨621⟩, or *Assay for Steroids* ⟨351⟩. In cases when the use of nonspecific assay is justified, e.g., *Titrimetry* ⟨541⟩, other supporting analytical procedures should be used to achieve overall specificity. A specific procedure should be used when there is evidence of excipient interference with the nonspecific assay.

***Impurities*—**Process impurities, synthetic by-products, and other inorganic and organic impurities may be present in the drug substance and excipients used in the manufacture of the drug product. These impurities are controlled by the drug substance and excipients monographs. Organic impurities arising from the degradation of the drug substance and those arising during the manufacturing process of the drug product should be monitored.

In addition to the universal tests listed above, the following tests may be considered on a case-by-case basis:

***Physicochemical Properties*—**These are properties such as *pH* ⟨791⟩, *Viscosity* ⟨911⟩, and *Specific Gravity* ⟨841⟩.

***Uniformity of Dosage Units*—**This test is applicable for TDS and for dosage forms packaged in single-unit containers. It includes both the mass of the dosage form and the content of the active substance in the dosage form. The test can be performed by either content uniformity or weight variation (see *Uniformity of Dosage Units* ⟨905⟩).

***Water Content*—**A test for water content should be included when appropriate (see *Water Determination* ⟨921⟩).

***Microbial Limits*—**The type of microbial test(s) and acceptance criteria should be based on the nature of the drug substance, method of manufacture, and the intended use of the drug product. See *Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests* ⟨61⟩ and *Microbiological Examination of Nonsterile Products: Tests for Specified Microorganisms* ⟨62⟩.

***Antimicrobial Preservative Content*—**Acceptance criteria for preservative content in multidose products should be established. They should be based on the levels of antimicrobial preservative necessary to maintain the product's microbiological quality at all stages throughout its proposed usage and shelf life (see *Antimicrobial Effectiveness Testing* ⟨51⟩).

***Antioxidant Preservative Content*—**If antioxidant preservatives are present in the drug product, tests of their content normally should be determined.

***Sterility*—**Depending on the use of the dosage form, e.g., ophthalmic preparations, sterility of the product should be demonstrated as appropriate (see *Sterility Tests* ⟨71⟩).

PRODUCT QUALITY TESTS FOR TOPICAL DRUG PRODUCTS

General product quality tests such as identification, assay, content uniformity (uniformity of dosage units), impurities, pH, water content, microbial limits, antimicrobial preservative content, antioxidant preservative content, and sterility should be performed for topical drug products as described above. In addition, specific tests for topical dosage forms, as described below, also should be conducted.

***Viscosity*—**Rheological properties such as viscosity of semisolid dosage forms can influence their drug delivery. Viscosity may directly influence the diffusion rate of drug at the microstructural level. Yet semisolid drug products with relatively high viscosity still can exhibit high diffusion rates when compared to semisolid products of comparatively lower viscosity. These observations emphasize the importance of rheologic properties of semisolid dosage forms, specifically viscosity, on drug product performance.

Depending on its viscosity, the rheological behavior of a semisolid drug product may affect its application to treatment site(s) and consistency of treatment and thus the delivered dose. Therefore, maintaining reproducibility of a product's flow behavior at the time of release is an important product manufacturing control to maintain and demonstrate batch-to-batch consistency. Most semisolid dosage forms, when sheared, exhibit non-Newtonian behavior. Structures formed within semisolid drug products during manufacturing can show a wide range of behaviors, including shear thinning viscosity, thixotropy, and structural damage that may be irreversible or only partially reversible. In addition, the viscosity of a semisolid dosage form is highly influenced by such factors as the inherent physical structure of the product, product sampling technique, sample temperature for viscosity testing, container size and shape, and specific methodology employed in the measurement of viscosity.

A variety of methods can be used to characterize the consistency of semisolid dosage forms, such as penetrometry, viscometry, and rheometry. With all methods significant attention is warranted to the shear history of the sample. For semisolids, viscometer geometries typically fall into the following categories: concentric cylinders, cone-plates, and spindles. Concentric cylinders and spindles typically are used for more fluid, flowable semisolid

dosage forms. Cone-plate geometries are more typically used when the sample size is small or the test samples are more viscous and less flowable.

When contemplating what viscosity parameter(s) to test, one must consider the properties of the semisolid drug product both ''at rest'' (in its container) and as it is sheared during application. The rheological properties of the drug product at rest can influence the product's shelf life, and its properties under extensive shear can influence its spreadability and, therefore, its application rate that will affect the safety and efficacy of the drug product. Further, although it is necessary to precisely control the temperature of the test sample during the viscosity measurement, one should link the specific choice of the temperature to the intended use of the drug product (e.g., skin temperature for external application effects).

Because semisolid dosage forms frequently display non-Newtonian flow properties, formulators should give close attention to the shear history of the sample being tested, such as the shear applied during the filling operation, shear applied dispensing the product from its container, and shear introducing the sample into the viscometer. The point of reemphasizing this aspect is that considerable variability and many failures to meet specifications can be directly attributed to a lack of attention to this detail rather than a change of viscosity (or flow properties) of the drug product.

Tube (Content) Uniformity—Tube uniformity is the degree of uniformity of the amount of active drug substance among containers, i.e., tubes containing multiple doses of the semisolid topical product. The uniformity of dosage is demonstrated by assay of top, middle, and bottom samples (typically 0.25–1.0 g) obtained from a tube cut open to withdraw respective samples for drug assay.

Various topical semisolid products may show some physical separation at accelerated storage temperatures because emulsions, creams, and topical lotions are prone to mild separation due to the nature of the vehicle.

The following procedure should be followed for testing tube uniformity of semisolid topical dosage forms:

1. Carefully remove or cut off the bottom tube seal and make a vertical cut up the face of the tube. Then carefully cut the tube around the upper rim and pry open the two ''flaps'' to expose the semisolid.
2. At the batch release and/or designated stability time point remove and test 0.25- to 1.0-g samples from the top, middle, and bottom of a tube. If assay values for those tests are within 90.0% to 110.0% of the labeled amount of active drug, and the relative standard deviation (RSD) is not more than 6%, then the results are acceptable.
3. If at least 1 value of the testing described above is outside 90.0% to 110.0% of the labeled amount of drug and none is outside 85.0% to 115.0% and/or the RSD is more than 6%, then test an additional 3 randomly sampled tubes using top, middle, and bottom samples as described. Not more than 3 of the 12 determinations should be outside the range of 90% to 110.0% of the labeled amount of drug, none should be outside 85.0% to 115.0%, and the RSD should not be not more than 7%.
4. For very small tubes (e.g., 5 g or less), test only top and bottom samples, and all values should be within the range of 90.0% to 110.0% of the labeled amount of drug.

pH—When applicable, semisolid drug products should be tested for pH at the time of batch release and designated stability test time points for batch-to-batch monitoring. Because most semisolid dosage forms contain very limited quantities of water or aqueous phase, pH measurements may be warranted only as a quality control measure, as appropriate.

Particle Size—Particle size of the active drug substance in semisolid dosage forms is determined and controlled at the formulation development stage. When applicable, semisolid drug products should be tested for any change in the particle size or habit of the active drug substance at the time of batch release and designated stability test time points (for batch-to-batch monitoring) that could compromise the integrity and/or performance of the drug product, as appropriate.

Ophthalmic Dosage Forms—Ophthalmic dosage forms must meet the requirements of *Sterility* ⟨71⟩. If the specific ingredients used in the formulation do not lend themselves to routine sterilization techniques, ingredients that meet the sterility requirements described under *Sterility* ⟨71⟩, along with aseptic manufacture, may be employed. Ophthalmic ointments must contain a suitable substance or mixture of substances to prevent growth of, or to destroy, microorganisms accidentally introduced when the container is opened during use, unless otherwise directed in the individual monograph or unless the formula itself is bacteriostatic (see *Added Substances* under *Ophthalmic Ointments* ⟨771⟩). The finished ointment must be free from large particles and must meet the requirements for *Leakage* and for *Metal Particles* in ⟨771⟩. The immediate containers for ophthalmic ointments shall be sterile at the time of filling and closing. It is mandatory that the immediate containers for ophthalmic ointments be sealed and tamper-proof so that sterility is assured at time of first use.

PRODUCT QUALITY TESTS FOR TOPICAL DRUG PRODUCTS

General product quality tests such as identification, assay, content uniformity (uniformity of dosage units), impurities, pH, water content, microbial limits, antimicrobial preservative content, antioxidant preservative content, and sterility should be performed for topical drug products. In addition, specific tests for topical dosage forms, such as viscosity, tube (content) uniformity, and particle size also should be conducted. For details, see General Chapter *Product Quality Tests: Topical and Transdermal Drug Products* ⟨3⟩.

PRODUCT PERFORMANCE TEST FOR TOPICAL DRUG PRODUCTS

A performance test for topical drug products must have the ability to measure drug release from the finished dosage form. It must be reproducible and reliable, and although it is not a measure of bioavailability, the performance test must be capable of detecting changes in drug release characteristics from the finished product. The latter have the potential to alter the biological performance of the drug in the dosage form. Those changes may be related to active or inactive/inert ingredients in the formulation, physical or chemical attributes of the finished formulation, manufacturing variables, shipping and storage effects, aging effects, and other formulation factors critical to the quality characteristics of the finished drug product.

Product performance tests can serve many useful purposes in product development and in postapproval drug product monitoring. They provide assurance of equivalent performance for products that have undergone postapproval raw material changes, relocation or change in manufacturing site, and other changes as detailed in the FDA *Guidance for Industry—SUPAC-SS: Nonsterile Semisolid Dosage Forms, Manufacturing Equipment Addendum,* Dec 1998, available at http://www.fda.gov/cder/guidance/1722dft.pdf.

Vertical Diffusion Cell Method

***Theory*—**The vertical diffusion cell (VDC) system is a simple, reliable, and reproducible means of measuring drug release from semisolid dosage forms. A thick layer of the test semisolid is placed in contact with a reservoir. Diffusive communication between the delivery system and the reservoir takes place through an inert, highly permeable support membrane. The membrane keeps the product and the receptor medium separate and distinct. Membranes are chosen to offer the least possible diffusional resistance and not to be rate controlling. Samples are withdrawn from the reservoir at various times. In most cases, a five- to six-hour time period is all that is needed to characterize drug release from a semisolid, and when this is the case samples usually are withdrawn hourly.

After a short lag period, release of drug from the semisolid dosage form in the VDC system is kinetically describable by diffusion of a chemical out of a semi-infinite medium into a sink. The momentary release rate tracks the depth of penetration of the forming gradient within the semisolid. Beginning at the moment when the receding boundary layer's diffusional resistance assumes dominance of the kinetics of release, the amount of the drug released, *M*, becomes proportional to $\sqrt{t}$ (where *t* = time) for solution, suspension, or emulsion semisolid systems alike. The momentary rate of release, *dM/dt*, becomes proportional to $1/\sqrt{t}$, which reflects the slowing of drug release with the passage of time. The reservoir is kept large so that drug release is into a medium that remains highly dilute over the entire course of the experiment relative to the concentration of drug dissolved in the semisolid. In this circumstance, drug release is said to take place into a diffusional sink.

When a drug is totally in solution within the dosage form, the amount of drug released as a function of time can be described by:

$$M = 2 \cdot Co \sqrt{\frac{D \cdot t}{\pi}}$$

where:
M = amount of drug released into the sink per cm^2
Co = drug concentration in releasing matrix
D = drug diffusion coefficient through the matrix.

A plot of *M* vs $\sqrt{t}$ will be linear with a slope of

$$2 \cdot Co \sqrt{\frac{D}{\pi}}$$

The following equation describes drug release when the drug is in the form of a suspension within the dosage form:

$$M = \sqrt{2 \cdot Dm \cdot Cs \left(Q - \frac{Cs}{2} \right) t}$$

where
Cs = drug solubility in the releasing matrix
Dm = drug diffusion coefficient in the semisolid matrix
Q = total amount of the drug in solution and suspended in the matrix.

When *Q*>>*Cs*, the previous equation simplifies to:

$$M = \sqrt{2 \cdot Q \cdot Dm \cdot Cs \cdot t}$$

A plot of *M* vs $\sqrt{t}$ will be linear with a slope of $\sqrt{2QDmCs}$.

Coarse particles may dissolve so slowly that the moving boundary layer recedes to some extent behind the particles. That situation introduces noticeable curvature in the $\sqrt{t}$ plot because of a particle size effect. During release rate experiments, every attempt should be made to keep the composition of the formulation intact over the releasing period.

***In Vitro* Drug Release Using the VDC—**A VDC system is used to determine in vitro release of semisolid (cream, ointment, and gel) preparations. Typically, 200–400 mg of a cream, ointment, or gel is spread evenly over a suitable synthetic inert support membrane. The membrane, with its application side up, is placed in a vertical diffusion cell (typically of 15-mm diameter orifice), e.g., a Franz cell. The release rate experiment is carried out at 32 ± 1 °C, except in the case of vaginal creams for which the temperature should be 37 ± 1 °C. Sampling generally is performed over 4–5 hours, and the volume sampled is replaced with fresh receptor medium. To achieve sink conditions, the receptor medium must have a high capacity to dissolve or carry away the drug, and the receptor media should not exceed 10% of *Cs* (drug solubility in

the releasing matrix) at the end of the test. The test is done with groups of 6 cells. Results from 12 cells, 2 runs of 6 cells, are used to document the release rate.

Application of Drug Release—The drug release results can be utilized for purposes such as ensuring product sameness after scale-up and post-approval related changes or successive batch release comparison.

The VDC assembly consists of two chambers, a donor chamber and a receptor chamber, separated by a donor compartment and held together by a clamp (see *Figure 1*). This type of cell is commonly used for testing the in vitro release rate of topical drug products such as creams, gels, and ointments. Alternative diffusion cells that conform to the same general design and size can be used.

The VDC body normally is made from borosilicate glass, although different materials may be used to manufacture the body and other parts of the VDC assembly. None of the materials should react with or absorb the test product or samples.

In the donor compartment, the semisolid dosage form sample sits on a synthetic membrane within the cavity of the dosage compartment that is covered with a glass disk.

The diameters of the orifices of the donor chamber and the dosage compartment, which defines the dosage delivery area for the test, should be sized within ± 5% of the specified diameter. The receptor chamber orifice should never be smaller than the orifice of the donor chamber and should be fabricated to the same size as the donor chamber orifice. The design of the VDC should facilitate proper alignment of the dosage compartment and receptor orifices.

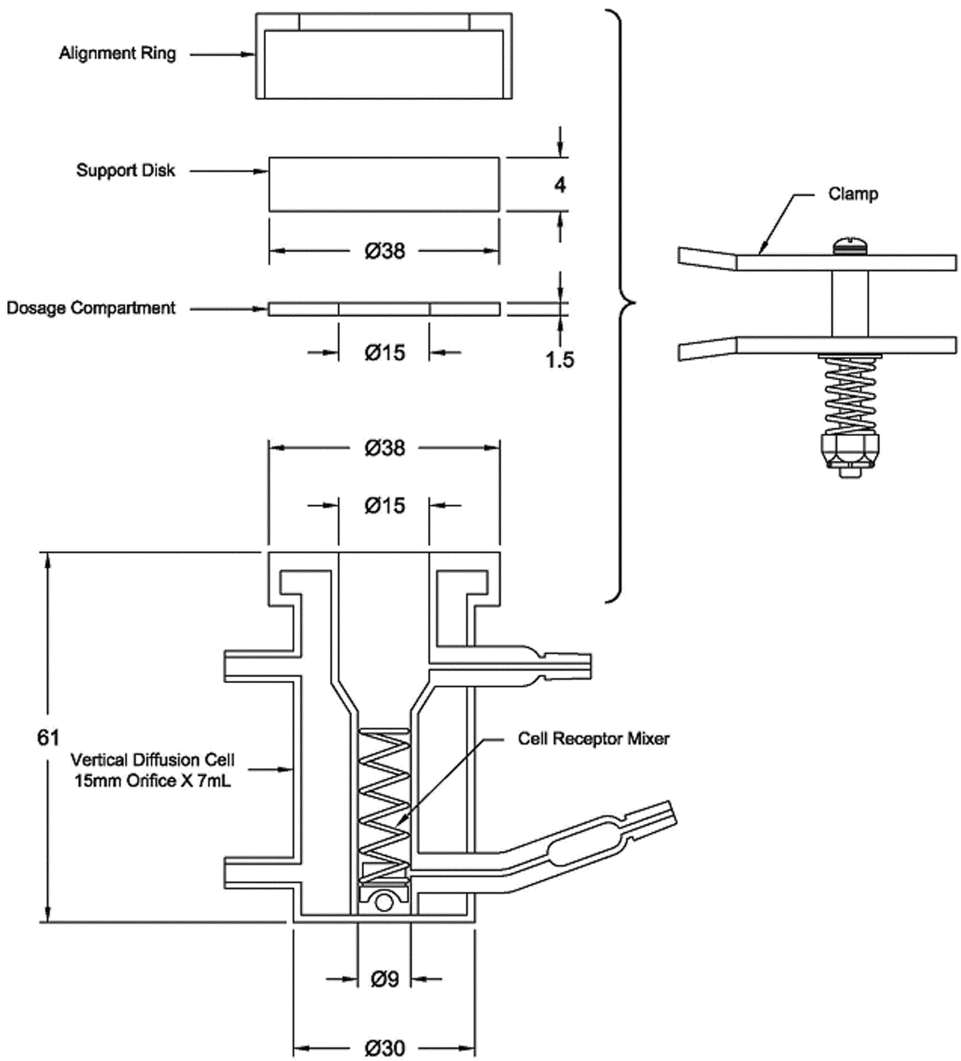

Figure 1. Vertical diffusion cell. (All measurements are expressed in mm unless noted otherwise).

The thickness of the dosage compartment normally is 1.5 mm. This thickness should be sized within ± 10% of the specified thickness.

The cell body should be manufactured consistently, with uniform height and geometry. Cells should appear the same, and their internal receptor volumes should fall within ± 20% of their specified volume.

Volume—Before conducting testing, determine the true volume of each receptor chamber in the VDC. The volume of each VDC should be determined with the internal stirring device in place.

Temperature—The temperature of the receptor media during the test should remain within ± 1.0 °C of the target temperature (typically 32 °C).

Speed—The rotational speed tolerance is ± 10% from the target speed (normally 600–800 rpm). The speed selected should ensure adequate mixing of the receptor media during the test.

Sampling Time—Samples should be taken at the specified times within a tolerance of ± 2% or ± 2 min, whichever is greatest.

Qualification—Unless otherwise specified in the individual monograph, the qualification of the apparatus is demonstrated by verifying the test temperature and speed requirements are met, along with a performance verification test (PVT). The PVT is passed if two tests of 6 cells comply with FDA's *SUPAC-SS* requirements of a 90% confidence interval. The PVT is performed by one analyst testing the specified reference standard in duplicate. The first test with 6 cells is performed and is defined as the reference. The second test of 6 cells is defined as the test. The PVT is passed if the second test passes the 90% confidence interval with reference to the first reference test.

Procedure—Unless otherwise specified in the individual monograph, degas the medium using an appropriate technique. With the stirring device in place, fill the VDC with the specified media and allow time for it to come to a temperature of 32 °C. If necessary, saturate the membrane in the specified media (generally receptor media) for 30 min. Place the membrane on the dosage compartment and invert. Apply the material that will be tested into the cavity of the dosage compartment, and spread the material out to fill the entire cavity of the dosage compartment.

Assemble each of the prepared dosage compartments to each VDC with the membrane down and in contact with the receptor media. During this application it is important to ensure that there are no bubbles under the membrane. When all dosage compartments and the remaining components are in place, turn on the stirring device, which constitutes time zero.

Follow the specified sampling procedure and collect an aliquot from each VDC for analysis. Ensure that during the sampling process bubbles are not introduced into the cell. Exercise care during sampling and replenishment of the medium in order not to introduce bubbles.

With some cells it is acceptable to have up to three bubbles under the membrane if the bubbles are less than 1 mm in diameter. With some cells, bubbles may be removed from the receptor chamber during the test by tipping the cell as long as this process is required only one time per position.

Calculation of Rate (Flux) and Amount of Drug Released

Creams and ointments are considered extended-release preparations. Their drug release largely depends on the formulation and method of preparation. The release rate of a given drug product from different manufacturers is likely to be different. It is assumed that the drug release of the product is linked to the clinical batch.

Unless otherwise specified in the individual monograph, the release requirements are met if the following have been achieved:

The *Amount Released* (μg/cm²) at a given time (t_1, t_2, etc.) is calculated for each sample as follows:

$$\text{Amount Released}_{t_1} = \frac{A_u}{A_s} \bullet C_s \bullet 1{,}000 \bullet \frac{V_c}{A_o}$$

$$\text{Amount Released}_{t_2} = \frac{A_u}{A_s} \bullet C_s \bullet 1{,}000 \bullet \frac{V_c}{A_o} + \left(AR_{t_1} \bullet \frac{V_s}{V_c} \right)$$

$$\text{Amount Released}_{t_n} = \frac{A_u}{A_s} \bullet C_s \bullet 1{,}000 \bullet \frac{V_c}{A_o} + \sum_{i=1}^{n-1} \left(AR_{t_{n-1}} \bullet \frac{V_s}{V_c} \right)$$

where
A_u = Area of the current sample
A_s = Average area of the standard
C_s = Concentration of the standard, mg/mL
V_c = Volume of the diffusion cell, mL
AR = Amount released, μg/cm²
A_o = Area of the orifice, cm²
V_s = Volume of the sample aliquot, mL.

For each cell the individual amount released is plotted vs time, and the slope of the resulting line (rate of drug release, flux) is determined. The average of 6 + 6 slopes represents the drug release of the dosage form and serves as the standard for the drug product.

Application of Drug Release

The drug release results can be utilized for purposes such as ensuring product sameness after *SUPAC-SS*–related changes or successive batch release comparison. This is illustrated by the following example where the initial drug batch is referred to as *Reference Batch* (R) and the changed or subsequent batch is referred to as *Test Batch* (T). The individual amount released from R is plotted vs time, and the resulting slope is determined. These are the reference slopes. The process is repeated to determine the test slopes.

The T/R Ratios are calculated for each Test-to-Reference Slope. This is most easily done by creating a table in which the Test Slopes are listed down the left side of the table and the Reference Slopes are listed across the

top of the table. The T/R ratios are then calculated and entered in the body of the table where the rows and columns intersect (*Table 1*).

After the T/R Ratios have been calculated they are ordered from lowest to highest. The 8th and 29th T/R Ratios are extracted and converted to percent (multiply by 100). To pass the first stage these ratios must fall within the range of 75% to 133.33%.

If the results do not meet this criterion, the FDA *SUPAC-SS* guidance requires that 4 more tests of 6 cells each must be run, resulting in 12 additional slopes per product tested. The T/R ratios are calculated for all 18 slopes per product tested. All 324 individual T/R Ratios are calculated and ordered lowest to highest. The 110th and the 215th ratios are evaluated against the specification of 75% to 133.33%.

No third stage is suggested.

PVT Method for USP Hydrocortisone Cream Reference Standard

Materials and Equipment

USP Hydrocortisone Cream Reference Standard; 25-mm, 0.45-μm hydrophilic polysulfone [NOTE—a suitable filter is Tuffryn available from www.pall.com] membrane filters; vacuum filtration apparatus consisting of a filter holder with a medium or fine-porosity sintered glass holder base, funnel with a 250-mL capacity, and magnetic stirrer; small and smooth jeweler's forceps; depression porcelain color plate; Diffusion Cell System with 6 diffusion cells and temperature control circulator; and sampling syringe or device and collection vials.

Procedure

Receptor Medium Preparation

Mix 60 mL of USP Alcohol with 140 mL of water to prepare a 30% alcoholic media. Degas the media by filtering through a 47-mm, 0.45-μm membrane by vacuum filtration. Assemble the filtration apparatus placing a magnetic stir bar (approximately 1in × 0.25 in) in the receiving flask. Place the apparatus on a magnetic stirring plate, and spin the bar at a moderate rate. Apply vacuum and pass the media through the filter while stirring. After all media have passed through the filter, continue stirring while maintaining a vacuum for 2 min. Applying vacuum and stirring beyond 2 min may change the composition of the water–alcohol media. Care should be taken to ensure that the period of time that the media is under vacuum after the filtration is complete is limited to 2 min.

Immediately transfer the degassed receptor medium to a suitable receptor medium bottle and stopper. Place the receptor medium bottle in the jacketed beaker and allow the media to equilibrate for 30 min before use.

Preparation of Apparatus

Set the circulating bath to a temperature (typically 32.5 °C) that will maintain the temperature in the diffusion cells at 32 °C during the test. Place the appropriate magnetic stirrer in each diffusion cell. Allow the system to equilibrate for at least 30 min before beginning the test.

Sample Preparation

Carefully lift one membrane at its very edge with jeweler's forceps. Place the membrane on a paper tissue, and blot any extreme excess solution (a slight excess solution is desired). Carefully place the membrane in the center of the dosage compartment. Place the dosage compartment, with the membrane centered on the underside, onto a tissue and press down on the compartment. Apply an appropriate amount of Hydrocortisone Cream Reference Standard (between 200 mg and 400 mg) on top of the membrane and inside of the dosage compartment cavity. Use a spatula to carefully smooth the material over the membrane, filling the entire cavity of the dosage compartment. Wipe any excess material from the surface of the dosage compartment. Repeat for a total of 6 sample preparations.

Performing the Test

Fill the diffusion cells with receptor media, and allow time to equilibrate to 32 °C. Ensure that the stirrers are not rotating and that there is a positive meniscus covering the complete top of each diffusion cell. Place the glass disk on top of the dosage compartment against the sample. Place the dosage compartment/glass disk assembly on the top of the diffusion cell, avoiding bubbles. Inspect under the membrane for bubbles. Assemble the cell. Repeat for each cell.

Begin the test according to the following test parameters: temperature: 32 °C; stir speed: 600–800 rpm; total test time: 6 h; sampling times: 1, 2, 3, 4, and 6 h.

Table 1. Calculation of T/R Ratios

	RS1	RS2	RS3	RS4	RS5	RS6
TS1	TS1/RS1	TS1/RS2	TS1/RS3	TS1/RS4	TS1/RS5	TS1/RS6
TS2	TS2/RS1	TS2/RS2	TS2/RS3	TS2/RS4	TS2/RS5	TS2/RS6
TS3	TS3/RS1	TS3/RS2	TS3/RS3	TS3/RS4	TS3/RS5	TS3/RS6
TS4	TS4/RS1	TS4/RS2	TS4/RS3	TS4/RS4	TS4/RS5	TS4/RS6
TS5	TS5/RS1	TS5/RS2	TS5/RS3	TS5/RS4	TS5/RS5	TS5/RS6
TS6	TS6/RS1	TS6/RS2	TS6/RS3	TS6/RS4	TS6/RS5	TS6/RS6

Sampling Procedure

At each of the stated sampling times, collect a sample from each cell as follows:

Stop the stirrer 30 sec before sampling. Repeat sampling procedure for each cell in order from 1 to 6. After the sixth cell has been sampled, resume the stirrer rotation.

High-performance Liquid Chromatography (HPLC) Hydrocortisone Analysis

USP Hydrocortisone Cream Reference Standard; acetonitrile, HPLC grade; water, HPLC grade; USP alcohol, 95%; 47-mm, 0.45-μm hydrophilic polysulfone membrane filters [NOTE—a suitable filter is Tuffryn available from www.pall.com]; HPLC System with UV detector capable of 10-μL injections; 50 mm × 3.9 mm column that contains 5 μm packing L1.

Procedure

Mobile Phase Preparation

Prepare and degas a sufficient volume of mobile phase to complete the analysis of the samples collected. For each 1 L of mobile phase mix 200 mL of acetonitrile with 800 mL of water. If necessary, adjust the mobile phase composition to achieve an approximate retention time of 7 min for the hydrocortisone peak.

Standard Preparation

Obtain a portion of appropriately dried Hydrocortisone Cream Reference Standard. Prepare a stock hydrocortisone standard solution at a concentration of approximately 0.20 mg/mL in USP alcohol. A solution of 20 mg hydrocortisone in 100 mL of USP alcohol is suggested for the stock standard preparation. Prepare a working standard solution by making a 5-fold dilution of the stock standard in a solution of 30:70 USP alcohol/water mixture. For example, dilute 2 mL to 10 mL.

Chromatographic Conditions

Wavelength—242 nm; flow rate: 1 mL/min; injection volume: 10 μL; run time: 10 min; column: 50 mm × 3.9 mm C-18, 5-μm (Symmetry); mobile phase: 20/80 acetonitrile/water. Begin the analysis by making 5 replicate injections of the working hydrocortisone standard solution for system suitability.

System Suitability Requirements—Relative standard deviation: < 2%; tailing factor: NMT 1.5. Make single injections of each of the samples obtained during the in vitro release testing. Bracket injections of samples with single standard injections after the analysis of the 2-h samples, 4-h samples, and 6-h samples. Calculate the results as specified.

Other Test Systems

Other diffusion-type cell devices are available as potential apparatus for drug release testing from topical/dermal drug products. However, only limited data are available for these devices. USP will consider these devices for inclusion in this General Chapter after they are validated and collaborative study data have been evaluated. The devices currently include:

Modified Holding Cell—A sample of semisolid dosage form is placed in an inert holding cell with a suitable membrane separating the dosage form from the receptor medium. The holding cell is positioned at the bottom of a modified, reduced-volume dissolution vessel of the USP Apparatus 2 type and is stirred with a mini paddle.

USP Apparatus 4 (Flow-through Cell) with a Trans-cap Semisolid Cell—A sample of the semisolid dosage form is placed in the trans-cap cell with a suitable membrane separating the dosage form from the receptor medium. The trans-cap cell with membrane facing upward is inserted into the 22.6-mm flow cell of USP Apparatus 4 (Flow-through Cell).

Extraction Cell—A sample of the semisolid dosage form is placed in an inert extraction cell with a suitable membrane separating the dosage form from the receptor medium. The test is performed using the USP Apparatus 2 assembly with the extraction cell positioned at the bottom of the dissolution vessel.

Product Quality Tests for Transdermal Delivery Systems

TDS are physical devices that deliver their active ingredient at a fixed rate over a prolonged period of time, e.g., from days to as long as one month. Their methods of delivery or release mechanisms vary significantly because of differences in their composition and fabrication. TDS systems can be categorized as (1) liquid form, fill, and seal systems, (2) peripheral adhesive systems, or (3) matrix systems. The latter two categories include the subcategories of monolithic, matrix, multi-laminate, and drug-in-adhesive systems. Moreover, recent advances in the design of novel transdermal drug delivery systems has expanded the list of basic TDS categories further, including, systems that employ iontophoresis, heat-assisted drug delivery, or micro-needles.

In all three principal TDS categories, the drug is in solution or suspension. Factors that can influence drug release and, therefore, the performance of TDS dosage forms include changes in formulation composition involving the adhesive, solvents, viscosity-modifying agents, permeation enhancers, and changes in the dosage form's semipermeable film or laminate.

The product quality tests for transdermal drug delivery system include assay, content uniformity, homogeneity, and adhesive test.

Uniformity of dosage units—This test is applicable for transdermal systems and for dosage forms that are packaged in single-unit containers. It includes both the mass of the dosage form and the content of the active substance in the dosage form. It can be done by either content uniformity or weight variation (see ⟨905⟩).

Assay of excipient(s) critical to the performance of the product should be considered; e.g., residual solvent content can affect certain patches.

Adhesive Test—Three types of adhesive tests generally are performed to ensure the performance of the TDS dosage forms. These are the peel adhesion test, tack test, and shear strength test. The peel adhesion test measures the force required to peel away a transdermal patch attached to a stainless steel test panel substrate at panel angles of 90° or 180° following a dwell time of 1 min and peel rate of 300 mm/min.

The tack test is used to measure the tack adhesive properties of TDS dosage forms. With this test a probe touches the adhesive surface with light pressure, and the force required to break the adhesion after a brief period of contact is measured.

The shear strength or creep compliance test is a measure of the cohesive strength of TDS dosage forms. Two types of shear testing are performed: dynamic and static. During dynamic testing the TDS is pulled from the test panel at a constant rate. With the static test the TDS is subjected to a shearing force by means of a suspended weight.

Leak Test—A test that is discriminating and capable of detecting sudden drug release, such as leakage, from the TDS should be performed. Although form, fill, and seal TDS are more likely to display leak problems, all TDS should be checked for sudden drug release (dose dumping) during release testing of the dosage form.

Product Performance Tests for TDS

As with topical drug products, a performance test for transdermal drug products also must have the ability to measure drug release from the finished dosage form, must be reproducible and reliable, and must be capable of detecting changes in drug release characteristics from the finished product. Again, the latter have the potential to alter the desired pharmacologic effect(s) of the active ingredient. Such changes could be related to active or inactive/inert ingredients in the formulation or physical dosage form, physical or chemical attributes of the finished preparation, manufacturing variables, shipping and storage, age, and other critical-to-quality characteristics of the finished dosage form.

When based on sound scientific principles, product performance tests can be used for pre- and postmanufacturing purposes such as during the product research and development phase, as a basic quality control tool, for demonstrating product similarity, or for demonstrating compliance with FDA guidelines (e.g., approval and postapproval changes in the dosage form).

In vitro drug release methods for transdermal patches include USP Apparatus 5 (Paddle over Disk Method), Apparatus 6 (Rotating Cylinder Method), or Apparatus 7 (Reciprocating Holder Method). In general, it has been found that Apparatus 5, a modified paddle method, is simpler and is applicable for most types, sizes, and shapes of TDS.

Apparatus 5 (Paddle over Disk Method)

Apparatus—Use the paddle and vessel assembly from *Apparatus 2* as described in *Dissolution* ⟨711⟩, with the addition of a stainless steel disk assembly (*1*) designed for holding the transdermal system at the bottom of the vessel. Other appropriate devices may be used, provided they do not absorb, react with, or interfere with the specimen being tested (*2*). The temperature should be maintained at 32 ± 0.5 °C. During the test maintain a distance of 25 ± 2 mm between the paddle blade and the surface of the disk assembly. The vessel may be covered during the test to minimize evaporation. The disk assembly for holding the transdermal system is designed to minimize any dead volume between the disk assembly and the bottom of the vessel. The disk assembly holds the system flat and is positioned so that the release surface is parallel with the bottom of the paddle blade (see *Figure 2*).

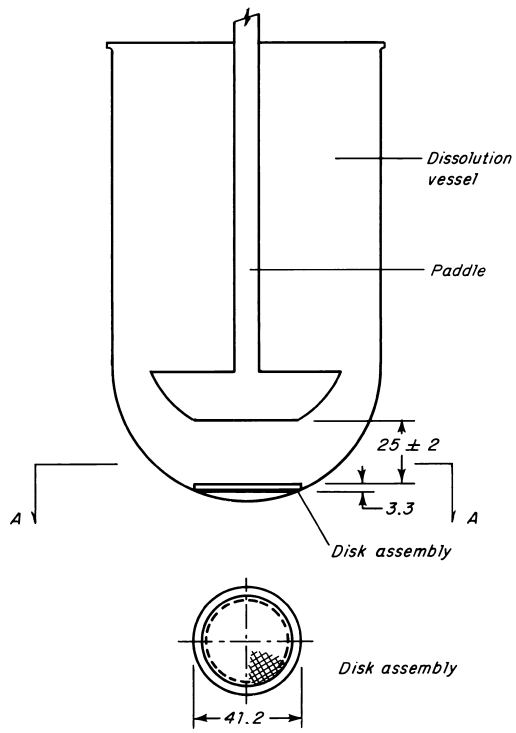

Fig. 2. Paddle over Disk. (All measurements are expressed in mm unless noted otherwise.)

Apparatus Suitability Test and Dissolution Medium—Proceed as directed for *Apparatus 2* in ⟨711⟩.

Procedure—Place the stated volume of the *Dissolution Medium* in the vessel, assemble the apparatus without the disk assembly, and equilibrate the medium to 32 ± 0.5 °C. Apply the transdermal system to the disk assembly, ensuring that the release surface of the system is as flat as possible. The system may be attached to the disk

by applying a suitable adhesive (*3*) to the disk assembly. Dry for 1 min. Press the system, release surface side up, onto the adhesive-coated side of the disk assembly. If a membrane (*4*) is used to support the system, it should be applied in such a way that no air bubbles occur between the membrane and the release surface. Place the disk assembly flat at the bottom of the vessel with the release surface facing up and parallel to the edge of the paddle blade and surface of the *Dissolution Medium*. The bottom edge of the paddle should be 25 ± 2 mm from the surface of the disk assembly. Immediately start operation of the apparatus at the rate specified in the monograph. At each sampling time interval, withdraw a specimen from a zone midway between the surface of the *Dissolution Medium* and the top of the blade, not less than 1 cm from the vessel wall. Perform the analysis on each sampled aliquot as directed in the individual monograph, correcting for any volume losses, as necessary. Repeat the test with additional transdermal systems.

***Sampling Time*—**The test time points, generally three, are expressed in hours. Specimens should be withdrawn within a tolerance of ± 15 min or ± 2% of the stated time; select the tolerance that results in the narrowest time interval.

***In Vitro Release Criteria*—**Unless otherwise specified in the individual monograph, the requirements are met if the quantities of active ingredient released from the system conform to *Acceptance Table 1* for transdermal drug delivery systems. Continue testing through the three levels unless the results conform at either L_1 or L_2.

Acceptance Table 1

Level	Number Tested	Criteria
L_1	6	No individual value lies outside the stated range.
L_2	6	The average value of the 12 units ($L_1 + L_2$) lies within the stated range. No individual value is outside the stated range by more than 10% of the average of the stated range.
L_3	12	The average value of the 24 units ($L_1 + L_2 + L_3$) lies within the stated range. Not more than 2 of the 24 units are outside the stated range by more than 10% of the average of the stated range, and none of the units is outside the stated range by more than 20% of the average of the stated range.

Apparatus 6 (Rotating Cylinder Method)

***Apparatus*—**Use the vessel assembly from *Apparatus 1* as described in ⟨711⟩, but replace the basket and shaft with a stainless steel cylinder stirring element and maintain the temperature at 32 ± 0.5 °C during the test. The shaft and cylinder components of the stirring element are fabricated from stainless steel to the specifications shown in *Figure 3*. The dosage unit is placed on the cylinder at the beginning of each test. The distance between the inside bottom of the vessel and the cylinder is maintained at 25 ± 2 mm during the test.

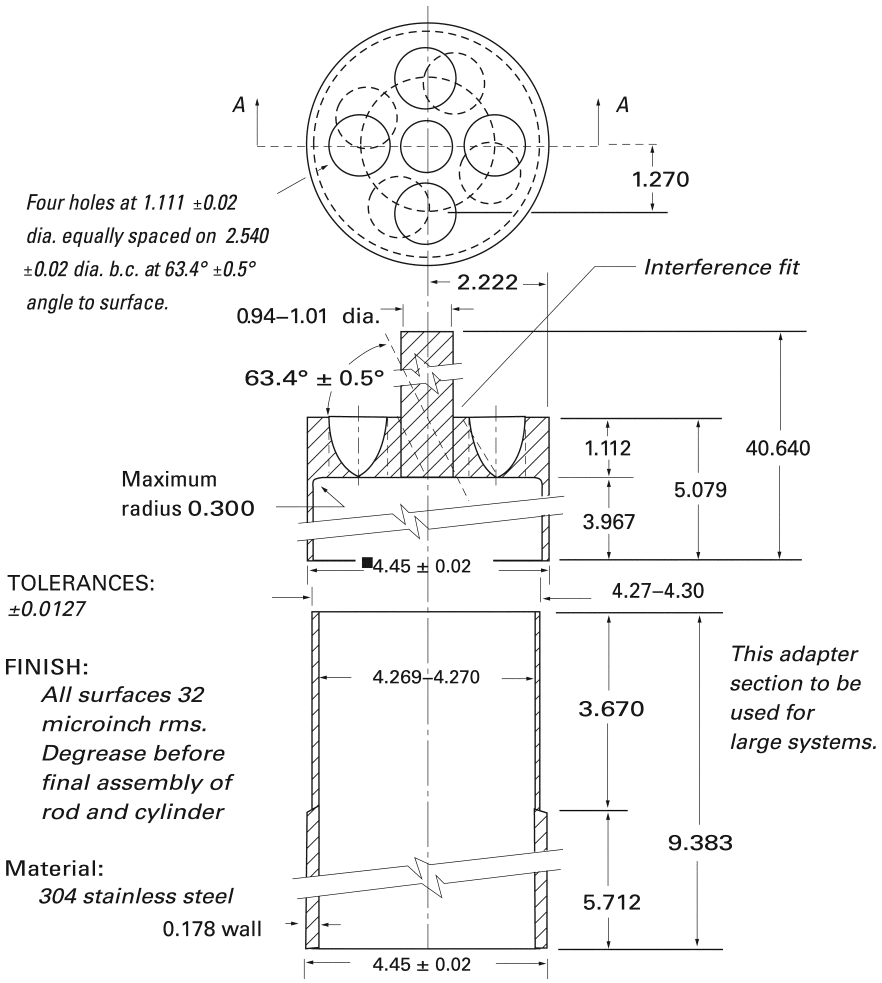

Fig. 3. Cylinder Stirring Element (*5*). (All measurements are expressed in cm unless noted otherwise.)

***Dissolution Medium*—**Use the medium specified in the individual monograph (see ⟨711⟩).

***Procedure*—**Place the stated volume of the *Dissolution Medium* in the vessel of the apparatus specified in the individual monograph, assemble the apparatus, and equilibrate the *Dissolution Medium* to 32 ± 0.5 °C. Unless otherwise directed in the individual monograph, prepare the test system before the test as follows:

Remove the protective liner from the system, and place the adhesive side on a piece of Cuprophan (*4*) that is not less than 1 cm larger on all sides than the system. Place the system, Cuprophan-covered side down, on a clean surface, and apply a suitable adhesive (*3*) to the exposed Cuprophan borders. If necessary, apply additional adhesive to the back of the system. Dry for 1 min. Carefully apply the adhesive-coated side of the system to the exterior of the cylinder so that the long axis of the system fits around the circumference of the cylinder. Press the Cuprophan covering to remove trapped air bubbles. Place the cylinder in the apparatus, and immediately rotate at the rate specified in the individual monograph. Within the time interval specified, or at each of the times stated, withdraw a quantity of *Dissolution Medium* for analysis from a zone midway between the surface of the *Dissolution Medium* and the top of the rotating cylinder, not less than 1 cm from the vessel wall. Perform the analysis as directed in the individual monograph, correcting for any volume losses as necessary. Repeat the test with additional transdermal drug delivery systems.

***Sampling Time*—**Proceed as directed for Apparatus 5.

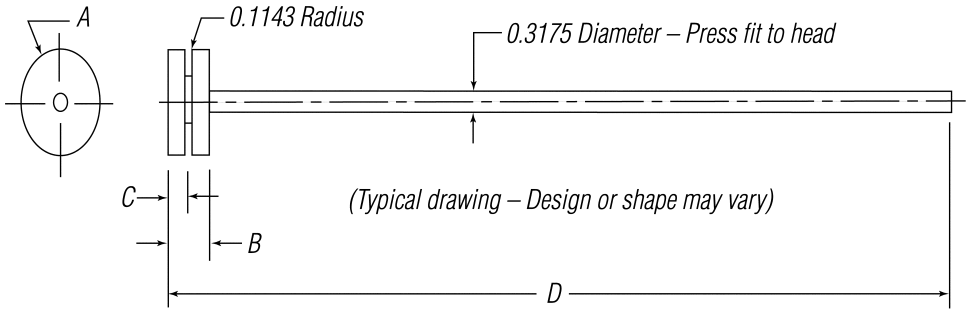
***In Vitro Release Criteria*—**Unless otherwise specified in the individual monograph, the requirements are met if the quantities of active ingredient released from the system conform to *Acceptance Table 1* for transdermal drug delivery systems. Continue testing through the three levels unless the results conform at either L_1 or L_2.

Apparatus 7 (Reciprocating Holder Method)

***Apparatus*—**The assembly consists of a set of volumetrically calibrated or tared solution containers made of glass or other suitable inert material (*6*), a motor and drive assembly to reciprocate the system vertically and to index the system horizontally to a different row of vessels auto-

matically if desired, and a set of suitable sample holders [see *Figure 4* (*2*) and *Figures 5a* and *5b*). The solution containers are partially immersed in a suitable water bath of any convenient size that permits maintaining the temperature, *T*, inside the containers at 32 ± 0.5 °C or within the allowable range, as specified in the individual monograph, during the test. No part of the assembly, including the environment in which the assembly is placed, should contribute motion, agitation, or vibration beyond that due to the smooth, vertically reciprocating sample holder.

An apparatus that permits observation of the system and holder during the test is preferable. Use the size container and sample holder specified in the individual monograph.



Dimensions are in centimeters

	HEAD				ROD		O-RING
System[a]	*A (Diameter)*	*B*	*C*	Material[b]	*D*	Material[c]	*(not shown)*
1.6cm^2	1.428	0.9525	0.4750	SS/VT	30.48	SS/P	Parker 2-113-V884-75
2.5cm^2	1.778	0.9525	0.4750	SS/VT	30.48	SS/P	Parker 2-016-V884-75
5cm^2	2.6924	0.7620	0.3810	SS/VT	8.890	SS/P	Parker 2-022-V884-75
7cm^2	3.1750	0.7620	0.3810	SS/VT	30.48	SS/P	Parker 2-124-V884-75
10cm^2	5.0292	0.6350	0.3505	SS/VT	31.01	SS/P	Parker 2-225-V884-75

[a] Typical system sizes.
[b] SS/VT=Either stainless steel or virgin Teflon.
[c] SS/P=Either stainless steel or Plexiglas.

Fig. 4. Reciprocating Disk Sample Holder (*7*).

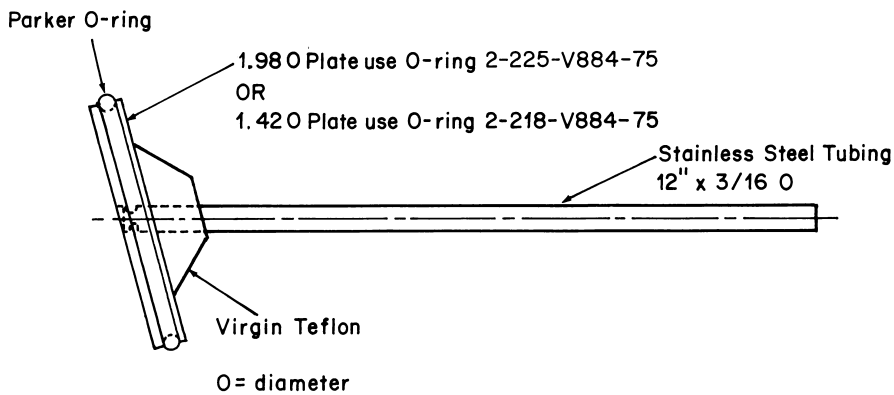


Fig. 5a. Transdermal System Holder—Angled Disk.

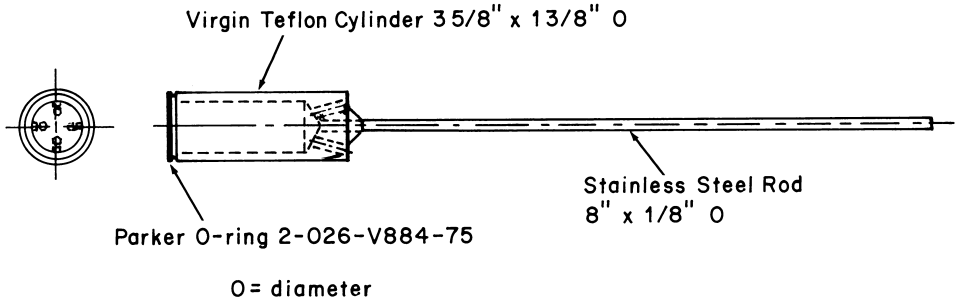

Fig. 5b. Transdermal System Holder—Cylinder.

***Sample Preparation A*—**Attach the system to be tested to a suitable sample holder with 2-cyano acrylate glue.

***Sample Preparation B*—**Press the system onto a dry, unused piece of Cuprophan (*4*), nylon netting, or equivalent with the adhesive side against the selected substrate, taking care to eliminate air bubbles between the substrate and the release surface. Attach the system to a suitably sized sample holder with a suitable O-ring so that the back of the system is adjacent to and centered on the bottom of the disk-shaped sample holder or centered around the circumference of the cylindrical-shaped sample holder. Trim the excess substrate with a sharp blade.

***Sample Preparation C*—**Attach the system to a suitable holder as described in the individual monograph.

***Dissolution Medium*—**Use the *Dissolution Medium* specified in the individual monograph (see ⟨711⟩).

***Procedure*—**Suspend each sample holder from a vertically reciprocating shaker so that each system is continuously immersed in an accurately measured volume of *Dissolution Medium* within a calibrated container preequilibrated to temperature, *T*. Reciprocate at a frequency of about 30 cycles/min with an amplitude of about 2 cm, or as specified in the individual monograph, for the specified time in the medium specified for each time point. Remove the solution containers from the bath, cool to room temperature, and add sufficient solution (water in most cases) to correct for evaporative losses. Perform the analysis as directed in the individual monograph. Repeat the test with additional drug delivery systems as required in the individual monograph.

***Sampling Time*—**Proceed as directed for Apparatus 5.

***In Vitro Release Criteria*—**Drug release should be measured at least at 3 time points, first time point around 1 hour, second around 50% of total drug release, and third around 85% drug release. Unless otherwise specified in the individual monograph, the requirements are met if the quantities of the active ingredients released from the system conform to *Acceptance Table 1* under *Dissolution* ⟨711⟩ for transdermal drug delivery systems, or as specified in the individual monograph. Continue testing through the three levels unless the results conform at either L_1 or L_2.

NOTE

This *Stimuli* article is subdivided into 2 chapters: *Product Quality Tests: Topical and Transdermal Drug Products* ⟨3⟩ and *Product Performance Tests: Topical and Transdermal Drug Products* ⟨725⟩. Both of these appear elsewhere in this issue of *Pharmacopeial Forum*.

ACKNOWLEDGMENT

The authors acknowledge the helpful suggestions of Loice Kikwai, Erika Stippler, and Will Brown of USP and Satish Asotra of Taro Pharmaceuticals.

Performance-based Monographs

Small Molecules Collaborative Group, R.L. Williams, D.R. Abernethy, W.F. Koch, W.W. Hauck, and T.L. Cecil[a]

ABSTRACT This *Stimuli* article describes a performance-based monograph (PBM) that specifies tests and acceptance criteria for articles in the *US Pharmacopeia* (*USP*) and *National Formulary* (*NF*). For selected tests of the monograph, a certified reference material (CRM) from USP would be provided to assist analysts in developing sound procedures. Availability of a default procedure in association with the PBM is considered, pros and cons of the approach are presented, and comments are solicited.

INTRODUCTION

A *US Pharmacopeia* (*USP*) specification for a drug substance, excipient, or product contains four universal tests (Definition, Identification, Assay, and Impurities) and certain specific tests, with accompanying procedures and acceptance criteria. Each manufacturer develops a unique specification for its ingredients and products. Specifications developed by multiple manufacturers of the same ingredient or product may include tests and acceptance criteria that are similar, but the procedures used in the tests may not be the same. Despite this, USP's intent is to present a monograph establishing a standard specification that encompasses all legally marketed ingredients and products, where appropriate. The procedures presented in *USP* traditionally have been provided by the innovator of a drug substance. As additional manufacturing sources of ingredients and products become available, these original procedures can become too restrictive, causing the *USP–NF* monograph to be out of step with current industry practice. This has led to the development of flexible monographs (*1*) and the need for alternative suppliers of information and reference materials (RMs) to provide evidence that their procedures are adequate for all marketed products (*2*).

In contrast to the current approach wherein all elements of the monograph's specification are explicitly provided, a performance-based monograph (PBM) provides a specification for a drug substance that includes a *Test* and *Acceptance criteria*, but the *Procedure* would define only the criteria needed to show that the procedure used is acceptable. The universal tests and acceptance criteria generally are consistent between monographs [e.g., Assay, 98.0%–102.0%; *Identification* with IR or chromatography; impurities, not more than (NMT) 0.10%; and others] and rarely differ significantly. Therefore, in the case of most drug substances, a default set of tests and acceptance criteria could be used. An example of a performance-based monograph appears in *Appendix 1* in the form of a PBM for Acamprosate Calcium. The general approach fits well within the concepts articulated under the general term *quality by design*, where knowledge and design space requirements conclude with an understanding of the private control space pertinent to a particular ingredient and product (*3, 4*). The control space for the public standard may be viewed as the total array of tests and acceptance criteria of the monograph.

The application of a PBM approach would involve a number of important changes in the way that *USP–NF* monographs and related General Chapters are created, used, and interpreted. The major components of this concept include the PBM itself, to include a definition of an acceptable procedure, primary certified reference materials (CRMs), and, when available, appropriate screening procedures. Initially, only new monographs would be targeted for the PBM approach. In some instances, the performance-based procedure may appear in a General Chapter (*5*).

ACCEPTABLE PROCEDURES

What defines an *acceptable procedure*? There are several means to define an acceptable procedure, including equivalent or better, and others described by Hauck et al. (*6*). In that article, the term *acceptable procedure* is described as a procedure that ''meets a set of minimum performance requirements.'' The term acceptable also means that a procedure is suitable for its intended use. An acceptable procedure also has been defined as a procedure that is validated as described in USP General Chapter *Validation of Compendial Methods* ⟨1225⟩ (*7*). This General Information Chapter provides a set of criteria (reproduced herein as *Table 1*) but does not provide the minimum performance criteria necessary to define an acceptable procedure. Using these criteria as a starting point, one can see that the type of test directly affects the set of performance requirements. In this discussion, we focus on International Conference on Harmonization (ICH) universal tests for ingredients, with the understanding that many of the applications also pertain to drug products.

Table 1. Data Elements Required for Validation

Analytical Performance Characteristics	Assay	Impurity Tests		Performance Tests (e.g., Dissolution, Disintegration)	Identification
		Quantitative	Limit Tests		
Accuracy	Yes	Yes	[a]	[a]	No
Precision	Yes	Yes	No	Yes	No
Specificity	Yes	Yes	Yes	[a]	Yes
Detection Limit	No	No	Yes	[a]	No
Quantitation Limit	No	Yes	No	[a]	No
Linearity	Yes	Yes	No	[a]	No
Range	Yes	Yes	[a]	[a]	No

[a] May be required depending on the nature of the specific test.

Assay Tests

Table 1 suggests that the critical parameters needed to validate an Assay procedure include precision, accuracy, specificity, linearity, and range. Further review makes it apparent that range is covered by other criteria and thus will not be discussed further. All decisions of procedure and testing include trade-offs between precision, accuracy, costs, time, specificity, and many other parameters. Three criteria that are particularly closely linked are precision, accuracy, and limit of quantitation (LOQ). For an Assay procedure, the LOQ typically is not an issue and therefore is not included in this discussion.

1. Assay—Accuracy and Precision. Trade-offs often are necessary to achieve acceptable accuracy (bias) and precision (standard deviation) in a given procedure. The linkage between the two can be best seen in the Operating Characteristic Curve (OCC) illustrated in *Figure 1*. This curve describes the degree of accuracy and precision needed to ensure that a measurement would have a 95% probability of falling between 98% and 102% if the true value was 100%. Expressed another way, *Figure 2* identifies the boundary conditions for acceptable precision and accuracy values. Any combination of precision and accuracy falling under the shaded portion of the curve would be acceptable for the procedure being evaluated. The accuracy (bias) measurement is determined relative to a USP RM. This bias is estimated as the difference between the mean of three independent determinations of USP RM and the true accepted value. The bias should be evaluated at three points in the range of the procedure. Precision is estimated by testing several separate sample preparations and is calculated as the standard deviation of those measurements. The number of samples to be evaluated should be the number necessary to ensure that the confidence interval for bias and upper confidence bound for the standard deviation fall within the shaded portion of *Figure 2*. For illustration purposes *Figure 2* shows precision and accuracy values on the OCC.

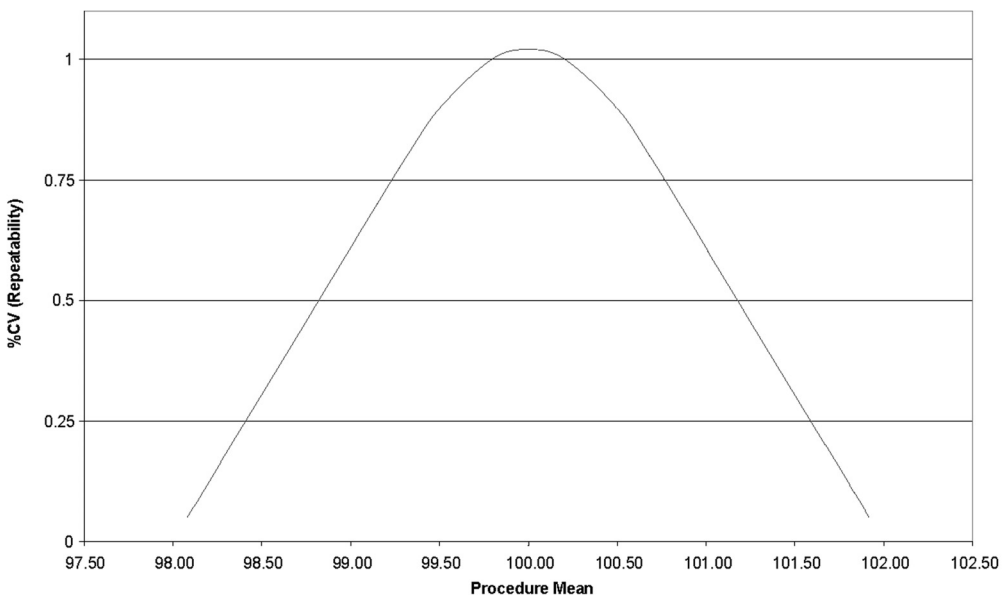

Figure 1: Operational Characteristic Curve for Assay Assuming 98%–102% limits; True Value = 100%; Probability of Passing = 0.95.

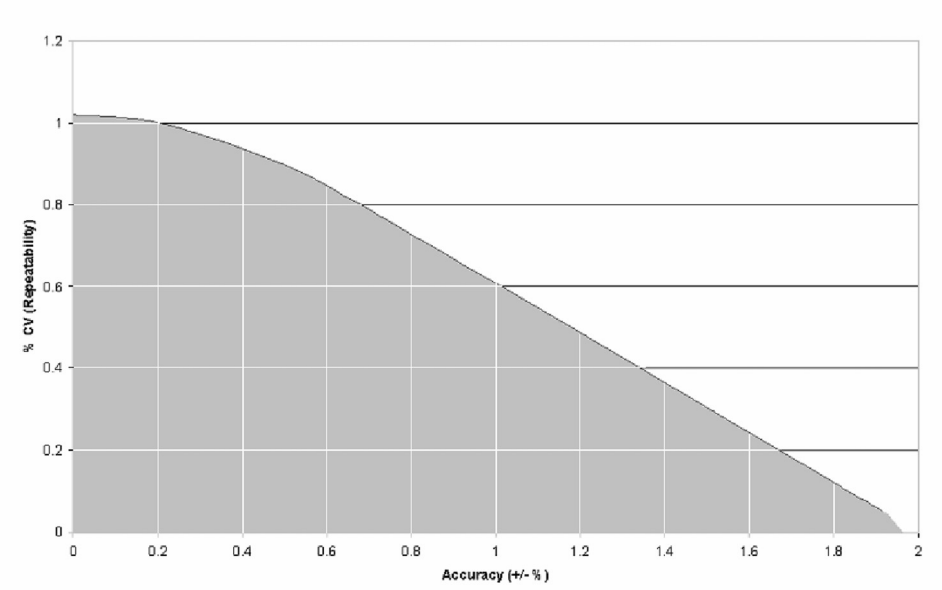

Figure 2: Precision and Accuracy for Assay.

2. Assay—Specificity. The specificity of a chromatographic *Assay* procedure is a measure of the level of interference caused by other peaks in the chromatogram. This is described by the resolution, *R,* between two closely eluting peaks. Generally speaking, an acceptable procedure should have a minimum resolution of 1.25 so that near-baseline resolution is achieved, and the resulting contribution to the error of the main peak would be minimal. The effect on the measurement of a primary peak due to the presence of a secondary peak with a response ratio of 16:1 would be an error of about 0.5% (*8, 9*), recognizing that this level of error is beyond that typically seen in pharmaceutical analytical laboratories. This can best be evaluated by spiking a USP RM with likely impurities at about a 6.25% level. These spiked samples are then compared to the labeled content of the RM using the procedure under evaluation. If the level of error is $< 0.5\%$ then the procedure is acceptable for this performance measure.

3. Assay—Linearity. Linearity is measured as the correlation coefficient (R^2) and slope of a plot of the measured concentration vs actual concentration from 50% to 150% of the expected analytical concentration. If R^2 is greater than 0.99 and the slope is 1.0 ± 0.1, then the procedure is acceptable for this performance measure.

Identification Test

Identification procedures can be broadly categorized as spectral, chromatographic, and classical procedures. These can be further classified as quantitative, semiquantitative, or qualitative in nature. *Table 1* indicates that only specificity is indicated for validation. In a performance-based paradigm, additional information is necessary to provide adequate information about the drug substance.

The criteria that define an adequate identification procedure will vary depending on the type of procedure and the nature of that measurement and are described in *Table 3*. In all cases the specificity is determined by a comparison with USP RM.

Table 2. Precision and Accuracy Characteristics for Small-molecule Assay Procedures

Assay	Measure	Example 1	Example 2	Example 3
Precision	OCC	CV $\leq$ 0.1%	CV $\leq$ 0.5%	CV $\leq$ 1.0%
Accuracy	OCC	$\pm$ 1.84%	$\pm$ 1.18%	$\pm$ 0.20%
Specificity	Contribution to Error	0.5%	0.5%	0.5%
Linearity	R^2	> 0.99	> 0.99	> 0.99

Table 3. Small-molecule Identification Procedures

Identification	Qualitative	Semi-quantitative	Quantitative
Spectral	Provides a Spectrum or Signal That Is Unique to the Moiety of Interest	N/A	See: Impurities Requirements (*Table 4*)
Chromatographic	N/A[a]	See: Impurities Requirements (*Table 4*)	See: Assay Requirements (*Table 2*)
Classical (wet-chemistry)	Provides a Response That Is Selective for the Attribute of Interest	Provides a Response That Is Selective for the Attribute of Interest	N/A

[a] Chromatographic procedures are quantitative but may at times be used for qualitative purposes.

Table 4. Small-molecule Impurities Procedures

Impurities Procedure	Measure	Quantitative	Limit Test (Semi-quantitative)
Precision		[a]	[b]
Accuracy	Difference between Calculated and Known Content	[a]	$\pm 0.01\%$[a]
Specificity	Contribution to Error	NMT 2%	NMT 2%
LOD		N/A	NLT 5:1
LOQ		[a]	N/A
Linearity	R^2	≥ 0.99	N/A

[a] Depends on the uncertainty necessary to meet the acceptance criteria.
[b] May be needed.

Stimuli to the Revision Process

Impurities Test

Impurities tests can be thought of as an *Assay* test for minor components in a mixture of materials. Therefore, parameters to describe an acceptable procedure are very similar to those in *Table 2*. However, as indicated in *Table 1*, impurities have two additional components that should be considered. These are the limits of detection (LOD) and LOQ. An acceptable procedure should be able to quantify impurities accurately and precisely at concentrations that are lower than the acceptance criteria in a monograph or in a drug substance specification. However, the acceptance criteria should be safety based and not capability based. This topic was discussed and a guidance proffered by ICH in the Q3A(R) guideline (*10*). In this guidance, default acceptance criteria for nontoxic impurities was set to 0.10% with the specification that all nontoxic impurities having concentrations of $\leq 0.05\%$ could be disregarded. To achieve this level of quantitation, a procedure must have sufficient accuracy and precision to provide an uncertainty of $<10\%$ of the target level.

1. Quantitative Procedures for Impurities. For quantitative tests, the precision, accuracy, and limit of quantification are linked. LOQ is the lowest concentration at which the analyte can not only be detected reliably but also at which some predefined goals for bias and precision are met (*11*). As stated above, the goals for bias and precision are defined by the requirement to provide a calculated test uncertainty of NMT 10% of the reporting level. The goals would be scaled depending on the uncertainty necessary to report a value consistent with the acceptance criteria (e.g., for NMT 1 ppm, an uncertainty of ≤ 0.1 ppm is necessary).

2. Limit Tests for Impurities. For these procedures the goal is to minimize false negatives by making the acceptance criteria semi-quantitative. Therefore, the precision is not defined, but it may be evaluated. The accuracy is linked to the reporting value for the acceptance criteria.

3. Specificity for Impurities. The evaluation of specificity is based on the ability to quantify all known and unknown impurities in the article. The impurities may be quantified individually or as a group, depending on the procedure. Therefore, specificity is evaluated by comparing the calculated concentration of known impurities spiked into the drug substance matrix relative to the amount added. Rather than an evaluation of all impurities, specificity determinations may be made using only critical impurities or those impurities that occur nearest to the acceptance limit. The authors acknowledge the interrelationship between accuracy and specificity where the latter can be considered in terms of the resolution when a chromatographic procedure is used.

CERTIFIED REFERENCE MATERIALS (CRMS)

Because all measurements are comparisons to a known standard, suitable RMs are required for procedures associated with a PBM in order for the approach to be suc-

cessful. Some RMs are linked to specific SI units (e.g., gram, meter, joule), others to primary standards that are linked or are traced to SI units. The evaluations described in this article all assume the use of an RM with stated content and level of uncertainty of the measurement (e.g., a USP CRM). As compendial procedures become more flexible and undefined, the need for well-characterized RMs traceable, where feasible, to the SI unit for amount of substance (kg) increases. As clearly demonstrated in the previous section, the uncertainty of a measurement has a direct bearing on the acceptability of the procedure and the ability of the procedure to serve its intended purpose. Because all measurements are comparisons, the uncertainty of the RM must be factored into the calculated uncertainty of the procedure. For these reasons, this article postulates that the RM accompanying a PBM should be certified with respect to both quantity (g/g) and uncertainty.

DEFAULT PROCEDURES

In addition to the option of using performance-based standards, some users of the USP's compendia may wish to use a specified default procedure. For these parties a procedure that evaluates identity, strength, quality, and purity via a more inclusive and less case-specific approach is preferred to procedures that are optimized for speed and throughput for a specific process. The more-inclusive, non-optimized procedures are typically developed by a drug manufacturer early in the development cycle and are refined as the process is finalized. These procedures often are used for investigation of forced degradation products, in evaluating potential changes in impurities caused by process changes, and later in assessing generic competition.

To accommodate both those wishing to develop an optimized, and those preferring to use a default procedure, both procedures would be provided for. The primary specification is the PBM discussed above, with specified procedures not provided. Beyond this presentation, a default procedure would be made available. The one or more default procedures would appear in the compendial monograph with a statement to the effect that either the PBM procedure or the default procedure is suitable. In a separate part of the compendia, USP may provide additional, optional, acceptable procedures.

SUMMARY

This article discusses PBMs as a means of allowing flexibility in analysts' choice of acceptable procedures. The general approach has been used in many industries over the years and is part of a larger trend affecting all industries. It also is increasingly used in many regulatory and compendial statements. A sample PBM is included in *Appendix 1*.

The PBM has pros and cons, many of which are interrelated and may be mitigated by the use of CRMs and the presence of alternative screening (default) procedures:

1. Pros
   a. Provides analysts with flexibility in choosing acceptable, equivalent, or better procedures;
   b. Reduces requests to manufacturers who do not wish to share procedures and/or candidate reference materials;
   c. Promotes harmonization;
   d. Aligns with regulatory statements and requirements;
   e. Reduces monograph backlogs and promotes updating of monographs;
   f. Accords well with modern measurement science that allows evaluation and use of different procedures in collaborating studies;
   g. May limit need for pending and non-US monograph approaches;
   h. Would support the application of new technologies;
   i. Would minimize future revisions and changes in the standard.

2. Cons
   a. Compendial test to ensure compliance may be unclear;
   b. Initially may not provide acceptable procedures;
   c. Will take substantial commitment with participating laboratories, including those of USP, to create needed CRMs in the absence of donated procedures.

If the approach articulated in this *Stimuli* article is adopted, following suitable discussion, it would shift monographs in *USP–NF* away from a monograph with all tests, procedures, and acceptance criteria toward a more flexible monograph with allowance for a PBM aproach, optional acceptable procedures coupled with an equally acceptable default procedure. These procedures would necessarily be deemed equivalent or better (*5*). Comments are encouraged and welcomed.

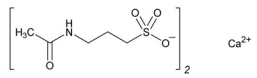
APPENDIX 1: A PERFORMANCE-BASED MONOGRAPH

Acamprosate Calcium



$C_{10}H_{20}CaN_2O_8S_2$ 400.48

1-Propanesulfonic acid, 3-(acetylamino)-, calcium salt (2:1); Calcium 3-(acetylamino)propane-1-sulfonate [77337-76-9]. [77337-73-6] acamprosate.

DEFINITION

Acamprosate Calcium contains NLT 98.0% and NMT 102.0% of $C_{10}H_{20}CaN_2O_8S_2$, calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION ⟨197K⟩**
- **B. CALCIUM ⟨191⟩:** Meets the requirements

ASSAY

- **PROCEDURE**

Standard solution: USP Acamprosate Calcium RS in an appropriate diluent [NOTE—Neat determination may be substituted where appropriate.]

Sample solution: Acamprosate Calcium in an appropriate diluent [NOTE—Neat determination may be substituted where appropriate.]

Performance suitability solution: 1 to 1000 dilution of *Standard solution* in an appropriate diluent

System performance

Sample: *Performance suitability solution* and *Standard solution*

Performance requirements

Precision and accuracy

Precision: Standard deviation calculated from NLT 5 determinations of the 5 replicate *Standard solutions*

Accuracy: Difference between the average calculated content of 5 replicate *Standard solutions* and the RS label claim

Suitability requirement: The point described by the precision and accuracy values falls in the shaded portion of *Figure 2*.

Specificity: Contribution to error: NMT 0.5%

Linearity: Plot of calculated content vs measured content

R^2: NLT 0.99

Slope: 1.0 ± 0.1

Acceptance criteria: 98.0%–102.0% of $C_{10}H_{20}CaN_2O_8S_2$

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION ⟨281⟩:** NMT 0.1%
- **HEAVY METALS,** *Method I* **⟨231⟩:** 10 ppm

Organic Impurities

- **PROCEDURE**

Standard solution: USP Acamprosate Calcium RS in an appropriate diluent [NOTE—Neat determination may be substituted where appropriate.]

Sample solution: Acamprosate Calcium in an appropriate diluent [NOTE—Neat determination may be substituted where appropriate.]

Performance suitability solution: 1 to 1000 dilution of *Standard solution* in an appropriate diluent

System performance

Sample: *Performance suitability solution* and *Standard solution*

Performance requirements

Precision and accuracy

Precision: Standard deviation calculated from NLT 5 determinations of the 5 replicate *Standard solutions*

Accuracy: Difference between the average calculated content of 5 replicate *Standard solutions* and the RS label claim

Suitability requirement: The point described by the precision and accuracy values falls in the shaded portion of *Figure 2*.

Specificity: Measured values for *Sample solution* spiked with known impurities at reporting level differ from calculated values by NMT 2.0%.

Linearity: Plot of calculated content of each known impurity vs measured content of each known impurity

R^2: NLT 0.99

Slope: 1.0 ± 0.1

Acceptance criteria

Any individual impurity: NMT 0.1%

Total impurities: NMT 2.0%

SPECIFIC TESTS

- **WATER DETERMINATION,** *Method I* **⟨921⟩:** NMT 0.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE** Preserve in well-closed containers, and store at 25°; excursions permitted to 15°–30°.

Acceptable, Equivalent, or Better: Approaches for Alternatives to Official Compendial Procedures

W.W. Hauck, PhD,[a] A.J. DeStefano, PhD, T.L. Cecil, PhD, D.R. Abernethy, MD, PhD, W.F. Koch, PhD, R.L. Williams, MD

ABSTRACT The *General Notices* in the *US Pharmacopeia* (*USP*) permit analysts to use acceptable (suitable) alternatives to an official procedure. In a revision that will be effective May 1, 2009, the *General Notices* will require that the alternative procedure be demonstrated to give results that are equivalent to or better than those obtained by the official procedure. This *Stimuli* article discusses approaches for determining equivalent or better procedures. The concepts and tests discussed in this paper may become one or more *USP* General Chapters. The preceding *Stimuli* article speaks to approaches that determine an acceptable procedure without requiring a study to document equivalent or better.

INTRODUCTION

In its *General Notices*, the *US Pharmacopeia* (*USP*) states: ''Compliance may be determined also by the use of alternative methods, chosen for advantages in accuracy, sensitivity, precision, selectivity, or adaptability to automation or computerized data reduction or in other special circumstances. Such alternative or automated procedures or methods shall be validated (*1*).[b] The *General Notices* requirement for validation means the analyst using the alternative procedure has determined the procedure is acceptable (suitable) for its intended use in the specified monograph test. The wording of the *USP General Notices* presumes that the alternative procedure possesses *some* property for which there is an advantage, however defined—otherwise why use it? But the *General Notices* statement does not require comparison to the compendial procedure on advantageous properties. A priori, one would think that the alternative procedure should be not be worse, however defined, than the compendial procedure, but this is not stated in the current *General Notices.* A revision to the *General Notices* (*3*) that will be official May 1, 2009, calls for the alternative procedure to ''give equivalent or better results'' by comparison with the compendial procedure. In addition, elsewhere the *General Notices* state: ''Proportionately larger or smaller quantities than the specified weights and volumes of assay or test substances and Reference Standards may be taken, provided the measurement is made with *at least equivalent accuracy*. . .[emphasis added]'' (*1*). General Chapter *Validation of Alternative Microbiological Methods* ⟨1223⟩ states, ''The critical question is whether or not the alternat[iv]e method will yield results *equivalent to, or better than*, the results generated by the conventional method [emphasis added]'' (*1*, p. 681). *USP* does not provide a definition or approaches for alternative procedures, whether they are deemed acceptable, equivalent, or better.

The Food and Drug Administration (FDA) and ICH employ similar language regarding alternative procedures. The Code of Federal Regulations, in the section that covers requirements for Equivalent Methods and Processes for biological products, requires ''that the modification will provide assurances of the safety, purity, potency, and effectiveness of the biological product *equal to or greater than* the assurances provided by the method or process specified in the general standards or additional standards for the biological product [emphasis added]'' (*4*). FDA also uses a similar phrase in its draft guidance, *Analytical Procedures and Methods Validation: Chemistry, Manufacturing, and Controls Documentation* (*5*). In discussing alternative analytical procedures this guidance notes, ''A validated alternative analytical procedure should be submitted only if it is shown to perform *equal to or better than* the regulatory analytical procedure [emphasis added]'' (*5*). ICH Q6A, *2.7 Alternative Procedures*, states, ''Alternative procedures are those which may be used to measure an attribute when such procedures control the quality of the drug substance or drug product to an extent that is *comparable or superior* to the official procedure [emphasis added]'' (*6*). In MAPP 5310.7, FDA's Office of New Drug Quality Assessment states the following policy for its reviewers: ''If there is no USP/NF monograph for an excipient, drug substance, or drug product, and the applicant proposes to use an analytical procedure from the BP, EP, or JP in a specification in lieu of the corresponding analytical procedure in the General Chapters of the USP/NF, the BP, EP, or JP procedure is considered an alternative analytical procedure and may be used provided the analytical procedure in the BP, EP, or JP is *equivalent to or better than* the corresponding analytical procedure in the USP/NF [emphasis added].'' ''Equivalent'' is used in this paper rather than the ''equal'' of 21 CFR 610.9(c) in order to avoid the connotation of *equal* as meaning *identical* (*7*).

[b] Using terminology of the International Conference on Harmonization (ICH), the US Pharmacopeial Convention (USPC) uses the term *procedure* to describe the steps to be followed by the analyst in conducting a test. This is in agreement with the *International Vocabulary of Metrology (VIM) (2)*, which describes a measurement procedure as a detailed description in contrast to a measurement method, which is a generic description (such as ''indirect, a direct method, or an instrumental method''). This *Stimuli* article thus will use the terminology *comparison of procedures* rather than *comparison of methods*.

Based on this brief review, the various regulatory and compendial statements appear to lack precision in definition. Following internal discussions, USPC has identified four options (*Table 1*) to allow consideration of alternatives to official procedures, even though the usual wording allows only ''equivalent or better.''

- The first is for *USP* to set minimum performance requirements for alternative procedures. Procedures meeting these requirements are termed *Acceptable Procedures.* For example, for chromatographic procedures, manufacturers could establish minimum requirements for repeatability and peak separation. The concept then would be that any alternative procedure that meets the applicable requirements would be acceptable, i.e., suitable for its intended use. In effect, two procedures that both meet the performance requirements would be considered ''equivalent'' (and hence acceptable) under this option without any direct comparison to the official procedure.
- The remaining options directly compare the alternative procedure to the compendial procedure and require ''method-performance studies,'' (*8*) i.e., procedure comparison studies, thus dealing more explicitly with the requirement to show that the alternative is equivalent to or better than the official procedure. This article proposes three questions that drive the subsequent three options. For the second option, termed *performance equivalence*, the question is: Are the two procedures equivalent or better with respect to validation characteristics? This is similar to Option 1 because it considers validation characteristics but features a direct comparison to the official procedure. For the third and fourth options, the question is: Do the two procedures agree? Agreement can be assessed by considering the numerical result (Option 3) of the procedure or a decision (Option 4) relative to some acceptance criterion that is based on the numerical result. For the third and fourth options, USPC proposes the terms *results equivalence* and *decision equivalence*, respectively, to delineate the two options. Each question leads to different statistical approaches to allow the comparison.

Following the metrological distinctions between *procedure* and *method* in *VIM*, the discussion of this paper applies regardless of whether the comparison is between two procedures that correspond to different methods or between two different procedures for the same method (*2*). The statistical and compendial issues are the same in either case. This paper assumes that the two procedures being compared are measuring the same attribute. Comparison of two bioassays that measure different attributes of an article, for example, is a topic not addressed by this discussion. A similar problem is termed *method transfer* (same procedure but different laboratories). That is not a pharmacopeial issue but is statistically similar to the topic considered here (see *Appendix* for some references).

This paper first addresses each of the four options individually with consideration of advantages and disadvantages and a brief overview of statistical considerations. In the discussion the paper summarizes choices and ways forward. The purpose is to identify issues that should be considered and candidate statistical approaches with the intent of initiating a dialog that could lead to compendial recommendations or requirements in one or more General Chapters. This *Stimuli* article includes an *Appendix* that cites some publications that are relevant to the discussion.

OPTION 1: ACCEPTABLE PROCEDURES

General Comments

The essence of Option 1 is to allow the analyst more than one—perhaps even many—acceptable alternative procedures without a requirement for comparison to another procedure. The comparison, instead, is to a reference material with known properties. This option may be particularly valuable in cases where the current compendial procedure is especially accurate or precise. It would be difficult to demonstrate that the alternative procedure is equivalent to or better than the official procedure in such cases. Implicitly, the judgment of acceptability of a procedure would acknowledge that it is ''equivalent'' in meeting compendial expectations. To this end, USPC has proposed, in a related article in this *Pharmacopeial Forum*, performance-based monographs in which one and perhaps more than one optional acceptable procedure would be deemed acceptable for use in a particular test (*9*). The key characteristic of a performance-based procedure in a monograph is that it would specify performance requirements for a procedure rather than provide a required compendial procedure, although one could be deemed preferred (official) for compliance purposes.

Table 1. Comparison of Options

Option	Name	Demonstrating	Comparison to Official Procedure?	Based on Numerical Results or Conclusion?	Number of Characteristics Considered
1	Acceptable Procedures	Acceptable	No[a]	Results	Many
2	Performance Equivalence	Equivalent or Better	Yes	Results	Many
3	Results Equivalence	Equivalent	Yes	Results	One
4	Decision Equivalence	Equivalent	Yes	Conclusions	One

[a] There need not be an official method.

For Option 1, the criteria for an acceptable procedure could be based on validation characteristics such as specificity, absence of bias, and precision. Criteria for acceptance could be based on the procedure's operating characteristics, specifically on whether articles of known properties pass or fail appropriately when compared to the relevant acceptance criteria. See (*9*) for an example of this approach.

OPTION 2: PERFORMANCE EQUIVALENCE

General Comments

Performance equivalence means demonstrating ''equivalent or better'' results on some subset of validation properties. General Information Chapter ⟨1225⟩ lists many candidate properties. By focusing on a subset, Option 2 is similar to verification in General Information Chapter ⟨1226⟩, where determination of which properties for the procedure's intended use are important. In the context of alternative procedures, the most important generally are specificity and accuracy. Although precision (variability) is important, analysts can sometimes address precision in different ways, such as the choice of the number of replicates (discussed below). Even with focus on a subset of characteristics, a disadvantage of Option 2 is the multiplicity of statistical tests corresponding to the multiple validation properties for a given procedure and the designated attribute of the measurand. One can easily envision an alternative procedure that is better on some properties, equivalent on some, and worse on some. What should be the final decision regarding the alternative? Prioritizing the importance of the validation properties seems to be a key. An additional question is whether the new procedure actually is better than the official procedure on *some* property. An affirmative answer does allow that the alternative procedure may be preferable based on considerations not captured by validation characteristics (e.g., cost or time).

Equivalence Testing

Comparing two procedures to show equivalent or better performance for one or more validation properties leads to a body of statistical work referred to as equivalence testing. The basic idea is to properly align the statistical hypotheses with the intent of the work. If the goal is to positively demonstrate equivalent or better performance, then ''equivalent or better'' needs to be the statistical alternative hypothesis. The statistical null hypothesis is then ''neither equivalent nor better.'' This has not been common practice, although the literature in this field has evolved to equivalence testing. For comparison of means, for example, a common practice has been to declare equivalence if the two means are not found to be statistically different with a standard *t*-test. With a standard *t*-test, the alternative hypothesis is difference, and the null hypothesis is no difference. The papers by Limentani et al. (*10*) and Chambers et al. (*11*) contain good examples of why the equivalence approach is preferred to the still commonly used standard *t*-test.

When comparing two procedures to understand if they are ''equivalent or better,'' the analyst must determine which of three outcomes (questions) are sought in the comparison study: 1) the new procedure may be importantly worse than the current procedure; 2) the new procedure may be importantly better than the current procedure; and 3) there may be no important difference, either better or worse, between the new and current procedures. When outcomes 2 and 3 are found, the results are ''equivalent or better,'' and only the first outcome is excluded. In clinical trials this is referred to as noninferiority. When outcome 3 is found in the comparison results, the procedures are referred to as ''equivalent.'' Thus in a comparison study, the analyst must be clear about the intent of the study in order to derive useful conclusions.

Demonstrating Equivalent or Better—Means

A starting point for comparing two procedures is to compare only means. Ideally, though, this would be a comparison of biases (*accuracy* in ICH and USP terminology). A noninferiority hypothesis would be that the bias of the alternative procedure is equivalent to or better (less) than that of the official procedure. This would require a comparative accuracy (trueness) assessment of the two procedures. If bias cannot be assessed, a related approach would be to suggest that the bias of the official procedure is acceptable. This leads to a two-sided equivalence hypothesis of equivalence of the two procedures' means for the alternative. Specifically, the alternative procedure must be similar on average to the official procedure. Statistical procedures for one- and two-sided equivalence hypotheses for means are well developed (*12, 13*).

The problem with a simple comparison of means is that the difference may vary with the quantity being measured. Analysts may need to compare accuracy separately at each of a range of values rather than perform a single, composite accuracy comparison. Calibration (regression) approaches have been developed and allow for both systematic and proportional differences between the results of the procedures; see the *Appendix* for references. Most of the procedures in the literature determine the regression for the relationship and then, inappropriately, test the null hypotheses of intercept equal to 0 (no systematic difference) and slope equal to 1 (no proportional difference). If both are not rejected, equivalence is claimed. This is the common error of wrong hypotheses for an equivalence problem. Equivalence hypotheses should specify a range for an intercept sufficiently close to 0 and for a slope sufficiently close to 1. These are two-sided equivalence hypotheses.

Demonstrating Equivalent or Better—Variances

Variance comparisons are clearly one-sided (noninferiority); i.e., a procedure that results in an important increase in variance only would not be considered performance equivalence. The general approach is already covered in *USP*'s General Information Chapter *Analytical Data—Interpretation and Treatment* ⟨1010⟩. The larger question relates to which variance(s) to compare. If the context is a single laboratory, reproducibility is not

relevant. For companies with multiple laboratories using a procedure and for compendial statements about procedures that are ''equivalent or better,'' reproducibility is relevant. Where comparisons are confined to a single laboratory, analysts also must bear in mind that repeatability is not a full characterization of the precision of a procedure. The question then becomes, Which intermediate precision components should be assessed?

The other issue with variances is that, in a certain sense, the variance comparison sometimes can be made less important, at least for repeatability. That is, variance may be overcome with increased sample size. If the new procedure appears to be more variable than the official procedure, the sample size can be increased to make the new procedure comparable. With respect to a procedure being developed for use as an alternative procedure, variance can be addressed during validation. The ''sample'' for determining what needs to be increased will depend on the source(s) of variability and the variance of interest. If repeatability is at issue, this may mean simply more samples and/or replicates. If intermediate precision or reproducibility is at issue, improving repeatability is not sufficient and it may not be feasible to increase, e.g., the number of analysts conducting the procedure or the time over which the procedure is conducted in order to reduce the contribution from those components of intermediate precision.

OPTION 3: RESULTS EQUIVALENCE

General Comments

When results equivalence is sought, the hypothesis of the comparison study is that the alternative and official procedures obtain equivalent numerical results. Showing that two procedures obtain similar results could be useful, e.g., for a procedure applied in stability testing when it is desirable to avoid a discontinuity in results with a change of procedure. Option 3 is thus similar to Option 2 in that the focus is on the numerical results obtained by the procedures. Options 2 and 3 differ in the nature of the comparison. In Option 3, there is a direct comparison of results. In Option 2, the comparison is indirect; validation characteristics are evaluated and compared.

Demonstrating Essentially the Same Numerical Result

There are at least two general approaches that could be taken. For the first, a large body of literature examines the general issue of inter-rater reliability. The general idea is to assess the extent to which two raters get the same result when using the same instrument. Many applications of inter-rater reliability involve psychometric studies in which the instrument is a questionnaire, but applications are widespread. For continuous measures, the intraclass correlation coefficient is the most common measure of agreement, and generally accepted terms describe the degree of agreement (*10*). This literature can be adapted to comparison of compendial procedures if one interprets ''rater'' as ''procedure.'' A more recent alternative is to use the concordance correlation coefficient.

Design of experiments for interprocedure agreement should focus on ensuring that the two procedures obtain similar results for each sample tested. If the testing is nondestructive, this is straightforward. For destructive testing, this involves, e.g., preparing replicate aliquots from common preparations.

A difficulty with both intraclass and concordance correlation approaches is the lack of a direct connection to consequences with respect to producer risk (failing to adopt an equivalent alternative procedure) and consumer risk (adopting an inequivalent alternative procedure). With this consideration in mind, the second general approach considered here, the total error approach, was proposed for procedure transfer. The basic idea is to use tolerance intervals to control how often the two procedures give numerical results that differ by an important amount. What constitutes an important amount then depends on the acceptance criteria associated with the procedure.

OPTION 4: DECISION EQUIVALENCE

General Comments

Comments for decision equivalence are similar to those for results equivalence. The difference between Options 3 and 4 is whether agreement occurs with respect to numerical results (Option 3) or a decision relative to some acceptance criteria (Option 4). The distinction leads to different statistical procedures. Thus the key characteristic of Option 4 is that it looks only at the pass/fail results, not the actual numerical results that are the basis of Options 1, 2, and 3.

Demonstrating Essentially the Same Pass/Fail Results

If the only concern is whether or not the two procedures agree on meeting acceptance criteria—rather than the actual numerical value—different statistical procedures apply. A related application arises when a procedure yields only an either/or result (meets/does not meet), as is the case for limit or identity tests. The primary statistical procedure here is the kappa coefficient. Otherwise the issues are the same as for the intraclass and concordance correlations. The kappa coefficient shares the same disadvantage, namely no easy connection to consequences. A possible alternative is to consider the full operating characteristic curves for the two procedures. The operating characteristic curves, by moving the comparison to the probability rather than correlation scale, may make it easier to consider which differences between the procedures are important.

DISCUSSION

This paper has considered four options for what is meant by ''equivalent or better.'' Although there is some similarity across the four, they do differ. An alternative procedure that might be judged equivalent or better by one option need not be judged the same by the other options. One important distinction between Option 2 and Options 3 and 4, is that Options 3 and 4 preclude ''better'' because the alternative procedure must be dif-

ferent to be better. Another distinction is that Option 1, because it does not involve a formal procedure comparison study, yields no guarantee that any two acceptable procedures will agree with respect to either numerical results or decisions relative to some acceptance criterion, though tight criteria about what constitutes ''acceptable'' makes it likely two acceptable procedures will not differ greatly with respect to results.

Discussion regarding alternative procedures tends to return to the decision made based on results from the procedure. The various options differ in how they connect to the accept/reject decision. With Option 4, agreement of procedures with respect to decision is a direct connection. For Options 1, 2, and 3 the connection must be indirect. A general issue, as for any equivalence assessment, is: How close is close enough? A general approach is to link the procedure comparison or the definition of acceptable back to its use in support of accept/reject decisions: What is the impact on consumer and producer risks? The analytic error is just one component of uncertainty. Applied to a product that naturally varies from batch to batch, a good analytic procedure is one whose uncertainty is small relative to the acceptance interval so that the procedure only minimally leads to wrong decisions.

Options based on validation characteristics (Options 1 and 2) share a problem of multiplicity, i.e., many characteristics to be compared. It seems desirable to attempt to reduce the number of comparisons. Partly, this is being selective in the characteristics to compare. Further, one can envision multivariate approaches at least for related characteristics or a combination of some characteristics, e.g., by use of mean squared error rather than bias and repeatability. A further problem is termed *assay sensitivity*. That is, Is the procedure–equivalence study capable of finding an important difference between the two procedures if one exists?

Regulatory and compendial statements have emphasized the importance of ensuring that alternatives to private or public (compendial) procedures be ''equivalent or better.'' As discussed in this article, USPC believes that the requirement or recommendation should be framed somewhat differently. Option 1 simply states that within the acceptance criteria delineated for a test, many procedures using the same or different methods may be acceptable. No further studies are needed, and specifically it isn't necessarily sensible to require additional studies to show equivalence (options 3 and 4) or better (option 2). For USPC this leads to ''performance-based monographs.'' Another *Stimuli* article in this issue of *Pharmacopeial Forum* describes performance-based monographs, some details regarding how *acceptable* might be defined, and USPC's plans for implementation (*9*).

Although USPC is advancing consideration of a performance-based monograph approach (an implementation of Option 1), the choice of option can be viewed as monograph specific. For monographs for which the performance-based option does not apply, one of the other options will be needed. At this writing, USPC is not specifying which option to use for implementing the *General Notices* requirement to demonstrate equivalent or better for a proposed alternative procedure. The choice is to be made and justified by the laboratory. In the future the choice may be specified in the monographs. Should analysts, however, wish to demonstrate ''equivalent or better,'' they must posit the correct hypothesis and conduct the appropriate statistical tests. In so doing, they can readily determine through careful design of experiments whether an alternative procedure is equivalent or better. The general approach relies on good understanding of the control space of the public monograph—the acceptance criteria for the specified tests.

34. Stöckl D, Cabaleiro DR, Van Uytfanghe K, Thienpont LM. Interpreting method comparison studies by use of the Bland–Altman plot: reflecting the importance of sample size by incorporating confidence limits and predefined error limits in the graphic [letter]. *Clin Chem*. 2004;50:2216–2218.

35. Tan CY, Iglewicz B. Measurement-methods comparisons and linear statistical relationship. *Technometrics*. 1999;41:192–201. Keywords: Confidence interval; equivalence test; errors in variables; measurement error.

36. Westgard JO. Points of care in using statistics in method comparison studies [editorial]. *Clin Chem*. 1998;44:2240–2242.

37. Walter SD, Eliasziw M, Donner A. Sample size and optimal designs for reliability studies. *Stat Med*. 1998;17:101–110. Note: For test of intraclass correlation.

38. Zhong B, Shao J. Testing the agreement of two quantitative assays in individual means. *Commun Stat Theory Methods*. 2002;31:1283–1299. Notes: Sets a measure of agreement; hypotheses wrong (fixed in their 2003 paper—see next entry); does not assume linearity and does not require replication.

39. Zhong B, Shao J. Evaluating the agreement of two quantitative assays with repeated measurements. *J Biopharmaceutical Stat*. 2003;13:75–86. Notes: Method of their 2002 paper with equivalence hypotheses; requires replication.

NOMENCLATURE

This section includes supplements to the latest edition of the *USP Dictionary of USAN and International Drug Names* that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

Nomenclature

INDEX

This is a cumulative directory for the content of all issues of *PF* beginning with *PF* 35(1).

[*Note—This index covers Vol. 35 No. 1, pp. 1–218; Vol. 35 No. 2, pp. 219–498; and Vol. 35 No. 3, pp. 499–784.*]

CHROMATOGRAPHIC REAGENTS USED IN *USP–NF* AND *PHARMACOPEIAL FORUM*

This is an update based on the proposals published in this issue of *PF*.

Chromatographic Reagents Used in *USP-NF* and *Pharmacopeial Forum*
May–June 2009

ANDROGRAPHIS (DSD Mgh #3539)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(4)	L1	Luna C18(2)	Identification and Content of	Content of diterpene lactones. 4.6 mm x 25 cm. Manufacturer: Phenomenex

BOSWELLIA SERRATA (DSD Mgh #2775)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(4)	L1	Prevail C18	Identification and Content of	Content of keto-derivatives of B-boswellic acids. 4.6 mm x 25 cm. Manufacturer: Grace Alltech

BOSWELLIA SERRATA EXTRACT (DSD Mgh #867)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(4)	L1	Prevail C18	Identification and Content of	Content of keto-derivatives of B-boswellic acids. 4.6 mm x 25 cm. Manufacturer: Grace Alltech

FLUCONAZOLE INJECTION (DSD Mgh #33243)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(3)	L1	Symmetry C-18	Organic Impurities	Procedure 3. 4.6 mm x 15 cm, 3.5 μm. Manufacturer: Waters Corp.

HEPARIN SODIUM (DSD Mgh #36690)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(2)	L##	CarboPac PA20	Limit of	Limit of galactosamine in total hexosamine. Analytical column 3 mm x 15 cm. Guard column 3 mm x 3 cm. Manufacturer: Dionex

MORPHINE SULFATE EXTENDED-RELEASE TABLETS (DSD Mgh #54850)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(3)	L1	Keystone ODS-B	Assay, Related Compounds, and Uniformity of Dosage Units	4.6 mm x 15 cm, 5 μm. Manufacturer: Thermo Electron

OIL- AND WATER-SOLUBLE VITAMINS WITH MINERALS ORAL SOLUTION (DSD Mgh #88697)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(2)	L1	Synergi Hydro-RP	Assay	Method 2. 4.6 mm x 75 cm, 4 μm, 80A. Manufacturer: Phenomenex

PECTIN (DSD Mgh #61250)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(2)	G43	Zebron ZB-624	Methanol, Ethanol, and Isopropanol	0.32 mm x 30 m, 1.8 μm. Manufacturer: Phenomenex
35(2)	S3	Porabond Q	Methanol, Ethanol, and Isopropanol	0.32 mm x 25 m, 5 μm. Alternative column. Manufacturer: Varian

PENTAMIDINE ISETHIONATE (DSD Mgh #62125)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(3)	L1	Symmetry C-18	Related Compounds	4.6 mm x 25 cm, 5 μm. Manufacturer: Waters Corp.

POWDERED ANDROGRAPHIS (DSD Mgh #3540)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(4)	L1	Luna C18(2)	Identification and Content of	Content of diterpene lactones. 4.6 mm x 25 cm. Manufacturer: Phenomenex

POWDERED ANDROGRAPHIS EXTRACT (DSD Mgh #3541)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(4)	L1	Luna C18(2)	Content of	Content of diterpene lactones. 4.6 mm x 25 cm. Manufacturer: Phenomenex

VITAMIN A ORAL LIQUID PREPARATION (DSD Mgh #4007)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(3)	L8	ZORBAX NH2	Assay	4.6 mm x 15 cm, 5 μm. Manufacturer: Agilent Technologies

ZOLPIDEM TARTRATE EXTENDED-RELEASE TABLETS (DSD Mgh #2061)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(3)	L1	Inertsil ODS-2	Related Compounds	4.6 mm x 15 cm, 5 μm. Manufacturer: GL Sciences

Table of Contents*

PHARMACOPEIAL FORUM VOL. 35 NO. 4 **JULY–AUG. 2009**

* The *USP–NF* (*USP 33–NF 28*), the *Supplement* (*Supp*), or the *Interim Revision Announcement* (*IRA*) for which the revision proposal is targeted is shown in parentheses next to each proposed item.

THE JOURNAL OF STANDARDS DEVELOPMENT AND OFFICIAL COMPENDIA REVISION

Please address comments on *Pharmacopeial Forum* content to
USP Executive Secretariat
12601 Twinbrook Parkway,
Rockville, MD 20852
execsec@usp.org

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI),* in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences.*

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

Printed in USA by United Book Press, Baltimore, Maryland

ISSN: 0363-4655

STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum* (*PF*), for the development of official standards in the *United States Pharmacopeia* and the *National Formulary* (*USP–NF*).

USP publishes *PF* on a bimonthly basis to provide an opportunity to review and comment on the new or revised standards.

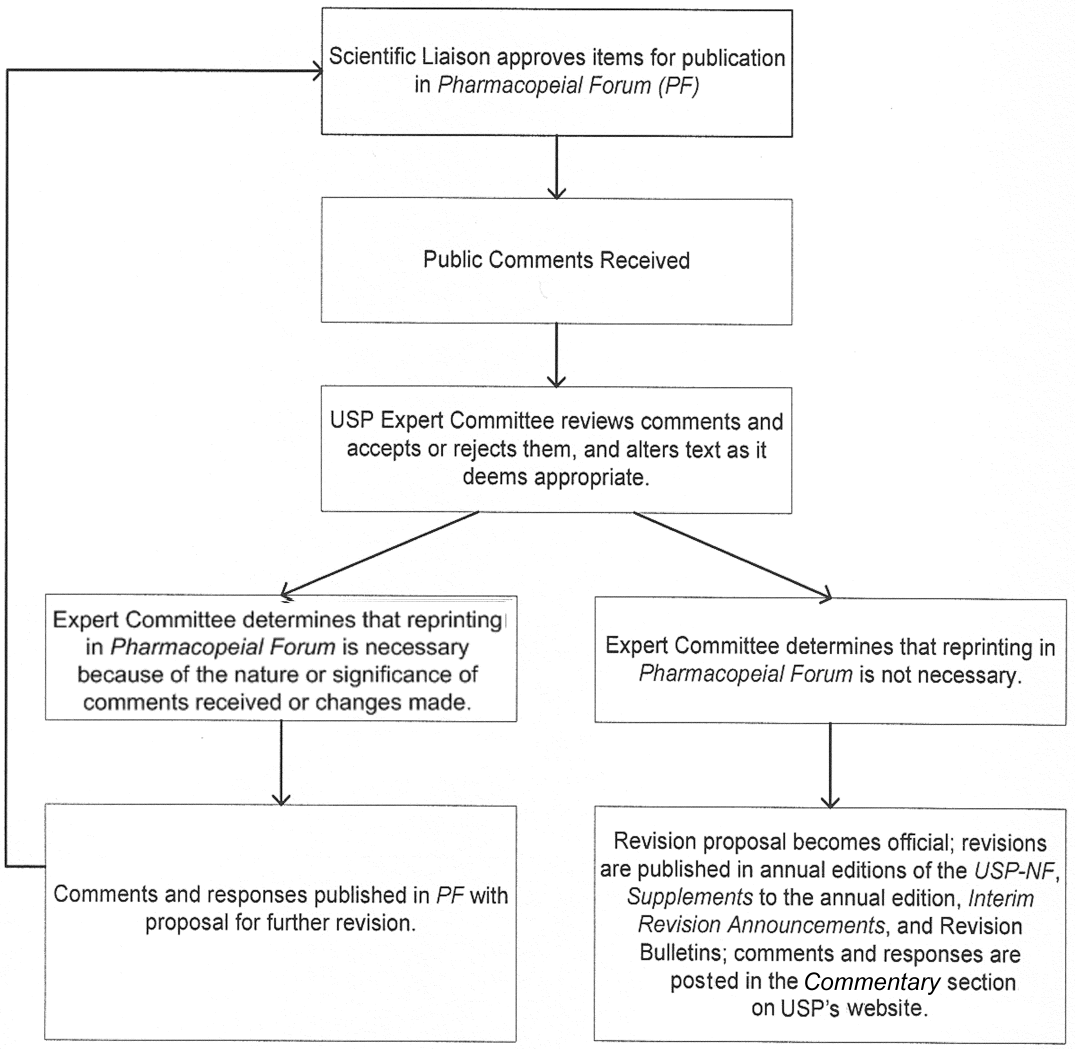
PF includes the following:

1. **Proposed Revisions**—New or revised standards targeted for adoption through USP's typical Revision Process. USP's Revision Process calls for publication of a proposed revision in *PF* for a 90-day notice and comment period. After the comment period and subsequent review of comments and approval by the relevant USP Expert Committee, the official standard is published in the next *USP–NF* or *Supplement*. If comments received are significant, or if the Expert Committee's consideration of comments results in significant additional changes, the Expert Committee may determine that reprinting in *PF* is necessary prior to the revision becoming official. See the *In-Process Revision* section for current proposed revisions.
2. **Accelerated Revisions**—New or revised standards that become official through an accelerated process in accordance with USP's Guideline on Accelerated Revisions (available on the USP website) (e.g., *Interim Revision Announcements*, *Revision Bulletins*, and *Errata*). Accelerated Revisions allow for a revision to become official prior to the next *USP–NF* or *Supplement* and do not always require notice and comment. *Interim Revision Announcements* are first presented for a 60-day public comment period in the *Proposed Interim Revision Announcement* section before becoming official in a later *PF* in the *Interim Revision Announcements* section of the *PF*. Note that *Revision Bulletins* appear only on the USP website.

USP welcomes comments and data on proposed revisions. Comments, along with USP's responses, will be published in the *Commentary* section of the USP website (www.usp.org).

The chart below shows the public review and comment process and its relationship to standards development.

Public Review and Comment Process for *USP-NF* Standards Development



Questions on the process should be addressed to Director, Executive Secretariat, United States Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: execsec@usp.org).

HOW TO USE *PF*

''How to Use PF'' describes the various parts of *Pharmacopeial Forum*, lists the *Committee Designations*, and includes the *Staff Directory*.

The contents of the various sections of *PF* are briefly described below. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a *Request for Revision* is available in the *Guideline for Submitting Requests for Revision to the USP–NF* on the USP website (www.usp.org/USPNF/submitMonograph/subGuide.html).

Proposed and Adopted Revisions to the *USP–NF*

Section	Content	How Readers Can Respond
Proposed Interim Revision Announcement Accelerated Revision targeted to become official in an upcoming *PF.*	Proposals for *Interim Revision Announcements (IRAs)* that will be published as official in a future *Pharmacopeial Forum.* BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst, such as the brand name of the column used in developing the proposed procedure and the USP Scientific Liaison who handled the issue.	Review material and send comments within 60 days of the *PF* publication where the standard was proposed (or per the Briefing). Direct comments to the USP Scientific Liaison (see the *Staff Directory*) identified at the end of the Briefing.
Interim Revision Announcement Official Accelerated Revision (on the first day of the second month, unless otherwise indicated).	Standards that have been adopted and will become official on the date that is specified in the section's introductory page or within parentheses following a particular item. New or revised text is marked by the symbols •.	Review material to see whether affected by any of the changes. Note date when standards become official, and ensure compliance.
Errata Accelerated Revision.	Corrections to official standards that will be printed in *USP–NF.*	Review material to see whether affected by any changes.
In-Process Revision Revisions for public review and comment.	Proposals for standards that will be published as official in a future *USP–NF* book or *Supplement*. BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst, such as the brand name of the column used in developing the proposed procedure and the appropriate USP Scientific Liaison.	Review material and send comments. Comment deadlines are found at the end of the *Policies and Announcements* section. Direct comments to the USP Scientific Liaison (see the *Staff Directory*) identified at the end of the Briefing. For general inquiries or in cases where a Scientific Liaison is not identified, use the general USP telephone number 301-881-0666 or fax number 301-998-6839.
Previous PF Proposals	Proposals from previous *PF*s that did not advance to official status in an official USP publication. This section is cumulative.	Review material to track pending proposals.
Canceled Proposals	Items that were published in *PF* and were pending, but have since been canceled. Note that canceled proposals may be republished to be considered in the future for adoption in *USP–NF.*	Review material to track canceled proposals.

Proposed and Adopted Revisions to the *USP–NF*

Section	Content	How Readers Can Respond
Stage 4 Harmonization Items the Pharmacopeial Discussion Group (PDG) is working to internationally harmonize	BRIEFING: Scientific rationale for the potential inclusion or change or for the proposed change. Stage 4 is available for comment.	Review material and provide comments to the appropriate Scientific Liaison cited in the Briefing. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia, with a copy to USP, for a given article. The addresses for the European (PhEur) and Japanese (JP) pharmacopoeias are as follows: PhEur Secretariat Ms. Lynn Kelso-Eleuterio Central Secretariat European Pharmacopoeia Department European Directorate for the Health Care Council of Europe 7, Allée Kastner CS 30026 67081 Strasbourg France Tel: +33 (3) 88 41 31 48 Fax: +33 (3) 88 41 27 71 lynn.kelso@edqm.eu JP Secretariat Dr. Shigenori Harada Quality Expert Pharmaceuticals and Medical Devices Agency (PMDA) Shin-kasumigaseki Building 3-3-2, Kasumigaseki, Chiyoda-ku Tokyo, 100-0013 Japan Phone: +81-3-3506-9431 Fax: +81-3-3506-9440 harada-shigenori@pmda.go.jp
Stage 6 Harmonization Items the Pharmacopeial Discussion Group (PDG) is working to internationally harmonize.	Stage 6 is the final official harmonized standard and is not available for comment. This information is published for informational purposes only. New or revised text to Stage 6 documents is marked with symbols that indicate the publication in which the book or *Supplement* becomes official.	Review material to see whether affected by any changes.

Other Sections

Expert Committee Designations
Names of the Expert Committees (comprising volunteer scientific experts) that work with USP staff on the development of standards

Staff Directory
Names of key USP Standards Division staff members, including Scientific Liaisons, with contact information

Policies and Announcements
- General scientific and policy issues affecting *USP–NF* standards and processes
- Update on standards-related issues being considered by USP
- Guidelines on how to comment
- Publication and comment schedules

Stimuli to the Revision Process
- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

Nomenclature
- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the *USP Dictionary of USAN and International Drug Names*
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

Index
Cumulative directory for the content of all issues of *PF* beginning with *PF* 35(1)

Chromatographic Columns Used in USP–NF and Pharmacopeial Forum
Update of chromatographic columns based on the proposals published in this issue of *PF*

EXPERT COMMITTEE DESIGNATIONS*

2005–2010

AER	Aerosols

POLICIES AND ANNOUNCEMENTS

This section provides general information resources for *USP–NF* standards and processes. Information resources include announcements on scientific and policy issues currently under consideration, schedules for USP publications, and schedules for comment periods for proposed standards.

USP ANNOUNCES REVISION TO HAWTHORN MONOGRAPHS. The Dietary Supplements—Information Expert Committee has approved the deletion of the cautionary statement in the *Hawthorn Leaf with Flower* and the *Powdered Hawthorn Leaf with Flower* monographs. These monographs were previously printed as proposed *Interim Revision Announcements* in *Pharmacopeial Forum*, *PF* 34(5) [Sept.–Oct. 2008.] The approved *Interim Revision Announcements*, which appear elsewhere in this issue of *PF* and will become official on August 1, 2009, will supersede the monographs as presented in *USP 32–NF 27* until the revised versions of the monographs are published in *USP 33–NF 28*, which will be released November 1, 2009 and will become official on May 1, 2010.

The revisions to cautionary statements in *Dietary Supplements* are further clarified in the Compendial Notices announcement ''USP Revises Admission Criteria and Safety Classification for Dietary Supplements,'' which is posted on USP's website. The Compendial Notices announcement also describes the cautionary statement revisions that apply to the *Green Tea Extract* monograph.

For further information on the Hawthorn monographs, contact Dandapantula Sarma, Ph.D., at 301-816-8354 or dns@usp.org.

USP ISSUES CALL FOR CANDIDATES FOR 2010–2015 COUNCIL OF EXPERTS, ITS EXPERT COMMITTEES, AND ITS EXPERT PANELS. In accordance with the Bylaws of the USP Convention, USP is issuing a Call for Candidates for the 2010–2015 Council of Experts (COE). The 2010–2015 COE includes Expert Committees in the areas of Nomenclature, Small Molecules, Biologics and Biotechnology, Excipients, General Chapters, Reference Standards, Compounding, Food Ingredients, and Dietary Supplements. In the 2010–2015 cycle, USP is expanding the number of Expert Panels that report to Expert Committees.

These Expert Committees and Panels align with the new USP Strategic Plan, which focuses on expanding and enhancing USP's core compendial and standards-setting activities. The ability to add Expert Panels according to USP's needs introduces flexibility and scalability into USP's activities. USP plans to continue to attract a global base of experts and therefore encourages any qualified individual to apply. Importantly, this approach also enables USP to closely align its documentary and reference standards activities for a more efficient standards-setting process.

Specific Expert Committees and Expert Panels for which USP is seeking candidates are listed at USP's nominations Web site (www.usp.org/goto/nominate). The deadline for applications for the COE (Expert Committee Chairs) is **December 31, 2009**. The deadline for applications for Expert Committee members is **May 15, 2010**. Recruitment for Expert Panel members will begin in July 2010 and will be continuous.

For further information, please contact Nelufar Mohajeri, Director, Volunteer Affairs and Compendial Initiatives (nym@usp.org or nominate@usp.org).

USP POSTS COMMENTARY TO INTERIM REVISION ANNOUNCEMENTS ON THE USP WEB SITE. In order to maintain transparency for revisions made to proposed *Interim Revision Announcements* that become official in the *Pharmacopeial Forum*, USP posts commentary for the proposed *Interim Revision Announcements* on the *Revisions and Commentary* web page on the date that the official standard is released in *Pharmacopeial Forum*. Note that commentary to *In-Process Revisions* is posted on the *Revisions and Commentary* web page under the final book or supplement where the official standard appears.

Commentary is not part of the official text of the monograph and is not intended to be enforceable by regulatory authorities. Rather, it explains the basis of the Expert Committee's response to public comments. If there is a difference between the contents of the *Commentary* section and the official monograph, the text of the official monograph prevails. In case of a dispute or question of interpretation, the language of the official text, alone and independent of the *Commentary* section, shall prevail.

***PHARMACOPEIAL FORUM* PUBLIC REVIEW AND COMMENT PERIOD DEADLINES.** The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. In accordance with the Rules and Procedures of the 2005–2010 Council of Experts, USP has implemented a 90-day comment period by providing a deadline for each issue of *PF* unless otherwise stated in the individual briefing. The listing of comment period deadlines and the targeted official publications appears below.

Pharmacopeial Forum	Comment Deadline	Targeted Official Publication	Release Date	Official Date
PF 35(2)	June 15, 2009	*USP 33–NF 28 1st Supplement*	February 2010	August 1, 2010
PF 35(3)	August 15, 2009			
PF 35(4)	October 15, 2009	*USP 33–NF 28 2nd Supplement*	June 2010	December 1, 2010
PF 35(5)	December 15, 2009			
PF 35(6)	February 15, 2010	*USP 34–NF 29*	November 2010	May 1, 2011
PF 36(1)	March 31, 2010			

All official revisions are published in the annual edition or *Supplements* to *USP–NF* (twice yearly). Between these publications, official revisions are published in *PF* in the *Interim Revision Announcement* section and incorporated in the upcoming *USP–NF* or *Supplement*. They may also be published as *Revision Bulletins* on www.usp.org in the ''New Official Text'' section. The official publication in which an *Interim Revision Announcement* (*IRA*) is incorporated will depend upon publication deadlines. See the table below. The electronic version of *USP–NF* is updated as each *Supplement* becomes available and, therefore, contains all official text up to and including the contents of the latest *Supplement*. The table below outlines the publications and their release and official dates, and the *USP–NF* or *Supplement* that supersedes them.

Publication Schedules

Publication	Release Date	Official Date	Superseded by
USP 32–NF 27	November 1, 2008	May 1, 2009	*1st Supplement to USP 32–NF 27*
IRA [*PF* 35(1)]	January 1, 2009	February 1, 2009	*2nd Supplement to USP 32–NF 27*
1st Supplement to USP 32–NF 27	February 1, 2009	August 1, 2009	*2nd Supplement to USP 32–NF 27*
IRA [*PF* 35(2)]	March 1, 2009	April 1, 2009	*2nd Supplement to USP 32–NF 27*
IRA [*PF* 35(3)]	May 1, 2009	June 1, 2009	*USP 33–NF 28*
2nd Supplement to USP 32–NF 27	June 1, 2009	December 1, 2009	*USP 33–NF 28*
IRA [*PF* 35(4)]	July 1, 2009	August 1, 2009	*1st Supplement to USP 33–NF 28*
IRA [*PF* 35(5)]	September 1, 2009	October 1, 2009	*1st Supplement to USP 33–NF 28*
IRA [*PF* 35(6)]	November 1, 2009	December 1, 2009	*2nd Supplement to USP 33–NF 28*
USP 33–NF 28	November 1, 2009	May 1, 2010	*1st Supplement to USP 33–NF 28*

PRIORITY NEW MONOGRAPH ITEMS. USP is seeking monographs for the following drug substances and drug products that are, or soon will be, off patent and thus are of the highest priority. USP also is seeking monographs for the excipients listed below. Monographs are marked ''Received'' upon receipt of a monograph proposal. Received monographs are removed from this list upon publication in *Pharmacopeial Forum* or when posted in the *USP Pending Monographs* section of the USP website (http://www.usp.org/standards/pending/). This list has been updated as of April 15, 2009; monographs received since the last update to the list are noted in bold.

Monograph sponsors should consult USP's Guideline for Submitting Requests for Revision to the *USP–NF* at http://www.usp.org/USPNF/submitMonograph/subGuide.html.

For additional information, contact Karen A. Russo, Ph.D., kar@usp.org.

Small Molecules (Drug Substances)—As of April 15, 2009

1. Allopurinol Sodium	2. Aminopropazine Fumarate	3. Aminopterin Sodium
4. Anagrelide Hydrochloride ***(Received)***	5. Arsenic Trioxide	6. Auranfoin
7. Azelaic Acid ***(Received)***	8. Bentoquatam	9. Benzphetamine Hydrochloride
10. Bivalirudin ***(Received)***	11. Calcipotriene	12. Calcium Trisodium Pentetate
13. Calfactant	14. Candesartan Cilexetil ***(Received)***	15. Ceftibuten
16. Cetrorelix	17. Cevimeline Hydrochloride ***(Received)***	18. Chloroxine
19. Choline Salicylate	20. Cysteamine Bitartrate	21. Dalfopristin

Small Molecules (Drug Substances)—As of April 15, 2009 *(Continued)*

22. Dapirazole Hydrochloride	23. Desirudin	24. Desonide ***(Received)***
25. Dexrazoxane	26. Difenoxin Hydrochloride	27. Entacapone ***(Received)***
28. Epoprostenol Sodium ***(Received)***	29. Erythromycin Phosphate	30. Erythromycin Thiocyanate
31. Esmolol Hydrochloride ***(Received)***	32. Estazolam ***(Received)***	33. Estramustine Phosphate Sodium
34. Ethanolamine Oleate	35. Etomidate ***(Received)***	36. Etoposide Phosphate
37. Exemestane	38. Famciclovir ***(Received)***	39. Felbamate ***(Received)***
40. Fluoromethane F 18	41. Fosfomycin Tromethamine ***(Received)***	42. Gadobenate Dimeglumine
43. Gadopentetic Acid	44. Gallium Nitrate	45. Ganirelix
46. Guanidine Hydrochloride	47. Halobetasol Propionate ***(Received)***	48. Haloperidol Decanoate ***(Received)***
49. Hydrocodone Polistirex	50. Ibandronate Sodium	51. Imipramine Pamoate
52. Imiquimod	53. Isosulfan Blue	54. Latanoprost ***(Received)***
55. Lomustine ***(Received)***	56. Metipranolol Hydrochloride	57. Miglitol
58. Milrinone Lactate	59. Moexipril Hydrochloride	60. Nalbuphine Hydrochloride
61. Nedocromil Sodium	62. **Nicardipine Hydrochloride** ***(Received)***	63. Nilutamide
64. Nisoldipine	65. Olsalazine Sodium ***(Received)***	66. Orlistat ***(Received)***
67. Oxiconazole Nitrate	68. Pemirolast Potassium	69. Pioglitazone Hydrochloride ***(Received)***
70. Piperonyl Butoxide	71. Pirbuterol Acetate ***(Received)***	72. Poractant Alpha
73. Porfimer Sodium	74. Pramiprexole Dihydrochloride ***(Received)***	75. Quetiapine Fumarate ***(Received)***
76. Ranitidine	77. Rivastigmine Tartrate ***(Received)***	78. Ropinirole Hydrochloride ***(Received)***
79. Rose Bengal Disodium	80. Rosiglitazone Maleate	81. Sodium Phenylbutyrate
82. Sodium Phosphates	83. Spectinomycin Sulfate	84. Streptozocin
85. Tenofovir Disoproxil Fumarate ***(Received)***	86. Tiludronate Disodium	87. Tiopronin
88. Trimetrexate Glucuronate	89. Venlafaxine Hydrochloride ***(Received)***	90. Voriconazole ***(Received)***
91. Zaleplon ***(Received)***	92. Zinc Tridosium Pentetate	93. Zoledronic Acid

Small Molecules (Drug Products)—As of April 15, 2009

1. Abacavir Sulfate, Lamivudine, and Zidovudine Tablets	2. Acarbose Tablets	3. Acetaminophen, Butalbital, Caffeine, and Codeine Phosphate Capsules
4. Acetaminophen, Clemastine Fumarate and Pseudoephedrine Hydrochloride Tablets	5. Acetazolamide Extended-Release Capsules	6. Albuterol and Ipratropium Bromide Inhalation Aerosol
7. Albuterol and Ipratropium Bromide Inhalation Solution	8. Albuterol Extended-Release Tablets	9. Albuterol Inhalation Aerosol
10. Albuterol Sulfate Inhalation Solution	11. Albuterol Sulfate Oral Solution	12. Alendronate Sodium Oral Solution
13. Alfuzosin Extended-Release Tablets	14. Allopurinol for Injection	15. Alprazolam Extended-Release Tablets
16. Alprostadil Urethral Suppository	17. Aminopropazine Fumarate and Neomycin Sulfate Tablets	18. Aminopropazine Fumarate Injection
19. Aminopropazine Fumarate Tablets	20. Aminopterin Sodium Tablets	21. Amiodarone Hydrochloride Injection
22. Amlodipine and Benazepril Hydrochloride Capsules ***(Received)***	23. Amphotericin B Injection	24. Anagrelide Hydrochloride Capsules ***(Received)***
25. Arsenic Trioxide Injection	26. Atovaquone and Proguanil Hydrochloride Tablets	27. Atovaquone Tablets

Small Molecules (Drug Products)—As of April 15, 2009 *(Continued)*

28. Auranofin Capsules	29. Azatadine Maleate and Pseudoephedrine Sulfate Extended-Release Tablets	30. Azelaic Acid Cream
31. Azithromycin for Injection ***(Received)***	32. Azithromycin Tablets ***(Received)***	33. Baclofen Injection
34. Beclomethasone Dipropionate Inhalation Aerosol	35. Beclomethasone Dipropionate Nasal Suspension	36. Benazepril Hydrochloride and Hydrochlorothiazide Tablets
37. Bentoquatam Topical Suspension	38. Benzocaine and Cetylpyridinium Chloride Lozenges	39. Benzocaine and Menthol Lotion
40. Benzphetamine Hydrochloride Tablets	41. Bivalirudin for Injection ***(Received)***	42. Brompheniramine Maleate, Dextromethorphan Hydrobromide and Pseudoephedrine HCl Oral Solution
43. Budesonide Inhalation Aerosol	44. Bupivacaine and Lidocaine Hydrochlorides Injection	45. Buprenorphine Hydrochloride Injection
46. Butalbital and Acetaminophen Capsules	47. Butalbital and Acetaminophen Tablets	48. Calcipotriene Cream
49. Calcipotriene Ointment	50. Calcipotriene Topical Solution	51. Calcitriol Capsules
52. Calcitriol Oral Solution	53. Calcium Acetate Capsules	54. Calcium Trisodium Pentetate Injection
55. Calfactant Intratracheal Suspension	56. Carbidopa and Levodopa Tablets For Oral Suspension ***(Received)***	57. Carbidopa, Levidopa, and Entacapone Tablets
58. Carmustine Implant	59. Cefdinir Tablets	60. Cefditoren Pivoxil Tablets
61. Ceftibuten Capsules	62. Ceftibuten For Oral Suspension	63. Ceftiofur Hydrochloride Oral Suspension
64. Cetirizine Hydrochloride Tablets ***(Received)***	65. Cetrorelix Injection	66. Cevimeline Hydrochloride Capsules
67. Chloroxine Cream	68. Chlorpromazine Hydrochloride Extended-Release Capsules	69. Choline and Magnesium Salicylates Oral Solution
70. Choline and Magnesium Salicylates Tablets	71. Choline Salicylate Oral Solution ***(Received)***	72. Ciclopirox Shampoo
73. Ciclopirox Topical Gel	74. Ciclopirox Topical Solution ***(Received)***	75. Cimetidine Oral Solution
76. Ciprofloxacin Extended-Release Tablets	77. Ciprofloxacin Hydrochloride and Hydrocortisone Otic Suspension	78. Ciprofloxacin Otic Solution
79. Cisplatin Injection	80. Citalopram Hydrobromide Oral Solution	81. Citric Acid, Gluconolactone, and Magnesium Carbonate Irrigation
82. Cladribine Injection	83. Clemastine Fumarate Syrup	84. Clobetasol Propionate Gel
85. Clorazepate Dipotassium Capsules	86. Clorazepate Dipotassium Extended-Release Tablets	87. Clotrimazole and Betamethasone Dipropionate Lotion
88. Compound Undecylenic Acid Cream	89. Compound Undecylenic Acid Topical Powder	90. Conjugated Estrogens and Medroxyprogesterone Acetate Tablets
91. Cyclosporine Modified Capsules	92. Cyclosporine Modified Oral Solution	93. Cyclosporine Ointment
94. Cyclosporine Topical Solution	95. Cysteamine Bitartrate Capsules	96. Cytarabine Liposome Injection
97. Dalfopristin and Quinupristin Injection	98. Dantrolene Sodium Oral Suspension	99. Dapiprazole for Ophthalmic Solution
100. Desirudin for Injection	101. Desonide Cream	102. Dexrazoxane for Injection
103. Dextroamphetamine Sulfate Extended-Release Capsules	104. Dextromethorphan Polistirex Extended-Release Oral Suspension	105. Diazepam Injectable Emulsion
106. Diclofenac Sodium Ophthalmic Solution	107. Diethylpropion Hydrochloride Extended-Release Tablets	108. Difenoxin Hydrochloride and Atropine Sulfate Tablets
109. Difloxacin Hydrochloride Tablets	110. Dihydroergotamine Mesylate Metered Spray	111. Diltiazem Hydrochloride Injection
112. Dinoprostone Vaginal Suppositories	113. Diphenhydramine Hydrochloride and Acetaminophen Tablets	114. **Divalproex Sodium Delayed-Release Capsules** ***(Received)***
115. Dorzolamide and Timolol Ophthalmic Solution	116. Dorzolamide Ophthalmic Solution	117. Doxepin Hydrochloride Cream
118. Doxycycline Oral Gel	119. Econazole Nitrate Cream	120. Edrophonium Chloride and Atropine Sulfate Injection
121. Enalapril Maleate and Felodipine Extended-Release Tablets	122. Entacapone Tablets ***(Received)***	123. Ephedrine Sulfate and Guaifenesin Tablets
124. Epirubicin Hydrochloride for Injection	125. Epirubicin Hydrochloride Injection	126. Epoprostenol for Injection
127. Epoprostenol Injection	128. Esmolol Hydrochloride Injection	129. Esomeprazole Magnesium Capsules

Small Molecules (Drug Products)—As of April 15, 2009 *(Continued)*

130. Estazolam Tablets ***(Received)***	131. Estramustine Phosphate Sodium Capsules	132. Ethanolamine Oleate Injection
133. Etidronate Disodium Injection Concentrate	134. Etomidate Injection ***(Received)***	135. Exemestane Tablets
136. Famotidine Orally Disintegrating Tablets	137. Felbamate Oral Suspension	138. Felbamate Tablets
139. Fentanyl Lozenges	140. Famciclovir Tablets	141. Fentanyl Transdermal System ***(Received)***
142. Ferrous Fumarate and Docusate Sodium Extended-Release Capsules	143. Fluconazole Oral Suspension	144. Flunisolide Inhalation Aerosol
145. Flunisolide Nasal Spray	146. Fluocinolone Acetonide Shampoo	147. Fluorescein Sodium Ophthalmic Solution
148. Fluorometholone Ointment	149. Fluticasone Propionate Inhalation Powder ***(Received)***	150. Fluticasone Propionate Pressurized Inhaler
151. Foscarnet Sodium Injection	152. Fosfomycin for Oral Solution	153. Gabapentin Oral Solution
154. Gadobenate Dimeglumine Injection	155. Gallium Nitrate Injection	156. Ganciclovir Capsules
157. Ganirelix Acetate Injection	158. Gatifloxacin Injection	159. Gatifloxacin Tablets
160. Gentamicin Sulfate Oral Solution	161. Gentamicin Sulfate Soluble Powder	162. Glipizide Extended-Release Tablets
163. Guaifenesin and Pseudoephedrine Hydrochloride Extended-Release Tablets	164. Guaifenesin and Salts of Dextromethorphan and Pseudoephedrine Oral Solution	165. Guanidine Hydrochloride Tablets
166. Halobetasol Propionate Cream	167. Halobetasol Propionate Ointment	168. Haloperidol Decanoate Injection
169. Haloperidol Lactate Injection	170. Haloperidol Lactate Oral Concentrate	171. Hydralazine Hydrochloride and Hydrochlorothiazide Capsules
172. **Hydrochlorothiazide Capsules** ***(Received)***	173. Hydrochlorothiazide Oral Solution	174. Hydrocodone Bitartrate and Acetaminophen Capsules
175. Hydrocodone Bitartrate and Acetaminophen Oral Solution	176. Hydrocodone Bitartrate and Aspirin Tablets	177. Hydrocodone Bitartrate and Guaifenesin Oral Solution
178. Hydrocodone Bitartrate and Homatropine Methylbromide Syrup	179. Hydrocortisone Acetate Dental Paste	180. Hydrocortisone Acetate Rectal Foam Aerosol
181. Hydrocortisone Butyrate Lotion	182. Hydroflumethiazide and Reserpine Tablets	183. Hydroquinone Lotion
184. Ibandronate Sodium Tablets	185. Ibuprofen Capsules	186. Idarubicin Hydrochloride Injection
187. Imipramine Pamoate Capsules	188. Imiquimod Topical Cream	189. Ipratropium Bromide Inhalation Aerosol
190. Ipratropium Bromide Inhalation Solution	191. Irinotecan Hydrochloride Injection	192. Isosulfan Blue Injection
193. Isradipine Extended-Release Tablets	194. Itraconazole Injection	195. Itraconazole Oral Solution
196. Ketoconazole Cream	197. Ketoconazole Shampoo	198. Ketoprofen Capsules ***(Received)***
199. Ketoprofen Extended-Release Capsules	200. Ketoprofen Tablets	201. Ketotifen Fumarate Ophthalmic Solution
202. Lactic Acid Lotion	203. Lamotrigine Tablets ***(Received)***	204. Latanoprost Ophthalmic Solution
205. Leucovorin Calcium for Injection	206. Levetiracetam Tablets ***(Received)***	207. Levocabastine Ophthalmic Suspension
208. Levofloxacin Solution	209. Lincomycin Hydrochloride and Spectinomycin Sulfate Soluble Powder	210. Liothyronine Injection
211. Lomustine Capsules ***(Received)***	212. Lopinavir and Ritonavir Solution	213. Lopinavir Capsules
214. Lopinavir Solution	215. Melphalan for Injection	216. Mesalamine Suppositories
217. Mesoridazine Besylate Concentrate	218. Metaraminol Bitartrate Injection	219. Methacholine Chloride for Inhalation Solution
220. Methadone Hydrochloride Oral Concentrate	221. Methocarbamol and Aspirin Tablets	222. Methoxsalen Softgels
223. Methyclothiazide and Deserpidine Tablets	224. Methylphenidate Hydochloride Chewable Tablets	225. Metipranolol Ophthalmic Solution
226. Metronidazole Cream	227. Metronidazole Extended-Release Tablets	228. Metronidazole Hydrochloride for Injection
229. Metronidazole Lotion	230. Miconazole Nitrate Topical Aerosol	231. Mifepristone Tablets

Small Molecules (Drug Products)—As of April 15, 2009 *(Continued)*

232. Miglitol Tablets	233. Milrinone Injection	234. Misoprostol Tablets ***(Received)***
235. Moexipril Hydrochloride and Hydrochlorothiazide Tablets	236. Moexipril Hydrochloride Tablets	237. Molindone Hydrochloride Oral Solution
238. Morphine Sulfate for Injection Concentrate	239. Morphine Sulfate Oral Solution	240. Morphine Sulfate Oral Solution Concentrate
241. Morphine Sulfate Tablets	242. Nalbuphine Hydrochloride Injection	243. Mycophenolate Mofetil Oral Solution
244. Nalmefene Hydrochloride Injection	245. Naphazoline Hydrochloride and Pheniramine Maleate Ophthalmic Solution	246. Naproxen Sodium Extended-Release Tablets
247. Nedocromil Sodium Inhalation Aerosol	248. Neomycin Sulfate Oral Powder	249. Nicardipine Hydrochloride Capsules
250. Nilutamide Tablets	251. Nimodipine Capsules	252. Nisoldipine Extended-Release Tablets
253. Nitroglycerin Solution In Acrylic Adhesive	254. Nitroglycerin Transdermal System	255. Nizatidine Tablets
256. Ofloxacin In Dextrose Injection	257. Ofloxacin Injection	258. Olsalazine Sodium Capsules
259. Orphenadrine Citrate Extended-Release Tablets ***(Received)***	260. Orphenadrine Citrate, Aspirin, and Caffeine Tablets	261. Oxcarbazepine Suspension
262. Oxiconazole Cream	263. Pamidronate Disodium Injection	264. Pantoprazole Sodium for Injection
265. Pantoprazole Sodium Tablets	266. Paroxetine Hydrochloride Extended-Release Tablets	267. Paroxetine Oral Suspension
268. Pemirolast Potassium Ophthalmic Solution	269. Penicillin G Potassium Tablets for Oral Solution	270. Pentamidine Isethionate for Inhalation
271. Pentamidine Isethionate Injection ***(Received)***	272. Pentazocine Hydrochloride and Acetaminophen Tablets	273. Phendimetrazine Tartrate Extended-Release Capsules
274. Phenobarbital Capsules	275. Phentermine Resin Complex Capsules	276. Phenylephrine Hydrochloride and Chlorpheniramine Maleate Extended-Release Capsules
277. Phenylephrine Hydrochloride, Chlorpheniramine Maleate, and Acetaminophen Extended-Release Tablets	278. Pilocarpine Hydrochloride Ophthalmic Gel	279. Pilocarpine Hydrochloride Ophthalmic Ointment
280. Pioglitazone Hydrochloride Tablets ***(Received)***	281. Piperonyl Butoxide and Pyrethrins Aerosol Foam	282. Pirbuterol Acetate Inhalation Aerosol
283. Poractant Alpha Suspension	284. Porfimer Sodium for Injection	285. Povacrylate Solution
286. Povacrylate-Iodine Topical Solution	287. Povidone-Iodine Gauze	288. Povidone-Iodine Swabsticks
289. Povidone-Iodine Topical Aerosol Foam	290. Povidone-Iodine Vaginal Suppositories	291. Pramipexole Dihydrochloride Tablets
292. Prednisolone Sodium Phosphate Oral Solution	293. Prochlorperazine Maleate Extended-Release Capsules	294. Progesterone Capsules
295. Propafenone Hydrochloride Tablets	296. Pseudoephedrine Hydrochloride and Brompheniramine Maleate Extended-Release Tablets	297. Pseudoephedrine Hydrochloride and Naproxen Sodium Extended-Release Tablets
298. Pseudoephedrine Hydrochloride, Chlorpheniramine Maleate, and Codeine Phosphate Oral Solution	299. Pseudoephedrine Hydrochloride, Guaifenesin, and Codeine Phosphate Oral Solution	300. Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Extended-Release Tablets
301. Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Oral Solution	302. Pseudoephedrine Sulfate, Dexbrompheniramine Maleate, and Acetaminophen Extended-Release Tablets	303. Pyrilamine Maleate Injection
304. Quinapril Hydrochloride and Hydrochlorothiazide Tablets	305. Quinidine Sulfate Injection	306. Ranitidine Capsules
307. Rauwolfia Serpentina and Endroflumethiazide Tablets	308. Reserpine and Polythiazide Tablets	309. Rimantadine Hydrochloride Oral Solution
310. Risperidone Orally Disintegrating Tablets ***(Received)***	311. Rivastigmine Tartrate Capsules ***(Received)***	312. Rivastigmine Tartrate Oral Solution ***(Received)***
313. Rocuronium Bromide Injection	314. Ropinirole Hydrochloride Tablets	315. Rosiglitazone Maleate Tablets
316. Salicylic Acid and Sulfur Cleansing Lotion	317. Salicylic Acid and Sulfur Lotion	318. Salicylic Acid and Sulfur Shampoo
319. Salicylic Acid Cream	320. Salicylic Acid Ointment	321. Salmeterol Inhalation Aerosol

Small Molecules (Drug Products)—As of April 15, 2009 *(Continued)*

322. Salmeterol Xinafoate Inhalation Powder	323. Scopolamine Transdermal System	324. Selegiline Hydrochloride Capsules
325. Sertraline Hydrochloride Oral Solution	326. Sibutramine Hydrochloride Capsules	327. Sodium Bicarbonate and Sodium Citrate for Oral Solution
328. Sodium Bicarbonate, Sodium Citrate, and Sodium Tartrate for Oral Suspension	329. Sodium Iodide Injection	330. Sodium Phenylbutyrate Oral Powder
331. Sodium Phenylbutyrate Tablets	332. Sodium Phosphates for Oral Suspension	333. Sodium Phosphates Tablets
334. Sodium Salicylate and Sulfur Shampoo	335. Sterile Talc Aerosol	336. Streptozocin for Injection
337. Sucralfate Oral Suspension	338. Sulconazole Nitrate Cream	339. Sulfacetamide Sodium and Fluorometholone Ophthalmic Suspension
340. Sulfacetamide Sodium and Prednisolone Sodium Phosphate Ophthalmic Solution	341. Sulfasalazine Oral Suspension	342. Sulisobenzone Lotion
343. Sumatriptan Injection	344. Tacrolimus Injection	345. Tacrolimus Ointment
346. Technetium Tc 99m Teboroxime Injection	347. Tenofovir Disoproxil Fumarate Tablets ***(Received)***	348. Terbinafine Hydrochloride Cream
349. Terbinafine Tablets ***(Received)***	350. Terbinafine Topical Solution	351. Terconazole Vaginal Cream
352. Terconazole Vaginal Suppositories	353. Testosterone Transdermal Gel	354. Testosterone Transdermal System
355. Tetracycline Hydrochloride Periodontal Fiber	356. Theophylline Extended-Release Tablets	357. Tioconazole Vaginal Ointment
358. Tiopronin Tablets	359. Tolnaftate Topical Aerosol Solution	360. Topiramate Capsules ***(Received)***
361. Torsemide Injection	362. Torsemide Tablets ***(Received)***	363. Trandolapril and Verapamil Hydrochloride Extended-Release Tablets
364. Trandolapril Tablets	365. Tranexamic Acid Injection	366. Tretinoin Capsules
367. Tretinoin Microsphere Gel	368. Triamcinolone Acetonide Nasal Suspension	369. Trifluridine Ophthalmic Solution
370. Trimetrexate for Injection	371. Trimipramine Maleate Capsules	372. Triprolidine and Pseudoephedrine Hydrochlorides and Codeine Phosphate Syrup
373. Trolamine Salicylate Cream	374. Trolamine Salicylate Gel	375. Trolamine Salicylate Topical Emulsion
376. Undecylenic Acid Topical Foam Aerosol	377. Urea Cream	378. Vecuronium Bromide for Injection
379. Venlafaxine Extended-Release Capsules ***(Received)***	380. Venlafaxine Tablets ***(Received)***	381. Verapamil Hydrochloride Capsules
382. Verapamil Hydrochloride Extended-Release Capsules	383. Voriconazole Injection	384. Voriconazole Oral Suspension
385. Voriconazole Tablets	386. Yttrium Y-90 Chloride Solution	387. Yttrium Y-90 Glass Microspheres
388. Yttrium Y-90 Microspheres Injection	389. **Zaleplon Capsules** ***(Received)***	390. Zidovudine and Lamivudine Tablets ***(Received)***
391. Zinc Acetate Capsules	392. Zinc Tridosium Pentetate Injection	393. Ziprasidone Hydrochloride Capsules
394. Zoledronic Acid for Injection	395. Zonisamide Capsules ***(Received)***	

Excipients—As of April 15, 2009

1. Acetone Sodium Bisulfite	2. Acetylated Monoglycerides	3. *N*-Acetyl-L-Methionine
4. Aconitic Acid (Achilleic Acid)	5. Acrylic Acid-Octyl Acrylate Copolymer	6. Albumin Colloidal
7. Aliphatic Polyesters	8. Allantoin-Sodium Pyrrolidone Carboxylate	9. Aluminum Ammonium Sulfate
10. Aluminum Lactate	11. Aluminum Oxide	12. Aluminum Potassium Sulfate
13. Aluminum Silicate	14. Aluminum Sodium Sulfate	15. Aluminum Stearate
16. Ammonium Bicarbonate	17. Ammonium Calcium Alginate	18. Ammonium Phosphate
19. Beeswax, Synthetic	20. Benzododecinium Bromide	21. Benzyl Chloride
22. Benzyl Nicotinate	23. Beta Naphthol	24. *N,N*-Bis(2-Hydroxyethyl)Stearamide

INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:
- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- Newly adopted (official) revisions to the *USP–NF* that become effective before the effective date of the next *Supplement* or that were not ready for adoption by the closing date for the upcoming *Supplement*. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.

Symbols—New text is enclosed in symbols and set off from the current official text as shown in the following example: •new text•

Where the symbols appear together with no enclosed text, such as ••, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the issue of a given *PF* volume.

Errata—Errata are considered to be text, erroneously published in the *USP–NF* or its *Supplements,* that does not accurately reflect the intended official requirements of the Council of Experts. Beginning with *PF* 35(2), Errata will be published both in the *Pharmacopeial Forum* and on the usp.org website. At the end of the *Interim Revision Announcement* section in this publication is a list of errata and corrections to *USP 32–NF 27*. The page number indicates where the item is found in *USP–NF.* Errata are updated as necessary in each *Pharmacopeial Forum* issue and monthly on the usp.org website. This information will also be cumulative in future *Supplements,* and will appear in its corrected form in the next annual edition of *USP–NF.* The list of Errata has been relocated to www.usp.org, where updates will be posted monthly.

INTERIM REVISION ANNOUNCEMENT to *USP 32* and to *NF 27*

By authority of the United States Pharmacopeial Convention, Inc.
Prepared by the Council of Experts and published by the Board of Trustees

Duane M. Kirking, Pharm.D., Ph.D., *Chair, USP Board of Trustees*

Roger L. Williams, M.D., *Executive Vice President, CEO,* and *Chairman, USP Council of Experts*

Susan de Mars, J.D., General Counsel and Chief, Documentary Standards Officer
William F. Koch, Ph.D., FACB, *Chief Metrology Officer*

Released July 1, 2009 **Official August 1, 2009**

All inquiries and comments regarding *USP 32* text and *NF 27* text should be addressed to the Executive Secretariat, *USP–NF,* 12601 Twinbrook Parkway, Rockville, MD 20852 (execsec@usp.org).

New USP Reference Standards

The following USP Reference Standards, which were not available when the associated monograph was made official, have since become available. The respective official date of each *USP 32* or *NF 27* standard, test, or assay requiring the use of the following USP Reference Standards is indicated in parentheses after the name of the Reference Standard.

USP 23-Epi-26-deoxyactein RS (January 1, 2009)
USP Actein RS (January 1, 2009)

Unavailable First-Time Official USP Reference Standards

The official dates of any *USP 32* or *NF 27* standards, tests, or assays requiring the use of the following new USP Reference Standards are postponed until further notice pending availability of the respective Reference Standards. This listing was updated as of February 6, 2009. Please refer to the current USP Catalog for a more up-to-date availability list. The USP Catalog can be accessed on-line at http://www.uspcatalog.com.

USP Acarbose RS
USP Acarbose System Suitability Mixture RS
USP *S*-Adenosyl-L-homocysteine RS
USP Albumin Human RS
USP Alteplase RS
USP Amifostine RS
USP Amifostine Thiol RS
USP Antithrombin III Human RS
USP Aprotinin RS
USP Aprotinin System Suitability RS
USP Copolymer Polypropylene RS
USP Diethylstilbestrol Diphosphate RS
USP Powdered *Echinacea pallida* Extract RS
USP Eucatropine Hydrochloride RS
USP Fludeoxyglucose Related Compound B RS
USP Gonadorelin Hydrochloride RS
USP Hemoglobin RS
USP Alpha Lipoic Acid RS
USP Maritime Pine Extract RS
USP Menotropins RS
USP Oleyl Oleate RS
USP Propylene Glycol Dilaurate RS
USP Sargramostim RS
USP Sincalide RS
USP Valrubicin Related Compound A RS
USP Vasopressin RS

DIETARY SUPPLEMENTS—MONOGRAPHS

Hawthorn Leaf with Flower

Change to read:

Labeling—The label states the Latin binomial and, following the official name, the parts of the plant contained in the article. ••4

Powdered Hawthorn Leaf with Flower

Change to read:

Labeling—The label states the Latin binomial and, following the official name, the parts of the plant source from which the article was derived. ••4

ERRATA

Following is a list of errata and corrections to *USP–NF*. The page number indicates where the item is found and in which official or pending official publication of *USP–NF*. If necessary, this list will be updated with every issue of *PF*. This information will also be available as a cumulative table in future *Supplements* and will appear in its corrected form in a future annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement. USP staff is available to respond to questions regarding the accuracy of a particular requirement by calling 1-800-822-USPC.

USP32–NF27 **Page**	**Title**	**Section**	**Description**
310	⟨788⟩ *Particulate Matter in Injections*	*Introduction*	Second paragraph, line 2: Change ''of mobile undissolved particles,'' to: of extraneous mobile undissolved particles,
1178	*Butylated Hydroxytoluene*	*Related compounds*	Line 1 under *Potassium ferricyanide solution*: Change ''50 mg'' to: 500 mg Line 1 under *Ferric chloride solution*: Change ''105 mg'' to: 1050 mg
1855	*Cefprozil*	*Chemical names*	Change the first chemical name to read: 5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[[amino(4-hydroxyphenyl)acetyl]amino]-8-oxo-3-(1-propenyl)-, monohydrate, [6*R*-[6α,7β(*R**)]]- Change the second chemical name to read: (6*R*,7*R*)-7-[(*R*)-2-Amino-2-(*p*-hydroxyphenyl)acetamido]-8-oxo-3-propenyl-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid monohydrate

USP32–NF27 **Page**	**Title**	**Section**	**Description**
1948	*Citalopram Hydrobromide*	*Related compounds*	*Table 1* referenced under TEST 1, *Procedure*, appears at the bottom of page 1950.
2906	*Metformin Hydrochloride Tablets*	*Dissolution* ⟨711⟩	Insert Test 3, official in Second IRA of 2007. TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3.* *Medium:* pH 6.8 phosphate buffer; 1000 mL. *Apparatus 1:* 100 rpm. *Time:* 60 minutes. Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by employing the following method. *0.05 M Sodium phosphate with 1-pentanesulfonic acid solution*—Dissolve 1.38 g of monobasic sodium phosphate in about 1800 mL of water. Add 3.484 g of 1-pentanesulfonic acid sodium salt, and mix. Adjust with diluted phosphoric acid to a pH of 3.00 ± 0.05. Add water to make 2000 mL, and mix. *Mobile phase*—Prepare a filtered and degassed mixture of *0.05 M Sodium phosphate with 1-pentanesulfonic acid solution* and acetonitrile (19:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩). *Standard stock solution*—Transfer about 25 mg, accurately weighed, of USP Metformin Hydrochloride RS to a 100-mL volumetric flask, and add about 50 mL of *Medium*. Sonicate until dissolved, and dilute with *Medium* to volume. *Standard solution*—Transfer 10.0 mL of the *Standard stock solution* to a 50-mL volumetric flask, and dilute with *Medium* to volume. *Test solution*—Withdraw a portion of the solution under test, and pass through a 0.45-μm nylon filter. Dilute with *Medium,* if necessary, to obtain a concentration similar to that of the *Standard solution.* *Chromatographic system*—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph replicate injections of the *Standard solution,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 2.0; the column efficiency is not less than 1500 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%. *Procedure*—Separately inject equal volumes (about 40 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of metformin released by the formula: $$\frac{r_U \times C_S \times 900 \times 100}{r_S \times D \times LC}$$ in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of metformin in the *Standard solution;* 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; *D* is the dilution factor of the *Test solution;* and *LC* is the Tablet label claim, in mg. *Tolerances*—Not less than 70% *(Q)* of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ is dissolved in 60 minutes.

USP32–NF27 **Page**	**Title**	**Section**	**Description**
3372	*Prednisolone Sodium Phosphate*	*Related compounds*	Line 1 under *Test solution*: Change ''Accurately weigh a known quantity of USP Prednisolone Sodium Phosphate RS'' to: Accurately weigh a known quantity of prednisolone sodium phosphate
3374	*Prednisolone Sodium Phosphate Injection*	*Identification*	Change: ''**B:** It responds to *Identification* test *A* under *Prednisolone Sodium Phosphate*.'' to: **B:** *Infrared Absorption* ⟨197K⟩— *Test specimen:* Place 5 mL of the *Assay preparation* obtained as directed in the *Assay,* in a glass-stoppered, 100-mL volumetric flask, mix with 5 mL of *Alkaline phosphatase solution* prepared as directed in the *Assay,* and add 50 mL of methylene chloride. Insert the stopper, and allow to stand, with occasional gentle inversion (about once every 15 minutes), for 2 hours. Filter the methylene chloride layer through a dry paper, and evaporate 25 mL of the filtrate to dryness. *Standard specimen*: Prepare as directed in *Infrared Absorption* ⟨197K⟩, using USP Prednisolone RS.

USP32–NF27 **Page**	**Title**	**Section**	**Description**
		Assay	Change ''*pH 9 Buffer with magnesium*—Prepare as directed in the *Assay* under *Prednisolone Sodium Phosphate.*'' to: *pH 9 Buffer with magnesium*—Mix 3.1 g of boric acid and 500 mL of water in a 1-L volumetric flask, add 21 mL of 1 N sodium hydroxide and 10 mL of 0.1 M magnesium chloride, dilute with water to volume, and mix. Change ''*Alkaline phosphatase solution*—Prepare as directed in the *Assay* under *Prednisolone Sodium Phosphate.*'' to: *Alkaline phosphatase solution*—Transfer 250 mg of alkaline phosphate enzyme to a 25-mL volumetric flask, dissolve by adding *pH 9 Buffer with magnesium* to volume, and mix. Prepare this solution fresh daily. Change: ''*Standard preparation*—Prepare as directed in the *Assay* under *Prednisolone Sodium Phosphate.*'' to: *Standard preparation*—Dissolve a suitable, accurately weighed quantity of USP Prednisolone RS in methylene chloride, and dilute quantitatively and stepwise with methylene chloride to obtain a solution having a known concentration of about 16 μg per mL. Pipet 100 mL of the solution into a glass-stoppered, 100-mL cylinder, and add 1.0 mL of *Alkaline phosphatase solution* and 1.0 mL of water. Allow to stand, with occasional gentle inversion, for 2 hours. Change: ''*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Prednisolone Sodium Phosphate.*'' to: *Procedure*—Pipet 1 mL of the *Assay preparation* into a glass-stoppered, 100-mL cylinder, add 1.0 mL of *Alkaline phosphatase solution* and about 50 mL of methylene chloride, insert the stopper, and allow to stand, with occasional gentle inversion (about once every 15 minutes), for 2 hours. Add methylene chloride to volume, mix, and allow to stand until the methylene chloride layer is clear (about 20 minutes). Concomitantly and without delay, determine the absorbances of the methylene chloride solution obtained from the *Assay preparation* and the *Standard preparation* at 241 nm, with a suitable spectrophotometer, using methylene chloride as the blank.

USP32–NF27 **Page**	**Title**	**Section**	**Description**
3375	*Prednisolone Sodium Phosphate Ophthalmic Solution*	*Identification*	Change: ''**Identification**—It responds to *Identification* test *A* under *Prednisolone Sodium Phosphate* and to *Identification* test *A* under *Prednisolone Sodium Phosphate Injection.*'' to: **Identification**— **A:** *Infrared Absorption* ⟨197K⟩ *Test specimen:* Place 5 mL of the *Assay preparation* obtained as directed in the *Assay,* in a glass-stoppered, 100-mL volumetric flask, mix with 5 mL of *Alkaline phosphatase solution* prepared as directed in the *Assay,* and add 50 mL of methylene chloride. Insert the stopper, and allow to stand, with occasional gentle inversion (about once every 15 minutes), for 2 hours. Filter the methylene chloride layer through a dry paper, and evaporate 25 mL of the filtrate to dryness. *Standard specimen:* Prepare as directed in *Infrared Absorption* ⟨197K⟩, using USP Prednisolone RS. **B:** Dissolve 65 mg of phenylhydrazine hydrochloride in 100 mL of dilute sulfuric acid (3 in 5), add 5 mL of isopropyl alcohol, and mix. Heat 5 mL of this solution with 1 mL of *Assay preparation* (obtained as directed in the *Assay*) at 70° for 2 hours: a yellow color develops.
First Supplement to USP32–NF27			
4031	*Betamethasone Oral Solution*	*Assay*	Line 1 under *Standard stock preparation*: Change ''Dissolve an accurately weighed quantity of USP Betamethasone RS in alcohol,'' to: Dissolve an accurately weighed quantity of USP Betamethasone RS in dehydrated alcohol, Line 1 under *System suitability preparation*: Change ''Dissolve an accurately weighed quantity of betamethasone in alcohol,'' to: Dissolve an accurately weighed quantity of betamethasone in dehydrated alcohol,

PROPOSED INTERIM REVISION ANNOUNCEMENTS

This section includes proposals for *Interim Revision Announcements* (*IRAs*) that will be published as official *USP* or *NF* standards. There is a 60-day comment period for these proposals, beginning on the 15th of the first month of this *Pharmacopeial Forum*. The approved official text will be published in a future *Pharmacopeial Forum* and additionally in the ''New Official Text'' section of USP's web site (www.usp.org). Readers should review material in this section and provide comments to the Scientific Liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Expert Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Each proposal is preceded by a Briefing that indicates the proposed revisions.

Proposed IRA

IN-PROCESS REVISION

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) proposed revisions placed directly under *In-Process Revision,* or (2) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the staff liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

BRIEFING

> **Name of Item**, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How to Use PF*), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
>
> (DSI: D. Sarma.) RTS—C55678

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. Because of the redesign of monographs, any proposed new text with revisions for *USP 33–NF 28* and beyond will be set off from the current official text by shading where the symbols surround the text changes. Standards that become official as *Interim Revision Announcements (IRAs)* in *Pharmacopeial Forum* will continue to identify changed text in a larger font (print edition only). All *USP–NF* revisions use the following symbols that indicate the final destination of the official text: •new text• if slated for an *IRA*; ▲new text▲ if slated for *USP–NF*; and ■new text■ if slated for a *Supplement* to *USP–NF*. The same symbols *not* set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as ••, or ■■, or ▲▲, it means that text has been deleted and no new text was proposed to replace it.

In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •2 indicates that the revision is proposed for the *Interim Revision Announcement* that will appear in issue 2 of a given *PF* volume, ■2S (*USP 32*) indicates that the proposed revision is slated for the *Second Supplement to USP 32*, and ▲*USP33* and ▲*NF28* indicates that the revisions are proposed for *USP 33* and *NF 28*, respectively.

Official Title Changes Where the specification ''***Monograph title change***'' is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

MONOGRAPHS (USP)

BRIEFING

Medical Air, *USP 32* page 1434; **Oxygen,** *USP 32* page 3173; **Oxygen 93 Percent,** *USP 32* page 3173. It is proposed to revise the *Assay* to specify the use of a paramagnetic oxygen analyzer. The paramagnetic analyzer measures the concentration based on the paramagnetic response of the oxygen molecules. Oxygen is strongly paramagnetic, whereas most common gases such as nitrogen, helium, and nitrous oxide are diamagnetic. The *Identification* test proposed is limited to the presence of oxygen in the sample. USP is seeking feedback on the need for a procedure to provide positive identification of all components of Medical Air. The *Impurities*, *Packaging and Storage*, and *Labeling* sections have been revised as well. The *Assay* and *Impurities* sections refer to the proposed new *USP* general test chapters *Impurities Testing in Medical Gases* ⟨413⟩ and *Medical Gases Assay* ⟨415⟩, which appear elsewhere in this issue of *PF.*

(AER: K. Zaidi.) RTS—C61164

Medical Air

DEFINITION

Medical Air is a natural or synthetic mixture of gases consisting largely of nitrogen and oxygen. It contains NLT 19.5% and NMT 23.5%, by volume, of O_2.

IDENTIFICATION

Add the following:

■• When tested as directed in the Assay, the analytical result is NLT 19.5% and NMT 23.5%, by volume, of oxygen.■2S (*USP33*)

ASSAY

Change to read:

• **PROCEDURE**

~~**Analysis:**~~■2S (*USP33*) Determine the oxygen concentration of Medical Air using ~~an electrochemical cell analyzer readable to 0.1% of oxygen and calibrated with ambient air to an accuracy of ± 0.2% of oxygen.~~

~~[NOTE—The instrument uses the variations of electric current produced by the interaction of oxygen with an electrochemical cell to display the oxygen strength of a confined sample or an in-line flow of the gas. This current generates a signal proportional to the oxygen concentration, which is displayed on a meter.]~~■a paramagnetic analyzer for oxygen (see *Medical Gases Assay* ⟨415⟩).

Zero gas: Nitrogen certified standard

Span gas: 21% oxygen in nitrogen certified standard

Sample: Sample under test

[NOTE—See *Reagents, Indicators, and Solutions* for information on certified standards.]

Analysis: Determine the percentage of oxygen in the sample.■2S (*USP33*)

Acceptance criteria: ~~19.5%–23.5%~~■NLT 19.5% and NMT 23.5%, by volume, of O_2.■2S (*USP33*)

IMPURITIES

Change to read:

Inorganic Impurities

■See *Impurities Testing in Medical Gases* ⟨413⟩.

[NOTE—The various detector tubes called for in the respective tests are listed under *Reagents, Indicators, and Solutions.*]■2S (*USP33*)

• **CARBON DIOXIDE:** ~~Pass 1000 ± 50 mL through a carbon dioxide detector tube at the rate specified for the tube: the indicator change corresponds to NMT 500 ppm.~~

■**Sample:** Manufacturer's recommended gas volume (±5%)

Analysis: Pass through a carbon dioxide detector tube at the rate specified for the tube.

Acceptance criteria: The indicator change corresponds to NMT 500 ppm.■2S (*USP33*)

• **CARBON MONOXIDE:** ~~Pass 1000 ± 50 mL through a carbon monoxide detector tube at the rate specified for the tube: the indicator change corresponds to NMT 10 ppm.~~

■**Sample:** Manufacturer's recommended gas volume (±5%)

Analysis: Pass through a carbon monoxide detector tube at the rate specified for the tube.

Acceptance criteria: The indicator change corresponds to NMT 10 ppm.■2S (*USP33*)

• **SULFUR DIOXIDE:** ~~Pass 1000 ± 50 mL through a sulfur dioxide detector tube at the rate specified for the tube: the indicator change corresponds to NMT 5 ppm.~~

■**Sample:** Manufacturer's recommended gas volume (±5%)

Analysis: Pass through a sulfur dioxide detector tube at the rate specified for the tube.

Acceptance criteria: The indicator change corresponds to NMT 5 ppm.■2S (*USP33*)

• **LIMIT OF NITRIC OXIDE AND NITROGEN DIOXIDE:** ~~Pass 1000 ± 50 mL through a nitric oxide–nitrogen dioxide detector tube at the rate specified for the tube: the indicator change corresponds to NMT 2.5 ppm.~~

■**Sample:** Manufacturer's recommended gas volume (±5%)

Analysis: Pass through a nitric oxide–nitrogen dioxide detector tube at the rate specified for the tube.

Acceptance criteria: The indicator change corresponds to NMT 2.5 ppm.■2S (*USP33*)

Organic Impurities

• **PROCEDURE: WATER AND OIL:** Support 1 container in an inverted position (with the valve at the bottom) for 5 min. Cautiously open the valve slightly, maintaining the container in an inverted position. Vent the gas with a barely audible flow against a stainless steel mirror for a few s: no liquid is discernible on the mirror.

SPECIFIC TESTS

• **ODOR:** Carefully open the container valve to produce a moderate flow of gas. Do not direct the gas stream toward the face, but deflect a portion of the stream toward the nose: no appreciable odor is discernible.

ADDITIONAL REQUIREMENTS

Change to read:

• **PACKAGING AND STORAGE:** ~~Preserve in cylinders or in a low-pressure collecting tank. Containers used for Medical Air are not to be treated with any toxic, sleep-inducing, or narcosis-producing compounds, and are not to be treated with any compound that would be irritating to the respiratory tract when the Medical Air is used. [NOTE—Reduce the container pressure by means of a regulator. Measure the gases with a gas volume meter downstream from the detector tube to minimize contamination or change of the specimens.]~~

~~The various detector tubes called for in the respective tests are listed under *Reagents, Indicators, and Solutions—Reagent Specifications.*~~

In-Process Revision

■Preserve in pressurized containers. Container connections shall be appropriate for air. Adaptors shall not be used to connect containers to patient use supply system piping or equipment.■2S (*USP33*)

Change to read:

• **LABELING:** Where it is piped directly from the collecting tank to the point of use, label each outlet "Medical Air".

■Where the medical air is a synthetic mixture, label as "Mixture of Oxygen USP and Nitrogen NF".

Where the medical air is a synthetic mixture of oxygen and nitrogen and where oxygen complies to Oxygen USP and Nitrogen complies to Nitrogen NF, then the *Impurities* tests are not required.■2S (*USP33*)

BRIEFING

Atropine Sulfate, *USP 32* page 1604. Atropine Sulfate is a racemic mixture. One of its enantiomer, the Hyoscyamine Sulfate monograph, was modernized via *In-Process Revision* in *PF* 31(4) [Jul.– Aug. 2005]. Similarly, this monograph is modernized and the following revisions are proposed:

1. Include an *Identification* test, based on the retention time of the major peak in the test for *Organic Impurities*.
2. Replace the current test for *Other Alkaloids* with a more specific test for *Organic Impurities* from the Hyoscyamine Sulfate monograph. The stability-indicating liquid chromatographic procedure in the test for *Organic Impurities* is based on analyses performed with the Aquasil C18 brand of L1 column. The typical retention time for hyoscyamine is about 9.8 min. The proposed method is very similar to *European Pharmacopoeia* monograph. The only difference is that the *European Pharmacopoeia* monograph uses a mixture of impurities whereas this proposal uses only one of the impurities. The chemical names for impurities are included in the proposal.
3. Omit the test for *Melting Range or Temperature* because the test for *Organic Impurities* provides sufficient information for potential impurities.
4. Replace the test for *Angular Rotation* with *Specific Rotation* to make it independent of concentration. Additionally, the specification is revised to be consistent with that in the *European Pharmacopoeia* monograph, *6th Edition*.
5. The test for *Acidity* is removed because the test for *Organic Impurities* provides enough information to determine the purity of the product.
6. Storage conditions consistent with that of the Hyoscyamine Sulfate monograph in *USP 32* and the *European Pharmacopoeia* monograph, 6th *Edition* is included.

(MD-PP: H. Ramanathan, R. Ravichandran.) RTS—C57193

Atropine Sulfate

$(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O$ 694.83
$(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4$ 676.83

Benzeneacetic acid, α-(hydroxymethyl)-, 8-methyl-8-azabicyclo [3.2.1]oct-3-yl ester, *endo*-(±)-, sulfate (2:1) (salt), monohydrate;
1α*H*,5α*H*-Tropan-3-α-ol (±)-tropate (ester), sulfate (2:1) (salt) monohydrate [5908-99-6].
Anhydrous [55-48-1].

DEFINITION
Atropine Sulfate contains NLT 98.5% and NMT 101.0% of $(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4$, calculated on the anhydrous basis.
[**CAUTION—**Handle Atropine Sulfate with exceptional care, because it is highly potent.]

IDENTIFICATION
• **A. INFRARED ABSORPTION** ⟨**197K**⟩
• **B. IDENTIFICATION TESTS—GENERAL,** *Sulfate* ⟨**191**⟩
Sample solution: 50 mg/mL
Acceptance criteria: Meets the requirements

Add the following:

■• **C.** The retention time of the major peak in the *Sample solution* corresponds to that of the *Standard solution*, as obtained in *Organic Impurities, Procedure*.■2S (*USP33*)

ASSAY
• **PROCEDURE**
Sample: 1 g
Analysis: Dissolve in 50 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid VS. Perform a blank determination (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N perchloric acid is equivalent to 67.68 mg of $(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4$.
Acceptance criteria: 98.5%–101.0% on the anhydrous basis

In-Process Revision

BRIEFING

Balsalazide Disodium Capsules. Because there is no existing *USP* monograph for this drug product, a new monograph, based on validated methods of analysis, is being proposed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with the Supelco Hypersil BDS C18 brand of L1 column. The typical retention time for the balsalazide peak is about 5 min. The liquid chromatographic procedure in the test for *Organic Impurities* is based on analyses performed with the Zorbax Eclipse XDB-C18 brand of L1 column. The typical retention time for the balsalazide peak is about 17 min.

(MD-GRE: E. Gonikberg. BPC: M. Marques.) RTS—C70442

Add the following:

▪Balsalazide Disodium Capsules

DEFINITION

Balsalazide Disodium Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of balsalazide disodium ($C_{17}H_{13}N_3Na_2O_6 \cdot 2H_2O$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B. ULTRAVIOLET ABSORPTION**

  Using a 0.2-cm cell, record the UV spectrum of the *Sample solution*, obtained in the *Assay*, in the range of 200–400 nm: it exhibits maxima at about 261 nm and 357 nm.

ASSAY

- **PROCEDURE**

  Buffer: Add 5 mL of triethylamine to 1000 mL of water, and adjust to a pH of 6.00 ± 0.1 with phosphoric acid.
  Mobile phase: Acetonitrile and *Buffer* (1:4)
  Diluent: Water
  Standard solution: 60 µg/mL of USP Balsalazide Disodium RS in *Diluent*. [NOTE—Use sonication as necessary.]
  Sample stock solution: Transfer an equivalent to 150 mg of balsalazide disodium, from the Capsules contents, to a 100-mL volumetric flask, add 70 mL of *Diluent*, sonicate for 5 min, and dilute with *Diluent* to volume.
  Sample solution: 60 µg/mL of balsalazide disodium, from *Sample stock solution*, in *Diluent*. Pass a portion of this solution through a suitable filter, discarding the first 3 mL.
  Chromatographic system
  (See *Chromatography* ⟨621⟩*, System Suitability*.)
  Mode: LC
  Detector: UV 360 nm
  Column: 4.6-mm × 25-cm column; 5-µm packing L1
  Column temperature: 30°
  Flow rate: 1 mL/min
  Injection size: 10 µL
  System suitability
  Sample: *Standard solution*
  Suitability requirements
  Column efficiency: NLT 10,000 theoretical plates
  Tailing factor: NMT 2.0
  Relative standard deviation: NMT 2.0%
  Analysis
  Sample: *Standard solution* and *Sample solution*

  Calculate the percentage of the labeled amount of $C_{17}H_{13}N_3Na_2O_6 \cdot 2H_2O$ in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

  r_U = peak response from the *Sample solution*
  r_S = peak response from the *Standard solution*
  C_S = concentration of USP Balsalazide Disodium RS in the *Standard solution* (mg/mL)
  C_U = nominal concentration of balsalazide disodium in the *Sample solution* (mg/mL)

  Acceptance criteria: 90.0%–110.0%

IMPURITIES

Organic Impurities

- **PROCEDURE**

  Buffer: Dissolve 2.7 g of monobasic potassium phosphate in 1000 mL of water, and adjust to a pH of 6.00 ± 0.1, using 10% potassium hydroxide solution.
  Diluent: Use water.
  Solution A: Use the *Buffer*.
  Solution B: Use acetonitrile.
  Sample solution: Transfer an amount of finely crushed powder equivalent to 100 mg of balsalazide disodium to a 100-mL volumetric flask, add 70 mL of *Diluent*, sonicate for 5 min, and dilute with *Diluent* to volume. Pass a portion of this solution through a 0.45-µm PVDF filter.
  Standard solution: 1.0 µg/mL of USP Balsalazide Disodium RS in *Diluent*
  System suitability solution: 1.0 µg/mL of USP Balsalazide Disodium RS, 1.5 µg/mL of USP Balsalazide Related Compound A RS, 0.5 µg/mL of USP Balsalazide Related Compound B RS, and 0.5 µg/mL of USP Salicylic Acid RS in *Diluent*
  Mobile phase: See the gradient table below.

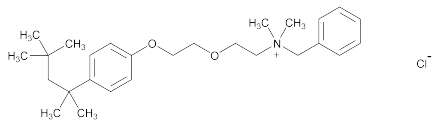
BRIEFING

Benzethonium Chloride, *USP 32* page 1638. It is proposed to modernize this monograph by replacing two wet chemistry procedures, *Identification* tests *B* and *C*, with a single, more selective IR test.

(MD-AA: M. Puderbaugh, B. Davani.) RTS—C73680

Benzethonium Chloride



$C_{27}H_{42}ClNO_2$ 448.08
Benzenemethanaminium, *N*,*N*-dimethyl-*N*-[2-[2-[4-(1,1,3,3-tetramethylbutyl)phenoxy]ethoxy]ethyl]-, chloride;
Benzyldimethyl[2-[2-[*p*-(1,1,3,3-tetramethylbutyl)phenoxy]ethoxy]ethyl]ammonium chloride [121-54-0].

DEFINITION
Benzethonium Chloride contains NLT 97.0% and NMT 103.0% of $C_{27}H_{42}ClNO_2$, calculated on the dried basis.

IDENTIFICATION
• **A. PROCEDURE**
Sample solution: 10 mg/mL
Analysis: To 1 mL of the *Sample solution*, add 2 mL of alcohol, 0.5 mL of 2 N nitric acid, and 1 mL of silver nitrate TS.
Acceptance criteria: A white precipitate, which is insoluble in 2 N nitric acid but soluble in 6 N ammonium hydroxide, is formed.

Delete the following:

■• ~~**B.** A solution (1 in 100) forms precipitates with 2 N nitric acid and with mercuric chloride TS, both of which dissolve upon the addition of alcohol.~~■2S *(USP33)*

Delete the following:

■• ~~**C. PROCEDURE**~~
~~**Sample solution:** 0.1 g in 1 mL of sulfuric acid~~
~~**Analysis:** Add 0.1 g of potassium nitrate, and heat on a steam bath for 3 min. Cautiously dilute the solution with water to 10 mL, add 0.5 g of granulated zinc, and warm the mixture for 10 min. Cool, add 0.2 g of sodium nitrite to 1 mL of the clear liquid, and add this mixture to 20 mg of naphthol~~

In-Process Revision

~~dipotassium disulfonate or naphthol disodium disulfonate in 1 mL of ammonium hydroxide.~~

~~**Acceptance criteria:** The solution turns orange-red, and a brown precipitate may be formed.~~ ■2S *(USP33)*

Add the following:

■• **B. INFRARED ABSORPTION** ⟨197K⟩■2S *(USP33)*

ASSAY

• **PROCEDURE**

Sample: 0.3 g of Benzethonium Chloride

Analysis: Dissolve the *Sample* in 75 mL of water contained in a glass-stoppered, 250-mL flask. Add 0.4 mL of bromophenol blue solution (1 in 2000), 10 mL of chloroform, and 1 mL of 1 N sodium hydroxide. Titrate with 0.02 M sodium tetraphenylboron VS until the blue color disappears from the chloroform layer. Add the last portions of the sodium tetraphenylboron solution dropwise, agitating vigorously after each addition. Each mL of 0.02 M sodium tetraphenylboron is equivalent to 8.962 mg of $C_{27}H_{42}ClNO_2$.

Acceptance criteria: 97.0%–103.0% on the dried basis

IMPURITIES

Inorganic Impurities

• **RESIDUE ON IGNITION** ⟨281⟩**:** NMT 0.1%

Organic Impurities

• **PROCEDURE: LIMIT OF AMMONIUM COMPOUNDS:** To 5 mL of a solution (1 in 50), add 3 mL of 1 N sodium hydroxide, and heat to boiling: the odor of ammonia is not perceptible.

SPECIFIC TESTS

• **MELTING RANGE OR TEMPERATURE** ⟨741⟩**:** 158°–163°, the specimen having been dried previously

• **LOSS ON DRYING** ⟨731⟩**:** Dry a sample at 105° for 4 h: it loses NMT 5.0% of its weight.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

Add the following:

■• **USP REFERENCE STANDARDS** ⟨11⟩

USP Benzethonium Chloride RS■2S *(USP33)*

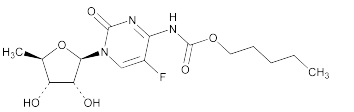
BRIEFING

Capecitabine, *USP 32* page 1774. On the basis of comments received, it is proposed to make the following changes:

1. In the *Assay*, specify the use of glacial acetic acid in *Solution A*.
2. In order to be consistent with ICH guidelines, in the test for *Organic Impurities*, delete the requirement for *Total unspecified impurities* in *Impurity Table 1*.

(MD-OOD: F. Mao, M. Waddell.) RTS—C74146

Capecitabine



$C_{15}H_{22}FN_3O_6$ 359.35

Carbamic acid, [1-(5-deoxy-β-D-ribofuranosyl)-5-fluoro-1,2-dihydro-2-oxo-4-pyrimidinyl]-, pentyl ester;

Pentyl 1-(5-deoxy-β-D-ribofuranosyl)-5-fluoro-1,2-dihydro-2-oxo-4-pyrimidinecarbamate [154361-50-9].

DEFINITION

Capecitabine contains NLT 98.0% and NMT 102.0% of $C_{15}H_{22}FN_3O_6$, calculated on the anhydrous and solvent-free basis.

IDENTIFICATION

• **A. INFRARED ABSORPTION** ⟨197K⟩

Sample: 2 mg of sample in 300 mg of potassium bromide

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

Change to read:

• **PROCEDURE**

BRIEFING

Capecitabine Tablets, *USP 32* page 1775 and page 72 of *PF* 35(1) [Jan.–Feb. 2009]. On the basis of comments received, it is proposed to make the following changes:
1. Specify the use of glacial acetic acid in *Solution A* for the *Mobile phase* preparation in the *Assay*.
2. Delete the requirement for total unspecified impurities in the *Organic Impurities* test, to be consistent with ICH guidelines.
3. Modify *Impurity Table 1* to include known process impurities that are likely to be present in the *Sample solution.* Add a footnote to *Impurity Table 1* specifying that process impurities are not included in the *Total degradation products* requirement.

(MD-OOD: F. Mao, M. Waddell.) RTS—C72555

Capecitabine Tablets

DEFINITION
Capecitabine Tablets contain NLT 93.0% and NMT 105.0% of the labeled amount of capecitabine ($C_{15}H_{22}FN_3O_6$).

IDENTIFICATION
• **A. INFRARED ABSORPTION** ⟨**197K**⟩
Analytical wavelength: 1500–1760 cm^{-1}
Sample: Grind one Tablet to a fine powder with a mortar and pestle. Mix 1 mg of this sample with 300 mg of potassium bromide.
• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay.*

ASSAY

Change to read:

• **PROCEDURE**
Diluent: Methanol, acetonitrile, and water (7:1:12)
Solution A: 0.1% mixture of ■glacial■2S *(USP33)* acetic acid in water
Solution B: Methanol, acetonitrile, and *Solution A* (7:1:12)
Solution C: Methanol, acetonitrile, and *Solution A* (16:1:3)
Mobile phase: See the gradient table below.

Time (min)	Solution B (%)	Solution C (%)
0	100	0
5	100	0
20	49	51
30	49	51
31	100	0
40	100	0

System suitability solution: Includes 0.6 µg/mL of USP Capecitabine RS, 0.6 µg/mL of USP Capecitabine Related Compound A RS, 0.6 µg/mL of USP Capecitabine Related Compound B RS, and 0.6 µg/mL of USP Capecitabine Related Compound C RS in *Diluent.* [NOTE—Sonicate if necessary.]
Standard solution: 0.6 mg/mL of USP Capecitabine RS in *Diluent.* [NOTE—Sonicate if necessary.]
Sample solution: Equivalent to 0.6 mg/mL of Capecitabine, from powdered Tablets (NLT 20), in *Diluent.* [NOTE—Pass through a PVDF 0.45-µm membrane filter, and use the filtrate.] [NOTE—Sonicate if necessary.]
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability.*)

In-Process Revision

Mode: LC
Detector: UV 250 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Column temperature: 40°
Autosampler temperature: 5°
Flow rate: 1 mL/min
Injection size: 10 µL

System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—For the purpose of peak identification, the approximate relative retention times are given in *Impurity Table 1*. The relative retention times are measured with respect to capecitabine.]
Suitability requirements

Tailing factor: NMT 1.5, *Standard solution*
Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{15}H_{22}FN_3O_6$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Capecitabine RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of capecitabine in the *Sample solution* (mg/mL)

Acceptance criteria: 93.0%–105.0%

PERFORMANCE TESTS

Change to read:

• **DISSOLUTION** ⟨**711**⟩
Medium: Water; 900 mL, degassed
Apparatus 2: 50 rpm
Time: 30 min
Sample solution: *Sample* per *Dissolution* ⟨711⟩. Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*. Pass a portion of the solution under test through a 0.45-µm fiberglass filter.
Standard solutions
For Tablets labeled to contain 150 mg: 17 mg of USP Capecitabine RS in 100 mL of *Medium*
For Tablets labeled to contain 500 mg: 28 mg of USP Capecitabine RS in 50 mL of *Medium*
Analysis: Determine the amount of $C_{15}H_{22}FN_3O_6$ dissolved by employing UV absorption at the wavelength of maximum absorbance at 304 nm ~~(for Tablets labeled to contain 150 mg) and at 325 nm (for Tablets labeled to contain 500 mg)~~▲▲*USP33* on portions of the *Sample solution*, suitably diluted with *Medium*, if necessary, in comparison with the appropriate *Standard solution*, using a 1-mm quartz cell. Calculate the percentage of $C_{15}H_{22}FN_3O_6$ dissolved in each Tablet:

$$\text{Result} = (A_U/A_S) \times C_S \times (V/L) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of capecitabine in the *Standard solution* (mg/mL)
V = volume of medium, 900 mL
L = label claim (mg/Tablet)
Tolerances: NLT 80% (Q) of the labeled amount of $C_{15}H_{22}FN_3O_6$ is dissolved.

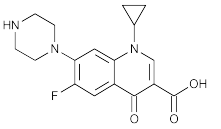
BRIEFING

Ciprofloxacin, *USP 32* page 1939. It is proposed to replace the current TLC identification procedure with the HPLC retention time agreement from the *Assay*.

(MD-AA: M. Puderbaugh, B. Davani.) RTS—C74255

Ciprofloxacin



$C_{17}H_{18}FN_3O_3$ 331.34

3-Quinolinecarboxylic acid, 1-cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-7-(1-piperazinyl)-;

1-Cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-7-(1-piperazinyl)-3-quinolinecarboxylic acid [85721-33-1].

DEFINITION

Ciprofloxacin contains NLT 98.0% and NMT 102.0% of $C_{17}H_{18}FN_3O_3$, calculated on the dried basis.

IDENTIFICATION

- **A. Infrared Absorption**

The IR absorption spectrum of a potassium bromide dispersion of it exhibits maxima at the same wavelengths as that of a similar preparation of USP Ciprofloxacin RS.

Change to read:

- **B. ~~Thin-Layer Chromatographic Identification Test~~**

~~**Standard solution:** 10.0 mg/mL of USP Ciprofloxacin RS in 6 N ammonium hydroxide~~

~~**Sample solution:** 10.0 mg/mL of Ciprofloxacin in 6 N ammonium hydroxide~~

~~**Developing solvent system:** Methylene chloride, methanol, ammonium hydroxide, and acetonitrile (4.4.2.1)~~

~~**Chromatographic system**~~

~~(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)~~

~~**Mode:** TLC~~

~~**Adsorbent:** 0.25-mm layer of silica gel mixture~~

~~**Application volume:** 5 µL~~

~~**Analysis**~~

~~**Samples:** *Standard solution* and *Sample solution*~~

~~Separately apply, as 1-cm bands to the thin-layer chromatographic plate, 5 µL of each solution to a suitable thin-layer chromatographic plate. Place the plate in an atmosphere of ammonia for about 15 min, then transfer the plate to a suitable unsaturated chromatographic chamber, and develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the plate to air-dry for about 15 min. Examine the plate under both short- and long-wavelength UV light.~~

~~**Acceptance criteria:** The intensity and R_F value of the principal band from the *Sample solution* corresponds to that from the *Standard solution*.~~ ■The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.■2S (*USP33*)

ASSAY

- **Procedure**

Solution A: 0.025 M phosphoric acid. Adjust with triethylamine to a pH of 3.0 ± 0.1.

Mobile phase: Acetonitrile and *Solution A* (13:87)

Standard solution: Transfer 12.5 mg of USP Ciprofloxacin RS to a 25-mL volumetric flask. Add 0.1 mL of 7% phosphoric acid and dilute with *Mobile phase* to volume.

System suitability stock solution: 0.025 mg/mL of USP Ciprofloxacin Ethylenediamine Analog RS in *Mobile phase*

System suitability solution: Transfer 1.0 mL of the *System suitability stock solution* to a 10-mL volumetric flask, and dilute with *Standard solution* to volume.

Sample solution: Transfer 25 mg of Ciprofloxacin to a 50-mL volumetric flask. Add 0.2 mL of 7% phosphoric acid, and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 278 nm

Column: 4.6-mm × 25-cm; packing L1

Column temperature: 30 ± 1°

Flow rate: 1.5 mL/min

Injection size: 10 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

[Note—The relative retention times for ciprofloxacin ethylenediamine analog and ciprofloxacin are about 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 6 between ciprofloxacin ethylenediamine analog and ciprofloxacin, *System suitability solution*

Column efficiency: NLT 2500 theoretical plates from the ciprofloxacin peak, *Standard solution*

Tailing factor: NMT 2.5 for the ciprofloxacin peak, *Standard solution*

Relative standard deviation: NMT 1.5%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{17}H_{18}FN_3O_3$ in the portion of Ciprofloxacin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Ciprofloxacin RS in the *Standard solution* (mg/mL)

C_U = concentration of Ciprofloxacin in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

Inorganic Impurities

- **Residue on Ignition ⟨281⟩:** NMT 0.1%, except that where it is intended for use in preparing Ciprofloxacin for Oral Suspension, it is NMT 0.2%.
- **Chloride**

Sample solution: Add 30.0 mL of water to 0.5 g of Ciprofloxacin, shake for 5 min, and pass through chloride-free filter paper. Use the filtrate as the *Sample solution*.

Standard solution: 8.2 µg/mL of sodium chloride (5 µg/mL of chloride)

Analysis

Samples: *Sample solution* and *Standard solution*

Transfer 15.0 mL of the *Sample solution* to a 50-mL color-comparison tube, and transfer 10.0 mL of the *Standard solution* to a second matched 50-mL color-comparison tube, add 5.0 mL of water to the tube containing the *Standard solution*, and mix. To each tube add 1 mL of 2 N nitric acid, mix, add 1 mL of silver nitrate TS, and mix.

Acceptance criteria: The turbidity exhibited by the *Sample solution* does not exceed that of the *Standard solution* (0.02%).

- **Sulfate**

Sample solution: Dissolve 0.5 g in 5.0 mL of 2 N acetic acid and 15.0 mL of water.

Standard solution: 18.1 µg/mL of potassium sulfate in 30% alcohol (10 µg/mL of sulfate)

Analysis

Samples: *Sample solution* and *Standard solution*

To each of two 50-mL matched color-comparison tubes transfer 1.50 mL of the *Standard solution*. To each tube add, successively and with continuous shaking, 1.0 mL of 250 mg/mL barium chloride solution, and allow to stand for 1 min. To one of the tubes transfer 15.0 mL of the *Standard solution* and 0.5 mL of 30% acetic acid, and mix. To the second tube add 15.0 mL of the *Sample solution* and 0.5 mL of 30% acetic acid, and mix.

In-Process Revision

Acceptance criteria: The turbidity exhibited in the tube containing the *Sample solution* does not exceed that of the tube containing the *Standard solution* (0.04%).

- **HEAVY METALS,** *Method II* ⟨**231**⟩**:** NMT 20 ppm

Organic Impurities

- **PROCEDURE 1: LIMIT OF FLUOROQUINOLONIC ACID**

Standard stock solution: Transfer 5.0 mg of USP Fluoroquinolonic Acid RS to a 50-mL volumetric flask containing 0.05 mL of 6 N ammonium hydroxide and dilute with water to volume.

Standard solution: Dilute 2.0 mL of the *Standard stock solution* with water to 10.0 mL.

Sample solution: 10.0 mg/mL of Ciprofloxacin in 0.1 N acetic acid

Developing solvent system: Methylene chloride, methanol, acetonitrile, and ammonium hydroxide (4:4:1:2)

Chromatographic system

(See *Chromatography* ⟨621⟩*, Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of silica gel mixture

Application volume: 5 µL

Analysis

Samples: *Standard solution* and *Sample solution*

Place the plate in a suitable chamber in which is placed a beaker containing 50 mL of ammonium hydroxide. After 15 min, transfer the plate to a suitable chromatographic chamber, and develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the plate to air-dry for about 15 min. Examine the plate under short-wavelength UV light.

Acceptance criteria: Any spot from the *Sample solution*, at an R_F value corresponding to the principal spot from the *Standard solution*, is not greater in size or intensity than the principal spot from the *Standard solution* (0.2%).

- **PROCEDURE 2**

Solution A, Mobile phase, System suitability stock solution, System suitability solution, Standard solution, Sample solution, Chromatographic system, and **System suitability:** Prepare as directed in the *Assay*.

Analysis: Proceed as directed in the *Assay*. Calculate the percentage of each impurity peak in the chromatogram from the *Sample solution* taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each impurity
r_T = sum of the responses of all the peaks

Acceptance criteria

Ciprofloxacin ethylenediamine analog or any other individual impurity peak: NMT 0.2%

Total impurities: NMT 0.5%

SPECIFIC TESTS

- **CLARITY OF SOLUTION:** Dissolve 0.25 g in 10 mL of 0.1 N hydrochloric acid: a clear to slightly opalescent solution is obtained.
- **MICROBIAL ENUMERATION TESTS** ⟨**61**⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨**62**⟩**:** Where it is intended for use in preparing Ciprofloxacin for Oral Suspension, the total microbial count does not exceed 1000 cfu/g, and the total combined molds and yeast count does not exceed 100 cfu/g. It also meets the requirement for absence of *Salmonella* species and *Escherichia coli*.
- **LOSS ON DRYING** ⟨**731**⟩**:** Dry it in a vacuum at 120° for 6 h: it loses NMT 1.0% of its weight, except that where it is labeled as intended for use in preparing Ciprofloxacin for Oral Suspension, it loses between 10% and 20% of its weight.
- **STERILITY TESTS** ⟨**71**⟩**:** Where the label states that it is sterile, it meets the requirements.
- **BACTERIAL ENDOTOXINS TEST** ⟨**85**⟩**:** Where the label states that it is sterile or where the label states that Ciprofloxacin must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 0.50 USP Endotoxin Unit/mg of ciprofloxacin.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at 25°, excursion permitted between 15° and 30°, and avoid excessive heat.
- **LABELING:** Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms. Where it is intended for use in preparing Ciprofloxacin for Oral Suspension, it is so labeled.
- **USP REFERENCE STANDARDS** ⟨**11**⟩

In-Process Revision

Ciprofloxacin Injection

DEFINITION

Ciprofloxacin Injection is a sterile solution of Ciprofloxacin or Ciprofloxacin Hydrochloride in Water for Injection, in 5% Dextrose Injection, or in 0.9% Sodium Chloride Injection prepared with the aid of Lactic Acid. It contains NLT 90.0% and NMT 110.0% of the labeled amount of ciprofloxacin ($C_{17}H_{18}FN_3O_3$).

IDENTIFICATION

ASSAY

- **PROCEDURE**

Solution A: 0.025 M phosphoric acid. Adjust with triethylamine to a pH of 3.0 ± 0.1.
Mobile phase: Acetonitrile and *Solution A* (13:87)
Standard solution: 0.5 mg/mL of USP Ciprofloxacin Hydrochloride RS in *Mobile phase*
System suitability solution: 0.025 mg/mL of USP Ciprofloxacin Ethylenediamine Analog RS in *Mobile phase*. Transfer 1.0 mL of this solution to a 10-mL volumetric flask, and dilute with *Standard solution* to volume.
Sample solution: Equivalent to 0.5 mg/mL of Ciprofloxacin from Injection diluted with *Mobile phase*
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 278 nm
Column: 4.6-mm × 25-cm; packing L1
Temperature: 30 ± 1°
Flow rate: 1.5 mL/min
Injection size: 10 µL
System suitability
Samples: *Standard solution* and *System suitability solution*
[NOTE—The relative retention times for ciprofloxacin ethylenediamine analog and ciprofloxacin are 0.7 and 1.0, respectively.]
Suitability requirements
Resolution: NLT 6 between the ciprofloxacin ethylenediamine analog peak and the ciprofloxacin peak, *System suitability solution*
Column efficiency: NLT 2500 theoretical plates from the ciprofloxacin peak, *Standard solution*
Tailing factor: NMT 2.5 for the ciprofloxacin peak, *Standard solution*
Relative standard deviation: NMT 1.5%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the label claim of $C_{17}H_{18}FN_3O_3$ in the portion of the Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area from the *Sample solution*
r_S = peak area from the *Standard solution*
C_S = concentration of USP Ciprofloxacin Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of ciprofloxacin, *Sample solution* (mg/mL)
M_{r1} = molecular weight of ciprofloxacin, 331.34
M_{r2} = molecular weight of anhydrous ciprofloxacin hydrochloride, 367.81

Acceptance criteria: 90.0%–110.0% of $C_{17}H_{18}FN_3O_3$

OTHER COMPONENTS

- **LACTIC ACID CONTENT**

Mobile phase: Acetonitrile and 0.005 N sulfuric acid (3:17)
Standard solution: 0.8 mg/mL of USP Sodium Lactate RS in water or 4 mg/mL where the Injection is labeled as being a concentrated form
Sample solution: Use the undiluted Injection.
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 208 nm
Column: 7.8-mm × 30-cm; packing L17
Temperature: 40 ± 1°
Flow rate: 0.6 mL/min
Injection size: 20 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0 for the analyte peak
Relative standard deviation: NMT 2.0%
[NOTE—After each analysis, rinse the column with a mixture of 0.01 N sulfuric acid and acetonitrile to elute the ciprofloxacin from the column. Promptly regenerate the column with 0.01 N sulfuric acid, and the column may be reused or stored.]
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the concentration of lactic acid ($C_3H_6O_3$) in mg/mg of ciprofloxacin:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2})$$

r_U = peak response of lactic acid from the *Sample solution*
r_S = peak response of lactic acid from the *Standard solution*
C_S = concentration of USP Sodium Lactate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of ciprofloxacin in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of lactic acid, 90.08
M_{r2} = molecular weight of sodium lactate, 112.07

Acceptance criteria: 0.288–0.352 mg of lactic acid for each mg of ciprofloxacin claimed on the label, except that where the Injection is labeled as being a concentrated form, it contains 0.335–0.409 mg of lactic acid for each mg of ciprofloxacin claimed on the label

- **DEXTROSE CONTENT** (if present)

Analysis

Sample solution: Undiluted Injection

Determine the angular rotation in a suitable polarimeter tube (see *Optical Rotation* ⟨781⟩).

Calculate the percentage (g/100 mL) of dextrose ($C_6H_{12}O_6 \cdot H_2O$) in the portion of Injection taken:

$$A \times R \times (M_{r1}/M_{r2}) \times (100/F)$$

A = 100 mm divided by the length of the polarimeter tube (mm)
R = observed rotation (degrees)
M_{r1} = molecular weight of dextrose monohydrate, 198.17
M_{r2} = molecular weight of anhydrous dextrose, 180.16
F = midpoint of the specific rotation range for anhydrous dextrose (degrees), 52.9

Acceptance criteria: 4.75–5.25 g/100 mL

- **SODIUM CHLORIDE CONTENT** (if present)

Sample solution: Injection

Analysis: Transfer 10.0 mL of *Sample solution* to a suitable container, dilute with water to 150 mL, add 1.5 mL of potassium chromate TS, and titrate with 0.1 N silver nitrate TS. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of sodium chloride (NaCl).

Acceptance criteria: 85.5–94.5 mg

IMPURITIES

Organic Impurities

- **PROCEDURE: LIMIT OF CIPROFLOXACIN ETHYLENEDIAMINE ANALOG**

Mobile phase, System suitability solution, Sample solution, Chromatographic system, and **System suitability:** Proceed as directed in the *Assay*.

Analysis

Sample: *Sample solution*

Proceed as directed for *Analysis* in the *Assay*. Calculate the percentage of ciprofloxacin ethylenediamine analog from the chromatogram obtained from the *Sample solution:*

$$\text{Result} = F \times r_A/(0.7r_A + r_C) \times 100$$

F = correction factor for ciprofloxacin ethylenediamine analog, 0.7
r_A = ciprofloxacin ethylenediamine analog peak response
r_C = ciprofloxacin peak response

Acceptance criteria: NMT 0.5%

SPECIFIC TESTS

- **PARTICULATE MATTER IN INJECTIONS** ⟨788⟩**:** Meets the requirements
- **pH** ⟨791⟩**:** 3.5–4.6, except that where the Injection is labeled as being a concentrated form, its pH is 3.3–3.9
- **BACTERIAL ENDOTOXINS TEST** ⟨85⟩**:** It contains NMT 0.50 USP Endotoxin Unit/mg of ciprofloxacin.
- **STERILITY TESTS** ⟨71⟩**:** It meets the requirements for *Test for Sterility of the Product to Be Examined, Membrane Filtration*.
- **COLOR AND ACHROMICITY** ⟨631⟩ (where it is labeled as being a concentrated form)**:** It has no more color than a solution prepared by diluting 5.0 mL of *Matching Fluid O* with 95.0 mL of 0.12 N hydrochloric acid.
- **OTHER REQUIREMENTS:** It meets the requirements for *Injections* ⟨1⟩*, Volume in Container*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose containers, preferably of Type I glass, and store in a cool place or at controlled room temperature. Avoid freezing and exposure to light.
- **LABELING:** The label indicates whether the vehicle is Sterile Water for Injection, 5% Dextrose Injection, or 0.9% Sodium Chloride Injection. Label the Injection that has Sterile Water for Injection as the vehicle to indicate that it is a concentrated form that must be diluted to appropriate strength (1–2 mg/mL) with 5% Dextrose Injection or 0.9% Sodium Chloride Injection before administration, and that the resulting solution is stable for up to 14 days when stored in a cool place or at controlled room temperature.

~~Proceed as directed under General Chapter. Separately apply, as 1-cm bands to the thin-layer chromatographic plate. Place the plate in an atmosphere of ammonia for about 15 min, then transfer the plate to a suitable unsaturated chromatographic chamber, and develop the chromatogram in developing solvent system until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the plate to air-dry for about 15 min. Examine the plate under both short- and long-wavelength UV light.~~
~~**Acceptance criteria:** The intensity and R_F value of the principal band from the *Sample solution* corresponds to that from the *Standard solution*.~~ ■2S (*USP33*)

BRIEFING

Citalopram Tablets. *USP 32* page 1949. On the basis of comments received, it is proposed to modify the monograph as follows:

1. Include an alternative sample preparation procedure for *Identification* test *A*.
2. The sample solution preparation and final concentration in *Uniformity of Dosage Units* is identical to the *Assay*. The redundant procedure and calculations are deleted from the *Uniformity of Dosage Units* section.
3. The test for *Organic Impurities* is simplified by deleting the *Related compounds stock solution* and *Peak identification solution*.
4. The concentration of the *Standard stock solution* is modified so that the *System suitability solution* will have the appropriate concentration of citalopram hydrobromide.
5. The *System suitability solution* is modified to serve the peak identification purposes.
6. The system suitability parameters, *Capacity factor* and *Column efficiency,* have been deleted, because the method has four other system suitability parameters: *Resolution*, *Tailing factor*, *Relative standard deviation*, and *Signal-to-noise ratio*, which are adequate to ensure the suitability of the HPLC system.
7. Citalopram has been added to the impurity table to provide appropriate reference for calculations of the *Relative retention time*.

(MD-PP: R. Ravichandran.) RTS—C59574

Citalopram Tablets

DEFINITION

Citalopram Tablets contain an amount of Citalopram Hydrobromide equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of citalopram free base ($C_{20}H_{21}FN_2O$).

IDENTIFICATION

Change to read:

• **A. INFRARED ABSORPTION ⟨197K⟩**
Sample: Extract finely ground Tablet powder containing 200 mg of citalopram with 30 mL of water, and filter. Add 1 mL of 1 N sodium hydroxide to the filtrate, and extract with 50 mL of cyclohexane by shaking for 10 min. Pass the cyclohexane layer through a silicone-treated filter paper into a beaker. Reduce the filtrate down to 3 mL, using gentle heat as necessary. Transfer the hot solution to a small centrifuge tube. Induce crystallization while cooling by scratching the side of the test tube with a spatula. Centrifuge the mixture, and decant off the cyclohexane. Dry the residue under vacuum in a desiccator. ■[NOTE—If crystallization fails to occur in the above procedure, use the following alternative procedure. Extract finely ground Tablet powder containing about 50 mg of citalopram, mix with 10 mL of chloroform in a test tube, and sonicate for 1 min. Centrifuge for 10 min, and filter into a beaker. Evaporate to dryness with nitrogen and if necessary induce crystallization by etching the beaker.]■2S *(USP33)*
Mix approximately 2 mg of the residue with approximately 300 mg of potassium bromide, and record the IR spectrum.
• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

In-Process Revision

ASSAY

• **PROCEDURE**

Solution A: 1.42 mg/mL of anhydrous dibasic sodium phosphate in water

Diluent: Methanol and *Solution A* (4:1)

Mobile phase: 0.77 mg/mL of dodecyltrimethylammonium bromide in *Diluent*

Internal standard solution: 0.25 mg/mL of USP Citalopram Related Compound F RS in *Diluent*

Standard stock solution: 1.25 mg/mL of USP Citalopram Hydrobromide RS in *Diluent*

Standard solution: Pipet 5.0 mL of the *Standard stock solution* and 5.0 mL of *Internal standard solution* into a 50-mL volumetric flask. Dilute with *Diluent* to volume.

Sample solution: Transfer 10 Tablets to a 200-mL volumetric flask, add 25 mL of *Solution A*, and shake by mechanical means until disintegrated. Add 100 mL of methanol, and sonicate for about 5 min. Allow to cool to room temperature, then dilute with *Diluent* to volume. Allow to stand until the residue settles before taking an aliquot for dilution. Transfer a volume of the clear supernatant to a 50-mL volumetric flask to obtain a final nominal concentration between 0.090 and 0.10 mg/mL of citalopram. Add 5.0 mL of *Internal standard solution*, and dilute with *Diluent* to volume. Pass a portion through a filter (PTFE) having a 0.45-µm or finer porosity.

Chromatographic system

(See *Chromatography* ⟨621⟩*, System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 45°

Flow rate: 1 mL/min

Injection size: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for citalopram related compound F and citalopram are about 1.36 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between citalopram and citalopram related compound F

Column efficiency: NLT 2000 theoretical plates, calculated from the citalopram peak

Relative standard deviation: NMT 1.5% for the citalopram peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of label claim of citalopram in the portion of the Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

R_U = ratio of the peak response of citalopram to the internal standard from the *Sample solution*

R_S = ratio of the peak response of citalopram to the internal standard from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

C_U = nominal concentration of the *Sample solution* (mg/mL)

M_{r1} = molecular weight of citalopram, 324.39

M_{r2} = molecular weight of citalopram hydrobromide, 405.30

Acceptance criteria: 90.0%–110.0% of the labeled amount of $C_{20}H_{21}FN_2O$

PERFORMANCE TESTS

• **DISSOLUTION** ⟨**711**⟩

Buffer solution: pH 1.5 buffer (prepared by transferring 118 mL of 1 N hydrochloric acid and 82 mL of 1 N sodium hydroxide to a 1000-mL volumetric flask, diluting with water to volume, and adjusting with 1 N sodium hydroxide to a pH of 1.5

Medium: *Buffer solution;* 800 mL, deaerated

Apparatus 1: 100 rpm

Time: 30 min

Detector: UV 239 nm

Sample solutions: Sample per *Dissolution* ⟨711⟩. Pass through a 0.45-µm PVDF filter, dilute with *Medium* as needed.

Standard solution: 12 µg/mL of USP Citalopram Hydrobromide RS in *Medium*

Analysis: Calculate the amount of citalopram dissolved, as a percentage:

$$(A_U \times C_S \times M_{r1} \times D \times 800 \times 100)/(A_S \times M_{r2} \times L)$$

A_U = absorbance from the *Sample solution*

A_S = absorbance from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

M_{r1} = molecular weight of citalopram, 324.39

M_{r2} = molecular weight of citalopram hydrobromide, 405.30

D = dilution factor of the *Sample solution*

800 = volume of *Medium* (mL)

L = Tablet label claim of citalopram (mg)

Tolerances: NLT 80% (Q) of the labeled amount of citalopram ($C_{20}H_{21}FN_2O$) is dissolved.

In-Process Revision

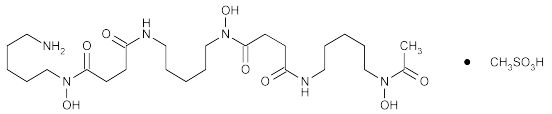
BRIEFING

Deferoxamine Mesylate, *USP 32* page 2062. As a part of monograph modernization, the following changes are proposed for this monograph:

1. Replace the nonspecific wet chemistry *Identification* test with a more specific IR spectroscopic test procedure, and add *Identification* test *B* based on the HPLC retention time agreement of the major peaks in the *Sample solution* and *Standard solution.*
2. Add a test for *Organic Impurities* based on the stability indicating HPLC procedure.
3. Replace the spectrophotometric *Assay* with a specific, stability-indicating HPLC procedure employed in the *Organic Impurities* test. The liquid chromatographic procedures in the test for *Organic Impurities* and in the *Assay* are based on analyses performed with the Zorbax SB C-18 or Zorbax Eclipse XDB-C18 brands of L1 column. The typical retention time for the deferoxamine peak is about 15 min.
4. Because the current nonspecific *Assay* does not differentiate between deferoxamine mesylate and its impurities, the introduction of the specific *Assay* procedure necessitates the change in the lower assay limit in the *Definition*, to reflect the actual content of deferoxamine mesylate present in the sample.
5. Add storage conditions to the *Packaging and Storage* section.

(MDGRE: E. Gonikberg, H. Ramanathan.) RTS—C66406

Deferoxamine Mesylate



$C_{25}H_{48}N_6O_8 \cdot CH_4O_3S$ 656.79

Butanediamide, *N*′-[5-[[4-[[5-(acetylhydroxyamino)pentyl]amino]-1,4-dioxobutyl]hydroxyamino]pentyl]-*N*-(5-aminopentyl)-*N*-hydroxy-, monomethanesulfonate;
N-[5-[3-[(5-Aminopentyl)hydroxycarbamoyl]propionamido]pentyl]-3-[[5-(*N*-hydroxyacetamido)pentyl]carbamoyl]propionohydroxamic acid monomethanesulfonate (salt) [138-14-7].

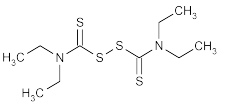
BRIEFING

Disulfiram, *USP 32* page 2187. USP has received comments from a manufacturer stating that selenium is not used in the manufacturing process. In order to address this, a note is being added to the test for *Selenium* in the *Inorganic Impurities* section. In addition, to simplify the monograph, *Solution A* and *Solution B* in the *Assay* have been combined into a single *Buffer* solution.

(MD-PP: R. Ravichandran.) RTS—C74344

Disulfiram



$C_{10}H_{20}N_2S_4$ 296.54
Thioperoxydicarbonic diamide $[(H_2N)C(S)]_2S_2$, tetraethyl-; Bis(diethylthiocarbamoyl) disulfide [97-77-8].

DEFINITION

Disulfiram contains NLT 98.0% and NMT 102.0% of $C_{10}H_{20}N_2S_4$.

In-Process Revision

IDENTIFICATION
- **A. INFRARED ABSORPTION** ⟨**197K**⟩

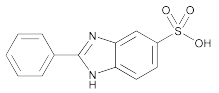
BRIEFING

Ensulizole, *USP* 32 page 2257. It is proposed to replace the name of USP Phenylbenzimidazole Sulfonic Acid RS with USP Ensulizole RS to be consistent with the name used on the label for this Reference Standard. The *USP Reference Standards* section is being revised to reflect this change.

(MD-AA: H. Ramanathan, B. Davani.) RTS—C73290

Ensulizole



$C_{13}H_{10}N_2O_3S$ 274.30
1*H*-Benzimidazole-5-sulfonic acid-2-phenyl-;
2-Phenylbenzimidazole-5-sulfonic acid [27503-81-7].

DEFINITION
Ensulizole contains NLT 98.0% and NMT 102.0% of $C_{13}H_{10}N_2O_3S$, calculated on the dried basis.

IDENTIFICATION
- **A. INFRARED ABSORPTION** ⟨**197K**⟩
- **B. ULTRAVIOLET ABSORPTION** ⟨**197U**⟩
Sample solution: 5 µg/mL
[NOTE—Transfer 100 mg of Ensulizole to a 100-mL volumetric flask, dissolve in 4 mL of 1 N sodium hydroxide, and dilute with water to volume. Transfer 0.5 mL of the solution to a 100-mL volumetric flask, and dilute with water to volume.]
Acceptance criteria: The absorptivities, calculated on the dried basis, at the wavelength of maximum absorbance at about 302 nm, do not differ by more than 3.0%.

ASSAY
- **PROCEDURE**
Sample solution: 48 mg/mL of Ensulizole in 0.5 N sodium hydroxide
Titrant: 0.5 N hydrochloric acid VS
Analysis: To the *Sample solution,* add phenolphthalein TS, and titrate the excess with *Titrant.* Perform a blank determination, and make any necessary corrections (see *Titrimetry* ⟨541⟩). Each mL of 0.5 N sodium hydroxide is equivalent to 137.15 mg of $C_{13}H_{10}N_2O_3S$.
Calculate the percentage of $C_{13}H_{10}N_2O_3S$ in the portion of Ensulizole taken:

$$\text{Result} = [(N \times (V_B - V_A))/(W \times (1 - \text{LOD}))] \times M_{r1} \times 100$$

N = actual normality of *Titrant*
V_B = volume of *Titrant* used for the blank (mL)
V_A = volume of *Titrant* used for the *Sample solution* (mL)
W = weight of Ensulizole taken for the *Sample solution* (mg)
LOD = percentage of loss on drying expressed as a decimal fraction, as determined in the test for *Loss on Drying*

In-Process Revision

M_{r1} = molecular weight of ensulizole, 274.30
Acceptance criteria: 98.0%–102.0% on the dried basis

SPECIFIC TESTS
• **LOSS ON DRYING ⟨731⟩:** Dry a sample at 105° for 4 h: it loses NMT 2.0% of its weight.

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in tight containers in a cool place.

Add the following:

■• **LABELING:** Where Helium is piped directly from a container or storage tank to the point of use, label each outlet Helium.■2S (*USP33*)

BRIEFING

Hydromorphone Hydrochloride Oral Solution. Because there is no exisiting *USP* monograph for this article, a new monograph, based on validated methods, is being proposed. The liquid chromatographic procedures in the *Assay* and in the test for *Organic Impurities* are based on analyses performed with a Waters Symmetry brand of L1 column. The typical retention times for hydromorphone in the *Assay* and in the test for *Organic Impurities* are about 5.0 and 20.0 min, respectively.

(MD-CCA: C. Anthony. MSA: R. Tirumalai.) RTS—C44494

Add the following:

■Hydromorphone Hydrochloride Oral Solution

DEFINITION
Hydromorphone Hydrochloride Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of $C_{17}H_{19}NO_3 \cdot HCl$. It may contain suitable preservatives.

IDENTIFICATION
• **A. ULTRAVIOLET ABSORPTION** ⟨**197U**⟩
Blank: 0.01 N hydrochloric acid and water (8:2) containing the expected concentration of excipients
Standard solution: 0.04 mg/mL of USP Hydromorphone Hydrochloride RS, 2 mg/mL of glycerin, and 20 mg/mL of sucrose in 0.01 N hydrochloric acid and water (4:1)
Sample solution: Equivalent to 0.2 mg/mL of hydromorphone hydrochloride in water
Analysis: Pretreat a solid phase extraction column containing L1 packing serially with about 10 mL of methanol and about 10 mL of 0.01 N hydrochloric acid. Transfer 5.0 mL of *Sample solution* to the column, add about 19 mL of 0.01 N hydrochloric acid in at least two portions, and elute into a 25-mL volumetric flask. Dilute with 0.01 N hydrochloric acid to volume, and mix. Using a suitable cell, compare the spectrum of the *Sample solution* with that of the *Standard solution*, using the *Blank* to zero the instrument.
Acceptance criteria: The absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelength as that of the *Standard solution*.
• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **PROCEDURE**
Diluent: Phosphoric acid and water (1:1000)
Solution A: 1.0 mg/mL of sodium 1-heptanesulfonate monohydrate in methanol and water (1:9). Add 1.0 mL of triethylamine and adjust with phosphoric acid to a pH of 2.5 ± 0.1.
Solution B: 1.0 mg/mL of sodium 1-heptanesulfonate monohydrate in methanol and water (1:1). Add 1.0 mL of triethylamine and adjust with phosphoric acid to a pH of 2.5 ± 0.1.
Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	85	15
24	5	95
25	85	15
30	85	15

Standard solution: 0.08 mg/mL of USP Hydromorphone Hydrochloride RS in *Diluent*
Sample solution: Equivalent to 0.08 mg/mL of hydromorphone hydrochloride in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 220 nm
Column: 4.6-mm × 5-cm; 3.5-µm packing L1
Flow rate: 1 mL/min
Injection size: 20 µL
Temperature: 45°
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.5 for hydromorphone peak
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{17}H_{19}NO_3 \cdot HCl$ in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Hydromorphone Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of hydromorphone hydrochloride in the *Sample solution* (mg/mL)
Acceptance criteria: 90.0%–110.0%

IMPURITIES
Organic Impurities
• **PROCEDURE**
Diluent, Solution A, and Solution B: Proceed as directed in the *Assay*.

BRIEFING

Hydroxypropyl Cellulose Ocular System, *USP 32* page 2594. On the basis of comments received, it is proposed to specify the sample amount needed to prepare the *Standard solution* and the *Sample solution* in the *Assay*. Using the proposed sample weight minimizes weighing issues, as hydroxypropyl cellulose is both electrostatic and hygroscopic. It is also recommended to stir the *Standard solution* and the *Sample solution* overnight before diluting to volume to ensure complete dissolution.

(MD-OOD: H. Ramanathan, F. Mao.) RTS—C64389

In-Process Revision

Hydroxypropyl Cellulose Ocular System

DEFINITION
Hydroxypropyl Cellulose Ocular System contains NLT 85.0% and NMT 115.0% of the labeled amount of Hydroxypropyl Cellulose. It contains no other substance. It is sterile.

IDENTIFICATION
• **INFRARED ABSORPTION**
Sample solution: Prepare a 10 mg/mL solution in methanol, based on the labeled amount of Hydroxypropyl Cellulose. Evaporate 2 drops of the solution on a silver chloride plate so that it forms a thin film.
Acceptance criteria: The IR absorption spectrum of the film exhibits maxima only at the same wavelengths as that of a similar preparation of USP Hydroxypropyl Cellulose RS.

ASSAY

Change to read:

• **PROCEDURE**
~~**Standard solution:** 0.05 mg/mL of USP Hydroxypropyl Cellulose RS~~
~~[NOTE—Dissolve with agitation.]~~
~~**Sample solution:** 0.05 mg/mL of hydroxypropyl cellulose from a sufficient number of Ocular Systems to provide 25 mg of hydroxypropyl cellulose~~
~~[NOTE—Dissolve with agitation in 250 mL of water before diluting to volume.]~~
■**Standard stock solution:** 0.25 mg/mL of USP Hydroxypropyl Cellulose RS prepared as follows: Weigh 25 mg of USP Hydroxypropyl Cellulose RS into a 100-mL volumetric flask. Dissolve in 80 mL of water. Mix well by agitating on a mechanical shaker until completely dissolved. Add one drop of methanol to dispel the foam and dilute with water to volume. [NOTE—Stirring overnight before diluting to volume is recommended.]
Standard solution: 0.05 mg/mL of hydroxypropyl cellulose in water, from *Standard stock solution*
Sample stock solution: 0.25 mg/mL of hydroxypropyl cellulose prepared using the same procedure as the *Standard stock solution*
Sample solution: 0.05 mg/mL of hydroxypropyl cellulose in water, from *Sample stock solution*■2S *(USP33)*

Spectrometric conditions
Mode: UV-Vis
Analytical wavelength: 620 nm
■**Cell length:** 1.0 cm, quartz■2S *(USP33)*

Analysis
Samples: *Standard solution* and *Sample solution*
Separately pipet 2 mL of the *Standard solution*, the *Sample solution*, and water, to provide a blank, into individual 50-mL centrifuge tubes. Add to each tube, 6.0 mL of a 0.5 mg/mL solution of anthrone in sulfuric acid, and mix on a vortex mixer. ~~After 40 min, again mix~~■Let the centrifuge tubes cool for approximately 40 min and remix.■2S *(USP33)*
Concomitantly determine the absorbances of the *Standard solution* and the *Sample solution*. ■[NOTE—Prepare anthrone in sulfuric acid solution just before use in low-actinic glassware, and mix well before adding to the tube. Use it within 12 h of preparation. Avoid contact between the glassware and the paper products during analysis; the cellulose in the paper will react with the sulfuric acid and alter the results.]■2S *(USP33)*
Calculate the percentage of hydroxypropyl cellulose in the Ocular System:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
C_U = nominal concentration of hydroxypropyl cellulose in the *Sample solution* (mg/mL)
Acceptance criteria: 85.0%–115.0%

PERFORMANCE TESTS
• **WEIGHT VARIATION**
Analysis: Determine the weight of each of a sufficient number of Ocular Systems.
Acceptance criteria: NMT 1 out of 20 Ocular Systems varies more than 25% from the average or, failing that, NMT 6 out of 60 (including the original 20) vary more than 25% (but none more than 35%) from the average weight.

SPECIFIC TESTS
• **STERILITY TESTS** ⟨**71**⟩**:** Meets the requirements

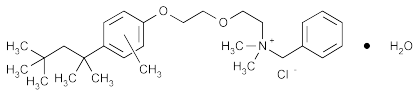
ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in single-dose containers, at a temperature not exceeding 30°.
• **USP REFERENCE STANDARDS** ⟨**11**⟩
USP Hydroxypropyl Cellulose RS

BRIEFING

Methylbenzethonium Chloride, *USP 32* page 2937. It is proposed to modernize this monograph by replacing three wet chemistry procedures, *Identification* tests *B*, *C*, and *D*, with a single, more selective IR test.

(MD-AA: M. Puderbaugh, B. Davani.) RTS—C73681

Methylbenzethonium Chloride



$C_{28}H_{44}ClNO_2 \cdot H_2O$ 480.12
Benzenemethanaminium, *N*,*N*-dimethyl-*N*-[2-[2-[methyl-4-(1,1,3,3-tetramethylbutyl)phenoxy]ethoxy]ethyl]-, chloride, monohydrate;
Benzyldimethyl[2-[2-[[4-(1,1,3,3-tetramethylbutyl)tolyl]-oxy]ethoxy]ethyl]ammonium chloride monohydrate [1320-44-1].
Anhydrous 462.12
[25155-18-4].

DEFINITION
Methylbenzethonium Chloride contains NLT 97.0% and NMT 103.0% of $C_{28}H_{44}ClNO_2$, calculated on the dried basis.

IDENTIFICATION
• **A. PROCEDURE**
Analysis: To 1 mL of solution (1 in 100), add 2 mL of alcohol, 0.5 mL of 2 N nitric acid, and 1 mL of silver nitrate TS.
Acceptance criteria: A white precipitate, which is insoluble in 2 N nitric acid and soluble in 6 N ammonium hydroxide, is formed.

Delete the following:

■~~• **B. PROCEDURE**~~
~~**Analysis:** Treat separate portions of a solution (1 in 100) with 2 N nitric acid and with mercuric chloride TS, respectively.~~

ASSAY
• **PROCEDURE**
Sample solution: Transfer the equivalent to 500 mg of dried methylbenzethonium chloride, with the aid of 35 mL of water, to a glass-stoppered, 250-mL conical separator containing 25 mL of chloroform. Add 10.0 mL of freshly prepared potassium iodide solution (1 in 20), insert the stopper in the separator, shake, allow the layers to separate, and discard the chloroform layer. Wash the aqueous layer with three 10-mL portions of chloroform, and discard the washings. Transfer the aqueous layer to a glass-stoppered, 250-mL conical flask, and rinse the separator with three 5-mL portions of water, adding the washings to the flask. Add 40 mL of cold hydrochloric acid to the flask, and mix.
Analysis: Titrate with 0.05 M potassium iodate VS until the solution becomes light brown in color. Add 5 mL of chloroform, insert the stopper in the flask, and shake vigorously. Continue the titration, dropwise, with shaking after each addition, until the chloroform layer becomes colorless and the aqueous layer is clear yellow. Perform a blank determination, using 20 mL of water as the test specimen (see *Residual Titrations* under *Titrimetry* ⟨541⟩). Each mL of 0.05 M potassium iodate is equivalent to 46.21 mg of $C_{28}H_{44}ClNO_2$.
Acceptance criteria: 97.0%–103.0% on the dried basis

IMPURITIES
Inorganic Impurities
• **RESIDUE ON IGNITION** ⟨281⟩**:** NMT 0.1%
Organic Impurities
• **PROCEDURE: LIMIT OF AMMONIUM COMPOUNDS**
Analysis: To 5 mL of a solution (1 in 50) add 3 mL of 1 N sodium hydroxide, and heat to boiling.
Acceptance criteria: The odor of ammonia is not perceptible.

SPECIFIC TESTS
• **MELTING RANGE OR TEMPERATURE** ⟨741⟩**:** 159°–163°, the specimen having been previously dried
• **LOSS ON DRYING** ⟨731⟩**:** Dry a sample at 105° for 4 h: it loses NMT 5.0% of its weight.

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in tight containers.

USP Methylbenzethonium Chloride RS■2S *(USP33)*

BRIEFING

Mycophenolate Mofetil Capsules. Because there is no existing *USP* monograph for this drug product, a new monograph, based on validated methods of analysis, is being proposed. The liquid chromatographic procedure in the *Assay* and in the test for *Limit of Degradation Products* is based on analyses performed with a Phenomenex Luna C8 (2) brand of L7 column. The typical retention time for mycophenolate mofetil is about 4.2 min. The liquid chromatographic procedure in the test for *Limit of Z-Mycophenolate Mofetil* is based on analyses performed with an Agilent Technologies Zorbax SB C8 brand of L7 column. The typical retention times for mycophenolate mofetil and *Z*-mycophenolate mofetil are about 11.5 and 12.4, respectively.

(MD-OOD: F. Mao. BPC: M. Marques.) RTS—C69397

Add the following:

■Mycophenolate Mofetil Capsules

DEFINITION
Mycophenolate Mofetil Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of mycophenolate mofetil ($C_{23}H_{31}NO_7$).

IDENTIFICATION
• **A. ULTRAVIOLET ABSORPTION** ⟨197U⟩
Standard solution and **Sample solution:** Use the *Standard solution* and *Sample solution* as prepared in the test for *Dissolution*.
Acceptance criteria: The UV absorption spectrum of the *Standard solution* and the *Sample solution* exhibit maxima and minima at the same wavelength within ±3 nm.
• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **PROCEDURE**
Phosphoric acid solution: Phosphoric acid and water (3:50)
Triethylamine solution: Transfer 3 mL of triethylamine to 1000 mL of water. Adjust the pH to 5.3 with *Phosphoric acid solution*.
Mobile phase: Acetonitrile and *Triethylamine solution* (11:9)
Standard solution: 0.125 mg/mL of USP Mycophenolate Mofetil RS in acetonitrile
Sample solution: Open Capsules, equivalent to 1.25 g of mycophenolate mofetil based on the label claim, and transfer contents including Capsule shells into a 500-mL volumetric flask. Add 50 mL of water and shake mechanically for a minimum of 15 min. Add 350 mL of acetonitrile, sonicate for 15 min, and shake mechanically for 20 min. Dilute with acetonitrile to volume. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, and dilute with acetonitrile to volume. Pass

In-Process Revision

through a 0.45-µm nylon filter, and discard the first 5 mL of filtrate.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 250 nm
Column: 4.6-mm × 25-cm column; 5-µm packing L7
Column temperature: 45°
Auto sampler temperature: 10° ±5°
Flow rate: 1.5 mL/min
Injection size: 20 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{23}H_{31}NO_7$ in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of mycophenolate mofetil in the *Standard solution* (mg/mL)
C_U = nominal concentration of mycophenolate mofetil in the *Sample solution* (mg/mL)
Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **Dissolution** ⟨**711**⟩
Medium: 0.1 N hydrochloric acid; 900 mL
Apparatus 2: 40 rpm with sinkers
Time: 20 min
Sample solution: Pass a portion of the solution under test through a suitable 0.45-µm filter.
Standard solution: 0.278 mg/mL of USP Mycophenolate Mofetil RS in *Medium*
Detector: UV 250 nm
Path length: 0.1 cm
Blank: *Medium*
Calculate the percentage of mycophenolate mofetil dissolved:

$$(A_U/A_S) \times (C_S/L) \times 900 \times 100$$

A_U = absorbance from the *Sample solution*
A_S = absorbance from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
V = 900 mL
L = tablet label claim (mg)
Tolerances: NLT 80% (Q) of the labeled amount of mycophenolate mofetil is dissolved.

• **Uniformity of Dosage Units** ⟨**905**⟩**:** Meet the requirements

BRIEFING

Nevirapine Oral Suspension, *USP 32* page 3073. On the basis of comments received, it is proposed to clarify the *Acceptance criteria* for total impurities in the *Procedure* under *Organic Impurities* to specify only unknown impurities because the known process impurities are controlled in the drug substance.

(MD-AA: M. Puderbaugh; B. Davani.) RTS—C67480

Nevirapine Oral Suspension

DEFINITION

Nevirapine Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of nevirapine ($C_{15}H_{14}N_4O$).

IDENTIFICATION

• **A. THIN-LAYER CHROMATOGRAPHY**

Standard solution: 5 mg/mL of USP Nevirapine Anhydrous RS in chloroform

Sample solution: Transfer a volume of Oral Suspension, equivalent to 10 mg of nevirapine, to an 8-mL glass stoppered tube. Pipet 2.0 mL of chloroform into the tube. Shake the solution and allow the two phases to separate, and then using

a disposable glass Pasteur pipet, remove some of the organic layer from the bottom, and transfer to another container.

Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
Adsorbent: 0.25-mm layer of chromatographic silica gel 60 F254
Mode: TLC
Application volume: 5 µL
Developing solvent system: Ethyl acetate, isopropanol, and concentrated ammonium hydroxide (18:2:0.1)
Spray reagent: 1.35 g of ferric chloride in 25 mL of water and 1.64 g of potassium ferricyanide in 25 mL of water. Mix the two solutions immediately before use.

Analysis
Samples: *Standard solution* and *Sample solution*
Develop the chromatogram in a chamber saturated with a solvent system until the solvent front has moved 6–7 cm from the point of application. Remove the plate from the chamber, mark the solvent front, and dry. Examine the chromatograms under UV light at 254 nm, and outline the spots with a soft pencil. Spray the plate with *Spray reagent.*

Acceptance criteria: The R_F value (approximately 0.4–0.5) of the principal blue spot under UV and after spraying, from the *Sample solution*, corresponds to that from the *Standard solution.*

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay.*

ASSAY

- **PROCEDURE**

Diluent: Methanol and water (1:4)
Solution A: 13.6 g of monobasic potassium phosphate in 1900 mL of water. Adjust with phosphoric acid to a pH of 3.0, and dilute with water to 2000 mL.
Solution B: Acetonitrile and *Solution A* (3:97)
Solution C: Acetonitrile and *Solution A* (24:76)
Mobile phase: See the gradient table below.

Time (min)	Solution B (%)	Solution C (%)
0	100	0
1	100	0
31	0	100
32	100	0
42	100	0

Standard stock solution: Dissolve 50 mg of USP Nevirapine Anhydrous RS in 20 mL of methanol in a 50-mL volumetric flask. Sonicate with intermittent swirling until the sample dissolves. Add water to 1 cm below the meniscus, cool to room temperature, and dilute with water to volume. The concentration is 1 mg/mL of nevirapine.
Standard solution: 0.3 mg/mL of nevirapine from *Standard stock solution* diluted with *Diluent*
Stock impurity solution: 3 mg of USP Nevirapine Related Compound A RS and 3 mg of USP Nevirapine Related Compound B RS in 20 mL of methanol in a 100-mL volumetric flask. Sonicate to dissolve. Add water to 1 cm below the meniscus, cool to room temperature, and dilute with water to volume.
System suitability solution: Transfer 15.0 mL of *Standard stock solution* and 2.0 mL of *Stock impurity solution* into a 50-mL volumetric flask, and dilute with *Diluent* to volume.
Weight determination: Using a 1- to 10-mL suitable pipet and a positive displacement tip, withdraw 5.0 mL of the Oral Suspension. The sample should be free of air bubbles. Dispense into a tared vial, and record the weight of the Oral Suspension to ±0.1 mg.
Sample solution: Equivalent to 60 mg of nevirapine is taken using a 1- to 10-mL suitable pipet and a positive displacement tip to withdraw the Oral Suspension. The sample should be free of air bubbles. Remove the excess Oral Suspension by wiping the outside of the tip carefully so as not to touch the opening of the tip, and deliver the sample into a 200-mL tared volumetric flask. Record the sample weight to the nearest ±0.1 mg. Add 40 mL of methanol, and sonicate for 5 min with intermittent swirling. Add water to 1 cm below the meniscus. Do not shake the flask. Allow the solution to attain room temperature, and dilute with water to volume. Shake the flask gently, and allow to stand for 5 min.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 4.6-mm × 15-cm; 3.5-µm packing L10
Guard column: 4.6-mm × 12.5-mm; 5-µm packing L10
Column temperature: 35°
Flow rate: 1.5 mL/min
Injection size: 20 µL

System suitability
Samples: *Standard solution* and *System suitability solution*
Suitability requirements
Resolution: NLT 3.0 between nevirapine and nevirapine related compound A; NLT 1.7 between nevirapine and nevirapine related compound B
Tailing factor: NMT 1.5 for the nevirapine peak
Relative standard deviation: NMT 2.0%

Analysis
Samples: *Standard solution* and *Sample solution*
Measure the responses for the nevirapine peak. Calculate the quantity, in mg, of $C_{15}H_{14}N_4O$ in each mL of the Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Nevirapine Anhydrous RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DISSOLUTION** ⟨711⟩

Medium: 0.1 N hydrochloric acid; 900 mL
Apparatus 2: 25 rpm
Time: 45 min
Determine the amount of $C_{15}H_{14}N_4O$ dissolved by using the following method.
Diluent: Dehydrated alcohol and water (1:1)
Mobile phase: Acetonitrile and water (23:77)
System suitability solution: Dissolve 10 mg of USP Nevirapine Anhydrous RS and 15 mg of methylparaben in 2 mL of *Diluent*, and dilute with *Medium* to 250 mL.
Standard solution: Dissolve 28 mg of USP Nevirapine Anhydrous RS in 2 mL of *Diluent*, and sonicate for 1 min. Standard will not be completely dissolved at this point. Dilute with *Medium* to 500 mL, and visually examine the solution to ensure that the Standard is completely dissolved. The final concentration is 0.056 mg/mL of nevirapine.
Sample solution: For sample mixing, gently shake the bottle for approximately 10 s by inverting it slowly and rotating it from side to side. The sample should be free of air bubbles. Do not sonicate the sample. Using a 1–10 mL suitable positive displacement pipet set at 5 mL, withdraw the equivalent of 50 mg of nevirapine. Remove excess Oral Suspension by wiping the outside of the tip carefully so as not to touch the opening of the tip. Introduce the sample into the dissolution vessel over a 1–2 s time period by immersing the tip of the pipet midway between the paddle and the side of the vessel, approximately 1 cm below the meniscus. Similarly dispense the Oral Suspension into the other vessels. At 45 min, withdraw 5 mL of the solution under test, and pass through a 0.45-µm nylon filter, discarding the first 2 mL.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)

In-Process Revision

Mode: LC
Detector: UV 214 nm
Guard column: 3.9-mm × 20-mm; packing L1
Column: 3.9-mm × 15-cm; 5-µm packing L1
Flow rate: 1 mL/min
Injection size: 10 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
Suitability requirements
Resolution: NLT 5.0 between nevirapine and methylparaben
Tailing factor: NMT 1.8
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Record the chromatograms for at least 14 min, and measure the responses for the nevirapine peaks.
Calculate the percentage of $C_{15}H_{14}N_4O$ dissolved:

$$\text{Result} = (r_U \times C_S \times V_1)/(r_S \times V_2 \times L) \times 100$$

r_U = peak response from the *Sample solution*
C_S = concentration of USP Nevirapine Anhydrous RS in the *Standard solution* (mg/mL)
V_1 = volume of the *Medium*, 900 mL
r_S = peak response from the *Standard solution*
V_2 = volume of Oral Suspension taken (mL)
L = label claim (mg/mL)
Tolerances: NLT 80% (Q) of the labeled amount of $C_{15}H_{14}N_4O$ is dissolved.

BRIEFING

Nitrous Oxide, *USP 32* page 3099. It is proposed to change the procedure in the *Assay* to a chromatographic method that provides a higher level of accuracy, precision, and reliability. Time of analysis is also reduced with this modification. The *Identification* test is also modified accordingly. The *Packaging and Storage* section has been revised and a new section on *Labeling* has been added to the monograph.

(AER: K. Zaidi.) RTS—C73268

Nitrous Oxide

N_2O 44.01
Nitrogen oxide (N_2O);
Dinitrogen monoxide [10024-97-2].

DEFINITION

Change to read:

Nitrous Oxide contains NLT 99.0%, by volume, of N_2O.
~~[NOTE—The following tests are designed to reflect the quality of Nitrous Oxide in both the vapor and liquid phases that are present in previously unopened cylinders. Reduce the container pressure by means of a regulator. Withdraw the samples for the tests with the least possible release of Nitrous Oxide consistent with proper purging of the sampling apparatus. Measure the gases with a gas volume meter downstream from the detector tubes to minimize contamination or change of the specimens. Perform tests in the sequence in which they are listed.~~
~~The various detector tubes called for in the respective tests are listed under *Reagents* in the section *Reagents, Indicators, and Solutions*.]~~
■■2S (USP33)

IDENTIFICATION

Change to read:

• ~~**A:**~~ ~~With the container temperatures the same and maintained between 15° and 25°, concomitantly read the pressure of the Nitrous Oxide container and of a container of nitrous oxide certified standard (see *Reagents, Indicators, and Solutions—Reagents*).~~ ~~[NOTE—Do not use the nitrous oxide certified standard if it has been depleted to less than half of its full capacity.]~~ ~~The pressure of the Nitrous Oxide container is within 50 psi of that of the nitrous oxide certified standard~~■When tested as directed in the *Assay*, the result is NLT 99.0% Nitrous Oxide, by volume.■2S (USP33)

In-Process Revision

Delete the following:

~~■• **B.** Pass 100 ± 5 mL released from the vapor phase of the contents of the Nitrous Oxide container through a carbon dioxide detector tube at the rate specified for the tube: no color change is observed (distinction from carbon dioxide).■2S (USP33)~~

Delete the following:

~~■• **C.** Collect 100 mL of the gas under test in a 100-mL tube fitted at the top with a stopcock. Open the stopcock, and quickly add a freshly prepared solution of 500 mg of pyrogallol in 2 mL of water and a freshly prepared solution of 12 g of potassium hydroxide in 8 mL of water. Immediately close the stopcock, and mix: the gas is not absorbed, and the solution does not become brown (distinction from oxygen).■2S (USP33)~~

ASSAY

Change to read:

- **PROCEDURE**

Sample: Nitrous Oxide, taken from the liquid phase. ■[NOTE—Sampling can be from the vapor phase, although this may give a higher air/lower assay result. If a result of more than 1% air is obtained, a sample may be taken from the liquid phase and the analysis repeated. Care shall be taken to ensure that the sample is fully vaporized before injection into the gas chromatograph.]■2S (USP33)

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability* ■and *Medical Gases Assay* ⟨415⟩.)

Sample gas: Sample under test

Standard gas: Suitable 1% air–helium certified standard (see *Reagents, Indicators, and Solutions—Reagents*.)■2S (USP33)

Mode: GC

Column: ~~6 m × 4 mm (i.d.); packed with porous polymer beads, which permit complete separation of N_2 and O_2 from N_2O, although the N_2 and O_2 may not be separated from each other~~■2.1-mm × 2.4-m; 80/100 mesh S3 packing■2S (USP33)

Detector: Thermal conductivity

■**Temperature:** Column, injector, and detector: 70°■2S (USP33)

Carrier gas: Industrial grade helium (99.99%)

■**Flow rate:** 30 mL/min

Injection type: Gas sampling loop

System suitability

Sample: *Standard gas*

System suitability requirements

Resolution: NLT 1.5 between air and nitrous oxide

Relative retention time: NLT 1.5■2S (USP33)

Analysis

Samples: *Sample gas* and *Standard gas*

~~Introduce the *Sample* as directed in the test for *Nitrogen Dioxide*, into a gas chromatograph. Select the operating conditions of the gas chromatograph such that the peak response resulting from the following procedure corresponds to NLT 70% of the full-scale reading. Preferably, use an apparatus corresponding to the general type, and control the column temperature.~~

■■2S (USP33)

Acceptance criteria: The air peak response produced by the *Sample* under test is equivalent to or less than 1.0% of air when compared to the peak response of the *Standard gas* (NLT 99.0%, by volume, of N_2O).

Change to read:

Inorganic Impurities

■(See *Impurities Testing in Medical Gases* ⟨413⟩.)

[NOTE—The various detector tubes called for in the respective tests are listed under *Reagents, Indicators, and Solutions*.]■2S (USP33)

- **AMMONIA** ~~Proceed with Nitrous Oxide as directed in the test for *Carbon Monoxide*, except to use an ammonia detector tube.~~

■**Sample:** Manufacturer's recommended gas volume (±5%)

Analysis: Pass the manufacturer's recommended gas volume of nitrous oxide drawn from the vapor phase through an ammonia detector tube at the rate specified for the tube.■2S (USP33)

Acceptance criteria: The indicator change corresponds to NMT ~~0.0025%~~■25 ppm.■2S (USP33)

- **NITRIC OXIDE** ~~1000 ± 50 mL~~

■**Sample:** Manufacturer's recommended gas volume (±5%)

Analysis: Pass the manufacturer's recommended gas volume of nitrous oxide drawn from the vapor phase through a nitric oxide–nitrogen dioxide detector tube at the rate specified for the tube.■2S (USP33)

Acceptance criteria: The indicator change corresponds to NMT 1 ppm.

- **NITROGEN DIOXIDE** ~~Arrange a container so that when its valve is opened, a portion of the liquid phase of the contents is released through a piece of tubing of sufficient length to allow all of the liquid to vaporize during passage through it, and to prevent frost from reaching the inlet of the detector tube. Release into the tubing a flow of liquid sufficient to provide 550 mL of the vaporized sample plus any excess necessary to ensure adequate flushing of air from the system. Pass 550 ± 50 mL of this gas through a nitric oxide–nitrogen dioxide detector tube at the rate specified for the tube.~~

■**Sample:** Arrange a container so that when its valve is opened, a portion of the liquid phase of the contents is released through a heated regulator or piece of tubing of sufficient length to allow all of the liquid to vaporize during passage through it and to prevent frost from reaching the inlet of the detector tube. Release into the tubing a flow of liquid sufficient to provide sufficient vaporized sample plus any excess necessary to ensure adequate flushing of air from the system.

Analysis: Pass the manufacturer's recommended volume (±5%) of vaporized nitrous oxide through a nitric oxide–nitrogen dioxide detector tube of the appropriate measurement range.■2S (USP33)

Acceptance criteria: The indicator change corresponds to NMT 1 ppm.

- **HALOGENS** ~~1000 ± 50 mL released from the vapor phase of the contents of the container, through a chlorine detector tube at the rate specified for the tube.~~

■**Sample:** Manufacturer's recommended gas volume (± 5%)

Analysis: Pass the manufacturer's recommended gas volume of nitrous oxide drawn from the vapor phase through a chlorine detector tube at the rate specified for the tube.■2S (USP33)

Acceptance criteria: The indicator change corresponds to NMT 1 ppm.

- **CARBON MONOXIDE** ~~1000 ± 50 mL released from the vapor phase of the contents of the container, through a carbon monoxide detector tube at the rate specified for the tube.~~

■**Sample:** Manufacturer's recommended gas volume (±5%)

Analysis: Pass the manufacturer's recommended gas volume of nitrous oxide drawn from the vapor phase through a carbon monoxide detector tube at the rate specified for the tube.■2S (USP33)

Acceptance criteria: The indicator change corresponds to NMT ~~0.001%~~■10 ppm■2S (USP33)

In-Process Revision

• **CARBON DIOXIDE** ~~1000 ± 50 mL released from the vapor phase of the contents of the container, through a carbon dioxide detector tube at the rate specified for the tube.~~

■**Sample:** Manufacturer's recommended gas volume (±5%)
Analysis: Pass the manufacturer's recommended gas volume of nitrous oxide drawn from the vapor phase through a carbon dioxide detector tube at the rate specified for the tube.■2S (*USP33*)

Acceptance criteria: The indicator change corresponds to NMT ~~0.03%~~■300 ppm.■2S (*USP33*)

SPECIFIC TESTS

Change to read:

• **WATER** ~~It meets the requirements of the test for *Water* under *Carbon Dioxide*~~

■**Sample:** Manufacturer's recommended gas volume (±5%)
Analysis: Flush the regulator with 5 L or more of the gas specimen. Following the detector tube manufacturer's recommended procedure, pass nitrous oxide released from thevapor phase through a water vapor detector tube of the appropriate measurement range connected to the regulator with a minimum length of metal or polyethylene tubing. Measure the gas passing through the detector tube with a gas flowmeter set at a flow rate specified for the tube.
Acceptance criteria: The indicator change corresponds to NMT 150 mg/m^3.■2S (*USP33*)

• **AIR:** NMT 1.0% of air is present, determined as directed in the *Assay*.

ADDITIONAL REQUIREMENTS

Change to read:

• **PACKAGING AND STORAGE:** ~~Preserve in cylinders.~~■Preserve nitrous oxide in pressurized containers. Container connections shall be appropriate for nitrous oxide. Adapters shall not be used to connect containers to patient-use supply system piping or equipment.■2S (*USP33*)

Add the following:

■**Labeling:** Where Nitrous Oxide is piped directly from a remote location to the patient point of use, label the point of use outlet "Nitrous Oxide".■2S (*USP33*)

BRIEFING

Oxygen, *USP 32* page 3173—See briefing under *Medical Air*.

(AER: K. Zaidi.) RTS—C61157

Oxygen

O_2 32.00
Oxygen
Oxygen [7782-44-7].

DEFINITION
Oxygen contains NLT 99.0% of O_2, by volume.
[NOTE—Oxygen that is produced by the air-liquefaction process is exempt from the requirements of the tests for *Carbon Dioxide* and *Carbon Monoxide*.]

IDENTIFICATION

Change to read:

• ~~**PROCEDURE**~~■■2S (*USP33*)

When tested as directed in the *Assay*, ~~NMT 1.0 mL of gas remains~~■the result is NLT 99.0% of oxygen, by volume.■2S (*USP33*)

Delete the following:

BRIEFING

Pantoprazole Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being proposed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 15-cm analytical column that contains 5-µm packing L1. USP has received data indicating that an Inertsil ODS-3 from MetaChem Technologies, Inc. is suitable. The typical retention time for the pantoprazole peak is about 2.6 min.

(CRX: R. Schnatz.) RTS—60335

Add the following:

■Pantoprazole Oral Suspension

DEFINITION

Pantoprazole Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled content of pantoprazole sodium. Prepare Pantoprazole Oral Suspension, 2 mg/mL, as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩).[1]

Pantoprazole Sodium	200 mg
Sodium Bicarbonate 8.4% Injection	A sufficient quantity
To make	100 mL

Calculate the required quantity of each ingredient for the total amount to be prepared. Remove the trademark imprint from the Tablets by gently rubbing on a paper towel that has been dampened with Alcohol, USP. Allow the Tablets to air-dry for a few min. Triturate the Tablets to a coarse powder by using a mortar and pestle, and transfer to a calibrated bottle. Add 50 mL of Sodium Bicarbonate 8.4% Injection and agitate until the coating is dissolved. Add sufficient Sodium Bicarbonate 8.4% Injection to bring the final volume to 100 mL and mix well until the powder is uniformly suspended.

[NOTE—If the imprint is not properly removed, the pharmaceutical elegance of the final product will be compromised by the presence of flecks of dark material.]

ASSAY

• **PROCEDURE**

Mobile phase: Acetonitrile and 50 mM dibasic potassium phosphate (40:60). Adjust the pH to 7.0 with phosphoric acid. Make adjustments if necessary.

Standard stock solution: 1.0 mg/mL of USP Pantoprazole Sodium RS in water

Standard solution: Transfer 1.5 mL of *Standard stock solution* to a 100-mL volumetric flask, and dilute with water to volume in order to obtain a solution containing about 15 µg/mL of pantoprazole sodium. Pass through a 0.22-µm filter.

Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Accurately pipet 3.75 mL of Oral Suspension to a 50-mL volumetric flask. Add 25 mL of water to the flask, and place on an orbital shaker for 20 min. Dilute with water to volume. Take a 5-mL portion of the diluted sample and further dilute with water to 50 mL to obtain a solution with a nominal concentration of 15 µg/mL of pantoprazole sodium. Pass through a 0.22-µm filter.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

[1] This formula is frequently used for home health patients with feeding tubes who have been discharged from hospitals. The goal of the drug is to neutralize the acidity of the stomach.

Mode: LC
Detector: UV 280 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Flow rate: 1.6 mL/min
Injection size: 10 µL
System suitability
Sample: *Standard solution*
[NOTE—The retention time for the pantoprazole peak is about 2.6 min.]
Suitability requirements
Relative standard deviation: NMT 1.0% for the replicate injections
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{16}H_{14}F_2N_3NaO_4S \cdot 1.5\ H_2O$ in the volume of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Pantoprazole Sodium RS in the *Standard solution* (µg/mL)
C_U = concentration of pantoprazole sodium in the *Sample solution* (µg/mL)
Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS
- **pH ⟨791⟩:** Between 7.9 and 8.3

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled cold temperature.
- **LABELING:** Label it to indicate that it is to be well-shaken before use, and to state the *Beyond-Use Date*.
- **BEYOND-USE DATE:** NMT 14 days after the date on which it was compounded when stored at controlled cold temperature
- **USP REFERENCE STANDARDS ⟨11⟩**
USP Pantoprazole Sodium RS■2S (*USP33*)

BRIEFING

Pentobarbital, *USP 32* page 3249. On the basis of comments received, the following revisions are proposed:

1. Delete *Identification* test *B* by UV because the remaining two *Identification* tests by IR and HPLC retention time match are sufficient to establish the identity of the drug substance.
2. Delete the *Capacity factor* sytem suitability requirement from both the *Assay* and the test for *Organic Impurities* because it contributes no additional value in establishing the suitability of the HPLC system. The remaining three parameters namely, theoretical plates, tailing factor, and relative standard deviation are adequate to ensure the suitability of the HPLC system.
3. Revise the calculation formula under the *Organic Impurities* test to be consistent with the redesigned format.
4. Delete the test for *Melting Range or Temperature* because it does not contribute any additional value in establishing the quality of the drug substance. This test was included in the original monograph when there was no selective method to quantify the impurities. The currently official monograph contains a selective stability-indicating HPLC method for the *Assay* and the *Organic Impurities* test both of which together provide sufficient information about the purity of the drug substance.

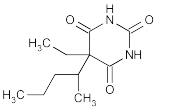
Pentobarbital



$C_{11}H_{18}N_2O_3$ 226.27
2,4,6(1*H*,3*H*,5*H*)-Pyrimidinetrione, 5-ethyl-5-(1-methylbutyl)-, (±)-; (±)-5-Ethyl-5-(1-methylbutyl)barbituric acid [76-74-4].

DEFINITION
Pentobarbital contains NLT 98.0% and NMT 102.0% of $C_{11}H_{18}N_2O_3$, calculated on the dried basis. Where the material is labeled as intended solely for veterinary use, Pentobarbital contains NLT 97.0% and NMT 102.0% of $C_{11}H_{18}N_2O_3$, calculated on the dried basis.

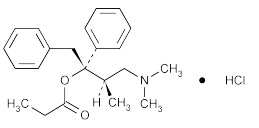
BRIEFING

Propoxyphene Hydrochloride, *USP 32* page 3417. The current official methods for *Organic Impurities* and the *Assay* use a Microbondapak C18 column, which is not well-suited for basic compounds. It is proposed to replace the column with a Zorbax XDB Eclipse C18 brand of L1 column. Under the new chromatographic conditions, propoxyphene related compound A, propoxyphene related compound B, and propoxyphene have typical retention times of about 5.7, 8.1, and 9.5 min, respectively. The new method requires the *Definition* to be revised from 98.0–101.0% to 98.0–102.0%, based on approved acceptance criteria. The revised *Organic Impurities* method allows the inclusion of limits for specified and unspecified impurities. It is also proposed to delete the *Melting Range* test, since it contributes no additional value in establishing the quality of the drug substance as a selective HPLC method has been added via the proposed revision.

(MD-CCA: C. Anthony.) RTS—C39791

Propoxyphene Hydrochloride



$C_{22}H_{29}NO_2 \cdot HCl$ 375.93

Benzeneethanol, α-[2-(dimethylamino)-1-methylethyl]-α-phenyl-, propanoate (ester), hydrochloride, [*S*-(*R**,*S**)]-; (2*S*,3*R*)-(+)-4-(Dimethylamino)-3-methyl-1,2-diphenyl-2-butanol propionate (ester) hydrochloride [1639-60-7].

DEFINITION

Change to read:

Propoxyphene Hydrochloride contains NLT 98.0% and NMT ~~101.0%~~■102.0%■2S (USP33) of $C_{22}H_{29}NO_2 \cdot HCl$, calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** ⟨197S⟩
  Sample solution: 50 mg/mL in chloroform
- **B. PROCEDURE**
  Sample solution: 17 mg/mL of Propoxyphene Hydrochloride in Purified Water
  Analysis: Treat 3 mL of *Sample solution* with 1 mL of 6 N ammonium hydroxide to precipitate the propoxyphene base. Filter to remove the precipitate, acidify the filtrate with 2 mL of nitric acid, and add 1 mL of silver nitrate TS.
  Acceptance criteria: A white, curdy precipitate that is soluble in an excess of 6 N ammonium hydroxide confirms the presence of silver chloride.

BRIEFING

Ramipril Capsules. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed. The liquid chromatographic procedures in the *Assay* and in the tests for *Dissolution* and *Organic Impurities* were validated using a Zorbax SB 5-µm column of packing L1. The typical retention time for ramipril under the gradient conditions for the *Assay* and the test for *Organic Impurities* is about 26 minutes. The typical retention time under the isocratic conditions for the *Dissolution* test is about 2.6 minutes.

(MDCV: S. Ramakrishna. BPC: M. Marques.) RTS—C65921

In-Process Revision

Add the following:

▪Ramipril Capsules

DEFINITION

Ramipril Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of $C_{23}H_{32}N_2O_5$.

IDENTIFICATION

• **A. ULTRAVIOLET ABSORPTION ⟨197U⟩**
Phosphoric acid solution: 30 mL of phosphoric acid in 1 L of water
Diluent: Acetonitrile and *Phosphoric acid solution* (2:3)
Standard solution: 0.2 mg/mL of USP Ramipril RS in *Diluent*. Sonicate for 1 min, if necessary, for complete dissolution.
Sample solution: Use the *Sample solution* prepared as directed in the *Assay*.
Wavelength range: 200–400 nm

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution,* as obtained in the *Assay.*

ASSAY

• **PROCEDURE**
Buffer: Dissolve 17 g of monobasic potassium phosphate and 11.2 g of sodium perchlorate in 750 mL of water in a 1-L flask. Dilute with water to volume. Adjust with phosphoric acid to a pH of 2.3.
Solution A: Acetonitrile, *Buffer*, and water (1:2:2). [NOTE—Do not filter *Solution A*.]
Solution B: Acetonitrile, *Buffer*, and water (9:10:6). [NOTE—Do not filter *Solution B*.]
Mobile phase: Use the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
5	100	0
50	0	100
51	0	100
51.1	100	0
60	100	0

Phosphoric acid solution: Prepare as directed in *Identification* test *A*.
Diluent: Prepare as directed in *Identification* test *A*.
Standard solution: 0.2 mg/mL of USP Ramipril RS and 0.002 mg/mL of USP Ramipril Related Compound A RS in *Diluent*
Sample stock solution: Transfer the contents of 8 Capsules into a suitable flask as described in *Table 1*. Add Capsule shells into the flask. Add acetonitrile per *Table 1* and swirl to agitate the contents. Sonicate for 15 min and mechanically shake for 10 min. Dilute with acetonitrile to volume for Capsule strengths 5.0 and 10 mg only. For 1.25 and 2.5 mg use the solution as is without further dilution. [NOTE—Extracts from the vial cap may result in extraneous peaks.]

Table 1

Strength of Capsule (mg)	Volumetric Flask Size (mL)	Acetonitrile (mL)
1.25	50	25
2.5	100	50
5.0	100	70
10	200	140

Sample solution: 0.2 mg/mL of ramipril in *Phosphoric acid solution* from *Sample stock solution*. Pass through a 0.20-µm nylon filter, and discard the first 2 mL of the filtrate.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 215 nm
Column: 4.6-mm × 15-cm column; 5-µm packing L1 with a guard column, packing L1
Temperature: 60°
Flow rate: 1.5 mL/min
Injection size: 50 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Resolution: NLT 2.5 between ramipril and ramipril related compound A
Tailing factor: NMT 2.5 for the ramipril peak
Relative standard deviation: NMT 2.0% for the ramipril peak
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{23}H_{32}N_2O_5$, based on the label claim, in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = response of the ramipril peak from the *Sample solution*
r_S = response of the ramipril peak from the *Standard solution*
C_S = concentration of ramipril in the *Standard solution* (mg/mL)
C_U = nominal concentration of ramipril in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION ⟨711⟩**
Medium: 0.1 N hydrochloric acid; 500 mL
Apparatus 2: 50 rpm, with sinkers. [NOTE—A suitable sinker is catalog number CAPWHT-02 available from www.QLA-LLC.com.]
Time: 30 min
Standard solution: 0.01 mg/mL of USP Ramipril RS in *Medium*.
Sample solution: Pass a portion of the solution under test through a suitable 0.45-µm filter.
Phosphoric acid solution: Prepare as directed in *Identification* test *A*.
Mobile phase: Acetonitrile and *Phosphoric acid solution* (2:3)
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 215 nm
Column: 4.6-mm × 15-cm column; 5-µm packing L1
Temperature: 30°
Flow rate: 1 mL/min
Injection size: 25 µL
Suitability requirements
Sample: *Standard solution*
Tailing factor: NMT 2.0 for the ramipril peak
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of ramipril dissolved by the formula:

$$(r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of ramipril in the *Standard solution* (mg/mL)
L = capsule label claim (mg)
V = 500 mL

Tolerances: NLT 80% (Q) of the labeled amount of ramipril is dissolved.

In-Process Revision

• **UNIFORMITY OF DOSAGE UNITS ⟨905⟩:** Meet the requirements
Procedure for content uniformity
Phosphoric acid solution: Prepare as directed in *Identification* test *A*.
Mobile phase: Acetonitrile and *Phosphoric acid solution* (2:3). Pass through a 0.45-µm nylon filter.
Standard solution: 0.03 mg/mL of USP Ramipril RS in *Mobile phase*. Sonicate for 1 min, if not dissolved completely.
Sample solution: Transfer the contents of 1 Capsule into a suitable flask as described in *Table 2*. Add (about 50% of total volume) *Mobile phase*, and sonicate for 25 min. Mechanically shake for 10 min and dilute with *Mobile phase* to volume. Further dilute samples as shown in *Table 2* with *Mobile phase*. Pass through a 0.20-µm nylon filter, and discard the first 2 mL of the filtrate.

Table 2

Strength of Capsule (mg)	Volumetric Flask Size (mL)	Dilution Volume (mL)	Volumetric Flask (mL)
1.25	50	—	—
2.5	100	—	—
5.0	200	—	—
10	50	6.0	50

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Proceed as directed in the test for *Dissolution*.
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{23}H_{32}N_2O_5$, based on the label claim, in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = response of the ramipril peak from the *Sample solution*
r_S = response of the ramipril peak from the *Standard solution*
C_S = concentration of ramipril in the *Standard solution* (mg/mL)
C_U = concentration of ramipril in the *Sample solution* (mg/mL)

IMPURITIES
Organic Impurities
• **PROCEDURE**
Buffer, Solution A, Solution B, Phosphoric acid solution, Diluent, Standard solution, and **Sample solution:** Proceed as directed in the *Assay*.
Sensitivity solution: Dilute the *Standard solution* in *Diluent* to prepare a solution having a concentration of 0.1 µg/mL of ramipril.
Chromatographic system: Prepare as directed in the *Assay*.

[1] Disregard this impurity as it is process related and is controlled in the drug substance.
[2] Ramipril diketopiperazine (6,7,8-trichloro-3,5-dihydroimidazo[2,1-*b*]quinazolin-2(1*H*)-one).

BRIEFING

Risperidone Oral Solution. Because there is no existing *USP* monograph for this dosage form, a new monograph is being proposed. The liquid chromatographic procedures in the *Assay* and in the test for *Organic Impurities* were validated with a Hypersil BDS brand of L1 column, in which risperidone elutes at about 9 min.

(MD-PP: R. Ravichandran.) RTS—C51559

Add the following:

▪Risperidone Oral Solution

DEFINITION

Risperidone Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of risperidone ($C_{23}H_{27}FN_4O_2$). It may contain a suitable preservative.

IDENTIFICATION

• The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Buffer: 5.0 g/L ammonium acetate in water

Mobile phase: Acetonitrile:*Buffer* (11:39)

Standard stock solution: 1 mg/mL of USP Risperidone RS, in methanol

Standard solution: 0.2 mg/mL of USP Risperidone RS prepared from *Standard stock solution* as follows: transfer 5.0 mL of the *Standard stock solution* to a 25-mL volumetric flask. Add 5.0 mL of water followed by 12.5 mL of *Buffer*, and allow to cool to room temperature. Dilute with methanol to volume.

Sample solution: Nominal concentration of 0.2 mg/mL risperidone prepared from Oral Solution as follows: transfer an amount of Oral Solution, equivalent to 5 mg of risperidone to a 25-mL volumetric flask, add 12.5 mL of *Buffer*, fill with methanol almost to volume, and mix well. Allow to cool to room temperature, and dilute with methanol to volume.

System suitability solution: 0.25 mg/mL of USP Risperidone Related Compounds Mixture RS prepared as follows: weigh USP Risperidone Related Compounds Mixture RS into a suitable volumetric flask. Dissolve first in 20% of the flask volume of methanol. Add 20% of the flask volume of water followed by 50% of the flask volume of *Buffer*, and allow to cool to room temperature. Dilute with methanol to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 275 nm

Column: 4.6-mm × 10-cm; 3-µm packing L1

Flow rate: 1.5 mL/min

Injection size: 10 µL

Run time: 2 times the retention time of risperidone

System suitability

Samples: *System suitability solution* and *Standard solution*

Relative retention times: See *Impurity Table 1*.

Suitability requirements

Resolution: NLT 1.5 between bicyclorisperidone and *Z*-oxime, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Sample solution* and *Standard solution*

Calculate the percentage of $C_{23}H_{27}FN_4O_2$ in the portion of risperidone taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for risperidone from the *Sample solution*

r_S = peak response of risperidone from the *Standard solution*

C_S = concentration of USP Risperidone RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of risperidone in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DELIVERABLE VOLUME ⟨698⟩:** Meets the requirements

IMPURITIES

Organic Impurities

• **PROCEDURE**

Buffer, Mobile phase, System suitability solution, and **Sample solution:** Proceed as directed in the *Assay*

Standard stock solution: 5 µg/mL of USP Risperidone RS, in methanol

Standard solution: 1 µg/mL of USP Risperidone RS from *Standard stock solution* prepared as follows: transfer 5.0 mL of *Standard stock solution* to a 25-mL volumetric flask. Add 5.0 mL of water followed by 12.5 mL of *Buffer*, and allow to cool to room temperature. Dilute with methanol to volume.

Chromatographic system

Prepare as directed in the *Assay*.

System suitability

Samples: *System suitability solution* and *Standard solution*

Relative retention times: See *Impurity Table 1*.

Suitability requirements

Resolution: NLT 1.5 between bicyclorisperidone and *Z*-oxime, *System suitability solution*

Relative standard deviation: NMT 10%, *Standard solution*

Analysis

Samples: *Sample solution* and *Standard solution*

Calculate the percentage of each impurity in the portion of risperidone taken:

$$\text{Result} = (r_I/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_I = response for each individual impurity from the *Sample solution*

r_S = response for risperidone from the *Standard solution*

C_S = concentration of USP Risperidone RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of risperidone in the *Sample solution* (mg/mL)

F = relative response factor from *Impurity Table 1*

In-Process Revision

Acceptance criteria
Individual impurities: See *Impurity Table 1*.
Total impurities: NMT 1.0%

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

BRIEFING

Sumatriptan Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph is proposed based on validated methods. The liquid chromatographic procedures in the *Assay* and test for *Organic Impurities*, *Procedure* are based on analyses performed using a Waters Spherisorb ODS-1 brand of L1 column. The typical retention time for sumatriptan is about 6 min in the *Assay* and about 13 min in the test for *Organic Impurities*, *Procedure.*

(MD-PP: R. Ravichandran. BPC: M. Marques.) RTS—C73613

Add the following:

■Sumatriptan Tablets

DEFINITION
Sumatriptan Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of sumatriptan ($C_{14}H_{21}N_3O_2S$).

IDENTIFICATION
- **A. INFRARED ABSORPTION ⟨197K⟩:** The IR spectrum exhibits main bands at or near (± 1) wave numbers (cm^{-1}) 1708, 1567, 1339, 1300, 1235, 1207, 989, 844, and 767.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
- **PROCEDURE**
  Solution A: 2.93 g/L of monobasic sodium phosphate, 1.3 mL/L of dibutylamine, and 0.4 mL/L of phosphoric acid in water, adjusted to a pH of 6.5 with 10 N sodium hydroxide solution
  Mobile phase: Acetonitrile and *Solution A* (1:3)
  Solution B: 3.9 g/L of monobasic sodium phosphate, adjusted to a pH of 6.5 with 10 N sodium hydroxide solution prior to dilution
  Diluent: Acetonitrile and *Solution B* (1:3)
  Standard solution: Equivalent to 0.1 mg/mL of sumatriptan from USP Sumatriptan Succinate RS in *Diluent*
  Sample solution: Equivalent to 0.1 mg/mL of sumatriptan in *Diluent* [NOTE—Sonicate if necessary.]
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 282 nm
  Column: 4.6-mm × 25-cm column; 5-µm packing L1
  Flow rate: 1.5 mL/min
  Injection size: 10 µL
  Run time: 10 min
  System suitability
  Sample: *Standard solution*
  Suitability requirements
  Tailing factor: NMT 2.0
  Relative standard deviation: NMT 1.0%
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of $C_{14}H_{21}N_3O_2S$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

  r_U = peak response from the *Sample solution*
  r_S = peak response from the *Standard solution*
  C_S = concentration of USP Sumatriptan Succinate RS in the *Standard solution* (mg/mL)
  C_U = concentration of the *Sample solution* (mg/mL)
  M_{r1} = molecular weight of sumatriptan, 295.4
  M_{r2} = molecular weight of sumatriptan succinate, 413.5
  Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS
- **DISSOLUTION ⟨711⟩**
  Medium: 0.01 N hydrochloric acid; 900 mL
  Apparatus 2: 30 rpm
  Time: 15 min
  Standard solution: 0.025 mg/mL of USP Sumatriptan Succinate RS in *Medium*
  Sample solution: Pass a portion of the solution under test through a suitable 0.45-µm filter. Dilute with *Medium*, if necessary.
  Mode: Spectrophotometry
  Detection: UV 282 nm
  Blank: *Medium*
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the quantity of $C_{14}H_{21}N_3O_2S$ dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times D \times V \times (M_{r1}/M_{r2}) \times 100$$

  A_U = absorbance of the *Sample solution*
  A_S = absorbance of the *Standard solution*
  C_S = concentration of the *Standard solution* (mg/mL)
  L = tablet label claim (mg)
  D = dilution factor of the *Sample solution*
  V = volume of *Medium*, 900 mL
  M_{r1} = molecular weight of sumatriptan, 295.4
  M_{r2} = molecular weight of sumatriptan succinate, 413.5
  Tolerances: NLT 80% (Q) of the labeled amount of sumatriptan is dissolved.

• **UNIFORMITY OF DOSAGE UNITS ⟨905⟩:** Meet the requirements

IMPURITIES

Organic Impurities

• **PROCEDURE**

Solution A: Prepare as directed in the *Assay*.

Mobile phase: Acetonitrile and *Solution A* (3:17)

System suitability solution: 0.1 mg/mL each of USP Sumatriptan Succinate RS and USP Sumatriptan Succinate Related Compound C RS in *Mobile phase*

Standard solution: 3 µg/mL of USP Sumatriptan Succinate RS in *Mobile phase*

Sample solution: Equivalent to 3 mg/mL of sumatriptan in *Mobile phase* [NOTE—Sonicate if necessary.]

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 282 nm

Column: 4.6-mm × 25-cm column; 5-µm packing L1

BRIEFING

Terazosin Capsules. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed. The liquid chromatographic procedure in the *Assay* is validated using a Burdick and Jackson OD5 5-µm column containing packing L1. The test for *Organic Impurities* is validated using a Symmetry Shield RP18 5-µm column containing packing L1. The typical retention time for terazosin hydrochloride is about 11.5 min for the *Assay* conditions and about 8.1 min for the *Organic Impurities* test conditions.

(MD-CV: S. Ramakrishna.) RTS—C65483

Add the following:

■Terazosin Capsules

DEFINITION

Terazosin Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of $C_{19}H_{25}N_5O_4 \cdot HCl$, calculated as a free base.

IDENTIFICATION

• **A. ULTRAVIOLET ABSORPTION ⟨197U⟩**

[NOTE—Discard the first 5 mL from the filtered *Diluent*, *Standard solution*, and *Sample solution* for use.]

Diluent: 0.1 N hydrochloric acid

Standard solution: 0.005 mg/mL of USP Terazosin Hydrochloride RS in *Diluent*. Sonicate for 10 min for complete dissolution. Pass the solution through a 0.45-µm nylon filter.

Sample solution: Combine the contents from 20 Capsules and transfer 10 mg into a 100-mL flask, and fill with *Diluent* to 50% of the volume of the flask. Sonicate the flask for 10 min. Allow it to cool to room temperature. Dilute with *Diluent*

In-Process Revision

to volume. Further dilute 5 mL of this solution with *Diluent* to 100 mL, and mix well. Pass 10 mL of this preparation through a 0.45-µm PTFE filter.
Blank: Pass the *Diluent* through a 0.45-µm PTFE filter.
Analytical wavelength: 200–400 nm
Flow cell: 1 cm
Acceptance criteria: The UV spectrum of the *Sample solution* exhibits maxima and minima at the same wavelength as that of the *Standard solution*.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution,* as obtained in the *Assay.*

ASSAY

- **PROCEDURE** [NOTE—Use all glass syringe.]

Hydrochloric acid solution: Prepare 0.1 N methanolic HCL by adding 0.85 mL of hydrochloric acid in 1 L methanol
Diluent: *Hydrochloric acid solution*:water (2:3)
Mobile phase: Mix 700 mL of acetonitrile with 300 mL of water. Pass through a 0.45-µm nylon filter. Add 10.00 mL of glacial acetic acid, and degas. After degassing, pipet 0.20 mL of diethylamine into the solution, and mix.
Standard stock solution: 0.55 mg/mL of USP Terazosin Hydrochloride RS in *Diluent.* Sonication for 5 min may be necessary for complete dissolution.
Standard solution: Use the *Standard stock solution* to prepare 0.055 mg/mL of Terazosin Hydrochloride in *Diluent.* Pass through a 0.45-µm PTFE filter and discard NLT the first 8 mL of filtrate.
Sample solution: Combine the contents of NLT 20 Capsules and weigh a quantity equivalent to 10 mg of terazosin into a 200-mL flask. Add 100 mL of *Diluent* and sonicate for NLT 10 min. Shake the flask mechanically for NLT 10 min. Repeat until the sample is well dispersed. Allow the solution to cool, and dilute with *Diluent* to volume. Pass through a 0.45-µm PTFE filter and discard the first 8 mL of filtrate.
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 4.6-mm × 15-cm column; 5-µm packing L1
Flow rate: 2.5 mL/min
Run time: NLT twice the retention time of the terazosin peak
Injection size: 25 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.8 for the terazosin peak
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Sample solution* and *Standard solution*
Calculate the percentage of $C_{19}H_{25}N_5O_4$, based on the label claim, in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100 \times (M_{r1}/M_{r2})$$

r_U = response of the terazosin peak from the *Sample solution*
r_S = response of the terazosin peak from the *Standard solution*
C_S = concentration of Terazosin Hydrochloride in the *Standard solution* (mg/mL)
C_U = nominal concentration of terazosin in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of terazosin, 387.44
M_{r2} = molecular weight of terazosin hydrochloride, 423.90

Acceptance criteria: 90.0%–110.0% as a free base

PERFORMANCE TESTS

BRIEFING

Terazosin Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph is proposed based on validated data. The liquid chromatographic procedure in the *Assay* is validated using a Burdick and Jackson C18 5-µm column containing packing L1. The test for *Organic Impurities* is validated using a Symmetry Shield RP18 5-µm column containing packing L1. The typical retention time for terazosin hydrochloride is about 2.3 min for the *Assay* conditions and about 8.1 min for the *Organic Impurities* test conditions.

(MD-CV: S. Ramakrishna.) RTS—C65484

Add the following:

■Terazosin Tablets

DEFINITION

Terazosin Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of $C_{19}H_{25}N_5O_4 \cdot HCl$, calculated as a free base.

IDENTIFICATION

- **A. ULTRAVIOLET ABSORPTION** ⟨197U⟩
  [NOTE—Discard the first 5 mL from the filtered *Standard solution* and *Sample solution* for use.]
  Diluent: 0.1 N hydrochloric acid
  Standard solution: 0.005 mg/mL in *Diluent*. Sonicate for 10 min for complete dissolution. Pass the solution through a 0.45-µm nylon filter.
  Sample solution: Transfer 10 mg from the pool of ground Tablets (NLT 20) into a 100-mL flask. Dilute with *Diluent* to 50% of the volume of the flask. Sonicate the flask for 10 min. Allow it to cool to room temperature, and dilute with *Diluent* to volume. Further dilute 5 mL of this solution with *Diluent* to 100 mL, and mix well. Pass 20 mL of this preparation through a 0.45-µm PTFE filter.
  Analytical wavelength: 200–400 nm
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE** [NOTE—Use all glass syringe.]
  Hydrochloric acid solution: Prepare 0.01 N methanolic HCl by adding 0.85 mL of hydrochloric acid to 1 L of methanol.
  Diluent: *Hydrochloric acid solution*:water (2:3)
  Mobile phase: Acetonitrile:water (7:3). Add 10.00 mL/L of glacial acetic acid, and degas. Pass through a 0.45-µm nylon filter. Pipet 0.20 mL of diethylamine into the solution and mix.
  Standard stock solution: 0.55 mg/mL of USP Terazosin Hydrochloride RS in *Diluent*. Sonicate for 5 min for complete dissolution.
  Standard solution: Use *Standard stock solution* to prepare 0.055 mg/mL of terazosin hydrochloride in *Diluent*. Pass through a 0.45-µm PTFE filter and discard the first few mL of filtrate.
  Naproxen standard solution: 0.5 mg/mL of USP Naproxen RS solution. Dissolve by sonication USP Naproxen RS in acetonitrile (25% of the volume of the flask), and dilute with water to volume.
  System suitability solution: Use the *Standard solution* and *Naproxen standard solution* to prepare 0.05 mg/mL of naproxen and 0.055 mg/mL of terazosin hydrochloride. Pass through a 0.45-µm PTFE filter, and discard the first few mL of filtrate.
  Sample solution: 0.05 mg/mL of terazosin in *Diluent*. Combine the contents of NLT 20 Tablets, and weigh a quantity equivalent to 10 mg of terazosin into a 200-mL flask. Add 100 mL of *Diluent*, and sonicate for NLT 10 min. Shake the flask mechanically for NLT 10 min. Repeat until the sample is well dispersed. Allow the solution to cool, and dilute with *Diluent* to volume. Pass through a 0.45-µm PTFE filter, and discard the first few mL of filtrate.
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 254 nm
  Column: 4.6-mm × 15-cm column; 5-µm packing L1
  Flow rate: 2.5 mL/min
  Run time: NLT 1.8 times the retention time of the terazosin peak
  Injection size: 25 µL
  System suitability
  Sample: *Standard solution* and *System suitability solution*
  Suitability requirements
  Resolution: NLT 2.0 between the naproxen and terazosin peaks, *System suitability solution*
  Tailing factor: NMT 1.8 for the terazosin peak, *System suitability solution*
  Relative standard deviation: NMT 2.0, *Standard solution*
  Analysis
  Samples: *Sample solution* and *Standard solution*
  Calculate the percentage of $C_{19}H_{25}N_5O_4$, based on the label claim, in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100 \times (M_{r1}/M_{r2})$$

r_U = response of the terazosin peak from the *Sample solution*
r_S = response of the terazosin peak from the *Standard solution*
C_S = concentration of terazosin hydrochloride in the *Standard solution* (mg/mL)
C_U = nominal concentration of terazosin in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of terazosin, 387.44
M_{r2} = molecular weight of terazosin hydrochloride, 423.90

In-Process Revision

Acceptance criteria: 90.0%–110.0% as a free base

PERFORMANCE TESTS
- **DISSOLUTION ⟨711⟩:** [To come]

IMPURITIES
Organic Impurities
- **PROCEDURE**

Buffer: Dissolve 4.1 g of monobasic potassium phosphate and 1.1 g of heptane sulfonic acid sodium salt monohydrate in 950 mL of water. Adjust the pH to 3.0 ± 0.10 with phosphoric acid. Dilute to 1 L with water. Pass through a 0.45-µm nylon filter.
Mobile phase: Acetonitrile:*Buffer* (6:19)
Standard solution: 0.003 mg/mL of USP Terazosin Hydrochloride RS in *Mobile phase*
Sample solution: Transfer 15 mg of the powder from the crushed Tablets (NLT 20) into a 50-mL volumetric flask. Dilute with *Mobile phase* to approximately half the volume of the flask. Sonicate for NLT 10 min and shake the flask for NLT 20 min. Dilute with *Mobile phase* to volume, and pass through a 0.45-µm nylon or Teflon filter, discarding the first 5 mL of filtrate. The final concentration of the *Sample solution* is 0.3 mg/mL.
Sensitivity solution: Dilute the *Standard solution* with *Mobile phase* to prepare 0.15 µg/mL of USP Terazosin Hydrochloride RS.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 246 nm
Column: 4.6-mm × 25-cm column; 5-µm packing L1
Flow rate: 1 mL/min
Column temperature: Ambient
Injection size: 10 µL
Run time: NLT 1.2 times the retention time of terazosin in the *Standard solution*; NLT 4.5 times the retention time of terazosin in the *Sample solution*
System suitability
Sample: *Standard solution* and *Sensitivity solution*
Capacity factor: NLT 1.0 for the terazosin peak, *Standard solution*
Relative standard deviation: NLT 2.0%, *Standard solution*
Tailing factor: NMT 2.0 for the terazosin peak, *Standard solution*
Signal to noise: NLT 10 for the terazosin peak from the *Sensitivity solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_I/r_S)\,(C_S/C_U) \times 100 \times (1/F) \times (M_{r1}/M_{r2})$$

r_I = response of each individual impurity from the *Sample solution*
r_S = response of terazosin from the *Standard solution*
C_U = nominal concentration of terazosin in the *Sample solution* (mg/mL)
C_S = concentration of terazosin hydrochloride in the *Standard solution* (mg/mL)
F = relative response factor as given in *Impurity Table 1*
M_{r1} = molecular weight of terazosin, 387.44
M_{r2} = molecular weight of terazosin hydrochloride, 423.90

Acceptance criteria
Impurity limits: Meets the impurity limits specifed in *Impurity Table 1*

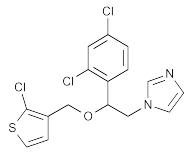
BRIEFING

Tioconazole, *USP 32* page 3751. It is proposed to revise the *Assay* to remove the dimensions of the precolumn which are not critical to the method.

(MD-AA: M. Puderbaugh, B. Davani.) RTS—C73797

Tioconazole



$C_{16}H_{13}Cl_3N_2OS$ 387.71
1*H*-Imidazole, 1-[2-[(2-chloro-3-thienyl)methoxy]-2-(2,4-dichlorophenyl)ethyl]-;
1-[2,4-Dichloro-[*β*-(2-chloro-3-thenyl)-oxy]phenethyl]imidazole [65899-73-2].

DEFINITION
Tioconazole contains NLT 97.0% and NMT 103.0% of $C_{16}H_{13}Cl_3N_2OS$.

IDENTIFICATION
- **A. INFRARED ABSORPTION ⟨197M⟩**
- **B. PROCEDURE**

Standard solution: 50 mg/mL of USP Tioconazole RS in methanol
Sample solution: 50 mg/mL of Tioconazole in methanol
Developing solvent system: Chloroform, methanol, and glacial acetic acid (40:5:1)
Visualizing solution: Dissolve 0.85 g of bismuth subnitrate in 10 mL of glacial acetic acid, and dilute with water to 50 mL. Mix 10 mL of this solution, 50 mL of potassium iodide solution (2 in 25), and 20 mL of glacial acetic acid, and dilute to 100 mL.
Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)

Mode: TLC
Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
Application volume: 10 µL
Analysis
Samples: *Standard solution* and *Sample solution*
Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber and locate the spots on the plate by viewing under short- and long-wavelength UV light after drying the plate at 80° for 5 min. Spray the plate with *Visualizing solution*, air-dry for 2 min, and overspray with sodium nitrite solution (1 in 20). Air-dry the plate for 5 min, and examine it for brown spots on a pale yellow background.
Acceptance criteria: The R_F value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

- **C.** The retention time of the major peak for tioconazole of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

Change to read:

- **PROCEDURE**

Mobile phase: Acetonitrile, methanol, and water (44:40:28). Degas the solution, and add 2.0 mL of ammonium hydroxide. [NOTE—Prepare the *Mobile phase* fresh daily.]
Standard solution: 200 µg/mL of USP Tioconazole RS in methanol
Sample solution: 200 µg/mL of Tioconazole in methanol
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 219 nm
Column: 5-mm × 25-cm; packing L1 with a ~~4-mm × 10-cm~~ 2S *(USP33)* precolumn containing packing L4 installed between the pump and the injector. [NOTE—Replace the precolumn daily.]
Flow rate: Adjust to obtain a retention time of between 12 and 17 min for tioconazole.
Injection size: 20 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Column efficiency: NLT 1000 theoretical plates, determined from the analyte peak
Tailing factor: NMT 2.0 for the analyte peak
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{16}H_{13}Cl_3N_2OS$ in the Tioconazole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Tioconazole RS in the *Standard solution* (mg/mL)
C_U = concentration of the *Sample solution* (mg/mL)
Acceptance criteria: 97.0%–103.0%

IMPURITIES
Inorganic Impurities

In-Process Revision

BRIEFING

Valacyclovir Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph is proposed based on the validated methods. The proposed liquid chromatographic procedures in the *Assay* and in the test for *Organic Impurities* are performed using a Diacel Chiral Phase Crownpack, 5-µm column containing packing L66. The liquid chromatographic procedure in the test for *Dissolution* is performed using a Hypersil BDS or MOS 5-µm column containing packing L1. The typical retention time for valacyclovir is about 4.5 min under the specified conditions for the *Assay*.

(MD-AA: S. Ramakrishna; B. Davani. BPC: M. Marques.)
RTS—C44129; C59195

Add the following:

▪Valacyclovir Tablets

DEFINITION

Valacyclovir Tablets contain an amount of Valacyclovir Hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of valacyclovir ($C_{13}H_{20}N_6O_4$).

IDENTIFICATION

- **A.** The retention time of the major peak in the chromatogram of the *Sample solution* corresponds to that in the chromatogram of the *Standard solution,* as obtained in the *Assay.*
- **B. IDENTIFICATION TESTS—GENERAL,** *Chloride* ⟨**191**⟩**:** Meets the requirements

ASSAY

- **PROCEDURE**

Diluent: 0.1% (v/v) phosphoric acid in water
Mobile phase: Methanol and *Diluent* (5:95)
Standard solution: 0.1 mg/mL of USP Valacyclovir Hydrochloride RS in *Diluent*. [NOTE—USP Valacyclovir Hydrochloride RS contains a detectable quantity of D-valacyclovir.]
Sample solution: Transfer NLT 5 Tablets into a suitable volumetric flask, and add 0.1 M hydrochloric acid (approximately 80% of the volume of volumetric flask). Mechanically shake the sample until the Tablets disintegrate into a fine suspension (60 min), and sonicate for 10 min. Cool to ambient temperature, dilute with 0.1 M hydrochloric acid to volume, and mix to obtain a solution having a concentration of 2.5 mg/mL. Dilute a portion of the sample with *Diluent* to obtain a nominal concentration of 0.1 mg/mL of valacyclovir, and mix. Pass a portion of this solution through a 0.45-µm or finer porosity membrane filter, and use the filtrate.
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 4-mm × 15-cm column; 5-µm, packing L66
Column temperature: 10°
Flow rate: 0.75 mL/min
Injection size: 10 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Resolution NLT 1.3 between the D-valacyclovir and valacyclovir peaks
Tailing factor: NMT 2.0 for the valacyclovir peak
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{13}H_{20}N_6O_4$, based on the label claim, in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of valacyclovir hydrochloride in the *Standard solution* (mg/mL)
C_U = nominal concentration of valacyclovir in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of valacyclovir, 324.34
M_{r2} = molecular weight of valacyclovir hydrochloride, 360.80

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DISSOLUTION** ⟨**711**⟩

Medium: 0.1 N hydrochloric acid; 900 mL
Apparatus 2: 50 rpm
Time: 45 min
Diluent: Prepare as directed in the *Assay.*
Buffer: Dissolve about 1.15 g of ammonium dihydrogen orthophosphate in 950 mL of water, add 2 mL of triethylamine, and adjust with *o*-phosphoric acid to a pH of 2.5 ± 0.05. Add 10 mL of acetonitrile, and dilute with water to 1000 mL.
Mobile phase: Acetonitrile and *Diluent* (5:95)
Standard solution: Prepare a solution in *Diluent* containing USP Valacyclovir Hydrochloride RS equivalent to 0.044 mg/mL of valacyclovir free base.
Sample solution: Pass a portion of the solution under test through a suitable 0.45-µm filter. Dilute with *Diluent* to obtain a final concentration of about 0.044 mg/mL considering complete dissolution of the Tablet label claim.
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 4.6 mm x 5-cm, 5-µm packing L1
Flow rate: 2.0 mL/min
Injection size: 10 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of valacyclovir dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S) \times (M_{r1}/M_{r2}) \times (1/L) \times 100 \times 900$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of valacyclovir in the *Standard solution* (mg/mL)
M_{r1} = molecular weight of valacyclovir, 324.34
M_{r2} = molecular weight of valacyclovir hydrochloride, 360.80
L = Tablet label claim (mg)

Tolerances: NLT 75% (Q) of the labeled amount of valacyclovir is released in 45 min.

- **UNIFORMITY OF DOSAGE UNITS** ⟨**905**⟩**:** Meets the requirements [NOTE—All of the concentrations are expressed as valacyclovir free base.]

Diluent: Prepare as directed in the *Assay.*
Mobile phase: Acetonitrile and *Diluent* (5:95)
Standard solution: Prepare a solution of USP Valacyclovir Hydrochloride RS, equivalent to 0.04 mg/mL of valacyclovir in *Diluent*.
Sample solution: Transfer one Tablet into a suitable volumetric flask. Add *Diluent* (approximately 60% of the volume of the

In-Process Revision

flask), and mechanically shake the samples until the Tablets disintegrate into a fine suspension, and sonicate for 10 min. Cool, dilute with *Diluent* to volume, and mix. Dilute a portion of each sample with *Diluent* to obtain a nominal concentration of 0.04 mg/mL of valacyclovir. Pass a portion of each sample through a 0.45-µm membrane filter, and use the filtrate.

Chromatographic system and **System suitability:** Proceed as directed under *Dissolution*.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{13}H_{20}N_6O_4$, based on the label claim, in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of valacyclovir in the *Standard solution* (mg/mL)
C_U = nominal concentration of valacyclovir in the *Sample solution* (mg/mL)

IMPURITIES

Organic Impurities

• **PROCEDURE**

Diluent, Mobile phase, Chromatographic system, Standard solution and **Sample solution:** Proceed as directed in the *Assay*.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of D-valacyclovir and the percentage of acyclovir in the portion of Tablets taken:

$$\text{Result} = (r_i/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times (1/F) \times 100$$

r_i = peak responses of D-valacyclovir or acyclovir from the *Sample solution*
r_S = peak response of valacyclovir from the *Standard solution*
C_U = nominal concentration of valacyclovir in the *Sample solution* (mg/mL)
C_S = concentration of valacyclovir hydrochloride in the *Standard solution* (mg/mL)
M_{r1} = molecular weight of valacyclovir, 324.34
M_{r2} = molecular weight of valacyclovir hydrochloride, 360.80
F = relative response factor as given in *Impurity Table 1*

Acceptance criteria

Impurity limits: Meets the impurity limits specifed in *Impurity Table 1*

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
D-Valacyclovir [a]	0.82	1.0	3.2
Acyclovir [b]	0.56	1.4	2.5

[a] D-Valine, 2-[(2-amino-1,6-dihydro-6-oxo-9*H*-purin-9-yl)methoxy] ethyl ester, monohydrochloride.

[b] 2-Amino-9-[(2-hydroxyethoxy)methyl]-1,9-dihydro-6*H*-purin-6-one (acyclovir).

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Valacyclovir Hydrochloride RS■2S *(USP33)*

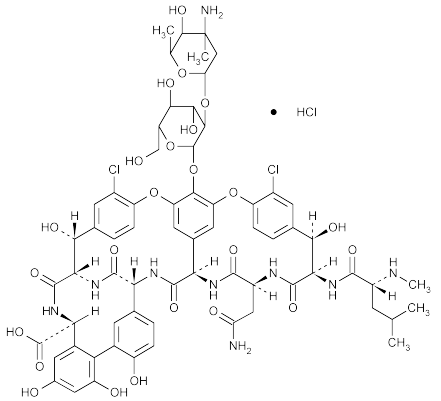
BRIEFING

Vancomycin Hydrochloride, page 3845 of *USP 32* and page 111 of *PF* 34(1). On the basis of comments received, the following revisions are being proposed:

- The *Identification* test is revised to delete the word "undried," which is redundant since the label for USP Vancomycin Hydrochloride RS indicates that this material should not be dried.
- A test for *Heavy Metals* is added to the monograph to reflect approved acceptance criteria. Vancomycin Hydrochloride is soluble in water, but *Heavy Metals, Method II* ⟨231⟩ is specified to avoid interference from solution color.
- The retention times specified in the test for *Limit of Monodechlorovancomycin* are deleted, as these values do not ensure optimal resolution for the peaks of interest.
- The term "elution time" in the *Analysis* subsection of the test for *Composition of Vancomycin* is revised to "retention time," since the latter is more commonly used by chromatographers. The *Acceptance criteria* for vancomycin B and any other peak in this test are revised on the basis of comments received regarding the *PF* 34(1) proposal and on supporting data from marketed products.

(MD-ANT: A. Wise.) RTS—C62988

Vancomycin Hydrochloride



$C_{66}H_{75}Cl_2N_9O_{24} \cdot HCl$ 1485.71

Vancomycin, monohydrochloride;
Vancomycin monohydrochloride
(S_a)-(3*S*,6*R*,7*R*,22*R*,23*S*,26*S*,36*R*,38a*R*)-44-[[2-*O*-(3-Amino-2,3,6-trideoxy-3-C-methyl-α-L-*lyxo*-hexopyranosyl)-β-D-glucopyranosyl]oxy]-3-(carbamoylmethyl)-10,19-dichloro-2,3,4,5,6,7,23,24,25,26,36,37,38,38a-tetradecahydro-7,22,28,30,32-pentahydroxy-6-[(2*R*)-4-methyl-2-(methylamino)]valeramido]-2,5,24,38,39-pentaoxo-22*H*-8,11:18,21-dietheno-23,36-(iminomethano)-13,16:31,35-dimetheno-1*H*,16*H*-[1,6,9]oxadiazacyclohexadecino[4,5-*m*][10,2,16]benzoxadiazacyclotetracosine-26-carboxylic acid, monohydrochloride;

In-Process Revision

DEFINITION

Vancomycin Hydrochloride is the hydrochloride salt of a kind of vancomycin, a substance produced by the growth of *Streptomyces orientalis* (Fam. Streptomycetaceae), or a mixture of two or more such salts. It has a potency equivalent to NLT 900 µg of vancomycin/mg, calculated on the anhydrous basis.

IDENTIFICATION

Change to read:

• **INFRARED ABSORPTION** ⟨197K⟩**:** ~~Undried~~■■2S (*USP33*)

ASSAY

• **PROCEDURE:** Proceed with Vancomycin Hydrochloride as directed under *Antibiotics—Microbial Assays* ⟨81⟩.

Acceptance criteria: NLT 900 µg/mg on the anhydrous basis

IMPURITIES

Add the following:

■Inorganic impurities

• **HEAVY METALS,** *Method II* ⟨**231**⟩**:** NMT 30 ppm■2S (*USP33*)

Change to read:

Organic Impurities

• **PROCEDURE: LIMIT OF MONODECHLOROVANCOMYCIN**

[NOTE—The *System suitability solution*, *Sample solution*, and *Standard solution* should be refrigerated immediately after preparation and during analysis. The solutions are stable for 4 days when refrigerated.]

Mobile phase: Dissolve 2.2 g of 1-heptanesulfonic acid in about 500 mL of water, add 125 mL of acetonitrile and 10 mL of acetic acid, and dilute with water to 1 L.

Rinse solution: 10% acetonitrile in water. [NOTE—Use to rinse needle and column.]

System suitability solution: 1 mg/mL of vancomycin B from USP Vancomycin B with Monodechlorovancomycin RS in water

Standard solution: 50 µg/mL of vancomycin B, from *System suitability solution*

Sample solution: 1 mg/mL of Vancomycin Hydrochloride in water

Blank: Water

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6 mm × 25 cm; packing L1

Temperature: 60°

Autosampler temperature: 5°

Flow rate: 1.5 mL/min

Injection volume: 50 µL

[NOTE—This procedure is sensitive to temperature changes. Sufficient tubing should be placed in the column oven to ensure that the samples have reached 60° before separation.]

System suitability

Samples: *System suitability solution*, *Standard solution*, *Sample solution*, and *Blank*

[NOTE—*Blank* and *Standard solution* run times are about 90 min. *System suitability solution* and *Sample solution* run times are about 120 min.]

[NOTE—~~The retention time of vancomycin B is 32–42 min. The relative retention time of monodechlorovancomycin is 1.1.~~■The relative retention times for vancomycin B and monodechlorovancomycin are 1.0 and 1.1, respectively.■2S (*USP33*)]

Suitability requirements

Selectivity: The chromatogram for the *Blank* does not contain peaks that interfere with vancomycin B or monodechlorovancomycin.

Retention times: ± 3.0% between monodechlorovancomycin in the *Sample solution* and the mean of the monodechlorovancomycin peaks in the *Standard solution*

Resolution: NLT 1.5 between vancomycin B and monodechlorovancomycin, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of monodechlorovancomycin in the portion of Vancomycin Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times 100$$

r_U = peak area of monodechlorovancomycin in the *Sample solution*

r_S = average peak area of the vancomycin peak in the *Standard solution*

C_S = concentration of USP Vancomycin B with Monodechlorovancomycin RS in the *Standard solution* (mg/mL)

C_U = concentration of Vancomycin Hydrochloride in the *Sample solution* (mg/mL)

P = potency of Vancomycin in USP Vancomycin B with Monodechlorovancomycin RS (mg/mg)

Acceptance criteria: NMT 4.7% of monodechlorovancomycin is found.

SPECIFIC TESTS

Add the following:

■• **STERILITY TESTS** ⟨**71**⟩**:** Where the label states that Vancomycin Hydrochloride is sterile, it meets the requirements when tested as directed for *Test for Sterility of Product to Be Examined, Membrane Filtration*, except to dissolve the specimen in water, instead of in *Fluid A*.■2S (*USP32*)

Add the following:

■• **BACTERIAL ENDOTOXINS TEST** ⟨**85**⟩**:** Where the label states that Vancomycin Hydrochloride must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 0.33 USP Endotoxin Unit/mg of vancomycin.■2S (*USP32*)

• **pH** ⟨**791**⟩**:** 2.5–4.5, 50 mg/mL in water

• **WATER DETERMINATION,** *Method I* ⟨**921**⟩**:** NMT 5.0%

Change to read:

• **COMPOSITION OF VANCOMYCIN**

Solution A: Triethylamine and water (1:500). Adjust the pH to 3.2 with phosphoric acid.

Solution B: Acetonitrile, tetrahydrofuran, and *Solution A* (7:1:92)

Solution C: Acetonitrile, tetrahydrofuran, and *Solution A* (29:1:70)

Mobile phase: See the gradient table below. [NOTE—Make adjustments, if necessary, changing the acetonitrile proportion in *Solution B* to obtain a retention time of 7.5–10.5 min for the main vancomycin peak.]

Time (min)	Solution B (%)	Solution C (%)
0	100	0
12	100	0

BRIEFING

Vancomycin Hydrochloride for Injection, *USP 32* page 3847 and page 992 of *PF* 34(4). On the basis of comments received, the following revisions are proposed:
- Since there is a proposal in this *PF* to add a requirement for *Heavy Metals* to the *Vancomycin Hydrochloride* monograph, this requirement is no longer necessary in the *Vancomycin Hydrochloride for Injection* monograph and will be deleted.
- On the basis of comments received regarding the *PF* 34(1) proposal to replace the monograph for *Sterile Vancomycin Hydrochloride* with the monograph for *Vancomycin Hydrochloride for Injection*, the *Acceptance criteria* for vancomycin B and any other peak in the test for *Composition of Vancomycin* have been revised to reflect the limits for marketed products.

(MD-ANT: A. Wise.) RTS—C62988

Vancomycin Hydrochloride for Injection

DEFINITION

Change to read:

Vancomycin Hydrochloride for Injection is a sterile dry mixture of Vancomycin Hydrochloride and ■may contain■2S *(USP32)* a suitable stabilizing agent. It ■■2S *(USP32)* contains NLT 90.0% and NMT 115.0% of the labeled amount of vancomycin.

BRIEFING

Sterile Water for Inhalation, *USP 32* page 3871. On the basis of comments received, it is proposed to update the *Definition* of this monograph to specify that no added antimicrobial agents are contained.

(PW: A. Hernandez-Cardoso.) RTS—C73472

Sterile Water for Inhalation

DEFINITION

Change to read:

[NOTE—For microbiological guidance, see *Water for Pharmaceutical Purposes* ⟨1231⟩.]

Sterile Water for Inhalation is prepared from Water for Injection that is sterilized and suitably packaged. It contains no ~~antimicrobial agents, except where used in humidifiers or other similar devices and where liable to contamination over a period of time, or other added substances~~ ■added antimicrobial agents.■2S *(USP33)*

[NOTE—Do not use Sterile Water for Inhalation for parenteral administration or for other sterile compendial dosage forms.]

SPECIFIC TESTS
• **OXIDIZABLE SUBSTANCES**
Sample: 100 mL
Analysis: Add 10 mL of 2 N sulfuric acid, and heat to boiling. For Sterile Water for Inhalation in containers having a fill volume less than 50 mL, add 0.4 mL of 0.02 M potassium permanganate, and boil for 5 min; where the fill volume is 50 mL or more, add 0.2 mL of 0.02 M potassium permanganate, and boil for 5 min. If a precipitate forms, cool in an ice bath to room temperature, and pass through a sintered-glass filter.
Acceptance criteria: The pink color does not completely disappear.
• **WATER CONDUCTIVITY,** *Packaged Water* ⟨**645**⟩**:** Meets the requirements
• **STERILITY TESTS** ⟨**71**⟩**:** Meets the requirements
• **BACTERIAL ENDOTOXINS TEST** ⟨**85**⟩**:** Less than 0.5 USP Endotoxin Unit/mL

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in glass or plastic containers. Glass containers are preferably of Type I or Type II glass.
• **LABELING:** Label it to indicate that it is for inhalation therapy only and that it is not for parenteral administration.
• **USP REFERENCE STANDARDS** ⟨**11**⟩
USP Endotoxin RS

BRIEFING

Zolpidem Tartrate Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph, based on validated methods of analysis, is being proposed. The liquid chromatographic procedures in the test for *Organic Impurities* and in the *Assay* are based on analyses performed with a 4.6-mm × 15-cm Spherisorb ODS1 C 18 brand of 5-µm, L1 column. The typical retention time for zolpidem is about 9.8 min.

(MD-PP: R. Ravichandran. BPC: M. Marques.) RTS—C47817

Add the following:

■Zolpidem Tartrate Tablets

DEFINITION
Zolpidem Tartrate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of zolpidem tartrate ($C_{42}H_{48}N_6O_8$).

IDENTIFICATION
• **A. ULTRAVIOLET ABSORPTION** ⟨**197U**⟩**:** The spectrum of the *Sample solution* from the test for *Dissolution* matches that of the *Standard solution.*
• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **PROCEDURE**
Solution A: 3.4 g/L of monobasic potassium phosphate in water, adjusted with ammonium hydroxide to a pH of 5.5
Mobile phase: Acetonitrile, methanol, and *Solution A* (3:2:5)
Standard stock solution: 0.8 mg/mL of USP Zolpidem Tartrate RS in 0.01 M hydrochloric acid

In-Process Revision

Standard solution: 0.16 mg/mL of USP Zolpidem Tartrate RS in *Mobile phase* from the *Standard stock solution*
Sample stock solution: Transfer NLT 20 Tablets to a suitable volumetric flask to obtain a solution having a concentration of 0.4 mg/mL of zolpidem tartrate. Add 40% of the flask volume of 0.125 N hydrochloric acid. Mix well until the Tablets disintegrate, then add 50% of the flask volume of *Mobile phase*. Dilute with water to volume, and stir for 30 min using a magnetic stirrer. Allow solid particles to settle, and pass the supernatant through a suitable filter (e.g. Whatman No. 40 filter or equivalent).
Sample solution: 0.16 mg/mL of zolpidem tartrate from filtered *Sample stock solution* and *Mobile phase*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Flow rate: 1.2 mL/min
Injection size: 10 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 3.0 for zolpidem
Relative standard deviation: NMT 2.0% for zolpidem
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{42}H_{48}N_6O_8$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Zolpidem Tartrate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of the *Sample solution* (mg/mL)
Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨**711**⟩
Medium: 0.01 N hydrochloric acid; 900 mL, deaerated
Apparatus 2: 50 rpm
Time: 15 min
Sample solution: Pass a portion of the solution under test through a suitable 0.45-µm filter.
Standard solution: L/1000 mg/mL of USP Zolpidem tartrate RS in *Medium*, where L is the Tablet label claim in mg
Detection: UV 295 nm
Blank: *Medium*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of $C_{42}H_{48}N_6O_8$ dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
L = label claim per Tablet (mg)
V = 900 mL
Tolerance: NLT 80% (Q) of the labeled amount of $C_{42}H_{48}N_6O_8$ is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨**905**⟩**:** Meet the requirements

IMPURITIES

Organic Impurities

• **PROCEDURE**
Solution A, Mobile phase and **Standard stock solution:** Proceed as directed in the *Assay*.
System suitability solution: 2 mg/mL of USP Zolpidem Impurities Mixture RS, prepared by dissolving the weighed amount of USP Zolpidem Impurities Mixture RS in 10% of the flask volume of 0.01 N hydrochloric acid, and diluting with *Mobile phase* to volume.
Standard solution: 8 µg/mL of USP Zolpidem Hydrochloride RS in *Mobile phase* from the *Standard stock solution*
Sample solution: Use the *Sample solution* as prepared in the *Assay*.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Prepare as directed in the *Assay*.
System suitability
Samples: *System suitability solution* and *Standard solution*
Suitability requirements
Resolution: NLT 1.5 between zolpidem related compound B and zolpidem related compound C, *System suitability solution*
Tailing factor: NMT 2.0 for the zolpidem peak, *Standard solution*
Relative standard deviation: NMT 10.0% for zolpidem peak, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_T) \times 100$$

r_U = peak response for each impurity from the *Sample solution*
r_S = peak response for zolpidem from the *Standard solution*
C_S = concentration of USP Zolpidem Tartrate RS in the *Standard solution* (mg/mL)
C_T = concentration of zolpidem tartrate in the *Sample solution* (mg/mL)
Acceptance criteria
Individual impurities: See *Impurity Table 1*.
Total impurities: NMT 0.5%

Impurity Table 1

DIETARY SUPPLEMENTS—MONOGRAPHS

BRIEFING

Ashwagandha. A new *USP* Dietary Supplement monograph is proposed. The liquid chromatographic procedure in the test for *Content of Withanolides* is based on analyses performed with the Luna C18(2) brand of L1 column, with 5-µm packing. Typical retention times for withanoside IV, physagulin D, 27-hydroxywithanone, withanoside V, withanoside VI, withaferin A, withastramonolide, withanolide A, withanone, and withanolide B are about 15.5, 16.6, 17.6, 19.6, 19.6, 20.2, 21.2, 22.1, 22.3, and 25.2 min, respectively.

(DSB: M. Sharaf.) RTS—C56130

Add the following:

▪Ashwagandha

DEFINITION

Ashwagandha is the dried mature roots of *Withania somnifera* (L.) Dunal (Fam. Solanaceae). It contains NLT 0.3% of withanolides, calculated on the dried basis as the sum of withanolide aglycones, calculated as withanolide A, and withanolide glycosides, calculated as withanoside IV.

IDENTIFICATION

• **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST ⟨201⟩**

Standard solution: About 200 mg of USP Powdered Ashwagandha Extract RS in 10 mL of methanol. Heat gently for 10–15 min, centrifuge, and use the supernatant. [NOTE—Save the remaining volume of the supernatant for use in the test for *Content of Withanolides*.]

Sample solution: Transfer about 5.0 g of Ashwagandha, finely powdered, to a 250-mL flask fitted with a reflux condenser. Add 50 mL of methanol, reflux on a water bath for 10–15 min, cool to room temperature, and decant the supernatant. Repeat until the last extract is colorless. Combine the extracts, filter, concentrate under vacuum to about 40 mL, and adjust the volume to 50.0 mL using methanol. [NOTE—Save the remaining volume of the *Sample solution* for use in the test for *Content of Withanolides*.]

Developing solvent system: A mixture of ethyl acetate, toluene, and acetic acid (45:55:3)

Adsorbent: 0.25-mm layer of chromatographic silica gel

Spray reagent: Mix 0.5 mL of anisaldehyde, 10 mL of glacial acetic acid, 85 mL of methanol, and 5 mL of concentrated sulfuric acid in the order given.

Application volume: 25 µL

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the *Samples* as bands to a suitable plate (see *Chromatography* ⟨621⟩). Use a saturated chamber. Develop until the solvent front has moved about 90% of the length of the plate. Dry the plate, spray with *Spray reagent*, heat for 5–10 min at 100°, and examine under visible light.

Acceptance criteria: The *Sample solution* exhibits five main grayish-blue bands with R_F values of approximately 0.12, 0.29, 0.47, 0.67, and 0.73 that are similar in position and color to the main bands in the *Standard solution*. Other less intense bands are observed for the *Sample solution* and the *Standard solution*.

• **B.** The chromatogram of the *Sample solution* in the test for *Content of Withanolides* shows main peaks at retention times corresponding to those of withanolide A and withanoside IV in *Standard solution A* and *Standard solution B*, respectively. Identify other withanolide peaks in the *Sample solution* by comparison with *Standard solution C* and the reference chromatogram provided with the lot of USP Powdered Ashwagandha Extract RS being used. The *Sample solution* shows additional peaks corresponding to some of the following withanolides: physagulin D, 27-hydroxywithanone, withanoside V, withanoside VI, withaferin A, withastramonolide, withanone, and withanolide B.

COMPOSITION

• **CONTENT OF WITHANOLIDES**

Solution A: Dissolve 0.14 g of potassium dihydrogen phosphate in 900 mL of water, add 0.5 mL of phosphoric acid, dilute with water to 1000 mL, and mix.

Solution B: Filtered and degassed acetonitrile

Standard solution A: Dissolve, using gentle heat, a quantity of USP Withanolide A RS in methanol to obtain a solution having a known concentration of about 0.1 mg/mL.

Standard solution B: Dissolve, using gentle heat, a quantity of USP Withanoside IV RS in methanol to obtain a solution having a known concentration of about 0.1 mg/mL.

Standard solution C: Dilute 5 mL of the *Standard solution* prepared in *Identification* test *A* with methanol to 10 mL, and mix. Before injection, pass through a membrane filter having a 0.45-µm or finer porosity.

Sample solution: Use the *Sample solution* prepared in *Identification* test *A*. Before injection, pass through a membrane filter having a 0.45-µm or finer porosity, discarding the first few mL of the filtrate.

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	95	5
18	55	45
25	20	80
28	20	80
30	95	5
40	95	5

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 227 nm

Column: 4.6-mm × 25-cm, end-capped; packing L1

Flow rate: 1.5 mL/min

Injection size: 20 µL

Column temperature: 27 ± 1°

System suitability

Samples: *Standard solution A* and *Standard solution C*

[NOTE—Using the chromatogram of *Standard solution C* and the reference chromatogram provided with the lot of USP Powdered Ashwagandha Extract RS being used, identify the retention times of the peaks corresponding to the various withanolide aglycones and glycosides. The approximate relative retention times of the withanolide aglycones and glycosides are provided in the following table.]

Analyte	Relative Retention Time
Withanoside IV	0.70
Physagulin D	0.75
27-hydroxywithanone	0.80
Withanoside V	0.89

Analyte	Relative Retention Time
Withanoside VI	0.89
Withaferin A	0.92
Withastramonolide	0.96
Withanolide A	1.00
Withanone	1.01
Withanolide B	1.14

Suitability requirements

[NOTE—The chromatogram for *Standard solution C* is similar to the reference chromatogram provided with the lot of USP Powdered Ashwagandha Extract RS being used.]

Resolution: NLT 1.0 between the withanolide A and withanone peaks, *Standard solution C*; NLT 3.0 between the withaferin A and coeluting withanoside V and withanoside VI peaks, *Standard solution C*

Tailing factor: NMT 1.5, withanolide A peak, *Standard solution A*

Relative standard deviation: NMT 2.0% for replicate injections, withanolide A peak, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Calculate the percentage of withanolide aglycones in the portion of Ashwagandha taken:

$$5(r_T/r_S)(C_S/W)$$

r_T = sum of the peak responses for withaferin A, withastramonolide, withanolide A, withanone, and withanolide B in the *Sample solution*

r_S = peak response for withanolide A in *Standard solution A*

C_S = concentration of USP Withanolide A RS in *Standard solution A* (mg/mL)

W = weight of Ashwagandha taken to prepare the *Sample solution* (g)

Calculate the percentage of withanolide glycosides in the portion of Ashwagandha taken:

$$5(r_T/r_S)(C_S/W)$$

r_T = sum of the peak responses for withanoside IV, withanoside V, and withanoside VI in the *Sample solution*

r_S = peak response for USP Withanoside IV in *Standard solution B*

C_S = concentration of USP Withanoside IV RS in *Standard solution B* (mg/mL)

W = weight of Ashwagandha taken to prepare the *Sample solution* (g)

Acceptance criteria: The sum of the percentages of withanolide aglycones and withanolide glycosides is NLT 0.3%, calculated on the dried basis. [NOTE—Because of inherent variations, some of the withanolides mentioned in this test may be present in minor quantities or may be totally absent. The sample will be deemed compliant if the sum of the total withanolides is NLT 0.3%.]

IMPURITIES

Inorganic Impurities

- **ARTICLES OF BOTANICAL ORIGIN,** *Acid-Insoluble Ash* ⟨**561**⟩**:** NMT 1.0%
- **HEAVY METALS,** *Method II* ⟨**231**⟩**:** NMT 20 ppm

Organic Impurities

- **PROCEDURE 1: ARTICLES OF BOTANICAL ORIGIN,** *Foreign Organic Matter* ⟨**561**⟩**:** NMT 2.0%
- **PROCEDURE 2: ARTICLES OF BOTANICAL ORIGIN,** *General Method for Pesticide Residues Analysis* ⟨**561**⟩**:** Meets the requirements

SPECIFIC TESTS

- **BOTANIC CHARACTERISTICS**

Macroscopic: Primary roots are not branched and are straight, conical, or fingerlike in shape and variable in thickness with age; some carry a crown, consisting of a number of remains of stem base; the outer surface is buff to grayish-yellow with longitudinal wrinkles; facture is short and uneven; secondary roots are thin and fibrous.

Histology

Transverse section of roots: It shows a narrow band of yellowish crumpled cork, moderate-size cortex and a wide wood. The cork cells are rectangular, radially flattened, nonlignified, and filled with starch grains and reddish brown content; cork cambium is 2–4 diffused rows of cells; secondary cortex is formed of 20–25 rows of thin-wall parenchymatous cells, filled with starch grains, and shows occasional microsphenoidal crystals of calcium oxalate; phloem consists of sieve tubes, companion cells, and phloem parenchyma; vascular cambium consists of tangentially elongated parenchymatous cells; vessels and tracheids are in radial rows toward the periphery of the wood; medullary rays are uniseriate to 2- to 3-seriate, and are filled with starch grains; scattered vessels in groups are embedded in the parenchyma; vessels have pitted and scalariform thickening, and generally the end walls are perforated; and a few fibers with thick lignified walls are also found scattered in the wood.

- **LOSS ON DRYING** ⟨**731**⟩**:** Dry 1.0 g of finely powdered Ashwagandha at 105° for 3 h: it loses NMT 12.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN,** *Total Ash* ⟨**561**⟩**:** NMT 7.0%, determined on 1.0 g of finely powdered Ashwagandha
- **ARTICLES OF BOTANICAL ORIGIN,** *Alcohol-Soluble Extractives, Method 2* ⟨**561**⟩**:** NLT 10.0%
- **MICROBIAL ENUMERATION TESTS** ⟨**2021**⟩**:** The total aerobic bacterial count does not exceed 10^5 cfu/g, the total combined molds and yeasts count does not exceed 10^3 cfu/g, and the bile-tolerant Gram-negative bacteria count does not exceed 10^3 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS** ⟨**2022**⟩**:** Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*
- **ARTICLES OF BOTANICAL ORIGIN,** *Aflatoxins* ⟨**561**⟩**:** Meets the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store at room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant contained in the article.
- **USP REFERENCE STANDARDS** ⟨**11**⟩

In-Process Revision

BRIEFING

Boswellia Serrata; Boswellia Serrata Extract. New monographs are proposed. The liquid chromatographic procedure in *Identification* test *B* and the test for *Content of Keto-Derivatives of B-Boswellic Acids* is based on analyses performed with the Alltech Prevail C18 brand of L1 column. The typical retention times observed for 11-keto-*B*-boswellic acid, 3-acetyl-11-keto-*B*-boswellic acid, *B*-boswellic acid, and 3-acetyl-*B*-boswellic acid are about 7.1, 9.6, 20.6, and 35.1 min, respectively. Similar results and shorter retention times were obtained on the Merck LiChrospher, 4.0-mm × 25-cm, 5-µm brand of L1 column.

(DSB: M. Sharaf.) RTS—C56127

Add the following:

▪Boswellia Serrata

DEFINITION

Boswellia Serrata is the oleogum resin obtained by incision or produced by spontaneuos exudation from the stem and branches of *Boswellia serrata* Roxb. (Fam. Burseraceae). It contains NLT 1.0% of the keto derivatives of *B*-boswellic acid, calculated on the dried basis as the sum of 11-keto-*B*-boswellic acid and 3-acetyl-11-keto-*B*-boswellic acid.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST ⟨201⟩**

Adsorbent: 0.25-mm layer of chromatographic silica gel

Standard solution: Treat a quantity of USP Boswellia Serrata Extract RS with gentle heating in methanol to obtain a solution having a known concentration of 30 mg/mL, cool, centrifuge, and use the supernatant.

Sample solution: Use the *Sample solution*, prepared as directed in the test for *Content of Keto-Derivatives of B-Boswellic Acids*, concentrate to 10% of the volume.

Developing solvent system: A mixture of hexane and ethyl acetate (6:4)

Dipping reagent: Prepare a solution of 10% sulfuric acid in methanol. [NOTE—Prepare fresh immediately before use.]

Application volume: 10 µL

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the samples as bands to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about 90% of the plate. Remove the plate from the chamber, dry, examine under UV light at 254 nm, dip in the *Dipping reagent*, heat for 5–10 min at 100°, and examine under visible light.

Acceptance criteria: Under UV light at 254 nm, the chromatogram of the *Sample solution* exhibits two main zones due to 11-keto-*B*-boswellic acid and 3-acetyl-11-keto-*B*-boswellic acid at R_F values of about 0.30 and 0.36, respectively, corresponding to zones in the chromatogram from the *Standard solution*. Under visible light, the chromatogram of the *Sample solution* exhibits two additional zones due to *B*-boswellic acid and 3-acetyl-*B*-boswellic acid at R_F values of about 0.49 and 0.58, respectively, corresponding to zones in the chromatogram from the *Standard solution*. Other less intense zones are observed in the chromatograms of the *Sample solution* and *Standard solution*.

- **B.** The 210-nm chromatogram of the *Sample solution*, in the test for *Content of Keto-Derivatives of B-Boswellic Acids*, exhibits peaks for 11-keto-*B*-boswellic acid, 3-acetyl-11-keto-*B*-boswellic acid, *B*-boswellic acid, and 3-acetyl-*B*-boswellic acid at retention times that correspond to those in the 210-nm chromatogram of *Standard solution B* and the 210-nm Reference Chromatogram provided with the USP Boswellia Serrata Extract RS.

COMPOSITION

- **CONTENT OF KETO-DERIVATIVES OF *B*-BOSWELLIC ACIDS**

Standard solution A: Dissolve a quantity of USP 3-acetyl-11-keto-*B*-Boswellic Acid RS in methanol to obtain a solution having a known concentration of 0.1 mg/mL.

Standard solution B: Treat a quantity of USP Boswellia Serrata Extract RS with gentle heating in methanol to obtain a solution having a known concentration of 10 mg/mL. Before injection, pass through a filter having a 0.45-µm porosity.

Sample solution: Transfer about 2.0 g of crushed Boswellia Serrata into a round-bottom flask and reflux in 50 mL of methanol in a water bath for 15 min, stirring with a magnetic stirrer. Repeat till the last extract turns colorless. Evaporate the combined extracts to about 50 mL, transfer to a 100-mL volumetric flask, and complete to volume with methanol. Before injection, pass through a filter having a 0.45-µm porosity and discard the first few mL of the filtrate.

Mobile phase: Prepare a a filtered and degassed mixture of acetonitrile, water, and glacial acetic acid (900:100:0.1). Make adjustments if necessary.

Chromatographic system

(See *Chromatography* ⟨621⟩*, System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: See the gradient table below.

Time (min)	Flow Rate (mL/min)
0	1
5	1.5
10	2
30	2
32	1
45	1

Injection size: 20 µL

System suitability

Samples: *Standard solution A* and *Standard solution B*

[NOTE—The relative retention times for 11-keto-*B*-boswellic acid and 3-acetyl-11-keto-*B*-boswellic acid are about 1.0 and 1.4, respectively.]

Suitability requirements: The chromatogram of *Standard solution B* is similar to the 254-nm Reference Chromatogram provided with the USP Boswellia Serrata Extract RS.

Relative standard deviation: NMT 2.0% of the 3-acetyl-11-keto-*B*-boswellic acid peak response in replicate injections, *Standard solution A*

Tailing factor: NMT 1.5, 11-keto-*B*-boswellic acid peak, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Using the chromatogram of *Standard solution B* and the 254-nm Reference Chromatogram provided with the lot of USP Boswellia Serrata Extract RS being used, identify the retention times of the peaks of 11-keto-*B*-boswellic acid and 3-acetyl-11-keto-*B*-boswellic acid in the *Sample solution* chromatogram.

Separately calculate the percentages of the two analytes in the portion of Boswellia Serrata taken:

$$\text{Result} = (r_U/r_S) \times (C_S/W) \times 10F$$

r_U = peak area of each analyte in the *Sample solution*

r_S = peak area of 3-acetyl-11-keto-*B*-boswellic acid in *Standard solution A*

In-Process Revision

C_S = concentration of USP 3-Acetyl-11-keto-*B*-Boswellic Acid RS in *Standard solution A* (mg/mL)
W = weight of Boswellia Serrata taken to prepare the *Sample solution* (g)
F = conversion factor for each analyte (0.93 for 11-keto-*B*-boswellic acid and 1.0 for 3-acetyl-11-keto-*B*-boswellic acid)

Acceptance criteria: Add the percentages calculated for 11-keto-*B*-boswellic acid and 3-acetyl-11-keto-*B*-boswellic acid: NLT 1.0% is found, on the dried basis.

IMPURITIES

Inorganic Impurities

- **PROCEDURE 1: ARTICLES OF BOTANICAL ORIGIN,** *Acid-insoluble Ash* ⟨**561**⟩**:** NMT 0.5%
- **PROCEDURE 2: HEAVY METALS,** *Method II* ⟨**231**⟩**:** NMT 20 ppm

Organic Impurities

- **PROCEDURE 1: ARTICLES OF BOTANICAL ORIGIN,** *Foreign Organic Matters* ⟨**561**⟩**:** NMT 2.0%
- **PROCEDURE 2: ARTICLES OF BOTANICAL ORIGIN,** *General Method for Pesticide Residues Analysis* ⟨**561**⟩**:** Meets the requirements

SPECIFIC TESTS

- **BOTANIC CHARACTERISTICS**
  Macroscopic: It occurs as small ovoid tears, sometimes form agglomerated masses up to 5-cm long and 2-cm thick; whitish to golden yellow; fracture is brittle, fractured surface is waxy and translucent; characteristic aromatic odor, and an aromatic, slightly mucilagenous taste.
- **LOSS ON DRYING** ⟨**731**⟩**:** Dry 1.0 g of finely powdered Boswellia Serrata at 105° for 2 h: it loses NMT 12.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN,** *Total Ash* ⟨**561**⟩**:** NMT 2.0%, determined on 2.0 g of finely powdered Boswellia Serrata
- **ARTICLES OF BOTANICAL ORIGIN,** *Alcohol-soluble Extractives, Method 2* ⟨**561**⟩**:** NLT 56%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light and moisture, and store in a cool place.
- **LABELING:** The label states the Latin binomial of the species of *Boswellia* from which the oleogum resin was obtained.
- **USP REFERENCE STANDARDS** ⟨**11**⟩
  USP 3-Acetyl-11-keto-*B*-Boswellic Acid RS
  USP Boswellia Serrata Extract RS■2S *(USP33)*

BRIEFING

Boswellia Serrata Extract. See briefing under *Boswellia Serrata*.

(DSB: M. Sharaf.) RTS—C40936

Add the following:

■Boswellia Serrata Extract

DEFINITION

Boswellia Serrata Extract is prepared from pulverized Boswellia Serrata using suitable solvents such as isopropanol, alcohol, methanol, hexanes, or mixtures of these solvents. The ratio of starting plant material to Extract is approximately 6:1. It contains NLT 90.0% and NMT 110.0% of the labeled amount of Extract, calculated, on the dried basis, as the sum of 11-keto-*B*-boswellic acid and 3-acetyl-11-keto-*B*-boswellic acid; it may contain suitable added substances.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** ⟨**201**⟩
  Adsorbent: 0.25-mm layer of chromatographic silica gel
  Standard solution: Treat a quantity of USP Boswellia Serrata Extract RS with gentle heating in methanol to obtain a solution having a known concentration of 30 mg/mL, cool, centrifuge, and use the supernatant.
  Sample solution: Treat a quantity of Extract with gentle heating in methanol to obtain a solution having a known concentration of 30 mg/mL, cool, centrifuge, and use the supernatant.
  Developing solvent system: A mixture of hexane and ethyl acetate (6:4)
  Dipping reagent: Prepare a solution of 10% sulfuric acid in methanol. [NOTE—Prepare fresh immediately before use.]
  Application volume: 10 µL
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Apply the samples as bands to a suitable thin-layer chromatographic plate (see *Chromatography* ⟨621⟩). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about 90% of the plate. Remove the plate from the chamber, dry, examine under UV light at 254 nm, dip in the *Dipping reagent*, heat for 5–10 min at 100°, and examine under visible light.
  Acceptance criteria: Under UV light at 254 nm, the chromatogram of the *Sample solution* exhibits two main zones due to 11-keto-*B*-boswellic acid and 3-acetyl-11-keto-*B*-boswellic acid at R_F values of about 0.30 and 0.36, respectively, corresponding to zones in the chromatogram from the *Standard solution*. Under visible light, the chromatogram of the *Sample solution* exhibits two additional zones due to *B*-boswellic acid and 3-acetyl-*B*-boswellic acid at R_F values of about 0.49 and 0.58, respectively, corresponding to zones in the chromatogram from the *Standard solution*. BRIEFING

Crypthecodinium Cohnii Oil. Because there is no existing *USP* monograph for this article, the following new monograph is being proposed. The *Content of DHA* is conducted using the same chromatographic procedure described in the section *Omega-3 Fatty Acids Determination and Profile* in the *USP* general test chapter *Fats and Fixed Oils* ⟨401⟩ that has been published in the *First Supplement* to *USP 32–NF 27* to become official on August 1, 2009.

(DSN: C. Phinney.) RTS—C55685

Add the following:

■Crypthecodinium Cohnii Oil

DEFINITION
Crypthecodinium Cohnii Oil is obtained from the fermentation and extraction of algae of the species *Crypthecodinium cohnii* and contains NLT 40.0% (w/w) of docosahexaenoic acid (DHA, $C_{22}H_{32}O_2$) (C22: 6 n-3), as the only significant polyunsaturated fatty acid present. Suitable antioxidants in appropriate concentration may be added.

IDENTIFICATION
• **FATTY ACID PROFILE:** Proceed as directed in the test for *Content of DHA*.
Analysis: Determine the peak area for all peaks with retention times longer than that of methyl laurate.
Acceptance criteria: The retention time of the peaks of the docosahexaenoic acid methyl ester and the eicosapentanoic acid methyl ester from the *Test Solution* corresponds to that from *Standard Solution 2*, as obtained in the test for *Content of EPA and DHA*. The area percent for the methyl esters of the fatty acids from the *Test Solution* in the test for *Content of EPA and DHA* meet the requirements for each fatty acid indicated in the table below.

Fatty Acid	Shorthand Notation	Lower Limit (area %)	Upper Limit (area %)
Polyunsaturated fatty acids			
Linoleic acid	18:2 n-6	0	1.0
Eicosapentanoic acid	20:5 n-3	0	0.1
Docosapentaenoic acid	22:5 n-6	0	0.1
Docosahexanoic acid	22:6 n-3	39.0	47.0

In-Process Revision

COMPOSITION

• **CONTENT OF DHA**

Analysis: Proceed as directed in *Fats and Fixed Oils* ⟨401⟩, *Omega-3 Fatty Acids Determination and Profile*.

Acceptance criteria: NLT 40.0% docosahexaenoic acid (DHA)

IMPURITIES

Inorganic Impurities

• **LIMIT OF ARSENIC**

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytef, and plastic vessels before use, employ water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of arsenic as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytef, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solution A: Transfer 1 g of ultrapure palladium metal into a Teflon beaker. Add 20 mL of water and 10 mL of nitric acid, and warm on a hot plate to dissolve. Allow the solution to cool to room temperature, transfer it into a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution B: Transfer 1 g of ultrapure magnesium nitrate into a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it into a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% nitric acid (3:2:5). A volume of 5 µL provides 0.015 mg of palladium and 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (1:19)

Standard stock solution: Transfer 10.0 mL of *Standard Arsenic Solution*, prepared as directed under *Arsenic* ⟨211⟩, to a 100-mL volumetric flask, add 40 mL of water and 5 mL of nitric acid, and dilute with water to volume. This solution contains 0.10 µg/mL of arsenic.

Standard solutions: Dilute the *Standard stock solution* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 µg/mL of arsenic.

Sample solution: For preparation of the *Sample solution*, use a microwave oven with a magnetron frequency of 2455 MHz and a selectable output power of 0–950 watts in 1% increments, equipped with advanced composite vessels with 100-mL polytef liners. Use rupture membranes to vent vessels should the pressure exceed 125 psi. The vessels fit into a turntable, and each vessel can be vented into an overflow container. Equip the microwave oven with an exhaust tube to ventilate fumes. [**CAUTION—**Wear proper eye protection and protective clothing and gloves.] Transfer approximately 500 mg of Crypthecodinium Cohnii Oil, weighed to the nearest 0.1 mg, into a Teflon digestion vessel liner. Prepare samples in duplicate. Add 15 mL of nitric acid, and swirl gently. Cover the vessels with lids, leaving the vent fitting off. Predigest overnight under a hood. Place the rupture membrane in the vent fitting, and tighten the lid. Place all vessels on the microwave oven turntable. Connect the vent tubes to the vent trap, and connect the pressure-sensing line to the appropriate vessel. Initiate a two-stage digestion procedure by heating the microwave at 15% power for 15 min, followed by 25% power for 45 min. Remove the turntable of vessels from the oven, and allow the vessels to cool to room temperature. [NOTE—A cool water bath may be used to speed the cooling process.] Vent the vessels when they reach room temperature. Remove the lids, and slowly add 2 mL of 30% hydrogen peroxide to each. Allow the reactions to subside, and seal the vessels. Return the vessels on the turntable to the microwave oven, and heat for an additional 15 min at 30% power. Remove the vessels from the oven, and allow them to cool to room temperature. Transfer the cooled digests into 25-mL volumetric flasks, and dilute with water to volume.

Analysis: Program the graphite furnace as follows. Dry at 115°, using a 1-s ramp, a 65-s hold, and an argon flow of 300 mL/min; char the sample at 1000°, using a 1-s ramp, a 20-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2400°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 µL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 µL of *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for arsenic. Determine the peak area at the arsenic emission line at 193.7 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of arsenic, in µg/mL, and calculate the regression line best fitting the points. Determine the concentration, C, in µg/mL, of arsenic in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of arsenic in the portion of Crypthecodinium Cohnii Oil taken:

$$\text{Result} = 25 \times (C/W)$$

C = concentration as obtained above
W = weight of Crypthecodinium Cohnii Oil taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

• **LIMIT OF LEAD**

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytef, and plastic vessels before use, employ water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytef, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solution A: 10 g of ultrapure monobasic ammonium phosphate in 1 mL of nitric acid and 40 mL of water to dissolve the phosphate. Dilute with deionized water to 100 mL.

Solution B: 1 g of ultrapure magnesium nitrate, to a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% nitric acid (2:1:2). A volume of 5 µL provides 0.2 mg of phosphate plus 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (1:19)

Standard stock solution: Transfer 10.0 mL of *Lead Nitrate Stock Solution*, prepared as directed under *Heavy Metals* ⟨231⟩, to a 100-mL volumetric flask, add 40 mL of water and 5 mL of nitric acid, and dilute with water to volume. Transfer 1.0 mL of this solution to a second 100-mL volumetric flask, add 50 mL of water and 1 mL of nitric acid, and dilute with water to volume. This solution contains 0.10 µg/mL of lead.

Standard solutions: Dilute the *Standard stock solution* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 µg/mL of lead.

Sample solution: Prepare as directed for *Sample solution* in the test for *Limit of Arsenic*.

Analysis: Program the graphite furnace as follows. Dry at 120°, using a 1-s ramp, a 55-s hold, and an argon flow of 300 mL/min; char the sample at 850°, using a 1-s ramp, a 30-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2100°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 µL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 µL of *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for lead. Determine the peak area at the lead emission line at

283.3 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of lead, in µg/mL, and calculate the regression line best fitting the points. Determine the concentration, C, in µg/mL, of lead in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of lead in the portion of Crypthecodinium Cohnii Oil taken:

$$\text{Result} = 25 \times (C/W)$$

C = concentration, as obtained above
W = weight of Crypthecodinium Cohnii Oil taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

- **LIMIT OF CADMIUM**

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytef, and plastic vessels before use, employ water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of cadmium as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytef, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solution A: 10 g of ultrapure monobasic ammonium phosphate in 40 mL of water and 1 mL of nitric acid to dissolve the phosphate. Dilute with deionized water to 100 mL.

Solution B: Transfer 1 g of ultrapure magnesium nitrate to a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% nitric acid to volume (2:1:2). A volume of 5 µL provides 0.2 mg of phosphate and 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (1:19)

Standard stock solution A: 0.1372 mg/mL of cadmium nitrate

Standard stock solution B: *Standard stock solution A*, nitric acid, and water (2:1:97). This solution contains 0.10 µg/mL of cadmium.

[NOTE—Before make up to final volume dissolve in a portion of water and nitric acid.]

Standard solutions: Dilute *Standard stock solution B* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 µg/mL of cadmium.

Sample solution: Prepare as directed for the *Sample solution* in the test for *Limit of Arsenic.*

Analysis: Program the graphite furnace as follows. Dry at 120°, using a 1-s ramp, a 55-s hold, and an argon flow of 300 mL/min; char the sample at 850°, using a 1-s ramp, a 30-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2400°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 µL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 µL of *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for cadmium. Determine the peak area at the cadmium emission line at 228.8 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of cadmium, in µg/mL, and calculate the regression line best fitting the points. Determine the concentration, C, in µg/mL, of cadmium in each mL of the *Sample solution* by interpolation from the regression line. Calculate the content of cadmium in the Crypthecodinium Cohnii Oil taken:

$$\text{Result} = 25 \times (C/W)$$

C = concentration, as obtained above
W = weight of Crypthecodinium Cohnii Oil taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

- **LIMIT OF MERCURY:** Proceed as directed under *Mercury* ⟨261⟩, *Method IIa*, except to use a *Standard Mercury Solution* having the equivalent of 0.1 µg/mL of mercury.

Sample solution: Prepare as directed for the *Sample solution* in the test for *Limit of Arsenic* combining the two duplicate cooled digests into 1.0 mL of *Potassium Permanganate Solution.*

Acceptance criteria: NMT 0.1 µg/g

SPECIFIC TESTS

- **FATS AND FIXED OILS,** *Anisidine Value* ⟨**401**⟩**:** NMT 20.0
- **FATS AND FIXED OILS,** *Acid Value (Free Fatty Acids)* ⟨**401**⟩**:** The free fatty acids in 10 g require for neutralization NMT 1.42 mL of 0.1 N sodium hydroxide.
- **FATS AND FIXED OILS,** *Peroxide Value* ⟨**401**⟩**:** NMT 5.0
- **FATS AND FIXED OILS,** *Total Oxidation Value (TOTOX)* ⟨**401**⟩**:** NMT 26, calculated:

$$\text{Result} = (2 \times PV) + AV$$

PV = peroxide value
AV = anisidine value

- **FATS AND FIXED OILS,** *Unsaponifiable Matter* ⟨**401**⟩**:** NMT 3.5%
- **SPECIFIC GRAVITY** ⟨**841**⟩**:** 0.91–0.93

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and avoid exposure to excessive heat.
- **LABELING:** The label states the content of docosahexaenoic acid in mg/g. It also states the name and concentration of any added antioxidant.

USP Docosahexaenoic Acid Ethyl Ester RS
USP Eicosapentaenoic Acid Ethyl Ester RS
USP Methyl Tricosanoate RS■2S *(USP33)*

BRIEFING

Schizochytrium Oil. Because there is no existing *USP* monograph for this dietary supplement ingredient, a new monograph is being proposed. The test for the *Content of DHA* references the gas chromatographic procedure described under USP general test chapter *Fats and Fixed Oils* ⟨401⟩, *Omega-3 Fatty Acids Determination and Profile* that has been published on page 3941 of the *First Supplement* to *USP 32*, to become official on August 1, 2009.

(DSN: C. Phinney.) RTS—C55687

Add the following:

■Schizochytrium Oil

DEFINITION

Schizochytrium Oil is obtained by fermentation and extraction of algae of the genus *Schizochytrium* and contains NLT 30.0% (w/w) of docosahexaenoic acid (DHA, $C_{22}H_{32}O_2$) (C22:6 n–3), as the main polyunsaturated fatty acid. Suitable antioxidants in appropriate concentration may be added.

In-Process Revision

IDENTIFICATION

• **LONG CHAIN UNSATURATED FATTY ACID PROFILE**

Analysis: Proceed as directed in *Composition*, *Content of DHA*. Determine the peak areas of all the peaks corresponding to fatty acids with retention times longer than that of lauric acid methyl ester.

Acceptance criteria: The retention times of the peaks of the docosahexaenoic acid methyl ester and the eicosapentanoic acid methyl ester of the *Test Solution* correspond to those of *Standard Solution 2*, as obtained in the test for the *Content of EPA and DHA* under *Fats and Fixed Oils* ⟨401⟩*, Omega-3 Fatty Acids Determination and Profile*. The area percentage for the methyl esters of the fatty acids from the chromatograph of the *Test Solution* in the test for the *Content of EPA and DHA* meet the requirements for each fatty acid indicated in the table below.

Fatty Acid	Shorthand Notation	Lower Limit (Area %)	Upper Limit (Area %)
Dihomo-gamma-linolenic acid	20:3 n–6	1.7	2.8
Arachidonic acid	20:4 n–6	0.6	1.3
Eicosapentaenoic acid (EPA)	20:5 n–3	1.3	3.9
Docosapentaenoic acid (DPA n–6)	22:5 n–6	10.5	16.5
Docosahexanoic acid (DHA)	22:6 n–3	30.0	40.0

COMPOSITION

• **CONTENT OF DHA**

Analysis: Proceed as directed under *Fats and Fixed Oils* ⟨401⟩*, Omega-3 Fatty Acids Determination and Profile*.

Acceptance criteria: NLT 30.0% docosahexaenoic acid (DHA)

IMPURITIES

Inorganic Impurities

• **LIMIT OF ARSENIC**

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytef, and plastic vessels before use, employ water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of arsenic as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytef, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solution A: Transfer 1 g of ultrapure palladium metal to a Teflon beaker. Add 20 mL of water and 10 mL of nitric acid, and warm on a hot plate to dissolve. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution B: Transfer 1 g of ultrapure magnesium nitrate to a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% nitric acid (3:2:5). A volume of 5 µL provides 0.015 mg of palladium and 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (1:19)

Standard stock solution: Transfer 10.0 mL of *Standard Arsenic Solution*, prepared as directed under *Arsenic* ⟨211⟩, to a 100-mL volumetric flask, add 40 mL of water and 5 mL of nitric acid, and dilute with water to volume. This solution contains 0.10 µg/mL of arsenic.

Standard solutions: Dilute the *Standard stock solution* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 µg/mL of arsenic.

Sample solution: For preparation of the *Sample solution*, use a microwave oven with a magnetron frequency of 2455 MHz and a selectable output power of 0–950 watts in 1% increments, equipped with advanced composite vessels with 100-mL polytef liners. Use rupture membranes to vent vessels should the pressure exceed 125 psi. The vessels fit into a turntable, and each vessel can be vented into an overflow container. Equip the microwave oven with an exhaust tube to ventilate fumes. [**CAUTION—**Wear proper eye protection and protective clothing and gloves.] Transfer approximately 500 mg of Schizochytrium Oil, weighed to the nearest 0.1 mg, to a Teflon digestion vessel liner. Prepare samples in duplicate. Add 15 mL of nitric acid, and swirl gently. Cover the vessels with lids, leaving the vent fitting off. Predigest overnight under a hood. Place the rupture membrane in the vent fitting, and tighten the lid. Place all vessels on the microwave oven turntable. Connect the vent tubes to the vent trap, and connect the pressure-sensing line to the appropriate vessel. Initiate a two-stage digestion procedure by heating the microwave at 15% power for 15 min, followed by 25% power for 45 min. Remove the turntable of vessels from the oven, and allow the vessels to cool to room temperature. [NOTE—A cool water bath may be used to speed the cooling process.] Vent the vessels when they reach room temperature. Remove the lids, and slowly add 2 mL of 30% hydrogen peroxide to each. Allow the reactions to subside, and seal the vessels. Return the vessels on the turntable to the microwave oven, and heat for an additional 15 min at 30% power. Remove the vessels from the oven, and allow them to cool to room temperature. Transfer the cooled digests to 25-mL volumetric flasks, and dilute with water to volume.

Analysis: Program the graphite furnace as follows. Dry at 115°, using a 1-s ramp, a 65-s hold, and an argon flow of 300 mL/min; char the sample at 1000°, using a 1-s ramp, a 20-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2400°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 µL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 µL of *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for arsenic. Determine the peak area at the arsenic emission line at 193.7 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of arsenic, in µg/mL, and calculate the regression line best fitting the points. Determine the concentration, C, in µg/mL, of arsenic in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of arsenic in the portion of Schizochytrium Oil taken:

$$\text{Result} = 25 \times (C/W)$$

C = concentration as obtained above
W = weight of Schizochytrium Oil taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

• **LIMIT OF LEAD**

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytef, and plastic vessels before use, employ water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytef, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solution A: 10 g of ultrapure monobasic ammonium phosphate in 1 mL of nitric acid and 40 mL of water to dissolve the phosphate. Dilute with deionized water to 100 mL.

Solution B: Transfer 1 g of ultrapure magnesium nitrate to a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the

solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% nitric acid (2:1:2). A volume of 5 µL provides 0.2 mg of phosphate plus 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (1:19)

Standard stock solution: Transfer 10.0 mL of *Lead Nitrate Stock Solution*, prepared as directed under *Heavy Metals* ⟨231⟩, to a 100-mL volumetric flask, add 40 mL of water and 5 mL of nitric acid, and dilute with water to volume. Transfer 1.0 mL of this solution to a second 100-mL volumetric flask, add 50 mL of water and 1 mL of nitric acid, and dilute with water to volume. This solution contains 0.10 µg/mL of lead.

Standard solutions: Dilute the *Standard stock solution* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 µg/mL of lead.

Sample solution: Prepare as directed for *Sample solution* in the test for *Limit of Arsenic.*

Analysis: Program the graphite furnace as follows. Dry at 120°, using a 1-s ramp, a 55-s hold, and an argon flow of 300 mL/min; char the sample at 850°, using a 1-s ramp, a 30-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2100°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 µL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 µL of *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for lead. Determine the peak area at the lead emission line at 283.3 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of lead, in µg/mL, and calculate the regression line best fitting the points. Determine the concentration, C, in µg/mL, of lead in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of lead in the portion of Schizochytrium Oil taken:

$$\text{Result} = 25 \times (C/W)$$

C = concentration, as obtained above
W = weight of Schizochytrium Oil taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

- **LIMIT OF CADMIUM**

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glass, polytef, and plastic vessels before use, employ water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of cadmium as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytef, and plastic vessels before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solution A: 10 g of ultrapure monobasic ammonium phosphate in 40 mL of water and 1 mL of nitric acid to dissolve the phosphate. Dilute with deionized water to 100 mL.

Solution B: Transfer 1 g of ultrapure magnesium nitrate to a Teflon beaker. Add 40 mL of water and 1 mL of nitric acid, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A, Solution B*, and 2% nitric acid to volume (2:1:2). A volume of 5 µL provides 0.2 mg of phosphate and 0.01 mg of magnesium nitrate.

Blank: Nitric acid and water (1:19)

Standard stock solution A: 0.1372 mg/mL of cadmium nitrate

Standard stock solution B: *Standard stock solution A*, nitric acid, and water (2:1:97). This solution contains 0.10 µg/mL of cadmium. [NOTE—Before make up to final volume dissolve in a portion of water and nitric acid.]

Standard solutions: Dilute *Standard stock solution B* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 µg/mL of cadmium.

Sample solution: Prepare as directed for *Sample solution* in the test for *Limit of Arsenic.*

Analysis: Program the graphite furnace as follows. Dry at 120°, using a 1-s ramp, a 55-s hold, and an argon flow of 300 mL/min; char the sample at 850°, using a 1-s ramp, a 30-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2400°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 µL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 µL of *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for cadmium. Determine the peak area at the cadmium emission line at 228.8 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of cadmium, in µg/mL, and calculate the regression line best fitting the points. Determine the concentration, C, in µg/mL, of cadmium in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of cadmium in the portion of Schizochytrium Oil taken:

$$\text{Result} = 25 \times (C/W)$$

C = concentration, as obtained above
W = weight of Schizochytrium Oil taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

- **LIMIT OF MERCURY**

Sample solution: Prepare as directed for the *Sample solution* in the test for *Limit of Arsenic*, combining the two duplicate cooled digests into 1.0 mL of *Potassium Permanganate Solution* (see *Reagents* under *Mercury* ⟨261⟩, *Method IIa*).

Analysis: Proceed as directed under *Mercury* ⟨261⟩, *Method IIa*, except to use a *Standard Mercury Solution* having the equivalent of 0.1 µg/mL of mercury.

Acceptance criteria: NMT 0.1 µg/g

SPECIFIC TESTS

- **FATS AND FIXED OILS,** *Anisidine Value* ⟨**401**⟩**:** NMT 20.0
- **FATS AND FIXED OILS,** *Free Fatty Acids* ⟨**401**⟩**:** The free fatty acids in 10 g require NMT 1.42 mL of 0.1 N sodium hydroxide for neutralization.

MONOGRAPHS (NF)

BRIEFING

Amylene Hydrate. *NF 27* page 1166. On the basis of comments received, it is proposed to replace *Identification* test *A, Identification Tests—General, Acetate* ⟨191⟩ and *Identification* test *B* with a more definitive infrared absorption test. The existing *Identification* test *C* will be renamed *Identification* test *B*.

(EM1: R. Lafaver.) RTS—C63260

Amylene Hydrate

$C_5H_{12}O$ 88.15
2-Butanol, 2-methyl-;
tert-Pentyl alcohol [75-85-4].

DEFINITION
Amylene Hydrate contains NLT 99.0% and NMT 100.0% of $C_5H_{12}O$.

IDENTIFICATION

Change to read:

• **A. ~~IDENTIFICATION TESTS—GENERAL,~~** *Acetate* ⟨**~~191~~**⟩
~~Sample:~~ ~~2 mL~~
~~Analysis:~~ ~~Mix the *Sample* with 15 mL of water, 5 mL of sulfuric acid, and 10 g of potassium dichromate. Heat the mixture under a reflux condenser for 2 h, and then distill, collecting and reserving the first 2 mL of the distillate. Continue the distillation until most of the water has distilled over, render this distillate alkaline with 1 N sodium hydroxide, add 2 N sulfuric acid dropwise until the solution is neutral to litmus, and carefully evaporate to dryness.~~
~~Acceptance criteria:~~ ~~Meets the requirements~~
■*Infrared Absorption* ⟨197F⟩■2S (*NF28*)

Change to read:

• **B. PROCEDURE**
~~Sample:~~ ~~1 mL of the reserved distillate obtained in *Identification* test *A*~~
~~Analysis:~~ ~~To the *Sample* add 5 drops of sodium nitroferricyanide TS and 2 mL of 1 N sodium hydroxide, then add a slight excess of 6 N acetic acid.~~
~~Acceptance criteria:~~ ~~A deep red liquid, which develops a violet tint when diluted with several volumes of water, is produced.~~
■**Sample solution:** 1 in 10
Analysis: To 10 mL of *Sample solution* quickly add 5 mL of a 1-in-100 solution of vanillin in sulfuric acid.
Acceptance criteria: A violet-red color is produced.■2S (*NF28*)

Delete the following:

■• ~~**C. PROCEDURE**~~
~~**Sample solution:** 1 in 10~~
~~**Analysis:** To 10 mL of *Sample solution* quickly add 5 mL of a 1-in-100 solution of vanillin in sulfuric acid.~~
~~**Acceptance criteria:** A violet-red color is produced.~~ ■2S (*NF28*)

ASSAY
• **PROCEDURE**
Sample solution: Amylene Hydrate
Chromatographic system
Mode: GC
Detector: Thermal conductivity
Column: 4-mm × 2-cm glass column; packed with chromatographic support S2 (under typical conditions)
Temperature
Column: 190°
Injection port: 200°
Detector block: 200°
Carrier gas: Helium
Flow rate: 50 mL/min
Injection size: 0.4 µL
Analysis
Samples: *Sample solution*
From the area under the curve, calculate the percentage (a/a) of $C_5H_{12}O$ in the Amylene Hydrate taken.
Acceptance criteria: 99.0%–100.0%

IMPURITIES
Inorganic Impurities
• **LIMIT OF NONVOLATILE RESIDUE**
Sample: 10 mL
Analysis: Evaporate the *Sample* in a tared porcelain dish on a steam bath to a volume of about 1 mL, and allow it to evaporate spontaneously to dryness while protected from dust.
Acceptance criteria: The residue, if any, is colorless, and when dried at 105° for 1 h, weighs NMT 2 mg (0.02%).
• **HEAVY METALS,** *Method I* ⟨**231**⟩
Sample solution: Evaporate 5.0 mL (4 g) on a steam bath to dryness, warm the residue gently with 1 mL of dilute hydrochloric acid (1 in 120), add water to make 25 mL, and filter, if necessary.
Acceptance criteria: NMT 5 ppm
Organic Impurities
• **PROCEDURE**
Sample solution: 1 in 20
Analysis: To 10 mL of *Sample solution* add 0.10 mL of 0.10 N potassium permanganate.
Acceptance criteria: The pink color does not completely disappear within 10 min.

SPECIFIC TESTS
• **SPECIFIC GRAVITY** ⟨**841**⟩**:** 0.803–0.807
• **DISTILLING RANGE,** *Method I* ⟨**721**⟩**:** It distills completely between 97° and 103°, a correction factor of 0.037°/mm being applied as necessary.
• **WATER:** The relative retention time of water on the gas chromatographic column used in the *Assay* is approximately 0.2 times that of Amylene Hydrate. From the area under the curve obtained in the *Assay,* calculate the percentage (a/a) of water in the Amylene Hydrate taken: NMT 0.5% is found.
• **ALDEHYDE**
Sample solution: 1 in 20
Analysis: To 10 mL of *Sample solution* add 1 mL of silver-ammonium nitrate TS, and heat the mixture on a water bath at 60° for 10 min.

Acceptance criteria: No darkening occurs.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight containers.

BRIEFING

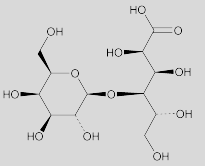
Lactobionic Acid. Because there is no existing *NF* monograph for this excipient, a new monograph, based on the monograph appearing in the *European Pharmacopoeia* 6.3, is being proposed. Interested parties are encouraged to comment on the proposal.

(EM1: R. Lafaver. NOM: A. Wilk.) RTS—C65791

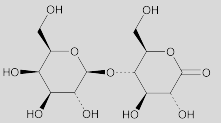
Add the following:

▪Lactobionic Acid

$C_{12}H_{22}O_{12}$ (acid form) 358.3
[96-82-2].



$C_{12}H_{20}O_{11}$ (δ-lactone) 340.3
[5965-65-1].



4-*O*-β-galactopyranosyl-D-gluconic acid.

DEFINITION
Lactobionic Acid is a mixture in variable proportions of 4-*O*-β-D-galactopyranosyl-D-gluconic acid and 4-*O*-β-D-galactopyranosyl-D-glucono-1,5-lactone. It contains NLT 98.0% and NMT 102.0%, on the anhydrous basis.

IDENTIFICATION
- **A. INFRARED ABSORPTION ⟨197K⟩:** [NOTE—If the spectra obtained show differences, dissolve the test substance and USP Lactobionic Acid RS separately in water, dry at 105°, and record new spectra using the residues.]
- **B. THIN-LAYER CHROMATOGRAPHY ⟨621⟩**
  Adsorbent: Chromatographic silica gel mixture with an average particle size of 10–15 µm (TLC plates)
  Sample solution: 10 mg/mL of Lactobionic Acid
  Standard solution: 10 mg/mL of USP Lactobionic Acid RS
  Developing solvent: Methanol, ethyl acetate, ammonium hydroxide, water (2:1:1:1)
  Application volume: 5 µL
  Spray reagent: Slowly add 10 mL of sulfuric acid to about 40 mL of water. Mix, and allow to cool. Dilute with water to 100 mL, and mix. Add 2.5 g of ammonium molybdate and 1 g of ceric sulfate, and shake for 15 min to dissolve.
  Analysis: Develop the chromatograms until the solvent front has moved about three-fourths the length of the plate, and allow to dry. Spray the plate with *Spray reagent*, and allow to dry. Repeat two more times, heat at 110° for 15 min, and examine.
  Acceptance criteria: The principal spot from the *Sample solution* is similar in position and color to the principal spot from the *Standard solution*.

ASSAY
- **PROCEDURE**
  Sample solution: Dissolve 0.350 g of Lactobionic Acid in 50 mL of carbon dioxide-free water, previously heated to 30°.
  Analysis: Immediately titrate with 0.1 M sodium hydroxide and determine the two equivalence points potentiometrically. Calculate the percentage of lactobionic acid in the portion of Lactobionic Acid taken:

$$\text{Result} = V_1 + (V_2 - V_1)$$

V_1 = 1 mL of 0.1 M sodium hydroxide, equivalent to 35.83 mg of $C_{12}H_{22}O_{12}$ (corresponds to the acid form of lactobionic acid)
V_2 = 1 mL of 0.1 M sodium hydroxide, equivalent to 34.03 mg of $C_{12}H_{20}O_{11}$ (corresponds to the δ-lactone form)

  Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES
Inorganic Impurities
- **HEAVY METALS ⟨231⟩**
  Thioacetamide reagent: To 0.2 mL of thioacetamide TS, add 1 mL of a mixture of 5 mL of water, 15 mL of 1 M sodium hydroxide, and 20 mL of glycerin. Heat in a water bath for 20 s. [NOTE—Prepare immediately before use.]
  Lead nitrate stock solution: Prepare as directed for *Special Reagents* under *Heavy Metals*.
  Standard lead solution: On the day of use, dilute 2.0 mL of *Lead nitrate stock solution* (10 ppm Pb) in water to 30 mL.
  Sample solution: Dissolve 1 g of Lactobionic Acid in water to 30 mL.
  Prepare the filtration apparatus by adapting the barrel of a 50-mL syringe without its piston to a support containing, on the plate, a membrane filter (pore size 3 µm) and above it a prefilter.
  Transfer the *Sample solution* into the syringe barrel, put the piston in place, and then apply an even pressure on it until the whole of the liquid has been filtered. When opening the support and removing the prefilter, check that the membrane filter remains uncontaminated with impurities. If this is not the case replace it with another membrane filter and repeat the operation under the same conditions.
  Analysis: To the prefiltrate, add 2 mL of *pH 3.5 Acetate Buffer*. Mix, and add 1.2 mL of thioacetamide reagent. Mix immediately and allow to stand for 10 min, and again filter as described above, but inverting the order of the filters, the liquid passing first through the membrane filter before passing through the prefilter. The filtration must be carried out slowly and uniformly by applying moderate and constant pressure to the piston of the syringe. After complete filtration, open the support, remove the membrane filter, and dry using filter paper. In parallel, treat the reference solution in the same manner as the *Sample solution.*
  Acceptance criteria: The color of the spot from the *Sample solution* is not more intense than that from the reference solution (NMT 20 ppm).

SPECIFIC TESTS
- **WATER DETERMINATION,** *Method Ia* **⟨921⟩**
  Sample solution: 0.50 g in a mixture of methanol and formamide (2:1)
  Acceptance criteria: NMT 5.0%
- **APPEARANCE OF SOLUTION**
  Sample solution: 120 mg/mL of Lactobionic Acid
  Standard stock solution: Pipet 24.0 mL of ferric chloride CS and 6.0 mL of cobaltous chloride CS into a 100-mL volumetric flask. Dilute with 1% (w/v) hydrochloric acid to volume.

In-Process Revision

Reference solution: Pipet 12.5 mL of *Standard stock solution* into a 100-mL volumetric flask. Dilute with 1% (w/v) hydrochloric acid to volume.
Acceptance criteria: The solution is clear and not more intensely colored than the *Reference solution*.

- **OPTICAL ROTATION** ⟨**781S**⟩
Sample solution: 10 mg/mL of Lactobionic Acid. Allow to stand for 24 h.
Acceptance criteria: +23.0° to +29.0° (anhydrous substance)
- **REDUCING SUGARS**
Dissolve 5.0 g of Lactobionic Acid in 25 mL of water with the aid of gentle heat. Cool, and add 20 mL of cupric citrate TS and a few glass beads. Heat so that boiling begins after 4 min, and maintain boiling for 3 min. Cool rapidly, and add 100 mL of a 2.4% solution of glacial acetic acid and 20.0 mL of 0.025 M iodine VS.
Analysis: With continuous shaking, add 25 mL of a mixture of 6 mL of hydrochloric acid and 94 mL of water and, when the precipitate has dissolved, titrate the excess of iodine with 0.05 M sodium thiosulfate VS using 1 mL of starch TS, added towards the end of the titration, as an indicator.
Acceptance criteria: NLT 12.8 mL of 0.05 M sodium thiosulfate VS is required, corresponding to NMT 0.2% of reducing sugars, as glucose.
- **ARTICLES OF BOTANICAL ORIGIN,** *Total Ash* ⟨**561**⟩**:** NMT 0.2%

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** ⟨**11**⟩
USP Lactobionic Acid RS■2S *(NF28)*

BRIEFING

Methacrylic Acid Copolymer, *NF* 27 page 1279. On the basis of comments and data received, the proposed revision in *PF* 33(6) has been cancelled; and this monograph is being split into two individual monographs, which are proposed elsewhere in this issue of *PF*:
- *Methacrylic Acid and Methyl Methacrylate Copolymer*
- *Methacrylic Acid and Ethyl Acrylate Copolymer*

The newly proposed *Methacrylic Acid and Methyl Methacrylate Copolymer* monograph contains the procedures and limits outlined for Methacrylic Acid Copolymer Types A and B. The newly proposed *Methacrylic Acid and Ethyl Acrylate Copolymer* monograph contains the procedures and limits outlined for Methacrylic Acid Copolymer Type C.

The two new monographs are proposed for inclusion in the *Second Supplement* to *USP* 33-*NF* 28, with an official date of December 1, 2010. However, use of the names (1) Methacrylic Acid and Methyl Methacrylate Copolymer and (2) Methacrylic Acid and Ethyl Acrylate Copolymer will be permitted as of December 1, 2010, but their use will not be mandatory until December 1, 2015. The 60-month extension will provide the time deemed necessary for labeling changes to be made for the article and the numerous preparations in which it is an ingredient, as well as for practitioners, consumers, and regulatory agencies to become familiar with the new terminology. After December 1, 2015, the *Methacrylic Acid Copolymer* monograph will be discontinued.

The following changes in the *Methacrylic Acid Copolymer* monograph are being proposed to make it consistent with the two new proposed monographs.
1. The chemical structure, chemical names, and CAS numbers are added.
2. The *Definition* is updated.
3. The *Identification* section is updated.
4. The *Assay* is updated.
5. The method in the test for *Limit of Monomers* is improved, employing the approach currently used in the *NF* monographs *Ammonio Methacrylate Copolymer* and *Ammonio Methacrylate Copolymer Dispersion*. This method includes precipitation of the polymer before analysis in order to avoid clogging of the column and other separation problems. The HPLC chromatographic procedures in the test for *Limit of Monomers* are based on analyses performed with a Nucleosil 100 C18 column with 7-µm L1 packing. With this system, methacrylic acid, ethyl acrylate, and methyl methacrylate elute at approximately 2.9, 7.4, and 8.2 min, respectively.
6. The *Analysis* in the test for *Viscosity* indicates the shear rate conditions. This is based on validation data demonstrating that the test solution behaves as a Newtonian fluid under the test conditions for a shear rate of NLT 1 s^{-1} and NMT 100 s^{-1}.
7. Storage conditions are specified in the *Packaging and Storage* section.
8. Added surface-active agents are indicated in the *Labeling* section for all the types.

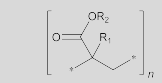
(EM2: H. Wang.) RTS—C65736

Methacrylic Acid Copolymer

(***Any article currently titled Methacrylic Acid Copolymer, Type A or Type B, will be officially titled Methacrylic Acid and Methyl Methacrylate Copolymer after December 1, 2015. Any article currently titled Methacrylic Acid Copolymer, Type C, will be officially titled Methacrylic Acid and Ethyl Acrylate Copolymer after December 1, 2015. After December 1, 2015, the Methacrylic Acid Copolymer monograph will no longer be valid.***)

Add the following:

■



Type	R_1	R_2	Ratio
A	CH_3	H or CH_3	1:1
B	CH_3	H or CH_3	1:2
C	CH_3	H	1:1
	or H	C_2H_5	

Type A or Type B: Poly(methacrylic acid, methyl methacrylate); Methacrylic acid–methyl methacrylate copolymer [25086-15-1].
Type C: Poly(methacrylic acid, ethyl acrylate); Methacrylic acid–ethyl acrylate copolymer [25212-88-8].■2S *(NF28)*

DEFINITION

Change to read:

~~Methacrylic Acid Copolymer is a fully polymerized copolymer of methacrylic acid and an acrylic or methacrylic ester. Type C may contain suitable surface-active agents. The assay and viscosity requirements differ for the several types, as described in the table below.~~■Methacrylic Acid Copolymer consists of methacrylic acid and methyl methacrylate monomers arranged in a random distribution or consists of methacrylic acid and ethyl acrylate monomers arranged in a random distribution. It may contain suitable surface-active agents. The *Assay* and *Viscosity* requirements differ for the three types, as described in the table below.■2S *(NF28)*

In-Process Revision

Type	Methacrylic Acid Units, Dried Basis (%)		Viscosity (~~cps~~■mPa·s■2S (NF28))

~~r_S = peak response for the monomer from the *Standard solution*~~

~~C = concentration of the monomer in the *Standard solution* (µg/mL)~~

~~Acceptance criteria:~~ ~~NMT 0.05%~~

■**Phosphate buffer:** Prepare an aqueous solution containing 17.8 g/L of anhydrous dibasic sodium phosphate and 17.0 g/L of monobasic potassium phosphate. Adjust with phosphoric acid to a pH of 2.0. This buffer has a concentration of 0.125 M.

Sodium perchlorate solution: 35 mg/mL of sodium perchlorate. This solution has a concentration of 0.25 M.

Mobile phase: Add phosphoric acid dropwise to water to obtain a solution having a pH of 2.0. Prepare a mixture of this acidified water and methanol (80:20), and degas.

Standard solution for Type A or Type B: Dissolve 0.05 g of methacrylic acid and 0.05 g of methyl methacrylate in 5 mL of butanol, and add methanol to exactly 100 mL. Transfer 1.0 mL of this solution to a 100-mL volumetric flask. Dilute with methanol to volume. Mix 3.0 mL of this solution with 10.0 mL of *Phosphate buffer*. This solution contains 1.15 µg/mL each of methacrylic acid and methyl methacrylate.

Standard solution for Type C: Dissolve 0.01 g of methacrylic acid and 0.01 g of ethyl acrylate in 5 mL of butanol, and add methanol to exactly 100 mL. Transfer 1.0 mL of this solution to a 100-mL volumetric flask. Dilute with methanol to volume. Mix 5.0 mL of this solution with 5.0 mL of *Sodium perchlorate solution*. This solution contains about 0.5 µg/mL each of methacrylic acid and ethyl acrylate.

Sample solution for Type A or Type B: Transfer 1 g of Methacrylic Acid Copolymer, Type A or Type B, to a 50-mL volumetric flask, dilute with methanol to volume, and mix. Add 3 mL of this solution dropwise, while continuously stirring, to a beaker that contains 10.0 mL of *Phosphate buffer*. Remove the precipitated polymer to obtain a clear supernatant by centrifugation (e.g., NLT 5000 × *g* for NLT 5 min). Use the clear supernatant.

Sample solution for Type C: Transfer 3 g of Methacrylic Acid Copolymer, Type C, to a 50-mL volumetric flask, dilute with methanol to volume, and mix. Add 5 mL of this solution dropwise, while continuously stirring, to a beaker that contains 5.0 mL of *Sodium perchlorate solution*. Remove the precipitated polymer to obtain a clear supernatant by centrifugation (e.g., NLT 5000 × *g* for NLT 5 min). Use the clear supernatant.

Chromatographic system

(See *Chromatography* ⟨621⟩*, System Suitability*.)

Mode: LC

Detector: UV 202 nm

Column: 4.0-mm × 12.5-cm analytical column; 7-µm packing L1

In-Process Revision

Flow rate: 2 mL/min
Injection size: 20 µL

For Type A or Type B

System suitability

Sample: *Standard solution for Type A or Type B*

[NOTE—The relative retention times for methacrylic acid and methyl methacrylate are 1.0 and 2.8, respectively.]

Suitability requirements

Resolution: NLT 2.0 between methacrylic acid and methyl methacrylate

Relative standard deviation: NMT 2.0%.

Analysis

Samples: *Standard solution for Type A or Type B* and *Sample solution for Type A or Type B*

Calculate the percentage of each monomer (methacrylic acid or methyl methacrylate) in the portion of Methacrylic Acid Copolymer Type A or Type B taken:

$$\text{Result} = (r_U/r_S) \times (C/W) \times V_F \times D \times F \times 100$$

r_U = monomer (methacrylic acid or methyl methacrylate) peak response from the *Sample solution for Type A or Type B*

r_S = monomer (methacrylic acid or methyl methacrylate) peak response from the *Standard solution for Type A or Type B*

C = concentration of the monomer (methacrylic acid or methyl methacrylate) in the *Standard solution for Type A or Type B* (µg/mL)

W = weight of Methacrylic Acid Copolymer Type A or Type B taken to prepare the *Sample solution for Type A or Type B* (g)

V_F = final volume of the *Sample solution for Type A or Type B*, 13 mL

D = dilution factor for preparation of the *Sample solution for Type A or Type B*, 16.7

F = conversion factor, 10^{-6} g/µg

Acceptance criteria: NMT 0.05% for the total amount of monomers

For Type C

System suitability

Sample: *Standard solution for Type C*

[NOTE—The relative retention times for methacrylic acid and ethyl acrylate are 1.0 and 2.6, respectively.]

Suitability requirements

Resolution: NLT 2.0 between methacrylic acid and ethyl acrylate

Relative standard deviation: NMT 2.0%.

Analysis

Samples: *Standard solution for Type C* and *Sample solution for Type C*

Calculate the percentage of each monomer (methacrylic acid or ethyl acrylate) in the portion of Methacrylic Acid Copolymer Type C taken:

$$\text{Result} = (r_U/r_S) \times (C/W) \times V_F \times D \times F \times 100$$

r_U = monomer (methacrylic acid or ethyl acrylate) peak response from the *Sample solution for Type C*

r_S = monomer (methacrylic acid or ethyl acrylate) peak response from the *Standard solution*

C = concentration of the monomer (methacrylic acid or ethyl acrylate) in the *Standard solution for Type C* (µg/mL)

W = weight of Methacrylic Acid Copolymer Type C taken to prepare the *Sample solution for Type C* (g)

V_F = final volume of the *Sample solution for Type C*, 10 mL

D = dilution factor for preparation of the *Sample solution for Type C*, 10

F = conversion factor, 10^{-6} g/µg

Acceptance criteria: NMT 0.01% for the total amount of monomers.■2S (*NF28*)

SPECIFIC TESTS

Change to read:

- **VISCOSITY** ⟨**911**⟩

Analysis: ~~Place 254.6 g of isopropyl alcohol and 7.9 g of water in a conical flask having a ground-glass joint. Add a quantity of Methacrylic Acid Copolymer equivalent to 37.5 g of solids on the dried basis, while stirring by means of a magnetic stirrer. Close the flask, and continue stirring until the polymer has dissolved completely. Adjust the temperature to 20 ± 0.1°. Equip a suitable rotational viscosimeter with a spindle having a cylinder 1.88 cm in diameter and 6.25 cm high attached to a shaft 0.32 cm in diameter, the distance from the top of the cylinder to the lower tip of the shaft being 0.75 cm, and the immersion depth being 8.15 cm (No. 1 spindle). With the spindle rotating at 30 rpm, immediately observe and record the scale reading. Convert the scale reading to centipoises by multiplying the reading by the constant for the viscosimeter spindle and speed employed.~~■Place 254.6 g of isopropyl alcohol and 7.9 g of water in a test flask. Add a quantity of Methacrylic Acid Copolymer, equivalent to 37.5 g of solids on the dried basis, while stirring by means of a magnetic stirrer. Close the flask, and continue stirring until the polymer has dissolved completely. Adjust the temperature to 20 ± 0.1°. Equip a rotational viscometer with an accessory.[1] The shear rate under the test condition is NLT 1 s^{-1} and NMT 100 s^{-1}. Follow the instrument manufacturer's directions to measure the apparent viscosity.■2S (*NF28*)

Acceptance criteria

~~**Type A:** 50–200 cps~~
~~**Type B:** 50–200 cps~~
~~**Type C:** 100–200 cps~~

BRIEFING

Methacrylic Acid and Ethyl Acrylate Copolymer. See Briefing under *Methacrylic Acid Copolymer.* The newly proposed

[1] A suitable accessory is available from Brookfield Engineering as the LV1 spindle, a cylindrical spindle 1.9 cm in diameter and 6.5 cm high attached to a shaft 0.3 cm in diameter. The spindle rotates at 30 rpm at an immersion depth of 8.15 cm.

In-Process Revision

NF monograph shown here contains the procedures and limits outlined for Methacrylic Acid Copolymer Type C.
In this monograph:

- The test for *Limit of Methacrylic Acid and Ethyl Acrylate* includes precipitation of the polymer before analysis in order to avoid clogging of the column and other separation problems. The HPLC chromatographic procedure in the test is based on analyses performed with a Nucleosil 100 C18 column with 7-µm L1 packing. With this system, methacrylic acid and ethyl acrylate elute at approximately 2.9 and 7.4 min, respectively.
- The *Analysis* in the test for *Viscosity* indicates the shear rate conditions. These are based on validation data demonstrating that the test solution behaves as a Newtonian fluid under the test conditions for a shear rate of NLT 1 s^{-1} and NMT 100 s^{-1}.

Poly(methacrylic acid, ethyl acrylate);
Methacrylic acid–ethyl acrylate copolymer [25212-88-8].

DEFINITION

Methacrylic Acid and Ethyl Acrylate Copolymer consists of methacrylic acid and ethyl acrylate monomers arranged in a random distribution. Methacrylic acid units in Methacrylic Acid and Ethyl Acrylate Copolymer are NLT 46.0% and NMT 50.6%, calculated on the dried basis. It may contain suitable surface-active agents.

IDENTIFICATION

- **A. Infrared Absorption ⟨197K⟩**
  Use USP Methacrylic Acid and Ethyl Acrylate Copolymer (1:1) RS for Methacrylic Acid and Ethyl Acrylate Copolymer having a range of 46.0%–50.6% for methacrylic acid units.
- **B.** It meets the requirements of the *Assay*.

ASSAY

- **Procedure**
  Sample: 1 g, previously dried
  Analysis: Dissolve the *Sample* in 100 mL of neutralized acetone, and titrate with 0.1 N sodium hydroxide VS, determining the endpoint potentiometrically (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N sodium hydroxide is equivalent to 8.609 mg of methacrylic acid ($C_4H_6O_2$) units.
  Acceptance criteria: 46.0%–50.6% for Methacrylic Acid and Ethyl Acrylate Copolymer on the dried basis

IMPURITIES

Samples: ■*Standard* and *Sample*■2S (*NF28*)

Introduce separately into the gas chromatograph by means of a gas sampling valve.

Acceptance criteria: ~~The peak response produced by the *Sample* exhibits a retention time corresponding to that produced by the *Standard* and is equivalent to~~■■2S (*NF28*) NMT 3.0% of oxygen when compared to the peak response of the *Standard*, indicating NLT 97.0%, by volume, of N_2

IMPURITIES

Change to read:

Inorganic Impurities

■(See *Impurities Testing in Medical Gases* ⟨413⟩.)

[NOTE—The various detector tubes called for in the respective tests are listed under *Reagents, Indicators, and Solutions*.]■2S (*NF28*)

In-Process Revision

- **CARBON DIOXIDE**

  Sample: ~~1000 ± 50 mL~~■Manufacturer's recommended gas volume (±5%)■2S (*NF28*)

  Analysis: Pass through a carbon dioxide detector tube at the rate specified for the tube.

  Acceptance criteria: The indicator change corresponds to NMT 300 ppm.

- **CARBON MONOXIDE**

  Sample: ~~1000 ± 50 mL~~■Manufacturer's recommended gas volume (±5%)■2S (*NF28*)

  Analysis: Pass through a carbon monoxide detector tube at the rate specified for the tube.

  Acceptance criteria: The indicator change corresponds to NMT 10 ppm.

- **SULFUR DIOXIDE**

  Sample: ~~1000 ± 50 mL~~■Manufacturer's recommended gas volume (±5%)■2S (*NF28*)

  Analysis: Pass through a sulfur dioxide detector tube at the rate specified for the tube.

  Acceptance criteria: The indicator change corresponds to NMT 5 ppm.

- **LIMIT OF NITRIC OXIDE AND NITROGEN DIOXIDE**

  Sample: ~~1000 ± 50 mL~~■Manufacturer's recommended gas volume (±5%)■2S (*NF28*)

  Analysis: Pass through a nitric oxide–nitrogen dioxide detector tube at the rate specified for the tube.

  Acceptance criteria: The indicator change corresponds to NMT 2.5 ppm.

- **LIMIT OF OXYGEN:** NMT 3.0% of oxygen is present, determined as directed in the *Assay*.

SPECIFIC TESTS

- **ODOR:** Carefully open the container valve to produce a moderate flow of gas. Do not direct the gas stream toward the face, but deflect a portion of the stream toward the nose: no appreciable odor is discernible.

ADDITIONAL REQUIREMENTS

Change to read:

- **PACKAGING AND STORAGE:** ~~Preserve in cylinders or in a low-pressure collecting tank.~~■Preserve nitrogen in pressurized containers. Container connections shall be appropriate for Nitrogen 97 Percent. Adaptors shall not be used to connect containers to patient use supply system piping or equipment.■2S (*NF28*)
- **LABELING:** Where it is piped directly from the collecting tank to the point of use, label each outlet "Nitrogen 97 Percent".

BRIEFING

⟨92⟩ Growth Factors and Cytokines Used in Cell Therapy Manufacturing. Because there is no information in *USP* on this subject, it is proposed to include this new general test chapter to provide general considerations and requirements for growth factors and cytokines used in cell manufacturing.

(BB CGT: F. Atouf.) RTS—C72116

Add the following:

■⟨92⟩ GROWTH FACTORS AND CYTOKINES USED IN CELL THERAPY MANUFACTURING

DEFINITION

Qualification of reagents, source materials, and control of the manufacturing process are key elements that ensure the quality and safety of cell therapies. Growth factors and cytokines are important for the maintenance, growth, selection, and purification of cultures of cell therapy products. This chapter describes the accepted tests, procedures, and acceptance criteria for growth factors and cytokines that may be involved in the manufacturing of cell therapy products.

RECOMBINANT HUMAN INTERLEUKIN 4 (rhIL-4)

MHKCDITLQE	IIKTLNSLTE	QKTLCTELTV	TDIFAASKNT
TEKETFCRAA	TVLRQFYSHH	EKDTRCLGAT	AQQFHRHKQL
IRFLKRLDRN	LWGLAGLNSC	PVKEANQSTL	ENFLERLKTI
MREKYSKCSS			

$C_{658}H_{1071}N_{193}O_{197}S_8$ 15,096 Da

rhIL-4 is a single-chain polypeptide of 130 amino acid residues expressed in *Escherichia coli*. It is produced as a lyophilized powder and contains NLT 0.5×10^7 USP Units of IL-4/mg of total protein. Process specific host-cell DNA impurities in IL-4 with limits of less than 1 ng/mg are determined as described in *Nucleic Acid-Based Techniques—Approaches for Detecting Trace Nucleic Acids (Residual DNA Testing)* ⟨1130⟩. Neither manufacturing license nor market approval is required for IL-4 intended for use as an ancillary material during manufacturing. Following are typical IL-4 quality attributes.

IDENTIFICATION

- **A.** Amino-terminal sequence analysis of at least eight amino acids is performed with an automated sequencer, as described in *Biotechnology-Derived Articles* ⟨1045⟩. Stepwise-released phenylthiohydantoin amino acids are identified with on-line reversed-phase high-performance liquid chromatography, on the basis of their elution times.
- **B.** Use the electrophoresis method followed by western blotting analysis to visualize the IL-4 protein. The method is sodium dodecyl sulfate polyacrylamide gel electrophoresis (SDS-PAGE), described in the tests for *Purity*.

Phosphate buffered saline: Proceed as directed in the test for *Purity* in the *Assay*.
Laemmli sample buffer, reducing: Proceed as directed in the test for *Purity* in the *Assay*.
Laemmli sample buffer, nonreducing: Proceed as directed in the test for *Purity* in the *Assay*.
Standard stock solution: 50 µg/mL of reconstituted USP rHuman Interleukin 4 RS in *Phosphate buffered saline*. [NOTE—Do not agitate while mixing; swirl gently.]
Standard solution: 20 µg/mL of IL-4, from *Standard stock solution*, in *Phosphate buffered saline*
Standard solution, reducing: Combine 20 µL of *Standard solution* and 5 µL of *Laemmli sample buffer, reducing*.
Standard solution, nonreducing: Combine 20 µL of *Standard solution* and 5 µL of *Laemmli sample buffer, nonreducing*.
Sample stock solution: 50 µg/mL of reconstituted IL-4 in *Phosphate buffered saline*. [NOTE—Do not agitate while mixing; swirl gently.]
Sample solution: 20 µg/mL of IL-4, from *Sample stock solution*, in *Phosphate buffered saline*
Sample solution, reducing: Combine 20 µL of *Sample solution* and 5 µL of *Laemmli sample buffer, reducing*.
Sample solution, nonreducing: Combine 20 µL of *Sample solution* and 5 µL of *Laemmli sample buffer, nonreducing*.
Analysis
Samples: *Standard solution, reducing; Standard solution, nonreducing; Sample solution, reducing;* and *Sample solution, nonreducing*
Western blotting: After electrophoresis, the proteins are transferred onto a polyvinylidene fluoride (PVDF) membrane using standard procedures. Incubate the membrane for 1 h at room temperature with *Phosphate buffered saline* containing 0.1% Tween 20 and 5% skim milk powder. The membrane is then incubated with an anti-IL-4 antibody[1] (diluted appropriately in *Phosphate buffered saline*), followed by incubation with a secondary antibody at room temperature under gentle agitation for 1 h for each of the antibodies. The IL-4 protein band is identified by developing the membrane using a suitable detection system.[2]
Acceptance criteria: The developed Western blot should give a positive signal equivalent to the USP rHuman Interleukin 4 RS.

ASSAY

- **PURITY:** [NOTE—Purity is determined on the bulk material.] SDS-PAGE is performed as described under *Biotechnology-Derived Articles—Polyacrylamide Gel Electrophoresis* ⟨1056⟩ under reducing and nonreducing conditions.

Molecular weight marker: Use a suitable molecular weight marker containing protein bands between 10 and 200 kDa.
Phosphate buffered saline: 2.67 mM of potassium chloride, 1.47 mM of potassium phosphate (KH_2PO_4), 137.93 mM of sodium chloride, and 8.06 mM of dibasic sodium phosphate in water. Adjust to a pH of 7.0 to 7.3.
Laemmli sample buffer, nonreducing: 100 mM TRIS-HCl, pH 6.8, 50% glycerol, 0.25% bromophenol blue indicator, and 10% sodium lauryl sulfate in water
Laemmli sample buffer, reducing: Add 2.5 µL mercaptoethanol to 50 µL of *Laemmli sample buffer, nonreducing*.
Sample stock solution: 400 µg/mL of bulk IL-4 in *Phosphate buffered saline*
Sample solution 1: Combine 20 µL of *Sample stock solution* and 5 µL of *Laemmli sample buffer, nonreducing*.
Sample solution 2: Combine 20 µL of *Sample stock solution* and 5 µL of *Laemmli sample buffer, reducing*.
Control A stock solution: 4 µg/mL of IL-4, from *Sample stock solution*, in *Phosphate buffered saline*. [NOTE—*Control A solutions* are run in triplicates in both reducing and nonreducing conditions.]
Control A solution 1: Combine 20 µL of *Control A stock solution* and 5 µL of *Laemmli sample buffer, nonreducing*.
Control A solution 2: Combine 20 µL of *Control A stock solution* and 5 µL of *Laemmli sample buffer, reducing*.
Control B stock solution: 12 µg/mL of IL-4, from *Sample stock solution*, in *Phosphate buffered saline*. [NOTE—*Control B solutions* are run in duplicates in both reducing and nonreducing conditions.]
Control B solution 1: Combine 20 µL of *Control B stock solution* and 5 µL of *Laemmli sample buffer, nonreducing*.

[1] A suitable anti-IL-4 antibody can be obtained from commercial sources (e.g., Dianova Inc.).
[2] A suitable detection system can be obtained from commercial sources (e.g., Pierce/Perbio Science).

In-Process Revision

Control B solution 2: Combine 20 µL of *Control B stock solution* and 5 µL of *Laemmli sample buffer, reducing*.

Electrophoretic conditions

(See *Biotechnology-Derived Articles—Polyacrylamide Gel Electrophoresis* ⟨1056⟩.)

Mode: Discontinuous PAGE gel

Stacking gel: 4% acrylamide

Resolving gel: 12% acrylamide

Run conditions: 10 min at 100 V; then 30 min at 200 V

Protein detection: Silver stain

Analysis

Samples: *Sample solution 1, Sample solution 2, Control A solution 1, Control A solution 2, Control B solution 1*, and *Control B solution 2*

Incubate 25 µL of each *Sample solution* and *Control solution* under nonreducing conditions for 5 min at 60°, and load onto the gel. Incubate 20 µL of each *Sample solution* and *Control solution* under reducing conditions for 5 min at 60°, and load onto the gel. After silver staining and scanning the whole gel, determine the intensity of all detectable protein bands by densitometry, and calculate the percentage of each detectable protein band, in the *Sample solution*, twice by comparing the pixel intensity of each contaminating band with the mean value of *Control solutions A* and *B*, respectively, by the formulas:

$$(A_{100}) \times 1/(A_1) \text{ and}$$

$$(A_{100}) \times 3/(A_3)$$

A_{100} = intensity of one contaminating band of the *Sample solution*

A_1 = mean intensity of all detectable bands of *Control A solution*

A_3 = mean intensity of all detectable bands of *Control B solution*

IL-4 control solutions analysis should yield one detectable band with an apparent molecular weight of approximately 15 kDa. If values calculated by means of *Control A solution* are different from those revealed by comparison with *Control B solution*, the value corresponding to the highest amount of impurity should be taken. If the intensity of one of the contaminating bands is lower than the value of *Control A solution* (corresponding to 1%), the value of this contamination is set to 1%. The purity of the sample solution is then calculated:

$$\text{Result} = 100 - \Sigma\, C_n$$

C = percentage of each contamination given in rounded whole numbers

n = number of contaminants of the IL-4 *Sample solution*

Acceptance criteria: The purity of IL-4 is NLT 97%, as determined by SDS-PAGE.

• **PROTEIN CONTENT:** [NOTE—Protein content is determined on the basis of the packaged product.]

Sample solution: 50 µg/mL of IL-4 in *Phosphate buffered saline*. [NOTE—Do not agitate while mixing; swirl gently.]

Blank: *Phosphate buffered saline* as described in the test for *Purity* in the *Assay*.

Spectroscopic conditions

(See *Spectrometry and Light Scattering* ⟨851⟩.)

Mode: UV

Pathlength: 1 cm

Analytical wavelength: 280 nm

Analysis

Samples: *Sample solution* and *Blank*

Calculate the protein concentration:

$$C = A_{280}/0.63$$

C = IL-4 concentration of the *Sample solution* (mg/mL)

A_{280} = absorbance at 280 nm

SPECIFIC TESTS

• **BIOIDENTITY:** [NOTE—The biological activity measurement is determined on the basis of the packaged product.]

RPMI 1640 medium with L-glutamine: Prepare a mixture of the ingredients in the quantities shown in sufficient water to obtain 1 L of medium, and sterilize by filtration:

Material	Quantity
Calcium Nitrate ($Ca(NO_3)\cdot 4H_2O$)	100 mg
Magnesium Sulfate ($MgSO_4\cdot 7H_2O$)	100 mg
Potassium Chloride	400 mg
Sodium Chloride	6000 mg
Sodium Phosphate, Dibasic Anhydrous	800 mg
Sodium Bicarbonate	2000 mg
Glycine	10 mg
L-Arginine	200 mg
L-Asparagine	50 mg
L-Aspartic Acid	20 mg
L-Polyvinylidene Fluoride L-Cystine Dihydrochloride	20 mg
L-Glutamic Acid	20 mg
L-Glutamine	300 mg
L-Histidine	15 mg
L-Hydroxyproline	20 mg
L-Isoleucine	50 mg
L-Leucine	50 mg
L-Lysine Hydrochloride	40 mg
L-Methionine	15 mg
L-Phenylalanine	15 mg
L-Proline	20 mg
L-Serine	30 mg
L-Threonine	20 mg
L-Tryptophan	5 mg
L-Tyrosine Disodium Salt Dihydrate	20 mg
L-Valine	20 mg
Biotin	0.2 mg
Choline Chloride	3 mg
D-Calcium Pantothenate	0.25 mg
Folic Acid	1 mg
i-Inositol	35 mg
Niacinamide	1 mg
Para-Aminobenzoic Acid	1 mg
Pyridoxine Hydrochloride	1 mg
Riboflavin	0.2 mg
Thiamine Hydrochloride	1 mg
Vitamin B_{12}	0.005 mg
D-Glucose (Dextrose)	2000 mg
Glutathione (Reduced)	1 mg
Phenol Red	5 mg

In-Process Revision

Growth medium: Using aseptic procedures, prepare the following tissue culture medium:

RPMI-1640 with L-Glutamine	500 mL
Sodium Pyruvate 100 mM	5 mL
Fetal Bovine Serum	50 mL
Human rGM-CSF[3]	3×10^4 International Units

[3]Granulocyte-Macrophage Colony-Stimulating Factor (GM-CSF) is added extemporaneously.

Sterilize by filtration, and store at between 2° to 8°. Use within one month. Add GM-CSF immediately prior to use.

Assay medium: Use *Growth medium* containing no GM-CSF.

Phosphate buffered saline: Proceed as directed in the test for *Purity* in the *Assay*.

Resazurin solution: 0.11 mg of resazurin in *Phosphate buffered saline*. [NOTE—Sterile filter and store solution protected from light at 4°. *Resazurin solution* is stable for at least six months if treated under sterile conditions.]

[NOTE—For all *Standard* and *Sample solutions*, IL-4 concentration is determined by photometry at 280 nm using an extinction coefficient (ε) of 0.63 $mg^{-1}cm^{-1}$.]

Standard stock solution: 50 µg/mL of USP rHuman Interleukin 4 RS in *Phosphate buffered saline*. [NOTE—Do not agitate while mixing; swirl gently.]

Standard solutions: 36, 12, 4, 1.33, 0.44, 0.15, 0.05, 0.016, 0.006 ng/mL of IL-4, from *Standard stock solution* in *Assay medium*

Sample stock solution: 50 µg/mL of IL-4 in *Phosphate buffered saline*. [NOTE—Do not agitate while mixing; swirl gently.]

Sample solutions: 36, 12, 4, 1.33, 0.44, 0.15, 0.05, 0.016, 0.006 ng/mL of IL-4, from *Sample stock solution* in *Assay medium*

Control solution: Use the *Assay medium*.

Cell culture preparation: Prepare cell cultures of the human factor-dependent TF-1 cell line (ATCC No. CRL-2003), following the protocol described in the ATCC information sheet. Passage the cultures every 2–3 days, using 1:3 subcultures of the cells for up to 1 month. Seed density should be 0.5×10^6 cells/mL, and maximal density should be 3×10^6 cells/mL. Viability of the cells should be >90%. Maximal passage number is 24, and maximal cultivation time from thawing is 28 days. After 28 days, initiate a new culture. Cells are propagated using *Growth medium* at 37°, supplemented with air and 5% carbon dioxide.

Analysis

Samples: *Standard solutions, Sample solutions,* and *Control solution*

The activity of the *Sample solution* is determined in duplicate. Wash the cells three times in *Phosphate buffered saline*. Plate 2×10^4 TF1 cells resuspended in 100 µL of *Assay medium* per well in 96-well, flat-bottom microplates. Incubate for 72 h at 37° and 5% CO_2 atmosphere in a humidified incubator in the presence or absence of various concentrations of *Standard solution, Sample solution*, or *Control solution* by adding 100 µL of the corresponding solution to each well. Add 30 µL of *Resazurin solution* to each well and incubate for another 24 h. Determine the fluorescence intensity per well by reading the plate with a microplate reader using 544 nm (excitation) and 590 nm (emission). Convert the fluorescence intensity in each well to a percentage of the maximum fluorescence intensity. For the *Sample solution* and *Standard solution*, plot the percentage of fluorescence intensity versus the concentration of the respective solution. By using the least squares method of regression analysis, compute the ED50 in ng/mL of the *Sample solution* and the *Standard solution*. The coefficient of determination for curve regression should be ≥ 0.98. Calculate the potency in USP Interleukin 4 Units/mg:

$$\text{Result} = A \times E_S/E_U$$

A = activity of USP rHuman Interleukin 4 RS (USP units/mg)

E_S = determined ED_{50} of *Standard solution* (ng/mL)

E_U = determined ED_{50} of *Sample solution* (ng/mL)

Acceptance criteria: NLT 0.5×10^7 USP IL-4 Units/mg is found.

- **STERILITY TESTS ⟨71⟩:** Meets the requirements
- **BACTERIAL ENDOTOXINS TEST ⟨85⟩:** It contains NMT 50 USP Endotoxin Units/mg.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at –80°.
- **LABELING:** Material is of recombinant DNA origin.
- **USP REFERENCE STANDARDS ⟨11⟩**
  USP Endotoxin RS
  USP rHuman Interleukin 4 RS■2S *(USP33)*

BRIEFING

⟨228⟩ Ethylene Oxide and Dioxane. This proposed new general test chapter is applicable to products prepared from ethylene oxide. Currently two test procedures are included in this chapter. *Method I* is used, among others, in a series of official and proposed monographs for polyoxyl-containing substances; *Method II* is used in the *Polyethylene Glycol* monograph proposed for harmonization and in the harmonized *Polysorbate 80* monograph. With the addition of this chapter, the detailed procedures for tests of ethylene oxide and dioxane, as well as cross-references to them, will be removed from the monographs where they occur and will be replaced by a cross-reference to this chapter.

(EGC; EM2: H. Wang.) RTS—C69591

Add the following:

■⟨228⟩ Ethylene Oxide and Dioxane

The following procedure is used to determine the contents of residual ethylene oxide and dioxane in the products prepared from ethylene oxide.

Method I

[**CAUTION**—*Ethylene oxide is toxic and flammable. Prepare these solutions in a well-ventilated fume hood, using great care. Protect both hands and face by wearing polyethylene protective gloves and an appropriate face mask. Store all solutions in hermetic containers, and refrigerate at a temperature between 4° and 8°.*]

[NOTE—Before using the polyethylene glycol 200 in this test, remove any volatile components from it by placing 500 mL of polyethylene glycol 200 in a 1000-mL round-bottom flask and attaching the flask to a rotary evaporator maintained at 60° and under a vacuum of 10–20 mm Hg for 6 h.]

Acetaldehyde solution: 10 µg/mL of acetaldehyde. [NOTE—Prepare immediately before use.]

Ethylene oxide stock solution: 2.5 mg/g of ethylene oxide. Prepare as follows: Tare a glass-stoppered conical flask, add 50 mL of polyethylene glycol 200, and reweigh the flask. Transfer 5 mL of the liquid ethylene oxide to a 100-mL beaker chilled in a mixture of sodium chloride and ice (1:3). Transfer 300 µL (corresponding to 250 mg) of liquid ethylene oxide to the polyethylene glycol 200, and swirl gently to mix. Replace the stopper, reweigh the flask, and determine the amount of ethylene oxide absorbed by weight difference. Adjust the weight of the mixture with polyethylene glycol 200 to 100.0 g, replace the stopper, and swirl gently to mix.

[NOTE—Fill a chilled pressure bottle with liquid ethylene oxide, and store in a freezer when not in use. Use a small piece of polyethylene film to protect the liquid from contact with the rubber gasket. Use adequately chilled apparatus where appropriate. Prepare this stock solution immediately prior to use, and store in a refrigerator after preparation.]

Ethylene oxide solution: Tare a glass-stoppered conical flask, and chill it in a refrigerator. Add 35 mL of polyethylene glycol 200, and reweigh the flask. Transfer 1 g of chilled *Ethylene oxide stock solution* to the tared conical flask. Adjust the weight of the solution with polyethylene glycol 200 to 50.0 g, replace the stopper, and swirl gently to mix. Transfer 10 g of this solution to a 50-mL volumetric flask. Add 30 mL of water, and mix. Dilute with water to volume, and mix to obtain a solution containing 10 µg/mL of ethylene oxide. [NOTE—Use adequately chilled apparatus where appropriate. Prepare immediately before use.]

Dioxane solution: 500 µg/mL of dioxane

Standard solution A: Transfer 0.1 mL of *Ethylene oxide solution* to a 10-mL pressure headspace vial. [NOTE—Other sizes such as 22-mL may be used, depending on operating conditions; however, the same size must be used for *Standard solution A*, *Standard solution B*, and the *Sample solution*.] Add 0.1 mL of *Acetaldehyde solution* and 0.1 mL of *Dioxane solution*, seal the vial, and mix.

Standard solution B: Transfer 1.0 g of the test substance to a 10-mL pressure headspace vial, add 0.1 mL of *Ethylene oxide solution*, 0.1 mL of *Dioxane solution*, and 1.0 mL of *N*,*N*-dimethylacetamide. Seal the vial, and mix.

Sample solution: Transfer 1.0 g of the test substance to a 10-mL pressure headspace vial, and add 1.0 mL of *N*,*N*-dimethylacetamide and 0.2 mL of water. Seal the vial, and mix.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: Headspace GC

Detector: Flame ionization

Column: 0.32-mm × 30-m glass or quartz capillary; 1.0-µm layer of phase G1

Temperature

Injection port: 150°

Detector: 250°

Column: See the column temperature table below.

Temperature (°)	Rate (°/min)	Hold Time (min)
50	—	5
50→180	5	—
180→230	30	—
230	—	5

Carrier gas: Helium

Linear velocity: 20 cm/s

Injection volume: 1 mL (the gaseous headspace)

Injection type: Split ratio 20:1

Headspace sampler

Temperature equilibration time: 45 min

Equilibration temperature

70° for *Standard solution A*

90° for *Standard solution B*

90° for *Sample solution*

Transfer line temperature: 150°

Pressurization time: 1 min

Injection time: 12 s

System suitability

Sample: *Standard solution A*

[NOTE—The relative retention times for acetaldehyde and ethylene oxide are 0.94 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between acetaldehyde and ethylene oxide

Signal-to-noise ratio: NLT 5, determined from the dioxane peak

Relative standard deviation: NMT 15%

Analysis

Samples: *Standard solution B* and *Sample solution*

[NOTE—The relative retention times for ethylene oxide and dioxane are 1.0 and 2.5, respectively.]

Calculate the content of ethylene oxide, in ppm, in the portion of the test substance taken:

$$\text{Result} = A_E \times r_U / [(r_S \times W_U) - (r_U \times W_S)]$$

A_E = quantity of ethylene oxide added to *Standard solution B* (µg)

r_U = ethylene oxide peak responses from the *Sample solution*

r_S = ethylene oxide peak responses from *Standard solution B*

W_U = weight of test substance taken to prepare the *Sample solution* (g)

W_S = weight of test substance taken to prepare *Standard solution B* (g)

Calculate the content of dioxane, in ppm, in the portion of the test substance taken:

$$\text{Result} = A_D \times r_U / [(r_S \times W_U) - (r_U \times W_S)]$$

A_D = quantity of dioxane added to *Standard solution B* (µg)

r_U = dioxane peak responses from the *Sample solution*

r_S = dioxane peak responses from *Standard solution B*

W_U = weight of the test substance taken to prepare the *Sample solution* (g)

W_S = weight of the test substance taken to prepare *Standard solution B* (g)

Method II

Ethylene oxide standard solution: Dilute 0.5 mL of ethylene oxide in methylene chloride (50 mg/mL)[1] with water to 50.0 mL. [NOTE—The solution is stable for 3 months if stored in vials with polytetrafluoroethylene (polytef)-coated silicon membrane crimped caps at –20°.] Allow to reach room temperature. Dilute 1.0 mL with water to 250.0 mL to obtain a solution having a concentration of 2 µg/mL of ethylene oxide. [NOTE—Use this solution immediately after preparation.]

Dioxane standard solution: 0.05 µL/mL of dioxane

Acetaldehyde standard solution: 10 µg/mL of acetaldehyde. [NOTE—Prepare immediately before use.]

Resolution solution: Add 2.0 mL of *Acetaldehyde standard solution* and 2.0 mL of *Ethylene oxide standard solution* to a 10-mL headspace vial. Seal the vial immediately with a polytef-coated silicon membrane and an aluminum cap, and mix carefully.

Standard solution A: 0.48 µg/mL of ethylene oxide, from *Ethylene oxide standard solution*, and 0.005 µL/mL of dioxane, from *Dioxane standard solution*, in water

Standard solution B: Transfer 1.0 g of the test substance into a 10-mL headspace vial. Add 2.0 mL of *Standard solution A*, seal the vial immediately with a polytef-coated silicon membrane and an aluminum cap, and mix carefully.

Sample solution: Transfer 1.0 g of the test substance into a 10-mL headspace vial. Add 2.0 mL of water, seal the vial immediately with a polytef-coated silicon membrane and an aluminum cap, and mix carefully.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: Headspace GC

Detector: Flame ionization

Column: 0.53-mm × 50-m fused-silica capillary column; 5.0-µm layer of phase G27

[1] This is a commercially available solution.

BRIEFING

Amphetamine Assay, *USP 32* page 141. It is proposed to delete this general test chapter from *USP* as it is no longer referenced in any *USP* monograph.

(MD-PP: R. Ravichandran.) RTS—C74660

Delete the following:

■⟨~~331~~⟩ ~~AMPHETAMINE ASSAY~~

~~**USP Reference Standards** ⟨11⟩ —*USP Dextroamphetamine Sulfate RS.*~~

~~**Standard Preparation**— Dissolve a suitable quantity of USP Dextroamphetamine Sulfate RS, accurately weighed, in 2 N sulfuric acid (saturated with chloroform), and dilute quantitatively with the same solvent to obtain a solution having a known concentration of about 0.5 mg of dextroamphetamine sulfate per mL.~~

~~**Assay Preparation**— Prepare as directed in the individual monograph.~~

~~**Preparation of Chromatographic Column** (see *Chromatography* ⟨621⟩)— Pack a pledget of fine glass wool in the base of a 25 × 300 mm chromatographic tube. Place 2 g of purified siliceous earth in a 100 mL beaker, add 1 mL of 0.1 N hydrochloric acid, and mix until a fluffy mixture is obtained. Transfer the mixture to the column, and tamp moderately to compress the material into a uniform mass. Transfer the *Assay Preparation* to the column, dry rinse the beaker with 1 g of purified siliceous earth, and transfer to the column. Tamp a pledget of fine glass wool into place at the top of the column.~~

~~**Procedure**— Wash the column with 100 mL of chloroform previously saturated with water, and discard the washings. Place under the column, as a receiver, a 125 mL separator containing 10.0 mL of 2 N sulfuric acid previously saturated with chloroform. Pass through the column 35 mL of ammoniacal chloroform, prepared by equilibrating 2 mL of ammonium hydroxide and 100 mL of chloroform, and complete the elution with 70 mL of chloroform previously saturated with water. Remove the separator, shake vigorously for 1 minute, allow the layers to separate, discard the chloroform layer, and use the 10.0 mL acid solution of the sulfate salt of the amphetamine as the *Assay Solution*. Concomitantly determine the absorbance of the solution from the *Standard Preparation* and that of the *Assay Solution* in 1 cm cells at 280 nm and at the wavelength of maximum absorbance at about 257 nm, with a suitable spectrophotometer, using 2 N sulfuric acid previously saturated with chloroform as the blank. Record the absorbance of the solution from the *Standard Preparation* as A_u and that of the *Assay Solution* as A_s, and calculate as directed in the individual monograph.~~ ■2S (*USP33*)

BRIEFING

⟨**413**⟩ **Impurities Testing in Medical Gases.** This new general test chapter is being developed to support the medical gases monographs. The chapter outlines the gas sampling procedure from high-pressure containers specifically for determining impurities using various detector tubes.

(AER: K. Zaidi) RTS—C64174

Add the following:

■⟨413⟩ IMPURITIES TESTING IN MEDICAL GASES

INTRODUCTION

This general test chapter defines the safe and proper means to sample high-pressure gas containers of different medical gas compositions using the manufacturer's suggested total gas volume for the purpose of conducting detector tube analysis to satisfy the *USP* monographs. See *Reagents* in the section *Reagents, Indicators, and Solutions* for information on each referenced detector tube.

There are two types of detector tubes currently manufactured, those to be used with a manual hand pump of fixed volume (e.g., 100 mL/pump stroke), and those used in a continuous flow system that can be set to pass a volume of gas through the detector tube at approximately one (1) atmosphere. It is important to match the appropriate detector tube type to the mode of gas volume exchange.

To ensure that the required gas volume has passed through the detector tube, measure the gas volume at the time of the analysis either by using a hand pump or using a flowmeter that is calibrated to the subject gas or corrected via a calibration chart. Flowmeter manufacturers generally provide a chart of the gas volume flow of

common gases for each of the flow tubes identified in this general chapter. [NOTE—See general chapter *Medical Gases Assay* ⟨415⟩ for sampling.]

Continous Flow System

Identify the gas contained in the container and select the appropriate gas regulator. Secure the regulator to the gas container. Do not apply lubricant or Teflon tape to the container-to-regulator connections. Purge the regulator with the gas under test. Select float setting to achieve total gas volume as recommended by the manufacturer. Attach the detector tube, then adjust the flow rate to the required level as indicated by the charts that accompany the flowmeter and the detector tube. Time the gas flow to achieve the desired total gas volume ±10 s. At the allotted time close the regulator valve, then the main container valve. Observe the tube while it is still attached to determine the degree of color change and record the result. Remove the tube, and disconnect the apparatus, vent the regulator gas pressure to atmosphere, and remove the regulator from the container. Dispose of the tube after use.

Hand Pump—Fixed Volume

The alternative approach is to apply the gas detector hand pump. The system draws a consistent volume with each pump stroke. To ensure the accuracy of the total gas volume, the user must follow the manufacturer's suggested recommendation about how to pump.■2S (*USP33*)

BRIEFING

⟨**415**⟩ **Medical Gases Assay.** This new general test chapter is being developed to support the medical gases monographs. The chapter includes information on sampling and qualification for conducting medical gases assay testing using gas chromatography and paramagnetic analyzers. It also covers validation and calibration of these instruments.

(AER: K. Zaidi) RTS—C64173

Add the following:

■⟨415⟩ MEDICAL GASES ASSAY

INTRODUCTION

The evaluation of the purity of a gas used for medical treatment or as a component of a pharmaceutical process is the purpose of a *USP* medical gas monograph. The purity generally is evaluated by an assay for the content of the article and by analyses for trace impurities. The application of gas chromatography, paramagnetic analysis, and detector tubes to medical gases is somewhat different from traditional procedures used for analytes in the liquid phase and therefore warrants a separate description. This general test chapter focuses on the assay for content tests. Sampling for impurities is addressed in general chapter *Impurities Testing in Medical Gases* ⟨413⟩.

This chapter includes sampling and qualification aspects of gas chromatographic and paramagnetic analyses of medical gases. In addition, it includes a description of the initial set-up, validation, and calibration of these instruments. The specific assay procedures are defined in the specific monograph for that gas.

The basic definitions of instrumental qualification and validation are included in general information chapters *Analytical Instrument Qualification* ⟨1058⟩ and *Validation of Compendial Methods* ⟨1225⟩, respectively, and will not be repeated. However, when variations of the materials presented in these chapters are necessary due to the character of the analyte, this chapter will define those variations.

METHODS

Gas Chromatography (GC)

See *Chromatography* ⟨621⟩.

Detectors for Medical Gases Assay

The two most common detectors used in the analyses of medical gases are the Thermal Conductivity Detector (TCD) and Flame Ionization Detector (FID).

The TCD will detect any gas or vapor that has a thermal conductivity (TC) that differs significantly from the high TC of the reference gas, usually helium, therefore it is virtually universal. However, the generally accepted lower detection limit for the TCD is 50 ppm v/v. This represents a limitation for the evaluation of trace impurities in medical gases.

The FID is also used for the evaluation of trace impurities in medical gases, because it is more sensitive to organic compounds but does not produce a signal for most common medical gases.

QUALIFICATION

Installation Qualification (IQ)—The IQ requirements ensure the gas chromatograph hardware and software (or readout device) is installed safely and in accordance with the manufacturer's instructions.

Consideration should be given to the following as applicable:

- Suitability of the sample system (including connections);
- Leakage (should be leak free);
- Representative sampling;
- Sample flow rates;
- Response time;
- Correct output signals;
- Power supply (including voltage regulation); and
- Appropriate environmental conditions of the instrument and of the sample itself (e.g., temperature and pressure).

Operational Qualification (OQ)—OQ verifies that the GC performs as intended within its anticipated operating range. For medical gas final product testing, the GC is tested to ensure repeatability (verification that relative standard deviation is consistent with claims) for each analyte of interest. Due to the specific nature of medical gas testing and the limited number of analytes, routine calibration and challenge testing of a GC instrument and the testing procedure may be used in place of initial or periodic OQ. When an instrument is used for a broader range of analytes, the replacement of OQ with calibration and challenge testing is inappropriate.

Performance Qualification (PQ)— For medical gas final product testing, the GC is periodically checked at appropriate intervals during analytical runs with a calibration gas (i.e., verifying that the results are consistent with a named concentration within acceptable accuracy and precision ranges after a specific number of sample injections).

Paramagnetic Oxygen Measurement

Theory—The paramagnetic analyzer measures the displacement of a diamagnetic gas (nitrogen) by a paramagnetic gas (oxygen), in a strong magnetic field. A measuring cell typically employs a glass dumbbell with nitrogen-filled spheres that is suspended on a torsion strip between magnets that concentrate the flux around the dumbbell. When oxygen molecules enter the measuring cell, the dumbbell is deflected by the force exerted by the oxygen molecules that are attracted to the strongest part of the magnetic field. By using optical sensors, a feedback coil, and suitable electronics, analysts measure an output that is directly proportional to the partial pressure of oxygen.

Oxygen is the only paramagnetic gas present above trace levels in the atmosphere. However, paramagnetic analyzers can be affected by the magnetic susceptibility of the background gas. Therefore changes to background gases in *USP* monographs should be avoided.

Design Considerations

The design considerations for the purchase of new instruments may include the following parameters.

Drift—A change of the output of the instrument for a given concentration over a stated period of time under constant conditions and without any adjustments being made to the instrument by external means. Drift is the summation of two components, zero drift and span drift. Drift determines the frequency of instrument calibration.

Zero Drift—A change in the output when zero gas being measured.

Span Drift—Change in the output at the level of oxygen concentration that is being measured.

Operating Temperature—The ambient temperature range for which the stated performance specification of the instrument will remain valid. A larger temperature coefficient will indicate that a smaller change in ambient temperature is permitted before recalibration is required.

Operating Pressure—The instrument should operate at the inlet pressures of the samples to be tested.

Qualification Aspects

Installation Qualification (IQ)—The IQ requirements ensure the oxygen analyzer hardware and software (or readout device) is installed safely and in accordance with the manufacturer's instructions.

Consideration should be given to the following as applicable:

- Suitability of the sample system (including connections);
- Leakage (should be leak free);
- Representative sampling;
- Sample flow rates;
- Response time;
- Correct output signals;
- Power supply (including voltage regulation); and
- Appropriate environmental conditions of the instrument and of the sample itself (e.g., temperature and pressure).

Operational Qualification (OQ)—The OQ requirements verify that the paramagnetic analyzer performs as intended within its anticipated operating range and is suitable for the actual conditions of use. Instruments and apparatus should be calibrated and used in accordance with the manufacturer's instructions. Because of the specific nature of the instrument, routine calibration may be used in place of initial or periodic OQ testing.

Performance Qualification (PQ)—The PQ requirements verify that the paramagnetic analyzer performs as intended in its normal operating environment. For medical gas final product testing, the paramagnetic analyzer is initially calibrated (zeroed and spanned using a certified standard) in accordance with the manufacturer's instructions and is periodically recalibrated to ensure continued acceptable performance.

Zeroing the Instrument (establishing the lower limit)—Using the certified standard defined in the monograph, establish a zero setting on the analyzer by passing the zero gas into the analyzer at the manufacturer's suggested flow rate. Maintain the flow until a stable reading is observed on the instrument. As necessary, adjust the zero setting to a value of 0.0% according to manufacturer's instructions. Confirm the reading is stable. [NOTE—Depending on the intended use of the instru-

ment, zeroing to a setting other than 0.0% is an acceptable alternative to this procedure if it provides greater measurement precision.]

Spanning the Range of Use—Establish the upper limit (span) with a span gas defined in the monograph and appropriate for the range of use. Pass the span gas through the instrument at the manufacturer's suggested flow rate. Confirm the reading is stable. Adjust the span setting to the certified value of the reference standard according to the manufacturer's instructions. Confirm the reading is stable.

VALIDATION

Validation of this instrument is generally completed during the (IQ/OQ) process. Routine verification is performed as described in the OQ/PQ sections of this chapter and therefore specific information on instrument validation is unnecessary.

PROCEDURE

For Off-line Instrument—Before analysis, the instrument is calibrated by zeroing and spanning as described in the PQ section. [NOTE—The calibration need not be run concomitantly with the test samples.] Connect the sample gas to the instrument, and establish a constant flow into the analyzer at the manufacturer's suggested flow rate. Maintain the flow until a constant reading is observed on the instrument. The definition of a constant reading is included in the manufacturer's instructions or in the user's instrument qualification documentation.

For On-line Instrument—The calibration intervals are defined by the manufacturer, by past history, or by statistical means. Establish a constant flow into the analyzer at the manufacturer's suggested flow rate.

SAMPLING

Sampling from Liquid Phase—Cylinders containing a dip tube allow a liquid sample to be obtained from the valve outlet with the cylinder in the upright position. If a dip tube is not present, the cylinder should be placed in an inverted position with the cylinder and main valve safely supported (so the liquid phase is in contact with the valve).

Sampling of medical gases should always be conducted using the required regulator. Regulators should be purged with the gas that will be sampled. When necessary, the flow to the analyzer should be measured using a calibrated flow-measuring device.

Sampling from Gaseous Phase—Cylinders that do not contain a dip tube allow a gaseous sample to be obtained from the valve outlet with the cylinder in the upright position. If a dip tube is present, the cylinder should be in an inverted position with the cylinder and main valve safely supported (so the gaseous phase is in contact with the end of the dip tube). Sampling of medical gases should always be conducted using the required regulator.

CERTIFIED STANDARDS FOR MEDICAL GAS ANALYSIS

USP monographs for medical gases require tests that use certified standards for instrument calibration and analytical determinations. Such compendial testing may be conducted using reference materials that are traceable to the U.S. National Institute of Standards and Technology.■2S (*USP33*)

Physical Tests and Determinations

BRIEFING

〈**741**〉 **Melting Range or Temperature,** *USP 32* page 294. On the basis of comments received, it is proposed to incorporate specific procedures for Class Ia, Apparatus II and Class Ib, Apparatus II. Also, because of the eventual inclusion of two new USP Melting Point Reference Standards, the number "six" corresponding to the current number of available Reference Standards has been removed.

(GC: A. Hernandez-Cardoso.) RTS—C75258

Change to read:

For Pharmacopeial purposes, the melting range, melting temperature, or melting point is defined as those points of temperature within which, or the point at which, the first detectable liquid phase is detected to the temperature at which no solid phase is apparent, except as defined otherwise for *Classes II* and *III* below. A melting transition may be instantaneous for a highly pure material, but usually a range is observed from the beginning to the end of the process. Factors influencing this transition include the sample size, the particle size, the efficiency of heat diffusion, and the heating rate, among other variables, that are controlled by procedure instructions. In some articles, the melting process is accompanied by simultaneous decomposition, which is visually evidenced as a side event like darkening of the material, charring, bubbling, or other incident. The visual impact of this side reaction frequently obscures the end of the melting process, which it may be impossible to accurately determine. In those circumstances, only the beginning of the melting can be accurately established; and it is to be reported as the melting temperature. The accuracy of the apparatus to be used as described below should be checked at suitable intervals by the use of one or more of the ~~six~~

■available■2S *(USP33)*
USP Melting Point Reference Standards, preferably those that melt nearest the melting temperatures of the compounds being tested (see *USP Reference Standards* 〈11〉).

Five procedures for the determination of melting range or temperature are given herein, varying in accordance with the nature of the substance. When no class is designated in the monograph, use the procedure for *Class Ia* for crystalline or amorphous substances and the procedure for *Class II* for waxy substances.

The procedure known as the mixed-melting point determination, whereby the melting range or temperature of a solid under test is compared with that of an intimate mixture of equal parts of the solid and an authentic specimen of it, e.g., the corresponding USP Reference Standard, if available, may be used as a confirmatory identification test. Agreement of the observations on the original and the mixture constitutes reliable evidence of chemical identity.

Change to read:

Procedure for Class I, Apparatus II—Prepare the substance under test and charge the capillary tube as directed for *Class I, Apparatus I*. Operate the apparatus according to the manufacturer's instructions. Heat the block until the temperature is about 30° below the expected melting point. Insert the capillary tube into the heating block, and continue heating at a rate of temperature increase of about 1° to 2° per minute until melting is complete.

The temperature at which the detector signal first leaves its initial value indicates the beginning of melting, and the temperature at which the detector signal reaches its final value corresponds to the end of melting, or the melting point. The two temperatures fall within the limits of the melting range. ~~In the event of dispute, only the melting range or temperature obtained as directed for *Class I, Apparatus I*, is definitive.~~

■■2S *(USP33)*
If melting occurs with decomposition, the melting temperature corresponding to the beginning of the melting is within the range specified. In the event of dispute, only the melting range or temperature obtained as directed for *Class I, Apparatus I,* is definitive.

Add the following:

■**Procedure for Class Ia, Apparatus II—**Prepare the test substance and charge the capillary as directed for *Class I*, *Apparatus I*. Operate the apparatus according to the manufacturer's instructions. Heat the block until the temperature is about 10° below the expected melting point and is rising at a rate of 1 ± 0.5° per minute. Insert the capillary as directed under *Class I*, *Apparatus I* when the temperature is about 5° below the lower limit of the expected melting range, and continue heating until melting is complete. Record the melting range as directed for *Class I*, *Apparatus I*. If melting occurs with decomposition, the melting temperature corresponding to the beginning of the melting is within the range specified. In the event of dispute, only the melting range or temperature obtained as directed for *Class Ia*, *Apparatus I*, is definitive■2S *(USP33)*

Add the following:

■**Procedure for Class Ib, Apparatus II—**Place the test substance in a closed container and cool to 10°, or lower, for at least 2 hours. Without previous powdering, charge the cooled material into the capillary tube as directed for *Class I*, *Apparatus I*, then immediately place the charged tube in a vacuum desiccator and dry at a pressure not exceeding 20 mm of mercury for 3 hours. Immediately upon removal from the desiccator, fire-seal the open end of the tube, and as soon as practicable pro-

ceed with the determination of the melting range as follows: operate the apparatus according to the manufacturer's instructions. Heat the block until the temperature is about 10 ± 1° below the expected melting range, then introduce the charged tube, and heat at a rate of rise of 3 ± 0.5° per minute until melting is complete. Record the melting range as directed for *Class I*, *Apparatus I*.

If the particle size of the material is too large for the capillary, pre-cool the test substance as above directed, then with as little pressure as possible gently crush the particles to fit the capillary, and immediately charge the tube. In the event of dispute, only the melting range or temperature obtained as directed for *Class Ib*, *Apparatus I*, is definitive.■2S (*USP33*)

BRIEFING

⟨795⟩ Pharmaceutical Compounding—Nonsterile Preparations, *USP 32* page 31 4; **⟨1075⟩ Good Compounding Practices,** *USP 32* page 523. As part of USP's efforts to modernize and improve monographs and general chapters, the Compounding Pharmacy Expert Committee proposes to delete the contents in the existing general test chapter ⟨795⟩ and replace the content with completely new text. It is also proposed to delete general information chapter ⟨1075⟩.

(CRX: R. Schnatz) RTS—C71288

Change to read:

⟨795⟩ PHARMACEUTICAL COMPOUNDING—NONSTERILE PREPARATIONS

~~For the purposes of this chapter, the pharmacist or other licensed health care professional responsible for preparing the compounded preparations is referred to as "compounder".~~

~~Compounding is an integral part of pharmacy practice and is essential to the provision of health care. The purpose of this chapter and applicable monographs on formulation is to help define what constitutes good compounding practices and to provide general information to enhance the compounder's ability in the compounding facility to extemporaneously compound preparations that are of acceptable strength, quality, and purity.~~

~~Compounding is different from manufacturing, which is guided by GMPs (see *Good Manufacturing Practices for Bulk Pharmaceutical Excipients* ⟨1078⟩). Some of the characteristics or criteria that differentiate compounding from manufacturing include the existence of specific practitioner–patient–compounder relationships; the quantity of medication prepared in anticipation of receiving a prescription or a prescription order; and the conditions of sale, which are limited to specific prescription orders.~~

~~The pharmacist's responsibilities in compounding drug preparations are to dispense the finished preparation in accordance with a prescription or a prescriber's order or intent and to dispense those preparations in compliance with the requirements established by the Boards of Pharmacy and other regulatory agencies. Compounders must be familiar with statutes and regulations that govern compounding because these requirements vary from state to state.~~

~~The compounder is responsible for compounding preparations of acceptable strength, quality, and purity with appropriate packaging and labeling in accordance with good compounding practices (see *Good Compounding Practices* ⟨1075⟩), official standards, and relevant scientific data and information. Compounders engaging in compounding should have to continually expand their compounding knowledge by participating in seminars, studying appropriate literature, and consulting colleagues.~~

~~RESPONSIBILITY OF THE COMPOUNDER~~

~~The compounder is responsible for ensuring that the quality is built into the compounded preparations of products, with key factors including at least the following general principles. (See also *Good Compounding Practices* ⟨1075⟩.)~~

1. ~~Personnel are capable and qualified to perform their assigned duties.~~
2. ~~Ingredients used in compounding have their expected identity, quality, and purity.~~
3. ~~Compounded preparations are of acceptable strength, quality, and purity, with appropriate packaging and labeling, and prepared in accordance with good compounding practices, official standards, and relevant scientific data and information.~~
4. ~~Critical processes are validated to ensure that procedures, when used, will consistently result in the expected qualities in the finished preparation.~~
5. ~~The compounding environment is suitable for its intended purpose.~~
6. ~~Appropriate stability evaluation is performed or determined from the literature for establishing reliable beyond-use dating to ensure that the finished preparations have their expected potency, purity, quality, and characteristics, at least until the labeled beyond-use date.~~
7. ~~There is assurance that processes are always carried out as intended or specified and are under control.~~
8. ~~Compounding conditions and procedures are adequate for preventing errors.~~
9. ~~Adequate procedures and records exist for investigating and correcting failures or problems in compounding, testing, or in the preparation itself.~~

~~COMPOUNDING ENVIRONMENT~~

~~Facilities~~

~~Areas designated for compounding have adequate space for the orderly placement of equipment and materials to prevent mixups between ingredients, containers, labels, in-process materials, and finished preparations. The compounding area is also to be designed, arranged, used, and maintained to prevent adventitious cross-contamination. Areas used for sterile preparations are to be separated and distinct from the nonsterile compounding area (see *Environmental Quality and Control* under *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩). The entire compounding area is to be well lighted. Heating,~~

ventilation, and air conditioning systems are to be controlled to avoid decomposition of chemicals (see *Storage Temperature* under *Preservation, Packaging, Storage, and Labeling* in the *General Notices and Requirements* and the manufacturers' labeled storage conditions). Storage areas provide an environment suitably controlled to ensure quality and stability of bulk chemicals and finished preparations.

Potable water is to be supplied for hand and equipment washing. This water meets the standards prescribed in the EPA's National Primary Drinking Water Regulations (40 CFR Part 141). *Purified Water* must be used for compounding nonsterile drug preparations when formulations indicate the inclusion of water. *Purified Water* must also be used for rinsing equipment and utensils. In those cases when a water is used to prepare a sterile preparation, *Water for Injection, Sterile Water for Injection,* or *Bacteriostatic Water for Injection* must be used (see *Water for Pharmaceutical Purposes* ⟨1231⟩ and *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩).

Compounding areas are to be maintained in a clean and sanitary condition. Adequate washing facilities are to be provided, including hot and cold water, soap or detergent, and air driers or single service towels. Sewage, trash, and other refuse in the compounding area is to be disposed of in a safe, sanitary, and timely manner. Equipment is to be thoroughly cleaned promptly after use to avoid cross contamination of ingredients and preparations. Special precautions are to be taken to clean equipment and compounding areas meticulously after compounding preparations that contain allergenic ingredients (e.g., sulfonamides or penicillins).

Equipment

Equipment is to be of appropriate design and size for compounding and suitable for the intended uses. The types and sizes of equipment will depend on the dosage forms and the quantities compounded (see *Weights and Balances* ⟨41⟩, *Prescription Balances and Volumetric Apparatus* ⟨1176⟩, and equipment manufacturers' instruction manuals). All equipment is to be constructed so that surfaces that contact pharmaceutical components, in process materials, or finished preparations are not reactive, additive, or adsorptive to avoid altering the safety, identity, strength, quality, or purity of the preparation. The use of micropipets, electronic or analytical balances, or triturations or dilutions shall be considered when needed quantities are too small to accurately measure with standard equipment required by a state Board of Pharmacy. Equipment and accessories used in compounding are to be inspected, maintained, cleaned, and validated at appropriate intervals to ensure the accuracy and reliability of their performance.

STABILITY OF COMPOUNDED PREPARATIONS

"Stability" is defined as the extent to which a preparation retains, within specified limits, and throughout its period of storage and use, the same properties and characteristics that it possessed at the time of compounding. See the table *Criteria for Acceptable Levels of Stability* under *Stability Considerations in Dispensing Practice* ⟨1191⟩.

The compounder must avoid formulation ingredients and processing conditions that would result in a potentially toxic or ineffective preparation. The compounder's knowledge of the chemical reactions by which drugs degrade provides a means for establishing conditions under which the rate of degradation is minimized. The factors that influence the stability of compounded preparations are generally the same as those for manufactured drug products (see *Factors Affecting Product Stability* and *Responsibility of the Pharmacist* under *Stability Considerations in Dispensing Practice* ⟨1191⟩).

Primary Packaging

Compounded preparations should be packaged in containers meeting USP standards (see *Containers* under *Preservation, Packaging, Storage, and Labeling* in the *General Notices and Requirements, Containers—Plastics* ⟨661⟩, and *Containers—Performance Testing* ⟨671⟩). The container used depends on the physical and chemical properties of the compounded preparation. Container–drug interaction is to be considered with substances such as phenolic compounds and sorptive materials (e.g., polypeptides and proteins).

Sterility

Assurance of sterility in a compounded sterile preparation is mandatory. Compounding and packaging of sterile drugs, such as ophthalmic solutions, will require strict adherence to guidelines presented in the general test chapter *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩ and in the manufacturers' labeling instructions.

Stability Criteria and Beyond-Use Dating

The beyond-use date is the date after which a compounded preparation is not to be used and is determined from the date the preparation is compounded. Because compounded preparations are intended for administration immediately or following short-term storage, their beyond-use dates may be assigned based on criteria different from those applied to assigning expiration dates to manufactured drug products.

Compounders are to consult and apply drug-specific and general stability documentation and literature when available, and are to consider the nature of the drug and its degradation mechanism, the container in which it is packaged, the expected storage conditions, and the intended duration of therapy when assigning a beyond-use date (see *Expiration Date and Beyond-Use Date* under *Labeling* in the *General Notices and Requirements*). Beyond-use dates are to be assigned conservatively. When using manufactured solid dosage forms to prepare a solution or aqueous suspension, the compounder is also to consider factors such as hydrolysis and the freeze-thaw property of the final preparation before assigning a beyond-use date. In assigning a beyond-use date for a compounded drug preparation, in addition to using all available stability information, the compounder is also to use his or her pharmaceutical education and experience.

When a manufactured product is used as the source of active ingredient for a nonsterile compounded preparation, the product expiration date cannot be used to extrapolate directly a beyond-use date for the compounded preparation. However, a compounder may refer to the literature or to the manufacturer for stability information. The compounder may also refer to applicable publications to obtain stability, compatibility, and degradation information on ingredients. All stability data must be carefully interpreted in relation to the actual compounded formulation.

At all steps in the compounding, dispensing, and storage process, the compounder is to observe the compounded drug preparation for signs of instability. For more specific details of some of the common physical signs of deterioration, see *Observing Products for Evidence of Instability* under *Stability Considerations in Dispensing Practice* ⟨1191⟩. However, excessive chemical degradation and other drug concentration loss due to reactions may be invisible more often than they are visible.

In the absence of stability information that is applicable to a specific drug and preparation, the following maximum beyond-use dates are recommended for nonsterile compounded drug preparations[1] that are packaged in tight, light-resistant

[1] For guidelines applicable to dating sterile compounded preparations, see Storage and Beyond-Use Dating under Pharmaceutical Compounding—Sterile Preparations 797.

containers and stored at controlled room temperature unless otherwise indicated (see *Preservation, Packaging, Storage, and Labeling* in the *General Notices and Requirements*).

For Nonaqueous Liquids and **Solid Formulations**—

Where the Manufactured Drug Product is the Source of Active Ingredient—The beyond-use date is not later than 25% of the time remaining until the product's expiration date or 6 months, whichever is earlier.

Where a USP or NF Substance is the Source of Active Ingredient—The beyond-use date is not later than 6 months.

For Water-Containing Formulations (prepared from ingredients in solid form)—The beyond-use date is not later than 14 days for liquid preparations when stored at cold temperatures between 2° and 8° (36° and 46° F).

For All Other Formulations—The beyond-use date is not later than the intended duration of therapy or 30 days, whichever is earlier. These beyond-use date limits may be exceeded when there is supporting valid scientific stability information that is directly applicable to the specific preparation (i.e., the same drug concentration range, pH, excipients, vehicle, water content, etc.). See also the beyond-use dating information in the *Labeling* section under *Repackaging Into Single-Unit Containers and Unit-Dose Containers for Nonsterile Solid and Liquid Dosage Forms* ⟨681⟩.

Beyond-Use Labeling

Federal law requires that manufactured drug products be labeled with an expiration date. Some state laws may require a beyond-use date. The label on the container or package of an official compounded preparation must bear a beyond-use date. Good compounding practice dictates beyond-use labeling for all compounded preparations.

DEFINITIONS

For purposes of this chapter, the following terms shall have these meanings.

PREPARATION is a drug dosage form, a dietary supplement, or a finished device. It is the finished or partially finished preparation of one or more substances formulated for use on or for the patient or consumer (see *General Notices and Requirements*).

OFFICIAL SUBSTANCE includes an active drug entity, a dietary supplement, or a pharmaceutic ingredient (see also *NF 23*) or a component of a finished device.

ACTIVE INGREDIENT usually refers to chemicals, substances, or other components of articles intended for use in the diagnosis, cure, mitigation, treatment, or prevention of diseases in humans or other animals or for use as dietary supplements.

ADDED SUBSTANCES are ingredients that are necessary to prepare the preparation but are not intended or expected to cause a human pharmacologic response if administered alone in the amount or concentration contained in a single dose of the compounded preparation. The term *added substances* is usually used synonymously with the terms *inactive ingredients, excipients,* and *pharmaceutic ingredients.*

INGREDIENT SELECTION

Sources

Official compounded preparations are prepared from ingredients that meet requirements of the compendial monograph for those individual ingredients for which monographs are provided.

A USP or an NF grade substance is the preferred source of ingredients for compounding all other preparations. If that is not available, or when food, cosmetics, or other substances are or must be used, then the use of another high-quality source, such as analytical reagent (AR), certified American Chemical Society (ACS), or Food Chemicals Codex (FCC) grade, is an option for professional judgment. For any substance used in compounding not purchased from a registered drug manufacturer, the compounder must establish purity and safety by reasonable means, which may include lot analysis, manufacturer reputation, or reliability of source.

A manufactured drug product may be a source of active ingredient. Only manufactured drugs from containers labeled with a batch control number and a future expiration date are acceptable as a potential source of active ingredients. When compounding with manufactured drug products, the compounder must consider all ingredients present in the drug product relative to the intended use of the compounded preparation.

A compounder may not compound a drug preparation that appears on the FDA list of drug products withdrawn or removed from the market for safety reasons.

Compounding Nondrug Requirements

If the preparation is intended for use as a dietary or nutritional supplement (to supplement the diet) or cosmetic (e.g., to beautify), then the compounder must adhere to *Good Compounding Practices* ⟨1075⟩ and to this chapter, and must comply with any federal and state requirements.

CHECKLIST FOR ACCEPTABLE STRENGTH, QUALITY, AND PURITY

The following questions are to be considered carefully before compounding.

1. Have the physical and chemical properties and medicinal, dietary, and pharmaceutical uses of the drug substances been reviewed?
2. Are the quantity and quality of each active ingredient identifiable?
3. Will the active ingredients be effectively absorbed, locally or systemically according to the prescribed purpose, from the preparation and route of administration?
4. Are there added substances (see *Definitions*), confirmed or potentially present from manufactured products, that may be expected to cause an allergic reaction, irritation, toxicity, or undesirable organoleptic response from the patient? Are there added substances (see *Definitions*), confirmed or potentially present, that may be unfavorable (e.g., unsuitable pH or inadequate solubility)?
5. Were all calculations and measurements confirmed to ensure that the preparation will be compounded accurately (see *Pharmaceutical Calculations in Prescription Compounding* ⟨1160⟩)?

COMPOUNDED PREPARATIONS

The term *compounded preparations* includes the terms *compounded dosage forms, compounded drugs,* and *compounded formulations,* and means finished forms that are prepared by or under the direct supervision of a licensed compounder.

When controlled substances are used, check with state and federal authorities concerning their policies. Unless otherwise indicated or appropriate, compounded preparations are to be prepared to ensure that each preparation shall contain not less than 90.0% and not more than 110.0% of the theoretically calculated and labeled quantity of active ingredient per unit weight or volume and not less than 90.0% and not more than 110.0% of the theoretically calculated weight or volume per unit of the preparation. Compounded preparations include, but are not restricted to, the following pharmaceutical dosage forms described under *Pharmaceutical Dosage Forms* ⟨1151⟩.

Chromatographic Reagents

Capsules, Powders, Lozenges, and Tablets

When compounding these dosage forms, the compounder is to prepare an amount of the total formulation sufficient to allow the prescribed amount or quantity to be accurately dispensed. Selected practices and precautions for compounding these dosage forms include the following:

- reducing solid ingredients to the smallest reasonable particle size;
- implementing appropriate checks to ensure that all ingredients are blended to achieve a homogeneous mixture;
- monitoring humidity if moisture might cause hydrolysis, dosage form adhesion to containers, or softening or partial dissolution of capsule shells;
- accurately performing weighings to ensure that each unit shall be not less than 90% and not more than 110% of the theoretically calculated weight for each unit [NOTE—Preparations classified as dietary supplements are required by the U.S. Food and Drug regulations to be not less than 100% of the declared potency.]; and
- packaging dosage units according to container specifications for capsules and tablets of the specific active ingredient unless specified otherwise in individual monographs (see *Containers—Glass* ⟨660⟩ and *Containers—Plastic* ⟨661⟩).

Emulsions, Solutions, and Suspensions

When compounding these dosage forms, the compounder is to prepare a 2% to 3% excess amount of the total formulation to allow the prescribed amount to be accurately dispensed. Selected practices and precautions for compounding these dosage forms include the following.

- For single-unit containers, the weight of each filled container, corrected for tare weight, shall be the equivalent of not less than 100% and not more than 110% of the labeled volume.
- Aqueous suspensions are prepared by levigating the powder mixture to a smooth paste with an appropriate wetting agent. This paste is converted to a free-flowing fluid by adding adequate vehicle. Successive portions of the vehicle are used to wash the mortar, or other vessel, to transfer the suspension quantitatively to a calibrated dispensing bottle or graduate. The preparation may be homogenized to ensure a uniform final dispersion.
- Reducing solid ingredients to the smallest reasonable particle size.
- Solutions shall contain no visible undissolved matter when dispensed. [NOTE—An exception may occur with supersaturated solutions such as *Potassium Iodide Oral Solution*.]
- Emulsions and suspensions are labeled, "Shake well before using."

Suppositories

When compounding suppositories, the compounder is to prepare an excess amount of total formulation to allow the prescribed quantity to be accurately dispensed. Selected practices and precautions for compounding these dosage forms include the following:

- not using ingredients that are caustic or irritating, and thoroughly comminute solids that are abrasive to the mucous membranes;
- selecting a base that allows active ingredients to provide the intended local or systemic therapeutic effect;
- reducing solid ingredients to the smallest reasonable particle size; and
- weighing a representative number of suppositories to ensure that each is not less than 90% and not more than 110% of the average weight of all suppositories in the batch.

Creams, Topical Gels, Ointments, and Pastes

When compounding semisolid dosage forms, the compounder is to prepare an excess amount of total formulation to allow the prescribed quantity to be accurately dispensed. Selected practices and precautions for compounding these dosage forms include the following:

- not using ingredients that are caustic, irritating, or allergenic to the skin or other application sites unless they are necessary for a treatment;
- selecting a base or vehicle that allows active ingredients to provide the intended local or systemic therapeutic effect;
- reducing solid ingredients to the smallest reasonable particle size;
- geometrically incorporating the active ingredients with the added substances to achieve a uniform liquid or solid dispersion in the dosage form; and
- observing the uniformity of the dispersion by spreading a thin film of finished formulation on a flat transparent surface (e.g., clear glass ointment slab).

COMPOUNDING PROCESS

The compounders are to consider using the following steps to minimize error and maximize the prescriber's intent.

1. Judge the suitability of the prescription to be compounded in terms of its safety and intended use. Determine what legal limitations, if any, are applicable.
2. Perform necessary calculations to establish the amounts of ingredients needed (see *Pharmaceutical Calculations in Prescription Compounding* ⟨1160⟩).
3. Identify equipment needed.
4. Don the proper attire and wash hands.
5. Clean the compounding area and needed equipment.
6. Only one prescription should be compounded at one time in a specified compounding area.
7. Assemble all necessary materials to compound the prescription.
8. Compound the preparation following the formulation record or prescription (see *Compounding Records and Documents* below), according to the art and science of pharmacy.
9. Assess weight variation, adequacy of mixing, clarity, odor, color, consistency, and pH as appropriate.
10. Annotate the compounding log, and describe the appearance of the formulation.
11. Label the prescription containers to include the following items: a) the name of the preparation; b) the internal identification number; c) the beyond-use date (see *Beyond-Use Labeling*); d) the initials of the compounder who prepared the label; e) any storage requirements; and f) any other statements required by law.
12. Sign and date the prescription affirming that all procedures were carried out to ensure uniformity, identity, strength, quantity, and purity.
13. Thoroughly and promptly clean all equipment, and store properly.

COMPOUNDING RECORDS AND DOCUMENTS

All compounders who dispense prescriptions must comply with the record-keeping requirements of their individual states. If the compounder compounds a preparation according to the manufacturer's labeling instructions, then further documentation is not required. All other compounded preparations require further documentation. Such compounding documents are to list the ingredients and the quantity of each in the order of the compounding process.

The objective of the documentation is to allow another compounder to reproduce the identical prescription at a future date. The formulation record provides a consistent source document for preparing the preparation (recipe), and the compounding record documents the actual ingredients in the preparation and the person responsible for the compounding

activity. These records are to be retained for the same period of time that is required for any prescription under state law. The record may be a copy of the prescription in written or machine readable form that includes a formulation record, a compounding record, and a Material Safety Data Sheets (MSDS) file.

Formulation Record

The formulation record is a file of individually compounded preparations. This record must list the name, strength, and dosage form of the preparation compounded, all ingredients and their quantities, equipment needed to prepare the preparation, when appropriate, and mixing instructions. Mixing instructions should include the order of mixing, mixing temperatures or other environmental controls, such as the duration of mixing, and other factors pertinent to the replication of the preparation as compounded. The formulation record must include an assigned beyond use date, the container used in dispensing, the storage requirements, and any quality control procedures.

Compounding Record

The compounding record contains documentation of the name and strength of the compounded preparation, the formulation record reference for the preparation, and the sources and lot numbers of ingredients. The compounding record also includes information on the total number of dosage units compounded, the name of the person who prepared the preparation and the name of the compounder who approved the preparation, the date of preparation, the assigned internal identification number or the prescription number and an assigned beyond use date, and the prescription number. For all compounded preparations, results of quality control procedures are to be recorded (e.g., weight range of filled capsules). When compounding problems occur with preparations prepared according to USP compounding monographs, the compounder must complete a USP Monograph Experience Reporting Form, and submit the form to USP for evaluation.

MSDS File

MSDS are to be readily accessible to all employees working with drug substances or bulk chemicals located on the compounding facility premises. Employees are to be instructed on how to retrieve and interpret needed information.

QUALITY CONTROL

The safety, quality, and performance of compounded preparations depend on correct ingredients and calculations, accurate and precise measurements, appropriate formulation conditions and procedures, and prudent pharmaceutical judgment. As a final check, the compounder is to review each procedure in the compounding process. To ensure accuracy and completeness, the compounder is to observe the finished preparation to ensure that it appears as expected and is to investigate any discrepancies and take appropriate corrective action before the prescription is dispensed to the patient (see the *Checklist for Acceptable Strength, Quality, and Purity,* the appropriate pharmaceutical dosage form under *Compounded Preparations,* and the steps under *Compounding Process*).

VERIFICATION

Compounding procedures that are routinely performed, including batch compounding, shall be completed and verified according to written procedures. The act of verification of a compounding procedure involves checking to ensure that calculations, weighing and measuring, order of mixing, and compounding techniques were appropriate and accurately performed.

PATIENT COUNSELING

The patient or the patient's agent should be counseled about proper use, storage, and evidence of instability in the compounded preparation at the time of dispensing (see *Responsibility of the Pharmacist* under *Stability Considerations in Dispensing Practice* ⟨1191⟩).

▪INTRODUCTION

The purpose of this chapter is to provide compounders with guidance on applying good compounding practices for the preparation of nonsterile compounded formulations for dispensing and/or administration to humans or animals. Compounding is an integral part of pharmacy practice and is essential to the provision of health care. This chapter and applicable monographs on formulation help define what constitutes good compounding practices. Furthermore this chapter provides general information to enhance the compounder's ability in the compounding facility to extemporaneously compound preparations that are of acceptable strength, quality, and purity. It is expected that pharmacists and others engaged in the compounding of drug preparations will comply with applicable state and federal compounding laws, regulations, and guidelines.

DEFINITIONS

ACTIVE PHARMACEUTICAL INGREDIENT (API)—Any substance or mixture of substances intended to be used in the compounding of a drug preparation, thereby becoming the active ingredient in that preparation and intended to furnish pharmacological activity or other direct effect in the diagnosis, cure, mitigation, treatment, or prevention of disease in humans and animals or to affect the structure and function of the body.

ADDED SUBSTANCES—Ingredients that are necessary to compound a preparation but are not intended or expected to cause a pharmacologic response if administered alone in the amount or concentration contained in a single dose of the compounded preparation. The term added substances is used synonymously with the terms inactive ingredients, excipients, and pharmaceutical ingredients.

BEYOND-USE DATE (BUD)—The date after which a compounded preparation is not to be used and is determined from the date the preparation is compounded.

COMPONENT—Any ingredient used in the compounding of a drug preparation, including any active ingredient or added substance that is used in its preparation.

COMPOUNDER—A professional authorized by the appropriate jurisdiction to perform compounding pursuant to a prescription or medication order by a licensed prescriber.

COMPOUNDING—The preparation, mixing, assembling, packaging, and labeling of a drug or device in accordance with a licensed practitioner's prescription, medication order, or initiative based on the practitioner/patient/pharmacist/compounder relationship in the course of professional practice. Compounding includes the following:

- Preparation of drug dosage forms for both human and animal patients.
- Preparation of drugs or devices in anticipation of prescription drug orders based on routine, regularly observed prescribing patterns.
- Reconstitution or manipulation of commercial products that may require the addition of one or more ingredients.
- Preparation of drugs or devices for the purposes of, or as an incident to, research, teaching, or chemical analysis.
- Preparation of drugs and devices for prescriber's office use where permitted by federal and state law.

HAZARDOUS DRUG—Any drug identified by at least one of the following six criteria:

- Carcinogenicity,
- Teratogenicity or developmental toxicity,
- Reproductive toxicity in humans,
- Organ toxicity at low doses in humans or animals,
- Genotoxicity,
- New drugs that mimic existing hazardous drugs in structure or toxicity [see current National Institute for Occupational Safety and Health (NIOSH) publications].

MANUFACTURING—The production, propagation, conversion, or processing of a drug or device, either directly or indirectly, by extraction of the drug from substances of natural origin or by means of chemical or biological synthesis. Manufacturing also includes (1) any packaging or repackaging of the substance(s) or labeling or relabeling of containers for the promotion and marketing of such drugs or devices; (2) any preparation of a drug or device that is given or sold for resale by pharmacies, practitioners, or other persons; and (3) the preparation of any quantity of a drug product without a licensed prescriber/patient/licensed pharmacist/compounder relationship.

PREPARATION—For the purposes of this chapter, a compounded drug dosage form, dietary supplement, or device. This term will be used to describe compounded formulations while the term product will be used to describe manufactured pharmaceutical dosage forms. (For the definitions of official substances and official preparations, see *General Notices and Requirements*.)

STABILITY—The extent to which a preparation retains, within specified limits, and throughout its period of storage and use, the same properties and characteristics that it possessed at the time of compounding. See the table *Criteria for Acceptable Levels of Stability* in the general information chapter *Stability Considerations in Dispensing Practice* ⟨1191⟩.

VEHICLE—A component for internal or external use that is used as a carrier or diluent in which liquids, semi-solids, or solids are dissolved or suspended. Examples include, but are not limited to, water, syrups, elixirs, oleaginous liquids, solid and semi-solid carriers, and proprietary products.

CATEGORIES OF COMPOUNDING

In the three general categories of nonsterile compounding described in this section, it is to be understood by compounders that there are different levels of experience, training, and physical facilities associated with each category.

Criteria used to determine overall classification include

- degree of difficulty of the compounding process,
- stability information and warnings,
- packaging and storage requirements,
- dosage forms,
- complexity of calculations,
- local versus systemic biological disposition,
- level of risk to the compounder, and
- potential for risk of harm to the patient.

See chapter ⟨797⟩ for risk levels associated with sterile preparations. Specialty areas such as radiopharmaceuticals require special training and are beyond the scope of this chapter. Compounders shall acquire and maintain knowledge and skills in all areas (e.g., dosage form, patient population, and medical specialty) for which they compound.

Categories

Simple—Making a preparation that has a *USP* compounding monograph or that appears in a peer-reviewed journal article that contains specific quantities of all components, compounding procedure and equipment, and stability data for that formulation with appropriate BUDs. Examples include Captopril Oral Solution, Indomethacin Topical Gel, and Potassium Bromide Oral Solution, Veterinary.

Moderate—Making a preparation, including but not limited to those with a *USP* monograph or with a peer-reviewed journal article, that requires special calculations or procedures (such as calibration of dosage unit mold cavities) to determine quantities of components per preparation or per individualized dosage units; or making a preparation for which stability data for that specific formulation is not available. Examples include Morphine Sulfate Suppositories, diphenhydramine hydrochloride troches, and mixing two or more manufactured cream products when the stability of the mixture is not known.

Complex—Making a preparation that requires special training, environment, facilities, equipment, and procedures to ensure appropriate therapeutic outcomes. Examples of possible complex preparation types include transdermal dosage forms, modified-release preparations, and some inserts and suppositories for systemic effects.

RESPONSIBILITIES OF THE COMPOUNDER

The compounder is responsible for compounding preparations of acceptable strength, quality, and purity, and in accordance with the prescription or medication order. The compounder is also responsible for dispensing the finished preparation, with appropriate packaging and labeling, and in compliance with the requirements established by the applicable State Board of Pharmacy and other regulatory agencies where appropriate. Individuals who are engaged in drug or dietary supplement compounding shall be proficient in compounding and should continually expand their compounding knowledge by participating in seminars and/or studying appropriate literature. They shall be knowledgeable of the contents of this general test chapter *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩, and should be

familiar with *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩, *Pharmaceutical Dosage Forms* ⟨1151⟩, *Pharmaceutical Calculations in Prescription Compounding* ⟨1160⟩, *Quality Assurance in Pharmaceutical Compounding* ⟨1163⟩, *Stability Considerations in Dispensing Practice* ⟨1191⟩, *Prescription Balances and Volumetric Apparatus* ⟨1176⟩, and all applicable compounding laws, guidelines, and standards.

To ensure the quality of compounded preparations, compounders shall adhere to the following general principles (additional information on these general principles is provided in the sections that follow.)

General Principles of Compounding

1. Personnel are appropriately trained, and are capable and qualified to perform their assigned duties.
2. Compounding ingredients of the appropriate grade and quality are purchased from reliable sources and are properly stored.
3. Bulk component containers are labeled with appropriate Occupational Safety and Health Administration (OSHA) hazard communication labels, and Material Safety Data Sheets (MSDS) are available to compounding personnel for all drugs and chemicals used in compounding.
4. All equipment used in compounding is clean, properly maintained, and used appropriately.
5. The compounding environment is suitable for its intended purpose; and procedures are implemented to prevent cross-contamination, especially when compounding with drugs (e.g., hazardous drugs and known allergens like penicillin) that require special precautions.
6. Only authorized personnel are allowed in the immediate vicinity of the drug compounding operations.
7. There is assurance that processes are always carried out as intended or specified and are under control.
8. Compounding conditions and procedures are adequate for preventing errors.
9. All aspects of compounding are appropriately documented.
10. Adequate procedures and records exist for investigating and correcting failures or problems in compounding, testing, or in the preparation itself.

COMPOUNDING PROCESS

The compounder is responsible for ensuring that each individual incidence of compounding meets the criteria given in this section (additional information on these criteria is provided in the sections that follow).

Criteria When Compounding Each Drug Preparation

1. The dose, safety, and intended use of the preparation or device has been evaluated for suitability in terms of the chemical and physical properties of the components, dosage form, and route of administration, including local and systemic biological disposition; and legal limitations, if any.
2. Ingredients used in the formulation have their expected identity, quality, and purity. If for humans or food-producing animals, the ingredients are not on the list of federally recognized drugs that have been withdrawn or removed from the market for safety reasons. Certificates of Analysis, when available, and MSDS have been consulted for all ingredients used.
3. Compounding is done in a clean area dedicated to this activity.
4. Only one preparation is compounded at one time in a specific workspace.

5. Appropriate compounding equipment has been selected and inspected for cleanliness and correct functioning, and is properly used.
6. A reliable BUD is established to ensure that the finished preparation has its expected potency, purity, quality, and characteristics, at least until the labeled BUD.
7. Personnel engaged in compounding have washed properly and wear clean clothing appropriate to the type of compounding performed, e.g., hair bonnets, coats, gowns, gloves, facemasks, shoes, aprons, or other items as needed for protection of personnel from chemical exposures and for prevention of drug contamination.
8. The preparation is made in accordance with this chapter, other official standards referenced in this chapter, and relevant scientific data and information.
9. Critical processes are verified to ensure that procedures, when used, will consistently result in the expected qualities in the finished preparation.
10. The final preparation is assessed using such factors as weight, adequacy of mixing, clarity, odor, color, consistency, and pH as appropriate, and this information is recorded on the Compounding Record.
11. The preparation is packaged as recommended in the *Packaging* section of this chapter.
12. The preparation container is labeled according to all applicable state and federal laws. The label should include the BUD and storage and handling information as well as a statement that ''this is a compounded preparation.''
13. The Master Formulation Record and the Compounding Record have been reviewed by the compounder to ensure that errors have not occurred in the compounding process.
14. The preparation is delivered to the patient or caregiver with the appropriate consultation.

COMPOUNDING FACILITIES

Compounding facilities shall have an adequate space that is specifically designated for compounding of prescriptions. This space shall provide for the orderly placement of equipment and materials to prevent mixups between ingredients, containers, labels, in-process materials, and finished preparations, and is designed, arranged, and used to prevent adventitious cross-contamination. Areas used for sterile preparations are to be separated and distinct from the nonsterile compounding area (see *Environmental Quality and Control* under *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩).

Potable water is to be supplied for hand and equipment washing. This water meets the standards prescribed in the EPA's National Primary Drinking Water Regulations (40 CFR Part 141). Purified Water must be used for compounding nonsterile drug preparations when formulations indicate the inclusion of water. Purified Water must also be used for rinsing equipment and utensils. In those cases when a water is used to prepare a sterile preparation, follow the appropriate monographs and general chapters.

The plumbing system shall be free of defects that could contribute to contamination of any compounded preparation. Adequate hand and equipment washing facilities shall be easily accessible to the compounding areas. Such facilities shall include, but are not limited to, hot and cold water, soap or detergent, and an air-drier or single-use towels. The areas used for compounding shall be maintained in clean, orderly, and sanitary conditions, and shall be maintained in a good state of repair. Waste shall be held and disposed of in a sanitary and timely manner and in accordance with local, state, and federal guidelines.

The entire compounding and storage area is to be well-lighted. Heating, ventilation, and air conditioning systems are to be controlled to avoid decomposition and

contamination of chemicals (see *Storage Temperature and Humidity* under *Preservation, Packaging, Storage, and Labeling* in the *General Notices and Requirements* and the manufacturers' labeled storage conditions). All components, equipment, and containers shall be stored off the floor and in a manner to prevent contamination and permit inspection and cleaning of the compounding and storage area.

Hazardous drugs shall be prepared for administration only under conditions that protect the healthcare workers and other personnel in the preparation and storage areas. Hazardous drugs shall be stored separately from other inventory in a manner to prevent contamination and personnel exposure. The following are references for the safe handling of antineoplastic and hazardous drugs in health care settings:

- OSHA Technical Manual—Section VI: Chapter 2, *Controlling Occupational Exposure to Hazardous Drugs*.
- NIOSH Alert: *Preventing Occupational Exposure to Antineoplastic and Other Hazardous Drugs in Health Care Settings* (DHHS (NIOSH) Publication No. 2004-165).

Disposal of all hazardous drug wastes shall comply with all applicable federal and state regulations. All personnel who perform routine custodial waste removal and cleaning activities in storage and preparation areas for hazardous drugs shall be trained in appropriate procedures to protect themselves and prevent contamination.

COMPOUNDING EQUIPMENT

The equipment and utensils used for compounding of a drug preparation shall be of appropriate design and capacity. The equipment shall be of suitable composition such that the surfaces that contact components are neither reactive, additive, nor sorptive and therefore will not affect or alter the purity of the compounded preparations. The types and sizes of equipment will depend on the dosage forms and the quantities compounded (see *Prescription Balances and Volumetric Apparatus* ⟨1176⟩, and equipment manufacturers' instruction manuals).

The equipment shall be stored in such a manner as to protect it from contamination, and shall be located in such a place as to facilitate operations for its use, maintenance, and cleaning. Automated, mechanical, electronic, and other types of equipment used in compounding or testing of compounded preparations shall be routinely inspected, calibrated as necessary, and checked to ensure proper performance.

Immediately prior to initiation of compounding operations, the equipment shall be inspected by the compounder to determine its suitability for use. After use, the equipment shall be appropriately cleaned. Extra care should be used when cleaning equipment used in compounding preparations requiring special precaution, e.g., antibiotics, cytotoxins, cancer drugs, and other hazardous materials. When possible, special equipment shall be dedicated for such use, or when the same equipment is being used for all drug products, appropriate procedures must be in place to allow meticulous cleaning of equipment prior to use with other drugs.

COMPONENT SELECTION, HANDLING, AND STORAGE

The following guidelines shall be followed when selecting, handling, and storing components for compounded preparations.

1. A *USP, NF,* or *FCC* grade substance is the preferred source of ingredients for compounding all preparations.
2. The compounder must first attempt to use components manufactured in an FDA-registered facility. When components are not obtainable from an FDA-registered facility, compounders shall use their professional judgment in selecting a source deemed acceptable and reliable and shall establish purity and

safety by reasonable means, which may include lot analysis, manufacturer reputation, or reliability of source.

3. Official compounded preparations are prepared from ingredients that meet requirements of the compendial monograph for those individual ingredients for which monographs are provided. These preparations may be labeled ''USP'' or ''NF'' as appropriate.
4. When components of compendial quality are not obtainable, components of high quality such as those that are chemically pure, analytical reagent grade or American Chemical Society-certified may be used.
5. For components in containers that have an expiration date from the manufacturer or distributor, the material may be used in compounding before that expiration date (a) when the material is stored in its original container under conditions to avoid decomposition of the chemicals (see *Storage under Nonspecific Conditions* under *Preservation, Packaging, Storage, and Labeling* in the *General Notices and Requirements* unless other conditions are noted on the label), (b) when there is minimal exposure of the remaining material each time material is withdrawn from the container, and (c) when any withdrawals from the container are by those trained in the proper handling of the material. If the component has been transferred to a different container, a new appropriate expiration date must be assigned. The new container shall be identified with the component name, the original supplier, the lot or control number, and the transfer date.
6. For components that do not have expiration dates assigned by the manufacturer or supplier, the compounder shall label the container with the date of receipt and assign a conservative expiration date, not to exceed three years after receipt, to the component based on the nature of the component and its degradation mechanism, the container in which it is packaged, and the storage conditions.
7. A manufactured drug product may be a source of active ingredient. When a manufactured drug product is used as the source of the active ingredient, the manufacturer's product container must be labeled with a batch control number and a future expiration date to be acceptable. When compounding with manufactured drug products, the compounder must consider all ingredients, including excipients, present in the drug product relative to the intended use of the compounded preparation.
8. If the preparation is intended for use as a dietary or nutritional supplement or cosmetic, then the compounder must adhere to this chapter, and must also comply with any federal and state requirements. Generally, dietary supplements are prepared from ingredients that meet *USP, FCC*, or *NF* standards. Where such standards do not exist, substances may be used in dietary supplements if they have been shown to be acceptable food grade quality using other suitable procedures.
9. When a component is derived from ruminant animals (e.g., bovine, caprine, ovine) the supplier shall provide written assurance that these animals were certified free of bovine spongiform encephalopathy (BSE).
10. When compounding for humans or food-producing animals, the compounder shall not use components that have been withdrawn from the market for safety reasons by the FDA.
11. All components to be used in the compounding of preparations must be stored as directed by the manufacturer, or according to *USP, NF,* or *FCC* monograph requirements, in a clean, dry area, under appropriate temperature conditions (controlled room temperature, refrigerator, or freezer). All com-

ponents shall be stored off the floor, handled and stored to prevent contamination, and rotated so that the oldest stock is used first. All containers shall be properly labeled.

STABILITY CRITERIA AND BEYOND-USE DATING

The BUD is the date after which a compounded preparation is not to be used and is determined from the date the preparation is compounded. Because compounded preparations are intended for administration immediately or following short-term storage, their BUDs are assigned based on criteria different from those applied to assigning expiration dates to manufactured drug products.

Compounders are to consult and apply drug-specific and general stability documentation and literature when available, and are to consider the nature of the drug and its degradation mechanism, the container in which it is packaged, the expected storage conditions, and the intended duration of therapy when assigning a BUD (see *Expiration Date and Beyond-Use Date* under *Labeling* in the *General Notices and Requirements*). BUDs are to be assigned conservatively. When using manufactured solid dosage forms to prepare a solution or aqueous suspension, the compounder is also to consider factors such as hydrolysis, oxidation, and the freeze-thaw property of the final preparation before assigning a BUD. In assigning a BUD for a compounded drug preparation, in addition to using all available stability information, the compounder is also to use his or her pharmaceutical education and experience.

When a manufactured product is used as the source of the API for a nonsterile compounded preparation, the product expiration date cannot be used directly to assign a BUD for the compounded preparation. Instead, the compounder shall refer to the manufacturer for stability information and to the literature for applicable information on stability, compatibility, and degradation of ingredients. All stability data must be carefully interpreted in relation to the actual compounded formulation.

At all steps in the compounding, dispensing, and storage process, the compounder is to observe the compounded drug preparation for signs of instability. For more specific details of some of the common physical signs of deterioration, see *Observing Products for Evidence of Instability* under *Stability Considerations in Dispensing Practice* ⟨1191⟩. However, excessive chemical degradation and other drug concentration loss due to reactions may be invisible more often than they are visible.

General Guidelines for Assigning Beyond-Use Dates

In the absence of stability information that is applicable to a specific drug and preparation, the following maximum BUDs are recommended for nonsterile compounded drug preparations that are packaged in tight, light-resistant containers and stored at controlled room temperature unless otherwise indicated and for sterile preparations where a program of sterility testing is in place (see *Preservation, Packaging, Storage, and Labeling* in the *General Notices and Requirements*). Drugs or chemicals that are known to be labile to decomposition will necessitate shorter BUDs.

For Nonaqueous Formulations—The BUD is not later than 25% of the time remaining until the earliest expiration date of any API or 6 months, whichever is earlier. The BUD shall not be later than the expiration date on the container of any component.

For Water-Containing Oral and Sterile Liquid Formulations—The BUD is not later than 14 days when stored at controlled cold temperatures.

For Water-Containing External-Use Liquid and Semi-Solid Formulations—The BUD is not later than 30 days.

Water-containing preparations and other susceptible preparations should contain suitable antimicrobial agents to protect against bacteria, yeast, and mold contamination inadvertently introduced during or subsequent to the compounding process. When antimicrobial preservatives are contraindicated in such compounded preparations, storage of the preparation at controlled cold temperature is necessary; to ensure proper storage and handling of such compounded preparations by the patient or caregiver, appropriate patient instruction and consultation is essential. Antimicrobial preservatives should not be used as a substitute for good compounding practices.

For information on assigning BUDs when repackaging drug products for dispensing or administration, see *Expiration Date and Beyond-Use Date* under *Preservation, Packaging, Storage, and Labeling* in the *General Notices and Requirements*, and *Repackaging in Single-Unit Containers and Unit-Dose-Containers for Nonsterile Solid and Liquid Dosage Forms* ⟨681⟩.

Assurance of sterility in a compounded sterile preparation is mandatory. Compounding and packaging of sterile drugs (including ophthalmic preparations) requires strict adherence to guidelines presented in the general chapter *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩ and in the manufacturers' labeling instructions.

PACKAGING AND DRUG PREPARATION CONTAINERS

The compounder shall ensure that the containers and container closures used in packaging compounded preparations meet USP requirements (see *Containers* under *Preservation, Packaging, Storage, and Labeling* in the *General Notices and Requirements*, *Containers—Plastics* ⟨661⟩, and *Containers—Permeation* ⟨671⟩), and when available, compounding monographs. Containers and container closures intended for compounding of sterile preparations must be handled as described in *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩.

The containers and closures shall be made of suitable clean material so as not to alter the quality, strength, or purity of the compounded drug preparation. The container used depends on the physical and chemical properties of the compounded preparation. Container-drug interaction is to be considered with substances that have sorptive or leaching properties.

The containers and closures shall be stored off the floor, handled and stored to prevent contamination, and rotated so that the oldest stock is used first. The containers and container closures shall be stored in such a way as to permit inspection and cleaning of the storage area.

COMPOUNDING DOCUMENTATION

Documentation enables a compounder, whenever necessary, to systematically trace, evaluate, and replicate the steps included throughout the preparation process of a compounded preparation. All compounders who dispense prescriptions must comply with the record keeping requirements of their State Boards of Pharmacy. When the compounder compounds a preparation according to the manufacturer's labeling instructions, then further documentation is not required. All other compounded preparations require further documentation as described in this section.

These records are to be retained for the same period of time that is required for any prescription under state law. The record may be a copy of the prescription in written or machine readable form, and includes a Master Formulation Record and a Compounding Record.

Master Formulation Record

This record shall include

- name, strength, and dosage form of the preparation;
- calculations needed to determine and verify quantities of components and doses of active pharmaceutical ingredients;
- description of all ingredients and their quantities;
- compatibility and stability information including references when available;
- equipment needed to prepare the preparation, when appropriate;
- mixing instructions that should include
  1. order of mixing,
  2. mixing temperatures or other environmental controls,
  3. duration of mixing, and
  4. other factors pertinent to the replication of the preparation as compounded;
- assigned BUD;
- container used in dispensing;
- packaging and storage requirements; and
- quality control procedures.

Compounding Record

The Compounding Record shall contain

- name and strength of the compounded preparation;
- Master Formulation Record reference for the preparation;
- sources, lot numbers, and expiration dates of ingredients;
- total quantity compounded;
- name of the person who prepared the preparation and the name of the compounder who approved the preparation;
- date of preparation;
- assigned internal identification number or the prescription number;
- assigned BUD; and
- results of quality control procedures (e.g., weight range of filled capsules, pH of aqueous liquids, etc.).

Standard Operating Procedures

All significant procedures performed in the compounding area should be covered by standard operating procedures (SOPs). Procedures should be developed for the facility, equipment, personnel, preparation, packaging, and storage of compounded preparations to ensure accountability, accuracy, quality, safety, and uniformity in compounding. Implementing SOPs establishes procedural consistency and also provides a reference for orientation and training of personnel.

Material Safety Data Sheets File

Material Safety Data Sheets shall be readily accessible to all employees working with drug substances or bulk chemicals located on the compounding facility premises. Employees are to be instructed on how to retrieve and interpret needed information.

QUALITY CONTROL

The safety, quality, and performance of compounded preparations depend on correct ingredients and calculations, accurate and precise measurements, appropriate formulation conditions and procedures, and prudent pharmaceutical judgment. As a final check, the compounder shall review each procedure in the compounding process. To ensure accuracy and completeness, the compounder shall observe the finished preparation to ensure that it appears as expected and shall investigate any discrepancies and take appropriate corrective action before the prescription is dispensed to the patient.

Compounding Controls

1. The compounder shall ensure that there are written procedures for the compounding of drug preparations to ensure that the finished preparations have the identity, strength, quality, and purity that they purport to have. These procedures shall be available in either written form or electronically stored with printable documentation as described in the section *Compounding Documentation*.
2. The written procedures shall be followed in execution of the compounding process.
3. The compounder shall check and recheck each procedure at each stage of the process.
4. The compounder shall have established written procedures that will describe the tests or examinations to be conducted on the preparation compounded (e.g., the degree of weight variation among capsules) to assure uniformity and integrity of compounded drug preparations.
5. Appropriate control procedures shall be established to monitor the output and to validate the performance of those compounding processes and equipment that may be responsible for causing variability in the final compounded preparations.
6. For further guidance on recommended quality control procedures, see *Quality Assurance in Pharmaceutical Compounding* ⟨1163⟩.

PATIENT COUNSELING

At the time of dispensing, the patient or the patient's agent shall be counseled about proper use, storage, handling, and disposal of the compounded preparation. The patient or the patient's agent shall also be instructed to observe and report to the compounder any changes in the physical characteristics of the compounded preparation (see *Responsibility of the Pharmacist* under *Stability Considerations in Dispensing Practice* ⟨1191⟩). The compounder shall investigate any reported problem with a compounded preparation and take corrective action.

TRAINING

All personnel involved in the compounding, evaluation, packaging, and dispensing of compounded preparations shall be properly trained for the type of compounding conducted. It is the responsibility of the compounder to ensure that a training program has been implemented and that it is ongoing. Steps in the training procedure include the following:

- All employees involved in pharmaceutical compounding shall read and become familiar with this general chapter *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩. They should also be familiar with the contents of the USP *Pharmacists' Pharmacopeia* and other relevant publications, including how to read and interpret MSDS.
- All employees shall read and become familiar with each of the procedures related to compounding, including those involving the facility, equipment, personnel, actual compounding, evaluation, packaging, storage, and dispensing.
- All personnel who compound hazardous drugs shall be fully trained in the storage, handling, and disposal of these drugs. This training shall occur prior to preparing or handling hazardous drugs. For information on training for personnel who compound hazardous drugs, see the references in the section *Compounding Facilities* earlier in this chapter.
- All training activities shall be documented. The compounder shall meet with employees to review their work and answer any questions the employees may have concerning compounding procedures.
- The compounder shall demonstrate the procedures for the employee, and observe and guide the employee throughout the training process. The employ-

ee will then repeat the procedure without any assistance from, but under the direct supervision of, the compounder.

- When the employee has demonstrated to the compounder a verbal and functional knowledge of the procedure, then and only then, will the employee be permitted to perform the procedure without direct supervision. However, the compounder should be physically present and shall approve all ingredients and their quantities, and the final preparation.
- When the compounder is satisfied with the employee's knowledge and proficiency, the compounder will sign the documentation records to show that the employee was appropriately trained.
- The compounder shall continually monitor the work of the employee and assure that the employee's calculations and work are accurate and adequately performed.
- The compounder is solely responsible for the finished preparation.

COMPOUNDING FOR ANIMAL PATIENTS

A compounder's responsibility for providing patients with high quality compounded preparations extends beyond the human species. All portions of this chapter ⟨795⟩ apply to compounds prepared for animal patients. Intended use (e.g., companion, performance, food) of any animal patient shall be determined prior to compounding for that patient.

Because humans can consume animal patients as food, care must be taken to prevent drug residues from entering the human food chain when compounded preparations are used in animal patients. For this reason, all compounders preparing formulations for animals shall possess a functional knowledge of drug regulation and disposition in animal patients. Veterinarians are required by law to provide food-producing animal caregivers with an accurate length of time to withhold treated animal tissues (e.g. meat, milk, and eggs) from the human food supply. This length of time is referred to as a withdrawal time (WDT) and must also, by law, be included on the dispensing label of every prescription prepared for a food–producing species.

Drug use in any performance animal is strictly regulated by federal and state governments, in addition to the governing bodies of each of the specific disciplines. Penalties for violation of these rules may be severe for all contributing to the violation, including the veterinarian, pharmacist, and caregiver.

The pharmacist shall be knowledgeable of the individual species limitations in physiology and metabolic capacity that can result in toxicity when certain drugs or excipients are utilized in compounded preparations. For this reason, compounders preparing compounds for animals should utilize, when at all possible, formulations specifically developed for animal patients. If such formulations are not available, the compounder shall conduct a literature review to determine whether a specific component of the formula is toxic to the target species. Extrapolating compounding formulations intended for use in humans may not be appropriate for animal species and may contribute to negative outcomes.

Veterinarians and pharmacists preparing compounds for animal patients should be familiar with all state and federal regulations regarding drug use in animals, including but not limited to the Food, Drug, and Cosmetic Act; the Animal Drug Amendment; the Animal Medicinal Drug Use Clarification Act; FDA's Compliance Policy Guideline for Compounding of Drugs for Use in Animal Patients.

See the *Veterinary* sections of the *Pharmacists' Pharmacopoeia.*■2S (*USP33*)

GENERAL CHAPTERS

General Information

BRIEFING

⟨**1075**⟩ **Good Compounding Practices,** *USP 32* page 523. It is proposed to delete this general information chapter. See also the briefing under *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩.

■⟨1075⟩ GOOD COMPOUNDING PRACTICES

The purpose of this chapter is to provide compounders with guidance on applying good compounding practices for the preparation of compounded formulations for dispensing and/or administration to humans or animals. This chapter is intended to provide information as a supplement to other relevant chapters. The following discussion is applicable to those engaged in compounding preparations in all pharmacies. It is expected that pharmacists or compounders engaged in the compounding of drugs will compound in conformance with applicable state and federal compounding laws, regulations, or guidelines.

APPLICABLE DEFINITIONS

Compounding (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩)—Compounding involves the preparation, mixing, assembling, packaging, and labeling of a drug or device in accordance with a licensed practitioner's prescription of medication order under an initiative based on the practitioner/patient/pharmacist/compounder relationship in the course of professional practice. Compounding includes the following:

a. Preparation of drugs or devices in anticipation of prescription drug orders based on routine, regularly observed prescribing patterns.
b. Reconstitution or manipulation of commercial products that may require the addition of one or more ingredients as a result of a licensed practitioner's prescription drug order.
c. Preparation of drugs or devices for the purposes of, or as an incident to, research, teaching, or chemical analysis.

Categories of Compounding—The categories of compounding are intended to provide an understanding among compounders when different forms of preparations are compounded. It is to be understood that there are levels of training associated with each category. In the categories of compounding described below, certain criteria were used to determine the overall classification.

Category 1	Nonsterile—Simple Generally, the mixing of two or more commercial products
Category 2	Nonsterile—Complex Generally, compounding with the bulk drug substances or when calculations are required.
Category 3	Sterile—Risk Level I (See *Low-Risk Level* in USP general chapter ⟨797⟩)
Category 4	Sterile—Risk Level II (See *Medium-Risk Level* in USP general chapter ⟨797⟩)
Category 5	Sterile—Risk Level III (See *High-Risk Level* in USP general chapter ⟨797⟩)
Category 6	Radiopharmaceuticals Preparation of radiopharmaceuticals
Category 7	Veterinary Preparation of veterinary pharmaceuticals

Manufacturing—Manufacturing involves the production, propagation, conversion, or processing of a drug or device, either directly or indirectly, by extraction of the drug from substances of natural origin or by means of chemical or biological synthesis. Manufacturing also includes (1) any packaging or repackaging of the substance(s) or labeling or relabeling of containers for the promotion and marketing of such drugs or devices; (2) any preparation of a drug or device that is given or sold for resale by pharmacies, practitioners, or other persons; (3) the distribution of inordinate amounts of compounded preparations or the copying of commercially available drug products; and (4) the preparation of any quantity of a drug product without a licensed prescriber/patient/licensed pharmacist/compounder relationship.

Component—A component is any ingredient used in the compounding of a drug product, including any that are used in its preparation, but may not appear on the labeling of such a product. (See *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩ for additional definitions.)

Compounder—A compounder is a professional authorized by the state to perform compounding pursuant to a prescription order by a licensed prescriber.

RESPONSIBILITIES OF THE COMPOUNDER

a. Compounders who are engaged in drug compounding or nutriceutical compounding shall be proficient in compounding and should continually expand their compounding knowledge by participating in seminars and/or studying appropriate literature.
b. A compounder must be familiar with all of the details of *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩, *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩, *Pharmaceutical Calculations in Prescription Compounding* ⟨1160⟩, and other applicable state or federal compounding guidelines or laws. In addition, the compounder must be responsible for the following:
   • certifying all prescription orders;
   • approving or rejecting all components, drug product containers, closures, in-process materials, and labeling;
   • preparing and reviewing all compounding records to assure that errors have not occurred in the compounding process;

Chromatographic Reagents

- assuring the proper maintenance, cleanliness, and use of all equipment used in a prescription compounding practice;
- assuring that only authorized personnel shall be in the immediate vicinity of the drug compounding operations;
- assuring that the drug product and components of drug products are not on the list of federally recognized drug products that have been withdrawn or removed from the market for public health reasons.

a. The compounder must ensure that personnel engaged in compounding wear clean clothing appropriate to the type of compounding performed, e.g., coats, gowns, gloves, masks, shoes, aprons, or other items as needed for protection of personnel from chemical exposures and for prevention of drug contamination.

a. The compounder must implement procedures to prevent cross-contamination when compounding with drugs (e.g., penicillins) that require special precaution to prevent cross-contamination.

TRAINING

All personnel involved in the compounding, evaluation, packaging, and dispensing of compounded preparations shall be properly trained for the type of compounding conducted. All training activities will be covered by appropriate standard operating procedures (SOPs) and documentation.

All compounders and all personnel involved in compounding must be well trained and must participate in current, relevant training programs. It is the responsibility of the compounder to ensure that a training program has been implemented and that it is ongoing. Standards of practice require that all employees be adequately trained in their job functions and that all of the training is properly documented. Steps in the training procedure will include the following:

a. All employees involved in pharmaceutical compounding shall read and become familiar with *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩, *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩, and *Pharmaceutical Calculations in Prescription Compounding* ⟨1160⟩.

b. All employees shall read and become familiar with each of the procedures related to compounding, including those involving the facility, equipment, personnel, actual compounding, evaluation, packaging, storage, and dispensing.

c. The compounder shall meet with employees to review their work and answer any questions the employees may have concerning SOPs.

d. The compounder shall demonstrate the procedures for the employee, and will observe and guide the employee throughout the training process. The employee will then repeat the procedure without any assistance from, but under the direct supervision of, the compounder.

e. When the employee has demonstrated to the compounder a verbal and functional knowledge of the procedure, then and only then, will the employee be permitted to perform the procedure without direct supervision. However, the compounder should be physically present and should check off the final preparation.

f. When the compounder is satisfied with the employee's knowledge and proficiency, the compounder will sign off on the documentation records to show that the employee was appropriately trained.

g. The compounder shall continually monitor the work of the employee and assure that the employee's calculations and work are accurate and adequately performed. The compounder is completely responsible for the finished preparation. The compounder will answer any questions the employee may have concerning the SOPs.

PROCEDURES AND DOCUMENTATION

All significant procedures performed in the compounding area will be covered by SOPs and will be documented.

Procedures should be developed for the facility, equipment, personnel, preparation, packaging, and storage of compounded preparations to ensure accountability, accuracy, quality, safety (including access to Material Safety Data Sheets), and uniformity in compounding. Implementing SOPs establishes procedural consistency and also provides a reference for orientation and training of personnel.

Documentation enables a compounder, whenever necessary, to systematically trace, evaluate, and replicate the steps included throughout the preparation process of a compounded preparation.

DRUG COMPOUNDING FACILITIES

a. Compounding facilities shall have an adequate space that is specifically designated for compounding of prescriptions. This area may include a space for the storage of equipment and materials.

b. Sterile compounded preparations shall be compounded in accordance with the provisions in *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩, and aseptic processes shall be conducted in an area separate and distinct from the area used for the compounding of nonsterile products.

c. The areas used for compounding shall be maintained in clean, orderly, and sanitary conditions.

d. The areas for drug compounding shall be maintained in a good state of repair. The plumbing system shall be free of defects that could contribute to contamination of any compounded product. Adequate washing facilities shall be easily accessible to the compounding areas. Such facilities shall include, but not be limited to, hot and cold water, soap or detergent, and an air drier or single use towels.

e. Potable water shall be supplied under continuous positive pressure.

f. The area for compounding shall have adequate lighting and ventilation.

g. The area for compounding shall be free of infestation by insects, rodents, and other vermin. Trash shall be held and disposed of in a sanitary and timely manner.

h. Sewage and other refuse in the area of compounding shall be disposed of in a safe and sanitary manner.

i. Bulk drugs and other chemicals or materials used in the compounding of drugs must be stored as directed by the manufacturer, or according to USP monograph requirements, in a clean, dry area, under appropriate temperature conditions (controlled room temperature, refrigerator, or freezer). The bulk chemicals shall be stored in a manner such that they are protected from contamination. All containers shall be properly labeled.

j. If parenteral products are compounded, the compounder shall refer to *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩, and *Injections* ⟨1⟩ for compounding technique applications.

DRUG COMPOUNDING EQUIPMENT

(See also *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩.)

a. The equipment or utensils used for compounding of a drug preparation shall be of appropriate design and capacity. The equipment should be stored in such a manner as to protect it from contamination, and shall be located in such a place as to facilitate operations for its use, maintenance, and cleaning.

b. The equipment should be of suitable composition such that the surfaces that contact components are neither reactive, additive, nor absorptive and therefore will not affect or alter the purity of the compounded preparations.

c. Automated, mechanical, electronic, and other types of equipment used in compounding or testing of compounded preparations should be routinely inspected, calibrated as necessary, and checked to ensure proper performance.

d. Immediately prior to initiation of compounding operations, the equipment shall be inspected by the compounder to determine its suitability for use.
e. After use, the equipment should be appropriately cleaned. Extra care should be used when cleaning equipment used in compounding preparations requiring special precaution, e.g., antibiotics, cytotoxins, cancer drugs, and other hazardous materials. If possible, special equipment may be dedicated for such use or if the same equipment is being used for all drug products, appropriate procedures must be in place to allow meticulous cleaning of equipment prior to use with other drugs.

COMPONENT SELECTION REQUIREMENTS

a. The compounder must first attempt to use *USP–NF* drug substances manufactured in an FDA registered facility.
b. The compounder shall also first attempt to use inactive components manufactured in an FDA registered facility.
c. If components are not obtainable from an FDA registered facility or if the FDA and/or the providing company cannot document FDA registration, compounders shall use their professional judgment in first receiving, storing, or using the components that meet official compendial requirements or are provided by another high-quality source.
d. If components of compendial quality are not obtainable, components of high quality such as those that are chemically pure, analytical reagent grade, American Chemical Society certified, or Food Chemicals Codex grade may be used.
e. When a component is not obtained from an official compendial source or is not obtainable from the sources mentioned above, the component may be obtained from a source deemed acceptable and reliable in the professional judgment of the compounder.
f. When a component is derived from ruminant animals (e.g., bovine, caprine, ovine) the supplier shall provide written assurance that these animals were born, raised, and slaughtered in countries where bovine spongiform encephalopathy (BSE) and scrapie are known not to exist.
g. The compounder shall not use components that are listed by FDA to be withdrawn from the market for public health reasons.
h. Components shall be stored off the floor, handled and stored to prevent contamination, and rotated so that the oldest stock is used first.

PACKAGING AND DRUG PREPARATION CONTAINERS

a. The compounder shall ensure that the containers and container closures used in packaging the compounded preparations meet the requirements under *Containers—Glass* ⟨660⟩, *Containers—Plastics* ⟨661⟩ and *Containers—Performance Testing* ⟨671⟩. The compounder shall obtain written records from the supplier to show that the containers meet USP requirements.
b. Containers and container closures intended for compounding of sterile preparations and nonsterile preparations must be handled, sterilized (if appropriate), and stored as described in *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩ and *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩. The use of commercially available presterilized containers is encouraged for sterile preparations.
c. The containers and closures shall be stored off the floor, handled and stored to prevent contamination, and rotated so that the oldest stock is used first.
d. The containers and container closures shall be stored in such a way as to permit inspection and cleaning of the work area.
e. The containers and container closures shall be made of clean materials that are neither reactive, additive, nor absorptive.
f. The containers and closures shall be of suitable material so as not to alter the quality, strength, or purity of the compounded drug.
g. The compounder shall ensure that the containers and container closures selected to dispense the finished compounded prescription, whether sterile or nonsterile or radiopharmaceutical, meet the criteria in sections (a)–(f) above.

COMPOUNDING CONTROLS

a. The compounder should ensure that there are written procedures for the compounding of drug products to assure that the finished products have the identity, strength, quality, and purity that they purport to have. These procedures should be available in either written form or electronically stored with printable documentation.
b. The compounder shall establish procedures that include a description of (1) components, their amounts, the order of component additives, and the compounding process; (2) the required equipment and utensils; and (3) the drug product container and closure system.
c. The written procedures described above shall be followed in execution of the compounding process.
d. The compounder shall accurately weigh, measure, and subdivide as appropriate.
e. The compounder shall check and recheck each procedure at each stage of the process to ensure that each weight or measure is correct as stated in the written compounding procedures.
f. If a component is transferred from the original container to another container (e.g., a powder is taken from the original container, weighed, placed in a container, and stored in that other container), the new container shall be identified with the component name, weight or measure, the lot or control number, the expiration or beyond-use date, and the transfer date.
g. The compounder should have established written procedures that will describe the tests or examinations to be conducted on the preparation compounded (e.g., the degree of weight variation among capsules) to assure uniformity and integrity of compounded drug preparations.
h. Appropriate control procedures should be established to monitor the output and to validate the performance of those compounding processes that may be responsible for causing variability in the final compounded preparations. Factors that may cause variability include (1) capsule weight variation; (2) adequacy of mixing to assure uniformity and homogeneity; and (3) clarity, completeness, or pH of solutions.
i. Appropriate written procedures should be designed to prevent microbiological contamination of compounded drug preparations purporting to be sterile, and these procedures shall be followed. Such procedures shall include validation of sterilization processes (see *Pharmaceutical Compounding—Sterile Preparations* ⟨797⟩).
j. The compounder should establish appropriate beyond-use dates determined either from available *USP–NF* monographs, appropriate testing, or from peer-reviewed literature.
k. The compounder should adopt appropriate storage requirements as provided in *Preservation, Packaging, Storage, and Labeling* under *General Notices and Requirements*.

LABELING

1. The compounder's preparation label should contain information required by state and federal law and accepted standards of practice. [NOTES—(a) The compounder shall

~~use the established name or distinct common name (cannot use the trademarked name of a manufactured product). (b) The compounder cannot indicate that the compounded product is therapeutically equivalent to a manufactured product. (c) The label should state that this is a compounded preparation. (d) The compounder shall not use an NDC number assigned to another product.]~~

~~2. The compounder shall label any excess compounded products so as to reference them to the formula used, the assigned control number, and beyond-use date based on the compounder's appropriate testing, published data, or *USP–NF* standards.~~

~~3. Preparations compounded in anticipation of a prescription prior to receiving a valid prescription should not be prepared in an inordinate amount. A regularly used amount should be prepared on the basis of a history of prescriptions filled by the pharmacy. These preparations should be labeled or documentation referenced with the following:~~
~~a. A complete list of ingredients or preparation name and reference or established name or distinct common name~~
~~b. Dosage form~~
~~c. Strength~~
~~d. Preparation date~~
~~e. Name and address of compounder~~
~~f. Inactive ingredients~~
~~g. Batch or lot number~~
~~h. Assigned beyond-use date, based on published data, or appropriate testing, or *USP–NF* standards.~~
~~Storage conditions for these preparations should be dictated by their composition and sterility, e.g., stored in a clean, dry place under appropriate temperature conditions (controlled room temperature, refrigerator, or freezer.)~~

~~4. The compounder should examine the preparation for correct labeling after completion of the compounding process.~~

~~RECORDS AND REPORTS~~

~~a. The compounder shall maintain records, including but not limited to, the hard copy of the prescription to indicate that the prescription is compounded, and to provide formulation records and compounding records.~~
~~b. The compounder shall keep adequate records of controlled drug substances (scheduled drugs) used in compounding.~~
~~c. All records of all compounded preparations shall be kept for a period of time as set forth in the federal and state laws or regulations. Such records shall be readily available for authorized inspection.~~
~~d. The compounding records shall include the manufacturer and lot number of all ingredients.~~

~~COMPOUNDING FOR A PRESCRIBER'S OFFICE USE~~

~~a. Compounders may prepare compounded drug preparations for a prescriber's office use only where permitted by federal and state requirements.~~
~~b. An order by the prescriber indicating the formula and quantity ordered may be filled in the compounder's facility.~~
~~c. Where compounding for office use is permitted, the compounder shall compound the preparation for the sole purpose of administration by or for the prescriber.~~
~~d. A record of the compounding process shall be maintained.~~
~~e. A label must be generated and a number may be assigned.~~

~~COMPOUNDING VETERINARIAN PRODUCTS~~

~~a. Compounders shall compound prescriptions for animals on the basis of prescription orders.~~
~~b. These prescriptions shall be handled and filled according to the guideline available for compounding of veterinarian products.~~ ■2S (*USP33*)

BRIEFING

〈**1117**〉 **MICROBIOLOGICAL BEST LABORATORY PRACTICES,** *USP 32* page 616. On the basis of internal deliberations by the expert committee, (1) revisions have been proposed to several sections to enhance clarity, and (2) the new sections *Sample Handling*, *Microbiological Media Incubation Times*, and *Laboratory Resources* have been added.

(MSA: R. Tirumalai) RTS—C73547

Change to read:

INTRODUCTION

Good laboratory practices in a microbiology laboratory consist of activities that depend on several principles: aseptic technique, control of media, control of test strains,

■operation and■2S (*USP33*)
control of equipment, diligent recording and evaluation of data, and training of the laboratory staff. Because of the ~~known~~

■inherent risk of■2S (*USP33*)
variability in microbiology data, reliability and reproducibility are dependent on the use of accepted methods and adherence to good laboratory practices.

Change to read:

MEDIA PREPARATION AND QUALITY CONTROL

Media Preparation

Culture media are the basis for most microbiological tests. Safeguarding the quality of the media is therefore critical to the success of the microbiology laboratory. Media preparation, proper storage, and quality control testing can ensure a consistent supply of high-quality media.

It is important to choose the correct media or components in making media based on the use of accepted sources or references for formulas. The manufacturer's formula and instructions for preparation routinely accompany dehydrated media and ready-made media. Because different media types may have different preparation requirements (e.g., heating, additives, and pH adjustment), it is important to follow these instructions to ensure preparation of acceptable media quality. A certificate of analysis describing expiration dating and recommended storage conditions accompanies ready-made media, as well as the quality control organisms used in growth-promotion and selectivity testing of that media.

Water is the universal diluent for microbiological media. Purified Water is most often used for media preparation, but in certain cases the use of deionized or distilled water may be appropriate.

■Water of lesser quality should not be used for microbiological media preparation.■2S (*USP33*)
The volume of the water used should be recorded.

Consistent preparation of media requires accurate weighing of dehydrated media or media constituents. A calibrated balance with the appropriate weight range for the ingredients should be used

■(See *Weighing on an Analytical Balance* ⟨1251⟩).■2S (*USP33*)
Clean weighing containers and tools (such as spatulas) should be used to prevent foreign substances ~~that may alter the composition of the finished media~~

■■2S (*USP33*)
from entering the formulation. The weight of the components should be recorded.

Dehydrated media should be thoroughly dissolved in water before dispensing and sterilization. If heating is necessary to help dissolve media, care should be taken not to overheat media, becdause all culture media, to a greater or lesser extent, are heat-sensitive. Equipment used in the preparation of media should be appropriate to allow for controlled heating, constant agitation, and mixing of the media. Darkening of media (Maillard-type reaction or nonenzymatic browning) is a general indication of overheating. When adding required supplements to media, adequate mixing of the medium after adding the supplement should be performed.

Preparation of media in poorly cleaned glassware can allow inhibitory substances to enter the media. Inhibitory substances can come from detergent residue after cleaning glassware or from prior materials used in the glassware. Be sure that the cleaning process removes debris and foreign matter, and that the detergent is thoroughly rinsed out with Purified Water. See *Cleaning Glass Apparatus* ⟨1051⟩ for additional guidance.

Sterilization of media should be performed within the parameters provided by the manufacturer or validated by the user. Commercially prepared media should provide documentation of the sterilization method used. ~~Ideally the manufacturer should provide the sterility assurance level (SAL) of the media against a recognized biological indicator.~~

■■2S (*USP33*)
Autoclaving by moist heat is the preferred sterilization technique, except in instances when boiling is required in order to avoid deterioration of heat-labile components of the media. Sterilization by filtration may also be appropriate for some formulations.

The effects of the sterilization method and conditions on the media should be validated by sterility and growth-promotion testing of the media. In addition, if sterilized by moist heat, the autoclave cycle should be validated to ensure proper heat distribution for selected loads and volumes. Typically, manufacturers recommend using an autoclave cycle of 121° for 15 minutes using a validated autoclave. These conditions apply to time at temperature of the media. As

■container size and■2S (*USP33*)
the load configuration of the autoclave will influence the rate of heating, longer cycles may be required for larger loads. However, the sterilization time will be dependent on the media volume and autoclave load. Sterilization cycles in which the autoclave is slow to come up to temperature may result in overheating of the media. Therefore, care must be taken to validate a sterilization cycle, ~~to deliver the minimum SAL required~~

■■2S (*USP33*)
balancing the need for sterile media against the tendency of the media to degrade under excessive heating. Storage of the media in the autoclave after the liquid cycle is completed is not recommended after cooling, as it may damage the media. Improper heating or sterilizing conditions—for commercially prepared or internally prepared media—may result in a difference in color change, loss of clarity, altered gel strength, or pH drift from the manufacturer's recommended range,

■as well as reduced growth-promotion activity and/or selectivity.■2S (*USP33*)
The pH of each batch of medium should be confirmed after it has cooled to room temperature

■(20°–■2S (*USP33*)
25°) by aseptically withdrawing a sample for testing.

■Refrigerated purchased media should be allowed to warm up to ambient room temperature.■2S (*USP33*)
A flat pH probe is recommended for agar surfaces, and an immersion probe is recommended for liquids.

■See *pH* ⟨791⟩ for guidance with pH measurement and instrument calibration.■2S (*USP33*)
The pH of media should be in a range of ±0.2 of the value indicated by the manufacturer, unless a wider range is acceptable by the validated method.

Prepared media should be checked by appropriate inspection of plates and tubes for the following:

- Cracked containers or lids
- Unequal filling of containers
- Dehydration resulting in cracks or dimpled surfaces on solid medium
- Hemolysis
- Excessive darkening or color change
- Crystal formation from possible freezing
- Excessive number of bubbles
- Microbial contamination
- Status of redox indicators (if appropriate)
- Lot number and expiration date checked and recorded
- Sterility of the media

Media Storage

It is prudent to consider how the manufacturer or supplier transports and stores media before distribution to the end user. Manufacturers of media should use transport and storage conditions that minimize the loss of moisture, control the temperature,

■prevent microbial contamination,■2S (*USP33*)
and provide mechanical protection to the prepared media.

Media should be labeled properly with batch or lot numbers, preparation and expiration dates, and media identification. Media should be stored according to the manufacturer's instructions. Media prepared in house should be stored under validated conditions. Do not store agar at or below 0°, as freezing could damage the gel structure. Protect stored media from exposure to light and excessive temperature. Before prolonged storage, agar plates should be placed into a sealed package or container to retard moisture loss.

Remelting of an original container of solid media should be performed only once to avoid media whose quality is compromised by overheating or potential contamination. It is recommended that remelting be performed in a heated water bath or by using free-flowing steam. The use of microwave ovens and heating plates is common, but care should be taken to avoid damaging media by overheating and to avoid the potential injury to laboratory personnel from glass breakage and burns. The molten agar medium should be held in a monitored water bath at a temperature of 45° to 50° for not more than 8 hours. Caution should be taken when pouring the media from a container immersed in a water bath to prevent water from the bath commingling with the poured sterile media. Wiping the exterior of the container dry before pouring may be advisable.

Disposal of used cultured media (as well as expired media) should follow local biological hazard safety procedures.

Quality Control Testing

Although growth media can be prepared in a laboratory from individual components, many laboratories, for ease of use, use dehydrated media or purchase commercially prepared media in

■plastic■2S (*USP33*)
plates or glass containers. Manufacturers of media attempt to standardize raw materials from biological sources, but must constantly deal with unavoidable differences in raw materials obtained from natural sources, and therefore, lot-to-lot variability of media must be considered.

■In addition,■2S (*USP33*)
the performance of media prepared in a laboratory or by a manufacturer is highly dependent on preparation

■and storage conditions.■2S (*USP33*)
Improper media preparation can cause unsatisfactory conditions for microbial growth or recovery and unreliable results.

■Therefore,■2S (*USP33*)
quality control tests should be performed on all prepared media. Tests routinely performed on in-house prepared media ~~are pH, growth promotion~~

■should include pH, growth promotion, inhibition, and

indicative properties (as appropriate),■2S (*USP33*)
and periodic stability checks to confirm the expiration dating.

When in-house prepared microbiological media are properly prepared and sterilized using a validated method, the growth-promotion testing may be limited to each incoming lot of dehydrated media, unless otherwise instructed by the relevant compendial method. If the media preparation

■procedure■2S (*USP33*)
was not validated, then every batch of media ~~would~~

■should■2S (*USP33*)
be subjected to growth-promotion testing. Test organisms may be selected from the appropriate compendial test chapter.

■In addition, microorganisms used in growth-promotion

testing may be■2S (*USP33*)
based on the manufacturer's recommendation for a particular medium, or may include representative environmental isolates

■(but these latter are not to be construed as compendial

requirements).■2S (*USP33*)

Expiration dates on media should have supporting growth-promotion testing to indicate that the performance of the media still meets acceptance criteria up to and including the expiration date. The length of shelf life of a batch of media will depend on the stability of the ingredients and formulation under specified conditions, as well as the type of container and closure.

When a batch of media does not meet the requirements of growth-promotion testing, an investigation should be initiated to identify the cause. This investigation should include a corrective action plan to prevent the recurrence of the problem. ~~Any nonconforming lot should not be used if an assignable cause or corrective resolution relative to nongrowth support is undetermined.~~

■Any batch of media that fails growth-promotion testing

is unsuitable for use. [NOTE—Failed growth-promotion

test results may not be used to negate positive test re-

sults.]■2S (*USP33*)

Some reagents are used for diagnostic purposes to help support identification of microbial organisms, e.g., Gram stain and oxidase test reagents. These may have attributes that can be quality control tested similar to microbiological media. Select the correct quality control standard microorganisms, following the manufacturer's instructions, and perform the testing before unknown sample diagnostic testing.

■All relevant diagnostic reagents should be subjected to

incoming quality confirmation before use.■2S (*USP33*)

Special care should be taken with media that is used in environmental monitoring studies. Media used for environmental monitoring of critical areas should preferably be double-wrapped and terminally sterilized. If terminal sterilization is not performed, media should be subjected to ~~pre-incubation and 100% inspection~~

■100% pre-incubation and inspection■2S (*USP33*)
before use within a critical area.

■[NOTE—Growth-promotion testing for this media must

be performed after the pre-incubation stage.]■2S (*USP33*)
This will prevent extraneous contamination from being carried into controlled environments and will prevent false-positive results. A raised agar level for surface contact plates should be verified.

Change to read:

MAINTENANCE OF MICROBIOLOGICAL CULTURES

Biological specimens can be the most delicate standards to handle because their viability and characteristics are dependent on adequate handling and storage. Standardizing the handling and storage of cultures by the user laboratory should be done in a way that will minimize the opportunity for contamination or alteration of growth characteristics. The careful and consistent treatment of stock cultures is critically important to the consistency of microbiological test results. Cultures for use in compendial tests should be acquired from a national culture collection

■or a qualified secondary supplier.■2S (*USP33*)
They can be acquired frozen, freeze-dried, on slants, or in ready-to-use forms. Confirmation of the purity of the culture and the identity of the culture should be performed before its use in quality control testing. Ready-to-use cultures ~~may require confirmation of purity, identity, and inoculum size. This~~

■should be subjected to incoming testing for purity and

identity before use. The■2S (*USP33*)
confirmation of identity for commonly used laboratory strains should ideally be done at the level of ~~genotypic analysis (i.e., DNA fingerprinting, 16S rRNA gene sequencing, or PCR analysis using suitably validated probes).~~

■genus and species.■2S (*USP33*)

Preparation and resuscitation of cultures should follow the instructions of the supplier or a validated, established method. The ''Seed-Lot'' technique is recommended for storage of stock cultures.

The original sample from the national culture collection

■or a qualified secondary supplier■2S (*USP33*) is resuscitated and grown in an appropriate medium. Aliquots of this stock culture (the first transfer or passage) are suspended in a cryoprotective medium, transferred to vials, and frozen at –30° or below, until use. If stored at –70°, or in lyophilized form, strains may be kept indefinitely. These frozen stocks can then be used to inoculate monthly or weekly working cultures. Once opened, do not refreeze unused cell suspensions after culturing a working suspension. The unused portion should be discarded to minimize the risk of loss of viability and contamination of the stock.

The number of transfers of working control cultures should be tracked to prevent excessive subculturing that increases the risk of phenotypic alteration

■or mutation.■2S (*USP33*) One passage is defined as the transfer of organisms from a viable culture to a fresh medium with growth of the microorganisms. Any form of subculturing is considered to be a transfer/passage.

Change to read:

~~**MAINTENANCE OF**~~

■■2S (*USP33*)

LABORATORY EQUIPMENT

Most equipment (incubators, water baths, and autoclaves) is subject to standard validation practices of incoming qualification, operational qualification, and performance qualification. Additionally, periodic calibration (generally annually) is commonly required. New equipment, critical to the operation of the laboratory, should be qualified according to a protocol approved by the quality assurance unit (QAU).

■In addition, regular cleaning and sanitization of equipment such as incubators, refrigerators, and water baths should be performed to minimize the potential for contamination in the laboratory.■2S (*USP33*)

Instruments (pH meters and spectrophotometers) used in a microbiology laboratory should be calibrated on a regular schedule and tested to verify performance on a routine basis. The frequency of calibration and performance verification will vary based on the type of instrument and the importance of that equipment to the generation of data in the laboratory.

■Equipment that is difficult to sanitize (such as refrigerators and incubators) should be dedicated to aseptic operations (such as storage of media for testing and incubation of sterility test samples) and live culture operations to minimize the potential for inadvertent contamination of the tests.

Autoclaves are central to the operation of the laboratory and must have proper validation in place to demonstrate adequate sterilization for a variety of operations. Autoclave resources must be available (and validated) to sterilize waste media (if performed in that laboratory) as well as the media prepared in that laboratory. The choice of one or several autoclaves is not driven by a need to separate aseptic and live operations (everything in the properly maintained autoclave is sterile after the cycle) but rather driven by resource considerations (see below).■2S (*USP33*)

Change to read:

LABORATORY LAYOUT AND OPERATIONS

Laboratory layout and design should carefully consider the requirements of good microbiological practices and laboratory safety. It is essential that cross-contamination of microbial cultures be minimized to the greatest extent possible, and it is also important that microbiological samples be handled in an environment that makes contamination highly unlikely.

In general, a laboratory should be divided into clean or aseptic areas and live culture areas. Areas in which environmental or sterile product samples are handled and incubated should be maintained completely free of live cultures, if possible. If complete separation of live and clean culture zones cannot be accomplished, then other barriers and aseptic practices should be employed to reduce the likelihood of accidental contamination. These barriers include protective clothing, sanitization and disinfection procedures, and biological safety cabinets designated for clean or aseptic operations only. Procedures for handling spills or mishaps with live cultures should be in place, and all relevant technical personnel should be trained regarding these methods.

Some samples will demonstrate microbial growth and require further laboratory analysis to identify the contaminants. When growth is detected, the sample should be taken from the clean section of the laboratory to the live culture section without undue delay. Subculturing, staining, microbial identification, or other investigational operations should be undertaken in the live culture section of the laboratory. If possible, any sample found to contain growing colonies should not be opened in the clean zone of the laboratory. Careful segregation of contaminated samples and materials will reduce false-positive results.

Staff engaged in sampling activities should not enter or work in the live culture handling section of a laboratory unless special precautions are taken, including wearing protective clothing and gloves and careful sanitizing of hands upon exiting. Ideally, staff assigned to sampling activities, particularly those in support of aseptic processing, should not work in the vicinity of live culture laboratory operations. ~~Also, all microbiological samples should be taken using aseptic techniques, including those taken in support of nonsterile products. If possible, all microbiological samples should be taken under full aseptic conditions in specialized sampling areas.~~

■■2S (*USP33*)

It is important to consider that microbial contamination of samples, which leads to false-positive results, is always possible unless careful aseptic precautions are taken. Facilities should be designed so that raw material and excipient sampling can be done under controlled conditions, including proper gowning and sterilized sampling equipment. It may not always be possible to sample utility systems, such as water systems, under full aseptic conditions; however, it should be noted that when samples are not taken aseptically, their reliability is inevitably compromised.

Environmental sampling methods should require minimal aseptic handling in loading and unloading sampling instruments. Whenever possible, sampling equipment should be loaded with its microbiological recovery media in the environment that is to be sampled.

All testing in laboratories used for critical testing procedures, such as sterility testing of final dosage forms, bulk product, seed cultures for biological production, or cell cultures used in biological production, should be performed under controlled conditions. Isolator technology is also appropriate for critical, sterile microbiological testing. Isolators have been shown to have lower levels of environmental contamination than manned clean rooms, and therefore, are generally less likely to produce false-positive results. Proper validation of isolators is critical both to ensure environmental integrity and to prevent the possibility of false-negative results as a result of chemical disinfection of materials brought into or used within isolators (see *Sterility Testing—Validation of Isolator Systems* ⟨1208⟩).

Add the following:

▪SAMPLE HANDLING

Viable microorganisms in most microbiology samples, particularly water, environmental monitoring and bioburden samples, are sensitive to handling and storage conditions. Critical parameters in these conditions include product (or sample) composition, container composition, time of storage, and temperature of storage. Therefore, it is important to minimize the amount of time between the sampling event and the initiation of testing and to control, as much as possible, the conditions of storage. If the sample is to be transported to a distant location for testing, then the conditions of transport (time, temperature, etc.) should be qualified as suitable for that test and sample. Guidance for water testing in this regard can be found in *Water for Pharmaceutical Purposes* ⟨1231⟩. Product mixing before sampling may need to be evaluated and applied in order to ensure microbial dispersement and representation in the sample aliquot.

All microbiological samples should be taken using aseptic techniques, including those taken in support of nonsterile products. If possible, all microbiological samples should be taken under full aseptic conditions in specialized sampling areas. The areas should be as close to the point of use as possible to minimize contamination during transit.

Samples submitted to the microbiology laboratory should be accompanied by documentation detailing source of the sample, date the sample was taken, date of sample submission, person or department responsible for the submission, and any potentially hazardous materials associated with the sample. The testing department should acknowledge receipt of the sample and reconcile the identity and number of samples as part of this sample documentation. ■2S (*USP33*)

Add the following:

▪MICROBIOLOGICAL MEDIA INCUBATION TIMES

Incubation times for microbiological tests of less than 3 days' duration should be expressed in hours: e.g., ''Incubate at 30° to 35° for 18 to 72 hours''. Tests longer than 72 hours' duration should be expressed in days: e.g., ''Incubate at 30° to 35° for 3 to 5 days''. For incubation times expressed in hours, incubate for the minimum specified time, and exercise good microbiological judgment when exceeding the incubation time. For incubation times expressed in days, incubations started in the morning or afternoon should generally be concluded at that same time of day. ■2S (*USP33*)

Change to read:

TRAINING OF PERSONNEL

Each person engaged in each phase of pharmaceutical manufacture should have the education, training, and experience to do his or her job. The demands of microbiological testing require that the core educational background of the staff, supervisors, and managers be in microbiology or a closely related biological science. They should be assigned responsibilities in keeping with their level of skill and experience.

A coherent system of standard operating procedures (SOPs) is necessary to run the microbiology laboratory. These procedures serve two purposes in a training program. Firstly, these SOPs describe the methodology that the microbiologist will follow to obtain accurate and reproducible results, and so serve as the basis for training. Secondly, by tracking the procedures in which a particular microbiologist has demonstrated proficiency, the procedure number or title also serves to identify what training the microbiologist has received specific to his or her job function.

Training curricula should be established for each laboratory staff member specific to his or her job function. He or she should not independently conduct a microbial test until qualified to run the test. Training records should be current, documenting the microbiologist's training in the ~~proper~~

■current■2S (*USP33*)
revision to the particular SOP.

Periodic performance assessment is a wise investment in data quality. This performance testing should provide evidence of competency in core activities of the microbiology laboratory such as hygiene, plating, aseptic technique, documentation, and others as suggested by the microbiologist's job function.

Microbiologists with supervisory or managerial responsibilities should have appropriate education and in-house training in supervisory skills, laboratory safety, scheduling, ~~laboratory investigations~~

■budgeting, investigational skills,■2S (*USP33*)
technical report writing, relevant SOPs, and other critical aspects of the company's processes as suggested in their role of directing a laboratory function.

■Competency may be demonstrated by specific course work, relevant experience, and routinely engaging in relevant continuing education. Achieving certification through an accredited body is also a desirable credential. Further, it is expected that laboratory supervisors and managers have a demonstrated level of competence in microbiology at least as high as those they supervise. Expertise in microbiology can be achieved by a variety of routes in addition to academic course work and accreditation. Each company is expected to evaluate the credentials of those responsible for designing, implementing, and operating the microbiology program. Companies can thus ensure that those responsible for the program understand the basic principles of microbiology, can interpret guidelines and regulations based on good science, and have access to individuals with theoretical and practical knowledge in microbiology to provide assistance in areas in which the persons responsible for the program may not have adequate knowledge and understanding. It should be noted that microbiology is a scientifically based discipline that deals with biological principles substantially different from those of analytical chemistry and engineering disciplines. Many times it is difficult for individuals without specific microbiological training to make the transition.■2S (*USP33*)

Add the following:

▪LABORATORY RESOURCES

The laboratory management is responsible for ensuring that the laboratory has sufficient resources to meet the existing testing requirements. This requires some proficiency in budget management and in determining appropriate measures of laboratory performance. A measure of laboratory performance is the number of investigations performed on tests conducted by the laboratory, but this measure alone is not sufficient. In addition to tracking investigations, the period of time between sample submission and initiation of testing should be tracked, as well as the period of time between end of test and report release (or test closure). Significant delays in these measures are also indications of an underresourced laboratory staff.

The laboratory management should have sufficient budget to meet testing requirements. Particular measures of budgetary requirements will be specific to the given laboratory, but budgetary considerations related directly to the need of the laboratory for sufficient resources must be addressed to ensure reliable testing results.■2S (*USP33*)

Change to read:

DOCUMENTATION

Documentation should be sufficient to demonstrate that the testing was performed in a laboratory and by methods that were under control. This includes, but is not limited to, documentation of the following:

- Microbiologist training and verification of proficiency
- Equipment validation, calibration, and maintenance
- Equipment performance during test (e.g., 24-hour/7-day chart recorders)
- Media preparation, sterility checks, and growth-promotion and selectivity capabilities
- Media inventory and control testing
- Critical ~~components~~

■aspects■2S (*USP33*)
of test conducted as specified by a procedure

- Data and calculations ~~verified~~

■verification■2S (*USP33*)

- Reports reviewed by QAU or a qualified responsible manager
- Investigation of data deviations ~~(if needed)~~

■(when required)■2S (*USP33*)

Change to read:

MAINTENANCE OF LABORATORY RECORDS

Proper recording of data and studies is critical to the success of the microbiology laboratory. The over-riding principle is that the test should be performed as written in the SOP, the SOP should be written to reflect how the test is actually performed, and the laboratory notebook should provide a record of all critical details needed to

■reconstruct the details of the testing and■2S (*USP33*)
confirm the integrity of the data. At a minimum, the laboratory write-up should include the following:

- Date
- Material tested
- Microbiologist's name
- Procedure number
- Document test results
- Deviations (if any)
- Documented parameters (equipment used, microbial stock cultures used, media lots used)
- Management/Second review signature

Every critical piece of equipment should be noted in the write-up, and all should be on a calibration schedule documented by SOP and maintenance records. Where appropriate, logbooks or forms should be available and supportive of the laboratory notebook records. Equipment temperatures (water baths, incubators, autoclaves) should be recorded and traceable.

The governing SOP and revision should be clearly noted in the write-up. Changes in the data should be crossed off with a single line and initialed. Original data should not be erased or covered over.

Test results should include the original plate counts, allowing a reviewer to recreate the calculations used to derive the final test results. Methods for data analysis should be detailed in cited SOPs.

All laboratory records should be archived and protected against catastrophic loss. A formal record retention and retrieval program should be in place.

Change to read:

INTERPRETATION OF ASSAY RESULTS

Analytical microbiological assay results can be difficult to interpret for several important reasons: (1) Microorganisms are ubiquitous in nature, and common environmental contaminants—particularly organisms associated with humans—predominate in many types of microbiological analysis; (2) the analyst has the potential to introduce contaminating organisms during sample handling or processing in the laboratory; (3) microorganisms may not be homogeneously distributed within a sample or an environment; and (4) microbiological assays are subject to considerable variability of outcome. Therefore, ~~minor~~

■apparent■2S (*USP33*)
differences from an expected outcome may not be significant.

Because of these characteristics of microbiological analysis, laboratory studies should be conducted with the utmost care to avoid exogenous contamination as previously discussed in this chapter. Equally important, results must be interpreted from a broad microbiological perspective, considering not only the nature of the putative contaminant, but the likelihood of that organism(s) surviving in the pharmaceutical ingredient, excipient, or environment under test. In addition, the growth characteristics of the microorganism should be considered (especially in questions of the growth of filamentous fungi in liquid media).

When results are observed that do not conform to a compendial monograph or ~~another~~

■■2S (*USP33*)
other established ~~quantitative target~~

■acceptance criteria,■2S (*USP33*)
an investigation into the ~~finding~~

■microbial data deviation (MDD)■2S (*USP33*)
is required. There are generally two distinct reasons for the observation of microbial contamination that does not comply with a target or requirement: There may be either a laboratory error or laboratory environmental conditions that produced an invalid result, or the product contains a level of contamination or specific types of contaminants outside established levels or limits. In either case, laboratory management and, in most cases, ~~general management~~

■the Quality Unit■2S (*USP33*)
should be notified immediately.

A full and comprehensive evaluation of the

■laboratory■2S (*USP33*)
situation surrounding the result should be undertaken. All microbiological conditions or factors that could bring about the observed condition should be fully considered, including the magnitude of the excursion compared to established limits or levels. ~~It is critical to know if the finding is statistically significant in light of assay variability~~

■In addition, an estimate of the variability of the assay may be required in order to determine whether the finding is significant.■2S (*USP33*)

The laboratory environment, the protective conditions in place for sampling, historical findings concerning the material under test, and the nature of the material, particularly with regard to microbial survival or proliferation in contact with the material, should be considered in the investigation. In addition, interviews with the laboratory analyst(s) may provide information regarding the actual conduct of the assay that can be valuable in determining the reliability of the result and in determining an appropriate course of action. If laboratory operations are identified as the cause of the nonconforming test outcome, then a corrective action plan should be developed to address the problem(s). Following the approval and implementation of the corrective action plan, the situation should be carefully monitored and the adequacy of the corrective action determined.

If assay results are invalidated on the basis of the discovery of an attributable error, this action must be documented. Laboratories also should have approved procedures for confirmatory testing (retesting), and if necessary, resampling where specific regulatory or compendial guidance does not govern the conduct of an assay investigation.

BRIEFING

⟨1211⟩ Sterilization and Sterility Assurance of Compendial Articles, *USP 32* page 720. Based on internal deliberations of the Expert Committee, revisions have been proposed to (1) eliminate the discussion of the now defunct nonharmonized sterility tests and the references to first and second stage sterility tests and (2) eliminate the older radiation sterilization guidance and direct the reader to relevant ISO standards.

(MSA: R.Tirumalai.) RTS—C73550

⟨1211⟩ STERILIZATION AND STERILITY ASSURANCE OF COMPENDIAL ARTICLES

Change to read:

This informational chapter provides a general description of the concepts and principles involved in the quality control of articles that must be sterile. Any modifications of or variations in sterility test procedures from those described under *Sterility Tests* ⟨71⟩ should be validated in the context of the entire sterility assurance program and are not intended to be methods alternative to those described in that chapter.

Within the strictest definition of sterility, a specimen would be deemed sterile only when there is complete absence of viable microorganisms from it. However, this absolute definition cannot currently be applied to an entire lot of finished compendial articles because of limitations in testing. ~~Absolute sterility cannot be practically demonstrated without complete destruction of every finished article.~~

■■2S (*USP33*)
The sterility of a lot purported to be sterile is therefore defined in probabilistic terms, where the likelihood of a contaminated unit or article is acceptably remote. Such a state of sterility assurance can be established only through the use of ~~adequate sterilization cycles and subsequent~~

■validated sterilization processes or■2S (*USP33*)
aseptic processing, if any, under appropriate current good manufacturing practice, and not by reliance solely on sterility testing. The basic principles for validation and certification of a sterilizing process are enumerated as follows:

1. Establish that the process equipment has the capability of operating within the required parameters.
2. Demonstrate that the critical control equipment and instrumentation are capable of operating within the prescribed parameters for the process equipment.
3. Perform replicate cycles representing the required operational range of the equipment and employing actual or simulated product. Demonstrate that the processes have been carried out within the prescribed protocol limits and finally that the probability of microbial survival in the replicate processes completed is not greater than the prescribed limits.
4. Monitor the validated process during routine operation. Periodically as needed, requalify and recertify the equipment.
5. Complete the protocols, and document steps (1) through (4) above.

The principles and implementation of a program to validate an aseptic processing procedure are ~~similar to~~

■substantially more extensive than■2S (*USP33*)
the validation of a sterilization process. In aseptic processing, the components of the final dosage form are sterilized separately and the finished article is assembled in an aseptic manner.

Proper validation of the sterilization process or the aseptic process requires a high level of knowledge of the field of sterilization and clean room technology. In order to comply with currently acceptable and achievable limits in sterilization parameters, it is necessary to employ appropriate instrumentation and equipment to control the critical parameters such as temperature and time, humidity, and sterilizing gas concentration, or absorbed radiation. An important aspect of the validation program in many sterilization procedures involves the employment of biological indicators (see *Biological Indicators* ⟨1035⟩). The validated and certified process should be revalidated periodically; however, the revalidation program need not necessarily be as extensive as the original program.

A typical validation program, as outlined below, is one designed for the steam autoclave, but the principles are applicable to the other sterilization procedures discussed in this informational chapter. The program comprises several stages.

The *installation qualification* stage is intended to establish that controls and other instrumentation are properly designed and calibrated. Documentation should be on file demonstrating the quality of the required utilities such as steam, water, and air. The *operational qualification* stage is intended to confirm that the empty chamber functions within the parameters of temperature at ~~all of the~~

■■2S (*USP33*)
key chamber locations prescribed in the protocol. It is usually appropriate to develop heat profile records, i.e., simultaneous temperatures in the chamber employing multiple temperature-sensing devices. A typical acceptable range of temperature in the empty chamber is $\pm 1^\circ$ when the chamber temperature is not less than 121°. The *confirmatory* stage of the validation program is the actual sterilization of materials or articles. This determination requires the employment of temperature-sensing devices inserted into samples of the articles, as well as *either* samples of the articles to which appropriate concentrations of suitable test microorganisms have been added, *or* separate biological indicators (BIs) in operationally fully loaded autoclave configurations. The effectiveness of heat delivery or penetration into the actual articles and the time of the exposure are the two main factors that determine the lethality of the sterilization process. The *final* stage of the validation program requires the documentation of the supporting data developed in executing the program.

It is generally accepted that terminally sterilized injectable articles or critical devices purporting to be sterile, when processed in the autoclave, attain a 10^{-6} microbial survivor probability, i.e., assurance of less than 1 chance in 1 million that viable microorganisms are present in the sterilized article or dosage form. With heat-stable articles, the approach often is to ~~considerably~~

■■2S (*USP33*)
exceed the critical time necessary to achieve the 10^{-6} microbial survivor probability (overkill)

■of any presterilization bioburden.■2S (*USP33*)
However, with an article where extensive heat exposure may have a damaging effect, it ~~may not be feasible to employ this~~

■will not be feasible to employ an■2S (*USP33*)
overkill approach. In this latter instance, the development of the sterilization cycle depends heavily on knowledge of the microbial burden of the product, based on examination, over a suitable time period, of a substantial number of lots of the presterilized product.

The D value is the time (in minutes) required to reduce the microbial population by 90% or 1 log cycle (i.e., to a surviving fraction of 1/10), at a specific temperature. Therefore, where the D value of a BI preparation of, for example,

■*Geo*■2S (*USP33*)

bacillus stearothermophilus spores is 1.5 minutes under the ~~total process parameters~~

■process conditions defined,■2S (USP33) e.g., at 121°, if it is treated for 12 minutes under the same conditions, it can be stated that the lethality input is 8D. The effect of applying this input to the product would depend on the initial microbial burden. Assuming that its resistance to sterilization is equivalent to that of the BI, if the microbial burden of the product in question is 10^2 microorganisms, a lethality input of 2D yields a microbial burden of 1 (10° theoretical), and a further 6D yields a calculated microbial survivor probability of 10^{-6}. (Under the same conditions, a lethality input of 12D may be used in a typical ''overkill'' approach.) Generally, the survivor probability achieved for the article under the validated sterilization cycle is not completely correlated with what may occur with the BI. For valid use, therefore, it is essential that the resistance of the BI be greater than that of the natural microbial burden of the article sterilized. It is then appropriate to make a worst-case assumption and treat the microbial burden as though its heat resistance were equivalent to that of the BI, although it is not likely that the most resistant of a typical microbial burden isolates will demonstrate a heat resistance of the magnitude shown by this species, frequently employed as a BI for steam sterilization. In the above example, a 12-minute cycle is considered adequate for sterilization if the product had a microbial burden of 10^2 microorganisms. However, if the indicator originally had 10^6 microorganisms content, actually a 10^{-2} probability of survival could be expected; i.e., 1 in 100 BIs may yield positive results. This type of situation may be avoided by selection of the appropriate BI. Alternatively, high content indicators may be used on the basis of a predetermined acceptable count reduction.

The D value for the

■*Geo*■2S (USP33) *bacillus stearothermophilus* preparation determined or verified for these conditions should be reestablished when a specific program of validation is changed. Determination of survival curves (see *Biological Indicators* ⟨1035⟩), or what has been called the fractional cycle approach, may be employed to determine the D value of the biological indicator preferred for the specific sterilization procedure. The fractional cycle approach may also be used to evaluate the resistance of the microbial burden. Fractional cycles are studied either for microbial count-reduction or for fraction negative achievement. These numbers may be used to determine the lethality of the process under production conditions. The data can be used in qualified production equipment to establish appropriate sterilization cycles. A suitable biological indicator such as the

■*Geo*■2S (USP33) *bacillus stearothermophilus* preparation may be employed also during routine sterilization. Any microbial burden ~~method for sterility assurance~~

■based sterilization process■2S (USP33) requires adequate surveillance of the microbial resistance of the article to detect any changes, in addition to periodic surveillance of other attributes.

METHODS OF STERILIZATION

In this informational chapter, five methods of terminal sterilization, including removal of microorganisms by filtration and guidelines for aseptic processing, are described. Modern technological developments, however, have led to the use of additional procedures. These include blow-molding (at high temperatures), forms of moist heat other than saturated steam and UV irradiation, as well as on-line continuous filling in aseptic processing. The choice of the appropriate process for a given dosage form or component requires a high level of knowledge of sterilization techniques and information concerning any effects of the process on the material being sterilized.[1]

[1] ~~A number of guidelines dealing particularly with the development and validation of sterilization cycles and related topics have been published. These include, by the Parenteral Drug Association, Inc. (PDA), Validation of Steam Sterilization Cycles (Technical Monograph No. 1), Validation of Aseptic Filling for Solution Drug Products (Technical Monograph No. 2), and Validation of Dry Heat Processes Used for Sterilization and Depyrogenation (Technical Monograph No. 3); and by the Pharmaceutical Manufacturers Association (PMA), Validation of Sterilization of Large Volume Parenterals—Current Concepts (Science and Technology Publication No. 25). Other series of technical publications on these subjects by the Health Industry Manufacturers Association (HIMA) include Validation of Sterilization Systems (Report No. 78-4.1), Sterilization Cycle Development (Report No. 78-4.2), Industrial Sterility: Medical Device Standards and Guidelines (Document #9, Vol. 1), and Operator Training . . . for Ethylene Oxide Sterilization, for Steam Sterilization Equipment, for Dry Heat Sterilization Equipment, and for Radiation Sterilization Equipment (Report Nos. 78-4.5 through 4.8). Recommended practice guidelines published by the Association for the Advancement of Medical Instrumentation (AAMI) include Guideline for Industrial Ethylene Oxide Sterilization of Medical Devices—Process Design, Validation, Routine Sterilization (No. OPEO-12/81) and Process Control Guidelines for the Radiation Sterilization of Medical Devices (No. RS-P 10/82). These detailed publications should be consulted for more extensive treatment of the principles and procedures described in this chapter.~~

■Documents addressing the development and validation of sterilization cycles and related topics include, by the Parenteral Drug Association, Inc. (PDA), Validation of Moist Heat Sterilization Processes: Cycle Design, Development, Qualification and Ongoing Control (Technical Report No. 1); Process Simulation for Aseptically Filled Products (Technical Report No. 22); Sterilizing Filtration of Liquids (Technical Report No. 26); and Validation of Dry Heat Processes Used for Sterilization and Depyrogenation (Technical Monograph No. 3); and by the Pharmaceutical Manufacturers Association (PMA), Validation of Sterilization of Large-Volume Parenterals—Current Concepts (Science and Technology Publication No. 25). Additional radiation sterilization content can be found in ISO 11137—Sterilization of Health Care Products—Requirements for Validation and Routine Control—Radiation Sterilization. These more detailed publications should be consulted for more extensive treatment of the principles and procedures described in this chapter.

■2S (USP33)

Steam Sterilization

The process of thermal sterilization employing saturated steam under pressure is carried out in a chamber called an autoclave. It is probably the most widely employed sterilization process.[2]

■■2S (*USP33*)
The basic principle of operation is that the air in the sterilizing chamber is displaced by the saturated steam, achieved by employing vents or traps. In order to displace air more effectively from the chamber and from within articles, the sterilization cycle may include air and steam evacuation stages. The design or choice of a cycle for given products or components depends on a number of factors, including the heat lability of the material, knowledge of heat penetration into the articles, and other factors described under the validation program (see above). Apart from that description of sterilization cycle parameters, using a temperature of 121°, the F_0 concept may be appropriate. The F_0, at a particular temperature other than 121°, is the time (in minutes) required to provide the lethality equivalent to that provided at 121° for a stated time. Modern autoclaves generally operate with a control system that is significantly more responsive than the steam reduction valve of older units that have been in service for many years. In order for these older units to achieve the precision and level of control of the cycle discussed in this chapter, it may be necessary to upgrade or modify the control equipment and instrumentation on these units. This modification is warranted only if the chamber and steam jacket are intact for continued safe use and if deposits that interfere with heat distribution can be removed.

Dry-Heat Sterilization

■/Depyrogenation■2S (*USP33*)

The process of thermal sterilization of Pharmacopeial articles by dry heat ~~is usually carried out by a batch process in an oven designed expressly for that purpose A modern oven is supplied with heated, filtered air, distributed uniformly throughout the chamber by convection or radiation and employing a blower system with devices for sensing, monitoring, and controlling the critical parameters. The validation of a dry-heat sterilization facility is carried out in a manner similar to that for a steam sterilizer described earlier. Where the unit is employed for sterilizing components such as containers intended for intravenous solutions, care should be taken to avoid accumulation of particulate matter in the chamber.~~

■may be carried out by a batch process in an oven designed expressly for that purpose or in a dry-heat tunnel in which glass containers move on a continuous basis through the system. A dry-heat sterilization/depyrogenation system is supplied with heated, HEPA filtered air, distributed uniformly throughout the unit by convection or radiation and employing a blower system with devices for sensing, monitoring, and controlling all critical parameters.■2S (*USP33*)

A typical acceptable range in temperature in the empty chamber is ±15° when the unit is operating at not less than 250°.

In addition to the batch process described above, ~~a continuous process is frequently employed to sterilize and depyrogenate glassware as part of an integrated continuous aseptic filling and sealing system. Heat distribution may be by convection or by direct transfer of heat from an open flame. The continuous~~

■the continuous-tunnel■2S (*USP33*) system usually requires a much higher temperature than cited above for the batch process because of a much shorter dwell time. However, the total temperature input during the passage of the product should be equivalent to that achieved during the chamber process. The continuous process also usually necessitates a rapid cooling stage prior to the aseptic filling operation. In the qualification and validation program, in view of the short dwell time, parameters for uniformity of the temperature, and particularly the dwell time, should be established.

~~A microbial survival probability of 10^{-12} is considered achievable for heat-stable articles or components. An example of a biological indicator for validating and monitoring dry-heat sterilization is a preparation of *Bacillus subtilis* spores. Since dry-heat is frequently employed to render glassware or containers free from pyrogens as well as viable microbes, a pyrogen challenge, where necessary, should be an integral part of the validation program, e.g., by inoculating one or more of the articles to be treated with 1000 or more USP Units of bacterial endotoxin. The test with *Limulus* lysate could be used to demonstrate that the endotoxic substance has been inactivated to not more than 1/1000 of the original amount (3 log cycle reduction). For the test to be valid, both the original amount and, after acceptable inactivation, the remaining amount of endotoxin should be measured.~~

■Because depyrogenation is a more rigorous challenge for dry-heat processing systems than biological indicator inactivation, it is generally not necessary to include BIs when validating dry-heat processes if validation of depyrogenation is demonstrated. A 3 log cycle reduction or greater is a suitable acceptance criterion for depyrogenation and when successfully demonstrated will ensure not only adequate depyrogenation of compendial articles but also sterilization. Depyrogenation tests are typically done using articles inoculated with reference standard endotoxin. Articles are then evaluated after exposure for residual levels of endotoxin using *Limulus* lysate-based assays.■2S (*USP33*)
For additional information on the endotoxin assay, see *Bacterial Endotoxins Test* ⟨85⟩.

Gas Sterilization

The choice of gas sterilization as an alternative to heat is frequently made when the material to be sterilized cannot withstand the high temperatures obtained in the steam sterilization or dry-heat sterilization processes. ~~The active agent generally employed in gaseous sterilization is ethylene oxide of acceptable sterilizing quality. Among the disadvantages of this sterilizing agent~~

[2] ~~An autoclave cycle, where specified in the compendia for media or reagents, is a period of 15 minutes at 121°, unless otherwise indicated.~~ ■■2S (*USP33*)

■The most commonly employed method of gaseous sterilization is ethylene oxide. Among the disadvantages of ethylene oxide■2S (*USP33*) are its highly flammable nature unless mixed with suitable inert gases, its mutagenic properties, and the possibility of toxic residues in treated materials, particularly those containing chloride ions. The sterilization process is generally carried out in a pressurized chamber designed similarly to a steam autoclave but with the additional features (see below) unique to sterilizers employing this gas. Facilities employing this sterilizing agent should be designed to provide adequate post sterilization degassing, to enable microbial survivor monitoring, and to minimize exposure of operators to the potentially harmful gas.[2]

~~Qualification~~

■Validation■2S (*USP33*) of a sterilizing process employing ethylene oxide gas is accomplished along the lines discussed earlier. However, the program is more comprehensive than for the other sterilization procedures, because in addition to temperature, the humidity, vacuum/positive pressure, and ethylene oxide concentration also require ~~rigid~~

■appropriate parametric■2S (*USP33*) control. An important determination is to demonstrate that all critical process parameters in the chamber are adequate during the entire cycle. Because the sterilization parameters applied to the articles to be sterilized are critical variables, it is frequently advisable to precondition the load to achieve the required moisture content in order to minimize the time of holding at the required temperature before placement of the load in the ethylene oxide chamber. ~~The validation process is generally made~~

■Validation is generally conducted■2S (*USP33*) employing product inoculated with appropriate BIs such as spore preparations of *Bacillus ~~subtilis~~*

■*atrophaeus.*■2S (*USP33*) For validation they may be used in full chamber loads of product, or simulated product. The monitoring of moisture and gas concentration requires the utilization of sophisticated instrumentation that only knowledgeable and experienced individuals can calibrate, operate, and maintain. ~~The BI may be employed also~~

■BIs may also be employed■2S (*USP33*) in monitoring routine runs.

As is indicated elsewhere in this chapter, the BI may be employed in a fraction negative mode to establish the ultimate microbiological survivor probability in designing an ethylene oxide sterilization cycle using inoculated product or inoculated simulated product.

One of the principal ~~limitations~~

■limiting factors■2S (*USP33*) of the ethylene oxide sterilization process is the limited ability of the gas to diffuse to the innermost product areas that require sterilization. Package design and chamber loading patterns therefore must be determined ~~so that there is minimal resistance to gas diffusion.~~

■to allow for necessary gas penetration. The reader is referred to ISO 11135 for a complete description of process development, validation, and routine control of ethylene oxide sterilization processes.■2S (*USP33*)

Sterilization by Ionizing Radiation

The rapid proliferation of medical devices unable to withstand heat sterilization and the concerns about the safety of ethylene oxide have resulted in increasing applications of radiation sterilization. ~~It is applicable also to drug substances~~

■This method may also be applicable to active pharmaceutical ingredients■2S (*USP33*) and final dosage forms. The advantages of sterilization by irradiation include low chemical reactivity, low measurable residues, and the fact that there are fewer variables to control. In fact, radiation sterilization is unique in that the basis of control is essentially that of the absorbed radiation dose, which can be precisely measured. ~~Because of this characteristic, new procedures have been developed to determine the sterilizing dose. These, however, are still under review and appraisal, particularly with regard to the need, or otherwise, for additional controls and safety measures.~~

■Dose-setting and dose-substantiation procedures are used to validate the radiation dose required to achieve a sterility assurance level.■2S (*USP33*) Irradiation causes only a minimal temperature rise but can affect certain grades and types of plastics and glass.

The two types of ionizing radiation in use are radioisotope decay (gamma radiation) and electron-beam radiation. In either case the radiation dose established to yield the required degree of sterility assurance should be such that, within the range of minimum and maximum doses set, the properties of the article being sterilized are acceptable.

■The reader is referred to ISO 11137-1, - 2, and -3 for a complete description of process development, validation, and routine control of ionizing radiation processes.■2S (*USP33*)

~~For gamma irradiation, the validation of a procedure includes the establishment of article-materials compatibility, establishment of product loading pattern and completion of dose mapping in the sterilization container (including identification of the minimum and maximum dose zones), establishment of timer setting, and demonstration of the delivery of the required sterilization dose. For electron-beam irradiation, in addition, the on-line control of voltage, current, conveyor speed, and electron-beam scan dimension must be validated.~~

~~For gamma radiation sterilization, an effective sterilizing dose that is tolerated without damaging effect should be selected. Although 2.5 megarads (Mrad) of absorbed radiation was historically selected, it is desirable and acceptable in some cases to employ lower doses for devices, drug substances, and finished dosage forms. In other cases, however, higher doses are essential. In order to validate the efficacy particularly of the lower exposure levels, it is necessary to determine the magnitude (number, degree, or both) of the natural radiation resistance of the microbial population of the product. Specific product loading patterns must be established, and absorbed minimum and maximum dosage distribution must be determined by use of chemical dosimeters. (These dosimeters are usually dyed~~

[2] See *Ethylene Oxide*, Encyclopedia of Industrial Chemical Analysis, 1971, *12*, 317–340, John Wiley & Sons, Inc., and *Use of Ethylene Oxide as a Sterilant in Medical Facilities*, NIOSH Special Occupational Hazard Review with Control Recommendations, August 1977, U.S. Department of Health and Human Services, Public Health Service, Centers for Disease Control and Prevention, National Institute for Occupational Safety and Health, Division of Criteria Documentation and Standards Development, Priorities and Research Analysis Branch, Rockville, MD.

plastic cylinders, slides, or squares that show color intensification based directly on the amount of absorbed radiation energy; they require careful calibration.)

The setting of the preferred absorbed dose has been carried out on the basis of pure cultures of resistant microorganisms and employing inoculated product, e.g., with spores of *Bacillus pumilus* as biological indicators. A fractional experimental cycle approach provides the data to be utilized to determine the D_{10} value of the biological indicator. This information is then applied in extrapolating the amount of absorbed radiation to establish an appropriate microbial survivor probability. The most recent procedures for gamma radiation sterilization base the dose upon the radiation resistance of the natural heterogeneous microbial burden contained on the product to be sterilized. Such procedures are currently being refined but may provide a more representative assessment of radiation resistance, especially where significant numbers of radiation resistant organisms are present.[4] These range from inoculation with standard resistant organisms such as *Bacillus pumilus* to subprocess (sublethal) dose exposure of finished product samples taken from production lines. Certain hypotheses are common to all these methods. Although the total microbial population present on an article generally consists of a mixture of microorganisms of differing sensitivity to radiation, the step of subjecting the article to a less than totally lethal sterilization dose eliminates the less resistant microbial fraction. This results in a residual relatively homogeneous population with respect to radiation resistance and yields consistent and reproducible results of determinations with the residual population. The amount of laboratory manipulation required is dependent upon the particular procedure used.

One such procedure requires the enumeration of the microbial population on representative samples of independently manufactured lots of the article. The resistance of the microbial population is not determined, and dose setting is based on a standard arbitrary radiation resistance assigned to the microbial population, derived from data obtained from manufacturers and from the literature. The assumption is made that the distribution of resistances chosen represents a more severe challenge than the natural microbial population on the product to be sterilized. This assumption, however, is verified by experiment. After verification, the appropriate radiation sterilization dose is read from a table.

Another and, more elaborate method does not require the enumeration of the microbial population but uses a series of incremental dose exposures to allow a dose established to be such that approximately one out of 100 samples irradiated at that dose will be nonsterile. This is not the ultimate sterilization dose, but it provides the basis on which to determine the sterilization dose by extrapolation from the dose yielding one out of 100 nonsterile samples, using an appropriate resistance factor that characterizes the remaining microorganism resistant population. A periodic audit is conducted to check that the findings continue to be operative.

More elaborate procedures, requiring more experimentation and including the isolation of microbial cultures, include one in which, after determining the substerilization dose (yielding one out of 100 nonsterile samples), the resistance of the surviving microorganisms is used to determine the sterilizing dose. Another is based on different determinations, starting with a substerilization incremental dose that results in not more than 50% of the samples being nonsterile. After irradiation of sufficient samples at this dose, a number of microbial isolates are obtained. The radiation resistance of each of these is determined. The sterilization dose is then calculated using the resistance determinations and the 50% sterilizing dose initially determined. Audit procedures are required for these methods, as for the others described.

Where the required minimum radiation dose has been determined and delivery of that dose has been confirmed (by chemical or physical dosimeters), release of the article being sterilized could be effected within the overall validation of sterility assurance (which may include such confirmation of applied dosage, the use of biological indicators, and other means).

■■2S (*USP33*)

[4] Detailed descriptions of these procedures have been published by the Association for the Advancement of Medical Instrumentation (AAMI) in the document entitled Process Control Guidelines for Radiation Sterilization of Medical Devices (No. RS-P-10/82).

Sterilization by Filtration

Filtration through microbial retentive materials is frequently employed for the sterilization of heat labile solutions by physical removal of the contained microorganisms. A filter assembly generally consists of a porous matrix sealed or clamped into an impermeable housing. The effectiveness of a filter medium or substrate depends upon the pore size of the porous material and may depend upon adsorption of bacteria on or in the filter matrix or upon a sieving mechanism. There is some evidence to indicate that sieving is the more important component of the mechanism. Fiber shedding filters, particularly those containing asbestos, are to be avoided unless no alternative filtration procedures are possible. Where a fiber shedding filter is required, it is obligatory that the process include a nonfiber shedding filter introduced downstream or subsequent to the initial filtration step.

■The sterilization of fluids by filtration is a separative process and differs from the other methods of sterilization that rely on destructive mechanisms. Filtration through microbial retentive materials is frequently employed for the sterilization of heat-labile solutions by physical removal of the contained microorganisms. A filter assembly generally consists of a porous matrix integrated with or clamped into a housing. The effectiveness of a filter medium depends upon the pore size of the porous material, the prefiltration bioburden, and may depend upon adsorption of bacteria on or in the filter matrix or upon a sieving mechanism. There is some evidence to indicate that sieving is the more important component of the mechanism. Fiber-shedding filters, particularly those containing asbestos, are to be avoided unless no alternative filtration procedures are possible. Where a fiber-shedding filter is required, it is obligatory that the process include a nonfiber-shedding filter introduced downstream or subsequent to the initial filtration step.■2S (*USP33*)

Filter Rating— The pore sizes of filter membranes are rated by a nominal rating that reflects the capability of the filter membrane to retain microorganisms of size represented by specified strains, not by determination of an average pore size and statement of distribution of sizes. Sterilizing filter membranes (those used for removing a majority of contaminating microorganisms) are membranes capable of retaining 100% of a culture of 10^7 microorganisms of a strain of *Pseudomonas diminuta* (ATCC 19146) per square centimeter of membrane surface under a pressure of not less than 30 psi (2.0 bar). Such filter membranes are nominally rated 0.22 μm or 0.2 μm, de-

~~pending on the manufacturer's practice.[5] This rating of filter membranes is also specified for reagents or media that have to be sterilized by filtration (see treatment of Isopropyl Myristate under *Oils and Oily Solutions* or *Ointments and Creams* in the chapter *Sterility Tests* ⟨71⟩). Bacterial filter membranes (also known as analytical filter membranes), which are capable of retaining only larger microorganisms, are labeled with a nominal rating of 0.45 μm. No single authoritative method for rating 0.45-μm filters has been specified, and this rating depends on conventional practice among manufacturers; 0.45-μm filters are capable of retaining particular cultures of *Serratia marcescens* (ATCC 14756) or *Ps. diminuta*. Test pressures used vary from low (5 psi, 0.33 bar for *Serratia*, or 0.5 psi, 0.34 bar for *Ps. diminuta*) to high (50 psi, 3.4 bar). They are specified for sterility testing (see *Membrane Filtration* in the section *Test for Sterility of the Product to be Examined* under *Sterility Tests* ⟨71⟩) where less exhaustive microbial retention is required. There is a small probability of testing specimens contaminated solely with small microorganisms). Filter membranes with a very low nominal rating may be tested with a culture of *Acholeplasma laidlawii* or other strain of *Mycoplasma*, at a pressure of 7 psi (0.7 bar) and be nominally rated 0.1 μm. The nominal ratings based on microbial retention properties differ when rating is done by other means, e.g., by retention of latex spheres of various diameters. It is the user's responsibility to select a filter of correct rating for the particular purpose, depending on the nature of the product to be filtered. It is generally not feasible to repeat the tests of filtration capacity in the user's establishment. Microbial challenge tests are preferably performed under a manufacturer's conditions on each lot of manufactured filter membranes.~~

■The pore sizes of filter membranes are rated by a nominal rating that reflects the capability of the filter membrane to retain microorganisms of size represented by specified strains, not by determination of an average pore size and statement of distribution of sizes. Sterilizing filters cannot be narrowly defined because, depending upon the bioburden present in the fluid stream, different filters may be considered effective for sterilization. Currently a sterilizing filter can be defined as, ''a filter that, when appropriately validated, will remove all microorganisms from a fluid stream, producing a sterile effluent''. The nominal ratings of sterilizing filters based on microbial retention properties differ when rating is done by other means, e.g., by retention of latex spheres of various diameters. It is the user's responsibility to select a filter of correct rating for the particular purpose, depending on the nature of the product (especially considering its potential bioburden) to be filtered. It is not feasible to repeat the tests of filtration capacity in the user's establishment. Microbial challenge tests are preferably performed under a manufacturer's conditions on each lot of manufactured filter membranes.■2S (*USP33*)

The user must determine whether filtration parameters employed in manufacturing will significantly influence microbial retention efficiency. Some of the other important concerns in the validation of the filtration process include product compatibility, sorption of drug, preservative or other additives, and initial effluent endotoxin content.

Because the effectiveness of the filtration process is also influenced by the microbial burden of the solution to be filtered, determining the microbiological quality of solutions prior to filtration is an important aspect of the validation of the filtration process, in addition to establishing the other parameters of the filtration procedure, such as pressures, flow rates, and filter unit characteristics. Hence, another method of describing filter-retaining capability is the use of the log reduction value (LRV). For instance, a 0.2-μm filter that can retain 10^7 microorganisms of a specified strain will have an LRV of not less than 7 under the stated conditions.

~~The process of sterilization of solutions by filtration has recently achieved new levels of proficiency, largely as a result of the development and proliferation of membrane filter technology. This class of filter media lends itself to more effective standardization and quality control and also gives the user greater opportunity to confirm the characteristics or properties of the filter assembly before and after use. The fact that membrane filters are thin polymeric films offers many advantages but also some disadvantages when compared to depth filters such as porcelain or sintered material. Since much of the membrane surface is a void or open space, the properly assembled and sterilized filter offers the advantage of a high flow rate. A disadvantage is that since the membrane is usually fragile, it is essential to determine that the assembly was properly made and that the membrane was not ruptured during assembly, sterilization, or use.~~

■■2S (*USP33*)

The housings and filter assemblies that are chosen should first be validated for compatibility and integrity by the user. While it may be possible to mix assemblies and filter membranes produced by different manufacturers, the compatibility of these hybrid assemblies should first be validated. Additionally, there are other tests to be made by the manufacturer of the membrane filter, which are not usually repeated by the user. These include microbiological challenge tests. Results of these tests on each lot of manufactured filter membranes should be obtained from the manufacturer by users for their records.

Filtration for sterilization purposes is usually carried out with assemblies having membranes of nominal pore size rating of 0.2 μm or less.~~, based on the validated challenge of not less than 10^7 *Pseudomonas diminuta* (ATCC No. 19146) suspension per square centimeter of filter surface area. Membrane filter media now available include cellulose acetate, cellulose nitrate, fluorocarbonate, acrylic polymers, polycarbonate, polyester, polyvinyl chloride, vinyl, nylon, polytef, and even metal membranes, and they may be reinforced or supported by an internal fabric. A membrane filter assembly should be tested for initial integrity prior to use, provided that such test does not impair the~~

■A membrane filter assembly must be tested for initial integrity prior to use, provided that such test does not impair the safety, integrity, and■2S (*USP33*)
validity of the system, and should be tested after the filtration process is completed to demonstrate that the filter assembly maintained its integrity throughout the entire filtration procedure. Typical use tests are the bubble point test, the diffusive airflow test, the pressure hold test, and the forward flow test. These tests should be correlated with microorganism retention.

▪Unidirectional ■2S (USP33)

Aseptic Processing

Although there is general agreement that sterilization of the final filled container as a dosage form or final packaged device is the preferred process for ensuring the minimal risk of microbial contamination in a lot, there is a substantial class of products that are not terminally sterilized but are prepared by a series of aseptic steps. These are designed to prevent the introduction of viable microorganisms into components, where sterile, or once an intermediate process has rendered the bulk product or its components free from viable microorganisms.

▪The fundamental difference between aseptically produced sterile products and terminally sterilized products is the presence of a step that can be validated, whereby the final package is subjected to conditions shown to kill viable contaminants. Consequently, an aseptically filled product labeled as sterile must use a system of risk assessments to establish that an acceptable level of sterility assurance has been achieved. Current technology cannot provide an adequate safety assessment based on individual unit testing. In currently used methods of environmental monitoring, process simulations have not been shown to correlate directly with contaminated finished products. Finished product destructive testing (sterility tests) can only examine a very small percentage of a lot and are thus only capable of detecting grossly contaminated lots.■2S (USP33)

This section provides a review of the principles involved in producing aseptically processed products with a minimal risk of microbial contamination in the finished lot of final dosage forms.

A product defined as aseptically processed is likely to consist of components that have been sterilized by one of the processes described earlier in this chapter. For example, the bulk product, if a filterable liquid, may have been sterilized by filtration. The final empty container components would probably be sterilized by heat, dry heat being employed for glass vials and an autoclave being employed for rubber closures. The areas of critical concern are the immediate microbial environment where these presterilized components are exposed during assembly to produce the finished dosage form and the aseptic filling operation.

The requirements for a properly designed, validated, and maintained filling or other aseptic processing facility are mainly directed to (1) an air environment ~~free from viable microorganisms,~~

▪that is suitably controlled with respect to viable and nonviable particulates,■2S (USP33)

of a proper design to permit effective maintenance of air supply units, and (2) the provision of trained operating personnel who are adequately equipped and gowned. The desired environment may be achieved through the high level of air filtration technology now available, which contributes to the delivery of air of the requisite microbiological quality.[3] The facilities include both primary (in the vicinity of the exposed article) and secondary (where the aseptic processing is carried out) barrier systems.

For a properly designed aseptic processing facility or aseptic filling area, consideration should be given to such features as nonporous and smooth surfaces, including walls and ceilings that can ~~be sanitized frequently;~~

▪withstand routine decontamination;■2S (USP33)
gowning rooms with adequate space for personnel and storage of sterile garments; adequate separation of preparatory rooms for personnel from final aseptic processing rooms, with the availability, if necessary, of devices such as airlocks and air showers; proper pressure differentials between rooms, the most positive pressure being in the aseptic processing rooms or areas; the employment of ~~laminar (unidirectional)~~

▪unidirectional■2S (USP33)
airflow in the immediate vicinity of exposed product or components, and filtered air exposure thereto, with adequate air change frequency; appropriate humidity and temperature environmental controls; and a documented sanitization program. Proper training of personnel in hygienic and gowning techniques should be undertaken so that, for example, gowns, gloves, and other body coverings substantially cover exposed skin surfaces.

Certification and validation of the aseptic process and facility are achieved by establishing the efficiency of the filtration systems, by employing microbiological environmental monitoring procedures, and by processing of sterile culture medium as simulated product.

Monitoring of the aseptic facility should include periodic ~~environmental filter examination as well as routine particulate and microbiological environmental monitoring and may include periodic sterile culture medium processing.~~

▪HEPA filter evaluation and testing, as well as routine particulate and microbiological environmental monitoring. Periodic media-fill or process-simulation testing should also be performed.■2S (USP33)

Change to read:

STERILITY TESTING OF LOTS

It should be recognized that the referee sterility test might not detect microbial contamination if present in only a small percentage of the finished articles in the lot because the specified number of units to be taken imposes a significant statistical limitation on the utility of the test results. This inherent limitation, however, has to be accepted, because current knowledge offers no nondestructive alternatives for ascertaining the micro-

[3] Available published standards for such controlled work areas include the following: (1) ~~Federal Standard No. 209B, Clean Room and Work Station Requirements for a Controlled Environment, Apr. 24, 1973.~~
▪ISO 14464 1-7 Cleanrooms and Associated Controlled Environments.■2S (USP33)
(2) NASA Standard for Clean Room and Work Stations for Microbially Controlled Environment, publication NHB5340.2, Aug. 1967. (3) Contamination Control of Aerospace Facilities, U.S. Air Force, T.O. 00-25-203, 1 Dec. 1972, change 1-1, Oct. 1974.

biological quality of every finished article in the lot, and it is not a feasible option to increase the number of specimens significantly.

■For information regarding the conduct of the sterility test please see *Sterility Tests* ⟨71⟩.■2S (*USP33*)

~~The primary means of supporting the claim that a lot of finished articles purporting to be sterile meets the specifications consists of the documentation of the actual production and sterilization record of the lot and of the additional validation records that the sterilization process has the capability of totally inactivating the established product microbial burden or a more resistant challenge. Further, it should be demonstrated that any processing steps involving exposed product following the sterilization procedure are performed in an aseptic manner to prevent contamination. If data derived from the manufacturing process sterility assurance validation studies and from in-process controls are judged to provide greater assurance that the lot meets the required low probability of containing a contaminated unit (compared to sterility testing results from finished units drawn from that lot), any sterility test procedures adopted may be minimal, or dispensed with on a routine basis. However, assuming that all the above production criteria have been met, it may still be desirable to perform sterility testing on samples of the lot of finished articles. Such sterility testing is usually carried out directly after the lot is manufactured as a final product quality control test.[7] Sterility tests employed in this way in manufacturing control should not be confused with those described under *Sterility Tests* ⟨71⟩. The procedural details may be the same with regard to media, inocula and handling of specimens, but the number of units and/or incubation time(s) selected for testing may differ. The number should be chosen relative to the purpose to be served, i.e., according to whether greater or lesser reliance is placed on sterility testing in the context of all the measures for sterility assurance in manufacture. Also, longer times of incubation would make the test more sensitive to slow-growing microorganisms. In the growth promotion tests for media, such slow growers, particularly if isolated from the product microbial burden, should be included with the other test stains. Negative or satisfactory sterility test results serve only as further support of the existing evidence concerning the quality of the lot if all the pertinent production records of the lot are in order and the sterilizing or aseptic process is known to be effective. Unsatisfactory test results, however, in manufacturing quality control indicate a need for further action (see *Performance, Observation, and Interpretation*).~~

~~Definition of a Lot and Selection of Specimens for Sterility Test Purposes~~

~~Articles may be terminally sterilized either in a chamber or by a continuous process. In the chamber process, a number of articles are sterilized simultaneously under controlled conditions—for example, in a steam autoclave—so that for the purpose of sterility testing, the lot is considered to be the contents of a single chamber. In the continuous process, the articles are sterilized individually and consecutively (for example, by exposure to electron-beam radiation), so that the lot is considered to be not larger than the total number of similar items subjected to uniform sterilization for a period of not more than 24 hours.~~

~~For aseptic fills, the term "filling operation" describes a group of final containers, identical in all respects, that have been aseptically filled with the same product from the same bulk within a period not longer than 24 consecutive hours without an interruption or a change that would affect the integrity of the filling assembly. The items tested should be representative of each filling assembly and should be selected at appropriate intervals throughout the entire filling operation. If more than three filling machines, each with either single or multiple filling stations, are used for filling a single lot, a minimum of 20 filled containers (not less than 10 per medium) should be tested for each filling machine, but the total number generally need not exceed 100 containers.~~

~~For small lots, in the case of either aseptic filling or terminal sterilization, if the number of final containers in the lot is between 20 and 200, about 10% of the containers should usually be tested. If the number of final containers in the lot is 20 or less, not fewer than 2 final containers should be tested.~~

■■2S (*USP33*)

Delete the following:

■PERFORMANCE, OBSERVATION, AND INTERPRETATION

~~The facility for sterility testing should be such as to offer no greater a microbial challenge to the articles being tested than that of an aseptic processing production facility. The sterility testing procedure should be performed by individuals having a high level of aseptic technique proficiency. The test performance records of these individuals should be documented.~~

~~The extensive aseptic manipulations required to perform sterility testing may result in a probability of non-product-related contamination of the order of 10^{-3}, a level similar to the overall efficiency of an aseptic operation and comparable to the microbial survivor probability of aseptically processed articles. This level of probability is significantly greater than that usually attributed to a terminal sterilization process, namely, 1 in 1 million or 10^{-6} microbial survivor probability. Appropriate, known-to-be-sterile finished articles should be employed periodically as negative controls as a check on the reliability of the test procedure. Preferably, the technicians performing the test should be unaware that they are testing negative controls. Of these tests, a false-positive frequency not exceeding 2% is desirable.~~

~~For aseptically processed articles, these facts support the routine use of the test set forth under *Sterility Tests* ⟨71⟩ or a more elaborate one. The production and validation documentation should be acceptable and complete. For effectively terminally sterilized products, however, the lower microbial survivor probability may direct the use of a less extensive test than the compendial procedure specified under *Sterility Tests* ⟨71⟩, or even preclude altogether the necessity for performing one. This added reliability of sterility assurance of terminal sterilization depends upon a properly validated and documented sterilization process. Sterility testing alone is no substitute.~~

~~**Interpretation of Quality Control Tests**—The overall responsibility for the operation of the test unit and the interpretation of test results in relation to acceptance or rejection of a lot should be in the hands of those who have appropriate formal training in microbiology and have knowledge of industrial sterilization, aseptic processing, and the statistical concepts involved in sampling. These individuals should be knowledgeable also concerning the environmental control program in the test facility to ensure that the microbiological quality of the air and critical work surfaces are consistently acceptable.~~

~~Quality control sterility tests (either according to the official referee test or modified tests) may be carried out in two separate stages in order to rule out false positive results. *First Stage.* Regardless of the sampling plan used, if no evidence of microbial growth is found, the results of the test may be taken as indicative of absence of intrinsic contamination of the lot.~~

~~If microbial growth is found, proceed to the *Second Stage* (unless the *First Stage* test can be invalidated). Evidence for invalidating a *First Stage* test in order to repeat it as a *First Stage* test may be obtained from a review of the testing environment and the relevant records thereto. Finding of microbial growth in negative controls need not be considered the sole grounds for~~

~~[7] *Radioactive Pharmaceutical Products*—Because of rapid radioactive decay, it is not feasible to delay the release of some radioactive pharmaceutical products in order to complete sterility tests on them. In such cases, results of sterility tests provide only retrospective confirmatory evidence for sterility assurance, which therefore depends on the primary means thereto established in the manufacturing and validation/certification procedures.~~

~~invalidating a *First Stage* test. When proceeding to the *Second Stage*, particularly when depending on the results of the test for lot release, concurrently, initiate and document a complete review of all applicable production and control records. In this review, consideration should be paid to the following: (1) a check on monitoring records of the validated sterilization cycle applicable to the product, (2) sterility test history relating to the particular product for both finished and in-process samples, as well as sterilization records of supporting equipment, containers/closures, and sterile components, if any, and (3) environmental control data, including those obtained from media fills, exposure plates, filtering records, any sanitization records and microbial monitoring records of operators, gowns, gloves, and garbing practices.~~

~~Failing any lead from the above review, the current microbial profile of the product should be checked against the known historical profile for possible change. Records should be checked concomitantly for any changes in source of product components or in processing procedures that might be contributory. Depending on the findings, and in extreme cases, consideration may have to be given to revalidation of the total manufacturing process. For the *Second Stage*, it is not possible to specify a particular number of specimens to be taken for testing. It is usual to select double the number specified for the *First Stage* under *Sterility Tests* ⟨71⟩, or other reasonable number. The minimum volumes tested from each specimen, the media, and the incubation periods are the same as those indicated for the *First Stage*.~~

~~If no microbial growth is found in the *Second Stage*, and the documented review of appropriate records and the indicated product investigation does not support the possibility of intrinsic contamination, the lot may meet the requirements of a test for sterility. If growth is found, the lot fails to meet the requirements of the test. As was indicated for the *First Stage* test, the *Second Stage* test may similarly be invalidated with appropriate evidence, and, if so done, repeated as a *Second Stage* test.~~ ■*2S (USP33)*

BRIEFING

⟨1235⟩ Vaccines for Human Use—General Considerations. Because of extensive changes in the previously proposed chapter (see page 1297 of *PF* 34(5) [Sept.–Oct. 2008]), that proposal is canceled, and a new draft is proposed for this general information chapter. The proposed general information chapter *Bovine Serum* ⟨1024⟩, referred to in the section *Fermentaion and Cell Culture Media*, can be viewed on page 628 of *PF* 35(3) [May–June 2009].

(BB VV: F. Atouf) RTS—C74087

Add the following:

■⟨1235⟩ VACCINES FOR HUMAN USE—GENERAL CONSIDERATIONS

INTRODUCTION

Vaccines have been used for centuries to immunize individuals against pathogenic organisms with the goal of preventing the associated disease. Vaccines are biological products that contain antigens capable of inducing a specific and active acquired immune response in the body. Antigens present in vaccines are processed by specialized cells in the body's immune system, resulting in the development of blood proteins known as antibodies (i.e., humoral immunity) or specialized lymphocytes (i.e., cell-mediated immunity) or both. Therefore immune responses may be antibody mediated, cell mediated, or both. Thus, antigens are critical for vaccine function and generally consist of a portion of the pathogenic organism, or an attenuated form of the whole microorganism. In the case of DNA-based vaccines (currently under development), the vaccine would contain nucleotide sequences (genetic material) that encode microbial antigens.

Examples of types of licensed vaccines appear in *Appendix 1*. A current list of vaccines licensed in the United States is posted at www.fda.gov/cber/.

Vaccines can be of various types, depending on their design and processes involved in their manufacture. Vaccines for human use may contain whole killed or attenuated organisms (e.g., bacteria or viruses) or contain antigens derived from portions of a pathogen, either by partitioning and purification or derived using recombinant technology (*Table 1*). Some polysaccharide vaccines are conjugated to a carrier in order to enhance their immune response.

Table 1. Bacterial and Viral Vaccines

Live attenuated whole cell or virus[a]

Whole cell or virus[c]
Recombinant proteins[d]
Subunit[e]
Polysaccharides
Proteins
Modified toxins

[a] Live attenuated bacterial or viral vaccines are weakened (attenuated) forms of a pathogen. They contain antigens that are similar to disease-causing microbes. They may be derived from the pathogen itself, or from a different organism that contains antigens that cross-react with the virulent microbe (e.g., vaccinia and variola).

[b] Inactivated bacterial and viral vaccines are produced by growing cells of disease-causing bacteria or viruses in cell substrates and subsequently inactivating them to prevent replication in the recipient.

[c] Inactivated/killed whole-cell or virus vaccines consist of the entire microorganisms after they have been inactivated. These preparations may or may not be partially or completely purified.

[d] Recombinant protein viral and bacterial vaccines are derived from host cells that have been transformed with expression vectors that carry genes that encode antigenic material from infectious agents. The expression cells are grown in bioreactors to produce the recombinant antigenic material.

[e] Subunit vaccines are extracts from inactivated/killed viruses or bacteria. Subunit-type vaccines generally undergo some degree of purification.

In addition to antigen(s), vaccines may contain several other components, such as adjuvants that enhance the immune response to the vaccine antigen, preservatives to prevent bacterial or fungal contamination of multiple-dose vials, or other excipients needed for pharmaceutical manufacturing or vaccine stabilization. Residual components from the manufacturing process also may be present in vaccine preparations. Examples of these categories are listed in *Table 2.*

Different vaccine antigens are often combined in one final formulation in order to elicit immunity against multiple diseases and to reduce the number of separate administrations needed to achieve immunity to the various vaccine antigens.

Despite the multiple forms vaccines may take, several common features characterize the manufacture and testing of vaccines. This chapter focuses on commonalities throughout the manufacturing process, from raw material qualifications to final release tests.

Regulations and Standards

Vaccines are regulated by FDA as biological products. The general requirements are listed in national laws and international guidances. For the U.S., national requirements are codified in 21 CFR, the 200 and 600 sections, with additional recommendations available in FDA *Points*

to Consider and Guidance documents (www.fda.gov). International guidances are available from the International Conference on Harmonization (ICH) (www.ich.org; see *Appendix 2*) and the World Health Organization. New methodologies are continually being developed and validated and will be included in *USP* as they become available. Reference standards are available from USP and FDA.

OVERALL MANUFACTURING PLAN

When considering the overall plan for manufacturing a vaccine, manufacturers need to consider the following factors:

- Physical facilities;
- Raw materials and process aids;
- Actual manufacturing process, including
  a. initial process (production of virus/bacteria and recombinant materials);
  b. downstream processes (purification or chemical modification, if applicable);
- Antigen modifications such as conjugation or toxoiding;
- Storage of process intermediates and final bulk;
- In-process and final product testing regimens and control schemes;
- Addition of adjuvants, if applicable;
- Formulation and filling;
- Container–closure system; and
- Stability program that supports the dating period of the product.

Quality systems are needed to support the following manufacturing process development: specifications for raw materials, process intermediates, and final product; change control; and failure investigations and complaints. All of these elements are important in the life cycle of the vaccine product.

The overall goal of a comprehensive manufacturing program is to consistently produce a vaccine that is safe and effective. Concurrently with clinical development of the vaccine, the manufacturing process is refined and the process and testing methods are validated for consistency. This includes systems to control changes to the process or inputs. Manufacturers should expect that changes will be required during the vaccine's manufacturing life cycle, and manufacturers necessarily will use data from development and routine manufacturing to assess the process as well as proposed changes. The manufacturers should adopt systems that continually evaluate all aspects of manufacturing to identify unanticipated changes in vaccine quality and to assess them as quickly as possible.

Manufacturing Facilities and Systems

Manufacturers should have a general layout of manufacturing facilities, including diagrams that show the following: flow of raw materials and process inputs; movement of product, intermediates, waste streams, and personnel; and air flows and pressurization levels. These diagrams assist in minimizing the risk of potential product contamination from various sources. These sources can include cross-contamination from other products, contamination from different batches of the same product, and extraneous contamination from microorganisms and personnel. Evaluation of the flow diagrams can assist with strategies for development of engineering controls, personnel procedures, and monitoring systems to enable compliance with Good Manufacturing Practices (GMPs). Analysis of potential risks may also provide insights about what information should be recorded in batch documentation to facilitate consistent manufacture and also to facilitate failure investiga-

tions. Together, physical facilities, procedures, personnel, training, and quality systems make up the GMP environment in which a vaccine will be produced.

Manufacturing Process

The manufacturing process includes process inputs such as raw materials and processing aids and unit operations comprising both the initial and downstream processing steps. A process flow map for the manufacturing process is useful and assists in validation of the manufacturing process. This map shows all unit operations, the inputs to each operation, and the outputs to subsequent manufacturing steps. Analytical testing done at relevant steps and the specifications required to proceed to the next stage of processing may be added to the map. A process map also supports a processing space to facilitate a rugged process, i.e., one based on suitable characterization studies to establish boundaries within which manufacturing can occur to promote unchanged safety and efficacy outcomes.

The process flow map should include all steps from making the seed/cell bank (described below) to formulation and filling of the final product. The validation strategy should include the steps that require validation, along with identification of the process space, associated critical process parameters (CPP), and critical quality attributes (CQA). The critical process parameters are those that directly affect core quality attributes needed to successfully manufacture a batch of product. Some manufacturers identify other processing parameters that are important for processing but do not affect critical quality attributes. These important but noncritical factors help identify the process development space, can contribute to the development of a rugged process, or can be useful when the company assesses processing deviations. The concepts of quality by design and exploration of the process space are relatively new to the biologics/vaccine industry but are becoming considerations for the overall development-planning process.

Manufacturing Surveillance

Manufacturing surveillance is the continual observation of how the process and the resulting product are performing. This section is not exhaustive; rather, the points raised here outline the types of considerations recommended for a manufacturer during development of a vaccine. Manufacturing surveillance includes the following:

- Periodic review of the performance of the manufacturing process;
- Analytical assays;
- Stability programs;
- Product complaints;
- Adverse event reports;
- Product failure investigations;
- Atypical or deviation events.

Taken as a whole, these activities allow a manufacturer to assess the state of the process and product and to evaluate which, if any, operations need to be modified. These same systems also provide a surveillance matrix to evaluate changes. In any of these programs it is also valuable to develop additional characterization assays that are not used for process intermediate or product release purposes but may be used for further evaluation when additional information is needed or desired. These additional assays for characterization are often based on different underlying analytical procedures to provide different ways to evaluate materials.

Routine surveillance processes are increasingly implemented to attempt to detect changes in processes before any critical quality attributes are adversely affected. Not all vaccine processes can be characterized to the same extent or level (e.g., a live virus vaccine vs. a recombinant

protein vaccine), and statistical tools are often used to determine alert or action levels in surveillance programs. Exceeding these levels requires the manufacturer to evaluate the situation but does not necessarily signal product failure.

GMP manufacturing entails facility design, process development, quality systems, and manufacturing surveillance. Together these systems help the manufacturer to control the production of a vaccine. As noted, many types of vaccine are marketed, and each has its unique features and therefore requires different plans for each of the steps mentioned in this section.

SEED LOT SYSTEMS

Seed lots are the stocks of specific strains of bacteria, viruses, or biotechnology-engineered cells used to express vaccine antigens. All seed lots should be documented in terms of their isolation, derivation (or construction, in the case of recombinant vector or engineered cells), and passage history. The purpose of a seed-lot system, which typically includes master and working stock seeds, and associated master and working cell banks, is to help ensure the consistency of vaccine manufacturing. The use of master and working seed lots provides a method to limit the replication of the seed and to minimize the possibility of genetic variation.

A master seed lot is a physically homogeneous preparation derived from an original seed processed at one time and passaged for a limited number of times. The master seed lot is characterized for its biological, biochemical and genetic characteristics, and to ensure its purity, its freedom from adventitious agents, and its clinical ability to produce an effective vaccine.

Cultures from the working seed lot should have the same characteristics as the master seed lot from which they are derived. For influenza vaccines, which may be reformulated with new virus antigens each year, certified seed lots can be obtained from national regulatory agencies.

A working seed lot is derived from the master seed within a limited number of passages. The working seed is tested to ensure its purity, freedom from adventitious agents, and biochemical properties. The working seed is used for production of vaccine without intervening passages.

Bacterial Vaccine Seed Lot System

In the bacterial seed lot system, a master seed is subcultured to produce a working seed one passage beyond the master seed. An aliquot of the working seed is then expanded to produce a vaccine lot. The strain(s) used for the master seed lots are identified by historical records that include information about their origin. Information about the bacterial seed lot system should include source, passage history, and raw materials to which it was exposed, with specific emphasis on raw materials of ruminant origin. Seeds should be stored at an appropriate temperature in more than one location within a facility or at a distant site in order to decrease catastrophic risk.

Identity tests may include inoculation onto suitable biochemical media, Gram stains, genotype, and serological identification with suitable specific antisera. Special tests may be added, for example, to show culture viability but also lack of virulence.

Purity of the bacterial strains used for seed lots is verified by methods of suitable sensitivity to ensure that no adventitious agents are present. These purity tests often are performed in the presence of the seed under conditions where growth is inhibited by the presence or the absence of specific nutrients. Streaking can also be used to show that the cultured seed is a pure culture.

Viral Vaccine Seed Lot System

The derivation and passage history of viral seeds should be recorded in detail. Any manipulation of the viral phenotype (e.g., cold adaptation, development of temperature sensitivity, or attenuation of virulence) or intentional genetic manipulations (e.g., reassortment or recombination) should be documented.

These viral seeds are commonly differentiated into a master viral seed and working viral seeds or working viral stock. Viral seeds should be stored at cryogenic temperatures to promote stability and in more than one location within a facility or at a distant site to decrease catastrophic risk. Manufacturers should assess the following characteristics of the viral seed stock:

- Growth characteristics on the intended production cell substrate,
- Tissue tropism;
- Genetic markers;
- Identity (for recombinant vectors);
- Viability during storage,
- Genetic stability through production;
- Attenuation properties;
- Purity;
- Absence of adventitious agents. If attenuation or derivation is achieved by passage through different species, the viral seed should be assessed for absence of adventitious agents common to those species.

The master viral seed should be extensively characterized to demonstrate the stability of genotype and phenotype for a number of passages beyond the level used in production. Generally, during assessment of genetic stability, a master seed undergoes a minimum of five passes beyond the passage that will produce the final vaccine.

Tests should be performed for identity (e.g., sequencing the entire virus or a portion of it), adventitious agents, viral phenotype, genetic stability, and, if applicable, agents that might be present in the seed as a result of its passage history). Viral phenotype can be assessed further for tissue tropism, attenuation properties, and temperature sensitivity. Not all of these tests may be necessary for every viral seed strain.

In some cases the viral seeds may have a broad host range and therefore may require neutralization of the vaccine virus before they are tested for adventitious agent(s). If possible, testing for adventitious agents should be done without neutralization in order to avoid an antiserum that may inadvertently neutralize an adventitious agent present in the seed. Sometimes it is not possible to effectively neutralize a viral seed, and in such cases alternative strategies can be used. For example, the test can be performed in a cell substrate that does not permit replication by the vaccine virus. However, such a substitution of the substrate cell may compromise the test's sensitivity for detection of other adventitious agents. Therefore, the tests may be supplemented with use of polymerase chain reaction (PCR) assays.

Assessment of neurovirulence may be appropriate if the virus is known to be neurotropic. Manufacturers should consult with regulators about appropriate animal models, methods, and scoring systems for this assessment before they initiate such studies. For viruses that are neurovirulent or may revert to neurovirulence (e.g., polioviruses), it may be necessary to assess neurovirulence beyond the master seed.

If the master viral seed is well characterized, the working viral seed may not require extensive characterization. For example, it may not be necessary to repeat testing for all the relevant viruses from the derivation history.

Systems for Biotechnology-Engineered Vaccines

For a vaccine produced via a biotechnology-engineered cell-expression system, a master seed lot or a master cell bank will be established during product development. The seed lot or cell banks should be homogenous, which is often accomplished by limiting dilu-

tions. The seed lot or cell bank system should be characterized in a manner analogous to that used for the cell substrate discussed in the next section, and additional tests can be used to demonstrate the genetic stability of the expression system.

FERMENTATION AND CELL CULTURE MEDIA

A medium is the material in which an organism is grown and amplified in quantity to produce mass material for vaccine production. Its composition is diverse and depends on the cell types that the medium supports, ranging from well-defined chemical media to chemically undefined media that contain natural components such as sera from animal origin (see *Bovine Serum* ⟨1024⟩). Culture media should be suitable for their intended purpose and should be free from adventitious agents and known undesirable components such as toxins, allergens, and similar compounds. If undefined ingredients are necessary, the amount should be kept below levels that are demonstrated to be safe for the final product.

Fermentation Media for Bacterial Growth

The nutrients consist of materials like proteins, sugars, inorganic trace elements, amino acids, and vitamins needed for bacterial growth. The protein component may be as simple as free casein (milk protein), or it can be as complex as extracts from bacterial, plant, or animal sources. Any fermentation nutrients of animal origin are sourced carefully and tested for adventitious agents. The composition of a medium is often customized to optimize product quality attributes. Medium components that are known to cause allergic reactions should be avoided.

Media for Cell Culture for Viral Vaccines

The types and composition of media used for isolation and all subsequent culture of components of viral vaccines need to be recorded in detail. Chemically defined media without materials of animal origin are preferred. The medium should be tested for sterility and suitability for the cells used in product production. If materials of animal origin are used, they are assessed for freedom from adventitious agents. If human albumin is used in a U.S.-licensed vaccine, it must be licensed by FDA. The final product should be within specified limits of residual medium components such as serum, antibiotics, selection agents or reagents added for growth enhancement.

Media for Biotechnology-Engineered Cells

The requirement for media used for the fermentation and propagation of biotechnology-engineered cells is the same as that noted above for bacterial fermentation and cell culture growth.

PROPAGATION AND HARVEST

The propagation and harvest phases follow the manufacturing process from the initiation of cell growth in the working cell bank to the separation of the crude drug substance. In addition, in these manufacturing process steps, raw materials, media, and solutions should be qualified for their intended use. Batch numbers should be clearly assigned as needed, and the relationship between component harvests and batches of individual drug substances should be recorded clearly.

Propagation and Harvest for Bacterial Vaccines

Propagation of bacteria for bacterial vaccines is performed under specified conditions for the inoculum preparation and the fermentation phases. In-process

monitoring and testing should be conducted for quality assurance. All controls and testing performed after production (e.g., purity, viability, antigen yield, and phenotypic identity) should be documented. The first step of drug-substance recovery is harvesting from the bioreactor. A variety of equipment is available, and the process equipment used depends on the nature of the process. Procedures should be established to ensure containment and prevention of contamination during harvesting and to monitor bioburden (including acceptance criteria) or sterility. The storage conditions and the stability time limit for the harvest material should be described. For most bacterial vaccines, an inactivation step is necessary. Personnel involved in bacterial inactivation should consider the following: how cell culture purity is verified after inactivation, whether culture purity should be defined before inactivation, choice of the inactivation agent, and validation of the procedure(s).

Propagation and Harvest for Viral Vaccines

The manufacturing of viral vaccines using eukaryotic cell culture includes a two-phase production process. The first is the expansion of the cell cultures used as a substrate for viral replication. The second phase includes the initial virus infection and subsequent replication and virus production.

Cell Substrate Growth Phase—The cell substrate expansion process for viral production is the phase designed to prepare the cells in a physiological state appropriate to sustain virus growth. Cell substrates often require complex animal-derived supplements such as serum. The source and testing requirements of bovine serum are subject to regulatory requirements (see *Bovine Serum* ⟨1024⟩).

Virus Production Phase—Relatively few cell types have been used as substrates in U.S.-licensed viral vaccines, but these include primary cells (e.g., certain cells derived from monkey, chick, or mouse tissue), diploid cell lines (e.g., WI38, MRC-5, or FRhL-2), and continuous cell lines (e.g., Vero). Vaccine manufacturers have optimized nutrient requirements, growth factors, and serum concentration to support robust growth and strong virus productivity for these cell lines.

PURIFICATION

The objective of the purification steps is to remove as much as possible of the impurities in the initial harvest and to maximize the purity of the final vaccine product. Process residuals may consist of materials from the culture medium and/or cellular components. Purification procedures should be optimized and validated. When applicable, viral clearance steps (viral removal or inactivation) should be included and validated using relevant model viruses. Special considerations are observed depending on the types of vaccines and production system used, as discussed below.

Bacterial Fermentation

Bacterial fermentations are typically highly productive and yield large amounts of biomass. For bacterial subunit products or recombinant components expressed by bacteria, fermentation can produce very high concentrations of the desired active ingredient. Manufacturers should initiate culture purity testing before further processing.

Live Bacterial Vaccines—Live bacterial vaccines such as Bacillus Calmette-Guérin (BCG) and *Salmonella typhi* Ty21a are relatively fragile as pharmaceutical products and therefore tolerate only fairly gentle purification approaches. If osmotic and shear forces are constrained, then the integrity of the bacteria usually can be maintained.

Inactivated Bacterial Vaccines—At present no inactivated whole-cell bacterial vaccines are licensed for use in the U.S.

Purified Bacterial Antigens—Purification of bacterial components (e.g., proteins, toxins, and polysaccharides) generally requires cell disruption. More selective purification methods can be used to remove culture media and bacterial impurities and to achieve high purity of the target bacterial component.

Biotechnology-Engineered Cells

Of special concern in the purification of recombinant-derived vaccine components is the issue of residual host cell components that could produce an adverse immunogenic response in patients. This response could be exacerbated by the presence of vaccine adjuvants.

Recombinant Virus-Like Particles (VLP)—Formation of VLPs can coincidentally result in incorporation of host cell components (e.g., DNA) into the quaternary structure of the molecular assembly, resulting in a class of impurities that has a tight association with the active pharmaceutical ingredient. As a result, modern approaches to VLP production in some cases include a disassembly step that dissociates impurities from the viral proteins. This procedure is followed by a reassembly step that reforms the VLPs in the absence of the host components. Liquid-phase extractions and chromatographic procedures can be used to provide high-purity components for use in vaccine products with no substantial risk of carrying over significant residual host components.

Viral Vaccines Derived from Cell Culture

Viral Vaccines Derived from Continuous Cell Lines—If a continuous cell line (e.g., Vero) is used for vaccine production, a validated filtration step is necessary to separate virus from intact cells. The quantity and size of any residual host cell DNA also should be determined (see general information chapter *Nucleic Acid-Based Techniques—Approaches for Detecting Trace Nucleic Acids (Residual DNA Testing)* ⟨1130⟩). Currently, 10 ng of host cell DNA is permitted per dose of a parenterally administered vaccine, and regulatory agencies continue to consider on a case-by-case basis the level of risk posed by host cell DNA for vaccines that are administered by other routes (e.g., nasal or oral). Multiple purification methods to reduce the size and amount of residual host-cell DNA present in the vaccine are desirable and include steps such as treatment with DNAse, diafiltration, ultrafiltration, and column chromatography.

Viral Vaccines Derived from Human Diploid Cell Culture—FDA has licensed several vaccines made using human diploid cells. The two most commonly used diploid cell lines are MRC-5 and WI-38, both of which are derived from human embryonic cells and have the normal diploid number of human chromosomes. They are widely used to manufacture vaccines because they have been shown to have no tumorigenic or oncogenic potential and have been shown to be susceptible to a wide range of human viruses. However, unlike continuous cell lines that can be passaged indefinitely, human diploid cell lines are capable of attaining only a certain number of population doublings, after which they experience a rapid decline in their ability to proliferate. This issue is managed by freezing multiple aliquots of master and working cell banks.

Viral Vaccines Derived from Primary Cell Culture—Like diploid cells, primary cells normally are not tumorigenic or oncogenic. However, when primary cells are used to manufacture live vaccines, the donor animals from which the primary cells are obtained are extensively tested for a variety of pathogens before being used. For example, chicken flocks used to prepare chicken embryo kidney cells undergo extensive serological testing for adventitious agents before the flock can be used to prepare

the cells. Some of these tests are described in the Code of Federal Regulations (CFR, see the sections listed in *Appendix 2*) and the USP general information chapter *Virology Test Methods* ⟨1237⟩.

Viral Vaccines Derived from Chicken Eggs

The embryonated chicken egg is a highly productive growth substrate for certain viruses, such as those used to make vaccines for yellow fever and several influenza vaccines. In the case of influenza vaccines, vaccine virus is harvested from egg allantoic fluid. In the case of yellow fever vaccine, the vaccine virus is harvested from embryo tissues. Therefore, residual egg or embryo components are special considerations in vaccine purification.

Egg-based vaccine production, like all biomass expansions, requires care and quality control of the virus seed lots and egg substrates to avoid contamination with other organisms.

Live Attenuated Virus Vaccines—Viruses for live vaccines (e.g., yellow fever or live influenza) are produced using Specific Pathogen-Free (SPF) eggs. These eggs are produced by chicken flocks that are regularly screened for avian pathogens (e.g., avian leukosis virus) and are maintained using appropriate animal husbandry practices. To preserve the infectivity and antigenic integrity of the vaccine viruses while removing egg-derived components, relatively simple, mild methods (e.g., zonal sucrose gradient centrifugation and diafiltration) are used for vaccine virus concentration, purification, and buffer exchange.

Inactivated Whole Virus Vaccines—Viruses for inactivated vaccines can be produced using non-SPF eggs because of required chemical inactivation steps in the manufacturing process. Because the vaccine virus needs to be retained intact while removing egg-derived components and inactivating chemicals, relatively mild purification and concentration methods (e.g., zonal sucrose gradient centrifugation) are used. If chemical agents are used in the process, they should be minimized in the final product to below prespecified levels.

Split Virus and Purified Subunit Vaccines—Viruses for split virus and purified subunit influenza vaccines are produced in non-SPF embryonated eggs. Inactivation and purification of vaccine viruses are achieved by chemical treatment (e.g., formaldehyde or β-propiolactone) and zonal sucrose gradient centrifugation, respectively. Split virus vaccines are prepared by disruption of vaccine virus particles using a detergent (e.g., sodium deoxycholate) that preserves antigenic integrity.

INTERMEDIATES

Intermediates are defined here as the unformulated active (immunogenic) drug substances that are processed before final formulation and can be stored for long periods of time before further processing. These intermediates can be stored and should be included in a formal stability program. Examples of intermediates include bulk polysaccharides, purified recombinant proteins (concentrates), and conjugates.

Production of Intermediates

Intermediates are manufactured from starting materials by one or a combination of different processes (e.g., fermentation, cultivation, isolation, or synthesis). Subsequent steps of the procedure involve preparation, characterization, and purification, eventually resulting in the drug substance. Quality systems documents are adopted for production and all applicable information should be recorded in a controlled document (i.e., a batch record). When applicable, stability studies and release tests should be performed before proceeding to the next steps (see below).

Tests for Intermediates

The quality attributes of the intermediate are commonly tested in conjunction with further processing. Characterization beyond release testing should be considered. Characterization methods can use appropriately qualified procedures. Some tests are routinely performed before the intermediates are converted to the final bulk, depending on individual vaccines.

If intermediates need to be stored and/or subsequently shipped to a different location for further processing, the stability of these materials should be demonstrated. Stability tests can be a combination of both physicochemical analysis and biological assays.

FINAL BULK

Final bulk is the bulk drug product that contains the drug substance(s), excipients, and other ingredients at desired concentrations and is ready for filling into individual containers.

Production of Final Bulk

Appropriately controlled amounts of all ingredients are blended to uniformity to produce the final bulk. The processing may include one or more steps such as buffer exchange and addition of diluents, bulking agent, stabilizing excipients, adjuvants, and preservatives. Final bulk may be prepared aseptically or processing may include a sterilization step.

Tests for Final Bulk

The quality attributes of the final bulk should be tested. Appropriate testing should be performed with respect to identity, purity, potency, sterility (see *Sterility Tests* ⟨71⟩), and antimicrobial effectiveness (see *Antimicrobial Effectiveness Testing* ⟨51⟩). Tests demonstrating safety, if applicable, are performed. The list includes, for example, tests for the absence of adventitious agents, mycoplasma, and other microorganisms.

Testing is required for specific process-related and product-related impurities, depending on the vaccines being manufactured. In addition, tests are required for the bulking agent, stabilizing excipients, adjuvants, and/or preservatives, if used. All the testing should be done according to respective standard operating procedures (SOPs), and all tests should have specifications (or provisional specifications, where applicable).

Stability Test for Final Bulk

If final bulks are stored and/or subsequently shipped to a different location for further processing, the stability of these materials should be demonstrated. Stability tests can be a combination of both physicochemical analysis and biological assays. Implementation of a stability program is required for formal stability studies, and the studies should be executed according to a protocol that contains detailed information about types of tests, including specifications, testing intervals, and data and analysis.

FINAL CONTAINER

A final container of vaccine contains the active ingredient(s) (i.e., antigen(s)) as well as additional components, such as stabilizers, adjuvants, or antimicrobial preservatives. They also may include residual materials from the manufacturing process.

Excipients and Other Additives

In addition to specific antigens, vaccines often include excipients and other additives that are intentionally added to the vaccine by the manufacturer for a specific purpose. These include adjuvants, antimicrobial

preservatives, and stabilizers. Vaccines also contain manufacturing residuals, which are trace amounts of various components used during manufacturing. Thus, the combinations of these components comprise and define the complete vaccine product. Manufacturers must adhere to regulations governing permissible limits of such components, as indicated in the product's license.

Adjuvants—Adjuvants are agents incorporated into vaccine formulations to enhance and increase the immune responses generated by the vaccine antigens. Specifically, they can increase the amount of antibody produced, direct the immune response (Th1 or Th2), increase the duration of antibody presence (persistence), or produce a combination of these effects.

Aluminum compounds have long been the most widely used adjuvants worldwide. Two methods traditionally have been used for combining aluminum adjuvant to antigen to form aluminum-adsorbed vaccines. The first involves the addition of the antigen solution to preformed aluminum precipitate. The second involves the addition of an antigen to aluminum in solution and the addition of a compound that will coprecipitate the aluminum salt and the antigen in situ. Solutions of aluminum potassium sulfate, known as alum or aluminum chloride, have been used together with phosphate salts as precipitating agents. A number of aluminum adjuvant formulations are used in vaccines.

Tests for aluminum are based on metal detection tests described in the general test chapter *Aluminum* ⟨206⟩. Regulations limit the amount of aluminum permitted in a dose of vaccine. The Code of Federal Regulations [21 CFR 610.15(a), *Ingredients, preservatives, diluents, adjuvants*] states that ''the amount of aluminum in the recommended individual dose of a biological product shall not exceed:

1. 0.85 milligrams if determined by assay;
2. 1.14 milligrams if determined by calculation on the basis of the amount of aluminum compound added; or
3. 1.25 milligrams determined by assay provided that the data demonstrating that the amount of aluminum used is safe and necessary to produce the intended effect and are submitted to and approved by the Director, CBER [Center for Biologics Evaluation and Research at FDA].''

The third criterion above aligns U.S. regulations with World Health Organization guidance for aluminum content in a single human dose of a vaccine product.

Note that adjuvants are not licensed by themselves; they do not constitute a product. Rather, a vaccine consisting of specific antigen(s) and an adjuvant are licensed together as a drug product.

Antimicrobial Preservatives—In the case of multiple-dose containers, antimicrobial preservatives are added to inhibit the growth of microorganisms that may be introduced from repeated puncture of multidose vials. With certain exceptions, a preservative is required to be present in vaccines marketed in multidose containers [21 CFR 610.15(a)]. Exceptions include yellow-fever vaccine; measles, mumps, and rubella (MMR); and dried vaccines when the accompanying diluent contains a preservative.

The microbial preservatives currently used in vaccines are thimerosal, 2-phenoxyethanol, benzethonium chloride, and phenol. These agents must pass the appropriate antimicrobial effectiveness test, as described in *Antimicrobial Effectiveness Testing* ⟨51⟩. Antimicrobial test challenges should be conducted as part of the normal formal stability program, including at expiration date. Various tests for preservatives can be found in *Antimicrobial Agents—Content* ⟨341⟩.

Stabilizers—The primary purpose of stabilizers is to protect certain vaccines from adverse conditions such as heat or to serve as a cryopreservative during the lyophilization process, usually the freezing step. The particular

materials chosen for this purpose include sugars (e.g., sucrose or lactose), amino acids (e.g., glycine or glutamic acid [monosodium salt]), glycerol, and proteins (e.g., human serum albumin [HSA] or gelatin). Materials should be customized to a specific vaccine formulation and selected with patient safety in mind.

When a protein is chosen as a stabilizer, two main safety concerns arise. One stems from the source of the protein: animal or human origin raises the possibility of the presence of an adventitious agent. The second concern is the possibility of an allergic reaction in persons sensitized to that protein. This should be evaluated as part of the clinical program during vaccine development. At present two proteins are used as stabilizers for vaccines: HSA and gelatin. FDA requires that any serum-derived albumin used in manufacturing be U.S.-licensed HSA. FDA guidance further recommends that a statement indicating the source and related risks appear in the ''Warnings'' section of the labeling for HSA-containing products.

Gelatin or processed gelatin also is used as a vaccine stabilizer. The gelatin source may be either bovine or porcine. Although the conditions of manufacturing gelatin are harsh (i.e., the product is subjected to extremes of heat and pH), there remains a concern with bovine sources about the presence of the transmissible spongiform encephalopathy (TSE) agent, because this agent is known to resist such conditions. Therefore, if gelatin added to a vaccine or used in manufacturing is from a bovine source, the material should have the appropriate documentation certifying that it comes from a country or region that is in compliance with TSE guidance for industry.

Manufacturing Residuals—Vaccines may contain residual amounts of any of the materials used in the manufacturing process. These materials are termed manufacturing residuals. As a general principle, it is not possible to remove a particular substance completely, nor is it possible to conclusively demonstrate that a particular substance has been completely removed. Therefore the goal is to reduce these substances to an undetectable level, using a sensitive and validated analytical methodology. Some products are tested for pyrogenic substances as a manufacturing residual (see *Pyrogen Test* ⟨151⟩); and, if the product is freeze-dried, it should be tested for residual moisture (see *Loss on Drying* ⟨731⟩). Residual levels of manufacturing materials, including, if applicable, inactivating agents, should be justified. The release specifications of these components are required as part of the approved license.

Cell-Derived Residuals—Live attenuated bacterial vaccines are not usually subject to a high degree of post-expansion purification. But killed bacterial component vaccines typically undergo significant purification to reduce cell-derived residuals. Common cellular components to be reduced are proteins, nucleic acids, and polysaccharides. Assays for these components are routinely conducted, if appropriate, to ensure purity. A common residual in bacterial vaccines made from Gram-negative bacteria is lipopolysaccharide (LPS), commonly known as endotoxin. Endotoxin testing is performed during the manufacturing process for any Gram-negative bacterial vaccine. In the case of Gram-positive bacterial vaccines, the endotoxin testing should be conducted to ensure that no contaminants from Gram-negative bacterial growth are present. Also, there must be a release specification for this residual. Two tests are currently used to detect LPS in biological products, the *Limulus* amebocyte lysate (LAL) test (see *Bacterial Endotoxins Test* ⟨85⟩) and the rabbit pyrogen test (see *Pyrogen Test* ⟨151⟩). The *Limulus* lysate that is used to test for bacterial endotoxin in FDA-regulated products is itself a U.S.-licensed product. The rabbit pyrogenicity test requires the use of animals and is more difficult to perform; therefore, it is not employed to the extent that the LAL test is used.

Viral vaccine manufacturing requires cell substrates to produce the viruses, which are then taken through purification processes. Generally, killed viral vaccines are more highly purified than are live attenuated ones. Depending on the method used to manufacture the vaccine, manufacturers work with FDA to develop prudent specifications for the final vaccine. Animal-derived host cells have been used extensively in vaccine manufacturing, particularly viral vaccines. For example, influenza and yellow fever vaccines are produced, respectively, in egg allantoic fluid and chicken embryos. Mumps, measles, and some rabies vaccines are produced in chick embryo cells. The labels of these products must state that residual chicken proteins may be present in the final vaccine, and the label may indicate how much is present. Further, the label also urges practitioner caution when vaccinating a person with known hypersensitivity to eggs.

Two U.S.-licensed hepatitis B vaccines are based on recombinant DNA-derived proteins expressed in yeast cultures. In both cases, the labels notify health care professionals that yeast protein may be present in the vaccine and recommend that suitable precautions should be exercised. In the case of live viral vaccines, considerations may be given to the reduction of cellular residual materials (e.g., host DNA, proteins).

Materials of Animal Origin—Some raw materials and reagents, such as gelatin, calf serum (see *Bovine Serum* ⟨1024⟩), or trypsin for vaccine manufacturing raise concerns regarding the potential presence of adventitious agents. Raw materials should be sourced from countries acceptable to FDA. Additionally, manufacturers should test these materials when possible to minimize the risks of contamination with adventitious agents. Reduction of serum components (e.g. BSA) should be considered in processing.

Antibiotic Residuals—Some antibiotics (but not penicillin) can be used in minimal amounts in the manufacturing process for viral vaccines, according to 21 CFR 610.15(c). Those that have been used include gentamicin, streptomycin, neomycin, and polymyxin B. There is no requirement for tests of residual levels of these antibiotics in the final vaccine. However, according to 21 CFR 610.61(m), the calculated amount expected to remain as a residual in the final vaccine, based on the amount added and the dilution factor in the manufacturing process, must be stated on the product label.

Inactivating Chemical Agents—Several chemical agents have been used to inactivate bacteria and viruses or to detoxify toxins in vaccine production processes. Formaldehyde and β-propiolactone are the most commonly used inactivating agents. Other less often used inactivating agents include glutaraldehyde and hydrogen peroxide. As a manufacturing residual, the inactivating agent should be removed from the final product as thoroughly as possible. The upper limit for formaldehyde is generally 0.02%, equivalent to 0.1 mg per 0.5 mL vaccine dose. The limit for β-propiolactone should be below the limit of detection.

EVALUATING THE STABILITY OF VACCINES

The stability of vaccine products depends on the nature of a vaccine antigen, the product formulation, and the control of vaccine storage prior to use.

Vaccine products are evaluated with programs that include real-time long-term storage under prescribed conditions. The use of extreme temperatures to potentially accelerate degradation may help manufacturers understand the stability of the product.

Vaccine products, like all pharmaceutical products, should be evaluated to define suitable conditions for storage (21 CFR 610.50 and 610.53). General principles of stability testing for biological products are described in *Quality of Biotechnological Products: Stability Testing of Bi-*

otechnological/Biological Products ⟨1049⟩. Typically these concerns are focused on the final vaccine product, but evaluations also are needed for bulk intermediates to justify the conditions under which they are held. In both cases manufacturers define in advance the conditions to which the product will be exposed (e.g., temperature, light, and humidity) and the time range during which the product will be exposed to those conditions. Stability studies should evaluate all storage conditions to which the product or intermediate are likely to be exposed during production, handling, shipping, and storage so that appropriate time limits can be placed on the exposure to those conditions.

The primary criteria for defining the storage conditions for these intermediates and the final products are generally focused on acceptable maintenance of potency; but, as discussed below, there often are other attributes that need to be considered.

Evaluation of the stability of vaccine products has three general purposes. First, the products are shown to maintain an acceptable analytical profile throughout manufacture and use to preserve safety and effectiveness. Second, stability studies across several product batches provide an effective way to characterize the inherent properties of the product. This in turn leads to the third use, demonstrating manufacturing consistency in the product.

Stability Protocols

The overall experimental plan for evaluating the stability profile of a given set of product or intermediate batches typically includes specific definition of the conditions under which the samples will be stored and why these conditions are relevant, the length of time the samples will be stored at each condition, when samples will be tested during this time course, and the analytical measurements at each time point. Additionally, these stability protocols include itemization of the analytical procedures to be used. For stability studies that occur early in product development, the studies may be conducted to confirm the suitability of the product formulation and/or storage conditions. Later in development, stability studies are typically conducted to provide data supporting product dating period or intermediate hold time, to provide more elaborate product characterization, and to evaluate manufacturing consistency. These latter studies define product end–expiry specifications that allow definitions of acceptable and unacceptable product. Unacceptable product is defined as product that is no longer acceptable for use in clinical studies or for commercial use (e.g., because of degradation or loss of potency). Stability studies should be conducted over a duration sufficient to determine the point of loss of acceptable potency or other relevant parameters.

Analytical Measurements

Manufacturers should consider the rigor of the analytical method(s) used to evaluate the stability of complex products and improve their understanding of the parameters that are critical to immunogenicity (including stability-indicator parameters). Selection of the stability-indicator parameters varies with each vaccine's unique characteristics.

The primary parameter that reflects stability for most vaccines is the potency assay (see *Potency Tests* in *Lot Release Testing*, below). This assay can take many forms, depending on individual vaccines (e.g., an infectivity assay for a live virus vaccine or a measure of the proportion of conjugated polysaccharide for a polysaccharide–protein conjugate vaccine). The potency assay is generally the key analytical result predicting whether a vaccine remains suitable for use and whether it will produce the expected clinical response. Other analytical measurements can provide important supplemental data, particularly

those that have a clear link to the potency of the product. Examples include degradation profile, dissociation of a carrier protein from conjugated vaccines, and dissociation of an adjuvant from an antigen complex. Additionally, other common assays typically are performed as part of the stability study and may address physical or chemical changes in the product that may or may not affect its potency (e.g., general safety, degree of aggregation, pH, moisture, container, preservative, and enclosure).

Formal Evaluation of Stability Data and Product Expiry Dating

Vaccines must remain within potency specifications at the expiration date, provided that the product was stored under the normal conditions specified. Manufacturers should conduct stability studies to determine those storage conditions and that dating period to demonstrate that the product remains within the potency specifications. Manufacturers should conduct stability studies on a continuing basis. If a major manufacturing process changes, additional stability studies should be conducted to verify that there is no adverse impact on the stability profile. Under certain conditions such as process changes, accelerated stability studies could be conducted. An accelerated study involving temperatures both higher and lower than routine can evaluate the impact of temperature excursions on products. A similar evaluation should be done for product intermediates to establish how long a given intermediate can be held under defined conditions before it is processed further or discarded.

NOMENCLATURE

There are no uniform systems for naming new vaccines. 21 CFR 299 describes the cooperation of the FDA and the U.S. Adopted Names Council (USAN) in naming drugs, including vaccines. USAN is a private organization sponsored by the American Medical Association, USP, and the American Pharmacists Association. Section 262 in Title 42 of the Public Health Service Act requires that each package of the biological product be plainly marked with the proper name (name designated in the license 21 CFR 600.3) of the biological product contained in the package.

LABELING

Vaccine product labeling is regulated in compliance with 21 CFR 201 and 610. Requirements are set for container labeling and package labeling.

Container Label

Provisions are made for the following labels:

- Full label;
- Partial label; and
- No label on the container itself when the containers cannot support a label that includes all required information and should be placed in a package that does include all required information.

The label should be affixed to the container in a manner that allows visual inspection of the contents for the full length or circumference of the container. If no package exists, the container bears all of the information required for the package label.

The full container label normally contains the following:

- Proper name of the product;
- Name, address, and license number of the manufacturer;
- Lot number or other lot identification;
- Expiration date;
- Recommended individual dose, for multiple-dose containers;
- The phrase *Rx only* for prescription biologicals; and
- Any applicable cautionary statements.

Package Label

In addition to the information required on the container label, the package label should describe the following:

- Any preservative used and its concentration, or the words *no preservative* if no preservative is used and its absence is a safety factor;
- Number of containers, if more than one; or
- Amount of product in the container, expressed as number of doses, volume, units of potency, weight, and equivalent volume (for dried product to be reconstituted); or
- A combination of the above to provide an accurate description of the contents, as applicable;
- Recommended storage temperature;
- The words *shake well*, *do not freeze*, or the equivalent, as well as other instructions when indicated by the character of the product;
- Recommended individual dose, for multiple-dose containers;
- Recommended route of administration, or reference to such directions in an enclosed circular;
- Presence of known sensitizing substances;
- Type of antibiotics added during manufacture and the amount calculated to remain in the final product;
- Inactive ingredients, when they constitute a safety factor or are referenced to an enclosed circular;
- Adjuvant, if present;
- Source of the product, when this may be a factor in safe administration;
- Identity of each microorganism used in manufacture and, if applicable, the production medium and the method of inactivation or reference to an enclosed circular;
- Minimum potency in terms of official standard of potency, or the words *no U.S. standard of potency*.

Prescribing Information

Detailed information about a vaccine appears in its prescribing information, commonly called the package insert. Increasingly, vaccines are distributed with patient package inserts written in lay language. Prescribing information (21 CFR 201.56 and 201.57) includes the following:

- Highlights of prescribing information
- Product names, other required information
- Boxed warning
- Recent major changes
  a. Indications and usage
  b. Dosage and administration
  c. Dosage forms and strengths
  d. Contraindications
  e. Warnings and precautions
  f. Adverse reactions
  g. Drug interactions
  h. Use in specific populations (e.g., pregnancy, nursing mothers, pediatric, geriatric)
  i. Drug abuse and dependence
  j. Overdosage
  k. Description
  l. Clinical pharmacology
  m. Nonclinical toxicology
  n. Clinical studies
  o. References
  p. How supplied/storage and handling
  q. Patient counseling information

LOT RELEASE TESTING

General Principles

Manufacturers perform all appropriate tests for the licensed specifications for the product, according to 21 CFR 610.1 and 610.2. Samples of each licensed lot and protocols containing the manufacturers' test results are

submitted to FDA. After FDA evaluates the protocol to ensure that the product specifications are met, and after satisfactory confirmatory testing, FDA approves the release of the lot if all tests meet the standards of safety, purity, and potency established for the particular vaccine product. After approval is granted, the manufacturer distributes and markets the product.

Guidelines are available regarding alternatives to lot release and a surveillance system. All of these variations are subject to the regulations in 21 CFR 610.2 that allow FDA to require that samples of any lot of licensed product (e.g., vaccine), together with the protocols showing results of applicable tests, be sent to FDA.

Common Tests

The tests common to all lots of all products include tests for potency, general safety, sterility, purity, identity, and constituent materials. The manufacturer completes these tests for conformity with standards applicable to each product. The results of all tests are considered, except when a test has been invalidated as a result of causes unrelated to the product (21 CFR 610.1).

Potency Tests (Vaccine-Specific)—The basic definition and requirements for vaccine potency and potency assays are provided in 21 CFR 600.3 and 610.10. A vaccine potency assay should indicate the therapeutic activity of the drug product as indicated by appropriate laboratory tests or by adequately developed and controlled clinical data. Potency may be expressed in terms of units by reference to a standard. Product potency tests vary with vaccine product types (e.g., viral, bacterial, live attenuated, inactivated, or polysaccharide). As a result, potency assays for vaccines span a variety of approaches to the expression of potency. In vitro potency tests for live virus may include plaque formation assays, endpoint dilution assays (e.g., the tissue culture infective dose [$TCID_{50}$], virus neutralization assays, or quantitative polymerase chain reaction [PCR] assays). Quantitative colony formation assays are used for live attenuated bacterial vaccines. Animal challenge tests for immunogenicity assays of potency, such as those for diphtheria and tetanus (U.S. Department of Health, Education, and Welfare, 1953; see *Appendix 2*), or rabies and anthrax show in vivo response. Antigenicity assays use enzyme-linked immunosorbent assays (ELISA), e.g., with hepatitis A or rate nephelometry and rocket immunoelectrophoresis (e.g., with pneumococcal polysaccharides). The potency tests for bacterial vaccines, such as the meningococcal polysaccharides, pneumococcal polysaccharides, or *Haemophilus b* protein conjugate vaccines use chemical and physical chemical assays. In the case of pure polysaccharide vaccines, the concentration or quantity of the vaccine component (polysaccharide) and its quality (e.g., size) have been shown to be indicative of human immune response.

Assay precision and reproducibility vary with the different methodologies that are used in potency assays, ranging from the high accuracy and precision of chemical tests at one end of the spectrum to bioassays at the other end. The general test chapter *Design and Analysis of Biological Assays* ⟨111⟩ provides guidance for bioassays and applies to vaccine potency assays. Other tests should be validated as described in general information chapter *Validation of Compendial Procedures* ⟨1225⟩.

Release Tests—Official release of vaccines by the vaccine regulatory authority may be based on either the bulk or the final container. It is highly desirable to perform potency tests on the final container. However, under certain circumstances this may not be practical or even possible: thus, a case-by-case approach would be required. The choice of whether to test the bulk or the final container derives from a number of considerations, such as the quantity of vaccine available for tests at the different manufacturing stages. For certain vaccines, both bulk and final container receive official release. The potency

test is generally required for the final container. If it is not feasible to perform the potency test on the final drug product, the test is performed on the bulk material.

General Safety—For biological products that are intended for administration to humans, manufacturers perform a general safety test in order to detect any extraneous toxic contaminants. Procedures and exceptions are specified in 21 CFR 610.11.

Sterility—A sterility test of each lot of each product is conducted according to procedures described in *Sterility Tests* ⟨71⟩ and 21 CFR 610.12 for both bulk and final container material.

Bacterial Endotoxins—Each lot of final containers of a vaccine intended for use by injection is tested for bacterial endotoxins, as indicated in *Bacterial Endotoxins Test* ⟨85⟩.

Purity—Vaccines need to be free of extraneous material. Approved vaccine license applications indicate extraneous materials that are unavoidable in the manufacturing process for a specific product. The application may indicate test results and allowable limits for such materials, according to procedures described in 21 CFR 610.13.

Residual Moisture—Each lot of dried product is tested for residual moisture (see 21 CFR 610.13 (a), *Loss on Drying* ⟨731⟩, and FDA's *Guideline for the Determination of Residual Moisture in Dried Biological Products* (see *Appendix 2*).

Pyrogens—Each lot of final containers of a vaccine intended for use by injection is tested for pyrogenic substances, as indicated in *Pyrogen Test* ⟨151⟩ and 21 CFR 610.13 (b).

Identity—The contents of a final container of each filling of each lot are tested for identity after labeling is completed. Identity is established by physical or chemical characteristics of the vaccine, inspection by macroscopic or microscopic methods, specific cultural tests, or in vivo or in vitro immunological tests. In large part, identity tests are performed to distinguish the subject vaccine from other materials manufactured at the same site (21 CFR 610.14).

Constituent Materials—Ingredients, preservatives, diluents, adjuvants, extraneous protein, cell culture-produced vaccines, and antibiotics are tested according to 21 CFR 610.15.

Permissible Combinations

Formulations that combine several vaccines must be licensed as combinations (21 CFR 610.17). The potency of each vaccine in the combination is individually tested and must meet the specifications in the context of the final combined product; other appropriate quality tests apply as well. For vaccines that are physically combined in clinical locations just before administration to a patient, prescribing information should describe specific procedures to follow in those settings.

Quality

In general, quality control systems for vaccine manufacture are identical to those routinely employed for production of other pharmaceuticals. These include raw material testing and release, manufacturing, process-control documentation, and aseptic processing. Manufacturers formally assign responsibility to designated staff for maintaining the continued safety, purity, and potency of the product and for ensuring compliance with applicable product and establishment standards, along with compliance with current GMPs. Analysts use reference standards and validated methods to determine active ingredients, residuals, and impurities. Manufacturers determine product safety in a variety of ways that may include the use of experimental animals, procedures to demonstrate product sterility, and tests to ensure product po-

tency. The complexity of the quality control systems for vaccines lies in the variety of methods used to produce and control production. Lot release testing proceeds according to 21 CFR 610.2 and involves evaluating lots for safety, purity, and potency before release. Manufacturers follow FDA and applicable international standards for testing and validation. The basic considerations for validation are included in *Validation of Compendial Procedures* ⟨1225⟩, in addition to guidance documents issued by FDA and the International Conference on Harmonization (ICH) (see *Appendix 2*).

Alternative Tests

Modification of test methods or manufacturing processes as licensed may be permitted if the regulatory authority can be assured that the modifications cause no reduction in safety, purity, potency, and effectiveness of the biological product. It may be necessary for the manufacturer to file the proposed changes prior to implementation (21 CFR 601.12 and 21 CFR 610.9).

APPENDIX 1. TYPES OF VACCINES CURRENTLY LICENSED IN THE U.S. (EXAMPLES)

- Bacterial, live attenuated (e.g., *Salmonella typhi*)
- Bacterial, polysaccharide (e.g., meningococcal, pneumococcal)
- Bacterial, polysaccharide-protein conjugate (e.g., meningococcal, pneumococcal)
- Bacterial, toxoid (e.g., diphtheria, tetanus)
- Bacterial, extracts (e.g., pertussis, anthrax)
- Viral, live attenuated (e.g., influenza, measles, mumps, rubella)
- Viral, whole inactivated (e.g., rabies)
- Viral, subunit (e.g., influenza, hepatitis B, human papillomavirus)

APPENDIX 2. SELECTED REGULATORY DOCUMENTS

GLOSSARY

1. ***Acceptance criteria***—The product specifications and acceptance or rejection criteria, with an associated sampling plan, necessary for making a decision to accept or reject a lot or batch (or any other convenient subgroups of manufactured units).
2. ***Active ingredient***—Any component intended to furnish pharmacological activity or other direct effect in the diagnosis, cure, mitigation, treatment, or prevention of disease, or to affect the structure or any function of the body of man or other animals. The term includes those components that may undergo chemical change in the manufacture of the drug product and may be present in the drug product in a modified form intended to furnish the specified activity or effect.
3. ***Adventitious agent***—A microorganism (e.g., bacteria, fungi, mycoplasma, spiroplasma, mycobacteria, rickettsia, viruses, protozoa, parasites, TSE agent) that is inadvertently introduced into the production of a biological product.
4. ***Batch***—A specific quantity of a drug or other material intended to have uniform character and quality, within specified limits, and produced according to a single manufacturing order during the same cycle of manufacture.
5. ***Biological product***—Any virus, therapeutic serum, toxin, antitoxin, or analogous product applicable to the prevention, treatment or cure of diseases or injuries of man.
6. ***Cell bank***—Vials of cells of uniform composition (not necessarily clonal) derived from a single tissue or cell, aliquoted into appropriate storage containers, and stored under appropriate conditions.
7. ***Cell line***—Cells that have been propagated in culture since establishment of a primary culture and have survived through crisis and senescence. Such surviving cells are immortal and will not senesce. Diploid cell strains have been established from primary cultures and expanded into cell banks, but have not passed through crisis and are not immortal.
8. ***Characterization***—Determination of the properties of a substance.
9. ***Component***—Any ingredient intended for use in the manufacture of a drug product, including those that may not appear in such drug product.
10. ***Container*** (also final container)—The immediate unit, bottle, vial, ampule, tube, or other receptacle containing the product as distributed for sale, barter, or exchange.
11. ***Control***—Having responsibility for maintaining the continued safety, purity, and potency of the product and for compliance with applicable product and establishment standards, and for compliance with current good manufacturing practices.
12. ***Control cells***—Cells that are split off from the production culture and maintained in parallel under the same conditions and using the same reagents

(e.g., culture medium) to perform quality control tests on cells that have not been exposed to the vaccine virus (which may interfere with some tests).

13. ***Dating period***—The period beyond which the product cannot be expected beyond reasonable doubt to yield its specific results.
14. ***Diploid***—Having the expected number of chromosomes for a species, (i.e., two of each autosomal chromosome and two sex chromosomes)
15. ***Drug product***—A finished dosage form (e.g., solution, suspension) that contains an active drug ingredient generally in association with inactive ingredients.
16. ***End-of-production cells***—Cells harvested at the end of a production run or cells cultured from the master cell bank or working cell bank to a passage level or population doubling level comparable to or beyond the highest level reached in production.
17. ***End-of-production passage level***—The maximal passage level achieved during manufacturing at final vaccine harvest. Cells may be evaluated at this level or beyond.
18. ***Endogenous virus***—A virus whose genome is present in an integrated form in a cell substrate by heredity. Endogenous viral sequences may or may not encode for an intact or infectious virus.
19. ***Expiration date***—The calendar month and year, and where applicable, the day and hour, that the dating period ends.
20. ***Filling***—A group of final containers identical in all respects, which have been filled with the same product from the same bulk lot without any change that will affect the integrity of the filling assembly.
21. ***Final bulk***—The stage of vaccine production directly prior to filling of individual vials.
22. ***Free of and freedom from***—For a substance to be considered free of a contaminant, an assay must demonstrate that a defined quantity of the substance is negative for that contaminant to a defined level of sensitivity. The level of assay sensitivity is defined by the choice of assay and can be determined experimentally using standardized reagents. Alternatively, a validated process that is known to remove a contaminant to a defined level may be used to demonstrate freedom from that contaminant.
23. ***Harvest***—Collection of material at the end of vaccine virus propagation in cell culture, from which vaccine will be prepared. This material may be the culture supernatant, the cells themselves (often in disrupted form), or some combination thereof.
24. ***Inactive ingredient***—Any component other than an active ingredient.
25. ***In-process material***—Any material fabricated, compounded, blended, or derived by chemical reaction that is produced for, and used in, the preparation of the drug product.
26. ***Intermediates***—Unformulated active ingredients that are processed before final formulation and can be stored for long periods of time before further processing.
27. ***Label***—Any written, printed, or graphic matter on the container or package or any such matter clearly visible through the immediate carton, receptacle, or wrapper.
28. ***Latent virus***—A virus that is present in a cell, without evidence of active replication, but with the potential to reactivate, is considered to be microbiologically latent.
29. ***Lot***—A batch, or a specific identified portion of a batch, having uniform character and quality within specified limits; or, in the case of a drug product produced by continuous process, it is a specific identified amount produced in a unit of time or quantity in a manner that assures its having uniform character and quality within specified limits.

30. ***Lot number, control number, or batch number***—Any distinctive combination of letters, numbers, or symbols, or any combination of them, from which the complete history of the manufacture, processing, packing, holding, and distribution of a batch or lot of drug product or other material can be determined.
31. ***Manufacture***—All steps in the propagation or manufacture and preparation of products. Includes, but is not limited to, filling, testing, labeling, packaging, quality control, and storage by the manufacturer.
32. ***Manufacturer***—Any legal person or entity engaged in the manufacture of a product subject to license under the Public Health Service (PHS) Act. Manufacturer also includes any legal person or entity who is an applicant for a license where the applicant assumes responsibility for compliance with the applicable product and establishment standards.
33. ***Master cell bank***—A bank of a cell substrate from which all subsequent cell banks used for vaccine production will be derived. The master cell bank represents a characterized collection of cells derived from a single tissue or cell.
34. ***Master virus seed***—A viral seed of a selected vaccine virus from which all future vaccine production will be derived, either directly, or via working virus seeds.
35. ***Oncogenicity***—The property of certain biological agents (e.g., viruses) or materials (e.g., nucleic acids) that are capable of immortalizing cells and endowing them with the capacity to form tumors. Oncogenicity is distinct from tumorigenicity.
36. ***Package***—The immediate carton, receptacle, or wrapper, including all labeling matter therein and thereon, and the contents of the one or more enclosed containers. If no package is used, the container shall be deemed to be the package.
37. ***Passage level***—The number of times, since establishment from a primary cell culture, a culture has been split or reseeded.
38. ***Population doubling level***—The number of times, since establishment from a primary cell culture, a culture has doubled in number of cells.
39. ***Potency***—The therapeutic activity of the drug product as indicated by appropriate laboratory tests or by adequately developed and controlled clinical data. Potency may be expressed in terms of units by reference to a standard.
40. ***Primary cells***—Cells placed into culture immediately after an embryo, tissue, or organ is removed from an animal or human and homogenized, minced, or otherwise separated into a suspension of cells. Primary cells may be maintained in medium, but are not passaged (split).
41. ***Process***—A manufacturing step that is performed on the product itself which may affect its safety, purity, or potency, in contrast to such manufacturing steps which do not affect intrinsically the safety, purity, or potency of the product.
42. ***Proper name***—The name, designated in the license, to be used on each package of the product.
43. ***Purity***—Relative freedom from extraneous matter in the finished product, whether or not harmful to the recipient or deleterious to the product. Purity includes but is not limited to relative freedom from residual moisture or other volatile substances and pyrogenic substances.
44. ***Qualification***—Determination of the suitability of a material for manufacturing based on its characterization.
45. ***Safety***—The relative freedom from harmful effect to persons affected, directly or indirectly, by a product when prudently administered, taking into consideration the character of the product in relation to the condition of the recipient at the time.

46. ***Specification***—The quality standard (i.e., tests, analytical procedures, acceptance criteria) provided in an approved application to confirm the quality of products, intermediates, raw materials, reagents, components, in-process materials, container closure systems, and other materials used in the production of a product.
47. ***Standards***—Specifications and procedures applicable to an establishment or to the manufacture or release of products, which are prescribed in this subchapter or established in the biologics license application and designed to insure the continued safety, purity, and potency of such products.
48. ***Sterility***—Freedom from viable contaminating microorganisms, as determined by tests prescribed by the FDA.
49. ***Tumorigenic***—A property of certain cell types to form tumors when inoculated into animals (generally a syngeneic, an immunosuppressed allogeneic, or an immunosuppressed xenogeneic host). These tumors may be at the injection site or a different site and may also metastasize to other sites.
50. ***Tumorigenicity***—The process by which immortalized cells form tumors when inoculated into animals. Tumorigenicity is distinct from oncogenicity.
51. ***Unacceptable product***—Product that is no longer acceptable for use in clinical studies or for commercial use (e.g., because of degradation or loss of potency).
52. ***Validation***—The performance characteristics of an analytical procedure, based on the demonstration that the procedure is suitable for its intended purpose or use. Validation of a process is the determination of the extent to which a process meets the requirements for the various performance characteristics and the demonstration that the process uniformly performs to defined characteristics. Validation is generally performed in accordance with *Validation of Compendial Procedures* ⟨1225⟩ and the relevant ICH guidelines.
53. ***Viral clearance***—The combination of the physical removal of viral particles and the reduction of viral infectivity through inactivation.
54. ***Virus seed or viral seed***—A live viral preparation of uniform composition (not necessarily clonal) derived from a single culture process, aliquoted into appropriate storage containers, and stored under appropriate conditions.
55. ***Working cell bank***—A cell bank derived by propagation of cells from the master cell bank under defined conditions and used to initiate production cell cultures on a lot-by-lot basis.
56. ***Working virus seed***—A viral seed derived by propagation of virus from the master virus seed under defined conditions and used to initiate production cell cultures lot-by-lot.■2S (*USP33*)

DIETARY SUPPLEMENTS

General Information

BRIEFING

⟨2040⟩ Disintegration and Dissolution of Dietary Supplements, *USP 32* page 782 and page 435 of *PF* 34(2) [Mar.–Apr. 2008]. Three revisions to this dietary supplement chapter are proposed:

1. New specifications for the beaker used in *Apparatus B* in the *Disintegration* section: the new narrower specifications are based on experimental data showing that the current range of 97 to 115 mm produces significant variation in disintegration times.
2. A new test for *Delayed-Release (Enteric-Coated) Soft Shell Capsules* is included in the *Disintegration* section as a result of the increase in dietary supplements that use enteric-coated capsules.
3. In the *Dissolution* section, a new flow cell chamber for *Apparatus 4* (see *Dissolution* ⟨711⟩) is introduced for soft shell capsules with lipophilic contents.

(DS-PS: Natalia Davydova) RTS—C74668; C75300; C75302

Change to read:

DISINTEGRATION

This test is provided to determine whether dietary supplement tablets or capsules disintegrate within the prescribed time when placed in a liquid medium at the experimental conditions presented below. Compliance with the limits on *Disintegration* stated in the individual monographs for dietary supplements is required except where the label states that the products are intended for use as troches, are to be chewed, or are designed as extended-release dosage forms. Dietary supplements claiming to be extended-release dosage forms must comply with standards other than disintegration to verify that the release of the dietary ingredients from the dosage form is for a defined period of time. Dietary supplements claiming to be extended-release dosage forms shall not be labeled as in compliance with USP unless a USP monograph exists for such product. Determine the type of units under test from the labeling and from observation, and apply the appropriate procedure to 6 or more units.

For purposes of this test, disintegration does not imply complete solution of the unit or even of its active constituent. Complete disintegration is defined as that state in which any residue of the unit, except fragments of insoluble coating or capsule shell, remaining on the screen of the test apparatus or adhering to the lower surface of the disk, if used, is a soft mass having no palpably firm core.

Apparatus

Apparatus A—Use the *Apparatus* described under *Disintegration* ⟨701⟩ for tablets or capsules that are not greater than 18 mm long. For larger tablets or capsules, use *Apparatus B.*

Apparatus B—The apparatus[1] consists of a basket-rack assembly, a 1000-mL low-form beaker for the immersion fluid, a thermostatic arrangement for heating the fluid between 35° and 39°, and a device for raising and lowering the basket in the immersion fluid at a constant frequency rate between 29 and 32 cycles per minute through a distance of not less than 53 mm and not more than 57 mm. The volume of the fluid in the vessel is such that at the highest point of the upward stroke the wire mesh remains at least 15 mm below the surface of the fluid and descends to not less than 25 mm from the bottom of the vessel on the downward stroke. At no time should the top of the basket-rack assembly become submerged. The time required for the upward stroke is equal to the time required for the downward stroke, and the change in stroke direction is a smooth transition rather than an abrupt reversal of motion. The basket-rack assembly moves vertically along its axis. There is no appreciable horizontal motion or movement of the axis from the vertical.

Basket-Rack Assembly—The basket-rack assembly

■(*Figure 1*)■2S (*USP33*)
consists of three open-ended transparent tubes, each 77.5 ± 2.5 mm long and having an inside diameter of 32.0 to 34.6 mm and a wall 2.0 to 3.0 mm thick; the tubes are held in a vertical position by two plastic plates, each ~~about~~

■■2S (*USP33*)
97

■ ± 2■2S (*USP33*)
mm in diameter and 7.5 to 10.5 mm in thickness, with three holes, ~~each about 33 to 34~~

■36.0 to 40.6■2S (*USP33*)
mm in diameter, equidistant from the center of the plate and equally spaced from one another. Attached to the undersurface of the lower plate is 10-mesh No. 23 (0.025-inch) W. and M. gauge woven stainless-steel wire cloth having a plain square weave. The parts of the apparatus are assembled and rigidly held by means of three bolts passing through the two plastic plates. A suitable means is provided to suspend the basket-rack assembly from the raising and lowering device, using a point on its axis.

The design of the basket-rack assembly may be varied somewhat, provided that the specifications for the glass tubes and the screen mesh size are maintained.

[1] An apparatus and disks meeting these specifications are available from Varian Inc., 13000 Weston Parkway, Cary, NC 27513, or from laboratory supply houses.

■

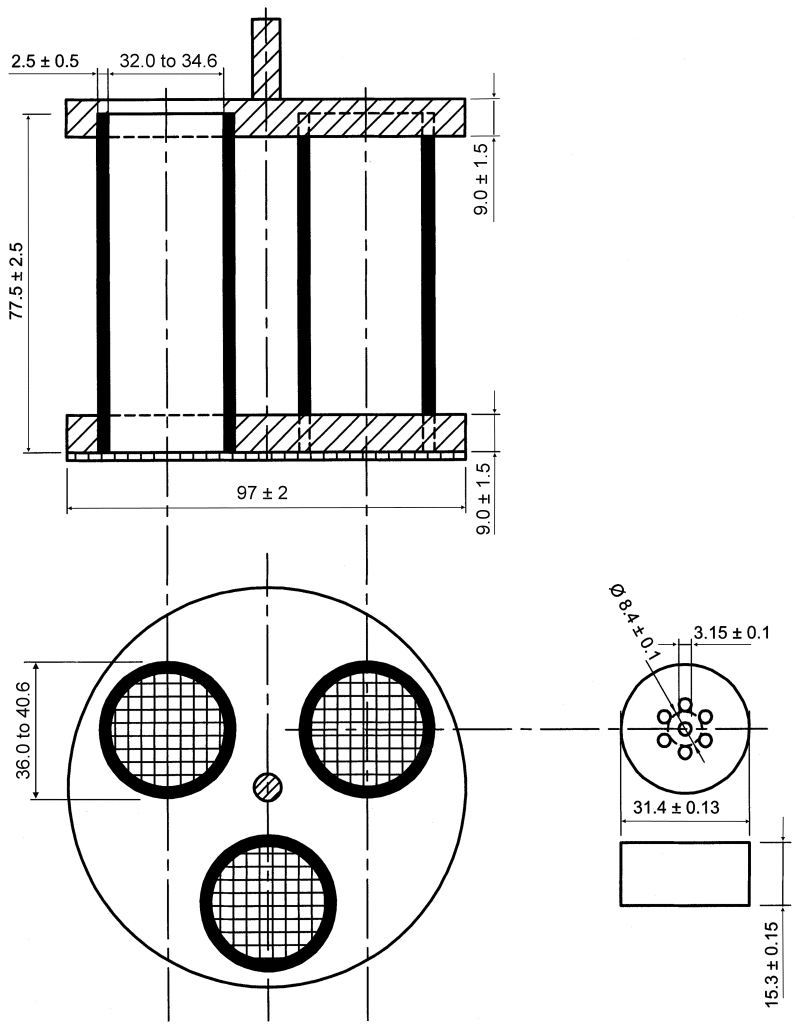

Figure 1. Basket-rack assembly, *Disintegration, Apparatus B* (dimensions in mm).

Beaker—Low form, 1000 mL; the difference between the diameter of the plastic plates, which hold the tubes in a vertical position, and the inside diameter of the beaker should not be more than 6 mm.[2] ■2S (*USP33*)

Disks—Each tube is provided with a perforated cylindrical disk 15.3 ± 0.15 mm thick and 31.4 ± 0.13 mm in diameter. The disk is made of a suitable, transparent plastic material having a specific gravity of between 1.18 and 1.20. Seven 3.15 ± 0.1-mm holes extend between the ends of the cylinder, one of the holes being through the cylinder axis and the others parallel with it and equally spaced on a 4.2 ± 0.1-mm radius from it. All surfaces of the disk are smooth.[3]

Procedure

Uncoated Tablets—Place 1 tablet in each of the tubes of the basket and, if prescribed, add a disk to each tube. Operate the apparatus, using water or the specified medium as the immersion fluid, maintained at 37 ± 2°. At the end of 30 minutes, lift the basket from the fluid, and observe the tablets: all of the tablets disintegrate completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets. The requirement is met if not fewer than 16 of the total of 18 tablets tested disintegrate completely.

Plain Coated Tablets—Place 1 tablet in each of the tubes of the basket and, if the tablet has a soluble external sugar coating, immerse the basket in water at room temperature for 5 minutes. Then, if prescribed, add a disk to each tube, and operate the apparatus, using water or the specified medium as the immersion fluid, maintained at 37 ± 2°. At the end of 30 minutes, lift the basket from the fluid, and observe the tablets: all of the tablets disintegrate completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets. The requirement is met if not fewer than 16 of the total of 18 tablets tested disintegrate completely.

[2] 1000-mL low-form beakers, designed in compliance with the current ASTM E 960 Type I or Type II or ISO 3819 specifications, are suitable. ■2S (USP33)

[3] The use of automatic detection employing modified disks is permitted where the use of disks is specified or allowed. Such disks must comply with the requirements for density and dimensions given in this chapter.

Delayed-Release (Enteric-Coated) Tablets—Place 1 tablet in each of the six tubes of the basket, and if the tablet has a soluble external sugar coating, immerse the basket in water at room temperature for 5 minutes. Then operate the apparatus using simulated gastric fluid TS maintained at 37 ± 2° as the immersion fluid. After 1 hour of operation in simulated gastric fluid TS, lift the basket from the fluid, and observe the tablets: the tablets show no evidence of disintegration, cracking, or softening. Operate the apparatus, using simulated intestinal fluid TS, maintained at 37 ± 2°, as the immersion fluid for the time specified in the monograph. Lift the basket from the fluid, and observe the tablets: all of the tablets disintegrate completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.

▪Delayed-Release (Enteric-Coated) Soft Shell Capsules—Place 1 softgel capsule in each of the six tubes of the basket. Use two baskets for a total of six tubes for *Apparatus B*. Omit the use of a disk. Operate the apparatus using simulated gastric fluid TS maintained at 37 ± 2° as the immersion fluid. After 1 hour of operation in simulated gastric fluid TS, lift the basket from the fluid and observe the softgels: the softgels show no evidence of disintegration or rupture permitting the escape of the contents. Operate the apparatus with disks, using simulated intestinal fluid TS, maintained at 37 ± 2°, as the immersion fluid. Lift the basket from the fluid, and observe the capsules. All the capsules disintegrate completely within 60 minutes. If 1 or 2 capsules fail to disintegrate completely, repeat the test on 12 additional capsules: not fewer than 16 of a total of 18 capsules tested disintegrate completely.▪2S (*USP33*)

Buccal Tablets—Apply the test for *Uncoated Tablets*. After 4 hours, lift the basket from the fluid, and observe the tablets: all of the tablets disintegrate completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.

Sublingual Tablets—Apply the test for *Uncoated Tablets*. At the end of the time limit specified in the individual monograph, all the tablets disintegrate completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not fewer than 16 of the total of 18 tablets tested disintegrate completely.

Hard Shell Capsules—Apply the test for *Uncoated Tablets,* using as the immersion fluid, maintained at 37 ± 2°, a 0.05 M acetate buffer prepared by mixing 2.99 g of sodium acetate trihydrate and 1.66 mL of glacial acetic acid with water to obtain a 1000-mL solution having a pH of 4.50 ± 0.05. Attach a removable wire cloth, as described under *Basket-Rack Assembly,* to the surface of the upper plate of the basket-rack assembly. At the end of 30 minutes, lift the basket from the fluid, and observe the capsules: all of the capsules disintegrate except for fragments from the capsule shell. If 1 or 2 capsules fail to disintegrate completely, repeat the test on 12 additional capsules: not fewer than 16 of the total of 18 capsules tested disintegrate completely.

Soft Shell Capsules—Proceed as directed under *Rupture Test for Soft Shell Capsules.*

Use of Disks—

VITAMIN–MINERAL DOSAGE FORMS—Add a disk to each tube unless otherwise specified in the individual monograph.

BOTANICAL DOSAGE FORMS—Omit the use of disks unless otherwise specified in the individual monograph.

DIETARY SUPPLEMENTS OTHER THAN VITAMIN–MINERAL AND BOTANICAL DOSAGE FORMS—Omit the use of disks unless otherwise specified in the individual monograph.

NOTE—The use of disks for enteric-coated tablets is not permitted.

Change to read:

RUPTURE TEST FOR SOFT SHELL CAPSULES

Medium: water; 500 mL.

Apparatus—Use *Apparatus 2* as described under *Dissolution* ⟨711⟩, operating at 50 rpm.

Time: 15 minutes.

Procedure—Place 1 capsule in each vessel, and allow the capsule to sink to the bottom of the vessel before starting rotation of the blade.

▪Use sinkers if the capsules float.▪1S (*USP32*)
Observe the capsules, and record the time taken for each capsule shell to rupture.

Tolerances—The requirements are met if all of the capsules tested rupture in not more than 15 minutes. If 1 or 2 of the capsules rupture in more than 15 but not more than 30 minutes, repeat the test on 12 additional capsules: not more than 2 of the total of 18 capsules tested rupture in more than 15 but not more than 30 minutes.

▪For soft gelatin capsules that do not conform to the above rupture test acceptance criteria, repeat the test with the addition of purified pepsin to the *Medium* that results in an activity of 750,000 Units or less per 1000 mL.▪1S (*USP32*)

Change to read:

DISSOLUTION

This test is provided to determine compliance with the *Dissolution* requirements where stated in the individual monograph for dietary supplements, except where the label states that tablets are to be chewed.

See *Dissolution* ⟨711⟩ for a description of the apparatus used, the *Apparatus Suitability Test,* and other related information.

•Soft gelatin capsule preparations of dietary supplements meet the requirements for *Disintegration.*

Official until May 1, 2010.• (RB 1-May-2009)

▪*Figure 2* shows the schematic view of a flow-through cell specifically intended for lipid-filled soft gelatin capsules. It consists of three transparent parts that fit into each other (USP *Apparatus 4*). The lower part (1) is made up of

two adjacent chambers connected to an overflow device. The dissolution medium passes through chamber A and is subjected to an upward flow. The flow in chamber B is directed downward to a small-size bore exit that leads upward to a filter assembly. The middle part (2) of the cell has a cavity designed to collect lipophilic excipients that float on the dissolution medium. A metal grid serves as a rough filter. The upper part (3) holds a filter unit for paper, glass fiber, or cellulose filters.■2S (*USP33*)
Of the types of apparatus described in ⟨711⟩, use the one specified in the individual monograph.

■

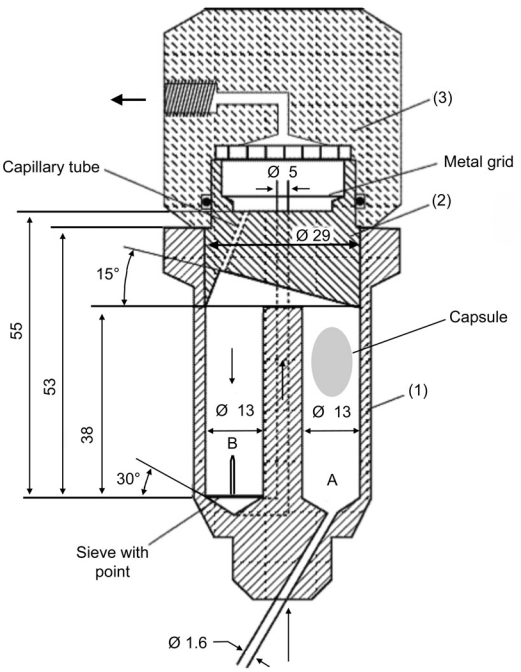

Figure 2. Flow-through cell designed for lipid-filled soft gelatin capsules (dimensions in mm).■2S (*USP33*)

For hard or soft gelatin capsules and gelatin-coated tablets that do not conform to the dissolution specification, repeat the test as follows. Where water or a medium with a pH of less than 6.8 is specified as the *Medium* in the individual monograph, the same *Medium* specified may be used with the addition of purified pepsin that results in an activity of 750,000 Units or less per 1000 mL. For media with a pH of 6.8 or greater, pancreatin can be added to produce not more than 1750 USP Units of protease activity per 1000 mL.

This nonspecific dissolution is intended to be diagnostic of known technological problems that may arise as a result of coatings, lubricants, disintegrants, and other substances inherent in the manufacturing process. For dosage forms containing botanical extracts, this dissolution measurement allows an assessment of the extent of decomposition of the extract to polymeric or other nondissoluble compounds that may have been produced by excessive drying or other manipulations involved in the manufacture of botanical extracts. The operative assumption inherent in this procedure is that if the index or marker compound(s) or the extract is demonstrated to have dissolved within the time frame and under the conditions specified, the dosage form does not suffer from any of the above formulation or manufacturing related problems.

Vitamin–Mineral Dosage Forms

All dietary supplements belonging to USP *Classes II* to *VI,* prepared as tablets or capsules, are subject to the dissolution test and criteria described in this chapter for folic acid (if present) and for index vitamins and index minerals. This test is required because of the importance of the relationship between folate deficiency and the risk of neural tube defects. The accompanying table lists the dissolution requirements for the individual USP classes of dietary supplements. *Class I* dietary supplements are combinations of oil-soluble vitamins for which dissolution standards are not established; hence, dissolution requirements do not apply to the oil-soluble vitamins contained in formulations belonging to *Class IV* or *Class V.* Vitamin–mineral combinations that may not be strictly covered by USP *Class I* to *Class VI* are subject to the dissolution test and criteria specified in the individual monographs.

Dietary Supplements—Vitamin–Mineral Dosage Forms

USP Class	Combination of Vitamins or Minerals Present	Dissolution Requirement
I	Oil-Soluble Vitamins	not applicable
II	Water-Soluble Vitamins	one index vitamin; folic acid (if present)
III	Water-Soluble Vitamins with Minerals	one index vitamin and one index element; folic acid (if present)
IV	Oil- and Water-Soluble Vitamins	one index water-soluble vitamin; folic acid (if present)
V	Oil- and Water-Soluble Vitamins with Minerals	one index water-soluble vitamin and one index element; folic acid (if present)
VI	Minerals	one index element

Unless otherwise stated in the individual monograph, test six dosage units for dissolution as directed under *Dissolution* ⟨711⟩.

DISSOLUTION CONDITIONS FOR FOLIC ACID

NOTE—Perform this test under light conditions that minimize photodegradation.

Medium: water; 900 mL. If the units tested do not meet the requirements for dissolution in water, test six additional dosage units for dissolution in a medium of 900 mL of 0.05 M pH 6.0 citrate buffer solution, prepared by mixing 9.5 mL of 0.1 M citric acid monohydrate and 40.5 mL of 0.1 M sodium citrate dihydrate in a 100-mL volumetric flask, diluting with water to volume, mixing, and adjusting to a pH of 6.0 by using either 0.1 M hydrochloric acid or 0.1 M sodium hydroxide solution.

Apparatus 1: 100 rpm, for capsules.

Apparatus 2: 75 rpm, for tablets.

Time: 1 hour.

NOTE—Compliance with the dissolution requirements for folic acid does not exempt the product from dissolution testing of the pertinent index vitamin or the corresponding index mineral.

DISSOLUTION CONDITIONS FOR INDEX VITAMINS AND INDEX MINERALS

Medium: 0.1 N hydrochloric acid; 900 mL.
Apparatus 1: 100 rpm, for capsules.
Apparatus 2: 75 rpm, for tablets.
Time: 1 hour.

For formulations containing 25 mg or more of the index vitamin, riboflavin, use the following conditions:

Medium: 0.1 N hydrochloric acid; 1800 mL.
Apparatus 1: 100 rpm, for capsules.
Apparatus 2: 75 rpm, for tablets.
Time: 1 hour.

NOTE—Compliance with dissolution requirements for the pertinent index vitamin or index mineral does not exempt the product from dissolution testing of folic acid, if present.

SELECTION OF INDEX VITAMINS AND INDEX ELEMENTS

Compliance with the dissolution requirements for dietary supplements representing combinations of water-soluble vitamins (*Water-Soluble Vitamins Capsules* and *Water-Soluble Vitamins Tablets*) and combinations of oil- and water-soluble vitamins (*Oil- and Water-Soluble Vitamins Capsules* and *Oil- and Water-Soluble Vitamins Tablets*) is determined by measuring the dissolution of a single index vitamin from the water-soluble vitamins present. Riboflavin is the index vitamin when present in the formulation. For formulations that do not contain riboflavin, pyridoxine is the index vitamin. If neither riboflavin nor pyridoxine is present in the formulation, the index vitamin is niacinamide (or niacin), and in the absence of niacinamide (or niacin), the index vitamin is thiamine. If none of the above four water-soluble vitamins is present in the formulation, the index vitamin is ascorbic acid.

Compliance with the dissolution requirements for dietary supplements representing combinations of minerals (*Minerals Capsules* and *Minerals Tablets*) is determined by measuring the dissolution of only one index element. Iron is the index element when present in the formulation. For formulations that do not contain iron, the index element is calcium. If neither iron nor calcium is present, the index element is zinc, and in the absence of all three of these elements, magnesium is the index element.

Compliance with dissolution requirements for dietary supplements representing combinations of water-soluble vitamins and minerals (*Water-Soluble Vitamins with Minerals Capsules* and *Water-Soluble Vitamins with Minerals Tablets*) and combinations of oil- and water-soluble vitamins and minerals (*Oil- and Water-Soluble Vitamins with Minerals Capsules* and *Oil- and Water-Soluble Vitamins with Minerals Tablets*) is determined by measuring the dissolution of one index water-soluble vitamin and one index element, designated according to the respective hierarchies described above.

PROCEDURES

In the following procedures, combine equal volumes of the filtered solutions of the six individual specimens withdrawn, and determine the amount of folic acid or the index vitamin or element dissolved, based on the average of six units tested. Make any necessary modifications, including concentration of the analyte in the volume of test solution taken. Use the *Medium* for preparation of the Standard solution and dilution, if necessary, of the test solution.

Folic Acid—Determine the amount of $C_{19}H_{19}N_7O_6$ dissolved by employing the procedure set forth in the *Assay for folic acid* under *Oil- and Water-Soluble Vitamins with Minerals Tablets*, in comparison with a Standard solution having a known concentration of USP Folic Acid RS in the same *Medium*.

Niacin or Niacinamide, Pyridoxine, Riboflavin, and Thiamine—Determine the amount of the designated index vitamin dissolved by employing the procedure set forth in the *Assay for niacin or niacinamide, pyridoxine, riboflavin, and thiamine* under *Water-Soluble Vitamins Tablets.*

Ascorbic Acid—Determine the amount of $C_6H_8O_6$ dissolved by adding 10 mL of 1.0 N sulfuric acid and 3 mL of starch TS to 100.0 mL of test solution, and titrating immediately with 0.01 N iodine VS. Perform a blank determination, and make any necessary correction.

Iron, Calcium, Magnesium, and Zinc—Determine the amount of the designated index element dissolved by employing the procedure set forth in the appropriate *Assay* under *Minerals Capsules*.

TOLERANCES

The requirements are met if not less than 75% of the labeled content of folic acid and not less than 75% of the labeled content of the index vitamin or the index element from the units tested is dissolved in 1 hour.

Botanical Dosage Forms

Compliance with dissolution requirements necessitates the testing of six dosage units individually, or testing two or more dosage units in each of the six vessels of the dissolution apparatus, and measuring the dissolution of one or more index/marker compound(s) or the extract specified in the individual monograph.

PROCEDURES

Combine equal volumes of the filtered solutions of the six or more individual specimens withdrawn, and use the pooled sample as the test solution. Determine the average amount of index or marker compound(s) or the extract dissolved in the pooled sample by the *Procedure* specified in the individual monograph. Make any necessary modifications, including concentration of the analyte in the volume of the test solution taken. Use the *Medium* for preparation of the Standard solution and dilution, if necessary, of the test solution.

INTERPRETATION

Pooled Sample—Unless otherwise specified in the individual monograph, the requirements are met if the quantities of the index or marker compound(s) or the extract dissolved from the pooled sample conform to the accompanying acceptance table. The quantity, *Q*, is the amount of dissolved index or marker compound(s) or the extract specified in the individual monograph, expressed as a percentage of the labeled content. The 5%, 15%, and 25% values in the acceptance table are percentages of the labeled content so that these values and *Q* are in the same terms.

Acceptance Table for a Pooled Sample

Stage	Number Tested	Acceptance Criteria
S_1	6	Average amount dissolved is not less than Q + 10%
S_2	6	Average amount dissolved (S_1 + S_2) is equal to or greater than Q + 5%
S_3	12	Average amount dissolved (S_1 + S_2 + S_3) is equal to or greater than Q

Dietary Supplements Other Than Vitamin–Mineral and Botanical Dosage Forms

Unless otherwise stated in the individual monographs for dietary supplement dosage forms in this category, compliance requires the testing of six individual units, measuring the dissolution of the dietary ingredient as the average of the six units tested.

PROCEDURES

Combine equal volumes of the filtered solutions of the six specimens withdrawn, and use the pooled sample as the test solution. Determine the average amount of dietary ingredient dissolved in the pooled sample by the *Procedure* specified in the individual monograph. Make any necessary modifications, including concentration of the analyte in the volume of the test solution taken. Use the *Medium* for preparation of the Standard solution and for dilution, if necessary, of the test solution.

TOLERANCES

Because of the diversity of chemical characteristics and solubilities of dietary ingredients pertaining to this category, general tolerances cannot be established. See individual monographs for *Tolerances*.

REAGENTS, INDICATORS, AND SOLUTIONS

Reagent Specifications

BRIEFING

Calcium Acetate, *USP 32* page 812. It is proposed to correct the CAS number of this reagent.

(HDQ: M. Marques.) RTS—74956

Change to read:

Calcium Acetate, $Ca(C_2H_3O_2)_2 \cdot H_2O$—**176.18** ~~[62-54-4]~~ ■[*5743-26-0*]■2S (*USP33*)
—White, crystalline granules or powder. Soluble in about 3 parts of water; slightly soluble in alcohol. Use ACS reagent grade.

BRIEFING

1,3-Dicaffeoylquinic Acid. It is proposed to add this new reagent used to prepare *Standard solution 2*in the *Identification* test under *Echinacea angustifolia*.

(HDQ: M. Marques) RTS—C73258

Add the following:

■**1,3-Dicaffeoylquinic Acid** *(Cynarin; (1R,3R,4S,5R)-1,3-Bis[[3-(3,4-dihydroxyphenyl)propenoyl]oxy]-4,5-dihydroxycyclohexanecarboxylic Acid),* $C_{25}H_{24}O_{12}$—**516.45** [*30964-13-7*]—Use a suitable grade.

[NOTE— A suitable grade is available as catalog number 3991 from www.chromadex.com]■2S (*USP33*)

BRIEFING

Nitrogen Certified Standard. It is proposed to add this new reagent used in the monograph for *Medical Air.*

(HDQ: M. Marques.) RTS—C61164

Add the following:

■**Nitrogen Certified Standard**—A suitable 99.99% nitrogen certified standard is available from most suppliers of specialty gases.■2S (*USP33*)

BRIEFING

Methyl Red, *USP 32* page 833 and page 177 of *PF* 35(1) [Jan.–Feb. 2009]. It is proposed to include additional information about this reagent.

(HDQ: M. Marques.) RTS—C74960

Change to read:

Methyl Red *(2-[4-Dimethylaminophenylazo]benzoic Acid; C. I. Acid Red 2)* ~~$C_{15}H_{15}N_3O_2$— **269.30,**~~

▲ $C_{15}H_{15}N_3O_2$, free acid—**269.30** [*493-52-7*]; $C_{15}H_{14}N_3O_2Na$, sodium salt—**291.28** [*845-10-3*]▲*USP33*
—Use ACS reagent grade.

▲The free acid is recommended for nonaqueous titrations, particularly when an aprotic solvent is used. The sodium salt is recommended for titrations in aqueous media and also for nonaqueous titrations where the medium is an amphiprotic solvent.▲*USP33*

■The hydrochloride salt is recommended for titrations in aqueous media and amphiprotic solvents.■2S (*USP33*)

In-Process Revision

BRIEFING

93.0% Oxygen Certified Standard. It is proposed to add this new reagent used in the monograph for *Oxygen 93 Percent*.

(HDQ: M. Marques.) RTS—C61161

Add the following:

▪**93.0% Oxygen Certified Standard**—A suitable 93.0% oxygen certified standard is available from most suppliers of specialty gases.▪2S (*USP33*)

BRIEFING

Oxygen in Nitrogen Certified Standard. It is proposed to add this new reagent used in the monograph for *Nitrogen*.

(HDQ: M. Marques.) RTS—C73267

Add the following:

▪**Oxygen in Nitrogen Certified Standard**—A mixture of 1.0% oxygen in nitrogen. It is available from most suppliers of specialty gases.▪2S (*USP33*)

BRIEFING

3.0% Oxygen in Nitrogen Certified Standard. It is proposed to add this new reagent used in the monograph for *Nitrogen 97 Percent*.

(HDQ: M. Marques.) RTS—C61146

Add the following:

▪**3.0% Oxygen in Nitrogen Certified Standard**—A mixture of 3.0% oxygen in nitrogen. It is available from most suppliers of specialty gases.▪2S (*USP33*)

BRIEFING

21.0% Oxygen in Nitrogen Certified Standard. It is proposed to add this new reagent used in the monograph for *Medical Air.*

(HDQ: M. Marques.) RTS—C61164

Add the following:

▪**21.0% Oxygen in Nitrogen Certified Standard**—A suitable 21.0% oxygen in nitrogen certified standard is available from most suppliers of specialty gases.▪2S (*USP33*)

BRIEFING

Oxygen–Helium Certified Standard, *USP 32* page 836. It is proposed to delete this reagent because of the revisions being made to the monographs for *Nitrogen* and *Nitrogen 97 Percent*.

(HDQ: M. Marques.) RTS—C61146

Delete the following:

▪~~**Oxygen-Helium Certified Standard**—A mixture of 1.0% oxygen in industrial-grade helium. It is available from most suppliers of specialty gases.~~▪2S (*USP33*)

BRIEFING

Delta-8-tetrahydrocannabinol. It is proposed to add this new reagent used to prepare the *System suitability solution* used in the *Assay* test in the monograph for *Dronabinol Capsules*.

(HDQ: M. Marques) RTS—C73224

Add the following:

▪**Delta-8-tetrahydrocannabinol** *(Δ-8-tetrahydrocannabinol)* $C_{21}H_{30}O_2$—**314.47** [*5957-75-5*]—Use a suitable grade which may be a solid material or a solution in methanol. [NOTE—A suitable grade of a methanolic solution (1 mg/mL) is available from www.cerilliant.com, catalog number T-032.]▪2S (*USP33*)

In-Process Revision

REFERENCE TABLES

BRIEFING

Container Specifications for Capsules and Tablets, *USP 32* page 881, and page 650 of *PF* 35(3) [May–June 2009].

(HDQ) RTS—C44129; C47817; C65483; C65484; C65921; C69397; C70442; C73613

The following table is provided as a reminder for the pharmacist engaged in the typical dispensing situation who already is acquainted with the *Packaging and storage* requirements set forth in the individual monographs. It lists the capsules and tablets that are official in the *United States Pharmacopeia* and indicates the relevant tight (T), well-closed (W), and light-resistant (LR) specifications applicable to containers in which the drug that is repackaged should be dispensed.

This table is not intended to replace, nor should it be interpreted as replacing, the definitive requirements stated in the individual monographs.

Container Specifications for Capsules and Tablets

Monograph Title	*Container Specification*
Add the following:	
▲Acetaminophen and Tramadol Hydrochloride Tablets	$T_{▲USP33}$

BRIEFING

Description and Relative Solubility of USP and NF Articles, *USP 32* page 890, page 266 of *PF* 29(1) [Jan.–Feb. 2003], page 1053 of *PF* 33(5) [Sept.–Oct. 2007], page 817 of *PF* 34(3) [May–June 2008], page 1046 of *PF* 34(4) [July–Aug. 2008], page 1322 of *PF* 34(5) [Sept.–Oct. 2008], page 1565 of *PF* 34(6) [Nov.–Dec. 2008], page 188 of *PF* 35(1) [Jan.–Feb. 2009], and page 464 of *PF* 34(2) [Mar.–Apr. 2009], and page 651 of 35(3) [May–June 2009].

(HDQ) RTS—C70442; C71283; C65791; C73593

Add the following:

■**Balsalazide Disodium:** Orange to yellow powder. Freely soluble in water and in isotonic saline; sparingly soluble in methanol and in alcohol; practically insoluble in all other organic solvents.■2S *(USP33)*

Add the following:

▪**Lactobionic Acid:** White or almost white, crystalline powder with a melting point of about 125° with decomposition. Freely soluble in water; slightly soluble in glacial acetic acid, in anhydrous ethanol and in methanol. *NF category:* Antioxidant.▪2S (*NF28*)

Add the following:

▪**Methacrylic Acid and Ethyl Acrylate Copolymer:** White powder having a faint, characteristic odor. Soluble to freely soluble in methanol, in alcohol, in isopropyl alcohol, and in acetone, each of which contains not less than 3% of water; soluble in diluted alkali, in simulated intestinal fluid TS, and in buffer solutions of pH 7 and above; insoluble in water, in diluted acids, in simulated gastric fluid TS, and in buffer solutions of up to pH 5. The solubility between pH 5.5 and pH 7 depends on the content of methacrylic acid units in the copolymer. *NF category:* Coating agent; film-forming agent.▪2S (*NF28*)

Add the following:

▪**Methacrylic Acid and Methyl Methacrylate Copolymer:** White powder having a faint, characteristic odor. Soluble to freely soluble in methanol, in alcohol, in isopropyl alcohol, and in acetone, each of which contains not less than 3% of water; soluble in diluted alkali, in simulated intestinal fluid TS, and in buffer solutions of pH 7 and above; insoluble in water, in diluted acids, in simulated gastric fluid TS, and in buffer solutions of up to pH 5. The solubility between pH 5.5 and pH 7 depends on the content of methacrylic acid units in the copolymer. *NF category:* Coating agent; film-forming agent.▪2S (*NF28*)

Pending Proposals

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *Pharmacopeial Forum (PF)* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in the *USP–NF,* its *Supplements,* an *IRA* , or a *Revision Bulletin.* Those items that have not yet been adopted are marked as *Pending Proposals.*

The *Pending Proposals* list contains these items separated into the following categories: General Notices and Requirements; *USP* monographs; Dietary Supplements Monographs; General Chapters; Reagents; Indicators; and Solutions; Reference Tables; Excipients; and *NF* Monographs. Each entry in the *Pending Proposals* list contains the monograph title and the citation of the most recent publication of the monograph. Reprints of *PF* proposals may be purchased from USP by sending a written request for information to custsvc@usp.org.

To check the status of a *Pending Proposal,* please contact USP as directed below.

- The briefing accompanying the monograph or general chapter lists the names of the Scientific Liaisons responsible for the proposed revisions. The contact information (phone number and email) for the Scientific Liaison is available in the *Staff Directory* section of *How to Use PF.* For *USP–NF Online* subscribers, the name and contact information for the assigned Scientific Liaison is available in the *Auxiliary Information* portion of each monograph.
- Call USP at 301-816-8344 and ask to speak with the Scientific Liaison assigned to the monograph or general chapter of interest.
- Submit questions by email to stdsmonographs@usp.org. Please indicate the name of the monograph or general chapter in the subject line of the email.

Following these lists the reader will find the *Canceled Proposals* list. These are items that were published in *PF* and were pending, but have since been canceled. This list contains cumulative entries for the six issues per volume of *PF* [i.e., 35(1) through 35(6)]. Note that canceled proposals may be republished in *PF* to be considered for future adoption into the *USP–NF.*

Dapsone—*Assay*	31	3	750
Human Acellular Dermal Matrix (new)	35	3	558
Microsized Human Acellular Dermal Matrix (new)	35	3	561
Desmopressin Nasal Spray Solution (new)	31	4	1059
Dextroamphetamine Sulfate—*Definition, USP Reference standards, Identification, Chromatographic purity* (delete), *Related compounds* (add), *Organic volatile impurities* (delete), *Assay*	34	4	921
Dextrose—*Harmonization*	34	6	1585
Diazepam Extended-Release Capsules—*USP Reference standards, Assay*	32	2	330
Diclazuril (new)	35	1	73
Diclofenac Sodium Delayed-Release Tablets—*Dissolution*	35	2	271
Dicyclomine Hydrochloride—*Readily carbonizable substances*	34	5	1152
Didanosine for Oral Solution—*Assay*	34	6	1443
Dihydroxyaluminum Sodium Carbonate Chewable Tablets (new)	29	6	1873
Dolasetron Mesylate—*Impurities*	35	2	272
Dopamine Hydrochloride—*Readily carbonizable substances*	34	5	1152
Doxazosin Mesylate—*Assay*	34	5	1152
Doxycycline Hyclate Delayed-Release Tablets (new)	34	3	589
Dronabinol Capsules—*Definition, Assay, USP Reference Standards*	35	3	549
Ecamsule Solution (new)	34	5	1153
Egg Phospholipids (new)	31	3	757
Enalaprilat Injection (new)	34	3	593
Endotoxin Indicator for Depyrogenation (new)	34	6	1444
Enrofloxacin (new)	34	4	924
Epirubicin Hydrochloride (new)	35	2	273
Erythromycin Pledgets—*Identification* (add), *Other requirements*	34	5	1157
Sterile Erythromycin Ethylsuccinate—*Identification* (add), *Other requirements*	34	5	1158
Esomeprazole Magnesium—*Identification B, Other Components—Content of Magnesium, Optical Rotation* (delete)	35	3	550
Estradiol Tablets—*USP Reference standards, Chromatographic purity* (add)	34	3	596
Estradiol Vaginal Inserts (new)	34	3	597
Esterified Estrogens—*Identification, Free steroids, Assay*	32	6	1678
Esterified Estrogens Tablets—*USP Reference standards, Assay*	32	6	1680
Ethinyl Estradiol Tablets—*Dissolution* (add)	31	4	1067
Ethotoin Tablets—*USP Reference standards, Assay*	32	2	332
Famotidine Injection (new)	32	2	333
Famotidine for Oral Suspension—*Uniformity of dosage units*	34	5	1158
Fenofibrate—*Definition, Assay*	35	2	275
Fenoprofen Calcium—*Chromatographic purity*	34	3	601
Fentanyl (new)	34	3	602
Fexofenadine Hydrochloride Tablets—*Dissolution*	34	4	931
Fluconazole Injection (new)	35	3	552
Fluconazole Tablets (new)	34	4	932
Fludarabine Phosphate for Injection—*Related compounds*	34	4	933
Flurazepam Hydrochloride—*Identification*	31	3	766

Pending Proposals (*continued*)

Water for Injection—*Definition, Bacterial Endotoxins Test, Water Conductivity, Sterility Tests* (add), *Packaging and Storage* (add), *Labeling* (add)	35	2	316
Purified Water—*Definition, Packaging and Storage* (add), *Labeling* (add)	35	2	317
Sterile Water for Inhalation—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add), *Oxidizable substances*	31	3	802
Sterile Water for Injection—*Oxidizable substances*	31	3	803
Sterile Water for Irrigation—*Oxidizable substances*	31	3	804
Sterile Purified Water—*Oxidizable substances*	31	3	804
Xylose—*USP Reference standards, Identification, Chromatographic purity, Assay*	34	4	995
Zidovudine—*Assay*	34	3	656
Zidovudine Capsules—*Related compounds, Assay*	34	3	657
Zidovudine Injection—*Related compounds, Assay*	34	3	658
Ziprasidone Hydrochloride (new)	35	3	592
Zolpidem Tartrate (new)	34	6	1487
Zolpidem Tartrate Extended-Release Tablets (new)	35	3	595
Zonisamide (new)	34	6	1489
Dietary Supplements Monographs			
Acesulfame Potassium—*Packaging and storage* (add), *Limit of fluoride*	31	3	811
N-Acetyltyrosine (new)	35	1	107
Calcium and Vitamin D with Minerals Tablets—*Assay for calcium; Assay for copper; Assay for magnesium; Assay for manganese; Assay for zinc; Assay for calcium, copper, magnesium, manganese, and zinc, Method 2* (add)	34	6	1491
Calcium Citrate Tablets (new)	34	2	312
Fish Oil Containing Omega-3 Acids—*Content of EPA and DHA*	34	5	1207
Glucosamine Hydrochloride—*Assay*	33	4	691
Glucosamine Sulfate Potassium Chloride—*Assay*	33	4	692
Glucosamine Sulfate Sodium Chloride—*Assay*	33	4	692
Glutamic Acid (new)	34	4	997
Grape Seeds Oligomeric Proanthocyanidins (new)	34	3	659
Guggul (new)	34	4	1000
Native Guggul Extract (new)	34	4	1002
Purified Guggul Extract (new)	34	4	1003
Guggul Tablets (new)	34	4	1004
Hawthorn Leaf with Flower—*Labeling*	34	5	1209
Powdered Hawthorn Leaf with Flower—*Labeling*	34	5	1209
Ground Limestone (new)	34	4	998
Alpha Lipoic Acid—*Limit of 6,8-epitrithiooctanoic acid* (delete), *Limit of polymer content* (delete), *Chromatographic purity* (add), *Assay*	34	5	1209
Maleic Acid—*Identification*	31	3	815
Maltose—*Water*	31	3	815
Minerals Capsules—*Definition, Assay for calcium; Assay for chromium; Assay for iron; Assay for magnesium; Assay for manganese; Assay for phosphorus; Assay for zinc; Assay for boron, nickel, tin, and vanadium, Method I; calcium, chromium, copper, iron, magnesium, manganese, phosphorus, and zinc, Method 2; molybdenum and selenium, Method 3* (add)	34	6	1493
Minerals Tablets—*Definition, Assay for calcium; Assay for chromium; Assay for copper; Assay for iron; Assay for magnesium; Assay for manganese; Assay for phosphorus; Assay for zinc; Assay for boron, nickel, tin, and vanadium, Method I; calcium, chromium, copper, iron, magnesium, manganese, phosphorus, and zinc, Method 2; molybdenum and selenium, Method 3* (add)	34	6	1495

Pending Proposals (*continued*)

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	***PF Volume, Issue, and Page Numbers of Pending Proposals***		
	Vol.	***No.***	***Page(s)***
Olive Oil—*Definition, Labeling* (add), *Teaseed oil*	31	3	815
Omega-3 Acid Triglycerides (new)	34	3	662
Phenoxyethanol—*Chromatographic purity, Assay*	31	3	816
Polyethylene Glycol (new)—*Harmonization*	31	3	897
Polyoxyl 10 Oleyl Ether—*Free ethylene oxide*	31	3	816
Polyoxyl 20 Oleyl Cetostearyl Ether—*Free ethylene oxide*	31	3	817
Potassium Citrate Tablets (new)	34	2	313
Sodium Benzoate—*USP Reference standards* (add), *Identification*	31	3	818
Sucrose (new)—*Harmonization*	31	3	902
Sugar Spheres—*Identification, Specific rotation*	31	3	819
Tagatose (new)	31	3	819
Thymol—*USP Reference standards* (add), *Identification*	31	3	821
Tumeric (new)	33	6	1229
Powdered Tumeric (new)	33	6	1232
Powdered Tumeric Extract (new)	33	6	1232
Ubidecarenone—*USP Reference standards, Assay*	31	1	86
Valerian Capsules (new)	27	1	1825
Vitamin A Oral Liquid Preparation (new)	35	3	596
Oil- and Water-Soluble Vitamins with Minerals Capsules—*Definition, Assay for calcium; Assay for chromium; Assay for copper; Assay for magnesium; Assay for manganese; Assay for phosphorus; Assay for zinc; Assay for boron, nickel, tin, and vanadium, Method I; calcium, chromium, copper, iron, magnesium, manganese, phosphorus, and zinc, Method 2; molybdenum and selenium, Method 3* (add)	34	6	1499
Oil- and Water-Soluble Vitamins with Minerals Tablets—*Definition, Assay for calcium; Assay for chromium; Assay for copper; Assay for iron; Assay for magnesium; Assay for manganese; Assay for phosphorus; Assay for zinc; Assay for boron, nickel, tin, and vanadium, Method I; calcium, chromium, copper, iron, magnesium, manganese, phosphorus, and zinc, Method 2; molybdenum and selenium, Method 3* (add)	34	6	1500
Water-Soluble Vitamins with Minerals Capsules—*Definition, Assay for calcium; Assay for chromium; Assay for copper; Assay for iron; Assay for magnesium; Assay for manganese; Assay for phosphorus; Assay for zinc; Assay for boron, nickel, tin, and vanadium, Method I; calcium, chromium, copper, iron, magnesium, manganese, phosphorus, and zinc, Method 2; molybdenum and selenium, Method 3* (add)	34	6	1505
Water-Soluble Vitamins with Minerals Tablets—*Definition, Assay for calcium; Assay for chromium; Assay for copper; Assay for iron; Assay for magnesium; Assay for manganese; Assay for phosphorus; Assay for zinc; Assay for boron, nickel, tin, and vanadium, Method I; calcium, chromium, copper, iron, magnesium, manganese, phosphorus, and zinc, Method 2; molybdenum and selenium, Method 3* (add)	34	6	1507
Xanthan Gum—*Assay*	31	3	821
Zinc Citrate (new)	34	2	315
Zinc Citrate Tablets (new)	34	2	316
Zinc Gluconate Tablets (new)	35	3	597
Zinc and Vitamin C Lozenges (new)	34	2	317
USP General Test Chapters			
⟨1⟩ Injections—*Ingredients, Foreign and Particulate Matter*	35	3	601

STAGE 4 HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization consists of several steps (Stages 1 through 7, as defined below). Stage 4 drafts are available for comments. Below are descriptions of the developmental Stages as defined by the United States Pharmacopeia, the European Pharmacopoeia, and the Japanese Pharmacopoeia.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF,* this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

MONOGRAPHS (NF)

BRIEFING

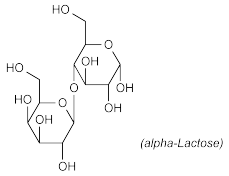
Anhydrous Lactose. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Anhydrous Lactose monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the revised **OFFICIAL INQUIRY STAGE 4** document, is based in part on comments from the Japanese Pharmacopoeia and the United States Pharmacopeia. Differences between this draft and the current monograph for Anhydrous Lactose include the following:

1. Clarification of the *Clarity and Color of Solution* test to allow the solution to cool before examination.
2. An updated procedure for the *Content of Alpha and Beta Anomers* is included.
3. The acceptance criteria for total combined molds and yeasts is updated at the request of EP.
4. A test for *Salmonella* is added at the request of JP.

(EM1: K. Moore.) RTS—C72359

Add the following:

Anhydrous Lactose



(alpha-Lactose)

DEFINITION

Anhydrous Lactose is *O*-β-D-galactopyranosyl-(1→4)-β-D-glucopyranose (β-lactose), or a mixture of *O*-β-D-galactopyranosyl-(1→4)-β-D-glucopyranose and *O*-β-D-galactopyranosyl-(1→4)-α-D-glucopyranose (α-lactose).

ASSAY

• **CONTENT OF ALPHA AND BETA ANOMERS**

Silylation reagent: Dimethyl sulfoxide, pyridine, and trimethylsilylimidazole (19.5:58.5:22)

Standard solution: Prepare a mixture of alpha lactose monohydrate and beta lactose having an anomeric ratio of about 1:1, based on the labeled anomeric contents of the alpha lactose monohydrate and beta lactose. Introduce 10 mg of this mixture into a vial with a screw cap. Add 4 mL of *Silylation reagent*. Sonicate for 20 min at room temperature. Transfer 400 µL to an injection vial. Add 1 mL of pyridine. Close the vial and mix well.

Sample solution: Transfer 10 mg of Anhydrous Lactose into a vial with a screw cap. Add 4 mL of *Silylation reagent*. Sonicate for 20 min at room temperature. Transfer 400 µL to an injection vial. Add 1 mL of pyridine. Close the vial and mix well.

Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: GC
Detector: Flame ionization
Precolumn[1]: 0.53-mm × 2-m intermediate polarity deactivated fused-silica.
Column[2]: 0.25-mm × 15-m G27 on fused silica, film thickness 0.25 µm
Temperature: See temperature table below.

	Time (min)	Temperature (°)
Detector		325
Injection port		275 or use cold on-column injection
Column	0	80
	1	80
	3	150
	15.5	300
	17.5	300

Column pressure: 70 kPa
Carrier gas: Helium
Flow rate: 40 mL/min
Injection size: 0.5-µL splitless or by cold on-column injection
System suitability
Sample: *Standard solution*
Suitability requirements
Resolution: NLT 3.0 between the peaks due to alpha lactose and beta lactose
Analysis
Sample: *Sample solution*
[NOTE—The relative retention times for beta lactose and alpha lactose are 12 and 0.9, respectively. The retention time for beta lactose is about 12 min.]
Calculate the percentage content of alpha lactose:

$$\text{Result} = (S_A/S_A + S_B) \times 100$$

S_A = area of the peak due to alpha lactose
S_B = area of the peak due to beta lactose

Calculate the percentage content of beta lactose:

$$\text{Result} = (S_B/S_A + S_B) \times 100$$

S_B = area of the peak due to beta lactose
S_A = area of the peak due to alpha lactose

IMPURITIES

Inorganic Impurities

• **RESIDUE ON IGNITION ⟨281⟩:** NMT 0.1%, determined on a specimen ignited at a temperature of 600 ± 50°

Organic Impurities

• **PROCEDURE: CLARITY AND COLOR OF SOLUTION**

Hydrazine sulfate solution: Dissolve 1.0 g of hydrazine sulfate in water and dilute to 100.0 mL. Allow to stand for 4–6 h.

Hexamethylenetetramine solution: In a 100-mL ground-glass-stoppered flask, dissolve 2.5 g of hexamethylenetetramine in 25.0 mL of water.

Primary opalescent suspension: To the *Hexamethylenetetramine solution* in the flask add 25.0 mL of the *Hydrazine sulfate solution*. Mix and allow to stand for 24 h. This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.

Standard of opalescence: Dilute 15.0 mL of the *Primary opalescent suspension* with water to 1000.0 mL. This suspension is freshly prepared and may be stored for up to 24 h.

Reference suspension: To 5.0 mL of *Standard of opalescence* add 95.0 mL of water. Mix and shake before use.

[1] A Restek guard column is suitable.
[2] A Varian CP-Sil 8 CB guard column is suitable.

Brown-yellow stock solution: Mix 2.4 mL of ferric chloride CS, 1.0 mL of cobaltous chloride CS, 0.4 mL of cupric sulfate CS, and 6.2 mL of hydrochloric acid (10 g/L HCl).
Brown-yellow reference solution: Mix 2.5 mL of *Brown-yellow stock solution* and 97.5 mL of hydrochloric acid (10 g/L HCl).
Sample solution: 1 g in 10 mL of boiling water is clear and nearly colorless.
Spectrometric conditions
Mode: UV-Vis
Analytical wavelength: 400 nm
Acceptance criteria: Its clarity is the same as that of water or its opalescence is not more pronounced than that of the *Reference suspension*, and it is not more colored than the *Brown-yellow reference solution*. The absorbance divided by the path length in cm is NMT 0.04.

SPECIFIC TESTS

- **Loss on Drying** ⟨**731**⟩**:** Dry a sample at 80° for 2 h: it loses NMT 0.5% of its weight.
- **Water Determination,** *Method II* ⟨**921**⟩**:** NMT 1.0%, determined on a preparation containing anhydrous lactose in a mixture of methanol and formamide (2:1)
- **Microbial Enumeration Tests** ⟨**61**⟩ and **Tests for Specified Microorganisms** ⟨**62**⟩**:** Total aerobic microbial count is NMT 100 cfu/g; total combined molds and yeasts count is NMT 10 cfu/g; and it meets the requirements of the test for absence of *Escherichia coli* and *Salmonella* species.
- **Protein and Light-Absorbing Impurities** ⟨**851**⟩
Sample solution: 1% solution
Spectrometric conditions
Mode: UV
Wavelength range: 210–300 nm
Acceptance criteria: The absorbance divided by the path length in cm at 210–220 nm: NMT 0.25; and at 270–300 nm: NMT 0.07.
- **Acidity or Alkalinity**
Sample solution: Dissolve 6 g by heating in 25 mL of carbon dioxide-free water, cool, and add 0.3 mL of phenolphthalein TS.
Acceptance criteria: The solution is colorless, and NMT 0.4 mL of 0.1 N sodium hydroxide is required to produce a pink or red color.
- **Optical Rotation,** *Specific Rotation* ⟨**781S**⟩
Sample solution: Dissolve 10 g by heating in 80 mL of water to 50°. Allow to cool, and add 0.2 mL of 6 N ammonium hydroxide. Allow to stand for 30 min, and dilute with water to 100 mL.
Acceptance criteria: +54.4° and +55.9°, calculated on the anhydrous basis, at 20°

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers.
- **Labeling:** Where the labeling indicates the relative quantities of alpha and beta lactose, determine compliance using *Content of Alpha and Beta Anomers*. Where the labeling states the particle size distribution, it also indicates the d_{10}, d_{50}, and d_{90} values and the range for each.

STAGE 6 HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization consists of several steps (Stages 1 through 7, as defined below). This section includes Stage 6 adopted text which is provided for information. USP cannot incorporate public comments at Stage 6 without consulting PDG partners. Below are descriptions of the developmental Stages as defined by the United States Pharmacopeia, the European Pharmacopoeia, and the Japanese Pharmacopoeia.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

BRIEFING

Excipients, USP and NF Excipients, Listed by Category, *NF 27* page 1143 and page 318 of *PF* 35(2) [Mar.–Apr. 2009]. It is proposed to add *Carmellose* to the *Suspending and/or Viscosity-Increasing Agent* category; *Lactobionic Acid* to the *Antioxidant* category; and *Methacrylic Acid and Ethyl Acrylate Copolymer* and *Methacrylic Acid and Methyl Methacrylate Copolymer* to the *Coating Agent* and *Film-Forming Agent* categories, to complement the proposed new monographs for *Carmellose, Lactobionic Acid, Methacrylic Acid and Ethyl Acrylate Copolymer***, and** *Methacrylic Acid and Methyl Methacrylate Copolymer,* **which appear elsewhere in this issue of** *PF.*

(EM1; EM2) RTS—C65791; C71283; C73593

In the following reference table, the grouping of excipients by functional category is intended to summarize the most typically identified purpose that these excipients serve in drug product formulations. The list of substances included in each category is not comprehensive. The statement of category is intended neither to limit in any way the choice or use of the substance nor to indicate that it has no other utility.

BRIEFING

Carmellose. The Japanese Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Carmellose monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the **ADOPTION STAGE 6** document, is based on the Official Inquiry Stage 4 document which appeared in PF 33(3). Because there is no existing monograph for this excipient, a new monograph based on the **ADOPTION STAGE 6** document is presented.

Identification B	+	+	+
Chloride	+	+	+
Sulfate	+	+	+
Loss on Drying	+	+	+
Residue on Ignition	+	+	+

*EP and USP will adopt Carmellose Reference Standard; JP will adopt a Reference spectrum.

Legend: + will adopt and implement; – will not stipulate
Nonharmonized attributes: *Heavy Metals* and *Packaging and Storage* (USP)
Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference substances and spectra and reagent specifications.

Carboxymethylcellulose [9000-11-7].

DEFINITION
Carmellose is a carboxymethyl ether of cellulose.

IDENTIFICATION
- **A. INFRARED ABSORPTION ⟨197K⟩**
- **B. pH ⟨791⟩**
  Sample solution: 10 mg/mL of Carmellose suspension
  Acceptance criteria: 3.5–5.0

IMPURITIES
Inorganic Impurities
- **RESIDUE ON IGNITION ⟨281⟩:** NMT 1.5% on 1 g, calculated on the dried basis
- **CHLORIDES**
  Sample solution: Shake well 0.8 g of Carmellose with 50 mL of water, dissolve in 10 mL of sodium hydroxide TS, and add water to make 100 mL. Heat 20 mL of this solution with 10 mL of nitric acid, diluted on a water bath until a flocculent precipitate is produced. Cool, centrifuge, and take out the supernatant. Wash the precipitate with three 10-mL portions of water by centrifuging each time, combine the supernatant and the washings, and add water to make 100 mL. Take 25 mL of this solution, add 6 mL of nitric acid, and dilute with water to make 50 mL.
  Control solution: 0.40 mL of 0.01 N hydrochloric acid VS and 6 mL of dilute nitric acid. Add water to make 50 mL.
  Analysis: Add 1 mL of silver nitrate TS to the *Sample solution* and to the *Control solution*, mix well, and allow to stand for 5 min protected from direct sunlight. Compare the opalescence developed in both solutions against a black background by viewing downward or transversely.
  Acceptance criteria: The turbidity produced in the *Sample solution* is NMT that in the *Control solution* (NMT 0.36%).
- **SULFATES**
  Sample solution: Shake well 0.40 g of Carmellose with 25 mL of water, dissolve in 5 mL of sodium hydroxide TS, and add 20 mL of water. Heat this solution with 2.5 mL of hydrochloric acid in a water bath until a flocculent precipitate is produced. Cool, centrifuge, and take out the supernatant. Wash the precipitate with three 10-mL portions of water by centrifuging each time, combine the supernatant and the washings, and add water to make 100 mL. Filter this solution, discard 5 mL of the first filtrate, take 25 mL of the subsequent filtrate, add 1 mL of hydrochloric acid, and dilute with water to make 50 mL.
  Control solution: 1.5 mL of 0.01 N sulfuric acid VS and 1 mL of dilute hydrochloric acid. Add water to make 50 mL.
  Analysis: Add 2 mL of barium chloride TS to the *Sample solution* and to the *Control solution*, mix well, and allow to stand for 10 min. Compare the turbidity developed in both solutions against a black background by viewing downward or transversely.
  Acceptance criteria: The turbidity produced in the *Sample solution* is NMT that of the *Control solution* (NMT 0.72%).
- **✦HEAVY METALS,** *Method II* **⟨231⟩:** Proceed with 1.0 g of Carmellose and perform the test. Prepare the control solution with 2.0 mL of *Standard Lead Solution*.
  Acceptance criteria NMT 20 ppm✦

SPECIFIC TESTS
- **LOSS ON DRYING ⟨731⟩:** Dry 1 g at 105° for 4 h: it loses NMT 8.0% of its weight.

ADDITIONAL REQUIREMENTS
- **✦PACKAGING AND STORAGE:** Preserve in tight containers.✦
- **✦USP REFERENCE STANDARDS ⟨11⟩**

BRIEFING

Polysorbate 80. The European Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for the Polysorbate 80 monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following monograph, which represents the **ADOPTION STAGE 6** document, is based on the corresponding monograph for Polysorbate 80 that was prepared by the European Pharmacopoeia and published in *PF* 33(5) [Sept.–Oct. 2007]. The European Pharmacopoeia draft was based in part on comments from the Japanese Pharmacopoeia and the United States Pharmacopeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the European Pharmacopoeia. No significant differences were made from the draft published in *PF* 33(5) [Sept.–Oct. 2007].

Sorbitan, mono-9-octadecenoate, poly(oxy-1,2-ethanediyl) derivs., (*Z*)-;
Polyoxyethylene 20 sorbitan monooleate [9005-65-6].

DEFINITION

Polysorbate 80 is a mixture of partial esters of fatty acids, mainly oleic acid, with sorbitol and its anhydrides ethoxylated with approximately 20 moles of ethylene oxide for each mole of sorbitol and sorbitol anhydrides.

IDENTIFICATION

• **PROCEDURE**
Acceptance criteria: It complies with the test for *Composition of Fatty Acids*.

ASSAY

• **COMPOSITION OF FATTY ACIDS**
Diluent: 20 g/L sodium hydroxide in methanol
Saturated sodium chloride solution: Sodium chloride and water (1:2). Before use, decant the solution from any undissolved substance and filter, if necessary.
Reference solution A: Prepare 0.50 g of the mixture of calibrating substances with the composition described in *Table 1*. Dissolve in heptane, and dilute with heptane to 50.0 mL.
Reference solution B: *Reference solution A* in heptane (1 in 10)
Reference solution C: Prepare 0.50 g of a mixture of fatty acid methyl esters, which corresponds to the composition of the substance to be examined. Dissolve in heptane, and dilute with heptane to 50.0 mL. [NOTE—Commercially available mixtures of fatty acid methyl esters may also be used.]
Sample solution: Dissolve 0.10 g of Polysorbate 80 in 2 mL of *Diluent* in a 25-mL conical flask, and boil under a reflux condenser for 30 min. Add 2.0 mL of 14% boron trifluoride–methanol through the condenser, and boil for 30 min. Add 4 mL of heptane through the condenser, and boil for 5 min. Cool and add 10.0 mL of *Saturated sodium chloride solution*, shake for about 15 s, and add a quantity of *Saturated sodium chloride solution* such that the upper phase is brought into the neck of the flask. Collect 2 mL of the upper phase, wash with three quantities, each of 2 mL, of water and dry over anhydrous sodium sulfate.

Table 1

Mixture of the Following Substances	Composition (%)
Methyl myristate	5
Methyl palmitate	10
Methyl stearate	15
Methyl arachidate	20
Methyl oleate	20
Methyl eicosenoate	10
Methyl behenate	10
Methyl lignocerate	10

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: GC
Detector: Flame ionization
Column: 0.32-mm × 30-m G16 on fused silica, film thickness 0.5 µm
Column temperature: See the temperature program table below.

	54	220

Carrier gas: Helium
Linear velocity: 50 cm/s
Injection size: 1 µL
System suitability
Samples: *Reference solution A* and *Reference solution B*
Suitability requirements
Resolution: NLT 1.8 between the peaks due to methyl oleate and methyl stearate, *Reference solution A*
Signal-to-noise ratio: NLT 5 for the peak of methyl myristate, *Reference solution B*
Theoretical plates: NLT 30,000 calculated for the peak of methyl stearate, *Reference solution A*

Analysis
Sample: *Sample solution*
Identify the peaks from *Reference solution C*. Calculate the percentage of each component in the *Sample solution*:

$$\text{Result} = A_c/A_T \times 100$$

A_c = peak area for the component of interest
A_T = total area of all peaks related to fatty acids

Acceptance criteria: Myristic acid, NMT 5.0%; Palmitic acid, NMT 16.0%; Palmitoleic acid, NMT 8.0%; Stearic acid, NMT 6.0%; Oleic acid, NLT 58.0%; Linoleic acid, NMT 18.0%; Linolenic acid, NMT 4.0%

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION ⟨281⟩:** Heat a silica or platinum crucible to redness for 30 min, allow to cool in a desiccator, and weigh. Evenly distribute 2.00 g of the substance to be examined in the crucible. Dry at 100° to 105° for 1 h and ignite to constant mass in a muffle furnace at 600° ± 25°, allowing the crucible to cool in a desiccator after each ignition. Flames should not be produced at any time during the procedure. If after prolonged ignition the ash still contains black particles, take up with hot water, filter through an ashless filter paper and ignite the residue and the filter paper. Combine the filtrate with the ash, carefully evaporate to dryness and ignite to constant mass.
  Acceptance criteria: NMT 0.25%
- **‡HEAVY METALS,** *Method II* ⟨**231**⟩**:** NMT 10 ppm‡

Organic Impurities

- **PROCEDURE: ETHYLENE OXIDE AND DIOXANE**
  Ethylene oxide standard solution: Dilute 0.5 mL of a commercially available solution of ethylene oxide in methylene chloride (50 mg/mL) with water to 50.0 mL. [NOTE—The solution is stable for 3 months, if stored in vials with a teflon-coated, silicon membrane crimped caps at –20°.] Allow to reach room temperature. Dilute 1.0 mL of this solution with water to 250.0 mL.
  Dioxane standard solution: Dioxane in water (v/v) 1 in 20,000
  Acetaldehyde standard solution: 0.01 mg/mL acetaldehyde in water
  Standard solution: Dilute 6.0 mL of *Ethylene oxide standard solution* and 2.5 mL of *Dioxane standard solution* with water to 25.0 mL.
  Sample solution A: 1.0 g of Polysorbate 80 into a 10-mL headspace vial. Add 2.0 mL of water, and seal the vial immediately with a teflon-coated, silicon membrane and an aluminum cap.
  Sample solution B: 1.0 g of Polysorbate 80 into a 10-mL headspace vial. Add 2.0 mL of *Standard solution*, and seal the vial immediately with a teflon-coated, silicon membrane and an aluminum cap.
  Reference solution: Introduce 2.0 mL of *Acetaldehyde standard solution* and 2.0 mL of *Ethylene oxide standard solution* to a 10-mL headspace vial, and seal the vial immediately with a teflon-coated, silicon membrane and an aluminum cap.
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: Headspace GC
  Detector: Flame ionization
  Column[1]**:** 0.53-mm × 50-m G27 on fused silica, film thickness 5 µm
  Column temperature: See the temperature program table below.

	Time (min)	Temperature (°)
Detector temperature		250
Injection port		85
Column	0	70
	18	250
	23	250

  Split ratio: 3.5
  Carrier gas: Helium
  Flow rate: 4.0 mL/min
  Injection size: 1 mL
  [NOTE—The relative retention times for ethylene oxide, acetaldehyde, and dioxane are 1.0, 0.9, and 1.9, respectively. The retention time for ethylene oxide is about 6.5 min.]
  System suitability
  Sample: *Reference solution*
  Suitability requirements
  Resolution: NLT 2.0 between the peaks due to acetaldehyde and ethylene oxide
  Analysis
  Samples: *Sample solution A* and *Sample solution B*
  Calculate the content of ethylene oxide:

$$\text{Result} = (2 \times C_{EO} \times A_a)/(A_b - A_a)$$

C_{EO} = concentration of ethylene oxide in *Sample solution A* (µg/mL)
A_a = peak area of ethylene oxide from *Sample solution A*
A_b = peak area of ethylene oxide from *Sample solution B*

  Calculate the content of dioxane:

$$\text{Result} = (2 \times 1.03 \times C_D \times A_{a'})/(A_{b'} - A_{a'})$$

1.03 = density of dioxane (g/mL)
C_D = concentration of dioxane in *Sample solution A* (µg/mL)
$A_{a'}$ = peak area of dioxane from *Sample solution A*
$A_{b'}$ = peak area of dioxane from *Sample solution B*

  Acceptance criteria: NMT 1 ppm for ethylene oxide; NMT 10 ppm for dioxane

SPECIFIC TESTS

- **SPECIFIC GRAVITY ⟨841⟩:** about 1.10 at 20°
- **VISCOSITY ⟨911⟩:** about 400 mPa · s at 25°
- **FATS AND FIXED OILS,** *Acid Value* ⟨**401**⟩
  Sample solution: Dissolve 5.0 g in 50 mL of a mixture of equal volumes of alcohol and hexane (previously neutralized with 0.1 N potassium hydroxide or 0.1 N sodium hydroxide), using 0.5 mL of phenolphthalein solution as indicator. If necessary, heat to about 90° to dissolve the substance to be examined.
  Analysis: Titrate the *Sample solution* with 0.1 N potassium hydroxide or 0.1 N sodium hydroxide until the pink color persists for at least 15 s. When heating has been applied to aid dissolution, maintain the temperature at about 90° during the titration.
  Acceptance criteria: NMT 2.0
- **FATS AND FIXED OILS,** *Hydroxyl Value* ⟨**401**⟩
  Sample: 2.0 g
  Analysis: Introduce the *Sample* into a 150-mL acetylation flask fitted with an air condenser. Add 5.0 mL of *Pyridine–Acetic Anhydride Reagent*, and attach the air condenser. Heat the flask in a water bath for 1 h keeping the level of the water about 2.5 cm above the level of the liquid in the flask. Withdraw the flask, and allow to cool. Add 5 mL of water through the upper end of the condenser. If a cloudiness appears, add sufficient pyridine to clear it, noting the volume added. Shake the flask, and replace in the water bath for 10 min. Withdraw the flask, and allow to cool. Rinse the condenser and the walls of the flask with 5 mL of alcohol, previously neutralized with

[1] CP-Sil 8 CB is suitable.

phenolphthalein solution. Titrate with 0.5 N alcoholic potassium hydroxide using 0.2 mL of phenolphthalein solution as indicator. Carry out a blank test under the same conditions.
Acceptance criteria: 65–80

- **FATS AND FIXED OILS,** *Peroxide Value* ⟨**401**⟩
Sample: 10.0 g
Saturated potassium iodide solution: Prepare a saturated solution of potassium iodide in carbon dioxide-free water. Make sure the solution remains saturated as indicated by the presence of undissolved crystals.
Analysis: Introduce the *Sample* into a 100-mL beaker, and dissolve with 20 mL of glacial acetic acid. Add 1 mL of *Saturated potassium iodide solution*, and allow to stand for 1 min. Add 50 mL of carbon dioxide-free water and a magnetic stirring bar. Titrate with 0.01 M sodium thiosulfate, determining the endpoint potentiometrically. Carry out a blank titration.
Acceptance criteria: NMT 10
- **FATS AND FIXED OILS,** *Saponification Value* ⟨**401**⟩
Sample: 4.0 g
Analysis: Introduce the *Sample* into a 250-mL borosilicate glass flask fitted with a reflux condenser. Add 30.0 mL of 0.5 N alcoholic potassium hydroxide and a few glass beads. Attach the condenser, and heat under reflux for 60 min. Add 1 mL of phenolphthalein solution and 50 mL of dehydrated alcohol, and titrate immediately with 0.5 N hydrochloric acid. Carry out a blank test under the same conditions.
Acceptance criteria: 45–55
- **WATER DETERMINATION,** *Method I* ⟨**921**⟩**:** NMT 3.0%, determined on 1.0 g

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of Expert Committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues.

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* section. Readers interested in submitting comments should see *Instructions to Authors.*

INSTRUCTIONS TO AUTHORS

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP–NF* revision will be considered for publication in *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously in any language or medium and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication they will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention (USPC) and may not be subsequently published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

Style and Usage—*Stimuli* articles generally follow the current *Chicago Manual of Style* except in scientific usage (numbers, abbreviations, etc.). For the latter, authors should use the current *AMA Manual of Style* or the current *ACS Style Guide*. Authors may usefully consult a current copy of *Pharmacopeial Forum*.

References—Consult the current *AMA Manual of Style*, which is generally consistent with the National Library of Medicine's *Recommended Formats for Bibliographic Citation*. A current copy of *Pharmacopeial Forum* will offer examples of reference formats.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Contact Person—USP will designate a Scientific Liaison in the Documentary Standards Division as the corresponding author. This ensures that USP receives all comments generated by the *Stimuli* article. Authors should contact the Scientific Liaison if they would like to receive copies of comments generated by their *Stimuli* articles.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

Co-processed Excipients

Lawrence H. Block,[a] Richard C. Moreton,[a] Shireesh P. Apte,[a] Richard H. Wendt,[a] Eric J. Munson,[a] Joseph R. Creekmore,[a] Indira V. Persaud,[a] Catherine Sheehan,[b] and Hong Wang[c]

ABSTRACT This *Stimuli* article summarizes the thinking of the USP Excipient Monographs 2 Expert Committee and USP staff regarding a class of excipients—collectively labeled *co-processed excipients*—that have been and continue to be introduced into the *National Formulary* (*NF*). This article presents some suggested criteria for acceptance of such monograph proposals into *NF* and solicits public input.

INTRODUCTION

In recent years drug formulation scientists have recognized that single-component excipients do not always provide the requisite performance to allow certain active pharmaceutical ingredients to be formulated or manufactured adequately. In response to these deficiencies, drug formulation scientists have relied on increasing numbers of combination excipients introduced by excipient manufacturers into the commercial market. Combination excipients fall into two broad categories: physical mixtures and co-processed excipients.

Physical mixtures, as the name suggests, are simple admixtures of two or more excipients typically produced by short duration low-shear processing. They may be either liquids or solids and are generally used for convenience rather than for facilitating the manufacturing process or improving the resultant pharmaceutical product. Examples of such physical mixtures include immediate-release film coating powders for dispersion that reduce the time required to prepare film coating suspensions and to minimize color variation of the final product. Such physical mixtures are not appropriate for consideration for *National Formulary* (*NF*) monographs because the individual components are isolated (distinct and intact) before mixing; i.e., the manufacturing process of each of the individual components has been taken to completion, and consequently these components can be adequately controlled before mixing.

Co-processed excipients are combinations of two or more excipients that possess performance advantages that cannot be achieved using a physical admixture of the same combination of excipients. Typically they are produced using some form of specialized manufacturing process. The performance benefits relate to the manufacture or performance of the finished pharmaceutical product. This improvement in performance has been a primary driver for the introduction of co-processed excipients into the marketplace. Co-processed excipients are appropriate for consideration as new monographs because one or more of the components may be formed in situ, or the component may not be isolated prior to co-processing. That is, the manufacturing process for one component may not have been taken to completion before the addition of the other components, and/or the co-processed excipient combination cannot be adequately controlled using the monograph tests for the individual component excipients.

Because many co-processed excipients contain a macromolecular excipient as one of the constituents, responsibility for reviewing these monographs and recommending them for inclusion in *NF* falls within the purview of the EM2 Expert Committee, one of three Expert Committees that set excipient standards for *NF* in USP's Council of Experts.[d] Recently there has been increased interest in *NF* monographs for co-processed excipients. The Expert Committee is therefore addressing the more general question of compendial acceptance of these types of excipients. To this end the EM2 Expert Committee believes that guidelines for the acceptance of monograph proposals for co-processed excipients would be useful.

CURRENT STATUS OF CO-PROCESSED EXCIPIENT MONOGRAPHS IN *NF*

During the past 20 years, several monographs, each of which presents a co-processed combination of existing excipients, have appeared in *NF*. These excipients may be either liquids or solids. *Table 1* lists several examples of co-processed excipient combinations included in *NF 27* (2009). The co-processed excipient monographs listed in *Table 1* meet current *NF* submission requirements as defined by the following: Each of them is either included in an approved drug application (in the FDA inactive ingredient database) or has a Generally Recognized as Safe (GRAS) designation.

[a] Excipient Monographs 2 Expert Committee. Lawrence H. Block is the chair, and Richard C. Moreton is the vice chair.

[b] Director, Excipients, USP.

[c] Correspondence should be addressed to: Hong Wang, PhD, Scientific Liaison to Excipient Monographs 2 Expert Committee, Documentary Standards Division, US Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852-1790; tel. 301.816.8351; hw@usp.org.

[d] The other two Expert Committees that set excipient standards for *NF* are: Excipient Monographs 1 Expert Committee, which works with small-molecule excipients, and Excipient General Chapter Expert Committee, which prepares General Chapters for excipients.

Table 1. Co-processed Excipients

Name	Form
Ammonio Methacrylate Copolymer Dispersion	Liquid
Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion	
Ethylcellulose Aqueous Dispersion	
Methacrylic Acid Copolymer Dispersion	
Microcrystalline Cellulose and Carboxymethylcellulose	Solid

The excipients shown in *Table 1* typically are manufactured using some type of specialized manufacturing process such as high-shear dispersion, granulation, spray drying, or melt extrusion. Such combination excipients produced using these specialized manufacturing processes are commonly called co-processed excipients (*1–4*). Researchers have reported that these co-processed excipients, when incorporated into the finished product, offer one or more improvements in performance in comparison with the corresponding physical admixtures of the constituent excipients or individual components (*5*).

RECOMMENDATIONS FROM USP EM2 EXPERT COMMITTEE

The EM2 Expert Committee together with involved USP staff has considered the issues regarding co-processed excipients, especially for solid forms, during several years of monograph development and in collaboration and discussion with monograph sponsors. The Expert Committee has formulated the following guidelines that may help determine whether or not such combination excipients are co-processed and whether they will be eligible to be considered for a *NF* monograph. The Expert Committee welcomes comments regarding these guidelines.

Due to the complex nature of co-processed excipients and the diverse composition of their individual constituents, the Expert Committee is unable to propose a single test or other criterion that can be applied to distinguish these co-processed excipients from their corresponding simple physical admixtures. The committee will therefore evaluate *NF* submissions for co-processed excipients on a case-by-case basis using the following criteria:

1. A co-processed excipient is a combination of existing pharmacopeial excipients, and it must be distinguishable—in at least one non–performance-related property—from the admixture obtained by physically mixing the corresponding constituent excipients. A co-processed excipient typically is produced by some specialized manufacturing process such as high-shear dispersion, granulation, spray drying, or melt extrusion. When it is submitted as a potential *NF* monograph, information relating to its quality must meet current *NF* submission requirements: The claimed co-processed excipient is either included in an FDA-approved drug application or has a GRAS designation or is under special consideration by the Council of Experts.
2. A physical mixture of the various excipient components—which have not been individually modified in order to change their inherent thermodynamic state prior to being physically mixed—will not quantitatively exhibit one or more characteristics of the co-processed excipient. Co-processed excipients demonstrate one or more different properties regardless of whether a comparative analysis is performed using the physical mixture as is or using a sample of the physical mixture whose particle size distribution is very similar to that of the co-processed excipient. This or other characteristics of the co-processed excipient can be determined by a suitable test method.
3. The physical or chemical characteristic(s) of the co-processed excipient that differ from those of the physical mixture may cause or may be correlated with improvements in the performance of the finished product. However, these unique characteristic(s) must be inherent, demonstrably analyzable, and quantitatively different in the co-processed excipient itself *before* incorporation into the finished product. Thus, if the proposed co-processed excipient does not exhibit any analytical differences from the physical mixture, then it may not be considered a co-processed excipient even if it alters the performance of the finished product.
4. At least one of the components of the co-processed excipient is capable of being analyzed qualitatively and quantitatively in the co-processed state, i.e., without the use of any specific physical or chemical methods to separate the components of the co-processed excipient before analysis of the individual component(s).
5. No unintended covalently bonded chemical entity is formed when the individual ingredients are mixed to form the co-processed excipient. The absence of any chemical reaction(s) between individual ingredients in the co-processed excipient must be analytically demonstrated initially and over the proposed storage period of the co-processed excipient. However, intentional in situ salt formation, or formation of a known excipient by in situ polymerization or covalent cross-linking would be allowed.
6. The individual ingredients used in a co-processed admixture must have *USP–NF* monographs, or at least monograph proposals published in *Pharmacopeial Forum* as part of in-process revision. This does not necessarily imply that those individual ingredients must demonstrably meet monograph specifications in *USP–NF* before being incorporated or processed into the co-processed excipient. Indeed, this may not be possible because one or more individual component(s) of the co-processed excipient may not be capable of being isolated before co-processing.

However, the proposed co-processed excipient cannot be considered for inclusion as a monograph in *NF* if its production or manufacture involves incorporation of a noncompendial ingredient. In such cases, the co-processed excipient is excluded from *NF* regardless of whether or not the noncompendial ingredient is isolated before co-processing. Thus, if a sponsor wishes to propose a monograph for a co-processed excipient that contains a noncompendial excipient, the sponsor would first be required to secure an approved *NF* monograph for the noncompendial excipient.

CASE STUDIES

Since 2005 the EM2 Expert Committee has been working with a monograph sponsor to develop a new monograph titled Silicified Microcrystalline Cellulose (*6*). This excipient is recorded in the FDA inactive ingredient database as Prosolv, Prosolv 50, Prosolv 90, Prosolv HD 90, Prosolv SMCC 50, or Prosolv SMCC 90. It is categorized as a co-processed excipient (*3*). The monograph for this excipient underscores the importance of identification tests for this type of material. In the proposed Silicified Microcrystalline Cellulose monograph, four individual tests are used to identify this co-processed excipient. They are Fourier-transform infrared spectroscopy (FTIR), wet chemical tests for cellulose and silicon, and a *Silica dispersion uniformity test*, which is used to distinguish the co-processed excipient from the equivalent physical admixture of microcrystalline cellulose and silica. FTIR is useful for providing a confirmation of molecular structure. The FTIR measurement ensures that the material is predominantly a microcrystalline cellulose–like material. Additional identification tests in combination provide differentiation among microcrystalline cellulose, silicified microcrystalline cellulose, and a physical admixture of microcrystalline cellulose and colloidal silicon dioxide.

The EM2 Expert Committee believes that Silicifed Microcrystalline Cellulose meets all the criteria for inclusion as a separate monograph in *NF* based on the criteria listed above under Recommendations.

The EM2 expert committee also published a new monograph: Polyvinyl Acetate Dispersion (*7*). This material is a liquid co-processed excipient manufactured by an in situ polymerization process. The polymerization occurs in the presence of emulsifiers and stabilizers in water to form the dispersion, which is different from a physical admixture because the monomer, vinyl acetate, is polymerized during the manufacturing process. This excipient is used in an FDA-approved drug product, although it is not yet recorded in the FDA inactive ingredient database. Its application was confirmed by a US drug company. In addition to the major component, polyvinyl acetate, some minor components in the dispersion are povidone and sodium lauryl sulfate. *NF* includes monographs for Povidone and Sodium Lauryl Sulfate, as well as Polyvinyl Acetate. In 2008 the EM2 Expert Committee published a new monograph proposal for Polyvinyl Acetate (*8*) to replace a previous proposal (*9*). In the new monograph proposal for Polyvinyl Acetate Dispersion, the Expert Committee recommended strengthening the *Labeling* section: Any added surface active agent or stabilizer should be named, and its quantity should be provided. The Expert Committee further recommended that a test for Povidone should be included under a section called Stabilizers or Surface Active Agents and a limit test should be used.

The EM2 Expert Committee believes that Polyvinyl Acetate Dispersion also meets the criteria for inclusion as a separate monograph in *NF* based on the Recommendations listed above.

SUMMARY

The EM2 Expert Committee continues to work on developing/updating monographs that satisfy current regulatory requirements and industrial practices and that appear to be scientifically sound. The development of guidelines to facilitate the incorporation of co-processed excipients in *NF* and to differentiate them from physical mixtures promises to be a challenging and interesting topic for the EM2 Expert Committee for the remainder of the current cycle and for new Expert Committees and/or Expert Panels in coming cycles. With staff, the USP EM2 Expert Committee welcomes public comments on these proposals (please send comments to hw@usp.org).

Liquid-filled Gelatin Capsules

Margareth R.C. Marques,[ab] Ewart Cole,[c] Dale Kruep,[d] Vivian Gray,[e] Dennis Murachanian,[f] William E. Brown,[a] Gabriel I. Giancaspro[a]

ABSTRACT This *Stimuli* article provides an overview of the manufacturing, characteristics, and in vitro performance evaluation of liquid-filled gelatin capsules. The intent of the article is to initiate discussion, to solicit public comments, and to invite participation of interested parties in the efforts of the USP Biopharmaceutics Expert Committee in either updating USP General Chapter *Dissolution* ⟨711⟩ or creating a new General Chapter that will address the particularities and special approaches required to develop and carry out in vitro performance evaluations of liquid-filled gelatin capsules.

HISTORY OF LIQUID-FILLED GELATIN CAPSULES

Initially capsules were used because it was simple to formulate them as unit dosage forms for drugs in powdered or granular form and because they provided an easy-to-swallow container that effectively masked the bitter taste of drugs. With the advent of pellet technology that enabled modified drug release, capsules provided a useful vehicle into which multiparticulates could be filled without risk of modifying the release characteristics associated with other processing methods such as compression of multiparticulates into tablets (*1*). Since the early 1980s technology has been available to permit accurate dosing and sealing of liquids into hard gelatin capsules (*2–4*).

Advantages of liquid- and semisolid-filled hard gelatin capsules include:

- Improved bioavailability
- Improved content uniformity of low-dose active substances
- Reduced dust for handling potent compounds
- Process simplification for low-melting-point active substances
- Enhanced stability
- Sustained release.

Unlike soft gelatin capsules, in which the fill and the shell are manufactured in one operation, hard capsules are manufactured and supplied to the pharmaceutical manufacturer empty. The capsule first needs to be filled and then sealed. Most modern capsule-filling machines can be modified to allow hard gelatin capsules to be filled with hot or cold liquids. Equipment requirements that allow industrial manufacture of liquid-filled capsules are reported by Cole (*5*), and examples of some available models are given in *Table 1*.

Table 1. Capsule-filling Machines for Liquid Filling of Hard Gelatin Capsules up to Production Scale

Machine Type	Filling Action	Approximate Filling Rate (Capsules/h)

An essential part of a liquid-filling operation is the ability to effectively seal the capsule. Various methods are available to seal hard gelatin capsules, and these have been reviewed by Wittwer (*6*). The two most studied methods are banding using a gelatin band as described by Bowtle (*7*) and sealing using a hydroalcoholic solution as described by Cole (*8, 9*). Both methods are described in USP General Information Chapter *Pharmaceutical Dosage Forms, Capsules* ⟨1151⟩ (*10*).

NOMENCLATURE

Liquid-filled capsules can be classified into two main types based on the physical characteristics of the shell: soft gelatin capsules or softgels, and hard gelatin capsules or hardgels. Softgels have a thicker shell and typically exhibit a higher degree of elasticity because of a greater amount of added plasticizer relative to gelatin. Hardgel shells are thinner and more rigid than softgels. Both soft and hard gelatin capsules basically are composed of gelatin, a plasticizer, and water. For hardgels water acts as the plasticizer, whereas softgels use high-boiling-point polyols such as glycerol and sorbitol. Although many parameters affect the physical and chemical performance of the shell, the ratio of gelatin to plasticizer primarily determines the rigidity, brittleness, and dissolution performance of the shell.

Liquid-filled capsules also can be characterized by the chemical properties of the fill material (hydrophobic-based vs hydrophilic-based fill materials) or by the physical properties of the fill material (solution vs suspension). Hydrophobic solutions include neat oils, combinations of miscible oils, or drugs dissolved in oil vehicles. Hydrophobic suspensions include drugs suspended in oils or in oil–wax mixtures, often referred to as semisolids. Hydrophilic solutions may be neat liquids or syrups, combinations of water-soluble liquids or syrups, or drugs dissolved in water-soluble vehicles. Hydrophilic suspensions include drugs suspended in hydrophilic vehicles such as polyethylene glycol.

GEL COMPOSITION AND MATERIAL PROPERTIES

Composition and Properties of Gelatin Raw Material

Considerable interest lies in replacements for gelatin as a suitable capsule shell matrix, especially in the dietary supplement industry that serves a large number of consumers who are strict vegetarians and do not want to consume articles derived from animal origin. In addition, some consumers avoid consumption of products of porcine origin. Alternative suitable materials include nonanimal sources such as potato starch and carrageenans from seaweeds, as well as synthetic hydrogels, and ongoing research aims to improve the quality and reduce the cost of these replacements. However, as previously noted, gelatin is the material used to produce the shell matrix for most of the liquid-filled capsule pharmaceutical products currently on the market. Consequently, this *Stimuli* article focuses on products for which the fill material is encapsulated in a gelatin-based shell.

Gelatin is obtained from the partial hydrolysis of collagen, which is the most abundant animal protein in nature. Collagen is an insoluble, highly ordered fibrous protein and is the primary fibrous component of bone, skin, and connective tissue. The majority of pharmaceutical gelatin is produced from collagen from bovine bone, bovine hide, and porcine skin, although some reports describe the use of the skin from poultry and fish. Collagen is a highly structured protein. It consists of individual polypeptide chains containing approximately 1000 amino acid units of which glycine, proline, hydroxyproline, and alanine constitute ~60%. The primary structure is dominated by regions of repeating amino

acid sequences rich in glycine, proline, hydroxyproline, and alanine. These regions readily form left-handed helices that make up most of collagen's secondary structure. Although collagen contains minimal tertiary structure, significant quaternary structure is formed when the helical regions of three different protein chains wind around each other in a right-handed superhelix, forming a ropelike structure. This superhelix, also called tropocollagen, is held together by hydrogen bonding and creates a three-dimensional protein matrix. The regions of the primary structure not involved in the helices contain most of the amino acids with ionic side chains such as lysine, arginine, glutamic acid, and aspartic acid. These regions contribute to the stabilization of the three-dimensional structure by entering into ionic and covalent linkages between protein chains and forming the characteristic collagen fiber (*11*).

As noted above and in *USP–NF* (*12*), gelatin is a product obtained by the partial hydrolysis of collagen derived from the skin, white connective tissue, and bones of animals. The hydrolysis may be catalyzed by the addition of strong acid or base. Gelatin derived from acid-catalyzed hydrolysis is referred to as Type A, and gelatin derived from base-catalyzed hydrolysis is referred to as Type B. The main difference between gelatins derived from these two processes is that the gelatin derived from the acid-catalyzed process typically exhibits an isoelectric point (pI) of approximately 7–9, whereas the pI of gelatin obtained from the base-catalyzed process is typically 4.7–5.4. The lower pI resulting from the treatment with base is due to the hydrolysis of the amide groups of glutamine and asparagine, creating glutamic acid and aspartic acid. Because of the manufacturing process used, gelatin molecules exhibit significant polydispersity: The molecular weight of individual molecules typically ranges from 15,000 to 250,000. Gelatin maintains many of the chemical and physical properties of collagen, the most important of which is its ability to form superhelices and to associate into a three-dimensional matrix. For gelatin this is a thermally reversible process at relatively low temperatures and is an important reason why gelatin has been the material of choice for providing the shell matrix of liquid-filled capsules.

Gelatin is graded primarily on the strength of the gel it forms, and, depending on the process used and the tissue source, noticeable differences in strength are apparent among suppliers and even between lots from the same supplier. Consequently, controlling the strength of the gel from batch to batch (measured as *bloom strength*) is a key to obtaining a consistently performing product. Bloom strength is a measure of the ability of a given weight of gelatin to set up in water under controlled conditions and is a function of the molecular weight of the gelatin molecules, the concentration of the gelatin in the gel, and the pH of the gel. It is a measure of the resultant gel's resistance to compression and is reported in bloom-grams or simply grams. Bloom strength increases when the gelatin concentration in the gel increases, when the average molecular weight of the gelatin increases, and when the pH of the gel approaches neutrality (from either direction). In addition, as bloom strength increases the cost of gelatin increases and gel dissolution rate decreases. Bloom strength also can have an effect on the clarity and color of liquid-filled capsules. For gelatin with higher bloom strength, less gelatin is needed to produce a suitable shell, which results in a clearer shell and a reduced need for colorants and dyes in order to produce the desired hue. Although gelatin with bloom strengths ranging from 50 to 300 is available, most gelatins used in the manufacture of liquid-filled capsules have a bloom strength of approximately 150–200 for softgels and 220–280 for hardgels. Gelatin manufacturers commonly blend different sublots of gelatin to meet bloom requirements.

Composition and Properties of the Gel Mass and Finished Shell

In its simplest form the shell of a liquid-filled capsule is prepared from a molten gel mass that is composed of gelatin and a plasticizer dissolved in an aqueous vehicle. For hardgels water acts as both the plasticizer and the vehicle. For softgels small polyhydroxy compounds such as glycerol, sorbitol, and maltitol typically are used as plasticizers. Normally, during the preparation of the gel mass gelatin is first hydrated in a measured amount of excess water before plasticizer is added and the mass is heated to complete the solution. Less frequently, gelatin may be added directly into hot water and dissolved immediately. The gel mass for hardgels normally contains about 30–35 parts gelatin and 65–70 parts water by weight. The gel mass for softgels commonly starts out at approximately 40–45 parts gelatin, 30–35 parts plasticizer, and 20–30 parts water. However, depending on the desired performance traits of the shell, the size of the shell, and the composition of the fill material, the gelatin:plasticizer ratio for softgels may vary from 1.0 to 3.0. Other minor components added to the gel mass may include colorants, flavors, stabilizers, buffers, and opacifiers.

Before the encapsulation process the gel mass is kept warm (about 60 °C) and at a high water content so that it remains pliable and free flowing, in some cases as long as 4 days. During this time the gelatin exists as single protein molecules in a random configuration and sheathed by water molecules. The proteins slowly hydrolyze over time at high temperatures, and this occurs more rapidly the further the pH of the gel mass departs from neutrality. This phenomenon may be detected by a decrease in the viscosity of the gel mass.

For softgels the capsule shells are manufactured and filled in one continuous operation. The warm gel mass is allowed to flow onto a chilled rotating casting drum where gelation begins to occur and a gel ribbon is formed. As the temperature of the gel decreases below 40 °C and lower, the gelatin molecules begin to re-form the secondary structural characteristics that were exhibited by the parent collagen fibers and were held in place by hydrogen and ionic bonding. The degree to which the superhelices form depends on how fast the gel cools and to what extent the plasticizer associates with the gelatin. The plasticizer breaks up the ordered structure, thereby increasing elasticity. At this time the gel also begins to evaporate water, the rate of which also affects the final association and alignment of the gelatin molecules.

Within minutes a relatively wet, elastic gel ribbon is formed and is routed through lubricating rollers on its way to the dies and wedge on the encapsulation machine. At the wedge two opposing gel ribbons are brought together on the dies, and a sandwich is created as the fill material is injected between the ribbons. As the fill material is injected between the ribbons the latter are pressed into the die cavities, thereby creating the capsule. As the dies come together the two halves of the capsule shell are sealed. This process is assisted by the wedge, which is held at slightly elevated temperature (37–40 °C) to soften the ribbon. The dies finish the encapsulation process by cutting the capsules from the ribbon. Next, the capsules begin the drying process and are carefully dried to their final moisture content. Drying is performed under conditions of highly controlled temperature, relative humidity, and airflow. Along with gelatin concentration and gel strength, the rate and extent of water loss determine the hardness and brittleness of the capsules, their ability to undergo dissolution, and their tendency to stick to each other. In the completed product hardgel shells contain approximately 13%–16% water, and softgels contain approximately 6.5%–8.0%.

Gelatin is a hygroscopic material, and the relationships among relative humidity, gelatin moisture content, and hard gelatin capsule properties are shown in *Figure 1* (*13*). Kontny and Mulski (*14*) also have studied the relationship between relative humidity and brittleness of hard gelatin capsules. Because certain solvents are known hydrophilic agents, it is particularly important to monitor the mechanical properties of liquid-filled capsules stored under various conditions of temperature and relative humidity. Methodology to determine the compatibility of fill materials has been described (*15*).

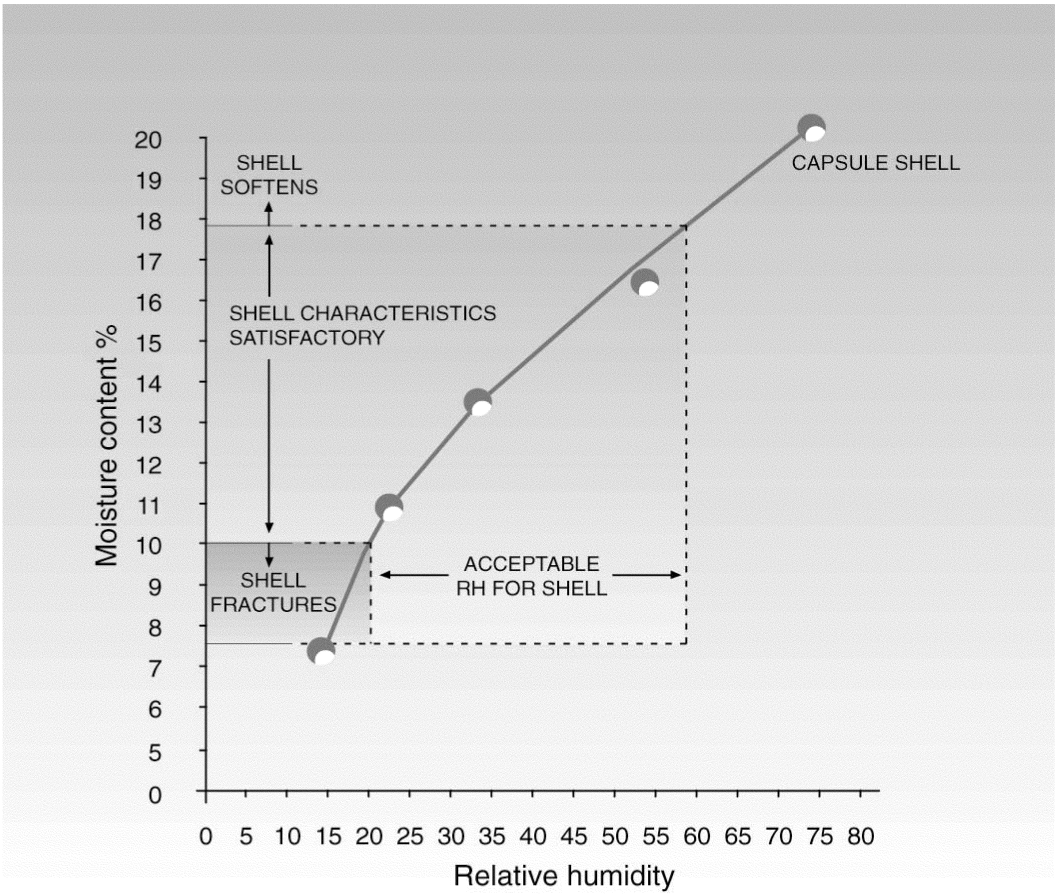

Figure 1. Relative Humidity (RH), Gelatin Moisture Content, and Hard Gelatin Capsule Properties.

Stability and Reactivity of Gelatin

At room temperature the shells of fully dried capsules are relatively effective at protecting the fill from oxygen and its effects, and when an opacifier such as titanium dioxide is added to the shell it can prevent photodegradation of the fill. In addition, the low water content of the shell does not promote microbial growth. Bacteria, yeasts, and molds require high water content of at least 0.80% (w/w), and the water content of capsule shells typically is less that half of that. However, it must be stressed that capsule shells are not unreactive, physically or chemically. As storage conditions change in temperature and humidity, so too does the gelatin matrix in the shell. As temperature and humidity increase the shell absorbs moisture, and the gelatin molecules assume additional freedom of movement. The sol–gel transition temperature for many gel formulas occurs just above 40 °C. Stress from temperature and relative humidity can result in weakened seams, leaking, and their capsules

sticking together. Recommended storage conditions of the final product are typically 15–30 °C and 30%–60% relative humidity, or standard room temperature conditions. Brief excursions outside of these conditions are rarely cause for concern.

Another phenomenon seen in capsules, especially softgels, is extensive cross-linking of the gelatin, which can occur during storage and can result in the formation during dissolution testing of swollen, rubbery water-insoluble membranes known as *pellicles* that may act as a barrier to drug release. A pellicle is a thin clear membrane of cross-linked protein surrounding the fill or the capsule and preventing the fill from being released. This cross-linking involves strong chemical linkages beyond simple hydrogen and ionic bonding between gelatin chains, and the linkages formed can affect the thermal reversibility of the gelatin shell. One of the strongest and most common types of cross-linking involves the covalent bonding of the amine group of a lysine side chain of one gelatin molecule to a similar amine group on another molecule. This reaction generally is catalyzed by trace amounts of reactive aldehydes (*16, 17*). Formaldehyde, glutaraldehyde, glyoxal, and reducing sugars are the most common catalysts. The covalent bonding produced with this type of cross-linking is, for all practical purposes, irreversible, and dissolution of the shell must involve the breaking of other bonds, e.g., by enzyme-mediated breaking of peptide bonds in protein chains. It has been proposed that chemically modifying gelatin, perhaps by adding succininc acid groups to the lysine side chains, may prevent or at least diminish aldehyde-mediated cross-linking. Another, weaker, type of cross-linking is complexation of free carboxylic acid groups on two different gelatin molecules with trivalent metal ions, such as Fe^{3+} and Al^{3+}. These cations may be found in some of the dyes used as colorants or as low levels of contaminants in excipients. Higher bloom gelatin, which normally is associated with higher quality, facilitates efficient cross-linking because fewer links are needed to join greater lengths of gelatin chains.

Common causes of cross-linking include:

- Aldehydes present in active pharmaceutical ingredients (APIs), excipients, packaging materials, or degradants formed in situ during storage
- High humidity
- Indirect catalysis in cross-linking reactions
- Decomposition of a stabilizer in corn starch (hexamethylenetetramine), which forms ammonia and formaldehyde, which in turn promote cross-linking reactions
- Rayon coilers that contain an aldeydic functional group (*18*)
- Polyethylene glycols that may auto-oxidize to form aldehydes
- UV light, especially in the presence of high heat and humidity (*19, 20*)
- Heat, which can catalyze aldehyde formation.

Dissolution testing of capsules that are affected by cross-linking can yield results that suggest an apparently slower drug-release profile. However, in vivo disintegration of cross-linked capsules in healthy volunteers was found to be rapid and to be equivalent to drug release from fresh nonstressed capsules (*21*). Bioequivalence between stressed and unstressed acetaminophen hard and soft gelatin capsules also has been established (*22*). These findings have led to the acceptance of a two-tier dissolution test using enzymes (*23*). Techniques to monitor any potential incompatibility between the fill material and the capsule have been described (*15*).

APPLICATIONS AND FORMULATION STRATEGIES FOR HARD GELATIN CAPSULES

Table 2 summarizes drug characteristics for which liquid-filling technology is applicable. The important factors during a liquid-filling operation are temperature and viscosity of fill material and, in the case of a suspension, the particle size of the suspended drug. In principle, any excipient found to be compatible with the gelatin shell can be used, but in a manufacturing environment the viscosity of the fill material is important. If the viscosity is too low, splashing of the bushings may contaminate the area of overlap between the capsule body and cap, preventing the capsule from being effectively sealed. Absence of a clean break during dosing (stringing) can have the same effect. Recommended guidelines for dosing liquids or semisolids into hard gelatin capsules are given in *Table 3*. Excipients that are solid at room temperature but melt at temperatures up to 70 °C are well suited for formulating APIs, provided they yield the desired pharmacokinetic and stability profiles. Bowtle (*7*) has described a process for selecting bases for thermosetting formulations.

Table 2. Drug Characteristics and Liquid-filling Technologies

Characteristic	References	Examples of Marketed Products
Poorly soluble	24–30	Nifedipine (Apricel) Ibuprofen (Solufen)
Short half-life requiring frequent dosing	31–37	Captopril (Captoril)
Low melting point	38	Oils of avocado and soya (Piascledine) Danthron (Co-danthramer)
Low dose/high potency	8, 31, 38, 39	Cytotoxic products in development
Critical stability	40–43	Vancomycin hydrochloride (Vancocin)

Other process-related factors include:

- Excipient/drug stability over time
- Temperature-dependent solubility of drug in lipid
- Aging/polymorphic characteristics of the lipid

- Adequate characterization of the saturation/supersaturation status of the drug in the lipid formulation in order to avoid drug ''crashing out.'' Optimally saturation status should be determined when the formulation is at equilibrium with the shell
- Stability in solution under stress
- The potential for aldehyde formation and drug degradation if hot melts are held for prolonged times at elevated temperatures
- The influence, if any, of the rate of cooling on the structure of certain excipients that may modify drug-release characteristics from the matrix (*43*).

Table 3. Recommended Guidelines for Dosing Liquids and Semisolids into Hard Gelatin Capsules

Parameter	Recommendation
Temperature of fill material	Maximum approximately 70 °C
Viscosity at the temperature of dosing	0.1–1.0 Pa · s
Dosing characteristics	Clean break from dosing nozzle and absence of ''stringing''
Particle size of suspended drug	$\leq$ 50 μm

As increasing numbers of poorly water soluble drugs enter the pipeline, so do the challenges of finding innovative ways of developing bioavailable and stable dosage forms. In the dietary supplement industry, formulators also are finding an increased interest in new liquid-encapsulated presentations of fat-soluble vitamins and lipophylic products such as Co-enzyme Q10, lycopene, or lutein that are prepared for improved bioavailability. Excipient suppliers, encouraged by potential opportunities, are developing new materials comprising mixtures of functional excipients.

A range of excipients have been tested and found to be compatible with hard gelatin capsules. They can be classified into three arbitrary groups:

- Lipophilic liquid vehicles
- Semisolid lipophilic vehicles/viscosity modifiers for lipophilic liquid vehicles
- Solubilizing agents, surfactants, emulsifying agents, and adsorption enhancers.

These excipients are listed below:

- Lipophilic liquid vehicles compatible with hard gelatin capsules*
- Refined specialty oils:
  - Arachis oil
  - Castor oil
  - Cottonseed oil
  - Maize (corn) oil
  - Olive oil
  - Sesame oil
  - Soybean oil
  - Sunflower oil.
- Medium-chain triglycerides and related esters:
  - Caprylic/capric triglycerides (Akomed E, Akomed R, Miglyol 810, and Captex 355)
  - Medium-chain triglyceride (Labrafac CC)
  - Propylene glycol diester of caprylic/capric acid (Labrafac PG)
  - Propylene glycol monolaurate (Lauroglycol FCC)
  - Fractionated coconut oil (Miglyol 812)
  - Caprylic/capric/diglyceryl succinate (Miglyol 829)
  - Medium-chain diesters of propylene glycols (Miglyol 840)
  - Partial ester of diglycerides with natural fatty acids (Softisan 645).
- Solubilizing agents, surfactants, emulsifying agents, and adsorption enhancers compatible with hard gelatin capsules:†
  - Propylene glycol monocaprylate (Capryol 90)
  - Polyglycolized glycerides (Gelucire 44/14 and 50/13)
  - Polyoxyl-40 hydrogenated castor oil (Cremophor RH 40)
  - Glycerol monostearate/di-triglycerides + glycerin (Imwitor 191)
  - Glyceryl monocaprylate (Imwitor 308*)
  - Glyceryl cocoate/citrate/lactate (Imwitor 380)
  - Glyceryl mono-di-caprylate/caprate (Imwitor 742)
  - Isosteryl diglyceryl succinate (Imwitor 780 K)
  - Glyceryl cocoate (Imwitor 928)
  - Glyceryl caprylate (Imwitor 988)
  - Oleoyl macrogol-8 glycerides (Labrafil M 1944 CS)
  - Linoleoyl macrogolglycerides (Labrafil M 2125 CS)
  - PEG-8 caprylic/capric glycerides (Labrasol)
  - Lauric acid
  - Propylene glycol laurate (Lauroglycol 90)
  - Oleic acid
  - PEG MW > 4000
  - Polyglycerol dioleate (Plurol Oleique CC 497)
  - Polyoxyethylene-polyoxypropylene copolymer (Poloxamer 124 and 188)
  - Partial glycerides of hydroxylated unsaturated fatty acids (Softigen 701)
  - PEG-6 caprylic/capric glycerides (Softigen 767)
  - Polyoxyethylene glyceryl trioleate (Tagat TO)
  - Polyoxyethylene(20)sorbitan monooleate (Tween 80).

The excipients shown below are generally incompatible with hard gelatin capsules and should be avoided in high concentrations. They may, however, be used in mixed systems (i.e., systems that involve nonreactive, acceptable excipients for hard gelatin capsules). In such cases the critical concentration that would lead to incompatibility must be determined experimentally. The com-

* Quality may vary among suppliers and also from batch to batch and should be routinely checked. The thermal history of excipients should be recorded during manufacturing.

† Quality may vary among suppliers and also from batch to batch and should be routinely checked. The thermal history of excipients should be recorded during manufacturing.

patibility of the final formulation, including the API, must be monitored as part of the routine development process.

Excipients that are incompatible with hard gelatin capsules in unmixed systems[‡]:

Ethanol
Hydrogenated polyoxyl castor oil (Cremophor EL)
Glycerin (with a content > 5%)
Glycofurol 75
Medium-chain mono- and diglycerides (Akoline MCM and Capmul MCM)
Glyceryl monocaprylate (Imwitor 308*)
PEGs of MW < 4000
N-methyl-2-pyrrollidone (Pharmasolve)
Propylene glycol
Sorbitan monooleate (Span 80)
Diethylene glycol monoethylether (Transcutol P).

APPLICATIONS AND FORMULATION STRATEGIES FOR LIQUID-FILLED CAPSULES

Hard Gelatin Capsules

Liquid-filled capsules often are used to deliver APIs such as oily or waxy substances that are not easily formulated in solid delivery systems. Substances that are easily formulated in solid dosage forms also may be formulated in liquid-filled capsules for product line extensions and to improve product performance or bioavailability. Reformulation may include coating the capsule or adding ingredients into the shell to produce delayed- or extended-release properties. Chewable products, which often require additional texture and flavor components, are being developed.

With some limitations and exceptions, most of the excipients used to develop pharmaceutical solutions or semisolids can be used for developing fill materials for liquid-filled capsules, including emulsifiers and liquid polymers. Hydrophilic substances can be formulated into a capsule filling material, but water or low molecular weight alcohols should be kept at or below 10%. Higher levels may initiate erosion of the shell or cause appearance problems because of diffusion and evaporation from the fill material and/or the shell. Levels of glycerol and other plasticizers should be kept to a minimum or should be accounted for in the shell formula because they can diffuse into the shell and produce unacceptably soft capsules. Conversely, glycerol in the shell may migrate into very hydrophilic fill material, and it may be necessary to add some glycerol to the fill material to establish equilibrium.

Soft Gelatin Capsules

The fill material cannot be so thin that it leaks around the pump and wedge assembly, but it must not be so viscous that it cannot flow through the lines to the encapsulation pump or be accurately pumped into the capsule. Thicker fill materials may be warmed to reduce viscosity, but the temperature must be kept below 35 °C so that integrity of the gelatin shell and the sealing operation are not compromised. Both shell and fill excipients should be controlled for levels of known cross-linking agents such as formaldehyde and reducing sugars. Shell and fill excipients should be controlled for particle size (normally $\leq$ 170 μm or 80 mesh) and the presence of fibers. Large particles in the shell and seams can create weak points where leaking can occur, and a fiber that crosses a seam can act as a wick that facilitates leaks.

A few processing variables and shell formulations should be controlled with a high degree of precision because certain fill materials behave unpredictably if processing steps are not well controlled. Die speeds that are too slow or too fast may create poor seam quality and result in leaking capsules. Gel ribbon thickness must be precisely controlled to ensure consistent product appearance and dissolution performance within and between lots of product. The rate and extent of capsule drying probably is the most important processing parameter. Drying parameters must be individually determined for each combination of shell and fill material, and they must be consistently maintained within and between lots of product. Removal of too much water may result in hard, brittle capsules that have a higher propensity to develop cracked shells and/or require a longer time for dissolution. Not enough drying results in capsules that are too soft and that may weep, become tacky, and/or tightly stick to each other. If the drying conditions remove water too rapidly—caused by high drying temperatures, very low relative humidity, and/or high airflow—*case hardening* may occur. Case hardening takes place when the exterior surface of the capsule dries very rapidly and forms a temporarily seal that prevents further egress of moisture from the fill and shell. During case hardening capsule hardness is temporarily increased, but when the capsule is removed from the rapid drying conditions excess moisture within the fill and shell diffuse into the hardened surface. Thus the capsule emerges as a too-soft, under-dried product.

DISSOLUTION PROCEDURE DEVELOPMENT

Purpose of Test

Among the reasons for measuring the dissolution performance of liquid-filled capsules is to ensure the quality of the product. A well-designed dissolution test indicates when significant batch-to-batch variations occur and is a surrogate for demonstrating manufacturing consistency or significant changes in the dissolution performance of a single batch during the product's shelf life (e.g., gelatin cross-linking) (*44–47*). Dissolution performance also can be used as a research tool. For example, during the development of a generic drug product the dissolution performance of various formulations may be compared to that of the reference listed drug to ensure that product development is proceeding correctly. Dissolution tests also are used to evaluate formulation design and storage conditions (*48*). More recently, dissolution testing has been

[‡] Mixed systems may permit use of some of these excipients in low concentrations, but the limit of the excipients listed here must be determined experimentally.

used to make in vitro/in vivo correlations (IVIVC) between different products or between variations of the same product.

Although conceptually designed for tablets, dissolution testing has been extended to encapsulated drug-delivery formulations. In these systems, the drug is presented, often solubilized, in a liquid or semisolid formulation, and the relationship between solid drug dissolution and ultimate bioavailability has been disconnected. When a dissolution test is conducted on this type of formulation, the result is either a dissolution of the contents or the formation of an emulsion and is complicated by the sensitivity of these emulsions to their physical environment. Further, many of these formulations undergo digestive processes in vivo resulting in a breakdown of the formulation that is not mimicked in a dissolution test. Thus, the translation of the concept of dissolution testing to bioavailability of lipid-based drug delivery formulations is confusing. Nevertheless, attempts to design dissolution tests for lipid-based systems have been reported and discussed (*49–52*).

The ''dissolution'' of a encapsulated liquid formulation depends on its design. The gelatin capsule must rupture to release its contents. Rupture is a process more relevant than complete disintegration, which usually measures the dissolution of the shell. Therefore, for dietary supplements, a general rupture test was recently incorporated in USP General Chapter *Disintegration and Dissolution of Dietary Supplements* ⟨2040⟩ (*53*), where disintegration for soft shell capsules is required. What happens next depends on the composition of the formulation. For water-based formulations containing concentrated solutions, the rupture of the shell may be the only relevant step for bioavailability and IVIVC. For this reason, several monographs in *USP* contain rupture tests as the only performance standard for these dosage forms. For lipid-based formulations, which often are less dense than the aqueous medium, the release from the capsule is buoyancy driven.

If the formulation has been designed to be self-emulsifying, the formulation will efficiently disperse into most aqueous media. Formulations such as those consisting simply of a triglyceride with no additional cosolvent or emulsifier will rapidly float to the top of the vessel. The assay results from a dissolution test in this situation provide the rate of extraction of drug from this floating layer. As is the case with dissolution tests for traditional tablets, the variables to consider are rotation speed, surfactant type and concentration, medium pH, and apparatus.

Because ''drug release'' and its connection with bioavailability are difficult to define, alternative tests may be useful to better guide the dosage form design. These tests include dispersibility, measurement of globule size for emulsions, micelle formation, lipolysis, precipitation on dilution in biorelevant media, phase behavior studies, and burst tests to detect gelatin crosslinking (*52, 54, 55*).

Design of the Test

Developing a suitable dissolution test procedure for a liquid-filled capsule depends on the physical and chemical properties of the drug substance and the product. Developing a dissolution method for most liquid-filled capsules that contain a hydrophilic fill material typically follows the approach used for solid oral dosage forms. It may be possible to use disintegration as the performance test if the drug is already dissolved in the hydrophilic matrix because rupture of the shell to release the capsule content is the limiting step (*49, 56*). Dissolution testing should be required if the drug is dispersed as a suspension or emulsion in the hydrophilic matrix. FDA's *Guidance for Industry—Dissolution Testing of Immediate-release Solid Oral Dosage Forms* is a general resource that lists the types of media and equipment settings that are acceptable from a regulatory standpoint (*57*). The first step involves identifying a dissolution medium or several media candidates that provide sink conditions, preferably using physiologically relevant media, for the drug product. At minimum, the medium selected must provide sink conditions for the drug, must not interfere with the activity of enzymes used to overcome crosslinking of gelatin in Tier 2 tests, and must not show negative interactions with the formulation. Next, during preliminary trials the apparatus, media, media volume, agitation rate, and other test parameters are varied to determine what effect each has on the dissolution performance of the product. A statistical matrix design can assist in identifying critical parameters for a procedure that will consistently provide a percentage dissolved of approximately 75%–80% of label claim within 30–45 min. Testing aged and/or stressed capsules typically provides valuable insight into a product's dissolution performance.

Developing a suitable dissolution procedure for liquid-filled capsules containing a hydrophobic matrix often poses considerable challenges and requires a creative approach. Typically problems are encountered when one tries to identify sink and agitation conditions for dispersing the fill material and solubilizing the drug. This is especially the case for suspensions and waxy paste-filled products. The ''release'' profile from hydrophobic matrices is sensitive to the solubility of both the drug and the matrix in the medium, as well as the relative partitioning of the drug between the matrix and the medium. Before choosing the apparatus and agitation intensity, formulators must determine which media will disperse the fill and dissolve the drug. Profiles that relate drug solubility to media pH and ionic strength may be constructed. Surfactants available for testing include the following:

- Polysorbates (Tween)
- Sodium dodecyl sulfate (sodium lauryl sulfate)
- Lauryl dimethyl amine oxide
- Cetyltrimethylammonium bromide
- Polyethoxylated alcohols
- Polyoxyethylene sorbitan
- Octoxynol (Triton X100)
- *N,N*–dimethyldodecylamine–*N*–oxide
- Hexadecyltrimethylammonium bromide
- Polyoxyl 10 lauryl ether
- Brij 721
- Bile salts (sodium deoxycholate and sodium cholate)
- Polyoxyl castor oil (Cremophor)
- Nonylphenol ethoxylate (Tergitol)
- Cyclodextrins

- Lecithin
- Methylbenzethonium chloride (Hyamine) (*58, 59*).

Although it is frequently used to improve the solubility of poorly soluble drugs in dissolution tests of tablets, sodium dodecyl sulfate should be considered only in the absence of other alternatives because it readily denatures enzymes that are used to overcome crosslinking in Tier 2 dissolution tests (*60, 61*). Use of pancreatin, which has lipase activity, may help to increase the dissolution rate not only because it hydrolyzes triglyceride matrices but also because of the additional surfactant effect derived from the resulting fatty acid salts.

Initial efforts attempt to identify suitable surfactants, concentrations, and pH conditions that provide sink conditions in an environment that ensures suitable stability. Then formulators can evaluatie the effect of these conditions on the formulation. During a dissolution test of a lipid-filled capsule, the gelatin capsule opens and the lipid-based formulation is released. The resulting fluid jet breaks up into droplets, and if the formulation is not solubilized by the medium it often floats to the top of the vessel. The fluid jet develops due to interfacial forces, and droplet break-up occurs due to Rayleigh–Taylor instability and the shear of mixing. Important physical properties include the density of the fluid, viscosity, and interfacial tension between the fill and the medium. However, upon dilution the formulation may undergo phase transitions that may affect the viscosity, density, and interfacial tension.

Simple visual evaluation can be used to screen the interactions between surfactant solutions and formulations by preparing blends of varying composition that span the range from the neat formulation to a final dilution in the surfactant medium that represents the expected dilution in a dissolution test (e.g., 1 part in 250 parts aqueous). Complete solubilization of the formulation will provide a more robust dissolution test. When the formulation is not solubilized by the medium, the dissolution profile is a measure of the extraction of the drug from the matrix and is influenced directly by the surfactant concentration and the rotation speed of the apparatus. Any surfactant–formulation combinations that form viscous phases at intermediate dilutions should be used with caution because they may negatively influence extraction of the compound or the rate of solubilization of the formulation and extend the ''release'' profile. Cationic surfactants should be avoided in formulations that contain fatty acids because of their propensity to form insoluble precipitates.

The dissolution profile obtained for a lipid-based formulation in a given medium is designed for that particular formulation. This specific dissolution procedure probably cannot be used to compare drug product release from several different formulations to predict in vivo performance. Such a comparison should be made only with a complete understating of the dispersion behavior of the formulations and their interactions with the medium. Often other measurements such as rate of dispersion, particle size, and lipolysis provide appropriate predictors of physico-chemical phenomena for correlation with in vivo performance. Depending on the nature of the drug and its mechanisms of absorption, it may be helpful to use dissolution conditions that mimic the in vivo environment. Such conditions include the use of specific enzymes to transform the drug into the entity that will be absorbed in vivo (*62*) or to affect excipients in a manner that modifies the in vivo release of the drug from the matrix.

Regulatory bodies discourage the use of organic co-solvents to improve sink conditions, and thus co-solvents should be employed as a last resort.

Procedures for sampling and analysis of aliquots are similar to those for traditional dissolution tests. Some precautions must be taken to avoid disturbance of partitioned formulations. Disruption or sampling of the floating layer will result in anomalously high release measurements and significant variability. Further, floating material or emulsion droplets can accumulate around the shaft of the paddle or basket, which can result in radial concentration gradients. Such gradients can lead to variability if sample position is not controlled.

Delayed-release and enteric-coated capsule products are developed as line extensions, therapeutic improvements, and protection for acid-labile drugs. Because of the special claims and requirements of these products the dissolution test conditions in *USP* General Chapters *Dissolution* ⟨711⟩ and *Drug Release* ⟨724⟩ are used (*63*). Deviations from ⟨711⟩ or ⟨724⟩ are rare, but the addition of surfactants, bile salts, or other solubilizing aids may be justified for drugs that present poor water solubility.

Selection of Apparatus

As is the case with solid dosage forms, baskets (USP Apparatus 1) and paddles (USP Apparatus 2) are most often chosen as the dissolution apparatus for gelatin capsules, and both have been used successfully. However, with liquid-filled capsules baskets may not be suitable in certain instances. As a capsule breaks down the gelatin from the shell may clog the basket's mesh, and, with very hydrophobic fill materials, oil phase released from the capsule may not disperse into fine enough droplets in the basket to efficiently pass through the mesh. Occasionally, the capsule and its contents may float in the dissolution media. In these instances wire coils can be wound around the capsules, or commercially available sinkers can be used to encase the capsules to hold them on the bottom of the vessel and to allow the fill to become exposed to more of the medium. In rare instances the capsule shell may stick to the basket or the bottom of the vessel. The reciprocating cylinder (USP Apparatus 3) may overcome this problem because of its different mechanism of agitation. Also, USP Apparatus 3 may be a more appropriate system for generating IVIVC data than the basket or paddle when one is testing liquid-filled capsules (*64*). However, USP Apparatus 3 has a tendency to generate foam when surfactants such as sodium lauryl sulfate are added to the media. The rotating bottle apparatus may be an alternative that overcomes this problem. For drugs formulated in soft gelatin capsules, an IVIVC was established using the rotating dialysis cell method (*65*). This cell is placed into a normal USP dissolution vessel. The cell encloses a small volume (maximum 30 mL) of inner fluid by means

of a dialysis membrane, and it can simulate the transfer of drugs from the intestinal lumen (inside the cell) to tissues (outside the cell) (*66–68*).

New dosage forms may require new approaches to using compendial apparatus. For example, floating dosage forms have been investigated as a means of prolonging retention in the stomach in order to maintain sustained release. Such dosage forms may use a delivery system that consists of a biphasic gelatin capsule that contains a rapid-release component such as a lipophilic drug dissolved in an appropriate lipophilic solvent and a sustained-release solid erodible matrix that contains an emulsifier. To demonstrate the biphasic release characteristics of this delivery system, USP Apparatus 2 (paddles) was modified in such a way that the top of the paddle blade was just breaking the surface film of the dissolution medium (*69–71*).

The use of USP Apparatus 4 (flow cell) is another suitable alternative for the dissolution test of liquid-filled capsules, mainly for drugs with poor solubility (*72, 73*). USP Apparatus 2 and Apparatus 4 were compared for dissolution of soft gelatin capsule formulations of a poorly water-soluble amine drug. During testing with 0.01 N hydrochloric acid containing 0.25% polysorbate 80, both apparatus gave similar dissolution profiles. Apparatus 2 tended to give a faster rate of dissolution, but Apparatus 4 was better able to distinguish between different formulations (*74*).

Table 4 gives a summary of the dissolution conditions that formulators should consider when developing a dissolution test for liquid-filled capsules.

Table 4. Dissolution Conditions That Should Be Considered for Liquid-filled Capsules

Apparatus Type and Agitation	Use of Sinkers
Medium	Aqueous
	Sink conditions
	Stability of the active ingredient
	Buffer strength
	Counter-ion effect
Surfactant	Sink conditions
	Dispersion of the lipophilic fill
	Compatibility
Medium pH	Biorelevant
Enzymes	Maximum activity at the medium pH

UNIQUE ISSUES ASSOCIATED WITH LIQUID-FILLED CAPSULES: SUMMARY AND CONCLUSIONS

The chemical and physical properties of liquid-filled capsules pose unique challenges when formulators attempt to develop dissolution methods, and this *Stimuli* article has reviewed some of these. One of the more common problems is pellicle formation and cross-linking of the gel. To address this issue formulators can use proteolytic preparations that contain pepsin or pancreatin and certain enzymes as additives to dissolution media when cross-linking occurs in gelatin shells (*23, 75*). Evaluation of the amount of enzymes is necessary in such cases and there may be circumstances in which the amount of enzyme added currently recommended in *USP 31* (*23*) may be insufficient. Occasionally, liquid-filled capsules may float in the dissolution medium, but this can be overcome if the capsule is held loosely in a sinker or if a wire coil is wound around the capsule. The use of commercially available sinkers is preferred and is strongly recommended to ensure consistent results between laboratories and between tests. Technology transfer studies have identified differences that were not related to sample performance but rather to the techniques used in different laboratories to prevent samples from floating.

Liquid-filled capsules are useful dosage forms for delivering oily or waxy pharmaceutical preparations, but, as discussed previously, obtaining sink conditions with universally accepted dissolution media may be a challenge. This challenge is compounded if cross-linking occurs because surfactants normally used to disperse the fill material and solubilize the drug may tend to diminish the protease activity of pepsin and pancreatin. This problem has recently been solved with a two-stage dissolution approach: The dissolution was performed according to a procedure involving 800 mL of 0.1 N HCl with the addition of pepsin to initiate hydrolysis of the pellicle. After 25 min, 100 mL of a sodium lauryl sulfate solution in 0.1 N HCl was added to complete the dispersion of the fill and solubilize the active ingredient. Samples were taken for analysis 5 min later. This approach worked very well for single-point quality control testing but would not be suitable for generating dissolution profiles. In many instances involving hydrophobic drugs and fill materials the only recourse may be to increase the dissolution time. Some procedures for hydrophobic drugs have shown a linear rate of dissolution that continues for up to 5 h (*58*).

Dissolution vs Disintegration

Historically, liquid-filled capsules have often employed disintegration testing—or, more accurately, rupture testing—instead of dissolution testing. *USP* monographs for calcifediol, chloral hydrate, cyclosporine, dronabinol, and docusate sodium are a few examples. For solution-filled capsules, especially those with a highly soluble drug in a hydrophilic fill material, this may be a reasonable approach (*49*). The active drug is already in solution, and the shell needs only to rupture to release the API. The point at which the disintegration of a liquid-filled capsule is considered complete is different from that of a solid dosage form. In order to disintegrate a tablet must fully break apart and collapse into a loose pile of drug and excipients, whereas a liquid-filled capsule needs only to rupture to meet the definition of disintegration. However, for capsules filled with a thick suspension or a waxy paste a simple rupture of the shell may not adequately demonstrate that the finished dosage form is delivering the drug in a suitable manner. Measures of the dispersion

and subsequent solubilization of the drug by the dissolution test also are required in order to evaluate the performance of the dosage form.

A risk-based approach (*56*) can be applied to the application of disintegration for testing the in vitro performance of liquid-filled capsules. The suitability of the disintegration test for this type of dosage form can be justified on the basis of the ICH Q6A decision tree #7 (*76*). For some products Q6A supports the use of the disintegration test instead of dissolution if the following conditions are met: a) the drug is highly soluble between pH 1.2 and 6.8; b) the drug releases rapidly, i.e., more than 80% in 15 min at pH 1.2, 4.0, and 6.8; and c) a relationship is established between dissolution and disintegration.

Regulatory Aspects

To date FDA has not released any guidances specifically related to the design of dissolution and/or disintegration tests for liquid-filled capsules. The FDA guidance for dissolution testing of immediate-release solid oral dosage forms (*77*) indicates the possible need for enzymes to dissolve pellicles, if any are formed, to permit drug dissolution, but it makes no other recommendations about this type of dosage form.

In *USP XXII* (1990), the sentence "Requirements for Dissolution do not apply to soft gelatin capsules unless otherwise specified in the monographs" was added to *Dissolution* ⟨711⟩. *Pharmacopeial Forum* 19(3) (1993) included a proposal to delete that exemption, and the deletion became official in *USP 23* (1995). *Pharmacopeial Forum* 23(4) contained a proposal to add a rupture test to all monographs for soft gelatin capsules. The monographs affected by this proposal were: Calcifediol Capsules, Chloral Hydrate Capsules, Chlorotrianisene Capsules, Clofazimine Capsules, Docusate Sodium Capsules, Dronabinol Capsules, and Ethchlorovynol Capsules. At that time the USP Subcommittee on Dissolution and Bioavailability wanted to include a dissolution test in all monographs for soft gelatin capsules, but, because of the inherent challenges associated with the development of dissolution testing for this type of dosage form, the Subcommittee proposed an interim Dissolution rupture test that requires observation of the rupture time for the capsule shell. The Subcommittee received no suggestions regarding dissolution conditions for these monographs and thus made the rupture test official. This test can still be found in the following *USP* monographs: Calcifediol Capsules, Chloral Hydrate Capsules, Clofazimine Capsules, Cyclosporine Capsules, Docusate Calcium Capsules, Docusate Sodium Capsules, Docusate Potassium Capsules, Dronabinol Capsules, Ergoloid Mesylate Capsules, Ethchlorovynol Capsules, Cod Liver Oil Capsules, and Saw Palmetto Capsules. The rupture test has been included in the *USP* General Information Chapter *Disintegration and Dissolution of Dietary Supplements* ⟨2040⟩ as a replacement of disintegration for liquid-filled soft shell capsules that contain dietary supplements (*52, 54, 55*).

NOMENCLATURE

This section includes supplements to the latest edition of the *USP Dictionary of USAN and International Drug Names* that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

Nomenclature

INDEX

This is a cumulative directory for the content of all issues of *PF* beginning with *PF* 35(1).

[*Note—This index covers Vol. 35 No. 1, pp. 1–218; Vol. 35 No. 2, pp. 219–498; Vol. 35 No. 3, pp.499–784; and Vol. 35 No. 4, pp. 785–1050.*]

CHROMATOGRAPHIC COLUMNS USED IN *USP–NF* AND *PHARMACOPEIAL FORUM*

This is an update based on the proposals published in this issue of *PF*.

Chromatographic Columns Used in *USP–NF* and *Pharmacopeial Forum*
July–Aug. 2009

ABACAVIR SULFATE (DSD Mgh #2654)

PF	LGS#	Reagent Brand	Type of Test	Comments
0(0)	L1	Hypersil BDS C-18	Assay	4.6 mm × 5 cm, 5 µm. Manufacturer: Thermo Scientific
0(0)	L51	Chiralpak AD	Enantiomeric Purity	4.6 mm × 25 cm, 10 µm. Manufacturer: Chiral Technologies, Inc.
0(0)	L1	Symmetry C-18	Related Compounds	3.9 mm × 15 cm, 5 µm. Manufacturer: Waters Corp.

BALSALAZIDE DISODIUM (DSD Mgh #6988)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(4)	L1	Eclipse XDB C18	Organic Impurities	4.6 mm × 25 cm, 5 µm. Manufacturer: Agilent

BALSALAZIDE DISODIUM CAPSULES (DSD Mgh #6990)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(4)	L1	Hypersil BDS C-18	Assay	4.6 mm × 25 cm, 5 µm. Manufacturer: Thermo Scientific
35(4)	L1	Eclipse XDB C18	Organic Impurities	4.6 mm × 25 cm, 5 µm. Manufacturer: Agilent

BEMOTRIZINOL (DSD Mgh #3022)

PF	LGS#	Reagent Brand	Type of Test	Comments
32(4)	L1	Hypersil BDS C-18	Assay and Related Compounds	3.0 mm × 12.5 cm. Manufacturer: Thermo Scientific

BRINZOLAMIDE (DSD Mgh #10206)

PF	LGS#	Reagent Brand	Type of Test	Comments
0(0)	L1	Spherisorb ODS2	Assay and Related Compounds	Related compounds test 2. 4.6 mm × 25 cm, 5 µm. Manufacturer: Waters Corp.

CARVEDILOL (DSD Mgh #2730)

PF	LGS#	Reagent Brand	Type of Test	Comments
34(5)	L7	Spherisorb C8	Limit of	Limit of carvedilol related compound F. 4.6 mm × 30 mm, 3 µm. Manufacturer: Waters Corp.

CARVEDILOL TABLETS (DSD Mgh #2701)

PF	LGS#	Reagent Brand	Type of Test	Comments
33(5)	L7	IB-SIL C8	Assay and Related Compounds	4.6 mm × 5 cm, 5 µm. Alternative column: Hypersil MOS C8, 2.5 µm, manufactured by Thermo-Electron. Manufacturer: Phenomenex

CEFDITOREN PIVOXIL (DSD Mgh #13988)

PF	LGS#	Reagent Brand	Type of Test	Comments
0(0)	L1	YMC-Pack ODS-AM	Assay and Related Compounds	4.6 mm × 25 cm, 5 µm. Manufacturer: YMC Co. Ltd.

CEFTIOFUR SODIUM (DSD Mgh #14135)

PF	LGS#	Reagent Brand	Type of Test	Comments
34(4)	G43	None Cited	Limit of	Limit of acetone and tetrahydrofuran. 0.32 mm × 30 m, 1.8 µm. Manufacturer: n/a

CLIMBAZOLE (DSD Mgh #1371)

PF	LGS#	Reagent Brand	Type of Test	Comments
33(5)	L7	LiChrospher 60 RP-Select B	Assay	4 mm × 25 cm, 5 μm. Manufacturer: Merck KGaA

DEFEROXAMINE MESYLATE (DSD Mgh #22400)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(4)	L1	ZORBAX ODS	Assay and Related Compounds	4.6 mm × 7.5 cm, 3.5 μm. Alternative column: Zorbax Eclipse XDB C18. Manufacturer: Agilent Technologies

FLUCONAZOLE INJECTION (DSD Mgh #33243)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(3)	L1	Symmetry C-18	Organic Impurities	Procedure 3. 4.6 mm × 15 cm, 3.5 μm. Manufacturer: Waters Corp.

METHACRYLIC ACID COPOLYMER (DSD Mgh #49850)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(4)	L1	Nucleosil 100 C18	Limit of	Limit of monomers. 4 mm × 12.5 cm, 7 μm. Manufacturer: Macherey-Nagel

METHACRYLIC ACID AND ETHYL ACRYLATE COPOLYMER (DSD Mgh #4368)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(4)	L1	Nucleosil 100 C18	Limit of	Limit of methacrylic acid and ethyl acrylate. 4 mm × 12.5 cm, 7 μm. Manufacturer: Macherey-Nagel

METHACRYLIC ACID AND METHYL METHACRYLATE COPOLYMER (DSD Mgh #4367)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(4)	L1	Nucleosil 100 C18	Limit of	Limit of methacrylic acid and methyl methacrylate. 4 mm × 12.5 cm, 7 μm. Manufacturer: Macherey-Nagel

MYCOPHENOLATE MOFETIL CAPSULES (DSD Mgh #55075)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(4)	L7	Luna C8(2)	Assay and Limit of	Limit of degradation products. 4.6 mm × 25 cm, 5 μm. Manufacturer: Phenomenex
35(4)	L7	ZORBAX SB C8	Limit of	Limit of *z*-mycophenolate mofetil. 4.6 mm × 15 cm, 3.5 μm. Manufacturer: Agilent Technologies

MYCOPHENOLATE MOFETIL TABLETS (DSD Mgh #55077)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(4)	L7	ZORBAX SB C8	Limit of	Limit of *z*-mycophenolate mofetil. 4.6 mm × 15 cm, 3.5 μm. Manufacturer: Agilent Technologies
35(4)	L7	Luna C8(2)	Assay and Limit of	Limit of degradation products. 4.6 mm × 25 cm, 5 μm. Manufacturer: Phenomenex

PROPOXYPHENE HYDROCHLORIDE (DSD Mgh #70590)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(4)	L1	ZORBAX Eclipse XDB-C18	Assay and Related Compounds	4.6 mm × 15 cm, 3.5 μm. Manufacturer: Agilent Technologies

RAMIPRIL CAPSULES (DSD Mgh #73034)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(4)	L1	Zorbax SB-C18	Assay, Dissolution, and Related Compounds	4.6 mm × 15 cm, 5 μm. Manufacturer: Agilent

SERTRALINE HYDROCHLORIDE (DSD Mgh #75100)

PF	LGS#	Reagent Brand	Type of Test	Comments
34(5)	L45	Chiradex	Assay and Related Compounds	4.0 mm × 25 cm, 5 µm. Manufacturer: Merck KGaA
34(5)	L40	Chiralcel OD-H	Limit of	Limit of (*R,R*) sertraline hydrochloride. 4.6 mm × 25 cm, 5 µm. Manufacturer: Daicel Chemical Industries

SUMATRIPTAN SUCCINATE (DSD Mgh #80104)

PF	LGS#	Reagent Brand	Type of Test	Comments
33(3)	L3	Spherisorb Silica	Limit of	Limit of sumatriptan succinate related compound A. 4.6 mm × 25 cm, 5 µm. Manufacturer: Waters Corp.

SUMATRIPTAN TABLETS (DSD Mgh #80108)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(4)	L1	Spherisorb ODS1	Assay and Organic Impurities	4.6 mm × 25 cm, 5 µm. Manufacturer: Waters Corp.

TERAZOSIN CAPSULES (DSD Mgh #80838)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(4)	L1	Burdick & Jackson C18	Assay	4.6 × 15 cm, 5 µm. Manufacturer: B & J
35(4)	L1	SymmetryShield RP18	Related Compounds	4.6 × 25 cm, 5 µm. Manufacturer: Waters Corp.

TERAZOSIN TABLETS (DSD Mgh #80842)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(4)	L1	SymmetryShield RP18	Related Compounds	4.6 mm × 25 cm, 5 µm. Manufacturer: Waters Corp.
35(4)	L1	Burdick & Jackson C18	Assay	4.6 mm × 15 cm, 5 µm. Manufacturer: B & J

VALACYCLOVIR TABLETS (DSD Mgh #87565)

PF	LGS#	Reagent Brand	Type of Test	Comments
0(0)	L1	Hypersil BDS C-18	Dissolution	4.6 mm × 5 cm, 5 µm. Manufacturer: Thermo Scientific
0(0)	L66	Crownpak CR (+)	Assay and Related Compounds	4 mm × 15 cm, 5 µm. Manufacturer: Daicel

Table of Contents*

PHARMACOPEIAL FORUM VOL. 35 NO. 5 **SEPT.–OCT. 2009**

* The *USP–NF* (*USP 33–NF 28*), the *Supplement* (*Supp*), or the *Interim Revision Announcement* (*IRA*) for which the revision proposal is targeted is shown in parentheses next to each proposed item.

THE JOURNAL OF STANDARDS DEVELOPMENT AND OFFICIAL COMPENDIA REVISION

Please address comments on *Pharmacopeial Forum* content to
USP Executive Secretariat
12601 Twinbrook Parkway,
Rockville, MD 20852
execsec@usp.org

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI),* in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences.*

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

Printed in USA by United Book Press, Inc., Baltimore, MD

ISSN: 0363-4655

STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum* (*PF*), for the development of official standards in the *United States Pharmacopeia* and the *National Formulary* (*USP–NF*).

USP publishes *PF* on a bimonthly basis to provide an opportunity to review and comment on the new or revised standards.

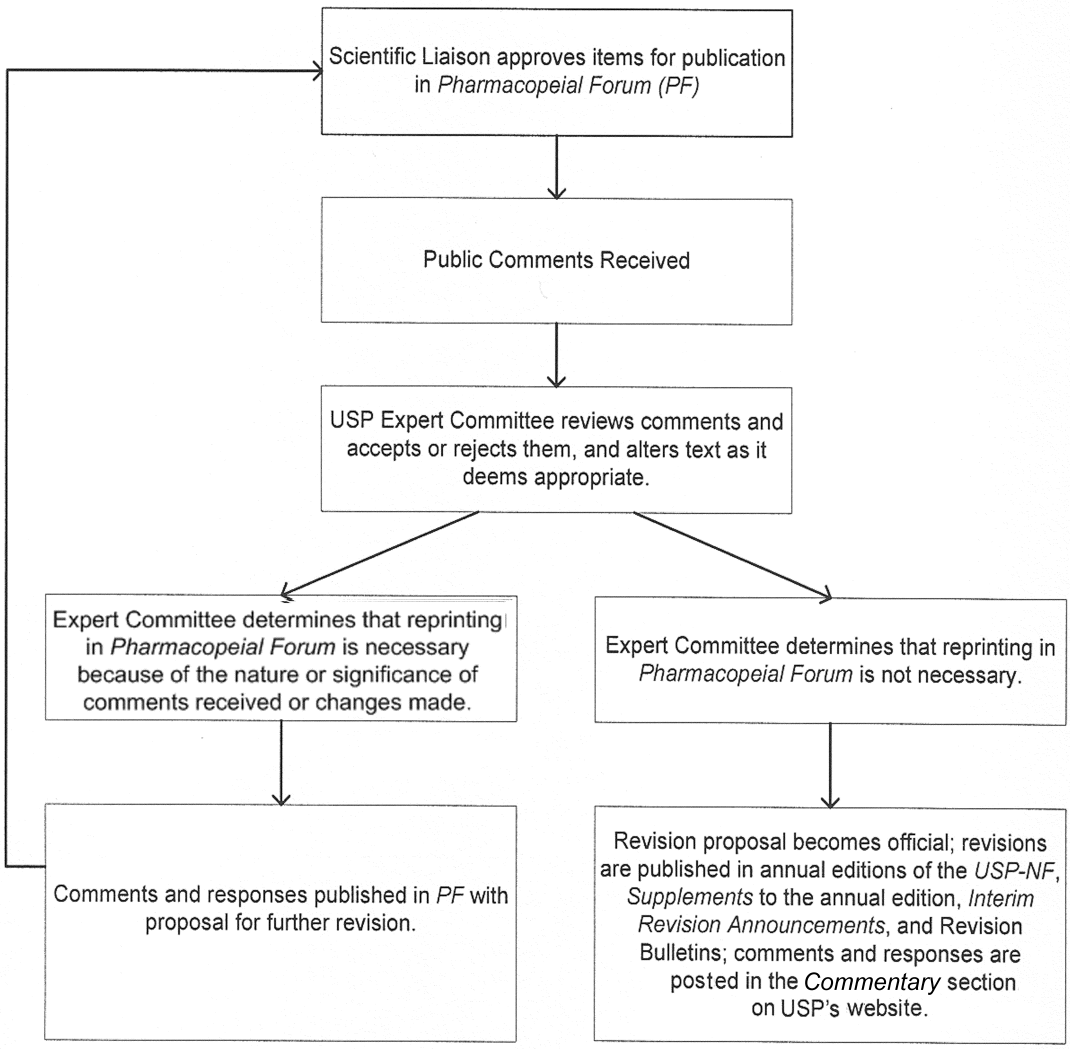
PF includes the following:

1. **Proposed Revisions**—New or revised standards targeted for adoption through USP's typical Revision Process. USP's Revision Process calls for publication of a proposed revision in *PF* for a 90-day notice and comment period. After the comment period and subsequent review of comments and approval by the relevant USP Expert Committee, the official standard is published in the next *USP–NF* or *Supplement*. If comments received are significant, or if the Expert Committee's consideration of comments results in significant additional changes, the Expert Committee may determine that reprinting in *PF* is necessary prior to the revision becoming official. See the *In-Process Revision* section for current proposed revisions.
2. **Accelerated Revisions**—New or revised standards that become official through an accelerated process in accordance with USP's Guideline on Accelerated Revisions (available on the USP website) (e.g., *Interim Revision Announcements*, *Revision Bulletins*, and *Errata*). Accelerated Revisions allow for a revision to become official prior to the next *USP–NF* or *Supplement* and do not always require notice and comment. *Interim Revision Announcements* are first presented for a 60-day public comment period in the *Proposed Interim Revision Announcement* section before becoming official in a later *PF* in the *Interim Revision Announcements* section of the *PF*. Note that *Revision Bulletins* appear only on the USP website.

USP welcomes comments and data on proposed revisions. Comments, along with USP's responses, will be published in the *Commentary* section of the USP website (www.usp.org).

The chart below shows the public review and comment process and its relationship to standards development.

Public Review and Comment Process for *USP-NF* Standards Development



Questions on the process should be addressed to Director, Executive Secretariat, United States Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: execsec@usp.org).

HOW TO USE *PF*

''How to Use PF'' describes the various parts of *Pharmacopeial Forum*, lists the *Committee Designations*, and includes the *Staff Directory*.

The contents of the various sections of *PF* are briefly described below. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a *Request for Revision* is available in the *Guideline for Submitting Requests for Revision to the USP–NF* on the USP website (www.usp.org/USPNF/submitMonograph/subGuide.html).

Proposed and Adopted Revisions to the *USP–NF*

Section	Content	How Readers Can Respond
Proposed Interim Revision Announcement Accelerated Revision targeted to become official in an upcoming *PF.*	Proposals for *Interim Revision Announcements (IRAs)* that will be published as official in a future *Pharmacopeial Forum.* BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst, such as the brand name of the column used in developing the proposed procedure and the USP Scientific Liaison who handled the issue.	Review material and send comments within 60 days of the *PF* publication where the standard was proposed (or per the Briefing). Direct comments to the USP Scientific Liaison (see the *Staff Directory*) identified at the end of the Briefing.
Interim Revision Announcement Official Accelerated Revision (on the first day of the second month, unless otherwise indicated).	Standards that have been adopted and will become official on the date that is specified in the section's introductory page or within parentheses following a particular item. New or revised text is marked by the symbols •.	Review material to see whether affected by any of the changes. Note date when standards become official, and ensure compliance.
Errata Accelerated Revision.	Corrections to official standards that will be printed in *USP–NF.*	Review material to see whether affected by any changes.
In-Process Revision Revisions for public review and comment.	Proposals for standards that will be published as official in a future *USP–NF* book or *Supplement*. BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst, such as the brand name of the column used in developing the proposed procedure and the appropriate USP Scientific Liaison.	Review material and send comments. Comment deadlines are found at the end of the *Policies and Announcements* section. Direct comments to the USP Scientific Liaison (see the *Staff Directory*) identified at the end of the Briefing. For general inquiries or in cases where a Scientific Liaison is not identified, use the general USP telephone number 301-881-0666 or fax number 301-998-6839.
Previous PF Proposals	Proposals from previous *PF*s that did not advance to official status in an official USP publication. This section is cumulative.	Review material to track pending proposals.
Canceled Proposals	Items that were published in *PF* and were pending, but have since been canceled. Note that canceled proposals may be republished to be considered in the future for adoption in *USP–NF.*	Review material to track canceled proposals.

Proposed and Adopted Revisions to the *USP–NF* *(Continued)*

Section	Content	How Readers Can Respond
Stage 4 Harmonization Items the Pharmacopeial Discussion Group (PDG) is working to internationally harmonize.	BRIEFING: Scientific rationale for the potential inclusion or change or for the proposed change. Stage 4 is available for comment.	Review material and provide comments to the appropriate Scientific Liaison cited in the Briefing. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopoeia, with a copy to USP, for a given article. The addresses for the European (PhEur) and Japanese (JP) pharmacopoeias are as follows: PhEur Secretariat Ms. Lynn Kelso-Eleuterio Central Secretariat European Pharmacopoeia Department European Directorate for the Health Care Council of Europe 7, Allée Kastner CS 30026 67081 Strasbourg France Tel: +33 (3) 88 41 31 48 Fax: +33 (3) 88 41 27 71 lynn.kelso@edqm.eu JP Secretariat Dr. Shigenori Harada Quality Expert Pharmaceuticals and Medical Devices Agency (PMDA) Shin-kasumigaseki Building 3-3-2, Kasumigaseki, Chiyoda-ku Tokyo, 100-0013 Japan Phone: +81-3-3506-9431 Fax: +81-3-3506-9440 harada-shigenori@pmda.go.jp
Stage 6 Harmonization Items the Pharmacopeial Discussion Group (PDG) is working to internationally harmonize.	Stage 6 is the final official harmonized standard and is not available for comment. This information is published for informational purposes only. New or revised text to Stage 6 documents is marked with symbols that indicate the publication in which the book or *Supplement* becomes official.	Review material to see whether affected by any changes.

Other Sections

Expert Committee Designations
Names of the Expert Committees (comprising volunteer scientific experts) that work with USP staff on the development of standards

Staff Directory
Names of key USP Standards Division staff members, including Scientific Liaisons, with contact information

Policies and Announcements
- General scientific and policy issues affecting *USP–NF* standards and processes
- Update on standards-related issues being considered by USP
- Guidelines on how to comment
- Publication and comment schedules

Stimuli to the Revision Process
- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

Nomenclature
- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the *USP Dictionary of USAN and International Drug Names*
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

Index
Cumulative directory for the content of all issues of *PF* beginning with *PF* 35(1)

Chromatographic Columns Used in USP–NF and Pharmacopeial Forum
Update of chromatographic columns based on the proposals published in this issue of *PF*

EXPERT COMMITTEE DESIGNATIONS*

2005–2010

AER	Aerosols
BB BBP	B&B Blood and Blood Products
BB CGT	B&B Cell, Gene, and Tissue Therapies
BB PP	B&B Proteins and Polysaccharides
BB VV	B&B Vaccines and Virology
BPC	Biopharmaceutics
CRX	Compounding Pharmacy
DSB	Dietary Supplements—Botanicals
DS-GC	Dietary Supplements—General Chapters
DSI	Dietary Supplements—Information
DSN	Dietary Supplements—Non-Botanicals
DS-PS	Dietary Supplements—Performance Standards [Formerly Dietary Supplements—Bioavailability (DSB)]
EGC	Excipient General Chapters
EM1	Excipient Monographs 1
EM2	Excipient Monographs 2
FI	Food Ingredients
GC	General Chapters
GTMDB	General Toxicity and Medical Device Biocompatibility
IH	International Health
MSA	Microbiology and Sterility Assurance
MD-ANT	Monograph Development—Antibiotics
MD-AA	Monograph Development—Antivirals and Antimicrobials
MD-CV	Monograph Development—Cardiovascular
MD-CCA	Monograph Development—Cough, Cold, and Analgesics
MD-GRE	Monograph Development—Gastrointestinal, Renal, and Endocrine
MD-OOD	Monograph Development—Ophthalmology, Oncology, and Dermatology
MD-PP	Monograph Development—Psychiatrics and Psychoactives
MD-PS	Monograph Development—Pulmonary and Steroids
NOM	Nomenclature
P&S	Packaging and Storage
PPI	Parenteral Products—Industrial
PDF	Pharmaceutical Dosage Forms
PW	Pharmaceutical Waters
RI	Radiopharmaceutical Information
RMI	Radiopharmaceuticals and Medical Imaging Agents
RS	Reference Standards
SCC	Sterile Compounding
SMU	Safe Medication Use
STAT	Statistics

POLICIES AND ANNOUNCEMENTS

This section provides general information resources for *USP–NF* standards and processes. Information resources include announcements on scientific and policy issues currently under consideration, schedules for USP publications, and schedules for comment periods for proposed standards.

USP ANNOUNCES REVISION TO BUDESONIDE MONOGRAPH. The Monograph Development—Pulmonary and Steroids Expert Committee has approved two revisions to *Limit of 11-ketobudesonide*. Resolution cannot be established due to the absence of a signal for 14,15-dehydrobudesonide and 21-dehydrobudesonide; therefore, the Expert Committee removed the resolution requirements as part of the system suitability. In addition, the Expert Committee added a requirement that the *Mobile phase* be pre-heated in order to stabilize the retention times. These revisions were previously proposed in *Pharmacopeial Forum* 35(3) [May–June 2009]. The approved *Interim Revision Announcement* supersedes the monograph printed in *USP 32–NF 27* until it is printed in *USP 33–NF 28*.

Please contact Domenick Vicchio, Ph.D, at 301-998-6828 or dwv@usp with any questions.

USP ANNOUNCES REVISION TO NEFAZODONE HYDROCHLORIDE MONOGRAPH. The Monograph Development—Psychiatrics and Pyschoactives Expert Committee has approved the revision of *Identification* test *B* for counter ion. The revision utilizes methanol as a solvent rather than water because the drug substance has better solubility in methanol. This revision was previously proposed in *Pharmacopeial Forum* 35(3) [May–June 2009]. The approved *Interim Revision Announcement* supersedes the monograph printed in USP 32–NF 27 until it is printed in USP 33–NF 28.

Please contact Ravi Ravichandran, Ph.D., at 301-816-8330 or rr@usp.org with any questions about the Nefazadone Hydrochloride monograph.

USP ANNOUNCES CHROMATOGRAPHIC REAGENTS IS NOW CALLED CHROMATOGRAPHIC COLUMNS. Starting with *PF* 35(5), USP is changing the *Pharmacopeial Forum* section title *Chromatographic Reagents* to *Chromatographic Columns* in order to reflect the current standard practice of using prepared columns in the laboratory. References to *Chromatographic Reagents* have also been revised throughout *Pharmacopeial Forum*. The column information that is contained within this renamed section is the same information that has been presented under the previous *Chromatographic Reagents* title.

Please contact Margareth Marques, Ph.D., at 301-816-8106 or mrm@usp.org with any questions.

USP ISSUES CALL FOR CANDIDATES FOR 2010–2015 COUNCIL OF EXPERTS, ITS EXPERT COMMITTEES, AND ITS EXPERT PANELS. In accordance with the Bylaws of the USP Convention, USP is issuing a Call for Candidates for the 2010–2015 Council of Experts (COE). The 2010–2015 COE includes Expert Committees in the areas of Nomenclature, Small Molecules, Biologics and Biotechnology, Excipients, General Chapters, Reference Standards, Compounding, Food Ingredients, and Dietary Supplements. In the 2010–2015 cycle, USP is expanding the number of Expert Panels that report to Expert Committees.

These Expert Committees and Panels align with the new USP Strategic Plan, which focuses on expanding and enhancing USP's core compendial and standards-setting activities. The ability to add Expert Panels according to USP's needs introduces flexibility and scalability into USP's activities. USP plans to continue to attract a global base of experts and therefore encourages any qualified individual to apply. Importantly, this approach also enables USP to closely align its documentary and reference standards activities for a more efficient standards-setting process.

Specific Expert Committees and Expert Panels for which USP is seeking candidates are listed at USP's nominations Web site (www.usp.org/goto/nominate). The deadline for applications for the COE (Expert Committee Chairs) is **December 31, 2009**. The deadline for applications for Expert Committee members is **May 15, 2010**. Recruitment for Expert Panel members will begin in July 2010 and will be continuous.

For further information, please contact Nelufar Mohajeri, Director, Volunteer Affairs and Compendial Initiatives (nym@usp.org or nominate@usp.org).

***PHARMACOPEIAL FORUM* PUBLIC REVIEW AND COMMENT PERIOD DEADLINES.** The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. In accordance with the Rules and Procedures of the 2005–2010 Council of Experts, USP has implemented a 90-day comment period by providing a deadline for each issue of *PF* unless otherwise stated in the individual briefing. The listing of comment period deadlines and the targeted official publications appears below.

Pharmacopeial Forum	Comment Deadline	Targeted Official Publication	Release Date	Official Date
PF 35(2)	June 15, 2009	*USP 33–NF 28 1st Supplement*	February 2010	August 1, 2010
PF 35(3)	August 15, 2009			
PF 35(4)	October 15, 2009	*USP 33–NF 28 2nd Supplement*	June 2010	December 1, 2010
PF 35(5)	December 15, 2009			
PF 35(6)	February 15, 2010	*USP 34–NF 29*	November 2010	May 1, 2011
PF 36(1)	March 31, 2010			

All official revisions are published in the annual edition or *Supplements* to *USP–NF* (twice yearly). Between these publications, official revisions are published in *PF* in the *Interim Revision Announcement* section and incorporated in the upcoming *USP–NF* or *Supplement*. They may also be published as *Revision Bulletins* on www.usp.org in the ''New Official Text'' section. The official publication in which an *Interim Revision Announcement* (*IRA*) is incorporated will depend upon publication deadlines. See the table below. The electronic version of *USP–NF* is updated as each *Supplement* becomes available and, therefore, contains all official text up to and including the contents of the latest *Supplement*. The table below outlines the publications and their release and official dates, and the *USP–NF* or *Supplement* that supersedes them.

Publication Schedules

Publication	Release Date	Official Date	Superseded by
USP 32–NF 27	November 1, 2008	May 1, 2009	*1st Supplement to USP 32–NF 27*
IRA [*PF* 35(1)]	January 1, 2009	February 1, 2009	*2nd Supplement to USP 32–NF 27*
1st Supplement to USP 32–NF 27	February 1, 2009	August 1, 2009	*2nd Supplement to USP 32–NF 27*
IRA [*PF* 35(2)]	March 1, 2009	April 1, 2009	*2nd Supplement to USP 32–NF 27*
IRA [*PF* 35(3)]	May 1, 2009	June 1, 2009	*USP 33–NF 28*
2nd Supplement to USP 32–NF 27	June 1, 2009	December 1, 2009	*USP 33–NF 28*
IRA [*PF* 35(4)]	July 1, 2009	August 1, 2009	*1st Supplement to USP 33–NF 28*
IRA [*PF* 35(5)]	September 1, 2009	October 1, 2009	*1st Supplement to USP 33–NF 28*
IRA [*PF* 35(6)]	November 1, 2009	December 1, 2009	*2nd Supplement to USP 33–NF 28*
USP 33–NF 28	November 1, 2009	May 1, 2010	*1st Supplement to USP 33–NF 28*

PRIORITY NEW MONOGRAPH ITEMS. USP is seeking monographs for the following drug substances and drug products that are off patent, are approaching off patent status, and thus are of the highest priority. USP also is seeking monographs for the excipients listed below. Monographs are marked ''Received'' upon receipt of a monograph proposal. Received monographs are removed from this list upon publication in *Pharmacopeial Forum* or when posted in the *USP Pending Monographs* section of the USP website (http://www.usp.org/standards/pending/). This list has been updated as of June 15, 2009; monographs received since the last update to the list are noted in bold.

Monograph sponsors should consult USP's Guideline for Submitting Requests for Revision to the *USP–NF* at http://www.usp.org/USPNF/submitMonograph/subGuide.html.

For additional information, contact Randy Kiser, MS, MBA, rwk@usp.org.

Small Molecules (Drug Substances)—As of June 15, 2009

1. Allopurinol Sodium	2. Aminopropazine Fumarate	3. Aminopterin Sodium
4. Anagrelide Hydrochloride ***(Received)***	5. Arsenic Trioxide	6. Auranfoin
7. Azelaic Acid ***(Received)***	8. Bentoquatam	9. Benzphetamine Hydrochloride
10. Bivalirudin ***(Received)***	11. Calcipotriene	12. Calcium Trisodium Pentetate
13. Calfactant	14. Candesartan Cilexetil ***(Received)***	15. Ceftibuten
16. Cetrorelix	17. Cevimeline Hydrochloride ***(Received)***	18. Chloroxine
19. Choline Salicylate	20. Cysteamine Bitartrate	21. Dalfopristin
22. Dapirazole Hydrochloride	23. Desirudin	24. Desonide ***(Received)***
25. Dexrazoxane	26. Difenoxin Hydrochloride	27. Entacapone ***(Received)***
28. Epoprostenol Sodium ***(Received)***	29. Erythromycin Phosphate	30. Erythromycin Thiocyanate
31. Esmolol Hydrochloride ***(Received)***	32. Estazolam ***(Received)***	33. Estramustine Phosphate Sodium
34. Ethanolamine Oleate	35. Etomidate ***(Received)***	36. Etoposide Phosphate
37. Exemestane	38. Famciclovir ***(Received)***)	39. Felbamate ***(Received)***
40. Fluoromethane F 18	41. Fosfomycin Tromethamine ***(Received)***	42. Gadobenate Dimeglumine
43. Gadopentetic Acid	44. Gallium Nitrate	45. Ganirelix
46. Guanidine Hydrochloride	47. Halobetasol Propionate ***(Received)***	48. Haloperidol Decanoate ***(Received)***
49. Hydrocodone Polistirex	50. Ibandronate Sodium	51. Imipramine Pamoate
52. Imiquimod	53. Isosulfan Blue	54. Latanoprost ***(Received)***
55. Lomustine ***(Received)***	56. Metipranolol Hydrochloride	57. Miglitol
58. Milrinone Lactate	59. Moexipril Hydrochloride	60. Nalbuphine Hydrochloride
61. Nedocromil Sodium	62. Nicardipine Hydrochloride ***(Received)***	63. Nilutamide
64. Nisoldipine	65. Olsalazine Sodium ***(Received)***	66. Oxiconazole Nitrate
67. Pemirolast Potassium	68. Pioglitazone Hydrochloride ***(Received)***	69. Piperonyl Butoxide
70. Pirbuterol Acetate ***(Received)***	71. Poractant Alpha	72. Porfimer Sodium
73. Pramiprexole Dihydrochloride ***(Received)***	74. Quetiapine Fumarate ***(Received)***	75. Ranitidine
76. Rivastigmine Tartrate ***(Received)***	77. Ropinirole Hydrochloride ***(Received)***	78. Rose Bengal Disodium
79. Rosiglitazone Maleate	80. Sodium Phenylbutyrate	81. Sodium Phosphates
82. Spectinomycin Sulfate	83. Streptozocin	84. Tenofovir Disoproxil Fumarate ***(Received)***
85. Tiludronate Disodium	86. Tiopronin	87. Trimetrexate Glucuronate

Small Molecules (Drug Substances)—As of June 15, 2009 *(Continued)*

88. Venlafaxine Hydrochloride ***(Received)***	89. Voriconazole ***(Received)***	90. Zaleplon ***(Received)***
91. Zinc Tridosium Pentetate	92. Zoledronic Acid	

Small Molecules (Drug Products)—As of June 15, 2009

1. Abacavir Sulfate, Lamivudine, and Zidovudine Tablets	2. Acarbose Tablets	3. Acetaminophen, Butalbital, Caffeine, and Codeine Phosphate Capsules
4. Acetaminophen, Clemastine Fumarate and Pseudoephedrine Hydrochloride Tablets	5. Acetazolamide Extended-Release Capsules	6. Albuterol and Ipratropium Bromide Inhalation Aerosol
7. Albuterol and Ipratropium Bromide Inhalation Solution	8. Albuterol Extended-Release Tablets	9. Albuterol Inhalation Aerosol
10. Albuterol Sulfate Inhalation Solution	11. Albuterol Sulfate Oral Solution	12. Alendronate Sodium Oral Solution
13. Alfuzosin Extended-Release Tablets	14. Allopurinol for Injection	15. Alprazolam Extended-Release Tablets
16. Alprostadil Urethral Suppository	17. Aminopropazine Fumarate and Neomycin Sulfate Tablets	18. Aminopropazine Fumarate Injection
19. Aminopropazine Fumarate Tablets	20. Aminopterin Sodium Tablets	21. Amiodarone Hydrochloride Injection
22. Amlodipine and Benazepril Hydrochloride Capsules ***(Received)***	23. Amphotericin B Injection	24. Anagrelide Hydrochloride Capsules ***(Received)***
25. Arsenic Trioxide Injection	26. Atovaquone and Proguanil Hydrochloride Tablets	27. Atovaquone Tablets
28. Auranofin Capsules	29. Azatadine Maleate and Pseudoephedrine Sulfate Extended-Release Tablets	30. Azelaic Acid Cream
31. Azithromycin for Injection ***(Received)***	32. Azithromycin Tablets ***(Received)***	33. Baclofen Injection
34. Beclomethasone Dipropionate Inhalation Aerosol	35. Beclomethasone Dipropionate Nasal Suspension	36. Benazepril Hydrochloride and Hydrochlorothiazide Tablets
37. Bentoquatam Topical Suspension	38. Benzocaine and Cetylpyridinium Chloride Lozenges	39. Benzocaine and Menthol Lotion
40. Benzphetamine Hydrochloride Tablets	41. Bivalirudin for Injection ***(Received)***	42. Brompheniramine Maleate, Dextromethorphan Hydrobromide, and Pseudoephedrine Hydrochloride Oral Solution
43. Budesonide Inhalation Aerosol	44. Bupivacaine and Lidocaine Hydrochlorides Injection	45. Buprenorphine Hydrochloride Injection
46. Butalbital and Acetaminophen Capsules	47. Butalbital and Acetaminophen Tablets	48. Calcipotriene Cream
49. Calcipotriene Ointment	50. Calcipotriene Topical Solution	51. Calcitriol Capsules
52. Calcitriol Oral Solution	53. Calcium Acetate Capsules	54. Calcium Trisodium Pentetate Injection
55. Calfactant Intratracheal Suspension	56. Carbidopa and Levodopa Tablets For Oral Suspension ***(Received)***	57. Carbidopa, Levidopa, and Entacapone Tablets
58. Carmustine Implant	59. Cefdinir Tablets	60. Cefditoren Pivoxil Tablets
61. Ceftibuten Capsules	62. Ceftibuten for Oral Suspension	63. Ceftiofur Hydrochloride Oral Suspension
64. Cetirizine Hydrochloride Tablets ***(Received)***	65. Cetrorelix Injection	66. Cevimeline Hydrochloride Capsules
67. Chloroxine Cream	68. Chlorpromazine Hydrochloride Extended-Release Capsules	69. Choline and Magnesium Salicylates Oral Solution
70. Choline and Magnesium Salicylates Tablets	71. Choline Salicylate Oral Solution ***(Received)***	72. Ciclopirox Shampoo
73. Ciclopirox Topical Gel	74. Ciclopirox Topical Solution ***(Received)***	75. Cimetidine Oral Solution
76. Ciprofloxacin Extended-Release Tablets	77. Ciprofloxacin Hydrochloride and Hydrocortisone Otic Suspension	78. Ciprofloxacin Otic Solution
79. Cisplatin Injection	80. Citalopram Hydrobromide Oral Solution	81. Citric Acid, Gluconolactone, and Magnesium Carbonate Irrigation
82. Cladribine Injection	83. Clemastine Fumarate Syrup	84. Clobetasol Propionate Gel
85. Clorazepate Dipotassium Capsules	86. Clorazepate Dipotassium Extended-Release Tablets	87. Clotrimazole and Betamethasone Dipropionate Lotion

Small Molecules (Drug Products)—As of June 15, 2009 *(Continued)*

88. Compound Undecylenic Acid Cream	89. Compound Undecylenic Acid Topical Powder	90. Conjugated Estrogens and Medroxyprogesterone Acetate Tablets
91. Cyclosporine Modified Capsules	92. Cyclosporine Modified Oral Solution	93. Cyclosporine Ointment
94. Cyclosporine Topical Solution	95. Cysteamine Bitartrate Capsules	96. Cytarabine Liposome Injection
97. Dalfopristin and Quinupristin Injection	98. Dantrolene Sodium Oral Suspension	99. Dapiprazole for Ophthalmic Solution
100. Desirudin for Injection	101. Desonide Cream	102. Dexrazoxane for Injection
103. Dextroamphetamine Sulfate Extended-Release Capsules	104. Dextromethorphan Polistirex Extended-Release Oral Suspension	105. Diazepam Injectable Emulsion
106. Diclofenac Sodium Ophthalmic Solution	107. Diethylpropion Hydrochloride Extended-Release Tablets	108. Difenoxin Hydrochloride and Atropine Sulfate Tablets
109. Difloxacin Hydrochloride Tablets	110. Dihydroergotamine Mesylate Metered Spray	111. Diltiazem Hydrochloride Injection
112. Dinoprostone Vaginal Suppositories	113. Diphenhydramine Hydrochloride and Acetaminophen Tablets	114. Divalproex Sodium Delayed-Release Capsules ***(Received)***
115. Dorzolamide and Timolol Ophthalmic Solution	116. Dorzolamide Ophthalmic Solution	117. Doxepin Hydrochloride Cream
118. Doxycycline Oral Gel	119. Econazole Nitrate Cream	120. Edrophonium Chloride and Atropine Sulfate Injection
121. Enalapril Maleate and Felodipine Extended-Release Tablets	122. Entacapone Tablets ***(Received)***	123. Ephedrine Sulfate and Guaifenesin Tablets
124. Epirubicin Hydrochloride for Injection	125. Epirubicin Hydrochloride Injection	126. Epoprostenol for Injection
127. Epoprostenol Injection	128. Esmolol Hydrochloride Injection	129. Esomeprazole Magnesium Capsules
130. Estazolam Tablets ***(Received)***	131. Estramustine Phosphate Sodium Capsules	132. Ethanolamine Oleate Injection
133. Etidronate Disodium Injection Concentrate	134. Etomidate Injection ***(Received)***	135. Exemestane Tablets
136. Famotidine Orally Disintegrating Tablets	137. Felbamate Oral Suspension	138. Felbamate Tablets
139. Fentanyl Lozenges	140. **Famciclovir Tablets** ***(Received)***	141. Fentanyl Transdermal System ***(Received)***
142. Ferrous Fumarate and Docusate Sodium Extended-Release Capsules	143. Fluconazole Oral Suspension	144. Flunisolide Inhalation Aerosol
145. Flunisolide Nasal Spray	146. Fluocinolone Acetonide Shampoo	147. Fluorescein Sodium Ophthalmic Solution
148. Fluorometholone Ointment	149. Fluticasone Propionate Inhalation Powder ***(Received)***	150. Fluticasone Propionate Pressurized Inhaler
151. Foscarnet Sodium Injection	152. Fosfomycin for Oral Solution	153. Gabapentin Oral Solution
154. Gadobenate Dimeglumine Injection	155. Gallium Nitrate Injection	156. Ganciclovir Capsules
157. Ganirelix Acetate Injection	158. Gatifloxacin Injection	159. Gatifloxacin Tablets
160. Gentamicin Sulfate Oral Solution	161. Gentamicin Sulfate Soluble Powder	162. Glipizide Extended-Release Tablets
163. Guaifenesin and Pseudoephedrine Hydrochloride Extended-Release Tablets	164. Guaifenesin and Salts of Dextromethorphan and Pseudoephedrine Oral Solution	165. Guanidine Hydrochloride Tablets
166. Halobetasol Propionate Cream	167. Halobetasol Propionate Ointment	168. Haloperidol Decanoate Injection
169. Haloperidol Lactate Injection	170. Haloperidol Lactate Oral Concentrate	171. Hydralazine Hydrochloride and Hydrochlorothiazide Capsules
172. Hydrochlorothiazide Capsules ***(Received)***	173. Hydrochlorothiazide Oral Solution	174. Hydrocodone Bitartrate and Acetaminophen Capsules
175. Hydrocodone Bitartrate and Acetaminophen Oral Solution	176. Hydrocodone Bitartrate and Aspirin Tablets	177. Hydrocodone Bitartrate and Guaifenesin Oral Solution
178. Hydrocodone Bitartrate and Homatropine Methylbromide Syrup	179. Hydrocortisone Acetate Dental Paste	180. Hydrocortisone Acetate Rectal Foam Aerosol
181. Hydrocortisone Butyrate Lotion	182. Hydroflumethiazide and Reserpine Tablets	183. Hydroquinone Lotion
184. Ibandronate Sodium Tablets	185. Ibuprofen Capsules	186. Idarubicin Hydrochloride Injection
187. Imipramine Pamoate Capsules	188. Imiquimod Topical Cream	189. Ipratropium Bromide Inhalation Aerosol
190. Ipratropium Bromide Inhalation Solution	191. Irinotecan Hydrochloride Injection	192. Isosulfan Blue Injection

Small Molecules (Drug Products)—As of June 15, 2009 *(Continued)*

193. Isradipine Extended-Release Tablets	194. Itraconazole Injection	195. Itraconazole Oral Solution
196. Ketoconazole Cream	197. Ketoconazole Shampoo	198. Ketoprofen Capsules ***(Received)***
199. Ketoprofen Extended-Release Capsules	200. Ketoprofen Tablets	201. Ketotifen Fumarate Ophthalmic Solution
202. Lactic Acid Lotion	203. Lamotrigine Tablets ***(Received)***	204. Latanoprost Ophthalmic Solution
205. Leucovorin Calcium for Injection	206. Levetiracetam Tablets ***(Received)***	207. Levocabastine Ophthalmic Suspension
208. Levofloxacin Solution	209. Lincomycin Hydrochloride and Spectinomycin Sulfate Soluble Powder	210. Liothyronine Injection
211. Lomustine Capsules ***(Received)***	212. Lopinavir and Ritonavir Solution	213. Lopinavir Capsules
214. Lopinavir Solution	215. Melphalan for Injection	216. Mesalamine Suppositories
217. Mesoridazine Besylate Concentrate	218. Metaraminol Bitartrate Injection	219. Methacholine Chloride for Inhalation Solution
220. Methadone Hydrochloride Oral Concentrate	221. Methocarbamol and Aspirin Tablets	222. Methoxsalen Softgels
223. Methyclothiazide and Deserpidine Tablets	224. Methylphenidate Hydochloride Chewable Tablets	225. Metipranolol Ophthalmic Solution
226. Metronidazole Cream	227. Metronidazole Extended-Release Tablets	228. Metronidazole Hydrochloride for Injection
229. Metronidazole Lotion	230. Miconazole Nitrate Topical Aerosol	231. Mifepristone Tablets
232. Miglitol Tablets	233. Milrinone Injection	234. Misoprostol Tablets ***(Received)***
235. Moexipril Hydrochloride and Hydrochlorothiazide Tablets	236. Moexipril Hydrochloride Tablets	237. Molindone Hydrochloride Oral Solution
238. Morphine Sulfate for Injection Concentrate	239. Morphine Sulfate Oral Solution	240. Morphine Sulfate Oral Solution Concentrate
241. Morphine Sulfate Tablets	242. Nalbuphine Hydrochloride Injection	243. **Mycophenolate Mofetil Oral Solution** ***(Received)***
244. Nalmefene Hydrochloride Injection	245. Naphazoline Hydrochloride and Pheniramine Maleate Ophthalmic Solution	246. Naproxen Sodium Extended-Release Tablets
247. Nedocromil Sodium Inhalation Aerosol	248. Neomycin Sulfate Oral Powder	249. Nicardipine Hydrochloride Capsules
250. Nilutamide Tablets	251. Nimodipine Capsules	252. Nisoldipine Extended-Release Tablets
253. Nitroglycerin Solution In Acrylic Adhesive	254. Nitroglycerin Transdermal System	255. Nizatidine Tablets
256. Ofloxacin In Dextrose Injection	257. Ofloxacin Injection	258. Olsalazine Sodium Capsules
259. Orphenadrine Citrate Extended-Release Tablets ***(Received)***	260. Orphenadrine Citrate, Aspirin, and Caffeine Tablets	261. Oxcarbazepine Suspension
262. Oxiconazole Cream	263. Pamidronate Disodium Injection	264. Pantoprazole Sodium for Injection
265. Pantoprazole Sodium Tablets	266. Paroxetine Hydrochloride Extended-Release Tablets	267. Paroxetine Oral Suspension
268. Pemirolast Potassium Ophthalmic Solution	269. Penicillin G Potassium Tablets for Oral Solution	270. Pentamidine Isethionate for Inhalation
271. Pentamidine Isethionate Injection ***(Received)***	272. Pentazocine Hydrochloride and Acetaminophen Tablets	273. Phendimetrazine Tartrate Extended-Release Capsules
274. Phenobarbital Capsules	275. Phentermine Resin Complex Capsules	276. Phenylephrine Hydrochloride and Chlorpheniramine Maleate Extended-Release Capsules
277. Phenylephrine Hydrochloride, Chlorpheniramine Maleate, and Acetaminophen Extended-Release Tablets	278. Pilocarpine Hydrochloride Ophthalmic Gel	279. Pilocarpine Hydrochloride Ophthalmic Ointment
280. Pioglitazone Hydrochloride Tablets ***(Received)***	281. Piperonyl Butoxide and Pyrethrins Aerosol Foam	282. Pirbuterol Acetate Inhalation Aerosol
283. Poractant Alpha Suspension	284. Porfimer Sodium for Injection	285. Povacrylate Solution
286. Povacrylate–Iodine Topical Solution	287. Povidone–Iodine Gauze	288. Povidone–Iodine Swabsticks

Small Molecules (Drug Products)—As of June 15, 2009 *(Continued)*

289. Povidone–Iodine Topical Aerosol Foam	290. Povidone–Iodine Vaginal Suppositories	291. Pramipexole Dihydrochloride Tablets
292. Prednisolone Sodium Phosphate Oral Solution	293. Prochlorperazine Maleate Extended-Release Capsules	294. Progesterone Capsules
295. Propafenone Hydrochloride Tablets	296. Pseudoephedrine Hydrochloride and Brompheniramine Maleate Extended-Release Tablets	297. Pseudoephedrine Hydrochloride and Naproxen Sodium Extended-Release Tablets
298. Pseudoephedrine Hydrochloride, Chlorpheniramine Maleate, and Codeine Phosphate Oral Solution	299. Pseudoephedrine Hydrochloride, Guaifenesin, and Codeine Phosphate Oral Solution	300. Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Extended-Release Tablets
301. Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Oral Solution	302. Pseudoephedrine Sulfate, Dexbrompheniramine Maleate, and Acetaminophen Extended-Release Tablets	303. Pyrilamine Maleate Injection
304. Quinapril Hydrochloride and Hydrochlorothiazide Tablets	305. Quinidine Sulfate Injection	306. **Ranitidine Capsules** ***(Received)***
307. Rauwolfia Serpentina and Endroflumethiazide Tablets	308. Reserpine and Polythiazide Tablets	309. Rimantadine Hydrochloride Oral Solution
310. Rivastigmine Tartrate Capsules ***(Received)***	311. Rivastigmine Tartrate Oral Solution ***(Received)***	312. Rocuronium Bromide Injection
313. Ropinirole Hydrochloride Tablets	314. Rosiglitazone Maleate Tablets	315. Salicylic Acid and Sulfur Cleansing Lotion
316. Salicylic Acid and Sulfur Lotion	317. Salicylic Acid and Sulfur Shampoo	318. Salicylic Acid Cream
319. Salicylic Acid Ointment	320. Salmeterol Inhalation Aerosol	321. Salmeterol Xinafoate Inhalation Powder
322. Scopolamine Transdermal System	323. Selegiline Hydrochloride Capsules	324. Sertraline Hydrochloride Oral Solution
325. Sibutramine Hydrochloride Capsules	326. Sodium Bicarbonate and Sodium Citrate for Oral Solution	327. Sodium Bicarbonate, Sodium Citrate, and Sodium Tartrate for Oral Suspension
328. Sodium Iodide Injection	329. Sodium Phenylbutyrate Oral Powder	330. Sodium Phenylbutyrate Tablets
331. Sodium Phosphates for Oral Suspension	332. Sodium Phosphates Tablets	333. Sodium Salicylate and Sulfur Shampoo
334. Sterile Talc Aerosol	335. Streptozocin for Injection	336. Sucralfate Oral Suspension
337. Sulconazole Nitrate Cream	338. Sulfacetamide Sodium and Fluorometholone Ophthalmic Suspension	339. Sulfacetamide Sodium and Prednisolone Sodium Phosphate Ophthalmic Solution
340. Sulfasalazine Oral Suspension	341. Sulisobenzone Lotion	342. Sumatriptan Injection
343. Tacrolimus Injection	344. Tacrolimus Ointment	345. Technetium Tc 99m Teboroxime Injection
346. Tenofovir Disoproxil Fumarate Tablets ***(Received)***	347. Terbinafine Hydrochloride Cream	348. Terbinafine Tablets ***(Received)***
349. Terbinafine Topical Solution	350. Terconazole Vaginal Cream	351. Terconazole Vaginal Suppositories
352. Testosterone Transdermal Gel	353. Testosterone Transdermal System	354. Tetracycline Hydrochloride Periodontal Fiber

INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- Newly adopted (official) revisions to the *USP–NF* that become official before the official date of the next *Supplement* or that were not ready for adoption by the closing date for the upcoming *Supplement*. (The official date for these revisions is stated on the next page.)
- Errata

Readers should review this section to determine if they are affected by any of the changes.

Symbols—New text is enclosed in symbols and set off from the current official text as shown in the following example: •new text•

Where the symbols appear together with no enclosed text, such as ••, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the issue of a given *PF* volume.

Errata—Errata are considered to be text, erroneously published in the *USP–NF* or its *Supplements,* that does not accurately reflect the intended official requirements of the Council of Experts. Beginning with *PF* 35(2), Errata will be published both in the *Pharmacopeial Forum* and on the usp.org website. At the end of the *Interim Revision Announcement* section in this publication is a list of errata and corrections to *USP 32–NF 27*. The page number indicates where the item is found in *USP–NF.* Errata are updated as necessary in each *Pharmacopeial Forum* issue and monthly on the usp.org website. This information will also be cumulative in future *Supplements,* and will appear in its corrected form in the next annual edition of *USP–NF.* The list of Errata has been relocated to www.usp.org, where updates will be posted monthly.

INTERIM REVISION ANNOUNCEMENT to *USP 32* and to *NF 27*

By authority of the United States Pharmacopeial Convention, Inc.
Prepared by the Council of Experts and published by the Board of Trustees

Duane M. Kirking, Pharm.D., Ph.D.,
Chair, USP Board of Trustees,
USP Trustee At-Large

Roger L. Williams, M.D., *Chief Executive Officer*
and *Chairman, USP Council of Experts*

Susan de Mars, J.D., *Chief Documentary Standards Officer and General Counsel*
William F. Koch, Ph.D., FACB, *Chief Standards Acquisitions and Metrology Officer*

Released September 1, 2009 **Official October 1, 2009**

All inquiries and comments regarding *USP 32* text and *NF 27* text should be addressed to the Executive Secretariat, *USP–NF*, 12601 Twinbrook Parkway, Rockville, MD 20852 (execsec@usp.org).

New USP Reference Standards

The following USP Reference Standards, which were not available when the associated monograph was made official, have since become available. The respective official date of each *USP 32* or *NF 27* standard, test, or assay requiring the use of the following USP Reference Standards is indicated in parentheses after the name of the Reference Standard. Note that the official date is six months after publishing in this PF.

USP *S*-Adenosyl-L-homocysteine RS (March 1, 2010)
USP Alpha Lipoic Acid RS (March 1, 2010)
USP Lypressin RS (March 1, 2010)
USP Propylene Glycol Dilaurate RS (March 1, 2010)
USP Valrubicin RS (March 1, 2010)
USP Vasopressin RS (March 1, 2010)

Unavailable First-Time Official USP Reference Standards

The official dates of any *USP 32* or *NF 27* standards, tests, or assays requiring the use of the following new USP Reference Standards are postponed until further notice pending availability of the respective Reference Standards. This listing was updated as of June 1, 2009. Please refer to the current USP Catalog for a more up-to-date availability list. The USP Catalog can be accessed on-line at http://www.uspcatalog.com.

Budesonide

Change to read:

Limit of 11-ketobudesonide—

Buffer solution—Proceed as directed in the *Assay.*

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution,* acetonitrile, and isopropanol (65 : 26 : 9). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Prepare as directed for *Standard preparation* in the *Assay.*

Test solution—Proceed as directed for the *Assay preparation.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains 3.5-µm packing L1. The flow rate is about 1.5 mL per minute. •Pre-heat the *Mobile phase* to 50° and•$_{5}$ maintain the column at 50°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.73 and 0.78, respectively, for the two epimers of 11-ketobudesonide, about 0.68 for 21-dehydrobudesonide, about 0.84 for 14,15-dehydrobudesonide, and 1.0 for the first eluted epimer of budesonide (epimer B). •$_{5}$ The column efficiency is not less than 5500 theoretical plates, determined from the budesonide epimer B peak.

Procedure—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of 11-ketobudesonide in the portion of Budesonide taken by the formula:

$$100(r_i / r_U)$$

in which r_i is the sum of the areas of the two ketobudesonide peaks; and r_U is the sum of the areas of the two budesonide peaks; not more than 0.2% of 11-ketobudesonide is found.

Change to read:

Heparin Sodium

•DEFINITION

Heparin Sodium is the sodium salt of sulfated glycosaminoglycans present as a mixture of heterogeneous molecules varying in molecular weights that retains a combination of activities against different factors of the blood clotting cascade. It is present in mammalian tissues and is usually obtained from the intestinal mucosa or other suitable tissues of domestic mammals used for food by man. The sourcing of heparin material must be specified in compliance with applicable regulatory requirements. The manufacturing process should be validated to demonstrate clearance and inactivation of relevant infectious and adventitious agents (e.g., viruses, TSE agents). See *Viral Safety Evaluation of Biotechnology Products Derived from Cell Lines of Human or Animal Origin* ⟨1050⟩ for general guidance on viral safety evaluation. It is composed of polymers of alternating derivatives of α-D-glucosamido (*N*-sulfated, *O*-sulfated, or *N*-acetylated) and *O*-sulfated uronic acid (α-L-iduronic acid or β-D-glucuronic acid). The component activities of the mixture are in ratios corresponding to those shown by the USP Heparin Sodium for Assays RS. Some of these components have the property of prolonging the clotting time of blood. This occurs mainly through the formation of a complex of each component with the plasma proteins antithrombin and heparin cofactor II to potentiate the inactivation of thrombin (factor IIa). Other coagulation proteases in the clotting sequence, such as activated factor X (factor Xa), are also inhibited. The ratio of anti-factor Xa activity to anti-factor IIa potency is between 0.9 and 1.1. The potency of Heparin Sodium, calculated on the dried basis, is NLT 180 USP Heparin Units in each mg.

IDENTIFICATION

• A. ^{1}H NMR SPECTRUM

(See *Nuclear Magnetic Resonance* ⟨761⟩.)

Standard solution: NLT 20 mg/mL of USP Heparin Sodium Identification RS in deuterium oxide with 0.02% (w/v) deuterated trimethylsilylpropionic (TSP) acid sodium salt

System suitability solution: Prepare 1% (w/w) USP Oversulfated Chondroitin Sulfate RS in *Standard solution.*

Sample solution: NLT 20 mg/mL of Heparin Sodium in deuterium oxide with 0.02% (w/v) deuterated TSP

Analysis

Samples: *Standard solution* and *System suitability solution*

Using a pulsed (Fourier transform) NMR spectrometer operating at NLT 500 MHz for ^{1}H, acquire a free induction decay (FID) using NLT 16 scans using a 90° pulse and 20 s delay. Record the ^{1}H NMR spectra of the *Standard solution* and *System suitability solution* at 25°. Collect the ^{1}H NMR spectrum with a spectral window of at least 10 to –2 ppm and without spinning. The number of transients should be adjusted until the signal-to-noise ratio of the *N*-acetyl heparin signal in the *Standard solution* is at least 1000/1 in the region near 2 ppm. The *Standard solution* shall be run at least daily when *Sample solutions* are being run. For all samples, the TSP methyl signal should be set to 0.00 ppm. The chemical shift for the *N*-acetyl resonance of heparin and oversulfated chondroitin sulfate in the *System suitability solution* should be observed at 2.05 ± 0.02 and 2.16 ± 0.03 ppm, respectively. Record the ^{1}H NMR spectrum of the *Sample solution* at 25°. Draw a baseline from 8.00 ppm to 0.10 ppm. The ppm values for H1 of GlcNAc/GlcNS, 6S (signal 1), H1 of IdoA2S (signal 2), the H2 of GlcNS (signal 3), and the methyl of GlcNAc (signal 4) of heparin are present at 5.42, 5.21, 3.28 (doublet centered at 3.28 ppm), and 2.05 ppm, respectively.[1] The ppm values of these signals do not differ by more than ±0.03 ppm. Measure the signal heights above the baseline of signal 1 and signal 2, and calculate the mean of these signal heights. Other signals of variable heights and ppm values, attributable to heparin and HOD, may be seen between signal 2 and 4.55 ppm. Residual solvent signals may be observed in the 0.10–3.00 range. Heparin Sodium must meet the requirements stated in *Residual Solvents* ⟨467⟩.

Acceptance criteria: No unidentified signals greater than 4% of the mean of signal height of 1 and 2 are present in the following ranges: 0.10–2.00, 2.10–3.20, and 5.70–8.00 ppm. No signals greater than 200% signal height of the mean of the signal height of 1 and 2 are present in the 3.35–4.55 ppm for porcine heparin.

• B. CHROMATOGRAPHIC IDENTITY

Solution A: Dissolve 0.8 g of monobasic sodium phosphate dihydrate in 2 L of water and adjust with phosphoric acid to a pH of 3.0. Filter the solution through a 0.45-µm membrane and degas prior to use.

Solution B: Dissolve 0.8 g of monobasic sodium phosphate dihydrate and 280 g of sodium perchlorate monohydrate in 2 L of water and adjust with phosphoric acid to a pH of 3.0. Filter the solution through a 0.45-µm membrane and degas prior to use.

[1] GlcNAc, *N*-acetylated glucosamine; GlcNS, *N*-sulfated glucosamine; S, Sulfate; IdoA, iduronic acid; GlcN, glucosamine; GalN, galactosamine.

Mobile phase: See the gradient table below.

Time (min)	*Solution A* (%)	*Solution B* (%)	Elution
0	80	20	Equilibration
60	10	90	Linear gradient
61	80	20	Linear gradient
75	80	20	Re-equilibration

Standard solution: NLT 20 mg/mL of USP Heparin Sodium Identification RS in water

System suitability solution: Prepare 1% (w/w) USP Oversulfated Chondroitin Sulfate RS and 1% (w/w) USP Dermatan Sulfate RS in *Standard solution*.

Sample solution: NLT 20 mg/mL of Heparin Sodium in water

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 202 nm

Column: 2-mm × 25-cm; packing L61

Guard column: 2-mm × 50-mm; packing L61

Column temperature: Maintain columns at 40°

Flow rate: 0.22 mL/min

Injection size: 10 µL

System suitability

Sample: *System suitability solution*

NOTE—The retention times for dermatan sulfate, heparin, and oversulfated chondroitin sulfate are about 20, 30, and 50 min, respectively.

Suitability requirements

Resolution: NLT 1.0 between the dermatan sulfate and the heparin peaks, and NLT 1.5 between the heparin and the oversulfated chondroitin sulfate

Relative standard deviation: NMT 2% for the heparin peak determined from three replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Record the chromatograms, and measure the retention times for the major peaks.

Acceptance criteria: The retention time of the major peak from the *Sample solution* corresponds to that from the *Standard solution*.

• **C. Anti-Factor Xa to Anti-Factor IIa Ratio**

Anti-factor Xa activity

pH 8.4 buffer: Dissolve amounts of tris(hydroxymethyl)aminomethane, edetic acid, and sodium chloride in water containing 0.1% of polyethylene glycol 6000 to obtain a solution having concentrations of 0.050 M, 0.0075 M, and 0.175 M, respectively. Adjust, if necessary, with hydrochloric acid or sodium hydroxide solution to a pH of 8.4.

Antithrombin solution: Reconstitute a vial of antithrombin (see *Reagents, Indicators, and Solutions—Reagent Specifications*) as directed by the manufacturer, and further dilute with *pH 8.4 buffer* to obtain a solution having a concentration of 1.0 Antithrombin IU/mL.

Factor Xa solution: Reconstitute bovine factor Xa as directed by the manufacturer (see *Factor Xa* in *Reagents, Indicators, and Solutions—Reagent Specifications*), and further dilute in *pH 8.4 buffer* to obtain a solution that gives an absorbance value between 0.65 and 1.25 at 405 nm when assayed as described below but using 30 µL of *pH 8.4 buffer* instead of 30 µL of the *Standard solutions* or the *Sample solutions*. [NOTE—*Factor Xa solution* contains about 3 nanokatalytic units/mL, but can vary depending upon the manufacturer of factor Xa or the substrate used.]

Chromogenic substrate solution: Prepare a solution of a suitable chromogenic substrate for amidolytic test (see *Reagents, Indicators, and Solutions—Reagent Specifications*) specific for factor Xa in water to obtain a concentration of 1 mM.

Stopping solution: 20% (v/v) solution of acetic acid

Standard solutions: Reconstitute the entire contents of an ampule of USP Heparin Sodium for Assays RS with water, and dilute with *pH 8.4 buffer* to obtain at least 5 dilutions in the concentration range between 0.03 and 0.375 USP Heparin Units/mL.

Sample solutions: Dissolve or dilute an accurately measured quantity of Heparin Sodium in *pH 8.4 buffer*, and dilute with the same buffer to obtain solutions having activities approximately equal to those of the *Standard solutions*.

Analysis

NOTE—The procedure can also be performed using alternative platforms. Perform the test with each *Standard solution* and *Sample solution* in duplicate.

To each of a series of suitable plastic tubes placed in a water bath set at 37°, transfer 120 µL of *pH 8.4 buffer*. Then separately transfer 30 µL of the different dilutions of the *Standard solutions* or the *Sample solutions* to the tubes. Add 150 µL of *Antithrombin solution*, prewarmed at 37° for 15 min, to each tube, mix, and incubate for 2 min. Add 300 µL of *Factor Xa solution*, prewarmed at 37° for 15 min, to each tube, mix, and incubate for 2 min. Add 300 µL of *Chromogenic substrate solution*, prewarmed at 37° for 15 min, to each tube, mix, and incubate for exactly 2 min. Add 150 µL of *Stopping solution* to each tube, and mix. Prepare a blank for zeroing the spectrophotometer by adding the reagents in reverse order, starting with the *Stopping solution* and ending with the addition of 150 µL of *pH 8.4 buffer*, and excluding the *Standard solutions* or the *Sample solutions*. Record the absorbance at 405 nm against the blank.

Calculations: Plot the log of the absorbance values of the *Standard solutions* and the *Sample solutions* versus heparin concentrations in USP Units. Calculate the activity of Heparin Sodium in USP Units/mg using statistical methods for slope ratio assays. Calculate the anti-factor Xa activity of Heparin Sodium by the formula:

$$A \times (S_T/S_S)$$

A = the potency of USP Heparin Sodium for Assays RS

S_T = slope of the line for the *Sample solutions*

S_S = slope of the line for the *Standard solutions*

Express the anti-factor Xa activity of the *Sample solution* as USP Heparin Units/mg, calculated on the dried basis. Calculate the ratio of anti-factor Xa activity against anti-factor IIa potency (see *Assay* below) by the formula:

anti-factor Xa activity/anti-factor IIa potency

Acceptance criteria: NLT 0.9 and NMT 1.1

• **D. Identification Tests— General**, *Sodium* ⟨191⟩**:** It meets the requirements of the flame test for sodium.

ASSAY

• **Anti-Factor IIa Potency**

pH 8.4 buffer: Dissolve 6.10 g of tris(hydroxymethyl)aminomethane, 10.20 g of sodium chloride, 2.80 g of edetate sodium, and, if suitable, between 0 and 10.00 g of polyethylene glycol 6000 and/or 2.00 g of bovine serum albumin in 800 mL of water. [NOTE—2.00 g of human albumin may be substituted for 2.00 g of bovine serum albumin.] Adjust with hydrochloric acid to a pH of 8.4, and dilute with water to 1000 mL.

Antithrombin solution: Reconstitute a vial of antithrombin (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to obtain a solution of 5 Antithrombin IU/mL. Dilute this solution with *pH 8.4 buffer* to obtain a solution having a concentration of 0.125 Antithrombin IU/mL.

Thrombin human solution: Reconstitute thrombin human (factor IIa) (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to give 20 Thrombin IU/mL, and dilute with *pH 8.4 buffer* to obtain a solution having a concentration of 5 Thrombin IU/mL. [NOTE—The thrombin should have a specific activity of NLT 750 IU/mg.]

Interim Revision Announcement

Chromogenic substrate solution: Prepare a solution of a suitable chromogenic thrombin substrate for amidolytic test (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to obtain a concentration of 1.25 mM.

Stopping solution: 20% (v/v) solution of acetic acid

Standard solutions: Reconstitute the entire contents of an ampule of USP Heparin Sodium for Assays RS with water and dilute with *pH 8.4 buffer* to obtain at least four dilutions in the concentration range between 0.005 and 0.03 USP Heparin Unit/mL.

Sample solutions: Proceed as directed for *Standard solutions* to obtain concentrations of Heparin Sodium similar to those obtained for the *Standard solutions*.

Analysis

[NOTE—The procedure can also be performed using alternative platforms.]

For each dilution of the *Standard solutions* and the *Sample solutions*, at least duplicate samples should be tested. Label a suitable number of tubes depending on the number of replicates to be tested: for example, if five blanks are to be used: B1, B2, B3, B4, and B5 for the blanks; T1, T2, T3, and T4 each at least in duplicate for the dilutions of the *Sample solutions*; and S1, S2, S3, and S4 each at least in duplicate for the dilutions of the *Standard solutions*. Distribute the blanks over the series in such a way that they accurately represent the behavior of the reagents during the experiments. [NOTE—Treat the tubes in the order B1, S1, S2, S3, S4, B2, T1, T2, T3, T4, B3, T1, T2, T3, T4, B4, S1, S2, S3, S4, B5.] Note that after each addition of a reagent, the incubation mixture should be mixed without allowing bubbles to form. Add twice the volume (100–200 µL) of *Antithrombin solution* to each tube containing one volume (50–100 µL) of either the *pH 8.4 buffer* or an appropriate dilution of the *Sample solutions* or the *Standard solutions*. Mix, but do not allow bubbles to form. Incubate at 37° for at least 1 min. Add to each tube 25–50 µL of *Thrombin human solution*, and incubate for at least 1 min. Add 50–100 µL of *Chromogenic substrate solution*. Please note that all reagents, *Standard solutions*, and *Sample solutions* should be prewarmed to 37° just prior to use.

Two different types of measurements can be recorded:

1. Endpoint Measurement: Stop the reaction after at least 1 min with 50–100 µL of *Stopping solution*. Measure the absorbance of each solution at 405 nm using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩). The RSD over the blank readings is less than 10%.
2. Kinetic Measurement: Follow the change in absorbance for each solution over 1 min at 405 nm using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩). Calculate the change in absorbance/min (ΔOD/min). The blanks for kinetic measurement are also expressed as ΔOD/min and should give the highest values as they are carried out in the absence of heparin. The RSD over the blank readings is less than 10%.

Calculations: The statistical models for *Slope ratio assay* or *Parallel-line assay* can be used depending on which model best describes the correlation between concentration and response.

Parallel-line assay: For each series, calculate the regression of the absorbance or change in absorbance/min against log concentrations of the *Sample solutions* and the *Standard solutions*, and calculate the potency of Heparin Sodium in USP Units/mL using statistical methods for parallel-line assays. Express the potency of Heparin Sodium/mg, calculated on the dried basis.

Slope ratio assay: For each series, calculate the regression of the log absorbance or the log change in absorbance/min against concentrations of the *Sample solutions* and of the *Standard solutions*, and calculate the potency of Heparin Sodium in USP Units/mL using statistical methods for slope ratio assays. Express the potency of Heparin Sodium/mg, calculated on the dried basis.

Acceptance criteria: The potency of Heparin Sodium, calculated on the dried basis, is NLT 180 USP Heparin Units in each mg.

INORGANIC IMPURITIES

• **RESIDUE ON IGNITION** ⟨281⟩**:** Between 28.0% and 41.0%

• **NITROGEN DETERMINATION**, *Method I, Nitrates and Nitrites Absent* ⟨461⟩*:* Between 1.3% and 2.5%, calculated on the dried basis

• **HEAVY METALS**, *Method II* ⟨231⟩*:* NMT 30 ppm

ORGANIC IMPURITIES

• **LIMIT OF GALACTOSAMINE IN TOTAL HEXOSAMINE** (a measure of dermatan sulfate and other galactosamine containing impurities)

Mobile phase: 14 mM potassium hydroxide

Glucosamine standard solution: 1.6 mg/mL of USP Glucosamine Hydrochloride RS in 5 N hydrochloric acid

Galactosamine standard solution: 16 µg/mL of USP Galactosamine Hydrochloride RS in 5 N hydrochloric acid

Standard solution: Mix equal volumes of *Glucosamine standard solution* and *Galactosamine standard solution*.

Hydrolyzed standard solution: Transfer 5 mL of the *Standard solution* to a 7-mL screw-cap test tube, cap, and heat for 6 h at 100°. Cool to room temperature, quantitatively transfer the solution to a 500-mL volumetric flask, and dilute with water to volume.

Sample solution: Transfer 12 mg of Heparin Sodium to a 7-mL screw-cap test tube, dissolve in 5 mL of 5 N hydrochloric acid, and cap.

Hydrolyzed sample solution: Heat the *Sample solution* for 6 h at 100°. Cool to room temperature and dilute with water (1 in 100).

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*)

Mode: HPIC

Detector: Pulsed amperometric detector, set to the following waveform:

Step	Time (s)	Potential (V)	Integration
1	0.00	+0.1	—
2	0.20	+0.1	Begins
3	0.40	+0.1	Ends
4	0.41	–2.0	—
5	0.42	–2.0	—
6	0.43	+0.6	—
7	0.44	–0.1	—
8	0.50	–0.1	—

Column: 3-mm × 30-mm amino acid trap column in series with a 3- × 30-mm guard column and a 3-mm × 15-cm column that contains packing L69

Column temperature: Maintain columns at 30°

Flow rate: 0.5 mL/min

Pre-equilibration: At least 60 min with *Mobile phase*

Injection size: 10 µL

Elution: 10 min with *Mobile phase*

Column cleaning: At least 10 min with 100 mM potassium hydroxide

Equilibration: At least 10 min with *Mobile phase* before each injection

System suitability

Sample: *Hydrolyzed standard solution*

Suitability requirements

Resolution: NLT 2 between the galactosamine and glucosamine peaks

Column efficiency: NLT 2000 theoretical plates for glucosamine

Tailing factor: Between 0.8 and 2.0 for the galactosamine and glucosamine peaks

Analysis

Samples: *Hydrolyzed standard solution* and *Hydrolyzed sample solution*

Record the chromatograms, and measure the responses for the peaks at the retention time of galactosamine and glucosamine. Calculate the response ratio of galactosamine to glucosamine ($GalN_R$) in the *Hydrolyzed standard solution*:

$$(GalN_B/GalN_W) \times (GlcN_W/GlcN_B)$$

$GalN_B$ = galactosamine peak area from the *Hydrolyzed standard solution*
$GalN_W$ = weight of galactosamine for the *Standard solution*
$GlcN_B$ = glucosamine peak area from the *Hydrolyzed standard solution*
$GluN_W$ = weight of glucosamine for the *Standard solution*
Calculate the percentage of galactosamine in the portion of total hexosamine taken:

$$\{[(GalN_U/GalN_R)]/[(GalN_U/GalN_R) + GlcN_U]\} \times 100$$

$GalN_U$ = galactosamine peak area from the *Hydrolyzed sample solution*
$GalN_R$ = galactosamine response ratio
$GlcN_U$ = glucosamine peak area from the *Hydrolyzed sample solution*

Acceptance criteria: The percent galactosamine peak area of the total hexosamine of the *Hydrolyzed sample solution* must be NMT 1%.

• **NUCLEOTIDIC IMPURITIES:** *Biotechnology-Derived Articles—Total Protein Assay* ⟨1057⟩*, Method I* with the following modifications

Analysis: Dissolve 40 mg of Heparin Sodium in 10 mL of water. Measure the absorbance of this solution at 260 nm using the light scattering correction procedure of *Biotechnology-Derived Articles—Total Protein Assay* ⟨1057⟩*, Method I*.

Acceptance criteria: The absorbance of this solution at 260 nm is NMT 0.20.

• **ABSENCE OF OVERSULFATED CHONDROITIN SULFATE**

A: Proceed as directed in *Identification* test *A*. No features associated with oversulfated chondroitin sulfate are found between 2.12 and 3.00 ppm.

B: Proceed as directed in *Identification* test *B*. No peaks corresponding to oversulfated chondroitin sulfate should be detected eluting after the heparin peak.

• **PROTEIN IMPURITIES**

Standard stock solution: 0.100 mg/mL of bovine serum albumin in water

Standard solutions: Dilute portions of the *Standard stock solution* with water to obtain NLT 5 standard solutions having concentrations between 0.005 and 0.100 mg/mL of bovine serum albumin, the concentrations being evenly spaced.

Sample solution: 5 mg/mL of Heparin Sodium in water. Prepare in triplicate.

Blank: Water

Lowry reagent A: Prepare a solution of 10 g/L of sodium hydroxide in water and a solution of 50 g/L of sodium carbonate in water. Mix equal volumes (2V:2V) of each solution, and dilute with water to 5V.

Lowry reagent B: Prepare a solution of 29.8 g/L of disodium tartrate dihydrate in water. Prepare a solution of 12.5 g/L of cupric sulfate in water. Mix equal volumes of both solutions (2V:2V), and dilute with water to 5V.

Lowry reagent C: Mix 50 volumes of *Lowry reagent A* with 1 volume of *Lowry reagent B*.

Diluted Folin-Ciocalteu's phenol reagent: Dilute Folin-Ciocalteu's phenol reagent 2–4 times with water. The dilution should be chosen such that the pH of the samples (i.e., *Standard solution* and *Sample solution* after addition of *Lowry reagent C* and the *Diluted Folin-Ciocalteu's phenol reagent*) is 10.25 ± 0.25.

Analysis

Samples: *Standard solutions, Sample solution,* and *Blank*

To 1 mL each of *Standard solution*, *Sample solution*, and *Blank*, add 5 mL of *Lowry reagent C*. Allow to stand at room temperature for 10 min. Add 0.5 mL of *Diluted Folin-Ciocalteu's phenol reagent* to each solution, mix immediately, and allow to stand at room temperature for 30 min. Determine the absorbance as directed in *Biotechnology-Derived Articles—Total Protein Assay* ⟨1057⟩*, Method 2*.

Calculations: See *Biotechnology-Derived Articles—Total Protein Assay* ⟨1057⟩*, Method 2*.

Acceptance criteria: NMT 1.0% (w/w) is found.

• **RESIDUAL SOLVENTS** ⟨467⟩**:** It meets the requirements.

SPECIFIC TESTS

• **pH** ⟨791⟩*:* 5.0–7.5, (1 in 100) solution

• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩*:* NMT 0.03 USP Endotoxin Unit/USP Heparin Unit

• **STERILITY TESTS** ⟨71⟩*:* Where it is labeled as sterile, it meets the requirements.

• **LOSS ON DRYING** ⟨731⟩*:* Dry under vacuum at 60° for 3 h. It loses NMT 5.0% of its weight.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE***:* Preserve in tight containers, and store below 40°, preferably at room temperature.

• **LABELING***:* Label it to indicate the tissue and the animal species from which it is derived.

Heparin Sodium Injection

•DEFINITION

Heparin Sodium Injection is a sterile solution of Heparin Sodium in Water for Injection. It exhibits a potency NLT 90.0% and NMT 110.0% of the potency stated on the label in terms of USP Heparin Units/mL.

ASSAY

• **ANTI-FACTOR IIa POTENCY**

NOTE—Allow alternative platforms.

pH 8.4 Buffer: Dissolve 6.10 g of tris(hydroxymethyl)aminomethane, 10.20 g of sodium chloride, 2.80 g of edetate sodium, and, if suitable, between 0 and 10.00 g of polyethylene glycol 6000 and/or 2.00 g of bovine serum albumin in 800 mL of water. [NOTE—2.00 g of human albumin may be substituted for 2.00 g of bovine serum albumin.] Adjust with hydrochloric acid to a pH of 8.4, and dilute with water to 1000 mL.

Antithrombin solution: Reconstitute a vial of antithrombin (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to obtain a solution of 5 Antithrombin IU/mL. Dilute this solution with *pH 8.4 Buffer* to obtain a solution having a concentration of 0.125 Antithrombin IU/mL.

Thrombin human solution: Reconstitute thrombin human (factor IIa) (see *Reagents, Indicators, and Solutions—Reagents Specifications*) in water to give 20 Thrombin IU/mL, and dilute with *pH 8.4 Buffer* to obtain a solution having a concentration of 5 Thrombin IU/mL. [NOTE—The thrombin should have a specific activity of NLT 750 IU/mg.]

Chromogenic substrate solution: Prepare a solution of a suitable chromogenic thrombin substrate for amidolytic test (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to obtain a concentration of 1.25 mM.

Stopping solution: 20% (v/v) solution of acetic acid

Interim Revision Announcement

Standard solutions: Reconstitute the entire contents of an ampule of USP Heparin Sodium for Assays RS with water and dilute with *pH 8.4 Buffer* to obtain at least four dilutions in the concentration range between 0.005 and 0.03 USP Heparin Unit/mL.

Sample solutions: Proceed as directed for *Standard solutions* to obtain concentrations of Heparin Sodium similar to those obtained for the *Standard solutions*.

Analysis

[NOTE—The procedure can also be performed using alternative platforms.]

For each dilution of the *Standard solutions* and *Sample solutions*, at least duplicate samples should be tested. Label a suitable number of tubes depending on the number of replicates to be tested. For example, if five blanks are to be used: B1, B2, B3, B4, and B5 for the blanks; T1, T2, T3, and T4 each at least in duplicate for the dilutions of the *Sample solutions*; and S1, S2, S3, and S4 each at least in duplicate for the dilutions of the *Standard solutions*. Distribute the blanks over the series in such a way that they accurately represent the behavior of the reagents during the experiments. [NOTE—Treat the tubes in the order B1, S1, S2, S3, S4, B2, T1, T2, T3, T4, B3, T1, T2, T3, T4, B4, S1, S2, S3, S4, B5.] Note that after each addition of a reagent, the incubation mixture should be mixed without allowing bubbles to form. To each tube add twice the volume (100–200 µL), of *Antithrombin solution* and one volume (50–100 µL), of either the *pH 8.4 Buffer* or an appropriate dilution of the *Sample solutions* or the *Standard solutions*. Mix, but do not allow bubbles to form. Incubate at 37° for at least 1 min. Add to each tube 25–50 µL of *Thrombin human solution*, and incubate for at least 1 min. Add 50–100 µL of *Chromogenic substrate solution*. Please note that all reagents, *Standard solutions*, and *Sample solutions* should be prewarmed to 37° just prior to use.

Two different types of measurements can be recorded:

1. ENDPOINT MEASUREMENT: Stop the reaction after at least 1 min with 50–100 µL of *Stopping solution*. Measure the absorbance of each solution at 405 nm using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩). The RSD over the blank readings is less than 10%.
2. KINETIC MEASUREMENT: Follow the change in absorbance for each solution over 1 min at 405 nm using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩). Calculate the change in absorbance/min (ΔOD/min). The blanks for kinetic measurement are also expressed as ΔOD/min and should give the highest values as they are carried out in the absence of heparin. The RSD over the blank readings is less than 10%.

Calculations: The statistical models for *Slope ratio assay* or *Parallel-line assay* can be used depending on which model best describes the correlation between concentration and response.

Parallel-line assay: For each series, calculate the regression of the absorbance or change in absorbance/min against log concentrations of the *Sample solutions* and the *Standard solutions*, and calculate the potency of Heparin Sodium in USP Units/mL using statistical methods for parallel-line assays. Express the activity of Heparin Sodium/mg, calculated on the dried basis.

Slope ratio assay: For each series, calculate the regression of the log absorbance or the log change in absorbance/min against concentrations of the *Sample solutions* and of the *Standard solutions*, and calculate the potency of Heparin Sodium in USP Units/mL using statistical methods for slope ratio assays. Express the activity of Heparin Sodium/mg, calculated on the dried basis.

Acceptance criteria: NLT 90.0% and NMT 110.0% of the potency stated on the label in terms of USP Heparin Units/mL.

SPECIFIC TESTS

• **BACTERIAL ENDOTOXINS TEST** ⟨85⟩**:** It contains NMT 0.03 USP Endotoxin Unit/USP Heparin Unit.

• **PARTICULATE MATTER IN INJECTIONS** ⟨788⟩**:** Meets the requirements for small-volume injections

• **pH** ⟨791⟩*:* 5.0–7.5

• **OTHER REQUIREMENTS:** It meets the requirements under *Injections* ⟨1⟩.

ADDITONAL REQUIREMENTS

• **LABELING:** Label it to indicate the volume of the total contents and the potency in terms of USP Heparin Units only per mL, except that single-dose containers may be labeled additionally to indicate the single unit-dose volume and the total number of USP Heparin Units. Where it is labeled with total content, the label states also that the entire contents are to be used or, if not, any remaining portion is to be discarded. Label it to indicate also the tissue and the animal species from which it is derived.

• **PACKAGING AND STORAGE:** Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, and store at a temperature below 40°, preferably at room temperature.

• **USP REFERENCE STANDARDS** ⟨11⟩

Interim Revision Announcement

PROPOSED INTERIM REVISION ANNOUNCEMENTS

This section includes proposals for *Interim Revision Announcements* (*IRAs*) that will be published as official *USP* or *NF* standards. There is a 60-day comment period for these proposals, beginning on the 15th of the first month of this *Pharmacopeial Forum*. The approved official text will be published in a future *Pharmacopeial Forum* and additionally in the ''New Official Text'' section of USP's web site (www.usp.org). Readers should review material in this section and provide comments to the Scientific Liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Expert Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Each proposal is preceded by a Briefing that indicates the proposed revisions.

BRIEFING

Acitretin Capsules, *USP 32* page 1426. On the basis of comments received, in the *Assay* it is proposed to revise the *Assay preparation* to state that only the contents of the Capsules will be used, rather than the entire Capsule including the shells. The acitretin concentration of the *Assay preparation* will also be specified. In the absence of any significant adverse comment, it is proposed to implement this revision via an *Interim Revision Announcement* pertaining to *USP 32–NF 27* in *PF* 36(1) [Jan.–Feb. 2010], with an official date of February 1, 2010.

(MD-OOD: F. Mao) RTS—C75260

Change to read:

Assay—

Diluent—Prepare a suitable mixture of methanol and tetrahydrofuran (13 : 10).

Mobile phase—Prepare a filtered and degassed mixture of methanol, water, alcohol, and glacial acetic acid (74 : 21 : 5 : 0.5). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—In a 100-mL volumetric flask, dissolve about 10 mg of USP Acitretin RS, accurately weighed, in 80 mL of *Diluent,* and sonicate for 5 minutes. Add 8 mL of water, and quantitatively dilute with *Diluent* to obtain a solution having a concentration of about 0.1 mg per mL.

System suitability solution—Transfer 2 mL of the *Standard preparation* to a clear 4-mL glass vial. After sealing the vial with a teflon-lined silicone septum and cap, place the vial on its side in a light chamber, expose it to 400 foot-candles of fluorescent light for 5 minutes, and then completely wrap the vial with aluminum foil. [NOTE—Exposure to the fluorescent light allows for the formation of two degradation products: acitretin related compound A and the 9-*cis* isomer [*(E,E,Z,E)*-9-(4-methoxy-2,3,6-trimethylphenyl)-3,7-dimethyl-2,4,6,8-nonatetraenoic acid].]

Assay preparation—~~Carefully separate and place both halves of 10 Capsules into a 100 mL volumetric flask. Stopper and shake the flask to remove the fill. Add 8 mL of water while rinsing any fill from the neck of the flask. Place the flask in a water bath set at 45° for 10 minutes, shaking initially and at 5-minute intervals up to 10 minutes. Place the resulting suspension in an ultrasonic bath for 15 minutes. Dilute with *Diluent* to volume, and sonicate for 5 additional minutes. Cool to room temperature and, if necessary, dilute with *Diluent* to volume. Filter the suspension, and use the clear filtrate.~~

•Open not fewer than 20 Capsules, composite the Capsule fill, and mix well. Transfer the Capsule fill, equivalent to 10 mg of acitretin, into a 100-mL volumetric flask. Add 8 mL of water to wet the sample, and sonicate for 5 minutes. Dilute with *Diluent* to volume, and sonicate for 5 minutes. Cool to room temperature. Pass the suspension through a suitable filter having a porosity of 0.5 μm, and use the clear filtrate. [NOTE—Inject the *Sample solution* within an hour of preparation.]•1

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 365-nm detector and a 4.6-mm × 15-cm column that contains 5-μm L1 packing. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between acitretin related compound A (relative retention time of about 0.84) and acitretin is not less than 3.0; the resolution, *R,* between the 9-*cis* isomer (relative retention time of about 1.09) and acitretin is not less than 1.8. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections of acitretin is not more than 2.0%.

Procedure—Separately inject equal volumes (about 25 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of acitretin ($C_{21}H_{26}O_3$) in the portion of Capsules taken by the formula:

$$100C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Acitretin RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

BRIEFING

Docusate Sodium, *USP 32* page 2195. Comments were received indicating that the ignition temperature of 600 ± 50° specified in the harmonized general test chapter *Residue on Ignition* ⟨281⟩ is not sufficient to effectively ash the material. It is proposed to specify that the test for *Residue on ignition* should be performed at 800 ± 25°, which is also consistent with the specifications in the *Food Chemicals Codex*.

Subject to consideration of comments received, it is proposed to implement this change via an *Interim Revision Announcement* pertaining to *USP 33–NF 28* in *PF* 36(1) [Jan.–Feb. 2010], with an official date of February 1, 2010. Comments regarding this proposal should be received by Nov. 15, 2009.

(MD-GRE: E. Gonikberg) RTS—C77132

Change to read:

Residue on ignition ⟨281⟩: between 15.5% and 16.5%, calculated on the anhydrous basis.

•*Procedure:* Transfer about 1 g, accurately weighed, to a tared crucible, ignite until thoroughly charred, and cool. Moisten the ash with 1 mL of sulfuric acid, and complete the ignition by heating at 800 ± 25° for 15-minute periods to constant weight.•1

BRIEFING

Propranolol Hydrochloride Extended-Release Capsules, *USP 32* page 3426. It is proposed to clarify how to measure time when running *Dissolution Test 1* and *Test 2*. It is proposed to add a *Dissolution Test 3* for a new generic product. In the absence of negative comments, it is proposed to implement these revisions through an *Interim Revision Announcement* with an official date of February 1, 2010.

Dissolution ⟨711⟩**—**

TEST 1—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.

pH 1.2 Buffer solution—Dissolve 2.0 g of sodium chloride in water, add 7.0 mL of hydrochloric acid, dilute with water to 1 L, and mix.

pH 6.8 Buffer solution—Dissolve 21.72 g of anhydrous dibasic sodium phosphate and 4.94 g of citric acid monohydrate in water, dilute with water to 1 L, and mix.

Media—Proceed as directed under *Method B* for *Delayed-Release Dosage Forms,* using 900 mL of *pH 1.2 Buffer solution* during the *Acid stage,* ~~run for 1.5 hours, and use the acceptance criteria given under *Acceptance Table 3*~~

•and conduct the test for 1.5 hours.•1
For the *Buffer stage*, use 900 mL of *pH 6.8 Buffer solution*, ~~run for the time specified~~

•conduct the test for 2.5 hours (this is the 4-hour time point: 1.5 hours in *Acid stage* plus 2.5 hours in *Buffer stage*), conduct the test for the additional time points, always considering T_1 = 1.5 hours,•1
and use the acceptance criteria given under *Tolerances*.

Apparatus 1: 100 rpm.

Times: 1.5, 4, 8, 14, and 24 hours.

Procedure—Using filtered portions of the solution under test, diluted if necessary, determine the amount of $C_{16}H_{21}NO_2 \cdot HCl$ dissolved, using UV absorbances at the wavelength of maximum absorbance at about 320 nm, with respect to a baseline drawn from 355 nm through 340 nm, by comparison with a Standard solution in water having a known concentration of USP Propranolol Hydrochloride RS.

Tolerances—The percentages of the labeled amount of $C_{16}H_{21}NO_2 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1.5	not more than 30%
4	between 35% and 60%
8	between 55% and 80%
14	between 70% and 95%
24	between 81% and 110%

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

pH 1.2 Buffer solution—Dissolve 2.0 g of sodium chloride in water, add 7.0 mL of hydrochloric acid, dilute with water to 1 L, and mix.

pH 7.5 Buffer solution—Dissolve 6.8 g of monobasic potassium phosphate and 1.6 g of sodium hydroxide in 900 mL of water, adjust with 1 N sodium hydroxide to a pH of 7.5, dilute with water to 1 L, and mix.

Media—Proceed as directed under *Method B* for *Delayed-Release Dosage Forms,* using 900 mL of *pH 1.2 Buffer solution* during the *Acid stage,* ~~run for 1 hour, and use the acceptance criteria given under *Acceptance Table 3*~~

•and conduct the test for 1 hour.•1
For the *Buffer stage*, use 900 mL of *pH 7.5 Buffer solution*, ~~run for the time specified~~

•conduct the test for 2 hours (this is the 3-hour time point: 1 hour in *Acid stage* plus 2 hours in *Buffer stage*), conduct the test for the additional time points, always considering T_1 = 1 hour,•1
and use the acceptance criteria given under *Tolerances.*

Apparatus 1: 50 rpm.

Times: 1, 3, 6, and 12 hours.

Procedure—Using filtered portions of the solution under test, diluted if necessary, determine the amount of $C_{16}H_{21}NO_2 \cdot HCl$ dissolved, using UV absorbances at the wavelength of maximum absorbance at about 320 nm, with respect to a baseline drawn from 355 nm through 340 nm, by comparison with a Standard solution in water having a known concentration of USP Propranolol Hydrochloride RS.

Tolerances—The percentages of the labeled amount of $C_{16}H_{21}NO_2 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	not more than 20%
3	between 20% and 45%
6	between 45% and 80%
12	not less than 80%

•TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Acid stage medium: pH 1.2 buffer solution (prepared by dissolving 2.0 g of sodium chloride in water, adding 7.0 mL of hydrochloric acid, and diluting with water to 1000 mL); 900 mL.

Buffer stage medium: pH 6.8 phosphate buffer; 900 mL.

Apparatus 1: 100 rpm.

Standard stock solution: Transfer 50 mg, accurately weighed, of USP Propranolol Hydrochloride RS to a 50-mL volumetric flask, and dilute with water to volume.

Working standard solution—Quantitatively dilute the *Standard stock solution* with water to obtain a final concentration of about L/1000 mg per mL, where L is the capsule label claim in mg.

Procedure—Conduct the test in *Acid stage medium* for 1.5 hours, sample, and pass through a suitable 0.45-μm filter. Replace the *Acid stage medium* with the *Buffer stage*

Proposed IRA

medium, and conduct the test for 2.5 hours (this is the 4-hour time point: 1.5 hours in *Acid stage medium* plus 2.5 hours in *Buffer stage medium*), conduct the test for the additional time points, always considering T_1 = 1.5 hours, and use the acceptance criteria given under *Tolerances*.

Determine the percentage of propanolol hydrochloride dissolved using the spectrophotometric procedure as directed for *Test 1*.

Tolerances—The percentages of the labeled amount of $C_{16}H_{21}NO_2 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1.5	not more than 15%
4	not more than 30%
8	between 25% and 60%
14	between 55% and 85%
24	not less than 75%

Proposed IRA

IN-PROCESS REVISION

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) proposed revisions placed directly under *In-Process Revision,* or (2) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the staff liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

BRIEFING

Name of Item, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How to Use PF*), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:

(DSI: D. Sarma.) RTS—C55678

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. Because of the redesign of monographs, any proposed new text with revisions for *USP 33–NF 28* and beyond will be set off from the current official text by shading where the symbols surround the text changes. Standards that become official as *Interim Revision Announcements (IRAs)* in *Pharmacopeial Forum* will continue to identify changed text in a larger font (print edition only). All *USP–NF* revisions use the following symbols that indicate the final destination of the official text: •new text• if slated for an *IRA*; ▲new text▲ if slated for *USP–NF*; and ■new text■ if slated for a *Supplement* to *USP–NF*. The same symbols *not* set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as ••, or ■■, or ▲▲, it means that text has been deleted and no new text was proposed to replace it.

In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •2 indicates that the revision is proposed for the *Interim Revision Announcement* that will appear in issue 2 of a given *PF* volume, ■2S (*USP 32*) indicates that the proposed revision is slated for the *Second Supplement to USP 32*, and ▲*USP33* and ▲*NF28* indicates that the revisions are proposed for *USP 33* and *NF 28*, respectively.

Official Title Changes Where the specification ''***Monograph title change***'' is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

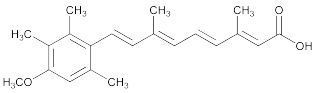
USP MONOGRAPHS

BRIEFING

Acitretin, *USP 32* page 1425. On the basis of comments received, it is proposed to revise the *System suitability* criteria in the *Assay*. The relative standard deviation is calculated on the basis of the acitretin peak from the *Standard solution* to make it consistent with the system suitability requirement in the monograph submission. It is also proposed to revise the test for *Heavy Metals* by replacing chapter ⟨231⟩, *Method I*, with *Method II*, because acitretin yields a yellow solution under the test condition.

(MD-OOD: F. Mao.) RTS—C71343

Acitretin



$C_{21}H_{26}O_3$ 326.43

2,4,6,8-Nonatetraenoic acid, 9-(4-methoxy-2,3,6-trimethylphenyl)-3,7-dimethyl-, (*all-E*)-;
(*all-E*)-9-(4-Methoxy-2,3,6-trimethylphenyl)-3,7-dimethyl-2,4,6,8-nonatetraenoic acid [55079-83-9].

DEFINITION

Acitretin contains NLT 98.0% and NMT 102.0% of $C_{21}H_{26}O_3$, calculated on the dried basis.

[**CAUTION—**Acitretin is a teratogen. Great care should be taken when handling to avoid inhalation of dust or contact with skin.]

[NOTE—Use low-actinic glassware, and perform all tests under yellow and subdued light.]

IDENTIFICATION

- **A. INFRARED ABSORPTION** ⟨**197K**⟩
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

Change to read:

- **PROCEDURE**

Mobile phase: Alcohol, glacial acetic acid, and water (92:0.3:8)

System suitability solution: In a 200-mL volumetric flask dissolve 2.0 mg each of USP Acitretin RS and USP Tretinoin RS in tetrahydrofuran. Dilute with alcohol to volume. Pipet 5.0 mL of this solution into a 200-mL volumetric flask, and dilute quantitatively with alcohol. [NOTE—Store the solution at 4° before injection.]

Standard solution: 0.1 mg/mL of USP Acitretin RS in alcohol. [NOTE—Use tetrahydrofuran to dissolve USP Acitretin RS before diluting with alcohol. The final concentration of tetrahydrofuran in the preparation will be 2%. Store the solution at 4° before injection.]

Sample stock solution: 0.25 mg/mL of Acitretin in tetrahydrofuran and alcohol (1:19). [NOTE—Dissolve in tetrahydrofuran before diluting with alcohol.]

Sample solution: 0.1 mg/mL of Acitretin from *Sample stock solution* in alcohol. [NOTE—Store the solution at 4° before injection.]

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 360 nm

Column: 4-mm × 25-cm; packing L1

Flow rate: 0.6 mL/min

Injection size: 10 µL

System suitability

Samples: *System suitability solution* ■and *Standard solution*■2S (USP33)

[NOTE—The relative retention times for tretinoin and acitretin are 0.84 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between tretinoin and acitretin, ■*System suitability solution*■2S (USP33)

Relative standard deviation: NMT 1.0% of acitretin, ■*Standard solution*■2S (USP33)

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{21}H_{26}O_3$ in the portion of Acitretin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Acitretin RS in the *Standard solution* (mg/mL)
C_U = concentration of Acitretin in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

Organic Impurities

- **PROCEDURE**

Mobile phase and **Chromatographic system:** Proceed as directed in the *Assay*.

Standard solution: 0.8 µg/mL each of USP Acitretin RS, USP Acitretin Related Compound A RS, and USP Acitretin Related Compound B RS in tetrahydrofuran. Dilute quantitatively with alcohol. [NOTE—Dissolve in tetrahydrofuran before diluting with alcohol. Store the solution at 4° before injection.]

Sample solution: 0.25 mg/mL of Acitretin in tetrahydrofuran, and alcohol (1:19). [NOTE—Dissolve in tetrahydrofuran before diluting with alcohol. Store the solution at 4° before injection.]

System suitability

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Sample: *Standard solution*

[NOTE—The relative retention times for acitretin related compound A, acitretin, and acitretin related compound B are 0.78, 1.0, and 1.61, respectively.]

Suitability requirements

Resolution: NLT 1.5 between acitretin related compound A and acitretin; NLT 1.5 between acitretin related compound B and acitretin

Relative standard deviation: NMT 10.0% for acitretin related compound A and NMT 10.0% for acitretin related compound B

In-Process Revision

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of acitretin related compound A and acitretin related compound B in the portion of Acitretin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of the relevant impurity from the *Sample solution*
r_S = peak response of the relevant impurity from the *Standard solution*
C_S = concentration of USP Acitretin Related Compound A RS or USP Acitretin Related Compound B RS in the *Standard solution* (µg/mL)
C_U = concentration of Acitretin in the *Sample solution* (µg/mL)

Calculate the percentage of impurities other than acitretin related compounds A and B in the portion of Acitretin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each individual unspecified impurity in the *Sample solution*
r_S = peak response of USP Acitretin RS in the *Standard solution*
C_S = concentration of USP Acitretin RS in the *Standard solution* (µg/mL)
C_U = concentration of Acitretin in the *Sample solution* (µg/mL)

Acceptance criteria: NMT 0.3% of acitretin related compound A; NMT 0.3% of acitretin related compound B; NMT 0.1% of any individual unspecified impurity; and NMT 0.4% of total unspecified impurities

Total impurities: NMT 1.0%

SPECIFIC TESTS

- **LOSS ON DRYING ⟨731⟩:** Dry a sample in a vacuum at a pressure not exceeding 19 mm of mercury at 100° for 4 h: it loses NMT 0.2% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light. Store at controlled room temperature.
- **USP REFERENCE STANDARDS ⟨11⟩**
  USP Acitretin RS
  USP Acitretin Related Compound A RS
  USP Acitretin Related Compound B RS
  USP Tretinoin RS

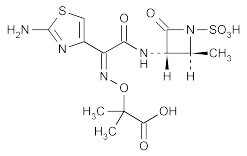
BRIEFING

Aztreonam, *USP 32* page 1616. On the basis of comments received, the following revisions are proposed:

- The *Definition* is revised to provide one set of acceptance criteria for both polymorphic forms.
- The *Assay* is revised to update the *Mobile phase*, the *System suitability solution*, the analytical wavelength, column dimensions, and system suitability based on a validated method. The format of the relative retention times is updated to follow current chromatographic conventions. Solution storage conditions are added to prevent isomerization of aztreonam *Z*-isomer to aztreonam *E*-isomer.
- A test for *Organic Impurites* is added to the monograph based on a validated method. The liquid chromatographic procedure in this test and in the *Assay* is based on analyses performed using a Waters µBondapak C18 brand of L1 column. The typical retention time for aztreonam under the conditions specified is 6 min.
- A test for *Limit of Alcohol* is added to the monograph based on a validated method. This is a test for residual alcohol. The gas chromatographic procedure in this test is based on analyses performed using a Supelco OVI-G43 brand of G43 column. The typical retention time for alcohol under the conditions specified is 3.5 min.

(MD-ANT: A. Wise.) RTS—C60576

Aztreonam



$C_{13}H_{17}N_5O_8S_2$ 435.43

Propanoic acid, 2-[[[1-(2-amino-4-thiazolyl)-2-[(2-methyl-4-oxo-1-sulfo-3-azetidinyl)amino]-2-oxoethylidene]amino]oxy]-2-methyl-, [*2S*-[2α,3*β*(*Z*)]]-;
(*Z*)-2-[[[(2-Amino-4-thiazolyl)[[(2*S*,3*S*)-2-methyl-4-oxo-1-sulfo-3-azetidinyl]carbamoyl]methylene]amino]oxy]-2-methylpropionic acid [78110-38-0].

DEFINITION

Change to read:

~~Aztreonam is anhydrous or hydrated. The anhydrous form contains NLT 90.0% and NMT 105.0% of $C_{13}H_{17}N_5O_8S_2$, calculated on the as-is basis. The hydrated form contains NLT 92.0% and NMT 105.0% of $C_{13}H_{17}N_5O_8S_2$, calculated on the anhydrous basis.~~

■Aztreonam, which may be anhydrous or hydrated, contains NLT 92.0% and NMT 105.0% of $C_{13}H_{17}N_5O_8S_2$, calculated on the anhydrous and solvent-free basis.■2S (*USP33*)

IDENTIFICATION

- **INFRARED ABSORPTION ⟨197K⟩:** If a difference appears in the IR spectra of the analyte and the standard, dissolve an equal portion of the test specimen and the Reference Standard in equal volumes of methanol. [NOTE—To achieve a complete dissolution, it is suggested to use about 25 mL of methanol for each 50 mg of material, and stir the mixture for 40 min at room temperature.]
  Evaporate the solutions to dryness under vacuum. Dry under vacuum at 40° for 4 h. Perform the test on the residues.

SPECIFIC TESTS

- **STERILITY TESTS ⟨71⟩:** Where the label states that Aztreonam is sterile, it meets the requirements for *Test for Sterility of the Product to Be Examined, Membrane Filtration,* using *Fluid A,* to which 23.4 g of sterile arginine has been added to each 1000 mL.
- **WATER DETERMINATION,** *Method I* **⟨921⟩:** NMT 2.0%; if labeled as the hydrated form: 12.0%–18.0%
  [NOTE—The term *hydrated form* refers to the α-form of Aztreonam, which is not a stoichiometric hydrate.]
- **BACTERIAL ENDOTOXINS TEST ⟨85⟩:** Where the label states that aztreonam is sterile or must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 0.17 USP Endotoxin Unit/mg of aztreonam.

Add the following:

■• **LIMIT OF ALCOHOL**
[NOTE—This test is to be performed if alcohol is used while manufacturing Aztreonam.]
Standard solution: 0.004 mL/mL of alcohol from USP Alcohol Determination—Alcohol RS and 0.004 mL/mL of acetonitrile from USP Alcohol Determination—Acetonitrile RS in dimethylformamide. [NOTE—The *Standard solution* contains 0.4% v/v alcohol and 0.4% v/v acetonitrile.]
Sample solution: 80 mg/mL of Aztreonam and 0.004 mL/mL of acetonitrile in dimethylformamide. [NOTE—Dissolve Aztreonam in dimethylformamide using 20% of the final volume, add a suitable aliquot of USP Alcohol Determination—Acetonitrile RS and dilute with dimethylformamide to volume. The concentration of acetonitrile in the *Sample solution* is 0.4% v/v.]
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: GC
Detector: Flame ionization
Column: 0.53-mm × 30-m; phase G43
Film thickness: 3.0-µm
Temperature
Injector: 210°
Detector: 280°
Column: See the temperature program table.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
50	0	50	5
50	10	200	4

Carrier gas: He
Linear velocity: 35 cm/s
Injection mode: Split
Split ratio: 5:1
Injection size: 0.5 µL
System suitability
[NOTE—The relative retention times for alcohol and acetonitrile are 1.0 and 1.3, respectively.]
Sample: *Standard solution*
Suitability requirements
Resolution: NLT 2.0 between alcohol and acetonitrile
Tailing factor: NMT 1.5
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of alcohol in the portion of Aztreonam taken:

$$\text{Result} = (R_U/R_S) \times (C_S \times D/C_U) \times F \times 100$$

R_U = peak response ratio of alcohol to acetonitrile from the *Sample solution*
R_S = peak response ratio of alcohol to acetonitrile from the *Standard solution*
C_S = concentration of alcohol in the *Standard solution* (mL/mL)
D = density of alcohol (g/mL)
C_U = concentration of Aztreonam in the *Sample solution* (mg/mL)
F = unit conversion factor (1000 mg/g)
Acceptance criteria: NMT 4%■2S (*USP33*)

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms. Where it is the hydrated form, the label so indicates.

BRIEFING

Soluble Bacitracin Methylene Disalicylate, *USP 32* page 1622. On the basis of comments received, it is proposed to change the title of this monograph in order to provide the chemically correct name of the methylenedisalicylate derivative.

(NOM: A. Wilk.) RTS—C72264

Change to read:

Soluble Bacitracin ~~Methylene Disalicylate~~ ■ Methylenedisalicylate■2S (*USP33*)

DEFINITION

Change to read:

Soluble Bacitracin ~~Methylene Disalicylate~~■Methylenedisalicylate■2S (*USP33*) is a mixture of ~~Bacitracin Methylene Disalicylate~~ ■Bacitracin Methylenedisalicylate■2S (*USP33*) and Sodium Bicarbonate. It has a potency of NLT 8 Bacitracin Units/mg, calculated on the dried basis.

ASSAY

- **ANTIBIOTICS—MICROBIAL ASSAYS ⟨81⟩**

Sample stock solution: Transfer a sample to a high-speed glass blender jar, add 99.0 mL of a 20 mg/mL sodium bicarbonate solution and 1.0 mL of polysorbate 80, and blend for 3 min. Add a sufficient volume of 0.01 N hydrochloric acid so that the amount of hydrochloric acid will be the same as in the median dose level of the Standard.

Sample solution: Dilute the *Sample stock solution* with *Buffer No. 1* (see *Phosphate Buffers and Other Solutions*) to obtain a concentration of bacitracin assumed to be equal to the median dose level of the Standard.

Analysis: Proceed as directed for *Bacitracin* in *Antibiotics—Microbial Assays* ⟨81⟩.

Acceptance criteria: NLT 8 Bacitracin Units/mg on the dried basis

SPECIFIC TESTS

- **pH ⟨791⟩:** 8.0–9.5, in a solution of 25 mg/mL
- **LOSS ON DRYING ⟨731⟩:** Dry 100 mg in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 h: it loses NMT 8.5% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Label it to indicate that it is for veterinary use only.
- **USP REFERENCE STANDARDS ⟨11⟩**
  USP Bacitracin Zinc RS

BRIEFING

Bacitracin Methylene Disalicylate Soluble Powder, *USP 32* page 1622. On the basis of the comments received, the title of the monograph is being changed in order to provide the chemically correct name of the methylenedisalicylate derivative.

DEFINITION

Change to read:

~~Bacitracin Methylene Disalicylate Soluble Powder~~■Bacitracin Methylenedisalicylate Soluble Powder■2S (*USP33*) contains NLT 90.0% and NMT 120.0% of the labeled amount of bacitracin.

ASSAY

- **ANTIBIOTICS—MICROBIAL ASSAYS ⟨81⟩**

Sample stock solution: Transfer a sample to a high-speed glass blender jar. Add 99.0 mL of sodium bicarbonate solution (1 in 50) and 1.0 mL of polysorbate 80, and blend for about 3 min. Add a sufficient volume of 0.01 N hydrochloric acid to a measured volume of *Sample solution* so that the amount of hydrochloric acid will be the same as in the median dose level of the Standard.

Sample solution: Dilute the *Sample stock solution* with *Buffer No. 1* (see *Phosphate Buffers and Other Solutions*) to obtain a concentration of bacitracin assumed to be equal to the median dose level of the Standard.

SPECIFIC TESTS

- **pH ⟨791⟩:** 8.0–9.5, 50 mg/mL
- **LOSS ON DRYING ⟨731⟩:** Dry 100 mg in a capillary-stoppered bottle in a vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 h: it loses NMT 8.5% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label it to indicate that it is for veterinary use only. Label it to state the content of bacitracin in terms of g/lb, each g of bacitracin being equivalent to 42,000 Bacitracin Units.
- **USP REFERENCE STANDARDS ⟨11⟩**
  USP Bacitracin Zinc RS

BRIEFING

Bendroflumethiazide Tablets, *USP 32* page 1637. Because of the low solubility of bendroflumethiazide in aqueous solvents, instructions are being added in the *Dissolution* test on how to prepare the *Standard solution*.

(BPC: M. Marques..) RTS—75670

Bendroflumethiazide Tablets

DEFINITION

Bendroflumethiazide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of bendroflumethiazide ($C_{15}H_{14}F_3N_3O_4S_2$).

IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

In-Process Revision

ASSAY

- **PROCEDURE**[NOTE—Use low-actinic glassware for the *Sample solution* and the *Standard solution*.]

Mobile phase: Dissolve 5.62 g of sodium chloride and 1.97 g of anhydrous sodium sulfate in 1000 mL of water in a 2-L volumetric flask. Add 4.0 mL of glacial acetic acid and 800 mL of methanol, and dilute with water to volume.

Standard solution: 50 µg/mL of USP Bendroflumethiazide RS in methanol

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer a portion of the powder, nominally equivalent to about 5 mg of bendroflumethiazide, to a 100-mL volumetric flask. Add about 70 mL of methanol, and sonicate for 15 min, with occasional shaking. Dilute with methanol to volume, mix, and centrifuge a portion of the solution for 15 min.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 270 nm
Column: 4.6-mm × 30-cm; packing L11
Temperature: 35 ± 5°
Flow rate: 1.5 mL/min
Injection size: 20 µL

System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 3.0% for five replicate injections

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{15}H_{14}F_3N_3O_4S_2$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Bendroflumethiazide RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of bendroflumethiazide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

BRIEFING

Biperiden Hydrochloride Tablets, *USP 32* page 1680. It is proposed to correct the volume of the *Standard solution*, *Sample solution*, and *Blank* to be used in the *Dissolution* test.

(BPC: M. Marques.) RTS—75629

Biperiden Hydrochloride Tablets

DEFINITION

Biperiden Hydrochloride Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of $C_{21}H_{29}NO \cdot HCl$.

IDENTIFICATION

- **THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST ⟨201⟩**

Standard solution: Proceed as directed for the *Sample solution* using 10 mg of USP Biperiden Hydrochloride RS in place of the powdered Tablets.

Sample solution: To a quantity of finely powdered Tablets, equivalent to 10 mg of biperiden hydrochloride, add 5 mL of water, mix, and sonicate to disperse the powder. Add 5 mL of methanol to the flask, mix, and sonicate for 15 min. Filter the solution into a separator, add 2 mL of 1 N sodium hydroxide and 10 mL of chloroform, and shake for 3 min. Filter the chloroform layer into a stoppered flask, and use the chloroform filtrate as the *Sample solution.*

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture. Condition by heating the plate at 105° for 1 h and allowing to cool.

Application volume: 20 µL

Developing solvent system: Methanol and ammonium hydroxide (100:1.5)

Visualization: Iodine vapor, 10 min

Analysis: Separately apply the *Sample solution* and the *Standard solution* to the chromatographic plate. Allow the applications to dry, and develop the chromatogram in the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by exposing the plate for 10 min to iodine vapors in a pre-equilibrated closed chamber, on the bottom of which there are iodine crystals.

In-Process Revision

Acceptance criteria: The R_F value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution.*

ASSAY

- **PROCEDURE**

Solution A: 38 mg/mL of monobasic sodium phosphate and 2 mg/mL of anhydrous dibasic sodium phosphate in water. Adjust to a pH of 5.3 ± 0.1, if necessary.

Solution B: Dissolve 400 mg of bromocresol purple in 30 mL of water, add 6.3 mL of 0.1 N sodium hydroxide, and dilute with water to 500 mL.

Phosphate buffer–bromocresol purple solution: Mix equal volumes of *Solution A*, *Solution B*, and chloroform, shake in a separator, and discard the chloroform. If appreciable color is extracted, repeat with additional portions of chloroform until no color is extracted.

Standard stock solution: 0.8 mg/mL of USP Biperiden Hydrochloride RS in methanol

Standard solution: 40 µg/mL of USP Biperiden Hydrochloride RS from *Standard stock solution*. Transfer 5.0 mL of *Standard stock solution* to a 100-mL volumetric flask, add 25 mL of water, and dilute with methanol to volume.

Sample solution: Transfer a portion of finely powdered Tablets, equivalent to 2 mg of biperiden hydrochloride, from NLT 20 Tablets, to a 50-mL volumetric flask, add 12.5 mL of water, and heat on a steam bath for 15 min. Cool, and dilute with methanol to volume.

Blank: Methanol and water (3:1)

Analysis

Samples: *Standard solution, Sample solution*, and *Blank*

Transfer 5.0 mL each of the *Standard solution*, the *Sample solution*, and the *Blank* to individual separators, each containing 10.0 mL of *Phosphate buffer–bromocresol purple solution*. Extract the solution in each separator with 20.0 mL of chloroform for 2 min. After the layers have separated, pass each chloroform extract through filter paper (Whatman No. 31 or equivalent) into separate glass-stoppered, 50-mL volumetric flasks. In the same manner, extract the solution in each separator with another 20.0-mL portion of chloroform, filter, and wash each filter with 8 mL of chloroform, collecting each combined filtrate and washing, respectively, in the 50-mL volumetric flask containing the first extract. Dilute each with chloroform to volume. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 408 nm, with a suitable spectrophotometer, using the *Blank* to set the instrument.

Calculate the percentage of $C_{21}H_{29}NO \cdot HCl$ in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times F \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of USP Biperiden Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of the *Sample solution* (µg/mL)
F = conversion factor, 0.001 (µg to mg)

Acceptance criteria: 93.0%–107.0%

PERFORMANCE TESTS

Change to read:

- **DISSOLUTION** ⟨**711**⟩

Medium: 0.01 N hydrochloric acid; 500 mL

Apparatus 2: 50 rpm

Time: 45 min

BRIEFING

Bupropion Hydrochloride Extended-Release Tablets, *USP 32* page 1723, page 4033 of the *First Supplement*, page 70 of *PF* 35(1) [Jan.–Feb. 2009], and the *Interim Revision Announcement* on page 531 of *PF* 35(3) [May–June 2009]. It is proposed to add the option of using sinkers, if necessary, in *Dissolution Test 3*.

(BPC: M. Marques.) RTS—C75800

Bupropion Hydrochloride Extended-Release Tablets

DEFINITION

Bupropion Hydrochloride Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of bupropion hydrochloride ($C_{13}H_{18}ClNO \cdot HCl$).

IDENTIFICATION

- **A. INFRARED ABSORPTION** ⟨**197K**⟩

Sample: Crush 1 Tablet using a mortar and pestle. Prepare an approximate 1% (w/w) dispersion of the sample in potassium bromide.

Acceptance criteria: The *Sample* shows strong bands at about 1690, 1560, and 1240 cm^{-1} and a weaker band at about 740 cm^{-1}, similar to the reference preparation.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay.*

In-Process Revision

ASSAY

• **PROCEDURE**

Diluent: Methanol and 0.001 N hydrochloric acid (2:8)

Solution A: Acetonitrile, trifluoroacetic acid, and water (10:0.04:90)

Solution B: Acetonitrile, trifluoroacetic acid, and water (95:0.03:5)

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	90	10
3.4	87	13
10.0	15	85
10.1	0	100
13.0	0	100
13.2	90	10
19.0	90	10

System suitability solution A: Separate solutions of 0.20 mg/mL each of USP Bupropion Hydrochloride Related Compound C RS and USP Bupropion Hydrochloride Related Compound F RS in methanol. Transfer suitable volumes of each solution to a single volumetric flask to obtain 0.0018 mg/mL of USP Bupropion Hydrochloride Related Compound C RS and 0.018 mg/mL of USP Bupropion Hydrochloride Related Compound F RS. Dilute with *Diluent* to volume.

System suitability stock solution B: 0.09 mg/mL of *m*-chlorobenzoic acid in water

System suitability solution B: 0.0018 mg/mL of *m*-chlorobenzoic acid from *System suitability stock solution B* and *Diluent*

Standard solution: 0.6 mg/mL of USP Bupropion Hydrochloride RS in *Diluent*

Sample solution: Transfer a number of Tablets to a suitable homogenizer vessel containing sufficient methanol to obtain a concentration of 3.0 mg of bupropion hydrochloride/mL. Immediately homogenize the sample for 30 s at 20,000 rpm. Allow extraction for 3 min, and follow by two additional 10-s pulses, each at 20,000 rpm, pausing 3 min between these pulses to ensure complete extraction. Pass a portion of the solution through a nylon filter having a 0.45-µm porosity, discarding the first 2–4 mL of the filtrate. Pipet 10.0 mL of the filtrate into a 50-mL volumetric flask, and add about 25 mL of 0.001 N hydrochloric acid. Allow to cool to room temperature, and dilute with 0.001 N hydrochloric acid to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩*, System Suitability*.)

Flow rate: 1.5 mL/min

Injection size: 5 µL

System suitability

Samples: *System suitability solution A*, *System suitability solution B*, and *Standard solution*

Suitability requirements

Resolution: NLT 1.5, between bupropion hydrochloride related compound C and bupropion hydrochloride related compound F, *System suitability solution A*

Tailing factor: NMT 1.9, *Standard solution*

Relative standard deviation: NMT 1.5%, *Standard solution*

Relative response factor: Between 0.22 and 0.26 for *m*-chlorobenzoic acid. [NOTE—Use the responses from *System suitability solution B* and the *Standard solution*.]

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{13}H_{18}ClNO \cdot HCl$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for bupropion hydrochloride from the *Sample solution*

r_S = peak response for bupropion hydrochloride from the *Standard solution*

C_S = concentration of USP Bupropion Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of bupropion hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

Change to read:

• **DISSOLUTION** ⟨**711**⟩

For products labeled for dosing every 12 h

Test 1

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Times: 1, 4, and 8 h

Standard solution: USP Bupropion Hydrochloride RS at a known concentration in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable filter, dilute with *Medium* if necessary.

Spectrometric conditions

Mode: UV-Vis

Analytical wavelength: 298 nm

Cell: 1.0 cm

Blank: *Medium*

Analysis

Samples: *Standard solution* and *Sample solution*

Tolerances: The percentage of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conforms to *Acceptance Table 2*.

Time (h)	Amount Dissolved (%)
1	25–45
4	60–85
8	NLT 80

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: 0.1 N hydrochloric acid, pH 1.5 (prepared by transferring 50 mL of concentrated hydrochloric acid to 6000 mL of water, adding 18 g of sodium hydroxide, mixing, and adjusting with either diluted sodium hydroxide or hydrochloric acid to a pH of 1.5 ± 0.05); 900 mL

Apparatus 1: 50 rpm

Times: 1, 2, 4, and 6 h

Determine the percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved by using the following method.

Buffer: 3.45 g of monobasic sodium phosphate monohydrate in 996 mL of water. Add 4.0 mL of triethylamine, and adjust with phosphoric acid to a pH of 2.80 ± 0.05.

Mobile phase: Methanol and *Buffer* (7:13)

Standard solution: USP Bupropion Hydrochloride RS in *Medium* at a known concentration similar to the one expected in the *Sample solution*

Sample solution: Use portions of the solution under test, and pass through a 0.45-µm nylon filter.

Chromatographic system

(See *Chromatography* ⟨621⟩*, System Suitability*.)

In-Process Revision

Mode: LC
Detector: UV 298 nm

• **UNIFORMITY OF DOSAGE UNITS ⟨905⟩:** Meet the requirements
Procedure for content uniformity
Standard solution: 0.33 mg/mL of USP Bupropion Hydrochloride RS in water
Sample solution: Transfer 1 Tablet to a suitable homogenizer vessel containing a volume of water to obtain a concentration of about 0.33 mg of bupropion hydrochloride/mL. Immediately homogenize the sample using single 30-s pulses each at 5,000, 10,000, and 15,000 rpm, and follow by two pulses each at 20,000 rpm. After the homogenate has settled, mix at 5000 rpm for an additional 30 s. Pass a portion of the solution through a nylon filter having a 0.45-µm porosity, discarding the first 4 mL of the filtrate.
Analysis: Proceed as directed for the appropriate *Dissolution* prodecure, using a 0.5-cm cell, and correct for dilution.

BRIEFING

Capecitabine Tablets, *USP 32* page 1775 and page 835 of *PF* 35(4) [July–Aug. 2009]. It is proposed to modify the wavelength used in the quantitation step in the *Dissolution* test.

(BPC: M. Marques.) RTS—C75630

Capecitabine Tablets

DEFINITION
Capecitabine Tablets contain NLT 93.0% and NMT 105.0% of the labeled amount of capecitabine ($C_{15}H_{22}FN_3O_6$).

IDENTIFICATION
- **A. INFRARED ABSORPTION ⟨197K⟩**
  Wavelength range: 1500–1760 cm^{-1}
  Sample: Grind one Tablet to a fine powder with a mortar and pestle. Mix 1 mg of this sample with 300 mg of potassium bromide.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay.*

ASSAY

Change to read:

In-Process Revision

BRIEFING

Cefdinir Capsules, *USP 32* page 1827. On the basis of comments received, it is proposed to revise the column and autosampler temperatures in the test for *Organic Impurities*. Robustness studies do not demonstrate the need for a narrow temperature range. In the test for *Organic Impurities*, *Impurity Table 1* is updated to provide chemical names for the related compounds and to update the impurity names in the footnotes to match those listed in the table. The 'Limit of Quantification' column header was revised to 'Reporting Threshold' as this more accurately represents the values in the table.

(MD-ANT: A. Wise.) RTS—C69056

Cefdinir Capsules

DEFINITION

Cefdinir Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of cefdinir ($C_{14}H_{13}N_5O_5S_2$).

IDENTIFICATION

- **A. ULTRAVIOLET ABSORPTION ⟨197U⟩**
  Buffer: Prepare as directed in the *Assay*.
  Blank: Use the *Buffer*.
  Standard solution: 10 µg/mL of USP Cefdinir RS in *Buffer*
  Sample solution: Equivalent to 10 µg/mL of cefdinir in *Buffer*. Filter before use.
  Cell size: 1 cm
  Acceptance criteria: *Sample solution* maxima and minima occur at the same wavelengths as those in the *Standard solution*.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**
  Buffer: 10.65 mg/mL of dibasic sodium phosphate and 3.40 mg/mL of monobasic potassium phosphate. Adjust with phosphoric acid or sodium hydroxide to a pH of 7.0 ± 0.05 before final dilution.
  Solution A: 7.0 mg/mL of citric acid monohydrate. Adjust with phosphoric acid to a pH of 2.0 ± 0.05.
  Mobile phase: Methanol, tetrahydrofuran, and *Solution A* (111:28:1000)
  Standard solution: 50 µg/mL of USP Cefdinir RS in *Buffer*
  System suitability solution: 50 µg/mL of cefdinir and 175 µg/mL of *m*-hydroxybenzoic acid in *Buffer*
  Sample solution: Equivalent to 50 µg/mL of Cefdinir, from Capsule contents (NLT 20) in the *Buffer*
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 254 nm
  Column: 3.9-mm × 15-cm; 4-µm packing L1
  Flow rate: 1.4 mL/min
  Injection size: 15 µL
  System suitability
  Samples: *Standard solution* and *System suitability solution*
  Suitability requirements
  Resolution: Greater than 3.0 between cefdinir and *m*-hydroxybenzoic acid, *System suitability solution*
  Tailing factor: NMT 2.0 for cefdinir, *System suitability solution*
  Relative standard deviation: NMT 1.0% for cefdinir, *Standard solution*
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of $C_{14}H_{13}N_5O_5S_2$ in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

  r_U = peak response from the *Sample solution*
  r_S = peak response from the *Standard solution*
  C_S = concentration of the *Standard solution* (µg/mL)
  C_U = nominal concentration of cefdinir in the *Sample solution* (µg/mL)
  Acceptance criteria: 90.0%–100.0%

PERFORMANCE TESTS

- **DISSOLUTION ⟨711⟩**
  Medium: 50 mM phosphate buffer pH 6.8; 900 mL
  Apparatus 2: 50 rpm
  Time: 30 min
  Detector: UV 290 nm
  Cell length: 1 cm
  Standard solution: 0.33 mg/mL of USP Cefdinir RS in *Medium*
  Sample solution: Sample per *Dissolution* ⟨711⟩. Pass each sample through a suitable 0.45-µm filter. Dilute with *Medium* to a concentration of about 0.33 mg/mL of cefdinir.
  Blank: Dissolve one empty capsule in 100 mL of *Medium*, and dilute to 900 mL; filter if necessary.
  Analysis: Determine the percentage of $C_{14}H_{13}N_5O_5S_2$ dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times D \times (V/L) \times 100$$

  A_U = absorbance of the *Sample solution*
  A_S = absorbance of the *Standard solution*
  C_S = concentration of the *Standard solution* (mg/mL)
  D = dilution factor of the *Sample solution* (mL/mL)
  V = volume of *Medium*, 900 mL
  L = label claim (mg)
  Tolerances: NLT 80% (Q) of the labeled amount of $C_{14}H_{13}N_5O_5S_2$ is dissolved.
- **UNIFORMITY OF DOSAGE UNITS ⟨905⟩:** Meet the requirements

Standard stock solution: 750 µg/mL of USP Cefdinir RS, *Buffer*

Standard solution: 15 µg/mL of USP Cefdinir RS, from the *Standard stock solution* in *Solution C*

System suitability stock solution 1: 40 µg/mL of USP Cefdinir Related Compound A RS in *Solution C*

System suitability stock solution 2: 40 µg/mL of USP Cefdinir Related Compound B RS in *Solution C*

System suitability solution: Transfer 37.5 mg of USP Cefdinir RS to a 25-mL volumetric flask. Add about 10 mL of *Buffer*. Add 5.0 mL of each of *System suitability stock solution 1* and *System suitability stock solution 2*, and dilute with *Solution C* to volume.

Sample solution: Transfer an equivalent to 300 mg of Cefdinir, from Capsule contents (NLT 20), into a 200-mL volumetric flask. Dissolve in 30 mL of *Buffer*, and dilute with *Solution C* to volume to obtain a solution having a ~~known~~ ■nominal■ *(2S USP33)* concentration of about 1.5 mg/mL of cefdinir.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC
Detector: UV 254 nm
Column: 4.6-mm × 15-cm; 5-µm packing L1
Column temperature: 40° ~~± 0.5°~~
~~**Sample solution temperature:** 4° ± 3°~~
■**Autosampler temperature:** 4°■ *(2S USP33)*
Flow rate: 1 mL/min
Injection size: 10 µL

System suitability
Sample: *Standard solution* and *System suitability solution*
Suitability requirements
Resolution: NLT 1.5 between cefdinir and the third peak of the USP Cefdinir Related Compound A RS, *System suitability solution*
Tailing factor: NMT 1.5 for cefdinir related compound B, *System suitability solution*
Relative standard deviation: NMT 2.0% for the cefdinir peak response, *Standard solution*

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (100/F)$$

r_U = peak response of each impurity from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
C_U = concentration of the *Sample solution* (mg/mL)
F = relative response factor (see *Impurity Table 1*)

Acceptance criteria
Individual impurities: See *Impurity Table 1*.
Total impurities: NMT 5.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight light-resistant containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS** ⟨**11**⟩
  USP Cefdinir RS
  USP Cefdinir Related Compound A RS
  USP Cefdinir Related Compound B RS

BRIEFING

Cefdinir for Oral Suspension, *USP 32* page 1830. On the basis of comments received, it is proposed to revise the column and autosampler temperatures in the test for *Organic Impurities*. Robustness studies do not demonstrate the need for a narrow temperature range. *Impurity Table 1* in the test for *Organic Impurities* is updated to provide chemical names for the related compounds. The 'Limit of Quantification' column header was revised to 'Reporting Threshold' as this more accurately represents the values in the table.

(MD-ANT: A. Wise.) RTS—C69057

Cefdinir for Oral Suspension

DEFINITION

Cefdinir for Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of $C_{14}H_{13}N_5O_5S_2$. It may contain one or more suitable buffers, flavors, preservatives, stabilizing agents, sweeteners, and suspending agents.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** ⟨**201**⟩
  Adsorbent: 0.25-mm layer of chromatographic silica gel, preconditioned with *n*-hexane and tetradecane (95:5)
  Buffer: Prepare as directed in the *Assay*.
  Standard solution: 600 µg/mL of USP Cefdinir RS in methanol and *Buffer* (3:1)
  Sample solution: Transfer an equivalent to 125 mg of cefdinir from reconstituted Suspension to a 100-mL volumetric flask, add 50 mL of *Buffer*, and dilute with methanol to volume. Pass a portion through a suitable 0.45-µm filter, transfer 5.0 mL of the filtrate to a 10-mL volumetric flask, and dilute with methanol to volume.
  Application volume: 10 µL
  Developing solvent system: Methanol and water (4:1)
  Visualization: Short-wavelength UV
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Develop the chromatogram until the solvent front has moved about 15 cm. Remove the plate from the developing chamber, and allow the solvent to evaporate.
  Acceptance criteria: The R_F value of the principal spot from the *Sample solution* corresponds to that from the *Standard solution*.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution,* as obtained in the *Assay*.

ASSAY

- **PROCEDURE**
  Buffer: 10.65 mg/mL of anhydrous dibasic sodium phosphate and 3.40 mg/mL of monobasic potassium phosphate in water. Adjust with phosphoric acid or sodium hydroxide to a pH of 7.0 ± 0.05 before final dilution.
  Solution A: 7.0 mg/mL of citric acid monohydrate. Adjust with phosphoric acid to a pH of 2.0 ± 0.05.
  Mobile phase: Methanol, tetrahydrofuran, and *Solution A* (111:28:1000)
  Standard solution: 50 µg/mL of USP Cefdinir RS in *Buffer*
  System suitability solution: 50 µg/mL of cefdinir and 175 µg/mL of *m*-hydroxybenzoic acid in *Buffer*
  Sample solution: Equivalent to 50 µg/mL of cefdinir, from constituted Suspension in *Buffer*
  Chromatographic system
  (See *Chromatography* ⟨621⟩*, System Suitability*.)
  Mode: LC
  Detector: UV 254 nm
  Column: 3.9-mm × 15-cm; 4-µm packing L1
  Flow rate: 1.4 mL/min
  Injection size: 15 µL
  System suitability
  Samples: *Standard solution* and *System suitability solution*
  Suitability requirements
  Resolution: NLT 3.0 between cefdinir and *m*-hydroxybenzoic acid, *System suitability solution*
  Tailing factor: NMT 2.0 for cefdinir, *System suitability solution*
  Relative standard deviation: NMT 1.0% for cefdinir, *Standard solution*
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of $C_{14}H_{13}N_5O_5S_2$ in the portion of Cefdinir for Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

  r_U = peak response from the *Sample solution*
  r_S = peak response from the *Standard solution*
  C_S = concentration of the *Standard solution* (µg/mL)
  C_U = nominal concentration of cefdinir in the *Sample solution* (µg/mL)
  Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DISSOLUTION** ⟨**711**⟩
  Medium: 50 mM phosphate buffer pH 6.8; 900 mL
  Apparatus 2: 50 rpm
  Time: 30 min
  Detector: UV 290 nm
  Standard solution: 0.14 mg/mL of USP Cefdinir RS in *Medium*
  Sample solution: Dilute a portion of each filtered sample with *Medium* as necessary to obtain a solution having a concentration of about 0.14 mg/mL of cefdinir.
  Blank: *Medium*
  Analysis: Transfer 5 mL, by weight, of the reconstituted Oral Suspension into the vessel. After the appropriate time, withdraw a portion of the solution under test and pass through a suitable 0.45-µm filter.
  Determine the percentage of $C_{14}H_{13}N_5O_5S_2$ dissolved:

$$\text{Result} = (A_U/A_S) \times ([C_S \times d \times D \times V]/W \times L) \times 100$$

  A_U = absorbance of the *Sample solution*
  A_S = absorbance of the *Standard solution*
  C_S = concentration of the *Standard solution* (mg/mL)
  d = density of the Oral Suspension (mg/mL)
  D = dilution factor of the *Sample solution* (mL/mL)
  V = volume of *Medium*, 900 mL
  W = weight of Oral Suspension taken (mg)
  L = label claim (mg)
  Tolerances: NLT 80% (Q) of the labeled amount of $C_{14}H_{13}N_5O_5S_2$ is dissolved.
- **UNIFORMITY OF DOSAGE UNITS** ⟨**905**⟩ (for solid packaged in single-unit containers)**:** Meets the requirements
- **DELIVERABLE VOLUME** ⟨**698**⟩ (for solid packaged in multiple-unit containers)**:** Meets the requirements

In-Process Revision

IMPURITIES

Change to read:

Organic Impurities

• **PROCEDURE**

Solution A: 14.2 mg/mL of anhydrous dibasic sodium phosphate

Solution B: 13.6 mg/mL of monobasic potassium phosphate

Buffer: Combine appropriate amounts of *Solution A* and *Solution B* (about 2:1) to obtain a pH 7.0 ± 0.1 solution.

Solution C: Dilute tetramethylammonium hydroxide (10% aqueous) with water to obtain a 0.1% solution. Adjust with dilute phosphoric acid (1 in 10) to a pH of 5.5 ± 0.1.

Solution D: 37.2 mg/mL of edetate disodium

Solution E: To 1000 mL of *Solution C* add 0.4 mL of *Solution D*.

Solution F: Acetonitrile, methanol, *Solution C*, and *Solution D* (150:100:250:0.2)

Mobile phase: See the gradient table below.

Time (min)	Solution E (%)	Solution F (%)
0	95	5
2	95	5
22	75	25
32	50	50
37	50	50
38	95	5
58	95	5

Standard stock solution: 750 µg/mL of USP Cefdinir RS in *Buffer*

Standard solution: 15 µg/mL of USP Cefdinir RS, from the *Standard stock solution* in *Solution C*

System suitability stock solution 1: 40 µg/mL of USP Cefdinir Related Compound A RS in *Solution C*

System suitability stock solution 2: 40 µg/mL of USP Cefdinir Related Compound B RS in *Buffer*

System suitability solution: Transfer 37.5 mg of USP Cefdinir RS to a 25-mL volumetric flask. Add about 10 mL of *Buffer*. Add 5.0 mL of each of *System suitability stock solution 1* and *System suitability stock solution 2*, and dilute with *Solution C* to volume.

Sample solution: Transfer an equivalent to 150 mg of cefdinir, from constituted Oral Suspension, into a 100-mL volumetric flask. Dissolve in 30 mL of *Buffer*, and dilute with *Solution C* to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩*, System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Column temperature: 40° ~~± 0.5°~~

~~**Sample solution temperature:** 4° ± 3°~~

■**Autosampler temperature:** 4°■2S *(USP33)*

Flow rate: 1 mL/min

Injection size: 10 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 1.5 between cefdinir and the third peak of the USP Cefdinir Related Compound A RS, *System suitability solution*

Tailing factor: NMT 1.5 for cefdinir related compound B, *System suitability solution*

Relative standard deviation: NMT 2.0% for the cefdinir peak response, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Cefdinir for Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (100/F)$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

C_U = nominal concentration of cefdinir in the *Sample solution* (mg/mL)

F = relative response factor (see *Impurity Table 1*)

Acceptance criteria

Individual impurities: See *Impurity Table 1*.

Total impurities: NMT 6.2%

BRIEFING

Cefotetan for Injection, *USP 32* page 1847. On the basis of comments received, in the *Other Requirements* section it is proposed to delete the cross-reference to the *Identification* test under *Cefotetan Disodium* and to replace it with a new expanded *Identification* section that is specific for this monograph.

(MD-ANT: A. Wise.) RTS—C69120

Cefotetan for Injection

DEFINITION
Cefotetan for Injection contains an amount of Cefotetan Disodium equivalent to NLT 90.0% and NMT 120.0% of the labeled amount of cefotetan ($C_{17}H_{17}N_7O_8S_4$).

IDENTIFICATION

Add the following:

■• **A:** The retention time of the major peak of the appropriate *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay.*■2S *(USP33)*

Add the following:

■• **B. Identification tests—General,** *Sodium* ⟨**191**⟩**:** Meets the requirements■2S *(USP33)*

ASSAY
- **Procedure**
  [Note—Protect the *Standard solution*, the *System suitability solution*, and the *Sample solutions* from light, and use within 2 h.]
  Solution A: Methanol, acetonitrile, and water (1:1:18)
  Mobile phase: Methanol, acetonitrile, glacial acetic acid, and 0.1 M phosphoric acid (105:105:100:1700)
  Standard solution: 20 mg of USP Cefotetan RS in a 100-mL volumetric flask. Add 5 mL of methanol, swirl for several min, add 5 mL of acetonitrile, and swirl until dissolved. Dilute with water to volume.
  System suitability solution: 10 mL of *Standard solution* in a glass-stoppered flask containing a few mg of magnesium carbonate. Sonicate for 10 min. If the solution is not turbid, add a few more mg of magnesium carbonate, and repeat the sonication. Pass the turbid solution through a filter of 0.5-µm or finer porosity. Use the clear filtrate.
  Sample solution A (where the package is represented as being in a single-dose container)**:** Constitute Cefotetan for Injection as directed in the labeling. Withdraw all of the withdrawable contents, and quantitatively dilute with *Solution A* to obtain a solution containing the equivalent of 200 µg of cefotetan/mL.
  Sample solution B (where the label states the quantity of cefotetan in a given volume of constituted solution)**:** Constitute Cefotetan for Injection as directed in the labeling. Dilute a volume of the constituted solution quantitatively with *Solution A* to obtain a solution containing the equivalent of 200 µg of cefotetan/mL.
  Chromatographic system
  (See *Chromatography* ⟨621⟩*, System Suitability.*)

In-Process Revision

BRIEFING

Cefuroxime Axetil for Oral Suspension, *USP 32* page 1864. On the basis of comments received, it is proposed to revise the test for *pH* to indicate how the solution should be prepared.

(MD-ANT: A. Wise.) RTS—C72175

Cefuroxime Axetil for Oral Suspension

DEFINITION

Cefuroxime Axetil for Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of cefuroxime ($C_{16}H_{16}N_4O_8S$).

IDENTIFICATION

- The retention times of the major peaks for cefuroxime axetil diastereoisomers A and B of the *Sample solution* correspond to those of the *Standard solution*, both relative to the internal standard, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Solution A: 23.0 mg/mL of monobasic ammonium phosphate in water

Mobile phase: Methanol and *Solution A* (19:31)

System suitability stock solution A: 1.2 mg/mL of USP Cefuroxime Axetil RS in methanol

System suitability stock solution B: 0.16 mg/mL of USP Cefuroxime Axetil Delta-3 Isomers RS in methanol

System suitability solution: Transfer 10.0 mL of *System suitability stock solution A* to a 50-mL volumetric flask. Add 5.0 mL of methanol and 3.8 mL of *System suitability stock solution B*. Dilute with *Solution A* to volume.

Standard stock solution: 1.2 mg/mL of USP Cefuroxime Axetil RS in methanol. [NOTE—Use this solution promptly.]

Standard solution: Transfer 10.0 mL of *Standard stock solution* to a 50-mL volumetric flask, add 8.8 mL of methanol, and dilute with *Solution A* to volume. [NOTE—Use this *Standard solution* promptly, or refrigerate and use on the day prepared.]

Sample stock solution: Equivalent to 2.5 mg/mL of cefuroxime, from constituted Oral Suspension, in methanol. Filter before further use. [NOTE—The Oral Suspension to be used should be constituted as directed on the label, and is freshly prepared and free of bubbles. After the addition of a portion of methanol, the solution should be shaken by mechanical means for about 10 min. Protect from light and use promptly.]

Sample solution: Transfer 5.0 mL of the filtered *Sample stock solution* to a 50-mL volumetric flask. Add 13.8 mL of methanol, and dilute with *Solution A* to volume. [NOTE—Protect this *Sample solution* from light and use promptly, or refrigerate and use on the day prepared.]

Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 278 nm
Column: 4.6-mm × 25-cm; 5-µm packing L13
Flow rate: 1.5 mL/min
Injection size: 10 µL

System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—The relative retention times for acetanilide, cefuroxime axetil diastereoisomer B, cefuroxime axetil diastereoisomer A, and cefuroxime axetil delta-3 isomers are 0.4, 0.8, 0.9, and 1.0, respectively.]

Suitability requirements
Resolution: NLT 1.5 between cefuroxime axetil diastereoisomer A and B; NLT 1.5 between cefuroxime axetil diastereoisomer A and cefuroxime axetil delta-3 isomers, *System suitability solution*
Column efficiency: NLT 3000 theoretical plates when measured using the cefuroxime axetil diastereoisomer A peak, *Standard solution*
Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{16}H_{16}N_4O_8S$ in each mL taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times P_S \times F \times (100 - K)$$

R_U = sum of the peak responses of the cefuroxime axetil diastereoisomers A and B from the *Sample solution*
R_S = sum of the peak responses of the cefuroxime axetil diastereoisomers A and B from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
C_U = nominal concentration of cefuroxime axetil in the *Sample solution* (mg/mL)
P_S = designated cefuroxime content of anhydrous USP Cefuroxime Axetil RS (µg/mg)
F = unit conversion factor (0.001 mg/µg)
K = percentage of water content of USP Cefuroxime Axetil RS

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DISSOLUTION** ⟨**711**⟩

Medium: 0.07 M pH 7.0 phosphate buffer, prepared by dissolving 3.7 mg/mL of monobasic sodium phosphate and 5.7 mg/mL of anhydrous dibasic sodium phosphate in water; 900 mL
Apparatus 2: 50 rpm
Time: 30 min
Analysis: Test 5.0 mL of constituted Cefuroxime Axetil for Oral Suspension equivalent to 125 or 250 mg of cefuroxime. Determine the amount of cefuroxime equivalent dissolved by using UV absorption at the wavelength of maximum absorbance at 280 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Cefuroxime Axetil RS in the same *Medium*.
Tolerances: NLT 60% (Q) of the labeled amount of $C_{16}H_{16}N_4O_8S$ is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** ⟨**905**⟩

For solid packaged in single-unit containers: Constitute Cefuroxime Axetil for Oral Suspension as directed in the labeling. Mix, and allow the contents of the container to drain into a beaker for 5 s. Withdraw and assay 5.0 mL of Cefuroxime Axetil for Oral Suspension from the beaker, or the total amount if it is less than 5 mL. It meets the requirements.

- **DELIVERABLE VOLUME** ⟨**698**⟩

For solid packaged in multiple-unit containers: Constitute Cefuroxime Axetil for Oral Suspension as directed in the labeling. It meets the requirements.

SPECIFIC TESTS

BRIEFING

Clarithromycin Tablets, *USP 32* page 1958, and page 73 of *PF* 35(1) [Jan.–Feb. 2009]. It is proposed to make some modifications in the preparation of the *Buffer solution* used in the *Dissolution* test.

(BPC: M. Marques.) RTS—C75373

Clarithromycin Tablets

DEFINITION
Clarithromycin Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of $C_{38}H_{69}NO_{13}$.

IDENTIFICATION
- The retention time of the major peak from the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
- **PROCEDURE**

Mobile phase: Methanol and 0.067 M monobasic potassium phosphate (13:7). Adjust with phosphoric acid to a pH of 4.0, and then pass through a filter having a 0.5-µm or finer porosity.

Standard stock solution: 625 µg/mL of clarithromycin from USP Clarithromycin RS dissolved in methanol.
[NOTE—Shake and sonicate to facilitate dissolution.]

Standard solution: 125 µg/mL of clarithromycin from *Standard stock solution*. Dilute with *Mobile phase*, and pass through a 0.5-µm porosity filter.

System suitability solution: Prepare 625 µg/mL of USP Clarithromycin Related Compound A RS in methanol. Transfer 10 mL of this solution and 10 mL of *Standard stock solution* to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

Sample solution: Finely powder a counted number of Tablets, nominally equivalent to 2000 mg of clarithromycin, and with the aid of methanol, transfer the powder to a 500-mL volumetric flask, add 350 mL of methanol, and shake by mechanical means for 30 min. Dilute with methanol to volume, and allow any insoluble matter to settle. Transfer 3.0 mL to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume. Pass through a filter having a 0.5-µm or finer porosity. Use the filtrate.

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 210 nm
Column: 4.6-mm × 15-cm; packing L1
[NOTE—A guard column containing packing L1 may be added.]
Column temperature: 50°
Flow rate: 1 mL/min
Injection size: 20–50 µL

System suitability
Samples: *Standard solution* and *System suitability solution*
[NOTE—The relative retention times for clarithromycin and clarithromycin related compound A are 0.75 and 1.0, respectively.]

Suitability requirements
Resolution: NLT 2.0 between clarithromycin and clarithromycin related compound A, *System suitability solution*
Column efficiency: NLT 750 theoretical plates from the clarithromycin peak, *Standard solution*
Tailing factor: 0.9–1.5, *Standard solution*
Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of label claim of $C_{38}H_{69}NO_{13}$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the *Sample solution*
r_S = peak area of the *Standard solution*
C_S = concentration of the *Standard solution* (µg/mL)
C_U = nominal concentration of the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

Change to read:

- **DISSOLUTION** ⟨711⟩

Buffer solution: ~~Transfer 13.61 g of sodium acetate trihydrate to a 1-L volumetric flask, add water to dissolve, dilute with water to volume. Adjust with 0.1 M acetic acid to a pH of 5.0.~~ ▲Combine portions of a solution containing 13.61 mg/mL of sodium acetate trihydrate in water with portions of a solution containing 5.7 mL of glacial acetic acid/L in water to obtain a pH of 5.0. ~~(the proportion is almost 1:1)~~■ ■2S *(USP33)*▲*USP33*

Medium: *Buffer solution*, 900 mL
Apparatus 2: 50 rpm
Time: 30 min
Standard solution: Proceed as directed in the *Assay*.
Sample solution: Sample per *Dissolution* ⟨711⟩. Dilute with *Mobile phase* to yield a nominal concentration of 125 µg/mL clarithromycin.

Analysis
Samples: *Standard solution* and *Sample solution*
Determine the amount of $C_{38}H_{69}NO_{13}$ dissolved in the *Medium*, as directed in the *Assay*.
Calculate the percentage of clarithromycin dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the *Sample solution*
r_S = peak area of the *Standard solution*
C_S = concentration of the *Standard solution* (µg/mL)
C_U = nominal concentration of the *Sample solution* (µg/mL)

Tolerances: NLT 80% (Q) of the labeled amount of $C_{38}H_{69}NO_{13}$ is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩**:** Meet the requirements

SPECIFIC TESTS
- **LOSS ON DRYING** ⟨731⟩**:** Dry a portion of powdered Tablets in vacuum at a pressure not exceeding 5 mm of mercury at 110° for 3 h: it loses NMT 6.0% of its weight.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Clarithromycin RS
  USP Clarithromycin Related Compound A RS

In-Process Revision

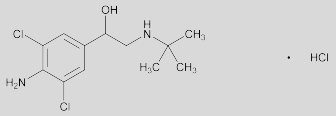
BRIEFING

Clenbuterol Hydrochloride. Because there is no existing *USP* monograph for this drug substance, a new monograph is being proposed based on the Clenbuterol Hydrochloride monograph in the *European Pharmacopoeia's 6.5 Edition* and comments provided to USP regarding its suitability for the article in distribution in the United States. The test for *Organic Impurities* is based on the analyses performed with an Agilent Lichrospher RP 18 brand of L1 column. The typical retention time for clenbuterol peak is about 29 min.

(VET: E. Gonikberg.) RTS—C58037

Add the following:

■Clenbuterol Hydrochloride



$C_{12}H_{18}Cl_2N_2O \cdot HCl$ 313.65

Ethanol, 1-(4-amino-3,5-dichlorophenyl)-2-(*tert*-butylamino), hydrochloride;
4-Amino-α-[(*tert*-butylamino)methyl]-3,5-dichlorobenzyl alcohol, hydrochloride [21898-19-1].

DEFINITION

Clenbuterol Hydrochloride contains NLT 98.0% and NMT 102.0% of $C_{12}H_{18}Cl_2N_2O \cdot HCl$, calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION ⟨197K⟩**
  [NOTE—Alternatively, *Infrared Absorption* ⟨197A⟩ may be used.]
- **B. IDENTIFICATION TESTS—GENERAL,** *Chloride* **⟨191⟩:** Meets the requirements

ASSAY

- **PROCEDURE**
  Sample solution: Dissolve 0.25 g in 50 mL of alcohol, and add 5.0 mL of 0.01 N hydrochloric acid.
  Analysis: Titrate with 0.1 N sodium hydroxide VS, determining the endpoint potentiometrically. Read the volume added between the two points of inflection. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N sodium hydroxide is equivalent to 31.37 mg of $C_{12}H_{18}Cl_2N_2O \cdot HCl$.
  Acceptance criteria: 98.0%–102.0% on the anhydrous basis

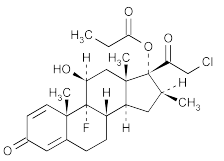
BRIEFING

Clobetasol Propionate. *USP 32* page 1976. Because Clobetasol Propionate is practically insoluble in water, it is proposed to specify that *Method II* be used for the *Heavy Metals* test. Additionally, it is proposed to specify that a platinum crucible be used for the *Residue on Ignition* test because porcelain, quartz, or silica crucibles may be eroded by hydrofluoric acid formed when clobetasol propionate is degraded, thereby resulting in aberrant results.

(MD-PS: D. Vicchio.) RTS—C39404

Clobetasol Propionate



$C_{25}H_{32}ClFO_5$ 466.97

Pregna-1,4-diene-3,20-dione, 21-chloro-9-fluoro-11-hydroxy-16-methyl-17-(1-oxopropoxy)-, (11β,16β)-;
21-Chloro-9-fluoro-11β,17-dihydroxy-16β-methylpregna-1,4-diene-3,20-dione 17-propionate [25122-46-7; 25122-41-2].

DEFINITION

Clobetasol Propionate contains NLT 97.0% and NMT 102.0% of $C_{25}H_{32}ClFO_5$, calculated on the dried basis.

IDENTIFICATION

- **INFRARED ABSORPTION** ⟨197M⟩

ASSAY

- **PROCEDURE**

Solution A: 0.05 M monobasic sodium phosphate. Adjust with 85% phosphoric acid to a pH of 2.5.

Mobile phase: Acetonitrile, methanol, and *Solution A* (19:4:17)

Internal standard solution: 0.2 mg/mL of beclomethasone dipropionate in methanol

Standard solution: Dissolve a quantity of USP Clobetasol Propionate RS in methanol and *Internal standard solution* to obtain a final solution of 0.04 mg/mL of USP Clobetasol Propionate RS and 0.08 mg/mL of beclomethasone dipropionate.

System suitability solution: 0.001 mg of USP Clobetasol Propionate Related Compound A RS and 0.1 mg of USP Clobetasol Propionate RS/mL of *Mobile phase*

Sample solution: Transfer 4 mg of Clobetasol Propionate to a 100-mL volumetric flask, add 40.0 mL of *Internal standard solution*, and dilute with methanol to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 240 nm

Column: 4.6-mm × 15-cm; packing L1

Flow rate: 1 mL/min

Injection size: 10 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for clobetasol propionate and clobetasol propionate related compound A are 1.0 and 1.1, respectively.]

Suitability requirements

Resolution: NLT 1.5 between clobetasol propionate and clobetasol propionate related compound A

Column efficiency: NLT 5000 theoretical plates for the clobetasol peak

Tailing factor: NMT 2.0 for the clobetasol peak

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—The relative retention times for clobetasol propionate and beclomethasone dipropionate are 1.0 and 1.6, respectively.]

Calculate the percentage of $C_{25}H_{32}ClFO_5$ in the portion taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = ratio of the clobetasol propionate peak area to the internal standard peak area from the *Sample solution*

R_S = ratio of the clobetasol propionate peak area to the internal standard peak area from the *Standard solution*

C_S = concentration of USP Clobetasol Propionate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of clobetasol propionate in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–102.0% on the dried basis

USP Clobetasol Propionate Related Compound A RS

BRIEFING

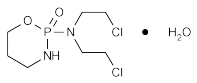
Cyclophosphamide, *USP 32* page 2040. On the basis of comments received, it is proposed to make the following changes:

1. *Identification* test *B* is revised to reflect the change in the *Assay*.
2. The internal standard is removed from the *Assay* and relevant changes are proposed.
3. New *Organic Impurities* section is proposed.
4. New *Limit of Chloride* section is proposed.
5. New *Limit of Phosphate* section is proposed.
6. The sections for *Bacterial Endotoxins Test*, *Sterility Tests*, and *Labeling* are added for sterile Cyclophosphamide.
7. New USP Reference Standards are introduced for the proposed tests.

(MD-OOD: F. Mao. MSA: R. Tirumalai.) RTS—C73270

In-Process Revision

Cyclophosphamide



$C_7H_{15}Cl_2N_2O_2P \cdot H_2O$ 279.10
$C_7H_{15}Cl_2N_2O_2P$ 261.09

2H-1,3,2-Oxazaphosphorin-2-amine, *N*,*N*-bis(2-chloroethyl)tetrahydro-, 2-oxide, monohydrate, (±);
(±)-2-[Bis(2-chloroethyl)amino]tetrahydro-2*H*-1,3,2-oxazaphosphorine 2-oxide monohydrate [6055-19-2].
Anhydrous [50-18-0].

DEFINITION

Cyclophosphamide contains NLT 97.0% and NMT 103.0% of $C_7H_{15}Cl_2N_2O_2P$, calculated on the anhydrous basis.
[**CAUTION**—Great care should be taken in handling Cyclophosphamide, as it is a potent cytotoxic agent.]

IDENTIFICATION

• **A. INFRARED ABSORPTION** ⟨197K⟩

[NOTE—The relative retention times for cyclophosphamide and ethylparaben are about 0.7 and 1.0, respectively.]
Suitability requirements
Resolution: NLT 2 between cyclophosphamide and ethylparaben
Relative standard deviation: NMT 2% from six replicate injections, cyclophosphamide peak

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_7H_{15}Cl_2N_2O_2P$ in the portion of Cyclophosphamide taken:

~~$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$~~

■

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$■2S (USP33)

~~R_U = peak response ratio of cyclophosphamide to the ethylparaben peak in the *Sample solution*~~
~~R_S = peak response ratio of cyclophosphamide to the ethylparaben peak in the *Standard solution*~~
~~C_S = concentration of the *Standard solution* (mg/mL)~~
~~C_U = concentration of Cyclophosphamide in the *Sample solution* (mg/mL)~~

■
r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Cyclophosphamide RS in the *Standard solution* (mg/mL) [NOTE—Concentration is calculated on the anhydrous basis.]
C_U = concentration of Cyclophosphamide in the *Sample solution* (mg/mL) [NOTE—Nominal concentration is calculated on the anhydrous basis.]
■2S (USP33)

Acceptance criteria: 97.0%–103.0% on the anhydrous basis

IMPURITIES

Inorganic Impurities

• **HEAVY METALS** ⟨231⟩**:** NMT 20 ppm
Sample solution: 40 mg/mL, and filter if necessary

Add the following:

■**Organic Impurities**

• **PROCEDURE 1: LIMIT OF PROPANOLAMINE**
Diluent: Methylene chloride and dehydrated alcohol (17:3)
Standard solution: 12.5 µg/mL of USP Propanolamine RS in *Diluent*. [NOTE—Propanolamine in the *Standard solution* is 0.025% of Cyclophosphamide in the *Sample solution*.]
Sample solution: 50 mg/mL of Cyclophosphamide in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)
Mode: TLC
Adsorbent: 0.1-mm layer of chromatographic silica gel
Application volume: 2 µL
Developing solvent system A: Toluene, methylene chloride, and methanol (5:5:1). Prepare at time of use.
Developing solvent system B: Methanol and glacial acetic acid (9:1)
Solution A: Hydrochloric acid and water (7:18)
Solution B: 5 g/L of potassium permanganate in water
Reagent A: *Solution A* and *Solution B* (1:1). Prepare at time of use.
Reagent B: 100 mg of tetramethylbenzidine in 2.5 mL of methylene chloride and diluted with cyclohexane to 100 mL
Analysis
Samples: *Standard solution* and *Sample solution*
Develop with *Developing solvent system A* over a path of 7 cm followed by air drying for 15 min. Develop again in *Developing solvent system B* over a path of 2 cm following by air drying for NLT 10 min. [NOTE—Transfer *Developing solvent system B* to the chamber 15 min before development.] Dry the plate at 45° under a vacuum for 50 min. Place the plate in a closed chromatography tank containing *Reagent A* and leave the plate in the tank for 10 min. Remove the plate and place it in a fume hood for 10 min to remove the excess chlorine. Stain the plate by dipping it into *Reagent B*. Remove it from *Reagent B* and wait for 15 min, evaluate it with a suitable densitometer, equipped with

a filter having its maximum transmittance at 375 nm, and locate and scan the spot produced by propanolamine from the *Standard solution* and any spot from the *Sample solution* having the same R_F as that produced by propanolamine from the *Standard solution*.

Acceptance criteria

Propanolamine: The spot of propanolamine from the *Sample solution* is not more intense than the spot of propanolamine from the *Standard solution* (0.025%).

• **PROCEDURE 2: LIMIT OF DEGRADATION PRODUCTS**

Diluent: Methanol and water (1:1)

Standard solution A: 12 µg/mL of USP Cyclophosphamide Related Compound A RS in *Diluent*

Standard solution B: 12 µg/mL of USP Cyclophosphamide Related Compound B RS in *Diluent*

Standard solution C: 12 µg/mL of USP Cyclophosphamide Related Compound C RS in *Diluent*

Standard solution D: 15 µg/mL of USP Cyclophosphamide Related Compound D RS in *Diluent*.

[NOTE—Cyclophosphamide Related Compound D is free base (M_r = 260.66) and USP Cyclophosphamide Related Compound D RS is available as dihydrochloride salt (M_r = 333.58).]

Standard solution E: 12 µg/mL of USP Cyclophosphamide RS in *Diluent*

Sample solution: 20 mg/mL of Cyclophosphamide in *Diluent*

Chromatographic system

(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 20 µL. [NOTE—Prepare at time of use.]

Developing solvent system: Methylene chloride, glacial acetic acid, methanol, and water (50:25:15:12)

Reagent A: 3.16 g/L solution of potassium permanganate in water and 10% hydrochloric acid (1:1). [NOTE—Prepare at time of use.]

Reagent B: Dissolve 250 mg of tetramethylbenzidine in 50 mL of dehydrated alcohol and dilute with cyclohexane to 200 mL.

Analysis

Samples: *Standard solution A* to *Standard solution E* and *Sample solution*

[NOTE—Apply *Standard solution E* after the plate development in the *Developing solvent system*, proceed as directed in the *Analysis* below.]

Develop with *Developing solvent system* over a path of 10 cm followed by drying at room temperature for 15 min in a fume hood. Develop again in the fresh portion of the *Developing solvent system* over a path of 10 cm following drying at room temperature for 15 min in a fume hood. Apply *Standard solution E* at the starting point of the plate. Dry the plate at 50° under a vacuum for 20 min. Allow the plate to stand at room temperature for 5 min. Place the plate in a closed chromatography tank containing *Reagent A* and leave the plate in the tank for 15 min. Remove the plate and place it in a fume hood for 15 min to remove the excess chlorine. Stain the plate by dipping it into *Reagent B*. Examine the plate by visual evaluation.

Acceptance criteria

The spot of cyclophosphamide related compound A from the *Sample solution* is not more intense than the spot of cyclophosphamide related compound A from *Standard solution A*.

The spot of cyclophosphamide related compound B from the *Sample solution* is not more intense than the spot of cyclophosphamide related compound B from *Standard solution B*.

The spot of cyclophosphamide related compound C from the *Sample solution* is not more intense than the spot of cyclophosphamide related compound C from *Standard solution C*.

The spot of cyclophosphamide related compound D from the *Sample solution* is not more intense than the spot of cyclophosphamide related compound D from *Standard solution D*.

The spot of any individual unspecified impurity in the *Sample solution* is not more intense than the spot of cyclophosphamide from *Standard solution E*.

Individual impurities: See *Impurity Table 1*.

Impurity Table 1

Name	Retardation Factor	Acceptance Criteria, NMT (%)
Cyclophosphamide related compound D[a]	0.15	0.06
Cyclophosphamide related compound C[b]	0.20	0.06
Cyclophosphamide related compound B[c]	0.43	0.06

Any unspecified impurity	—	0.06

[a] 3-[2-(2-Chloroethylamino)ethylamino]propyl dihydrogen phosphate.
[b] 3-Aminopropyl dihydrogen phosphate.
[c] 3-(2-Chloroethyl)-2-oxo-2-hydroxy-1,3,6,2-oxadiazaphosphonane.
[d] Bis(2-chloroethyl)amine hydrochloride.

■2S (*USP33*)

SPECIFIC TESTS

Add the following:

■• **LIMIT OF CHLORIDE**

Sample solution: Dissolve 2.0 g of Cyclophosphamide in 30 mL of water, and add 80 mL of isopropyl alcohol and 5 mL of 10% nitric acid.

Analysis: Titrate potentiometrically with 0.01 N silver nitrate VS. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each 1.0 mL of 0.01 N silver nitrate equals 0.355 mg of chloride ion.

Calculate the percentage of chloride in the portion of Cyclophosphamide taken:

$$\text{Result} = [(V - B) \times N \times F \times 100]/[TN \times W \times (100 - A)/100]$$

V = sample titrant volume (mL)
B = blank titrant volume (mL)
N = titrant normality
F = equivalence factor, 0.355 mg of chloride ion/mL of TN
TN = theoretical normality, 0.01 N
W = sample weight (mg)
A = assay correction for water

Acceptance criteria: NMT 0.033%■2S (*USP33*)

Add the following:

■• **LIMIT OF PHOSPHATE**

Diluent: 0.2 g/mL of hydrochloric acid in water

Solution A: Heat 20 g of tin with 85 mL of hydrochloric acid until no more hydrogen is released. Allow to cool. Transfer 1.0 mL of this solution into a 10-mL volumetric flask, and dilute with *Diluent* to volume.

Standard stock solution: 0.72 g/L of monobasic potassium phosphate. Transfer 1.0 mL of this solution into a 100-mL volumetric flask, and dilute with water to volume. Prepare immediately before use.

Standard solution: *Standard stock solution* and water (1:49). Prepare immediately before use. [NOTE—This solution contains 100 µg/L of PO_4.]

In-Process Revision

Sample solution: 1 g/L of Cyclophosphamide in water
Analysis: To the *Sample solution* add 4 mL of sulfomolybdic acid TS. Shake and add 0.1 mL of *Solution A*. Prepare a standard in the same manner using the *Standard solution*. After 10 min, compare the colors using 20 mL of each solution in color comparison tubes in diffused daylight, viewing vertically against a white background.
Acceptance criteria: Any color from the *Sample solution* is not more intense than that from the *Standard solution* (NMT 0.01%).■2S *(USP33)*

Add the following:

■• **BACTERIAL ENDOTOXINS TEST ⟨85⟩:** Where the label states that Cyclophosphamide is sterile, it contains NMT 0.0625 USP Endotoxin Unit/mg of cyclophosphamide.■2S *(USP33)*

Add the following:

■• **STERILITY TESTS ⟨71⟩:** Where the label states that Cyclophosphamide is sterile, it meets the requirements.■2S *(USP33)*
- **pH ⟨791⟩:** 3.9–7.1, in a solution (1 in 100), determined 30 min after its preparation
- **WATER DETERMINATION,** *Method I* **⟨921⟩:** 5.7%–6.8%

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight containers at a temperature between 2° and 30°.

Add the following:

■• **LABELING:** Where the label states that Cyclophosphamide is sterile, the tests for *Bacterial Endotoxins Test* ⟨85⟩ and *Sterility Tests* ⟨71⟩ should be performed.■2S *(USP33)*

BRIEFING

Diclofenac Sodium Delayed-Release Tablets, *USP 32* page 2124, page 3921 of the *First Supplement*, and page 271 of *PF* 35(2) [Mar.–Apr. 2009]. In the *Buffer Stage* of the *Dissolution* test, it is proposed to correct the concentration of the *Standard solution*.

(BPC: M. Marques.) RTS—C76056

Diclofenac Sodium Delayed-Release Tablets

DEFINITION
Diclofenac Sodium Delayed-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of diclofenac sodium ($C_{14}H_{10}Cl_2NNaO_2$).

IDENTIFICATION
- **A.** The retention time of the diclofenac peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B. IDENTIFICATION TESTS—GENERAL,** *Sodium* **⟨191⟩:** It meets the requirements of the flame test.

ASSAY
- **PROCEDURE**
  Solution A: Mix equal volumes of 0.01 M phosphoric acid and 0.01 M monobasic sodium phosphate. If necessary, adjust with additional portions of the appropriate component to a pH of 2.5 ± 0.2.
  Mobile phase: Methanol and *Solution A* (7:3)
  [NOTE—Increasing the proportion of buffer increases resolution.]
  Diluent: Methanol and water (7:3)
  System suitability solution: 20 µg/mL of diethyl phthalate, 7.5 µg/mL of USP Diclofenac Related Compound A RS, and 0.75 mg/mL of USP Diclofenac Sodium RS in *Diluent*
  Standard solution: 0.75 mg/mL of USP Diclofenac Sodium RS in *Diluent*
  Sample solution: Transfer 20 Tablets to a volumetric flask of such capacity that when filled to volume, a concentration of 0.75 mg/mL of diclofenac sodium is obtained. Add *Diluent* to about 70% of the capacity of the flask, and shake by mechanical means for NLT 30 min to disintegrate the Tablets. Cool to room temperature, and dilute with *Diluent* to volume. Pass a portion of the solution through a filter having a 0.5-µm or finer porosity, and use the filtrate as the *Sample solution*.
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 254 nm
  Column: 4.6-mm × 25-cm; packing L7 (end-capped)
  Flow rate: 1 mL/min
  Injection size: 10 µL
  System suitability
  Samples: *System suitability solution* and *Standard solution*
  [NOTE—The relative retention times for diethyl phthalate, diclofenac related compound A, and diclofenac are 0.5, 0.6, and 1.0, respectively.]
  Suitability requirements
  Resolution: NLT 2.2 between diethyl phthalate and diclofenac related compound A; NLT 6.5 between diclofenac related compound A and diclofenac, *System suitability solution*
  Relative standard deviation: NMT 2.0%, *Standard solution*
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of $C_{14}H_{10}Cl_2NNaO_2$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

  r_U = peak response of diclofenac from the *Sample solution*
  r_S = peak response of diclofenac from the *Standard solution*
  C_S = concentration of USP Diclofenac Sodium RS in the *Standard solution* (mg/mL)
  C_U = nominal concentration of diclofenac sodium in the *Sample solution* (mg/mL)
  Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

Change to read:

- **DISSOLUTION ⟨711⟩:** Proceed as directed for *Procedure*, *Apparatus 1 and Apparatus 2*, *Delayed-Release Dosage Forms*, *Method B* to determine the amount of $C_{14}H_{10}Cl_2NNaO_2$ dissolved.

In-Process Revision

Acid stage
Medium: 0.1 N hydrochloric acid; 900 mL
Apparatus 2: 50 rpm, paddles constructed of (or coated with) polytef being used
Time: 2 h
Detector: UV maxima at about 276 nm
Standard solution: Transfer 68 mg of USP Diclofenac Sodium RS to a 100-mL volumetric flask, add 10.0 mL of 0.1 N sodium hydroxide, and dilute with water to volume. Transfer 2.0 mL of this solution to a second 100-mL volumetric flask, dilute with a mixture of 0.1 N hydrochloric acid and 5 N sodium hydroxide (900:20) to volume, and mix. This *Standard solution* contains 13.6 µg/mL of USP Diclofenac Sodium RS.
Sample solution: At the end of 2 h, remove each Tablet, or the major portion thereof if the Tablet is not intact, from the individual vessels, and subject them to the test under *Buffer Stage*. To the 0.1 N hydrochloric acid remaining in each vessel, add 20.0 mL of 5 N sodium hydroxide, and stir for 5 min.
Buffer stage
Medium: *pH 6.8 phosphate buffer*; 900 mL
Apparatus 2: 50 rpm
Time: 45 min
Detector: UV maxima at about 276 nm
Solution A: 76 mg/mL of tribasic sodium phosphate
pH 6.8 phosphate buffer: *Solution A* and 0.1 N hydrochloric acid (1:3), adjusted with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of 6.8 ± 0.05, if necessary
Standard solution: ~~Transfer 68 mg of USP Diclofenac Sodium RS to a 100-mL volumetric flask, add 10.0 mL of 0.1 N sodium hydroxide, and dilute with water to volume. Transfer 2.0 mL of this solution to a second 100-mL volumetric flask, and dilute with *Medium* to volume. This *Standard solution* contains about 0.02 mg/mL of USP Diclofenac Sodium.~~
■Transfer 68 mg of USP Diclofenac Sodium RS to a 100-mL volumetric flask. Add 10.0 mL of 0.1 N sodium hydroxide, dilute with water to volume, and mix. Transfer 3.0 mL of this solution to a 100-mL volumetric flask, dilute with *Buffer stage Medium* to volume, and mix. The final concentration is ~~0.22~~ ■about 0.0204■2S *(USP33)* mg/mL of diclofenac sodium.■1S *(USP33)*
Sample solution: Sample per *Dissolution* ⟨711⟩. Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.
Tolerances: NLT 75% (Q) of the labeled amount of $C_{14}H_{10}Cl_2NNaO_2$ is dissolved.
• **UNIFORMITY OF DOSAGE UNITS ⟨905⟩:** Meet the requirements

IMPURITIES
Organic Impurities
• **PROCEDURE**
Solution A, Mobile phase, Diluent, System suitability solution, Sample solution, Chromatographic system, and **System suitability:** Proceed as directed in the *Assay*.
Standard stock solution: 0.8 mg/mL of USP Diclofenac Related Compound A RS in methanol
Standard solution: 4 µg/mL of USP Diclofenac Related Compound A RS from the *Standard stock solution* in *Diluent*
Analysis: Measure the peak responses over a period of 40 min.
Calculate the percentage of diclofenac related compound A in relation to the quantity of diclofenac sodium in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of diclofenac related compound A from the *Sample solution*
r_S = peak response of diclofenac related compound A from the *Standard solution*
C_S = concentration of USP Diclofenac Related Compound A RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of diclofenac sodium in the *Sample solution* (mg/mL)
Calculate the percentage of each other impurity, other than diethyl phthalate, if present, in relation to the diclofenac sodium in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for each impurity from the *Sample solution*
r_S = peak response for each impurity obtained from the *Standard solution*
C_S = concentration of USP Diclofenac Related Compound A RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of diclofenac sodium in the *Sample solution* (mg/mL)
Acceptance criteria
Individual impurities: NMT 0.5% of diclofenac related compound A; NMT 1.0% of any other individual impurity
Total impurities: NMT 1.5%

ADDITIONAL REQUIREMENTS
• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
• **USP REFERENCE STANDARDS ⟨11⟩**
USP Diclofenac Sodium RS
USP Diclofenac Related Compound A RS

BRIEFING

Diclofenac Sodium Extended-Release Tablets, *USP 32* page 2125. On the basis of comments received, it is proposed to revise the *Assay* procedure and add an *Organic Impurities* test to monitor the impurities present. The liquid chromatographic procedure in the *Assay* and in the test for *Organic Impurities* is based on analyses performed with a Zorbax C-8 brand of L7 column. The typical retention time for diclofenac is about 12.5 min.

(MD-CCA: C. Anthony.) RTS—C41893

Diclofenac Sodium Extended-Release Tablets

DEFINITION
Diclofenac Sodium Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of diclofenac sodium ($C_{14}H_{10}Cl_2NNaO_2$).

IDENTIFICATION
• **A.** The retention time of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
• **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST ⟨201⟩**
Standard solution: 2.0 mg/mL of USP Diclofenac Sodium RS in methanol. [NOTE—Shake by mechanical means for 10 min before makeup to final volume.]
Sample solution: Equivalent to 2.0 mg/mL of diclofenac sodium from a portion of the powder (NLT 10 Tablets) in methanol. [NOTE—Sonicate for 10 min, and shake by mechanical means for 10 min before make up to final volume. Centrifuge this solution, and use the clear supernatant as the *Sample solution*.]
Developing solvent system: Methanol, toluene, and glacial acetic acid (8:12:0.1)

In-Process Revision

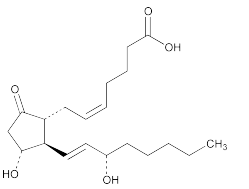
BRIEFING

Dinoprostone, *USP 32* page 2172. On the basis of comments received that the acceptance criteria for "any other impurity" is overly restrictive, it is proposed to revise *Impurity Table 1* in the test for *Organic Impurities* as follows:
1. Change the term "any other impurity" to "any individual unspecified impurity".
2. Change the acceptance criteria for unspecified impurities from NMT 0.1% total present to NMT 0.10% each.

(MD-PS: D. Vicchio.) RTS—C74667

Dinoprostone



$C_{20}H_{32}O_5$ 352.47
Prosta-5,13-dien-1-oic acid, 11,15-dihydroxy-9-oxo-, (5*Z*,11α,13*E*,15*S*)-;
(*E*,*Z*)-(1*R*,2*R*,3*R*)-7-[3-Hydroxy-2-[(3*S*)-(3-hydroxy-1-octenyl)]-5-oxocyclopentyl]-5-heptenoic acid;
Prostaglandin E_2 [363-24-6].

DEFINITION
Dinoprostone contains NLT 97.0% and NMT 103.0% of $C_{20}H_{32}O_5$.
[NOTE—Prepare all solutions in all tests immediately before use.]

IDENTIFICATION
• **A. INFRARED ABSORPTION ⟨197K⟩**
• **B.** The retention time of the major peak in the *Sample solution* corresponds to that in the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **PROCEDURE**
Mobile phase: Methanol and 0.2% acetic acid (29:21)
Standard solution: 2.5 mg/mL of USP Dinoprostone RS in *Mobile phase*

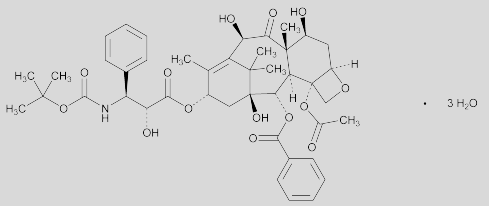
BRIEFING

Docetaxel. Because there is no existing *USP* monograph for this drug substance, a new monograph based on validated methods of analysis is being proposed. The liquid chromatography procedure for the *Assay* and for *Organic Impurities* is based on analyses performed with a Waters SunFire C18, 3.5-µm brand of L1 column. The typical retention time reported for docetaxel is about 26.5 min.

(MDOOD-05: F. Mao. MSA-05: R. Tirumalai.) RTS—C67219

Add the following:

■Docetaxel



$C_{43}H_{53}NO_{14} \cdot 3H_2O$ 861.93

Benzenepropanoic acid, β-[[(1,1-dimethylethoxy)carbonyl]amino]-α-hydroxy-, 12b-(acetyloxy)-12-(benzoyloxy)-2a,3,4,4a,5,6,9,10,11,12,12a,12b-dodecahydro-4,6,11-trihydroxy-4a,8,13,13-tetramethyl-5-oxo-7,11-methano-1*H*-cyclodeca[3,4]benz[1,2-*b*]oxet-9-yl ester trihydrate, [2a*R*-[2aα,4β,4aβ,6β,9α(α*R**,β*S**),11α,12α,12aα,12bα]]-. ;(2*R*,3*S*)-*N*-Carboxy-3-phenylisoserine, *N*-*tert*-butyl ester, 13-ester with 5β,20-epoxy-1,2α,4,7β,10β,13α-hexahydroxytax-11-en-9-one 4-acetate 2-benzoate, trihydrate [148408-66-6].

DEFINITION

Docetaxel contains NLT 97.5% and NMT 102.0% of $C_{43}H_{53}NO_{14}$, calculated on the anhydrous and solvent-free basis.

[**CAUTION—**Docetaxel is cytotoxic. Great care should be taken to prevent inhaling particles of Docetaxel and exposing the skin to it.]

IDENTIFICATION

- **A. INFRARED ABSORPTION** ⟨**197S**⟩
  Sample solution: 60 mg/mL in methylene chloride
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay.*

ASSAY

- **PROCEDURE**
  Solution A: Water
  Solution B: Acetonitrile

Time (min)	Solution A (%)	Solution B (%)
0	72	28
9.0	72	28
39.0	28	72
39.1	72	28
50	72	28

Diluent: Acetonitrile, water, and acetic acid (100:100:0.1)
Standard solution: 1.0 mg/mL made by transferring a quantity of USP Docetaxel RS to a suitable volumetric flask, dissolving in alcohol, equivalent to about 5% of the final volume, and diluting with *Diluent* to volume
System suitability solution: 1 mg/mL of USP Docetaxel Identification RS in *Diluent*. [NOTE—USP Docetaxel Identification RS contains docetaxel and a small amount of 2-debenzoxyl 2-pentenoyl docetaxel, 6-oxodocetaxel, 4-epidocetaxel, and 4-epi-6-oxodocetaxel. See *Impurity Table 1*.]
Sample solution: 1.0 mg/mL made by transferring a quantity of Docetaxel to a suitable volumetric flask, dissolving in alcohol, equivalent to about 5% of the final volume, and diluting with *Diluent* to volume
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 232 nm
Refrigerated autosampler temperature: 10°
Column: 4.6-mm × 15-cm column; 3.5-µm packing L1
Column temperature: 45°
Flow rate: 1.2 mL/min
Injection size: 10 µL
System suitability
Samples: *Standard solution* and *System suitability solution*
Suitability requirements
Resolution: NLT 4 between 2-debenzoxyl 2-pentenoyl docetaxel and docetaxel, *System suitability solution*
Relative standard deviation: NMT 1.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{43}H_{53}NO_{14}$ in the portion of Docetaxel taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of docetaxel in the *Standard solution* (mg/mL)
C_U = nominal concentration of Docetaxel in the *Sample solution* (mg/mL)
Acceptance criteria: 97.5%–102.0%, calculated on the anhydrous and solvent-free basis

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** ⟨**281**⟩**:** NMT 0.1%
- **HEAVY METALS** *Method I* ⟨**231**⟩
  Sample solution: Dissolve 1 g in 20 mL of a mixture of dimethylformamide and water (17:3). To 12 mL of this solution, add 2 mL of *pH 3.5 Acetate Buffer* and mix. Add 1.2 mL of thioacetamide–glycerin base TS and mix.
  Acceptance criteria: NMT 20 ppm

Organic Impurities

- **PROCEDURE**
  Standard solution, System suitability solution, Sample solution, and **Chromatographic system:** Proceed as directed in the *Assay*.
  Sensitivity solution: 0.5 µg/mL of USP Docetaxel RS in *Diluent*, from *Standard solution*
  System suitability
  Samples: *Standard solution, System suitability solution,* and *Sensitivity solution*
  Suitability requirements:
  Resolution: NLT 4 between 2-debenzoxyl 2-pentenoyl docetaxel and docetaxel, *System suitability solution*
  Signal-to-noise: NLT 10 for docetaxel peak, *Sensitivity solution*
  Relative standard deviation: NMT 1.0%, *Standard solution*
  Analysis
  Sample: *Sample solution*
  Calculate the percentage of each impurity in the portion of Docetaxel taken:

$$\text{Result} = (r_U/r_T) \times (1/F) \times 100$$

r_U = response of each individual impurity from the *Sample solution*
r_T = sum of the responses of all peaks from the *Sample solution*
F = relative response factor for each individual impurity, see *Impurity Table 1.*
Acceptance criteria
Individual impurities: See *Impurity Table 1*. [NOTE—Disregard any unspecified impurity peaks less than 0.05%.]

In-Process Revision

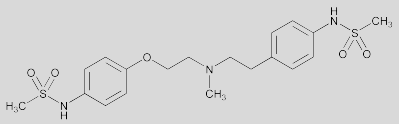
BRIEFING

Dofetilide. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on validated methods, is being proposed. The liquid chromatographic procedures in the test for *Organic impurities* are based on analyses performed with a Symmetry brand of 5-µm L1 column. The typical retention time for dofetilide is about 11 min. The liquid chromatographic procedures in the *Assay* are based on analyses performed with a Novapak brand of 4-µm L7 column. The typical retention time for dofetilide is about 17 min.

(MDCV: S. Ramakrishna.) RTS—C62478

Add the following:

■Dofetilide



$C_{19}H_{27}N_3O_5S_2$ 441.56

Methanesulfonamide, *N*-[4-[2-[methyl[2-[4-[(methylsulfonyl)amino]phenoxy]ethyl]amino]ethyl]phenyl]-; *β*-[(*p*-Methanesulfonamidophenethyl)methylamino]methanesulfono-*p*-phenetidide [115256-11-6].

DEFINITION

Dofetilide contains NLT 97.0% and NMT 103.0% of $C_{19}H_{27}N_3O_5S_2$, calculated on the anhydrous, solvent-free basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION, ⟨197K⟩**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Potassium hydroxide solution: 0.56 g/mL of potassium hydroxide
Buffer: Prepare a solution of 1.36 g of monobasic potassium phosphate and 5 mg of ascorbic acid in 1 L of water. Adjust with *Potassium hydroxide solution* to a pH of 7.0.
Mobile phase: Acetonitrile and *Buffer* (1:3)
System suitability solution: 25 µg/mL of USP Dofetilide RS and 0.5 µg/mL of USP Dofetilide Related Compound A RS in *Mobile phase*
Standard solution: 25 µg/mL of USP Dofetilide RS in *Mobile phase*
Sample solution: 25 µg/mL of Dofetilide in *Mobile phase*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 230 nm

System suitability solution: 1.25 µg/mL each of USP Dofetilide RS and USP Dofetilide Related Compound A RS in *Diluent*
Standard solution: 1.25 µg/mL of USP Dofetilide RS in *Diluent*
Diluted standard solution: 0.125 µg/mL of USP Dofetilide RS in *Diluent* from the *Standard solution*
Sample solution: 0.25 mg/mL of Dofetilide in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 230 nm
Column: 3.9-mm × 15-cm; 5-µm packing L1
Temperature: 30°
Flow rate: 1 mL/min
Injection size: 50 µL
System suitability
System suitability requirements:
Samples: *System suitability solution* and *Diluted standard solution*
Resolution: NLT 5.0 between dofetilide and dofetilide related compound A, *System suitability solution*
Column efficiency: NLT 35,000 theoretical plates for the dofetilide peak, *System suitability solution*
Tailing factor: NMT 1.5 for the dofetilide peak, *System suitability solution*
Relative standard deviation: NMT 10.0% for the dofetilide peak, *Diluted standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Dofetilide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response for each impurity from the *Sample solution*
r_S = peak response of dofetilide from the *Standard solution*
C_S = concentration of USP Dofetilide RS in the *Standard solution* (mg/mL)
C_U = concentration of Dofetilide in the *Sample solution* (mg/mL)
F = relative response factor (see *Impurity Table 1*)

Acceptance criteria
Individual impurities: See *Impurity Table 1*.
Total impurities: See *Impurity Table 1*.

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Dofetilide related compound A [a]	0.9	1.04	0.5
Dofetilide	1.0	—	—
Any other individual unspecified impurity	—	1.00[b]	0.1
Total impurities	—	—	0.5

[a] *N*-[4-(2-(2-[4-(Methanesulfonamido)phenoxy]ethylamino)ethyl)phenyl]-methanesulfonamide.
[b] Unless otherwise determined.

BRIEFING

Estradiol Transdermal System, *USP 32* page 2303, and page 225 of *PF* 33(2) [Mar.–Apr. 2007]. On the basis of comments received, the following revisions are being proposed in the test for *Drug Release*.

1. *Test 1*: The formulas used to calculate the percentage of estradiol dissolved are being revised to take into account that the amount of *Medium* withdrawn at each sampling is not being replaced. The *Tolerances* are being revised to express the results in percentage of the transdermal system label claim.
2. *Test 2*: The formulas used to calculate the percentage of estradiol dissolved and the *Tolerances* are being revised to express the results in percentage of the transdermal system label claim.
3. *Test 3* is being added. The chromatographic procedure in this test was validated with a Symmetry C18 brand of column containing packing L1 for 9 cm² transdermal systems, with estradiol having a retention time of about 9 min; and with a PartiSphere C18 brand of column containing packing L1 for 18, 27, or 36 cm² transdermal systems, with estradiol having a retention time of about 7 min.

(BPC: M. Marques.) RTS—C67685

Estradiol Transdermal System

DEFINITION

Estradiol Transdermal System contains NLT 90.0% and NMT 110.0% of the labeled amount of estradiol ($C_{18}H_{24}O_2$).

IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

In-Process Revision

ASSAY

• **PROCEDURE**

Diluent: Acetonitrile and water (1:1)

Mobile phase: Acetonitrile and water (11:9)

Standard solution: 0.1 mg/mL of USP Estradiol RS in *Diluent*

Sample solution: Cut 10 Transdermal Systems into pieces, keeping the pieces from each system separate. Remove the protective liners, if any, from the strips, and discard. Transfer the pieces of each system into separate stoppered flasks of suitable size, and add a measured volume of *Diluent* to each flask to obtain solutions having a concentration of 0.1 mg/mL of estradiol. Shake by mechanical means for about 3 h, and sonicate for 15 min.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 15-cm; packing L1

Temperature: 35°

Flow rate: 1 mL/min

Injection size: 25 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: 0.9–1.6

Relative standard deviation: NMT 2.5%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{18}H_{24}O_2$ in each Transdermal System taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Estradiol RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of the *Sample solution* (mg/mL)

Calculate the average quantity of estradiol (mg) in each Transdermal System. Use the individual assays to determine the uniformity of dosage units.

Acceptance criteria: 90.0%–110.0%

OTHER COMPONENTS

• **CONTENT OF ALCOHOL** (if present)

Diluent: Acetonitrile and water (1:1)

Internal standard solution: Pipet 4.0 mL of dehydrated methanol into a 100-mL volumetric flask. Dilute with water to volume.

Standard solution: Weigh, by difference, 1.6 mL of dehydrated alcohol into a tared 50-mL volumetric flask containing 15 mL of water. Dilute with *Diluent* to volume, and mix. Pipet 10.0 mL of this solution into a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix. Pipet 25.0 mL of this solution into a 50-mL volumetric flask, add 5.0 mL of *Internal standard solution*, and dilute with water to volume.

Sample solutions: Prepare as directed for the *Sample solutions*, with the following changes. Pipet 25.0 mL of each solution into individual 50-mL volumetric flasks. Add 5.0 mL of *Internal standard solution*, and dilute with water to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 2-mm × 2-cm glass column; support S2

Temperature

Column: 100°

Injector and **detector:** 200°

Carrier gas: Helium

Flow rate: 30 mL/min

Injection size: 2 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for the internal standard and alcohol are 0.4 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 1.5% from the ratios of alcohol peak areas to those of the internal standard

Analysis

Samples: *Standard solution* and *Sample solutions*

Calculate the percentage of alcohol in each Transdermal System taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of alcohol to internal standard from the *Sample solution*

R_S = peak response ratio of alcohol to internal standard from the *Standard solution*

C_S = concentration of dehydrated alcohol in the *Standard solution* (mg/mL)

C_U = nominal concentration of the *Sample solution* (mg/mL)

Calculate the average quantity of alcohol in the *Sample solution* taken.

Acceptance criteria: 80%–120% of the labeled amount of C_2H_5OH is found.

PERFORMANCE TESTS

Change to read:

▲• **DRUG RELEASE** ⟨724⟩

Test 1: For products labeled for dosing every 84 h

Medium: Water; 900 mL, deaerated

Apparatus 5: 50 rpm

Times: 24, 48, and 96 h

Mobile phase: Water and acetonitrile (3:2)

Standard solution: 9 µg/mL of USP Estradiol RS in dehydrated alcohol. Dilute this solution with *Medium* to obtain solutions having concentrations of about 0.9, 0.45, and 0.045 µg/mL.

Sample solution: At each sampling time interval, withdraw a 10-mL aliquot of the solution under test.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: Fluorimetric, with excitation at 220 nm and emission at 270 nm

Column: 4.6-mm × 3-cm, packing L1

Temperature: 40°

Flow rate: 1.0 mL/min

Injection size: 50 µL

System suitability

Sample: *Standard solution*

Tailing factor: 0.9–2.5

Relative standard deviation: NMT 3.0%, using 0.45 µg/mL of the *Standard solution*

Analysis: Plot the peak responses of the *Standard solutions* versus concentration, in µg/mL, of estradiol. From the graph determine the amount, in µg/mL, of estradiol released. ~~using the following formulas~~■Calculate the cumulative release rate as percentage of the labeled amount of estradiol:■2S *(USP33)*

~~µg of estradiol released in the interval 0 to~~■$At_{■2S\ (USP33)}$ ~~24 h:~~

~~$[900(A_1 - b)]/m$~~

■

$$\text{Result} = \{[900(A_1 - b)]/(1000 \times m \times L)\} \times 100_{■2S\ (USP33)}$$

~~µg of estradiol released in the interval 24 to~~■$At_{■2S\ (USP33)}$ ~~48 h:~~

~~$[900(A_1 - b)] - [890(A_{n-1} - b)]/480m$~~

■

$$\text{Result} = \{[890(A_2 - b) + 10(A_1 - b)]/(1000 \times m \times L)\} \times 100_{■2S\ (USP33)}$$

In-Process Revision

~~Cumulative µg of estradiol released:~~

$$\frac{900(A_n - b)}{20m} + \frac{10}{20}\left[\sum_{x=1}^{n=1}\frac{(A_x - b)}{m}\right]$$

■ At 96 h:

$$\text{Result} = \{[880(A_3 - b) + 10(A_2 - b) + 10(A_1 - b)]/(1000 \times m \times L)\} \times 100$$

■2S (*USP33*)

A_1 = peak area of estradiol in the *Sample solution* at the first time interval
A_n = peak area of estradiol in the *Sample solution* at the release interval *n*
m = slope of the calibration curve
b = y-intercept of the calibration curve■
L = Transdermal System label claim (mg)■2S (*USP33*)

Tolerances: ~~The amounts of estradiol released, as percentages of the labeled amount of the dose released to the skin~~ ■The percentage of the labeled amount of estradiol released■2S (*USP33*) at the times specified, conform to ~~*Acceptance Table 4*~~ *Acceptance Table 1*.

Time (h)	Amount Dissolved (Release Rate)
24	~~2.4% – 26.4%~~■1.2%–6.0%■2S (*USP33*)
48	~~4.8% –52.0%~~■3.0%–11.4%■2S (*USP33*)
96	~~10.0% –85.0%~~■5.0%–16.3%■2S (*USP33*)

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 2*.
Medium: 0.005 M phosphate buffer, pH 5.5, containing 0.3% sodium lauryl sulfate; 500 mL
Apparatus 5: 100 rpm. Use a 76-mm stainless steel disk assembly. Adhere the patch to the disk assembly using ~~double-faced adhesive~~ transfer tape. [NOTE—A suitable tape is available as 3 M adhesive transfer tape 927, www.mmm.com.]
Times: 1, 4, 8, and 24 h
Mobile phase: Acetonitrile and water (1:1)
Standard stock solution: 800 µg/mL of USP Estradiol RS in acetone
Standard solution: Dilute the *Standard stock solution* with *Medium* to obtain a solution having a known concentration close to that expected in the solution under test, assuming 100% drug release.
Sample solution: At each sampling time interval, withdraw a known volume aliquot of the solution under test.
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 205 nm
Column: ~~4.0 mm~~ 3.9-mm × 30-cm, packing ~~4 µm~~ L1
Flow rate: 1.0 mL/min
Injection size: 100 µL
System suitability
Sample: *Standard solution*
Tailing factor: NMT 2.0
Relative standard deviation: NMT ~~2.0%~~ 3.0%
Analysis: Calculate the amount of estradiol released at each sampling time:

$$M_i = r_U/r_S \times C_S \times V_i$$

$$m_1 = M_1$$

$$m_2 = M_2 + M_1(V_a/V_1)$$

$$m_3 = M_3 + M_2(V_a/V_2) + M_1(V_a/V_1)$$

$$m_4 = M_4 + M_3(V_a/V_3) + M_2(V_a/V_2) + M_1(V_a/V_1)$$

■ Calculate the percentage of the labeled amount of estradiol released at each sampling time:

$$\text{Result} = (m_i/L) \times 100$$

M_i = amount of estradiol released into the *Medium* at a given sampling time (mg)
r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
V_i = corrected volume of the *Medium* at a given sampling time (mL)
m_1, m_2, m_3, m_4 = total amounts of estradiol released from the patch at given sampling times (mg)
M_1, M_2, M_3, M_4 = amounts of estradiol released into the *Medium* at given sampling times (mg)
V_a = volume of the aliquot taken from the dissolution vessel at each sampling time (mL)
V_1, V_2, V_3 = volumes of *Medium* at given sampling times (mL)
L = Transdermal System label claim (mg)
■2S (*USP33*)

Tolerances: ~~The amounts of estradiol released, as percentages of the labeled amount of the dose released to the skin,~~ ■The percentage of the labeled amount of estradiol released■2S (*USP33*) at the times specified conform to *Acceptance Table 1*.

Time (h)	Amount Dissolved (Release Rate)
1	15%–40%
4	45%–70%
8	70%–90%
24	NLT 80%

■**Test 3:** If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 3*.
Medium: 1% Polysorbate 40 in water; 900 mL
Apparatus 5: 50 rpm
Times: 4, 8, and 24 h
Standard stock solution: Known concentration (mg/mL) of USP Estradiol RS in methanol
Standard solution: Make dilutions of the *Standard stock solution* in *Medium* to obtain at least 5 different concentrations within the range of the expected released amounts of estradiol.

In-Process Revision

Sample solution: At each sampling time interval, withdraw a known volume aliquot of the solution under test.
Mobile phase: Acetonitrile and water (2:3)
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 225 nm
Column: 4.6-mm × 15-cm, 5-µm packing L1 for 9-cm² systems. 4.6-mm × 12.5-cm, 5-µm packing L1 for 18-, 27-, or 36-cm² systems. In any case, a guard column containing packing L1 is used.
Flow rate: 1.0 mL/min
Injection size: 50 µL
System suitability
Sample: *Standard solution*
Relative standard deviation: NMT 2.0%
Analysis: Calculate the cumulative release rate as percentage of the labeled amount of estradiol by the formulas used in *Test 1*.

BRIEFING

Estradiol and Norethindrone Acetate Tablets, *USP 32* page 2305 and page 4052 of the *First Supplement*. It is proposed to make some revisions to the *Dissolution* test to be in accordance with the conditions approved by FDA.

(BPC: M. Marques.) RTS—C56383

Estradiol and Norethindrone Acetate Tablets

DEFINITION

Estradiol and Norethindrone Acetate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of estradiol ($C_{18}H_{24}O_2$) and NLT 90.0% and NMT 110.0% of the labeled amount of norethindrone acetate ($C_{22}H_{28}O_3$).

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST ⟨201⟩**
  Standard solution: 0.5 mg/mL of USP Estradiol RS and 0.25 mg/mL of USP Norethindrone Acetate RS in dehydrated alcohol
  Sample solution: Place 2 Tablets into a 10-mL vial, and add 0.2 mL of water. When the Tablets are partially disintegrated, add a few glass beads, and shake vigorously to disintegrate. Add 4.0 mL of dehydrated alcohol, and shake. [NOTE—Centrifuge until the supernatant is clear before application to the plate.]
  Adsorbent: 0.25-mm chromatographic silica gel plate
  Application volume: 2 µL
  Developing solvent system: Chloroform and acetone (9:1)
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Proceed as directed in the chapter, using the *Developing solvent system*. Apply the samples and develop the plate. After removal of the plate, mark the solvent front, and allow the solvent to evaporate. Place the plate on a heating plate at 100° for 15 min. Allow the plate to cool, and then immerse it in a mixture of dehydrated alcohol and concentrated sulfuric acid (95:5). Place the plate on a piece of thick horizontal paper until it is almost dry. Heat the plate at 100° until it has fully developed. Examine under UV light at 365 nm.
  Acceptance criteria: The color and R_F value of the principal spots of the *Sample solution* correspond to those of the *Standard solution*.
- **B.** The retention time and UV spectrum of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY

Change to read:

- **PROCEDURE**
  Mobile phase: Acetonitrile and water (11:9)
  Diluent: Dehydrated alcohol and water (1:1)
  Estrone standard stock solution: 0.12 mg/mL of USP Estrone RS in dehydrated alcohol
  Estradiol standard stock solution: 0.25 mg/mL of USP Estradiol RS in dehydrated alcohol
  Norethindrone acetate standard stock solution: 0.15 mg/mL of USP Norethindrone Acetate RS in dehydrated alcohol
  Standard solution: 20 µg/mL of USP Estradiol RS from *Estradiol standard stock solution* and 10 µg/mL of USP Norethindrone Acetate RS from *Norethindrone acetate standard stock solution* in *Diluent*

System suitability solution: Combine 800 µL of *Estradiol standard stock solution*, 600 µL of *Norethindrone acetate standard stock solution*, 200 µL of *Estrone standard stock solution*, and 10.0 mL of *Diluent*.
Sample solution: Add 12 Tablets into a measured amount of *Diluent* to obtain a solution having an estradiol concentration of 20 µg/mL and a norethindrone acetate concentration of 10 µg/mL.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: •UV Dual wavelength (254 nm/280 nm) or equivalent•$_6$
[NOTE—Thus, the absorption of estradiol at 280 nm and norethindrone acetate at 254 nm can be included in a single run by altering the wavelength.]
Column: 4.6-mm × 15-cm; packing L1
Flow rate: 1 mL/min
[NOTE—Perform an investigational run to determine the retention times for estradiol and norethindrone acetate.]
Injection size: 50 µL
System suitability
Samples: *Standard solution* and *System suitability solution*
Suitability requirements
Resolution: NLT 1.8 between estradiol and estrone acetate, *System suitability solution*
Relative standard deviation: NMT 3.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
[NOTE—Measure the areas for the estradiol and norethindrone acetate peaks.]
Calculate the quantity, as a percentage, of $C_{18}H_{24}O_2$ in each of the Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*
r_S = peak area from the *Standard solution*
C_S = concentration of USP Estradiol RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of estradiol in the *Sample solution* (µg/mL)
Calculate the quantity, as a percentage, of $C_{22}H_{28}O_3$ in each of the Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*
r_S = peak area from the *Standard solution*
C_S = concentration of USP Norethindrone Acetate RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of norethindrone acetate in the *Sample solution* (µg/mL)
Acceptance criteria: 90.0%–110.0% of the labeled amount of $C_{18}H_{24}O_2$ and 90.0%–110.0% of the labeled amount of $C_{22}H_{28}O_3$

Diluent: Dehydrated alcohol and water (1:1)
System suitability solution: 240 µg/mL of USP Estradiol RS, 60 µg/mL of USP Norethindrone Acetate RS, and 1 µg/mL of USP Estrone RS in *Diluent*
Estradiol standard stock solution: 250 µg/mL of estradiol from USP Estradiol RS in alcohol
Norethindrone acetate standard stock solution: 150 µg/mL of norethindrone acetate from USP Norethindrone Acetate RS in alcohol
Standard solution: Combine 250 µL of *Estradiol standard stock solution* and 100 µL of *Norethindrone acetate standard stock solution*, and dilute with 50.0 mL of *Diluent*.
Sample solution: A quantity equivalent to 240 µg/mL of estradiol and 120 µg/mL of norethindrone acetate from NLT 20 Tablets in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 235 and 254 nm
Column: 3.9-mm × 30-cm; 4-µm packing L1
Flow rate: 0.8 mL/min
Injection size: 100 µL
System suitability
Sample: *System suitability solution*
[NOTE—The relative retention times for estradiol, estrone, and norethindrone acetate are about 1.0, 1.4, and 3.0, respectively.]
Suitability requirements
Resolution: NLT 1.3 between estrone and estradiol, measured at 254 nm
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of any estradiol impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak response area at 235 nm for each impurity from the *Sample solution*
r_S = peak response area at 235 nm from the *Standard solution*
C_S = concentration of the *Standard solution* (µg/mL)
C_U = concentration of the *Sample solution* (µg/mL)
F = relative response factor (see *Impurity Table 1* or *Impurity Table 2*)

••$_6$ Calculate the percentage of any norethindrone acetate related impurities in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak response area at 254 nm for each impurity from the *Sample solution*
r_S = peak response area at 254 nm from the *Standard solution*
C_S = concentration of the *Standard solution* (µg/mL)
C_U = concentration of the *Sample solution* (µg/mL)
F = relative response factor (see *Impurity Table 1* or *Impurity Table 2*)

Acceptance criteria: •The Tablets meet the requirements given in either *Impurity Table 1* or *Impurity Table 2*.

Impurity Table 1. Tablets Labeled as Containing 1 mg of Estradiol and 0.5 mg of Norethindrone Acetate

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Estradiol related impurities			
6α-Hydroxyestradiol	0.47	1.0	1.0
6β-Hydroxyestradiol	0.51	1.0	1.0
6-Ketoestradiol	0.62	1.0	1.0
6-Dehydroestradiol	0.95	1.0	1.0

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** ⟨**61**⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨**62**⟩**:** The total aerobic microbial count does not exceed 1000 cfu/g, and the total combined molds and yeasts count does not exceed 100 cfu/g. The Tablets meet the requirements of the tests for the absence of *Salmonella* species and *Escherichia coli*.

In-Process Revision

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS** ⟨11⟩
  USP Estradiol RS
  USP Estrone RS
  USP Norethindrone Acetate RS

BRIEFING

Conjugated Estrogens. *USP 32* page 2309. On the basis of comments received, it is proposed to change the GC column temperature in the *Assay* from 220° to 208° to prevent an unknown component from co-eluting with the internal standard.

(MD-PS: D. Vicchio.) RTS—C66810

Conjugated Estrogens

DEFINITION

Conjugated Estrogens is a mixture of sodium estrone sulfate and sodium equilin sulfate, derived wholly or in part from equine urine or synthetically from Estrone and Equilin. It contains other conjugated estrogenic substances of the type excreted by pregnant mares. It is a dispersion of the estrogenic substances on a suitable powdered diluent.

Conjugated Estrogens contains NLT 52.5% and NMT 61.5% of sodium estrone sulfate and NLT 22.5% and NMT 30.5% of sodium equilin sulfate, and the total of sodium estrone sulfate and sodium equilin sulfate is NLT 79.5% and NMT 88.0% of the labeled content of Conjugated Estrogens. Conjugated Estrogens contains as concomitant components as sodium sulfate conjugates NLT 13.5% and NMT 19.5% of 17α-dihydroequilin, NLT 2.5% and NMT 9.5% of 17α-estradiol, and NLT 0.5% and NMT 4.0% of 17β-dihydroequilin, of the labeled content of Conjugated Estrogens.

IDENTIFICATION

- **A.** The relative retention times of the 17α-dihydroequilin, estrone, and equilin peaks of the *Sample solution* correspond to those of the *Standard solution,* as obtained in the *Assay.*
- **B.** The chromatogram of Conjugated Estrogens from the *Sample solution* in the *Assay* exhibits additional peaks or shoulders, corresponding to 17α-estradiol and 17β-dihydroequilin at retention times of about 0.24 and 0.35, relative to that of 3-*O*-methylestrone.

ASSAY

Change to read:

- **PROCEDURE**

Internal standard solution: 150 µg/mL of 3-*O*-methylestrone in methanol

Stock solution: 160 µg/mL, 70 µg/mL, and 50 µg/mL each of USP Estrone RS, USP Equilin RS, and USP 17α-Dihydroequilin RS, respectively, in alcohol

Solution A: Sodium acetate TS, 1 N acetic acid, and water (79:21:400). Adjust with 1 N acetic acid or sodium acetate TS to a pH of 5.2 ± 0.1, if necessary.

Standard solution: Pipet 1.0 mL of the *Stock solution* and 1.0 mL of the *Internal standard solution* into a suitable centrifuge tube fitted with a tight screw cap or stopper. Evaporate the mixture with the aid of a stream of nitrogen to dryness, maintaining the temperature below 50°. To the dry residue, add 15 µL of dried pyridine and 65 µL of bis(trimethylsilyl)trifluoroacetamide containing 1% trimethylchlorosilane. Immediately cover the tube tightly, mix, and allow to stand for 15 min. Add 0.5 mL of toluene, and mix.

System suitability solution: Pipet 1.0 mL of a 2.0 µg/mL solution of USP Estradiol RS (17β-estradiol) in alcohol, 1.0 mL of *Stock solution*, and 1.0 mL of *Internal standard solution* into a centrifuge tube fitted with a tight screw cap or stopper. Proceed as directed for *Standard solution*, beginning with "Evaporate the mixture…".

Sample solution: Transfer a quantity of Conjugated Estrogens, equivalent to 2 mg of total conjugated estrogens, to a 50-mL centrifuge tube, fitted with a polytef-lined screw cap, containing 15 mL of *Solution A* and 1 g of barium chloride. Cap the tube tightly, and shake for 30 min. If necessary, adjust the solution with 1 N acetic acid or sodium acetate to a pH of 5.0 ± 0.5. Place in a sonic bath for 30 s, then shake for an additional 30 min. Add a suitable sulfatase enzyme solution equivalent to 2500 Units, and shake for 20 min in a water bath maintained at 50°. Add 15.0 mL of ethylene dichloride to the warm mixture, cap the tube again, and shake by mechanical means for 15 min. Centrifuge for 10 min or until the lower layer is clear. Transfer as much of the organic phase as possible, and dry by rapidly passing through a filter consisting of a pledget of dry glass wool and 5 g of anhydrous sodium sulfate in a small funnel. Protect from loss by evaporation. Transfer 3.0 mL of the solution to a suitable centrifuge tube fitted with a tight screw cap or stopper. Add 1.0 mL of *Internal standard solution*. Proceed as directed for *Standard solution*, beginning with "Evaporate the mixture…".

Chromatographic system

(See *Chromatography* ⟨621⟩*, System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.25-mm × 15-m fused silica capillary column; with a 0.25-µm layer of phase G19, and a split injection system

Temperature

Column: ~~220°~~■208°■2S *(USP33)*

Detector: 260°

Injector port: 260°

Carrier gas: Hydrogen

Flow rate: 2 mL/min

Split flow rate: 40–60 mL/min

Injection size: 1 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—Adjust the operating conditions as necessary to maintain the elution time of the 3-*O*-methylestrone peak at between 17 and 25 min.]

[NOTE—The relative retention times for 17β-estradiol, 17α-dihydroequilin, estrone, equilin, and 3-*O*-methylestrone are 0.29, 0.30, 0.80, 0.87, and 1.00, respectively.]

Suitability requirements

Resolution: NLT 1.2 between estrone and equilin

Tailing factor: NMT 1.3 for the estrone peak

Relative standard deviation: NMT 2.0% for the estrone peak ratios, for NLT four injections of the *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of sodium estrone sulfate and sodium equilin sulfate in the portion of Conjugated Estrogens taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times F \times 100$$

R_U = ratio of the peak response of the appropriate analyte to that of the internal standard from the *Sample solution*

R_S = ratio of the peak response of the appropriate analyte to that of the internal standard from the *Standard solution*

C_S = concentration of USP Estrone RS or USP Equilin RS in the *Stock solution* (µg/mL)

C_U = concentration of the *Sample solution* (µg/mL)

F = conversion factor (ratio of molecular weight of sodium salts to free estrogen), 1.381

In-Process Revision

Acceptance criteria: 52.5%–61.5% of sodium estrone sulfate and 22.5%–30.5% of sodium equilin sulfate

OTHER COMPONENTS

- **CONTENT OF 17α-DIHYDROEQUILIN, 17β-DIHYDROEQUILIN, AND 17α-ESTRADIOL** (concomitant components)

Internal standard solution, Stock solution, Solution A, System suitability solution, Standard Solution, Sample solution, and **Chromatographic system:** Proceed as directed in the *Assay*.

[NOTE—The relative retention times for 17α-estradiol, 17α-dihydroequilin, and 17β-dihydroequilin are about 0.82, 1.00, and 1.11, respectively.]

Analysis:

Samples: *Standard solution* and *Sample solution*

Identify the peaks due to 17α-estradiol, 17α-dihydroequilin, and 17β-dihydroequilin in the chromatogram of the *Sample solution.* Calculate the quantities, in percentage, of 17α-estradiol, 17α-dihydroequilin, and 17β-dihydroequilin as their sodium sulfate salts in the portion of Conjugated Estrogens taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times F \times 100$$

- R_U = ratio of the peak response of the appropriate analyte to that of the internal standard from the *Sample solution*
- R_S = ratio of the peak response of 17α-dihydroequilin to that of the internal standard from the *Standard solution*
- C_S = concentration of USP 17α-Dihydroequilin RS in the *Stock solution* (µg/mL)
- C_U = concentration of the *Sample solution* (µg/mL)
- F = conversion factor (ratio of molecular weight of sodium salts to free estrogen), 1.381

IMPURITIES

Organic Impurities

- **PROCEDURE 1: LIMITS OF 17α-DIHYDROEQUILENIN, 17β-DIHYDROEQUILENIN, AND EQUILENIN** (signal impurities)

Internal standard solution, Stock solution, Solution A, System suitability solution, Standard solution, Sample solution, and **Chromatographic system:** Proceed as directed in the *Assay*.

[NOTE—The relative retention times for dihydroequilenin, 17β-dihydroequilenin, 3-*O*-methylestrone, and equilenin are 0.56, 0.64, 1.0, and 1.3, respectively.]

Analysis:

Samples: *Standard solution* and *Sample solution*
